THE ENGINEERING JOURNAL

INDEX TO VOLUME XXIV
JANUARY TO DECEMBER, 1941

THE ENGINEERING JOURNAL was established in 1918, and is published monthly by The Engineering Institute of Canada of which it is the official organ. It carries with it the full prestige and support of that organization and influences over 5,000 qualified men of the profession occupying important posts in every branch of industry and public utility service throughout Canada. It provides unparalleled personal contact with the technical men from coast to coast. The present circulation is over 5,200 copies and an annual C.C.A.B. audit is provided.

The Engineering Institute of Canada, incorporated in 1887, now has a membership of approximately 5,300 and maintains branches in each of the following cities: Cape Breton, Halifax, Saint John, N.B., Moncton, Quebec, Arvida, Three Rivers, Shawinigan Falls, Grand'Mère, Montreal, Ottawa, Kingston, Peterborough, Toronto, Hamilton, St. Catharines, Niagara Falls, Windsor, Sarnia, London, Sault Ste-Marie, Fort William, Port Arthur, Winnipeg, Regina, Saskatoon, Edmonton, Calgary, Lethbridge, Vancouver and Victoria.

HEADQUARTERS
2050 Mansfield Street, Montreal, Que.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 24 — MONTREAL, JANUARY 1941 — NUMBER 1

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

IGNITRON RECTIFIERS FOR WAR INDUSTRIES

JOSEPH T. THWAITES

Development Engineer, Special Products, Canadian Westinghouse Company, Limited, Hamilton, Ont.

Paper to be presented before the General Professional Meeting of the Engineering Institute of Canada, at Hamilton, Ont., on February 7th, 1941.

At the outbreak of war it was natural for engineers to realize that the chemical industries of the country would be greatly expanded but the large expansion which we have seen take place in the last year has been largely dependent on the work of the civil, mechanical and electrical engineers. Large development has taken place in the mechanical and electrical engineering field to provide the necessary plant equipment for war industries.

Up to 18 months ago, all mercury-arc rectifier equipment was imported from Europe or United States, the larger portion being from central Europe. With this source of supply eliminated, the chemical industries looked for their supply of rectifier equipment, which is a necessary adjunct to a number of electro-chemical processes, to the Canadian manufacturer and at the present time there is sufficient capacity in Canada to produce 40,000 kw. of rectifiers a month if the demand requires it.

The mercury-arc rectifier of today is a far cry from the equipment used in 1882 to prove that an arc between carbon and mercury electrodes would only pass currents in the direction from the carbon to the mercury, or from the Cooper-Hewitt rectifier of the late 90's with its large glass bulb, its temperamental starting equipment, and the blue glow which became familiar in the garages as the electric landau achieved popularity. The glass bulb type rectifier has been developed principally in England up to ratings of 500 amperes at 500 volts and is now a very satisfactory piece of equipment up to such ratings.

In 1908, Peter Cooper-Hewitt suggested the enclosure of the mercury-arc rectifier in a metal shell in order that it could have more mechanical strength to withstand the shocks of handling, and to withstand the physical forces in case the rectifier should fail in its valve action or "arc-back."

The first commercial metalclad rectifiers were built in 1910 by Westinghouse and followed the general shape and construction of the glass bulb rectifier in that the electrodes were placed in side arms and there was a large condensing dome in the centre. About the same time in Europe, a design was brought out by the Brown Boveri Company, which might be called the first commercial tank rectifier, in which the tank contained the electrodes and no arms projected from the tank. The rectifier thus took the form with which we are now familiar, in the multi-anode tank. Water cooling was adopted by 1913 and soon rectifiers capable of handling 700 amperes at 2,400 volts were produced. By 1918 the ratings had been pushed to 6,000 amperes per tank.

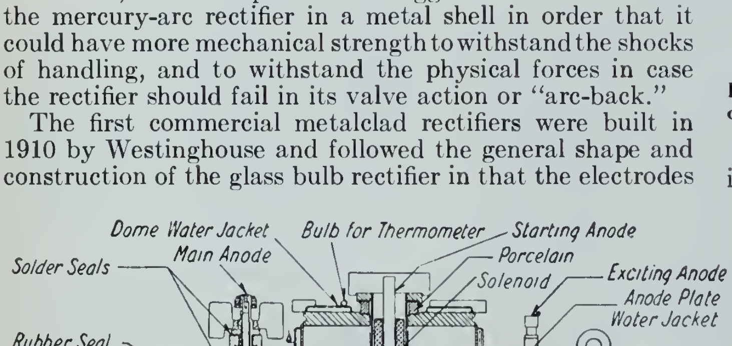

Fig. 1—Cross section of mercury arc rectifier.

Theory

The process of rectification by means of a mercury-arc in vacuum depends on the fact that mercury under certain conditions is a prolific source of electrons, while carbon is an extremely small source of electrons. The mercury pool in the bottom of the rectifier tank proper is known as the cathode and the various carbon electrodes are known as the anodes. The mercury will not emit electrons until a cathode spot has been formed on the surface. This was done in the old Cooper-Hewitt rectifiers by tilting the bulb and drawing an arc from an auxiliary electrode which caused what we call a cathode spot or a source of intense ionization from which electrons are freely emitted under the influence of an electric field. If the anode is made positive at the time when there is a cathode spot on the surface of the mercury, electrons are drawn across to the anode, ionizing the mercury vapour present in the tube and providing a path for the passage of current. In the multi-anode tank or conventional rectifier, there is usually an auxiliary anode or anodes arranged so that there is always one positive anode. It is a property of mercury-carbon arcs that once established they will continue as long as there is a flow of current in the proper direction; that once an arc is started from the cathode to an anode, it is necessary either for the anode to go negative or the voltage to be removed by some external means in order to prevent current flow. In the multi-anode rectifier, the various anodes are so connected to a transformer so that one or more is always positive and the positive anode is the collector of the electrons.

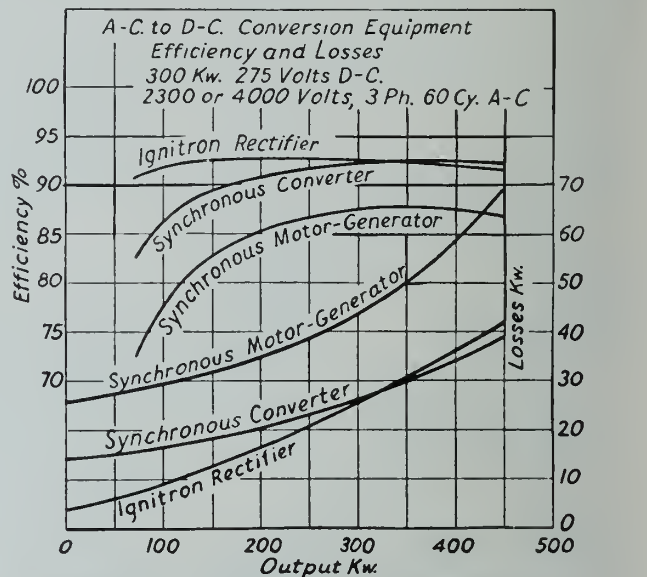

Fig. 2—Typical efficiency curves of the different a-c to d-c conversion units. The curves are for units rated 300 kw., 275 volts.

The process of rectification consists then of allowing the positive half cycles of an alternating current voltage to cause current flow from the anode to the cathode and from the cathode in turn through the external circuit back to the transformer. If the transformer connection is arranged so that it is the centre of a number of centre-tapped transformer windings arranged in various phase positions, the flow of direct current is continuous but not uniform. For instance, if only two anodes are used which are alternately positive, the flow of current is in a series of surges and may actually drop to zero under certain circumstances at the time of transition. If, however, the anodes are connected to a three-phase system, there is a slight overlapping and the current does not go to zero. By increasing the number of phases, the amount of ripples present can be reduced almost to zero. There are now commercial installations in Canada operating on the 36 phase system, and equipment in progress is being built for use on a 60 phase system. This 60 phase system will have less than 1/6 of one per cent ripple which is considerably smoother than that obtained from a commutator type of machine.

It can be readily seen that as the ratings of these multi-anode rectifiers increased, it was necessary to provide larger

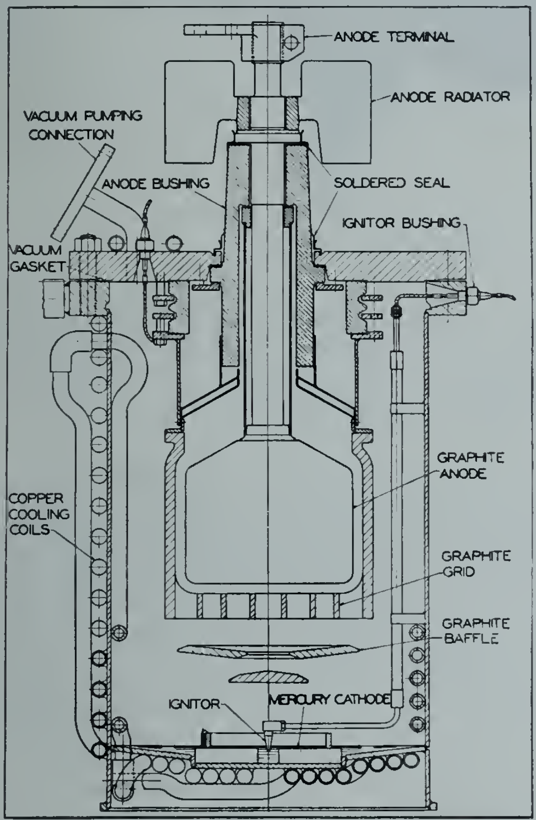

Fig. 3—Cross section of one of the larger ignitrons.

tanks in which to contain the increased number and also the physically larger anodes to carry the larger current. This, in turn, meant that the anode circle was larger and the distance from the anode to the cathode had increased. As the voltage lost in the arc is somewhat proportional to the length, it can be seen that the larger machines were relatively less efficient than the small ones. This is contrary to usual electrical practice and although engineers studied the problem, it seemed as if the arc loss was going to steady down at 28 to 30 volts for the average large size rectifier.

About once in a few million times, one anode would suddenly lose its valve action and become a conductor in the reverse direction. This phenomenon was known as "arc-back" and was accepted in the early rectifiers as part of the trouble with which one had to put up. The demand from operators for more continuous and better service caused manufacturers to seek means of eliminating or reducing the arc-back frequency, various expedients in the form of tortuous paths, stovepipe-like shields and grids were inserted in front of the anode to help de-ionize the path of the arc immediately after conduction should cease. These in turn brought the penalty of higher-arc-drop with resultant lower efficiency.

In 1933, Dr. J. Slepian announced a new method of forming a cathode spot on the mercury pool, which made

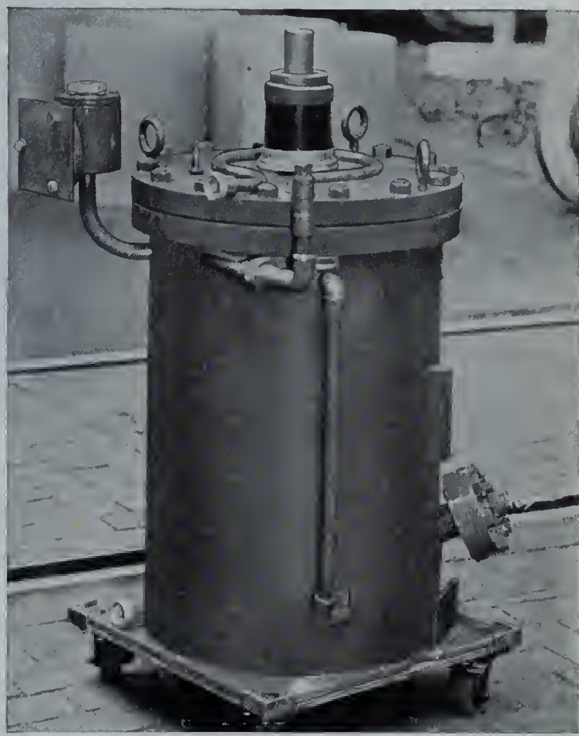

Fig. 4—Shop assembly of ignitron tank ready for mounting in frame.

it practical to put each anode in a single tank with its own cathode, strike the arc when required for conduction and allow the arc to go out naturally during the period when conduction was not required.[1] This allowed the anode to be placed much closer to the mercury pool and the shielding considerably simplified. This invention became known as the ignitron because it was ignited. Dr. Slepian found that by immersing a crystal of carborundum or other such material in the mercury and passing a fairly large current, but of very short duration, through this crystal to the

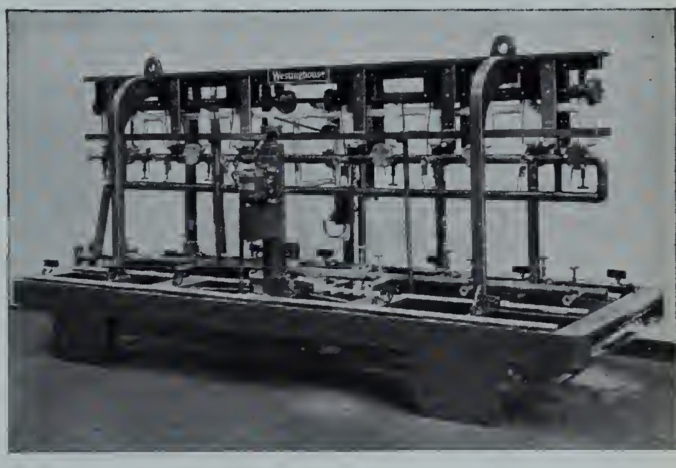

Fig. 5—Frame for 12 ignitrons with water and vacuum manifolds and small wiring in place.

mercury, a cathode spot would be formed on the surface of the mercury. On account of the much simpler arc path and shorter arc distance, he was able to reduce the arc-drop from approximately 30 volts to about 15 volts, thus reducing the rectifier losses by half in one operation. It was quickly

[1] Transactions of *The American Institute of Electrical Engineers*, June, 1933, V. 52, p. 693.

found that the arc-back frequency of this type of rectifier was so good that the shielding previously considered necessary could be largely dispensed with. The ignitron has so established itself as a rectifier that approximately 500,000 kw. of ignitron rectifiers have been sold within the past fifteen months.

Construction

The ignitron rectifier consists essentially of a steel tank formed of mild steel plate, welded vacuum tight, containing a pool of mercury at the bottom, a carbon anode suspended from the top and an igniter rod entering through an insulated bushing at the side. For voltages over 500, an additional electrode called the grid is suspended between the anode and the arc space. This electrode helps in controlling the backfires and it helps in establishing the arc pick-up. in the manufacture of all vacuum apparatus, the utmost cleanliness and absolute purity of the electrode materials are most essential. Foreign matter of any sort is detrimental to the functioning of the rectifier. The tanks are closed by a heavy steel plate top held by 14¾-in. high tensile steel bolts drawing up against aluminum gaskets. The porcelain is fastened to the top by means of a flange, clamping the flange of the porcelain in a recess in the steel top and made vacuum tight by means of solder seals in which the porcelain is actually soldered to the metal. The anode head itself is made of the purest graphite obtainable as experience has shown that no other material is so suitable for withstanding the strains of temperature which occur when a rectifier is operated under intermittent loads. The normal operating temperature of the anode head is approximately 900 deg. C. and very few materials have less electronic emission than carbon under such temperature. The mercury is carefully prepared by four chemical washes and finally by evaporating under vacuum and recondensing. All metals entering into the construction of the tank are sand blasted just before assembly to make sure that all foreign matter is removed. The assembly itself is done in an air conditioned room by operators who wear white cotton smocks and white cotton gloves which are changed at the first sign of soil. After closure, the tank is pumped to approximately 1/1,000,000 of an atmosphere pressure and operated at reduced voltage and up to three times normal current until no further gas can be driven off from the metal and carbon parts. Groups of these tanks are then assembled on a frame to form the requisite number for the capacity required, connected to a common manifold for pumping vacuum and to the necessary water inlet and outlet manifold and the small wiring added to make a complete 6 or 12 phase rectifier. One recent installation in Canada consisted of 48—12-tank rectifiers, each rated at 3,375 kw.

Fig. 7—A compact, convenient and portable arrangement of six ignitrons with control equipment.

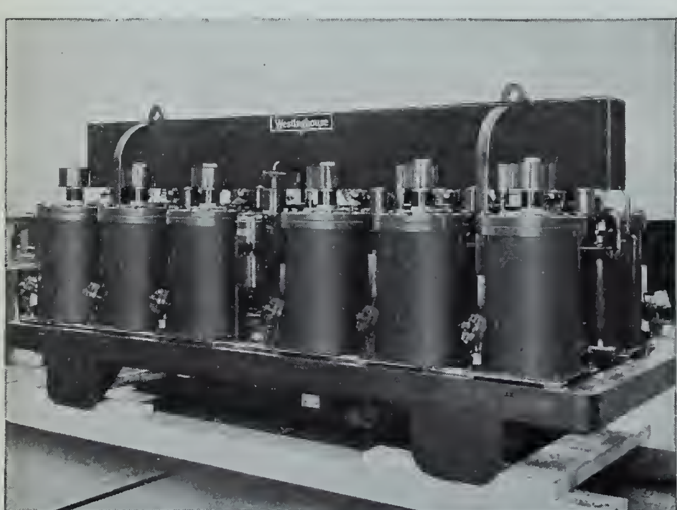

Fig. 6—Complete frame of 12 ignitron tanks rated 3,375 kw.

Ignitrons as Contactors

The ignitron with its peculiar properties of being able to carry current when desired and interrupting the current flow at the end of the first positive half cycle after initiation processes have stopped has become very useful as a contactor where rapid action is required, such as in the spot-welding and seam welding industry. By connecting two ignitrons back to back, they can be arranged to pass alternating currents to the primary of a welding transformer and such an installation has been in service in Hamilton for several years on a spot-welder on critical work in which the record to date has been one defective spot per 468,000 welds. The operation of the igniter control may be made fully automatic so as to cause the current to flow for two cycles on and two cycles off, for instance, or it may be made that it will flow for a predetermined time after the operator initiates the action and then stop completely until the operator takes control again. In the smaller sizes for welding control, the ignitrons are now sealed off and no pumping equipment is required to maintain the necessary vacuum. On account of the extremely large overload capacity available in such equipment, an ignitron rated at 225 amperes continuous is capable of an output of 3,000 amperes for a short time, provided the average is not over 225 amperes. This allows the use of comparatively small ignitrons to take the place of the extremely large contactors and to operate without any moving contacts or fuss. The saving in maintenance on contactors has caused several industries to go over wholly to ignitron contactors and other industries have said that the saving in production more than paid for the installation. It may be noted that the streamline trains made of stainless steel are all welded by the ignitron controlled welding equipment and that every Monel hot water tank sold in Canada has been welded on an ignitron controlled seam welder. The welding operator of a few years ago judged the time to make a spot-weld by the amount

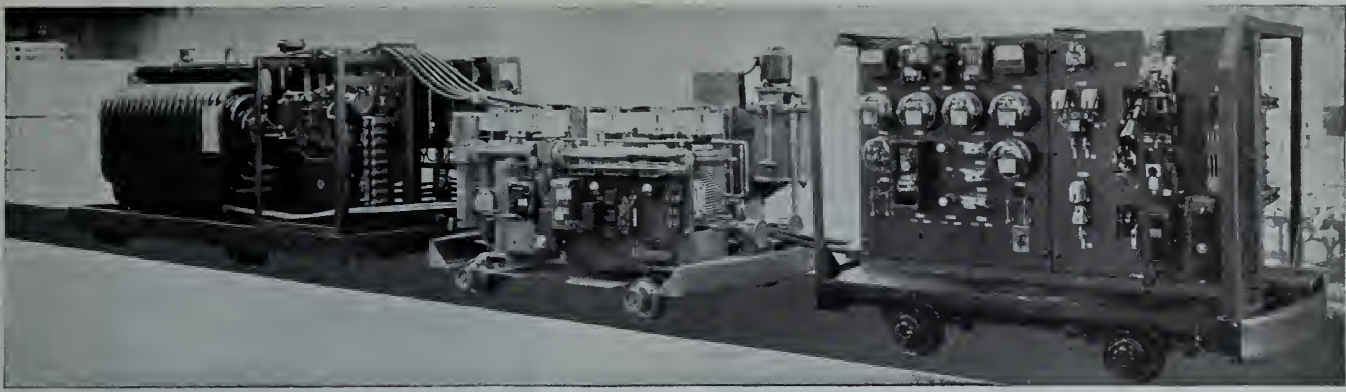

Fig. 8—A typical portable ignitron station for installation in a mine. When this assembly is hauled into place by the mine locomotive it is only necessary to connect to the high voltage feeder and the direct current distribution system, and the d-c substation is ready for operation.

of red that showed under the electrode of the spot-welder. Such a welder would have considerable trouble making welds on sheet lead, but with ignitron control, such welds are entirely practical. There are hardly any metals which cannot be spot-welded by means of ignitron control, whereas manual control can only be used for the few metals which have a large temperature range during which they are weldable.

It is felt that the ignitron is a distinct contribution to Canada's war effort both as a rectifier for the electrochemical industries and as a control device for the metal fabricating industries, and the production in Canada of such a large quantity of new equipment has been a worthwhile achievement.

THE SPIRE OF CHRIST CHURCH CATHEDRAL, MONTREAL

WALTER GRIESBACH, B.SC., M.E.I.C.
Chief Engineer, The Foundation Company of Canada, Limited, Montreal, Que.

The original appearance of Christ Church Cathedral, on St. Catherine Street West, in Montreal, has recently been restored by the erection of a new spire.

Construction of the cathedral was started in July, 1856, and was finished in the late fall of 1859. It is built in gothic style of limestone rubble masonry, set in lime mortar. The tower forming the base of the spire is 24 feet square with two buttresses at each corner and it originally extended 22 feet above the ridge of the main roof. The spire was octagonal in plan and was 121 feet high, the top being 226 feet above sidewalk level.

In the interior of the church the tower is supported by masonry arches and columns. The columns rest on irregularly shaped masonry piers, extending from the underside of the main floor to from 4 to 8 feet below basement ground level. The four piers are joined by inverted masonry arches having the intrados of the crown at the ground line.

As determined by borings, the piers rest on a layer of brown sandy clay 4 to 6 feet thick which, in turn, rests on a bed of blue clay 10 to 13 feet thick. The upper half of this blue clay is of a sticky consistency while the lower half is very soft. Below the blue clay, and overlying bedrock, is a layer of hard brown clay and hardpan about 22 feet thick. The bedrock is of limestone and is about 40 feet below the bottom of the piers.

Before the tower was completed, in 1858, it was discovered that the foundations were sinking and that the two south piers were sinking more than the north ones, causing the tower to lean south towards St. Catherine Street. When the spire was completed there was a maximum settlement of about 5 inches. This settlement disturbed and damaged the columns and arches adjacent to the tower to such an extent that it was necessary to make extensive repairs. While most of the settlement took place during construction, subsequent check measurements showed a slight progressive movement and in 1927, when the settlement was 6½ inches and the spire was 2 feet out of plumb, it was decided

Fig. 1—One of the tower arches. This view shows some of the damage caused by settlement before the original spire was completed.

to remove the spire and about 22 feet of the tower to avoid a possible catastrophe.

The total weight of the original spire, tower, piers and inverted arches was 4,329 tons, making an average load of about 7 tons per square foot on the sustaining soil. This excessive loading accounts for the settlement, and the bearing area of the south piers being a little less than that of the north ones accounts for the uneven settlement. By removing the spire and a portion of the tower the total load was reduced by 1,320 tons, leaving a load of 3,009 tons or about 5 tons per square foot on the soil. There was no further settlement under this reduced loading.

In 1939 an anonymous benefactor offered to provide funds for the construction of a new spire on condition only that the original design could be reproduced. After investigating soil conditions and alternative schemes for strengthening the foundations and reconstructing the spire, it was decided that the tower foundations should be underpinned down to the hard clay or hardpan formation; that the tower should be extended to a height of 25 feet in light masonry construction to match the existing stonework, and that the spire should be of light construction consisting of a structural steel frame covered with cast aluminum plates, treated to produce the appearance of stone masonry.

Considering the nature of the soil, the loads to be supported and the weakened condition of the arches in the interior of the church, it was manifest that the underpinning should be carried out with the least possible disturbance of the soil under the piers. To satisfy this condition and to confine the work to the basement only, the pipe pile method was adopted.

The total weight of the spire, tower, piers and inverted arches is now 3,447 tons, including a net additional weight of 438 tons in the new construction. To take care of the load under the piers, 36 twelve-inch pipe piles, nine under each of the four piers, were jacked down to the required depth, to a resistance of 100 to 105 tons per pile, by means of hydraulic jacks.

An examination of the old rubble masonry piers indicated that it would be necessary to reinforce them to take the reaction of the jacks. This was effectively done by building a collar completely around the upper 5 feet of each pier. The collar consists of a vertically reinforced gunite slab supported by two bands of 12-inch I-beams spaced about 3 feet apart. The beams were welded together at the ends and were prestressed, by wedging with steel wedges between the beams and the masonry, before the gunite was applied. To provide an additional margin of safety, the inverted arches were also strengthened with reinforced gunite and the two south piers were shored, temporarily, on the south face, by means of 75-ton jacks placed at an angle of about 60° to the pier, with the head of the jack in a recess in the masonry and the base bearing on a timber mat on the soil.

Fig. 2—The church after the old spire was removed.

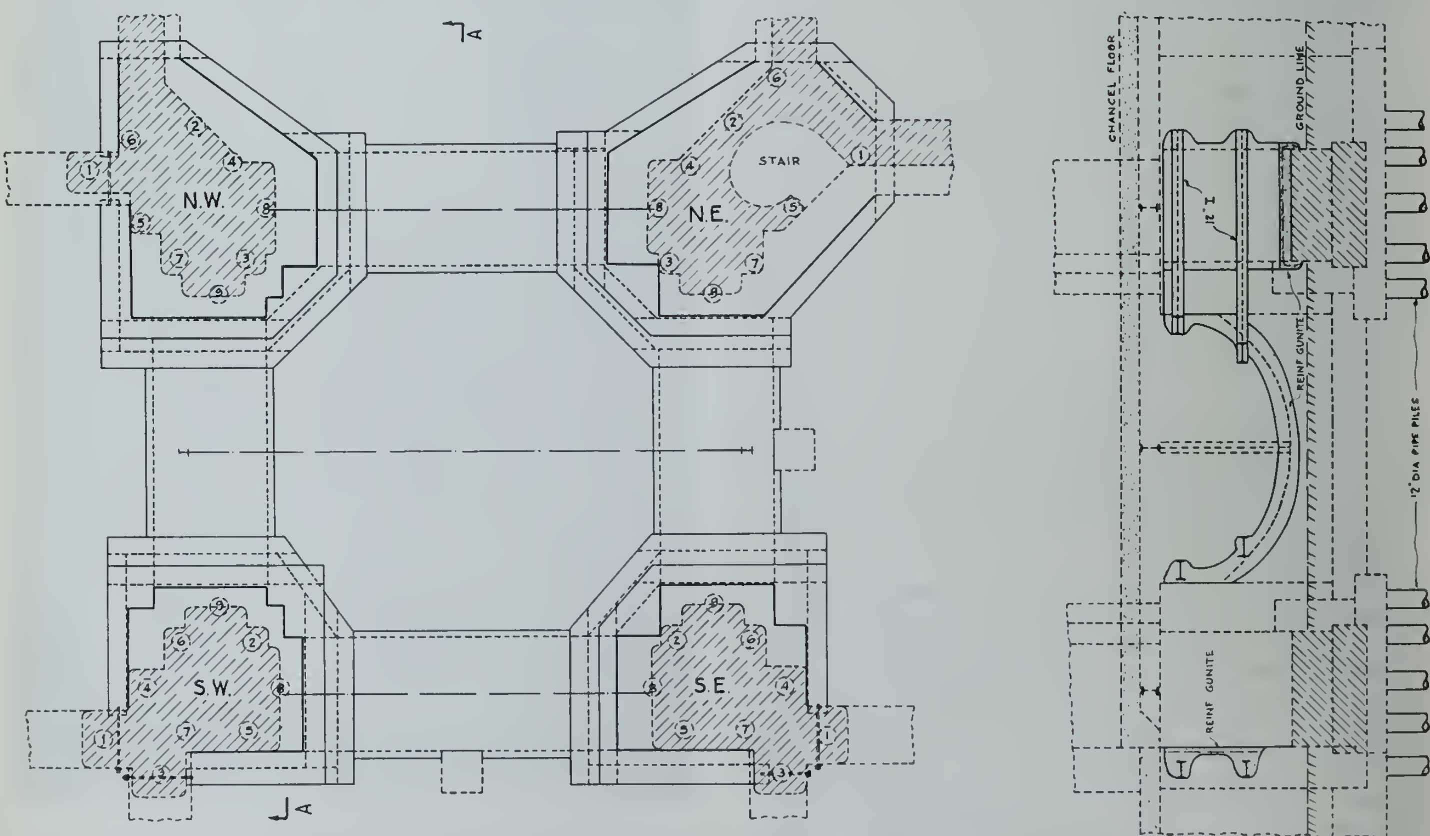

Fig. 3—Plan and section of the foundations. The reinforcing around the piers and over the inverted arches is indicated. The circles show the locations of the piles and the order in which they were placed.

After the gunite had set, recesses were chipped out of the masonry from just below the collar to the bottom of the pier. The recesses were of sufficient depth to allow the piles to be placed directly under the edges of the columns resting on the piers. A concrete pad was then formed at the top of the recess to distribute the load and to provide an even bearing for the head of the jack. The piles were then jacked down, in sections, to the required resistance, as indicated by the gauge on the hydraulic pump. As the maximum extension of the jack was only 8 inches, it was necessary to substitute oak blocks to obtain the required clearance for a new section of pipe. Each pile consisted of a cast iron point and sections of 12-inch standard weight steel pipe 3 feet 4 inches long, with cast iron sleeves between sections. The average length of pile was 18 feet 11½ inches. When the required resistance was reached the top section was carefully burned off to grade near the bottom of the pier and filed to leave an even bearing surface. The pipe was then filled with concrete and, after this had set, a structural steel column was wedged in place between the top of the pile and the concrete pad at the top of the recess. The recess was then filled with gunite. Chipping and jacking were carried on simultaneously at all four piers, one pile at a time at each pier, with the chipping kept in step ahead of the jacking. Preliminary work started on September 26th and the underpinning was completed on December 9th, 1939.

Fig. 4—Underpinning the piers. This view shows a pile being jacked down in the south east pier, which is about four feet deeper than the other.

The new tower forming the base for the spire was started in the spring of 1940. It is 24 feet square and extends 25 feet above the old masonry or ridge of main roof. It consists of a structural steel portal-type frame and four masonry walls with two buttresses at each corner and a louvre in each face. The bottom of the steel frame is attached to a structural steel grillage which is embedded in the masonry walls and on which the new concrete roof slab is supported. There are two rods at each corner, anchoring the grillage to steel beams embedded 10 feet down in the old masonry. The new masonry walls consist of Montreal limestone facing and Indiana limestone trim, with 12 inches of common brick backing. The louvres are of red wood, painted to match the stonework, and are encased in cast stone. The roof slab is insulated with fibre board and sheeted with copper. Two drainage outlets are provided through the walls.

The pyramidal steel frame for the spire is octagonal in cross section. It is 24 feet in diameter at the base and is 118 feet high, the top being at the same elevation as the original spire, about 226 feet above sidewalk level. The base is attached to a structural steel grillage which forms the transition plane between the square tower frame and the octagonal spire frame. The frame consists of 8 tee-section legs tied together at 9 foot intervals with angle diagonals and struts. The tee legs have their webs turned outward to connect to the aluminum corner castings, while additional angles, on the faces of the octagon, support the intermediate castings. Horizontal brace frames, which also serve as landings for the interior ladder system, are provided every 18 feet. The structure is designed to withstand a wind pressure of 30 pounds per square foot of vertical projection.

On account of the spire being situated at the centre of the cruciform church structure, the steel could not be handled in one lift from the ground to the spire. The general contractor's material-handling bridge from the nearby construction tower served as an intermediate landing stage, about 80 feet above ground level. It was raised to this level by means of a gin pole 90 feet long and was then wheeled along the bridge to the tower and hoisted into place by means of a small gin pole attached to the spire frame. This small gin pole was moved up, in turn, with the spire sections. The top section, with cross and finial fastened in place, was erected by means of a pole lashed to an outer face of the frame and cantilevered up to a position slightly above the top of the steel. Main field connections were riveted and other connections were bolted and provided with lock nuts. The steelwork was painted with metalastic black paint, the connections being given an additional coat. The total weight of steel erected was 38 tons.

The facing on the spire consists of cast aluminum plates modelled and treated to produce the appearance of stone masonry similar to that in the original spire. The plates are convex in shape and are made to represent one or more pieces of masonry. The dimensions vary from 16 inches by 8 inches to 16 inches by 84 inches. The plates are designed for their own particular location and are provided with lugs for bolting to the steel frame.

To obtain the desired effect, plaster models were first made of the plates and these were used as patterns for making the castings. The edges of the rough castings were made true by grinding and the surfaces were cleaned by sandblasting. The appearance of weathered masonry was obtained, immediately, by dipping the plates in a solution consisting of black antimony sulphide, sodium cyanide and warm water. It is expected that the coating deposited by this process will, in time, become slightly bleached but the weathered effect will be maintained by the action of the elements in the same manner that stone masonry attains the weathered appearance.

The contrasting effect of mortar joints, between sections representing stones in the plates, was produced by subjecting these joints to a special chemical treatment and, between the plates themselves, by leaving ⅜-inch open joints.

The plates were handled up to the base of the spire by means of the general contractor's material tower and bridge. They were then pulled up and erected from a platform attached to the outside of the spire. This procedure started at the top of the spire and was carried downward, the platform being moved at convenient intervals. All plates fitted exactly into place and all connection holes matched the holes provided in the structural steel, indicating the degree of accuracy used in manufacturing the castings and in fabricating and erecting the structural steel. On account of the inside of the spire being open to the weather, the bolts connecting the plates to the steel frame were given a rust preventative treatment and one coat of red lead paint in the shop, and one coat of metalastic black paint after erection. About 6,500 bolts were used and the total weight of aluminum castings erected was 16.6 tons.

With the exception of the installation of the new clock and the old bell, the spire was completed in November, 1940. It is believed that this is the first time cast aluminum plates have been used, in imitation of stone masonry, on a church spire.

A detailed inspection of the masonry arches in the interior of the church was made prior to the actual underpinning operations. All cracks and defects were carefully recorded and the most prominent ones were marked and photographed. Elevation marks were also established on the columns and piers. Subsequent inspections and level readings indicate that there has been no movement since the start of the new work.

Messrs. Ross and MacDonald were the architects and The Foundation Company of Canada Limited, the general contractors. The structural steel was supplied and erected by the Dominion Bridge Company Limited and the aluminum plates were manufactured and erected by the Robert Mitchell Co. Limited. The cut stone was supplied by Quinlan Cut Stone Limited and the cast stone by Mr. E. J. Ambrose.

THE DESIGN OF SPREAD FOOTINGS

I. F. MORRISON

Professor of Applied Mechanics, Department of Civil and Municipal Engineering, University of Alberta, Edmonton, Alta.

Foreword

The following paper is an attempt to place the design of spread footings on a rational basis. It is realized that there are numerous short-comings and that it will be easy to offer destructive criticism to many points contained in it. The author will welcome rational discussion both favourable and adverse but at the same time would beg of those—and there will be many—who disagree to bear in mind the philosophy of the "Better 'Ole."

General

In this paper it is proposed to deal with only the simplest type of foundation such as is commonly found under buildings. A laterally uniform soil will be assumed, the water content of which will be supposed to remain essentially constant. We shall be concerned, not with the strength of the footing, but merely with its size and shape in plan.

At the outset it is obvious that the criterion which forms the basis on which the proportionate size of the footings must rest is that of equal settlement; at least, in so far as such is at all possible in any particular case. We shall examine this aspect of the subject but, before proceeding to do so, it is necessary to discuss in a general manner the phenomenon of settlement of a footing and to enquire as to its causes.

Phenomenon and Causes of Settlement

Let us conceive a footing of rectangular shape which supports the interior column of a building. Its sole is, let us say, about one-half the width of the footing below the basement floor level so that the footing rests in the earth rather than on top of it. Due to the load from the column; to the weight of and load on the basement floor; and to the weight of the fill, top block, and footing itself; an average vertical unit pressure, p_o, is applied to the soil. If this pressure be appreciably greater than the original pressure at the same level due to the weight of the soil prior to excavation—and it usually is—then settlement of the footing will take place. Even if it be equal to the original pressure the soil may swell after the excavation has been carried out and subsequent settlement may occur. As to how much settlement will occur, that depends on a number of factors—among which are the physical characteristics of the soil strata to a considerable depth, the pressure applied by the footing to the soil, the size and shape of the footing, the depth of its sole below the surface of the surrounding earth, and also the pressure of other footings in the vicinity of it. It is by no means easy to estimate the combined influences of all of these factors.

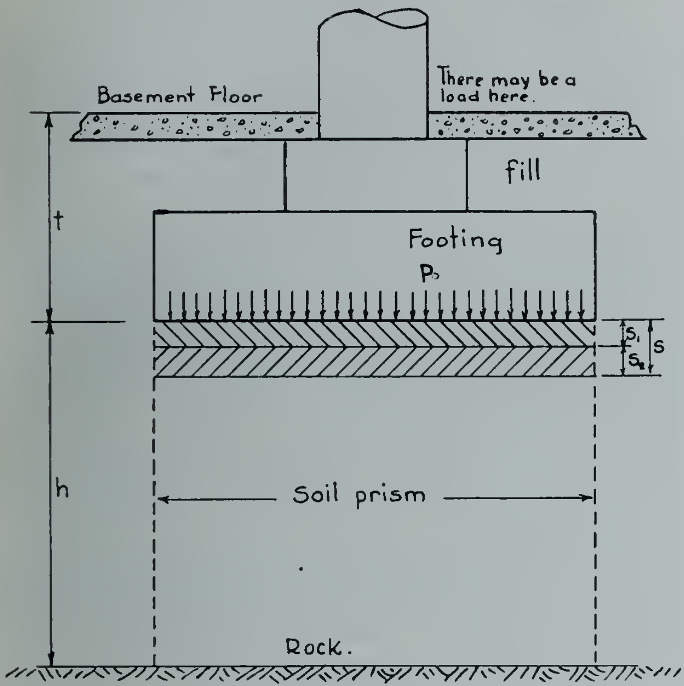

Fig. 1

The sinking of the footing into the ground is the result of two general effects produced by the stresses which result from the application of the pressure p_o to the soil. These effects are: 1: a compression, or consolidation, of the soil directly below the footing; and 2: a lateral movement of the soil from under the footing. The settlement of the footing is the combined result. These items have been the subject of much recent discussion and investigation, and here it is proposed to avoid further detailed consideration. The consolidation of the soil is due to the normal compressive stresses which cause the expulsion of some of the water and compression of the air which occupies the voids in the soil, which results in a change in the unit volume of the soil. Such change of unit volume is for the most part of a permanent character, though there is some elastic deformation as well. The lateral movement is also of an only partially elastic character. We shall find it convenient to assume a direct proportionality relationship between the settlement and the footing pressure, corresponding to the assumption of Hooke's law, i.e., for sole pressures, p_o, not too large, the settlement, s, will be directly proportional to p_o.

In order to make this discourse clear, Fig. 1 shows the footing resting on a prism of soil the cross-section of which is given by the size and shape of the footing in plan. s_1 is the settlement due to the lateral squeezing out of the soil prism and s_2 that due to the consolidation of the soil lying within the prism. The largest part of each of these effects occurs near the top of the soil prism and the total settlement is directly proportional to the change in volume of the soil lying within the prism.

The general shape of the load settlement curve is shown in Fig. 2 by the curve C. The ordinates to this curve are the sums of the respective ordinates to the curves A and B, due to the lateral movement and to the consolidation respectively. From a qualitative point of view, these curves represent the following well known facts: for curve A, as the footing pressure increases, the sinking s_1 increases at an increasing rate. In the early stages, the lateral bulging of the soil prism is elastic in character with some lateral consolidation of the soil which surrounds the soil prism; with increased pressure, due to the shear resistance of the soil being overcome by the shearing stresses, plastic flow outwards and upwards around the footing sets in as indicated by the sudden downward trend of the curve A. For curve B the consolidation increases with p_o at a decreasing rate. Near the origin of co-ordinates, the curve C is approximately straight and it is this fact which forms the basis for the assumption stated above regarding the proportionality of settlement to footing pressure; provided the latter be not too large. As to how large the sole pressure may become without invalidating this simple relationship between load and settlement is a question of the carrying capacity of the soil—a subject of importance, with which, however, we are not concerned at the moment.

At first sight, it would seem that we have in this way succeeded in putting the proportioning of footings on the same basis as the proportioning of, let us say, a concrete column or any other structure composed of materials to which we may feel justified in applying Hooke's law. This does not turn out to be the case, however, because the values of the ordinates to the curves A and B respectively are dependent not only on the properties of the soil, but are also functions of the size and shape of the footing itself and of the depth, h, of the soil layer. A mathematical analysis shows these functions to be extremely complicated and one does not, at present, feel that such refinement should be attempted in practice. It can be shown, however, that the total settlement can be represented by the formula

$$s = \frac{p_o}{E}(kr^n + k'r^{-1}) \qquad (1)$$

in which k and k' are parameters dependent on the shape and size of the footing and the depth of the soil to bedrock.

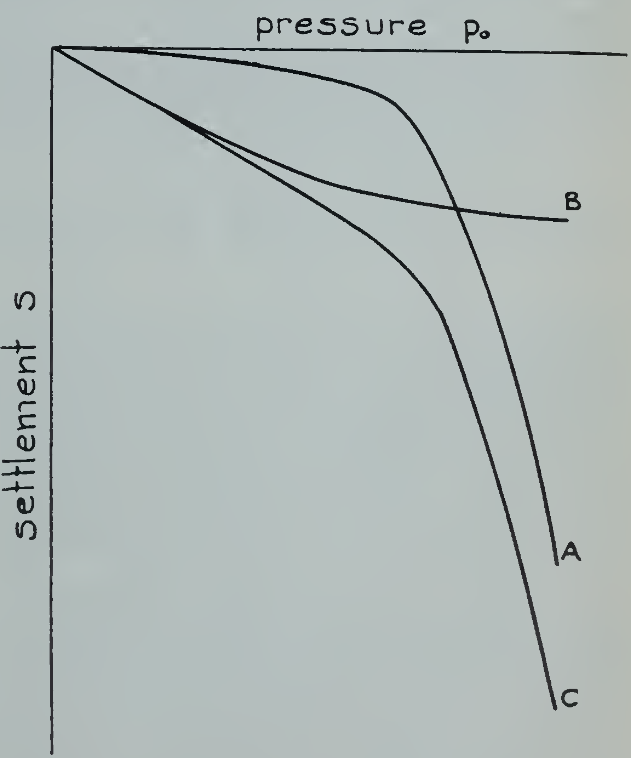

Fig. 2

E is the modulus of compression of the soil, and r is a lateral dimension, such as, for example, one-half of the smallest side of a rectangular footing, or the width of a strip footing, etc. Some attempts have been made to obtain numerical data for k. On the other hand but little is known regarding k' except that it is relatively small for small footing pressures and large footings, and that it may become large and, therefore, predominant, for large pressures and quite small footings. Most footings, in practical design, are sufficiently large that the term $\frac{p_o k'}{Er}$ may be neglected. Thus, we are left with the relatively simple expression $s = \frac{p_o r k}{E}$ (2) for the approximate settlement, in which n has been taken equal to unity as it has approximately that value.

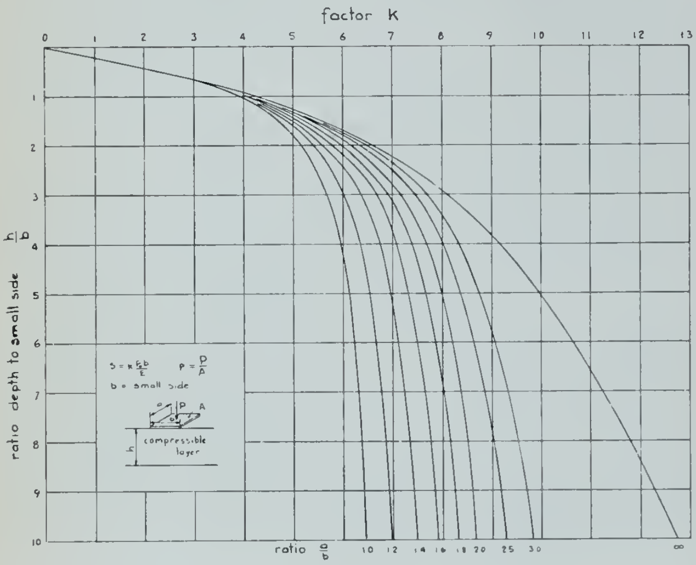

Fig. 3

Several simplified formulae have been given for k but here the discussion will be limited to that given by Steinbrenner* for the estimation of the settlement of rectangular footings.

Proportioning Footings

If, then, for two footings which are to support total loads P_1 and P_2 we are to secure equal settlement, we shall have

$$\frac{P_1 r_1 k_1}{E} = \frac{P_2 r_2 k_2}{E}$$

or, assuming the sole pressure to be uniformly distributed,

$$\frac{P_1 r_1 k_1}{A_1} = \frac{P_2 r_2 k_2}{A_2} \qquad (3)$$

in which A_1 and A_2 are the respective footing areas. The process for the design of footings on this basis may then be stated as follows: After the total loads on the soles of the footings have been determined, the smallest one is selected and with some allowable sole pressure the required area is determined by the usual process. With this data, all of the other footings are proportioned on the basis of equation (3) above. In order to do this, the values of k_1 and k_2 must be known and these may be determined from Steinbrenner's diagram, Fig. 3, by a trial and error process.

At first sight, the above process may appear to lead to larger footings than the older methods and therefore to increased cost. This is not the case, however, when it is realized that higher allowable soil pressures can be used with assurance than were advisable with the previous process. Also, the allowable soil pressure may be governed by other practical details. For example, in the design of a small steel frame building the exterior brickwalls rested on 14-inch concrete basement walls. It did not seem practical to place beneath these walls a footing less than 28 inches wide, though a 24-inch footing could perhaps have been used. From the total load per foot on these footings, the basic soil pressure per square foot was computed and, by using the process suggested above, all of the interior footings were proportioned. The unit sole pressure on the soil varied from 4.8 kips per sq. ft. under the wall footings, to 3.2 kips per sq. ft. under the largest of the interior column footings, which had a design load of 220,000 lbs. The soil was a deep deposit of silt with a natural water content of 19 per cent.

Distribution of Pressure under Footings

It becomes necessary, next, to examine the conditions under which it is possible to attain equal settlement for the footings of a building. Buildings which rest on deep deposits of compressible soil cause a saucer-shaped depression of the horizontal plane surface on which they rest. This is due to the fact that the distribution of stress from the various footings overlaps and thus, taken as a whole, there is more consolidation of the ground at the centre of the building than at its perimeter. Not much can be done about this aspect of settlement except to keep the settlement as a whole, and therefore the differential settlements, to a minimum. This can be done in part at least by deep excavation and by stiff foundation structures. Otherwise the building simply has to conform to the saucer-shape and it may, in certain circumstances, be expedient to choose a flexible type of structure for that purpose.

In order to discuss the overlapping of the stresses, it is first necessary to consider the spreading out of the pressure beneath a footing.

A number of formulae have been devised for the distribution of pressure beneath a spread footing and several useful diagrams and tables for the purpose are to be found in the contemporary literature. Painstaking accuracy,

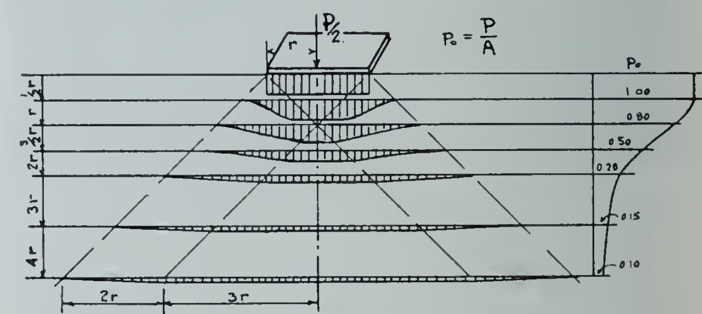

Fig. 4a

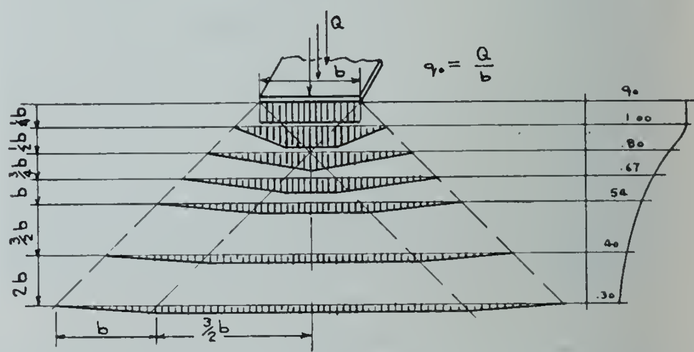

Fig. 4b

however, in this matter is not justified at the present state of knowledge, so that some simplified assumption as regards vertical stress distribution appears to be in order from a practical point of view. Without going into too much detail, we shall assume that the angle of spread of the pressure is at 45 deg. to the vertical. Figures 4a and 4b represent rectangular and strip footings respectively and an assumed vertical stress distribution at different levels is shown which will be adequate for practical purposes. From them, it will be seen that the stresses become rapidly smaller for horizontal planes at depths greater than the width of

(*) Figure 3 has been reproduced and modified from a modified diagram shown in Baugrund und Bauwerk by Kögler and Scheidig, and originally published by Dr. Steinbrenner in *Die Strasse*, 1934.

the footing and that these stresses taper to zero after a certain point away from the centre line is reached.

It is an easy matter to determine the minimum spacing between footings such that no serious overlapping of the stress distribution will occur. As an example, let us assume three equal footings each 8 by 8 ft. and that they rest on a compressible soil which has a depth $h=15$ ft. from the footing soles to bed-rock. What should be the centre to centre

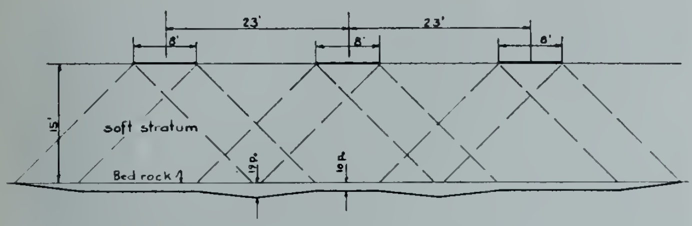

Fig. 5

distance between footings so that equal settlement may be expected ? Figure 5 shows the solution and additional comment seems hardly necessary.

Obviously the theoretical centre to centre distance between equal rectangular footings resting on a compressible stratum of thickness h is $d=h+b$, in which b is the least lateral width. If the footings be unequal in size, such, for example, as a small footing lying between two equal large footings, the distance between centres should be determined by the same process.

In case a soft stratum lies below a hard stratum in which the footings rest, the stresses—intensity and distribution—should be computed at the top and bottom of the soft stratum. From this information one can determine whether there will be unequal settlement—which is often the case—and an estimate of the amount can be made if the pressure-voids ratio curve has been obtained or if the E-value has been determined by test in the field. Simple preliminary studies of this sort may be an important factor in the choice of type of superstructure as well as the general arrangement of column spacing.

Total Settlement of a Structure

A second aspect of footing design is concerned with the amount of settlement of the structure as a whole. Several methods for such computations have been given, based both on the pressure–voids ratio relationship and on the E-value. Equation (2) affords one method for such computation and it becomes necessary to determine the E-value for the stratum (or strata) lying below the footings. The best method is to determine this value by direct test but in so doing a deep boring or open pit is necessary with suitable samples for the purpose of determination of the character of the supporting soil. Soils are not usually uniform for any great depth and consequently the E-value of the various strata must be taken into account by means of separate tests at suitable levels.

Loading Tests

The interpretation of soil loading tests and the determination of the E-value from them is by no means a simple matter. In order to properly interpret a soil loading test it is necessary to bear in mind the two terms which go to make up the settlement as given in equation (1). For tests on small areas the second term becomes perhaps more important than the first and often predominant. Figure 6 shows the relationship between size of footing, or test area, and the settlement for a constant unit pressure.

The curves A and B represent the first and second terms of equation (1) respectively and C the resultant of the two. The general shape of the curve C has been confirmed by numerous tests and also in theoretical analysis so that it appears to be well established. For areas of approximately 1 sq. ft. the settlement is a minimum for pressures not too large. For smaller areas the settlement increases very rapidly and for larger areas the increase is much slower. It is obvious that areas larger than one square foot are necessary for bearing tests if the useful part of the C curve is to be obtained. Several such curves (determined for different unit pressures) will enable one to determine the E-value for the soil immediately below the test footing. Concrete footing blocks having areas of 2 sq. ft. and 4 sq. ft. are suggested as practical sizes, though up to 10 sq. ft. would be desirable if the cost be not prohibitive.

If the substratum be not uniform, then other methods for the determination of the E-value at various levels must be employed. These, however, will not be described in this paper. Some attempts have been made to develop satisfactory tests on the strata *in situ* but much along this line still remains to be done.

A rough idea of the E-values for various kinds of soil may be obtained from the following table drawn from a similar table given by Kögler-Scheidig ([1].) It should be used only as a general guide in the absence of more reliable information.

Table I

Soil Type	E-Value (Tons per sq. ft.)
Gravel (dense)	1000—2000
Sand (dense)	500— 800
Sand (loose)	100— 200
Clay (hard)	80— 150
Clay (medium)	40— 80
Clay (soft)	15— 40
Clay (very soft)	5— 30

The E-value for the silt on the river flats at Edmonton is approximately 44 tons per sq. ft. This soil is known to be quite compressible.

In the determination of the E-value from a soil bearing test, Steinbrenner's diagram can be used to advantage provided of course the limitations as to size of bearing plate and magnitude of soil pressure are kept in mind. As an example, a bearing plate of 4 sq. ft. area showed a settlement of 1.1 in. due to a load of 4 tons per sq. ft. The soil was a yellow clay of considerable depth having a natural water content of 26 per cent. From this test the E-value is:

$$E=\frac{.65 \times 4 \times 2 \times 12}{1.1}=60 \text{ tons per sq. ft.}$$

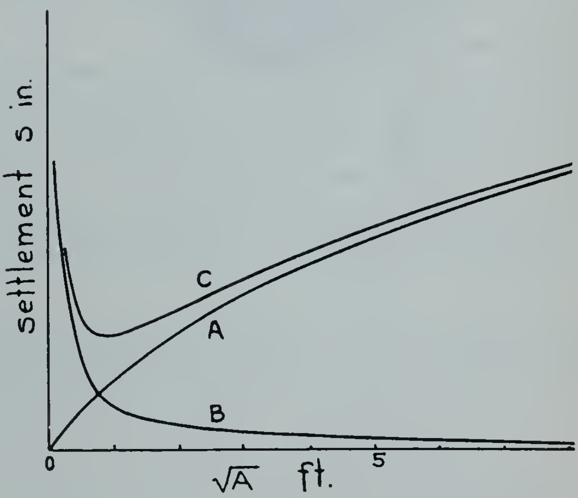

Fig. 6

Bearing Capacity

In the preceding remarks it has been assumed that the bearing capacity of the soil has not been exceeded. The designers should make sure that this will not happen. The best way to determine the bearing capacity of a soil is by actual test in the field provided the test be properly interpreted. Moreover, the character of the soil must be taken

(1) Baugrund und Bauwerk, Wilhelm Ernst & Sohn.

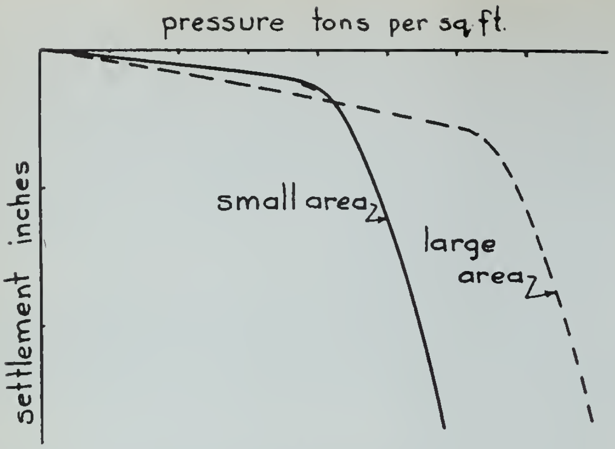

Fig. 7

into account. Figure 7 shows the typical loading test graph (full line) for a cohesionless soil, let us say carried out on an area of 4 sq. ft. We shall interpret this test as indicating that the bearing capacity of the soil is 4 tons per sq. ft. A second test on a larger bearing area will give a graph according to the dotted line. The correct conclusion is that for larger areas the bearing capacity of this soil is more than 4 tons per sq. ft., so that for such soil when we speak of the bearing capacity we must also have in mind the area of the footing.

Figure 8 shows a similar test on a cohesive soil. Here it will be noted that the bearing capacity is perhaps 3.5 tons per sq. ft. and that it is not as sharply defined as in the case of the non-cohesive soil. Also, it will be noted that the bearing capacity of this type does not increase with an increase in size of footing but remains substantially the same (dashed line). Many soils in nature will lie between these extreme cases and it becomes necessary to use judgment not only in interpreting the results of a soil test but in selecting from it a safe value for the maximum permissible soil pressure in any given case.

Failure—somewhat indefinitely defined as that point which is reached on the curve where for a small increment of load there is a large increment of settlement—is brought about by the lateral flow of the soil which in turn is dependent on the depth *t* of the sole of the footing below the surface of the soil which surrounds it. The bearing capacity increases with this depth and in fact does so quite rapidly, especially for cohesionless soils.

On the basis of the field tests shown by Figs. 7 and 8 respectively, one can safely adopt 4 or more tons per sq. ft. in the one case and perhaps but 1½ tons per sq. ft. in the other. One must remember, however, that such field tests exhibit the properties of the soil only to a comparatively small depth and that underlying soft strata in the case of Fig. 7 may have an appreciable influence on the design of the footing but not so much from the point of view of failure of the soil as from that of excessive settlement.

Loads on Footings

An important part of correct footing design lies in a proper estimate of the column loads for which the footings should be proportioned. Clay soils compress slowly and loads of short duration have little effect on the amount of settlement over a prolonged period. Sandy soils and silts, which compress relatively quickly, are affected by loads of short duration. For example, there is no point in allowing for impact loads on the foundations for the piers of a railroad bridge where the soil is a dense clay.

The column and wall loads in a building depend on three items. These are: the dead load of the structure, which may be accurately estimated; the permanent superimposed loads, which may remain in place for long periods; and the intermittent superimposed loads. Of these, the first is always present, the others may or may not be present in certain cases. The author believes that the footings should be proportioned in general only for the first and second, though there are obvious exceptional cases. It is difficult to estimate the amount of the second item. It is seldom equivalent to the floor and column design loads. For example, in the case of a warehouse which may be heavily loaded on all floors for long periods, 100 per cent of the floor design live load should be taken. At the other extreme the typical steel frame office building should have only 10 lb. per sq. ft. on all working floors with nothing allowed for the corridors.

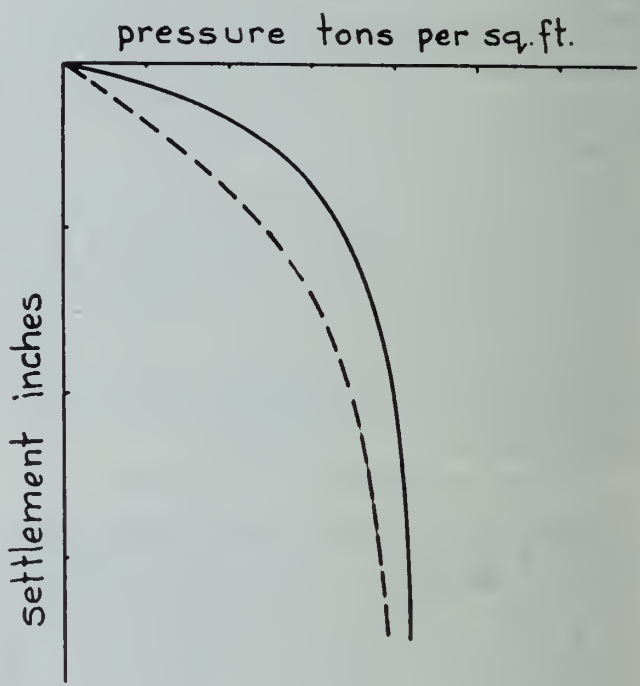

Fig. 8

This will be ample, though a larger allowance should be made for the basement floor which may be used for storage. No allowance need be made for snow on the roof except in certain localities. Such buildings as department stores, machine shops, etc., fall between these extreme cases. In any event, the determination of the footing loads should be given careful attention. It is indeed too often neglected. No proper proportioning of footings can be carried out without attention to an accurate estimate of the proper wall and column loads and this is one of the most difficult parts of foundation design.

ANNUAL MEETING, HAMILTON, ONT., FEBRUARY 6th and 7th, 1941

THE PREPARATION OF SMOOTH SURFACES

M. W. PETRIE

Production Research Division, Chrysler Corporation, Detroit, Michigan

Paper presented before the Border Cities Branch of The Engineering Institute of Canada at Windsor, Ont., on November 15th, 1940

(ABRIDGED)

During the past six years the author has directed the research on the development and application of fine metallic surface finish for the Chrysler Corporation. We evolved a revolutionary technique in the commercial preparation of smooth surfaces, which has solved major production and mechanical problems for the Corporation, and is called 'superfinish.' We then began the study of how to explain the production of fine metal surfaces from a technical viewpoint, so that a more universal use could be made of this development. This study has made headway, but many discussing the problem from both a technical and practical aspect base their conclusions on what they see, or rely exclusively on measurements by some instrument such as the profilometer and surface analyser, failing to realize that the metallurgical structure of the surface is of equal importance to the geometrical development in eliminating wear.

In order to discuss metallic surface finish intelligently from the industrial viewpoint, one should be able to answer the following questions:

1. What is a defective surface, and what are the factors causing it ?
2. What would be the practical industrial value of perfected metal surface finishes ?
3. What would be the loss to the public if surface finishing problems were not solved according to commercial and engineering requirements ?
4. What is the relationship of refined metal surfaces to wear and lubrication ?
5. What is the difference in topography between a ground surface and a geometrically developed smooth surface as shown by metallography ?
6. What is an unbroken oil film ?
7. What is the metallurgy of surface finish ?
8. What are the relative merits of the different methods of measuring refined metal surfaces such as: metallography, sound, stylus point, light wave, friction and microscopic ?
9. What processes are involved, and what are the major considerations in producing a refined finish on all types and shapes of metal surfaces ?

Excellent results in the development of fine metallic surfaces are being obtained daily on parts being produced for use in automobiles, aircraft motors, tractors, sewing machines, and in every conceivable type of mechanism.

The Beginning of 'Superfinish'

The story of 'superfinish' begins early in 1934,when the replacement of roller bearings in the front and rear axles of new cars was causing serious annoyance and trouble to the dealers and owners. The defect called, "brinelling" by service men, was an indentation on the bearing races, caused by the weight of the cars on the bearings acting during railroad transit to distant points. An examination showed that this indentation was very slight, measuring approximately .0001 in. in depth, yet in road driving it caused an obnoxious buzzing noise, making replacement necessary to satisfy owners. The indentations could be removed by lapping, indicating that they were not in the solid crystalline metal, but only in the "fuzz" left on the finished surface by the finish grinding operation. This started experimental work on how to remove economically this "fuzz" developed by the dimensional and finish grinding operation. Lapping with abrasive and oil did not produce a satisfactory surface from a commercial or economical point of view, but we developed a simple reciprocating device using a bonded abrasive stone, that was arranged to give a short reciprocal stroke under light pressure while the work was rotating. This device quickly removed the grinding "fuzz" which is really fragmented, amorphous, non-crystalline and/or smear metal, doing so in about fifteen seconds of time and leaving a smooth surface which under the microscope appeared black with a few scratches below the contacting surface.

By the use of this simple apparatus sufficient bearings were completed to equip, over a period of three months, approximately 200 cars to be shipped to distant points such as California. The shipments were accompanied by a toolmaker and service man, and none of the cars with properly finished bearing surfaces gave any indication of "brinell" or failure. This confirmed the necessity for having all bearings finished in such a manner as to remove the defective surfaces developed by the dimensional operations of finish grinding, and to-day more than one hundred million bearings have been 'superfinished' in the taper roller bearing factories. Experiments were made with ball bearings, for they have exactly the same defects where the surfaces are finished by grinders. The balls will indent under static loads and movement such as in railroad car shipping under load and pressure.

Fig. 1—Fragmented metal caused by severe machining methods. Scale: one inch = 0.040 inch.

A "Wear-Proof" Surface

While we were trying to perfect the production of this new finish it was found that after approximately fifteen to thirty seconds of operation, when the fragmented, non-crystalline metal had been removed, the action of the bonded abrasive entirely ceased and the operation could be continued for hours without removing any additional material.

By further experiments with lubricants of different viscosity we found that the lubricant supported the abrasive stones as soon as sufficient smooth area had been developed on the metal surface to permit the viscosity of the oil to balance the pressure of the load between the abrasive and metallic surface just as it would in the action of a journal bearing.

It then became evident that we could extend this surface finishing to practically all of our products, and experimental work continued from then to now on a wider basis. Up to May 1, 1940, the Chrysler Corporation had spent a total of $265,000 in research and study for the development of refined metallic surface finish, and between three and five million dollars has been spent by industry for 'superfinishing' machines, showing that this new method of producing refined metallic finish is accepted by industry as a mechanical advance. The photographs shown in Fig. 2 are evidence of this.

The Application of 'Superfinish'

After taper bearings we next used the application of 'superfinish' methods to the finishing of crankshafts with equally successful results, and this has been extended until today we are 'superfinishing' in some degree every surface in our motors, such as pistons, crankshafts, tappet barrels and faces, valve stems, camshaft bearings and cam contours, and many other parts where the elimination of wear and "break-in" periods is advantageous. In addition, such surfaces are capable of carrying bearing loads more than double those formerly possible. Also, fatigue failures caused by surface defects are eliminated.

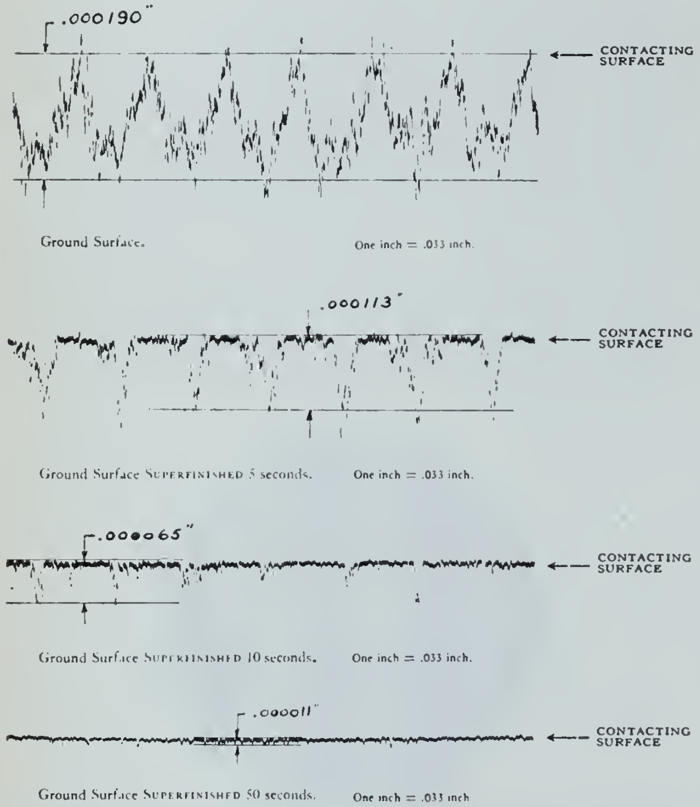

Fig. 2—Series of profilographs of a ground steel surface 'superfinished' at progressive lengths of time. Magnification: vertical 5,000, horizontal 30.

The highest quality cutting tools are now 'superfinished' in order that a cutting surface will be produced that is free of irregularities and any degree of annealed cutting edge formed by the grinding operation.

To-day's Description of 'Superfinishing'

The technique developed after several years of experience may be described as follows:

'Superfinish' is the name given to a mechanically-made metal surface finish that is the final process, superimposed on all other types of dimensional metal surface finishing methods, such as turning, honing, machine grinding and lap-grinding, and can be developed upon flat, internal, external, round, concave, convex and irregular surfaces whereby the metallic surface is metallurgically changed by economical methods and mechanical means from a fragmented, amorphous, non-crystalline or smear metal condition to a geometrically smooth, developed crystalline surface, free or practically free of all surface defects and scratches. This type of metal finish is produced by the combined action of proper bonded abrasive, low abrasive speed, light abrasive pressure and a combination of multi and random motion, short abrasive stroke, variable work and abrasive speeds and variable abrasive pressures, all in combination with a lubricant of proper viscosity whereby defective fragmented and non-crystalline metal is removed from the surface of the crystalline base metal, exposing for support of moving or static loads on lubricated or non-lubricated surfaces a geometrically smooth, developed surface of unworked crystalline base metal to permit of basic metallurgical conditions for the elimination of the development of wear and to permit greatly increased bearing pressures without oil film rupture or failure.

'Superfinishing' Technique

There are two main objectives in the production of a good metallic bearing surface, the one, metallurgical, is to remove the defective metal at the surface, previously produced by the shaping or dimensioning operation, and expose the true crystals of the material actually bisected so as to leave an extremely fine plane surface; and the other, geometrical, is to remove the hills and valleys (scratches and/or flaws), and by the laws of physics to generate a true and smooth surface which will eliminate the danger of oil film rupture and metal-to-metal contact that only lead to increased friction, wear and failure.

'Superfinish' technique differs from past practices for the development of smooth metallic surfaces for mass production in industry. The basic differences are as follows:

1. Abrasive speeds for average 'superfinishing' are 3 to 50 ft. per minute, with 5 to 20 ft. preferred, versus 6,000 to 10,000 ft. per minute for finish grinding.
2. The abrasive pressure for average 'superfinishing' for internal surfaces is 1 to 30 lb. per sq. in., preferably 3 to 10 lb., versus 500 to 1,000 lb. for average honing operations which must develop dimension and surface qualities simultaneously; (honing pressures are developed using 50 to 100 lb. hydraulic direct pressure, multiplied many times by the wedge action of expanding cones within the hones).
3. The pressure on the abrasive for average 'superfinish' of external surfaces is 3 to 50 lb., 3 to 20 preferred, versus pressures of approximately 200,000 lb. per sq. in. or more in grinding operations with only wheel line contact. (The high abrasive pressures of honing and grinding develop great heat which serves to make the surfaces more ductile, and the severity of the operation develops defective non-crystalline surfaces.)
4. True 'superfinish' technique makes extreme use, where mechanically possible, of multi and random motion together with a very short abrasive stroke performed with great rapidity (preferably of the vibratory order) by the abrasive stones. In order to take advantage of the geometrical laws for the generation of true surfaces, strokes of 1/16 to 1/4 of an inch at 300 to 3,000 reversals or more per minute (crank motion preferred) replace the continuous direction motion of wheel grinding, and the 50 to 100 reversals per minute, of much greater lengths of travel, of standard honing machines and honing methods.
5. 'Superfinish' technique uses a light oil of proper viscosity primarily for lubrication and to stop abrasive action, and not for cooling purposes, as low abrasive speed and pressure do not generate destructive heat. The light oil is used to carry away the minute particles abraded from the metallic surface by short abrasive stone stroke.
6. 'Superfinish' was developed primarily as a finishing operation and not a dimensional operation. On fine finishes in the past, such as required for the manufacture of gauges of all types, valves, air and liquid seals, a finishing operation was needed after the dimensional operation to eliminate metallic and surface defects

caused by the dimensional operations. 'Superfinish' is only an expansion of this to commercial and mass production ideas using basically new mechanical theories for the production of such surfaces.

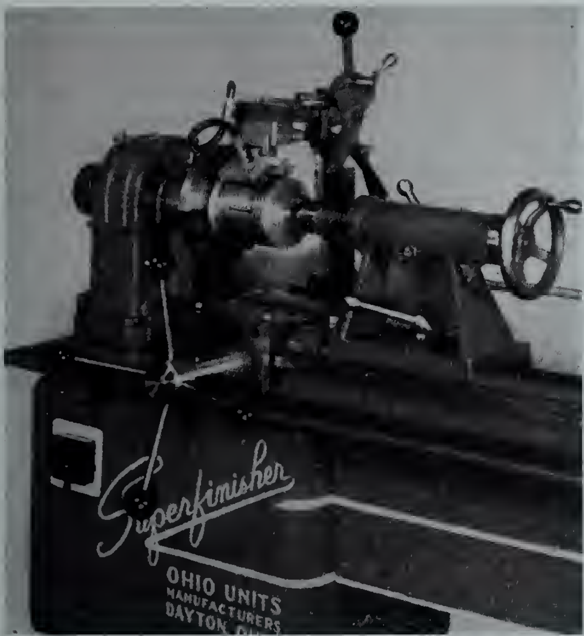

Fig. 3—The 'superfinisher' pictured here is set up for 'superfinishing' pistons. The stone-holder is reciprocated mechanically and the entire stone-holder mechanism traversed longitudinally by actuating the hand wheel shown in the foreground. The motions, with the revolving of the piston, produce the random motion necessary for the production of smooth 'superfinished' surfaces.

7. Dimensional sizing of work is made easy by the use of of 'superfinish' technique by the action of a coarser abrasive plus additional speed and pressure which will give dimensional accuracy that is not attained at the present time and at much greater production speeds. After this 'superfinishing' *dimensional operation* is completed the 'superfinishing' *finishing technique* is used for developing the crystalline, non-wearing metallic surface.
8. Finally, dimension and a fine, smooth, crystalline finish cannot be arrived at simultaneously, as the brutal action necessary to rupture metallic crystals to get dimension, destroys the contacting metallic surface, leaving it in a fragmented, amorphous, non-crystalline or smear condition. It is this surface, or "Beilby's Layer," that is removed by 'superfinishing,' used only as a finishing operation, that is, with low abrasive speed and pressure.

Surface Structure

It is now desirable to discuss the manner in which fragmented and smear metal is developed upon metallic surfaces and how it is produced by the processes of turning, grinding and honing. The principal methods are herewith outlined.

TURNING

1. If a turning tool is free-cutting without drag it will produce on the surface principally fragmented, or amorphous metal, but if the turning tool is arranged not only to turn metal off the surface, but is arranged with what is known as a drag or contacting surface just behind the turning or cutting edge, it will cut and compress the non-crystalline and fragmented metal into an amorphous or smear condition in such a manner as to leave a fairly smooth and bright surface. The quality and appearance of such a surface may be improved if coolants of anti-welding characteristics, such as soda or sulphur compounds are used, but the heat resulting from this compression, speed and pressure is such that a smear metal surface is developed which adheres tenaciously to the crystalline metallic base. This type of smear metal compares to the formation of "smear" snow by sliding a ski over a snow surface under load.

BURNISHING

2. Exactly the same condition of smear metal is developed on a turned or ground surface by roller burnishing. A smooth surface roller, forced under high pressure over a turned surface, crushes and compresses the fragmented material developed by the turning or grinding operation and the combination of heat and pressure results in a fairly smooth film of smear metal of greater uniformity, more smooth in appearance and which, perhaps on an average, adheres with somewhat greater tenacity to the crystalline base surface due to greater heat than that smear metal produced by a turning tool. This type of smear surface development leaves a surface that might be compared to a "metallic paint" and when such surfaces are developed by the best accepted burnishing practices they produce a bearing which may be satisfactory where there is low bearing pressure, reasonably continuous lubrication and slow speed as for railroad axles. This type of smear metal compares to formation of "smear" snow by rolling a lawn roller over the snow on ice under load.

GRINDING

3. The next and most common method of producing smear metal on a metallic crystalline surface is by finish grinding. Rough grinding with free-cutting wheels can be compared to turning with a tool that is not ground and arranged with a drag. However, finish grinding with sufficient high pressure to remove metallic material requires high abrasive speeds of from 6,000 to 8,000 ft. per minute and, with fine grit and hard bond, causes heat generated by the lack of cutting action of such finish grinding wheels. This heat produces a smear metal surface in which there are still hills and valleys (scratches) on the surface. These surface irregularities are produced by the points of the grain abrasive under pressure and prevent the maintenance of thin oil films without metal-to-metal contact, which under ordinary conditions is the cause of initial wear because of the difficulty of lubrication. This type of finish-ground surface was the cause of the taper bearing trouble that was previously referred to.

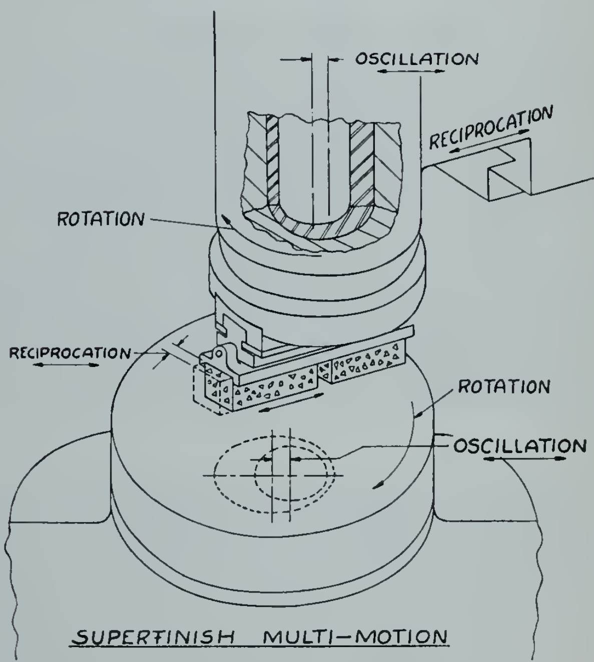

Fig. 4—Diagram showing the method of obtaining random path 'superfinishing' cutting action for flat work, of size limited only by machine capacity.

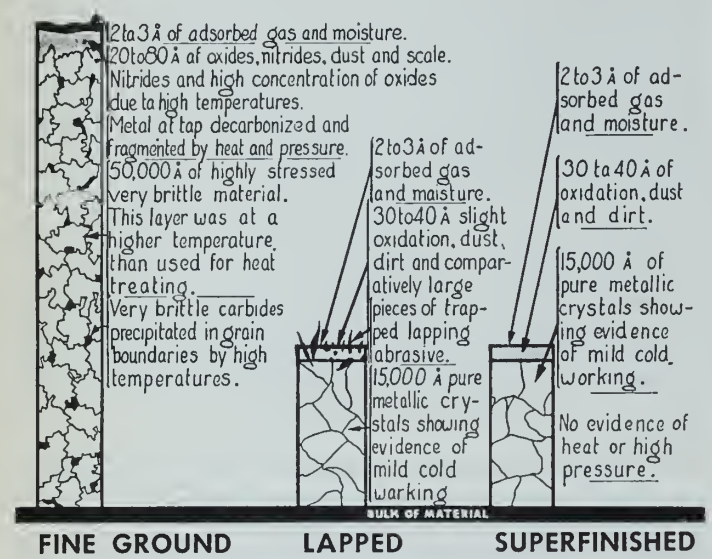
SLOW WHEEL GRINDING

4. The next type of smear metal surface is that produced on grinders, both centreless and centre type, with a slow speed abrasive wheel of approximately 300 to 1,500 surface feet per minute. The abrasive wheel is a combination of very fine abrasive grain and a very hard bond, or a bond of rubber, bakelite, plastic, etc. This method is usually a surfacing and not a dimensioning process, and produces a surface which has low microinch reading for surface defects,



The Ångstrom Unit (Å) for sub-microscopic distances

One Å = 4/1,000,000,000 inch

Fig. 5—Diagram showing the structure of metal surfaces finished by various methods.

but is defective from a metallurgical standpoint. The pressure of the broad, smooth, hard wheel so compresses, crushes and heats the surface that there is on an average a somewhat thinner and denser smear metal surface than is produced by other mechanical methods. On the finest of these surfaces one would be amazed by what is revealed by not more than three or four seconds of 'superfinishing,' showing under this surface the defects that are covered up by smear metal developed by the slow wheel grinding method.

As smear metal is formed by pressure and resulting heat of slow wheel grinding (burnishing) operations, its physical structure is harder than the bulk crystalline material; therefore, after flaking off is easily crushed and rolled through the bearing, producing a continuous, non-stopping abrading action.

HONING

5. Honing is the usually accepted method for finishing internal diameters. A grinding head, of great abrasive stone contact area is expanded and inserted into an ordinary single tooled or reamed bore and by the use of high speed, both rotating and traversing, and with great pressure, usually between 500 and 1,000 lb. per sq. in., a surface of smear metal is produced, often beautiful in appearance (except for cross hatch marks) of microinch reading of 5 to 15. Only a small amount of material is removed in the honing, dimensioning and finishing process, usually not more than .005 to .010 on the surface. This smear metal surface is developed because of the large abrasive contact area, long traversing stroke combined with speed and pressure, and a short hone.

From the above description of the development of smear metal surfaces, it will be noted that smear metal is always developed by trying to obtain a dimension and a surface finish simultaneously, which is brought about by pressure, speed and resulting heat.

Surfaces thus produced contain inclusions of the abrasive grain and only 'superfinish' or the finest of hand lapping eliminates this condition.

METALLURGICAL CONDITIONS OF SURFACES

In the past, surface metallurgy has not been given proper recognition for wear elimination and increased bearing load capacity. Beilby, in 1911, indicated that a surface structure existed on commercially finished metal surfaces that was different from the base metal and this has since been known as "Beilby's Layer." However, this condition was not then suspected as the cause of wear, oil film rupture and limitation of load-carrying bearing capacity.

Attention was first drawn to the metallurgical aspects of a bearing at the surface when examination of wheel bearings that had failed showed a distinct flaking off of a separate layer of metal over previous machining marks. These bearings had been finished by slow-wheel grinding.

These observations started a study of the surface of bearings processed by all commercial machining methods. Studies made by plan-view photomicrography revealed little, but efforts to produce informative profile-photomicrographs proved a success.

Information gathered from the study of such profile pictures led to further study by the newest and most up-to-date method, electron diffraction. These investigations were conducted for us by the Massachusetts Institute of Technology, and proved conclusively that the metal at the outer surface of a machined bearing is definitely different from that in the body of the bearing.

There appear to be three metallurgical conditions existing above the crystalline base metal when the metal surface has been finished by turning, grinding or honing. First is the fragmented crystalline metal that has been ruptured from the main crystalline body but still retains its crystalline structure. The second is the so-called amorphous structure that, through cohesion, holds the fragmented crystals together. The third is the undisturbed crystalline structure, that is, the bulk metal structure, points of which extend into the defective surface. The amorphous cement acts as a binder and fills in the voids or space that exists between the free crystalline and the base crystalline metal. The heat that is developed in the dimensioning operation caused the initial cohesion of the fragmented grain, amorphous and base crystalline structure.

Burnishing crushes the free fragmented grain and the points of crystalline base that extend into the disturbed surface structure, reducing all to an amorphous condition and leveling out of the base metal crystalline surface.

By the use of 'superfinishing' apparatus and technique the fragmented metal is more rapidly removed, and the clean, crystalline base more readily exposed than when the same set-up is used on the smear metal surface. The resultant quality of surface finish is the same, time being the only difference. This fact will in time, tend toward the elimination of finish grinding in industry.

MEASURING

What does industry require of refined surface finish measurement? First, the method of indicating the quality of finish must be as simple as the inch so that there will be a common understanding by the physicist, engineer or shop mechanic. Second, the apparatus must be accurate and inexpensive so that it can be supplied to all mechanics in industry. Third, the apparatus should indicate bearing load-carrying capacity. Recently, an article in a trade journal advocated the adoption of the microinch as a basis of evaluating surface quality. Evidently the author of this article did not try to analyze the limitation of this method at the present time for industry as a whole. First, there are over 200,000 industrial plants, and perhaps 5,000,000 mechanics, that have requirement for surface indicating equipment, yet there have been fewer than 150 microinch indicators built, and these, when delivered and ready for laboratory, or shop use, cost around $1,000 each. Also, it has been proved that this type of instrument does not give a comparative measurement except upon surfaces made under the same conditions. As an example, a fine ground finish of 10 microinch quality will carry only 50 per cent of the load of a 20 microinch ground finish that has been 'superfinished' to a 10 microinch quality. This is, of course, because of 'superfinish' development of smooth surface, replacing the hill and valley (scratches) of the fine ground surface. Yet both will measure 10 microinches.

A great and outstanding job in the field of refined surface measurement has been done by the manufacture of the profilometer, but this certainly is not the answer to ultimate universal requirement for industry, unless it can be produced for less than $100 complete, and then only if a method is not devised that is better.

For geometrically developed smooth surfaces as produced by 'superfinish' technique, the friction type, for recording surface quality, appears to have great possibilities; first, because it makes a known record of surface condition; second, because it has universal application; third, because it is reasonably cheap to build; and fourth, because, unlike the profilometer, it requires no trained operator. It has the drawback that surfaces must have smooth topography of 10 microinches or less to have recordable friction value. Measurement of bearing surfaces by their load-carrying capacity, which automatically takes into account the bearing area available, is provided for in the Wallace surface finish recording dynamometer. Utilizing pendulum action, and either surface or line-contact to the surface being tested, enables the dynamometer to be used for external, internal, and flat surfaces.

Enclosed in the pendulum is a clock timing device. This records accurately the time the pendulum is in motion.

Lubrication of moving load-carrying bearing surfaces has always been an engineering problem. Until the advent of 'superfinish,' ground surfaces produced in mass production had reached a peak of quality which engineers could not surpass by existing methods, and the only way that increased loads could be carried upon bearings was to increase the size of the bearings. But now, through technique which develops a true, smooth surface topography and exposes the crystalline base metal for load support, bearing surfaces are carrying more than double the loads they were formerly carrying under pressure lubrication. The smoother the bearing finish the more effective is the lubrication, but the finish of the bearing surface is far more important than the quality of the lubrication. For instance, a perfectly smooth bearing would probably function indefinitely under a heavy load and pressure lubrication with any clean oil, almost regardless of its lubricating qualities, whereas, the best oil will fail on a ground bearing surface of 15 to 25 microinch surface defect with all other conditions the same.

Bearing Lubrication

In our engineering department tests were made on an S.A.E. oil testing machine to determine the load-carrying capacity of surfaces of different smoothness and also a comparison of surfaces that had been ground and 'superfinished.' In this case the viscosity was known and the test cups were of different finish values. The result of one such test is shown in Table I where the total load applied in pounds designate the failure point of the load-carrying capacity of the oil.

We have found that an oil film has the maximum capacity to support great loads only if it is uniform in thickness and there are no projections above the supporting surface that destroy the structural strength of the oil film, which strength is due to molecular cohesion. This film strength increases at an inverse ratio as pressure reduces its thickness. But the projections above the supporting surface increase largely the material weakness of the film strength. Thus with a film thickness under load, and surface projections of 15 microinches R.M.S. which in reality means projections of 50 microinches, by actual measurement will reduce the oil film by half of its physical thickness, and since the entire surface is defective there is no possibility of maintaining the oil film under such conditions.

'Superfinishing' technique is the only method that will give the desired surface conditions from a metallurgical, as well as a physical standpoint, at an economical cost.

Table I

Machine used—Standard SAE oil-testing machine	*Microinches rms.*		*Total Load Applied, Pounds* 1	2	3	Average
R.P.M. 950	22 to 28	Ground	62	65	86	71
Rubbing Ratio 14.6:1	16 to 18	Ground	140	110	100	117
Load increase, lb. per sec 83.5	12 to 14.5	Ground	116	130	96	114
Oil used .... M.S. 782	8 to 10	Superfinished	165	148	146	153
Viscosity of oil used:	4 to 6	Superfinished	200	160	...	180
150 sec. at 210°F .... (99°C.)	0 to 2	Superfinished	222	224	204	217

Bearings of the Future

The economical production of bearing surfaces of the future with equipment that industry is now using and will be obliged to use for many years to come for economic reasons, will be geometrically true, developed by a compromise between so-called rough and finish grinding, 'superfinished' to a smooth topography of crystalline metal and super-surfaced in use by addition of chemical compounds in the lubricant, or super-surfaced by shop operation before assembly on such parts as ball and roller bearings, and on units that are completed before assembly of a final machine or device.

The preparation of really smooth surfaces, such as now required by engineers and industry, is in its youth, but sufficient results have been accomplished to greatly stimulate increased endeavor by physicists, engineers and production men, and still greater effort will be necessary to satisfy the engineer of the future.

ANNUAL MEETING, HAMILTON, ONT., FEBRUARY 6th and 7th, 1941

THE ST. LAWRENCE PROJECT

A REVIEW OF EARLY AND RECENT DEVELOPMENTS

Recently the St. Lawrence project has been brought to public attention again by the appearance in the press of statements credited to authorities in Washington and Ottawa to the effect that steps will be taken shortly to launch the undertaking. In view of the absence of any official statement regarding the scheme of development that is to be adopted in the International Rapids section, the news items in which reference is made to various schemes of development have been somewhat confusing. Because of the interest the engineering profession has in the undertaking, it was considered that the *Journal* might, with propriety, review briefly the evolution of the proposed Great Lakes-St. Lawrence development, in an endeavour to present a clearer view of the status of the project at the present time.—*Editor*.

Though, from time to time, various power interests both in Canada and the United States had attempted to bring about partial development in the International Rapids section of the St. Lawrence and both countries had evinced an interest in a general project, it was not until 1919 that they finally agreed to a joint study of the problem. In that year the International Joint Commission was asked to investigate what further improvements were necessary to make the St. Lawrence River between Montreal and Lake Ontario navigable for deep-draft vessels and to give the estimated cost. The Commission was also asked to consider a combined development for navigation and power to obtain the greatest beneficial use of the river. The Commission reported in 1921 that the development of the St. Lawrence for navigation and power was feasible, both economically and physically, and recommended a scheme combining navigation and power in the International section and a development for navigation alone in the National section with power development later.

Power interests in both Canada and the United States had submitted schemes for the development of the International Rapids section, and this led the Commission in its report to recommend that, before embarking upon the undertaking, the two countries set up an international engineering board to study the engineering features in greater detail and determine a scheme of development.

After some delay, what was known as the Joint Board of Engineers was formed, on which each country was represented by three engineers. This Board submitted its report in November of 1926. While agreeing as to the method of development in the National section, the Board could not agree upon the method to be followed in the more important International Rapids section. Two schemes of development were submitted: that presented by the American section of the Board was known as a Single-Stage Project, in which the total fall in the section was concentrated by a dam and power houses placed at the foot of Barnhart Island, navigation being carried around this obstruction by means of a side canal and locks on the American side; and that proposed by the Canadian section was a Two-Stage Project, with the upper dam and power houses at Ogden Island and the lower dam and power houses at the lower end of Barnhart Island. As an alternative, the Canadian section presented a second two-stage scheme, in which the upper plant was located at Crysler Island, the lower plant being located at Barnhart Island, as in the other scheme.

For various reasons, considerable time elapsed before the report was considered jointly by the two countries, but, in the meantime, it was under consideration by different official bodies in both Canada and the United States. The National Advisory Committee, set up by the Dominion, reported in January of 1928. Its report was generally favourable to the scheme, with the exception that it was definitely recommended that development of the National section should first be gone on with. As the United States' interests were confined solely to the International section, this recommendation did not make for progress.

It was not until June of 1931, due largely to changes in the political situation from time to time in either country, that negotiations were opened which ultimately resulted in the signing of a St. Lawrence treaty on July 12th, 1932.

The treaty provided for a two-stage scheme of development in the International Rapids section, with the upper dam and power houses located at Crysler Island and the side canal and locks on the Canadian side. The lower dam and power houses were placed at Barnhart Island, with the side canal and locks on the American side. When, however, the treaty came before the United States Senate in March, 1934, ratification was defeated. This marked another hiatus in the movement toward international action on the St. Lawrence development, which lasted until the spring of 1938.

In May, 1938, the United States Secretary of State, Mr. Cordell Hull, in a note to the Canadian Government, submitted a new draft treaty, and intimated that the United

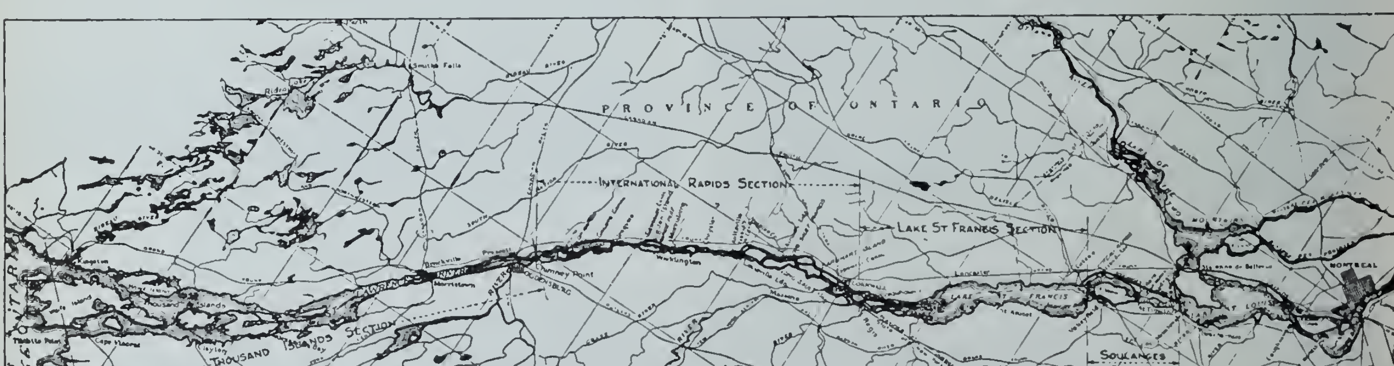


Fig. 1—Map of the St. Lawrence River, showing harbours, canals, rapids and the five divisions of the project suggested and used by the Joint Board.

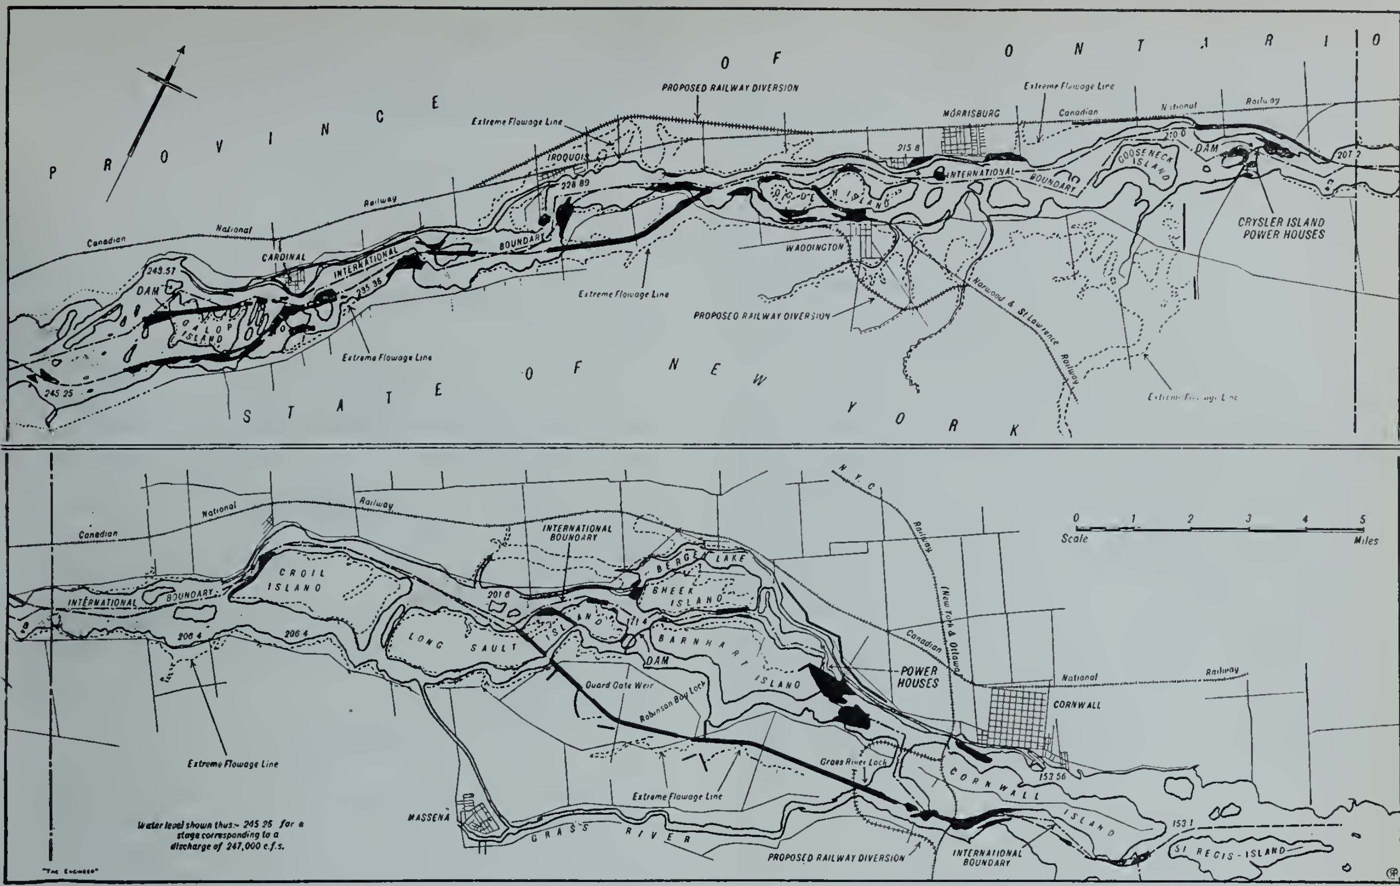

Fig. 2—Map showing proposed works in the International Rapids section.

States Government was prepared to enter into further negotiations. It was not, however, until the end of 1939 that any further action took place.

It is quite evident that full development of the St. Lawrence for navigation or for power is dependent upon agreement between Canada and the United States as to the scheme of development to be followed in the International section, and it is equally evident that such agreement is necessary before Ontario can make use of the potential power resources in the International section of the river, which forms a valuable part of that province's natural resources.

The cost of the whole St. Lawrence basin development has been the subject of much discussion, and a great many articles have appeared in the press from time to time criticizing the estimates first presented by the Joint Board of Engineers. The fact remains, however, that in the final analysis these estimates represent the opinion of those who have given the most study to the question, and they are used herein.

When considering the development of the St. Lawrence as a combined power and navigation project, it should be kept in mind that the costs of the undertaking fall into two main divisions: first, those which are properly part of the cost of developing power and producing electric power; and second, those which are properly chargeable to navigation. In the first division will be those costs assumed by the different authorities charged with the development and sale of power. It is stated that the investments in these undertakings would be self-liquidating and hence would not add to, or take from, the financial burden of the Government of Canada. Those costs coming under the second heading would be the obligation of the Federal Government.

In so far as the development of the International Rapids section is concerned, Ontario, as the owner of one-half of the power in this section, would make certain payments to Canada in respect to power's share of the cost of the undertaking, and these payments, when set off against those that Canada would make in respect to its share of the whole undertaking, would materially reduce that total.

The International agreement, which preceded the signing of the 1932 St. Lawrence treaty, was based upon a scheme known as the Two-Stage Crysler Island Project. The scheme was essentially that proposed by the Conference of Canadian Engineers, in which the upper dam, power houses and navigation locks were located at Crysler Island, where a head of twenty-four feet would be concentrated. The lower dam was located at the head of Barnhart Island, and the power houses at the foot of that island, where a head of sixty feet would be available. Provision was made to pass navigation around these works by means of side canals and the necessary locks.

The estimated cost of the two-stage Crysler Island project was $274,742,000.00, which amount was made up as follows:

Works solely for navigation	$ 34,188,000.00
Works primarily for power	132,452,000.00
Works common to power and navigation	108,102,000.00
Total	$274,742,000.00

Under the terms of the 1932 treaty, the United States would provide funds to construct all the works common to navigation and power and the substructures of the power houses.

The works in the International section for which Canada would pay were as follows:

Navigation works on the Canadian side	$ 8,219,000.00
Lands and rehabilitation works on the Canadian side	14,101,000.00
Total	$22,320,000.00

According to the 1932 agreement between Canada and

Ontario, the Province would pay the Dominion $67,202,-500.00, made up as follows:

Substructures of power houses, and headrace and tailrace excavation..........	$29,295,500.00
On account of lands and rehabilitation on the Canadian side, works common to power and navigation, and channel improvements....................	37,907,000.00
Total........................	$67,202,500.00

It is pertinent to note that, of this amount, the payment of $4,240,000.00 in respect to engineering and certain deferred power works was contingent upon Canada being able to arrange with the United States for the financing of these deferred works and for engineering services as and when required by Ontario. Actually, therefore, the sum guaranteed for payment by Ontario was $62,962,500.00.

According to the public press, what was described as "substantial agreement" was reached on the engineering features of the project by the Canadian and American engineers in Washington last January, and it was indicated that a single-stage scheme formed the basis for such agreement. The actual project was not disclosed, but it is understood that the basis of this agreement was a modified single-stage project in the International Rapids section which resembles, in its major features, the Single-Stage Project that was presented in the report of the Conference of Canadian Engineers of 1929.

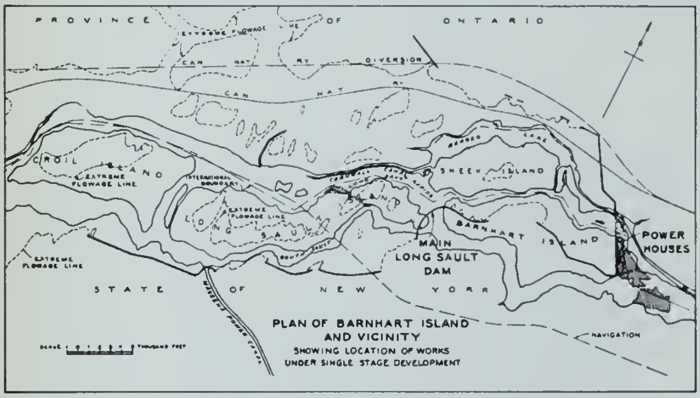

Fig. 3—Map showing location of the proposed power houses in the vicinity of Barnhart Island.

That report considered a single-stage scheme in which the main dam was located at the head of Barnhart Island and extended from that island to the foot of Long Sault Island and thence to the United States shore. The power houses were located at the lower end of Barnhart Island at the mouth of Little River, and were flanked by dykes extending on the south to high ground on Barnhart Island, and on the north to the high ground north of Mille Roches. Twenty-seven foot navigation was to be carried around these obstructions by means of a canal and locks located on the American main shore. Provision was also made to control the outflow and level of Lake Ontario by structures placed at the head of the Canadian Galops Rapids, at the head of the unwatering channel through Galops Island, and between Adams and Galops Islands.

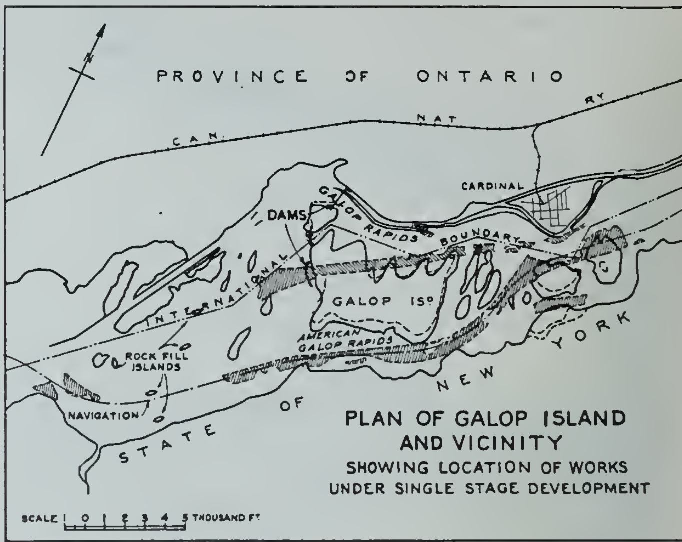

Fig. 4—Map showing the proposed control works at the head of Galops Rapids.

The lands and improvements that would be affected were the same as in the Two-Stage Crysler Island scheme, from the head of the Galops Rapids downstream as far as Crysler Island. Below Crysler Island the areas subject to flooding would be increased under the proposed plan, due to the higher water level and because no dyking was contemplated to protect any of the lands lying below the flood contour. The total land area below the extreme emergency level would be 28,600 acres, of which 14,800 acres would be on the Canadian side and 13,800 acres on the American side. Provision was made in the estimates for the rehabilitation of Iroquois and Morrisburg.

The cost of the Single-Stage scheme is estimated to be $236,418,000.00 made up as follows:

Works solely for navigation...........	$ 27,741,000.00
Works primarily for power............	87,481,000.00
Works common to power and navigation.	$121,196,000.00
Total.........................	$236,418,000.00

If Ontario contributed towards the cost of common works on the same basis as under the 1932 agreement, then the total payment would be:

Substructure of power house and excavation...........................	$18,909,500.00
On account of rehabilitation in Canada, and common works.................	42,418,500.00
Total........................	$61,328,000.00

ANNUAL MEETING, HAMILTON, ONT., FEBRUARY 6th and 7th, 1941

Abstracts of articles appearing in the current technical periodicals

THE BOEING B.17 AND DOUGLAS B.19 BOMBERS

From *Engineering* (London) November 15, 1940

Recent reports of the new American bombers, either ordered by Britain or for the United States Air Services, stress their size as an outstanding point.

One type of big American bomber is the Boeing B.17, sometimes called the "Flying Fortress." Actually, as big four-motored aircraft go, it is not unusually large. Its general dimensions and range correspond to those of Britain's 20-ton, four-engined flying boat, the Short "Sunderland." Its wing span of 105 ft. is 8 ft. less than that of the "Sunderland" and some 18 ft. less than the span of the Armstrong Whitworth "Ensign," Britain's biggest civil air liner, also a four-motored aircraft. As first produced some few years ago, the original "Flying Fortress" had four 1,000 H.P. Wright "Cyclone" motors, which give it a maximum speed of about 250 m.p.h. The effective range claimed was around 3,000 miles—say, from London to Tripoli and back—and the service ceiling just under 6 miles. Bomb load is a variable factor, dependent, among other things on the amount of fuel carried, but it is safe to assume that the B.17 could carry 4 to 5 tons of bombs and ammunition on a round trip of 2,000 miles. A feature of the design, which gave the B.17 the name of "Flying Fortress," is the number of protective gun positions. Four of these were originally provided in "blisters" on the outside of the fuselage, but later examples show gun turrets, similar to the British practice. Even so, the total gun power is not likely to approach that possessed by the latest versions of Britain's famous bombers, such as the turreted "Wellington." An improved "Flying Fortress," produced just before the war, had a cleaned-up external design and a special super-charging system for giving greater engine power at heights above 20,000 ft. The resulting performance figures were not made known, but it may be assumed that the maximum speed of 250 m.p.h. has been improved upon.

AIRCRAFT AND THE WEATHER

From *The Engineer* (London) November 15, 1940

There would still seem to be some doubt in the public mind concerning the influence of the weather on aerial activity. On some occasions the Air Ministry has announced that operations by aircraft of the Bomber Command have had to be cancelled or restricted because of unfavourable weather conditions, whereas on the self-same nights enemy aircraft have been over this country. It is therefore asked why we must be idle while the Germans are active. One reason is that while the weather over the target area is important, the weather over the bases from which the aircraft operate is even more important. British aircraft can take off and fly in the worst kind of weather, just as, presumably, the enemy's machines can, but they have to get back to their bases and land safely. Undoubtedly the enemy is more favourably situated in this respect than we are. His bombers on the outward journey have usually a short distance to travel to reach their objectives, and can carry enough petrol to enable them to return and land at almost any aerodrome from Bordeaux to Norway, some one or more of which will probably be outside the belt of bad landing weather. British aircraft, on the other hand, are compelled to work from a much smaller area, and frequently have to cover long distances to reach their targets. If on their return they find their bases partly obscured or blacked-out by low cloud or fog, the gravest risk is imposed on the crews and the aircraft. The enemy's strategy for a time consisted of endeavouring to inflict as much damage as possible without paying great attention to the casualties which he suffered. It is probable that the severity of the lesson administered to him has induced him to be less rash and that he is now paying more respect to the weather, as well as to the Royal Air Force, in planning his operations against us.

WARTIME INVENTIONS

From *The Engineer* (London) November 15, 1940

In an address which was broadcast by Dr. D. R. Pye, F.R.S., the Director of Scientific Research of the Ministry of Aircraft Production, the question of the many inventions received from the general public relating to war matters was dealt with in a most interesting way. Dr. Pye revealed that since the war started well over 20,000 inventions had been sent to the Air Ministry and the Ministry of Aircraft Production. They came, he said, from all over Britain, the Dominions and from abroad as well. At the present time they were pouring in at the rate of about 3,000 a week. Each letter or memoradum was recorded, filed and answered. For this work there were some thirty scientists, engineers and technicians, together with the necessary clerical staff, which devoted its whole energies to sifting and analysing the flood of ideas. In addition, there was a distinguished scientist and engineer of long experience, who acted as a referee in difficult cases. The ideas received, Dr. Pye said, included those of every imaginable kind. Among them were wild and fantastic, the sensible but already well known, and the interesting and unusual. The fantastic included the optimist who wanted to freeze the clouds and mount anti-aircraft guns upon them. There was also a wonderful helicopter, worked by a perpetual-motion engine, for carrying searchlights, guns and men to colossal heights. There were, too, many varieties of death rays. Most of those inventions were pious hopes, which the inventor hoped the technical expert would turn to practical use, of course under his own supervision. The most interesting group always was suggested by the need of the moment. A few months ago it was schemes for coping with the parachutist, and just now it was how to tackle enemy bombers after dark. In most cases the proposals submitted were some variant of schemes which had been studied and experimented with for many months or even years past. In such cases the most important thing to do was to see whether some new suggestion might not render a scheme practical which hitherto had not seemed worth while pursuing. Dr. Pye recalled that nearly five years before the war an Advisory Committee of Scientists was helping us to foresee what would be needed if war should come and to provide against it. So it was only to be expected perhaps that a large number of ideas now being put forward should have been thought of before. Any of those which showed promise were developed and experimented with, tests and calculations were made and full-scale trials were often carried out. He could not say very much as to the suggestions which had proved fruitful as we wanted them to be unplesant surprises for the enemy. In inviting his hearers to send in any suggestions which might help to win the war Dr. Pye said that there was close collaboration between the Directors of Scientific Research at the Admiralty, the Ministry of Supply and the Ministry of Aircraft Production, and any suggestion received was at once passed to the right department for examination.

GRANT OF ARMS TO THE INSTITUTION OF MECHANICAL ENGINEERS

From *Engineering* (London) November 15, 1940

In the Annual Report of the Council of the Institution of Mechanical Engineers for the year 1939, it was stated that a grant of armorial bearings had been made to the institution under Letters Patent from the College of Arms. The Royal Charter of Incorporation which was granted by the Crown in 1930 constituted the Institution of Mechanical Engineers "one Body Corporate and Politic, with perpetual succession and a Common Seal with power to break, alter and make anew the said Seal from time to time at their will and pleasure." By virtue of this authority, steps were taken to apply for these Letters Patent, so that the seal, arms, crest and supporters should be devised on correct heraldic principles. The accompanying illustration reproduces the emblazoned drawing by Mr. Cecil Thomas, who was commissioned by the Council to prepare the steel die for the seal.

The symbolism adopted is briefly as follows: On the shield, a device signifying the art of measurement and accuracy of workmanship; as the crest, controlled power dominating the world, typified by a heraldic horse chained to the globe from a coronet, which is itself a symbol of a chartered body; lastly, as supporters (to which the institution is entitled as a chartered body), a representation of Archimedes appears on the left, to signify science, and of Vulcan, on the right, to signify craftsmanship. The word "Progress," appearing below the shield, has been used by the institution on various of its devices and at different times since it was founded. The Council state that they were greatly assisted in the whole undertaking by one of their members, the late Colonel Sir George Willis, C.I.E., M.V.O., Mech.I.M.E., then Chairman of the Southern branch, who was an authority in heraldic matters.

In the words of the grant, the symbolism just given is thus described:

"Sable between the points of a pair of Callipers inverted Or a Plate and for the Crest on a Wreath of the Colours:—Upon a terrestrial Globe a Grey Horse forcene proper gorged with a Coronet composed of four Fleur-de-Lys with Chain reflexed over the back Or . . . : And by the Authority aforesaid I the said Garter King of Arms do further grant and assign the Supporters following that is to say:—On the dexter side a Figure representing Archimedes holding in his exterior hand a Pointer and on the sinister side a Figure representing Vulcan resting his exterior hand upon a Sledge Hammer proper . . . the whole to be borne and used for ever hereafter by The Institution of Mechanical Engineers on Seals, Shields, or otherwise according to the Laws of Arms."

LARGE OR SMALL A.R.P. SHELTERS

From *The Engineer* (London) November 15, 1940

When this war began, as everyone knows, German aircraft, intent upon raiding this country, had of necessity to begin their flights from within German borders and thus had to make a journey of several hundreds of miles. It was expected at that time that on the outbreak of war an aerial blitzkreig would be directed against London and other large cities; that it would be maintained by thousands of aircraft, and that the weight of the attack would be broken within a few weeks. When the blitzkreig did not materialize the only alternative that seemed probable was a succession of relatively frequent, but short-time, raids kept up by a smaller number of aircraft operating mainly in daylight; for it was known that the Germans did not regard night bombing as effective. There can be little doubt that the official policy of A.R.P. works designed to meet those conditions and adopted by Sir John Anderson was the right one in the light of expectations. It relied upon the dispersal of the population in Anderson shelters, street shelters, basements, and cellars to reduce the loss of life resulting from the effects of any single bomb. The public shelters envisaged, of which many have now been constructed, were to provide protection against blast and splinters, but were not intended to give security against a direct hit. As against a policy of building deep bomb-proof shelters which was advocated long before the outbreak of war, it was argued, and at that time we think rightly argued, that there was insufficient time to construct them and, of greater importance, that those requiring shelter when the sirens wailed would not have sufficient time to travel any distance, but must look for shelter on the spot. Since large shelters must be spaced out at relatively large distances, no expectation could be held out that their capacity for holding hundreds or even thousands of people would ever be properly used.

When, however, first Norway, then Holland, Belgium, and France were overrun by the Nazis in quick succession, the original conditions no longer held true. Thanks to the magnificent efforts of the R.A.F., daylight raids remained of the short-lived type. But the Germans began to raid by night and, thanks to the proximity of their captured aerodromes to our coasts, they are now able to maintain a raid from dusk to dawn. At night, therefore, instead of being forced to retire for an occasional short period to a place of security, as originally envisaged, the majority of the population, if it remains at home, has to choose between spending the night in safety and discomfort, as represented by a garden shelter, or in comfort and at risk as represented by the house itself. It is little wonder that as the weather has become progressively colder and wetter more and more people have deserted their homes each night and carried what comforts they can to public shelters, where warmth at least is usually combined with a greater sense of safety. They have done so in spite of the fact that those shelters were originally built with the intention of providing protection only for people caught in the streets—not for the surrounding householders and tenants. In fact, expectations regarding raids have not been realized. The chief objection to large shelters holding thousands of people has become no longer valid. For where such shelters exist, as in the case of Aldwych tube, they are filled to capacity before the night raids begin. In the light of these facts the A.R.P. Coordinating Committee, an independent body which has doctors, architects, scientists and engineers on its membership, has recently sent a communication to Mr. Morrison the recently appointed Minister of Home Security, condemning the policy recently announced by the Minister, which, so far as the provision of shelters is concerned, provides for little modification of his predecessor's methods. The object of the Committee, which has been in existence since a date before the war began, is to encourage the provision of really secure shelters for the greater part of the population. The Committee advocates the construction of large and really bomb-proof shelters. They can be of the tunnel or "deep" shelter type or built on the surface, then depending, not on depth, but on concrete and steel for their bomb-proof qualities; additionally, as indeed already provided for by the Government, it proposes construction of new shafts from the tube railways. The shelters, it is argued, should be of large size, for several reasons, the most important being that for a given expenditure per head the large shelter can be made safer than the small one. As to the cost, it is stated that the contract for the scheme for a deep shelter at Finsbury, that caused so much controversy in February, 1938, was actually being negotiated at that time for an amount which worked out at the not unreasonable figure of £13 per head.

Great sympathy will be felt by everyone with the objects of the Committee. There can be little doubt about the technical possibility of building bomb-proof underground shelters. We may, too, reasonably suppose that the Committee has satisfied itself, at least, regarding the possibilities of overcoming the technical difficulties of building really bomb-proof shelters above the ground. The large shelter, it is claimed by the Committee, has other advantages apart from its safety. The erection of bunks and the provision of ventilation, warmth and sanitary services, all necessities if the health of the people is to be maintained, can be very much reduced per capita as compared with small shelters. To some extent the Government has already admitted the need for large shelters by its decision to drive additional headings from the tube railways in London and by opening the Aldwych tube and the platforms and passages of other tube stations to those seeking all-night shelter. But it is clear that it still views with disfavour the general construction of large bomb-proof shelters. There are, of course, many factors which the Government in coming to that decision has had to take into account, notably in relation to finance and the availability of materials and labour. In that connection it is stated by the Committee that out of a pre-war steel productive capacity of 13 million tons annually, only 11,000 tons annually has been allocated to A.R.P. purposes. The whole matter, too, is obviously influenced by the possibility, the chances of which the Government is in a better position than anyone else to reckon, that the answer to the night bomber may be imminent. But at least the arguments of the Committee deserve careful consideration in conjunction with all other information available to the Government. It certainly must not be mere departmental inertia in failing to understand the altered conditions that holds back a change of policy, if such a change would be beneficial.

AMERICAN AIR EFFORT

Abstracted from *Trade and Engineering* (London), October, 1940

Buffalo and Boston

The United States is now delivering in quantity to the R.A.F. two useful types of aircraft—the Brewster single-seat fighter and the Douglas light bomber. In this country they will be known as the Buffalo and the Boston respectively. The Buffalo was originally developed for use by the United States Navy as a deck-landing fighter, but will be employed by the R.A.F. as a land-fighter. It is a midwing monoplane with a very short and deep fuselage, at first glance not unlike the Curtiss Hawk, which did such good work for the French Air Force. An undercarriage of unusual design, which retracts partly into the wing and partly into the fuselage, is a feature of the design. Generally, the aircraft is of orthodox stressed skin construction, with the exception of the movable control surfaces, for which fabric covering is employed. Power is provided by a Wright Cyclone nine-cylinder radial air-cooled engine, which drives a variable-pitch airscrew. It is believed that its performance is such as to make it an invaluable acquisition to the R.A.F. In size the Buffalo is similar to our Spitfire, but it can hardly be claimed to have such attractive lines.

The Boston is a twin-engined light bomber of unorthodox design. It is of monoplane type, with sharply tapered wings and a fairly deep, narrow fuselage. The undercarriage is of the tricycle type, with the two rear wheels retracting into the rear of the engine nacelles, and the nose wheel retracting rearwards and upwards into the fuselage. When raised, it is covered by hinged panels. Two Wright Cyclone nine-cylinder radial air-cooled motors should give a reasonable speed, but no performance data may yet be published.

Production Growing

Recently the United States National Defence Advisory Commission published a report stating that the country's aeroplane production was about 1,000 a month. Early next year it will be 2,000, and by the end of 1941 it will be 3,000. The report contained no indication of what proportion of the figures represents bombers, fighters, and trainers. It is also stated that by next spring mass production of defence materials generally will be developing rapidly. It contradicted Mr. Knudsen's statement that motor-car factories would be turned over to aircraft production, pointing out that the country would need plenty of motor-cars and lorries in the defence programme and that the present factories were best equipped to produce them.

Aircraft for Great Britain

Of special interest to this country is the statement that it has been arranged that Britain shall receive an average of 700 American fighter aircraft a month over the next 20 months. According to a usually reliable source this means that, counting aeroplanes which are already being manufactured in the United States, Britain will be able to buy a total of 14,000 aircraft by April, 1942, if she wishes to do so. The same source states that the record of British aircraft purchases in the United States between the middle of 1938 and August 27 of this year is as follows: ordered by the British Government, 4,778; undelivered French orders 3,286. These two figures give a total of British orders amounting to 8,064. Exports to the British Government were put at 2,633, while aeroplanes delivered but not yet exported numbered 195, leaving an undelivered balance of 5,236. The same report stated that the United States War and Navy Departments have also approved British orders for 1,820 additional aeroplanes, but that these have not yet been allocated among manufacturers. When they are allocated the total number of aircraft now being produced for the British Government in the United States will reach 7,056 and another 7,000 will be produced, according to present arrangements, in the next 20 months, as orders for them are placed.

Chain of Factories

According to the American paper, Wall Street Journal, Great Britain is planning to build a chain of aircraft factories in the United States, so as to produce about 1,300 aeroplanes a month by the end of 1941. Whether this is so or not, a number of aircraft factories are to be built by the United States, with loans from the Reconstruction Corporation, at an estimated cost of between £37,000,000 and £50,000,000. This scheme includes a loan to the Packard Motor Company for works at which Rolls-Royce aero engines will be constructed under licence. The Wright Aeronautical Corporation, which is doing a great deal of important work these days, has also accepted loans amounting to approximately £23,000,000 for new buildings and plant. As a safety measure the U.S. War Department has insisted on new aircraft factories being established in a special area which is several hundred miles inland from the Atlantic coast and already contains a number of blast furnaces, foundries, metal working shops, and machine-tool plant. Five well known companies—Douglas, Lockheed, Boeing, Vultee, and Consolidated—have also issued a joint statement announcing that without waiting to ascertain what legislation Congress will pass to limit their profits, they are going ahead with preparations to increase production. The Allison concern recently effected a considerable expansion of plant, with the result that a rapid increase has been taking place in its output of aero engines, and by the end of the year they should be coming out at a rate in excess of 500 a month. Equally big expansion has been achieved by the Pratt and Whitney division of the United Aircraft Corporation, which expects to produce between 700 and 800 aero-engines a month from now on, while the Curtis Wright Corporation is believed to have exceeded 600 engines a month.

Meanwhile, production is going ahead satisfactorily in Canada, and it was recently announced from Ottawa that the British Government had placed an order for 600 Hurricane fighters with the Canadian Car and Foundry Company. They will be built at the Company's plant at Fort William, Ontario.

CROMPTON'S FIRST APPRENTICE

From *Bepco Journal*, March, 1940

We give below a copy of the official apprenticeship indenture of Crompton's first apprentice, Mr. W. A. Murrell, who we regret to announce passed away at Chelmsford on May 5th, 1938.

"This Indenture Witnesseth that William Augustus Murrell, Son of William Bartwell Murrell, Innkeeper of the Three Cups Inn, Springfield Road, Chelmsford in the County of Essex, with his own free will and by the consent of his Father doth put himself Apprentice to Rookes Evelyn Bell Crompton of Anchor Iron Works, Chelmsford in the county aforesaid, to learn his Art and with him after the Manner of an Apprentice to serve from the eighteenth day of October, one thousand eight hundred and eighty unto and including the eighteenth day of October, one thousand eight hundred and eighty-five unto the full End and Term of Five Years from thence next following to be fully complete and ended. During which term the said Apprentice his Master faithfully shall serve his secrets keep his lawful commands every where gladly do. He shall do no damage to his said Master nor see to be done of others but to his Power shall tell or forthwith give warning to his said Master of the same. He shall not waste the Goods of his said Master nor lend them unlawfully to any. He shall not commit fornication nor contract Matrimony within the said Term shall not play at Cards or Dice Tables or any other unlawful Games whereby his said Master may have any loss with his own goods or others during the said Term without Licence of his said Master. He shall neither buy nor sell. He shall not haunt Taverns or Playhouses nor absent himself from his said Master's service day or night unlawfully. But in all things as a faithful Apprentice he shall behave himself towards his said Master and all his during the said Term.

"And the said Rookes Evelyn Bell Crompton his said Apprentice in the Art of a Light Brass Finisher and Electrician which he useth by the best means that he can shall teach and Instruct or cause to be taught and instructed. And the said Rookes Evelyn Bell Crompton agrees to pay to the said William Bartwell Murrell for the services of the said apprentice during the said term except through inability to work or loss of time arising either from illness or otherwise, namely, during the first year the sum of three shillings per week during the second year the sum of four shillings per week during the third year the sum of five shillings per week during the fourth year the sum of six shillings per week during the fifth year the sum of eight shillings per week. Hours of Labour to be regulated according to the Factory Act.

"And for the true performance of all and every the said Covenants and Agreements either of the said Parties bindeth himself unto the other by these Presents. In witness whereof the Parties above named to these Indentures interchangeably have put their Hands and Seals in the Fourty-fourth Year of the Reign of our Sovereign Lady Queen Victoria by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen Defender of the Faith and in the Year of our Lord One Thousand Eight Hundred and eighty-one."

Witness:

W. A. Robinson
Chelmsford

W. A. Murrell
W. B. Murrell
R. E. B. Crompton

William Augustus Murrell the within named apprentice has completed the term of his apprenticeship to my entire satisfaction.

R. E. Crompton

Chelmsford, October 20, 1885.

AIR-RAID DAMAGE AND MUNITIONS PRODUCTION

From *Engineering* (London) November 15, 1940

Broadly speaking, the strategy of the aerial warfare between Germany and her ally, and Britain, exhibits two principal phases. In one of these the machines have been used as auxiliaries to the ground or sea forces, for reconnaissance purposes and as a means of transporting offensive weapons, which can thus be used with great freedom against the opposing navies, armies and even the civil population. The Germans have exploited this method to the full, and it will be admitted that, from a purely military point of view, its value has been proved by events in Poland, Holland and France.

In the other phase, aircraft are also employed as destructive weapons; not, however, so much against the enemy's own fighting forces as against his land, sea and air communications, and especially against those industrial resources upon which his supply of munitions depends. It is this phase that we ourselves are now employing to the full, selecting targets the destruction of which will impede the enemy's war effort. That this policy, too, has not been lacking in success is shown by the reports of the condition of Hamburg, which has now virtually ceased to be a centre of production. For his part, the enemy, in his attacks on this country, has adopted the opposite view and in so doing has clearly shown his ignorance of the psychology of the British race. The result is that while by his constant raids he has exposed a number of innocent people to a great deal of unnecessary suffering and inflicted some thousand of casualties on men, women and children, he has, as Mr. Herbert Morrison recently pointed out, failed to reduce the productive capacity even temporarily by more than a small fraction of 1 per cent.

From a military point of view, we may, therefore, congratulate ourselves, both on adopting the more correct policy, and that, thanks to the efforts of the Royal Air Force, the enemy's contrary ideas have been proved to be fallacious, both in theory and practice. There is, however, another side to the picture. Though the damage that has been done to our factories and communications by indiscriminate bombing, considered from the material point of view, is small, it is not negligible. Moreover, it is by the nature of things more evident in London and South-Eastern England than in any other part of the country. How important this is is shown by the fact that this area is inhabited by something like a quarter of our population, and includes about the same proportion of the productive capacity of the industries which supply our munitions, using that term in its widest sense. Not only is this the case, but because the locality of London, as regards liability to bombing is so vulnerable, there are problems, among which transport is obviously one, which are not met with so acutely elsewhere.

How best to repair the damage to our productive capacity that has been caused by enemy action in this area is, therefore, rightly receiving the closest attention of the London and South Eastern Area Board. This Board, which is duplicated by others of the same nature in the rest of the country, comprises representatives, both of employers and of the trade unions, as well as of the Ministries concerned with aircraft production, naval construction and repair, and the needs of the army. Labour problems are looked after by the divisional controller of the Ministry of Labour, and the export trade by a representative of the Board of Trade. Moreover, there is liason with the Industrial Capacity Committee, of which the Area Boards in the country are a part, and through this committee with the War Cabinet. Finally a representative of the Minister of Transport has recently been added, since, in the London area at least, the maintenance of easy and rapid communication between the workers' homes and places of employment is an important part of the problem.

It may also be pointed out that one of the duties of these Area Boards has been to examine the machine tool census which, as is well known, takes place at regular intervals, and in this way to find means of using spare capacity of tools and premises, to see that labour is used in the most productive way, and particularly to make alternative arrangements which will ensure that industrial capacity is commensurate with industrial requirements when premises become partially damaged or disabled as the result of enemy action. It is in this connection particularly that transport is important. While it may be possible, even relatively easy, to arrange for the work of an essential factory to be carried on, at least temporarily, in one that is not so essential a few miles distant, such a transfer imposes disabilities on the workpeople, which are not willingly borne and which they can hardly be expected to bear. There is evidence that this is a point which employers sometimes tend to forget under the pressure of other work, and, if the Board can do anything to relieve the situation in this respect, they will have done much towards justifying their existence. The Board has also undertaken the task of arranging for the replacement of such precision tools as are the workers' personal property.

It will not be denied that if production is to be maintained under "Blitzkrieg" conditions, some organization, which will operate speedily and efficiently, and we had almost said with due disregard for rules and regulations, is required. It remains to be seen whether the arrangements which the Board has made fulfil these conditions. Actually, what has been done is to set up nine "clearing centres," seven in London and two in the South Eastern Area, to which those in need of help can refer and which can, in turn, invoke the assistance of their fellows. So far these clearing centres have been mainly concerned with engineering firms, and in particular have designed rather elaborate machinery for classifying the machine tools available. In this way, it is hoped that the possibilities of idle tools or idle labour will be eliminated, and the best and most economic use of the reserves will be secured. It is proposed to extend their labours by organizing such reconstruction of damaged premises as may be necessary after the emergency service designed by the Ministry of Aircraft Production has operated. It will, it is hoped, do this without duplicating the work of other departments, though, of course, it will work in the closest conjunction with them.

THE EAST-WEST AXIAL ROAD IN BERLIN AS A TRAFFIC ROUTE

By H. Langer
From *Verkehrstechnik*, 1939

Abridgement of an abstract compiled by the Department of Scientific and Industrial Research and Ministry of Transport, London

The provision of an axial road from east to west of Berlin formed part of the reconstruction plan sanctioned in 1937. This plan involved the partial reconstruction of the Charlottenburger Chaussée, Bismarckstrasse and Kaiserdamm. On the first of these, the new cross-section includes two 48-ft. carriageways each having a uniform straight crossfall and separated by a central strip 13½ ft. wide. The verges are raised about 9 in. above the carriageways; each contains a 4-ft. safety strip, a cycle track 6½ ft. wide and a footway 21 ft. wide. The provision of the safety strip between the cycle track and carriageway obviates danger to cyclists from the opening of car doors, etc. Access to the carriageway is gained only at important junctions. Trees are planted outside the footways. On one short section an additional carriageway 20 ft. wide is provided for local traffic. On the Kaiserdamm, where less space is available, the widths of the safety strips, cycle tracks, and footways are reduced respectfully to 2½ ft., 5 ft., and 20 ft. and the cycle track is separated from the footway by a line of trees. At intersections the cycle tracks have a gradient of 1 in 15 to the carriageway level, the slope beginning 24 ft. from the junction; the footways continue at their normal level to the actual junction, where the standard radius of curvature is 23 ft. Other important works include the reconstruction of the Grosser Stern, where seven roads meet. Here two subways have been provided for pedestrians. The whole of the intersection has been enlarged, the present extreme radius being 330 ft. and that of the central space 196 ft. At the intersection with the north-south axial road, two vehicular tunnels have been provided for cross traffic, and a single vehicular tunnel has been constructed at the important Knie intersection. The carriageways are surfaced throughout with a two-course carpet of stone-filled mastic 2 in. thick, placed on a 12-in. concrete foundation. All joints in the latter are close joints containing a double thickness of bituminised felt. The joints are protected by building paper painted on the under side with bituminous material. A spacing of 33 ft. is adopted for transverse joints. The central reservation is surfaced with small granite setts on an 8-in. concrete foundation. The safety strip is paved with rough granite setts, the cycle tracks with concrete slabs 12 by 12 by 1.6 in., and the footways with artificial stone slabs 20 in. square or with yellow gravel. The road is lighted by lamps carried in pairs at a height of about 19 ft. on posts 22 ft. high erected on the footways. The direction in which light is emitted is varied on different sections according to local conditions, e.g., the presence of trees. The posts are placed respectively 82 ft. and 62 ft. apart on the eastern and western portions of the route. The lanterns are cylindrical. Each contains two 750-watt filament lamps, one placed vertically above the other. A diagrammatic summary shows the maximum, minimum and average intensity of illumination on different portions of the road. Three-colour automatic signals are provided at intersections, one series controlling vehicular and cycle traffic and the other the movements of pedestrians.

FIFTY-FIFTH ANNUAL GENERAL

HAMILTON - ROYAL

THURSDAY AND FRIDAY,

H. A. COOCH
General Chairman

J. R. DUNBAR
General Vice-Chairman and Chairman of the Hotel Arrangements Committee

PROGRAMME

THURSDAY, FEBRUARY 6th

9.00 a.m.—Registration.

10.00 a.m.—Annual Meeting and Address of Retiring President.

12.30 p.m.—Luncheon.

2.30 p.m.—General discussion on the training and welfare of the young engineer under the auspices of the Institute's Committee of that name.

7.00 p.m.—Joint dinner with the Niagara District Electric Club.

8.00 p.m.—Joint Meeting. Lecture and demonstration by Dr. J. O. Perrine of the Research Division of the American Telephone and Telegraph Company.

FRIDAY, FEBRUARY 7th

9.30 a.m.—Technical Sessions.

12.30 p.m.—Luncheon.

2.30 p.m.—Technical Sessions.

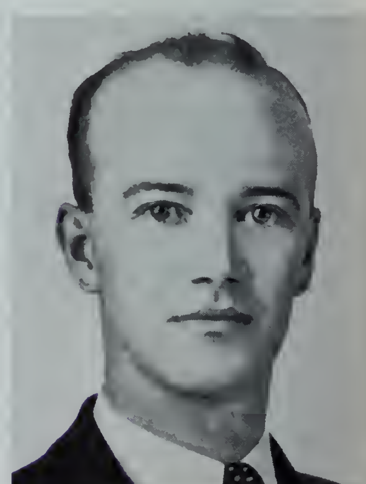
7.30 p.m.—Banquet.

10.30-2.00 a.m.—Dance.

Dr. William Elgin Wickenden, President of the Case School of Applied Science of Cleveland, Ohio, will be the guest speaker at the banquet on Friday night.

E. P. MUNTZ
Chairman of Papers and Meetings Committee

T. S. GLOVER
Chairman of the Publicity Committee



W. E. BROWN
Chairman of the Registration and Information Committee

Special return tickets will be supplied by the railways at the rate of one and a third of the regular one-

AND PROFESSIONAL MEETING

CONNAUGHT HOTEL

FEBRUARY 6 AND 7, 1941

MRS. HUGH LUMSDEN
Convener, Ladies Committee

PAPERS

Training for National Defence, by Dean A. A. Potter, Chairman of the Advisory Committee on Engineering Training for National Defence, Washington, D.C.

La Tuque Power Development, by J. A. McCrory, Vice-President and Chief Engineer, Shawinigan Engineering Company, Montreal.

Earth's Crust Resistance and Lightning, by A. S. Runciman, Superintendent of Transmission Lines, Shawinigan Water & Power Company, Montreal.

Canada's Highway—Banff to Jasper, by T. S. Mills, Department of Mines and Resources, Ottawa, Ont.

Moment Distribution and the Analysis of a Continuous Truss of Varying Depth, by E. R. Jacobsen, Structural Engineer, Dominion Bridge Company, Lachine, Que.

N. A. EAGER
Chairman of the Finance Committee

Ignition Rectifiers for War Industries, by J. T. Thwaites, Canadian Westinghouse Co. Limited, Hamilton, Ont.

Estimating Production Costs in Aircraft Manufacture, by A. T. Wanek, British Air Commission, New York.

W. L. McFAUL
Chairman of the Visits Committee

MAJOR H. B. STUART
Chairman of the Reception and Entertainment Committee

way fare. Necessary certificates will be mailed shortly along with a programme of the entire meeting.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

A New Year's Message

To every member of the Institute I extend my Best Wishes for a Very Happy New Year.

The year 1940 will be long remembered in the annals of civilization for its poignant tragedy, as well as for the inspired determination of the British people to fight for the freedom of all peoples and for the end of selfish national aggression.

Although 1941 will bring hardship and suffering and will test our strength and endurance to the utmost, we can, I am sure, find happiness in the knowledge that our contribution will be to the lasting benefit of all mankind.

President

CO-OPERATION ON THE MARCH

Another milestone on the road to co-operation was passed on December the fourteenth at Calgary. President Hogg of the Institute, and President McLean of the Association of Professional Engineers of Alberta, at that time signed a co-operative agreement between the two bodies. The occasion was marked by a dinner at the Renfrew Club, which set up a new record for attendance and for interest. One hundred and fifty engineers, from Montreal to Vancouver gathered to celebrate the important event and to participate in it.

The same enthusiastic support that was given by ballot to the proposal was given also to the ceremony of signing. It must be a source of much satisfaction to the leaders of the movement in the province to know that the profession backs them so wholeheartedly in their actions. The dinner left no doubt in the matter.

Alberta has joined the small group of provinces which, separately and collectively, are now taking practical steps towards bringing the profession together. For them, co-operation ceases to be a theory, a mirage or a football. It becomes a fact, a principle and a practice.

Although this event brings the total of agreements to only three, it marks a distinct forward movement. It is still a long way from complete co-operation, but within each province co-operation will be complete. The success of the movement in these three proving grounds should be an encouragement to engineers in other places who have similar ideals. Discussions are underway now with other provinces, which it is believed will lead within a short time to the submission of similar proposals in those areas. Eventually, a genuine desire for co-operation will bring to pass great and beneficial changes within the profession, and to these three pioneering provinces will go the lion's share of the credit.

THE PRESIDENT VISITS THE WEST

The visit of a president to any branch is an event of importance, but it carries extra values to those branches in the west and the east. Therefore it has been particularly pleasing that President Hogg was able to take time from the pressing demands of his office to go to Calgary for the signing of the co-operative agreement. In this way he emulated the example of his two immediate predecessors, each of whom carried out a similar ceremony during his term of office.

The president stopped at Winnipeg on the way west, and after the meetings at Calgary extended his trip to the coast. Splendid meetings were held at each stop, and great interest was shown on every hand. Thus the president rounds out a very active year. He visited all branches in Quebec, many in Ontario, and several in the west. If it were not for increased demands upon his time due to war time industrial expansion, he would have been able to get to the Maritimes, and branches elsewhere that he has been forced to pass by.

With the president on his western tour were Past-President Lefebvre, Councillors Vance of London, McLeod of Montreal, and the general secretary, and at Calgary Past-President Gaby was also present. This "entourage" was greeted with real western hospitality, and by its presence indicated the interest that is taken in far away branches by officers from central Canada.

At Winnipeg the president addressed a meeting of the branch held at the University on the evening of December eleventh, and on the following day met with the executive and past officers of the branch at luncheon. Both functions were presided over by Branch-Chairman H. L. Briggs. That evening the President's party went by plane to Calgary.

There were two outstanding events at Calgary. On the Saturday morning a regional meeting of Council was held, at which an attendance of forty was recorded. The presence of several past councillors and officers of the branch added materially to the interest and value of the discussions.

That night the main event took place at the Renfrew Club. It was a dinner given jointly by the Association of Professional Engineers of Alberta and the Alberta branches of the Institute, presided over by P. M. Sauder, vice-president of the zone, to celebrate the signing of the co-operative agreement. The local officials certainly did justice to the occasion. The attendance and the enthusiasm were gratifying in the extreme. Distinguished officers of sister societies such as the Canadian Institute of Mining and Metallurgy, the Dominion Council of Professional Engineers, and officers of the Institute from branches throughout the zone were present, and gracefully presented the greetings of the bodies which they represented.

The ceremony of signing the agreement was carried out with a dignity and a formality that would have done justice to the opening of an ancient parliament. There were impressive looking documents, gold presentation pens, pages in uniform, and much of the paraphernalia of pomp and circumstance. The arrangements were perfect, and the Alberta committee has "shown the world" how a ceremony should be conducted.

Early Sunday morning (the fifteenth), the party started on what was supposed to be a four hour flight, but nature took a hand in the proceedings, and so completely "fogged out" Vancouver that the plane had to go on to Patricia Bay, just north of Victoria. From Victoria the trip to Vancouver was completed by boat—substantially behind schedule.

On Monday, the president was guest speaker at a luncheon meeting of the Vancouver Board of Trade, under the chairmanship of H. N. Macpherson, councillor-elect of the Vancouver Branch, and in the evening attended a dinner meeting of the branch at which Branch-Chairman Dean J. N. Finlayson presided. Unfortunately, at this stage, President Hogg was forced to change his plans and return to Toronto, without going on to Victoria. However, the balance of the party visited the island and participated in a very enjoyable dinner meeting on Tuesday night, with Branch-Chairman E. W. Izard in the chair.

From Victoria the group returned to Vancouver, and were the guests of the Council of the Association of Professional Engineers of British Columbia at lunch on Wednesday, under the chairmanship of Frank MacNeill, the recently elected president. This gesture of hospitality was greatly appreciated by the Institute representatives, and was the last event of a very crowded programme.

Previous to going to Winnipeg, Councillor Vance and the general secretary visited the Lakehead Branch on Tuesday, the tenth, having luncheon in Fort William with the executive, and dinner in Port Arthur with the branch, Branch-Chairman H. G. O'Leary presiding over both functions. An interesting feature of the visit was a trip through the local aeroplane factory under the competent guidance of Elizabeth MacGill.

It was the opinion of the president's party that the affairs of the Institute in the west are in excellent condition. The activities of most branches throughout the year were greater than they have been for some time. Branch officers expressed themselves as feeling that the Institute was gathering momentum, and that the future held for it even greater things than have been disclosed in the past. Certainly, the enthusiasm expressed on all occasions was encouraging.

It would be a great thing if more members could become familiar with branches other than their own. A trip such as this is a revelation. It gives one a new grasp of the significance of the Institute, and a greater appreciation of its possibilities for the future. In every city the leading engineers are found guiding or supporting the affairs of the branch. Such interest and such loyalty are indeed sources of satisfaction and of inspiration to everyone. It is to be hoped that future presidents will be able to continue the well established and happy practice of visiting branches during their term of office. The value of such visits cannot be overestimated.

Details of the functions held at the various branches during the presidential tour will eventually be published in the News of Branches section.

NEW LIBRARY AND AUDITORIUM HALL FOR THE ECOLE POLYTECHNIQUE

The Ecole Polytechnique of Montreal is now completing another addition to its existing buildings. This new construction, five stories in height and covering a ground area of 5,200 sq. ft., will house a new laboratory for the chemical engineering course, a library of applied sciences, and an auditorium hall of a seating capacity of 360. The building is entirely fireproof, being a reinforced concrete structure with stone and brick walls. It was built primarily to answer the necessity of providing more adequate library facilities for the students, and the layout was conditioned by that fact and also by the restricted size of the plot of ground available. In the plan finally adopted, the laboratory occupies the basement floor, the library stack is arranged on the next three floors, with a general reading room occupying the full height of the three floors, and the hall is on the top floor. This arrangement was chosen for convenience of access to the library by the students. It was considered that the hall, being intended for infrequent uses only, ground floor entrance was not as important a factor as for the library, which is in constant use by the students and the alumni.

The library has now in its stack 32,000 volumes and 500 periodicals, besides hundreds of bulletins, catalogues and reports of various nature, and is one of the most complete in engineering and applied sciences. The stack has a capacity of 60,000 volumes and should answer the needs of the School for some years to come.

The official opening will take place as soon as the installation of the equipment and furniture has been completed, which should be towards the end of January.

CALVIN W. RICE MEMORIAL

One of the features of the recent Annual Meeting of the American Society of Mechanical Engineers was the unveiling of a bronze tablet to commemorate the character and work of Calvin Rice, who for twenty-eight years was secretary of the Society.

From *Mechanical Engineering* for January the following paragraphs have been extracted.

"On Monday noon, in the lobby of the Engineering Societies Building, a tablet to Calvin W. Rice, former secretary, 1906-1934, that had been hanging in the Society rooms for several years, was unveiled by Secretary Davies and formally dedicated. Henry A. Lardner, Fellow A.S.M.E. and president, United Engineering Trustees, Inc., the agency which handles the affairs of the Engineering Societies Library, and the Engineering Foundation, presided. He explained that the rules of the Trustees made it necessary for five years to elapse between the death of a person and the placing of a memorial to him in the public rooms of the building. It was most appropriate, he said, that a tablet to Mr. Rice should hang in the lobby of the building which the former secretary had been so influential in securing as a home for the engineering societies and their combined libraries. He then introduced Charles F. Scott, member A.S.M.E., who had been a member with Rice of the building committee and who had gone with Rice to solicit the interest and aid of Andrew Carnegie, donor of the building. Mr. Scott said: It is fitting that the tablet to Calvin Rice should be placed here, where 'If you seek his monument, look about you.' Across the lobby are the Carnegie letter of gift and the acknowledgment of the funds the societies raised for the land. In both Rice played a leading part."

"The building we see, but we sense something here we cannot see. Engineering Societies Building is more than a structure; the societies animate it with a professional spirit and vigorous life; it is an institution with hundreds of active groups—technical and general—national and local. And in all this Rice was at the forefront; even before the building project he was chairman of the first committee for establishing local sections and student branches.

"Rice became secretary of the mechanical engineers in 1906; just before the building was dedicated. He came with a wide experience in industry, in engineering, and with men; it ranged from Lynn to Anaconda including Schenectady and Pittsburgh and New York. He saw our modern industrial life from many angles. He had human understanding. He saw what engineering societies were doing and he visioned what they might do for their own members and for the nation, and also in world-wide co-operation. Anticipating the motto now on the Society's Fifty-Year Medal, 'What is Not Yet, May Be,' he acted.

"An old-time member likens the Society to a narrow-gauge, single-track road—a technical society—until Rice came. He expanded it into a standard-gauge modernized system, covering a wide area. He pioneered lines into fields of industrial relations, of economics, of social welfare. He installed interconnections with other branches of the profession. He visited England and Europe and South America, fostering intercourse and understanding among engineers.

He humanized engineering and he broadened and dignified its function in our modern life.

"The great engineering capability of Calvin Rice lay in his understanding of the role engineers and engineering should play in our modern advancing civilization. A stranger marveled that his list of honours, many of them foreign, record in 'Who's Who in Engineering,' should have come to an engineer with no great technical achievements; his achievement was the adjustment and co-ordination of engineering to life."

Following Mr. Scott's address, Mr. Lardner introduced C. E. Davies, Mr. Rice's successor as secretary of The American Society of Mechanical Engineers, who unveiled the tablet. Mr. Lardner then read the inscription on the tablet.

MEETING OF COUNCIL

Minutes of a regional meeting of the Council of the Institute held at the Palliser Hotel, Calgary, Alberta, on Saturday, December 14th, 1940, at nine-thirty a.m.

The president expressed the pleasure that it gave him to preside at a Council meeting in Calgary, and invited all guests to participate in the discussions.

The general secretary read the following resolution from the Lakehead Branch: "Resolved that the Lakehead Branch regrets the action taken by the Council at the Montreal meeting on June 15th, 1940, in respect to the Unemployed Insurance Bill, and suggests that action of this importance should only be taken after consulting the general members."

He explained that he and Mr. Vance had visited the Lakehead Branch on Tuesday, December 10th, and that at a meeting of the executive this matter had been discussed in detail. It was the opinion of the Lakehead executive that representations made to the government by business bodies that some time should be given to study the proposed insurance legislation was designed principally with the object of delaying the enactment of the legislation. The executive thought that Council had lent itself to a scheme to defeat unemployment insurance.

After a short discussion it was unanimously agreed that Council was quite within its proper field in taking an interest in such matters as unemployment insurance, and that it was not thought the organizations which had asked for time to study the legislation had in mind anything but the best interests of the whole proposal. The secretary was instructed to inform the Lakehead Branch that while Council appreciated the interest they took in all matters involving the Institute, Council did not see that in this particular instance anything had been done but what could be thoroughly approved in the light of the full information.

The president called for nominations for the Institute's two representatives on the joint finance committee to be established under the provisions of the Alberta co-operative agreement. Five names were submitted and balloted upon, the results showing that Messrs. B. L. Thorne, of Calgary, and J. T. Watson, of Lethbridge, were elected.

The secretary read a statement of results in Nova Scotia, which showed that of the ninety-four members of the Association who were not members of the Institute at the time of the signing of the agreement, seventy had since made application. Nine persons who had become members of the Association since the signing of the agreement had also joined the Institute.

The secretary reported on a meeting of the joint committee in Winnipeg which took place three days earlier, to which he had been invited. He explained that complete agreement had been reached on all clauses of a proposed agreement, and that it was expected the committee would prepare a final draft for submission to the Council of the Association and the Council of the Institute within a short time.

Past-President Lefebvre, as a member of the Institute's Committee on Professional Interests, outlined the developments in New Brunswick. He explained that a draft agreement had been drawn up and that there had been considerable discussions by correspondence, but he believed that within a short time an arrangement would be arrived at that would be perfectly acceptable to both organizations.

Past-President Lefebvre also dealt with the situation in Quebec, explaining that while very little action had been taken towards arriving at a written agreement, the very best of relationships existed between the Institute and the Corporation.

The general secretary read a letter from the Associate Minister of National Defence, C. G. Power, which was written in reply to the Council's letter complaining that unfair treatment was being accorded engineers in the Ordnance Department. The letter acknowledged the correctness of the claim, and stated that some reorganization was contemplated, but would be withheld until a report was received from Brigadier Carr, who was now in England and who was to investigate the British regulations before he returned. The letter also expressed appreciation of the Institute's interest and offered assurance that the Institute would be kept informed of any changes that were made. It was agreed that the Institute should communicate with certain of its members now in England with the object of having them get in touch with Brigadier Carr in order to emphasize the importance of obtaining complete information on the British regulations. This matter was left in the hands of the president and the general secretary.

A letter was read from one of the councillors in which attention was called to the small wages paid to engineers employed by the government on war work, with particular reference to airport construction. The general secretary stated that upon receipt of this communication, he had discussed the question with certain officials of the Department at Ottawa, and had been informed that the classifications were set by the Civil Service, and the rates of pay accordingly were governed by that scale. Unfortunately, Civil Service rates of pay were based on the assumption that the employee had a permanent position leading to a pension. These conditions did not apply to construction men on war work, but nevertheless it had not been possible to get the Civil Service to change their regulations.

After considerable discussion it was decided that Council should discuss the situation with some of the officers at Ottawa, to see if it would not be possible to have this work so arranged that it would not be controlled by Civil Service classifications. Finally, it was agreed that the matter be left with the president and the general secretary to investigate at Ottawa.

The secretary read a letter from the Institution of Mechanical Engineers stating that the James Watt Medal, which had been awarded to Professor Stodola, of Switzerland, was to be presented in London at a special ceremony, and asking the Engineering Institute of Canada to name a representative to attend. It was agreed that either General McNaughton or Sir Alexander Gibb be asked to do this honour for the Institute.

The Finance Committee recommended that each of the branches be given an opportunity to assist in meeting the costs of underpinning the Headquarters building. Their idea was that if every branch would accept a quota based on a rate of $1.00 for each corporate member and Junior in the branch it would raise a very substantial sum of money which would assist materially in meeting this unforeseen but necessary expense. The entire effort was to be on a voluntary basis, and the method by which the branches approached their members was to be left entirely to each individual branch. This recommendation was approved by Council, and the President agreed to write a letter direct to the chairman of each branch, outlining the proposal and asking for the co-operation of the branch.

Past-President Lefebvre, a member of the Provisional Committee for the Julian C. Smith Medal, presented on behalf of the committee, the names of eight members of the Institute to whom the committee desired the Julian C. Smith Medal to be awarded. While it was intended to restrict awards to one or two a year, the committee thought it desirable to make a multiple award in the inaugural year.

Dr. Lefebvre gave a short citation for each of the nominees outlining the manner in which he had rendered distinguished service in furthering the development of Canada. The names will be announced publically at the Annual Meeting.

It was unanimously agreed that members of the Dominion Council of Professional Engineers be invited to attend the annual meeting and Council meeting of the Institute to be held in February in Hamilton. It was also hoped that the Dominion Council would be able to arrange its annual meeting either immediately before or immediately after the Institute's annual meeting so that those in attendance would be able to participate in the Institute's activities. Mr. D. A. R. McCannel, president of the Dominion Council, thanked the president for the invitation, and said that he hoped it would be possible for many of the Dominion Councillors to accept.

The general secretary outlined an exchange of correspondence which had taken place between the Commissioner of Income Tax and himself relative to the wording of the brochure issued by the government describing exemptions to the income tax. This brochure listed five groups, the first one being headed "Learned Professions," which did not include the engineers.

It was explained that a change in classification would not in any way affect the amount of income tax, but would tend to wipe out some of the old-time impression that engineering was not a skilled profession. On the motion of Mr. McLeod, seconded by Mr. Sauder, it was unanimously agreed that the secretary again communicate with the Commissioner of Income Tax, requesting that engineering be included in the learned professions.

In accordance with established practice, it was unanimously Resolved that a Student membership for one year together with a free subscription to the "Engineering Journal," be awarded to the four students who had presented papers at the Annual Student Night of the Montreal Branch, held on November 21st.

A number of applications were considered, and the following elections and transfers were effected:

Elections	
Members	6
Juniors	4
Affiliates	1
Students admitted	26
Transfers	
Junior to Member	7
Student to Member	3
Students to Junior	17

Councillor Robertson said that on behalf of the Vancouver Branch he wanted to express appreciation of Council's policy of holding meetings away from Montreal. He thought that from the point of view of local branches, the value of such meetings could not be over-estimated. He hoped that Council would continue the practice in the future.

It was decided that the next meeting of Council would be held in Montreal on Saturday, January 18th, 1941.

The Council rose at one o'clock p.m.

ASSOCIATION OF PROFESSIONAL ENGINEERS OF ONTARIO

1941 Council

The Nominating Committee appointed to make nominations for the 1941 Council of the Association of Professional Engineers of the Province of Ontario, made the following nominations. Inasmuch as there were just sufficient nominations made to fill the vacancies, and since no other nominations were received the following will constitute the Council for 1941.

S. R. Frost, M.E.I.C.

President: S. R. Frost, M.E.I.C., Sales Director, North American Cyanamid Ltd., Toronto.

Vice-President: W. C. Miller, B.Sc., M.E.I.C., City Engineer, St. Thomas.

Past-President: J. W. Rawlins, B.A., B.Sc., 27 Ava Road, Toronto.

Councillors:

Civil Branch: W. E. P. Duncan, B.Sc., M.E.I.C., General Superintendent, Toronto Transportation Commission, Toronto; J. Clark Keith, B.A.Sc., M.E.I.C., General Manager, Windsor Utilities Commission, Windsor; J. L. Lang, B.A.Sc., M.E.I.C., Lang & Ross, Engineers and Contractors, Sault Ste. Marie.

Chemical Branch: R. M. Coleman, Smelter Superintendent, International Nickel Co., Copper Cliff; R. A. Elliott, B.Sc., General Manager, Deloro Smelting and Refining Co. Ltd., Deloro; E. T. Sterne, B.Sc., Manager, G. F. Sterne & Sons, Brantford.

Electrical Branch: H. A. Cooch, B.A.Sc., M.E.I.C., Vice-President, Canadian Westinghouse Co., Hamilton; J. H. MacTavish, M.B.E., M.C., B.A.Sc., Secretary, Toronto Electric Commissioners, Toronto; Com. C. P. Edwards, M.E.I.C., O.B.E., Chief of Air Services, Dept. of Transport, Ottawa.

Mechanical Branch: C. C. Cariss, M.E.I.C., Chief-Engineer, Waterous Ltd., Brantford; L. T. Rutledge, B.A.Sc., M.E., M.E.I.C., Associate Professor of Mechanical Engineering, Queen's University, Kingston; K. R. Rybka, M.E., D.Sc., M.E.I.C., Associate W. J. Armstrong, Consulting Engineer, Toronto.

Mining Branch: J. M. Carter, B.A.Sc., Mill Superintendent, Omega Gold Mines Ltd., Larder Lake; C. H. Hitchcock, E.M., B.S., Vice-President, Smith & Travers Co. Ltd., Toronto; D. G. Sinclair, B.A.Sc., Assistant Deputy Minister of the Department of Mines, Toronto.

Stanley R. Frost, M.E.I.C., Sales Director of the North American Cyanamid Ltd., the new president of the Association of Professional Engineers of the Province of Ontario, will assume office at the general meeting of the association, which is being held at the Royal York Hotel, Toronto, on January 18th, 1941.

Mr. Frost has taken an active interest in the affairs of the Association, of which he has been a member since 1923. He served as representative of the Mechanical Branch on Council for the years 1935, 1936 and 1937, during which time he was chairman of the Publicity Committee. For the past year, he has been vice-president and chairman of the Finance Committee.

In his early career he was engaged in the manufacture of iron and steel, Portland cement and similar industries in Canada and United States. For the past twenty years, he has been on the staff of the North American Cyanamid Ltd., with plants in Niagara Falls and Ingersoll.

Not only does Mr. Frost typify the engineer in industry, but he is an example of the engineer active in public service. While resident in Niagara Falls, he served on the aldermanic board of that city for several years and was an active member of the Town Planning Commission and the Chamber of Commerce. He was appointed to the Board of Water Commissioners and was chairman of the Board during the construction of the Niagara Falls filtration plant. On moving to Toronto a few years ago, he became an active member of the Engineering Branch of the Toronto Board of Trade and is now branch vice-chairman. He was recently appointed a member of the Zoning Commission of the City of Toronto and when the Committee for the Stimulation of Employment was formed at the instance of Dr. F. J. Conboy, he was appointed to the Farm Placement Committee.

Mr. Frost is a member of the Canadian Society of Technical Agriculturists, the Engineering Institute of Canada, and other engineering societies.

ELECTIONS AND TRANSFERS

At the meeting of Council held on December 14th, 1940, the following elections and transfers were effected:

Members

Blowey, John Frederick Gill, Bach. Mech. Engrg. (Detroit Inst. of Tech.), supervisor of trade school, Ford Motor Co. of Canada, Windsor, Ont.

Kelly, Joseph John, B.A.Sc. (E.E.), (Univ. of Toronto), mgr., Hamilton District Office, Lincoln Electric Co. of Canada, Ltd. Hamilton, Ont.

Laughton, James Alexander, B.Sc. (Civil), (Univ. of Man.), welding engr., shop supt., Hamilton Bridge Co. Ltd., Hamilton, Ont.

McGorman, Donald, B.A.Sc. (Mech.), (Univ. of Toronto), supt., Schultz Die Casting Co., Wallaceburg, Ont.

Robinson, Richard Henry, B.Sc. (Civil), (Univ. of Man.), sales engr., Vulcan Iron Works Ltd., Winnipeg, Man.

Simard, Joseph W., B.A.Sc., C.E., (Ecole Polytechnique, Montreal), International Water Supply Limited, Montreal, Que.

Juniors

Campbell, Noel, B.Eng. (Mech.), (McGill Univ.), engrg. dept., Ford Motor Co. of Canada, Windsor, Ont.

Dugal, Fernand, B.Eng. (Mech.), (McGill Univ.), purchasing dept., Canadian Associated Aircraft Ltd., Montreal, Que.

Glance, Earl Irvine, B.Sc. (Elec.), (Univ. of Man.), elec. engr., T. Pringle & Son, Montreal, Que.

Affiliate

Spall, Edward Arthur George, mgr., Penn Electric Switch Divn. Powerlite Device Ltd., Toronto, Ont.

Transferred from the class of Junior to that of Member

Akerley, William Burpee, Lieut., R.C.E., B.Sc. (Civil), (Univ. of N.B.), Works Officer, Dept. of National Defence, Saint John, N.B.

Climo, Percy Lloyd, B.Sc. (Queen's Univ.), mech. engr., Gaspesia Sulphite Co. Ltd., Chandler, Que.

Lochhead, Kenneth Young, B.Eng. (McGill Univ.), bldg. supt., Hudson's Bay Company, Vancouver, B.C.

Minard, Guy McRae, B.Sc. (Queen's Univ.), Pilot Officer, R.C.A.F., Aero-Engineering School, Montreal, Que.

Patriquen, Frank Andrew, B.Sc. (Elec. & Civil), (Univ. of N.B.), junior engr., Dept. of Public Works Canada, Fairville, N.B.

Stratton, William Donald George, B.Sc. (Civil), (Univ. of N.B.). res.engr., Civil Aviation Br., Dept. of Transport, Saint John, N.B.

Wheatley, Eric Edmund, B.Sc. (McGill Univ.), asst. to divn. engr., Laurentide Divn., Cons. Paper Corpn. Ltd., Grand'Mere, Que.

Transferred from the class of Student to that of Member

French, Philip Bemis, B.Eng. (McGill Univ.), sales engr., Canadian SKF Limited, Montreal, Que.

Mayhew, Earle Chandler, B.Sc. (Queen's Univ.), Deputy Chief Inspector of Armaments (G), Department of National Defence, Ottawa, Ont.

Plamondon, Sarto, B.A.Sc., C.E. (Ecole Polytechnique, Montreal), asst. sanitary engr., Ministry of Health, Amos, Que.

Transferred from the class of Student to that of Junior

Brannen, Edwin Ralph, B.Sc. (Elec.), (Univ. of N.B.), chief inspr., Canadian Johns-Manville Co. Ltd., Asbestos, Que.

Cartier, Léonard, B.A.Sc., C.E. (Ecole Polytechnique, Montreal), lab. asst., hydraulic laboratory, Ecole Polytechnique, Montreal, Que.

Demcoe, John William, B.Sc. (Civil), (Univ. of Man.), asst. divnl. engr., C.N.R., Toronto, Ont.

Desjardins, Roger, B.A.Sc., C.E. (Ecole Polytechnique, Montreal), engr., Provincial Public Service Board, Quebec, Que.

Ford, John Franklin, B.A.Sc. (Univ. of Toronto), job engr., Russel Constrn. Co., Toronto, Ont.

Gershfield, Max, B.Sc. (Elec.), (Univ. of Man.), asst. supt., Radio Oil Refineries, Winnipeg, Man.

Gervais, Aimé, B.A.Sc., C.E. (Ecole Polytechnique, Montreal), technical secretary, Public Service Board, Montreal, Que.

Hertel, Alfred Frederick, B.Sc. (Civil), (Queen's Univ.), junior engr., Dept. of Public Works Canada, London, Ont.

Hewitt, Herbert Eugene, B.Sc. (Civil), (Univ. of Alta.), engr., Sudbury Hydro-Electric Commission, Sudbury, Ont.

Hurtubise, Jacques Edouard, B.A.Sc., C.E. (Ecole Polytechnique, Montreal), i/c testing materials lab., Ecole Polytechnique, Montreal, Que.

LeBel, Raymond, B.A.Sc., C.E. (Ecole Polytechnique, Montreal), engr., J. M. Eug. Guay Inc., consltg. engrs., Montreal, Que.

MacKay, Norman Allison, B.Eng. (Mech.), (McGill Univ.), lubrication engr., Dominion Steel & Coal Corporation, Sydney, N.S.

Peters, James Horsfield, B.Sc. (Chem.), (Univ. of N.B.), shift supervisor, Defence Industries Limited, Brownsburg, Que.

Pope, Francis Robert, B.Eng. (Mech.), (McGill Univ.), asst. supt., Western Clock Co. Ltd., Peterborough, Ont.

Sanders, George Ostrom, B.Sc. (Queen's Univ.), mtce. engr., Howard Smith Paper Mills Ltd., Cornwall, Ont.

Sawle, Ross Tregerthen, B.Sc. (Queen's) M.A.Sc. (Univ. of Toronto), design engr., English Electric Co. of Canada Ltd., St. Catharines, Ont.

Whitehouse, Ralph John, B.Eng., (McGill Univ.), machine shop progress clerk, Cons. Mining & Smelting Co. Ltd., Trail, B.C.

Students Admitted

Archambault, Jean (Ecole Polytechnique), 289 de l'Epée St., Outremont, Que.

Freeman, Rex Morton (McGill Univ.), 1535 St. Mark St., Montreal, Que.

Freeman, Paul Ora (McGill Univ.), 131 Percival Ave., Montreal West, Que.

Gauthier, Raymond Claude (Univ. of Man.), 554½ DesMeurons St., St. Boniface, Man.

Galvas, Edward Henry (Univ. of Sask.), 274 Colony St., Winnipeg, Man.

Guy, Ross Thomas (Queen's Univ.), 303 University Ave., Kingston, Ont.

Haun, Glen Robert, B.Sc. (Civil), (Univ. of Alta.), 2322 Carleton St., Calgary, Alta.

Hodgson, Ronald H. (McGill Univ.), 1227 Sherbrooke St. West, Montreal, Que.

Kelly, James Oswald (McGill Univ.), 4109 Northcliffe Ave., Montreal, Que.

Kennedy, Lowell Keith (McGill Univ.), 3507 University St., Montreal, Que.

Keyfitz, Irving Mortimer (McGill Univ.), 3454 Addington Ave., Montreal, Que.

Koropatnick, Peter, (Univ. of Man.), 75 Edmonton St., Winnipeg, Man.

Lafond, R. Olier, (Ecole Polytechnique), 3646 St. Denis St., Montreal, Que.

Miller, Zavie (McGill Univ.), 673 de l'Epée Ave., Outremont, Que.

Morris, Robert McCoul, B.Eng. (Elec.), (N.S. Tech. Coll.), 548 Prince Arthur St. West, Montreal, Que.

Morse, Clifford Eric (McGill Univ.), 3437 Harvard Ave., Montreal, Que.

Olafson, Harold Sigmar (Univ. of Man.), Riverton, Man.

Parker, William Alfred, B.A.Sc. (Univ. of B.C.), 516 Charlotte St., Peterborough, Ont.

Russell, Gordon Douglas (McGill Univ.), 2358 Grand Blvd., Montreal, Que.

Sheinberg, Sydney (McGill Univ.), 4362 Laval Ave., Montreal, Que.

Smith, Harold Pennell (Univ. of Toronto), Newtonbrook, Ont.

Wilson, John Howard (McGill Univ.), Hudson Heights, Que.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

Past President E. A. Cleveland, M.E.I.C., has seen his term of office extended as chief commissioner of the Greater Vancouver Water District and chairman of the Vancouver and District Joint Sewage and Drainage Board, although the law required him to retire. Commenting on the special measure passed to this effect by the British Columbia Legislature, the *Vancouver Daily Times* writes: "The eminent engineer is entitiled to retirement; and the provincial House decided that he is too valuable a man to exchange the exactions of his highly-important and responsible position for the serenity and satisfaction one associates with life on a comfortable pension; Dr. Cleveland will carry on. From one day long ago, when he and some Danish settlers almost starved to death on Vancouver Island, and on down the years, his life has been strenuous. To add anything to the act of the Legislature and what it symbolizes would be to gild the lily."

A. W. Whitaker, M.E.I.C., was recently appointed general manager of the Aluminum Company of Canada, Limited. A graduate in chemical engineering from the University of Pennsylvania, he joined the company in July, 1913, as a research engineer. In 1926, he became superintendent of the newly built carbon plant at Arvida, Que., and in 1928 was made superintendent of the Arvida ore plant. In 1930, Mr. Whitaker became manager of the Arvida works, which post he held until 1939 when he was appointed chief engineer of the company. He will combine his new duties with those of chief engineer.

R. J. Durley, M.E.I.C., secretary emeritus of the Institute, has been elected as a member of council of the Institution of Civil Engineers of Great Britain and is chairman of the Canadian Advisory Committee of the Institution.

A. J. T. Taylor, M.E.I.C., chairman of British Pacific Securities Limited, and formerly president and chief engineer of the First Narrows Bridge Company, Vancouver, is now with the British Air Commission in Washington, D.C., as deputy to Mr. Morris Wilson, president of the Royal Bank of Canada, Montreal, who represents in North America Lord Beaverbrook, the head of the British Ministry of Aircraft Production. Mr. Taylor joined Mr. Wilson last June in New York, and has lately been transferred to Washington.

Lieut.-Col. J. L. Melville, M.E.I.C., is in command of the Corps Troops Engineer Units, designated C.R.E. Corps Troops, with the Army Corps commanded by Lt.-Gen. A. G. L. McNaughton in England. Colonel Melville resigned his position as commissioner on the War Veterans Allowance Board in the Federal Department of Pensions and National Health last spring to command the 1st Canadian Pioneer Battalion, Royal Canadian Engineers, C.A.S.F.

W. G. Mitchell, M.E.I.C., who has been associated during the past year with the Department of Munitions and Supply in Ottawa, has recently returned to Montreal to assume an executive position with Allied War Supplies Corporation in the same connection. Following graduation from McGill University (M.Sc., 1914), Mr. Mitchell spent some years abroad, engaged on various technical and economic investigations and, on his return to Canada in 1921 joined the staff of Price Brothers & Co., Limited, as assistant to the president. Admitted to the Institute as a Member in 1920, he became the first chairman of the newly established Saguenay Branch in 1923, serving in that capacity for two years. Later (1927-1931) he served for four years as Institute vice-president for Zone C. Terminating his connection with Price Brothers & Co., Limited, in 1932, he spent some three years engaged in private practice, principally in the southern United States. Returning to Canada in 1935, Mr. Mitchell acted for some two years as technical adviser to the Canadian Pulp and Paper Association, principally in relation to the re-organization of policy of the Pulp and Paper Research Institute in Montreal. In 1937, he established headquarters for a consulting practice in Montreal and since early in the present year has been engaged in connection with the national defence and war procurement programme.

W. R. Smith, M.E.I.C., who for the past sixteen years had been assistant county engineer of Middlesex County, Ont., has been appointed county engineer to succeed **Charles Talbot,** M.E.I.C., who is retiring after a long service in this capacity.

A. T. Hurter, M.E.I.C., has accepted a position as project engineer with Defence Industries Limited in Montreal. Lately he was representative at Red Rock, Ont., of the receiver and general manager of Lake Sulphite Pulp Company Limited. He had previously been engineer in charge of construction and assistant manager of the company.

W. M. Harvey, M.E.I.C., has joined the staff of Rhokana Copper Corporation at Nkana, Northern Rhodesia. Mr. Harvey, who is a Queen's graduate in mechanical engineering, had been for the past eight years with Noranda Mines Limited at Noranda, Que. He was previously connected with the Wabi Iron Works Limited of New Liskeard, Ont.

W. G. Mitchell, M.E.I.C.

A. J. T. Taylor, M.E.I.C.

A. W. Whitaker, M.E.I.C.

T. W. Lazenby, M.E.I.C., is now employed as a mechanical draftsman with the Consolidated Mining and Smelting Company at Trail, B.C.

M. L. Walker, M.E.I.C., has been commissioned with the rank of flying officer in the engineering branch of the R.C.A.F. and is now posted at Yarmouth, N.S., as technical officer. He was previously with the Imperial Oil Limited at Sarnia, Ont.

R. W. Angus, Hon.M.E.I.C. (left), receives congratulations from W. H. McBryde, retiring president of the American Society of Mechanical Engineers, after having been presented with an honorary membership certificate at the annual meeting of the Society, last December, in New York.

A. H. Cole, Jr.E.I.C., has joined the staff of the Canadian Car & Foundry Company Limited at Montreal. Since his graduation from McGill University in 1936 he had been with the D. W. Ogilvie and Company Inc., in Montreal.

A. W. Howard, S.E.I.C., has been transferred from Calgary to Montreal and is now employed with the Montreal Engineering Company Limited. Since his graduation from the University of Toronto in 1935 he had been with the Calgary Power Company, Calgary, Alta.

A. J. Ring, S.E.I.C., is on the staff of Defence Industries Limited in Montreal. He was graduated in civil engineering from the University of New Brunswick last spring.

G. L. Archambault, S.E.I.C., is a sales and maintenance engineer with the Minneapolis-Honeywell Regulator Company at Montreal. He was graduated in mechanical engineering from McGill University in 1939.

A. A. Buchanan, S.E.I.C., is now a pilot officer in the R.C.A.F. and is following a course at the aeronautical engineering school in Montreal. He is a graduate in mechanical engineering from the class of 1939 at McGill University.

R. Eastwood, S.E.I.C., is with the Consolidated Paper Corporation at Grand'Mere, Que. He was graduated in mechanical engineering from McGill in 1939.

F. Dugal, Jr.E.I.C., is now assistant to the purchasing agent with Canadian Associated Aircraft Limited at Montreal. Upon his graduation in mechanical engineering from McGill University in 1939 he went with the Department of National Defence as aircraft inspector. He also worked for a few months with Defence Industries Limited in Montreal.

D. H. Ferguson, S.E.I.C., is located at Shawinigan Falls, Que., with the Aluminum Company of Canada Limited. He was graduated in mechanical engineering from McGill University in 1939.

R. N. Ferguson, S.E.I.C., is on the staff of International Foils Limited, Cap-de-la-Madeleine, Que., as assistant engineer. He is a graduate of the 1939 class in mechanical engineering from McGill University.

R. H. Garrett, S.E.I.C., is training with the R.C.A.F. at Regina, Sask. Upon his graduation in mechanical engineering from McGill University in 1939 he went with the Mackenzie River Transport Company, at Edmonton, Alta.

R. E. Gohier, S.E.I.C., is a metallurgical engineer with Sorel Industries Limited at Sorel, Que. Upon graduation in mechanical engineering from McGill in 1939 he went with the International Foils Limited, at Cap-de-la-Madeleine, Que., a position which he left last month to accept his new appointment.

J. Hall, S.E.I.C., a graduate in chemical engineering from the class of 1939 at McGill, is with Shell Oil Company of Canada Limited at Montreal East, Que.

J. G. Langley, S.E.I.C., is with Canadian General Electric Company at Peterborough, Ont. He was graduated in electrical engineering from McGill University in 1939.

W. H. McGowan, S.E.I.C., an electrical engineering graduate from the class of 1939, McGill University, is with the Bell Telephone Company of Canada Limited in Montreal.

A. Mendelsohn, S.E.I.C., who was graduated in mechanical engineering from McGill in 1939 is now on active service and is located at Kingston, Ont.

S. Nathanson, S.E.I.C., is aircraft examiner with the British Air Commission at Montreal. He was graduated in civil engineering from McGill University in 1939.

H. C. Oatway, S.E.I.C., who was graduated in mechanical engineering from McGill University in 1939 is acting as temporary instructor at the University.

H. F. Staniforth, S.E.I.C., has joined the Royal Canadian Air Force as a pilot officer and is, at present, following a course in aeronautical engineering at Montreal. He was graduated in mechanical engineering from McGill in 1939.

Eric Tait, S.E.I.C., is with the Shawinigan Engineering Company Limited at Montreal. He was graduated in civil engineering from McGill in 1939.

W. J. Tanner, S.E.I.C., a chemical engineering graduate from the class of 1939 at McGill, is now with the Aluminum Company of Canada Limited at Shawinigan Falls, Que. Upon graduation he went for a few months with General Foods Limited at Montreal.

VISITORS TO HEADQUARTERS

Alfredo Medina, contractor, from Merida, Yucatan, Mexico, on November 26th.

R. L. Dunsmore, M.E.I.C., superintendent, Halifax refinery, Imperial Oil Limited, from Dartmouth, N.S., on December 3rd.

Past President Dr. Charles Camsell, C.M.G., M.E.I.C., Deputy Minister, Department of Mines and Resources, from Ottawa, Ont., on December 6th.

Major W. B. Redman, M.E.I.C., assistant engineer, Canadian National Railways, from Toronto, Ont., on December 18th.

Geoffrey Stead, M.E.I.C., from Saint John, N.B., on December 23rd.

Arsène Babin, M.E.I.C., resident engineer on construction, Quebec North Shore Paper Company, from Baie Comeau, Que., on December 24th.

L. P. Cousineau, M.E.I.C., assistant resident engineer, Quebec Streams Commission, Rapid No. 7, Ottawa River, from Cadillac, Que., on December 24th.

P. W. Greene, M.E.I.C., from New York on December 27th.

Capt. V. R. Davies, M.E.I.C., Royal Military College, from Kingston, Ont., on December 28th.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

John Kershaw Ashworth, M.E.I.C., died suddenly in the hospital at Montreal on December 16th, 1940. He was born in Hebdon Bridge, Yorkshire, England, on October 18th, 1885. He was educated at Halifax (England) Technical College and Manchester University. He came to Canada in 1911 for the firm of Hans Renold Limited of Manchester, England. Later he was engaged with the Coventry Chain Company Limited. From 1914 to 1916 he was in active service overseas, and upon returning from France in 1916 he became engaged in shell production with the Steel Company of Canada at Montreal. From 1920 to 1925 he was designing and sales engineer with Jones & Glassco Registered for the Coventry Chain Company Limited of Coventry, England. In 1927 he became manager of the Coventry Company Registered at Montreal. In 1933 he was appointed manager of R. & M. Bearings Canada Limited in Montreal. Until last April he was vice-president of the Company.

Mr. Ashworth joined the Institute as an Associate Member in 1925.

William Bell Cartmel, M.E.I.C., died at Montreal, on December 5th, 1940, after a long illness. He was born at Liverpool, England, on January 4th, 1872. He received his Bachelor of Science degree from the Case School of Applied Science of Cleveland, Ohio, in 1900, and two years later he obtained the degree of Master of Arts from the University of Nebraska. During the years 1902 and 1903 he was laboratory assistant in the Bureau of Standards at Washington. From 1903 to 1905 he was instructor in physics at Cincinnati University, and in 1906 to 1907 he was a Whiting Fellowship student in physics at Harvard University. From 1907 to 1911 Mr. Cartmel was professor of physics and electrical engineering at the University of New Brunswick. In 1911 he joined the Northern Electric Company at Montreal, and in 1915 he became in charge of the transmission division. In 1933 he was president of the W. B. Cartmel and Son Limited, electrical engineers and contractors of Montreal. For the past three years he had been a research associate at the University of Montreal.

Mr. Cartmel joined the Institute as a Member in 1922.

Valentine Irving Smart, M.E.I.C., died suddenly at his home in Ottawa on December 2nd, 1940. He was born at Brockville, Ont., on February 14th, 1875, and he was educated at Upper Canada College and Queen's University, Kingston, where he was graduated in 1887 as a Bachelor of Arts. He joined the Federal Government service in 1897 as a surveyor. From 1902 to 1907 he served as assistant manager, signal engineer and engineer of maintenance of way with the Chicago and Eastern Illinois Railway of Chicago. From 1907 until 1914 Colonel Smart was professor of railway engineering at McGill University. Later he became engaged with the General Railway Signal Company of Canada Limited of Montreal of which he was vice-president and general manager. For some time he also was a partner in the firm of Smart and Burnett, consulting engineers of Montreal. He was consulting engineer with the Department of Railways and Canals in connection with the Grand Trunk Railway arbitration from 1920 to 1923. He joined the Canadian National Railways in 1923 as a special engineer and in 1928 he became general superintendent of transportation for the western region. In 1930 he was appointed Deputy Minister of the Department of Railways and Canals at Ottawa. In July, 1940, when the Hon. C. D. Howe became Minister of Munitions and Supply with control also over civil aviation, Col. Smart held the unique position of being deputy to two ministers. He continued his work with the Transport Department under the Hon. P. J. A. Cardin and also was retained by Mr. Howe, former Transport Minister, in the air branch of his department.

Part of Col. Smart's work with the air services was undertaking construction of 100 aerodromes in Canada for the British Commonwealth Air Training Plan. Earlier he had been responsible to a large extent for detailed preliminary work with Trans-Canada Air Lines, planning flying fields, radio facilities, and similar work.

V. I. Smart, M.E.I.C.

Col. Smart was a member of the defence co-ordination committee and served as chairman of a sub-committee on reserved occupations which dealt with decisions on keeping men valuable in civilian occupations out of the armed forces.

During the Royal visit in 1939 he was chairman of a committee in charge of transportation arrangements for Their Majesties and the Royal party.

Col. Smart joined the Institute as a Member in 1917.

COMING MEETINGS

Association of Professional Engineers of the Province of Ontario—Annual general meeting, Royal York Hotel, Toronto, January 18th. Secretary, Walter McKay, 350 Bay St., Toronto, Ont.

The Dominion Council of Professional Engineers—Annual Meeting, Royal York Hotel, Toronto, January 20th and 21st.

Canadian Electrical Association—Mid-Winter Conference, Windsor Hotel, Montreal, January 20th and 21st.

American Road Builders' Association—Annual Convention at the Pennsylvania Hotel, New York City, January 27th to 30th. Director Charles Upham, International Building, Washington, D.C.

American Institute of Electrical Engineers—Winter Convention. Philadelphia, January 27th to 31st.

The Engineering Institute of Canada—Fifty-fifth Annual General and Professional Meeting to be held at Hamilton, Ont., on February 6th and 7th.

American Institute of Mechanical Engineers—Annual Meeting, New York, Engineering Societies Building and Commodore Hotel, February 17th to 20th.

Ontario Good Roads Association—Annual Convention, Royal York Hotel, Toronto, February 26th to 27th. Secretary, T. J. Mahony, Court House, Hamilton, Ont.

Canadian Institute of Mining and Metallurgy—Annual Meeting, Montreal, March 10th to 12th.

FLASHES OF THE PRESIDENT'S WESTERN TRIP

AT LAKEHEAD—1. Three veterans, Messrs. Duncan, Armstrong and Antonisen.

2. Councillor Doncaster, Elizabeth MacGill, and Chairman O'Leary.

AT WINNIPEG—3. The executive entertains, left to right, Mr. Attwood, the President, Chairman Briggs and Past-Chairman Hurst.

4. Past-President Lefebvre speaks, with John Porter on his right and the President to his left.

AT CALGARY—5. President Hogg signs the co-operative agreement with Chairman Sauder on his left and B. L. Thorne on his right.

6. President McLean signs for the Association, with Chairman Sauder looking on.

7. D. A. R. McCannel, President of the Dominion Council.

8. Past-President S. G. Porter tells the history of the profession in the province. In the background is H. R. Webb, Registrar of the Association.

9. President Howard McLean of Calgary.

10. P. Turner Bone.

AT VANCOUVER—11. The head table with Messrs. Cleveland, Hogg, Finlayson, Lefebvre, Vance and Walkem.

12. You can recognize Wm. Smaill, H. C. Fitz-James, Perce Buchan.

13. Kirk McLeod brings greetings from Montreal.

14. Dean Finlayson is chairman of the branch.

15. Past-President E. A. Cleveland.

■

AT VICTORIA—16. Chairman of the branch E. W. Izard, with W. A. Carrothers on his right.

17. Secretary Kenneth Reid reports.

18. Past-President Lefebvre calls on C. A. Magrath, Hon. M.E.I.C.

19. James Vance brings greetings from the London branch.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

H. L. Johnston, m.e.i.c. - *Secretary-Treasurer*
A. H. Pask, Jr. e.i.c. - - *Branch News Editor*

On November 15th, 1940, the monthly meeting of the Border Cities Branch was held in the Prince Edward Hotel beginning at 6.30 p.m. with a dinner. Following a short business meeting, Mr. T. H. Jenkins introduced the speaker of the evening, Mr. M. W. Petrie of the Production Research Department of Chrysler Corporation. The subject of the address was **Superfinish and Fluid Drive.**

Superfinish originated in the attempts to improve the life of bearing races by removing the grinding fuzz with lapping. This was very effective and a machine was devised to do this work. The value for other machine parts was seen and machines were devised for them.

The speaker enumerated the different methods of finishing from turning to honing and burnishing and gave the disadvantages of each. Turning has the highest speed and the greatest actual pressure at the working point, which may be equal to hundreds of tons per square inch. The pressure creates high temperatures which are sufficient to change the character of the surface metal. The temperature and pressures are true to lessening degrees for other finishing methods as grinding, honing and burnishing. These operations create an amorphous non-crystalline layer of metal about one one-thousandth deep which is best removed by lapping.

Superfinishing is a lapping operation done with very low unit pressures and speeds, using combined and superimposed short reciprocating motions. By using three or more motions combined it is possible to produce a geometrically perfect surface. In practice five motions are used.

The metal peaks left by the sizing operation, which may have been turning, are removed by superfinishing in a few seconds. As the actual unit pressure is initially low it becomes very low when the peaks are worn down flat. The lubricant used has a definite viscosity so that when a certain abrasive area is reached the pressure is supported by the lubricant and effective work stops. Usually only .0001 or .0002 inches of metal are removed for this.

The superfinish process, by removing peaks of metal leaves a surface much more easily lubricated as the film is not broken by these points, and metal to metal contact is avoided. Bearings finished in this way may therefore be initially used with a closer fit and will operate longer as lubrication is maintained better.

The speaker also described fluid drives as applied to the modern automobile and gave its advantages in this service.

Following an interesting question period, a vote of thanks was moved by Mr. J. E. Daubney. The meeting then adjourned on the motion of Mr. C. F. Davison.

CALGARY BRANCH

P. F. Peele, m.e.i.c. - - *Secretary-Treasurer*
F. A. Brownie, m.e.i.c. - *Branch News Editor*

The November 6 meeting of the Calgary Branch was featured by an address by Mr. R. E. Allen newly appointed chairman of the Alberta Petroleum and Natural Gas Conservation Board who spoke on the general subject of **Conservation.**

Conservation was defined as the "application of measures designed to produce the greatest oil recovery in the most economical way."

Mr. Allen then proceeded to discuss the various aspects of conservation. One of the most important of these is of course reservoir pressure. Below a certain critical pressure in any field the gas tends to come out of solution in the oil leaving the oil more viscous and less capable of flowing readily through the sand to the well. The maintenance of pressures above this critical point is of course of paramount importance. That this is the case is indicated by the great interest and activity in the United States in repressuring projects which return the gas to the producing horizon after it has produced its oil.

Reference was made to the varying degrees of government control exercised by different states. In Turner Valley to-day, for instance, only one well is permitted to each 40 acres of land. In the past, in certain states, as many as three wells have been drilled under one derrick resulting in a productive life of only a few weeks.

In recent years, the acidizing of wells to increase production has become an important factor displacing the more spectacular but less efficient method of "shooting" wells with nitro-glycerine.

Mr. Allen stressed the necessity of extending the productive area of Turner Valley by new wells and of developing new fields by "wildcatting" if the present production rate is to be maintained. Future possibilities were discussed briefly if oil production in Alberta can be increased by the discovery of new reserves.

The lengthy discussion which followed indicated the great interest which Mr. Allen's subject held for Branch members.

The meeting of November 21st was unusual in that it presented four speakers, three of whom were Branch affiliates.

Mr. A. Baxter discussed the **Design of the Coal Handling Plant at Murray Collieries in East Coulee.** By means of pictures and a flow sheet the course of the coal was followed from mine head to car.

Mr. L. R. Brereton dealt with **Some Considerations in the Design of Steel Castings.** This paper indicated the benefits to be gained by having steel casting designs checked by an experienced foundryman from the point of view of such factors as ease of casting, effects of shrinkage, and composition of various elements of the casting.

A rather unusual topic was presented by Mr. C. Lattman in his paper on **Standardization of Paper Sizes in Switzerland.** Under the scheme adopted all sheets of paper are standard sizes which, no matter how large, can be reduced by folding to the size and shape of the smallest standard sheet. The advantages of this system in filing and cutting of larger sheets is obvious.

The fourth paper by the Rev. R. J. Donavan, a Branch Affiliate, discussed the importance of economics to the engineer.

The evening of December 5th was designated as annual Ladies' night by the Calgary Branch. Since members' wives were present the programme consisted of a showing of natural colour slides under the title **Colour in the West** by Mr. S. R. Vallance, who also carried on a running commentary on the slides.

The first group showed a number of very beautiful views in and near Victoria, B.C. These were followed by a series made around Banff and Lake Minnewanka. Besides showing some striking new views of the magnificent mountain scenery they illustrated a number of interesting expeditions by Mr. Vallance which he described.

This programme was followed by the serving of refreshments. The meeting was held in the Palliser Hotel and Branch Chairman James McMillan presided.

EDMONTON BRANCH

B. W. Pitfield, M.E.I.C. - *Secretary-Treasurer*
J. F. McDougall, M.E.I.C. - *Branch News Editor*

The November dinner meeting of the Edmonton Branch was held in the Macdonald Hotel on November 26th. Thirty-six members were present for dinner. After dinner, thirteen additional members joined the meeting to hear the speakers of the evening.

After a short business session, Chairman E. Nelson introduced the speakers, Professor W. E. Cornish of the Department of Electrical Engineering and Professor R. M. Hardy of the Department of Civil Engineering of the University of Alberta.

Mr. Cornish had spent the past summer in eastern Canada and he described the construction of a large industrial plant on which he was working during his stay in the East. His paper was illustrated by a number of slides and he gave a very clear description of the plant.

Mr. Hardy had recently returned to Edmonton after a year's sabbatical leave from his duties at the University. He spent this sabbatical year at Harvard University doing post graduate work in soil mechanics. He described this work in a paper entitled, **Soil Mechanics and Foundation Engineering.**

In this paper he referred to the fundamental principles of soil mechanics, briefly outlined the nature of these principles and showed how they could be used in design of foundations. His topic was new to a number of the members and a very interesting discussion followed his paper.

A vote of thanks to both speakers was moved by Dean R. S. L. Wilson.

HAMILTON BRANCH

A. R. Hannaford, M.E.I.C. - *Secretary-Treasurer*
W. E. Brown, Jr.E.I.C. - *Branch News Editor*

On December 16th, in the lecture theatre at McMaster University the branch held Student and Junior members' night. The papers presented were in competition for the branch prize and also became eligible for the John Galbraith prize.

After opening the meeting the chairman, Alex Love, turned the meeting over to W. E. Brown.

L. C. Sentance, of the Canadian Westinghouse Company, Hamilton, spoke on **Working Stresses in Machine Members.**

M. D. Stewart of the Babcock-Wilcox and Goldie-McCullough Company, Galt, spoke on **The Effect of Wet Coal on Pulverisers and Boiler Performance.**

Mr. Sentance gave a review of some of the factors that influence the behaviour of materials used in machine members and which consequently affect the selection of suitable stress limits. The paper was illustrated with slides dealing with various theories of failures.

Mr. Stewart dealt with the many factors which combine to result in what we call boiler performance. He considered the matter from the storage bins up to the state of combustion. However, he stated plainly that he was mainly dealing with the matter from the point where pulverisation takes place.

Moisture, he said, caused a heat loss in the boiler and an increase in moisture would add to the fuel cost. The paper was of a distinctly technical nature and therefore many points were exemplified by a number of slides showing various diagrams.

Professor C. R. Young of the University of Toronto, one of the three judges appointed by the branch, concluded the meeting with an address entitled, **The Engineer and the Technologist.**

In his opening remarks, the speaker congratulated the branch on having as members such able young engineers as the competing speakers had proved themselves to be. He added that the replies to the lively discussion showed that both Mr. Sentance and Mr. Stewart were masters of their respective subjects.

Professor Young said that the work of the engineer had a direct effect on the lives and fortunes of the people, and he differed from the technician because, to be of real use to the world at large, the engineer must consider the human side of his works and not only the efficiency of his labours but the beneficial results to those under him and to mankind in general. He stated that the bishop of Ripon had once suggested the engineers and scientists "lay off" for a period of ten years so that the peoples of the earth might regain their equilibrium.

The engineer having created comfort, pleasure and methods of destruction had kindled a flame that he should beware did not consume us all.

Alex Love moved a vote of thanks to the speakers and particularly to Professor Young for his most interesting address. The 49 members and visitors enjoyed coffee and light refreshments after the meeting.

LAKEHEAD BRANCH NEWS

H. M. Olsson, M.E.I.C. - *Secretary-Treasurer*
W. C. Byers, Jr. E.I.C. - - *Branch News Editor*

The Lakehead Branch held a dinner meeting at the Shuniah Club, Nov. 21st, commencing at 6.30 p.m., and 30 members were present.

Mr. H. G. O'Leary presided at the meeting and welcomed Mr. David Boyd of Montreal and Mr. E. J. Soulsby and Mr. S. T. McCavour.

The Chairman then introduced the speaker of the evening Mr. J. M. Fleming, president of C. D. Howe Company Limited, consulting engineers, of Port Arthur. His subject was **The Grain Storage Situation in Canada.**

The speaker said that at the present time there is 850 million bushels of grain in sight this crop year in Canada, and due to consumption and export 300 million bushels will be removed, leaving in July, 1941, 550 million bushels to be stored. The total storage capacity in Canada is 500 million bushels including the temporary storage on farms. Of the regular storage capacity of 425 million bushels there are 5,700 country elevators with 190 million bushels capacity and 160 terminal and mill elevators, totalling 235 million bushels. The Lakehead, with 95 million, has 40 per cent of terminal storage capacity of Canada. There are now about 3,000 of the timber storage units—commonly called "Balloon Annexes"—built adjacent to country elevators, with a total capacity of 75 million bushels. The limit of this storage, however, is about 110 million bushels, being limited by spouting distance from the country elevator.

The storage of grain in box cars is not practicable because of the requirements by the railways for transporting other materials essential to the war effort. Very little grain can be stored in grain boats because of the anticipated busy season and the inability of the grain companies to guarantee removal of the grain at the opening of navigation.

The most logical location for the storage of large quantities of grain appears to be at the Lakehead, where terminal facilities can be used for unloading, drying and cleaning, and then the top grades could be placed in temporary timber structures. The wheat, if in a dry condition, can then be stored for several years, if necessary, without impairing the milling or food qualities. The other requirements for a development of this nature, such as railway and water facilities, vacant and suitably located property, and cheap power, are all available.

The speaker stressed the economic aspect of the problem which would govern the feasibility of a development of this nature. There are four types of storage that could be built, namely: the standard concrete elevator, annexes with large concrete bins, rows of concrete bins enclosing a large space with roof and concrete slab, and the temporary timber bins of reinforced warehouse type equipped with belts and elevator legs.

The timber structures were considered to be the best suited for storage of large quantities of grain over a short period of time, when the structures must be removed when emptied in about two or three years. Some guarantee perhaps should be given by the Wheat Board, of use of temporary storage space for a time sufficient to retire the cost of construction.

Mr. Fleming thought that some measure of acreage control could be effected. One measure might be to take the marginal land out of wheat production and use it for other crops, thus removing at least two million acres out of the wheat category.

A large quantity of wheat in storage is of great value to the Empire's war effort, he said. The crops of the last two years were abnormal; two years of poor crops would reduce the carryover in Canada to normal, and there was sure to be a demand for wheat in Europe after the war.

Mr. O'Leary thanked the speaker and opened the discussion in which several members took part. The points brought up added to the interest in the address.

A dinner meeting of the Lakehead Branch was held at the Kakobeka Inn on Oct. 16th, commencing at 6.30 p.m. There were 22 members and guests present.

Mr. N. G. O'Leary, the chairman, presided at the meeting and introduced the speaker of the evening, Mr. E. J. Davies, principal of the Port Arthur Technical School.

Mr. Davies spoke on **The Training of Young Men for Industries.** He described the method of instruction and how some students became readily adapted to their work while others were much slower in adapting themselves. More time is now being spent on some of the academic subjects than was formerly required in the vocational training. Night classes have been given in welding with remarkable success in placing the welders in local industries.

Mr. P. E. Doncaster extended a vote of thanks to the speaker.

The address was followed by a period of discussion in which nearly all of the members took part.

Mr. Bird, chief engineer of Kaministiqui Power Company, invited the members and guests to visit the hydro plant of Kakabeka before returning to the city. Most of the members visited the plant which is a 35,000 hp. plant operating under 190 ft. head.

LONDON BRANCH

D. S. Scrymgeour, M.E.I.C. - *Secretary-Treasurer*
John R. Rostron, M.E.I.C. - *Branch News Editor*

The regular meeting was held in the Public Utilities Board Room at 8 p.m. on Wednesday, November 20th, 1940. The speaker of the evening was V. A. McKillop, chief engineer of the London Public Utilities Commission.

The speaker chose as his subject, **The Distribution of Electrical Power in the City of London.** By means of graphical charts he followed the distribution of power from its source to the consumers in the several sections of the city, indicating the improvements which had been installed, the service which was being given, and the advance in electrical distribution in recent years.

Following the address, many of those present took part in the discussion, indicating that the subject was of interest to engineers generally.

The chairman announced that the secretary-treasurer, D. S. Scrymgeour, who has occupied that position for the last five years, had severed his connections with the London Structural Steel Company Limited, and was joining the staff of the Standard Steel Company Limited of Welland, Ontario, on the 1st of December.

In recognition of the valuable services of Mr. Scrymgeour to the branch, Mr. W. C. Miller presented Mr. and Mrs. Scrymgeour with a floor lamp, to which Mr. Scrymgeour suitably replied, indicating the pleasure that it had been to work for the London Branch, and that he appreciated the many associations he had been able to make. He said that he would always remember his friends in London, and hoped that they would not forget him.

Following the resignation of Mr. Scrymgeour, Harry G. Stead was elected secretary-treasurer for the balance of the present year.

Eighteen members and guests were present.

OTTAWA BRANCH

R. K. Odell, M.E.I.C. - - *Secretary-Treasurer*

Development of Dual Lane Highways

The Development of Dual Lane Highways in Ontario was the topic for discussion at the noon luncheon of the Ottawa branch on November 21. C. A. Robbins, district engineer for southern Ontario, of the provincial Department of Highways, Toronto, was the speaker. W. H. Munro, chairman of the branch, presided and introduced the speaker. A motion picture was also shown of the Queen Elizabeth Highway, a super-highway recently opened up from Toronto to the Niagara peninsula. Details of construction methods were shown, as well as views of the completed highway in use, including over- and under-passes, bridges, "clover leaf" designs, and other notable traffic control features.

Super-highways of the future are getting farther and farther away from the narrow lane idea with ditches flanking each side, stated Mr. Robbins. Occupying a right-of-way anywhere up to 300 feet in width, with ditches shallow or non-existent, with easy curves and grades reduced to a minimum, and with a boulevard separating the two streams of traffic, they may truly be characterized as "streamlined." Bridges will not only be utilitarian but beauty spots as well, small parks will be spaced along at frequent intervals to add their charm to the route, and hot-dog stands and ramshackle service stations will not be permitted. Centres of population will be by-passed, crossing roads and railways will be over or under passed, and entrances and exits will be effected so as to cause no interruption to traffic.

Registration of cars all over the world for 1939, stated Mr. Robbins, was about 44 million of which United States and Canada had about three-quarters of the total, with Canada alone accounting for about a million and a half vehicles. Over 80 per cent of the traffic in Ontario, according to a traffic census, accommodates itself to 20 per cent of the road mileage, and accordingly the concern of most road authorities today is how to divide up this 20 per cent. In Ontario the division is approximately: 2 per cent super-highways, 2 per cent express highways, and 16 per cent local and service roads.

Super-highways will cross the province from east to west and north to south and will be of the divided type suited for carrying four lanes of traffic. Express roads will be tributary to them reaching to the outlying sections of the province. They will be of the two or three lane type, and of a higher standard than the local road, missing densely settled areas but with convenient entrances and exits thereto. The local and service roads will join towns and cities, will provide access to markets, speed up industry, and develop suburban areas. These roads we will always have, remarked the speaker.

Naval Armaments

Guest speaker at the noon luncheon on December 5th, 1940, at the Château Laurier was Captain C. S. Miller, R.N., Inspector of Naval Ordnance, British Admiralty Technical Mission, who spoke on **Naval Armaments.** Naval guns on which a pressure of 20 tons per square inch is exerted at the time of firing, shells that penetrate heavy armour plate before they burst, star shells designed to silhouette the enemy vessels at night, magnetic mines that may wreck a whole ship's structure without blowing a hole in it, depth charges that can be set to explode at any depth from 50 feet under water to 500 feet, torpedoes, and other features of naval armaments were described by the speaker.

Naval cadet at Osborne Royal Naval College, 1908, and midshipman before the last war, Captain Miller saw action at Heligoland Bight in 1914, Dogger Bank on the battle cruiser H.M.S. *New Zealand* in 1915, and was at the Battle of Jutland in 1916 on the battle cruiser *Princess Royal* in which he served as sub-lieutenant and lieutenant. Later briefly with the Royal Australian Navy he subsequently specialized as a gunnery officer, serving in various ships and gunnery schools of the Royal Navy, was assigned to armaments inspection, research and experimental duties in 1926 and in July last to duty in Canada and the United States with the British Admiralty Technical Mission.

The speaker paid a tribute to the engineering profession in the progress made on the part of Canadians toward supplying munitions not only for the Royal Navy but for other naval forces of the British Commonwealth as well.

QUEBEC BRANCH

Paul Vincent, m.e.i.c. - *Secrétaire-Trésorier*

Assemblée Annuelle

Lundi soir, le 25 novembre, avait lieu à l'Edifice Quebec Power l'assemblée générale annuelle de la section de Québec. Une quarantaine de membres y assistaient.

L'assemblée débutait par la nomination des scrutateurs pour dépouiller les bulletins d'élection pour l'année 1940-41. Le secrétaire lut ensuite le procès-verbal de l'assemblée annuelle du 4 novembre 1939. Le rapport du comité exécutif pour les activités de l'année écoulée et le rapport financier du secrétaire-trésorier furent aussi présentés aux membres. Après quoi, l'assemblée s'occupa de la formation des divers comités avec les résultats suivants:

Comité de Législation: président, Olivier Desjardins, J. O. Martineau, J. G. O'Donnell.

Comité de Recrutement: président, Paul Vincent, Hector Cimon, E. D. Gray-Donald.

Comité d'excursions: président, Theo. M. Dechêne, W. R. Caron, Yvon R. Tassé.

Comité de Nominations: président, A. O. Dufresne, Lucien Martin, G. W. Cartwright.

Comité de Bibliothèque: président, A. V. Dumas, René Dupuis, Théo. Miville Dechêne, J. O. Martineau, Burroughs Pelletier.

Les scrutateurs présentèrent alors le rapport des élections pour 1940-41 et le président de l'assemblée, M. Philippe Méthé en donna lecture aux membres comme suit:

Président: L. C. Dupuis, élu par acclamation.

Vice-président: E. D. Gray-Donald, élu par acclamation.

Sec.-trésorier: Paul Vincent, élu par acclamation.

Conseillers élus pour 2 ans: Robert Sauvage, Gérald Molleur, Olivier Desjardins.

Les autres conseillers, élus l'an dernier pour deux ans, ont encore un an d'office. Ce sont: MM. Théo. Miville Dechêne, Adhémar Laframboise et A. O. Dufresne.

Le comité est complété à l'unaminité par la nomination de MM. Alex. Larivière, R. B. McDunnough et Philippe Méthé, comme membres ex-officio et de M. A. R. Décary, président honoraire à vie de la section.

Dans une brève allocution, le président sortant de charge, M. Philippe Méthé, remercia la Compagnie Quebec Power pour son hospitalité ainsi que les membres de l'Institut pour être venus aussi nombreux à l'assemblée. Il félicita les nouveaux élus et il témoigna sa reconnaissance au comité exécutif et à tous les membres pour leur collaboration aux activités de la section sous sa présidence. Il terminait en présentant le nouveau président, M. L. C. Dupuis, qu'il invita à prendre le fauteuil présidentiel.

M. Dupuis remercia alors ses confrères de la marque d'estime dont il était l'objet. Il assura aussi les membres de ses meilleures dispositions en prenant charge de sa nouvelle fonction. Le nouveau président déclara en terminant qu'il s'efforcerait de suivre l'exemple de son prédécesseur, Monsieur Méthé.

Pour marquer l'ouverture de la saison des activités de la section, les membres voyaient se dérouler devant eux un documentaire intéressant. Ce film sonore intitulé **Warnings** fut gracieusement prêté par le Comité de la Protection Civile. L'assistance put constater les dangers des raids aériens modernes pour les populations civiles. Tous les moyens adoptés pour la protection des citoyens à Londres au cours de ces raids furent très bien illustrés.

La réunion se termina par un petit goûter, des rafraîchissements et de la tire à l'occasion de la Ste-Catherine. Les membres, avant de se quitter, eurent alors l'occasion d'échanger leurs vues sur les problèmes mondiaux et leurs activités professionnelles.

Monday night, December 16th, some thirty members gathered in the Committee Room of the Château Frontenac to hear a very interesting lecture on the **Britannia Mines.** The speaker, Mr. G. W. Waddington, a graduate from British Columbia University, resigned his position as chief engineer of Britannia Mining and Smelting Co. Ltd. last summer to join the staff of Laval University as professor of mining engineering.

Britannia mines are located 30 miles by boat from Vancouver, B.C., on the east side of Howe Sound. The dominant geological feature is the coast range batholith, which is exposed over a length of 1,000 miles along the west coast of Canada and Alaska. Ore deposits of the gold-silver and silver-lead type are found along the eastern flank of the batholith while along the western flank copper deposits are found. Britannia belongs to this latter type. The Britannia ore bodies are replacements in a shear zone seven miles long by two miles wide. The economic minerals are chalcopyrite, sphalerite, pyrite, gold and silver.

Mr. Waddington gave a short history of the mines. Copper, he said, was discovered on the east side of Howe Sound by Dr. A. A. Forbes in 1888. Ten years later, in 1898, Oliver Furry located five mineral claims. It is from these five original claims that a large portion of the mine production has since come. Active production started in 1905.

The speaker then went on to explain the present operations of mining, transportation, milling and production. With very good projections illustrating his talk, Mr. Waddington stated that narrow veins were ordinarily mined by rill stopes or by square set stopes. The large ore bodies were mined by a retreating shrinkage system, frequently combined with powder drifts for primary breaking. The broken ore travels by gravity to the main haulage levels. Electric trolley locomotives haul this ore and dump it to the primary crusher located underground on the 3,900 ft. level. The crushed ore is then trammed on the 4,100 ft. level to the mill in 18-ton cars through a distance of over 2½ miles.

The process of milling used is selective flotation and the concentrator handles 6,000 tons of ore per day. The ratio of concentration is 30 to 1. The principal product is a copper concentrate containing copper, gold and silver. Other products are pyrite concentrate and sometimes zinc concentrate. The concentrates are loaded into ships by conveyor belts. In 1939, Mr. Waddington mentioned that Britannia produced 2,113,784 tons of ore, from which were recovered 9 per cent of copper or 37,059,210 pounds, 22,238 ounces of gold and 203,019 ounces of silver. In addition 105,418 tons of pyrite were marketed, and it is mainly used to produce sulfuric acid. Development work amounted to 32,203 ft. or 6.1 miles in that year. During the 35 years that Britannia plant has operated, development work has totalled 86 miles.

All ditch water flowing from the mine is passed through a precipitation plant, which recovers an average of 3,000 pounds of copper daily with an efficiency of 93 per cent.

Easily available hydro-electric power, he added, low cost mining methods and cheap sea transportation contribute to the successful mining of these relatively low grade ore bodies.

The speaker then answered for about twenty minutes to the questions of his audience.

Mr. L. C. Dupuis, chairman of the branch, presented Mr. Waddington who was thanked by René Dupuis, assistant general superintendent of the Quebec Power Company.

SAGUENAY BRANCH

T. A. I. C. Taylor, Jr. E.I.C. *Secretary-Treasurer*
B. E. Surveyer, Affil. E.I.C. *Branch News Editor*

The Saguenay Branch held its first meeting of the season on the 15th August at the Arvida Protestant School. The speaker was Mr. J. T. Thwaites of the Canadian Westinghouse Company who was supervising the installation of the Ignitron Station in Arvida. His subject was **Ignitrons.** Mr. Thwaites discussed the development of mercury arc rectification by means of the Westinghouse ignitrons, giving essential differences between multiple and single tank rectifiers.

The following meeting of the branch was held on 10th October and Mr. E. F. Hartwick, of the Aluminum Company of Canada, Limited, gave an illustrated lecture on **The Manufacture of Alpaste in Arvida.** Mr. Hartwick described the different processes used in making paint pigment. He explained the various steps of the process employed in Arvida exemplifying some of the dangers which could be encountered and the precautions which were taken to minimize them.

Water Filtration and Purification was the subject of an address given by Mr. Ross Watson at a meeting held on the 14th November. Mr. Watson is at present installing a filtration plant in Arvida and he gave a description of its equipment and its operation including the pumping, filtering and chemical treatment of water, and illustrated the different phases of the process. Following Mr. Watson's paper, Dr. H. G. Acres, well known hydraulic engineer, talked and showed some slides of the **Shand Dam, at Fergus, on the Grand River.** He discussed the engineering features of earth-filled dams and pointed out that a definite technique is now employed rather than the hit-and-miss method originally used. Following the presentation of these two highly interesting papers a meeting of the Executive of the Saguenay Branch was held.

SAULT STE. MARIE BRANCH

O. A. Evans, Jr.E.I.C. - *Secretary-Treasurer*
N. C. Cowie, Jr.E.I.C. - *Branch News Editor*

The seventh general meeting for the year 1940 was held in the Grill Room of the Windsor Hotel when 21 members and guests sat down to dinner at 6.45 p.m. The business portion of the meeting began at 8.00 p.m. with Chairman E. MacQuarrie in the chair. The minutes of the previous meeting were read and adopted on motion of W. Seymour and G. S. MacLeod. The chairman then called upon Mr. Perkins, manager of the Bell Telephone Company, to introduce the speaker of the evening, G. T. Long, historian of the Bell Telephone Company of Canada, who had for his subject, **War Time Communications.**

The value of the telephone in the mobilization, organization and direction of armed forces was recognized almost as soon as the invention was perfected. Alexander Graham Bell himself demonstrated its use at Aldershot in England with the assistance of the Royal Engineers in 1877. The first actual use of a telephone system on the field of battle took place in the Russo-Japanese war of 1905. The same tactics, only on a much larger scale, were used by both sides during the war of 1914-18. Telephone research workers produced many special inventions, including "electrical ears" for detecting enemy airplanes, gun emplacements, and submarines from afar, during that conflict.

In the present war, telephone research has produced instruments which help to promote air safety and, by means of teletype and telephoto, written messages and military maps can be transmitted over great distances by wire.

Overseas telephone service, now limited to official calls, is also assisting in maintaining imperial communications during the war. The speaker pointed out that the chief reason why the overseas telephone did not fulfill expectations as a peacemaker, by promoting international understanding, is that it was never given a chance in Europe. Europeans are less telephone-minded than Canadians and Americans. The good relations between the latter peoples he attributed in part to their use of the telephone to make contacts between them more personal.

In conclusion, the speaker said: "This is part of the story of one industry's contribution in men and materials to Canada's defence of principles which are dearer than life itself. Other industries can, no doubt, match that record. With resolute determination, Canada as a whole is working to defend the last citadel of democratic freedom. In the words of Prime Minister Churchill: 'Let us, therefore, brace ourselves to our duty, and so bear ourselves that if the British Commonwealth and Empire last for a thousand years, men will still say, 'This was their finest hour.' "

At the end of the speech, G. S. MacLeod moved a vote of thanks to the speaker. E. MacQuarrie thanked the speaker on behalf of the branch. N. C. Cowie moved that the meeting be adjourned.

TORONTO BRANCH

J. J. Spence, M.E.I.C. - *Secretary-Treasurer*
D. Forgan, M.E.I.C. - *Branch News Editor*

The subject for the third meeting of the branch held in Hart House on November 21st was as expected most interesting and provocative of much thought. Unfortunately, as a result of the incidence of other functions on the same night, the attendance was not as high as the excellence of the programme warranted.

The vice-chairman, Mr. H. E. Brandon, introduced the speaker, Mr. Chas. M. Baskin, B.Sc., whose subject was **Modern Problems in Highway Construction** and which dealt largely with problems of subgrade and base course design for roads. His talk brought home to the audience the fundamental facts relating to this important subject and stressed that more study should be given to the condition of the ground carrying the road. Proper consideration and treatment of this would result in cheaper and better road surfaces, and would probably extend surfaced roads into areas where these are not at present considered to be economically practical. Dr. N. W. McLeod of the Imperial Oil Laboratory was on hand to answer many of the questions propounded to the lecturer and himself. Coloured moving pictures of highway construction in South America were shown, and subsequent to the technical part of the lecture a second reel which depicted the wonderful scenery and the really large fish which can be obtained "Somewhere in South America."

The fourth regular meeting of the Toronto Branch of the E.I.C., held in Hart House, December 5th, was honoured by the presence of Dr. T. H. Hogg, B.Sc., D.Eng., president of the Institute, who introduced the speaker, Mr. McNeely DuBose, vice-president for Quebec. The latter's subject was **Man Power,** a non-technical paper of the type which, if the resultant discussion is a criterion, provoked a considerable amount of thought along lines which many engineers are not likely to study in the normal course of their activities. It was presented by Mr. DuBose in a masterly fashion, and it is expected that its matter will be reproduced elsewhere in the *Journal.* Careful study of the paper can be recommended.

The thanks of the meeting were ably tendered to the speaker by Mr. M. J. McHenry, after which refreshments were partaken of by most of those present and the discussion still carried on. This was a most successful meeting with an attendance of approximately 75.

VANCOUVER BRANCH

T. V. Berry, m.e.i.c. - *Secretary-Treasurer*
Archie Peebles, m.e.i.c. - *Branch News Editor*

Annual Meeting

The annual business meeting of the Vancouver Branch took place on Saturday, Nov. 23rd, in the customary manner of an informal dinner. Following dinner, the business of the meeting was transacted, including the election of officers and executive committee for 1941. The slate submitted by a nominating committee was elected by acclamation.

The secretary-treasurer presented his financial report, and the chairman, Mr. C. E. Webb, read his report for the year.

The address of the evening was given by Mr. J. G. Robson, president of the Timerland Lumber Co. and president of the B.C. Lumber and Shingle Manufacturers' Association. His subject was **The B.C. Lumber Industry Marches with the Troops.** In treating his subject, Mr. Robson described vividly the enormous expansion of the lumber industry to meet war requirements, in the face of many difficulties also occasioned by the war. Typical freight rates have advanced from $6 to $32, $12 to $60, and $15 to $75. Normal export markets were upset, and replaced by other export markets and an abnormal internal demand. Canada had to supply those demands which were formerly met in Norway, Sweden and Russia, increased many times for war needs. An example of this is in furnishing pit props for use in the United Kingdom, which required 200 cargoes of these in the past year. Another difficulty arose out of the control of shipping, whereby cargo space was allotted by the British Government, and was irregular and restricted. The positions of ships are not available in advance, so that cargoes must often be made ready on three or four days' notice. War construction also changed the usual distribution of lengths and sizes, and, in some cases, the species required in normal trade. A much greater proportion of high grade structural timber in large sizes and non-standard lengths was required. This called for careful distribution of orders among the mills equipped to cut long logs, and also for the production of longer logs in the logging camps. The very great demand for Douglas fir has resulted in a surplus of other woods which must be cut with the fir as they occur in the mixed growth forest areas. Some changes have been made by engineers in their specifications to use up some of this surplus. It is altogether likely that in about ten years time, Douglas fir will be a relatively scarce wood, and much of the ordinary building lumber used in homes, stores, warehouses and similar structures will be cut from hemlock, spruce and cedar. Fir will be reserved for structural work requiring large sizes and maximum strength.

This war time demand for lumber came from the building of hangars and supplementary buildings under the air training plan, from the new militia camps, warehouses for war supplies, new factories and their adjacent housing for personnel, from the needs of aircraft manufacture, as well as from a generally accelerated demand in residential and business construction. Mr. Robson gave some illuminating figures on some of these items which need not be repeated here. The logging industry had to step up its production in tune with the demand for lumber, and this had been done smoothly and efficiently, so that at no time was there any serious shortage of logs at the mills.

Throughout the period during which these changes took place, there was no form of government control beyond an order prohibiting the export of logs to non-empire countries. A timber control board was set up however, under Mr. H. R. MacMillan, which acted to co-ordinate demand and supply as far as possible. Through local committees of this Board, orders were distributed among producers according to their capacity and type of product. Stocks of standard sizes were cut in advance whenever possible, and advance shipments were also made in certain cases, so that construction might proceed more rapidly, by drawing on stock sizes. The price of lumber had been voluntarily stabilized at the June, 1940, level and will remain at this unless noticeable increases in production costs take place.

A vote of thanks for the above address was tendered the speaker by Mr. W. N. Kelly. Other guests at the head table were Mr. E. Redpath, president, and Mr. F. W. MacNeill, vice-president of the Association of Professional Engineers of British Columbia. The meeting concluded with the showing of an excellent film, "Alaska's Silver Millions," depicting the scenic beauty and the salmon fishing industry of that country. This was kindly loaned by Mr. Shayler of the American Can Co. Thirty-seven members and guests were present.

VICTORIA BRANCH

Kenneth Reid, m.e.i.c. - *Secretary-Treasurer*

On the evening of November 29th, thirty-five members and visitors of the Victoria Branch gathered at dinner at Spencer's dining room. The dinner was followed by a general meeting of the branch with the branch chairman, Mr. E. W. Izard, presiding. Among the visitors on this occasion were Mr. C. E. Webb, past chairman of the Vancouver branch, Mr. S. R. Weston, chief engineer of the B.C. Public Utilities Commission, and several members of His Majesty's Forces, who were made most welcome. On this occasion nominations for the officers for the year 1941 were received.

The principal speaker of the evening was Major J. C. MacDonald, engineer for the Province of B.C. Public Utilities Commission, who spoke on the subject, **Public Utility Regulations.** Major MacDonald reviewed the history leading to the necessity for regulation of the consumption of natural resources due to the wasteful methods created by our high standard of living and our competitive "open market" system. He cited the two schools of thought one of which regarded regulation as a necessity and the other as "tinkering with the laws of nature." In order to offset waste and destruction we must have regulation. The United States had been striving to work out a system of regulation but had found its Constitution a severe handicap with the result that regulatory bodies were constantly in the courts over decisions. Finally a model act was devised suitable to cover all states and it was upon this act that the present Public Utilities Act in B.C. was drafted.

The B.C. Water Board, of which Major MacDonald was previously a member, was the first body, outside of the Lieutenant-Governor-in-Council, with regulatory powers. Appeals to the various regulatory bodies formed since 1914 could only be made to the Lieutenant-Governor-in-Council and not to the courts. The fundamental principle underlying these bodies is that no public utility shall be allowed to exploit the public, yet shall be entitled to a reasonable return for service rendered. Appraisals of public utility holdings are essential in order to adequately set rates and this is often a difficult and laborious task. Major MacDonald then introduced Mr. S. R. Weston, chief engineer of the B.C. Public Utilities Commission who outlined the progress being made in this regard at present in British Columbia.

At the conclusion of these addresses, Mr. A. L. Carruthers moved a very hearty vote of thanks both to Major MacDonald and to Mr. Weston for their informative discussions of a most timely topic. Following the addresses, several reels of sound motion pictures obtained through the catalogues recently distributed by the Institute Papers Committee were shown and greatly appreciated by the membership, rounding out a very satisfactory evening programme.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS

The following books have been graciously presented to the Institute's library by the Montreal Section of the Institute of Radio Engineers and they are gratefully acknowledged here:

THEORY OF THERMIONIC VACUUM TUBES *by E. Leon Chaffie.*

MEASUREMENTS IN RADIO *by F. E. Terman.*

COMMUNICATION ENGINEERING *by W. L. Everitt.*

RADIO ENGINEERING *by F. E. Terman.*

REPORTS

Canada Department of Labour

Annual report for the fiscal year ending March 31, 1940, Ottawa, 1940.

Canada Department of Mines & Resources—Mines & Geology Branch—Geological Survey—Memoir

Malartic area, Quebec, Memoir 222.

Canada Department of Mines & Resources—Mines & Geology Branch—Geological Survey—Papers

Wapiabi Creek, Alberta, preliminary map. Paper 40-13.

Canada Department of Transport

Annual report for the fiscal year from April 1, 1939, to March 31, 1940. Ottawa, 1940.

Canada Minister of Public Works

Report of the Minister of Public Works on the works under his control for the fiscal year ended March 31, 1940. Ottawa, 1940.

Canadian Engineering Standards Association

Insulated power cable C68(A)-1940; Canadian Electrical Code, part, 2, Construction and test of insulated conductors for power-operated radio devices, C22.2-No. 16-1940; Construction and test of pull-off plugs for electro-thermal appliances, C22.2 No. 57-1940. Standard specification for the procedure for fire tests on building construction and materials, A54-1940.

Canadian Government Purchasing Standards Committee

Specification for antifreeze liquids, types 1 and 11; specification for thinner for nitrocellulose finishers; specification for asphalt varnish; specification for bituminous paint (type 1, for steelwork not exposed to weather) specification for fluids for hydraulic and shock absorber mechanisms on aircraft.

Electrochemical Society—Preprints

Semi-conductor photocells and rectifiers; the electrolytic reduction of methyl ethyl ketone to sec-butyl alcohol and n-butane; structure and grain size of electrodeposited copper; the irreversible phenomena of thallium 2. cathode potential in Tl_2SO_4 solution. Preprints 79-1 to 79-4.

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

A.S.T.M. STANDARDS on TEXTILE MATERIALS, prepared by Committee D-13 on Textile Materials. October, 1940

American Society for Testing Materials, Philadelphia, 1940. 368 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $2.00 (10 to 49 copies, $1.50 each.)

Sixty-six standards and tentative standards covering definitions and terms, methods of testing and specifications for textile and related materials are presented in this compilation. Additional material appearing in appendices includes photomicrographs of textile fibers, tables for yarn number conversion and relative humidity, a glossary of textile terms, proposed test methods and abstracts of papers presented at committee meetings.

AIRCRAFT DESIGN, 2 Vols.

By C. H. L. Needham. Chemical Publishing Co., New York, 1939. illus., diagrs., charts, tables, 9 x 5½ in., cloth, Vol. 1, 215 pp., $6.00; Vol. 2, 308 pp., $6.50.

The general principles of aircraft design are presented both as a textbook and as a guide for the practical constructor. The first volume outlines in simple language the principles of flight and stability, control devices and the propeller, with a special chapter on parasite drag. The second deals mainly with the mathematical treatment of design, including materials, seaplane construction and experimental testing. The illustrative material is taken from British practice.

AIRCRAFT DIESELS

By P. H. Wilkinson. Pitman Publishing Corp., New York and Chicago, 1940, 275 pp., illus., diagrs., charts, tables, 2½ x 6 6 in., cloth, $6.00.

This book is devoted exclusively to the Diesel engine in aviation. It outlines the basic principles upon which the engine functions and the phases and processes involved. Fuel-injection equipment, superchargers and accessories are described, the construction of different types of engines is presented in detail, and standardized pages of data are provided. The development and mass production of Diesels in Germany are discussed, their commercial utility is described, and suggestions are presented for the future.

AIRCRAFT ENGINES, Vol. 1

By A. W. Judge. D. Van Nostrand Co., New York, 1940. 380 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, $5.50.

In the words of its author, "the object of the present book, which is the first of two volumes on aircraft engines, is an endeavor to present the principles and results of relevant research work upon internal combustion engines, for the benefit of those entering or already engaged in aircraft engineering work. It is also written to fill a gap existing in aeronautical literature, between the more advanced specialist books on theory and design and the elementary descriptive ones on aircraft engines, maintenance, etc." There is a bibliography.

BAUGHMAN'S AVIATION DICTIONARY and REFERENCE GUIDE, Aero-Thesaurus

By H. E. Baughman. 1st ed., 2nd printing. Aero Publishers, Inc., 202 Security Bank Bldg., Glendale, Calif., 1940. 598 pp., illus., diagrs., charts, tables, 9½ x 6 in., lea. cloth, $5.00.

This reference book contains a wide variety of information frequently wanted by those engaged in aviation. An excellent dictionary of aeronautical terms is given, as are the regulations of the Civil Aeronautics Authority which concern students. The information upon occupations, drafting, lofting procedure, shop mechanics and materials is extensive and practical. Flight manoeuvers are illustrated by diagrams. There are tables of specifications and of needed mathematical data; directories of periodicals, house organs, publishers, clubs, societies, manufacturers and schools; as well as many other data.

COMMISSIONING of ELECTRICAL PLANT and ASSOCIATED PROBLEMS (Monographs on Electrical Engineering, Vol. 5).

By R. C. H. Richardson. Chapman & Hall, London, 1938. 363 pp., diagrs., charts, tables, 9 x 5½ in., cloth, 24s.

The object of this book is to present general and specific information which has been found useful when putting into service both alternating and direct-current generating, transforming, motive and converting equipment. The preparation, likely troubles and efficient testing of such equipment are fully described, and the last chapter outlines briefly several important conceptions useful in electrical engineering calculations. There is a classified selected bibliography.

(*Continued on page 48*)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

December 28th, 1940

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in February, 1941.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall he considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ANDERSON—HARRY CLYDE, of New Westminster, B.C. Born at Sturgis, Co. Dakota, U.S.A., July 13th, 1895; R.P.E. of B.C. 1926—Member of Council 1940; 1911, asst. on installn. of municipal water works and power plant at Merritt, B.C.; 1912-13, transitman and levelman with A. W. McVittie, Victoria, B.C., and E. H. Ferris, London, England, on land surveys and irrigation work; 1915-21, asst. on govt. surveys and private work consisting of installn. of irrigation systems, litigation surveys, etc.; 1919, charge of location of logging rly. for Nicola Pine Mills, Merritt; 1921-29, asst. district engr., Yale District, 1929-31, asst. dist. engr., and 1931 to date, district engr., Dept. of Public Works of B.C., New Westminster, B.C.

References: C. E. Webb, E. Smith, A. L. Carruthers, H. N. Macpherson, T. V. Berry.

BRIDGEWATER—ALBERT WILLIAM, of Westmount, Que. Born at Saskatoon, Sask., Oct. 7th, 1914; Educ.: B.Sc. (Civil), 1935, M.Sc. (Civil), 1936, Univ. of Sask.; R.P.E. of Ont.; 1936 (May-Nov.), instr'man. on constrn. of Borden Bridge 1937 (Feb.-Oct.), dftsman., Dominion Bridge Co. Ltd., Winnipeg; 1937-39, reinforced concrete detailer and gen. struct'l. designer, with M. M. Dillon, M.E.I.C., London, Ont.; 1939-40, res. engr., on constrn. of caustic finishing plant, for Canadian Industries Ltd., at Shawinigan Falls; March 1940 to date, with Defence Industries Ltd., at present, struct'l. designer.

GLENN—JOHN BURGESS, of 204 Wineva Ave., Toronto, Ont. Born at Southampton, Ont., Sept. 18th, 1915; Educ.: B.Sc. (Mech.), Univ. of Sask., 1938; 1938, inspr., Rogers-Majestic Radio Corpn.; 1938 to date, production engr., Link Belt Ltd., Toronto, Ont.

References: C. J. Mackenzie, I. M. Fraser, W. E. Lovell, N. B. Hutcheson, G. M. Williams.

MURCHISON—JAMES GRAY, of Fort William, Ont. Born at Crathes, Kincardine, Scotland, Feb. 25th, 1902; Educ.: 1919, Robert Gordon's College, Aberdeen. 1921, one year Arts, Aberdeen University; 1929-30, levelman on highway constrn., Dept. of Nor. Development, Sudbury, Ont.; 1930-34, clerk and foreman, highway constrn. and installn. of water system, H. T. Routly Constrn. Co., Toronto; with Dept. of Highways of Ontario as follows: 1936, laying out of Nipigon bridge, 1936-37, instr'man., 1937-38, res. engr., 1938-39, instr'man, 1939, associate of the late H. L. Seymour, M.E.I.C., town planning consultant, on preparation of town planning data for the cities of Fort William and Port Arthur; 1939-40, dftsman. and designer, on elevator and mill constrn., C. D. Howe Co. Ltd.; 1940, supt. of constrn. of internment camp, comprising all bldgs., water, sewer and lighting; at present, consultant to the Fort William Town Planning Commission, on the preparation of a zoning by-law and town planning for the City of Fort William.

LIBRARY NOTES

(Continued from page 46)

GRAPHICAL TREATMENT of VIBRATION and AIRCRAFT ENGINE DAMPERS

By C. H. Powell. Bookcraft, 135 Johnson St., Brooklyn, New York, 1940. 288 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $7.50.

The first part of this text presents a concise method of graphical solution for complex vibrating systems, by geometrically combining the more easily obtained solutions of simple elemental systems. Part II is a more particular application of the methods developed in Part I to various forms of engine dampers for torsional oscillation. Optimum conditions for all known types of dampers, the amplitude of the damper and the phase relations of the individual vibrating members are dealt with in detail. There are many charts and diagrams.

Great Britain, Department of Scientific and Industrial Research. BUILDING RESEARCH

Wartime Building Bulletin No. 9, CONSERVATION of CEMENT and of CLAY BRICKS. His Majesty's Stationery Office, London, 1940. 22 pp., diagrs., charts, tables, 11 x 8½ in., paper, 1s. (obtainable from British Library of Information, 50 Rockefeller Plaza, New York, $.30).

This pamphlet calls attention to ways in which substitutes can be used for cement and clay brick in many cases and to ways in which these materials can be used most economically where no alternative is available. Specifications are given for tar macadam roadways, for economical concrete floors and for methods of making walls.

Great Britain. Home Office. AIR RAID PRECAUTIONS. SPECIFICATIONS, etc., in regard to PERMANENT LINING of TRENCHES

H. M. Stationery Office, London, 1939. 8 pp., diagrs., 13 x 8½ in., paper, (obtainable from British Library of Information, 50 Rockefeller Plaza, New York, $.10).

The composite specification and bill of quantities are given for precast concrete trench lining units, accompanied by diagrammatic drawings. There are also a general specification for the permanent lining of trenches and a Home Office circular letter giving basic information on trench construction.

HANDBOOK of CHEMISTRY and PHYSICS

Edited by C. D. Hodgman and H. N. Holmes. 24 ed. Chemical Rubber Publishing Co., Cleveland, Ohio, 1940. 2,564 pp., diagrs., tables, 7½ x 5 in., cloth, $3.50.

This valuable handbook of data frequently needed by physicists and chemists becomes more comprehensive as new editions appear. The present issue contains over three hundred pages more than its immediate predecessor. The principal changes include rearrangement of the table of physical constants of organic compounds and the inclusion of several hundred new ones, a thorough revision of the table giving the properties of commercial plastics, a tabulation of the physical constants of four hundred industrial organic compounds and a table of induced radioactivities. In addition, minor changes and additions have been made throughout the book.

INDUSTRIAL MANAGEMENT

By R. H. Lansburgh and W. R. Spriegel. 3 ed. John Wiley & Sons, New York, 1940. 666 pp., illus., diagrs., charts, maps, tables, 9 x 6 in., cloth, $4.50.

General organization technique is stressed in this discussion of the principles, problems, ideals and successful methods of industrial management. In the several chapters on fundamental considerations, the plant, the product, personnel, wage payment, managerial controls and operating procedures, an effort has been made to show the relationships of each major portion of the business to the others and to outside influences. There is a bibliography.

INTRODUCTION to ABSTRACT ALGEBRA

By C. C. MacDuffee. John Wiley & Sons, New York, 1940. 303 pp., diagrs., charts, tables, 9 x 6 in., cloth, $4.00.

This book is planned for a full year's course, with problems furnishing laboratory material and concrete instances of the abstract concepts. The subject is developed logically from the system of rational integers to linear associative algebras. A selected body of facts from number theory, group theory and formal algebra is offered, to provide a background for understanding and appreciating the generalized facts of abstract algebra.

PULP and PAPERMAKING Bibliography and United States Patents 1939.

Compiled by C. J. West, Technical Association of the Pulp and Paper Industry, New York, 1940. 252 pp., 9 x 6 in., cloth, $3.00.

This comprehensive bibliography covers the articles upon pulp and papermaking which appeared during the year 1939 and the United States patents issued during that year which are of interest to the industry. Both sections are classified; the articles by a subject arrangement and the patents by the Patent-office classification. Subject and author indexes are included.

TREATISE on ADVANCED CALCULUS

By P. Franklin. John Wiley & Sons, New York, 1940. 595 pp., diagrs., charts, 9 x 6 in., cloth, $6.00.

Although the reader is assumed to be familiar with the fundamental methods of the calculus, these are briefly reviewed together with the prerequisite parts of algebra and analysis. The text then continues with an exposition of infinitesimal calculus, including those parts of the theory of functions of real and complex variables which form the logical basis of the infinitesimal analysis and its applications to geometry and physics. A group of exercises accompanies each chapter.

TURRET LATHE OPERATOR'S MANUAL

By J. R. Longstreet and W. K. Bailey; published by The Operators' Service Bureau of The Warner & Swasey Co., Cleveland, Ohio, 1940. 240 pp., illus., diagrs., charts, tables, 10½ x 7 in., cloth, $2.50.

This book, prepared by experienced engineers, provides an unusually comprehensive and detailed description of principles and practice. Tools and accessories, methods of working, short cuts and special problems are discussed with the help of over 350 excellent illustrations and drawings. The book is designed expressly for the lathe operator.

Employment Service Bureau

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

SITUATIONS VACANT

ENGINEER with pulp and paper experience to become Assistant Chief Engineer in a large mill. Either a man who can fit into the position immediately, or a younger man who has the training and ability to work into it gradually. The initial salary to be paid will depend upon the qualifications of the applicant. This position holds an interesting future for the right man. Send applications with full particulars to Box No. 2209-V.

ELECTRICAL ENGINEER, fully experienced in design of large modern power transformers. Give full details of education, experience, and salary expected. Applications not considered from persons now employed with firms producing war supplies or equipment. Apply to Box No. 2231-V.

MECHANICAL ENGINEER, with thorough knowledge of manufacturing, preferably in electrical apparatus. Supply complete information, education and previous experience. Applications not considered from persons now employed with firms producing war supplies or equipment. Apply to Box No. 2232-V.

DRAUGHTSMAN required by electrical manufacturer experienced in layout and detail work on power transformers. State experience and salary expected. Applications not considered from persons now employed with firms producing war supplies or equipment. Apply to Box No. 2233-V.

ENGINEER for fabricating plant, must be experienced in the detail and design of structural steel. This is a permanent position for the man with the necessary qualifications. Apply to Box No. 2234-V.

GRADUATE in metallurgical engineering required by large manufacturing plant in Montreal. Excellent opportunity for experience and promotion. Apply giving education, experience and salary expected to Box No. 2235-V.

YOUNG MECHANICAL ENGINEER, recent graduate, required for preparation of specifications and performance data on steam generating equipment and accessories. Previous experience in this line preferred but not essential. Excellent opportunities for advancement. Applications from persons at present employed in war industries will not be considered. Apply to Box No. 2239-V.

GRADUATE CHEMIST with digestion sewage disposal plant experience. Applicants to state experience, salary required and when at liberty. Apply Box No. 2244-V.

RECENT ENGINEERING GRADUATE, preferably mechanical, with some drafting experience. Work will consist of machinery and piping layouts and other general engineering work in a paper mill near Ottawa. Permanent position and excellent prospects for suitable man. Men now employed in war industry will not be considered. Apply Box No. 2245-V.

MECHANICAL DRAUGHTSMAN, for layout of power plant equipment, piping systems, etc., preferably university graduate with three or four years' experience. State age, experience, salary desired. Location Toronto. Apply to Box No. 2247-V.

ENGINEERING DRAUGHTSMAN required for centrally located mill. Preferably a graduate engineer with several years' experience. Applications from men employed in war industries will not be considered. Apply Box No. 2249-V.

REQUIRED for large gold mining organization in West Africa, several mill shiftmen, mill men and electricians. Salaries up to £40, £32 and £40 respectively per month, free living quarters. Ocean passage paid and three months' leave granted per year at half pay. Yearly renewable contracts. Defence regulations do not permit wives to accompany husbands at this time. Apply Box No. 2258-V.

SENIOR ELECTRICAL ENGINEER with from five to eight years experience required by large industrial concern. Apply with full details to Box No. 2261-V.

YOUNG CIVIL ENGINEER not more than two years out of college with field and office experience. Apply giving full particulars to Box No. 2259-V.

MECHANICAL DRAUGHTSMAN with some experience immediately required by a large industrial firm. Apply giving full particulars to Box No. 2262-V.

SITUATIONS WANTED

CONSTRUCTION ENGINEER, University graduate experienced in Power Plants, Transmission lines, gunite construction, etc. Available on short notice. Apply to Box No. 1527-W.

CIVIL ENGINEER AND SURVEYOR—Experienced in general building and war plant construction. Also installation of mechanical equipment. Immediately available. Apply to Box No. 2153-W.

ELECTRICAL ENGINEER, graduate, Age 47, married. Experience covers draughting, construction, maintenance, and operation. For the last ten years employed as electrical superintendent in a large industrial plant. Apply to Box No. 1718-W.

ENGINEER—M.E.I.C. Age 49. Desires change. Experience covers all types structural steel and plate work, rivetted and welded construction, as estimator. Designing, shop drawings. Available two weeks notice. Apply Box No. 2208-W.

MECHANICAL ENGINEER, Draughtsman, Specification Writer, Supervisor, specializing in Heating, Ventilating, Power Plants and Plumbing, available immediately. Will go anywhere. Apply Box No. 2285-W.

ENGINEERS FOR THE AIR SERVICE

The following communication is printed at the request of Air Marshal L. S. Breadner, Chief of Air Staff. Members of the Institute and other engineers are requested to give it careful consideration. Any persons remote from recruiting centres are welcome to write to Headquarters for additional information.

DEPARTMENT OF NATIONAL DEFENCE
"AIR FORCE"

Ottawa, Canada, November 29th, 1940.

MR. L. A. WRIGHT, *Secretary,*

ENGINEERING INSTITUTE OF CANADA, MONTREAL, QUE.

Dear Sir:

The development of the British Commonwealth Air Training Plan and the absorption of Technical personnel in war industry, has resulted in a shortage of available men with engineering qualifications.

At the present time the Royal Canadian Air Force is in urgent need of personnel for training as Aeronautical Engineer Officers. There is also an immediate requirement of Technical Engineers with practical experience in aircraft production or maintenance. Qualifications required of candidates for appointment under these two classifications are as follows:

(a) **Technical Engineer Officers**

Candidates must be suitable in personal respects to hold commissioned rank and must have the following qualifications:

Thorough knowledge in engineering, applicable to aeronautical requirements.

Adequate experience in aricraft repair work or extensive aircraft factory experience.

Age limit—up to 50 years (highly qualified candidates will be considered up to age 55).

While graduate engineers are preferred, it may be necessary to accept candidates with lesser academic standing provided they have extensive practical experience.

(b) **Potential Aeronautical Engineer Officers**

These officers will be required to undergo a very thorough course in aeronautical engineering before they are assigned to duties.

Candidates must be of good character, suitable in all personal respects for appointment to commissioned rank and above average in mental alertness.

An applied science degree in aeronautical, mining, mechanical, civil, chemical, or electrical engineering is desirable.

A candidate having extensive practical experience but with a lower standard of education may be accepted. He must, however, have attained a standard not lower than senior matriculation. University graduates should have at least one year's practical experience along any of the several mechanical lines. Candidates with less than university graduation standing will be required to have a correspondingly greater practical experience.

The preferred age for appointment in this category is 25 to 40 years.

It would be greatly appreciated if you would make our needs known to the several branches of your organization throughout Canada and through this medium, to the individual members of the Institute. It is felt that an appeal of this nature may be instrumental in directing to the Royal Canadian Air Force, men who possess engineering qualifications which may be of value to this service.

Prospective candidates should make application at the nearest R.C.A.F. Recruiting Centre, so that it may be ascertained whether they are physically fit and suitable in all respects. This action will not necessitate a severence of their civilian employment before they are appointed and will entail no obligation on their part until actually called for duty.

Your co-operation in this matter is earnestly requested and it is hoped that if you have knowledge of any suitable prospective applicants you will find it possible to acquaint them with our urgent need and the procedure for submitting their application. Might I also ask that you forward their names and addresses, together with your recommendation in each case, to the nearest R.C.A.F. Recruiting Centres or, if more convenient, to these Headquarters.

Assuring you that your assistance in this matter will be most sincerely appreciated.

I am, yours very truly,

(*Signed*) L. S. BREADNER, AIR VICE MARSHAL,
Chief of the Air Staff.

Industrial News

Industrial development — new products — changes in personnel — special events — trade literature

THREADING AND TAPPING EQUIPMENT

Landis Machine Co. Inc., Waynesboro, Pa., have issued an interesting 116-page handbook entitled "Landis Handbook" which contains instructions covering the use of various Landis machines including the grinding of chasers, operation of threading heads and machines, the grinding of tap chasers and the operation of collapsible taps. Data covering special threads used in the manufacture of modern transportation equipment is also included.

BALING PRESSES

Climax Baler Co. Ltd., Hamilton, Ont., have issued a four-page folder which illustrates various types of "Climax" hand and electric presses for baling wipers, clothing, fabrics, waste paper, excelsior, wool, etc. Special features and specifications are given in each case.

CARBOLOY STANDARD TOOLS

Carboloy Co. Inc., Detroit, Mich., represented in Canada by Canadian General Electric Co. Ltd., Toronto, Ont., have issued a twelve-page booklet No. GT-128 in the form of an instruction manual (3 ins. by 4¼ ins. in size) for operators. It contains complete information on speeds and feeds to be used with different materials and varying depth of cut; machine recommendations for machining steel; proper use of coolants; tool grinding instructions; standard tool angles; design and grinding of chip breakers and general operating hints.

BUILDING NECESSITIES

The 32-page Catalogue No. 40 recently issued by The Majestic Co., Huntington, Ind., covers the Company's extensive line of 44 specialties for the modern home. Among the items illustrated and described are various types of coal chutes, fire place equipment, garbage receivers, incinerators, heating equipment, etc. Included with each item are specifications.

SIRENS

Northern Electric Co. Ltd., Montreal, Que., describe and illustrate in their four-page bulletin No. 22-235004 "Federal" vertical sirens for municipal fire alarm, airport crash alarm and air raid warning; and industrial sirens for fire and burglar alarm and start and dismissal signal in industrial plants, mines, public buildings, warehouses, construction projects, etc. "Federal" vehicle sirens, compressed-air whistles and industrial vibratory horns are also included.

SNOW FENCE AND POSTS

"Stelco" snow fence and "Tee" rail snow fence post for use in drift prevention on highways, municipal roads, railways, industrial property, airports, parade grounds, mines and fur farms, are featured in a two-page pamphlet issued by The Steel Co. of Canada Ltd., Montreal, Que. Full details and specifications are included with a description of the Company's "one-man" post driver.

TEMPERATURE INSTRUMENTS

In their 32-page catalogue N-33-161, Leeds & Northrup Co., Philadelphia, Pa., describe "Micromax Temperature Instruments for Electric Power Equipment" for those concerned with the operation of electric power plant equipment, to show how knowledge of operating temperatures enables operators to act promptly, at the first sign of a rise, to protect units against overheating and provide a reliable guide for maximum safe loading. These recorders provide automatic and continual temperature checks at selected points in power units, and sound alarms if temperature at any point exceeds safe limits.

ELECTRIC ETCHING

Taylor, Taylor & Hobson Ltd., Leicester, Eng., are distributing in Canada through their representative, The Empire Engineering Co., Toronto, Ont., an 8-page bulletin entitled "The Javelin Etching Process," It describes this process of electric etching, illustrating the single etching unit and the multiple etcher, as well as the standard equipment included with each unit.

VIBRATING SCREENS

Link-Belt vibrating screens for the effective screening of a great variety of materials, such as sand, gravel, cinders, grain, clay, crushed stone, coke, fertilizer, feldspar, coal, ore, etc., are described and illustrated in a 20-page catalogue No. 1762 issued by Link-Belt Ltd., Toronto, Ont.

TIMBER HIGHWAY BRIDGES

The advantages of timber bridges and 12 typical designs of timber bridges with "Teco" joint connectors for spans of 30 ft. to 70 ft. are presented in a 14-page booklet issued by Timber Engineering Co., Washington, D.C. This company's Canadian distributor is V. H. McIntyre Ltd., Toronto, Ont.

TIMBER CONNECTORS

Timber Engineering Co., Washington, D.C., represented in Canada by V. H. McIntyre Ltd., Toronto, Ont., have issued an 8-page bulletin entitled "Installing Teco Timber Connectors in Light and Heavy Structures." This bulletin contains detailed illustrated description of the Company's various types of timber connectors designed to increase the joint strength of timber structures. Also shows fundamental steps necessary for installing timber connectors.

JOINS STAFF OF CANADIAN ENGINEERING PUBLICATIONS LIMITED

John M. Thom, formerly with the Montreal branch of the James Fisher Advertising Agency, has been appointed to the staff of Canadian Engineering Publications Limited, and will represent The Engineering Journal, the official organ of The Engineering Institute of Canada, The Engineering Catalogue, and New Equipment News. Mr. Thom will be located at the Company's head office in the Confederation Building in Montreal.

John M. Thom

TEMPERATURE AND PRESSURE RECORDERS

Bulletin DMF 814 entitled "Foxboro Instruments for Bottlers," made available by The Foxboro Co. Ltd., Montreal, Que., gives an illustrated description of the Foxboro single-pen and double-pen carbonating recorders featured with equipment supplied by the Liquid Carbonic Canadian Corp. Ltd., Montreal, Que. Detailed specifications and illustrations of a typical installation and charts showing actual operating records are included.

GAS ANALYZER

"The Modernized Hays Orsatomat—The Automatic Orsat," is the title of a 4-page bulletin No. 40-366 in which The Hays Corp., Michigan City, Ind., illustrate and describe the Orsat type of gas analyzer with full details of design, construction and method of operation of both the single unit for furnace testing and the double unit for exhaust gas analysis.

GRINDING FIXTURE

Industrial Engineering Co. Inc., Minneapolis, Minn., features in a 4-page bulletin the "Quick-way" grinding fixture for high speed power hack saw blades, and illustrates the fixture attached to a universal grinder.

"LIQUID" VIBRATING SCREENS

In a 4-page folder No. 1877, Link-Belt Ltd., Toronto, Ont., describes a specialized adaptation of the Company's variable high-intensity vibrating screen for the removal of solids from liquids to recover products formerly wasted. Illustrates and describes the unit and shows typical installations handling fish oil, fine rubber, asparagus, vegetable refuse and phosphate rock.

REFRIGERATION COMPRESSORS

A sectional illustration of Worthington-Carbondale refrigeration compressors of the vertical two-cylinder type, sizes 5 ins. by 5 ins. and smaller, with photographs of various parts, specifications and dimensional drawings is given by Carbondale Div., Worthington Pump and Machinery Corp., Harrison, N.J., in their 6-page bulletin No. C-1100-B11.

ROLLER BEARINGS

The Shafer aircraft type self-aligning roller bearings are described by Shafer Bearing Corp., Chicago, Ill., in their 6-page bulletin No. 531. A general description contains details of radial thrust capacity, integral self-alignment, load ratings, materials and lubrication. Dimensional drawings with tabulated data are included.

WELDING

An interesting 56-page booklet entitled "The Lincoln Weldirectory," has been issued by Lincoln Electric Co. Ltd., Toronto, Ont. This booklet contains carefully prepared detailed information covering the numerous products of this company used in arc welding and is well illustrated throughout.

DRILLS AND TAPPERS

Featured in the eight-page bulletin No. 2963-C of Canadian Blower & Forge Co. Ltd., Kitchener, Ont., are the "Buffalo" No. 15 heavy duty production drill, the No. 15 manufacturing type drill, the No. 15 tapping machine, and accessories. Completely illustrated with photographs and sectional drawings, this interesting bulletin also contains full specifications.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 24 MONTREAL, FEBRUARY 1941 NUMBER 2

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

PUBLISHED MONTHLY BY
THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET - MONTREAL

Price 50 cents a copy, $3.00 a year, in Canada, British Possessions, United States and Mexico. $4.50 a year in Foreign Countries. To members and Affiliates, 25 cents a copy, $2.00 a year. —Entered at the Post Office, Montreal, as Second Class Matter.

CONSTRUCTION OF THE HYDRO-ELECTRIC DEVELOPMENT AT LA TUQUE

J. A. McCRORY, M.E.I.C.
Vice-President and Chief Engineer, Shawinigan Engineering Company, Montreal, Que.

Paper to be presented before the General Professional Meeting of The Engineering Institute of Canada, at Hamilton, Ont., on February 7th, 1941.

The LaTuque development has an installed capacity of 178,000 hp. at the point of maximum efficiency and is capable of delivering 192,000 hp. at full gate. It is located in the province of Quebec, on the St. Maurice river 104 miles from its mouth. The river at this point flows through a narrow gorge three-quarters of a mile long in which it dropped 90 ft. between the upper and the lower pools. Throughout the gorge the river bed was generally less than 350 ft. wide between high water marks and during periods of normal flow most of the current was confined to a deep, narrow channel that had been eroded in the bed of the river near the west bank. The dam is built near the lower end of this gorge, its west abutment ending in a low corewall that penetrates the heavy layer of overburden on the west bank, and its east abutment terminating against the vertical face of a cliff that rises more than 100 ft. above the top of the dam.

As with many of the power sites on the St. Maurice, the river here occupies a different channel from that followed by the pre-glacial streams that drained this region. It is apparent that before the last glacial period the river flowed through a deep valley that lies beneath the plain on which the town of La Tuque now stands. We know that the depth to bed rock here is very great. As the ice receded, this valley was filled with glacial deposits, and the river took its new course through a saddle between the hills to the west of the buried valley and two granite knobs that protrude through the surrounding gneissic structure and from the eastern wall of the present gorge. The larger and more northerly of these knobs was known to the voyageurs as La Tuque. The river quickly cut down through the glacial drift to bed rock and then, over a long period of time, gradually carved for itself a steep, narrow channel. Glaciation and extensive faulting that has occurred in the rock of the gorge assisted the river in its work of erosion.

The development at La Tuque is the fifth built on the St. Maurice since the construction of the first power house at Shawinigan Falls forty years ago. With its completion the installed capacity of the plants on the river has reached a total of more than a million horse power. It is hard to realize that in the short period of forty years the St. Maurice valley has developed from little more than a wilderness to one of the important industrial regions of the Dominion. In 1900, Three Rivers was a small community of few industries, Shawinigan Falls was a construction camp where a group of young men was engaged in the "visionary" scheme of harnessing the falls and transmitting power to Montreal, 90 miles away, and Grand'Mère, the last outpost of civilization on the river, except for a few Hudson's Bay posts farther up, was a little pulp mill town.

Preliminary Studies

A partial development of the falls at La Tuque was made in 1909 by the Quebec & St. Maurice Industrial Company, predecessor of Brown Corporation. This development consisted of a wing dam at the head of the falls and a wood stave penstock leading to the power house at the lower end of the gorge. Two hydro-electric units of 3500 hp. capacity at 90 ft. head were installed in the power house and served the town and the pulp mill until 1931 when the Shawinigan Water & Power Company, in anticipation of the construction of the Rapide Blanc development, built a transmission line from Grand'Mère.

In 1929 Mr. Hardy S. Ferguson, M.E.I.C., reported to the Brown Corporation on the complete development of the falls. In his studies he investigated seven possible arrangements of the dam and power house with locations of the dam at various points between the head and the foot of the falls. His comparative estimates showed that the most economical arrangement would be with dam and power house located about 600 ft. above the foot of the falls. Independent studies carried out the following year by the Shawinigan Engineering Company confirmed this conclusion and also that the site could be developed economically. An agreement was entered into between the Shawinigan Water & Power Company and Brown Corporation for a joint development of the falls, the St. Maurice Power Corporation being formed for this purpose.

Between the years 1933 and 1938, when the construction of the development was begun, further studies and investigations were carried out by the Shawinigan Engineering Company. These consisted, in general, of topographical surveys, preliminary designs and estimates, studies of methods of construction and hydraulic studies of river flow, capacity of units and testing of model turbine runners.

The topographical surveys were a continuation of the work done in 1927 and 1928 by the Brown Corporation during which they made a detailed survey of the gorge, taking advantage of periods of low water to map exposed portions of the river bed. This topography was extended to cover all of the area above the falls that would be flooded by the construction of the development. It was apparent from a study of the data thus obtained, that the highest level to which the water could be raised without causing serious damage from flooding would be El. 498, Quebec Streams Commission datum. As the pool at the foot of the falls, at normal flow, is at El. 384, this would provide a head of 114 ft.

In studying the capacity of the units to be installed advantage was taken of the experience gained in the operation of the Rapide Blanc power house, thirty miles above La Tuque, and of some studies of river regulation made in 1927 and 1929 by Mr. R. G. Swan, M.E.I.C., of the Water Resources Department of the Shawinigan Company. These studies indicated that a flow at La Tuque of 12,500 c.f.s. could be depended upon for 90 per cent of the time and that the corresponding flow at Rapide Blanc would be 11,000 c.f.s. The drainage area between the two plants is 3,500 sq. mi. A flow of 11,000 c.f.s. at Rapide Blanc corresponds to the full load discharge of three of the four units installed in that plant. Owing to the large volume of the Rapide Blanc pond and to the comparatively small pondage at La Tuque, it is evident that, for maximum economy in the use of the water, the discharge of the La Tuque units should be closely correlated with that of the units at Rapide Blanc and the full load discharge of the units was accordingly fixed at 4,200 c.f.s. making their capacity 48,000 hp. at 114 ft. head.

Testing of Model Turbine Runners

Each summer since 1929 the Shawinigan Company has carried out a series of tests of model turbine runners at the Turbine Testing Plant at Shawinigan Falls. This testing has been done under the direction of Prof. Ernest Brown, M.E.I.C., Dean of the Engineering Faculty of McGill University, and in co-operation with the Dominion Engineering Works, of Montreal, who supplied the model runners. The first objective of these tests was a study of the serious pitting and erosion that was taking place in both the runners and the throats of the propellor-type turbines at La Gabelle plant, on the St. Maurice between Shawinigan Falls and Three Rivers. The results of tests made during the first two years were embodied in the installation of No. 5 unit in 1931, which showed marked improvements over the original units, Nos. 1 to 4, both in efficiency and in freedom from pitting. The knowledge gained from still later tests has led to the replacement of all of the original runners, with a resultant increase in both power and efficiency, and the complete elimination of the difficulties previously experienced.

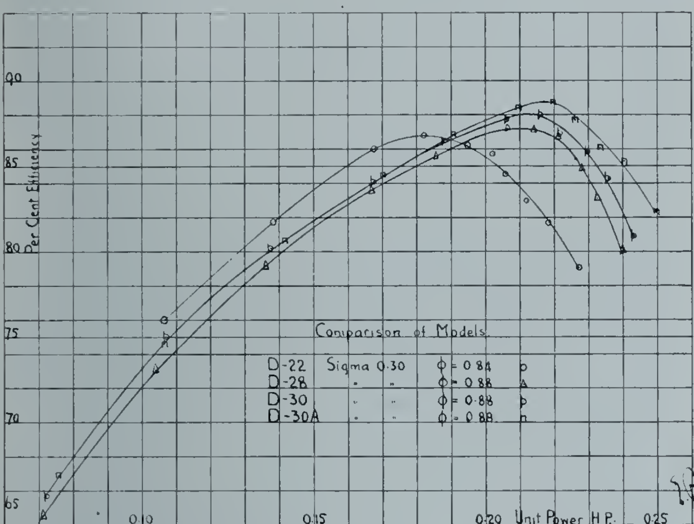

Fig. 1—Unit power-efficiency curves, Models D-22, D-28, D-30, D-30A.

The success that attended upon the search for an improved type of runner for the turbines at La Gabelle led in 1934 to examining the possibility of developing a propellor-type runner for higher heads with the prospect of its being available for use at La Tuque. The primary advantage to be gained, would be the higher r.p.m. speed with consequent reduction in the cost of the generators and possibly also in that of the turbines themselves. The summer of 1934 was devoted to the testing of five propellor runners designated D-14 to D-18 inclusive. From these, D-17 was selected as having the best characteristics for heads up to 110 ft. The following year complete tests of this model and of two Francis-type models, D-22 and 125-B, were made. Table I shows some preliminary general comparisons of dimensions, speed and settings for models developing approximately 39,000 hp. at peak efficiency, at a head of 114 ft.

TABLE I.

Model No.	Type	Approx. dia. of runner, inches	R.P.M.	Elev. discharge tips relatively to tailwater	Notes on runner
D-22	Francis	160	109.1	4.0′ above	Used at Chelsea, 94 ft. head; and at Rapide Blanc, 108 ft. head.
125-B	Francis	134	144	4.0′ above	New model; higher powered than D-22. Not yet used in practice.
D-17	Propellor	152.5	180	6.3′ below	New model; 8 blades, similar to but longer than improved blades at La Gabelle.

The table shows that the propellor wheel would have to be submerged below tailwater level, its setting being more than ten feet lower than that of the Francis runners. Its diameter would be smaller than that of D-22 and larger than that of 125-B, and it would run at a much higher speed than either of the Francis wheels. An evaluation of the relative merits of the three models was made by means of comparative estimates, taking into consideration the speeds and diameters and the cost of additional excavation made necessary by the lower setting of Model D-17. These estimates showed a probable saving, over D-22, in favour of both of the other models, the relative saving being the greater in the case of Model 125-B. Because of this and in view of some characteristics of the propellor runners tested that made their use for heads of 114 ft. questionable, it was decided to abandon the idea of using this type, at least for the time being. Model 125-B, while high powered, had a poor cavitation characteristic and some undesirable features in the power-efficiency curve. The marked increase in speed, however, which it showed over that for D-22 led to the hope that a runner having a somewhat smaller increase of speed and more satisfactory characteristics might be evolved by further testing.

The summers of 1936 and 1937 saw more intensive testing of models of the Francis type. During this period, tests were carried out on nine different models of which all but two were eliminated, D-22, the Rapide Blanc model, and a model developed by the Dominion Engineering Works for the Gatineau Power Company and designated D-28, a higher-powered runner than D-22.

Early in the following summer two other models, modifications of D-28 designated D-30 and D-30A, were tested and found to have very satisfactory characteristics and the latter model was chosen as the basis of the La Tuque runners. A comparison of the unit power-efficiency curves of these four models is shown in Fig. 1. The curves show, for corresponding conditions, a progressive increase in unit power of the models from D-22 up to D-30A, and also a progressive increase in peak efficiency. Model D-22 is clearly much lower-powered than the others and its peak efficiency is about two per cent below that of D-30A. The effect of increasing the out-flow area of D-30 to give D-30A is shown in the increased unit power and efficiency near and beyond the peak. At the smaller unit powers the curves

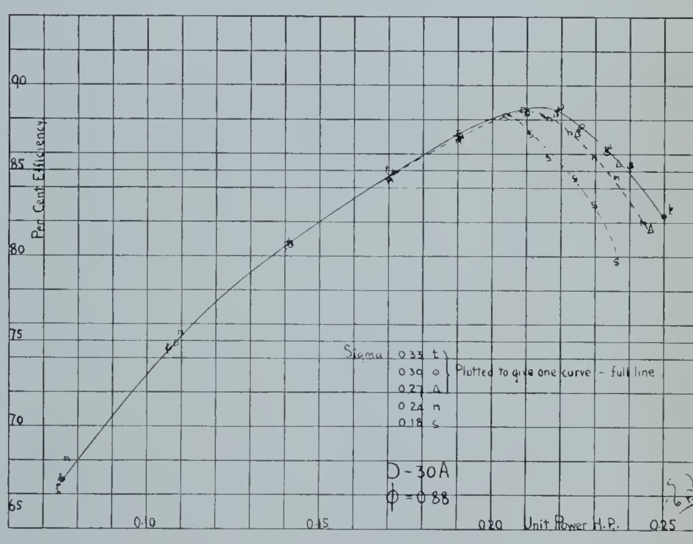

Fig. 2—Comparison of tests of Model D-30A for $\phi = 0.88$ and various values of σ.

are identical. These comparisons show that for a given rated output at a specified head, a runner based on D-30A will be of smaller diameter and run at a higher r.p.m. speed than one based on any of the other models.

Three points are of major importance in the selection of a runner:

1. The envelope of the speed-efficiency curves at different gate openings, which determines the speed corresponding to maximum efficiency.

2. The form of the power-efficiency curves at practicable speeds under the actual operating conditions and, in particular, the corresponding unit powers, since unit power determines the diameter of a runner for a given output and operating head.

3. The form of the power-efficiency curves at these practicable speeds in relation to the cavitation factor.

The coefficient ϕ, in Fig. 1, is a speed characteristic given by dividing the peripheral speed of the runner, in ft. per sec., by $\sqrt{2g}\,H$, in which H is the operating head. It will be noted that for Model D-22 the practicable value for ϕ, as determined by other tests, is 0.84 and that its value for the other models is 0.88. The factor "sigma" (σ) is known as the cavitation factor and is given by the formula $\frac{B\text{-}S}{H}$ in which B = barometric height; S = height of runner

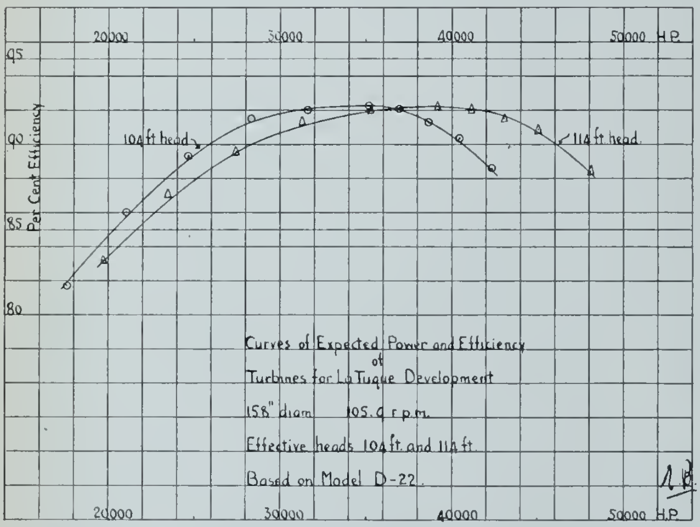

Fig. 3—Power-efficiency curves for runner based on D-22 at heads of 104 ft. and 114 ft.

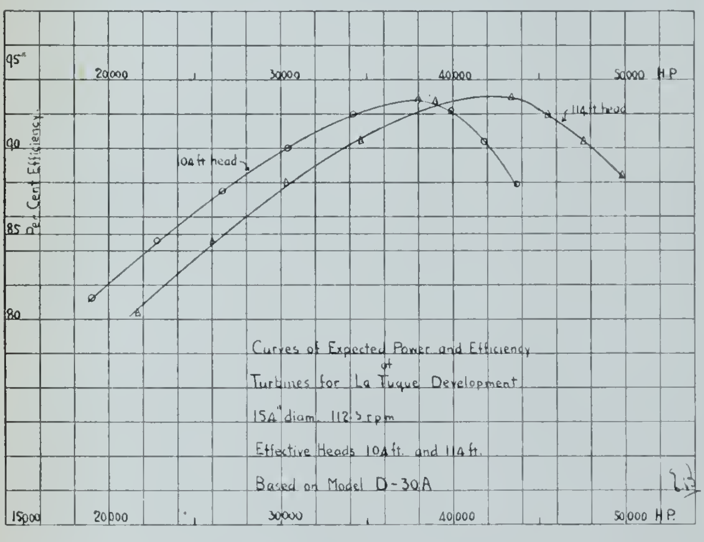

Fig. 4—Power-efficiency curves for runner based on D-30A at heads of 104 ft. and 114 ft.

above tailwater level and H = operating head. In the comparison made, the setting was the same for all models. The actual tests of any model include complete power-efficiency measurements over a wide range of speeds at progressively decreasing cavitation factors, usually five or six in number. The cavitation factor is controlled by regulating the tailwater level. Figure 2 shows comparisons of such tests for D-30A at ϕ = 0.88. It will be noted that one curve of unit power-efficiency fits all experimental points for cavitation factors 0.33, 0.30 and 0.27 and that there is a characteristic break in the curve when the tailwater is lowered further to correspond to a factor of 0.24. This is accentuated when the factor is 0.18. The breaks in the curve indicate cavitation and such a series of curves determines the practicable setting of the runner. A difference of 0.03 in the cavitation factor corresponds to a difference of 3.4 ft. in runner elevation for a head of 114 ft. Progressive lowering of the runner increases the margin of protection against cavitation but it also tends to increase costs.

A large number of additional tests were run at the Shawinigan Falls plant dealing with (a) the shape of the draft tube; (b) distribution of pressure in the draft tube; (c) effect of introducing air in the draft tube to reduce vibration, surges of pressure and noise in operation; (d) the erosion of paint from painted surfaces of runners to determine zones in which pre-welding might be desirable. In addition, the Dominion Engineering Works, at its testing plant at Lachine, Que., carried out a comprehensive series of tests on the effect of lengthening the draft tubes and on various designs for the scroll cases.

As noted above, a runner based on Model D-30A was adopted. Typical results to be expected at heads of 104 ft. and 114 ft. from runners based on D-22 and on D-30A are shown in Fig. 3 and Fig. 4 respectively. Model D-22 was the starting point in the testing of models of the Francis type. The curves are based on the Moody step-up formula and on information available on the performance of large units as compared with that of the small models on which they were based. It appears that a runner 158 in. dia. based on D-22 and operating at 105.9 r.p.m. would have an output some 3 to 4 per cent smaller than that of a runner 154 in. dia. based on D-30A and operating at 112.5 r.p.m. For a frequency of 60 cycles per sec. the latter speed requires a 64-pole generator as against a 68-pole generator at 105.9 r.p.m. There is also the expectation that the runner based on D-30A will show a somewhat higher peak efficiency. Outstanding differences of this kind have an important bearing on the cost of the development. The results of such a series of tests, providing as they do, a large amount of information on problems of design and operation, are the justification, if any were needed, for a long term programme of testing such as is being carried out by the Shawinigan Company.

Description of the Development

A view of the development, taken from a point on the west bank below the dam, is shown in Fig. 5 and a general plan in Fig. 6. The dam is 1,337 ft. long from end to end. It consists, in general, of the west bulkhead and corewall, the sluice section, the intake section and power house, and the east bulkhead. All sections of the dam are gravity type concrete structures and were designed for the following conditions:

1. Horizontal pressure on the upstream face due to water in the forebay at El. 498.

2. Horizontal pressure due to ice, assumed to be 10,000 lb. per lin. ft. applied at El. 497.

3. Uplift on the base of the dam over the whole area, assumed to be the full head at the upstream face and decreasing uniformly to zero or to tailrace pressure, if any, at the toe.

4. The weight of concrete was taken at 150 lb. per cu. ft.

5. The assumed uplift on the intake section was modified to two-thirds of the above and a more extensive drainage system was provided under the base.

The sluice section of the dam contains five main sluices, two regulating sluices and a log sluice. The main sluices are each 50 ft. wide and have their sills at El. 467, thirty-one feet below normal headrace level. The two regulating sluices are each 21 ft. wide by 21 ft. deep. The sill of the log sluice is at El. 492 and it has a width of 26 ft. All of the sluiceways are provided with motor-operated, fixed-roller steel gates. The discharge capacity of the sluiceways is 170,000 c.f.s. with fore-bay at El. 498 and more than

200,000 c.f.s. when the water is at El. 500. Figure 8 shows a cross section through one of the main sluiceways. The paving shown at the foot of the spillway is continued downstream a distance of about 600 ft. in order to protect the flood channels against erosion.

A cross section of the intake section and the power house is shown in Fig. 9. The intakes for six turbines have been provided, each intake consisting of two water passages 15 ft. wide, connected to a 22 ft. steel penstock. The penstocks are completely embedded in the concrete. The intakes are closed by means of steel head gates with fixed rollers, the head gates being operated, through line shafting, by two motor reduction units. By means of jaw-clutches, either of the motor reduction units can raise any one of the head gates. The lowering and the raising of the gates is actuated by push buttons in the gate house, with lowering buttons also in the control room of the power house. The 36-ton gantry shown on the top of the intake section has been provided to lift the gates out of their slots for painting and other maintenance and also for handling the racks and emergency gates which are installed in slots on the upstream face of the dam.

Four hydro-electric units are installed in the power house, with settings for two additional units for future installation. At 114 ft. head each unit has a rated capacity of 44,500 hp. at point of maximum efficiency and is capable of delivering 48,000 hp. at full gate. The turbines are connected to 11,000 V., 60 cycle generators rated at 40,000 kva. at 90 per cent power factor, which were manufactured by the Canadian General Electric Company. The generators are fully enclosed and water cooled. Louvres are provided in the housing for the purpose of heating the power house in cold weather. With the louvres closed the air is circulated through cooling coils supplied with water from the forebay. Enclosing the generators is a new departure for the Company. It was done principally for the purpose of reducing the accumulation of dust in the air passages around the generator windings and of maintaining the coils at a fairly uniform temperature at varying loads, but it has the added advantage of reducing both noise and heat in the power house.

Fig. 5—General view of the development.

The generator leads are carried through a tunnel to the switch building, which is located a short distance from the power house, and connected to an 11,000 V. bus which is segregated into four sections. The bus sections are connected, through air blast circuit breakers, to the Brown Corporation's 11,000 V. transmission line and to the Shawinigan Company's transformers which step the voltage up to 230,000 V. for transmission to the terminal station at Three Rivers. Three transformers are at present in

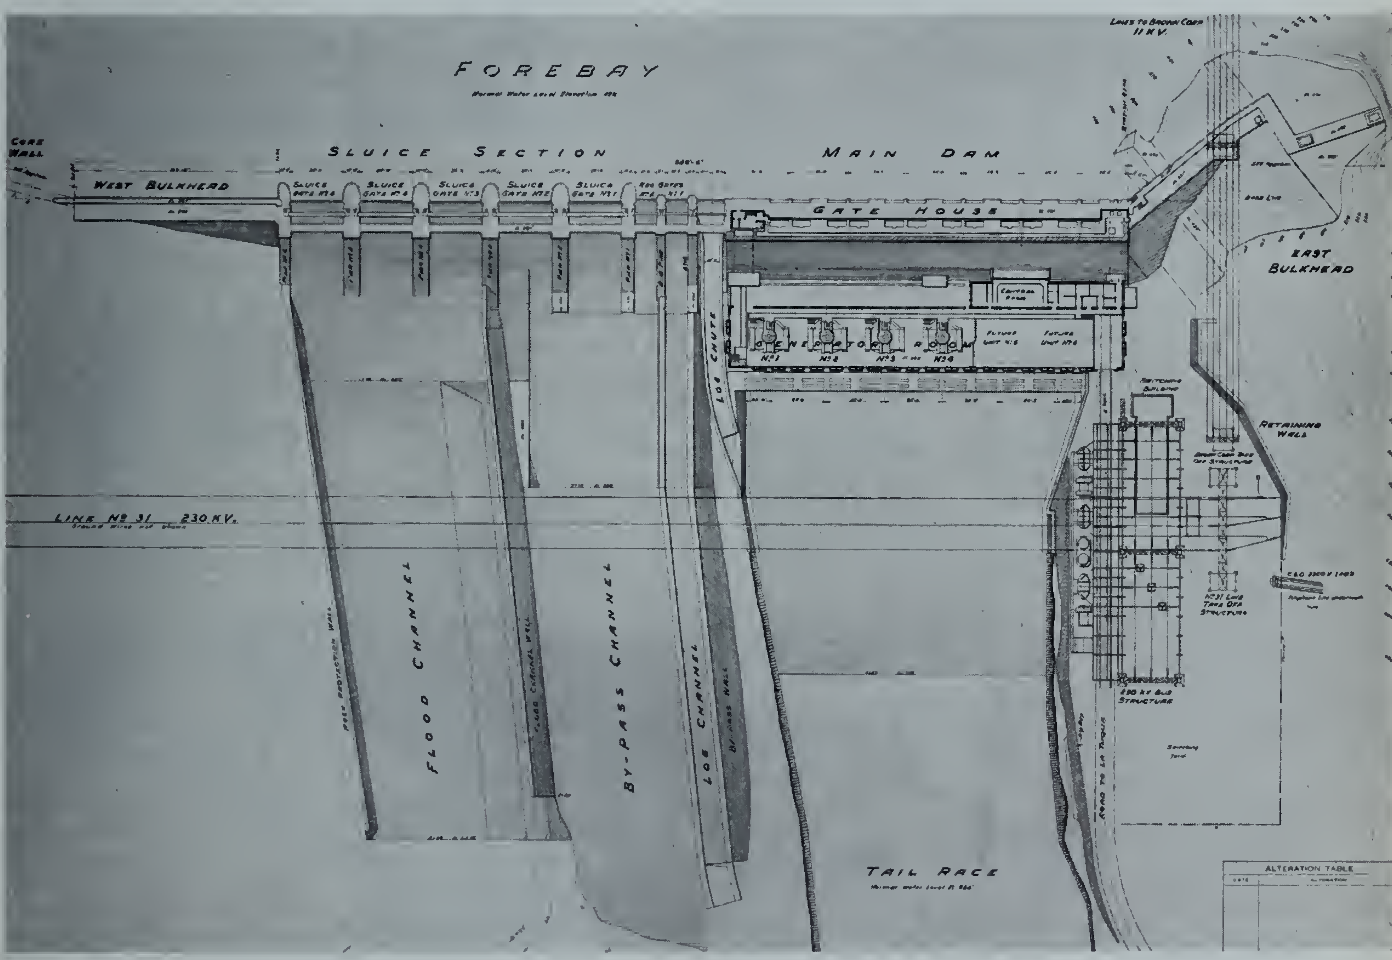

Fig. 6—General plan of the development.

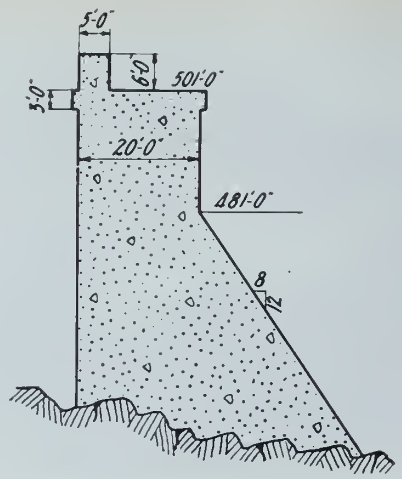

Fig. 7—Cross section of west bulkhead.

service, two rated at 36,000 kva. and one at 40,000 kva., while a fourth, at 40,000 kva. is in course of manufacture. The generators and transformers are connected in parallel on the high voltage bus only, through motor operated disconnecting switches. Provision has been made for the future installation of a high voltage circuit breaker for the line, which at present is directly connected to the high voltage bus.

Figure 10 shows a single-line diagram of the main electrical connections.

Preparation of the Foundation

The bed-rock at the dam site consists of a granitic gneiss, the foliation, or apparent bedding, of which varies considerably over different parts of the foundation. In the vicinity of the west bulkhead and the sluice section, the foliation strikes diagonally across the line of the dam and dips toward the northeast at an angle of about 20 deg., while under the intake section the strike is transverse to the dam and the dip at a slight angle to the east. A fault near the western end of the intake section divides the two areas of different geologic structure. The strike of this fault is almost normal to the axis of the dam and it dips toward the east at an angle of 48 deg. It showed up on the surface as a small gorge, about ten feet deep, that had been eroded in the bed of the river. Near it two parallel faults were encountered, one to the east and the other to the west.

The most important feature of the geologic structure in relation to the dam is a fault zone under the east bulkhead. The fault planes in the river are nearly parallel to this zone and are related to it. The footwall was encountered about 50 ft. east of the end of the intake section dipping toward the east at an angle of about 47 deg. to the horizontal. The hanging wall intersects the face of the cliff at about El. 470, thirty feet below the top of the dam. The faulted zone, 200 ft. wide, that lay between, was composed of thick strata of hard, grey rock alternating with strata of badly fractured red rock, some parts of which, near the surface, were so decomposed that they could be dug by a power shovel. In order to obtain rock sufficiently sound for the foundation of the east bulkhead it was necessary to carry the excavation down along the footwall of the fault to below El. 380. At the inner end of the cut its depth was more than 80 ft. below the surface. Excavation for a cutoff wall along the upstream face of the structure was continued to a further depth of about 50 ft.

As a precaution against seepage of water along the horizontal joints underneath the dam, a programme of grouting the foundation was followed. Diamond drill holes were put down along the whole upstream face of the dam at intervals of about 30 ft., except at the east bulkhead where more extensive grouting was done. Along the intake section of the dam these holes were drilled to a depth of 100 ft.; at the sluice section and west bulkhead the depth was 50 ft. Many of the holes were tested for tightness with water at a pressure of 90 lb. per sq. in. and all were grouted to refusal at pressures varying from 90 to 50 lb. per sq. in. depending on the depth at which the grouting was done. Where any evidence of open joints was found, sufficient additional holes were drilled and grouted to assure the complete sealing of the foundation. Very little grout was taken in any of the holes except in the vicinity of the fault planes at the junction of the intake and the sluice sections.

Although the stratum of rock which was finally reached in the excavation for the east bulkhead and on which the structure was built was sound, it was badly broken by the faulting and it was considered advisable to consolidate it by grouting. Holes were drilled to a depth of 20 ft. on five foot centres each way over the whole surface and grouted at a pressure of 90 lb. per sq. in. In addition to this, in order to eliminate the possibility of percolation beneath the structure, a row of diamond drill holes on five foot centres, parallel to the upstream face, was put down into the footwall and grouted at a pressure of 200 lb. per sq. in. after the concrete structure was built. The deepest of these holes, near the face of the cliff, penetrated the footwall at about El. 270. The inspection tunnel in the east bulkhead is built with sufficient head room to permit additional drilling and grouting if evidences of undue percolation should be discovered in the future.

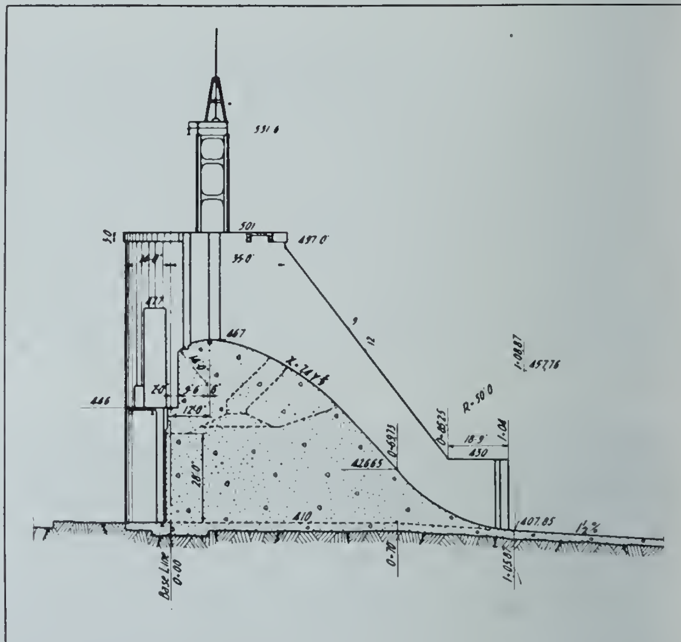

Fig. 8—Cross section through sluiceway.

The excavation and preparation of the foundation for the east bulkhead would not have been such a serious matter had it not been for rock falls that began to occur from the face of the cliff after the work had progressed well into the cut. The cliff had been carefully scaled and appeared to be perfectly safe, but it is probable that the heavy blasting that had been carried on over the rest of the job for a period of almost two years had loosened some of the joints. The first warning came with the fall of a mass of rock from a point about 100 ft. up that almost buried a shovel working in the cut. Fortunately the shovel runner had swung the boom toward the open end of the cut and was not injured, but the shovel had to be dragged out and sent to the shop for major repairs. Various scaling operations were tried in an effort to remove the hazard from this source but finally the whole face of the cliff, from top to bottom, had to be sliced off to a depth of about ten feet, removing 15,000 cu. yd. of solid rock in the process, before it was considered safe enough to resume work. The author has a great deal of admiration for the men who worked on that job. Realizing, as they did, the danger of the work, in spite of all the precautions taken and safeguards provided, they carried on day after day without hesitation until the job was done.

The east bulkhead, like the rest of the dam, is built in sections about 50 ft. long. The most westerly section rests on undisturbed rock. The fractured rock under the other sections is progressively deeper toward the east end owing to the slope of the footwall of the fault. For this reason the Company's geologist, Mr. Irving B. Crosby, M.E.I.C., in view of the possibility of unequal settlement between the sections, recommended that some form of seal should be provided in the vertical construction joints to prevent seepage through the joints should such settlement occur. After giving the matter some consideration it was decided that the type of seal provided in the other vertical joints throughout the dam would be adequate for this purpose. These seals were adapted from those used in the Chonchas dam in New Mexico where the possibility of unequal settlement was anticipated, and were constructed as follows:

1. A six in. dia. vertical hole was formed in the concrete centered on the joint and six feet back from the upstream face of the dam.
2. Twenty-ounce copper sheets were formed around the upstream semi-circumference of the hole and projected into the concrete on each side a distance of 12 in. The horizontal joints of the sheets were soldered together and the vertical edges were reinforced with two 1 by 1/4 in. steel bars.
3. The hole was filled with a plastic asphalt compound that retains its plasticity at relatively low temperatures. Numerous tests were made on various plastic materials until one was found that filled the various requirements.

To uncover the bed rock at the site of the sluice section and the west bulkhead and along the discharge channels, it was necessary to excavate 230,000 cu. yd. of overburden. This material was stripped by power shovels and trucked to spoil banks on the hillside a short distance downstream. Owing to the great depth of the overburden at the end of the west bulkhead the excavation for the corewall, which projects beyond the bulkhead a distance of 90 ft. was made

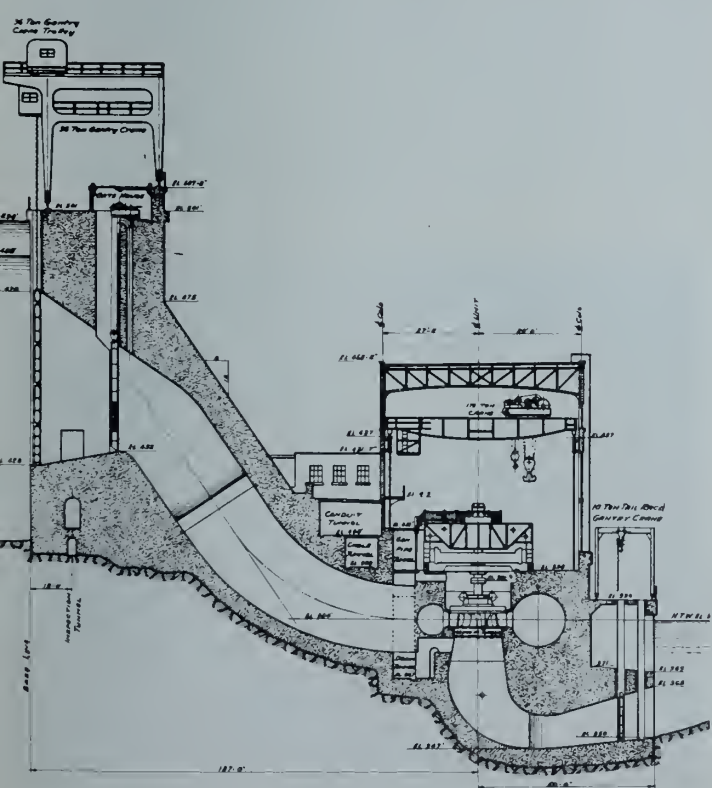

Fig. 9—Cross section of intake and power house on centre line of generator.

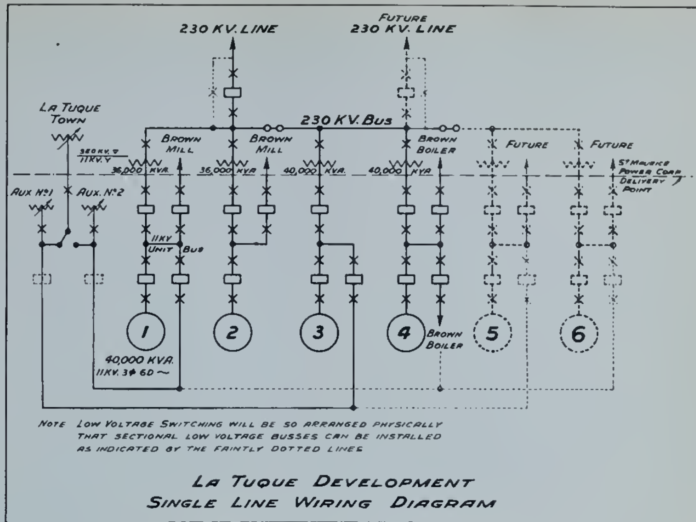

Fig. 10—Single line diagram of electrical layout.

by tunnelling. The tunnel was driven along the gradually rising rock to the point where the rock surface was about four feet above normal headrace level. The foundation of the corewall was prepared by barring off any loose rock encountered. The concrete was poured against the sides of the tunnel cut by removing the sheathing just ahead of the pouring, care being taken to fill with concrete any caves that had occurred in the tunnel walls. The corewall was brought up to the level of the top of the dam and the upper part of the tunnel was backfilled.

Construction

Probably the most important change that has taken place in the Company's construction procedure, during the past few years, has been in connection with the planning of the work. In the old days the head office planning was confined largely to an outline of the general construction methods, leaving to the field organization the task of filling in the details. Frequently, especially during the busy Twenties, the superintendent was hustled onto the work from another job, with little time for preparation and only the specification drawings and a few sketches to give him an idea of what he was supposed to build, and was expected to form an organization and make a good guess as to what his requirements would be for the next two or three years. It was a good bit to expect of a superintendent, no matter how experienced, and the result was that he usually grabbed all the construction equipment he could lay his hands on, in the hope that he would find it useful, and sometimes found, later on that he had placed some of his temporary structures in positions that interfered with the permanent works. The method was not conducive to economical construction.

Beginning with the Toro storage dam on the Mattawin, in 1929, a change in procedure was initiated by laying out part of the construction plant in the office. This process was further extended in 1931 when beginning the construction of Rapide Blanc development, with such good results that, when the final design and detailing of the La Tuque development was begun in the fall of 1937, the layout of the construction plant and the scheduling of the various operations was begun at the same time and carried out in complete detail. The decision of the Corporation to proceed with the construction raised the problem of making a 1935 estimate fit 1938 conditions. In the face of an increase that had occurred, in the meantime, both in labour rates and in the cost of materials and equipment, this could not have been accomplished without the most careful planning of construction plant and procedure and the closest supervision of the work. Figure 11 shows one of the 205 construction plant drawings. It illustrates the plant layout for excavating the power-house cut and the tailrace.

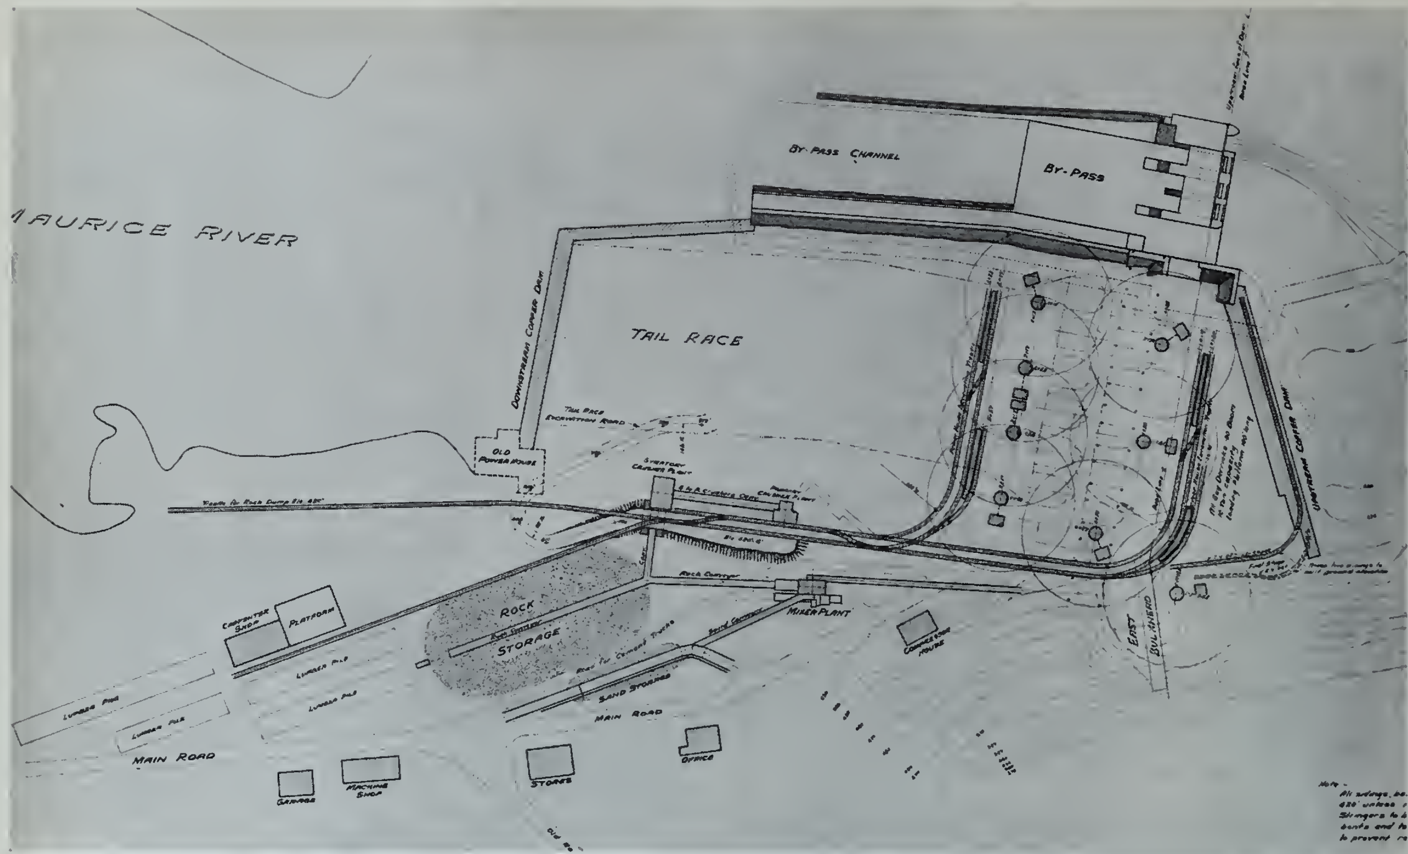

Fig. 11—Plan showing layout of construction plant for excavation of power house and tailrace.

The results of this careful planning are well illustrated by a brief comparison of an earlier job with the La Tuque job. La Gabelle development was built in 1924. It was considered to be a well built job and the unit costs, for the period, were low. However, if the unit costs for concrete and excavation at La Tuque had been the same as those for La Gabelle, these two items alone would have increased the cost of La Tuque project by almost $1,500,000.00. This is not entirely due to the advantages of more careful planning, however, but reflects also the improvement that has been made in construction plant and the difference in construction methods.

The construction plant used at La Gabelle was typical of the period. Transportation on the job was by dump car and steam dinkey, with tracks, more than 11 miles of them, radiating from the construction yard to all parts of the job. Most of the mucking was done by hand. The concrete was carried from the central mixer plant, in hoppers on flat cars, to wooden concreting towers located at various points on the job and distributed from these to the forms by chutes. At La Tuque, on the other hand, transportation was mostly by motor truck, with a small amount of rock hauled by gasoline locomotive. Most of the mucking was by means of power shovels. The concrete was carried from the mixer plant by belt conveyors to hoppers located at various points along the dam and handled by derricks to the point of deposit in the forms in two-yard, bottom-dump buckets. The location of derricks and of the various temporary structures was very carefully studied so that they would be of use in as many operations as possible without unnecessary shifting.

One of the first and most important steps in determining the type and the layout of the equipment consists in the preparation of the construction schedule. This is prepared in reverse to the order of construction. Assuming that the construction is to be started early in 1938 and that the date of completion is set for January 1, 1941, in order that the fourth generator will be erected, dried out and tested by that date its erection should be begun by November 1, 1940. Six weeks allowed for each generator would place the beginning of erection of Generator No. 1 about June 15th. At this time, in order to avoid congestion in the power house the erection of the four turbines and the concreting inside the power house should be completed. An allowance of a month for each turbine will mean that turbine erection should start February 15th. This fixes the date of the closing in of the power house superstructure, and so on until the schedule is complete. After this first key schedule has been drawn up the sequence of operations on the various parts of the work is outlined in detail and finally, knowing from the estimate the quantities of construction materials to be handled in the time allotted by the schedule, the type, duty and location of each piece of construction equipment is determined and the dates fixed for the ordering and delivery of construction materials and of the permanent equipment. This planning of the construction procedure in co-ordination with the design of the permanent structures enables the field organization to concentrate on the economical operation of the job and on the quality of the workmanship, which keeps them busy enough, and at the same time permits modifications to be made in the arrangement of the permanent structures that may be conducive to more economical construction.

The construction of La Tuque development was begun in March 1938 with the clearing of the site of the construction plant and the erection of some of the construction buildings. One of the first operations was the building of No. 1 cofferdam for the unwatering of the diversion channel on the west side of the river. The swift current in the deep channel near the west bank presented a problem in that it was necessary to construct the first cofferdam across this channel. The first crib of the cofferdam was located in a comparatively quiet eddy formed by a point of rock that projected into the river a few hundred feet upstream from the line of the dam. This crib served as an anchor for the rest of the cofferdam and from it the cofferdam was built diagonally downstream across the deep channel, gradually crowding the current to the other side of the river bed. The east end of this part of the cofferdam rested on a ridge of rock some points of which projected above the water to form small, rocky islands. From these islands the cofferdam was continued downstream parallel to the shore to the lower end of the by-pass channel, a distance of about 800 ft.

The control works of the by-pass channel consisted of four water passages through the lower part of a portion of the sluice section. One of these passages had a clear width of 50 ft. and the other three were each 21 ft. wide. The rock excavated from the by-pass channel was crushed by two 16 in. gyratory crushers set up temporarily on the west bank, and transported across the river to the mixer plant on a belt conveyor carried by a light steel truss bridge consisting of three 115 ft. spans supported on timber crib piers. In addition to the conveyor, the bridge carried a walkway. Concrete for the control works was brought across the river on the same conveyor, transported to the structure in two-yard bottom dump buckets on cars drawn by gasoline locomotives and handled into place by derricks. In order to prevent scour in the by-pass channel, the bottom is paved with concrete for a distance of 600 ft. below the dam. Upon completion of the control works, the upstream section of No. 1 cofferdam was blown up and the water diverted through the by-pass channel by the construction of cofferdam No. 2.

The construction programme was based on a period of two years and nine months beginning in March 1938 with completion of the project by December 31, 1940. In order to direct and control the work, a comprehensive schedule was prepared at the beginning showing the amount of work to be done, with the starting and completion dates for each item. Construction of the development may be divided into three main sections or periods each representing a definite phase.

The primary phase includes all work from the beginning of construction to the diversion of the river through the by-pass channel in November 1938. During this period the site was cleared, the railway siding completed, the permanent and temporary roads and bridges finished and the construction of all temporary buildings, as well as provision for water supply, fire protection, communication power supply and distribution completed. To complete the installation of derricks and shovels and of the rock crushing and concrete mixing plants with their conveying systems, storage piles and bulk cement-handling facilities in time to meet the excavating schedule of July 15 and the pouring of concrete on September 1 was a difficult and strenuous task but was successfully accomplished. Other work completed in the initial stage of construction was the stripping and opening of the sand pit, the installation of adequate facilities for the handling and transportation of all material from the railway siding to the job, the building of wharves and scows for the transporting of construction plant and other necessary material to the west bank of the river, the construction of the light steel bridge with conveying system for the handling of rock from the temporary crushing plant on the west bank to the rock storage pile near the mixer plant and for the transportation of concrete to the diversion channel structures as well as numerous miscellaneous details to make this portion of the installation a well-integrated layout.

Fig. 12—General view of construction plant.

Fig. 13—Interior of power house.

The construction buildings consisted of an office building, machine shop, carpenter shop, electricians' shop, concrete laboratory, drill sharpening shop, stores building, dynamite store, which was located on the west bank half a mile from the dam site, and garage. The main units of construction plant were the mixer, the crusher and the compressor plants.

The mixer plant housed two Smith mixers of two cu. yd. capacity each. Cement and aggregates were fed to the mixers from bins located in the upper part of the building. The designed proportion of the aggregates was maintained by means of weighing hoppers, the feed to the cement hopper being actuated by a photo-electric cell. Consistency of the mix was closely watched by inspectors under the direction of a concrete technician and the strength was checked by samples taken at regular intervals during the day and tested in the laboratory.

The concrete, as has been mentioned before, was transported from the mixer plant by a belt conveyor to hoppers located at various points along the line of the dam. From the hoppers it was handled by derricks to the point of deposit in the forms, in two-yard bottom-dump buckets. The concrete was placed very dry and compacted by vibrators. Our experience with vibrators was not entirely a happy one. This was not due to any fault of the vibrators themselves but to the ease with which the foremen found they could move the concrete from one part of the form to another and their tendency on this account to have the concrete deposited at one point, possibly more easy of access than others in the form, and to use the vibrators to make it flow to the corners and other less accessible places.

The crusher plant contained a 42 by 48 in. jaw crusher and the two 16 in. gyratories already mentioned as having been installed temporarily on the west bank during the excavation of the by-pass channel. The first cut to be made after the completion of the power-house cofferdam was the excavation for the draft tubes. This cut was more than 40 ft. deep. The rock was mucked by power shovels into skip boxes and hoisted by derricks to side-dump cars on a trestle along the downstream side of the cut. The cars were drawn by gasoline locomotives to the crusher plant where the rock was reduced to a maximum size of four inches. At the crusher plant it was screened and then carried to and distributed along the storage pile by belt conveyors. From the storage pile the rock was taken by belt conveyor,

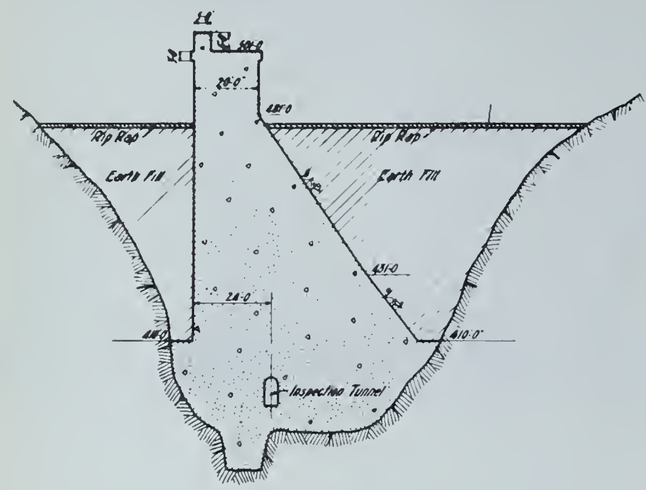

Fig. 14—Cross section of east bulkhead.

operating in a tunnel underneath the pile, to bins at the top of the mixer plant.

Upon completion of the draft tube cut the excavating equipment was moved to the tailrace and to the west bank, these two parts of the job being carried on simultaneously. The tailrace excavation was begun about 750 ft. below the power house and carried level at El. 374 for a distance of 480 ft., from which point it sloped down on about a 10 per cent grade to meet the outlet of the draft tubes at El. 350. From the tailrace cut the rock was transported by trucks to the crusher plant or to a spoil bank a short distance downstream.

The compressor plant had an installed capacity of 2,300 cu. ft. of free air per minute when operating against a pressure of 100 lb. per sq. in. The two larger units (1,040 c.f. per min. each) were of the horizontal reciprocating type, two-stage compression with inter-coolers and after-coolers. Each unit was direct connected to a 200 hp. synchronous motor. The small compressor was of the rotary type (220 c.f. per min.) direct connected to a 50 hp., S.C. motor. The installation was complete with control equipment, intake filters and air receivers.

Owing to the proximity of the job to the town of La Tuque it was not necessary to build camps for the men except at the peak of the work when additional accommodation had to be provided for about two hundred. During the thirty months when the work was in full swing, La Tuque was a boom town as in that period more than $2,000,000.00 was paid out in wages, most of which was spent in the town.

La Tuque is on the National Transcontinental Division of the Canadian National Railways. A siding from this line was built to serve the job about one and one-quarter miles from the dam site and connected with the construction yard by a road which was surfaced for a width of 20 ft. with a hot-mix asphaltic-concrete pavement. Facilities were provided at the siding for unloading and handling of construction materials and of equipment. Cement came to the siding in bulk and was unloaded by a conveyor into two steel silos with a capacity of 350 tons. From the silos it was drawn to the job as needed in special tank-body semi-trailers. More than 1,200 car loads of miscellaneous materials and 1,400 car loads of cement were received at the siding during the course of the job.

The provision of good sand in sufficient quantity for a job of this size is usually a serious problem on the Upper St. Maurice. However the region around La Tuque is exceptional in this respect, as prospection showed. Several large deposits of sand suitable for the concrete were found within reasonable trucking distance of the job, the one having the best grading and the most uniform quality being located within two miles of the site and about three-quarters of a mile from the siding. The sand was dug from this pit by a gasoline shovel and transported by trucks to the sand storage pile from which it was carried by a belt conveyor to a bin at the top of the mixer plant.

The construction of cofferdams in 1938, which is designated as auxiliary work, amounted to 35,000 cu. yd. or to 70 per cent of the total built. The only permanent work done prior to the passing of water through the by-pass during the primary phase was the removal of 125,000 cu. yd. of excavation and the pouring of 39,800 cu. yd. of concrete equivalent to 18 per cent and 14.7 per cent respectively of the total quantities involved. The diversion of the river from its regular course into the by-pass channel on the scheduled date of November 29th by the removal of a cofferdam in one blast completed the initial phase of the work.

The secondary phase involved the substantial completion of excavation and mass concrete work and the closing-in of the power-house and gate-house superstructures ready for the installation of equipment by the end of November 1939. This period is usually regarded as one of "operation" and, outside of the uncertainty of unwatering and the danger of flooding, causes no particular worry. It is the phase of mass production when various units of construction plant have an opportunity to demonstrate their efficiency and adequacy as an operating unit. The volume of excavation removed in this period amounted to 500,000 cu. yd. or 70 per cent of the total. The pouring of concrete could not be started until June 15 when unwatering of the main river sections following the spring flood was completed. In the following five months, 150,000 cu. yd. or more than 55 per cent of the total concrete of 270,000 cu. yd. was poured, an average rate of 1,200 cu. yd. per day.

The scheduling and control of this portion of the work was comparatively simple as the plant installed during the early stages of the job was designed for a given purpose and no difficulty was experienced in keeping the work up to schedule, with the single exception of the east bulkhead where the extensive faulting, previously mentioned, increased the volume and difficulty of excavating the foundation considerably and doubled the quantity of concrete. This forced the work into the first quarter of 1940.

The final stage consisted of installing the hydraulic, electrical and auxiliary equipment, closing the by-pass channel and raising the water to normal operating level, the pouring of final concrete and the finishing of a host of details to properly complete the job.

The various schedule dates were maintained with the exception of the by-pass closure which could not be started until after the 1940 spring flood had dropped off to 25,000 c.f.s. While this date was based on an average of a 13-year record of river flow plus ten days for contingency, the flood was late in starting and of longer duration than previously experienced.

Immediately after the spring flood, the closure of the 50 ft. opening in the control works of the by-pass channel was made by means of the sluice-gate stop logs. Some doubt was expressed as to whether the stop logs would go down of their own weight through the swift current that was flowing through the openings to a depth of 15 ft. Several years before, when one of the sluice gates at La Gabelle got stuck in the open position, it had been found necessary to close the 50 ft. opening with similar stop logs and no difficulty was experienced. Recently published results of tests n models showed that, under the conditions at La Tuque, the stop logs would not go down without assistance and accordingly pile hammers were provided at each end to force them down if necessary. The hammers were not used. The closure of the other three openings was made by means of special fixed-roller gates which were left in place after the concreting of the openings was completed. The closure was delayed by ten days and as a result the turning over of No. 1 unit was nine days behind schedule. The remaining three units went "on the line" slightly ahead of schedule with the final unit producing power on November 26 against a scheduled date of December 1.

The detailed schedule worked out at the beginning of the project was an indispensable tool in controlling and directing the work at all times. It was followed in detail for specifying the delivery of all material and equipment and gave constant warning to the drawing office of the dates on which drawings would be required in the field. One of its most valuable uses was in estimating the monthly expenditures in advance of requirements in order that suitable arrangements could be made for financing.

The dismantling of construction plant and temporary buildings is a mournful operation for the construction forces for they realize that it is the beginning of the end of a project which has absorbed their whole attention for many months and in which each one has played an important part. Their feeling is truly genuine and when they ask "where next" those who planned the project can appreciate their regret for they too have been a part of it.

Conclusion

In 1937, as the time set for the construction of La Tuque development approached, there was considerable discussion as to whether it should not be postponed for a year or two. The rate at which the load of the Shawinigan Company was growing indicated that power from this development would not be needed before the spring of 1942 and it was difficult to see how very much could be absorbed before then. However, certain commitments that had been made rendered it desirable to proceed with the construction in 1938 and it was then suggested that a four year construction programme be adopted instead of the three year programme on which the estimate was based and which, in our opinion would result in the most economical construction. Comparative estimates showed that both in first cost and in the long term results of the operation of the plant the three year programme would be the more economical from the standpoint of the St. Maurice Power Corporation but that the other would have decided advantages for the Shawinigan Company on account of its contract to take certain blocks of power when the plant came into production. During the past few months, the author has often thought how fortunate it was that the directors of the Company took the attitude that they did and decided to proceed with the construction on the basis of the most economical first cost, that is on a three year construction programme. To bring almost 200,000 hp. of additional capacity into production at this time has been of vital importance to the war effort of the Dominion.

Three units at La Tuque have been operating at full load almost continuously since the power house was put into service delivering 37,000 kw. each, and at times all four units have been in operation with a total load of 142,000 kw.

Associated with the Shawinigan Engineering Company on the work were, Mr. Hardy S. Ferguson, M.E.I.C., Consulting Engineer, Mr. Irving B. Crosby, M.E.I.C., Consulting Geologist and Mr. J. Cecil McDougall, M.E.I.C., Architect. The author is indebted to Dean Ernest Brown, M.E.I.C., of McGill University, for his assistance in the preparation of the section of turbine testing and to Mr. R. E. Heartz, M.E.I.C., Assistant Chief Engineer of Shawinigan Engineering Company, in the preparation of the section dealing with construction.

ENGINEERING TRAINING FOR NATIONAL DEFENSE IN THE U.S.A.

A. A. POTTER

Dean of the Schools of Engineering, Purdue University, Lafayette, Ind., and Consultant, U.S. Office of Education

Paper to be presented before the General Professional Meeting of The Engineering Institute of Canada, at Hamilton, Ont., on February 6th, 1941.

The United States of America has set out upon an armament program which has as its objective the doubling of its Navy and the quintupling of its Army in addition to large quantities of armaments for Great Britain. All facilities are being mobilized to insure speed and efficiency in carrying out this program. It is realized that the production of modern mechanized armaments on the scale contemplated requires not only millions of people who are skilled as mechanics but also large numbers of engineers who are competent in a wide variety of technical and supervisory services. One out of every ten employees of the aeroplane industry must be an engineer, as 250,000 man-hours are required to design a modern military plane. It takes about 25,000 blueprints for the construction of a medium size tank, and a modern battleship costs five to eight million dollars to design and involves drawings which weigh tons. Already an acute shortage of technical engineering talent exists in certain of the industries as well as in the Army and Navy of the United States of America. The aeroplane industry reports serious shortages in engineers who can design, test and maintain aeroplanes. Needed also are thousands of additional engineers who are competent as designers of tools, dies, jigs, or in part analysis, shop layout and cost estimates of labor and materials. Additional engineering inspectors are needed by industry as well as by the Army and Navy with knowledge of materials, physical testing, X-ray inspection, radiographic technique and explosives, and automotive and electric communication equipment. There is also a substantial shortage of machine designers, metallurgists, naval architects and marine engineers. Besides the needs for technical engineering specialists, industry is confronted with a shortage of industrial engineers and engineering supervisors to speed up the production of equipment necessary to the present armament program—engineers who are familiar with industrial organization, time and motion study techniques, production control, material handling and storage, inventory, budgetary and accounting control, industrial safety and industrial relations.

During the first World War the engineering schools of this country were responsible for the major portion of the vocational training program for the U.S. Army. The Vocational Division of the Students' Army Training Corps was mainly concerned with the training of mechanics and little attention was given to defense training on the engineering school level. During the past twenty-three years, the U.S. Government has co-operated with the various states in the development of a nation-wide program of vocational education of less than college grade. As a result of this, there are available in the U.S.A. over 1,000 public vocational schools with a plant valued at more than one billion dollars. The Congress of the U.S.A. has appropriated to the U.S. Office of Education for the present fiscal year, ending June 30, 1941, a total of 66½ million dollars for a vocational education program of "less than college grade." This vocational educational program is being administered in every state under the State Board of Vocational Education and is carried on mainly in secondary schools and trade schools. Much of this program is concerned with supplementary evening courses for individuals now employed in industry. Pre-employment full-time courses are also administered to increase the supply of workers essential in the National Defense Program. It is expected that, during the present fiscal year, the skills of more than 500,000 people will be increased through this vocational educational program of "less than college grade." No tuition is paid by those receiving instruction.

Engineering colleges realize that their greatest contribution to our armament program will come by undertaking the type of training for which they are best equipped, that is, training on the "engineering school level," rather than vocational trade courses which can ordinarily be taught more effectively by trade and vocational schools. By college level is meant instruction comparable in difficulty and prerequisites with courses included in engineering curricula. The leaders in the engineering profession as well as in the Army and Navy of the United States of America are insistent that the engineering schools of this country should maintain during the present emergency the strongest possible programs of undergraduate and graduate instruction and should increase their research efforts so that an adequate supply of well trained and creative engineers is assured. It is felt, however, that many of our engineering schools have special facilities which may be utilized advantageously, without interrupting their regular programs, in making available to our defense industries and to our Army and Navy additional and more competent engineering specialists. Congress has appropriated on October 9, 1940, to the U.S. Office of Education nine million dollars to be used in reimbursing engineering schools up to June 30, 1941, for the administration of the following programs:

1. In-service training programs for the purpose of upgrading the engineers and supervisors now employed in industry. More than 30,000 of the engineering and supervisory staffs, employed in defense industries, are now enrolled, mainly outside of working hours, in classes which meet two or more times every week. Some of these classes are in the nature of refresher courses and cover subjects ordinarily given during the first three years of an engineering college curriculum. The majority, however, are enrolled in advanced classes in design and industrial engineering. Present indications are that this in-service training program will have to be greatly extended and enlarged during the next few months. Through this type of training, engineering schools are in a position to speed up the armament program and to improve the product of defense industries without interrupting their regular collegiate engineering instruction on the campus.

2. Intensive resident program of study are being set up for the benefit of commissioned officers of the Army and Navy and for those who are interested in preparing for the specialized engineering positions now open in the defense industries or in government employ under the regulations of the U.S. Civil Service Commission. These intensive courses are about three months in length and are open to those who have had some formal engineering education, usually about three years, and considerable experience. As a concrete illustration: The Air Corps of the U.S. Army has at present fifty cadets, in each of two engineering schools, who are being given an intensive three-month course in aerodynamics, airplane structures, airplane power plants and airplane instruments. The majority of these cadets are engineering college graduates and are being prepared for commissions in the Air Corps of the U.S. Army as squadron engineering officers. It is expected that about 600 of such squadron officers will be trained during the next few months. Due to the fact that nearly all of the engineering college graduates are well placed in industry, the resident intensive

program is not developing as rapidly as is the in-service program. It is expected, however, that at least 10,000 will benefit by this program between now and June 30, 1941.

Up to December 30, 1940, a total of 444 engineering defense training programs have been approved to be administered by 91 engineering colleges in 44 states, the District of Columbia and Puerto Rico.

The engineering defense training program is administered under the Chief of the Division of Higher Education of the U.S. Office of Education, Dr. Fred J. Kelly, with Dean R. A. Seaton on leave from the Kansas State College as Director of the program. An Advisory Committee on Engineering Defense Training, which is representative of the engineering and engineering teaching profession, has been set up by the U.S. Office of Education to aid in formulating policies for the in-service and intensive training program on the engineering school level. Contacts between Washington and the engineering colleges and the defence industries are maintained by twenty-two regional advisers appointed by the U.S. Office of Education.

Present world conditions demand that technology operates at full speed. The engineer's initiative as well as his creative and managerial talents must be used most extensively in the gigantic armament program of the U.S.A. It is hoped that the in-service and pre-service intensive program on the engineering school level described will prove helpful in meeting the present acute shortage for engineering specialists and will also improve the competence of employed engineers and engineering supervisors so that they may be in a position to design and build better armaments in the shortest possible time.

APPRENTICESHIP TRAINING IN INDUSTRY

The following material is sent to the *Journal* by the chairman of the Committee on Student Selection and Guidance of the Engineers Council for Professional Development (E.C.P.D.). Although the conditions described refer to the United States, the article is generally applicable to Canada.—*Editor.*

Dr. Robert A. Milliken, president of California Institute of Technology, said in part in his Phi Beta Kappa address for 1940:

"Let the point be emphasized as strongly as possible that steering students away from an attempt to enter that higher educational system when they do not show any capacity for solving analytical problems with success is not only the most kindly but it is also one of the highest forms of civic duty, since the success of our democracy depends upon it."

"But someone asks, 'What is to be done with the rest ?' It is a most amazing thing that in the development of our American educational system so little attention has been paid to the making of any provision for *the apprenticeship training in industry* of our manual and commercial workers who must constitute a large fraction of our population. We are far behind the whole of Europe, England, Australia, and New Zealand in this respect. That is the reason so many of our skilled mechanics and other workers are imported from abroad. Fortunately within the past few years some of our educational agencies have been waking up to this problem so that what is probably the greatest deficiency in the educational development of the United States is now being given some attention. In consequence what to do with the boy who wants to become a really skilled mechanic is now being attacked through the industrial apprenticeship plan so well developed in other countries."

The Engineers' Council for Professional Development is concerned with the organization of committees and engineers to counsel with high school boys as a community duty as well as a professional service.

REPORT OF COUNCIL FOR THE YEAR 1940

General

No organization can come through a war year such as 1940 without having its normal activities seriously affected. Such a convulsion, world wide in its interest and influence, fraught with the greatest of consequences for all mankind, reaches down to the basis of civilization itself, and naturally touches everything man-made that has grown up out of that civilization. The very existence of societies such as the Institute—in fact of all societies—may depend upon their abilities to prove themselves specially useful in such national emergencies and times of crises.

In reporting to the membership on another year's activities, Council has these facts seriously in mind, and is happy to record a twelve months period of unusual activity, special services and continued success. There remain many things to do—some of them already under way and others just emerging from the planning stage and doubtless others not yet conceived, before this Institute will be rendering its maximum of service to its members and to its country. Council acknowledges the favourable position to render national service, in which the Institute now finds itself; and is confident that with the continued and perhaps increased support of the members, much can be done that will be of material assistance in the conduct of the war.

Branch Activities

A perusal of the reports of branches which are appended to this report will indicate a successful year in each of the twenty-five separate organizations. The programme of papers has been excellent, and in several instances innovations have been introduced which have added materially to the general interest. Some branches have shown substantially increased activity both in their programmes and in their acquisitions of new members. It is not necessary to mention any branch specifically as all have set up a splendid record, and their activities are reported separately herein.

Visits to Branches

The president visited branches in all zones except the Maritimes. It was part of his original plan to call at branches from coast to coast, but the increased demands upon his time brought about by the great emergency and industrial expansion made it necessary to curtail the programme. This has been a disappointment to the branches that were omitted, but it has been an even greater disappointment to the president. In all, the president visited fourteen branches.

The general secretary made thirty visits to branches including Halifax and Victoria.

There was also considerable visiting of councillors and officers between branches, a conspicuous example of this being the visit of Councillors Vance of London and McLeod of Montreal to the western branches in the company of the president. Past President Lefebvre of Montreal was also a member of this party. The value of the exchange of speakers between branches and the visits between members and officers cannot be over-estimated. It is to be hoped that every member will take advantage of any such opportunity that is presented, as in this way the life of branches is considerably stimulated.

Council Meetings

Council held eleven meetings including three away from Headquarters. All meetings were well attended, and it was very gratifying to see so many out of town councillors present. The interest shown in the regional meetings would seem to justify the continuation of this practice. These meetings were held at the following branches and the bracketted figures show the attendances, including guests as well as councillors: Toronto (55), Windsor (33), Calgary (39).

Co-operation

In addition to the co-operation mentioned later under "International Relations" considerable progress has been made on "domestic" co-operation. This falls into two classifications (a) that with provincial professional associations, and (b) that with other engineering institutes.

Under "a" there are two agreements to be recorded. In January, President McKiel and the general secretary visited Halifax to participate in the ceremony of signing the co-operative agreement with the Association of Professional Engineers of Nova Scotia. This has been operative throughout the year, and already has gone a long way towards "total" co-operation for the engineers of Nova Scotia.

The other agreement was signed in December, at Calgary, between the Association of Professional Engineers of Alberta and the Institute. President Hogg was the Institute's senior signing officer and was also the principal speaker at the joint dinner which marked the occasion. This agreement became effective in January 1941 and is expected to do much for the profession in that province.

Acknowledgment is made of the courtesies and aid afforded the Institute by the officers of both these provincial bodies. The consummation of the agreements is due entirely to the tireless and intelligent efforts of these officers associated with the Institute officers within the province. The breadth of vision and the sincerity of purpose in both cases is exceedingly commendable.

Under "b" there is to be considered the relationships with other engineering bodies in Canada. Based on a desire for genuine co-operation between all engineers, every effort has been made to retain close relationships with other engineering organizations. Beyond a doubt common interests should promote common efforts, and common efforts should produce that community of spirit which is so desirable throughout the profession. Two common interests have developed out of the war to produce common efforts that have brought all engineering bodies much closer together. These are the registration of technical personnel in Canada which was carried out with the co-operation of fifteen organizations, and the evacuee proposal which has been referred to elsewhere. It has been not only interesting but pleasant to work with these other societies, and it is to be hoped that the co-operation thus developed will find many more problems that will permit the continuation of this splendid spirit. The two Institutes which have been most closely associated with the Engineering Institute in these proposals are the Canadian Institute of Mining and Metallurgy and the Canadian Institute of Chemistry.

By-Law Changes

The abolition of the grade of Associate Member was accomplished with very little disturbance to the usual routine. The ballot authorizing the change was one of the most emphatic that has been recorded, and there appears to be no doubt but that the simplification in nomenclature was strongly desired by the membership. Thus the way to further co-operation with provincial professional associations has been simplified.

International Relations

It is doubtful if the Institute ever has been more closely associated with engineering societies in England and the United States, than it is at the end of 1940. Several circumstances have brought this to pass. The close relationships and the new contacts established through the negotiations and arrangements for the ill-fated British American Engineering

Congress in the fall of 1939 were carried forward to last year, and were further augmented by similar negotiations leading up to the organization established in Canada for the care of children of English engineers who might desire to send them here for the duration. These plans, like those for the engineering congress, were never put to the test due to the heinous methods of the Hun who ruthlessly destroyed the children rather than permit them sanctuary in Canada.

The one good thing that has already come out of all these negotiations is the closer relationship between the societies. The Institute in company with the other Canadian organizations that were associated in the evacuee proposals, has made many friends in the Old Country, and numerous letters have been received testifying to the warmth of the new relationships and expressing the desire that they should be continued and extended.

Our good neighbours to the south have continued their beneficial interest in our organization and have done much to reduce the international boundary to its mere geographic significance. The attendance of the chief officers of the American Society of Civil Engineers and the American Society of Mechanical Engineers at our Annual Meeting in Toronto was greatly appreciated, as it has always been. The assistance received from the executive officers of these societies has been of great value and, in company with the interest of the chief officers, has promoted very close relationships between the organizations—a matter of more than usual importance in these days of threatened agression, when understanding and co-ordination are so necessary if we are to preserve the precious privileges of life in North America.

Engineering Council for Professional Development

Certainly one of the most significant events of the year was the acceptance of the Institute's application for membership in the Engineers' Council for Professional Development (E.C.P.D.). This body is made up of the leading technical societies in the United States and has a most significant programme for the development of the professional spirit in engineering, and for the guidance and assistance of young engineers. Its field of influence is increasing constantly and beyond a doubt the welfare of the individual engineer and the entire profession will be greatly and favourably affected by it in the future. The Institute is happy to associate itself with its sister societies in carrying out such a splendid work.

Voluntary Service Registration Bureau

One of the most far-reaching proposals with which the Institute has been associated is the register of technically trained men, which was undertaken late in 1938 at the request of the Department of National Defence, and in association with the Canadian Institute of Mining and Metallurgy and the Canadian Institute of Chemistry. In 1939 these records were turned over to the Voluntary Service Registration Bureau, and were designated the "technical section" of that bureau. During 1940 the Joint Committee of Secretaries made several endeavours to have more use made of these records but in spite of appeals to various officials who it was thought would be interested, no changes were made, and in the opinion of the committee the great volume of vitally important information continued to be neglected.

Just at the close of the year, an approach to the Institutes was made and there is now the possibility that new and increased avenues of national service may be opened up. If arrangements now under discussion are completed a great responsibility will fall on the shoulders of these three national bodies, which will require the loyal and active support of every member.

Radio Programme

An innovation was added to the year's normal prorgamme, in the form of a series of six trans-Canada broadcasts arranged by the Radio Committee. The speakers were all prominent members of the Institute and, each spoke on a phase of engineering in which he was specially qualified. Reports from members and from the Canadian Broadcasting Corporation indicate that the series was well received, and made a real contribution to the "literature of the air" for 1940.

Annual Meeting

A review of the year's activities would not be complete without special comment on the conduct of the Annual Meeting held in Toronto. From every angle the meeting was a real success, and Council is particularly appreciative of the policy adopted by the committee whereby the cost to the Institute was so substantially reduced. The quality of the papers and discussions was excellent; the luncheon speakers were unusually interesting and the principal of McGill University as special guest at the banquet provided a thought provoking discussion on a timely and interesting topic. Toronto certainly maintained its reputation of doing things well.

Finances

It is a source of much gratification to the Finance Committee that in spite of war conditions, the auditors statement for the year shows that both income and expenditure are slightly more favourable than last year. Actually the committee had budgetted for the reverse of this. The report of the committee and of the treasurer are appended and both refer with satisfaction to the annual statement. Great credit is due the Finance Committee for its conservative budget and its actual handling of the Institute finances.

Headquarters

There have been few changes in the personnel of the Headquarters staff. With the increase in membership and the assumption of additional activities, an increase in the volume of work has developed but this has been handled without any increase in staff. The entire organization has participated in an unusually heavy year, and has rendered an excellent service which is appreciated by Council.

The general secretary and his assistant have endeavoured to attend branch meetings as frequently as possible. This has resulted in an increased number of visits, and it is hoped that this practice can be maintained throughout the coming year.

Roll of the Institute

The membership of all classes now totals 5,120—the highest figure in fifteen years. The year 1940 saw the addition of 436 names to the roll, although deaths, resignations and removals reduced this to a net gain of 307. It is heartening to see a substantial increase in the student membership, and to note the increased number of transfers to higher classifications. If this acceleration can be maintained for one more year, the total of membership will reach a a new all time "high." The details are submitted herewith.

During the year 1940, four hundred and thirty-six candidates were elected to various grades in the Institute. These were classified as follows: one hundred and forty Members; eleven Associate Members; fifty-four Juniors; two hundred and five Students, and twenty-six Affiliates. The elections during the year 1939 totalled three hundred and fifty-four.

Transfers from one grade to another were as follows: Associate Member to Member, three; Junior to Member, twenty-five; Student to Member, nineteen; Junior to Associate Member, six; Student to Associate Member, twelve; Student to Junior, eighty-seven, a total of one hundred and fifty-two.

The names of those elected or transferred are published in the *Journal* each month immediately following the election.

Removals from the Roll

There have been removed from the roll during the year 1940, for non-payment of dues and by resignation, forty-eight Members; twelve Associate Members; thirteen Juniors; twenty-two Students, and three Affiliates, a total of ninety-eight. Twenty reinstatements were effected, and sixteen Life Memberships were granted.

Deceased Members

During the year 1940 the deaths of fifty members of the Institute have been reported as follows:

Honorary Member

Tweedsmuir, The Right Honourable Lord

Members

Ashworth, John Kershaw
Baldwin, Robert Archer
Barnum, John Baylor
Barr, Shirely
Bertrand, J. N. Têtu
Bridges, Frederick
Burpee, David William
Carson, William Harvey
Cartmel, William Bell
Chambers, Edward Coulthurst Gibbons
Chapman, Walter Peck
Evans, Edward Arthur
Gates, Archibald Bland
Gzowski, Casimir Stanislaus
Hay, Alexander Loudon
Howard, Stuart
Jamieson, James A.
Johnston, John Thomas
Macdonald, Arthur Cameron
Mackenzie, Howard Archibald
MacPherson, Duncan
McCulloch, Andrew Lake
McNab, James Veitch
McRae, John Bell
Mitchell, Samuel Phillips
Monsarrat, Charles Nicholas
Naish, Theodore Edward
Ogilvie, William Morley
Owens, Edward James
Palmer, Robert Kendrick
Paterson, Alexander Wilson
Potter, Alexander
Routly, Herbert Thomas
Sabourin, Alexandre Georges
Salter, Ernest Milton
Seymour, Horace Llewellyn
Smart, Valentine Irving
Smith, Frank Lawrence
White, James Alexander Gordon
Wilgar, William Percy

Associate Members

Bright, David Mussen
Gordon, James Lindsay
Logan, William Allison
McColl, Samuel Ebenezer
Sammett, Matthew Alexander
Shearer, George Wyman
Woods, Joseph Edward

Students

Allan, Robert Gage
Lalonde, Jean A.

Total Membership

The membership of the Institute as at December 31st, 1940, totals five thousand, one hundred and twenty. The corresponding number for the year 1939 was four thousand, eight hundred and thirteen.

1939	
Honorary Members	16
Members	1,057
Associate Members	2,287
Juniors	496
Students	914
Affiliates	43
	4,813

1940	
Honorary Members	15
Members	3,465
Juniors	588
Students	985
Affiliates	67
	5,120

Respectfully submitted on behalf of the Council,

T. H. Hogg, M.E.I.C., *President.*

L. Austin Wright, M.E.I.C., *General Secretary.*

TREASURER'S REPORT

The President and Council:

It is gratifying to see that notwithstanding our war effort plus the losses the Institute has sustained due to war service, the financial statement is still better than last year.

Care should be taken to conserve our resources through these favourable years, as it is possible that a prolonged war or a sudden cessation of hostilities may affect our financial position seriously.

Unfortunately, the recent damage to our building by settlement will necessitate spending a sum considerably larger than anticipated, but I feel confident that the membership at large will be willing to give some special help.

Evidently the Institute should have a much larger amount laid aside for depreciation on the building.

Respectfully submitted,

deGaspé Beaubien, M.E.I.C., *Treasurer.*

FINANCE COMMITTEE

The President and Council:

The statement of revenue and expenditure for the past year, which is presented herewith, reflects a continuation of the healthy growth of the previous year, and of the keen interest being maintained by the branches in Institute affairs. The revenue and expenditures have been maintained at practically the same level as 1939, again reflecting the loyal co-operation of the general secretary and the Headquarters staff, as well as the executive officers of the various branches.

The balance of revenue over expenditures will liquidate the moneys borrowed some time ago from the special funds, so that the incoming Finance Committee will commence work with a clean sheet. It has also been recommended by your committee that the sum of $1,000.00 be placed in reserve for building maintenance. Recent events have shown this to be imperative, and it should be continued in the future, whenever conditions permit.

Particular mention should be made of the policy of the Toronto Branch in assuming a much larger portion of the cost of the Annual Meeting than is ordinarily taken by a branch. This action has materially assisted the Finance Committee in rendering a favourable report for the year.

The recognition of the Institute in public affairs and by our sister societies to the south during the past year is an indication of our outstanding position in the country, and it behooves us to give our full and continued financial support to all its activities.

Respectfully submitted,

Fred Newell, M.E.I.C., *Chairman.*

PUBLICATION COMMITTEE

The President and Council:

During the year your committee has made one or two changes in the *Journal*, the most important of which we think is the substituting of our Month-to-Month page for Editorial Comment. In view of the nature of our organization it was found difficult to maintain a sufficiently interesting editorial comment without the danger of introducing controversial matter. It was, therefore, considered wise to discontinue the practice of editorials as a regular feature and to substitute our Month-to-Month column, in which is included news of the affairs of the Institute and engineering matters of general interest to the membership.

Your committee has frequently to consider papers of importance which are too long and too expensive to publish in the *Journal*. One of these was "Some Developments in Alloys During the Last Twenty Years," by O. W. Ellis, and your committee decided to print this as a supplement. This was made available to the members and published at a moderate charge, and at the same time was reviewed in the *Journal*. The immediate response to this has not been entirely satisfactory but it is felt that if the practice of publishing a few of these a year were continued that the membership would become acquainted with the idea and that it might become more popular.

As will have been noticed we have also instituted the practice of using a photograph on the cover page, which we feel has made an improvement in the general appearance.

Frequently we have referred papers to various members to obtain their opinion on the value for publication, and we wish to thank them for their kind co-operation. We also wish to acknowledge the assistance of the secretary emeritus, whose work on the *Journal* is invaluable.

Respectfully submitted,

C. K. McLeod, M.E.I.C., *Chairman.*

PAPERS COMMITTEE

The President and Council:

The activities of the Papers Committee during the past year were somewhat curtailed by the fact that most of the members are very busy as the result of the war. It was finally considered advisable not to arrange meetings to accommodate the itinerary of speakers visiting various branches. However, the branches have been active with meetings. They have had good speakers and interesting and instructive papers.

There has been a marked increase in the visits of members to other branches and inter-branch meetings.

During the year, the Papers Committee, wherever possible, has promoted more direct contacts between branches. It is found difficult to maintain an effective clearing house at Headquarters or any other point to assist with speakers, papers, films and branch programmes in general. A more direct exchange of ideas between branch secretaries and other branch executives is advocated. By broader exchange of notice-of-meeting cards, by invitations to near-by branches and by travelling engineers visiting other branches, a healthy impetus can be given to the activities of the Institute.

Respectfully submitted,

James A. Vance, M.E.I.C., *Chairman.*

COMMITTEE ON THE TRAINING AND WELFARE OF THE YOUNG ENGINEER

The President and Council:

Subsequent to the submission of the last annual report, as published on pages 70 and 71 of the February, 1940, *Journal*, several members of the Committee met informally at the time of the 1940 Annual Meeting at Toronto. We agreed on the need for the continuance of our investigations along the lines already adopted.

The Committee had the opportunity of presenting its findings to a very largely attended meeting of Council in Toronto, on February 7th, 1940, when constructive suggestions were offered by leading educationalists present. The incoming Council authorized the re-appointment of the Committee, and it has continued its studies.

Branch Activities

The Institute branches were circularized on April 9th, 1940, to ascertain, generally, what activities were carried out especially for the younger members, and what suggestions could be offered. The replies received were encouraging, and on July 8th, a circular was issued to the branches, through the general secretary, urging:

(a) More attention to the preparation of papers for the prizes available to Students and Juniors, and the need for additional prizes.

(b) The organization of Junior Sections in the larger branches, and Young Engineer Committees in all other branches, to stimulate activities among the young men, and to improve the contacts with University students and Faculties.

(c) The encouragement of self-development groups for the study of technical, cultural and economic subjects.

(d) The necessity for maintaining the dignity, the social and cultural standards of the profession, as an example for the younger men.

Members of the Committee have addressed the branches on the young engineer problem, and the discussions have indicated a continuing interest.

Student Selection and Guidance

Our attention has been directed to the preparation of a suitable brochure for prospective engineering students, their parents and teachers. We were ready to proceed with this, when Council decided to apply for association with our American friends in the Engineer's Council for Professional Development.

The E.C.P.D. was then preparing a revision of its booklet "Engineering—A Career—A Culture." The proofs were forwarded to this Committee and certain changes were suggested to make it more suitable for Canadian distribution.

After the Institute was regularly admitted to membership in the E.C.P.D., the final proofs were edited and the new booklet "Engineering As A Career," will be published shortly. This will be available for distribution by the E.I.C. It is possible that this Committee may propose the preparation of a small pamphlet for distribution with this booklet, giving more information for Canadian students.

Members of your Committee have discussed student guidance with educationalists, and we are definitely aware that the Institute can give leadership in this important phase of engineering education. We shall discuss this matter at the meeting, in February, 1941, when a definite programme will be adopted.

Engineers' Council for Professional Development

The action of the Institute in applying for membership in the E.C.P.D., and the formal acceptance of that application on October 24th last, will make available to your Committee the information gained by that body in the study of similar problems in the United States. It is a pleasure to be permitted to associate with them in the activities of their several committees.

The E.I.C. and the Adaptation of the Young Engineer to the Profession

There is an indication that many of the branches of the Institute are extending their activities among the younger engineers. It is expected that evidence of these activities will be presented at the Annual Meeting.

Your Committee is following, closely, the progress being made by the E.C.P.D. Committee on Professional Training. Their findings indicate that success in this field will depend on the skill, patience and enthusiasm of the older members of the profession who are willing to give their time to this problem.

The Young Engineer and the War

Some members have suggested that the work of this Committee might be suspended during the war period. They base their conclusions on the fact that engineers generally should devote their spare time to furthering the war effort, and that many young engineers are in the several services.

These conditions do exist, but it should be noted that we are part of a rapidly changing social order, in which the engineer must play a more active part. Young men are entering the profession each year, despite the war, and many others are passing from the secondary schools to the universities for training.

It will be recalled that some of the branches of this Institute were organized during and just following the last war, despite the fact that many of our members were on active service. It is our opinion that we must be ready to assume a greater obligation to society after this war is over, as then the studies of this Committee will be increasingly valuable, and their conclusions more definitely necessary.

Plenary Meeting

Your Committee appreciates the action of Council in making it possible to convene a plenary meeting at the Annual Meeting in Hamilton. Questions which have been studied will be thoroughly discussed and our conclusions will be presented to the Annual Meeting, at the afternoon session, on Thursday, February 6th, 1941.

Respectfully submitted,

Harry F. Bennett, M.E.I.C., *Chairman.*

LIBRARY AND HOUSE COMMITTEE

The President and Council:

Your Committee reports as follows. The Committee was continued with the same personnel as during the previous year. It met on four occasions in the last half of the year.

Early in the summer a crack appeared in the masonry of the rear wall of headquarters building and this developed slowly. There was no danger involved, but developments were watched and during the fall the matter was considered. We reported to Council and were authorized to spend $150.00 to investigate conditions and bring in definite recommendations.

Test pits were excavated and we recommended the underpinning of the auditorium section in whole or in part. Council authorized the Committee to prepare detailed plans on the basis of using open caissons or piers. They decided that the general situation warranted the underpinning of the whole building at one time rather than face the probability that all of the work would have to be done sooner or later and that there might be further cracking and damage to the superstructure if a part of the work was delayed. Council authorized the signature to a contract on whatever basis the House Committee and Finance Committee might jointly agree. They also arranged for the Finance Committee to suggest ways and means of providing necessary funds.

Tenders were called and received shortly after Christmas. The contract was awarded to A. F. Byers & Company Limited, who were the lowest bidders. The work at present is almost 50 per cent complete. Conditions uncovered during construction have confirmed the information and deductions provided by the test holes.

The above item has been the only major item of work and as it represents a considerable expenditure for the Institute, other minor points have been delayed. Small

COMPARATIVE STATEMENT OF REVENUE AND EXPENDITURE

For the Year Ended 31st December

Revenue

	1940	1939
Membership Fees:		
Arrears	$ 3,332.75	$ 3,459.52

Surplus for Year	3,221.61	4,210.93
	$54,467.53	$54,375.95

repairs were made to the roof over the caretaker's quarters. There are one or two minor repairs yet to be done in this section of the building. It will also be necessary to repair the plaster and do some re-decorating in the auditorium during the coming year after all possible settlement due to shifting loads has been completed.

The photographs of all past general secretaries of the Institute have been placed in the library as authorized last year.

The library has been used about the same as last year. It it hoped that the necessary clearing out of the basement to permit the construction work being carried out will provide an opportunity to rearrange the physical set-up of the library accommodations to the advantage of the Institute and the staff.

The Committee would like particularly to acknowledge the interest and support of Messrs. Jamieson, Lalonde and McCrory who were called in to assist in connection with the discussions about underpinning the building. These special appointments to the personnel of the House Committee were made at the suggestion of Council when this work was authorized.

Respectfully submitted,

Bryan R. Perry, *Chairman*

COMMITTEE ON INTERNATIONAL RELATIONS

The President and Council:

It is the considered opinion of your committee that the external relations of the Institute have been strengthened and extended during the year.

The entry of the Institute into constituent membership of the Engineers' Council for Professional Development is an event which should greatly increase the Institute's ability to render service to the engineering profession. The committee believes that the consistent policy of the Council in maintaining as close and continuous a connection as possible with the Founder Societies of the United States is in the best interests of Canadian engineers, and it notes with appreciation that opportunities have been afforded the general secretary to confer with the secretariat of these societies.

Although the preoccupation of the engineering Institutions of Great Britain in the present crisis has hindered further development of fraternal relationships between them and the Institute, the committee believes that no better opportunity for serving these institutions is open to the Institute than the chance to look after their members' families who may find sanctuary in Canada.

Respectfully submitted,

J. M. R. Fairbairn, m.e.i.c., *Chairman.*

COMPARATIVE STATEMENT OF ASSETS AND LIABILITIES

As at 31st December

Assets

		1940	1939
Current:			
Cash on hand and in Bank		$ 2,043.18	$ 432.38

		$126,683.19	$126,233.80

Audit Certificate

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December, 1940, and have received all the information we required. In our opinion, the above Statement of Assets and Liabilities and the attached Statement of Revenue and Expenditure for 1940 are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December, 1940, and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books.

(Sgd.) Ritchie, Brown & Co.,
Chartered Accountants.

Montreal, 20th January, 1941.

COMMITTEE ON PROFESSIONAL INTERESTS

The President and Council:

Much progress has been made during 1940 in promoting the declared policy of the Institute—close co-operation with the provincial professional associations. At Calgary, on December 14th, 1940, the president and the general secretary signed an agreement with the Association of Professional Engineers of Alberta which should go a long way to clarify and simplify the organization of the profession in the province of Alberta.

Active negotiations are under way with the Association of Professional Engineers of the Province of New Brunswick which promise an early and satisfactory conclusion.

It is expected that the discussion the committee has had with the officials of the Institute in the province of Manitoba will result in a basis for an agreement between the Institute and the Association of Professional Engineers of the Province of Manitoba that can be brought to fruition before long.

The relationship between the Institute and the Corporation of Professional Engineers of Quebec continues very close and friendly. No attempt has as yet been made to evolve a formal agreement between the two bodies.

The results in Saskatchewan and Nova Scotia indicate that the co-operative agreements in those provinces are working out in the best interests of the profession.

Your committee notes with satisfaction that in Ontario and British Columbia there are many evidences of an increased interest on the part of the profession in general regarding the aspirations of both the Institute and the Associations.

Respectfully submitted,

J. B. Challies, m.e.i.c., *Chairman.*

LEGISLATION COMMITTEE

The President and Council:

In view of the fact that no issues involving Institute legislation developed during the year, there remained no work for the committee to do. Doubtless this is a healthy sign, for the work of the committee is similar to the work of the lawyer of which the average citizen avails himself only when in trouble.

The committee would have been very happy to be of assistance had any issue arisen, but rejoices with the rest of the membership in the fact that there were no legislative difficulties to detract from the year's operations.

Respectfully submitted,

J. Clark Keith, m.e.i.c., *Chairman.*

RADIO BROADCASTING COMMITTEE

The President and Council:

Your Committee was appointed in February last, in order to arrange for a series of Dominion-wide broadcasts indicating the contribution being made by the engineers of this country toward the national war effort.

At first there was some uncertainty as to the possibility of giving the broadcasts, due to war conditions, but later the Canadian Broadcasting Corporation was able to allot six suitable fifteen-minute periods. Your Committee met on August 29th and drew up a tentative programme which was approved by the C.B.C., on September 5th. It was arranged that six addresses should be delivered on consecutive Wednesdays at 7.45 p.m. Eastern Daylight Saving Time, beginning October 16th.

Invitations were accordingly issued to the speakers on September 11th, and although these outstanding engineers were already occupied in work for the national emergency, all undertook this additional effort, in the interests of the Institute. Appreciating this fine co-operation, your Committee would ask that Council extend to the speakers of this series the thanks of their fellow-members, of the Institute, with compliments on the fine results attained.

The speakers and their subjects were as follows:—

Oct. 16th—T. H. Hogg, c.e., d.eng., (Toronto), President of The Engineering Institute of Canada.
Engineers in the War.

Oct. 23rd—Dean C. J. Mackenzie, m.c., m.c.e., (Ottawa), Chairman, National Research Council.
War Research—An Engineering Problem.

Oct. 30th—Miss Elizabeth M. MacGill, m.s.e., (Fort William), Chief Aeronautical Engineer, Canada Car and Foundry Co. Ltd.
Aircraft Engineering.

Nov. 6th—Augustin Frigon, c.e., d.sc., (Montreal), Assistant General Manager, Canadian Broadcasting Corporation.
Radio in Canada.

Nov. 13th—William D. Black, b.a.sc., (Hamilton), President, Otis-Fensom Elevator Co. Ltd.
Industrial Development in Canada to Meet the War Emergency.

Nov. 20th—Armand Circé, (Montreal), c.e., Dean of the Ecole Polytechnique, Montreal.
The Training of Engineers at the Ecole Polytechnique.

The Committee is grateful to the officers and secretaries of the Institute branches throughout the country for their active and effective co-operation in connection with newspaper publicity and the Branch notices calling attention to these addresses.

Our thanks are also due to the Canadian Broadcasting Corporation for the use of its facilities and for many helpful suggestions; more especially to the Manager, Mr. W. Gladstone Murray, the Assistant Manager, Dr. Augustin Frigon, and Mr. H. W. Morrison, the Supervisor of Talks.

We would also thank the press throughout the country, and especially the Canadian Press for the publicity given the series.

The general appreciation accorded to these talks has encouraged a good friend of the Institute to provide the funds necessary to print the series in a brochure for circulation to interested persons. We appreciate this favour very much.

In the event of the Institute contemplating a similar undertaking in the future, we would recommend that the hour for the broadcasts should not be earlier than 10 p.m., Eastern Daylight Saving Time, in order that a more convenient opportunity may be provided our members in the West to enjoy the programmes.

Respectfully submitted,

G. McL. Pitts, m.e.i.c., *Chairman.*

COMMITTEE ON DETERIORATION OF CONCRETE STRUCTURES

The President and Council:

Your Committee has continued during the year just past the policy of confining its efforts largely to studies of methods for the repair of concrete rather than to the causes of deterioration. To this end the committee has submitted to the Institute a paper "Concrete Repair Methods" prepared by one of its members, Mr. Claude Gliddon, m.e.i.c., describing methods developed by the Gatineau Power Company of which he is chief engineer, which were adopted after experimenting with other procedures. The paper is important, therefore, as a record of practical experience.

At the present time, two other papers are being reviewed for publication in the *Journal*—one on Sea Water Repairs, and the other on the Effect of Natural Waters on Concrete.

A third has been promised on the recently completed repair of an important structure.

The Committee thanks all those who have so generously given of their time to further its work, and welcomes suggestions both as to sources of data or reports on repair jobs which may be of interest to the Institute.

Respectfully submitted,

R. B. Young, M.E.I.C., *Chairman.*

MEMBERSHIP COMMITTEE

The President and Council:

Your committee on membership has to report that the war restricted its normal activities to a very great extent. This restriction was caused by longer work hours and the absorption of its members in war work.

Your committee has, however, endeavoured to start a system of registering guests attending Institute activities, especially Branch meetings, the registration being made either by signing a guest book or filling up a guest card.

This registration is not aimed at preventing non-members from attending Institute functions but rather to make more apparent the value of membership in the E.I.C.

Respectfully submitted,

K. O. Whyte, M.E.I.C., *Chairman.*

BOARD OF EXAMINERS AND EDUCATION

The President and Council:

Your Board of Examiners and Education for the year 1940 has had prepared and read the following examination papers with the results as indicated:

Schedule B

	Number of Candidates	Number Passing
I. Elementary Physics and Mechanics	4	3
II. Strength and Elasticity of Materials	4	2

Respectfully submitted,

R. A. Spencer, M.E.I.C., *Chairman.*

PAST PRESIDENTS' PRIZE COMMITTEE

The President and Council:

Your Committee on the Past-Presidents' Prize has carefully read and considered the two papers entered in this competition this year.

It is the opinion of your Committee that neither of these papers is of sufficiently high calibre to warrant awarding the Past-Presidents' Prize to its author. We therefore unanimously recommend that this prize be not awarded this year.

Respectfully submitted,

R. DeL. French, M.E.I.C., *Chairman.*

DUGGAN PRIZE COMMITTEE

The President and Council:

In the opinion of the Committee appointed to consider the award of the Duggan Medal and Prize for the year 1939-40, there were only two papers eligible for the prize.

The members of the Committee are unanimous in recommending that the award be made to Mr. M. S. Layton for his paper on "Electric Welding."

Mr. Layton's paper presented material of a useful and timely nature which, although possibly not entirely new to those specializing in this subject, affords a comprehensive survey of its recent developments. This should be of especial benefit to those engaged in the study and practice of modern structural engineering and consequently interested in all practical methods of carrying out the various operations incident thereto.

Respectfully submitted,

F. P. Shearwood, M.E.I.C., *Chairman.*

GZOWSKI MEDAL COMMITTEE

The President and Council:

Your Committee takes pleasure in recommending unanimously that the award be made to Miss E. M. G. MacGill, M.E.I.C., for her paper "Factors Affecting Mass Production of Aeroplanes."

The Committee desire to express themselves as being impressed with the large number of meritorious papers which were eligible for consideration, but feel that the author selected is specially entitled to this recognition of esteem from her fellow engineers.

Respectfully submitted,

A. O. Wolff, M.E.I.C., *Chairman.*

PLUMMER MEDAL COMMITTEE

The President and Council:

Your Committee has considered the various papers eligible for the Plummer Medal award for the current year. Mr. Harkom, as author of one of the papers under consideration, preferred not to take part in the voting, but the remaining members have voted unanimously for the award to be given to Mr. O. W. Ellis for his paper "Some developments in alloys during the last twenty years."

One of the Committee members has summed up very adequately the feeling of the Committee in saying: "The subject has been given masterly treatment and the paper is well written and comprehensive in scope. It is an excellent contribution to the literature on the more important alloys and should prove of lasting value, both to the engineer and the metallurgist."

It should be noted that several of the Committee members also thought very well of Mr. Harkom's paper, as it reported original work done by the author.

Respectfully submitted,

F. G. Green, M.E.I.C., *Chairman.*

LEONARD MEDAL COMMITTEE

The President and Council:

Your Committee, consisting of Mr. Victor Dolmage, Mr. F. W. Gray, Professor W. G. McBride, Mr. George E. Cole, with myself as chairman, are unanimous in the opinion that the Leonard Medal for this year should be awarded to Mr. R. G. K. Morrison for his paper "Points of View on the Rock Burst Problem," published in the August, 1939, Bulletin of the Canadian Institute of Mining and Metallurgy.

The Committee is of opinion that the paper is well written and shows much originality in its treatment of a difficult and important problem of deep mining. In dealing with the fundamental principles causing rock bursts in deep mines, the author, in advancing the theoretical aspects of the problem, balances these against his practical experience.

The Committee, therefore, has much pleasure in recommending that the Engineering Institute of Canada grant the Leonard Medal to Mr. Morrison.

Respectfully submitted,

A. D. Campbell, M.E.I.C., *Chairman.*

STUDENTS' AND JUNIORS' PRIZES

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of the Institute were submitted to

Council at its meeting on January 18th, 1941, and the following awards were made:

H. N. Ruttan Prize (Western Provinces). No papers received.

John Galbraith Prize (Province of Ontario), to W. C. Moull, S.E.I.C., for his paper "The Electrification of a Modern Strip Mill."

Phelps Johnson Prize (Province of Quebec—English), to Léo Brossard, S.E.I.C., for his paper "Geology of the Beaufor Mine."

Ernest Marceau Prize (Province of Quebec—French), to Marc R. Trudeau, S.E.I.C., for his paper "Points Fixes et Lignes d'Influence."

Martin Murphy Prize (Maritime Provinces). No papers received.

EMPLOYMENT SERVICE

The President and Council:

The comparative figures of placements effected by the Employment Service Bureau, during the past six years, are evidence of the greater activity displayed during 1940 in this department.

1935	1936	1937	1938	1939	1940
77	110	181	61	88	147

The work done during the year is summarized in the following table and the corresponding figures for 1939 are given for purposes of comparison.

	1939	1940
Registered members	114	129
Registered non-members	92	89
Number of members advertising for positions	76	41
Replies received from employers	31	21
Vacant positions registered	153	260
Vacancies advertised in the Journal	50	43
Replies received to advertised positions	219	143
Men's records forwarded to prospective employers	325	179
Men notified of vacancies	310	178
Placements definitely known	88	147
Registered vacancies cancelled	6	2
Registered vacancies still open	23	33

It will be noted that the number of men registered with the Bureau during the year has been fairly high. It should be remembered that these figures do not include the number of applications revived from the inactive file. This heavy registration has involved the handling of an unusually high number of records and the interviewing of several men every day.

Most of the members requiring the services of the Bureau were actually employed but they desired either to improve their position or to ensure that their qualifications were used to the best advantage in the present emergency. It is appropriate to mention here the unselfishness of several members who were willing to accept severe reductions of salaries provided they could serve in some position directly connected with the war effort.

Graduating classes in the universities have readily been integrated into the profession and the comparatively small number of graduates registered with the Bureau during the year indicates that the majority had secured positions previous to graduation.

The number of vacancies registered reflects the large demand for engineers in all branches. The enquiries came from industry and, in a larger measure than was usual before, from the various government departments. Personnel problems affecting the entire staff of new industries have been placed before the Bureau.

With the first hand information contained in our employment files it has been possible to effect several placements and to cause moves from non-essential industries to war services. The range goes from dollar-a-year positions to situations with stipends in the five figures. The activity of the Bureau has embraced work from Halifax to Vancouver.

The facilities of the Employment Service have also been used extensively by the departments of government in the preparation of confidential reports which have ultimately led to placements in important positions. In this connection, it should be mentioned that Headquarters have received valuable assistance from the branches all over the country in securing accurate information.

In several instances, the Bureau has issued special calls from the active services. The latest of these appeals came from the Royal Canadian Air Force for engineer officers, and was published in the *Journal* and circularized among the branches. Officials from the Department at Ottawa have expressed their pleasure at the splendid response received. If it had been possible to record the enlistments which have resulted from these calls, the placements figure would be substantially increased.

It is felt that the Employment Bureau, within its field, has rendered a worthwhile service to the membership and to the country.

L. Austin Wright, *General Secretary.*

NOMINATING COMMITTEE

Chairman: R. A. Spencer, M.E.I.C.

Abstracts of Reports from Branches

Note—For Membership and Financial Statements see pages 16 and 17.

BORDER CITIES BRANCH

The Executive Committee met eight times during the year for the transaction of branch business.

Nine branch meetings were held during the year, including the annual meeting and the joint meeting of the Councils of the Institute and the Association of Professional Engineers of Ontario.

Information on the various meetings follows, attendance being given in brackets:

Jan. 12—Joint meeting of the Border Cities Branch and the Detroit Section of the American Society of Mechanical Engineers. Mr. Henry G. Weaver, Director of General Motors Customer Research Division spoke on **Sampling Public Opinion.** (133).

Feb. 19—**Streamlining Industry with Electrical Control Equipment,** by Geo. Chute of the General Electric Company, Detroit. (26).

Mar. 15—**The Nickel Industry,** by J. H. Clark of the International Nickel Company. (39).

April 12—Junior meeting. **Maintenance of Boiler Control,** by J. A. Ferrier, and **The History, Production and Uses of Salt,** by A. H. Pask. (26).

May 11—Meetings of the Councils of The Engineering Institute of Canada and Association of Professional Engineers of Ontario. Separate meetings were held during the forenoon followed by a joint luncheon. In the afternoon inspection trips were made to plants of the Canadian Bridge Company and the Ford Motor Company, followed by a reception and banquet. (93).

June 1—Meeting in Sarnia. C. M. Baskin of Imperial Oil Limited spoke on **Field Technology, A New Approach to Industrial Development.** (37).

Sept. 21—Meeting in Chatham. An inspection of the plant of Libby, McNeil and Libby was followed by a dinner meeting at the William Pitt Hotel. T. V. Proctor and C. K. Rowland of Libby McNeil and Libby spoke on **The Canning Industry.** (49).

Nov. 15—**Superfinish and Fluid Drive,** by M. W. Petrie, Chief of Production Research Department, Chrysler Division of Chrysler Corporation, Detroit. (37).

Dec. 6—Annual meeting and election of officers. Complimentary dinner to J. Clark Keith, Vice-President Zone B. A history of the Branch was given by O. Rolfson, commemorating the twenty-first anniversary of its formation. (25).

Branch Photograph Album

The Branch is indebted to Geo. A. McCubbin of Chatham, Ont., for reproducing photographs of members of the Branch and for presenting the Branch with two indexed albums of the photographs.

CALGARY BRANCH

The Branch held twelve meetings during the year. The following summary gives particulars. Attendances are shown in brackets.

Jan. 11—**The Development of the Combustion Chamber of the Internal Combustion Engine,** by Prof. A. E. Hardy. (53).

Feb. 1—**Development of the North West Territories,** by Dr. J. A. Allan. (61).

Feb. 15—**Engineering Law,** by E. J. Chambers, K.C.. (60).

Feb. 29—**Review of Surveys of Storage Projects in Southern Alberta,** by W. L. Foss; **Progress of P.F.R.A. Programme,** by J. Vallance; and P.F.R.A. motion pictures, by M. L. Jacobson. (78).

Mar. 9—Annual meeting following luncheon. (35).

May 14—**Ceramic Engineering,** by Prof. W. G. Worcester. (46).

Oct. 10—**Power Plants in Bolivia,** a paper prepared by J. K. Sexton, of the Montreal Engineering Company, was presented by G. Horspool. A smoker followed. (64).

Oct. 24—**Problems encountered in the formation and operation of the Trans-Canada Air Lines,** by W. A. Straith. (36).

Nov. 6—**Conservation,** by R. E. Allen, Chairman of the Alberta Petroleums and Natural Gas Conservation Board. (40).

Nov. 21—**Coal handling plant at the Murray Collieries Ltd.,** by A. Baxter; **Some considerations in the design of castings,** by L. R. Brereton; **Standardization of paper sizes in Switzerland,** by C. Lattman, and **The importance of Economics to the Engineer,** by the Rev. R. J. Donovan.

Dec. 5—Annual ladies night. **Illustrated talk on familiar western Scenery,** by S. R. Vallance. (80).

Dec. 14—Annual joint dinner of the C.I.M. & M., A.P.E. and E.I.C. at which function the signing of the agreement between the Institute and the Association of Professional Engineers took place. The president, Dr. T. H. Hogg, and many other visitors from East and West were present.

During the year, the Branch Executive committee met nine times.

CAPE BRETON BRANCH

During the year, the Branch held three general meetings; the papers presented were as listed below:—

Jan. 9—**Oxygen—its Fabrication and Service in Modern Industry,** by F. G. Kerry, Canadian Liquid Air Co., Montreal.

May 14—**Some New Sidelights on Refractories for the Coal and Steel Industries,** by J. W. Craig, Canadian Refractories Ltd., Montreal.

June 11—**Highway Engineering,** by F. A. Crawley, Dept. of Highways, Sydney, accompanied by moving pictures of highway machines shown by R. F. McAlpine, of Wm. Stairs, Son & Morrow, Halifax.

We were also pleased to have the General Secretary with us for a dinner meeting with the Executive Committee in April. Matters of general interest to the Institute were discussed and particularly the agreement with the Association of Professional Engineers of Nova Scotia.

EDMONTON BRANCH

During the past very successful year nine meetings were held, each preceded by a members' dinner.

Programmes are listed below with attendance given in brackets.

Jan. 10—**The Development of the Combustion Chamber of the Internal Combustion Engine,** by E. A. Hardy, Professor of Agricultural Engineering, University of Saskatchewan. (48).

Feb. 9—**Soil Corrosion and Cathodic Pipe Protection,** by F. A. Brownie, Canadian Western Natural Gas, Light, Heat and Power Co. Ltd., Calgary, Alta. (36).

Mar. 12—**Modern Communication Channels,** by W. Mason, Assistant Transmission and Equipment Engineer, Alberta Government Telephones (32).

April 16—**Arctic Adventure.** A colour motion picture of northern Canada photographed by Chairman C. E. Garnett (30).

May 13—**Ceramics and the Ceramic Engineer,** by W. G. Worcester, Professor of Ceramic Engineering, University of Saskatchewan (22).

Oct. 11—**Design and Operation of Instrument Transformers,** by Dr. J. M. Thomson, Vice President, American Institute of Electrical Engineers (40).

Oct. 25—**Some Problems in the Establishment of a Modern Air Transportation System,** by W. A. Straith, District Traffic Manager, Trans-Canada Air Lines, Winnipeg, Man. (42).

Nov. 26—**Construction of a Large Eastern Industrial Plant,** by W. E. Cornish, Department of Electrical Engineering, University of Alberta. **Soil Mechanics and Foundation Engineering,** by R. M. Hardy, Department of Civil Engineering, University of Alberta (49).

Dec. 10—**Some Aspects of Oil Conservation in Alberta,** by R. E. Allen, Chairman of the Petroleum and Natural Gas Conservation Board of Alberta (25).

The Executive Committee held five regular meetings and two luncheon meetings, one to meet the General Secretary and one for Professor W. G. Worcester who came from Saskatoon to address a general meeting of the Branch.

E. O. Greening, M.E.I.C. and W. C. Wild, Jr.E.I.C., left Edmonton during the year to see active service with His Majesty's Forces.

The Co-operative Agreement between the Engineering Institute of Canada and the Association of Professional Engineers of Alberta has met with the approval of the members of both organizations.

HALIFAX BRANCH

Since the last annual meeting which was in the nature of a reception in honour of Dean McKiel, then president of the Institute, we have had four dinner meetings as follows:

On February 29th at the Halifax Hotel, our guest speaker was Dean Vincent C. McDonald of Dalhousie University, who spoke on **The Legal Aspects of Transportation in the Dominion.** Following Dean McDonald's address and the usual discussions of its major topics, the retiring vice-president for the Maritimes, Mr. R. L. Dunsmore, gave an illuminating outline of the activities of the annual meeting of the Institute held in Toronto. Also at this meeting it was our extreme pleasure to present prizes to four senior students of the N.S. Technical College for papers submitted at our November 1939 meeting.

On April 22nd, also at the Halifax Hotel, we welcomed to our meeting, three representatives of the Headquarters of the Institute, three members whom we regard as old friends in the persons of Past President Dr. Challies, Mr. G. A. Gaherty and the Secretary, Mr. L. A. Wright. Addresses were given by all three guests, chiefly relative to problems arising from the co-operation of the E.I.C. and the Association of Professional Engineers.

At the third meeting of our branch, held on October 23rd, our guest speaker was Mr. Bernard Allen, Chief Economist of Canadian National Railways, whose address on a subject of present day importance was well received and afforded the members ample scope for discussion.

The Executive Council has had a particularly busy season and held ten regular meetings during this past year, also in addition one special meeting in August was held to meet with Mr. Harry F. Bennett, Chairman of the Young Engineer Committee, who outlined the aims and objects of his Committee.

HAMILTON BRANCH

The Executive Committee held six business meetings with an average attendance of six members.

Ten Branch meetings were held as follows, attendance being noted in brackets.

Jan. 12—Annual business meeting and dinner held at the Rock Lodge. **The Historians Debt to the Engineer,** by W. A. Aitken. Chairman J. R. Dunbar closed the evening by introducing the incoming chairman, Alex. Love (58).

Feb. 19—**Engineering in Public Health Activities,** by Dr. A. E. Berry, held at McMaster University (39).

Mar. 12—**Development of the Tin Plate Industry,** by W. D. Lamont, Chief Metallurgist, Dominion Foundries and Steel Co. Held at MacMaster University (42).

April 12—**New Lighting Tools for To-morrow's Jobs,** by Samuel G. Hibbins, Director of Applied Lighting, Westinghouse Electric and Mfg. Co., Bloomfield, N.J. Joint meeting of the Toronto Section, Illuminating Engineers Society, the Toronto Section, American Institute of Electrical Engineers and the Hamilton Branch of the Institute; held at the Canadian Westinghouse Auditorium (339).

May 14—**Gypsum Limes and their Uses,** by T. B. Buckley, Manager, Canadian Gypsum Company Ltd. Held at McMaster University (57).

May 16—**Insulation and Condensation in Buildings,** by W. W. Cullen, Chief Engineer, H. W. Johns-Manville Co. Held at McMaster University. Joint meeting with the Hamilton Chapter, Ontario Association of Architects, and the Hamilton Branch of the Institute (39).

Sept. 20—Branch members joined in a visit to the **Shand Dam,** during construction. Organized by the Grand Valley group of the Professional Engineers of Ontario. Dinner in evening at the Trails End Inn, Conistoga (70).

Oct. 8—**The British Commonwealth Air Training Plan,** by Stuart Armour, Deputy to Minister of Air, Ottawa. Held at McMaster University (45).

Nov. 7—**Electricity at Work,** by Phillips Thomas, Ph.D., of the Research Laboratories of the Westinghouse Electric and Mfg. Co., held in the Ball Room of the Royal Connaught Hotel. This was a joint meeting of the Advertising and Sales Club of Hamilton, the Hamilton Group of the American Institute of Electrical Engineers, and the Hamilton Branch of the Institute (795).

Dec. 16—Students' Night in competition for the Branch prizes. **Working Stresses in Machine Members,** by L. D. Sentance, and **The Effect of Wet Coal on Pulverisers and Boiler Performance,** by M. D. Stewart. After the papers, Professor C. R. Young, of Toronto University gave an interesting talk, entitled **The Engineer and the Technologist.** Held at McMaster University (45).

KINGSTON BRANCH

The Branch met three times during the year.

Jan. 18—Dinner meeting at Students' Union. Immediate Past Chairman, H. W. Harkness presided. Twenty-three members and four guests were present. Report of Executive meeting on December 8, 1939, presented. Minutes of last meeting approved. The Secretary read a copy of a letter from the General Secretary of The Engineering Institute of Canada to Colonel Alexander Macphail, informing Colonel Macphail that, at the last meeting of the Council, he was made a Life Member of the Institute. Other correspondence read. Increase of membership noted. Dr. E. L. Bruce, Miller Memorial Research Professor, Department of Geology, Queen's University, gave a very interesting illustrated lecture on **Finland and the International Situation.**

Feb. 21—Dinner meeting at Students' Union. Vice-Chairman Phil Roy presided. Twenty-four members of the Kingston Branch and two guests were present. Minutes of last meeting approved. Report of Executive Meeting on February 14, presented. Professor W. P. Wilgar introduced Mr. L. Austin Wright, General Secretary, E.I.C., who addressed the Branch on activities and affairs of the Institute, including the Annual Meeting and the registering of technically trained men. By arrangement of the Kingston Branch, Mr. Wright, introduced by Dean A. L. Clark, addressed the Queen's University Engineering Society in Miller Hall, in the afternoon of February 21.

Oct. 31—Dinner and annual business meeting at Queen's Students' Union. Eighteen members and three guests were present. The Chairman, G. G. M. Carr-Harris presided. Report of the Secretary-Treasurer was presented and accepted. The following officers were elected:—Chairman—T. A. McGinnis; Vice-Chairman—P. Roy; Secretary-Treasurer—J. B. Baty; Executive: V. R. Davies, K. H. McKibbin, K. M. Winslow, A. H. Munro; Ex-Officio—G. G. M. Carr-Harris. General business and policy of the Branch was discussed. Major H. H Lawson paid fitting tribute to the memory of the late Professor W. P. Wilgar, pointing out the important role he had filled in the activities of Queen's University and of the Institute, and recalling that he had served as the first secretary of the Kingston Branch, E.I.C. Mr. Louis Trudel, Assistant to the General Secretary, from Headquarters, reported upon the war activity of the Institute, describing the work of the employment bureau and its close contact with both industry and the departments of government. He called special attention to the affiliation of the Engineering Institute of Canada with the Engineers' Council for Professional Development, and reported upon the good health and increased membership of the Institute. Major G. G. M. Carr-Harris, Mechanical Engineer, Royal Canadian Ordnance Corps delivered an interesting address on **Some Fundamental Engineering Principles as applied to Mechanization.**

LAKEHEAD BRANCH

The Branch held the following meetings during the year.

Jan. 17—Dinner meeting. **The Use of Echo Sounding Devices in charting Water Depths in Survey of Lake Nipigon,** by C. T. Anderson, Engineer at the Thunder Bay Paper Mill.

Sept. 26—Visit to the Aeroplane Factory of the Canadian Car and Foundry Co. Ltd., at Fort William, Ont. Dinner and address on **The Manufacture of Aircraft** by David Boyd, Works Manager of the Aircraft Division of the Montreal Plant.

Oct. 16—Dinner meeting at the Kakobeka Inn. Address on **The Training of Young Men for Industries,** by E. J. Davies, Principal of the Port Arthur Technical School.

Nov. 21—Dinner meeting at the Shuniah Club. Paper by J. M. Fleming, President of C. D. Howe Co. Ltd., Port Arthur on **The Grain Storage Situation in Canada.**

LETHBRIDGE BRANCH

During the year seven regular meetings with an average attendance of 37; four corporate members' meetings with an average attendance of 10; and six executive meetings with an average attendance of 6 were held.

All the regular meetings were held in the Marquis Hotel, preceded by a dinner during which numbers were rendered by George Brown's Instrumental Quartette, followed by vocal soli, interspersed with community singing. This fall, in an effort to build up attendance, the branch meetings have been held on Wednesday evenings at 8 p.m. with refreshments served after the address. A corporate members meeting precedes the regular meeting at 7.30 p.m. This idea has resulted in a noticeable increase in attendance.

The list of speakers and subjects follows; attendance is given in brackets.

Jan. 6—Ladies' Night. **1939 Trip Through Europe,** by Miss Hildur Sandquist. (55).

Feb. 17—**The Best Places in the West,** by H. J. McLean, Production Superintendent, Calgary Power Company, Calgary. (16).

April 10—Annual Meeting (Corporate Members only). (10).

May 15—Joint meeting of the Branch, and the Lethbridge Board of Trade. **Ceramics,** by Professor W. G. Worcester, University of Saskatchewan, Saskatoon. (60).

July 16—Special Meeting (Corporate Members only). L. Austin Wright, General Secretary, spoke on **Institute Affairs.** (14).

Oct. 23—**The Engineer as a Factor in Modern Warfare,** by Senator W. A. Buchanan (30).

Nov. 6—**Air Traffic Control,** by Edwin D. Boyd, Officer in Charge, Control Tower, Kenyon Airfield, Lethbridge. (30).

Nov. 27—**The Selection of the Correct Type of Motor for Various Loads,** by F. N. Rhodes, Institute of Technology and Art, Calgary (30).

Dec. 18—Ladies Night. Luncheon Meeting. Motion pictures were shown by J. G. Maxwell, Traffic Representative, Trans-Canada Air Lines, entitled **The Swift Family Robinson** and **African Skyways.** (40).

The Annual Meeting of the Branch was held on April 10th, when the officers were elected for the 1940-1941 season.

LONDON BRANCH

During the year 1940, the executive held seven business meetings. Six regular and special meetings were held as follows; attendance is given in brackets.

Jan. 26—Annual meeting and election of officers held at the Grange Tea Rooms, London. **Building Downwards,** by Professor R. F. Legget of the University of Toronto (60).

Mar. 27—Special meeting at Hotel London, London, held in conjunction with the American Water Works Association Convention. **Technical Social Progress,** by H. E. Jordon, Secretary of the Association (76).

May 1—Regular meeting held in the Auditorium of the City Hall, London. **Engineering Science as Applied to Soil Conservation,** by John S. Cutler of the U.S. Dept. of Agriculture, Dayton, Ohio (35).

Sept. 25—Regular meeting held in the Board room of the Public Utilities Commission, City Hall, London. **The Engineer and Public Health,** by Wm. Storrie, of Gore and Storrie, Consulting Engineers, Toronto (26).

Nov. 20—Regular meeting held in the board room of the Public Utilities Commission, City Hall, London. **The Distribution of Electricity,** by V. A. McKillop of the Public Utilities Commission (18).

Dec. 12—Regular meeting held in the Board Room of the Public Utilities Commission, City Hall, London. **Engineering in the Mackenzie River Basin,** by Professor R. F. Legget of the University of Toronto (23).

Average attendance of all meetings—39.

We regret to record the death of Major D. M. Bright, who had been an active member of the Branch for many years.

MONCTON BRANCH

The Executive Committee held four meetings. One technical and two business meetings of the Branch were held, as follows:

May 13—A meeting was held for the purpose of nominating branch officers for the year 1940-41.

May 31—Annual Meeting.

Dec. 19—A dinner meeting was held in the Brunswick Hotel. An illustrated paper on **Aerodrome Construction for the British Commonwealth Air Training Plan** was given by E. C. Percy, Assistant District Airways Engineer.

MONTREAL BRANCH

The Branch received the official visit of Dr. T. H. Hogg, president of the Institute, on May 2nd. An informal dinner was given for Dr. Hogg at the University Club. During the evening, Dr. Hogg addressed the members of the Branch at Headquarters on Institute matters and showed slides and films on the construction of a power line, during winter, in Northern Ontario. All members present were personally introduced to the president.

In response to an appeal made by the Honourable James A. Gardiner, Minister of National War Services, for volunteer workers to help with the National Registration during August, the Branch canvassed its members and received 190 offers of service.

Papers and Meetings Committee

The Papers and Meetings Committee has completed one of its most successful seasons under the chairmanship of Mr. R. S. Eadie.

The committee has continued the policy of co-operating with sister societies by having joint meetings with such organizations as the Institute of Radio Engineers and the Society of Cost Accountants and Industrial Engineers.

The following is a list of the papers delivered during the year and the attendance is given in brackets:—

Jan. 11—Annual Meeting of the Branch (75).

Jan. 18—**Television and Its Recent Developments,** by W. B. Morrison (300).

Jan. 25—**Hydro Electric Work in Bolivia,** by J. K. Sexton (175).

Feb. 1—Branch Smoker.

Feb. 8—**Welding Rods and their Coatings,** by M. S. Layton. (100).

Feb. 15—**Some Problems and Responsibilities of Industrial Management,** by W. F. Hosford (200).

Feb. 20—**Co-axial Cable Systems,** by M. E. Strieby (200).

Feb. 29—**Electricity in Railroad Maintenance,** by C. C. Bailey. (75).

Mar. 7—**Some Phases of the Work of the National Research Council,** by Dean C. J. Mackenzie (90).

Mar. 14—**Regulating the Load Distribution on Interconnected Power Systems,** by S. B. Morehouse (55).

Mar. 21—**Power System Communications,** by H. W. Haberl (60).

Mar. 28—**The Automobile Industry in Canada,** by Colonel Frank Chappell (100).

April 4—**The Hotel Vancouver,** by John Schofield (120).

April 11—**The Mathematics of Management,** by Paul Kellogg. (75).

April 18—**Planning Quebec Highways,** by Ernest Gohier (125).

April 25—**Plant Visit to Wire Drawing Mill, Steel Company of Canada Limited, Montreal** (120).

May 2—Visit to Branch of President, Dr. T. H. Hogg (160).

Oct. 3—**Aerodrome Construction in Canada for the British Commonwealth Air Training Plan,** by J. A. Wilson. (140).

Oct. 10—**The Atom—Its Place in Daily Life,** by I. R. McHaffie (80).

Oct. 17—**Colour Photography—An interesting and useful tool for Technicians,** by P. J. Croft (200).

Oct. 24—**Work Simplification as an Aid to Defence,** by Allan H. Morgensen (250).

Oct. 31—**Observations on Frequency Modulation Broadcasting,** by Paul A. de Mars (130).

Nov. 7—**Electrical Marvels,** by Dr. Phillips Thomas (440).

Nov. 14—**Montreal Citizens' Committee and the New City Council,** by R. Percy Adams (55).
Nov. 21—Annual Student Night (240).
Nov. 28—**The Romance of Water,** by Norman J. Howard (55).
Dec. 5—**Metallizing,** by A. Van Winson (75).
Dec. 12—**Hydraulic Model Experiments,** by Dr. Kenneth C. Reynolds (110).
Dec. 19—**High Voltage Insulators,** by J. J. Taylor (70).

Average attendance—137.

Junior Section

The Junior Section, which has carried on almost entirely under its own organization for the past number of years, has continued its good work also this year in spite of the fact that a large number of the younger engineers and students are devoting a large amount of time to military training. At the Annual Student Night on November 21st a very good attendance was noted and four excellent papers were presented on a competitive basis. It is very evident that students are interested in Institute affairs. As evidence of this fact it might be mentioned that the chairman had the honour of being invited to be present at the annual banquet of McGill University Engineering Undergraduates Society and to bring to this gathering a brief message from the Engineering Institute. Mr. L. Trudel, Assistant to the General Secretary, was also asked to bring a message from the Institute to a gathering of students at Ecole Polytechnique.

The Executive is of the opinion that all possible encouragement should be given to students. Future strength of the Institute is dependent largely on recruiting among the student bodies.

The following is a list of the Junior Section meetings with the attendance given in brackets.

Jan. 22—Annual Meeting. **The Young Engineer and the War,** by L. Austin Wright, General Secretary (60).
Feb. 5—**Gravel Road Surface Stabilization,** by Gilbert Coupienne (12).
Feb. 19—Student Night. **Architecture in Engineering,** by Stuart McNab (McGill) and **Examination of Welded Structures,** by Fernand Marchand (Ecole Polytechnique) (23).
Mar. 4—**Education Continued,** by Professor J. A. Coote (19).
Mar. 18—**Public Ownership of Electricity in St. Hyacinthe, Que.,** by Jean Bouchard (32).
April 1—**Network Broadcasting in Canada,** by J. A. Ouimet (23).
Oct. 21—Opening Fall Meeting. **The Engineering Institute,** by H. J. Vennes, Chairman, Montreal Branch. Film, **The Rapide Blanc Hydro-Electric Development.** (62).
Nov. 4—**Chlorine, the Germicide of a Hundred Uses,** by Jacques Benoit (20).
Nov. 21—Student Night. Speakers: V. G. Griffin (McGill); Bernard Beaupré (Ecole Polytechnique); W. C. Brown (McGill); Roger Lessard (Ecole Polytechnique). Motion picture, **Liquid Air.** (240).
Dec. 2—**Automatic Process Controls,** Georges L. Archambault. (16).

Membership Committee

The Chairmanship of the Membership Committee was again entrusted to Mr. K. O. Whyte who reports, that normal activities have been restricted due to war conditions, resulting in fewer personal contacts with prospective new members.

Reception Committee

The Reception Committee, under the Chairmanship of Mr. Willis P. Malone reports an active year and a very successful one.

The Smoker was organized by Mr. C. R. Lindsey and held at the Windsor Hotel on Thursday evening, February 1st. Four hundred and thirty-six tickets were sold.

The golf tournament was held at the Senneville Country Club on Tuesday, June 4th. An enthusiastic and representative gathering enjoyed the round of golf and the dinner and prize-giving that followed. Twenty-five played golf and thirty-two sat down to dinner.

At five meetings during the year, refreshments were served. These meetings were: the annual meeting on January 11th, the occasion of the visit of the president, Dr. Hogg, on May 2nd, the opening meeting of the Branch on October 3rd, the opening meeting of the Junior Section on October 21st, and the Junior and Students' Night on November 21st.

Publicity Committee

Mr. L. Jehu, Jr., chairman of this Committee, reports that through the courtesy of the headquarters staff, notices of the weekly meetings were sent to the Montreal Star, the Gazette and La Presse who published these notices in the "City Items." Before a meeting of unusual interest, the papers were telephoned and a special request for a report was made. This method of handling the publicity proved satisfactory.

Deceased Members

It is with regret that we record the following list of those members who died during the year, and wish to extend to their families the most sincere sympathy of the Branch.

Life Member

James A. Jamieson

Members

John Kershaw Ashworth	Stuart Howard
John Baylor Barnum	Howard Archibald Mackenzie
Shirley Barr	Charles Nicholas Monsarrat
Frederick Bridges	George Wyman Shearer
William Bell Cartmel	Joseph Edward Woods
Casimir Stanislas Gzowski	

Student

Flying Officer Jean A. Lalonde
(killed on active service)

NIAGARA PENINSULA BRANCH

During the year the Executive held seven business meetings and one electoral meeting.

The programme committee arranged the following professional meetings.

Jan. 31—Dinner meeting at the General Brock Hotel, Niagara Falls. An illustrated talk on **Modern Airports** was given by Wing Commander D. G. Joy, District Inspector of Civil Aviation.
Mar. 8—Meeting with ladies and friends followed by buffet lunch at the Welland House, St. Catharines, Ont. An illustrated talk on **Weather Forecasting,** by John Patterson, M.A., F.R.S.C., Controller of the Meteorological Division of the Air Service Branch, Dept. of Transport.
April 16—Dinner meeting at the Leonard Hotel, St. Catharines, Ont. The member societies of the Niagara District Technical Council listened to an interesting address and sound film on **Plastics** given by R. N. Slipp of the Plastics Department Technical Sales Service, E. I. du Pont, de Nemours & Co. Inc.
May 20—Annual Dinner meeting at the General Brock Hotel, Niagara Falls, Ont. Our President, Dr. T. H. Hogg, was chief guest and speaker and gave a few personal reminiscences of his engineering experience in this district followed by a short talk on the functioning and problems of several of the more important Institute committees. Mr. E. P. Muntz, vice-president for Ontario, also spoke on the relationship between provincial Professional Engineering Associations and The Institute.

Under the chairmanship of C. H. McL. Burns, the 1940-41 Programme Committee arranged the following two meetings.

Nov. 1—Joint dinner meeting with the Ontario Chapter of the American Society for Metals at the Leonard Hotel, St. Catharines. An illustrated lecture on **Cold Drawn Steels and their Application to Industrial purposes** was given by Thomas D. Taylor, Metallurgical Engineer, Bliss & Laughlin Inc.
Nov. 28—Dinner meeting at the General Brock Hotel, Niagara Falls, Ont. **Flame Hardening as applied to Steel and Cast Iron,** by A. K. Seeman, Research Engineer, Linde Air Products, New York. W. Duncan, Toronto, of the Dominion Oxygen Company, assisted Mr. Seeman.

OTTAWA BRANCH

During the year the Managing Committee held six meetings for the transaction of general business.

It is with deep regret that we report the deaths of ten of our members: J. B. McRae, A. G. Sabourin, J. E. Woods, H. L. Seymour, J. T. Johnston, W. H. Carson, V. I. Smart, Vincent Perrin, Lt. Col. E. C. G. Chambers, and J. T. Lawson.

As in previous years the Branch donated two sets of draughting instruments to the Ottawa Technical School for presentation as prizes for proficiency in draughting. A copy of "Machinery's Handbook" was presented to the Hull Technical School to be awarded to one of its students.

The following is a list of meetings held during 1940, with attendance figures in brackets. Unless otherwise stated, these were luncheon meetings at the Chateau Laurier.

Jan. 11—Evening meeting, National Research Council Bldg. Annual meeting, Ottawa Branch, E.I.C. **Some Pre-War Observations in Europe,** by Dr. R. W. Boyle, Director of Physics and Electrical Engineering Division, National Research Council (91).

Feb. 1—**Canada Spreads Her Wings,** by Flying Officer J. Fergus Grant, Royal Canadian Air Force (170).

Feb. 20—Evening joint meeting with the Ottawa Branch of the Canadian Institute of Mining and Metallurgy, at the Victoria Memorial Museum. Illustrated lecture, **Petroleum, the Keystone of Empire Defence,** by Dr. J. W. Broughton, National Research Laboratories, and Dr. George S. Hume, Geological Survey of Canada (140).

Mar. 7—**The Engineer in a Modern Theatre of War,** by Brigadier E. J. C. Schmidlin, M.C., Director of Engineer Services, Department of National Defence, Ottawa (132).

April 4—**The Pattullo Bridge,** by Major W. G. Swan, D.S.O., Director of Construction, War Supply Board, Ottawa. (87).

April 25—Evening meeting, National Research Council Bldg. **Metal Spraying and Its Industrial Applications,** by A. Van Winsen, National Research Laboratories. (150).

May 9—Luncheon meeting and inspection, Ottawa Technical High School (82).

Oct. 17—Evening joint meeting with the Ottawa Branch of the Canadian Institute of Mining and Metallurgy, National Research Council Bldg. Illustrated lecture, **Heat Treatment of Nickel Steel,** by Mr. H. H. Bleakney, Metallurgist, Department of National Defence. (80).

Nov. 7—**LaTuque Development and the St. Maurice River,** by J. A. McCrory, Montreal, Vice-President and Chief Engineer, The Shawinigan Engineering Company, Montreal. (100).

Nov. 21—**Development of Dual Lane Highways,** by C. A. Robbins, Toronto, District Engineer, Southern Ontario, Department of Highways of Ontario (73).

Dec. 5—**Naval Armaments,** by Captain C. S. Miller, R.N., Inspector of Naval Ordnance, British Admiralty Technical Mission, Ottawa (114).

Dec. 19—**Development of Mechanical Transport,** by Major M. M. Evans, Technical Staff Officer, Directorate of Ordnance Services, Department of National Defence, Ottawa. (61).

PETERBOROUGH BRANCH

The following meetings were held during the year. Attendance is shown in brackets.

Jan. 11—**Fundamentals of Metallic Arc Welding,** by H. Foster, Welding Specialist, Canadian General Electric Company, Peterborough (50).

Feb. 22—**Recent Developments in Concrete,** by R. A. Crysler, Canada Cement Company, Toronto (26).

Mar. 7—Junior and Student Night. Open Discussion (33).

April 4—**New Developments in Switchgear,** by B. I. Vurgess, Switchgear Engineer, Canadian General Electric Co., Peterborough (38).

May 1—**Annual meeting** and Election of Executive Committee. (40).

Oct. 19—Joint meeting of the Peterborough Branch and the Toronto Section, American Institute of Electrical Engineers. **Glass Insulation.** (109).

Nov. 20—**Annual Dinner.** Attended by the president, Dr. T. H. Hogg, and Mr. De Gaspé Beaubien (87).

Dec. 5—**Early Surveys and Land Surveyors in Peterborough,** by J. W. Pierce (33).

QUEBEC BRANCH

During the past year, the Executive Committee has held seven meetings. Eight general branch meetings were also held, they are listed below with the attendance at each given in brackets:—

Jan. 15—Luncheon meeting at the Chateau Frontenac. **La Radiodiffusion—Esquisse d'une Orientation,** by Aurele Séguin, Manager of CBV Radio Station in Quebec (30).

Feb. 12—Evening meeting at the Palais Montcalm. Films **Transport and Communications** were shown. Refreshments were served after the meeting (75).

Mar. 9—**Social Evening** held at the Quebec Winter Club for members and their wives, preceded by a dinner and followed by a dance, cards and games (126).

Mar. 18—Annual Junior Night at the Palais Montcalm. Illustrated papers, **Motor Controls and Their Applications,** by Yvon R. Tassé, Canadian General Electric Co., and **Winter Roads Maintenance in Quebec,** by Roland Lemieux, Highway Department of Quebec. Refreshments were served after the meeting (55).

April 15—Evening meeting at Laval University. Sound films, **Telephone Communications,** sponsored by The Bell Telephone Co., and a Technicolor film, **New-York World's Fair,** presented by Roger Morin of Radio station CBV, were shown. The members and their wives with guests were invited (300).

April 30—Dinner meeting at the Chateau Frontenac to welcome the President of the Institute, Dr. T. H. Hogg. Vice-President McNeely Du Bose and General Secretary L. Austin Wright, attended this meeting. Dr. Hogg spoke on **Appeal to Engineers to Co-operate fully in Wartime Work.** (45).

Nov. 25—Annual meeting and election of officers, at the Reception Hall of the Quebec Power Co. A film, **War and Warnings,** followed, and refreshments were served (40).

Dec. 16—Evening meeting at the Chateau Frontenac. **Britannia Mines,** their history, early development and present operations, by G. W. Waddington, recently appointed professor of mining engineering at Laval University (25).

It is with deep regret that we record the deaths of the following branch members:—

Edward Arthur Evans and Jos. Têtu Bertrand.

SAGUENAY BRANCH

The Branch held the following meetings during the year.

July 4—Annual meeting at the Saguenay Inn, Arvida. Reception and dinner previous to the meeting. The Branch was honoured by the presence of the President, T. H. Hogg, Vice-President E. P. Muntz and the General Secretary, L. A. Wright.

Aug. 15—Meeting at the Arvida Protestant School. **Ignitrons,** by by J. T. Thwaites of Canadian Westinghouse Company Limited, Hamilton, Ont.

Oct. 10—**The Manufacture of Alpaste in Arvida,** by E. F. Hartwick of the Aluminum Company of Canada Limited.

Nov. 14—**Water Filtration and Purification,** by Ross Watson. **The Shand Dam at Fergus, Ont.,** by Dr. H. G. Acres.

SAINT JOHN BRANCH

Ten meetings of the Executive Committee, and the following six general Branch meetings were held during the year:

Jan. 18—Annual joint dinner meeting with the Association of Professional Engineers of the Province of New Brunswick. An address on **The Place of the Engineer in the National Life** was given by President H. W. McKiel.

Feb. 15—Supper meeting. **The Oil Industry in Western Canada,** by H. G. Cochrane.

April 11—Supper meeting. **The St. Lawrence deep waterway project,** by C. H. Wright.

May 8—Annual dinner and election of officers of the Branch. Address on **Achievements of Engineering in wartime,** by T. C. Macnabb.

Aug. 29—Supper meeting. Address on the work of **The Committee on the training and welfare of the Young Engineer,** by Harry F. Bennett, its chairman.

Oct. 17—Supper meeting. Address on **Trends and Forces behind the Outbreak of the War,** by Norman A. M. Mackenzie, president of the University of New Brunswick.

⑥Because of recent changes in officers, due to enlistment, it was not possible to secure these figures at the time of going to press.

SASKATCHEWAN BRANCH

As in the past several years all meetings, except the annual meeting, were held jointly with the Association of Professional Engineers of Saskatchewan and the local section of the American Institute of Electrical Engineers. The programme for the year was as follows:

Jan. 22—**Nature Appreciation,** an illustrated address by S. G. Bard, Field Collector, Provincial Museum.

Feb. 16—Annual meeting held jointly with the Association of Professional Engineers.

Mar. 15—**The Development of the Combustion Chamber of the Internal Combustion Engine,** by Professor E. A. Hardy, University of Saskatchewan.

April 15—**The Middle East and the War,** by M. A. MacPherson, K.C.

Nov. 16—**Ceramics and Ceramic Engineering,** by Professor W. G. Worcester, University of Saskatchewan.

Dec. 20—**Airport Construction in Saskatchewan,** by G. T. Chillcott, District Airway Engineer, Department of Transport.

The average attendance at these meetings was fifty-seven.

SAULT STE. MARIE BRANCH

The Executive Committee met on January 9th, and appointed standing committees. The committees and the chairmen are as follows:—

Papers and Publicity	J. S. MacLeod
Entertainment	J. L. Lang
Membership	C. Stenbol
Legislation and Remuneration	F. Smallwood

The Executive Committee met eight times during the year to discuss and promote the activities of the Branch and Institute.

Eight dinner meetings were held during the year. The average attendance was 23 members and guests. The meetings were held at no set time during the month, but were arranged to suit the convenience of the speakers.

Programmes of the meetings held were as follows:—

Jan. 26—**Modern Aircraft Development,** by George Ponsford, Director of the Ontario Provincial Air Service.

Feb. 23—**The Technique of Fruit Growing,** by A. G. Clarkson.

Mar. 15—Illustrated address on the **History of the Development of the Telephone,** by G. L. Long, Historian of the Bell Telephone Company.

April 26—**Mining and Beneficiation of Siderite at the Helen Mine,** by G. W. MacLeod.

Sept. 27—**The Manufacture of High Explosive Shells,** by Carl Stenbol.

Nov. 1—**The Fauna and Flora of Algoma,** by Paul P. Martin, Chairman, Algoma Travel Bureau.

Nov. 22—**War Time Communications,** by G. L. Long, Historian of the Bell Telephone Company.

Dec. 20—**Annual meeting** for 1940.

The Executive Committee regrets the loss through change of address of a number of active members of the Branch. The following have moved from the Branch: H. J. Leitch, Chairman of the Branch, A. G. Clarkson, F. A. Masse, and C. W. Holman, also R. J. Merritt, S.E.I.C.

ST. MAURICE VALLEY

The Branch held the following meetings during the year, and the attendances are shown in brackets.

Feb. 16—Meeting at the Cascade Inn, Shawinigan Falls. **Chromium in Steel,** by C. K. Lockwood of the Shawinigan Chemicals Limited, Montreal (40).

Mar. 5—Annual meeting of the Branch at the Laurentide Club, Grand'Mère. Reception and dinner previous to the meeting. The guest speaker was the General Secretary, Mr. L. A. Wright, who spoke on Institute activities (22).

May 1—Dinner meeting at the Chateau de Blois, Three Rivers, to welcome the President of the Institute on his official visit. The President was accompanied by Councillor A. Larivière and Mr. H. Cimon from Quebec and the General Secretary, L. A. Wright.

TORONTO BRANCH

The annual meeting of the Branch was held at the Granite Club on Thursday, April 18th, 1940. This change of meeting place evidently met with the approval of the 110 who were present.

The meeting was preceded by a dinner at 7 p.m. Among those present were Dr. T. H. Hogg, president of the Institute; E. P. Muntz, vice-president, Zone B; J. A. Vance, councillor, London Branch; A. R. Hannaford, secretary-treasurer, Hamilton Branch; Alexander Love, chairman, Hamilton Branch; D. G. Geiger, representing the A.I.E.E.; Bruce H. Wright, representing the Ontario Association of Architects and E. L. Cousins, speaker of the evening.

During the past year the Executive Committee has held twelve meetings with an average attendance of nine.

Regular meetings during the year are listed below with attendance given in brackets.

Jan. 18—Annual Students' night. **Wind Bracing,** by S. J. Simons; **The Rehabilitation of Flooded Generators,** by D. R. B. McArthur; **Aerodrome Construction,** by D. E. Kennedy; **Some Aspects of Depreciation,** by E. E. Hart; **Salvage,** by J. P. Stirling; **Science and War,** by B. Etkin (50).

Feb. 1—**Intercommunication in the Army,** by Lieut. Col. E. G. Weeks (75).

Feb. 8-9—Annual General and Professional meeting.

Feb. 22—**The Limestone and Lime Industry of the Thames River Valley,** by S. R. Frost (25).

Mar. 7—**Modern Sanitation and Water Supply Practice,** by William Storrie, and Dr. A. E. Berry (55).

Mar. 21—**Insulating, Heating and Air Conditioning of Buildings,** by Professor E. A. Allcut (50).

April 4—**Activities of the National Research Council in Relation to the War,** by C. J. Mackenzie (55).

April 18—Annual Branch Meeting (110).

Oct. 17—**The Bright Path, Wiring the Wilderness, Dancing Conductors,** films shown by courtesy of the Hydro Electric Power Commission of Ontario.

Nov. 7—**Modern Boiler Equipment,** by W. A. Osbourne (85).

Nov. 21—**Modern Problems in Highway Construction,** by Charles M. Baskin (25).

Dec. 5—**Man Power,** by McNeely DuBose (60).

Previous to each regular meeting, dinners have been held in Hart House. These have been well attended and enjoyed by all who have availed themselves of the opportunity to attend.

The highlight of the year just passed was the Annual General and Professional Meeting which was held in the Royal York Hotel on February 8-9th. The General Chairman was Dr. A. E. Berry, and the Chairman of the Papers Committee was Prof. C. R. Young, who undertook a gigantic task and carried it through with the appreciation of all those who were fortunate enough to be present. There was a total registration of 489 members, 200 of these being from out of town.

It is with deep regret that we record the death of the following members of the Branch during the year: R. A. Baldwin, W. P. Chapman, Lieut. Col. Duncan MacPherson, H. T. Routly and E. M. Salter. Sincere sympathy is extended to their families in their loss.

VANCOUVER BRANCH

Activities were well maintained by the Vancouver Branch during the year just closed. During the year twelve well attended meetings were held—two luncheon and ten evening functions. A particularly interesting meeting was held on May 27 when addresses were given by Lt. Col. L. E. Atkins and Capt. Arthur Trudeau of the Seattle office of the United States Army Engineers.

In July the Branch was honoured with a visit from the General Secretary of the Institute, Mr. L. Austin Wright. During his stay Mr. Wright met many of the members of the Institute as well as the executives of branches of sister organizations in the province.

The members of the Vancouver Branch have answered loyally to the call for officers in the Canadian Active Service Force. Seventeen members are recorded as being on active service at the present time.

An itemized list of meetings held during the year is appended hereto. The total membership of the Branch is now 192.

Jan. 29—Luncheon meeting. **Activities of the War Supply Board,** by Major W. G. Swan, Director of Construction, War Supply Board, Ottawa.

Feb. 19—**Pressures in Earth Fills,** by H. N. Macpherson.

Mar. 11—**The Organization of the Royal Canadian Air Force,** Address by Squadron Leader L. E. Wray, R.C.A.F. Station, Vancouver.

Mar. 27—**The Development of Roller Chain Driving,** by Stanley Morton, A.M.I.MECH.E., B.C. Manager, Renold Coventry Co. Ltd.

April 12—**The Design and Construction of Modern Airport Runways,** an illustrated address by Norman W. McLeod, of the Department of Asphalt Technology, Imperial Oil Ltd., Sarnia.

May 27—**The White River Flood Control Project and the Mud Mountain Dam,** an illustrated address by Lieut. Col. Layson E. Atkins, District Engineer, U.S. Army (Seattle District), and Captain Arthur G. Trudeau, Chief of Construction Division.

Sept. 30—**Regulation of Public Utilities,** by W. A. Carrothers, Chairman, Public Utilities Commission for the Province of British Columbia.

Oct. 23—**The King George VI Highway,** an address by Ernest Smith, Assistant District Engineer, Provincial Department of Public Works, New Westminster, and W. P. Beavan, Surfacing Engineer, Provincial Department of Public Works, New Westminster.

Nov. 4—**The Growth and Structure of Wood,** illustrated lecture by J. B. Alexander, M,SC., Chief of the Division of Timber Mechanics, Forest Products Laboratory, Department of Mines and Resources, Vancouver.

Nov. 23—Annual dinner meeting. **The B.C. Lumber Industry Marches with the Troops,** by J. G. Robson.

Dec. 16—Dinner in honour of the Institute President. The meeting was addressed by Dr. Hogg, Dr. Lefebvre, Mr. Vance and Mr. L. Austin Wright.

VICTORIA BRANCH

During the year seven general meetings of the Branch were held, six of them being dinner meetings and one a luncheon meeting, with an average attendance of 25, which reflects considerable revival of interest among the membership.

The list of meetings together with addresses and the speakers during the year 1940 is as follows:—

Jan. 19—Dinner and Annual Meeting. **Brothers of the Bridge,** by A. L. Carruthers, Bridge Engineer, Provincial Department of Public Works.

April 12—Dinner meeting. **A Tour through Europe,** coloured motion pictures, by Norman Yarrow, Works Manager, Yarrows Ltd., Victoria, B.C.

April 18—Dinner meeting. **Design and Construction of Modern Airport Runways,** by Dr. Norman McLeod of the Asphalt Division of the Imperial Oil Co., Calgary, Alta.

July 15—Luncheon meeting. The General Secretary, Mr. L. Austin Wright, spoke to the Branch on the British Engineer's Children Evacuee situation.

Oct. 22—Dinner meeting. **Fuel and Our Use of It,** by Kenneth Moodie, Engineer, Provincial Architect's Office, Victoria.

Nov. 29—Dinner meeting. **Public Utilities Regulations,** by J. C. MacDonald, Engineer, and S. R. Weston, Chief Engineer, B.C. Public Utilities Commission.

Dec. 17—Dinner meeting. Visit of Past President Dr. O. O. Lefebvre, J. A. Vance, and the General Secretary, on the occasion of the President's tour of the western branches.

Three meetings of the executive committee were held to deal with business relating to the Branch and Institute headquarters.

Membership

As was the case in the previous year there were several transfers of branch members to and from other branches, and a number of members of our Branch have gone overseas. In all, ten transfers were made to the Branch and twelve transfers away.

WINNIPEG BRANCH

The Executive Committee held thirteen regular and three special meetings during the year. Nine general meetings were held under the joint auspices of the Winnipeg Branch and the Association of Professional Engineers of the Province of Manitoba, continuing an arrangement entered into in 1938, in which all general meetings except the annual meeting and any special meetings were to be held jointly. The annual meeting was held on February 1st.

In addition to the above the Branch was honoured by a visit by Dr. Hogg on December 11th, at which time the Branch held a special general meeting. Dr. Hogg was accompanied by Councillor J. Vance of Woodstock, Ontario, and L. Austin Wright, the General Secretary. The next day Mr. O. O. Lefebvre, a past president, also arrived, and the Executive and members of past executives gave a luncheon in honour of Dr. Hogg and the party from Headquarters.

The papers presented are listed below, the attendance for each meeting being shown in brackets.

Jan. 25—**Modern Weather Forecasting,** by Dr. Donald C. Archibald, of the Meteorological Division of the Department of Transport (102).

Feb. 22—**Unlocking Canada's Treasure Trove.** Sound pictures by courtesy of the Department of Mines and Natural Resources. Introduced by G. E. Cole (104).

Mar. 7—**Plastics,** by Prof. H. Saunderson, University of Manitoba. (87).

Mar. 21—**Teletypewriter Systems and some Applications,** by J. Granich, Printer Telegraph Supervision C.P.R. Communications (59).

April 4—**The Design and Construction of Modern Airport Runways,** by Dr. N. W. McLeod, Department of Asphalt Technology, Imperial Oil Company, Sarnia Ont. (145).

April 18—**Arc Welding, its Development and Progress,** by Professor W. F. Riddell, University of Manitoba (71).

Oct. 17—**Gas, Coke and Allied Subjects,** by A. H. Harris, Jr., Manager of Gas Utility, Winnipeg Electric Company (56).

Nov. 7—Visit to the Sugar Beet Plant of the Manitoba Sugar Company, under the auspices of Messrs. Fosness and Hrudka.

Nov. 21—**Broadcast Networks in Canada,** by V. C. Jones, District Engineer, Communications Department, C.P.R. (60).

THE PERFORMANCE OF MODERN AIRCRAFT DIESELS

By Paul H. Wilkinson, *S.A.E. Journal*, November, 1940

Abstracted by L. M. Arkley, M.E.I.C.

In 1939, actuated by the conflicting reports in regard to the status of the Diesel engine in aircraft, Paul H. Wilkinson, consulting engineer of New York, set out to find something on the subject first-hand.

He visited Germany and investigated such plants as the Junkers and the B.M.W. engine factories and the Dornier works where Diesel-engined flying boats are built, the repair shops of Deutsche Lufthansa where the Diesels used in their airlines are serviced and he also talked with Dr. Schmidt in his laboratory. Besides Dr. Schmidt, he met (in Germany) such experts as Mr. Achterberg, Dr. Schwager and Mr. Lang.

In France he met Messrs. Clerget, Coatalen, Jalbert and others interested in this work.

In England he visited the Bristol and Napier engine factories and talked with many people interested in Diesels including the well known Dr. Fedden. Recently he spent some time at the N.A.C.A. engine laboratory at Langley field where a comprehensive Diesel development programme is under way.

The author describes and shows photographs of many engines such as—

(a) The Jumo 205, developing 880 hp., for take off and weighing only 1.43 lb. per hp.

(b) The Junkers Jumo 207 equipped with turbo-supercharger, developing 1,000 hp. for take-off and this output is maintained at altitudes of 20,0C0 ft., weight per hp. of 1.43 lb., including supercharger and a b.m.e.p. of 131 lb. per sq. in. The specific fuel consumption of these engines is 0.35 lb. per hp. hr. at cruising speed.

(c) The 16-cyl. water cooled Clerget, operating on the four stroke cycle (built in France) is equipped with four Rateau turbo-superchargers, and is designed to develop 2,000 hp. at 2,200 r.p.m., altitude 16,000 ft., specific weight 1.87 lb. per hp., with b.m.e.p. of 145 lb. per sq. in.

The above gives an idea of the kind of information appearing in the paper and there are tables such as the following giving interesting comparisons.

Make & Model	Junkers Jumo 207	Allison V 1710 C6	Rolls-Royce Merlin X	Hispano-Suiza 12Y
Type	Diesel	Gasoline	Gasoline	Gasoline
Cooling	Water	Ethylene Glycol	Ethylene Glycol	Water
Number of cylinders	12	12	12	12
Total displacement	1014 cu. in.	1710 cu. in.	1647 cu. in.	2197 cu. in.
Maximum horse power	1000	1000	1010	1200
R.p.m.	3000	2600	3000	2600
Output, hp. per cu. in.	0.99	0.58	0.61	0.55
Weight of engine, lb.	1430	1280	1394	1080
Specific wt., lb. per hp.	1.43	1.28	1.38	0.90
Fuel Consumption (ratio), lb. per hp-hr.	0.38	0.58	0.66	0 55
As above for cruising	0.35	0.46(E)	0.53(E)	0 44(E)
Bmep. lb. per sq. in.	1.31	1.77	1.61	1 67
Rated altitude	20,000	12,000(E)	17,500	11,500

(E)—Estimated figures.

Judging from the data compiled, the author believes that the Diesel, on the whole is better than the gasoline driven unit for airplane work.

He gives the advantages of the Diesel as follows (1) reduced fire hazard; (2) low fuel operating cost; (3) large pay load and flight range possibilities; (4) reliability; (5) efficiency.

Diesel Fuel

Commenting on the above he says that Diesel fuel is safer than gasoline because it does not give off inflammable vapours at atmospheric temperature and it has a higher flash point. There has yet to be recorded a fire on a Diesel-engined airplane where the fuel ignited and burned.

Low Operating Cost

According to the author combining the lower specific cost of the Diesel with the lower specific fuel consumption gives a final figure much in favour of the Diesel.

Reliability

Ninety long non-stop flights over the South Atlantic (1900 miles) and 48-2,400 mile trips over the North Atlantic completed by the Diesel-engined planes of the Deutsch Lufthansa are cited as an example of reliability. In another table, mileage and time of operation are given for each year from 1931 to 1938 as total mileage flown of 4,243,895 with 69,967 flying hours.

In the discussion following the presentation of the paper, which gives a rather rosy picture of the Diesel compared with the more commonly used gasoline engine, Mr. Robert Insley of the Pratt & Whitney Aircraft Corporation, and Mr. A. L. Beall and Mr. Nutt of the Wright Aeronautical Corporation all pay their respects to Mr. Wilkinson; the general trend of their remarks tend to discredit many statements appearing in the paper. A few important points brought out in the paper are first the limiting of the fire hazard because the Diesel needs no electric spark for ignition and uses a fuel which will not readily take fire and burn under atmospheric conditions but it must be remembered here that the ordinary Diesel fuel oil used is not suitable for airplane work; it must be refined which brings its cost to near the gasoline figure.

The second point noted is the comparatively low specific weight value for Diesels of about 1.43 lb., and along with this is the low specific fuel consumption of 0.38 lb. per hp. hr.

On the whole the paper is a painstaking effort and is well worth reading.

WAR-TIME FACTORIES

From *Trade & Engineering* (London), December, 1940

Valuable hints on the design of single-storey war-time factories, based on experience of the effects of bombing, are given in Bulletin No. C. 12, issued by the Research and Experiments Department of the Ministry of Home Security.

After pointing out that the object of air attack is to paralyze production, the Bulletin states that war-time designers can do much to make factories highly resistant to collapse and difficult to fire, while damage can be localized, and the steadiness of the workers reinforced by giving them cover at hand. The intelligent development of the design methods advocated is regarded as an important counter in maintaining production despite air attack.

So far more steelwork has been destroyed by fire than by high explosives. The simplest way of minimizing fire damage is to limit the combustible materials in the factory. In the roof timber purlins or any form of slates or tiles on boarding should not on any account be used.

The tendency towards very large buildings should be reversed. Even in a small building, the explosions will to some extent be confined by the walls and roof, and adjacent buildings will be relatively undamaged.

By far the most common type of factory for war-time production is the single-story building, and the first principle in its design is that all loads should be carried by a framework of steel or reinforced concrete. Load bearing walls are dangerous. Where reinforced concrete is used the most satisfactory way of minimizing damage is to divide the framework into as many discontinuous units as possible, thus localizing any collapse that may occur.

The second principle is that the steel frame should resist collapse notwithstanding the sudden removal of any one main member. This is not so rigorous as it sounds. Near the explosion, the load is generally relieved by the roof covering being blown away, and there have been a number of cases where direct hits have severed either the rafter or the main tie of a steel roof truss without even producing a measurable sag.

The chief risk to roof steelwork arises from the violent displacement of a stanchion foundation, and the consequent shearing of the stanchion cap connection, leading to collapse of roof trusses. This risk is eliminated if two simple precautions are taken. The cap connection of the stanchion to the roof member should be made stronger than is usual in order that it shall not be sheared off even if the stanchion base is shifted 4 or 5 inches by a near miss. This precaution is particularly necessary in the case of trusses or beams framing into external stanchions. In addition to the effects of ground movement such stanchions are liable to be subjected to a considerable horizontal blast pressure applied to them by whatever wall construction is adopted. Provided their cap connections are adequate, however, the worst effect of this blast will be to bow out the stanchions without causing any major damage or collapse. In addition, the roof girder or valley beam should be spliced so as to be continuous. This will ensure that, even if a stanchion is destroyed, the valley beam is adequate to carry the dead load only of the roof (without the sheeting) over two bays. These precautions will not serve if two adjacent stanchions are destroyed, and a stanchion spacing of at least 30 ft. each way is desirable to prevent this.

The external walls of a war-time factory should be regarded as simply protective screens against weather and bomb fragments. Panels and sheeting should be so designed that blast damage shall not be transmitted by them to the framing. To ensure that the sheeting shall blow in harmlessly it should be of asbestos-cement or other brittle material, with anti-scatter protection by means of wire or sisal netting, which may be of large mesh, securely fixed to the steel framing behind the sheeting. The use of corrugated steel sheeting is not recommended for walls, as although it will blow out harmlessly from a hit inside the building, it is liable to cause considerable buckling of the steelworks under the effects of a near miss outside the building.

The use of lightweight internal partitions to sub-divide a factory should be avoided. Such partitions are particularly liable to blast damage and if glazed or sheeted with a brittle material they are a serious source of danger to personnel. Substantial internal partitions, however, can be designed to afford a considerable measure of protection. If they are built the full height of the shop they will provide useful fire stops and may limit blast damage to the roof. They should be framed in steel or reinforced concrete independent of the main structure.

The little evidence so far available on the behaviour under the effects of direct hits and near misses of flat roofs incorporating monitor lights and giving overhead protection by a 4 in. reinforced concrete slab indicates that they should afford considerable protection to the factory from debris thrown up from bomb craters. They may even give some protection to plant against the effects of those light bombs which, being instantaneously fused, explode when they strike the roof. Such a bomb would merely blow a hole about 5 ft. square in the roof with relatively little damage to the interior of the factory.

The effect of a large bomb exploding inside a factory is however, likely to be much more serious. The reinforced concrete roof slabs will undoubtedly be lifted over a fairly wide area. It is possible that they may also be displaced slightly and fall back into the shop instead of upon the supporting steelwork. Should this occur the roof slabs would do even more damage than the bomb, and this eventuality must be guarded against at all costs. The best safeguard would be to anchor the slabs to the steel framework. Such anchorage need not be of any great strength, but it should be designed to withstand an upright pressure on the roof of at least 100 lb. per sq. ft. Alternatively the slabs may be linked together. A saving of steel could be effected if the slabs were designed to be continuous, such continuity being provided by additional top reinforcement placed in position and grouted in after the slabs are erected.

Roofs being less subject to external blast from a near miss than are walls, the objection to the use of corrugated steel for walls does not apply to sheeted roofs, for which it is the ideal covering. The area of sheeting likely to be destroyed by a direct hit is about fifteen times as great for asbestos cement as for corrugated iron. The resistance of asbestos cement sheeting to blast can be considerably increased by reinforcing it, preferably with light-gauge sheet steel. Such sheeting reinforced with fabric tape has a considerably greater resistance to impact loads than unreinforced sheeting.

Insulating board lining under sheeted roofs should on no account be used. Under a direct hit such a lining does not save the roof sheeting and causes extensive damage to the roof steelwork. Unlined roof sheeting fixed in the usual way is capable of being blown off without damage to the steelwork. The presence of the lining, however, results in an excessive uplift being applied to the steelwork and may cause very extensive damage to it.

PULLING UP TRACK AT TEN BLOCKS AN HOUR

From *Transit Journal* (Albany, N.Y.) December, 1940

Removal of rails from the abandoned tracks of the Lafayette Street Railway was greatly facilitated by a machine designed and built by R. L. Shambaugh of Lafayette. The work was accomplished without first taking up the paving, and the ties were not disturbed, so that the street surface could be restored with the least disturbance.

The machine used consists of an A-shaped frame made up of steel beams. The channels which form the uprights have holes drilled at regular intervals for adjusting the height of the boom of a truck-mounted crane. The base, which is of built-up members, is attached at one end to the crane truck. To start the removal of a rail the paving is removed adjacent to a joint and the crane pulley attached by means of the crane tongs. As soon as the rail end has been lifted high enough a nickel-steel roller is inserted below it across the frame. The entire structure is then pulled along the street by the crane truck, a second truck being hitched in front to give extra traction. Since the frame is pressed against the pavement by the rail itself the disturbance is limited to the area immediately adjacent to the rail.

The machine was used in Lafayette on streets paved with brick and with black-top asphalt. Some of the rails were set in concrete 2 by 4 in. thick. Rails and spikes were pulled out as the machine moved along, leaving a ribbon of twisted steel ready to be cut up and hauled away. On an asphalt paved street, nearly ten blocks were removed in an hour. Finally, concrete was poured into the trench formed and the paving completed with asphalt.

STEAM FOR AEROPLANE PROPULSION

From *Trade and Engineering* (London) December, 1940

A London engineer visualizes the day when British aircraft will be powered by a new type of steam generator which he has invented. He may or may not live to see that day dawn—for he is 75 years old—but at any rate he has produced a model which works quite efficiently and conjures up all sorts of possibilities for the future of British aviation.

Much remains to be done on the invention, for as yet it is not certain that the device can be adapted for use in aircraft, though the inventor, Mr. Ernest Clarkson, is convinced it can be. A steam-driven aero-engine would obviously contain a great number of advantages, perhaps the most important of which is its silence. A night bomber equipped with such an engine would be extremely difficult to find. All the sound locators in the world would fail to pick it up, and unless there are developments which end for all time the problem of night interception it would be all Lombard Street to a China orange that it would be able to locate and bomb its target and return home without being seen by an enemy fighter.

The new idea upon which Mr. Clarkson worked was one which required both an unusually small steam generator and a very small quantity of water. The plan was not to boil water in the mass in boiler tubes but to apply a combination of spraying water into the tubes and impregnating it with an absorbent material which was kept at such a heat that the moisture evaporated immediately. In his first simple model Mr. Clarkson derived the heat from a Bunsen burner. The engine worked most efficiently. Starting from cold, it was turning over in 20 seconds and continued to run with a good output of power until its small supply of water was finished. The energy developed by a "boiler" only three-quarters the capacity of the cylinder was surprising.

Encouraged by the results obtained from this tiny model Mr. Clarkson constructed a bigger model, worked on rather different lines, but with the same basic principle. At one end he fixed a blow-lamp working on paraffin oil. This directed heat towards six straight copper tubes about 8 in. in length. Inside these tubes were much smaller ones, with tiny holes bored at intervals along the length. Between the two tubes he placed a lining of his secret metal substance. Underneath, he placed a brass tank with a water capacity of one quart, the water being pumped into two chambers—one for steam and the other for water. As soon as the outer copper tubes became really hot the water was sprayed through the holes in the inner tube upon the hot metal and was immediately converted into steam. The outlet of steam from the generator to the engine he controlled by means of a stop-cock or regulator. With this model he had expected to get a pressure of 200 lb. He not only obtained it but actually broke one of the 200 lb. gauges.

Mr. Clarkson believes that if the idea were developed for use in aeroplanes the engine could be driven by crude oil. He claims that the generator will work in any position, and indeed, after seeing it, there seems no reason why it should not. If the generator was adopted for use in aircraft, the copper tubes could be reinforced on the outside by steel tubes, and the whole of the tube area could be encased in asbestos or other covering, thus both conserving the heat inside and preventing it from getting into the aircraft itself outside.

NATIONAL DEFENCE SURVEY

From *Journal of the Institution of Engineers*, (Australia), August, 1940

A survey of the engineering profession for purposes of national defence was conducted in 1939 and immediately after the receipt of the returns from individual members, a preliminary classification was carried out. This classification was on a broad basis, the returns being grouped under nine convenient major headings. Although this grouping had a specific usefulness, it did not afford a ready selection of, say, the members who had had experience in, or were engaged on any particular type of work, without examining a large number of returns under one or more of the major headings. For this reason a more detailed classification was considered to be necessary and this has been undertaken by a group of members of the Sydney Division.

The returns received as the result of the original survey, together with those filed subsequently, have been re-classified, every important particular given on each return being indicated by a code number. Each return has been coded and the particulars recorded on cards punched to correspond with the coding of each particular return. In the event of a member having experience in more than one branch of engineering, a separate card has been made for each branch. By the use of a sorting machine, which has been made available for the use of The Institution, members with any particular qualifications can be determined very rapidly. A selection of the most suitable man can then be made by reference to the original returns and as the numbers of returns necessary to be examined has been greatly reduced, the survey should prove of greater use to the authorities.

The system of classification provides for 14 main headings but each of these is sub-divided into a number of special classes, the whole scheme permitting of the most precise selection. Its extension to the records of other Divisions has been recommended.

The classification, however, will be complete only when returns have been received from 100 per cent. of the membership of The Institution. This cannot be achieved without the personal co-operation of those concerned. The necessary forms will be made available on application.

MODERNIZATION OF WATERLOO AND CITY RAILWAY

From *The Engineer* (London) November 15, 1940

The first stage of the modernization of the Southern Railway's line between Waterloo Station and the Bank—the Waterloo and City Railway—has now been completed. The new arrangements were brought into operation on October 28th.

The new rolling stock now running on the line has been designed to obtain the maximum amount of seating capacity consistent with comfort, and also allows for a very much greater standing space than in the old rolling stock. Twenty-eight new coaches are being supplied—twelve motor coaches and sixteen trailer coaches. They will seat 1,312 passengers and will be formed into five five-coach trains, each consisting of two motor coaches and three trailer coaches. The remaining two motor coaches and one trailer coach are spares for maintenance, etc. During the busy hours five-coach trains will be run with accommodation for 600 passengers, and during the slack hours the service will be maintained by motor coaches detached from the five-coach trains. The control equipment is of the most modern design and is similar to and largely interchangeable with the equipments used on the latest suburban and express units of the Southern Railway. The coaches are provided with electrically controlled, air-operated doors, so that the guard is able to control all the doors on a train from one position. A tunnel telephone hand set is carried in each driving cab for use in emergency, and can be clipped to bare wires run the length of each tunnel. The clipping of the telephone to the wires automatically cuts off the current in the tunnel concerned and places the motorman in communication with the electric supply sub-station.

It has not been possible to introduce the new stock gradually as part of the improvement of this railway has been the moving of the conductor rail from its original position centrally between the running rails to the standard position laid down by the Ministry of Transport, i.e., 16 in. outside the running rail. As many as 6,445 yards of new conductor rail have been laid. The standard arrangement of conductor rails incidentally enabled the Waterloo and City trains to be tested on the surface lines of the Southern Railway.

In order to reduce noise to a minimum, the running rails have been welded into 315 ft. lengths, involving 544 welded joints. Noise absorbing shields will also be experimented with after the new rolling stock has been brought into use. These shields will be fitted between the lower portion of the coaches and the tunnel walls. New lighting in the tunnels has been installed on a semi-automatic principle, and colour-light signalling has been introduced. Tickets are no longer issued on the trains, as four automatic ticket-issuing machines have been provided at each station, as well as three booking offices at Waterloo and one at the Bank station.

Powers have been obtained for the construction of escalators at Bank Station, and a low-level subway giving direct access to the London Passenger Transport Board Central London Line; but, owing to the war, this section of the work has been deferred.

The Waterloo and City Railway is only 1 mile 46 chains long. The line was opened in August, 1898, and it carries an average of 30,000 passengers daily, most of them, of course, during the business rush hours.

DISPATCHER ON THE AIR

From *Transit Journal* (Albany, N.Y.) December, 1940

Realizing that time is becoming increasingly important in all aspects of transit operation, the Brooklyn & Queens Transit division of the New York City Transit System has streamlined its dispatching system through the establishment of two-way radio communication.

The Brooklyn & Queens surface system serves an area approximately 8 by 16 miles, using about 1,235 street cars and 300 buses. In addition to a headway recorder system for checking the passage of cars at various control points, about 175 street supervisors are used, some being assigned to twenty Chevrolet radio patrol cars.

Each car is handled by one man and carries fuses, cable, a 10-ton jack and other equipment, enabling the patrol inspector to handle almost any emergency from equipment repair to the removal of heavy traffic obstructions. Patrol districts include both street car and bus routes, and are divided on a basis of amount of work involved. Inspectors are men of long experience; they work on nine-hour shifts.

Ten of the patrol cars are equipped with 15-watt transmitters and receiving sets, both similar to those used on police patrol vehicles; the other ten cars have receivers only. In addition, receiving sets are installed on four heavy emergency trucks, on two lines department automobiles and on two autos of the surface track department. Two-way installation on only half of the cruisers was intended to provide a test of the real need for two-way talk. Four months' operation indicates that the need for two-way equipment is vital, because when the dispatcher calls a one-way car he either "sits on a hot seat" until he gets a clearance over the telephone, or makes an additional call to a nearby two-way cruiser to get an immediate answer, with the result that two-way cruisers get two to three times more work to do.

The dispatching radio equipment, furnished by Westinghouse Electric & Manufacturing Company, consists of a 50-watt central transmitter, remote control equipment in the dispatcher's office and four remote receivers spaced to pick up talk from the 15-watt transmitters on the patrol cars. The central transmitter is located at emergency headquarters approximately in the heart of the system. Its antenna is mounted on top of the building and rises 240 ft. above street level. Although low in power, the transmitter has given adequate coverage of the entire area, and system officials are quite satisfied with the results, though they had been warned it might not be sufficient to do the job. Experience indicates a minimum of "shadowed" area (where reception is difficult) and that most of these could not be materially reduced even with a considerably more powerful transmitter.

BOMBER VS. BATTLESHIP

From *Trade & Engineering* (London) December, 1940

The Attack at Taranto

The great success last month of the torpedo and bomb attack by aircarft of the Fleet Air Arm against units of the Italian Navy as they lay at anchor in Taranto harbour has revived once more the old controversy of the bomber versus battleship. This controversy raged for years before the war, and no satisfactory decision was ever arrived at. Those whose life had been spent in the Navy were firmly convinced that the battleship would always be able to hold its own; those who knew how devastating a bomb, delivered accurately from an aircraft, could be, were equally convinced that the ship would suffer severe damage if it did not sink altogether.

The first year of war would appear to have shown that each side was right to a certain extent. There have been cases of capital ships being hit and suffering little damage; there have been others of a bomb sending the ship to the bottom. It is certainly clear that smaller warships, such as destroyers, cannot hope to be any match for a bomber. About the effect of a torpedo delivered from an aeroplane there has never been much controversy. It was obvious that if only the torpedo-carrier could get into position the torpedo would destroy its target. The only doubt was whether the attacking aricraft would be able to live through the hail of fire which would be sent up by the ships.

Torpedoes dropped from the air are of the usual naval type, but slightly modified to enable them to be carried by a bomber. But the technique of a torpedo attack is entirely different from that of bombing. Bombs can be discharged against a ship either in a dive or in the orthodox manner, and from any height, although a ship is notoriously a most difficult target to hit if it is on the move. In this case the ships at Taranto were in harbour, and constituted an ideal objective.

To attack an objective with a torpedo is a hazardous task, for, carrying this weighty and cumbersome cargo, an aircraft cannot adopt evasive tactics, but must fly in a straight line. It must also come down to a height considerably less than 100 ft. and is consequently exposed to the fire of the light anti-aircraft guns with which all warships are equipped. Once it has been "fired" from the aircraft the torpedo moves forward under its own power, as it does after being fired from a submarine or destroyer.

The success of the Fleet Air Arm in this action has demonstrated the necessity of having ship-borne aircraft with every unit of the Fleet. Italy does not possess a single aircraft-carrier, and, before the war in the Mediterranean is over, she will no doubt have good cause to regret it. Had she possessed Fleet fighters, the Italians would no doubt have been able to minimize the effects of the raid. As it was, she had to rely entirely on the light guns on the ships, and they were able to bring down only two of the attackers. Aircraft-carriers are admittedly very vulnerable to attack from the air, but the Fleet Air Arm is now equipped with such splendid fighters that they would be able to give adequate protection against any force which Italy could muster.

It is doubtful whether any naval air service possesses such a first-rate aircraft as the new Fairey Fulmar. It has been described in many quarters as a "large Hurricane," but it would be much more accurate to describe it as a "baby Battle"—the younger brother of the bomber made by the same firm. In performance the Fulmar stands high above the older aircraft in use with the Fleet Air Arm. Not only has it a useful speed in the air but it also possesses another necessary attribute for a ship-borne aeroplane in having a low landing speed.

The success of the Fleet Air Arm in the Mediterranean may go a long way towards minimizing the advantage which the Italians enjoy in operating so near home, and may have far-reaching effects on the result of the war in the Middle East.

TEST ROAD COMPARES BASES OF VARYING THICKNESS

From *Engineering News Record* (New York, N.Y.), January, 1941

Highway bases of eight types, some stabilized with cement, some with asphalt and some untreated, are being tried out on a test road near Sacramento, Calif., under supervision of the California Division of Highways. The purpose is to make comparative tests of the different low-cost road designs and materials with a view to selecting the most economical base, under light traffic, both with regard to first cost and subsequent maintenance costs. A feature of this project is the placing of the road bases to be tested in strips 100 ft. long, varying in thickness from the minimum that could be considered practicable, to a thickness that should withstand all ordinary wear, thus giving an indication of how the failure progresses and at which thickness the several types are adequate to render service under the test loads that are used.

The test road is of oval shape with two 200-ft. tangents whose ends are connected by semicircular arcs. Each of the two tangents, which are 15 ft. wide, contains four 7½ by 100-ft. test panels, thus putting a different base under each of the two wheel tracks. Subgrade for the entire test section was prepared by excavating a trench in underlying hardpan and placing therein a 6-in. layer of clean, porous sand and screenings with pipes for admitting water. Over the sand is a 12-in. cover of soil with very low bearing value (saturated bearing value 5 per cent or less).

On this foundation the base materials were placed, increasing the thickness uniformly from a 3-in. base (plus a 2-in. surface) to an 18-in. thickness, also with a 2-in. surface. The point at which failure of maximum thickness occurs is expected to indicate the comparative strength and serviceability of the different types of construction, and direct observation should show how much benefit derives from the various forms of stabilization.

The eight bases comprise:

(1) Crusher-run base (untreated) with a minimum bearing value of 100 per cent.

(2) Cemented gravel mixture (untreated) with a 50 per cent bearing value.

(3) Same as (2) stabilized with 5 per cent emulsified asphalt.

(4) Same as (2) stabilized with 6 per cent portland cement.

(5) Sand-clay mixture (untreated) with a 15 per cent bearing value.

(6) Same as (5) stabilized with 5 per cent emulsified asphalt.

(7) Same as (5) stabilized with 6 per cent Portland cement.

(8) Same as (5) stabilized with 5 per cent of a special cut-back asphalt.

Over the entire test area a plant-mixed asphalt surfacing 2-in. thick was laid to protect the surface and to insure uniformity of load application. Subgrade base and bituminous wearing surface were compacted to the same extent as under favourable construction conditions.

Before the test was begun, water was put into the sand layer until water level rose to the underside of the layer of low-bearing-value soil. Thereafter the water inflow was continued at a rate just sufficient to maintain the water at this level until complete saturation of the 12-in. layer of soil had occurred as the result of capillary attraction.

When the subgrade saturated in this way, a loaded truck was started around the track, using first the legal load limit (17,000 lb. on the rear axle). Under this load failures in the thinner sections occurred too rapidly for satisfactory observation and the rear axle loading was reduced to 12,000 lb. The test load is operated around the track at 15 m.p.h.

Each failure of the road surface is repaired as it develops, after noting position and character of the failed area. Thus the surface is maintained constantly in good condition in order that no sound area may be prejudiced by pounding resultant from adjacent broken areas.

Tests were begun in the fall and were continued for 15,000 passes of the truck before closing down for the winter. During the rainy season it is expected that all bases and subgrades will take up a comparatively high percentage of moisture (the California Division of Highways has found this to be the case even in arid climates like Imperial Valley) and thus in the spring after all materials have had an opportunity to absorb moisture from winter rains as well as by capillarity, the test will be continued to obtain data for final conclusions. Officials of the Division of Highways have stated that until the tests have been completed, results will not be considered conclusive.

THE INSTITUTION AND AUSTRALIA'S WAR EFFORT

From *Journal of the Institution of Engineers*, (Australia), July, 1940

Considerable progress has been made in connection with the R.A.A.F. Preliminary Training Scheme developed within The Institution to provide facilities for the preliminary training in educational subjects, of recruits for the Royal Australian Air Force.

This scheme originated in a suggestion made by Mr. H. R. Halliday, B.E., A.M.I.E. Aust., to the Minister for Air that, to enable the period between enlistment and entrance to a training camp to be employed usefully, facilities should be provided Air Force recruits for "brushing up" those subjects of which an intimate knowledge is imperative if the recruit is to thoroughly absorb the specialized instruction he is later to receive.

In the provision of these facilities the Sydney Division of The Institution offered its full co-operation. The offer was accepted and, in consultation with the Educational Officer of the R.A.A.F., representatives of the Great Public Schools of Sydney and members of the Institution are devoting their time to the conduct of classes which all persons, accepted for service as air crews, are invited to attend.

No less than 477 members of the Sydney Division have offered their services in this connection, and at the present time 45 groups each comprising from 10 to 12 recruits, have been organized and are attending the classes arranged.

Both day and evening classes are held, and these are located throughout the various suburbs of Sydney, so that recruits who are still continuing their civil employment pending their call-up, may attend a class most conveniently situated to their place of residence.

The day classes occupy four half days each week, these being conducted at the headquarters of various engineering establishments, both governmental and private. The staffs of the organizations concerned have been freed to give necessary instruction.

The evening classes are conducted on three evenings in each week, each class occupying two hours, and these are held in the Great Public and State schools, church halls, various public halls, gas and electric light companies' showrooms and even the apprentices' room at one of the Sydney race-courses. Classes are being now organized in many towns throughout the State.

The subjects covered in the classes held include arithmetic algebra, logarithms and trigonometry, mechanics and physics. Each subject, or section, is subdivided into 16 lessons with five revision lessons, and the whole course is designed to be covered, either by correspondence or in class work, in 21 weeks. The four sections of the work are studied concurrently.

The scheme has been extended recently to include the educational training of artisans and mechanics required for the ground engineering staffs or in the production shops. In this extension the Sydney Technical College is directly co-operating, and is engaged in the training of ground staffs, i.e., fitters, air craft hands, etc.

NEW WORKS LIGHTING INTENSITIES RECOMMENDED IN REPORT

From *Industrial Power and Fuel Economist* (LONDON) OCTOBER 1940

The Departmental Committee on lighting in factories has recommended a new standard of intensities, and many installations have automatically become out of date.

The recommended minimum of lighting intensity is raised from 1 foot-candle at floor level to 6 foot-candles at 3 ft. above the floor. In some situations a lower intensity is permissible, but for most working areas this figure is the minimum.

Such an increase cannot be achieved by any haphazard decision as indiscriminately to fit higher power lamps. Existing lighting points and mounting heights should be used to fullest advantage, so ensuring a minimum dislocation of production and careful use of available materials, but a planned lighting scheme should be advised.

For general lighting, this can usually be mostly carried out by an arrangement of dispersive fittings. Each installation, however, has its peculiarities, and scientific application of principles by knowledgeable engineers is necessary.

For instance, where bays are relatively narrow in relation to their height, the fitting of dispersive reflectors at full height in accordance with too general a rule would result in undue wastage of light on walls, particularly if they have a low reflection factor. The simple solution is to mount dispersive reflectors at a convenient height something less than the maximum possible.

Combining Overhead and Side Lighting

In large bays where fittings need to be mounted above the cranes, it is advisable to fit concentrating type reflectors. The light distribution will then be such that illumination on horizontal surfaces is likely to be very much greater than that on a vertical plane, and so it is usually desirable to combine the overhead lighting with side lighting by suitable mounted angle reflectors. See Fig. 1.

Besides arrangement of fittings, another major problem of lighting planning is the choice of a light source. High pressure mercury vapour electric discharge lamps, such as Osira lamps, suit most industrial purposes, their efficiency being 38-45 lumens per watt, according to the wattage. Their higher visual acuity compared with tungsten lamps is a great asset, and the almost complete absence of red rays is a definite advantage in many production fields such as steel machine work.

Fluorescent electric discharge lamps have practically the same efficiency and they, or a combination of discharge lamps and tungsten lamps, will avoid an unpleasant facial appearance—sometimes a merit where female labour is employed.

Local Lighting

The need for high intensities in carrying out fine detail work with high accuracy has made local lighting increasingly popular. It cannot be emphasised too strongly, however, that this should always be supplementary to general lighting, and in no way supersede it. Brightness at the working level must not exceed ten times that of the surroundings or a tendency to eyestrain due to the need for ocular adjustment will be created. A further point to remember in maintenance is that the type of fitting necessary for local lighting requires very frequent cleaning, as it is nearly always installed near moving machinery.

A new lamp known as the Osira 5 ft. mains voltage fluorescent tubular lamp has many characteristics, especially in colour values, which make it worth consideration under this heading. The light colour is so near to day light that operatives find it extremely pleasant. Colour discrimination is very good, and fine detail easily distinguishable. The surface brightness is low, making it possible to utilise low mounting heights for high intensity local lighting. Their linear construction ensures heat dissipation over a wider area than is possible with a discharge lamp—a valuable factor in local lighting, because it minimises discomfort of the operative.

The result of applying knowledge involving such elements as have been described is well summarized in the following table.

Productive Value of Better Lighting

Process	Foot-candles Old system	Foot-candles New system	Increase of Production Per cent.
Typesetting by hand....	1.3	20	24
Foundry..............	2.5	7	7.5
Tile Pressing..........	1	3	6
Silk Weaving..........	50	100	21
Lathe Work...........	12	20	12
Post Office (Sorting)....	3	6	20
Wire Drawing.........	3	9	17
Roller Bearing Manufacture................	5	20	12.5

These figures are taken mainly from investigations carried out by the Government and show clearly how beneficial can be any efforts to assist the frequently overtaxed worker's eye.

Mixing Day and Artificial Light

An interesting aspect of sicentific lighting which arises from Black-out conditions is the manner of mixing day and artificial light. No matter how effective artificial lighting may be, there is an adverse subconscious effect upon workers who operate entirely under its influence during daylight hours. It is not feasible to exclude the psychological value of daylight per se, but prime requirements for welfare are bright or cheerful surroundings.

The admission of daylight is naturally ideal, since it is distributed from the sky with equal intensity in all directions, and provides a large upward component overhead in the form of reflected light off the ground. The proportion of daylight is not important, as the amount does not need to contribute measurably to actual working light. Where removable shutters were substituted for blackened windows after complaints by workpeople, the operatives troubled only to remove some of the shutters saying "just a little daylight makes all the difference." In this instance, artificial light was provided for workers during the day as well as at night.

It is suggested, therefore, that where daylight can be introduced by the installation of sliding doorways, adjustable blinds, roof ventilators, etc., this should be done. Should this be impossible, a cheerful lighting effect as well as one of high intensity should be achieved, because fatigue of the worker in a permanently blacked-out building is probably largely induced by the knowledge that daylight is present outside, and this induction will be the greater wherever lighting is notably "artificial."

When blending artificial light with daylight, electric discharge lamps are better than tungsten lamps. Also, for a given amount of light the heat developed is about a third of that of the necessary tungsten lamp installation, and the temperature is less liable to be raised to uncomfortable levels.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

THE PRESIDENT SUFFERS AN ACCIDENT

The injury to Dr. Hogg, which occurred three days ago at Toronto on January twentieth, has turned out to be less serious than was at first feared. Just as the *Journal* goes to press a telegram from Toronto conveys the encouraging statement: "Appears to be no real anxiety as to ultimate recovery."

Although full details are lacking, it seems that the President was hit by a motor truck while crossing the street at the Royal York Hotel, where he had attended the Empire Club luncheon to the Governor General. He suffered severe head injuries, but X-ray examinations showed there was no concussion.

It is too early to foretell the length of incapacitation that will follow, but it is certain that he cannot be at the Annual Meeting. This will be a great disappointment to him and to all members.

Frequently, an accident such as this gives startling proof of the esteem in which a person is held. No sooner was the news of the accident made public than inquiries began to pour into Headquarters. Beyond any doubt, our president occupies a position of unusual importance and prominence, both in the affairs of the country and in the hearts of those who know him. On behalf of the entire membership, the *Journal* extends to him sympathy and good wishes.

PRIZES AND AWARDS

Elsewhere in this issue are the reports of various prize committees announcing the awards for 1940. In addition to these, Council announces the award of the Sir John Kennedy Medal to Lieut.-General A. G. L. McNaughton, and the inaugural awards of the Julian C. Smith Medal to eight members of the Institute.

The Sir John Kennedy Medal is awarded "as a recognition of outstanding merit in the profession." It is apparent that a more deserving selection could not be made than Lieut.-General A. G. L. McNaughton. It is expected that arrangements for the presentation will be made through the senior engineering institutions in England.

The establishing of the Julian C. Smith medal was announced in the October *Journal*. It is appropriate that the memory of such a staunch supporter of the Institute should be perpetuated within the Institute by this excellent endowed medal. It is further appropriate that the initial awards should include members who were associated with Mr. Smith in many of his interests.

The medal is given for "achievement in the development of Canada," an objective which was always close to the heart of Mr. Smith. The inaugural announcement contains the names of several persons, although it is intended that for the future the honour shall be restricted to one award a year. Herewith is the list, and a brief account of the attainments which prompted the committee and Council in making the selection.

W. D. Black, of Hamilton, Ont., B.A.Sc., Toronto, 1909, President of the Otis-Fensom Elevator Co. Ltd. President of the Canadian Manufacturers' Association in 1938. Member of the Executive Committee, Bank of Canada. Patron of the Toronto Symphony Orchestra. Trustee, Leonard Foundation. Vice-President of the Allied War Supplies Corporation.

R. J. Durley, of Montreal, Que., B.Sc. University College of London, 1887; Ma.E., McGill University, 1898. Secretary-Emeritus of the Engineering Institute of Canada. Author of "Kinematics of Machines." Professor of Mechanical Engineering at McGill University (1901-12); Secretary, Canadian Engineering Standards Association (1919-25); Secretary of Engineering Institute of Canada (1925-1938). Member of Council and Chairman of the Canadian Advisory Committee, Institution of Civil Engineers (1940).

Augustin Frigon, of Montreal, Que., I.C., Ecole Polytechnique, Montreal, 1909; M.I.T. Boston, 1909-10; Ecole Supérieure d'Electricité, Université de Paris, E.E. 1921 and D.Sc. 1922. Assistant Manager of the Canadian Broadcasting Corporation. Author of many engineering reports. Member of Royal Commission on Radio Broadcasting (better known as Aird Commission), 1928-1929. Member of Electricity Commission, Province of Quebec (known as Lapointe Commission) 1934-35. President, Quebec Electricity Commission, 1935-36. President of Corporation de l'Ecole Polytechnique de Montréal.

F. W. Gray, of Sydney, N.S. St. George Technical School, graduated in coal mining '98. Hon.LL.D., Dalhousie, 1937. Assistant General Manager, Dominion Steel & Coal Corporation. Author of "Coal Fields and Coal Industry in Eastern Canada," and "Undersea Coal Mining." A staunch supporter of professional engineering bodies. President of Canadian Institute of Mining and Metallurgy, 1932.

Sir Herbert Holt, of Montreal, Quebec. D.C.L., Bishop's College, and LL.D. McGill. Chairman of the Board Royal Bank of Canada, and Montreal Light Heat & Power Cons. Director in a large number of corporations. Governor of McGill University, and the Montreal General Hospital. President of the Royal Victoria Hospital, Montreal. Established Herbert S. Holt Foundation in 1934.

R. S. Lea, of Montreal, Que. B.Sc. 1890, Ma.E. 1893, McGill. Consulting engineer. Author of many important engineering reports. Assistant Professor, Civil Engineering, McGill University (1893-1902). Adviser to Ontario Hydro-Electric Power Commission and certain federal and provincial governmental departments in connection with river problems.

Beaudry Leman, of Montreal, Quebec. B.Sc. University of Lille, France, and McGill University. Dr.c.sc. University of Montreal, 1934. President and managing director of Banque Canadienne Nationale, and director of several important companies. Past president of the Canadian Bankers' Association. Member, Canadian Advisory Committee on St. Lawrence Waterway. Member, Allied War Supplies Corporation.

C. A. Magrath, of Victoria, B.C. LL.D., Toronto, 1926. Retired. For many years, practised as irrigation engineer and land surveyor in western Canada and North-West Territories. Member of Legislature of N.W.T., 1891-1902. Member of House of Commons of Canada, for Medicine Hat, 1908-1911. Identified in advisory and executive positions on many governmental commissions and boards. Chairman of Canadian Section, International Joint Commission 1914-1935. Chairman, Hydro-Electric Power Commission of Ontario, 1925-1931.

It is hoped that all prize winners can attend at Hamilton and receive their honours before their fellow members.

MEETING OF COUNCIL

Minutes of a meeting of the Council of the Institute, held at Headquarters on Saturday, January 18th, 1941, at ten-thirty a.m.

The secretary read a letter from General McNaughton expressing his sincere appreciation of the great honour which the Institute had conferred upon him in the award of the Sir John Kennedy Medal. The secretary was directed to communicate with the secretaries of the Institutions in London to see if arrangements could be made for the presentation to take place at some joint function in London.

It was noted with appreciation that Lieut.-Col. C. G. DuCane, O.B.E., a prominent member of the Institute in London, had consented to represent the Institute on the occasion of the presentation of the James Watt Medal of the Institution of Mechanical Engineers to Professor Stodola on January twenty-fourth.

Mr. Newell, as chairman of the Finance Committee, reviewed briefly the financial statement for the year 1940 as prepared by the auditors. The figures were very similar to those of last year, and showed an operating surplus of a little over $3,000.00, which was substantially more than had been anticipated in the budget. Arrears of fees and current fees had kept up very well; *Journal* advertising and subscriptions were practically the same as last year; general expenses were down about $700.00, and rebates to the branches were a little less than last year, due to the co-operative agreements with the Professional Associations. It was decided to appropriate an additional $1,000.00 to the building reserve fund.

The satisfactory condition of the finances of the Institute was noted with appreciation, and on the motion of Mr. Wardle, seconded by Colonel Grant, it was unanimously resolved that the report of the Finance Committee and the financial statement be accepted.

The report of Council for the year 1940, the treasurer's report, and the reports of the various Institute committees, were taken as read and accepted for presentation to the Annual Meeting.

The general secretary presented a letter from Mr. Gaherty, chairman of the Institute's Committee on Western Water Problems, which accompanied the report of that committee. In view of the international significance of the report, and of the definite recommendations which are made, it was decided it should be printed and copies sent to all councillors so that a complete discussion could be held at the annual Council meeting in Hamilton.

The report of the Past-Presidents' Prize Committee recommended that the prize be not awarded this year. This report was accepted.

The committee had also considered at some length the question of how best to stimulate interest in this prize, which up to now had been unsatisfactory. Following discussion, it was finally decided that Past-President Challies be asked to discuss the matter with the other past-presidents and see if the rules governing this award could not be revised so as to create a greater interest.

On the recommendation of the Duggan Medal and Prize Committee, it was unanimously RESOLVED that the Duggan Medal and Prize for the year 1940 be awarded to M. S. Layton, Jr.E.I.C., for his paper "Coated Electrodes in Electric Arc Welding."

On the recommendation of the Gzowski Medal Committee, it was unanimously RESOLVED that the Gzowski Medal for the year 1940 be awarded to Elizabeth M. G. MacGill, M.E.I.C., for her paper, "Factors Affecting the Mass Production of Aeroplanes."

On the recommendation of the Plummer Medal Committee, it was unanimously RESOLVED that the Plummer Medal for the year 1940 be awarded to O. W. Ellis for his paper, "Some Developments in Alloys during the last Twenty Years."

On the recommendation of the Leonard Medal Committee, it was unanimously RESOLVED that the Leonard Medal for the year 1940 be awarded to R. G. K. Morrison, M.C.I.M.M., for his paper, "Points of View on the Rock Burst Problem."

The reports of the examiners regarding Students' and Juniors' Prizes were received and approved as follows:

John Galbraith Prize to W. C. Moull, S.E.I.C., for his paper "The Electrification of a Modern Strip Mill."

Ernest Marceau Prize to Marc Trudeau, S.E.I.C., for his paper "Points Fixes et Lignes d'Influence."

Phelps Johnson Prize to Léo Brossard, S.E.I.C., for his paper "Geology of the Beaufor Mine."

H. N. Ruttan Prize: no papers received.

Martin Murphy Prize: no papers received.

The membership of the Nominating Committee of the Institute for the year 1941, as submitted by the various branches, was noted and approved. It was unanimously RESOLVED that Professor R. A. Spencer, M.E.I.C., of Regina, be asked to accept the chairmanship of this committee.

The annual reports of the various branches were received for presentation to the annual meeting.

A Striking Committee was appointed to make recommendations regarding the chairmen of the various Institute committees for the year 1941.

Dr. Challies reported that he had recently attended a meeting of the executive committee of the Engineers' Council for Professional Development at New York. He explained that at that meeting it was announced that E.C.P.D. had been asked to continue the work of the Committee on Professional Ethics which had been inaugurated by the American Engineering Council. The executive asked the Institute to name a representative to this committee, and after consulting Dr. Surveyer, who was also in New York, Dr. Challies had tentatively proposed Professor C. R. Young. He now asked Council's approval of that recommendation, which was unanimously given.

Mr. Perry, chairman of the House Committee, reported that the contract for underpinning the Headquarters building had been awarded to A. F. Byers & Company Limited, the lowest tenderer. He gave a detailed description of the work, which was now well under way.

Considerable time was spent discussing the proposal which had been made to the Department of Labour by the joint committee of three secretaries representing the Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy and the Canadian Institute of Chemistry, a copy of which had been mailed to every councillor. It was decided unanimously that Council approved of the principle involved and was agreeable to offering any constructive assistance within its power. The secretary was instructed to inform the Deputy Minister to that effect. Council also asked the general secretary to continue to represent the Institute in this matter.

The general secretary reported that during his recent visit to the Victoria Branch a suggestion had been made by the councillor and others that the branch hold a professional meeting at Victoria. Council was quite interested in this proposal, but decided that it should be left to the consideration of the incoming Council and Finance Committee.

A number of applications were considered, and the following elections and transfers were effected:

Admissions	
Members	6
Juniors	3
Affiliates	1
Students	18

Transfers	
Junior to Member	3
Student to Member	1
Student to Junior	11
Affiliate to Member after passing examination under Schedule "C"	1

It was noted that the next meeting of Council would be held in Hamilton on Tuesday, February 5th, 1941, at ten-thirty a.m.

The Council rose at one-fifteen p.m.

DOMINION COUNCIL

The Annual Meeting of the Dominion Council of Professional Engineers was held at the Royal York Hotel, Toronto, on January 20th and 21st. The president of the Council, D. A. R. McCannel, M.E.I.C., of Regina (representing the Saskatchewan Association), occupied the chair. Others present included: Professor R. E. Jamieson, M.E.I.C., (Quebec); F. W. W. Doane, M.E.I.C., (Nova Scotia); C. C. Kirby, M.E.I.C., Honorary President, (New Brunswick); W. P. Dobson, M.E.I.C., (Ontario); P. Burke-Gaffney (Manitoba); Professor H. R. Webb, M.E.I.C., (Alberta); F. W. MacNeill (British Columbia); and Major M. Barry Watson, M.E.I.C., Secretary-Treasurer of the Council.

Mr. S. R. Frost, M.E.I.C., President of the Ontario Association of Professional Engineers, welcomed the representatives of the various provinces and offered them the assistance and facilities of the Association.

Among the reports presented to the Council were the reports of the Committees on the Admission of Foreign Engineers; Licensing of Engineers; the Construction Industry in Canada; National Defence and the Profession; and the Training of Young Engineers.

The Council reports that there is a definite shortage already of engineers in Canada and it is now necessary to allocate such engineering talents that we have. It expressed its willingness to assist in undertaking such distribution. According to the Council, insufficient guidance is being given to young men entering the engineering profession and it was resolved that the various Associations should offer guidance to high school students in regard to the duties and the necessary qualifications of an engineer, in order to cut down on the high percentage of failures in the various engineering colleges of the country. The Committee on the Training of the Young Engineers is co-ordinating its work with that of other engineering organizations.

D. A. R. McCannel of Regina was re-elected president of the Council for the year 1941. The other members of the Executive are the vice-president, the member from Quebec (not yet named); and W. P. Dobson of Toronto. Major M. Barry Watson was re-elected as secretary-treasurer.

The next meeting of the Council is to be held in St. John, New Brunswick, in 1942.

ELECTIONS AND TRANSFERS

At the meeting of Council held on January 18th, 1941, the following elections and transfers were effected:

Members

LeBel, Paul, B.A.Sc., (C.E.) (Ecole Polytechnique), consltg. engr., technical services, Imperial Oil Ltd., Montreal, Que.

Lloyd, Warren G., B.A.Sc. (Univ. of Toronto), divn. plant engr., western divn., Bell Telephone Company of Canada, Toronto, Ont.

Metcalfe, Neil, B.Sc. (Univ. of Wales), chief metallurgist, Burlington Steel Co. Ltd., Hamilton, Ont.

McCavour, Samuel Thomas, B.Sc. (C.E.), (Univ. of N.B.), chief engr. and joint mgr., The Great Lakes Paper Co. Ltd., Fort William, Ont.

Packard, Royal Day, S.B. (Mass. Inst. Tech.), chief engr., Brown Corporation, La Tuque, Que.

Saunders, Melville Sydney, B.A.Sc. (Univ. of Toronto), topographic engr., Tropical Oil Company, Colombia, S.A.

Juniors

Ain, Joseph, B.Eng (Civil), (McGill Univ.), instr'man., Dept. of Transport, Montreal, Que.

Crandall, Seymour Arnold, B.S. in Mining (Mich. Coll. of Mining), Creighton Mine, International Nickel Co. of Canada, Copper Cliff, Ont.

Rahilly, Thomas Francis Jr., B.Sc. (Mech.), (Queen's Univ.), master mechanic, blast furnace dept., Algoma Steel Corporation Ltd., Sault Ste. Marie, Ont.

Affiliate

Milligan, Gordon Herald, commercial representative, Calgary Power Company, Edmonton, Alta.

Transferred from the class of Junior to that of Member

Lamoureux, Marcel, B.Eng. (McGill Univ.), asst. engr., Dept. Public Works Canada, Ottawa, Ont.

Piché, Joseph Alphonse Arthur, B.A.Sc., (C.E.) (Ecole Polytechnique), asst. engr., Dept Public Works Canada, Quebec, Que

Pooler, Gilbert Douglas, B.Sc. (Queen's Univ.), asst. inspr., arms inspection br., Dept. of National Defence, Ottawa, Ont.

Transferred from the class of Student to that of Member

Ansley, Fred G., B.Sc. (Queen's Univ.), field engrg., Ford Motor Co. of Canada, Windsor, Ont.

Transferred from the class of Student to that of Junior

Baird, Malcolm Francis, B.Sc. (Elec.), (Univ. of N.B.), asst. lamp engr., Canadian Westinghouse Company, Hamilton, Ont.

Boone, Harold Percival, B.Sc. (Univ. of N.B.), apparatus correspondent, Canadian Westinghouse Company, Hamilton, Ont.

Brown, Ernest F., B.Eng. (Mech.), (McGill Univ.), junior mech. engr., Royal Canadian Mint, Dept. of Finance, Ottawa, Ont.

Chambers, Robert. B.Sc. (Elec.), (Univ. of Alta.), field engr., Shawinigan Engineering Company Ltd., Shawinigan Falls, Que.

Clarke, Bruce Porteous, B.Eng. (McGill Univ.), asst. hoist engr., Canadian Ingersoll Rand Co., Lennoxville, Que.

Dufour, Gaston, B.A.Sc., (C.E.) (Ecole Polytechnique), engr., Aluminum Co. of Canada, Arvida, Que.

Foster, Ian McLeod, B.Eng. (McGill Univ.), mech. engr., Brown Corporation, La Tuque, Que.

Guénette, Joseph Antoine Paul, B.A.Sc. (C.E.), (Ecole Polytechnique) asst. res. engr., Dept. of Roads, Montreal, Que.

Meagher, Robert Douglas, B.Eng. (Chem.), (McGill Univ.), gas plant operator, British American Oil Co. Ltd., Montreal East, Que.

Miller, Alex. Matthew, B.Sc. (Civil), B.Eng. (Mech.), (N.S. Tech. Coll.), refractory engr., Dominion Steel & Coal Corporation, Sydney, N.S.

Shatford, Ralph Grant, B.Eng. (N.S. Tech. Coll.), cracking coil inspr., Imperial Oil Limited, Dartmouth, N.S.

Students Admitted

Anderson, James Douglas (McGill Univ.), 3525 University Street, Montreal, Que.

Batanoff, George Boris, (Univ. of Sask.), 202 Clarence Ave. South, Saskatoon, Sask.

Bogle, Roy Thomas, B.A.Sc. (Mech.), (Univ. of B.C.), 426 Park St., Peterborough, Ont.

Borrowman, Ralph Willson, B.Sc. (Civil), (Univ. of Man.), 1192 Wolseley Ave., Winnipeg, Man.

Carty, Desmond Geoffrey, (McGill Univ.), 160 Waverley St., Ottawa, Ont.

Covo y Stramba, Peter Victor, (McGill Univ.), 3653 University St., Montreal, Que.

Eddy, Robert Cheyne, (Queen's Univ.), 406 Johnson St., Kingston, Ont.

Fleming, John Patten, (Univ. of Toronto), 61 Foxbar Road, Toronto, Ont.

Gareau, Leo Eugene Arthur, (McGill Univ.), 5509 Durocher Ave., Outremont, Que.

Gordon, Abraham Isaac, (McGill Univ.), 1343 Lajoie Ave., Outremont, Que.

Gordon, John A., (McGill Univ.), 534 Prince Arthur St. W., Montreal, Que.

Johnston, John Smyth, (Queen's Univ.), 15 Daniel St., Smiths Falls, Ont.

Leduc, René, B.A.Sc. (C.E.), (Ecole Polytechnique), Dept. of Roads, Montreal, Que.

Miller, Justin Ormond, (McGill Univ.), 3506 University St., Montreal, Que.

Simpkins, Arthur C., (McGill Univ.), First St., Sunny Brae, N.B.

Tremblay, Gérald René, (Ecole Polytechnique), 6880 De Laroche St., Montreal, Que.

Wein, Harry Garrick, (McGill Univ.), 1621 Ducharme Ave., Outremont, Que.

Yosipovitch, Joseph, (McGill Univ.), 661 Querbes Ave., Outremont, Que.

NATIONAL DEFENCE AND U.S.A.

To assist the national defence programme and industry in general in providing urgently needed engineers, Cornell University launched a nation-wide quest for fifty of America's best qualified secondary school seniors to be trained as engineers. They will be awarded John McMullen Regional Scholarships in Engineering this spring. The scholarships carry variable stipends up to $400, a year throughout a four or five-year course in the College of Engineering.

Dean S. C. Hollister announced recently that application blanks and instructions were mailed to more than 3,000 principals and headmasters throughout the United States.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

C. D. Harrington, M.E.I.C., vice-president and general manager of Anglin-Norcross Corporation, has recently been elected president of the Montreal Board of Trade. Since his graduation from McGill University in 1907 he has always been engaged in construction work, first with the firm of Byers and Anglin and later with Anglin Limited.

Wing Commander T. R. Loudon, M.E.I.C., professor of applied mechanics at the University of Toronto has recently been promoted from Squadron Leader to this rank and appointed chief technical officer of the Flight Research Establishment at Ottawa. He was previously in command of the School of Aeronautical Engineering established last year at Montreal under the British Commonwealth Air Training Plan.

Douglas S. Ellis, M.E.I.C., professor of civil engineering at Queen's University, Kingston, Ont., was recently appointed head of the department of civil engineering succeeding the late Professor W. P. Wilgar.

Colonel N. C. Sherman, M.E.I.C., chief ordnance mechanical engineer, Department of National Defence, Ottawa, has been appointed commandant of the R.C.O.C. Training Centre, Kingston, Ont.

C. D. Harrington, M.E.I.C.

R. E. Heartz, M.E.I.C.

Past Presidents J. B. Challies, M.E.I.C., and **Arthur Surveyer,** M.E.I.C., attended the Executive Meeting of the Engineers' Council for Professional Development held in New York City on January 4th, 1941.

Major M. Barry Watson, M.E.I.C., has been appointed second in command of the University of Toronto contingent of the Canadian Officers' Training Corps. He will also continue as chief instructor of the unit.

T. A. McGinnis, M.E.I.C., was recently elected chairman of the Kingston Branch of the Institute. Born at Belleville, Ont., he was educated at Queen's University, Kingston, where he received his degree in 1909. After graduation he engaged for a few years in railway surveys and construction. In 1907, he became resident engineer at the Canada Cement Company plant near Belleville, Ont., later becoming operating superintendent. From 1911 to 1914, he was construction engineer for the same company at various plants. From 1914 to 1918, he was managing director of Missisquoi Marbles Limited, Philipsburg, Que. In 1918, he became senior member of the firm McGinnis and O'Connor, engineers and contractors. Mr. McGinnis is now the owner of the firm.

R. E. Heartz, M.E.I.C., is the newly elected chairman of the Montreal Branch of the Institute. Born at Marshfield, P.E.I., he graduated from McGill in 1917 with the degree of B.Sc., and immediately after graduation was employed by the St. Maurice Construction Company at La Loutre, on the construction of the Gouin dam. Later in the same year he enlisted with the Royal Air Force, received his commission early in 1918, and was appointed flying instructor, being demobilized in 1919. In that year he joined the Fraser-Brace Engineering Company, Ltd., and was employed on the construction of the Big Eddy dam on the Spanish river. Mr. Heartz became resident engineer at La Gabelle development on the St. Maurice river in 1922, having joined the staff of the Shawinigan Engineering Company in 1920. He was resident engineer on the St. Narcisse development on the Batiscan river in 1924-1925, and in 1926 was transferred to Montreal for investigating preliminary design of hydro-electric developments. In 1927, Mr. Heartz was appointed resident engineer of the Paugan Falls development on the Gatineau river, and since the completion of that undertaking has been connected with the design and construction of different hydro-electric projects. He is at present assistant chief engineer of the Shawinigan Engineering Company.

R. B. Herbison, M.E.I.C., who was with the firm of Glenfield and Kennedy Limited, Kilmarnock, Scotland, is now a member of the Observer Corps and a lecturer in anti-gas measures, high explosive and incendiary bombs with the defence services in Scotland. Mr. Herbison was at one time mechanical designer and field engineer in the mechanical department of the Dominion Bridge Company, Lachine, Que.

Victor Meek, M.E.I.C., has recently been appointed controller of the Dominion Water and Power Bureau in the Department of Mines and Resources at Ottawa. Mr. Meek had been assistant controller since 1924.

Norman Marr, M.E.I.C., chief hydraulic engineer of the Dominion Water and Power Bureau in the Department of Mines and Resources at Ottawa, has been appointed assistant controller, succeeding Mr. Meek.

John Morse, M.E.I.C.

J. B. Challies, M.E.I.C.

P. S. Gregory, M.E.I.C.

Past-President J. B. Challies, M.E.I.C., has been appointed, last month, vice-president and executive engineer of The Shawinigan Water & Power Company, Montreal. Dr. Challies has been with the company since 1924, when he resigned the position of Director of the Dominion Water and Power Bureau at Ottawa to accept a professional appointment with Shawinigan.

P. S. Gregory, M.E.I.C., has been appointed vice-president in charge of sales and promotion with the Shawinigan Water & Power Company, Montreal. He joined the firm in 1918, having been previously connected with the Electrical Commission of Montreal and the Montreal Tramways Company.

John Morse, M.E.I.C., is one of the new vice-presidents of Shawinigan Water & Power Company of Montreal, and is in charge of operation. Mr. Morse has been with the company since 1907, having successively occupied the positions of superintendent of operation, general superintendent and assistant general manager.

C. H. McL. Burns, M.E.I.C., chairman of the Niagara Peninsula Branch of the Institute, who has been works manager and manager of the two Welland forging plants of the Canada Foundries and Forgings Ltd., for the last six and a half years, is at present associated with the Federal Foundries and Steel Company Ltd., in rehabilitating and bringing into production the old London Rolling Mills plant at London and the Sandwich Foundry at Windsor, recently acquired by this newly organized company. The Federal company expects to be in production within a few weeks and will produce S.A.E. rolled sections at London and grey iron and steel castings on a production basis at Windsor. Mr. Burns is associated in this work with the Brant Company of Detroit, specialists in industrial engineering and management.

Leslie Mackay, M.E.I.C., was appointed, last August, general superintendent and acting general manager of the Manitoba Power Commission, Winnipeg. He was graduated from the University of Manitoba in 1927. From 1929 to 1931 he was assistant resident engineer on the construction of Slave Falls power house for the Winnipeg Hydro-Electric System. He joined the Manitoba Power Commission in 1932 as secretary and assistant to the manager.

R. F. McAlpine, M.E.I.C., has returned to the Halifax office of Wm. Stairs Son & Morrow Limited, after having spent a few years as manager of the Cape Breton branch of the company. Mr. McAlpine joined the firm as a sales engineer upon his graduation from the Nova Scotia Technical College in 1928.

John Pringle, M.E.I.C., left last month for Trinidad, B.W.I., where he expects to stay for about a year in charge of work of a special nature. He was graduated from the University of Toronto in 1916 and, after serving in the last war with the Royal Engineers, he engaged in construction work in this country and in the United States. In this connection he supervised the erection of large apartment houses in New York City. In 1930, he became president of his own general contracting and real estate business in New York City. Mr. Pringle returned to Canada last year.

S. Stephenson, M.E.I.C., is now overseas with the 1st Canadian Pioneer Battalion, Royal Canadian Engineers. Previous to his joining up he had been for the last few years connected with the Whiting Corporation in Toronto.

P. J. Colgan, Jr.E.I.C., has joined the Royal Canadian Air Force and is, at present, stationed at Toronto. Previous to enlisting he was with the Cosmos Imperial Mills at Yarmouth, N.S.

J. B. Bryce, Jr.E.I.C., has left the National Research Council to accept a position in the hydraulic department of the Hydro-Electric Power Commission of Ontario at Toronto.

J. M. A. Crowe, Jr.E.I.C., who was a demonstrator in hydraulics in the department of mechanical engineering in the University of Toronto, is now located in Colombia, S.A., with the Tropical Oil Company.

John W. Wright, S.E.I.C., who was recently connected with Defence Industries Limited at Parry Sound, Ont., is now working in the aircraft division of the National Steel Car Corporation at Malton, Ont.

R. E. Jess, S.E.I.C., is now training as a pilot with the Fleet Air Arm in England. Previous to enlisting he was a student in engineering at McGill University.

E. R. Davis, S.E.I.C., is now production manager of the Control Apparatus Division of Railway and Power Engineering Corporation Ltd., at Toronto. He was previously electrical engineer with the Dominion Engineering Works, Montreal.

S. D. Levine, S.E.I.C., is on the inspection staff of the British Purchasing Commission and is stationed at the Republic Steel Corporation in Buffalo, New York. He was graduated from the University of Toronto in 1939.

Guy Savard, S.E.I.C., has joined the Royal Canadian Dragoons at St. Johns, Que., as a lieutenant. He was graduated from Royal Military College, Kingston, in 1937 and after a period of post-graduate work in Paris returned to Canada with the Canadian Liquid Air Company at Montreal.

VISITORS TO HEADQUARTERS

Captain V. R. Davies, M.E.I.C., Royal Military College, Kingston, Ont., on December 28th.

G. F. St-Jacques, M.E.I.C., Engineer, Provincial Public Utilities Board, Quebec, on December 28th.

Jean Morency, Jr.E.I.C., Inspector, Quebec Bureau of Mines, from Quebec on December 31st.

Marcel Papineau, S.E.I.C., from Noranda, on December 28th.

Professor H. E. T. Haultain, M.E.I.C., University of Toronto, from Toronto on January 3rd.

Paul Vincent, M.E.I.C., Secretary-Treasurer of the Quebec Branch, from Quebec on January 6th.

Georges Gravel, S.E.I.C., and **Rosaire Saintonge,** S.E.I.C., from Sherbrooke, Que., on January 9th.

David Hutchison, M.E.I.C., Manager, Mackenzie River Transport, Hudson Bay Company, from Edmonton, Alta., on January 16th.

Paul E. Buss, M.E.I.C., President, Spun Rock Wools Limited, from Thorold, Ont., on January 24th.

John C. Oliver, M.E.I.C., Registrar, Association of Professional Engineers of British Columbia, from Vancouver, B.C., on January 24th.

R. J. Chambers, M.E.I.C., Mechanical Engineer, Gaspesia Sulfite Company, Ltd., from Chandler, Que., on January 27th.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

David Williams Burpee, M.E.I.C., died at Fredericton, N.B., on November 3rd, 1939. He was born at Sheffield, N.B., on July 31st, 1875. His preliminary education was obtained in the grammar schools and his technical education through correspondence courses. He joined the Canadian Society of Civil Engineers as an associate member in 1904 and became a full member in 1910. He was a member of the American Engineering Association from 1906 to 1919. The greater part of his career was spent in railroading which he started in 1896, becoming chief engineer of the E.M.M.R. in 1914. Following this, he spent two years as a mining engineer in Newfoundland, returning to Canada in 1917 to join the staff of the New Brunswick Highway Department as a district engineer. In 1920 he resigned to become chief engineer of the Bangor and Aroostook Railway but later returned to the N.B. Highway Department, where he remained until 1926. From that time until 1928 he was with the Canada Steamships Ltd., retiring, on account of ill health, to his home in Fredericton, N.B., where he was able to do a limited amount of work at his avocation, cabinet making and repair, until his death.

Ernest Milton Salter, M.E.I.C., died suddenly at his home at Toronto on December 12th, 1940. He was born at Auburn, N.Y., on November 17th, 1889, and he was educated at the University of Toronto where he was graduated in 1911 in civil engineering. Upon graduation he became engaged in railway construction with the Canadian Northern Ontario Railway at Nipigon. In 1914 he joined the Greater Winnipeg Water District as a draughtsman and after a few months became resident engineer on railway construction. In 1915 he was assistant engineer on aqueduct construction for the Greater Winnipeg Water District. In 1919 he joined the Imperial Oil Company as a mechanical engineer at Sarnia, Ont., and later went to British Columbia where, for some years, he was general superintendent of the Imperial Oil Refinery at Ioco. He resigned this post because of ill health in 1930 and returned to Toronto, joining the manufacturing department. Two years later he was appointed safety engineer at the Sarnia refinery, leaving that post in 1938. Mr. Salter was supervising engineer at Malton airport near Toronto from February to July, 1940, at which time he was made supervising engineer at St. Catharines airport which position he occupied at the time of his death.

Mr. Salter joined the Institute as a Student in 1911 and was transferred to Junior in 1912. He became an Associate Member in 1916.

Athol Choate Wright, M.E.I.C., died at his home at Ottawa on January 5th, 1941. He was born at Hull, Que., on September 2nd, 1879, and was educated at Ottawa Collegiate Institute. For a period of five years from 1899 he was engaged in mining and surveying in western Ontario and British Columbia. In 1903 he became connected with the construction of the National Transcontinental Railway, first as an instrument man. He became resident engineer in 1908 and later occupied the same position with the Canadian Pacific Railway until 1914. From 1916 to 1919, he was overseas with the Royal Canadian Engineers and returned with the rank of captain. He then entered the Department of the Interior at Ottawa as an assistant hydraulic engineer. In 1933 he became connected with the National Parks of Canada, in the same department, and in 1935 he was made superintendent of Jasper National Park. He returned to Ottawa in 1938 and became attached to the Parks Branch of the Department of Mines and Resources. He had retired from this position last June.

Mr. Wright joined the Institute as a Student in 1908 and was transferred to an Associate Member in 1919. He became a Member in 1922.

COMING MEETINGS

The Engineering Institute of Canada—Fifty-fifth Annual General and Professional Meeting to be held at Hamilton, Ont., on February 6th and 7th. Secretary, L. Austin Wright, 2050 Mansfield St., Montreal, Quebec.

American Institute of Mechanical Engineers—Annual Meeting, New York, Engineering Societies Building and Commodore Hotel, February 17th to 20th. Secretary, C. E. Davies, 29W., 39th St., New York.

Ontario Good Roads Association—Annual Convention, Royal York Hotel, Toronto, February 26th to 27th. Secretary, T. J. Mahony, Court House, Hamilton, Ont.

Canadian Institute of Mining and Metallurgy—Annual Meeting, Montreal, March 10th to 12th. Secretary, E. J. Carlyle, Drummond Bldg., Montreal.

Corporation of Professional Engineers of the Province of Quebec—Annual Meeting, Montreal, March 29th. Registrar, C. L. Dufort, 354 Ste-Catherine St. East, Montreal.

The American Ceramic Society—43rd Annual Meeting, Lord Baltimore Hotel, Baltimore, Md., March 30th to April 5th.

Electrochemical Society—The 79th Annual Meeting to be held at the Hotel Cleveland, Cleveland, Ohio, April 16th to 19th.

American Water Works Association—Annual Convention, Royal York Hotel, Toronto. June 22nd to 26th. Secretary, Harry E. Jordan, 22 E 40th St., New York.

Canadian Electrical Association—51st Annual Convention, Seigniory Club, Quebec, June 25th to 26th, Secretary, B. C. Fairchild, 804 Tramways Building, Montreal.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

H. L. Johnston, m.e.i.c. - *Secretary-Treasurer*
A. H. Pask, Jr.e.i.c. - - *Branch News Editor*

The Annual Meeting of the Border Cities Branch was held on December 6th in the Prince Edward Hotel at Windsor, and began with a dinner at 6.30 p.m. Following this was a business meeting and the election of officers for 1941.

The chairman, Mr. J. F. Bridge, then gave the chair to Mr. T. H. Jenkins who proposed a toast to Mr. J. Clark Keith. Mr. Bridge presented Mr. Keith with a gold e.i.c. pin. Mr. Keith gave a short speech of thanks and presented the branch with a bronze plaque of the e.i.c. crest. This was received by Mr. Bridge who replied for the branch.

Mr. Jenkins with a few words on the history behind the branch reminded those present that this was the 21st anniversary of the organization of the Border Cities Branch. He then introduced as historian Mr. O. Rolfson, a charter member, to outline the history of the branch.

J. B. Keith presents the Border Cities Branch with a replica of the Institute's crest.

Mr. Rolfson told of the first meetings of organization beginning with an informal meeting held in the office of Mr. A. J. Stevens on January 17th, 1919. Mr. Stevens was elected chairman. On January 23rd formal application for the establishment of a branch was voted and signed by 20 Members and Associate Members. This was approved on February 25th and the group authorized to form a branch. Final elections were held on March 28th.

Mr. Rolfson recounted the names of many prominent and widely known members. He gave biographical sketches of several of these, many of whom have passed on.

Following the talk Mr. Bridge was again given the chair. The meeting adjourned on the motion of Mr. Jenkins seconded by Mr. F. J. Pollock.

EDMONTON BRANCH

B. W. Pitfield, Jr.e.i.c. - *Secretary-Treasurer*
J. F. McDougall, m.e.i.c. *Branch News Editor*

Mr. R. E. Allen, chairman of the Petroleum and Natural Gas Conservation Board of Alberta, addressed the December meeting of the Edmonton Branch on the evening of December 10th. He was introduced to the meeting by Dr. J. A. Allan of the Department of Geology of the University of Alberta. His topic was **Some Aspects of Oil Conservation in Alberta.**

He defined conservation as efficient production to prevent waste. As examples of conservation practised by modern men he mentioned forest and soil conservation. Forests are essentially a crop that can be replaced and soil can be remade and fertility returned. However, when dealing with petroleum we are dealing with a material that cannot be replaced or at the present time substituted. Every oil field is a liquidating asset as soon as it is found.

He mentioned how in 1923 many new fields were discovered in California and because of limited pipe lines capacity the old pumping fields were shut down. The new fields were depleted with horrible waste. By 1925 it was necessary to once again produce oil from the pumping fields. It was found that these old wells were in much better condition after their long rest.

In 1929, more California fields were discovered, and in the light of previous experience were operated more efficiently and oil conservation was started on a pro-rata basis. It was not until 1931 that sufficient data was available to show that conservation meant a longer life for a field, as well as a longer and greater income.

One of the principal savings due to conservation is a longer flowing well which in turn means cheaper overall production. He pointed out how it is necessary for oil wells to have sufficient energy in the form of gas pressure to bring the oil out of the producing sand and to the surface. Many wells have sufficient natural energy, if conservation is practised, to bring to the surface from 93 to 94 per cent of the entire quantity of oil contained in the sand, Improper production could easily reduce this to 50 or 55 percent.

Mr. Allen then dealt with a five-point programme for efficient production. He outlined these points as follows:

1. Adoption and use of the optimum rate principle by which a field is operated at a rate which will permit the greatest production in its entire life.

2. Reservoir pressure regulation. This is necessary for the conservation of the underground energy.

3. Development of an economical drilling programme.

4. Let a field produce only what the market can absorb and prevent dumping.

5. Prevent disturbing pressures in the industry such as an unreasonable profit motive.

In speaking of the Alberta situation he stated that at present the greatest need is for the development of more fields because conservation is easier to apply when the supply is ample.

He also pointed out how Alberta oils are limited in their competition with other oils because of high transportation costs. The eastern limit of the Alberta market is Portage-la-Prairie. A reserve of 200,000,000 barrels would be necessary to build a pipe line to Winnipeg, and the present Turner Valley reserve of 85,000,000 barrels is far from sufficient.

He stated that Alberta oils are also limited in competition with foreign oils because of high production costs. Most of the drilling equipment comes from the United States and high duties and unfavourable exchange at the outset mean a 60 per cent differential handicap.

At the close of the paper Mr. C. E. Garnett moved a hearty vote of thanks to Mr. Allen. Twenty-five members were present at the meeting. Chairman E. Nelson presided.

HALIFAX BRANCH

L. C. Young, M.E.I.C. - *Secretary-Treasurer*
A. G. Mahon, M.E.I.C. - *Branch News Editor*

The Annual Meeting of the Halifax Branch of the Institute was held at the Nova Scotian Hotel, Friday evening, December 20.

Branch Secretary L. C. Young read retiring Chairman Charles Scrymgeour's report of the past year's activity, which included the signing of the co-operative agreement between the Institute and the Association of Professional Engineers of Nova Scotia. Three meetings were held during the year, at which guest speakers addressed the members of the branch.

The secretary reported on the financial standing at the end of the fiscal year, and Scrutineers, H. W. Mahon and G. V. Ross, advised the chairman on the result of election of new officers for the coming year. S. L. Fultz was elected chairman, with J. A. MacKay, Dr. A. E. Cameron, Professor A. E. Flynn, D. G. Dunbar and J. F. MacKenzie replacing the retiring members of the executive. At this point in the meeting, retiring Chairman Charles Scrymgeour turned the chair over to S. L. Fultz.

There was considerable discussion as to the advisability of holding the joint meeting of the A.P.E.N.S. and the Halifax Branch of the E.I.C. this year. It was decided, however, that this function would take place as in the past, with some curtailment of entertainment.

The main feature of the evening was an address by Mr. Charles Scrymgeour, followed by moving pictures on the subject of **Fire Control in the Oil Refining Industry.** The address was exceptionally interesting and outlined the methods by which fire was avoided and fought in modern oil refining plants. The picture was provided by the Imperial Oil Company, and it well illustrated the speaker's remarks, showing actual conflagrations and the operation of oil fire fighting equipment.

HAMILTON BRANCH

A. R. Hannaford, M.E.I.C. - *Secretary-Treasurer*
W. E. Brown, Jr.E.I.C. - *Branch News Editor*

The annual business meeting was held at the Rock Garden Lodge on the evening of Monday, January 6th, 1941, when 63 members and guests were present. C. E. Sisson brought best wishes from the Toronto branch, for a successful Annual General Meeting in Hamilton in February and promised every support from Toronto.

The meeting was presided over by Alex. Love, the retiring chairman. After a very enjoyable dinner, the guest speaker, a gentleman travelling under the name of Colonel Beauchemin, who had arrived too late to take dinner with us owing to a presumed motor accident, gave a very interesting talk on British relations with the French, but towards the end of the talk it became evident that the disguise was hiding none other than T. S. Glover, M.E.I.C.

The business of the branch was now carried on. W. A. T. Gilmour was elected chairman, S. Shupe, vice-chairman, A. R. Hannaford, secretary-treasurer. Executive Committee: H. A. Cooch and A. C. McNab for two years and T. S. Glover and C. H. Hutton remain for one year. W. E. Brown is re-elected as assistant secretary and branch news editor.

After the business was completed Alex. Love handed the chair over to the new chairman, W. A. T. Gilmour.

A very hearty vote of thanks was given to the retiring chairman for the excellent work carried out during his term of office, and in his reply he thanked the executive and all members for the support so willingly given to him on all occasions.

In the interval between some very good musical numbers, door and other prizes were given out including a useless old electric stove and a broken down radio. However, behind this nonsense was a keen knowledge that our country is at war and with this in mind five partially filled in War Savings Certificates were given as other prizes.

Dr. Burke of McMaster University, replying to a special vote of thanks from Mr. Love, said the University authorities were pleased to give the Branch facilities for its meetings, which are of such great advantage to the membership.

KINGSTON BRANCH

J. B. Baty, M.E.I.C. - *Secretary-Treasurer*

On October 31st, 1940, the Kingston Branch held its annual dinner and business meeting at the Queen's Students Union. Eighteen members and three guests were present. The chairman, Major G. G. M. Carr-Harris presided. The report of the secretary-treasurer was presented and accepted.

The following officers were elected: chairman, T. A. McGinnis; vice-chairman, P. Roy; secretary-treasurer, J. B. Baty; executive: V. R. Davies, K. H. McKibbin, K. M. Winslow, A. H. Munro; ex-officio: G. G. M. Carr-Harris.

The general business and policy of the branch was discussed.

Major H. H. Lawson paid fitting tribute to the memory of the late Professor W. P. Wilgar, pointing out the important role he had filled in the activities of Queen's University and of the Institute, and recalling that he had served as the first secretary of the Kingston Branch of the Institute.

Mr. Louis Trudel, assistant to the general secretary, from Headquarters, reported upon the war activity of the Institute, and described the work of the employment bureau and its close contact with both industry and the departments of the government. He called special attention to the affiliation of The Engineering Institute of Canada with the Engineers' Council for Professional Development, and reported upon the good health and increased membership of the Institute.

Major G. G. M. Carr-Harris, mechanical engineer, Royal Canadian Ordnance Corps, delivered an interesting address on **Some Fundamental Engineering Principles as Applied to Mechanization.** This was published in the December, 1940, issue of the *Journal.*

LAKEHEAD BRANCH

H. M. Olsson, M.E.I.C. - *Secretary-Treasurer*
W. C. Byers, Jr.E.I.C. - *Branch News Editor*

The executive of the Lakehead Branch welcomed Mr. L. Austin Wright, general secretary, and Mr. J. A. Vance, a councillor of the Institute, on December 10th, at a luncheon held at the Royal Edward Hotel in Fort William. They were later escorted through the Canadian Car & Foundry Company plant and shown several points of interest at the Lakehead in company of the chairman, Mr. H. J. O'Leary.

A general dinner meeting was held at 6.30 p.m., at the Shuniah Club, in Port Arthur, and 35 members and guests were present.

The chairman called on Mr. J. A. Vance, who described the work of the Papers Committee and urged more exchange of speakers between the various branches, thus creating more interest at the meetings.

Mr. Wright was then called on to speak, and told of the contribution being made by engineers throughout Canada toward the prosecution of the war and expressed the desire of the Institute members to extend their knowledge and skill in the present conflict. He stated that there are now over 5,100 members in Canada and abroad, and that the Institute can boast of a credit balance in the bank. Mr. Wright also told of the large number of important war posts that are held by members of the Institute. He told of the work being done to improve the status of the engineers.

Mr. R. B. Chandler tendered a vote of thanks to the speakers and Mr. P. E. Doncaster and Mr. J. Antonisen expressed their appreciation.

LETHBRIDGE BRANCH

E. A. Lawrence, s.e.i.c. - *Secretary-Treasurer*
A. J. Branch, m.e.i.c. - - *Branch News Editor*

The Lethbridge Branch of the Engineering Institute of Canada held its regular meeting on Wednesday evening, Nov. 6th, 1940, at the Marquis Hotel with W. Meldrum presiding. Routine business was first attended to, then members and visitors assembled to listen to the address of the evening. Among the visitors were A. D. McLean, Superintendent of Air-Ways, Civil Aviation Div., Dept. of Transport and Flight-Lieut. J. F. Grant, Assistant to Air Commodore Cowley.

Mr. Knutson introduced the speaker, Ewan D. Boyd, Officer in charge of the Air Traffic Control Tower at Kenyon Field, who spoke on **Air Traffic Control.**

At the close of his address Mr. Boyd, assisted by Mr. Paul Doyle of the Air Traffic Control Staff, showed on a screen a large number of pictures of various airports of the North American Continent: New York, Toronto, Winnipeg, Chicago, Detroit and Lethbridge.

The number of questions asked of the speaker, after the address, was a good indication of the widespread interest in flying and all things connected therewith.

G. S. Brown had the support of the entire meeting in moving that a vote of thanks be accorded Mr. Boyd.

The meeting closed with the singing of the national anthem, after which refreshments were served by the staff of the Marquis Hotel.

On Wednesday evening, December 18th, 1940, the Lethbridge Branch of the Institute held its regular meeting in the Marquis Hotel.

In conformity with custom this was Ladies' Night and a suitable programme had been arranged.

In the unavoidable absence through sickness of the chairman of the branch, W. Meldrum, the meeting was presided over by J. M. Campbell. Following the singing of "O Canada," about 40 members and guests sat down to an excellent dinner, which was further enhanced by the music of Mr. Geo. Brown and his orchestra. Following the dinner the meeting was entertained by Mrs. Cull's group of young ladies in a delightful rendering of Christmas carols and popular songs. Lethbridge may well be proud of Mrs. Cull and her young ladies, who have done such splendid work in a good cause over a period of years. The Chairman conveyed to them the thanks and appreciation of the Lethbridge Branch as they prepared to leave.

After a short period of Community Singing led by Mr. R. S. Lawrence, and in which all joined, Mr. Chas. Daniel obliged with three songs which were much enjoyed.

The Chairman tendered the thanks of the Lethbridge Branch to Mr. Geo. Brown and his orchestra, and to Mr. Daniel for their contribution to the entertainment of the meeting. He then proceeded to give the meeting a resume of the proceedings of the joint meeting of members of the Association of Professional Engineers of Alberta and members of the Engineering Institute of Canada, held in Calgary on Saturday, Dec. 14th, 1940, for the signing of the co-operative agreement.

The chairman then called on J. T. Watson to introduce the speaker for the evening, J. G. Maxwell, traffic representative, Trans-Canada Air Lines. In introducing the speaker Mr. Watson paid tribute to Geo. Wakeman, general traffic manager, Trans-Canada Air Lines, Winnipeg, who had so kindly provided the films and equipment, and had arranged for a representative to come from Calgary to display them.

Mr. Maxwell stated that Lethbridge, one of the first stations on the T.C.A. system, was a good business point for the T.C.A. To give an idea of the volume of business handled by T.C.A. he stated that it carries an average of 90,000 lb. of mail per month, and has a load average of 70 per cent. Growth has been phenomenal and extensions of the service only await delivery of new planes which are expected in the next few months.

In a brief explanation of the motion pictures to be shown the speaker said that one entitled "African Skyways" was released by British Overseas Airways, which despite the war was still maintaining its service to and across Africa; and that the other entitled "The Swift Family Robinson" was released by Trans-Canada Air Lines and was being shown for the first time in western Canada, both pictures being complete with 'sound.'

"African Skyways" began with scenes of jungle life—elephants, giraffes, alligators, wart-hogs, hippopotami, and others, while from the 'sound' equipment came the chanting of natives, then followed scenes showing giant aircarft at various stages of flight across Africa from Alexandria to Cape Town; threshing with oxen, lifting water by hand for irrigation along the Nile, gold and diamond mines and native dances at Kimberley, how mail is delivered and collected at the "far flung outposts of Empire"; places which formerly could only be reached after arduous travel for several weeks by sea and land, now being reached by air travel in a few hours. The whole picture was filled with interesting glimpses of Africa and air travel across its vast distances.

"The Swift Family Robinson" was a motion picture in colour depicting the flight by air of the Robinson family from Montreal to Vancouver. It showed many of the interesting features of such a trip as it followed the progress of the Robinsons across Canada, and gave those present a better conception of Canada's great accomplishment, "Trans-Canada Air Lines."

Mr. Maxwell then expressed his willingness to answer questions, and the general interest in airways and flying was evident in the number of questions asked, all of which were ably dealt with by Mr. Maxwell.

A vote of thanks to Mr. Maxwell and Trans-Canada Air Lines was moved by C. S. Clendening, and heartily endorsed by all present.

LONDON BRANCH

Harry G. Stead, Jr.e.i.c. - - *Secretary-Treasurer*
John R. Rostron, m.e.i.c. - *Branch News Editor*

The regular meeting of the London Branch was held in the Board Room of the Public Utilities Commission, on Thursday evening, December 12th. The special speaker was Professor Robt. F. Legget, assistant professor of civil engineering at the University of Toronto, who chose as his subject, **Engineering in the MacKenzie River Basin.**

The speaker first described the geography of the area, which indicated that the MacKenzie River is one of the eight major river systems of the world, second only in size, in North America, to the Mississippi. Its catchment area is about 682,000 sq. mi., as compared with the St. Lawrence basin of 498,000 sq. mi. From its source to its several mouths in the Arctic Ocean, the MacKenzie River is 2,525 mi. long. Great Slave Lake, which is the largest fresh water area in the region, has a surface of 12,000 sq. mi. It is the fourth largest great lake of the North American continent.

Since the coming of the aeroplane in 1921, this region has opened up to the prospector, where formerly its activities were confined to the trapper and the Hudson Bay posts. To-day, industry has developed a salt well with processing plant, two water-power plants, five gold mines, an oil refinery, and the mine on Great Bear Lake, now not operating, from which radium was obtained.

Professor Legget described the engineering features of these several activities, and especially referred to the difficulties in transportation from the commercial centre at Edmonton to the operations of these several industries.

His address was illustrated with lantern slides, and the speaker was thanked by Chairman H. F. Bennett for his kindness in coming to London, and for the very excellent and informative address which he had given.

Many of the 23 members and guests present took part in the discussion, and Professor Legget added much to his address by his informative answers.

OTTAWA BRANCH

R. K. Odell, m.e.i.c. - *Secretary-Treasurer*

An illustrated address on the **Development of Mechanical Transport** was presented at the noon luncheon of the branch on December 19, 1940. Major M. M. Evans, Technical Staff Officer, Directorate of Ordnance Services, Department of National Defence, Ottawa, was the speaker.

The automotive industry has been of tremendous help in solving the problems of design and production of mechanized units for the Canadian forces and for shipment overseas, stated Major Evans. Among other things they have made available their personnel for this service almost to the point of crippling themselves. From this personnel has been drawn many of the present technical staff of the Department of National Defence that has to deal with mechanization.

The work for the staff has been very heavy, particularly at first, with twelve-hour days the rule and Sunday also being utilized. However, within a year after war was declared, many thousands of vehicles manufactured in Canadian plants have been shipped overseas and many more used in Canada for training and other purposes.

In the first Great War, stated the speaker, there were no specialized vehicles for military purposes, and the commercial trucks used were not entirely satisfactory. So great was the need felt for special and more rugged types of vehicles that the British War Office, in common with other countries, started in to develop specialized military units, using the experiences of the war as a guide. In the meantime, however, commercial vehicles themselves rapidly improved to such an extent that the War Office felt they could forgo their own investigations and use trucks and other vehicles right out of the factory. Then in the early 30's they adopted the practice of specially designing the vehicles again but employing as many commercial parts as possible.

The speaker, by the use of slides, illustrated the various types of vehicle equipment required, including equipment for the carrying of personnel, headquarters staff officers, wireless apparatus, machine gun units, anti-tank guns, and for hauling heavy artillery. In general much of the equipment has to have front wheel drive to obtain added traction, a short wheel base, large tires to give flotation over soft ground, high clearance for rough ground, and every facility for easy manoeuverability. They should be able to operate in any climate and maintenance problems should be reduced to a minimum.

In the manufacture of vehicles for the present war, special attention has been paid to the matter of standardization. The importance of this feature was stressed by the speaker, the idea being that the easy interchangeability of parts makes for rapid replacements or repairs whether in this country or overseas.

Although many hurdles have had to be surmounted in carrying out the programme set down, stated Major Evans, progress has been good and, incidentally, costs have been kept below what would have been required for purely commercial vehicles had they been used for the purpose. Production is now going on in full swing with many orders being turned out for the British Government as well.

W. H. Munro, chairman of the Ottawa Branch of the Institute, presided.

PETERBOROUGH BRANCH

A. L. Malby, Jr.E.I.C. - *Secretary-Treasurer*
E. Whiteley, s.e.i.c. - *Branch News Editor*

For twenty years, the Annual Dinner has marked an anniversary of the founding of Peterborough Branch of the E.I.C. Each year has added to the tradition of the event until, like most birthday celebrations, it is now something to look forward to, and to remember.

This year was no exception. Some 85 members and guests met at the Kawartha Golf and Country Club for the dinner on November 20th.

Dr. Thomas H. Hogg, president of the Institute, was introduced to the meeting by Mr. G. R. Langley. Peterborough Branch has been consistently fortunate in having the president at their annual dinner. Dr. Hogg outlined some of the present activities of the E.I.C. as a national organization. He mentioned the recent election of the E.I.C. to membership in the Engineer's Council for Professional Development, an important event in the life of the Institute. Progress was reported in the work of associating the E.I.C. and various provincial Associations of Professional Engineers, particularly in Nova Scotia, New Brunswick and Manitoba.

Annual Dinner of the Peterborough Branch.

These talks by the president are very helpful in bringing to each member a realization that the Institute is a national organization with activities beyond those of the local branches.

Mr. De Gaspé Beaubien, treasurer of the Institute, and joint chairman of the National War Savings Committee then addressed the gathering, in the latter capacity, on the economic aspects of the present war savings scheme. A brief summary follows.

There are very good reasons why the government issued War Savings Certificates as well as War Loan Bonds. The one appeals to classes that cannot be reached by the other. Also, the certificate appeals to savings in progress, the bond appeals to existing savings. They supplement each other.

And there are broader economic reasons for the War Savings Certificate. In normal times the financial and economic equilibrium of the country is regulated by supply and demand; e.g., over production leads to lower prices and a slackening of production or increase in consumption which restores the balance. The war introduces abnormal factors. Quantities of new products are required and new industries spring up. The country's wages are increased by some $900,000,000 per year. At the same time old industries have part of their productive capacity diverted to war work; there are no more goods than normal to be bought, in some cases less. If people with enhanced purchasing power compete to buy these goods an increase in prices would be inevitable and the vicious spiral of rising wages and rising prices means inflation. This could easily paralyze industry, disrupt our capital structure, and lead to labour trouble, all of which must be avoided at a time when our factories must supply equipment that is as vital for victory as fighting men.

The War Savings Certificate was designed to curtail inflation by diverting present excess purchasing power. This can be done by taxation to a limited extent, but in a free country such as this one, the restraint in handling excess purchasing power is preferably voluntary.

The National Committee supplies leadership, but actual selling and boosting of sales is done by local committees. Some 1,500 of these have been set up and are doing splendid work. All of this work, with the exception of a few full time workers at the Bank of Canada, is voluntary.

Peterborough Branch is indebted to Mr. Beaubien for an inspiring insight into this phase of our national war effort. Economics can be dry, but Mr. Beaubien made this issue a living one for his hearers, very interesting and stimulating.

There have been many annual dinners, all similar, yet each different. We will remember this 20th dinner for its association with Dr. Hogg and Mr. Beaubien, and for its minor but no less pleasant features—the stirring songs of Mr. Frank Oldfield, the reminiscing of Mr. C. E. Sisson, the stories of Mr. A. L. Killaly, and the notable introduction of Mr. Beaubien in both English and French by Mr. J. M. Mercier.

"There be of them that have left a name behind them..."

Those of us who live in city or district where street and place names are those of persons must have wondered about the people who are thus remembered. We wonder, but not often can we learn much about them.

Just such an unusual opportunity was given to the members of Peterborough Branch at their meeting, December 5, 1940. One of our members, Mr. J. W. Pierce, O.L.S., D.L.S., M.L.S., has spent many years as Land Surveyor in Peterborough and the surrounding districts. In the course of his work he has fallen heir to notes and papers of the early surveyors of these parts and has made an interesting hobby of collecting them. With some of these old notes, letters, and maps as illustrations, Mr. Pierce addressed the branch on **Early Surveys and Land Surveyors in Peterborough.** It was a colourful story that everyone enjoyed a great deal. Though it cannot be reproduced as told, and it loses much if a reader is not familiar with the local background in it, a brief summary follows for the benefit of the historically minded among readers of the Journal.

Surveys were begun in Ontario in 1783.

The townships of Monaghan and Smith were surveyed in 1817 and 1818 by S. S. Wilmot.

The town plot of Peterborough was laid out by Richard Birdsall in 1825. As happened in many Canadian cities, some streets followed the Indian portage trail, the rest were oriented to township lines.

John Houston came next, a colourful figure, born in Ireland, 1790, and commissioned a land surveyor in 1820. He served as local supervisor in the settlement of Peterborough district by Irish immigrants from 1825 on. He was a natural leader and besides being a surveyor was also justice of the peace, coroner, and later a major in the local militia. He surveyed the townships of Verulon and Methuen, and completed the survey of Peterborough in 1833-34.

John Reid, born 1807 in Ireland, came to Canada in 1822 and became a surveyor in 1837. He and his friend, Hon. T. A. Stewart, gave us our Reid street and Stewart street. As a surveyor, John Reid is remembered for his location of the north boundary of Peterborough in 1845 and the Burleigh road 1855.

G. A. Stewart and Sandford Fleming were apprenticed to John Reid in his survey practice. The former moved to Port Hope and finally became first superintendent of Banff National Park.

Sandford Fleming is well known as the engineer who gave us Standard Time. Mr. Pierce showed the meeting a reproduction of a map of Peterborough which Sandford Fleming engraved and printed during one of his winters as an apprentice. It was a remarkable piece of draughtsmanship.

Theodore and Mutius Clementi (whose father, Muzie Clementi, invented the pianoforte) were also among the apprentices with John Reid. They built the first of the now numerous summer cottages on beautiful Stony Lake.

J. W. Fitzgerald (born 1828) became a land surveyor in 1857 and came to Peterborough then. He did considerable work on the subdivision of townships around the city.

The records show among these early surveyors also J. W. Junior, T. Hewson (born 1846, P.L.S. 1866, died 1898) and A. J. Cameron (born 1864, P.L.S. 1889, died 1912).

No history of Peterborough would be complete without a mention of its famous lift lock. This was first suggested by a local man, Richard Birdsall Rogers (born 1857, P.L.S. 1879), also one of the early surveyors of the district.

During the discussion which followed Mr. Pierce's talk, our dependence on the landmarks left by these early surveyors was brought out, and incidentally, a project first sponsored by Mr. Pierce was mentioned—that of locating as far as possible the original marks of these early surveys and replacing the fast disappearing stones and trees on which these marks were made by more permanent concrete posts. The Ontario government had undertaken this worthwhile task, but lately had allowed it to lapse.

SAINT JOHN BRANCH

V. S. Chesnut - *Secretary-Treasurer*

G. L. Dickson, from Moncton, was elected president of the Association of Professional Engineers of the Province of New Brunswick at the annual meeting, held January 14th at the Admiral Beatty Hotel, preceding the annual joint dinner of the association and the Saint John Branch of The Engineering Institute of Canada. Mr. Dickson succeeds G. A. Vandervoort of Saint John as president.

Also elected to office were A. A. Turnbull, Saint John, as vice-president, and C. C. Kirby, Saint John, secretary-treasurer, while the following new councillors were elected: W. L. Lawson, Fredericton; A. R. Bennett, Moncton. Four councillors who still have another year to serve are V. C. Blackett, Moncton; R. K. Wills, Chatham; James T. Turnbull, Saint John, and Mr. Kirby.

J. P. Mooney, chairman of the Saint John branch of the Institute, presided over the dinner. The guest speaker was J. A. McCrory, vice-president and chief engineer of the Shawinigan Engineering Company, whose subject was **The La Tuque Development in Quebec.**

Mr. McCrory gave an illustrated address on the hydro development project carried out on the St. Maurice river, a scheme which has taken on huge proportions in the last two years. A four-unit plant is now in operation each at 50,000 hp. he said. Three had been in service continually since the plant was opened January 1st.

The fourth unit was operating at capacity much of the time, as well. By the use of slides he traced the construction work from its start in 1938. The dam is 1,337 ft. long and 100 ft. high. With completion of the construction contracts the entire facilities are now in the hands of the operators.

About 40 years ago, said Mr. McCrory, the first development in this area was carried out with a delivery of about 2,000 hp. to Montreal. With a view to bringing about the latest development a study was made of its possibilities in 1927.

The speaker dealt extensively with the entire project and outlined the progress being made in La Tuque's contribution to wartime industrial needs as a result of the last two years' construction programme.

SASKATCHEWAN BRANCH

Stewart Young, m.e.i.c. - *Acting Secretary-Treasurer*

A joint meeting of the Saskatchewan Branch of the Institute and the Saskatchewan Association of Professional Engineers was held in the Kitchener Hotel, Regina, on Friday, December 20, 1940, with 44 members and guests in attendance. The speaker of the evening, G. T. Chillcott, District Airways Engineer, Department of Transport, gave a comprehensive picture of the advance made during the past year in **Airport Construction in Saskatchewan.** A hearty vote of thanks was tendered the speaker on motion of H. R. MacKenzie. P. C. Perry, Branch Chairman, was in charge of the meeting.

SAULT STE. MARIE BRANCH

O. A. Evans, Jr.e.i.c. - *Secretary-Treasurer*
N. C. Cowie, Jr.e.i.c. - *Branch News Editor*

The Sault Ste. Marie Branch of the Institute held its annual meeting on Friday, December 20th, in the Grill room of the Windsor Hotel. Twenty members and guests sat down to an appetizing turkey dinner at 7.30 p.m.

The business portion of the meeting began at 8.15 p.m. The minutes of the previous meeting were read and adopted on motion of A. M. Wilson and A. E. Pickering.

The secretary's report was then read and adopted on motion of L. R. Brown and A. E. Pickering. W. M. Reynolds then brought in the report of the Nominating and Scrutineers Committee on the results of the election. The following were elected to office: E. M. MacQuarrie, chairman; L. R. Brown, vice-chairman; O. A. Evans, secretary-treasurer; N. C. Cowie, resident executive; C. R. Murdock, of Kapuskasing, non-resident executive. The chairmen of the various committees then brought in their reports. L. R. Brown and A. M. Wilson moved that W. M. Reynolds and N. C. Cowie be appointed auditors for the year 1941. F. Smallwood and N. C. Cowie moved that the secretary's honorarium be paid.

The society was then favoured by a short address by Judge MacDonald who left a few thoughts with members.

The chairman then thanked the members for their co-operation during the year. C. Stenbol moved that the meeting be adjourned.

VANCOUVER BRANCH

T. V. Berry, m.e.i.c. - - *Secretary-Treasurer*
Archie Peebles, m.e.i.c.- *Branch News Editor*

On the occasion of the visit to Vancouver of Dr. Thomas H. Hogg, president of the Institute, the branch held a dinner meeting at the Georgia Hotel on Monday, December 16th. Forty-two members and guests attended, and bid welcome to Dr. Hogg and his party. Dean J. N. Finlayson, branch chairman, presided, and others at the head table included Dr. O. O. Lefebvre, Institute past president; J. A. Vance, chairman of Papers Committee; C. K. McLeod, councillor of the Institute and past chairman of the Montreal branch; L. Austin Wright, general secretary; Dr. E. A. Cleveland and Major G. A. Walkem, past presidents of the Institute.

In a brief address, Dr. Hogg outlined the progress of negotiations towards the affiliation of the Engineering Institute of Canada with the various provincial Associations of Professional Engineers. An agreement has recently been concluded with the Alberta Association, which is the third province now having common membership arrangements with the Institute.

In the opinion of the speaker, Canada will probably receive a large influx of population from those countries of Europe which are now being subjected to the destructive agencies of war, and which will not be able to support their own people after the war is finished. People from countries which, through no desire of their own, have been over-run in the course of the war, will be anxious to get away from the scene of such destruction and the hardships which it will bring, and many of them will look towards Canada as a country offering them the opportunity to build a new home and enjoy it in peace. These people will bring with them industrial and agricultural skill, and perhaps capital, and will take part in a period of expansion in Canada, such as always takes place with an increase of population. While the future cannot be predicted beyond a certain period, if this post-war growth is based on sound principles, there is no reason why it should not continue for a long time.

The engineering profession will share in this rehabilitation, and will also have to do its part in the reconstruction of those countries which are in the actual theatre of conflict.

Other members of the visiting party also spoke briefly.

Dr. Lefebvre recalled his previous visits to Vancouver with obvious pleasure, and pointed out that since his term of office as president of the Institute it had become a custom for that officer to visit the western branches. He also gave further information on the relations between the Institute and the provincial associations. He did not see any pertinent difficulties in the way of an agreement for common membership in British Columbia. In New Brunswick, those problems which had arisen have been satisfactorily solved, and the path is clear for such an agreement. A similar situation is progressing favourably in Manitoba. In Quebec and Ontario there is not yet sufficient demand for affiliation, although there is a large existing common membership.

Mr. McLeod brought the greetings of the Montreal Branch, and hoped that a closer association of the branches might be brought about through the visits of members to other branches.

Mr. Vance spoke of the difficulty of arranging a central clearing house for papers to be published in the Journal. He suggested that each branch should take the initiative in submitting worth-while papers and addresses given at its own regular meetings, for publication. He also stressed the value of communicating with headquarters and other branches when a member was travelling across the country. Engineers do a considerable amount of travelling as a group, and often overlook the value to be found in visiting members of other branches at such times.

Mr. Wright spoke on the activities of the Council, and gave many examples of the problems which face it in the course of furthering the interests of the profession. Some of these difficulties are not widely known, as they are not discussed outside of council, but they exist, and require a great deal of time and effort in dealing with them. At the present time most of such problems have to do with the placing of technically trained men in the new industries arising out of war production. The necessity for a proper control of trained personnel is becoming greater every day, in order that war production shall not lag on account of inefficient placing of trained persons. Various government departments have control over such matters, so that it is necessary to secure co-operation between the government and the engineering profession. A great deal of work has already been done by the engineering societies, and it is felt that full and complete advantage of this has not yet been taken in the placing of engineers in their proper fields in the war effort.

At the close of the meeting a motion was made by Mr. I. C. Barltrop to send the best wishes of the Vancouver Branch to Mr. R. J. Durley, secretary-emeritus of the Institute. This was unanimously carried.

VICTORIA BRANCH

Kenneth Reid, m.e.i.c. - *Secretary-Treasurer*

The presence of Dr. T. H. Hogg, president of the Institute, and the general secretary, Mr. L. Austin Wright, at the ceremony of the signing of the agreement between the Alberta section of the Engineering Institute and the Association of Professional Engineers of Alberta in Calgary on December 14th presented the opportunity of an invitation being extended to the president and his party to pay a visit to the British Columbia branches as well, while in western Canada. Subsequently, arrangements were made for a general meeting of the Victoria Branch to be held in honour of President Hogg on the evening of December 17th at the Pacific Club, Victoria.

The meeting was preceded by a dinner at which twenty-six members and a few friends were present. The unfortunate circumstances necessitating the immediate return of Dr. Hogg to the East after visiting the Vancouver Branch was a very great disappointment to the Victoria members, however the presence of Past President Dr. O. O. Lefebvre and Mr. J. A. Vance somewhat alleviated this keen regret. Mr. E. W. Izard, chairman of the Branch, presided at the dinner and meeting to which Dr. W. A. Carrothers, chairman of the B.C. Public Utilities Commission, and Mr. H. D. Parizeau, Dominion hydrographer, were among the guests present.

Following a few short business transactions, the chairman called upon Dr. O. O. Lefebvre to address the meeting. Dr. Lefebvre spoke of his previous delightful experiences in his visits to the Coast, and the pleasure of escaping, if even for a short time, the cold and snow now being experienced on the Prairies and eastern Canada. He told of the meeting in Calgary and the signing of the agreement for the Alberta engineers, expressing the hope for an early movement of a similar nature in British Columbia and in certain other provinces of Canada. He mentioned the necessity for a proper classification of engineers, citing a number of abuses of the term which had recently come to his notice. The field of operations for the Institute and the Associations were outlined, the latter to regulate the practice of engineering and the Institute to promote engineering interests.

The general secretary, Mr. L. Austin Wright, being asked to speak, told of the affairs of the Institute at Headquarters, stating that the membership had now exceeded the five thousand mark for the first time in fifteen years and that the finances were in very good condition. He expressed the regrets of Dr. Hogg at not being able to be present explaining the necessity of his sudden and hurried return to Ontario. Mr. Wright spoke of the great co-operation and assistance that the Institute was rendering to the Dominion government at Ottawa and of the many placements of highly qualified technical engineers in war services through this co-operation. He also mentioned a number of details in connection with the very successful meeting recently held in Calgary.

The chairman next called upon Mr. J. A. Vance, who is at present chairman of the Institute's Papers Committee, to say a few words. Mr. Vance spoke of the work of his committee during the past year and particularly stressed the importance of branch visits and the exchange of speakers between adjacent or near branches. The value of keeping other branches informed of meetings and of the movements of engineers in their territory who might give addresses was stressed as an excellent means of stimulating the interest in the Institute and the branches.

Brief addresses of welcome and expressions of thanks to the visiting speakers were accorded by Mr. F. C. Green, Mr. A. L. Carruthers, Mr. Kenneth Moodie, and Mr. H. D. Parizeau and thus terminated another very successful and interesting Victoria Branch meeting.

Library Notes

Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

LIST OF NEW AND REVISED BRITISH STANDARDS

(Issued during October, 1940)

B.S. No.

436-1940—Machine Cut Gears, A. Helical and Straight Spur. (Revision).
This revision includes several important additions, and many improvements have been made in the charts in order to save time in calculations.

693-1940—Oxy-Acetylene Welding in Mild Steel. (Revision).
This specification is now in line with the code issued by the London County Council with regard to the use of oxy-acetylene welding in London, and also includes some simplified tests which will be sufficient to ensure sound welding.

789A-1940—Steel Tubes and Tubulars, Light-Weight and Heavy Weight Qualities. (Revision).
To meet the urgent need for the utmost economy in steel consumption, this War Emergency British Standard has been prepared at the request of the Ministry of Supply to supersede the B.S. 789-1938.
It provides for the replacement of the former three qualities (gas, water and steam), by two qualities designated respectively "light weight" and "heavy weight."

909-1940—Vitamins A and D in Oil for Animal Feeding Purposes.

910-1940—Controlled Cod Liver Oil Mixture for Animal Feeding Purposes.
The above two War Emergency Standards have been issued at the request of the Ministry of Food.
Following the outbreak of war an announcement had been made by the Ministry of Food in regard to war time veterinary cod liver oil. In order to ensure an adequate supply of veterinary cod liver oil the Ministry, together with the Ministry of Agriculture and Fisheries, had approved a scheme involving the dilution of stocks of cod liver oil of a high vitamin potency with a suitable marine oil to be supplied by the Ministry.

920-1940—Naval Brass Die Castings.
Provides for naval brass castings and specifies both the chemical composition of the ingots and the mechanical properties of the castings.

921-1940—Rubber Mats for Electrical Purposes
The mats referred to are rubber insulating mats for use as a floor covering near electrical apparatus in circumstances involving the possibility of direct contact with equipment of which the voltage does not exceed 3300 volts to earth.

922-1940—Domestic Electrical Refrigerators
This Specification prescribes the general constructional requirements, the performance and the methods of computing the capacity and food-storage area of domestic electrical refrigerators.

923-1940—Impulse-voltage Testing
Deals with the general principles of impulse-voltage tests with the object of determining the effect of voltage surges of short duration (such as are caused by lightning discharges) on electrical installations and on their individual parts.

924-1940—Rubber Hose with Woven Fabric Reinforcement
Provides for mandrel-built, wrap-cured rubber hoses internally reinforced by plies of woven fabric for air, low and high pressure water, chemical and brewers' maximum length 60 feet.

Prices—No. 436 7/6d Net. Post free 7/10d.
Remainder 2/– each Net. Post free 2/3d each.

Copies of the new specifications may be obtained from Canadian Engineering Standards Association 79, Sussex Street, Ottawa, Ontario.

CANADIAN ENGINEERING STANDARDS ASSOCIATION

NEW AND REVISED STANDARDS

C.E.S.A. No.

C22.2. No. 1A 1940—Second Edition. Power-Operated Radio Devices. Section (A) Inductively-coupled (Transformer) Type.

The Canadian Engineering Standards Association announces the revision of Specification C22.2 No. 1—Power operated Radio Devices—which was originally issued in March, 1932, and is now issued in two sections, namely "Section (A)—Inductively-coupled (Transformer) type" and "Section (B)—Conductively-coupled (Transformerless) Type." Both sections are Approvals Specifications issued under Part 11 of the Canadian Electrical Code, the requirements of which must be met in order to obtain C.E.S.A. approval of the electrical equipment concerned. Section (A), now published, becomes effective for new production on the date of publication, November 30th, 1940, and Section (B), which is still in committee stage, will be published shortly.

C22.2 No. 35 1940—Second Edition. Extra-Low Potential Control Circuit Wires and Cables.

The Canadian Engineering Standards Association announces the publication of a revised edition of Specification C22.2 No. 35—Extra-low Potential Control-circuit Wires and Cables which was originally issued in December, 1936, and is now issued as an Approvals Specification under Part 11 of the Canadian Electrical Code, the requirements of which must be met in order to obtain C.E.S.A. approval of the electrical equipment concerned. This specification is effective as of February 15th, 1941, for new production. The requirements of the specification have been modernized, particularly the section dealing with insulation which has been revised and extended to include rubber insulation. This rubber insulation is to be protected by a closely woven cotton braid covered with a flame-proofing compound to enable the insulation to withstand the flame test. The requirement relative to the size of conductor has been broadened so that either No. 18 or No. 16 B. & S. gauge copper wire can now be used.

C22.2 No. 69 1940—Porcelain Cleats, Knots and Tubes

The Canadian Engineering Standards Association announces the publication of a new Approvals Specification, C22.2 No. 69-1940—Porcelain Cleats, Knobs and Tubes—under Part 11 of the Canadian Electrical Code, the requirements of which must be met in order to obtain C.E.S.A. approval of the electrical equipment concerned. This specification is effective as of March 15th, 1941, for new production.

The standard was prepared in collaboration with interested manufacturers and industrial associations, and is based on laboratory tests and record in service. Its requirements apply to the construction and test of porcelain cleats, knobs and tubes intended for the support of wires and cables in open-wiring and in knob-and-tube work. Knobs intended for over-surface wiring are not within the scope of this specification.

Copies of these Standards may be obtained from the Canadian Engineering Standards Association, National Research Building, Ottawa, price 50 cents each.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS

Cofferdams

By Lazarus White and Edmund Astley Prentis, New York, Columbia University Press, 1940. 273 pp., 9½ x 6¼ in., $7.50.

Minerals Yearbook, 1940

Published by the United States Department of the Interior, Bureau of Mines. Washington, 1940. 1511 pp., 6 by 9¼ in.

The Canadian Almanac, 1941

Edited by Horace C. Corner, Toronto, Copp Clark Company, Limited, 6 x 9 in., $7.00.

American Society of Civil Engineers

Proceedings, Part 2, October 1940, V. 66.

Institution of Naval Architects

Transactions of the Institution of Naval Architects, 1940.

REPORTS

Canadian Broadcasting Corporation

Annual Report for the fiscal year ended March 31, 1940. Ottawa, King's Printer, 1940.

Canadian Engineering Standards Association

Canadian Electrical Code Part 2, Essential Requirements and Minimum Standards Covering Electrical Equipment, specification No. 35 Construction and test of extra low potential control-circuit wires and cables.

Canadian Electrical Code Part 2, Essential Requirements and Minimum Standards Covering Electric Equipment, specification No. 1 Construction and test of power-operated radio devices. Section (A) Inductively coupled (Transformer) type.

Cornell University—Engineering Experiment Station

Ultrasonics and Elasticity by H. F. Ludloff, July, 1940.

The Engineering Foundation

Annual Report for 1939-1940.

Institute of The Aeronautical Sciences

Bibliography of Aeronautics; part 1, Transportation; part 2, Meteorology; part 3, Insurance; part 5, Seaplanes; part 6, Flying Boats; part 7, Amphibians; part 8, Autogiros; part 9, Helicopters; part 10, Cyroplanes; part 11, Medicine.

Ohio State University—Engineering Experiment Station

America's Sources of Power and National Defence, by C. E. MacQuigg, November, 1940. Circular No. 38.

Portland Cement Association

Concrete Grandstands. Chicago, Portland Cement Association.

U.S. Department of Commerce—Building Materials and Structures

Structural Properties of a Precast Joist Concrete Floor Construction Sponsored by the Portland Cement Association, BMS62; Plumbing Manual, report of subcomittee on Plumbing, Central Housing committee on research, design and construction, BMS 66; Effects of wetting and drying on the permeability of masonry walls, BMS 55; A survey of Humidities in residences, BMS 56; Roofing in the United States—Results of a questionnaire, BMS 57; Properties of adhesives for floor coverings BMS 59.

University of California Publications

Phylogeny of North American Equidae, by R. A. Stirton, Berkley University of California Press, 1940.

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

(THE) AIRCRAFT PROPELLER, Principles, Maintenance and Servicing.

By R. Markey. Pitman Publishing Corp., New York, 1940. 155 pp., illus., diagrs., charts, tables, 8½ x 5 in., cloth, $1.50.

This text has been written to explain the workings of the aircraft propeller to student pilots, mechanics and laymen. Elementary aerodynamics and the construction and maintenance of propellers are dealt with, and separate chapters are devoted to description of certain types of constant-speed and varia able-pitch propellers. There is a list of definitions.

(THE) AIRPLANE and ITS ENGINE

By C. H. Chatfield, C. F. Taylor and S. Ober. 4 ed. McGraw-Hill Book Co., New York, 1940. 414 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth $3.00.

This book is intended "for the reader who desires a sound knowledge of the basic principles and a broad view of the present development of the airplane and its power plant, without giving to the subject the intensive study which is essential for the designing engineer or the expert mechanic." The new edition has been carefully revised to cover recent developments in all lines.

ANNUAL REVIEWS of PETROLEUM TECHNOLOGY, Vol. 5, 1939.

By F. H. Garner. Institute of Petroleum, c/o The University of Birmingham, Edgbaston, Birmingham 15, England, 1940. 457 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, 11s.

Reviews by experts of developments during 1939 are contained in this annual compilation covering the whole range of petroleum technology; geology, geophysics, drilling and production, transportation and storage, refining operations, gasoline and oil engines, lubrication, analysis and testing, etc. A new chapter on addition agents is included in this volume. In addition to chapter references there is a general review of petroleum literature in 1939, and the last chapter furnishes production and commercial statistics.

CATALYSIS, Inorganic and Organic

By S. Berkman, J. C. Morrell and G. Egloff. Reinhold Publishing Corp., New York, 1940. 1130 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $18.00.

This extremely comprehensive work discusses the phenomenon of catalysis, describes the various catalysts and the reasons for and extent of their activity and, in general, gives a systematic presentation of the subject with some consideration of its historical evolution. Inhibitors, promoters, poisons, carriers and characteristic catalytic reactions in inorganic and organic chemistry are discussed. There is a 350 page classification of catalysts with respect to type of reaction, and a final chapter dealing with catalysis in the petroleum industry. The work is thoroughly documented.

(THE) DEVELOPMENT of MATHEMATICS

By E. T. Bell. McGraw-Hill Book Co., New York and London, 1940. 583 pp., 9½ x 6 in., cloth, $4.50.

The author presents a broad account of the part played by mathematics in the evolution of civilization, describing clearly the main principles, methods and theories of mathematics that have survived, from about 4000 B.C. to 1940. Besides outlining the development of the leading ideas, the book gives the student a well-rounded understanding of the story by explaining the mathematics involved. Details of antiquarian interest are subordinated to a fuller exposition of things still alive in mathematics than is customary in histories.

DISPLACEMENT, VELOCITY and ACCELERATION FACTORS for RECIPROCATING MOTION

By L. B. Smith. P.O. Box 317, Hampton, Va., 1940. 17 pp., diagrs., tables, 9 x 6 in., paper, $.40 (3 copies, $1.00)

The tables presented in this pamphlet are intended for the use by engineers and others who need to compute displacement, velocity and acceleration factors for a reciprocating motion controlled by a uniform angular motion. A worked-out example of the procedure in using the tables is given, and the derivation of the exact formulas from which the tables were computed is shown in the appendix.

FESSENDEN, Builder of Tomorrows.

By H. M. Fessenden. Coward-McCann, Inc., New York, 1940. 362 pp., illus., tables, 9 x 6 in., cloth, $3.00.

The life and work of one of the well-known American pioneers in radio communication are described by his wife. His technical achievements, in addition to his contributions to this important field, include submarine signalling and detection, the generation and storage of power, and many articles on mathematical, physical and electrical subjects. There is also mention of his researches on the pre-deluge civilizations. A bibliography is appended.

FIRE ASSAYING

By O. C. Sheperd and W. F. Dietrich. McGraw-Hill Book Co., New York and London, 1940. 277 pp., illus., diagrs., charts., tables, 9½ x 6 in., cloth, $3.00.

Designed for the practicing assayer as well as for the technical student, this manual covers the fire assaying of gold, silver, the platinum metals, and certain base metals in ores, metallurgical products, bullions and solutions. The book also contains material on sampling methods, descriptions and lists of assay equipment and supplies and a geographical list of assay supply houses.

GRAPHS, How to Make and Use Them

By A. Arkin and R. R. Colton. rev. ed. Harper & Brothers, New York and London, 1940. 236 pp., illus., diagrs., charts., tables, 9½ x 6 in., cloth, $3.00.

All the usual methods of graphic representation are clearly and simply explained in this introductory work on the subject. The opening chapters present general principles and proper equipment for graph construction, and a wide variety of uses in business, economics, engineering and other fields is illustrated in the succeeding chapters.

MACHINE DESIGN

By L. J. Bradford and P. B. Eaton. 4th ed. John Wiley & Sons, New York, 1940. 275 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $3.00.

The object of this text is to supply a brief course which can be covered in about twenty-five lessons, and which will provide a good groundwork of the fundamental facts and processes of machine design. The new edition has been revised to conform with recent developments, especially in bell and roller bearings, gears and spring design.

MAGNETISM and VERY LOW TEMPERATURES

By H. B. G. Casimir. University Press, Cambridge, England; Macmillan Co., New York, 1940. 93 pp., charts, tables, 8½ x 5½ in., paper, $1.40.

The material contained in this booklet, presented originally in a series of lectures, is a systematic account of the field of research dealing with the relation between magnetism and very low temperature states. Special attention is given to paramagnetism and adiabatic demagnetization. There is a list of references.

MATERIALS HANDBOOK

By G. S. Brady. 4th ed. McGraw-Hill Book Co., New York and London, 1940. 591 pp., charts, tables, 9½ x 6 in., lea. cloth, $5.00.

The many materials used in industry are identified and described in this concise encyclopedic reference book. Information is given on physical and chemical properties, constitution and uses. The materials vary from such basic raw materials as mineral ores and woods to such products as alloy steels and synthetic resins. Intended primarily for purchasing agents and industrial executives, its field is much wider for reference use. Useful tables are appended.

MECHANICAL VIBRATIONS

By J. P. Den Hartog. 2 ed. McGraw-Hill Book Co., New York and London, 1940. 448 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $5.00.

In addition to the theoretical presentation of the subject, this textbook presents practical applications to water wheels, steam turbines, automobiles, airplanes, Diesel engines and electrical machinery. The text has been revised in accordance with recent developments, many new problems have been added and a comprehensive list of useful formulas has been appended. There is a bibliography.

PORT DICTIONARY of TECHNICAL TERMS

Compiled by Committee on Standardization and Special Research. American Association of Port Authorities, 2223 Short St., New Orleans, La., 1940. 208 pp., 9½ x 6 in., cloth, $1.50.

An enlargement of an earlier glossary, this technical dictionary defines words and phrases pertinent to all phases of port and harbor work. Many of the several hundred definitions are of considerable length, where special explanation was thought necessary.

PUBLIC UTILITIES and the NATIONAL POWER POLICIES

By J. C. Bombright. Columbia University Press, New York, 1940. 82 pp., 9 x 5½ in., cloth, $1.25.

This sketch of the New Deal power policies discusses the control of public utilities, rate regulation, holding companies, etc., and their relation to the question of public ownership. The electric light and power industry is used as an example, and the criticisms of present government policy are discussed. Suggestions are given for further reading.

RADIO AMATEUR'S HANDBOOK, 18th ed., 1941

American Radio Relay League, West Hartford, Conn. 552 pp., illus., diagrs., charts, tables, 10 x 6½ in., paper, $1.00, buckram, $2.50.

This well-known manual covers comprehensively the amateur short-wave field. The fundamental principles and the design, construction and operation of transmitting and receiving apparatus are described in detail, including ultra-high frequency, emergency, and portable equipment. Many new illustrations and descriptions of new equipment have been added, and the catalog and manufacturers data section has been expanded.

(THE) RING INDEX, a List of Ring Systems Used in Organic Chemistry. (American Chemical Society Monograph No. 84).

By A. M. Patterson and L. T. Capell. Reinhold Publishing Corp., New York, 1940. 661 pp., diagrs., 9½ x 6 in., cloth, $8.00.

The Ring Index is a collection of known parent ring systems, arranged in order from the simplest to the most complex. It is a compilation of structures, not of compounds, although corresponding compounds exist in nearly every case. Each entry presents the ring structure, commonly used names, even though not formed according to the system, references to original literature and to "Boilstein's Handbuch," and a serial number for future reference. There is an alphabetical index of names, and an appendix containing the proposed international rules for numbering ring systems.

SALES ENGINEERING

By B. Lester. John Wiley & Sons, New York, 1940. 200 pp., diagrs., 9 x 5½ in., cloth, $2.00.

Sales engineering is defined as the art of selling equipment and services which require engineering skill in their selection, application and use. The author discusses the field of sales engineering, describes the work of the sales engineer under current conditions, and indicates the training and development of the sales engineer.

STATISTICAL PROCEDURES and THEIR MATHEMATICAL BASES

By C. C. Peters and W. R. Van Voorhis. McGraw-Hill Book Co., New York, 1940. 516 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $4.50.

This book is designed to bridge the gap between elementary courses in which the formulas are given from a purely authoritative viewpoint, and the original monographic contributions which are often so highly mathematical. The authors bring together and synthesize the classical statistics and certain new developments, explaining mathematical derivations and their use from the viewpoint of students with little mathematical training. Exercises and references accompany each chapter.

STEAM-TURBINE PRINCIPLES and PRACTICE

By T. Croft, revised by S. A. Tucker, 2 ed. McGraw-Hill Book Co., New York, 1940. 298 pp., illus., diagrs., charts, tables, 8½ x 6 in., cloth, $3.00.

This book gives the operating engineer, the plant superintendent and the manager the information necessary for the successful and economical selection and operation of steam turbines. It covers installation, lubrication, testing and maintenance with special attention given to the economics of steam-turbine operation. The new edition has been generally revised to conform to current practice and has a new chapter describing the engineering principles involved in turbine selection and heat balance.

(THE) Story of SUPERFINISH

By A. M. Swigert, Jr. Lynn Publishing Co., Detroit, Mich., 1940. 672 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $5.00.

The equipment, technique and advantages of the metal finishing process called "superfinish" are discussed at length. Other methods for producing machined surfaces are described in detail, all methods for measuring machined surfaces are fully treated, bearing materials and design are considered, and the metallurgy and lubrication of metal surfaces are given considerable attention. The book is illustrated by a profusion of graphs, diagrams, photographs and photomicrographs.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

January 22nd, 1941

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in March, 1941.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

DE BONDY—JOSEPH AGAPIT, of Selkirk, Man., Born at Sorel, Que., May 1st, 1895; Educ.: 1905-13, Mount St. Bernard College, incl. chemistry and physics. Personal study and travel; 1915-16, lab. asst., Beauchemin & Fils Ltee., Sorel, Que.; 1916-17, lab. chemist and asst. metallurgist, and 1917-19, asst. furnace operator, Canadian Steel Foundries Ltd., Montreal. 1919-21, in charge Bessemer & Electric Steel Furnaces; 1921-41, metallurgist, in full charge of iron and steel production, Manitoba Steel Foundries, Ltd., Selkirk, Man. (In charge production of steels, synthetic irons, alloy steels and irons of all types. Laboratory, microscopy, heat-treating, production and quality of product). Member—Amer. Soc. for Metals, Amer. Soc. for Testing Materials. Has delivered papers before E.I.C., C.I.M.M. and other societies, and written articles for industrial and technical publications.

FOR TRANSFER FROM THE CLASS OF JUNIOR

NESBITT—MICHAEL CULLUM, of 3701 Quadra St., Victoria, B.C. Born at Regina, Sask., Oct. 21st, 1908; Educ.: B.A.Sc., Univ. of B.C., 1931; R.P.E. of B.C.,

(*Continued on page 106*)

Employment Service Bureau

SITUATIONS VACANT

ENGINEER with pulp and paper experience to become Assistant Chief Engineer in a large mill. Either a man who can fit into the position immediately, or a younger man who has the training and ability to work into it gradually. The initial salary to be paid will depend upon the qualifications of the applicant. This position holds an interesting future for the right man. Send applications with full particulars to Box No. 2209-V.

ENGINEER for fabricating plant, must be experienced in the detail and design of structural steel. This is a permanent position for the man with the necessary qualifications. Apply to Box No. 2234-V.

RECENT ENGINEERING GRADUATE, preferably mechanical, with some drafting experience. Work will consist of machinery and piping layouts and other general engineering work in a paper mill near Ottawa. Permanent position and excellent prospects for suitable man. Men now employed in war industry will not be considered. Apply Box No. 2245-V.

MECHANICAL DRAUGHTSMAN, for layout of power plant equipment, piping systems, etc., preferably university graduate with three or four years' experience. State age, experience, salary desired. Location Toronto. Apply to Box No. 2247-V.

REQUIRED for large gold mining organization in West Africa, several mill shiftmen, mill men and electricians. Salaries up to £40, £32 and £40 respectively per month, free living quarters. Ocean passage paid and three months' leave granted per year at half pay. Yearly renewable contracts. Defence regulations do not permit wives to accompany husbands at this time. Apply Box No. 2258-V.

YOUNG CIVIL ENGINEER not more than two years out of college, with field and office experience, involving computation and engineering analysis. Apply giving full particulars to Box No. 2259-V.

SENIOR ELECTRICAL ENGINEER with from five to eight years experience required by large industrial concern. Apply with full details to Box No. 2261-V.

MECHANICAL DRAUGHTSMAN with some experience immediately required by a large industrial firm. Apply giving full particulars to Box No. 2262-V.

SITUATIONS WANTED

CONSTRUCTION ENGINEER, University graduate experienced in Power Plants, Transmission lines, gunite construction, etc. Available on short notice. Apply to Box No. 1527-W.

CIVIL ENGINEER AND SURVEYOR—Experienced in general building and war plant construction. Also installation of mechanical equipment. Immediately available. Apply to Box No. 2153-W.

ELECTRICAL ENGINEER, graduate, Age 47, married. Experience covers draughting, construction, maintenance, and operation. For the last ten years employed as electrical superintendent in a large industrial plant. Apply to Box No. 1718-W.

ENGINEER—M.E.I.C. Age 49. Desires change. Experience covers all types structural steel and plate work, rivetted and welded construction, as estimator. Designing, shop drawings. Available two weeks notice. Apply Box No. 2208-W.

MECHANICAL ENGINEER, Draughtsman, Specification Writer, Supervisor, specializing in Heating, Ventilating, Power Plants and Plumbing, available immediately. Will go anywhere. Apply Box No. 2285-W.

PRELIMINARY NOTICE (*Continued from page 105*)

1936; 1927-28, B.C. topographical work; 1932, placer mining; 1933, bridge and crib constrn.; 1934, hydraulic mining, drift placer mining; 1935-36, supt., Columbia Development Co. Ltd., placer mining; 1937, supt., Langly Prairie Airport; 1937, shifter, Wingdam Mine; 1938, supt., highway constrn. for Baynes & Horie Ltd.; 1938, foreman, paving and highway constrn.; 1939, supt., highway constrn., H. R. Wade, contractor; 1939, i/c grading, Patricia Bay Airport; 1940 to date, supt. engr., Dawson Wade & Co., Contractors. (St. 1928, Jr. 1936).

LIST OF INSTITUTE PRIZES

Sir John Kennedy Prize	Gold medal	For outstanding merit or noteworthy contribution to science of engineering, or to benefit of the Institute.
Past President's Prize	$100 cash	For a paper on a topic selected by Council.
Duggan Prize	Medal and cash to value of $100	For paper on constructional engineering involving the use of metals for structural or mechanical purposes.
Gzowski Prize	Gold medal	For a paper contributing to the literature of the profession of civil engineering.
Plummer Prize	Gold medal	For a paper on chemical and metallurgical subjects.
Leonard Prize	Gold medal	For a paper on a mining subject, open to members of the Canadian Institute of Mining and Metallurgy as well as The Engineering Institute.
Students and Juniors	Books to the value of $25 (5 prizes)	For papers on any subject presented by Student or Junior members.
University Students	$25 in cash (11 prizes)	For the third year student in each college, making the best showing in college work and activities in student or local branch of engineering society.

THE ENGINEERING JOURNAL

VOLUME 24 MONTREAL, MARCH 1941 NUMBER 3

A MESSAGE FROM THE PRESIDENT

To serve as president of the Engineering Institute is one of the greatest honours that can come to a Canadian engineer. It gives him the responsibility of maintaining traditions established and strengthened throughout the years by men whose lives were devoted to the improvement of engineering and to building up the engineering profession. Their high standard of service constitutes a challenge to each successive incumbent, a challenge which it is now my privilege to accept. It will be my earnest endeavour to fulfil worthily the obligation thus imposed.

It has been customary in the past for an incoming president to speak of Institute policy for the ensuing year. This year there must be only one objective: to weld together all our resources, spiritual as well as material, into an unbreakable instrument for winning the war. To this task the entire membership of the Institute is dedicated.

In the past years we have been justly proud of the service given by the engineering profession in times of national peril. To-day, at this most critical moment in history, the engineers' war-time role is of even greater importance than in former crises. Engineers are now serving in numberless ways in all the fields of battle—on land, in the air, or upon the high seas—and are also rendering indispensable service in non-combatant duties—many of which are extremely hazardous. They are busy in industry, in the designing office and the workshops, in scientific laboratories, in educational institutions and training centres, and in public affairs.

But in addition to the work accomplished individually, by members, they can do much collectively as constituting a reputable and influential body. For example, the Institute, like a number of kindred organizations is actually in itself a reservoir of technically-trained man-power. Many of its members have special qualifications for particular positions; thus it is gratifying to learn that progress is now being made in utilizing the data regarding available men which exist in the professional records of the Institute and also in those obtained by other leading Canadian technical associations.

In this colossal struggle no one group in Canada would claim to be of greater importance than another, but possibly we engineers, as a body, realize more clearly than others how much this war is one of machines, of mechanics, of industrial production, of scientific development, of engineering technique and organization. We are proud that engineers are playing so vital a part in the conflict—proud, for instance, that the commander of the Canadian Army Corps, Lieutenant-General McNaughton, is an eminent and active member of our Institute, that the industrial organization of Canada is in the capable hands of another distinguished member, the Hon. C. D. Howe, and that scores of other members are holding positions of great responsibility.

Individual members of the Institute can render important service, not only in their daily war-work—whatever that may be—but also in promoting cool courage, quiet confidence, and unbroken morale in those with whom they come in contact. We, who have had an engineer's training and experience, should realize, better than laymen, the harm done by unguarded talk, idle gossip, and futile speculation based on imperfect or incorrect information. We can do much to impress upon those inclined to be careless in these respects the necessity of silence on all matters which may conceivably give comfort, information or assistance to the enemy.

We should realize that although in a physical sense this is a war of machines, no conflict in our history has been fought so entirely for the survival of human values. Our strength to-day lies not merely in our capacity to produce and man planes and tanks, but also in our recognition that our way of life is very precious, worth fighting for, worth dying for, if need be.

Just as we have huge arsenals for munitions, so also do we have, in a very real though intangible way, vast reserves of moral courage, capable of being constantly replenished by the inspirations of such deeds as the boarding of the *Altmark*, the battle for control of the "daylight air," Dunkerque, and the battle of Britain. When Captain Fogarty Fegen of the *Jervis Bay*, without a moment's hesitation, signalled that he was closing with the enemy, his contribution to our cause could not be measured in terms of ships and cargoes saved; his ebbing life and those of his men became the strength of millions—strength given to them as if by some gigantic blood-transfusion.

As engineers we can and will help materially in winning the war—but we must also dedicate our lives to maintaining that high morale without which no victory is possible.

The shadow of the swastika has fallen over nearly all the lands of Europe, blotting out in them all hope of personal liberty, free speech, and equal justice. Without these things we feel, as Britain does, that civilized life is impossible, and barbarism reigns.

What nobler task can there be than to fight this monstrous doctrine, to defend the last stronghold of freedom in Europe, and to make it impossible for Nazi methods to dominate the civilized world ?

C. J. Mackenzie

THE SECOND MILE

WILLIAM E. WICKENDEN
President, Case School of Applied Science, Cleveland, Ohio, U.S.A.

Address delivered at the Annual Banquet of The Engineering Institute of Canada, Hamilton, Ont., February 7th, 1941.

Dr W. E. Wickenden

"Whosoever shall compel thee to go one mile—go with him twain." I am not sure that I should dare to choose this counsel of perfection from the Sermon on the Mount as a text for a talk to engineers south of the border, such is the present state of our biblical illiteracy. The professor of a past generation who withered a classroom disturbance at Yale by urbanely remarking "Young gentlemen, I beg you to restrain yourselves until I cast one more pearl," would be met to-day by uncomprehending stares. Some one has said that the trouble with us in the States is that we have lost three pasts; first we lost the classical past, next we lost the biblical past, and now we are losing the historical past. In Canada where, I believe, you are much more deeply rooted in piety and sound learning, you will catch the meaning of my text. Every calling has its mile of compulsion, its daily round of tasks and duties, its standard of honest craftsmanship, its code of man-to-man relations, which one must cover if he is to survive. Beyond that lies the mile of voluntary effort, where men strive for excellence, give unrequited service to the common good, and seek to invest their work with a wide and enduring significance. It is only in this second mile that a calling may attain to the dignity and the distinction of a profession.

A preacher who was once reproached for straying rather widely from his text replied "A text is like a gate, it has two uses; you can either swing on it, or you can open it and pass through." Let us pass on through. There is a school of thought that seems to hold that all of the problems of the engineering profession may be solved by giving it a legal status. If only we compel all who would bear the name of *engineer* to go the mile of examination and licensure, we shall have protection, prestige and emoluments to our heart's desire. They forget, perhaps, that there are many useful callings which have traversed this mile without finding the higher professional dignities at its end. We license embalmers, chiropodists, barbers and cosmetologists, but we do it for the protection of the public, and not to erect them into castes of special dignity and privilege.

There is an illusion abroad that any calling may win recognition as a profession by the mere willing it so and by serving notice to that effect on the rest of the world. It helps a lot, too, if you can invent an esoteric-sounding name derived from the Greek. One reads, for example, of a group of barbers who elect to be known as "chirotonsors" in order to raise the prestige of their "profession." The truth seems to be that as soon as any word acquires a eulogistic character, we promptly proceed to destroy it by indiscriminate usage. When one scientist observed what the advertising fraternity has done to the word *research*, he remarked dryly that we now use that word to mean so many things we shall soon have to invent another word to mean *research*. The ambition to dignify honorable work is laudable, but there is much seizing after the form and letting the substance escape which would be ludicrous, if it were not pathetic.

A prominent English churchman once remarked facetiously that there were three sorts of Anglicans—the low and lazy, the broad and hazy, and the high and crazy. It seems to be much the same among engineers in our thinking about our profession. We have a low church party which holds that status and titles are of little consequence; so long as the public allows us to claim them not much else matters if the engineer does an honest day's work. The broad church party is all for inclusiveness; if business men and industrialists wish to call themselves engineers, let us take them in and do them good, not forgetting the more expensive grades of membership. The high church party is all out for exclusive definitions and a strictly regulated legal status; in their eyes, what makes a man a "professional" engineer is not his learning, his skill, his ideals, his public leadership—it is his license certificate.

In view of these divided counsels, it may not be amiss to consider briefly what a profession is, how it came to be, why it exists, how its status and privileges are maintained and what obligations it entails; and finally to discuss a few of our current issues in the light of these backgrounds.

Of professions there are many kinds; open professions like music, to which any man may aspire within the bounds of his talents, and closed professions like medicine which may be entered only through a legally prescribed process; individual professions like painting and group professions like law, whose members constitute "the bar," a special class in society; private professions like authorship and public professions like journalism; artistic professions like sculpture and technical professions like surgery; ameliorative professions like the ministry and social work and professions which achieve their ends by systematic destruction like the army and navy. Despite all these differences of pattern, there are characteristic threads which run like a common warp beneath the varying woof of every type of professional life and endeavor.

If one seeks definitions from various authorities, he finds three characteristic viewpoints. One authority will hold that it is all an *attitude of mind*, that any man in any honorable calling can make his work professional through an altruistic motive. A second may hold that what matters is a certain *kind of work*, the individual practice of some science or art on an elevated intellectual plane which has come to be regarded conventionally as professional. A third may say that it is a special *order in society*, a group of persons set apart and specially charged with a distinctive social function involving a confidential relation between an agent and a client, as the bar, the bench and the clergy. Another source of confusion arises from the fact that some define a profession solely in terms of ideals professed, others solely in terms of practices observed, and still others in terms of police powers exercised. All authorities recognize that some of the distinguishing attributes of a profession pertain to individuals, while others pertain to groups, but there is considerable variation in the emphasis given. Let us glance briefly at these two sorts of distinguishing attributes.

What marks off the life of an individual as professional? First, I think we may say that it is a *type of activity* which is marked by high individual responsibility and which deals with problems on a distinctly intellectual plane. Second, we may say that it is a *motive of service*, as distinct from profit. Third, is the *motive of self-expression*, which implies a joy and pride in one's work and a self-imposed standard of workmanship—one's best. And fourth, is a *conscious recognition of social duty* to be accomplished, among other means, by guarding the standards and ideals of one's profession and advancing it in public understanding and esteem, by sharing advances in professional knowledge and by rendering gratuitous public service, in addition to that for ordinary compensation, as a return to society for special advantages of education and status.

Next, what are the attributes of a group of persons which mark off their corporate life as professional in character? I think we may place first a *body of knowledge* (science) *and of art* (skill), held as a common possession and to be extended by united effort. Next we may place *an educational process* of distinctive aims and standards, in ordering which the professional group has a recognized responsibility. Third in order is a *standard of qualifications*, based on character, training and competency, for admission to the professional group. Next follows a *standard of conduct* based on courtesy, honor and ethics, to guide the practitioner in his relations with clients, colleagues and the public. Fifth, I should place a more or less formal *recognition of status* by one's colleagues or by the state, as a basis of good standing. And finally *an organization* of the professional group based on common interest and social duty, rather than economic monopoly.

The traditional professions of law, medicine, and divinity had a common fountain head in the priestcraft of antiquity. What is professional in engineering and in certain other modern callings can be traced back only so far as the mediaeval merchant and craft guilds. These arose in the period when feudal society was breaking down and the beginnings of the modern commercial and industrial era were appearing. In this period of disintegration and remaking of the social order, before cities had grown strong and central governments powerful, police powers had not been largely developed or protective services created by the state. Men who wished to engage in far-flung commerce or in trade on any extensive scale found it necessary to organize for mutual protection, and this in turn led to monopolistic control. In the various crafts it was the guilds which regulated by ordinance the hours of labor, the observance of holidays, the length and character of apprenticeship and the quality of workmanship; and it was the guild which tested the progress of novices, apprentices and journeymen and finally admitted them to the ranks of the masters. When the cities and the states waxed powerful, they usually confirmed the monopolies which the guilds had gathered to themselves and even incorporated them into the structure of the municipality, as in the City and Guilds of London. The church too lent its blessing, since the religious philosophy of the middle ages regarded society as a commonwealth divided into divinely ordained functions, and not as a mere aggregation of individuals—an idea which recent Papal encyclicals have sought to reanimate under the name of a corporative society. In the spirit of the times, the guilds required members to contribute periodically to a common fund for the relief of distress, to participate in certain religious observances and to honor certain festivities and pageants.

Many of these features are perpetuated in the modern professional body. The public grants it more or less tangible monopolies and self-governing privileges, in consideration of which it engages to admit to its ranks only men who have proved their competency, to scrutinize the quality of their work, to insist on the observance of ethical relations, and to protect the public against extortion and bungling. The occasion which calls for professional service is often a human emergency in which the legal doctrine of *caveat emptor*—let the buyer beware—breaks down. When a baby is about to be born or an appendix must be removed, you want some guarantee that the job is in competent hands. The layman often finds professional knowledge and skill a little too esoteric for his judgment. If you have a problem of mental hygiene in your family you want some guarantee that you are dealing with a qualified psychiatrist and not with a quack. The public wisely puts the burden of guaranteeing at least minimum standards of competency on the profession itself. It may implement this obligation through public examinations and licensure, or it may entrust it to a system of certification within the profession itself, but in the end it comes down to the same thing—a profession must guarantee to the public the competency of its practitioners. In return, the public protects the profession from the incompetent judgment of the layman by a privileged status before the law.

Professional status is therefore an implied contract to serve society, over and beyond all duty to client or employer, in consideration of the privileges and protection society extends to the profession. The possession and practice of a high order of skill do not in themselves make an individual a professional man. Technical training pure and simple, I think we can agree, is vocational rather than professional in its character. The difference between the two is not merely a matter of length or one of intellectual levels—it is rather a matter of spirit and ideals and partly an educational overplus beyond the minimum required to master the daily job. This overplus must be sought largely through foundation studies which give a deeper insight into underlying principles and relations than the mere mastery of technique requires. For the lawyer this means the study of philosophy, history and social institutions; for the physician a grounding that is both deep and broad in biology and psychology; and for the engineer philosophic insights into the mathematical and physical sciences. This overplus, again, is partly a matter of knowledge of social forces and institutions which enables the professional man to view his work and its consequences not only as a service to a client, but also in terms of its implications for society. An engineer, for example, recommends the introduction of a labor-saving process; does he see in this only a saving in the immediate cost of production, merely assuming that this is a desirable end in itself, or can he perceive the sequence of effects which will be felt in the lives of individuals, the organization which employs them, the community in which it functions and the wider sector of society which it serves? In the answer to this question there is wrapped up much of the difference between a high-grade technician and a man of true professional stature.

Through all professional relations there runs a three-fold thread of accountability—to clients, to colleagues, and to the public. Is business a profession or can it be made so? We sometimes hear it referred to as the oldest of trades and the newest of professions. It seems clear that business is moving away from the dog-eat-dog area to one nearer the fringe of professional life. This occurs when the direct management passes from the hands of proprietors to a distinct administrative caste with little immediate stake in the profits of trade. Business may still be far from a true profession, but management is well within the pale. Business has lived traditionally from balance-sheet to balance-sheet; the time-span of its thinking has often been about three months; the profit-and-loss statement has been its only yard-stick. Professional managers, if assured of reasonable security of tenure, are better able to think and plan in terms of long-range prosperity and to act as responsible middle-men between investors, workers, customers and the public. At one time I worked for the Bell Telephone System, of which no individual owns as much as one per cent. It is the best example of manager-operated, as distinct from owner-operated, business that I know of and the one that comes nearest to fulfilling professional standards.

All of us can take pride in this example, because it is so largely an engineer-managed enterprise. If we were to narrow our professional fellowship so as to include only men who render technical service on an individual agent-and-client basis and exclude all whose work is primarily administrative, I feel that we should do an irreparable injury both to ourselves and to society. The engineer has been the pioneer in the professionalizing of industry, and his task is only begun. Organized labor, it seems, is intent upon gaining a larger voice in the councils of industry; it wants to sit in when policies are made and to share in planning the schedules of production. This may be its major strategy for the defense period; witness the Knudsen-Hillman partnership in Washington and the Reuther plan for aircraft production by the automobile industry. If any such day is ahead, the middle-man of management who can reconcile the stake of the investor, the worker, the customer and the public is going to be the key man on the team. For that responsibility, the finger of destiny points to the engineer. This makes it all the more urgent that the young engineer, while seeking in every way to gain a discriminating and not unsympathetic knowledge of the labor movement, should avoid being sucked into it by the lure of a quick gain in income and in bargaining power.

The ethical obligations of a profession are usually embodied in codes and enforced by police powers. The physician and lawyer are bound by explicit obligations and woe betide the man who oversteps them. As engineers, our codes are more intangible, as our duties are less definable. In any case, the obligations of a profession are so largely matters of attitude that codes alone do not suffice to sustain them. Equal importance attaches to the state of mind known as professional spirit which results from associating together men of superior type and from their common adherence to an ideal which puts service above gain, excellence above quantity, self-expression above pecuniary incentives and loyalty above individual advantage. No professional man can evade the duty to contribute to the advancement of his group. His skill he rightly holds as a personal possession, and when he imparts it to another he rightly expects a due reward in money or service. His knowledge, however, is to be regarded as part of a common fund built up over the generations, an inheritance which he freely shares and to which he is obligated to add; hence the duty to publish the fruits of research and to share the advances in professional practice. If the individual lacks the ability to make such contributions personally, the least he can do to pay his debt is to join with others in creating common agencies to increase, disseminate and preserve professional knowledge and to contribute regularly to their support.

There are too many engineers with a narrow and petty attitude on these matters; mature men who complain that the immediate, bread-and-butter value of the researches and publications of a professional society are not worth the membership fee, and young men who complain because it does not serve them as an agency of collective bargaining. Shame on us! Do we look with envy on the high prestige of medicine and of surgery? Then let us not forget that this prestige has been won not merely through personal skill and service, but through magnificent contributions to human knowledge without profit to the seekers and with incalculable benefits for all mankind. Do we covet public leadership on a par with the legal profession? Then we do well to remember that the overplus which differentiates a profession from a technical vocation calls for personal development and for powers of expression sufficient to fit a man for a place of influence in his community.

Measured by the standards I have been seeking to outline, many men who call themselves engineers and who are competent in accepted technical practices can scarcely be said to have attained a real professional stature. These are the men who have let their scientific training slip away, who do not see beyond the immediate results of their work, who look on their jobs as an ordinary business relationship, who contribute nothing to advancement by individual or group effort and who have little or no influence in society. They have been unable to surmount routine in the early stages of experience and have gradually grown content with mediocrity. There is much in the daily work of a physician, a lawyer and a minister of religion which compels him to be a life-long student. In peace times the army officer is likely to spend one year in six going to school. The student habit is less often a mark of the engineer, which is natural perhaps in a man of action rather than one of reflection, but far too many seem to leave all growth after their college days to the assimilation of ordinary experience, without deliberate intellectual discipline of any kind.

There is a certain school of thought which has two quick and ready remedies for all ills and shortcomings of the profession. One is to keep the boys longer in college and to compel them to cover both the arts and the engineering course; the second is to compel every engineer to take out a public license. One need not quarrel with either the aims or the means; so far as they go both are good, but they cover only the first mile. Registration, I believe, will always be a qualifying standard rather than a par standard for the engineering profession. It will go far toward keeping the wrong men out, but will serve only indirectly to get the right men in. Beyond it lies a second mile of growth and advancement for which effective stimuli, incentives and rewards can be provided only within the profession itself. The riper experience of the medical profession seems a safe guide. For the protection of the public, the law determines who may practice general medicine; but if a registered physician wishes to qualify as an orthopaedic surgeon, he submits to a training prescribed by a voluntary group of specialists and undergoes an examination at their hands rather than those of a public licensing board. Evidences of distinction are likewise a gift within the sphere of the profession's inner life, rather than the domain of law.

The proposal to compel all engineering students to remain six years or more in college and to take both the arts and the engineering degrees is a counsel of perfection, attractive in theory and unworkable in practice. It has failed when tried principally because employment on attractive terms is widely available to four-year graduates, but also because the typical student of engineering shows an unmistakable craving for action toward the end of the undergraduate period and becomes fed up for a time with formal teaching and study. All our experience suggests that the further possibilities in the mile of voluntary advancement are much more hopeful than those in the mile of compulsory discipline. Growth in voluntary postgraduate enrollments has been going forward at a truly surprising pace. The most recent summary shows that our engineering schools granted 1,326 master's degrees and 108 doctorates in 1940 and that there are enrolled in the present year 4,589 candidates for the former degree and 623 for the latter. Equally encouraging are the gains in liberalizing the engineering curriculum by more adequate inclusion of studies in language and literature, in history and economics and in psychology and social institutions—gains which are being made possible by the progressive transfer of specialized technical studies to the graduate plane. My enthusiasm is stirred by the rapid gain in cultural interest and activity among engineering students, gains in the reading of books, in attendance at the theatre, in hearing and producing music and in the artistic forms of expression.

I am encouraged by these trends to end on a note of prophecy. You are fighting a technological war, and we are entering upon an all-out program of technological defense in which every man under arms must be backed by more than a dozen in industry and in which only one man in four under arms is expected to carry a rifle. This experience is likely to have a profound effect on education. Within a decade we are likely to see technological education, both at the secondary and the higher levels, becoming more and more the dominant type.

The climax of man's effort to subdue nature, shift labour from muscles to machines, to make material abundance available for all, and to abolish poverty and disease, may well fall in the next fifty years. After that human interest may shift from work to leisure, from industry to art. Meanwhile engineers will multiply, research will expand, and industry will grow more scientific. Engineers will find their way into every field where science needs to be practically applied, cost counted, returns predicted and work organized systematically. They will be called upon to share the control of disease with physicians, the control of finance with bankers, the bearing of risks with underwriters, the organizing of distribution with merchants and purchasing agents, the supplying of food with packers and purveyors, the raising of food with farmers and the operation of the home with housewives. In few of these new fields, if any, will engineers be self-sufficient; to be useful they must be team-workers; and they must be prepared to deal with "men and their ways," no less than "things and their forces."

The engineering profession will exercise a far greater influence in civic and national affairs. It will probably never be able to define its boundaries precisely, nor become exclusively a legal caste, nor fix a uniform code of educational qualifications. Its leaders will receive higher rewards and wider acclaim. The rank and file will probably multiply more rapidly than the elite, and rise in the economic scale to only a moderate degree.

Engineering education must break away from its present conventional uniformity. At one extreme, a part of it must become more profoundly scientific; at the other extreme, a vast development of practical technical education for directing production will be in demand. Engineering schools ought to be less alike, less standardized by imitation. The men who are to lead the profession will need a longer training, and one that is both more broadly humanistic and more profoundly scientific. Great numbers of workers in technology could do well with a more intensive type of training. For every *one* who should receive post-graduate training, possibly *four* would find the present course sufficient, and *ten* would find an intensive two-year course more suitable. The science of economy needs to be more strongly emphasized at all levels. A science of human work needs to be created and systematically taught.

The engineer's job will be so varied, and will change so fast, and his tools will so increase in variety and refinement with the advance of science, that no engineer can hope to get a once-and-for-all education in advance. We must expect to re-educate engineers at intervals throughout their careers. The most important development of all may come in after-college education. In the future we shall see large numbers of young engineers coming back to college, some for full time, some for half time, some in the evening, some in correspondence divisions; some to pursue higher work in science, some for new engineering technique, some for training in economics and business, and not a few for broader cultural opportunities. This is as it should be. We should cease to think of education as a juvenile episode. Once these means of adult education are provided in ample degree, the engineering colleges could broaden the scientific and humanistic bases of their curricula, cut down on early specialization, relieve over-crowding, inspire independent work, and show the world the best balanced and best integrated of all modern disciplines.

We have no quarrel with liberal education, nor with the doctrine that it is best for many young people to lay first a foundation of culture and then to erect upon it a superstructure of competency. But we hold that there are even more young people who will do better to lay first a foundation of competency and to build upon it a superstructure of culture and of social understanding. That is precisely what the enlightened engineering school of to-day is undertaking to do. It needs freedom from rigid prescription at the hands of the profession if it is to succeed at all, but it needs even more the united guidance and support of the profession if it is to succeed adequately. To our colleagues of Canada, the heartiest of welcomes to the Engineers' Council for Professional Development and to its goodly fellowship of the second mile. "Whosoever shall compel thee to go one mile—go with him twain."

ENGINEERING AND SOCIAL PROGRESS

Dr. KARL T. COMPTON

Excerpts from a Presidential Address to the Society for the Promotion of Engineering Education.

"If the engineer is to bring his influence to bear on broad public questions he must approach them, not with technical arrogance, but with sympathetic understanding. If he is to counsel the people he must gain the confidence of the people, and this confidence is obtained by placing ministry to the public above all other considerations. This concept of ministering to the public welfare, which is the concept underlying the professional attitude, is the remaining principle that needs to be fully synthesized with other elements that have been combined to form the engineering philosophy . . .

"Buttress by the dignity, altruism, and social responsibility of the true professional spirit, we can proceed with greatest confidence and effectiveness in applying engineering to the solution of the present urgent problems of our national welfare. . . .

"Our people are striving for an improvement in our lagging distribution system, for higher wages, shorter hours of labour, a higher standard of living. Engineering research and engineering methods are essential for the attainment of these goals. Our people want industrial peace, and the engineer, because he stands, by virtue of his professional status, in an intermediate position between capital and labour, has a superlative opportunity to create mutual trust between these two groups. . . .

"The impact of new discoveries sometimes produces technological unemployment even though new discoveries must ultimately increase employment. Improperly used, the products of engineering may promote unrest, multiply hazards, increase congestion, and stimulate materialism corrosive to the human spirit. Engineering creates opportunities and man may use these opportunities to advantage or detriment.

"Let us, first of all, lose no chance to stress the scientific method and its application by the engineer to social purposes. The conviction that Nature is orderly and understandable, the spirit of disinterested curiosity, the passion for truth, the subjecting of hypotheses to the test of irreducible and stubborn facts—these are the elements of the scientific method. Along with them go an unwillingness to manipulate truth for the sake of doctrine, a realization that it is impossible to get something for nothing, and that the skilful use of Nature's forces is the way to produce more. . . .

"Let us lose no chance to emphasize that our modern civilization owes its flourishing to the engineering philosophy, the most fruitful intellectual method and outlook in the world's history, and that a mis-use of it or a departure from it may easily plunge us into a new dark age. Let us also emphasize that the contributions of engineering have not been limited to material accomplishments, important as they have been. Its practical utility has been and will be of lesser consequence than its social and philosophical value. It has helped to make life itself a better thing. Through the moral values of its method, it has elevated our ethical standards. Through the effectiveness of its method, it has promoted confidence, giving us new comprehension, new respect for mind, and greater power over matter and the unknown with a consequent enhancement of the dignity of the human spirit. This dignity and self-confidence is essential if man is not to be a puppet but a citizen, free and freedom-loving."

COLUMNS SUBJECT TO UNIFORMLY DISTRIBUTED TRANSVERSE LOADS—ILLUSTRATING A NEW METHOD OF COLUMN ANALYSIS

J. A. VAN DEN BROEK,

Professor of Engineering Mechanics, University of Michigan, Ann Arbor, Mich.

SUMMARY—This paper illustrates a new method of column analysis. It presents four formulae applicable to the pin-ended column with uniform E and I, having at least one axis of symmetry and loaded transversely with a uniformly distributed load in a direction coincident with the axis of symmetry. Each of these formulae has its range of applicability. Two of them (III and V) are in the nature of first approximations; the other two (II and IV) are quite accurate, in fact, more accurate than are the values for E, I and e, which are inevitably involved. Of the two more accurate formulae (II and IV), the range of applicability of one lies outside the field of common engineering experience, that of the other effectively covers the cases generally encountered in engineering practice.

Although this method of analysis as here illustrated is applied to only one special case of column action, it is held that it may be successfully applied to a variety of problems involving stability.

Discussion

The column, subject to uniformly distributed transverse loads (Fig. 1a), does not, strictly speaking, present a problem in stability. That is, instead of failing as the result of sudden buckling, the column will at all times suffer a deflection. The deflections and stresses will vary with changes in value in either the transverse loads kw or in the axial load Q. However, such variations will not be linear; they will not be proportional to the changes in the value of Q. In other words, the principle of superposition does not apply. In the analysis of the beam-column, even though the principle of superposition is inoperative, the elasticity equations may still be used with confidence within certain limits.

If, in Fig. 1a, Q is finite, and kw approaches zero as a limit, then the elastic curve of the column will approach the sine curve, $y = -\triangle \sin\frac{\pi x}{l}$, as a limiting curve. If, on the other hand, kw is finite and Q approaches zero as a limit, then the elastic curve will approach the fourth degree parabola, $y = -\frac{16\triangle}{5l^4}(l^3x - 2lx^3 + x^4)$ as a limiting curve.

Figure 2 shows a number of curves plotted to scale. It may be observed that the sine curve and the fourth degree parabola are so nearly alike as to be almost indistinguishable. The true elastic curve will be one which lies somewhere between these two curves. Since we know the limiting value of the elastic curve and since these limiting values are so close as to be nearly identical, we may assume the elastic curve to be either the fourth degree parabola or the sine curve without introducing an appreciable error.

Once we accept the type of elastic curve which the beam-column will assume, we overcome the difficulty resulting from the fact that the principle of superposition is inoperative.*

In the expression,

$$F\triangle = \int \frac{m\,M\,ds}{EI}, \qquad \text{(Formula I)}$$

F (Fig. 1c) represents an auxiliary load. It is of finite magnitude. However, if we choose we may conceive it to be extremely small. The letter m represents the bending moment induced by the auxiliary load F (Fig. 1d); M represents the bending moment induced by the actual loading kw and Q, and their reactions; F is assumed to be fully acting while the moment M is being applied; $F\triangle$ represents the external work done by F as it is being displaced, the displacement being caused by the application of the actual load. The expression $\int\frac{m\,M\,ds}{EI}$ represents that portion of the total elastic energy growing out of the fact that F and its resulting moment m are fully acting while the actual loadings kw and Q, their resulting reactions, and their bending moment M are being applied. The two expressions, $F\triangle$ and $\int\frac{m\,M\,ds}{EI}$, are identical. This identity is independent of the principle of superposition and is merely contingent on the assumption that m remains constant and that the material is elastic. Since the bending moment M is a function of the elastic curve, the use of Formula I would be extremely involved if this elastic curve itself varied as to type as well as in magnitude. If, on the other hand, we assume this elastic curve for all values of kw and Q to be a sine curve, then Formula I may be easily integrated:

$$M = Qy + \frac{kwl}{2}x - \frac{kwx^2}{2}$$

$$= Q\triangle \sin\frac{\pi x}{l} + \frac{kwlx}{2} - \frac{kwx^2}{2}$$

$$m = \frac{F}{2}x$$

$$F\triangle = \int_A^C \frac{m\,M\,ds}{EI}$$

However, due to symmetry of both m and M about the centre of the span, this equation can be expressed as:

$$F\triangle = \frac{2}{EI}\int_A^B m\,M\,ds$$

If we here introduce the two assumptions which are commonly found to be acceptable, namely l is constant and $ds = dx$, then we may write:

$$EI\,F\triangle = 2\int_A^B m\,M\,ds = 2\int_0^{\frac{l}{2}} m\,M\,ds$$

$$= 2\int_0^{\frac{l}{2}} \frac{Fx}{2}\left(Q\triangle \sin\frac{\pi x}{l} + \frac{kwl}{2}x - \frac{kwx^2}{2}\right)dx$$

and

$$EI\,\triangle = \frac{Q\triangle l^2}{\pi^2} + \frac{5}{384}kwl^4$$

or

$$\left(EI - \frac{Ql^2}{\pi^2}\right)\triangle = \frac{5}{384}kwl^4 \qquad \text{(a)}$$

In the case of a sine curve:

$$y = -\triangle \sin\frac{\pi x}{l}$$

$$\frac{dy}{dx} = -\frac{\pi\triangle}{l}\cos\frac{\pi x}{l}$$

$$\frac{d^2y}{dx^2} = +\frac{\pi^2\triangle}{l^2}\sin\frac{\pi x}{l}$$

The curvature, and therefore the stress in a column of constant E and I, is a maximum when $x = l/2$. The maximum curvature in the column then is:

* See "Euler's Column Formulae," by J. A. Van den Broek, *Michigan Technic*, April, 1939, Vol. LVII, No. 7.

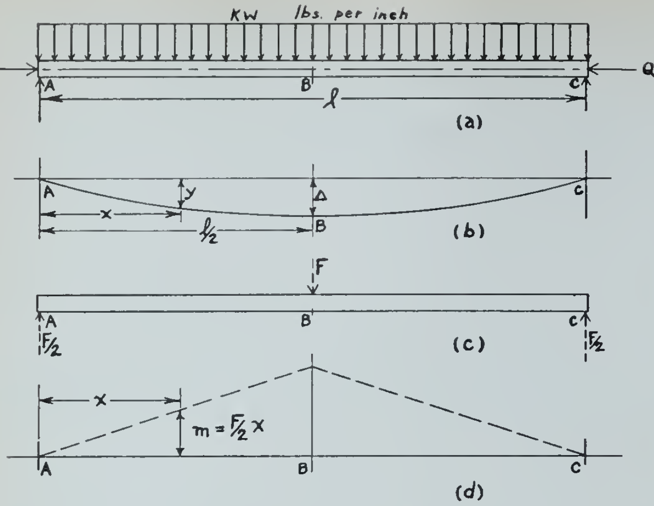

Fig. 1—(a) Column with uniformly distributed transverse load; (b) elastic curve of column; (c) auxiliary load; (d) bending moment due to auxiliary load.

$$\left(\frac{d^2y}{dx^2}\right)_{max} = \frac{\pi^2\triangle}{l^2}$$

The expression d^2y/dx^2 at any point may be given as f/Ec, in which f is stress at the extreme fibre resulting from curvature and c is distance from the neutral axis to the extreme fibre. The stress in the extreme fibre of the midpoint of the column, expressed as a function of the curvature, or as a function of the maximum deflection $\triangle$, would then be:

$$f = Ec\frac{d^2y}{dx^2} = \frac{Ec\pi^2\triangle}{l^2} \qquad \text{(b)}$$

As the load Q is eccentrically applied, relative to a bent column, the stresses throughout the column are augmented by the factor Q/A.

The expression for the controlling stress, the elastic limit stress f_1, as a function of the curvature and of the load Q therefore is:

$$f_1 = \frac{\pi^2 \triangle Ec}{l^2} + \frac{Q}{A}$$

or

$$\triangle = \left(f_1 - \frac{Q}{A}\right)\frac{l^2}{\pi^2 Ec} \qquad \text{(c)}$$

Combining equations (a) and (c) we obtain:

$$\left(EI - \frac{Ql^2}{\pi^2}\right)\left(f_1 - \frac{Q}{A}\right) = \frac{5}{384}kwl^2\pi^2Ec \qquad \text{(d)}$$

or

$$l^2Q^2 - (l^2f_1A + EI\pi^2)Q - \left(\frac{5}{384}kwl^2\pi^2Ec - EIf_1\right)\pi^2A = 0$$

Solving this quadratic equation we obtain:

$$Q = \frac{1}{2}\left\{f_1A + P_{cr} \pm \sqrt{(f_1A - P_{cr})^2 + 5.0734\,kwEcA}\right\} \qquad \text{(e)}$$

We select the — sign in order to obtain the minimum value for Q. Thus:

$$Q = \frac{1}{2}\left\{f_1A + P_{cr} - \sqrt{(f_1A - P_{cr})^2 + 5.0734kwEcA}\right\} \quad \text{Formula II}$$

Q = limiting load which induces elastic limit stress
f_1 = elastic limit stress
A = cross section area
w = weight per unit length
k = constant by which w is to be multiplied to arrive at uniformly distributed transverse load.
c = distance from neutral axis to extreme fibre.

$$P_{cr} = \frac{\pi^2EI}{l^2}$$

At this point the accuracy of Formula II may be checked against the known results which we should obtain in the two limiting cases: either when Q is a maximum and kw is zero, or when kw is a maximum and Q is zero. By making $kw = 0$, in equation (e), we obtain two limiting values for Q, namely, $Q = f_1A$ and $Q = P_{cr}$. When on the other hand the length is such that the elastic limit stress would be reached as the result of the transverse loading only, then $Q = 0$, or, from equation (d)

$$kw = \frac{7.78\,f_1I}{cl^2} \qquad \text{(f)}$$

In case of a simple beam subject to a uniformly distributed capacity load:

$$M = \frac{kwl^2}{8} = \frac{f_1I}{c} \text{ or } kw = \frac{8f_1I}{cl^2} \qquad \text{(g)}$$

The discrepancy between (f) and (g) is clearly the result of our assumption that the elastic curve is a sine curve, whereas, for this limiting case, when $Q = 0$, it is a fourth degree parabola.

In case of very slender beam-columns we may ignore the Q/A factor, in which case equation (d) appears as:

$$\left(EI - \frac{Ql^2}{\pi^2}\right)f_1 = \frac{5}{384}kwl^2\pi^2Ec$$

or

$$Q = P_{cr} - \frac{1.268\,kwEc}{f_1} \quad \text{Formula III (for slender beam columns).}$$

Development of Formulae IV and V

Had we assumed the elastic curve to be the fourth degree parabola instead of the sine curve, then, for M, we would have written:

$$M = \frac{16\triangle Q}{5l^4}(l^3x - 2lx^3 + x^4) + \frac{kwlx}{2} - \frac{kwx^2}{2}$$

and instead of equation (a) we would have obtained:

$$\left(EI - \frac{61}{600}Ql^2\right)\triangle = (EI - 0.10166\,Ql^2)\triangle = \frac{5}{384}kwl^4 \qquad \text{(h)}$$

For the fourth degree parabola the curvature is a maximum when $x = l/2$ and equals:

$$\frac{d^2y}{dx^2} = \frac{9.6\ \triangle}{l^2}$$

The curvature expressed in terms of the extreme fibre f gives:

$$\frac{d^2y}{dx^2} = \frac{f}{Ec}$$

Therefore,

$$\frac{9.6\ \triangle}{l^2} = \frac{f}{Ec}$$

or

$$f = \frac{9.6\ \triangle\ Ec}{l^2} \qquad \text{(i)}$$

The stress which controls the strength of the column is the elastic limit stress f_1. If we include the direct loading effect, we obtain:

$$f_1 = \frac{9.6\ \triangle\ Ec}{l^2} + \frac{Q}{A}$$

or

$$\triangle = (f_1 - \frac{Q}{A})\frac{l^2}{9.6\ Ec} \qquad \text{(j)}$$

Combining equations (h) and (j) we obtain:

$$(EI - 0.101667\ Ql^2)\ (f_1 - \frac{Q}{A}) = \frac{5\ kwl^2 \times 9.6\ Ec}{384}$$

$$= 0.125\ kwl^2Ec \qquad \text{(k)}$$

When we solve this equation for Q we obtain:

$$Q = \qquad \text{(l)}$$

$$\frac{1}{2}\left\{f_1A + \frac{9.836\ EI}{l^2} \pm \sqrt{(f_1A - \frac{9.836\ EI}{l^2})^2 + 4.918\ kwEcA}\right\}$$

For the minimum value of Q we have:

$$Q =$$

$$\frac{1}{2}\left\{f_1A + \frac{9.836\ EI}{l^2} + \sqrt{(f_1A - \frac{9.836\ EI}{l^2})^2 + 4.918\ kwEcA}\right\}$$

Formula IV(a)

When $w = 0$, then $Q = f_1A$, or $Q = \frac{9.836\ EI}{l^2}$.

When $Q = 0$, then from equation (k)

$$kw = \frac{8f_1I}{cl^2} \qquad \text{(m)}$$

Comparing (m) with (g) we find that they are identical, which was to be anticipated since Formula IV(a) was derived on the assumption that the elastic curve is a fourth degree parabola, being the curve which the beam would assume under a transverse load kw while Q is zero.

In case of slender beam-columns the factor Q/A may be ignored. Equation (k) then becomes:

$$(EI - 0.101667\ Ql^2)\ f_1 = 0.125\ kw\ l^2\ Ec$$

or

$$Q = \frac{9.836\ EI}{l^2} - \frac{1.2295\ kw\ Ec}{f_1}$$

Formula V (for slender beam-columns)

Table I shows the values of the limit load Q computed on the basis of Formulae II, III, IV(a) and V. These values apply to a beam-column consisting of a solid round steel rod of one inch diameter. Table II shows similar values for a 12 in. × 3 in. × 25 lb. standard channel, while Table III shows such values for a 5¾ in. × 9½ in. × 40 lb. subway column.

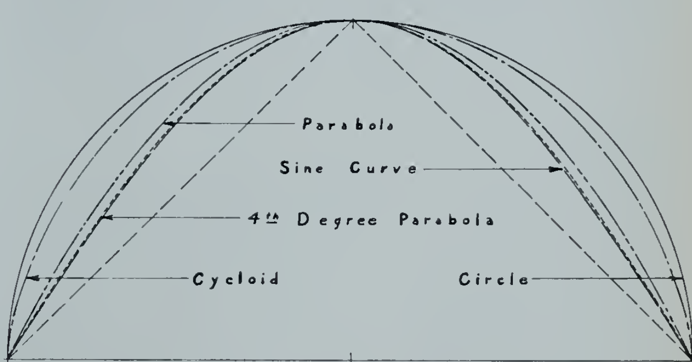

Fig. 2—Comparison of various elastic curves.

In Table I, Q is expressed in pounds. In Tables II and III, Q is given in kips.

The values recorded in the tables have been computed with greater accuracy than would be justified in practice. However, this procedure is here justified in that it permits us to confirm certain theoretical conclusions.

In comparing one with another the results obtained by means of Formulae II, III, IV(a) and V (as listed in Tables I, II and III), it should be realized that Formulae III and V give values consistently too high. This is so because, in

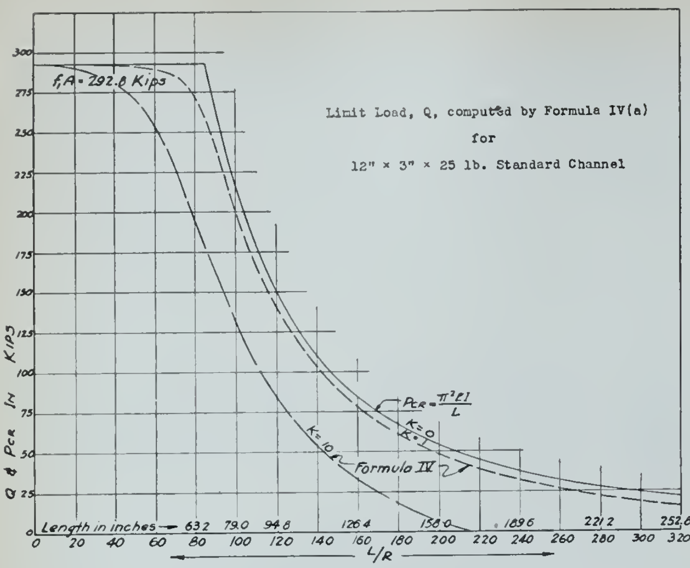

Fig. 3—Limit load (Q) computed by Formula IV(a) for 12″ x 3″ x 25 lb. standard channel.

their derivation, the factor Q/A was ignored. The magnitude of this error is quantitatively illustrated in columns A and B in the tables. These results bear out our earlier contention to the effect that for relatively slender columns and small values of k the Q/A effect on the critical axial load Q is negligible. This conclusion, however, is only of academic interest since the engineering profession frowns on the use of slender columns and is in the habit of ignoring the transverse load effect entirely when k is of the order of magnitude of, say, 1 or 2. A change in this practice is not recommended and we conclude, therefore, that Formulae III and V are not to be used for design purposes.

In comparing the results obtained by Formula II with those derived from Formula IV(a) we find our earlier contention confirmed. We held that, when the axial load predominates (that is, where the values or l/r and of k are small), the elastic curve is most nearly a sine curve. Under these conditions Formula II gives the higher and, therefore, the more nearly correct result. (See Columns II, IV(a), C and D, Tables I, II and III).

It appears that, theoretically, there might be cases in which Formula II must be given a slight preference over Formula IV(a). However, this is true only when the value of kc is small. When kc is of the order of magnitude of unity the engineering profession is in the habit of disregarding the

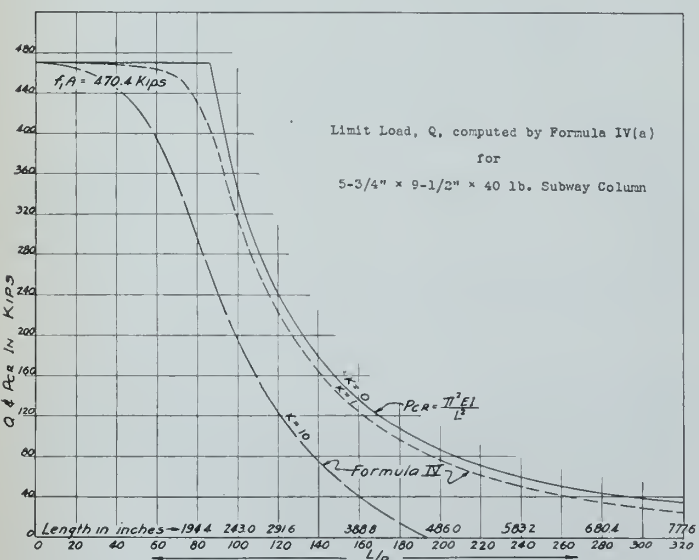

Fig. 4—Limit load (Q) computed by Formula IV(a) for 5¾″ x 9½″ x 40 lb. subway column.

effect of transverse loads on columns. In the light of this analysis no change in this practice is advocated, except possibly in the case of deep columns. In conclusion, then, it is recommended that, of the several formulae studied, Formula IV(a) be adopted.

Figures 3 and 4 show graphically the results obtained by Formula IV(a) as applied to the 12 in. × 3 in. × 25 lb. channel and to the 5¾ in. × 9½ in. × 40 lb. subway column respectively.

Formula IV(a), when divided through by the cross section area of the column, appears as:

$$\frac{Q}{A} = \frac{1}{2}\left\{f_1 + \frac{9.836\ E}{\left(\frac{l}{r}\right)^2} - \sqrt{\left(f_1 - \frac{9.836\ E}{\left(\frac{l}{r}\right)^2}\right)^2 + 4.918\frac{W}{A}E\,kc}\right\}$$

Formula IV(b)

in which w/A is weight per cubic inch of column. In this form it lends itself to graphical representation on one diagram and applies to columns of varying length, varying cross section dimensions and varying intensity of transverse loading, but is restricted to pin-ended columns with at least one axis of symmetry in the direction of the transverse load.

Figure 5 shows the graphs of Formula IV(b) plotted for varying values of kc and for structural steel of elastic limit

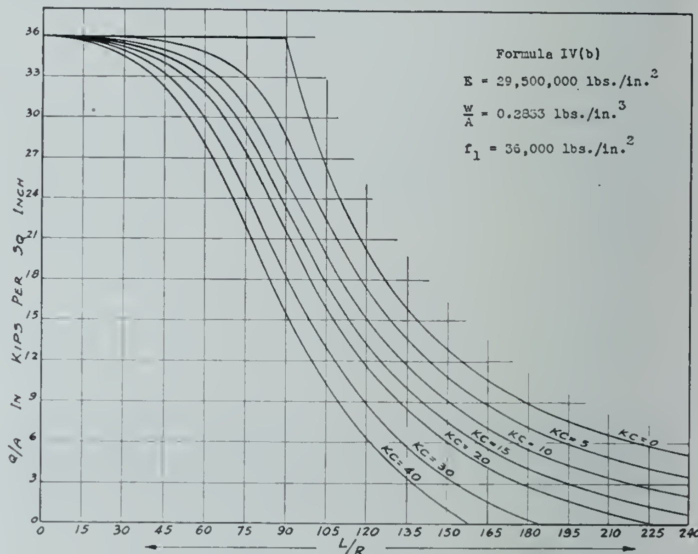

Fig. 5—Average axial limit load $\left(\frac{Q}{A}\right)$ computed by Formula IV(b) for steel of elastic limit f_1=36,000 lb. / sq. in.

$f_1 = 36{,}000$ lb. per sq. in., of modulus $E = 29.5 \times 10^6$ lb. per sq. in., and of unit weight $w/A = 0.2833$ lb. per cu. in.

Figure 6 shows similar graphs for a steel of an elastic limit of 54,000 lb. per sq. in.

Figure 7 shows similar graphs for the aluminum alloy 24S-T, having an elastic limit stress $f_1 = 30{,}000$ lb. per sq. in., a modulus $E = 10.3 \times 10^6$ lb. per sq. in., and a unit weight $w/A = 0.100$ lb. per cu. in.

Figure 8 shows how the average axial limit load Q/A is affected by a change in the value of the elastic limit f_1, all other factors remaining constant. It also shows how the value of Q/A is affected by a change in the modulus of elasticity E.

It is of interest that whereas the graph for Euler's formula, as we are familiar with it, shows the theoretical value Q/A = infinity when $l/r = 0$, the graph for Euler's formula as expressed by Formula II (for the case of $k = 0$) or the graph for Formula IV(b) (for the case of $k = 0$) appears as a limiting curve with $Q/A = f_1$ for all values of l/r less than critical.

In structural engineering the effect of transverse loading (the dead weight effect of a top chord of a bridge) is generally ignored. The limit axial strength of a column appears to be a function of one of the absolute dimensions of the

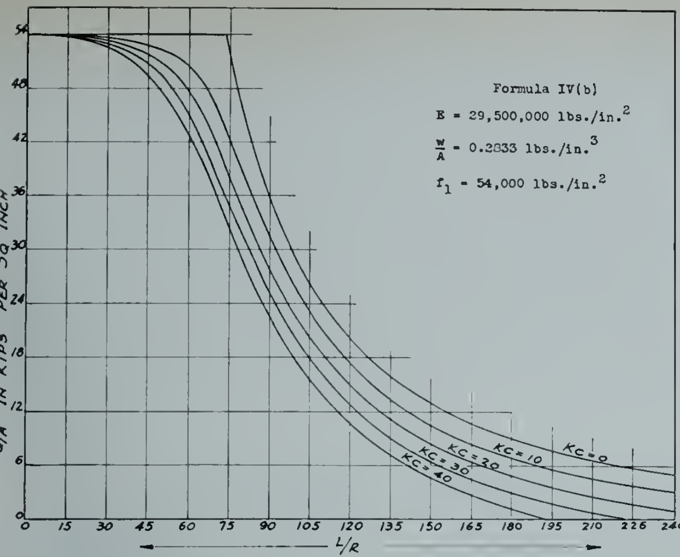

Fig. 6—Average axial limit load $\left(\frac{Q}{A}\right)$ computed by Formula IV(b) for steel of elastic limit f_1=54,000 lb. / sq. in.

column, namely, the value of c. For a pin-ended top chord, having a depth of 40 inches with only the dead weight acting ($k = 1$)*, c would be of the order of magnitude of 20 inches ($kc = 20$). It appears from Fig. 5 that, for such a column of an $l/r = 120$, the value of Q/A is approximately only 60 per cent of P_{cr}/A. For a 12 in. × 3 in. × 25 lb. channel in a horizontal position, with flanges upward of an $l/r = 120$, the limit axial load is 94 per cent of P_{cr} (see Table II). While it appears justified to ignore the dead weight effect on a horizontal channel section subject to compression, a similar dead weight effect on a deep column section is of much greater significance. It would appear, therefore, that in the design of large-size, horizontal columns the dead weight effect should be taken into account.

In aero engineering the transverse air loading on wing members subject to compression is generally taken into account. Every strut in inclined position, making an angle α with the normal force, is subject to transverse inertia loading of $kw \sin \alpha$, in which k represents the coefficient expressing the maximum accelerations encountered as a multiple of the accelerations of gravity. It seems that Formula IV not

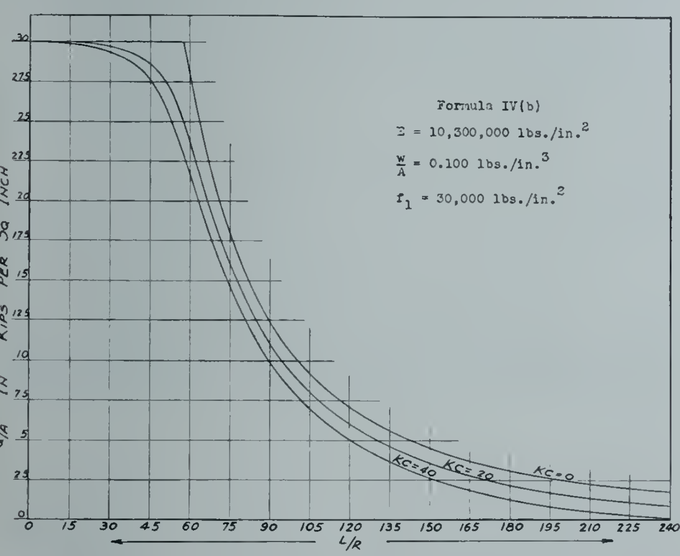

Fig. 7—Average axial limit load $\left(\frac{Q}{A}\right)$ computed by Formula IV(b) for aluminum alloy 24S-T of elastic limit f_1=30,000 lb. / sq. in.

*Even without transverse loading other than the dead weight, the factor k should be taken larger than unity in order that it may include the inertia effect resulting from the vibration of the bridge. See Dynamic Stress Analysis of Railway Bridges, by R. K. Bernhard, Proceedings Am. Soc. C. E. Jan. 1941.

only provides a means of designing members more effectively than is done by present methods, but it also offers a convenient way of including the inertia effect on airplane columns which are more or less perpendicular to the normal force.

It is recognized that the perfect pin-ended column is an academic abstraction. The fixed-ended column, however, is even more fictitious. Even as Euler's formula for pin-ended columns, though little used, serves as a standard for other column formulae, so Formula IV, and the method of its development, may well serve as a standard for other formulae which take into account such factors as varying degrees of end fixity, variations in loading, or variations in cross section dimensions.

For example, a first approximation formula for a fixed-ended column may be derived by the simple process of changing the factor l in Formula II to $l/2$, which gives:

$$Q = \frac{1}{2}\left\{f_1A + 4P_{cr} - \sqrt{(f_1A - 4P_{cr})^2 + 5.0734\, kw\, Ec\, A}\right\}$$

Formula VI(a)

or

$$\frac{Q}{A} = \frac{1}{2}\left\{f_1 + \frac{4\pi^2E}{\left(\frac{l}{r}\right)^2} - \sqrt{\left(f_1 - \frac{4\pi^2E}{\left(\frac{l}{r}\right)^2}\right)^2 + 5.0734\, \frac{w}{A}\, E\, kc}\right\}$$

Formula VI(b)

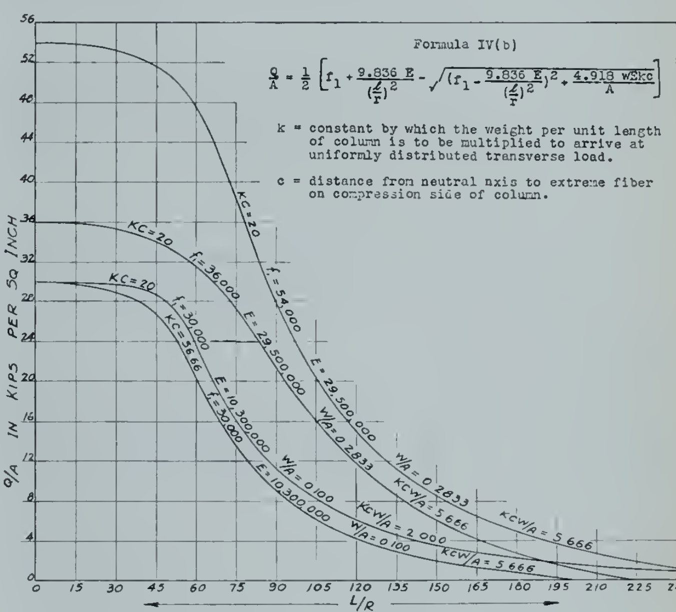

Fig. 8—Average axial limit load $\left(\frac{Q}{A}\right)$ as affected by change in value of elastic limit (f_1) or modulus E.

This formula involves the assumption that the elastic curve of the fixed-ended column is a sine curve. This assumption is probably not far from the truth. A closer approximation formula, however, may be obtained by a detailed study of the shape which the elastic curve of a fixed-ended column will assume—when such a column is subject to transverse loading. The author does not want to undertake this problem at this time because, first, he does not believe that fixed-ended columns occur in practice, and, second, the determination of the degree of end-fixity occurring in practice, which the engineering profession would be willing to accept as being on the safe side, is a matter for detailed and intensive separate study.

It should be pointed out, however, that where either Formula II or IV, which ignore end fixity, give results that are on the safe side, Formula VI would not give such safe results. The similarity between Formulae II and VI suggests that, if it seems safe and desirable to include the strengthening effect of the partial end-fixity of the column, this may be done by the selection of suitable coefficients in the place of the factor 9.836, as given in Formula IV. Or, if we are to allow a certain strengthening effect due to the partial fixity of the ends, this may be done by the simple process of using diagrams (Fig. 5, 6 or 7), and determining the value of Q/A for an l/r which has been reduced from the overall l/r of the column by a certain percentage. Thus, a structural steel 12 in. × 3 in. × 25 lb. channel, loaded transversely with a weight 10 times as great as its dead weight, would have a factor $c = 2.367$, and a factor $kc = 23.67$. From Fig. 5 it appears that such a channel (of an $l/r = 160$), if pin-ended, would develop an average critical load: $Q/A = 4.80$ kips per sq. in. For the same channel, having the same overall $l/r = 160$ and the same $kc = 23.67$, but with its ends completely fixed, the average critical load it could carry would correspond to the reduced value of $l/r = 80$ (Fig. 5), namely, $Q/A = 24$ kips per sq. in. For the same channel, again having the same overall l/r and the same $kc = 23.67$, but with its ends partially fixed, the average critical load it could carry would correspond to a partially reduced value of l/r, say, $l/r = 140$ (Fig. 5), namely, $Q/A = 7.5$ kips per sq. in.

Acknowledgement is expressed to Mr. C. M. Goodrich, M.E.I.C., formerly chief engineer of the Canadian Bridge Company, and to Professors Lloyd H. Donnell, of Armour Institute of Technology, and E. W. Conlon, of the University of Michigan, for their helpful suggestions and criticisms; to Mr. A. G. Clark for his assistance in preparing tables and graphs; and to the Horace H. Rackham School of Graduate Studies of the University of Michigan, for aid received.

THE FIFTY-FIFTH ANNUAL GENERAL MEETING

Convened at Headquarters, Montreal, on January 23rd, 1941, and adjourned to the Royal Connaught Hotel, Hamilton, Ontario on February 6th, 1941

The Fifty-Fifth Annual General Meeting of The Engineering Institute of Canada was convened at Headquarters on Thursday, January twenty-third, nineteen hundred and forty-one, at eight fifteen p.m., with Councillor J. L. Busfield, M.E.I.C., in the chair.

The General Secretary having read the notice convening the meeting, the minutes of the fifty-fourth annual general meeting were submitted and, on the motion of I. S. Patterson, M.E.I.C., seconded by H. G. Angell, M.E.I.C., were taken as read and confirmed.

Appointment of Scrutineers

On the motion of R. H. Findlay, M.E.I.C., seconded by L. H. Burpee, M.E.I.C., Messrs A. H. Chisholm, M.E.I.C., R. S. Eadie, M.E.I.C., and I. S. Patterson, M.E.I.C., were appointed scrutineers to canvass the Officers' Ballot and report the result.

There being no other formal business, it was resolved, on the motion of R. E. Heartz, M.E.I.C., seconded by J. W. Simard, M.E.I.C., that the meeting do adjourn to reconvene at the Royal Connaught Hotel, Hamilton, Ontario, at ten o'clock a.m., on the sixth day of February, nineteen hundred and forty-one.

ADJOURNED GENERAL MEETING AT THE ROYAL CONNAUGHT HOTEL, HAMILTON, ONTARIO

The adjourned meeting convened at eleven o'clock a.m., on Thursday, February 6th, 1941, with Vice-President J. Clark Keith in the chair.

The chairman opened the meeting by asking the General Secretary to read a communication from Dr. Hogg, in which the President expressed his regret at being unable to attend and his wishes for a successful meeting.

The chairman explained the President's enforced absence, and expressed the opinion of the entire meeting when he acknowledged the successful year that the Institute had experienced under Dr. Hogg's guidance. He referred to the agreements which had been reached with two of the provincial professional associations, the series of radio broadcasts, the affiliation with the Engineers' Council for Professional Development, and the elimination of the classification of Associate Member, all of which had been brought to fruition during Dr. Hogg's period of office.

Past-President Challies, following the tradition of the Institute, paid a tribute to the retiring President, and concluded with a resolution, which was seconded by Past-President Mitchell, to the effect that the General Secretary should send the President a formal motion of appreciation for the work which he had done during his term of office.

The General Secretary announced the membership of the Nominating Committee of the Institute for the year 1941 as follows:

Nominating Committee—1941

Chairman: R. A. Spencer, M.E.I.C.

Branch	*Representative*
Border Cities	C. G. R. Armstrong
Calgary	H. B. LeBourveau
Cape Breton	S. C. Mifflen
Edmonton	C. E. Garnett
Halifax	I. P. MacNab
Hamilton	W. J. W. Reid
Kingston	A. Jackson
Lakehead	E. L. Goodall
Lethbridge	C. S. Donaldson
London	V. A. McKillop
Moncton	R. H. Emmerson
Montreal	A. Duperron
Niagara Peninsula	A. W. F. McQueen
Ottawa	J. G. Macphail
Peterborough	W. M. Cruthers
Quebec	A. O. Dufresne
Saguenay	J. R. Hango
Saint John	A. A. Turnbull
St. Maurice Valley	A. C. Abbott
Saskatchewan	A. M. Macgillivray
Sault Ste. Marie	J. S. Macleod
Toronto	J. M. Oxley
Vancouver	E. Smith
Victoria	K. Moodie
Winnipeg	C. V. Antenbring

Awards of Medals and Prizes

The General Secretary announced the awards of the various medals and prizes of the Institute as follows, stating that the formal presentation of these distinctions would be made at the Annual Dinner of the Institute on Friday evening:

Sir John Kennedy Medal to Lieut.-General A. G. L. McNaughton, M.E.I.C.

Duggan Medal and Prize to M. S. Layton, Jr.E.I.C., for his paper, "Coated Electrodes in Electric Arc Welding."

Gzowski Medal to Elizabeth G. M. MacGill, M.E.I.C., for her paper, "Factors Affecting the Mass Production of Aeroplanes."

Plummer Medal to O. W. Ellis for his paper, "Some Developments in Alloys during the last Twenty Years."

Leonard Medal to R. G. K. Morrison, M.C.I.M.M., for his paper, "Points of View on the Rock Burst Problem."

Julian C. Smith Medals (Inaugural Awards), "For Achievement in the Development of Canada," to W. D. Black, M.E.I.C., R. J. Durley, M.E.I.C., A. Frigon, M.E.I.C., F. W. Gray, M.E.I.C., Sir Herbert Holt, M.E.I.C., R. S. Lea, M.E.I.C., Beaudry Leman, M.E.I.C., C. A. Magrath, M.E.I.C.

Students' and Juniors' Prizes

John Galbraith Prize (Province of Ontario), to W. C. Moull, S.E.I.C., for his paper, "Electrification of a Modern Strip Mill."

Phelps Johnson Prize (Province of Quebec—English), to Léo Brossard, S.E.I.C., for his paper, "Geology of the Beaufor Mine."

Ernest Marceau Prize (Province of Quebec—French), to Marc R. Trudeau, S.E.I.C., for his paper, "Points Fixes et Lignes d'Influence."

Report of Council, Treasurer's Report, and Report of the Finance Committee

On the motion of F. P. Shearwood, seconded by R. L. Dunsmore, it was *resolved* that the report of Council for the year 1940, the Treasurer's report, and the report of the Finance Committee, as published in the February, 1941, *Journal*, be accepted and approved.

Reports of Committees

On the motion of A. W. Sinnamon, seconded by A. H. Meldrum, it was *resolved* that the reports of the following committees be taken as read and accepted: Publications; Papers; Training and Welfare of the Young Engineer; Library and House; International Relations; Professional Interests; Legislation; Radio Broadcasting; Deterioration of Concrete Structures; Membership; Board of Examiners and Education; Employment Service.

Branch Reports

On the motion of H. J. Vennes, seconded by R. E. Heartz, it was *resolved* that the reports of the various branches of the Institute be taken as read and approved.

Rewording and Rearrangement of the By-Laws

Vice-President Keith reported that in accordance with Section 75 of the By-laws, the reworded and rearranged by-laws of the Institute, as published in the August, 1940, *Journal*, had been approved by a majority of members of Council upon letter ballot, and by the resolutions of the executive committees of a majority of the Institute branches, and were now presented for approval by this annual general meeting.

Dr. Challies drew attention to the tremendous amount of work involved in the complete rearrangement of the by-laws as now presented. Most of this work had been done by Secretary-Emeritus Durley, who was assisted materially by Mr. Gordon Pitts. It was unanimously agreed that the thanks and appreciation of the Institute be extended to these two members.

On the motion of E. P. Muntz, seconded by L. F. Creighton, it was *resolved* that the rewording and rearrangement of the Institute by-laws, as published in the August, 1940, *Engineering Journal*, be approved.

Election of Officers

The General Secretary read the report of the scrutineers appointed by Council to canvass the officers' ballot for the year 1941, as follows:

President.......................... C. J. Mackenzie

Vice-Presidents:

Zone A (Western Provinces).......... A. L. Carruthers
Zone B (Province of Ontario)......... K. M. Cameron
Zone C (Province of Quebec).......... deGaspé Beaubien

Councillors:

Vancouver Branch.................. H. N. Macpherson
Edmonton Branch................... J. Garrett
Saskatchewan Branch............... I. M. Fraser
Lakehead Branch................... J. M. Fleming
Border Cities Branch.............. E. M. Krebser
London Branch..................... J. A. Vance
Toronto Branch.................... A. E. Berry
Peterborough Branch............... H. R. Sills
Kingston Branch................... D. S. Ellis
Ottawa Branch..................... W. H. Munro
Montreal Branch................... G. McL. Pitts
H. J. Vennes
Saint Maurice Valley Branch....... J. H. Fregeau
Saguenay Branch................... M. G. Saunders
Saint John Branch................. H. F. Morrisey
Halifax Branch.................... S. W. Gray

On the motion of J. A. McCrory, seconded by H. G. O'Leary, it was *resolved* that the report of the scrutineers be adopted, that a vote of thanks be tendered them for their services in preparing the report, and that the ballot papers be destroyed.

Vice-President Keith announced that the newly elected officers would be inducted at the Annual Dinner on the following night.

On the motion of R. H. Findlay, seconded by E. S. Mattice, it was unanimously *resolved* that a hearty vote of thanks be extended to the Hamilton Branch in recognition of their hospitality and activity in connection with the holding of the fifty-fifth Annual General Meeting.

On the motion of Past-President S. G. Porter, seconded by L. A. Duchastel, it was unanimously *resolved* that the sincere thanks of the Institute be extended to the retiring president and councillors in appreciation of the work which they have done for the Institute during the past year.

The General Secretary reported that the Institute had been approached by the Citizens' Committee for Troops in Training, with a suggestion that the Institute, in company with certain other engineering organizations, might undertake to raise $760.00 for the purchase of band instruments for the Royal Canadian Engineers at Petewawa Camp.

The request had been considered by Council at its meeting on the previous day, and while it was felt that the Institute could not officially participate in such an endeavour, the Council was entirely in sympathy with the objective, and the suggestion was made that the money might be collected on a voluntary basis from the members attending the annual meeting. Accordingly, a collection had been taken up at the Council meeting, and the General Secretary now stated that he or his assistant would be glad to receive further contributions from any members who felt they would like to support this worthy object.

There being no further business, the meeting adjourned at eleven thirty-five a.m.

THE GENERAL PROFESSIONAL MEETING

At the luncheon on Thursday, the mayor of Hamilton, W. E. Morrison, extended a hearty welcome to the members and guests. His breezy remarks contained some good-natured references to the plight of neighbouring cities perhaps less bountifully endowed with natural beauty than is Hamilton. He was followed by W. D. Black, who spoke on **Industrial Morale** and its importance in the war effort. It is hoped to publish this thoughtful address in a later issue of the Journal, together with those given later during the meeting which dealt with similar problems of engineering interest at this time.

The special afternoon session, over which Vice-President deGaspé Beaubien presided, was devoted to a paper on **Technical Training for National Defence,** prepared by Dean A. A. Potter of Purdue University. This was presented by Dr. A. A. Cullimore and was well discussed, together with the report of H. F. Bennetts' Committee on the Training and Welfare of the Young Engineer.

That report and notes of the discussions upon it will be published in an early issue of the Journal.

Dr. J. O. Perrine

Dr. A. R. Cullimore

Dean A. A. Potter

J. A. McCrory, M.E.I.C.

A. S. Runciman, M.E.I.C.

A. T. E. Wanek, M.E.I.C.

T. S. Mills, M.E.I.C.

E. R. Jacobsen, M.E.I.C.

J. T. Thwaites, M.E.I.C.

In reference to the paper presented by Dr. Cullimore, E. P. Muntz pointed out that Canada's defence activities would call for at least five thousand more technically trained men. He urged prompt action on this matter. Professor W. L. Malcolm, now of Cornell University, outlined the courses established there as an aid to industry. Dean Brown of McGill and Professor C. R. Young of Toronto referred to the difficulties already caused in our engineering schools by wartime exigencies.

Friday morning's Technical programme comprised three papers on electrical subjects. Mr. McCrory described the important hydro-electric power development at La Tuque, and noted that the addition of almost 200,000 h.p. to the Dominions resources has been of great value to our war effort. Dean Brown gave interesting information regarding the studies on which the runner design for La Tuque was based, obtaining increased power and avoiding cavitation troubles. J. T. Thwaites followed with a paper on the use of Ignitron Rectifiers in war industries, particularly where electro-metallurgical processes are carried out. The paper by A. S. Runciman on Earth Crust Resistance gave valuable data on the protection of transmission lines from lightning damage. Vice-president DuBose was in the chair during this Session.

An address by Secretary George T. Seabury of the American Society of Civil Engineers was the principal feature at the luncheon on Friday when E. P. Muntz presided. He gave to the members present an interesting account of the organization and manifold activities of the **Engineers' Council for Professional Development**, the important consultative organization which the Institute has been privileged to join as the first member body located outside the United States. Mr. Seabury's remarks made it clear that The Engineering Institute of Canada will receive most valuable help from this membership in dealing with Canadian professional problems, and that in return the Engineers' Council will be able to profit by experience gained in Canada under conditions which are necessarily somewhat different from those in the United States.

Vice-president J. Clark Keith took the chair at the Friday afternoon session in the Starlight Room, where A. T. E. Wanek of the British Air Purchasing Mission, New York, gave a timely paper on the estimation of production costs of aircraft.

Next on the programme was a series of excellent coloured moving pictures taken during a journey over the Banff-to-Jasper Highway, illustrating a paper presented by T. S. Mills, which was commented on by J. M. Wardle, under whose supervision much of this scenic road was constructed.

Meanwhile in Dining Room "A," E. R. Jacobsen gave his paper on Moment Distribution and Analysis of a Continuous Truss of Varying Depth—K. M. Cameron presiding. A five-span highway bridge truss was taken as an example of the application of a new method of analysis, for which machine calculations are not necessary, which determines the moments directly, and requires less work than the conventional method of procedure. The discussion which followed was extensive and highly technical.

Joint Meeting

An unusual feature this year was the joint dinner and demonstration shared with the Niagara District Electric Club. This dinner was held in the Starlight Room and over six hundred were in attendance. The demonstration was given in the Ball Room by Mr. J. O. Perrine, assistant vice-president of the American Telephone and Telegraph Company.

The principal feature of this remarkable performance was "Voder" an electrical mechanism for producing the sound and formations of the human voice. By means of this apparatus, and the skilful young lady who controlled the keyboard, words could be produced that contained the identical sounds and inflections of the human voice. "Synthesized speech" is a good description of it.

The whole demonstration was unusually interesting, and an audience that exceeded the capacity of the room voiced its approval in no uncertain terms.

Another outstanding event of the meeting was of course the Annual Banquet of the Institute. Everyone regretted that Dr. Hogg could not be in the chair, but his place was ably filled by Vice-President DuBose, who presented the various prizes and medals of the Institute. The award of the Gzowski Medal to Miss Elizabeth MacGill in particular met with the enthusiastic approval of the large audience.

The army was well represented

The officers and distinguished guests at the head table included: Chairman McNeely DuBose and Mrs. DuBose; Dean C. J. Mackenzie, president, The Engineering Institute of Canada and acting president, National Research Council, and Mrs. Mackenzie; Dr. Wm. E. Wickenden, president of the Case School of Applied Science, Cleveland, Ohio; George T. Seabury, secretary, American Society of Civil Engineers, and secretary, Engineers' Council for Professional Development; R. J. Magor, chairman of the board of the Canadian Chamber of Commerce, and president, National Steel Car Corporation, Mrs. Magor and John Magor; W. A. T. Gilmour, chairman of the Hamilton Branch and Mrs. Gilmour: W. P. Dobson, representing the Dominion Council of Professional Engineers, and Mrs. Dobson; Professor R. E. Jamieson, president of the Corporation of Professional Engineers of Quebec; Burwell R. Coon, president, Royal Architectural Institute of Canada, and Mrs. Coon; and His Worship the mayor of Hamilton, W. E. Morrison.

A luncheon group made up of Messrs. Eadie, Brown, McCrory, Challies, all of Montreal, and General Mitchell (Toronto)

The principal speaker was President W. E. Wickenden

W. D. Black (Hamilton) was the luncheon speaker on Thursday. McNeely DuBose and H. A. Cooch were among head table guests

The "Pay-off"—next day John Dunbar squares off the hotel account while Bill Brown gives his approval.

George T. Seabury (New York) tells of the aims and purposes of E.C.P.D He is secretary of that body and also of the American Society of Civil Engineers.

Dr. A. R. Cullimore (Newark) presents Dean Potter's paper onTechnical Training for National Defense, and adds considerable material of his own. De Gaspé Beaubien is chairman.

Dean Brown (Montreal) left, supplements the material given in J. A. McCrory's paper on the La Tuque Development.

An interesting "father and son" group. R.J.Durley and Tom Durley(Montreal).

Past President F. P. Shearwood (Montreal) discusses the Jacobsen paper.

Jacobsen's paper on Moment Distribution and the Analysis of a Continuous Truss was discussed for over two hours. Here is the author.

Arthur Runciman (Montreal) describes some new things that have been found out about "Earth's Crust Resistance and Lightning".

Joe Thwaites (Hamilton) delivers his paper on Ignitrons.

Chairman R. L. Dunsmore (Halifax) discusses the papers with A. T. Wanek (New York), left, and J. M. Wardle (Ottawa), right.

Between meetings—left to right, L. H. Robinson of Oakville and H. L. Bucke of Niagara Falls.

Left to right, K. M. Cameron (Ottawa), Bill Bonn (Toronto) and John Stirling (Montreal) ask the General Secretary some questions.

Geoffrey Stead (Saint John) keeps up his unbroken string of 25 annual meetings, while Marc Trudeau (Montreal) takes in his first one.

Bill Reid (Hamilton) exhibits his radio personality.

Dr. W. E. Wickenden delivers his excellent address.

of the Case School of Applied Science, Cleveland. He took for his text a verse from the Gospel according to St. Matthew but his discourse was adorned with several anecdotes of more worldly origin. Its title was **The Second Mile**—a reference to a commandment in the Sermon on the Mount —which, according to Dr. Wickenden, represents that voluntary effort, over and above the regular required task, which distinguishes the efficient and willing from the mediocre performer. His address was full of humour and gave food for much thought regarding professional status and dignity.

At the close of the dinner the induction of the newly elected president took place, and Dean Mackenzie gave a brief message to the Institute.

The banquet was followed by a dance. Members and guests were received by Dean and Mrs. C. J. Mackenzie, Mr. and Mrs. W. A. T. Gilmour, and Mrs. Hugh Lumsden.

On Wednesday, previous to the general activities, there were two important functions, i.e., the council meeting and the president's dinner.

Council Meetings

As usual, incoming councillors were invited to this Council meeting, as well as past-presidents and certain other members whose interests and activities brought them into close contact with the Institute. In all, there was an attendance of forty-one. In the absence of the president, Vice-President Sauder presided at both the morning and the afternoon sessions. The details of the meeting are printed elsewhere in this number of the *Journal*.

The new council met at two-thirty on the afternoon of Friday, with the new president, C. J. Mackenzie, in the chair. In accordance with the usual custom, chairmen of standing and special committees were appointed and other routine business attended to. The detailed report of this meeting is also printed elsewhere in this *Journal*.

President's Dinner

The pleasant custom of the retiring president entertaining at dinner, the officers and councillors of the Institute and certain other members who have assisted him in his term of office, was maintained this year, even though the host himself could not attend. It was Dr. Hogg's firm desire that his accident would not rob the annual meeting of a pleasant feature and deny him the privilege of expressing in this way his appreciation of the aid and assistance which had been given him so generously. The dinner was held at the Tamahaac Club outside of Hamilton.

J. M. R. Fairbairn presided, an honour due him as the senior past-president present. To support him he had at the head table Past-Presidents Porter, Shearwood, Lefebvre and Challies, and President-Elect C. J. Mackenzie, Vice-Presidents Sauder, DuBose and Keith. Mr. N. S. Braden, vice-president of the Canadian Westinghouse Company, was a special guest.

Mr. Fairbairn, after expressing his regret at Dr. Hogg's absence, asked each past-president and each new councillor to make a speech. In view of the fact that absolutely no warning had been given, the results were extremely amusing but satisfactory. The past-presidents in particular acquitted themselves nobly, and indicated clearly that they had not lost their sense of humour.

The Committee on the Welfare and Training of the Young Engineer—left to right, Messrs. R. F. Legget (Toronto), R. E. Heartz (Montreal), Harry Bennett (London), chairman, A. E. Macdonald (Winnipeg). This is not the Mural Room.

Dean Mackenzie spoke on the future of the Institute and the profession, with particular reference to wartime conditions. He expressed his appreciation of his election to the presidency, and asked the support of all councillors throughout what would be a trying and decisive year.

The concluding feature of the evening was the showing of a sound movie depicting the collapse of the Tacoma Bridge. The party returned to the hotel by bus to join the ladies and break up the bridge session which was underway.

THE PRESIDENT'S DINNER

Head table—Chairman J. M. R. Fairbairn warns Jack Challies that he is going to be called on for a speech. Other past presidents are Sam G. Porter (Calgary), O. O. Lefebvre (Montreal), F. P. Shearwood (Montreal) just out of the camera's range. President-elect C. J. Mackenzie is in the foreground

N. S. Braden (Hamilton), centre, explains on his fingers, much to the amusement of McNeely DuBose (Montreal) and Clark Keith (Border Cities).

With characteristic gesture, Geoff Gaherty (Montreal) tells Hal Cooch (Hamilton) something he should know about transformers.

Even without their hair you can recognize Gordon O'Leary (Lakehead) "the darling of the profession," Charlie Sisson, R. B. Young and Barry Watson, all of Toronto.

Reg Findlay, at the "low" end of the table, tells another one to John Hall (left) and Harold Vennes (right), all of Montreal.

The Ottawa contingent—right to left, Messrs. W. F. Bryce, W. H. Munro, J. H. Parkin with Huet Massue (Montreal), Harry Bennett (London) and D. S. Ellis (Kingston) in the background

---

Harry Bennett presents branch prizes to L. C. Sentance and to M. D. Stewart.

Any paper that holds the audience like this for two hours must be good.

The reception line—left to right, Mrs. Hugh Lumsden, Mrs. Mackenzie, The President, Mrs. Gilmour and W. A. T. Gilmour, chairman of the branch.

A president is installed. Dean Mackenzie takes over from chairman McNeely DuBose.

Miss McGill (Fort William) winner of the Gzowski Medal, George Seabury (New York), Dr. Wickenden (Cleveland) and the luncheon chairman Eric Muntz.

The Ladies

A very complete programme for the ladies, taking up the better part of three days, was provided by the ladies' committee under the chairmanship of Mrs. Hugh Lumsden. Without having participated in it, it is impossible to describe every function, but judging from the printed programme and from the reports of those who did take part, everything was very satisfactory.

J. J. Mackay (Hamilton) explains a serious point. Left to right, J. A. Vance (Woodstock), L. A. Fraikin (Montreal), J. J. Mackay, D. L. Mackinnon (Montreal).

On Wednesday evening, while the councillors were at the Tamahaac Club, guests of the president, the ladies joined together for a modest bridge tournament.

And the ladies played bridge—from left to right, Mrs. F. P. Shearwood (Montreal), Mrs. C. J. Mackenzie (Ottawa), Mrs. Louis Trudel (Montreal), Mrs. W. H. Munro (Ottawa), Mrs. G. Moes (Hamilton), but Mrs. Hugh Lumsden (Hamilton) would not face the camera.

On Thursday afternoon it was the ladies' turn to visit the Tamahaac Club, where tea was served. The same night a special dinner was arranged for them at the Wentworth Arms Hotel.

Friday morning saw several ladies embarking on a prearranged shopping tour. Others visited certain industries in the locality, and all returned in time for lunch at the hotel. All ladies were guests of the Hamilton Branch for both luncheons, and for tea and dinner as well—a very much appreciated innovation.

The Hamilton ladies made a splendid showing in their part as hostesses. Mrs. Hugh Lumsden gathered together a competent and enthusiastic group that contributed much towards the success of the whole meeting.

RAILWAYS AND THE WAR

From *The Railway Magazine*, (London), December, 1940

Twelve months have passed since we published an article under the title of "Railways and the War." The previous instalment concluded by pointing out that, as we have readers in all parts of the world, we are naturally sensible to the necessity for maintaining perspective, and bear in mind that the incidence of war upon railways, as upon the lives of individuals, is important, but not all-embracing. From time to time, therefore, we have made references to the war as it has affected railways and now propose to give a general review of some of the more important events of 1940.

In Great Britain the events of last winter may be summarized as comprising the reduction of passenger services and their subsequent part-restoration, the difficulties of travellers due to the imposition of severe blackout restrictions; the giving of preference to freight traffic over passenger traffic; and the coincidence of very severe weather conditions with war conditions. By the early spring, shaded white light had been gradually restored to most passenger trains, and practically all are now so equipped, although the supply of current through the switch in the guard's control depends upon whether or not the passengers keep the blinds drawn.

The withdrawal of the B.E.F. and large numbers of the French Forces from Northern France through Dunkerque, provided the British railways, and the Southern in particular with an extraordinary test of organization and initiative in transporting some 320,000 from the Channel ports. It fell to the lot of the Southern Railway Company to initiate the arrangements, and all four railways contributed their quota of trains, of which 186 were used. A detailed report of this movement was given in The Railway Magazine for July. It will also be recalled that during the period of intensive B.E.F. evacuation, the British railways carried in addition some 20,000,000 passengers and 6,000,000 tons of freight. In the middle of the year the Minister of Transport decided that to conserve steel for essential war purposes, the new works of the London Passenger Transport Board in conjunction with the G.W.R. and the L.N.E.R. should be suspended. About the same time the Ministry of Home Security defined certain districts of the country as defence areas into which movement was restricted. Persons wishing to enter the specified areas for business purposes were not prevented from doing so, but holiday and pleasure visits were banned. Later these areas were subject to considerable extension, and roughly comprised a strip of varying width inland from the coast from Berwick-on-Tweed to Weymouth. Suspension of free movement into these areas naturally occasioned a considerable reduction in travel on certain sections of lines.

After the withdrawal of the British Forces from France and the subsequent movement to the French coast of the Germany army, the Local Defence Volunteer corps was formed for home defence purposes. Railway units of this force were formed by all the main-line companies, and these have done much valuable work in the general guarding of premises and key points on the systems. Later in the year the title of Local Defence Volunteer was changed to the more appropriate one of Home Guard. In October, the Ministry of Transport announced that railway station names which early in the war had been obliterated or greatly reduced in visibility might be displayed more freely. The object of the removal of names had been to avoid giving indications of the area concerned to low-flying aircraft, or to parachute troops. The Minister's intimation in the autumn of this year was to the effect that names might be displayed more freely provided they could not be read from a highway or by low-flying aircraft.

In the various parts of this country and also abroad, derelict tunnels have been made available as air raid shelters, and with the intensification of the war in the air, have become of increasing value to the public. Examples of tunnels put to this use are those at Southwark and King William Street, London, and at Dundee, Harrogate, Edinburgh and Ramsgate. Abroad an outstanding example of tunnel shelters is provided by Malta.

Air raids on London, which first began on an intensive scale on September 7, occasioned a certain amount of disorganization to the transport services of all kinds. Railway targets naturally proved attractive to the enemy, and on some occasions it has been necessary to divert or suspend the train services, although usually the periods involved have been very brief. A special group of buses has been formed to replace train services interrupted between certain points in the Metropolitan area. Repairs to damaged lines have been quickly undertaken, and services restored with a minimum of delay. Notwithstanding the difficult conditions under which operations have been conducted on many occasions, traffic in general has been kept moving with remarkable freedom. The work of the engineers indeed speaks well not only for the enterprise of individuals in the engineering departments when faced with emergencies, but also for the preparatory measures which had been taken by the railways in anticipation of troubles the exact nature of which, could, of course, not be foreseen. The easiest type of damage to repair is the straight-forward bomb crater. Where a bomb falls clear of the tracks, it may affect their alignment and level, and cover them with debris. The repair is then merely a matter of clearing and re-adjusting. Should a bomb fall upon the track it may necessitate bringing to the site material for filling the crater and relaying the damaged lines. Cables, both traction and signal, and conductor rails, not to mention telegraph wires, may have been damaged and these also have to be repaired. Traffic may, however, be resumed under hand signalling pending the re-establishment of the normal controls. Delayed action bombs may cause but small damage immediately, but until they are extracted and removed, a proceeding which has proved possible in many instances, they inevitably cause traffic interruption. Station buildings have been the victims of aerial bombardment, but restoration has been astonishingly rapid and in some instances train service is only very slightly interrupted.

The greatest problems both in nature and magnitude have, of course, been presented by damage to bridges and viaducts, and the ingenuity displayed in devising means of restoration, as well as the concentrated hard work which has gone to its realization, has astonished many who have had the opportunity of seeing what has had to be tackled. One instance of quick repair may be mentioned. A bomb fell on a brick arch viaduct supporting eight running lines carrying an intensive traffic. It penetrated through the brick arch and exploded with great violence wrecking several arches and shattering everything within a large radius. Traffic had to be suspended on all lines, and it was decided that the quickest method of restoration was to build retaining walls at each side of the viaduct, demolish the worst of the wrecked masonry and fill in and consolidate the whole formation. Filling, consisting of quarry refuse which packs quickly and solidly, was brought to the site in trains of hopper wagons. Two of the tracks were reopened to traffic within eight days, two more ten days later, and a further two very soon afterwards. Here and there fire has been a trouble, and there is an instance of an important station carried on a steel viaduct in which the terminal ends of all but one platform were badly damaged before the conflagration could be extinguished. Trains which were standing at the platforms at the time were attacked by the flames, but all were removed before extensive damage had been done, except one with wooden-centred wheels which, when burnt, let the axles drop. These vehicles thus became immovable and were destroyed. The scene immediately after this fire was one of desolation, but nevertheless so quickly and methodically was the wreckage handled that within 48 hours it was possible to work trains in and out of one platform. Five days later two more platforms were again in use providing sufficient accommodation for the traffic.

MODERN PROBLEMS IN HIGHWAY CONSTRUCTION

CHARLES M. BASKIN
Asphalt Technologist, Imperial Oil Limited, Toronto, Ont.

Abstract of paper delivered before the Toronto Branch of the Engineering Institute of Canada, November 21st, 1940.

Road construction to-day is more of a problem than it ever was in pre-modern times. The principal reason for this is that we are inclined to regard every road job as a standardized task. Actually, the modern motor road is a combined social, economic and technical problem.

Taking the railway as a basis for comparison, the speaker stated that the railway developed along standardized lines with little, if any, confusion, principally because, as a private enterprise, it tended towards massive unit construction and concentration in the most populated areas. Under these circumstances there was little incentive, on the part of the privately-owned railway, to pioneer in localities of doubtful return. Moreover, there is a definite minimum standard and, therefore, minimum cost of railway per mile, beyond which one cannot go. This minimum cost was still economically impossible for low revenue areas. But there can be a multitude of types of roads—from the massive four-lane highway to the graded earth road. Yet the heaviest motor vehicles can negotiate the earth road during relatively dry periods; hence the confusion in standards and specifications in highway construction as contrasted with the railway.

In a sense, roads are like a consumable commodity, where capacity to consume is always greater than ability to supply. The motorist's demand is both for mileage and for quality —mileage to get ever farther away from the over-concentrated areas—quality in form of safety, comfort and reduction of wear on the motor vehicle. The primary demand, however, is for mileage and this always outstrips the revenue that can be exacted from the motorist. Under such circumstances, the engineer followed the most obvious procedure. Where traffic was low, he tried to get by with the old time low-cost construction methods, resulting in a road of low bearing capacity. Where traffic was high, he based his design on the assumption that the pavement alone will have to support the total traffic load as, at certain times of the year, the supporting value of the subgrade may be nil.

Demand for road mileage not only outstripped increase in revenue, but was considerably ahead of technological developments on how to build a structurally adequate road at a cost compatible with available funds and mileage required. The speaker emphasized that lack of fundamental data on causes of road failures has driven us to massive construction which, in itself, is only a temporary palliative. It is only recently that systematic investigations have yielded data on behaviour of soils in presence of water. Effect of water has been the chief cause of most of our road failures.

He then expounded the theory of design of roads as a composite structure of several layers, consisting of the soil subgrade, the base course and the wearing surface, each layer intended to have and to retain a certain minimum bearing capacity, the sum total of which is adequate to support the heaviest wheel loads. In this connection, he outlined the newly developed methods of base course construction using natural clay as binder and gravel and sand as aggregate. Admixture of extremely small quantities of bitumen makes such masses of clay cemented aggregates water-repellent, thereby retaining the clay bond.

He further pointed out that such methods of base course construction have widened enormously the range of aggregates that can be used, thereby reducing costs and obtaining bases several times the structural strength of the unscientifically constructed macadam or gravel base. Add to this the mechanically improved road bed, and the combined bearing capacity of such composite structure (soil road bed and base) is more than adequate to support the heaviest traffic. This type of design obviates the necessity of massive pavements. A thin resilient wearing course is entirely satisfactory—hence the all-weather, high bearing capacity road at a low cost.

He further emphasized that even with massive pavements, we shall have to go to more scientific methods of drainage, soil compaction and construction of mechanically waterproofed base courses, otherwise our maintenance bills will continue to mount.

Our need for road mileage is increasing at a far greater rate than our revenues from motor vehicles. We are, in addition, faced with increasing weaknesses and even failure of both expensive and low-cost roads constructed over unstable soil and poorly designed bases. It is, therefore, essential that we constantly keep in mind that the only manner in which we will ever balance our budget is to have the scientific theories of to-day developed and made into the practice of to-morrow.

GAS

From *Aeronautics*, (London), December, 1940

Ashes to ashes and dust to dust; and gas to sewage and sewage to gas. Something of that kind, seems to be the fundamental process underlying the cycle of nature. Dr. Lawrie, in an important book which is reviewed in our book page, directs attention at the possibilities of using methane, or marsh gas, as a fuel for internal combustion engines. According to his examination of the problem we could find in this country a sufficient supply of methane to reduce markedly our imports of fuel.

The gas is given off when sewage is being treated by the bacterial method. At present we secure our supplies of aviation spirit through the good offices of the Navy, and the Royal Air Force does not forget that it owes its success to the Navy, for without the constant stream of tankers reaching our ports it would not be able to take off. But anything that can reduce that burden on our shipping is of immediate value.

Some might argue that the war has progressed so far that the introduction of new sources of fuel supply would come too late to be of value. But this is a false view, for if we can provide some of our own fuel we gain in peace as well as in war. Moreover the cyclic principle is gaining ground as the basic principle which should guide all human proceedings, agricultural and other. It is from the rotting leaf that the best fertilizer comes. Sewage undoubtedly contains material that is more valuable than gold. In the past the procedure was usually to throw it away. Now a wiser view tends to prevail and there is a better understanding of the cyclical processes which go to renew life and energy.

That we should take our aviation spirit from sewage is in train with this application of the cyclical principle. Dr. Lawrie's book deserves the closest attention from all those who are dealing to-day with the problems of the nation's supplies.

A NEW INDUSTRY IN SWEDEN

Abstracted by Emil Skarin, m.e.i.c.

Producer gas, made directly from either charcoal or wood, is rapidly substituting gasoline as fuel for the motor vehicle traffic in Sweden.

The war has necessitated this change. When hostilities broke out in September, 1939, Sweden had in operation 280,000 motor vehicles of all types. The greater portion of these had to be laid up for lack of gasoline. There being no restriction on the use of wood or charcoal, many trucks resorted to the use of producer gas, derived from charcoal, as was done in the first great war.

Charcoal is made from wood, both assiduous and dissiduous wood, preferably in dry condition. In Sweden, fairly large quantities are produced each year, usually from slabs, tree tops, and waste, surrounding the lumber industry. When charcoal was again required as fuel for the motor vehicles, the supplies were soon exhausted, and no cheap, dry wood supply was readily available. Nothing else was left except plain green wood.

The equipment used in the first great war, to facilitate the use of producer gas, had in the meanwhile been greatly improved. It was soon found that wood, cut into small cubes of about two inches, served almost equally as well, though the rate of burning was more difficult to control.

The use of wood directly is the outstanding and rather startling development, there being no scarcity of wood, and, furthermore, useless, crooked and twisted pieces could be used. Already 35,000 motor vehicles, mostly trucks, have been equipped for use of producer gas as fuel. Many more are ready to become so, as soon as equipment can be got ready. To serve these with supplies of wood, or charcoal, new depots are springing up all over the country along the highways, and a great number of people are finding new and profitable employment.

The equipment consists in the main of a pot, or retort, placed on a trailer behind the vehicle.The retort, somewhat similar to the tub of a washing machine, though larger, has on top a refueling lid which is kept tight. There is a slow draft allowed from the bottom, and the gas and smoke produced from the burning of the wood or charcoal in the retort is sucked into the engine by way of a tube. Evidently the only change to the engine equipment is a new or altered carburettor. The retort has to be cleaned out once in a while, like any other stove or furnace must be.

The above information is gathered from articles appearing in a Swedish road journal called "Svenska Vägföreningens Tidakrift." In one of these articles, Sten Gyllensverd, Civil Engineer, describes a trip by car, using charcoal as fuel, in which he himself took part.

The trip was made in the summer of 1940, in an ordinary six-cylinder, two-door car, with three passengers and one dog. The journey started from Halmstad in the south, and contacted Trollhätan, Karlstad, Rattvik, Falun, Örebro, Jönköping and back to Halmstad, a total distance of 1,859 kilometers, or 1,161 miles. The fuel consumption for this distance was 24¾ hectolitres of charcoal, or 75 kilometers per hectolitre of fuel. One hectolitre is 100 liters, and one gallon is 4.54 litres. Thus one hectolitre is about 22 gallons, or almost three bushels, since one bushel is eight gallons.

The cost of charcoal was five kroner per hectolitre, or in Canadian money $1.25. This averaged to 6.67 ore per Kilometer, or 2.6 cents per mile. The gasoline would have cost at the then prevailing prices in Sweden, about 26 per cent more. It may be mentioned that a six-cylinder, light car, can be operated here in western Canada for from 2 to 2½ cents per mile for gasoline, at 32 cents per gallon.

In addition to the above data, the author of the article states that no discernible quantity of lubricating oil had been used on the trip, since a very small quantity of oil is required with producer gas as fuel. The retort was cleaned twice on the trip. Best results were obtained when the retort was kept well filled with fuel. Each filling required from one to three hectolitres, and thirteen fillings were made. Rough roads, with downhill slopes helped the burning of the fuel and thus increased the effective power of the engine. The average speed made was 46.4 kilometers per hour, or 29 miles.

From the above we may conclude that very shortly other combustible material such as weed, brush, and perhaps straw, can be adopted to fuel for farm tractors and trucks hauling in far-off places. As indicated before, the really big step in the improvement of equipment, was made when it was possible to substitute wood for charcoal. With this advance made, it should be possible, with some further improvements, to regulate the burning of other material as indicated.

BRITAIN AFTER THE WAR

From Robert Williamson, London, Eng.

British scientists are working hard for the day when the sound of the builder's hammer will succeed the thud of the bomb.

At the Building Research Station, Watford, near London, they are looking ahead to peace time when Britain will multiply by many times the £200,000,000 which she used to spend on building in a year. Their work ranges over materials, for quality and suitability; over design, for light and warmth. They can tell, by consulting their Electric Man whether any given room, because of the materials of walls and ceiling, requires much heating or little.

This Electric Man is a cylinder with the same surface as an average human body. An electric current keeps him at body heat and a thermostatic control keeps this temperature constant. He is wheeled into a room and his consumption of electricity shows how much of it is needed to keep this constant.

And they have a section of the universe itself set up in miniature in their laboratory at Watford. An artificial sun is slotted in a vertical column and set at the appropriate altitudes of the changes of the seasons. A six-inch house model on a disc swung on pivots is orientated to season, latitude, and time of day.

So the helidon, this ingenious instrument showing the earth moving round the sun, tells the architect how the shadows will actually fall upon his finished house and show him where he may amend his design to get all the sunshine there may be.

WATER POWER IN THE PHILIPPINES

By Filemon C. Rodriguez, Chief Engineer, National Power Corporation

From *The Philippine Engineering Record* (Manila) 4th Quarter 1940.

There is nothing on record to show when water power was first introduced in the Philippines, but it is known that during the time of Spanish rule over these islands water power was made use of in little mills for the grinding of grain, for the pressing of sugar cane, for pumping water, and for other purposes. The remains of some of these crude, simple water wheels, mostly undershot and breast wheels, can still be seen in many parts of the Philippines, and some of them are still in use to this day.

Since the American occupation, some progress has been made in the development of water power. A number of projects of small to moderate size have been built, and improved design and manufacture have been adopted not only in the wheels but in the plants themselves. Hydro-electric plants were put up and the power has been made available to farther places than was possible under the direct drive system that was used before.

It is to be noted that only a total of 33,481.1 hp. has so far been developed, of which the Botocan hydro-electric plant of the Manila Electric Company has 22,800 hp. or 68 per cent of the whole. It could therefore be stated that outside of the Botocan plant there has been no hydro-electric development of consequence that has been undertaken.

That hydro-electric development throughout the Philippines has been very slow can be shown by a comparison with the development in other countries. Assuming a population of 16,000,000, the developed horse power per 1,000 population in the Philippines amounts to 2.12. The corresponding figures in some of the other countries for 1934 are as follows:

Country	*Hp. per 1000 Population*
Alaska	617
Canada	727
Mexico	27.2
Newfoundland	561
United States	131
Brazil	15.5
Chile	26.6
Austria	134
Finland	104
France	103
Germany	30.0
Italy	48
Norway	855
Spain	48.7
Switzerland	566
Soviet Russia	6.5
Japan	60.5
New Zealand	100
Tasmania	350

The growth of hydro-electric development in the Philippines and the growth of the electric power industry have not fully kept pace with the growth of the other industries. If the Botocan plant which was financed by the Associated Gas and Electric System is not included, we would have only 10,242 hp.

Potential Power Resources

The estimate given in the Almanac for the potential water power resources of the Philippines is 1,500,000 hp. There has been no investigation of the potential water power possibilities of the country, and there is, therefore, no way by which an intelligent and accurate inventory of the power sites in the Philippines capable of successful development can be made. However, it should be stated that certain general conditions favouring the economic utilization of water power are present in the Philippines, and a successful large scale development of our water power resources may be undertaken.

The record of the Weather Bureau shows that no droughts of dangerous proportions have visited this country. At the beginning of every dry season, the ground water storage of our watersheds is always filled to capacity from the rains during the preceding rainy season so that the flow of the streams during the dry season, though reduced, is more or less constant from year to year, thus making the prime power available therein also practically uniform from year to year.

Most of the larger islands composing the Archipelago have mountain areas and upland regions where the rain falls with greater intensity and from which the rivers originate and flow down the mountains in varying slopes through winding channels down to the oceans passing through the lowlands and valleys on which population has been concentrated. The steep slopes of these rivers as they emerge from the mountains into the lowlands provide a drop which could be utilized for power development. According to the data furnished by the Coast and Geodetic Survey, the total land area of the Philippines is 296,000,000,000 sq. m. and the average elevation of this land area above sea level is about 580 meters. From a rainfall map of the Philippines prepared from data gathered by the Weather Bureau, the average total amount of rain that falls over the Philippines in one year is about 670,740,000 cu.m. If it is conservatively considered that about 40 per cent of this volume of water flows through our streams, the maximum estimated potential water power available in this country can be placed at 342,000,000,000 kwh. a year. It is admitted that this figure presupposes complete regulation of all river systems and utilization of all available head which is beyond the realm of human capacity. It is merely noted here to serve as a limit for any guess that may be given of the power resources of the country. If it is assumed that the utilizable power of the streams is only 2 per cent, then the ultimate goal that might be set for hydro-electric development could be placed at 6,800,000,000 kwh. a year.

VOCATIONAL INSTRUCTION DURING MILITARY SERVICE

From the *Journal of the Institution of Civil Engineers* (London), December, 1940

The Board of Education having expressed the desire of the Army Council for the establishment of courses for persons under training for various professions in civil life who wish to continue their studies while temporarily serving in His Majesty's Forces, the Institution of Civil Engineers, together with the Institutions of Mechanical and Electrical Engineers, is co-operating with the Board of Education and the Advisory Council for Education in the Forces in the organization of courses in engineering subjects.

During the last war there was a break in the studies of a whole generation of engineers, with serious consequences to the profession; many on attempting to rejoin it had difficulty in resuming their studies and in passing examinations, and were consequently handicapped in completing their professional qualifications. The Council will regard it as an immense benefit if this experience could be avoided in the present war and consider that the provision of courses of engineering study will, should the conditions of the war allow a measure of study, help those whose engineering training has been interrupted to keep in touch with technical knowledge, and in some cases to complete a portion of their engineering qualifications whilst so serving.

It is hoped that it will be found possible to allow students to attend evening classes at a technical college where one is within convenient reach, but where the distance is too great it may be found possible when a sufficient number of students come forward in large camps, to arrange for the delivery of regular courses of lectures by qualified teachers. There must, however, remain a large number of cases, such as those of outlying and small stations, in which courses of private study, either by guided reading or a modified form of correspondence course, would be the only possible method.

Any student of the Institution of Civil Engineers or approved candidate for election to Corporate Membership who wishes to prepare himself for Section A and B of the Associate Membership Examination of The Institution under this scheme should apply to his Commanding Officer or to the Unit educational officer for information as to the method of procedure and for copies of the curricula.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

ANNUAL MEETING

Another Annual Meeting has come and gone, and left behind it a splendid record of achievement. With a registration of over five hundred and a banquet attendance of about the same figure, with well attended and thoroughly discussed technical meetings, with speakers of the highest order, and an excellent spirit of friendliness over all, Council and the Hamilton Branch may well feel pleased and satisfied.

This year's meeting was the third occasion on which the Hamilton Branch has acted as the host of the Institute members and guests for the principal gathering of the Institute year. The assembly which has just concluded fully maintained the Branch reputation for effective organization, unstinted hospitality, and the efficient preparatory staff work on which the success of such an affair depends.

The attendance was unusually large, particularly as regards the members of the many neighbouring branches in south-western Ontario. The technical sessions dealt with a variety of matters of timely interest which led to active discussion. At several of the sessions, at the luncheons and at the banquet the speakers' addresses were devoted to various aspects of the great problem which now confronts the engineering profession in Canada, namely, how best to ensure that continuous and ample supply of trained engineers and technicians which is essential in the present war, how to develop and maintain their efficiency and morale, and how to bring these needs into line with the orderly progress of the profession as a whole.

An unusually high note was struck by the banquet speaker, Dr. Wm. E. Wickenden, whose address is printed as the leading article in this number of the *Journal*. Dr. Wickenden's pleasant delivery and the excellence of his material marked the high spot of the whole programme. It is to be hoped that this thought provoking and inspirational address may come to the attention of every member of the profession in Canada.

At our Annual Meetings it is always a pleasure to welcome so many distinguished visitors from the United States. This year, in addition to Dr. Wickenden, we were happy to have Mr. Seabury with us again, and to receive the important data contained in his address. Further, Dr. Cullimore and Dr. Perrine were able representatives of the educational and technological sides of present-day engineering.

A review or a commentary on the meeting could not be complete without mention of the absence of the retiring president, Dr. Hogg. Only the good news of his excellent recovery made possible the pleasant and cheerful tone of the whole meeting. At every function he was referred to, and many messages of appreciation are recorded in the several minutes. It is regrettable that he could not be present to see the culmination of his successful year of office, and to receive in person the praise and thanks of the many members.

The invitation of the Montreal Branch to hold the 1942 meeting in Montreal was accepted by the new Council, and already the committee is discussing ways and means of maintaining the standards set by previous gatherings. The branch is greatly encouraged by the success of the Hamilton meeting, and is looking forward with pleasurable anticipation to being host to the Institute early in 1942.

THE SECOND MILE

So much favourable comment has been received about Dr. Wm. E. Wickenden's address at the annual banquet that special attention is called to the fact that it is reproduced herewith in full. Members are recommended to read it even though they attended the banquet. It is one of those addresses that merits reading and study over and over again. It is one of the soundest, best reasoned and most thoughtful talks that have been heard in Canada for a long time. It is a clear, intelligent call to the highest things in the profession.

Believing that messages of this kind are good for the whole profession, copies of Dr. Wickenden's address have been sent by Headquarters to many Canadian publications, in an endeavour to get the widest possible distribution for it. Reprints are in stock and can be obtained by members from Headquarters.

WARTIME BUREAU OF TECHNICAL PERSONNEL

Under this title the Minister of Labour at Ottawa recently announced the creation of an organization whose purpose was to find technically trained persons who could fill the wartime needs of industry, government and the active service forces.

This announcement marked the culmination of over two years interest in such a proposal by the technical societies themselves. In December, 1938, at the request of the Minister of Defence, a survey was made by the Canadian Institute of Mining and Metallurgy, the Canadian Institute of Chemistry, and the Engineering Institute of Canada, and from the information gathered a file was established and turned over to the government.

The present proposal goes much further than the previous one, due to the fact that the situation is much clearer now and the needs much more apparent than they were in 1939. The Department of Labour has estimated the needs for skilled and unskilled help for 1941, and from these figures can estimate the needs for technical help for the same period. It was evident that some additional assistance would be necessary if these requirements were to be met. Hence the establishment of the Bureau.

The request for co-operation came to the three national institutes from the Minister of Labour. A series of meetings in Ottawa led to the acceptance of the responsibility by the institutes and within a short time this responsibility will be passed on, through several additional organizations, to engineers and chemists throughout Canada.

The Bureau is to be operated by a Director selected by the societies themselves. It is a very fortunate circumstance that makes it possible to secure the services of E. M. Little, B.A.SC., who is referred to elsewhere in this issue, for this important task. Mr. Little will establish a Board representative of the various co-operating organizations, which will assist him on matters of policy and in direct dealing with the societies. The Headquarters of the Bureau will be at Ottawa, although it may be necessary to establish offices in Toronto, Montreal and elsewhere.

It is an important matter for all engineers that the government has come to the engineers themselves for this assistance. It is both a compliment and a challenge. To do this work to the satisfaction of everyone involved, and to the best interests of the war endeavours, is a task of no mean dimensions. It can be accomplished only if all engineering organizations and industry pull together as a team, determined that it shall be accomplished. Herein lies an opportunity for every member of the engineering profession—every chemist—to organize his profession on a national basis and to support his government in its endeavour to utilize technical man power to the utmost—and incidentally to prove that the greatest things are possible only by co-operation.

The Engineering Journal in company with the regular publications of the other societies, will endeavour to keep the profession well informed of the developments within the Bureau. It is felt that as this activity belongs to the whole profession, every effort should be made to keep the members in close touch with it. It is intended that every technical man in Canada shall be communicated with shortly by direct mail, and that subsequent contacts shall be maintained principally through the technical journals and the press.

ELLIOTT MENZIES LITTLE

Director of The Wartime Bureau of Technical Personnel

The recent announcement by the Minister of Labour of the setting up of this Bureau brings to the forefront of wartime activity the name of another engineer. Mr. Little is one of the outstanding figures in the pulp and paper field, and is well known to many engineers across Canada.

E. M. Little

His appointment to this position was made upon the recommendation of the Canadian Institute of Mining and Metallurgy, the Canadian Institute of Chemistry, and the Engineering Institute of Canada. The Minister's decision to hand over to the engineers the operation of the Bureau began with the appointment of a Director of their own choosing, authorized to set up his own organization. As all engineers and chemists will be hearing about and from Mr. Little, the *Journal* feels that some biographical information will be interesting and appropriate.

Mr. Little was born in Beachburg, Ontario, in 1899, but when he was three years old his parents moved to Haileybury. It was here that he attended public and high school. In 1914 he began his successful career in the paper business with the Abitibi Power and Paper Co. Limited, at Iroquois Falls, where he started at the bottom as office boy.

For about fourteen years he remained with the company, going through every department in the business, including office and mill, and finishing up as assistant mill manager.

His service with Abitibi was interrupted early in 1918 when he joined the Air Force, enlisting at Montreal. After demobilization in 1919 he entered the Faculty of Applied Science and Engineering at the University of Toronto, and was graduated as a B.A.SC. in electrical engineering in 1925, having been out one year because of a death in the family. Upon graduation he returned to the Abitibi Company as plant electrical engineer and remained there until 1932, at which time he joined the Anglo-Canadian Pulp and Paper Mills at Quebec City. In 1933 he was made general superintendent of this company, and in 1937 he became associated with the Gaspesia Sulphite Company—an affiliated organization. He is now general manager of both companies.

Mr. Little has taken a leading part in the affairs of the Canadian Pulp and Paper Association, being a member of the Executive Committee, and vice-chairman of the joint administrative committee in charge of research in the industry. He has also been chairman of the technical section of the Association.

His residence is in Quebec, and his services are made available to the government through the generosity of the officers of the two companies by which he is employed.

REGISTRATION IN THE FACULTIES OF APPLIED SCIENCE OR ENGINEERING IN CANADIAN UNIVERSITIES, SESSION 1940-1941

By direction of Council, enquiries have been addressed to the engineering schools in Canada, asking for particulars of their undergraduate registration for the current year in the various branches of engineering.

The following table has been compiled from the information furnished in reply.

University	Year	General Course	Agriculture	Architectural	Ceramic	Chemical Engrg. and Chemistry	Civil	Electrical	Forestry	Geology and Mineralogy	Mechanical	Metallurgy	Mining	Physics, Engrg.	Total

DEAN C. J. MACKENZIE, M.C., M.C.E., M.E.I.C.

PRESIDENT OF THE ENGINEERING INSTITUTE OF CANADA, 1941

The following chronological account of the career of the new president will indicate immediately the outstanding contribution he has made to the literature and to the development of the profession in Canada. Consultant, lecturer, teacher, public servant and leader, he has been a strong figure in Western Canada for thirty years, and has given sympathy and aid to every worthwhile proposal that has come to him. He is a noteworthy example of the broad minded, public spirited type of engineer of which so much has been written and heard in recent years.

Dean C. J. Mackenzie, M.C., M.C.E., M.E.I.C.

Chalmers Jack Mackenzie was born in St. Stephen, N.B., and received his B.E. from Dalhousie in 1909 and his M.C.E. from Harvard in 1915. He began his professional career in the Maritimes, but as early as 1910 he had moved west as resident engineer in charge of the construction of three municipal electric plants. In 1912-13, during the winter months, he inaugurated the engineering courses at the University of Saskatchewan, and was appointed Professor of Civil Engineering in 1915.

When the war broke out he was also a member of the firm of consulting engineers of Maxwell and Mackenzie at Edmonton, designing and building numerous structures such as waterworks and sewage systems and sewage disposal plants, electric power plants, etc.

From 1916 to 1918 he was overseas with the 54th Battalion, C.E.F., and was awarded the Military Cross.

From 1919 to 1939, he carried on a great variety of activities, including his university work and a consulting practice. During this time he took charge of the design and construction of the two large reinforced concrete bridges over the North and South Saskatchewan Rivers at Saskatoon. He was also chairman of the City of Saskatoon City Planning Commission, and directed the work of formulating the City Planning and Zoning By-laws which were adopted.

In 1921 he was appointed Dean of College at Saskatoon, and since that time has set up a remarkable record for growth and stability of an educational institution. In twenty years the attendance has gone from forty to almost five hundred.

In 1935 he was appointed to the Advisory Council of the National Research Council, and in 1939 was made Acting President when Lieutenant General McNaughton was given charge of the Canadian Active Service Force overseas.

Besides the several accomplishments which have been referred to, Dean Mackenzie has held the following offices:

1925 Chairman of the Saskatchewan Branch of the Institute;
1929-30 Vice-President of the Institute;
1930 President, Association of Professional Engineers of Saskatchewan;
1921-39 Member, Saskatchewan Council of Public Health;
1929-30 Alderman, City of Saskatoon;
1930-31 Member Advisory Board, Royal Military College;
1931-34 Member Saskatchewan Drought Commission;
1937-39 Chairman Board of Directors, Saskatoon City Hospital;
1937 to date Director, Canadian Geographical Society.

Dean Mackenzie has presented many papers to scientific and engineering societies in Canada and the United States, and over twenty-five have been published in the organs of the societies. He has already spoken to many branches of the Institute and to many public bodies. He is well known in all parts of Canada, and his elevation to the presidency of the Engineering Institute of Canada places him in a position to carry on to an even greater extent his activities on behalf of the profession.

He joined the Institute as a Junior in 1911, transferred to Associate Member in 1914, and to Member in 1920.

CORRESPONDENCE

The Canadian Government Trade Commissioner

Melbourne, Australia,
January 17th, 1941.

L. Austin Wright, Esq., M.E.I.C.,
Editor,
"The Engineering Journal,"
2050 Mansfield St.,
Montreal, Quebec.

Dear Sir,

I am sure you will be interested in the attached copy of a letter which I have received from Captain E. C. Johnston, Assistant Director-General of the Commonwealth Civil Aviation Department, Melbourne. Captain Johnston's letter refers to the article commencing on page 452 of the November, 1940, issue of your Journal, which I send to him for perusal.

With best wishes to The Engineering Institute of Canada for 1941, I am

Yours very truly,

(*Signed*) Frederick Palmer, M.E.I.C.
Canadian Trade Commissioner.

Commonwealth of Australia
Department of Civil Aviation

Melbourne, C.I.,
8th January, 1941.

Dear Mr. Palmer,

Thank you for sending me the November issue of "The Engineering Journal." I have read the article by Wilson with very much interest. Certainly your people have done a wonderful job on these aerodromes under the very difficult conditions that prevail, particularly as regards the winter months. I am dropping a note to Wilson to congratulate him on the job and on his excellent account of it.

As the article will be of interest to several other senior officers of this Department, I am taking the liberty of passing the Journal around to them before I return it to you. I hope you don't mind this but I will see that it is returned to you within a few days.

With all best wishes for 1941, I am

Yours sincerely,

(*Signed*) E. C. Johnston.

MEETINGS OF COUNCIL

Minutes of a meeting of the Council of the Institute held at the Royal Connaught Hotel, Hamilton, Ontario, on Wednesday, February 5th, 1941, at ten-thirty a.m. with Vice-President P. M. Sauder (Edmonton) in the chair. There were also present Past-President J. B. Challies (Montreal); Vice-Presidents McNeely DuBose (Province of Quebec), and J. Clark Keith (Province of Ontario); Councillors G. P. F. Boese (Calgary), W. F. M. Bryce (Ottawa), R. H. Findlay (Montreal), J. G. Hall (Montreal), W. R. Manock (Niagara Peninsula), H. Massue (Montreal), W. L. McFaul (Hamilton), C. K. McLeod (Montreal), J. H. Parkin (Ottawa), B. R. Perry (Montreal), H. R. Sills (Peterborough), C. E. Sisson (Toronto), and J. A. Vance (London); Treasurer deGaspé Beaubien, Secretary-Emeritus R. J. Durley, General Secretary L. Austin Wright, and Louis Trudel, Assistant to the General Secretary; Past-Presidents J. M. R. Fairbairn (Montreal), O. O. Lefebvre (Montreal), S. G. Porter (Calgary), and F. P. Shearwood (Montreal); President-Elect C. J. Mackenzie; Councillors-Elect E. M. Krebser (Windsor), W. H. Munro (Ottawa), and H. J. Vennes (Montreal).

The following were also present by invitation: S. R. Frost, president, and M. B. Watson, registrar, of the Association of Professional Engineers of Ontario; C. C. Kirby, honorary president of the Dominion Council of Professional Engineers and secretary of the Association of Professional Engineers of New Brunswick; G. A. Gaherty, chairman of the Committee on Western Water Problems; H. F. Bennett, chairman, and D. S. Ellis, R. E. Heartz (also chairman, Montreal Branch), R. F. Legget, and A. E. Macdonald, members of the Committee on the Training and Welfare of the Young Engineer, and the following branch chairmen: R. L. Dobbin (Peterborough), W. A. T. Gilmour (Hamilton), and H. G. O'Leary (Lakehead).

The general secretary reported that President Hogg was making satisfactory progress, which was noted with much gratification by all present.

On taking the chair, Mr. Sauder extended a welcome to all councillors and guests, and introduced each person present to the meeting.

The report of the Committee on Western Water Problems was presented and accepted by Council, and a committee was appointed to see what further action could be taken.

There was a general expression of appreciation of the excellent work done by the committee, which finally resulted in the unanimous approval of a motion that Council place itself on record as passing a vote of thanks to the committee and the sub-committee for the tremendous amount of work which they had completed and for the excellence of their conclusions and recommendations.

The general secretary pointed out that in view of the fact that the Council's final policy had not yet been determined the report should be kept strictly confidential.

The general secretary reported that Professor C. R. Young had accepted appointment as the Institute's representative on the E.C.P.D. Committee on Professional Ethics. This was noted with satisfaction.

The general secretary presented a letter from Squadron Leader A. J. Taunton advising that in view of the pressure of his present work he found it necessary to resign as councillor representing the Winnipeg Branch. This resignation was accepted with regret, and on the recommendation of the Winnipeg Branch it was unanimously RESOLVED that J. W. Sanger, M.E.I.C., be appointed as councillor to represent the Winnipeg Branch until the 1942 annual elections.

The secretary read a letter from the Steel Controller pointing out that under the stimulus of wartime consumption by industry, Canadian steel mills are faced with the necessity of greatly expanding their production of rolled steel products while simultaneously meeting urgent demands for early deliveries. To meet this situation the mills, with the approval of the Department of Munitions and Supply, have embarked upon a programme of standardization of all rolled products for the duration of the war. Continuing the progress, and turning their attention to reinforcing steel, the Department proposes to adopt as standard those sizes concurrently established as such by the Canadian Engineering Standards Association. The Steel Controller asked for the approval of the Institute with regard to the adoption of these standards throughout Canada.

After considering the proposals in detail, it was unanimously RESOLVED that the Institute support these recommendations.

The general secretary reported that the Deputy Minister of Labour, Dr. Bryce Stewart, had approached the three national Institutes, which had drawn up a register of technically trained men in 1938 and 1939, to ask if they would take over the handling of this register and the placing of technical personnel for the duration. Subsequently, a meeting was held with the Deputy Minister at Ottawa, at which the presidents and secretaries of the three Institutes were present. The outcome of this conference was that a direct proposal was made to the Department. Mr. Wright now reported that in a telephone conversation the day previous to the Council meeting the Deputy Minister had informed him that the proposal had been accepted and that an Order-in-Council had been passed giving authority for the work and providing the necessary funds.

The Deputy Minister had recommended that the three Institutes select a representative who could be installed as director or controller and be responsible to the government for the conduct of the work. The general secretary explained that a gentleman had been agreed upon between the three organizations, but that final acceptance had not been received, although it was expected this detail would be fixed up within a very few days.

It was explained that this gentleman had requested the Institute to make available to him the part time services of the general secretary in order to assist him in the operations of the Technical Bureau. After some discussion, participated in by Messrs. Challies, Hall, Mackenzie and Vance, it was agreed that Council was prepared to co-operate with the Department of Labour to the full extent of its ability, and that the Finance Committee be authorized to do whatever is necessary to make Mr. Wright's services available to the Minister.

The general secretary reported that President Hogg had intended to discuss with the Hon. Mr. Howe the desirability of appointing an engineer to fill the vacancy on the International Joint Commission, but had unfortunately been unable to do so. It was pointed out that Mr. C. A. Magrath, an eminent engineer, had acted as chairman of the Canadian Section for a great many years, and it was considered very desirable that an engineer should now be appointed to fill the present vacancy. After some discussion, it was unanimously agreed that Dr. Challies and Dr. Lefebvre be appointed a committee to make inquiries and appropriate representations to the government on behalf of the Institute.

Mr. C. C. Kirby, representing the Dominion Council of Professional Engineers, explained that a resolution had been passed at a meeting of the Council held in Toronto on January 20th and 21st, with respect to the co-ordination of the engineering societies in Canada, and it was hoped that it would be favourably received by the Engineering Institute and the other societies.

Following some discussion, it was unanimously RESOLVED that the resolution be referred to the Committee on Professional Interests for consideration and report.

The general secretary presented a letter from the Citizens' Committee for Troops in Training suggesting that the Institute might contribute towards a fund for the purchase of band instruments for the Royal Canadian Engineers now training at Petawawa.

It was pointed out that the Institute had no funds that could be appropriated for such a purpose, but the members present felt that it would be very desirable to help in this worthy object if at all possible. It was finally decided to take up a voluntary collection from members of Council present, and also from members attending the Annual General Meeting.

Mr. Harry Bennett, chairman of the Institute's Committee on the Training and Welfare of the Young Engineer, reported that his committee had been meeting all day, and was now prepared to report to Council. He pointed out the importance to the profession and to the Institute of the selection and guidance of engineering students and the training of the young engineer. It was the opinion of the committee that the Institute, with its many branches across Canada, had a splendid opportunity of assisting the educationalists. He pointed out the good work that could be done by bringing to the attention of prospective students some of the characteristics necessary to success in the profession. He mentioned that this matter had been discussed at a meeting of the Dominion Council of Professional Engineers, which he had been invited to attend, and that the Dominion Council had indicated that they were ready to assist his committee in this work if such co-operation could be of benefit. Accordingly, Mr. Bennett's committee, by resolution, proposed that Council shall invite the Dominion Council to co-operate with the Institute's committee to the fullest extent.

Mr. Bennett referred to the recent report of his committee which appeared with the annual report of Council. He explained that this was not as complete as he would like to have seen it, but that it was a further step along the way. He dwelt on the student activities within the branches, and explained that after to-day's meeting his committee was ready to present to the branches a scheme of counselling whereby members of the Institute would make their services available for the guidance of the student and the young engineer.

Mr. Bennett also referred to the manuscript for the new booklet which is to be printed by the Engineers' Council for Professional Development (E.C.P.D.). His committee thought this booklet could be revised to a considerable extent, but that as the material had been prepared for some time and was already in the hands of the printers, it would be difficult to make the desired changes. He pointed out that his committee was recommending that a smaller pamphlet be prepared which would be definitely Canadian, and which would have more direct application to the situation in this country. He also thought that a certain number of copies of the more complete booklet prepared by E.C.P.D. should be secured for distribution to the libraries and the heads of educational institutions. He wanted to see a publication in Canada that would readily indicate that the Institute is willing and prepared to promote and advance the welfare of the profession of engineering.

He explained that the problem of what the Institute could do for the young man after graduation still required a lot of thought and attention. He believed that if pre-engineering guidance were available so that contacts would be established with the students, it would be easier to carry on the work after graduation.

Mr. Bennett also touched on the question of engineering education, explaining that his committee had made a study of the recent report issued by the Society for the Promotion of Engineering Education. Their investigation confirmed the original belief that the most important element was a sound fundamental training and the inclusion of certain of the humanities or cultural subjects. He again emphasized the importance of the branches keeping in touch with the student and the young engineer.

A very thorough discussion followed Mr. Bennett's report, and finally, it was moved that the recommendation of the committee concerning the booklet be accepted, involving the revision, if possible, of the E.C.P.D. booklet "Engineering as a Career," and the provision of a booklet prepared by the Institute to cost not more than $250.00. This was approved unanimously.

Council then dealt with the recommendation of the committee that the offer of the co-operation of the Dominion Council be accepted. Accordingly, it was moved that the offer of the Dominion Council be accepted. Following this resolution, Mr. Bennett requested Council to add Mr. Kirby's name to the membership of his committee. This was agreed to unanimously.

By virtue of the co-operative agreement with the Association of Professional Engineers of Alberta, the following number of members of the Association, having indicated their desire to become members of the Institute, have been admitted to the classifications indicated:

Admissions

Members	20
Students	11

Transfers

Junior to Member	1
Student to Member	1
Student to Junior	1

Student membership in the Institute for one year, including the Journal subscription, has been awarded to the six successful contestants at the Annual Students Night of the Toronto Branch, held on January 16th, 1941:

A number of applications were considered, and the following elections and transfers were effected:

Admissions	
Member	1
Juniors	3
Affiliate	1
Students	12

Transfers	
Junior to Member	6
Student to Member	1
Student to Junior	5

The Council rose at five-thirty p.m.

Minutes of a meeting of the Council of the Institute held at the Royal Connaught Hotel, Hamilton, Ontario, on Friday, February 7th, 1941, at two-thirty p.m., with President C. J. Mackenzie in the chair. There were also present, Vice-Presidents deGaspé Beaubien, K. M. Cameron, and McNeely DuBose; Councillors G. P. F. Boese, J. G. Hall, E. M. Krebser, W. R. Manock, H. Massue, W. H. Munro, J. H. Parkin, G. McL. Pitts, H. R. Sills, C. E. Sisson, J. A. Vance and H. J. Vennes; Past-Vice-Presidents E. P. Muntz and P. M. Sauder; Past Councillors W. F. M. Bryce, P. E. Doncaster and O. Holden; H. G. O'Leary, chairman of the Lakehead Branch; Secretary-Emeritus R. J. Durley and General Secretary L. Austin Wright.

On the motion of Mr. Vance, seconded by Mr. Sisson, it was unanimously RESOLVED that L. Austin Wright be reappointed general secretary of the Institute.

On the motion of Mr. Cameron, seconded by Mr. Vennes, it was unanimously RESOLVED that Mr. John Stadler be appointed treasurer of the Institute.

On behalf of the Striking Committee, consisting of Dean C. J. Mackenzie, R. J. Durley, O. Holden and C. E. Sisson, appointed at the last meeting of Council to make recommendations regarding the chairmen of the various Institute committees for the year 1941, Mr. Holden presented the committee's recommendations, which were unanimously approved and adopted as follows:

	Chairman
Finance Committee	deGaspé Beaubien
Library and House	B. R. Perry
Papers	J. A. Vance
Publication	C. K. McLeod
Legislation	E. M. Krebser
Board of Examiners	R. A. Spencer
Past-Presidents' Prize	R. DeL. French
Gzowski Medal	H. O. Keay
Leonard Medal	A. D. Campbell
Plummer Medal	J. F. Harkom
Duggan Medal	F. P. Shearwood
International Relations	C. R. Young
Professional Interests	J. B. Challies
Western Water Problems	G. A. Gaherty
Radio Broadcasting	G. M. Pitts
Deterioration of Concrete Structures	R. B. Young
Membership	H. N. Macpherson
The Young Engineer	H. F. Bennett

At the request of Mr. Beaubien, the members of last year's Finance Committee were reappointed as follows: deGaspé Beaubien, chairman; J. E. Armstrong, G. A. Gaherty, J. A. McCrory, F. Newell.

An invitation to hold the 1942 Annual Meeting in Montreal was presented from the Montreal Branch.

After some discussion, it was unanimously RESOLVED that the invitation of the Montreal Branch be accepted, and that no decision be made at the present time as to the detailed plans for the meeting, in view of war conditions.

Mr. Pitts referred to the establishment of the Bureau of Technical Personnel by the Department of Labour, and suggested that the man who was appointed as director should be acceptable to the various co-operating organizations. The general secretary explained that the Deputy Minister had asked the three Institutes to select some person acceptable to all of them whom he could appoint as director or controller. The gentleman who had been selected was known to the officers of the three societies, and to the Deputy Minister himself, and his suitability to the task was agreed to by all. Mr. Wright also explained that it was intended to set up a Board or Advisory Committees which would be representative of the various co-operating organizations. Mr. Pitts indicated that the architects might be interested in joining with the engineers in such a Bureau. The general secretary explained that there had already been some discussions with the architects, and there appeared to be no reason why they could not participate if they so desired.

On the motion of Mr. Massue, seconded by Mr. Vennes, it was unanimously RESOLVED that a hearty vote of thanks be extended to the Hamilton Branch for their hospitality, and for the very efficient manner in which the annual general meeting had been conducted.

On the motion of Mr. Boese, seconded by Mr. Vennes, it was unanimously RESOLVED that the thanks of Council be extended to the retiring President and councillors for their efforts during the past year; much valuable time had been given to committee meetings and to meetings of Council, all of which had been very greatly appreciated.

It was left with the president and the general secretary to decide on the date for the next meeting of Council.

The Council rose at three thirty p.m.

COMING MEETINGS

Canadian Region of the Illuminating Engineering Society, Toronto—First Annual Convention, March 19th.

Corporation of Professional Engineers of The Province of Quebec—Annual Meeting, Montreal, 2050 Mansfield St., March 29th. Registrar C. L. Dufort, 354 Ste-Catherine St. East, Montreal.

American Society of Tool Engineers—1941 Annual Meeting and Machine Tool Progress Exhibition, Fort Shelby and Book-Cadillac Hotels, Detroit, Mich., March 24th to 29th.

American Society of Mechanical Engineers—1941 Spring Meeting, Hotel Biltmore, Atlanta, Ga., March 31st to April 3rd.

Midwest Power Conference—Sponsored by Illinois Institute of Technology and seven nationally known midwest colleges and universities, Palmer House, Chicago, April 9th to 10th. Alexander Schreiber, Illinois Institute of Technology, Chicago.

Electrochemical Society—79th Annual Meeting to be held at the Hotel Cleveland, Cleveland, Ohio, April 16th to 19th.

American Institute of Electrical Engineers—Summer Convention, Royal York Hotel, Toronto, Ont., June 16th to 20th. National Secretary, H. H. Henline, 33 West 39th St., New York, N.Y.

American Water Works Association—Annual Convention, Royal York Hotel, Toronto, Ont., June 22nd to 26th. Secretary, Harry E. Jordan, 22 E. 40th St., New York.

Canadian Section, American Water Works Association—Annual Meeting, Royal York Hotel, Toronto, Ont., June 23rd. Secretary Dr. A. E. Berry, Ontario Dept. of Health, Parliament Buildings, Toronto, Ont.

Canadian Electrical Association—51st Annual Convention, Seigniory Club, Quebec, June 25th to 26th. Secretary, B. C. Fairchild, 804 Tramways Building, Montreal, Quebec.

NEWLY ELECTED OFFICERS OF THE INSTITUTE

DeGaspé Beaubien, M.E.I.C., consulting engineer of DeGaspé Beaubien and Company, Montreal, is the newly elected vice-president for the province of Quebec. He is joint chairman of the National War Savings Committee, member of the Electrical Commission of Montreal and director of several industrial firms. He is president of the Rotary Club of Montreal, and immediate past-president of the Canadian Club of Montreal. He was born in Outremont, Que., the son of the Hon. Louis Beaubien of Montreal. Upon his graduation from McGill University in 1906 with the degree of B.Sc., Mr. Beaubien became demonstrator at that university. In 1908 he entered the Westinghouse Electric and Manufacturing Company at East Pittsburgh, having obtained experience with the Montreal Light, Heat and Power as early as 1903. From 1908 until 1922 he was in practice as consulting engineer in his own name, then under the name of Beaubien, Busfield and Company, from 1922 until 1929 when the present firm was established.

Mr. Beaubien joined the Institute as a Student in 1903, becoming an Associate Member five years later, and being elected a Member in 1921. For the last three years Mr. Beaubien had been treasurer of the Institute, as well as its representative on the executive committee of the Canadian Chamber of Commerce.

deGaspé Beaubien, M.E.I.C.

K. M. Cameron, M.E.I.C.

John Stadler, M.E.I.C.

K. M. Cameron, M.E.I.C., chief engineer of the Department of Public Works of the Dominion at Ottawa, is the newly elected vice-president for Ontario. He was born in western Ontario and received his early education at the Strathroy Collegiate Institute and at London. After matriculating, Mr. Cameron went to the Royal Military College at Kingston, from which he was graduated in 1901 with honours and with the silver medal for general proficiency. In April of the following year he received from McGill University the degree of B.Sc. in civil engineering. Then for two years he was office and inspecting engineer with the Canadian Niagara Power Company at Niagara Falls. From 1905 to 1906 he lectured at McGill University in surveying and geodesy. In 1906 Mr. Cameron went to the States and was engaged on various engineering projects until 1908 when he returned to Canada to work for Smith, Kerry and Chace, consulting engineers of Toronto. Shortly after he joined the Department of Public Works of the Dominion, being first located in London, Ont., and later in Sherbrooke, Que. He came to Ottawa as senior assistant in the dredging branch of the department in 1912. He became assistant chief engineer of the department in 1918 and was appointed chief engineer in 1923.

Mr. Cameron joined the Institute as a Student in 1901 being transferred to Associate Member in 1907 and becoming Member in 1920.

A. L. Carruthers, M.E.I.C., is the newly elected vice-president for the western provinces. He is bridge engineer with the Department of Public Works of the Province of British Columbia at Victoria, B.C. He was born in Sarnia Township, Ont., and was educated at the University of Toronto. In 1904 he joined the Canadian Northern Railway and was employed as an instrumentman, bridge inspector, resident engineer, and from 1911 until 1917 as a divisional engineer. At that time he became district engineer for the Department of Public Works of British Columbia at Prince Rupert, B.C. He was appointed bridge engineer of the department at Victoria in 1923.

Mr. Carruthers joined the Institute as an Associate Member in 1915 and he became a Member in 1921.

John Stadler, M.E.I.C., has been appointed treasurer of the Institute. Born in Bavaria, he is a graduate in engineering from the Polytechnical Institute at Munich. After a few years with Helios Company, of Cologne, as field engineer on construction of hydro-electric and industrial plants, he came to the United States of America in 1902. In 1905 he joined the staff of the Shawinigan Water and Power Company; he was superintendent of the Shawinigan Falls power house until 1906 when he joined the Belgo-Canadian Pulp and Paper Company, as plant engineer in full charge of design and construction. In 1913 he became assistant manager of the company, and occupied that position until 1924 when he went with the Newfoundland Power and Paper Company at Cornerbrook. In 1927 he was appointed general manager of the Lake St. John Power and Paper Company. Since 1929 Mr. Stadler carries a successful consulting practice in Montreal, specializing in pulp, paper and power. Mr. Stadler is a recognized authority in the pulp and paper industry.

A. E. Berry, M.E.I.C., is the newly elected councillor representing the Toronto Branch. He was born at St. Mary's, Ont., and was educated at the University of Toronto, where he was graduated in civil engineering with honours in 1917. Four years later he received the degree of M.A.Sc.. and in 1923 he was awarded the degree of C.E. in the University of Toronto. He obtained his Ph.D. degree in 1926. Following his graduation in 1917 he was employed

A. E. Berry, M.E.I.C.

D. S. Ellis, M.E.I.C.

J. M. Fleming, M.E.I.C.

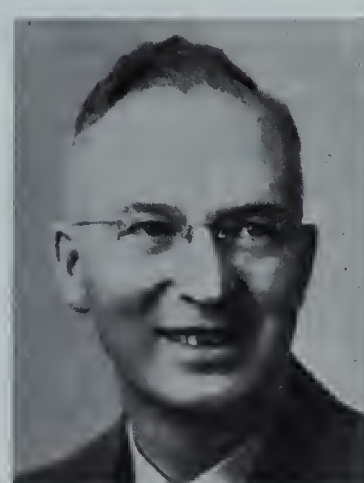
I. M. Fraser, M.E.I.C.

J. H. Fregeau, M.E.I.C.

J. Garrett, M.E.I.C.

S. W. Gray, M.E.I.C.

E. M. Krebser, M.E.I.C.



H. N. Macpherson, M.E.I.C.

H. F. Morrisey, M.E.I.C.

W. H. Munro, M.E.I.C.

G. McL. Pitts, M.E.I.C.

with the Ontario Department of Health for a short period, after which he went overseas and served with the Royal Engineers. On his return to Canada he joined the engineering staff of the Department of Health and in September, 1919, he became assistant sanitary engineer. In 1926 Dr. Berry became director of the Sanitary Engineering Division of the Ontario Department of Health, a position which he still holds.

D. S. Ellis, M.E.I.C., is the newly elected councillor representing the Kingston Branch. He was born at Cobourg, Ont., and received his education at Queen's University where he was graduated in 1910. In 1911 he became employed with the International Waterways Commission. During 1913 and 1914 he was engineer for the Commission on St. Lawrence Ship Channel. During the war 1914 to 1918 he served with the 6th Field Company, Royal Canadian Engineers. In 1918 he was lieutenant-colonel and chief instructor at the Canadian School of Military Engineering. Mr. Ellis was appointed assistant professor of civil engineering at Queen's University in 1919, later becoming professor. Last year he was appointed head of the department of civil engineering at Queen's.

J. M. Fleming, M.E.I.C., the newly elected councillor for the Lakehead Branch, was born at Winnipeg, Man., and received his education at the University of Manitoba. Upon his graduation in 1921 he became a designer with the Manitoba Power Company on the Great Falls development, and in 1923 he was resident engineer on the construction of the Tulsa aqueduct, in Oklahoma, U.S.A. In 1924 he joined the staff of C. D. Howe and Company, consulting engineers, Port Arthur, Ont., as a structural designer, engaged on the construction of grain elevators, docks and heavy structures. In 1933 he was appointed chief engineer and since 1936 he is the president and general manager of the firm.

I. M. Fraser, M.E.I.C., professor of mechanical engineering at the University of Saskatchewan, is the newly elected councillor for the Saskatchewan Branch. He was born at Pictou, N.S., and was educated at Dalhousie, and at McGill University where he received the degree of bachelor of science in 1919. In 1920 he was a lecturer at McGill University, and the following year he worked as a draughtsman on the staff of the Dominion Engineering Works Limited at Montreal. In 1921 he was appointed assistant professor of mechanical engineering at the University of Saskatchewan, becoming professor in 1926. He is, at present, head of the department at the University of Saskatchewan.

J. H. Fregeau, M.E.I.C., has been elected councillor to represent the St. Maurice Valley Branch. He was born at Beebe Plain, Que., and received his education at McGill University. Upon his graduation in 1910 he joined the staff of Shawinigan Water and Power Company and has always remained with the firm. From 1911 to 1914 he was in charge of the electrical installations at various stations. From 1915 to 1923 he was in charge of the construction of transmission lines. In 1923 he was transferred to Three Rivers as superintendent and in 1927 he became divisional manager, a position which he still holds. Since 1939 Mr. Fregeau is also manager of the St. Maurice Transport Company.

Julian Garrett, M.E.I.C., is the newly elected councillor for the Edmonton Branch. He was born at Hyde Park, Mass., U.S.A., and received his education at Harvard College and Lawrence Scientific School. Upon his graduation in 1924 he became engaged in railway engineering work in the States. From 1906 he was resident engineer for the Grand Trunk Pacific Railway After a number of years, during which time he was not connected with engineering work, he became secretary-treasurer of the Northwestern Utilities Limited at Edmonton, Alta., in 1924. Since 1928 he is manager of the company in charge of the operation of the Natural Gas System.

S. W. Gray, M.E.I.C., is the newly elected councillor for the Halifax Branch. He was born at Westville, N.S., and was educated at the Nova Scotia Technical College where he was graduated with the degree of B.Sc. in civil engineering in 1914. From 1914 to 1916 he was engaged in railway work and from 1916 to 1919 he was on active service in Canada, England and France. After some time spent as industrial surveyor with the Department of Soldiers Civil Re-establishment at Halifax, he joined the Nova Scotia Power Commission in 1924, and has been with this organization ever since. He is, at present, assistant hydraulic engineer.

E. M. Krebser, M.E.I.C., has been elected councillor representing the Border Cities Branch. He was born at Cambridge, Vermont, U.S.A., and was educated at the University of Vermont where he received the degree of bachelor of science in 1924. In 1925 he joined the staff of the Canadian Bridge Company Limited at Walkerville, Ont., as a draughtsman. In 1929 he was appointed assistant to the operating manager and in 1930 he became assistant shop superintendent. He is, at present, superintendent of Plant No. 2 of the company.

H. N. Macpherson, M.E.I.C., is the newly elected councillor representing the Vancouver Branch. He was born at Carleton Place, Ont., and was educated at the University of Toronto. Upon his graduation in 1914 he entered the Highways Department of Saskatchewan in the bridge branch. During 1915 and 1916 he was shell examiner with the Imperial Ministry of Munitions. In 1917 he was located

M. G. Saunders, M.E.I.C.

H. R. Sills, M.E.I.C.

J. A. Vance, M.E.I.C.

at Edmonton as chief examiner and in 1918 and 1919 he was assistant inspector of shells at Montreal. In 1920 he was chief engineer of O'Connor Bros. Ltd., road contractors, Montreal. From 1921 to 1923 he did contracting work on bridges in Saskatchewan. In 1926 he was manager in Regina of Regina Creosoted Products Ltd., and from 1927 to 1931 he was engineer and sales manager with the Alberta Wood Preserving Company Ltd., at Calgary. Since 1931 he has been the general manager of Permanent Timber Products Ltd., at Vancouver, B.C.

Mr. Macpherson has been a member of the executives of the Saskatchewan, Calgary and Vancouver Branches of the Institute.

H. F. Morrisey, M.E.I.C., the newly elected councillor of the Saint John Branch, is district engineer with the Department of Transport at Saint John. He was born at Saint John, N.B., and was educated at the University of New Brunswick where he received the degree of B.Sc. in 1912. He was awarded the M.Sc. degree in 1915. From 1912 to 1920 he was assistant engineer on the River St. Lawrence Ship Channel except for the time when he was overseas. In 1920 he became district engineer of the Marine Department at Saint John and was engaged in the construction and maintenance of wharves. He has been with the Department of Marine, and later the Department of Transport, ever since.

W. H. Munro, M.E.I.C., is the newly elected councillor representing the Ottawa Branch. He was born in Peterborough, Ont., and was educated at the University of Toronto, where he was graduated in 1904. For two years after graduation he travelled in the States visiting industrial firms and studying shop methods. In 1907 he joined the staff of J. B. McRae, consulting engineer, Ottawa, and was engaged on the design and supervision of the construction of hydro-electric power plants. In 1909 and 1910 he did the same kind of work with Smith, Kerry and Chace, consulting engineers, Toronto. From 1910 to 1915 he was manager of the Peterborough Light, Power and Gas Company. He went overseas in 1915 as a workshop officer, and he was later appointed officer commanding the 3rd Canadian Ammunitions Sub Park. Upon demobilization in 1919 he held the rank of Major. He stayed in England and joined the staff of Vickers Limited, London, in the hydro-electric department later becoming senior hydraulic engineer and chief of the department. He returned to Canada in 1925 as sales manager of Canadian Vickers Ltd., at Montreal. From 1926 to 1928 he was manager of the Nova Scotia Tramways and Power Company Ltd., at Halifax. In 1928 he joined the staff of the Montreal Engineering Company Limited and the following year he was appointed manager of the Bolivian Power Company Limited at La Paz, Bolivia. In 1933 he joined the Ottawa Electric Company at Ottawa. In 1935 he became general manager of the Ottawa Electric Company and the Ottawa Gas Company. In 1939 he was elected to the Board of Directors of each of these companies.

G. McL. Pitts, M.E.I.C., one of the newly elected councillors representing the Montreal Branch, is an engineer and architect. A native of Fredericton, N.B., Mr. Pitts was graduated from McGill University in 1908 with the degree of B.Sc., and in 1909 received the degree of M.Sc. In 1916 he received the degree of B.Arch. In 1906 Mr. Pitts was an engineer on construction with the Canadian Pacific Railway and in 1908 was a senior draughtsman with the Transcontinental Railway at Ottawa, Ont. In 1909 he joined the staff of P. Lyall and Sons Construction Co. Ltd., as engineer and superintendent, and in 1912 was supervising engineer for the construction of the Montreal High School for the Protestant Board of School Commissioners. He was assistant to John A. Pearson, architect for the Parliament Buildings at Ottawa. In 1919 he joined the firm of Edward and W. S. Maxwell, architects of Montreal, forming the firm of Maxwell and Pitts in 1923, thereby maintaining one of the oldest architectural practices in Canada.

Mr. Pitts is a past president of the Province of Quebec Association of Architects. He is, at present, honorary treasurer of the Royal Architectural Institute of Canada and president of the McGill University Graduates' Society. He has always been very active in Institute affairs, particularly as chairman of the Committee on Consolidation and chairman of the Radio Broadcasting Committee.

M. G. Saunders, M.E.I.C., has been elected the councillor representing the Saguenay Branch. He was born at Elgin, N.B., and educated at Acadia University and at the Nova Scotia Technical College. During the last war he served overseas with the Royal Canadian Engineers and with the Royal Air Force. From 1923 to 1926 he was instructor in engineering at Acadia University and in 1926 he became assistant professor in engineering. In 1927 he joined the staff of the Aluminum Company of Canada Limited, at Arvida, as a mechanical engineer. In 1931 he was appointed mechanical superintendent, a position which he holds at the present time.

H. R. Sills, M.E.I.C., is the newly elected councillor representing the Peterborough Branch. He was born at Kingston, Ont., and was educated at Queen's University. Upon his graduation in 1921 he joined the Canadian General Electric Company and has remained with the firm ever since. In 1922 he became engaged in the design of synchronous motor and A.C. generators and has now specialized in the design of such machinery.

J. A. Vance, M.E.I.C., was re-elected councillor to represent the London Branch. He was born in the County of Oxford, Ont., and was educated at the University of Toronto. On

H. J. Vennes, M.E.I.C.

the death of his father in 1914 he took over the contracting business and became responsible for the administration, engineering and construction of steel and concrete highway bridges. From 1919 the business grew to include the design and construction of factory buildings, sewers, dams and various concrete and steel structures. Mr. Vance is, at present, the proprietor and engineer of the firm of J. A. Vance, contractor, at Woodstock, Ont.

H. J. Vennes, M.E.I.C., has been elected councillor to represent the Montreal Branch. He has long been an active member of the Institute and on several occasions has delivered papers on various advanced subjects, some of which have been published in the Journal. Born in Norway, Mr. Vennes came to the United States in 1892. He was graduated from the University of Minnesota in 1916 with a B.A. degree, and spent five years at the Bell Telephone Laboratories in New York. Coming to Canada from New York in 1921, when the first carrier current telephone systems were being installed here, he remained in this country ever since, becoming a Canadian citizen and an outstanding communications engineer. He has had much to do with the design and installation of the many carrier current telephone and telegraph systems, radio broadcasting stations, sound pictures and public address systems in this country since their introduction, and was largely responsible for the many allied developments of Northern Electric in this country including the famous first radio "Peanut" tube and radio receivers in which it was used, and also other electrical devices now so generally used in communication systems, motion picture, aviation radio devices and the Hammond electric organ. He is, at present, special products engineer with the company in Montreal.

ELECTIONS AND TRANSFERS

At the meeting of Council held on February 5th, 1941, the following elections and transfers were effected:

Member

Anderson, Harry Clyde, district engr., Dept. of Public Works, Prov. of B.C., New Westminster, B.C.

Juniors

Bridgewater, Albert William, B.Sc., M.Sc. (Univ. of Sask.), struct'l. designer, Defence Industries Limited, Montreal, Que.

Glenn, John B., B.Sc. (Mech.), (Univ. of Sask). engr., Link Belt Ltd., Toronto, Ont.

Raynor, Warren, B.Sc. (Mech.), (Queen's Univ.), jig and tool designer, Canadian Car & Foundry Co. Ltd., Fort William, Ont.

Affiliate

Gung, Simon Fenwick, chief dftsman., engrg. dept., De Havilland Aircraft of Canada Ltd., Toronto, Ont.

Transferred from the class of Junior to that of Member

Bentley, Kenneth E., B.Sc. (Civil), (N.S. Tech. Coll.), mtce. engr., Imperial Oil Limited, Dartmouth, N.S.

Booth, Keith Alexander, B.Sc. (Elec.), (Univ. of Man.), B.Eng. (Mech.), (McGill Univ.), engr. i/c operating records dept., Kenogami newsprint mill, Price Bros. & Co. Ltd., Kenogami, Que.

Boucher, Raymond, B.A.Sc., C.E. (Ecole Polytechnique), M.Sc. (Mass. Inst. Tech.), associate professor of hydraulics, Ecole Polytechnique, Montreal, Que.

Colpitts, Gordon L., B.Sc. (Mech.), (N.S. Tech. Coll.), chief engr., Barranca Bermeja refinery, Tropical Oil Company, Colombia, S.A.

Henson, George Stanley Gordon, B.Sc. (Elec.), (Univ. of Man.), asst. engr., real estate, taxes, insurance dept., Winnipeg Electric Company, Winnipeg, Man.

Wilson, Thomas Whiteside, B.A.Sc. (Univ. of Toronto), Lieut., R.C.E., Petawawa Military Camp, Ont.

Transferred from the class of Student to that of Member

Moore, Robert Hugh, B.Sc. (C.E. and E.E.), (Univ. of Man.), mech. designer and machine erector, Hudson Bay Mining & Smelting Co. Ltd., Flin Flon, Man.

Transferred from the class of Student to that of Junior

Beach, John Edward, B.Sc. (Elec.), (Univ. of Alta.), asst. engr., Trinidad Leaseholds Ltd., Pointe-a-Pierre, Trinidad, B.W.I.

Delisle, Lucien, B.A.Sc., C.E. (Ecole Polytechnique), divn. engr., Dept. of Roads, Prov. of Quebec, Waterloo, Que.

Hammond, Rowland Ernest, B.A.Sc., M.A.Sc. (Univ. of Toronto), engr., Northern Electric Co. Ltd., Montreal, Que.

Loomis, James Gordon Mann., B.Eng. (Mech.), (McGill Univ.), engrg. dftsman., Cand. International Paper Co., Gatineau Mills, Que.

McMillan, Colin Brock, B.Sc. (Civil), (Queen's Univ.), civil engr., Saguenay Power Co. Ltd., Arvida, Que.

Students Admitted

Cole, Robert Arnold (Univ. of N.B.), 52 Shore St., Fredericton, N.B.

Collins, Kenneth Fawcett (Queen's Univ.), 196 University Ave., Kingston, Ont.

Courtright, James Milton (Queen's Univ.), 44 Second Ave., Ottawa, Ont.

Downman, Bernard Hugh Courtenay (Univ. of N.B.), Fredericton, N.B.

Hamilton, Harry Irwin (Queen's Univ.), 47 Clergy St., Kingston, Ont.

Heppner, Selwyn Alexander (Univ. of Man.), 22 The Roslyn Apts., Winnipeg, Man.

Heron, Alexander deForest (McGill Univ.), 433 Laird Blvd., Town of Mount Royal, Que.

Kinghorn, William Wallace (Univ. of N.B.), 206 Smythe St., Fredericton, N.B.

Knights, Kenneth Ronald (Univ. of Man.), 135 Maryland St., Winnipeg, Man.

McDougall, William Allan Jr. (Univ. of N.B.), 685 Charlotte St., Fredericton, N.B.

Tkacz, William (Queen's Univ.), 178 Johnson St., Kingston, Ont.

Van Damme, Joseph (Queen's Univ.), Arvida, Que.

ANNUAL FEES

Members are reminded that a reduction of one dollar is allowed on their annual fees if paid on or before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to all members wherever they are residing.

INSTITUTE PRIZE WINNERS

Lieutenant-General A. G. L. McNaughton, M.E.I.C., is the recipient of the Sir John Kennedy Medal for 1940. General McNaughton was born at Moosomin, Sask. He was educated at McGill University, receiving the degrees of B.Sc. in 1910 and of M.Sc. in 1912. After a few years on the teaching staff in the department of electrical engineering at the University, he entered private engineering practice for a brief period in 1914.

At the outbreak of the first Great War, he organized the 4th Battery, Canadian Field Artillery, which formed part of the 2nd C.F.A. Brigade of the First Canadian Division. He was wounded at the second battle of Ypres in April, 1915, but returning to France, commanded the 21st Howitzer Battery of the Second Canadian Division. Promoted to lieutenant-colonel in March, 1916, he took over the 11th Brigade, C.F.A., of the 3rd Canadian Division and commanded it through the battles of the Somme and until February, 1917, when he was appointed counter-battery staff officer of the Canadian Corps. After recovering from wounds received at Soissons, General McNaughton continued to carry out his duties until October, 1918, when he became General Officer Commanding the Canadian Corps heavy artillery. He was mentioned three times in dispatches, was awarded the D.S.O. and was made a C.M.G. Upon his return to Canada in May, 1919, he served with the Department of National Defence in numerous positions until 1929, when he was appointed to the highest military office in Canada and served four years as Chief of the General Staff.

Lieut.-General A. G. L. McNaughton, M.E.I.C.

E. M. G. MacGill, M.E.I.C.

O. W. Ellis

General McNaughton temporarily retired from the active list of the Canadian Militia to become president of the National Research Council on June 1st, 1935. As head of the Council, he was primarily responsible for building up an electrical engineering laboratory, especially for high voltage work, a subject in which he had done post-graduate work at McGill University. He was also directly responsible for development of the aeronautics laboratory and the cathode ray direction finder. In the summer of 1939 he accompanied a delegation of Canadian industrialists to Great Britain in connection with war supply contracts.

At the outbreak of the present war, General McNaughton was appointed officer commanding the first division of the Canadian Active Service Force, and went overseas late in 1939. Last summer he was promoted to the rank of Lieutenant-General, and appointed to command an army corps in England.

Elizabeth M. G. MacGill, M.E.I.C., has been awarded the Gzowski Medal for 1940, for her paper, "Factors Affecting the Mass Production of Aeroplanes," which was published in the July, 1940, issue of *The Engineering Journal.* Miss MacGill was born at Vancouver, B.C. She is a bachelor of applied science in electrical engineering from the University of Toronto, 1927, a master of science in engineering from the University of Michigan, and has taken two years post graduate study at the Massachusetts Institute of Technology leading towards a doctorate degree. She now occupies the position of chief aeronautical engineer of the Canadian Car and Foundry Company, and is located at Fort William, Ont.

She is the daughter of the late J. H. MacGill, M.A., barrister of Vancouver. Her mother is Judge of the Juvenile court, holder of an Honorary LL.D. of the University of British Columbia, and a bachelor of Music of the University of Toronto.

Miss MacGill has made previous contributions to the art and science of flying. Four years ago, for instance, before the Ottawa Branch of the Royal Aeronautical Society she read a paper on "Simplified Performance Calculations of Airplanes" which was valued for its practical application to a complicated subject. She has also contributed several papers before various branches of the Institute. Last year she delivered a paper at the Annual Meeting in Toronto. Miss MacGill is an Associate Fellow of the Royal Aeronautical Society.

R. G. K. Morrison, M.C.I.M.M., has been awarded the Leonard Medal for 1940 for his paper on "Points of View on the Rock Burst Problem" which was published in the August, 1939, issue of the *Canadian Mining Bulletin.* Mr. Morrison is a graduate of the University of Toronto in mining engineering, from the class of 1923. For a few years after graduation he was engaged in surveying and mining construction work in central Manitoba. In 1928 he went to India as chief assistant surveyor with the Oorgaum Gold Mining Company. From May, 1923, to November, 1936, he was underground superintendent of the Mysore Gold Mining Company, and since November, 1936, to date he has been superintendent of the Nundydroog Mines Ltd. During the summer of 1940 Mr. Morrison acted in a consulting capacity to various Ontario mining companies deeply concerned with the problem of rock burst. These companies were unanimous in their appreciation of his services.

Mr. Morrison resides at Oorgaum, South India.

O. W. Ellis is the recipient of the Plummer Medal for 1940 for his paper presented at the Annual Meeting of the Institute last year at Toronto on "Some Developments in Alloys during the Last Twenty Years." After serving an appren-

Léo Brossard, S.E.I.C.

W. C. Moull, S.E.I.C.

Marc R. Trudeau, S.E.I.C.

ticeship in England he came to Canada in 1910 and joined the Canadian Pacific Railway Company. In 1911 he entered the Department of Metallurgy at the University of Birmingham, England, and received his degree of B.Sc. in metallurgy in 1914. During the war 1914 to 1918 he worked as a metallurgist in the Royal Ordnance Factories. In 1916 he received the degree of M.Sc. from the University of Birmingham. At the end of the war he was appointed chief metallurgist at the Royal Laboratory Department of the Royal Ordnance Factories, and in 1920 he was called upon to reorganize all the metallurgical laboratories of the Factories. In 1921 he returned to Canada as an assistant professor of metallurgical engineering at the University of Toronto, a position which he retained until 1925. At that date he was appointed an Industrial Fellow at the Mellon Institute of Industrial Research, University of Pittsburgh, where he carried out work on metals for bearings. From 1926 to 1929 he was in the research department of the Westinghouse Electric and Manufacturing Company. In 1929 he was appointed to his present position as Director of Metallurgical Research at the Ontario Research Foundation, Toronto. Mr. Ellis is the author of numerous papers on metallurgical subjects, both ferrous and non-ferrous. He is a contributor to the National Metals Handbook. His prize winning paper was published by the Institute in July 1940 as a technical supplement to *The Engineering Journal.*

M. S. Layton, Jr. E.I.C., is the recipient of the Duggan Medal and Prize for 1940, for his paper "Coated Electrodes for Electric Arc Welding". He was born at Bury-St.-Edmuds, England, in 1914 and was educated at McGill University where he was graduated in 1935. Upon graduation he joined the staff of the Steel Company of Canada at Montreal. He resigned the position of assistant chemical engineer to enlist with the R.C.A.F. last October. He is at present located in Toronto. Mr. Layton's paper was published in the July 1940 issue of the *Journal.*

Léo Brossard, S.E.I.C., has been awarded the Phelps Johnson Prize for 1940, for his paper entitled "Geology of the Beaufor Mine". He was born at Laprairie, Que., in 1912. He received his early education at the Collège de Montréal, and in 1931 entered the Ecole Polytechnique where he obtained the degree of B.Sc.A. in 1936. Upon graduation he engaged in geological surveys and prospecting in northern Quebec. Returning to Montreal in 1938, he became attached to the teaching staff at the Ecole Polytechnique. In 1939 he was geologist with the Cournor Mining Company, Perron, Que. Last year, Mr. Brossard did post graduate work at McGill University, and received his M.Sc. degree in geology.

W. C. Moull, S.E.I.C., is the recipient of the John Galbraith Prize for 1940, for his paper "Electrification of a Modern Strip Mill". He was born at Seaforth, Ont., in 1916. and received his early education at the Collegiate Institute of Owen Sound, Ont. He entered the University of Toronto in 1935, and obtained his degree of B.A.Sc. in electrical engineering in 1939. Since graduation he has been with the Canadian General Electric Company, and is, at present, located in Toronto.

Marc R. Trudeau, S.E.I.C., has been awarded the Ernest Marceau Prize for 1940, for his paper "Points Fixes et Lignes d'Influence". He was born at Montreal, Que., in 1915, and received his early education at the Collège de Montréal. He entered the Ecole Polytechnique of Montreal in 1935, and was graduated with honours in 1940. He also holds the B.A. degree from the University of Montreal. Since graduation, Mr. Trudeau has been connected with the firm of Lalonde and Valois, consulting engineers of Montreal.

ANNUAL FEES

Members are reminded that a reduction of one dollar is allowed on their annual fees if paid on or before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to all members wherever they are residing.

JULIAN C. SMITH MEDALLISTS

WILLIAM DUNCAN BLACK

An engineer of high standing, William Duncan Black throughout his career has been on the lookout for opportunities to render service to the Canadian public and to his fellow members of the engineering profession. After building up an important heavy manufacturing industry, he is now at the head of a Canadian company which is actively devoting its equipment, plant and organization to vital munitions work. When president of the Industrial Relations Committee of the Canadian Manufacturers' Association, he was appointed employers' delegate to the International Labour Conference held in Geneva in 1934; later he served as president of that Association.

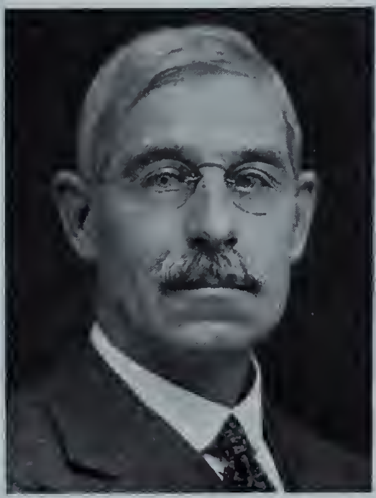
In these and other activities he has taken effective part in guiding Canadian industry. As a director of the Bank of Canada he shares responsibility for the financial policy of the Dominion.

RICHARD JOHN DURLEY

A mechanical engineer—a Whitworth Scholar—his career has included service as professor of mechanical engineering in McGill University, as consulting engineer, and in munitions inspection. He was the first secretary of the Canadian Engineering Standards Association. After thirteen years as secretary of the Engineering Institute of Canada, he now occupies a less onerous but more sedate position as its secretary-emeritus.

A former councillor of the Institute, he has just been honoured by election as the Canadian member of the Council of the Institution of Civil Engineers.

W. D. Black, M.E.I.C.



R. J. Durley, M.E.I.C.

A. Frigon, M.E.I.C.

AUGUSTIN FRIGON

After obtaining scientific training and engineering experience in France and the United States as well as in Canada, Augustin Frigon, at the head of the Ecole Polytechnique, Montreal, led in placing the engineering education of French-Canadian youth on a firm basis. His public services have also included membership in many important government commissions; he has served on the Council of the Institute. He now occupies a prominent and responsible position in the Canadian Broadcasting Corporation, to whose success he has materially contributed.

FRANCIS WILLIAM GRAY

A Yorkshireman by birth, who is at the same time an author, an artist and an authority on undersea coal mining, Francis William Gray has long been a staunch supporter of professional engineering bodies. He is a past president of the Canadian Institute of Mining and Metallurgy, and of the Mining Society of Nova Scotia, and a past councillor of the Engineering Institute of Canada, and a member of the Institution of Mining Engineers (Gt. Britain).

After long residence in the Maritimes, he holds a consultative and advisory position in one of the most important industries of that region. His breadth of view, technical knowledge and power of expression and industrial leadership have gained for him an enviable reputation throughout the Dominion.

SIR HERBERT SAMUEL HOLT

A member of the Institute for fifty-three years, Sir Herbert Holt's long and successful experience in civil engineering, in industrial administration, and then in finance, has qualified him for the prominent position he has so long held in the industrial and banking worlds. He has played a principal part in the industrial and commercial development which has carried Canada forward so rapidly during the last forty years. At the head of a great public utility and a leading bank, he has found time for activity on the councils of two great hospitals and a great university. His unobtrusive benefactions are administered by the foundation which bears his name.

RICHARD SMITH LEA

An educationalist and consultant who is internationally known as an authority in the field of hydraulic engineering, Richard S. Lea is a native of "The Island," which has given Canada so many distinguished sons. He was for some years assistant professor of civil engineering and lecturer in mathematics at McGill University. Later, in his extensive practice as consulting engineer, he had to deal with many of the different problems which have presented themselves during the rapid growth of Canada's urban populations. His ability and technical knowledge of these, and of river questions generally, have led to his being retained as adviser to federal and provincial Government departments—including the Hydro-Electric Power Commission of Ontario—as well as to municipalities and several of the principal hydro-electric companies in Canada.

BEAUDRY LEMAN

Seldom does an engineer engaged in hydro-electric developments and municipal engineering become president of the Canadian Bankers' Association. But this has happened in the career of Beaudry Leman.

Born in Montreal, he studied engineering in France and in Canada, graduating at McGill University in 1900. He has been a member of the Engineering Institute for over

F. W. Gray, M.E.I.C.

Sir Herbert S. Holt, M.E.I.C.

R. S. Lea, M.E.I.C.

Beaudry Leman, M.E.I.C.

C. A. Magrath, M.E.I.C.

forty years. In 1912, he transferred his activities to the art or science of banking. His early technical training has enabled him to serve on Royal Commissions such as the Canadian Advisory Committee on the St. Lawrence Waterway in 1927-28, on the Railways and Transportation Commission in 1931-32 and latterly on the Allied War Supplies Corporation.

His influence and counsel have been sought in the solution of public and municipal financial problems as well as in the administration of many companies of which he is a director. As president of a great Canadian bank he occupies an outstanding position in the realm of finance.

CHARLES ALEXANDER MAGRATH

A pioneer in the development of the West, a surveyor qualified to practise in every province, and an expert in the conservation and use of water resources, Charles Alexander Magrath in the long past was a member of the Territorial Assembly at Regina, and later of the Dominion Parliament. He took an important part in the work of the International Joint Commission as chairman of the Canadian Section. He succeeded the late Sir Adam Beck as chairman of the Hydro-Electric Power Commission of Ontario. During the last war he was Fuel Controller of Canada, and among other deliberative bodies on which he has served may be mentioned the War Trade Board, the Patriotic Fund executive, and the Newfoundland Royal Commission. Throughout his long career he has made a special study of questions connected with Canada's growth and development, particularly in the western provinces.

JANUARY JOURNALS REQUIRED

There has been an unusual demand for extra copies of the January 1941 issue of the *Engineering Journal* and it would be appreciated if members who do not retain their copies would return them to Headquarters, at 2050 Mansfield Street, Montreal, Que.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

Dr. T. H. Hogg, M.E.I.C., has recovered sufficiently from the injuries suffered in a recent accident that he has been able to leave the hospital. He is now convalescing at Nassau, Bahamas, and is expected back at his office in Toronto early in April.

Lieut. Commander C. P. Edwards, M.E.I.C.

Lieutenant Commander C. P. Edwards, O.B.E., M.E.I.C., has recently been appointed Deputy Minister of the Department of Transport at Ottawa. The position was left vacant by the death of Colonel V. I. Smart, M.E.I.C., last fall. Commander Edwards is chiefly known for his work in radio and wireless telegraphy, and played a large part in building up Canada's networks of radio and wireless facilities. A Welshman, he has spent the greater part of his life in Canada. He first entered the field of wireless communication in 1903 when Guglielmo Marconi erected a demonstration station at Chester, Eng., just over the Welsh border from Dodleston, Cmdr. Edwards's birthplace. Through his work with that pioneer wireless station he became a junior technical assistant on Marconi's staff, and in 1904 came to Canada to supervise the construction of stations at Camperdown, N.S., and on Sable Island. His appointment as radio director in the Marine Department came in 1909 and he took charge of all wireless and radio activities. Cmdr. Edwards has been the Dominion's representative at practically all the international and North American radio conferences held since 1912. He was chairman of the committee which drew up regulations for the compulsory equipment of ships with radio at the International Conference for the Safety of Life at Sea in 1929, and since 1936 has been chief of Canadian air services.

As Deputy Transport Minister he will have charge of civilian aviation under direction of Hon. C. D. Howe, Minister of Munitions and Supply, and in the transport division he will operate under the authority of the Transport Minister, the Hon. P. J. A. Cardin.

H. E. T. Haultain, M.E.I.C., who resigned from his position as professor of mining engineering at the University of Toronto, two and a half years ago, was granted laboratory facilities for continuing his research work by President Cody and the Board of Governors. He is actively continuing his work not only in the University laboratories, but in co-operation with some of the mines. Two of his instruments have become well known as the Superpanner and Infrasizer. The Superpanner is a piece of laboratory apparatus for concentrating small batches of ore for testing purposes and makes separations according to difference of specific gravity of finer particles and with less differences of specific gravity than any other instrument. The Infrasizer is also a piece of laboratory apparatus and is used for the size analysis of particles finer than the finest wire sieves. Professor Haultain has undertaken the distribution of these instruments not as a commercial proposition but under a sense of professional obligation to supply them to those who really need them. They are manufactured in Toronto for him under his personal supervision. There has been no advertising or selling campaign and yet one or both of these instruments have been sold to all parts of the world. Most recent orders for these instruments have come from Ecuador and Russia. Professor Haultain continues to develop the applications of these instruments and is also actively engaged on other research work on aids to the milling problems.

W. A. Newman, M.E.I.C., was recently appointed general manager of Federal Aircraft Limited, a Crown company handling much of Canada's war-time aircraft production. Mr. Newman is the chief mechanical engineer of the Canadian Pacific Railway Company. He was graduated from Queen's University in 1911 and entered the service of the Canadian Pacific Railway Company upon graduation. In 1913 he became lecturer in mathematics at Queen's and then from 1914 to 1916 he was assistant professor in mechanical engineering. Mr. Newman returned with the Canadian Pacific Railway in 1916 and successively occupied the positions of assistant mechanical engineer, engineer of locomotive construction, mechanical engineer, and since 1928, chief mechanical engineer.

Major W. G. Swan, M.E.I.C., is now district engineer officer for M.D. No. 11 at Victoria, B.C. At the outbreak of war he was director of construction of the War Supply Board.

Huet Massue, M.E.I.C., has been elected on the Council of the Chambre de Commerce du District de Montréal. Mr. Massue, who is on the staff of the Shawinigan Water and Power Company at Montreal is a councillor of the Institute.

J. A. Baird, M.E.I.C., is now on the executive staff of the Union Gas Company of Canada Limited, at Chatham, Ont. A graduate of the University of Toronto, Mr. Baird has for a number of years carried a consulting practice as an engineer and surveyor at Sarnia, Ont.

H. C. Beck, M.E.I.C., has relinquished his position as manager of the Substation Department of the English Electric Company, Stafford, England, to become personal assistant to the chief electrical engineer of the Southern Railway at Dorking, Surrey, England.

Squadron Leader C. W. Crossland, M.E.I.C., is now located at Trenton, Ont., at No. 6 Repair Depot, R.C.A.F. He was graduated from McGill University in 1931, and after taking a post graduate course in aeronautical engineering at the Massachusetts Institute of Technology obtained the degree of M.Sc. After spending a few years in England with aircraft manufacturing firms he returned to Canada and became assistant engineer in the aeronautical branch of the Department of National Defence at Ottawa. He joined the R.C.A.F. last year. In 1933, Squadron-Leader Cross was awarded the John Galbraith Prize of the Institute for his paper on "The Rationalization of Load Factors for Aeroplane wings."

H. B. Dickens, M.E.I.C., has returned to Canada after having filled a two year appointment with the British War Office at Woolwich Arsenal, Woolwich, England. He is, at present, attached as a consultant to the General Engineering Company at Toronto.

K. Y. Lockhead, M.E.I.C., has received an appointment in the aeronautical engineering branch of the R.C.A.F. He was previously located at Vancouver with the Hudson's Bay Company.

J. B. Nelson, M.E.I.C., has been appointed sales engineer with the London Structural Steel Company Limited at London, Ont. He was lately chief engineer of Plate and Structural Steel Products Company, Toronto, and formerly with the Hamilton Bridge Company.

W. B. Crombie, M.E.I.C., has left the Great Lakes Power Company, Sault Ste. Marie, to accept a position with the Hydro-Electric Power Commission of Ontario as chief resident engineer on the Ogoki Diversion project. He is now located at Ferland, Ont.

K. A. Truman, M.E.I.C., is now located at Nelson, N.B., with the Canadian Pacific Railway Company. He was previously located at Regina, Sask.

J. G. D'Aoust, M.E.I.C., has left his position with the Powell River Company Limited, at Powell River, B.C., and is now employed with Defence Industries Limited, Montreal. He was graduated from the University of British Columbia in 1927 and joined the Powell River Company as a mechanical draughtsman in 1934.

J. R. Carter, M.E.I.C., has been transferred from the head office of Canadian Industries Limited, Montreal, to the Nylon Division, Kingston, Ont. He was graduated from the University of Toronto in 1931.

A. H. Douglas, M.E.I.C., has been appointed pilot officer in the aeronautical engineering branch of the R.C.A.F. He was previously in the Department of Highways of Saskatchewan at Regina as an assistant bridge engineer.

Paul Vincent, M.E.I.C., has been appointed chief engineer of works in the Department of Colonization of the Province of Quebec. He has been with the Department since 1937 when he joined as district engineer for the roads and bridge division. Last year he had been appointed chief of the technical section in the Department. Mr. Vincent is the secretary-treasurer of the Quebec Branch of the Institute.

C. A. Norris, M.E.I.C., has joined the staff of the Montreal Locomotive Works at Montreal. He was previously editor of the *Engineering and Contract Record* at Toronto, Ont.

A. N. Gunter, Jr.E.I.C., has been transferred from McMasterville, Que., to the Nobel, Ont., plant of Defence Industries Limited. He was graduated in chemical engineering from the University of Alberta in 1938.

F. J. Hastie, Jr.E.I.C., is now with the East Kootenay Power Company at Coleman, Alta. Upon graduation in electrical engineering from the University of Alberta in 1936 he joined the Canada Packers Limited at Edmonton, Alta., as an assistant engineer. In 1939 he became shift engineer.

J. R. C. Macredie, Jr.E.I.C., is now employed with the Department of Defence at Ottawa as structural draughtsman. He was graduated from the University of New Brunswick in 1931 and for several years was employed with the Department of Highways at New Brunswick.

C. B. McMillan, Jr.E.I.C., is now employed with the Canadian National Railways at Montreal. Upon graduation in civil engineering from Queen's University in 1936 he went with the Ontario Paper Company at Baie Comeau, Que. The following year he joined the staff of the Aluminum Company of Canada Limited, as a junior engineer at Arvida, Que. In 1938 he was transferred to the staff of the Saguenay Power Company, at Arvida, and remained in that position until the end of last year.

W. E. Seely, Jr.E.I.C., is now assistant engineer in the works and building division of the R.C.A.F. at Montreal. He was graduated in civil engineering from the University of New Brunswick in 1930 and has since been employed on several construction projects.

Squadron-Leader M. M. Hendrick, Jr.E.I.C., is now located at No. 3 Wireless School at Winnipeg, Man.

J. E. Thom, Jr.E.I.C., has joined the staff of Defence Industries Limited, in Montreal. He was previously located at Regina, Sask.

F. C. Morrison, Jr.E.I.C., is sales-combustion engineer with the Dominion Steel and Coal Corporation Ltd., at Halifax, N.S. Mr. Morrison joined the company upon his graduation in electrical engineering from Nova Scotia Technical College in 1936. Lately he was located with the Dominion Coal Company Ltd., a subsidiary, at Montreal.

H. M. Howard, S.E.I.C.

H. M. Howard, S.E.I.C., has accepted a position as metallurgical sales engineer with E. Long, Limited, at Orillia, Ont. He was graduated in mining engineering from the University of Toronto, in 1940 and spent several months with Fraser-Brace Engineering Company at Nobel, Ont.

W. L. Garvie, S.E.I.C., has been transferred from Peterborough to the Davenport electric works, Canadian General Electric Company Ltd., Toronto, Ont. He was graduated from the University of British Columbia in 1939.

Second-Lieutenant W. J. Milhausen, S.E.I.C., has received a commission with the Royal Canadian Engineers and is stationed at the Petawawa Military Camp. He was graduated in civil engineering from the University of Manitoba in 1940.

A. K. Cameron, S.E.I.C., is now located at Brownsburg, Que., with Canadian Industries Limited. He was graduated in mechanical engineering from McGill University in 1938. Lately he was connected with F. S. B. Heward & Company Ltd., at Toronto, Ont.

W. F. Jarrett, S.E.I.C., has joined the staff of the Saguenay Power Company, as a junior engineer at Arvida, Que. Upon graduation from the University of Manitoba in 1939 he joined the Manitoba Power Commission as a draughtsman at Winnipeg.

ERRATUM

In reporting the appointment of C. J. Jeffreys, M.E.I.C., to the staff of Allied War Supplies Corporation in Montreal, it was erroneously stated that Mr. Jeffreys had been, for the past two years, resident engineer at Powell River, B.C., with Powell River Company, Limited. On checking over the record we find that he was assistant engineer and that Mr. Neville Beaton, M.E.I.C., who is now the resident engineer has occupied that position for the past seven years.

VISITORS TO HEADQUARTERS

Past-President A. J. Grant, M.E.I.C., from St. Catharines, Ont., on January 28th.

John E. Cade, M.E.I.C., assistant chief engineer, Fraser Companies Limited, from Edmundston, N.B., on January 29th.

H. B. Dickens, M.E.I.C., Royal Ordnance Factory, from South Wales, England, on January 29th.

Geoffrey Stead, M.E.I.C., from Saint John, N.B., on February 5th.

J. E. Gill, M.E.I.C., resident engineer, Rapid No. 7, Quebec Streams Commission, from Cadillac, Que., on February 5th.

W. R. C. Taylor, Jr.E.I.C., from Winnipeg, Man., on February 6th.

Major G. G. M. Carr-Harris, M.E.I.C., D.O.M.E., M.D. No. 11, from Esquimalt, B.C., on February 7th.

W. J. Piercy, Jr.E.I.C., O'Brien Gold Mines Limited, from Kewagama, Que., on February 13th.

R. J. Askin, M.E.I.C., manager, Thunder Bay Paper Company Ltd., from Port Arthur, Ont., on February 17th.

H. B. Stuart, M.E.I.C., field engineer, Hamilton Bridge Co. Ltd., from Toronto, Ont., on February 17th.

P. Codd, S.E.I.C., from Moose Jaw, Sask., on February 24th.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Edgar Thomas John Brandon, M.E.I.C., died at his home in Toronto on September 23rd. 1940. He was born at Toronto on December 20th, 1880, and was educated at the School of Practical Science of the University of Toronto, where he was graduated in 1902. He was then employed until 1905 with the Ontario Power Company at Niagara Falls. From 1905 until 1908 he was in the States working on the design of power developments. In April, 1908, he joined the Hydro-Electric Power Commission of Ontario as a designer and rose to the position of chief electrical engineer.

E. T. J. Brandon, M.E.I.C.

Owing to ill health he had retired from active duties late in 1938.

Mr. Brandon joined the Institute as a Student in 1904, transferring to Associate Member in 1911.

Edgar Murray McCheyne Hill, M.E.I.C., died at Winnipeg, Man., on August 14th, 1940. He was born at Guelph, Ont., on October 13th, 1882. He was educated at the University of Toronto where he was graduated in 1904, from the School of Practical Science. His entire professional career was spent in the service of what is now the Canadian National Railways in the west. Upon graduation he joined the company as a resident engineer on the construction of the main line at Battleford, Sask., and at Edmonton, Alta. In 1907 he became in charge of location parties, west of Edmonton. From 1911 to 1914 he carried out reconnaisance and exploration work in connection with possibilities of railway development in northern Alberta. In 1914 he was divisional engineer in charge of construction of the Calgary-MacLeod branch. From 1914 to 1916 he carried out location work in Alberta. He enlisted with the Royal Canadian Engineers in 1916 and was transferred to the Royal Engineers in 1917 and served until 1919 attaining the rank of captain. Upon demobilization he returned to the Canadian National Railways at Winnipeg. In 1932 he was appointed engineer of construction and in 1935 he also took over the duties of regional right-of-way agent. On January 1st, 1940, he was appointed chief engineer with Headquarters at Winnipeg, Man.

Mr. Hill joined the Institute as a Student in 1907 and he was transferred to Member in 1919.

William Cooper Lumbers, M.E.I.C., died on August 29th, 1940. He was born at Toronto on March 5th, 1887. He was educated at Jarvis Collegiate and University of Toronto, graduating from the School of Practical Science in 1901. From 1902 to 1907 he was employed with the Canadian Pacific Railway. From 1907 to 1912 he was employed with F. A. James, Toronto, and from 1912 to 1916 he was with Frank Barber, civil engineer, Toronto. After some time spent on inspection work on munitions in 1916 he returned with Mr. Barber, and stayed with the firm until 1923. He joined the staff of the Hydro-Electric Power Commission of Ontario in March, 1924. At the time of his death he was employed in the transmission section of the electrical engineering department.

Mr. Lumbers joined the Institute as an Associate Member in 1921.

William Henry Sullivan, M.E.I.C., for twenty years principal assistant engineer in charge of the Welland Ship Canal, died at his residence at St. Catharines, Ont., on January 20th, after a brief illness. He was born at Kingston, Ont., on August 23rd, 1871, the son of the late Senator Michael Sullivan, M.D., of Kingston. He was educated at private schools, and at the Kingston Collegiate Institute. He entered the Royal Military College of Canada in September, 1888, graduating in June, 1892, when he was commissioned as an officer in the Royal Canadian Engineers. He entered the Canadian Government service in September, 1892, being first engaged on the Ontario St. Lawrence Canal, later being appointed assistant engineer in charge of the Cornwall Canal enlargement. In September, 1900, he was transferred to the Prince Edward Island Railway as principal assistant engineer in charge of construction of the Hillsboro bridge and Murray Harbour bridge and railway, and in 1904 was appointed engineer in charge of that work. In October, 1905, Mr. Sullivan was transferred to the position of assistant superintending engineer of the Welland Canal at St. Catharines, Ontario, and was promoted to superintending engineer on January 1st, 1912. In November, 1913, he was appointed principal assistant engineer in charge of the Welland Ship Canal construction, of which the late Mr. J. L. Weller was then engineer in charge. Mr. Sullivan retained this position until December 31, 1923, when he retired because of ill health.

In November, 1901, Mr. Sullivan married Miss Adele Marion, eldest daughter of the late Sir William Sullivan, then Chief Justice of Prince Edward Island, who survives him, together with four sons: Lieutenant Michael V. Sullivan, R.C.N.V.R., Halifax, N.S., Gerald F. Sullivan of Toronto, William W. Sullivan and Philip H. Sullivan of St. Catharines, and two sisters, Mrs. C. J. Crookall of Brooklyn, N.Y., and Miss Frances Sullivan of Kingston, Ont.

Mr. Sullivan joined the Institute as an Associate Member in 1899, becoming a Member in 1920. He had been made a Life Member shortly after his retirement in 1924.

W. Dixon Craig, K.C., who passed away at Edmonton, Alta., on January 27th, 1941, was born in Toronto, son of the late T. Dixon Craig, M.P., for many years member for East Durham. After taking a brilliant course in Arts and Science at the University of Toronto (class '97), he went to Midland, Ont., as mining geologist and metallurgist for the Canada Iron Corporation of Montreal. In 1913 Mr. Craig left the east and made his home in Edmonton, where he began the study of law at the University of Alberta, graduating with distinction (Chief Justice Gold Medal) in 1917. He immediately joined the law firm of Woods, Field, Craig and Hyndman. However, Mr. Craig always kept a live interest in his former profession. He was a member of the Association of Professional Engineers of Alberta, member of the Canadian Institute of Mining and Metallurgy, vice-consul of the Netherlands, member of the Faculty of Law, University of Alberta. He held many prominent offices in the Church of England, and for many years was Chancellor of the Diocese of Edmonton, and Registrar of the Diocese of Athabasca. Mr. Craig is survived by his wife and two daughters, Mrs. F. E. L. Priestly of Vancouver and Mrs. Joseph Fisher of Toronto.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

W. P. Augustine, M.E.I.C - *Secretary-Treasurer*
J. B. Dowler, M.E.I.C. - - *Branch News Editor*

The first meeting of the Border Cities Branch in the new year was held in the Prince Edward Hotel on January 14th. The meeting was presided over by the newly-elected chairman, George E. Medlar. After dinner and a short business meeting, J. F. Bridge introduced the speaker of the evening, Mr. R. K. Scales of the research department of the Ethyl Gasoline Corporation of Detroit. The subject of the address was **Fuels and Engines of the Future.**

The future, Mr. Scales said, is a very dangerous subject; predictions can only be based on past performances. However, the aviation industry may be said to be pioneering for the automotive industry so that some basis for prediction may be established. This is because the great expanse of the aviation engine allows room for the most advanced engineering.

Over the past ten years the average size of the automotive engine has become relatively smaller while the horsepower and compression ratio have gone up. The compression ratio is controlled by the anti-knock qualities of the fuels available. The octane (anti-knock) number of fuels commercially sold today is on the average ten points higher than in 1940. The petroleum industry strives at all times to make the best fuel commercially possible. The automotive industry at the same time strives to improve engine design to take full advantage of improved fuels.

Some extravagant claims have been made as to the octane rating of some commercial gasolines. But there are several methods devised by research engineers for obtaining the octane rating and these methods do not all agree. Therefore, the only fair rating is when the fuel has been tested by the different methods and the results averaged. Aviation fuels of ten years ago had an octane rating of 73. This last year it was 92 for airlines. For military pursuit planes, 100 octane fuel is used. Experimental fuels have octane number of over 100 and up to 128.

This matter of high octane number is very important to military aviation. High octane gasoline reduces the bomber's fuel load, increases the engine power and reduces the take-off run needed by as much as 45 per cent.

One of the bottlenecks of German bomber operations would seem to be the necessity, because of long take-off runs, of large numbers of airfields. The longer a bomber must wait in the air for the squadron to assemble the less its final effectiveness. Thus, the lower octane rating of the German gasoline has cut down the number of planes which can take part in a raid on England at any one time. Some idea of the time it takes to put planes into the air may be obtained when it is realized that one of the largest airports in the United States can handle only 280 planes per day.

A few years ago crude oils which were free of gum and so useful for aviation gasoline were very scarce. However, with recent developments in refining methods and in the use of blending agents, almost any crude may be used. Some blending agents used now are iso-octane, iso-pentane and neo-hexane with a small quantity of tetra-ethyl lead. Aviation gasoline may contain as high as 40 per cent blending agent and 60 per cent gasoline with 3 cc. per gallon of tetra-ethyl lead.

Of course, advantage of high octane fuels cannot be obtained without supercharging. The whole trend seems to be towards more powerful, smaller engines with superchargers.

Up to the present time the public has been satisfied with present day highways and speeds. However, as more superhighways are built, the public will demand more powerful, more truly streamlined cars which may call forth some of the developments in aviation engines and their application to automobiles.

The meeting closed with a somewhat spirited discussion period, the subject of Mr. Scales' address being of great interest to the automotive engineers among the members.

EDMONTON BRANCH

B. W. Pitfield, Jr.E.I.C. - - *Secretary-Treasurer*
J. F. McDougall, M.E.I.C. - *Branch News Editor*

Mr. E. A. Hardy, professor of agricultural engineering at the University of Saskatchewan, addressed the fifth dinner meeting of the 1940-41 session on the evening of January 14, 1941. Professor A. R. Greig introduced the speaker. Mr. Hardy's topic was the **Development of the Combustion Chamber of the Diesel Engine.**

In his paper, which he supplemented with slides, Mr. Hardy described several types of combustion chambers which have been used by the designers of diesel engines. He stressed particularly the problem these designers have encountered in obtaining complete combustion of a low grade fuel which is not volatile, and causes smoky exhaust as the engine operates near full load.

An interesting and lengthy discussion period followed the paper, after which Mr. R. M. Dingwall moved a hearty vote of thanks to the speaker.

Twenty-four were present for dinner and an additional sixteen heard the paper. Among the guests present was Squadron-Leader Berven of the Elementary Flying Training School.

Professor R. M. Hardy acted as chairman in the absence of Branch Chairman E. Nelson.

The Engineering Students Society of the University of Alberta invited the Edmonton Branch of the Institute to be guests at their meeting on the evening of January 27th, 1941.

At this meeting was shown a United States Bureau of Mines motion picture entitled **The Making and Shaping of Steel.** The film was composed of seven reels and dealt very fully with the following topics:

Reel 1—Open pit and underground mining of iron ore. The mining of limestone. The making of coal into coke. The operation of a blast furnace was shown in detail by means of animated drawings and the reel ended with molten iron being transported to another shop for refining into steel.

Reel 2—The open-hearth and Bessemer process were shown. The closing scenes showed the removal of moulds from ingots after the steel had solidified and the transfer of the ingots to soaking pits to attain uniform temperature for rolling.

Reel 3—Flat rolled products; Reel 4—Bars and structural shapes; Reel 5—Rails, wheels and axles; Reel 6—Wire and wire products; Reel 7—Pipe and tube manufacture.

The entire film had excellent continuity and although it went into complete detail of the various phases of steel manufacture, it maintained the interest of the meeting throughout.

Immediately after the film, E. Nelson presented Charles A. Stollery, winner of the 1940 Engineering Institute of Canada Prize for the University of Alberta, with an engrossed certificate.

HALIFAX BRANCH

L. C. Young, M.E.I.C. - *Secretary-Treasurer*
G. V. Ross, M.E.I.C. - - *Branch News Editor*

On January 23rd, the members of the Halifax Branch of the Institute and of the Association of Professional Engineers of Nova Scotia, and friends gathered at the Nova Scotian Hotel for the annual joint banquet. The attendance of 240 was an increase of 43 over last year's record and included many men from outside the Halifax area.

After the toast to the King, Captain J. I. Hallett, D.S.O., R.N., delivered a strong straightforward talk encouraging Canadians to realize the dangers of the present time. "Britain needs your money for planes, guns and supplies. You are like boxers still lounging on the ropes, waiting for the bell. You should be up on your toes as they are in the Old Country." Captain Hallett was introduced by Rear Admiral S. S. Bonham Carter, C.V.O., D.S.O., R.N., Commanding 3rd Battle Squadron.

The toast to the Services, proposed by Ira P. Macnab, was responded to by Brigadier General C. E. Connolly, D.S.O., Officer Commanding Military District No. 6. Mr. F. A. Bowman, senior engineer of Nova Scotia, responded to the toast to the engineering profession proposed by Mr. E. J. Cragg, commissioner of the N.S. Power Commission.

Guests of the Institute and the Association included Commodore G. C. Jones, R.C.N., commanding officer, Atlantic Command, Air Commodore N. R. Anderson, officer commanding, Eastern Air Command R.C.A.F., Premier, A. S. MacMillan, Mayor W. E. Donovan, and American Consulate General Clinton E. MacEachran. The branch chairman, S. L. Fultz, and the Association president, J. Lorne Allan, alternated as chairman during the evening.

A splendid entertainment programme under the direction of Harry Cochrane was provided by the Canadian General Electric Company and the Northern Electric Company, K. L. Dawson, acting as master of ceremonies.

Favours were donated to everyone present by Imperial Oil Company, Moloney Electric Company, Canada Cement Company, Canadian Westinghouse Company, N.S. Power Commission, N.S. Department of Highways and Mr. Donald C. Keddy.

After the meeting, Mr. Ira Macnab conducted a sale of war savings stamps which netted about $400.00.

LAKEHEAD BRANCH

H. M. Olsson, M.E.I.C. - *Secretary-Treasurer*
W. C. Byers, Jr.E.I.C. - *Branch News Editor*

The Lakehead Branch held a Dinner Meeting at the Royal Edward Hotel, in Fort William, at 7 p.m. on January 15th. There were 37 members and guests present. The chairman, Mr. H. G. O'Leary, presided at the meeting. He mentioned how that, purely by accident, he had met the General Secretary Emeritus at the railroad depot and that he had expressed his desire to be remembered to all the members of the Branch.

The chairman then called on Mr. J. I. Carmichael, of the Canadian Car & Foundry, who spoke on the subject: **Some Problems in Aircraft Production.**

The basic problems to be coped with are: purchasing the required material; finding a suitable supply of labour, both skilled and unskilled; obtaining tools necessary for fabrication; organizing for production; marketing and financing; organizing for production being the most serious problem to the manufacturer, the remaining problems being external.

The policy of the designer is to obtain the highest possible performance. Having established the requirements, the type of structure is selected from among semi-monocoque, geodetic, welded tubular, tube and gusset or other less popular types. However, the semi-monocoque is the most common type used today. The design must maintain interchangeability of important components. The Hawker "Hurricane" is an example of mixed type of construction. The wings are of stressed skin type and the remainder bolted tube and gusset construction. On the "Hurricane" there are about 6,000 detail parts. This type of construction requires rigid material specification, special shapes, low manufacturing tolerances, large number of detail parts and critical inspection.

An embargo was placed on export of aircraft material from England, so supplies had to be located in America to meet the requirements of the British Air Commission. When the supplier had proved his ability to produce the material of the required specification he was then placed on the approved list and went into production.

Limitations in the rate of expansion of industry are set by the rate at which the necessary material can be supplied and the necessary labour can be absorbed. There is shortage of skilled labour so there is some delay while suitable labour is trained. Under good conditions it is possible to employ female labour to the extent of 30 per cent of the total staff.

The machine tool industries in both the United States and Canada have been operating to capacity, thus the manufacturer is forced to sub-contract a large portion of this machine work. The manufacturer must supply the sub-contractor with all necessary data, supervision and raw material with all possible assistance to ensure delivery in the required time.

The Inspection Department sees that only proper materials are used, standard manufacturing procedures followed, workmanship is good and drawing dimensions followed.

The Stores Department stores finished parts and is supervised by the Inspection Department.

The duties of the Shop are to maintain discipline, to train new men, and to assemble the aircraft after completing competent parts.

The Production Department sees that all necessary steps are taken to complete the programme on time with maximum efficiency.

The Planning Department is responsible for getting the required parts in the correct place at the right time. It investigates new programme feasibility.

The Material Control Department supervises the distribution of all material from external sources and its efficient operation is of vital importance.

The duties of the Control Department are to dispatch and record production orders, to route parts in the Shop and to supervise progress and to correct if necessary.

In the automobile industry, assembly proceeds without fitment with minimum skill and the assembly line operations are in units so that a continuous operation is achieved. In aircraft industry the main components are built in jigs with a large number of parts, most of which are incomplete and remain to be completed on assembly, thus producing an intermittent operation of assembly procedure.

"Thus with present design, continuous manufacturing operations cannot be used except in the case of detail parts where a saving of only ten per cent has been anticipated. Therefore, with the exception of this ten per cent saving, mass production methods will give little assistance to aircraft production."

P. E. Doncaster gave a vote of thanks to the speaker and mentioned how engineering had changed from railway construction in 1912 to aeronautical engineering in 1941.

R. B. Chandler seconded the vote of thanks and expressed interest in several statements made by the speaker.

David Boyd, Works Manager of the Aircraft Division, and E. J. Soulsby, Superintendent of Aircraft, both corroborated the statements made by the speaker and paid tribute to the work he is doing at the plant to accelerate the production of aircraft.

Several aircraft inspectors from the Canadian Car & Foundry were present at the meeting.

LETHBRIDGE BRANCH

E. A. Lawrence, s.e.i.c. - - *Secretary-Treasurer*
A. J. Branch, m.e.i.c. - - *Branch News Editor*

On Wednesday, January 15th, 1941, the Lethbridge Branch of the Institute held its regular meeting in the Marquis Hotel.

At 7.30 p.m. the corporate members of the branch met to transact the routine business and at 8 p.m. the regular meeting was opened by Wm. Meldrum, who called upon A. J. Watson, to introduce the speaker of the evening, J. H. Ross of Calgary, director of the Dominion-Provincial Youth Training for Alberta.

The speaker described the steady expansion of the youth training movement from its early stages.

The early aims of the scheme were to prepare young people physically, mentally and, if possible, vocationally for jobs. The object was to refresh minds which had been depressed by years of unemployment but, as the scheme continued trainees were fitted for work and placed in industry.

To train young people for industry efforts were made to discover inclinations of persons and then training along this line followed. Many were placed to learn the occupations with employers who generally placed trainees on their staffs when they had learned enough to be valuable.

At the request of the federal government the scheme undertook the training of mechanics in hand skills. Women are also being taught for jobs in war industry.

The training scheme is now producing many valuable men for industry who are highly developed in performing work; requiring exacting precision. This is enabling factories to continue to gear up production of war materials for the Dominion.

A question period followed the address; then Lieut.-Col. G. S. Brown, with a few well chosen remarks moved a hearty vote of thanks to the speaker in which all concurred.

The meeting closed with the singing of the National Anthem. Refreshments were then served.

LONDON BRANCH

H. G. Stead, jr.e.i.c. - - *Secretary-Treasurer*
A. L. Furanna, s.e.i.c. - *Branch News Editor*

The annual dinner meeting of the London Branch of the Institute was held on Wednesday, January 15th, 1941, at the Grange Tea Room.

The retiring chairman, Mr. H. F. Bennett, presided over a business meeting at which the auditor, Mr. F. Ball, presented the financial statement for 1940. Officers were elected for 1941.

The guest speaker of the evening was Mr. R. E. Laidlaw, K.C., assistant regional counsel for the Canadian National Railways. His subject was **The Machinery of the Law.** Mr. Laidlaw described the functions of the various courts from the daily police courts to the Dominion's last Court of Appeal, the Privy Council of England. The intricate proceedings of the law were illustrated by the speaker as he led the meeting, step by step, through the imaginary case of one charged with homicide. All through the address it was emphasized how the seemingly slow and tedious ceremony of the courts was desgined for the protection and assurance of justice to the accused. In his concluding words, Mr. Laidlaw indicated the development of justice in the courts to its present perfection, by comparing actual cases of crimes and the pronounced sentences in the days of Bonnie Prince Charlie with those of today. However, in spite of this quality of justice, those present were cautioned against any acts or circumstances which might bring the law to bear upon them.

Concluding the meeting, Mr. E. V. Buchanan proposed and Mr. J. A. Vance seconded a vote of thanks to Mr. H. F. Bennett for his services as branch chairman for the past two and a half years. Mr. Bennett was also congratulated on his work as chairman of the Committee on the Training and Welfare of the Young Engineer.

There were fifty-six members and guests in attendance at dinner.

MONCTON BRANCH

V. C. Blackett, m.e.i.c. - *Secretary-Treasurer*

A dinner meeting of Moncton Branch was held on December 19, 1940, in the Palm Room of the Brunswick Hotel. F. O. Condon, chairman of the branch, presided. During the course of the dinner the chairman introduced E. L. Miles, a member who has recently come to Moncton, J. E. Gibault, Assistant General Manager, Canadian National Railways. The guest speaker of the evening was Mr. E. C. Percy, Assistant District Airways Engineer, who read a paper prepared by Mr. J. A. Wilson, Controller of Civil Aviation, entitled **Aerodrome Construction for the British Commonwealth Air Training Plan.** The paper was illustrated with lantern slides. The speaker was called upon to answer numerous questions, and a lengthy discussion followed. A vote of thanks was extended Mr. Percy on motion of C. S. G. Rogers, seconded by Dean H. W. McKiel.

MONTREAL BRANCH

L. A. Duchastel, m.e.i.c. - *Secretary-Treasurer*

On November 21st, 1940, the Branch held its Annual Student Night. A good attendance (240) was noted and four excellent papers were presented on a competitive basis. The papers and speakers were as follows: **Manufacture of Modern Refrigerators,** by V. G. Griffin, (McGill); **Utilization and Disposal of Cannery Wastes,** by Bernard Beaupré, (Ecole Polytechnique); **Construction of Boulder Dam,** by W. C. Brown, (McGill); **Nomography,** by Roger Lessard, (Ecole Polytechnique).

All four competitors were given student memberships for the year 1941 and cash prizes were awarded to Bernard Beaupré and V. G. Griffin for the best and second best papers. While the judges were arriving at a decision a motion picture entitled **Liquid Air** was shown through the courtesy of the Canadian General Electric Company. Refreshments were served after the meeting.

The Romance of Water was the title of a paper given by Mr. Norman J. Howard, F.C.I.C. on November 28th, 1940. Mr. Howard is director of water purification for the City of Toronto, and president-elect of the American Water Works Association. The paper dealt with the progress made in water purification and analysis during the past century. The subject of taste and colour was also touched by Mr. Howard who is a specialist on the matter. The paper was illustrated with lantern slides and preceded by a courtesy dinner at the Windsor Hotel.

On December 5th, Mr. A. Van Winson gave a talk on **Metalizing** which was followed by very interesting demonstrations showing the possibilities of metal spraying. A courtesy dinner was held at the Windsor Hotel before the meeting.

Hydraulic Model Experiments was the title of an interesting talk given on December 12th by Dr. Kenneth C. Reynolds on the newer phases of hydraulic experimentation. Dr. Reynolds is a professor at the Massachusetts Institute of Technology and has made intensive studies of the flow of water in open channels. His paper was illustrated by a coloured motion picture and lantern slides and was preceded by a courtesy dinner at the Windsor Hotel.

On December 19th, Mr. J. J. Taylor gave a paper entitled **High Voltage Insulators** which was illustrated with slides and a motion picture showing dancing conductors. A courtesy dinner was held at the Windsor Hotel.

The Annual Meeting of the Branch was held on January 9th, 1941. The report of the retiring executive and the financial statement were given. The scrutineers presented their report and the results of the election were announced.

After the meeting a film on the British Navy was shown and refreshments were served.

On January 16th, Mr. George S. Mooney gave a paper entitled **Our Cities—Their Role in the National Economy,** and discussed cities as centres of industry, trade, transportation and culture.

Professor Louis E. Endsley spoke, on January 23rd, on **Diesel Electric Locomotives** and included comparisons between the diesel electric and the steam locomotive as to fuel cost and repairs. A courtesy dinner was held at the Windsor Hotel.

Prior to the Branch meeting, the Annual General Meeting of the Institute for 1941 convened for transaction of formal business and was adjourned to Hamilton on February 6th.

On January 30th, the Branch held its Annual Smoker at the Ritz Carlton Hotel. The attendance was over 500 and the entertainment was given in a gay 90's atmosphere, everyone being provided with a paper moustache. The Atterbury players provided a drama and members of the Montreal Repertory Theatre furnished several short songs and dances. A very enjoyable evening was enjoyed by everyone.

On February 3rd, a meeting was held in the Bell Telephone Auditorium to hear Dr. J. O. Perrine speak on **Energy, Frequencies and Noise Relations in Line and Amplifiers of Coaxial Cables and other Multi-channel Telephone Systems.** Members of the Institute of Radio Engineers were invited to attend the meeting which was preceded by a courtesy dinner at the Windsor Hotel.

Through the courtesy of J. L. Busfield the members of the Branch were invited to attend a luncheon of the Rotary Club of Montreal on February 11th, to hear the Hon. C. D. Howe give his first public address since his return from England. The Branch is indebted to Mr. Busfield for the opportunity afforded the membership to attend this important luncheon.

On February 13th, Mr. Gerald N. Martin gave a paper entitled **Recent Installations of Large Power Boilers in England.** The paper was a descriptive outline of recent trends in this field and an account of the visits made by the speaker to some of Britain's latest power plants.

Junior Section

On November 21st, the Annual Student Night was held as described above.

Mr. Georges L. Archambault, S.E.I.C., gave a talk, on December 2nd, on **Automatic Controls in Air Conditioning.**

On February 10th, Mr. Jacques Hurtubise, Jr.E.I.C., gave a paper on **Experimental Research on Soil Stabilization.**

MONTREAL BRANCH SMOKER

Max Sauer tells it to Lyman Playfair

From left to right: Richard L. Hearn, H. C. Fitz-James (Vancouver), A. C. D. Blanchard, Eric P. Muntz, G. E. Templeman.

Well posed by Messrs. Jamieson, Heartz, Brown and Laporte.

From left to right: D. R. Eastwood, Charles Morrison, Walter Griesbach, A. G. Sullivan.

NIAGARA PENINSULA BRANCH

Geo. E. Griffiths, m.e.i.c. - *Acting Secretary-Treasurer*
C. G. Cline, m.e.i.c. - - *Branch News Editor*

On January 24th, the Branch held a dinner meeting at the Leonard Hotel, St. Catharines, with an attendance of 45. In the absence of the branch chairman, C. H. McL. Burns, the vice-chairman, A. L. McPhail, presided.

The speaker of the evening was R. W. Angus, professor of mechanical engineering at the University of Toronto. He was introduced by J. B. McAndrew. The subject was **The History of the Development of Water Turbines and Pumps.** Professor Angus began with an interesting account of the pioneers in hydraulics. Archimedes (287-212 B.C.) developed the science of hydrostatics and also made use of the block and tackle, the screw and the lever. Vitruvius (85 B.C.) and Frontinus (35 A.D.) helped to build and operate the nine aqueducts at Rome and have left us interesting accounts of their work. Leonardo da Vinci (1452-1519 A.D.) was a versatile genius, being at once artist, sculptor and engineer. In New York city there is a display of models made from the drawings preserved in his note-books, including canals, churches, double-acting pumps, gear wheels, guns, a flying machine, parachute, air-pump and saw-mill.

This introduction was followed by a set of lantern pictures, including early examples of undershot, overshot and breast water wheels, with both straight and curved vanes; Fourneyron and Francis turbines; propeller and Kaplan type runners; and Pelton wheels. Also, there were views of a number of modern power plants in both Europe and North America which had been visited by the speaker. He showed also a shorter series of pictures illustrating in a similar manner the development of the pump.

A vote of thanks to the speaker was moved by W. R. Manock.

OTTAWA BRANCH

R. K. Odell, m.e.i.c. - *Secretary-Treasurer*

The annual meeting of the Ottawa Branch was held on Thursday evening, January 9, 1941, at the auditorium of the National Research Council building, Sussex Street. Reports for the past year were presented and officers elected for the forthcoming year. W. H. Munro, retiring chairman, presided and in his retiring address referred to the branch having had a most successful year.

W. L. Saunders reported for the membership committee.

The report of the Proceedings Committee, by W. H. Norrish, stated that twelve meetings, including the annual meeting of the branch, were held during the year. Of these, eight were luncheon meetings, one of which was held at the Ottawa Technical High School. Of the evening meetings, two were held jointly with the Ottawa Branch of the Canadian Institute of Mining and Metallurgy. The average attendance for all meetings was 107 and many outside engineers temporarily stationed in Ottawa were freely welcomed to the luncheons and other meetings.

L. A. Wright of Montreal, general secretary of the Institute, was present at the meeting and spoke briefly. He referred to the steady increase in membership of the Institute, stating it was now the highest in fifteen years.

After the business of the annual meeting proper was concluded, Dr. Charles A. Robb, professor of mechanical engineering of the University of Alberta at the time of the outbreak of the present war, and now power consultant of the Munitions Branch, Department of Munitions and Supply, gave an address on **Gauges for Mass Production.**

Through the courtesy of Dean C. J. Mackenzie, acting president of the National Research Council, the members inspected the gauge laboratory where some of the methods of testing gauges were explained.

At the close of the meeting light refreshments were served.

At the noon luncheon at the Chateau Laurier on Thursday, January 30, Alan Hay, engineer of the Ottawa Suburban Roads Commission and consulting engineer for the Federal District Commission, told of the organization so far undertaken in Ottawa and vicinity in the matter of **Air Raid Precautions.** The luncheon was under the chairmanship of W. H. Munro, immediate past chairman of the branch.

In Canada air raid precaution work is being carried on through national, provincial and local committees, mostly on a voluntary basis so as to ensure a normal or nearly normal functioning of life and services in the case of emergency. It is the aim in carrying out these precautions to maintain the morale of the public, to keep down panic, to educate the average individual how he can protect himself, and to allow certain individual volunteers to take training to fit themselves for greater service.

A national committee under the chairmanship of Dr. R. E. Wodehouse, deputy minister of the Department of Pensions and National Health, has been actively engaged in this work for the past two years, with parallel efforts undertaken by the Saint John Ambulance Association which has trained a great many people so that they may be available as instructors. Actually, two or three weeks before the war, officials from the Department travelled from coast to coast in the interests of air raid precaution work, particularly in connection with the coast cities, so that immediately war was declared some of them could have readily carried out blackout operations. Some of these cities, stated Mr. Hay, have now reached a stage of preparation quite comparable to that of most cities in the British Isles.

The organization for the Ottawa district is somewhat different from that of some of the other cities on account of the individual conditions prevailing here, including the fact that it is the seat of the federal government and also lies astride an inter-provincial boundary between two provinces. The federal location accordingly extends on both sides of the Ottawa river including Britannia, Deschenes, Hull cement works to the Gatineau Mills, Rockcliffe airport, the National Research Council location on the Montreal Road, and Billings Bridge, or 55 square miles in all. A main committee on policy for the district includes the heads of the various municipalities embraced, as well as others prominent in municipal life, with Fred Bronson, chairman of the Federal District Commission, as chairman of the committee. Working committees under this main committee look after, respectively, municipal engineering, fires, police duties, medical health, and public utilities, with a sixth committee consisting of the chairman of the other five to prevent duplication of effort and to co-ordinate the work. Mr. Hay himself is chairman of this sixth committee.

Mr. Hay detailed the duties of these various committees. The municipal engineering committee, for instance, is in charge of ordinary repair services and has to consider ways and means of restoring services that may be affected. Under the fire chief's committee, consideration is being given to the use of small type apparatus for the fighting of small fires. For instance, small fires can be fought with a pail of sand and a small shovel, and in England such equipment is practically a household necessity. Also there are pumps that can be carried by hand and used from any emergency water source, even to a bucket of water.

Regarding the efficacy of different types of shelters Mr. Hay could not speak from first hand knowledge. He felt, however, that Canada's geographical situation, the more open dispersal of population in the Canadian cities, the backyards and front lawns, and the type of construction of Canadian homes rather favoured the people of this country. Shelters naturally fell into two types of design, (1) concealment and (2) protection. Concealment may be effected by taking advantage of natural topography such as an erection against a hillside, in the shadow of trees, or by decentralizing plants so that individual units are in out-of-the-way places. Another idea here in factory construction is the "Ribbon" principle following the production line, so that if one part is hit production may be detoured. Regarding protection there has been considerable controversy on the relative merits of large and small shelters. The large shelter can be built at a lower cost per individual, and keeps up morale in affording opportunity for community efforts and singsongs. But to be safe it should be 50 feet underground or have a three-feet thick roof. For economic reasons large shelters in most Canadian cities would be far apart and so small shelters would also have to be built.

Relative danger during air raids has been worked out as follows: outside and standing up in the open, 100 per cent danger; outside and lying down in the open, 50 per cent; in a frame house, 30 per cent; in a protected brick house, 12 per cent; in a reinforced basement, 5 per cent; in an Anderson shelter, 2 per cent; and in a heavy concrete shelter, no danger.

After Mr. Hay's address was concluded, Acting Chairman W. H. Munro called on Dr. R. E. Wodehouse, who was present, to address the meeting briefly. Dr. Wodehouse referred to the plight of localities that had believed that "it can't happen here" and indicated the course of preparations in this country. Incidentally he mentioned that underground shelters should have zigzag entrances. "A direct entrance invites trouble," he stated. Also, already England has made over sixty million gas masks. Interest in gas masks over there had waned for a time but now with the threat of invasion and the possibility of gas being included, it has revived greatly.

QUEBEC BRANCH

Paul Vincent, m.e.i.c. - *Secretary-Treasurer*

Lundi soir, le 27 janvier, nous avions le plaisir d'entendre Monsieur Robert Dorion, m.e.i.c., nous parler de **L'Administration Municipale par un Ingénieur-Gérant.**

Depuis la crise économique de 1929, commença le conférencier, les principales cités et villes ouvrières de la province de Québec ont subi l'assaut du chomâge avec un déplorable résultat sur leurs finances et leur administration. Après dix ans de ce système plus ou moins néfaste, dit-il, les corps publics en sont venus à se demander quel serait le meilleur mode d'administration permettant d'éviter et de corriger si possible les abus et les excès du passé.

Monsieur Dorion nous prouva que le meilleur système administratif des cités et villes est bien celui de la gérance, surtout par un ingénieur. L'ingénieur-gérant est un officier exécutif; c'est lui qui fait exécuter les règlements passés au Conseil. Le gérant exécute et le Conseil légifère. Le gérant est aussi l'agent de liaison entre les membres du Conseil et les différents corps publics. Il s'intéresse au budget, il vérifie les dépenses et les revenus.

Dans la province de Québec, 15 villes ont adopté le système de gérance. Ce sont: Westmount, Outremont, Verdun, Mont-Royal, Lachine, Montréal-Est, St-Lambert, Arvida, La Tuque, Grand'Mère, Shawinigan Falls, Valleyfield, Val d'Or, Baie Comeau et Témiscamingue.

Il est intéressant, dit le conférencier, de noter que pas une de ces villes ayant adopté l'administration par gérant ne l'a abandonnée. Aux Etats-Unis ce système de gérance fut inauguré en 1908; aujourd'hui on compte 516 villes ainsi administrées.

L'ingénieur-gérant, dit en terminant M. Dorion, doit être un administrateur, non un dictateur.

Le conférencier répondit avec plaisir aux questions que lui posèrent quelques-uns des membres dans l'auditoire.

Monsieur Adhémar Laframboise avait presenté M. Dorion, et il fut remercié par Monsieur Lucien Trempe. Monsieur L. C. Dupuis, président de la Section de Québec, occupait le siège présidentiel.

The successful social gathering innovated last year was repeated this year in a more formal way.

The Quebec Branch held a ball at the Quebec Winter Club on Saturday evening, February 8th. At this **Fête Annuelle,** various forms of entertainment were provided throughout the evening and the guests danced to the or-

Quebec Branch annual dance, Quebec Winter Club.

chestra of Georges Amyot. For those who did not dance, there was bridge in the card room.

Through the fine collaboration of Messrs. Alex.L ariviere, Léo Roy, Gérald Molleur, Roland Lemieux, Chas. H. Boisvert and Gustave St-Jacques, the success of this formal gathering exceeded that of last year. One hundred and seventeen people kept their gay spirit all evening and they went home with reluctance.

During the buffet served in the lounge of the club, Messrs. L. C. Dupuis and E. D. Gray-Donald, respectively chairman and vice-chairman of the branch, thanked the members for their fine co-operation.

All present expressed their enchantment and their desire of making this kind of activity an annual affair.

SAULT STE. MARIE BRANCH

C. A. Evans, Jr. e.i.c. - *Secretary-Treasurer*
N. C. Cowie, Jr. e.i.c. - *Branch News Editor*

The first general meeting for the year 1941 was held in the Grill Room of the Windsor Hotel at 6.45 p.m. on Friday, January 31st, 1941, when 24 members and guests sat down to dinner. The business portion of the meeting began at 8.00 p.m. with Chairman E. M. MacQuarrie occupying the chair. The minutes of the Annual Meeting were read and adopted.

The chairman then called upon T. F. Rahilly, general manager of the Algoma Steel Corporation, to introduce the speaker of the evening, Mr. L. F. McCaffery of the Algoma Steel Corporation. Mr. Rahilly in a few words told of Mr. McCaffery's fitness to talk on the subject, **The Installation and Operation of Continuous Strip Mills,** as the speaker had charge of some of the biggest plants in America. Mr. McCaffery's address was illustrated with motion pictures.

At the conclusion of the showing of the films, the secretary was asked to write the United Engineering Company of Pittsburgh, Pennsylvania and thank them for their courtesy in supplying us with the films.

TORONTO BRANCH

J. J. Spence, m.e.i.c. - *Secretary-Treasurer*
D. Forgan, m.e.i.c. - *Branch News Editor*

Students' Night has been a successful feature on the programmes of the Toronto Branch for several years past. This year it was held during the meeting of January 16th, which took place in Hart House. As has been the case in previous Student Nights, the meeting was principally devoted to the presentation of papers by members of the student body. This one was no exception to the general run, and displayed a high level of excellence in the subject matter and in the presentation of the individual papers.

About forty members of the branch assembled to hear the six prize-winning papers which had been selected out of a much larger number of contestants by the Engineering Society. Experience has shown that more than this number cannot properly be presented in the time normally available for a Branch meeting.

The branch chairman, Nicol MacNicol, presided and introduced the speakers, whose subjects were: J. W. Ames—**Future Trend in Aircraft Design**; B. Etkin—**Estimation of Aircraft Performance**; W. D. Ramore—**A Modern Method of Placing Concrete**; P. B. Smith—**Relay Protection of Transformers**; G. M. Nixon—**The Co-Axial Cable in Telephone Transmission**; D. P. MacVannell—**Wind Tunnel Testing.**

At the conclusion of the papers and while the judges (Messrs. A. B. Cooper, J. Grieve, D. G. Geiger) were considering the relative merits of the papers, moving pictures were shown, the principal of these being a film in technicolour showing the manufacture of nylon, rayon, and similar products. Just previous to this the Institute prize awarded to the best third year man was presented by Mr. Smithers to the winner, B. K. Smith.

One outstanding feature of the programme was the large proportion of the papers devoted to aeronautical subjects, an indication perhaps of present trends and of the future direction of much engineering practice. Another was the manner in which the papers were presented by their authors. Ease, confidence and clarity characterized the delivery of each contestant, and the use of notes was practically negligible. In his concluding remarks the chairman voiced the feeling of many of the older engineers in regard to the impressions they received, comparing the present training and capabilities of students along these lines to those generally prevailing in the days when the old timers attended university.

VANCOUVER BRANCH

T. V. Berry, m.e.i.c. - *Secretary-Treasurer*
A. Peebles, m.e.i.c. - *Branch News Editor*

A programme meeting of the Vancouver Branch was held on Monday, January 20th, at the University of British Columbia. Addresses were given by two members of the university faculty, F. A. Forward, associate professor of metallurgy, and W. O. Richmond, assistant professor of mechanical engineering.

Professor Forward spoke on **The Heat Treatment of Steel.** He dealt chiefly with the structure of metals and alloys and the principles which govern heat treating techniques, rather than with the techniques themselves; pointing out that an understanding of these principles is prerequisite to the development of successful alloying or heat treating processes.

All metals are crystalline in structure, and the nature of the crystals determines the physical properties which the metal will develop. Changes take place in the size and alignment of the crystals when a metal is heated or when it is worked by rolling, and some of these changes are stable while others will revert when the metal returns to normal temperatures. The crystal structure of irons and steels is a simple one, while that of most non-ferrous metals is more complex and in the case of alloys the structure is highly intricate. Some crystals are cubic in form, that is, the atoms are arranged in a manner which builds into a cube-shaped crystal, in some cases large enough to be identified through the microscope. The atomic arrangement varies within the cube in different metals but the cubic crystal remains. Other metals may have hexagonal crystals, or still more complex shapes.

Those metals exhibiting a simple crystal form are soft and malleable, while those of a complex nature are hard and brittle.

Alloys are of three general types, a mechanical mixture, metals mutually soluble in one another, or chemical compounds. The resulting crystal formation and physical properties are determined by the type of alloy, according to this grouping. The grain size of a metal is also related to its physical properties. In general, fine-grained metals are hard and brittle. At high temperatures, the grains of metal will grow in some cases, so that grain size control is an important element in the treatment of steel. Rolling will control the grain size to a considerable extent.

The rate of cooling of a metal from high temperatures is very important in hardening and tempering processes. The effect of the cooling rate can be modified by alloying with other metals, in some instances slowing the cooling changes down to a rate which permits certain working of the metal while it is in some desirable but unstable crystalline form.

The speaker illustrated the above material with lantern slides showing typical eutectoid curves and photo-micrographs of iron and steel in some of their many forms.

Professor Richmond's subject was **The Application of Material Tests to Design.**

There are three forms of loading which are considered when designing structures and structural parts. These are the static load, the variable load, and the impact load. In testing, the tensile strength test is used for static loading. From this a stress strain curve is obtained which serves as a basis for determining design stresses. In iron and steel, a well defined yield point is apparent, but in other metals the curve will be smooth with no clearly defined point beyond which permanent deformation occurs. In such cases it is difficult to select a working stress limit. In most non-ferrous metals some permanent strain occurs as soon as load is applied, and if an unloading curve is plotted it will not be coincident with the loading curve but parallel to it. A common method of selecting the design stress is to use the point on the loading curve from which an unloading curve when projected back would show a permanent strain of 0.2 per cent of the original length of the specimen.

In testing for variable loading, rapid cycles of a reversed bending stress are used. Fatigue failure results from the development of a small crack or fissure between the grain clusters in the metal, and the gradual spread of this crack to the point where rupture occurs. Metals do not crystallize due to reversed stresses, since they are always crystalline in structure. This is an erroneous idea rather widely held.

Dean J. N. Finlayson, branch chairman, presided over the meeting, and a vote of thanks was tendered by W. O. Scott, vice-chairman. About sixty members and guests attended. Following adjournment in the lecture room, the party was conducted through the mining and metallurgical laboratories where they saw demonstrations of equipment used in studying the structure and properties of metals.

VICTORIA BRANCH

Kenneth Reid, m.e.i.c. - *Secretary-Treasurer*

The annual meeting of the Victoria Branch was held at Spencer's Dining Room, Victoria, on January 17th, 1941, with E. W. Izard presiding. The meeting was preceded by the usual dinner at 6.30 p.m.

Following the dinner the presentation of the annual reports and the financial statement were made by the chairman and the secretary. These showed the branch to be in a very healthy state with a small surplus over operating expenditure in spite of considerable increased activity in the way of branch meetings during the past year.

The election of officers for the year 1941 resulted in the election of G. M. Irwin, Victoria City engineer as chairman and A. S. G. Musgrave, engineer of the Municipality of Oak Bay, as vice-chairman. Kenneth Reid, engineer with the Victoria City Light Department, was returned as secretary-treasurer for the seventh consecutive term. Other members elected to the executive committee were J. H. Blake, Provincial Forestry Department, A. L. Ford, (retired), and B. T. O'Grady, of the Provincial Department of Mines.

Following the meeting the members of the branch were entertained by Mr. D. S. Scott with several reels of motion pictures, one on the sinking of the Graf Spee, and others depicting the nesting habits of wild fowl around Victoria and vicinity, including sea-gulls and cormorants, which proved most interesting. At the conclusion of the meeting a hearty vote of thanks was extended Mr. Scott for his very fine pictures.

WINNIPEG BRANCH

C. P. Haltalin, m.e.i.c. - *Secretary-Treasurer*

The annual meeting of the Winnipeg Branch of the Institute was held on February 6th, 1941.

After the chairman's address the various committee reports were read and approved.

Professor G. H. Herriott moved a hearty vote of thanks to the retiring chairman, Mr. H. L. Briggs, for his excellent work for the Branch during the year.

The scrutineers' report showed the following branch officers elected for the year 1941—Immediate Past Chairman: H. L. Briggs; Chairman: V. Michie; Secretary-Treasurer: C. P. Haltalin; Executive Committee: C. V. Antenbring, H. B. Brehaut, J. T. Dyment, H. W. McLeod, T. E. Storey; Chairman of the Membership Committee: Mr. E. S. Braddell; Chairman of the Programme Committee: Mr. S. G. Harknett.

At the conclusion of the business of the annual meeting a sound film entitled "There is a Difference" was shown by courtesy of Mr. L. A. Rodgers of the Winnipeg District Office of the Canadian General Electric Company.

Refreshments were served following the adjournment.

News of Other Societies

Items of interest regarding activities of other engineering societies or associations

ASSOCIATION OF PROFESSIONAL ENGINEERS OF THE PROVINCE OF ONTARIO

The seventh general meeting of the Association of Professional Engineers of the Province of Ontario was held in the Roof Garden of the Royal York Hotel, Toronto, on Saturday afternoon, January 18th, 1941. The retiring president, Mr. J. W. Rawlins, occupied the chair.

In a few brief remarks the chairman welcomed not only the members of the Association, but also the members of the Dominion Council of Professional Engineers who were present. He called upon Mr. D. A. R. McCannel of Regina, president of the Dominion Council, to introduce the members of his Council to the gathering. Mr. J. C. Oliver, registrar of the British Columbia Association of Professional Engineers, was also welcomed to the meeting.

Mr. Rawlins briefly reviewed the activities of the Association during the past year, mentioning the fact that the net increase in membership for the year was 124, while the increase in recorded engineers-in-training was 133. He further stated that the Association had granted bursaries to the value of $100.00 each at the University of Toronto and at Queen's University. Detailed reports were given by the chairmen of the various committees of Council.

Mr. S. R. Frost, president-elect, reported that the Association had, after consideration by a special committee of Council, offered its assistance to the Royal Society of Canada in making a survey of the resources of our country.

In the absence of Dr. A. H. Harkness, chairman of the Committee of Consultants, his report was presented by E. A. Cross; after which Professor L. T. Rutledge presented the report of the Committee on the Recording of Engineers-in-Training. He pointed out that provisions were being made for the recording as engineers-in-training of graduates, undergraduates and students serving under articles who have insufficient experience to be granted registration.

Mr. S. R. Frost presented the report of the Finance Committee which indicated the healthy financial position of the Association.

The report of the Publicity Committee was presented by Mr. R. A. Elliott; Mr. W. C. Miller presented the report of the Legislation Committee; Mr. J. Clark Keith, the report of the Committee on By-Laws and Code of Ethics; and Mr. N. G. McDonald, the report of the Board of Examiners. Mr. D. A. R. McCannel briefly reviewed the activities of the Dominion Council during the past year.

The highlight of the meeting was the report presented by Mr. W. P. Dobson, chairman of the special committee on the remuneration of salaried engineers. In this report, the committee requested that the Association recommend the principle "Job Evaluation" as a fair criterion in determining the salaries of employees and render every assistance possible to corporations endeavouring to use this principle in their plants. Mr. J. O. Arrowsmith, explained the meaning of "Job Evaluation" and used lantern slides for illustration.

Mr. A. E. MacRae of Ottawa moved a vote of thanks to the 1940 Council for the excellent report which they gave of their activities and stated that the membership was indebted to them for the time they had devoted to the affairs of the Association. He paid particular tribute to Mr. Rawlins, the past-president who had been a member of Council since 1926.

In closing, Mr. Rawlins introduced the 1941 Council to the members.

Approximately 250 members were present at the dinner which immediately followed when Mr. George C. Bateman, president of the Canadian Institute of Mining and Metallurgy and Metals Controller of Canada spoke on the subject, **The Role of the Engineer in Peace and War.**

Mr. J. W. Rawlins, retiring president, occupied the chair. Grace was asked by Canon H. J. Cody, president of the University of Toronto. A toast to the sister professions was proposed by Mr. D. A. R. McCannel, president of the Dominion Council of Professional Engineers and replied to by Dr. A. B. Whytock, president of the Ontario Medical Association.

The speaker of the evening was introduced by the Hon. Charles McCrae, former Minister of Mines for Ontario. Others at the head table were: Mayor F. J. Conboy, representing the City of Toronto; A. J. Hazelgrove, representing the Ontario Association of Architects; Peter White, K.C., representing the Law Society of Upper Canada; J. Clark Keith, representing the Engineering Institute of Canada; G. E. Berkeley, representing the Ontario Land Surveyors; F. W. MacNeill, representing the Association of Professional Engineers of British Columbia; C. C. Kirby, representing the Association of Professional Engineers of New Brunswick; Major F. S. Milligan, District Engineering Officer, M.D. No. 2; Professor R. E. Jamieson, representing the Corporation of Professional Engineers of Quebec; E. P. Muntz, representing the National Construction Council; R. C. Poulter, representing the Affiliated Engineering & Allied Societies in Ontario; S. R. Frost, president-elect; W. C. Miller, vice-president-elect; W. P. Dobson, a past-president of the Association; and Lieut.-Col. A. D. LePan also a past-president of the Association.

Certificates were presented by the Chairman to the two students who had won the bursaries of the Association in 1940: Mr. V. M. Wallingford of the University of Toronto and Mr. Norman Grandfield of Queen's University.

Mr. J. W. Rawlins, the retiring president, installed into office Mr. Stanley R. Frost, the incoming president.

Meeting of the Dominion Council of Professional Engineers held at the Royal York Hotel, Toronto, on January 20th and 21st, 1941; From left to right—J. W. Rawlins, Past-President of the Ontario Association; Prof. H. R. Webb, representing the Alberta Association; P. Burke-Gaffney, representing the Manitoba Association; J. C. Oliver, Registrar of the British Columbia Association; F. W. MacNeill, representing the British Columbia Association; M. Barry Watson, Secretary-Treasurer; D. A. R. McCannel, representing the Saskatchewan Association; C. C. Kirby, representing the New Brunswick Association; F. W. W. Doane, representing the Nova Scotia Association; Prof. R. E. Jamieson, representing the Quebec Corporation and W. P. Dobson, representing the Ontario Association.

ASSOCIATION OF PROFESSIONAL ENGINEERS OF NOVA SCOTIA 1941 ANNUAL MEETING

The 1941 Annual Meeting of the Association of Professional Engineers of Nova Scotia was held in the Mechanical Laboratory Building of the Nova Scotia Technical College, Halifax, N.S., on Thursday, January 23rd, 1941, commencing at 2.30 p.m.

The president, Mr. R. B. Stewart, was in the chair and about fifty members were present.

The president reported that during the year past four meetings of the Council had been held at which the usual committees had been appointed, applications for membership considered and routine business discussed.

The agreement between the two engineering bodies of the province, which had been consumated at the 1940 joint banquet had resulted in a very close co-operation of the two. Of our present membership of 232, some 199 are members of both the Institute and the Association, and some 33, of which 12 are outside of the province and not eligible for membership in the Nova Scotia branches of the Institute, are members of the Association only.

The question of bringing the graduate engineers, who are not as yet eligible for membership, more closely in touch with the activities of the Association was given a good deal of attention during the year. A by-law with this in view drafted by a special committee and approved by Council was submitted to the Association by letter ballot at the end of the year.

In conclusion, the president thanked the members of Council for their help and co-operation during the year and especially the past president, Mr. Gray, and President-Elect Allan for their valuable help on Council.

The registrar reported a total membership of 231.

Members of Association only in the province	18
Members of Association outside of the province	12
Members of Association and E.I.C.	201
	231

Of the total joint members, 14 were admitted by direct application to the Association and 36 were admitted by application through the E.I.C. branches during the year. 79 Association members took advantage of the co-operative agreement.

Professor Copp asked the opinion of the meeting regarding the appointment of a central examining board as proposed by the Dominion Council. In this connection the president read F. W. W. Doane's report of proceedings at the last Dominion Council meeting as published in the Association's 1939 Year Book, which showed that Mr. Doane did not look very favourably on the proposition. Considerable discussion ensued and the consensus of opinion expressed seemed to indicate that our Association could not see the necessity for the appointment of a central examining board.

The financial statement showed income during the year of $2,850.86. Expenditures amounted to $2,585.51 leaving a balance for the year of income over expenditure of $265.35 which included dues paid in advance of $130.00. The balance carried from 1939 amounted to $994.50 making a deposit in the bank of $1,259.85 at December 31st, 1940.

Assets including investments, accrued interest and amounts outstanding estimated collectable $6,179.00 and liabilities nil.

The scrutineers reported on amendments to by-laws as follows:

For the amendment, 97; against the amendment, 3; spoiled ballots, 1; for officers of the Association, the scrutineers reported as follows:

President, J. L. Allan; Vice-President, D. G. Dunbar; Councillors: Dr. A. E. Cameron, Professor W. P. Copp, J. R. Morrison and J. K. McKay.

President Stewart thanked the retiring councillors for their support and warmly welcomed the newly elected president and officers of the Association.

Mr. Allan then took the chair and expressed the hope that he and the newly elected officers would be able to carry on the business of the Association as successfully as the retiring president and 1940 officers had done.

The joint banquet which followed is reported in the news of the branches section of this issue, under Halifax Branch.

ASSOCIATION OF PROFESSIONAL ENGINEERS OF ALBERTA

In accord with the by-laws, the Nominating Committee appointed following the Annual Meeting on March 30, 1940, has nominated the following slate for the vacancies to be filled on Council:

President: W. E. Cornish; Vice-Presidents: S. G. Coultis, L. C. Stevens; Civil Councillors: G. P. F. Boese, C. S. Clendening; Electrical Councillors: W. I. McFarland, R. D. Wagner; Mechanical Councillors: R. R. Couper, W. S. White; Mining Councillors: C. S. Donaldson, A. C. Dunn.

Annual Meeting

The Annual Meeting will be held on March 22, 1941, so nominations made under this clause should be in the hands of the Registrar on or before February 10, 1941.

Ballot on Classification

The Engineering Profession Act of the Province of Alberta divides the membership for voting purposes and for election of councillors, into four groups, namely: civil, electrical, mechanical and mining engineering. Modern engineering embraces so many additional branches as well as specialized subdivisions of these four main classifications, that many members felt that they were wrongly classified. A committee was appointed to study the question and the recommendation was to the effect that steps be taken to have the Act amended to abolish all such classification of members and that Council should be nominated from the membership at large.

On receipt of this report the 20th Annual Meeting, held in March, 1940, felt that it was a matter on which all members should express an opinion and that a ballot should therefore be sent out to obtain the views of all members.

The results of the ballot, canvassed last December, show that 131 members voted in favour of the abolition of the classification and 16 were against such amendment.

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

A.S.T.M. STANDARDS ON COAL AND COKE
Prepared by Committee D-5 on Coal and Coke, December, 1940. American Society for Testing Materials, Phila., Pa. 126 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $1.25.

The various A.S.T.M. methods of testing, definitions and specifications for coal and coke are brought together in convenient form, together with the standard specifications for the classification of coal according to rank and grade. Among the thirty-four standards given is one covering the sieves used for testing.

A.S.T.M. VISCOSITY INDEX TABLES. 31 pp., 50c.

A.S.T.M. CONVERSION TABLES FOR KINEMATIC AND SAYBOLT UNIVERSAL VISCOSITIES. 10 pp., 25c.
American Society for Testing Materials, Phila., Pa., tables, 9 x 6 in., paper.

The viscosity tables, which are based on the tentative method for calculating the viscosity index, provide a tabulation of the index, calculated from basic Saybolt universal viscosity, against Saybolt at 100 seconds under Saybolt values at 210 degrees fahrenheit for 40 seconds to 161 seconds.

The conversion tables, which are based on the standard method for the conversion of kinematic viscosity to Saybolt universal viscosity, provide a quick conversion. The tables range from 2.00 to 330.0 centistokes by increments of 0.01, 0.02, 0.10 and 0.20, depending on the range.

The two tables are particularly of interest in the field of petroleum products and lubricants.

AIRPLANE METAL WORK. Vol. 2: Airplane Sheet Metal Shop Practice.
By A. M. Robson. D. Van Nostrand Co., New York, 1940. 109 pp., illus., blueprints, tables, 10 x 7 in., paper, $1.25.

This book is intended for mechanics actively engaged in the aircraft industry and for prospective mechanics in training. Following a general discussion of work habits and conduct, the author presents practical information about specific job operations and shop practices, including questions and answers. There is also a full list of tool and miscellaneous equipment and other supplies for the airplane sheet-metal shop.

APPLIED CHEMISTRY FOR ENGINEERS
By E. S. Gyngell. Edward Arnold & Co., London; Longmans, Green & Co., New York, 1940. 328 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, $4.00.

The chemistry of materials and processes used by the engineer is dealt with in a practical manner. Major topics discussed are fuels and combustion, metallic corrosion, paints and varnishes, water treatment and sewage disposal, cements, and lubrication. Metallurgy is omitted because of its large scope and good coverage elsewhere. No details are given of methods of analysis or testing, but books covering these phases are included in the selected bibliographies.

AUDEL'S SHIPFITTER'S HANDY BOOK
By R. Newstead. Theo. Audel & Co., New York, 1940. 252 pp., illus., diagrs., charts, tables, 7 x 5 in., cloth, $2.00.

This practical treatise on steel shipbuilding and repairing is presented in simple form for the benefit of the average ship worker. All phases of ship construction are covered, including production planning and modern welding practice. There are a glossary of marine and shipbuilding terms, a list of terms and abbreviations for marking plates and templates, and many helpful illustrations.

(The) AXIAL ADJUSTMENT OF DEEP-WELL TURBINE PUMPS. (University of California Publications in Engineering, Vol. 4, No. 2, pp. 19-26)
By M. P. O'Brien and R. G. Folsom. University of California Press, Berkeley and Los Angeles, Calif., 1940. 25 pp., illus., diagrs.k charts, tables, 11 x 18 in., paper, 25 cents.

The effect of axial adjustment on deepwell turbine pumps is considered to depend upon the impeller design. Results of experimental investigations are presented showing the effect and reactions with both semi-open and closed impellers.

COFFERDAMS

By L. White and E. A. Prentis. Columbia University Press, New York, 1940. 273 pp., illus., diagrs., charts, maps, tables, 9½ x 6 ins., cloth, $7.50.

Based largely on experience gained by the authors during several years of work along the Mississippi River, this practical manual contains the essentials of scientific cofferdam construction. Hydrodynamic considerations, erosion and earth pressures are discussed as well as the construction of representative types. The book is well illustrated and contains a brief glossary and a bibliography.

(The) DESIGN OF HIGH PRESSURE PLANT AND THE PROPERTIES OF FLUIDS AT HIGH PRESSURES

By D. M. Newitt. Clarendon Press, Oxford, England; Oxford University Press, New York, 1940. 491 pp., illus., diagrs., charts, tables, 10 x 6 in., cloth, $10.00.

The first part of this book is devoted to the kinds and properties of materials used in the construction of high-pressure plant and equipment, the calculation of the stresses and strains which must be dealt with, practical design data and the measurement of high pressures. In part II the pressure-volume-temperature relationships of gases and liquids, the equation of state problem and the influence of pressure upon such properties as viscosity, solubility and refractivity are discussed. Details of experimental methods and procedure are given where necessary, and numerous illustrations and tables of data are included in the text and in appendixes.

ELECTRICAL MEASUREMENTS AND MEASURING INSTRUMENTS

By E W. Golding. 3 ed. Sir Isaac Pitman & Sons, London; Pitman Publishing Corp., New York, 1940. 828 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, $7.50.

Originally designed to cover the knowledge required for certain British examinations, this textbook has been expanded to meet the requirements of electrical engineers in general. The theory and use of all types of electrical measuring instruments and methods are comprehensively covered, including the mathematical derivations for wave-forms and transient phenomena. Refcrence bibliographies appear at the ends of the chapters, and there is a large group of examination questions with answers.

ELECTROMAGNETIC THEORY

By J. A. Stratton. McGraw-Hill Book Co., New York and London, 1941. 615 pp., diagrs., charts, tables, 9 x 6 in., cloth, $6.00.

In this advanced text the author places primary emphasis on dynamic rather than static field theory, postulating Maxwell's equations from the outset. A mathematical formulation of the general theory is followed by a comprehensive investigation of energy and stress relations. The properties of static fields are then discussed, and the rest of the book is devoted to the propagation of plane, cylindrical and spherical waves, the theory of radiation, and boundary-value problems. There are groups of illustrative problems.

ELEMENTARY ENGINEERING THERMODYNAMICS

By V. W. Young and G. A. Young. 2 ed. McGraw-Hill Book Co., New York and London, 1941. 243 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $2.75.

This textbook presents the fundamental theoretical basis for an accompanying course in practical heat engineering. All important topics are covered in a simple, concise manner, with many illustrative examples. The new edition makes use of the more modern Keenan and Keyes steam tables, which were not available for the first edition.

EXPLORATION GEOPHYSICS

By J. J. Jakosky. Times-Mirror Press, Los Angeles, Calif., 1940. 786 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $8.00.

The chief object of this book is to describe the fundamental theories, equipment and field techniques of the recognized exploratory geophysical methods, and to illustrate their application to problems of economic geology. An early chapter presents the geologic and economic background, and succeeding chapters deal respectively with magnetic, gravitational, electrical, siesmic, geochemical and geothermal methods. Drill hole investigations and oil well production problems are also considered. In addition to literature references in the text there is a patent bibliography appended to each chapter.

EXTERIOR BALLISTICS, a reprint of Chapters X and XII from "Elements of Ordnance"

By T. J. Hayes. John Wiley & Sons, New York, 1940. 98 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $1.00.

This pamphlet contains two chapters of Hayes's "Elements of Ordnance", the textbook used by cadets at West Point. These chapters deal with Exterior Ballistics and Bombing from Airplanes, two subjects of direct interest in courses of study connected with the national defense programme. The reprint makes the text available at a modest price.

GEAR DESIGN SIMPLIFIED

By F. D. Jones. 2 ed. Industrial Press, New York, 1940. 139 pp., diagrs., charts, tables, 11½ x 8½ in., cloth, $3.00.

The book consists of a series of charts which illustrate, by simple diagrams and examples, the solution of practical problems of gear design. The types included arc spur, straight-tooth and spiral-bevel, helical, herringbone and worm gears. Information is also provided upon the determination of gearing ratios and speeds and on the power-transmitting capacity of gears. This second edition also contains definitions, a method for checking spur gears, and a table of steels for industrial gearing.

GEOPHYSICAL EXPLORATION

By C. A. Heiland. Prentice-Hall, New York, 1940. 1,013 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $10.00.

This book is intended as a comprehensive survey of the entire field of geophysical exploration, emphasizing the relations, differences, common features and fundamentals of geophysical methods. The elementary first part describes working principles and geological applications for those not directly concerned with field or laboratory operations. The second and major part discusses the subject from an engineering viewpoint, presenting theory, field technique, laboratory procedure and geological interpretations for gravitational magnetic, seismic and electrical methods. Consideration is also given to minor methods and to geophysical well testing.

HIGH POLYMERS. Vol. 2. PHYSICAL CHEMISTRY OF HIGH POLYMERIC SYSTEMS

By H. Mark. Interscience Publishers, New York, 1940. 345 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.50.

This book gives a survey of the physical and chemical methods which have proved necessary and effective in the preparation, purification, examination and elucidation of the structure of the high polymers. It shows how and with what restrictions the fundamental laws of physical chemistry can be applied to this group of chemical compounds which play such an important role in science and industry as plastics, proteins, rubber, etc. The text material is well documented.

HISTORY OF GEOMETRICAL METHODS

By J. L. Coolidge. Clarendon Press, Oxford, England; Oxford University Press, New York, 1940. 451 pp., diagrs., tables, 10 x 6 in., cloth, $10.00.

The methods which men have invented throughout the centuries to deal with geometrical questions are considered under three main headings: synthetic geometry, the earliest type which considers figures directly; algebraic geometry, including co-ordinate systems; and differential geometry. The work of the important pioneers in each field has been emphasized. There is a large bibliography.

HOISTING MACHINERY

By W. H. Atherton. Technical Press, London, 1940. 314 pp., illus., diagrs., charts, tables, 10 x 6 in., cloth, 32s. 6d.

This practical volume deals with the design, construction, maintenance and uses of the types of material handling equipment which perform intermittent short-range movements: cranes, derricks, grabs, skip hoists, stackers, telphers and transporters. There are many helpful illustrations, and literature references appear both in the text and in a brief bibliography at the end.

HOUSING FOR DEFENSE

By M. L. Colean. Twentieth Century Fund, 330 West 42nd St., New York, 1940. 198 pp., diagrs., tables, charts, maps, 9½ x 6 in., paper, $1.50.

The problems and experience with regard to housing during the last war are described, with considerable attention to the resulting government policies. The present situation is compared with the past. The relation between housing and the location of defense activities is emphasized, and community problems are discussed. The final chapters deal with the construction and financing of new housing, the relative parts to be played by private and governmental agencies, and the recommendations of the housing committee.

INTRODUCTION TO THE KINETIC THEORY OF GASES

By Sir J. Jeans. The Macmillan Co., New York; University Press, Cambridge, England, 1940. 311 pp., diagrs., charts. tables, 9 x 5½ in., cloth, $3.50.

This book provides such knowledge of the kinetic theory as is required by the serious student of physics and physical chemistry. In the discussions of pressure in a gas, molecular collisions, viscosity, heat conduction, diffusion, etc., the emphasis is on the physicist's needs although the mathematical student will find the necessary basic material from which to proceed to more specialized study.

LACQUER AND SYNTHETIC ENAMEL FINISHES

By R. C. Martin. D. Van Nostrand Co., New York, 1940. 526 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $5.20.

The subject of discussion is the cellulose nitrate and acetate basic lacquers and synthetic enamels as developed in the twentieth century. Part I deals with nitrocellulose, solvents, plasticisers, resins and synthetic compounds, and pigments. Parts II and III cover plant and equipment, requirements, types, formulation, laboratory and field tests, and faults and corrections. Part IV describes methods of application and the finishing of furniture and motor cars. There is a very large glossary of paint, varnish, lacquer and allied terms.

LOCOMOTIVES ON PARADE

By E. Hungerford. Thomas Y. Crowell Co., New York, 1940. 236 pp., illus., woodcuts, diagrs., charts, 9 x 6½ in., cloth, $2.50.

The history of one of the very important mechanical contributions of the last century, the steam locomotive, is told in layman's language. The successive types that evolved are described, including famous individual representatives and the men whose insight and mechanical genius made them possible. There are many photographs and line drawings.

(THE) METER AT WORK

By J. F. Rider. John F. Rider, Publisher, New York, 1940. 152 pp., illus., diagrs., charts, tables, 9 x 5 in., cloth, $1.25.

This practical book for servicemen and others who employ electric meters in radio and allied electronic arts describes how each type of meter works, how each is used in the field, how to increase efficiency and how to select new meters. An unusual method of book construction, which places the illustrations above and separate from the text, makes reference from one to the other more convenient.

MODERN AIR CONDITIONING, HEATING AND VENTILATING

By W. H. Carrier, R. E. Cherne and W. A. Grant. Pitman Publishing Corp., New York and Chicago, 1940. 547 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $4.50.

The whole field of interior conditioning is covered in this manual, which is designed to apply existing theory to actual practice in the industry. Basic theories are explained, but emphasis is placed on the engineering principles and design of equipment. Comfort and economic factors are also considered. Practical examples are presented and worked out in detail, and many useful tables and charts have been collected in an appendix.

MODERN ROAD EMULSIONS

By F. H. Garner, L. G. Gabriel and H. J. Prentice. 2 ed. Road Emulsion and Cold Bituminous Roads Association Ltd., 11 Bow Church Yard, London, E.C.4, 1939. 245 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, 10s.

The purpose of this book is to present the underlying principles and properties of bituminous emulsions and their behavior on the road. Some historical material, methods and plant for the transport and application of emulsions, and many tests and specifications are also included. There is a bibliography.

NATIONAL ELECTRICAL CODE HANDBOOK

By A. L. Abbott. 5 ed. McGraw-Hill Book Co., New York and London, 1940. 595 pp., illus., diagrs., charts, tables, 7½ x 4½ in., lea., $3.00.

The provisions of the National Electrical Code are discussed and their practical application is explained. These provisions are grouped into six major divisions: definitions of terms; approved types of wiring; installation of materials and apparatus; general requirements applying to all wiring systems; special cases; and construction of materials. The present edition is based on the 1940 Code.

PHYSICS OF THE AIR

By W. J. Humphreys. 3 ed. McGraw-Hill Book Co., New York, 1940. 676 pp., illus., diagrs., charts, maps, tables, 9½ x 6 in., cloth, $6.00.

This text provides a comprehensive account of the facts and theories relating to the mechanics and thermodynamics of the atmosphere, to atmospheric electricity, acoustics and optics, and to the factors that control climate. This edition has been revised to include recent information.

POWER IN TRANSITION

By E. R. Abrams. Charles Scribner's Sons, New York, 1940. 318 pp., maps, tables, 8½ x 5½ in., cloth, $3.00.

The development of the electrical utilities is briefly described up to the peak of private operation. In the succeeding chapters the growing tendency toward public control is considered. Some sixty major power projects are analyzed, their history through Congress is traced, engineering problems are discussed, and the resources, requirements and expectations of the several regions to be served are carefully detailed. Probable effects of these developments of the national power policy are briefly pointed out in a final chapter. There are chapter bibliographies.

PRACTICAL TUNNEL DRIVING

By H. W. Richardson and R. S. Mayo. McGraw-Hill Book Co., New York and London, 1941. 436 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $5.00.

This practical text and reference book for engineers and contractors covers all phases of tunneling and all kinds and classes of tunnels. All steps, from the engineering fundamentals to completion of the project, are considered, including full discussion of location, investigation and planning of the project, design, construction and economics. Attention is paid to such practical details as track layout, size of cars, timbering, explosives, etc., and there is a brief history of tunneling.

PRELIMINARY AIRPLANE DESIGN

By R. C. Wilson. Pitman Publishing Corp., New York and Chicago, 1941. 67 pp., diagrs., charts, tables, 8½ x 5 in., cloth, $1.00.

This brief, simple text is based upon the practical procedure used as a guide for instruction at the Air Corps Engineering School at Wright Field. All preliminary design factors are considered, and an appendix contains sample data sheets and weight control tables.

SEWAGE-TREATMENT WORKS

By C. E. Keefer. McGraw-Hill Book Co., New York, 1940. 673 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $6.00.

The administration and operation of sewage plants are discussed in a thorough, practical manner, with emphasis on the processes of treatment that are in wide use today. The author describes the various types of modern equipment, tells how they perform, outlines operating methods and discusses costs. The quantity and composition of sewage from institutions, municipalities and industrial plants are also given.

STEEL CASTINGS HANDBOOK

Steel Founders' Society of America, Cleveland, Ohio, 1941. 503 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $2.00.

Full of diagrams, data tables and photographs, this practical handbook covers the cast-steel industry from history to commercial applications. The physical, mechanical and engineering properties of carbon and low alloy cast steels are given in detail; production and heat-treatment methods are described; design procedure is considered; and a glossary of foundry terms is included. There are chapter references.

STORAGE BATTERIES

By G. W. Vinal. 3 ed. John Wiley & Sons, New York, 1940. 464 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $5.00.

This standard textbook is a comprehensive treatise on the theory of batteries, charging methods and equipment, the care of batteries and remedies for troubles encountered. The physical and chemical properties of storage battery materials are discussed, and manufacturing methods are described. There is a long chapter on present-day uses for storage batteries. The present edition has been considerably revised.

STRESS ANALYSIS AND DESIGN OF ELEMENTARY STRUCTURES

By J. H. Cissel. John Wiley & Sons, New York, 1940. 335 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $4.00.

Fundamental and practical material which would generally be of value to an engineer in any field is presented in this textbook, which is primarily intended for engineering students other than civil. The section on stress analysis covers external forces and loads, graphic statics, beams, trusses, masonry structures and foundations. The elementary design section covers structural fastenings and connections, timber, steel and reinforced concrete beams and columns.

TEXTILE RECORDER YEAR BOOK, 1940

Edited by W. Hubball and others. Harlequin Press, Manchester, England. Illus., diagrs., charts, tables, 7 x 5 in., cloth, 10s. 6d.

Encyclopedic in scope, this annual publication furnishes technical information upon the production, preparation, spinning, weaving, dyeing and finishing of all textile fibers. There are also sections on hosiery and knitting, microscopy and testing, and power transmission. Patent and trade mark information is given, and a classified list of recently introduced textile machines and appliances is included.

THOMAS' REGISTER OF AMERICAN MANUFACTURERS, 31st ed., Dec., 1940

Thomas Publishing Co., New York, Boston, Phila., San Francisco, Toronto, Can., 1941. 5,000 pp., illus., 14½ x 9 in., cloth, $10.00 to former subscribers, $15.00 to new subscribers.

This huge annual directory of American manufacturers has its customary three main sections: the classified directory of products (with index) in which the firms are listed, with capital ratings, geographically under each product; the alphabetical list of manufacturers, giving addresses, subsidiaries, branches, etc.; and the trade name index. The innovation, introduced in the previous edition, of assigning arbitrary numbers to advertisers, including a "key" index, has been expanded in the present volume.

TRENDS IN INDUSTRIAL PENSIONS (Industrial Relations Monograph No. 5)

By M. W. Latimer and K. Tufel. Industrial Relations Counselors, New York, 1940. 88 pp., tables, 9½ x 6 in., paper, $1.00.

The objectives of this monograph, which analyzes some 350 active company pension plans, are: first, to determine whether the characteristics and trends of pension systems have changed in the last seven years, and, if so, in what direction; second, to analyze the growth or decline and the present extent of the voluntary pension movement; and third, to consider the adaptation of private pension systems to governmental old age insurance legislation. The numerical findings of the investigation appear in a group of tables.

WELDING METALLURGY. Vols. 1 and 2

By O. H. Henry and G. E. Claussen. American Welding Society, New York, 1940. 359 pp., illus., diagrs., charts, tables, 8 x 5 in., cloth, $1.50.

Intended to familiarize members of the welding industries, including fabricators and designers, with the metallurgical aspects of the welding process, this book deals with the structure, properties and composition of welded materials. It shows how the steel is affected by varied conditions of heat and stress, explains heat treatment procedure and points out the way in which metallurgy can be used to control the welding process.

BIBLIOGRAPHY ON AIRPLANE HANGARS

Current interest in all matters connected with aviation has prompted the Engineering Societies Library to prepare a list of references on the Design and Construction of Airplane Hangars. The list includes one hundred articles selected from those published during the years 1928-1940 in the leading domestic and foreign periodicals, and contains material on both steel and reinforced concrete structures. Copies may be obtained by sending two dollars to Engineering Societies Library, 29 West 39th Street, New York.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

February 25th, 1941

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in April, 1941.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AGNEW—ELLIS A., of Hamilton, Ont. Born at Toronto, Ont., April 4th, 1900; Educ.: B.A.Sc., Univ. of Toronto, 1924; 1924-29, technical control of mfg., The Carborundum Co., Niagara Falls, N.Y.; 1929-32, plant supt., Lion Grinding Wheels Ltd., Brockville, Ont.; 1932 to date, vice-president i/c of engrg., design and mfg. of stokers, and ventilating and air conditioning equipment, Livingston Stoker Co. Ltd., Hamilton, Ont.

Employment Service Bureau

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

SITUATIONS VACANT

ENGINEER with pulp and paper experience to become Assistant Chief Engineer in a large mill. Either a man who can fit into the position immediately, or a younger man who has the training and ability to work into it gradually. The initial salary to be paid will depend upon the qualifications of the applicant. This position holds an interesting future for the right man. Send applications with full particulars to Box No. 2209-V.

REQUIRED for large gold mining organization in West Africa, several mill shiftmen, mill men and electricians. Salaries up to £40, £32 and £40 respectively per month, free living quarters. Ocean passage paid and three months' leave granted per year at half pay. Yearly renewable contracts. Defence regulations do not permit wives to accompany husbands at this time. Apply Box No. 2258-V.

STEAM ENGINEER wanted by paper mill in Ontario. Applicants should be University graduates in mechanical engineering with experience in the generation and distribution of steam. Apply stating full particulars of education and experience, and giving references to Box No. 2283-V. Applications will not be considered from persons in the employment of any firm, corporation or other employer engaged in the production of munitions, war equipment, or supplies for the armed forces unless such employee is not actually employed in his usual trade or occupation.

COMBUSTION ENGINEER preferably a mechanical graduate with some fuel oil burner and steam boiler experience. Position with large company on peace time work and steady employment. Please write giving qualifications, age, salary expected, if bilingual, etc., to Box No. 2302-V.

EMPLOYERS!

Your attention is called to Page 133 of this issue which contains a table showing the number of engineers graduating this spring from Canadian universities. Additional information on available men may be obtained from our Bureau.

SITUATIONS WANTED

CHIEF ENGINEER—twenty years industrial construction, production and operation. Structures, equipment, steam, hydro. Experienced conferences, preliminaries, organizing, preparing plans, estimates, specifications, negotiation of contracts. Apply to Box No. 36-W.

ENGINEER—M.E.I.C. Age 49. Desires change. Experience covers all types structural steel and plate work, rivetted and welded construction, as estimator. Designing, shop drawings. Available two weeks notice. Apply Box No. 2208-W.

MECHANICAL ENGINEER, Draughtsman, specification writer, supervisor, specializing in heating, ventilating, power plants and plumbing, available immediately. Will go anywhere. Apply Box No. 2285-W.

PRELIMINARY NOTICE (*Continued from page 162*)

SCHEUNERT—HANS, of 3 Manor Lodge, Fort William, Ont. Born at Novorossisk, Russia, March 17th, 1903; Educ.: 1921-25, Frankhausen Engrg. College, Mech-Engr., 1925; (Aeronautical engrg. course included in last two years of college); 1926-29, dftsman., asst. shop engr., Junkers Aircraft & Engine Works, Dessua; 1930-31, sales and service engr., Canadian Junkers Ltd., Montreal; 1931-32, project engr., Canadian Diesel Engine Corpn., Montreal; 1932-36, i/c mtce. and service, Canadian Junkers Ltd., Winnipeg; 1937-38, asst. engr., Bickle Seagrave Ltd., Woodstock, Ont.; 1938 to date, with the Canadian Car & Foundry Co. Aircraft Divn., Fort William, layout dftsman, project engr., and at present, production engr.

Industrial News

Industrial development — new products — changes in personnel — special events — trade literature

MONORAIL

The principal uses of the Beatty Monorail Systems installed in stores, warehouses, sidings, foundries, factories and shops are illustrated and described in the new 4-page bulletin issued by Beatty Bros. Ltd., Fergus, Ont.

SPIRAL WELDED PIPE

In their recently issued 6-page booklet, Canada Ingot Iron Co. Ltd., Guelph, Ont., give facts, advantages and uses of Armco spiral welded pipe in the oil and gas industry, together with data for designing pipe lines and car loading data.

STEELSTRAP

Acme Steel Co., Montreal, Que., have issued an 8-page house organ which illustrates applications of steelstrap to shipments. Includes articles on strapping practices employed by shippers of trucks, sugar, airplanes, nut meats, boats, sucker rods, salmon and mining equipment.

INSULATING VARNISH

In a 4-page folder, Irvington Varnish & Insulator Co. of Canada Ltd., Hamilton, Ont., announce Harvel 612C—a recently developed, internal drying, synthetic resinous phenol-aldehyde type varnish which solidifies throughout by heat-induced chemical polymerization. Illustrations, and technical and application data are also included.

VALVES

An interesting handbook, No. 740 of 38 pages issued by Saunders Valve & Supply Co. Ltd., Montreal, Que., describes the Saunders standard diaphragm valve, non-standard diaphragm and straightway valve. Gives details of applications, technical data and maintenance. This book is thoroughly illustrated and is tab-indexed to facilitate reference.

STEEL PRODUCTS

The Steel Co. of Canada Ltd., Montreal, Que., have issued a 32-page alphabetically arranged list of the company's products revised to September 15th, 1940, showing the works in which each is manufactured, the location of the warehouse where each is stocked and the principal sales office.

MASONRY DRILLS

Canadian General Electric Co. Ltd., Toronto, Ont., have recently issued a bulletin CGT-103C which gives instructions for the use of Canadian-made carboloy drills for drilling holes in slate, concrete, tile, plaster and other non-metallic substances. Lists of new prices are also included.

MATERIALS HANDLING EQUIPMENT

Catalogue No. 2140 of 184 pages, issued by Richardson Scale Co. of Canada Ltd., Fort Erie North, Ont., fully describes and illustrates automatic scales, Convey-O-Weigh, weighing, proportioning and feeding equipment for glass manufacture and automatic feeder weighers.

BOILER BLOWOFF EQUIPMENT

The Permutit Co. of Canada Ltd., Montreal, Que., have issued a bulletin, No. 2391, of 8-pages which discusses typical arrangements of continuous blowoff systems based on flash or non-flash, high or low heat level, single or group control operating characteristics. Indicated Permutit equipment is described.

DRAINAGE PRODUCTS

The 46-page catalogue No. 12 of Canada Ingot Iron Co. Ltd., Guelph, Ont., is a quick reference to Armco drainage products, completely illustrated with photographs of installations of Armco drainage pipes of various sizes and types to meet a wide range of conditions and requirements.

FLAME-CLEANING

Entitled "3 New Processes," an 8-page booklet issued by Canadian Liquid Air Co. Ltd., Montreal, Que., describes flame-cleaning and dehydrating of old and new structural steel by paint burning and surface conditioning and the descaling of billets, castings and forgings.

INSTRUMENTS FOR INDUSTRIAL APPLICATIONS

A number of scientific, optical, indicating and measuring instruments for a wide range of industrial uses are described and illustrated in the 20-page catalogue issued by Frederick C. Baker & Co., Toronto, Ont.

DRILL AND TAPPERS

The "Buffalo" No. 15 heavy duty production drill; the No. 15 manufacturing type drill; the No. 15 tapping machine; and accessories are featured in an 8-page bulletin No. 2963-C which was just recently made available by Canadian Blower & Forge Co. Ltd., Kitchener, Ont. This bulletin is completely illustrated with photographs and sectional drawings and contains full specifications.

OXYGEN RECORDER

Mine Safety Appliances Co. of Canada Ltd., Montreal, Que., have issued a bulletin of 2 pages which describes the M.S.A. oxygen recorder which is now available completely assembled on a steel panel thus simplifying installation and permitting easy maintenance. The instrument measures oxygen concentrations from 0 to 20.8 per cent and can be calibrated for any range desired within these limits.

TRANSFORMERS

Typical examples of the many types of Moloney transformers and installations are featured in the 36-page booklet issued recently by Moloney Electric Co. of Canada Ltd., Toronto, Ont. This attractively prepared booklet also describes and illustrates the company's plant and manufacturing facilities.

BALL BEARING UNITS

A 32-page catalogue, No. 840, issued by Stephens-Adamson Mfg. Co. of Canada Ltd., Belleville, Ont., includes complete line of "Sealmaster" ball bearing units. These units are pre-lubricated, self-aligning and feature the "Sealmaster Centrifugal Labyrinth Seal." Each type of unit is illustrated and described and tables of capacity and dimensions are also given.

WELDING EQUIPMENT

A detailed description of the many products of this company used in arc welding is contained in the 56-page bulletin No. 402, an issue of Lincoln Electric Co. of Canada Ltd., Toronto, Ont. All products are well illustrated and valuable reference information is given in each case.

INDUSTRIAL ADVERTISERS SELECT TORONTO FOR 1941 CONFERENCE

Toronto has been chosen by the National Industrial Advertisers Association as the city in which its nineteenth annual conference, to take place in September, will be held, according to a statement just released by Richard P. Dodds, president of the Association, and advertising manager of Truscon Steel Co., Youngstown, Ohio.

The Conference will be sponsored by the Industrial Advertisers Association of Ontario, the Toronto Chapter of N.I.A.A. This chapter has a membership of 50, headed by John A. M. Galilee, assistant advertising manager, Canadian Westinghouse Co. Ltd., of Hamilton, Ontario. The Montreal chapter of N.I.A.A. will co-operate in putting on the conference.

The Royal York Hotel, Toronto, will be headquarters for the thousand or more members and guests of N.I.A.A. who are expected to attend the conference from the 20 chapters throughout the United States and Canada. Total membership of the Association is now over 1,500.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 24 | MONTREAL, APRIL 1941 | NUMBER 4

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

CANADIAN ENGINEERS AND THE WAR

DR. THOMAS H. HOGG, M.E.I.C.

Chairman and Chief Engineer, The Hydro-Electric Power Commission of Ontario, Toronto, Ont.

This address was delivered by Dr. Hogg on the occasion of the joint banquet at Calgary celebrating the signing of a co-operative agreement between the Association of Professional Engineers and the Institute, on December 14th, 1940.

(ABRIDGED)

When Mr. Churchill said, "Never in the field of human conflict was so much owed by so many to so few," he was speaking of the Royal Air Force and its magnificent defence of Great Britain. But this fine tribute of the British Prime Minister has also been earned by those engineers and scientists, both of the fighting services and in civil life, who have, during the past twenty years or more, laboured so that in the day of trial Britain's sword can strike so effectively. For years these men, aided by the staff officers of the naval and military forces, have been quietly developing British machines and equipment that have proved superior to those of our enemies.

It is thus fitting to discuss Canada's war effort and the problems which are facing Canadian engineers in this, the most important business of today.

Canada's Resources

Although a nation of only 11½ million people, Canada's capacity to help is probably at least twice as great as that of an equal European population. This is due mainly to two things: first, Canada's immense natural resources; and second, the up-to-date character of our equipment for utilizing these resources effectively.

The fundamental measure of a nation's scientific and industrial status is the degree to which mechanical power has replaced human labour. One of the principal items of Canada's equipment today is the ample supply of low-cost hydro-electric power available in all provinces, as evidenced by statistics of the power used per capita in Canada, which, in some measure, is a gauge of the nation's industrial capacity. In 1914 the hydraulic turbine power installed in Canada was less than two million horsepower. By 1918 this had risen to 2⅓ million horsepower. There is now available in Canada more than four times the amount of electric power that was available in 1918 at the end of the last war, and of this nearly 7¾ million horsepower is utilized in central electric station industry.

Much of the increase in power utilization has been devoted to the production of raw materials of industry, many of which are of primary importance in war. This increased production is particularly noticeable in non-ferrous metals. Since 1914 copper production has risen from 76 to 607 million pounds per year—a nine-fold increase. Zinc production was quite small in 1914, but it is now nearly 400 million pounds—a sixty-fold increase making Canada the third largest world producer. Nickel production has risen from 47 to 227 million pounds—a five-fold increase. All these metals are of great significance in munitions production.

Canada has no known commercial deposits of aluminum ore, bauxite, but its water powers situated near tidewater have been put to good use in developing, from ore imported from British sources, a large aluminum industry. Since 1914, the production of aluminum in Canada has increased immensely, and to-day our entire production of this vital war metal is under contract to the British Government.

There is no need to continue a catalogue of advances in mineral production. Other war minerals being produced in useful quantities in Canada include lead, now ten times the average output of the 1915-18 war years, as well as platinum, cobalt, molybdenum, asbestos, magnesite and mica.

In 1914, Canada was only just beginning to feel its strength in industrial and manufacturing facilities. Since then we have not only trebled our manufacturing facilities but we have immensely improved their efficiency. Thus Canada is in a far better position than in 1914 to lend effective aid to the Empire cause.

It is important to note, however, that this rapidly-developed productive capacity was intended almost exclusively for peaceful purposes. In 1914 the situation was similar but on a smaller scale, yet we were then able to divert our material and mechanical resources into the channels of war production in an effective way. The same effort is being made to-day.

Personnel Problems

Another impediment to the acceleration of our industrial war effort may be the difficulty of securing suitable personnel for the new armament plants and for the operation of existing industrial plants now being adapted to munitions manufacture.

There are several ways in which the shortage of the highly skilled workers can be made up. First, with the willing co-operation of the union organizations of the skilled workers, industrial management will be able to organize production so as to employ the maximum of partly-skilled labour under the minimum of fully-skilled supervision. Again, in many operations involved in manufacturing light mechanical equipment and instruments, Canadian women will probably play an important part, as indeed they did in the last war. Further, the ranks of the skilled workers may well be filled by the best of the students training at the technical and vocational schools and by the re-training of men who have had some industrial experience but have abandoned manual work for other employment.

Research Work

Since the last war, Canada has been farsighted in supporting scientific and industrial research. During this period the problems which engaged the National Research Council were naturally concerned with peacetime activities, but to-day the efforts of a staff, doubled in number, are devoted almost exclusively to war problems. It is gratifying to note that there is close co-operation between Government war departments, such as the Department of National Defence and the Department of Munitions and Supply, and the various organizations carrying on research work.

Adequate Power Resources Available

Some concern has recently been expressed as to whether the power now available in Canada will be sufficient to service our war activities. Speaking for Ontario—and I think this applies to most, if not all, of the other provinces —I have previously expressed the belief that for the immediate future sufficient power was available in all districts to enable Ontario's war effort to be speeded up and maintained at this higher level. Up to the present although the demand for power has increased, it has been met without undue difficulty.

The development of war industries, however, is inevitably accompanied by a more rapid tempo in other activities, which again produces an increased demand for power all along the line. It follows, therefore, as I have pointed out before, that Canada cannot play her full part unless there can be made available large additional quantities of power. It is obvious that in such a case we cannot wait until the demand actually arises. We must plan and move well in advance.

Now there has never been a time when future needs for power have been more difficult to estimate. Thus it is in a maze of uncertainty that weighty decisions respecting new developments have to be made. The electric supply industry of Canada is now preparing itself to meet the demands that may be made upon it, no matter what they may be.

Canada Prepares

In Ontario, even before the war started, we had planned, and have since carried out, a strengthening of our transmission and distribution networks to enable us to transfer power with greater facility from one part of the province to another; we also constructed one additional power development. At the present time we have under construction two others.

Diversions of Water to Great Lakes

We have also been able, in co-operation with the Dominion authorities, to arrange for the use of more water at Niagara by undertaking to make permanent diversions to the Great Lakes of a substantial flow of water from certain rivers in northern Ontario. These are known as the Ogoki river and Long Lake diversions, and their immediate value depends upon the co-operation extended by the United States. There is now an understanding (confirmed by formal interchange of notes between the Canadian Minister to the United States and the United States Secretary of State) whereby Canada is enabled to utilize immediately, for increasing power output at Niagara for war purposes, an additional flow of water equivalent to that which will be added to the Great Lakes when the diversion works are completed; Canada undertaking to start immediately the construction of the necessary dams, channels, etc., for the Ogoki diversion and to divert to Lake Superior immediately the 1,000 cubic feet of water per second from Long Lake, for which the physical works have already been completed. The ultimate result will be a beneficial diversion of water from one watershed to another by taking stream flow from the upper portion of two tributaries of the Albany river—the Ogoki and Kenogami, and transferring that water to the Great Lakes system.

The physical conditions permit the diversion of the flow from an area of about 5,800 square miles of the upper watershed of the Ogoki river to lake Nipigon and thence to lake Superior; and from about 1,500 square miles of the watershed of Long lake, at the head of the Kenogami river, directly to lake Superior down a short stream.

At present the water from these watersheds flows down the Ogoki and Kenogami rivers to their junctions with the Albany and thence down the Albany river to James bay.

These diversions will work no injury to any future industries or settlements in the watershed of the Albany river, as there is ample power at other sites in the vicinity of the Ogoki area.

Turning to the province of Quebec, large additions have recently been made to generating equipment at the Beauharnois power development on the St. Lawrence river and at the new La Tuque plant of the St. Maurice Power Corporation.

St. Lawrence River Improvement

The improvement of the St. Lawrence river for navigation and for power development is a subject that is again receiving attention. As a project it is now linked up with the joint steps being taken by the United States and Canada for the defence of the Americas. Time will not permit any discussion of the proposed further development of this great waterway, but it is evident that changing world conditions must profoundly modify many of the views previously held respecting this great undertaking.

Regulation by Dominion Power Controller

Certain economies in power consumption can be effected by restricting the less essential uses of electricity. Great care, however, must be exercised in doing so, because it is quite possible to save electricity at the cost of imposing other burdens which would diminish rather than increase our total war effort. These matters are receiving the careful attention of the Dominion Power Controller, in co-operation with the various provincial authorities.

One ruling by the Dominion Power Controller has already effected a substantial saving in power demand—namely the extension of daylight saving time in Ontario and Quebec in those communities which adopted it during the summer. This regulation has unfortunately resulted in some confusion in the mind of the general public. It has even been suggested that electric power could be conserved by cutting off street and highway lighting, and electric signs; some people are trying to conserve electricity in their homes. Such efforts, while being commendable because they are sincere, are not very helpful unless you happen to reduce peak load by switching off lights when your generating stations are operating at their maximum capacity—which is usually late in the afternoon when all factories are in full production.

Thus it is desirable that everybody should continue to use electricity as fully as needed until they receive advice from the Dominion Power Controller, or their local electric utility, otherwise they may interfere with their own war effort. Engineers will understand that the effect of introducing a staggered form of Daylight Saving Time (as has been done in Ontario and Quebec) creates a better diversity in the time of peak demands from various classes of consumers.

Conclusion

This brief review of Canada's war effort has, I hope, indicated to some extent the important part that is being played by Canadian engineers.

To-day, notwithstanding the temporary superiority enjoyed by Germany in numbers and masses of military weapons and supplies, it may be stated with some assurance that in scientific and technical matters the British Empire is superior to Germany. This is to be expected, because the highest achievement in these things can only be attained where the utmost freedom of thought and action are permitted. While dictatorships may have some advantages over democracies in the regimentation of a nation for controlling its political and economical life, the same control cannot successfully be applied to its scientific development.

In addition to its natural resources and its up-to-date equipment for their utilization, Canada enjoys for the time being a freedom from direct enemy action against her territory. This is both an advantage and a danger. It leaves us free to devote our energies to our assigned task of training personnel for the great air armada in the making, and to develop our raw materials, and manufacture and assemble them for shipment. But the danger lies in the possibility that we may become complacent and fail to mobilize every ounce of our strength.

Relatively speaking, Canada has more to lose, should the Empire fail to achieve victory, than even Britain herself. Just before the war Germany had many accredited agents travelling through Canada making an inventory of our assets. Asked what they were particularly interested in, one of these agents replied, "In your natural resources." Canada, therefore, has a very definite and important part in the struggle. We must develop and use our natural resources to the utmost to prevent the enemy from taking them from us.

As Canadian engineers we may be proud that those to whom the call has come have been found both willing and able to render effective help. We cannot all apply our engineering knowledge in active service overseas. But in our appointed tasks we can each employ our talents, our engineering experience and whatever specialized knowledge we may possess to the solution of the problems with which we have to deal—to the end that, by the efficient mobilization of the great resources of this Dominion, a continuous stream of munitions and supplies of all kinds may flow through unimpeded channels to their appointed destination.

EARTH'S CRUST RESISTANCE AND LIGHTNING

ARTHUR S. RUNCIMAN, E.E., M.E.I.C.
Superintendent of Transmission Lines, Shawinigan Water & Power Co., Montreal, Quebec.

Paper presented before the General Professional Meeting of the Engineering Institute of Canada, at Hamilton, Ont., on February 7th, 1941.

It has been a pleasant experience to review the past ten years' work on the reduction of lightning outages. This has led to the realization that our knowledge of the earth's crust is not all one should expect in these enlightened days.

During the summer of 1940 we were given the opportunity of measuring the footing resistance of the steel grillage tower foundations which were being installed for a new 220 kv. steel tower transmission line (No. 35) between the cities of Three Rivers and Quebec. A field party was sent out with earth resistance measuring apparatus described later. The data obtained were plotted so that comparisons could be made along the right-of-way to determine what sections should be specially treated to obtain the lowest overall resistance to earth for the least money spent.

Low resistance to earth along a steel tower line has been found to be a very important factor in reducing, (and on several high voltage lines, eliminating) power arc-overs caused by lightning.

A study of the graph of resistance per tower base vs the line plan and profile (see Fig. 1) yields some curious information. The largest river crossed, the St. Maurice, has high resistance banks. The reason for this is, probably, the sandy soil from which all of the soluble conducting materials have been washed or leached into the river by the infiltration of surface water and rains. Such high resistance was specially noted where slopes are steep, as at Towers 55-70.

This high resistance was found to a lesser degree at other, but not all, rivers along the line. It seems reasonable to suppose that most soils through which water can pass even slowly should be poor conductors. Water itself is not a good conductor except when salts or acids are present in solution.

This condition of high resistance tower footings near rivers was so intriguing that other old ground resistance measurement data were investigated and a typical case on line No. 33 is offered for reflection, in Fig. 2.

For the No. 35 line tests, a box with metal end plates was used, containing approximately one cubic foot of earth

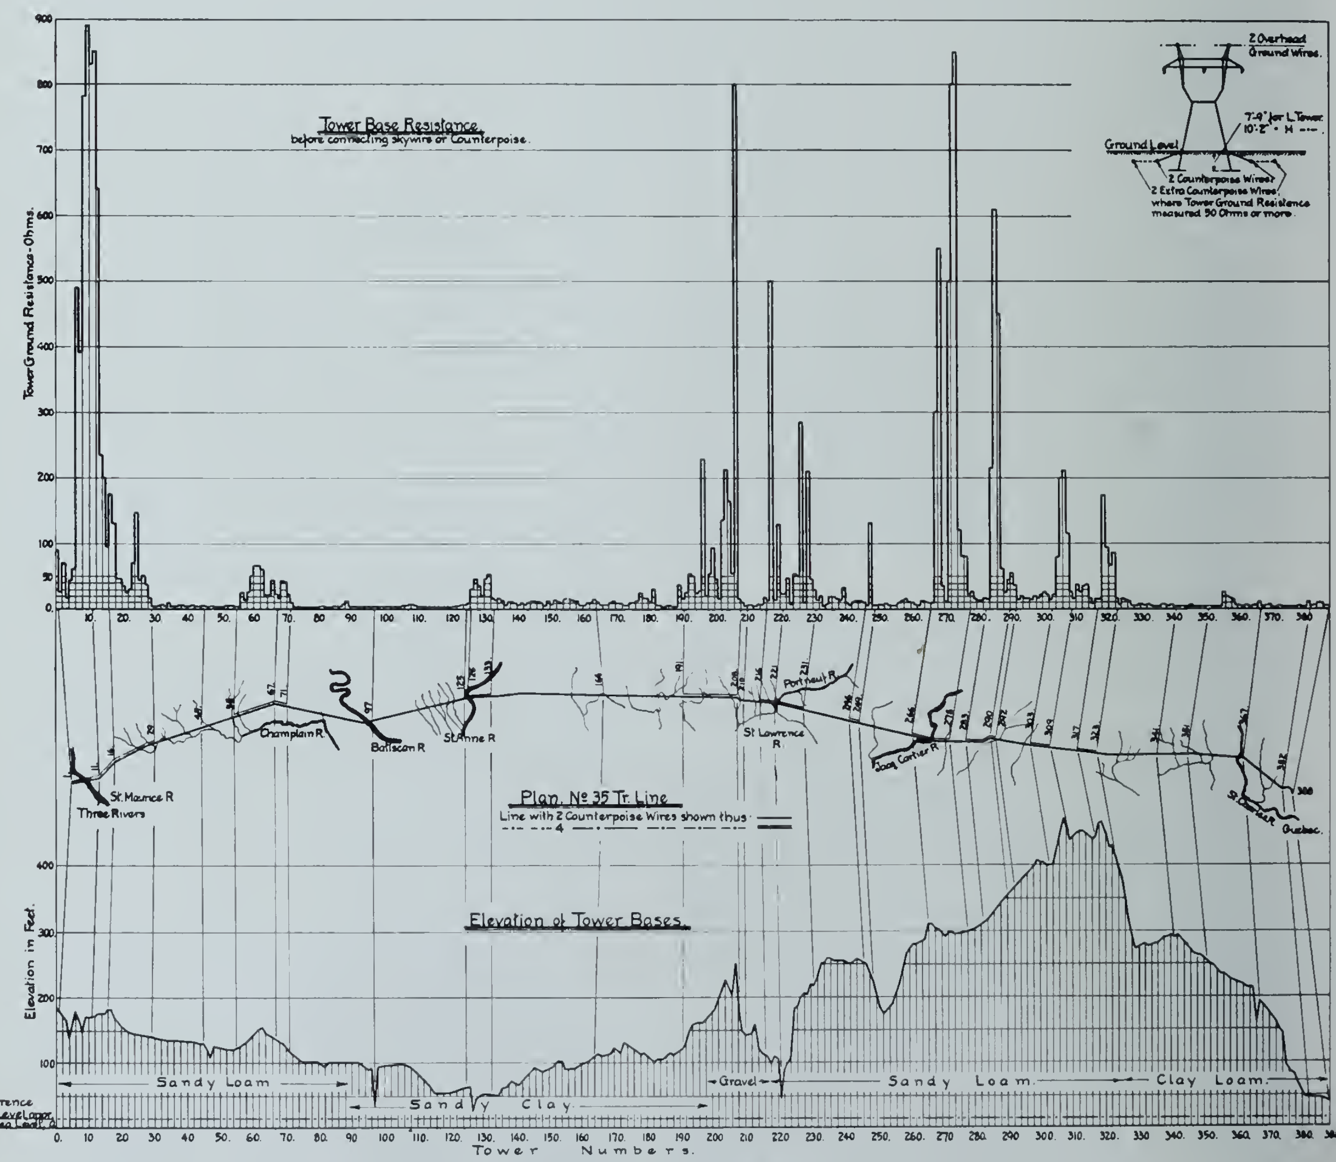

Fig. 1—Diagram showing ground resistance along transmission line No. 35.

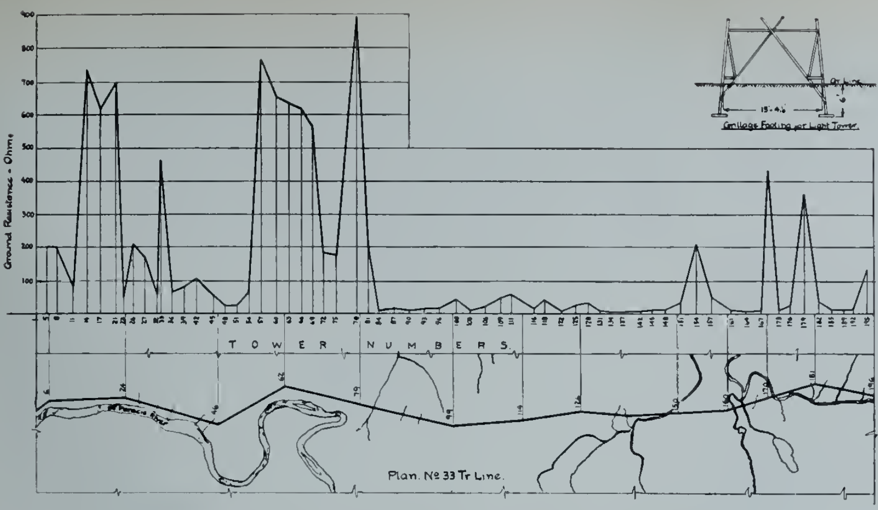

Fig. 2—Diagram showing the high resistance of tower footings near rivers.

The resistance of earth samples measured in this box ranged from 253 to 3,000 ohms. Such high resistances showed that the earth contained few conducting impurities. If such impurities were present, the galvanized steel footings would soon be damaged by rust action.

In connection with Figs. 3 and 4, it should be explained that the ground resistance measuring gang, consisting of four men equipped with an Evershed & Vignoles earth tester, wires, probes, etc., followed the base setting gang, well ahead of the wire gang. Thus they had buried steel bases to measure without the effects of other man-made grounds.

The method of testing was the probe or potential. This was checked by a loop resistance measurement of the tower base under test in series with a long lead, usually 1,100 ft. in length, and the nearest measured tower base. The two methods checked closely so that a fair idea of the base resistance at each tower was obtained.

This method of testing isolated grounds involves reversed or alternating currents passed into the earth. (See Fig. 5). The potential drop P_1 to P_2 in the earth between the two current points C_1 and C_2, when combined with the current, can be read on the instrument as earth resistance of the point C_1, which is the tower base under investigation. This method gives a measure of local resistance which, from a lightning protection standpoint, is the resistance value in which we are interested.

Just why are we interested in resistance of tower footings and the earth's crust?

The sketch in Fig. 6 has been made up in an attempt to show what may happen when a stroke of lightning contacts a transmission line. An instrument such as a photographic cathode ray oscillograph could be used as a recorder or voltmeter.

It will be noted from Fig. 6 that in this case we have a potentiometer. At the point where the stroke contacts the line, current is carried to ground via the tower steel, and the potential between the instrument and the flashover is recorded on the view plate and photographed.

A shunt path in parallel with r will by-pass the flow and, if this shunt is of sufficiently low resistance, the IR drop will not be high enough to flash the insulators.

The shunt path may be a sky wire or a counterpoise or deep driven ground rods, or all three.

Before proceeding further, a study of the phenomenon of lightning might be helpful. Our electricity is carried on what we call electrons, and we choose to call these electrons negative in polarity. When these electrons accumulate in a cloud, they repel each other by virtue of their similar negative properties. They are held together by atmospheric insulation because they cannot get away until they develop sufficient potential difference to some other collection (a cloud) or perhaps the earth. Now let us consider the earth or its crust: we have been led to believe that some strange opposite charge follows around a negatively charged cloud. This is easier to visualize if we consider the repulsion effect of the negatively charged cloud repelling the electrons out of the area below. We know (from data collected by communication companies) that potential differences exist between points or grounds on the earth's crust. These potential differences do not assume very large values unless something special happens. One case of something special happening, is when a cloud loaded with electricity (negative electrons) in an insulating atmosphere finally develops such a potential difference to earth that it dumps the charge down a path made luminous by the ionization and heat of the electron flow, or the I^2R power as we say.

Why so much negative current flows down this single path can be explained if we remember that flowing electrons are always accompanied by counter-clockwise whorls of magnetic lines, and that parallel current paths magnetically attract each other, finally becoming one path.

The graph shown in Fig. 7 is a reproduction of a flash record taken by the General Electric Company in New

Fig. 3—Steel underground in grillage tower base.

Fig. 4—Steel above ground in grillage tower base.

York of a lightning stroke on the Empire State building. This diagram is important in that it settles, we hope finally, the nature of the lightning discharge.

We have a cloud dumping a large flow of electrons or electricity down a flash to earth, the normal container for all of our earthbound electricity. The flow varies in quantity but not in direction. In a few records the flow at the end of the discharge has been found to reverse, but unless you are interested in the theory of low resistance oscillating circuits it is just as well to ignore these few rare cases.

If some of the mystery of the discharge has been dispersed, suppose we consider what happens to the electrons when they arrive at the earth. Of course, the spot struck receives a huge quantity of electrons which must be distributed to the rest of the earth's crust.

We now have a fascinating study for a mathematician who likes dealing in circles and hemispheres. The nature of the material in these circles and hemispheres, of course, must be variable just to make it interesting. However, we should not go too deeply into this angle of the question because it has been worked out for us by a record of our flashovers on our transmission lines.

We know from records of damage to wood poles caused by lightning, and found by patrolmen on 60 kv. power lines, that potential differences of 600 kv. and more may exist between poles approximately 200 ft. apart. These high potential differences which exist up to 2,000 ft. from the point struck are shown by our records to have reached values as high as 2,000 kv. in some instances. That these potential differences exist we are sure. The exact mechanics of each case is not so easily understood. This fact leads to a study of probabilities and chances based on our meagre set of rules to cover mass movement of electrons at widely varying rates of flow.

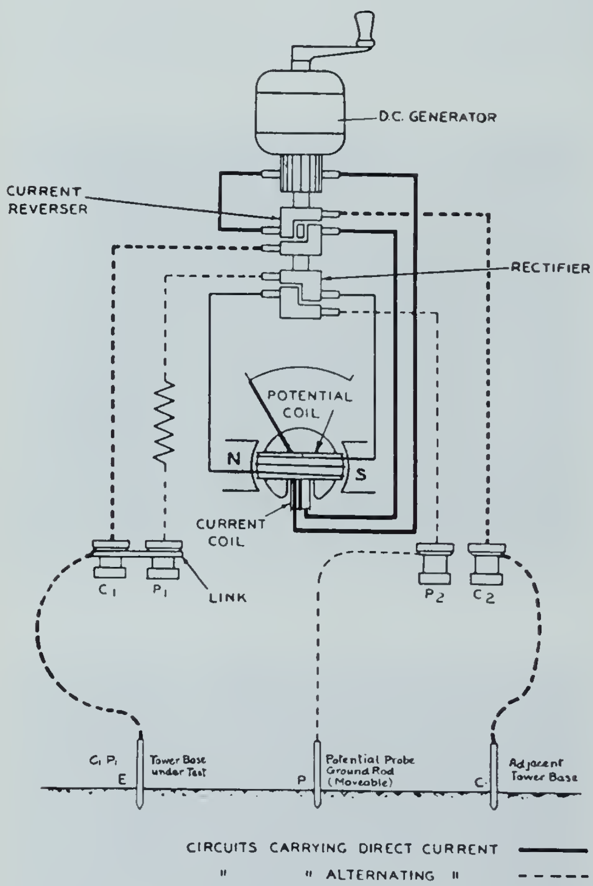

Fig. 5—Diagram showing the principle of operation of a Megger earth tester.

Figures 8 and 9 show the conditions found on lines Nos. 18 and 38 due to lightning storms on July 8 and June 11, 1939, respectively.

The tubes noted on the poles (Fig. 10) are similar to a fuse holder. The lightning flashes through the tube and builds up pressure which at times explodes the tube. No other damage is experienced and when the line trips out, as it does if the relaying is fast, the line closes back. Other than the tube loss, there is no permanent damage even to insulators.

So far as this paper is concerned, the tube acts as an indication of a flashover caused by high lightning potential.

If our municipal engineers care to think of a heavy rain storm or cloudburst on roofs equipped with eave troughs (sky wires) and conductor pipes (steel towers or pole ground leads), some idea of the effect may be visualized.

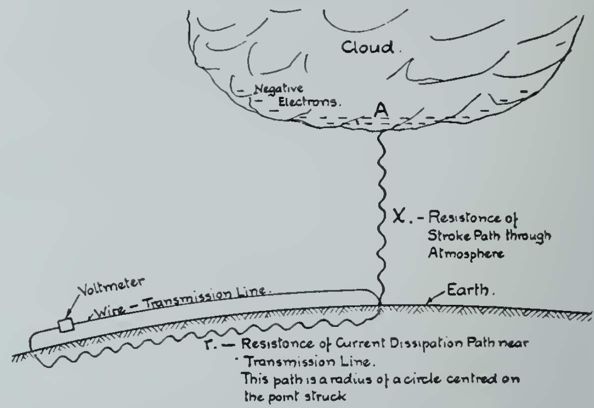

Fig. 6—Diagram showing the method of measuring the potential drop during distribution of electrons following lightning flash.

If the run off sewer (counterpoise or other equally good continuous grounding) be adequate, no spill over will occur.

Lightning is in the same category as a cloudburst; it must be got rid of and quickly by properly designed run off equipment.

We have ten years' records to show that short-circuiting the bases of steel towers reduced materially the flashovers. On a number of lines the lightning outages have been reduced to zero. Some of the results of the preventive work are shown in Figs. 11, 12, 13, 14.

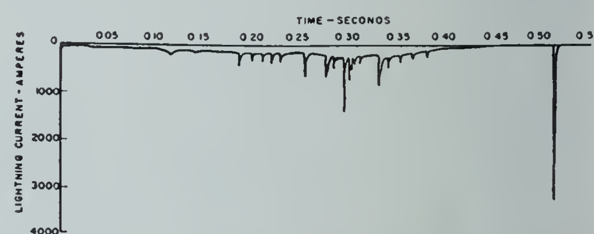

Fig. 7—Crater lamp oscillogram of lightning stroke on Empire State Building, New York. (Reproduced from *Electrical World*, February 10, 1940, Wave Shapes of Successive Lightning Current Peaks, by K. B. McEachron.)

Fig. 11 is an eleven year record of the line outages caused by lightning on the Shawinigan system between Shawinigan Falls and Montreal.

The top graph is the result of a count made each year of the days on which lightning was recorded and conveys some idea of the severity of lightning for the different years.

The second graph from top shows the percentage of tower line right of way which has the bases of the towers bonded together by counterpoise wire buried approximately 18 inches.

The third graph is a plot of the outages caused by lightning each year; note the downward slope as the percentage of continuous counterpoise increases in the graph above.

The fourth graph is the same as the third, but in terms of outages per 100 miles of circuit for easy comparison with other companies' records.

The voltage on these circuits (Fig. 11) is 110 kv. insulated by seven standard suspension insulators. One of the tower lines has two overhead sky wires and the other tower line has no sky wire. This point is discussed later with Fig. 14.

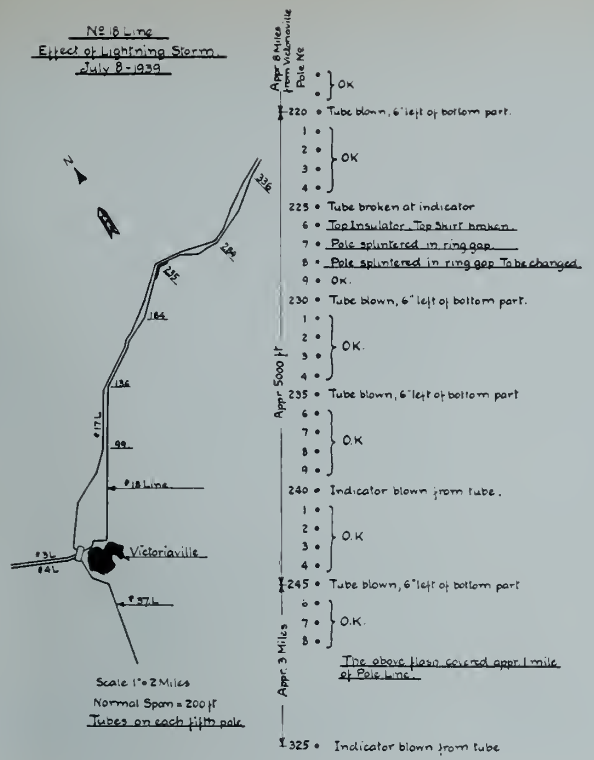

Fig. 8—Plan of line No. 18 indicating damage done by lightning storm.

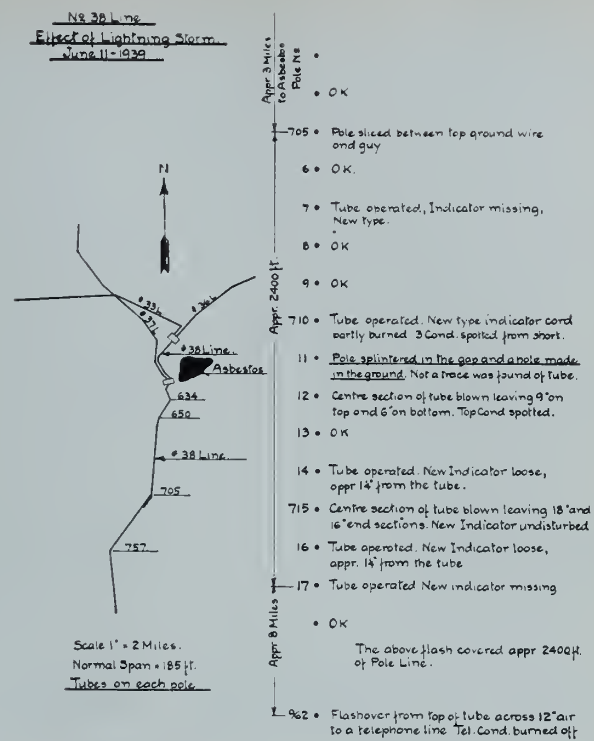

Fig. 9—Plan of line No. 38 indicating damage done by lightning storm.

It will be noted by the dotted lines in the side sketch of the tower and counterpoise arrangement on each graph, that the towers are cross connected together underground wherever counterpoise has been installed on right of way used by more than one line of towers.

In another case where 100 per cent counterpoising of three important circuits operating at 60 and 110 kv. was carried out, the outages were completely eliminated. The insulation is seven standard suspension units. It has been found by comparing the records of 110 kv. and 60 kv. lines operating on the same construction and insulation that no difference in outages is apparent. This suggests future studies on how low insulation can be reduced on a well protected high voltage line.

Fig. 12 is a record showing a reduction in outages of which we are justly proud. This line is operating at 220 kv. and insulated by 16 units of the standard five inch suspension type. The improvement after counterpoising was definite.

We would not be surprised if an outage should occur in future years. Such an occurrence would be studied and further grounding measures taken, as is being done in the case shown in Fig. 13.

The tower lines referred to in Fig. 13 were counterpoised and also two sky wires added in the case of Nos. 19-21 section. The record showed reduction to zero for one year but not the second or third years. Here we found that the flashed towers were on very high resistance earth in the St. Maurice river valley. Tests were made by driving deep rods. Resistances as follows, were found:—

Tower No.	Depth of Rod.	Ohms to the Tower & Sky Wire
84	64 ft.	50 ohms
85	88 "	30 "
98	112 "	40 "
118	48 "	70 "
119	48 "	75 "
123	56 "	75 "
134	40 "	700 "
171	56 "	20 " (in a swamp).

The earth resistance of this section is so high that more than the usual counterpoise grounding is necessary. Two extra wires in the ground or more deep driven rods are indicated before the next lightning season.

The purpose of the so-called "counterpoise" wire, which is buried 18 inches deep and connected to the tower bases, is to provide a conducting path through the poorly conducting earth's crust immediately below the transmission line, so that any mass distribution of electrons can flow away in the earth, and not force the streams of electrons to jump insulators into the transmission conductors to get

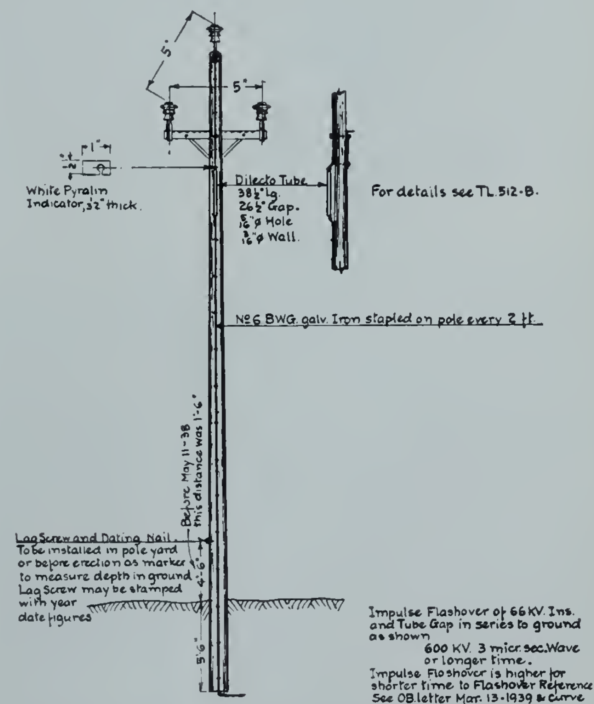

Fig. 10—Wood pole for 60 kv. line with tube gap connection.

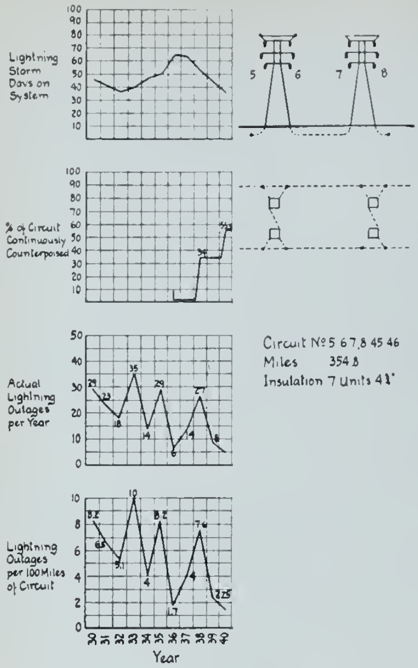

Fig. 11—110 kv. lines 55.3% counterpoised. Outages reduced 75%.

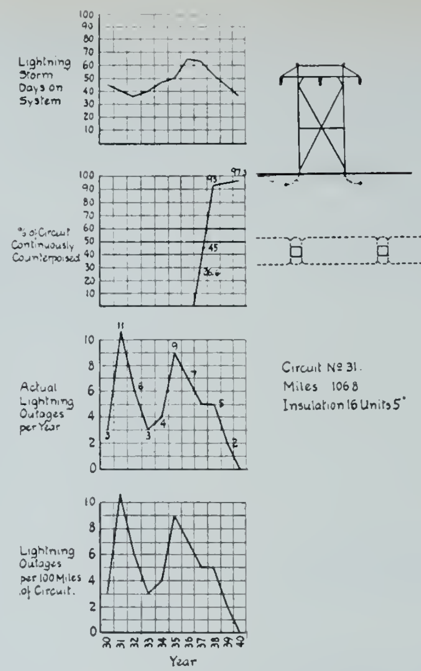

Fig. 12—220 kv. line 100% counterpoised. Outages reduced 100%.

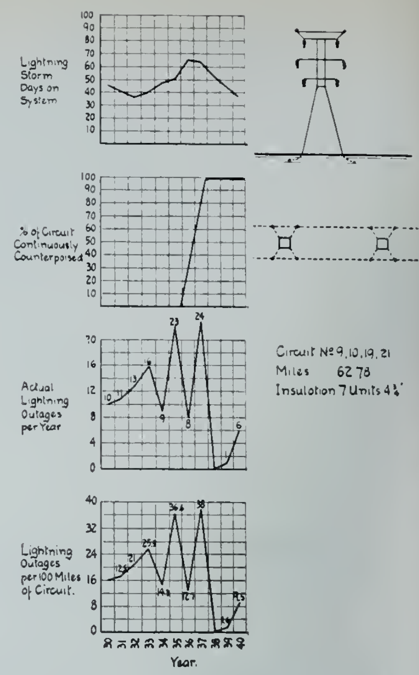

Fig. 13—110 kv. lines operating at 110 kv. and 60 kv. Counterpoised 100%. Outages reduced to zero, one year only.

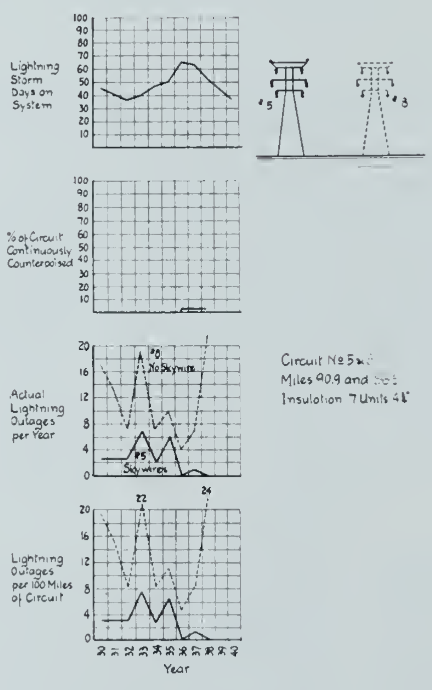

Fig. 14—Comparison of 110 kv. lines with (No. 5) and without (No. 8) sky wire.

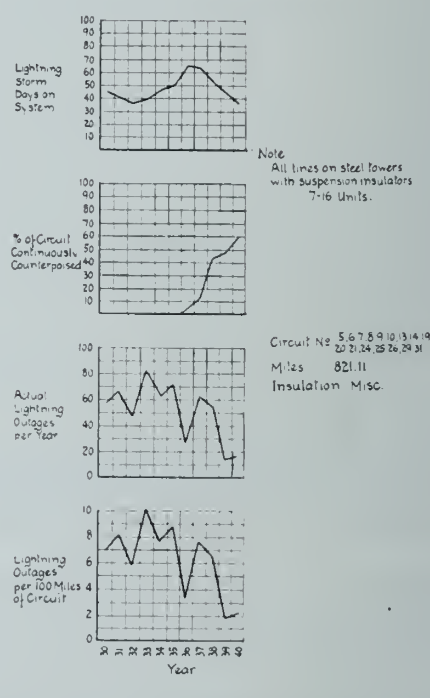

Fig. 15—Graphs for all 60, 110, 185 and 220 kv. lines with partially continuous counterpoise showing that with 60% of circuits continuously counterpoised outages have been reduced 75% that is, from 8 to 2 outages per 100 miles of circuit per annum.

where they are going by virtue of their concentration or potential difference.

The sky wire functions as a collector of lightning, also it acts as part of the shunt or bonding circuit between the towers. Thus it supplements the conduction of the earth's crust and other ground connections, continuous counterpoise, etc.

Before anything definite can be decided in reference to height of sky wires or lightning rods, it is believed essential that adequate continuous counterpoise grounding be provided to run off, without dangerous rise of potential, the very high lightning currents.

Fig. 14 has been included to show that a tower line equipped with sky wires has a better record than a tower line with no sky wire. Tower lines No. 5 and No. 8 are 50 ft. apart on the same right of way for a distance of 90 miles and present a fair comparison of the case. It should be noted that a small amount of counterpoise was installed in 1936.

There are volumes of records to show the protecting value of the sky wire, and recent records combine the sky wire and the buried counterpoise or the deep driven ground rod. I do not believe any engineer would claim for sky wire 100 per cent protection in these enlightened days, but many records have been published in the last year or two which indicate a tendency to complete protection when the grounding is thoroughly carried out. Our own records are most conclusive.

TABLE I

At the end of 1940 the Shawinigan Water & Power Company had 613.64 circuit miles of power lines, 60 to 220 kv., protected by counterpoise. This corresponds to 332 miles of tower line.

In percentage figures for the entire 60, 110, 185 and 220 kv. steel tower line system, 51.6 per cent of our circuit miles or 45.7 per cent of our tower line miles are now continuously counterpoised. In addition to this, we have the new 220 kv. line No. 35 continuously counterpoised with two wires and four wires where the resistance per tower base was measured as 50 ohms or more.

Fig. 15 is a composite graph for all the lines on which any serious counterpoising has been carried out. The total miles of circuit from which outage records are compiled is 821.11. Only 60 per cent of the total milage is protected by continuous counterpoise to the end of 1940. The graph indicates that the outages have dropped to the low figure of 2 per 100 miles of circuit. The downward slope of the outages corresponds to the upward rise in the curve indicating the percentage of circuits continuously counterpoised. With the exception of one case indicated in Fig. 13, no lightning flashovers have occurred on any lines continuously counterpoised and insulated with seven or more units in suspension at a distance greater than 1,000 ft. from the end of the counterpoise. Flashovers have occurred on the tower at the end of the counterpoise in several cases.

Tables I and II are tabulations covering complete line outages caused by lightning, and line outages on circuits under special study with reference to counterpoise, respectively.

What we now lack is two or three years' data on a transmission line protected by counterpoise alone in order to evaluate the relative protection afforded by the buried counterpoise and the sky wire. With such data on record, the actual value of the sky wire would be better understood.

Various conductors have been used for counterpoise. We use No. 5 BWG electro-galvanized steel, resistance 9.8 ohms per mile, weight 625 lbs. per mile, 0.8 ounce zinc per sq. ft. This wire is placed 18 inches underground by a specially

*D.C.C. is the abbreviation for Double Continuous Counterpoise.

constructed plough drawn by one or two tractors. The cost of installation, exclusive of any property arrangements, is approximately $100.00 per wire-mile. Figure 16 shows the relative location of the wires.

Conclusions

1. The earth near rivers is usually washed clear of conducting salts and acids and has high ohmic resistance.

2. Buried counterpoise continuous tower to tower, from powerhouse to substation, is giving excellent operating records through lightning storms.

3. The cost of such protection from lightning flashover is comparatively low.

4. There is need for data on the protecting value of the continuous buried counterpoise without sky wires. Such data may lead to reduced cost of high voltage lines.

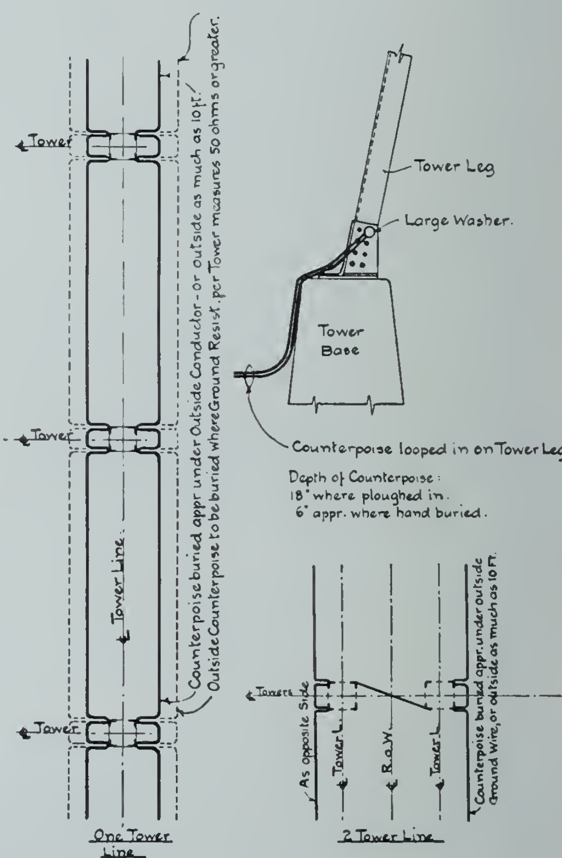

Fig. 16—Diagram showing a counterpoise installation.

DISCUSSION

W. B. Buchanan[1]

The author has presented data of a type which is important to those interested in the grounding of electrical circuits and, particularly, with respect to the protection of power lines against flashovers due to lightning. He mentions the possibility of such a study justifying the use of a lesser amount of line insulation. This may not be permissible however for other reasons—liberal factors of safety will be demanded and while insulator life is doubtless better than formerly, some allowance should be made for faulty insulators.

The writer was intrigued by the use of the term "Earth's Crust" and, after reading the paper carefully, wondered if Mr. Runciman had really reached the earth's crust as some of us have had reason to consider it. This remark is not by way of criticism, as we are quite in agreement with the author's exposition of principles and practice, but is intended as a caution that still greater variations may occur in practice than appear in the paper.

As a member of the staff of the Hydro-Electric Power Commission of Ontario, the writer has been concerned in several extensive studies in earth resistance measurements. Some of the information obtained is of interest in comparison with corresponding data in the paper.

Some years ago an extensive series of tests were made of the resistances of driven-rod or service grounds as used on distribution systems. Compilation of the data appeared to justify a division into three classes, defined as regards the character of the soil. Those in the group having low resistances were in heavy clay loam and could very well have been represented by a chart like that of Fig. 1 of the paper, considering those below 50 ohms. The second group, classed as sandy or gravelly loam, varied considerably but few exceeded 300 ohms. Dry sand or gravel, however, might give much higher values, up to thousands of ohms. It is under such conditions as these that the earthed counterpoise becomes helpful, or even necessary, if troubles due to lightning are to be minimized.

During the installation of the first 220 kv. line built by the Hydro-Electric Power Commission, from Toronto to the Quebec border, a complete series of tower footing resistance tests were made. The method of measurement was different from that mentioned by the author as extra leads and probes were not required. Two overhead ground wires were already installed and furnished an effective tie with many other lower grounds in parallel. Raising and insulating these at one tower enabled an instrument to be inserted by which the resistance of a composite loop could be measured in which the footing under test would be much the greater component.

Here again, the values were shown to depend on the nature of the soil. Throughout a clay-loam belt of thirty miles or more, resistances from four to twenty ohms were obtained and the writer believes that no lightning flashovers have occurred in this district. Real difficulty, however, became evident throughout the rocky district. Many miles of line pass through country where there is very little earth of any kind over the rock; here tower footing resistances were measured exceeding one thousand ohms and even these values were not very dependable. Some efforts were made to reduce them by connecting the footings to adjacent lakes, pockets of earth, etc., but this could not be done in all cases.

A very unusual case of lightning damage occurred in this district. The stroke passed down through a group of basswood trees about fifty feet outside of the right of way, travelled along the surface of the ground to the tower footing, up the tower and tripped out the line. The evidence was observed by many persons and this story may be regarded as authentic.

Under such circumstances reluctance on the part of engineers to guarantee 100 per cent protection against lightning is quite understandable.

Usually the possibilities of protection against lightning depend, more or less, upon economic considerations. The following example illustrates what may be regarded as an extreme but very effective use of the counterpoise.

During the construction of the Chats Falls generating plant, the writer was requested to make an earth survey with a view to establishing satisfactory grounds for all equipment and considering all possible uses of such grounds. The terrain was almost altogether rock with very little earth even as overburden. The initial problem of locating probes for measuring resistance was very conveniently solved by nature providing pools of water in pockets on the surface. The resistivity is roughly indicated by the value of 1,800 ohms obtained as the resistance between two pools each of approximately one hundred square feet area and not more than fifty feet apart.

The net results of such tests led to the installation of two heavy copper cables between the remote ends of generating and switching stations, supplemented by additional leads to various pockets of earth in the vicinity that might have value. This constituted really an artificial earth of large dimensions and seemed to be the only practical solution of the grounding problem.

The overhead ground-wire network was also given careful study and an extensive screen was installed. The fact that the station, so far as we have been able to learn, has been immune to any harmful effects from lightning, speaks well for the soundness of the design.

In view of the last conclusion stated in the paper, the writer would suggest that overhead ground-wire and counterpoise should be regarded as supplementary rather than competitive in their effects. Available data tend to indicate that a sky-line may be so placed as to shield the power conductors almost 100 per cent from direct strokes, that the induced surge on the power conductor with a satisfactory ground plane such as should result from the use of counterpoise would be only one-half (or less) than the potential in the sky-line in case of direct stroke and that such induced charge would contain only a small fraction of the amount of energy of the main stroke and be dissipated much more quickly. If lightning could be persuaded to confine its attention to the towers only, the path of the current being at right angles to the power conductors, there would probably be very little induced charge on the latter, but with long span construction, particularly, the chances of doing this seems very remote.

In connection with the data submitted, I would like to ask:

1. Re Fig. 8. Are the poles which are noted as O.K. after the storm, equipped with down wires and ground rods, or have the poles on which the detectors were mounted been required to drain the most of the discharge?
2. What means are used to install rods to depths of from 40 to 112 feet as noted in the table, Page 173?

I must confess inability to absorb all the information contained in this paper within the time available, or appraise its value. However, we shall doubtless have occasion to refer to it in future studies.

Lachlan Gilchrist[2]

The following comments are offered on Mr. Runciman's paper:—

I. With reference to the character of the ground and the tower base resistances.

It is a little difficult to understand the great differences in tower resistances from tower positions 0 to 90 in Fig. 1,

[1]Testing Engineer, The Hydro-Electric Power Commission of Ontario, Toronto, Ont.

[2]Professor of Physics, University of Toronto, Toronto, Ont.

which seem to occur at rather slight but sharp rises in elevation. Possibly these are due to the use of the three-point method of measuring the resistance as shown in Fig. 5. In this method even a narrow section of very dry sand close in at the tower footings—dry because of a slight increase in elevation—would cause a high resistance reading which would hardly give a true indication of the average resistivity of the ground at some distance from the tower footings. An occasional check at some of these places could be made by making a four-point reading, i.e. separating C_1 and P_1 and grounding P_1 at least halfway from the tower footings to the potential probe ground rod P. To make a fair comparison the specific resistance or resistivity should be calculated for each of the resistance readings on the "Megger" earth tester.

II. With reference to the theory associated with Fig. 6 there is this added theory.

The negative electrons on the cloud draw to the top of the towers positive charge from the earth which gathers at the top of the towers and perhaps also on the sky lines in considerable density, σ. This positive charge acts with an outward force on itself of $2\pi\sigma$ dynes per sq. cm. and this outward force depends on the value of σ, which is greater the sharper the tops of the towers. There is also the pulling force of the negative electrons on the cloud on the positive charge on the top of the tower. The result is a silent discharge from the towers to the cloud which tends to neutralize the negative charge on the cloud and consequently lowers the potential drop between the cloud and the tower to a value below that which is necessary for a lightning discharge, thus avoiding the ionization of the air about the insulators and the consequent spill-over. This is similar to the ordinary lightning-rod effect and it would appear that the towers act as lightning-rods, perhaps slightly inefficient if not supplied with points at the top and not thoroughly counterpoised to as low a ground resistance as possible. According to this theory the towers on the peak elevations of ground are the best lightning-rods, but probably are the most difficult to provide with the lowest possible ground resistance. Hence it is evident that a special effort should be made to obtain this low ground resistance for the elevated towers.

III. It is interesting to note that Mr. Runciman's experiments indicate considerable advantages in the continuously counterpoised towers over those with sky lines. The conclusion seems to be that the lightning-rod effect of producing a silent discharge is largely due to the towers and very little due to the sky lines. In any case it might improve the efficiency in decreasing outages by making the towers more lightning-rod-like in character with projecting points, and lowering the ground resistance of those towers on high elevations. Further, the continuous underground line between towers might be attached to counterpoise plates at several well chosen places between the tower positions, in order to make the grounding resistance as low as possible. This should be of considerable assistance in diminishing the number of spillovers.

Claude Gliddon, m.e.i.c.[3]

I am glad to offer the following comments on Mr. Runciman's paper:—

1. The phenomenon of high ground resistance near rivers as observed by Mr. Runciman is new to us. It should be possible, however, to compare observations of ground resistance made in the vicinity of many rivers by other observers and thus determine whether this phenomenon applied generally to all rivers. Gatineau Power Company's observations so far have indicated that ground resistance depends largely on the nature of the soil (clay being low resistance and sand being high resistance) and moisture content.

2. The advantages of counterpoise for reducing lightning outages, as observed by Mr. Runciman, bear out the experience of other observers. A considerably longer period of record will be required to determine quantitative results.

3. The suggestion made in the paper that improvement in line performance may sometimes be more economically obtained by other means than simply adding more insulators, is a very good one, and is an important consideration in transmission line design.

Edwin Hansson[4]

Mr. Runciman's paper presents a most convincing case for the value of sky wires and low footing resistances combined with ample insulation as a means of lightning protection for high tension lines.

The author comments on the poor soil conductivity near some of the rivers. It is a well known fact that the conductivity varies with the composition of the soil, and clean sand is practically non conductive. What surprises me is the high conductivity with which Mr. Runciman is blessed in his territory. On our system, soil resistance varies from 3,000 to 10,000 ohms per cubic foot, as determined during a partial survey by A.T. & T.

I do not think it is necessary to wait for records from a line equipped with counterpoise but no sky wires. In a paper by Edgar Bell (*AIEE Transactions* 1940, Vol. 59, p. 822) he states that "three out of every four strokes to an overhead-ground-wire section of this line occurred to such wires between structures." It seems reasonable to assume that a large number, if not practically all, of these strokes would have caused flashovers if permitted to contact the conductors.

On page 175 the author mentions the lack of two or three years' experience with a counterpoised line without sky wires. I want to say a word of caution against putting any reliance on short time records in connection with this subject. The factors are so many and so varied that even ten years is none too long to get valid evidence. The number of strokes per 100 miles of line varies greatly from year to year and, in addition, there is a great variation in severity of strokes. In comparing the four-year record of two different lines we find that the number of strokes per 100 miles per year varies from 54 to 129 for the one line and from 85 to 232 for the other, and the minimum for the one occurs the same year as the maximum for the other.

The author deserves to be congratulated on having kept and published such careful records. Every such contribution goes a long way to clear up a subject of which we know none too much.

K. B. McEachron[5]

There is little question in my mind but that flashovers on transmission lines are caused, in some cases, by lightning strokes to points so located with respect to transmission lines that currents flow from the point of contact on the earth's surface to the transmission line tower, up the tower, and may well cause flashover of the transmission line conductors.

It would be expected that such a phenomenon would occur most frequently in places where the soil is of poor conductivity, so that when flashover occurs, the transmission line tower, and its conductors present an appreciably better chance to secure connections to earth.

Although I have no factual data with respect to transmission lines, I have known several cases in which the following conditions were typical: lightning struck a tall pine tree leaving its characteristic mark over the surface of most of the tree, which was about 60 ft. in height. From that point it travelled over the surface of the ground horizontally, leaving a characteristic furrow in the earth's surface. This furrow terminated at the base of a telephone

[3]Chief Engineer, Gatineau Power Company, Ottawa, Ont.

[4]Pennsylvania Water & Power Company, Baltimore, Md., U.S.A.

[5]Research Engineer, General Electric Company, Pittsfield, Mass., U.S.A.

pole, which was split on the outside up to the point of attachment of a pair of telephone wires. Considerable damage was noted on the telephone circuit, in a cable on one side and in the subscribers' station on the other side of the split pole. There was no damage observable to the pole above the point of attachment of the wires. This indicates the phenomenon very clearly.

In the case of a steel tower line, or a wood pole line with down wires, using overhead ground wires in either case, such a stroke of lightning would find its way to earth down a considerable number of towers in parallel, due to the presence of the overhead ground wire. If tower footing resistance were high, flashover still might ensue, particularly on the structure or structures over which the lightning current originally flowed from the earth, presumably nearest the point struck.

I would expect that a buried counterpoise at the base of such structures would assist materially in those cases where strokes did not make contact with the transmission line, but did occur close enough to it so that considerable volumes of current must be dissipated. In this case, the buried earth counterpoise would act to distribute these charges over sufficiently wide areas so that flashover would not occur. This perhaps is a partial explanation of the phenomenon indicated by Mr. Runciman, particularly in paragraph 4 of his conclusion. It is to be noted in this regard that overhead ground wires with frequent down connections to earth are not only helpful in this way but they are also advantageous in connection with strokes which are to be diverted from the transmission line through the protective tent offered by the overhead ground wires.

On the other hand, a buried counterpoise without the overhead ground wires will be useful only in those cases where lightning occurs nearby and does not strike the transmission line. It is probable with the lower ground resistance resulting from the use of the counterpoise, that for strokes to the transmission line conductors, flashover is somewhat more likely, because of the presence of the counterpoise. This naturally leads one to the general conclusion that counterpoise plus the overhead ground wire results in the most satisfactory combination, taking care of both strokes to the line and strokes nearby, provided the ground resistance and the insulation on the structure are suitable.

It is interesting to observe that a negative stroke to a point near a transmission line, travelling to the base of a tower, and up a tower, would be registered as a positive stroke on a magnetic link connected to that tower for the purpose of measuring lightning currents flowing through the tower structure. This may explain some of the positive records which have been obtained in the past.

THE AUTHOR

It is interesting to note that both Mr. McEachron and Mr. Buchanan mention cases of lightning hitting nearby and travelling to conductors on pole lines. Mr. McEachron's case was a telephone line and Mr. Buchanan's a power line. No doubt there are many such cases but it is not easy to obtain the evidence. This type of lightning stroke is taken care of readily by the use of a buried counterpoise, which is assisted in many cases by the parallel sky wire. The point which is not at all clear as yet, is the reason for advocating trials without sky wires. This theory is based on the fact that the lightning stroke path is an expansion of a smaller current flow through the lowest resistance path. Some idea of the theory may be obtained by studying pictures, which were incorporated in a paper by Mr. Goodlet in the Journal of the Institution of Electrical Engineers, dated July, 1937.

In the discussion following the paper, page 46, Mr. F. J. Miranda produces these pictures, giving credit to Stekolnikov for making the original experiment. The experiment consisted of a buried metal sphere and two sand cones. Overvoltage discharges flashed both to the cones and to the metal ball buried below the surface of the sand. The voltage was considerably higher than that required to just flash to the cones and, therefore, built itself a path of low conductivity through the longer gap to the buried sphere. A careful study of these pictures indicates that this is correct and, in the case of a well counterpoised steel tower transmission line, the lightning would be expected to strike one or more steel towers, on account of the fact that this path would be the lowest resistance circuit; that it would have lower resistance than another circuit involving the conductor.

Mr. Hansson's reference to Edgar Bell's paper citing a case where three out of four strokes contacted the overhead sky wire does not prove that the conductors would be struck if the overhead sky wire were not present. It rather tends to prove that the sky wire circuit is a good path to ground and that height is not the sole factor in the establishment of the lightning stroke circuit. The author's opinion is that if the sky wire were absent, the lightning stroke would contact the best ground, which would be the top of the tower.

Mr. Hansson's question re the relative resistance of earth in Quebec and Maryland requires the explanation that we were using an earth tester, whose top limit was 3,000 ohms. No doubt the resistances were higher than could be read. It is probable that Quebec and Maryland and other soils elsewhere read up to his figure of 10,000 ohms per cubic foot.

The author does not disagree in the use of sky wire, but believes that when the above phenomenon is better understood, engineers will feel more satisfied to design transmission lines well counterpoised and possibly omitting the sky wires.

To quote from a letter received from A. E. Silver, consulting Electrical Engineer, Ebasco Services Inc.: "It is the opinion of those who have been observing the performance of this line that substantial benefit has resulted from the continuous counterpoise in the way of reduction of the number of single phase tripouts and apparent elimination, during the period in use, of three-phase faults, occasionally being experienced before the counterpoise was installed."

This statement refers to a 35-mile section of the Wallenpaupack-Siegfried 220 kv. line, which was equipped with counterpoise and no sky wire.

To answer Mr. Buchanan's point, in reference to reduced insulation, it should be pointed out that the minimum insulation for a 220 kv. line in wet weather would be about six suspension units, and some other companies, eighteen to twenty-four units. The extra units are there because of our fear of lightning flash over and the occasional defective unit.

Replying to Mr. Buchanan's other questions:

1. The poles were equipped with ground wires in which some sort of gap is inserted to increase the insulation to lighting from 200 kv. to 600 kv.

2. The gasoline driven Barco hammer drives rods to any required depth.

GAUGES FOR MASS PRODUCTION

C. A. ROBB, M.E.I.C.
Power Consultant, Munitions Branch, Department of Munitions and Supply, Ottawa, Ont.

Paper presented at the Annual Meeting of the Ottawa Branch of The Engineering Institute of Canada, Ottawa, 9th January, 1941.

SUMMARY—This paper deals with gauges which are among the most essential tools for quantity production of duplicate and interchangeable parts. The subject is treated with particular reference to developments in recent years and to current practice in Canada.

Gauges are essential tools for the quantity production of duplicate and interchangeable machine parts. They are used to measure and control the size and accuracy of the manufactured pieces, and should be on hand before actual production begins. The critical task in manufacture is to know when and where to stop the removal of material. When only a small quantity of parts of mechanisms are required, standard shop measuring instruments are adequate. However, when large scale or mass production is involved, the use of such instruments is slow, expensive, and presents many chances of error.

Mass Production of Interchangeable Parts

In mass production no two pieces of a series coming from a machinery process can have exactly the same size or form. To ensure satisfactory assembly of the complete machine, limits must therefore be specified for each part, within which the dimensions and shape of all acceptable parts must lie. The closer these limits are, the more expense is incurred in manufacture, and in inspecting the pieces for acceptability.

Thus, for example, in a pair of parts, involving a cylindrical plug which has to fit a cylindrical hole, gauges must be provided which will make sure that the smallest hole and the largest plug will fit properly and, similarly, that the largest hole and the smallest plug will be satisfactory. It is also necessary to ascertain that both the hole and the plug are reasonably cylindrical and that the parts are everywhere within the dimensional limits or tolerance required by the designer. The plug must not be larger than a given dimension; a snap or caliper gauge, of that size, which fits over the plug provides this assurance and is known as the "high," or "high limit" gauge, or the "go" gauge. Similarly, the plug must not be too small, and if a gauge of the same type, but of the smaller dimension required (the low limit),

Fig. 1—Ring and plug gauge.

will *not* fit over the part at any point, it follows that the plug is within the specified limits—the high limit and the low limit.

It will be noted that, because the "go" gauge has accepted the plug, wear of this gauge will result from repeated use. However, if the low or "not go" gauge has been too small to receive the part or plug, then wear of this gauge, except possibly at the point of entrance, has not occurred. Here we have a simple example of limit gauges. All plugs, which are received by the "go" gauge and are not received by the "not-go" gauge, are considered to be within the required limits and are acceptable. While both gauges can be made in one piece and, in certain cases this design is convenient from the standpoint of inspection, the usual practice is to make a separate gauge for the high limit and another gauge for the low limit. It is noted that since the "go" gauges wear, a large number of them will be required, while a relatively small number of "not-go" gauges will be needed.

Gauges are commonly made of tool steel and require for their manufacture the services of skilled tool makers. They are produced by successive operations of roughing, hardening, grinding, and lapping. They are expensive, ranging in price per unit from a dollar to many hundreds of dollars. However, the total cost for gauges may be only a small fraction of the cost of the finished product. In making the gauges themselves, the permissible tolerances are of course

Fig. 2—Snap gauges.

much smaller than for the parts whose sizes they control. In typical cases, the gauges are within .0001 in. or .0005 in. of the nominal size, with .0003 in. as a common value. This tolerance is, when possible, allowed in the direction of wear.

We have seen that gauges are necessary to provide speed, economy, and accuracy in mass production. While they may be required during the tooling-up process, their normal application is for the inspection of the finished product. This inspection usually occurs at the establishment where the mechanisms or parts are made. Gauges must be handled with care, protected against excessive shocks or extremes of temperature, must be kept under competent supervision, and replaced as soon as worn beyond the permissible allowance.

Classification of Gauges

Various types of gauges may be classified in the order of difficulty of their manufacture, as thread, profile, fixture, ring, snap and plug gauges. Shop gauges are often provided for preliminary shop inspection. In this case the gauge tolerance may be the same as for inspection gauges but the limits are reduced to insure acceptance of the parts upon final inspection.

Manufacturing Technique

Plug gauges (as shown in Fig. 1) may be roughed out in a common engine lathe, but when any considerable quantity is required, turret lathes are used. In order to economize material and to facilitate renewals, separable handles are often provided. A limited number of different-sized handles serves a large variety of plug gauges. The gauge may be pinned to the handle. Naturally, the weight of the handle must be properly related to the gauge. A handle which is too heavy introduces a risk of damage to the gauging surface or breakage in handling.

The tool steel gauging portion may be manufactured in a turret lathe and, after hardening, be ground to approximately the required dimensions, from .0001 in. to .0003 in. of material being left on for the final lapping or polishing operation. This lapping may be done in a lapping machine, or by hand.

Snap gauges may be made from drop-forged blanks, be forged from material approximating the dimensions required, or be cut from the plate (see Fig. 2). In the latter case, the gauges are roughed out, ground on the faces and then finished in gangs, as many as twenty being handled in this manner. The economy of the method is obvious, when it is realized that, for example, if a gang of only three were finished at one time, the two end gauges of the gang are sometimes scrapped, due to the behaviour of the wheel at the entering and leaving points of the gang. Certain types of gauges require a minimum of two in the set-up. Flat grinding is done by a surface grinder on which the rotating wheel is mounted. The gauge, commonly held in position by a magnetic chuck, is moved back and forth in front of the wheel, which has been dressed, usually with a diamond pointed tool, to provide the necessary flatness of surface.

In the lapping machine, the gauge itself, if it is a plug gauge, may be rotated and is embraced by a cylindrical nut provided with an adjustment to permit closing in as required, and held from turning, usually by hand. The lap may be of cast iron, steel, or other suitable material, impregnated with an abrasive—diamond dust, carborundum, or the like.

The Gauging Surface

Finishing the gauging surface is an expensive process. Three classes of gauging surface are in use. Of these, the finest is described as a mirror finish, and is the most costly. The cheapest, or commercial finish is less polished and some of the marks left by the grinder may remain. Plug gauges are ground on a cylindrical grinder in which the gauge is rotated. The wheel is mounted in a similar manner to the tool post of a lathe, but at the back. The external cylindrical grinder is usually provided with a cooling liquid to control the temperature of the gauge being ground. The wheels of most modern grinders are motor driven. Internal grinders are available for diameters as low as ¾ in.

Fig. 3—Male and female screw gauges

Thread Gauges

Thread gauges are difficult to make, require thread grinding machines—which are expensive—and are the first concern of the gauge production man. Typical forms are shown in Fig. 3. Thread-grinding machines, hereafter referred to as thread grinders, must provide the necessary accuracy in pitch and with it, a suitable form of thread. These machines are of two kinds; the universal type in which any desired pitch or number of threads per inch may be obtained by the use of a suitable gear train which actuates the lead screw of the machine, and a second type which requires a lead screw and nut for each desired pitch. The former tends to have a higher first cost. The cost of the latter is dependent upon the variety of pitches required. Very substantial progress has been made in the art of thread grinding in recent years. The requirements of a thread grinder are an accurate lead screw, accurate ways, carriage, satisfactory wheel dressing devices, and a suitable non-rusting, non-inflammable cooling fluid. The switch control board of a modern thread-grinding machine is quite elaborate. The tendency has been to provide the operator with devices which will permit control of measurements and inspection of the gauge as the operation proceeds. The value of the thread grinder will be appreciated, because with the earlier method the hardening process, which followed the final machining operation, tended to change the dimensions of the piece, thus altering the pitch. Attempts to correct this inaccuracy in pitch by further lapping usually resulted in an unsatisfactory form of thread.

Fig. 4—Fixture gauges.

While thread gauges for well casings having a V-form had been ground previously, it was not until 1917 that thread grinders were developed for Whitworth threads. Machines of each type described above, but in crude form, were tried out at that time. The most successful thread grinder of this early period consisted of an old Norton cylindrical grinder, which was adapted for this service, and had the added advantage of the cooling fluid. Thread grinders made it possible for tool steel to supersede the pack-hardened machinery steel previously used. This contributed to a reduction in the price of a 2-inch threaded gauge about one inch long from \$100.00 per unit to about \$10.00 in a few months.

Due to a tendency of thread gauges to chip and to wear rapidly, it is usual to leave a softer gauging surface than is the case in other types. The feather edge which results at the end of the gauge is ground back until the entering thread has full form. In order to provide for the removal of debris which tends to collect in the parts to be measured, it is usual to cut a slot axially across the threads; this provides a tapping action, the groove serving to collect the chips and dirt.

During the current year at least one manufacturer has adopted the thread grinder to grind commercial threads for optical instruments.

Details of British Standard screw threads are given in the publications of the British Engineering Standards Association, London, those of American Standard screw threads, by the American Standards Association, New York.

In most thread grinders production is limited to the plug form, that is to say, they are simply external grinders. In the case of ring thread gauges, it is usual to grind the taps and laps in the thread grinder. These may be made in sets of two or three each.

In order to guard against an erroneous impression that thread gauge production to-day is a simple matter and without hazard, it may be mentioned that recently one manufacturer lost 35 thread gauges out of a total lot of 50. This occurred due to cracking during the grinding process. In this case the onus was placed on the tool steel.

Optical Projection Apparatus

Among the devices which have contributed to the successful production of modern thread gauges, optical projection apparatus is the most outstanding. This aid to the inspection of thread gauges was developed in 1916, at the gauge laboratory of the Imperial Ministry of Munitions at Ottawa. In this early design, a direct current arc was used to project the shadow of the thread form on a screen placed at a distance of from 15 to 30 feet. On this screen the image was compared with a diagram having the correct form. It was necessary, of course, to rake either the beam or the gauge in order to secure the clearest possible definition, and the device was of great value in assisting the manufacturer to get a clear picture of his gauge production troubles. It must be remembered that even when the above precaution has been taken, the image is not the shadow of a straight line element, but rather that of two curved surfaces. Some tendency to error is due to parallax and to the differences which exist between the actual image and the image which would be obtained from a thin longitudinal section or lamina cut by planes passing through the axis of the thread.

Special Machines

Another machine, the jig borer, developed in recent years, is used in the production of fixture and profile gauges (see Figs. 4 and 5). This machine, in which the movable table can be set to bear on Johansson blocks, makes it possible for a hole to be located within .0002 in. or less.

Certain of these machines, utilizing the principle of the pantograph, are adapted for the manufacture of profile gauges.

Some types of profile gauges are made by special fixtures in which either the gauge or the grinding wheel is carried at the end of a radius arm of adjustable length to suit the particular gauges concerned.

Gauge Inspection Equipment

Comparing the position to-day with that in 1916, it is recalled that at that time only two sets of Johannsson blocks and two Rivett lathes, having a very accurate lead screw, were available in Canada. A Pratt and Whitney

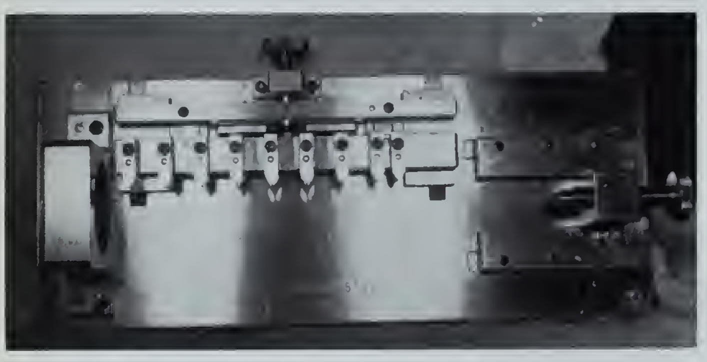

Fig. 5—Fixture gauge.

measuring machine was obtained to facilitate precision measurement of gauges. Johannsson blocks are now to be found in most of the better tool shops. A set of them is shown in Fig. 6. These, originally developed in Sweden, are small steel blocks of which two faces are plane and parallel within an accuracy of one-hundred–thousandth of an inch—an amount three hundred times less than the diameter of a human hair. In the gauge shops, such blocks provide the standard for measurement, and are in use wherever gauges are to be verified. Johannson blocks are now manufactured in the United States, as are the somewhat similar Hoke gauges. The latter are an interesting development of 1917, and are stated to have comparable accuracy. These reference blocks are checked by interferometer measurements, utilizing the interference of light waves.

Plug thread gauges are measured as follows: the full, effective and core diameters are found by means of a micrometer or measuring machine in conjunction with accurate cylindrical wires; the form of thread is checked by the same means in conjunction with the projection apparatus; the pitch by means of a pitch measuring machine of which the Pitter is an example. This is used in conjunction with the projection apparatus and it is usual, as a final precaution, to have a threaded ring gauge or check into which the plug thread gauge must fit. Plaster casts of the threads of ring thread gauges may be used to assist in checking the form of thread; certain kinds of dental plasters can be used for this purpose.

The accuracy of a surface as regards roughness may be measured in microns by means of an electrical device, the profilometer. Chips, cracks or internal fractures in precision parts, which are difficult or impossible to discover by ordinary methods are detected by means of the X-ray, magnaflux or other devices.

Dial indicators with plain, partially jewelled, and fully jewelled bearings are used for production, shop and gauge inspection, as is also a companion device, the comparator. The latter consists of an accurate anvil surmounted by a dial indicator and suitable lighting devices which permit a quick comparison between, for example, a Johannsson block and a part or gauge which is to be measured.

The Solex system of gauging, which depends for its operation on an air blast, is especially adaptable for measuring long cylindrical parts of which internal measurements are required.

Space will not permit the discussion in this paper of the various forms of pitch measuring devices, plain and thread micrometers, height and depth gauges, surface plates and straight edges, which are essential for gauge inspection.

Hardness

Devices for measuring hardness include the Rockwell, Vickers, Brinell and the Shore scleroscopes.

The Rockwell method is most commonly employed in Canadian shops, and for commercial gauges, a hardness ranging from sixty-two to sixty-four Rockwell has been found acceptable.

All of these devices have the disability that they cannot be applied directly to the gauging surface without causing damage. When the gauge is made of tool steel, satisfactory results may be obtained with a hardness tester. However, there is a wide-spread disposition to employ a fine Swiss file to test the actual gauging surface, which, if it is scratched by the file, is considered to be too soft. Some manufacturers regularly draw the hardness from the gauge at other than the gauging parts, in order to reduce internal strains, the risk of breakage, and to give added strength. A stabilizing process is applied to most of the more accurate gauges.

Temperature Control

Gauges and measuring equipment should be at approximately the same temperature for routine inspection. Certain firms install a temperature-control standards room with a range of precise measuring equipment, to give an immediate ruling on all questions of accuracy and to keep a rigid check on their gauges.

Wear of Gauges

The wear of gauges, the durability of different types of steel and the effect of different heat treatments, are questions which have received a good deal of attention in recent years, more particularly in connection with screw gauges, the life of which is short as compared with that of gauges of other types. This is due to the greater length of travel of the screw gauge for each gauging operation. For example, the two-inch thread gauge already referred to, when applied to the part to be measured, travels a distance of about twelve feet in gauging one part. A plain gauge of similar dimensions would travel only about two inches in one gauging operation. Experience has shown that a hard lapped steel gauge of these dimensions can only be depended upon for about 6,000 inspections before becoming worn beyond allowable limits. An overall length gauge, on the other hand, may serve for about 300,000 parts. Wear of gauges also depends upon the material and the quality of the surfaces to be measured. Thus, a gauge used in inspecting steel parts may have only about one-quarter the life of a similar gauge used for inspecting brass parts. A short pilot may be provided at the tip of thread gauges to reduce trouble experienced from progressive chipping away of the first threads in ordinary use. It has already been stated that the specified standard of hardness for screw gauges is definitely lower than that for other gauges.

Re-inspection for Wear

Various methods are employed for the re-inspection of gauges for wear. Some gauges can be examined from time to time simply by the application of a suitable check which will ensure that the gauge has not worn beyond allowable limits. However, when the allowable life of a gauge is not known, and future requirements have to be estimated well in advance of production, it is usual to report the measurement of each re-inspection, serial numbers being assigned to each individual gauge. One Canadian manufacturer regularly inspects and reports on all shop gauges every 48 hours. When gauges are placed in service, wear begins at once and provision must be made for the replacement of

Fig. 6—Johannsson gauge blocks.

worn gauges or parts thereof as the case may be. Having this in mind, the designer should provide as far as possible for salvaging by the replacement of relatively inexpensive parts, such as pins, ball points, and the like. For example, in the pin type snap gauge, the gauging surfaces consist of pins, commonly screwed into the body of the snap gauge and provided with suitable locking and sealing devices. Similarly, threaded roller type gap gauges are used for the measurement of threaded parts; these are amenable to adjustments as to the diameter of the part and may be designed in such a way that the threaded ring can be rotated from time to time, so as to present a new gauging surface.

Cylinder gauges may be provided with a hardened ring set at the entering edge of the gauge, which can be cheaply replaced.

Caliper gauges are usually designed with an adjustable ball point, which is replaceable.

Certain adjustable threaded ring shop gauges are reclaimed by closing in the gauge and relapping. When very accurate inspection is required, and especially when the gauge takes the form of a threaded concentricity gauge, the solid type is preferred and indeed may be required. This type does not lend itself to this method of salvage.

Chrome Plating

Hard chrome deposited by electrolysis is used for the rectification and repair of gauges. This material when

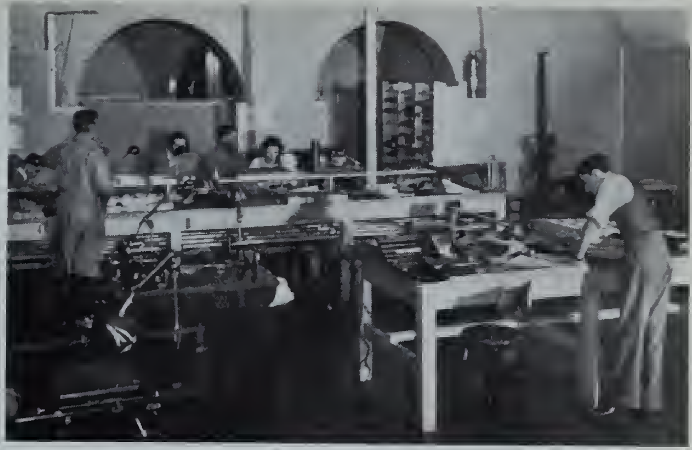

Fig. 7—Corner in National Research Council gauge laboratory.

ground and polished provides an excellent mirror gauging surface, having approximately five times the wear of a polished hardened steel gauge.

For snap, plug, ring and cylinder gauges, the cost of reclamation ranges from one-quarter to one-half the cost of the original gauge. In repairing old gauges, it is usual to grind off from .002 to .003 in. from each gauging surface. The chrome is then deposited, ground and finally polished. It is claimed that a hard surface is required for the deposition of the chrome. In some cases, the hardness of the steel is drawn back to 42 Rockwell. This practice is not general. However, experience has shown that gauges, in which the chrome surface has been scratched, have failed, owing to cracking of the steel. It may be that when the concentration of stress occurs in the hard chrome, the steel does not have sufficient resilience to resist the beginning of a crack. The result follows the conventional picture of such failures. The author, while admitting the need for a hard base for chrome, is of the opinion that there are limits for the resilience of the base metal and that hardness is a factor in a successful technique. Reclamation of Whitworth plug-thread gauges by chrome plating has been successfully carried out on this continent. In this case, the tendency for the chrome to heap at the crest of the thread has been overcome by placing an electrode at the foot of the thread. This is a significant development.

Tungsten carbide is being used successfully on gauges which are subject to exceptional wear.

Nitriding

Nitrided steel has a very hard surface, but unless the material has a special heat treatment after the process of nitriding, it tends to chip away at the very hard skin. The fact that the process of nitriding causes an increase in the dimensions of a steel gauge makes it necessary to grind after the nitriding process. This is quite possible, but care has to be used to avoid grinding through the hard outer casing. Although one manufacturer abroad specializes in this type of gauge, nitrided gauges are not extensively used in this country, and the process may be considered to be in the laboratory stage in Canada.

Gauge Production

While steam engine manufacturers regularly produced interchangeable parts before the turn of the century, motor-car manufacturers have given the lead in precision work in recent years. Twenty-five years ago, they required an accuracy of .0001 in. for master gauges.

To-day, one manufacturer requires that four classes of parts be measureable within .0002 in., including intervening surfaces as shown by the profilometer.

The smaller shops which supply taps, jigs, fixtures, etc. and production parts for the motor car manufacturers, provide a natural source of supply for gauges. For the last year in which statistics are available, no gauges as such were exported from Canada and about $290,000 worth were imported annually. Only one manufacturer included gauges in his list of advertised products. To-day more than fifty manufacturers are engaged in this task.

As the production of gauges develops, the tendency is towards a substantial reduction of unit cost for any particular gauge.

Standards of Measurements

The National Research Council is the repository of standards for measurements in Canada, the National Physical Laboratory for the United Kingdom and the Bureau of Standards for the United States.

The Research Council, in collaboration with the Ontario Research Foundation, has made a very substantial contribution in the present emergency.

THE BURMA ROAD AND INDUSTRIAL DEVELOPMENT IN CHINA

Dr. C. A. MIDDLETON SMITH, M.Sc., M.I. Mech E., L.L.D.

Reproduced from *The Engineer*, London, November 22, 1940.

No triumph of the civil engineer has attracted such world-wide attention as the new road that connects the Burma and China frontier with the large inland provinces of Yunnan and Szechwan in Western China. The interest of millions of newspaper readers has been aroused because of the effect of the road upon the China-Japan War and with our own struggle for survival. "To-day the fortunes of Western civilization have become inseparable from the eternal Chinese." Those words were written recently by a renowned English journalist; it is well to remember them.

Newspapers have recently explained that the Burma Road is an astounding affair, running over high mountains, down precipitous cuttings, crossing famous gorges over dizzy bridges, and that it was built in an incredibly short time by hand labour of a patient and industrious people, with no other mechanism than a stone boulder hauled by a bullock!

They have not mentioned that there were also Chinese engineers at work on the road, engineers who had had a sound technical training in well-equipped universities. They used modern materials, such as steel and concrete, for the many bridges, culverts, etc. There was no more mechanism than was in use centuries ago, when the Chinese built the Great Wall and the Grand Canal. Yet it was their knowledge of applied science, as well as the efficient manual labour of the workers, that made it possible for the Chinese to build the road over this difficult country.

Some time ago the writer described in this journal* in detail, the engineering problems solved by the Chinese who built the road. It is now proposed to discuss "the imponderable forces" that are at work in Asia and that are rapidly changing the industrial and social systems of a large number of people in that continent. Since the spread of a knowledge of applied science has been the chief cause of these changes it may be of interest to engineers to consider them and their probable developments.

The building of the Burma Road has demonstrated what can be done by an almost unlimited supply of Chinese man power. In Malaya, Hong Kong, in China, and in other parts of the world, Chinese and British have worked together to their mutual advantage. The Chinese have supplied the man power needed for engineering and industrial schemes and the British the technical knowledge and administrative experience. It is not improbable that the present conflict will result in closer co-operation between the two nations.

Although it is my conviction that British engineers will, when peace returns, take an active part in the inevitable transformation of large areas in Asia, yet an increasing number of native engineers will be employed. The greater the number of these native engineers at work in their own countries, the more rapid will be the development of natural resources and the greater the demand for imported machinery. Foreign advice for large engineering schemes will be needed. There are now a considerable number of Chinese and Indian engineers who have a sound knowledge of applied science. My experience with Chinese engineers makes me believe that they have the patience, industry, and ability that is a sure foundation for successful work.

Moreover, the Chinese artisan is a great aid to any engineer. No more industrious and good tempered workman can be found. More than one engineer-captain, in charge of a large number of Chinese artisans in the important R.N. Dockyard in Hong Kong has expressed to me his great appreciation, and indeed admiration, for the Chinese, who so quickly learned how to use new types of machinery. Many thousands of them are in the big private dockyards in the colony, where they are building and repairing ocean-going ships of big tonnage. Many other Chinese artisans are at work in Malaya, Siam, and other parts of the Far East.

Mining and Mechanization

The Japanese invasion of China has stimulated mechanization and mining developments to an extent that seemed impossible three years ago. The Chinese intellectuals always held the Japanese in contempt, but the terrible behaviour of the Japanese soldiers in China has created an intense hatred amongst all classes, and it will live for many years. Like the people in Britain, the Chinese "can take it," and their engineers and artisans will work on until the enemy is defeated. Their tenacity of purpose has enabled China to make a steady advance in developing her internal resources; that is much more important than a spectacular military victory.

Before the Burma Road was built the two largest provinces in China, Yunnan and Szechwan, respectively 150,000 and 220,000 square miles in area, were isolated (England is 50,874 square miles in area). It is true that of late years the railway from the coast in Indo-China has connected Kunming (the capital of Yunnan province) with the sea—the railway that "cost a human life for every sleeper laid for miles along the dreaded Nanti valley." There was also difficult water transport up to Chungking, in Szechwan, 1,350 miles above Shanghai. It was exciting to make a trip in a British vessel of about 1,200 tons register, driven by oil engines of 3,500 hp., through the famous gorges, where the rapids make navigation perilous and where the difference between high and low water each year is about 180 ft. There are no British ships operating on the Yangtse to-day; most of them are laid up, and it is probable that the loss is about £250,000 per annum.

These two provinces are on a lofty plateau; Kunming is at a height of 6,400 ft. In Yunnan there are four arsenals, several power-driven factories—there are 18,000 spindles in operation—and immense mineral wealth—tin, coal, gold, etc. Kunming is 2,000 miles from the old centre of government, now called Peiping; the Imperial express took 100 days for the journey. From Chungking to Rangoon is 1,500 miles. The journey now takes about eight days by road and rail; this will be improved upon.

Kunming is 600 miles from Chungking. The total length

**The Engineer*, December 23rd and 30th, 1938.

of the road to Laschio, the railhead in Burma, is 772 miles. The Burmese Government built the 124 miles of road in their territory, and at the other end the Chinese Government had completed the 281 miles of road from Kunming to Hsiakuan two years before the outbreak of war. Since the outbreak of war more than 5,700 kiloms. of highways have been built in the interior of China, and the Minister for Communications, Mr. Chang Kiang An, recently stated that the vastness of the interior of China necessitates a huge fleet of trucks to carry on international trade.

From Hsiakuan to the frontier, 367 miles, the road was built over mountains, 8,000 ft. high. It passes over two mighty rivers (the Salwen and the Mekong) and countless valleys that make the country look like a toast rack. The gradients are appalling. There are hairpin bends where the road is only 8 ft. wide, with a drop of 2,000 ft. for any vehicle that slips over. A Chinese engineer told me, in a casual manner, "We lose on the average two lorries and three or four men every day on the road, but that is nothing in war." He reminded me that in Yunnan province alone, 10,000,000 lives were lost in the sixteen years of the Moslem rebellion (A.D. 1856-72). There were many more casualties during the Taiping rebellion in the middle of last century, but which did not affect Yunnan.

Of their present affliction, the Chinese say, "This too, will pass." In a land where flood and famine have periodically taken a toll of millions of lives, and where rebellions have decimated the inhabitants of large districts, calamities are accepted with a stolidity that astounds the English. It is a characteristic due, to a great extent, to a social code which has been observed by the race through many generations, and which insists that the family is of more importance than the individual. Brave and cheerful, industrious and intelligent, but pledged to parentage, the Chinese in his home formerly asked nothing from the outside world, and felt no "national" obligations to that outside. That social system was not likely to throw up natural leaders for a nation, such as the *samurai* in Japan. That is why this intelligent and industrious race seem to be unable to organize any large undertakings. The war and the new methods of communication have, however, unified the nation as never before. It has always been an axiom in China that the people have not only the right, but the duty, to rebel against oppression, and often have they done so. Any Chinese Government must guarantee personal freedom, but to-day it is accepted that it can not only guide but compel.

The Province of Szechwan

Their social system made the Chinese weak in organization, and so American experts were engaged to organize traffic on the Burma Road. They have effected great improvements. No doubt it is well camouflaged in the difficult country through which it runs. The Japanese will bomb it, but my inspection of craters in South China showed me they are poor marksmen. And the Chinese have huge labour battalions ready to make repairs.

Szechwan, now the home of the Chinese Government, is about twice the size of Britain and has a population at least equal to that of Japan. A tremendous influx of refugees from the Yangtse Valley has enormously increased the numbers. Many of the refugees are skilled artisans and engineers. A great amount of machinery was carried up into the province in advance of the Japanese tide up the Yangtse River. With abundance of cheap labour, it is being used, not only for military purposes, but to utilize the great variety of raw materials in the province. For Szechwan is rich in many things—foodstuffs, such as rice, wheat, maize, sugar, and oranges; minerals, such as iron, copper, salt, coal, and gold; textile materials, such as silk, wool, and hemp. A great quantity of wood oil was exported; much of it was carried in bulk in ships down the river to Shanghai. Some of the immense wealth of metal in Yunnan province —gold-bearing copper, the zinc of the Kungshan coalfield, and silver-bearing lead—was carried by coolies and animals, and later by motor trucks, to markets in Szechwan.

As long ago as 200 B.C., Chinese engineers provided a remarkable irrigation and flood-prevention scheme in Szechwan. It transformed the Chengtu Plain from waste into fertility, an area equal to that of Middlesex. Ten years ago the population on the plain was ten times as great as that of the English county, but the great influx of refugees has added to the numbers there.

Transport in South-East Asia

Last year it was my good fortune to travel some thousands of miles by motor through French Indo-China, Siam, and

The Burma Road

Malaya. Visits were also made to Manilla and Java. It was surprising to find such excellent motor roads in all these places, and to be told of the recent advances in modern methods of transport. Public vehicles were crowded.

The French engineers had done good work in Indo-China. One of them told me of a large reclamation scheme on the coast which had been recently completed. He stated that the land reclaimed had provided work, mostly on ricefields, for so many people that 3,000,000 human beings were living on an area which previously was entirely uninhabited.

French scientists had also been at work and had done a great deal to make the country a centre of interest to Europeans and a more prosperous home for the natives. No engineer could visit the famous city of Angkor without feeling immense admiration for the constructive ability of the builders of the temples and palaces of ten centuries ago. For about 300 years a million people lived in the City of Angkor, and then it was suddenly deserted; no one lived within a hundred miles of it, and no one knows why it was deserted. Europeans had never heard of it until at the end of last century the French discovered it, buried in the jungle, which has reduced to ruins many of the huge stone buildings. But the French have restored the vast temple called Angkor Vat, certainly the most fascinating building it has been my lot to inspect. When, after a 300-mile motor ride from Saigon, over excellent roads, but under the heat and glare of a tropical sun, we reached Angkor, we met an acquaintance, a shrewd Scotch banker who had travelled all over the world. He had just returned from a visit to Angkor Vat. "Let me come with you to see it again," he said. "You are an engineer, so you ought to be able to explain to me how they erected a building higher than Notre Dame, built only of huge stone blocks, and standing through nearly eleven centuries, without any mortar or cement to hold it together." Then, after a pause, he said: "Well, I have been disappointed when seeing many of the sights of the world, after reading about them in the tourist books, but, believe me, there is no baloney about Angkor —it beats any description!"

The building is now in a good state of restoration. It was probably saved from the encroachment of the jungle, which ruined so many other fine works, because it was surrounded by a moat. It is rectangular in shape, and on the ground floor is a wide corridor, with walls built up of large stone blocks placed one on top of the other. You can walk round the four sides of the rectangle, along this corridor, the total length of which is 2.2 miles! And you can climb up the many stone steps to the *sanctum sanctorum* on the third storey of the temple. "Tell me how they got that huge coping stone, that forms the roof, up here," said the banker. The answer was that an enormous earth ramp must have been provided for the purpose. The quarries whence came the large rectangular stones that, piled one on top of another, make up this amazing temple, were several miles away, and the stone must have been floated on rafts down the river. It is strange that few Europeans in the Far East have heard of Angkor, and on my return to England it was noticeable that none of my friends had heard of it. Indo-China is but a name to most people in this country, but it meant much to the many French people there, amongst whom were engineers and scientists, pushing forward the new type of peaceful civilisation into Asia. We cannot believe that their work has been in vain. The Japanese have obtained possession of the railway from Hanoi, on the coast, to the Chinese frontier. A few months ago they bombed the end of one of the tunnels, and a train, containing amongst the many passengers several Europeans, was wrecked and everyone on the train was killed. Chinese engineers, with as many coolies as they wanted, made a new tunnel and had the line running again within a month.

Water and Road Transport

Between the great mountain system in Asia and the seas to the south and east—the Indian and Pacific oceans—there is an immense granary, whose economic strength has not yet been fully developed, and that is awaiting the spread of knowledge concerning applied science in order to yield its tribute to mankind. And in that area 48 per cent of the world's total population is concentrated on barely 5 per cent of the land surface of the earth!

To the north and north-west of the high mountain ranges is the background of the vast Arctic-Atlantic hinterland, with its endless leagues of steppes flanked by a huge area of primeval forests. Centuries ago some 200,000 horsemen, intent on looting the rich plains to the south of China, found their path blocked by that marvellous structure, the Great Wall. The horsemen recoiled, like the waves of the sea stopped by a cliff, and they dashed across the many thousands of miles of Asia, right up to the walls of Vienna. Thus did the Chinese engineers who built the wall bring the Turks into Europe. The reaction came with the development of applied science, and especially since the invention of the steam engine, accelerated the rise of ocean power and enabled engineers to make travel by rail easy, rapid, and safe. Calais and Hong Kong in South China were connected by rails that run through the tropics, Siberian forests, across Asia and Europe, connecting the Pacific Ocean with the English Channel. Many thousands of miles of railways and motor roads were built. The old single-file caravan tracks, with their tens of thousands of human and animal bearers, slowly carrying goods between trade centres, have been converted into modern highways. By air, passengers and mails have been carried from Hong Kong to London, from Hong Kong to Chungking and other remote cities in China, and from Hong Kong across the Pacific to San Francisco.

In Asia Nature has developed certain features on a gigantic scale, but there is room for them. There are abrupt contrasts between the comparatively small swarms of raiders of great mobility in the north and the remarkable concentration of humanity, 48 per cent of the world's population, between the ramparts of the great mid-world mountain system and the Indo-Pacific Ocean. On the one side, virility; on the other, there seemed to be deceptive immobility, brooding over Hinduism and Buddhism, creeds of calm and contemplation.

India was the first part of Asia to be affected by the work of the engineer, and, whatever may be the political and social changes in that land, there will always remain many monuments to commemorate the devotion of British engineers to a sense of duty.

Burma and Siam presented greater obstacles to engineers than India; obstacles of a political type rather than technical difficulties. But there has been progress. In recent years the Japanese have put forward a scheme which at first sight seems attractive, but which presents enormous engineering difficulties. It is to cut a canal across the Kra Isthmus in Siam. It would save 600 miles of sea travel between Calcutta and Canton, and at least 1,200 miles between Rangoon and Bangkok.

My tour in Malaya last year made me realize that the notable economic progress in that country had been very largely due to the work of engineers. Everywhere there was evidence of the determination of the Government to do everything possible, so that the country should benefit by improved methods of communications and engineering schemes of all types. It was typical of the enterprise of Government officials in Malaya that we travelled in air-conditioned railway carriages—a very great relief in a tropical country. Malaya supplies plenty of evidence, as do Hong Kong and Shanghai, of co-operation between Chinese and British.

Chinese Engineers and Scientists

Mechanised transport, ships, motor-cars, trains, and aeroplanes enabled us to travel thousands of miles along the coast line, through cities, villages, rice fields, rubber plantations, and jungle in this fascinating part of the earth. In the evening we listened to the B.B.C. news relayed from the Hong Kong wireless station, and we knew that they could hear it in many parts of China. We found that the English language could be understood in nearly all the places we visited. It seems inevitable that the vast experience that Angle-Saxon engineers have gained in tropical lands (India, Africa, and America) will be applied in this part of the world.

About thirty years ago a number of us listened to Dr. Diesel at a meeting of the Institution of Mechanical Engineers, when he outlined his belief that the British would utilize tropical soil for the production of vegetable oil suitable for the production of power. When we saw the rather crude mechanism installed on the palm oil plantations in Malaya, where they obtain quite large quantities of oil for human consumption, the vision of Dr. Diesel came to my mind, and it often returned as we rode in comfort through the jungle. Under the tropic sun Nature accelerates the reproduction of vegetable, insect, and animal life in a manner that at first bewilders the native of the temperate zone. It seems that the earth and the fulness thereof have been placed at the disposal of man, but that *homo sapiens* has, so far, miserably failed to make good use of the good earth and the sun.

The contrast between many of the natives of South-east Asia and the Chinese who had emigrated to the south made me realise that Nature abhors indolence even in a land where a man can exist on a few handfuls of rice and the fruits dropped from the trees. Starvation is easily defeated, but malaria, enteric, and other preventable diseases each year claim millions of victims. Indolence leads to decadence. Many of the natives, and some Europeans, live as if "there aint no Ten Commandments," and pay the inevitable penalty, for which the climate is too often blamed. The poverty-stricken Chinese emigrants, on the other hand, are the most active workers, pulling through hardships that would kill the average European, demonstrating that work will win and that the meek—and energetic—accumulate wealth. These Chinese ex-coolies are the millionaires and ideal citizens in Malaya, Siam, and Indo-China. They were taught from infancy the Confucian code that man is capable of great development provided that he follows the moral code taught by his elders and betters.

An Englishwoman who travelled over the Burma Road in a lorry wrote: "I sat down to consider my revolutionized ideas of the Chinese. True, my knowledge of them was extremely slight, gleaned from hearsay, books, and casual acquaintance with members of the race in other parts of the world; but nothing I had learned had prepared me for their amazing kindliness, their attention to practical detail, their strong sense of humour." My own experience makes me re-echo those words.

The wealthy Chinese emigrants remain loyal to the Confucian code. They train their sons to respect their elders, their teachers, and to remember the old axiom that of all men the scholar stands highest in social status. They accept another ancient axiom from their classics, viz., that people should be governed by moral and intellectual agencies rather than by physical force.

There are many young Chinese men and women who are seeking the new knowledge in European and American universities, but they know the Confucian code. You see the results in the struggle made by the Chinese graduates to build roads and communications of all types. They have installed power plants and opened up mines. They are at work on the new hospitals—my friend, Dr. Ling, was running a hospital on the Burma Road when last we heard of him. They are teaching the laws of hygiene; they are trying to improve agriculture, and to urge the importance of scientific research. Perhaps some are attracted by certain Western political and economic theories, much of which will not fit into the Chinese social system. But make no mistake, there is the same dynamic urge to do useful work that brought wealth to their fathers in a land waiting for development. The Japanese military caste fear the results of scientific knowledge and methods in China and have made great efforts to bomb the modern universities. They have not succeeded in preventing instruction in applied science subjects in China, and even if they did there are the millions of overseas Chinese, many of them wealthy, who are urging their sons to qualify as engineers, doctors, etc., so that they may return to China or work in South-east Asia.

Mention must be made of the Malay islands—Java, larger than England; Sumatra and Borneo, much larger; Celebes, and numerous other islands—these are the lands for which the English and Dutch fought each other so bitterly in the seventeenth century, and where it seems probable they will closely co-operate for the development of their natural resources at no distant date. What opportunities for the engineer and scientist are offered by these fertile areas: Already the ubiquitous Chinese have done much of the commercial development. Some of our Hong Kong engineering graduates returned to Java, Sumatra, or Borneo, and we heard of them installing power plants for sawmills, cold storage, etc., or engaged in surveys of the jungle. There are schools in this area where the Chinese are trained in English up to matriculation standard.

It can be claimed that the British were the pioneers of engineering works in China, and, indeed, in the Indo-Pacific areas. Not only did they build railways, docks, and industrial power-driven factories, but they were responsible for great improvements in harbours and inland waterways. For many years there was blind opposition to Western science in China, but that no longer exists. On the contrary, there is a demand for any machinery or other equipment that will aid the war effort or develop the resources of the country. Recently an officer of the Hong Kong University flew to consult the Chinese Government in Chungking, as to how the University could best help China. A reliable correspondent in Hong Kong has informed me that the reply was: "Send us as many trained engineers as you can; hundreds of them." They were not interested in anything else! My experience in Hong Kong was that the Chinese did not oppose the instruction in science of their own nationals, but that a number of English residents, particularly graduates of Oxford or Cambridge, who had studied classics, did their utmost to prevent any extension of the engineering departments. They did not hesitate to inform me that engineering was not a fit subject to be included in a university course. There should be, they said, a technical school unconnected with any institution that confers degrees. During my service in the universities of Birmingham and London in the early part of this century, my colleagues in the Faculty of Arts often expressed those views—in a very pleasant manner—but which left the impression that they believed that engineers were out of place in the academic cloisters, which, they said, should be preserved for those concerned with ideas which do not affect things material. It was useless to talk to them about the ideals of engineers; all of the evils of the industrial system were attributed to the inventors of machinery. That spirit still exists in England. Only a few days ago an Oxford professor solemnly stated in my hearing, in the course of an address, that the war was caused by wireless, because Hitler would never have attained to such power without the aid of that invention! There are perhaps men of the Mandarin type of mind in Britain, as well as a few in China. It is significant, however, that the Chinese Government, in this crisis, is doing everything possible to encourage engineering developments.

It is not only the Burma Road that is of interest to those British engineers whose thoughts are turned to the Far East. We see in the conference at Delhi evidence of co-operation between India and the rich tropical countries in the Pacific. We can be sanguine that at no distant date there will also be co-operation with the Chinese. In the last war the Chinese labour battalions in France did splendid work. It is not improbable that in this war we may seek the aid of Chinese labour and co-operate much more closely with the Chinese Government. It is my firm conviction that the Chinese work more harmoniously with British people than with any other nationals. It has been stated that there are 3,000,000 Chinese who have British nationality and who reside in Malaya, Hong Kong, and other parts of the British Empire. In the days of reconstruction it will be to the mutual advantage of both nations if they can co-operate in the economic development of South-east Asia.

THE DESIGN OF BEAMS IN STEEL FRAME BUILDINGS

S. D. LASH, Ph.D., M.E.I.C.

Acting Secretary, National Building Code Project, National Research Council, Ottawa, Ont.

SUMMARY—Methods are given for the design of beams in steel frame buildings in which allowance is made for partial or complete restraint of the ends. For secondary beams the design method assumes that a high degree of restraint is present and it is shown that this may be ensured by the use of a comparatively small amount of special steel in the form of reinforcing bars placed in the concrete floor slab, if present, or by plates attached to the top flanges of the beams. In the case of beams connected to columns, curves are derived by which allowance may be made for the restraint produced by simple connections using clip angles. The design method is based on the work of the Steel Structures Research Committee (Great Britain) but is considered to be simpler to use and more accurate than the method recommended by that committee. A number of examples are given showing the application of the proposed methods and the possible saving in weight of steel. The recommended methods of design form Appendix E of Part 3 of the National Building Code.

The National Building Code is a model building code for use by Canadian municipalities which is being prepared under the joint sponsorship of the National Research Council and the Department of Finance of Canada. The complete Code is not yet available but Part 3, Engineering Requirements, has been issued separately and it is reviewed on Page 214 of this issue. The author of this paper was Secretary of the Subcommittee on Steel Construction.

Introduction

In the recent report of the Joint Committee on Concrete and Reinforced Concrete* the following words occur:

"In the design of buildings it has been for many years common practice to design columns and beams as isolated members, the columns as compression members axially loaded, and the floor system by prescribed coefficients for moments at the ends and in the centre of the span. In some cases prescribed moment coefficients have also been used to evaluate the bending in columns induced by unbalanced loadings from the floor system.

"Although such practice has apparently resulted in safe design in the case of buildings with uniform column spacings, it has become increasingly clear with the advent of newer methods of analysis that the degree of safety was neither uniform throughout the structure nor in some cases equal to that intended in the design. In the rather frequent cases of unequal spacing of columns or story heights, the design based on the usual moment coefficients often leads to improper design, and quite generally to wide departure from uniformity of factor of safety in the various members of the structure.

"The committee recognizes that more exact methods of analysis are now available for general use in the design of buildings and other framed structures, also that they may be simplified without undue sacrifice of accuracy. These methods will result in better provision for the effects due to continuity and should thereby secure a more uniform degree of safety. The need for such improvement in design becomes more important with the introduction of higher strengths and lighter weights of concrete and the accompanying higher working stresses. The consideration of continuity is especially important in cases of unequal spans alternately loaded where the ratio of live to dead load is large."

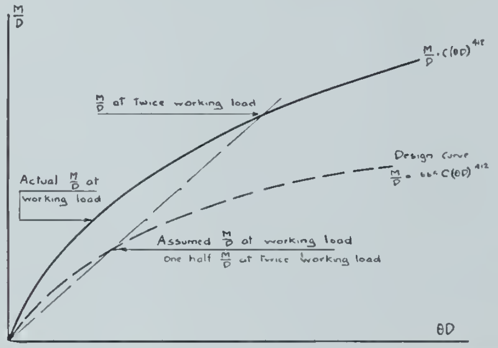

Fig. 1—Derivation of design curves for semi-rigid connections.

It has become increasingly evident in recent years that a somewhat similar state of affairs exists in connection with steel frame construction. This realization must be attributed largely to the work carried out from 1929 to 1935 by the Steel Structures Research Committee in Great Britain. The following extract from the Journal of the Institution of Civil Engineers[1] will show the importance attached to the work of the Committee by the Chairman, Sir Clement Hindley:

"Sir Clement considered that the investigation was of outstanding importance to the engineering profession, and he did not think that in the last 40 or 50 years there had been one of more importance, or one which might affect more definitely the work of engineers engaged in design; if the more rational method of design could be brought into practice the work would be of the very greatest importance and value."

The work of the Steel Structures Research Committee clearly established, both by measurements in the field and by laboratory tests, that, in the average steel frame building, the factor of safety for columns is considerably less than the factor of safety for beams. In such circumstances appreciable economies may be made in the weight of beams without reducing the overall factor of safety of the structure of which they are a part.

In this paper it is proposed to consider the possible economies that can result from making allowance for the complete or partial restraint of beams. Two types of beams will be considered, beams which frame into other beams and beams which frame into columns. For convenience, beams of the first type will be referred to as secondary beams and those of the second type as girders. The treatment of girders is based upon the work of the Steel Structures Research Committee, but the proposed design method is believed to be considerably simpler and somewhat more accurate than the method recommended by the Committee. The design of secondary beams was not considered by the Committee. The recommended methods of design form Appendix E of Part 3 of the National Building Code.

Secondary Beams

The restraint at the end of a secondary beam depends partly upon the torsional rigidity of the girder to which it is connected and partly upon the stiffness of the end connection of the beam. In general, the torsional rigidity of beams of I section is small, but it is greatly increased if the girder is solidly encased in concrete. Standard beam connections are comparatively flexible but a high degree of restraint may be developed by the use of a small amount of additional steel. For example, MacKay[2] showed by a number of tests made at McGill University in 1924 that the additional steel could take the form of reinforcing rods placed in a concrete floor slab. There is no doubt also that plates suitably connected to the beams could be used for this purpose.

If it is assumed that torsional rotation of the girder may be neglected, either as a result of the stiffening effect of concrete encasement, or because the moments on either side of the girder are equal in magnitude and opposite in direction, then it is possible by a simple calculation to determine

*This Committee consists of representatives of the American Society of Civil Engineers, the American Society for Testing Materials, the Portland Cement Association, the American Concrete Institute, the American Railway Engineers Association, the American Institute of Architects.

the amount of supplementary steel needed to ensure an adequate degree of restraint. Alternatively, it would be possible to estimate the degree of restraint produced by any given quantity of supplementary steel. The former method appears to be more satisfactory since it leads to an exceedingly simple method of design.

Consider first, a beam carrying a uniform load. If the ends are fixed, the maximum moment will be $\frac{WL}{12}$ which will occur at the ends. If a restraining moment of $\frac{WL}{24}$, i.e. 50 per cent of the fixed end moment, is applied the maximum moment will also be $\frac{WL}{12}$ but will occur at mid-span. Thus 50 per cent restraint is sufficient to justify a reduction of one-third in the maximum bending moment of a freely supported beam. In the case of a beam carrying a single load at mid-span, 50 per cent restraint is sufficient to justify a reduction of one-quarter in the maximum bending moment in the beam, and with 60 per cent restraint a reduction of 30 per cent in the maximum bending moment will result.

On the basis of the above figures it appears to be reasonable to provide sufficient supplementary steel for 60 per cent restraint and to assume that the maximum bending moment will be reduced by one-third, whatever the loading. The reduction in moment must be ensured not only at working loads but at overload also. In this connection it is convenient to use the term 'load factor' as meaning the ratio of the maximum useful load that can be placed on a structure to the working load. This term is used in preference to 'factor of safety' which is defined in most text books as the ratio of the ultimate strength of a material (usually in tension) to the unit working stress. It will be assumed that a load factor of two is sufficient, this being somewhat greater than that usually found in columns and somewhat less than the common value for beams.

The required area of supplementary steel may be determined in the following manner:

Let A_S be the area of the cross section of the beam,
A'_S the area of cross section of supplementary steel in tension,
D the depth of beam,
D' the lever arm of the force in the supplementary steel,
f_s the allowable flexural working stress in the steel,
f_y the stress at yield,
k the radius of gyration of the area of cross section of the beam,
M_F the fixed end moment,
and S the section modulus of the beam.

Many modern codes, including the National Building Code, permit the load on a beam to be increased if it is encased in concrete. Such increase is equivalent to an increase of working stress and on this basis it will be assumed that the working stress has been increased from f_s to f_s $(1+P)$.

Then

$$C_1 M_F = f_s(1+P)S \qquad (1)$$

where C_1 is a constant greater than one.

If the supplementary steel yields at twice the working load, its moment of resistance will be $f_y A'_S D'$ which may be written $C_2 f_y A'_S D$ where C_2 is a constant.

Thus, if the restraint at twice the working load is to be six-tenths of the fixed end moment,

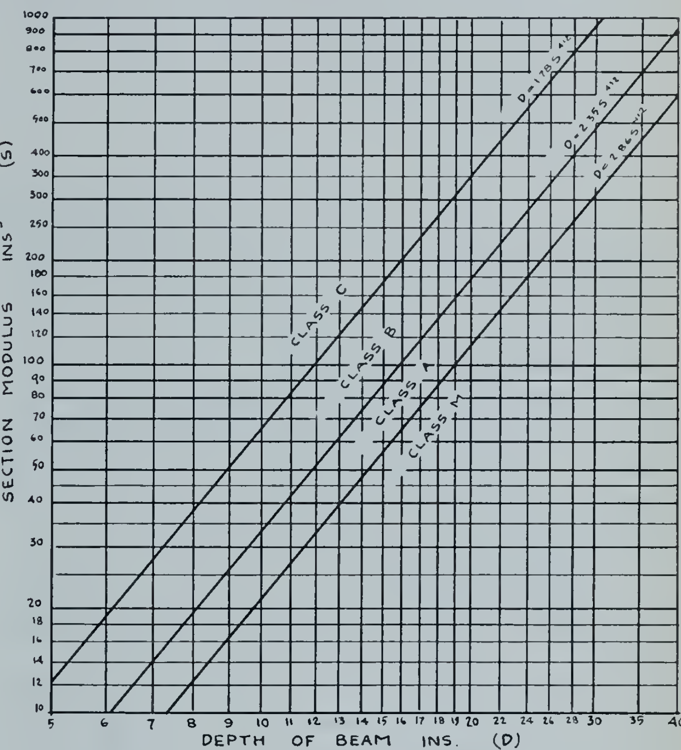

Fig. 2—Classification of beams.

$$\frac{C_1(C_2 f_y A'_S D)}{2 f_s(1+P)S} = 0.6 \qquad (2)$$

and substituting $S = \frac{2I}{D} = \frac{2A_S k^2}{D}$,

$$\frac{A'_S}{A_S} = \frac{0.6(1+P)}{C_1 C_2}\left(\frac{f_s}{f_y}\right)\frac{4k^2}{D^2} \qquad (3)$$

$\frac{A'_S}{A_S}$ will be a maximum when P, $\frac{f_s}{f_y}$ and $\frac{4k^2}{D^2}$ have maximum values and when C_1 and C_2 have minimum values. Studies on the properties of encased beams suggest 0.16 as a reason-

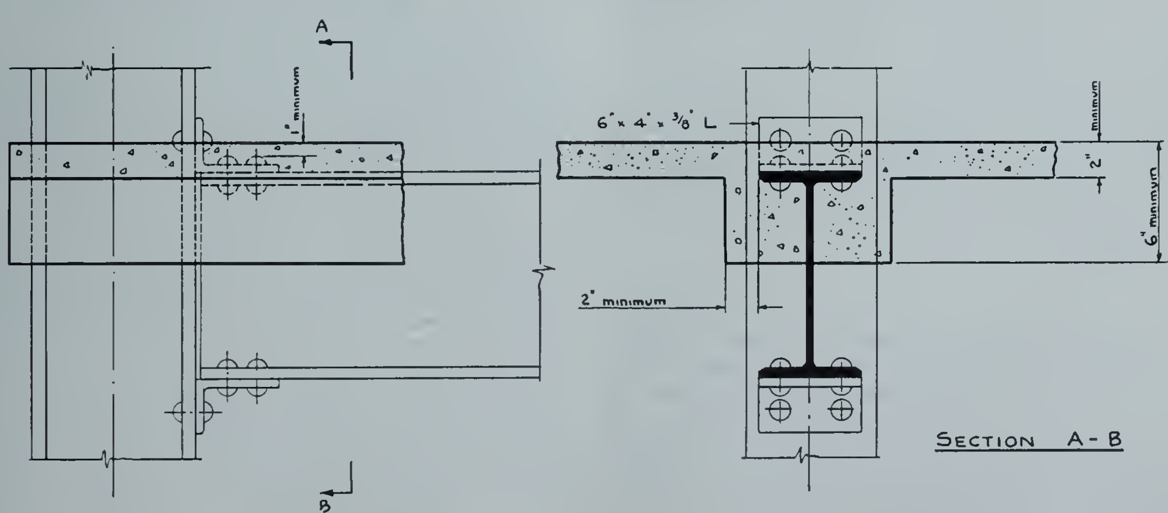

Fig. 3—Minimum concrete encasement required for Class B connections using 3/8-in. clip angles.

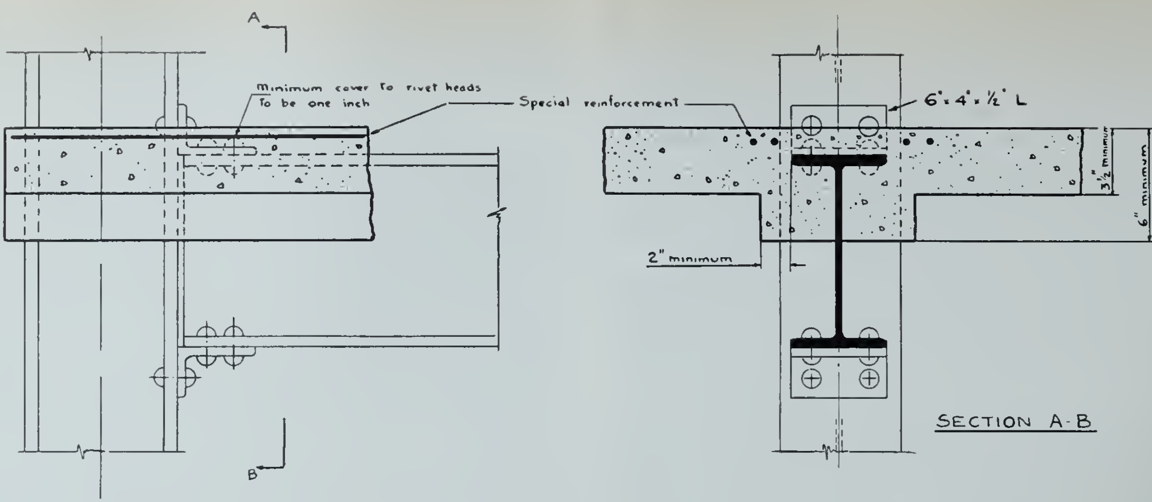

Fig. 4—Minimum encasement required for Class C connections using ½-in. clip angles.

able maximum value for P; the minimum value of C_1 is one and it is unlikely that C_2 will be appreciably less than one. If f_y is assumed to be the specified yield point stress, $\frac{f_s}{f_y}$ will be approximately 0.6. Tests on beams have shown, however, that yield will occur at an apparent stress somewhat in excess of the tensile yield point and it therefore appears to be reasonable to assume $\frac{f_s}{f_y}$ to be equal to one-half.

With these assumptions, equation (3) reduces to

$$\frac{A_S'}{A_S} = 0.348\,\frac{4k^2}{D^2} \qquad (4)$$

The value of $\frac{4k^2}{D^2}$ depends only upon the properties of the beam sections. Obviously k can never exceed $D/2$ and hence $\frac{4k^2}{D^2}$ can never exceed one. Examination of tables of properties of sections leads to the conclusion that $\frac{4k^2}{D^2}$ will not exceed 0.66 in the case of standard beams and 0.76 in the case of wide flange beams. It appears to be reasonable therefore to assume 0.76 as a maximum value for $\frac{4k^2}{D^2}$; substituting this value in equation (4) the value of $\frac{A_S'}{A_S}$ is found to be 0.264. Thus, if supplementary reinforcement having an area equal to 0.264 times the area of cross section of the beam is provided, the beam may be designed to resist only two-thirds of the static moment; and the load factor will in no case be less than two. It is possible, but not probable, that if twice the working load were applied, the supplementary reinforcement would yield. This, however, would not affect the safety of the beam in any way, and is not in itself undesirable.

In practice, the coefficient 0.264 may be assumed as one-quarter without serious error, and since the allowable stress in the supplementary steel may not be the same as that in the beam, the requirement may be expressed in a more general way by requiring the supplementary steel to be capable of resisting a tensile force

$$T' = \frac{f_s A_S}{4} \qquad (5)$$

The preceding discussion has been concerned only with the method of resisting tension. It will, of course, be necessary also to transmit compression from the girder to the lower flange of the beam. If the girder is solidly encased in concrete it may be assumed that the concrete is capable of resisting the compressive stresses. Alternately, certain types of end connection may be used; for example, a seat angle connected to the lower flange of the beam with four rivets will be adequate in many cases.

Girders

The moments present at the end of a girder depend upon the following variables:

(1) The magnitude of the load
(2) The distribution of the load
(3) The stiffness of the end connections
(4) The stiffness of the members to which the girder is attached
(5) The moment of inertia of the girder
(6) The depth of the girder
(7) The length of the girder.

Of these variables, the stiffness of the end connections has proved to be the most difficult one to estimate. Semi-rigid types of end connections are indeterminate structures in which certain portions are stressed beyond yield. Attempts to predict the behaviour of such connections by calculation have proved to be particularly unsuccessful and it is necessary therefore to refer to the results of tests. Such tests have been carried out by the Steel Structures Research Committee (3) (4) in England, by C. R. Young and K. B. Jackson (5) in Canada, and by Rathbun(6) in New York.

The relation between end moment and the slope at the end of a beam is given by the slope-deflection equation

$$M = M_F - \frac{2EI\theta}{L} \qquad (6)$$

in which M is the end moment,
M_F the fixed end moment,
E the modulus of elasticity,
I the moment of inertia of the cross-section of the beam about the neutral axis,
θ the slope at the ends of the beam,
L the length of the beam.

The equation in the above form applies only to beams symmetrically loaded. In such a case it is obvious that the maximum moment on the beam will be reduced by an amount M, which may therefore be termed the allowable restraining moment. It has, however, been shown by Batho(7) that the same equation may be used to determine the allowable restraining moment in the case of unsymmetrical loading if the mean of the fixed end moments be substituted for M_F. It was further shown that when the end restraints are unequal the allowable restraining moment at either end of the beam may be determined on the assumption that an equal restraint is present at the opposite end of the beam. The allowable restraining moment at the position of maximum moment can then be determined by calculation or by drawing a bending moment diagram. This approximation involves a loss of economy in some cases and, considering the maximum moment in the beam, a very small error on the wrong side in a few cases. More accurate results, however, do not appear to be needed and could only be obtained by a great increase in complexity of the calculation. It should perhaps be pointed out that the calculation of the mean of the fixed end moments can be very simply made for any condition of loading. For example,

(a) For a single load P anywhere on the beam, the mean of the fixed end moments is $\frac{Pab}{2L}$, where a and b are the segments into which the span is divided.

(b) For a load uniformly distributed on a part of a span, the mean of the fixed end moments is $\frac{Wab}{2L}-\frac{Wd^2}{24L}$ where a and b are the segments into which the centre line of the load divides the beam and d is the length over which the total load W is distributed.

In order to consider the stiffness of the end connection it is necessary to introduce some scheme of classification of such connections. In the draft rules for design (Steel Structures Research Committee) four classes of connections, A, B, C, and D were established. Class A included connections which transmit very small moments, and Class D included connections of the wind bracing type which are nearly rigid. Classes B and C represented intermediate degrees of restraint. A somewhat simpler scheme of classification is to have only three classes, Classes A and B including the more flexible types of connections and Class C the rigid or nearly rigid types. Possibly this is as great a subdivision as can be justified on the basis of ordinary commercial practice.

The rigidity of any type of connection is increased if the connection is encased in concrete. This increase is very great for small loads but not so great for loads sufficient to cause cracking of the concrete. Batho[8] has described the results of a considerable number of tests on encased connections, some of which were provided with reinforcement. On the basis of these results and the tests by MacKay referred to previously it would appear to be reasonable to give a small amount of credit for concrete encasement without reinforcement especially with more flexible connections, and to give considerably more credit for the stiffening effect of concrete properly reinforced.

In addition to classifying end connections it has been found desirable also to classify beam sections. Such a classification makes possible a direct method of design; whereas in other methods it is usually necessary to assume some property of the beam such as its depth and recalculate the moment if the assumption did not prove to be correct. This classification has been accomplished by assuming that for any particular beam the depth, D, may be expressed in terms of the section modulus, S, by the equation

$$D=C_3S^{.412}\qquad(7)$$

and hence beams may be classified in accordance with the value of the constant C_3.

It is obvious that the fourth variable listed above, i.e., the stiffness of the members to which the girder is attached, is one that may introduce problems of great complexity. In order that a simple design method be possible, it is necessary to make some fairly drastic sort of assumption. This was done in the procedure recommended by the Steel Structures Research Committee by assuming that, in the case of a girder connected to the flange of a column,

$\frac{K_B}{K_U+K_L}$ is generally not greater than 1.5,

K_B is the stiffness of the beam,

K_U and K_L the stiffness of the column lengths above and below the beam respectively.

(The symbol $K=\frac{I}{L}$)

A figure of 1.5 was chosen after a survey of a considerable number of buildings and will include all ordinary cases except perhaps a few roof beams. In such exceptional cases it is probably simpler not to make any allowance at all than to try and derive some complicated method of calculation.

When a girder is connected to the web of a column, $\frac{K_B}{K_U+K_L}$ may exceed 1.5; in such cases allowance for end restraint can only be made in respect of the moment due to dead loads in approximately equal spans on either side of the web. When $\frac{K_B}{K_U+K_L}$ is less than 1.5, allowance can be made for end restraint in a girder connected to a web provided the web is stiffened so as to prevent excessive local deformation. It will be appreciated that under unsymmetrical loading the comparatively thin web of a column may be deformed considerably by reason of a beam connection attached to it.

It was also shown by Batho that, if various small corrections are omitted, the assumption that $\frac{K_B}{K_U+K_L}$ is equal to 1.5 may be expressed by modifying the equation (6) to read,

$$M=\frac{M_F}{2}-\frac{EI\theta}{L}\qquad(8)$$

in which M is the allowable restraining moment and θ the corresponding angular deformation of the end connection.

Design of Girders Having Rigid Connections (Class C)

In the case of girders having rigid or nearly rigid connections tests have shown that the relation between end moment and angular deformation is nearly linear and that the end moment will be about 80 per cent of the fixed end moment. This will be reduced approximately one-half by the allowance for flexibility of the columns. Thus, the minimum restraint when rigid connections are used can be assumed to be about 40 per cent of the fixed end moment. It is recommended therefore that the end restraint be assumed to be four-tenths of the fixed end moment in all

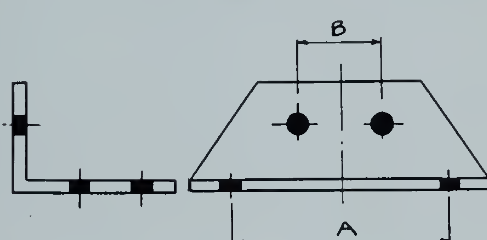

Fig. 5

cases where rigid or nearly rigid connections are used provided that $\frac{K_B}{K_U+K_L}$ does not exceed 1.5. This assumed value of moment is a lower limit value and the connections themselves should in most cases be capable of transmitting the full fixed end moment without failure.

Semi-rigid Connections

Much experimental work was carried out at the University of Birmingham from 1929-1935 upon the behaviour of semi-rigid connections. In particular, connections made up of angles attached to the flanges of the beam (clip angles) were investigated in great detail (see the First, Second, and Final Reports of the Steel Structures Research Committee) and sufficient information was collected to enable lower limit curves for various types of connections to be specified. These curves were found to be of the type,

$$M=C\theta^{\alpha}\qquad(9)$$

M is the moment transmitted by the connection,

θ the angular deformation of the connection, and

C and α are constants.

The constant α was found to be approximately 0.412 for all types of connections. Less complete investigations were made, however, upon the rigidity of connections having web angles as well as flange angles but it was shown that, although the rigidity of web connections alone is small,

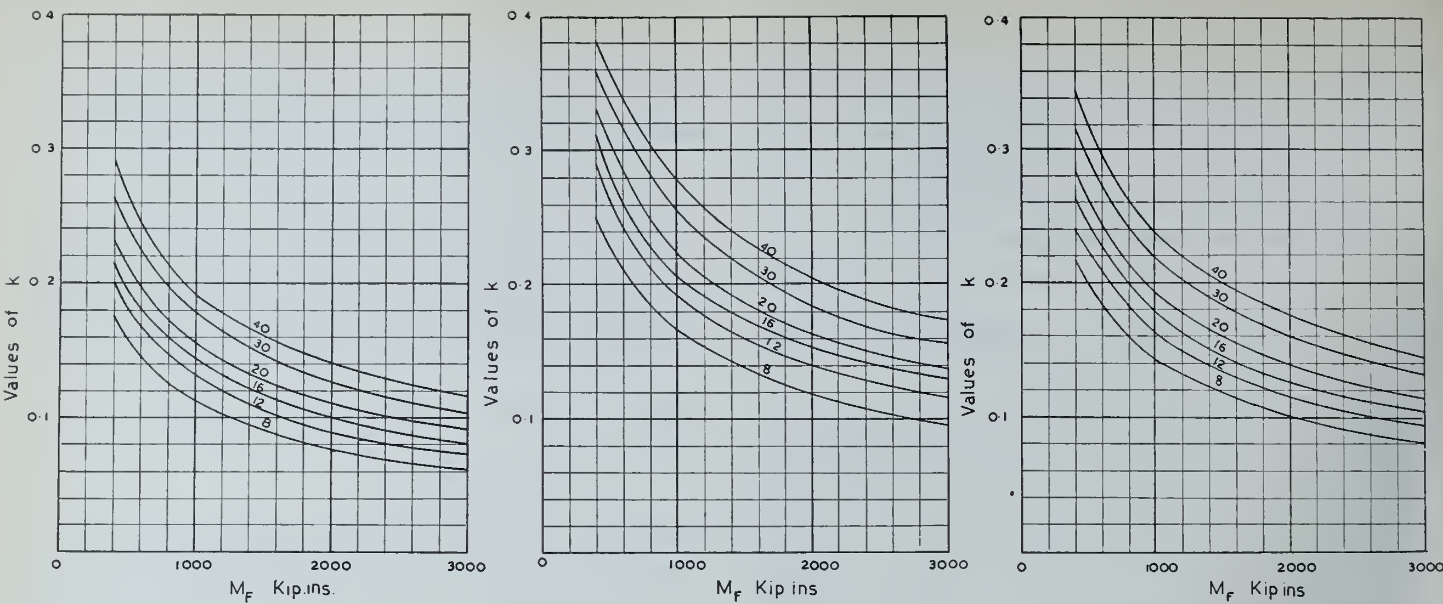

Fig. 6—Curves showing the relation between allowable restraint and fixed end moment when Class A connections are used. (The figures on the curves indicate the length of the beam in feet).

they add considerably to the total rigidity of the connection when used in conjunction with flange angles.

The results obtained from tests can only be applied directly to beams having the same depth as those used in the original tests. The curves can, however, be made of general application by putting them into the form,

$$\frac{M}{D} = C(\theta\ D)^{.412} \ldots\ldots\ldots\ldots\ldots\ldots (10)$$

(in which the value of C is not the same as in equation (9)) Since the relation between end moment and load is not linear, this curve cannot be used directly for determining allowable end restraint at working loads. Reference to Fig. 1 will make this point clear. Hence, the Steel Structures Research Committee proposed a graphical construction for determining a design curve. This is shown also in Fig. 1 and the basis of the method will be readily apparent. The same result can be obtained without using a graphical construction since it can be shown that if the curve for the connection is $\frac{M}{D} = C(\theta\ D)^{.412}$, then the design curve for a load factor of two will be

$$\frac{M}{D} = .655C\ (\theta\ D)^{.412}$$
$$= C_4\ (\theta\ D)^{.412} \ldots\ldots\ldots\ldots\ldots\ldots (11)$$

It is convenient now to bring together the various equations that have been assumed or derived. They are as follows:

$$M = \frac{M_F}{2} - \frac{EI\theta}{L} \ldots\ldots\ldots\ldots\ldots\ldots (8)$$

$$\frac{M}{D} = C_4(\ \theta\ D)^{.412} \ldots\ldots\ldots\ldots\ldots\ldots (11)$$

$$D = C_3S^{.412} \ldots\ldots\ldots\ldots\ldots\ldots (7)$$

These equations may be solved in the following manner:

From (11)

$$\theta D = \frac{(M)^{\frac{1}{.412}}}{(C_4D)} = \frac{M^{2.42}}{C_4^{2.42}\ C_3^{2.42}\ S} \ldots\ldots\ldots (12)$$

From (8)

$$M = \frac{M_F}{2} - \frac{ESD\theta}{2L}$$
$$= \frac{M_F}{2} - \frac{ESM^{2.42}}{2L(C_4C_3)^{2.42}\ S}$$
$$= \frac{M_F}{2} - \frac{C_5\ M^{2.42}}{L} \text{ where } C_5 = \frac{E}{2(C_4C_3)^{2.42}} \ldots (13)$$

Let $M = kM_F$

From (13) $kM_F = 0.5M_F - \frac{C_5}{L}\ k^{2.42}\ M_F^{2.42}$

$$k = 0.5 - \frac{C_5}{L}\ k^{2.42}\ M_F^{1.42}$$

$$M_F = \left\{\frac{L}{C_5}\right\}^{0.703} \frac{(0.5-k)^{.703}}{k^{1.70}}$$

$$\text{or } M_F = \left\{\frac{L}{C_5}\right\}^{.703} C_K, \text{ where } C_K = \frac{(0.5-k)^{.703}}{k^{1.07}} \ldots\ldots (14)$$

$$C_5^{.703} = \frac{E^{.703}}{2^{.703}\ (C_4C_3)^{1.70}}$$

If $E = 29000$ kips. per sq. in.

$$C_5^{.703} = \frac{842}{(C_4C_3)^{1.70}}$$

Substituting in (14),

$$M_F = \frac{L^{.703}(C_4C_3)^{1.70}\ C_k}{842} \ldots\ldots\ldots\ldots\ldots\ldots (15)$$

Equation (15) means that the degree of restraint depends only upon the magnitude of the load, the length of the beam and the constants C_4 and C_3.

Having fixed values of C_4 and C_3 it is then possible to compute values of C_k and hence of k, the latter equation being most conveniently solved by the use of a curve. It is very important to notice that the depth of the beam has been eliminated and thus a direct method of design becomes possible (credit for this should be given to Dr. H. C. Rowan who first discovered that with many British Standard beams the end moment for a given load was independent of the depth). Equation (15) can only be used with advantage if the classification of beam sections by the use of Equation (7) is practical. This has been found to be the case and Fig. 2 shows the proposed classification graphically. It is also given in Table I.

TABLE I

Classification of Beams

Class of Beams	Value of C_3	Beams Included
M	Not less than 2.86	Junior beams and others less than the standard weight.
A	" " " 2.35	American standard beams. British standard beams (light). Some wide flange beams.
B	" " " 1.78	Some wide flange beams.
C	Less than 1.78	All beams not included in Classes M, A, or B.

The proposed classification of connections is shown in Table II together with its accompanying note.

TABLE II

Minimum Requirements for Class A, Class B and Class C Connections

Class	Details of Connection	Required Concrete Encasement
A	6″ x 4″ x ½″ clip angle	None required.
B	6″ x 4″ x ⅜″ clip angle with web angles (see Note)	None required.
	6″ x 4″ x ⅜″ clip angle	Solid encasement of the upper flange of the beam and a 2″ slab as shown in Fig. 3.
C	6″ x 4″ x ½″ clip angle	Solid encasement of the upper flange of the beam, 3½″ slab and special reinforcement as shown in Fig. 4.
	Split I	None required.
	Gusset plate	None required.

Note: Web angles shall be adequate to carry the total end shear.

(i) Where a clip angle is used the horizontal leg shall be fastened to the beam with not less than four rivets.

(ii) The seat angle shall be adequate to carry, in conjunction with the web angles (if any), the total end shear and shall be at least as strongly connected as the clip angle.

(iii) The clip angle shall not be less than 5 inches long and rivets not less than three-quarters inch in diameter shall be used, except that if the width of the flange or the width of the column to which it is attached is less than 5 inches the length of the angle shall be at least equal to the lesser width and the rivets shall be the largest that can be used but in no case less than ⅝ inch diameter.

(iv) The rivets connecting the clip angle to the beam are to be symmetrically arranged about the vertical axis of the cross-section of the beam.

(v) The inner row of rivets in each leg of the clip angle shall be not more than 2¼ inches from the back of the angle provided that a variation of ⅛ inch may be permitted on this dimension.

(vi) The lateral spacing of the rivets connecting the clip angle to the column shall not differ from the spacing of those connecting it to the beam by more than 8 inches (see Fig. 5).

(vii) Steel erection packings up to ⅜ inch in thickness may be introduced between the flange of the beam and either the top or the bottom connection angles.

(viii) When concrete encasement is specified the concrete shall have a minimum strength of 2000 lb. per sq. in. and shall provide a minimum cover of one inch over all rivet heads and other projecting parts.

(ix) Where concrete encasement is specified, care shall be taken to ensure that the dead load does not cause deformation of the connection before the concrete has set; or the connection shall be considered as unencased for that portion of the load applied before the concrete has set.

(x) Where a beam frames eccentrically into the flange of a column no allowance shall be made for end restraint if the distance between the centre line of the beam and the centre line of the column exceeds ⅙ of the width of the column flange or two inches, whichever is the lesser.

(xi) When a beam makes a skew connection to a column no allowance shall be made for end restraint if the angle of skew exceeds 15 degrees.

The above classification is based largely upon the work of the Steel Structures Research Committee except that only three classes are included and allowance is made for the stiffening effect of concrete encasement. The constant C_4 is assumed to be 43 for Class A connections and 68.6 for Class B connections. Using these values the curves in Figs. 6 and 7 have been constructed showing the degree of restraint which may be assumed to be present when designing beams. When these curves are used the load factor cannot fall below two and will in most cases be appreciably greater.

The above method of determining allowable restraining moments whilst differing in form from the procedure recommended in the Steel Structures Research Committee report is based upon the same fundamental work, with one exception. In the experimental determination of moment angle curves, observations were not normally made for angular deformations in excess of .01 radian. In the draft rules for design proposed by the Committee it was assumed that at or about this point the curve became horizontal and limiting values for $\frac{M}{D}$ were fixed. In the proposed method of design the curve has been assumed to be continuous and no limiting value has been taken. (It is impossible to incorporate a limiting value in the proposed method.) The moment angle curve does in fact continue to rise and a few experiments in which measurements were made up to .02 radian showed that there is no reason to doubt the validity of the lower limit curve up to this value. Experience of breaking tests shows that the curve continues to rise though at a decreasing rate until the maximum load is reached and consequently there appears to be good reason for the assumption that the moment angle relation is a continuous function. In practice, with the class of connection it is proposed to standardize it makes very little difference whether the curve be assumed to rise or not for values of θ in excess of .01 radian.

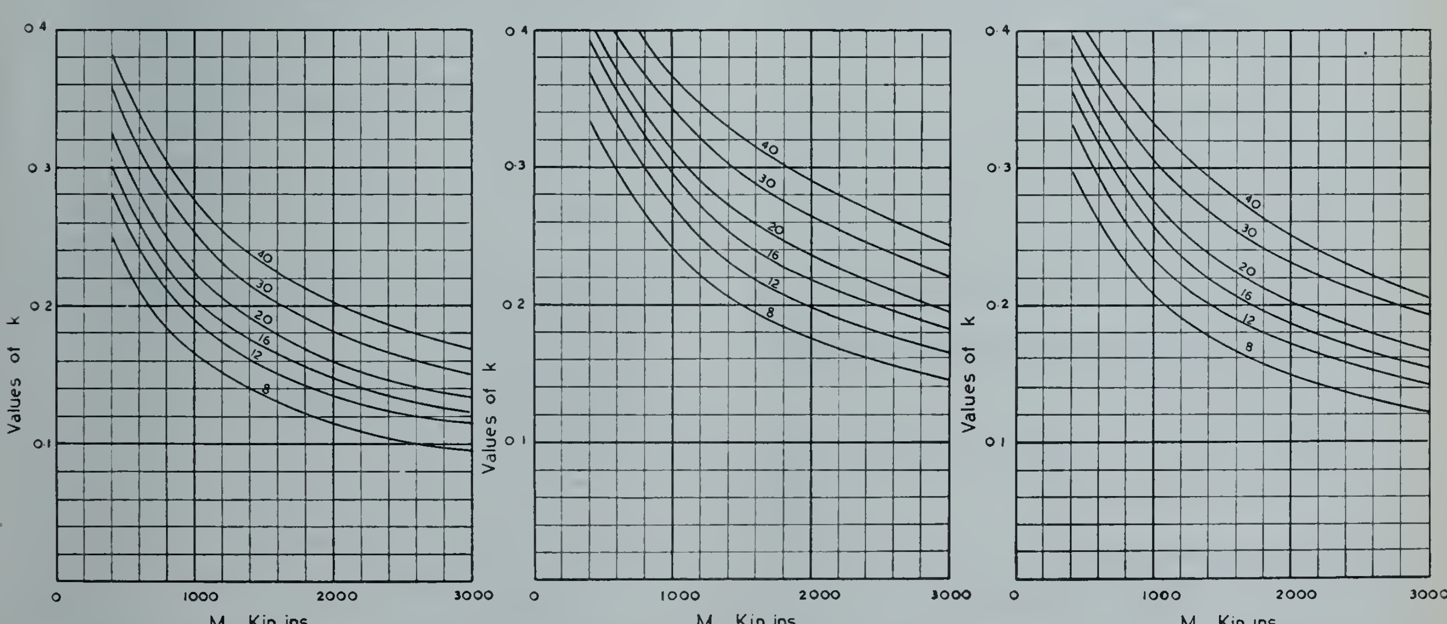

Fig. 7—Curves showing the relation between allowable restraint and fixed end moment when Class B connections are used. (The figures on the curves indicate the length of the beam in feet).

Effect of Concrete Encasement

The effect of concrete encasement is to increase the section modulus of the beam for a given depth and thus to decrease the value of C_3.

Thus, for an unencased beam

$$D = C_3 S^{.412} \quad \ldots\ldots(7)$$

but for an encased beam

$$D = C_2^{1} [S(1+P)]^{.412} \quad \ldots\ldots(16)$$

If we assume P has a maximum value of 0.16

then $C_2^{1} = 0.954\ C_2$.

Thus the effect upon the end restraint of a comparatively large allowance for encasement is small and it is felt that it can be neglected in all cases without introducing appreciable errors.

Examples

The following examples show the simplicity of the design procedure and give some indication of the saving in weight

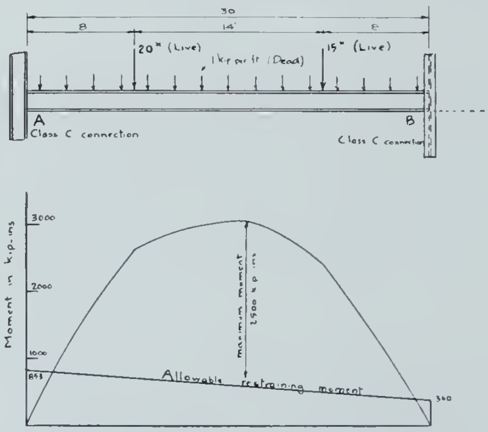

Fig. 8—Design of girder having unsymmetrical loads and restraints.

to be expected when the proposed methods are used. An allowable fibre stress of 20 kips. per sq. in. is assumed in all cases.

EXAMPLE (i) SECONDARY BEAM

Span: 20 ft.
Load: 48 kips uniformly distributed.
Girder solidly encased in concrete.

(a) *Using Supplementary Steel to Ensure Restraint*

$$M = \frac{2}{3}\left(\frac{WL}{8}\right) \frac{48(20)12}{12} = 960 \text{ kip-in.}$$

$$S = \frac{960}{20} = 48 \text{ in.}^3$$

Use 14″ x 6¾″ WF @ 34 lb.

Supplementary Steel

$$A_s^{1} = \frac{A_s}{4} = \frac{10.0}{4} = 2.5 \text{sq. in.}$$

If this is provided by reinforcing bars, use 4 — ⅞″ dia. about 8 ft. long.

If this is provided by a plate welded to the top flange, use a 5″ x ½″ Pl. about 2′6″ long.

Total Weight of Steel

Beam	680 lb.	Beam	680 lb.
Reinforcing bars	64 lb.	Plate	21 lb
	744 lb.		701 lb.

(b) *Without Supplementary Steel*

$$M = \frac{WL}{8} = \frac{48(20)12}{8} = 1{,}440 \text{ kip-in.}$$

$$S = \frac{1440}{20} = 72 \text{ in.}^3$$

Use 16″ x 7″ WF @ 45 lb.
Total weight of steel 900 lb.

EXAMPLE (ii) GIRDER

Span: 30 ft.
Load: 64 kips applied at the third points of the span.
It will be assumed that the girder is connected at each end to the flange of a column using Class B connections.

With Allowance for End Restraint

$$M_F = \frac{PL}{9} = \frac{64(30)12}{9} = 2560 \text{ kip-in.}$$

Assume Class A beam — From Fig. 7 $k = 0.208$

$$\text{Moment if simply supported} = \frac{PL}{6} = 3840 \text{ kip-in.}$$

Allowable restraining moment = 0.208 (2560) = 532 kip-in.
Maximum bending moment = 3308 kip-in.

$$S = \frac{3308}{20} = 165.4 \text{ in.}^3$$

Use 24″ x 9″ WF @ 74 lb.

Check class of beam from Fig. 2.

It will be found that this beam lies just below the line separating Class A and Class M. Since the restraint will be slightly increased if Class M beams are used the assumption of a Class A beam was on the safe side.

Without Allowance for End Restraint

$$M = \frac{PL}{6} = 3840 \text{ kip-in.}$$

$$S = \frac{3840}{20} = 192 \text{ in.}^3$$

Use 24″ × 9″ WF @ 87 lb.

EXAMPLE (iii) GIRDER

Span: 30 ft.
Load and end connections as shown in Fig. 8.
Depth of beam limited to 16 in.

Reactions

By taking moments, $R_A = 33.7$ kips
$R_B = 31.3$ kips

Bending Moments

Bending moment diagram assuming the beam to be freely supported will be as shown in Fig. 8.

With Allowance for End Restraint

At A, allowance may be made for restraint due to live and dead loads.

Dead load $M_F = 30(30) = 900$ kip-in.

Live load $M_F = \dfrac{35(8)22(12)}{60} = 1232$ kip-in.

Total 2132 kip-in.

Allowable restraining moment $(k = 0.4) = 0.4(2132)$
$= 853$ kip-in.

At B, allowance may be made for restraint due to dead load provided there is an approximately equal adjacent span.

Allowable restraining moment $(k = 0.4) = 360$ kip-in.
From bending moment diagram,

Maximum moment = 2500 kip-in.

$$S = \frac{2500}{20} = 125 \text{ in.}^3$$

Use 16″ x 8½″ WF @ 78 lb.

Without Allowance for End Restraint

Maximum bending moment = 3010 kip-in.

$$S = \frac{3010}{20} = 150 \text{ in.}^3$$

Use 16″ x 11½″ WF @ 88 lb.

BACTERIAL CONTAMINATION IMPROBABLE AS AN IMPLEMENT OF WAR

By Carl G. Flebus

From *Civil Engineering* (New York), March, 1941

The possibility of an enemy deliberately spreading an epidemic by polluting the water supply of a city has often been discussed. But it is improbable that resort will be had to this dreadful method of warfare—not because humanitarian considerations may be expected to sway an enemy who wages total war, but because the desired results would not be assured.

Repeated experiments made by various European powers on the pollution of reservoirs have given totally negative results. Owing to the nature of these experiments they were shrouded in the utmost secrecy, and the results were withheld from the public. However, during my last visit to Europe, I had the opportunity to discuss this phase of warfare with well-informed medical officers who had participated in the experiments. Though I am not sufficiently versed in the technical details to discuss the matter academically, I believe that I can give certain data that will be of interest.

The mere fact that a certain type of pathogenic bacteria is present in a body of water does not necessarily mean that persons who drink the water will immediately contract the disease. Much depends on the quantity of bacteria absorbed at one time and on the ability of the individuals concerned to resist the infection.

It appears that each continent, besides having its own climate, seasonal changes, and atmospheric ionization, has its own particular bacterial flora. Acclimatization and growth elsewhere vary extensively with the species and method of transplanting. It has been observed that only well-developed colonies survive when the transfer occurs within the original host, and a latent state occurs as soon as they have left it. Cultivated bacteria very seldom survive in a new environment. The water in a large impounding reservoir therefore can only be contaminated by aboriginal bacterial flora, and then only when local conditions are such as will foster the growth of the organisms.

Of 42 or more commonly known diseases caused by bacteria, few are caused by spore-bearing types. The majority are caused by mesophilic types which will not survive over eight days in a body of fresh water. Present prophylactic measures taken by health authorities are sufficient to impede the development of an artificially provoked epidemic.

While bacteriological studies definitely discard the possibility of contaminating a water supply by dropping bombs containing artificially cultivated disease bacteria, they do not rule out the possibility of contamination by saboteurs dropping soiled matter and infected articles in the water, or causing sewage to discharge into sources used for human consumption. After discussing this subject with well-informed members of the medical profession here and abroad, the writer is of the opinion that an epidemic in a nation at war is less likely to occur because of enemy action than because war activities may divert the attention of health departments from their routine prophylactic duties.

Large quantities of infected material are necessary to poison a large reservoir; however, it would be possible for a saboteur to poison filters, small reservoirs, stand pipes, and so forth. To provide against this danger and at the same time avoid expensive and delicate analyses, before the water is delivered to consumers a part should be by-passed through an artificial brook where mountain trout are cultivated in a natural environment. These fish are very sensitive to the slightest change in their water supply, and sharply react to poison of any nature, organic or otherwise, by coming to the surface, emerging their heads, and breathing heavily. In large cities where this method may not be feasible, colorimetric chemical analysis for various inorganic poisons can be developed, and used as a part of the regular daily routine.

AESTHETICS OF ENGINEERING STRUCTURES

By Oscar Faber

From *Journal of the Institution of Civil Engineers* (London), February, 1941

Engineers must conform to the reasonable demand that our cities shall be built with considerations of beauty and harmony, and that engineering structures, forming, as they do, important elements in our civilization, must conform to the same requirements and be things of beauty.

If this aspect of their work were lost, the public would remove from the control of such engineers the design of important engineering structures.

This aspect of the engineer's work is inadequately dealt with in the curricula of engineering colleges, and young engineers receive little training in this part of their work.

The author suggests that an engineering structure must satisfy four main requirements to be really satisfactory. It must fulfil all its functional requirements, be sufficiently permanent, sufficiently economical, and must give aesthetic satisfaction.

The paper deals with the things which go to determine whether the latter requirement will be met, and shows that the four main requirements are harmony, composition, character, and interest. These in turn depend on the proper handling of masses, colour, texture, rhythm, silhouette, expression of purpose, and expression of construction.

THE DEFENSE CHALLENGE

By Edward S. Bres

From *Civil Engineering* (New York), March, 1941

Several months ago our country was aghast at the realization that in spite of the magnitude of our industries and the super strides they had made, we would be unable to manufacture sufficient materials, ammunition, and supplies to equip, in less than a year's time, the first augmentation of our army of one million men. It was unbelievable.

More unbelievable was the fact that when five semi-motorized triangular divisions were ordered into the field in September, 1939, in connection with the largest manoeuvers ever undertaken, seven months were required to secure sufficient motor equipment even for these 55,000 men. True, the specifications called for motor vehicles not in all respects of commercial type; however, who could have believed this delay possible in our efficient motor industry, which manufactures several million units yearly!

A Crisis at Hand

We are face to face with a great national emergency—a serious social, political, and economic crisis. To meet and overcome this crisis a vast programme of National Preparedness for Defense has been instituted. Traditionally it has been the policy of our national government, after a crisis has passed, to ignore entirely the need for preparedness to meet emergencies that may manifest themselves in the future. In the face of this policy to ignore the future, when an emergency such as the present one appears, our task for preparedness assumes the proportions of an overload burden. I submit that this task and the burden falls primarily on the engineers.

To-day and at least for the next five years, we engineers are faced with the industrial development and procurement required for a standing army exceeding twenty times, at least, the size of the five divisions that we were unable to equip in less than seven months' time. During manoeuvers the food supply, alone, for a mobilization of 50,000 to 100,000 men is a daily problem that can admit of no failures or sudden changes.

Other Items of Supply

Visualize the gasoline requirements of the German Army for one day at 30 million gallons. Estimate the transportation needed for this item alone. In the German invasion of Belgium and France it is said that pipe lines were laid as the troops moved forward, and that fuel was pumped direct instead of being transported by truck and railroad.

In the invasion of Poland (lasting less than 30 days), a recognized masterpiece of military planning that was participated in by approximately 700,000 men, Germany's fuel expense, alone, was 40 million dollars. During the last world war the artillery fire of 3,000 guns for one day cost 300 million dollars; every minute London's anti-aircraft batteries are in action at least 100 thousand dollars' worth of ammunition is fired; for every soldier in the front lines two are required in the service of supply. Production, transportation, and distribution—all these responsibilities fall to the lot of the engineer.

Industrial Organization Also Essential

The vast expanses of seas separating our shores from all nations that might conceivably become aggressive have, in small part perhaps, been the reason or excuse for the so-called logic underlying our traditional policy of neglecting preparedness for the future. Now, however, the tremendous developments in the speed of all modes of travel and transportation have narrowed these sea barriers to a dangerous degree. The Army and Navy Munitions Board, recognizing the essential technical burdens, called a conference to prepare plans for organizing American industry. Partly as a result, there are now more than 40,000 engineers of various classifications at work on the country's mobilization for national defense.

It might be suggested that preparation for defense most certainly extends into preparation for ultimate offense. Else how can an aggressor be conquered and his activities in the future controlled? It follows, then, that after the factory has been enlarged, the innumerable machine tools made, and the machines of war constructed and their production output maintained, the engineer's task of manning, maintaining, and operating these machines goes right on.

Depends on Engineers

Illustrative of the time and cost of preparation is the big-gun problem. We are now in need of 16-in. gun carriages. Present arsenal capacity, now speeded up, can produce but four in one year. At first, at a large cost and with much delay, it was proposed to construct a plant to build them. Careful study and planning discarded this plan and the supply will be secured through augmentation of arsenal facilities and by contract arrangements.

If there are bottlenecks and obstructions in the production of all the essential elements, their dilation is our job—the engineer's job. Preparation of plans is estimated to require 20,000 man-years of the time of skilled technicians. Even with all this confronting us, it appears that complete national preparedness will be accomplished by the spring of 1942. However, with increasing patriotism in industry it may be hoped that the job will be practically completed by the late summer of 1941. It is an engineer's job. We must compute every stress and strain; design every structure to withstand every force applied to it. It is estimated that 80% of the personnel engaged in defense preparations consists either of engineers or of others whose every effort is planned, guided, and controlled by engineers. The magnitude of the purely civilian effort of technologists is tremendous.

In Military Units, Too

Consider the parallel tasks of engineers in the military service. Should we mobilize an army of 4,000,000 men, the purely engineering ratio of this vast force, both officers and enlisted men, will approximate 6 per cent, or 245,000 of the total number. In the German army this ratio is more than doubled, and it is interesting that officers for construction engineer units are taken from practicing civilian engineers.

With the strength of 1,400,000 now being mobilized, there will be approximately 73,000 engineer officers and men. In addition, other engineers not definitely classified as such will be used in the Artillery for computation of firing data, map interpretation, erection of field fortifications, and purely technical emergency service; in the Quartermaster Corps on construction, logistics, and lines of communications; in the Signal Corps for procurement and operation of telephone, telegraph, and radio equipment; in the Chemical Warfare Service; in the Ordnance Department for the design and manufacture of tanks and of cannon, small arms, and ammunition; and in many branches for work related to motor transport and air service.

A LARGE ALL-WELDED ELECTRICAL MOTOR

From *Electrical Review* (London), November 8th, 1940

By the fabrication of a 1,900 horsepower, three-phase motor from steel plates with the aid of oxy-coal-gas cutting and electric arc welding, important savings have been effected in production costs, together with economy in materials, a reduction in manufacturing time, and increased rigidity and strength in comparison with castings. The machine, of the synchronous-induction type, is 16 feet long by 14 feet high, and weighs 40 tons. It is designed to operate at unity power-factor on a 50-cycle, 11-kilovolt circuit, and is similar in construction to a slip-ring induction motor, except for a larger air-gap to ensure synchronous stability and more rotor copper to reduce losses. Self ventilation is effected by paddle-type fans and air-deflectors on the rotor. Details are given of the frames and windings of the stator and rotor, and of the starting system.

ARMAMENTS

From *Aeronautics* (London), November, 1940

Gun Turrets

On aircraft of earlier designs it was found that the wind pressure on the body of the air gunner was sufficiently great as to cause grave discomfort and to lead to inaccurate marksmanship. In winter, the intense cold experienced at any height aggravated the trouble.

With the suddenly accelerated upward trend of flying speeds of some five or six years ago, it became imperative for some form of protection for the air gunner, and as a result the movable gun turret was evolved.

This consists of a splinterproof glass enclosed compartment in which the air gunner is stationed. In the case of the gun position in the rear cockpit the glass covering is domeshaped and covers the full angular sweep of the horizon; similarly with those turrets which are, in certain types of bombers, let down from the belly of the fuselage. The gun turrets in the nose of the fuselage and in the tail unit do not allow of complete rotation.

The gun or guns project through a slit and the whole turret is rotated to bring the guns into the required position by the air gunner or indirectly by hydraulic or electrical means. Hydraulic turrets, developed by Captain Frazer-Nash and built by Parnell and others, are a distinctively British component.

Machine-Gun Equipment

In the majority of modern types of aircraft the front guns are fixed in the wing, but in some types the guns still fire through the propellor arc. In this case some form of mechanism is necessary to prevent the propellor blades being shot away. The Constantinesco gear is a device whereby an impulse is conveyed from the trigger to the machine gun along a column of oil.

The piston of an oil pump which is fixed to the engine shaft forces oil through a tube to which a second pump is attached. This second pump is mounted on the machine gun and operates the lock of the gun according to the impulses created by the shaft. By means of cams the impulse is timed to fire the bullets so that they miss the propellor blades.

The pressure in the oil tube is maintained by a hand-operated pump situated near the pilot, and only a few and occasional pumps are required.

The air gunner's guns are fixed to a rotatable mounting and can be easily moved in the horizontal and vertical planes.

TACOMA BRIDGE INSURANCE PAYMENTS IN DISPUTE

From *Engineering News-Record* (New York), March 13, 1941

Declaring the collapsed Tacoma Narrows suspension bridge a total loss, the Washington State Toll Bridge Authority, March 1, filed a proof of loss with underwriters for $5,200,000, representing 80 percent of its $6,500,000 value, and the full amount of the insurance. Answering the claim, the 23 insurance companies which underwrote the bridge declared in a formal statement that they believe the span can be restored to its original condition at a cost not exceeding $1,800,000.

Ask Almost Complete Dismantling

In making the claim for total loss, assistant state attorney-general Oliver Malm filed under a state law that provides that total loss may be claimed "where the structure insured cease to exist as such by reason of damage to it." It is contended that state statutes would supersede any exemptions or loopholes in the policies themselves by which the insurance companies might conceivably attempt to avoid payment of the full loss. Because the bridge had been in operation only four months, the Authority refused to write off any depreciation.

As bearing on the total loss claim, the Authority's board of consulting engineers reported, March 10, that only the piers are definitely salvagable, although there is a possibility that the central section of the towers and the three lower struts may be used. All the remaining superstructure, it is said, must be dismantled, before the causes of the collapse can be determined.

The statement by the underwriters was issued by Paul A. Carew, manager of the Marine office of America in Seattle, and chairman of a committee representing the interests of all companies involved. "Acting upon the advice of eminent engineers of national reputation," the statement said, "it is the definite opinion of the insurance companies that all damages to the bridge can be fully repaired at a cost of not exceeding $1,800,000, and, accordingly, as provided by the insurance policies, a demand for an appraisal to determine the actual amount of damage has been filed with the Washington Toll Bridge Authority."

The "demand for appraisal" means that the insurance companies have invoked the arbitration clause of their contracts with the Bridge Authority. This clause provides that in the event of a dispute over loss, both state and underwriters select an appraiser, and that the two appraisers then select an umpire, to whom they will submit all questions on which they cannot privately agree. The insurance companies named as their appraiser, Isaac Farber Stern, consulting engineer, Chicago.

In the event the appraisers fail to agree on an umpire, one would be appointed by a Washington court of record. The purpose of the board of arbitration would be to reconcile the differences existing between the state and the underwriters, and to make a formal finding of loss. It seemed generally agreed last week, however, that the dispute eventually will go to court.

Engineers advising the insurance companies, the statement said, had declared that the towers need not be taken down nor the cables respun. The insurance companies' repair cost of $1,800,000 was based upon use of the towers and cables and the construction of a new deck. Inspecting the bridge last week for the insurance companies were Clifford E. Paine of Chicago, H. D. Robinson and Shortridge Hardesty, New York, Prof. W. M. Wilson, University of Illinois, Clark Clarahan, Chicago, and Prof. Hardy Cross, Yale University.

BIG RISE IN CHARCOAL PRODUCTION

From *Civil Engineering* (London), December, 1940

Rapid changes in the technique of charcoal burning—one of Britain's oldest industries—have now made it possible to dispense entirely with imports, states the Ministry of Supply.

Wood charcoal is a vital raw material. It is used as a case hardening compound in the production of aero engine parts, in the manufacture of artificial silk, in the processing of rubber, and in the manufacture of cyanide for the extraction of gold. Another form of charcoal has an important use in the filters of our gas masks.

Before the war Britain produced less than half of the charcoal consumed, and the craft of charcoal burning, entailing a hard and solitary life, survived only in a few places. The charcoal burner's job was a constant round of digging, stacking, turning, watching and dousing. A change in the direction of the wind or a rain storm could spoil the work of weeks.

To-day production has been more than doubled by the use of a new kind of steel kiln which can be moved from place to place, wherever suitable wood is available, and can be worked by unskilled labour under skilled supervision.

The need for importing from remote sources of supply, including the Gold Coast, the Philippines and India, has now been overcome with consequent saving in foreign exchange and without risking men and shipping.

SEARCHLIGHTS AND THOSE WHO MAN THEM

From *Aeronautics* (London), November, 1940

Not until the beginning of the air offensive on Britain did people realize the importance of searchlight work and how much A.A. guns and fighter aircraft were dependent on their efficiency.

Royal Air Force personnel sometimes express a desire to know about the method of working the searchlights, their power and range and other factual matter, and this article is intended to meet that desire.

Searchlight batteries are a section of the Royal Artillery, from whom they receive their orders. Each battery is divided into a number of detachments which become in themselves complete and independent units under the charge of a non-commissioned officer. On receiving orders to take up position, each detachment, consisting of 10 men, is given a map showing the location of the site they are to occupy, and, with every piece of equipment required packed into just one lorry, they set off by themselves. In a matter of a few hours the equipment is erected and the crew is ready to go into action.

The searchlight itself is erected in the centre of the site. Its make-up is simplicity itself, and resembles on a large scale that of an ordinary pocket torch. The main features are the lamp, the projector and the mirror, the combination of which results in the beam with which everybody is now familiar. The lamp or source of light is situated in the centre of the projector, at the back of which is fixed an ordinary concave mirror serving to reflect the light through the front of the projector and to gather it together, as it were, and shape it into a beam. The light is obtained from a circuit of electricity, which causes carbons to burn with a sharp phosphorescent glow, developing up to 200 million candle power. This power gives the beam a range of about five miles. A point flying people do not always appreciate is that although range is apparently restricted in cloudy weather, in reality the beam can penetrate the clouds, and, controlled by the sound locator, can assist fighter aircraft to find the enemy machine.

The projector has a long arm at the end of which is a wheel so that bearing and elevation are controllable.

The projector, rotating on a base, has a long arm fixed to it at the end of which a wheel is used to regulate the elevation. The direction of the beam, both in bearing and elevation, can be controlled by one man, who, pushing or pulling the "long arm" and at the same time turning the wheel left or right, can very quickly move the beam into any position desired.

The adjustment and control of the beam are under orders from other members of the detachment who operate other pieces of equipment. These pieces include the sound locator, by which the course of a "heard" target can be plotted. There are also the two "spotters," equipped with binoculars, who aid in directing the beam on to "seen" targets. As several "heard" and several "seen" targets may pass over an area at the same time, obviously only one aeroplane can be engaged and only one man can give orders, which necessitates a high standard of drill and efficiency in the men employed. They must be able to pick out enemy aeroplanes from friendly, quickly and certainly, and expose on the right ones. For the protection of the site from low flying attacks, each site is equipped with an anti-aircraft light machine gun.

The technical side of the job is run by two men whose duty it is to see that the correct current is supplied to the generator. Also attention must be paid to the smooth and efficient burning of the carbons to assure a stable beam.

Men engaged in searchlight work generally have a longer and more intricate period of training than men of other units, for apart from their general drill and training in the use of weapons, they must learn to be efficient in at least three separate jobs on the detachment, so that in the event of casualties being sustained by enemy action, they may take the place of their comrades with confidence and with the knowledge that they can do the work properly.

Lastly they must always be ready to engage and attack any paratroops that may land in their area.

Perhaps one of the most important factors regarding searchlights is their remarkable mobility. Every piece of equipment can be taken down and packed away into the lorry, and, as there is still room to spare for the men and their kits, this one little complete unit can travel about in the shape of just one loaded lorry. Consequently in an area which might frequently become untenable owing to enemy action, or in the event of searchlight units backing up our own advancing forces to aid them at night, they can move freely from one place to another and be ready for action each nightfall. They thus maintain the British Army's reputation for being one of the most highly mechanised forces in the world.

These facts go to make searchlight work one of the most highly skilled and interesting jobs in the British Army.

SHORTAGE OF ENGINEERS

From *Engineering News-Record* (New York), March 13, 1941

There is a great need for co-ordination between the U.S. Office of Education and those who are administering the Selective Service Act if the reported shortage of engineers is not to become more serious as the defense effort increases in intensity. Last week a number of engineering educators met in Washington to discuss with executives of the U.S. Office of Education plans for speeding up the training of students now near the end of their engineering courses. At the same time, draft boards were calling young engineers and engineering instructors into service and assigning them to infantry or other units where the value of their engineering training will be wasted.

Responsibility for this anomalous situation does not rest on local draft boards, who must follow the letter of their instructions, but on the policy-forming officers of the War Department in Washington, who could relieve the possibility of a shortage of engineers by a few simple rulings.

First, there should be a decision as to whether engineering instructors and some or all engineers in training should be exempt from the draft. In Canada, young engineering educators are exempt because what they are doing is recognized as an essential war service. Then it should be decided whether students of civil, mining, chemical and electrical engineering should be switched to mechanical engineering wherever possible, as that is the field where the shortage is most acute. Finally, young engineers who are drafted should be assigned to engineer or shop regiments where they will be most useful and from where, in an emergency, they can be assigned to industries badly in need of engineers.

Our whole schedule of engineering training should not be upset until it is known how real the shortage is and how much it can be reduced by changes in administering the Selective Service Act. Agencies in Washington now working in separate channels should get together.

THE UHL RIVER HYDRO-ELECTRIC PROJECT

By Herbert Percival Thomas

From *Journal of the Institution of Civil Engineers,* (London), February, 1941

In October, 1921, a survey of the hydro-electric possibilities of the Punjab was commenced by Major R. N. Aylward, D.S.O., M.C., under the supervision of the late Colonel B. C. Battye, D.S.O., M.C., Assoc.Inst.C.E., on the instructions of the Punjab Government and attention was called to the possibility of developing power from the Uhl River.

The first project put forward was for the development of 118,400 kilowatts, at an estimated gross capital cost of 121,000,000 rupees. The scheme was to be developed in three stages. The first stage was to comprise head works in the Uhl river valley, a tunnel through the range between the Uhl river and Joginder Nagar, and a power house at Joginder Nagar. The second stage consisted of the addition of an arch storage dam, 220 ft. high, with a crest 612 ft. long, in a rock gorge in the Uhl valley, creating a storage of 21,500 acre-feet. The third stage was to utilize the tail water from the Joginder Nagar plant through a drop of 1,200 ft. made available by leading the water in a 4-mile flume round a spur below the power house which terminates above a bend of the Neri Khad.

The present development follows the lines of the first stage of the original project. The waters of the Uhl river and its tributary, the Lambadag, are impounded by weirs above the junction of the two rivers, and are led off through decantation chambers by flumes to the tunnel. The tunnel, 3 miles in length, pierces the range dividing the Uhl valley from that of the Neri Khad, a small stream which finds its way into the Beas river, and the water passes on down through penstock pipes to the power house 2,000 ft. below the intake on the Uhl river. The chief point of interest in regard to the head works is the equipment for ensuring that the water reaching the turbine jets is free from sand and gravel. The Uhl weir is equipped, in its mid-stream section, with a falling gate which subsides into the river bed and is capable of supporting 15-ton boulders as they are rolled down in the monsoon floods. The water taken in at the off-take above the impounding weirs is passed through decantation chambers, fitted with "venetian-blind" concrete slabs in the floors of compartments of the "hopper-bottom" type, through which the deposited silt is scoured into scour ducts, and so returned to the river below the weirs. The decantation is effected by enlarging the cross-sectional area of the chambers till the speed of flow is reduced to 1 ft. per second at full demand. This has been found most successful since no abrasive particles of sand or silt have reached the nozzles; the wear on the needles and buckets after five years is hardly discernible.

The 3-mile tunnel is 9 ft. 3 in. in diameter inside the lining, and in various places necessitated special methods of driving. The Himalayan mountains are amongst the newest known and are composed very largely of rocks, twisted and shattered by the working of the earth's crust which has caused their evolution, so that nowhere, throughout its entire length, did the tunnel penetrate rock of such a soundness that it could be left unlined; in many places progress was only made possible by installing steel sets made from rolled-steel joists at 4 ft. centres, supporting a sheathing of reinforced-concrete slabs. Those sets and the concrete slabs were embedded in the concrete lining of the completed tunnel. The tunnel was extremely wet owing to the infiltration of water from the seams, and, in places, jets of water spouting from the walls or roof, when confined, registered pressures ranging from 60 to 80 lb. per square inch. A detailed description of the methods used in driving and lining this tunnel is given in a paper presented before the Punjab Engineering Congress in 1932.

From where the main tunnel ends, two 6-ft.-diameter pipes, surrounded by 2 ft. of concrete, carry the water 1,100 ft. to emerge on the hillside at the valve house. Building the surge tank at the junction of these pipes with the tunnel constituted a difficult problem. When the second stage, including the 220-ft. dam, is built the surge-shaft chamber will be subjected to a static pressure due to a head of 300 ft; the rock at this point is so shattered that even the 6-ft. steel pipes had to be protected throughout their length of 1,100 ft. by a 2-ft. casing of concrete. Loss of water could not be countenanced and, furthermore, any leakage from the surge-shaft base would undoubtedly have found its way to the mountain side and have caused serious slips, endangering the whole scheme. Dr. Gruner, an eminent authority on pressure tunnels, was consulted, and the chamber was constructed according to his design, which consists of a cage of steel reinforcing-rods with steel-rod ties carried back into the main tunnel and the two pipe tunnels, the whole being united in place.

The power house is situated on the banks of the Neri Khad, and is designed for the ultimate accommodation of seven 12,000 kilowatt generators and their necessary switchgear. The building is of the earthquake-proof type, the entire structure being carried by heavy steel stanchions founded on a mat of concrete which is 12 ft. thick and is continuous throughout its length under the machinery hall and control block. The walls are merely partitions between the stanchions and consist of cement plaster on expanded metal. They are designed for a wind pressure of 25 lb. per sq. ft. The design is based on a seismic acceleration of 32 ft. per sec. There are four generators, each of 12,000 kilowatts output, and each directly connected to 17,000-brake-horsepower Boving impulse turbines of the overhung type with a speed of 425 revolutions per minute. They are equipped with high-speed excitation. The voltage of generation is 11,000 and this is stepped up to 132,000 for transmission to Amritsar, Lahore, and Jullundur, from which places 66,000-, 33,000- and 11,000-volt branch-lines radiate, making supply available in twenty-four towns and a rural area of approximately 20,000 square miles.

After installation, tests were carried out on both generators and turbines; the method employed in measuring the water was the subject of a paper by Mr. E. N. Webb, M.Inst.C.E.

The outlay on production works was 26,135,285 rupees and the installed capacity of the plant is, at present, 48,000 kilowatts, indicating an installation cost per kilowatt of 545 rupees; although this may appear high, it must be remembered that the headworks, tunnel, and surge shaft are all built to a design which makes them capable of passing sufficient water for the development of a total of 72,000 kilowatts. Furthermore, the footings of the anchors for the next two pipe-lines have been completed, which means that the capital expenditure of 26,135,285 rupees includes an amount of 9,000,000 rupees which has been expended on behalf of the second stage, so that this second stage may be constructed without interruption to supply, and so as to take advantage of the greater efficiency and lesser cost due to the construction being undertaken in conjunction with the first stage works. Taking this figure into account, the installation cost per kilowatt may be said to be 357 rupees. The cost per unit generated, even including the full capital expenditure made to date, works out at 2-5 pies (a pie is approximately 1/12 penny) and will be proportionately lower for the second and third stages. The average return obtained, at present, is 11 pies per unit sold and the load connected after 5 years' operation exceeds 30,000 kilowatts. Additional generating capacity will be necessary to meet the fast increasing demand in the year 1942, and proposals for suitable extensions are being considered.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

BAD NEWS

It will be a disappointment to all members, as it has been to Council, to learn that changing soil conditions have made necessary certain major repairs to the Headquarters' premises. Most buildings in the neighbourhood have suffered similar damage, and extensive underpinning operations have been carried out in several places, as for instance at the University Club, and the McGill Union. In one instance a whole new front had to be built on a residence.

It is a little consolation to know that others are equally unfortunate, but it does indicate that the fault was not in the building itself. It is the contention of many (although not admitted by the company) that the tunnel under the mountain has lowered the water table thereby drying out the clay formation and causing the soil to recede. Test pits and subsequent excavation carried out at Headquarters showed clearly that the soil had subsided from two to six inches under all walls and piers and that the heads of the protruding piles under the footings had rotted sufficiently to permit settlement of the building.

The House Committee made a thorough investigation, and drew up plans and specifications which were figured on by five contracting firms, all closely associated with the Institute. The contract went to the lowest tenderer who did an excellent piece of work at a reasonable price. The work is now complete, and the task of moving the library stacks back into place and rearranging stationery and other supplies is well underway.

The President has written to the chairman of all branches explaining the situation and asking if they would be able to assist in meeting the cost of this extraordinary expense, amounting to $10,000. The Institute finances are in good shape with no bank loans and no outstanding debts of any kind, but it is not good business to spend reserves in time of prosperity. The experience of the last war indicates positively that conditions after this war will require the full use of reserves if the Institute activities are to be maintained, and services to the members not curtailed. It would be folly—if it can be avoided—to meet this major expense with funds that will have much more important work to do later.

The Montreal Branch has responded excellently. Regardless of the fact that Montreal members fees on the average are approximately two dollars a year more than any other members, they have set themselves a quota of four thousand dollars, and have notified the president of their plans to collect it. This should be an inspiration to other branches.

The president's two letters to the branches are printed herewith.

National Research Council,
Ottawa, Ontario.
3 March, 1941.

Branch Chairman,
The Engineering Institute of Canada,

Dear Sir:

The unfortunate accident to Dr. Hogg in January prevented him completing an important undertaking to which he had set his hand. Before leaving for the south on a recuperative trip he asked me to take up the proposal and complete it on his behalf. This I am very happy to do.

Due to changing soil conditions in the neighbourhood of our Headquarters, considerable damage to the building developed in the spring of 1940. On the recommendation of the House Committee, and after an investigation by that committee, Council decided to have the building underpinned in order to arrest the settlement. This work has just been completed at a cost of approximately $9,000. Last year's financial statement shows that we had an excellent year, and indicated that the Institute affairs are in very good shape, but such an unforeseen expenditure as this is very disturbing. It has been decided that the major portion of this cost will be met from our 1940 balance, and that some other means be devised for finding the balance.

The experience of the years after the last war leads Council to believe that the Institute will suffer a substantial reduction in income after this war, with increased opportunities for service. Consequently, it has seemed unwise to deplete our reserve now, if it can be avoided. The suggestion has been made that members might prefer to make some voluntary contribution in order to assist Council in maintaining our financial position.

Dr. Hogg was confident that members would react favourably to such a proposal, and intended to approach the branch officers to get the benefit of their opinions. Unfortunately, his accident now makes all this impossible. In Dr. Hogg's place I am proposing the plan which he had in mind.

If all members of the Institute with the possible exception of Students, contributed an average of one dollar each it would build up an amount of about $4,000 and would not seriously affect the finances of any individual. This sum would enable Council to meet the cost of the repair work without any sacrifice of reserve funds. Would your executive approve of such a proposal, and take whatever steps are necessary to collect the money? It has been thought that this collection could be done much better by the branch executives than by Council.

I would consider it a favour if you would let me have the benefit of your opinion as well as that of your executive at as early a date as is convenient to you. I feel this is an important matter, and one that concerns every member from coast to coast. The Headquarters building is a real asset to the whole Institute and not just to the Montreal Branch. The work was absolutely necessary and must be paid for. Your sympathetic consideration of this proposal will be greatly appreciated both by Dr. Hogg and myself.

Yours sincerely,

(*Signed*) C. J. Mackenzie, *President*,
Engineering Institute of Canada.

25th March, 1941.

Branch Chairman,
The Engineering Institute of Canada,

Dear Sir:

With reference to my letter of 3 March. As a result of correspondence with the chairmen of several branches, I would like to submit a few further observations on the motives which prompted Dr. Hogg and myself to initiate the proposal.

The general facts are that it became necessary to make extensive repairs in the foundations of the Headquarters Building last year and a sum of $10,000 was expended. The Council has sufficient funds in its reserve account to meet this item and it was originally proposed to do so. Some of the senior members of the Institute, including Dr. Hogg, felt, however, that, if at all possible, it would be unwise to seriously deplete any reserve at this time because it was thought that in all probability more serious days would come with the end of the War and it would be very desirable if the Institute could have some resources to meet the demands of that period.

As a Member who has never resided in the Montreal district, I would like to point out that the proposal to raise money by voluntary subscription from the membership at large did not originate in the Montreal Branch, and is of no particular advantage to that branch. In periods of depression, the larger branches are much more competent to take care of their problems than are the smaller branches and such branches, we felt, have a real interest in keeping our reserve at a high point at this time. Notwithstanding this situation, the Montreal Branch has put on a vigorous campaign to raise $4,000 which, I think, is an indication of their willingness to carry even more than their share of the project.

Most of the branches have shown their willingness to get behind this movement and I am hoping that we will be successful in raising a very material portion of the $10,000, and the Council as a whole, I think, will make every effort to conserve and add to our general reserves during this period, when even in the face of heavy taxation, our problems will probably not be as acute as they will be later on. We all realize that the different branches across Canada find themselves in different situations and we do not wish to be put in the position of unduly urging the proposal but anything which the branches can do, even although the actual contributions are very small, will be very much appreciated as we feel strongly that the proposal is a wise one, and the results will be beneficial to the entire membership.

Yours sincerely,

(*Signed*) C. J. Mackenzie, *President*,
Engineering Institute of Canada.

WARTIME BUREAU OF TECHNICAL PERSONNEL

Announcement has just been made of the Advisory Board of the Bureau, and of the appointment of the Assistant Director. The Board is made up of a representative and an alternate selected by each of the larger organizations associated with the proposal. The list is as follows:

The Engineering Institute of Canada—Dean C.J. Mackenzie, President of the Institute, and Acting President of the National Research Council.

Alternate: L. C. Jacobs, Supervisory Engineer, Dept. of Munitions and Supplies.

The Canadian Institute of Mining and Metallurgy—G. C. Bateman, Immediate Past-President of the Institute, and Metals Controller.

Alternate: G. C. Monture, Chief, Division of Economics, Bureau of Mines.

Canadian Institute of Chemistry—L. E. Westman, Acting Secretary of the Institute.

Alternate: Dr. Paul E. Gagnon, Hon. Treasurer of the Institute and Professor of Chemistry, Laval University.

Canadian Manufacturers Association (also representing Technical Service Council)—Geo. C. Carruthers, President, Technical Service Council and President, Interlake Tissue Mills Ltd.

Alternate: W. D. Black, Past-President of the Association and President, Otis-Fensom Elevator Co. Ltd.

Universities—D. S. Ellis, Professor of Civil Engineering, Queen's University.

Alternate: R. De L. French, Professor of Highway and Municipal Engineering, McGill University.

Provincial Professional Associations—R. E. Jamieson, President, Corporation of Professional Engineers of Quebec and Professor of Civil Engineering, McGill University.

In the March *Journal* it was announced that E. M. Little had accepted the position of Director, and now it is announced that the General Secretary of the Engineering Institute of Canada, L. Austin Wright, has been appointed Assistant Director. Mr. Wright, in association with the secretaries of the Canadian Institute of Mining and Metallurgy and the Canadian Institute of Chemistry, has been interested in the registration of technical personnel for the advancement of the war since 1938 and, therefore, is well informed on the work which is being undertaken by the Bureau. His time is made available to the Department of Labour by the Council of the Institute.

It is felt by Council that the work entrusted to the Bureau is of paramount importance to the members of the Institute, to the profession at large, and to the war effort. Under such circumstances the entire facilities of the Institute should be placed at the Government's disposal, and this Council does gladly. Certain adjustments of duties at Headquarters will be necessary; but the entire staff has declared itself as ready to co-operate to the utmost.

The Bureau has obtained office space in the Supreme Court Building at Ottawa where it can work very closely with the Department of National War Services. Other Departments with which the Bureau is associated are near at hand, such as Labour, Munitions and Supply, and National Defence. With the control of war effort both in industry and the combatant forces directed from Ottawa, the location is ideal for the Bureau.

It is necessary to canvass the situation thoroughly to determine the latest demand for engineers and chemists, as well as the available supply. Thus it is indicated that a questionnaire must again be circulated. There are many who feel they have answered enough questions and completed too many forms but the fact remains that there is no complete up-to-date list of technical personnel and that without it the job cannot be done.

The new form will probably reach the members of the various societies about the same time as this *Journal* appears. You are asked to complete it carefully and quickly. To-day there is no surplus of technical man power, and the indications are that the demand will increase with the expanding war programme. Therefore, it becomes of first importance that engineers' qualifications should be placed before this Government agency, along with some indication of their availability for war work if they are not already so engaged.

It is in everyone's interest that this information be gathered quickly, accurately and without omission. It is the intention to reach every qualified person whether or not he is a member of a professional or technical society. It is hoped that it will not be necessary to waste time and effort in following up on the original request. A prompt reply to the questionnaire will give you the assurance that you have done everything you can to assist the Bureau in its national effort.

There is also in process a canvass of industry and governmental departments, to determine the number of men who will be required, what their qualifications must be, and when they will be needed.

By these two operations it is intended to bring into one office reasonably accurate figures as to the number of men available as well as the number required. Only by such methods can an efficient and satisfactory relationship between supply and demand be maintained, and only by such methods can members of the profession make their maximum contribution towards the salvation of their country and their civilization.

CORRESPONDENCE

The Institution of Mechanical Engineers,
Storey's Gate, St. James's Park,
London, S.W.1.
31st, January, 1941.

L. Austin Wright, Esq., Secretary,
Engineering Institute of Canada,
2050 Mansfield St., Montreal, P.Q.

Dear Mr. Austin Wright:

James Watt International Medal

At the special meeting of the Institution last Friday, 24th January, we had the honour of the company of His Excellency the Swiss Minister in London, M. Walter Thurnheer, who received the Watt Medal on behalf of Professor Stodola in the presence of a large number of members and distinguished guests, including Mr. C. G. Du Cane (your Official Delegate), and Brigadier C. S. L. Hertsberg, M.C., Chief Engineer to the Canadian Corps. Prior to the meeting the Council held a special luncheon, at which our guests were entertained, together with the Hon. Vincent Massey, High Commissioner for Canada.

The meeting was eminently successful, and I hope to send you shortly a full account of the proceedings.

Yours sincerely,

(*Signed*) J. Montgomrey, *Secretary.*

The Institution of Engineers, Australia
Science House, Sydney, N.S.W.
February 14th, 1941.

The General Secretary,
Engineering Institute of Canada,
2050 Mansfield St., Montreal, P.Q.

Dear Sir:

I wish to express my deep appreciation of the kindly thought of your International Relations Committee in sending to me a card conveying the Season's Greetings.

May I believe that it is not too late in the New Year to hope that your Institute, its members in general, and the members of the International Relations Committee in particular, will triumph over the difficulties and troubles which are unavoidable in these days of world conflict. Each individual must make his personal contribution, and we are confident that in Canada, as in Australia, the professional engineer will not fail in his duty.

To you, Mr. Secretary, I convey my personal greetings.

Yours faithfully,

(*Signed*) E. S. Maclean, *Secretary.*

MEETING OF COUNCIL

A meeting of the Council was held at Headquarters on Saturday, March 15th, 1941, at ten-thirty a.m., with President C. J. Mackenzie in the chair, and ten other members of Council present; together with the newly appointed treasurer, John Stadler.

The Secretary read a cable just received from the Secretary of the Institution of Electrical Engineers advising that they would be delighted to arrange for the presentation of the Sir John Kennedy Medal to General McNaughton at the Kelvin Lecture meeting to be held on May 8th, when the presidents of other leading institutions are usually present. It had been ascertained that this date would be convenient for General McNaughton and also for the High Commissioners for Canada in London.

This arrangement was considered extremely satisfactory, and the Secretary was directed to thank the Institution for their co-operation. A number of possible guests were suggested, including Brigadier C. S. L. Hertzberg, Sir Alexander Gibb, Colonel DuCane, the Rt.-Hon. R. B. Bennett, and Dr. A. S. Eve. After some discussion it was agreed that the secretary should communicate with the Canadian High Commissioner in London, and that appropriate additional names be sent to the Institution.

At the Hamilton Meeting of Council it had been suggested that the president should call a meeting of representatives of the Ontario branches to discuss the possibility of establishing some system of rotation for the offices of vice-president in Ontario. The President reported that a suggestion had been made that the April meeting of Council might be held in Toronto to coincide with a meeting of the Council of the Association of Professional Engineers of Ontario, tentative arrangements for which had been made for the 19th or 26th, and it had been suggested that a special meeting of Ontario councillors might be called at that time. This proposal was agreed to.

At the Hamilton Meeting of Council the president had been authorized to appoint a committee to consider what further action should be taken with regard to the report of the Committee on Western Water Problems, and he had nominated Mr. Gaherty as a committee of one, with power to add. The president understood that Mr. Gaherty had had some conversations with various members of the government, and that other bodies were taking action on this matter.

The secretary read a letter from Mr. Gaherty advising that since the Annual Meeting the government had appointed an interdepartmental committee to make a study of the St. Mary's project. He had interviewed two members of this committee, to whom it had been explained that the Institute was anxious to co-operate with the government committee in any way it could, and to offer them constructive support.

The secretary reported that in response to the request from the Citizens' Committee for Troops in Training for a contribution towards a fund for the purchase of band instruments for the Royal Canadian Engineers in training at Petawawa, $160.00 had been raised by voluntary contributions from councillors and members attending the Annual General Meeting at Hamilton.

The membership of the following committees, as submitted by the chairmen, was noted and unanimously approved: Papers, Publication, Past Presidents' Prize, Gzowski Medal, Plummer Medal, Professional Interests, Western Water Problems, The Young Engineer, Radio Broadcasting, Board of Examiners and Education, Students' and Juniors' Prizes.

Acting on the recommendation recorded at the Hamilton Meeting of Council, the Finance Committee gave consideration to the proposal that the general secretary's services should be made available on a part-time basis to the Department of Labour at Ottawa in order to assist in carrying out the work of the Wartime Bureau of Technical Personnel in the capacity of Assistant Director.

After considerable discussion, in which the question was examined from all angles, the committee decided to give authorization to the proposal. It appears that the successful operation of this Bureau is not only of great importance to the Institute but to the war effort as well. It was pointed out that when the Bureau gets under way it is expected that it will replace the work now being done by the Employment Department of the Institute and that therefore a great deal of Mr. Trudel's time, which is now devoted to employment, would be available to assume additional duties now carried out by the general secretary. Mr. Durley had also offered to take over some additional work on the *Journal*. In view of the importance of the work at Ottawa, and of the assured co-operation of the balance of the Headquarters staff, the committee felt sure that the affairs of the Institute would not suffer unduly.

The recommendation of the Finance Committee that joint members in provinces where co-operative agreements are in force should still be entitled to the privileges of that membership if they were temporarily absent from their province on war work for the government, was unanimously approved.

Mr. Perry reported briefly on the repair work to the building which was now practically completed, and which, in his opinion, had been very satisfactorily done. Council expressed its appreciation of Mr. Perry's efforts, and of the splendid co-operation of the contractors, who were also members of the Institute.

It was noted that Dean Mackenzie had written to the chairman of each of the twenty-five branches with reference to the contributions which it was hoped would be raised by the branches from their members to assist in meeting the cost of the building repairs. There had been some delay in issuing this letter as, in the first instance, it had been planned that Dr. Hogg would write it. However, Dean Mackenzie had taken it over, and had worded his letter so that the request came both from him and from Dr. Hogg.

The president felt that the point should be stressed with all members that the Institute was anxious to go into the period after the war with a substantial reserve, so that it would be in a good position to serve its members at that time. Dean Mackenzie suggested that it might be desirable to write a letter to all councillors asking them to emphasize this point when the matter comes before their executives. Following some discussion, it was decided that this should be done, and the president agreed to draw particular attention to this phase of the situation when visiting the various branches.

The secretary presented a letter from Major C. C. Lindsay, M.E.I.C. (late Canadian Engineers), suggesting that the members of the Engineering Institute of Canada, through the local branches, might render valuable assistance in the war effort by co-operating with the various units of the Royal Canadian Engineers particularly in their endeavours to recruit a sufficient number of qualified men.

It was agreed that a copy of the letter should be sent to all branches for their consideration and action, explaining that Council was entirely in sympathy with this proposal, but felt it was a matter for each branch to settle in the light of conditions as they exist in each locality.

A number of applications were considered, and the following elections and transfers were effected:

Admissions	
Members	3
Juniors	2
Affiiliate	1
Students	38

Transfers	
Junior to Member	3
Student to Member	3
Student to Junior	4

It was decided that the April meeting of Council should be held in Toronto to coincide with the meeting of the Council of the Association of Professional Engineers of Ontario, it being left with the General Secretary to arrange a convenient date.

The Council rose at one-fifteen p.m.

ELECTIONS AND TRANSFERS

At the meeting of Council held on March 15th, 1941, the following elections and transfers were effected:

Members

MacQuarrie, Archibald Henry, B.A.Sc. (Univ. of Toronto), sales engr., The Canadian Bridge Co. Ltd., Walkerville, Ont.

Richards, George Henry, manager, Lee & Nash, Civil Engrs. & Surveyors, Brantford, Ont.

Smith, Cleve A., B.A.Sc. (Univ. of Toronto), asst. engr., (Trans. Section, Elec. Engrg. Dept.), H.E.P.C. of Ontario, Toronto, Ont.

Juniors

MacKimmie, Robert Dunstone, B.Eng. (Elec.), (McGill Univ.), asst. engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

Parker, William Ernest Bain, B.A.Sc., M.A.Sc. (Univ. of Toronto), asst. research engr., H.E.P.C. of Ontario, Toronto, Ont.

Affiliate

Murchison, James Gray, consultant, Suite 5, Buntin Block, Fort William, Ont.

Transferred from the class of Junior to that of Member

Dale, James Graham, B.Sc (E.E.), (Univ. of Alta.), installn. engr., Northwestern Utilities Ltd., Edmonton, Alta.

Nesbitt, Michael Cullum, B.A.Sc. (Univ. of B.C.), supt. engr., Dawson Wade & Co., Contractors, Victoria, B.C.

Seely, Wallace Errol, B.Sc (Civil), (Univ. of N.B.), junior engr., Dept. of National Defence (Air Force), Montreal, Que.

Transferred from the class of Student to that of Member

Butler, John Arthur Tweed, B.Eng. (Mech).) (McGill Univ.), chief stress analyst, Fairchild Aircraft Ltd., Longueuil, Que.

Fogarty, James William Patrick, B.Sc. (Elec.), (McGill Univ.), professor of engineering, St. Francois Xavier University, Antigonish, N.S.

Spence, Graydon Dill, B.Sc. (Elec.), (N.S. Tech. Coll.), res. engr., N.S. Power Commission, St. Croix, N.S.

Transferred from the class of Student to that of Junior

Campbell, Duncan Chester, B.Sc. (Univ. of N.B.), asst. engr., Dept. of Transport, Civil Aviation Branch, Saint John, N.B.

Green, John Scott, B.A.Sc. (Univ. of Toronto), aircraft examiner, British Air Commission, Toronto, Ont.

Miller, G. Grant B., B.Sc. (Elec.), (Univ. of N.B.), sales engr., E. S. Stephenson & Co. Ltd., Saint John, N.B.

Zion, Alfred Bernard, B.Eng. (McGill Univ.), factory supt., Dominion Lock Co. Ltd., Montreal, Que.

Students Admitted

Barurek, Christian Stephen, (McGill Univ.), 5691 Brissette St., Montreal, Que.

Bradshaw, Thomas Earl, (Univ. of Man.), 549 Jubilee Ave., Winnipeg, Man.

Brenan, William Murdoch, (Univ. of N.B.), 215 Germain St., Saint John, N.B.

Burrows, James Louis, B.Sc., (Queen's Univ.), 37 Clergy St. W., Kingston, Ont.

Chilman, William Richard, (Queen's Univ.), 78 Barrie St., Kingston, Ont.

Coulthart, Eldred Norman, (Queen's Univ.), Monklands, Ont.

Cronyn, John B. (Univ. of Toronto), R.R. No. 3, London, Ont.

Cuthbertson, Robert Shedden, (Queen's Univ.), Cardinal, Ont.

Demers, Charles Eugene, (Queen's Univ.), 300 Earl St., Kingston, Ont.

Dowd, Elbert Watson, (Queen's Univ.), 159 First Ave., Ottawa, Ont.

Floud, John Rhys, (McGill Univ.), 20 Thornhill Ave., Westmount, Que.

Godbout, Adolphe Gerard, (McGill Univ.), 2100 Jeanne-Mance, Montreal, Que.

Haacke, Ewart M. (Queen's Univ.), 276 University Ave., Kingston, Ont.

Hastey, Wm. Kingsley Wright, (Queen's Univ.), 61 Maple Ave., Shawinigan Falls, Que.

Hopps, John Alexander, (Univ. of Man.), 136 Girton Blvd., Tuxedo, Man.

Kennedy, John Frederick, (Univ. of N.B.), 84 Grey St., Fredericton, N.B.

Kummen, Harold T., (Univ. of Man.), 317 Fort St., Winnipeg, Man.

Lindsay, Gerald Alec Edwin, (McGill Univ.), 520 Grosvenor Ave., Westmount, Que.

MacCallum, Wallace Allison, (N.S. Tech, Coll.), 28 Fenwick St., Halifax, N.S.

MacKinnon, Archibald Hugh, (N.S. Tech. Coll.), 72 South St., Halifax, N.S.

Madore, Paul Rene, (Ecole Poly.), 6798 Fabre St., Montreal, Que.

Magnan, Joseph Maurice, (Ecole Poly.), 5808A Des Erables, Montreal, Que.

Pageau, Marcel, (Ecole Poly.), 1791 Ave. de l'Eglise, Cote St. Paul, Montreal, Que.

Paget, Kenneth Kane, (Univ. of Man.), 520 Raglan Rd., Winnipeg, Man.

McInnis, John Francis, (N.S. Tech. Coll.), Maple St., Inverness, N.S.

Marantz, Oscar, (Univ. of Man.), 121 Euclid Ave., Winnipeg, Man.

McLaughlin, George Frederick Armstrong, (Univ. of N.B.), Perth, N.B.

Ronalds, Ivan Frederick, (Univ. of N.B.), 623 Scully St., Fredericton, N.B.

Ross, James Finlay, (Mt. Allison), 43 Westminster Ave., Montreal West, Que.

Schofield, Stewart Macleod, (Univ. of Man.), 231 Oakwood Ave., Winnipeg, Man.

Scott, Ainsworth David Houghton, B.Eng. (McGill Univ.), 631 Milton St., Montreal, Que.

Sergi, Frank Jose, (McGill Univ.), 772 Sherbrooke St. West, Montreal, Que.

Shearer, John Alexander, (Univ. of N.B.), Fredericton Junction, N.B.

Snodgrass, John Roscoe, (Univ. of N.B.), 634 Brunswick St., Fredericton, N.B.

Sokoloski, Steve, (Univ. of Man.), 390 Simcoe St., Winnipeg, Man.

Termuende, John Edward, (Univ. of Man.), 192 Canora St., Winnipeg, Man.

Wigdor, Leon, (McGill Univ.), 2183 Maplewood Ave., Montreal, Que.

Zweig, Irving, (Sir George Williams Coll.), 4156 DeBullion St., Montreal, Que.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

Brig.-General C. H. Mitchell, M.E.I.C., has resigned from the position of Dean of the Faculty of Applied Science and Engineering at the University of Toronto, which he has occupied since 1919. The occasion has been marked in many ways, but perhaps the most outstanding event was the dinner given on Saturday, March 1st, by the Alumni, at which all members of the graduating class were guests. Many fine tributes were paid to the Dean and Mrs. Mitchell, and as a souvenir of the occasion an easy chair and a reading lamp were presented to him.

The Dean responded appropriately, and besides thanking the Alumni for the honour which had been done him, gave the graduating class some words of wisdom that would be of assistance to them in the professional careers that were before them.

Brig.-General C. H. Mitchell, M.E.I.C.

"Pat" Wingfield, president of the Alumni, occupied the chair, and was supported in the several features of the programme by Canon Cody, Professor Angus, Tony Reid, Ross Robertson and M. B. Hastings.

Dr. O. O. Lefebvre, M.E.I.C., has been elected president of the Corporation of Professional Engineers of Quebec, following the annual meeting held in Montreal last month.

Hew M. Scott, M.E.I.C., has been located in Montreal for the last few months and is on the staff of Allied War Supplies Corporation. He was formerly in Toronto where he was engaged in the contracting business.

H. V. Butterfield, M.E.I.C., has recently been appointed superintendent of maintenance in the Air Service Department of the Canadian Pacific Railway Company, at Montreal. Born in England he was educated at Leeds University where he was graduated in 1914. Upon graduation he joined the staff of Aircraft Manufacturing Company, Hendon, London. From 1917 to 1919 he was chief production engineer and assistant general manager of the National Aircraft Factory, Aintree, England. From 1919 to 1925 he was inspector in the mechanical service of the Ministry of Public Works, Cairo, Egypt. He came to Canada in 1926 as mechanical superintendent for Massey-Harris Company, Toronto, Ont., and later became plant manager. In 1934 he was appointed general manager of Leland Electric Canada Ltd., later becoming president and managing director. In 1939 he was appointed plant manager of the National Steel Car Corporation at Malton, Ont. For the last few months Mr. Butterfield had been employed with the British Air Commission at Washington, D.C.

L. G. Buck, M.E.I.C., has recently been transferred from the Toronto to the Ottawa office of the Bell Telephone Company of Canada. He entered the company upon his graduation from the University of Toronto in 1924, and after a period of training he was appointed field engineer in the Toronto division. In 1927 he became district plant manager at Toronto. From 1930 to 1934 he was exchange plant engineer for the eastern area and was located in Montreal. In 1934 he became division plant engineer at Montreal, and then he was transferred to Toronto as division plant supervisor.

A. W. Sinnamon, M.E.I.C., has recently joined the staff of the Hamilton Bridge Company Ltd., in Hamilton, Ont.

Engineer-Captain G. L. Stephens, M.E.I.C., has been appointed engineer-in-chief of the Royal Canadian Navy, and is now located at Ottawa in the Naval Service of the Department of National Defence. Lately he was stationed at Esquimalt, B.C., as chief engineer of H.M.C. Dockyard.

P. R. Sandwell, M.E.I.C., has recently been appointed resident engineer to the Australian Newsprint Mills Proprietary Limited, at Boyer, Tasmania. Born at London, England, he was educated at the University of British Columbia where he was graduated as a mechanical engineer in 1935. Upon graduation he joined the Dominion Engineering Works in Montreal as a mechanical draughtsman. In 1937 he became assistant to the chief engineer and was engaged in investigation and development work. Last year he went to Tasmania with the above named firm.

W. T. Dempsey, M.E.I.C., is now employed with Chemical Construction Corporation at Niagara Falls, Ont. He was graduated in civil engineering from the University of Saskatchewan in 1934. Since then he has been employed on several construction projects.

J. L. McDougall, M.E.I.C., has joined the staff of H. G. Acres & Company, consulting engineers, Niagara Falls, Ont. He had been connected lately with the Ontario Paper Company at Thorold, Ont.

J. A. Ogilvy, M.E.I.C., is now employed in the Department of Munitions & Supply at Ottawa. He was connected lately with the General Engineering Company (Canada) Limited at Toronto, and previously was with the Omega Gold Mines Ltd., at Larder Lake, Ont.

A. G. Moore, M.E.I.C., has joined the staff of Defence Industries Limited in Montreal. For the past two years he had been resident engineer with the Compagnie Immobilière de Ste. Marguerite, Lake Masson, Que. Previously he was connected with the Montreal Light Heat and Power Company.

R. N. Sharpe, JR.E.I.C., is now in Seattle, Wash., with the British Air Commission, and is doing inspection work on aircraft manufacturing. He was previously located in Toronto. Upon his graduation from the University of Manitoba in 1938 he joined the Department of Transport. Later he was in the employ of the Manitoba Government in Winnipeg.

A. LeB. Ross, JR.E.I.C., has joined the staff of Defence Industries Limited at Montreal. Upon his graduation in electrical engineering from McGill University in 1932 he went with Noranda Mines Limited at Noranda, Que., as a junior electrical engineer, and in 1934 he became technical assistant to the plant engineer. A few months later he joined the staff of Railway and Power Engineering

Corporation at Toronto, where he was engaged in the design, manufacture and sale of industrial motor control apparatus.

W. G. Hamilton, JR.E.I.C., has accepted a position with Canadian Car Munitions Limited at St. Paul L'Ermite, Que. He was graduated in mining engineering from Nova Scotia Technical College in 1935 and was employed with Canadian Johns-Manville Company Limited, at Asbestos, Que., and with Tashota Gold Fields Limited, at Tashota, Ont. In 1939 he went with Gold Coast Main Reef Limited, in West Africa. Lately Mr. Hamilton was located in Halifax.

J. G. Wanless, JR.E.I.C., has been transferred from the Toronto to the Montreal office of the Dominion Rubber Company. He joined the company upon his graduation from McGill University in 1934.

R. G. Rowan, S.E.I.C., is on the staff of the Bell Telephone Company of Canada in Montreal. He was graduated in civil engineering from Queen's University last year.

P. A. Weber, S.E.I.C., is, at present, employed with Canadian National Railways in Toronto. He was graduated in civil engineering from the University of Saskatchewan in 1940.

Percy Codd, S.E.I.C., has joined the staff of Defence Industries Limited, and is located at Valleyfield, Que. Upon his graduation from the University of Saskatchewan in 1939 he went with the Hudson Bay Mining and Smelting Company at Flin Flon, Man., and remained in the employ of the firm until his recent appointment.

H. G. Dickie, S.E.I.C., has been employed, since his graduation from Queen's University last spring, in the engineering department of Canadian Car and Foundry Company, Limited, at Fort William, Ont.

VISITORS TO HEADQUARTERS

Lieutenant R. F. P. Bowman, M.E.I.C., 10th Field Company, Royal Canadian Engineers, C.A.S.F., from Petawawa, Ont., on March 4th.

H. U. Ross, Jr.E.I.C., from Port Colborne, Ont., on March 5th.

R. C. Purser, M.E.I.C., from Ottawa, Ont., on March 6th.

P. A. Fetterly, M.E.I.C., Dominion Water & Power Bureau, from Calgary, Alta., on March 7th.

Max Gershfield, Jr.E.I.C., Aeronautical Inspection Directorate, Fleet Aircraft Ltd., from Fort Erie, Ont., on March 8th.

J. B. deHart, M.E.I.C., Department of National Resources, Canadian Pacific Railway Company, from Calgary, Alta., on March 10th.

H. J. Racey, M.E.I.C., Shawinigan Engineering Company Limited, from La Tuque, Que., on March 10th.

F. W. Gray, M.E.I.C., Assistant General Manager, Dominion Steel & Coal Corporation, from Sydney, N.S., on March 13th.

E. I. Glance, Jr.E.I.C., Montreal, on March 13th.

C. G. J. Luck, M.E.I.C., Assistant Engineer, National Harbour Board, from Churchill, Man., on March 19th.

James Oliver, S.E.I.C., from Arvida, Que., on March 18th.

F. S. Lawrence, M.E.I.C., Canadian National Railways, from Quebec, Que., on March 17th.

C. A. McVey, Bridge Engineer, Department of Public Works of New Brunswick, from Fredericton, N.B., on March 20th.

H. P. Moller, M.E.I.C., Electrical Superintendent, Lake St. John Power & Paper Co., from Dolbeau, Que., on March 24th.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Percy Sandwell, M.E.I.C., died at his home in Hobart, Tasmania, on January 22nd, 1941. He was born at London, Eng., on November 7th, 1888, and was educated in the local public and technical schools. After having served his apprenticeship with Messrs. George Aston & Sons, London, he joined in 1909 the staff of Messrs. Hales Limited, haulage contractors, as an engineer, and was in charge of maintenance and management of a steam plant. In 1911 he became chief mechanical draughtsman with the Shepherds Bush Exhibition Limited in London, a position which he retained until 1913. During the war he first served with the 72nd Brigade R.F.A., and from 1916 to 1920, served as a lieutenant in the Royal Engineers. He came to Canada in 1920, and joined the staff of the Powell River Company at Powell River, B.C. From 1922 to 1926 he was assistant resident engineer, and from 1926 to 1932 he was resident engineer. In 1932 he was appointed assistant manager, a position which he retained until 1934 when he entered private practice as a consulting mechanical engineer in Vancouver, B.C. In 1938 he was appointed chief engineer on the construction of a newsprint mill in the Derwent Valley, Tasmania.

At the time of his death he was chief engineer of the Australian Newsprint Mills Proprietary Limited, and had just completed the first stage in the development of the first newsprint mill to be built in the Antipodes. He died during the period of preliminary testing, and did not, unfortunately, see the commencement of operation of the plant which he had been building for the last few years.

Mr. Sandwell joined the Institute as an Associate Member in 1923, and was transferred to Member in 1936.

Francis Joseph O'Reilly, M.E.I.C., died in the hospital at Victoria, B.C., on March 20th, 1941. He was born at New Westminster, B.C., on February 9th, 1866. He received his education at private schools in England, and at King's College, London. From 1883 to 1887 he served as an articled pupil to Messrs. Kinnipple and Morris, and was employed in the construction of docks at Greenock, Scotland, and later at Esquimalt, B.C. From 1888 to 1892 he was engaged as an assistant engineer on the construction of a section of the Great Southern Railway at Buenos Aires, South America. He then returned to British Columbia, where for fourteen years he was surveying in the Kootenays. In 1906 he founded the firm of Cross and Company in Victoria, B.C., and practised for several years as a consulting engineer and a provincial land surveyor. At the time of his death he was manager of the Belmont Building at Victoria, B.C.

Mr. O'Reilly joined the Institute as a Member in 1915.

COMING MEETINGS

American Institute of Electrical Engineers—Summer Convention, Royal York Hotel, Toronto, Ont., June 16th to 20th. National Secretary, H. H. Henline, 33 West 39th St., New York, N.Y.

American Water Works Association—Annual Convention, Royal York Hotel, Toronto, Ont., June 22nd to 26th. Secretary, Harry E. Jordan, 22 E. 40th St., New York.

Eastern Photoelasticity Conference—13th Semi-Annual Meeting, Cambridge, Massachusetts, June 12 to 14th. Chairman of the Local Committee, W. M. Murray, Massachusetts Institute of Technology, Cambridge, Mass.

Canadian Electrical Association—51st Annual Convention, Seigniory Club, Quebec, June 25th to 27th. Secretary, B. C. Fairchild, 804 Tramways Building, Montreal, Quebec.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

P. F. Peele, m.e.i.c. - - *Secretary-Treasurer*
F. A. Brownie, m.e.i.c. - *Branch News Editor*

December 14th was the occasion of the joint annual dinner of the Calgary Branch of the Institute, the Alberta Professional Engineers of the Calgary district and the Rocky Mountain Branch of the Canadian Institute of Mining and Metallurgy. No ordinary annual dinner, however, it was also the occasion of the signing of the co-operative agreement between the Association of Professional Engineers of Alberta and the Engineering Institute of Canada.

In a carefully rehearsed ceremony pages presented the memoranda of agreement and a special gold fountain pen in turn to the various signers as follows: Dr. Hogg, president of the E.I.C., Mr. H. J. Maclean, president of the A.P.E.A., Mr. L. A. Wright, general secretary of the E.I.C., Mr. H. R. Webb, registrar of the A.P.E.A. and the respective witnesses Dr. O. O. Lefebvre, past president of the E.I.C., Mr. R. J. Gibb, past president of the A.P.E.A., Mr. P. M. Sauder, vice-president of the E.I.C., and Mr. R. A. Brown, past president of the A.P.E.A. Later the gold fountain pen was presented to Mr. Maclean as a memento of the occasion.

Other distinguished guests from outside Alberta, most of whom spoke briefly, were Dr. F. A. Gaby, past president of the E.I.C., C. K. McLeod, councillor for the Montreal Branch, J. A. Vance, councillor for the London Branch, J. Robertson, councillor of the Vancouver Branch, P. C. Perry, chairman of the Saskatchewan Branch and president of the Association of Professional Engineers of Saskatchewan, D. A. R. McCannell of Regina, president of the Dominion Council of Professional Engineers and A. P. Linton, councillor for the Saskatchewan Branch.

The main address of the evening on the subject **The Engineer and the War** was by Dr. Hogg. It is published elsewhere in this number of the *Journal.*

The general interest in this meeting was indicated by an attendance of over 150. Chairman for the evening was P.M. Sauder.

The guest speaker at the regular meeting of January 16, was Mr. R. M. Hardy, assistant professor of civil engineering at the University of Alberta who spoke on **Soil Mechanics and its Applications.** Mr. Hardy had spent the winter of 1939-40 doing some advanced work on this subject at Harvard University and, during that time, had the privilege of studying under Dr. Terzaghi, who is deservedly known as "father of soil mechanics."

Mr. Hardy's paper dealt very briefly with the history of this new field of civil engineering and discussed possible reasons why most engineers are so unfamiliar with the subject. One obvious reason is that some of the fundamental principles of soil mechanics are outside the field of an ordinary engineering training. The speaker dealt briefly with some of these principles such as the fact that soil must be recognized as a two or three phase system (soil particles and water and sometimes gas); the effect of soil water is tremendously important since although it has no strength in shear it can, of course, resist compression stresses and in the fine capillaries of clay can actually develop around 15,000 lb. per sq. in. in tensile strength. The different types of soil structures were also described.

The final section of the paper dealt with some of the applications of a knowledge of soil mechanics, such as in foundations, earth fill dams and in the study and solution of problems involving frost boils.

After an extended discussion the speaker was tendered a hearty vote of appreciation by the meeting.

The regular meeting of January 30th was devoted to a showing of seven reels of a very interesting film on "The Making of Steel" loaned by the U.S. Bureau of Mines.

One of the most enjoyable meetings of the season was that of February 13th in which the entire programme was in charge of the Juniors and Students. The first item was a talk on **Oil Well Servicing** by J. Langston. Mr. Langston described the manufacture and use of gun perforating equipment as developed by the Lane-Wells Company, illustrating his talk with a reel of films. With the help of a number of slides he then discussed the applications of this procedure in selective production of various horizons and the use of gun perforating before acidizing.

Mr. T. Stanley who also acted as chairman for the evening, then discussed the new **Cascade Development** now being undertaken by the Calgary Power Company. This development includes an earth fill dam at Lake Minnewanka, some three miles of combination canal, woodstave and steel pipe and a power plant near Anthracite containing one unit of 23,000 h.p. operating under some 340 ft. head.

The next item was a quiz competition between Members, Juniors and Students, conducted by Mr. F. T. Gale. The Members turned out to be the winners but admittedly rather by superiority of numbers than of intelligence.

The final item was a talk by Mr. W. G. Sharp on **Modern Movie and Sound Projection Equipment.** An outline was presented of the mechanical operation of the equipment followed by the showing of a reel of films on a popular subject.

An extended, informal discussion followed in which members were allowed to examine certain apparatus brought to the meeting by Mr. Sharp and Mr. Langston.

EDMONTON BRANCH

B. W. Pitfield, Jr.E.I.C. - - *Secretary-Treasurer*
J. F. McDougall, m.e.i.c. - *Branch News Editor*

The February dinner meeting of the Edmonton Branch of the Institute was held at the Macdonald Hotel on February 25th. Immediately after dinner, Chairman E. Nelson called the meeting to order and introduced the speaker of the evening, Mr. C. W. Carry, sales engineer of the Standard Iron Works Limited.

The title of Mr. Carry's paper was **Arc Welding in Industry.** Mr. Carry stated that the ease and speed with which weld metal can be satisfactorily deposited is mainly dependent on the stability of the arc. The arc which can be maintained for the longest period, other things being equal such as current and electrode size, will deposit the greatest amount of weld metal during a given period.

He then proceeded to describe the relative advantages of alternating and direct current in producing welding arcs. Alternating current is imperative for the double carbon arc to keep the consumption of both electrodes equal and in the atomic hydrogen arc for the same reason. In the structural steel and medium weight plate shop, the direct current arc is more popular for producing general purpose work. A 200 amp. machine is suitable for say gauge plate work, and tacking heavier plates in assembling a structure. A 300 amp. machine is suitable for medium plate up to ¼ or 5/16 in. thickness, and a 400 amp. machine is the favourite for continuous duty on work up to say 1 in. thickness.

He stated that the five separate and distinct forces at work when weld metal is being deposited through the arc to the parent metal are gravity, gas expansion, electromagnetic force, electric force and surface tension.

When molten weld metal is exposed to the air, it absorbs a harmful volume of nitrogen, and also suffers partial oxidation. Such metal tends to be brittle, even though it may have a tensile strength of 50,000-60,000 lb. per sq. in. In many cases its use is satisfactory and economical. It is produced generally by the use of bare or uncoated electrodes, without the use of a shielding flux, and is known as the unshielded arc process.

The use of fluxes and inert gases are intended to shield the arc from the air, and also to protect the deposited and base metal from molton to cold stage by forming a slag covering. This is known as the shielded arc process.

The author next dealt with the residual stresses which are left in welded joints and explained how these are commonly dealt with by letting the material ways as it cools, letting the weld warp by using a ductile welding rod or by annealing the welded structure.

He told how the hull plates of the new battleship "King George V" were welded instead of riveted and predicted a great future for the welding process in ship construction.

A lengthy discussion period followed Mr. Carry's paper after which a hearty vote of thanks to the speaker was moved by Mr. Hansen.

About forty members were present at the meeting.

HALIFAX BRANCH

S. W. Gray, M.E.I.C. - *Secretary-Treasurer*
G. V. Ross, M.E.I.C. - *Branch News Editor*

Dr. C. D. Harvey, provincial archivist of Nova Scotia was guest speaker at the dinner meeting in the Halifax Hotel on February 20th. He traced the origins of the various peoples who first settled in Nova Scotia and outlined the contributions which each group made to the life of the province.

Our first citizens were the Micmac Indians, who gave us the canoe, the snowshoe, many of the trails which have developed into the highways of to-day, and a knowledge of our geography.

First from the old world were the Acadians. Longfellow, in his "Evangeline" has painted a tragic picture of the expulsion of these people in 1755, but history is less unkind to the English rulers of that time. They left a lasting memorial in the dykes, those walls of sod and marsh mud which still hold back the tides of Fundy from the rich lands around Grand Pré.

The first English settlers, along with some Germans were mostly ex-soldiers and sailors. They were sent out primarily to farm and to fish, but were chosen with an eye to defence.

Halifax, prior to the American Revolution, had been dominated by English people who had come from the New England States. The first English settlements outside Halifax were established when the great influx of New England planters took place between 1760 and 1765. These people laid the foundations of British civilization in this province and from their stock came Tupper, Borden and Bennett to be leaders in Canadian life. Then came the Loyalists. They doubled the population of the province, and since many were highly educated, they contributed much to the life of that time. They produced Richard Haliburton, Joseph Howe and Samuel Cunard; formed the bishoprics, a college, and a magazine.

Scottish settlers began to arrive in numbers in 1773 and from Pictou they spread out over the Northern part of the mainland and to Cape Breton Island. Inspired by a love of learning, they have made great contributions in the field of education, not only in Nova Scotia, but throughout Canada.

The language and customs of the Welsh who came in 1817 or 1818, have all but disappeared. Many Irish settled around Minas in the early 1800's but large numbers of them later moved on to the United States.

Dr. Harvey called the period from 1834 to Confederation, the "Spacious Days of Nova Scotia," when Nova Scotians reached for the stars and almost brought them down. Those were the days of the wooden sailing vessel, when every bay had its shipyard and Bluenose ships were trading in every port of the world.

Following the talk by Dr. Harvey, Mr. R. L. Dunsmore outlined the highlights of the recent Annual Meeting in Hamilton. S. W. Gray, formally took over the work of secretary-treasurer of the Branch, succeeding L. C. Young, now serving in the R.C.C.S.

Seven senior students of the Nova Scotia Technical College were present as guests of the Branch.

HAMILTON BRANCH

A. R. Hannaford, M.E.I.C. - *Secretary-Treasurer*
W. E. Brown, Jr.E.I.C. - - *Branch News Editor*

The meeting of the Hamilton Branch, held on Monday, March 10th, in the Lecture Theatre at McMaster University was addressed by Professor K. B. Jackson of the University of Toronto. His subject was entitled, **Aerial Surveying.**

Before the lecture, Michael S. Layton was presented with the gold medal, awarded for his successful paper entitled

Michael S. Layton receives the Duggan Medal of the Institute, from W. L. McFaul.

"Coated Electrodes in Electric Arc Welding" as part of the G. H. Duggan Prize.

For the first time the G. H. Duggan Medal and Prize has been awarded to a Junior member of the Engineering Institute. Mr. Layton formerly with the Steel Company of Canada at Montreal, is now attending No. 1 Gunnery and Bombing School at Jarvis, Ontario. Owing to his military duties he was prevented from attending the Annual Meeting at Hamilton last month to receive his award.

Before the presentation was made at the monthly meeting of the Hamilton Branch, the Executive invited Mr. Layton to a reception dinner at the Royal Connaught Hotel. The Mount Hope Airport was represented by Manager G. Moes and Flying Officer Jeffery. The speaker of the evening, Professor K. B. Jackson was also present.

Chairman W. A. T. Gilmour, opening the meeting in the Lecture Theatre at McMaster University said that the first part of the meeting would be taken up by our members doing honour to Mr. M. S. Layton, winner of the Duggan award. W. L. McFaul, member of Council for the Hamilton Branch, made the presentation and in a few well chosen words expressed the congratulations of headquarters and particularly the honour enjoyed by the Hamilton Branch in having the duty of making the presentation.

Mr. Layton, wearing the uniform of the Royal Canadian Air Force, modestly acknowledged the honour. He expressed the hope that his studies might be of some benefit to those engaged in arc welding.

Professor K. B. Jackson was introduced by T. S. Glover. The speaker showed various methods of taking pictures from the air and described the equipment used and showed by slides of charts, diagrams and photographs how aerial surveying is carried out. He also showed how surveys are made by camera, on the ground. He explained the various merits of high oblique, low oblique and vertical exposures. Mr. Jackson described a camera taking a centre picture and several radial pictures together with the method of plotting and necessary corrections for distortion, and also the manipulation of an angle extractor.

The explanation and showing of a number of anaglyphs was remarkable and illustrated stereoscopically the third dimension. The views of mountainous country were very beautiful and each one in the room was supplied with a pair of coloured glasses so that the desired result was obtained from the slides.

At the end of the address Chairman W. A. T. Gilmour said that he would not ask for the customary movement of a vote of thanks to Mr. Jackson but would see what applause the audience would give and the result was spontaneous. The meeting then adjourned for coffee and sandwiches.

KINGSTON BRANCH

J. B. Baty, M.E.I.C. - *Secretary-Treasurer*

An unusually well attended and interesting meeting was held in connection with a dinner at Queen's Students' Union on Thursday, January 30th. Mr. T. A. McGinnis, chairman, presided and a total of forty-three members and guests were present. Lt.-Col. Le Roy F. Grant presented the framed certificate, signifying the award of the Institute prize for 1940 at Queen's University, to Mr. James M. Courtright, Science '41 student at Queen's.

An excellent paper on **The Aluminum Industry of the World** was presented by Mr. M. N. Hay, works manager of the Aluminium Company of Canada Limited, Kingston, Ontario. The paper was illustrated with interesting coloured motion pictures.

Aluminum was first isolated in 1825 by a Dutch chemist. Commercial production was originated in 1856 in France by a slow and expensive method. The cost of aluminum was $90.00 a pound. Napoleon III subsidized the industry in France, thinking that it might be useful for military purposes.

In 1939, Canada is listed as the third producing country in the world, a position which Mr. Hay believes it will also hold in 1940. Germany is in first position and United States second. The speaker said that since 1932, Germany's aluminum production has shown an almost ten-fold increase to the output of 1939. He pointed out that the Nazis have regardless of cost, attempted to make themselves self-sufficient in aluminum production, and have subsidized the industry in order to feed their vast war machine.

He discussed the economic production of aluminum in the chief producing countries under the headings of "electric power, bauxite, coal, transport and other facilities." Considering all these factors, he placed Canada in number one position, with United States second and Germany third. To highlight this assertion, which he stressed was purely a personal one, he pointed out that Canada has, at Arvida, the largest aluminum plant in the world.

Dr. A. L. Clark, Hon.M.E.I.C., Dean of the Faculty of Applied Science at Queen's University, very fittingly moved the vote of thanks to Mr. Hay.

Another good meeting on Tuesday, February 25th, held in connection with a dinner at Queen's Students Union, manifested a renewed spirit in the Kingston Branch this winter. Forty-seven members and guests, including a large group of students, were in attendance. Chairman T. A. McGinnis presided.

Professor D. S. Ellis, newly-elected member of Council from Kingston reported upon the annual meeting of the Institute in Hamilton, with particular reference to the meetings of the Committee on the Training of the Young Engineer. Mr. McGinnis and Professor L. M. Arkley, who also attended the annual meeting, supplemented Professor Ellis' report. Mr. McGinnis expressed his pleasure at the attendance of the large number of student-members present at the branch meetings and encouraged them to continue their interest and activities in the Institute.

Dr. A. E. Berry, director of the Sanitary Engineering Division of the Ontario Department of Health, a past-chairman of the Toronto Branch and at present a member of Council of the Institute was the guest speaker. His subject was **The Engineer in Public Health.** In a most interesting and enlightening manner, Dr. Berry explained the relationship of engineering to public health. "The public-health engineer has two objectives," said Dr. Berry, "the protection of the health of the citizens in a community, through the sanitary control of environment, and an improvement in the standard of living—an indirect effect on health—such as better housing, ventilation, lighting, heating, and improved working conditions."

By lantern-slide illustrations, Dr. Berry showed the developments in the fields of water purification, sewage treatment, refuse collection and disposal, safe control of milk supplies and swimming pool sanitation—all accomplishments of the sanitary engineer or public-health engineer.

Col. N. C. Sherman moved the vote of thanks to Dr. Berry.

LAKEHEAD BRANCH

H. M. Olsson, M.E.I.C. - *Secretary-Treasurer*
W. C. Byers, Jr.E.I.C. - *Branch News Editor*

On Wednesday evening, February 14th, the Lakehead Branch held its customary Ladies' Night which, this year, took the form of a St. Valentine Supper Dance in the Norman Room of the Royal Edward Hotel.

The dance was very well attended by the members and their friends who greatly enjoyed the occasion. One hundred and six couples participated in this gay entertainment which is rapidly becoming one of the outstanding social events at the Lakehead.

The guests were received by H. G. O'Leary, chairman of the Lakehead Branch, and Mrs. O'Leary; Mr. B. A. Culpeper, vice-chairman and Mrs. Culpeper; and wife of ex-councillor, Mrs. P. E. Doncaster.

E. J. Davies, chairman of the entertainment committee, was greatly responsible for the successful entertainment.

The ballroom was nicely decorated in the spirit of St. Valentine with an added engineering touch such as destroyer and aeroplane models and a miniature high tension wire post, etc. The focus of interest, however, was a large revolving illuminated glass globe made up of hundreds of minute mirrors and held aloft by a tapering tower. This ingenious arrangement was located in the centre of the ballroom casting myriads of multi-colored reflections on the dancers and the spacious dance floor of the Norman Room. Several large shields bearing the crest of the Engineering Institute of Canada adorned the walls.

Card tables were also arranged on the mezzanine floor overlooking the ballroom, but dancing was preferred.

Even the dance programme reflected the spirit of the profession with such appropriate innovations as the Slip Stick Tango, the Hurricane Foxtrot, the Floating Power Waltz and many others. Music was provided by Joe

Turner's Six Piece Orchestra aided by Miss Gladys Smith, vocalist.

A midnight supper was greatly enjoyed in a candlelit dining-room also festive with St. Valentine decorations. After supper, dancing continued till two o'clock when the programme was brought to a close with the singing of "God Save the King."

Other members on the entertainment committee were J. I. Carmichael, S. E. Flook and Elizabeth M. G. MacGill.

LETHBRIDGE BRANCH

E. A. Lawrence, s.e.i.c. - *Secretary-Treasurer*
A. J. Branch, m.e.i.c. - - *Branch News Editor*

A regular meeting of the Lethbridge Branch of the Engineering Institute of Canada was held, Wednesday evening, at 8 p.m., in the Marquis Hotel, with Wm. Meldrum presiding.

Mr. J. E. Campbell introduced the speaker, Mr. L. B. George, Divisional Master Mechanic, Canadian Pacific Railway. Lethbridge.

Mr. George took as his subject **A Visit to an Aeroplane Factory.**

Mr. George said: "During the past few years we have been quietly preparing both our air force and our aeroplane industry against a possible war."

Prior to the war, however, there was a number of small Canadian plants manufacturing light aeroplanes for private flying, for training and some for commercial freighting in the Northland. During the past two years this picture has changed. Rumblings of a possible war brought a British military mission to Canada in 1938, the result of which were the placing of "educational" orders for bombing planes in Canada.

Canadian manufacturers also sought orders for aeroplanes in Central and South America, Turkey and Spain. All these orders were experience for the Canadian aeroplane industry which began to expand in early 1939 and we were able to take orders for bombers, fighting and training planes for both the British and Canadian Governments.

New plants and extensions on existing plants were built in industrialized areas of both Ontario and Quebec. A central assembly company was set up by six aircraft manufacturers to take care of the specific British orders for bombers. These six companies are making parts which are shipped to newly built central assembly plants near industrial areas. Engines for these planes have been shipped to Canada from Great Britain.

At the beginning of the war Canada had no engine factories, but now we are building certain types of aircraft outright. Among the types built in Canada are the Hawker Hurricane, British Hanley Page, Hampden Bomber, Vickers flying boats, and others. Since the outbreak of war, production has been considerably stepped up.

Canada has sent large numbers of men over to England to get specialized training in the large aeroplane factories. Furthermore some of the large concerns over there have sent key men to Canada in order to assist in the large factories.

Skilled workers in an aeroplane plant include: machinists, fitters, welders, electricians, painters, erectors, sheet metal workers, heat treatment operators, patternmakers and moulders. The next important worker is the Class "A" production worker, then the Class "B," and after them come the helpers and learners who may be promoted as they become proficient.

Turning to a discussion of the industry in England the authors mentioned that decentralization was being adhered to. Different parts of the aeroplane are manufactured at points 10 to 50 miles away from the assembly plant, in order to cut down losses in time and equipment caused by enemy bombing action. Most of the factories are built either above or below the ground and those above the ground have no windows in them.

In the sub-assembly department we find benches well equipped.

In his closing remarks the speaker mentioned that there is one man in the office for every ten men on the floor. The work in the dope department is practically all handled by women, who have to wear gas masks for this job.

In England, Mr. George said each factory has its air raid shelter below the ground which is reached by means of the stairs and, if in a hurry, by means of the fireman's slide pole. Sentries and fire watchers are posted about the plant at all times.

Following a short discussion period, Mr. C. S. Glendening moved a hearty vote of thanks to Mr. George for his excellent address.

The Regular meeting of the Lethbridge Branch of the Engineering Institute of Canada, was held in the Marquis Hotel, on Wednesday, evening, February 5th, 1941, with Wm. Meldrum presiding.

In his opening remarks the chairman paid tribute to H. W. Meech who has recently been made a Fellow of the Royal Architectural Institute of Canada. He then introduced Mr. John Dykes, as the speaker for the evening, his subject: **Robert Burns.**

Mr. Dykes began his talk by referring to the sterling character and humble circumstances of the parents of Robert Burns, with special reference to his mother. He then touched on the highlights of the life of the poet himself.

He told how early in the 18th century for championing the cause of freedom and liberty, Burns was branded a democrat (in those days a disgraceful thing). The speaker went on to show how great has been the change since those days. To-day the whole British Empire is championing the cause of freedom and liberty. Frequently throughout his talk, Mr. Dykes pointed his remarks with apt quotations from the works of Robert Burns.

Everyone present enjoyed his address and so expressed themselves to Mr. Dykes, who was thanked by Mr. Meldrum.

LONDON BRANCH

H. G. Stead, Jr.e.i.c. - - *Secretary-Treasurer*
A. L. Furanna, s.e.i.c. - *Branch News Editor*

The London Branch of the Engineering Institute of Canada held its first meeting of the 1941 series on Wednesday, February 19th with R. Garrett as chairman. The meeting was held in the Board Room of the London Board of Education. Guests included the speaker, H. Boardman, C. H. Burns, chairman, and W. R. Manock, councillor of the Niagara Peninsula Branch of the Institute. Mr. Boardman, chief testing engineer for the Chicago Bridge and Iron Company, gave his lecture demonstration on the **Stress Analysis of Welded Joints by Polarized Light.**

The speaker opened his lecture with a brief explanation of the theory involved in this method of stress analysis and a description of the apparatus he was about to use. It must be realized that in this analysis the original member is judged upon the performance of a model of its section subjected to stress. This imposes certain requirements upon the model and certain limitations upon the results. The model is made from an elastic material so that under stress its reaction will be similar to steel. However, this similarity between the model and the original exists only as long as the steel is not stressed beyond its elastic limit. The model must also be transparent in order to allow passage of the examining polarized light. The third requirement of the model is that its shape be a faithful reproduction of the original. The limitations imposed by the model upon the value of the analysis are as follows. Firstly, the stress distribution observed is that due to shape only. Secondly, internal stresses in the original member, due to rolling or the presence of foreign material, do not appear in the model. Thus, it is important to remember that the load stresses in any such member are superimposed upon the internal stresses, but the polarized light reveals only those due to the load. The apparatus was simple. It consisted of a projection lantern, a set of polaroid lenses, a bracket for holding the model, a projection lens and screen, arranged in that order. The bracket was so built that the model could be stressed in tension by turning a thumb screw.

The relative magnitude of the various stresses was determined by the colour it produced upon the screen. The unstressed model showed up a pale yellow colour. As the stress was applied and increased, this yellow became deeper, turning to orange, then red violet, green, and finally blue. If the stress is further increased the foregoing cycle repeats itself until the model fails. The point of maximum stress is that point where the colour cycle is farthest advanced.

Mr. Boardman showed a large number of models of various welded joints. The first models indicated the waste in extra reinforcing, the resultant high stress around a hole in the weld and the disastrous effect of undercuts in a weld subjected to pulsating loads. Other defective welds were incomplete, or contained a valley in their surface. The ideal type of weld was found to be a double butt weld, having its surfaces flush with the surface of the main metal. Some welds using backing bars were examined. It was found that this bar should not be welded to the plate because it offers little or no help in transmitting the stress across the weld. Two other joints examined were the lap welded joint and a riveted joint. The riveted joint in particular indicated high stress concentrations.

In several of the above cases, Mr. Boardman had slides of test samples showing how actual members failed and that the failure was in keeping with the evidence given by the polarized light. In the case of the ideal butt weld the member failed outside the weld indicating one hundred per cent efficiency for the weld.

The enthusiasm shown by the meeting during the question period following the lecture was in keeping with the very interesting demonstration.

There were fifty-six members and guests present.

MONCTON BRANCH

V. C. Blackett, m.e.i.c. - *Secretary-Treasurer*

On Tuesday evening, March 18th, a meeting of the branch was held in the Council Chamber of the City Hall. F. O. Condon was the presiding chairman. A four-reel sound film was shown, illustrating operations at the Sudbury Basin mines of the International Nickel Company of Canada. The pictures first dealt with the drilling and blasting of the ore in the underground workings, some of which extend more than 4,000 ft. below the surface of the earth. Succeeding scenes showed methods of raising the ore to the surface. Then followed smelting operations, the refining of the nickel and the copper, and the recovery of precious metal by-products such as gold, silver and platinum.

A vote of thanks to the International Nickel Company for the loan of the films, and to F. L. Tuck for motion picture equipment, was moved by T. H. Dickson and seconded by J. A. Godfrey.

OTTAWA BRANCH

R. K. Odell, m.e.i.c. - *Secretary-Treasurer*

Military Explosives was the subject of an address given before the Ottawa Branch at a noon luncheon at the Chateau Laurier on February 13th, 1941. E. T. Sterne, manager of G. F. Sterne & Sons, Limited, of Brantford, and at present with the Chemical and Explosives Division of the Allied War Supplies, was the speaker. T. A. McElhanney, newly-elected chairman of the local branch, presided. A number of prominent engineers from United States were present and were introduced to the gathering by Victor Meek of the branch.

Military explosives in the present war, stated Mr. Sterne, are pretty much the same as they were during the last Great War. Developments since that time have been more in the nature of technique and in refinements of manufacture and use rather than in the actual explosives themselves. Such things as costs, for instance, have to be considered. Thus toluol, an explosive ingredient that cost as much as seven dollars per gallon during the Great War, can normally be produced now at 30 cents per gallon. Lyddite, an expensive disruptive explosive that was considered once as standard for its purpose, has given way to trinitrotoluene (T.N.T.) a fairly cheap explosive, safe under normal conditions and "A gentleman to handle, but when it does go off there is no fooling about it." It was first used to any considerable extent in the Great War. The result is that so far as known there is no lyddite commercially manufactured as an explosive on the American continent today.

Mr. Sterne divided military explosives according to their use into the initiatory group, the propellant group, the disruptive group, and fuse powders. The initiatory group are used to carry the impact to the main explosive as in caps and detonators. Although highly sensitive they should be safe to make and to handle. The propellant group are those applied to the base of the projectile so that it can arrive where it is sent. Inasmuch as there are different types of projectiles there must be different types of propellants. The disruptive group are those that burst the shell when it arrives where it is sent. Whereas a propellant may burn at the rate of a few metres per second a disruptive explosive may burn at the rate of thousands of metres per second. As for the fuse powders, they represent a small but important class wherein the time element in their burning is a first consideration. Gunpowder has been used in these.

In selecting a site for the manufacture of explosives two things in particular must be carefully considered. There must be a dependable supply of good cool water, since much of it is used for cooling purposes, and some suitable means for getting rid of waste products should be available since much of these waste products are in highly coloured liquid form and acid in character. Other influencing factors are labour markets, power supply and transportation charges.

At the commencement of the luncheon proceedings the chairman remarked upon the honour that had been paid to the Ottawa Branch this year at the recent annual convention of the Institute by the election of members of the Branch to the office of president of the Institute and also vice-president for the province of Ontario. These are, respectively, C. J. Mackenzie, acting president of the National Research Council, and K. M. Cameron, chief engineer of the Department of Public Works.

Mr. Mackenzie in acknowledging the honour paid him, spoke briefly and paid a tribute to two former presidents of the Institute who were present at the luncheon, namely, Dr. Charles Camsell, deputy minister of the Department of Mines and Resources; and G. J. Desbarats, formerly deputy minister of the Department of National Defence. Mr. Cameron also spoke briefly.

At the noon Luncheon at the Chateau Laurier on Thursday, February 27th, G. L. McGee, supervising engineer of aerodromes, Department of Transport, gave a talk illustrated with slides on the **Planning and Construction of Aerodromes.** T. A. McElhanney, chairman of the Ottawa Branch, presided.

Ten years ago 6,000 lb. was a standard weight for passenger aircraft, stated Mr. McGee, requiring a landing field 1,800 ft. long. To-day, with the increase in size of aircraft, a minimum length of landing field of 4,000 ft. is required and there is every reason to believe that aircraft weighing 60,000 and even 80,000 lb. will be in use before very long.

Designers of the earlier days did not foresee these remarkable developments, commented Mr. McGee. On account of the difficulty of expanding their landing areas an aerodrome at Detroit, for instance, has had to abandon its location after the expenditure of two million dollars. Similar examples may be cited for other localities.

Nowadays there should be three or even four runways at least 4,000 ft. long each and 150 ft. wide at sea level, though a 200 ft. width is better and the runways should be capable of expansion to 5,000 ft. with one at least to 6,000 ft. The United States Navy, as an indication of the trend, is reported to have one airfield under construction with runways two miles in length.

Special attention must also be given to the approaches to the airfield, so that a plane in landing or taking off can do so on a proper gradient. For this reason it should not be too close to the built-up portion of a city. For a main airport a minimum of 600 acres of land is required, which must be reasonably level but not to the extent that drainage would be seriously interfered with. In fact, drainage is one of the most important problems in selecting a site.

Mr. McGee spoke then on the various considerations affecting the efficiency of a landing field with particular reference to drainage, to the design and layout of buildings, the setup of the beacon, and other features.

PETERBOROUGH BRANCH

A. L. Malby, Jr.E.I.C. - *Secretary-Treasurer*
E. Whitely, S.E.I.C. - *Branch News Editor*

On January 16th, 1941, Mr. A. E. Davison, Electrical Engineering Department, Hydro Electric Power Commission, addressed the members of the Peterborough Branch on **Power Transmission.**

The paper traced the origin of various problems as they arose in the development of our modern transmission lines and showed how they have been solved or are now being attacked. Among the points covered were: tower design, corona effect, lightning protection, line clearances, sleet formation, and conductor vibration. A variety of slides provided plenty of illustration for the talk.

In addition, two very interesting movies gave a more detailed picture of some main points. One, "Dancing Conductors" showed the peculiar vibrations which are set up in some transmission lines under certain conditions of icing and wind. These vibrations if persisting often lead to mechanical failure of the lines.

Mr. Davison showed how maintaining a suitable conductor temperature by electrical load on the line will prevent adhering of the ice or sleet and avoid the vibrating. There was evidence to confirm this, but in some cases it is an unsatisfactory solution as lines cannot always be loaded to capacity.

The second film, which incidentally was a masterpiece of amateur colour photography, showed the building of a wood-pole transmission line from Ear Falls to Uchi Mines. A series of still pictures taken from this film were shown before the picture itself and accompanied by Mr. Davison's comments illustrated the problems that had to be met in this particular transmission line. The mines of northern Ontario owe much of their present productive capacity to the work of Mr. Davison and his colleagues in bringing extension water power and rich oil deposits together though separated by many miles of rough wilderness.

The branch met again on February 13th, 1941, this time to hear Mr. L. E. Marion, industrial application engineer, Canadian General Electric Company Limited, Toronto. A number of years in active association with his subject, a very well organized series of slides, and evident careful preparation, all combined to make an outstanding paper on **Some Modern Trends in Industrial Applications.**

A few examples of old and modern equipment showed the obvious changes that have taken place in industrial control and motor equipment in the years since their beginning. On the basis of this development, especially the more recent changes, some trends were easily seen.

For instance, there is a trend towards the building of this equipment in factory-assembled units; compact, protected units; easily installed or re-located if necessary at any time. Large sections of switchboard are now built up at the factory complete with meters, relays, switches, disconnects and interconnecting bus. These units are all ready to drop into place, connect to incoming lines and load and the installation is complete. This, combined with the trend toward enclosure, has revolutionized switching and control equipment.

The trend to enclosure is noticeable also in motors. Better design and materials combined with rapidly widening fields of application has led to smaller, more reliable motors.

There is a trend towards the use of colour. Switchboards have put off their sombre black and now appear in cream, buff, grey or bronze to harmonize with well decorated switch rooms. This is not mere aesthetic exuberance. With surroundings of certain colours an operator can do better work, both because it is easier to see with more light and better contrasts, and because colour of surroundings influences his state of mind.

Machines and their driving motors are tending toward higher speeds. Improved technical knowledge and better materials have made this possible.

New applications are continually arising. In textile mills there are now high speed motors especially designed for their job, and lint-free motors of a special open construction such that lint does not readily accumulate. High frequency motors have appeared for high speed drive of wood working tools.

There is an increasing use of synchronous motors or capacitors for power factor correction. Both have been developed tremendously in the last decade to make their use in this way more economical and satisfactory.

A trend to variable speed drives, flexible distribution systems, and load centred distribution systems were among the other trends also mentioned.

SAULT STE. MARIE BRANCH

O. A. Evans, Jr.E.I.C. - *Secretary-Treasurer*
N. C. Cowie, Jr.E.I.C. - *Branch News Editor*

The second general meeting for the year 1941 was held in the Grill Room of the Windsor Hotel at 6.45 p.m. on February 28th, 1941, when twenty members and guests sat down to dinner.

Chairman E. M. MacQuarrie called the meeting to order at 8.00 p.m. The secretary then read the minutes of the previous meeting which were adopted as read.

The chairman then introduced the speaker of the evening, N. C. Cowie, engineer for the Great Lakes Power Company who had for his topic, **Kilowatts, Horsepower and Water.** Mr. Cowie just explained the topic of his speech. In his address the speaker brought to light many interesting facts concerning the production and uses of electricity, a few of which are listed below. A man when working hard only develops one-eighth horsepower or the same amount as that of one of the smallest motors. One kilowatt hour will heat enough water for forty-five cups of tea, drive the motor in the home refrigerator for eight hours, or heat an electric iron for one hour, also keep the coil in the motor of your car warm for two hours. A fully electrified home would only use some 350 kilowatt hours per month.

The electrical industry, even in the depression, had a steady growth. In 1931 there was 5.6 million prime horsepower in Canada while in 1940 there was 7.38 million. The capital investment in 1931 was 1.23 billion dollars while in 1940 it was 1.63 billion dollars. The revenue derived from the sale of electricity in 1931 was 123.7 million dollars at an average of ¾ cent per k.w.h. while in 1940 it was 150.66 million dollars at an average of ½ cent per k.w.h.

The speaker cited the fact that the growth of the Great Lakes Power Company roughly paralleled that of the Dominion. In 1931 there was 51,200 hp. while in 1940 there was 71,200 hp. with a capital investment of 171 dollars per hp.

The speaker then dealt with the uses of electricity in industry. The ferro alloy industry was a case of where electricity was almost entirely used for its manufacture. Large amounts were used in the production of the various alloys as the heat required to melt the charge was furnished by the electricity.

In the discussion that followed, J. L. Lang and L. R. Brown debated the causes of surges in the local transmission lines.

L. R. Brown thanked the speaker for his interesting address. The chairman then thanked the speaker on behalf of the branch.

SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Acting Secretary-Treasurer*

The annual meeting of the Saskatchewan Branch, was held in the Saskatchewan Hotel, Regina, on Friday, February 21st, 1941, with P. C. Perry, the Branch chairman, presiding.

The report of the papers and meetings committee, presented on behalf of the convenor, D. D. Low, indicated six meetings held during the year, with an average attendance of 57. Supplementary to this report was the report of the Saskatoon Section, presented by N. B. Hutcheon, indicating five meetings held during the year with an average attendance of 38. The report stated that the students at the University are showing an increased interest both in the Engineering Institute of Canada and in the Association of Professional Engineers.

A. P. Linton reviewed his activities for the past year as the Saskatchewan representative on the Institute Council, stating that he had attended the Regional meeting of the council held last fall at Calgary, Alberta.

After the meeting all members attended the Annual Dinner of the Association of Professional Engineers where the guest speaker, Hon. A. T. Proctor, Minister of Highways and Transportation delivered an address on the value to the public of the professions generally and the engineering profession in particular. He severely criticized a series of articles recently appearing in the press, intended, apparently, to undermine public confidence in the professions.

Mr. Proctor suggested the advisability of an organized campaign by professional men generally to inform the public of the useful part they play in our every day life. He closed his address with an appeal to uphold the ideals of our democratic system.

TORONTO BRANCH

J. J. SPENCE, M.E.I.C. - *Secretary-Treasurer*
D. FORGAN, M.E.I.C. - *Branch News Editor*

A very interesting meeting of the Toronto Branch was held on the evening of February 20th at Hart House, University of Toronto, when Mr. George W. MacLeod presented a paper entitled, **The Helen Mine and Beneficiating Plant.**

The branch chairman, Mr. Nicol MacNicol, opened the meeting and welcomed those members of the Canadian Institute of Mining and Metallurgy who were in attendance. Professor C. Williams of the University of Toronto introduced the speaker.

Mr. MacLeod pointed out that not so very many years ago a talk on iron mining would not have occasioned very much interest. One does not associated the same amount of romance with the mining of iron that one does with gold mining. The war has certainly changed the status of iron to one of considerable national importance. There were over 70 members in attendance at the meeting and this in itself served to indicate the interest in the subject.

The speaker pointed out that the earliest prospecting for iron was carried out in the province of Quebec in the 18th century. This spread to other provinces and since 1886, when records were first kept over seven million tons of iron have been mined. The province of Ontario is Canada's biggest iron producer, being credited with 72 per cent. Of this the Algoma properties contribute 63 per cent.

The Helen mine was discovered in 1898 by a man by the name of Gates who was prospecting for gold in the Wawa Lake district. The deposit which was uncovered was found to be a high grade hematite. Mr. F. H. Clergue took over the property soon after its discovery and commenced the building of the Algoma Steel Corporation Limited.

Mr. MacLeod traced the history of the mine. He told how its ore deposit was exhausted and how the Magpie mine was developed in its place. The ore at the Magpie mine was siderite, which contained 35 per cent iron in the natural state. It was found that by roasting three tons of the ore two tons of ore grading 50 per cent iron could be developed and this was then found to be quite satisfactory for blast furnaces. The ore structure was very good and the ore contained about three per cent manganese and enough lime to be self-fluxing. The Magpie mine produced about one million tons of iron before it was shut down in 1921. A few years before the Magpie mine was shut down it was noticed that a large cone shaped hill near the site of the old Helen mine was another deposit of siderite. A check-up revealed the presence of over 100 million tons. This deposit was really not given serious consideration until 1937, when the Ontario Government established a bounty on iron ore production. Sir James Dunn then took a very active interest and under the direction of Mr. C. D. Kaeding an intensive study was undertaken to determine the most economical and effective method of mining and preparing the ore for the blast furnace. A means had to be devised for reducing the high sulphur content of the ore. Finally, a continuous refining process was developed which practically eliminated the sulphur content and left approximately 51 per cent iron.

Mr. MacLeod showed a number of lantern slides of the quarrying operation, and the aerial tram which conveyed the ore from the mine the four miles to the sintering plant.

Mr. MacLeod also explained in detail the quarrying operation. He pointed out how they were able to mine approximately 3,000 tons of ore per day with the expenditure of an average of only ¼ lb. of blasting powder per gross ton of ore mined.

The ore, as mined, is conveyed in the buckets of the aerial tram, each of which has a capacity of one gross ton, and of which there are 120 on the line. There is a 200,000 ton ore storage at the sintering plant.

The sintering operation is very interesting and it is remarkable to consider that the sinter which leaves this plant is practically free of sulphur and contains 53½ per cent iron. This product is known as Algoma Sinter. It is ideal for blast furnace operation and it has been found that it is most economical in coke consumption.

The sinter is hauled by rail to the terminal at Michipicoten, where it is dumped from the railway cars into a 14,000 ton hopper from which it in turn is loaded into the boats for transfer to the steel plant at Sault Ste. Marie. A conveyor belt system transfers the ore from this large hopper to the boats, loading directly into the vessel hatch at the rate of about 1,500 gross tons per hour. It is possible to handle up to 2,000 gross tons per hour, which will result in loading a boat in five hours. Up to the end of 1940 this conveyor belt system has handled over 471,000 gross tons of sinter.

An interesting question period was carried on when Mr. MacLeod had finished his paper, at the conclusion of which Mr. S. R. Frost moved a vote of thanks. The hearty handclap which Mr. MacLeod received was indiciative of the extent to which his paper had been enjoyed.

After the adjournment the members retired to one of the private dining rooms where refreshments were served.

VANCOUVER BRANCH

T. V. BERRY, M.E.I.C. - - *Secretary-Treasurer*
ARCHIE PEEBLES, M.E.I.C. - *Branch News Editor*

The Vancouver Branch met on Wednesday, February 26th, at the Hotel Georgia to hear an address on **The Origin, Theory and Dynamics of Tides.** The speaker was Ralph Hull, professor of mathematics at the University of British Columbia.

Dr. Hull based his interpretation of the causes of tidal phenomena on the equilibrium theory, which is the principle followed in forecasting and the preparation of tide tables. The fundamental mathematical relationships derived from this theory are fairly simple, but when all factors affecting the variables are taken into account, the result is a very intricate series of equations which have to be solved simultaneously. Actually, the computations are done on a type of integrating machine, of which there are only five or six in existence, one of these being at Liverpool, where tide tables for Canada are prepared.

Tides exhibit several different sets of variations, each due to a different cause and independent of the other, although their effects are inter-related. Principal variations are the semi-diurnal, fortnightly, and long range variations. Semi-diurnal changes take place in an average time of 12 hrs. 25 min. and are the result of the passage of the moon over the meridian of any local point. Fortnightly changes are in the range of tide between high and low, and in the equality or otherwise of highs and lows. Variations in range are spoken of as spring and neap tides, and are the result of the attractions of the earth and the moon either supplementing or cancelling each other. This is also known as the synodic effect. Long range variations are less noticeable, and are chiefly due to changes in the maximum declination of the moon because its orbit is not parallel to that of the earth.

In some localities one effect will predominate more than the other, as regards the long range variations. The synodic effect is most pronounced in Atlantic tides, and those of Hudson's Bay and the St. Lawrence. On the Pacific Coast, the declinational effect is the predominant one. The anomalistic effect, or that due to the moon's elliptical orbit, is noticeable in the tide of the Bay of Fundy. Prediction calculations are made for five locations on the coast of British Columbia, and corrections are applied for other locations. Calculations for currents and tidal estuaries are usually made by hand in a local office. Corrections have to be made for each month of the year.

Engineers are interested in tide phenomena where they have to deal with bridge foundation problems, dredging, dock construction, sewage disposal, etc. A great deal of discussion took place along these lines, much of which concerned the experiences of those present in various parts of the country. Many peculiarities of tides cannot be explained on the same basis as tide predictions are made, because they are due to local terrestrial influences.

The chair was occupied by Dean J. N. Finlayson, branch chairman, and a warm vote of thanks was extended to Dr. Hull by Mr. H. N. Macpherson. About sixty members and guests attended.

Clad Metals, their manufacture, application in industry and anti-corrosive properties, was the subject at a meeting of the branch on March 7th at the Universtiy of British Columbia. In the absence of Dean Finlayson the chair was occupied by W. O. Scott.

The address was given by E. C. Gosnell, chemical engineer, Lukens Steel Company of America, through the courtesy of Wilkinson and Company Limited, their Vancouver representatives. In introducing his subject, the speaker pointed out that anti-corrosive materials are used for the following reasons: to increase the life of the structure, to maintain the quality and prevent contamination of products, to permit sterilization of equipment, to reduce maintenance costs, to reduce weight, and for better appearance.

Clad metals at present available employ nickel, monel, inconel and stainless steel as the anti-corrosive or cladding material. They are manufactured by placing two sheets of one of these metals between thick steel plates which have been sand-blasted and fluxed on the side adjacent to the clad. The clad metal is not as wide as the steel backing plate. Steel strips are then welded around the edge of the layer of four plates to make a gas tight joint. After heating to rolling temperature the layer is rolled out to finished thickness, each metal being proportionately reduced, thus maintaining a known thickness of clad. A bond is secured between the clad and the steel backing which will not separate during any fabrication. The two pairs of plates separate after rolling when the edges have been sheared off, thus providing a completely clad steel plate of proper thickness. Test pieces to test the strength of the bond have all broken outside of the bonded surfaces, and a bond strength of 57,900 lb. per sq. in. has been reached. It is believed that under rolling, the clad metal is densified and that an anti-corrosive layer is secured which is less porous than one laid on by electrolytic processes.

Any metal may be used as a clad which does not have an appreciably different melting temperature from that of the backing material. For this reason it is not yet possible to clad steel with aluminium, which will not maintain its properties at the rolling temperature of steel.

Clad metals have already found widespread use in industry for the manufacture of tanks, kettles, piping, mixers, table tops and similar equipment.

Applications in the industry were shown by lantern slides, which were explained in complete detail by Mr. Gosnell. In summarizing, he stated that his company was equipped to furnish clad plates up to 162 in. width, and dished heads up to 162 in. diameter. Larger sizes can be fabricated by welding separate plates. It is expected that with increased application, clad plates will become cheaper, as the tonnage produced increases, and a more economical disposal of the scrap material which is sheared off around the edges is effected.

A number of questions were asked regarding the best materials for certain corrosive substances, and some problems in fabrication. A hearty vote of thanks was proposed by Mr. Ernest Smith and the agreement of the audience was quite apparent. Forty-five members and guests were present.

NATIONAL BUILDING CODE
PART 3; ENGINEERING REQUIREMENTS*

National Research Council, Ottawa, 1941
256 pp., 5½ x 8½ inches, $1.75

Reviewed by S. R. Banks, m.e.i.c.**

The purpose of the National Building Code, which is produced at the instance of the Department of Finance, the Royal Architectural Institute of Canada, and other organizations concerned in the elimination of unsatisfactory construction, is the establishment of a model building-code to meet particularly the needs of smaller municipalities. The code in itself bears no mandatory powers, though provincial laws in general require that any work carried out under its regulations shall be designed and supervised by a properly-qualified engineer or architect.

The part now under review was prepared, under the National Research Council, by committees recruited from men of high standing in the appropriate fields of theory and practice. The product of three years' work, it is a thorough, comprehensive, and valuable document, bearing every indication of the influence of close examination of the results of recent research on this continent and overseas, together with observation of modern trends in the numerous parallel codes that exist. The compilers have not hesitated to make useful and frequent reference to the standards of well-known authorities, chief among which are the Canadian Engineering Standards Association and the American Society for Testing Materials. The editing throughout is of a high standard, and the indexing is good. The reproduction and binding of the text, however, are not of the standard merited by a publication of this nature and origin.

The outstanding contribution of the book lies in the presentation, for the first time as Canadian standards, of specifications relating to Wood Construction, Masonry Construction, and Excavations and Foundations. In the first of these sections, the tabulation of allowable stresses and of safe loads for various types of connection alone forms a serviceable addition to engineering reference. A feature of the second is the recognition and control of reinforced brickwork, gypsum masonry, and glass block as building materials. The third section is of special interest in view of the large amount of research currently going forward (or, unfortunately, deferred), in many countries, into the behaviour of foundations, particularly in cohesive soils. The provisions of the code in respect to the classification of soils and maximum allowable pressures thereon are generally in accord with modern usage, although the specified limit appears high in some cases. A caution is given regarding the anticipation of settlements, and reference is made to the value of positive tests. The Hiley formula for pile-driving is presented: this formula is of British origin, and Kempe's Year-Book gives it prominence as yielding satisfactory results.

The section relating to Reinforced Concrete Construction also fills a growing Canadian need. A cursory comparison of this standard with the commonly-used Joint Committee Report of the U.S.A. reveals several interesting innovations in the detailed treatment of this material, but space does not permit of their present discussion. The regulations pertaining to structural steelwork do not differ greatly from those of the C.E.S.A. except in that a method is propounded for the estimation of the restraining-effects of common beam-connections. Among other items in the book may be mentioned the logical treatment accorded to wind-forces and snow-loads, and the inclusion of a method for computing earthquake-forces. There are also regulations dealing with walls and roofs.

Apart from judgement of its intrinsic worth, however, it is pertinent to look at the Code in its relation to other engineering standards, notably those of the C.E.S.A. While it is appreciated that a fresh and vigorous outlook upon, and an independent study of, specification requirements cannot but offer the stimulus of competition to the existing organization, yet from the standpoint of the practising engineer it is somewhat confusing to be confronted with two official standards of approximately the same weight and differing only in matters of detail. Such a state of affairs is well exemplified in the publication, within a year's time, of the two C.E.S.A. specifications relating to steel structures for buildings and metallic arc welding and of the section of the code that deals with the same subjects. It may furthermore be conjectured that the C.E.S.A. will before long produce a revised specification for reinforced concrete. It will no doubt occur to many engineers that the work of this new code might, with the advantages of simplicity and economy, have been carried out under the auspices and with the co-operation of the longer-established authority, the more so in view of the similarity of standing of the two personnels concerned, and of the two results insofar as they have been achieved.

* Part 5, Requirements Bearing on Health and Sanitation, has already been published. Parts 1, 2, and 4, Administrative Requirements, Definitions, Fire Protection, respectively, are not yet available.

Canada Department of Mines and Resources—Mines and Geology Branch—Geological Survey Papers:

Preliminary Map George Creek, Alberta, paper 40-17; Preliminary Report Natural Gas in Brantford Area, Ontario, Paper 40-22.

Canadian Engineering Standards Association:

Canadian Electrical Code Part 2, Essential Requirements and Minimum Standards Covering Electrical Equipment, Specification No. 69. Construction and test of Porcelain Cleats, Knobs, and Tubes.

Canadian Government Purchasing Standards Committee:

Specification for Interior Paint, Semi-Gloss; Exterior Priming Paint, White Lead-Linseed Oil Type; Marine Enamel, White and Grey; Exterior Linseed Oil Paints, White and Tinted; Exterior and Marine Enamel, Signal Red and Post Office Red; Exterior Enamel, White and Tinted.

Electrochemical Society—Preprints

The Effect of Gas Pressure on the Passivity of Iron; The Effect of Silver (0.05 to 0.15 per cent) on Some Properties and the Performance of Antimonial Lead Storage Battery Grids; Formation of Anodic Coatings on Aluminum; Indium Plating. Preprints Nos. 79-9 to 79-12.

International Nickel Company of Canada, Limited

Annual Report, for the year ended December 31, 1940.

Ohio State University Studies Engineering Series—Engineering Experiment Station Circulars

America's Sources of Power and National Defense, No. 38; Notes on the Properties of Clay Casting Slips, No. 39; The University and Industry, No. 40.

U.S. Department of Commerce—Building Materials and Structures:

Strength, Absorportion, and Resistance to Laboratory Freezing and Thawing of Building Bricks Produced in the United States, BMS60; Moisture Condensation in Building Walls, BMS63; Methods of Estimating Loads in Plumbing Systems, BMS65; Stability of Fiber Sheathing Boards as Determined by Accelerated Aging, BMS69.

U.S. Department of the Interior—Geological Survey Bulletins:

Subsurface structure in part of Southwestern New York and Mode of Occurrence of Gas in the Medina Group, 899-B; Chromite Deposits in the Seiad Quadrangle Siskiyou County, California, 922-J; Chromite Deposits of the Pilliken Area, Eldorado County, California, 922-O; Chromite Deposits in the Sourdough Area, Curry County and the Briggs Creek Area, Josephine County, Oregon, 922-P.

U.S. Department of the Interior—Geological Survey Professional Paper:

Geology and Biology of North Atlantic Deep-Sea Cores, Paper 196-A.

U.S. Department of the Interior-Geological Survey Water-Supply Paper:

Maximum Discharges at Stream-Measurement Stations Through December 31, 1937, with a supplement including changes through September 30, 1938. Paper 847.

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

A.S.T.M. STANDARDS ON RUBBER PRODUCTS

Prepared by Committee D-11, December, 1940. American Society for Testing Materials, Philadelphia. 256 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $1.75.

Thirty-four standard and tentative methods of test and specifications pertaining to rubber products are presented in convenient form for laboratory use and reference. The standards cover chemical analysis, physical properties and various kinds of equipment. There is a nine-page bibliography of recent references on the mechanical testing of rubber.

ANALYTICAL MECHANICS FOR ENGINEERS

By F. B. Seely and N. E. Ensign. 3 ed. rewritten. John Wiley & Sons, New York, 1941. 450 pp., diagrs., charts, tables, 9 x 6 in., cloth, $3.75.

The principles of mechanics that are essential for engineers are presented in four parts: statics; kinematics; kinetics; and a group of special topics. The aim has been to present these principles clearly, to develop them from common experience, to apply them to concrete practical problems, and to emphasize their physical interpretations. A new chapter on mechanical vibrations and many new problems have been added in this edition.

(The) AVIATION MECHANIC

By C. Norcross and J. D. Quinn. McGraw-Hill Book Co., Whittlesey House, 1941. 563 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $3.50.

Intended as a comprehensive course for the prospective airplane mechanic, this text presents first a simple exposition of aerodynamical theory. The very complete section on airplane construction includes a step-by-step description of the building of a light, all-metal airplane and of mass production methods. Maintenance practice for all types of planes is explained in detail, and in this section, as well as the rest of the book, there is a wealth of practical illustrations. Tool requirements for the airplane mechanic are appended.

BIBLIOGRAPHY OF SPECTROCHEMICAL ANALYSIS. 2 ed. 1940.

Compiled by D. M. Smith. British Non-Ferrous Metals Research Association, Euston St., London, N.W.1. 55 pp., 10 x 6 in., paper, 3s.

This bibliography includes all the references published in the 1935 "Bibliography of Literature on Spectrum Analysis," supplemented by articles published in the more important scientific journals of all countries up to August, 1940. The references are broadly classified and have short explanatory notes. There is an author index.

COMMERCIAL TIMBERS OF THE UNITED STATES

By H. P. Brown and A. J. Panshin. McGraw-Hill Book Co., New York, 1940. 554 pp., illus., diagrs., tables, 9½ x 6 in., cloth, $5.00.

The first half of this comprehensive work is devoted to a full exposition of the structure of wood with special attention to identification features. Two keys are then given for the identification of the more important commercial woods of the United States, one based on characters visible to the naked eye and the hand lens, the other based on microscopic features. The descriptions by species record and explain important uses, and selected references are given. There is a glossary.

CROSBY-FISKE-FORSTER HANDBOOK OF FIRE PROTECTION

Edited by R. S. Moulton. 9th ed. National Fire Protection Association, Boston, Mass., 1941. 1,308 pp., illus., diagrs., charts, tables, 7 x 4½ in., lea., $4.50.

This comprehensive manual contains essential information on all phases of fire prevention and fire protection. All new developments during the five years since the last edition in hazards, protective equipment and methods have been included in this revision, to continue the policy of providing an authoritative review of accepted practice.

EXPERIMENTAL ELECTRICAL ENGINEERING and Manual for Electrical Testing, Vol. 2

By V. Karapetoff and B. C. Dennison. 4th ed. revised. John Wiley & Sons, New York, 1941. 814 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $7.50.

The second volume of this laboratory manual for students and engineers contains theory and tests for more advanced study of the subjects introduced, in their simpler aspects, in volume I, and describes the more complicated electrical equipment not covered previously. The thorough revision includes the treatment of new methods and types of apparatus and the addition of some three hundred new drawings and cuts. There are chapter bibliographies.

FOURIER SERIES AND BOUNDARY VALUE PROBLEMS

By R. V. Churchill. McGraw-Hill Book Co., New York and London, 1941. 206 pp., diagrs., tables, 9 x 6 in., cloth, $2.50.

This book presents an introductory treatment of Fourier series and their application to the solution of boundary-value problems in the partial differential equations of physics and engineering. The aim is to give the student a conception of orthogonal sets of functions and their use in the classical process of solving these problems. References and review problems are included.

GEOLOGY OF COAL

By O. Stutzer, translated and revised by A. C. Noé. University of Chicago Press, Chicago, Ill, 1940. 461 pp., illus., diagrs., charts, maps, tables, 10 x 7 in., cloth, $5.00.

Based on a standard German work, this considerably revised translation presents comprehensive data from world-wide sources on the character and varieties of coal and the techniques of its examination. The origin, chemical and physical constitution, and structure of coal beds are fully explained, including their significance in the preparation and utilization of coal. A long list of references accompanies each chapter.

HANDBOOK OF THE GLASS INDUSTRY

Compiled and edited by S. R. Scholes. Ogden-Watney Publishers, New York, 1941. 209 pp., diagrs., charts, tables, 9 x 6 in., cloth, $5.00.

This reference manual for the factory engineer, chemist and plant executive provides practical information on raw materials, glasshouse fuels, compressed air, properties of glasses, furnaces, pyrometers and ware defects. Extensive use of graphs and tables increases its ready-reference value. Necessary related data are included, and there is a glossary of glass-house terms.

MASTERING MOMENTUM

By L. K. Sillcox, Simmons-Boardman Publishing Corp., New York, 1941. 274 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $2.50.

Modern transport trends are discussed with particular reference to their influence upon the equipment of American railways. Current developments in train operation and braking, wheels, axles, trucks and draft gear which will improve control, wear factors and riding quality are described. Illustrations and reaction graphs of various brake systems are appended.

(The) METALLURGY OF DEEP DRAWING AND PRESSING

By J. D. Jevons, with a foreword by H. W. Swift. John Wiley & Sons, New York, 1940. 699 pp., illus., diagrs., charts, tables, 10 x 6 in., cloth, $10.00.

This comprehensive work covers the many phases of the subject in such a way as to be of value for both practical workers and scientific students. The author first describes the production of brass and steel sheet, including the metallurgical considerations. The defects and difficulties met in deep-drawing brass, steel and other metals are discussed in detail and the mechanical equipment is described. Test methods, material specifications, new applications and desired improvements in metals and methods occupy separate chapters. There is a large list of references.

PETROLEUM INDUSTRY, an Economic Survey

By R. B. Shuman. University of Oklahoma Press, Norman, Okla., 1940. 297 pp., tables, maps, charts, 9 x 6 in., cloth, $3.00.

All phases of the petroleum industry are discussed from the viewpoint of an industrial enterprise. The technological subjects of production and refining, transportation and storage are tied in with considerations of marketing practice, investment and financial policies, taxation, etc. Labor relations and international trade are covered briefly, and a considerable chapter is devoted to questions of conservation and control. Much information is condensed into tables and diagrams. A bibliography is appended.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

March 29th, 1941

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in May, 1941.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A **Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

COURCHESNE—CHARLES EDOUARD, of 324 Laurier Ave., Quebec, Que. Born at Quebec, April 5th, 1892; Educ.: 1910-12, Laval Univ., Land Surveyor, June, 1912, Reg'd. Prof. Land Surveyor 1914. R.P.E. of Quebec, 1938; 1913-14, dftsman., Transcontinental Rly.; 1914-15, instr'man., Gauvin & Beauchemin; 1916-20, instr'man., Quebec & Saguenay Rly.; 1920-37, divnl. engr., and 1937 to date, asst. district engr., Provincial Highway Dept., Quebec.

References: A. Gratton, J. O. Martineau, J. A. Lefebvre, R. J. L. Savory, P. Vincent.

JOHNSTON—BRUCE HENRY, of 4502 Royal Ave., Montreal, Que. Born at Port Stanley, Ont., Jan. 4th, 1894; Educ.: B.A.Sc., Univ. of Toronto, 1922; 1910-13, four year ap'ticeship course, testing elect'l. apparatus, Can. Gen. Elec. Co. Ltd., Peterborough, Ont.; 1914-16, on power plant constrn., installing rotary converters, switchboards, oil circuit breakers, etc.; 1916-19, overseas, Lieut., Can. Engrs.; 1922-25, on export sales—specialist on motors, control and industrial devices, International General Electric Co., Schenectady, N.Y.; 1925-30, sales engr., apparatus sales dept., Can. Gen. Elec. Co. Ltd., Toronto, Ont.; 1930 to date, Montreal district manager, i/c transformer sales in eastern Canada, Moloney Electric Co. of Canada Ltd., Montreal.

References: E. Gray-Donald, R. H. Mather, W. H. Noonan, G. A. Vandervoort, R. N. Coke.

LAJOIE—GERARD, of Quebec, Que. Born at St. Epiphane, Que., Oct. 21st, 1909; Educ.: B.A.Sc., C.E., Ecole Polytechnique, Montreal, 1937; 1937-40, i/c as asst. for wharves constrn., retaining & diverting walls, breakwaters, dredging, harbour improvements, etc., Public Works of Canada, Quebec; 1940 to date, i/c of constrn. of intercepting sewer, City of Quebec, for Arthur Surveyer & Co., Montreal, Que.

References: J. M. Begg, A. R. Decary, P. Vincent, L. G. Trudeau, A. Surveyer, J. G. Chenevert.

LANG—EDWIN GEORGE POWER, of 1290 Fort St., Montreal, Que. Born at Wimbledon, England, March 5th, 1896; Educ.: Stanley Technical, London, England. Croydon Polytechnic, Croydon, England: 2nd Class Diploma, College of Preceptors, London, England; 1917-20, with the R.A.F.; 1920-25, on constrn. for C.N.R. and C.P.R.; 1925-26, surveys, Shawinigan Engineering Company; 1926-33, field engr., Canadian Car & Foundry Co. Ltd.; 1934-36, private geological investigations and surveys; 1937-39, geological investigator, rock, gravel & sand, Canada Cement Company; June, 1940 to date, res. engr. i/c constrn. & mtce., No. 12 Equipment Depot, R.C.A.F., Montreal East. (Civil Service Status—senior asst. engr., Dept. of National Defence for Air).

References: J. A. McCrory, J. M. Breen, W. McG. Gardner, C. R. Lindsey, L. McCoy, G. S. Stairs, J. L. Pidoux.

MARTIN—ARTHUR LEY, of 1181 Mountain St., Montreal, Que. Born at Winnipeg, Man., Nov. 12th, 1909; Educ.: B.Sc. (C.E.), Univ. of Man., 1934; 1935 (Sept.-Nov.), junior engr., Manitoba Good Roads Dept.; June, 1936, asst. inspr., C. D. Howe & Co. Ltd.; 1936 (July-Nov.), sub-grade inspr., Manitoba Good Roads Dept.; 1937 (Jan.-Apr.), inspr., Greater Winnipeg Sanitary District; 1937-40, dftsman., Truscon Steel Co. Ltd., Toronto, Ont.; At present, dftsman., General Engrg. Dept., Aluminum Co. of Canada, Montreal.

References: A. E. Macdonald, S. R. Banks, H. H. James, D. G. Elliot, G. H. Herriot, J. N. Finlayson.

NARSTED—GEORGE KENDALL, of Windsor, Ont. Born at Sault Ste. Marie, Ont., May 29th, 1917; Educ.: B.Eng. (Mech.), McGill Univ., 1940; 1936-37-38 (summers), machine shop work: 1939 (summer), dfting & estimating, F. L. Smidth Co., New York; 1940-41, assembly layouts & work in purchasing dept., Canadian Bridge Co. Ltd., Walkerville. At present, machine tool designer, Eaton Wilcox Rich Ltd., Windsor, Ont.

References: F. J. Pollock, H. L. Johnston, A. H. MacQuarrie, T. R. Durley, W. L. Saunders.

PEACE—JOHN THOMAS, of 103 Earlscourt Road, Toronto, Ont. Born at Reigate, Surrey, England, Sept. 4th, 1905; Educ.: Central Technical School, Toronto. Corres. course, elec. engrg., Bell Telephone Co. of Canada. Qualified as Sergeant in Military Engrg. at Kingston, 1925, and as Warrant Officer in 1929; 1926-39, with the Bell Telephone Co. of Canada, Toronto. With the Royal Canadian Engrs. as follows: 1929-36, Company Sergeant Major, 2nd field Co., Toronto; 1936-39, Regimental Sergeant Major, 2nd Dist. H.Q.; 1939-40, Engineer Clerk, Sergeant Major, No. 1 Workshop & Park Co., C.A.S.F. At present, Regimental Sergeant Major, 1st Battn., Canadian Army (overseas). (Asks admission as Affiliate).

PRITCHARD—WILLIAM ROBERT, of the Town of Mount Royal, Que. Born at Brantford, Ont., May 8th, 1904; Educ.: B.A.Sc., Univ. of Toronto, 1925; With the Bell Telephone Co. of Canada as follows: 1925-29, asst. mtce. engr., 1929-37, central office engr., 1937-38, personnel supervisor, 1938 to date, repair supervisor, involving general staff methods and results of work re exchange mtce.

References: G. S. Ridout, A. M. Mackenzie, H. E. McCrudden, J. L. Clarke, H. J. Vennes.

RANKIN—ROBERT ARTHUR, of Montreal, Que. Born at Glasgow, Scotland, Nov. 19th, 1902 Educ.: Diploma in Engrg. Science, Royal Technical College, B.Sc., Glasgow Univ., 1925; M.Eng. (Indust. Economics), 1933, M.Sc. (Metallurgy), 1937, McGill Univ.; R.P.E. of Quebec; 1916-17, Ferme Colliery, Rutherglen, Glasgow; 1917-22, John McNeil & Co., Glasgow, dfting., pattern, foundry, fitting, machine shops—erection & testing (heavy mech. & power equipment); 1922-24, with the Armstrong Construction Company (Armstrong Whitworth, Glasgow), work included steel trans. lines in New Zealand, hydro-electric & paper mill equipment in Nfld., rotary-converter & transformer stations in England, dry dock equipment, etc.; 1924-27, Naval Dockyard, Dalmuir, Scotland (operated by Wm. Beardmore Ltd.), design, testing, trial trips, etc., power, propulsion, technical services; 1930-31, manager, Morton Engrg. & Drydock Co., Quebec; 1931 to date, general industrial consltg. practice in Montreal (a) with Ernest Cormier, M.E.I.C., incl. mech. & elec. work at University of Montreal, Le Petit Journal press room & plant, the Supreme Court of Canada; (b) partner—Robert A. Rankin & Company, incl. work for Algonquin Paper Co., St. Lawrence Paper Co., The Ogilvie Flour Mills Co. Ltd., and the Brown Corporation (Canada). Retained by two latter companies for supervision of all mtce., engrg., and development of new projects, etc.

(*Continued on page 217*)

Employment Service Bureau

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

SITUATIONS VACANT

SALES ENGINEER for pulp and paper mill machinery, woodworking and machine tools. Salary $60 a month plus 1% commission. Apply to Box No. 2250-V.

STEAM ENGINEER wanted by paper mill in Ontario. Applicants should be University graduates in mechanical engineering with experience in the generation and distribution of steam. Apply stating full particulars of education and experience, and giving references to Box No. 2283-V. Applications will not be considered from persons in the employment of any firm, corporation or other employer engaged in the production of munitions, war equipment, or supplies for the armed forces unless such employee is not actually employed in his usual trade or occupation.

ENGINEER—Age 35-45. To sell and demonstrate metal spraying equipment. Must have successful sales record and own his own car. Salary paid while training, then on a drawing account against commissions earned. Apply Box No. 2309-V.

ALLOY METALLURGISTS with a knowledge of physical chemistry and elementary metallography. Apply Box No. 2326-V.

YOUNG MECHANICAL ENGINEER interested in research and mechanical testing rather than production for work in Canada. Apply Box No. 2327-V.

GRADUATE MECHANICAL ENGINEER in good health, energetic, to work with large industrial concern in British Guiana. Applications should be sent to Box No. 2328-V.

MECHANICAL ENGINEER, preferably graduate, familiar with diesel engines, tractors and shovels for maintenance work with large industrial firm in British Guiana. Applications should be addressed to Box No. 2329-V.

CONSTRUCTION MAN with experience in heavy construction for either a long or short term contract in British Guiana. Applications should be addressed to Box No. 2330-V.

SITUATIONS WANTED

CHIEF ENGINEER—twenty years industrial construction, production and operation. Structures, equipment, steam, hydro. Experienced conferences, preliminaries, organizing, preparing plans, estimates, specifications, negotiation of contracts. Apply to Box No. 36-W.

OFFICERS URGENTLY REQUIRED FOR TECHNICAL UNIT

The Commanding Officer of the No. 4 Army Field Workshop, R.C.O.C. (AF) has advised us that there are several vacancies in his officer establishment for men with engineering training and experience. Generally speaking the qualifications necessary are as follows:

Age—25-42 (British Subject).

Education—A degree in mechanical or electrical engineering is preferred, but is not essential if practical experience has been considerable.

Experience—(Civil) Should have been along general mechanical lines, machine shop, maintenance, etc. A knowledge of motor vehicles is desirable. Military experience is desirable, but not essential.

Character—Satisfactory character reference must be submitted and personality will be taken into consideration.

A short description of the composition and functions of an Army Field Workshop would be of natural interest to any candidate.

The A.F.W/S. is completely mobile and consists of a Main Shop, Recovery Sections and Light Aid Detachments. The officers are known as Ordnance Mechanical Engineers and the other rank personnel is mainly composed of tradesmen, such as fitters, machinists, electricians, welders, mechanics, etc.

The equipment is extraordinary, consisting of workshop lorries, breakdown and recovery vehicles, stores lorries, as well as transport vehicles, motorcycles, etc.

The principal functions of an A.F.W/S. are to take care of 1st and 2nd line recovery, repair and maintenance of practically all equipment used by an Army in the field. This includes small arms, mobile artillery up to 9.2 inch, radio and other electrical equipment, textiles, all motor transport except that operated by the Army Service Corps.

Apart from the privilege of giving to his country the benefit of his knowledge and training, an officer in a unit of this type has a great opportunity for the acquirement of very valuable experience.

All inquiries may be addressed to the Officer Commanding the unit at Westmount Barracks, 4350 St. Catherine St. West, Westmount, Que.

PRELIMINARY NOTICE (*Continued from page 216*)

WALES—CHARLES CLARKE, of Indian Point, Ont. Born at Sharon, Penn., July 25th, 1900; Educ.: B.A.Sc., Univ. of Toronto, 1924; Regd. Prof. Engr., State of Ohio, 1936; 1924-25, graduate students' course, Westinghouse Company, East Pittsburgh; 1925-27, asst. chief metallurgist, 1927-29, supt., open hearth blooming mill, Bar Mills, and 1929-37, chief engr., Otis Steel Company, Cleveland, Ohio; 1939 to date, vice-president and general manager, Hamilton Bridge Co. Ltd., Hamilton, Ont.

Industrial News

Industrial development — new products — changes in personnel — special events — trade literature

STEEL SPECTROSCOPE

Empire Engineering Co., Toronto, Ont., represent Adam Hilger, Ltd., of London, Eng., who have issued a 12-page booklet, No. 243/3, which describes at length and illustrates the Spekker Steeloscope, an instrument designed for rapid and reliable sorting, checking of steel stores, purchases and scrap and for general control of production.

MOLYBDENUM TUNGSTEN HIGH SPEED STEELS

A 12-page booklet issued by Jessop Steel Co. Ltd., Toronto, Ont., describes the company's molybdenum tungsten high speed steel. The physical properties, approximate analysis, hardness values at varying drawing temperatures and heat treating procedure are enumerated.

HANDLING EQUIPMENT

Lift trucks, die handling trucks, sheet handling trucks, and elevating tables, all hydraulically operated; also trucks with hydraulic elevating tables, utility trucks, steel frame skid platforms, and special handling equipment are all featured in a 2-page pamphlet published by Lyon Iron Works, of Greene, N.Y.

GLASS CLOTH

Irvington Varnish & Insulator Co. of Canada Ltd., Hamilton, Ont., are distributing an interesting folder, with samples attached, describing Irvington Varnished Fiberglas. The folder gives dielectric strengths of the five different cloth thicknesses now regularly manufactured when impregnated and coated with black or yellow insulating varnishes. Standard widths and lengths of rolls of both tape and full width cloth are given.

FRACTIONAL H.P. SILENT CHAIN DRIVES

Folder 1894, of Link-Belt Limited, Toronto, Ont., describes 3/16-in. pitch silent chain drive for fractional horse power duty, such as on cameras, picture projectors, ice cream freezers, machine tools, cigar machines, bread slicers, doughnut machines, stokers, meters, blowers, etc.

WATER CONDITIONING

A 48-page catalogue issued by Cochrane Corp., Philadelphia, Pa., describes and illustrates the company's Hot Process Water Softeners for removal of hardness, silica and other scale forming material from boiler feed and industrial process waters. It also contains a 9-page appendix of feed-water chemistry, also heat balances, flow diagrams, two-colour construction drawings and engineering tables and charts.

SOLDER FITTINGS AND VALVES

Catalogue "S"-B, 16 pp., issued by Empire Brass Mfg. Co. Ltd., London, Ont., covers the complete Empire line of cast brass solder fittings and valves for use with hard wall copper pipe. Price list included.

EQUIPMENT FOR BUILDINGS

Entitled "Equipment for Buildings and Institutions," bulletin WP-1099-B 27, issued by Worthington Pump & Machinery Corp., Harrison, N.J., features this company's extensive range of equipment for air conditioning, refrigeration, water softening and other requirements in the modern public building and industrial plant.

TRACTORS AND ROAD EQUIPMENT

Caterpillar Tractor Co., Peoria, Ill., have issued a 36-page illustrated catalogue listing more than 50 products—track-type tractors, road machinery, Diesel and natural gas engines, Diesel marine engines, Diesel automotive engines and Diesel and natural gas electric sets.

STEAM-JET EJECTORS

Worthington Pump & Machinery Corp., Harrison, N.J., announce the publication of bulletin W-205-B8 (two-stage type CPA) and bulletin W-205-B6B (single-stage type NPA). These two bulletins, 4 pp. each, provide illustrations, descriptive drawings and engineering data of these two types of steam-jet ejectors.

STAINLESS STEEL PANEL

A reprint from "Steel" describing and illustrating "Ludlite Bord," a stainless steel "Lumber" for all kinds of interior and exterior trim, has been issued by the Ludite Div. of Allegheny Ludlum Steel Corp. La Salle Builders Supply Ltd., Montreal, are distributors of this new product.

RADIO INTERFERENCE

A reprinted article from "Line" entitled "Prevention Easier Than Cure of Radio Interference" and illustrated by diagrams, is being distributed by Canadian Line Materials, Ltd., Toronto, Ont.

PUMPS AND SOFTENERS

Pumps and Softeners, Ltd., London, Ont., have issued three bulletins, in a binder, which contain complete descriptions of Duro shallow and deep well pumps (pneumatic water systems, hot water circulating pumps, condensation return units, cellar drainers, sump pumps) and Duro domestic water softeners and water conditioning equipment.

PUMPS

Bulletins 38-D, 58-C, 70-C and 76-H, entitled "Side Suction Centrifugal Pumps," "Vertical Steam Pumps," "Triplex Power Pumps," and "Small Size Self Oiling Power Pumps," have been published by The Smart-Turner Machine Co. Ltd., Hamilton, Ont. These bulletins are 8 pages each and contain illustrations, specifications and instructions.

POTHEADS

"Indoor and Outdoor Potheads" is the title of a thoroughly illustrated catalogue, No. 41-1, issued by Canadian Line Materials Ltd., Toronto, Ont., which contains reference data covering a wide range of types of potheads. Details of construction are clearly given and the features illustrated by descriptive drawings.

DRYER

"The Link-Belt Roto-Louvre Dryer" is the title of a 24-page catalogue, No. 1911, published by Link-Belt Limited, Toronto, Ont., which contains engineering data, photographs and installation drawings of this dryer. It is recommended for drying products of mine, chemical, process, food and agricultural industries and can be used also as a cooler.

DRILLING MACHINES

Describing and illustrating ten of the fourteen models of "Buffalo No. 18" drilling machines with chrome-nickel alloy spindles, Bulletin No. 3123, issued by Canadian Blower & Forge Co., Ltd., Kitchener, Ont., contains specifications, capacities and dimensional drawings.

CENTRAL ELECTRIC STATION OUTPUT

The chart, issued each year by Canadian General Electric Co. Ltd., Toronto, showing the kilowatt hour output of Canadian Central electric stations, contains the records from 1919 to the present.

CEMENT DISPERSION

In a 20-page pamphlet, The Master Builders Co. Ltd., Toronto, discuss the manner in which dispersing agents function in colloidal systems generally and describe the way in which this principle has been applied to cement. The pamphlet summarizes the effects of a dispersing agent on the properties of the hardened concrete or mortar.

AUTOMATIC CONTROLS

Designated as Catalogue No. 10, a 24-page book issued by Davis Automatic Controls Co., Toronto, Ont., illustrates the company's line of automatic controls with specifications in each case. This covers a wide range of controls for heating, refrigeration and industrial equipment.

MELBOURNE F. YULL

Formerly a partner in the firm of Potter & Company, Montreal, Mr. Yull has been appointed manager of the Montreal office of H. L. Peiler & Co. Ltd.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 24 | MONTREAL, MAY 1941 | NUMBER 5

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

PUBLISHED MONTHLY BY
THE ENGINEERING INSTITUTE
OF CANADA
2050 MANSFIELD STREET - MONTREAL

Price 50 cents a copy, $3.00 a year, in Canada, British Possessions, United States and Mexico. $4.50 a year in Foreign Countries. To members and Affiliates, 25 cents a copy, $2.00 a year. —Entered at the Post Office, Montreal, as Second Class Matter.

REPORT OF THE COMMITTEE ON WESTERN WATER PROBLEMS

2050 Mansfield Street, Montreal,
April 26th, 1941

The Right Honourable William Lyon Mackenzie King, C.M.G., LL.D.
Prime Minister, Ottawa, Canada.

Sir,

The Engineering Institute of Canada submits herewith for the consideration of the Government of Canada the report of its Committee on Western Water Problems, dealing more particularly with the utilization of Canada's share of the waters of the international streams, the St. Mary and Milk rivers. If the projected irrigation development on these streams is to be proceeded with as a post war rehabilitation project the preliminary work will have to be commenced without delay. Therefore we suggest that early consideration be given to the appointment of the advisory board recommended in the report.

Respectfully submitted,

L. AUSTIN WRIGHT, *General Secretary*,
The Engineering Institute of Canada.

In 1935 the Council of the Institute appointed a committee under the chairmanship of G. A. Gaherty to study the problem of water distribution in the drought area of the western provinces. Subsequently a sub-committee was appointed, and between these two bodies a great volume of work has been accomplished. At the Annual Meeting of the Institute in Ottawa in 1939 eight papers were presented on this subject, as part of the work of the committee. Herewith is the complete report which was presented to Council on January 18th, 1941.—*Editor*.

The President and Council:

The Engineering Institute of Canada.

A progress report was presented to and accepted by Council on February 7, 1940, and was published in the Engineering *Journal* of March 1940. As indicated in the progress report, your Committee felt that the situation with respect to the international waters of the St. Mary and Milk rivers in Alberta and Montana had grown so pressing, that the Committee should devote its next efforts to a review of that situation, but without intending thereby to minimize the importance of other water problems of the West.

Also, in line with the progress report, a Sub-committee of western Members of the Engineering Institute of Canada was set up to assemble facts and arguments bearing on the matter.

The Sub-committee has been very active and has gone thoroughly into every phase of the situation and has explored all sources of information. In addition, the Sub-committee has been able to bring to bear on the subject the wide and long experience of its members, not only with the general conditions of the West, but also with the various phases of the subject itself.

The Sub-committee has produced and submitted to the Committee a most excellent and thorough report, which, together with a map, prepared for the Committee showing the areas involved and indicating the works proposed, is attached hereto, being exhibits as follows:

Exhibit A. The report of the Sub-committee, except—

Exhibit B. The paper in full by G. N. Houston, M.E.I.C., entitled "International Aspects of the Problem" attached to and a part of the Sub-committee's report, and

Exhibit C. The paper in full by D. W. Hays, M.E.I.C., entitled "Economic Development for Irrigable Land" which is also attached to and a part of the Sub-committee report.

Exhibit D. Map of portions of Alberta and Montana, showing sources of water and present and proposed irrigation developments.

The report of the Sub-committee and the other accompanying exhibits all bear directly on the St. Mary river and Milk river international situation and its solution through the development of the Lethbridge South-East Project. In addition, Mr. Hays' paper (Exhibit C) is of general application. He develops an important argument with respect to irrigation development and arrives at specific figures for allowable total costs and equitable allocation of costs. While there is room for difference of opinion with respect to his specific conclusions, there can, we believe, be general acceptance of the soundness of his reasoning, and of the method of his argument in arriving at conclusions.

The report of the Sub-committee is in such form that the Committee finds it desirable to incorporate it into its own report in full, rather than abstract and re-arrange the information it supplies. Therefore, your Committee recommends that the Sub-committee report, including the two papers by Mr. Houston and Mr. Hays, be published in full, together with the map, as parts of this report.

From the report of the Sub-committee, and from other sources, your Committee submits:

1. That the St. Mary and Milk rivers are international, that their waters are now partially used and can be fully used, beneficially, mainly for irrigation, but also, to some extent, for domestic and other purposes, by Canada and the United States together.

2. That the division of the waters between the two countries is governed by a treaty between Great Britain and the United States, dated January 11, 1909, and under the supervision of a permanent authority, the International Joint Commission.

3. That the International Joint Commission, after holding hearings over a period of about six years, made rulings under date of October 4, 1921, as to the methods of determining the allotment to each country, and on October 6, 1921, made certain recommendations regarding provision of storage reservoirs.

4. That either country may, for good and sufficient cause, ask for a re-opening of the matter and request modification of the regulations in its interest.

5. That since October 4, 1921, the waters have been divided between the two countries in accordance with the rulings, but that there has been no joint action with regard to storage.

6. That Canada's share of the waters of the two rivers allotted to her under the terms of the treaty as interpreted by the regulations of the Commission has averaged since 1922 about 393,000 acre-feet annually.

7. That Canada has been diverting and putting to beneficial use since 1935 an average of about 172,000 acre-feet annually, from the natural un-regulated flow of the St. Mary river and not more than 2,000 acre-feet annually from Milk river.

8. That Canada's share, still unused, amounts to an average of about 220,000 acre-feet annually.

9. That the Government of the United States has been and is proceeding diligently to use its share of the water of the two rivers. That works now constructed, in progress or contemplated are adequate to put to beneficial use all of its share and more.

10. That the general principle governing the right to the use of water for irrigation and other uses, in arid and semi-arid areas, is its application to beneficial use.

11. That, as a consequence, Canada, if she fails to exercise due diligence in putting her share to beneficial use, stands in danger of losing, in perpetuity, valuable rights allotted to her under the terms of the treaty.

12. That there is an economically sound method of beneficially utilizing Canada's share of these international waters.

13. That this utilization will create taxable wealth and a flow of trade far in excess of the cost.

14. That the utilization of this water in irrigating available lands will bring about an extension of intensive agriculture into one of the worst drought areas, a very desirable contribution to full national and provincial development, and a very substantial contribution to the solution of the perennial problems of drought, crop failure and relief costs.

With respect to the specific problems of water utilization, your Committee finds:

1. That it is economically desirable to associate the full development of the St. Mary river and the Milk river with plans for their common development with the waters of the Belly and Waterton rivers.

2. That it is quite feasible and relatively simple to carry the available waters of the Belly and Waterton rivers into the St. Mary river at a point between Cardston and Spring Coulee.

3. That it is feasible to create a storage reservoir of approximately 270,000 acre-feet capacity on the main channel of St. Mary river near Spring Coulee and below the point of inflow of the water diverted from the Belly and Waterton rivers.

4. That the proposed reservoir is ideally situated in that it will control the entire annual flow of St. Mary river below any important tributary, and that, together with the diverting works, canals and auxiliary reservoirs, it can conserve for beneficial use all of the available water of these three rivers, an estimated average of 760,000 acre-feet annually.

5. That after allowing for 210,000 acre-feet for lands already having irrigation rights, this amount of water will be sufficient to serve an additional area of 345,000 acres.

6. That there is an area of tributary land suitable for irrigation and intensive agricultural development very substantially in excess of the above area, which has been designated as the Lethbridge South East Project.

7. That the proposed development is economically feasible and is definitely related to national, provincial and local growth and self-sufficiency.

8. That climatic and soil conditions of the areas available for irrigation development are similar to those of the Lethbridge area. That crops that it is known can be grown to advantage under irrigation include alfalfa and other forage crops, sugar beets, potatoes, vegetables, and some fruits and coarse grains (as well as wheat), all of which lend themselves to building up intensive agricultural production and are important adjuncts to the livestock industry on adjacent grazing lands, as is so well exemplified in the present irrigated areas around Lethbridge and in other irrigated areas of the semi-arid region.

9. That there will be some important structures of large —but by no means unprecedented—size, and that the very considerable investigations already made indicate that there will be no serious foundation or other construction problems.

10. That the completed project will cost about $12,000,000 or not more than $40 per acre of irrigable land. That it lends itself to an orderly step-by-step development over a period of years. That its construction, in considerable measure, will lessen relief costs during the construction period and will thereafter result in the transfer of many farmers in the drought area from relief rolls to self-supporting, wealth-producing agriculturists.

Your Committee recommends that the Council of the Engineering Institute of Canada should, through the proper channels, suggest:

1. That the Dominion and Provincial governments, in co-operation, approve the development of the Lethbridge South East Project and constitute an agency for carrying out such development. That funds be made available for an early start on construction in accordance with a plan for orderly progress over a suitable period.

2. That an agency charged with development should, before final decisions are made with respect to important engineering structures and system layout, appoint an advisory board of engineers and at least one geologist to report on sites, foundations and designs.

3. That the same or another advisory board of engineers and economists be appointed to report on the joint engineering and economic aspects of the project.

4. That in the interest of allocating unused water to the best advantage, the Province of Alberta set up an advisory board to study this matter and advise the government. That pending the results of such procedure, action on applications for allotment of unappropriated water be deferred as far as possible.

Acknowledgments

Your Committee wishes to express its sincere thanks and appreciation to those persons and agencies who have given so much help to the Sub-committee and to whom the Sub-committee expressed its appreciation.

It also wishes to commend and express its appreciation to the members of the Sub-committee for their untiring efforts and for the splendid and valuable report they have rendered.

References

To the reader with limited interest, we suggest that the report of the Sub-committee should be read as part of this report in order to get a clear picture of the situation.

To those whose interest goes a little deeper, we recommend a reading and study of the two excellent papers by Mr. Houston and Mr. Hays.

To those who may wish to go more fully into the matter, a great many sources of information are available. Many papers on western water problems and related subjects have been presented to the Engineering Institute of Canada and published in its *Journal*. A number of these, dating back to December 1934, are indicated as follows:

1. Editorial—"Water for the Western Farmer," December 1934.
2. A symposium of twelve papers presented to the Annual Meeting of the Institute at Toronto, February 1935, published in April 1935, preceded by a short review of the papers, and followed by an editorial entitled "The Technical Aspects of the Western Drought Problem."
3. Two papers, one by Dr. E. S. Archibald, the other by Ben Russell, and an editorial on the work under the Prairie Farm Rehabilitation Act, May 1936.
4. "Irrigation Engineering" by S. G. Porter, June, 1937.
5. A symposium of four papers and four talks on Western Drought and Water Problems presented to the Annual Meeting of the Institute at Ottawa, February 1939. Three of the papers were published in the January 1939 *Journal* and the fourth, "Drought, A National Problem," by G. A. Gaherty, in the February 1939 issue.
6. "Stream Control in Relation to Drought and Floods" by P. C. Perry, June 1939.

Further information as to the papers and copies of the papers, or the *Journal* issues in which they appear, may be had by application to the General Secretary, Engineering Institute of Canada, 2050 Mansfield Street, Montreal.

Signed, on behalf of the Committee,

G. A. Gaherty, *Chairman.*

Dated, January 15, 1941.

EXHIBIT "A"

REPORT OF THE SUB-COMMITTEE TO THE COMMITTEE ON WESTERN WATER PROBLEMS OF THE ENGINEERING INSTITUTE OF CANADA

Preface

The Western Water Problems Committee of the Engineering Institute of Canada is much exercised over the situation developing in regard to the international waters of the St. Mary and Milk rivers. On the American side of the boundary, works are nearing completion that will enable the Americans to put to beneficial use not only the share presently allotted to them, but also water of Canada's share not put to use by Canada. As our right to the water is contingent upon our putting it to beneficial use with due diligence, we are likely to lose it forever unless prompt action is taken. This means that the existing irrigation users on the Canadian side will suffer a deficiency in water supply in perpetuity and that a tract of several hundred thousand acres south and east of Lethbridge that could be made highly productive under irrigation must continue permanently devoted to ranching or precarious dry farming.

The implications of the question are such that it is necessary to be sure of our ground. To this end, the Western Water Problems Committee nominated a Sub-committee to investigate the problem and prepare a detailed report setting out certain facts in so far as they can be ascertained.

The proposed diversions, storages and distribution systems to fully utilize Canada's share of the international waters supplemented by water from other sources as explained, and the lands served by them are collectively designated as the Lethbridge South East Project. For simplified layout, construction, operation and management it is probable that the existing irrigation systems diverting water from the St. Mary river and the lands served by them should be absorbed into the larger project.

Personnel

Members of the Sub-committee are:

F. G. Cross, m.e.i.c.,
Superintendent, Alberta Railway & Irrigation System,
Lethbridge, Alberta.

D. W. Hays, m.e.i.c.,
Manager, Canada Land & Irrigation Company Ltd.,
Medicine Hat, Alta.

G. N. Houston, m.e.i.c.,
Consulting Engineer (formerly Commissioner of Irrigation, Dominion Government),
Olds, Alberta.

P. M. Sauder, m.e.i.c.,
Director of Water Resources, Province of Alberta,
Edmonton, Alberta.

H. J. McLean, m.e.i.c. (Chairman)
Production Superintendent, Calgary Power Company Ltd.,
Calgary, Alberta.

Scope of the Report and Assignments

This report is directed primarily and particularly to a consideration of the proposed Lethbridge South East Project, and the utilization of Canada's share of the waters of the St. Mary and Milk rivers, in connection with which it is desirable to associate the developments of the available waters of the Belly and Waterton rivers and tributaries of the St. Mary river in Canada above the proposed St. Mary river reservoir.

Special assignments were made as follows:

(*a*) International Aspects to G. N. Houston.
(*b*) Economic Development to D. W. Hays.
(*c*) Water Supply to P. M. Sauder.
(*d*) Availability and Suitability of Irrigable Land to F. G. Cross.
(*e*) Engineering (with particular reference to the proposed St. Mary storage reservoir) to H. J. McLean.

Meetings

Three meetings of the Sub-committee were held:

First: At Calgary, May 22, 1940, at which Mr. S. G. Porter, member of the Committee, was also present.

Second: At Calgary, July 11, 1940, at which the following named members of the Committee were present: Messrs. G. A. Gaherty, chairman, S. G. Porter and A. Griffin.

Third: At Calgary, December 3, 1940. All members being present except Mr. Houston. Also present were Messrs. S. G. Porter and A. Griffin.

In addition, there were numerous meetings and consultations between two or more members of the Sub-committee and close contact was maintained with local members of the Committee.

Trips and Inspections

At various times, as opportunity permitted, all members of the Sub-committee, singly and in groups, visited the places and areas concerned and studied the various problems on the ground. In addition, Messrs. Hays, Houston and Sauder were able to bring to the various problems their intimate association with past investigations over a period of more than twenty years. Mr. Hays made a very exhaustive study of the same project some twenty years ago, reported fully by him under date of June 30, 1923.

Acknowledgments

1. To Dr. W. H. Fairfield, Superintendent of the Dominion Experimental Station, Lethbridge, for his opinions and advice as to the suitability of available lands for irrigation development.
2. To Dr. F. A. Wyatt of the Soils Department, University of Alberta, and staff, for Soil Survey Reports and other information supplied.
3. To the office of the Director of Water Resources, Province of Alberta.
4. To the reports of Surveys and Investigations over the past forty or more years by the Dominion Reclamation Service and other agencies.
5. To the Prairie Farm Rehabilitation Act (P.F.R.A.) organization and particularly to Mr. Ben Russell, Chief Engineer, Regina, and to Mr. W. L. Foss, District Engineer, Calgary, for access to the reports of the very extensive surveys, investigations and studies made during the past several years and for information and advice personally given.
6. To numerous others.

Reference

As evidence of the anxiety of the people of southern Alberta regarding the present water situation, reference is here made to the organization known as the South Alberta Water Conservation Council, formed October 4, 1939. The purpose of this organization is to secure the benefits of irrigation for their lands and communities and to impress upon our government the necessity of prompt action for the conservation of the water resources of southern Alberta and their complete agricultural utilization. More than 2500 farmers on irrigated land and more than 1500 farmers on drought-stricken land have subscribed to the funds of the organization. In addition, most towns, villages and municipalities and many business men in southern Alberta have also subscribed. It is a virile organization and has used every opportunity to bring the matter to the attention of our governments.

Submissions

(*a*) *International Aspects of the Problem.*

Mr. G. N. Houston has prepared a paper, which, on account of its thorough treatment of this important subject, is submitted in full, attached hereto. Following is a brief summary:

The author reviews the history leading up to the signing of the treaty of January 11, 1909, providing for the diversion of the waters of Milk and St. Mary rivers under the International Joint Commission. He quotes freely from the treaty, and from the proceedings and findings of the International Joint Commission.

The United States has developed storage and plans additional development in conformity with the spirit of the Commission's recommendations. The United States is now in a position to put Canada's share of Milk river water to beneficial use.

Approximately 50 per cent of Canada's share of St. Mary river water is now lost for want of storage facilities. Unless Canada proceeds promptly and actively to utilize her shares of the waters of these two rivers she will be left in a weak position to defend her claim to the rights to which she is entitled.

(*b*) *Economic development of Irrigable Land.*

Mr. D. W. Hays has prepared a paper dealing so thoroughly with this subject that it, also, is submitted in full, attached hereto. Following is a brief summary:

The author prefaces his paper by the statement that in the past history of irrigation development in Canada, the costs for development of irrigable lands have been based on the principle of repayment by the farmers who occupy the land. Recently and to the other extreme, it has been suggested that governments should build irrigation projects in the general interest of political economy without repayment of any capital costs by the farmer. The author states that both principles are wrong.

He indicates the advantages of irrigation farming: that a capable farmer can make a good living and a comfortable home on irrigated land and should be willing to pay in fair proportion to the benefits received and also indicates the advantages to governments in taxable wealth and concludes that benefits do accrue—

1. To the farmer who irrigates the land.
2. To local and regional centres in which developments are created and which aid through taxation in the maintenance of municipal and provincial government.
3. To the general development of the country at large by the business created, out of which the Dominion government gains by increased taxable wealth and the maintenance of employment and business activity.

The author states that past experiences show that irrigation districts, acting independently, cannot sell irrigation bonds without government guarantees and that private companies are not warranted in financing irrigation projects, limited as they have been to repayments by farmers only. He concludes that any future developments must be initiated and carried out by the provincial and Dominion governments or by one acting directly through equitable arrangements with the other.

In the event such developments are undertaken by governments, the author indicates the proportionate costs which should be shared by those benefited, the sum of which is the total permissible cost for irrigation development. He concludes that the share of the cost would approximate one-third to each beneficiary and that the total permissible cost would work out at $62.50 per acre. Making allowance for development cost during the transition period from initial development to completed settlement of lands, the author states, in round numbers, that $50 per acre is a permissible value for land and cost of irrigation works.

(*c*) *Water Supply.*

Mr. Sauder and the Sub-committee find:

That a safe, conservative estimate of the available water, on past records, is, in round numbers, as follows:

1. Canada's share annually, is—		
Milk river	36,000 acre-feet	
St. Mary river	357,000 "	393,000 acre-feet
2. Inflow into St. Mary river, north of international boundary		43,000 "
3. Combined flow of Belly and Waterton rivers, available and divertable to St. Mary reservoir		360,000 "
Total		796,000 "

NOTE: The greater part of the flow of St. Mary river originates in the high mountains of Glacier park in the United States. This is in an area of high precipitation with large snow fields which do not melt until early summer, and with a number of glaciers which contribute to late summer flow. The watershed of Milk river on the other hand reaches only to the foothills east of Glacier park. Precipitation is much less, snow runoff occurs in late spring and flow dwindles to the vanishing point in summer, except as revived by summer storms on the prairies and in the foothills.

After allowing for domestic and riparian needs and for estimated storage and transmission losses, this amount of water will adequately serve a total irrigable area of 465,000 acres, as follows:

Now served or entitled to be served with irrigation,	120,000 acres
Possible extensions	345,000 "

Up to the present time the only diversion from the St. Mary river in Canada has been by the Alberta Railway and Irrigation system, known as the A. R. & I., with headworks at Kimball, Alberta, a few miles north of the international boundary. There is no regulating storage, and diversion is limited to the day-by-day natural flow, or to the capacity of the canal (about 1300 cubic feet per second at the present time) depending on which is the lesser. This means, of course, that during periods when more than canal capacity is available, the excess must be wasted, while during the extended periods of low flow occurring each irrigation season there are severe shortages which limit both the area of land that can be irrigated and the effective use of such water as is available.

The lands which are irrigated through this system include not only the A. R. & I. lands but also the Magrath, Raymond and Taber irrigation districts. The Taber irrigation district is supplied from storage in Chin and Stafford reservoirs, which in turn are supplied through the A. R. & I. system. The irrigation of lands, except those of the Taber irrigation district, is wholly dependent on the day-by-day flow available to them. This leads, at times, to excessive use in times of plenty, in anticipation of shortages to follow —a crude and only partially effective method of conservation. During periods of shortage there is necessarily restricted and less effective use. This leads to excessive and inefficient use of the water supply as a whole, as compared with the economy and efficiency of the use of a regulated supply, such as would be provided by the adequate storage contemplated for the Lethbridge South East Project.

There has been a progressive increase in the capacity of the A. R. & I. diverting canal, so that for similar flow conditions of the river there has been some increase in the amount of water that can be diverted and beneficially used. During the four-year period 1936 to 1939 inclusive, the annual diversion has been from 152,000 to 195,000 acre-feet with an average of 172,000 acre-feet. Naturally, the amount that can be diverted depends on the total flow and its seasonal distribution. Unfortunately it is a fact that low total flow and poor distribution is associated with hot dry years when irrigation needs are greater. The capacity of the diversion canal is near its economic limit unless and until there is regulation by storage on the river above the diversion works (which is not very feasible, if at all, in Canada). In addition, there should be supplementary storage reservoirs within the irrigation system for best results.

Very little use has been made of Canada's share of Milk river water, the few existing licenses being for a total of only about 2,000 acre-feet annually.

(d) *Availability and Suitability of Irrigable Land.*

Mr. Cross and the Sub-committee find:

Within the area lying east of the St. Mary river and extending almost to Medicine Hat, and between the international boundary on the south and the Old Man river on the North, there are many tracts of land of good agricultural quality, in elevation below present and proposed diversions of water and capable of being served by such diversions and capable of being beneficially irrigated. Through investigations, surveys and studies over a period of more than forty years, areas suitable for irrigation development and capable of being served have been determined. Soil surveys have been made at various times by Dominion and provincial governments and other agencies. Quite recently and still in progress, are reviews of these earlier investigations as well as new and independent studies by the Prairie Farm Rehabilitation Act engineers. It is known that there is much more land suitable for irrigation and capable of being irrigated than the 465,000 acres which, it has been estimated, can be served by the available water. This land does not lie in one solid block, but is in tracts of various sizes only loosely connected to adjacent tracts, or in some cases completely separated by ridges or drainage lines.

The Alberta Railway Irrigation system has served a number of these tracts, beginning about forty years ago,

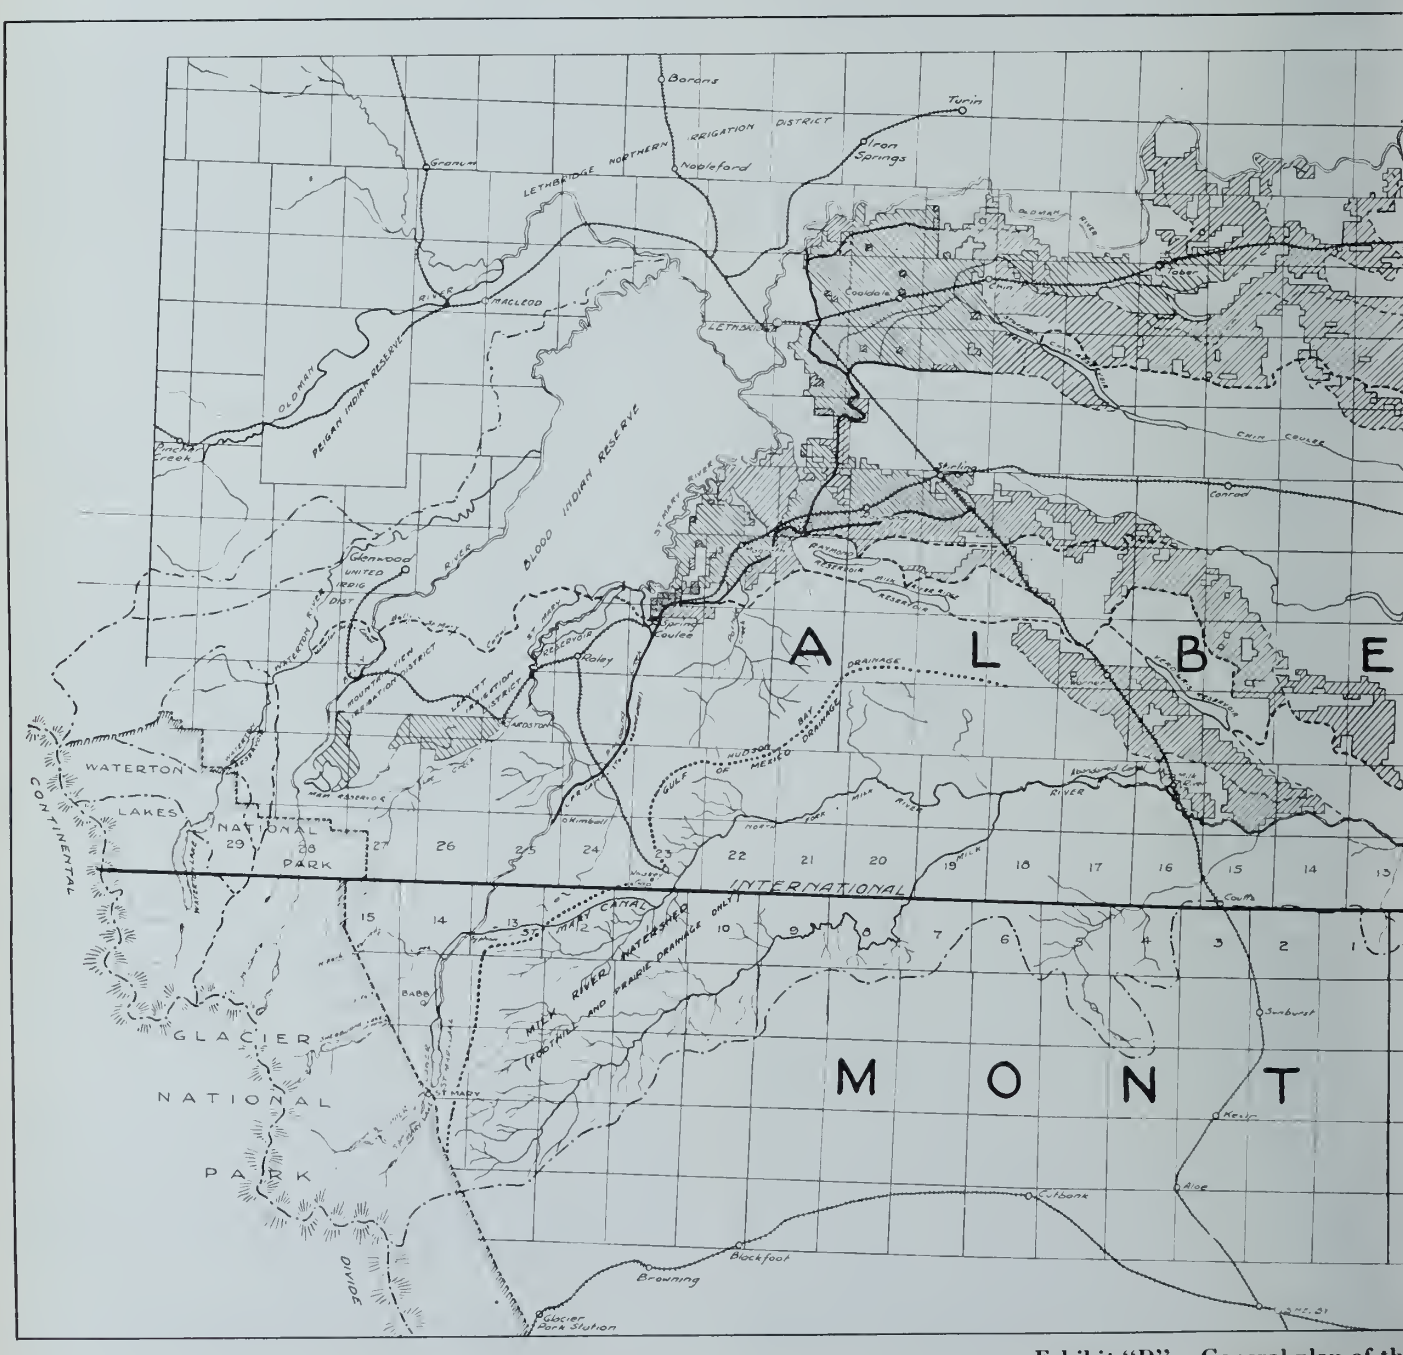

Exhibit "D" — General plan of the

either directly or indirectly through the Magrath, Raymond and Taber irrigation districts. The total area which can be served by this system (including the three irrigation districts), as approved by the government, is 143,661 acres, of which 120,193 acres received water or were entitled to receive water as of 1939.

All of these tracts are located within the arid or semi-arid portion of southern Alberta. Some, in the more favoured localities, are reasonably adapted to dry farming. The greater part are in the zone of precarious dry farming and a substantial portion are in the drought area, where relief conditions have been acute and there has been much abandonment by dry farmers. It is evident that it will be possible and desirable to exercise considerable discretion in choosing the particular lands that can be served to best advantage by the available water.

In addition to supplying full irrigation rights to most of the land to be served it is probable that it will be found desirable to devote a portion of the water supply to providing stock and domestic water and irrigation water for small isolated areas to serve the adjacent extensive ranching industry which will be permanent throughout the area.

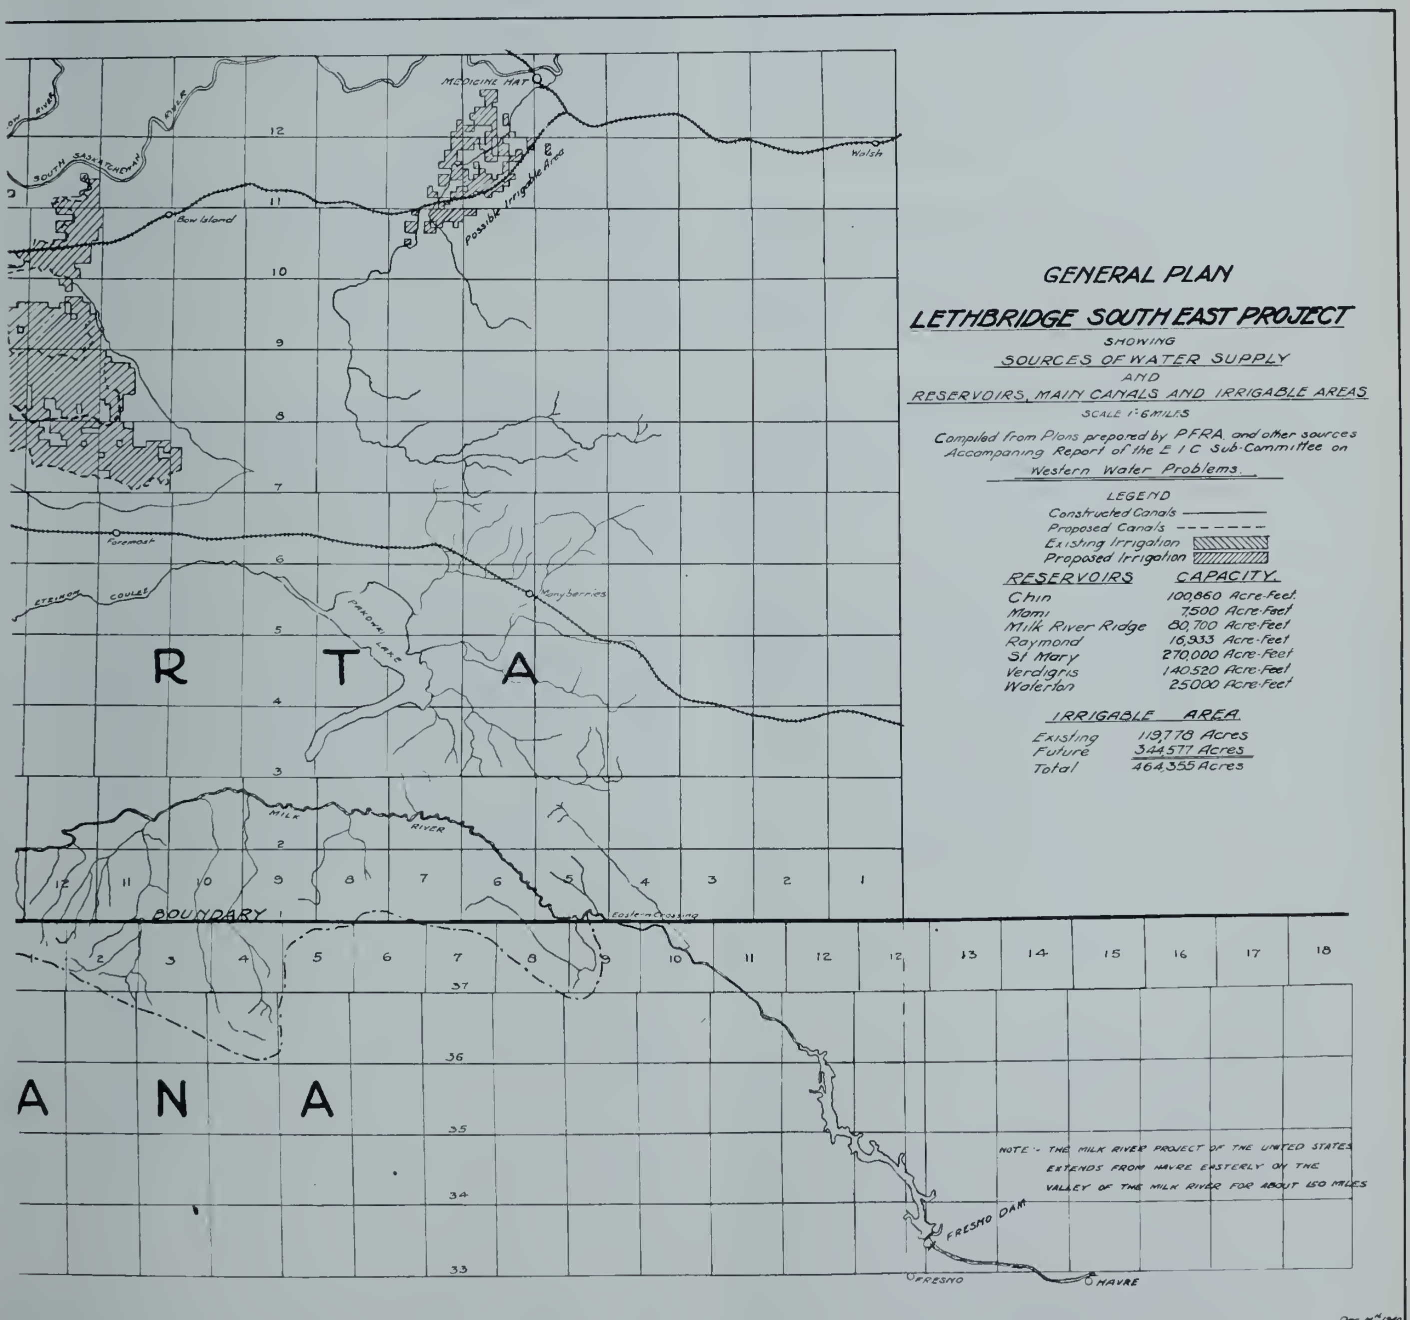
(e) *Engineering.*

Mr. McLean and the Sub-committee find:

The "works" for the Lethbridge South East Project would include a reservoir of 270,000 acre-feet capacity on the channel of the St. Mary river within Canada, at a point near Spring Coulee. This reservoir with appurtenant works would conserve the entire yearly flow of the St. Mary river passing into Canada, and also the substantial inflow from Lee creek and lesser tributaries in Canada.

A canal, of proposed capacity of 1100 cubic feet per second, would divert the available natural flow, within its capacity, from Waterton river into Belly river. A diverting canal of proposed capacity of 1700 cubic feet per second from Belly river would divert the water brought from the Waterton river plus the available natural flow of the Belly iver, within the capacity of this canal, into the St. Mar y reservoir. The estimated yield of these two rivers of 360,000 acre-feet annually is based on diversions during the ice-free period only and without the benefit of regulatory storage. A reservoir on the Waterton river storing 25,000 acre-feet is among the proposals, however.

A third diverting canal of 3,000 cubic feet per second



Lethbridge South East Project.

capacity would lead the accumulated waters of the three rivers easterly from St. Mary reservoir. Irrigable land would be reached within a few miles. A southerly branch would carry water into storage in Milk river ridge reservoir (80,000 acre-feet) and into Raymond reservoir (17,000 acre-feet). These two reservoirs command most of the irrigable land of the project, both proposed or now served. Water can also be diverted into Milk river ridge reservoir from Milk river and this may be done, unless, as is probable, a more satisfactory arrangement can be worked out involving an exchange with the United States of Milk river water for St. Mary river water.

Another branch of this diverting canal would join the A. R. & I. system, portions of which would need to be enlarged. This would supply the existing Chin reservoir which would be enlarged from 35,000 acre-feet to 100,000 acre-feet. These diverting canals from St. Mary reservoir would supply the distributing systems for certain tracts but the bulk of the new lands in the project would be served by distributing systems from the three supplementary reservoirs above mentioned. Under full development there will doubtless be other subsidiary storages provided in the lower portions of the distributing systems for special requirements of regulating flow, prevention of waste and salvaging of water that would otherwise necessarily be wasted.

Some of the main canals would be of large size and there would also be some rather large structures. However, there is nothing that will present any serious engineering or construction problem.

The reservoir on St. Mary river is a key feature to the whole project and the one that should be provided first. It also involves the largest and most important dam and other structures of the project and the ones presenting the most difficult engineering and construction problems. Therefore it is dealt with at some length.

St. Mary Reservoir

The investigatory work done by the Canadian Pacific Railway, the Reclamation Service, Mr. D. W. Hays and the P.F.R.A. indicates that a large storage reservoir on the St. Mary river, north of the international boundary, would be most desirable to conserve spring run-off and winter flow of the river. In 1938 a reconnaissance survey of the river was made by Mr. W. L. Foss, District Engineer, P.F.R.A., to investigate the possible and practicable storage sites on the St. Mary river. This survey indicated that a former suggested site between Spring Coulee and Magrath, would require a very high dam (height 225 feet) for a relatively small storage of approximately 100,000 acre-feet. Also, an outlet tunnel approximately three-quarters of a mile in length would be required to deliver water to the canal. Another site near Raley (Sec. 34-4-24 W. 4th M.) would provide approximately 250,000 acre-feet of storage, but would be relatively expensive owing to canal location which would involve heavy cuts. The P.F.R.A. concluded that both of these sites would be more costly per acre-feet of storage water than the one now selected near Spring Coulee which they find is a favourable site to meet all requirements.

A preliminary topographic survey has been made of the Spring Coulee site, also some test borings taken, which information permitted working out a tentative design for the purpose of obtaining cost estimates. This preliminary design is for an earth fill dam 186 feet in height with crest length of 2,600 feet and net effective storage of 270,000 acre-feet. The cost of the dam is estimated at $3,445,000 and the construction of the irrigation works complete to the existing A. R. & I. canal would bring this total to $3,800,000. An alternative design for a concrete gravity dam indicated that the cost would be approximately thirty per cent greater.

The St. Mary reservoir and outlet canal would be the first step in extension of the Lethbridge South East Project. It has been estimated that the total cost of the complete project would be approximately eleven to thirteen million dollars which would represent a cost of from $30 to $35 per acre of irrigable land. P.F.R.A. engineers are continuing the study of various alternative designs, methods and procedures.

A few remarks follow as to certain features of the proposed St. Mary reservoir dam:

(*a*) *Foundations.*

Additional test pits are required to permit study of the quality of the foundation rock, also the dip and strike of the strata for projection to areas not proved by test holes. Dr. R. T. D. Wickenden, Dominion Government Geologist, has the information obtained to date and it is expected that he will make a field examination and a thorough study of the sub-surface conditions at the proposed dam site and reservoir. This information is urgently needed since it will have an important bearing upon the type and design of structure proposed for the site.

(*b*) *Unwatering.*

The unwatering tunnel now being considered would be set on foundation rock and the upstream section of this would be sealed off by concrete, after completion of the structure, leaving an intake penstock through the concrete plug for the purpose of water supply to the small hydro-electric unit planned for the utilization of water discharged for riparian rights.

(*c*) *Intake to Irrigation Canal.*

As an alternative to the vertical pressure section and tunnel leading to the irrigation canal as shown in the P.F.R.A. design it is now proposed that the intake for the canal be placed on the bed rock at Contour 3538 with the intake entrance near the upstream heel. This conduit would be covered by the earth fill dam and the flow controlled by suitable regulating equipment.

(*d*) *Overflow Spillway Dam.*

A concrete spillway dam located at the north end of the bed rock would be provided with a concrete apron and chute to discharge approximately 36,000 cu. ft. per sec. at full supply level through stop log openings. Excavation at the site of the spillway dam would provide material for the earth fill structures.

Fairly detailed designs of the above listed features will be necessary before arriving at cost estimates, which are expected to be considerably less than those shown for the original design. The rolled earth fill dam would have a volume of approximately 3,200,000 cu. yd. and the volume of concrete would amount to 48,000 cu. yd. The earth fill material available on the north bank should be carefully tested and analyzed for both core material and side berms and it is noted that gravel supplies are not assured as yet.

It will be noted that it is planned to provide a spillway capacity of 36,000 cu. ft. per sec., which appears ample in view of the maximum recorded flow of 18,000 cu. ft. per sec. at Kimball in 1908, to which should be added the simultaneous flood flow of Lee Creek and intervening tributaries which are liberally estimated at 5,000 cu. ft. per sec. A further factor of safety lies in the fact that the flood stages are of short duration and occur at a time of the year when, under ordinary operating procedure, the St. Mary reservoir would have been lowered by the transfer of water to the lower reservoirs of the system. Another safety factor arises from the annual spring snow surveys from which close estimates are made of the total probable summer yield of the watersheds, and reliable information is obtained as to the probable magnitude and duration of normal flood flow.

Suggested Plan of Development

The Sub-committee finds:

The Lethbridge South East Project lends itself to a step-by-step orderly development over a period of years.

The first step should be an immediate start on construction of St. Mary reservoir, followed by a first stage in the construction of the diverting canal from the reservoir and first units of the distributing system. This will enable Canada to fully control the flow of the St. Mary river and put it to beneficial use and will constitute due diligence on her part. It will probably be found economical to complete the St. Mary reservoir and appurtenant works in one continuous operation. The 3,000 cu. ft. per sec. diverting canal can probably be built to a lesser capacity, with future enlargement, in two or three stages as required. Units of the lower storage system can be provided as required. The distribution systems to the various tracts can be built in units as land settlement and development proceed.

At a later stage the diverting canal from the Belly river can be provided and still later the diverting canal from the Waterton to the Belly. If it proves feasible and desirable to provide regulating storage on the Belly or Waterton rivers (or both) this would find its suitable place in a later stage of the plan.

The final place of Milk river in the plan is somewhat obscure due to the fact that it can be fitted in, in several different ways. It is quite feasible from an engineering standpoint to divert and use Canada's share of Milk river. However, it is a flashy stream with very little available to Canada during the irrigation season. It is not feasible to use it effectively without providing regulating storage on the main river, or alternatively, an unduly large diverting canal by means of which water could be carried into the proposed Milk river ridge reservoir. Both of these methods are relatively expensive. They are further complicated by the fact that Milk river in Canada carries United States water diverted from St. Mary river (as provided by the treaty and its regulations) and during much of the irrigation season this constitutes the bulk of the flow in Milk river. By far the larger portion of the flow of Milk river is allocated to the United States. The United States has provided, by Fresno dam, across the channel of Milk river, near Havre, Montana, a reservoir capable of storing more than the entire average annual flow of the Milk. This reservoir is capable of further substantial enlargement and the Chain-of-Lakes reservoir adjacent to Milk river is still being considered. In addition, the Nelson reservoir lower down the Milk river project in Montana provides an additional means of conservation of the Milk river flow as regulated by Fresno dam reservoir.

Since practically all land in Canada irrigable from Milk river can also be supplied from St. Mary river as a part of Lethbridge South East Project at lesser cost and with less probability of international complications, it would seem desirable to arrange an interchange with the United States of at least most of Canada's share of Milk river for a corresponding share of the United States rights in St. Mary river. The Verdigris Coulee reservoir, into which water can be diverted from Milk river and from which it can be returned to Milk river, has been proposed as an instrument of such interchange, but with the storage now provided and contemplated by the United States, it is, possibly, not of further interest.

SIGNED, on behalf of the Sub-committee,

H. J. McLEAN, *Chairman.*

Dated at Calgary, December 14, 1940.

EXHIBIT "B"

INTERNATIONAL ASPECTS OF THE SOUTHERN ALBERTA IRRIGATION PROJECT

G. N. HOUSTON, M.E.I.C.
Consulting Engineer, Olds, Alta.

History

The early settlers in the eastern States and provinces came principally from humid countries where the rainfall was sufficient to mature crops and they found the conditions in this new country similar to those to which they had been accustomed. There was no need of their using water from the streams for irrigation as the rainfall was sufficient. So the common law of riparian rights came with them. Briefly this allows an owner of land on a non-navigable stream to use the water flowing past his property providing he returns it to the stream practically undiminished in quantity and unpolluted in quality.

As settlement pushed westward to the semi-arid parts of the country, it was found necessary to divert water from the streams on to the land in order to mature agricultural crops or increase their yield. Most of this water being absorbed by the plants could not be returned to the stream, the volume of which was depleted by this amount and the lower riparian owners deprived of its use.

The settlers were obliged to abandon the law of riparian rights and adopt from the old Roman law the doctrine of prior appropriation and beneficial use which at present is the basis of all irrigation law. In brief this is as follows:

The appropriators of water from a stream are granted priority for its use in the order of their respective dates of appropriation: i.e., first in time is first in right, provided they proceed with due diligence to put the water to beneficial use. This basic principle is recognized wherever irrigation is practised in the United States and Canada. Between 1890 and 1904, surveys had been made and water appropriated for the irrigation of certain lands in Montana from the Milk river. Some of this land had been settled and irrigation started. The Milk river rises in the United States and flows north into Canada, thence easterly through Alberta some 210 miles, then turns south across the international boundary again into Montana and thence into the Mississippi river drainage. During the same period in Alberta, the Dominion government had granted an appropriation of 500 cu. ft. per sec. from the flow of the St. Mary river to the Canadian Northwest Irrigation Company for the irrigation of a block of land in the vicinity of Lethbridge. The St. Mary river rises in Glacier park, Montana, and flows north across the boundary into Alberta and thence into the Hudson bay drainage.

The Company completed some 90 miles of main canal from its head gates near the international boundary to Lethbridge.

In 1904, the several companies which were interested in the development of the lands, coal mines and irrigation in southern Alberta merged, forming the Alberta Railway and Irrigation Company (later acquired by the Canadian Pacific Railway Company).

This Company was granted a priority on all surface water supplies in southern Alberta which might be used, as development progressed to irrigate their land.

In 1904, they built a diversion dam in the Milk river and a canal running north to irrigate land in the vicinity of the towns of Milk River and Warner.

The early investigations on the United States side had shown that additional water for irrigation of the lands of the settlers in the lower Milk river valley could be obtained from the St. Mary river by an all United States canal, but estimates of cost showed this to be a very expensive development and it was decided to construct the canal only as far as the head waters of the Milk river in the United States. They would then use the Milk river channel as a conduit to run the water to their irrigation projects in the lower valley. This contemplated running the water through the 210 miles of river in Canada.

The building of this irrigation canal from the Milk river, by the Alberta Railway and Irrigation Company in Canada, immediately raised a protest from the United States settlers, that this would interfere with the proposed development on their side of the line; and they appealed to their government to protect them.

It should be noted that no water had been run from the St. Mary to the Milk river at this time, as the United States did not complete its 29-mile canal until 1916. The result of this protest is Article VI of the treaty entered into between the two countries on January 11th, 1909. This article is as follows:

"The High Contracting Parties agree that the St. Mary and Milk rivers and their tributaries (in the State of Montana and the Province of Alberta and Saskatchewan) are to be treated as one stream for the purpose of irrigation and power, and the waters thereof shall be apportioned equally between the two countries; but in making such equal apportionment, more than half may be taken from one river and less than half from the other by either country *so as to afford a more beneficial use to each.* It is further agreed that in the division of such waters during the irrigation season, between the first of April and the thirty-first of October, inclusive, annually, the United States is entitled to a prior appropriation of 500 cu. ft. per sec. of the waters of the Milk river, or so much of such amount as constitutes three-fourths of its natural flow, and that Canada is entitled to a prior appropriation of 500 cu. ft. per sec., of the flow of St. Mary river, or so much of such amount as constitutes three-fourths of its natural flow."

"The channel of the Milk river in Canada may be used at the convenience of the United States for the conveyance, while passing through Canadian territory, of waters diverted from the St. Mary river. The provisions of Article II of the treaty shall apply to any injury resulting to property in Canada from the conveyance of such waters through the Milk river."

"The measurement and apportionment of the water to be used by each country shall from time to time be made jointly by the properly constituted Reclamation Officers of the United States and the properly constituted Irrigation Officers of His Majesty under the direction of the International Joint Commission."

The division of water between the two countries proceeded under this treaty until 1915. The United States Reclamation Officers and the Irrigation Officers of the Dominion of Canada however were not able to agree as to the manner in which the waters of the two rivers should be measured. So the International Joint Commission, under whom they were working, decided that before making a ruling in the matter it would be proper to hear such representations and suggestions thereon as the parties concerned might see fit to make. To this end the Commission held several meetings during the years 1915 to 1921, inclusive, at various points in United States and Canada. At these meetings the governments of United States and Canada, the provinces of Alberta and Saskatchewan and various corporations and individuals appeared and presented their views. As a result of these hearings, the International Joint Commission, on October 4th, 1921, handed down a unanimous decision, interpreting Article VI of the treaty and ordering the division of the waters to proceed in accordance with certain rules which they presented. In brief these are as follows:

RULES

1. During the Irrigation Season.
   (a) When the flow in the St. Mary river at the international boundary is 666 cu. ft. per sec. or less, CANADA gets ¾ of the water. UNITED STATES gets ¼ of the water.
   (b) When the flow exceeds 666 cu. ft. per sec. CANADA gets 500 cu. ft. per sec. UNITED STATES gets 166 cu. ft. per sec. The balance is divided equally between the two countries.
   (c) When the flow in the Milk river at the easterly crossing of the international boundary, is 666 cu. ft. per sec. or less, CANADA gets ¼ of the water. UNITED STATES gets ¾ of the water.
   (d) When the flow exceeds 666 cu. ft. per sec. CANADA gets 166 cu. ft. per sec. UNITED STATES gets 500 cu. ft. per sec. The balance is divided equally.
2. During the Non-Irrigation Season.

   The flow of each river is divided equally at the boundary.
3. The tributaries of the Milk river, rising in Saskatchewan, (Battle creek, Lodge creek, Frenchman river etc.) and joining the main river in the United States beyond the easterly crossing are each divided equally at the boundary.
4. The flow in tributaries not naturally crossing the boundary are apportioned to each country.
5. Gives the methods in detail by which the flow at the boundary is to be computed.
6. 7. Directs where gauging stations are to be maintained.
8. Directs the reclamation and irrigation officers to make such additional measurements and take such further steps as may be necessary or advisable to insure the division of said waters as directed and "to operate the irrigation works of either country in such a manner as to facilitate the use by the other country of its share of said waters and subject hereto, *to secure to the two countries the greatest beneficial use thereof.*"
9. Disagreements are to be reported to the Commission.
10. Cancels a former order.

Two days later, October 6th, 1921, the Commission made certain recommendations regarding *storage of waters of the St. Mary and Milk rivers*, which in brief are as follows:

After a very thorough investigation they find *that the quantity of land in each country susceptible of irrigation development from the St. Mary river and Milk river and their tributaries far exceed the capacity of the rivers, even under the most exhaustive system of conservation.*

In order to avoid misunderstanding between the two countries it is therefore of greatest importance *"that every effort should be made to obtain maximum efficiency in irrigation from these waters"*; the Commission therefore recommends:

1. That the United States, in addition to the Sherburne Lake reservoir already constructed on the headwaters of the St. Mary, proceed to build the proposed Chain-of-Lakes reservoir in the Milk river valley, Montana, below the easterly crossing.
2. That Canada construct their proposed Verdigris reservoir on Verdigris Coulee in Canada.
3. That the construction of a dam at the outlet of the St. Mary's lakes in Glacier park which was proposed by the United States Reclamation Service, for creating storage for their own use, be made an international reservoir, the cost of construction to be borne jointly by the two countries and not charged against any particular project.

The title to the reservoir to be vested in the United States government.

4. In the opinion of the Commission the operation of these reservoirs under their direction would make it possible to conserve the entire winter flow and flood waters of the St. Mary and Milk rivers.

From 1922 to 1938, inclusive, the division of these waters proceeded under the rules of the Commission but none of their recommendations regarding storage of water was carried out. Notwithstanding the fact that the United States was operating Sherburne Lake reservoir on the head waters of the St. Mary, they were only able to make beneficial use of an average each year of 51 per cent of their share of the water. Canada without any storage during the same period used an average of only 46 per cent of its share. That is, 52 per cent of the average flow in the St. Mary river each year was going to waste.

It is quite evident from this that storage of the St. Mary river water is very necessary in both countries in order to get the maximum beneficial use of the water.

The Canadian Reclamation Service, from 1913 to 1921, made a survey of some 350,000 acres, known as the Lethbridge Southeastern Project, and in their 1921-22 report in connection with this project, recommended a storage site on the St. Mary river in Section 34, Township 4, Range 24.

Nothing was done toward developing this site, however, largely on account of the recommendation of the Commission for the joint development of St. Mary's lakes which would probably have been cheaper.

The development of St. Mary's lakes was not carried out however, partly because of the great distance the water would have to run (some 500 miles) before reaching the land to be irrigated on the United States side, and partly because of the general public sentiment in the United States against development of natural lakes in national parks as reservoirs, for fear of destroying their scenic beauty. In 1938, the United States completed the Fresno reservoir located a short distance below the site of the Chain-of-Lakes reservoir recommended by the Commission. This solved the storage problem for them and as a result they were able to use, last year, nearly 100 per cent of their share of the St. Mary water. Apparently they have not abandoned the development of the proposed Chain-of-Lakes reservoir for still more storage. The following excerpt from the *Reclamation Era*, May, 1940, page 138, presents their view of the matter. (This is an official publication of the United States Reclamation Service.)

"Construction of the Fresno dam and the creation of the Chain-of-Lakes reservoir, will not only supply additional water for the system, but it will help control the periodic floods of the river. The towns of Havre, Chinook and Harlem will use water and the Utah-Idaho Sugar Company has agreed to a contract for water. Success of the development plans for the entire valley depends directly upon this unit of the irrigation system."

Since the United States abandoned the proposed storage in St. Mary's lakes, Canada, through the Prairie Farm Rehabilitation Act organization, has located a storage site on the St. Mary river, on the Canadian side of the line.

This location is a short distance below the site recommended by the Canadian Reclamation Service in 1922.

With regard to the Milk river: the natural flow of this stream at the easterly crossing of the boundary rarely carries as much as 500 cu. ft. per sec. for any considerable length of time. Occasionally there are floods which carry double this amount but they subside rapidly. Canada's share is only one quarter of the usual flow. We have used a very small amount of this. There are no large projects taking water from this source, only a few individual farmers. The Milk river canal, previously mentioned, built in 1904, never ran water except to test the canal. The diversion dam has washed out and the canal has been abandoned.

On the eastern tributaries in Saskatchewan of Milk river the ruling provides that each shall be regarded as a separate stream and the flow divided equally at the boundary. Up to 1938 on this side of the line there were only a few individual farmers using water and no record was kept of the total amount. By 1938 however, the P.F.R.A. had developed two large projects on the Frenchman river, which, together with the existing diversions, used about 34 per cent of our share of the flow in this stream. Last year (1939), some 9,000 acres more had been added to the irrigated land on these streams and we used: on Frenchman river—15 per cent of our share: on Lodge creek—5 per cent of our share; on Battle creek—114 per cent of our share. It will be noted that we overdrew our account on Battle creek last year. The total flow last year on these three largest tributaries was about 144,000 acre-feet of which our share was 72,000. Of this we used a total of 22 per cent. It should be noted that the division of flow of the eastern tributaries has no direct bearing on the division of flows of Milk river west of the eastern crossing and St. Mary river.

Present Situation

This brings us up to the present situation, which is as follows. In view of the large area covered by the proposed Lethbridge Southeastern Project, Canada has proceeded with due diligence, from the time of its inauguration of the project in 1913, to the completion of the surveys and estimates in 1922, in preparing to put to beneficial use its share of the St. Mary and Milk rivers, so apportioned by the treaty.

Storage of the St. Mary waters was recognized as essential to this scheme and was provided for in the surveys.

The Joint Commission's recommendation, for the joint development of the St. Mary's lakes for this purpose, introduced a new element into the problem.

Owing to the delay and final abandonment of this solution by the United States, progress was held up in Canada by causes beyond its control.

There would have been little use in proceeding with the construction of the recommended Verdigris storage, as the chief value of this reservoir would be to store Canada's share of the Milk river together with water from other sources not available to the United States, to trade for additional water from the St. Mary.

Neither United States nor Canada was in a position then to use this additional water. Up to 1938, each country was able to use only about 50 per cent of its share of the St. Mary water.

With the completion of the Fresno reservoir by the United States, however, the whole situation has changed. They have put themselves in a position to use all of their share and more if available. The treaty cannot be enforced like an Act of Parliament. It is more in the nature of a gentleman's agreement. There is no time limit for its duration. Either party may repudiate the agreement and ask for a reconsideration of the whole matter if it is thought the terms are working against their interests.

At the time of signing, both countries had the same very definite object, namely, the maximum beneficial use of the water by each country. They were satisfied at the time that the terms of the treaty would produce that result.

In endeavouring to carry out the terms, however, many difficulties arose. In the discussion of these troubles before the Joint Commission in 1915, F. H. Newel, consulting engineer for the United States Reclamation Service, expressed the United States view as follows:

"In making the apportionment, therefore, the operation is to a certain extent simplified by being confined to a consideration of the water which may be used either by *direct diversion or storage.* On the other hand, *it should not be assumed that because one country is not prepared to use one-half of the water therefore the other country must be deprived of the use of any portion which otherwise would be wasted.*"

The water which Canada is wasting at present would supply not only the present settlers with much needed late water, but would irrigate at least one hundred thousand acres (100,000 acres) additional land.

Now that the United States is prepared to use its full share and more if available, we may expect that a revision of the treaty will be requested with the idea of getting some or all of Canada's share which is now going to waste, unless Canada proceeds promptly to put it to use.

In the event of a reconsideration of the whole matter, Canada would be in a very weak position to defend its claim to more than 50 per cent of the water to which it is entitled under the treaty, on the grounds of beneficial use, unless it is proceeding with an orderly development, and might lose this water to the United States permanently. There are other complications which might arise in the event of a reconsideration, which need not be considered here, but which make it very desirable to maintain the *status quo*.

It is, therefore, very essential to the future development of southern Alberta that storage be provided immediately on the St. Mary river, so that water for the gradual development of the Lethbridge Southeastern Project can be assured.

EXHIBIT "C"

ECONOMIC DEVELOPMENT FOR IRRIGABLE LANDS

D. W. HAYS, M.E.I.C.

Manager, Canada Land and Irrigation Company, Limited, Medicine Hat, Alberta

Some centuries ago farmers of the day used tread mills or buckets attached to sweeps to draw water from the Nile or the Yangtze rivers to sustain meager crops on a thirsty soil. The method was crude and the work hard but the farmers gained a living for themselves and their families. The kings of Babylonia built canals to irrigate lands in the valley of the Euphrates, thereby aiding to supply the food required for the subjects of an empire. They, too, knew the value of irrigation. From these early beginnings, irrigation has progressed throughout the centuries until today we have such massive monuments to the value of storage, irrigation and power as the Boulder and Grand Coulee dams with probably still larger projects to come.

Millions of dollars have been spent on irrigation projects and great countries have been enriched by the developments. Their useful purposes have been manifested. They serve a dual purpose, firstly, in the direct benefit to the individual who creates a farm home; secondly, in benefit to governments through increased taxable wealth and to all citizens in the many channels of trade and business activity. These interlocking benefits are generally recognized. To the uninitiated they are a misty apparition. To those close to the subject they are real though diffused and not in all respects tangible in the threads leading by many ramifications, in and out, to sundry political and commercial centres.

In the past history of irrigation in Canada, the costs for development of irrigable lands have been based on the principle of repayment by the farmer who occupies the land. Recently and to the other extreme, it has been suggested that governments should build irrigation projects in the general interest of political economy without repayment of any capital costs by the farmer. Both principles are wrong.

As to the first principle, no large project can be built with its attending development costs and be paid for with interest by the farmer. Private companies and bonded irrigation districts have learned this by sufficiently heavy losses. This principle, if it were to be fulfilled, would limit development to small projects cheaply built and easily settled, if these can be found, and ignore the value of the business accruing from them for which something should be paid by the public.

As to the suggestion that governments should build projects with no repayment of costs by the farmer, this foreshadows bad complications. Primarily it implies a gift of land or a water right or both to individuals favoured with irrigable land, on which they can make a living, as compared with the individuals who must buy land for purposes of dry farming which has less agricultural attributes. It discounts the property value to those who now own or have an equity in irrigated lands and in turn, by direct implication, further reduces if not destroys the value in property and irrigation works of company projects and irrigation districts. Moreover and perhaps of significant importance, there are the political repercussions which may thrive on patronage of this sort.

Reasons for Irrigation Development

It is known that a capable farmer can make a good living and a comfortable home on irrigated land. He is an independent and self-supporting citizen. Were he to buy land outside of an irrigated area, it would cost him money with less favourable prospects for sustained agricultural progress. Therefore irrigated land, properly farmed, is worth something to the farmer, for which he should be willing to pay in fair proportion to the benefits received.

From a provincial standpoint, it is evident that taxes on highly productive lands will exceed the taxes on sparsely settled lands in stock leases and on lands where poor crops are the rule rather than the exception. Government stock leases bear a combined rental and tax levy of about 4 cents per acre per year. On good productive farm lands the taxes average 30 cents or more per acre per year.

On dry farmed lands in the drought areas large sums of tax arrears remain unpaid and from time to time are written off. Likewise advances for various forms of relief remain unpaid and also must be written off. This is an unavoidable waste of money so long as dry farming is permitted in these areas.

The following figures are informative as related to four municipalities for the year 1937:—

Total population 3,964 individuals; total relief in seed grain, clothing, food and tractor fuel supplied in 1937 was $250,344.00. Taxes levied $86,552.00, amount unpaid $77,377.00. The year 1937 was very dry but every year has its deficits with poor prospects of meeting current yearly costs let alone paying arrears. The losses represent huge sums of money over a period of years about which both the provincial and Dominion governments are aware and gravely concerned.

In contrast to the above, lands having an appreciable area under irrigation and with similar soil and climatic conditions, have a population per square mile many times as large, have assessed land valuation five times as much per acre, create agricultural and live-stock wealth approximately ten times as great, promote and support general business activity proportionately larger and impose little or no burden on the governments for relief.

If some of these lands in the drought areas were irrigated or the inhabitants placed on irrigated land, capital costs as applied to irrigation would convert waste to profitable use, aid in the rehabilitation of farms and farmers and create an asset for posterity. Irrigation potentialities in Alberta of say 500,000 acres would supply irrigated farms to 3,500 or more families or enough to take care of a large part of the farmers in the drought areas of the province.

Benefits of Irrigation

Presuming it is recognized that general benefits do result from irrigation and that development is warranted as a government undertaking, it is the purpose of the author to assess the value of these benefits to individuals and to the public at large as a basis for a fair proportional repayment of the costs involved.

It is apparent that any payments of cost made by the public would be through taxation. It is therefore pertinent to this subject that some analysis be made as a basis for taxation. There is an old saying that for each family engaged in primary production there is a family engaged in the disposal of that primary production. This provides for the building of urban towns and regional cities, local and distant merchandizing and manufacturing centres, railways, elevators, etc., all subject to taxation.

It is a principle of political economy that production is a measure of national wealth and the distribution of that wealth is the basis of trade and commerce. Governments build railways, roads, waterways, buildings, etc., to facilitate the movement of commerce. Railways have been subsidized by land grants in the interest of national development. It is axiomatic that outgoing shipments of one product create an important movement of other products. One is essential for trade with the other. The products of irrigated farms are exchanged for other food products, textiles, machinery, etc. This in itself creates an exchange for the value of primany farm products. But there is still a further value which exists in excess of the amount received by the farmer for his primary product. This is represented in various services and functions, paid for by the ultimate consumer, for transportation, marketing, merchandizing and in outside manufacturing using raw farm products.

For example, it is the difference in the value of a bushel of wheat sold by a farmer, say in Alberta, and the value of the flour, shorts, bran, etc., obtained from the bushel of wheat plus containers, sold to a consumer living, say in Montreal. The primary product has undergone transportation, processing, wholesale and retail salesmanship, by which an earned increment in value has been created. These various functions require land, rails, elevators, buildings, equipment, which are built and enhanced in value because of primary production. If production should cease, in part or whole, of which we have examples in drought years, employment and capital values decrease. Conversely new agricultural development creates new wealth; in land, in urban and regional centres, in transportation, power and manufacturing at distant places. These are taxable as they may now exist and would sustain increased taxation arising out of business improvements or enlargements and by new development.

In recent years, a Royal Commission was appointed in Alberta to enquire into all phases of irrigation development in the province. In the course of their findings they made the following statement:—

"The Commission has been made fully aware that irrigation authorities now agree that the full capital costs of an irrigation project should not be charged up to the land fully benefited. The conversion of a non-productive area into lands intensively farmed, benefits not only the irrigation farmer but also the community, the Province and the Dominion, as well as many private enterprises such as railways and factories."

In respect to the above, it may be added that in irrigation districts in California and other states where urban values are taxed, they bear 25 to 35 per cent of the operation and maintenance costs and interest charges of the districts. This is the same approximate proportion which the increments in local urban land values bear to the total local value created.

On this subject other information goes to show that the increment in total values approximates five times the increment in farmed lands. It is known also, in irrigation districts, that the farmed land itself is generally placed as the sole security of bonds for irrigation works. In other words the farmer who may realize 20 per cent of the total values created is called upon to pay the whole costs for irrigation. This position is untenable as evidenced by the amounts of capital costs which have been written off in irrigation districts and by the private companies in reducing costs to the farmer to a point within his means. In the case of irrigation districts in Alberta, whose bonds have been guaranteed by the province, the amounts written off have been sustained by the public through taxation—a procedure which could have been anticipated had the views of relative responsibility for costs as indicated by this paper, been in effect when the districts were first started. In the case of private irrigation projects, the amounts written off have been sustained as a loss.

Proportionate Benefits of Irrigation

It will be recognized that benefits accrue to the farmer, to local urban and regional centres of business and to the country at large. These are broad conclusions. The details leading to such conclusions are greatly involved in the intricately woven fabric which makes up the country's business.

It is not difficult in an abstract way to arrive at a value of the farmers' primary production having regard to average yields and average prices. It is also not impossible to obtain a figure up to a point, which would fairly represent the earned increment in value of a certain processed raw product, ultimately paid for by the consumer. For example, in the case of a bushel of wheat grown in Alberta and its equivalent in flour or breakfast food sold, say in Montreal. Flax may appear as oil and oil-cake, and sugar beets as sugar or syrup. But to proceed further brings in complications. Oil may go into paint, soap or shoe polish and be shipped back to the point of the original flax production. Oil-cake may be fed to cattle locally and appear as beef on a consumer's table at some remote point.

Further illustrations of a complex problem are unnecessary and it is sufficient to say that details are not available to the author. It is, however, apparent that ultimately through many ramifications, benefits do accrue to:—

1. The farmer who irrigates the land.
2. To local urban and regional centres in which developments are created and which aid, through taxation, in the maintenance of municipal and provincial governments.
3. To the general developments in the country at large by the business created in transportation, marketing and processing primary farm products, for which the ultimate consumer pays, and out of which the Dominion government gains by increased taxable wealth and the maintenance of employment and business activity.

Division of Benefits

In a paper presented by Mr. Walter E. Packard at a meeting of the Pacific Coast Section of the American Society of Agricultural Engineers, the author deals with the economic feasibility of the Columbia Basin Project in the state of Washington. This project contemplates the irrigation of 1,200,000 acres of land. He predicts the ultimate value of the primary farm product (the price that would be paid by the consumer) and makes a division firstly, to the individuals or groups who would receive the proceeds and secondly, an allocation by location, i.e. local and regional centres or outside points, where the proceeds would be spent.

With respect to individuals or groups receiving the money paid by the consumer he concludes that it is divided:—

47 per cent to the farmer;

9 per cent to local manufacturers such as creameries, canning factories, meat packers and others.

44 per cent to transportation agencies, merchandizing interests and outside manufacturers.

With respect to the locality where the money is spent, through the various facilities necessary to the interchange of goods, he gives abstract figures as related to the Columbia Basin Project which are here reduced to percentages as follows:—

Total price paid by the ultimate consumer for product originating on the farm....	100 per cent
Less part of price arising for outside services, transportation, marketing, etc.	24.3 per cent
Remainder treated as a local fund........	75.7 per cent

This amount is an annual sum wholly dependent on farm production. It would disappear if production should cease. It is shown to be expended as follows:—

In local trade representing services required by the community including the farmer, approximately..........................	20 per cent
In regional centres, distributed to manufacturers, wholesalers, investors, and public utilities, approximately..........	34 per cent
In outside centres, manufacturers of machinery, auto equipment, textiles, processed food products and miscellaneous supplies..........................	21.7 per cent

Summarizing with respect to location where money is spent, we have:—

Remaining in community for local trade..........	20 per cent	
Spent in regional centres..	34 per cent	54 per cent
Outside:—Services, transportation, marketing, etc.	24.3 per cent	
Outside:— Manufacturing, machinery, textiles, etc..	21.7 per cent	46 per cent

Mr. Packard's figures are evidently based on the kinds of products, market facilities, and other factors bearing on the problem he had in hand. These may differ with respect to kinds of produce and other factors arising out of irrigation development in western Canada as they may affect the percentages stated.

The figures, however, do supply a basis for intelligent approach to a problem respecting financial requirements for irrigation, which has been long neglected in Canada. What has been done during the past by irrigation districts or private companies in adjusting debts, has been an aftermath created by necessity which has resulted in severe prejudices to irrigation generally. Whereas by an appreciation of the general benefits arising out of irrigation, not only to the farmer but to the public as well, a clearer understanding of the problem is obtained respecting future developments for which suitable provisions can be made for financial requirements.

Past experiences show that irrigation districts, acting independently, cannot sell irrigation bonds without government guarantees. Private companies are not warranted in financing irrigation projects, limited as they have been to repayments by the farmers only. Hence it is apparent that any future developments must be initiated and carried out by the provincial and Dominion governments or by one acting directly through equitable arrangements with the other.

Repayment of Costs for Development

Early irrigation developments in the United States and Canada as previously indicated were based on the principle that the entire costs for irrigation would be repaid by the farmer. The principle failed and various adjustments have been required. In Canada, adjustments had been made at sundry times and by sundry projects to meet local conditions. They were not uniform as between different projects nor determined by a similar procedure. The results were dissimilar and a farmer on one project compared his position with that of a farmer on another project and found reason to complain.

To meet this situation a Royal Commission was appointed in 1936 and requested to investigate into various phases of irrigation development in all irrigation projects in Alberta. This commission is commonly known as the Ewing Commission. The Commission was instructed, among other things, to enquire into (a) the ability to pay by a farmer of average attainments and (b) the value of land and water right to the farmer.

The Commission made exhaustive enquiry over all projects in the province.

Under (a)—With respect to "Ability to Pay" the findings stated:—"The Commission has endeavoured to arrive at an average ability to pay based on average production having in mind average capacity and average conditions." It based its findings on the production of wheat, oats, and hay or pasture subject to a yearly crop share to be delivered by the farmer. The Commission stated: "According to this assumption the crop share would equal $3.16 per acre." For grain and hay production the average yield-value per year should approximate $16.00 per acre. The value of the crop share is to apply to water rental or service tax, interest and to principal. Assuming that average water rental charges are $1.50 per acre per year, this leaves $1.66 to apply to interest and principal. This annual payment at 5 per cent interest would pay off a capital debt of $23.39 in 25 years. Where production is on a higher basis than wheat, oats, and hay, as in the case where sugar beets and canning products are a part of farm operations, the annual payment at a higher crop share value, would pay the capital cost in less period of years, or would pay a higher land value as may be required for higher land rating.

Under (b)—With respect to the value of land with water right, the Commission fixed a value of $20.00 per acre for land having a rating of 70 per cent. Rating is established by the relative merits of soil, topography, location and water-area factor and may naturally vary with each quarter section of land. The average rating of land and water right commonly considered as irrigable, as applied to existing or prospective projects in Alberta, will result in average prices from $16.00 to $25.00 per acre. This is the sum the farmer is expected to pay over a period of years.

In the figures given, relating to division of benefits, it is shown that 47 per cent of the ultimate sale price, of produce originating at the farm, is received by the farmer. This represents the value of raw farm products. The remaining 53 per cent of the ultimate sale price is the increased value brought about in the processing and distribution of the product. Of the total value it appears that 54 per cent of the money is used or spent locally and 46 per cent at outside places.

The theory of the author is that repayment of costs for total development may be allocated in the proportions of: the value of the primary product received by the farmer who also spends it, the amount spent in local and regional centres and the amount spent at outside points. These factors bear to each other in the ratio of 47 to 54 and 46 respectively. Reduced to the basis of 100 they would work out as follows:—

To be repaid by the farmer...........	32 per cent
To be repaid by local urban and regional interests through taxation by municipal and provincial governments.....	37 per cent
To be repaid by the public at large through taxes imposed by the Dominion government as represented in income taxes, excise duties, sales taxes, etc............................	31 per cent

The work of the Ewing Commission was thorough and exhaustive as related to the annual and total payment which the farmer was called upon to pay. The Commission also stated, specifically as before referred to, that the total costs for irrigation should not be charged to the lands immediately benefited. They were not asked under their appointment to go further than to allocate the amounts to be paid by the farmer.

If, however, the amount the farmer is required to pay, as determined by the Commission, is used to arrive at the value of benefits to other interests as hereinbefore set out, we have some measure in dollars of the amounts these other interests should pay and the sum of these figures will represent the total permissable outlay to provide irrigation. Using the percentages last mentioned and taking the farmer's payment at $20.00 per acre for irrigable land an average rating of 70 per cent we have:—

To be paid by the farmer	32 per cent	$20.00
To be paid by local urban and regional interests...........	37 per cent	$23.12
To be paid by the public at large......................	31 per cent	$19.38
Total permissable outlay per acre....................................		$62.50

Limit of Cost for Irrigation Works

On the premises preceding, the total outlay for irrigation development is stated at $62.50 per acre. A part of this sum is required for costs in meeting carrying charges arising from interest on capital indebtedness and from deficits in operation and maintenance of the canal system pending the time when settlement of lands by farmers is completed. There are also costs for colonization.

Irrigation systems require a large percentage of the total costs for works to be expended in initial development, viz: dams, reservoirs, main and branch canals and attending structures, etc. These must be built prior to any use of water and in the case of raw prairie lands, prior to settlement of the lands. A gradual transition takes place in the development, from the first settlers to the time when the project may be fully colonized. During the past, this has been a slow process as experienced particularly in early irrigation projects in Canada. This can be attributed to several reasons. Primarily the prairies had been settled, partially at least, by people who expected to carry on dry farming operations and by the encouragement of occasional wet years, they refused to admit drought conditions; also irrigation farming, where first started, was new and the prices for irrigated lands were high. These and other conditions delayed settlement in irrigation projects. Today a different viewpoint exists. Irrigation projects have shown their merits. It is generally recognized that parts of the prairies are not suitable for dry farming and there is now an urgent demand on the part of farmers themselves for irrigation. These conditions imply good prospects for rapid settlement but there is need, nevertheless, that some provision should be made for costs of various kinds, which will arise in the interval between the time when the irrigation works are built and the time when each acre in the project is contributing its share to the current and ultimate costs.

Past records of irrigation districts and private companies in Canada would show these costs to be very high but they were created under unfavourable conditions. With respect to future projects and in the light of present views on irrigation, these costs should be estimated for each project, having in mind availability of settlers and any special considerations for markets and general facilities for establishing the farmers on the land. Such determined cost, to be provided for by a carrying fund or development fund, should be deducted from the total permissible outlay to arrive at the permissible capital costs for irrigation works. It is apparent too that if development costs can be reduced, then a larger part of the total permissible outlay becomes available for irrigation works.

In the opinion of the writer, having in mind existing conditions and assuming works completed to enable relatively immediate use of all the land for irrigation farming of which a part may be already settled, such costs should not exceed $12.50 per acre (assessable to local and regional interests), thereby leaving in round numbers approximately $50.00 per acre as a permissible value for lands and cost for irrigation works.

This value is attributed to land requiring a full water right and not to lands where a partial water right is used as a supplement to dry farming operations.

ESTIMATING PRODUCTION COSTS IN AIRCRAFT MANUFACTURE

A. T. E. WANEK, M.E.I.C., A.R.Ae.S.
Air Ministry Technical Cost Officer, British Air Commission, Washington, U.S.A.

Paper presented before the General Professional Meeting of The Engineering Institute of Canada, at Hamilton, Ont., on February 7th, 1941

The following paper gives the author's idea of the way in which the estimated costs of aircraft production should be arranged and prepared by a manufacturing firm. It must be understood that the system here outlined is not in any way to be regarded as official or as describing the methods followed by any government costing departments. Without attempting to enter into complicated detail, the article suggests a method of estimating production costs which can be successfully used in present-day aircraft manufacture.

In the aeronautical industry the continual and rapid changes in design and manufacturing conditions, together with the fact that the large productive orders enjoyed by other branches of engineering are not yet experienced by aircraft manufacturers, are vital factors when considering a suitable basis to work on.

At the outset the difference between actual costs and estimated costs must be realized. In the former case, future costs cannot be ascertained until a batch of aircraft have actually been completed, whilst with estimated costs, an advance and fairly accurate schedule of costs can be compiled even before the building of the prototype machine.

The final cost of manufacture of any aircraft is advisedly based on the following main items:—

I. Labour—Direct and indirect.
II. Overhead—Development charges.
III. Material—This should be divided into:

1. *Raw Material*, i.e., sheet, bar, etc.
2. *Bought out items*, e.g., rivets, bolts, A.G.S. parts,* standard drawn or extrusion sections (not obtainable in the works), patent fasteners, pins, etc.
3. *Proprietary articles* such as coolers, pumps, oil separators, specialized equipment such as undercarriage and tail wheels not manufactured by the aircraft designer.
4. *Sub-contract work*, i.e., any parts of the aircraft which for reasons of delivery or lack of special plant, the firm decides to obtain from outside suppliers.

IV. Profit, usually a percentage based on the completed costs.

With regard to overhead (Item II), it is not necessary to go into detail, as the make-up of this item does not differ greatly from that usual in other branches of engineering industry, with the important exception that in aircraft work overhead is usually higher and involves a larger allowance for development and experimental work.

The labour charge is the most important factor and is best estimated as the total number of hours necessary to build the aircraft at an average hourly rate, e.g., 30,000 man-hours at 1/9.

After having obtained and checked a complete set of drawings and schedules for every part and assembly required on the aircraft, a breakdown scheme to simplify and expedite costing should be planned.

The most straightforward method of doing this is to divide the machine into self-contained constructional units under such headings as the following:—

(a) *Assembly* of all main structural units (already completely sub-assembled) comprising assembly of wings and tail unit to machine, final erection, connection of pipe lines and hydraulic systems, painting, flight, shed work, test flights, etc.

(b) *Wings*: Probably again divided into top inner and outer, bottom inner and outer. It is usually only necessary to plan either the port or starboard side, as in many cases they are identical; if not, any slight difference can be easily added or subtracted as required. Also included in the wing assessment will be flaps, ailerons and slots according to the design and type of aircraft.

(c) *Fuselage*. This can always be subdivided if necessary, especially if built in several sections or portions, e.g., front, mid and rear fuselage. The fuselage section will possibly include preparation for equipment, such as wireless and any other sub-section which is constructed or installed in the fuselage, such as armament, gun turrets, etc.

(d) *Empennage* comprising the tail unit: tail plane, elevators, fins, rudder and attachment tabs, etc.

(e) *Power unit* or engine installation which will include oil and fuel systems, hydraulic equipment and installation. Care must be taken that all these systems are subdivided as they will almost certainly occur in various sections of the machine.

(f) *Flying controls and engine controls*. These are self-explanatory.

(g) *Undercarriage* often made to special requirements and bought outside. This will include landing wheels, brake gear, and (nearly always) retracting gear which require assembling and embodying in the aircraft.

(h) *Engine mountings*. It is advisable to keep this distinct from Section E (power unit), as the engine mountings and attachment usually assume quite large proportions and may make the power unit section complicated if included in it.

(j) *Electrical services and installations*. This will include all electrical wiring and panels and equipment. It can be subdivided to apportion the amount of labour falling in any of the main units already mentioned, i.e., electrical wiring and installation in fuselage (Section C). It will also embody such items as electrical bomb release, navigation lamps and wiring, wireless, ignition starting and generator starting, etc.

(k) *Armament* comprising bomb mountings and gun turret and gun installation in fuselage or wings, together with any protective items such as armour plating, etc.

(l) *Miscellaneous and general equipment*. This will apply mainly to such matters as oxygen system, stowages for equipment, parachute and flare stowages, first aid outfit and other items of equipment depending on the type of aircraft being built.

(m) *Ground equipment*, which will include such items as trestles, trolleys, ladders, bombcarriers, covers, jacks, slings, or ancillary equipment.

The above sections (a) to (m) break down the machine advantageously for planning, production, and cost estimating, and also with regard to supplying spares. The costs of labour or material are easily calculated from these sections.

It is advisable to correlate the drawing number system with this sectional scheme, so that for instance the prefix b will immediately indicate a part or drawing on the wing

*Aircraft General Stores parts, in England, include such parts as rivets, Simmonds nuts, standard size split pins, cotter pins, turnbuckles, bolts, slotted nuts, all of which are common to almost every aircraft of English design.

Section "B" Complete

Item	Quantity per Aircraft	Drg. No. and Description	LABOUR		MATERIALS				
			Total Value Time at 1/9						
			Hrs.	Amount	Raw	Bought Out	Sub-Contract	Proprietary Articles	Total Material
1	1	Section "B" comprises Inner wings, Outer wings, Centre Section, Ailerons, Flaps, etc.	3000	£262.10.0	£75	£25	£ 2	£20	£122
2	1	B-707—Port Outer Wing......	750	£ 65.12.6	£45	£ 7	10/-	£ 3	£ 55.10.0
3	1	B-7071—Port Outer Wing Spar Assembly.	70	£ 6. 2.6	£6.10.0		...	.....	£6.10.0
4	2	B-7076—Port Wing Spar Web.	5	8/9	£1. 5.0		...	.....	£ 1. 5.0

section, or H725 would refer to a part on the engine mounting.

It then follows that for estimating and production purposes the cost of any part or unit of the machine can be individually assessed, or can at any time be easily found from the schedules, either for labour, planning, or material cost requirements.

The most suitable schedule system will be a master record of the sections already dealt with, first with the section complete and followed by a breakdown scheme. The above example shows how this would be done for Section B (wings)—

Thus a complete schedule, breaking down each section, is compiled.

Note that Item 4 cost is thrown back into Item 3 and again Item 3 is referenced into Item 2, so that we have all the details, then the sub-assembly, followed by the unit assembly and finally the complete section assembly as shown by Item 1.

Additional columns can be used to give the material breakdown costs so that almost any item on the machine can be extracted from the main costs in a few moments, obviously a very useful and desirable feature.

These breakdown schemes and the sectionalizing of the aircraft are the bases on which a correct estimated cost depends. In the hands of competent, experienced estimators there is no danger of any omissions or complicated overlapping of costs, and in this way a fairly accurate version of manufacturing cost can be arrived at sooner than by any costing system which is dependent on actual costs, and is subject to fluctuations.

Detail Costs

Perhaps a few words about detail costs and methods recommended for obtaining them will be advisable at this stage.

Firstly, dependent on the number of aircraft to be built on the contract, the jig and tool layout and production methods should be planned.

This is a vital factor in planning, production, and estimating cost, because the method used in making any particular part, or the time taken to assemble completely a unit depends on the jigs and tools available. Thus the number of aircraft to be manufactured and the binding delivery dates will govern the types of jigs and tools desirable, and these in turn will limit the methods or operational layout of the part or unit in question.

When estimating a contract, these points are of paramount importance as they determine the labour value of any particular job.

It will be found that when a full set of operational layout sheets has been checked and prepared in accordance with the system already described, the complete planned production cost can rapidly be arrived at.

Preferably all detail parts in any one section should be estimated first, followed by the sub-assemblies and then by the assembly of the unit, and in some cases possibly again followed by assembly of unit in the aircraft. Using this basis the estimator, having first completed details and sub-assemblies, when reaching the main assembly—naturally the most difficult part—will be familiar with the whole make-up of the unit, and will know exactly what is necessary to allow for in the main assembly cost. This sequence is regarded as of major importance. Unfortunately it is often neglected and its value not realized, yet its advantages in obtaining maximum accuracy of cost are undeniable.

Critics may say that this procedure is not possible or that it is uneconomical, especially in a large firm. Nevertheless, after years of experience and study of costing methods the author maintains that such a method is essential where accurate results are required at the early stages of a large contract.

With regard to the operational layout, on which estimated costs largely depend, a straightforward, complete layout is essential.

For example, to make a simple bracket the following would suffice:

	Material Cost	Material
1. Cut material to strip size.		
2. Blank and pierce.		
3. Open holes to finished size...	1.5d	3″ x 2″ of L.38
4. Burr holes and clean edges...		6 off required per aircraft
5. Part number..............		Ass. on B7071

This brief but complete summary is a history of all that is done, from start to finish, to make a part.

Notice that this combined planning and estimating sheet includes material required and its cost; also the number off per machine, but above all the indication where the part assembles, thus lining up with the breakdown scheme already described at length.

It is unnecessary to go into details regarding operational layouts for small component parts, because the estimates of experienced technical men for such work will not differ to any appreciable extent. After all, the amount of time required to face, turn, screw, radius, and complete a small machine component—given the plant and operational layout—does not present a difficult problem, and the margin of difference in a number of labour estimates will be exceedingly small.

This leads us to assembly unit estimates and costs. This is where many firms fail to realize exactly what is necessary in both operational planned layout, or to allow for unseen labour factors, i.e., time spent on the job which is not always obvious, even to an individual who after years of practical technical experience appreciates and foresees all the snags which occur in every workshop and may be described as "human elements" of time required.

It is important that a detailed operational layout on any assembly should be prepared. The author has been amazed at the number of famous firms who totally disregard this.

Such descriptions as "assemble all items, drill, bolt, rivet and complete" are sheer waste of time, besides being unsatisfactory and conducive to grave errors in costing.

Again, unless the whole job is visualized as it will be done by the mechanics in the shops, a reasonably accurate cost cannot be ascertained. Many experts forget that parts do not fly into place and that a certain amount of time is expended in preparation and on non-productive operations during assembly of a unit. Such operations as preparing and cleaning of the assembly jig, truing up, alignment of main members of the unit—such as spars, ribs, leading and trailing edges—often take longer than the actual operational time required to drill and rivet. Provision must be made for checking, stripping down for treatment, accessibility (another obviously important consideration, but too often not fully realized) and lastly, snags and rectification after normal completion. Thus for an assembly of an aileron one should begin:—

1. Obtain all details and parts required.
2. Clean down jig and check for truth.
3. Position and assemble front and rear spars (already sub-assembled).
4. Position main ribs on spars—check for centres and align before drilling.
5. Drill and temporary service-bolt ribs—and so on until the final stage of "Inspect, rectify inaccuracies and complete."

The assembly question has been discussed at some length as it is during assembly that high or varying costs always occur and where even a complete knowledge of the jigs and tools to be used will not reveal the true value of the labour required unless all details are given full consideration. In many cases the reverse occurs, i.e., through lack of correct planning and operational layout an estimated cost far in excess of an actual cost is arrived at. This is just as serious as underestimating, for it may lead to a firm's quotation being high or unreasonable, with consequent loss or perhaps valuable contracts.

Particularly is this true in regard to Section A, where the question of accessibility is of paramount importance. It should be noted that many jobs require two men and allowances must be made accordingly.

Consideration must be given to allowance for setting up or preparation, according to the batch of aircraft being manufactured on one order. Many experts compute this allowance at about 5 per cent of the total man-hours required for the aircraft, but the author does not accept this estimate, it would appear to be on the low side but is essentially dependent on the size of the order and number of parts manufactured at the same time in the shops. Possibly an allowance of 8 per cent will cover most types of aircraft.

Having completed all estimates and embodied them into their respective schedules and sections it is a simple matter to combine all the totals and obtain a complete figure in hours necessary to build a machine.

To do this must be added:

1. Setting up and preparation allowance (already mentioned, approximately 8 per cent.)
2. Contingency, or provision for labour difficulties.
3. Scrappage, varying according to design, type of machine and size of order.

Merely as a guide, the author, from actual experience, believes that in most cases Item 2 requires an allowance of 7 per cent and Item 3 of 5 per cent. These amounts can be added on to each section for the purpose of replacements or spares.

Similarly the material totals are obtained and allowances made for scrappage, handling charges of bought out proprietary articles and sub-contract supplies; the whole being combined into a total material figure.

It is then necessary to ascertain an hourly rate which will include bonus schemes, ability rates,* setting rates, in fact an all-in rate which will allow a small margin of safety against such events as future wage increases or inability to find suitable labour for jobs. This will naturally be decided in conjunction with the firm's cost accountants. Thus the price of an aircraft can be summarized (including all contingencies) somewhat as follows:—

Man-hours labour, 30,000 at 1/9 or	£2625
Overheads, 100%	£2625
Material (total)	£2125
	£7375
Profit, 10%	£737.10
	£8112.10

In a case like this the quoted price would possibly be £8250, including delivery and trucking charges within a reasonable area.

This article would not be complete without mentioning one or two other important matters, one of which is aptly described as the nightmare of the industry, i.e., modifications.

These are obviously impossible to assess with accuracy before installation, but, if economically planned, so as to be incorporated during production on a machine that has not advanced to an inconvenient stage, the cost can be ascertained with reasonable accuracy, and without the difficulty of complications resulting in overlapping and excessive costs.

Finally, tool costs, i.e., all fixtures, special tools and assembly jigs. This item is elastic, because the deliveries required and period allowed for completion govern the types and number of jigs required. On a small batch of aircraft the ratio of tool cost to production cost should fall between 1.4 and 1.6. In the case of the imaginary aircraft quoted above, the value of 50 off, at £8250 each, would be £412,500. The tool cost should approximate £68,750; or £1,375 per aircraft.

Jig and tool engineers will no doubt reflect that no comparison can be drawn between the various production labour costs of components and the "relative" tool costs. As in the case of engine mountings and undercarriage jigs, the tool costs are heavy and often exceed even the value of the completed component; but they are necessary to ensure accuracy, interchangeability, and accurate synchronization of components. As against this example, the jig and tool costs for ribs, formers, or attachment brackets are quite moderate and, in addition, they effectively reduce the production labour costs to a minimum.

These facts indicate that jig and tool costs present a problem peculiar to aircraft manufacture and must receive very careful thought and consideration when preparing the money and labour estimates as this in turn will favourably or adversely affect the final production cost of any aircraft. This applies particularly to main assembly and erection jigs.

Larger quantities will vary the relationship. While no attempt is made in this article to lay down definite ratios of cost, the foregoing remarks will indicate approximately what liability is likely to be incurred for the tool cost.

The author has purposely refrained from quoting operational times and dealing with statistics at length, because these might prove uninteresting and perhaps misleading, but he feels that the system and methods which have been described are essential as the basis for estimating production costs.

While there will no doubt be criticism and disagreement with many of the points raised, it is hoped that some of the ideas put forward will prove helpful and possibly present a fresh point of view.

*This refers to a special rate awarded to key men like shop mechanics who, by reason of their outstanding ability in speed, experience, and familiarity with the job, are awarded an additional amount, usually a penny or two over the standard shop rate, and are necessary to take charge of certain units or assembly operations. A fair average would be one ability man to eight normal mechanics. This is not to be confused with grades in labour, such as skilled and semi-skilled. It can rather be described as a super-skilled man who has a number of skilled men under him, and is often referred to in some labour categories as a "working charge hand."

DISCUSSION

Elizabeth M. G. MacGill, m.e.i.c.[1]

I have listened to the presentation of Mr. Wanek's paper with pleasure and considerable profit, but it is with misgiving that I accept the chairman's suggestion to comment on the paper, believing wholeheartedly that a shoemaker should stick to his last. My rôle, therefore, is that of questioner rather than of critic.

Such a method of estimating costs of production of an aeroplane as yet unbuilt but of which the design and drawings are completely finished, should be of particular value, I believe, to companies submitting tenders on aeroplanes designed at the instance of governmental bodies—such as the British Air Ministry. However, due to the different circumstances attaching to aeroplane designs prepared here, I believe that the emphasis must be shifted from estimated costs to actual costs before it would fill the need of the aircraft industry on this continent. Here, in general, for commercial and governmental work, the prototype aeroplane is produced simultaneously with the aeroplane drawings and is usually finished before them. This postulates that by the time the drawings have reached that state of completion demanded by the method, work on the prototype or first batch of machines has progressed to such a point that considerable information regarding actual costs is available, and hence estimates are not required. In such cases, however, the method proposed is still applicable, for I see no reason why *actual* costs rather than *estimated* costs should not be determined by the same procedure. Thus the breakdown system would be adopted as outlined, but actual cost figures obtained from shop timecards would be substituted for estimates in the portion of the table relating to labour.

In considering the work of grouping the airframe drawings preparatory to breaking down the costs, it is immediately apparent that the use of a numbering system for the airframe drawings which automatically groups the drawings would considerably simplify the task. Thus the common American numbering system by which a prefix letter in the drawing number identifies the drawing with its group (i.e. all wing drawings bear the prefix letter "W"; all fuselage drawings bear the prefix letter "F") is admirably suited to this work. Such a system groups the drawings regardless of whether they are introduced early or late into the drawing system.

In discussing the item labour, I should like to ask Mr. Wanek if he does not think that a more accurate cost estimate could be obtained, if each unit or group were allotted its own average hourly rate, i.e. one average hourly rate for wings, another for engine installation. Superficially at least, it would appear no more difficult to obtain an hourly rate for each unit than for the complete airframe, and the accuracy of the final results might be improved thereby.

Also, in estimating the cost of scrap, would it not be more direct to consider it as a percentage of material cost rather than to determine it in man-hours? The heading Scrap might be entered under Material in the table and the loss due to cutting waste be determined as a percentage of the material cost, the precentage varying with the material. Thus for electrical cable which is bought in rolls and cut to the desired length, the percentage of scrap would be small, whereas for rivets requiring heat treatment and handling the percentage waste would be large. Also the scrap due to errors and rejections might be considered as a percentage of the material, a higher percentage being taken for parts requiring a number of different and difficult operations than for those having few and simple operations.

Regarding tooling costs, I wondered if Mr. Wanek had on mind calculating them from the drawings of the jigs and tools in a manner similar to that which he suggests for the airframe drawings. Since the airframe cost estimate is commenced after the airframe drawings are completed, it is not unreasonable to suppose that the jig and tool drawings might be completed or well on the way to completion at that time, and hence be available for cost estimation.

Mr. Wanek has with good reason stressed the number of imponderables present—the size of the production order, the overhead charges due to costly experimental and development work, the recurring modifications to drawings.

In conclusion, I would like to express my appreciation to the speaker for his thought-provoking paper, and his particularly interesting presentation.

[1]Chief Aeronautical Engineer, Canadian Car and Foundry Company, Limited, Fort William, Ont.

Air Vice-Marshal E. W. Stedman, m.e.i.c[2]

The method of estimating production costs which have been described by Mr. Wanek can be used only when the complete drawings of all parts of the aeroplane, including the smallest detail, are available, and also when the scheme for tooling up has been completed and the process for the manufacture of each part has been worked out. This method of estimating may be of value in Great Britain where many orders are placed before the price has been determined, but in the usual methods of business on this continent it is necessary for the manufacturer to be able to estimate his costs before the aircraft is designed. For instance, bids may be asked for the production of a prototype aircraft and varying numbers of production aircraft of the same type ranging from 15 to 300, in peace time.

Therefore, the manufacturer must be in a position to know what his prototype is going to cost, and how much the cost of the production aircraft will vary with quantity. This variation of cost with quantity is a most important factor, which has been hardly touched by Mr. Wanek.

A recent quotation for bombers in the United States varied from $200,000 apiece for 15 to $75,000 apiece if the order was for 300.

The best method of taking into account these factors in the early stages before the design work has been completed appears to be that covered in a paper to the *Journal of Aeronautical Sciences* by Mr. Kendall Perkins of the Curtiss-Wright Corporation. This paper is entitled "Dollar Values in Aeroplane Design," and is published in the February, 1937, copy of the Journal. The estimation of manufacturing costs is dealt with on pages 140 to 142. In this method Mr. Perkins arrives at an approximate cost of labour per lb. of aeroplane, and at an approximate cost of material per lb. of aeroplane. In each case these costs vary with the type of aeroplane and the method of construction. He also uses a factor which has the effect of reducing the costs with increased quantities, thus allowing not only for the personnel becoming familiarized with the work, but also for the more complete tooling up, which is possible with large orders.

In Mr. Perkins' paper he suggests values that can be used for different types of construction, but owing to the increased costs since the war the values given in 1937 cannot be used at the present time. From my own experience in the analysis of a large number of quotations and orders I feel certain that with a continual check and changing the constants as a result of changing conditions in the industry it is possible by Mr. Perkins' methods to make a very accurate prediction of the cost of aeroplanes before the final details of the design have been completed, and before the method of tooling up has been determined.

A criticism of Mr. Perkins' method is that any estimation based upon weight is wrong because it places a premium upon heavy and bad design. This criticism is, however, groundless because aeroplanes that are too expensive become eliminated by competition, and, therefore, only the best designs survive.

[2]Chief Aeronautical Engineer and Member of the Air Council, Air Service, Department of National Defence, Ottawa, Ont.

The Author

At the meeting, Miss MacGill commented on the difficulties experienced with material in regard to delivery and the difficulty of complying with the stringent Air Ministry specifications of materials.

The author considers that it is a planning and organization responsibility to ensure that material arrives well in hand for the manufacturing process; he also feels that any experienced estimator would provide sufficient allowance for these difficulties. But the author also realizes that the material factors today, during the war time conditions, are exceptional and therefore Miss MacGill's comments were justified and of particular importance.

Miss MacGill then mentioned the fact that comparative costs of any part of an airplane against, for example, an automobile, would be very much higher because of the accuracy, interchangeability and inspection requirements.

This is true, but the author would respectfully point out that this factor was referred to in the opening paragraph of the paper, where reference was made to the special manufacturing conditions experienced in the aircraft industry. Again, in the contingency and allowance section, Paragraphs 1, 2 and 3 are particularly applicable to this point. The author thinks that Miss MacGill's comments on these points were really covered in the paper.

Miss MacGill then commented on the effect of modifications and consequent delays and production difficulties.

Although these and other unforseen difficulties will arise, the author feels that, in most cases, a competent estimator, who must have had long experience in aeronautical engineering, will be able to fully cover these cases.

In later comments, which Miss MacGill kindly gave in writing, she suggested that the emphasis must be shifted from estimated costs to actual costs in order to fill the needs of the aircraft industry on this continent. This has serious disadvantages. One is, that actual costs do not necessarily give a true valuation of what the article should cost. Briefly, actual costs take no account of the competitive tender or the need to produce aircraft as economically as possible. I think Miss MacGill will agree that there can be no comparison between the value of aircraft where the cost has been planned and assessed, and where the management are aware to some extent of what it should cost, and the cost when the management simply sit back and await the routine completion of aircraft and then use the actual cost. Having estimated a cost, the manufacturing company and management are aware of the liability and make every possible effort to do the work economically. In some circumstances it is quite possible that the actual cost will soar to an unexpected height. The author does not wish to cast aspersions on any costing system or methods used by manufacturers during the present critical emergency period. The need, however, for the most economic and controlled cost during such a period is even greater than under normal conditions.

After years of experience, the author is opposed to accepting actual costs as a fair and reasonable basis, except in exceptional and special circumstances.

With regard to the comments suggesting that an accurate cost could be obtained if each unit or group were given average hourly rates, it has been demonstrated on a large range of types and quantities of aircraft contracts that this course is not necessary, and is subject to disadvantages which are not obvious at first sight. One of these is that even on each group or unit, so many types and grades of labour are used, that it would entail an enormous amount of detailed work to decide rates covering all of these categories.

Another point, nearly always overlooked, is the fact that the assembly labour, which is by far the largest cost in the complete manufacture, is also the largest in man-hours. Such assembly labour is always the highest paid and most difficult to obtain and control. If, therefore, an average rate, based on the assembly rate value, is used over all the aircraft, this will give the manufacturers and management added confidence and also provide a safety factor, inasmuch as they are covering lower grade labour with the highest rate of labour used.

The lowest paid grades of labour perform only a small percentage of the complete man hours necessary to build an aircraft.

These comments will, therefore, indicate the desirability of using an average rate over the whole aircraft.

With reference to Miss MacGill's comments regarding scrap, the author intended that scrap allowance would be covered in the estimated cost as follows:

1. Material:

(a) In the schedule shown, depicting the process manufacture of a detailed part, the material allowance given already allows for cutting waste and a small scrappage factor.

(b) In the complete material cost, an additional five per cent on top of the allowance made in paragraph (a), has been added.

(c) The material scrappage and waste have therefore been determined as a percentage, and only at the final stage have they been turned into monetary value.

(d) The allowance of scrappage to vary with the material has been included in the detailed planning allowances, as, of course, there should be more allowance for waste of materials such as "perpec's" and stainless steel than that of duralumin and mild steel plate.

2. Regarding scrappage on manufactured aircraft or labour, this has been allowed for as follows:

(a) In each unit, for example, the assembly of the aileron, duly quoted allowance was made for inspection rectification.

(b) Seven per cent allowance was quoted as contingency in the grand totals.

(c) Five per cent allowance was quoted for scrapping.

Thus consideration has been given to all the factors mentioned by Miss MacGill.

In practice it is not possible to allow different scrappage factors for different parts. On many units, such as assembling of aileron to wing, attachment of rudder to empennage, or attachment of main planes to fuselage, there cannot possibly be any scrappage. So that the scrappage allowance of five per cent on the complete man hours labour taken to build the aircraft, adequately provides for the scrappage factor. Statistics of costs over many years on various types of aircraft substantiate the author's opinion.

Remarks in the paper relative to tool costs were not intended to convey the impression that such costs should or could be calculated and estimated in detail. They were given merely as an indication of the probable liability for tool cost against production cost.

Summarizing this briefly, on a medium size order, i.e., from 300 to 500 machines, the ratio of tool cost to production cost should be 1 in 4 to 1 in 6. In other words, if the aircraft cost $6.00, the tool allowance should be $1.00 to $1.50. This cost ratio is, of course, per aircraft.

The author very much appreciates the discussion contributed by Miss MacGill. It is obvious that she has given the subject and paper considerable thought before writing these comments. He hopes that Miss MacGill will not consider his reply in any way a criticism; he feels that the subject covers a wide field and that many points which appear obvious prove on investigation to be more complicated.

Air Vice-Marshal Stedman's reference to Mr. Perkin's method of estimation of cost, which was published in the *Journal of Aeronautical Sciences*, February, 1937, is of interest. As far back as 1934 to 1935, discussions under the auspices of various aeronautical and production engineering societies took place relative to this particular subject. Acknowledged authorities from aircraft engineering plants from many parts of the world took part when this topic of cost of labour per pound and ratio of weight and cost factors was discussed. It was generally agreed that this principle could never be applied to the aircraft industry. Many engineers went so far as to openly condemn it as misleading, impracticable, and unsuitable for application in principle, in view of the extensive range of types of aircraft, both in weight and materials.

It is further pointed out that the changing manufacturing conditions, which are governed by the extreme range of many varied types of aircraft, would preclude the use of any static or constant factors which could be regarded as reliable and accurate.

The most important fact is, however, that should this method ever be attempted, it would be solely dependent on the use of data derived from previous and similar types of construction, which, in turn, would be based on actual costs. In other words, the constants or weight cost ratio factors to be used depend wholly on the availability of past technical costs data, without which no accurate estimate could possibly be arrived at.

Thus the cost per pound theory is entirely dependent upon previously estimated or actual costs from a similar type of aircraft.

With reference to Air Vice-Marshal Stedman's statement that the manufacturer is required to give an estimate before the aircraft is even designed, this is most unusual; the author has never heard of a case where any aircraft firm would be prepared to give a quotation on an aircraft that had not been designed and for which all the drawings were not available.

Valuations and assessments must not be confused with estimating production costs; the former procedures apply strictly to prototype aircraft, or for an order which is only for a very small number of aircraft. They can be regarded only as an approximate indication of costs or liability.

The author has no knowledge of any aircraft firm ever quoting a price for a prototype aircraft. It may be regarded as almost an impossibility. All available evidence indicates that where any firm has been asked to build a prototype aircraft, it has been on a cost-plus basis. If, however, a firm were requested to build a prototype aircraft, and also given a small order, for example, ten aircraft, the cost of the prototype aircraft would be spread over the cost of the ten aircraft. In no case would any firm risk giving a price on one prototype aircraft.

Based on these foregoing remarks, the author feels that it is correct to maintain that an estimate must be based on a complete set of drawings, because whatever the country where the aircraft is built, it must be manufactured to the specification and drawing requirements.

With regard to the remakrs that the variation in cost has not been considered, the author would respectfully draw Air Vice-Marshal Stedman's attention to the opening paragraph of the article which most emphatically refers to this factor. Another reference to this point occurs in the paragraph on detailed costs, where specific mention is made of the fact that the jigging, tooling and manufacturing costs will depend on the number of aircraft to be built, giving consideration to the binding delivery period. Further reference is made in the paragraph describing jig and tool costs, where the quantity factor is again emphasized.

With regard to the weight per pound theory, after discussing this point with leading American and Canadian aircraft manufacturers, both from technical and design staffs, the author finds that they agree that it is not applicable, nor is there any evidence of its being successfully used. In the main, they concur with the author's opinion on the subject.

ANTITANK AND ANTIAIRCRAFT GUNS

Brig.-Gen. R. H. SOMERS

Chief, Technical Staff, Office of the Chief of Ordnance, Washington, U.S.A.

Paper reprinted from *Army Ordnance*, Washington, January-February 1941, with the kind permissson of the editors

(abridged)

The advent of the internal-combustion engine made the tank and the airplane possible, and these in turn made the development of counter weapons imperative.

Present European combatants seem to consider that the prime necessity in overcoming a tank is armour penetration. Any projectile or sizable fragment of a projectile which gets inside a tank, together with the fragments broken from the armour plate, will do sufficient damage to the mechanism and the crew to put the tank out of combat. Tank armour is remarkably resistant to the effects of high-explosive shell bursting outside the tank, and there is no point in trying to secure bursts inside, since a solid projectile gives better penetration than a shell and will as certainly put the tank out of action. Consequently, the present trend is toward solid projectiles.

The caliber .30 armour-piercing bullet is almost ineffective against any recent tanks, and even the caliber .50 bullet soon may lose its value relatively. The larger calibers which have been considered for antitank use are the 20-mm., the 37-mm. and the 75-mm. In our service to date, principal emphasis has been on the development and utilization of the 37-mm. gun.

The methods of fire control used by anti-tank weapons apply the principles previously in use by our land services. Ranges are comparatively short—generally not more than a few hundred yards. The targets are moving with whatever rapidity possible. No great refinement of apparatus is possible under battle conditions. Telescopes are single power and are fixed with their axes parallel to the bores of the guns. They are provided with graduated reticules by means of which the gunner can adjust his fire by observation. Tracers are provided in the projectiles to make observation easier.

The problem of attacking aircraft is quite different. The airplane presents an entirely new kind of target, moving in three dimensions at speeds of 350 to 400 miles an hour.

After a period of cut-and-try development, the director system of fire control has been evolved. The problem involves three co-ordinates, for the gun must point in the proper direction, it must be laid with the proper elevation, and the fuse must be set so that the projectile will arrive and burst at the position which will be occupied by the airplane several seconds after the gun is fired.

Two principal and numerous auxiliary devices contribute to this end. To solve a triangle we must know the length of at least one of its sides, and our first device obtains this information by means of a complex optical instrument known as a "height finder." This is simply a military-type range finder with an added mechanism to translate automatically the rapidly changing actual slant range to the target into terms of the slowly changing height at which the target is moving. At the height finder we have two observers, each of whom follows the target through a telescope in the instrument; as long as they are accurately on the target and a third observer keeps the instrument adjusted to the distance of the target, the instrument gives a continuous reading of the height of the airplane above the ground. The reading is set on an electrical data transmitter on the height finder, which causes the data to be transmitted to the next principal device—the "director"—where an index or pointer is caused to move to correspond to the height of the target. Here, no one actually has to read the data. An operator by turning a small handwheel causes a second pointer to move and keeps it matched with the one which brings the data from the height finder to the director.

With numerous planes in the air, it would be easy for the observers at the height finder and those at the director to become confused and to take observations on different airplanes. To obviate this, a device on the director automatically "repeats back" to the height finder the direction and the angular elevation of the target on which the director is set. These are registered electrically at the height finder and serve to keep the two groups of observers on the same target.

Several tasks must be performed by the director before the data necessary to set the gun to hit the target in its future position are available. Allowance must be made for the speed of the airplane. Corrections must be made for wind, for the density of the atmosphere, for any variation in the muzzle velocity of the gun from standard, etc. The rapid movement of the target is allowed for and its future position computed by observers at telescopes attached to the director, one of whom keeps a vertical cross hair on the target by rotating the whole instrument about a vertical axis. Another keeps a horizontal cross hair on the target by rotating the telescopes about a horizontal axis and in doing so sets into motion a train of mechanism inside the director.

The result of all of this is that the machine computes continuously and with high accuracy the three co-ordinates needed at the gun. No one has to read these data, however. They are sent to the gun automatically where three operators, by the same "follow-the-pointer" system mentioned above, set them off. The gun is thereby continuously kept pointed in the proper direction and laid at the proper elevation for hitting the target. The setting of the fuse for the time of flight from the gun to the target, however, offers more difficulty. No satisfactory device has yet been produced for setting the fuse with the projectile actually in the gun. The best that can be done at present is to set it outside the gun in a device known as a fuse setter. A certain time is required to take the round of ammunition from the fuse setter, insert it in the gun and pull the lanyard. This is known as "dead time." The figure from the director which sent to the fuse setter allows for the time it takes the projectile to travel from the gun to the future position of the target plus an estimated allowance for "dead time." This would be good if the "dead time" could be kept uniform. But inevitably this time will vary from round to round—gunners are human and their timing is not uniform. When it is seen that a difference of one second, with the target travelling 250 miles an hour, means a difference of over 350 feet in its position in space, it is apparent that the elimination of "dead time" is greatly desirable.

The question of locating an aircraft target at night is immensely more difficult than in daytime. The principal method of doing this has been by means of an instrument known as a sound locator. This instrument consists, in effect, of two pairs of horns which conduct the sounds of an approaching aircraft to the ears of two observers, one of whom can turn the instrument about a vertical axis and the other about a horizontal one. This instrument operates upon the principle that, for a person with normal hearing, a sound affects each ear with equal intensity when it appears to come from a position directly in front. Each observer moves the instrument until he appears to be directly facing the source of the sound. It is to be remembered, however, that sound travels at a velocity of roughly 1,100 feet per second, and with an aircraft 20,000 feet away, the direction from which the sound appears to come will be very considerably behind the actual position of the aircraft. In order to compensate for this the data from the sound locator is fed into another instrument known as an "acoustic corrector" which makes the necessary corrections for the travel of the aircraft during the time it takes the sound wave to reach the ground and then gives the instant position of the target. The aircraft having been thus located, the battery is ready to open up its searchlights and get it within their beams. This having been done, the problem of fire control is the same as in daylight.

The classic time fuse is the powder-train fuse, but a newer and more accurate type is the clockwork fuse. This consists of a small watch movement mounted in the nose of the projectile. It is arranged to start when the gun is discharged and runs for a predetermined time, set by the fuse setter at the gun, at the end of which it causes the projectile to burst.

There is still another branch of antiaircraft activity which has not yet received anything approaching a stabilized solution. This is defence against low-flying aircraft such as the so-called hedgehopper and the dive bomber. Here we have very high speed targets flying so as to arrive with the least possible warning. A method of individual sight control has given fair results at times and is still being developed. Another method depends on tracer ammunition. This would seem to be easy, since the line of flying bullets is visible like a stream of water from a fire hose. Unfortunately, it is practically impossible for the observer on the ground to tell what part of the trajectory is nearest the airplane and hence in what direction to move his sight. This difficulty is made worse because the brightest part of the tracer path is closest to the gun. The method does have the advantage, however, that it requires no apparatus and is instantly available.

A further development is the central-control tracer method, in which the sights of several guns are controlled by an observer placed where he can best observe the fire. A small control box is provided into which vertical and lateral estimated deflections are set off while observing the tracer, and these leads are transmitted by flexible shafts to the sights of the several machine guns in the group. The gunners then concentrate on aligning the sights directly on the target against which they are firing. This method yields considerably better accuracy than individual tracer control since the control box is not directly back of the guns, but it sacrifices the greater advantage of individual tracer control which requires no apparatus whatsoever. Because of the apparatus required, it is not available on the march, but can be used only for firing in position. A fourth method that is now in the development stage is that of central control with computed leads. This is the most accurate of all methods under discussion when circumstances are such as to permit its use. Here leads, instead of being estimated, actually are computed by suitable apparatus.

Low-flying aircraft are available as targets only for a very short time. It is necessary, therefore, to have extremely flexible guns to meet them. Guns such as our 3-inch and 90-mm. antiaircraft cannon, although entirely satisfactory to meet bombing airplanes, are entirely too slow and cumbrous to engage such targets. In addition to the smaller caliber machine guns, we have developed an automatic 37-mm. gun and are developing a semiautomatic 75-mm. gun for this purpose. The standard projectile for attack of low-flying aircraft is a high-explosive shell with an impact fuse.

COMPLACENCY IN CONFUSION

ROBERT E. DOHERTY

President, Carnegie Institute of Technology, Pittsburgh, Pa., U.S.A.

An address delivered to students at the Carnegie Institute of Technology, Pittsburgh, Pa., on "Carnegie Day," November 26, 1940, and printed simultaneously in the publications of the members of the Engineers Council for Professional Development

Most people live in a state of complacent confusion. College students and graduates are no exceptions. How many of them, for instance, have only a vague and confused notion of the fundamental principles of their professional study or practice; how many of them are content to live without a clearly thoughtout philosophy of life; how many of them are inclined to think with their emotions instead of with their minds; how many, disillusioned by events of the past decade, are intellectually lost and assume the role of the cynic; how many, I ask, thus bear their own evidence of confusion? I believe you will agree with me that the number is discouragingly great.

The consequences of complacent confusion are serious. If these consequences were personal only—if they were merely the unrewarded personal careers, or the travail of minds that see no way out of new and trying situations, or the sterile satisfactions that go with intellectual poverty —they would be serious enough. But the consequences do not end there. They become national in scope when confused minds decide matters of destiny, for our democracy rests full-weight upon the proposition that the people are competent to determine their destiny. If they depend upon leadership, as they must, and leadership is confused, the consequences in national and local community life must be devastating, and indeed they have been devastating. By leadership I do not mean federal leadership alone. It is only a part of the whole. I mean every policy-making body or policy-making person in the country, whether in business, industry, education, or government. The general direction of flow of national and community life depends upon the general policy pattern constituted of all the individual policies of these agencies, and the people must accept that flow of life. Hence the consequences of confusion may strike you on two serious counts. They may strike you personally and professionally if you elect to join the large ranks of the confused, and then you may continue to be the victims with all the rest of us of confused leadership. You thus have a definite and direct personal interest in this matter, and also a very important interest as a citizen, even if this may appear to you less direct. My purpose here is to help you to recognize your interest and to encourage you to do something about it. I realize that the immediate, direct personal interest is, from your point of view, probably a more convincing basis for my appeal to you, but since the general social interest is not less important to you, I wish to pursue it further.

In the confused and demoralized world in which we now live, and which certainly will become more confused and more demoralized, there is a great challenge to the college students of America. It is the challenge to become intellectually prepared to deal with such a world, to meet with intelligence, courage, and confidence the new and trying situations which rapid changes are now bringing about. In such a world, which will be the world of your generation, life in America must be profoundly affected. National life will be difficult. Individual life will be difficult. The formulas of day-to-day contemporary life will not suffice because many of them will not apply to the new situations. New formulas must be thought out, and in this thinking there must be a return to the very fundamentals of science and living. There must be a clarification of basic philosophies —personal, professional, social. There must be clear, straight thinking. And to have these there must be genuinely educated people. Walking encyclopedias and handbooks will accomplish little. College graduates who have learned only the routine skills and formulas of their work will be intellectually lost in a world of new problems and thus will be ineffective in determining either social or individual destiny. There must be an intellectual renaissance, and that is your challenge.

I have mentioned confusion and its consequences and how I find these related to your own interests. I wish now to consider the question why in a nation of incomparably great educational opportunity there should be such pervasive confusion; why it is that the experience of 16 or 18 years of formal study, especially the period of college study, does not cultivate in more students a deeper understanding and a greater intellectual competence? After I have considered this question, I shall indicate more fully the nature of the task you will face if you set out in earnest to cultivate your own mind to its full capacity.

Does the habit of confusion and superficiality among so many college graduates stem from an inherent lack of intellectual capacity? Many times I have heard this given as the reason. But my personal experience with students and large numbers of young graduates does not confirm this defeatist view. Now I know it is a long hard struggle for most of us really to learn the art of constructive thought, but I know, too, that many of us have more capacity for understanding and for intelligent thought than we are given credit for having. In college we may be slow in getting our thinking gears into mesh; and if while we are trying to get them into mesh the external machinery of classroom procedure moves too fast, the gears get stripped. Then disorder and confusion result. However, with a little more patience and a little more emphasis at the right points, more of us might have got our mental machinery into gear and successfully made the shifts until we got into high gear. No, I do not accept the view that inherent limitations of mind fix the intellectual achievements of college graduates at their present levels. We all have our own limits, of course, and these are not the same for everybody; but I am convinced that there is still good leeway between actual and potential intellectual achievement. So we must look elsewhere for the trouble.

I have already hinted at it. We strip the gears. The trouble is that too much is undertaken in the time available. In the modern curriculum there is so much subject matter to be covered that in the time available few, if any, students can cover all of it with understanding. The result is that they do not understand much of what they have covered, or only partly understand it. They come to depending more and more upon memorizing, and less and less upon understanding. This process of racing through, with one eye on the next quiz, pages of words and formulas with half understanding or no understanding is utterly demoralizing. It is repeated in American colleges day after day, month after month, year after year, until superficiality becomes a habit, until confusion becomes accepted as a normal state of mind. With such a habit firmly established in college, it naturally persists afterward; and thus confusion and superficiality mark the minds of too many graduates.

It is therefore a deplorable fact that the college diploma is usually not a certificate of a cultivated mind. Rather it may signify only that the graduate has acquired the requisite number of credits by meeting the course requirements of grades, lessons, and attendance. And the meeting of these requirements is no guarantee of intellectual competence in the sense that I am stressing. The work may have been fully done and good grades received, and still the diploma might not be a certificate of a cultivated mind. I mean a mind that can cope with new situations—a mind that intelligently can find its way out of perplexities, whether these be professional, personal, or social—and that has the capacity of humane appreciation. The test for identifying a cultivated mind is to face it with perplexities—to face it with new situations not in the books but involving principles and knowledge which that mind has studied. Then see how it behaves. Does it grab for straws, does it become emotional, is it evasive, does it give up ? Or does it try to anchor to principle, does it have a philosophical base for its thought, has it essential knowledge, however limited, that will give meaning to its principles and to its philosophy, and can it think logically in applying all of these to the understanding and solution of the new situations with which it is faced ? I might state the point in still different words. An educated person is one whose intellect has been cultivated in the processes of understanding, of thinking, of appreciating, of solving perplexities; and the only way yet found that I know of to cultivate these processes is actually to engage in them, to experience them, and to keep on experiencing them at increasing levels of difficulty. Thus, the question whether at commencement you, and indeed all other college graduates, will have achieved the status of educated persons will not, I am afraid, be answered completely by the fact that you and they have received diplomas. Moreover, neither will the extent to which you have approached that status be necessarily measured by the number of courses you have taken, nor yet infallibly indicated by our grades. But you can measure it. You can tell whether you understand thoroughly what you have studied, whether you have grasped great truths and worked them into your thinking so that as time goes by you can think your way out of situations and problems of increasing difficulty. You can know your own mind. Do not rest upon the assumption that a college diploma tells the whole story. It does signify that you have completed a college programme and it may also be a ticket to a job; but it is not a ticket to the ranks of intellectual competence or to a successful career.

I am trying to have you grasp what I consider to be the most important thought in your educational career. It is this: that genuine education—the only kind of education that will help you to advance professionally and that will help you to live a life of service and satisfaction in a changing world—is not to be achieved merely by memorizing large quantities of miscellaneous information; it is not to be achieved merely by learning formulas, important as many of these may be; still less is it to be achieved by memorizing the words or the symbolisms of such information without understanding what they mean. It is to be achieved only by the acquisition of fundamental knowledge that is thoroughly understood and by the development of a purposeful attitude of mind and of a competence in thinking your way out of perplexities.

I realize I am on delicate ground. I run the danger of suffering your judgment that I indulge in pedantic counsel to you, and the faculty's judgment that my appraisal may be too pessimistic. I hope that I may not deserve such judgments; but if I seem to, may I ask that before the judgment becomes final, you at least think over carefully what I say and place it against the background of the world changes you see on all sides.

In any case, do not misunderstand me. Memorized information and formulas are of course important, indeed they are essential, but only so if they are thoroughly understood and furthermore are related *in your own mind* to a definite intellectual purpose. Then they cease to be miscellaneous information and become knowledge. For instance, it is futile to learn, however perfectly, the language of Newton's laws of motion unless the significance of the language is clearly comprehended in its relation to the tangible physical facts which these laws correlate; in other words, unless one can visualize and interpret a physical situation involving these laws.

Let me be more specific regarding the nature of genuine education as I conceive it. I will discuss four essential elements which I have already mentioned in passing. The first is the acquisition of fundamental knowledge; that it to say, the learning and understanding of great basic truths and of a sufficient background of related fact to give definite and constructive meaning to those truths. As great truths I include those in the physical world, in the social and economic world, and in the realm of the human spirit. There are not many. I refer to such principles as the law of conservation of energy; the law of diminishing return, the principle underlying the golden rule. There are of course hundreds, perhaps thousands, of principles and formulas derived from such basic truths, much as the numerous theorems of geometry are derived from a few fundamental premises; and then there are perhaps a few hundred more based upon somebody's opinion. But it would be both hopeless and futile to undertake to learn all of them. One must discriminate between these and the great truths that form the bedrock of intelligent thought.

A second element is the development of a philosophy of life. This is a long process. It is settling upon basic purposes and attitudes in life and the reasons for them; it is placing the indispensable underpinnings of faith and courage and self-confidence. It is a continuing building process—the process of testing against the experience of your own life and the recorded lives of others, those purposes and attitudes that are tentatively adopted and of thus selecting and fitting in, piece by piece, the structural units of a life purpose. For instance, one important and immediate unit in this structure with which you are now presumably concerned is professional purpose. I do not mean the specific details and place of your future work, but the broad lines of professional activity that now seem to offer the greatest promise of those satisfactions which, after careful thought, you have come to cherish.

Next I mention humane appreciation. A mind or life that shuts itself off from an understanding of man as a human being; that shuts itself off from an appreciation of the desires and disappointments, the yearnings and satisfactions that motivate human activity; that shuts itself off from an appreciation of the literature and arts through which the human soul has attempted to express itself—such an isolated mind or life is only half human, and therefore not genuinely educated.

Finally I come to intellectual competence. Without this competence the other elements I have mentioned—fundamental knowledge, a philosophy of life, and humane appreciation—would represent merely passive satisfactions. Such satisfactions are of course important fruits of education. But they do not constitute a whole; they are complementary to another fruit—the fruit of constructive thought. And to achieve this competence in thinking one's way out of perplexing situations is to round out that genuine education which I am urging upon you.

Do you want that kind of an education ? Do you wish to prepare for keen competition ? Do you wish to preserve your precious liberty of thought, speech, and worship ?

If you want these things you can have them, provided you pay the price. I doubt that the price is any higher than you are now paying, for I know most of you are already working hard. But it is a different kind of price. it is the price of *taking the initiative* in your educational work. This demands of you greater resolution than does merely *following* the regimen of class-work. It requires greater devotion to purpose.

No one can possibly do this educational *job* for you. The assumption that the instructor can do it for you is the basis for more educational confusion than any other I can think of, save one, namely, the assumption that education is achieved by memorizing a lesson merely in order to report it back on a quiz and get a grade. A recent definition, if I may be facetious, is that education is the process by which the instructor's notes get into the notes of the student without passing through the brains of either. No, the kind of education I am proposing cannot be given to you; you must *win* it by hard intellectual struggle in which you take the initiative. The faculty may inspire you to intellectual effort, but you must exert it; the faculty can help you to understand, but you have to do the understanding; the faculty can coach you in the art of logical thought, but you must do the thinking; and the faculty can help you to cultivate good taste and humane appreciation, but you have to do the cultivating. Every time you struggle with a new concept and *master it*—for instance, a physical law, or an economic theory, or a concept of art—you will have made an educational advance, you will have added to your intellectual stature. Furthermore, every time you make *use* of such a law or theory or concept to think your way out of a perplexity or to experience a new appreciation, you will have achieved another and further intellectual advance But in both cases you must do the job. You, not the coach, must carry the ball.

So I urge you to take the initiative and learn to use your heads. In the first place, dig yourself out of confusion. Insist on understanding! Do away with superficiality! Stop memorizing words and formulas that you do not understand, merely for a grade. Do not go on cultivating a habit that will cripple your mind for the rest of your days—the habit of superficiality, the habit of accepting confusion as a normal state of mind, the habit of playing on words that carry no meaning. You know when you understand and when you do not; when you grasp a point that is clear and clean cut and when, instead, it is blurred and confused. With all the emphasis in me I repeat: Insist on understanding! Then, under the guidance of the faculty in your regular class programmes, but under your own initiative, you will be in position to go forward more effectively and more rapidly with the acquisition of great truths, the evolution of a philosophy of life, the cultivation of humane appreciation, and the development of intellectual competence—in other words, a genuine education gauged to the demands of the changing world in which you will live.

DISCUSSION ON ENGINEERING TRAINING FOR NATIONAL DEFENCE[1]

A. R. Cullimore[2]

In dealing with the tremendous defence programme in the United States from a production standpoint, it was soon realized that the problem could not be met by industry alone without some help as regards technical or vocational and, on the top, engineering training.

The engineering training programme, it seemed to me, was conceived on a threefold basis. It was easy enough to get in boys if they were available, or young men from plants on the outside, and teach them to operate a machine. But in order to get production, there had to be something more specific or definite than that. So a plan of training was prepared in Washington, in collaboration with Dean Potter and his Advisory Committee and the United States Department of Education, taking into account three factors.

One was training at the vocational school level. For this, men were recruited largely from the local State Unemployment Bureaux, the United States Unemployment Commission, and the W.P.A.

This training, of which Dean Potter speaks, and to which $66,000,000 has been given, was really a pre-service, as well as an in-service training.

In addition there is a very definite in-service training as such, or training within industry, which is in charge of two of our ablest men in the States, Mr. C. R. Dooley of the Standard Oil Company, and Mr. Walter Dietz of the Western Electric Company.

The United States Department of Education have charge of all this vocational training.

In addition, it was evident that the engineer had a part to play and before we got very far in the spending of dollars we must have more men on what might be called the engineering level.

So, Congress provided money for that, and they named Dean Potter as Consultant and Chairman of the Advisory Committee on Engineering Training for National Defence. While his paper covers only a part of the whole picture, we in engineering believe that it is a very important part.

It has been a pleasure to present Dean Potter's paper. As my contacts have been particularly in the New Jersey area, and as I was more or less familiar with the basic philosophy of the programme, Dean Potter suggested that I might attempt to answer questions arising during discussion. Please note, however, that the answers or opinions are mine, not his.

We in our America, as you in your part of America, are very sensitive as to our autonomy, as regards educational institutions.

The situation was that our engineering colleges throughout the country were not able to finance short courses of intensive training without financial help. Probably those of you who are in educational work will appreciate that difficulty. So it was decided to have the institutions responsible directly to the United States Government, without any attempt at supervision, except direction as to the broad general lines of the endeavour.

Thus the institutions became custodians of certain general public funds to be spent upon courses which were outlined and definitely laid down by the institution, and not by the United States Government, with the help of advisers, of whom I happen to be one.

Sometimes as educational adviser I have wished I could tell all the colleges in any neighbourhood exactly what they ought to do and when they ought to do it, and get something started, but that comes perilously near the sort of dictatorship which is repugnant to our ideals.

This brings in the great problem which we face today. How can we make the best of existing conditions and get efficiency ?

The question has been asked whether the United States of America is doing all possible to help the war. My reply is "No, not all possible, but all that is humanly possible."

The problem then becomes one of gearing up a plan of this kind to meet the human needs, the human factors and the human criteria which bear upon it, and in my opinion, Dean Potter and his committee did an outstanding job in that respect.

Take the case in our own industry, which had its own specific needs, in some cases quite vital, in other cases not so vital. At the start, contracts were coming in at the rate of one billion, three hundred million in six months. A man

---

[1] Paper prepared by A. A. Potter, Dean of the Schools of Engineering, Purdue University, Lafayette, Ind., and Chairman of the Advisory Committee on Engineering for National Defence, at Washington, for presentation at the Annual Meeting of the Institute and published in the February, 1941, issue of *The Engineering Journal*. Owing to the pressure of work in the defence programme, Dean Potter was prevented, at the last moment, from coming to the meeting at Hamilton. Fortunately one of the members of his Committee, Mr. A. R. Cullimore, was able to present the paper and tell of his own experience in organizing the State of New Jersey.

[2] President, Newark College of Engineering, Newark, N.J., U.S.A.

the day before he had his contract had no needs in the way of staff or production engineering. The day he got the contract he did not know what it was all about.

Thus the whole picture changes from day to day. The plant with no needs yesterday has overwhelming needs today, and the plant that has no needs today may have over whelming needs tomorrow. In order to meet the specific needs in engineering training, it was necessary to build up a reserve of engineering personnel, based on the experiences which we gathered in trouble shooting.

The thing that seemed to us the most necessary in that particular area was the question of production engineering and production supervision. And if we could only get the heads of our concerns production-minded we would have accomplished a great deal.

Next to that was the subject of engineering drawing, not necessarily from the standpoint of draughtsmanship, although there was great need for instance in the aeroplane industry for draughtsmen, but because drawing is the universal language of engineering, and it is difficult to picture any man going far in the engineering field unless he knows something about the language with which one engineer could talk to another.

Another thing which became and still is extremely important is the inspection and testing of material.

These three matters in our area, and probably in most regions of the United States, stood foremost in our immediate wants.

I think something ought to be said about the type of men—they are not all young men—coming in for this work. When we started in New Jersey at Newark College, we had four engineering courses, but did not give the matter much publicity. We had a few posters in the vicinity of Newark in plants, and a few newspaper articles appeared.

In our own institution there were some 3,500 applications within the first two weeks. They were studied to see what class of men were applying, and to find whether these men were really wanted by industry, or just boys who wanted to get a little tuition free and of course get a little more money in connection with the defence programme. In other words, how many really came with the backing and blessing of their own industrial concern. At least 35 per cent of them came with this support.

One of the reasons why industry was not asked to name these men was because we thought this programme had very definite value as a recruiting agency. After all, what we wanted to get a hold of was a group of men who not only held defence positions of some consequence and who would be directly benefited by a programme of this sort, but we wanted to find, if we could, if there were any other men in any non-essential plants who had the capacity of getting into defence industry, as such. Actually, there was a very considerable group of such men. About 75 per cent of our applications were from college graduates, engineering college graduates. Quite a few men had had two, three or four years work in engineering college, without graduation.

Some of the men had one, or two, or even four years in the college of arts, majoring in science or mathematics.

It is felt that to gather together those people, to give them a course, to test them in that field, to make them available for industry, was in itself a very considerable contribution.

Now, that, in a word is perhaps a very sketchy outline of some of the things that we have been trying to do. At the present time, out of the total of 3,500 applicants in New Jersey, we have in training there, by the 10th of the month, 1,089 young engineers, and none of whom have had less than two years of engineering training.

Concerning the capacity of the vocational schools and the technical institutes, we found we would have to adopt the farming out method, taking care of about 565 men more than we have any business to take care of, and doing it very largely by utilizing laboratories on Saturday afternoons, when they were free, and holding classes in the junior colleges, art classes—anywhere we could get space within the limits of Newark.

We have to do with education production as with other production—farm out a good deal of material where we can.

As regards the relation of vocational training to training in the plant, I am heartily in sympathy with plant training, but believe that if higher education plant training or vocational training, separately or together, can turn out a man who can step in and immediately take his place in a productive capacity, the problem is being solved.

For instance, in talking with a man in charge of one of the large arsenals the other day, he said, "We give them a good course of about sixty hours when they get into the arsenal."

Of course they do. We could not possibly give a course in our college or any vocational school which would teach a man how to be a powder inspector in a certain particular arsenal, testing a certain particular powder. We could give enough of the background of powders—the technology, metallurgy and chemistry—and then they could take that engineer as an assistant and jump him from that to a junior, finally a senior, and finally an inspector.

So the vocational problem and the school problem in engineering is only a part of the whole frame, and I think that should be definitely realized.

E. P. Muntz, M.E.I.C.[3]

Dean Potter has shown us very clearly how the United States Office of Education, for which he is consultant, is coping with the shortage of technical and skilled manual workers. The plan he outlines is impressive and its results should once again emphasize the effectiveness of analysis and execution of the solution of many such problems from the engineering point of view.

As the war progresses we are becoming more and more accustomed to thinking in sums over seven figures. A plant valued at over one billion dollars, and composed of over one thousand public vocational schools, is something to conjure with when an increase in manual workers is required. I wonder if Dr. Potter would give us the approximate capacity of these schools. He mentions that "it is expected that during the present fiscal year the skills of more than five hundred thousand people will be increased through this vocational educational programme of 'less than college grade'." The figures given indicate a high average—over five hundred per unit—at least high to us in this country.

It is most impressive to learn from Dr. Potter's paper that up to December 30, 1940, a total of four hundred and forty-four engineering defence training programmes had been approved to be administered by ninety-one engineering colleges in forty-four states, the District of Columbia and Puerto Rico.

In this country also, there is an acute shortage of engineering specialists in many lines. Our new war industries are reported as requiring one hundred thousand workers this year, between four and five thousand of whom must be technically-trained people.

A similar supervising agency for technical education is required here. There should be the closest co-operation between such an agency and the most efficient placement agency that can be devised.

Our potential reservoirs of technically-trained workers lie undoubtedly in:

1. Refreshing and re-establishing those previously qualified and presently engaged in non-essential industries.
2. Giving to those already proficient in mathematics and physics sufficient additional instruction along practical lines to permit them to take over certain specific technical work and thus release those with a broader technical training.

[3] Foundation Company of Canada, Limited, Montreal, Que.

Our regular supply of technically-trained workers comes from our engineering schools of course and must be augmented to the limit of the capacity of staffs and facilities.

The best trained and most efficient man in the world is not much good if placed in the wrong job.

I wonder if it is too early to ask what results are indicated under the United States system and what difficulties are encountered in placing the people trained? A principle which has been advocated here is that training in vocational schools, while desirable to a point, should be carried on only to supplement a much larger proportion of training within industry itself. The chief reasons are: (1) that the actual contact with, and orientation to, industry is made by the individual during schooling, considerable time and wastage thus being saved; (2) that in a vocational school a whole class is too often retarded by one or two drones to an extent out of all proportion to its numbers, the result being a longer period of training for the majority or less proficiency in a given time.

It would be interesting to know if the Office of Education in the United States is attempting to bring about any considerable increase in schools within individual industries.

Dr. Potter notes that "Present world conditions demand that technology operates at full speed." We will all agree absolutely. Once again our profession is called upon to create newer and newer articles for offensive and defensive warfare far in advance of our normal peacetime development and at the same time to develop the most stupendous industrial production of all time.

However, it would be neither good engineering nor common sense (and the two are really largely synonymous) to disregard where we are going. True, the paramount concern of every one of us is to contribute all our energy to winning the war—but how much more sensible to have a definite plan for after the war, and, as the opportunity occurs, so mould our actions without impairing the effectiveness of our war effort, that the birth pains of peace may be endured.

We as a profession will be accused once again of having developed processes and increased productions without a thought to the distribution of the increased products of our brain children. This accusation will not appear during time of war—but it will thereafter. The last Great War is so fresh in the minds of so any of us, and the aftermath, too, that there should be little doubt that winning the peace is equally as important as winning the war, or even more important. Therefore, I plead that just as soon as our various technical educational programmes show that the war demand is being fulfilled, attention must be given to after-the-war requirements, so that we may not lag behind the requirements.

We who have been largely responsible for our technical advances may develop by engineering approach to, and analysis of, these requirements, a plan for the future which will have some prospect of avoiding the unemployment and resulting hardships of the decade previous to the present war, as well as much of the unrest immediately following the last.

Already Great Britain has a Ministry of Reconstruction, one of its chief duties being adequate preparation to meet post-war problems. Great Britain will have vastly more physical reconstruction to contemplate than we are likely to have. It is becoming increasingly evident as time goes on that she has solved many social problems that we still have to face. Mismanagement of these is much more likely to lead to disorder and chaos, than if all our physical possessions were battered by bombs.

Everyone will agree that after the last war we tried to get back to a so-called normal altogether too quickly. This time the problems are much greater and the time required to readjust will be considerable. Such educational programmes as Dr. Potter has outlined will be of the greatest benefit if continued and moulded to help realign us to peaceful occupations.

I would like to compliment Dr. Potter on his paper. It is a most valuable contribution at a very crucial time.

Ernest Brown, m.e.i.c.[4]

The central thought in the scheme of engineering training described by Dean Potter is expressed by that paragraph of his paper which reads as follows: "The leaders in the engineering profession as well as in the Army and Navy of the United States of America are insistent that the engineering schools of this country should maintain during the present emergency the strongest possible programmes of undergraduate and graduate instruction and should increase their research efforts so that an adequate supply of well trained and creative engineers is assured."

A meeting of this kind hardly needs to be assured of the special responsibilities of those in charge of our engineering schools during war time. The difficulties in the problem of training are probably not realized so fully. Two main factors are of paramount importance—the staffing of the schools, and the state of mind of the student body. Members of staffs have withdrawn wholly, or in part, from teaching duties in our schools to serve in the active forces, to act as instructors in the air-training scheme, to work on special problems in association with the National Research Council, or in numerous other forms of war effort. Replacements are in many cases impossible in existing conditions, and the teaching burden of those who remain has increased greatly. Many young graduates who normally would be doing post-graduate work are engaged in industry, and are therefore not available as demonstrators. As a result of all this, teaching resources are heavily taxed.

A condition of unrest exists in our student body. Under an agreement made between the universities and the Government they have devoted six hours per week to military training, in addition to the regular course of study, and have been immune from call for training during the college year. It is difficult, however, to keep their minds centred on the idea that in thus continuing professional training they are doing their part fully and serving a necessary purpose in the war effort. There is the strong and ever present pressure towards enlistment, or towards work in some war industry. The latter condition, particularly in the final year, frequently involves the question of a student leaving before completion of his studies, or in the extreme case a drastic shortening of the period of study leading to a degree in the case of all students. The student does not wish to leave without his diploma. The diploma, as a certificate of professional training, loses some of its value if that training is seriously curtailed, or itsefficiency impaired. Only those who are in close touch with such a situation can realize the full effects of it, and the difficulties which it creates. It is a long way removed from the ideal outlined by Dean Potter. It results from our being at war.

A survey of the careers of members of a class which graduated about five years ago, showed that a considerable number are on active service. Enlistment, or withdrawal for war service from the earlier years of our courses is already appreciable, and shows a tendency to increase. The numbers graduating in the next two or three years will thereby be reduced, and it seems likely that the needs of industry and of our active forces will increase. These facts show the need for intelligent effort to establish a proper balance. The Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy, and the Canadian Institute of Chemistry took early steps to provide for the Government a register of their memberships, and of their special qualifications, in the hope that the best use might be made of our technically trained men in the war effort. The results have been disappointing. It is rumoured, however, that a proper control will soon be set up, in which the bodies named will be asked to take an active part, so

[4] Dean of the Faculty of Engineering, McGill University, Montreal, Que.

that better use may be made of our resources. This should tend to ease the situation in the schools by enabling industry to appeal confidently to such an organization to fill its needs, rather than to seek partially trained men from the schools. A favourable reaction on the state of mind of the student should follow—an important matter where his education is concerned. The industries themselves, and our technical schools, can continue to train effectively the large numbers required in the sub-professional groups such as machinists, welders, junior draftsmen, etc.—a service for which the engineering schools are not equipped. Their true function, as Dean Potter has said, is to "maintain during the present emergency the strongest possible programme of undergraduate and graduate instruction . . . so that an adequate supply of well trained and creative engineers is assured."

C. R. Young, M.E.I.C.[5]

The outline of the personnel activities being carried on in the United States in connection with the great defence programme of our neighbour indicates a very comprehensive and a very thorough enterprise.

I fancy that those here present who, like myself, are particularly concerned with engineering education are most interested in training on the engineering college level. As Dean Brown has clearly pointed out, there are great difficulties associated with the carrying on of a war-training programme as we might wish to carry it on.

At the outset of the war a very helpful letter was addressed by Lieut.-General MacNaughton to the presidents of the universities of Canada, suggesting, on behalf of the National Research Council, that training in engineering and in scientific courses should follow normal lines, that it would be inadvisable for men in such courses to enrol in any large numbers in the armed forces immediately, particularly so for those in the upper years, and that it would be much better for them to continue their courses and be thoroughly prepared and ready for the call when it should come.

At the University of Toronto we have carried on in accordance with that policy. In the session of 1939-40 no great numbers of men left their courses for the armed forces or for war industry, but during the present session we have found a very considerable unrest. The symptoms reported at McGill are duplicated at Toronto.

It had been known almost from the beginning of the session that considerable numbers would wish to enter the armed forces long before the session had ended and, late in December, when we were besieged by urgent requests on the part of war industry, in some cases from governmental corporations, it became necessary to adopt special measures to deal with the situation. We consequently released a number of men, especially in chemical engineering, at the end of the first term with the assurance that they would receive their degrees in June if they presented certificates of having been suitably employed in war industry for a defined period. These were picked men whose success in the year's work was assured, and who therefore might very reasonably be allowed to go without doing any violence to the standards of the institution.

Since then further withdrawals have taken place. Out of a fourth year of 186, over 30 (43 on March 8th) have withdrawn for the armed forces or industry, and I have no doubt more will withdraw before the end of the session.

In the third year unrest was also evident, and in order to do something to stabilize the situation it was decided by the Council of the Faculty of Applied Science and Engineering that in the national interest we should curtail the fourth year, at least so far as the examinations were concerned, and free the men of this year by the middle of March with all examinations and tests completed. The third year is being freed by the first of April, with examinations and tests also completed. These measures will, I think, have some effect in quieting the unrest. The curtailed examinations or tests will be as simple as it is possible to make them in order to discover the qualifications of the men for graduation or for undertaking the work of the next higher year.

We are not curtailing in the slightest the work of the first two years and the normal examinations will be held for them.

That is merely one contribution that we are trying to make to the national war effort at the University of Toronto. Another one has been the selection from the fourth year of a number of men of particularly high qualifications to take an intensive special course in radio and communications. It is believed that these men, along with others from the final year in the Faculty of Arts, will be most useful in connection with certain activities with which you are already familiar.

We could wish that we had a little more direct leadership from governmental authorities as to the lines which our endeavour might profitably take in the Faculty of Applied Science and Engineering at Toronto. It seems probable that as a result of the newly announced federal activity in marshalling the technical personnel of this country we may have direction in the framing of our programmes very shortly. I am quite sure that at Toronto, as at all of the other engineering colleges in Canada, we are prepared to do anything that may be practicable and in the national interest, despite the fact that our staff is overworked due to the absence of several senior members of it on war service.

It is a very difficult thing, as Dean Brown has suggested, to find at this time the teaching personnel required for special war courses. Unless we can attract additional men of sufficiently high qualifications, I do not believe that we could undertake additional courses of the kind to which Dr. Malcolm has referred.

Someone in authority might very well point out at this time the great need of holding in the engineering colleges those men who are especially qualified to teach technical subjects. The lure of the armed forces is very great, but it should be pointed out that the duty of many of these men distinctly lies in teaching work in the engineering colleges.

I was very much pleased to read some time ago a recommendation of the National Academy of Sciences and the National Committee on Education and Defence of the United States to the effect that deferment of military training under the Selective Service Law be granted for those who are required to replenish depleted instructional staffs. We ought to be thoroughly aware of the fact that to allow teaching personnel to go off to war industry, or to the armed forces is tantamount to eating our seed grain. You cannot possibly carry on the grade of training that is essential in these days without having a skilled and competent teaching staff.

We should like to carry on graduate work to a much greater degree than we are able to do it at the present time. There is here, again, the problem of staff, but at the same time there is to some extent a disposition amongst students to look for something that is quick and direct; in other words a demand for the *ad hoc* type of training. Training for the armed forces is, of course, very much of that variety. It is necessarily training in a narrow specialty, intensive and direct, with a view to doing some particular job in a particular way. Such is not sound engineering education, but, after all, the conduct of war is not a normal engineering enterprise such as you would ordinarily advocate for the people of any country. It is a disagreeable task that must be done in the shortest possible time and in the most effective way that can be discovered.

I fancy that as time goes on we shall be asked to undertake some narrower and more intensive training than we now give and to fit it in somehow or other with our existing programmes. If we are asked to do so we must be aided in some manner in the obtaining of the necessary staff and

[5] Professor of Civil Engineering, University of Toronto, Toronto, Ont.

the necessary funds. Under the existing budget it is impracticable at the University of Toronto to carry out any large programme of specialized training. Additional funds would need to be provided from some governmental source.

Whether courses of this kind should be carried on simultaneously with the regular courses, or whether they should be given at night or given during the summer months has not yet been determined. At Toronto there is a Committee of the Faculty Council now giving careful study to the whole matter and I feel quite sure that when the policy is laid down for us and we are able to work to a definite pattern, we shall not fail in doing our duty.

Lindsay Malcolm, m.e.i.c.[6]

It seems somewhat preposterous for me to discuss a matter brought up by Dr. Cullimore of Newark College, but I am probably in the position of being a platoon commander, rather than a general, or the general's aide, whom Dr. Cullimore represents.

We have been up to our necks in this kind of training since last September. Cornell University, due to the exertion of our Dean, saw the opportunity of doing some work to help the aeroplane industry, more particularly in Buffalo, and in September last he organized there a course at graduate level to help this industry.

This was not under the Defence Training Plan, as this plan was not then constituted. We had in that first course about 125 students from the aeroplane industry who were graduates of some university or other. To teach this group we released one man from the School of Mechanical Engineering, and one from the School of Civil Engineering, (both assistant professors).

The assistant to the Dean, Dr. Adams, was placed in immediate charge, so that these three men were there to to do the work. They carried on until the Defence Training Plan came into being.

Immediately following the organization of the Defence Training Plan there was set up at Buffalo an additional course at the undergraduate level for those who had graduated from high schools or had an adequate period of training in the industry itself. We had about 400 students apply and about 350 are carrying on at the present.

The Curtiss plant and the Bell plant, if I may speak particularly, were so much impressed that they have continued this work and have asked for an additional school in mechanics at a higher level then even the graduate level. Dr. Goodier, who was formerly connected with Toronto University, is in charge of that work. He is the head of the Mechanics Department in the School of Mechanical Engineering. He goes to Buffalo every Friday. Peculiarly enough, where we expected 30 we have 70 students taking this very advanced course in aeronautics.

We have three very flourishing courses at Buffalo. Now, we were not able to release any more than two members of the staff, without counting Dr. Adams, to this Buffalo work. We had to go out in the open market and obtain engineers who were capable of teaching, and we now have four additional members of staff there, making seven in all for the training programme in Buffalo.

I suppose you might call them special courses, although the instructors are for the present permanently there.

Professor Moynihan, of the School of Mechanical Engineering, and Professor Chamberlain, of the School of Electrical Engineering, were sent to the southern and western part of New York State to canvass all industry. They came home with the most surprising amount of information concerning the industries who wished their employees to take advantage of this opportunity, so they could speed up their work from the engineering point of view.

In Elmira, N.Y., the chief industry is the American Bridge Company, and the officials asked that courses be set up for their men. This has been done, but we did not limit the courses to those men. Anybody in that district capable of doing the work can come. We have students there from about eight or nine industries. The courses we have set up are handled from the School of Civil Engineering at Cornell.

In the structural field on Friday last we started an advanced course in structural draughting, at the request of the American Bridge Company. We had no instructors that we could spare, so we obtained from the chief engineer of the American Bridge Company in Elmira, one of his men, who he thought was capable of doing the work. This instructor is proving a very satisfactory man indeed.

The elementary course in structural engineering and elementary design, and the advanced course, could not be handled in any other way than simply to detail two of our staff. As we have had some deaths in the past year in our staff, we could not overload the new men coming in, so one of the members of the Structural Department and I are teaching these two courses.

In Ithica itself, because we draw from such places as Corning, Elmira, Bath, Sidney, on the south, Geneva on the north, and Courtland on the east (we cannot go too far to the east because Syracuse University is in the picture there), we have organized five different groups in Ithaca, largely in the industrial field. The courses which we have in Ithaca, are: Materials Testing and Physical Metallurgy, Electronics, Machine Design, Tooling and Design, Production Management and Supervision, specifically related to industry.

In all we have eleven courses set up. (There are three others in contemplation, at the request of people who are interested.) This has put a great strain on the staff. Our staff members normally have been, as in most universities, doing all that they could at any one time, sometimes being overloaded (although our friends in the open always want to tell the professors how little they do). We have thirty members of staff actually teaching these courses. The courses have from seven to fifteen students in any one particular course. We try to keep the classes as small as possible in order to provide supervision—on design and draughting and personnel work. We try to limit attendance in any one course to about twenty per teacher per evening. Normally the length of these courses is three hours each night. In order to get around and see that everyone is following the work, the classes should be limited in size.

I was impressed by Dr. Cullimore's statement about the ages of these men. In the class of which I have personal charge, there are three boys whom one industry has just taken in the draughting-room. These have had high school training and have graduated from the high school. They are just youngsters, keen, fairly well trained in their mathematics, and seem to follow the work all right.

I have four men in that same class that I would say were fifty years of age. These men have been in highway engineering, in sales department work, etc., and are anxious to get back to the technical side of the work. It is surprising how keen both these boys and men are. They are anxious to get ahead with their work, and they show that they intend to go to it and stick it out.

Another point that Dr. Cullimore suggested was the recruiting for these courses. We have used the newspapers and two radio stations in the district, that I know of. There is one other that I do not think we have used yet. Cornell University has its own radio station, and we have used that rather extensively to cover the district. We have also used the radio station in Elmira, and we have had surprisingly good results. It is not a very highly industrialized area, but we are drawing from the industries that we have. These industries give us their support and the managements in many cases are intensely interested. For example, last Friday and Monday nights, the chief engineer of the American Bridge Company at Elmira attended all the sessions, just to show his interest in this worth-while problem.

[6]Director of the School of Civil Engineering, Cornell University, Ithaca, N.Y., U.S.A.

NEW AMERICAN TONNAGE

From *Trade and Engineering*, (London), November, 1940

In the programme undertaken by the U.S. Maritime Commission for the rebuilding of the mercantile fleet are 18 cargo-passenger liners. A number of tankers and many pure cargo ships have been completed as part of the programme, but none of the cargo passenger ships have yet run trials. These are, however, in many ways the most interesting of all the vessels. Some of them are equipped with steam machinery and others with Diesel engines. The first steamer will be placed in service in the course of the next month or two, and the first of the oil-engined vessels will run trials next spring. According to present arrangements, the motorliners and some of the steamers will trade between New York and East Coast South American ports. The remaining steamers were intended to operate on a round-the-world service, or between New York and London. These routes will have to be modified while the war is in progress.

The hulls are standardized in most respects, in spite of the installation of different classes of machinery, and it may be noted that the high-pressure boilers and steam turbines are to be installed in a machinery space equal to that occupied by the Diesel engines. The range of action of the steamers is, however, less. The length overall of the ships is 492 ft., the moulded breadth 69 ft. 6 in., and the draught 27 ft. 3 in. The gross register is 7,800 tons, and in normal service a speed of 16½ knots is to be maintained.

In the motor-ship two Sun-Doxford engines will be installed, each developing 4,500 b.h.p. The installation will be entirely different from that of any British-built Doxford-engined ship, since the two units will be geared to a single shaft. They are designed to run at 180 r.p.m. which is a much higher speed than has hitherto been adopted with Diesel machinery, and the propeller will turn at 80 r.p.m. The drive is taken through Westinghouse gearing and electric couplings, which receive their excitation at 240 volts from the main generators. The total cargo capacity is 560,000 cu. ft., including 60,000 cu. ft. of refrigerated produce.

The cost of each of the ships at normal rate of exchange is in the neighbourhood of £800,000, which, at the time the order was placed, was probably about double the expenditure involved in building a similar ship in this country.

REPORT ON CONSULTING ENGINEERING PRACTICE AND FEES

From *Mechanical Engineering* (New York), March, 1941

The problems facing the consulting mechanical engineer in setting fees for his services, in defining the scope of his activities, and in determining the cost to him of rendering service have been before The American Society of Mechanical Engineers for some time. Early in 1940, President McBryde initiated an investigation of these problems and in August appointed a Committee on Consulting Practice to analyze them in the light of the greatly increased use of consulting mechanical engineering services in the national-defense programme and also in relation to the broad aspects of rendering consulting services in the fields which are predominantly of a mechanical-engineering nature.

Subsequent meetings brought forth a preliminary draft which was reviewed carefully by the committee members and Mr. Davies and then sent to a number of representative engineers (in all parts of the country) fully conversant with consulting engineering problems as they relate both to rendering and to using such services. The finished draft was presented to the Executive Committee of the Council in November, together with the written comments of this large informal "board of review."

An abstract of the report has been prepared and is included with this article for the benefit of all A.S.M.E. members. Where members or organizations contemplate using consulting mechanical-engineering services, it is recommended that a copy of the complete report be studied.

The report has been divided into ten sections: (1) General principles for consulting work; (2) classification of consulting services; (3) designation of mechanical-engineering projects; (4) cost of rendering consulting service: (5) types of service on design projects; (6) recommended bases for making charges; (7) repetitive work; (8) drawings and designs; (9) patents; and (10) confidential data.

The report defines the various types of consulting service and classifies them into two broad groups:

(a) Personal Service, Reports, Investigations, etc.

1. Individual service.
2. Appraisals, valuations, rate studies, reports.
3. Management and production engineering services.
4. Inspection or testing of apparatus, equipment, etc.

(b) Design Projects:

1. Machinery or equipment consulting services.
2. Consulting services on complete projects or sections of projects.

For per-diem rates covering personal service, reports and similar activities a minimum rate of $50 per day for each day or fraction thereof, with a minimum charge of $100 for each engagement is recommended. Where special technical knowledge or skill is involved, charges from $100 to $250 per day are considered reasonable.

When long-term engagements are required, a reduction of 25 to 50 percent from these minimum rates is justified providing the term of engagement is in excess of one week to ten days. Variations of the per-diem rate such as billing at three times pay roll or cost-plus-a-fee, and cost-plus-a-percentage are also recommended.

Recommended Minimum Fees based on Net Cost of Work, Designed by Consulting Engineer, expressed as a percentage of cost of work.

	A	B	C
	Mechanical equipment of Bldgs.		Complete Mechanical engineering projects percents
	With supervision percent	Without supervision percent	
Net cost of work, dollars			
25,000 or under.......	10	8½	14
50,000...............	8¾	7½	12¾
100,000...............	7¼	6¼	10½
200,000...............	6¼	5¼	9
300,000...............	6	5	8
500,000...............	6	5	8

Where the scope of services can be determined in advance with some degree of accuracy and where the total cost of the work does not exceed $500,000 the method of evaluating fees as a percentage of the cost of the work has been recommended.

The detailed description of the various items included under this service is set forth in the complete report. It should be noted that these percentage fees do not include reproduction or communication costs, living or travelling expenses incurred on account of the work, nor do they include resident inspection or supervision at the site. Such items are billed in addition to the percentage fee as are field surveys, etc.

TRUCK CARRYING-CAPACITY RATING

Report of S.A.E. Motor Truck Rating Committee

From *Journal of Society of Automotive Engineer*, March, 1941

The carrying capacity of a motor truck is the end product of the almost innumerable elements of its design and construction. It is the integration of the carrying capacities of the tires, wheels, bearings, axles, springs, stearing system, brakes, frame, engine, etc., and the many parts of these major components. Ideally it would be desirable to rate carrying capacity by means of an engineering criterion, or formula, which would integrate this multitude of complex elements and give an answer entirely objective in character. Unfortunately no such criterion is available and, if an acceptable one could be developed, it would be exceedingly complicated. It consequently would not have the requisite characteristics of simplicity and understandability, and thus would be without practical usefulness.

Lacking such a criterion the Rating Committee believes that the most satisfactory alternative is for the manufacturer to rate the carrying capacity of his own products and that, for the worth-while benefits to be derived from uniformity, the form of rating should follow a standardized pattern. This would require each manufacturer to provide the same information about the carrying capacity of his trucks. This information, however, would not necessarily be entirely comparable because of the variations in the bases on which different manufacturers rate their products as determined by their own design and selling policies.

With this background, the Rating Committee presents its recommendations for a uniform method of rating the carrying capacities of motor trucks.

The carrying capacity should be rated by the following terms:

1. Maximum Gross Vehicle Weight............pounds.
2. Maximum Gross Combination Weight.......pounds.
3. Maximum Gross Carrying Capacity.........pounds.
4. Maximum Authorized Tire Equipment........
5. Structural Chassis Weight..................pounds.

The above terms which, taken together, give the capacity rating of a truck, are defined as follows:

1. Maximum Gross Vehicle Weight is the weight in pounds of a truck chassis with lubricants, water and full tank or tanks of fuel, plus the Maximum Gross Carrying Capacity as defined below.

2. Maximum Gross Combination Weight is the Maximum Authorized Gross Weight in pounds of a tractor truck and any combination of trailers. It is made up of the sum of the weights of all chassis (including tractor-truck and trailer), cab, lubricants, water, full tank or tanks of fuel, all bodies, special chassis and body equipment, attaching parts and payload.

3. Maximum Gross Carrying Capacity is the maximum authorized weight in pounds which may be superimposed upon a truck chassis when equipped with the maximum authorized number and size of tires. It is equal to the sum of the weights of cab, body, special chassis and body equipment, and payload.

4. Maximum Authorized Tire Equipment means the size, number of plies and number of tires on the load carrying wheels of the prime mover which, in accordance with Tire and Rim Association Standards, is the maximum in capacity authorized by the manufacturer.

5. Structural Chassis Weight is the weight in pounds of a truck chassis without lubricants, water and fuel, less the weight of tires, radiator (including shell and grille), engine, clutch, transmission and propeller shaft assemblies.

Relation of Capacity Rating to Ability Rating

The information conveyed by the five factors used as a basis for the capacity rating, taken in conjunction with the information required for the ability rating, gives a complete general idea of the capabilities of any given truck chassis.

In addition to the capacity factors, the maximum certified horsepower and the r.p.m. at which it occurs are necessary to evaluate the all-around ability of a truck and to compute the ability factor.

It is recommended that this information at least be presented by means of a plate upon which the six factors required for both ability rating and capacity rating are shown.

WHAT U.S. AID MEANS

From *Aeronautics*, (London), February, 1941

While during the last two decades many practical demonstrations of British progress in aviation were being made, year after year, the United States was running us close and sometimes outpacing us in technical development. This was noticeably so in the production of commerical landplanes and, until the Short Empire boat was designed, it seemed as though the lead in flying boat construction which Britain had held was to be eclipsed by the strikingly advanced designs of American manufacturers. It has always been a characteristic of aircraft constructors in the United States that they never shrink from breaking away from the orthodox, and it is largely due to this that we have to thank them for such standardized features as the retractable undercarriage, the metal variablepitch airscrew, for it was in America that these were brought to practical form in the first place. To-day the American aircraft industry with its immense research and manufacturing resources is making great strides in substratosphere flying technique. It is pushing ahead with petrol injection systems and exhaust-driven supercharging designs. It is solving icing-up problems, and it is doing much in evolving pressure cabins and new aerofoils for high-altitude flight. Progress is being achieved, too, in new aircraft alloys, plastics and fuels.

There is no doubt that America will be able to teach England quite a lot and England in return will pass on a great deal to America in the way of new ideas, developments, and discoveries in the near future. This close Anglo-American co-operation and joint effort without a doubt will result in the R.A.F. and the U.S. Army Air Corps having the finest aircraft in the world before this war is over. Not only that, but we shall have them in tremendous numbers, and quality and quantity are the factors that are going to count.

LIGHT WEIGHT CONCRETE

From *Civil Engineering* (London), November, 1940

Notes on the production of vermiculite are given in *Mineral Trade Notes*. The raw material is crushed, dried and screened before being expanded in an oil-fired vermiculite kiln, after which it is separated into three sizes. A great many fines are rejected at the mine, so a ton of dried material yields 700 lb. of house-fill that passes ¼ in. but remains on 10 mesh and 900 lb. of minus 10 plus 30 mesh, which is used in plaster and concrete products. The product used for house-fill weighs only 5½ lb. per cu. ft. The finer sizes, which bulk 6 to 7 lb. to the cu. ft., are made into plastic insulation, plaster and concrete products. Experiments are being made with insulation brick, which may be sold at $80.00 a thousand. The latter appear to be blended with bentonite and amphibole asbestos fibre, thus differing from the plastic insulating material only in that they are pressed after being moulded.

Col. Ellis C. Soper has designed a pre-cast concrete slab for floor, roof or wall construction that weighs 35 to 40 lb. per cu. ft., and carries at least 200 lb. per sq. in. in compression. A 7 ft. slab support near the ends will bend as much as 1½ in. under a 150 lb. load at the middle and then come back to its original shape. In addition to their light weight and heat-insulating properties, it is said that these slabs are easy to install. If necessary they can be sawn, cut with a knife, drilled or nailed, in much the same way as wood lumber.

THE QUEEN ELIZABETH WAY

Abstract of paper by A. L. MacDougall, delivered before the Sault Ste. Marie Branch of the Engineering Institute of Canada, March 21st, 1941.

The Queen Elizabeth Way, the first four lane highway in Ontario, is being built to relieve congested traffic conditions between Toronto and the Niagara Peninsula. It has now been completed from Toronto to Niagara Falls, a distance of 73 miles and the remaining 18 miles to Fort Erie, directly opposite the Peace Bridge over the Niagara River has been graded and will probably be paved this year.

The completion of the highway will provide adequately for the heavy tourist traffic from the United States. It is estimated that 50% of the United States visitors to Canada enter at border points in the Niagara District. It will provide transportation facilities for materials and finished products to and from a large number of industrial plants now engaged in the production of war supplies. It will also be valuable from a military standpoint; recent troop manoeuvres demonstrated that motorized units could maintain on it a speed of from 45 to 50 miles per hour as compared with a speed on ordinary roads of from 25 to 30 miles per hour.

A traffic census taken during the Labour Day period last year showed that from 17,000 to 38,000 vehicles were handled daily and it is estimated that a traffic of 60,000 vehicles per day would be no inconvenience.

The road is being built to the highest modern standards of both safety and stability. Grades are limited to a maximum of 3% and curves to 2 degrees. The pavement is of cement concrete four lane construction, the driving lanes being 11 feet in width and passing lanes 12 feet. Separating the motor ways is a grassed boulevard of varying widths but generally 30 feet. Slopes are being sodded and trees planted. Grade separations are being installed at all intersecting heavily travelled roads and railways, and clover leafs constructed at entrances and outlets to Towns and Cities. Separated bridges have been built accommodating traffic in each direction.

The highway is being lighted as an added safety measure, 14 miles already having been done. All crossings and junctions are being marked with sodium vapour lamps which glow a bright yellow in contrast with the incandescent lights elsewhere. Another safety measure is the banning of bicycles from the highway. There are parallel roads nearby which can be used by cyclists and horse-drawn vehicles.

One of the rolls of film shown deals more particularly with construction work carried out last year between Burlington and Niagara Falls. As time was an important factor the 41 miles to be built were divided into eight contracts. The most up-to-date type of equipment was used and the whole pavement was laid in 44 working days. The highest individual daily production of concrete by one contractor was 4,000 feet of 11-foot wide strip in 16 hours. The highest total daily production for seven contracts was the equivalent of 2.33 miles of 23-foot-wide pavement.

All mixes of concrete were determined by trial in the field, trial mixes being based on a cement content of 6.6 to 6.75 sacks of cement per cubic yard of concrete; slump limited from 1 in. to 3 in. and a water cement ratio of four imperial gallons per sack of cement.

Daily tests of samples of concrete, job cured, showed an average compressive strength of 4,500 lbs. per square inch.

The pavement section adopted has a uniform thickness of 9 in. as compared with the 10-7-10 adopted heretofore. Adjacent slabs are keyed together by a key formed in the side of the slab 3 in. deep and 1 in. wide. Transverse expansion joints of creosoted wood were installed at 300-ft. intervals.

After the concrete was poured, finished and broomed, it was cured by the customary method of covering with wet burlap kept continuously wet for 24 hours, then by ponding for 8 days.

RAILWAY DIFFICULTIES

From *Trade & Engineering*, (London), December, 1940

After 15 months of war and three months of intensive air attacks train speeds and punctuality are suffering. The main reasons are the redistribution of the population, greatly increased freight traffics, black-out and weather conditions, the immediate and after effects of enemy action, and air-raid warnings. Longer trains are being run to carry all who desire and have to travel. More passengers are making longer journeys than in peacetime. Men and women in uniform, evacuee children, their parents and relatives, all make long, individual journeys. The running of longer trains at times involves double stopping at stations and delays to main line trains react on services in other parts over wide areas. During air-raid "alerts" train speeds of 25 miles an hour are necessary for safety reasons during non-black-out hours, a restriction which has undoubtedly reduced the severity of casualties in railway accidents, apart from saving rolling stock, engines, carriages and wagons which are not now readily replaceable. It is perhaps overlooked that the railways have not endless supplies of locomotives, carriages, rails and sleepers, and the renewal of rolling stock requires men and material urgently needed elsewhere.

All kinds of commodities, coal, munitions, shells, guns, war equipment and essential food supplies are being moved in greater masses on the railways than in peace-time. As a nation we are becoming more and more self-supporting. Evacuation has meant that small stations now deal with three and four times more freight than hitherto, and evacuation also means that supplies of clothing, foods, fuels, mails, newspapers and all other commodities for the upkeep of the new homes of the people require transport. Home-grown timber is being loaded at country stations, branch lines are busier, and local produce is being moved in quantities to feed the nearest large towns and cities. Heavy freights have also to be handled when the convoys arrive at the docks and there has been such diversion to the railways of freights which formerly were carried by coastwise steamers. New unusual traffics, such as the leaves of bushes and plants for medical supplies, are being dispatched to wholesale chemists, and the urgent tonnages for the war effort are being moved by freight trains which are slower than passenger trains and take much longer times on their journeys.

Much of the freight traffic in peace-time was handled during the night. To-day the position is that during the black-out hours freight movements and shunting are slowed up, and the time available for loading and unloading in daylight is restricted. Winter-time weather also affects the rapidity of freight operation. Throughout the railway system control staffs are constantly watching and regulating the flow of traffic, both passenger and freight, to keep the railway wheels turning. Although railwaymen remain at work during air raids, air raid warnings affect the collection and delivery of goods, and although extremely rapid repairs are carried out to bombed tracks, stations, bridges, and tunnels, it is often necessary for speed checks to be instituted at particular points on the railway lines until more permanent restorations can be effected. The running of more and faster passenger trains is said to be impracticable in present conditions when priority must be given to the movement of freight traffics for war production. Every passenger train provides regular communication for as many places as possible, and while there is no restriction on travel by train, essential freights must get through. The railways have stood up well to the effects of enemy action, and although there does not seem much prospect of an immediate return to the regularity and punctuality of peace-time passenger trains, railwaymen are determined that the trains shall be kept running and the essential services maintained.

A ROLE FOR ENGINEERS

From *Mechanical Engineering*, Easton, Pa., April, 1941

Engineers should find some way to pluck William E. Wickenden out of his administrative duties as President of the Case School of Applied Science and from his important services at Washington in the cause of national defense and send him around the country for a few months at least, to carry to all engineers and their well-wishers the message he delivered on February 7th to The Engineering Institute of Canada. The reading of it will start many minds off on a track of wishful speculation and, it is hoped, pious resolve to work for the advancement of the engineering profession, and it should also help to crystalize in the minds of readers some of the basic principles of professionalism. Probably Dr. Wickenden cannot be spared from either of his important posts at this time, but one wonders if he might not at some future date speak on this subject to many groups and bring within the influence of his personality men who, awakened to the high purposes his address sets forth, would immeasurably raise the level of the profession in which they find themselves and coincidentally make a better world for their fellow men.

It is a satisfaction to direct attention, for the purpose of emphasis, to a portion of Dr. Wickenden's address that covers a point frequently urged in these pages. This refers to the strategic position held by engineers as managers of enterprises, in whole or in part, where their intermediate position between owners and employee vests them with responsibilities to both and equal responsibilities to the public served by these enterprises. Few thinking men doubt the inevitable social and economic changes that the future, conditioned by world-wide upheaval of which the war is a horrifying witness, may hold in store. The industrial era of modern civilization is working toward its climatic phase, during which the pattern of economic, social, and political life will either be woven into a strong fabric of more wholesome relationships or be replaced by one that is alien to most of us.

Just as engineers hold the key position in respect to the military conflict that is spreading so rapidly over the globe, so also they may occupy the position of determining influence in the unpredictable events that inevitably will accompany peace. But to exercise to beneficial purpose the influence that may be theirs, engineers must rapidly assume a habit of intellectual maturity in the chaotic field of human relationships. They alone cannot insure the character of the pattern of things to come, but, aided by thousands of men of sound judgment and intelligent understanding of the rapidly developing history of our times, they afford the most hopeful instrumentality by means of which a better world may be built.

NATURE LED THE WAY TO INSULATION

From *Refrigeration and Air Conditioning* (Gardenvale, Que.) November, 1940

In Spain, Portugal, Southern France, and Northern Africa are heavily wooded areas which are subjected to a scorching sun and hot, parching winds. During the summer, when practically all other vegetation is dried up, you see certain flourishing trees unaffected by the heat.

These are cork oak trees. They survive because they are heavily sheated with an outer bark of such peculiar structure that it insulates the living cork tree from the heat and from the drying wind.

This outer bark is cork. From it is obtained the commercial cork which finds its way into a thousand and one nooks in our daily life.

The commercial cork is obtained by "stripping." The "sap bark" lying next to the woody growth carries the life-blood of the tree and under no circumstances should be disturbed. This in turn is covered by a thick layer of multi-celled bark, highly resilient and compressible. It is this bark which is used for insulation and other purposes. A shaggy outer bark encases the whole, this last having no commercial value.

When stripped from the parent tree, the bark is naturally curved, as it conformed to the trunk or large branch. These slabs are piled high on a cradle arrangement and the huge bundle is picked up by a hand crane and swung over and into a vat of boiling water. After being immersed for a short time the bark becomes pliable and can be readily flattened out. At the same time the coarse outer bark is softened and is easily scraped off.

After being trimmed to size and thickness, the slabs are carefully wrapped and packed for transportation.

The large companies operating in Canada and the United States have their own factories in the cork growing districts and do their own processing and packing. Arrangements are made for shipping to the American continents where the majority of the world's supply is consumed. Usually, freighters are chartered to make the trip from a Spanish or Portuguese port across the Atlantic. These runs are scheduled to keep the market supplied without maintaining too large stocks on this side.

However, the present war has considerably interrupted the even flow of supplies. The two greatest export countries are situated on the more dangerous trade routes and shipping, even when not commandeered, is irregular. This situation has caused Canadian and American manufacturers and importers to build up as large stocks as possible in order to handle the regular volume of business and to take care of war demands. Naturally, munitions have to receive first consideration, but supplies have been ample to meet all demands from every quarter.

BOILER OIL FOR MOTOR-SHIP ENGINES

From *Trade & Engineering*, (London), November, 1940

It was mentioned in these columns some time ago that all the motorships, numbering over 40, which are being, or have been, built under the U.S. Maritime Commission's programme have to operate on a heavy grade of residual oil. The results of the performance of some of these vessels in service are now available. It appears that the oil is known as a modified Bunker B, that its specific gravity may be anything up to unity, and that it contains a maximum of one per cent of sulphur. The new vessels—there are four of them—are cargo ships of about 11,600 tons deadweight capacity, with geared two-stroke machinery of 8,000 b.h.p. driving a single shaft. Four engines are employed and they run at 225 r.p.m. The shaft speed is about 90 r.p.m.

The results indicate that the total fuel consumption with this boiler oil in service on fairly long routes is 0.42 lb. per b.h.p. hour for all purposes. This figure seems somewhat high, even bearing in mind the large amount of electric power generated by Diesel machinery, required on board ship. It is, moreover, expected that the cylinder liner wear will be greater, and these two factors have to be taken into account when the question of the economy of utilizing boiler oil is under consideration. In a corresponding European ship with a single engine direct-coupled to the propeller, a fuel consumption of about 0.38-0.39 lb. per b.h.p. hour for all purposes would be expected. Thus, the increased consumption with the heavier oil, to the extent of 10 per cent, and the cost of more frequent liner replacements have to be set against the economy affected by burning oil which is, roughly speaking, 30 per cent cheaper.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

HONOURS FOR THE PRESIDENT

It is a matter of general satisfaction and pleasure to all engineers that Dean Mackenzie is to receive this month, not only one but two honourary degrees. On May thirteenth, at Halifax, his own alma mater, Dalhousie University, gives him a Doctorate of Laws, and on May twenty-ninth, McGill University confers upon him a Doctorate of Science.

While there is more than one justification for paying these tributes to Dean Mackenzie, members will feel that his presidency of the Institute may have been a contributing factor, and engineers in general may be excused if they see in these acknowledgments of merit and attainment, a tribute to the profession.

The profession will be proud to have him speak for it as well as for himself on these two significant occasions. Engineers throughout Canada join wholeheartedly in congratulations and wish him unlimited success in his important field of usefulness.

THE PRESIDENT VISITS THE MARITIME BRANCHES

It has been admitted that the importance and urgency of the work being done by President Mackenzie in his capacity as Acting President of the National Research Council, would make it difficult, if not impossible, for him to visit the branches of the Institute. Therefore it is a matter of much satisfaction that he has been able to arrange to visit at least some of the maritime branches in conjunction with his trip to Halifax for the convocation of Dalhousie University.

A schedule of visits follows. From this it will be seen that a regional meeting of Council is to be held in Saint John, N.B., as a feature of the short tour. It is expected that councillors from all maritime branches will be present, and that additional representatives will come from Ontario and Quebec. This will make the third meeting of Council this year away from Headquarters.

(All times are Standard. Either Eastern or Atlantic)

Sat.,	May 10—Leave Ottawa......	4.00 p.m.	C.N.R.

A COMMITTEE REPORTS

For seven years the Institute's Committee on Western Water Problems has been at its task. The work has gone on quietly, continuously and methodically. Not many members of the Institute were aware of its existence or its purpose, and some wondered at its tenacity and longevity. All these can now satisfy themselves that the Committee and Sub-Committee were doing a great work. It is recommended that the report of the Committee appearing in this number of the *Journal* be read and studied as an example of the usefulness of such groups and of the purposes by which the Institute can render a useful service to the public.

This report has been submitted by Council to the Prime Minister of Canada. It is felt that leadership in this important problem of combatting drought and preserving international water rights will be welcomed by the provincial governments concerned, as well as by the federal authorities. The report certainly provides that leadership as it makes clear and specific recommendations based on the findings of experts, representing a non-political, non-prejudiced Canadian-wide professional organization.

The situation is urgent. Early action is necessary if certain benefits of national importance are not to be lost in perpetuity.

REMISSION OF FEES

At the April meeting, Council accepted without hesitation the recommendation of the Finance Committee that fees of members of the Institute resident in the United Kingdom be remitted. It was felt that as such persons are undergoing extraordinary experiences of privation, suffering and disturbances to normal living, any reduction in ordinary business obligations would be helpful. In all there are about fifty members so affected.

This modest gesture of sympathy and support will receive the unanimous approval of all members on this side of the Atlantic.

WARTIME BUREAU OF TECHNICAL PERSONNEL

There is little additional progress that can be reported at this time. The basic work is well underway and many additional developments are under discussion. The mechanics of the proposal are rather formidable, and care is being taken to check each item thoroughly before the body of technical personnel is approached. The quantities are so large that only careful planning and preparation will prevent confusion and waste motion from developing to a disturbing degree.

The questionnaire will be mailed to every person who, on his national registration last September, declared he was then practising engineering, or that his normal occupation was engineering. The mere photostating of the original records runs into a tremendous task. It is estimated that the list will be in the neighbourhood of a thousand feet long, and will contain approximately thirty thousand names and addresses.

With this number thirty thousand in mind it is possible to grasp some idea of the amount of detail involved. It means thirty-thousand envelopes to be addressed, the same number of covering explanatory letters, questionnaires and classifications lists. Upon their return, the information has to be indexed, sorted and filed. The resultant file system will have in it from sixty to seventy thousand cards of one kind or another, all of which will have to be kept up to date.

Certain interesting information on demand and supply has been obtained, which indicates that the Bureau has a real work to do. At a meeting of the Advisory Board held in Ottawa in April, approval was given to the work already done and to plans for the future. Discussions brought forth indications that the usefulness of the Board might go much farther than was originally contemplated.

At present the main task is to get the forms out to the engineers and chemists. This is a larger undertaking than was at first contemplated, but the extra time taken now in more detailed preparation will facilitate the working of the system later when it goes into action.

CORRESPONDENCE

The Institution of Electrical Engineers,
18th March, 1941.

L. Austin Wright, Esq.,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, Canada.

Dear Mr. Wright,

Your letter of the 3rd February inviting the Institution of Electrical Engineers to undertake the presentation of the Sir John Kennedy Medal to General McNaughton did not reach me until the 10th March, when I immediately consulted the President, who greatly appreciated the opportunity you have afforded us in England to do honour on your behalf to General McNaughton.

Accordingly, after ascertaining a date that would be convenient to General McNaughton and to the High Commissioner for Canada, I telegraphed you as follows:

"Yours 3rd February just received stop delighted arrange presentation medal to General McNaughton at Kelvin Lecture meeting May 8th when Presidents other leading Institutions usually present stop have ascertained date convenient General and High Commissioner stop telegraph or air mail further instructions and suggested guests advisable post medal early with details recipients career and conditions award."

On account of the general situation here and also the pressure at which the majority of our members are working, meetings have not been held in London during the present Session, but a few weeks ago it was decided that on the occasion of the Annual General Meeting which, being a statutory meeting, would have to be held, the Kelvin Lecture should also be delivered. This occasion would seem to be one which would be appropriate, and one on which we could hope to do justice to the presentation ceremony.

We are honoured that General McNaughton is a member of this Institution, and, in welcoming him on his arrival in this country, we placed our resources at the disposal of himself and his officers. More recently, on learning of the award of the Sir John Kennedy Medal, we wrote congratulating him. From this you will appreciate why, at a meeting of my Council on the 13th March, pleasure was unanimously expressed at your proposal and at the decision our President had taken.

If the time your letter has taken in reaching here is typical, we shall not have much opportunity for further interchange of views before the 8th May, and it was for this reason that I suggested your sending me as soon as possible full details of the award and the names of distinguished Canadians and others whom you would wish to suggest might be asked to the presentation.

Before the meeting there will be an informal luncheon for members of the Council and to this General McNaughton and the High Commissioner understand that they will receive an invitation.

I sincerely hope that no circumstance will interfere with the arrangements for a ceremony to which we are looking forward with pleasure.

Yours sincerely,
(*Signed*) W. K. Brasher, *Secretary.*

E.C.P.D. ANNUAL REPORT

Engineering, in many and obvious ways, is growing as a profession. The quality of that growth is largely governed by activities in accrediting curricula, in improving the admission of suitable students to the profession, and in securing the proper appreciation of all that it means to be an engineer. These activities are described in the Eighth Annual Report of Engineers' Council for Professional Development, just published.

The Chairman of E.C.P.D., John P. H. Perry of New York City, records not alone the affiliation of The Engineering Institute of Canada, in October 1940 with E.C.P.D., but stresses the remarkable progress in accrediting engineering curricula. He reports also the petition from a group of technical institutes that some such plan of accrediting be evolved by E.C.P.D. for the technical institutes of the country, thus giving more effective recognition to their sphere in technical education.

The Committee on Student Selection and Guidance, Dean Emeritus R. L. Sackett of Pennsylvania State College, *Chairman*, reports further progress in the study of aptitude tests and, especially, advance in the promotion of proper selection of engineering as a career by high school boys. This committee's report contains excerpts from summaries of activities, submitted by local groups of engineers, in New York, Omaha, Detroit, Iowa, and Canada, whose aim was not to recruit to engineering but to give boys of high school age an opportunity to learn the qualities and aptitudes essential to success. Thus, those with decided engineering talent will continue in their ambitions for this field while those without sufficient aptitude will not undertake a career in engineering if they will be more likely to succeed elsewhere.

Dean A. A. Potter of Purdue University, for the Committee on Engineering Schools, discusses the problems of accrediting and gives statistics on the subject since the initiation of the accrediting programme.

The Committee on Professional Training, Dean O. W. Eshbach of Northwestern University, *Chairman*, reports further efforts to discover what is being done by and for junior engineers in their immediate post-graduation period, and includes as an appendix a questionnaire used to gather information, on this subject. This will be used, then, as the basis of a programme to be developed for use among the various organizations.

The Committee on Professional Recognition, Professor Emeritus Charles F. Scott of Yale University, *Chairman*, probes the matter of engineering as a profession, and an appreciation of it as such. He strongly urges the various constituent organizations of E.C.P.D. to encourage emphasis on ethics, the teaching of ethics, and the professional spirit among engineering students, in order that they may acquire a full conception of the profession as early as possible.

Founded in 1932, E.C.P.D. is an organization representing the American Society of Civil Engineers, American Institute of Mining and Metallurgical Engineers, The American Society of Mechanical Engineers, American Institute of Electrical Engineers, American Institute of Chemical Engineers, Society for the Promotion of Engineering Education, National Council of State Boards of Engineering Examiners, and The Engineering Institute of Canada. The purposes of E.C.P.D. is to enhance the professional status of the engineer. Its Eighth Annual Report evidences definite progress toward this objective.

MEETING OF COUNCIL

Minutes of a regional meeting of the Council of the Institute held at the Royal York Hotel, Toronto, Ontario, on Saturday, April 19th, 1941, at two o'clock. p.m.

Present: President C. J. Mackenzie in the chair; Past-President J. B. Challies (Montreal); Vice-Presidents K. M. Cameron (Ottawa), McNeely DuBose (Arvida), and J. Clark Keith (Border Cities); Councillors A. E. Berry (Toronto), D. S. Ellis (Kingston), J. G. Hall (Toronto), E. M. Krebser (Border Cities), J. L. Lang (Sault Ste. Marie), A. Larivière (Quebec), W. R. Manock (Niagara Peninsula), H. Massue (Montreal), W. L. McFaul (Hamilton), C. K. McLeod (Montreal), W. H. Munro (Ottawa), H. R. Sills (Peterborough), C. E. Sisson (Toronto), J. A. Vance (Woodstock), and General Secretary L. Austin Wright.

There were also present by invitation: Past-President C. H. Mitchell; Past-Councillors W. E. Bonn, A. U. Sanderson, J. G. R. Wainwright and R. B. Young; Branch

Chairmen C. H. McL. Burns (Niagara Peninsula), W. A. T. Gilmour (Hamilton), and R. L. Dobbin (Peterborough); H. E. Brandon, chairman, W. S. Wilson, vice-chairman, F. J. Blair and R. F. Legget, members of the executive, and J. J. Spence, secretary-treasurer of the Toronto Branch; and H. F. Bennett, chairman of the Institute's Committee on the Training and Welfare of the Young Engineer.

After each person was introduced to the meeting, the President extended a cordial welcome to all guests, and asked them to feel free to take part in any of the discussions.

The general secretary reported briefly regarding the James Watt International Medal, which is the senior award of its kind in the Old Country. The final decision is made by a committee appointed under the auspices of the Institution of Mechanical Engineers, sixteen national engineering societies being asked to submit nominations. At the last meeting of Council a letter was read from one of our members in London, Colonel C. G. DuCane, suggesting that it would be very suitable if the next award could be made to some one from one of the Dominions. It is likely that Mr. A. G. M. Mitchell, M.C.E., F.R.S., will be nominated for the next award by the Institution of Engineers of Australia, and supported by the Institution of Engineers of South Africa. It is suggested that if the Engineering Institute of Canada would support this nomination it would probably insure Mr. Mitchell's success. At the last meeting of Council it was decided to leave the matter open to see if anyone had any other names to suggest. Since then the general secretary had been in correspondence with several outstanding members in the mechanical engineering field, all of whom had endorsed this nomination. Following some discussion, on the motion of Mr. McFaul, seconded by Mr. Sisson, it was unanimously resolved that Mr. Mitchell's nomination be supported by the Engineering Institute of Canada.

At the request of Dr. Challies, the President vacated the chair, which was then taken by Past-President Mitchell.

Dr. Challies drew the attention of Council to the two honorary degrees which are shortly to be conferred upon the Institute's worthy and much respected president. On May 13th his Alma Mater, Dalhousie University, will confer upon him the honorary degree of Doctor of Laws, and on May 29th McGill University will confer an honorary degree of Doctor of Science. Dr. Challies moved, and Mr. Larivière seconded a motion that Council record its pleasure and satisfaction that these timely and deserved distinctions had come to Dean Mackenzie, and that the congratulations of this meeting be presented to him through the acting chairman. This proposal was greeted with enthusiastic applause, and Past-President Mitchell graciously conveyed the greetings and good wishes to the president.

In reply, on retaking the chair, President Mackenzie expressed his sincere appreciation of the honours which are to be conferred upon him and of Council's congratulations. He did not consider the conferring of such degrees as entirely a personal matter. He felt that the office of president of The Engineering Institute of Canada, to which he had been graciously elected, was mainly responsible for these awards. Recognition, on the part of the universities, of the position the engineering profession in Canada holds, is shown in this very tangible way, and is something in which all engineers should take pride.

The president reported that during the morning a meeting had been held with the Ontario councillors to discuss means by which the two vice-presidencies for Ontario could be arranged so that every branch would have a fair share of the honour. The outcome of the discussion was that it was agreed that the best results would be obtained if the province were divided into two circuits with Ottawa, Toronto, Peterborough and Kingston in one, and the remaining six branches in the other. Subject to the approval of the branches in the first group, a gentleman's agreement could be arrived at whereby one vice-presidency would go from Ottawa to Toronto, to Kingston, then back to Ottawa, Toronto and Peterborough, this circle repeating regularly. Such an arrangement would give Ottawa a vice-president two years out of six, with Toronto in the same proportion. Peterborough and Kingston would have a vice-president two years out of every twelve years. In the other circuit, the vice-presidency would rotate regularly, thus giving every branch in that group a vice-president two years out of every twelve.

The advantage that this gives to Ottawa and Toronto was thought by all councillors to be equitable. It was expected that the branch which had the privilege of naming nominees would put up more than one name for election. The president explained that the proposal could not be any more than a recommendation to the chairman of the Nominating Committee each year, but thought such an arrangement should be satisfactory as it was already followed in the other zones.

The president also reported that at the morning meeting there had been considerable discussion about ways and means by which the Institute might expand its programme of promoting co-operation within the province of Ontario. The discussion revealed the fact that in the councillors' opinions there was nothing special that should be done at this time beyond following out the established policy of promoting at every opportunity frank and friendly co-operation with all engineering bodies.

Another matter which was discussed was the possibility of establishing additional branches in the province. Some of the councillors suggested that certain areas had developed to the point that the Institute could render a better service by establishing branches in those areas. It was left with certain councillors to investigate conditions locally and to report back to Council.

It was noted that the financial statement to the end of March had been examined by the Finance Committee and approved.

In view of the privation, and the sacrifice which is being made by Institute members resident in the United Kingdom, and the difficulties attendant upon remission of money to Canada, the Finance Committee recommends that Council agree that the fees of such members for the year 1941 be remitted. The Secretary reported that this would affect the Institute's revenue by about $700.00 a year, but it was the unanimous opinion of the councillors that this sacrifice should be made in view of the circumstances.

Upon the motion of Mr. Hall, seconded by Mr. Massue, it was unanimously and enthusiastically agreed that this policy should be followed, and the secretary was accordingly instructed to communicate with all members who will be affected by the ruling.

The secretary reported that an interim statement from the Hamilton Annual Meeting Committee indicated that the deficit on local events usually paid by Headquarters was being met by the Branch out of their own funds. This would make it possible to keep the total cost of the meeting to Headquarters down to a very reasonable sum. As a part of the motion approving of the Finance Committee's report, it was agreed that Council should express its appreciation of the action of the Hamilton Branch.

Dr. Challies, chairman of the Institute's Committee on Professional Interests, reported briefly on the progress being made towards co-operation with the various provincial associations. The co-operative agreements in Saskatchewan and Nova Scotia, completed in 1938 and 1939 respectively, and the recently completed agreement in Alberta, are working very satisfactorily. Discussions are under way in Manitoba and New Brunswick, and it is hoped that substantial progress will be made this year.

Mr. H. F. Bennett, chairman of the Institute's Committee on the Training and Welfare of the Young Engineer, reported that definite progress was being made in the preparation of the Canadian booklet for distribution to high school students. The final draft will be submitted to Council, and it is expected that the booklet will be ready for distribution in the early fall. This was noted, and the president commented on the valuable work that is being done by Mr. Bennett's committee.

On the motion of Mr. Vance, seconded by Mr. Massue, it was unanimously resolved that a vote of thanks be tendered to the Toronto Branch executive for their kindness and courtesy in entertaining the councillors at lunch.

Two councillors referred to two specific cases where Institute certificates were being displayed by engineers who were no longer members. In their opinion this was an undesirable condition, and they inquired to see if any means were available whereby such certificates could be returned to the Institute.

In the discussion which followed, it was pointed out that the by-laws of the Institute require certificates to be returned when membership ceases, but that it had been found impossible to carry this out in practice. The meeting agreed that it was desirable to have the certificates returned, and the secretary undertook to include such a request in any correspondence having to do with resignations or removals from the list.

The secretary was also instructed to write to the two individuals specifically mentioned after a further check was made to see if the certificates were still on display.

The president pointed out that in conjunction with the presentation of his honorary degree at Halifax on May 13th, it might be possible for him to visit some of the other maritime branches at that time. He suggested that if any other members of Council could find it convenient to accompany him, it would be very much appreciated by the branches. Speaking from his own experience in the west, he realized how much such visits meant to the smaller branches, and how they stimulated interest in Institute affairs. He would be very glad to hear from any councillors who could make the trip.

A number of applications were considered and the following elections and transfers were effected:

Admissions	
Members	17
Students	26
Transfers	
Junior to Member	5
Student to Member	1
Student to Junior	13

It was left with the President to decide on the date and location of the next Council meeting.

The Council rose at four o'clock p.m.

ELECTIONS AND TRANSFERS

At the meeting of Council held on April 19th, 1941, the following elections and transfers were effected:

Members

Agnew, Ellis A., B.A.Sc. (Univ. of Toronto), vice-president i/c engrg., Livingston Stocker Co. Ltd., Hamilton, Ont.

Danks, Cyril Norwood, Diploma, S.P.S. (Univ. of Toronto), Ontario District Engr., Canadian Ingersoll-Rand Co. Ltd., Toronto, Ont.

Duncan, Wm. Archibald, B.A.Sc. (Univ. of Toronto), manager, Process Service, Dominion Oxygen Co. Ltd., Toronto, Ont.

Dyer, Frederick Frank, B.A.Sc. (Univ. of Toronto), general engrg. dept., Imperial Oil Limited, Sarnia, Ont.

Folger, Collamer Coverdale, (Queen's Univ.), general manager Public Utilities Commission of Kingston, Ont.

Hole, William George, B.Sc. (Univ. of Alta.), heating engr., T. Pringle & Son, Montreal, Que.

Johnson, Edwin Lewis, B.Sc. (McGill Univ.), works mgr., Canadian Industries Ltd., "Dominion" Ammunition Divn., Brownsburg, Que.

Leheup, Charles Samuel Henry, (Leyton Tech., Woolwich Polytechnic London), member of United Kingdom Technical Mission to Canada, Montreal.

Noonan, William Fleming, B.Sc. (Queen's Univ.), Divn. engr., Dept. of Highways of Ontario, Kingston, Ont.

Rawlins, James Walter, B.Sc. (Queen's Univ.), 27 Ava Rd., Toronto, Ont.

Wood, Elvin Morley, B.A.Sc. (Univ. of Toronto), planning engr., H.E.P.C. of Ontario, Toronto, Ont.

Transferred from the class of Junior to that of Member

Bonnell, Alexander Robertson B.Sc. (Univ. of N.B.), road engr., Trinidad Leaseholds, Ltd., Pointe-a-Pierre, Trinidad, B.W.I.

Gray, Harry Alden B.Sc. (Univ. of Man.), res. engr., Quebec Roads Dept., Knowlton, Que.

Smith, Carl Clifford, B.Sc. (Queen's Univ.), Elec.engr., Canadian Westinghouse Co. Ltd., Hamilton, Ont.

Spriggs, Robert Hayward, B.Sc., (McGill, Univ.), div. plant engr., Bell Telephone Co. Ltd., Toronto, Ont.

Taylor, Franklin Thomas, B.A.Sc., (Univ. of Toronto), dftsman. Richard Wilcox Canadian Co., London, Ont.

Transferred from the class of Student to that of Member

Tassé, Yvon Roma, B.A.Sc., C.E. (Ecole Polytechnique), apparatus sales engr., Canadian General Electric Co., Quebec, Que.

Transferred from the class of Student to that of Junior

Adams, Jack Douglas, B.Eng. (McGill Univ.), inspr., Dominion Bridge Co. Ltd., Montreal, Que.

Baldry, George S., B.Sc. (Univ. of N. Dakota), 810 Wolsley Ave., Winnipeg, Man.

Bellamy, Keith Lacy, B.Sc. (Queen's Univ.), electrical contractor, Niagara Falls, Ont.

Brooks, Joseph Warren, B.Sc. (Queen's Univ.), lecturer, civil engrg., Queen's Univ., Kingston, Ont.

Forsythe, Marshall Anthony, B.Sc. (Univ. of Alta.), elect'l dftsman., Shawinigan Engineering Co., Montreal, Que.

Howe, Harold Bertram, B.Sc. (Queen's Univ.), engr. dftsman., Canada Cement Co., Montreal East, Que.

McIntosh, William Gardner, B.Sc. (Univ. of Man.), Flight Lieut., R.C.A.F., engrg. branch, Ottawa, Ont.

Oliver, James, B.Sc. (Univ. of Alta.), 1407 First St. N.W., Calgary, Alta.

Racicot, Jacques, B.A.Sc., C.E. (Ecole Polytechnique), res. engr., Quebec Roads Dept., Montreal, Que.

Wardrop, William Leslie, B.Sc. (Univ. of Man.), instructing at University of Manitoba, Winnipeg, Man.

Students Admitted

Bateman, Leonard Arthur, (Univ. of Man.), 508 Carlaw Ave., Winnipeg, Man.

Callaghan, James Francis, (Univ. of N.B.), 543 Brunswick St., Fredericton, N.B.

Copping, Edward E., (McGill Univ.), 49 St. Thomas St., Joliette, Que.

Cunningham, Robert Auld, (Queen's Univ.), 151 Second Ave., Ottawa, Ont.

Dubé, Jean Thomas, (McGill Univ.), 174 St. Jacques St., Grand'-Mere, Que.

Gaudreau, Marcel, (Ecole Polytechnique), 3527 Evelyn St., Verdun, Que.

Hiseler, Ronald Percy, B.E.E. (N.S. Tech. Coll.), Canadian General Electric Co. Ltd., Peterborough, Ont.

Kippan, James Alexander, (Univ. of Man.), 129 Arlington St., Winnipeg, Man.

Lentz, Claude Peter, (No. 1 Wireless School, Montreal), Gander, Nfld.

McCorkindale, Donald Harvey, (Queen's Univ.), 75 Lower Alfred St., Kingston, Ont.

McDowell, Creighton Joseph, (Queen's Univ.), 437 Elm Ave., Windsor, Ont.

McKay, William Gordon, B.Sc. (Queen's Univ.), 1940, 382 Earl St., Kingston, Ont.

Pasquet, Pierre Auguste, (Queen's Univ.), 25 King St. W., Kingston, Ont.

Pierce, John Gourley, (Queen's Univ.), 492 Homewood Ave., Peterborough, Ontario.

Pue-Gilchrist, Alfred Conde, (McGill Univ.), 3437 Peel St., Montreal, Que.

Remus, Frank Richard, (Queen's Univ.), 141 Agnes St., Oshawa, Ont.

Savory, John Alfred, (Queen's Univ.), 10 Lumsden Ave., Hamilton, Ont.

Seymour, David Llleyellyn, (Queen's Univ.), 87 Cartier St., Ottawa, Ont.

Stopps, F. Sidney, (McGill Univ.), 3506 University St., Montreal, Que.

Trout, Ross Gregory, (Queen's Univ.), Estevan, Sask.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

Dean C. J. Mackenzie, M.E.I.C., president of the Institute and acting president of the National Research Council has been given the honorary degree of LL.D. by his Alma Mater, Dalhousie University, at the Convocation held on May 13th.

McGill University will also be conferring a degree of Doctor of Science on Dean Mackenzie at the Convocation to be held this month.

J. M. R. Fairbairn, M.E.I.C., past-president of the Institute and former chief engineer of the Canadian Pacific Railway Company has been appointed director of works and buildings, Naval Service, Department of National Defence, at Ottawa.

Geo. A. Walkem, M.E.I.C, past president of the Institute, is president and managing director of the Gulf of Georgia Towing Company Limited, Vancouver, B.C. In the January number of *Harbour and Shipping*, a monthly magazine published at Vancouver, a very interesting account is given of the beginning of the company, 32 years ago, with five small scows. The company has now progressed to a point where it owns five diesel tugs and sixty scows, and is the most prominent towboat company operating out of the largest city in British Columbia.

H. E. Brandon, M.E.I.C.

H. E. Brandon, M.E.I.C., is the newly elected chairman of the Toronto Branch of the Institute. He was born at Cannington, Ont., and was educated at the University of Toronto where he was graduated in 1907. Upon graduation he went with the Manitoba Bridge and Iron Works at Winnipeg, and in 1910 joined the Vulcan Iron Works of Winnipeg. From 1911 to 1915 he was chief engineer with this firm, and from 1915 to 1919 he was overseas in active service. In 1919 he joined the Hydro Electric Power Commission of Ontario as a structural and mechanical engineer, and is still with the Commission.

W. H. Munro, M.E.I.C., director and general manager of the Ottawa Light Heat and Power Company Limited was elected president of the Rotary Club of Ottawa last month. He has also been elected to the vice presidency of the Industrial Accident Prevention Association of Ontario. Mr. Munro is a councillor of the Institute representing the Ottawa Branch. It is interesting to note that the present president of the Rotary Club of Montreal, Mr. DeGaspé Beaubien, is also a member of the Council of the Institute being vice-president for the province of Quebec.

Major W. L. Thompson, M.E.I.C., has recently been promoted to that rank and appointed to be second in command of No. 2 Army Field Workshop, R.C.O.C., which is stationed in England. Born near London, Ont., Major Thompson received his education at the University of Toronto, graduating in mechanical engineering in 1927. Since then Major Thompson has been with the Bailey Meter Company Limited, of Montreal, where he specialized on the automatic control of steam power plants. Shortly before the outbreak of war he was appointed manager of the company at Toronto. An officer of the Non-Permanent Militia unit of No. 2 Army Field Workshop before the outbreak of war, Major Thompson proceeded overseas in January, 1940, and has served with the unit in England since that time. Major Thompson is the brother of Lieutenant-Colonel H. G. Thomspon, D.F.C., M.E.I.C., who originally commanded the unit.

G. H. Kirby, M.E.I.C., has recently been appointed chief engineer of the Canadian Car Munitions Limited, Montreal. He had been with the company since early last fall. Previously Mr. Kirby was with Price Brothers and Company, Ltd., at Kenogami, Que., as electrical superintendent of the Riverbend mill.

J. A. Ouimet, M.E.I.C., has been appointed assistant chief engineer of the Canadian Broadcasting Corporation. Born at Montreal in 1908, he was educated at the College Ste-Marie and obtained his B.A. degree from the Université de Montréal in 1932. He received his engineering training at McGill University where he was graduated in electrical engineering, with the highest honours, in 1932. After graduation he was employed as research engineer with the Canadian Television Limited and the Canadian Electronic Company until 1935 when he joined the staff of the Canadian Radio Broadcasting Commission, now the Canadian Broadcasting Corporation. He was employed in development work until 1937 when, as operations engineer, he was put in charge of the operation and maintenance of all C.B.C. stations. In 1939, he was made general supervising engineer and was given full responsibility for the engineering organization of the royal visit broadcasts. In his new position Mr. Ouimet will continue to supervise all technical facilities of the C.B.C. and will be responsible for the administration of the engineering division under the direction of the chief engineer.

Lieutenant Trevor C. Thompson, M.E.I.C., is now in England with the Royal Canadian Ordnance Corps. Before enlisting last fall, he was with the Bell Telephone Company of Canada, at Montreal.

T. R. Bell, M.E.I.C., is now acting as resident technical officer for the Department of Munitions and Supply in the General Electric Company's works at Peterborough, Ont. He was previously with the Jaeger Machine Company Limited, and was located in Toronto.

J. A. Creasor, M.E.I.C., is now located at Port Colborne, Ont., with the Canada Cement Company Limited. Lately he had been located at Kilmar, Que., with the Canadian Refractories Limited.

H. B. Montizambert, M.E.I.C., has been granted a commission in the Royal Canadian Airforce with the rank of Flying-Officer, and has been appointed Works and Building Engineer at No. 13 Service Flying Training School, at St. Hubert, Que. Flying-Officer Montizambert has been connected with several large construction projects during his professional career, and is well known in the Montreal Branch where he has been particularly active.

R. A. Sara, M.E.I.C., has been appointed managing secretary of the Industrial Development Board of Manitoba at Winnipeg. Mr. Sara is an alderman for the City of Winnipeg.

J. A. Ouimet, M.E.I.C.

W. H. Munro, M.E.I.C.

Noel N. Wright, M.E.I.C.

Noel N. Wright, M.E.I.C., has recently been elected president of the Young Men's Canadian Club of Montreal. He was born in England and educated at the University of Illinois where he was graduated in 1928. He has been with Ferranti Electric Limited as a sales engineer since graduation, covering eastern Canada. He is chairman of the electrical section of the papers committee of the Montreal Branch.

Léon A. Duchastel, M.E.I.C., has been appointed Officer Commanding the Collège Jean de Brebeuf contingent of the C.O.T.C. at Montreal. Major Duchastel is power sales engineer with Shawinigan Water and Power Company. He is also the secretary-treasurer of the Montreal Branch of the Institute.

A. M. Reid, M.E.I.C., who was district engineer with the Department of Public Works of Alberta at St. Paul, has been transferred to Grande Prairie.

H. R. Younger, M.E.I.C., former superintendent of the Kettle Valley Division of the Canadian Pacific Railway Company at Penticton, B.C., has been appointed district engineer at Calgary, Alta. He has been with the company since his graduation from McGill University in 1910.

Donald A. Forbes, Jr.E.I.C., has joined the staff of Price Brothers & Company Limited, at Kenogami, Que. He was graduated in civil engineering from the University of Saskatchewan in 1934. For a few months after graduation he worked with the Canadian National Railways at Saskatoon, and in 1935 he was employed on a geographical survey with the Department of Mines and Resources of Canada. Since 1936 he had been with the Consolidated Paper Corporation at Port Alfred, Que.

R. V. Anderson, Jr.E.I.C., left the Imperial Oil Company in August, 1940 after returning from five-years' service in the tropics and has since been employed by the Chemical Construction Corporation at Niagara Falls, Ont. He was graduated from the University of British Columbia in 1931.

F. M. Booth, Jr.E.I.C., has joined the staff of the Canadian Pacific Railway Company, Air Service Department, in Montreal. He was graduated in 1938 from McGill University in mechanical engineering and upon graduation joined the staff of Trans-Canada Airlines in Winnipeg. He was engaged in the design and testing of aircraft structures and equipment, as well as development work, until he left to accept his new position.

A. Mead Wright, S.E.I.C., has been commissioned as sub-lieutenant in the R.C.N.V.R., Engineers' Special Branch, and upon his graduation from McGill University in electrical engineering last month, left for Halifax, N.S., to follow a training course. Sub-Lieutenant Wright is the son of the general secretary of the Institute.

Jacques Belle-Isle, S.E.I.C., is now employed as field engineer in the Plant Department of the Bell Telephone Company, Montreal. He was graduated from the Ecole Polytechnique in 1938 and has since been employed with the Quebec Roads Department. Lately, he was division engineer at Plessisville, Que. Mr. Belle-Isle was the winner of the Ernest Marceau Prize of the Institute in 1938.

James O. Dineen, S.E.I.C., is now employed as an instructor in the War-Emergency Radio Classes at the Westdale Technical School, Hamilton, Ont. He was graduated in electrical engineering from the University of New Brunswick in 1940.

J. S. Hubley, S.E.I.C., has returned from Trinidad where he has been employed for the past year and has joined the staff of the McColl Frontenac Oil Company Limited, in Montreal. He was graduated in chemistry from Mount Allison University in 1939.

A. D. K. Laird, S.E.I.C., is now employed with Fraser Brace Engineering Company Limited, at Winnipeg, Man. He was graduated in mechanical engineering from the University of British Columbia in 1940, and upon graduation joined the staff of Defence Industries Limited in Montreal.

D. L. Rigsby, S.E.I.C., is employed with the British Air Commission at Canadian Car and Foundry Company in Montreal.

A. M. Swan, S.E.I.C., has been transferred from the Peterborough works of the Canadian General Electric Company Limited, to the Toronto district office. He was graduated in electrical engineering in 1939 from the University of Manitoba.

VISITORS TO HEADQUARTERS

A. D. Fish, S.E.I..C., from Nobel, Ont., on March 24th.

H. M. Howard, S.E.I.C., Metallurgical Sales Engineer, E. Long Limited, from Orillia, Ont., on March 28th.

M. J. McHenry, M.E.I.C., Director of Sales Promotion, Hydro-Electric Power Commission of Ontario, from Toronto, Ont., on March 31st.

H. G. Stead, Jr.E.I.C., Chief Draughtsman, E. Leonard and Sons, from London, Ont., on April 3rd.

H. I. Mulligan, M.E.I.C., Newfoundland Pulp and Paper Co., from Corner Brook, Nfld., on April 4th.

J. H. Johnson, M.E.I.C., Chief Engineer, The Borden Company of Canada, from Tillsonburg, Ont., on April 8th.

Marcel Papineau, S.E.I.C., from Noranda, Que., on April 16th.

Professor J. A. Van den Broek, University of Michigan, from Ann Arbor, Mich., on April 17th.

F. S. Hutton, Jr.E.I.C., from Hamilton, Ont., on April 18th.

J. M. Fleming, M.E.I.C., President and General Manager, C. D. Howe Company Limited, and Councillor of the Institute representing the Lakehead Branch from Port Arthur, Ont., on April 21st.

L. C. Dupuis, M.E.I.C., Division Engineer, Canadian National Railways, and Chairman of the Quebec Branch of the Institute from Levis, Que., on April 22nd.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Charles George Du Cane, O.B.E., M.E.I.C., died at St. Albans, Herts., England, on March 4th, 1941, after a short illness. He was born at Willingale, Essex, on March 20th, 1879, and was educated at Winchester College and Cambridge University, where he was graduated in 1900. He served his engineering pupilage with Messrs. Crompton and Company of Chelmsford, where he was engaged in the construction of electric locomotives and in general mechanical work, and also received training, as an assistant to Messrs. Sir John Wolfe Barry and Partners, in general parliamentary work and in the design and construction of bridges, docks, and reservoirs. He served as assistant engineer to the firm on the dock extensions at Middlesbrough, and in 1905 was appointed resident engineer. Later he was engaged for the firm on parliamentary work, chiefly in connection with the London Outer Circle Railway. In 1910 he became chief engineer to Messrs. Norton Griffiths and Company Ltd., of Vancouver, B.C., and his activities included the design and construction of reclamation works at Vancouver. In 1912 he practised as a consulting engineer in the firm of Messrs. Du Cane, Dutcher and Company, at Vancouver, and was responsible for the design and construction of the hydro-electric plant at Kamloops, and for water supply, electric lighting, irrigation, and land drainage in Canada, including complete surveys and estimates for the Calgary-Fernie Railway.

After the outbreak of war in 1914 he was appointed a superintending engineer, being gazetted with standing as a Commanding Royal Engineer. In 1915 he went to Russia on reconnaissance and negotiations for the Murman Railway, and in the same year was commissioned in the Royal Engineers and after road construction work with a Labour Battalion became water-supply officer to the Third Army. He formed and commanded the 352nd Electrical and Mechanical Company, Royal Engineers, and later served on the staff of the Engineer-in-Chief, at General Headquarters, as water-supply officer for laison with the five armies. He was demobilized in March, 1919, with the rank of Lieutenant-Colonel, and in April travelled to India as the representative of Messrs. Sir John Wolfe Barry & Partners to report on harbours for the Madras and Mysore Governments. In 1922 he became a partner in the firm.

The most recent individual work carried out by his firm was as engineers to the London & North Eastern Railway for the New Fish Dock at Grimsby and its equipment at a total cost of over £1,700,000.

Colonel Du Cane was one of the consulting engineers and agents for the Bombay Port Trust and Aden Port Trust and was also a partner in the firm of Messrs. Fox and Mayo, consulting engineers. In 1918 he was awarded the honour of Championship of the Order of the British Empire.

He was elected an Associate Member of The Institution of Civil Engineers on the 4th December, 1906, and was transferred to the class of Member on the 14th December, 1920. He served on the Council of the Institution from November, 1938 until his death. He was a Member of the Institution of Mechanical Engineers, a Member of the Smeatonian Society of Engineers and a Member of the Association of Consulting Engineers being chairman of the latter in 1939.

Colonel Du Cane joined the Institute as an Associate Member in 1912, and he transferred to Member in 1931. He had represented the Institute last January at the presentation of the James Watt International Medal to Professor Stodola, in London.

Frederick Bowles Fripp, M.E.I.C., died in the hospital at Victoria, B.C., on April 14th, 1941. He was born at Ottawa, Ont., on February 18th, 1867, and educated at the Ottawa Collegiate Institute. In 1884 he became engaged with the Ontario Pacific Railway and a few months later entered the office of P. K. Hyndman, civil engineer, Montreal, where he studied for a year. In 1885 he joined the staff of the Department of Railways and Canals as a draughtsman. From 1887 until 1890 he worked as assistant engineer on the construction of the Cape Breton Railway. In 1891 he became connected with the Canadian Pacific Railway Company as an assistant in charge of work at Outremont, Que. From 1894 to 1898 he worked as a leveller in the surveys of the Trent Canal. During the years 1898 and 1899 he worked on the canals at Sault Ste. Marie, Williamsburg and Cornwall. From 1898 to 1913 he was engineer in charge at Sault Ste. Marie for the Department of Railways and Canals, and from 1913 until 1919 he was engineer in charge at the Prince Edward Island Railway Car Ferry Terminals. In 1919 he was appointed harbour engineer with the Canadian National Railways at Moncton, N.B. He retired on pension in 1932.

Mr. Fripp joined the Institute as an Associate Member in 1892. He became a Life Member in 1933.

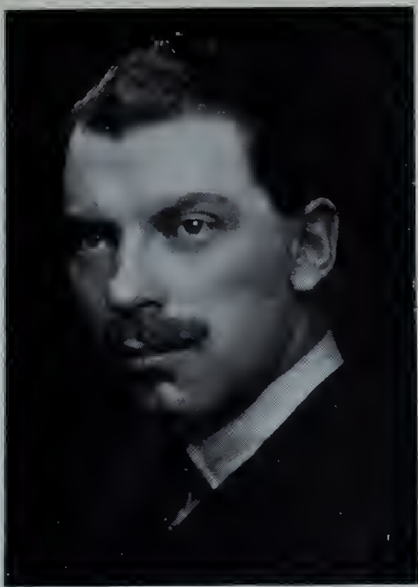
Gaston Lalonde, S.E.I.C., died at his home in Montreal on April 10th, 1941, after a few months' illness. He was born at Montreal on May 15th, 1915, and received his early education at the Mount St.-Louis College, Montreal. He entered the Ecole Polytechnique in 1938 and was in his fourth year at this institution when he died. Several of his classmates gave of their blood for transfusion during his illness. Gaston was the nephew of J. A. Lalonde, M.E.I.C., general manager of the Highway Paving Company, and the cousin of Flying Officer Jean A. Lalonde, killed in active service last summer.

Mr. Lalonde joined the Institute as a Student last fall.

James Grant Moloney, M.E.I.C., was killed in an accidental explosion on March 20th, 1941, while on military duty with the Royal Canadian Engineers in England. He was born in London, Ont., on June 1st, 1908, and was educated in the public schools of that city and at Tri-State College, Indiana, where he was graduated in civil engineering in 1935. Returning to London, Ont., after graduation, he was employed for six months by the City Gas Company in surveying and appraisal work. He then spent three years with a construction company, six months with a firm of consulting engineers in Buffalo, a year with Watt and Blackwell, architects, assisting in the steel design of the Huron & Erie Building at London, and two years with Archibald & Dillon, consulting engineers, London. In 1936 he became designing engineer for the Dominion Road Machinery Co. Ltd., Goderich, Ont., which position he resigned on February 1st, 1938, to join the editorial department of The Canadian Engineer Publications.

He joined the militia as a lieutenant in the Canadian Fusiliers at London in 1935. When he moved to Toronto he secured a transfer to a Toronto regiment. Last June he enlisted for active service, and after three months' training at Petawawa he went overseas in September with reinforcements for an engineering unit.

No details have been received in regard to the explosion that caused Lieut. Moloney's death, but it was known that he had been engaged in the construction of gun emplacements along the south coast of England.



James Grant Moloney, M.E.I.C.

Lieutenant Moloney joined the Institute as a Junior in 1936 and he was transferred to Associate Member in 1939.

John William Morrison, M.E.I.C., died suddenly at his home at Haileybury, Ont., on February 22nd, 1941. He was born at Oldham, N.S., on January 21st, 1880, and was educated at Dalhousie University and Nova Scotia Technical College, where he was graduated in 1912. Upon graduation he went with the Lucky Cross Mines Limited at Swastika, Ont., and later went with the Miller Lake O'Brien Mines, at Gowganda, Ont. From 1914 to 1918 he was manager and engineer with the Lake Shore Mines Ltd., at Kirkland Lake, Ont. From 1919 to 1925 he was with the Argonaut Gold Limited at Dane, Ont., first as manager and later as general superintendent. In 1925 he went to Haileybury, Ont., and inaugurated a consulting practice in mining engineering which he still carried at the time of his death. He was also manager and director of Albany River Mines.

Mr. Morrison joined the Institute as a Member in 1919.

James Weir, M.E.I.C., died at his home at Outremont, Que., on April 16th, 1941. He was born at Miami, Man., on May 8th, 1883, and was educated at McGill University where he was graduated with the degree of B.Sc. in civil engineering in 1913. He acted as assistant in the Department of Surveying before graduation and remained with the University as a staff member. During his career as professor, he successively taught surveying and geodesy. At one time Professor Weir was superintendent of the McGill Observatory. He gave invaluable service during the Great War in determining the exact time from the stars and sending it out over Canada by telegraph. Troop movements from eastern Canadian ports were regulated on these signals. At the time of his death he was associate professor of geodesy in the Faculty of Engineering.

Professor Weir joined the Institute as an Associate Member in 1921.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

W. P. Augustine, M.E.I.C. - *Secretary-Treasurer*
J. B. Dowler, M.E.I.C. - *Branch News Editor*

The February meeting of the Border Cities Branch was held on February 14th at the Prince Edward Hotel. After a short business session the chairman, Mr. George Medlar, turned the meeting over to Mr. C. G. R. Armstrong who introduced the speaker of the evening. The speaker, Mr. H. Lloyd Johnson, is a member of our own branch and a Lieutenant of the Veterans Civil Guard. He is also warden of Division No. 4 of the Civilian Defence Committee of Windsor. His subject was **The Warden System of the Civilian Defence Committee.**

Civilian defence is now a national undertaking and committees are being formed in the cities and towns of Canada. Under the Defence of Canada Regulations the Dominion Government has constituted an air raid precautions committee. Under this the provincial governments have sponsored the effort to have each community form local air raid precautions organizations based on the organization now functioning in England.

Early in December, 1940, the Windsor Board of Control and Council met and formed the Civilian Defence Committee of Windsor. The committee as formed has followed closely the suggestions contained in literature on the organization of the committees in England where they are operating so successfully.

The objective of the Civilian Defence Committee is to be ready to combat all forms of attack including attack from the air and attack from within. Some people think that the committee exists solely for the purpose of controlling damage that may be caused by attack from the air. This is not so. The impression is prevalent for the reason that, at the present time our sister organization in Great Britain devotes most of its time to air raid work. In broad terms the function of the Civilian Defence Committee is to assist the authorities to combat any and all forms of attack.

In Windsor the mayor is chairman of the Civilian Defence Committee. There are five auxiliary services, namely, public utility services, police services, fire services, medical services, transportation and communication services. Under the police and fire services come the warden services. Other auxiliaries can be added as found necessary.

Reporting to the police and fire chiefs is the chief warden, under him are five divisional wardens in charge of five divisions of the city. Each division, according to population is divided into two or three districts each in charge of a district warden. Each division is divided again into groups in charge of group wardens. Each group is divided into posts in charge of post wardens. The post area comprises approximately 500 people. Each post warden organizes the people in his post who will volunteer to serve in the organization. Thus the warden service covers the entire city.

One of the very important functions of the wardens system is to assist in exposing and combating subversive activities. Many people will not take the time and trouble to give bits of valuable information to the police but they will pass along information when they belong to a voluntary organization.

In Canada we are fortunate in being able to copy the British A.R.P. organization, an organization that was planned so brilliantly that basically it has not been changed. The development is similar in many ways to the development of an organization for carrying out an engineering project. First a small staff is formed and then gradually expanded and authority delegated to the various branches. Work of almost any magnitude can be undertaken. Each branch functions independently and yet co-operates closely with the other branches. Any part of the organization may be expanded quickly to handle any amount of work necessary.

In Great Britain the A.R.P. organization was started in 1935. In 1937 the Air Raid Precautions Bill was passed by parliament and local organizations started. By the time the war started, four years of thought had been given to the development of the A.R.P. system and for two years the organization had been in existence. The civilian population of Britain was prepared.

The veterans civil guard is a voluntary organization of veterans which forms the mobile unit of the Civilian Defence Committee. It comprises five companies corresponding to the five divisions into which the city is divided. It is so organized that it can be called out to any part of the city where trouble arises in a very few minutes.

After Mr. Johnsons' talk a vote of thanks was moved by Mr. Wm. Fletcher.

Our new councillor, Mr. E. Krebser, was introduced to the members and spoke for a few minutes.

Mr. P. H. Jenkins, the retiring councillor, then gave a brief report on the annual meeting at Hamilton. He reviewed for a few moments the papers and the procedure of the meeting. This branch was represented at the meeting by Messrs. P. H. Jenkins, J. C. Keith, C. M. Goodrich, P. E. Adams, E. M. Krebser, G. C. Henderson, J. G. Turnbull and J. H. Bradley.

The meeting was then adjourned.

The March meeting of the Border Cities Branch was held on March 14th at the Prince Edward Hotel. G. E. Medlar, the branch chairman, presided over the dinner and the meeting afterwards. C. M. Goodrich introduced the speaker of the evening, Mr. J. A. McCrory, vice-president and chief engineer of the Shawinigan Engineering Company. Mr. McCrory's subject was **La Tuque Power Development.** The paper was published in the February issue of the *Journal.*

After an interesting discussion period, J. Clark Keith moved a vote of thanks to the speaker.

The branch was privileged to have two visitors from London, Ontario, J. A. Vance, councillor, and H. F. Bennett.

CALGARY BRANCH

P. F. Peele, m.e.i.c. - *Secretary-Treasurer*
F. A. Brownie, m.e.i.c. - *Branch News Editor*

The February 27th meeting of the Calgary Branch was devoted to a paper by Mr. R. M. Watson of Canadian Industries Limited on the subject, **Commercial Explosives and Their Application in Fill-Settlement Operations.**

Mr. Foster outlined briefly the history of explosives, stressing the great debt owed to Alfred Nobel, not merely because he invented dynamite and the blasting cap, but because of the high place he occupied among the great minds of all time. He also pointed out the fact that explosives fall into two distinct classes, military and commercial, and that explosives of one class are not well adapted for use in the other.

When a road is constructed across a swamp or muskeg, it will gradually settle until a firm foundation is reached. This results in the continual necessity of repairing and building up the road surface. If explosives are available, the fill may be completed to its ultimate depth on top of the swamp and landed on firm material by blasting out the muck underneath it.

The annual general meeting of the Calgary Branch was held following a luncheon at the Palliser Hotel on March 8th, 1941.

Mr. Boese, councillor for the Calgary Branch, reported at some length on the recent annual meeting of the Institute held at Hamilton, Ontario. Reports of the various committees were read and adopted following which the results of the election of officers were announced. Before adjournment the meeting was turned over to H. J. McEwen, newly elected vice-chairman in the absence of the new chairman, J. B. de Hart.

EDMONTON BRANCH

B. W. Pitfield, Jr.e.i.c. - *Secretary-Treasurer*
J. F. McDougall, m.e.i.c. - *Branch News Editor*

The Edmonton Branch held a mixed dinner and meeting at the Macdonald Hotel on the evening of April 1st. Chairman E. Nelson was toastmaster. Mr. Julian Garrett proposed the toast to the ladies and Mrs. R. M. Dingwall responded.

After dinner the Belasco Players, a local comedy troupe, entertained the members with several songs and skits. They were extremely gifted artists and kept everyone laughing.

Later, a motion picture dealing with the manufacture of household silver articles was shown.

Twenty-six members and their wives were present. All agreed that the evening was a great success and that a mixed dinner should become an annual feature of the branch. The meeting adjourned at 11.00 p.m.

HALIFAX BRANCH

S. W. Gray, m.e.i.c. - *Secretary-Treasurer*
G. V. Ross, m.e.i.c. - *Branch News Editor*

A technicolour talking picture entitled **Friction Fighters** was shown to the members of the Halifax Branch and the Professional Engineers of Nova Scotia, at the March dinner meeting. Presented by R. L. Dunsmore, superintendent of the Imperial Oil Refinery, the picture is a story of the development of lubricating oils in keeping pace with the high speeds and pressures in present day motor cars.

Several senior students of the Nova Scotia Technical College were guests of the branch. The Institute award to the student outstanding in scholastic and extra-curricular work, was made by Ira P. Macnab to Wallace A. MacCallum of Amherst, N.S., a senior mechanical.

S. L. Fultz presided at the meeting which was attended by about fifty members and their guests.

LONDON BRANCH

H. G. Stead, Jr.e.i.c. - *Secretary-Treasurer*
A. L. Furanna, s.e.i.c. - *Branch News Editor*

The regular monthly meeting of the Branch on March 13th, 1941, was addressed by J. A. McCrory, the vice-president and chief engineer for the Shawinigan Engineering Company of Montreal. He described the **La Tuque Hydro-Electric Development.** The paper was published in the February issue of the *Journal.*

The many questions asked of Mr. McCrory after he had given his paper indicated the keen interest taken by those present. The speaker was introduced by Mr. Buchanan.

NIAGARA PENINSULA BRANCH

Geo. E. Griffiths, m.e.i.c. - *Acting Secretary-Treasurer*
C. G. Cline, m.e.i.c. - *Branch News Editor*

A dinner meeting of the Niagara Peninsula Branch was held on March 21st, 1941, at the Reeta Hotel, Welland. Mr. H. B. Chambers, metallurgist of Atlas Steels, Welland, spoke on **Some Fundamental Steel Characteristics of Special Interest to Engineers.** He stated that the metallurgist has been able to produce a range of steels that can cover all ordinary requirements, but the engineer does not always use them to the best advantage. With the aid of slides, the speaker showed the chemical basis of all steels. He showed the relation of carbon content to application in the case of plain carbon steels. These steels must be hardened in water and this tends to cause warping and cracking. He showed the effect of mass on the mechanical properties and how an increase in size causes shallow penetration of hardness. It is these shortcomings of water-hardening steels that have led to the introduction of alloy steels, which may be hardened in oil or even in air, thus reducing hardening strains. In some cases it is possible to improve the design, from a metallurgical point of view, by balancing the cross section, thus reducing hardening stresses and making it possible to use plain carbon steel. Where the design is so intricate that this cannot be done, an alloy steel, either oil or air hardening, should be used.

The speaker was introduced by A. N. Conklin and the vote of thanks was tendered by Paul Buss. A. L. McPhail, vice-chairman of the Branch, presided. There was an attendance of thirty.

OTTAWA BRANCH

R. K. Odell, M.E.I.C. - *Secretary-Treasurer*

At one of the most largely attended luncheon meetings in the history of the Branch, held at the Château Laurier on March 13th, Flying Officer H. T. Mitchell, D.F.C., of the Royal Air Force, gave an address on the **Activities of a Fighter Squadron.** In simple language and in unassuming manner he told of the activities of the Hurricane Fighter Squadron to which he had been attached from the beginning of the war, first in France and then in England.

At the commencement of the war the squadron was located in the vicinity of Rouen, France, though at first there was not a great deal to do. The first German plane shot down was a Heinkel 111, of which some interesting photographs were taken from the moment it was attacked until it fell to the ground. Other moves of the squadron were to Amiens and to Verdun. While at the latter place the blitzkrieg started in real earnest and the squadron was moved to Lille before it was forced to return to England. In twelve days of fighting, five of the R.A.F. squadron pilots were shot down to 73 enemy planes.

The return to England had to be made on ten minute's notice, and each pilot was told to land on any English field available. Two weeks were then taken to get reassembled and re-equipped and for this reason the squadron missed action at Dunkerque, most of the action there being taken by home defence squadrons. When the German air raids on England commenced in real earnest the squadron was located at the south coast.

Flying Officer Mitchell outlined the course of action on a typical day against the enemy from the time the first telephone call came from the "operations room" that an enemy formation was massing for attack over the west coast of France until the action was over. He stated that ordinarily it took 2½ minutes for the squadron to get into the air and from five to ten minutes after that before contact was made with the enemy. In a real fight there may be as many as 500 aeroplanes in the air at the same time and the pilot himself does not get a clear impression of the fight as a whole, being concerned more with his own individual action and that of his immediate enemy.

In answer to a question from the audience he stated that the most vulnerable part of a plane is the pilot himself and then the gas tank. In the Messerschmidt 109 there is a gas tank immediately behind the pilot. It is not armour plated and if a direct hit is scored upon it the plane and pilot are quite likely to both be put out of action. He also gave it as his personal opinion that no matter how speeds are increased the pilots will be able to stand up to them. In some dive bombing actions, speeds in the region of 600 miles per hour are obtained with no effects upon the pilot except perhaps "blackout," but this is something that experience overcomes.

The most dangerous enemy plane, the speaker believed, was the Heinkel 113 fighter, especially when it followed the practice of rushing in, attacking quickly, and then flying off. This with the Messerschmidt 110 twin-engined fighter or fighter-bomber constitute the two most dangerous enemy planes, he believed.

Asked to give his opinion regarding the relative merits of manoeuverability and speed he believed the former will win over the latter in the end. The Hurricane fighter is the most manoeuverable of the English planes and it has shot down more than any other, even though it is not the fastest. The Spitfire he believes is the best interceptor fighter but in a big fight the Hurricane is best.

Flying Officer Mitchell is at present in Canada on instructional duties connected with the air training scheme.

At the noon luncheon on March 27th, L. A. Hawkins, executive engineer of the General Electric Company, Schenectady, New York State, gave an address on **Research and Security Now and Later.** T. A. McElhanney, chairman of the Branch, presided.

Mr. Hawkins commenced his address by paying a tribute to the work of the National Research Council at Ottawa which he said was "as fine a research institution as is to be found anywhere." He also referred to the loss sustained through the recent death of Dr. Banting, a man whom history would accord a high place in his own field alongside, for instance, of such men as Osler in medicine and Rutherford in physics. Research actually has no national boundary lines with its products of benefit to everyone.

Regarding the onset and trend of the present war and its threat to democracy, Mr. Hawkins stated that his country was all too slow in recognizing the emergency. "The United States was bound in a strait jacket of official neutrality," he said, "although we know how the vast majority of people felt in that country."

To-day there is little left of that official neutrality with the passage of the Lend-Lease Bill and the country "to the limit of its ability will not only produce all the materials that Great Britain needs but will see that they get there."

When the United States at last woke up to the emergency facing it, the president of the General Electric Company made it quite clear that they would do all they could to help the war programme. Now about 75 per cent of the technical staff are working intensively on war projects, working hours per week have been extended and the staff increased. "All of us are convinced," he said, "that if the role of the United States in this war is to be the arsenal of the free nations then we should do all in our power to see that the stock going into that arsenal is the best possible."

The speaker related some of the research results achieved during the first Great War, particularly in the development of submarine detecting devices, wireless apparatus, and portable safe X-ray outfits, for use of the military forces. To-day, he added, "war is becoming mechanized beyond belief," the problems are far more complex, much different from 1917, and "we have a real job to catch up." It is a war of ships, tanks, aeroplanes, and other machines, he said, and the efforts of the research laboratories in England "first class in every particular" as well as those in the other free countries are all needed.

Mr. Hawkins stated that in peace time there should be some kind of consolidation of the powers of the English-speaking nations for their own protection and advancement. Several steps along this line have already been taken, including the formation of the Joint United States Canadian Mission for defence as well as the agreement relating to the transfer of United States destroyers to England and the use of naval bases by United States in return. This general policy has been advanced and "crystallized" under the Lend-Lease Bill.

If the consummation of such a policy, he declared at the conclusion of his address, can afford to our children and to our children's children a full measure of peace, liberty and prosperity then the sacrifices called forth by the present war will not have been made in vain.

At a largely attended evening meeting held at the National Research Laboratories on April 10th, A. E. Davison, transmission engineer of the Hydro Electric Power Commission of Ontario, gave an address illustrated with motion pictures on **Dancing Cables and Bridges.**

Mr. Davison has devoted considerable thought in the past fifteen years to the subject of vibration and remarked that everything was not yet known about it. So far as cables and bridges are concerned, vibration gives rise to the phenomenon known as "galloping" or "dancing" which may become so pronounced as to cause damage. Cable conductors and supporting structures have been brought to the ground in severe cases and bridges have collapsed, as in the recent case of the Tacoma Narrows Bridge.

One contributing cause to the dancing of cables, stated the speaker, is the change in cross section due to the formation of ice on one side. The cross section, then, instead of being a circle, approaches that of an ellipse or even that of an aeroplane wing. While temporarily of this shape, moderate gusty winds will cause the cable to assume an undulating or rolling motion that becomes more severe as the wind increases in velocity. The central portion of a cable, as suspended between two supports, will travel upward as well as downward through the action of the wind and will also move from side to side in a remarkable manner.

This characteristic was revealed by motion pictures exhibited at the meeting. They showed the action of wind on cables partially encrusted with ice and damage done to transmission lines under such conditions. In one case, due to the galloping action, cables were detached from the supporting cross arms and newly erected wooden poles were snapped off at points several feet from the ground.

A most interesting event of the evening was the showing of a remarkable coloured film of the galloping of the Tacoma Narrows Bridge preceding its collapse and the actual collapse itself.

T. A. McElhanney, chairman of the Branch, presided and the speaker was introduced by W. H. Munro, past chairman of the Branch, and present councillor of the Institute.

PETERBOROUGH BRANCH

A. L. Malby, Jr.E.I.C. - *Secretary-Treasurer*
E. Whitely, Jr.E.I.C. - *Branch News Editor.*

The evening of March 20th was a noteworthy one for members of the Peterborough Branch. In the first place it was the night when the Junior and Student Section provide the programme, an annual affair. This year, under chairman F. Athey, a new programme was tried, with evident success. The dinner was followed by a student paper and entertainment in the form of some very interesting moving pictures.

Student engineers are guests of senior members of the Branch at this meeting and are introduced to the members during the meeting. It has been found that this helps the membership committee a great deal. The event was remarkable this time in the presence among the student engineers of a young lady. Miss E. Rabkin graduated from the University of Alberta in electrical engineering and is now taking the student engineering course with the Canadian General Electric Company. This event introduces a new note into the activities of the Branch.

Mr. H. R. Sills, our councillor, was also present and gave his impressions of the annual general meeting, recently held in Hamilton, especially the things that would be of interest to the junior engineers. The meeting must have been inspiring when even the story of it was enthusiastic.

The speaker of the evening, J. M. Mercier, graduated from the University of Montreal, Ecole Polytechnique, in 1940 and is now in the Test Department of the Canadian General Electric Company. His paper, **Some Aspects of Railway Signalling,** was based on a study made for his graduation thesis with a background of life-long association with and interest in railroads.

Beginning with the simple track circuit Mr. Mercier showed the fundamental components of modern signal systems and how they operate. This is one of those things everyone comes in contact with but few people know how they work. As described by Mr. Mercier it is all very simple. The development of the various systems was traced historically, and quite completely as far as fundamentals go. The complicated details were omitted which is as it should be when such things are first described to laymen. The story was not without its thrills too, a rare thing in technical papers. It was quite evident from the discussion afterwards that the speaker's description of two trains meeting on a single track at a siding, the trains passing without stopping, with their position being indicated on a remote control board from which the track switches are operated stirred many to imagine themselves doing the switching. All kinds of difficulties were imagined, but Mr. Mercier was able to convince everyone the feat is not only feasible but a common occurrence. Our railway signal systems are much bigger and more important than the average person might suspect. They are apparently extremely efficient.

At a meeting of Peterborough Branch on February 27th, 1941, Mr. C. L. Sherman, metallurgist for Phillips Electrical Works Limited, Brockville, Ontario, presented an excellent paper on **Processing of Copper.** The paper covered the metallurgy and processing of copper from mine to copper wire, one of its finished products.

Canada is fortunate in having large copper ore deposits containing about 1 lb. of copper, in the form of copper sulphide, per ton of ore. The ore is picked over to remove obvious waste, crushed in rod or ball mills and the wet powder agitated in an oily solution. This last process known as flotation, gives a 20 to 40 per cent concentrate. The next step is smelting in reverberatory furnaces where the concentrate is melted and a slag or matt of iron-copper-sulphide is skimmed off. The molten matt is put in converters where air is blown in and a siliceous flux is added. The resulting reaction removes most of the sulphur and iron leaving a charge that is cast in cakes, called blister copper because it is very porous.

Beyond this point there are alternative methods of treating the copper—by electrolysis in copper sulphate solution, or by further melting in furnaces. Electrolytic copper is very pure but unfortunately in present processes it is remelted for casting into rods and thereby picks up gases and loses some of its desirable purity.

Small amounts of impurities have a marked effect on the electrical conductivity and mechanical strength of copper.

Rod for wire is produced from the standard bars by hot rolling alternately oval and square sections. This breaks up large crystal structures and refines the grain size at the same time as the section is reduced. Water cools the rolls and cracks off oxide scale which forms on the rod. It is important that surface defects are not put on the rod at this stage as they will persist to the final wire and may lead to slivers.

The wire is drawn from rod thus made, the amount of cold working being adjusted to suit the temper required in the wire, which may be hard, medium or soft. Annealing will reduce the hardness produced by cold working. Carbide dies are used for larger sizes, and diamonds for smaller sizes. There seems to be no limit to the speed at which wire can be drawn except the purely mechanical difficulties in high speed machines. Speeds of a mile-a-minute are common.

Quite a lively discussion followed Mr. Sherman's talk which was illustrated by slides and a motion picture "The Mining, Smelting and Refining of Copper-Nickel Ores."

QUEBEC BRANCH

Paul Vincent, M.E.I.C. - *Secretary-Treasurer*

Lundi soir, le 17 février, avait lieu une représentation de films à la fois instructifs et récréatifs présentés par l'International Nickel Company of Canada Limited.

Cette séance marquait l'inauguration d'une série de films documentaires sur les activités des ingénieurs dans le domaine du génie civil en général. Les dames et le public étaient admis à cette soirée d'éducation technique.

Le programme se composait de cinq films parlants et semi-techniques sur **l'Industrie du Nickel au Canada.**

Les méthodes récentes d'exploitation des mines de nickel et de cuivre au Canada y furent montrées et tous purent constater le rôle important que ces deux métaux jouent dans la vie économique du pays.

Au début de la séance, le secrétaire Paul Vincent souhaita la bienvenue à un auditoire d'environ 200 personnes. Monsieur J. Alex. Larivière, régisseur de la Régie des Services Publics de Québec, remercia l'assistance de son encouragement et il annonça que d'autres séances semblables suivraient.

Le 28 février, les membres de la section de Québec de l'Institut furent invités à un déjeuner-causerie au Château Frontenac.

L'Honorable T. A. Crerar, Ministre des Mines à Ottawa y donna une conférence des plus intéressantes sur les **Contributions Minières du Canada dans la Guerre.**

Cette causerie était sous les auspices des Clubs Canadien, Rotary, Kiwanis et de l'Engineering Institute of Canada. Monsieur L. C. Dupuis, président de la Section de Québec et le secrétaire-trésorier Paul Vincent représentaient l'Institut à la table d'honneur. Plusieurs membres assistèrent à ce déjeuner.

On Monday, March 10th, the Quebec Branch held a very interesting meeting in the theatre room of the Palais Montcalm.

The **Engineer and the Hydroelectric Developments on the St-Maurice River** was the subject which captivated the interest of the members accompanied by their wives. The public was also invited, so that some 500 people listened to Huet Massue and Guy Rinfret, who were the guest speakers. Five films were presented to illustrate their talk. A local orchestra played some winning music pieces while the silent films were being shown on the screen.

Mr. Huet Massue, engineer with the Shawinigan Water & Power Company, gave a short, but a masterly and well illustrated talk, on the **Hydroelectric Industry in Quebec** and the **Hydrology of the St. Maurice River.**

A forty-minute programme of silent films was then presented on the Shawinigan Power and especially on the Construction of the Rapide Blanc Power Plant.

Mr. Guy Rinfret, then presented a short talk on the **Construction of the Rapide Blanc and La Tuque Power Plant.**

Mr. E. D. Gray-Donald, vice-chairman of the Branch introduced the speakers and Mr. R. B. McDunnough moved a vote of thanks to the lecturers and to the large audience for their encouragement to engineering activities.

SAGUENAY BRANCH

T. A. I. C. Taylor, Jr.E.I.C. - *Secretary-Treasurer*
B. E. Surveyer, Affil.E.I.C. - *Branch News Editor*

The first meeting of the Saguenay Branch, for the year 1941, was held on 14th January at the Arvida Protestant School. The speaker was A. T. Cairncross, of the Aluminum Company of Canada, Limited. The subject of his talk was **Experiences of an Engineer in China.** Mr. Cairncross was engaged for quite a number of years on engineering work in China. With the help of slides he took the meeting through an imaginary trip in the interior of that country. He showed what an engineer had to cope with in his work over there, some of the difficulties encountered and some of the methods used in solving these. He blended his talk with some of his own personal experiences all of which made for a highly interesting and educational evening. After the presentation of the paper a meeting of the executive of the Branch was held.

The second meeting of the New Year was held on the 21st February at the Arvida Protestant School. The guest speaker was W. H. D. Clark, chief engineer of the Combustion Engineering Corporation. He entertained his audience with an illustrated talk on **Combustion Boiler Installations.** He spoke on modern boiler designs and described the different types of boilers now in use showing the improvements reached in recent years. He pointed out in detail the problems solved by the designers stressing the fact that improvements and new designs were based on past performances rather than any set formula. His subject was timely, as in this district an increased use of combustion boilers has been made in the last eighteen months, and the active discussion which followed served to demonstrate the interest felt by everyone at the meeting.

The following meeting of the Saguenay Branch was an unusual one, unusual in the way that it was a mixed meeting and that all attendance records were broken. It was held on 28th March at the Arvida Protestant School. The speaker was Jean Flahault, of the Aluminum Company of Canada, Limited, and his subject, highly up to date, was **Engineering in the Battle of France.** Mr. Flahault, a graduate of the Ecole Polytechnique of Montreal, has just recently returned from France where he was taken prisoner of war while serving with the French Army. After making his escape to unoccupied France he obtained passage to Canada and he is now a resident of Arvida. He discussed some of the methods used by the German Army in their conquest of western Europe and emphasized the engineering basis on which the German High Command had developped their new modes of offensive warfare. He gave examples on the workings of some of the weapons used and showed how field and air strategy can efficiently co-operate when based on engineering principles. He flavoured his topic by relating some of his own personal experiences and adventures injecting the right amount of humour at the right time. That the evening and the lecture were such a huge success stand as a tribute to the talents of Mr. Flahault as a speaker.

SAINT JOHN BRANCH

V. S. Chesnut, M.E.I.C. - *Secretary-Treasurer*

A supper meeting was held at the Admiral Beatty Hotel on March 21st. The attendance was 16.

A four reel sound film, loaned by the International Nickel Company of Canada Limited, was shown. The film portrayed the various operations involved in producing nickel and copper at the Company's plants in Sudbury and Port McNicoll, Ontario, from the mining of the ore to the refining of the metal.

A proposal by President Mackenzie to ask all members and juniors to contribute $1.00 towards the expense of underpinning the Headquarters building was unanimously approved.

The Tacoma bridge film was presented at a meeting of the branch on April 18th.

There were twenty present at our meeting, all of whom found the film most interesting. After the showing of the film, considerable discussion took place, led by Mr. Sidney Hogg of the Saint John Drydock and Shipbuilding Co., Ltd.

The programme was then rounded out by Mr. H. P. Lingley who presented a colored film of his own, showing fishing scenes and scenes of wild life in New Brunswick, and a view of the recent Emerson fire in Saint John.

A motion of thanks to Institute Headquarters and to Mr. Lingley was passed for a very enjoyable programme.

SASKATCHEWAN BRANCH

Stewart Young, M.E.I.C. - *Acting Secretary-Treasurer*

The regular monthly meeting of the Saskatchewan Branch, of the Institute was held jointly with the Association of Professional Engineers and the Saskatchewan Section of the American Institute of Electrical Engineers at the Kitchener Hotel, Regina, on Friday evening March 21st, with 52 members and guests in attendance. The speaker of the evening, Flight Lieutenant G. Thornber, gave an outline of the theory of **Air Bombing and Gunnery** progressively illustrating his lecture by lantern slides showing graphs of the several aspects of his subject. Considerable discussion followed the address after which a hearty vote of thanks, moved by W. E. Denley, was tendered the speaker.

SAULT STE. MARIE BRANCH

O. A. Evans, Jr.E.I.C. - *Secretary-Treasurer*
N. C. Cowie, Jr.E.I.C. - *Branch News Editor*

The third general meeting for the year 1941 was held in the Windsor Hotel on Friday, March 21st, when 19 members and guests sat down to dinner at 6.45 p.m.

The business portion of the meeting began at 8.00 p.m., with Chairman E. M. MacQuarrie, presiding.

A letter was read from President C. J. MacKenzie, asking the branch to solicit funds from the members for the work done on Headquarters building last year, caused by settling due to changing soil conditions under the building. J. S. MacLeod and N. C. Cowie, moved that the secretary circularize the members in the branch asking for a donation of $1.00 for this cause. K. G. Ross and W. S. Wilson moved an amendment to the motion that the necessary funds be taken from the branches' funds provided a proportionate amount is raised from the other branches. The amendment was carried.

The chairman then introduced the speaker of the evening A. L. MacDougall, district engineer for Highways, who gave a short address on the **Queen Elizabeth Highway.**

On the conclusion of the address the members were shown two technicolour reels on the Queen Elizabeth Highway. The first showed the construction of the highway, while the second was the highway from Toronto to Niagara as seen from the air.

At the conclusion, C. Stenbol moved a vote of thanks to the speaker for obtaining this fine film for the branch. E. M. MacQuarrie thanked Mr. MacDougall on behalf of the branch.

ST. MAURICE VALLEY BRANCH

Gordon B. Baxter, Jr.E.I.C. - *Secretary-Treasurer*

The annual dinner meeting of the St. Maurice Valley Branch of the Institute was held on Saturday evening, March 22nd, in the Cascade Inn, Shawinigan Falls.

The retiring chairman, Mr. C. H. Champion, presided and the secretary-treasurer read the annual report and financial statement. This showed the Branch's financial position to be excellent.

C. H. Champion the retiring chairman and A. H. Heatley the incoming chairman of the St. Maurice Valley Branch.

The presiding chairman introduced the chairman-elect, Dr. A. H. Heatley, of Shawinigan Falls. Dr.Heatley thanked the retiring chairman for the good work accomplished during the past year, following which he introduced the members of his executive committee for the coming year.

The guest speaker of the evening was our general-secretary, Mr. L. Austin Wright, who outlined the setting up and duties of the Wartime Bureau of Technical Personnel under the directorship of Mr. E. M. Little, a prominent engineer and general manager of the Anglo-Canadian Pulp and Paper Mills, and the Gaspesia Sulphite Company. Mr. Wright stated that the Department of Labour by authority of the Minister, had handed over the operation of the Bureau to the engineers themselves with full authority to set up their own organization and choose their own directorate. Mr. Little had accepted the appointment on condition that all the engineering societies would support him, and Mr. Wright was selected to be assistant director of the Bureau.

He then gave a brief outline of the trouble to the Headquarters building, due to shifting soil conditions and the

Preceding the annual dinner of the St. Maurice Valley Branch. From left to right, A. H. Heatley, A. C. Abbott, C. H. Champion, J. P. Villemure, G. B. Baxter, J. M. Mitchell, V. Jepsen, H. K. Wyman.

necessary repairs that had to be made, which cost $10,000. He outlined several proposed schemes to pay for this. Stating that council believes that the Institute finances should be kept intact if possible since same are sure to be needed in the difficult period that will follow the end of this war. He pointed out that if each member, other than students, were to furnish $1.00 apiece, about $4,000 would be realized, which would be a big help.

Mr. Abbott thanked the speaker in a very capable manner, remarking that the members were always glad to hear news from the Institute Headquarters. He concluded by saying that he hoped that we would hear from him again in the very near future.

VANCOUVER BRANCH

T. V. Berry, M.E.I.C. - - *Secretary-Treasurer*
Archie Peebles, M.E.I.C. - *Branch News Editor*

Industrial Applications of the X-Ray was the subject of an illustrated address given by A. H. Eggleton, manager of the Industrial X-ray Company, Vancouver, before the Vancouver Branch of the Institute on Thursday evening, March 27th.

Mr. Eggleton first described some of the industrial uses to which the X-ray has been put in the past ten years. Even at the present time, the use of X-ray is generally associated with medicine and surgery, in spite of the fact that the first X-ray pictures made by their discoverer, Rôentgen, in 1895, were of pieces of metal. One possible reason for the slower development of their use for industrial purposes is the greater penetrating power required in most cases, requiring high voltage equipment with elaborate protective and cooling devices for safety in continuous operation.

In the packaged food industries, considerable use is now made of X-ray to detect foreign material which may have found its way into the product during processing. Typical of the products checked in this way are cereals, peanuts, confections, canned soups, etc. One firm marketing tobacco makes a similar check.

The X-ray technique in dealing with large numbers of articles is to pass them before a fluorescent screen so that the rays will penetrate the object and cast an image on the screen. Variations in the colour of this image indicate materials of different density, permitting the detection of foreign material or damaged product.

Where the use of a screen is not practicable, owing to the higher power required and the necessary protection of operators, the radiograph exposure method is adopted. A film is so placed in relation to the object that it will be exposed by the X-rays which have penetrated the material. The degree of penetration, which depends on the density of the substance and its thickness, will be indicated by light and dark areas on the developed negative.

Applications of the radiograph method include the testing of castings and welds, and the detection of highly stressed metal as might be caused by heat treatment. Power line poles have been X-rayed to ascertain the extent of decay before replacement. Automobile tires are examined for nails, stones, or damaged fabric, as well as being checked at the factory for inferior construction. About 75 miles of welded seams in the penstocks at Boulder dam were radiographed, using 36 in. of exposure at a time. In aircraft factories, many thousands of castings are examined daily for shrinkage, cracks or gas pockets. By means of such examinations, foundry procedure can be altered to eliminate these defects, such as by changing the radius of fillets or by pouring the mould at a different point. Steam tubing, valves, and all types of pressure tanks are now tested, and in some countries such testing is required by law. In some cases, rejects in casting have been reduced to 2 per cent from as high as 90 per cent.

Commercial X-ray machines are available up to 400,000 volts capacity, and these will penetrate up to 3½ in. of steel or 9 in. of aluminum. The largest unit is at the National Bureau of Standards in Washington, D.C., and develops 1,500,000 volts. A larger unit still is under construction for the Ford Motor Company. The usual commercial machines will photograph straight welds in 17 in. lengths, and circumferential welds in 10 in. lengths. A device known as a stepped penetrameter must be included in the radiograph to check the penetration. It is a stepped piece of metal varying in thickness by steps of known height, which forms a standard band of colour in the negative and permits checking the penetration of the X-rays to within 0.002 in. The heat generated in large units requires a circulating oil cooling system, and immersion of the tube and coils in oil. The operator must be shielded by a lead lined cab, as a protection against wandering X-rays. These large machines are now built completely portable, mounted on rubber-tired wheels. In some cases it is easier to move the subject material, while in others it is more convenient to move the machine.

The speaker predicted that very rapid growth in the use of X-ray would extend the control of products and manufacturing methods even more than it has done in the last few years, because of the large savings resulting from it, and the greater safety which is synonymous with products free from defects. A large number of radiographs and samples of welds and castings were shown to the audience by Mr. Eggleton, chief technician of the Industrial X-ray Company. The chair was occupied by Dean J. N. Finlayson, branch chairman, and the appreciation of the audience was expressed by Mr. W. N. Kelly. About 40 members and guests were present.

News of Other Societies

Items of interest regarding activities of other engineering societies or associations

JOINT MEETING OF COUNCILS OF THE ENGINEERING INSTITUTE OF CANADA AND THE ASSOCIATION OF PROFESSIONAL ENGINEERS OF ONTARIO

A joint dinner of the members of Council of the Engineering Institute of Canada and of the members of Council of the Association of Professional Engineers of Ontario was held at the Royal York Hotel, Toronto, on Saturday, April 19th, 1941. That an event of this kind could be held was possible due only to the fact that a meeting of the Council of the Institute coincided with the quarterly meeting of the Council of the Ontario Association.

Dean C. J. Mackenzie, president of the Institute and S. R. Frost, president of Ontario Association of Professional Engineers.

Stanley R. Frost, President of the Association, acted as Chairman. Others at the head table included Dean C. J. Mackenzie, President of the Institute; McNeely DuBose, K. M. Cameron, W. C. Miller, Dr. T. H. Hogg, Alex Larivière (Vice-President of the Dominion Council of Professional Engineers), J. Clark Keith and Dr. J. B. Challies.

The Chairman in his opening remarks welcomed the Council of the Engineering Institute to Toronto and stated that it was a great pleasure for the Council of the Ontario Association to meet with them on this occasion recalling a similar meeting held in Toronto three years ago. He then called on Dean Mackenzie, Acting President of the National Research Council and President of the Institute, for a few words. Dean Mackenzie stated that the Councillors of the Institute welcomed the opportunity of meeting with the Council of the Association. He outlined the part that the engineer was playing in the war.

Alex Larivière, a councillor of the Institute and Vice-President of the Dominion Council of Professional Engineers brought greetings from that body. Other speakers included Dr. T. H. Hogg, immediate Past-President of the Institute; Lieut-.Comdr. C. P. Edwards, Deputy Minister

S. R. Frost addresses the joint dinner with Dr. T. H. Hogg, past-president of the Institute on his left.

McNeely DuBose, vice-president of the Institute was also a speaker at the joint dinner. On his left, W. C. Miller, Dean Mackenzie, S. R. Frost, Dr. Hogg, Alex Larivière and J. Clark Keith.

of Transport and Councillor of the Ontario Association; Dr. J. B. Challies, Past-President of the Institute and Dean C. H. Mitchell, Past-President both of the Institute and of the Association.

ASSOCIATION OF PROFESSIONAL ENGINEERS OF ALBERTA

A joint dinner of the Association of Professional Engineers of Alberta and the Engineering Institute of Canada was held in the Marquis Hotel at Lethbridge on Saturday evening, March 22nd, 1941, following the annual meeting of the Association. H. J. McLean, president of the Association of Professional Engineers, presided.

About 60 members and guests sat down to dinner. Many came from as widely separated points as Edmonton, Calgary, the Crow's Nest Pass, Cardston, and Waterton, and a good representation from Lethbridge. Music was supplied during the evening by Mr. and Mrs. Geo. Brown and Mr. Henderson. After the toast to the King, community singing was led by Mr. R. S. Lawrence. Mr. Tom Smith and Mr. Geo. Brown, Jr., contributed to the enjoyment of the meeting by rendering several soli which were enthusiastically received. At the conclusion of the musical portion of the programme, Mr. H. J. McLean tendered the artists the thanks of the meeting for their splendid entertainment.

The chairman then introduced to the meeting Professor Cornish of Edmonton, president of the Association of Professional Engineers of Alberta, for the ensuing year. Professor Cornish made suitable acknowledgement in a brief speech of thanks.

The chairman next called upon Mr. J. T. Watson to introduce the speaker of the evening, Mayor D. H. Elton, which Mr. Watson proceeded to do with sundry reminiscences of previous similar gatherings which they had both attended.

Mayor D. H. Elton rose to address the meeting announcing as his subject **History Repeats Itself.** It is a matter for regret that we are not able to give a verbatim report of this address, which was acknowledged by those present to be of outstanding quality. In his presentation Mayor Elton quoted fluently from such a wide variety of sources as Mother Shipton's Prophecy, William Shakespeare, Oliver Cromwell, Thomas Grey, Wordsworth, Abe Lincoln, Tennyson, J. S. Blackie, Garibaldi, Winston Churchill, Chamberlain, Grenville, Franklin D. Roosevelt, Solomon, Kipling, the New York Times, and Norman Rogers. This with references to Hitler and Mussolini left no doubt in the minds of his listeners that history does repeat itself, The chairman in calling for a vote of thanks complimented Mayor Elton on an outstanding address, to which the meeting gave enthusiastic approval.

The meeting then closed with the singing of the national anthem.

The newly elected officers of the association are: President, W. C. Cornish; Vice-President, S. G. Coultis; Councillors, F. R. Burfield, J. A. Carruthers, H. B. Le Bourveau, C. W. Dingman, C. S. Clendening, R. R. Cauper, W. J. McFarland, C. S. Donaldson.

ASSOCIATION OF PROFESSIONAL ENGINEERS OF SASKATCHEWAN

The annual meeting of the Association of Professional Engineers of Saskatchewan wes held in the Saskatchewan Hotel, Regina, on Friday, February 21st, 1941, with the president, P. C. Perry, in the chair.

The newly elected officers are: president, R. A. McLellan, vice-president, A. P. Linton; councillors, R. W. Jickling, H. R. Mackenzie, B. Russell. Continuing councillors are G. L. MacKenzie, C. J. McGavin and A. A. Murphy.

Upon concluding the business session those in attendance gathered for an hour's informal get-together before proceeding to the annual banquet; following which, interspersed by appropriate musical numbers, greetings were conveyed on behalf of the Alberta Association by Squadron Leader Davidson, for Manitoba by George Cole, president, and from Ontario by Colonel Dillon. A telegram of greeting was read from J. J. White, registrar for the past several years and now on active service.

Presentation of a bowler hat was made to D. D. (Dave) Low for his excellent service during the past year in organizing the several meetings; presentation also of a gold Institute badge was made to I. M. Fraser, past president and past chairman, Saskatchewan Branch, Engineering Institute of Canada.

The main speaker of the evening was Hon. A. T. Proctor, Minister of Highways and Transportation, Saskatchewan, whose address may well have been entlied **The Professions Protect the Public.**

Terming a recent series of articles appearing in the public press as "part of a grand campaign to do away with what all democratic peoples are fighting for," Mr. Proctor said that "the effect on the public of the recent articles in the press can only be to make them think that professional bodies have a legalized method of robbing the public."

Mr. Proctor suggested that the presidents and executives of all professions should get together to offset the campaign through, possibly, a series of articles dealing with the achievements of the respective professions.

"We should give a true understanding," said Mr. Proctor, "of what the professions mean; not that the numbers of those engaged in the professions should be limited but to make sure that the people who enter should have the integrity and honour which the professions are trying to maintain."

He concluded with an appeal that the ideals of democracy for freedom and liberty, gained only through sacrifice in the past, could be maintained only at a heavy price in the future.

ENGINEERS' CLUB OF TORONTO

At a recently held meeting of The Engineers' Club of Toronto the following officers and directors were elected for the current year: *President,* W. S. Ewens, B.Sc. (McGill), vice-president, Sangamo Company, Ltd.; *1st Vice-President,* H. C. Crane, B.A.Sc. (Toronto), Chief Engineer, Turnbull Elevator Co., Ltd.; *2nd Vice-President,* J. F. Comer, B.Sc. (Queen's), J. F. Comer Company; *3rd Vice-President,* K. A. Christie, B.A. (Toronto), Chairman, Toronto Hydro-Electric Commission.

Other Directors: Messrs. G. Bishop, W. L. Dobbin, J. E. Greenland, J. M. Gordon, C. C. Huston, T. C. James, R. J. Jowsey, W. E. Ross, J. W. R. Taylor, G. E. Treloar and A. F. Wells.

Secretary-Manager, Wm. C. Foulds.

CORPORATION OF PROFESSIONAL ENGINEERS OF QUEBEC

The annual general meeting of the Corporation of Professional Engineers of Quebec was held at the headquarters of the Engineering Institute of Canada, Mansfield Street, Montreal, on Saturday, March 29th, with about seventy-five members of the Corporation present. The annual report of council, the treasurer's report and the financial statement showing a continued satisfactory condition were adopted unanimously.

The results of the elections to council for the current year were announced as follows: for the district of Montreal, Messrs. C. C. Lindsay, J. A. McCrory and Brian R. Perry; for the district of Quebec, Mr. A. O. Dufresne. The council for the ensuing year consists of Messrs. A. O. Dufresne, R. E. Jamieson, Alex. Larivière, Dr. O. Lefebvre, C. C. Lindsay, J. O. Martineau, J. A. McCrory and Brian R. Perry.

At a meeting held immediately after the annual meeting, Dr. Olivier Lefebvre was elected president, Mr. Brian R. Perry, vice-president, and Mr. C. C. Lindsay, secretary-

Professor R. E. Jamieson delivers his retiring address as president of the Corporation of Professional Engineers of Quebec. On his left are J. R. Smith, Brian R. Perry and J. A. McCrory.

treasurer. Mr. C. René Dufresne was appointed auditor for the current year.

In the evening, the Corporation held a dinner at the Windsor Hotel. The guests included Mr. McNeely DuBose, representing the Engineering Institute of Canada, Mr. J. R. Smith, representing the Province of Quebec Association of Architects, and Mr. Aimé Cousineau, representing the Alumni Association of the Ecole Polytechnique.

Part of the head table at the Corporation dinner. Left to right, Hector Cimon, J. O. Martineau, Aimé Cousineau, A. O. Dufresne, Alex Larivière.

McNeely DuBosc tells another one. At the right Dr. O. O. Lefebvre, newly elected president of the Corporation.

A.I.E.E. CONVENTION IN TORONTO

Canadian electrical engineers are to be hosts this year to members of the profession from the United States when the American Institute of Electrical Engineers holds its summer convention in Toronto, Canada, on June 16-20. Plans are now practically completed for the five-day gathering, to consist of technical sessions, inspection trips, entertainment and sports activities. A number of advance registrations have already been received by the Royal York Hotel, the Toronto Convention Headquarters, and this fact is taken as an indication that a record attendance may be expected.

The technical papers to be presented will cover every major branch of electrical engineering. Starting with a session on communications, there will be papers and meetings covering: instruments and measurements; basic sciences and electronics; land transportation; switching equipment; electrical machinery; relays, lighting and insulation; industrial power applications; power transmission; domestic and commercial applications; and power generation.

Generally speaking the afternoons and evenings will be free for sports and entertainment. The sports events include the annual A.I.E.E. Mershon Trophy competitions, (both golf and tennis), the Lee Trophy competition, and a variety of special golf tournaments. There will be sports events and special entertainment for the ladies at some of Toronto's beauty spots. For the evenings elaborate plans have been laid to present feature entertainments of a uniquely Canadian nature.

Of course, the war is bound to leave its imprint on the convention. Canada is an active participant in the present conflict, and accordingly wartime regulations will have some effect on the programme. On the whole, however, it is felt that the wartime spirit prevalent in Canada will add a zest to the convention which would not otherwise be present.

In spite of wartime regulations, the inspection trips committee has arranged visits to several utility properties and manufacturing plants. *Advance registration for these trips is absolutely essential due to national defence requirements.*

Expected to be one of the most popular trips is the one to be held on Monday afternoon to the Toronto-Leaside 220 kv. transformer station of the Hydro-Electric Power Commission of Ontario. Located on the outskirts of the city, some seven miles from convention headquarters, this station is one of two receiving terminal stations of the Hydro's 220 kv. system. The initial components of the station were placed in service in 1928, since then it has been expanded to its existing capacity of 420,000 kva. Three 220 kv. circuits enter and one leaves the station, on four-circuit bridge-type structure on a 200-ft. wide right-of-way. Six banks of 45,000 kva. and two banks of 75,000 kva. three-winding transformers are installed. Four 25,000 kva, vertical shaft, outdoor synchronous condensers are also installed.

Perhaps of still greater interest will be the Hydro-Electric Power Commission's new 220 kv. receiving terminal now nearing completion of the initial installation. It is located some 40 miles west of Toronto on the Queen Elizabeth Way. Known as the Burlington Transformer Station, this new receiving terminal has an initial installation of two incoming 200 kv. circuits and two banks of 75,000 kva. forced air-cooled transformers. The station is designed for an ultimate installation of 450,000 kva.

The 220 kv. transmission extension of the Commission, around the metropolitan area of Toronto and west to Burlington, consists of double circuit construction, utilizing type HH segmental-copper conductors. Arrangements will be made to inspect this new construction as part of the Burlington trip.

For cummunications men there will be a trip to the Bell Telephone Automatic Exchange on Monday, June 16, and on Tuesday, June 17, a specially arranged communication trip will take in radio station CBL, Hornby repeater station, and the Trans-Canada Airways beacon and airport facilities. A special trip for distribution men will cover the low voltage network of the Toronto Hydro-Electric System, also a tour of the recently completed primary network of York Township Hydro, as well as visits to the newly completed residential substation of the Toronto Hydro, and another to the Glengrove Avenue substation. A trip is also arranged to the Hillcrest Shops of the Toronto Transportation Commission.

Of special interest are organized strips to the Hydro-Electric Power Commission's laboratories, an inspection of the H.E.P.C's network calculator, and an evening trip (on Wednesday, June 18) to the Dunlap Observatory.

Efforts will be made to arrange trips to a number of manufacturing plants in Toronto, Hamilton and Oshawa. These trips, of course, must be governed entirely by National Defence Regulations which may be in force at the time of the Convention, but if advance registration indicates sufficient interest, the Trips Committee will do its best to arrange visits to such of the following plants as are of particular interest to visitors: Canada Wire & Cable Co. Ltd.; Canadian Westinghouse Co. Ltd.; Steel Company of Canada; Otis-Fensom Elevator Co.; Ferranti Electric Co.; Canadian General Electric Co. Ltd.—transformer plant, and others.

The personnel of the General Convention Committee is as follows: M. J. McHenry, general convention chairman; A. H. Frampton, vice-chairman; D. G. Geiger, secretary; C. E. McWilliam, treasurer; Sub-Committee Chairmen: M. J. McHenry, finance; T. W. Hill, publicity; W. J. Gilson, entertainment; T. W. Eadie, sports; J. F. Neild, transportation; V. G. Smith, trips; F. F. Ambuhl, hotel and registration; O. W. Titus, ladies' entertainment; J. W. Barker, technical programme; O. W. Titus, local representative technical programme; J. M. Thomson, local representative sections. Members at large: J. H. Steede, Vancouver; B. J.O. Strong, Regina; E. V. Caton, Winnipeg; R. B. Chandler, Port Arthur; A. W. Bradt, Hamilton; K. V. Farmer, Niagara Falls; G. R. Langley, Peterboro; W. G. C. Gliddon, Ottawa; H. W. Haberl, Montreal; C. H. Burchill, Halifax.

Library Notes

Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

NEW CANADIAN STANDARDS

The Canadian Engineering Standards Association announces the publication of the revised and new standards mentioned below.

C.E.S.A. No.

C22.2 No. 51—1941—Armoured Cables and Armoured Cords (2nd edition):

C22.2 No. 52—1941—Service-entrance Cables:

The Canadian Engineering Standards Association announces the publication of two Approvals Specifications, C22.2 No. 51-1941—Armoured Cables and Armoured Cords (2nd edition) and C22.2 No. 52-1941 —Service-entrance Cables—under Part II of the Canadian Electrical Code, the requirements of which must be met in order to obtain C.E.S.A. approval of the electrical device concerned. Both standards were prepared in collaboration with interested manufacturers and industrial associations, and are based on laboratory tests and record in service.

Specification No. 51 applies to the construction and test of armoured cables and armoured cords for use in power and lighting circuits in accordance with the Rules of Part I of the Canadian Electrical Code. These conductors are not ordinarily used on communication circuits. This Specification is effective as of April 30th, 1941, for new production.

Specification No. 52 applies to the construction and test of service-entrance cables for use on circuits involving potentials of 600 volts or less, and for use—in the case of cables embodying in their assembly an uninsulated conductor—on circuits involving potentials of 150 volts or less to ground, when installed in accordance with the Rules of Part I of the Canadian Electrical Code. This specification is effective as of April 15th, 1941, for new production.

Price 50 cents each.

B 62—1940—Welded Genuine Wrought-Iron Pipe:

This specification covers "standard weight," "extra strong" and "double extra strong" welded genuine wrought-iron pipe. Pipe ordered under this specification is intended for coiling, bending, flanging, and other special purposes. Butt-welded pipe is not intended for flanging and is not recommended for bending or coiling in sizes 1¼ in. or over.

Price 50 cents.

B 64—1940—Copper and Brass Pipes, Standard Sizes:

This specification covers seamless copper and brass pipes in standard sizes suitable for use in plumbing, boiler feed lines, etc.

Price 50 cents.

B 66—1940—Copper Water Tubes:

This specification covers seamless copper Tubes especially designed for plumbing purposes, underground water service etc., but also suitable for copper coil water heaters, fuel oil lines, gas lines, etc.

Price 50 cents.

S 69—1941—Welders' Helmets, Hand Shields and Goggles, and for General Purpose Anti-Glare Goggles:

The Canadian Engineering Standards Association announces the publication of a specification for the various protective devices against injurious radiations from welding operations. This specification covers the essential characteristics of helmets, hand shields and goggles, it is intended to provide against the hazards to the eyes and the skin of the head in operations involving exposure to intense ultra-violet, infra-red or visible radiation.

Price 50 cents.

Copies of these Standards may be obtained at prices quoted from the Canadian Engineering Standards Association, National Research Building, Ottawa Ontario.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS

Cement Chemists' and Works Managers' Handbook

By W. Watson and Q. I. Craddock, London, Concrete Publications Ltd., 1940. 199 pp., 9½ x 6¼ in. $3.50.

National Building Code—Part 3, Engineering Requirements.

Published by National Research Council, Ottawa, 1941. 256 pp., 8¼ x 5½ in. $1.75.

Reinforced Concrete Chimneys

By C. Percy Taylor and Leslie Turner, London, Concrete Publications Ltd., 1940. 64 pp., 9½ x 6¼ in., $1.90.

Structural Drafting

By Carlton T. Bishop, New York, John Wiley & Sons, 1941. 287 pp., illus., charts, 9¼ x 6 in., $3.50.

Theory of Simple Structures

By Thomas Clark Shedd and Jamison Vawter, New York, John Wiley & Sons, 1941. 505 pp., illus., diagrs., 9¼ x 6 in., $3.75.

PROCEEDINGS, TRANSACTIONS, ETC.

American Institute of Electrical Engineers

Transactions, volume 59, 1940.

Canadian Good Roads Association

Proceedings of the 25th Annual Convention, 1940.

Electric Supply Authority Engineers Association, New Zealand

Transactions prepared for the 14th Annual Conference, 1939, Volume 12, 1940.

National Council of State Boards of Engineering Examiners

Proceedings 21st Annual Meeting, 1940-41.

REPORTS

Aluminum Research Laboratories—Technical Papers

Bending tests on panels of stiffened flat sheet, by E. C. Hartmann and R. L. Moore, Aluminum Company of America, 1941, technical paper No. 4; Static and repeated load tests of aluminum alloy and steel riveted hull plate splices by R. L. Templin and E. C. Hartmann, Aluminum Company of America, 1941, technical paper No. 5.

Aluminum Research Laboratories

Fatigue machines for testing structural units by R. L. Templin, 1939; Fatigue test results, their use in design calculations by E. C. Hartmann, 1941.

American Institute of Consulting Engineers

Constitution and by-laws and list of members, 1941.

Canada Department of Mines and Resources:

Report of the Department of Mines & Resources including report of Soldier Settlement of Canada, for the fiscal year ended March 31, 1940. Ottawa, 1941.

Canada Department of Mines & Resources—Mines & Geology Branch-Geological Survey papers.

Preliminary map Grave Flats, Alberta, paper 40-15; preliminary map Pembina Forks, Alberta, paper 40-16; preliminary map Bearberry, Alberta, paper 40-19; preliminary map Mishagomish Lake, Quebec paper 40-21.

Electrochemical Society—Preprints

Silver Plating baths containing amines; Studies of electro-chemical polarization; diagnosis of cancer by means of the dropping mercury electrode; Potentials of iron-chromium alloys containing hydrogen; Efficiency of a sodium chlorate cell with rod cathodes; Voltage (during discharge) of the sponge lead plate of the storage battery; Electric currents in the atmosphere and their effects. Preprints Nos. 79-13 to 79-19.

New Brunswick Electric Power Commission

Tweny-first annual report for the year ending October 31, 1940.

Nova Scotia Board of Commissioners of Public Utilities

Report of the Board of Commissioners of Public Utilities, for the year ended December 31st, 1940. Halifax, 1941.

Nova Scotia Power Commission:

Twenty-first annual report for the twelve months period ended Nov. 30th, 1940. Halifax, 1941.

Quebec Association of Architects:

Register for the year 1941.

United States Department of Commerce—Building Materials and Structures

Solar heating of various surfaces, BMS 64; Wall and floor constructions—supplement to report BMS 17.

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

ADVANCED ELECTRICAL MEASUREMENTS

By W. C. Michels, 2 ed. D. Van Nostrand Co., New York, 1941. 347 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, $3.50.

In addition to the standard methods and apparatus of the electrical laboratory, this book covers the application of instruments essentially electrical in character to the measurement of other physical quantities. Among alternative methods or instruments the author has chosen to describe those which he has found satisfactory from personal experience. The thorough revision for the new edition is particularly marked in the application of electronic methods.

AMERICAN PLANNING AND CIVIC ANNUAL, 1940

Edited by H. James. American Planning and Civic Association, Washington, D.C., 1940. 278 pp., illus., 9½ x 6 in., cloth, $3.00.

The papers collected in this volume constitute a record of recent civic advance in the fields of planning, parks, housing and neighborhood improvement. About half the material was prepared especially for the Annual; the remainder consists of the principal papers delivered at the 1940 National Conference on Planning and the nineteenth National Conference on State Parks, 1940.

ANALYTICAL DESIGN OF HIGH SPEED INTERNAL COMBUSTION ENGINES

By F. M. Cousins. Pitman Publishing Corp., New York and Chicago, 1941. 226 pp., diagrs., charts, tables, 9 x 6 in., cloth, $3.50.

Beginning with a brief review of thermodynamic cycles the author proceeds to a detailed study of the dynamics of high-speed engines. In-line, V-type, radial and off-set cylinder engines are all considered in the discussion of engine balance and the analysis and design of cams, crankshafts, etc. For practical purposes, the analysis has been restricted to the calculus and simple harmonic theory. A bibliography is provided.

APPLIED HEAT TRANSMISSION

By H. J. Stoever. McGraw-Hill Book Co., New York and London, 1941. 226 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $2.50.

The purpose of this book is to provide in readily usable form some of the more important data on heat transmission and to describe some of the common types of equipment for transferring heat and kinds of insulation used in industry. The presentation is a thoroughly practical one, intended for engineers. A large number of charts and tables for determining convection coefficients and values of the pressure drop is included.

CAR BUILDERS' CYCLOPEDIA OF AMERICAN PRACTICE, 15th ed., 1940

Compiled and edited for the Association of American Railroads—Mechanical Division. Edited by R. V. Wright and others. Simmons-Boardman Publishing Corp., New York., illus., diagrs., charts, tables, 12 x 8 in., cloth, $5.00.

This standard reference book presents definitions and typical illustrations of railroad and industrial cars, their parts and equipment. There are also descriptions and illustrations of shops and equipment employed in car construction and repair. Many new designs of cars and appliances have been added since the previous edition, and the table of contents and index to car parts have been amplified for better reference.

(The) CHEMICAL ACTION OF ULTRAVIOLET RAYS

By C. Ellis and A. A. Wells, rev. and enl. ed. by F. F. Heyroth. Reinhold Publishing Corp., 1941. 961 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $12.00.

In the sixteen years since this valuable monograph first appeared, there have been great advances in the field of photochemistry, and the new edition has called for much rewriting and considerable expansion. The book is characterized by comprehensiveness and profusion of bibliographical references. Part one describes the types of apparatus available for producing ultraviolet rays. Part two deals with photochemical reactions. In part three the uses of photochemistry in industry are described, and in part four the applications in biology.

COMMERCIAL REFRIGERATION AND COMFORT COOLING

By S. C. Moncher. Nickerson & Collins Co., Chicago, Ill., 1940. 109 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $1.50.

A brief, non-mathematical description of commercial refrigeration, with emphasis on engineering methods in common use. The book is intended for those with a general knowledge of the field, who wish definite information upon equipment and its installation. The book is confined to the type of apparatus used in retail shops and restaurants. Air conditioning is considered briefly.

CUTTING TOOLS FOR METAL MACHINING

By M. Kurrein and F. C. Lea. J. B. Lippincott Company, Philadelphia and New York, 1940. 219 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $6.00.

This new and informative book describes how the best results can be obtained from any machining operation. Workshop practice, or production as distinct from design, is the major consideration. Tool shapes and angles are treated fully, and much recent information on feeds and speeds has been summarized. Tool grinding and hardening are also briefly covered.

DESCRIPTIVE GEOMETRY

By A. S. Levens and H. C. T. Eggers. Harper & Brothers, New York and London, 1941. 240 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $2.50.

A full presentation of both graphic and algebraic methods of descriptive geometry provides a double check on solutions and achieves a correlation between descriptive and analytical geometry. In addition to the general coverage of fundamentals there is a long chapter on present-day practical applications in various technical fields.

DESIGN OF SHADING COILS FOR ALTERNATING-CURRENT ELECTROMAGNETS

By L. A. Doggett and F. S. Veith. Pennsylvania State College Engineering Experiment Station Bulletin No. 52, State College, Pa., 1940. 24 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, 50c.

This booklet contains complete instructions for the design of a shaded-coil alternating-current electromagnet, with special reference to minimizing vibration by proper selection of shading-coil resistance. There is a short bibliography.

DRAINAGE AND FLOOD-CONTROL ENGINEERING

By G. W. Pickels. 2 ed. McGraw-Hill Book Co., New York and London, 1941. 476 pp., illus., diagrs., charts, maps, tables, 9 x 6 in., cloth, $4.00.

The improvement of small areas of cultivable land by under-drainage and the reclamation of large areas of wet and overflow lands by surface drainage and by flood control are discussed in this treatise. The new edition has been thoroughly revised, and the information acquired during the last fifteen years incorporated.

ELECTRIC AND MAGNETIC FIELDS

By S. S. Attwood. 2 ed. John Wiley & Sons, New York, 1941. 430 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $4.50.

The fundamentals of electricity and magnetism are presented in a manner intended to co-ordinate under-class work in mathematics, mechanics and physics with the professional work of the last two years. This edition has been revised with the object of providing an adequate background for courses in electronics, electrical design and machinery. The four parts of the book cover respectively the electric field, the magnetic field, the ferromagnetic field and combined fields.

ELEMENTARY STRUCTURAL ENGINEERING

By L. C. Urquhart and C. E. O'Rourke. McGraw-Hill Book Co., New York, 1941. 348 pp., diagrs., charts, tables, 9 x 6 in., cloth, $3.00.

Intended for use both as a text for non-civil engineering courses and as a manual for graduate engineers and architects, this book presents first the basic principles of structural mechanics and the more important properties of structural materials. Succeeding chapters cover the fundamental principles of structural theory and design in steel, timber and concrete. There are many worked-out examples.

GENERATING STATIONS, Economic Elements of Electrical Design

By A. H. Lovell. 3 ed. McGraw-Hill Book Co., New York, 1941. 471 pp., illus., diagrs., charts, tables, maps, 9 x 6 in., cloth, $4.50.

The application of economic principles to the problems of the design of generating stations and transmission systems is described. The selection and application of apparatus, the proportioning of details of the assembly, the balancing of initial and subsequent costs, and related topics are considered. The new edition has been revised in the light of recent developments. Illustrative problems accompany each chapter.

Great Britain. Dept. of Scientific and Industrial Research. Building Research. Wartime Building Bulletin No. 12. EMERGENCY PIPE REPAIRS

His Majesty's Stationery Office, London, 1941. 8 pp., charts, 11 x 8½ in., paper, (obtainable from British Library of Information, 50 Rockefeller Plaza, New York, 15c.).

This pamphlet tells what is known both of thoroughly tried methods alternative to lead jointing and of others of a less established nature which may be used to restore service quickly when pipe lines are injured by enemy action.

Great Britain. Home Office. Air Raid Precautions Dept.

Air Raid Precautions Memorandum No. 1 (2 ed.). ORGANIZATION OF AIR RAID CASUALTIES SERVICES. 32 pp., 15c.

Air Raid Precautions Memorandum No. 3 (2 ed.). ORGANIZATION OF DECONTAMINATION SERVICES. 12 pp., 5c.

Air Raid Precautions Memorandum No. 6 (2 ed.). LOCAL COMMUNICATIONS AND REPORTING OF AIR RAID DAMAGE. 49 pp., 15c.

Air Raid Precautions Memorandum No. 7 (1 ed.). PERSONAL REQUIREMENTS for AIR RAID GENERAL and FIRE PRECAUTIONS SERVICES, and the POLICE SERVICE. 11 pp., 5c.

His Majesty's Stationery Office, London, 1938-1939. Diagrs., charts, tables, 9½ x 6 in., paper, (obtainable from British Library of Information, 50 Rockefeller Plaza, New York).

These memoranda have been prepared for the guidance of local authorities in organizing services to deal with the problems that result from air raids.

Great Britain, Ministry of Health, Ministry of Home Security

RECOMMENDATIONS OF LORD HORDER'S COMMITTEE REGARDING THE CONDITIONS IN AIR-RAID SHELTERS WITH SPECIAL REFERENCE TO HEALTH; and a Brief Statement of Action Taken by the Government Thereon

His Majesty's Stationery Office, London, 1940. 7 pp., 9½ x 6 in., paper, (obtainable from British Library of Information, 50 Rockefeller Plaza, New York, 5c.).

These recommendations deal with various phases of the air-raid shelter problem, but are mainly concerned with sanitation, first aid, ventilation and other hygienic considerations. Annotations describe what is being done to comply with the recommended practices.

HEATING, VENTILATING, AIR CONDITIONING GUIDE, Vol. 19, 1941

American Society for Heating and Ventilating Engineers, New York. 1,120 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $5.00.

The annual revision of this comprehensive manual provides designers and installers of apparatus for heating, ventilating and air conditioning with up-to-date information on the subject. The theory and practical application presented cover both domestic and industrial practice. In addition to necessary revision the chapters have been rearranged and grouped into seven major sections. The Guide also contains a Catalogue Data section which lists apparatus and materials, a glossary of terms and the membership list of the Society.

HYDRAULIC MEASUREMENTS

By H. Addison. John Wiley & Sons, New York, 1941. 301 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, $5.00.

This is a manual of hydraulic measuring technique, intended to be of practical utility both in the laboratory and in making measurements under service conditions. The whole range of measurements is covered, and a great variety of methods and apparatus is considered critically. A glossary and a bibliography are appended.

INDUSTRIAL RELATIONS DIGESTS

I. The ORGANIZATION of a PERSONNEL DEPARTMENT. 7 pp.

II. The EMPLOMENT DIVISION. 7 pp.

III; RE-ORGANIZATION of HOUR SCHEDULES. 7 pp.

Princeton University, Industrial Relations Section, Princeton, N.J., 1941. Tables, 10 x 7 in., paper, 20c. each.

The three pamphlets listed above have been prepared for use in companies facing rapid expansion because of defense orders. They are based on information received currently from a large number of representative companies. In the case of No. III, a more complete study is in preparation.

MANUAL FOR THE DESIGN OF FERROUS AND NON-FERROUS PRESSURE VESSELS AND TANKS

By K. Siemon. Karl Siemon, Metuchen, New Jersey, 1940. 280 pp., diagrs., charts, tables, 8½ x 5½ in., cloth, $3.00.

The first part of this manual discusses the physical properties and fabricating characteristics of the principal metals used. The larger section, on design, gives, for each of the different elements entering into pressure vessel design, an analysis of the problems involved and a brief discussion of the methods suggested for the calculation of stresses. Tables of necessary data are appended and there are numerous references to books, papers and existing codes.

MANUAL OF A.S.T.M. STANDARDS ON REFRACTORY MATERIALS, prepared by A.S.T.M. Committee C-8 on Refractories

American Society for Testing Materials, Phila., Pa., January, 1941. 174 pp., illus., diagrs., charts, tables, 9 x 6 in., board, $1.50; cloth, $1.75.

All of the A.S.T.M. specifications, classifications, methods of testing and definitions pertaining to refractories are brought together in convenient form. Certain other pertinent information, of value in the testing and use of refractories, is also included, such as recommended procedures, standard sampling for chemical analysis, and industrial surveys of service conditions. The personnel and regulations governing the A.S.T.M. refractories committee are appended.

MATHEMATICS FOR ENGINEERS

By R. W. Dull. 2 ed. McGraw-Hill Book Co., New York and London, 1941. 780 pp., diagrs., charts, tables, 8½ x 5½ in., cloth, $5.00.

This work affords a convenient review of those phases of mathematics which are especially important in engineering work, and is intended for use as a practical reference work or as a text for private study. The chapter on the slide rule has been extended in this edition, and minor changes made throughout the text.

MECHANISM, Fundamental Theory of the Modification and Transmission of Motion

By S. E. Winston. American Technical Society, Chicago, Ill., 1941. 372 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $3.50.

This book deals with mechanical movements and the combinations of links or machine elements by which these movements are modified and transmitted. The use of the graphical method for analyzing relative motions allows a simple mathematical treatment. Review questions and problems accompany each chapter.

MOLD-LOFT WORK, 2 Pts.

By A. C. Halliburton. International Textbook Co., Scranton, Pa., 1940. Pt. 1, 82 pp.; Pt. 2, 69 pp., diagrs., charts, tables, 8 x 5 in., cloth, $2.15.

The whole process of laying-out a ship is covered in this practical, concise textbook. The many illustrations assist in demonstrating actual procedures. Equipment, materials and personnel are also briefly discussed.

PRINCIPLES OF INLAND TRANSPORTATION

By S. Daggett. 3 ed. Harper & Brothers, New York, 1941. 906 pp., illus., diagrs., charts, maps, tables, 9½ x 6 in., cloth, $4.00.

Intended as a college text, this comprehensive work covers road, rail, water, air and pipe line transport, chiefly with respect to the United States. Early chapters present a brief historical survey and a consideration of transportation geography. Subsequent sections discuss rates, competition, labor and finance, relations of carriers with each other and relations between carriers and users. The problems and practice of regulation have been given full consideration. This new edition has been thoroughly revised for current use.

RUNNING AN ENGINE LATHE

By F. H. Colvin. McGraw-Hill Book Co., New York and London, 1941. 117 pp., illus., diagrs., tables, 8 x 5 in., cloth, $1.25.

This is a practical manual for apprentices and young machinists in which the foundation principles of engine-lathe work are presented simply and clearly.

THEORY OF SIMPLE STRUCTURES

By T. C. Shedd and J. Vawter. 2 ed. John Wiley & Sons, New York, 1941. 505 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $3.75.

This textbook for engineering students is intended to develop ability to solve problems in structural analysis by giving the student a thorough understanding of the underlying principles. A simple but complete discussion of the essential fundamental laws of statics and their application to simple structures is given, including many problems. The last two chapters present an introduction to statically indeterminate structures.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

April 28th, 1941

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in June, 1941.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ARPIN—JEAN VICTOR, of 571 Champagneur Ave., Outremont, Que. Born at Prince Albert, Sask., July 28th, 1913; Educ.: B.A.Sc., C.E., Ecole Polytechnique, Montreal, 1938. Post graduate course in chemistry 1939-40; R.P.E. of Que.; 1934-37 (summers), asst. on Geol. surveys; 1938 (7 mos.), res. engr., 1939 (7 mos.), asst. engr., Dept. of Roads, Quebec; Aug. 1940 to date, production engr., Canadian Car Munitions, Ltd., Montreal, Que.

NIXON—WILLIAM HERBERT, of 262 Broadway Ave., Toronto. Born at Toronto, Oct. 31, 1894. Educ.: B.A.Sc. Univ. of Toronto, 1921; 1920 (summer) dfting. dept. James, Proctor & Redfern Ltd., Toronto; 1921-22 asst. highway engr., Toronto & York Roads Comm.; 1923-27 with James, Proctor & Redfern Ltd. as res. engr. on instlln. of various waterworks and sewerage systems; 1928-30 field engr. Peter Lyall & Sons Constn. Co. Ltd., on constrn. of lock section of Welland Ship Canal and the new Customs House, Toronto; 1930-31 field engr. Redfern Constrn. Co. Ltd.; 1931-32 res. engr. at Midland, Ont., for James, Proctor & Redfern Ltd.; 1933 field engr. for Quebec Paving Co. Ltd., Montreal; 1934-35 field engr. for Dufferin Constrn. Co. Ltd., Toronto; 1936-37 field engr. Foundation Co. of Canada, Montreal; 1938 field engr. for Scott & Jackson Constrn. Co., Toronto;

(*Continued on page 274*)

Employment Service Bureau

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

SITUATIONS VACANT

STEAM ENGINEER wanted by paper mill in Ontario. Applicants should be University graduates in mechanical engineering with experience in the generation and distribution of steam. Apply stating full particulars of education and experience, and giving references to Box No. 2283-V. Applications will not be considered from persons in the employment of any firm, corporation or other employer engaged in the production of munitions, war equipment, or supplies for the armed forces unless such employee is not actually employed in his usual trade or occupation.

GRADUATE MECHANICAL ENGINEER in good health, energetic, to work with large industrial concern in British Guiana. Applications should be sent to Box No. 2328-V.

MECHANICAL ENGINEER, preferably graduate, familiar with diesel engines, tractors and shovels for maintenance work with large industrial firm in British Guiana. Applications should be addressed to Box No. 2329-V.

CONSTRUCTION MAN with experience in heavy construction for either a long or short term contract in British Guiana. Applications should be addressed to Box No. 2330-V.

REQUIRED a number of experienced concrete detailers, designers and draughtsmen for work on industrial plants and power developments. Apply Box No. 2351-V.

GOOD practical steel designer, proficient in drawings and calculations of steel designs for industrial plants, and in addition able to approve details. Apply Box No. 2352-V.

SITUATIONS WANTED

CHIEF ENGINEER—twenty years industrial construction, production and operation. Structures, equipment, steam, hydro. Experienced conferences, preliminaries, organizing, preparing plans, estimates, specifications, negotiation of contracts. Apply to Box No. 36-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., 14 years' experience as factory manager in machine tool factory and as consulting industrial engineer in widely diversified metal working trades improving factory and office methods specially cost accounting, desires permanent position $5,000 yearly. Apply to Box No. 1730-W.

FOR SALE

PLANIMETER, Dennerty & Pape, perfect condition, complete with case. Apply Box No. 42-S.

WANTED
MECHANICAL ENGINEER

Mechanical engineer required, young, with auto-aero engine testing experience, for immediate employment in Canadian factory in Montreal, engaged in construction of high-speed craft.

Applications from those engaged in War industries will not be considered.

Apply with full particulars to:
Box 2353-V
THE ENGINEERING JOURNAL
2050 Mansfield St.
MONTREAL

PRELIMINARY NOTICE (*Continued from page 273*)

1939 to date supt. of constrn. for Foundation Co. of Canada, Montreal, on the constrn. for the expansion of the Aluminum Co. of Canada, Ltd. plant at Arvida (at present night supt.).

CHARACTERISTICS AND PECULIARITIES OF SOME RECENT LARGE POWER BOILERS IN ENGLAND

GERALD N. MARTIN, Jr.E.I.C.
Designer, Dominion Bridge Company, Limited, Montreal, Que.

Paper presented before the Montreal Branch of The Engineering Institute of Canada, on February 13th, 1941

In July, 1938, the author went to England for the purpose of obtaining a broader experience in boiler engineering, and to this end joined the staff of International Combustion of London and Derby, while remaining under the guidance of Mr. Johnstone Wright, chief engineer of the Central Electricity Board.

This was prior to the Munich episode, when peace-loving Britain was thought to be still very much asleep. But, while the then foreign, and now enemy propaganda machines were deriding Britain for her impotence and weakness, an industrial revolution was being started; Britain was rearming; not guns or other weapons of war as yet—but she was renovating her industrial machinery.

Electricity is, of course, the very heart of the modern industrial machine, and in England, 98 per cent of the electrical energy is derived from coal. Previous to three years ago, however, many of the central power plants operated at low efficiency, and a few years previous to that the distributing systems were decidedly haphazard. The systems overlapped; the current frequency often differed on the two sides of the same street; alternating and direct current systems operated side by side.

In 1936-37, however, it became apparent that great changes were under way. Larger, more efficient, and better located plants had to be installed to relieve London's overstressed system and to help industrialize the so-called "distressed" areas: Wales, Lancashire, Scotland. Extensions of existing plants were studied and new installations were planned with an eye to a higher national efficiency and availability.

To undertake such a task, British engineers were in an advantageous position. Authority to promote such schemes had been vested in a non-political, government-free institution: The Central Electricity Board. This Board could base its decisions on information derived from the latest practical researches conducted in the United States and on the Continent, and on local and national conditions. Reports of boiler plant operations from these countries led to the consideration of the use of larger output, higher pressure and temperature units, also to the introduction of the forced circulation principle. Thus, plants of 300,000 lb. per hr. steaming at 1,500 lb. per sq. in. with final steam temperature of over 900 deg. F., were conceived. Now, LaMont and Loeffler units are in use alongside natural circulation boilers.

It is not the author's intention to describe these stations in detail nor to inflict upon the reader quantities of figures and data. Numerous articles written by recognized authorities have already been published on this subject. It is, however, the purpose of this paper to illustrate, through examples with which the author was actively and closely connected, the present trends of power plant practice in Britain.

The majority of the central power plants installed in Britain are of the natural circulation type, divided equally as to the type of firing; that is, stoker and pulverized fuel. For stoker firing, the chain grate type is the most commonly used with the American favourite, the multiple retort, running second. It appears that most English coals are suitable for this type of firing, and are equally satisfactory for firing in the pulverized form. For the latter type of firing, the unit system is mainly used, the mill being the only intermediary between the raw coal bunker outlet and the burner.

It is of interest to note the types of turbines and generators most widely used in British power stations. Two types of plants are used: condensing units and non-condensing units. The latter classification includes the superposed turbines or topping units which have been so front-paged in the United States. They find their economy in plants where the space restrictions or the available capital, or both, do not warrant the extra expenditure required by a complete new high pressure system, involving a new condensing plant.

For these turbines, a throttle pressure of 1,250 lb. per sq. in. is the average, with steam temperature of 925 deg. F. Since a 50-cycle frequency has been adopted for the British Grid System, the generator revolves at 1,500 or 3,000 r.p.m. depending on the kva. capacity. The back pressure against which the turbine exhausts, naturally depends on the existing plant characteristics.

Condensing turbine units operate with 1 or 1½ in. Hg. vacuum and a proposed standard of practice is described in Table I.

The average over-all efficiency of British stations lies between 20-25 per cent from the coal barge or freight car to the station's bus bars.

However, most of the preferred stations, such as Barking, Battersea, etc., which carry the bulk of the electrical output, average 25-30 per cent efficiency. Brimsdown station in London has a design efficiency of 32 per cent, the highest in Europe.

Naturally, these efficiencies are greatly in excess of those met in industrial steam power plants. They are made pos-

TABLE I

sible through the use of feedwater heaters and turbine bleeding; by the maintenance of a nearly complete vacuum and by an efficiency of steam generation in the neighbourhood of 85-90 per cent.

This last efficiency requires the use of economisers and air heaters to cool the gases to the vicinity of 300 deg. F. and calls for a combustion 98 to 99 per cent efficient.

Since the aim of the central station designer is to generate a certain quota of electricity in the most efficient fashion, he must be guided by the foregoing limits of efficiency.

A typical arrangement of a stoker-fired boiler is shown in Fig. 1. The unit is a normal tridrum, steaming at 300 lb. per sq. in. with final steam temperature of 785 deg. F. at the normal rate of 120,000 lb. per hr. and capable of 150,000 lb. per hr. (maximum continuous rating) with peaks of 165,000. The boiler heating surface is 14,800 sq. ft. The furnace walls are partly protected by finned tubes externally fed by down-coming pipes, connected to the boiler mud drum. The steam and water mixture rising in the furnace wall tubes is collected in two side wall headers, and, from there, taken to the front drum. The front wall tubes are also connected to this drum. Circulation tubes return the water and the steam to the rear steam and water drum; the water to be started again on its cycle, and the steam to be extracted and led to the superheater.

Attention is drawn to the smallness of the ignition arch, high volatile coal being fired on a "type L" self-cleaning louvre type stoker, 26 ft. wide by 22 ft. 6 in. long, providing a grate area of 585 sq. ft. This permits a burning rate of approximately 35 lb. per sq. ft. per hour when an efficiency of approximately 85 per cent is obtained.

The gases, following the conventional path after their passage through the screen tubes at the furnace outlet, travel at an average velocity of 35 ft. per sec. through the Melesco superheater, and then transfer their heat energy to the water in the boiler tubes. Similarly, the remainder of the recuperable energy is absorbed by the finned tube economiser of 7,452 sq. ft. of heating surface and by a plate air heater of 17,000 sq. ft.

It can be seen from the layout of the ducting that preheated air is admitted underneath the coal bed while secondary air jets force the flame away from the front wall, helping to obtain complete combustion by creating turbulance in the gases released from the fuel bed.

The removal of the ash is typical; two front hoppers collect riddlings and a hopper is provided at the rear end of the stoker for the ash removal.

Dust particles carried in the gas stream are extracted by a cyclone local to the induced draft fan. National smoke abatement laws make compulsory the use of dust catchers. This is done with a cyclone (as in this unit), or with precipitators in conjunction with pulverized fuel units. Some large plants even resort to gas washing.

Part of the preheated air is re-circulated into the eye of the forced draft fan, increasing the temperature of the air to approximately 130 deg. F. at the air heater inlet. This process, better illustrated in connection with another installation, has been found the cure for the operating trouble well known to operators as "low dew point."

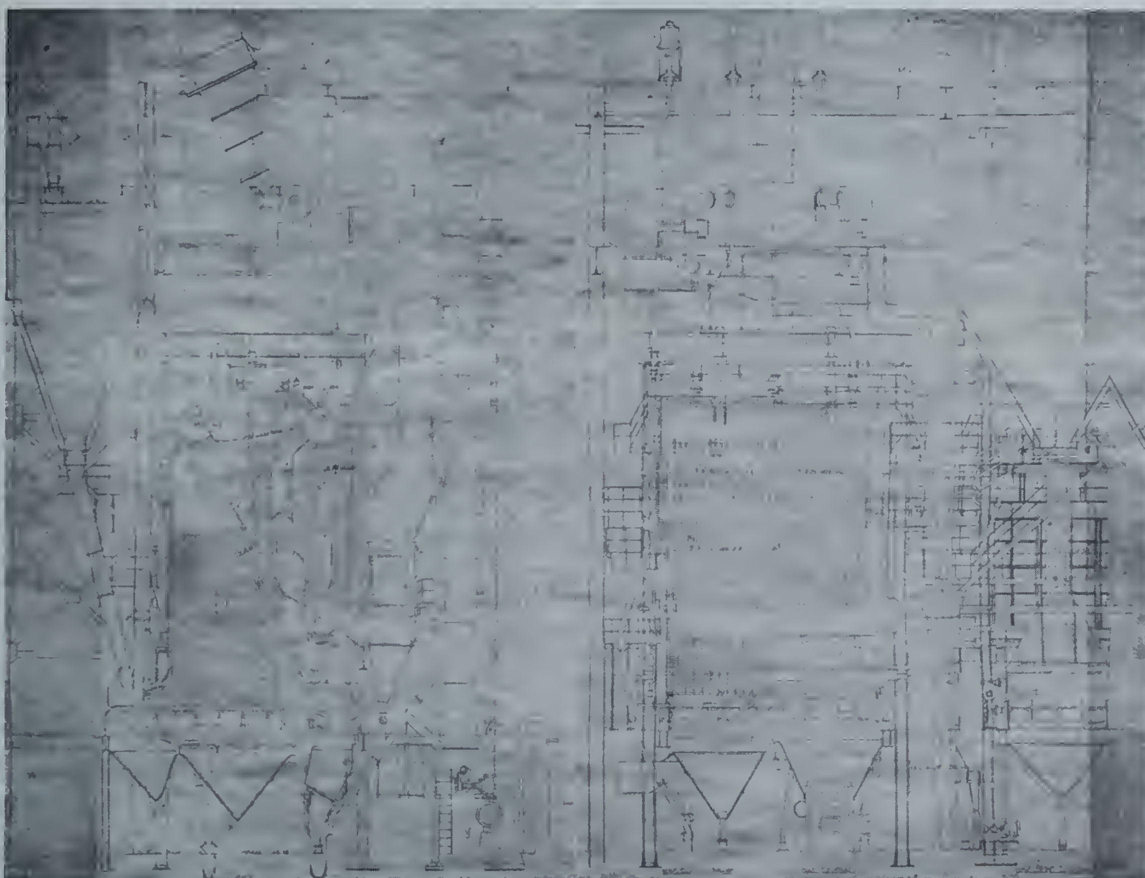

Fig. 1—Layout of stoker-fired boilers at Kilmarnock, Scotland. Capacity, 150,000 lb. per hr. (m.c.r.).

A further illustration of this type of boiler plant is given in Fig. 2, which shows the general arrangement of one of the three boilers installed in the Borough of Stepney, in the heart of London's well known Whitechapel district. These units were erected in an existing building in replacement of obsolete equipment.

The furnace consists of finned tubes with exterior downcomers and risers; the boiler itself is a standard Stirling design, popular with many British engineers. Its normal evaporation at 370 lb. per sq. in. with final steam temperature of 860 deg. F. is 125,000 lb. per hr. and it is capable of an overload capacity of 150,000 lb. per hr. A total heating surface of 12,919 sq. ft. is installed, divided as follows:

Boilers....	11,619	Superheater M=L=S. design	7,200
Side walls.	360	Econo. finned tube.........	8,235

Front wall.	750	USCO plate heater......... 17,437
Rear wall..	190	Final air temp... 296 deg. F.
	12,919	Final gas temp.. 277 deg. F.

A twin-grate stoker, 21 ft. wide by 20 ft. long giving an area of 420 sq. ft. permits the burning of 34.5 lb. of coal per sq. ft. per hr.

The coal cycle starts from a belt conveyor feeding the gunite-lined coal bunkers. Three travelling chutes distribute

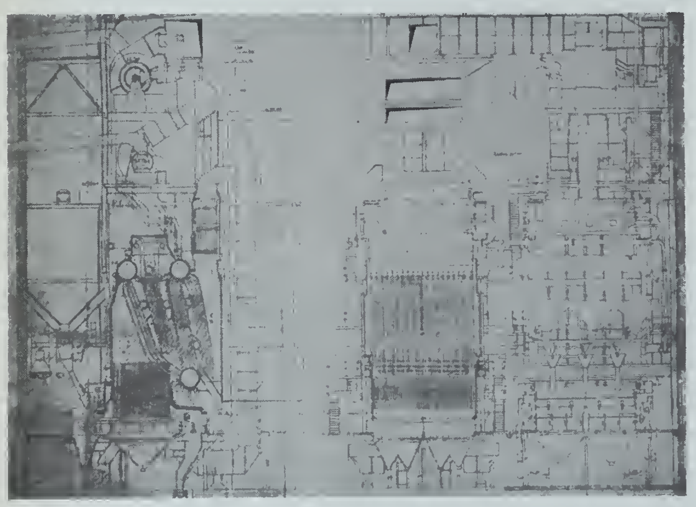

Fig. 2—Layout of stoker-fired boilers at Stepney, London. Capacity 125,000 lb. per hr. (m.c.r.).

the coal evenly in the stoker hoppers. This even distribution is obtained through a screw arrangement linked by a chain to the stoker drive. The feeding, therefore, is effected in direct ratio to the grate speed.

An adjustable guillotine door at the hopper outlet maintains the fuel bed thickness found most suitable under the individual prevailing operating conditions. This thickness is mainly governed by the type, size, moisture-content and quality of the fuel burned.

Variations in steam output are met with an adjustment of an eight-speed gear-box on the stoker drive or, in the case of a direct current motor drive, by a voltage variation.

The construction of this stoker is of further interest, in that no air zoning is provided; a plenary air chamber together with adjustable air valves provided along the grate permit proper distribution of the air quantities necessary for complete and efficient combustion. Floating air seals eliminate leakages and the air passage, provided by a special construction of the louvres, is kept clear by the self-cleaning arrangement which is the most important characteristic of this equipment. Thus the grate is kept cooled, and maintenance costs are therefore at a minimum.

The use of preheated air at 300 deg. F., necessitated by the desire to obtain a high efficiency, and by the presence of high initial feedwater temperatures, was for a long time the bug-bear of stoker manufacturers, and their latest designs are a direct answer to this problem.

The ashes and clinkers are dumped in the rear hopper and continuously removed under water by a drag scraper. This principle of ash removal eliminates the infiltration of air during ashing operations, which sometimes last as long as 30 minutes in each 8-hr. shift.

The gases, cooled below the ash softening point by the absorption of their radiant energy by the furnace wall tubes and water-cooled arches, travel in a normal way through the boiler's four passes; and finally lose their remaining recuperable energy to the feedwater in the economiser and to the air in the air preheater.

The air cycle starts with extraction of air at the top of the boiler house, helping to keep a moderate ambient temperature and to reduce radiation losses. After its passage through the preheater, the air is ducted down to the stoker plenary chamber.

A proportion of air had already been extracted at the heater outlet for recirculation, and in the basement another quantity is abstracted by two secondary air fans for injection at 6 to 12 in. presure above the ignition arch.

This plant includes also two types of de-superheating equipment: one of the non-contact type, to be described further on, and one of the jet-type, where part of the treated feedwater is injected in a controlled way into a vessel set in parallel with the main steam range. Part of the superheated steam is thus cooled, the feed-water is evaporated, and the increased steam quantity is re-introduced along with the original steam, thus decreasing the final steam temperature to the desired level.

Figure 3 gives the arrangement of a high-pressure high-capacity, pulverized fuel unit. It is one of the four boilers recently commissioned for the Little Barford plant of the Edmunson's Electricity Corporation. In this new central station in Bedfordshire the unit system has been used throughout. The installation is complete, from the coal bunker to the electric generator, in a single common room. Two steam generators were supplied by the Babcock-Wilcox Company and two by International Combustion Limited.

The author had the privilege of working on this contract during its development, in the design and drawing stages, and in the contracts department. Throughout the design, it was necessary to keep in mind the availability of the plant, as an uninterrupted service of twelve months was specified. Moreover, the appearance of the unit was of more than usual importance as the boilers were in the same room as the turbo-generators. For this reason, the layout had to be cleancut and simple.

The normal evaporation of each boiler is 270,000 lb. per hr. with overload capacity of 300,000. The pressure at the superheater outlet is 675 lb. per sq. in. while the drums are designed for a working pressure of 775 lb. per sq. in.

The coal is fed from a triple outlet bunker to three automatic weighing machines. A by-pass is provided so that the continuity of the service may not be impaired by the failure of any one of these three machines. The coal chutes, approximately 50 ft. in length, distribute the coal to table type feeders which feed Loesch design mills similar to the

Fig. 3—Layout of pulverized fuel units at Little Barford, Bedfordshire. Capacity 300,000 lb. per hr. (m.c.r.)

American bowl mill. The coal is then ground and a rotating classifier maintains the desired fineness. Three exhaust fans of 24 in. static pressure deliver the coal-air mixture to burners arranged in the four corners of the combustion chamber for tangential firing. Two of the three mills serve two diagonally opposed burners while the third mill, used as a stand-by, can fire the four corners simultaneously.

As can be seen in the figure, the unit installed is of the high-head type, the water level being approximately 50 ft.

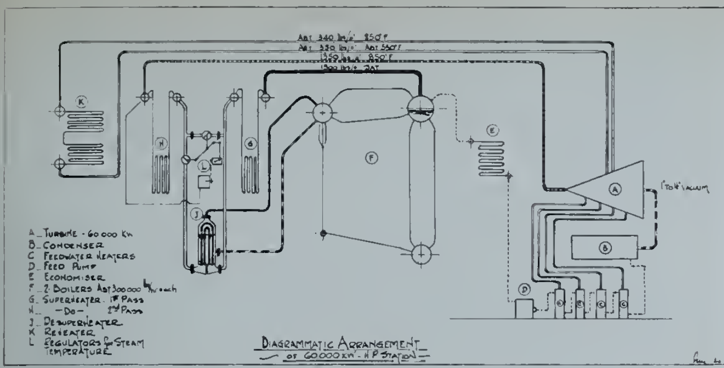

Fig. 4—Diagrammatic arrangement of Littlebrook power station. 60,000 kw.

above the bottom mud-drum. Substantially, it consists of a completely water-cooled finned tube furnace integrally-fed, surmounted by a three drum boiler arranged to provide an extended furnace volume.

The furnace tubes are bent around the burner and tertiary air castings and are fed from the mud-drum through screen tubes and horizontal side-wall feeders. A tile baffle protects from the heat the downcomer tubes which are kept inside the boiler casing. Side and front wall release tubes carry the steam-water mixture to the top drums directly, or through the intermediary of top side wall headers.

An elaborate system of interior baffling was devised to eliminate foaming and priming and to ensure the generation of clean, dry steam.

A multiloop two-pass superheater of the Melesco type is arranged in a vertical position for easy cleaning and replacement of elements. The saturated steam is abstracted from two nozzles on the rear top drum and fed to both ends of the primary superheater headers. After its passage through the primary elements, the steam enters the secondary superheater through inter-connecting pipes at the top front of the unit. On the outlet header, a Y-piece is provided connecting the two superheater outlets to the 12 in. steam main.

The final steam temperature of 910 deg. F. is maintained by the automatic operation of dampers permitting the bypassing of a proportion of the flue gas.

It will be seen from the figure that the structural steel design must present certain difficulties. Vibrating loads of 100 tons had to be accommodated on an independent suspension 70 ft. high. Care had to be paid to thermal expansion, casings were designed for pressures due to sudden ignition of the pulverized coal; galleries had to be provided for, etc.

A 13,600 sq. ft. steaming economizer is provided in the back of the boiler and arranged for downward flow of the gases. A gas by-pass can be used when starting up the unit. The outlet tubes are directly expanded in the drum and the general construction is of the steel-tube type with cast-iron extended surface shrunk on. An asbestos curtain damper can be dropped at the outlet of the economizer to help retain the heat in the component parts of the unit during short shut-down periods equivalent to banking conditions in a stoker fired unit.

The gases are ducted from the economizer to two Ljungström air-heaters of 23,200 sq. ft. each arranged for horizontal shaft and bearing. The air which is sucked from the top of the boiler house by the forced draft fans located in the basement is heated to 434 deg. F. at the outlet of the heaters, while the gases are cooled to 286 deg. F.

The air ducting can be followed from the outlet of the heaters down underneath the operating floor where a manifold section serves the longitudinal ducts from which three connections to the mills are tapped and which continue to the front of the boiler. From here, four branches are taken vertically upwards to the coal burners and to the tertiary air ports.

In order to avoid possible operating trouble with the air heaters due to low dew point condition of the gases, the principle of re-circulation was made use of. That principle, already referred to in connection with the previously shown installations, is best illustrated in this instance. A certain proportion of the air from the heater outlet is tapped in a controlled way through a damper and directed into the suction of the forced draft fan, so that the entering temperature of the air will be above 100 deg. F. Thus, the cooled elements of the regenerative heater are maintained at a temperature high enough to prevent sudden chilling of the gases with resulting deposits of moisture, possible adherence of fly-ash carried in suspension in the flue gas, and with accompanying formation of H_2SO_3 and resulting corrosion. This expedient results in a higher power consumption by the fan motors but it has proved to be a definite remedy for an operating trouble which, for certain coals, reduces so much the availability of the plant.

In order to comply with the very strict smoke abatement laws, a precipitator is installed with all powdered fuel stations in Great Britain. The most frequent type met with is the electrostatic precipitator, consisting of a large concrete building, housing electrically-charged tubes of large diameter hanging in the gas path. The dust particles carried in suspension are electrically attracted to these tubes and deposit on their surface in a very thin layer. A rapping gear is set in motion, causing the fall of these particles

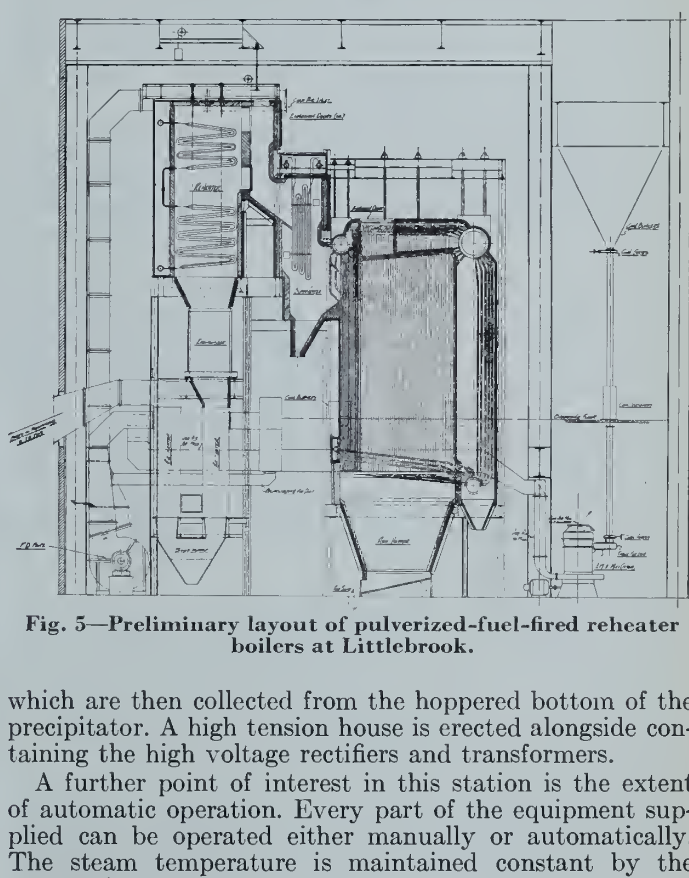

Fig. 5—Preliminary layout of pulverized-fuel-fired reheater boilers at Littlebrook.

which are then collected from the hoppered bottom of the precipitator. A high tension house is erected alongside containing the high voltage rectifiers and transformers.

A further point of interest in this station is the extent of automatic operation. Every part of the equipment supplied can be operated either manually or automatically. The steam temperature is maintained constant by the automatic operation of a gas by-pass; the boiler output changes are met by an automatic change of the fuel feed with corresponding variation of the required air quantities; the ashing operation is started at the touch of a push button; valves are motor-operated, even the sootblowers are automatic, their sequence of operation being followed on a light chart. All damper control gears are centered at the front of the boiler. Bi-colour water gauges with reflectors of the floor pedestal type are also in front. The mills, located in a separate dust-tight room in the basement, can be operated manually from the main panel where pilot lights indicate the state of operation. Practically all that the operating engineers have to do besides taking half-hourly readings is to stand ready to push the right button

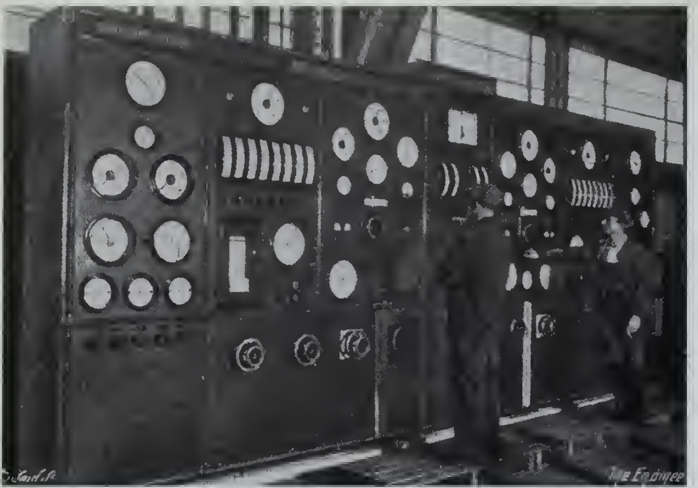

Fig. 6—Control panel for Loëffler boilers.

at the right moment and to see that their automatic servo-motors are in order.

Figure 4 is a diagrammatic arrangement of the extension for the Littlebrook power station owned by the Kent Electric Company. The layout of this extension was guided by a previous installation and was started before the latter was put in operation. It consists of units capable of developing 60,000 kw. at maximum continuous rating, the turbine being of the two-stage type and the boilers of the reheat principle. Incidentally, it was the last contract the author worked on in England.

The cycle begins at the feedwater heaters, receiving the water from the condensers through lift pumps. The water is heated by steam bled from the turbines at various temperatures and pressures and receives a further increase in temperature in the economizer, from which it is fed to the boiler.

The bulk of the steam generated in the boiler enters the superheater's primary elements. From there they pass to the secondary elements either directly or after the passage of a portion of the steam through the desuperheater. The function of the latter will be explained later. The superheated steam is then directed to the turbine where it expands to a point determined by the economies of the installation, whence it is returned to the reheater to be superheated once again, but this time at a lower pressure.

From the reheater outlet this low pressure but high temperature steam is returned to the turbine for further extraction of energy.

The non-contact condenser fitted at the outlet of the turbine condenses the steam by extracting its latent heat of evaporation through the intermediary of circulating water. The steam thus returns to its original state and starts another cycle as feedwater. Like most central stations, the water cycle is a closed one with as little as ½ per cent make-up water.

Figure 5 shows a preliminary arrangement of the boiler room for the same station. Slight alterations were made in the course of the contract's development, but the general idea was maintained.

It will be seen that the boiler is of the radiant type, consisting of a huge furnace lined with finned tubes; the only convection surface provided is in the form of screen tubes. A generous number of downcomer tubes feed the bottom drum which, in turn, supplies the rear wall tubes, the front wall tubes through the bottom granulating screen tubes, and the side walls through the intermediary of the side headers.

Water and steam circulators are provided between the two top drums. Thus to generate 300,000 lb. of steam at 1,500 lb. pressure, or, to develop 10,000 boiler hp. to suit the still-popular conception of boiler rating, only 4,500 sq. ft. of heating surface are provided. Using these same popular standards, we can translate this evaporation as a rating of over 2,000 per cent of normal rating, which is between five or ten times the rating of normal boilers. The average furnace temperature at maximum continuous rating is 1,980 deg. F. The gases are cooled to 1,900 deg. F. through the screen tubes. They then enter the second phase of the unit, which consists of a large two-pass Melesco superheater of the pendant type.

In order to maintain a constant final steam temperature over a wide range of ratings and therefore obtain a high thermal efficiency without incurring the risk of damaging the plant equipment, a desuperheater is put in parallel to the steam circuit between the first and the second pass.

Thermostat-regulated valves control the quantity of steam taken from the superheater's first stage to the desuperheater. There, some of its enthalpy (heat content) is dissipated in evaporating boiler water which returns to the boiler as saturated steam. That is, the final steam temperature is controlled by reducing its heat content by a required amount at the middle of its path through the superheater.

The final temperature of the steam is thus maintained at 850 deg. F. while the pressure at the outlet of the superheater drops to 1,300 lb. per sq. in. Steam is taken to the high-pressure end of the turbine through an 8-in. pipe; is expanded down to 350 lb. and returned through two 12-in. pipes to the third section of the unit, the re-heater. This section is virtually a low-pressure superheater, raising the steam temperature from about 530 deg. F. to 850 deg. F. This low-pressure steam is piped to the low-pressure end of the turbine and is finally condensed and ready to start the cycle over again. The gases are cooled from 1,320 to 1,000 deg. F. while passing through the 22,500 sq. ft. reheater. A gas by-pass is provided in order to maintain a constant final steam temperature. This operation is done automatically.

From then on, the rest of the plant is very similar to the previous installations shown. The heat recovery sections consist of an economizer weighing 120 tons of the finned-tube type, cooling the gas from 1,000 to 665 deg. F. This is followed by two air-preheaters of the plate type providing 81,000 sq. ft. of heating surface and weighing 100

Fig. 7—Stokers for two Loëffler boilers.

tons each, which keep the final gas temperature below 300 deg. F. All these temperature figures mentioned are for maximum continuous output. Here again the air re-circulation principle is made use of, as evidenced by the ducting layout.

The two units are corner-fired two pulverizers being supplied for each unit, each capable of milling 12 long tons per hour. The water circulation problems involved can be appreciated when comparing the densities of the water and of the steam at 1,500 lb. pressure. The margin producing the thermosyphonic circulation is very small, thereby necessitating a large vertical distance between the top and bottom drums. To illustrate this problem, it may be mentioned that the ratio of the steam density at 150 lb. per sq. in. to that of water is 152, whereas, at 1,500 lb. per sq. in. it is only 11.5, a reduction of over 92 per cent. In this case, vertical distance of 43 ft. 6 in. was necessary between drums to get adequate circulation. The bottom drum was set 20 ft. above the basement level in order to provide head room for an ash hopper of 50 ton capacity.

These requirements affected the physical aspect of the plant and necessitated a final height of 92 ft. to the top of the 100-ton re-heater. The supporting of this re-heater, together with a 60-ton superheater, and a 250-ton boiler at heights varying between 70 and 90 ft. presented no easy problem.

The design of the drums presented another group of interconnected problems. The large steam and water drum required an internal diameter of 54 in. This diameter was determined by the steam liberating surface required and also by the physical dimensions of a steam washer.

The function of the steam washer mentioned above is to remove the salts entrained in the steam and thus lengthen the life of the turbine blades at the low pressure end, and, also, the life of the superheater elements. The removal of these solids is accomplished by washing the steam in the clean entering feedwater.

Thus, it was necessary to design a large diameter vessel for a pressure of 1,500 lb. per sq. in. while sustaining static loads of over 100 tons. Using material of an ultimate tensile strength of 80,000 to 86,000 lb. per sq. in. we arrive at the amazing required thickness of 6 in. for the wall of the vessel. To reduce bending stresses, the drum is supported at intermediary points and its wall thickness had to be increased by ⅜ of an inch at the support points in order to provide enough material to sustain the stresses. Bending moments due to the weight of the drum itself—approximately 50 tons—and due to the suspended loads were investigated and contributed in increasing the drum thickness to its final dimension. Special equipment had to be designed for forging these drums and the tube drawing machines had to be altered to accommodate 3 in. o.d. tubes ⅜ of an inch thick and 45 ft. long.

The units are totally steel encased and walkways are provided at six levels for easy access to operation points. Combustion control is centralized in a single panel located mid-way in front of the two boilers.

So far, we have looked only at arrangements of natural circulation boilers of the latest and most familiar types. It may be of interest, then, to examine briefly some other types of boilers in use in Britain.

Restricted by a shortage of materials and a reluctance to import special alloys necessary in the building of high pressure units of the natural circulation type, Germany, Czecho-Slovakia and a few central European countries started some time ago exploring the possibilities of economical steam generation using the forced circulation system in the design of the boilers. These conditions did not obtain in Great Britain nor in the United States. Therefore, it is logical that the engineers of these two countries started investigating this related problem only after the Central European engineers had discovered unforseen advantages in the use of this type of plant. The most popular system of forced circulation boiler in Europe is that first put forward by a United States' naval officer—the LaMont system. International Combustion secured patents for England and built the first unit of this type for the Imperial Chemical Industries plant at Wallerscote. Then another boiler company—the John Thompson Co. also secured patents for the same boiler and in the last five years they have built a few large units. One was for the London Power Company and was then the largest LaMont boiler in the world. The steam output is 350,000 lb. per hr. and the final steam conditions are 350 lb. per sq. in. and 850 deg. F.

The outstanding feature of the LaMont system is the use of forced circulation through the boiler tubes. A circulating pump running at constant speed forces the water into distributing headers replacing the multiplicity of expensive drums used in a normal boiler. From that point, the water is divided to each boiler tube system through an orifice so that each element may receive the quantity of water required by its evaporative potentiality. Thus, the pump overcomes the frictional losses of the system, while absorbing but ½ per cent of the energy output of the boiler.

Small tube diameters and greater tube lengths can be used in the LaMont system with better heat transfer and decreased boiler weight. Since the percentage of power required by the circulating pump remains a small part of the energy output of the boiler, even at very high pressure, this type of boiler is usable over the whole pressure range up to the critical pressure (3,200 lb. per sq. in.).

The latest and largest unit of this type of boiler is at present under construction in the U.S.A. It is designed for 650,000 lb. per hr. at 1,850 lb. per sq. in. at the superheater outlet, and it is to be equipped with all the modern heat recovery sections, so that an efficiency of 89 per cent will be attainable at maximum continuous rating.

Another system of forced-circulation is that used by the boiler designed originally by the Austrian, Dr. Stefan Löeffler. The first installation of this type in England was built

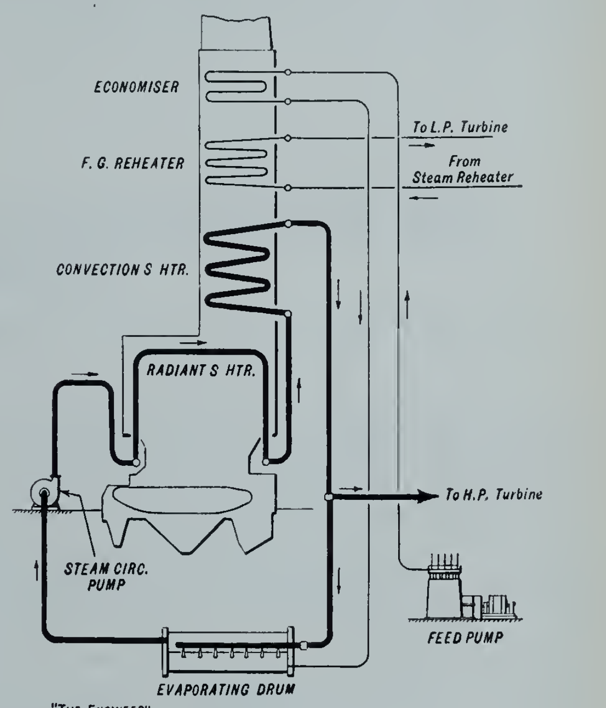

Fig. 8—Diagram showing the principle of operation of the Loëffler boiler.

for the central station of the North Metropolitan Power Supply Company, at Brimsdown, a Borough of London. The layout of the new high pressure plant is perhaps not as good as it might have been had it not been necessary to utilize the existing buildings.

Figures 6 and 7 show the control panel and the stokers for two Loëffler boilers, each rated at 210,000 lb. per hr. (maximum continuous rating). High-pressure steam is delivered to the high-pressure set, which develops 19,000 kw. After the steam has been reheated, it passes to the low-pressure 34,000 kw. set. Although it was originally intended to reheat the steam in two stages: first in a steam-to-steam reheater using the high-pressure high-temperature steam, and then in reheaters incorporated in the boilers, it has been found to be possible to reheat to the specified temperature without the steam-to-steam reheater.

The principle of the Loëffler boiler is diagrammatically explained in Fig. 8. Contrary to the usual practice, in the Löeffler boiler the steam is not generated in water tubes heated directly by the fire, but in evaporating drums which can be located in any convenient position outside of the boiler. Heat for evaporating the water in the drums is supplied by injecting superheated steam into it. This superheated steam is produced by pumping, by means of a steam circulating pump, saturated steam at a pressure of 2,000 lb. per sq. in. out of the drums and passing it through the boiler, which is actually a superheater. The first portion of the boiler, lining the combustion chamber, becomes a radiant superheater absorbing approximately 50 per cent of the energy of the fuel and raising the steam temperature up to 750 deg. F. which comes out at 940 deg. F. at the final outlet. At this point it divides, approximately ⅓ going to the turbine plant and ⅔ returning to the evaporating drums into which it is discharged by special nozzles. Once the boiler is working, it is this steam that evaporates the feed water; but, for starting up, an external supply of low pressure steam is required.

Thus a limitation to the use of this type of boiler is imposed by its inherent design but it also offers many redeeming qualities.

Internal cleaning of the boiler, together with the dangers of scale deposits and bursting tube failures are eliminated. The power consumption of the pump necessitates the use of high pressure steam. That could be verified by a quick glance through the steam tables under the heading: specific volume.

Valves, piping, etc., are of special design. High molybdenum and chromium steels are necessary. Special high creep tests have to be conducted. Trained, skilled workers have to be employed for the field welding of the tubes and a hand picked plant personnel is required to take charge of operations.

It may be mentioned here that no operation difficulties were encountered in this plant, except a few related to the combustion. The author spent six months here supervising the operation of a twin grate stoker supplied by International Combustion, and finally became familiar with seeing the needle point at 2,000 on the pressure gauge without thinking of running for cover.

Apparently the owners were satisfied with the operation of the plant as they gave a repeat order for two larger boilers of the same design. Their erection was started early last spring.

Since the underlying principle of the conception of the Grid System was to increase Britain's industrial efficiency, the efficiency of its component parts had also to be increased. In the main stations with which the author had contact, this increase was obtained by carefully-judged increased pressures and temperatures and increased capacity of units; by the extensive use of automatic devices and by thoughtful planning of safety features.

The general effect of this development was to provide Britain at the outbreak of war with a beautifully balanced power house from which to expand her additional war industries.

THE JUSTIFICATION AND CONTROL OF THE LIMIT DESIGN METHOD

F. P. SHEARWOOD, M.E.I.C.

Consulting Engineer, Dominion Bridge Company, Limited, Montreal, Que.

SUMMARY—Many engineers who have watched the fabrication and erection of steel and the uses and abuses to which it is often subjected, must have been impressed by the fact that if steel must break when strained to the equivalent ultimate stress as given by a constant ratio of stress to strain, very few of our structures would survive their fabrication, let alone their erection and the abuses to which they so often are subjected. To state this matter more plainly, steelwork is nearly always strained during its fabrication and subsequent life, far above its ultimate stress equivalent as measured by the strain and does not fail, but continues to function as if undamaged.

The question which must occur to many designers is, why is the fact ignored that steel can yield sufficiently to bring understressed paths into proportionately greater resistance than the conventional theories allow.

Limit design is based on the utilization of these understressed paths.

In this discussion of limit design, complicated formulae are avoided, as they tend to befog the main object of visualizing the practical effect of yield and its control.

Introduction

The present accepted practice of designing steel structures involves the rigid application of the elastic theory. Limit design proposes to modify this method by also considering yield, and has been discussed by many engineers on both sides of the Atlantic.

A recent paper on this subject by Professor Van den Broek* entitled "Theory of Limit Design" has claimed that the capacity load and not the stress in one member should be used in determining the safe limit of loading. In a general way, the same theory is followed in this discussion but it deals more directly with the amount of strain or yield which should be counted on in estimating the capacity load. This was briefly but ably referred to by Professor L. H. Donnell in discussing Professor Van den Broek's paper.

The object of the present paper is to suggest again that ductile yield does influence the strength of steel structures and, therefore, should be counted on in its design. It is hoped to lead some of our scientific investigators away from the fascinating hobby of solving exactly the theoretical elastic strains in complicated structures and induce them to pursue the equally important question as to whether it is reasonable and safe to count on some of the ductile yield of steel to bring the excess strength of understressed paths automatically into increased resistance.

Structural steel is more reliable in its physical properties than any other material extensively used in construction. Its elasticity is constant up to about half its ultimate strength. It is highly ductile and there is no loss of strength as it deforms until it has yielded to a very considerable extent.

The design of steel structures is entirely based on the strain varying exactly with the stress, and prohibits reliance on, or even risking, any permanent distortion in any part of a structure. This has led to the modern demand for exact stress computations and the definite limitation of specified unit stresses. At the same time many secondary resistances are disregarded, and also the fact that the external forces are generally only assumptions, the present theory ignores the faults of assembling, the strains from fabrication, and many other conditions which affect structures to such a degree that some parts must often have been strained far beyond their elastic limit.

To produce failure in a steel structure the strain in some part of it must exceed some limit to which it can be de-

*Prof. Van den Broek, *Trans.* American Society of Civil Engineers, V. 105 and C. M. Goodrich, *The Engineering Journal*, January, 1940.

formed without loss of strength, and it must be stressed above its strength. For instance in Fig. 1a, the rod is proportioned to support a load which will stress it to the allowed unit stress, 20,000 lb. per sq. in. and it will fail if the load is increased by its factor of safety (20,000 x 3) as there is nothing to restrict it being stretched to its ultimate strain. If the same load is applied to a similar rod but under the conditions shown in Fig. 1b, it will not fail because it will not be strained more than 0.067 in. Even if the clearance is increased to 0.2 in. (Fig. 1c) which is the strain equivalent to its ultimate strength, it will not fail and possibly will not be weakened for continuing to exert its full strength.

Since ductile yield is such a remarkable and unique property of steel, it seems extraordinary that in the designing of steel structures there should be a stricter guard against partial overstraining than there is with most other materials.

Much thought and time is being consumed in solving the exact distribution of stress in so-called indeterminate structures, these solutions being based on the elastic theory and absolute correctness of all factors. In these structures, the variation of strain sought for might amount to 0.03 per cent deformation, while the safe deformation of ductile steel is likely to be ten times this amount, provided the straining is not intermittent. Therefore, why be so particular ?

It is only in recent years that the reasonable use of the ductile yield of steel in designing has been suggested by what has been named or rather misnamed "limit design."

Limit design differs from the present methods in that it recognizes that steel will deform far more quickly than in direct ratio to the stress after it reaches a certain stress and it is proposed to utilize this feature to a limited extent in estimating the safety of structures.

It is well known that steel frequently stressed or substantially strained above its elastic limit will fatigue, and that, some limit of strain must be placed on its most rigid path, in order that it will not be too greatly deformed before the strength of other paths comes into sufficient operation to provide the required resistance. Therefore, it is tentatively proposed that design should be based on three assumptions: (1) To estimate on the sum of all resisting paths at the normal unit stresses when treated independently. (2) That no path be strained above the elastic limit when the whole structure is treated elastically. This insures that deformation of the material is only counted on in the factor of safety and not for normal conditions. (3) That the stress in a member is constant after the strain in it has passed the proportional (or elastic) limit. This is not actually correct, but it errs on the safe side, as it will show slightly greater maximum unit strain.

These suggestions differ from those of Professor Van den Broek, who would estimate the capacity load on the elastic limit of the most limber primary path, instead of placing a limit of strain on the most rigid path.

Typical Illustrations

It is not intended in this paper to go deeply into the science of devising the correct formula for applying the limit design theory or to decide upon the exact amount of strain or deformation that can be safely permitted, but rather to visualize the probable distribution of stress at failure in complicated structures, and from that to judge whether it is reasonable and safe to count on the ductile yield of steel to modify the strength given by the elastic theory. In order to indicate the effect of yield on the strength of steel frames, the computed stresses as given by the elastic and yield (limit design) methods are compared in the following typical examples:—

(1) A hanger composed of bars of different lengths.

(2) The bending resistance of beams of various cross sections.

(3) Continuous girders.

It is interesting to compare the figured safe tension values of a hanger composed of rods of the same length with one having rods of different lengths.

First consider one with three rods of the same length, as shown in Fig. 2. The computed allowed load by either method would be 60 kips.

Second, consider one with rods of different lengths as shown in Fig. 3. The allowed load according to the elastic theory works out as follows:—

It has been recognized for many years that a round section, the only solid section that is frequently used in structural steel design, is stronger in bending than the elastic theory allows for. Specifications have arbitrarily permitted a substantial increase in the allowed unit for bending stress in pins, thereby partially recognizing the principle of limit design. In fact, the raising of that unit stress from 20,000 to 27,000 lb. per sq. in. as is done in the C.E.S.A. specification, is more than that which is here proposed.

In our medium steel specification the material has to meet a bend test without fracture which strains the extreme

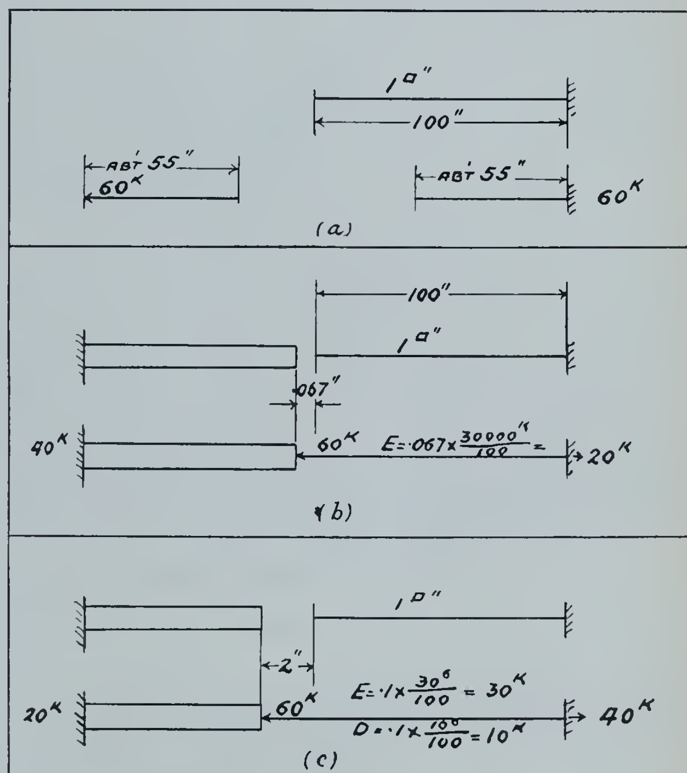

Fig. 1

Scale: Length 1″=40″, Clearance 1″=0.4″

E=30,000,000-1; D=10,000,000-1.

fibre to 43 per cent of its length. If the stress-strain ratio was constant this would induce a fibre stress of 12,900,000 lb. per sq. in.

The greater use of or reliance on the inner fibres of beams in bending seems at least to warrant serious thought and investigation, as its adoption in some degree might bring about considerable economy and possibly a safer or more efficient type of beam sections.

In such structures as continuous beams, it should be our object to find out the safe limit of loading and not merely the loading which will produce an allowed unit stress in the most highly stressed fibre. Therefore, the problem to solve is whether very minute deformation of the most rigid paths of resistance in structures can occur (without damaging their strength value) and bring the latent resistances of other paths more fully into action. If this occurs, the advisable factor of safety should be applied to this con-

dition, instead of restricting the loading to the allowed unit stress of its most rigid path.

To obtain some insight into this matter, it should be helpful to visualize what happens to a beam with rigidly fixed ends as it is progressively loaded. A fixed ended beam subjected to a uniform load has its flanges stressed and strained in varying amounts throughout its length, but as its ends are rigidly fixed the sum of these deflections (strains) in each flange must be zero, and, therefore, the point of contraflexure (c.f.) must be at a point which will produce this result. So long as the strains vary in direct ratio to the stress the c.f. in a beam of uniform cross section will be at 0.211 of its length, but if the strain at the point of maximum stress exceeds the proportional limit and the fibres along the overstressed part of the flanges have their ratio of unit strain to unit stress increased, the c.f. must be moved towards the overstressed part in order to preserve the balance of plus and minus deflections, and so keep the ends unmoved. This will increase the positive and decrease the negative moments.

If the loading is further increased, this shifting of the c.f. will continue so long as the fibres on the one side of the c.f. are increasingly over-strained as compared with the other side. When the loading is increased so that the addition of over-strain becomes as great on the positive portion of the beam, the stresses will become balanced, and so an automatic action exists to utilize both resisting moments to their full extent. Thus, failure will only occur when one path is either overstrained or the combined strength is over stressed. The problem is to find out the unit strain that can be safely permitted under the various conditions of loading.

In Fig. 7 is shown a beam of uniform section with a span of 200 in. stressed by a uniform load. The parabolic curves

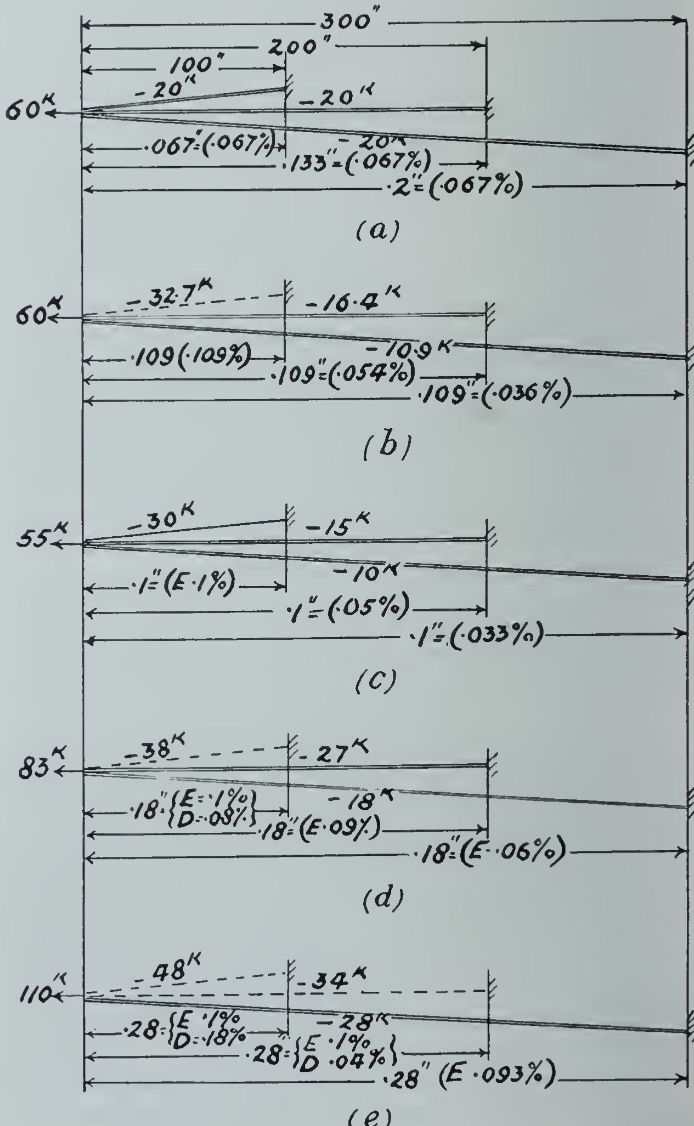

Fig. 4

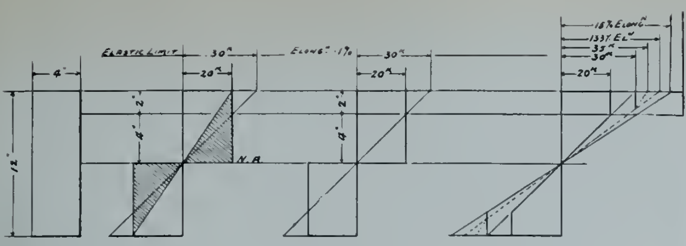

Fig. 5

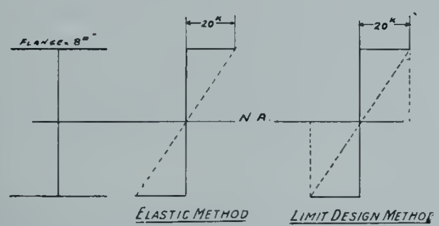

Fig. 6

represent the sum of the moments allowed under various uniform loadings.

Curve A is the allowed resisting moment for a simply supported beam stressed to 20,000 lb. per sq. in. In this there is only one possible path of resistance, and consequently nothing to resist the maximum moment except the beam strength's at the centre.

Curve B is the resisting moment for a fixed-end beam allowed by the elastic theory for a unit stress of 20,000 lb. per sq. in. In this there are three paths of resistance interdependent on one another. Elastic conditions place the c.f. on the line "yy," which gives equal plus and minus strain length in each flange, but the positive moment is only half the negative and there is strength available to prevent any overstrain from the negative moment.

Curve C is the allowed resisting moment if calculated by the limit design method, that is, to arbitrarily assume the c.f. where it will give the greatest combined resistance, viz.: at "xx" where the positive and negative moments become equal, and the beam is fully stressed. This, however, cannot occur so long as the strains vary directly with the stresses and the ends remain fixed, because the tension and compression deformations will not equal one another. The real unit stress at the supports (while still acting elastically) will be 26,700 lb. instead of 20,000 lb. and at the centre 13,300 lb. instead of 20,000 lb. If the loading is increased so as to stress the fibres over the supports to over 30,000 lb. (assumed elastic limit) the strain at this point will begin to increase at a higher rate than the stress, and to maintain equal plus and minus flange deflections the c.f. must move towards the support, and so reduce the negative moment and increase the positive. This will continue as the load is increased until the stresses at the centre from the positive moment also exceed the elastic limit and the deformations increase as rapidly as those in the negative region.

Curve D is the maximum moment which will not strain any part of the beam above the elastic limit. It indicates that there is no deformation at normal loading if a beam is proportioned by the limit design method, that is by assuming equal positive and negative resisting moments.

Curve F is the moment when the combined maximum fibre stresses are 50 per cent greater than given by curve "C" (viz. 60,000 lb.). Acting elastically, the negative stress is 40,000 lb. and the positive 20,000 lb. which brings about nine inches of the flange to be overstressed and causes extra deformation in it which will move the c.f. down the curve towards the support, possibly to point "T" and so transfer about 2500 lb. fibre stress from the negative to the positive stresses.

Curve G is for combined maximum fibre stresses amounting to 70,000 lb. When treated elastically, it is divided into 46,700 lb. negative and 23,300 lb. positive, which overstrains about 13 inches of the flanges adjacent to the supports and probably shifts the c.f. to the point "r" bringing the positive maximum fibre stress to just over the elastic limit (30,000 lb). To bring about this condition, the deformation required in the over-strained portion must make up the difference between the tension and compression elastic strains of the whole flange. From curve "G," it is apparent that the extra deformation required in the negative side to equalize the plus and minus deflections must be produced

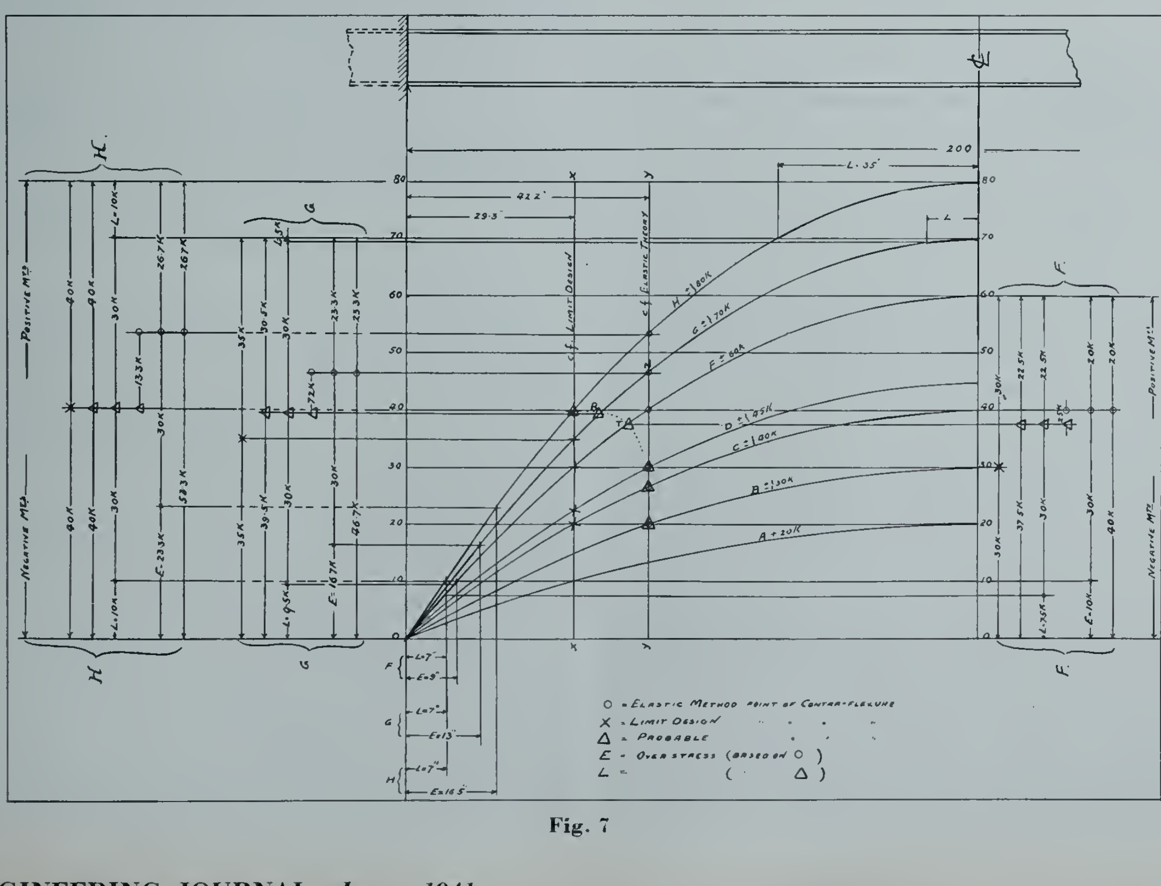

Fig. 7

by a stress equal to the vertical distance between n and r (7200 lb-stress) acting over the half length of the span.

$$\text{i.e. yield} = \frac{7200 \times 100}{30,000,000} = 0.024'' = (\text{less than } \tfrac{1}{32}'').$$

This has to be provided for by deformation in the overstrained 13 inches (shown by heavy lines) adjacent to the support. Assuming that the yield varies from zero at 30,000 lb. stress to a maximum at the highest stress, the maximum percentage of elongation in these flanges will be

$$\frac{0.024 \times 2}{13} \times 100 = 0.37 \text{ per cent.}$$

$$1\text{—}100 \text{ in. rod} = 1 \times 20000 \times \frac{100}{100} = 20000$$

$$1\text{—}200 \text{ in. rod} = 1 \times 20000 \times \frac{100}{200} = 10000$$

$$1\text{—}300 \text{ in. rod} = 1 \times 20000 \times \frac{100}{300} = 6700$$

Total 36700

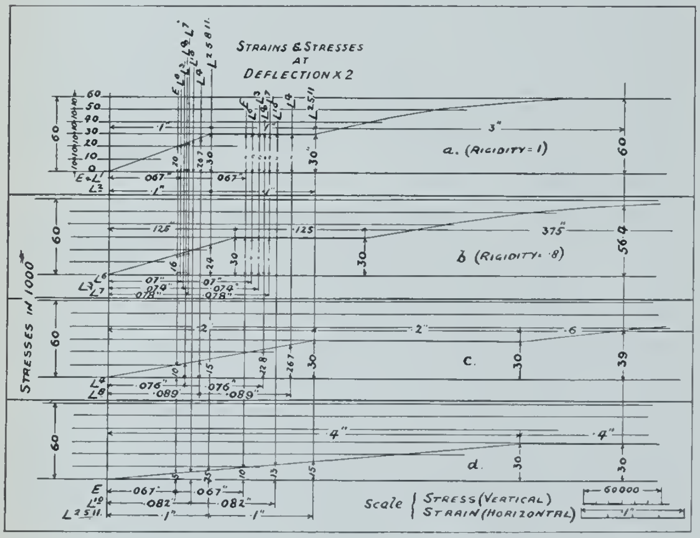

Fig. 8

By the limit design method, the allowed load, treating the rods as independent, would be as shown by Fig. 4, viz:— 3 x 1 x 20000 = 60000 lb. (or 60 per cent more than by the elastic theory).

But if the hanger as a whole is assumed to act elastically the distribution of stress for this load would be as shown on Fig. 4b, the stress in the short bar would be above the elastic limit (30000 lb.). Therefore, the maximum load which will not deform any of the bars will be as shown by Fig. 4c (which is in accordance with the suggested limitation) and the allowed load will be 55,000 lb., or 50 per cent more than if computed by the elastic theory as in Fig. 3. It is also about 8 per cent less than if the rods were all the same length.

As it is the safety of the hanger as a whole that is our aim, the hanger should be proportioned to give a certain factor of the capacity load and not merely a factor of the strain in any one part of it, and so it is interesting to examine what happens when these loads are increased by 50 and 100 per cent.

By increasing these computed loads by 50 per cent and assuming that the deformation beyond the elastic limit is three times as great as below it, the resulting stresses and strains will be about as shown by 2b, 3b and 4d. In 2b all the rods are just at the point of deformation and there is no elastic reserve. In 3b the shorter bar is at the limit of elasticity, while the other rods have 50 and 67 per cent of their elastic stress resistance unused. In 4d the shorter bar has deformed 0.08 per cent of its length, but the 200 in. rod has 10 per cent and the 300 in. rod 40 per cent of their elastic resistance in reserve.

If the computed allowed loads are doubled, the strains and stresses are about as shown in 2c, 3c and 4e. In 2c all the rods are deformed by about 0.1 per cent and there is no reserve elastic resistance. In 3c the short rod is deformed 0.05 per cent, while there is still 25 and 50 per cent elastic stress resistance unused in the other two. In 4e the shortest rod is deformed 0.18 per cent which is only about 3/16 in. for the 100 in. rod and the intermediate rod is deformed 0.05 per cent, but there is still 7 per cent reserve elastic stress resistance in the long rod to prevent progressive creep.

Reviewing these results and assuming that the proportioning by the elastic theory as given in Fig. 2 is correct, it would seem that the safe loading given in Fig. 3 hanger (viz. by the elastic method) is extravagant and that that given by the limit design method in Fig. 4c is quite as safe as in Fig. 2.

The question to be investigated is whether under certain loading conditions some of the members of a steel structure which only provide a part of the total resistance can be restrictedly deformed to some limit (say 0.1 per cent or even 0.2 per cent) without harm. From practical experiences, it does appear to be permissible for a great proportion of structures and well worthy of consideration.

It should also be kept in mind that medium steel specification calls for an elongation of 22 per cent or equivalent to a stress of 6,600,000 lb. per sq. in.

The reasons for considering the limit design method as a justifiable way of estimating the safe bending resistance of beams can be best visualized by comparing the allowed resistances based on the elastic and limit design theories for a solid beam with that of a beam having all its bending resistance concentrated in its extreme fibres.

Consider a 12 in. x 4 in. beam as shown by Fig. 5a. The stress-strain diagram is as indicated by Fig. 5b for the elastic theory, and by Fig. 5c for the limit design (i.e. that all fibres act independently). In Fig. 5b only the extreme fibres are resisting at their full value, whereas in Fig. 5c all the fibres are assumed to be equally stressed. The latter cannot occur while the extreme fibres are still strained within the elastic limit but the inner fibres will begin to assume this condition as soon as the outer fibres pass their elastic limit (when the stress does not increase proportionately with the strain).

If it were possible to strain infinitely the inner fibres of the beam, and the fibres could deform without increased resistance after passing the elastic limit. the stress diagram would be two rectangles as shown by Fig. 5c and the calculated section modulus would be:

$\frac{bd^2}{4} = 144$, or 50% greater than $\frac{bd^2}{6} = 96$, as given by the elastic theory (Fig. 5b.).

In Fig. 5b (elastic theory) only the extreme fibres are fully used and all the interior fibres have reserve elastic strength, which is not used in the estimate of the beam's strength. Thus no credit is taken for this reserve resistance which is indicated by the hatched area in Fig. 5b in spite of the fact that the outer fibres can probably deform enough before injuring the beam to bring much of this excess elastic resistance into effect.

In a beam with all its area concentrated in the outer fibres, (Fig. 6a) the computed bending resistance is the same by either method, since there is no unused resistance to be included in the limit design result.

It is quite evident from the stress diagrams, Fig. 5c, that the limit design cannot function fully, because the fibres inside the point where they are not stressed above the elastic limit must act elastically. If it is assumed that the outer fibres can be strained to 0.15 per cent of their length without harm, assuming the stress in the overstrained fibres remain constant after passing the elastic limit, the stress-strain diagram will be as shown by Fig. 5d (full lines)

TABLE No. I

			L	1@30000 3@ 7500	52500.*	50%		2.85	.95

S —relative independent strength of path.
* —maximum elastic resistance which will not strain any path above its elastic limit.

and the calculated resistance of the beam will be $(2 \times 4 \times 5 \times 2) + \frac{(4 \times 8^2)}{6} = 122.6$ or 28 per cent above what is given by the elastic theory. This divided by the factor of safety should give a safe working value.

As the stress does increase (but at a much slower rate) after the strain passes the elastic limit, the full lines in Fig. 5d are not actually correct, and it is likely that the actual stress diagram will be somewhat as shown by the light dotted lines, and the strain diagram by the heavy dotted lines. This will give somewhat greater strength and less deflection than given by the full lines. To calculate the precise bending resistance of beams as their outer fibres are strained beyond their elastic limit is a complicated problem. It has been discussed in many books on the "Strength of Materials" (by Swain and Morley) and "Theories of Elastic Stability" (by Timoshenko, and others). What is here discussed is limited to the main question as to whether it is justifiable to consider yield in the extreme fibres, and does not touch on the more involved problem of finding the exact amount.

This strain is only about 1/50 of the elongation specified for the material and while it is realized that most of the specified elongation cannot be safely used, it seems likely that this relatively small proportion can be relied on to redistribute much of the overstress into the path which is still acting elastically before failure occurs.

Curve H is for unit stresses which are still within the strength of the beam when considered as acting elastically. It is interesting as showing the lengths which become overstrained (deformed) as the loads are increased. When acting elastically about 16½ in. of the negative side are overstrained, but if adjusted to give equal moments, there are only about seven inches on the negative side which are overstrained, while on the positive side 35 in. become overstrained, indicating a far more rapid lengthening of the positive overstraining as the load is increased. Of course, both of these conditions cannot occur together, but they point to the probability of ensuring the location of the point of contraflexure so as to utilize nearly the full strength of both paths before failure occurs through overstraining.

In the case of a fixed ended beam with a concentrated load, the limit design method gives results similar to the elastic theory, because the paths of resistance are of equal rigidity and both are stressed to the maximum and any yielding in one will merely throw excess on to the other which is already fully stressed.

In the moment diagrams, which are given in Fig. 7, the movement of the c.f. from its elastic position is, of course, largely approximate guessing, and therefore the distribution of stress between the positive and negative portions of the beam is not definitely known. But is this so very important if the yield of the overstressed part can be relied on to be sufficient to bring other paths which still have excess elastic strength into sufficient resistance to prevent the overstressed path exceeding its safe limit of strain?

It is probably at present impossible to calculate the exact location of the c.f. and consequent distribution of the resistance between the positive and negative moments in continuous beams before failure (or fatigue) occurs, but it is evident that these moments are inter-dependent and that extra deformation in the overstrained path must automatically reduce the proportion of stress in the heavier strained path by transferring it to the understrained one.

The three examples which have been discussed represent only a few cases of the types of structures in which yield should be considered, but apply equally to all so-called indeterminate structures such as arches, buildings supported on numerous columns, etc.

In order to illustrate graphically the distribution of stresses and strains among the several paths of complicated structures, diagrams giving the strains and stresses of four paths having different rigidities are shown in Fig. 8.

The stress-strain diagrams are intended to represent those of medium structural steel. It is, therefore, assumed that the strain varies directly with the stress up to 30,000 lb. per sq. in. and amounts to 0.1 per cent of the length, then there is a strain of 0.1 per cent without increase of stress after which the strain develops at an increasing rate until a strain of 0.5 per cent with a stress of 60,000 lb. per sq. in.

Diagram "a" is for a path with the equivalent strain of 0.1 per cent.

Diagram "b" is for a path equivalent to 0.125 per cent or 80 per cent rigidity as compared with "a."

Diagram "c" is for 0.2 per cent and 50 per cent rigidity.

Diagram "d" is for 0.4 per cent and 25 per cent rigidity.

The actual strains and stresses computed by the elastic theory and the limit design method, for various combinations of these paths can be obtained by scale from Fig. 7.

It will be seen from Table I that the working or allowed capacities (Column 5) given by the limit design, are much higher than those allowed by the elastic theory, the difference varying from zero for a one path structure to 50 per cent extra when the major resistance is from the limber paths.

The increased resistances developed by doubling the deflection can be scaled from Fig. 8. They indicate a reasonable agreement between the limit design method and a structure with only one path, while the elastic theory gives a considerable excess for nearly all combinations.

In Column 7 are given the resistances when the most rigid path is stressed to the assumed ultimate (60,000 lb. per sq. in.). Column 8 gives the ratio of this to the working stress as given in Column 5. If these factors of safety (Column 9) are compared with that given for a one pathed structure, it is found that the elastie theory gives a considerably greater factor of safety and the limit design a decidedly lower factor. It must, however, be remembered that a 0.5 per cent strain will not fracture medium steel and that any further increase of strain will develop increasing proportional resistance from the other paths while the stress in the rigid path will scarcely alter.

This simple illustration is extremely superficial and is merely shown to help visualize in the simplest way what must tend to happen in a complicated structure,—it shows that the present elastic method fails to give a true safety factor and emphasizes the need of considering deformation as well as elastic strain when designing structures with more than one path of resistance.

In order to count with safety on the effect of yield in designing steel structures, it becomes important to determine whether and how much yield can be endured without damage. There is not at present any accepted practice as to the amount of yield that may be counted on, nor the precise ratio of yield to stress. It is, however, accepted, first that on reaching the elastic limit a relatively large amount of strain takes place with little or no increase of stress, and, second, that further increase of stress produces a greater and accelerated ratio of strain.

Fatigue

Many tests have shown that repetition of stress, even well below the elastic limit, will produce failure and, therefore, it may be claimed that it is dangerous to count on the stress in any part of a frame ever passing the working limit. Nearly all fatigue tests have been made by applying frequently certain loads to bars which have had nothing to restrict progressive elongation. It seems likely that if the strain had been restricted, the probable reason of fatigue, viz., progressive creep, would have been stopped and fatigue would have been avoided.

The application of limit design principles to the design of structures which will probably seldom or never be loaded to their designed capacity, and to those carrying an immovable load, seems quite permissible, while for structures intermittently supporting their full load or those subjected to severe vibration, its application is less safely justifiable.

The aim of structural engineering is to practise safe and efficient methods of designing structures and any permanent and reliable resistance which must function before failure or damage occurs and which is not included in estimating the safe loading, is waste and is not, therefore, good engineering.

As is the case in all our discussions, the object of drawing attention to these questions is to place the subject before those who are fortunate enough to be in a position to investigate it further. The subject of limit design, which is bound up with the determination of the amount of strain or yield which can be relied on before damaging the material, is recommended to those who have the opportunity to examine the matter minutely from a scientific research point of view.

The establishment and general recognition of the amount of restricted yield that can be used with safety would give confidence in a wider use of rigid construction, it should often influence the investigations regarding the safety of old bridges and other steel structures, and would simplify the designing of indeterminate structures. It might even cultivate a keener appreciation of deformation effects, and prevent too much dependence on the strict literal application of standard specification rules applied in accordance with conventional practice.

The safe unit of strain as well as of strength for different conditions of loading is essential, but it has never been, even approximately, determined.

Acknowledgment

The author wishes to acknowledge the help given him by Mr. A. M. Bain, M.E.I.C., and to express his appreciation for the many suggestions he made to clarify the issue.

RESUME OF PRESENT DAY POWER TRENDS

A. G. CHRISTIE

Professor of Mechanical Engineering, The John Hopkins University, Baltimore, Md., U.S.A.

Paper presented before the Midwest Power Conference, at Chicago, Illinois, on April 9, 1941

Today's trends in power development are influenced by recent economic and political events. The depression which started in 1929 led to large reductions in the power loads of utilities and industries. As a result ample reserve capacity was available for several years and few new generating units were installed. But the domestic load continued to increase throughout this period. The Government undertook large-scale hydro-electric developments in various parts of the country with the stated intention of lowering rates for electrical service. The Government also started a campaign for rural electrification. While many engineers disagree with the methods by which the selling prices of the various services have been fixed by the Government's agencies, these developments have been contributing factors in the present trends.

In 1937 a noticeable improvement in business made it apparent that an early pick-up in industry would require additional generating capacity. This has proved a fortunate circumstance for the equipment ordered at that time is now available. The start of the war in 1939 and the rapid rise in industry since then have greatly increased the demands for power. One large utility recently stated that its output in kilowatt hours doubled in the last six years. Fortunately, new hydro-electric capacity now available, together with the reserves of the public utilities, have been sufficient to meet all demands to date with a reasonable stand-by. In the meantime, additional equipment aggregating a large kilowatt capacity has been ordered or is being installed, and this will add to available power as demands increase. Baring untimely strikes, sabotage or dislocation of labour in plants building power plant equipment, the electric utilities appear able to meet all demands due to the defence emergency.

Hydro-Electric Power Development

The attention of the public has, for some time past, been centered on hydro-electric developments. Some notable plants have been completed by the Government in the last decade such as Boulder Dam, the TVA plants, and Bonneville, while work is actively progressing at Shasta and Grand Coulee. The Canadian plants at Niagara Falls have been permitted to use additional water during the present emergency and in anticipation of the diversion of water into Lake Superior from the Hudson's Bay watershed. Additional capacity has been added at Beauharnois on the St. Lawrence river and at La Tuque on the St. Maurice river.

Hydro-electric plants serve two classes of customers, the large power user located close at hand as at Niagara, Shawinigan, Alcoa, Arvida, etc., or public utility loads at varying distances from the plant. Boulder Dam is among the latter, with transmission lines 267 miles along to Los Angeles. Others have loads closer at hand. The American consumer demands continuity of service and consequently steam stand-by plants are already provided or will soon be needed by the vast hydro-electric systems of the United States. For instance, new steam stations are now under design for the TVA system and at Los Angeles for Boulder Dam. Other large hydro-electric systems may add steam stand-by plants, in some cases to care for low water flows, in others to avoid interruptions to service.

From a military point of view, hydro-electric plants are vulnerable while long distance transmission lines are subject to interruptions. These considerations further emphasize the necessity of steam stand-by service in the communities served. Also transmission lines should be located so that these can be easily patrolled in case of war.

The latest available figures for this country indicate that 26 per cent of the kilowatt-hours output of the public utilities came from hydro plants though the installed capacity was 28 per cent of the total of hydro and steam capacity in all.

What about further hydro-electric development? Canada possesses many large undeveloped sites ranging from Labrador to the Pacific Coast which can be developed as needs arise in the future. By means of remedial works in the rapids above Niagara Falls, additional water can be diverted for power development on both sides at a central point where it can be of maximum value. Additional sites are available on the Colorado river above Boulder Dam. Other developments are possible in many other parts of the country.

The development of the International Section of the St. Lawrence river has been retarded by political considerations concerned with the proposed deep waterways through the Great Lakes. There is much confusion regarding the cost of this large project. In 1925 the Hydro-Electric Power Commission of Ontario published a report of their studies of this development. One proposal was for a single dam to give 75 ft. head which would permit the development of 1,113,000 kw. at a total cost of $141,700,000, or $127 per kilowatt. Provision for deep waterway navigation would cost $68,150,000 additional. With 75 per cent load factor the Commission estimated that this power could be delivered at the end of a transmission line 300 miles long and stepped down to 12,000 volts at a cost between one-half and two-thirds cents. This project awaits international agreement before development is undertaken.

One can safely predict that additional hydro-electric capacity will be developed as rapidly as political and economic considerations warrant.

Steam Generated Power

Great central stations have been built and others will be planned. But one must consider factors which may influence their size. Difficulties arise where too many large feeders must radiate from a single plant. A large station makes an excellent target for aircraft attack. A number of smaller stations feeding into various portions of the distribution system would make the system less liable to complete outage. The large station emits enormous volumes of flue gases into the surrounding atmosphere, the dispersion of which raises problems. A number of smaller stations emitting the same total gas volume at widely scattered points would lead to more satisfactory dissipation. Finally, the practice of unit construction of one boiler-one turbine permits the design of smaller plants with efficiencies practically equal to the super-power plant. A trend towards more scattered stations of moderate size may be considered a future possibility.

There is a distinct tendency towards the employment of high pressures and high temperatures in new plants. Many will operate at 850 p.s.i. and 900 deg. F. at the throttle, while an increasing proportion of new units will employ 1,250 p.s.i. and temperatures up to 950 deg. F. Superposed units in general are built for the higher pressures and temperatures. Temperatures in these ranges are closely controlled by desuperheaters, by-pass dampers, etc. Advances to still higher pressures appear to depend on the production by our metallurgists of metals capable of standing even higher temperatures. There is considerable basis for the expectation that such metals suitable for 1,200 deg. F. may soon be at hand in which case initial pressures of 2,000 to

2,500 p.s.i. may be employed on the regenerative cycle without excessive moisture at the exhaust.

This advance in pressure will not be made without some extensive changes in plant equipment. The increased density of the saturated steam may necessitate the more rapid development of forced circulation boilers. Already one such boiler for 2,000 p.s.i., 960 deg. F. with reheater is under construction. The problems arising from circulation in boilers are receiving much attention and boilers are being modified to secure more positive flows in steam generating tubes.

A marked trend in recent years is towards the employment of bent-tube steam generators with definite circulation paths from and to the drums. These appear to have overcome the recirculation difficulties experienced in certain earlier straight tube types.

The tremendous influence on boiler design of radiant heat as a means of effective heat transfer is now recognized in the design of practically all boilers. This means of heat transfer has not been fully exploited, even though one manufacturer is now offering a "radiant type." Some future design may provide still higher furnaces than at present or use two stage furnaces, both of which will be designed almost wholly for radiant heat transfer to the steam generating tubes forming the solid furnace walls.

While stokers continue to be added in the older stations and where special fuels are used, practically all new coal-fired plants burn pulverized coal. Furnaces with powdered coal may have wet or dry bottoms, depending upon the fusibility of the ash and the nature of the load. Low fusing ashes such as are found in midwestern coals, and high continuous loads favour the wet bottom. Eastern high fusing ash and loads requiring frequent shutdowns as on stand-by or peak load service, lead to the use of dry bottom furnaces. Due to low grindability of western and northern lignites, the spreader type stoker may be employed for their combustion.

The nature of the ash in available fuels has a great influence on steam generator design. The fusible ash particles formed during combustion must be cooled and solidified before coming in contact with boiler or superheater surfaces or the deposit on such tubes will plug up gas passages and require hand labour for lancing while in service. To avoid such deposits, furnaces may be made larger with lower average rates of heat release to insure proper gas temperature at exit and tubes of both boiler and superheater may be spaced wider apart, even at the expense of greater total superheater tube surface.

It will be evident from the preceding paragraphs that steam generator designs are still being modified. No standardization is in sight and further changes are forthcoming.

A most important consideration in operation is the assurance of clean steam. Methods of centrifuging and washing the outgoing steam have been tried and notable advances have been made. Studies of boiler water conditioning to avoid scale and corrosion have led to marked improvements in operation. Much still remains to be learned about the action of water in high pressure boilers. Silica in feed water has been difficult to remove. Our chemists will eventually develop satisfactory boiler water.

Steam generators have been built for outputs up to 1,000,000 lb. per hour. There appears to be no obstacle to the construction of larger boilers with welded parts. Troubles with rolled joints at high pressures may lead to the welding of all boiler tubes. Long water wall tubes and most of the piping connected to the steam generator are now welded. Steam lines to turbines are now generally welded throughout.

The trend in steam turbine development is towards the use of units operating at 3,600 r.p.m. They are of less weight and, with smaller physical dimensions, are less affected by temperature changes than 1,800 r.p.m. units. These condensing units are more economical than 1,800 r.p.m. turbines in sizes below 50,000 kw. There is little thermal advantage in the 3,600 r.p.m. units in condensing turbines above 50,000 kw. capacity but larger units have been purchased for other reasons. Earlier difficulties with high pressure blading appear to be overcome.

Generators above 25,000 kw. are now generally cooled with hydrogen. Large two pole generators at 3,600 r.p.m. are subject to 120 cycle vibration. This has been overcome by mounting the stator core on supporting devices, which prevent the vibration being carried to the foundation.

Rearrangements of the tube layout have improved condenser performance and still further changes can be made. Tubes rolled at both ends with some flexible member to care for differential expansion are now generally employed. More attention will be given to tube materials and to tube supports which prevent vibration, in order to secure longer life and lower maintenance charges.

It is becoming general practice in coal-burning plants to install some form of dust catcher in the flue gas ducts. Cottrell precipitators, cyclones and washers are in use for this purpose. Clean flue gases will be required from most new plants in the future.

Improved operating efficiency and increased heat drop have decreased the B.t.u. per k.w.h. which results in decreased coal consumption. However, increased coal prices may offset this reduction in cost. As a result, production costs may change only slightly.

The mercury-steam stations now in service continue to operate satisfactorily and improvements have been made in the design of the mercury boilers. The additional cost of this equipment and the narrowing margin of gain in thermal performance over high pressure steam plants tend to restrict the increasing use of this efficient system.

Internal Combustion Engines

Many Diesel engines have been built during the past few years. The vast majority of these have been used in automotive equipment such as tractors, railroad locomotives, trucks and contractors' equipment and in marine installations. A considerable number have been installed in industrial plants. While many have been built for public utility service in municipal and other plants, the aggregate output in kilowatts is only a small fraction of the nation's generating capacity.

The Diesel engines will continue to be used in small plants and for automotive service. They will probably never be a large factor in public utility service because they have not been built in large sizes and, if built, their economy would not differ greatly from that of large steam stations.

The gas turbine is attracting attention and several have been installed in oil refineries operating on the Houdry process. Its efficiency is dependent upon initial gas temperatures which are now limited to about 1,000 deg. F. Under such conditions, it is not a competitor from a thermal standpoint with Diesel engines or condensing turbines. However, when metals are available for higher temperatures and gas turbines are built in such sizes as to warrant the use of several heat recovery auxiliaries, it may find a place in sections where cheap oil and gas are available and particularly where water is scarce, as no condensing water is needed. It may also be used on locomotives.

The Future

Predictions of future developments are dangerous as they are usually wrong. However, the continued increase of output of our utilities indicates that loads have not ceased growing and that greater total plant capacities must be provided in future years. Larger and more economical steam generators and turbines will be utilized and improved forms of equipment provided. Power plant development in the future will require the best skill and equipment this country can offer, for progress must not cease.

SCIENCE AND ART IN ENGINEERING

J. K. FINCH
Professor at Columbia University, New York City, U.S.A.

Address delivered at the American Institute of Consulting Engineers, New York, March 5th, 1941, and printed in the publications of the Engineers Council for Professional Development.

(ABRIDGED)

There are countless cross-currents in the stream of life and often there seems to be no pattern, or distinguishable direction, in the trends of civilization. This difficulty is frankly announced by modern youth who remark we don't know where we're going but we're on our way.

Yet this viewpoint will not deter the engineer from attempting to appraise the present and forecast the future. His method is that of extrapolation, which is based on the observation that the pathways of the present lead out of the past, and the best guide to the future can be secured by extending their alignment. There has been a great change in our profession—a change which has had a momentous effect both on engineering, and through engineering, on modern life, namely, the advent of the modern scientific technique in engineering which has transformed an ancient art into a modern science. These remarks will be confined to one branch of engineering, civil engineering, but apply also, with more or less force, to other engineering fields.

It may be said that for forty-nine of the fifty centuries of recorded history, engineering was practised as an art. Then, beginning in the early years of the eighteenth century, but reaching its first marked development less than a century ago, much of the detail of this ancient art was found to be based on mathematical and mechanical principles, and much of its technique was rapidly "reduced to a science." It is desirable, if only by way of contrast, to recall certain fundamental professional practises in the days before this advent of an unwelcomed new baby.

The practice of an art, we are told, depends upon an intuitive genius for that art, a feeling and a judgment, in the case of civil engineering, primarily for structure, ripened through apprenticeship to a master and matured through experience. The young man of today sees little of this element in engineering, but all of us can recall this quality in many of our earlier masters and in many of our associates whose engineering judgment we now value. The uncanny skill in design which the outstanding engineers of the past possessed, although clearly qualitative in character, was almost quantitative in its results. Recall, for example, Perronet's Pont de la Concorde at Paris, which could be little improved in its effective and economical use of material through the application of even the most advanced modern analysis. Or the Gothic cathedral, masterpiece of construction, which will probably remain man's greatest achievement in stone, for the age of stone masonry is past. These, and countless other examples from the Roman aqueduct to the truss bridge, attest the accomplishment of engineering as an art.

How then has this intruding science found a welcome in the engineering nest? The basic force has been purely economic. Listen to the words of Wellington writing about 1880:

"It is beyond doubt that the true reason for the striking progress in bridge-building in recent years has been, not that men have been driven to excellence by the 'responsibility for human life' resting on them . . . The impelling force has been the keen competitive struggle to bring the first cost of every bridge as low as possible, and yet do nothing which shall injure its permanent efficiency and compel it to be speedily rebuilt."

This is exactly what science in engineering permits the bridge designer to do.

Clearly, when we are able, through the use of applied mechanics and a knowledge of the strength of materials, to proportion each part of a structure or machine to the load which it actually carries, we can secure material savings over a design which is purely the product of judgment and experience. Also, depending upon this technique, we may plan and erect structures of a magnitude which an earlier generation would have classed as visionary.

One of the first consequences of this revolutionary change in technique was the establishment of engineering schools. When engineering was an art, education for its practice was through apprenticeship. With much of the basic technology of engineering rationalized and scientific, much of this training could be transferred to the formal teaching of the classroom, for such transfer resulted in economy of time and in increased efficiency of instruction. In our own country there were but two schools of engineering before 1850, whereas, following the introduction of such books as Rankine's Applied Mechanics and his Steam Engine, there was a tremendous jump, and, by 1870, a total of seventy such schools were active. The engineering school was thus born of this revolution in engineering.

Just recall, for a moment, the reception of the young graduate of such a school when he attempted to secure a position after graduation. He was received by the so-called practical engineer with about the same smile that spreads over the face of a cannibal chief as he observes the landing of a missionary on his desert isle. Yet, today, these same practising engineers practically insist that graduation from an engineering school is a first essential to admission to a professional engineering society and to professional registration. The young engineering graduate had something that was worth dollars and cents.

But the urge of economy only furnishes the impetus to activity in reducing engineering to a science; the fuller meaning of this movement lies deeper. Standardization has also been a factor in modern development, the standardization not only of structural and machine elements, structural shapes, screws and threads, reinforcing bars and pipes, and to a very considerable extent of structures and machines, together with the even more important standardization of method, in which science has been an essential.

A century ago the practise of engineering was limited to those who possessed a native gift and genius for the art and had achieved a skill and reputation through practice. Such men were few in number. It is inconceivable, with engineering merely an art, that a handful of gifted men could meet the engineering needs of a modern world. The reduction of the technique of engineering to a science has made possible a widespread extension of engineering all over the globe by putting much of the labour of engineering planning and design in the hands of men of more ordinary intelligence. Once the type of a modern structure, its general features and principles of design have been established, patience and skill, but no especially gifted genius, are required to elaborate its details.

In his biography of Richelieu, Hilaire Belloc observes that, while "the conquests of physical science have been due to the minute and extensive observation conducted by vast numbers of men, and therefore, for the most part, by the unintelligent, . . . this, for the most part unintelligent, mass of observation called 'Modern Science' has led to astounding results."

Mr. Belloc does not deny that there have been great men in science—men who had the breadth of vision to draw from this mass of observation the great generalizations of science. Neither does he attempt to belittle science; it "has led to astounding results." Why? Because it is possible through the methods of science to utilize the labours of the relatively unintelligent in advancing scientific knowledge.

It is interesting, at this point, to consider for a moment influences which have made European rather than American engineers the leaders in the development of the scientific approach in engineering design. The answer, it would seem, is to be found in the fact that, abroad, skilled labour is generally plentiful and cheap. The emphasis is on economy of material rather than, as it has been here, on economy of production. Clearly a more exact technique of design leads to economy of material. On the other hand the situation in America has been changing. Whereas in the past simplicity and ease of construction was a criterion, continuous bridges, the statically indeterminate structure, rare twenty years ago, have become commonplace. Why? Because the former saving, which rested on the use of unskilled labour, is no longer such a determining element in many lines of construction. The ultimate economy of a saving in material—the result of more exact design—begins to make itself felt. There is thus every reason to expect that the movement for more science in engineering will continue to grow and expand.

And how does this affect the practise and prospects of our profession, especially the position of the consulting engineer?

To put it bluntly, the great bulk of engineering practise today is carried on by organized groups of employees—federal, state and municipal departments on the one hand, or the highly organized functional divisions of the industrial engineering offices on the other. The consulting engineer is now called upon only for the great and the difficult—the unusual job that is uneconomical for the routine office staff to handle.

The consulting engineer is thus the modern representative of the *art* of engineering. He is pre-eminently the master of those problems in practice which are not solved in books. He is a court of last resort for the solution of problems which have not, as yet, been fully rationalized. He is the custodian of the one unchanging thing in our profession—those basic principles which make it a profession rather than a simple technology. Technique may change but these principles remain. If, which God forbid, engineering is ever reduced completely to a science, it will no longer be a profession but a dull form of scientific accounting—and there will be no consulting engineers.

But the consulting engineer is also a leader in the movement for rationalization which is perpetually working him out of a job.

There is one activity in modern life that furnishes a parallel to this situation. Fortunately this is an activity of which I actually know something. Not being a consulting engineer, it would otherwise be presumptuous on my part to offer advice to the American Institute of Consulting Engineers.

In short, I am a professor and am responsible in part for the administration and policies of a type of engineering school, which seems to face problems closely parallel to those of the consulting engineer, namely, the privately endowed engineering school.

The independent, privately endowed engineering school of the present day is outnumbered, say, ten to one, by state-supported institutions; furthermore, if the struggle is for numbers, or for great and costly equipment, the public tax list is far more potent than the private pocketbook. If it is a matter of dollars and cents, free tuition at public expense is far more attractive than the prospect of $400 per year in a private school. While not wishing to cast any aspersions on the tax-supported schools, among which are some of the foremost schools of our country, it is evident that the privately endowed engineering school can stay in business only when it does a better job than the tax-supported institution, and this is exactly the reason why the consulting engineer is still in business.

Now there are certain basic reasons why, not always but in general, the private school can do a better job.

It can hire and, within reasonable limits, it can fire its staff. Political preference need never determine the quality of its faculty.

It can select its students and it can reject the laggards without fear or favour—*provided* it has sufficient endowment so that fees do not constitute its full measure of income. No uncle on the legislature can keep the lazy and incompetent in its classes.

The independent consulting engineer has similar freedom in the choice of personnel.

The privately endowed school can never cease to struggle for leadership. It must keep ahead of the procession. It must be progressive in its educational ideas. It must look ahead, endeavour to anticipate future demands—and so must be consulting engineer. It has not been by accident that many of the newer ideas of modern technique—soil mechanics, for example—originated in private engineering schools.

One of the most vital elements in stimulating engineering education is research—the determined and orderly search for new knowledge and new methods. It is surprising how many important contributions to modern practice have been the results of college research. Truly productive research adds greatly to the respect in which our profession holds any engineering school. A recognition on the part of a school of the kind and type of research it can profitably undertake is fundamental—it must base its programme on its interests, on its facilities of staff and equipment and on its contacts.

It is also true that some schools undertake such research as a thing separate from their main business which is education. A consulting office would not advise or follow this plan even if it could afford to do so. Your research is directly related to the improvement of your business—of your technical methods and practise. Similarly, the chief object of college research must be the improvement of its business, the enrichment and stimulation of education. Accordingly, we have, in the school I serve, no horizontal division between research and teaching. The man who guides research also inspires the undergraduate to take part in the great adventure—to do some independent, productive thinking.

From all of which, I take it, you will agree with me that the basic element in our progress—in our ability to maintain our positions—the privately endowed educational institution and the independent consulting office—lies primarily in the maintenance of a free and dynamic leadership. We must be willing to venture into new fields and seek new forms in which to pioneer in the progress of our profession.

Engineering is not merely an instrumentality of western civilization whereby man endeavours to meet his material needs and wants and to make himself increasingly master of his environment; it is a habit of mind, a conviction, and a viewpoint, holding much greater potentialities. A habit of mind which recognizes that there is a rational way of doing things as opposed to the emotional, unreasoning, biased, partisan approach; that seeks to discover and perfect this honest path of science and reason, and a conviction that mankind can apply this method with profit, not only in one field but in the solution of a much wider variety of life's problems.

What opportunities there are in this picture for the continued advance of our profession—for pioneering and leadership by those who guide its destinies—the consulting engineers and our engineering schools.

THE YOUNG ENGINEER IN TO-MORROW'S DEMOCRACY

H. F. BENNETT, M.E.I.C.
District Engineer, Department of Public Works of Canada, London, Ont.

Address delivered by the Chairman of the Committee on the Training and Welfare of the Young Engineer, at the Annual Meeting of The Engineering Institute of Canada, at Hamilton, Ont., on February 6th, 1941.

Canada is facing a great national emergency. The capacity of our engineering skill will be taxed to its limits. Our national effort can go that far and no farther. The engineers of Canada must carry the load on their shoulders if the materials of war are to be produced, and if those materials are to be better than the products of our enemies.

The president of the Junior Institution of Engineers of Great Britain had this to say in his recent presidential address—

"The watchwords for engineers to-day are these—elasticity of thought, adaptability of mind, readiness to alter preconceived ideas when necessary, and willingness to improvise with new methods, new tools and strange materials. There will not always be a war. When victory is achieved we shall not be able to sit back and pause. A heavy weight of responsibility will sit on the shoulders of the engineer, for though the planning of reconstruction may be in other hands, the methods and actual work of restoring a stricken world will fall largely to the scientist and the engineer.

"To-day we must leave the engineer carrying on the vital task of designing, building and operating the immensely complicated machine which we call mechanized war. On the success of that machine depends our very existence, and the happiness of the world in the coming years. When victory is accomplished we shall still look to the engineer to take his part in establishing and reconstructing the future of the world."

Wishful thinking will not win battles. There is no group, no social organization, no profession, if you will, that looks facts squarely in the face as do engineers. It is from these facts that we make our deductions, we draw our conclusions, and we plan for the future. A great task faces us. The question is, could we have been better prepared ?

We cannot turn back the pages of life, but we can face the facts of the past and plan the future of our profession so that it will more adequately meet the demands which must lie ahead.

It is mainly for these reasons that your Committee on the Training and Welfare of the Young Engineer has continued its studies. It is in a time of great stress that we can best determine our failures.

Some may ask—what is a profession, and why an engineering profession ? Dr. Wickenden, the distinguished educationist who is with us at this meeting, has given us his views on this subject. He separates professional characteristics into those of individuals and of groups.

The individual attributes must be:—

"1. A type of activity on a high intellectual plane.

"2. A motive of service.

"3. A motive of self-expression.

"4. A conscious recognition of social duty by sharing advances in knowledge, by guarding standards and ideals, by rendering gratuitous public service."

In the attributes of group professional life, he includes:—

"1. A body of knowledge (science) and art (skill).

"2. An educational process.

"3. A standard of qualifications for admission.

"4. A standard of conduct.

"5. A recognition of status, and

"6. An organization of the professional group."

These ideals are the standards to which we, individually and collectively, must aspire. It is to such ideals that your Committee must turn as we study the training and welfare of the young engineer.

I shall first treat the subject as a normal evolution without considering the emergent war condition. There are two groups of Canadian citizens who are responsible for the training of future engineers—the educationists and the engineering profession itself. Both are represented on your Committee, and in our future proposals it will be advisable to consult both groups.

Our activities have in view the development of a professional consciousness and a true professional spirit. Where should this development begin, how can it be fostered, and what should be the results ?

The engineers of the future come from our public and secondary schools. It cannot be expected that every young man, on entering high school, will know his vocation. During that period of indecision, he should have some source from which to obtain definite and authoritative information.

It should be the objective of The Engineering Institute to provide such a source. In collaboration with provincial and local educational authorities, a system can be worked out to furnish reliable advice to those who are contemplating an engineering career.

The actual methods of approach can be left to the individuals or Institute Branches, but everywhere there must be uniformity of information, careful preparation of detail, and sincerity of purpose. Advice must deal with opportunities of employment, trends in engineering occupation, the extent and value of available courses, and the need for adequate preparation to meet the responsibilities of citizenship.

We believe that essential aid to the standing of our profession can be given by such wise counselling of prospective engineering students.

Then we follow the student into his university course. What should he find of value there; how should he be directed; can his cultural and technical training be well balanced when he completes his course; will he be worthy of assistance in his further training, and has he the outlook on things cultural and things material, which will make him a credit to his profession and a worth while citizen.

Members of this Institute have pointed out that the training of an engineer should be of a general character, and that attention to cultural and economic subjects is necessary to equip him for the present day requirements of his profession.

Although the engineers of this continent have endorsed these basic principles, the advances of science crowd new technical courses into the limited time available, and it would seem that the training in the humanities must wait.

It is stated that few graduate engineers fail through lack of technical training. Failures are due to lack of personality, of ambition, of willingness to co-operate, of initiative, and so on. It is evident, therefore, that our engineering educators are keeping abreast of scientific advances and industrial and construction demands, but more care must be exercised in the selection of students who have the qualities grouped under the term "personality."

The recent report of the Committee of the Society for the Promotion of Engineering Education on the "Aims and Scope of Engineering Curricula" says:—

"Broadening of the base of engineering education, now in process, should be continued. Its roots should extend more deeply into the social sciences and humanities as well as into the physical sciences in order to sustain a rounded educational growth which will continue into professional life."

Copies of this report have been studied by the members of your Committee, in order that we may be acquainted with the trend of thought in the United States on this most important subject.

The report tabulates the results to be expected from broadening engineering curricula, with emphasis on:—

(a) Mastery of fundamental scientific principles.

(b) Understanding of the engineering method.

(c) Ability to select the significant results of an engineer-study and to present them clearly and concisely by verbal and graphic means.

(d) The stimulation of a continuing interest in further professional development.

In fact, in the studies which are new in the engineering curricula, he will be led to an "understanding of the evolution of the social organization and of the influence of science and engineering on its development."

All this means a revision of present day curricula; higher efficiency in the use of the limited time available; abandonment of some specialization courses; greater concentration upon the mastery of fundamentals, and the cultivation of intellectual powers required in the more advanced use of the engineering method. The student would then be prepared for subsequent professional development.

Keep in mind, however, that while all these new concepts are vital and their importance must be adequately recognized, engineering science and method are still of dominant interest in the curriculum.

Among the conclusions reached in the report are:—

"The present flexible arrangement of four-year undergraduate curricula, followed by postgraduate work, will better meet the needs served by engineering education than will longer undergraduate curricula of uniformly prescribed duration.

"Advanced training for the higher technical levels of engineering should be included in the general programme of engineering education, but should not become its domnant aim.

"Undergraduate curricula should be made broader and more fundamental through increased emphasis on basic sciences and humanistic and social studies. This will require greater efficiency in the use of the student's time to be gained by pruning to the essentials of a sound educational programme.

"There are advantages in the parallel development of the scientific-technological and the humanistic-social sequences of engineering curricula. The present integrated type of programme extending throughout the entire undergraduate period should therefore be preserved.

"No measures taken with respect to engineering education should limit the freedom that now exists for experimentation and change."

This report is recommended for careful study by all interested in engineering education.

The question now arises whether these young men coming from our colleges, filled with technical knowledge, inspired by the guidance they have already had, are to be left to their own devices as they tread the devious paths which we all know so well.

Here we reach a field in which we, as members of the Engineering Institute, have missed many opportunities. We have allowed these young men, some 600 or 700 each year, to step out into the world of action with too little recognition. These men need the loyal co-operation of their seniors.

Many industries have developed means of selecting and training students for post-graduation employment in the sales, administrative or technical branches of those industries. But, unfortunately, this only provides for a small percentage of the young graduates. The others, in many cases, find themselves without guidance as to the best means of continuing their studies, and if initiative is lacking, little or no further progress is made.

The industries to which I have referred, teach these young people how to develop their characteristic talents and how to go about their job. In this connection, your Committee has made several suggestions and we shall probably continue to do so as certain practices come to our attention. We have already recommended that:—

1. Each Branch should organize junior sections or committees;
2. Contacts should be made and should be continued with university students and faculties;
3. Study groups for the purpose of self-development should be organized and encouraged;
4. Junior and Student members should be given a larger part in Branch activities and the encouragement of the senior members.

The war emergency has brought home to us, to the people of Canada, and to the responsible authorities, the need for more technically trained men. To-day our Army requires that our junior engineer officers must have the educational standards necessary for admission to the Engineering Institute. Further, young officers are given special intensive training to fit them for the many technical branches of the armed forces.

It is not expected, therefore, that our engineering schools can provide a training sufficiently diversified to cover all these fields. Why, then, should it be expected that the engineering schools of this country can provide the diversity of training necessary for the many branches of governmental technical services in peace time?

With this in mind, we shall advocate the recruiting of all such governmental technical services from selected university engineering graduates. They should be embodied in a training group under combined departmental and civil service supervision, with a training period so planned as to develop individual characteristics and permit of the separation of the group into the departments and services for which their talents are best fitted.

It may be argued that this will take time and expense which cannot be considered as economically sound. If industries can do this, why cannot the greater industries of government do the same? If the Army, Navy and Air Force can do it, with definite results, without which they could not function, why should not our peace-time services do likewise, with a consequent increase in efficiency? The better training given to the technical branches of these services, the more economically they will be operated and the more valuable they will be to the social structure.

There are other matters which can be discussed under the "welfare of the young engineer," but we cannot attack all the problems at once. We should like to promote the extension of educational facilities to those whose finances are not sufficient for the cost involved. We intend, however, to postpone more concrete proposals until a fair start has been made along the avenues already opened.

No programme of development for young engineers can be successful without their own co-operation. These young men must not think that their student days are over when they leave college. They must be urged to become associated with an active engineering organization and to be inspired with the professional spirit.

The four years at college are only the beginning for an engineering career; as one leading member of our profession has said—"there will be plenty of time for further study between the hours of 5 and 12 and between the ages of 21 and 70."

We have been pleased to learn that the work of this Committee has engendered discussion in many places. This alone will be of some value. Let us continually keep in mind the future of our profession. It has been worth while to us, let us make it more worth while for our successors.

DISCUSSION ON CONSTRUCTION OF THE HYDRO-ELECTRIC DEVELOPMENT AT LA TUQUE

Paper by J. A. McCrory, M.E.I.C.,[1] published in *The Engineering Journal*, February, 1941.

Irving B. Crosby, affil.e.i.c.[2]

Mr. McCrory has given an excellent description of the engineering problems of an interesting development. This writer will outline the geological situation which made possible the dam and which caused some of the problems.

The streams of this region are deeply incised in the Laurentian Plateau, the St. Maurice Valley at this point being some 800 ft. deep. The region was heavily glaciated, the north-south valleys were widened and straightened by the removal of spurs, and when the ice melted, the valleys were partially filled with debris, sand and clay, washed from the ice. This filling was so deep that pre-glacial divides were sometimes buried. The reborn streams took their courses over the surface of the glacial deposits without regard to the topography of the buried bed rock. They often passed from one pre-glacial drainage system to another and as they entrenched their channels in the sand and clay they frequently cut down upon buried rock ridges and spurs. Such was the case at La Tuque.

At the close of the glacial period the St. Maurice Valley was filled with glacial deposits up to the level of the plain upon which the town of La Tuque stands. (Fig. 15.) The two granite knobs projected from this plain. The river happened to flow to the west of these knobs and it eroded the sand rapidly and soon became entrenched on rock between the northern knob and the mountains to the west. Erosion upstream from this point was checked by the sill of bed rock but downstream it cut 100 ft. deeper in the sand and produced the La Tuque falls. The depth to bed rock in the centre of the main valley has been determined by electrical prospecting as approximately 500 ft., indicating that the St. Maurice Valley is filled with some 500 ft. of glacial deposits. The pre-glacial depth of the valley was therefore twice the present depth. If the reborn post-glacial river had flowed east of the knobs instead of west of them, it would have cut down rapidly through the sand, produced a graded channel without falls, and there would have been no easy opportunity for power development.

Fig. 15—Aerial view of La Tuque dam showing the two granite knobs and the sand-floored valley to the east (right) under which the pre-glacial valley is buried.

The dam blocks the river gorge in the saddle between the granite knobs and the mountains to the west, and the main valley is blocked by the sand plain upon which the Brown Corporation mill and the town of La Tuque stand. This plain forms a natural dam of sand with a minimum width of over 2,000 ft. A study was made of seepage through this natural sand dam, both under present conditions and when the river is raised, and it was concluded that seepage is and will remain harmless. Two observation wells have been provided in order that any rise of ground water level may be detected.

The bed rock at the dam site is largely gneiss with intrusions of granite, but the knob at the east end of the dam is principally granite. Under the west bulkhead and sluice sections of the dam the foliation of the gneiss strikes north 29 deg. west and makes an angle of 40 deg. with the axis of the dam. The rock is in beds from one to several feet thick which diagonally dip upstream at an angle of approximately 30 deg. from the horizontal, thus producing a corrugated surface on the rock. In preparing the foundations, weathered beds were stripped off leaving a corrugated surface of fresh rock which provided an excellent footing for the dam. In order to slide, it would be necessary to push the dam up these inclined surfaces or else shear the granite gneiss across the grain, both of which would be impossible.

In the west end of the intake section of the dam are three parallel faults, mentioned by Mr. McCrory. One of these showed on the surface as a small gorge 10 ft. deep, but 20 ft. deeper it and the other faults were merely cracks, half an inch wide, tightly filled with rubbery clay gouge. These faults did not cause any problems or difficulties. They are all very old and there is no evidence of geologically recent movement.

The fault zone at the east end of the dam has been described by Mr. McCrory. When the writer made a preliminary investigation of the dam site for the Brown Corporation in 1928 he recognized on physiographic evidence the probability of a fault along the western base of the two granite knobs. (Lefthand base in Fig. 15). There was no subsurface information available at the time, but he reported that a fault with a great thickness of broken rock must be expected at the eastern end of the dam site. Subsequent excavation has proved that there is a fault zone about 200 ft. wide along the east side of the gorge. This fault zone extends up and down the river, probably for miles, and there is no place at La Tuque falls where a dam could be built without crossing this fault. The problem was, therefore, to meet the unfavourable geological situation by engineering measures, which has been done successfully.

The fault zone is formed by two nearly parallel fault planes which form the foot wall and the hanging wall. Between these are secondary faults and numerous fractures which cut the rock into irregular blocks. The fractures have permitted the circulation of ground water which has attacked the different beds of the gneiss to varying degrees. Some beds were badly disintegrated while others were sound, though fractured. Excavation was carried down along the foot wall to a bed of gneiss which was sound and undecomposed, though fractured. This rock was consolidated by shallow grouting. To insure against seepage through the underlying fractured rock, a cut-off wall was carried down along the foot wall 50 ft. deeper to a level about 70 ft. lower than the river bed. To control possible seepage under this end of the dam, closely spaced deep holes were grouted under high pressure. Provision has been made for additional grouting, if needed, from the inspection tunnel, as has been described by Mr. McCrory.

The possibility of unequal settlement of the east bulkhead section and the provisions to allow this to take place harmlessly were described by Mr. McCrory. The seals used in the vertical construction joints were adapted from those

[1]Vice-President and Chief Engineer, Shawinigan Engineering Company, Montreal, Que.

[2]Consulting Geologist, Boston, Mass., U.S.A.

used at Conchas Dam, New Mexico, where the danger of settlement was much greater.[3]

This development is a good example of the proper relations of geologists and engineers. The geologist interpreted the subsurface conditions and pointed out their practical importance, and the engineers designed the dam to meet these conditions. The geologist visited the site at frequent intervals during the construction period and discussed details, as they were disclosed, with the engineers. It was known in advance that certain unfavourable conditions existed at the La Tuque dam site, but by means of adequate investigation and competent engineering these conditions have been overcome and a safe and satisfactory dam has been constructed.

H. R. Sills, m.e.i.c.[4]

To one whose contact with large power developments was made in the late twenties, the speed with which the physical structures at La Tuque materialized was truly amazing. The writer had the privilege of spending a little time there last June, again in September during the hectic days of starting up, and yet again this January in the final mopping up. Mr. McCrory has mentioned that the assembly of the generators began in February after the power house was closed, except for the penstocks, and at the breech of one of these the rotor of the first generator was being assembled. To quote Robert Service, "Talk of your cold, through the parka's fold it stabbed like a driven nail." This assembly is rather finicky work, and the excellent job the field men did under this condition is much to their credit.

The generators have already been described in the technical press (*Electrical News*, June 15, 1940), but it may be of interest to outline some observations made during their tests and early operation. In general the performance was close to that predicted; the excitation characteristics came within three per cent, the reactance within five per cent; and the efficiencies were about 0.3 per cent higher than the guarantees. Even though the generators were equipped with a pole face winding the distribution of the stator winding and skewing of the slots was effective in producing a voltage wave with the remarkably low telephone influence factor of 1.5.

Mechanically, the units were sweet running machines; when enclosed for air recirculation they were very quiet, even at maximum over speed. The balance of the rotors as assembled was perfect; no field balancing was necessary. In view of the extent of housing enclosing these machines we were fortunate in avoiding vibration or drumming in them. Instantaneous short circuits at normal voltage and above, both three-phase and single-phase, were applied to secure the transient reactance characteristics and the inspection afterwards showed everything in perfect condition.

It is pleasant to catalogue these virtues but hardly interesting or informative. They do, however, form a necessary background for the following comments on ventilation which, at first, was by no means perfect, although the machines were able to carry load from the beginning. The Shawinigan Engineering Company had consented to the otherwise duplicate machines being built with slightly different types of ventilating arrangements in each so that it would be possible to compare the effectiveness of several innovations which were being tried, and so get a direct comparison. The main difference was in the type of wedge used to hold the stator coils in their slots. The shape of these wedges can materially affect the flow of air out through the ducts in the stator core forming, as they do, the entrance to these ducts. It has been standard practice to make the wedges flush with the surface of the teeth and notch them back at the ducts so as to enlarge their orifice. Previously a wedge had been used that was serrated in the direction of rotation at the ducts. This gave very good characteristics on machines having relatively high angular velocities but with machines of large diameters and relatively low angular velocities the air did not distribute evenly. It was discovered that this flow could be equalized by projecting the wedge out beyond the teeth or by recessing it below the face of the teeth, but there were no performance data in large machines. So one machine was furnished with recessed wedges and the others with projecting wedges of two different types. It was found that the projecting type wedge exhausted considerably more air than the recessed wedge but both exhibited a duct pressure distribution entirely different from any previously had. The pressure in the ducts nearest to the intake side of the rotor had the highest pressures and this tapered off toward the opposite end. Past experience had suggested the opposite, that is, low pressure at the intake side and high pressure at the other end. The rotor had been baffled to prevent recirculation of air blowing off the fans as previous experience showed that fans at the end of the poles would generate a pressure higher than that of the intake air and this air would tend to recirculate. However, with the new type wedges there was a suction at the end of the poles that would take all the air the fans could supply. At the opposite end, air was being sucked in from outside of the stator to supply the ducts at this end. Hence the air at this end was recirculating from the hot outside air and this had to be stopped. Eventually this was done by removing all the recirculation baffles for the rotor and opening up the rotor spider arms to feed the other end of the core through the rotor spider arms. These experiences were most valuable. The new type wedging is most effective; the tangential velocity of these rotors is 9,000 ft. per minute; manometer readings 1 in. back from air gap show pressures of 3.6 and 3.2 in. of water on opposite sides of the stator coil. This represents a 75 per cent conversion from tangential to radial velocities which is remarkably high, as much air is exhausted through these machines as in other machines of the same size and capacity running at 25 per cent higher speeds. This improvement in ventilation shows direct benefits in lower temperatures—the resistance temperature detector reading of this machine was 48 deg. rise compared to the guaranteed and designed value of 60 deg. rise. Low temperatures mean additional life to the winding and reserve capacity.

Thanks are due to the Shawinigan Engineering Company for their co-operation in assisting in this investigation. In large generator design, model tests are not often possible and developmental work must be done on the machines themselves. Such work may involve some adjustments after the machines are running and, at this stage, the co-operation of the purchaser in arranging clearances is invaluable. This assistance is often entirely altruistic, bringing no direct benefits, but the knowledge gained is of ultimate benefit to the industry as a whole, as it results in improved design and better and safer machines. The writer's company has found that when the object of a proposed development or investigation has been outlined to the utility engineers they have been most helpful. As an ardent believer in experimental research as a method of finding facts, the writer takes this opportunity to thank the utilities as a whole and the Shawinigan Engineering Company in particular for their willing co-operation. It is a policy which can be extended to the mutual benefit of the utilities and the manufacturer.

Prof. Robert W. Angus, hon. m.e.i.c.[5]

The writer has found the first part of Mr. McCrory's paper of considerable interest, dealing as it does with the method of finding the style and size of turbine that was used. Models which were made and tested, have enabled the author to find the best turbine to be used on the job, and he is to be commended for bringing to the attention of members of the Institute the amount of preliminary

[3]I. B. Crosby. Engineering Geology Problems at Conchas Dam, New Mexico. *Transactions*, American Society Civil Engineers, vol. 105, pp. 581-599, 1940.

[4]Assistant A.C. Engineer, Canadian General Electric Company, Peterborough, Ont.

[5]Professor of Mechanical Engineering, University of Toronto, Toronto, Ont.

work that should be done in advance of the actual selection of the turbine.

Unfortunately, the paper is not complete enough to enable a reader to get from the model tests the data from which the final decisions were made, nor can one get much technical information from the testing that was done. In Fig. 1 the curves all correspond to the same σ, but presumably the models were all tested at the same head, and if so they all had different specific speeds. Since the best value of σ is known to be connected with the specific speed, information on that point should be given in this connection.

A similar argument applies to the speed coefficient ϕ, and further information should be given in Section 3 at the top of Page 56.

The writer would ask about the method of obtaining the different values of σ in Fig. 2. Since the head used on the model has not been stated, it is difficult to discuss this point, but if one assumes the headwater level to remain constant, then variation in tailwater level may make quite large changes in the head, and therefore in the specific speeds on which σ depends. Would the author give further information on this point?

The statement is also made on Page 56 that the curves of Figs. 3 and 4 were calculated from the model tests by "the Moody step up formula and on information available on the performance of large units as compared with that on the small models on which they were based." The latter part of this statement nullifies the first part, for the figures are either based on Moody's formula or they are not. The writer asks data on the model and on the prototype so that the Moody formula may be checked for such turbines as were finally built from the model tests.

As the statements in the paper stand, they are not complete enough in the writer's opinion.

M. V. Sauer, m.e.i.c.[6]

The evidence of the co-operation between the author's company and the turbine manufacturers to determine the characteristics and performance of various types of runners is most praiseworthy. That they succeeded in producing a turbine of an improved type by such study and testing is sufficient warrant for the time and expense spent on such studies. It is to be hoped that actual performance tests on the installed units will be the subject of a further paper by the author.

There are many features of interest in the La Tuque development that have been brought out by the author but the writer will confine himself to only one or two.

In regard to pressure grouting of the rock foundations, there has always seemed to him an element of risk in the use of high pressures resulting in a possible shifting or raising of some of the rock layers and consequent further disturbance of the foundation. To determine if there was any such shifting on a recent job in the United States, measuring rods were grouted into the bottom of a series of holes and as grout was pumped into adjacent holes any shift of the surface rock could be detected by noting the lift of the surface rock as compared to the tops of the rods, thus eliminating any risk of further disturbance. It has been the writer's experience that a pressure only slightly in excess of the actual head above the bottom of the hole accomplished as much sealing of the rock seams as the higher dangerous pressures.

In regard to the construction of the upstream coffer dam, it would be of interest to know how much stress was imposed on the cables in pulling the cribs into place, also the depth and velocity of the water. It was found in a recent job with which the writer was connected, in which cribs of 20 ft. depth were placed in water flowing at a velocity of 14 ft. per sec., that the stress on the cables amounted to 50,000 lb.

In a later job in which the cribs were 35 ft. in depth and in which the velocity of the water was 12 to 14 ft. per sec., it was realized that the placing of timber cribs would be a very expensive operation, if indeed possible. In consequence, instead of using timber cribs, steel frames or open boxes were substituted and only sufficient rock placed in them to make them stable. In this manner all the frames were placed and being much more open than timber they allowed the water to pass through without building up a large head and producing scour on the bottom as the last cribs were placed. After the frames were thus placed it was a simple matter to dump rock in horizontal layers from trucks running back and forth until the dam was filled up.

[6]Hydraulic Engineer and General Supt., Generating Stations, Montreal Light, Heat & Power Cons., Montreal, Que.

The Author

The author appreciates the interest shown in his subject as evidenced by the discussions submitted. Mr. Crosby has described, in considerably more detail than was contained in the paper, the very interesting geology of the site and has mentioned some of the foundation problems which developed and which he assisted in solving.

Mr. Sills has in his discussion well illustrated the fact that a project of this kind is pre-eminently a co-operative effort to which a large number of engineers contribute and that advances in the art are brought about by this co-operation and by experimentation.

The following explanation will I think answer the questions raised in the discussion submitted by Prof. Angus:

1. The curves in Fig. 1 were drawn to show a direct comparison on a unit power base of four of the models tested. Different σ values might have been used for the different curves but it would not have materially altered either their shape or their values as is illustrated in Fig. 2. The specific speed of Model D-22 is 60 and that of D-30A is 66. The other two models have specific speeds slightly smaller than D-30A.

The values for the speed coefficient ϕ used in Fig. 1 are those determined by the series of tests run as giving the best efficiency for the various models.

2. The elevation of the Testing Plant forebay above centre line of turbine casing remains constant at 60 ft. The different values of σ are obtained by varying the level of the tailrace and the corresponding variation in the total head is taken into consideration in working up the test results. In the tests referred to in the paper the heads for different σ values, for average conditions, were approximately as follows:

σ..............	0.33	0.30	0.27	0.24	0.21	0.18
Head in ft.......	70.0	71.0	73.0	74.5	76.3	78.0

3. The statement on Page 56 with regard to the basis on which the curves in Figs. 3 and 4 are drawn is evidently not quite clear and probably should read that these curves were based on the Moody set-up formula modified by experience.

In the testing of large turbines it has been noted that while the point of maximum efficiency usually agrees fairly closely with that expected from the model tests stepped up in accordance with the Moody formula, some divergence exists for powers both below and above the peak, this part of the performance curve usually lying above the expectancy curve. The divergence in the case of the Rapide Blanc turbines, which are based on Model D-22, amounts to between four and five per cent above the stepped-up curve at the lower power outputs.

It is reasonable to assume that a similar runner installed at La Tuque would show a similar divergence from the stepped-up curve and so the curves shown in Fig. 3, while based on the Moody step-up formula, have been modified to conform with the performance of a prototype of the model.

The curves shown in Fig. 4 on the other hand being an estimate of the possible performance of a runner based on a newly developed model, D-30A, follow more closely the values derived by the Moody step-up formula. Our aim was to give to Model D-22, our starting point, the highest performance possible on any known and reasonably accredited basis.

The curves submitted in the paper are only typical of the tests made on a large number of models and there was no intention of dealing in detail with the relation between the performance of large units and of models.

Mr. Sauer's point with regard to the danger of disturbing the rock foundations by excessive grouting pressures is well taken. It was with this in view that, in grouting along the upstream face of the dam, the pressure in the upper parts of the holes was limited to 50 lb. per sq. in. By means of a gadget made up on the job, grouting could be done below any desired level in the hole and at any pressure up to 90 lb. per sq. in., which was the maximum air pressure available. Pressures up to 200 lb. per sq. in. were obtained by means of a grout pump and were used only in the foundation of the east bulkhead after the concrete structure was completed.

Two 1 in. dia. steel cables were used for holding the coffer-dam cribs in place after they were launched and while they were being loaded with rock. The tension in these cables was not measured and the author would hesitate guessing as to its amount. The cribs were built in sections 16 ft. long and were placed in water having an average depth of 15 ft. and flowing at a velocity estimated to have been 10 to 12 ft. per sec. The maximum depth of water was 20 ft.

SAFETY IN THE CAMPUS

In practically every walk of life people nowadays are subject to hazards with which previous generations did not have to contend. Most of these dangers are due to the increased complexity of present-day existence, and the more rapid tempo of our pursuit of happiness. But along with increased risks, effective counter measures have been developed, so that accidents can be rendered less harmful and in many cases prevented. The effectiveness of these precautions, however, depends on timely preparation, proper instruction and the willing co-operation of the persons concerned.

Thus it is not surprising to find that in the United States a pamphlet* has been issued by the National Safety Council which is devoted to the dangers to life and limb existing on the college campus, and even in university buildings, where one would suppose that academic calm would give security. Apparently this is not so. Indeed modern education has its own perils, affecting not only the care-free student, but also the instructing staff, college employees, and the visitors who flock to see the sights of great American universities. The pamphlet is intended as a guide to college administrators in promoting accident prevention programmes. The survey on which it is based has been a thorough one.

It is true that records available are not very complete, but they indicate that some 25 per cent of student deaths (as reported by nine universities) were due to accidents; more than half these were automobile accidents. College athletics account for more than 10,000 injuries per year. There are 1,628 colleges and universities of all types in the United States, employing a staff of 110,000 in administration, teaching and research, and registering about 1,300,000 regular students annually. Higher education is in fact a major American industry.

From the figures for accidents to students in the college buildings it would appear that mechanical engineering laboratory and shop work courses head the list, followed by chemical and physical laboratory work.

Automobile traffic on the campus needs and receives attention, particularly in the larger universities. In many places it has been necessary to place special restrictions on the driving privileges of students; parking for staff and student cars has to be planned and regulated.

The booklet can be recommended as giving a general survey of desirable safety practices. If students and instructors become familiar with them, the safety consciousness thus produced may well have a lasting influence on their habits and attitude towards safety problems.

IRON MAN

From Robert Williamson, London, Eng.

It is now possible to cut coal, without any men at hand, on a steep coal face with a gradient of 60 degrees.

This remarkable advance in the technique of coal mining has been brought about by a famous engineering firm in Scotland.

The clue to the new use of these "iron men," as miners in early days called the coal-cutting machines, lies in the ingenious design of the hydraulic winch which, from its position on top of the coal face, directs the mechanical coal-cutter with extreme ease and certainty. For example, the strong wire rope connecting the winch to the coal-cutter draws the machine up the steep face at any one of seven speeds.

Safety devices operate at all points. The pull on the rope cannot exceed the fixed maximum, which is more than enough to haul the machine up the face during the hardest cutting, and, should the picks or teeth of the cutter be blunted or the machine be jammed by timber, work comes to a standstill.

After a little experience, the haulage operator in charge of the winch on top of the coal face can tell how the machine is cutting, the hardness of the material and the sharpness of the mechanical picks, as accurately as if he were actually close at hand to the coal-cutter itself.

THE SPITFIRE MK 111

From *Aeronautics* (London), April, 1941

Permission was given in February for the release of details of the latest Vickers-Armstrong Spitfire which is now in service. This machine, the Mark 111 type, is armed with cannon, and it has already proved to be even more deadly against the enemy than its predecessor. Modifications to the engine and the airframe have brought a marked improvement in the general performance so that the top speed is nearly 400 miles and hour and the powers of manoeuvre are phenomenal. Outwardly, there are few striking changes; the wing tips had been clipped so that the span was 33 ft. 8 in., as against the span of the earlier type which is 37 ft. 4 in., but later the wing tips were replaced. The engine has been boosted still further so that the power the Merlin now yields is sensational. The removal of the wing tips spoilt the appearance of this famous fighter. The performance has been very greatly improved. Moreover, pilots report that the machine handles superbly and is as free from any vicious tendencies as the Spitfire 1.

SPECTROSCOPIC ANALYSIS

From *Trade & Engineering*, (London), April, 1941

The examination of steels and non-ferrous metals for important constituents present only in very small quantities is being carried out on an ever-widening scale by means of physical tests made with the spectroscope rather than by chemical analysis. The rapid routine control of steels is an outstanding example; with the aid of a works instrument recently introduced the testing can be done with surprising speed by an intelligent but unskilled lad after only a few days' practice.

Different chemical elements burn with flames of different colours. Thus strontium burns with a bright red flame, copper with a green, sodium with a vivid yellow flame, and so on. If these flames are visually examined after their light has been passed through a prism, the colours are seen to be due to brilliant coloured lines which are really images of the slit of the instrument, through which the light is first passed. Each such coloured line is due to radiations of light having different wave-lengths, the measurement of which—made with the spectroscope—gives an infallible clue to the identity of the substance. Metals which, like incandescent steel, burn "white" have a very complex spectrum, but nevertheless contain coloured lines which can be quickly identified with a modern instrument.

Hence it is not difficult to understand that such a chemical "stethoscope" is finding general adoption in engineering and metallurgical fields, especially as great improvements in construction and design during the last few years have made available works instruments which are portable and simple to use, and give a high order of accuracy in both qualitative and quantitative work.

It was stated recently at the Institute of Metals by Mr. F. Twyman, F.R.S., that the consistency of spectro-chemical analysis of non-ferrous alloys is from 2.5 to 7.5 percent in the percentage of minor constituents, according to the nature of the alloy. In the case of steels, it is possible within a minute or so of obtaining the sample to discriminate between two steels containing only 0.24 and 0.19 per cent of vanadium. Rough and quantitative measurements of manganese in steel between 0.6 and 1.4 per cent, and the estimation of the manganese in a sample in less than one minute with an accuracy sufficient for prescribing the most suitable heat treatment, are other examples of the capabilities of the spectroscope. The extensive applications which are being made at the present time are quite remarkable, the accuracy of spectro-chemical analysis having increased by some four times during the last five years.

In the Spekker Steeloscope, a workshop spectroscope designed for the rapid estimation of nickel and other metals in steel and for sorting and checking steel stores generally, a small piece of the alloy to be tested is used as the negative pole of an electric arc. The light from the arc is spread out by prisms within the instrument and is seen in the eye-piece as a series of coloured lines. If the presence of molybdenum, for example, is being looked for, a slide on the eye-piece is moved along until it clicks into a position marked for this metal, when one of its distinctive lines will be seen in the middle of the field. The quantity present in the steel is gauged by the brightness of the coloured lines as compared with neighbouring lines due to the iron; by comparison with standard samples the amount can be estimated very quickly.

In a communication from the Spectrographical Section of the Naval Ordnance Inspection Laboratory, Sheffield, to the Iron and Steel Institute it has been stated by Mr. F. G. Barker that several samples of brass are often received together for complete analysis to a specification which limits the impurities to very small amounts. Whereas the chemical analysis of a batch of a dozen samples would occupy one man about a week, the spectroscopic method enables the work to be done within three hours.

ROCHESTER, N.Y., AND THE SMOKE PROBLEM

By Ernest B. Brundage

The Smoke Ordinance for Rochester, N.Y., was adopted in 1914. There have been no amendments to date. The legality of the ordinance was soon questioned by two proved bad offenders, and they lost their cases in court. Since then no one has been fined or jailed for violation of the Smoke Ordinance. However, many prosecutions have been started after several written notices have been sent to an offender of violations. As soon as a violator complies with the Smoke Ordinance the prosecution proceedings are dropped.

At the turn of the present century this city burned mostly anthracite and a small amount of coke for the heating of homes, churches, schools, apartment houses and small stores. The public utility, factories and the few large buildings burned soft coal. Because of the difference in price, anthracite costing nearly twice as much as bituminous coal, there was and has been a continuous desire to burn the cheaper fuel. It was evident that civic pride would not deter people from burning good bituminous coal in an objectionable manner. Hence, the Smoke Ordinance.

As stokers were developed and other mechanical methods of firing were devised which increased the efficiency of the heating plants and made only what might be considered a reasonable amount of smoke, the owners started to install the new equipment.

The following shows a trend in the City of Rochester:

Year	Number of Mechanical pieces of Equipment installed to burn soft coal. Mostly underfeed stokers	Of these installations the following numbers changed from anthracite, oil, gas, utility steam, coke to soft coal
1937	60	16
1938	95	32
1939	35	12
1940	56	21

At the end of 1940 there were 860 installations of underfeed, side feed, overfeed and pulverized fuel installations in Rochester burning mostly high volatile bituminous coal.

During prosperous times there have been as many as four men assisting with the smoke problem at the same time. For the past several lean years, one inspector has had to handle the entire work for a city of 340,000 people. In spite of that, in 1937 a system was started and since maintained for measuring the air pollution through solid deposit and the requiring of permits for the installation of soft coal burning equipment has been another step forward in our attack of the problem.

NEW BRITISH STEEL

From Robert Williamson, London, Eng.

A new shock-resisting steel has been produced in England after two years' intensive research.

Some years ago the makers introduced a metal combining the strength of high tensile steel with the ductility of mild steel. It was used for many purposes, notably for 8,000 railway wheel centres for London's tube trains and for ship's davits.

But whereas it permitted davits to be loaded up to 25 per cent greater than before, now davits made from the new steel for special duties have recently been passed for a further increase of up to 15 per cent loading for the same frame size.

In addition to the properties of the other, the new steel has a yield point of 60 per cent., or more, of the ultimate tensile strength and a resistance to shock of not less than 20-ft. lb.—two to three times the normal figure for carbon steel castings of this tensile strength. Uses to which this new shock-resisting steel has so far been put include excavator castings and automatic couplers for railway rolling stock.

MEASUREMENTS OF TEMPERATURE

From *Trade & Engineering*, (London), April, 1941

There are three principal methods of measuring temperature electrically. The first is based on the variation of the electrical resistance of a metal with its temperature, the second on the electromotive force set up in an electrical circuit comprising two dissimilar metals when the two junctions of those metals are at different temperatures, and the third on the fact that the intrinsic brilliancy of a luminous body depends on its temperature. Devices operating on the first principle are known as resistance thermometers and those on the second as thermo-electric or radiation pyrometers accordingly as the active junction is directly exposed to the measured temperature, or is placed at the focus of a mirror which receives radiant energy from the source of high temperature to be measured. Devices operating on the third principle are called optical pyrometers; an image of the source of high temperature is focused on the filament of an electric lamp and the temperature is measured by the current in the filament of the lamp that is required to make its brightness exactly match that of the image. Radiation and optical pyrometers have an inherent accuracy inferior to that of the more directly operating resistance and thermo-electric devices.

The resistance thermometer is the most versatile of electrical temperature measuring devices. The resistance of the thermometer coil is measured by comparing it with that of electrical components consisting of alloys having resistances that are unaffected by temperature change. The electrical power for operating the indicating instrument depends not only on the change of resistance of the thermometer coil but also on the electrical power put into the whole circuit, and by increasing this power input the instrument power can be made ample for indicating small temperature changes of the thermometer coil without sacrifice of robustness of construction. The resistance thermometer suffers from the drawback that an external source of power is necessary, and its accuracy depends on the constancy of the current drawn from this source; the equipment must therefore include some device either for compensating for changes of the input current or for maintaining this current at a constant value.

The thermo-electric thermometer or pyrometer is the simplest of all devices for the electrical measurement of temperature because it produces the electrical power required for operating the indicator. As the indicator is responsive to a temperature difference, either one junction of the dissimilar metals of the circuit must be maintained at a constant datum temperature, or the mechanical zero of the indicator must be maintained by hand or automatic adjustment at a value corresponding to this inactive junction temperature. The power available for measuring temperatures under 500 deg. F. is so small that specially delicate construction of the indicator is required. Although the resistance thermometer is generally more convenient for measuring moderate temperatures, the thermo-electric method is usefully applied for measuring the internal temperature of large electrical machines, because the junctions are so compact that they can be built into the windings.

The highest accuracy and the greatest range of temperature measurement by the thermo-electric method are given by the use of junctions or couples composed of rare metals such as platinum and rhodium. For temperatures up to 1,200 deg. F. base-metal couples are used, not only because they are cheaper but also because they give more power for instrument operation than do rare-metal couples. The life of a base-metal couple exposed to a temperature of about 1,200 deg. is necessarily limited, and towards the end of the life of a couple its accuracy is likely to fall off seriously.

As inaccuracy in a thermo-electric pyrometer is difficult to detect, special interest attaches to the results of an investigation recently carried out by the United States National Bureau of Standards on the useful life of base-metal couples of three types under various temperature conditions. Iron-Constantan couples maintain good accuracy with 1,000 hours' exposure to temperatures up to 1,200 deg. F. With higher temperature the electrical indication tends to be low and the life to become less, failure taking place after 12 hours' exposure to 2,000 deg. and after 300 hours' exposure to 1,600 deg. Similar but somewhat better results were obtained with Chromelo-Constantan couples. Couples of Chromel-Alumel gave a useful life of 100 hours up to 2,000 deg. F., with a tendency for the electrical indication to be high with temperatures above 1,200 deg.

The results of this investigation show that the conditions in which a base-metal couple are used should not be changed if the highest accuracy is required. A couple that will give accurate results for temperatures below 1,000 deg. should not be exposed to any higher temperature, else the accuracy at moderate temperatures around 500 deg. may suffer. The position of a couple in a furnace should never be altered after it has been installed. It is even inadvisable to remove a couple for calibration in a laboratory furnace.

The accuracy of the indication of a thermo-electric pyrometer depends jointly on the accuracies of the couple and of the indicating instrument, and freedom from error cannot be inferred from good condition of the instrument. The Bureau of Standards investigation shows that users of couples for temperatures above 1,000 deg. should realize that the useful life is terminated not by actual failure but by falling-off of accuracy.

AIRCRAFT ARMOR

By HORACE J. ALTER

From *Army Ordnance*, (Washington, D.C.), March-April, 1941

The Protection of Flying Personnel from Hostile Fire

The strategic value of the airplane as a military weapon was discovered soon after its first successful flight. Its value as a long-range artillery weapon exceeds that of any gun in efficiency and destructive effect. The continued development of bomber and pursuit has resulted in a race similar to that which goes on between armor-plate and projectile manufacturers. Each seeks to develop a better airplane to force the other out of the sky. Every means to keep the airplanes flying is used, and protection for personnel and equipment is now provided on all fighting airplanes.

Steel plate as a protective covering has been used for over a century and a half, but the development of light armor plate 1 to 1½ inches or less thick has been limited to the years following the World War. It was developed during that conflict for use on tanks and armored cars, and its continued development has followed the demand for increased speed in these vehicles, which requires light plate. Soon after airplanes were flying over the Western Front, pilots were asking for something to protect the seat of their pants against the fire of ground troops and something at their backs to protect them from the hostile airplanes on their tail. They used stove lids, gun shields, car doors or any piece of heavy metal lying around loose. The development of armor plate for aircraft use soon followed, but the work was not continued in the years following the close of the war.

Armor is used to protect the airplane's operating personnel and vital flying and fighting equipment. Service tests prove that a combat crew trained and working together reaches a high degree of efficiency. The loss of a member of the crew is followed by a decrease in efficiency and a temporary reduction in morale. Important mechanisms, bombing apparatus, electrical equipment, etc., must be protected in order that the airplane may fulfill its mission against all obstacles. The fuel and oil tanks must be protected to sustain flight and prevent explosions. Protection also must be provided for the electrical, hydraulic, and control systems. The use of protective armor has a marked effect upon the psychology and morale of the combat crew by relieving the nervous tension and strain which exist when the crew is exposed to direct machine-gun and cannon fire.

Airplanes may be subjected to several different types of ammunition fire. They may be fired upon by ground troops, anti-aircraft batteries, and hostile airplanes. Ground troops used caliber .30 or .50 ball, tracer, and armor-piercing ammunition, depending upon the type of weapon used. The guns of hostile aircraft may use caliber .30 or .50 ammunition or light cannon with 20-or 37-mm. explosive shells. Three-to five-inch shells are used by antiaircraft batteries, and it is entirely feasible that airplanes may soon carry cannon of large bore.

The modern airplane is so constructed that little if any serious damage can be done to the structure by small-bore ammunition. In some cases the structure has survived hits by large shells and the airplane has still continued in flight. However, since the structure and covering of the airplane is not sufficient protection for personnel and equipment against small-bore ammunition and shell fragments, additional means in the form of armor plate must be added.

Attacks on the airplane can be launched from several directions simultaneously, but it cannot be attacked by more than one airplane at a time from any one direction. Hostile aircraft attack may be complemented by antiaircraft and ground-troop fire. Aircraft attacks are most probable from the rear hemisphere, from about fifteen degrees below to about forty-five degrees above the horizontal. With the advent of the multiseat fighters, attack from the forward lower hemisphere is feasible. Antiaircraft fire from large guns may be effective in any direction, but usually strikes from below. It is essential that the crew and mechanisms be protected from as many directions as possible.

There are certain advantages which occur and which may be taken into account when designing armor plate for airplanes: (1) The major portion of gunfire is directed at angles less than normal to the surfaces of the airplane; (2) The relative distance between airplanes in combat allows the pilot time to manoeuver away from the fixed guns of an opponent; (3) The speed of the airplane relative to the speed of the bullet and rate of fire of the gun is so high as to give a wide dispersion of hits and the spacing between shots is increased as the ratio of speeds increase.

It is seen that, given sufficient velocity, ordinary ball ammunition will penetrate armor plate as readily as armor-piercing. The particular velocity at which a plate just resists penetration by the bullet is called the ballistic limit of the plate. Penetration is also dependent upon the striking angle of the bullet-penetration being greatest at normal angles of impact and least when the angle of impact approaches zero.

It is seen that the attacking airplane controls three factors which affect the penetration of the projectile; namely, (1) The velocity of the bullet, determined by the powder charge and length of the gun barrel; (2) The caliber of the bullet, determined by the bore of the gun, which is indirectly influenced by the size of the airplane; (3) The weight and thus the trajectory of the bullet.

The factors which the attacked airplane controls and which can be designed into the airplane by the armor plate designer are: (1) The thickness of armor plate; (2) The type of plate and its ballistic properties or resistance; (3) The angle of impact of the bullet upon the plate. This is determined by figuring from which angles the airplane is most likely to be attacked.

In the design of plate for aircraft use, advantage may be taken of the fact that penetration under glancing impact is resisted by thinner plate than under normal impacts. The effect of impact at normal angles is limited to an area approximately three calibers in diameter, thus putting a high stress in the plate. Under the glancing impact, the effect is distributed over an area from two to five calibers long by two to three calibers wide, depending upon the bullet-impact angle. The effect of tumbling or turning the bullet is to increase the angle of impact.

If it is assumed that the resistance of the plate is the maximum obtainable, the thickness of the plate varies for different sections of the airplane. The gauge of plate is proportional to the angles at which the plate is mounted. For armor installed on the upper surface of the wing, where the angles of impact are more likely to be zero, the plate will be thin, while for a section at the rear of the fuselage, where the bullets will strike at more normal angles, the plate will be thick. Where the bullets are likely to pass through structure or equipment before hitting vital parts or personnel, advantage may be taken of the tumbling effect of the member and a thin plate installed.

There are two general types of light steel armor plate. First, there is a face-hardened plate in which the face exposed to gunfire has a greater hardness and resistance to penetration than the remainder of the plate. The exposed face is heat-treated and hardened to give a compact physical structure, while the remainder of the plate is made very tough and ductile.

Then there is homogeneous plate—a type which has a uniform and consistently hard and compact structure from face to rear. In some cases, ductility and toughness are sacrificed to secure good ballistic properties. The plates show tendencies to throw buttons, spall and shatter when subjected to bursts of machine-gun fire due to the vibration which is set up in the internal molecules of the plate. Since aircraft plate would not be subjected to concentrated bursts, vibration and shattering are not likely to occur.

Present combat ranges for airplanes are approximately one hundred yards or more. Homogeneous or face-hardened plate one-quarter of an inch thick will stop complete penetration of a caliber .50 armor-piercing bullet when the angle of obliquity, the angle between the flight path of the bullet and a normal to the plate, is sixty-five degress or less. One-half inch plate will stop armor-piercing caliber .50 bullets at twenty degrees. Good plates of either type shatter the projectile without appreciable signs of cracking or shattering. Most of the armor-piercing cores break into small fragments upon striking the plate.

Flexible mountings, such as springs or rubber pads, show little or no improvement and may be injurious by producing a racking effect; that is, tearing the plates loose from their fastening bolts.

Bullet-proof glass is also used for armoring purposes. The hard surface of glass makes it a good protective plate. Bullet-proof glass is used in airplane windshields where the angle of impact is very low about forty-five degrees or less, and where a glancing blow causes the bullet to ricochet. When the bullets strike at angles more nearly normal, the surface is starred and the glass powdered or splintered and slivered. The bullet core is imbedded between the layers of glass and the plastic binder. The area affected varies from six to ten inches, although visibility is still possible through the outer regions of the affected area.

Bullet-proof glass two inches thick will stop penetration of caliber .30 ball ammunition at normal impacts. Glass three inches thick will stop caliber .50 bullets.

Armor in the pilot's compartment should protect his head, back, and seat. Bullet-proof glass should protect him from fire coming from the forward hemisphere. Where possible, all equipment in the pilot's compartment should be placed to form protection and baffles. It must be remembered that a preponderance of attacks are most likely to occur from the rear at angles normal or nearly normal. It is essential that plate protecting against gunfire from this quarter be heavier than that protecting against gunfire from the forward quarter.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

THE PRESIDENT'S TOUR

In the vernacular of the political press to the south of us, President Mackenzie took a "swing" around the maritime branches during the month of May. He visited Halifax, Moncton and Saint John, holding branch meetings in each city and a Council meeting in Saint John. In Halifax, his alma mater Dalhousie presented him with an honorary Doctor of Laws, and in return received from him the convocation address.

Throughout the trip he was accompanied by Vice-President K. M. Cameron, J. A. Vance, R. L. Dobbin, G. A. Gaherty and the general secretary. At Saint John, J. B. Challies and Huet Massue joined the group to take in the Council meeting. This splendid support was a real tribute to the president, and added much to the interest and value of his visits to the branches.

In each city the president found a warm welcome, not only was he greeted as the Institute head, but also as a friend. Born in New Brunswick and educated in Nova Scotia he is at home in both provinces, and is among friends no matter where he pauses. He found the branches active and thriving, and was particularly impressed with the progress that has been made in Nova Scotia towards a common membership between the Association and the Institute.

It is evident that presidential visits are a welcome stimulus, and that meetings of council create a favourable influence within the regions where they are held. Such events make great demands in time and money, and the Institute is fortunate that in its choice of presidents it has found so many who can and do make these sacrifices for the good of the profession.

It is to be hoped that notwithstanding the importance of Dr. Mackenzie's work at Ottawa, he will be able to visit other branches and that on such occasions he will again be supported by officers of the Institute and of branches.

A.R.P. AND THE INSTITUTE

It is possible that air-raid precautions have been discussed in several branches of the Institute across Canada, but only two have reported their interest to Headquarters. Some time ago the Montreal Branch set up a committee, and recently word has come from the Saint John Branch that a committee has been set up there at the request of the city's committee for A.R.P. to organize for demolition work.

Realizing that the growing interest in this work in Canada was a matter of concern to engineers, the Institute has received authorization from the Ministry for Home Security to circulate in this country the splendid bulletin prepared by the Research and Experiments Branch of that department. In the United Kingdom this information is distributed by the Institution of Civil Engineers.

These bulletins cover such topics as:

- Bulletin No. C. 1—New Design Methods for Strutting of Basements, Etc.
- Bulletin No. C. 2—Consolidation of Earth Covering on Anderson Shelters.
- Bulletin No. C. 3—The Propping of Reinforced Concrete Beams.
- Bulletin No. C. 4—The Protection of Glass in Hospitals.
- Bulletin No. C. 5—Steps that should be taken to increase the Resistance of "Umbrella" type Roofs to Collapse due to Air Attack.
- Bulletin No. C. 6—Damage to Cast Iron Pipes in Works.
- Bulletin No. C. 7—The Protection of Factory Glazing.
- Bulletin No. C. 8—Structural Damage Caused by Recent Air Raids to Some Single Storey Buildings.
- Bulletin No. C. 9—The Protection of Plate Glass Windows.
- Bulletin No. C. 10—Flexible Substitutes for Glass.
- Bulletin No. C. 11—Chemical Fire Extinguishers. (Their application to incendiary bombs and resultant fires.)
- Bulletin No. C. 12—Single Storey Wartime Factory Design.
- Bulletin No. C. 13—Obscuration, Ventilation and Protection from Glass in Large Buildings.
- Bulletin No. C. 14—Refuge Room Dormitories. (A sequel to "Your Home as an Air Raid Shelter.")
- Bulletin No. C. 15—Strengthening Steel Framed Shed Buildings Against Collapse (due to air attack).
- Bulletin No. C. 16—Notes on Indoor Shelters.

And will be of invaluable assistance in the study of and preparation for such visitations in this continent.

The printing and distribution involves a task of substantial preparation and it is not possible as yet to announce the procedure. It is hoped that details can be announced in the next number of the *Journal*. In the meantime it is thought advisable to inform members that the material published up to the present is now at Headquarters and that future publications will be sent regularly as issued.

The material on hand also includes fifty-four bulletins issued by the British Standards Institution known as the A.R.P. Series.

QUEBEC "WINGS FOR BRITAIN"

In a recent issue of the *Montreal Star*, an editorial reference was made to the contribution received by "Wings for Britain" from the Corporation of Professional Engineers of Quebec. This is a piece of news of interest to the whole profession, and the *Journal* is glad to reprint herewith the entire editorial in tribute to the Corporation.

"The solidarity with which all sections of the Canadian community stand behind the war effort was effectively demonstrated yesterday afternoon when, on behalf of the Corporation of Professional Engineers of Quebec, its president, Dr. Olivier Lefebvre, presented a cheque for $2,000 to 'Wings For Britain,' the organization which is providing funds for many fighter planes. This is a bilingual organization, and some of the most distinguished French-Canadian and English-speaking engineers comprise its membership. Its gift, then, was a tribute offered on behalf of a profession which is contributing very largely in other ways toward the general war effort. An engineer, General McNaughton, commands the Canadian forces overseas, and in many other capacities the profession is placing its talents at the disposal of the Government.

"In his presentation address Dr. Lefebvre paid a remarkable tribute to the British people, using words which undoubtedly express the views of his compatriots throughout the Province. 'We all appreciate,' he said, 'that in the present war our liberty and all that makes life worthwhile are at stake. The British Empire alone, with the aid of the United States, is defending our liberty. The courage, determination and will to win shown by English-speaking people have won the admiration of the whole world.' And, in tendering the cheque to Mr. Joseph Simard, a member of the general committee of 'Wings For Britain,' he added the fervent hope that the money 'would serve to aid Great Britain and her Allies to defend the cause of democracy, and all that they stand for.'

"In accepting the gift on behalf of the committee, Mr. Simard took occasion to supplement Dr. Lefebvre's remarks with a statement particularly appropriate at this time. 'This shows,' he said, 'once more that Canadians of the Province of Quebec are anxious to participate in any undertaking indispensable for the pursuit of the war to a victorious peace. The insinuations made by certain persons regarding the French-Canadian population are not justified, and for my part I have yet to meet one of my fellow-citizens who is not wholehearted in the ends which we pursue.'

"The gift was unsolicited, as the small gathering was informed, and was therefore made as a spontaneous gesture of appreciation. Such gifts serve further to bind the community together in the common effort."

THE CENTENARY OF QUEEN'S UNIVERSITY

In 1841, a rented frame house on a side street of Kingston, two professors and ten students. In 1941, a beautiful campus, situated close by the shore of Lake Ontario, containing thirty-three buildings with adequate equipment, worth $5,000,000; an endowment fund of $4,000,000; a staff of three hundred and fifty; an intramural and extramural student registration of four thousand; and an alumni body of fourteen thousand.

Such has been the development of Queen's University at Kingston in the hundred years that have passed since Queen Victoria, on October 16, 1841, granted a royal charter to the small colonial college that was eventually to become one of Canada's greatest seats of learning.

Queen's University is today an institution of which every Canadian may be justly proud. In this, her centenary year, Queen's can look back upon a record of pioneering service and educational achievement that Canada could ill have spared.

Founded by the Presbyterian Church in Canada for the primary purpose of training ministers for the widely scattered areas of Upper Canada, Queen's activities were confined at first to theology and arts. After a few years the teaching of medicine was begun, and eventually a Faculty of Applied Science was organized. In all of these fields, Queen's University has done, and is still doing, great work.

Not the least important of Queen's contributions to Canadian life has been in the realm of engineering. Established in 1893 under the auspices of the Ontario Government, the School of Mining at Kingston was the first institution of its kind in Canada. It rapidly proved its worth, shortly became affiliated formally with Queen's and finally developed into the present Faculty of Applied Science of the University. Many hundreds of engineers have gone forth from Queen's to fill posts of trust and responsibility from coast to coast in Canada, and elsewhere throughout the world.

Queen's hundredth year is being marked by a series of conferences of learned societies and organizations at the University during the summer months, and by a special Centenary celebration from October 16 to 18. Some of the high-lights of the programme are as follows:

A service of thanksgiving and remembrance.

A series of addresses—by some of the most eminent scholars of England, Canada and the United States—on the progress of theological thought, of the humanities and social sciences, of medicine, of science and applied science, and of business and finance during the past hundred years.

A Centenary Convocation, at which a number of honorary degrees will be conferred and at which the University's Centenary Poem will be presented.

A special Convocation at which an honorary degree will be conferred upon His Excellency the Earl of Athlone, Governor-General of Canada and Rector of Queen's.

The programme also includes: a Centenary banquet; a combined alumni-student ceremony, at which His Excellency the Governor-General will deliver his Rectorial Address, and at which the "Story of Queen's" will be told; a University reception; an alumni dance; and various other graduate and student functions.

As Queen's University moves on into her second century, she takes with her the good wishes of the whole of Canada —that her service in the future may be as fruitful as that of the past.

THE BY-LAWS

Some time ago in accordance with By-law No. 75 Council authorized the secretary emeritus to reword and rearrange the by-laws of the Institute. This work has been underway for over a year and at last all the requirements as stipulated have been met and the new booklet has just appeared. Copies will be sent to all officers and to branch secretaries. Any member who is interested may secure a copy without cost simply by writing Headquarters. All the material appeared in the August, 1940, number of the *Journal*.

The new arrangement will be found more logical and more useful. The many amendments made during recent years had caused some vagueness and inconsistency with other portions that had not been altered. It is believed this has now been overcome without in any way altering the original intention or purpose of the by-laws.

WARTIME BUREAU OF TECHNICAL PERSONNEL

The mailing of questionnaires to engineers, chemists and architects is now under way. As there are forty thousand to be mailed, it has been decided to send out only a thousand a day. This spreading out is necessary in order to give the office staff an opportunity to keep up with the returns.

The first mailings will cover the Quebec and the maritime provinces. Ontario will follow, and the four western provinces will be next. This order has no significance, but is simply the result of the way the lists were received from the Bureau of Statistics. Attention is called to it now, so that persons will not become unduly disturbed if these forms do not arrive immediately.

Accompanying the questionnaire is a postage-free return envelope, an explanatory letter, and a list of classifications. Each person is asked to classify himself according to the lists, and also to state whether or not he is prepared to transfer from his present occupation to one of more wartime significance, providing that satisfactory arrangements can be made with his present employer.

As there are almost no engineers out of work to-day, it is evident that the increasing needs of war industry will have to be met by transferring or borrowing men from industries of less national importance. Herein lies the real work of the Bureau—to locate the required men and to negotiate for their transfer or loan.

It seems evident that in the list of 40,000 names secured from the national registration, there must be many who do not rightly qualify for that classification. It is expected that many thousands will be eliminated in the re-classification that will be done when the forms are returned; but on the other hand, many useful persons may be uncovered who possess "near" engineering qualifications, and who have called themselves engineers or chemists at the time of registration for lack of a more precise classification.

You are urged to give your questionnaire careful and early attention. It is hoped that everyone will return the required information without regard to whether or not he is at the moment engaged in urgent and vital work. A complete record in one office will not only assist with the war effort now, but will be valuable to the whole profession in the future.

ERRATUM

In the discussion on Mr. Runciman's paper "Earth's Crust Resistance and Lightning" which appeared in the April issue, a line was dropped from the next before last paragraph on page 179. The paragraph should read: "To answer Mr. Buchanan's point, in reference to reduced insulation, it should be kept in mind that the minimum insulation for a 220 kv. line in wet weather could be about six suspension units, whereas we use fourteen and sixteen units, and some other companies, eighteen to twenty-four units." etc.

INSTITUTE MEDAL RECEIVED BY LIEUT.-GENERAL McNAUGHTON

The announcement of the recent presentation of the Sir John Kennedy Medal to Lt.-General McNaughton in London was pretty well distributed by the press but Headquarters has received a report direct from the Institution of Electrical Engineers which gives more detail. The original letter, the photographs and the address referred to have not arrived at time of going to press. Doubtless they are on a slower mail.

The Institute is very pleased to read of the splendid ceremony, and to acknowledge the kindly greetings of a sister society. The desire to foster closer collaboration between engineering groups finds a ready response throughout this organization. It is a pleasure to look forward to the resumption of negotiations at the conclusion of the war.

The following is printed from carbon copies which have come by air mail.

THE INSTITUTION OF ELECTRICAL ENGINEERS

London, 22nd May, 1941.

L. Austin Wright, Esq.,
The Engineering Institute of Canada, Montreal.

Dear Mr. Wright:—

I now have much pleasure in sending you the enclosed report of the proceedings at our Ordinary Meeting on 8th May when the Sir John Kennedy Medal was presented to General McNaughton.

You will see that reference is made to an address to your Institute and I should explain that the Council felt that they would like you to have for retention in your archives a record of the circumstances under which the presentation ceremony was carried out. They also felt that General McNaughton might like to have a copy and authority was therefore given by the Council at their meeting held earlier in the day for the signing and sealing of two copies of the address, one of which I now send to you with this letter. I also enclose three photographs that were taken at the presentation ceremony.

To complete the record of the events arising out of the presentation I should refer to the Council luncheon held at the Waldorf Hotel immediately preceding the Ordinary Meeting. A list is given below of all those who were present, and you will see that it contains the names of several distinguished Canadians as well as Lord Hankey, the Chancellor of the Duchy of Lancaster, and the Rt. Hon. Sir Andrew Duncan, the Minister of Supply, and representatives of leading sister Institutions in this country. In response to a speech of welcome delivered at this luncheon by the president, Mr. Vincent Massey replied in general terms on behalf of the guests and with particular reference to General McNaughton, his remarks being very much appreciated by all present.

In conclusion, I am asked to express once again the Council's keen pleasure at having had the opportunity of this association with you in giving honour to a great scientist and a great soldier.

Yours sincerely,
(Signed) W. K. BRASHER,
Secretary.

EXTRACT FROM THE PROCEEDINGS OF THE INSTITUTION
966TH ORDINARY MEETING, 8TH MAY, 1941

Mr. J. R. Beard, M.Sc., (President): "My first duty this afternoon, and it is a most agreeable and unusual duty, is to present, on behalf of the Engineering Institute of Canada, their Sir John Kennedy Medal to Lieut.-General Andrew George Latta McNaughton, C.B., C.M.G., D.S.O., M.SC., LL.D., D.C.L., General Officer Commanding the Canadian Forces in Great Britain. We esteem it a great privilege that this presentation should have been entrusted to us, more especially as General McNaughton is one of our members.

For some time past we, in common with the Institutions of Civil and Mechanical Engineers, have wished to foster closer collaboration with the representative engineering institutions in the Dominions and this was actively in hand until necessarily interrupted by the outbreak of war. We intend to take it up again when the war is over and meanwhile this function to-day helps to keep the spirit of co-operation alive.

"Three years ago the Engineering Institute of Canada celebrated its Jubilee and representatives of our Institutions under the leadership of Sir Alexander Gibb went to Canada to offer our congratulations. We were ably represented by my immediate predecessor, Mr. Johnstone Wright, who brought back most happy memories of Canada and an increased enthusiasm for the encouragement of co-operation between our Institutions.

"The Sir John Kennedy Medal is awarded when occasion merits to Corporate Members of the Engineering Institute of Canada 'in recognition of outstanding merit in the profession or of noteworthy contribution to the science of engineering' and I understand that this is only the fifth or sixth award which has been made. General McNaughton fully meets those requirements, in addition to having given most distinguished service to Canada in wider fields.

"Born in Saskatchewan in 1887, General McNaughton graduated in electrical engineering at McGill University, where he was subsequently on the teaching staff and in private practice. From his undergraduate days he had taken the keenest interest in military science and by 1913 was a Major commanding a field battery in the Militia. During the 1914-1918 war he gave distinguished service in France and was wounded at Ypres. Later he rose to be Lieut.-Colonel in charge of a field artillery brigade in the 2nd Canadian Division, fought through the battles of the Somme and became counter battery staff officer of the Canadian Corps; he was again wounded at Soissons in 1918 while attached to the French Army. Just prior to the end of the war he was General Officer Commanding Canadian Corps Heavy Artillery at the early age of 31. Apart from the several honours and distinctions which I have enumerated, he was mentioned three times in despatches.

"On his return to Canada, General McNaughton became successively Director of Military Training, Deputy Chief of the General Staff and, in 1929, Chief of the General Staff, with the rank of Major-General, which I understand is the highest military appointment in Canada. During this period he continuously stressed the rapidly increasing importance of the engineer in modern warfare, a view which has been fully justified in recent months. He was also active in afforestation.

"In 1935 he became president of the Canadian National Research Council, a position which he still occupies, and his energy did much to promote the constructive application of science to industry.

"In electrical engineering his development of the cathode-ray direction finder, in co-operation with Col. W. A. Steel, is well known. At the Research Council he promoted work on high-voltage investigations and not only equipped the laboratories for this purpose but took an active part in planning the experimental programme. In 1939 he was appointed by the Canadian Government as technical adviser to accompany a delegation of Canadian manufacturers to Great Britain in order to investigate the possibility of producing munitions in Canadian plants.

"Throughout his military career General McNaughton has always directed his attention especially to the scientific and engineering side. Signals, radio, aircraft, artillery and mechanization have been his chief interests. In many other directions he has played an active part, such as in the St. Lawrence waterways and air transport.

"Soldier, scientist and skilful administrator, a Canadian with a true understanding of the place Canada holds in world affairs and with a broad vision of the future which its potential resources may enable it to attain, General McNaughton has devoted his life in large measure to the development of Canada, the promotion and application of engineering science and the advancement of his chosen profession.

"We had hoped to have with us this afternoon Mr. Vincent Massey, the High Commissioner for Canada, but unfortunately though he had fully intended to come, he has at the last minute been called to a very urgent appointment and has had to forego giving us the pleasure of his presence. We have with us to-day, however, the former Prime Minister of Canada, the Rt. Hon. Mr. R. B. Bennett, who is very well known to us over here and who, as you know, has taken up his residence among us. We are also pleased to welcome several distinguished technical officers of the Canadian Forces.

"Our Council feel that they would like to make a record of this occasion by presenting to the Engineering Institute of Canada an address stating the circumstances of this presentation and their pleasure at being invited to make it. A copy of the address is also being handed to General McNaughton."

The President then, amid applause, handed to General McNaughton the Sir John Kennedy Medal of the Engineering Institute of Canada and a copy of the address.

Lieut.-General A. G. L. McNaughton: "I know you will forgive me if my remarks on this occasion are very brief, because you will understand that the high honour which I have received to-day from the Engineering Institute of Canada, through the agency of The Institution of Electrical Engineers, goes right to my heart. I feel very much that the recognition which has been given to me is to a very large extent a recognition of that great institution, the National Research Council, with which I have the honour to be associated and to which I was sent by the Rt. Hon. Mr. Bennett, whose presence here to-day I deeply appreciate.

"I have sought all my life to have an opportunity of taking part in actual development work and construction work in engineering, but it always seems that as soon as one starts an active project of investigation or research something happens in the world and one is drawn away to outside activities.

"Twice in my life, once at McGill and then at the Research Council, I have gone deeply into the field of high-voltage research, but no sooner had I got the equipment assembled on those two occasions than war in Europe broke out. I can assure you, however, that Mr. Ballard and my other associates in Canada who are continuing to use and develop the Research Council's laboratory are keeping me informed of what is going on, and as soon as the war is brought to a satisfactory conclusion—I have no doubt about its ultimate result—I want to continue my work there with the beautiful apparatus that we have got together operating at millions of volts with much power behind them and at many frequencies. I hope some day to have the privilege of presenting a paper to this Institution."

Attendance at Council Luncheon

Sir E. V. Appleton, D.S., F.R.S., (Secretary of The Department of Scientific and Industrial Research); The Rt. Hon. R. B. Bennett, K.C.; Prof. S. Chapman, M.A., D.Sc., F.R.S., (I.E.E. Kelvin Lecturer, 1941; Chief Professor of Mathematics, Imperial College, South Kensington, London); Mr. E. Graham Clark (Secretary, The Institution of Civil Engineers); Sir Henry Dale, C.B.E., F.R.S. (President, The Royal Society); The Rt. Hon. Sir Andrew Duncan, G.B.E. (Minister of Supply), Honorary Member I.E.E.; Prof. A. C. Agerton, M.A., F.R.S. (Secretary, The Royal Society); Dr. A. P. M. Fleming, C.B.E., M.Sc. (Faraday Medallist I.E.E., 1941; Past President I.E.E.); Mr. J. S. Forrest, M.A., B.Sc. (Winner of Cooper's Hill War Memorial Prize and Medal, awarded by I.E.E. for 1940); Colonel J. Genet, M.C., M.E.I.C. (Chief Signals Officer, Canadian Corps.); The Rt. Hon. Lord Hankey, G.C.B., G.C.M.G., G.C.V.O. (Chancellor of The Duchy of Lancaster); Brigadier C. S. L. Hertzberg, M.E.I.C. (Chief Engineer, Canadian Corps); Professor A. V. Hill, O.B.E., F.R.S. (Secretary, The Royal Society); The Hon. Vincent Massey (High Commissioner of the Dominion of Canada); Lieut.-Ceneral A. G. L. McNaughton, C.B., C.M.G., D.S.O., M.E.I.C. (Commander of the Canadian Forces in Great Britain); Mr. J. E. Montgomrey (Secretary, The Institution of Mechanical Engineers); Sir Archibald Page (Chairman, Central Electricity Board; Past President I.E.E.); Mr. W. Stanier (President, The Institution of Mechanical Engineers); Brigadier G. R. Turner, M.E.I.C. (Canadian Corps.); *President* Mr. J. R. Beard, M.Sc. (Senior Partner, Messrs. Merz & McLennan, Consulting Engineers); *Past Presidents* Mr. J. M. Donaldson, M.C. (General Manager, Northmet Power Company); Lt. Col. K. Edgcumbe, T.D. (Director, Everett Edgcumbe & Co. Ltd., Electrical Measuring Instrument Makers); Mr. F. Gill, O.B.E. (Chairman Standard Telephones & Cables; Vice-President and Director, International Standard Electric Corporation); Mr. J. S. Highfield (Consulting Engineer); Mr. P. V. Hunter, C.B.E. (Director, Joint Manager and Chief Engineer, Callender's Cable & Construction Co.); Sir George Lee, O.B.E., M.C. (formerly Engineer-in-Chief, G.P.O., London); Dr. Clifford C. Paterson, O.B.E. (Director Research Laboratories, General Electric Co. Ltd.); Dr. Alexander Russell, M.A., F.R.S. (Advisory Principal, Faraday House, Electrical Engineering College, London); Prof. W. M. Thornton, O.B.E., D.Sc., D. Eng. (Emeritus Professor of Electrical Engineering, Armstrong College, Durham University); Mr. Johnstone Wright (Chief Engineer, Central Electricity Board); Mr. H. T. Young, (Managing Director, Messrs. Troughton & Young, Ltd., Electrical Contractors); *President-Designate:* Sir Noel Ashbridge, B.Sc. (Eng.) (Chief Engineer, British Broadcasting Corporation); *Vice-Presidents:* Colonel A. S. Angwin, D.S.O., M.C. (Engineer-in-Chief, C.P.O., London); Dr. P. Dunsheath, O.B.E., M.A. (Director and Chief Engineer, Messrs. W. T. Henley's Telegraph Works Co. Ltd.); Mr. V. Z. de Ferranti, M.C. (Chairman, Messrs. Ferranti, Ltd.); Professor C. L. Fortescue, O.B.E., M.A. (Professor of Electrical Engineering, City and Guilds College, London); *Honorary Treasurer:* Mr. E. Leete (Director, London Electric Wire Co. & Smiths Ltd. and The Liverpool Cable Co. Ltd.); *Secretary I.E.E.* Mr. W. K. Brasher, B.A.

CORRESPONDENCE

10, Climie Place, Kilmarnock, Scotland.
26th March, 1941.

The Secretary,
The Engineering Institute of Canada,
Montreal.

Dear Mr. Wright,

I read (with some blushes) in the February *Journal* your reference to my little contribution to the war effort.

There was, however, a little misunderstanding as I am still on the staff of Messrs. Glenfield and Kennedy Ltd., and my particular war work is carried on outside of business hours and is entirely voluntary.

We, in this county, greatly appreciate the great contribution Canada is making towards the winning of the war.

As so many airmen are being trained in the Dominion and as the Observer Corps to which I belong is a part of the Royal Air Force, it might be of some interest to you to know a little of our organization and work, especially as I am sure there are many of my fellow members in the Air Force.

The Observer Corps had been in existence since the 1914-18 war as a branch of the special constabulary, but on the outbreak of this war was taken over by the R.A.F.

Our badge depicts a watcher on the shore, watching for the Spanish Armada, his torch is lighted, ready to set fire to the warning beacon on the hill behind him. The Corps motto is "Forewarned is forearmed."

The posts are established throughout the British Isles and are so located that the area for which each group is responsible is overlapped by the adjoining posts, and as the whole country is covered some of our posts are in rather out-of-the-way places.

The post consists of a small stockade of timber, earthwork or sandbags and in this stockade is placed our spotting instrument mounted on its tripod.

There is also a small hut or shelter where the observers coming on to the 3 a.m. to 7 a.m. duty may sleep during the early part of the night. The two Observers on duty must, however, remain in the open stockade.

The instrument has a circular table which carries an ordnance map of the area, protected by a celluloid covering drawn to a scale of 1 in.-1 mile and divided into squares of two kilometre side.

At the Observer Corps post shown here are an engineer aged 54 and a farmer aged 60: they are being relieved by an artist aged 47 and a stockbroker aged 57.

The squares are numbered and at my post our area is bounded by a circle of 16 miles diameter. The instrument proper has a carriage, pivoted at the centre and free to rotate on rollers around the table. On the carriage is mounted a height bar, sighting arm and traversing slide for the pointer and so geared that when the estimated height of the visible plane is set on the height bar and the plane taken into the sights of the instrument, the pointer has come to rest over the numbered square, above which the plane is flying.

The progress of the plane is reported continuously while it is within sight or hearing of the post.

Each post is in direct telephonic communication with the "centre" where reports from all posts are received and where on a large map of the whole section of country, markers are placed by "plotters" who are thus able to follow the course of all planes, friendly or hostile. Each plotter at "centre" plots for a group of 3 to 6 adjacent posts and as our phones are interconnected, each post hears the plots from his neighbours as they are passed through to centre and so planes can be passed on from post to post, enabling checks and corrected heights to be obtained. From the centre our plots are passed direct to the fighter command.

When a plane is heard but cannot be seen a "sound plot" on a 10 mile circle is passed to centre. A typical single plot would be "Plane(s) seen (number and type), height 5,000 ft., square 9281, flying west."

There are numerous methods of checking heights by cross plots from adjacent posts, etc., and it will be realized that if a plane can be either seen or heard, its position is definitely known to fighter command which is in communication with our fighters in the air.

The R.A.F. are dependent on the Observer Corps for the location of all planes over the country by day and night.

At my post there are three "full time" observers who take all duties from 7 a.m. to 7 p.m. from Monday to Saturday, on watch, two at a time, each working eight hours per day and 48 hours per week. All night duties and Sunday work is undertaken by the voluntary members who work in pairs for four hours at a time and who put in 8 to 12 hours duty per week. The posts are thus manned continuously by two observers, and all planes, friendly or hostile, are plotted and passed through centre to fighter command. The work is interesting but exacting, as one must be able to recognize a plane as soon as it is seen and there are about 400 types.

There is much of the organization which I cannot write about, but the few details I have given may be of interest to you. Our work has been described in the press and by broadcast many times so that my rather rambling notes can hardly be looked upon as military secrets.

We take a longing for Canada, and feel a bit homesick at times, but perhaps when this turmoil is over we may again renew old friendships.

With kindest personal regards,

Yours very truly,

(*Signed*) R. M. Herbison, m.e.i.c.

MEETING OF COUNCIL

Minutes of a regional meeting of the Council of the Institute held at the Admiral Beatty Hotel, Saint John, N.B., on Saturday, May 17th, 1941, at 2.15 p.m.

Present: President C. J. Mackenzie in the chair; Past President J. B. Challies (Montreal); Vice-President K. M. Cameron (Ottawa); Councillors, S. W. Gray (Halifax), H. Massue (Montreal), H. F. Morrisey (Saint John), G. E. Smith (Moncton), J. A. Vance (Woodstock), and General Secretary L. Austin Wright. There were also present: Past Vice-President R. L. Dobbin (Peterborough), Past-Councillors A. Gray (Saint John), S. Hogg (Saint John), G. G. Murdoch (Saint John), G. Stead (Saint John), J. Stephens (Fredericton), F. P. Vaughan (Saint John); G. A. Gaherty, chairman of the Committee on Western Water Problems; F. O. Condon, chairman of the Moncton Branch; and the following members of the executive of the Saint John Branch, J. P. Mooney, F. A. Patriquen (chairman), D. R. Smith, A. O. Wolff and V. C. Chesnut.

In the absence of the chairman of the Finance Committee, the general secretary presented the report of the committee. In commenting on the financial statement up to the end of April he pointed out that the income of the Institute was slightly ahead of the same period last year, and that expenditures were running at approximately the same level. The Finance Committee reported financial affairs to be in a satisfactory condition.

The reports from branches relative to the fund for repairs to the headquarters show that all branches have agreed to undertake a collection of funds. Some branches have already made returns on the basis of a dollar per member, and others have reported that their collections are already in excess of that amount. The Montreal Branch reported by telegram to the president that their fund was already in excess of five thousand dollars.

The secretary also read a letter from the vice-chairman of the annual meeting committee of the Hamilton Branch in which it was announced that a further sum of twenty-two dollars had been voted by the branch executive towards the building fund. The branch has already sent in its check for the full amount on the basis of a dollar per member.

The president commented on the fine arrangements which had been made for the annual meeting in Hamilton, and stated that many features were presented which should be considered by every branch holding an annual meeting. It was his opinion that the Hamilton meeting had been exceptionally well run.

The secretary read a letter from the Engineers' Council for Professional Development pointing out that Dr. Challies' term as a member of the executive of that organization representing the Engineering Institute of Canada expires this fall, and asked Council to name a representative for the next three years. In view of Dr. Challies' close association with this activity, he was requested by Council to accept the office for a further period of three years. This Dr. Challies agreed to do. At the president's request, he then outlined some of the work which was being done by E.C.P.D., and emphasized the values which membership in this body would bring to the members of the Institute.

The question of admitting enemy aliens into membership of the Institute was given a great deal of consideration. Many councillors took part in the discussion, and the fact was disclosed that the Federal Government has refused naturalization papers to such persons as long as their country was at war with Canada. It was the opinion of Council that the Institute could not very well admit such persons to membership in view of the Government's policy. It was also pointed out that the qualifications and the loyalty of most of the persons who were applying were beyond dispute, but in view of the fact that Institute membership might be of assistance to enemy agents, and might well be sought for such purposes, it was decided as a protective measure that applications from such persons should be refused for the duration. The secretary was instructed to explain the circumstances to applicants, and to ask them if they would hold their applications until after the war.

Mr. Cameron commented on the pleasure it had given him to attend the monthly, and, in some cases, the annual meeting of the maritime branches. He thought that if notice of annual meetings of branches were distributed more widely, members from other branches would be glad to attend. He commented on the cordiality and hospitality which he had experienced at each branch, and the pleasure which it gave him to support the president on his maritime tour.

Dr. Challies reported that, as chairman of the Institute's committee on professional interest, and in company with Messrs. Gaherty, Vance, and Wright, he had met with the council of the Association of Professional Engineers of the Province of New Brunswick on Saturday morning, and the details of the proposed agreement were discussed. The council of the Association met again after lunch, and he had just been informed that further progress had been made and that all matters had been ironed out sufficiently that he was confident that a final agreement would shortly be reached between the two bodies. He hoped that the time was not far distant when the president could again return to Saint John in order to participate in the ceremony of signing an agreement. He also expressed the hope that on such an occasion the president would again be supported by a substantial delegation from the provinces west of New Brunswick.

The president expressed his pleasure at this announcement, and said that he would be very happy to come back to Saint John for the ceremony. He also commented on the support which he had received as prseident from the past-presidents. He thought that the Institute was unique in that past-presidents did not lose interest as soon as their term of office was over, but continued to be interested in Institute affairs, and to support the president and council throughout their lifetime. Such support was extremely valuable to the sitting president, and was very much appreciated.

A number of applications were considered, and the following elections and transfers were effected:

Admissions

Members	9
Juniors	1
Students	3
Affiliates	3

Transfers

Junior to Member	1
Student to Member	1
Student to Junior	5

In conclusion, Mr. Cameron expressed the thanks of the president's party for the splendid hospitality which had been extended by the members of the Saint John branch. He also congratulated them on the appointment of their new chairman, Mr. Frank Patriquen. In reply, Mr. Patriquen stated that the whole branch was very pleased to have had a regional meeting of council and that they would be even more pleased if the ceremony could be repeated again in the future.

The meeting adjourned at 4.15 p.m.

ELECTIONS AND TRANSFERS

At the meeting of Council held on May 17th, 1941, the following elections and transfers were effected:

Members

Courchesne, Charles Edouard, Land Surveyor (Laval Univ.), asst. district engr., Provincial Highway Dept., Quebec.

Johnston, Bruce Henry, B.A.Sc (Univ. of Toronto), Montreal district mgr., Moloney Electric Co. of Canada, Ltd., Montreal.

Michaud, Joseph Sylvio Andre, B.Sc.A., (Ecole Polytechnique), asst. engr., heating divn., Directorate of Works & Bldgs., R.C.A.F., Ottawa.

Phillips, Sidney, (Faraday House) of Niagara Falls, Ont.

Pritchard, William Robert, B.A.Sc. (Univ. of Toronto), repair supervisor, Bell Telephone Co. of Canada, Montreal.

Rankin, Robert Arthur, M.Sc., M.Eng., (McGill Univ.), partner, Robt. Rankin & Co., Montreal.

Robinson, Clesson Thomas Miller, B.Sc. (Queen's Univ.), engineer, Paper Mill, Corner Brook, Nfld.

Smith, Walter H., (Toronto Tech. Sch.), chief engr., T. Eaton Co. Ltd., Toronto.

Wales, Charles Clarke, B.A.Sc. (Univ. of Toronto), vice-president and general manager, Hamilton Bridge Co. Ltd., Hamilton, Ont.

Affiliates

Hayhurst, William James, (Queen's Univ.), Armour Plate Dept., Dominion Foundries, Ancaster P.O., Ontario.

Peace, John Thomas, (Central Technical Sch., Toronto), R.S.M., 1st Battalion, R.C.E. Overseas.

Juniors

Martin, Arthur Ley, B.Sc., (Univ. of Manitoba), draughtsman, Aluminum Company of Canada, Montreal.

Narsted, George Kendall, B.Eng. (McGill Univ.), machine tool dsgr., Eaton Wilcox Rich Co., Windsor, Ont.

Transferred from the class of Junior to that of Member

Graham, George, B.Sc., (Univ. of Sask.), consulting engr. to and fire protection engr. for Can. Under. Assoc., and insurance companies.

Transferred from the class of Student to that of Member

Brossard, Leo, B.Sc.A., (Ecole Polytechnique) and M.Sc. (McGill), lecturer, Bureau of Mines, Quebec.

Transferred from the class of Student to that of Junior

Dussault, Jean Edouard, B.Sc.E. (Ecole Polytechnique), res. engr., Dept. of Transport, Pointe aux Trembles, Que.

Leroux, Jacques, B.Sc.E., (Ecole Polytechnique), res. engr., i/c constrn. Mont Joli Aerodrome, Mont Joli, Quebec.

Lochhead, John Starley, B.Eng. (McGill Univ.), shop foreman of small welding and detail department, Dominion Bridge Co. Ltd., Montreal.

Martin, Clifford Davison, B.Eng. (Nova Scotia Tech. Coll.), sales engr., Northern Electric Co. Ltd., Halifax, N.S.

Perry, George Thomas, B.A.Sc. (Univ. of Toronto), asst. to Director, Divn. of Mechanical engrg., National Research Council, Ottawa.

Students Admitted

Bruce, Gordon Wyndham, (Univ. of N.B.), R.C.M.P. Barracks, Fredericton, N.B.

Hayman, William Morris, (McGill Univ.), 3843 Royal Avenue, Montreal, Sub-Lieut., R.C.N.V.R.

Lutes, Eric MacPherson, (Univ. of N.B.), Lady Beaverbrook Residence, Fredericton, N.B.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

A. O. Dufresne, M.E.I.C., has been appointed Deputy Minister of the Department of Mines of the Province of Quebec. Since 1929 he had been Director of the Quebec Bureau of Mines. Mr. Dufresne was graduated in 1911 from the Ecole Polytechnique as a mining engineer, and after post graduate work at McGill University he obtained his degree of Master of Science in 1913. From 1914 to 1929 he was engaged in private practice as a mining engineer and prepared several reports on mining properties.

J. A. Vance, M.E.I.C., councillor of the Institute for the London Branch has been appointed chairman of the Victory Loan Committee for Oxford County in Ontario.

M. E. Hornback, M.E.I.C., has been appointed assistant chief engineer of the Aluminum Company of Canada, Limited, Montreal. Born at Chillicothe, Mo., U.S.A., he was educated at the University of Missouri where he was graduated in 1912. For fifteen months after graduation he was employed as a draughtsman and designer on reinforced concrete railway structures with Chicago, Milwaukee and St. Paul Railway, Chicago, Ill., until February 1914, when he went with the Condron Company of Chicago as a structural engineer on the design of industrial buildings. In 1915, he joined the staff of John S. Metcalf Company, Chicago, as a designer of grain elevator structures. In 1917, Mr. Hornback came to Montreal with the firm of Metcalf and for the following twenty years, until 1937, he was connected with the design and construction of most of the grain elevators in this country. For a few months in 1938 he was employed with Marine Industries Limited and later in the same year, he was field engineer with E. G. M. Cape & Company of Montreal on the construction of concrete wharf cribs. He joined the staff of Aluminum Company of Canada in 1939 as an engineer in the Montreal office.

F. L. Lawton, M.E.I.C., has been appointed assistant chief engineer of the Aluminum Company of Canada, Limited, He was graduated in electrical engineering from the University of Toronto in 1923 and after graduation spent two years with the General Electric Company at Schenectady, N.Y. In 1925 he became engaged, as assistant to the electrical engineer, with the Quebec Development Company and the Duke-Price Power Company. From 1927 to 1930 he was assistant to the superintendent of operation. In 1930 he became electrical engineer with Duke-Price Power Company Limited, now Saguenay Power Company Limited, and in 1938 he was promoted to chief engineer of the Saguenay Power Company Limited, at Arvida, Que.

G. B. Lomer, M.E.I.C., has accepted a position as assistant to the chief engineer with Canadian Car Munitions Limited at St. Paul L'Ermite, Que. He has had extensive experience in the design and maintenance of industrial plants.

R. E. Heartz, M.E.I.C., chairman of the Montreal Branch of the Institute, is at present on the staff of Wartime Merchant Shipping Limited at Montreal. Mr. Heartz is the assistant chief engineer of Shawinigan Engineering Company.

George H. Midgley, M.E.I.C., of Dominion Bridge Company Limited, has been loaned to Wartime Merchant Shipping Limited, Montreal, for several months in connection with their work, after which he will return to Dominion Bridge Company Limited to continue his former duties as sales engineer.

H. A. Wilson, M.E.I.C., has been appointed plant engineer with Canadian Car Munitions Limited at St. Paul L'Ermite, Que. Shortly after joining the firm last year, he had been made chief machine and tool designer. A graduate in mechanical and electrical engineering of the University of Toronto, he has had extensive industrial experience with the following firms: J. C. Wilson Manufacturing Company, Glenora, Ont., Nash Engineering Company of South Newark, Conn., Canadian Fairbanks Morse Company Limited, Montreal, and lately with Stephens Adamson Manufacturing Company of Canada Limited at Belleville, Ont.

F. A. Patriquen, M.E.I.C., is the newly elected chairman of the Saint John Branch of the Institute. He was graduated in electrical engineering from the University of New Brunswick in 1930 and obtained his degree in civil engineering the following year. From 1931 to 1937, he was employed with the National Harbours Board at Saint John, N.B., as a junior engineer. Since 1938, he has been with the Department of Public Works of Canada, at Saint John, first as a draughtsman and now as a junior engineer.

I. F. McRae, M.E.I.C., has been appointed manager of the Peterborough works of the Canadian General Electric Company. Having received his education at Vancouver, B.C., Mr. McRae has been with the company continuously since 1925 when he was an apprentice in the test department. He spent a short time at the Davenport works of the company. After a period of two years in the test department at Peterborough, he was transferred to the engineering department. In 1937 he was appointed assistant to the works manager.

P. W. Greene, M.E.I.C., is now employed on the staff of Dry Dock Engineers, New York City, in the capacity of designing engineer.

H. I. Mulligan, M.E.I.C., is now employed with the New Brunswick Electric Power Commission at Newcastle Creek, N.B. Since his graduation in civil engineering from McGill University in 1926 he has been engaged on several construction projects both as designer and field engineer.

Alexander Scott, M.E.I.C., is now division engineer with the Canadian National Railways at Halifax, N.S. Previously he occupied the same position at Charlottetown, P.E.I.

Lieutenant R. C. Farrow, M.E.I.C., is now serving overseas with the 1st Canadian Survey Regiment. Previous to his enlistment he was district engineer with the Water Rights Branch of the Province of British Columbia.

C. G. J. Luck, M.E.I.C., has been appointed assistant engineer with the National Harbours Board at Churchill, Man.

H. B. R. Craig, M.E.I.C., has joined the staff of the Hydro-Electric Power Commission of Ontario.

H. L. Schermerhorn, M.E.I.C., county engineer and road superintendent, Lennox and Addington Counties, Ont., has received a commission as lieutenant in the Royal Canadian Engineers.

T. Linsey Crossley, M.E.I.C., of Defence Industries Limited, was recently honoured by the Technical Section of the Canadian Pulp and Paper Association by being elected an Honorary Life Member for services in the educational development of the industry.

G. W. Painter, Jr.E.I.C., of the Canadian General Electric Company, Toronto, has received a commission with the First Armored Division Workshop, R.C.O.C.

Major J. G. Spotton, M.E.I.C., has recently been promoted to Major and appointed to command a battery in the 3rd Division. Previous to his enlistment, Major Spotton was

F. A. Patriquen, M.E.I.C.

M. E. Hornback, M.E.I.C.

F. L. Lawton, M.E.I.C.

located in Toronto where he carried on a business of manufacturers' representative in the field of electrical and mechanical engineering equipment.

M. C. Archibald, Jr.E.I.C., has joined the staff of the Montreal Engineering Company Limited at Montreal. After his graduation in electrical engineering from Nova Scotia Technical College in 1933 he was engaged for two years in the newspaper business. From July, 1935, to January, 1936, he was employed by the Maritime Electric Company at Charlottetown, P.E.I. In 1936 he joined the staff of the Public Utilities Commission at Woodstock, Ont., a position which he retained until his recent appointment.

Warren Raynor, Jr.E.I.C., is now located at Amherst, N.S., with the Canadian Car & Foundry Co. Ltd., as a tool designer. He has been with the company since 1940, first at Fort William and lately at Montreal. After his graduation in mechanical engineering from Queen's University in 1939 he served for a year as a demonstrator in the mechanical engineering department at Queen's.

W. G. McKay, S.E.I.C., is now employed with the Department of National Health at St. Catharines, Ont., as an assistant engineer. He was previously a demonstrator in the department of civil engineering at Queen's University where he was graduated in 1940.

H. I. Hamilton, S.E.I.C., is employed in the production department of R.C.A. Victor Company Ltd., at Montreal. He was graduated from Queen's University this spring in mechanical engineering.

Henri Audet, S.E.I.C., is the newly elected president of the students' association at the Ecole Polytechnique, Montreal.

J. G. Pierce, S.E.I.C., has accepted a position with Falconbridge Nickel Mines, at Falconbridge, Ont., upon his graduation from Queen's University last month.

J. R. Dunn, S.E.I.C., has joined the R.C.N.V.R. as a Sub-Lieutenant. Previous to his enlistment he was with Canadian General Electric Company at Toronto. Sub-Lieutenant Dunn was the winner of the John Galbraith Prize of the Institute in 1939.

VISITORS TO HEADQUARTERS

A. H. Gregory, S.E.I.C., from Winnipeg, on April 28th.

J. A. McCoubrey, M.E.I.C., Hadley & McHaffie, from Toronto, Ont., on April 28th.

J. T. Thwaites, M.E.I.C., engineer on switching equipment, Canadian Westinghouse Company Ltd., from Hamilton, Ont., on April 30th.

L. C. Turner, S.E.I.C., from Saskatoon, Sask., on May 10th.

J. D. Rice, Jr.E.I.C., International Petroleum Company Ltd., from Negritos, Peru, on May 12th.

Henrik Mugaas, M.E.I.C., Lamaque Gold Mines Ltd., from Val d'Or, Que., on May 13th.

J. A. Vance, M.E.I.C., general contractor, from Woodstock, Ont., on May 18th.

R. L. Dobbin, M.E.I.C., general manager, Peterborough Utilities Commission, from Peterborough, Ont., on May 18th.

I. M. McLaughlin, S.E.I.C., from Amherst, N.S., on May 19th.

K. M. Cameron, M.E.I.C., chief engineer, Department of Public Works, from Ottawa, Ont., on May 22nd.

O. W. Smith, M.E.I.C., Department of Public Works, from Victoria, B.C., on May 27th.

W. Burri, M.E.I.C., from Port Hope, Ont., on May 27th.

Obituary

Justus Mitchell Silliman, M.E.I.C., died at his home in Kingston, Ont., on April 26th, 1941, after a long illness. He was born in Easton, Pennsylvania, on September 8th, 1885, and was educated at Lafayette College, Easton, where he received the degree of civil engineer in 1907. Upon graduation he came to Canada and joined the Canadian Pacific Railway as an instrumentman. In 1911 he became resident engineer on construction of the South Ontario Pacific Railway. From 1913 to 1915 he was located in Montreal. Later he became district engineer of construction for the Canadian Pacific Railway, and was located at Brantford, Ont. In 1923 he returned to the Montreal office as an assistant engineer. In 1926 he was appointed division engineer at Sudbury, Ont., a position which he retained until his retirement in 1934. He had been living at Kingston, Ont., for the last seven years.

Mr. Silliman joined the Institute as a Student in 1907, and he was transferred to Associate Member in 1912.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

W. P. Augustine, m.e.i.c. *Secretary-Treasurer*
J. B. Dowler, m.e.i.c. - *Branch News Editor*

On April 25th, a meeting of the Border Cities Branch was held in the Prince Edward Hotel. This began with a dinner at 6.30 p.m. Following was a very interesting paper presented by Mr. Cyril R. Cooper, general manager of the Windsor Elementary Flying Training School on the subject of the **British Commonwealth Air Training Plan.** G. E. Medlar was chairman and Mr. Cooper was introduced by J. Clark Keith.

The speaker outlined the object of the plan and its vast size stating that it has been called "Canada's greatest single enterprise." In personnel it is equal to the Canadian Pacific Railway. The early problems of development were covered, the factors affecting selection of sites for schools, and their present extent and use.

The organization and control of the plan were explained along with the equipment used. Then in some detail the speaker followed the career of a man from the time he enlists.

An interesting discussion followed the delivery of the paper after which a vote of thanks to the speaker was moved by E. M. Krebser and the meeting adjourned.

EDMONTON BRANCH

B. W. Pitfield, jr.e.i.c. - *Secretary-Treasurer*
J. F. McDougall, m.e.i.c. *Branch News Editor*

The final dinner meeting of the 1940-41 session of the Edmonton Branch was held on April 22nd. Chairman E. Nelson presided.

After dinner the meeting was called to order and the annual elections took place. The following officers were elected: Chairman, R. M. Hardy; Vice-Chairman, D. A. Hansen; Secretary-Treasurer, F. R. Burfield; Executive, J. A. Carruthers, C. W. Carry, D. Hutchison, B. W. Pitfield, E. R. T. Skarin, W. F. Stevenson, Julian Garrett and E. Nelson, Ex-officio.

The chairman next introduced the speaker of the evening, Mr. D. Hutchison, manager of the Mackenzie River Transport, Hudson's Bay Company. Mr. Hutchison's topic **Compressed Air Its Application in Industry and Effect on Workmen.**

He stated that although compressed air has many applications in engineering he would confine his paper to the use of compressed air in underwater construction. Many foundations could not be constructed, especially in water-bearing strata, without the aid of compressed air. A unique job was done on the Michigan Northern Power Plant several years ago where inclined buttresses were built under twenty feet of water and driven sixty feet to rock. Mr. Hutchison described this work very fully and showed several slides. He had been employed in this job as a diver and had many interesting experiences to relate.

He stated that caisson disease had been until comparatively recently the stumbling block in underwater work. For the last century, work has been carried out with compressed air. At first, pressures were limited to one or two atmospheres, because at higher pressures workmen developed caisson disease which often resulted in death. Successful experiments on the cause and treatment of this disease were performed by Dr. Haldane and the British Admiralty. They proved that caisson disease is caused by the absorption of nitrogen in the blood at high pressures. It was established that saturation and desaturation took about the same time. Based on this, and the assumption that certain parts of the body became 100 per cent saturated in 40 minutes and other parts 50 per cent saturated in 75 minutes, a decompression chart was devised which was considered conservative. This table is now in use in the British Admiralty and in practically all world navies.

By constant development and study the limit of compression today is about 125 lb. per sq. in. in a flexible diving suit. Work was carried out at this pressure during the salvaging of the German Fleet at Scapa Flow. A United States diver at Honolulu descended 306 ft. while salvaging gold bullion from the Laurentic.

Sir Robert Davis' invention of the submersible decompression chamber has alleviated the decompression problem.

In conclusion, he stated, "If we engineers want to avoid legislation that tends to make the work prohibitive from an economic standpoint, our duty is to familiarize ourselves with requirements for safe practice and co-ordinate with contractors and owners."

After a long and interesting discussion period a hearty vote of thanks was tended the speaker. Mr. Hardy thanked the retiring chairman for his excellent work during the year. The meeting adjourned at 9.30 p.m.

HALIFAX BRANCH

S. W. Gray, m.e.i.c. - *Secretary-Treasurer*
G. V. Ross, m.e.i.c. - *Branch News Editor*

Journal readers are aware of the recent honour conferred on our president, Dean Mackenzie, at the convocation exercises of Dalhousie University. President Mackenzie was accompanied to Halifax by Vice-President K. M. Cameron, general secretary, L. Austin Wright, Councillor James Vance, Ross Dobbin, and G. A. Gaherty.

To welcome these guests, the Halifax Branch held a dinner meeting at the Halifax Hotel on May 12th at which 95 members and guests were present. Father Burns, professor of philosophy at Saint Mary's College, was the guest speaker.

Chairman S. L. Fultz introduces the president whose right hand indicates that he is clearing his throat. On his right are Father Leo Burns, Ken Cameron, W. P. Copp, J. B. Hayes.

Father Burns discussed the social reconstruction which took place following the last war and the more difficult problems which will follow the present one. He urged engineers to do their part and keep the ideals of democracy in view. The "isms" which have spread over so much of the world are the result of mistakes which threaten all democractic systems. People must be educated to make of democrary a state based on Christianity, not just a political creed. Canada's past war problems will be great and we must take care that in giving our leaders the right to rule, we do not transfer to the state our individual rights.

President Mackenzie spoke briefly on the contribution of engineers and research workers to the war work. He paid tribute to the unknown engineers and scientists who were at work in the services during peace time and said few people realize how much they had accomplished, but up to the present time scientific or technical men have had very little voice in the direction of the policies of our

The president speaks. The others are, from left to right, Chairman Fultz, Lorn Allan, president of the Association of Professional Engineers of Nova Scotia and Captain F. H. Jefferson.

Facing the camera is Sam Gray, Councillor and Secretary-Treasurer of the branch—and taking it seriously. Next, is a rear view of Geoff Gaherty with Ross Dobbin looking over his shoulder.

governments. He stated that this fact is being realized and corrected in Great Britain and believes the change is one of great importance.

An insight into the problems and progress of the Wartime Bureau of Technical Personnel was given by L. Austin Wright. He asked for an accurate and prompt response to the questionnaire which will soon be distributed to all Canadian engineers.

The final feature of the evening was the motion picture of the Tacoma bridge collapse. A large number of guests were present, chiefly from the services. S. L. Fultz was chairman.

At the graduation exercises of the Nova Scotia Technical College on May 22, the Institute prize was awarded to Harold T. Rose, of St. Johns, Newfoundland. Presentation was made by P. A. Lovett.

HAMILTON BRANCH

A. R. Hannaford, m.e.i.c. - *Secretary-Treasurer*
W. E. Brown, jr.e.i.c. - *Branch News Editor*

A joint meeting of the Branch was held with the Toronto Section of the American Institute of Electrical Engineers in the Westinghouse Auditorium on the evening of April 18th. The speaker, Mr. C. A. Powel, manager of the Engineering Department, Westinghouse Electric and Manufacturing Company, Pittsburgh, and a Member A.I.E.E., addressed the meeting on the subject, **Electricity in National Defence.**

Mr. Powel said that the immediate problem before the United States is to establish the means of producing weapons of war—more factories, munitions, machine tools, steel and electricity.

The major factories are making considerable direct war material for the Army and Navy but another great contribution, at the moment, is the supply of normal products to others who are expanding their facilities to provide the sinews of war.

To illustrate his address, the speaker showed slides of turbo-generators, hydro-electric generators and other apparatus important to power distribution in factories turning out defence products. One slide showed a 40,000 hp. motor recently completed by the Westinghouse to drive a fan to create a 400-mile per hour gale for certain war purposes.

Mr. Powel told of having seen, in Germany, in 1938, large transformers which had been built by the order of the Government in standardized form. He related how the three large electrical concerns of Germany had been made to pool their resources to complete this transformer. The transformer is mounted on railway trucks and is instantly available anywhere in the country.

W. A. T. Gilmour, chairman of the Hamilton Branch, opened the meeting and introduced Dr. J. H. Thomas, chairman of the Toronto Section of the American Institute of Electrical Engineers. Dr. Thomas introduced the speaker, who, previous to his present position, has seen service in France, Japan, England and the United States. He was born in 1884 in Rouen, France, of Welsh parentage and was educated in Switzerland.

After a very interesting general discussion, S. Shupe moved a vote of thanks to the speaker.

KINGSTON BRANCH

J. B. Baty, m.e.i.c. - *Secretary-Treasurer*

In order to give a larger number of science students the opportunity of hearing Mr. Otto Holden, Chief Hydraulic Engineer of the Hydro-Electric Power Commission of Ontario, and on account of the brief period of time which the speaker could spend in Kingston, a joint meeting with the Queen's University Engineering Society (student organization) was arranged, in place of the usual dinner meeting, for Thursday evening, March 13th.

Approximately sixty members of the two organizations gathered in the amphi-theatre of the Medical Building at Queen's University to enjoy Mr. Holden's lecture on **The Ogoki River and Long Lake Diversions.** Professor D. S. Ellis, member of Council, took charge of the meeting and introduced the speaker in the absence of the chairman, T. A. McGinnis.

Normally the waters of the Ogoki River, which lies to the north of Lake Nipigon, and that of Long Lake, some distance further east, flow north into James Bay. Studies made by the engineers of the Commission indicated that it would be quite feasible to divert water from both these bodies into channels which would carry it into Lake Superior and where it could be used in the power plants at the Sault, then at Niagara and later along the St. Lawrence if it were so desired.

Prospective shortage of power more or less compelled the Commission to proceed with the project which now is practically complete. The result is that an increased flow over that defined by the international treaties, already in force, is availbale for the Canadian plants on the international rivers. The United States magnanimously agreed that this power might be immediately available for use in these plants.

Mr. Holden described in detail the topographical features involved in the scheme, and then discussed some interesting structural and hydraulic details in relation to the dams and weirs required. He explained a very interesting economic study which was made in order to determine how far the diversion of water should go, so that the greatest good might be derived from it.

One point of particular interest was the care taken in all the designs so that if it should ever be deemed expedient to redivert the water again into its original channels to the north, it could be done at once.

Following the explanation of the project, Mr. Holden showed several reels of motion pictures, in technicolour, of the various points of interest. These portrayed magnificently the colour and movement in the forests, streams and lakes of that country during the early summer.

At the conclusion Murray Luscombe, president of the Engineering Society, expressed to Mr. Holden the deep appreciation of the audience for his very interesting talk, and also for the personal sacrifice which he made in coming to Kingston when his own work was so heavy.

LAKEHEAD BRANCH

H. M. Olsson, m.e.i.c. - *Secretary-Treasurer*
W. C. Byers, jr.e.i.c. - *Branch News Editor*

The regular monthly meeting of the Lakehead Branch was held in the City Council Chambers in the Whalen Building, Port Arthur, on March 20th at 8.15 p.m. The meeting was attended by twenty-five members and guests. The vice-chairman, B. A. Culpeper, presided at the meeting in the absence of H. G. O'Leary. G. R. Duncan introduced the speaker of the evening, Mr. R. B. Chandler, manager of the Port Arthur Public Utilities Commission, who spoke on **The Ogoki and Long Lac Diversions.**

The speaker reviewed the water power resources of Canada. Ontario and Quebec, the most thickly populated and highly industrialized provinces, contain about 60 percent of the water power resources. Canada's potential water power is 44,126,000 hp. of which, in 1940, only 19.4 per cent had been developed.

Ontario with potential waterpower totalling 9,200,000 hp. has 28.2 per cent installed turbine capacity, one-half of this installed capacity being operated by the Hydro-Electric Power Commission.

To keep up with increasing load conditions the Hydro engineers have investigated the feasibility of diverting water from inaccessible watersheds to others more favourable to development. Since July, 1939, 1,000 cu. ft. per sec. have been diverted from Long Lac at the headwaters of Kenogami River, a tributary of Albany River emptying into James Bay, and made to flow south into Lake Superior. Two concrete dams were required to control the tributary watershed. One dam is located at the height of land, 15 miles north of Long Lac, on the Kenogami River, being 68 ft. high and 296 ft. long and impounds an area of 62 sq. mi. The second dam is located five miles south of the upper end of Long Lac and is used to regulate the flow into a new channel to Lake Superior which also provides an economical transport for pulpwood. Long Lac being 425 ft. above Lake Superior provides a potential power of 20,000 ft. The cost was about $1,300,000.

The possibility of diverting the Upper Ogoki River into Lake Superior was first suggested to the Hydro by Mr. R. Keemle, a Canadian engineer. It was later found economically feasible to develop. The development includes the construction of a main dam at Waboose Rapids on the Ogoki River, to raise the water level sufficient to divert the river flow above this point across the height of land from Mojikit Lake and other adjoining lakes, through a series of small lakes into Seymour Creek flowing into Lake Nipigon. A control dam will be located near the entrance to South Summit Lake and several new channels provided between lakes to Seymour Creek. The estimated cost is $5,000,000. The main dam will be 50 ft. high with crest width of 1,700 ft. The drainage area of the Ogoki River above Waboose Rapids is about 6,000 sq. mi. with runoff about 4,000 cu. ft. per sec.

The water from the Ogoki River reaching the Great Lakes would mean an additional turbine capacity of 352,000 hp. made available.

The apparent economic benefits are: (1) Increase in power resources with an annual revenue of about $7,000,000; (2) More timber resources made available; (3) Benefit to shipping on Great Lakes of about $1,000,000 annually, by increase of water level of 2 to 2½ in.

In the Thunder Bay system the present safe operating capacity is 110,000 hp. and with the added flow from the Ogoki River, 120,000 hp. could be supplied without materially increasing the capital investments in the present generating plants and transmission lines.

Mr. Bird gave a vote of thanks to the speaker and a period of discussion followed.

LONDON BRANCH

H. G. Stead, jr.e.i.c. - *Secretary-Treasurer*
A. L. Furanna, s.e.i.c. - *Branch News Editor*

The regular monthly meeting of the Branch was held on Thursday, April 17th, 1941. This meeting was arranged by the Junior Engineers Committee of the Branch and presided over by its chairman, M. C. Archibald. Papers were presented by three of the Junior members, H. G. Stead, chief engineer for E. Leonard & Sons, H. F. Hertel of the Department of Public Works, and A. L. Furanna of the Public Utilities Commission.

Mr. Stead spoke on the **Progress and Development of Power.** He traced the growth of this industry from its infancy in the time of James Watt to its present prominence in the modern world of machines.

A very timely subject was chosen by Mr. Hertel, **Some Things That Might Help Win the War.** In his paper Mr. Hertel stressed the value of deception and camouflage. He also proposed some new methods of armour design which were intended to reduce the effectiveness of enemy fire.

Mr. Furanna's paper was on **London's Low Voltage Network System.** He gave a general description of the system with particular emphasis on those features which guarantee the network's excellent performance.

The discussion which followed each of the papers was evidence of the great interest taken by the senior members.

Mr. H. F. Bennett closed the meeting. He thanked the young men for their efforts and expressed the hope that in the future the Junior Engineers would take an active part in the Branch affairs.

MONCTON BRANCH

V. C. Blackett, m.e.i.c. - *Secretary-Treasurer*

On April 22nd the Tacoma bridge films were shown at a joint meeting of Moncton Branch and the Engineering Society of Mount Allison, held in the Science Building of the University at Sackville. About 150 were in atttendance, composed of branch members, engineering students and the technical staff of the Robb Engineering Company,

At head table we have the president, Chairman Condon, Councillor George Smith and Vice-President K. M. Cameron.

Amherst, N.S. C. J. Fear, president of the Engineering Society, was in the chair.

Before the films were screened, C. S. G. Rogers, bridge engineer, Atlantic Region, Canadian National Railways, reviewed the main features of suspension bridge design and methods used to overcome defects inherent in that type of structure. Ample provision had been made in the Tacoma

Left to right: R. L. Dobbin, H. J. Crudge, J. A. Vance, C. S. G. Rogers and E. Larracey. On Mr. Dobbin's right was Mr. E. L. Miles, who does not appear in the photograph.

design against sidesway, said Mr. Rogers, but the collapse of the bridge was caused by vertical undulations, and apparently no system of diagonal stay cables to prevent this had been included in the design. In the opinion of the speaker, two main cables per side, with different sags, would have gone a long way towards dampering the undulations and saving the bridge.

The showing of the films was followed by a lengthy discussion. A vote of thanks to Mr. Rogers was moved by Dean H. W. McKiel.

The Presidential Visit

On May 14th, the Moncton Branch was honoured by a visit from the president of the Engineering Institute of Canada, Dr. C. J. Mackenzie. Travelling with the president were Vice-President K. M. Cameron, General Secretary L. Austin Wright, Councillor James Vance and the Chairman of the Peterborough Branch, R. L. Dobbin. In the afternoon, the presidential party, accompanied by branch

From right to left: J. E. Gibault, V. C. Blackett, sec.-treasurer of the Moncton branch, G. L. Dixon, president of Association of Professional Engineers of New Brunswick, A. R. Bennet, E. R. Evans, T. H. Dickson, E. B. Martin.

officers and Councillor G. E. Smith, visited the Moncton Airport and Air Training School. They were then taken to what the president later described as our "crazy" magnetic hill. Visitor's comments were extremely guarded, as automobiles, with engines dead, coasted uphill (?) and water in the ditches ran in the same direction. Apparently it was not safe to motor in that vicinity without a level.

In the evening, a dinner meeting was held at the Riverdale Golf Club. F. O. Condon, chairman of the branch presided, and at the conclusion of the dinner, called upon C. S. G. Rogers to introduce the president. In his address, Dr. Mackenzie spoke of the advantages of membership in the Institute. He emphasized the personal contacts made possible and declared that therein lay the real value of Institute connection. Explaining the work of the National Research Council, of which he is the acting head, the president told of the important part played in working out problems in the designing of equipment for the armed forces of the nation in their fight against Axis aggression.

Left to right: N. B. Eagles, E. M. Nason, R. H. Emmerson, R. W. Laskey, E. B. Martin.

General Secretary Wright dealt with the work being carried out in connection with the organization of the Wartime Bureau of Technical Personnel, of which he is assistant director. The function of the Bureau will be to provide wartime industry with skilled engineers, who by their present employment have been trained to take an active and useful part in the wartime industry of the nation.

Heard in lighter and humourous vein, were K. M. Cameron, James Vance, R. L. Dobbin and T. H. Dickson.

Nominations were then called for branch officers for 1941-42. F. O. Condon was nominated to act as chairman for a second term. H. J. Crudge was named vice-chairman, and V. C. Blackett, Secretary-Treasurer. E. R. Evans and E. B. Martin were nominated to fill two vacancies on the Executive Committee.

MONTREAL BRANCH

L. A. Duchastel, m.e.i.c. *Secretary-Treasurer*

On February 20th, Mr. R. L. Martin spoke on the **Development of Transport Mechanization** and illustrated his talk by lantern slides. A courtesy dinner was offered the speaker who is now serving with the Inspection Board, Department of National Defence, in Ottawa.

Mr. E. W. Knapp described a system for locating faults in transmission lines in a talk entitled **Transmission Line Fault Location** given on February 27th. He explained the electrical theory and by means of slides illustrated the results obtained in practice.

The assistant to the president and director of public relations of General Motors of Canada, Mr. R. D. Kerby, spoke on **Automotive Industries War Effort** on March 6th and supplemented his talk with a film entitled "Motors on the March." The evening was preceded by a courtesy dinner.

On March 13th, **Destruction Forces, Damage and Repair** was the subject of a paper by Mr. John Dibblee, assistant chief engineer of the Hydro Electric Power Commission of Ontario. The paper dealt with the destructiveness of the forces of nature in relation to hydro-electric plants and transmission lines and the methods employed to repair the damage. A courtesy dinner was given in honour of the speaker.

Methods now in use by the Department of Highways of Ontario for utilizing steel sheet piling and steel bearing piles for bridge foundations, thereby dispensing with expensive coffer-damming and unwatering operations, were described on March 20th by Mr. A. Sedgwick in a paper entitled **Departures in Bridge Foundation Construction.** The talk was preceded by a courtesy dinner.

Utilization of the Power Resources of the Upper St. Maurice River was the subject of a talk delivered by Mr. E. V. Leipoldt on March 27th. The author reviewed the electrical development of power on the St. Maurice river and its bearing on the design of the more recently constructed plants.

On April 3rd, **War Time Communications** were discussed by Messrs. G. L. Long and J. L. Clarke of the Bell Telephone Company. A comparison was made between communication facilities used for war purposes in the past and their modern counterparts in use to-day.

Improving Operations in Industrial Plants was the subject of a talk given on April 17th by Mr. W. T. Johnson of the George S. May Company, Management and Industrial Engineers of New York. A courtesy dinner was held at the Windsor Hotel.

On April 24th, Mr. Roy A. Crysler, of the Canada Cement Company, Toronto, gave a paper entitled **Soil-Cement Paving** which was illustrated by a coloured movie of the soil-cement runway construction at Camp Borden, Ontario. A courtesy dinner was tendered the speaker before the meeting.

On April 17th a drive was started by the Montreal Branch to collect $4,000 amongst its members to defray part of the cost of repairs to the foundations of headquarters building. The response has so far been excellent and at the time of writing the objective is in view.

Junior Section

On March 17th, Mr. W. B. Morrison addressed the Junior Section on **Some Aspects and Problems of Television Broadcasting.** Last year, Mr. Morrison gave a number of demonstrations on Television Broadcasting, after spending six months at Camden, N.J., on experimental research.

Mr. A. Monti gave **A Simple Explanation of Ship Model Testing** on March 31st. His paper dealt with the principles, use and procedure of hull model testing and pertaining problems. A description was given of the work conducted by the author, at the Hydraulic Laboratories of l'Ecole Polytechnique, on a hull model of a torpedo boat.

NIAGARA PENINSULA BRANCH

G. E. Griffiths, m.e.i.c. - *Acting Secretary-Treasurer*
C. G. Cline, m.e.i.c. - *Branch News Editor*

The Ontario Chapter of the American Society for Metals and the Niagara Peninsula Branch of the Institute held a joint dinner meeting at the Leonard Hotel, St. Catharines, on May 16th, with an attendance of 180. Messrs. H. Thomasson, chairman of the Ontario Chapter, and A. L. McPhail, vice-chairman of the Niagara Peninsula Branch, acted as joint chairmen for the meeting. The speaker, Mr. O. W. Ellis of the Ontario Research Foundation, described certain researches on **Forgeability**, as applied to both ferrous and non-ferrous metals, using 27 lantern slides to show the results obtained. It is expected that his paper will be printed in an early issue of the *Journal*. The speaker was introduced by Mr. N. Metcalfe. Mr. J. W. Watson, chairman of the entertainment committee of the Ontario Chapter, provided also a movie talkie, "Tobacco Weather," supplied by Tuckett Tobacco Co., which showed the growing and processing of tobacco in Ontario. The attendance prize, donated by the Canadian Westinghouse Company, was won by Mr. A. L. McPhail.

PETERBOROUGH BRANCH

A. L. Malby, jr.e.i.c. - *Secretary-Treasurer*
E. Whiteley, s.e.i.c. - *Branch News Editor*

At their final technical meeting for the 1940-41 season, on April 24th, members of the Peterborough Branch heard an excellent paper by their secretary, Mr. A. L. Malby, on the subject, **Carrier Current for Peak Load Control.** A brief summary follows.

The flat-rate water heater has become very popular as a profitable form of off-peak power consumer. Quite early in its use, however, it was found that some control was needed to remove the heaters during peak periods. A pilot wire system is expensive for the number of heaters found on an average distribution system so the carrier current control was developed. In this, a high frequency impulse is transmitted over the distribution lines of such a low voltage that the ordinary loads on the system do not absorb appreciable power from the high frequency source, but tuned relays respond to the impulse and control the water heaters.

Experiments have shown the best carrier frequencies to be less than 1,000 cycles per second. Higher frequencies are desirable from the standpoint of the source of the frequency for then vacuum tube oscillators can be used. But at economical frequencies of this kind the response of distribution systems varies with the load on the system. Many installations now use 720 and 480 cycles with a small alternator as the source of power.

Several types of relay are used. All employ tuned circuits or tuned reeds as the frequency selective element. The latter have been popular in Europe. In Canada, however, the tuned circuit relay is now used a great deal. Mr. Malby then demonstrated the type of relay used by the Peterborough Public Utilities Commission, using impulses sent out from their central sub-station in a pre-arranged order.

There are several methods of superimposing the carrier on systems and these were explained with illustrated slides. Finally a few views of installations gave all a picture of the actual equipment used in this work. Mr. Malby has done a great deal in the development of this equipment for a number of Canadian cities, which probably accounts for the interesting story he told and the way he could tell it.

SAINT JOHN BRANCH

V. S. Chesnut, m.e.i.c. - *Secretary-Treasurer*

The Saint John Branch held its Annual Meeting and Dinner at the Admiral Beatty Hotel on Friday, May 16th. The attendance at the meeting was 10 and 43 attended the dinner.

The business meeting was held at 5 p.m. and the following officers were elected: Chairman, F. A. Patriquen; Vice-Chairman, D. R. Smith; Secretary-Treasurer, V. S. Chesnut; Executive, H. P. Lingley and W. B. Akerley.

An Engineers' Demolition Committee was appointed to act in conjunction with the Air Raids Precaution Committee of the City of Saint John.

At the dinner, the branch was honoured by the presence of the president of the Institute, Dr. C. J. Mackenzie. Other guests were K. M. Cameron, vice-president for Ontario, councillors J. A. Vance and Huet Massue, General-Secretary L. Austin Wright, R. L. Dobbin, chairman of the Peterborough Branch, G. A. Gaherty, a member of the Finance Committee, Capt. J. E. W. Oland, D.S.C., R.C.N., officer in charge of the Naval Control Service at Saint John and Brigadier G. G. Anglin, D.O.C. Military District No. 7.

Retiring Chairman J. P. Mooney poses with the newly elected chairman, F. A. Patriquen, and Sec.-Treasurer Victor Chesnut.

Dr. Mackenzie emphasized the necessity for unity in the engineering profession, and said that "the struggle against disunity is the greatest problem in the world today, and it is a struggle which the engineering profession must win in order to keep the mechanized materials of war moving across the Atlantic to embattled Britain." He referred to

Head table, left to right: Dr. C. J. Mackenzie, F. A. Patriquen, K. M. Cameron, A. A. Turnbull, Brigadier G. G. Anglin, J. A. Vance.

The army and navy were out in force. Left to right: Alex. Gray, Capt. J. E. W. Oland, Lt. Anderson, Brigadier G. G. Anglin, Capt. G. Y. Dow, Lt. G. A. Mackie, Lt. W. B. Akerley, Lt. D. Adams.

Left to right: Brigadier G. G. Anglin, K. M. Cameron, Alex Gray.

Doc Smith talks with L. F. Harding while F. P. Vaughan eavesdrops in the background.

Left to right: J. A. Vance, Oscar Wolff, Geoff Stead.

Commander Oland "tells all" to the amazement of Geoff Gaherty.

At Fredericton Junction, left to right: Prof. John Stevens, University of New Brunswick, G. A. Gaherty, J. A. Vance, J. B. Challies, C. J. Mackenzie, O. Wolff, on steps of car, R. L. Dobbin, T. C. MacNabb of C.P.R.

the men of the merchant marine as the greatest heroes of the war and said that "with the help of these gallant men of unconquerable spirit, together with unity in our profession and nation, we will win this engineer's war," and that the time it will take and the price to be paid is immaterial.

Mr. Wright spoke of the work of the Wartime Bureau of Technical Personnel, which was set up by the Dominion Government as a means of classifying the qualifications of the technically trained men of the country. It is hoped, by this means, that more effective use may be made of these men in the war effort.

The other guests were introduced by the chairman, and spoke informally.

On the following day, May 17th, a regional council meeting was held, to which the branch executive and senior members of the branch were invited.

ST. MAURICE VALLEY BRANCH

C. G. de Tonnancour, s.e.i.c. - *Secretary-Treasurer*

The St. Maurice Valley Branch of the Institute held a very successful meeting on April 29th at the Laurentide Club in Grand'Mere with an attendance of approximately ninety members and friends.

The guest speaker was Dr. P. T. Pratley, noted author on bridge design who gave a brief outlook on the design of suspended bridges, in a very witty and understandable way. He indicated to his audience what were, in his opinion, the weak points in the Tacoma Bridge which led to its ultimate destruction.

The queer and absolutely incredible behaviour of "Galloping Gurtie", which he had described, was shown to the audience by the means of two sensational motion picture films, which the Institute had recently acquired.

Dr. Pratley then proceeded with slides and some of his own films to illustrate the design and erection of a similar structure, the Lion's Gate at Vancouver, which he designed. These depicted very well the various problems which confront the engineers in this type of work and how they were solved successfully.

The speaker was introduced by E. B. Wardle and thanked by Professor H. O. Keay.

SAULT STE. MARIE BRANCH

O. H. Evans, Jr.E.I.C. - *Secretary-Treasurer*
N. C. Cowie, Jr.E.I.C. - *Branch News Editor*

The fourth general meeting for the year 1941 was held in the Grill Room of the Windsor Hotel on Tuesday, April 22nd, when twenty-three members and guests sat down to dinner. The business portion of the meeting began at 8.00 p.m. with E. M. MacQuarrie presiding.

The chairman called upon the speaker of the evening, Judge J. H. MacDonald, who had for his topic, **The St. Lawrence Deepening and Its Possibilities.**

In his opening words the judge said it was always a pleasure for him to meet with engineers as they had a different aspect on life than the legal profession. The law could not claim the exactitude of science but its rules were based on the lengthy experience of human nature.

He felt that with the completion of the St. Lawrence Waterway, the products of the interior could reach the markets of the world more readily and cheaper, also imports could be brought to the heart of the continent in a more convenient manner.
