PREPARING GAME FOR MARKET.—Poultry should be fat, and kept for twenty-four hours from food before killing, to have the crop empty. Food in the crop soars, blackens the skin, injures the sale of the article, and buyers will not pay for this useless weight. Opening the vein in the neck, or bleeding in the mouth, is the proper mode of killing. If bled inside the throat, the bills should be pried open with a piece of chip, and the poultry hung up by the feet prevent bruising. The head and feet should be left on, and the entrails in. The flesh should not be mutilated in any manner. Turkeys and chickens dry picked keep much longer and sell higher than the scalded. If the picking is done by scalding, the water should be heated just to the boiling point, and the poultry held by the feet, dipped in and out the water four or five times, counting three each time in or out. The work should be done neatly, quickly, and thoroughly. After picking, hang up the poultry by the feet in a cool, dry place, till the animal heat is out, and the poultry thoroughly cold and dry. Avoid freezing, as poultry will not keep long after thawing. Wrap in thin, light, strong paper. Brown and dark, heavy paper, having too much acid in it, injures the poultry. The head should be wrapped separately. Always pack head downwards. This throws the soft entrails on the breast bone, the poultry keeping longer in this position. Pack in clean, dry, tight boxes. After being killed, should have all the feathers picked off, then rubbed all over with fine rosin, after which dip them in boiling hot water in and out seven or eight times, then rub off the pin feathers, after which wash off the fowl with warm water, using soap and a hard brush. Immediately after rinsing them well in cold water, then dip them up by the feet in a cool, dry place till they are thoroughly dry, when they can be wrapped and packed as before suggested. Poultry thus dressed and packed will, in moderately cold weather, keep sweet and fresh for fifteen to twenty days, and can be shipped from the extreme West with safety by freight. Never pack poultry in straw, as in damp or warm weather it causes it to sweat and heat.

Game, deer, rabbits, coons, opossums, and squirrels should be opened, and all the entrails taken out, leaving only the kidney fat; then the insides should be wiped perfectly dry with a soft, clean cloth, after which wrap in small game in paper, packing back downwards.

Wild turkeys, ducks, geese, grouse, pheasants, quail, pigeons, and birds of all kinds should always have the entrails left in them, and the head and feet on. They should never be mutilated in any manner. Drawn birds sour in a short time, and sell for less than the undrawn, even if sweet. Wrap the head

separately in paper, then the body. Pick head downwards in tight, clean barrels, the same as poultry.

Shippers should remember well that all game and poultry should be thoroughly cold before being packed, otherwise it will soon sweat and heat. Barrels are the best packages that shippers can ship in.—*Jesse Gilmore.*

THE LION IN HIS OLD AGE.—When a young lion reaches the age of two years he is able to down a horse or an ox; and so he continues to grow and increase in strength till he reaches his eighth year, when his talons, teeth, and mane are perfect, and he grows no more. For twenty years after he arrives at maturity his talons and fangs show no signs of decay; but after that he grows "chubbish." He is no longer a match for the tremendous buffalo; he prowls around the cattle kraals, and snatches a lamb or a kid, just as he did when he set out with his parents nearly thirty years before. A woman or a child at night shares the same fate. His strength and sight now decline more and more, till the mighty lion grows lean and mangy, and crawls about from place to place eating any offal he can pick up, and despising not even so small an animal as the field mouse; and starves or dies, or is felled on and slaughtered by a few cowardly hyenas, or is discovered, unable to move, beneath a tree, and knocked on the head by some wandering Kaffir.

—The experiments with the Peabody rifle have not caused the experts to admire it as they might, owing to its kicking power; but this fault is now, it seems, thrown on the cartridges, which were provided by the State. It is proposed in future to use the Berdan cartridges, which are claimed to be thoroughly fitted for the breech loaders of the Peabody pattern.

—The question whether snakes eat toads is answered affirmatively by a writer in *Naturalist*, who speaks from direct observation. Having discovered a garter-snake eating a toad, he struck the creature with a sharp blow with a stick, and out flew a medium-sized toad. Before the blow only the hind feet of the toad were visible, protruding from the snake's mouth.

HILBRO HOUSE, West Kirby, Cheshire, England, November 10, 1874.—*Editor Forest and Stream*.—I give you much credit for the dignified and high-toned way in which you distinguish the FOREST AND STREAM. We all read your various correspondent's articles with much profit and pleasure. Wishing you and your efforts to give a high and lofty tone to the true gentlemen of the sporting world may crown your paper with complete success, I am, dear sir, yours, faithfully, G. DE LANDER MACDONA.

HURST'S
Natural History
For Object Teaching in Schools,
AND
PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers
of the first series of
Animals and Birds of North America.

To these will be added a second series of foreign specimens,
and various Animals and Birds in grotesque at-
titudes, never before exhibiting their natural instincts,
and various Animals and Birds in grotesque at-
titudes from nature. One of the great moving ele-
ments in our modern system of education is object
teaching. The meretricious character of the stereoscope
transfers the animals and birds from their natural
habitat to the rooms of the student, and the freedom of
our home, where they cannot fail to leave a lasting
impression of the form, color, habits, and locality of
each specimen.

An experience of more than twenty-five years as
Taxidermist of the New York State Cabinet of Natural
History, and in gathering his large collection of nat-
ural specimens, enables Mr. Hurst to transfer to
nature in every view the locality of their natural
combine in with appropriate rocks, woods or water, and coloring
from the original life.

- 1. Wild Cat or Bay Lynx..... *Lynx Eryx.*

The above is a list of the first 60 numbers of the
series. Back numbers and parts of sets always on hand.

TESTIMONIALS.
CONNELL UNIVERSITY,
ITHACA, March 14th, 1870.
I must congratulate you upon your recent success in
this new educational enterprise. If you assure our
unanimous assent so as to make them impart interest
to the mind, it will be a step in advance in edu-
cation.
EZRA CORNELL.

WASHINGTON, D. C., March 15th, 1870.
I am much pleased with the success you have met
with in giving to the stuffed specimens a very decided
appearance of life.
I hope you may be able to continue the Series, and
I have no doubt they will furnish interesting means
of instruction and instruction in the study of the wild
animals of New York.
SPENCER F. BAIRD.

STATE HOUSE, BOSTON, Mass., March 15th, 1870.
I have examined carefully the "Stereoscopic Studies
of Natural History," and judging by the first ten num-
bers, should say that they will prove of very great
value, both as object lessons for students, and as an in-
teresting series for the parlor stereoscope. The de-
scriptions, positions, and color of the different groups,
and the general treatment are most perfect. I cordially
recommend them to the public attention, and trust
you will meet the same success in the sale of them
you have carried.
EDWARD A. SAMUEL,
Curator of Zoology in Mass. State Cabinet.

PEABODY ACADEMY OF SCIENCE,
SALEM, Mass., March 19th, 1870.
I have shown your Stereoscopic Views to the Direc-
tors of the Academy and the editors of the "American
Naturalist." Dr. Packard and Mr. Morse.
They are much pleased with the natural truthfulness
and the taste which you have displayed in surround-
ing the specimens with natural objects and scenery of
characteristic features. They are certain that they
not only as parlor and draw room illustrations, but
as educational illustrations, or the use of schools and
colleges, than anything we have yet seen.
A. HYATT.
CONNELL UNIVERSITY, PRESIDENT'S ROOMS,
ITHACA, March 19th, 1870.
I have received the Stereoscopic Views of objects in
Natural History, and have enjoyed them greatly.
They have surprised me who have seen them. They
wonderful in their beauty, both as regards the animals and
their surroundings, and I think they can not fail to be
of great service to the student of Natural History, by
attracting students to it, and next by perfecting their
knowledge of it.
ANDREW D. WHITE.

FOR EXPLODING
HUNTING, FISHING, TRAPPING
American Wild Fowl Shooting.
BY JOSEPH W. LONG.
Describing the habits, habits, and methods of
shooting wild fowl, with instructions concerning
guns, birds, baits and decoys; the training of water
retrievers, &c.
This book is written in plain English, and in a most
attractive style. A broad, and at the same time ac-
curate view, is taken of duck shooting in all parts
of the country. The habits and feeding grounds of the
wildfowl, blue-winged teal, pintail, wood, gadwall,
and coverts; red-head, buff-head, and other
kinds of ducks, geese, swans, &c., have been carefully
and ingeniously studied and given to the reader.
In thirty chapters the author has furnished infor-
mation for the young, as well as for the practical
sportsman.

For Forest and Stream.
HERALDS OF WINTER.

WINTER'S dread heralds come again,
As southward sinks the pale, shorn sun;
From frowning clouds pours the chill rain,
The latest harvest lacks is done;
The winds grow keen and high, and loud,
And whist on high the rustling leaves,
The proud old forest, chafed and bowed,
The vanished pomp of Summer gives.

O'er the lone woodland path no more
Linger light and cool the graceful scene,
But dark, and staid, and blistered o'er,
Tendrils, and vine, and trunk are seen.
E'en the shy rill, whose Summer song
Was fainter than the pine's low sigh,
Now swells suddenly and strong,
With stormy voice goes foaming by.

Nor herd nor scattered flock is seen
Dotted the pastures far and wide,
But groning by the high bank's screen,
Or crooning by the forest's side,
With plaintive bleat and lowing call
They heg the shepherdman prepare
The littered sheds and sheltering stall,
'Gainst the chill sleet and sharp 'ning air.

The wild geese by the North's broad lakes
With presence keen the warning lead,
And with her well reared young forakes
Her Summer haunts of whispering reeds;
The monarch's signal note is given,
A thousand throats respond the cry,
And instant up the darkened heavens,
Southward the marshalled columns fly.

No birds fulfil such cheerless time,
Save the hoarse crow, or shrill, pert Jay;
Their wings have sought a sunnier clime,
Their blithe, glad song is far away;
The harder few which dare to bide
Winter's dread reign, now venture near
The haunts of men, with banded pride
And stealthy wing, and mien of fear.

And thus have vanished, one by one,
Along our pathway, bird and flower;
The solemn wood is drear and lone,
And frosts have ravished field and hower;
But shall the stern invader's threat
Cause us to other climes to roam—
His silent seal of foe be set
Upon our pleasant Summer home?

No! Though the storm is wild without,
The genial fire within is bright,
And light, young hearts shall crowd about
Our warm and cheerful hearths to-night;
And friendly converse, tale and song,
Which makes the charmed sitting late,
Shall bind all hearts and make them strong
To brave or bear each adverse fate.

And dear old books that torpid sleep
On bookcase shelves through Summer hours,
Shall yield new meaning, clear and deep,
And hearts long cold commune with ours;
The great, the good, the shrined of yore,
Crowned monarchs of the realm of thought,
At bidding shall reveal the lore,
With which their matchless minds were fraught.

And mightiest birds, whose words of fire
Blaze on undimmed through countless years,
Shall strike once more the slumbering lyre
From their high throats amid the spheres.
Such are my friends, although no lords
Of vassals, lands, or storied halls,
They come like guests around my board,
Familiarly with my humble walls.

Can Spring, with all its hoarded green,
And birds and flowers and murmuring bees,
Or Summer, with its glare and sheen,
Yield to the soul such joys as these?
No! They but lure the eye and ear,
And tempt the restless foot to roam,
While Winter, when her skies are drear
Sends to the heart a heaven at home.

KEUKA.

November, 1874.
—Live oak is fast disappearing from our forests, owing to the large quantity exported. The total destruction of this valuable tree should be checked by an act of Congress,

For Forest and Stream.
Three Weeks on the Wagneteuan.

NUMBER TWO—WOLVES AT NIGHT.

IT was the second week of my stay at the lovely Sheep Lake. We had troiled its different shallows and deep waters, respectively, from the rocky bluffs of East Island, under which the bass lay in multitudes, seeking the small shrimps along the stony bottom, to the extreme upper end of the lake, where the river flows in amid long lines of pickerel weeds and lily pads; here it is shallow and still, except directly where the channel cuts in, and among the tangled mass and on the horder of the deep water, the immense pickerel, that fresh water shark, lies in wait, or prowls up and down his "beat" like the grim scintled that he is. It required no skill to take those fish. With Jenkins at the paddle and a common spoon trout, I have dragged them up to the canoe by simple main force until wearied with the sport, always taking care to return at once to the water what were not wanted. We had been taking things easy all day, and after our early but hearty supper had been discussed and Ned and I were, as usual after meals, lying outside the shanty on our blankets, reducing our stock of "tobac," I felt strongly inclined towards an excursion by moonlight up the lake for a deer. Jack hunting was not new to me, but never having killed a deer by moonlight, I was tempted to try.

"What say you Ned," said I. "Would there be much show to-night along the marsh for a buck; we want meat."
"Yes," drawled he. "We'll keep waiting until to-morrow, I reckon; you'll git no deers when the moon blazes like it will by nine o'clock; you see there's nary cloud, and it was too light last night, you know; we might have had one to-day if we tried a liddle harder," (a dig at me.)

"Well, I suppose so," replied I, "but we had enough for two or three good cuts left, and won't starve now, I hope, but we saw four or five last night, and—"

"Got nary one," broke in he. "Them deers 'll see quick as you do them when we move around, but we can run up to that point and lay in the shade of the big pine and meb-be git a whack at the fellow we seen night before last."

"Why, you don't expect to see the same one, Ned, do you?" exclaimed I. "That deer may be miles off to-night."
"No, sir-ee," said he. "If that buck drinks to-night he'll come in just around the point and come about the same time we see him then; deers are pretty regular both in time and place, and he'll come there all Summer, unless he's skeart away, and we didn't do that, you recollect."

"That's so, but when shall we go; about nine?" asked I.
"No, I guess we had better paddle in just after sundown and lay there; it'll be dark at half past eight and the moon 'll be out so quick that we'll be seen if we wait; he may go in to wet himself, and we must be ready when he comes."

The sun was near an hour high, and before the time came to start I lay on my blanket, watching the sunset, sweet digestion stealing over me, enjoying my pipe, and drinking in the glorious tranquil scene around. The Summer heat of midday had gradually tempered down to a refreshing coolness, but no air stirring, the clear, beautiful water, as far as could be seen, was still as glass—not a swell or motion, and hardly a perceptible ripple on the pebbles at my feet; the dense foliage of maple and oak, or the darker green of the pine, that seemed to touch the water, were photographed in the depths beneath with an effect almost startling; every shrub on the shore of an island, the cloudless sky above, the occasional bird flying overhead, were all reproduced in the mirror below.

It reminded me of Coleridge's weird story, and I wondered at the strange sight of the Ancient Mariner no longer, for when the clear, fresh Sheesheep water, with its beautiful surroundings, seemed to reflect such wonderful sights I could understand how the ban of awful silence for weeks and weeks made his brain grow weak and dizzy when he lingered there alone on the wide, wide sea.
Isaac Walton was right when he designated fishing as a

contemplative man's recreation, although I am passionately fond of the sport for its own sake. I follow with equal zest the various trains of thought and imagination that are certain to be aroused when I am following the trout stream or lying idle in my boat on salt water waiting for a nibble. There have been so many fine intellects, who were conversant with Nature before my time, and have left the rich treasures of their lives for me to improve my poor faculties with, that whenever the fitting time arrives I can always feel by recalling their beautiful ideas that other senses than mine have been and are being thrilled by the grand and beautiful, and wherever I may be I am never less alone than when alone.

As I lay there musing, the stars came out one by one, the bird ceased his flight and song, the beautiful reflection in the water died away and Summer twilight stole o'er lake and hill, deepening the shadows of the forest and bringing quantities of bats from its depths. My castles tumbling as Ned arose to his feet, and stepping down to the beach, lifted the light canoe from its resting place and laid it gently on the water. He never left it in the lake when not in use, even for half an hour. Cautiously stepping to the bow I drew my overcoat closely around me, and kneeling down in my old position, laid my back against the front bar or cross piece, facing ahead, and prepared for the run up the lake. We were soon near the marsh, and as the tall pines stood out clearer as we neared them, caught a glimpse of a fiery red ball between the trunks that told me that the moon was up, and we were none too soon. Silently gliding on through the pads and weeds, we rapidly neared the shore, and in a moment, the checked speed of the canoe signified caution on Ned's part, and well he did his work. Nearer the shore we drew, until only ten feet intervened and we lay under the shadow of an immense pine; then thrusting the blade of his paddle into the mud Ned turned the canoe "bow on" to the bank, and tapped with his finger on the side. Upon my turning around at the signal, he whispered to me as if we were on an Indian scout:—

"There's nothing in it, but will be soon; when deers come shoot as soon as you can; I'll see whatever you do, so don't wait for me to speak, but keep quiet whatever you see or do."

Minutes passed as we lay there until half an hour slipped by; the moon was lessening the shadow of the pine every minute, and slightly turning my head, I could see that the lake behind was flooded with the cold, white light, and away in the distance above our camp fire, a flickering red speck in the universal silver; up came the moon until our protective shadow faded away and we, too, were surrounded with light as almost that of day. Kneeling, as both of us were, our heads and body to the bips only showing above the side of the canoe, we looked like some old log, and still had a show of not being detected, provided we kept perfectly still. I had heard two deer plunge into the marsh away off on my right hand, and turning a little, could fancy I distinguished their forms in the water, but it would be almost impossible to steal down upon them with that great calcium light full upon us, so I knelt still and worshipped the beautiful night; the only noise was the faint splash of the deer across the marsh, the nearer plunge of the muskrat and the "boom" of the frogs; the wonderful photographing that I had witnessed had a few hours ago, as the sun was setting, was now being repeated still more impressively by the full July moon, and as the dark forest gradually appeared so distinctly in the water below, the effect was beyond description.

My companion knelt in the stern as if a statue, not a muscle stirring, and as I looked ahead into the woods and across the silent water, it seemed as if I was there alone in the wilderness—alone with that beautiful night. Reclining against the cross piece, with the rifle resting from side to side of the canoe, ready at any grasp, all that was familiarly connected with such a situation came to me then, and as the light streamed down through the gigantic branches of the pines, fair Melrose Abney was standing there with its grand old relics of the past, and through the gaps of the trunks I could swear that William of Deloraine and the Monk of St. Mary's Aisle were digging there in search of the forbidden book, and involuntarily I repeated—

"The Lady of Brakenoe greets thee by me,
Says that the fared non is come,
And that to-night I shall wait with thee,
To win the treasure of the tomb."

Then I could see them come walking through the oriel that was flooded with moonlight, and was thinking of the awfulness of that moment, when the wizard's grave had been plundered and the soldier was full of terror, so graphically described by Scott, when I heard the faint snapping of wings and slight rustling of leaves peculiar to the tread of an animal away off on the right hand side of the point and some twenty rods *in* from the lake. Roused from my reverie I listened intently for a continuance of the same, but heard nothing.

"It is the deer," I thought. "He is coming out on the other side of the point, and Jenkins is wrong after all; but why has he stopped, he surely is not frightened at us at such a distance."

Hearing nothing more, I concluded that a muskrat had wandered in and was the cause, when I was surprised to hear the twigs crack again, and instantly followed by three or four low "snuffs."

Thoroughly aroused and certain that Ned was listening also, I silently lifted the rifle into the hollow of my right arm, for I shot from the left shoulder, and strained my eyes to see what was in the brush. I was puzzled at the caution of the deer, for I had heard no "whistle," and knew he was not alarmed; but why was he so slow, and what were those "snuffs?"

When all of a person's faculties are thus aroused, seconds become minutes, and I listened with "thumping" heart, but could hear or see nothing. Silently lowering the gun, as my elbow touched the side of the canoe, I felt the lightest tap of Ned's finger, and I drank and my hand "lackedwards" to see what it meant. There he knelt, grasping the handle of his paddle, body as rigid as the wood itself, and eyes steadily fixed upon an object on the left hand side of the point, where I had not looked for half an hour. Not a motion from him, but knowing he saw me, I carefully and slowly turned again and following the direction of his look, saw, to my great surprise, that a deer had come into the water, and was drinking, and my hand was now curiously regarding our host. The light shone full upon his beautiful form and I could distinctly see the antlers, yet in the velvet, that instantly convinced me that he was the buck of the night before. Knowing that he would jump at any sudden movement, I gradually drew the rifle to my right shoulder, and when five seconds more would have let me send the ball into the white star in his forehead, I felt the canoe suddenly sheer around, utterly disconcerting my aim, and instantly the shout of Jenkins startling the air "shoot that wolf!" sent a chill all over me, and does yet when I think of that scene. As the canoe turned to the right I caught a glimpse of a large brownish object on the extreme edge of the shore, and as I was turned toward the deer, hardly ten feet from my back. Dropping the gun into my right hand, I pulled without sighing, and with the report felt the canoe spring out into the deep water, under the strong hand of Ned.

Confused, as I was, and for a moment realizing nothing, I pushed in a cartridge, and looked to where I had shot. There was a long "snarl" followed instantly by a rattling of teeth, such as I had never heard before, and then a confused rush and trampling of feet, and stillness, except the distant "whistling" of the deer, which soon was silent, also. I turned to look when about twenty rods from shore and I turned to Jenkins.

"My God!" said he in a surprised tone. "That was the strangest thing I ever seen; I heard 'em come up, but never calculated they'd come so close to you; he may have only been curious, but, I swear, he looked wicked."

"That was a wolf, Ned, wasn't it?" said I. "I thought I heard the brush stir up before you tapped, but thought it was the deer on that side."

"Wolf! yes, and several of them," answered he. "Look here?" pointing to the pines. "You see where we lay? well, I heard the brush creak after we had been still not twenty minutes, and heard it on the right of the pine, too. I knew it wasn't deer, because I heard no tread, and it came nearer so slow. I supposed you were watching, and could see better than me, as you were nearer, but was going to break or rap, to be sure, when I heard the loud stir to the left, and waited for him to get to drinking; he got in the water mighty still, I will say, and I suppose you were looking toward that way, was why you never seen or heard him."

"Yes, I never thought of the other side after I first heard the noise to the right," said I. "Why didn't you let me know sooner?"

"Because I was so afraid of starting him, we were so in the light," replied Ned. "I calculated you'd look there before he went out, but I see him stop and look, and then tapped and you turned the wrong way. I never dared take my eyes off him until I saw you shifting your gun, and while you was a doing that I see that wolf come out and stop at the water between us, so I couldn't see him plain. I turned the boat so as you'd be further off if he jumped, and hold on!" "shoot" to see him, and all you see. You see he was awful close, and in three seconds more he'd been in the boat, if he was coming at all, and if he out got to us, the rest'd come after mighty quick."

"But was he coming, Ned?" asked I. "I might have killed the deer in five seconds more."

"I wouldn't risk it," said he, shaking his head. "If he'd jumped I'd come in like a bird and upset the canoe, and we'd had no chance in the water; they wolves take hold like a trap, and if he had hit you once, it would have laid you up, and mebbe cut your throat, for they grab there. I never saw them that bold in Summer before, but I guess they come after the buck and never see us until all of a sudden, by the way he acted; but how he barked when you shot!"

"Never mind his bark," answered I. "I don't want to see where the ball went, but would rather get to our island. I wouldn't come on the mainland to-night for fifty dollars; hang me if I ain't trembling all over."

"Well, well," said Ned, sweeping his paddle through the water, "I was skeart myself at first, but I don't mind these things when I can see the trouble in front, but you were between me and the wolf, and you know I left my gun in camp, but it's worse now, so we went worry, but didn't the deer 'liddle' when he saw the gun? if you like I'll tell you what happened up here this Spring with a man that lives below us."

"Well, suppose you wait until we reach camp," answered I. "Then you can scare me as much as you please, but not here, thank you."

What that story was, I cannot tell at present, for want of space, but I never more will be troubled with our dear old friend, and he was comfortable. I listened eagerly to him about the scrape they were in with the wolves, and

now, as I sit in my snug room, miles away from Shesheep Lake, recalling that eventful night, I can close my eyes and fancy that I am again off the point watching with Ned, that I can see the deer and hear his warning shout as the boat sways around, and although inclined to laugh at my fear, I can yet remember the thrill of recollection at what I believe now to have been a near proximity to a fearful struggle, if not death itself.

For Forest and Stream.
IOWA SHOOTING—1874.

THE writer thinks, perhaps, a few observations upon the late shooting season in Iowa, and some incidental remarks, may not be unappreciated by your general readers. We had a most favorable Spring during the breeding time of pinnated grouse, ruffed grouse, and quail, and the lovers of sport anticipated unwonted pleasure. The rains did not drown out their nests or interfere with their young. The 15th of August, eagerly expected by many, commenced the attack upon the prairie chicken. [The writer prefers calling it by his name, as most of our Western sportsmen do, and he is not in the least in the least proud of his name.] Now while he enjoys most delectably the sport among them, he does not believe in the vanity of shooting simply for count or boasting of slaughter. He therefore declines the labor of an immense bag, and the gratification, if such it be, of beating any competitor for extermination. He believes in using, not wasting, every bird secured by well directed shot, over a faithful, trained dog, and no wanton slaughter for insatiable pride of his numbers. If all our good and true sportsmen would unite in condemning the practice of shooting, not for legitimate sport, but for the empty glory of boast, birds would have a better chance, and hunters proper exercise and healthful pleasure. But this is probably digression. We have had fair grouse shooting, even though the time for the fun few weeks ago.

The writer has been shooting some in different parts of the State, finding the best locality towards its northern line. On the 15th of August himself and Charley, taking the Davenport and St. Paul Railroad, started for the terminus of the road, 124 miles distant, to Fayette, in Fayette county. Reaching this point near sundown, there was no time except for a little amusement with the rod and fly among the haunts of the trout, and the writer, with his basses, we returned to our hotel, and, retiring early to rest, were soon lulled to sleep by the music of a neighboring mill dam and the plaintive notes of the whippoorwill. We had a right royal breakfast upon our huss before the peep of day, when with horses and machine we started for Wilson's Grove, some ten miles due west. For four or five miles our way was timbered along the Volga, when we reached the open prairie and struck westward. We had with us two yearling setters, of good stock, pretty well house-broken, but strangers to game. Our primary purpose was hunting, not birds, but lands that belonged to the subscriber; but having flushed eight flocks of chickens along the road, we killed seventeen, and returned in time to renew a different sport on the Volga. Before the sun reached the horizon we were casting flies on the stream in the twilight, and were early on the way from the village, who looked down from the bridge in laughing mood and remarked upon our attempt to hook bass with such bait. But when a three pounder struck, leaping wildly from the water, and the shout went up, "there, he's got one!" they were silent and respectful. You know success, right or wrong, scientific or otherwise, always commands respect. A few more were taken, and we adjourned, and the shades of twilight were creeping slowly over the western horizon.

Early in the morning we returned southward to the next station—Brush Creek—where, from all accounts and reports, we expected glorious sport among the pinnated grouse. But we were disappointed sadly, as the sequel will show. With a good team, and fair two seated hunting wagon, we struck westward some seven miles on the prairie. At the end of the first mile we found the shades of twilight were creeping slowly over the western horizon, skirting prairie, where an isolated twenty to one hundred acre wheat stubble looked the very home of the bird we sought. The day being oppressively hot, we waited patiently the evening shooting, stopping at George Hazen's, who is a fair shot and lover of the sport. George is the owner of 100 acres of rich prairie land, a fine farm, with handsome improvements, and a fine stock of the first and best of the west, and a flock in the afternoon George called his dog, as pure and pretty a young pointer as can be seen, and took a seat in our wagon with his muzzle loader. We crossed the meadow and reached the stubble, when the dogs began winding, and then tracking birds. Charley, in his eighteenth year, more eager for the sport than his seniors, leaped from the wagon and got two beautiful shots, arose and stepped forward to the bird, and reached the open, skirting prairie, where an isolated twenty to one hundred acre wheat stubble looked the very home of the bird we sought. We crossed the meadow and reached the stubble, when the dogs began winding, and then tracking birds. Charley, in his eighteenth year, more eager for the sport than his seniors, leaped from the wagon and got two beautiful shots, arose and stepped forward to the bird, and reached the open, skirting prairie, where an isolated twenty to one hundred acre wheat stubble looked the very home of the bird we sought. The day being oppressively hot, we waited patiently the evening shooting, stopping at George Hazen's, who is a fair shot and lover of the sport. George is the owner of 100 acres of rich prairie land, a fine farm, with handsome improvements, and a fine stock of the first and best of the west, and a flock in the afternoon George called his dog, as pure and pretty a young pointer as can be seen, and took a seat in our wagon with his muzzle loader. have much to do with the size and development of the bins, for beyond question there is a striking difference in them. But this is becoming a long waded article, and for fear you might repudiate, it is most respectfully closed.
Davenport, Iowa, December, 1874. J. H. B.

BUCK FEVER.

WE had just pitched our camp, Tom, Hank, Ed., and I, on a headland running out into Little Tupper Lake, which lies in that section of the Adirondacks between the Raquette Lake and the Cold River Mountains. We had not seen a deer yet, and many were the boasts and bets as to who would shoot the first. Our guides had told us that all novices upon seeing their first deer had what is known as the "buck fever." They described it as a feeling of great "zonzeness." In fact, a becoming so debilitated as not to be able to set a gun. Of course I had no fear.

Our morning Tom held all our hearts jumbling by saying, "Well boys, we have got to shoot a big buck to-night, or starve, one or 'other." All was commotion in camp, gear ready, cleaning guns, preparing cartridges, and fixing "breech" a jack, by the way, being a small box, made of larch bark, with one side open, and containing two candles. This is placed in the bow of the canoe. On hearing a deer feeding in the lily pads, the candles are quickly lighted, and the animal, fascinated or bewildered by the glare, stands immovable. The least noise and he is gone like a flash. How we prayed for a dark night, and that it would not rain or blow. At last it came. The darkness settled down upon us thick and close. Not a leaf stirred, everything seemed asleep; even the frogs had stopped croaking as if to listen. But despite the seeming sleep of all things, we knew that out there in the night were many red deer, that, with uplifted heads were scenting the evening air, and whose sharp ears were strained for the slightest sound.

In a whisper Tom says, "are you ready boys?" (Our wretchedly indicated ten o'clock.) "Yes," is the answer, and we go softly to our canoes and are soon being paddled swiftly across the lake. We take Smith's Inlet, and Hank and Ed., Rock Pond. Wadding myself in the narrow bow of the canoe, we say "good luck," and soon are lost to each other's sight in the thick fog. The lake is soon crossed and we reach the inlet. With a dispersed word of "watch the wind," we launch our bows, and set my teeth to stop the beating of my heart, for the least noise now, (if the deer has ever been shot at before) the dropping of gun or paddle, would banish all hope of getting a shot at him. The inlet is three miles long and ten yards wide, with pads nearly filling the whole stream.

Through this we must go silently as the flight of a bird. Straining our eyes through the fog, and with all our senses alert, we creep on like some huge serpent. A bark of the boat by Tom varies me to listen. Splish! splish! splish! and then all is still. With trembling hands the candles are lighted and turned toward the sound. The trunks of the trees and the bushes look like spectres, with the fog settling around them like their mantles. Many snakes, weigt and grotesque, pass through the avenue of light. But regardless of all these, my eyes have you ready boys?" (Our wretchedly indicated ten o'clock.) "Yes," is the answer, and we go softly to our canoes and are soon being paddled swiftly across the lake. We take Smith's Inlet, and Hank and Ed., Rock Pond. Wadding myself in the narrow bow of the canoe, we say "good luck," and soon are lost to each other's sight in the thick fog. The lake is soon crossed and we reach the inlet. Then with all my inner man struggling to get out, I dropped the weapon, and seizing my knife yelled to Tom to put me ashore. Being near it, I landed a wild leap, and landed in three feet of mud and a foot of water. Through this I waded for the bushes. I had a presentiment I should find the buck somewhere.

"Quick, quick, Tom," I shouted, he will get away." "I guess he will," said Tom; and then stopping and looking at him out of one eye (for the other was full of mud) I saw him, by the light of the jack, cutting out a quid of tobacco from a very large cigar.

"Tom," I roared, "this is awful—it's dreadful! That deer may be seeking some place to die in, and may be snuffing. I should not be a bit surprised if he was crawling through the bushes this very minute, trying to get away from us." "I shouldn't wonder," said Tom—and he said or did nothing more.

Then it struck me that possibly I had missed again, and with the conviction of our men. Now a word did I answer Tom's encouragement. "You'll hit him next time!" Silently I was borne home, silently I crept under my little blanket, and pulled it over my head. But I had this consolation, that outweighed all my disappointment; if I did not shoot a deer, I had hit the "buck fever," for Tom said so.

RICE LAKE.

FOR a long time we had heard from Indians and trappers that, back in the wilderness, a few miles from the iron pathway, that traverses this country, was a vast lake in which green wild rice grew, and to which, in the Fall ducks and geese on the vast prairie resorted to feed. Putting on light boots and Carlo, the prince of retrievers, and a curly-headed veteran on the train, we moved away, and in an hour were landed at Pillager Station on the Northern Pacific Railroad.

A team and driver that were to meet us here, were not on hand, so this necessitated a four-mile walk in quest of the aforesaid driver, who was found enjoying his dinner in his comfortable farm house, the banks of the great team track stream in the State—the Crow-Wing. Truce Moore's, for that is his name, was never known to let any one leave his house hungry, and as the sharp walk had given us good appetites, we needed no second invitation to dinner, to which we did full justice. This over, a spanking team hitched to an express wagon was driven to the door, so we got in while Truce turned his pack of dogs loose, and soon were off over the prairie, where the grain the team struck that ran away with "Little Breaches." Finally the wild driver checked his team, and bringing them to a sober trot, drove quietly along till we reached Pillager again, where we carefully loaded our boat, tent, baggage, &c., in the wagon, and were off for Rice Lake.

As we walked along, the dogs racing about here and there, we were advised to look out for game, and soon the yelp of Phil, a handsome specimen of a wood spaniel, put us on the alert as he dashed into a poplar thicket. A moment and we found ourselves right among a pack of ruffed grouse that kept every gun in the party busy for a few moments. Picking up eight of these handsome birds we moved along, and found another small flock a half mile further on, and with them two of those elegant, but stupid birds, called the Canada or spruce grouse, and the great blue-winged teal still on a tree trunk almost allow one to take them by hand.

Dogro asserted that he had seen an Indian catch them on trees with a horse-hair noose, fixed to a small pole. We opened one of them and found its crop full of pine needles. Four miles over and we stopped at the outlet of the lake. A lumber shanty that stood on the bank of the stream was soon cleaned out, a fire started, the horses attached, and after a few minutes the boat was launched, and started up the outlet, two of us on the bank and two in the boat.

A half mile of paddling and we entered the lake, or rather rice field, for we could not see any water save the narrow stream we were pushing our boat in. At the first report of the gun, (fired at a stray mallard which got up in a hurry and came down again in like fashion,) the walls of lead and teal arose with a noise like thunder, and in a few minutes all over the rice fields as we could see, the birds were going, and as fast as we could keep the breech loaders going, we had rare sport, while our friends on shore kept up a hislaude, and assisted by their dogs, made a good bag. Carried away by the excitement, we did not notice where we were going, so when it grew dark found that we were unable to find our way out of the rice; and to add to our discomfort a falling shower of rain, we did not get out through the rice fields for an hour.

For two long hours we pushed and dragged the boat through and over the tangled masses of rice stalks, vainly seeking for the outlet or some familiar headland, until we began to think we should have to spend the night afloat.

"It is very tedious," as the veteran sportsman in the bow observed as he turned around and wiped the rain drops from his grizzled forehead, "and I would advise to see if we could discover the location of the outlet."

The rain came thicker and faster, the black clouds were gathering overhead, the rice field seemed to grow denser and denser, and our tired muscles almost refused to do their duty, when the welcome report of a gun, in the willows on shore, fired by one of our party, who, alarmed at our long absence, had started to go out, gave us the direction, so driving the middle into the weeds with a vengeance we started the light boat through and over the rice, and, finally, wet through and dripping with perspiration, we struck the outlet and floated down to camp, glad enough to see the bright fire and rude shelter again.

Cleaning his breech loader by the fire was a new comer, a duck shooter and an old acquaintance, who, belated in the woods, had seen a canoe and followed us. He had a swabber, a fisherman's dress, in "old country" sporting suit, a man of means and education, one who had wisely left the circumscribed limits of his boyhood's home, to seek for himself and family a home in Minnesota, where he can have all the land he wants and all the sport he has time to attend to.

The evening was spent in camp drying our clothes, cleaning guns and setting traps. A side of English sport, well told, and Moore's tales of clucking fun among the Indians long years ago, and wild adventures on the prairie when he was younger than he is now, and "took a hand" in all the fun and frolic that was going on. He told us how with a "waggon load of preachers" he and Paul Beaulieu chased a bear six miles over the prairie and killed him at last with a shot gun, jumping out and running alongside the panting beast, while his unhappy passengers, pitched out of the

wagon long miles behind, were not in sight. He told us also of a huge moose stopping his team on the Leech Lake road, and playing about the frightened horses like a cat till he had to get out of his wagon and drive the ungainly animal off with his whip. So passed the pleasant hours away as hours in camp usually pass, and we each sought our blankets and dreamed of the sport at daylight in the morning.

The fog was just rising from the swampy rice field when we were all again astir, the ducks were in swarms, and the ringing echoes of the fast shooting guns sounded far and wide through the dim woods. Rapid was the shooting, plenty were the ducks and heavy was the bag we made. May we here again some pleasant morning with the same good fellows, is the heartfelt wish of
 HAYLAND.

AN IDLE IDYL.

VIEWING the long line of flat beach lapped by the ocean girth, with the constant liability of tangible terra firma to be submerged by the vast preponderance of fluid, one cannot but be impressed with the precariousness of mundane probations. Most fitting signs of our changeable existence are the curious hills of sand that dot these arid salt flats. There is something almost supernatural in the wild surging of the breakers; and in the commotion of the white-caps afar off, now foaming and madly careering, and then gradually lulling into gentle placid whisperings. Here is continuity with a vengeance, and without parallel.

Sitting here in the mellow Autumnal sunshine, the little sand crabs peer forth from their myriad perforations in the earth, purblind, bald, and unaware of constituting a link in the great Darwinian chain. Snipe scurry along the beach and majestically snap up and gobble the molecules and all inconspicuous mollusks. Fish hawks emerge from the briny deep with "bankers" in their cruel claws. The thatched roof of a wrecker's hut juts above a sugar loaf knoll. It is covered with dried sea weeds, and the door is propped up with a whale jaw. Around the Point, toward the Bay, two huge reeds for drying seines loom up like spectres, and a man winding inside of one, looks in the grey twilight like a restless spider.

One day the remorseless waves washed ashore the body of a sailor, a fair youth. On his right arm was tattooed the name of "Jacob West." A simple cross marks the spot where he was laid to rest, and the sea sings "Booby-bug!" in a Pickwickian spirit come to drive me home in the water cart. This worthy of five decades avers that he has been "once to meeting and twice to mill," and is in all respects an anomalous character. He "tinklers" around the place. He states, as the emaciated equine ambles leisurely about, that when he is "to him" he wears better raincoat, that he is the best of his race, and has "taught twenty thousand dollars in bonds and a purty mortgage." He affects politeness, having served in the capacity of town constable. Though much given to practical jokes and dismal facetie, he yet has a heart for any fate. After his daily toil he explains the "Miracle of the Loaves and Fishes" to the uncounted sea-farers, and he loves to dwell upon the "heathen Parable of the Lily." He mournfully tells of the dissolution of his first wife. Slowly he played Marier in a Pickwickian spirit come to drive me home in the water cart. Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

PROF. BAIRD'S REPORT.

ONE of the most interesting and important works issued from the Government printing presses in many a day, is the report of Prof. Baird, the United States Commissioner of Fisheries, a hand-book that cannot be excelled either in its thoroughness, or the manner in which the facts are presented. The work is divided into two general departments, the first being an "Inquiry into the decrease of food fishes," and the second into "The propagation of food fishes in the waters of the United States." The first part opens with an inquiry into the motives that led the Government to appoint commissioners to make a report on the fisheries and the cause for their decrease, and the result of their investigations. Of the corresponding researches of other nations he says:—

"A few years previous to the movement on the part of the United States in the establishment of a commission for the investigation of the fish and fisheries of its coast, the *Fischerer-Verein*, an association composed of several eminent naturalists, physicists, and statisticians of Germany, warmly urged upon its government the importance of prosecuting similar researches, recognizing equally with the United States that the only way of securing definite and practical results in the ways of protecting and improving the fisheries was to institute a series of thorough inquiries into the general physical and natural history of the seas.

A commission was accordingly appointed by the German government to report upon the best method of securing the desired object. A report of what was needed was presented by the commission, which invited careful inquiry into the following points: first, the depth and character of the water, the peculiarities of the bottom, the percentage of salt and in the sea, and in the rivers, its currents and temperatures; secondly, a minutely-detailed determination of the animals and plants found in the sea; and, thirdly, the distribution, mode of nourishment, propagation, and migration of the useful fishes, shells, crustaceans, &c. While this programme embraced the primary physical conditions of organic life in the sea, and their variations, the final object, of course, was a practical one, namely, the determination of the facts embraced under the third head. As, however, very little was known in reference to the natural laws of distribution, &c., of the useful animals, it became necessary to investigate them from a scientific point of view; so that the primary inquiries were strictly scientific, the deductions therefrom leading to the practical end.

The initiation of the Franco-German war interfered very materially with this programme, and it was not until 1871, and nearly at the same time with the American investigations, that operations were actually commenced. The commission consisted of Dr. H. A. Meyer, Dr. K. Möbius, Dr. G. Karsten, and Dr. V. Hansen, each gentleman having charge of some special branch, and all co-operating toward the common result. Fixed stations were established at various points for the purpose of observing the variations of atmospheric conditions, the daily changes of temperature of the water, and the occurrence of special phenomena of animal and vegetable life; and for several months in the year the commission, with its assistants, was engaged in researches at sea, prosecuted upon the government steamer *Pomoranica*, placed at its disposal, under Captain Hoffmann. Upon this work the commission has been engaged for three successive years, and its labors, as published a report of its operations during the year 1871.

Of the cod fisheries of New England he says:—

"At all the various fisheries formerly prosecuted directly off the coast of New England, North of Cape Cod, the depreciation in that of the cod appears to be of the greatest economical importance. Formerly the waters abounded in this fish to such an extent that a large supply could be taken throughout almost the entire year along the banks, especially in the vicinity of the mouths of the larger rivers. At that time the tidal streams were almost choked up with the alewives, and the salt water was struggling for entrance in the Spring, and which filled the adjacent waters throughout a great part of the year.

As is well known, the erection of impassable dams across the streams, by preventing the ascent of the species just mentioned to their spawning grounds, produced a very great diminution, and almost the extermination, of their numbers; so that whereas in former years a large trade could be carried on, and, in proper season, now nothing would be gained by the effort.

Of late the attention of the legislatures of the New England States has been called to this fact, and to the importance of restoring their fisheries, and a great deal has been already accomplished toward that end. Unfortunately, however, the lumbering interest in Maine, and the manufacturing in New Hampshire and Massachusetts, are so powerful as to render it very difficult to carry out any measures which in any way interfere with their conveniences or profits; and notwithstanding the passage of laws requiring the construction of fish-ways through the dams, these have either been neglected altogether, or are of such a character as not to answer their purpose. The reform, therefore, however imperatively required, has been very slow in its progress, and many years will probably elapse before efficient measures will be taken to remedy the evils referred to.

It would, therefore, appear that while the river-fisheries have been depreciated or destroyed by means of dams or by exhaustive fishing, the cod fish have disappeared in equal ratio. This is not, however, for the same reason, as they are taken only with the line, at a rate more than compensated by the natural fecundity of the fish. In an well satisfied, however, that there is a relation of cause and effect between the present bad condition of the two series of fish; and in this I am supported by the opinion of Capt. U. S. Treat, of Eastport, by whom, indeed the idea was first suggested to me. Captain Treat is a successful fisherman, and dealer in fish on a very large scale, and at the same time a gentleman of very great intelligence and knowledge of the many details connected with the natural history of our coast fishes, in this respect worthily representing Captain At-

wood, of Provincetown. It is to Captain Treat that we owe many experiments on the reproduction of alewives in ponds, and the possibility of keeping salmon in fresh waters for a period of years. These general conclusions which have been reached as the result of repeated conversations with Captain Treat and other fishermen on the coast incline me to believe that the reduction in the cod and other fisheries, so as to become practically a failure, is due to the decrease of food fishes, the quantity, primarily, of alewives; and, secondarily, of shad and salmon, more than to any other cause.

It is well known to the old residents of Eastport that from thirty to fifty years ago cod could be taken in abundance in Passamaquoddy Bay and off Eastport, where only stragglers are now to be caught. The same is the case at the mouth of the Penobscot River and at other points along the coast, where once the fish came close in to the shore, and were readily captured with the hook throughout the greater part of the year. That period was before the multiplication of mill-dams, cutting off the ascent of the alewives, shad, and salmon, especially the former. The *Salat Croix River* was choked in the Spring with the numbers of these fish, endeavoring to ascend; and the same was the case at the mouth of the Penobscot River, and of *Devon's Lake*, about seven miles above Eastport. The lake in question is one of considerable size, and was visited by immense numbers of alewives, which could be dipped out to any extent, on their passage upward, while the waters of the adjacent bay were alive with the young fish on their return.

The fish themselves enter the waters of the streams in May or June, and return seaward immediately after spawning to the sea. But they may be taken by the drift-nets along the shores as early as March and April; and, indeed, it is quite probable that the whole period of their abode in the salt water is spent adjacent to the rivers in which they were born. The young come down from the ponds in which they are hatched, from August to October, keeping up a constant stream of the young fish. In this way a supply of alewives was to be met with throughout the greater part of the year, and nearer the coast they furnished every inducement for the cod and other ground fish to come inshore in their pursuit.

It is true that the sea herring is also an attraction to these fish, and probably but for their presence our pollack, haddock, and lake-fisheries would be greatly diminished. Nevertheless, the alewife appears to be more attractive as a bait, and furnishes the sea herring are so common on the coast, especially in shore, occurring as they do at stated intervals, when they come in from the deep sea to spawn. It is possible, too, that they are less easily captured by the cod, since they swim nearer the surface than the alewives. Corroboration of this idea is furnished in the testimony of Mr. W. B. McLaughlin, of Southern Head, Grand Manan, who informs me that he has seen the only stream in the island which ever furnished alewives to any extent was Seal Cove Creek, which discharges to the east of the southern extremity of Grand Manan, and into which these fish entered in immense numbers in the Spring. At that time cod, haddock, and pollack, as well as halibut, were taken in great abundance in Seal Cove Sound, between *Hardwood Cove*, on Wood Island, and *Indian or Parker's Point*, on the main island. They were to be met with during the greater part of the year, especially from May to January; and the fishery in the channel-way within a quarter of a mile of the shore was really more productive than on the banks much farther out to sea.

As this report is too valuable to be even summarized, and as it affords the very species of information which our fish culturists, and those interested in sea fishing require, we shall produce it from week to week as the state of our columns will permit.

LAND-LOCKED SALMON.

RECENT experiments with this fish have proved that it can be reared in ponds the same as trout, and that it "strips" as readily as any of its family. Mr. H. L. Leonard of Bangor Maine, has been experimenting with this species for the past year, and he has succeeded in getting from it about 400,000 eggs, which he now offers for sale. As they are the first in the market that we know of, they will no doubt meet a ready sale. The first from which the ova were taken were captured in Grand Lake stream, Washington county, Maine. They were "stripped" by the dry or Russian process in Mr. Leonard's pond, where they entered to spawn. The result of a short investigation proves that the milk of one male is sufficient to impregnate the eggs of four or five females, and that the larger portion of the young are likely to be hatched out early in Spring if the water is kept at a fair temperature. If the water is too cold they will not appear before March, but by increasing the temperature, which is usually 32° Fahrenheit, to 35°, they will present themselves a month sooner. These pretty creatures, when hatched in ponds and fed regularly, do not manifest any unsexiness about their confinement, but the old ones which are enclosed when they enter the fishways almost always die if they are not allowed to make their escape when they have deposited their spawn.

A few feet last winter in a pond in Massachusetts for the purpose of experimenting with them, died later in the season, it is supposed from a nervous irritation at their confinement, as they were constantly leaping and dashing about in a state of excitement, and finally refused all food. The youngsters, on the contrary, seemed to be content with their narrow house, and to thrive on their meals of finely ground cutfish. The old fish spawn every alternate year, and on such occasions they commence running up the streams about the latter part of July or the first of August, and continue until the middle of November, but they do not deposit their ova until late in October or early in the month following. When in this condition they are caught by the pisciculturist with hook and line, or seine, and "stripped" according to the process mentioned.

This fish will live in water having a temperature of 70°, but if kept in ponds there should be scope enough for them

to play about freely, and the water should have depth enough to give them an abundance of oxygen.

The best time to impound them is about the first of August, as they are then in good condition, and being well filled with ova their instinct of maternity is very strong, so that they will thrive in places which under other circumstances would prove most disagreeable to them.

They will live on excellent terms with the black bass, so those who have ponds containing the latter should by all means try to give them the former for companions, as it is presumed that both thrive better by this companionship.

If the land-locked salmon can be cultivated to a large extent in ponds, it will be a most important step in fish culture, and will be quite an event in gastronomy.

For Forest and Stream.

RAISING THE GRAYLING.

OUR friend Collins has given some very valuable items on raising this fish, and coming from one who has rather looked with an unfavorable eye upon their introduction, it carries great weight.

He may justly be proud of being the first to raise this fish, notwithstanding he says: "I do not see wherein consists their superiority to the brook trout, nor of what particular use they are, any how."

It has seemed strange to me why the introduction of the grayling should have been opposed in some quarters, unless it was by some very enthusiastic trout-worshipper, who could not bear a rival near the throne.

Mr. Collins is not an enthusiast, on the contrary he is a cool, observing man, generally careful as to his facts and inferences. He says they were larger at six months old than brook trout at the same age; this suggests rapid growth, and early maturity. And I claim a great superiority for them in the fact that they do not eat each other. This is a great point, especially in fish that seek their own food, as in large ponds and lakes. As to other points, it is a question of taste as to their gastronomic qualities. Seth Green don't like them, but has only eaten them in the spawning season. I ate them at the same time and liked them. Col. Skinner, of the *Turf, Field and Farm*, was eloquent over a grayling dinner at Sutherland's, and many others, among them the veteran angler, Hon. S. H. Ainsworth.

The "particular use" of the grayling seems to me to be to live in streams and lakes with the trout and not devour them; to furnish the angler with a new variety as "gamey" as his old favorite, and one to my eye and taste fully as beautiful, and as fine for the table.

Every one that visits my ponds allows that the grayling are much the handsomest fish in the water. I am glad to get this testimony from Mr. Collins as to their growth, and although he only had a hundred eggs, I hear from outside parties that he has done well with them.

My brother, who has had the care of my fish this season, says that *one trout will eat as much as six grayling*, yet the latter are plump and in fine condition. I have about sixty of the lot from the An Sable, and they have grown considerably, and I do not hesitate to say that in my opinion they will become an equal favorite with the trout in the estimation of anglers, and much superior to them with the fish breeder, for the reasons given, viz: rapid growth, small feeders, and the absence of cannibalism. Mine have had only best lights; I never feed liver to my fish, for I cannot get it. FRED MATHER.

SALMO QUINNAT.—The United States Fishery Commission is commencing to move the California salmon (*Salmo quinnat*), a little early, it seems to us, although we have not seen the young fish, and don't know how nearly the saes may be absorbed. Fred Mather has gone to Niles, Michigan, with a lot of the small fry, and the distribution will continue until the entire quantity on hand is disposed of. Private parties who wish to procure spawn of the California salmon can now do so by applying to Seth Green, of Rochester.

Last week Fish Commissioners Major T. B. Ferguson and F. B. Downs, Esq., of Maryland, placed in the Marsh run, a tributary of the Antietam Creek, Maryland, four thousand salmon, averaging in size about one inch. The little beauties were hatched out in Baltimore county, from spawn obtained from fish caught in McCleod River, California. We are informed that fifteen thousand more will be placed in tributaries to the Potomac.

GREAT MORTALITY OF SHAD IN THE ST. LAWRENCE.—We find the following singular statement in the *Montreal Witness* of December 3d. It will at once engage the attention of the fish culturists on Lake Ontario, whose labor, we trust, has not been in vain.

"During the last few days the River St. Lawrence, opposite the city, has been literally filled by an immense number of small bright sealed fish, averaging two inches in length, and which have been identified by Mr. P. Caythorne, who has shown us a sample, as young shad. The fish are floating dead and swimming down stream in such immense numbers that yesterday Mr. Caythorne, while crossing to the island in a boat, could scoop them up out of the water by the handful. Such a phenomenon has, it is said, never before been seen opposite Montreal. The cause of many of the fish being dead is unknown, except that the great change of temperature in the last few days caught the little shad while they were not prepared for it. Shad ascend the rivers from the sea early in June to spawn, the offspring returning before Winter. If they were boxed up in oil, they would make an excellent substitute for sardines.

Iowa has had 500,000 whitefish spawn placed in her ponds by the Fish Commissioner.

—A note from Mr. Atkins informs us that the spawning season at Bucksport lasted from October 31st until November 25th. Five hundred and nineteen salmon were recaptured, forty-one being females and 178 males. The whole number of eggs obtained was 3,039,000, which is 700,000 more than in any other year. The cost of collecting them is about \$2 per thousand against \$2.73 last year, and the ratio of eggs obtained to breeding salmon caught has been raised from 3,500 to 5,137. —*Marie Farmer.*

—The State Fish Commissioners have placed 3,000 salmon trout, for breeding purposes, in the ponds in the neighborhood of Newton, in the northwestern section of the State.

Natural History.

For Forest and Stream.
DOMESTIC SPONGES.

IT is not generally known that many varieties of sponges are found growing on our own coasts. The sponges of commerce come principally from the Mediterranean, the Red Sea and West Indies, and the popular ideas of the nature of sponges are all derived from these. They are, however, only the dried remains, the soft parts which once coated the bare tracery of the skeletons kept for sale having been removed by maceration in water. When obtained by the divers they are quite solid, with a surface and consistency resembling a piece of liver. The large apertures, out of which the water pours in almost continuous streams, may be seen upon the skeletons, but the minute apertures, through which it enters, are visible only when the animal is living. Sea-lungs is certainly the most appropriate name in common use, for these animals are perpetually sifting into their porous bodies, through innumerable minute orifices, the sea water, and spouting it out again through the larger ones. These last are so like volcanic craters in aspect, that a round sponge may be very aptly compared with the rugged, volcano-specked photographs of the moon. The comparison is still more complete when the animal is in full and vigorous action, since the streams of water spouting with great force bring with them immense numbers of small pellets, the refuse matter, or excrements, which may be compared to the stones accompanying the fiery stream from the mouth of a crater. The interior is a net work of canals lined with a membrane composed of minute animals or cells, each one of which takes into its interior the floating animalcules, digests them, and casts forth the refuse. This floats on in the channel, which becomes larger and larger by the addition of other canals, each leading from some minute orifices in the surface, and each bearing its burden of refuse, until finally, like a swollen stream, the enlarged canal shoots forth its burden through one of the craters into the open sea. The water is drawn in by the action of the innumerable cilia, or hair-like projections which cover the surface, each little cell of the lining membranes of the canals being furnished with one. These move with such unanimity and force that the water is perpetually drawn in through the innumerable surface pores, and then by the pressure thus created forced out through the points of least resistance—the larger canals and openings. The sponges of commerce, however, are only representative of one division, the true horny or keratose sponges; those the skeletons of which contain no spicules at all. These are not represented on our North coast at all, except by a series of forms such as *Chalina arbuscula* (Verrill), *Chalina oculata* (Bowerbank) and *Isodictya*, which have a net work of horny tubules, but when examined by the microscope these are found to be largely composed of minute spicules, or needles of stiff, hard, flinty texture. These lead into *Haliclona*, *Chiona*, etc., which, upon our coast, in the shallow waters, represent the next division, or true silicious sponges. In these the spicules are united by a very small quantity of horny matter, or none at all, and are of many and varied forms. The pricking sensation experienced in pressing the common, flat, yellow sponge, sublutes found in Martha's Vineyard, is due to these spicules, which penetrate the pores of the skin and cause considerable irritation.

The most interesting of these is the *Chiona sulphurea*, which begins its existence by penetrating the interior of shells, clam shells being a favorite resort. It speedily increases until the shell is entirely honey-combed, the large exhalant orifices penetrating completely through to the surface on either side. When there is nothing more to conquer it spreads into the outer world in a yellow, solid mass, with a thick outer rind. Here it voraciously undertakes the consumption of sand, gravel, stones, or anything else which touches its surface, but these being impenetrable, it has to content itself with growing wrong. Then it forms those large, coarse-looking yellow masses so frequently brought up from the bottom by the fisherman. The next division of the sponges are called calcareous, their spicules consisting of lime. These are little bottle-shaped masses, open at one end.

PROF. S. V. VERRILL.

SPITZBERGEN MAMMALS.—The animals of Northern countries are few in number. According to recent reports the mammals of Spitzbergen and Nova Zembla, consist chiefly of seals and whales. The terrestrial mammal fauna comprehends only two species of lemming (*Myodes torquatus* and *M. obsonis*): the arctic fox, common fox, and wolf and sea-bear among the carnivores, and a single ruminant—the reindeer—seven species in all. The birds are more numerous, though here again the marine species far predominate, the land-birds being only ten in number out of a total of fifty. Amongst the former we are surprised to see recorded

as an accidental visitor the Hoopoe, usually considered as rather an inhabitant of the tropics, but of which a single straggler was captured in Southern Spitzbergen by a merchant-vessel in August, 1868. Reptiles are conspicuous only by their absence in Spitzbergen and Nova Zembla, and of fishes thirty species are recorded as having been obtained on various parts of the coast, all belonging to known forms either of the Atlantic or of the waters of Northern Asia.

THE SCARCITY OF WOODCOCK.—It is noteworthy, if not singular, that the same complaint is heard in England as here, of the unusual scarcity of woodcock this season. Is this merely a coincidence, or is it possible that we are to read the speedy extinction of this bird in its rapid annual declination? A letter from our correspondent, Jackson Gillbanks, written at Carlisle, Nov. 14th, says:—

"Our woodcock are very scarce this season. Although mine is a noted place for them, I have not yet seen one. They become fewer every year, (though many breed here now,) and will eventually become extinct."

THE BLUE BACK TROUT.

PHILADELPHIA, DEC. 1, 1874.

EDITOR FOREST AND STREAM:—In response to the call for information concerning this truly interesting fish, I would communicate the following items, which I hope will not prove altogether devoid of interest to your readers. Some three years ago my attention was first called to this fish, which well-known woodman and hunter, Nat. Bennett. It was while camping in Starvedew Pond, not far from his dwelling, that I engaged him as guide to take me to a beaver pond that lay back in the forest some six or seven miles. He assured me that this pond abounded in brook trout of a fine size, and most delicious flavor. From his account I anticipated rare sport, as the pond was seldom visited by anglers. I am glad to be able to say that my most sanguine expectations were more than realized. Such a day's sport seldom falls to the lot of the most enthusiastic and persevering angler. Some day I may give your readers the record of it. While on our way tramping through the woods, among other questions Bennett asked me if I had ever seen a blue back. On replying I never had, he gave me an account of the fish that excited a special interest in me. I concluded I must be new species of trout, and from that time became anxious to obtain a specimen for examination. While at Rangleys Lake during last season I made the acquaintance of that veteran hunter and guide, George Soule, a most trustworthy and intelligent man, who has lived some forty years on or near the waters of Rangleys and Richardson lakes. From him I received similar statements in regard to the blue back. I engaged him to secure and send on a box of them some time during the past month. For some reason or other they have not yet come to hand.

In the meantime, however, I received a fine specimen from my son residing at Bangor, Maine, which he wrote me was out of a lot of ninety-five sent from Rangleys to E. M. Stillwell, Fish Commissioner. I infer that it was one of the same lot of fish sent on to the city of New York. I spent some time in making a critical and scientific examination of the specimen and became fully satisfied that its distinctive characteristics were such as to constitute a new species. I searched in vain to find any description or even mention of this singular fish in such works on Ichthyology as I possessed, or had access to. In view of this fact I took the specimen to the Academy of Natural Sciences as a donation, and at the stated meeting of the members on Tuesday evening the 17th ult., gave a minute description of it, pointing out the specific differences between it and the *salmo fontinalis*.

There was an unusually full meeting, and the members all seemed to be much interested in what was regarded as a new species, for none of them had ever seen the fish before, or met with any description of it. I was requested to write out my description and to propose a name. I did so, giving the name of *salmo carolinoides*, regarding it as a distinct and heretofore undescribed species of the genus *salmo*. It was referred to the Standing Committee on Ichthyology. A day or two after this meeting Prof. Leidy of the Academy, he suggested to me that I should send it to Prof. Baird, of the Smithsonian Institute, at Washington, for his opinion. Dr. L. kindly consented to send it for me, and this evening handed me Prof. Baird's letter, to use as I pleased.

The following is a copy of his letter in reply, and is quite to the point:—
UNITED STATES COMMISSION, FISH AND FISHERIES, }
Washington, Nov. 27, 1874. }

DEAR LEIDY:—I shall probably find the specimen of blue backed trout at the Smithsonian when I call on you before, or get with my description of it. I have the question in regard to it. They were described many years ago by Girard as the *salmo agassizii*. We receive specimens nearly every year from Rangleys. It appears to be a variety from the common brook trout. Yours very truly,

DR. JOSEPH LEIDY, } S. F. BARBER. }
Academy of Sciences, Phila. }

P. S.—The fish has come, and is the *S. agassizii*. It will go back tomorrow. See description in Proceedings Boston Natural History, Vol. IV, 1854.

In referring to the above volume I find that the blue back was described and named by Chas. Girard as far back as October 20, 1852. His description is very accurate and interesting, and was given to the Academy of Natural Sciences at Boston subsequent to a visit he made to Rangleys Lake. He speaks of the fish as being more delicate even than the brook trout in its edible qualities. The specific name given by Girard is derived from the aboriginal name of Rangleys, and indicates its locality rather than any specific characteristic. I have been much interested in the contributions of Geo. S. Page in regard to this fish, appearing as they have just subsequent to my own inquiries in a similar direction.

C. A. KROSBRY.

Mr. Eugene Blackford, of Fulton Market, to whom a lot of these fish were consigned, as noticed by us some weeks since, has kindly handed us the subjoined letter from Mr. Milner, which is in reply to a letter of special inquiry from him respecting the blue backed trout. This letter was not received in season for publication in our last issue:—

UNITED STATES COMMISSION, FISH AND FISHERIES, }
Washington, Nov. 25, 1874. }

DEAR MR. BLACKFORD:—The specimens of the Oquosse trout came to hand and were specially valuable for their bright spawning colors, which were not well retained in the alcoholic specimens we had before received; besides, they were suitable for photograph and cast, which is not the case with specimens in alcohol.

You ask for distinguishing characteristics between them and *salmo fontinalis*. It is not very easy to detect *S. fontinalis* from others and similar species, because it ranges through a great variety of forms, which differ in the general form of the body; the shape of the head, the teeth on the vomer, and other characters. I enclose you two drawings, displaying the most constant points of difference between *salmo agassizii* and *salmo fontinalis*.

The type of form in *S. agassizii* is much more slender, with a tendency in its different parts to prolongation not seen in the brook trout. Thus the length of the fish, compared with the thickness, with the length of the head, the thickness of the head to the length, the pectoral fin prolonged to a slender point, the two lobes of the caudal extended in the same way, showing a more ferocious, and the opercular bones prolonged into a more acute angle.

On the contrary, the maxillary bone extends much less far, back of

the position of the eye, or toward the hinder end or hinge of the lower jaw in the Oquosse trout.

The interopercular bone is much larger in *S. agassizii* and the suboperculum is wider.

The tail in *salmo fontinalis* is more truncated than in any species. It is likely to be confounded with the drawings shown a comparison of the caudal fin when spread and when partially closed. I think the most of these characters will be found constant, even under the various forms the brook trout assumes.

Do you ever get any salmon trout or Lake trout from Hamilton county New York; from what DeKay called Louis Lake or Lake Lotb? If we could obtain two or three they would be very valuable in the knowledge of the lake trout. In fact, the lake trout from inland waters generally are desirable.

YOURS, JAMES W. MILNER.

To E. G. BLACKFORD, New York.
[The foregoing letters, it seems to us, cover the ground of inquiry pretty thoroughly.—Ed.]

OFFICE OF PHILADELPHIA "SCIENTIFIC VERIFIER," }
PHILADELPHIA, December 3, 1874. }

EDITOR FOREST AND STREAM:—By changing "our" in the MSS into "your" in your issue of December 3d, page 285, the whole of my last item is rendered perfect nonsense. The MSS reads distinctly "In the last issue of our paper" (meaning the *Solutio-Zeitung*) Please have this corrected. A. VON LENKMAN.

RIPE SHAD IN DECEMBER.

PERKSKILL, N. Y., December 4, 1874.

EDITOR FOREST AND STREAM:—As I came past the fish market last evening I saw on the slab a fine shad, weighing 4 pounds, full of eggs, and to all appearances just ready to spawn. It was taken yesterday morning in the Hudson River, three miles below here (between Verplanck's Point and Stony Point), in a net set for bass. The fish sold for \$2. I was told by an old fisherman standing by, that half grown shad are frequently caught while fishing for bass at this season of the year, but that he never saw or heard of anything like this—a ripe female shad in the Hudson in December. Thinking it might interest some of the readers of your very interesting journal to know of these facts, I felt free to write you. S. H. M.

CAMBRIDGE, MASS., November 30, 1874.

EDITOR FOREST AND STREAM:—In your issue of the 25th inst., I note the remarks on the capture of an albino, *Columbus septentrionalis*, in Salem Harbor, Mass., by "R. L. N." After passing through some three or four hands, I have the good fortune to be the present owner of the specimen, and I must be allowed to be one of the finest and most striking specimens of albinism I have ever seen. Mr. "N." speaks of not having heard of albinism occurring among water fowl. To be sure, it does not occur as frequently in this class of birds as in some others, though I have seen fine specimens of the *Anas boschas*, *Querquedula discors*, *Discopelta Americanus*, *Harelda glacialis*, and *Melanitta melanotos*, pure white, with the exception of the feet, which had a decidedly yellowish cast, and partial albinism in the *Bernicla brentus* and *Aythya valisineria*. I can call to mind some forty or fifty different species in which I have seen this freak of nature represented, some pure white, some pied, while others bore but slight traces. We are albinism noted in the columns of your paper, of which I am a constant reader. Yours truly, RICHARD DEANE.

THE WHEELER EXPEDITION.—This expedition has returned from its arduous labors in Arizona and New Mexico. Dr. Rothrock, the botanist, has collected about 900 species of plants, averaging 12 specimens to the species. Many of these will doubtless prove new to science. Special attention was paid to the timber, its abundance and quality, with reference to economic purposes. The forage plants were also carefully studied, and attention was given to a statement of their quality and quantity, with reference to their grazing properties in the forthcoming report. Many of the plants now attracting attention among florists are found very abundant in Arizona.

Professor Henshori, the zoologist of the expedition, began his collections about the middle of June at Fort Wingate, and worked south to the Sonora line. He has collected about 1,000 specimens of birds, with a large number of insects, snakes, &c., which have been sent forward to Washington, and which will be eventually placed in the Smithsonian Institution. Quite a large number of birds new to our fauna have been found.

Among other discoveries made was what is believed will prove to be a new variety of locust. It is of very diminutive size, and the color of the body of the locust nearly resembles the common white-tailed locust. It is found in great numbers all through the southern portion of Arizona territory. The meat of a full-grown locust, after being divested of the entrails, hide, &c., only filled a camp kettle, and was very delicious eating. A fat four-pronged brook weighed only sixty pounds. Grasshoppers were found with colors brilliant and beautiful as the butterfly, and of great size. A fully developed black grasshopper was over three inches long.

EVOLUTION OF THE HOG.—The predecessors or ancestors of the hog, Babirusa, and similar existing animals, are being gradually brought to light by modern palaeontological studies. One of these nearest the domesticated form has been found in the miocene of France, and is referred to the genus *Pelecochorsus*. It is also related to the peccaries, which appear to have existed during the same early period in North America in considerable abundance. Their existence in South America at the present time is one of many indications that that region has not advanced in respect to its fauna as rapidly as our own and the old continent. Another miocene genus was discovered during the past season in Colorado much the largest species of *Elothoriscus* yet known. The skull was longer than that of the Ludian Rhinoceros, and the tuberosities of the lower jaw were greatly developed. The front pair formed divergent branches on the lower front of the chin, so that it appeared to bear a horn on each side, which the animal doubtless found useful in rooting in the earth. The specimen was semilunar in its habits, like the hippopotamus, and the mandibular teeth in which they are furnished with extraordinary developments of the lower incisor teeth for tearing up their food, the *Elothoriscus ramosus* is the only animal known which possessed horns in the same position and for the

same purpose. A still older type of hoags—which may claim to be the predecessor in structure, as well as in time of all known genera—is the *Achondrodon*, Cope, from the Eocene of Wyoming. The *A. insolens* was a powerful beast, larger than a bear, with a comparatively short head, and with the uninterrupted series of teeth which belongs to all the oldest forms of the mammals and to the higher quadrupeds.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
New York, Dec. 6, 1874.

Animals received at Central Park Menagerie for the week ending December 26, 1874:

One Mottled Owl, *Scops asio*. Presented by Mr. Chas. M. Schieffelin.
Three Guinea Figs, *caeca imperata*, Latb. Brazil. Presented by Mr. H. A. Brown.

Two White Fronted Geese, *Anser albifrons*. Received in exchange.
One Muscovy Duck, *Anas domestica*. Presented by Mr. Samuel Smith. W. A. CONKLIN.

Woodland, Lawn and Garden.

FERNS AS A DECORATION.

THE little tuft of ferns, spoken of heretofore, gives us a hint how to use the evanescent beauties of the forest. How well they are adapted for decorative service; how nicely they adjust themselves to the elegances of social life! Our native ferns are numerous, handsome, and, intermingled with a tasteful hand, manifest in their arrangement many original creations not devoid of artistic beauty. There may be found in our American and English ferns an almost endless variety of material for ornament for house and public decoration. Why not, then, make use of them? They have all their uses—the love of the beautiful in the last floral offerings of Autumn seems to me particularly appropriate. We should receive them as a thankful recognition of God's universal bounty to us as exhibited in the changing seasons, so wonderfully developed in this crowning the last months with a chaperon of enduring flowers. We need not seek far to find many of the last leaves of the season so well adapted for use. Go with me to the woods; look beneath that old willow, beside that old gray rock, and behold the clusters waiting to be plucked. It is not exceedingly brilliant for a fern? Truly one would hardly believe his own eyes. Yet so it is. Here we have only to turn around to behold another plant we would add to our collection. A particularly pluck this green crested laetia. This will give a fine contrast to your scarlet maple leaves. Now for a plant of this prickly *polystichum*. Then spray leaves, like this maiden hair, is just what you want. Here is a rare old wild plant of the deep woods, not often found; but its scariness adds to it a wealth of beauty. It is the red veined wild callidum. Carefully remove it, and as carefully place it in your basket. Now, after gathering these purple wild asters, we have all we desire for our table decorations.

OLLIPOD QUILL.

THE FALL OF THE LEAF.

THE phenomenon of the "fall of the leaf," common as it is, is very difficult to obtain satisfactorily. The following are the facts, so far as we understand them, which are exceedingly interesting and instructive. It seems that Nature begins the provision for separation almost as soon as the leaf is born in Spring. When first put forth into the atmosphere the stalk of the leaf, supposing one to be present, is continuous with the stem. As the leaf and its stem grow, however, an interruption between their tissues (fibrous and cellular) occurs at the base of the leaf stalk, by means of which a more or less complete articulation or joint is gradually and ultimately formed. This articulation is produced by the continuation of the growth of the stem after the leaf has attained full growth, which it generally does in a few weeks.

The growth of the leaf being completed, the base of its petiole, or foot stalk, is no longer able to adapt itself to the increasing diameter of the stem, and a friction between that base and the stem necessarily ensues; the excision advances from without inward, until it finally reaches the bundles of woody fibers, which form the main support of the leaf. While, however, Nature is forming a wound, she is at the same time making provision to heal it, for the cuticle or epidermis of the stem is seen to grow over the surface of the scar, so that when the leaf is detached the tree does not suffer from the effects of an open wound.

The provision for separation being thus completed, the leaf is parted from the stem by the growth of the bud at its base, the force of the wind, or even by its own weight. Therefore, as soon as the glorious colors of the Autumn leaves begin to fade, this provision for separation is completed, and the winds sing their death dirge as they carry them away from their Summer's home on the branches of the trees, and scatter them in countless numbers upon the ground.

The fall of the leaf is therefore the result of a regular process, which commences with the final formation of the leaf, and is only completed when it is no longer attached to the tree. There is no denying, however, that the frosts of Autumn, by suddenly contracting the tissues at the base of the leaf stalk, accelerate the fall of the leaves. All must have noticed, on a frosty morning in Autumn, that the slightest breath of air moving among the decayed and dying leaves will bring them in complete showers from the trees to the ground.

The leaves of the beech, hornbeam, and oak, die in Autumn, but frequently remain attached to these trees throughout the Winter months, provided that the trees are not so situated as to be exposed to violent winds. Such leaves, when examined, will be found to be continuous with the stem, and therefore without that articulation or joint which so naturally assists in the separation of the leaf from the tree. Those dead leaves fall off with the next leaves are put forth in Spring; they are, in fact, pushed off by the expansion of the stem when the growth of the season commences. The leaves of evergreen trees and shrubs, and of coniferous trees, as the pine and fir, do not fall in Autumn, but in Spring when the growth of the season is proceeding; and as this annual leaf fall is only partial, consisting of one half or one third at a time, there is always a sufficient number of leaves left on such trees to keep them clothed with perpetual verdure. Hence it is

that their foliage consists of leaves which have been attached to the stem from one to three or five successive years.—Gardener.

ANSWERS TO CORRESPONDENTS.

M. SALMON, Pennsylvania.—I have upwards of 250 apple trees, some four years old and some a number of years older. Last July they began to curl up, looked as though they had passed through a fire—and so badly were they injured from some unknown cause that the young twigs died. In one or two localities, quite near together, all the varieties died in the scion. What is it? Is it blight? Please tell me.

It is quite difficult to give an adequate answer to a question like yours, lack of personal observation being unfavorable to a correct solution of the evils you desire to rectify. We think in your case the land is exhausted from over-cropping, and needs potash, lime, bone manure, and good strong barn manure; and, what would be the best rectifier of all, if easily attainable, slaughter house manures spread upon the surface of the soil and deeply ploughed in. Give your trees a careful scoping and a good trimming, cutting back thoroughly the long twigs of your young trees. To this add a water made as follows, namely—one part cow manure, fresh from the yard; one part stable manure, new and free from straw; one part loam, or clay; half part of pulverized charcoal, and half pound potash. Add water to render this admixture the consistency of paint, and apply with a whitewash brush. This will restore your orchard to bearing and thriftiness if anything will.

OLLIPOD QUILL.

B. R. M., Pennsylvania.—The snail you send is a garden snail of the order or family *Paludonidae*, generally called slugs. It is sometimes found beneath peaches in the garden, and upon choice fruit, particularly melons and pears. One kind takes the leaves of many garden plants, and some are very troublesome to the farmer in other ways beside eating fruit. The species you send, namely—*Helix*, is well, and quite hearty. I gave them some fresh leaves, tender and succulent, and they immediately thrust out their little horns, or feelers, and commenced eating at once. They have some characteristics of the true snail, as they are termed. Both in the night, and their habits are to be found in damp places—under logs, beneath loose banks and decaying woods, or stones; among the grass in Massachusetts, and under out houses, in New York, in numbers in all places of dampness. They do not hibernate, and cold makes them torpid. Cold weather kills them; warmth gives them life. They are particularly troublesome in gardens. Dry lime and sulphur is an antidote for them. There are a great number of these slugs and snails, belonging to many classifications, and they are quite interesting as a microscopic study.

OLLIPOD QUILL.

THOMAS BOYDEN, MISSOURI.—The insect you sent in a phial came safely to hand, and in good condition. It is a prominent, injurious insect, noticed among several others, by Mr. Riley, in a catalogue of insects in Missouri, and is a new one, found upon the cucumbers in Massachusetts, as well as in your region. It is the *Phacelia nitidula*, and is the offspring of a small caterpillar, which perforates the cucumber when about the size for pickling. One worm will destroy a cucumber, by causing it to rot. There is no remedy for its ravages yet found. We conclude, from several microscopic examinations of this insect, made during the last Summer, that it is very voracious, and is not likely to become troublesome, at least in this section.

OLLIPOD QUILL.

L. L. S., Orange, N. J.—We would meet your enquiry—"Would not planting trees around a low pond, hole, or cove, tend to the atmosphere, and thus drive away manure? How large is your pond of water and how deep is it? Is it surrounded by vegetation growing into the edges from its borders, and does the water get low and remain so for days and weeks? If such is the case, you should first drain the water from this low pond hole, then cover it with soil, and you need not set out any trees upon it. You evidently have a good plantation for a cranberry ground, and with a little labor you might make it a fine cranberry farm, and an wholesome one—a healthy locality and a fine cranberry plot."

OLLIPOD QUILL.

HELEN BARRY, Chelsea, Mass.—The trouble with your pet canary is from the presence of a great multitude of parasites, which look like a red powder, or rust, at the top of the wire cage. These are often found in the cages of canaries, goldfinches, and other singing birds. When such is the case the bird will be continually pecking himself, and appears restless and wretched, and will die at last, with all your washing and care, unless you take it from the cage and, with a candle flame, burn carefully and thoroughly every portion of your cage, at the top, sides, &c. By doing this you will drive away all your parasites, and your cage will be all right, and in as good voice as ever, and at once warbles forth his thanks for your care and attention. If you could only examine the biting apparatus of these little parasites, you would cease to wonder at the uneasy restlessness of your bird.

OLLIPOD QUILL.

WM. LANDOR, Nyack, N. Y.—The package of pens and beans you send to our address was received. The pea contains the pea weevil (*Bruchus pisi*) of Liut., and the beans contain the *Bruchus fabae* of Riley. They are the common weevils. You should notice them in the time of the young pods of beans and peas. You will observe them attached to the outside of the pod at its base, or some of your growth. These eggs contain the young grub, which, as soon as the pod is hatched, will look like a red powder, or rust, at the top of the wire cage. These are often found in the cages of canaries, goldfinches, and other singing birds. When such is the case the bird will be continually pecking himself, and appears restless and wretched, and will die at last, with all your washing and care, unless you take it from the cage and, with a candle flame, burn carefully and thoroughly every portion of your cage, at the top, sides, &c. By doing this you will drive away all your parasites, and your cage will be all right, and in as good voice as ever, and at once warbles forth his thanks for your care and attention. If you could only examine the biting apparatus of these little parasites, you would cease to wonder at the uneasy restlessness of your bird.

OLLIPOD QUILL.

H. L. B., South Falmouth, Mass.—The animal you so carefully enclosed in the tiny box came safely to hand. It is known as *Chelys serpentina*. This insect is found under the bark of trees and shrubs, on and about old stumps under the familiar name of the wood tick. It is oval shaped, brown in color, and possesses a remarkable tenacity of "holding on" to a subject. It has long antenna, and is a very uncomfortable companion to encounter at any time or at any place. It is often found near the sea shore, and is sometimes mistaken for the moss chelifer.

OLLIPOD QUILL.

The Kennel.

BEAGLE HUNTING.

A CORRESPONDENT of the New Orleans *Picayune*, writing from East Baton Rouge, discourses on beagles in this wise:—

"Imagine an ordinary fox hound with his legs cut down about half their natural length and bowed like those of a bull terrier, with nose even elongated beyond that of the hound, and ears of equal flatitude, and body rounder and chunkier; give him the same tremendous power of yelping and howling—on every ad and too often on unsuitable occasions—and you have a faint idea of the beagle.

With some eight or ten of these animals we started one bright day on a "rabbit" hunt. Unlike the deer hunt, the mimic substitute involved a short walk and a luxurious promenade through a dry and well beaten field, interspersed with briar patches. The beagles were called together by the *assemble* blown from a cow-horn by a young Creole mounted on a mustang pony. The beagles responded to the flourish with prolonged yells. Then, at a signal, they struck into the briar patches and disappeared from sight. What they were doing, what progress they were making, could only be judged from their yells. When these were faint and intermittent, we were told that the trail was struck; when they grew quicker and louder, the trail was fresh; and when at last the whole pack burst out in one continuous yelp, we were told to look out, which we did very closely on our side, whilst our companions, forming a "quadrilateral" around the bushes and the beagles, were alike vigilant on their side. Bang! bang! from two guns announced the better fortune of my two companions, when, following their orders, I rushed to their stands and found a brace of hares lying prone on the grass, and their shavers coolly reloading their guns, whilst the pack had emerged from the bushes on my side and were in full chase of a fine hare, which I had missed the chance of arresting in his course by the breach of discipline in abandoning my post. But the fleet little mimics were not to be so easily fooled. The young Creole on the mustang joined in the chase and pushed the beagles to their full speed, until the hare struck into a brush, where they pounced on him, and were about to devour him, when their master arrived in time to arrest their strongly-developed earnestness. After this little lesson, I comprehended the whole science of this style of hunting. At the next engagement I stood to my post, and had the satisfaction to get the first shot and the first hare "got down" to my credit. In gratification of the beagles, who licked their jaws with avidity, I shook my yelp over their heads. And so the hunt proceeded—the indefatigable little keen-nosed, howlegged brutes peering into every briar bush, rooting up every suspicious-looking grass tuft or knoll, and inquiring in every retired post and corner for poor Molly, and never resting until she was discovered, and sent in wild and fleet terror careering across the field under the fire of some half a dozen first-class marksmen. Fortunate hare to escape beagles and barrels, if she only had the sagacity to emigrate, and not, as is her foolish habit, return to the scene of her great peril and escape. Thus after a few hours of this easy and pleasant sport we managed to bag about a dozen fine fat hares, which we found delightful food for next day's breakfast and dinner. Another trial of the same sport was equally successful and satisfactory, confirming our as I shook my yelp over their heads. And so the hunt proceeded—the indefatigable little keen-nosed, howlegged brutes peering into every briar bush, rooting up every suspicious-looking grass tuft or knoll, and inquiring in every retired post and corner for poor Molly, and never resting until she was discovered, and sent in wild and fleet terror careering across the field under the fire of some half a dozen first-class marksmen.  (Post Office Box 8822)
 125 SOUTH THIRD STREET, PHILADELPHIA,
 COBB'S BUILDING, DEARBORN ST., CHICAGO.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty percent, allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 10, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this journal are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and commendation of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will wander to no depraved tastes, nor pervert the legitimate sources of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

HUNTING CLUBS.

PERHAPS no sport known to modern days has occupied so much of the attention of aristocratic sportsmen as the pursuit of the hare, fox, or stag with well-bred, well-trained hounds; and even the poor peasant or drudging costermonger will leave his labor to take a run with the hayug pack, whose musical chorus resounds through the gorse, or is echoed in various tones by the heath-clad hills. It has a charm for almost all classes of people that few can resist; but to its devoted lover it possesses an attraction nearly amounting to delirium. The cry of a ringing, deep-toned pack of hounds has more allurements for the latter than the most delicious tones ever evolved by Verdi, Gounod, Rossini, Mozart, Hayden, Beethoven, and other great masters of the soothing, sensuous art, for the former arouses their virile nature, which loves the break-neck dash and dangers peculiar to the hunting field, besides that peculiar and indescribable sensation produced by being first in at the death, and receiving the compliments of fair ladies and gallant rivals, while the latter merely tranquilizes the senses, or aids in developing the higher social qualities. One is the spur to many deeds; the other the incentive to the gracious courtesies of the drawing room, and the development of certain aesthetic qualities; hence, while every virile nature responds with alacrity to the first, it requires a certain amount of culture to be intelligently impressed by the second. It is on these grounds alone that we can understand why the sturdy squires of old would expend thousands of pounds upon their kennels, and become ecstatic in their descriptions of the fine tongue of a well matched pack, when they would not rent a box at the opera, or perhaps go fifty miles to hear the most famed songstress. Any one who has ever ridden a spirited hunter after the wild music of the hounds can readily forgive these devoted lovers of the chase for their enthusiasm, and sympathize with them rather than criticize their, to some persons, eccentric taste. It is this love and practice of physical exercise that has kept the natives of the British Isles in their sturdy manhood, and has imparted to them that courage which defies danger, and in fact makes them court it, for they will go far afield to assault the treacherous tiger in his lair, or pursue the elephant over the torrid plains of Africa. This education has brought them blessings which one might not readily deduce from such pastimes, for it has given them that spirit which will not brook any tyrannical restraint on their liberty, and imparted those

qualities of daring and endurance which defy all obstacles, and lead them on their conquering mission wherever they plant themselves among other peoples.

In our own great land these same characteristics exist; but they come to us by inheritance rather than by cultivation, for we have not yet devoted any attention, except in few instances, to developing our physical powers, as all our energies have been given up to the collection of the "root of all evil." Now that our people, or a large proportion of them, have attained a position of comfort, if not of luxuriance, they are enabled to indulge in the exhilarating, health-giving sports of their ancestors, and, by practicing these, they not only make their life one of healthful pleasure, but they transmit to their posterity a vigor of frame which they must have if they would be able to carve out a niche for themselves in this bustling, crowding world.

The ancient Greeks attained fame as athletes and horsemen ere they became a nation of warriors, poets, and sages, yet they did not carry bodily exercise to too great an extreme, for they argued that such an action would only lead to a dull and material, though vigorous race, as much as the indulgence in music, painting, and the fine arts alone would to an effeminate one. It is only by the judicious combination of both that as perfect a race as the mutations of the world will permit can be developed. Our most cultured citizens support the higher class of arts quite liberally—such as music and painting—but they do not, we fear, pay attention enough to their own physical education. Many of them, we doubt not, suppose that the training of nerve and muscle is contrary to mental culture, and opposed in every way to the acquirement of the esthetic qualities; that it is, in fact, coarse, and therefore unfit for persons of refinement. This is a most serious mistake, for some of the ablest statesmen, poets, artists, and military strategists the world has known were accomplished in all physical exercises, and to this condition may be traced, to a certain extent, the vigor which characterized them.

To attain health, surety of eye, and presence of mind when confronted by danger, we know of few pastimes so excellent for this purpose as a good canter after a pack of hounds. It is one which may be indulged by the most fastidious member of society, so that there can be no objection to it on account of plebeianism. The cost of a pack of hounds is trifling compared with the pleasure it gives, and its salutary effect on health and longevity.

If the pack was sustained by subscription, the sum to be paid by each member of the hunting club would be quite small, and to a gentleman would hardly be worthy of consideration. In Canada, where money is much scarcer than in this country, and where it is more difficult to be obtained, they support two or three hunt clubs in excellent style. If this can be done in the Dominion, it certainly ought to be here, and it seems to us a matter of surprise that our sporting gentlemen have not inaugurated such associations long ere this. With the exception of a hunt club recently organized in Baltimore, Maryland, we do not know of another in the country; for the gathering of individual hounds from their owners for an occasional run, which is quite common in the South, cannot be called a hunting pack in its literal sense. There is nothing to prevent the formation of hunting clubs in this country, as we have all the materials required for its success, for game, horses and money are plentiful enough. We have also advantages which they do not possess either in France or the British Isles, so that the only thing lacking to make mounted hunting popular here is a few gentlemen to lead in the matter. The cost of a pack of about twenty couples should not be over \$6,000 per annum, including the person attending to the kennel, and this certainly could be raised quite readily. We hope to see clubs organized in various portions of the country at an early day, and we are much if they will not be well supported, and furnish more solid pleasure than can be extracted from any sybaritical pursuit.

TERRAPINS.

PLACE a dish of cooked terrapin before a Philadelphian or a Baltimorean, and he will readily determine by its flavor whether it was raised in Maryland, Virginia, Georgia, or South Carolina. Their sense of taste is as delicate and critical as that of the Chinese tea tasters, while the flavor of the terrapin itself is more difficult to define or to analyze than the grateful odor of the truffle. In New York we scarcely appreciate the distinction, as we are not educated to it. We do not wish to decry the merits of the terrapins found South of Maryland, but we know that in our markets the Long Island and Chesapeake terrapins command much higher prices than their Southern congeners. To keep terrapins—to pack them—has long been the dream of our various market dealers, and numerous experiments have been tried to preserve them, so as to have them ready for the season. The festive supper period being over, say about February in the Northern States, the demand for this most delicate terrapin ceases. In July and August they are found quite plentifully South. The problem is to buy them in the South, when out of season, for use North, and to keep them for Winter, when the demand sets in. Seeing a live young terrapin, scarce larger than a trade dollar, swimming along uncommodiously lively in an aquarium the other day, we determined to trace up the origin of the infant phenomenon. A gentleman purchasing the terrapins coming from Georgia, South Carolina, and even Texas, they were introduced into a preserve arranged for them at Long Branch. As the terrapins from

the South arrive North just at the period of laying their eggs, it was hoped that they might be hatched, and a supply be obtained; but as their growth is very slow this is rather a difficult matter, for a terrapin a year old will not exceed two inches in length. Another obstruction to the success of the enterprise is the fact that the young terrapins are often eaten by the parents the moment they appear. The age of the terrapin is judged from the wrinkles on the shell, and by competent persons it is supposed that it takes from eight to ten years before it attains full growth. The Southern species is readily distinguished from the Northern by its darker shell, and having less prominence of knobs on the ridge of the shell.

The only large establishment in the Northern States devoted specially to the breeding of terrapins is that belonging to Mr. West, at Long Branch; but how far it may be successful it would be hard to decide at present. The hatching of the eggs by artificial process has proved successful to a certain extent, for many of the eggs are often thrown away owing to a want of that knowledge required for incubating them properly. If fifty per cent. are hatched it is considered good returns; so it will be seen that a large capital is required to carry the enterprise to a successful issue, as a terrapin does not lay over five or six eggs, and the young are assailed by many enemies, prominent among which are the crab and some voracious fishes. At the Long Branch establishment 1,500 terrapins are now being reared; but it will be a long time before they yield any financial returns, owing to the slowness of their growth. They do not require any food throughout the Winter, as they hide themselves away from the cold, and lie in a dormant state until the return of warm weather. Their usual food is fish, for they refuse all meat. One reason given for the decrease of shell fish in our rivers, where they were formerly plentiful, is that the terrapin catches take old and young alike, and as the creatures do not commence laying eggs before they are four years old it is evident that their increase is prevented by this needless slaughter. The only way to prevent this idle destruction is to make a stringent law, fining every person who sells one under six inches in length. This will allow the creatures to increase, so there will be little danger of a scarcity when they are wanted.

HINTS FOR SOUTHERN HUNTING.

THE birds are now well on their way to the Sunny South; our streams will soon be ice-clad and their finny denizens shut from pursuit, and the game animals in the snow-covered forests will be found only by men of unusual hardihood after days and nights of exposure, but, still, within easy access are hunting grounds that will never be without abundant game, where free from ice, snow and bitter storms the gun and rod may be carried amid novel and pleasant scenes, and not only our familiar Northern birds be found in unfamiliar haunts, but new forms of animal life be met with in interesting variety.

The Gulf States, with woodland in unlimited areas, with broad rivers of fresh water and estuaries without end, with open sea beaches and rocky and coral harbors, invite Northern hunters; and if perchance he meet the Southern in their homes, or at their camps, a new and genial companionship is assured, that once enjoyed will not fade from memory, for Southern welcomes are as broad as Southern fields, and as full of sunshine.

In going far from home there is usually an inclination to carry many articles of impedimenta that are found not to repay any annoyance of their care. The enthusiastic Englishman, Sir George Gore, invaded Florida last Winter with as much luggage as filled a store house, comprised of cases of every imaginable thing needful, and everything unnecessary, and as may be inferred, he did not go to Florida and return for "One Hundred Dollars," his bill for extra luggage being some three hundred dollars on a short trip, and it is doubtful if his curious assortment is all yet removed from the State.

We will not counsel those who would go with much "duffel," as the guides term luggage; they will suit their own abundant fancy; nor will we hint to the luxurious yachtman how to store his lockers with dainties, although pleasant memories recall the way it has been bountifully done, but will venture on a few simple suggestions that may be of some value to persons going South.

First and foremost, as to guns: For all but boat shooting, guns to be used under the hot sun that, even in Winter, falls on the Southern fields with a fierce heat, should be light, and of not too large bore, to economize weight of ammunition.

A rifle should be short, and one chosen that will in opening be free from long levers that may catch in bridle reins, will avoid annoyance. For alligators, the Mead explosive ball is unequalled, and its use increases very materially the chances of so shocking and stunning those tenacious animals, as to recover them at once. As they lie on logs, and on slimy banks, they usually retain life enough to wriggle into the water, when they sink; but we have shot them with the Mead bullet, and saw them dash out upon land, and be unable to get any command of their movements. All the talk of a ball glancing harmlessly from their scales may have been true years ago, but the modern rifle carries its missile through the scales and skull, and penetrates any part of the animal, even at long range.

For all but "gaiter," the shot gun is the convenient arm. Deer are usually "jumped" and shot bounding through the large leaves of low Palmetto, and at all times one load of fine shot is needed for quail, snipe and plumage birds, that are constantly duttering up.

Shot Gun and Rifle.

GAME IN SEASON FOR DECEMBER.

Moose, *Alces Alceis*. Caribou, *Tremulus Rangifer*. Elk or Wapiti, *Cervus Canadensis*. Red deer, *Cervus Virginianus*. Hares, brown and gray. Quail, *Ortyx Virginianus*. Wild Turkey, *Meleagris gallopavo*. Pinnated Grouse, *Tetrao Cupido*. Woodcock, *Colaptes auratus*. Wild Duck, Geese, Brant, &c. Ruffed Grouse, *Tetrao umbellus*.

[Under the head of "Game, and Fish in States;" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish thousands of notices. That relative to birds of passage, and quail, we would require a great amount of our space. In designing game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States, for constant reference. Otherwise, our attempts to assist them will only create confusion.]

DEER, TITL—FOXES AND SKINS—THE QUOTATIONS ARE:

According to size, color and quality.	Northern and Eastern.		Western.		Southern.	
	Yds.	Yds.	Yds.	Yds.	Yds.	Yds.
Beaver, per lb.	\$1 50	\$2 00	\$1 00	\$1 10	\$2 50	\$2 75
Beaver, dark, per pelt	3 00	4 00	2 50	3 00	1 00	1 50
Beaver, pale	2 50	3 00	2 00	2 50	1 00	1 50

Skunk, short striped	60	75	60	75	75	75
Skunk, long striped	30	50	30	50	30	50

GAME IN MARKET.—The market is well supplied with game at present. Canvas back ducks in fine condition, from Havre de Grace, bring \$3 per brace; red-heads \$2; black-heads 75 cents; mallard \$1 25. Ruffed grouse bring \$1 per brace; prairie chickens \$1; Venison from Minnesota, 25 cents per pound; quail from the West and the interior of New York bring only \$2 per dozen.

NEW JERSEY.—*Barnegat, Dec. 3.*—At last the brant have made their appearance in large numbers. Our fairs are now full of them; a good number of stores and a few still hear of big shooting. T. D. Wettrick killed five swans near the "Cedars" one day last week, and C. Parker and J. W. Kinsey killed thirteen brant on Tuesday, C. Parker killed six brant and two geese Wednesday. Weather too mild to make big days; plenty of black ducks; fair show of geese; no show of any prairie birds, which generally are so numerous here.

MR. EDITOR:—Your article in reference to the scarcity of foxes and the "apparent want of mice in dogs" this season, was well timed, as many so-called sportsmen were under the impression that their dogs were worthless, not knowing the effect produced by drought. One good thing has been perfected by this, viz: Few birds have been killed, and naturally the increase will be greater next season, thereby making the sport all the greater. I never knew partridge to be so plentiful as this year, and they, like the quail, have succeeded in escaping death by the gun. The leaves in the mountains are so thick and dry as to make it impossible to approach within gun shot of the birds, and if the foxes and weasels don't kill them this Winter they will be out in full force next year. Have you noticed the scarcity of rabbits? The minks, foxes and weasels have laid them out in certain sections. I shot one large brown weasel, and a friend of mine killed a large mink last week, whilst hunting for quail. In legislating to protect our game it would be well for you to suggest to the conventions the necessity of offering a large bounty for every mink and weasel caught running wild.

E. S. WAXMAKER.

MARYLAND.—*Deer Park, Dec. 4.*—Since I wrote you last the people here have been attacked with hunting fever, and during the light snow of this week the woods were filled with hunters. One gentleman named Lashorn had splendid luck last Saturday. He was out rabbit-hunting, and was standing in a thicket waiting for the dogs to run out a rabbit, when a large buck and doe ran up to within twenty-five paces of him and stopped. He could see nothing but the buck's horns, but being afraid to move, he calculated the distance to his (the buck's) shoulder and fired, shooting him through the neck and wounding him mortally. He had a muzzled loading shot gun, with a load of No. 1, 2 and 4 shot mixed, and a shot in one barrel. Another hunter shot a buck with No. 4 shot. I don't know at what distance. Deer are very plentiful. I heard of one man's bringing eight saddles to town one day this week, and of many others had from one to four. Great numbers of rabbits, grouse, quail, squirrels, &c., are for sale at the stores throughout the country. Quail bring 50 cents per brace, quail \$1 25 per dozen, rabbits 30 cents per brace, venison 12 1/2 cents per pound. A flock of ring-necked turkeys shooting to-morrow. I will inform you of my luck.

ALLEGHANY.

TENNESSEE.—*Memphis, Nov. 30.*—Without going into details as to the probable yield of game in this vicinity for the next week or ten days, I will say that since my last letter lovers of the dog and gun have had a fair week's sport, and each and all who have been "out" now an improvement in the supply of small game, and "old hunters" have had their time well occupied in the pursuit of it, as well as on the other side of the Mississippi, of bear and deer, as is attested by the fact that our market is glutted with venison, and at nearly every game stand can be found choice cuts of "bar" meat, which is so highly (?) polished by epicures, and notwithstanding that the weather has been exceedingly mild, large numbers of ducks and some turkeys have rewarded the calls of the "callers." The canebrakes and swamps adjoining nearly all of the

Wild turkeys are hard to kill, but often an expert caller will bring them so near that missing is needless, and the use of a wire cartridge of large shot in one barrel will do all that can be to insure success in getting this superb bird, which is a far finer trophy, and more difficult to obtain than any that tempts the sportsman from his camp while the day has not dawned.

No dainty split bamboo rods, nor leaders of tinted gut need be carried South of the Mountains of Carolina; for the trout, grayling and *salmo salar* live not in the streams that bear away the washings from rich mellow bottom lands. The trout of these rivers is a black bass, and with gar fish, cat fish and other heavy-mouthed fellows try physical force with the angler, artful devices are not called for; but one or two stiff boat rods, all the better if in pairs with all the joints interchangeable, and some large lines, gimp and wire-mounted hooks, strong spoons, a gaff and one or two spears for trolling fish, and some ponderous sinkers for tide ways, will fit the fisherman for all ordinary work. If he wishes a new sensation, it may be obtained at the end of a half-inch rope, with shark hook and chain, but beware of any coil about the legs, and get up anchor for a tow seaward, if a large shark or swordfish accepts the challenge.

About Anastasia Island, St. Augustine, the Minoreans capture huge swordfish and sharks by fastening the rope to a post, and carrying the hook out in a boat, leave it, and retire to conduct their share of the conflict on, *terra firma*. A boat is as useful in Florida as a horse on the plains. For short trips from the settlements, nothing will be more convenient, and render the sportsman more independent, than a flat-bottomed boat, with small sail, centre board, and a water tight end with tight trap to carry dry clothing, tea, sugar, &c., to protect from the frequent showers. Floating quietly with the current or tide, a patient hunter may surprise almost all the game birds and animals, and he will see more of interest in the little streams than in miles of the frequented channels. For exploration and travel a boat 18 to 22 feet long, 4 or 5 feet beam, with the full width carried to the stern, built with a flat keel, and broad bearings to insure light draft, fitted with centre board and sail, the latter on sliding topmast for compactness, will be found the best. When anchored the bow will point to the wind. A tent open aft may be hung under the boom, spread with stretchers, and furled sail; and with light boards a bed for three or four may be arranged, and cooking by spirit lamp be done at the wide stern.

With such a boat, and two good negroes, boatmen, (cooks they generally are), more interesting trips can be made than with a yacht, and more unfrequented points be reached. If cruising in the wide waters is intended, some considerable shear to the bow lines will make a dryer and safer boat, and a canvas bow deck will do good service. Air cushions will be found very comfortable, and in mishaps they are invaluable as life preservers.

One of Pond & Duncklee's stoves will fit out such a party, but a spirit lamp is very useful to heat water for a preventive punch, or for a bowl of soup from Liebig's Extract of Beef, and with it and an old Dominion coffee pot, excellent hot coffee may be made, or Borden's Extract will give it more simply.

Often for miles no hard ground is to be found, and some heating apparatus is indispensable. No one should brave the night air of the everglades without warm and stimulating food and drinks, and a little quinine will do no harm. Light wines are of great service, and the water flowing from the swamps will not be harmed by a "wee drop," and for the rattlesnake or moccasin bite that never comes, the same is needful. Prudent ones usually do not wait for a bite, but show unbounded confidence in preventive measures.

For sleeping in camp, in this animated land of fleas, spiders and the creeping things so unfortunately taken into the ark, a hammock should be used; one arranged, (as it may be easily be,) with a light canvas roof, with sides of netting. Two or three rafter-shaped triangles hung on a line will spread such a shelter, and in a canvas hammock under it, one can rest free from the companionship of the guides and dogs, and without vivid ideas of snakes and centipedes. Sportsmen are often disabled by the fiercest animal in Florida, the flea. High boots will be some defence, but keep away from the vicinity of domestic animals, and sleep not in any of the "cracker" houses, but camp in remote pine woods and keep the dogs away from the tent. Such forest is comparatively free from mosquitoes, and in mid Winter the sad flies are not very annoying.

For minor details the hints common to all hunting will afford a general idea, and perhaps at another time some more suggestions may be made if these are found to warrant such an appendix.

AMATEUR CLUB.

Colonel Wingate, the energetic Captain of the Amateur Rifle Club "team," has written to Captain Mildmay, Secretary of the Wimbledon Association, stating that a party of American riflemen will be in England during the Wimbledon Meeting, and that he would like to know under what conditions, if any, they would be permitted to shoot. He also desired to learn if they would be allowed to enter in the military match, that is, of course, provided they wished to do so. No answer has been received yet, but one is expected ere long. Colonel Wingate has made no direct request for an opportunity to display the skill of his men, as all he desired was to know what the conditions would be in case he desired to do so. What the probabilities are for our "team"

being represented at Britain's great contest, it would be hard to specify at present, as the matter of competing or not will depend much, undoubtedly, on their mood and other circumstances. In the military match they would labor under the difficulty of not using the calibre required by the rules of the Wimbledon Association, for according to these every rifle used in the contest must be of 45 calibre, whereas those used here are only 44; so if the latter were allowed, they could only use a ball having a 43 9-10 calibre, while the others use 44 9-10.

This may have some weight with the English riflemen to prevent their extending the unsolicited courtesies they otherwise would to our men.

But inasmuch as no request has been made to allow our "team" to enter the contest, and the purport of the letter was to learn what conditions would be required in certain cases, if they do not compete at all it leaves them in the same position as they are at present. We should, however, like to see them test their skill with the best riflemen of the United Kingdom, that they might be able to make certain deductions which they cannot do here, owing to atmospheric effects. That they would worthily represent the skill of our riflemen under all conditions we know very well. So their principal object in competing would be to gain experience.

MAN IS NOTHING.—According to scientists man is nothing, or at least next to nothing, as he came from a little mite of dirt, or fluid, or something of that sort; so those who believe with Shakespeare that he is like an angel or a god must feel small, and with them those who boast of "blue blood," for, after all, this peculiar hue of the vital force only comes from a watery source, and the god and angel-like creatures are only developments from a bit of mucus, that is, if the scientists are to be believed. This lowering of man to the category of *rudens* is not very pleasant, but if facts are facts, why must we do the best we can under these peculiar circumstances. The first effort ought to be to take away from some persons their egotism, self-importance and vanity, and if it does this, the new theory will have accomplished its good.

Among the recently published reports of the British Association, is a paper read by Mr. E. R. Lankester, "on the Genealogical Import of the External Shell of Mollusca," in the course of which he introduced the recapitulation hypothesis, as it has been called, which effects to see in the development of all living things a rapid series of resemblances of their ancestors arranged in historical order. Taking man as an example of this theory, the origin of human being was a small speck of protoplasm of mucous-like consistency, such as might be found in ponds; the next stage shows him in the shape of a small sac, composed of two layers of living corpuscles, the inheritance from poly-like ancestors; later he is an elongated creature with slits, like the gill-slits of a shark, in the side of the neck, inherited from an ancestor of a shark kind. Tracing the child's peculiarities after birth Mr. Lankester showed how in its crawling, climbing and striking qualities it exhibited other results of inheritance.

CREEDMOOR.—The Scottish American Rifle Club tried their skill at Creedmoor on the 26th ult., with the following result. Military rifles only were used:—

	400	500		900	500	Tot.	
	Yds.	Yds.	Yds.	Yds.	Yds.	Yds.	
1. Lindsay	30	35	65	7. Robertson	28	23	51
2. Ross	37	40	77	8. Clarke	37	28	65
3. Fulton	30	28	58	9. Duke	29	19	48
4. Fyfe	37	30	67	10. Hickling	16	25	41
5. Cameron	31	38	69	11. Yarnett	25	16	41
6. Edmondstone	25	28	53				

The Winchester Rifle Club, of Connecticut, made the following scores at the last meeting. They shot at a 200 yard range, five shot strings. The honors and prize were won by J. Daniels:—

H. B. Sullivan	28	31	Sherman	18	3
J. E. Stetson	28	31	A. Tilton	43	3
J. Danvers	31	34	D. F. Barrett	49	7

THE CHALLENGE ACCEPTED.

We published a few weeks ago a challenge from Co. E, First California Regiment, and now comes the answer. D COMPANY, TWELFTH INF'Y, U. S. G. S. N. Y., NEW YORK, December 7, 1874.

EDITOR FOREST AND STREAM:—

On behalf of this Company, we accept the challenge issued by Co. E, First California National Guard.

As their proposition is an indefinite condition, we make the following suggestions as our idea of what would equally determine the superiority:

First—Let a team of, say twelve men, be named by each Company, to be regularly enrolled members of the Companies, according to the laws of the State under which they exist.

Second—Let the arms be either Remington or Sturp's military rifle.

Third—Distances, 200 and 500 yards; standing at 200; any position at 500 without artificial rest. Target, same dimensions as now in use at Creedmoor, scoring by the same scale as prescribed by the N. R. A., seven shots and two sighting shots at each distance, so that the weather may be nearly equal. Let the match occur on or about June 30th, 1875. Let each team begin firing simultaneously, telegraphing result on completion of firing.

Of course more definite arrangements may hereafter be made. We trust this match will improve the marksmanship of all participants and move others to more arduous rifle practice.

Very respectfully, your obedient servants,
H. B. SMITH, Captain,
JOHN H. WOOD, 1st Sgt.,
ACHELTON WOOD, 2d Sgt.,
D. PARKER, Private,
THOS. J. DOLAN, Private.

—The First and Second Regiments are practicing diligently in hopes of being able to make a good record at Creedmoor next year.

—We are still short of our issue of February 12, 1874, and shall be glad to receive copies from our subscribers.

bays on the river are full of the finest game, some of them showing up handsomely in the way of bear, panther, wild cats, wolves, deer, and occasionally elk are found, and especially is this the case at Bayou Fenisot above here, which lies on the river, partly in Missouri and partly in Arkansas, and just now about a dozen "sports" are there, some from this city and some from St. Louis. The cane below here is equally well supplied, and hardly a day passes that parties do not leave here for a few days' gunning, and all have good luck. Some of the amateurs make some terrible mistakes—that's what they call it—in their shooting, as was the case at Bayou Fenisot, when, through a couple of gentlemen firing themselves out of their wigs, mule, camp equipage, &c., and located in Nonconant bottom, and after a day's sport would tether their mule close to the canoe and near the camp. On Friday night his muleship longing for a square meal of oats, broke loose from his fastenings and wandered off to a neighboring farm house for a "rubbin' or two," and there he was met by a pack of dogs who gave chase, "Muley" making for camp, head and tail erect, in dashing through the camp where the sleeping hunters, one of whom declaring that the noise in the canoe was occasioned by a deer chased by a pack of hounds in pursuit, phrased himself near an opening where suddenly the mule popped out, and the hunter (3) let go both barrels of a double barreled gun "loaded with mugs to the muzzle" and to make a long story short, I need only say that the mule died; then click. He was dead the hunter had to foot it to the city and get another vehicle, but declares that he never will shoot at another "antile" until he knows what it is. It must not, however, be considered from this one mistake, that even our amateurs are prone to such errors. On the contrary, they are skilled in the deer hunt as a general thing, and seldom return from a hunt without plenty of meat. The present cold snap will serve to improve the supply of game in this immediate vicinity, as well as in the central part of the State; but there, from the latest reports, they do not require even a dog or gun to bag their game, but wait for a first-class hail storm, as was the case one day last week, and then start out with a cotton basket, which they fill in a short time with birds killed by the falling hail stones. Mississippi is well supplied with large game this season, but quail, partridges and the like are not abundant. He who sports there make use of the deficiency in the latter by devoting their time to the former, and their average luck is shown by the hunt of Mr. A. F. Lewis, of Catochu County, who one day last week, with his dogs, ran four yearling bears up a tree and killed three, capturing the fourth alive. The swamps and cane along both the Arkansas and White rivers in Arkansas are full of game and the many intricate lakes about with fish and wild ducks. Red River is also equally well supplied, and there I learn that vast numbers of ducks are slaughtered daily; so many, in fact, that Shreveport's citizens are living on insensate mallards at from ten to fifteen cents each, the average day's yield for gunners in that stream being from 100 to 150. Our fox closers have not been idle during the week, but have had two days fine sport. On the first chase reward was turned in at noon and the second at 11 o'clock, 7 o'clock the following morning, when the day took the trail—then nineteen hours old—and followed it until afternoon, when the fox was started from cover, and after a three hours' chase he saved himself by crossing a creek, into which Alvey would not let the dogs go, as the weather had changed suddenly from warm to cold. In the next chase a native fox was started and followed three hours through brush and thick cane until the best dogs were badly bruised and cut, and then they were called off.

KENTUCKY.—Shelbyville talks of organizing a shooting club.

NORTH CAROLINA.—Messrs. C. P. Keeler, Judge Tufts and B. E. Rieker, of Boston, and members of the Monkey Island Club, shot in ten days, between Nov. 10 and Nov. 25, in Currituck, 55 canvas backs, 7 swans, 3 geese, 200 ducks, mostly red heads, bald patches, black ducks and sprig tails. Mr. Noah Chris, of Boston, joined them Nov. 27, and the first day's shooting brought in 11 canvas backs, 25 other ducks and 6 geese.

ILLINOIS.—*Elkhart, Dec. 3.*—The hunting has been good here this Fall and Winter, and the quail and chicken are plenty. In five days—Friday and Saturday of last week and three days of this week—I killed 223 quail and 74 chickens, and mostly in cornfields and along hedges. There are no ducks here now.

Champion Wing Shot of America.

Netting quails is indulged in very freely by pot-hunters.

OHIO.—*Tiffin, Dec. 5.*—In publishing an extract from one of my letters you make me say, "killed the first buck," &c., which is a mistake, of course, *first* being the word used in my letter. Several larger ones, however, have lately been killed. Since writing the letter above referred to the slaughter of deer has been immense, seventy-six having been transferred in one day at this point alone. As the deer shooting season has closed, this class of sport must be postponed until next Fall, when I fear they will be nearly exterminated. G. D. L.

Sportsmen will do well to take notice that the season for killing deer in Ohio closed December 1. The penalty for violating the law, which will be rigidly enforced by the Sportsmen's Association of local clubs, is a fine not less than \$10, nor more than \$50, or imprisonment not more than thirty days, or both, at the discretion of the Court.

MISSISSIPPI.—*Montello, Dec. 5.*—Although duck shooting is over at Puckaway Lake, comparatively good shooting may be had along the Fox River, as considerable numbers of mallards and red heads seem loath to leave the "chill North." I bagged a few brace of the latter three days ago, but do not consider the sport sufficient to sacrifice one's self to the "keen blasts of Winter," nor could it be compared to Fall shooting, and I have no doubt that there is something far more exciting and exhilarating in getting down a mallard as he rises from the rice, than in putting an occasional shot in Winter by walking along the river bank with nubby hands and using all caution to prevent being heard in the crusty snow. I anticipate some fair sport ere long at Buffalo Lake, the margin of which abounds with spring flocks, and here ducks are plenty all Winter. My usual plan is to hunt on skates at this lake, a somewhat novel mode, but it adds to the attraction.

MINNESOTA.—*Bratard, Dec. 2.*—Snow a foot deep (splendid for deer hunting) and buffalo overcoats at a premium. It is safe to say that 150 deer have been killed within four miles of town this season and ruffed grouse by the hun-

dred. Deer shooting will be over on the 15th, and it is a good thing.

No deer shooting in Minnesota after the 15th of December.

TOWA.—*Burlington, Dec. 1.*—On the river are plenty of geese and brant, floating down on the ice blocks; quail plenty; chickens scarce on the bottoms; deer found only beyond the Des Moines, in a southwesterly direction in abundance, on the line of the Burlington and South Western Railroad, now completed to Unionville, Missouri, 130 miles. There is not a thoroughbred dog in this town, though there are some first-class sportsmen. M. M. T.

NEBRASKA.—The Sioux tribes of Dakota, Wyoming, are hunting buffalo in the Republican Valley. Their luck has not been great so far.

MAST DESTROYED.—Heavy frosts several weeks since destroyed the mast in a number of counties in Arkansas. Notwithstanding that, however, Horsfall, who has emigrated from Memphis to that peaceful (?) State, is having plenty of sport, and has thirty-nine dogs in training. So many that it required two steamers to transport them.

—Company C, Third New Jersey, had a match on the 26th of 100, 200 and 500 yards, with the following result, the highest points possible being sixty: Captain W. H. DeHart, 2d, Corporal Spinning 26, Private Hoagland 24, Corporal Heskland 21, Private August 21, Corporal 20, Private Houston 20, Private Gregory 20, Sergeant Moore 19, Private Robt. 18, Private Clay 17, Private Naar 16, Private Nar 16. The tie in the first and second score was split off and won by Captain De Hart 15 to 14.

—Congress at its last session made an appropriation of \$10,000 for the purpose of testing Lee's breech loading arm. A small number are now being made at the National Amory under the supervision of the inventor, and when completed will be sent into the field for trial.

—Mr. Post, of New York, and Mr. Baylis, of Brooklyn, accompanied by a number of sporting friends, went to Long Island last Wednesday to test their skill in a pigeon shooting match. Mr. Post's party were 21 birds, 25 yards rise, \$250 a side, H. & T. traps, Long Island. Mr. Baylis, who was the favorite among the betting men, used a Scott ten-bore, and his rival a Donnell twelve gauge. Mr. Baylis won the match, having killed 13 out of 18, while his opponent only killed 4 out of 18.

After this Mr. Greene, of Brooklyn, and Mr. Post agreed to shoot 15 birds each, from 5 traps, English rules, for \$25 a side. Mr. Greene had the advantage, as he had the riles, and not having a twelve gauge gun, as called for, was compelled to allow his opponent one yard for the ten bore, which he desired to use, making the distances: Greene, 31 yards; Post, 30 yards. At the fifteenth bird they had each killed six, when Greene missing and Post scoring, the latter proved the winner, killing seven to six for Greene.

Following came a match for 10 birds each, 30 yards rise, 5 traps, and English rules, between Mr. Baylis and Ira A. Paine. Baylis took the initiative, and at the tenth bird had killed seven, which obliged Ira to retire, as he had scored but five out of nine, and could not win.

A second match of 10 birds, 30 yards rise, English rules to govern, for \$20 a side, was gotten up between Mr. Post and Mr. Hieckoff, of Brooklyn. The latter at the ninth bird had scored six, and was obliged to retire, the privilege of retiring, as out of eight he had killed but three.

A handicap sweepstakes of \$5 each, 3 birds, H. & T. traps, wound up the sport of the day. Eight entered in this, these being Messrs. Van Buren, 25 yards; Baylis, 25 yards; Lott, 21 yards; Ireland, 24 yards; Monroe, 21 yards; Post, 24 yards; Paine, 27 yards, and Wingate, 24 yards. Baylis, Monroe and Wingate each killed their three, when the shot of the four, who were shot on the third bird, and Baylis and Wingate, each killing three straight, divided the money.

—Messrs. Belmont and Robinson shot a pigeon match against Messrs. Lowry and Grymes at New Dorp, Staten Island, last Saturday. It resulted in a victory for the latter. The following is the score:—25 birds each, 28 yards rise, 5 traps, English rules, Grymes, 15; Lowry, 19; Belmont, 11; Robinson, 20.

QUAIL SHOOTING IN GEORGIA.

SAVANNAH, November, 1874.

EDITOR FOREST AND STREAM.—Yesterday morning, while in the office of a friend on Bay street, he proposed that we should go out for an afternoon's sport, and if we could not secure one, of course, had no objection, and after talking over the subject awhile, we arranged to meet at his house at two o'clock. At the appointed time we were both ready, and getting into his buggy, with his man Dick behind, the dogs, three in number, two handsome liver and white pointers, the third a fine white setter bitch, got by "Bismarck," moving along on either side the road, we speedily made our way to the woods, where we were to have a duck. Some four miles out on the Ogeechee road we got our leaving Dick in the buggy with directions to meet us at a point near town, we loaded our guns, and getting over a fence, entered a field in which the rice had been cut about a week previous. Not more than fifty yards we were gone before the dogs came to a "stoney boy," says my friend H., and stopping up to them, we flushed a fine cover of dozen birds. Three barrels ran and their full, round reports, and two birds are down. Marking the remainder of the cover down in a piece of heavy cover along the edge of a ditch, we go on after them, first placing in our pockets our birds, which the dogs retrieved handsomely. Reaching the place where we had marked them down, the dogs again came to a point on different birds. Four are up in front of me, two of which are knocked over by a snuff double lock, while a single bird flushed from under my feet is once out down, and loading our guns another gets up and goes off unharmed. Two of our birds are specially bagged, the third, a crippled one, defying the attempts of the dogs to find him. Two more single birds are put up and knocked over, and begging them we work toward the road, and getting into the buggy, drive on to another point, where we find a fine bag of who run in wild on them. After administering a severe flogging to him, we hunt them up, the dogs pointing them beautifully, and as they rise one falls to the right barrel of H.'s Lancaster, while the contents of the left go on an exploding expedition toward the top of a fallen tree. Catching two as they come a quick shot brings them down, while the second barrel, pocketing our birds, we try another field, as the rest of the cover had gone into the heavy swamp, but here no birds are to be found. In the next one, which was heavily planted in grass, we flush a fine large cover, out of which we get three fine birds. Marking them down, the dogs soon find them in the cover, and in a short time a more cover is down, two of which are only wing tipped, and running into a swamp, we are compelled to give up the search for them, it getting late, and B. being obliged to get back to attend to some unshelved business,

so we return homeward, perfectly satisfied with our afternoon's sport. R. is expecting soon a valuable addition to his kennel of a splendid young setter of the famous Giltersleeve strain, bred and raised by the veteran sportsman, Hon. G. Smith, Esq., of Philadelphia, and if he does not get an A No. 1 dog in every respect, it is much to be regretted. If he is half as good as my dog "Jack," which I got from Mr. S., some years ago, and which was pronounced by several of the finest shots and best sportsmen then and now living in this city, to be the best and most perfectly broken dog they had ever shot over, he will have a dog which any sportsman would be glad to have.

GAME IN WEST VIRGINIA.

New York, November 30, 1874.

EDITOR FOREST AND STREAM.—A year or two since I spent some weeks alone of those miserable spring which are so numerous in the Alleghany Mountains of West Virginia, and I was really amazed at the abundance of game of all descriptions, making it a very paradise for sportsmen with either the rod or gun. Thinking a few lines on the subject might interest the readers of your valuable paper, I will trespass on your space to a limited extent. The Virginia Springs, in most New Yorkers are well aware of, are but twenty-four hours distant from the metropolis, and the last twelve hours ride is through most beautiful region, passing by the Shenandoah Valley, and the fine mountain scenery of West Virginia. At the period of my sojourn at the springs the Chesapeake and Ohio Railroad (since completed) was only running to Covington, W. Va. from whence a line of cars connected with the White Sulphur, Sweet, Red Sweet, Bath, Warm, Backbridge, or whatever point the tourist might wish to be transported to. Well do I recollect arriving at Covington in the dusk of a Summer evening, after a rapid railroad ride, the last fifteen miles down a grade of sixty or seventy feet to the mile, and run in seventeen minutes by the watch, and then putting up at the village hotel, where was spread a supper of chicken, venison, brook trout, &c., such as an epicure might enjoy. Some of our party left by the night stage, but myself and a number of others, comprising most of the ladies, preferred waiting until daylight, especially as there was a risk of too "rapid transit" by the stage missing the road and tumbling down the mountain side, which catastrophe had happened a short time before. After a refreshing night's rest, we were up and away next morning at 6 A. M., and after a lively ride of from twenty to thirty-five miles according to destination, we find down the mountain sides, fordage streams with the water over the hubs, and which were so situations that we crossed one rivulet seventeen times in twenty miles. We reached our objective points, some going to the White Sulphur and others, including myself, keeping on to the old Sweet, which was—If my recollection is correct—about thirty-five miles from Covington.

Now, since the completion of the railroad, the traveler, by leaving the train at Alleghany Station, has only nine miles staving to the old Sweet Springs, and to the White Sulphur zone at all, the cars stopping within a stone's throw of the hotels. The White Sulphur Springs, since my sojourn there, has for my part, I always preferred the old Sweet because of the other resorts in account of its being less crowded, and to any local objection. Situated in Monroe County in a beautiful valley, it is surrounded by charming highland scenery, and the temperature is delightful, even in July and August. The hotel and cottages accommodate 700 or 800 guests, and was very well kept, at that time, by the gentleman, C. R. formerly of the Tenth House, Savannah, Ga. The bath house, and one of the cottages, and one of the cottages as clear as crystal, and which has a temperature of 75° the year round.

These springs were discovered in the last century by the Indians, who would bring their sick and infirm, and biconic by their side. Some wonderful stories are told of the cure effected by these highly medicinal waters, which I will not weary you by relating here. But I am digressing from my subject.

Game of all kinds, fish, fowl, is so abundant as not to be appreciated. Woodcock frequently were shot within five hundred feet of the house, and a mile or two back in the hills was one of the finest drives for deer to be imagined by the most recent sportsman; while for the displeasure of Isaac Walton ten minutes walk from the house was a trout brook, where the capture of two to ten pounders was an every day occurrence. Every day we had the speckled beauties served up on the table, which, with tender, juicy, venison steaks and side dishes of woodcock, pheasant, &c., formed a menu unsurpassed anywhere. The deer were actually so plentiful that on my return ride to Covington, when about half way to that place, as we stopped by the wayside in late the town where the driver said to me "I was sitting on the front seat; "There, sir; if you wish to see a grand sight, look there." I did look, and lo and behold on a mound about one hundred yards distant, stood as fine a stag as ever I beheld, with his head erect, and his large, soft eyes staring at (to him) woodrons side of so many intruders on his royal domain. A moment he stood there, but one of the horses raising his head, which was the signal to me to get up, and I was off in a twinkling; we would have shot him with ease. The driver told me that he frequently saw them crossing the road ahead of him. Altogether, I know of no region within a day's journey of New York that offers so rich inducements to the hunter, whether of fur, fish, or feather. I have just finished reading your letter on Salmon Fishing in California, in your issue of Nov. 19th, and I have the pleasure to give you my warmest congratulations on the first salmon fishing in the world. When I was in San Francisco, in 1870, salmon was so plentiful that it sold for 5 cents a pound, and I suppose that the succeeding years have caused no diminution in quantity. Should it meet with your approbation, I might send you a short account of my experience during a Winter trip across the continent the first Winter the railroad was open, with an account of a day's fishing near Ogden, Utah. Yours truly, FLETCHER.

A QUEER OLD GAME.

DEER PARK, Md., December 4, 1874.

EDITOR FOREST AND STREAM.—I took a trip into West Virginia some time ago, and had some amusing incidents happen to me. One of the most curious was the case of a man and his wife, who were about forty years of age, and who (as I was told) me had not a razor on his face for thirteen years, which fact caused his face to resemble the "Jack o'lantern" underneath on the sides of our road. He was dressed in huckskin breeches and a homespun coat, which he had bought of one of his neighbors, and were the only articles of "bourgeois clothing" that he had ever worn. We rode together for some miles, and he informed me that he lived at a place called "Thunder-struck." On the previous morning he had one of his dogs speared, and on going out discovered four bears, two old ones and two cubs, dragging the hog off. He was afraid to "hackle" them alone, and they took themselves and the porker into a neighboring hickory thicket. During the conversation I then asked him a few questions, and so much interested me that I felt that I ought to inquire a little more. Presently my companion said: "Say, Mister, will yer let me smoke awhile on that scow? I'll give it right back. I didn't buy nary one at the store; they're two cents apiece, and ain't never no count, now." After a short, but violent struggle with my indignities, I consented, and offered him a cigar from my case. He took it, and said: "I'd rather have the one you've been smoking on." I gave it to him, and he told me that he "gave him good kick to smoke the same scow that any one else had been smoking."

The country fairly swarmed with game of all kinds. I met one man, who told me he had killed off (if I recollect rightly) sixty-three deer the previous Winter, and had a fine and grand place for hunting, and quite handy, being but a few miles from B. and O. R. R.

Yours respectfully, ALLEN W. V.

—Great Britain annually consumes 27,000,000 home-bred rabbits, not counting the Welsh ones on foot.

be within a foot of the bottom, with or without a cork, as you prefer. I think the manœvers of a cork when a bass is biting add very much to the enjoyment, besides, in very clear water, it assists you in making out a correct diagnosis. The best hooks for black bass are the notched end Kendall, made by Hooman & Son, No. 1 or 10. The long curved board, and just the right tumbler, make them admirably adapted for handling the jumping rascal. The best times for fishing on Lake Erie are during the months of May and October entire.

The paradise for black bass fishing is at Pt. Pelee Island in Western Lake Erie. The fishing is equally good from dock or boat. I caught the best last Fall ranging from three to five pounds, and was literally seized with the sport. As Isaac Walton said of trout, "they seemed to bite from mere wantonness." Our Kentucky puries who go there estimate their catch by thousands of pounds. It seems to be one of the most difficult problems for men to determine the proportionate strength of a fish and a fishing rod. The strength of a fish is magnified about ten times, and a rod only secondarily. Trout fishermen have more sense on that point than our Western anglers.

T. J. CUNLIE.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER FOR THE WEEK.

Table with columns: Date, Boston, New York, Charleston. Rows for Dec 10, 11, 12, 13, 14, 15, 16.

BRAVERY.—Our correspondent, Mr. J. W. Kinsey, at Barnegat, last week saved the life of a sailor wrecked in the inlet near his hotel. He was assisted by the lighthouse keeper, Mr. Yates. All readers of the FOREST AND STREAM are practical men, and well-schooled.

At the annual meeting of the International Yacht Club, at Detroit, the following officers were elected: Commodore, K. Barker; Vice Commodore, W. H. Clark; Commodore, G. S. Davis; Secretary, P. H. Van Buren; Treasurer, A. G. Lindsay; Measurer, D. Reaume. Executive Committee: C. B. James, E. A. Brush, C. E. Lock, Wm. Griggs, Chas. Parent. Regatta Committee: W. G. Thompson, Robert Haekett, Joseph Nicholson, E. A. Armstrong, E. A. Brush.

The third annual ball of the Boston Boat Club takes place at Beethoven Hall Friday evening, Dec. 11.

YACHTING NOTES.—The yachting season just closed has been an eventful and interesting one to Canadian yachtsmen. The challenge race between the American yacht Corp. of Detroit, and the Annie Aubert, a Canadian yacht, which took place on Lake St. Clair, was the most important yachting contest of the season. The Canadian yacht won the race easily, after three trials to make the course in the prescribed five hours.

The challenge "Goodwin Cup," a gift from Queen Victoria, is now held in Canada. The winner of this choice trophy, properly rigged and manned, can outfit in an open boat race of thirty miles with an eight-knot breeze, any yacht on our inland waters, with the usual time allowance.

The regatta of the Royal Canadian Yacht Club this season was a brilliant contest. The day was favorable; a fine breeze was blowing. The schooner-yacht Oriole won the first place, while the Annie Cuthbert showed that she was a worthy and successful antagonist.

The third great yachting event of the season came off on the Bay of Quinte, below Belleville. The Ina won the first place and retained the champion flag, which she carried away a year ago.

The fourth regatta took place over the famous Cobourg course. Unfortunately this regatta came off so late that the entries were fewer than they otherwise would have been for the liberal prizes offered. The Annie Cuthbert however, her luck being in her favor, won the first prize.

The fifth regatta was on Burlington Bay, and the Brunette bore off the first prize. Captain Stinson pluckily sailed his yacht in every race on Lake Ontario this season, and sailed her well, and his deserved reward came in the victory which he won at his own home.

To recapitulate briefly, the record of Lake Ontario for the year past stands as follows:—At the Toronto regatta the Oriole won the first prize in her class; at the Cobourg Annie Cuthbert was first, and at Hamilton the Brunette was the winner. Thus the four rivals each won the first prizes in the four yachting events of the season. A fairer division of the honors could not be made. The Oriole has been laid up near Hamilton's wharf.

The Lady Stanley is hauled out on the island, while the Geraldine and Rivet are snugly secured at Clarkson's wharf. The Oriole is in dry dock at Fort Dalhousie, and the Ina is hauled out at the foot of the lake, in her old winter quarters. The Annie Cuthbert is secured for the Winter at Hamilton, as is also the Brunette. The Dauntless lies at Belleville, and will undergo some repairs to spars and sails this Winter. When properly fitted out, as she will be, she will trouble our fleetest yachts. The Gorilla is laid up at Cobourg.—Toronto Globe.

The four-cared race between Bagnall and Winslip against Lumsden and Boyd, for \$1,000 a side, will be pulled on the Tyne on the 21st of December.

KEELS VS. CENTRE-BOARDS.

SOUTH BOSTON, December 2, 1874.

EDITOR FOREST AND STREAM:—Most of the yachtsmen of my acquaintance agree that the centre-board yachts of the present day are faster than the keels. This I admit to be true. But when they say a centre-board is superior sailing before the wind, I cannot agree with them, for various reasons. If a keel boat cannot outstrip a centre-board with the sheets straved, of what use are they for speed? In the first place, philosophy teaches that the object which makes the least resistance in passing through the water is wedge shaped, offering much less resistance than a flat or round bottomed one of the same bulk under the same conditions. The keel is built so as to come much nearer this wedge shape than the centre-board which, as a rule, is of light draught, and with great beam and a large "seat" in the water. Again, there is another disadvantage in the centre-board boat. The opening in which the centre-board works up and down admits considerable water, which of course rises to its level in the case and makes a heavy dead-water drag. But, it may be urged, the keel yacht has a dis-

advantage of a heavy piece of timber continually acting as a drawback; but of the two evils I think the former is the greater. But there are a great many keel boats in Boston and vicinity which are almost exactly the same models as centre-boards, the only perceptible difference being the substituting of a keel for a centre-board. I am by no means certain that my argument would then be altogether unavailing. I can only justify me in saying that keel boats, as a class, are faster of the wind than centre-boards. For racing, however, I would much prefer a centre-board model. Finer working to windward this model is much to be preferred, and there is much less danger of mistayling. But for seagoing qualities and rough weather, commend me to the old-fashioned keel model, smacking somewhat of the "Dudon" style. I am sorry to see that the famous old styles falling away, to be replaced by the shallow "skindish" of the present day. C. F. G.

MR. BISHOP'S CANOE VOYAGE.

Mr. Bishop has kindly sent us the following note of his progress thus far:—

PAPER CANOE "MARIA TERESA," CORE'S ISLAND, E. S. VA., December 1, 1874.

EDITOR FOREST AND STREAM:—I have roved from Quebec by interior water courses to this Island beach on the eastern shore of Virginia, having passed up the St. Lawrence River to the beautiful Richelieu; thence up that stream to Rouse's Point, where I entered Lake Champlain and the United States. Up Lake Champlain one hundred and fifty miles to Whitehall, and thence through the canal fifty-one miles to Albany, ended the journey made in a wondrous canoe. In October I set out in one of E. Waters & Sons' paper "Dudon Powell" canoes, on my journey Southward to Florida. My canoe is an open one. She is fitted with outrigger rocklocks, which allow me to row as well as paddle. In an open canoe, of only eight and a half inches depth of hold amidships, I consider sailing an unsafe undertaking; so I shall avoid my own misadventure by express from Norfolk, as I have not space to lose by carrying my canoe. I passed through Kill Von Kull and between Staten Island and the main land, I ascended the Raritan to New Brunswick, N. J., and followed the canal thirty-six miles to Bordentown, where it coalesces with the waters of the Delaware. Continuing southward, down the Delaware River to Love's Creek, head of Rehoboth Sound. Rowing across Rehoboth and Indian River Sounds, the canoe ascended White Creek and made a second portage three miles overland, into Little Assowoman Bay. Since that portage was made I have been over the bays and sounds and through the net work of salt marshes, therefore, crossing the strong tidal currents of Chincoteague, Assawoman, Parvathy, Matokinik, Waterprague, Little Mouth, and Great Neck, Virginia, to the Chesapeake Bay. It is situated about eight miles from the main land. I will cross to now-row to the main land, and haul my canoe five miles overland to Cherrystone, on the east side of Chesapeake Bay. From Cherrystone Landing across the bay to Norfolk is a distance of thirty-five miles. This water I will cross on the steamer "N. A. Baker" to Norfolk, and then push on to the Currituck Sound via Elizabeth River to the new canal into North Landing River. Down the North Carolina Sounds to Cape Fear, thence along the Atlantic eighty miles to Georgetown, S. C., and by interior waters to the St. John's River, Florida. I will continue the journey, and southward, up the St. John's to Salt Lake, two hundred and forty miles, where I will make a portage of some miles east, to Indian River. The waters of Indian River flow to the south and Jupiter Inlet, where, becoming land-locked, it will be necessary, for the second time, to trust to the surface of the ocean, until the southern end of Florida is reached.

While in the Isle of Wight Bay, on the eastern coast of Maryland, it was my good fortune to visit Dr. Cornell's sea estate. I was much interested in finding out the cause of the "gull" which had been his misadventure, the ancestors of which the Doctor introduced there some five years since, with two species of the California "gull." The results of these interesting experiments I will forward to you when I can get a dryer camp table than a damp salt marsh, threatened by immersion by an in-creasing tide.

The dimensions of my canoe are: Length, 41 feet; beam, 23 inches; depth, 8 inches; height of bow from a horizontal line at keel, 23 inches; height of bow from a horizontal line at stern, 24 inches; weight of canoe, 58 pounds; oars 2 feet 8 inches, 61 pounds; mast, sail, boom, &c., 6 pounds; paddle (double bladed) 21 pounds. Total, 73 pounds. My own weight is 130 pounds; blankets, charts, provisions, &c., about 100 pounds. I am, very truly yours, N. H. Bisson.

The Colleges.

The contest of various Western colleges at Galesburg, Ill., has been completed with moderate success. That of some of the Eastern colleges will consist of two separate contests. Thirteen essays have been handed in to the judges, Messrs. James T. Fields, Richard Grant White and T. W. Higginson. The decision will be announced at the conclusion of the oratorical contest on the 7th of January, at Association Hall. The verdict of the judges for the latter competition will be based upon the style of composition and manner of delivery. Walter Coleman Bryant, George William Curtis and Whitelaw Reid are three gentlemen named to make the award. Considerable interest is manifested in the success of Col. Higginson's idea.—Yule Record.

YALE COLLEGE, December 5, 1874.

EDITOR FOREST AND STREAM:—The event of Columbia College visited New Haven to play a game of football, the second of this Fall, with our boys. This time they appeared in full force, and with a plucky and determined set of men seemed bound to win, if such a thing could be done. It could not be accomplished, although several of our best players were unable to participate in the sport, making it necessary to play substitutes in their stead. The final result was Yale six goals; Columbia one. The twines were School of Mines, King, 76; captain; Cornwall, Morewood, Rhodes and Tompon, of '76; Lindley, Radford and Roenda, of '77; Law—McMahon, Edmunds, Sprague and Webb, of '77; Drowne, Kling and Vandevanter, of '78; College—Bach, George, Price, Root and Weeks, of '78. For Columbia—White, Bristol and Deering, P. G. Bushnell and Peters, '78; Avery, Denton, Cochran, Fulton, Coleman, McBurnie (capt.), and Hays, S. S. of '75; Arnold, Phelps, Trumbull, Vail, Wakeman and Wright, of '76; Baker and Cooke, of '77; and Wurts, of '78, represented the blue. Columbia won the toss and cant (both of which, by the way, we have lost every time this year) and as usual Morewood bestowed the initiatory kick upon the much-kicked, highly-bonding mass of rubber. The first goal was won by Columbia in 24 min., through some excellent playing by Cornell, who had succeeded in making the ball better than myself. After this they were unable to score another goal, as we won the remainder in the following times—second, 9 min.; third, 21 min.; fourth, 13 min. 30 sec.; fifth, 56 min.; sixth, 7 min. 30 sec.; 7th, 17 min. 15 sec. The playing was of most lively description. Indeed, I never saw so much "rushing" indulged in, and with such good success. I noticed among the Columbia players, as well as in the departing athletic corps, were White, Vandevanter, McMahon, Weeks and Morewood. Among our boys, Baker, Wurts, Wakeman, Bristol and Grinnell were prominent. Of course there was an accident; in fact two men were slightly injured, and were obliged to retire. In the fifth inning Radford was the unlucky man, and for us Vail gave place to Johnson of '76. The referee was, Cortes Maxwell, of '75. Judge—Columbia, Mr. C. M.

Ward, '77, S. of M. Yale, Mr. Betts of '75. With becoming grace, dignity and fairness their arduous duties were performed to the complete gratification of the spectators, who, in spite of cold and dampness, viewed the game to its completion. Taken as a whole, this contest was far superior to the last, as regards skillful playing. The two twenties seem to all to have improved greatly. We have met with Princeton yet, partly from inability to visit him at time, and partly because as yet we cannot visit us owing to pressing examinations. If next Fall, they visit us, we hope to meet her, and will do our best to reverse the order of things. K.

NEW HAVEN, December 4, 1874.

EDITOR FOREST AND STREAM:—The New England college presidents, in consultation assembled lately, determined to encourage, rather than discourage, muscular development among collegians. They considered college boating in all its phases, and although it appeared that much time was taken from study by the necessary training, which is incombent upon the athlete, yet the advantages derived from such a course of action seemed to them, if anything, precluded against it, sufficient to counterbalance all other considerations. Such a sentiment, from such a source, is surely worthy of mention. Can anything but good result from it?

In your issue of two weeks ago you mentioned that the athletic sports for the year closed last week. The same might have been carried off a prize on gave the list of prizes and of the times to be made. As yet, the sports record of the findings of the boys this Fall has not been published in your paper, and as they are worthy of being preserved, I send them to you for this late issue.

The hurdle race was first, and Cortes Maxwell, of '75, won it with ease—10 minutes, 120 yards in 21 sec. The same man carried off a prize of like nature at Saratoga last July—the J. G. Bennett Cup. There were three contestants. The throwing of a base ball was next in order, and C. M. Daves, '76, was the winner over four competitors. The distance was 317 feet 10 inches, which is excellent, as it was against the wind. H. W. Drown, '76, came out victor in the half-mile walk. His opponents were five in number. His time was 2:17. The standing leap jump brought out three contestants. Cortes Maxwell won easily, his best jump being 11 feet 3/4 inches. Fifteen contestants appeared to contend in the 100 yards dash. Owing to the great number the race was run in three squads of five each, the winners to contest for the prize. Maxwell won the first heat, Davis the second, and Betts the third. The race between these three for the prize was won by F. W. Wurts, of '74. His running high jump was won by Cortes Maxwell over one competitor. He jumped 4 feet 7 inches, his sole opponent giving up at 4 feet 6 inches. After this Maxwell cleared 4 feet 9 inches for the amusement of the crowd. The one mile walk resulted in a victory of A. H. Ely, of '75, over his eight opponents. The time announced as official was 10 min. 27 sec. Your correspondent, as well as several unofficial timekeepers, made it 9 min. 24 sec., which is most likely to be nearer the true time. The hop, step and jump was won by Cortes Maxwell with the greatest possible ease. Three trials were allowed each competitor. Maxwell only jumped twice, his last jump—41 feet 3 inches—being sufficient to make him a winner over his sole opponent, a theologian. The wrestling, which was divided into two classes, heavy and light weight, came next in order. D. B. Cunningham, '76, won the light weight wrestling, after a tough struggle over eight contestants. C. M. Forbes, of '76, also vanquished his two opponents in the other department, being thrown but once. S. R. Betts, of '75, won the one quarter mile dash from eight competitors. His time was 57 sec. This was the most exciting race of the day. Davis, in the first of the dash, being about ten feet behind. The three-legged race (consolation) was next, and it ended the most successful series of athletics ever held here. Betler and Hammond, '76, S. S. S., covered the 125 yards in the fast time of 20 1/2 sec.

The result of these games so far exceeded the expectations of those interested that they are to be a standing thing hereafter. It is probable that the college will be the only place where the Athletic Association, thus cutting loose from the supervision of the boating, football, and base ball organizations, under whose charge these sports have hitherto been conducted. Winter, with its cold days, precludes almost every sport, except foot ball, and this is not indulged in with such a zest as formerly. The gymnasium, however, will soon have its busy season, and all college will exercise in doors, in preparation for the Spring struggle. K.

Chess.

THE NEW BRIGHTON CLUB.—Through the efforts of Capt. Taylor, of Bay street, Tompkinsville, Staten Island, a club has now in succession been organized in the above city, and an interesting chess tourney has been commenced. The club meet at the Captain's residence every Saturday night, and a pleasant social time is had around the chess boards. Mr. A. Heydenschick is the Secretary, and his address is 59 Liberty street, New York.

THE WILLIAMSBURG CLUB.—A new club has been recently organized in the Eastern District of Brooklyn by a number of German chess players, and at the first election the following corps of officers were chosen: President, Charles Neher, Vice President, H. A. Schwab, Secretary, O. Walter, Treasurer. The club already numbers about twenty-five members.

Appended is the score of a pretty little game played between Dr. Barnett and Mr. Davis in the above tourney, the Doctor giving the odds of Queen's Knight, which is removed from the board. In the seventeenth move he threatened mate in three moves and forced the game:—

Remove White's Q.'s Kt. White (Attack) Black (Defence) DR. BARNETT. MR. DAVIS. 1. P. to K. 4. 1. P. to K. 4. 2. P. to K. 3. 2. P. to K. 3. 3. Kt. to K. B. 3. 3. Kt. to K. B. 3. 4. B. to Q. 4. 4. —Mr. Murray, one of our valuable correspondents, is now engaged in making a survey of Newfoundland. He penetrated to the interior of the island by following the courses of the principal rivers. He reports the country to contain fertile valleys, large coal fields, and fine forests.

—The transit of Venus, which occurred last Tuesday, was carefully noted by American scientists from the principal points in the world. The party landed on Desolation Island, in Australia, will not see their comrades of the Swatara for six months.

—Navigation on the inland lakes of Canada is over for the season.

The Horse and Course.

—Three trotting contests came off at Fleetwood Park last Wednesday. The first was between Mace's Clara G. and running mate in harness and John Murphy's Lady Dahlan under saddle. Though the latter was admirably ridden by her owner the team won. Best time, 2:28. The second race was a sweepstakes of \$400 between Sherman, Willie, Lady Trine and Sorrel Jake. The former won in three straight heats. Best time, 2:41. The third affair was a sweepstakes for \$800, between Black Hawk, Jerry, and Jericho. The former lost the first heat but won the next three and the race.

—Eleven heats were trotted last Thursday afternoon at Fleetwood Park to decide two matches, five in one and six in the other. The races were between C. Walker's bay gelding named Moore, two-year-old, and H. Smith's bay gelding Humpty Dumpty, in harness; and F. Lovnd's bay mare Butcher Girl, to wagon, and Ben Wilson's bay gelding Pet, in harness. In the first match Humpty Dumpty had the call in the betting for two heats, both of which he won; but when Tommy Moore had scored the third heat he in turn became the favorite, and Tommy Moore also won the fourth heat; but when the horses started for the fifth Humpty Dumpty sold for the highest price. The latter won the concluding heat and the race. Best time, 2:40. In the match between Butcher Girl and Pet the first heat was won by Pet, but Butcher Girl won the second and third heats and became a great favorite. She made a dead heat for the fourth, gave Pet the fifth, and then went about her business and won the sixth heat and the race. Best time, 3:04.

—Fleming's Allee Gray and Jan. Murphy's Tip trotted at Fleetwood Park last Saturday for a purse of \$200, and after four heats the former was winner. Best time, 2:55.

—Walker's Pet and Lovnd's Butcher Girl trotted at Fleetwood last Monday. The former won the race in the fifth heat. Best time, 3:08.

—Joe Platt and Laly Woods tried their mettle at Sea View Park last Saturday for a purse of \$100. The former won in three straight heats. Best time, 2:50.

—The Louisiana Jockey Club Fall meeting was inaugurated last Wednesday. The first race was a hurdle race, two miles or eight hurdles; club purse, \$500; \$350 to the first, \$100 to second, and \$50 to third horse. The race was won by Biloxi, beating Chris Doyle, Huntress, Mary Forrest, and Captain Jack, in the order named. Time, 4:00. Captain Jack fell at the second hurdle. The second race was a six-furlong hurdle race, two miles; \$35 entrance, \$200 to play, with \$700 added; second horse to receive \$200, and third, \$100; one mile, to carry three-year old weights. There were eleven nominations and three horses started. The race was won by Puss Broadway, beating Leap-year, second, and Pauline Sprague, third. Time, 1:54. The third race was for the Club purse of \$500, for all ages; \$400 to first and \$100 to second horse; mile heats. Ballukuel, Bonaventure, Mary L., Bob Britton and Tom Leathers started, but the former winning the first two heats was declared victor. Time, 1:44, 1:43.

—The third day of the Louisiana races witnessed some excellent contests. The first event was a handicap hurdle race of two miles for a club purse of \$500, of which \$350 to the first, \$100 to the second and \$50 to the third horse. The race was won easily by Biloxi, beating Captain Jack, Chris Doyle, Mary Forrest, Huntress and Astrabel, in the same order. Time, 3:36. The second race was for a club purse of \$400, for all ages; \$350 to first, \$100 to second, and \$50 to third; one mile and three-quarters. The race was won by Ballukuel by six lengths, beating Carrie P., Falmouth, Colonel Nelligan and Rainy Day, in the same order. Time, 3:10. The third race was for a club purse of \$700, for all ages; \$550 to the first and \$150 to the second horse; mile heats; best three in five. The race was won by Lottie Moore in three straight heats, Crown Prince taking second money. The first and third heats were secured easily, but the second was almost dead between the winner and Crown Prince. Time, 1:45, 1:45, 1:46.

—The last day of the Louisiana races closed last Monday. Pauline Sprague, Puss Broadway, Nannie and Leap Year entered for the Howard Stakes for colts and fillies. The former was the winner. Time, 2:06. In the Consolation Stakes for a purse of \$400, Carrie, Brown Prince, King Amadeus, Mary L., Captain Jack and Bob Britton were entered. The former was the victor. Time, 1:59. For the Club purse of \$1,200, four mile heats, there were five entries, and victory fell to Colonel Nelligan in the two first heats. Time, 8:34, 8:20.

—It is announced by the San Francisco papers that a handicapped running race—two miles and repeat—is about being arranged between Katie Pease, Henry, Hardwood and a horse called Gillingipper, Katie Pease to carry 105 pounds, being four pounds more than rule weight; Henry to carry

ninety-five pounds, which is nine pounds less than the rule call for; Hardwood to carry ninety-two pounds, being twelve pounds less than rule weight; and Gillingipper, although an aged horse, will be allowed to run with ninety pounds up. The purse is to be \$1,000, and the race to be decided over the new track, the time to be set.

—Syrian, the winner of the great Shropshire handicap, distance one mile, was timed by Benson's chronograph in 1 minute, 37.2 seconds. Syrian is an aged horse and had 101 pounds up.

—F. Archer, a well known English jockey had 507 mounts during the past season, out of which he succeeded in winning 143.

—The largest training stable in the country is shortly to be established at Ranocoes, Burlington County, New Jersey, by William Brown, formerly with TenBroeck, England.

CHALLENGE.—Mr. John Rook, of Manchester, England, offers to trot his mare, Steel Greg, against any horse in the world for either \$1,000 or \$1,500. The sum is too small to cause any American "eracks" to go to the trouble of meeting the grey mare.

SPEED IN HORSES.—Just at this time, when trotting horses that can trot a mile in 2:20 are becoming so common, and when horses taken out of butcher carts in California are trotting a mile in 2:18 with ease, it may not be uninteresting to inquire whether this class of horses are really the most useful as well as the most valuable, their value being judged by the money they will sell for.

When perseverance as well as speed is required in a horse, another style than the American trotters must be chosen—the well known roadster. He is not built like these celebrated trotters. He has deeper shoulders, a straight back, and much stronger loins. He possesses stouter forelegs, and all his legs are shorter. His foot points straight forward; he lifts it well, and brings it down square on the whole bottom at once. Such a horse is very useful, for he can maintain great speed all day, and can even take with him the commodities and produce which his owner is compelled to transport by this kind of conveyance.

Some of the recorded achievements of these horses are of a nature to command our admiration, and from various sources we compile some of them for the benefit of our readers.

On the 25th of July, 1753, in England, Mr. Crockett's grey mare trotted 100 miles in 12 hours, without seeming fatigue, but

the rider was so exhausted that he had to be held in the saddle during the last few miles. The celebrated horse Phenomenon, bred by Sir Edward Astley, in Norfolk, trotted 17 miles in 53 minutes, with perfect ease. This mare was pushed so hard in these long heats that she ran down, and sold in 1810 for about \$35. Under good care she recovered, and when she was 23 years old trotted 9 miles in 29 1/2 minutes, and gained four matches in one day. A Shetland pony in an exciting match ran 44 miles in 3 hours and 45 minutes, and a Galloway ran 91 1/2 miles, all the way at the rate of 9 miles per hour.

The nobleman of England, in 1750, furnished a rig, consisting of four horses attached to a four-wheeled coach, that accomplished 19 miles in 5 1/2 minutes, on ordinary roads, and Mr. Giles drove his celebrated mare Maid of the Mill, 28 miles in an hour and fifty-eight minutes—on the trot throughout.

The inhabitants of Toorkistan, it is said by way of forcible illustration, are born in the saddle, and their horses are perhaps the best in the world on long, speedy excursions. One hundred miles per day is their standard.

They train them especially for long, hostile excursions into neighboring territory, and when a horse is in proper condition, they express it by saying, "His flesh is marble." In 1800 a Toorkistan horse carried a dispatch from Shiraz to Teheran, a distance of 500 miles, in precisely six days.

A CARD.

In the issue of FOREST AND STREAM of 7th month 33d inst, we inserted an advertisement containing an extract from a letter of James Parley, 314 Oxford street, London, which it appears, was only intended for our own information, and not for publication. Our use of it—which we regret—was caused by our misunderstanding the object of Mr. Parley's letter, and we very cheerfully make public the following—

JOS. C. GIBBS & CO.,

712 Market street, Philadelphia, Pa.

London, Nov. 13th, 1874.

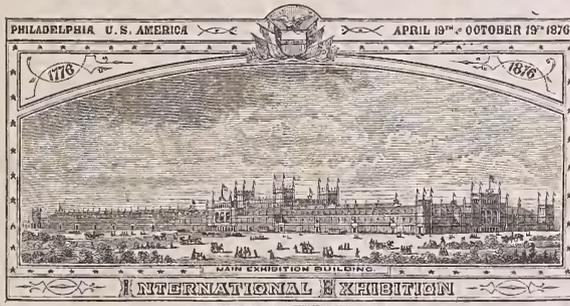

GENTLEMEN:—I observe with great regret in the issue of FOREST AND STREAM of the 30th of July last, my letter to you of the 9th of June. This letter was intended quite as a private communication to you, and certainly never intended for publication. I should further remark in simple justice to several well known gun manufacturers in Birmingham, that the remarks made in the first paragraph of such letter, in regard to the quality of work turned out by Birmingham gun houses, did not in any way apply to them, for, on the contrary, I am convinced that there are many houses there who have and are manufacturing good, sound, and excellent guns. Begging you to set this matter right,

I am, gentlemen, yours very truly,

JAMES PURDEY.

To Messrs J. O. Grubb & Co.

INTERNATIONAL EXHIBITION—FAIRMOUNT PARK, PHILADELPHIA.

PHILADELPHIA U. S. AMERICA APRIL 19th - OCTOBER 19th 1876
Length (East and West) 1,850 ft.; Width, 464 ft.; Height, 70 ft.; Height of Central Towers, 120 ft. Main Entrance on Elm Avenue. Area covered, 936,708 square feet, thus divided into parallel zones, lengthwise of the building. Corridors and Stairs will occupy points outside the building. This arrangement will bring the products of each class from the whole world into the same line.

ART GALLERY.

DIMENSIONS OF THE BUILDING.
Length, 365 feet; Width, 210 feet; Height, 59 feet. Height of Dome above the ground, 150 feet. Materials—Granite, Glass, and Stone. Site—Landsdowne Place, Shares of Centennial Stock, \$10.00.

HOLABIRD'S SHOOTING SUITS OF all sizes; also loaded cartridges for breach loaders of any desired size or charge always on hand; I have also a very fine 8 bore breach loader, 14 lbs. weight, made by Scott & Son, at a low price.
HENRY C. SQUIRES,
No. 1 Cortlandt street.

HAVING recently purchased, for the use of our Florida Commissioners, a very fine Breach Loading Gun, made by the celebrated firm of W. & C. Scott & Sons, England, and the outfit purchased being in excess of their wants, we now offer the gun for sale. The gun can be seen at FOREST AND STREAM Office.

Prize List!

FOREST AND STREAM.

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of

The Fish Culturists' Association of America.

The Publishers of FOREST AND STREAM

In order to stimulate the development of

MANLY AND ATHLETIC EXERCISES,

AS OF

FISHING, SHOOTING, ARCHERY, CRICKET, FOOTBALL, and CROQUET.

Offer the following prizes for clubs of three or more subscribers.

Single Subscription per Annum \$3

Starting Clubs.—Agents, and others interested, are advised that we do not insist upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 60 days will be entitled to same premiums as if all were sent together.

CRICKET.

For \$30 00, four copies, one year, with one best spring bat, one Colgate bat, one Dark cricket ball; price \$7 50.
For \$25 00, five copies, one year, with a complete cricket set; one Colgate bat, one polished bat, Cripshaw; one Dark cricket ball; one set of stumps; price \$12 00

FOOTBALL.

For \$15 00, three copies, one year, with one Rugby football; price \$5 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7 00.
For \$20 00, twelve copies, one elegant rod; suitable for trout, black bass with fly, or for trolling bass or pickerel; as fine a rod as can be made; German silver tipped, with three tips; price \$25 00.

CROQUET.

For \$30 00, four copies, one year, with very handsome set of croquet; price \$7 00.
For \$25 00, five copies, one year, with super set of Croquet; price \$10 00.
For \$30 00, six copies, one year, with the finest set of croquet made; price \$14 00.

TABLE CROQUET.

For \$10, two copies one year, with handsome set of Table Croquet, 8 balls and 8 mallets, in wooden box. This game can be played on dining room or other tables.
For \$15, three copies one year, with the handsomest set of Table Croquet manufactured, made of cocca.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Remington Deer rifle; price \$25 00.
For \$100, twenty copies, one year, with one Target rifle, 30-inch octagonal barrel, to be used for sporting, hunting, or target shooting; price \$35 00.
For \$100, twenty copies, one year, with one Remington double barreled, breech-loading shot-gun. This is the best gun ever offered to American sportsmen; price \$45 00.

SHARPE RIFLE.

For \$100, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$40 00.

WARD-BURTON RIFLE.

For \$300, forty copies, one year, with one Ward-Burton rifle magazine gun for large game, price \$0 00.

SINGLE AND DOUBLE BARREL MUZZLE LOADING SHOT GUNS.

For \$30 00, four copies, one year, with one American single barrel gun, perfectly safe, fine barrels, walnut; price \$10 00.
For \$35 00, seven copies, one year, with one American double gun; handy and reliable gun every way; price \$15 00.
For \$40 00, ten copies, one year, with one double boys' two twist barrel gun; a safe gun every way for boys; price \$20 00.
For \$75 00, five copies, one year, with double gun, English laminated steel barrels, handsome finish; price \$45 00.

CASH PREMIUMS.

To those who catch such premiums a discount of 25 per cent. will be made on all clubs of three and upwards.
Every article is of the finest quality and will be sent free of expense.

Remitting Money.—Checks on New York City banks and bankers are best for large sums; made payable to the order of FOREST AND STREAM PUBLISHING COMPANY, 17 CHATHAM STREET, NEW YORK. Post Office Money Orders for \$50 or less are cheap and safe.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

PULEX IRRITANS—FLORIDA.*

FLORIDA Florida, enchanting and sunny land
Of azure skies and a climate bland;
Low murmuring surf on a golden strand,
Grey vines by gentle zephyrs fanned,
With lovely scenes upon either hand,
Thy fleas are as many as grains of sand.

And fearfully made is this wonderful mite,
Fitted to conquer in foray and fight,
Agile and fierce as demon or sprite,
Stealing a march in the darkness of night,
Brave as a soldier whose cause is right,
Abl valet is notting; seek safety in flight!

Yes, a terrible host is the Floridian flea,
A scandalous fellow indeed, as he;
The bloodthirsty rascal he biteth me!
Attacketh we, ah! I afflicteth she,
Making himself intolerably free,
In a manner really unpleasant to see.

Nor ereth he whom he may be on,
High bred prince, or low bred peon,
Crawling about, feeding perfectly free on
The purest blood, in heralric tree on,
And we venture to say that Ponce de Leon,
In his Florida life, had many a flea on

Theory (not Darwinian) of the origin of Pulex Irritans:—

The Devil one morn, cross after a spree,
As blue and upset as a Devil could be,
Without any soda, and no *cau de vie*,
Gathered his fangs, and announced to their gloe,
As a last, most infernal, triumphant *Utee*,
The hot road in disguise, the Florida flea.

Anticipated result of the Pulex Irritans fully realized:—

A wicked cop does this small seed bear,
For it maketh full many a good man swear,
And pious lips, ever guarded with care,
Exclaim "old Scratch!" instead of a prayer,
While in many a way more foul than fair,
Has it jarred with eases the Florida air.

Lesson to be impressed by the Pulex Irritans upon those who see "good in everything":—

'Tis a sed, sad moral, the rose and the thorn,
That hopes will wither, tho' brightly born,
That in fairest breasts beat hearts foleorn,
That the dearest smile may be used in scorn,
That the brightest land carressed by the sun,
Has its thorn and its thorn in the Florida flea.

*The mouth of *Pulex Irritans* will be the first member to impress its wonderful adaptability upon the unscientific observer, who may feel interested in the following description of its construction. See *Encyclopedia Britanica*, Vol. X, p. 315.
"The mouth is composed of a labium, two almost membranaceous mandibles, a pair of maxillae, each furnished with a palpus of four five to six articulations, and of a labellum of four emarginations, bearing two quadri-articulate palpi."
L. W. L.

For Forest and Stream.

Winter Sport in the Mississippi Bottom.

BY FARMAN WYDE.

THE extensive tract of lowland, forest and swamp, known as the Mississippi "Bottom," is one of the various regions in different quarters of the globe to which, at one time and another, I have resorted in search of sport; for there, at certain seasons of the year, an abundant variety of game is to be found. The Bottom is not to be recommended to anybody as the right place to go, either in the Summer or in the Fall, for at these seasons the unfortunate sojourner is so sorely afflicted with the tropical heat, the ague, and the mosquitoes and other blood-sucking insects, as to make life seem well nigh intolerable, and death a blessed relief. But with the first month of Winter the pleasant times begin, and for two or three months thereafter, the man who loves a genial sky and bracing atmosphere, a rough labyrinthine territory to explore in, work for his gun in variety and abundance, and last, though not least, very good living, that man will find in the Mississippi Bottom all these attractions. It has been my lot to shoot on both sides of the river; but I prefer the Eastern shore, although the mallard in Arkansas has always seemed

to me to be a bird of bigger size and brighter plumage than his kinsman of Mississippi. Of course, that is nothing more than a mere fancy. At a distance from any of the towns, the country on the Arkansas side is sparsely settled, and my recollections of it are not the pleasantest. Many a weary mile have I ridden in search of a cup of cold water, and often have I been turned away from rude cabins and log huts almost always with the same answer—a scowl, and a slam of the rickety door. But I have found an excuse for such rude treatment, similar as it was to the inhospitality Goldsmith's "Traveller" may have experienced,

—where the rude Cornishman poor
Against the houseless stranger shouts the door.

I say I have found an excuse for it, in the sickness prevailing among the people, for all seemed to be wan and yellow, worn out and shaking with the fever and ague.

No such miserable experiences mingle in my recollections of Mississippi—only happy memories recur to me in thinking of that rich State. It cannot with propriety be called an Arcadia, but there is nothing in it to repel any one somewhat used to roughing it, and not afraid to wet his ankles. The temperature at this season of the year is apt to be changeable, and the fog of the morning is often melted at noon. A roaring log fire is very desirable at night, especially in the airy frame houses of the Bottom, raised off the ground on stables as they sometimes are, to keep them free from the damp. Nevertheless, it is no difficult matter to put oneself in a perspiration tramping through the woods in the day time. But what a country it is for sport, when once the aquatic birds begin to fly South! Here they find great scope of open water, and great score of cornfields. The crops that are grown in the Bottom are corn, cotton, and sorghum—the corn averaging eight feet high, and the cotton five feet—and the fields are now no doubt white with cotton not yet gathered. But the cultivated land is a mere patch in comparison with the extent occupied by the swamps, the woods, and the canebrakes. Let me try to describe the features of the region.

Immediately behind the levee, constructed to keep the "Father of Waters" within bounds, there is generally a cypress swamp, a belt of cottonwood trees, or a canebrake—the canes being so dense that a man on horseback has a hard and painful job of it to get through their ranks, the while they conduct a vigorous *bastinado* on every part of his luckless body. After all, he may fail to penetrate. Behind these swamps and canebrakes lie the cultivated fields and the tracts of "deadening," in which the tree trunks lie rotting, or stand upright, black, charred, and spectral, amid the tall rank grasses. How like ghosts these black trunks look in the dusky twilight, as they loom up from the vaporous ground and are dimly outlined against the murky heavens! And what a hard time you would have getting a "colored brudder" to pass in their awful vicinity after dark! In these fields of "deadening" the deer lie ruminating, and dogs give tongue ere they have been in their covers many minutes. Deer are to be had either by still hunting them, or by running them before the dogs; but as the former method requires not only great experience, but also an accurate knowledge of the country, a stranger will find the other the more productive and satisfactory of the two. Although some of the planters in the Bottom keep their own packs of hounds, yet it will be as well for the sportsman, if he go South with the intention of running deer, to take along a couple of dogs. The people are generally very ready to point out the deer passes, or "stands," and I must acknowledge that with or without dogs I never found myself in a difficulty, or came away disappointed. However, it should be borne in mind that a letter of introduction, though not absolutely requisite, will be found a never failing "open sesame" to the hospitality and good offices of the people.

Behind the swamps and canebrakes, behind the cultivated fields and the tracts of "deadening," stretches the great forest, enroached upon at intervals by patches of cleared land, and intersected by lengthly bayous and broad lagoons. These are the Winter haunts of aquatic birds,

and this is a veritable sportsman's paradise, rivalling the hypothetical hunting grounds of the red man. Here the sportsman may bag ducks and geese innumerable, and swans also, if he can stalk them. All kinds of water fowl are as thick as blackberries in August, and may be shot in many places where they are easily recovered at the cost of a wetting; but when one has to thread his way among the lagoons and bayous, a good retriever is an almost indispensable assistant. Some of the lagoons are of great extent, and are almost invariably provided with a skiff, a dug out, or a floating machine of some sort, the use of which is generally to be had without any trouble by an application to the neighboring planter, whose property it is: To my mind, duck shooting afloat is better than duck shooting on *terra firma*. Pushing out from the little cove where the skiff has been moored, let the sportsman paddle towards one of the clumps of reeds which dot the surface of the water here and there like little islands, and let him run the skiff close by its edge, or even a short way among the reeds, so as to leave a fringe of them between his craft and clear water. By these means he is placed fairly in concealment. The birds in the neighborhood have of course been disturbed by this manoeuvre, but before very long a string of ducks flies overhead, and when once the firing has begun all the water fowl on the lake are set in commotion by the noise, and one train after another sweeps past within easy range and in rapid succession. Indeed, it very soon becomes necessary to set about removing the dead and wounded birds, and though it is with considerable reluctance that one proceeds to paddle to and fro to find the birds he has hit, especially when the game is so plentiful as to give even a breech loader little rest; yet the duty should not be omitted or too long postponed, and no disabled bird should be allowed to creep into sedges to linger on in pain. When the birds have all been picked up, the position should be changed to another clump of reeds; for ducks may soon become shy of the spot where their enemy lies concealed when once it is discovered, and are certain thereafter to give it a wide berth. Swan are also to be found in considerable numbers on these lagoons, but are not easy to get within range of; yet I have seen them very readily tumbled over by making a bullet ricochet along the ice. The best sort of place to post oneself to shoot ducks and geese in the morning and in the evening is among the rows of cornstalks in some field with a pond in it, as many fields in the Bottom have; or, at least adjacent to some water. A man with an observant eye very soon discovers the right spot, and is successful in his sport accordingly. Flocks of wild turkeys are often to be met in the woods in the Bottom, and, for my part, I prefer them to come across my path, for I have not been very fortunate when I set out to hunt them with premeditation. Often I have invited them to my neighborhood with dialect notes blown upon the shank bone of one of their own kind, but my invitations have been in vain. They either did not hear my call, or, having heard, deemed not to give it the slightest heed, a circumstance which, while it has caused me to abate some of my pretensions to be a master of the sporting craft, has unquestionably raised the turkey in my respect as a bird possessed of some small medium of sense, all reports to the contrary notwithstanding. I have never had an opportunity to entrap them by means of a decoy bird, but at dawn of day I have lain in wait for them at their roost on the persimmon tree, and have carried off most of the brood. It is the early bird that gets the worm, and this early method of circumventing the turkeys is the only satisfactory method I have learned in my experience. There is only one difficulty about it—the difficulty of finding out their roosting place, but the roost found, one must be a very indifferent sportsman if he do not find the turkeys also. If the visitor to the Bottom can enlist the aid of any of the local Nimrods, he may probably vary the monotony of his sport with an occasional bear hunt. The brute of the Bottom is far from being a formidable animal, and is rarely in a humor to molest anything bigger than a shote, or sucking pig; but when he has been snooked out of his hollow tree, or teased out of the cozy quarters

into which he has retired to hibernate, or when, possibly, he has been slightly wounded with a bullet, or hit upon the nose with a heavy missile, then he is no gentle customer for dogs to encounter, or men either, for that matter. Bear hunts in the Bottom are all much alike, and they invariably have one tedious search for the animal, and the provention of him to combat, sometimes as tedious as short, sharp tussle with the dogs—a few bold strokes with the knife—and that is the death of him. The fight with the dogs is the exciting part of the business, and if the animal seen in danger of faring badly, the bear receives the *comp de grace* so much the sooner.

The country in the neighborhood of Austin, Bolivar county, Mississippi, and in the State of Helena, Arkansas, some twenty or thirty miles below Austin, answers very closely to the description given above. Indeed, in writing this article, I had these two districts chiefly in my mind. This Winter three years ago I was hunting in Arkansas, a hundred miles or more North of Helena; but it is a much longer period since last I was in Mississippi in search of game. The folks there were trying to reconstruct and recuperate, and tilling very hard, with varying success, to grow a bale of cotton to the acre. The sport then was as good as I describe it, and from all I can learn it is little inferior now. But the sportsman has this great advantage in the Bottom; it is impossible for he can be cribbed, cabined, and confined in one spot, for he has only to hail the first steamer in order to transport himself to "fresh fields and pastures new."

FLORIDA SKETCHES.—No. 2.

THE FLORIDA PANTHER.

TO the average Florida tourist who sails luxuriously up the St. John's, or stays idling at the hotel, the idea that there are any wild animals in the State rarely occurs. It is only to the camper-out that the privilege of making their acquaintance is vouchsafed. If he camps in a place sufficiently remote from civilization he will probably be favored with a sight at the animal mentioned above. It is more than likely that he will be favored with its moaning cry or see its signs about his camp. The panther is so rarely seen, however, that it is regarded as mythical by many men passing through the State, and its very rare fortune to meet with, and be in at the death of, and soon after the demise of several others. There is a vast difference existing between this panther, tiger or puma, and the wild cat, or lynx. The latter animal, and another, the catamount, occur in Florida, but are not half the size of the panther. The latter has been found measuring nine feet from tip to tip. I have seen one measuring eight feet four inches, and have the skin of one measuring eight feet good. In color, the panther is a yellowish-brown, darker on the back, growing to a yellowish-white on the belly. It has great strength and no pack of dogs can successfully attack one. It frequents the swamps and hammocks during the day, and seeks its prey by night. Old hunters say it remains concealed in the large trees, ready to drop upon unwary travelers. Its tracks may be frequently seen in the woods back of Indian River, or interior. I have been told that an animal larger than this species, and striped—in fact, the regular tiger—was seen near New Smyrna, but this is the only related instance, and not likely to prove correct. This animal is more generally known by the name of tiger than any other, and as such is spoken of with dread by the "crackers." The only panther I ever had a hand in killing was a goodly sized one near Hope Sound. It was camped at St. Sebastian Creek, and having with me the practice of boatmen, Jim R., lacked not in either fish or game. But ducks and fish were not enough to satisfy, even in the abundance provided there by a lavish nature, and I cast about for some new diversion.

It was at this period that Jim suggested we should go down the river and secure the skeleton of a manatee we had discovered a month previous. It was just the thing, and we were soon sailing down river with a fair wind. It was about fifty miles from the place we had intended to land from our destination. When we awoke next morning we discovered that our whole stock of pork was missing. Further search revealed the tracks of a panther, and, connecting the circumstances, we were at no loss to account for the absence of the pork. The most aggravating circumstance was, that the theft had been committed while we had a dog in the camp, whose sole purpose was to guard our property. It was useless to follow up the trail, as it was soon lost, and we left camp and entered the Narrows beneath the shade of India rubber and palm. The manatee we were in search of had been discovered in a decomposed state, so, as it was securely lodged in a bend of the channel, we had left it to the tender mercies of a coroner's jury of vultures, intending to return for it later. Now we had returned, and making our boat fast over the spot where we supposed the ivory lay, we proceeded to work. As the one method of getting it was by diving, and the water swarmed with the ugliest alligators ever seen by mortal man, there was no rivalry between Jim and myself—in fact, Jim desired to give me precedence; he was perfectly willing I should take the lead in the way of diving, and developed a new feature in his disposition. Around our camp fire he always manifested a disposition to secure a front seat when the pork and diapnoid were to be changed, but he always resigned the role of leader and be content with that of follower. But I was not at all desirous of securing glory at his expense, and so he went overboard first and I followed. The water was about neck deep, and rather cold. Our mode of operation was to wade about, feeling the mud beneath us with our feet for the ivory. Occasionally we would assume the posture of a frog, and feel along in the mud, groping and poking mud with our hands. With our heads under water we might have reminded a disinterested spectator—through there was not another white man in a radius of a dozen miles—of the ostrich who thought so long as his head was covered his extremities were secure. But we didn't think so, for we were constantly thinking of our unprotected parts, and we often wondered whether the saying that an alligator wouldn't bite a white man were true.

It was upon coming up from such a position as I have described that I heard a low growl from our dog, a huge old mastiff, whom we had left aboard the boat. Following the direction of his fixed and eager gaze, I saw, as soon as the water had cleared from my eyes, a huge, cat-like animal stealthily moving among the mangrove on shore. I remember getting a glimpse of a mowing pair of eyes,

and then I imitated the ostrich before alluded to, and stuck my head under water and started for the boat. Jim had seen the animal at about the same time, and although I started first for the boat, he had reached it first, being much nearer.

Snatching my double-barreled breech loader and slipping in a couple of buck shot cartridges, he jumped into his breeches and then jumped ashore, and was far on the trail of panther and dog before I had equipped myself for the race. Putting on pants and moccasins, I took a large bowie knife, the only available weapon, and isusally followed on the trail. It was long and circuitous, but I finally found them—Jim and the dog—a mile or so from the boat. I know not the silence of the dog, some time before I reached them, that the panther was tired, and did not need Jim's information to that effect. It was in a small hammock of an acre or so that they had brought him to bay, and after closely reconnoitering we concluded he would be likely to stay till dark, and that it would be best for one of us to return and get some more ammunition and the rest of our clothes. Accordingly, I remained guarding the hammock until Jim returned with the necessary articles. Taking courage, from a small tree we had by us in a small hollow, we proceeded to make a thorough and systematic search for the panther.

The hammock was in the pine woods, and was just such a one as is common in the Florida pine barrens—a collection of oaks and other deciduous trees, with an abundance of vines and undergrowth.

We proceeded but slowly, for neither of us cared to meet the animal without an introduction, and it was late in the afternoon when we approached the centre of the clump towards which we had been steadily working. We had held the dog back all this time, for fear he would cause the beast to take refuge in another hammock, but no sooner had we reached this central clump of old oaks and tangled briars, than he dashed madly forward, and wildly clayed at the bark of a huge old oak some forty yards away. A panther in a tree, I perceived, and we proceeded to search. After the sun has dipped below the horizon; and again, the color of a panther so assimilates with that of the rough, brown bark, that it takes a sharp eye to detect one, even when you know he is there.

Guided by Jim's finger, I saw two firey eyes gleaming from over a large limb, close to the trunk of the tree. Ugh! how they pierced me. They seemed to burn me through and through. I perceived that I soon saw the animal's tail, nervously working from side to side. His body was hidden behind the tree.

"There," said Jim, "you take the gun and shoot just below his eyes. If you do that you'll likely hit him in the throat."

"No, Jim, I think you can do this business best; you see I am not much in the panther line, anyhow."

"No, you be liable to yell and shoot 'em in I can with that gun, and besides, you can hit him as he jumps, for you're good on the wing, you know. I'll stand ready to stick him when he falls, old boy, an' I'll fix him if you don't."

So saying, he handed me the gun and took the bowie. I always had thought I should like to kill a panther, and had often pictured to myself a panther in my clutches, with my left hand hold in his throat and my right in the act of plunging a knife into his breast. But now the supreme moment had arrived I was actually shaking with fear, or something akin, and refusing the high honor of killing one. But I knew that, as Jim had said, it was best that I should start the panther up and leave to him the *comp de grace*. Settling myself to this, I tried, by a desperate effort, to quiet my nerves. Securing a position behind the trunk of a palmetto, I rested the gun against it and lighted the shot below those blazing orbs. It was an eventful moment. It was to fire or not to fire—to leave the panther unprovoked, or arouse a terrible destructive power that nothing but death would allay. My hand yet trembled, and I let the barrels fall; but, with a powerful effort, I held the sight upon the panther's throat again and fired. With the report came a howl of anguish and a rushing noise as the huge animal leaped himself into the air. There were no splashing, but a smothered, and a muscular one, held my gun upon him, and stopped him midway his leap, as it were. I have shot birds when their flight was so swift that their wings seemed a misty film, but never, it seemed to me, had I such speed and velocity to overcome before.

He fell nearly at my feet, and the dog was upon him ere he had hardly touched the ground. The growling, snarling and snuffing that ensued, was a horrible beyond description, but it struck no terror to the heart of my guide, for, watching his opportunity, he rushed in and plunged the long bowie almost to the hilt in the panther's side. Groaning and gasping for breath, the animal tottered, fell upon his side and yielded at last, overcome by superior numbers. We skinned him that night by the light of a fire of light wood. The skull, with two broken fangs, a paw and the end of a snuffing tail, created a very horrible beyond to touch for this story, even as the man was willing to show the pen he wrote the letter with. My first shot had broken two of his fangs and the second had broken a fore leg, besides wounding him internally.

The panther is a cowardly animal, and will not attack man. This refers to the Southern panther—but instances are well authenticated where it has followed women and children, evidently with murder on their hearts. Indeed, I remember now an incident related by a settler, of a negro child being devoured by a panther, but cannot recall the locality of the occurrence. They are fond of hogs, however, and will often risk considerable to capture a good porker—a rarity, by the way, in Florida. The day before my arrival at the Kissimmee River a panther came up to a settler's cabin in broad daylight, and carried off a full grown sow, the children of which were in the yard. The settler, his wife and children. The next day dogs were gathered and a hunt instituted that resulted in the death of the panther, a large eight-footer.

Near Fort Drum, in the interior of Florida, panthers have been very troublesome of late years, and are often killed there. That they will kill dogs, I have the testimony of an old guide and hunter, who described to me an "accident" happening to his dog upon the very place, and in the same campsite. He said he was camped there, and his mosquito bar pitched and had gone to sleep. Something, he knew not what, awoke him, just in time to see a dark body leap over his bar and pounce upon the dog. There was a short struggle, and then the worthy guide was minus a good dog. He didn't take part in the fight, but was a quiet, if not disinterested, spectator.

Sometimes they will manifest the utmost contempt for man, and will seem to take delight in keeping him in suspense. An old "live oaker" told me that he came upon two panthers in a narrow trail and that they walked ahead of him to the shore of the river where one of them sat down and refused to move. Upon his companion throwing a "shank of light wood" at it, it merely started a little and smiled in a way that convinced the two live oakers that it "wasn't goin' to stan' no nonsense." They left him there. Another live oaker, a chopper, was engaged in squaring a fallen tree, when a full grown panther came up and quietly carried away his dinner, which lay upon the other end of the log. This act, though very gracefully and daintily done, so alarmed the man that he dropped his axe and ran into camp, a mile or more. But the panther devoured his dinner.

SPORTS IN TEXAS—TURKEY HUNTING BY MOONLIGHT.

HAVING been sent after a load of corn to Tvas bead, Red River, where we would have to stay over night, C. and I placed our guns in the wagon and drove like Jehu to get the time to go to hunting. Arriving some two hours before night, and mine host not being in, we shouldered our guns and marched down a deep ravine to Red River bottom. After starting several deer without getting a shot, we started back, traveling single file up the ravine, C. in the advance. Suddenly turning an angle, we came upon a flock of wild turkeys, and almost instantly C.'s rifle broke the silence of twilight, and a nice gopher was uttering on the ground. Hastily loading, we advanced but a little distance, when C. dropped his turkey and brought his rifle to his face. Then turning to me he said—

"Must I shoot?"

"I replied, 'I see nothing.'"

"There, across the gully; don't you see that object?"

"Yes, shoot!"

Dang goes C.'s rifle again. The small white object, that had been partly obscured, now became clearly visible, and it was evident that C. had missed. I now brought old Spiffire to a poise and fired. From the movements of the little animal, I was sure my shot had taken effect. Hurrying to the spot, C. said—

"Well! isn't it pr'ty?"

"Yes; what is it?"

"I don't know; what do you say?"

"I do not know; unless it's a polecat. It looks like the picture of one."

"Pshaw!" said C., "I have seen many a polecat in T—, but they were not half so big as this. We'll have his hide, my boy."

About this time the stranger, made some struggles, and C. commenced stamping on it with his heel. Suddenly were our olfactory saluted with a scent that sent us off as fast as our legs could carry us. C. crying out—

"It is a polecat; we won't skin it, will we?"

On arriving at the house we found our friend Me., who, on hearing of our adventure, exclaimed, "Green from the States," a term commonly applied to persons not up to all Texas tricks. After supper, Me. said—

"Well, now get your guns, and we'll go down in the bottom and kill some turkeys."

As the moon was quite low to me—killing turkeys with a rifle by moonlight. The fact is, I doubted killing one by moonlight myself, and thought best to let Me. and C. have the first shot. The moon was not quite full, and just about the right height for shooting. And just here I will state that not only I, but almost every man on the border of Texas, feels a strange, sad feeling at beholding the full moon, for he knows that by the light of almost every moon the earthly savage assails the sleeping frontiersman. But I digress.

I had not traveled far till Me. pointed upward and whispered, "I see they are." On looking in the tops of some tall oaks I saw two dark objects tolerably plain. Me. and C. already had their rifles pointed, and I thought I would try my luck at a venture. So I raised my gun, and bang, bang, thump, thump, came the two turkeys.

Not a word was said between Me. and I as we killed one of the turkeys, which was only settled upon a finding that his gun had not been fired. We now hunted but little longer, as we had about as much as we wished to carry.

In this same locality, some boys invited a learned divine, recently from the States, to accompany them. Of course the gentleman accepted the invitation. They soon found a tree full of buzzards, and very generously rendered him the first shot. Imagine his shame at killing an innocent buzzard, and the boys' crying, "Green from the States."

Concho county, Texas, October 27th, 1874.

A RUN THROUGH COLORADO.

YOU have among your city readers many business men, who, like myself, however fond they may be of wood and water sports, can only get away from their offices for two or three weeks of each season, and for their benefit you may publish, if you think it worth while, a plain account of my recent trip to the Middle Park of Colorado. They need look for no angling or hunting exploits. I did not take my gun out of its case and fished less than three hours. It was not because game was scarce, the spirit unwilling, or the flesh weak. It was my first visit to the West, and each day's novel sights moved me to keep moving. I owe to the feathered and antlered game, whose favorite resorts I made myself acquainted with, an apology I hope to present next Summer in person, and to many a noble sportsman, the fact that I was in the West, leaving New York at 7 P. M. Saturday September 12th, by the Erie Railway, in a Pullman car that took its passengers to St. Louis without change, I reached Denver at 6.30 P. M. of Wednesday. One's first ride over the plains of Kansas and Colorado can never be forgotten. I passed three hours of the earliest daylight, on the platform of the car, in wondering gaze at the homeless sea-like expanse and watching the animals disturbed by our noisy iron horse, recognizing the hare, gopher, prairie dog, wolf and antelope. The view from Denver of the Rocky Mountains, is very imposing. I took the Colorado Central next morning for Golden, seventeen miles distant, at the foot of the mountains, where the Clear Creek Canon debouches. Here we changed to the narrow gauge branch of the road and our train wound up along and across the creek, through

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

PROF. BAIRD'S REPORT.

We continue this excellent report this week. "The act of Congress specially directed that investigations be conducted on the great lakes, of the same kind as those ordered for the United States; and, under this provision, Mr. James W. Milner was appointed assistant commissioner with instructions to collect as reliable data as possible on the following points: the evidences of decrease in the numbers of the food-fisheries and, this fact established, to ascertain its causes, and what practicable methods may be applied for their restoration. It was determined to confine the inquiry for the first season to one lake, and to give it a thorough examination. Lake Michigan, having the longest line of shore within the United States and the largest number of fisheries, was selected as the region for the investigation. Instructions were also given him to make full collections of all forms of life found in the waters, and to take as full notes as possible on the habits of the species; making the white fish, the most valuable food-fish of the lakes, the principal object of attention and efficient action for their restoration.

On the 13th of April, 1871, the first visit to the fishing shores was made, and it became evident from the first, that to obtain any definite knowledge of the amount of decrease, it would be necessary to make the entire circuit of the lake. The migratory habits of the fish and the tendency to entirely change their locality after a term of years, at least in the opinion of the fishermen, made it evident at once that the conditions as to numbers could not be understood from any circumstances, but that a collection of accurate statistics through a term of years for all the fishing regions must be gathered to give satisfactory evidence as to their condition.

The Southern end of the lake was visited from point to point by steamer and rail before the middle of Summer, and, at the Northern end, where no steamers plied, the tour was made in an open boat, the trip lasting about five weeks, the season of the year being the most favorable for fishing about six hundred miles. Seventy-one stations were visited, embracing nearly the entire number of fisheries.

Though recorded statistics in the fishing localities were rare, still good evidences were obtained of the decrease and its causes, and many interesting notes of the habits of species and their mutual relations procured. Information was constantly sought and obtained from fishermen, dealers and residents, on the subject of the fisheries, which was noted for use in preparing a report of the subject of the inquiry.

The inquiry was renewed in the latter part of June, 1872; the region of Lake Superior was explored, collections and notes were obtained, and similar inquiries were made with reference to numbers of fishes. Much less evidence of decrease in this lake was the result, though a marked diminution was ascertained to have taken place in certain localities.

In the Autumn of 1872 nearly a million of white fish eggs were obtained by Mr. Milner and placed in Mr. N. W. Clarke's hatching-house at Clarkston, Mich., from which in the Winter a large number were forwarded to California for the waters of Clear Lake. Arrangements were also made for the hatching of salmon for the waters of Michigan and Wisconsin.

After the close of the field work of the season, Mr. Milner visited all the prominent dealers on the chain of the lakes, and obtained the amounts of their receipts of lake-fish for the year.

After the close of the distribution of the shad in 1873, Mr. Milner visited the shores of Lake Huron, and obtained a collection of its fishes. The inland locality in that region inhabited by the grayling was also examined, notes relating to its habits were obtained, and a knowledge of the facilities for obtaining the spawn acquired.

Later he proceeded to Lake Erie, and made a large collection of fishes in the vicinity of Sandusky, Ohio; and afterward at Cincinnati the species of the Ohio River were obtained.

PROPAGATION OF SHAD IN 1872.

"Little time was to be lost in carrying out the suggestions with relation to the shad, as the propagation was not advanced until the 1st of July, and the season during which the eggs could be successfully hatched lasted but a few days beyond that period. Both Messrs. Green and Cliff, however, undertook to do what they could, and worked with great energy. In addition to the large number of eggs introduced by Mr. Green, in behalf of the State of New York, into the Hudson River, Oneida Lake, Lake Champlain, and Genesee River, he furnished 100,000 fish for Lake Champlain to the Commissioners of Vermont, and, in behalf of the United States Government, placed 40,000 in the Alleghany River at Salamanca, N. Y., and 25,000 in the Mississippi River, a few miles above St. Paul, Minn.

The latter period at which the shad spawn in the Connecticut enabled Mr. Cliff to secure a larger margin of time for his arrangements; and, by the kind assistance of the various residents of the State of Connecticut, he succeeded in procuring, from the State hatching-house at Holyoke, Mass., a substantial number for his purpose. Mr. Cliff started, on the 2d of July, with several hundred thousand young fish, filling nine eight gallon casks. Of these, a portion, estimated at 100,000, were placed in the Alleghany at Salamanca, and a like number in the Cayuga, in the White River at Indianapolis, Ind.; the remainder were carried direct to Denver, in the Colorado; and, on the 7th of July, introduced 2,000 in number into the Platte.

Very valuable assistance was rendered in this experiment by the express companies, especially the Adams and the American and Merchants' Union. Without the help of special instructions to their agents to assist Messrs. Green and Cliff, it would have been difficult to accomplish the object in view.

Arrangements are also due to the commissioners, both of New York and Connecticut, for placing their respective establishments at the disposal of the United States in order to furnish the necessary number of eggs. Concurrently with the operations on the part of the United States, the commissioners of both New York and Connecticut were industriously engaged during 1872 in

continuing experiments previously instituted in regard to stocking the waters of their respective States with shad, and incredible numbers of young fish have been introduced. Thus, in New York, under the efficient direction of Mr. Seth Green, 7,000 shad were released in the waters of the State, while the extraordinary number of 92,065,000 young fish is reported by Dr. Hudson to have been turned into the waters of the Connecticut. Dr. Edmonds, Commissioner of Vermont, also obtained 50,000 young fish from Mr. Green, which were placed in Burlington Bay, Lake Champlain.

Whether shad can live permanently in fresh water, and maintain those characteristics of flavor and size which give them such a prominence, and whether they can be established in the Mississippi Valley, are problems not yet solved; but the results to be obtained, in the event of its possibility, are of such transcendental importance in relation to the food-supply of the country, and the cost of the experiment so very trifling, that it would be inexcusable not to attempt it.

HAMBURG, Pa., December, 1874.

EDITOR FOREST AND STREAM.— We, having contributed several articles prior to this, concluded to give the promised notes on pisciculture at this writing. To begin, we will write of the Schuylkill River, which half a century ago was famed for its fisheries, where now in this section not a single cat is found in its waters, every species of living creatures having been exterminated from the entire cat region of Pennsylvania—Schuylkill. Up to 1828 the disciples of Isaac Walton had ample scope to work on, but since the successful operations in the coal regions the fish diminished in number and size, until all were eradicated from this section, what remained of the fish, sought from here by the members of the frye tribe seem to fish, although few in number. The river at or near that point was stocked a half black bass two years ago, which have increased rapidly, and afford one fine sport, although farther down the river all varieties of fish incident to these waters become more abundant and plentiful. North of the above localities referred to, nothing of the sort can be found in the waters affected by the coal-mining dirt. There are, excepting among the small fry—in this section, at which places a few bait fish might perhaps be caught, but the quarry naturally presents itself: "What can be done with them?" and consequently, after due deliberation, they are usually returned from whence they came. The emnets constructed depopulated other streams to an alarming extent, as the erection of dams was necessary, which arrested the passage of the fish. Shad, in the beginning of the present century, were very abundant in the Schuylkill, at which places no fish, or any other living creature, having its abode in the aqueous fluid, can be found. It was surmised that fish would be plentiful in this part of Berks county, but, thus far, the prodigies proved all too false. What thoughts enter into the mind of a disciple of Isaac Walton, living upon the banks of a river, and still unable to procure any members from the unruly waters, while further down the stream, a distance of sixteen miles, the forks are catching mammoth fish of different species! Surely, the mere thought is really disgusting. All efforts to propagate by pisciculturists in this stream there would undoubtedly prove unsuccessful. There are minor streams in the country, in which the fish are of medium size, but "few and far between," not unlike angel's visits.

Since we have concluded the article of the fish of the Schuylkill River, north of the county seat, Reading, some, no doubt, will infer that Hamburg is an "out of the way" place; but this is not the fact, as a visit would amply prove. It has won considerable notoriety as a Summer resort, and the range of mountains (Blue), about one mile north of it, present elegant views of a river, and still capable of affording what is sought by all pleasure seekers. The population, although not large (about 2,500), is composed of quiet and respectable people, and visitors cannot fall being pleased with the citizens of Hamburg. PERR NIXON.

WHEN BLACK BASS SPAWN.

NEW HAVEN, November 27, 1874.

EDITOR FOREST AND STREAM.— I occasionally see in the FOREST AND STREAM instances of variation in the breeding habits of fish, and as a knowledge of all such instances is of importance to fish breeders and others, I send you the following, of which I made a note at the time. On the 10th of July, while fishing for black bass in the Housatonic River, I observed a bass of about one-half pound weight carefully guarding a nest near the shore. Thinking at first that the bass had taken possession of the nest of a roach (whose nest most resembles that of the black bass) for the purpose of catching the small fish, which are always swimming around a nest, watching for a chance to nabble the spawn, I watched its action, and finally came to the conclusion that the nest belonged to the bass, and thought it very strange for that species to be breeding at that time. I intended to find out if it were so, by using my dip net over the nest, and thus, as usual, directly ahead of it, and dam it up into the current. Drawing it in as quickly as possible, that I might not injure itself in its endeavors to free itself from the hook, I set it at liberty again. After its disappearing for some time, it finally returned to the nest, and commenced guarding it as before. This, I think, clearly proved that the nest belonged to the bass. J. T. M.

CALIFORNIA SALMON.

CHICAGO, Ill., December 8, 1874.

EDITOR FOREST AND STREAM.— The U. S. Fish Commissioner has already commenced the distribution of the California salmon from Mr. Fox's hatchery and his assistant, Chesell, passed through here last night, having in charge 15,000 fish for the Brazos River, Texas. They came from the Michigan State Hatching Works at Niles, which are in charge of Mr. George H. Jerome, who has about 400,000 more, which will, however, be distributed within the States. The fish were lively and in good condition.

MORE SALMON.

LEESBURG, Va., December 13th, 1874.

EDITOR FOREST AND STREAM.— Major Ferguson has 1,000 salmon put in the Big Spring, near this town, this evening. They were transferred immediately upon their arrival at the depot to a carriage and driven directly to the spring. All were lively and well. We hope to hear of them again. The Big Spring branch is tributary to the Potomac. T. W.

BELMONT'S TROUT.

EDITOR FOREST AND STREAM.— Last week I went up the Island for a few days' shooting, and had excellent sport. On going on board the boat for Hunter's Pond, I noticed a few milk cans with a crowd about them. Supposing the milk had been well watered, I walked up, and was surprised to see them filled with trout four inches long, as lively as if they were in a brook. I learned that Mr. Thompson of Pennsylvania, and sold Augustus Belmont two thousand trout, and they were being delivered to his place at Babylon. If trout can be raised in such quantities in Pennsylvania, why cannot it be done on Long Island, and our ponds be stocked and have some fishing? If they cannot be hatched here, let us make up a purse and buy some trout and stock our ponds and have some sport. Let some one who understands start it. I am, &c. C. S. L.

Natural History.

THE WHITE TAILED DEER.

EDITOR FOREST AND STREAM.— A RECENT article in your paper, by Judge Caton, in which he specifies that the metatarsal gland is alike in the common deer (*C. Virginianus*), and the white-tailed deer (*C. leucurus*), of the Pacific States and Territories, has attracted my attention. From the assumption of the article I am led to believe that the writer considers the two species or varieties mentioned as being the same species, differing only in minor details, not general enough to form each into a distinct species.

If I am correct in my comprehension of the matter, I would beg leave to call the attention of Judge Caton and others to an article on the cervidae of the Northwest, which I saw published in your journal last Summer, under the name de plume of "Mortimer Kerry," in which he states that hybridity is very common among the white-tailed deer, and not only that, but also, that small herds of white deer are met with occasionally in the mountains of Oregon and Washington Territory, and that they are supposed to be albinos of the *C. leucurus*. He called the former, I believe, *C. leucurus var. variatus*, and to the latter he gave the specific name also, classifying it as variety *albus*. In his measurements of the white-tailed deer I find that it also differs materially from the Virginia deer, especially in length of tail, legs and breadth of head, while the colors differ quite materially. Its mode of running is also unique. Now if both these deer are the same species, it seems peculiar to me that one is not found west of the Rocky Mountains, nor the other east of it, and that two varieties of albinism should be so general in one species, and so rare in the other. If they differ in such essential characteristics it does not seem plausible to me to infer that, because they may have the metatarsal glands alike, that they are the same species. The subject, I think, has not yet received the decisive stamp of naturalists who have been able to make an extensive investigation, so, ere we can accept the assertion that both the deer mentioned are one species, I should like to hear from Prof. Baird, Judge Caton, Dr. Cones and others who have had an opportunity of judging for themselves. While I give Judge Caton the tribute he so richly merits as a pains-taking naturalist, yet, might he not decide hastily in this case? The matter may have no general interest, yet it has for the hunter and lover of animals, so I hope to see the opinions of our naturalists given in the columns of your able journal. T. J. S.

A CURIOSITY.—A phenomenon, indeed, in natural history has been found in Canada, if the facts be true. This is no less than the killing of a doe with antlers. We should deem ourselves obliged to our Canadian friends if they would give us the particulars of this case, as it is to us one of unusual interest.

SUICIDE OF A SCORPION.—It has been a mooted question whether animals purposely commit suicide. An English correspondent gives the following detail of the suicide of a scorpion, an animal one would not suppose to be troubled with such a mania.—

"One morning a servant brought to me a very large specimen of the black scorpion, which, having stayed out too long in its nocturnal rambles, had apparently got bewildered at daybreak, and been unable to find its way home. To keep it safe, the creature was at once put into a glazed entomological case. Having a few leisure minutes in the course of the forenoon, I thought I would see how my prisoner was getting on, and to have a better view of it the case was placed in a window, in the rays of a hot sun. The light and heat seemed to irritate it very much, and this recalled to my mind a story which I had read somewhere, that a scorpion, on being surrounded with fire, had committed suicide. I hesitated about subjecting my pet to such a terrible ordeal, but taking a common botanical lens, I focused the rays of the sun on it back. The moment this was done it began to run hurriedly about the case, hissing and spitting in a very fierce way. This experiment was repeated some four or five times with like results, but on trying it once again, the scorpion turned up its tail and plunged the stinging quick as lightning, into its own back. The infliction of the wound was followed by a sudden escape of fluid, and a friend standing by me called out, 'See, it has stung itself; it is dead!' and sure enough in less than half a minute life was quite extinct. I have written this brief notice to show (1) That animals may commit suicide; (2) That the poison of certain animals may be destructive to themselves.

—The remains of a gigantic steer have just been found in Seneca township, Lawrence county, Mich. The most curious of the skeleton is over twenty feet long, and the tips of the horns were about twenty feet apart. The ends of each are decayed, but they now measure eight feet nine inches in length, and must have measured about ten feet when whole. Three feet from the large end they are twenty-two and a half inches in circumference, and they weigh 175 pounds each. Some of the ribs were seven feet long. The tooth secured is a frontal tooth, three inches square, and weighs four and a half pounds.—Western Journal.

—I. Newton, of Alstead, has a white hedgehog.—Z.

—A California exchange has this to say of the California deer: "We are at a loss to conceive how this beautiful animal should be confounded with the clumsy, ill-shaped elk. It differs from the elk in a great many respects, especially in its most striking features. The elk, besides the great hump on the neck, has a much longer head and ears, and heavier horns. The nostrils of the elk also resemble those of the horse; while those of this deer, as will be observed,

hear no resemblance to the horse. A most striking peculiarity of the California bucks, and one which has doubtless been observed by hunters, is their savage disposition after being wounded. After being pursued for hours, and arrested at length by a bullet, they turn suddenly on their pursuers, and make desperate battle. This movement on their part, as may be imagined, generally creates considerable excitement, still, as it is never resorted to until a sudden messenger has been felt, the gallant bearing of the animal is of but short duration. The venison of California is pronounced the finest in the world."

A NEW SPECIES OF FISH.

Navy Yard, Washington, D. C., December 30th, 1874.
Editor Forest and Stream:—
This morning, at Little Falls, New York, I was shown several small and peculiar fish that had been taken in a dip net by Mr. James Smith while entering minnows to feed some magnificent brook trout which he has had in an aquarium for some years past. The new fish of which two inches long, color of a perch, with transverse bars of black, two dorsal fins, one large and one but slightly developed. Its motions were those of a gar or blue fish; lying very quiet at the bottom, it would suddenly dart rapidly and come to an abrupt stop. The brook in which they were caught had furnished me with a specimen of the same (in a momentary and legend says was once a trout brook. It has its use in springs among the hills to the northward and westward of Little Falls, and empties into the Mohawk above the falls, and about three miles above an old feeder that connects through basins and aqueduct with the Erie canal. No fish of this description has ever before been found in this brook, nor known in this vicinity. The year before a specimen of California salmon had been placed in the brook. I brought the specimens in alcohol to Prof. Baird, who has written me the accompanying letter in regard to them, which will be of interest.
I. A. BEARDSLEE.

UNITED STATES COMMISSION, FISH AND FISHERIES, WASHINGTON, December 31st, 1874.

MY DEAR CAPT. BEARDSLEE:—
The small fish from Little Falls, which you sent me some time ago, you are describing as being an extremely interesting species belonging to the family of Etheostomidae, characterized by the absence of an air bladder and some other peculiarities. Most of the species in this family, as far as I know, being found in warm countries, I have placed the Atlantic. Your fish is neither of these, and is either an undescribed kind, or is one of the Western forms. I have sent it to Prof. Putnam, who is a specialist in such matters, and as soon as he replies will write you. Yours truly,
S. S. GREEN.

THE "DEVIL WORM."

ROCHESTER, N. Y., December 15th, 1874.

EDITOR FOREST AND STREAM:—
I send you a short description of a worm which I discovered last week. It is one of the enemies of small fish. Its home is in the moss that grows on sticks and stones in running streams. It is about one and a half inches long, and has a head which is fourths of an inch long. It catches its prey by lying concealed in the moss with its head protruded and its arms spread out by itself. It has a small head, and looks like "fool for fishes," and when the small fry come to take it the worm wrings its arms around its victims and devours them. Yours,
S. S. GREEN.

[These worms are undoubtedly the larva of the dragon fly (family Libellulidae). They are especially destructive to gold fish, and we have known a single "devil worm" to eat five small fish, a quarter of an inch long in an hour.]—Ed.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, N. Y. CITY, Dec. 13, 1874.

- Animals received at Central Park Menagerie for the week ending December 13th, 1874.
One Opossum, Didelphis Virginiana. Presented by Prof. J. W. Hall.
Three Double-striped Thick Knees, Odontomyias bairdianus. Hab. Central America. Presented by Master Arthur P. Chabrousse.
Two Nicaraguan Squirrels, Sciurus colvici. Presented by Commander Edward P. Lull, U. S. N.
Two Crested Porcupines, Hydrice cristata. Hab. Africa.
W. A. CONKLIN.

Woodland, Lawn and Garden.

ALTERING AND PRUNING OLD APPLE TREES.

IN a former number of FOREST AND STREAM I gave the treatment necessary to render an old apple orchard productive. In this article I will speak of still older trees. Trees thirty years old require a different treatment from those of fifteen to twenty years' growth. The wood of an apple tree being made up of annual layers, will in very thirty year growing trees be found of half an inch in thickness, and composed of large, open cells, through which the sap flows in full volume. Like a well and healthy man, full of good blood, they live only to grow and bear well to certain stages. Whenever the tree becomes old and enfeebled, either from neglect of culture or overbearing, from want of the stimulants which at this particular time it requires, the cells become smaller and the layers thinner and thinner, until their growth becomes almost imperceptible. Now, every well informed agriculturist knows that the sap of the tree ascends through this sap wood, which is composed of layers of yearly wood, and also, that the layers of the latest formation send or transmit a larger proportion of sap than the older ones.

Now the above information should be known to the orchardist as well as the scientific author and agriculturist, for it belongs to his domain. If, therefore, our readers will please give their careful attention to what I write about these old trees, I will try to make my teachings interesting and profitable.
In the first place, nothing worth having is usually to be obtained without care and labor, study and observation; therefore I say to my friends, commence at the commencement, and take up the outer layer of the bark and examine toward the centre; here you find less and less sap in each successive ring of wood, presently you reach the young heart of the wood, where no sap is found. This is dead wood, and of no use, as it has no vitality in it. I have frequently pronounced—in the course of my observations of all orchards—trees as "dead at the heart," and have rarely found my judgment wrong. Such trees never do much, even with the very best of culture. I have found in different sections of country a different result. In our Eastern States, I have seen many young trees, some neither hollow nor over sixteen years old, that gave every prestige of old age; they were dying slowly, and at the same time inevitably. For them there was apparently no

help. Now comes the important question, What will you do with these trees? Is there not some remedy by which they can be saved a little longer; is the axe to be laid at the roots of all these trees? All the fertilizers or cultivation in the world would not save the extremest scion. Let us try both together, and note the results. Some fifteen years ago I was called to examine an old orchard of apple trees of a very large size, and some of which being natural fruit their tops were some seventy feet from the ground. They had originally been planted by the cows some ninety or perhaps a hundred years ago. These old trees grew upon the meadow of the estate of H. W. Longfellow, and were there in the days when Washington held his headquarters in this historical vicinity.

The question again recurred to me, What shall I do with these old trees? One good agricultural friend advised me to cut them down. The owner said, by no means; spare them yet a little longer, and make an examination of them with reference to future treatment. I found some of them measured two feet and upwards at the ground, growing in cold, clayey meadow land. They grew near to a woody enclosure, and were very tall, with from four to six large limbs branching from the main trunk fifteen to twenty feet from the ground.

It was no use to graft these trees at the near extremity of the branches, as usual in cleft grafting, they were too high altogether to admit of it. All the extreme limbs and small branches bore fruit yearly of a diminutive size, and not good for cider only. I also found upon an examination that from the force of the wind several of the larger limbs had been broken off some thirty or forty feet from the ground, and had sent out suckers all along and around the trunk; near the portion just where they were broken off some of the suckers had become of sufficient size to graft with the ordinary cleft graft. It came to my mind that here was a case clearly not laid down in any agricultural journal, and consequently I had no law or precedent, but must become a law for myself. In my future examination one fact plainly revealed itself to my mind, that as the sap rises slowly in trees as they grow older, or as certain circumstances predetermine, I found all the sap arising had been used up and absorbed by these suckers and the apples on the extreme ends of the thrifty branches. One fact please notice here, that wherever you find these sap shoots about the centre of the tree you have an indication that there is still hopes for this old trunk. These trees, at the age of ten years or less, if grafted, would have yielded a plentiful harvest. But in those days they did not care much about apples or apple orchards.

I commenced operations on these old trees—some twenty-five in number—by reducing the height of them some twenty feet, and by cutting off the limbs with a very fine saw, taking care not to start any of the bark. Some of these fells would measure eight inches in diameter for the larger limbs, down to four and even three inches. Whenever a good strong shoot was found to make a good limb, it was left for the usual method of grafting for the next year, the main limb being left on one foot above this shoot. Now the treatment of the larger limbs of the thrifty branches, one grafting—a method of grafting made by inserting all around the crown of the limb scions of from half an inch to an inch in size, made of the most thrifty seasons to be had. This is easily performed by use of a nice little ivory tool, with which the outer bark is removed, and the scion, sharpened all from one side, inserted; when necessary, the scion is to be shouldered. These seasons were set two and half inches apart, and all the limbs were cut off to an inch in width being tied around the head of the scions to keep them in place. These were covered with grafting wax, and left until the following year. The trees were scraped, and then washed with a composition of cow manure, clay, and potash. The next year every other scion in the crown of the large limbs was sawed out, and the process of a new head formation was taking place, much to the satisfaction of all concerned. The succeeding year a limb—for they had become quite large now—was sawed out, and a good, strong, firm head had grown out from my trees.

Since that period I have had numerous letters of inquiry as to how to handle these old trees of the forest and farm, and I have given one only of more than a dozen of well noted experiments made by myself among the old orchard menageries. I never recommend such treatment until you find much vigor of root in old subjects, which may be known by a profusion of suckers about the bodies of large trees.

Such treatment, you will understand, will not give you a very ornamental tree, as we learned in our first experiment, but we can assure you that the fruit these old trees bore in after years was proof positive that it was a complete and remunerative success.
OLIPHO QUILL.

THE STRIPES STOCK OF WATER.—The surveys authorized by the last Legislature to determine to what extent and at what probable cost the immense accumulation of water in the Adirondaeks could be held in reserve and drawn upon as needed for State purposes, result in the following conclusions:
First—That immense quantities of water can be safely stored at a comparatively low per centage of cost on the Upper Hudson, most of which would now go to waste, as it runs to waste in the Spring freshets, which in various ways are the cause of great damage annually.

Second—That this excess alone is sufficient to supply the deficiency of the main river at the low Summer stages for 100 days, after a liberal discount for any losses in its passage.

SAVE THE MOOSE.—The following petition is in circulation in Maine, and will be presented to the next Legislature. We called attention to it some three weeks ago:—

"The undersigned, hunters, trappers, sportsmen, farmers, merchants, and business men of Maine, respectfully present that the moose of our forests are in great danger of extermination, and that the interests of the Canadian Indians, who are the hunters of the moose, are deepened. Viewing their destruction as already certain, our own hunters have decided to strip the forest at the earliest opportunity. We therefore earnestly pray that so valuable an animal may be protected by suitable legislation. Our forest lands are capable of producing their crop of meat as our tilled fields are of grain, and without other outlay than that of the plow. We would propose an act which should prohibit the killing of moose for five years, and direct the seizure of the hides, at all seasons, wherever found."

The Kennel.

THE IRISH SPANIEL

PREVIOUS to his departure for home, Mr. J. K. Milner, of the Irish team, gave us a description of the famed Irish water spaniel, and as he has received several prizes for the dogs of this breed that he has placed on exhibition on several occasions, we consider him the most competent authority on the characteristics of the animal. He says that throughout Ireland the brown water spaniel is found quite generally, but that the best breed is somewhat scarce and is confined to the kennels of a few gentlemen. This strain is readily known by its marked peculiarities. The larger the dog is the better it is appreciated among fanciers. The body is round an strongly made, the legs are rather short, the feet broad, the hind quarters or stern should be short, broad and tapering to a fine sting, and covered with short hair like a pointer. Some have short, crisp curls, and in this case there should be no straight hair or fringe. The head should not be broad or coarse; the nose should be long and free from wave; the ears should be long and so broad in the leather that they will meet across the nose, and be covered with the long ringlets which give the animal such a striking appearance. A moustache is considered a sign of bad blood or impurity; so this is an important point to be considered by purchasers or breeders.

On the forehead, between the ears, there is a long ringlet which hangs down between the eyes. This is one of the most important signs of the thoroughbred, and should be carefully noted, as some are inclined to wear a "wig," instead, and in this case such a peculiarity is most objectionable.

The legs of the pure blood are heavily feathered with ringlets, whilst the remainder of the body is covered with short, crisp curls of a rich, dark liver color, entirely free from white. A breed in the North of Ireland, known as the "Lough Neagh," differs somewhat from this description, and though all are splendid retrievers, yet they are not considered as good as the type described. They are readily recognized by their "feathered" tail.

As a retriever, the Irish spaniel cannot be surpassed, especially in its own element, the water, so that no more valuable dog can be found for duck or goose shooting.

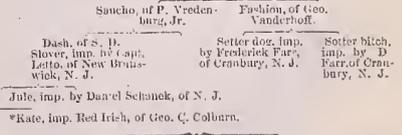

AN AMENDED PEDIGREE.

WE have received the following letter from Mr. F. Furman Taylor, of Col's Neck, N. J., the owner of the celebrated orange and white setter Spancho, better known as the one-eyed dog, in which he wishes to correct a former pedigree sent us and which our readers will remember we published. We take pleasure in giving this amended pedigree to our patrons, and I am happy to notice the growing carefulness with which our sportsmen are keeping such records; this the FOREST AND STREAM is continually advised as tending to improve our stock of field dogs in America, and we take not a little gratification in believing we have materially assisted to this end:—

Editor FOREST AND STREAM:—
In giving you the pedigree of one-eyed Spancho some time ago, I got the strain a little mixed and not complete. I have obtained it since from Mr. George Vaunderhoff, of F. Child, N. J., who was one of the owners and breeders of Fashion, the grand dam of my dog. Vaunderhoff is perfectly reliable, and I do not doubt the correctness of his statement. Never having raised any dogs for disposal, I did not remember the pedigree much farther back than one generation. As to the red bitch Kate, of Chatham, she was so far above the ordinary class of dogs for breeding and field work I should never care to know where she came from, for wherever any of her stock is left among us it is good.

Trusting that the amendment will cast no reflection upon any of us on account of the publication of the first, I remain, dear sirs, respectfully,
Yours truly,
F. FURMAN TAYLOR.

PEDIGREE OF ONE-EYED "SPANCHO."

THE PROPOSED BENCH SHOW OF DOGS.—We learn that among the members of the Philadelphia Sportsmen's Association there is quite an agitation in regard to a Bench Show of dogs to take place some time after the present shooting season closes. Although the matter has taken no decided shape, and has not as yet been discussed at a meeting of the society, we have strong hopes, owing to the interest that appears to be taken, that an exhibition of this description will be arranged, and under the present board of directors we cannot doubt of its success. As an illustration of the confidence which a friend of the FOREST AND STREAM has in the financial success of a movement of the kind, the gentleman expressed a willingness to guarantee against a loss in such an enterprise, providing he could have the profit accruing therefrom, and be given the privilege of offering prizes for poultry in connection with the Bench Show.

THE CLEFT OR FURROWED NOSE.—The cleft or double nostril appears to have been at one time a semi-characteristic of the Spanish pointer, and frequently present in a breed of the same dog in France, which was originally brought from Spain. It is never seen in purely bred Eng

A WEEKLY JOURNAL,

Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 17, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published in objection to the name. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notices of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentleman-sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and continuance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible. CHARLES HALLOCK, Managing Editor. WILLIAM C. HARRIS, Business Manager.

A COLLEGE RIFLE CLUB.

NO better idea of the hold which rifle exercise has taken of our people can be given than the statement that the graduates of Harvard have organized a rifle club. This proves how rapidly the love of manly accomplishments is springing into an active existence, and how generally it is being diffused. In order to make this organization one which will bind all the members of the gray old *alma mater* together, all good shots who are now in the University will be entitled to fellowship.

Our colleges have within the past few years devoted much attention to all exercises that tend to strengthen the muscles, improve the health and impart that sturdy, self-reliant spirit to their students which all men should possess; and the introduction of rifle practice now caps the climax and gives them the whole range of physical education. The men who can jump the highest, run the fastest, and lift heavy weights, ought certainly to become excellent marksmen, for besides possessing these qualities, their brains have also been educated to reason on cause and effect, and to make the proper deductions, so that mistakes may be detected and the remedy applied.

We believe it can be asserted boldly that the best riflemen must be persons of intelligence, who will have the nerve to fight bravely in a contest, the assiduity to practice with diligence, and the observation to note closely, and to reason from certain results.

These are the men who can practice self-denial also for the sake of honor, and who will leave no effort untried to gain an honorable victory, or attain a fair eminence in any contest which they may enter.

The matches in the British Kingdom, Canada and the United States have proven that the best marksmen have been, as a general rule, persons of superior intelligence, as they seemed to be the best able to understand the force of the wind, and the principles which govern the flight of projectiles. Such being the case, it ought to follow that our students should in the future be not only at the summit in physical and mental power, but also in surety of eye and steadiness of nerve, and consequently to marksmanship. The effect of the exercise now introduced must be highly beneficial, so we hope to learn of other colleges following the lead of Harvard.

—Earthquake last week all around New York, but the wicked city was not shaken.

FLORIDA.

The season in Florida is now fairly open, and invalids, tourists, and sportsmen are wending their way thither. Old habits are seeking out their well-known haunts, and strangers are in ecstasies over the prospect of viewing the charms of the flowery land, which to them will be a new revelation. And what a delightful land it is! replete with perfume of flowers, luxuriant with vegetation, balmy with the genial air of the sub-tropical Winter, and abundant in Summer fruits and vegetables! Let us read a few paragraphs from the Jacksonville *Floridian* of the current week.

"Strawberries have been selling in our market last week. They were grown at Mandarin. Cucumbers, grown by Mr. J. Hawkins, near this city, have also made their appearance in the market, and met ready sale.

"The schooner Rover brought 8,000 oranges from Vass and Dummitt's grove last week. They were sold off in one day at \$35 per thousand.

"The finest potatoes we have seen this year have been sent in by Mr. John R. Herndon, from Sanderson, Baker county. They were huge things, of the red yan variety.

"Fish is plentiful; a four-pound mullet selling for twenty cents. The market is well kept up with good meat of all kinds.

"The weather all last week was very warm. On Sunday night, the 6th, it began to rain, which continued to fall all night, and it got colder on Monday, the wind northwest."

"What a relief must be a 'little colder' weather in this month of December! Our New Smyrna correspondent reports the average mid-day temperature for November to be about 75 degrees. It varies about ten degrees in the twenty-four hours. And our Northern friends who shivered here last week are counting the shade of the olives, the magnolias, and the China trees. The *Floridian* says the steamer brought over two hundred of them to the city last week.

At St. Augustine the Magnolia Hotel is in full blast, and doing a good business. The Floridian has been repainted and otherwise improved. The St. Augustine has a new tin roof and new attractions. All the boarding houses are open and doing as well as can be expected. The *Press* reports an unusual number of visitors, both transient and permanent. And so, Florida is in life once more; loungers stroll upon the old sea wall that flanks San Marco, and passengers wave handkerchiefs of recognition with the steamers that ply up and down the St. John; invalids are picking the luscious oranges once more at Palatka, and the alligators of the Ocala now already recognize the familiar pellets of the thundering eight bore that rattle on their armor plates. We shall soon have stories of exploits to print from venturesome sportsmen. Says the Palatka *Herald*:

"The Ocklawaha River never grows old and never tires the eye. Its crooked course and picturesque scenery by night as well as by day, ever furnishing exciting objects to the curious mind and eye of every traveler. That distance of a hundred miles through the cypress and palmetto forest is in our judgment, the finest collection of curiosities in the world, to say nothing of Silver Spring, one of its grand sources, and one of the most astonishing fountains of pure water on the continent. The alligators and snakes afford a splendid opportunity for shot-gun sporting, while the birds, both large and small, and of varied plumage, add interest to the journey, and afford an opportunity for shooting."

This paper reports the people on the head waters of the Ocklawaha (upper lakes) in earnest upon the subject of building a railroad from Lake Harris to the waters of the St. John's River, connecting either at Hawkinsville or Lake George.

A gentleman who has no land interest on the upper lakes says that the lands on Lake Harris are the best that he has seen in East Florida. The scenery is unusually beautiful and attractive. Frost seldom, if ever, injures the sugar-cane; it tassels, and grows from fifteen to twenty feet in height. Lake Harris connects with Lakes Griffin and Huestis. The timber around the lakes is tall and stately. Fine fish in abundance abound in their waters. This section is healthy, and is rapidly filling up with new settlers, and will in a few years become one of the most interesting settlements in this country. These settlers find much profit in the culture and sale of fruits and vegetables for the early Northern markets. Even in the interior of the State, notably at Lake City, many of the citizens are speaking of giving up the cultivation of cotton and turning their attention to English peas and other vegetables for shipment to Northern markets. Several intend trying tobacco, and, if successful, it will soon become a leading production.

Eighteen years ago, with the exception of Welaka, scarcely anything was to be seen but the interminable forests along the St. Johns River. There was scarcely a settlement or clearing to mark the advance of civilization. What a change now appears! Ludwigs, clearings, houses and orange groves map out to the eye of the traveler the rapid improvement now going on.

One of the most useful improvements contemplated is the canal, now being laid out by the U. S. Coast Survey, across the narrow strip of dividing lands between the Indian River proper and Mosquito lagoon, where the present canal has been cut. This strip of land is coquina rock, soft, and very easy to excavate, about ten feet above the water, and only 800 yards wide from this canal north to the head of navigable waters. On the Tomoko the channel is open and clear. The distance is about seventy-five miles. From thence across the land to navigable waters of Haws' creek, the distance cannot exceed ten miles, and the average height above the water level of both streams cannot be over six feet. No dams or locks will be required; there will always be water enough. In fact, these two canals

will make Indian River a tributary to the St. Johns one hundred times more valuable than the whole upper St. Johns. This scheme, the Palatka *Herald* says, is receiving the gravest attention of the most practical men.

There seems, no doubt, that the population and developed resources of Florida are destined to double in ten years. Those who have some presence will do well now to take time by the forelock that they may reap coming advantages.

We have often spoken of the necessity of a hotel on Indian River, where sportsmen with their families could be comfortably housed and fed, in hope that some gentleman of means, who know how to keep a hotel, might be induced to take the venture. Sportsmen are often deterred from visiting this most delightful part of Florida because they cannot find suitable accommodations for their families. Two or three applicants or inquirers approached us on this subject last Summer, but none, we believe, have decided to take hold. Now, our readers will congratulate themselves and us, and especially admire the courage of our well-known correspondent, Major Geo. J. Alden, now or late of the U. S. Signal Service at New Smyrna, when we inform them that, although not a gentleman of large fortune, by any means, he has consented to open his house to guests, and presently to enlarge it to meet the requirements of the situation. Mr. Alden, we are forced to say, was the projector of the only game protective club that now exists in the State of Florida. He is well and favorably known to all gentlemen who have visited New Smyrna. Perhaps we can explain the present situation and progress of his new enterprise in no better way than to copy from one of his recent letters. This letter was a private one, and not intended for publication, but we will venture it:

CUSTOM HOUSE, NEW SMYRNA, FLA.,
 DEPUTY COLLECTOR'S OFFICE, Dec. 7, 1874. J

CHAR. HALLOCK, Esq.

I agree with you that we need a large hotel here, but as I had not the funds I thought best to commence in a small way, and thus get a class of sportsmen to come here who would see the advantages for hunting and fishing I have over others, and thus perhaps be induced to aid me further.

I have room for several buildings, which I think better than to have all guests in one large building; if not, I could work my way so as to build what I wish eventually. I inclose a rough sketch of the peninsula. You will see 100 acres north of me, and section 16 (160 acres) south. I shall have the deeds for all in January. The beach where I am located is heavily wooded, and an excellent place for gardens, oranges, lemons, bananas, etc. One can get all the deer they want within four miles, and within twenty yards of the house good bass and sheep-head fishing.

Your correspondent, S. C. Clarke, will vouch for this, and for the desirability of the place for a hotel. It is by all odds the best location between St. Augustine and Key West. Any yacht that can come over the bar can come to my wharf, and it is the only place where this can be done. Good anchorage close by. I intend to have a carriage and horses for those who wish to drive on the beach, which is one-half mile back of the house, plenty of good dogs for deer and bear, and boats for fishing.

That we do not write specially in the interest of Mr. Alden, will be seen by the following, passage which shows what a demand exists for just such a resort as we think we have been instrumental in securing for readers of FOREST AND STREAM:

"As to taking boarders, I have all rooms engaged, and have rejected over fifty applicants for want of room. Had I a hundred rooms I could engage them all in advance."

So much for Florida—at present.

ARMY OFFICERS AS RIDERS.

The latest Vienna papers received contain a description of the grand military steeple-chase, under the patronage of the Emperor, which came off recently at the Austrian capital. From this we should infer that German officers are much better "cross-country" riders than they have received credit for, and that they have a breed of horses that will take a wall as quickly and with as much ease as an Irish steeple-chaser. This race is the great event of the year on the turf, and is attended by all nobility, aristocracy and burgeoisie of the capital, so that the course is usually one mass of gay toilets and brilliant uniforms, whose glittering hues are only increased by the sober black of the quiet and aged gentlemen. This meeting is patronized more than any other for the reason that none compete in it but officers, and they generally belong to the cavalry, and in Austria that is the most famous arm of the service, so that the young fellows who wear the Hussar jackets are the military pets of the country. When these pets enter the list for a contest in equestrianism, of course the populace must see them, for it would never do to miss such an event for fear of social ostracism. This interest has caused the previously rigid and mechanical riders to assume a firm seat and a flexible attitude; to become, in fact, horsemen in its literal sense, so that no matter what sort of broken country they meet, they may be able to go to it, or over it, provided their horses have courage and power. This is an important element of the education of cavalry officers, as it increases their efficiency by giving them confidence in their own ability when they may encounter danger.

Steeple-chasing and riding to hounds is also getting more popular in France from day to day, so that it is no unusual event now to see a French officer taking his walls and ditches with the same ease that one of Lever's heroes would. This equestrian exercise is encouraged by the war office as much as possible, in order to make the officers what they should be—thorough horsemen.

In the British Kingdom the hunting field has long been the great display ground for officers of all arms of the ser-

vice, and but for them the hurdle race-and steeple-chase would, in all probability, long since have fallen into disuse. The consequence of this attachment to the dangers of the "cross country" run, is, that the officers of John Bull's troopers and artilleryists are, as a general rule, bold riders, who will stay out their steeds as long as men can.

In our own army, where regiments are scattered far apart, and only one or two companies are at the same post, it is very hard for our officers to practice horsemanship; so their only school is the plains and mountains of the far West, where they have an abundance of rough riding in pursuit of the painted savages; and while this is an excellent one to impart a certain kind of thoroughness, yet it does not seem complete enough to finish their equestrian education. For this reason we think that they should be encouraged to organize hurdle-races and steeple-chases whenever a few of them may meet at one post and remain there for any length of time. Such exercise not only tends to kill time at those dreary places, but it also gives animation to the camp, and certainly imparts pleasure and experience to the participants. The higher powers should stimulate such contests by word and action, and, if necessary, a sum should be devoted for premiums every year. A grand military steeple-chase, open to all officers of the regular army, should certainly be a feature of our turf, but it should be under the patronage of the army, though run by any of the principal courses of the country. Such a meet would be very popular, and would do much to encourage a desirable *esprit* in our officers, and the breeding of a class of horses that are needed by our cavalry. If the matter can be successfully carried out in Europe it certainly ought to be here. So we hope our officers will take the matter into consideration and inaugurate a yearly contest if possible. It will do them much good, and attract the people more to them and their arduous and often unacknowledged labor.

BICYCLING.

THE enthusiasm with which this species of exercise has been adopted in England recently, seems somewhat surprising to us on this side of the Atlantic, who have been rather apt to classify any person treading a bicycle through the streets or over the roads as one devoid of much sense, not to use a coarser term, and rather fonder of silly display than a man ought to be. We know that the French people devoted some attention to the pastime long ere it was introduced into this country, and that bicycle races were among the pleasures of the young beaux frequenting the Bois de Boulogne and other prominent places of resort, but on trying to analyze the source of enjoyment of such means of locomotion, we failed to find it, so concluded that it was merely a Parisian whim, and that it would die out in an early day.

Such a fate seems to be rather distant at present, however, for not only has the two-wheeled machine become a greater favorite than ever in France, but it has also been elevated into the niche occupied by the higher classes of physical exercise in England, and is now patronized by some athletes and officers of the army. The consequence of this is, that bicycle matches are now quite general, and elicit more attention than one could possibly expect. To make them popular, the experts in these contests pit themselves against horses, and sometimes with good results, though the victory most frequently falls to the four-footed creatures.

Matches between the four-in-hand clubs and the bicyclists are the last efforts of testing the speed of men and horses, when used as propelling powers, and to make the matter a test of endurance also, the distances range from two to fifty miles.

What important deduction one can make in case the velocipede drivers should win every race, does not present itself at first glance, unless it is that driving two wheels with two legs aids in the development of the latter to a certain extent; for we certainly cannot see that bicycling has any other advantage; inasmuch as it has no apparent merits from which one would argue that its introduction would be of any benefit to mankind in general, or to many persons in particular. It has met its fate in this country, apparently, so from present outlooks it does not promise to be revived.

THANKS.—We tender the members of the Junior Gun Club of Toronto our thanks for an invitation to attend their annual dinner. We hope their reunion was a pleasant one, and that it encouraged them to perform greater deeds than ever with their favorite weapon. That the repast was a decided success seems quite evident from the *carte*, and that genial fellowship reigned we can readily imagine from the names of some of the gentlemen present, who are among the leading citizens of Canada. We tender the Junior Gun Club our congratulations, and hope they may have many reunions of the same sort.

—We are glad to find that the Commissioners and Wardens appointed under the auspices of the Game Protection Society of Nova Scotia to carry out the new game laws, are vigilant and active in the discharge of their duties. Not long since a young sportsman of Halifax was fined heavily for illegally shooting a moose near Sheet Harbor, and more recently a firm in Guysborough county were fined thirty dollars for having three moose hides in their possession. The legal penalty was \$50 for each skin, but a rebate was allowed.

—A country paper prints the information that a heavy tycoon (sic) in Japan recently caused the destruction of two hundred lives.

GROUSE CULTURE IN MARYLAND.

OUR valued correspondent signs only his initials below, but we trust we violate no confidence or law of etiquette in this case, by stating that he is no other than Mr. N. H. Bishop, the celebrated canoe voyager, who is now on his way to Key West. The information he gives our readers is not only most interesting, but to those who are endeavoring to restock sundry Eastern States with prairie chickens, is of much practical value.

MARSHES, HEAD OF CRIBBITUCK SOUND, }
NORTH CAROLINA LINE, December 9, 1874. }
EDITOR OF FOREST AND STREAM.

I take this opportunity to write you about the attempt that was made to introduce the prairie chicken into Eastern Maryland. About five years since a resident of Philadelphia sent to Dr. F. J. Purnell, near Berlin, Worcester county, Maryland, a few pairs of prairie chickens, and a covey of both the "valley" and "mountain" partridge, or quails. I am now using popular terms. Dr. Purnell has an estate of fifteen hundred acres lying along the banks of Newport Creek, which stretches down into Stinopus Bay, on the Eastern Shore of Maryland. Since the war this estate has been worked for the doctor by his tenants. Much of it is woodland and salt meadows. The partridges were kept confined for some time in the house and then set at liberty. They soon disappeared, excepting one pair which returned daily to the kitchen door to be fed. For some cause the pair went to a neighbor's house, on the same estate, and were fed from the kitchen door for some weeks. This pair of birds nested in the garden near the house, and raised a brood of young birds. The covey left their old quarters, and were not heard from but once since their departure. A person reported that he saw the covey of "California quails on the other side of the creek." This was two years since. It is now supposed that these partridges have been shot by gunners, or have died from natural causes.

The prairie chickens adapted themselves to their new home with but little trouble to the proprietor of the estate. Their nests filled with eggs were found along the fences of the fields near the meadows. The birds became tame, visiting the cattle yards, and feeding near the buildings of the farm. They multiplied rapidly. A law was passed by the Maryland Legislature protecting them from gunners. The birds seemed to like the large salt meadows of the estate, and exhibited but little fear of strangers. Unfortunately for the birds, a number of terrapin hunters from New Jersey ascended the bay and river in their small vessels. Seeing these tame birds on the meadows the Jersey men commenced a war of extermination upon them, which soon resulted in the destruction of almost the entire lot. A workman on Dr. Purnell's estate informed me that he had seen eighteen prairie chickens in the corn field, near the house, in November of the present year. It was the only covey left by the Jersey terrapin hunters, who came up from Chincoteague Inlet. The same gentleman who sent these fine birds to Dr. Purnell is about to send down from New Jersey the ruffed grouse, called in that State and Pennsylvania, the "pheasant." There are no ruffed grouse on the Peninsula. Truly your friend, N. H. B.

PROTECTION OF GAME.

THE regular monthly meeting of the New York Association for the Protection of Game was held at the residence of Mr. Charles E. Whitehead, No. 64 West Thirty fifth street, last Monday evening, the President, Mr. Royal Phelps, in the chair. The Secretary, Mr. William J. Hays, not being present, Mr. Thomas X. Cuthbert was appointed Secretary *pro tem*. Several reports were made, among which was that of the President and Vice President Roosevelt, regarding the character of the fish for the sale of which out of season the association had brought suit against Messrs. Chappel & Storer. While upon this subject Messrs. Penniman, Roosevelt, and Whitehead referred to the subject of the killing of bay snipe and other bay birds on Long Island, and thought it would be beneficial if amendments were made to the game laws that would in the future enable the officers of the association to prosecute any person found shooting such birds in the Spring. Mr. Whitehead advised that it was only a matter of time for the association to give expression to such views in the passage of new enactments, as it was their intention to ask the Legislature for greater power when the public mind was educated to a point that would enable them to move successfully.

The President presented the resignation of the Secretary and Treasurer, Mr. W. J. Hays, made necessary by his seriously impaired health, and, on motion of Mr. Whitehead, it was accepted, whereupon Mr. Clinton Gilbert offered some highly complimentary resolutions, thanking Mr. Hays for his efficiency, which were unanimously adopted.

After considerable minor business the association unanimously elected Thomas X. Cuthbert to the position of Secretary and Treasurer. Several members were then elected, when Mr. Cuthbert, with appropriate explanatory remarks, introduced the following, which received unanimous approval:

The attention of the New York Association for the Protection of Game is invited to the probability that during the coming session of the Legislature efforts will be made by marketmen and others who are now being prosecuted by the association, to procure the alteration or repeal of some of the most important provisions of the game laws of this State. One of these provisions, which is most objectionable to them, and which they have repeatedly decided upon to repeal, is that which prohibits the possession or sale during the close season of game that has been killed out of the State. It is scarcely necessary to remind the association that without some such provision the game laws could never be enforced, owing to the impossibility of proving where game was killed. Another objectionable provision is that which provides for searching suspected places, without which the operators who only supply their regular customers, could never be detected. An attempt will also probably be made to reduce the

penalty imposed by the present statute, or to secure the insertion of a provision that but one penalty be imposed for any violation of the statute, instead of a penalty for each bird or fish, as now provided. Several dealers have claimed that prosecutions for violations of the game laws should be brought by the District Attorney alone, and it is not improbable that an attempt may be made to have a provision to that end inserted. In that case it is doubtful, to say the least, whether the law could ever be enforced. The District Attorneys in this State now have the power to bring these actions; but we have yet to learn of a single instance of their having done so.

In view of these facts, it would appear advisable to refer this matter to the committee appointed at the last meeting on proposed amendments to the game laws, with instructions to oppose the passage of such acts introduced during the coming session of the Legislature, in co-operation with the State Association and other associations, and to authorize said committee to draw upon the funds in the hands of the Executive Committee for their necessary expenses.

A letter was read from Mr. Dix, thanking them for electing him an honorary member, and stating that it will afford him much pleasure to co-operate with the organization to put an end to the abuses which they are associated to suppress.

Adjourned to meet in January, at the residence of the Vice President, Robert B. Roosevelt, No. 26 East Twentieth street.—Herald.

THE BIG HUNT.

Colonel McClary writes us from Chicago, under date of December 9th: "I am perfecting my plans and making contracts all through. To-morrow I close with the Pullman Car Company, and for my wagons, teams and harness, &c. I want this to come off as a grand affair, and will soon have it in such a shape as will preclude all possibility of such a thing as failure."

TREASURER'S OFFICE.

EDUE R. K., 23d street, Dec. 9th, 1874. }
EDITOR FOREST AND STREAM.

FOREST AND STREAM grieves me now for the first time, in favoring that diabolical big hunting and fishing crusade scheme. That's not the way for you and me to hunt or to recommend. It will be a most reckless, foolish, destructive slaughter, and it may be a very good ending story. Think of half a dozen such murderous armies sweeping over our plains and mountains every season for years to come. It makes my blood boil to think of it. I sincerely hope McC— may get impaled on a bison's horn, or hugged within an inch of his last breath by a grizzly, or kicked to pieces by a buck, or bunted black and blue by a mountain ram. Excuse my heat, but I am dreadfully sorry you don't pitch into his plan. The "speculations" may be crude, but I am strong in my convictions, and I hear them confirmed by others among your readers.

Yours truly, I. H. THOMPSON.

OBITUARY.—Hon. Ezra Cornell, of Ithaca, the founder of Cornell University, who died last week, was a gentleman of fine aesthetic tastes, and extremely fond of natural objects. Although he was in no sense of the word a sportsman, he was nevertheless a member of the Blooming Grove Park Association, and interested himself in its affairs. For one year he was a director of the same. As an instance of his enthusiasm, as well as of his perseverance in objects which he undertook, he two years ago rode out from Lackawanna fourteen miles to the Park in a driving rain storm, which came on just as he was about to leave the depot. He arrived at the club house drenched to the skin, but having taken a warming stimulant he proceeded to make a tour of the breeding park and adjoining premises, and after a three hours' inspection drove fourteen miles back to the depot in the same soaking rain. Perhaps the seeds of his fatal illness were sown in that trip.

INTERESTING SPORTING NOTES.—The following notes on sporting matters in the West have been forwarded to us by our special correspondent, M. M. Barker, brother of K. C. Barker, Commodore of the Northwestern Yacht Club, of Detroit, who is now traveling extensively in that region, and who has everywhere had the most unbounded hospitality pressed upon him by public and private parties. The officers of the Missouri, Kansas and Texas Railway especially have placed us under great obligations on his account, and we owe them acknowledgments in other respects. It will be seen by perusing our correspondent's letter that Mr. Hope, of Lagrange, Missouri, who is a prominent dog fancier, has issued a challenge to all comers for a field trial, to take place within the next six months. No owner of the strains of dogs will regret its acceptance. General Singleton, spoken of herein, honored two members of the Irish Team by extending abundant hospitalities to them during their recent Western tour.

LA GRANGE, Mo., December 5th, 1874.

EDITOR FOREST AND STREAM.

To the lover of rural sport, in almost every variety, there is no country offering greater inducements, from its ready access by steamboats and railroads, than the valley of the Mississippi, from St. Louis to Burlington, Iowa. Here you will find field and river sports in abundance. Game is so plentiful that my buskwaicker, with a shooting iron and mangled, can fill his bag in no time, and the real sport which springs from science is thereby overlooked. Notwithstanding this, we now and then fall in with those of rare degree of excellence in field and other sports, equal to any in the States. Kernels of imported thoroughbreds are occasionally met with, having choice strains and pedigrees as long as desired. That of Mr. Ed. W. Hope, of this place, in whose hospitable mansion I am a guest, contains as fine thoroughbreds and well trained dogs as can be found anywhere. He is an English gentleman, with the title of Nature's nobility—imported his own stock, and hereby puts forth a challenge to any gentleman in the country to settlers. He will put up \$300 or more against any brace of setters, or quail, woodcock, or snipe, with brace of dogs, new within mouth of the year. The accepting dogs may be three months older, and the trial to take place in this State or in Illinois within six months, subject to the rules adopted by the State Sports men's Association of Tennessee.

I can assure any gentleman who may accept this challenge that a rare treat is in store for him not only in the field, but in the good old English hospitality extended to him by Mr. Hope and his illustrious lady &c.

his objection can there be to throwing out superfluous balls? No doubt those who put in very expensive ballast favor this rule, but that is not a good reason for its enforcement. Then there are very few yachtsmen who do not throw over ballast if occasion requires, the regulation to the contrary notwithstanding. I have seen a man tumble out over three hundred pounds of ballast in a race, and, though his yacht won the race, indignantly make any claim to the judges, which proves the rule to be a dead letter.

The other rule provides that any yacht whose hull shall touch a stakeboat in going round a shoal forfeit all claim to a prize. Now, a yacht surely cannot save any time by running against a stakeboat, but runs some risk of losing considerable by it. It is natural enough that a skipper should be anxious to shove as close as possible, and save as much as he can by cutting round the course, and he is bound to do so, if the unfortunate enough to run against one of the boys, wags goes his chances for a prize. I confess I do not see any reason whatever for such a regulation, unless, indeed, it is that a yacht-man has no right to save time. I do not recollect that a boat ever lost her prize by any such misfortune, and it is not likely that one ever will. I think the rules and regulations of any club would be sufficiently stringent and explicit if these two rules were left out. The rule prohibiting shifting ballast is a thing of the past. It was always disliked, and last season several of the clubs came into flat-footed and abolished it. I hope before next Spring to be able to inform you of the striking out of the other two. Yours,

C. FRED GORMAN.

Rational Pastimes.

THE CURLING SEASON.

The bluffs which herald the coming of the "blust'ring raller" are giving the lovers of the "roaring game" warning that it is time to bring their brooms and stones out of the enforced torpidity of Summer, and to hold themselves in readiness for the first call to the icy board. The curlers of Paterson had commenced operations on Halidon Hill last year before Thanksgiving, an unusually early date, as the season does not generally open for some weeks after that day. It may be expected, unless the premonitory warnings are false, that the "jolly" curler will soon be gratified by having his implements in full use. A brief historical retrospect and short sketch of the arrangements for the coming curling season may be acceptable before hostilities commence.

The game, although sufficiently Americanized to be regarded as one of our regular Winter sports, was originally imported from Scotland. To trace its development in that country backward to its origin is a difficult matter. Some authorities say it originated in the Low Countries at a very early date, and that it was imported thence into Scotland, while Scotchmen generally are desirous of claiming it as indigenous to the "land of their birth." Without entering into that matter, or speculating upon the probability of its introduction by us with St. Andrew, the question of its arrival here may briefly be stated as one involving an investigation confined entirely within the bounds of this historic period. A very few years ago hurling huge stones along the ice was regarded by Americans as very poor sport, indeed; but the enthusiasm of its Scotch supporters has proved infectious, and numbers of our emigrants are now to be found among its most ardent admirers. It has one recommendation which might have passed it more specifically into their favor, that even in so far as its pre-American reputation goes, it is conducted on the most approved Republican principles. Writers tell us that when rinks are picked in Scotland, every mark of caste is thrown aside, and the peer, the parson and the peasant are thrown together in a way which obliterates for the time being the otherwise well-defined grades of society. Lucky, then, for the moral character of the game, that it is held upon the terms of its conqueror. This circumstance, peculiar in itself, arises from two things with which we in this country have more to do; the merits or attractions of the game, and the sociability which it invariably engenders. The former may be estimated from the fact that every curler is a "keen" curler. One almost always finds the adjective associated with the substantive, and it is claimed as one of the peculiarities of the game that it accords such a hold upon the affections of those who practice it, that they *would* become enthusiastic. The curler, they say, has no divided affection. To him there is only one sport in the world worthy of man's serious attention, and it is called "curling." This very feature accounts in part for its devoted styling each other Scotch "brithers," though the fraternal feeling is more recently confined to the character of the game. One cannot play, nor two; there must be the full "rink" of eight players, and the more rinks the merrier. The game has many other merits. It is one of the most healthy pastimes known, and what is true of it physically is also true of it morally. Gambling is entirely foreign to it, and has no place among its associations, while that form of speculation, which consists in selling a game, is simply an impossibility. There is no "early" living, it may fairly be said, who, if he did demean himself by so far as his own individual play could effect the desired result, would not forget all about wagers, and in the excitement of the fray, with all his true instincts strong within him, would not play to win. The game, therefore, stands almost alone in many respects. There is, however, one characteristic of its lovers which ought to be put down on the debit side of the account. They are fearfully prone to the vice, the result of an adverse issue, and to confound themselves with the victor in a manner which, to say the least, is very singular. This trait might have been heard very amusingly illustrated at one of the meetings of the Grand National Curling Club by a prominent officer of that organization. From what was there said it might have been gathered that no one was ever beaten, in which case the oral traditions differ very widely from the historical records of the game.

From the date of its introduction into the United States to the present day, curling has gradually advanced in public favor. The Scotch have been and are its chief supporters and the chief means of disseminating a knowledge of its principles and practice in every nook and corner of this broad land. One has only to pass a single hour on the ice within reach of the sound of the rumbling "stones" and to hear the historical records of the game, to recognize in many of the players a son of St. Andrew. But it would be wrong, as has been said above, to suppose that all the curlers are Scotchmen, or that there are not many Americans among the "knights of the broom." The game

has grown in favor surely, if not rapidly, among the men of all nationalities who meet in our cosmopolitan country. Many clubs, such as that of Paterson, are largely composed of American members. From a few Scotchmen meeting in some retired retreat to have a quiet game a few years ago, curling has now become an American institution, under the central supervision of a Grand National Curling Club, having its affiliated members in every part of the United States and Canada.

This central body meets once a year to arrange for the season following, and to make such regulations and alterations upon the laws of the game as may be deemed expedient. The last meeting was held in this city in June, and several matters were there discussed, which will more or less affect the season about to open. In the first place a challenge was presented by a Toronto curler to fifty rinks from the United States to meet a similar number of Canadians in a grand international "bonspiel" some time in the early part of next year. The matter was referred to a committee of five to make the arrangements necessary for the match, and the secretary has now addressed a circular to each club for information as to the number of players it will engage to send. A great amount of interest has hitherto been shown in these friendly frays across the border from either side, and if a match can be arranged on a scale as large as that proposed, the season 1874-5 will have a commensurate importance in the annals of the game. It must be admitted that, although the Canadians were slightly worsted on their last appearance in Central Park, the conditions were anything but satisfactory, and that they have generally manifested a proficiency not yet developed by their Southern opponents. The gap of disparity is, however, fast being bridged over, and the competition growing keener every year.

To keep alive a healthy spirit of rivalry among the individual clubs, the Grand National Club has for some years back given a series of medals to be played for by specified clubs. The following are the matches for these medals arranged by the Committee on Distribution for this year:—The Caledonian Curling Club of Brooklyn vs. The "Thistle Club of New York; Burns, N. Y. vs. Thistle, Brooklyn; Jersey City vs. Empire City, N. Y.; Paterson vs. Ivanhoe; Paterson, Canadian, N. Y. vs. Jonkers; New York Club vs. St. Andrews, N. Y. vs. New York Mills; Milwaukee vs. Chicago; Granite, Detroit vs. Thistle, Chicago; Caledonian, Buffalo vs. Burns, Cleveland; Thistle, Detroit vs. Orchard Lake; Burns, Ogdensburg vs. Four Brothers Club, of Canada. The dates for these matches are left to the competitors in each. Besides the above series the grand Scotch match for the medal presented by Mr. A. Dalrymple of this city, between players from the North and South of Scotland, will be played as usual.

The indications, therefore, are in favor of the ensuing season being one of unusual interest. Any sudden accession to the ranks of the fraternity is not expected, but it appears that representatives from Philadelphia and Newark are soon expected to seek admission within the fold. It is further worthy of note that an attempt has been made with every prospect of success, to introduce the game into our colleges. With an eye, it may be, to the possible national product of the Scotch fish, the first effort made was to enlist Princeton, which bids fair to have a successful issue.

—The several curling clubs of New York are preparing for the coming season, and they expect to have a lively time on the ice this Winter. The New York Curling Club has elected the following gentlemen as "skips": J. Adie, David Reid, George Grieve, and Alexander Pyle. The following gentlemen have been chosen "skips" by the St. Andrew's Curling Club: Messrs. A. Dalrymple, Major Ferguson, Joseph Henderson, and James Kellogg. The silver prize in this grand National Curling Club have been completed by Mr. Wilson. On one side is the motto, "We're brithers a'", and the name of the competing club, while on the other side is a cross formed of two brooms, with a curling-stone beneath, and the words "Grand National Curling Club of America," the whole surrounded by a wreath of bisties.

—Professor Judd who attempted to walk 500 miles in six days and a half commenced his work a week ago last Monday at the American Institute and walked until Saturday P. M. when he was compelled to give up the undertaking owing to the failure of his right leg which seemed to be badly strained. His long and slow preparation only counted 359 miles which is comparatively far below Weston's first attempt. One reason for the failure of Mr. Judd in not making better time is that he manifested a decided laziness, and did not attempt what is fresh to make his best time. He was cheered on his weary way by several members of the Athletic Club, by the applause of ladies and gentlemen and the strains of Gilmore's band, but all did not cause overtakes. Mr. Judd, however, would permit. The Professor had picked enough to fight fate to the last; so he will attempt the feat a second time when he has thoroughly recovered from his present arduous task.

Several members of the Athletic Club, judging from their exhibition of walking the other evening, are admirable specimens of physical power, as the poorest pedestrian walked his mile in a little over eight minutes. Prof. Judd's fastest mile was made in 14 minutes and 23 seconds and the slowest in 20 minutes and 25 seconds.

THE ST. LOUIS CLUB.—This new base ball club is now fully organized, and below will be found the official list of officers and players of the new club for 1875:

- President—J. B. C. Lucas.
- Vice President—W. C. Steigers, of the St. Louis Times.
- Secretary—Charles A. Fowle, 406 North Fourth street.
- Treasurer—S. Prentiss Smith, son of "old" Sol. Smith.
- Catcher—Thomas F. Miller, Easton, Penn.
- Pitcher—George W. Bradley, Easton, Penn.
- First Baseman—Harmon C. Dehman, Atlantic.
- Second Baseman—Joseph V. Battin, Atlantic.
- Short Stop—Richard Pearce, Atlantic.
- Third Baseman—William Hunt, Easton, Penn.
- Right Fielder—Charles C. Waitt, Easton, Penn.
- Center Fielder—Lipman Pike, Hartford.
- Left Fielder—Edgar E. Cutbert, Chicago.
- Substitute—Thomas Barlow, Hartford.
- Substitute—Thomas Barlow, Hartford.
- Will be one other, not yet decided on.
- S. M. Graffen, of the old Olympics, of Philadelphia, will be the manager.

—The annual meeting of delegates to the National Amateur Association was held at the Astor House on Dec. 16, the attendance being limited, owing to the dissatisfaction of the majority of clubs with the administration of its affairs during the past season. A new President and Secretary were elected, and next season the rules of the association will no doubt be issued.

—The Metacomb club of Taunton, Mass., played in eleven matches during 1874, of which they won all. Their best games were those played with the Independent club, of Easton, at Taunton, marked by scores of 8 to 2, and 9 to 4.

—The Clipper club, of Webster, Mass., played in twenty-nine games in 1874, of which they won 23 and lost 7. Their best games were the following:

June 22—Clipper vs. Picked Nine of Worcester.....	4 to 1
July 18—Clipper vs. Star of Boston.....	6 to 4
Sept. 12—Clipper vs. Star of Boston.....	7 to 3
Sept. 21—Clipper vs. Star of Boston.....	9 to 1
Oct. 8—Clipper vs. Lows Oak, of Lynn (Limington).....	8 to 6
Oct. 10—Clipper vs. Griffin of Griffin.....	10 to 4

—The Neshannock club—champions of Western Pennsylvania—played in fifteen games during 1874, winning 12 and losing 3 only. Their best game was that with the Mercer club, which they won by a score of 9 to 7, their only single figure game of the season.

—The cold snap of Dec. 15 resulted in the covering of the ponds in the parks of the metropolis and its vicinity with a thick coating of ice, and by Christmas, if not sooner, the signal for skating will no doubt be flying both at Central as well as Prospect Park. On Dec. 15 the thermometer fell to 10° above zero in New York, a fall of over 30° in twenty-four hours.

A championship medal, offered by the Amateur Bicycle Club in a ten-mile race, was contested for by J. J. Lee, D. Stanton, and C. Hicks, at the Millbridge Grounds, London, England, Nov. 23. The race was exciting between Keen and Stanton, the first named winning in 36 minutes 32 seconds; Stanton's time, 36:47. The latter ran the first mile in 3:4, one second quicker than Keen, and the tenth in 2:29, the victor covering his last mile in 2:23.

—An amateur pedestrian of the name of Franklin is anxious to walk a thousand miles in a thousand hours, and a proposition has also been made by another who believes in his staying powers to walk 1,000 quarter miles in 1,000 quarter hours.

—A Pigeon Flying Contest, for a silver cup, gold lined, is to take place at Fairmount, Philadelphia, on Christmas Day. It will be given by Joseph Buckley, to whom entries can be made, at No. 2,311 Callowhill street, on or before Dec. 21.

Billiards.

PROFESSIONAL CONTESTS IN THE METROPOLIS.—Two matches of more than ordinary interest marked the week's record of metropolitan billiard playing. The first was the contest between Maurice Vignaux and Cyrille Dion at the French game, 800 points up, which took place December 8, at the Metropolitan Hall, in the presence of an audience which crowded the hall. The second was that between Rudolph and Garnier, at the same game, 600 points up, played at Tammany Hall, December 10, before a moderately sized assemblage only, a rather exciting time being anticipated, owing to the bitter rivalry which exists between the players. The Vignaux and Dion game proved to be one of the best contested matches on record, Cyrille Dion showing his old nerve play throughout, while Vignaux proved himself to be cool and collected in his style of play as he is masterly in his execution of the most scientific shots known to the game. It was anybody's game almost to the last, Vignaux only winning by a lead of 28 points in the 800. At the call of the first hundred the figures stood at 124 to 53 in favor of Vignaux. At the second call he was still ahead by 216 to 101. At the third the figures were 246 to 200, showing Dion to be gaining. The fourth left them at 310 to 275, and the fifth saw Cyrille in the van for the first time by 450 to 361. The sixth call, however, left Vignaux once more with the lead by 526 to 499; and again did Dion make a successful rally, and the seventh call left the totals in his favor by 612 to 567. Now it was that the contest became exciting. Dion's first lead was obtained by a masterly run of 18 and a second rally was marked by 22, but he was immediately following Vignaux's first "century," and as he left the totals in his favor by 667 to 659, the contest began to be intensely interesting. Once more Dion rallied for the lead, and the close of the fifty-fifth innings left him in the van by 723 to 693. Neither did meet after this until the sixteenth innings, when Vignaux ran 26, and adding 48 immediately after, he took a winning lead, and in his sixty-second innings he ran the game out and won by 800 to 775. His average was 11 67, and his highest run was a hundred, while Dion's average was 11 26-46, and best run 127. The referee was Isadore Gayroud.

In the Rudolph and Garnier match, Rudolph led at the first call by 141 to 87, and at every call thereafter he was largely in the van, except in the third, when Garnier led by 319 to 212 in a run of 101 materially assisting him. The next call, however, saw Rudolph leading by 500 to 337, a splendid run, 161, having practically given him the game. The final result was Rudolph's success by 600 to 357, a signal defeat of his rival, who thereby lost—metaphorically—the champion cup, which, by the way, was stolen from him two weeks before. Rudolph's average was 14 26-41, while Garnier's was 9 27-40. The next match of importance will be that between Vignaux and Joe Dion, named to take place December 30th, at Tammany Hall.

—The *Billiard Cue* for December, published by Messrs. Colleder & Co., contains the full scores in detail of the games played in the recent tournament held at Tammany Hall, besides other interesting billiard information.

—In a three ball practice game, between Joe and Cyrille Dion, last Saturday, Joe made the remarkable run of 238 points.

—Mr. George Gardner succeeded in holing the fifteen balls at Deau's room, corner of Fulton and Smith streets, Brooklyn, last Saturday night, for which he received the sum of a prize of ten dollar piece.

THE BROTHERS AMATEUR TOURNAMENT.—On Saturday last Messrs. La Torre and Dorian played off their game at Stannell's Billiard House in Brooklyn, to settle the question of the ownership of the third prize in the tourney, La Torre winning the game and the prize. Afterwards the

prizes were duly awarded in accordance with the decision of the party to whom an appeal was made, and the result was that Mr. Pickett became owner of the champion one and \$30. Mr. Pfannkucher of the second prize, and Mr. La Torre of the third. Appropriate resolutions of thanks to Mr. Samuels, and Messrs. Phelan, Groie and Fowler for their respective assistance in making the tourney a success, were adopted, and the amateur tourney of 1874 came to a close. Mr. Pfannkucher has challenged Mr. Pickett for the cue, and the match will be played at Samuels' in January.

Chess.

THE CENTENNIAL TOURNAMENT.—Provision has been made for a grand international chess tournament to take place in Philadelphia in 1876, and in furtherance of the plans arranged by the American Chess Association, the following circular has been sent to the European chess centers, and the London Chess Magazine in commenting on the enterprise, says:

We have received, and are requested to publish the following communication respecting the proposed International Tournament of 1876. It is evident the players of America intend, if possible, to make the forthcoming event one that shall have a very high place in the history of chess. We wish them all success, and shall do our utmost to assist the scheme from this side of the Atlantic:

TO THE CHESS PLAYERS OF EUROPE.

GENTLEMEN: The chess players of the United States desire to hold a grand International Chess Tournament in Philadelphia in conjunction with the Centennial Exhibition, during July, 1876.

The Tournament will hardly have the desired success unless a number of the best players in Europe participate. We desire to ascertain what is the least amount of prizes that will induce the strongest players in Europe to enter the list.

As the funds of the tournament will all be collected by subscription, the liberality of the American lovers of the noble game will, undoubtedly, be equal to the occasion, if they are satisfied that this Tournament will produce a real contest for the championship of the world.

The time limit will be fifteen moves per hour, with the usual rules.

The first prize will consist of two-fifths of the amount subscribed.

The second prize will consist of two-fifths of the remainder.

The third prize will consist of three-fifths of the remainder.

The fourth prize will consist of three-fifths of the remainder.

The fifth prize will consist of the remainder.

The players who think it probable that they will enter the Tournament, are respectfully invited to address Mr. James Roberts, Altoonah, Philadelphia, U. S. A.

Other chess journals will please copy.

J. A. CONGON, President A. A. C. A.

JAMES ROBERTS, Secretary A. A. C. A.

PHILADELPHIA, Oct. 1874.

—The Kingston, Canada, Chess Club has elected for the ensuing year W. R. Mingage, President, T. W. Nash, Vice President, Robert T. Burns, Secretary and treasurer.

The Colleges.

The death of Ezra Cornell, Esq., the founder and patron of Cornell University, is a serious loss to that institution in more ways than one. The testimonials of regret paid to his memory show a deeply felt regret for the deceased.

—We take the liberty, without solicitation, to invite all alumni and those having relatives and friends at Yale, to take and read the Yale Record. It is a very full and interesting compendium and purveyor of college news and current topics, and is edited with an ability which some professed newspapers would be proud to possess and boast of.

—Yale has organized a natural history society, and at the last meeting several interesting papers were read by the members. The membership at present is rather limited, but it promises to increase rapidly.

—The building at Vassar College, N. Y., formerly used as a fine school, had been altered so as to accommodate the museum, picture gallery, art studio, laboratory, and gymnasium.

—A number of Yale seniors dressed in night-gowns and old hats created quite a sensation recently by marching in solemn line from Duffee to the rooms of several of their classmates. Entering a room, they would range themselves in a line and sing the "Conspirators' chorus" from "La Fille de Madame Angot." Their success was great until a tutor appeared upon the scene.

EDITOR FOREST AND STREAM.

In all probability the Yale crew for next Summer will be constituted as follows:

- G. L. Brownell, East Haddam, Ct., bow; I. F. Wood, Norwich, Ct., 2; D. H. Kellogg, Spayten Duynin, N. Y., 3; E. C. Cooke, Worcester, Mass., 4; J. Kennedy, Strathers, Ohio, 5; R. C. Cook, Fayette City, Pa., stroke and captain, 6.

As yet the selection has not been made, but the general opinion is, that Yale will be represented in the next Intercollegiate regatta by the above mentioned men. As any rate a stronger and most trustworthy crew could hardly be selected. They are all hoisting men, in the true sense of the term. Capt. Cook, without doubt, is the most prominent name in college boating. He has piloted on the "Varsity" for three years, and although the story is old, still it is worthy of record, that the Yale crew, under his captainship, after a long succession of defeats, succeeded at last in "beating the best" above all others. Kennedy is Cook's right hand man. He has piloted No. 2 on the Yale crew for the past two years, and is an excellent oarsman. Cooke, the new man, was captain and stroke of our Freshman crew at Saratoga last Summer. He is a strong and ardent, and a valuable acquisition. Kellogg was a member of the crew last year, as well as Wood and Brownell, and all of them have shown that they are well worth the positions which they occupy. Taken, as a whole, the crew, if this make up, will be stronger than that of last year, and, indeed, a New York paper of prominence has already settled upon us, editorially, as the coming victors. Your correspondent can only hope that his pre-

dition may be true, and that without any foils or obstructions to hinder us, once more we may come out ahead. In this connection a few words about our new boat house may be acceptable. Last year subscriptions were raised to erect a spacious and suitable building. We were promised to see it erected when this college year began, but our fondest hopes were blasted. Owing to necessary delay, arising from some legal quibble, nothing had been done on it up to the middle of October. At last the only obstacle in the path of its progress was removed by arbitration. Governor Ingersoll was the arbitrator selected by the city and by the college, and a short time afterwards a suitable building was erected. It is now pronounced that it will be finished by April 1st, provided a further subscription is raised. When finished our boat house will be a model one, and will supply a long-felt want. In this connection it may be interesting to state that an entertainment is to be given early next term, at Music Hall, in order to raise funds to furnish the parlors of our new building. The affair is to be conducted entirely by graduates and the project originated with Henry E. Elliot, of '74. Much interest is felt over it, and a fine entertainment is expected, and it is also anticipated that money enough will be raised to furnish entirely and splendidly our rooms.

Our Chess Club is now occupied over a game with Cornell College, and as yet neither side has a marked advantage. We only hope and expect that Cornell will get differently from Williams, as last year, when we had the lateral most beaten, as refused to continue the game, and then commenced anew by sending us new challenges. It would be a good thing if all the various colleges had organized chess clubs, when contests could easily be carried on between them by postal cards. Surely much time could be spent very profitably in such a game.

'75 had her last class election yesterday, and the following persons were elected by ballot to represent the class: Senator. The meeting was presided over by Mr. Mitchell, and was very exciting:

- Drator, Charles F. Child, Princeton, Ill.
Poet, Eugene Benton, Jefferson, N. Y.
Promenade-Frank H. Jones, Pittsfield, Ill. Floor Manager: Harry S. Barnes, New York City, Chairman, Edward S. Alvarer, Fomkeshke, N. Y.; Harry Hays, New York; Dwight A. Jones, Easton, N. Y.; Charles W. Cochran, White Plains, N. Y.; Joseph A. Griffin, Tonkca, Kansas; Guy Howard, Portland, Oregon; John A. Post, Newburgh, N. Y.
Ivy—Samuel J. Huntington, Cincinnati, Ohio; Henry M. Harding, Bath, Maine; George P. Torrence, Cincinnati, Ohio.
Class Cup—Messrs. S. Gordon, Exeter, N. H.; Albert V. Smith, Pittsburg, Pa.; Eugene W. Waukey, Chicago, Ill.

Examinations began to-day and will term closes on Thursday next, when all will go homewards or to visit friends. Several parties have been formed to indulge in hunting, but we fear that not much hunting will be done. However, we trust that all will enjoy themselves and return to their college duties next year with renewed vigor to prosecute their various duties.

PRINCETON COLLEGE, December 10, 1874.

EDITOR FOREST AND STREAM.

Examination and very cold weather together have caused a rapid decline in the interest exhibited by the college generally in all outdoor sports. Since Rutgers experienced her severe defeat here, nearly three weeks ago, not a single match game, either between our institutions and that of Rutgers, or between ourselves, has taken place. Even the great number of those who were wont to exhibit their zeal and fondness for the above diversion on the campus, between East and West colleges, at noon, and after chapel each day, has dwindled down to an enthusiastic few. On Tuesday a meeting of the boat club was held, in order to elect delegates to represent Princeton at the Convention of the Intercollegiate Rowing Association to be held at Hartford on the 14th inst. Messrs. A. Alexander, '75, and W. A. Butler, Jr., '76, were elected delegates, with Mr. Ely, '77, as alternate.

The views entertained by Princeton, in regard to rowing with coxswains at the next regatta, coincide with those held by Harvard, Yale, and Columbia, and it is to be hoped that the other members of the association will each favor this mode, as desirable change in the manner of rowing. The great number of contestants in the college regatta prove the feasibility of the present mode, and that unpleasant occurrence which marred the last Intercollegiate race at Saratoga, furnishes abundant proof that a new method should be adopted. Let each crew have its coxswain, and all such informality will be obviated, and peace and harmony will prevail upon the water. As a change in the manner of rowing, for the rapid increase in the membership of the association will cause the contestants to become so numerous that this danger of fouling will be very great, unless the above plan be adopted.

Princeton will be represented at the Intercollegiate Literary contest to be held at New York on the 7th of January, 1875, by W. D. Nicholas, of the class of '74.

PRINCETON COLLEGE, December 13, 1874.

EDITOR FOREST AND STREAM.

In my communication of the 10th inst. I stated that Messrs. Alexander, '75, and W. B. Butler, Jr., '76, had been elected as delegates to the Convention of the Intercollegiate Rowing Association to be held in New York on the 14th of December. At the meeting the two named above was elected on the ground that he was the only one who could leave college at that time, being exempt from examination on account of illness. But the fact that the meeting of the convention has been postponed until some time in January having become known, another meeting of the boat club was called to-day, in which the former election was declared null and a new one was instituted. Messrs. A. Alexander, '75, President of the Princeton College Rowing Association, and D. Nicoll, '75, Captain of the University Crew, were elected as delegates. Through the change has caused considerable ill feeling, it is generally considered to have been advisable and strictly necessary, as the president and captain of the club should be its natural representatives at the convention, in virtue of their respective offices.

Canada.

—Mr. H. L. Butler, of Montreal, the secretary of the committee appointed to act as host on behalf of the G. N. C. C., to arrange for this match of patron of the States, has issued a circular to the secretaries of clubs, asking for information as to how many rinks each club will send, and requesting an answer not later than the 5th prox.

—A pigeon shooting match came off at St. Catharines on the first inst., between Mr. C. Bolton of Niagara, and Mr. G. Rogers of St. Catharines, 21 birds each, \$50 a side. Bolton killed 15 birds and Rogers 14, one of the birds shot by the former fell out of the bounds, also three of the latter. The friends of Mr. Rogers are willing to back him to shoot another match from \$50 to \$250 a side.—Sportsman.

—Mr. James Poulson, of Fendon, while out deer hunting at Four Mile Lake shot a doe with horns, orrathur, with one horn; the other having been broken some off. The one left was a single spike, seven or eight inches in length.

—While hunting at Buckhorn recently, Mr. Robert Walton, of Peterboro, fired a large duck gun, heavily charged, at a rising duck; the shock caused him to lose charge, and upset his canoe, the contents of which, in-

cluding three guns, a revolver and a complete camp equipage, went to the bottom, but Mr. Walton didn't. His companion in another canoe towed him ashore.

—The leading gentlemen of Halifax, Nova Scotia, have just organized the "Halifax Snow-Shoe Club," membership limited to fifty. The uniform adopted is the "tunique blue," blue blanket, blanket coat and red sash. The following gentlemen were unanimously elected officers for the present year.—President, M. B. Almon; Vice President, W. Macfarlane; Secretary and Treasurer, F. C. Simidars; Committee, John Albro, C. Ogden, A. C. Edwards, G. A. Black.

—Deer hunting is now in course of vigorous prosecution throughout the Dominion, so the number shot is quite large.

—A buck weighing 250 pounds was shot last week in Pashin Township.

—The Curling Clubs are making active preparations for the Winter campaign. The greater number have elected their officers for the ensuing year.

—The Lobster Factories of Cape Breton have closed for the season.

—A disease has broken out among the poultry in portions of the Dominion.

—A new half-mile course is being built at the west end of Hamilton, and will be open by Christmas.

—Messrs. Bowie and Allen, of Montreal, two good pedestrians, who were to test each other's speed in a one mile walk for a cup valued at \$250, have given up the attempt owing to an accident that befell the former.

—The Markham Club held a pigeon match last week.

—Whitby is agitating for a skating rink.

—Ice fishing has commenced.

—Twenty geese were bagged by two young sportsmen at Bay du Vin last week.

—Two thousand barrels of oysters were raked at Lower Bay du Vin during the autumn just closed.

—The Junior Club practised at snow birds last week.

New Publications.

Publications sent to this office, inviting your notice that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our editorial rooms will be promptly acknowledged in this issue. Publishers will confer a favor by promptly returning us of any omission in this respect. Prices of books inserted when desired.

BOOKS RECEIVED.

HOMES AND HOW TO MAKE THEM. By E. C. Gardner. Boston, H. Osgood & Co.

Every man should have a home, is made a specialty of this little companion of all who would gather in the family reunion. It was not writ ten for hachelors, but for the socially inclined, and is just such a book as comes within our own department. The aim of this visitor is to give practical information in a series of pleasant suggestions to all who would have a home of their own, rather than a "joliner's" treble board talk. Resolving through a course of some forty letters the whole subject of housebuilding, family wants and counting the cost, is ably discussed in this valuable work before us.

HALF HOUR RECREATIONS, No. xiii, 2d Series. By John Tyndall. AND GEANTIC CUTTLE FISH. By W. Saville Kent.

These popular works are well known to every scientific student. We would that they passed before a larger class of general readers. These, with all the full of deep learning, the first paper of this No., upon the transmission of sound, presents some facts heretofore unknown and gives information of a series of experiments not known before, except to some of our scientific sportsmen and backwoodsmen. How often does the scientist have to inquire of some backwoodsman—your Bruce, or more cultured deer shooter, as to the most simple facts concerning the transmission of sounds in the forest and on the sea shore, in fog, or in clear weather? How much depends upon the simpler laws of nature! All should read these monthly half hour chats with our greatest minds.

MAGAZINES.

The Galaxy for January has been placed on our table, and a glance at its varied table of contents informs us that they are indeed mental bonnet beaches, if we may be allowed to use this rather material expression in such a case. The standard of the articles is high, without rigidity. From its scientific miscellany we take the following note of the sagacity of the partridge:

"An interesting instance of the sagacity with which the partridge will protect its young is given in the report of the Government Surveyor of the one hundredth meridian. While riding through pine woods, a brood of partridges, containing the mother and eight or ten young, had been seen. The mother was some fifty yards from the feet of the foremost male almost torn on them. The young rose, flew a few yards, and dropping down, were in an instant hid in the underbrush. The mother, meanwhile, began some very peculiar tactics. Rising up, she fell back again to the ground as if perfectly helpless, and imitated the actions of a wounded bird so successfully that for a moment it was thought she had been really trodden upon. Several of the men, completely deceived, attempted to catch her, but she eluded every way, keeping just out of reach of their hands, until they had been enticed ten or twelve yards off, when she rose and was off like a bullet. Her tactics had successfully covered the retreat of her young."

—Any tourists who may travel in Florida this Winter would do a kindness to Prof. Baird, of the Smithsonian Institution, by turning over some of the shell heaps at Palatka. Perhaps they will find something interesting.

—No more useful and acceptable holiday present can be given than a year's subscription to FOREST AND STREAM. The recipient will appreciate it above anything else of like value.

—Caracas, the capital of Venezuela, is mentioned as an excellent Winter resort for those who desire to flee from Northern climes. The city is about 3,000 feet above the sea, and the atmosphere mild, dry and bracing. The days are warm, the nights cool and refreshing; there is good society, also, at Caracas.

—That man only is truly educated who has been so trained in his youth that his body is the ready servant of his will, and performs with ease and pleasure all the work that, as a mechanism, it is capable of doing.

—Some person has been counting the hens in France and gives the number at 40,000,000 and their value at \$30,000,000. The figures are surprisingly round.

The Horse and Course.

Four trotting races came off last Wednesday afternoon at Plectwood Park, the first being a sweepstakes for \$300, mile heats, best three in five, to wagons. The contestants were John Murphy's bay gelding Charley Green, William Thoin's bay gelding Phil O'Neil and Peter Mance's brown gelding Bob. Charley Green was the favorite over the field at odds. Seven heats were trotted before the meet was decided, and with all the vicissitudes of the race Charley Green was the favorite. Best time, 2:40. The second event was a match between the bay gelding Harry and the sorrel mare Long Branch Maid, mile heats, best three in five, in harness. Harry won the first and fourth heats; in the latter he distanced the mare. Best time, 3:01. The third race was between the bay gelding Gemine and the brown stallion Talonal. Gemine won by three straight heats. Best time, 3:03. The fourth event of the day was a trotting match under the saddle between John Rogers' bay mare Lady Annie and John Murphy's sorrel gelding Sorrel Jake. The betting before the start was in favor of Sorrel Jake; but after the first heat Lady Annie had the call and continued favorite to the end. She won the race in three straight heats. Both horses were finely ridden. Best time, 2:37.

The horses Mystery and Paul competed at Deerfoot last Wednesday for a purse of \$500; three mile heats; the former won; best time, 9:11. Aleck and Chafin met last Wednesday for a purse of \$300; mile heats, best three in five, in harness. The former was victorious in the fourth heat. Best time, 2:38.

The Board of Appeals of the National Trotting Association, who have been in session in New York during the past week, have decided several important questions.

An adjourned meeting of delegates to take into consideration and arrange the Spring and Fall Eastern trotting circuits was held at the Everett House, this city, on Tuesday evening. The following gentlemen were present: Samuel T. Payson, Pascal C. Burke and A. S. Swan, of Brooklyn, representing the Prospect Park Fair Grounds Association; George Sturges, of Philadelphia, representing Point Breeze Park Association; Birdet Loomis, William H. Peck and Alexander Harbison, of Hartford, representing the Connecticut Stock Breeders' Association; L. I. Powers, H. M. Phillips and H. S. Hyde, of Springfield, representing the Hampden Park Association; W. Longstreet, of Providence, representing the Narragansett Park Association, and George W. Brigham, of Boston, representing George H. Bailey & Co., as proprietors of Mystic Park, and D. W. Beekler, as proprietor of Beacon Park.

The meeting was organized by the selection of L. I. Powers of Springfield, as chairman, and D. W. Longstreet, of Providence, as secretary. The records of the last meeting being read, the assignment of days as informally agreed upon at the former meeting, was unanimously adopted.

Point Breeze Park Association, Philadelphia, commencing Tuesday, May 25.

Prospect Park Association, Brooklyn, commencing Tuesday, June 1.

Connecticut Stock Breeders' Association, Hartford, commencing Tuesday, June 8.

Narragansett Park Association, Providence, commencing Tuesday, June 15.

Mystic and Beacon Parks, of Boston, the two weeks commencing Tuesday, June 22, and Tuesday, June 29.

The Hampden Park Association, of Springfield, declined a place in the Spring circuit, for reasons which the President explained.

Upon motion of Mr. Longstreet, it was unanimously voted that the meetings at each park shall comprise four days trotting, in three days, as proposed at the former meeting.

The amount of premiums to be given by each was then changed from \$10,000 to \$12,000, and the following programme was unanimously adopted:

FIRST DAY.—Class 2:45, \$1,000—\$600 to first, \$300 to second and \$100 to third. Class 2:50, \$1,500—\$900 to first, \$450 to second and \$150 to third.

SECOND DAY.—Class 2:31, \$1,500—\$800 to first, \$450 to second and \$150 to third. Class 2:32, \$2,500—\$1,500 to first, \$750 to second and \$250 to third.

THIRD DAY.—Class 2:40, \$1,000—\$600 to first, \$300 to second, \$100 to third. Class 2:45, \$1,500—\$900 to first, \$450 to second and \$150 to third.

FOURTH DAY.—Class 2:34, \$1,500—\$800 to first, \$450 to second and \$150 to third. Class 2:39, \$1,500—\$800 to first, \$450 to second and \$150 to third.

Entries to close at each park on Tuesday, May 18, 1875, at nine o'clock, P. M., and to be addressed to such persons as shall be hereafter announced in the advertisement. The following gentlemen were appointed stewards, to whom was referred all matters in detail:—

George Sturges, of Philadelphia; Pascal C. Burke, of Brooklyn; Birdet Loomis, of Hartford; D. F. Longstreet, of Providence; George H. Bailey and D. W. Beekler, of Boston.

FALL CIRCUIT.

After competing the arrangements for a spring circuit as above, the following dates were agreed upon for a fall circuit, composed of the same associations, with the addition of the Hampden Park Association, viz:—

Hampden Park Association, Springfield, commencing Tuesday, August 17.

Connecticut Stock Breeders' Association, Hartford, commencing Tuesday, August 24.

Narragansett Park Association, Providence, commencing Tuesday, October 31.

Mystic and Beacon Parks, Boston, the two weeks commencing Tuesday, September 7 and September 14.

Prospect Park Fair Grounds Association, Brooklyn, commencing Tuesday, October 5.

Point Breeze Park Association, Philadelphia, commencing Tuesday, October 12.

The same stewards were appointed, with the addition of L. I. Powers, of Springfield. Without completing the programme for the Fall circuit the meeting adjourned at the call of the chairman.

TOUGH AND PLUCKY PONIES.—A specialty of renown in Russia are the little horses of the Muskh. They are hardy in the first instance, as everything is in Russia, and they are quick and strong. Two of these little horses, hardly enough to be called ponies, will draw a plough all day, with a panse at noon. They are now largely exported (under the name of Littlehauers) to Prussia, and in some places have altogether superseded the oxen of their old privileges. I worked with them on one of the estates of Barton Place, where they were fed upon chaff of any description, even of lupines, very successfully, conditioned with some potato refuse from the distillery. In harvest time, when the little mice had to work like brewers' horses, I administered to them some bran, and they grew fat even under so unfavorable circumstances. We soon had some more sent down, and so we would spare them a little, and send them into the inclosure with the foals low and then. Two of them were able to draw the reaper all day long, and got two pecks of oats each as an encouragement. They, too, laid on flesh during the time. I mean to say that they are the most useful animals for easy agriculture existing, and we used to work them. —Russian Journal.

STEEPLECHASE.—They don't do these things in Portugal as they do in England and France, says La Chasse Illustrée. In a match between Senors Joseph Martins and Carlos Relvas there was a ditch, an Irish leap, and seven fences, which the cavaliers surmounted nobly. After clearing the last, they returned courteously side by side at a walk to the starting post, amidst the enthusiastic plaudits of the spectators, who regarded them as rivals worthy of the days of ancient chivalry.

Miscellaneous

DR. RADWAY'S Sarsaparilian Resolvent. THE GREAT BLOOD PURIFIER.

FOR THE CURE OF CHRONIC DISEASE, SCROFULA, HEREDITARY OR CONTAGIOUS. BE IT ENTERED IN THE Lungs or Stomach, Skin or Bones, Flesh or Nerves. CORRECTING THE SOLIDS AND VITIATING THE FLUIDS. Warranted to effect. Price 25 cents per box. Sold by Druggists.

Dr. RADWAY & Co., 32 Warren St., N. Y.

COL. JOHN BODINE.

WE present our readers with a portrait of Col. John Bodine, of Highland, Ulster County, N. Y., one of the members of the American Team, in the late International Rifle Match. Col. Bodine is a true representative of the Amateur Riflemen of America. His great steadiness and unvarying high scores at Creedmoor, together with the nerve displayed by him in the International Match when firing the "Last Shot," has procured for him the sobriquet of "Old Reliable." His experience in rifle shooting extends over thirty years, commencing with the heavy target of twenty to forty pounds, with telescope sights and light bullet, and range of one to two hundred yards, and ending with the superior breech loader of ninety grains of powder, and five hundred and fifty grains of lead, weight 10 pounds, and range accurate and effective at two-thirds of a mile, as used by him at Creedmoor.

His experiments for the past few years have been thoroughly practical and scientific, and his suggestions in regard to modifications and improvements in the construction of rifles or methods of preparing ammunition for the same, has had much to do with the present perfection of the Creedmoor target gun, which now equals anything in the world in simplicity of action, rapidity of fire, length of range and accuracy, a breech loader equal, if not superior to the famous muzzle loaders of Great Britain in accuracy and power. Col. Bodine is also an accomplished sportsman in the field, and his collection of modern sporting guns is perhaps the finest in the States.

He is forty-eight years of age, was born in the county in which he now resides, and is descended from the "Huguenot Patentees" who settled the valley of the Wallkill. He was brought up a farmer, and followed this business up to the year 1854. At this time leaving the farm, he engaged in the service of the New York and Erie Railroad for two years, since which he has resided on the Hudson River, at Newburgh, being engaged in the Bank of Newburgh as paying and receiving teller. His health failing from close confinement, he relinquished his position in the Bank for his present business, and for a number of years past, has been prominently identified with Steamboating and Bargeing on the Hudson River. He is now engaged in running a line of barges between Highland and New York, doing a Freight and Commission business in Merchandise and Farmer's Produce. Through a most active business man, yet he finds an occasional day for his favorite pastime of rifle shooting and field sports, proving that it is not necessary that men should be "professionals" to excel in manly sports. Previous to leaving the farm, he was connected with the State Militia, and held the rank of Colonel in the 92d Regt., 8th Brigade, N. Y.

Colonel Bodine is a type of the men who are to make Creedmoor as famous in America, as Wimbledon is in England.

New York, November 19th, 1874.

F. Remington & Sons: GENTLEMEN—I take great pleasure in furnishing you with accompanying transcript from my "Score Book," a copy of target made in the Bennett Match October 2d, 1874, distance 800 yards, together with the memorandum for the same.

Yours truly, JOHN BODINE.

Wind—6—7—8. Gentle to brisk. Atmosphere, damp. Distance, 800 yards. Time, 10 to 11 A. M. Elevation, 101, 102. Date, October 2d, 1874. Wind, calm. 2 1/2. Light, dark grey, no sunshade. Rifle, pistol gun, Remington bullet, 557 gr., hardened. Powder, Hazard's. Remarks—A very favorable morning for shooting, both on account of favorable light and of slight effect of wind from rear.

To Housekeepers. All housekeepers and others who desire to make their homes or apartments wear the appearance of elegance should call on Mr. Bendall, 112 Fulton street, and select a handsome carpet for about one third its real worth. The stock embraces all sorts of carpets for parlors, sitting rooms, libraries, chambers, dining rooms, and stairs; also a large variety of oil cloths.

"It is certainly the best of American Magazines."—Express, Buffalo, N. Y. "Its present popularity is the result of pure merit."—Commercial, Missouri, Pa. "There is not a dull page between its covers."—N. Y. Times. "A model periodical."—Philadelphia Press.

SPORTING MECHANICAL FAIR

VIENNA, AUSTRIA, Nov. 30, 1873. Messrs. Wm. S. Kimball & Co.: Since a friend of mine sent me, with a transport of Indian Snuff, two pounds of "Vanilla" I have had the best tobacco ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanilla" is the King and by its aromatic flavor and the right sort of substances. My friend in New York got an appointment in California, by that reason, I apply immediately to you for cigars to send me for the exclusive dollars, a supply of "Vanilla" Snuff and with the best tobacco to be obtained. If I have a chance to see you, I will see you at "Vanilla Fair," I will be glad to receive you at the address. Dr. Joe. Hyatt. Professor of Anatomy in the University of Vienna

It is manufactured from the best Virginia and North Carolina Leaf. It is particularly adapted to Meerschaum and Cigarette smoking—does not bite or make the tongue sore—is therefore unlike any other tobacco in these respects.

LUCAGO'S ISLE.

A THOUSAND little worlds are they,
The Islands of the Southern sea;
With silver coves and many a bay,
Delightful are thy scenes to me.
Then chant ye trade wind breezes, chant,
Along Bahama's sunny shore,
Let Neptune, if he pleases, grant
Smooth seas to thee for evermore.

Thy fragrant trees and shimmering sands,
Gave joy to me in youth's bright days;
The ocean sighted along thy strands,
And sadly sang her mournful lays.
Then chant ye trade wind breezes, chant,
Along Lucago's sunny shore;
Let Neptune, if he pleases, grant
Smooth seas to thee for evermore.

I love these islands of the sea,
Where gently falls the pattering rain;
'Tis sweet to sing, dear land, of thee—
I long to view thy banks again.
Then chant ye pleasant breezes, chant,
Along Bahama's coral shores,
Let Neptune, if he pleases, grant,
Smooth seas to thee for evermore.

St. John, N. B.

J. NEWTON WILSON.

Sea Fishing in the Tropics.

BY PERSE.

"WHAT do you think of pompano?" asked a friend with whom the writer dined some time ago at a hotel in the neighborhood of Boston, famous for the excellence of its fish and game. "Some persons say it's delicious."

"I know the fish," I answered, "though not under that name. I have been not a little amazed at observing in the sudden popularity of this novelty how the mere rarity of a dish, outside of any peculiar merit, takes priority. This pompano, as you call it, is well known in tropical waters, where it attains a pretty good size, up to twenty or twenty-five pounds weight. It is not held in much account for the table, though to a new comer, the taste, until from its richness it becomes tiresome, is not unpleasant. Its best merit is its strength and the resistance it makes when hooked, though in this respect, as well as in point of flavor, it is immeasurably inferior to the king fish, which, not unlike the salmon in appearance, still more resembles that most game of all fish in flavor, and the brilliant, well-sustained efforts it makes for escape, rushing about with great speed, pulling hard, and sometimes leaping fully four or five feet clear out of the water. In size it seldom exceeds, at least in the parts I am acquainted with, twelve or fifteen pounds, but is so full of strength and play, that unless the fisher has his hand protected by a good glove, he runs the pretty certain risk of having his fingers cut into the bone. The king fish, its congener, the Spanish mackerel, and the cavalli, the West Indian name for your pompano, are principally caught by hand-lines, trolling in a boat or dug-out moving at full speed—the bait being generally a long strip of glistening fish from certain fish, the balahou being considered the best for this purpose.

Talking of cavalli, reminds me of my first experience of hand-line trolling in the tropics, and an incident, which, though trivial enough, remains in my memory as an instance how large and fierce fish are not infrequently taken by means, which, in comparison with their strength, would be as weak as a thread in a man's hands. I have often put out, as night-fishes for shark, a stout rope with a large strong hook and a float in the shape of a small keg or some such thing, and in the morning have found the rope snapped like a thread, and hook and barrel gone. While on the other hand, I remember having drawn in with the seine a sawfish, thirteen feet long, counting the saw, and in girth over four feet, which allowed itself to be hauled ashore without a motion, a courtesy that we in utmost alarm for our slender

net, were extremely obliged for. It was not until safely placed on *terra firma*, and it had received a thrust or two from a machete, that the bulky brute condescended to move its formidable weapon. But such is the exception.

The barracouta is *par excellence*, the most ungentlemanly of all fish to have the misfortune to find in the seine. He dashes wildly about in all directions, tearing everything before him in blind fury, until, at last setting himself at liberty, he leaves the melancholy marks and tokens of his unwhished-for presence in the tattered fragments of the net, damaged to an extent requiring a couple of days' hard work for repairs. The only plan with this high-way robber of the deep, when you have the mishap to catch the Tartar, is with all hands in the boats to hurry up the seine and fold it round and round, and thus hamper his lightning-like movements. This is, however, much more easily said than done, even with a small net, of, say from forty to fifty yards long. The difficulty of hauling the heavily weighted net from the boats, in addition to the hurry, scurry, rush and confusion of the occasion is seldom attended with success, the result being that in most cases, every effort to the contrary notwithstanding, Signor Barracouta effects his own escape, and the destruction of the seine.

The grouper, too, constitutes a most disturbing element, if by chance a stray one gets in, though as these frequent the deep water round rocky headlands, where netting is impracticable, such seldom occurs. A medium-sized, moderately well behaved sea citizen of this class is, however, a very welcome item in the haul. The grouper, by the way, holds by universal consent first rank among West Indian fish for the table, and—stewed in claret—is, I may tell you, a thing to remember. But, save us from an ungovernable scoundrel of from forty to sixty pounds weight in a seine. He is worse than a bull in a china shop, or a pig at a dance. He must have everything his own way. With a connotation, to be sure, he does cause, and we confusedly glad we used to be to get rid of the unmanageable, unannually brute, and he left even a few meshes to patch together. But I am getting away from my cavalli.

Last time I was down the West Indies I spent some time in Trinidad. Shortly after my arrival I received an invitation from my good friends at Sweetbrier, that gem of a tropical country house. They were off to the Fire Islands for a month or so, and would be glad, they said, if, when business permitted, I could spend a few days there with them.

These Fire Islands, a favorite bathing resort of the people of Port of Spain, are a picturesque cluster of rocky islets, distant about six miles from the town in the direction of the Northern Boeas, or mouth of the Gulf of Paria, and lying three miles out from the shore where the land bends inward into a broad bay, the mountains with their glorious luxuriance of tropical foliage reaching down almost to the water's edge, and to the long sandy beach lined with prickly roseaux and lofty coco palms. Behind the further arm of the bay which, with the elevated Island of Carreras at its extremity, backs the Fire Islands, lies the deep and exquisitely beautiful harbor of Chaguaramas. Here it was where the Spaniards sank their fleet at Abercrombie's approach. And from these ancient sunken war vessels Yankee enterprise was able not many years since to extract sufficient treasures and stores to pay all expenses and give sufficient profit. Beyond Carreras and Chaguaramas, the background of wooded mountains with numerous spurs ridging to the sea, circle round to meet the first Boca and the Islands of Moros, Hacros and Chaguachacra, that stretch like broken links of a connecting chain across to the Spanish Main.

The phrase in Trinidad is not, as with us, to "take a bathing lodge," but the more sounding term, to "take an island." On each of these rocks, for in reality they are not much more, is perched a house, or rather a collection of small one-storied buildings. Every nook and cranny on the isle is, moreover, utilized in the shape of terraces and verandas, the whole making each spot quite a picture of snug prettiness, standing out independently in the sunlit

sea. When three or four families, congenial and pleasant, a conjunction by no means difficult or unrequent in Trinidad, are at the islands together, then may jolly times be expected—perfect *abandon*, mirth, flirtation, delightful bathing in the almost tepid waters, break-of-day excursions to seine the quiet coves all around, swarming with infinite varieties of fish, or shooting in a canoe at top-most speed along the open waters, trolling for those that love the deep.

I was not long in seizing an opportunity to join the G.'s at Mercer's, as their temporary habitat was called. C. was also coming, and in his gig, rowed by four sturdy negroes, we put off one Saturday afternoon for the Islands. The breeze blowing bright and strong against us, the inconvenient awning was willingly dispensed with, the baits put on, and the lines let out. No fish, however, came to our allurements. Schools of porpoises were tumbling about here and there, but that could not have been the cause, for now and then a silvery cloud of skip-jacks would flash over the dancing waves, or a man-of-war bird swoop down with unerring aim—showing that fish were there in plenty. At length the tide, sweeping strongly in shore, compelled our boatmen to keep farther out, and in this change of course the luck was better. Beyond the occasional necessary jerk to the line, my arm had been for some time doing its duty in a listless and perfunctory manner, when, whew! I got a pull that nearly twisted me right round, and I was engaged with a stunner. "Cavalli," said Lico, our bow oar. No fish was to be seen, but the style of play told the sort. The line was out far, the only business now was to haul in. Down went the fish, pulling like a demon. But no go for him against a strong line and a ten-foot leader of best copper wire. In a few minutes an eighteen pound cavalli was flapping his green and gold streaked sides at the bottom of the boat. Some more cavalli—with a couple of Spanish mackerel—when C.'s capture of a dashing king fish made me eager for a trial with one myself, especially as the Islands were not far, and the morrow being Sunday and an idle day. My wish was gratified. I hooked a splendid fellow. The work was every whit as exciting as tacking with a rattler of a salmon fresh from the sea. This was a totally different mode of proceeding from the unceremonious treatment of the plebeian cavalli. No, sir. Bear too hard on the king fish, and his majesty comes to the surface, swift as a bolt from a crossbow, and dashes straight up, quivering, several feet out of the water. By George! 'tis a sight to see him then, just like the instantaneous flash of a silver spear-head in the sunshine. But this is the most dangerous time, too. It is no use pulling hard, if you want your fish. You must regularly play him, the boat giving way, when required, as in lake salmon fishing. If you try rough work with the king fish, you lose him; in his quick rushing resistance he will actually tear himself off the hook. He must be taken in exhausted after careful, patient play—no easy thing, either, with such a thorough game fish, when you have no rod and do the work with the hands only. I got this one, and I must say that I would have been terribly disappointed if I had lost him.

We reached Mercer's just as the sun was sinking into the sea. In a moment after, and for a few moments only, the whole Western sky was resplendent in the multitude of magnificent tints of the gorgeous tropic sunset. It was a pretty sight—the picturesque rocky islet, with its quaint caves and verandas amid the broad-leaved wild almond trees, in bold relief against the burnished waters and the departing splendor of the day—and no less pleasant, too, was the throng of friends watching our coming at the little jetty on the leeward side, and foremost, A. R. G., himself, ready with that heartiest of all greetings, a West India planter's hospitable welcome to his home.

They take you in awfully, do Trinidadians, when they ask you down to the Islands. You have to rough it, you know. I easily got used to it; so would you, if you were one of the twenty or more, men, women and children, that, immediately after our arrival, sat down to dinner—turtle soup, delicious fresh-caught red fish, roast mutton and guava jelly, hams, capons, plantains, cush-cush, cassava,

and a host of other vegetables—washed down with goblets of foaming Bass, and dry amontillado. What laughter, chat and jest we had, and what fearful appetites!

We had our coffee and cigars outside, underneath the spreading almond trees, where soon after the ladies joined us. A young moon in early crescent, barely affording a perception of subdued light on the star-reflected waters, gave a velvet softness to the surrounding isles and the outlines of the mountains above. The waves dashed in drowsy monotone against the jagged sides of the rocky nest, or rumbled with dull murmurs through the water-worn hollows beneath. A gentle nightwind barely stirred the large leaves overhead, or occasionally shook down upon us the waxen petals of the almond blossoms as we lay in lazy luxuriosities on the terrace, half-listening to one of G.'s nonsensical stories, when, all of a sudden, *un far niente* was disturbed by the shout of Bob H., who had gone to inspect the night lines.

"Look here! There's a thundering big shark on one of the lines." "Shark," muttered the somnolent Will G. "Bosh, sell!" and would not stir.

Bob was correct though. There, in the shadow of the island, was a good-sized shark coiled on an unoccupied line a night line. What was to be done with him? The line was a strong one enough—quite sufficient for any ordinarily large rock fish, but as efficient to hold this catch as a twine would a bullock.

"Out with the boats," cried C., "and bring a rope. Don't pull on him, boys," he added, as he made for the jetty.

Meanwhile while the shark gave one or two uneasy rolls, as if not quite satisfied with his position, and then the head of a large fish came spinning up the line like a bead into our hands. This accounted for things. A fish had taken our bait, the shark had taken him, and the greedy gluton was disinclined to give up his prey. Would the line last? The tension on it now was extreme; you could play a tune on it with a stick, it was so tight stretched. Came he but one jerk, and bizz! 'twas parted. In a few moments the boats were round the island, a noise was thrown over the monster's tail, (how ever they managed it, I don't know,) and we, on shore, cut loose the night line. Then succeeded a series of wild plunges by the shark, now completely alive to the state of affairs—dragging the boat at first hither and thither. But all to no avail. His tail was well hoisted on to the stern, the four strokes dug deep into the water, the boatman, not at all squeamish as to articles of diet appropriated, as they did also the large liver to extract oil from, which they say is as good as cod-liver oil. The biter got bitten well this time, but the mystery was why he did not disgorge, for the hook was wholly inside the cavall and did not pierce him at all. A moral on greed-gules, I guess. Next morning, after tea, that had been made, I set to "transcribing" the head with most artistic skill and industry. Our unlucky visitor must have had a pretty good swallow, for when the jaws were cleared and divested of flesh, they were, with ease, passed over the head and shoulders of little Sandy G., a well known boy of eight or nine years, a process of measurement which gave his mother an involuntary shudder, for she said Master Sandy was a regular young water dog, and swam about the island, regardless of consequences. Sharks abound there, and are, as venous enough, yet, strange to say, no one ever hears of an accident from them, and the idea of such danger hardly ever enters one's head when bathing therabouts.

For Forest and Stream.

SALMON FISHING NEAR VESCADERO, CALIFORNIA.

FROM THE NEPHEW OF E. J. HOOPER BY HIS FATHER, IN ENGLAND.

MY letter this week shall be devoted to a description of my doings among the grilse and salmon. Having got everything in readiness the night before, I rose at 6, and having met my uncle, proceeded to the railway station in an express wagon. The train took us to Redwood City, a small town twenty-eight miles south of San Francisco. There we mounted the stage, having secured two front seats next the driver a week in advance. When I say two seats I deviate slightly from the truth. A seat and a half would be nearer the mark, not only were we squeezed into this small space, but were compelled to overlap so as not to stop the circulation. No deduction, however, was made in the ordinary fare! The distance from Redwood to Vescedero is about thirty-two miles. The route lies through a very beautiful section of the country; first over level agricultural grounds, next undulating, and then the road winds its way up into the Redwoods and along the mountain ridges. A number of us dismounted to lighten the load during the ascent, the stage being packed full, and the work very severe for our six horses. The scene from the summit is intensely grand, commanding views over the entire coast range, Bay of San Francisco, and the region far into the interior of the State. We stopped at a small way-side house at noon for lunch, and then continued our journey oceanwards, passing through an extremely wooded country, principally composed of cedar and the big tree growth. We descended a valley, following in its course a beautiful stream, the liquid sound of whose waters refreshed us on our journey. At 4:30 we arrived at Vescedero. We occupied a couple of pleasant little rooms *en suite* in a cottage belonging to the hotel. I will not trouble you with a formal diary, as the days' programme varied but little. The distance from our cottage to the river is about two-thirds of a mile. We rose each morning about sunrise (say 6), and after hot coffee, breakfast, and eggs, walked to the bridge where the boat was moored. The distance from thence to the Red Rock, or principal fishing ground, is about two miles. We much enjoyed the exercise of rowing, and occasionally I indulged in a swim, though the water was hardly warm enough to justify such proceeding. About noon, from our cottage, we were likely to be productive of a good report. My uncle caught the first fish—a grilse of a pound—bait fishing off the rocks. Toward sunset the silvery beauties could no longer resist

the red-bodied, grey-winged fly. With fine tackle I killed twelve, weighing, with a few small fish, nineteen pounds. The second day produced ten fish, weighing sixteen pounds; third day, thirteen, weighing eighteen pounds; fourth day, only four fish, weight seven pounds; fifth day, nine fish, weight sixteen pounds; sixth day, torrents of rain; we ventured out as far as the bridge, but were soon driven home by an increasing deluge; seventh day, river flooded, and a fresh morning till five. On the eighth day we tried new waters, that is, instead of rowing down we remained near the bridge. I could not rise a fish with a fly, so I put on a gut leader and a very small artificial spinning minnow. With this I killed six fish, weighing ten pounds. As I used my fly-rod the sport was nearly equal to fly-fishing. Ninth day, we tried the same ground above the bridge. Suddenly we observed a big fish, chasing the small fry about the end of a bed of rushes. This was fifteen or twenty yards from our boat. I asked uncle to pull very cautiously to within reach of the spot. I then drew my minnow slightly below the surface, when I saw the salmon seize it. Out he came, once, twice, thrice, four feet above water, then up stream like a streak of lightning, with thirty-five yards of my line. To check his highest would have been a feat, with such fine tackle. As all the time feared, as my hooks were very small. After several long runs he commenced steady, deep swimming up the river, with the tide. We followed. Great was the caution to be observed, as numerous feces projected into the stream, a few stumps, posts, &c. We continued our course for no less than three-fourths of a mile, at the end of which the salmon came to a full stop. At length the prize was safely netted and in the boat at my feet, weight exactly eight pounds.

Those six large fish I killed in the Lagoon last April were land-locked salmon, and were killed in a much shorter time, though of about the same size. You may readily imagine the perfect condition of this fish, which fought for an hour and a half, and carried us three-fourths of a mile. I doubt whether a much larger fish would have given more sport. Judging from the length of his resistance, I imagined it to be a heavier fish. Nothing can exceed the extreme beauty of these fresh-water salmon and grilse. In shape and in general condition, perfection. The strength of a pound fish is quite remarkable. They seem as they fling their silvery scales to the water, as if you were driving a nail. On the capture of the eighth pounder we descended the stream, and rowed the boat alongside some stakes. A fish of two pounds jumped out of the water. I cast the minnow over the spot, and was instantly in him, and soon he lay alongside his elder brother. We pulled down the river toward the Red Rock, and landed at a favorable point of land, near which the water flows along a deep channel. The first cast slightly hooked a large fish, which escaped. Almost immediately I hooked another, which, after a gallant struggle was landed; weight three pounds. I had the misfortune to hook and lose another very large salmon. This is easily accounted for, as my hooks, though strong, were too small. With the capture of the three-pounder my sport ended. The next day (our last) could not move my fly-rod. Uncle, however, did not give up, and he and my half-brother and I spent the day in fishing. My friend was in a great state of excitement, and declared he could never wish to see a more beautiful sight in his life! And truly I was justified in feeling somewhat proud of my achievement. Of the eight fish, we saw everyone before I hooked them, either rising or leaping into the air. And nobody more fully appreciates the pleasure of first seeing and then hooking a fish than an angler. The following evening I even enjoyed greater sport, for, in no more than eighteen consecutive casts, I killed twelve grilse. While taking one fish off the hook I could see another on the surface waiting to be hooked! But exquisite as were these evenings' sport among the smaller grilse, I always felt disappointed that the mighty salmon of ten, fifteen, and twenty pounds should be so scarce. I had a grand evening's sport, which defied the number of the older and wiser fish, which deigned only to look at my fly. During my sport the great waves and mighty separations of the water showed that fish were on the move, and now and again a monster would fling himself into mid air, coming down like a rock into the water. Some evenings, at low tide, the whole river was alive with salmon plunging up the weeds and chasing the small fry across the shallows. I tried every means in my power by anchoring the boat in the most likely spot, but to no purpose. Uncle caught a few good fish and a number of small ones, with worms and mussels, &c. Near the fishing ground was an old hermit. He amused us with his primitive fishing-tackle. We found him constructing a fly with a bunch of hairs from an old black-brush!

At the end of the evening I must give you a gratified when I begged him to accept a few flies from my hook. At the table a modest and pretty maiden waited at the table. She never was known to look at you in the face. With eyes directed to the ceiling or the floor, she daily made the announcement of "Beefsteak, mutton chops, ham and eggs." Then, without moving a muscle, she awaited the orders, and wheeling around us on a pivot seat would make for the kitchen door, and disappear to the right or to the left. Truly such maiden modesty is rare these days.

I may mention a remarkable occurrence which somewhat resembles the capture of your big trout in the Len, at Rattery's, Hoddesdon. I was fishing in a dead canal with the finest leader I could select. I hooked a grilse of nearly two pounds, which, after playing some time, broke away with my two gutts. My tackle being readjusted, I cast another small fly on the water, instantly hooking a quarter-of-a-pound fish. I soon became aware that the weight on my line was more than could be produced by so small a fish. In a few moments I lauded the small fish in company with the two-pounder I had previously lost, the former having run foul of and become entangled with the lost line in the mouth of the latter! After losing my two flies, I remained for some time standing by. "See if I don't recollect your name." Imagine their surprise at seeing me indistinctly succeed as if by a superhuman instrumentality!

A man living in the Vescedero, whom we met fishing, told us that earlier in the season, when the salmon com-

enced running in from the ocean, he could see nine large fish following his spoon in the clear water. Out of the number he killed seven! He killed no fish while we were there. When the fishing was poor he could always find other occupation. We often rowed to the mouth of the river, and frequently had no small difficulty in keeping the boat from the breakers and rocks. The coast scenery, though not to be compared with the Atlantic or the Irish coast, is nevertheless, beautifully irregular. Wild ducks are very plentiful, and many varieties are to be seen, but the total absence of covert makes shooting difficult.

We returned by a different route to the city. Mounting the stage at 8:30 A. M., we passed for some distance along the coast, enjoying the magnificent scenery. There were several squalls passing around, but none to affect us. The sun seemed to shine on our path as if by special agreement, the rain falling all around us on land and sea! I never remember having witnessed such wonderful cloud effects as were produced by those great storm clouds. At Spanish Town we took a lunch, and afterward continued our journey over the mountains to San Mateo, and from thence by rail to the city. P. F. H.

San Francisco, Dec. 6.

A FOX DRIVE.

ONE bright morning in the latter part of February, 1873, a stranger in the vicinity of certain roads in Wayne county, Indiana, would doubtless have been surprised at the unusual noises which were to be heard and the large number of men, and other animals actually scaring. But to the initiated it meant the capture of all (?) the reynolds to be found on one hundred square miles of ground, and an unlimited amount of fun.

The manner in which Reynard was to be caught was to surround a tract ten miles square, and then march to the centre. The matter had been advertised for two weeks, and as it was slack time among the farmers, and no gun dogs were allowed, but anything that would make a noise was in demand. An account of these implements of noise would possess variety at least. They consisted of tin pans, kettles, sections of mill saws, horse fiddles, dumbbells, sections of stove pipe and a thousand other indescribable affairs. One party of four had a five foot circular saw, which two of them carried, while the other two mounted with mallets, and last but not least, five hundred tin horns were distributed among the boys. Two full brass bands, a half dozen string bands and as many drums and fifes completed the outfit.

By ten o'clock the men were all arrayed, the signal gun fired and the start made. On we marched, making a perfect pandemonium of the woods and fields, actually scaring the foxes out of their holes. After going three miles our line was halted to wait for the others to come up. For half an hour we waited, all the time hearing the other lines in front and to the right and left. At last the opposite line came out of the wood over a mile in front. They came as thick as they could walk, and the other lines were equally crowded, while ours sat on the fence so that neither squares were still more than a mile across, so you can imagine our numbers, but as so the hideous din we made no one can have any idea. Up to this time we had not seen a fox, but just at this moment four were seen coming right for our part of the line. At sight of the game every man seemed to think it was his duty to pick it right up, and every man broke ranks and ran for the fence, regardless of the noise and confusion, but fortunately the first rush turned the foxes, and before they came around again we had recovered our presence of mind. The whole line now advanced slowly to the centre, every man of us trying to make the most noise. Although the game had yet quite a large place to run in, the ground seemed fairly alive with them, scampering and dashing in every direction, and from one point seven or eight were seen to start. Unfortunately it so happened that one portion of the line was made up of three car loads from a neighboring city, and they had imbibed so freely that they allowed nine to run by them in a body. Several more escaped at different places, so that only four were finally corralled. The final circle was forty rods across, and the men were closely packed around it from six to twenty-five deep. The fox, however, was very much interested in their actions. They would run to the middle of the ring and lie down a few minutes, then get up and run in a slow gallop around the ring within ten or twenty feet of the excited men who were yelling, beating their tin pans and blowing horns. Occasionally one would stop and look at what he thought was a weak point, then walk up within six feet of the line and then lay away to some other point. One of them laid down in the centre and died in a few moments—seared to death. At the expiration of the twenty minutes three men were detailed to catch the foxes, which they did in a very few minutes, as they were already run down. They were then put down for the benefit of the boys under twelve years old, and one of them with the courage of desperation, forced his way through the line and caught the bear, but was soon picked up by a cur which was near. The other two were kept alive, but died that night.

While going home a party of the boys started one that skulked in a brush pile and soon caught him without the aid of a dog. Two days after the drive a snow fell, but not a fox track was to be seen, while all though the line and they had been so numerous that it was impossible to track them. O. H. HAMPTON.

For Forest and Stream.

A LITTLE REMINISCENCE.

THE perusal of an article on page 226, headed, "Trouting under Difficulties," brings to my mind a similar experience of my own a few years since on Salmon River near Redfield, in Oswego county, N. Y.

Sportsmen in Central New York have nearly all breathed the exhilarating atmosphere of insects for the glorious land-sports of their fathers. I will not at this late day attempt a description of things in this region, as many of your readers no doubt could anticipate me, and say readily upon the name of Redfield being mentioned, "Oh yes, I admit it all; I have been there, and have taken a basket full on the east branch before lunch time, between the State bridge

and Waterbury's, and after a glorious dinner hour on the bank of Prince's brook, quaffing its crystal waters between sandwiches, and taking a happy snooze under the shade of some favorite old tree, have again strapped on my creel and slowly wended my way along the river, now and then picking out a "beauty," until heartily satisfied with the day's sport, have reached Diminick's bridge, meeting the team that carried us to an early supper at the Fisherman's Home."

To many of those who in past years have visited this favorite old spot, certain names will fall upon the heart like the memory of delicious music from the lips of loved ones in days langsyne. I will only mention a few of them: Seymour's and Corey's Bridge, The Meadows, North Branch, with its slippery boulders, the Brick Yard, Petrie's and Stoney Brook. Many of those who went there at an early day have "traveled on." Still, every year finds not a few of old time sportsmen, with rod and line, tramping over old familiar scenes, not with the fire and ambition of youth, but, nevertheless, with hearts as young and delights as keen as when no spectacles were needed to tie a broken leader and no threads of grey adorned their heads. Not alone do these genial old sportsmen visit these scenes, but every year finds new names and new faces amongst the old. It is "nothing to be made of," as the saying is, but the basket full as in days of yore, but enough of them still remain, and doubtless ever will, to induce the patient and careful fisherman to visit the place for years to come. My companion on one occasion made the remark, in which I fully agree with him, that "it was worth a journey to Redfield to look over the beautiful scenes and breathe in the invigorating air, if we do not wet a line."

The Fisherman's Home, with its cheerful dining room, where the photograph of the six-pound trout so long adorned the walls; the lower stoop, with its wicker seats where so many "traps" have been displayed preparatory to the day's sport; and the upper portico, over whose railings "wet pants" have been so oft at evening hung, have fallen a prey to the all-devouring flames, but many landmarks still remain to remind us of the old days.

How wildly and how far have I digressed from the thought that induced the penning of this communication! Begging your indulgence, I will return.

One beautiful June morning, some four years since, a party consisting of W. C. B., J. H. G. and J. L. G. made one of their visits to the loved old grounds and were soon at home in the familiar quarters that they for many years had occupied on similar occasions. As the day advanced, not to go out until after dinner, while the latter two decided to visit the meadows of North Branch. A buckboard wagon, with lively team attached, soon carried us safely to the point of attack just below the old dam and above the alders. Some choice selections soon graced our creels, and in the eddy that whirls under the roots of overhanging trees just above the bridge, a careful cast was made and assured by the report of a "clack," and fully two pounds were instantly struck and spinning out the contents of our reel. Two minutes sufficed to entangle stretcher, droppers, and leader so inextricably in the roots that to land the prize was impossible. A sigh of disappointment, a few minutes of work seated on the bank, and philosophy prevailed, and we entered the meadows below the bridge, where hay-mocks and "cows" were not taken by the basket. Every square-built individual of the genus homo, dropped his scythe and came towards us. We had not studied German then, and what he said was, of course, all "Greek to us." In order, however, to make himself understood, he drew from his pocket—not a revolver—a pouch, from which he took a five dollar note, referring to it in words, repeated pointings and rapid gestures. At last the thought forced itself upon our unwilling minds that we were required to pay five dollars for fishing through his meadows, and upon our stoutly, and with some warmth, refusing such an outrageous demand, he as loudly persisted in exclaiming, "Nine! Nine!" At last we told him flatly that he might go to any place he chose, but that he would never get nine dollars out of us.

As the evening was approaching, a crisis happily met when one of his co-laborers came up and offered that he would change for a five dollar bill, which we very gladly furnished him and proceeded on our way rejoicing.

J. L. G.
Auburn, Nov. 26, 1874.

FOR FOREST AND STREAM.
TRIALS OF A SALMON FISHER.

MAINE and the Adirondacks have suffered for several Springs from my perseverance as an angler, but this year, induced by an advertisement in your journal and persuaded by a number of friends, I have taken to the Canadian salmon rivers, and perhaps it would be instructive or amusing to some of your readers to hear my experience.

Leaving one of our pleasant watering places early in July, I gathered together my numerous fixings in New York preparatory to starting. In looking over the map for the easiest way to Quebec, I unfortunately ran across an advertisement in your issue, recommending a route to Quebec. Their time-table looks all right, but when I saw that the trip could be made in twenty-four hours, whereas two night changes were required, involving no little inconvenience. After leaving Quebec, three days' sail on a steamer, with a twenty-five miles drive brought us to our destination. "Now for the exhilarating sport of salmon fishing!" was my first thought. My first pool was devoid of salmon, with a great deal of half-bred birch bark on its banks; the next was adorned with a catamaran, and, next, showing the inventive genius of our near neighbors; in the third, the best pool on the river, we found three genial Blue-noses amusing themselves with the spear! Strange intimation of these simple countrymen! They knew we had the lease of the river and would arrive that day. They had placed a sentry on the lookout down the river expecting us to come up with the catamaran, but having experienced the pleasure of being poled up a shallow river, before we had shown our preference by being driven in; so we had the pleasure of capturing three poachers, (a new game for me.) It is needless to say that we discharged our river guardian for willful neglect of duty.

My friend, who is a first-class salmon fisher, said that after all these precautions we must give the salmon pools a rest by not fishing for at least a week or so. As far as fishing was concerned, we had all the salmon we could use, as we had confiscated the fish taken by the poachers. My experience in mosquitoes has been very extended. I have had blood extracted on Jersey Flats, Louisiana Bayous, California Ranches, Cuban Plantations, and Jamaica Pene,

but nowhere have I seen the same audacity or persistency as in the insect that inhabits the wilds of New Brunswick. Its song is the most unmusical I ever heard. Balls of penny-royal or creosote were only a slight preventive.

At last after three tedious days we were blessed with a slight rain, which raised the river some inches. Our hearts were cheered the next evening by seeing salmon in all the pools. Toward evening my friend, who wanted to give me all the slow possible, said, "Pitch in!" I had passed the two previous days in practicing with my salmon rod, and had become so expert that I could throw out fifty feet without getting it snarled more than every third time. Putting on my English wasling pants, (I had all the late improvements,) selecting some of Forest of Tulso best flies, I waded in up to my waist and began brushing the water, but being anxious to get near the centre of the pool, with doubts of being able to cast there for, I waded in a little deeper. I wish I hadn't! I trod on a slippery stone and lost my balance. The air in the pants took my feet up and I passed an agreeable five minutes learning the steps of a new dance, sometimes with one foot on the bottom, oftener with both higher than my head. Oh, Jimminy! wasn't the water cold! I did not mind the cold water so much as seeing my friend and the guides on the bank looking on and laughing at me. I was in a little of a predicament that is the surest way to catch salmon." My good nature gave way under such circumstances, and I am afraid I used some hard words in reference to salmon fishing, &c., &c. After numerous hot potions my genial spirits were revived, and I enjoyed my *faute pas* as well as any one.

At last the long wished for day arrived. One afternoon, while fishing in one of the pools, I was rewarded. The day was perfect, with breeze enough to keep a ripple on the water, without disturbing the enjoyment of the flies (black). I had been casting for an hour or so, more or less, (by the way I have calculated it takes 733 casts to every rise, at least it did me.) So, feeling the necessity of the enlivening effects of tobacco to enable me to continue, I made a long cast, letting my fly sink while I was filling my pipe. The tobacco was not at all strong, but I was frightened by what I thought was a new boiling spring! The next moment I struck something that appeared to be solid, when up into the air went a beautiful salmon. It appeared to my unaccustomed gaze like a good sized whale. For the next five minutes the fish equally divided his time between the water and air, with rather a partiality to the latter. The strain of a sixteen feet reel began to tell; so, gathering himself up, he made a dash for the bank. I was of a 100 pound Parrot shell, taking out a hundred yards of line. I checked him just as he was about entering the rapids. Now began the labor, (and labor it is.) After the first five minutes of excitement, the weight of the rod increases at the rate of a pound a minute. At the end of twenty minutes I would gladly have said, "Give us a rest, old fellow!" About the time the salmon began to offer the same thing. After careful manipulation he was brought within reach of the gaff, but clumsy handling of it gave my tired arms five minutes more work. At last my prize was gently reposing on the mossy bank of the river. What satisfaction, after a severe tussle, to see your opponent finished up! It was a magnificent fish, weighing not quite twenty-one pounds. I have caught large fish, but never did I feel so satisfied. I had this one for my dinner (my first salmon). I was fully repaid, even for my trip on the Great Passaic through route, to Quebec. Our river was not a success. With low stage of the water and partiality of our neighbors to fish diet, we were only rewarded after persistent fishing, with twenty-two salmon, of which I had the pleasure of taking nine in out of the wet.

Out in the middle of the afternoon I found an offering in reward for the successful extermination of the insect pest? My friend says it would not do at all, as we come to the woods to get hardened, and nothing hardens one so much as to be bitten by mosquitoes, black flies, fleas, gnats, no-sees-ems, &c., in rotation. Hoping to have a better two weeks' fishing next Summer, I am, Mr. Editor, &c.

For Forest and Stream.

HOW WE SAVED THE BRIDGE.

IT was in March 1874—that a party consisting of Lawyer L., Col. H., Gen. R., his son and the undersigned, disembarked from a steamer at the town of Vincennes. Snipe was the principal sport that we had come for, though of course we would not refuse a stray duck which might come in range.

It was about midnight, if I remember rightly, when we got out of the cars. We hired a conveyance for us and our traps, to take us to the hotel. When we arrived at the mansion we found it enveloped in complete darkness. Not a light was to be seen in, or anywhere about the building. Repeated knocks on the door, given lustily by our Jehu, soon brought the night-capped head of the barkeeper to our thankful vision.

"Charlie, cum right down heah," said our Jehu, "heabs some gemmen bin waitin' mornen an hour for you."

"Dat is all right," replied a voice in the upper regions; "ye've us."

We soon obtained an entrance, but were disappointed to hear that there was not a vacant bed in the house. We had telegraphed from Cincinnati when we started, but the telegram had not been received. We passed the night with lilliard playing and arose (P) ready for the work we had before us. We drove out to the fields in which we were to shoot, loaded up and started. The first rise of the day was to be made in a point of snipe, Bang! I was in the bagged. "Better luck next time," awaited me, for I killed my pair in fine style. But I must not to the end of my story. We had fine sport all day and were returning home when we came near a long trestle work on the O. and M. railroad. We were obliged to wait a short time until a train went thundering by. We noticed that the engine gave out an unusual amount of smoke as it passed, but we were crossing the bridge. Col. H. saw a small column of smoke rising from the center of the bridge. He jumped out of the wagon and ran to the spot.

"The bridge is on fire!" he shouted to us.

Jumping out of the wagon we ran to the place where it stood trying to stamp out the fire with his feet. The fire was almost in the centre of the bridge, on one of the large beams which run transversely in the bridge. The beam was so situated that the oil in the engines passing over would fall on it. In time this accumulation was very great, and a spark alighting in it, a blaze was the immediate result. When we first saw it the hand could easily cover the space occupied, but it was growing with dangerous rapidity,

What to do no one seemed to know. There were three drinking cups in the party, but it was so far to the end of the bridge, then down to the water that it would take too much time to get so little water. At the end of the bridge was a small house in which buckets and tubs were kept in case of fire, but the door was locked and the keeper, as we afterwards found out, was lost in the pleasant occupation of shooting snipe. But something must be done, and that something quickly or the bridge is doomed.

"Pitch in!" said the old doctor, "I have a bucket of oil; if we don't get a bucket we can do nothing."

The door proved to be less strong than we had imagined, and a few sturdy kicks burst it open. As we entered, the first thing visible was a row of buckets filled with water. Seizing one each, we were soon at the conflagration. A dashing of the contents of our buckets on the blaze soon extinguished it. We arose from our labors only to be confronted by the bridge keeper, gun and bandolier and fully equipped in the usual manner. On learning the cause of the trouble, he dropped his gun, and rushing frantically to his house brought out a couple of buckets and dashed their contents on the now extinguished blaze.

"The company pays me to watch and put out fires and I'm a-going to do it."

ALGONA.

DISEASE IN TOWN AND COUNTRY.

IT has been the question of the times whether sanitary regulations in our cities, and even in the country, have been such as the magnitude of the subject demands. We are much inclined to believe that so long inquiry is made by parties whose business it is to know how men live, and why they are so prone to mortality in places where the common observation would find only the elements of health. We believe much good to be the result of the proper remedies for the various ills that flesh is heir to, and in the prompt use of the resources of the mineral and vegetable world. We would by no means put out the fires of the chemist, or the alchemist, or the physician, or the pharmacist. We would give the disciple of Galen and the gatherer of roots, herbs, and plants, their proper place in the world—would say to the allopath and the homeopath, Go work in the vineyard of the world. Nor would we end our suggestions here. We believe a still greater good will be had from the examinations into the physical and natural causes which underlie the most prominent first causes of many of the diseases which men suffer, both in city and country, and which to the faculty, learned and unlearned, are sealed from their knowledge.

As an illustration of our true position in this matter, we restate that physicians are often baffled in their efforts to produce a cure simply from the lack of a true knowledge of the inducing or predisposing cause of the malady of their patient.

A young, strong man was stricken down with typhoid fever. "Why should he have it? But he had it, and the learned doctor was greatly puzzled to know why he should take sick in the midst of such beautiful surroundings. His case progressed, and was considered until the head of doubtful ones. The old gray headed physician was indeed much puzzled. He thought much, but it seemed to do him no good. The patient died, and his friends, who had been standing he lived among the green trees and clear, bracing atmosphere. "Something new must be tried," said the physician. You are right for this time, venerable disciple of old Esculapins. Something must be done, and that very speedily, or you will lose that young man.

After a few moments' thought, our old friend came to the conclusion that it would be given by him, before he proceeded to extreme measures, in this case, to call in the services of a young doctor recently settled in the village. It was with much self-doubt that he finally consented to see a note to the other doctor to meet him in professional consultation. (Some M. D.'s are jealous and narrow minded; and why should they be?) He accordingly came, and our old time physician gathered him in a friendly and dignified way, and in his opening conversation said to our friend, "I am sending for him, he took occasion to remark: 'This case, I admit, has baffled my own expectations. At first it exhibited none of the later alarming symptoms. I had no fears that it would not yield in time to the usual remedies. This is a healthy location, and why should it be so obstinate a case as it is?'"

"What then all the outer surroundings are healthful, we must look for a nearer or secret cause, for secret cause there must be."

"No," remarked the old M. D., "I do not read so much or so many new books as you do. I have not the time; my patients demand all my time."

"They commenced a thorough search into the probable cause of the illness of the patient. After a careful search in and about the house, they proceeded to the cellar, where the secret enemy of health lay self-evident in some ten bushels of rotten potatoes. They adjourned to the sitting room, when the old doctor said—

"Well, what do you think of my treatment of the young man? (no allusion to the rotten potatoes.) Would you add anything to my formula?"

"The young doctor well managed the case," said the young doctor. "Only one addition need be made; and continue to carefully nurse the patient and his cure will be sure."

"Thank you, Dr. Jones, thank you; please write your additional prescription, and I will have it administered."

"The young doctor wrote upon a slip of paper as follows:—

"With the least possible delay have him put in rotten potatoes, and have them buried in a barrel, and give him a pound of chloride of lime over the bottom of the cellar."

It was done, and the young man speedily recovered.

This brings us to the consideration of a great agricultural question, which has occupied much of our personal attention and observation as a sanitary power for the prevention of many diseases for some thirty years. We believe that for many years past, in scarcely any of our great cities, has the proper consideration been given by the constituted authorities to the simple and not costly appliances for the comfort and health of the masses of the citizens. The importance of this subject, added to the expressed request for our views upon the sanitary bearing of the question, and the use of trees in our cities, has induced us to place our thoughts and observations before the readers of FOREST AND STREAM. In our next paper we shall give the results of our observations, illustrated by cases of well known and authenticated facts. We shall show that with the horticulturist, the agriculturist, the florist, and landscape gardener, rest a responsibility none the less important or unnecessary for not being known.

PROF. BAIRD'S REPORT.

(Continued.)

PROPAGATION OF MAINE SALMON IN 1872.

More time was allowed for satisfactory arrangements in regard to the propagation of salmon than of shad, because of the much later period in the year when they spawn; this in the common salmon (S. selar) not taking place until the end of October or the beginning of November, and varying with the locality.

In compliance with the suggestion of the meeting at Boston, I had an interview with Mr. Charles G. Atkins, at Bangor, and ascertained the probable degree of expansion that he could give to his operations at Bucksport, on the Penobscot River, with additional funds.

The method devised by him consists in obtaining mature fish as they come up the river and are taken by the fishermen, placing them in a pen situated in a large pond of about 150 acres, and keeping them there until the season of reproduction, and then securing the spawn, and after impregnating it, hatching it in a suitable hatching house.

The only method of obtaining salmon in sufficient numbers was to offer the full market price to the fishermen for all they could deliver up to the hatching establishment. About six hundred fish were obtained during the Summer. But little mortality occurred among these fish, and on the 28th of October, Mr. Atkins and his assistants commenced taking the spawn, securing about 1,500,000 eggs. These were brought forward in the hatching house at Bucksport until February. During that month and March they were distributed to other hatching houses in different parts of the country in order there to be fully developed.

The experiment of obtaining salmon in the hatching establishment was initiated in New York on the 17th of April, 1872, by an agreement of several parties to contribute funds to a given amount, the division of the spawn to be made in the same ratio. The subscriptions were as follows:—

- E. M. Stillwell and H. O. Stanley Jr., for the State of Maine..... \$60
- A. Brackett, for the State of Massachusetts..... 100
- H. Barden, for the State of Rhode Island..... 100
- W. M. Hudson, for the State of Connecticut..... 100
- W. C. Clegg, for the State of New York..... 1,000

These gentlemen kindly consenting I supplied, from the funds at my disposal, the means to greatly enlarge the scale of operations, and received a pro rata share of the eggs. The full history of the entire enterprise connected with the taking of the eggs in 1872, and their distribution in 1873, will be found in Mr. Atkins' report, beginning page 226 of the present volume.*

PROPAGATION OF THE RHINE SALMON IN 1872.

The possible contingency of failure in Mr. Atkins' experiment induced me to look to other sources for an additional supply of eggs; but I was unable to make any arrangement in that regard. That purpose, in consequence of the scarcity of fish, it was impossible to realize upon other salmon rivers of Maine the experiment that Mr. Atkins had begun on the Penobscot; and the regulations of the Dominion authorities in regard to gravid salmon and their eggs are such as to preclude the idea of looking across the borders for assistance.

The Canadian government has, it is true, a hatching establishment at Belleville, on the north side of Lake Ontario, near Toronto, and has occasionally allowed a surplus, but after it has supplied its own wants, to be sold to parties in the United States. The charge, however, being \$40 a thousand (in gold), was considered excessive, and the only alternative left was to look to Europe, where the streams emptying into the North Atlantic abound in precisely the same species. Under the circumstances, and after much consideration, I decided to obtain what I wanted from the Rhine, the fish of that river being famous for their excellence and size. I accordingly applied to the secretary of Deutsche Fischerei Verein at Berlin, inquiring whether any eggs could be procured from the government fish breeding establishment at Hfingen. To my gratification, I was informed that, on the representation of the Verein to the German government, the board had decided that 250,000 eggs should be presented to the United States at the proper time, all ready and packed for transmission, provided I would agree to have them transported to a point of shipment under the care of an experienced operator. To this, of course, I gladly agreed, and named Mr. Rudolph Hessel, of Offenburg, an eminent fish culturist and highly esteemed correspondent, from whom I had already derived much valuable information, to take charge of that duty. Articles by this gentleman upon the salmon of the Danube River (Salmo hueho), the breeding of the cyprinoid fishes, &c., will be found in the appendix to his report.†

The following letters on this subject were received from the authorities in Germany:—

[TRANSLATION.]
BUREAU OF THE DEUTSCHE FISCHEREI-VEREIN,
BERLIN, JUNE 11, 1872.

In consequence of your letter of the 19th of May, addressed to Prof. Yare, of this city, in reference to the purchase of salmon eggs for your Government, we applied to the superintendent of the fish culture establishment at Hfingen, and have received his reply, of which we inclose a copy.

Facing you thus in possession of the facts in the case, we beg that you will favor us as speedily as possible with a reply as to whether your Government is ready to assume the cost of the transportation of 250,000 salmon eggs. ALXANDER.

LIEUTENANT G. BAIRD, Washington.

[TRANSLATION.]
HfINGEN, June 7, 1872.

On receipt of your letter I placed myself immediately in communication with the circle president in reference to the conditions under which the establishment could supply salmon eggs to the American Government. On my presentation of the facts to any extent that you desire, we should be furnished free of expense, although it is not possible to supply "several millions." As the salmon eggs are hatched in the first place, for Germany alone, the establishment can not place itself to supply more than 250,000 at most, and this only on the condition that the necessary care be exercised in their transportation. It is an indispensable condition that the eggs shall be taken from here by a special assignee to Havre or Cherbourg, so that they may be secured against heaving during the journey. Arrangements must also be made for their preservation on the steamer in a uniformly cool place, and for their reception in New York by an expert in such matters. The double packing of a quarter of a million of salmon eggs will require at least thirty boxes,

each weighing about fifteen pounds; so that the whole will weigh nearly five hundred pounds, and occupy a considerable space.

BLACK, Director.

HEER, MANARD.

[TRANSLATION.]

EMPEROR FISH CULTURE INSTITUTION,
HUNGINGEN, NEAR ST. LOUIS, ALSACE, APRIL 13, 1872.

HONORABLE SEN—I have been asked by the Bureau of the German Fishery Association to write Hessel, in respect to the purchase of salmon eggs to be sent to America. The first eggs are usually obtained by the middle of November, but in such small number that it would be impossible to make one quarter of a million of them. It is one of the most difficult points for large transports. The institution receives from 20,000 to 30,000 eggs a day, and taking into account the considerable loss in the winter months, it requires from twelve to fifteen days to collect a quarter of a million. With so great a difference in time of collecting, the eggs are, of course, not ready for transportation at the same time. It is not until the middle of the season we obtain occasionally 100,000 to 150,000 eggs per day, and we have to arrange that such days be reserved for the intended large collection. These days nearly cease a quarter of a million of December, and the eggs to be sent to America could not have any place before the middle of January. Since about five weeks are necessary for the incipient hatching. Besides, the day of sailing of the steamer has to be taken into consideration, and I believe there are only two trips per month during the Winter season. These are difficulties to meet and to overcome which we have seen the power of Hessel still have for some time. I consider it an affair of honor, and mention the usual difficulties only to explain a possible delay.

The packing of one-quarter million of eggs will require twenty-five single parcels, each consisting of two double boxes. Each parcel weighs about 150 pounds, and the whole will weigh 250 pounds, or 31 hundred weight. Believing it to be absolutely necessary that an expert be sent to accompany the transport to Hamburg or Bremen, and direct the suitable packing there, the expense is considerable, scarcely less than one hundred thalers per hundred weight.

Should our institution furnish the eggs gratis, and no funds are available for the transportation, the cost of the eggs must be made by the end of the year a sum of money of the above amount placed at my disposal, so that no delay may be caused by its want.

Accurate accounts will be rendered in time, BLACK, Director.

PROF. S. F. BAIRD.

As a still larger number of eggs was considered desirable, at the suggestion of Freiburg, I applied to Oberbergmeister Schuster, of Freiburg, and offered from one million to one and a half million eggs, which he agreed to furnish at the very reasonable price of two thalers per thousand (their actual cost amounted to \$1.67 entreecy per 1,000), guaranteeing them to be taken from large healthy fish. These were also placed in charge of Mr. Hessel for shipment, who finally agreed to accompany the two sets of eggs to New York for the great certainty of their receipt in good condition.

As is well known, the best period for transporting salmon eggs is when they are about half hatched, or when the eyes are visible through the envelope. They are then put up in damp moss in shallow boxes, and inclosed in other dampened receptacles. In this condition they may be kept out of water for a long time. Indeed, the eggs are not infrequently hatched out in the moss itself, it kept long enough to be placed in water at all. Mr. Norris gives an instance of this kind in regard to some eggs which had been shipped from the Wilnot establishment on Ontario, a portion of them, that had been thrown aside with the damp moss having subsequently hatched, and this has since been confirmed by the experience of the Commission.

Owing to the fact that the water at the Hfingen establishment was warmer than that at Freiburg, and from the cause pointed by the German government were developed first, those at Freiburg requiring some further time, so that it involved considerable effort to combine the two sets so as to prepare them for shipment to the United States at the same time.

Mr. Hessel, in accordance with the agreement, took charge of the eggs, and also those of Freiburg, and brought them to Bremen, where they were packed and shipped on board one of the steamers of the North German Lloyd's. Unfortunately several circumstances concurred to render it doubtful to Mr. Hessel whether these eggs would come safely through. In the first place, the weather was exceptionally warm throughout Germany, no cold weather being experienced up to the middle of January, so that the eggs were developed in their shells much too fast for their welfare. It was impossible to retard these by the application of ice, as the stock in Bremen was very low, and supplies were only to be had at an enormous expense.

Again, the steamer upon which the eggs were first placed broke down, and was obliged to return to port. Mr. Hessel's packages were thus exposed to the continuous heat for another week. The consequence was that on his arrival in New York, to his great distress he found that the eggs in large part had been prematurely hatched, and the gases resulting from their putrefaction had destroyed many more of the eggs.

Application had been previously made to the Secretary of the Treasury to have the packages containing the salmon eggs with their cost, as they were disposed of, to the collector of customs, and other authorities. The number, sixty in number, occupying nearly 200 cubic feet of space, were transferred to the hatching houses of Dr. Slack, near Bloomsbury, N. J., and the contents immediately assorted, out of the 750,000 eggs only four or five thousand were sound. These were successfully hatched out, and ultimately introduced into the Musconetcong, a tributary of the Lawrence, situated in the State of New Jersey.

Such help was rendered in this experiment by the authorities of the North German Lloyd's, who gave up a special house on deck for the accommodation of the eggs, and assisted in various other ways, especially by advancing all the funds needed for the expenses in Germany and allowing the settlement of the account in New York. I had the assistance, also, in the reception and transfer of the eggs, of Dr. W. C. Clegg, of New York, and Mr. J. B. Conant, and of Mr. Seth Green, of New York; the whole party, with the exception of Dr. Hudson, proceeding to Bloomsbury with Dr. Slack, for the purpose of giving the eggs the best attention. I have no doubt that with a Winter of average severity, which would not carry the eggs forward so rapidly as happened in this very exceptional instance, the mass of salmon eggs can be made from Europe without the slightest receipt by an expert, as is now the case. Perhaps a somewhat different method of packing would be required, and the inclosure of the eggs in smaller boxes would tend to promote their safety. In the extreme probability that heretofore there may be obtained from American waters all the eggs that can be properly hatched, I think it will be unnecessary to repeat the experiment.

The entire cost of the enterprise, including the purchase of the Freiburg eggs, the freight, the sailing expenses, and salary of Mr. Hessel, and every other outlay, amounted to \$1,959 83, or to about \$2 624 per 1,000.

The value of this donation of eggs from the German government is not to be estimated by its worth in money, but to be appreciated as an evidence of kind feeling on its part toward the United States, especially as there is a

very great demand for salmon eggs throughout Europe, and as the supply received from Hfingen is entirely insufficient to meet the calls from Germany alone.

SALMON IN MARYLAND.

DEER PARK, Md., December 16, 1871.

EDITOR FOREST AND STREAM:—

I hear that Mr. Ferguson is stocking the streams around here with salmon. I will find out the number of fish and the names of the streams as soon as a car load of fish comes here, which I have been told is expected soon. ALLEGHANY.

SALMON IN TEXAS.—Our frequent contributor, Fred Mather, Esq., has arrived safely at Austin, Texas, in charge of the salmon sent there under his charge by the United States Fishery Commission, for the purpose of stocking the Colorado River. The Austin State Gazette of December 13th says:—

"We are truly glad to see our river being stocked with such an excellent quality of fish, and are perfectly satisfied. We think with the two importations we have had (of shal and California salmon) that our market will be supplied with fish of this character inside of two years. Mr. Mather informed us that he had considerable trouble in getting the salmon here alive, it being necessary to change their water every few hours, and the particular kind of water he desired being hard to get, especially in the Indian Territory. He started with 15,000, and arrived here with 10,000. One thousand, according to instructions, were left at Hempstead with Mr. L. S. Daniels for the Brazos River. Some necessarily died, but those he brought here were all well. It is whimsy as well that he intended to take some of these fish to San Antonio, but as he had been so long on the road, and they not having had the necessary frequent change of water, he was afraid to attempt to take any this trip across the country by stage or wagon. He will probably be on again to stock some of the streams tributary to the Colorado, and also the San Antonio River and other streams in that portion of the State. Texas has some beautiful streams for fish as any State in the Union."

We notice in the same paper that the city council of Austin passed an ordinance on the 10th of December, prohibiting the taking of any fish in the Colorado within the city limits at any time except with hook and line. This looks as though the Texans were earnest in sustaining the efforts of the United States Fishery Commission.

—In illustration of what may be done in the way of introducing food fishes in new localities, we refer to the results of experiments made in Tasmania in connection with the English trout and English perch. In four successive years prior to 1861 attempts were made to introduce these fishes into Tasmania, New England, but it was not until December, 1861, that a fifth attempt succeeded. A certain number of live fish having been brought out and placed in ponds expressly built for them by Mr. Alport, others were obtained in the following year, from which the immense supply now so extensively distributed throughout Tasmania and Australia has been derived. The present abundance may be estimated from the fact that, in Lake Wendouearre, at Ballarat, no less than nine tons were caught during the last season. One fish, three years old, weighed three and a half pounds; another, taken in 1874, weighed four pounds. The parent fish were brought from England to Tasmania, and afterward from the latter country to Victoria. Five small fishes represent the ancestry of the fish referred to as existing in the last mentioned country.

—A contributor to the Popular Science Monthly, speaking of the oyster, says that for a creature of lowly rank in the scale of animate being, it is wonderful what a literature attaches to the oyster. Through the roll of ages it has been a factor of prime importance in convivial instincts, the moralities and the industries of men. It has honorable mention in classic song and story. When imperial Rome had her many million populace and her almost fabulous wealth, the oyster figured prominently in the more than lavish luxury of that extravagant city. Do our oyster growers know how ancient their calling is? About 2,400 years ago one Sergius Grata, a man of a practical mind, turned Lake Averna into an oyster bed, and through his culture of that invaluable fish, he became rich, as they were called, because of the reputation of the "Saddle Rock" of Rome. And what a splendid market he had! His practical genius carried the new industry of oyster planting to great perfection; and such was his reputation that the Romans had a saying that, should the oysters stop growing in Lucina Lake, Sergius would make them grow on the tops of the houses. Averna has at last succumbed to the mutations of time, and it is to-day a miserable hole of volcanic mud. It now offers a good opportunity to test the great man's abilities; but Sergius Grata himself "dried up" some time ago.

FISHWAYS ON THE PRESUMPSCOOT.—The cases of appeals on the Presumpscoot River, in Maine, have all been decided in favor of the plans submitted by the Commissioners of Fisheries. Most of the plans were spiral fishways, in imitation of that invented by Commissioner Pike of Connecticut.

SALMON BREEDING AT BUCKSPORT.—The season at Bucksport has been very successful. Over 500 of the breeding salmon have been recaptured, leaving less than fifty to be accounted for. The number of eggs obtained is 3,639,000, being 700,000 more than last year.

Sixteen States now have fishery commissions engaged in replenishing depleted waters and protecting the fish. Three have been added during the present year, namely—Ohio, Iowa, and Minnesota. The others include the six New England States, New York, New Jersey, Pennsylvania, Michigan, Virginia, Alabama, and California.

—We are indebted to Mr. E. M. Stillwell for a most interesting report on the fisheries of Maine. We shall review it at an early day.

MORE FACTS ABOUT THE NEWFOUNDLAND DEVIL FISH.

OUR now celebrated devil fish has lately come to the front once more, and has awakened fresh interest in scientific circles in England. Sir Stephen Hill, Governor of this Colony, in a despatch to Lord Kimberley, late Colonial Secretary, enclosed photographs of the specimens of this extraordinary fish, of which I was fortunate enough to obtain possession, together with my description. Lord Kimberley forwarded these to Mr. Frank Beckland, permitting him to "make such use of these papers, in the interests of science, as he thought proper, and requesting to be informed in which Museum he considered they should be finally deposited." Mr. Beckland published the papers in "Land and Water," and he and Mr. Seattle painted the fish to life from the photographs, and placed the painting in his own Museum. The London press, including the Times, has been discussing the subject, and the Daily Telegraph had an interesting article on the subject. The discovery I was fortunate enough to make, last year, of a perfect specimen of these gigantic cuttle fish, is now regarded by naturalists as of the highest importance, enabling them to set at rest the vexatious question regarding which scientific men were so divided in opinion, and to positively define the degree of affinity existing between certain of these monsters and the numerous smaller representatives of the group, with which they were previously acquainted. The existence of gigantic cephalopoda, having bodies from twenty to thirty feet in length, and tentacles from thirty to forty feet in length, has long been regarded as a matter of fiction. The time science will elucidate their habits and social economy. In all probability this group of cephalopodous mollusca contains representatives of enormous dimensions distributed in the seas throughout the globe, and embracing many distinct genera and species. In size these giant calamaries vie with the cetacea, and are therefore among the largest animal forms.

On the occasion asked, "how comes it that these remarkable creatures have been so seldom seen; and that never before last year was a perfect specimen secured, even in Newfoundland?"

In answer to this I would remark that, in all probability, they inhabit the open ocean, and only occasionally approach the land, when driven by storms—hence the specimens that have been secured, are of an unfiled date, with the exception of those found last year. In the open ocean a shoal of them might pass a ship unnoticed, having no occasion to rise to the surface to take in air. Their appearance, however, around these shores is by no means uncommon; but as their importance was unknown till lately among our people, no attention was paid to the specimens which drifted ashore. In proof of this, and in affording additional evidence regarding the matter, I may mention that recently I met with an intelligent and respectable inhabitant of Bonavista Bay, who gave me a minute account of a "big squid" which was cast ashore close to his residence. The name of my informant is John Quinton, of Redcliffe Island, Bonavista Bay; and I have every reason to believe that his narrative is strictly in accordance with fact. A few days before Christmas, 1872, on going out one morning to observe a large school of water seals stranded about fifteen yards from the beach. There had been a violent storm the previous night. On examination it proved to be "a big squid," and the people of the settlement resolved to drag it ashore. A rope was passed round it, and it required fourteen men to haul it close to the beach. My informant was struck with the enormous length of the tentacles, and in describing the matter to me, he found them thirty two feet in length, somewhat thicker than a stout man's wrist, and having rows of suckers at the extremity, each three inches in diameter. The short arms were eight feet in length, and "thicker than a man's thigh." The eyes were of immense size, and the beak "as large as the crown of his hat" in diameter. Unfortunately he did not measure the body, but thinks it could not have been less than four feet in length, and in diameter. I may mention that on a short time, and one of his neighbors carried home the beak and preserved it for a time. Soon after a storm came on and the waves washed the fragments back into the ocean. He is in hopes that the beak is still in existence in his neighbor's cottage, "if the children have not destroyed it," and if so, I am to become its owner. He said that Mr. Saville Kent, late Superintendent of Fisheries at the Brighton Aquarium, and now of the Manchester Aquarium, one of the most eminent Marine naturalists in Britain, says in an article in "The Popular Science Review," "Calamaries are themselves an easy prey to other tenants of the deep. The whales, in fact, with which they have been compared in size, are their most formidable and implacable enemy. It is probably the only animal possessing which could oppose these monsters with any prospect of success in their native element. Our remarks in this case are of course restricted to the toothed whales, and with these we have abundant evidence to show that the colossal cephalopoda constitute a favorite diet."

M. HARVEY.

THE ENGLISH SPARROW.—Mr. Robert Ridgway, a naturalist of the Smithsonian Institution, in a recent number of the American Sportsman says—At one time the native song-sparrow was by far the most numerous and familiar bird in the extensive park surrounding the Smithsonian Institution. As the result of a recent inquiry from a few individuals to hundreds of pairs, the song-sparrow was found from dozens of pairs to none. I have not seen a single individual for at least a year, whereas three years ago they were

numerous on every hand; and to me, the harsh, monotonous chirp of these foreign intruders is a sorry substitute for the cheering song of our equally familiar native bird (whose protection) now so sadly replaced by them. Whether or not the desertion of the park by the song-sparrow is caused by persecutions instigated by the introduced species, or by a scarcity of food caused by the large numbers of the latter, I will not attempt to say; but that the European sparrow is in a degree pugnacious, was proven to me only yesterday by witnessing the determined pursuit of a straggling snow-bird who eluded to alight in a cotton-wood tree in close proximity to a box near which a pair of sparrows were sitting.

At the present time the number of European sparrows is at least twice that of all native birds combined; three years ago, song and white throated sparrows, snow-birds, cardinals, towhees and other species, counted at least five times their present number.

It may be that this diminution in numbers of the native species in the park of this city may be brought about by causes independent of the presence of the house-sparrow; but the facts as above stated are too conspicuous to escape attention."

RARE BIRDS.—M. W. Clark, Esq., of the Maine department of the Grand Trunk Railway, has just received at Danville Junction, per Allan line of steamers from Sheffield, England, one pair silver pheasants, one raven, one starling, one jackdaw, two magpies, two larks, and one black bird, all in fine condition. These were imported for his private collection, and are not for sale. Mr. Clark says—"The raven, jackdaw and magpies constitute the most continental 'bird family' I have ever had."

THOSE BLUE BACKS.

EDITOR FOREST AND STREAM.—A word more about the blue back trout of Rangeley and Moosehead Lake. Five or six years ago I spent the month of October in the Maine woods, and for the first time saw the blue back trout, of which I had heard. This was in the Androscoggin River, between Indian Rock and the dam. The trout came from the Cupaticus or Moosehead Lake; they came up from Indian Rock to the dam. In the pool below the dam there were myriads, the water being literally black with them, and under every stone, stick, or log in the stream, scores would shoot out when disturbed; you could scarcely step anywhere in the stream without stirring some, and so of the streams emptying into the Rangeley Lake. We ate of them several times, and found them a nice pan-fish—juicy, tender and delicate, but from my little experience, would not give up the brook trout for them; but tastes differ. Some are lightly colored, and a bright shining gray, and some are dark or black, but once a year (about Oct. 10), and then all at once, and so suddenly, would it not be an interesting study for some of our scientists to learn and note their habits and peculiar characteristics, &c.?

George and Charles Soule gave me many interesting facts concerning the fish, and they could furnish any one, at that time, with plenty of trout to examine, and opportunity to send the habits, &c., and perhaps find their habits. If they are up the streams for spawning, when do the young go to the "home of the parent?" for they are not seen in the stream except in October, when, as Mr. Face says, they are caught by the barrel, and their name is legion. Whether they ever take fly or bait, seems to be a mooted question. Mr. Face says, no. That used to be the common red snapper, and was now by our party did take a few with bait. I thought then the reason of their not being freer was because they came on other business, and were too busy attending to that to pay any attention to biting. E. S. MERRILL.

Our correspondent is referred to previous numbers of FOREST AND STREAM for much information on this interesting subject.—ED.

Woodland, Lawn and Garden.

WINTER GARDENS—WHY CANNOT WE HAVE THEM.

WE present a short paper this week in response to several letters we have before us asking the above question. We might say that the public taste is not sufficiently educated to the point of appreciating such methods of recreation, and that many of our wealthy citizens have in their extensive and elegant greenhouses a very good realization of a Winter garden. And still another reason may be found in the answer a gentleman gave us a few weeks since when speaking of this subject. He said—"We have Summer parks and are not at all variety adequate to the wants of all our citizens; they must suffice for the present, or at least until money is more plenty."

Allowing the soundness of his remarks in part, we cannot agree with him in the assertion that our parks fill the wants of the people to the degree they should. Not to depreciate the Park Commissioners, or the educated intellect that spreads out the landscape garden before us, we do feel that to many besides ourselves a most sensible want is felt for a Winter garden of some sort. We hope to see the time ere long when this necessary want will be provided, and when our parks shall number among their pleasant features a Winter retreat as well as a Summer resort. It is a feature of our climate that to those who love out-of-door exercise and rambles among the greenwood paths of our parks, only a short time is given them for their Summer enjoyment. This comes to us in a sudden inquiry of our correspondents—"Can there be no means for giving us a small Winter garden, fit for an experiment only?"

While the great mass of our citizens cannot indulge in the luxury of extensive green houses and covered gardens, why may not an association be formed for the creation of a Winter garden in some one of our parks? We certainly see no objection to the feasibility of such an undertaking, giving to the people a Winter garden covering an acre or the pertinent say five or more acres of land. In this paper we shall outline our idea for suggestion only, proposing to thoroughly discuss the matter hereafter in all its bearings, its beauties, and its results, should it awaken any interest among our readers. Coming directly within the province of this paper—the insulation of men and women of a healthy interest in out-door recreation, and study—we expect to hear many responses to our suggestion for a Winter garden in some of our parks.

We need a resort where even in mid Winter the beautiful green of the tropics may be enjoyed—where the sweet denizens of Florida, of Brazil, the Orient, and the isles of the sea may catch their fragrance and gladden the hearts of our people. The plan suggested is not utopian; it can be realized, and we believe by a great extent of self-sustaining enterprise. Who is there that would not pay a

reasonable sum of money for admittance within the domain of our tropical world, our Winter garden, for an hour's ramble only?

With the many capabilities for improvement afforded by our Central Park, why not take advantage of some portion of it for the purpose suggested. It would not cost a very large sum of money to select in a proper location in the park, or any other grounds, a tract of five or six acres. Over this throw a light glass roof of the Paxton or McIntosh improved iron span—something of the Crystal Palace style—and you have a very completely covered glass roof, the sides of which can, if necessary, have an inside area of ten feet or more, as a walk or drive way, with an inside glass, making a great saving of the fuel used for heating the garden. The whole could be double glazed if found necessary. Now with such a structure as this, with all its imperfections, what an amount of real happiness it would afford. Our ladies and gentlemen might take stock in a less promising undertaking, for aside from its pleasures, we can demonstrate to them that there is money in it.

We might go on to speak at length of the many plants and attractions of such a resort. We might name the azaleas, the laurels, and hundreds of other beautiful and rare plants, but reserve for the future a more concise and elaborate plan of what we think all the people want. OLLIPOP QUILL.

CHOICE PELARGONIUMS FOR WINTER BLOOM.—The habits of some of the zonal pelargoniums are admirable for Winter blooming, and the varieties to be chosen for this purpose are such as generally bloom the most freely. I always choose for myself those of a dwarf habit in preference to others, and can recommend them as best adapted for room and greenhouse culture. Among the best varieties, I would name among others equally suitable, the following, namely:—Dwarf bright scarlet and a very fine bloomer, literally covering itself with showy puffs of brilliant flowers; vulcan, another scarlet of fine habits, and grows in trusses. Then I have grown with much satisfaction vesuvius, a rich red scarlet. This is a dwarf among the dwarfs, blooming freely, and very easily cultivated. Then we have the old and well known penny, whose rich tawny, shaded with pink or a bright scarlet, and it will be sure to place in your window-box, as it will almost take care of itself. Add two fine plants of pure white—the bride and the white swan—and you have all the whites you need. These, two, I think, cannot be surpassed for indoor bloomers, and possessing all the requisites of good, hardy flowers, you may have confidence in them. There are others we have seen well adapted for the purposes of window gardening and room culture, but we trust the above selection will give the best satisfaction to our lady gardeners, and having proved them ourselves we know whereof we speak. OLLIPOP QUILL.

ANSWERS TO CORRESPONDENTS.

BELLE MAY, Ipswich, Mass., inquires the name of a fern she sends us. Many of our wild wood ferns are spared us until the cold days of December. On the day of this writing—December 31—gathered one of the finest specimens of the *Cinis minor*, or little dog fern. I took it from a very sheltered spot in the crevice of the rocks, where it was growing in the line of a large adobe tree, and so luxuriantly that I was vain to leave it untouched, but as I had your letter of inquiry in my pocket, I transferred this little fern to my basket for a more careful examination. The specimen you send me belongs to this class, and if you carefully remove the plant with considerable earth it will richly repay you for your pains. It will give you an abundance of seeds next year, and these seeds will give you some fine plants, or sprouts, of an entirely different kind, though they will still be of the little dog fern family. I have found that one of these ferns, taken up in the Fall, and placed in the centre of a shallow pot of earth, and surrounded with the "chequerberry" of our school girls, makes a most delightful and cheap parlor ornament.

J. L. B., Long Branch, N. J.—The seed of the sedges, to which your inquiry leads, cannot usually be obtained from seedsmen or stores. At least, we have never seen any for sale, or noted any in catalogues issued by our fine class nurseries. There are an almost indefinite number of the plants and grasses, seed bearing seeds, belonging to the *Cyperaceae*. In the sedges you will find the seeds principally used for feeding by the rice breeder, or reed bird, to be of four kinds, and those are found generally together. First, the *Cyperus*; spikes flattened distinctly; many seeded; ripe June to September. Second, the *Cyperus*; grain oblong pointed. Third, *Luzula*; lanceolate seeds, resembling rice, and sometimes known as wild rice. Fourth, the *Milium*; seeds large and free. All the above seeds, together with many other species of seeds intergrowing with them, on the river banks in Virginia, Pennsylvania, and all along the Southern coast, yield an abundance of good seed, which may be easily gathered by boats in the proper season. The seeds are dropped in due time, and float upon the waters to their destined anchorage on the creeks and inlets of all our navigable and unnavigable waters.

F. SINCLAIR, Fredericksburg, Va.—Box containing the three packages of different kinds of corn came to hand. A careful analysis; enables us to give you the following answers. The first is a shell marl, and contains a large percentage of carbonate of lime. As a fertilizer, it should be applied in liberal quantities; it is good for wheat or clover, or any growing grass; will pay well for hauling and careful spreading. The second is a fine kind of lime, and is a good fertilizer; use as you of the usual amount of seed of this kind of earth; is from a loam where only fine granules, or poor sand is found. This is of little value, any way; it can perhaps be mixed with clay lands, but as a fertilizer is worth little or nothing to the farmer. The third is common muck, with some shells, and a little peaty formation. This is valuable as a fertilizer, and can be used as a basis for retaining phosphates to OLLIPOP QUILL.

WINTER GARDENING IN HIGH LATITUDES.—We clip the following from the Montreal Witness. Col. Rhodes is an old contributor to FOREST AND STREAM, and a mighty moose hunter and angler as well as gardener—"Col. Rhodes, of Quebec, desires a great credit for his enterprise and skill in producing a Winter vegetable garden

ties to delight the appetite. Last Winter he supplied this market with salad, radishes, rhubarb, and other vegetables. He also shipped large quantities to New York. This Winter the Colonial has entered a new field, and in the window of Messrs. McMillan & Balm, opposite, are specimens from his greenhouse of various sorts of evergreens, including heaths, ferns, heather, lycopodiums, both native and exotic, all in a state of refreshing greenness."

FEED THE BIRDS.

Milton, Mass., December 17, 1874.

EDITOR FOREST AND STREAM:

A hint to all who love the little birds in this cold weather: Procure a piece of a net, tie it securely to some bush or tree near your window, and as you see have a call from the chickadees, and perhaps, if the snow has been on the ground long, the blue jay will be tempted to come and get a bit or two, and then hurry away before you can see half his beauty.

This hint may give pleasure to some sportsman who is confined to his house, but who still recalls how, on some lone runway, while after a deer or fox, he has been visited by the chickadees; when, by keeping still, they would come and peep into the muzzle of his gun as it rested over his shoulder. Yours truly, Geo. S. Estey.

The Kennel.

CANKER IN THE EAR.—We have seen within the past two weeks two very bad cases of canker in the ear of our setter and one pointer cured by the following treatment, which we give our readers, feeling confident of its utility. The treatment, as follows, our friends tell us, they took from Herbert's "Sportsman's Vade Mecum," but on reference we find it differs somewhat. From the severity of the cases we inspected, and the perfect recovery the treatment wrought, we give it as it has been handed us, as it will doubtless be valuable to the sportsman.

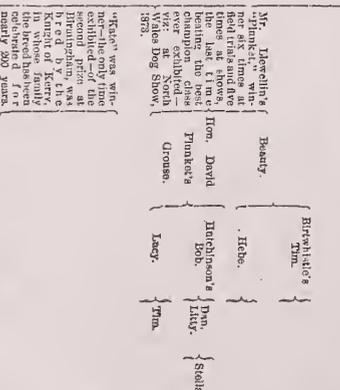

Begin by washing the ear well with mottled castile soap and warm water, afterwards filling up the member with powdered charcoal, and cleaning out every day with a small piece of soft sponge fastened to a pliable whalebone, using warm water. After the ear is perfectly clean, dip the sponge into a weak solution of acetate of lead or sulphate of zinc; insert into the ear again, and turn it around gently once or twice.

Canker is a very dangerous disease in a dog, and many are destroyed by it, as it frequently attacks the drum of the ear, and even extends to the brain if neglected. As we said before, we particularly noticed the severity of these two cases, and are pleased to hand their cure to our patrons.

ANOTHER PEDIGREE.—We have received from our correspondent, "Nimrod," of Boston, the pedigree of his famous Irish setter Kitten, an animal that he imported last year from the kennel of Mr. Llewelin, of England. He also sent us the photograph of Dick, another of the Irish breed, and from looks we should say that it was a fine type of its race. The brother of Kitten won the first prize at Glasgow and the second at the Crystal Palace:—

KITTIE.

Red Irish setter bitch, winner of second prize, North Wales Dog Show, and own sister to Mr. Llewelin's "Kite," winner both at the show bench and in the field.

THE DINGO DOGS AT PHILADELPHIA.—The Philadelphia Zoological Society have lately added to their collection of animals a remarkably fine pair of wild Dingo dogs from Australia. These animals have become domesticated in a great measure, and show their pleasure while visitors are about their enclosure by an active wagging of the tail. In appearance they resemble a cross of the Esquiman dog and shepherd, and in color are very much like the Scotch colley; but in countenance we could not help noticing the same wolfishness apparent in all wild dogs, with the ever characteristic fox-like eye. The keeper informed us that thus far he had never heard them bark, the only sound they utter being a whine or howl. They readily partake of bread or biscuit given to them by visitors; but their chief food is the flesh provided for them once a day. In their native state, the Dingo dogs hunt in packs of from fifteen to twenty, following a leader and running by scent, and are extremely fasting and fleet on foot. They are said to have excellent olfactory powers, and seldom fail to run their prey down. In Australia, the Dingo dog is a great pest to the settler, doing great damage to the sheep fold. The natives have

succeeded in domesticating it, and use it for the chase to advantage; but in every case it can be said the animal is but partly tamed, always retaining its savage nature. The Dingo dogs at the Philadelphia Zoological Gardens are male and female, and, like those in the collection at London, will no doubt breed in confinement.

SNIPE TO FIRST BREAK PUPPIES ON.—We heard in the past week a very forcible argument in favor of the snipe as being the best bird on which to first break young setters or pointers. The trainer in question is remarkable for the perfection with which dogs know his hands, and tells us that owing to the stubbornness with which the quail flies, a beginner will soon learn that the bird will allow his near approach before pointing, and on being hunted on snipe or woodcock, which do not lie so close as the first mentioned bird, the puppy will naturally attempt to get as near to them as he could to the quail. There is a great deal of truth in this, for we seldom see a crack quail dog that is at all good on snipe and woodcock, much more often finding a fine snipe dog equally as good on quail.

A MAGNIFICENT BLOODHOUND.—Mr. Oscar Spitzer, of East Thirtieth street, New York, advertised in our journal that he had a Siberian bloodhound for sale, and in a day or two after he sold the animal. Ere delivering him to the purchaser, he brought him to our office, and from his looks we must say that he is one of the finest types of his race we have ever seen. He is a direct descendant of Francis Butler's celebrated dog Uncas, his dam being one of the Emperor of Russia's most valued kennel of Russian bloodhounds. He is of a black and white hue, the former merging closely into the mouse color. He is the only animal of his peculiar breed in this country and in England. We understand that there is only one kennel of the same type, and that belongs to the Queen, though none of her dogs are as tall as this one, nor as long by a few inches. It is supposed that he is the largest animal of his breed in the world, and this can be readily understood from the measurement which we made ourselves, and which we give here. Length of body from tip of nose to root of tail, fifty-six inches; length of caudal, twenty-two inches; total, seventy-eight inches, or six and a half feet; length of head from the nose to the anterior portion of the ears, thirteen inches; depth through the forehead to the neck, twenty-five inches; girth of neck, twenty and a half inches; girth of body near the fore-shoulder, thirty-six inches; height at fore-shoulder, thirty-one inches; length of foreleg below the shoulder, eighteen and a half inches; weight, 136 pounds.

Though he was in rather poor condition, owing to recent illness, it will be seen that he displayed fine proportions. The purchaser was Mr. James D. Butler, attorney-at-law, of Portsmouth, New Hampshire.

POINTER vs. SETTER.

POMPERY CENTRE, CONN., December 7, 1874.

EDITOR FOREST AND STREAM:

Two typographical mistakes in my account of the Webster setters. Instead of Zip read Zie, and instead of one sixth read one-sixteenth. I see you consider the pointer the steadiest, easiest worked, and less liable to flush his game. If you have or know of any extra fine, cautious ones, I would like you to make me a visit and bring one and see how my setters will compare with him on ruffed grouse, which is the most wary game bird we have to get points over. I have three setter hitches, all well broken, all small size, and one in good condition only weighs 24 lbs. She is very speedy. The other two are quiet, steady working ones in the field, but will drop each a litter of pups the last of this month. I have also here a fine bred, nice working pointer, that came direct from the kennel of the Duke of Newcastle, sired by the prize dog that sold for \$500 in gold. My kennel now numbers twelve, all told—four setter hitches, five setter dogs, one fox hound, and one St. Bernard.

E. ALLIN.

Our correspondent is a little sensitive on the pointer and setter difference. If he will re-peruse our article he would see that we recommend the pointer for the sportsman who goes into the field but two or three times a season, but for the every day, constant shooter, we admire the setter, and so does everybody.

—The following very "Frenchy" story is going around:—"Recently the dogs lost a fox near to the station of Ferte Saint Aubin, and, though they beat up the neighborhood for two hours, could get no trace. It was thought very strange that an old dog was missing also. Next day it was ascertained that the fox had leaped into the baggage car of a train just going out, and the dog had followed and killed him."

—Rev. Wm. Atwood has secured a venerable goose, said to be seventy-one years old, having been hatched in 1803. This is age with a vengeance.

—Boston ate three million frogs last season. One firm in Newburyport supplied most of them, hiring men to hunt the swamps for them.

—A canny Scot has discovered that if a hide is immersed for four or five days in a mixture of vegetable or animal chareon and water, of the consistency of a thin paste, the hair is entirely removed, and the leather made from a hide thus treated is of superior quality.

—A Darwin man went coon hunting recently, and on coming home mistook his wife's band-box for a stool and sat down on it. There were no harsh words, no tears, no upbraiding—she simply rapped him with a club.

—An Atlanta man left a shot gun at the guard house the other night as a sort of security for the appearance of his mother, who had been arrested. Desiring to go hunting the next morning he carried the old lady down, turned her over to the authorities, and proudly marched off with his gun.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER FOR THE WEEK.

Table with columns: Date, Boston (H. M., E. M.), New York (H. M., E. M.), Charleston (H. M., E. M.). Rows for Dec 24, 25, 26, 27, 28, 29, 30.

For Forest and Stream.

YACHTING.

OUR good yacht May at her mooring awning. The waves are dashing merry and free; The wind through the rigging gaily sings, So up with the anchor and out to sea.

You may talk of gunning and sewing. Of your sport with the plover and quail, But burrah for the fresh breeze blowing, As out of the harbor we sail.

Ah! that last puff was rather heavy— Are your timbers and spars quite strong? And really, it's getting quite wavy— I hope there is nothing wrong.

Doesn't that topsail crowd her? Is not I think I'll step below, That seaward's villainous chowder Has upset my stomach so! C. F. G.

THE SEA-CAPTAINS OF THE FUTURE.—The schoolship St. Mary's is moored in the East River, off Twenty-third street, and will remain until next Spring. She arrived recently from Boston, where she was fitted for the school service. Half the library was taken out to make room under the deck for study-tables for the boys. The object of the training school is to fit the boys to become seamen in the merchant service. Their drill embraces hoisting the compass, learning to distinguish a true knot from a "granny" knot, splicing and knotting ropes, reefing and furling sails, heaving the lead, and handling the boats. Their heaviest exercise will be to unmanoeuvr the big guns once a day. The boys will sleep in hammocks, and wear navy blue.

There is room, Commander R. L. Phythian says, for 200 boys in the ship. A light crew is to be engaged until the boys learn how to run up to the mast heads and man the yards. The officers appointed by President Grant are Commander Phythian, Lieut.-Commander D. D. Wadleigh, and Surgeon D. C. Burleigh. The school is to be opened this week.—Sun.

—The ice boats have been out on the Hudson in full force since the ice has enabled them to run. Several improvements have been made recently in these picturesque crafts, and they now seem to be as perfect as they can be made.

—A telegram from the Signal Service observer at Cape Hatteras announces the arrival there on Dec. 18, of Mr. N. H. Bishop, who has made the trip from Quebec, Canada, in his paper canoe, the Maria Theresa. The craft weighs only fifty-eight pounds, and has been since the 4th of July last making the voyage. Mr. Bishop expects to reach his destination, Key-West, about March 1, 1875.

—The Columbia Yacht Club has elected R. McWhinney, Commodore; E. H. Osborn, Vice Commodore; James A. Smith, Secretary; Robert Wilson, Treasurer; Wm. Copper-Smith, Measurer; J. P. Smith, Steward.

—Within the past ten years the screw has entirely replaced the paddle in transatlantic navigation; the weight of marine engines has decreased one half, the steam pressure has quadrupled, and the consumption of coal has diminished two-thirds.

THE FAIR HAVEN SHARPIE.—We have alluded several times in these columns, incidentally, to the Fair Haven "sharpie," a craft strictly sui generis, as will be found by reading the following from the New Haven Register:—

The sharpie is a craft that can be successfully built only in this port. Gen Duca of Chicago bought one in Fair Haven about a year ago and took it home, where it has become famous. In 1873 Frank Leslie had one built in Fair Haven, and took it with him to Florida, where the boat whipped everything in those waters. Amos Cummings, of the Sun, has recently purchased a sharpie of David O. Twitchell, of this city, which he has taken to Florida. It is said that several sharpie builders, who had built famous boats in Fair Haven, found it impossible to equal their former successes after removing to ports on the Long Island shore.

The sharpie was born in Fair Haven and several have been built there and sent across the Atlantic in answer to orders. The most famous specimen of the craft in these parts is the boat known throughout the Sound as "Law's sharpie." So fast is she that she is harried out of the races which are frequently given up along the shore in Summer, and excellent builders have vainly tried to equal her by making boats whose measurements, weight, and spread of canvas were exactly the same as hers. Amos Cummings, of the Sun, has in this port, but the divine swiftness of the prototype admits no rival. Those who have seen her scudding under full sail, with two men sitting on the end of a long plank running out over the water to the windward to keep her from tipping over, will always remember "Law's sharpie."

We are personally quite familiar with this species of craft; and every Yale alumnus, or any other man who has resided in New Haven will recall their familiar outlines and their wonderful achievements. A description of the boat which Mr. Twitchell built for Mr. Cummings of the Sun will answer for them all, in a general way, although the length varies greatly, and the lines are different. Most of them have two masts, with leg-of-mutton sails. This boat was sixteen feet long, four feet four inches wide on the top, and three feet eight inches wide on the bottom,

thus having a flare of four inches. Her depth amidships was fifteen inches; at the bow nineteen. She was decked over four feet on the bows and two feet on the stern, with a washboard of four inches and a combing of two. Her centre board was four feet long, the forward end being against the mast; the mast was four inches in diameter in the largest place; the sail contained thirteen yards of cloth and was made of the best twilled cotton. The boat was well provided with seats; sterced with a madder; was strongly built, being put together with brass screws; was a good sailor and a perfectly safe pleasure boat. Sharpies are built here all the way from sixteen to forty feet in length, but one twenty feet is sufficient for a pleasure boat, the larger ones being for carrying oysters. They can be built and fitted complete for \$75. Any sportsman contemplating a Winter visit to Florida, would do well to purchase one.

REVIEW OF OUR YACHT FLEET.—During the past Summer there has been a large number of pleasure yachts added to the fleet, and St. Augustine never before possessed as many. Among the recently built, we find the *Seminole*, the largest, owned and built by Alex. Iwanowski, during the past Summer, thirty-seven feet long, fifteen feet beam, sloop rigged; the *Enchautee*, which was launched during the week, thirty-three feet long, twelve feet beam, sloop rigged, built by Emanuel Sanchez, Joseph and Fernando Leonardy, and owned by the two latter; the *Itler*, twenty-four feet long, nine and a half feet beam, sloop rigged, built and owned by Matthias Leonardy; the *Traveler*, now being finished by its builder and owner, Joseph S. Sanchez, twenty three feet long, nine feet and one inch beam, sloop rigged. One of the neatest, and the only round bottom boat ever built here, is the *Elizabeth*, built this Summer by W. Ham and Reuben Flankham, and owned by the former. All of the above are well built, and their owners, the yacht builders may well feel proud for the production of such good workmanship, with but so little experience. Below is a list of the boatmen, with their yachts' names.

Mr. Iwanowski enters the "field of action" with the *Seminole*, *Belle of the Bay*, *Brooklyn Belle*, *Jessie*, *Columbia*, and a number of small boats. Mr. W. and H. Flankham own and build the *Itler*, the *Traveler*, *Waver*, *Elizabeth*, *Florida*, and small boats. A. Munson, with the *Leapwave*, or *Tidal Wave*, and the *Yononoe Eagle*. Adolphus Pacetti with the *Billy Boy* and *Nellie*. Joseph S. Sanchez with the *Wanderer*, *Traveler*, and small boats. Emanuel Sanchez with the *Cricket*. Walton with the *Fleeting*. Fernando and Joseph Leonardy with the *Enchautee*. Matthias Leonardy with the *Itler*. There are besides these other boats and boatmen.

Mr. D. Edgar's private yacht, the *America*, is being overhauled and painted by Iwanowski, also the yacht of N. Edgar, and both will shortly appear in streamers and beauty. Capt. Clay's *Belle of Florida*, and the *S. O. A. B.*, are moored off the sea wall, and are wearing a cheerful look. Mr. Mollerson's boat was launched during the week, also looking hearty. J. O. Whitney, Incz de Castro still presents a forlorn and neglected spectacle on the inner side of the sea wall, and apparently abandoned. "Capt. Pete's" *Curlew* was ordered to report at Ravenswood Arsenal, and has been assigned duty in the waters of the St. Sebastian. —Florida Press, December 12th.

THE ENGLISH CLUB SYSTEM.—Since Captain Cook's return from England, we have heard more or less about the club system in rowing and the desirability of its introduction here at Yale. The broad difference between this and the present system is that instead of proprietors, there are lesses of the boats employed. In Oxford and Cambridge, where rowing has been long established and commands universal participation, there is a guarantee to the boat builder that his boats will be hired from year to year; hence no strong necessity for organization arises. In fact, however, a very close organization with strict regulations prevails. When any student or party of students from a college of the University hires a boat, he takes care first to enter the college club, thus subjecting himself to its regulations, and, if possible, to enter the University club. The college club then selects men for its trial eights and hires the necessary boats. These trial crews have races which bring out material for the college crews. These college crews may be considered to correspond to our class crews, except that for the field of selection is even smaller than that afforded by one of the classes of the Academic or Scientific departments. The various colleges then meet in the college races and from these crews the University trial eights are formed. In the race for 1872, nineteen colleges entered crews. Of these colleges, nine had under seventy-five members, six had under 100, while only four had nearly over 100, the smallest number being fifty-eight and the largest 245. The victorious college had a membership of seventy-six.

The system at Harvard embraces many of the features of the above. The whole University is divided among four clubs, two dormitories being assigned to a club. Each club has an average membership of fifty. Each member pays the first year \$15, payable in advance, to the treasurer of the club, who then issues a privilege of using the boats of the club. The treasurer also has the duty of collecting, who make payments according to agreement. Damages, the result of ordinary wear and tear, are repaired at the expense of the builder; but serious damages are assessed upon the student, or in part upon the student and builder, to such amounts as a committee of arbitration, consisting of the captain of the University crew, the captain of the four clubs and one other person, may determine. It is of course, to the interest of the builder to keep the boats in good repair, that their year of service may be the longest possible. The arbitration committee have the right to reject any boat as unfit for service. A sent in a boat is furnished to every three members of a club, the boats being somewhat as follows:—Two four-oared gigs, two small sculls and four single sculls, with such change as each club may direct. On this basis it is found that the members of a club can each get a row at least once a day, and the practical workings of the club in this respect have been very smooth. It is probable that after the clubs get into successful operation here a reduction of the price of membership could be made. There would then also arise the practice of renting boats to individuals and parties at rates somewhat higher than those for the members of the club party. The changes above sketched would also make an

entirely new system of races necessary. Some such plan of races as the following could be adopted:—

Full Races.—Races of trial sixes of the clubs in barges; races of club crews, barges; (possibly) races of class crews, shells, or the regular Fall regatta.

Spring and Summer Races.—Races of trial sixes of the clubs; races of the club crews, barges; races of trial University crews, barges; races of class crews, shells, or the Summer regatta.

It will be understood that these races would not be confined to six-oared boats, but would include pair oars, double and single sculls, and, possibly, ultimately, four-oared boats. Again it will be remarked that trial sixes and club races of such a character as those above plan. It may be thought advisable to change these to four-oared boats. In our next we shall try to explain more particularly the plan of the club system as proposed for Yale. —Yale Record.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

Pompano. Snapper. Grouper. Rockfish.	SOUTHERN WATERS.		Sheepshead. Tailorfish. Sea Bass.
	Trout (black bass). Dunn (two species). Kingfish. Striped Bass.		

FISH IN MARKET.—Bluefish are coming in market in profusion from Norfolk, Virginia. The price is ten cents per pound, retail. Codfish is also abundant, as large catches are made off the shores of Long Island. It brings from eight to ten cents per pound. Flounders or black-backs which are coming in from Boston, bring fifteen cents, and striped bass from Newburyport, Massachusetts, bring from twenty to twenty-five cents per pound, according to size. Large quantities arrived yesterday, and as the catch is expected to be large a profusion of this species is anticipated. Kingfish from Key West is arriving in limited quantities. Price from fifteen to eighteen cents per pound. Spanish mackerel which must have been caught by accident, came from the same place, but the flavor is not equal to that of those caught in season. They are so scarce that they bring fifty cents per pound. Scallops are out of season, so none are coming in, but hard shells crabs are abundant enough to meet all demands at \$3 50 per 100.

—We see it stated that the first shad of the season have reached Baltimore from Ronoake Sound, N. C., but cannot confirm it. It is early yet for shad, even at Savannah.

—The fishermen of Canarsie, Long Island, have recently been making large catches of codfish. There are about a dozen vessels in the fishing fleet, and all report excellent luck.

MARINE FISHERIES OF CANADA.—At the last meeting of the Natural History Society of Canada, Mr. J. L. Whitesides read a paper on the marine fisheries, particularly on the oyster beds of the St. Lawrence, but he also described in general terms the better known fishes frequenting the Gulf. These embrace the mackerel, cod, tunny or horse mackerel, the tautoga or blackfish, the old English hake, called weally whiting, the American hake or ling, the haddock, flounder, smelt, capelin, herring, and the menhaden, or porgy. Of the oyster beds he says that they occupy, relatively, but a small area, and that there are none, so far as known, in the seas of the Province of Quebec, around the shores of Newfoundland, the Magdalen Islands or in the Bay of Fundy.

—The Detroit papers warn epicures against salted whitefish. The recent glazes drove the water all out of the ponds where the fishermen have been keeping a supply of live whitefish to ship East with cold weather. These fish died, and now the men are busily salting them for market.

—One hundred and eighty-one blackfish were driven on shore and slaughtered in the harbor of Friendship, Me., one day last week. The largest was nineteen feet in length. It is estimated they will make 150 barrels of oil. The oldest fisherman there never saw a blackfish that side of Georges Island before.

—The *Manchester (N. H.) Mirror*, December 10th, says:—"The surface of Massachusetts, Dorr's and Nutt's and all the other ponds in this vicinity, are as glare as the best of skaters could wish. Along with good skating on the ice we have good fishing under the ice. The weather is, for the season, warm and clear; the ice is thick enough to be safe, and thin enough to be cut through without trouble, and the ponds are plenty and of good size. Not for many years have fishermen had so uniform good luck through the ice. Every day we hear of and see fine strings which weigh from ten to fifty pounds.

—At Buffalo Lake near Montello, Wisconsin, large numbers of bass and pickerel may be speared through the ice by darkening the hole through the ice with a blanket.

—Messrs. G. W. Howland, at Tignish; L. C. Hall, at Tignish and Grand River; and Churchill Brothers, at Rustico, all of Canada, have shipped about 98,000 barrels of mackerel this Autumn. Hundreds of vessels from Cape Cod and Gloucester, Massachusetts, and elsewhere, have also secured large quantities of mackerel around the coast. Much larger quantities have been taken this year than in any former season. The yield of the deep sea fisheries has been less than the average, while the returns from the in-shore fisheries have been remarkably good.

—The fisheries of Prince Edward's Island have done remarkably well this Summer, especially in lobster picking. The lobster factories at Murray Harbor and at West Point have each done a large and profitable business. The proprietors of the establishment at Murray Harbor are preparing to extend their operations next season, and expect to put up not less than 100,000 cans. The lobsters preserved are of large size, averaging in weight from two to five pounds. Only those of good quality and condition are canned. There are now at least forty-seven excellent establishments in Nova Scotia and New Brunswick, which use up

from three to five tons each per day, in the season, making the total annual consumption in those Provinces about 30,000 tons. It is very doubtful if the supply will long prove equal to the drain upon it.

BASS AND TROUT FISHING IN FLORIDA.—Some weeks ago we quoted an old Florida authority on black bass fishing. A correspondent wrote us thereon this wise:—

"A matter attracting my attention in your paper, is a statement that a century ago trout were caught in the South by a species of fly, Bartram, in 1761, describing the device which he calls a "bob," as follows: "A hook with a cork in the back and with part-colored feathers. You say the "bob" is in use at the South to this day. In this you are quite correct, though the part-colored feathers are seldom, if ever, employed. The threecolors, however, are still in vogue, but are attached to a spinning lure, which closely resembles a minnow, as it is drawn lightly above the surface of the water. The description otherwise of "bobbing," as is explained by your correspondent, is to throw the fish "strikes" he comes riding along just under the surface like a rill-dro train, and I fancy your fly jointed rod would pop like pipe stems before the whirl he gives when he feels the steel. Even our tough casts should like a bow, and ones in a great while fly surrenders to the hook. We fish also with live bait (minnows) about two feet below the surface. This takes a line fit to hold a horse. I have seen a 12 pound trout, but this weight is rare, a good one being 5, 6 and 7."

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to anglers and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, desiring facilities for good hunting, fishing, and trapping, and giving advice and instructions as to outfit, implements, routes, distances, seasons, expenses, remedies, traps, species, etc., etc., as far as we can, and we are sure our work will receive attention. Anonymous Communications not Noticed.

EAZER.—Your favor in our next.

EMERSON (VERMONT).—For good fishing in the Indian Territory, go down among the Creeks.

WILKIE, WASHINGTON.—In our answer to query Dec. 3, for Anderson and Buckner, read Audubon and Bechman.

L. C. W., WESTON.—Are there any good shooting, single barrel breech loaders made? Ans. Stevens' gun—a good, strong shooter, interchangeable with rifle barrel. Retail at \$18.

GEN. FLETCHER.—We have written a letter to the proprietors of Reeves' gun, urging the importance of their placing it before the American people through an agency or advertisements.

J. B. BENTLEY, AND C. E. W., NASHUA.—In our answer to query Dec. 3 and Dec. 17, for 3 inch target read 3 1/2 inch target. A 3 1/2 inch target means thirty inches each side, or an area of 500 square inches.

G. J., WASHINGTON.—Please inform me of the size of orange lightning powder, which comes nearest in size to the Lawrence No. 3 of English manufacture? Ans. No. 3 is the same as the Lawrence No. 3. No. 7 is the coarsest and No. 1 the finest.

STUART, LAWRENCE, KANSAS.—Would you be kind enough to refer me, please, to a reliable gunner who answers to some extent from what I can obtain water-proof fishing stockings? Ans. Geo. C. Hennig, 410 7th Street, N. W., Washington, D. C.

M. Y. B., Good Ground, L. C.—What will a good rabbit dog cost me, and do you know where I can purchase one? Ans. We do not know where you can purchase one. These dogs are in much demand, yet no person imports them to sell. In England a good dog would cost you about \$7.

W. P. ANSONIA.—Can you tell me where I can procure a good, reliable setter dog, without paying a fancy price? I don't hunt a great deal, and can't afford to pay too much, but still I like to shoot over a good dog as well as any body. Ans. See advertising columns. Know of none except parties represented there.

J. S. G., BINGHAMTON.—What is your opinion as to good size (gauge, length of barrels, and weight) of breech loader gives the best satisfaction in woodscock and grouse shooting? Ans. Ten gauge, thirty to thirty-two inches in the barrel, and ten pounds in weight, will prove most useful for all kinds of game.

N. B., NEW YORK.—A correspondent writes: I would advise your correspondent N. B., New York, in last week's number, to have his Babson Dactor gun lengthened to about 40 inches; it will add but little to the present weight of the gun, but greatly to its shooting qualities. I would then advise him to take a trip to Stevens' Book for excellent goose shooting. Surf boats for the sport, \$1 per day.

COMPETITIVE HUNTS.—In counting game the following conventional values are usually attached to each variety, and named as follows: Swan, 500; goose, 300; turkey, 200; coon, 20; groundhog, 10; 20; possum, 10; sandhill crane, 100; pheasant, 75; woodcock, 50; trout, 35; prairie chicken, 20; large duck, 20; large rail, 20; small rail, 5; mall duck, 15; pigeon, 15; jack snipe, 15; quail, 10; quail, 10; rarer, 5; golden plover, 5; ring plover, 5.

QUON, Poughkeepsie.—I have a good muzzla loading shot gun, which I would like to have made into a breech loader. Who can do for me, and what would be the expense? also would it injure the shooting of the gun? Ans. The only successful alterations from muzzle to breech loaders that we have seen are those of Clark & Snider, Baltimore, and their work is always spoken of as eminently satisfactory. Cost comparatively little; we forgot exactly how much.

F. S., Brooklyn.—I thought it was a well known fact that ornithologically considered, there is no partridge indigenous to this country, although quail and ruffed grouse are decimated partridge in some sections. But a summary of a day's shooting, printed in a leading sporting paper, seems to contradict this fact, when it enumerates 120 quail, 12 brace partridges, 4 brace pintail grouse, 13 brace ruffed grouse, 1 rabbit. Here, you will notice, are mentioned quail, ruffed grouse, and partridge. If you can explain this, please do so? Ans. We have no true partridges in this country, therefore the statement is incorrect.

FIVE PRIZES, GREENWOOD, WIA.—Will you please inform me whether the Ward Burton rifle is in the market. Their advertisement looks as if they had no stock, but I do not know, nor, I think, do you. Also state the difference, if any, between an Express rifle and the heavily charged Crocodor ones? Ans. I. Ward Burton can not yet in the market. Arrangements now in process of completion to manufacture the rifle on a large scale. Express rifles generally use a round ball and heavy charge, say 100 or 150 grains powder, the object being to get a flat trajectory as not to require adjustment of back sight, say to 100 or 300 yards.

A. L., City.—Visiting to buy a good and cheap shot gun, I inquired about the Remington single barrel breech loader, and a dealer in firearms told me that the Remington single gun was not worth much. It was the more astonished at this assertion, as I have seen it recommended in your paper frequently. I don't know what to do now—if to buy a double barreled muzzle loader, or to disregard the dealer's assertion and buy a Remington single breech loader. I can get a Wm. Scott & Sons' double barreled muzzle loader for \$25, neither do I wish to pay any more for a shot gun. Is the Daxler Smith single brace loader as good or any better than the Remington? Ans. As a general rule we object to purchasing one sort of gun at the expense of another, unless we know that to be dangerous to life. Another thing is that every sportsman has his own choice in shot guns. If we recommend any gun we do it on good grounds. 2. That can be proved only by experiments, so that we cannot give you any positive information. Should publish instructions to gun purchasers in a few days, and that will enable you to know, why and make you want.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
 (POST OFFICE BOX 3221.)
 125 SOUTH THIRD STREET, PHILADELPHIA,
 101 & 106 MADISON ST., CHICAGO.

Terms, Five Dollars a Year, Sixtiety in Advance.

A discount of twenty per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 24, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guarantee of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentleman sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will tender to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

MERRY CHRISTMAS!

"WHEN rosemary, and hays, the poet's crown,
 Are bawled in frequent cries through all the town;
 Then judge the festival of Christmas near—
 Christmas, the joyous period of the year.
 Now with bright balls all your temples strew,
 With holly green and sacred mistletoe;
 Now, heaven-born Charity! thy blessings shed;
 Bid meagre Want appear her sickly bed;
 Bid shivering limbs be warm; let Plenty's bowl
 In humble ruffs make glad the needy soul!
 See, see! the heaven-born maid her blessings shed;
 Let meagre Want appear her sickly bed;
 Clothed are the naked, and the needy glad,
 While selfish Avarice alone is sad."

The most important day in the Christian calendar has again made its annual round, and with it comes all those little kindnesses that render home the scene of particular enjoyment to the young, and of deep pleasure to all. Dear are its memories, and fondly is it greeted, for it brings a cheerfulness to every household in the land, to which many of them are often strangers. It is a day of rejoicing to all classes, but to the Christian it possesses an interest above its mere social phase, for to him it is the anniversary of the birth of a faith that freed the world from a groping religious slavery, and gave mankind a promise of future life and a hope of salvation. Since the day that Christianity was heralded to the world, the shackles of mental and physical slavery have been gradually falling off, and the cause of man has been ever onward and upward. The Christian world therefore hails the return of that day with pleasure, and makes it a marked event in the year. To the most unimpressible nature it brings memories dear, for it is a compendium of the greatest hopes and achieved results of childhood's days, and is the representative of a period of open generosity, gracious courtesies and unalloyed happiness. Even to the old its return brings some social event which leaves a train of pleasurable emotion in the mind long after it has followed in the cycle of time. Throughout Europe the day is one of great rejoicing, and no matter how poor the family may be, their house on this occasion will be decorated with evergreens, many lights will illumine it, good cheer will be abundant and happiness will reign supreme. Though the wassail bowl, the hoar's head and the yule log have long since been suppressed, and kissing under the mistletoe is no longer practiced, except in a few instances, yet the day has lost none of its interest; those departed pleasures are at least balanced by our

modern comforts, for, although the latter may lack the quaint romantic aspect of their predecessors, they more than compensate for this by their variety and quality. The sturdy swain and the fair young damsel must, however, regret the absence of that mistletoe bough, from which so much innocent amusement was extracted, and so many prospects gleaned. In our own broad land Christmas is becoming a more important event every year, but in portions of New England it still retains the flavor the Puritans gave it, hence is not welcomed with the same warmth that it is in other sections of the country. This indifference is, however, being rapidly overcome, so this Christmas will, no doubt, be generally observed throughout the length and breadth of the land. This is as it should be, for our holidays are few enough, and as the day is above all others one of pleasure to old and young, and one of kindly greetings among all, we join in the general salutation, and bid our readers a Merry Christmas and many of them, and hope all may realize the fruits of that blessing which the angels uttered: "Peace on earth to men of good will."

THE BAD LANDS SOUTH OF THE BLACK HILLS.

GREAT are the attractions of the Black Hill country. While hundreds of venturesome miners are waiting till Spring to risk their scalps for gold, a devotee of science has braved both the storms of Wiuter and the most hostile Indians for fossil bones.

It has long been known to geologists that the region south of the Black Hills, through which the White River flows, is the basin of an ancient lake of Tertiary age, in which are entombed the remains of many tropical animals that once lived around its borders. Comparatively few of these remains, however, have hitherto been secured, but these were of great interest to scientific men.

There has always been one great obstacle to the exploration of these beds. The headquarters of Red Cloud and Spotted Tail, and their powerful bands—the Ogalallah and Brule Sioux, thousands in number—are on the White River south of the Black Hills, and these have hitherto guarded effectually the approaches to that wonderful region. These tribes, especially the former, although professing friendship for the whites, have for years been virtually hostile; and it is not too much to say that most of the Indian outrages of the past five years, between the Missouri River and the Rocky Mountains, although attributed to various other bands, have been committed by the Ogalallahs.

We have therefore until the present time been obliged to content ourselves with the meagre information and collections of the earlier expeditions.

Since Gen. Custer's reconnaissance to the Black Hills, the Indians have been especially jealous of any encroachment on their territory in that direction, and have threatened with death any white man who should dare to approach that region in search of gold. It required, therefore, no small amount of courage for any man to venture into the very stronghold of the Indians in quest of fossils. The statement that the explorer merely wished to pick up some of the bones with which the Bad Lands are strewn, met with little credence. Your Indian cannot comprehend why any one should want the bones of the giants that lived in the olden time, before the little men of to-day were created, and naturally supposes that the statement of the white man is only a shallow excuse invented for the purpose of gaining an entrance to the Black Hills, and seeking there the gold that all the white men want. To succeed in reaching these bone fields, then, it required courage, and something more. It required a clear, cool head, a calm, well-balanced judgment, and an energy ready for any emergency and capable of grasping the slightest advantage.

For the last five years Prof. Marsh has been engaged in the study of the extinct animals of this country, especially those of the far West. During this time he has described over two hundred species of fossil mammals, birds, and reptiles, among which the following are some of the more interesting: A large number of new Mososaurs, huge marine reptiles, veritable sea serpents, that lived in the cretaceous ocean, where now the Rocky Mountains are, but with small fore and hind limbs in the shape of paddles, and ranging from twenty to seventy feet in length; the first Pterodactyles, or flying dragons, that have been found in this country, some of them of gigantic size, having a spread of wings of at least twenty-five feet; the first fossil birds described from this country; among them a new sub-class of birds (*Otontornis*), with teeth, and having *biconcave* vertebrae, the latter a characteristic feature of fishes; as well as a giant diving bird (*Hesperornis*), resembling in some respects our loon (*Colymbus torquatus*—Brun.), but which was about six feet in height. All these are from the cretaceous of Kansas. He has also described a new order of Perissodactyle mammals (*Dinocerata*), nearly or quite equalling the elephant in bulk, and remarkable on account of many strange features. The skull of these animals was armed with at least two, and perhaps three, pairs of horns, and they had enormous canines in the upper jaw, resembling those of the walrus. Another discovery of importance was that of fossil Marsupials, animals allied to the opossum, of fossil bats and of fossil monkeys, none of which had ever been observed before in this country.

About the 1st of last October, Prof. Marsh received information from Gen. Ord, commanding the Department of the Platte, of a new and very wonderful deposit near the Black Hills, and it became evident to him that a great opportunity for the acquisition of some of the won-

ders of this new country was at hand if the suspicions of the Indians could be allayed and permission obtained to enter the forbidden ground. In fact, the information was too important to be disregarded. Prof. Marsh started at once, and on reaching the West organized a party from the guides and frontiersmen that he had employed on former expeditions. Accompanied by a military escort from Fort Laramie, he started for the Bad Lands through the territory of the Sioux.

It is needless to repeat in detail the incidents of the trip. The determined opposition and hostility of the Indians, the council feasts and numerous presents given by Prof. Marsh to propitiate them, and, when all these failed, the stolen march by night across the White River, are told in the daily journals. It is enough to say that the deposit was reached, and nearly two tons of fossil bones secured, notwithstanding the continued opposition of the Indians and the bitter cold, and that the party returned in safety. Some of the fossils are now in New Haven, and the rest are on their way and will soon be deposited in the Peabody Museum.

The most interesting of the forms found at this locality was the gigantic animal that Prof. Marsh has named *Bronthotherium*. The first species of this genus was found by the first Yale scientific expedition in the bad lands of Colorado, which were discovered and first explored by Prof. M. and party during the Summer of 1870. The remains secured at that time, however, were few indeed compared with those obtained this Fall on the White River. Prof. Marsh has stated that on the first day he saw at least a dozen skeletons or portions of skeletons of this animal.

Bronthotherium gigas (Marsh) was proportioned somewhat like the rhinoceros, but nearly equalled an elephant in bulk. The skull is about two and one half feet long, and was armed with a pair of huge horns, projecting from the nose. These horns are not placed one before the other in the median line, as in all living two horned rhinoceroses; but one on each side of the face transverse to the axis of the head as in the horned ruminants of to-day. The animal had short legs like a rhinoceros, a neck of moderate length, so that a proboscis was not required; but it could lower its head to the ground in feeding. It is probable, however, that the upper lip was somewhat prehensile, perhaps something like the snout of the present tapir. Another animal of this genus was *Bronthotherium ingens* (Marsh), which exceeded the preceding in bulk by about one third, the skull being fully a yard in length.

In the locality south of the Black Hills Prof. Marsh evidently found an extensive sepulchre of these huge creatures. He has stated that in some places which he passed the Bad Lands were fairly whitened with their bones. He succeeded in unearthing many portions of the skeleton hitherto unknown, and, what was more important, he found in several instances the bones of the feet all occupying their relative positions, just as they laid when the carcass was covered with the mud. This was particularly fortunate, since in animals so remotely related to existing species as those under consideration it is very difficult to make out the relations of the bones of the extremities, and from the relations of these bones may be inferred in no small degree the zoological affinities of the animal.

Eothenium was another species that was largely represented in these beds. This animal was about the size of a tapir, but resembled the hog in many of its characteristics. An interesting animal found in the same formation was *Anchitherium*. This was a little horse-like animal, about the size of a sheep, and differing from the horse in having three toes, all reaching the ground. The middle and largest one corresponded to the single hoof of the modern horse. In another stratum higher up in the same deposit, were found multitudes of fossil turtles of various descriptions, ranging from six inches to two feet in diameter, and near these the *Oreodon*, an animal about the size of a sheep, and showing points of resemblance to the hog, the deer, and the camel, was very abundant.

All these animals belonged to one lake basin of Miocene age. Over these were deposits of a second lake which existed in Pliocene time, and abounded in remains of fossil horses, camels, and rhinoceroses. The remains of horses were especially numerous, and represented at least a dozen different kinds varying in size from that of a sheep to that of the largest modern horse. The animals entombed in this lake were all different from those of the older Miocene lake, and also quite distinct from any now living. In life they roamed about the borders of these fresh inland seas and daily came down to the water's edge to drink. Occasionally, no doubt, one of them became mired in the tenacious clays that formed the banks of the lake, and being unable to extricate himself was drowned. At other times, when crossing the rivers which poured into the lake at various points, the swift current would bear away one or two to the common tomb of the species. Thus gradually these relics of a far distant past were accumulated, which are now being brought to light through the labors of the devoted students of science.

VANITY FAIR TOBACCO.—Those sportsmen to whom the "Vanity Fair Tobacco" of Messrs. Kimball & Co., of Rochester, was such a solace in camp during the Summer and Autumn seasons, will find it no less acceptable as they gather around their Winter hearthstones to recount the adventures of the past. Read their advertisement and be happy.

State Fish Commissioners will oblige us by sending their annual reports as soon as published.

ARE DOGS PROPERTY?

THIS is a question that must soon be definitely answered and forever settled. The case of Manasseh Smith, Esq., a prominent lawyer of Portland, Maine, whose dog was wantonly shot by a scoundrelly neighbor some months ago, is now before the courts, and the verdict we trust will go far toward securing a just recognition hereafter of this description of property and the rights of owners. Mr. Smith, it will be remembered, sued for damages, but failed to recover; whereupon, failing in legal measures of redress, he took satisfaction, as the saying is, out of the hide of his antagonist. For this personal indignity the dog-killer sues for \$6,000 damages! We should have preferred to see this case tried exclusively on its merits, and an appeal taken to a higher court, but we feel confident that the final result of the litigation will be to establish the same right of ownership in dogs as is vested in other domestic animals of far less value, and to increase the sense of security in the ownership of such property.

A valuable precedent, we observe, was established the other day at Manlius, New York, where a most intelligent and valuable dog belonging to Mr. Abraham Shoemaker, of that place, was wantonly killed by a scamp, against whom suit was brought before a Justice of the Peace, and judgment rendered for \$125. An appeal was taken, and a jury confirmed the judgment with costs. We shall look forward to the Portland case with great interest, but not with undue solicitude, for we feel that at no distant day dog owners will be recognised as having some rights that vindictive scamps are thus bound to respect, and that dogs themselves will be treated to that consideration, in kennel, in field, and in transit, which their high status in the animal kingdom entitles them to.

THE MILITARY CHALLENGE.

The challenge from Company E, First Regiment, California National Guard, to shoot any military team in the United States at 200 and 500 yards, which we published a few weeks ago, and which was promptly accepted by Company D, Twelfth Regiment, N. Y. S. N. G., has aroused a most desirable interest among the Guardsmen of the Pacific Coast, and several of them are now devoting a large share of attention to rifle practice, in order that they may not be unworthy of recognition in our national contests. As an indication of the interest manifested by the riflemen of the Golden State in the match between the two companies representing the most Easterly and Westerly portions of our continent, we may add the fact that the telegraph companies dispatched in full the terms offered by Company D, and at the same time gave due credit to our journal for its enterprise in bringing the meeting about, and publishing the conditions of the match. We have not yet received the answer of the Californians, but expect it by letter at an early day, and from what we know of their temper we shall expect it to be an affirmative one. These matches are productive of much good, as they give our Guardsmen an esprit necessary to their efficiency, and urge them onward by their desire to attain an honorable position in such contests. As riflemen, our National Guards will compare with any in the world, but they must not be content with this, for they ought to be the best shots on either continent, as they have both the means and opportunity to practice as much as may be desirable.

Rifle contests should not be confined to the Guardsmen alone, but they should also be participated in by our Regular Army. The officers of the latter do not seem to manifest any interest in these matters, at least we do not see them openly advocating them, so we must conclude that they are, to a certain extent, indifferent to the efficiency of their commands as riflemen.

It has been stated that Volunteers were far superior to Regulars as marksmen, but this statement cannot be accepted in its literal sense until experience has proved it. It is true that those in civil life who use the rifle are more intelligent and more attached to their weapon than the soldiers of the Regular Army, but this fact does not prove that they have greater experience than the latter, or that they know the power and quality of their weapon any better.

The fact that the Volunteers of England are better marksmen than their comrades of the line, cannot hold good in this country, as the conditions are almost entirely altered. There the Regulars have comparatively little practice, while they have much here, as they are often actively engaged with Indians or in pursuing wild animals. This, of course, will apply to those on duty in the West, and they embrace the greater number of the army. To test the matter of proficiency the Regulars should challenge a team of the Guardsmen to shoot at short or long ranges, and, if accepted, the question could then be decided in a particular sense at least. That they have not done it indicates, apparently, that they have no sympathy with such matters, or that they do not think themselves capable of successful competition. This would prove a timidity we should not like to accord them; yet if they do not take part in future contests, we must admit this, or else assume that they lack the very necessary spirit that characterizes good soldiers. Besides the lessons deduced from such a trial of skill, we could also learn the shooting qualities of the various military rifles, and the advantages or disadvantages each may possess. This would be an important addition to our knowledge of weapons; solve hope that our Regular Army will organize a rifle team, and by a match with their comrades of the National Guard prove the truth or falsity of the statements uttered against them.

CURLING CLUBS.

The curlers of Canada equal, if they do not excel in enthusiasm, the residents of old Caledonia herself, if we may judge from their recent meetings, held in nearly every portion of the Dominion. These were all largely attended by the lovers of the slippery game, many of whom were gentlemen of high professional and social distinction. It has been asserted that curling is the most democratic game of skill in the world, and this we can readily understand where we see the artisan and professional man, the humble peasant and titled noble, unite on the common ground of love for the exercise. A fellow feeling in this case makes all wondrous kind, hence all social barriers are overthrown when curlers meet.

In our own country the game is now rapidly assuming an importance one would not accord it a few years ago, for where we had one club then we have twenty now, and all are large in membership and devoted to their favorite Winter pastime. The coming international match will cause it to loom up more prominently, as it will then attract an attention from the public at large which it has not heretofore received. The effect of this must be to render it more popular among all classes of people, and to cause it to assume its deserved place in the list of athletic exercises. The clubs of New York were the first to engage in the enterprise of having an international "hoopspiel," so this would prove that the natives of Scotia in this country do not lose any of their enthusiasm by their isolation from their native land.

WOODCOCK IN ENGLAND.—We recently quoted our English correspondent, Jackson Gilbanks, as authority that woodcock were not only marvellously scarce in some portions of Great Britain, but that they seemed to have become practically extinct in localities where they have been abundant hitherto. Since his letter was written a most remarkable irruption of these birds has taken place into the country, which might compare with the marvellous visitation of quails into the camp of the Israelites when they journeyed toward Canaan. We quote from *Bell's Life*, November 28: "The severity of the weather in Northern Europe, more especially in Norway, the bright clear nights, and easterly winds, have caused an immense quantity of these beautiful birds to arrive in this country, to seek shelter and food in our numerous and spacious coverts. A great number of them alighted on the Dover coast during the week, and after resting a short time, departed further inland." What else can this be considered than a God-send—this repopulating, by providential intervention, of the depleted coverts? and who will bless the occasion more than those who so lately bewailed their prospective loss?

—Mr. Bergh has organized a new society for the Prevention of Cruelty to Children. The objects of the society are definitely stated to be:—"To bring to justice those who shamefully neglect or cruelly ill-treat children. It is not our intention to labor in the interest of any religious class or political party. Our duty toward the children that we rescue will be performed when they are safe in the hands of a Judge, upon whom will rest the obligation of disposing of them wisely." The Board of Officers includes the following strong names: President, John T. Wright; Vice Presidents, Cornelius Vanderbilt, August Belmont, John J. Ciseo, Peter Cooper, Wm. E. Dodge, James Brown, Henry Bergh, Eldridge T. Gerry, Robert L. Stewart and Theodore Roosevelt; Secretary, John L. Giffon; Treasurer, Wm. L. Jenkins; Counsel, Eldridge T. Gerry; and Executive Committee, James Gordon Bennett, Louis J. Jennings, Henry Bergh, Thomas C. Acton, Wm. M. Vermilyea, Burden B. Sherman, Jonathan Thorne, Joseph Seligman, Wilson G. Hunt and John Howard Wright.

OUR FLORIDA COMMISSIONER.—Our Florida Commissioner has about reached his objective point—Cedar Keys—and we presume will shortly send us his weekly communication. We desire in this connection to express our obligation and thanks to Gen. Eckert, Geo. H. Mumford, and other officers of the Western Union Telegraph Company, who have kindly instructed their agents South to extend to our commissioner such courtesies as will facilitate the object of our West Coast Expedition.

—Professor Cope, the eminent naturalist, has been kind enough to send us a report on the vertebrate fossils discovered in New Mexico, with descriptions of new species found—the latter being classified by himself. To the lover of paleontology this is an interesting volume, as it is both thorough and concise.

WRITE LEGIBLY.—As a great portion of our paper is put in type on the day and night of going to press—affording little time for revision—we suggest to our correspondents the importance of writing plainly, proper names and technical terms especially. A little care on the part of writers will prevent many errors which otherwise will occur, and for which editors, proof readers and printers are blamed.

POSTAGE FREE.—After the 1st of January, 1875, the FOREST AND STREAM will be mailed to its subscribers free of postage, with no additional charge therefor. The publishers prepay the postage.

—Quail can be found dead by the dozen in many parts of Kansas, owing to the scarcity of food. The peasant farmers are feeding them.

BREACH LOADERS.

OWING to the numerous letters of inquiry which we receive every week from sportsmen asking for our opinion as to the best style of breach loaders, their mechanism, charges to be used, the character of the powder and shot, and many other questions bearing on these subjects, we have concluded to publish sketches of the different kinds of breach loaders from time to time, so that every person can then judge for himself what sort of gun he needs; how he should use it, and what are its good and bad qualities. The analyses and assertions we shall copy from the work of "Gloam," one of our most valued contributors, but we shall beg leave to differ from certain of his statements, and we call upon our readers to give us their opinions on some points also, that is so far as actual experience will permit. What we aim at in this case is exclusive truth, but ere we can hit it we must cause the varied experience of our sportsmen to be presented, that they may be compared and sifted and the proper deductions made. Ere entering into a discussion of this weapon it may not be uninteresting to glance at its early history. He says:—

"Breach loading guns are of great antiquity. In the Tower of London, Woolwich Museum, and in the Museum in Paris, besides the museums of the Continent, may be seen hundreds of such arms, centuries old, and of exquisite workmanship; thus once again verifying that there is nothing new under the sun.

"In Mr. Latham's essay, read before the Royal United Service Institution, (quoted in an able review in *Belgravia*), it is stated that "Breach, or, rather, chamber loading guns of the fifteenth century, are found in many of the Continental museums. In the Museum of Artillery, at Woolwich, there is a breach loading perrier, or patenera, of the time of Edward IV., in 1471. This consists of a directing barrel, terminating in a square bar or frame of iron, and a separate loading chamber, with handle, which was fastened in its place for firing by a quoin or wedge of wood or metal."

"It is probably to the early part of Henry VIII's reign that it should refer the very curious pistol shells, or targets shielded with gonges," of which many specimens exist in the Tower; but no examples of the kind have been found in any foreign collection.

"The shield is probably intended to protect the gunner in firing from the small loopholes of fortified places, called *meurtrieres*, and the barrel generally occupies the centre of the shield, in the place of the spile which is usually in this position. There is a small aperture covered with a grating in the upper part, for the purpose of taking aim, and a handle in the lower half enables the gunner to direct the weapon. A separate loading chamber, containing the charge, is pushed in at the breech, and a cross-bar or frame, which turns on trunnions, is shut down, and retained in its place by a spring or bolt to secure it while firing. If you compare this plan with that of the breach loading patenera, you will see how very simple is the adaptation of the method already in use for cannon."

"A larger weapon of similar date and construction, said also to have belonged to the king, but of inferior workmanship, is in the Tower. This has a much larger bore, and is furnished with a screw bolt to lock the hinge piece. The barrel is three feet six inches long, and is styled in the early catalogues the "fowling-piece" of that monarch."

"A breach loading trestle-gun (A. D. 1500) was looked by an author about the end of the last century, and is delineated in the *Archæologia Britannica*. In 1497 breach loaders were used at the siege of Boppard, in Germany."

"The records of St. Etienne, in France, it is shown that the French monarch, Henry II., shot with a breach loader in 1540.

"In 1661 the Marquis of Worcester took out a patent in England for a breach action on the cut-screw principle, which is thus described:—

"An invention to make certain guns or pistols which in the part of one end of an hour may be recharged; the fourth part of one turn of the barrel, which remains still fixt, fastening it as forcibly and effectually as a dozen shrids of any serev, which, in the ordinary and usual way, require as many turns."

"This system has been subsequently repented, and the specifications describe the working parts to be a male and female screw, having parts of the male screw to rotate in the other, and is engaged with a small turn."

"There are several specimens of this kind of breach mechanism in the Woolwich Museum, and, among others, one of German manufacture, of the date of 1700, with a combined lock to work with either flint or match.

"Abraham Hill, of the City of London, and Fellow of the Royal Society," in 1674 patented a different system for breach loaders. The first described "a new way of making a gun or pistol, the breach whereof rises on a hinge, by a contrivance of a motion under it, by which it is also let down and bolted fast by one and the same motion." There are two specimens of this gun in the Woolwich Museum. Another plan of Mr. Hill is, "for a gun or pistol, which is charged by the breech, and has the sight for the trigger, at the upper end of the breech, and shuts with a cartridge or roundish plate of iron, and without the sight of vizier."

"Popy, in his diary of March 4, 1661, says:—"There are several people trying a new fashioned gun brought my Lord Peterborough this morning to shoot off often, one after the other, without trouble or danger."

"But M. Lefautchoux, of France, is entitled to the honor of making the breach loader available as a sporting gun in modern days. By originating the cartridge, he virtually recreated the weapon. It was used quite generally for many years on the Continent in the shape in which M. Lefautchoux put it, before it was introduced into England. When, however, it was first taken to England, it was weak in mechanism, and did not shoot nearly as well as the English muzzle loader. In addition to which, the English powder was stronger than the Continental, and the loads were heavier. So that the "French Crotch Gun," as it was then derisively called, shot poorly, soon rattled in its joints, and was generally condemned.

"The English makers had the sagacity to see that the

principle of the gun was desirable. They seized upon that, and by applying their superior workmanship and better judgment to it—thereby increasing the power of the gun—then not only remedied its defects, but little by little, made it perform as well as their own muzzle loaders. Of course this result was not all at once attained. It required much patience, experiment, and knowledge to reach the standard muzzle loader, and, of course, disbelievers asserted that by no amount of skill or time could it ever be made to shoot as the muzzle loader did. More powder was demanded and counseled for it, and then the results were equal.

"But it was in the hands of progress; and it went on, until now, after thorough trial and test, it ranks as the peer of the other.

"In considering the shooting of the two guns, an anomaly is presented as to the shape of a breach.

"While but few exceptions, all breech loading guns resemble closely that of M. Leitch's. His gun had the pin cartridge. The central fire cartridge, since invented, and now so extensively used, is merely a new application of the same idea. It involves no new principle.

"The general principle of the breech loader is this:—The barrels of the gun are movable at their rear end, and about upon the face of the standing breech. The ends of the barrels are smooth. The face of the breech is also smooth. There is nothing upon the ends of the barrels nor upon the standing breech to resist the force of the gunpowder, or to hold the barrels in their place. The two hooks of the muzzle loader fitting into the stock are not there, nor anything like them. But the barrels are held in their places by means of a solid piece of iron attached to them underneath, called the "lump," descending into an iron bed on the stock, called the "nuts." The projections on the lump fit into corresponding recesses in the action, and are there held together by keys, wedges, bolts, and grips.

"Each maker has his own device for gripping, wedging, or bolting up the gun. The variations in the appliances and forms by which the barrels are held to the stock are as widely different and as great as the ingenuity of inventors and the power of their gun make them.

"The barrel plays upon a hinge pin, and drop down at the muzzle, thereby throwing up the rear ends to receive the new and to reject the old cartridge. At every discharge the gun shall be thus opened and closed. The means by which the gun shall be thus opened and closed are equally numerous and various as are the means by which the parts are held together. Upon these mechanisms depend the safety, solidity, and value of the gun, and just so far as the variations in them goes, is the difference between them all. Whether it be that the barrels are held up by one process or the other, or whether they are dropped down by one lever or another, it is all a difference of movement, giving more or less security, but no difference of rule. It is at last the Lafcaux gun altered, modified, and sometimes, but not invariably, improved.

COLORADO GAME LAWS.—We have received a copy of the Game and Fish laws of Colorado and the constitution and by-laws from the Denver Sporting Club, an organization that is doing most effective work in suppressing the outrages of pot-hunters and ultra-glycerine anglers. The officers of this club are Carlos Gove, President; H. A. Cummings, Vice President; H. W. Kerr, Treasurer; C. C. Davis, Secretary; James B. Thompson, Assistant Secretary. These gentlemen have had placards published for distribution, in which the penalties for destroying game and fish out of season are distinctly stated. The fines are as follows:

Quail, until Oct. 1, 1873, \$10; prairie chicken, Nov. 1 to Sept. 1, \$2 to \$10; mountain grouse and wild turkey, Dec. 1 to Sept. 1, \$2 to \$10; wild goose, wild duck, curlew, snipe, plover, lark, or dove, May 15 to Aug. 15, \$2 to \$10; insectivorous and upland birds, or robbing their nests, at any time, \$2 to \$10; buffalo, elk, deer, mountain sheep, or antelope, Jan. 1 to Aug. 1, \$25; for killing and leaving any edible part of buffalo, elk, deer, mountain sheep, or antelope to waste, \$25. The penalty for ensnaring, netting, entrapping, or taking by any other device, quail, at any time, is not less than \$10 or more than \$100. The penalty for killing or taking trout or other fish by any poisonous or deleterious drug, or by the use of any explosive substance, is not less than \$100. The penalty for obstructing any stream by a dam, weir, or other artificial obstruction is \$100. The penalty for taking fish of any kind from any private pond, lake, or stream, without the consent of the owner, is not less than \$50 or more than \$200.

We are also under obligations to Freund & Brother, of Denver, for several courtesies. Their place is one of the most interesting in the West, as it is a perfect museum of the fauna of the West and the various kinds of shot-guns and rifles. Around the museum buffalo, elk, and deer heads, handsomely mounted, are grouped, and under them are ranged the Rocky Mountain sheep and goat, the different species of bears and cats indigenous to the region, and the numerous varieties of trout. Persons visiting Denver, wishing any information about the hunting and fishing of Colorado and the best resorts, should not fail to call on these gentlemen, as they have made the subject a special study. The Messrs. Freund have been always foremost in the efforts being made to propagate and protect the game and fish of Colorado.

WALKER'S "BATTLE OF LOOKOUT MOUNTAIN."—The grand picture of the Battle of Lookout Mountain, now on exhibition at the corner of Broadway and Fourteenth street, is, in our opinion, one of the finest battle pieces exhibited in this city. Not only does the spectator seem to be present at the great fight, but the soldiers appear to be instinct with life and imbued with that steady action indicative of veterans joining in a glorious strife. The figure of the old mountain looms up in solemn majesty, with its crest above the clouds, while the Union troops are seen winding in a long, serpentine line up the steep slopes of the rocky paths, moving onward with undaunted courage, and overcoming all the obstacles that nature and a valiant enemy could oppose to them. The figures of Gen. Hooker

and the Chief of Artillery, Major Reynolds, stand prominently forward, and are excellent likenesses, while all the incidents are portrayed with a master's hand. The breastworks and rifle-pits of the Confederates, extending from the base to the crest of the mountain, show how strongly they were entrenched and what difficulties the Federal troops had to encounter on that eventful day. Every soldier should witness this fine work of art, and every one who can appreciate a noble deed nobly described should not fail to see it. The well-known elocutionist, Prof. Lawrence, ably describes the picture every evening at 8 o'clock and recites Boker's noble poem of the "Battle of Lookout Mountain" with an eloquence worthy of the subject and himself.

FLORIDA FRUIT-GROWERS' ASSOCIATION.—This active organization which elected its officers at Palatka in November, will hold its next meeting 24th January. It has already commenced a work of much importance to the State by recommending a botanical garden in which tropical fruits, flowers and plants are to be cultivated, and from which seeds may be distributed gratuitously to the poor. The importance of this step cannot be overestimated, for besides the benefit it will bestow on the residents it will also attract our attention to the State, and thus cause it to become the Italy of this continent. No portion of the country has a climate more suitable for the growth of tropical plants; hence it would indicate a most serious lack of enterprise if this advantage was not utilized. The report made by a committee appointed to investigate its feasibility states that the "enterprise will be a great auxiliary to the science of botany. The explorer in this field—the novice and the proficient—will here find subjects for study which have hitherto been excluded from their contemplation, and our children will have text books on this science far surpassing those previously in use.

In the wilds of Florida our great garden would be the attraction of civilization and refinement, and to the people, the sovereigns of the land, would be open a hundred avenues of delight, as the myriad paths leading among the gardens of Babylon, to gratify the senses of oriental sovereigns, who derived their titles, not as we derive ours, from a free American institution.

A more beneficent scheme for our country, or one more capable of expansion by hallowed influences, cannot be conceived, and it behooves this the first Convention of the Fruit-Growers of Florida to intimate and appeal to a common government for its promotion.

The officers of the Association are President, P. P. Bishop; Vice President, Harrison Reed; Secretary, Charles H. Walton; Assistant Secretary, J. W. Whitney; Corresponding Secretary, C. Codrington; Treasurer, C. Drew, Jacksonville.

THE BIG HUNT AGAIN.

CHICAGO, Ill., December, 1874.

EDITOR FOREST AND STREAM.—The appearance of the article of Dec. 3, in reference to the great hunt about to be organized next May, has attracted my attention, and beg to say a few words, as a lover of hunting and fishing, in which sports I have spent my best days, being known throughout the United States and Canada as a shooter by gentlemen sportsmen. I wish them to know my views in regard to the hunting party to be organized to slaughter breeding birds and animals in the breeding season. Their flesh and skins, which are then worthless, would be left to rot on the plains. For my part, I think it the greatest outrage ever attempted in this or any other country. How any man, or party of men, calling themselves gentlemen, can engage in such cruelty, is beyond my comprehension. Where is Dufferin? Why cannot these gentlemen wait until the 1st of September? They have then ample time for all the sport they wish before the season closes to give the Texans and Indians an opportunity to corral their animals previous to slaughtering them. If this great organizer and hunter, whose glory and achievements are heralded over three continents, hungers for blood, let him go to Hutchinson's Packing House, where they kill eight thousand hogs a day, and they will give him the chance to take the fiery edge off his bloodthirsty appetite. Yours with respect,

J. FARNSWORTH,
UNION STOCK YARD.

BALTIMORE SPA, N. Y., December 5, 1874.

EDITOR FOREST AND STREAM.—I notice in your last issue of FOREST AND STREAM an article in regard to a hunting party being organized, and thought perhaps you might meet with some of the promoters of the scheme, and might call their attention to the necessity of their having a number of portable folding boats as a part of their outfit. I claim that I have the only safe, durable, and perfectly portable boat manufactured. The frame, being of tough ash, cannot be easily broken by the rough usage of individuals or on pack animals, and can be repaired on the spot by simply lashing with strong twine, which can be done by any person, in any place; while on the other hand a metallic or wooden boat would require expert mechanics with proper tools to repair it when stove or broken. The frame, besides being folded for ordinary transportation, can be divided into several different sections or pieces to be carried by individuals or on pack animals, and can be put together with a screw driver, the only tool necessary, and which may be done in a few minutes. The canvas cover can at any time be repaired with a large needle and some cotton twine, by simply sewing a patch on the rent, the same as a farmer would repair a bag. The canvas is of great strength and durability, and can be slung as a hammock, or used for a shelter tent, and various other purposes. The boat, as an invention, is intended for the roughest usage without regard to beauty. Boats of the size to carry five to seven persons capacity would, I think, be the most suitable, and when lashed together will form a ferry boat or raft to ferry wagons, horses and materials across streams. Such a raft or lighter can be improvised in an hour's time, by lashing together with "wagon beds, tent poles, or any material at hand. I will furnish such boats to the expedition at cost.

JOHN HEGEMAN.

EDITOR FOREST AND STREAM.—In the 31 November number of your paper I read with much interest an editorial headed "A Great Hunting Party." The new set of great international hunting party, to be composed of English and American gentlemen, meeting next Summer to inaugurate a grand hunting and fishing excursion upon the great plains of the West, is certainly a most inspiring theme. Hence, I am not surprised that under this general view of it, you, as well as others, have approved of it. But for this I see you are making severely to lag by one of your correspondents; and as to Col. McCarty, the projector of the expedition, he

stands already "impaled on a lisoa's horn, or hinged within an inch of his last breath by a grizzly, or kicked to pieces by a buck, or buried black and blue by a mountain ram." I fear the bare mention of the bad propensities of all these animals may have a disheartening effect upon our English neighbors across the way, and hence I will add that the writer states that he wrote in a "hat," and hence I think there is no danger.

Nor are his views so harsh, when viewed from his own standpoint. He evidently sees game everywhere, slaughtered in piles mountain high. He says "it will be a most reckless, foolish, destructive slaughter, and it may be inaugurate a never ending series." Think of half a dozen such murderous armies sweeping over our plains and mountains every season for years to come! It may be "foolish," it may be "reckless," we admit. This depends upon how it is conducted. But there need be no fear of the "destructive slaughter." No, not any—I have been there.

There is no fear of "great slaughter"—no, none. The rambling vagaries of all these animals may have a disheartening effect upon our English neighbors across the way, and hence I will add that the writer states that he wrote in a "hat," and hence I think there is no danger. Nor are his views so harsh, when viewed from his own standpoint. He evidently sees game everywhere, slaughtered in piles mountain high. VISITORS TO FLORIDA.—A St. Augustine correspondent writes us under date of Dec. 14th:—

"The Winter season for travel has now sensibly commenced. Strangers and tourists are arriving daily in unprecedented numbers, far exceeding that of any previous year. The hotels are doing an encouraging business, and are all well kept. For location, the St. Augustine Hotel, for elegance of furniture, the Florida House, and for the best table, the Magnolia Hotel. Beside these, there are numerous boarding houses, all conducted in good style. Your enterprises—the Pines and Yemassee—are universally appreciated and spoken of in flattering terms. Among the prominent visitors here are A. J. Alexander, of Ky.; Henry Ball, of Newburg; John P. Howard, of New York; Holmes Amidown, of New York; John L. Wilson, of Boston; J. W. Dunbar, of New York; R. F. Armstrong, of Nova Scotia; D. M. Edgar, of New York; James McMartin, of Albany; J. Blakey, of Philadelphia; Chas. H. Royce, of New York; George Washington, of New Jersey; and a large number of others."

About Friday, the 11th inst., the last iron rail of the St. John's R. R. was laid; thus connecting St. Augustine with Teocoy by a fine rail road as there is in Florida.

A new steamer is to be put on the St. Johns River, which will get up a speed of eighteen miles an hour.

A steamer has at last been purchased for St. Augustine to be used for pleasure parties, and will visit the Beach hourly. It is a side wheel boat, and will accommodate about seventy-five passengers. Dr. Wescott is one of the parties interested.

Shot Gun and Rifle.

GAME IN SEASON FOR DECEMBER.

Moose, *Alces Melchior*. Caribou, *Tarandus Rangifer*. Elk or Wapiti, *Cervus Canadensis*. Red Deer, *Cervus Virginianus*. Quality brown and grey. Wild Turkey, *Meleagris gallopavo*. Pinnated Grouse, *Tetrao Cupido*. Woodcock, *Scolopax rusticicola*. Wild Duck, Goose, Brant, &c. Ruffed Grouse, *Tetrao umidus*.

(Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that we wish to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws in nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for reference. Otherwise, we ourselves would be liable to any error or confusion.)

GAME IN MARKET.—Owing to the approach of the holidays game has advanced in price during the last week. Wild turkeys, which are quite common, came principally from Illinois and Missouri. This abundance has reduced the price to 16 cents per pound, though the best conditioned bring a higher sum. Quails are very scarce, so bring from \$2 75 to \$3 per dozen. Ruffed grouse, which are quite abundant, sell at \$1 per brace; prairie chickens the same price, and venison at from 30 to 35 cents per pound. The animals killed in this State bring the former sum and those killed in Minnesota the latter. Canvas back ducks bring \$3 per brace; red heads, \$1 50; mallards, \$1; black ducks, \$1; teal, 75 cents; brant, \$1 75; squab pigeon, \$3 per dozen; English pheasants, \$3 per brace; English hares, \$2 50; Canadian hares, \$1; rabbits 75 cents.

NEW HAMPSHIRE.—There has been a large bear rumbling over the Northern range of Ossipee Mountains the past week, and was killed by the name of Merrill set a steel trap that weighed twenty-five pounds, with an ox chain attached to it that would hold a pair of six feet cattle to draw by, and yet his bearship snapped it in twain and left for other parts.

MASSACHUSETTS.—One hundred deer were shot in Sandwich and Barnstable woods during the month of November.

Old hunters say there are ten foxes on Cape Cod now where there was one a few years ago.

NEW YORK, Pond Eddy, Dec. 11.—One deer shot within ten miles of here, three miles back in the mountains from Pond Eddy, next station from Port Jervis, and two bears; a third badly wounded.

Long Island, Dec. 12.—The shooting at this place holds good, the weather fine, and ducks plenty; more birds than has been known in a number of years. We are visited by parties from New York every week; all have succeeded in getting good bags of duck. Walter Richmond, Esq., of the Richmond Print Factory, of Providence, was here, and was killed one day and one day 21 ducks with his own gun. Colonel Bodine also visited me last week; carried away a flour barrel full of ducks; rabbits are plenty.

M. V. B.

MARYLAND.—Deer Park, Dec. 13.—Game is about the same as last week, and is it anything more plentiful. A great many deer have been killed near town, and they seem thicker than they have been for many years. I never saw

I will say here, in favor of breech loaders, they are a great invention for this kind of gunning more than any other, as it is no easy matter to aim with the muzzle loader. The powder, and salt water flying in all directions. Of the action, the side snap and paper shells are preferred, as when you are done you don't have to carry home several pounds of dry metal shells, will coat with green, from the action of salt or brass. It is hard work to bring old salts down to breech loaders, but they will all come to it in time. They say they shoot brass, Mine do not. I can see no difference. They are properly closed. I shoot a 12 pound, 32 inch gun, charge 1/2 drachm powder, 1 oz. shot. In rough weather I increase the powder a drachm and shot 1 oz. There is nothing left of paper shells for second loading. I have killed dead seven ducks out of one flock, and find no fault of close shooting with the gun.

S. K. R., Jr.

SALUDA, December 14, 1874.

EDITOR FOREST AND STREAM.

I have perused with interest the criticisms of "A. H. B." upon "Coasting in Cape Ann." My article is still worth his face, and only lack of time prevents me from lengthening. Suffice it to say that the lay of the land at Cape Ann and Cape Cod is much different; that the several points picked up by "A. H. B." are such as ought commonly to be understood; that boats on the duck grounds are not supposed to be permanently moored there; that no careful gunner would ever shoot over a companion's head. And I think you, Mr. Editor, will admit that breech loaders have established a right to put in their favor to admit of my argument, especially with "that black rascal." Those who, before now, have been in a cramped position in a boat, with both barrels empty, and now using breech loaders, can perhaps tell which they prefer. Yours truly,

R. S. N.

THE MISSISSIPPI CLUB.

EDITOR FOREST AND STREAM.

ROCKFORD, Ill., December 21, 1874.

Rockford is a handsome city of 11,500 souls, situated on the beautiful Rock River, in Northwestern Illinois. The Indian name of this fine stream was "Mississippipi," and is the name selected for our club, just formed for the protection of fish and game. This organization starts with a membership of 123, and is growing by many additional and substantial citizens. The necessity of an active and efficient organization of the kind is apparent to all, more particularly to those who can remember with delight the rich sport enjoyed in the years past and, gone, when our dear old "Mississippipi" abounded in fish, and our prairies and woods were alive with game. We cannot hope to restore all the primitive life of this old time, but we can and will stop the wanton destruction of fish and game, and we have already existing in our State, and will use every effort to have still here others enacted in accomplish the desired end. Our State law for the protection of game, if rigidly enforced, would soon result in replenishing our depleted flocks of grouse and quail; but the laws now existing for the protection of fish are singularly deficient in many respects, and must be remodelled. Great things can be accomplished by vigilant, active clubs throughout the country, and we hope to hear of their formation in every direction. We will not doubt have opportunities afforded us after the 1st of January to try the metal of our new club, but I am confident that its members will not be found wanting in zeal to prosecute each and every offender. There are two large social clubs here, that have their club houses at Twin Lakes, Wis., and usually employ for weeks to fishing, boat riding, dancing, &c. Of some of the particulars of these excursions I may give you an account at some future time. Yours, NIMROD.

SHELLS—PAPER OR BRASS?

EDITOR FOREST AND STREAM.

I have been an active reader of much current literature upon this subject, and some one apparently do not. Moreover, I have had occasion to use several thousand shells within two years, which is more to the point on the part of one who proposes to speak on the subject. I have no objection to brass shells—rather but one objection, which I will state presently. Theoretically, brass shells have an element of danger to the paper ones have, and, practically, it is no such thing. Has anybody, anywhere, at any time, known of a properly capped brass shell exploding accidentally outside of a gun? Perhaps a carelessly loaded shell which exactly fits the chamber, may shoot a slab better than a paper one, but I could never see any difference. Who has any "facts and figures" to prove this? I suspect the evidence about the supposed superiority of shells which are not capped, is a very small one. In the better shooting of muzzle loaders as against breech loaders, brass shells may be cheaper than paper ones in the long run; with those to whom this is a recommendation I have no argument; we all have to eat our coat more or less according to our cloth. In fine, I admit everything that has been or can be said in favor of brass shells, and yet I use paper ones almost entirely, for the simple reason that brass shells are a nuisance to load, a nuisance to clean, a nuisance to carry loaded, and a greater nuisance to carry empty.

What is the use of carrying about a bit of brass to be loaded and cleaned, when all this dirty work can be avoided? Paper shells can be loaded by a machine for that purpose at the store where bought, with any kind and quantity of ammunition. They are not used twice; there is of course no cleaning to be done; the stock of ammunition is put in the safest, most convenient and portable shape. Various ingenious loading apparatus for overcoming the stultifications of brass shells is done away with. Moreover, well crimped paper shells stay loaded till fired, which is not always the case with brass ones, unless the shot was stuck in some how. Once again, a paper shell discharged is done for. We toss it on the ground where it may rest in peace; the empty brass one is pocketed, care being taken to put it in a different receptacle from the loaded ones, and towards the end of the day we walk about rattling like a peddler's wagon, with a pocketful of useless brass. Were other points all equal, this single matter of having to take care of the empty shells would decide the matter in favor of paper shells.

It is true that brass shells may be loaded at the store as well as paper ones; but it is also true that this is not reasonably practicable as a rule. Who takes into the field even the two or three hundred brass cartridges he may expect to use in a few days' sport?

It is undeniable that paper shells will stick in a foul barrel oftener than brass ones, and, if they do, sometimes pushes past them, or sticks in their metal heads-off. But I have seen an instance where a brass shell slipped past the shoulder of a brass shell, too. And when a brass shell does stick this way there is more trouble with it than there is with a paper one, which may easily be dug out with a jackknife, or with the tool invented for that purpose. But the moral of this is chiefly to have a good extractor.

As an objection to brass shells that I have not seen negged, and which I recommend to their enemies. All brass shells won't fit a breech loader—don't mean, of course, as to calibre—but as in the thickness of the metal head of the shell, which is sometimes too great for the sink in which the shoulder of the shell is received. In such case, either the gun cannot be locked, or, if locked, cannot be broken down. So tight is it pinched by the projecting brass, it is an exaggeration of the difficulty that occurs when a cap is not properly fitted down on the nipple or anvil. One might say that could always be avoided by selecting shells to fit your gun. So it can be; but in proof that such selection is not always practicable, let me adduce this circumstance: I bought a brass new breech loader which would take a clean empty. I inserted a pair of brass cartridges sent by the manufacturer of the gun, and the gun locked beautifully, but with all the force I dared exert in every conceivable way, it would not unlock. I was living two thousand miles from New York, and the upshot was that my gun had to be taken apart by the "village blacksmith," and every one of my four dozen brass shells

had to have their heads sawed down. I suppose paper shells might be made to work as badly, but I have never seen or heard of any such. Their metal heads are made thin enough and the cap is properly adjusted.

The annoyance of uncapping and recapping brass shells is an great involving such a demand upon the temper and verbal morality, that a wise man, if he be of nervous temperament, or inclined to explosive modes of speech, will avoid it.

I have said that I use paper shells "almost entirely." The qualification is as follows: If I am going to a far-off region, I supplement my stock of paper shells with various kinds of shot, with a fair amount of loose ammunition and a few brass shells, to come into use if my main stock of fixed ammunition should give out, through unexpected demand upon it, or should meet with an accident. I also carry, when in the West, a few brass shells loaded with all the powder my gun will burn, with buck-and-duck, and double wads; the shot will glaze in, and the powder will burn over. The idea is to get a cartridge, which will keep well when long unused, will stand rough handling, and prove practically waterproof, so that its efficiency may be implicitly relied upon in such an emergency as may arise in an Indian country, when a double barreled breech loader in the hands of a person who can use it, is the most effectually known weapon of offence at distance at short range. For such exceptional purposes, the solid brass is perhaps preferable to paper—not that it should better—but because it keeps safer until used.

To conclude, are there any absolute reasonable objections to paper shells not also applicable to brass ones? and do not the former present some decided advantages over the latter in the case with which they are manipulated in the convenience of use? I am always ready to learn.

Yours truly,

ELIASE CORES.

SHELLS AND OTHER MATTERS.

EDITOR FOREST AND STREAM.

NEW YORK, December 30, 1874.

In mine of 3d of October, in regard to length of paper shells, I neglected to state the mode I use in cranking or closing the shells, which neglect called forth a question from one of your correspondents, "Toodles," and which I shall proceed to answer now, being deterred before from press of business.

Now, "Toodles," I use one of Hall's patent crappers, and I most agree with you that it certainly does not improve the shooting; but something must be done, as you doubtless have found, to prevent the shot wad from coming loose in the pocket, or from the jar of discharge of the first barrel. Your plan, my dear fellow, of putting three hard wads over the shot, does not work. You can rattle the shot loose in your pocket, even though you put four wads on, and those of one size larger than the calibre of the shell. The India rubber wad you mention are not in the market that I know of, and as the price of the crude material is over a dollar a pound, it is probable that even if they were made, they would be too costly for almost any one to use. It might be well to try the experiment, however.

In regard to the expression I used, I do "opened" boring, I claim that it is technically right. Gunmakers use it in contradistinction to the word "relieved." "Opening" means boring a cone whose base is at the breech, and "relieving" is boring with the base of the cone at the muzzle. Am I right, "Toodles," old boy?

Like "Toodles," I should like to have some "expert enlighten me" in regard to this "opened" boring. There must be some reason for it, or good makers would not adopt it, as most of them do.

Mr. Editor, can you give us any reason for the general scarcity of game in the Middle States? Reports of all the sportsmen with whom I have exchanged notes unite in stating the same old fact. Dry weather has something to do with it, no doubt, or rather makes birds harder to find than the game itself. The markets seem well stocked with painted and ruffed grouse from the West; it is probable that they have taken Mr. Greeley's advice?

I was very much amused at the joke a small error in your paper played upon several parties. A gentleman in New York was said to have had a gun made with a stock 124 inches from butt to trigger. Two men I know immediately detected it, got their guns altered to suit the new style, and did so, when let in upon the gentleman in question comes out with a correction, saying that the length of the stock was 134 inches—and such a very short one after all. Probably these searchers after "some new thing" will find out their error when they get a few black eyes. Yours truly,

SIDE LEVY.

EXTIRPATE THE VERMIN.

EDITOR FOREST AND STREAM.

BOSTON, December 13, 1874.

I have used the dog and gun both in this country and England for a number of years. I have used the dog and gun together, and I have used all our game birds—much more plentiful than they are now, viz. Fox, the State to employ a few men to trap vermin and hook after poachers, if which there are plenty around Boston. I feel certain more harm is done by cats, snooks, weasels, mink, &c., than can be done by the gun. Moreover, if it were known that there were men whose duty it was to exterminate any and every kind of vermin, and that, in season, it would keep many from shooting woodcock and snaring partridges during the Spring and Summer, that now make a business of it. Yours very respectfully,

C. I. G.

National Pastimes.

The first annual convention of the Amateur Association, organized in December, 1873, was held at Room 14, in the Astor House, this city, on the night of the 16th of December, 1874. Though the business to be transacted need not have occupied the time of the Convention over two or three hours, it was not until after 10 o'clock at night that the session ended, and, as was said by one of the allied delegates present, no meeting had ever been held by the amateurs which was so little creditable to them as this. It is alleged that there is a membership of nearly a hundred and thirty clubs in the Association, but only thirty-four sent delegates to this Convention, the meeting being entirely repudiated by the leading college clubs of the country, a class of the amateur who are most to be relied upon for an intelligent and influential representation in a Convention of the kind. The experiment of running this Association under metropolitan auspices having apparently failed, in the opinion of the majority of the delegates present, they wisely concluded to transfer the organization to Boston, where probably the best class of reputable amateur clubs exist. At this rate it is evident that a failure here will be a failure everywhere, and certainly no worse than that which have been, no matter where the next Convention meets. The business before the Convention was primarily the election of officers and the preparing the way for the work of the March Convention of 1875, in the adoption of a code of rules at that time. The officers chosen: President, Mr. Lamb, of the Beacon club, of Boston; Vice President, Mr. J. G. Mays, of the New York club, of New York; Treasurer, Mr. Dillon, of the Confidence club, of New York; Secretary, Mr. Blodgett, of the Arlington club, of New York; Judge Advocate, Mr. Cogswell, of the Athletics, of Jamaica, Long Island. The delegates present were from eight New York clubs, five Brooklyn, and the remainder from adjacent towns of New York, Connecticut, New Jersey,

Pennsylvania and Massachusetts. Not a club was represented from Philadelphia, and but one from Boston, Harvard, Yale, Amherst, Cornell, Brown, Princeton and Columbia sent no delegates, nor were such clubs as the New York Knickerbockers or the Brooklyn Excelsiors represented.

The Centennial Club, of Philadelphia, have leased the old parade grounds at Eleventh and Wharton streets. About two thousand loads of dirt will have to be hauled away, the ground graded and sodded, and a fence put up before it will be ready for use. James H. Chambers, their energetic Secretary, is busily engaged in arranging matters for their Southern tour in February.

WESTON'S SUCCESS.—Edward Payson Weston who (after two failures at the Hippodrome in New York) began at 12:05 A. M., on Monday, the 14th, at the Rink in Newark, a third attempt to walk 500 miles in six days, accomplished the undertaking at 11:31 1/2 P. M., Saturday, 25 min. 45 sec., within the proscribed time, seemingly none the worse for the march. He was hoisterously cheered by several thousand spectators. On Friday evening (when it seemed certain that he would succeed) he became fearful of being interfered with by unscrupulous persons who had bet on his failure, and special precautions were taken by the police. Justice Mills also issued warrants for the arrest of Joseph Coburn and several others who were suspected of foul designs.

Last week Messrs. W. E. Harding and C. E. San Gard were taken from Taylor's Hotel, in Jersey City, to New Brunswick, thirty-three miles, in six hours and fifty minutes, including sundry detentions and stoppages.

W. Perkins, champion walker of England, backed himself to walk eight miles in an hour on the 21st inst., for \$500.

Messrs. James E. Thompson, Henry L. Butler, A. Dalrymple and James Gillies, the committee appointed by the Grand National Curling Club on an international curling match between Canada and the United States, have received enough answers to their circulars from the various clubs in this country to warrant them in recommending the postponement of the match to a more favorable season, as, on account of the depressed condition of business, a sufficient number of players cannot be obtained to successfully represent the Grand National Curling Club. A magnificent medal, to be played for this season, has been presented by Mr. Kirkpatrick, and the conditions of the competition for it and other curling matters will be decided at the next meeting.

The great international "bonspiel" between American and Canadian curlers has been postponed for a year, owing to the fact that players enough cannot be secured to make the affair a success during the present financial crisis.

The New Jersey Athletic Association offers the following conditions to those who are anxious to test their physical prowess in athletic pastimes:

The Association offers an elegant gold medal for the championship of the United States and Canada, to be contested for at the Spring meeting, May 30, 1875, under the following conditions:

1. Any amateur residing in Canada or the United States may compete, provided that he is a member of some recognized boating or athletic association, or is endorsed by such association as an amateur. The definition of the word "amateur" is that accepted by the New York Athletic Club and the New Jersey Athletic Association.

2. Each competitor who is named in the entries shall have the privilege of naming one gentleman, who will represent the interest of his club in his vote. These gentlemen will decide upon all rules governing the contest, and will form a Board of Appeals for 1875, to whom all questions as to championship matches are to be referred.

3. The medal shall be held by the winner at two consecutive meetings of the New Jersey Athletic Association. The winner of the medal shall have the property and carry with it the title of Amateur Champion of the United States and Canada.

4. Contestants, on entering, must signify in writing their willingness to abide by the rules laid down for the government of the contest by the Board of Judges.

5. The entries will close on April 1, 1875, at which time, the final qualification with those who have entered, the distance and rules will be made known, giving the contestants two months for preparation.

The New Jersey Athletic Association offers this medal with the most earnest desire to advance public interest in many sports, and asks the co-operation of all athletic clubs throughout the country in this effort to bring about a unity of feeling and action in a matter of such importance.

The New Jersey Athletic Association offers another gold medal for the Championship of the United States and Canada in a 100 yard run, to be contested for at the same place and time, and under the same conditions as the medal first mentioned.

The Harrisburg club will have a strong amateur nine next season. John Donnelly and Darrah will play with them.

The pupils of Wood's Gymnasium Academy gave an exhibition of fencing, boxing and athletic exercises last Friday evening.

The skating season of 1874-5 was opened when the Capitoline and Union ponds were opened to the public. Since that time these resorts have been the only places where skating has been at command in the metropolis, as the Park lakes, either at the Central or Prospect Park, have not yet been opened to the public. The fact is, in the Capitoline lake the water does not exceed two feet deep in the deepest place, and the ice forms quicker and thicker there than at the other places. At the parks it averages four to six feet deep, and the wind will blow such a crowd of flocks to the parks when the ball is up to go on the ice unless it is at least four inches thick. On Monday night the Capitoline lake was cleared of snow and flooded, and on Tuesday there was excellent skating there. On the Union lake there is to be a series of base ball matches on ice, and on the Capitoline lake a match at cricket on skates.

SKATES FOR THE CHINESE.—We are now sending skates to all parts of the world where skating is in vogue. American skates monopolize the English, French, and German markets, and now we are sending skates to that land of inventive genius, China. On board the James Gordon, which cleared for Yokohama last Monday, were 143 cases of our model American skates, which surpass anything in simplicity and perfection of make ever seen in the land of the Manchurians.

Billiards.

C. DION VS. UBASSY.—The two nights' match between these well-known professionals, which took place at Chris. Comer's private parlor, on Dec. 15 and 16, resulted in the success of Ubassy, who played with unusual skill and endurance. The match was 1,000 points up at the three-ball game, on a carom table five feet by ten. The contest lasted over five hours, and resulted in a score of 1,000 to 350, in favor of Ubassy. The winner's average was 8.16-123, and the loser's 7.78-122. Ubassy's best run was 137, and Dion's 91.

RODOLPHE VS. VIGNAUX.—Rodolphe has issued the appended challenge to VIGNAUX:

No. 32 EAST FORTY-THIRD STREET, }
NEW YORK, Dec. 17. }

MATHEW DELANY, Esq., President National Billiard Congress and Stakeholder.—Dear Sir: Desiring to challenge the winner for the championship of America and possession of the championship emblem, enclosed please find certified check for \$250 forfeit, in accordance with the rules adopted for the government of such contests.

Yours truly, A. P. RODOLPHE.

WILSON VS. GUILLET.—There is likely to be a three-ball match in Brooklyn between Clark E. Wilson, a resident of that city now, and Louis Guillet. In a letter to the *Clipper* Wilson says:

I understand that Mr. Louis Guillet wants to play anyone in Brooklyn at the three-ball game. Allow me to say that will accommodate him—game to be 400 points up, with three balls, for \$50 or \$100—at any time that suits his convenience. I am, respectfully,

CLARK E. WILSON,
No. 635 Fulton street, Brooklyn.

Chess.

THE CAFÉ INTERNATIONAL TOURNAY.—This series of chess contests does not advance toward its completion very rapidly, the second-class players not playing games as frequently as they might do. Thus far the record is as follows:

Player.	Games Played.	Won.	Lost.
Mason	45	35	10
Alberoni	40	32	8
Delmar	37	27	10
Perin	37	26	11
Dell	34	23	11
McClellan	31	23	8
Dr. Barnett	27	18	9
Barnes	29	18	11

Mr. Perrin, who has been sick, has resumed his play in the tourney.

THE BROOKLYN CLUB TOURNAY.—The following is the record in this tourney up to Tuesday. "We give the names only of those who have won more games than they have lost:

Player.	Games Played.	Won.	Lost.
Dr. Barnett	13	10	3
Spence	12	10	2
Homer	10	8	2
Robinson	10	8	2
Philip	7	6	1
Perrin	5	3	2

THE PHILADELPHIA CLUB.—Hiehelhelm, the noted player of Philadelphia, this refers to the new chess club which has recently been established in Philadelphia on what promises to be a permanent basis. He says:

"The club now numbers ninety members, and is increasing from five to ten every week. A handsome suite of rooms has been taken on West Penn square, opposite the new public buildings. These rooms are located in the second story, and command the view. They are splendidly furnished, the expense for furnishing alone amounting to nearly \$1,000. The President, Mr. Joseph M. Bennett (one of the wealthiest men in Philadelphia, worth \$3,000,000), has donated a billiard table, which will occupy a room by itself. Some of our foremost citizens have joined, and the club is a splendid success! The officers are as follows: George L. Bennett, President; George C. Halmbold, Jr., Emerson Bennett, Jacob Elson, James G. Whitehead, and James Roberts, Vice Presidents; G. Heichhelm, Recording Secretary; B. M. Neill, Corresponding Secretary, and W. H. Sayen, Treasurer. More anon."

The three great chess clubs of the world are now the St. George's, of London; the Vienna, with a Baron Rothschild at its head, and the Philadelphia Chess Club. All success, unity, and permanence to the latter.

The Colleges.

—Each of the members of the Columbia College, who won the boat race at Saratoga last Summer, was presented with a handsome cup as a memento of the victory. The only souvenir of this occasion was a set of flags, which belongs to the college, and not to the individuals, so the last presentation was to give each a suitable and valuable prize, that all might have something to recall their first boating success. Prof. Van Armaning delivered a very appropriate speech on the occasion, which was loudly applauded. Upon one side of each is engraved "The Students of Columbia College and the School of Mines to the"—giving the name and position in the boat of the individual to whom the cup was presented. Upon the other side is engraved, "Victorians in the Intercollegiate Regatta of 1874, at Saratoga, over the crews of Wesleyan, Harvard, Williams, Dartmouth, Cornell, Trinity, Princeton, and Yale." After the presentation exercises, the company engaged in dancing to a late hour. The occasion also did a double service, as it was the formal opening of the new building for the School of Mines.

The Columbians will build a handsome boat house next Spring, as funds have been contributed largely by their friends.

—Professor W. D. Whitney, of Yale College, has been elected an honorary member of the London Philological Society.

—There are now no less than forty college papers printed in the United States. Nearly every principal seminary would seem to have its literary organ.

—President Potter, of Union University, has contributed \$500 toward the organization of the college boat club.

—Brown University had its boat house destroyed by fire last Fall. Eleven hundred dollars have already been pledged for a new one and several hundred more are expected. None of this amount has come from alumni, but all has been raised within this college, the faculty contributing largely.

—The college chapel at Yale will be ready for occupation by next May.

—The aggregate of gifts and legacies to universities and colleges in 1873, was \$8,238,141.

—Foot ball was very brisk Saturday the 12th; the college twenty played thirty picked men, beating twice; the third game was declared drawn because of the darkness—but fifteen of the "twenty" participated. A supplementary athletic contest was held in the gymnasium last Saturday afternoon. The programme included a two mile walk; Downs, 75; Sewall, 74, and Wharf, 77, being the contestants. On the sixty-first round Wharf retired. Downs won in 17.23 1-4. Sewall's time was 17.49, and Wharf's, for 1-3-4 mile, 16.23. Wharf was suffering from a blistered foot. —*Middleton College Argus.*

HARVARD UNIVERSITY, Dec. 18, 1874.

THE HARVARD crew for the next season will probably be selected from the following:—

Wernors, 75; Bacon, 76; Hall, 76; Brown, 76; Taylor, 77; Bacon, 77; Parsons, 78; Loring, 78; Morgan, 78; Ely, 78; Otis, L. S. S.; James, L. S. S.; Thayer, L. S. S.

This is perhaps a larger number than ever offered themselves for the "Varsity" before. They train very steadily, and if Harvard is not well represented next Summer it will not be from a lack of excellent material. Trial races have already taken place between crews selected by lot from the names, and the results have been in every way satisfactory.

The class of '75 has filled her various offices as follows:—

Pres.—Theodore C. Page.
Orator.—Lester W. Clark.
Marshals.—Vincent G. Bowditch, Abbott Lawrence and Henry S. Van Duzer.

Secretary.—Warren A. Reed.
Chaplain.—Richard Montague.
Oleo.—Henry W. Broughton.
Lay Orator.—Albert S. Thayer.

Class Day Committee.—Nathaniel H. Stone, John H. Appleton and Nelson Taylor.

Class Committee.—James H. Hoag, Benjamin R. Curtis and Mauley A. Raymond.

The Chess Club formed by the students is quite prosperous under Mr. Bungey as President. As the Club has been organized but a short time it will play no match games till after the New Year's intermission.

The Glee Club has been obliged to give up their trip to New York, Philadelphia, Baltimore, and Washington as the faculty disapprove of entertainments given by students, at which an admission fee is charged.

Owing to the cold winter athletic sports receive but little attention at present, although a few still enjoy a short time at foot ball.

Mr. Notman has engaged to take the class photographs for '75. He has given general satisfaction, and pleased us very much by the manner in which he photographed the Harvard and McGill foot ball teams taken and finished by him last October.

Canada.

Mr. H. Collier and Mr. A. May, both of St. Catharines, returned a few days since from a shooting tour in Muskoka, where they spent the latter part of November. While on their expedition in that delightful sporting district they succeeded in killing sixteen deer and a large amount of other game. —*Canadian Sportsman.*

A number of sportsmen from Elora, who have been north in quest of deer, have returned with large quantities. —*Id.*

Mr. A. Dulmage and Capt. Hayes, American Consul, have just returned from the most successful hunt of four weeks in the township of Denbigh, county of Addington. They bring back with them thirty brace of partridges and thirteen deer. When the trappers learned of Mr. Dulmage's trip they visited him in numbers and sold him \$1,000 of furs. He is the Belleville agent of the Hudson Bay Company. —*Belleville Chronicle.*

The Amherstburg *Echo* says: "Some 158 squirrels were shipped from Bismarck station on Saturday for Buffalo. They were killed by some sportsmen from Buffalo."

New Publications.

CYCLOPEDIA OF RURAL SPORTS. By J. H. Walsh (Stonehenge). First American from the eighth English edition: Philadelphia: Porter & Coates.

This well known work has already won for itself a name and a place in many sportsmen's libraries. It tells us of many things we ought to know, but of which we have scarcely dreamed. Here you have a plain, concise and comprehensive epitome of shooting, hunting, coursing, fishing, boating, racing, pedestrianism, cricket, base ball, and in a word, all the moral out of door games, as practiced in Europe and America. A vast amount of knowledge, concerning which every person loving these sports needs much or little every day information. The illustrations, numerous and fitting, are of much value to this work; they are by Wells and Hines, and are engraved by Dalziel and Toddkins. In the preface to the seventh edition, the author notes the many and great changes from the "old shot gun and rifle" of the past, and points out the numerous improvements of to-day, noting all the changes. We recommended "Stonehenge" as it is an exceedingly cheap and valuable work. In relation to our American trotting horses there occurs some typographical errors, which we regret to notice in a book of this character. With this slight drawback we pronounce the work unexceptionable.

MAGAZINES.

Popular Science Monthly, December, 1874. D. Appleton & Co. This popular exponent of the higher class essays, lectures, etc., is a well edited and interesting work. It is a higher order of scholarship, comes to us with a rich and varied freight of thirteen papers, and the scientific and literary articles are varied, rigorously written, and highly instructive. Where all subjects treated upon are of an order above common magazine articles, it would take too much space to do ample justice to all within the scope of our paper. We therefore give the following extract only, on oysters, from its January:—

"According to the popular notion, which is in the main, is correct, the spawning season of the oyster embraces those months which have no *r* in their spelling, namely, May, June, July and August, the four warm months of the year. The fact notes the many and great changes from these four months; but few are able to spawn whenever the water is warm enough, and large numbers pass through the year without spawning; and these, were it not for the facility of ascertaining them, would be available for food at any time. But the prejudice is universal against

them during the *r*-less months. That they are not in so good condition as during the cooler months, is reasonable to suppose; but that they are all necessarily unwholesome in the warm months, is far from true. The success of business, especially in the West, is so dependent upon the "milk," This means the presence of an opaline fluid in considerable abundance, and which has to do with the wants of its young—part of the milk.

Scribner's Monthly for January. The January number of Scribner is not without a Christmas flavor, containing, as it does, a Christmas sketch by L. Clarke Davis, entitled "My Nephew in a Stage Coach," a "Christmas Suggestion," and "A Christmas Night Ride," the latter by F. R. Stockton. In this number begins Dr. Holford's new serial, "The Story of Sawwood," by the author of "William IV." The first chapter tells about "Sawwood" and "How Miss Butterworth passed one of her evenings" in the second chapter "Mr. Belcher carries his point at the town meeting, and the reader is introduced to Jim Fenton." The first installment of Major Powell's account of his daring descent of the Colorado is here given, with striking illustrations by T. Mann and W. L. Sheppard, and the beginning of a series of "Old Letters," written from London in the time of William IV., and now for the first time published. The present installment is accompanied by an original portrait sketch of Rogers, the poet, "Travels in South America," the opening article of the *Monthly*, is effectively illustrated and interesting. How they catch turtles in South America is described in the following sketch:

"The turtle is the main source of food supply to the Comba. The forest and waters furnish him fish, flesh and fowl in great variety, but he cares for little else beside the turtle when he can procure it. Between August and Sep. 1st the waters of the Brazil, the tributaries of the Amazon, on which the Comba live, become less impetuous, in consequence of snow having ceased to fall on the summits of the Andes. The spawners of sand and shell fish, the turtle being at once commences. On a fixed day the Comba enter in canoes furnished with all necessary utensils, and travel up and down the river for from thirty to sixty or even one hundred miles. When they discover in the shore the clay-married fowl built by the turtle when walking, they call a halt, and having built in some two hundred yards from the water their *spawner* cabin, they patiently wait for the arrival of their amphibious prey. Generally their instinct is so accurate that their encampment hardly precedes by more than a day or two the appearance of the vast spawners of sand and shell fish, the turtle being at once commences. As the fixed day the Comba enter in canoes furnished with all necessary utensils, and travel up and down the river for from thirty to sixty or even one hundred miles. When they discover in the shore the clay-married fowl built by the turtle when walking, they call a halt, and having built in some two hundred yards from the water their *spawner* cabin, they patiently wait for the arrival of their amphibious prey. Prize List!

FOREST AND STREAM,

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of

The Fish Culturists' Association of America.

The Publishers of FOREST AND STREAM

In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,

AS OF

FISHING, SHOOTING, ARCHERY, CRICKET, FOOTBALL, and CROQUET.

Offer the following prizes for clubs of three or more subscribers.

Single Subscription per Annum \$5

Starting Clubs.—Agents, and others interested, are advised that we do not list upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 90 days will be entitled to same premiums as if all were sent together.

CRICKET.

For \$20.00, four copies, one year, with one best spring bat, one Colledge bat, one Dark cricket ball; price \$7.50.
For \$25.00, five copies, one year, with a complete cricket set, one Colledge bat, one polished bat, Clapshaw's one Dark cricket ball; one set of stumps; price \$12.00.

FOOTBALL.

For \$15.00, three copies, one year, with one Rugby football; price \$5.00.

FISHING ROBS.

For \$15.00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7.00.

For \$50.00, twelve copies, one elegant rod; suitable for trout, black bass with fly, or for trolling bass or pike; as fine a rod as can be made; German silver tipped, with three tips; price \$25.00.

CROQUET.

For \$20.00, four copies, one year, with very handsome set of croquet; price \$7.00.
For \$25.00, five copies, one year, with superb set of croquet; price \$10.00.
For \$30.00, six copies, one year, with the finest set of croquet made; price \$14.00.

TABLE CROQUET.

For \$10, two copies one year, with handsome set of Table Croquet 3 balls and mallet, in wooden box. This game can be played on dining room or other tables.

For \$15, three copies one year, with the handsome set of Table Croquet manufactured, made of cocca.

REMINGTON RIFLE AND SHOT GUN.

For \$75.00, fifteen copies, one year, with one Remington Deer rifle; price \$28.00.

STURGEON'S

Natural History

For Object Teaching in Schools, AND PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various Animals and Birds in grotesque attitudes, never however violating their natural instincts. We reserve the right to add pictures of the same objects from nature. One of the great moving objects in our modern system of education is just teaching the meretricious fidelity of the stereoscopic transfers the animals and birds from their natural habitat to the rooms of the student, and the first of our books, where they cannot fail to leave a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of North American specimens, enables Mr. Emery to combine in every view the locality of the specimen with its appropriate rocks, woods or water, and coloring from the original.

- 1. Wild Cat, or Bay Lynx..... Lynx Erpina.
- 2. Snowy Owl..... Nictalia Nyctea.
- 3. American Woodcock..... Scolopax Am. A. L.

TESTIMONIALS.

CORNELL UNIVERSITY, ITHACA, March 16th, 1870. I most congratulate you upon your great success in this new educational enterprise. If we can arrange our arrangements so as to make them impart instruction to the mind, it will be a step in advance in education. EZRA CORNELL.

WASHINGTON, D. C., March 18th, 1870. I am much pleased with the success you have met with in giving to the stuffed specimens a very decided appearance of life. I hope you may be able to continue the Series, and I believe they will furnish interesting means of information and instruction in regard to the wild animals of New York. SPENCER F. BAIRD.

STATE HOUSE, BOSTON, Mass., March 18th, 1870. I have examined carefully the "Stereoscopic Studies of Natural History," and judging them from their title, should say that they will prove of very great value both as objects lessons for students, and as most interesting aids for the teacher. The variety of illustrations, position, and color of the different groups and the general treatment are most perfect. I cordially recommend them to the use of schools and trusts you will meet the encouragement which you have earned. EDWARD A. SAMUEL, Curator of Zoology in Mass. State Cabinet.

PEARBY ACADEMY OF SCIENCE.

PEARBY, Mass., March 18th, 1870. I have shown your Stereoscopic views to the Directors of the Academy and the editors of the American Journal. Dr. Peabody and Mr. Peabody are very much interested in them. They concur with me in praising their truthfulness and the taste which you have displayed in surrounding the specimens with natural objects and scenes of characteristic fitness. They are especially better fitted, not only as parlor and drawing room illustrations, but as educational illustrations for the use of schools and colleges, than anything we have yet seen. A. HYATT.

CORNELL UNIVERSITY, PRESIDENT'S OFFICE, ITHACA, March 19th, 1870. I have received the Stereoscopic Views of objects in Natural History, and have enjoyed them very much. They have surprised all who have seen them by their wonderful fidelity, both as regards the animals and the surrounding nature, and I think they will not fail to be of great service to the study of Natural History, first by attracting students to it, and next by perfecting them in it. A. DREW HITE.

American Wild Fowl Shooting. BY JOSEPH W. LONG.

Describing the habits, habits, and methods of shooting wild fowl, with instructions concerning gun, bill, boots and decoys; the training of water retrievers, &c.

This book is written in plain English, and in a most attractive style. Careful and at the same time accurate view, is taken of duck shooting in all parts of the country. The habits and feeding grounds of the various blue-winged teal, pintail, wood, gadwall and coveiler; red-headed, buff-breasted, and other kinds of ducks, geese, swans, &c., have been carefully and ingeniously studied and given to the reader.

In thirty chapters the author has furnished information for the young, as well as for the practical sportsman.

"A book for sportsmen, by a sportsman."—Argus. "Tell where to find game in the morning, in the afternoon, and in the evening."—Sun.

"Almost indispensable to the sportsman."—Arcadian.

SCHUYLER, HARTLEY & GRAHAM, 19 Maiden Lane, 20 & 22 John street, N. Y. BREECH LOADING GUNS A SPECIALTY.

We would call the attention of the public to our large assortment of Breech-Loading Shot Guns, Manufactured by the following celebrated makers: MERRIS, W. & C. SCOTT & SONS (winners at the International Gun Trial of 1873); P. WEBLEY & SON, W. W. GREENE, WESTLEY RICHARDS, J. HOLLIS & SONS, and other makers.

A full line of fine PISTOLS and RIFLES CONSTANTLY ON HAND. DIXONS & HAWKLEY'S SHOOTING TACKLE. To insure good shooting from breech-loading guns, we would recommend the use of the STURTEVANT BRASS SHOT SHELLS, manufactured by the Union Metallic Cartridge Co., Bridgeport, Conn. These shells are the cheapest and best in the market, can be easily re-capped with ordinary caps, without the use of the implements necessary in priming all other kinds of shells.

BUSSEY'S PATENT GYRO PIGEON AND TRAP, WITH CASE, AND 100 BIRDS. Black's Patent Cartridge Vest. This Vest affords the best arrangement yet in carrying cartridges, so evenly distributed that it is scarcely felt. The weight is carried by the vest, which is worn when used, as when carrying a heavy load, the weight on the shoulders is relieved. In ordering send measurement around the chest. Price \$7.50.

AGENTS FOR THE Union Metallic Cartridge Company's Ammunition, WARRANTED TO BE THE BEST IN THE MARKET. SEND FOR CIRCULAR.

PODGER'S DAM.

W H O yer' callin' Pot hunter, say?
Any fell-r that roosts round this way?
Kase there's a chum of mine a piece up the road,
Showed me one of yer dorned papers, and allows its me
That ansers on a big part 'er the load
You put on them city chaps. Now see,
I jest want to bett' alone, d'ye hear?
Mud how you steer,
Or you won't esch no papers to my friends,
They stands with me—all on 'em, seuds
Warnin' to every one— you fancy pole men.
Not to come up in our parts agin,
Or I'm dashed.
If you don't get your slimsy flimsy smashed,
I'm free, I am,
An' I've lived class by this ere dam
Nigh on to forty year,
An' its thunderin' queer,
If a paper man, or any cranky cuss,
Comes where he don't belong, to raise a fuss,
And try to make me walk a mile;
It's blamst cool.
Pop'lar, or not—agin' the law, or no,
I'm on this thing, and bound to stay, (jes so).

"The public's all agin' me." Let 'em be,
I'll ketch my trout the way of pleases me;
Little and big, you bet it's few I lose,
A hookin', nertlin', snacen' when I choose,
I ain't seen no law agin' it yet,
For all ther brags to ease and make me sweat,
I'd jest like ont to see 'em try it on,
I'd fix the flint of every mother's son.

How's that!
Me fined a hundred dollars? sho!
Good joke, though,
Squire, I ows yer' one,
I swan!
Whar' 'taint no joke"—plank down or bounce, ye say?
Gook! who'd a thought the law'd a foundd its way?
To Podger's Dam?
Well, I'm beat, I am.

T. W. A.

Across Newfoundland.

**INTERIOR EXPLORATIONS—FLORA,
FAUNA, AND GEOLOGICAL FORMA-
TION.**

CHAPTER I.

THE recent travels of our valued correspondent, Mr. Murmy, in Newfoundland, recalls its previous exploration. In the year 1823 Mr. W. E. McCornack, being then in that country, determined to explore the interior; and in order to do it successfully he commenced trading with some Indians in order to learn all that they could teach him in woodcraft and other accomplishments peculiar to the "Children of the Forest." Equipping two Indians with everything necessary for a campaign of three months, he took passage from St. Johns to Trinity Bay, and noted the topography and geological formation of the coast region. Of a prominent landmark, he says:—

"The Point of Grates is the part of North America first discovered by Europeans. Sebastian Cabot landed here in 1496, and took possession of The Newfoundland, which he discovered in the name of his employer, Henry VII. of England. He recorded the event by cutting an inscription, still perfectly legible, on a large block of rock that stands on the shore.

"Bacneloa Island, formed of a horizontally stratified rock, apparently gritty slate, is famous for the numbers of sea fowl that frequent it in the breeding season, principally the puffin, called on this coast the Bacneloa birds. The island has one landing place only, on its east side, and no resident inhabitants; but is visited by men in boats and small schooners called Eggers, who carry off cargoes of new laid eggs. The end of the profession of these men will be the extermination of the sea fowl of these parts for the sake of a cruelly begotten temporary subsistence. The destruction by mechanical force of tens of thousands of eggs, after the commencement of incubation, precedes

the gathering of a small cargo of fresh laid eggs. Penguins, once numerous on this coast, may be considered as now extirpated, for none have been seen for many years past."

Speaking of the scenery near Trinity Bay, he says:—
"From the summits of the hills immediately around the harbor there is a view of the country in all directions inland for twenty to thirty miles, encompassing part of Random Island in the southwest. The whole is a continued succession of groups of rugged hills (mountains, except in height), all apparently of a similar description to those on which we stood, with some small patches of fir woods, and a few lakes interspersed. It presented a prospect of at least a week's hard labor overland, before we could reach what we could only hope might be the verge of the interior. This suggested to me the plan of going nearer to the centre of the island by water, in order to save all our strength and resources for the main object of the undertaking, as it was impossible to know what difficulties and necessities we might have to contend with. This was to be effected by taking a boat from hence to the west part of Random Sound, which lay to the west-southwestward. The country we now saw was within the reach of any one to explore at any short interval of time, and was therefore of secondary interest to me.

"The west side of Trinity Bay is composed of rocks of the transition clay slate formation, similar to those on the east. The hills, frequently of 400 to 600 feet in height, are chiefly of greenstone and hornblend slate; the out-goings of the nearly vertical strata and dykes of which sometimes present a perfectly mural front to the sea; blue clay slate alternates, and has cubical iron pyrites often imbedded, some of which are several inches in diameter. In the valleys are beds of horizontally stratified gritty slate of the tabular structure, similar to that noticed at other parts of the east coast. The tables or flags are often several yards in length, formed under a double oblique intersecting cleavage, and admirably adapted for many purposes of building. The beds are traversed in all directions by dykes several feet in thickness, of a dark colored green stone; also of the seamed structure, the plinters of which are translucent at the edges.

"The plants met with at this part of the northeast coast of America, although only 48° 20' N. lat., or nearly in the parallel of Brest, and the highest hills not exceeding 600 feet, seem to be similar to those of Norway and Lapland in the northwest of Europe, under the Arctic Circle.

"Having engaged a boat to carry us to the most inland part of Random Sound, we left Bonaventure on the passage to the northeast entrance. About six miles southwest of Bonaventure we witnessed the phenomenon of the very great transparency of the sea, which it assumes here during the time of change of wind from West to East. The fishes and their haunts amongst the rocks and luxuriant weeds at the bottom were seen to a fearful depth. Every turn of the sound presents a different aspect of rugged, and in some parts grand scenery. Both sides are formed of steep and perpendicular hills of greenstone, and of rocks of the transition clay slate formation, of 500 to 600 feet in height, the nakedness of which displays, as at the outer parts of Trinity Bay, the skeleton of the earth. The strata are of various thickness, and lie in different directions. Patches of fir trees—*Pinus balsamea*—principally grow where the steepness does not prevent debris from lodging. The appearance of both sides of the sound or strait correspond so remarkably that it might be inferred Random Island is a break off from the main island. The North Arm of the sound, that which we came through, is about thirty miles in length, and varies from one eighth to one third of a mile in width. Within two or three miles of its west extremity it expands and becomes shallow, and here the scene of gloom and barrenness is suddenly contrasted with a pretty small sheet of water, surrounded by a flat, thickly wooded country, as inviting as the past was forbidding.

"Taudom Bar, at the west extremity of the sound, caused by the meeting of the tide here, in the form of two con-

siderable bores from the north and south arms, is dry except for an hour or two before and after high water, and there is then about two feet only of water upon it. It is in 48° 13' north latitude, and 53° 40' west longitude, (by Steel's chart, published in 1817.)

"The land adjacent to the bar is low, and the soil is good. Westward towards the interior it rises from the water's edge very gradually, and is entirely covered with wood. "Our boat having lain dry on the bar nearly all night, we slept in her in preference to encamping in the woods. Wild geese and other birds were flying to and fro over us during the whole time, most industriously and fearlessly in search of food. This is a favorite resort of ducks, herons, and other aquatic fowls.

"My traveling equipments being landed, the boat with the party which brought my Indian had left us on her return to Bonaventure.

"It would have been impossible, with the object I had in view, to reach this spot by land from St. John's, as the coast we passed is without roads or paths of any kind, and an entire assemblage of rocky mountains, forests, and lakes, intersected by deep bays.

"Being now removed with my Indian from all human communication and interference, we put our knapsacks and equipments in order and left this inland part of the sea shore in a north direction, without regard to any track, through marshes and woods towards some rising land, in order to obtain a view of the country. The centre of the island bore nearly west from us.

"My dress chiefly consisted of a grey moleskin shooting jacket, small clothes of worsted cord, three entire inside woolen body dresses (no linen or cotton whatever), worsted stockings and socks, Canadian long moccasins boots. The Indian wore leggings or gaiters made of swanskin blanketting, together with moccasins instead of boots. I was armed with a double barrelled fowling piece and a brace of bayoneted pistols, two pounds and a half of gunpowder, and ten pounds of bullet and shot. The Indian had a single barrelled fowling piece and a pistol, and the like quantity of powder and shot. Our stock consisted of a hatchet, two small tin kettles for cooking; about twenty pounds of biscuit, eight pounds of pork, some portable soup, tea and sugar, pepper, salt, etc.; a blanket each, and one for the camp roof, a telescope, a pocket compass each. I took a small fishing rod and tackle, and various minor articles for our casual necessities and for mineralogical and other purposes of observation and notes. On another journey of the kind I should very little vary this equipment.

"After several hours of hard labor, owing chiefly to the great weight of our knapsacks, we made only about two miles progress. From the tops of the highest trees the country in all directions westward for at least twenty miles appeared to be covered with one dense unbroken pine forest, with here and there a bold granitic pap projecting above the dark green surface. We had expected to see some open country nearer.

"At sunset we halted, and bivouacked beneath the forest. As the weather was fine, and no prospect of rain, our camp consisted merely of a fire and a bundle of spruce boughs to lie on. My Indian, Joseph Sylvester by name, at midnight rolled himself up in his blanket, and evidently slept perfectly at home.

"September 6th.—No clear ground appearing in our course, we struck directly westward through the forest. Wind-fallen trees, underwood, and brooks lay in our way, which, together with the suffocating heat in the woods, and mosquitoes, hindered us from advancing more than five miles to-day, in a W.N.W. direction.

"September 7th, 8th, 9th were occupied in traveling westward through the forest, at the rate of seven or eight miles a day.

"In our progress we ascended several of the insulated paps to view the country; stunted firs and a thick rug of moss crept almost to their summits. The prospect of the ocean of undulating forest around—of the high land of

Trinity and Bonavits bays, and of the Atlantic Ocean in the distance northward, were splendid. There was an evident use in the line—westward from Radium Bar.

"These papers consist of a fine, very coarse grained. They lie northward and southward of each other, and seem to belong to a primitive range that exhibits itself at distant spots above the transition clay slate formation. They stand like imperishable monuments of the original construction of the earth, overlooking the less perfectly crystallized rocks around them mouldering into soil. The granite often appears in the form of round banded hills, or small masses, which owes its green color to an intimate association in various proportions with chlorite, alternates in the clay slate formation, and appears next in elevation to the granite; it presents plain weathered surfaces, resembling yellow-gray sandstone, owing to the decomposition of its chief component part—feldspar. The clay slate rocks are distinctly seen at all the brooks and lakes within eighteen or twenty miles of the sea. Beyond that the primitive rocks are almost entirely covered by the forest, it being useless to repeat, is composed almost entirely of trees of the pine tribe, firs, in general fit for small spars, the black and red spruce, *pinus nigra*, and *pubera* predominating. In some favored spots a few birches, larch, and *pinus Sibirica*, attain a considerable size. Birch is the only deciduous timber tree met with in Newfoundland; there being here neither beech, maple except the two diminutive species already noticed, oak, nor ash, all common on the neighboring islands and continent.

"Marshes and lakes lie hidden in the forest. Every marsh is accompanied almost invariably by a lake, and every hill also by a lake—of proportional extent at its foot, and the three are frequently found together. We traveled on the rising ground in order to avoid the lakes. "On the skirts of the marshes and lakes the most are found the following trees and shrubs—poplar, alder, birches, willow, Indian pear, wild gooseberry, wild currant, raspberries, yellow flowering honey suckle, Indian or Labrador tea, *Ledum latifolium nigricans*, etc.

"The marshes consist of what is termed marsh peat, formed chiefly of the mosses, *Sphagnum capill lichen*, and are for the most part covered with grasses, rushes, etc. Some portions of the marshes are much wetter than others, and here the prevalent plants are a variety of rushes. Other spots of the marshes are raised above the common surface, owing generally to the projection of the underlying rocks, and consequently retain less moisture. Here the *Kalmia Augustifolia* sometimes occupies entire acres, and in the flowering season displays (as may be seen in the vicinity of St. Johns) a very brilliant appearance. The *Thalictrum flavum* is another plant which puts forth its delicate lilac blossoms before its leaves, is also common. The pools and lakes shone brilliantly with white and yellow water lilies.

"Under the shade of the forest the soil is light, dry, very rocky, of a yellow brown color, and covered everywhere with a beautiful thick carpet of green moss—formed principally of *Polytrichum commune*. As there are few or no conditions on the soil of the country, the plants add little or nothing to ameliorate or enrich the soil, and the velvet-like covering remains unsoftened by fallen leaves.

"There being neither browse, grass, nor berries in any quantity in the pine forest, even traces of any kind of game are seldom seen. Hence the necessity of carrying a stock of provisions while traveling through such woods. Yet a heavy load prevents expedition and observing much of the nature and condition of the country. If brooks are only visited by otters; the pools and small lakes by beavers and muskrats. The martin, *Martella martin*, is sometimes seen on the trees. Of the feathered tribe, the Jay, *Corvus Canadensis*, and sometimes the titmouse followed us, chattering and flitting, showing that their retreats were never before invaded by man. A woodpecker, of which there are two or three kinds, is now and then heard tapping, and sometimes on the dead trunk of a rotten catches the ear. These are the only interruptions to the dead silence that always and everywhere reigns during the day in such forests. Man alone forces his way fearlessly onward; scarce a sound being heard except he is directly or indirectly the cause. The loud notes of the loon, *Colymbus Arcticus* and *Colymbus glacialis*, discovered to us at night, as we lay in our camp, in what direction the lakes lay that we were near, and we thus avoided them if in our course next day. The loon, like the other aquatic birds of passage, geese and ducks, is most alert in the night time, when the permanent inhabitants of the country are at rest. Almost every lake is occupied during the breeding season by a pair of these nocturnal clamorers.

"It is impossible in an unknown country, and one into which for centuries admission was in a manner denied, to reconnoitre oneself with certainty as to where few occurrences among the aborigines might have wandered from the more central parts of the island to our neighborhood and spy our fire from a distance and steal upon us unawares. No civilized being had been here before, nor was any now expected. Apprehensions and thoughts of no ordinary kind occupy the mind unaccustomed to the untrodden, boundless wilderness. Sleep is not looked for.

"We had as yet but only a few pieces of grubs, *Tetrao albus*, while crossing the very rocky spots of the woods, and our stock of provisions was nearly consumed.

"The heat in the woods was very oppressive, and there being no circulation of air under the trees, myriads of mosquitoes, with black and sand flies, annoyed us.

"We lodged at night under the thickest of the woods, encamping or bivouacking in the Indian manner. As the weather was fine, this was agreeable and cheerful. Familiarity with this method of sheltering, adopted from expediency, is soon acquired. It may be shortly described. Continuing our journey about an hour before sunset, a dry, firm spot of ground on which to make a fire and to sleep under the thickest of the trees for shelter is pitched upon as near as possible to water, and an easy supply of wood for fuel. Care should be taken that the spot selected be not hollow underneath the moss that covers the ground, for in such places, which are very numerous, if by its own bed, may sink before the night so far below the surface as to be useless, and expose a cavity amongst

blocks of granite into which the firebrands have fallen, and sufficient to swallow up any slumberer that might chance to slide into it. Arms and knapsacks are then piled, as much wood as will be brought to the spot as will serve to keep up a good fire all night, and the fire is kept by pulverizing a small piece of dry, rotten wood and a little gunpowder together between the hands, and ignited by a spark from the lock of a fowling piece, or by any other means; the smoke of the fire affords instant relief from the constant devouring enemy, the flies. Boughs are broken from the surrounding spruce trees, two or three arms of each person, and are used for roasting by; and some are placed on the ground at the windward side, the fire is blown from the smoke, then upon tiered feathers upon the back of a bird, the thick or broken ends placed in lines towards the fire, and forming a kind of mat three or four inches in thickness. A few light poles are then stuck in the ground along the windward side of the bed, inclined in an angle of about 45° over it, towards the fire, on which to stretch a blanket to serve as a roof against the event of rain during the night; the upper ends of the poles rest on a horizontal ridge pole which is suspended at each end by a forked stick, or a post. The camp being now ready for the general accommodation, wet clothes are taken off, and supper is prepared accordingly.

"The labor of exploring and hunting is such that the clothes are always wet from perspiration. A forked stick stuck in the ground and used for roasting by; and some pieces of rind of a birch or spruce tree, cut into flat, cloth, platter, and torches. To make a camp after a day's hard fatigue requires about an hour, and the whole should be done before it is dark. Then, and not till then, is it proper to sit down to rest. After supper, each, when disposed, rolls himself up in his blanket and reposes on his fragrant bed of boughs, placing the soles of the feet near the fire. This precaution is not strictly necessary, as a preservation of health, the feet being wet all day.

(To be continued.)

For Forest and Stream.

THE MUSKOKA REGION.

BY referring to the FOREST AND STREAM of October 1st the reader will find a synopsis of the principal lakes and rivers, together with minute directions regarding the most feasible route to the Muskoka region.

Desirable localities, easy of access, where good fishing and shooting may be enjoyed conjointly with comfortable hotel accommodations, are rare. The writer proposes briefly to set forth the merits and demerits of this section, and the reader can use his own discretion regarding a trip thitherward.

My wife, a young lady and myself arrived at Toronto, Ontario, about July 15th, 1874. We found the "Queen's Hotel" very comfortable, and were much pleased with it in every way; charges, \$3 each per day in gold. The trip by the Northern railway is a delightful one; we left by this route at 4 P. M., and arrived at Lake Couchiching Hotel at 10 same evening. The hotel is delightfully located about a mile from the pretty little Swiss station, and the drive to it, through the grove, over the point, impresses one favorably. The building is a fine one and commands an extensive view of the lake from which it takes its name. The lawn is artistically laid out and kept with faultless care; everything indicates a most charming resort. It was the writer's expectation to leave the ladies here for a few weeks and to thoroughly explore as much of the sporting country beyond as the time would permit, and the drive, notwithstanding its complete appointments and charming location, was so badly managed that on Monday morning the ladies resolved to brave the fourteen mile "carry," and to us, unknown country beyond, rather than submit to the discomforts of the hotel.

Telegraphing to the terminus of the railway for a private conveyance, instead of a pleasant ride to Gravenhurst. The start is usually made in the morning, and the ride, whether in rain or sun, and as the cost is but little for the private conveyance, it is much preferable. The steamboat ride hence to Pratt's, is superlatively charming. A pamphlet accurately describing the trip, giving distances, &c., may be obtained by addressing A. P. Coekburn, M. P. P., Toronto.

Pratt's Hotel is delightfully situated at the head of Lake Rosseau; it is well kept and proved to be exactly the place we were seeking. The hotel was crude and unfinished, but so clean and neatly served was everything, we did not feel the want the unfinished condition otherwise would have made apparent; indeed we were glad to put up with the trifling inconveniences, as they added the charm of novelty. The charges were \$1 per day, gold; it is the expectation, however, of the landlord to charge somewhat higher rates when all is completed—say ten to twelve dollars each per week. The house is comfortably furnished, has a large parlor, good piano and enough conveniences. It is romantically located near and commands a fine view of the lake. Good guides, or more properly, men to row, may be obtained for \$2 per day each, including boat. We heard in Toronto many reports concerning the size and number of muskings, but found on inquiry that the size and number were all there, and all except in the Severn River. One who understands landing black bass may take from ten to fifty during the morning, averaging two and a half pounds each. They will not rise to a fly in this section. Still fishing with live minnows, and trailing the same along the water near the shores, usually afforded satisfactory sport. Wall-eyed pike are numerous; the largest we caught weighed nine pounds. In May and June thousands of salmon trout are taken. We took but one. In certain parts of the Adirondacks they may be caught trolling during July and August, but this is exceptional.

Lakes Muskoka, Rosseau and Sheep are connected by streams, and are much alike in their physical and piscatorial characteristics; a description of one answers for all. The country is undulating, almost hilly; the borders of the lakes rocky and picturesque, often rising fifty feet above the surface of the water. Beautiful mosses carpet the rocks and gnarled roots and branches add quaintness and beauty to the scenery. Blueberry bushes luxuriate on the islands which everywhere dot the lakes; dainty little groves and mossy banks often times lure the weary sportsman from his boat to their drowsy depths. A few settlers are scattered about, several miles apart, primeval forest covers the earth, even to the water's edge, and nature reigns in her primitive wildness. Occasional fires have marred the beauty of the landscape.

At Pratt's, or Rosseau, as it is called, are a few busses, a

telegraphic office and store. Everything indicates frontier life, and luxuries are rare indeed. We saw traces of deer within three miles from the hotel; bears occasionally make their appearance, but are harmless if let alone. We have read of wolves lurking near and stealing in their shadows towards their prey, but saw none.

"There is a good road running to Lake Nepissing, about sixty miles distant, crossing the Muskoka about half that distance from Rosseau. We did not try far into this section, but unhesitatingly recommend what we saw of it to sportsmen. Deer and trout abound but are not to be had for the asking; skill, patience and experience are necessary adjuncts. Some half a dozen miles into the woods we found a pond possibly a quarter of a mile in length, from which we took, during one morning, nine brook trout and weighing in the aggregate fourteen pounds, two and three quarters pounds. Mosquitoes numerous and are a pest; the mixture of tar and oil is a palliative. Excursion tickets for the round trip from Toronto can be purchased for six dollars, gold. We also recommend Frazer's, at head of Joseph Lake; it is a very desirable place to put up at. Fishing here is better for black bass than in either of the other lakes.

Comparing the relative merits of this section with the Adirondacks we first note the absence of mountains; this serves to give a less romantic effect to the scenery; otherwise it is similar, possibly less beautiful. Camping out is rarely practiced, therefore the hotel proprietors have no outfits, and cannot be depended upon for a supply. Fishing, except for brook trout, in this country is superior to the Adirondacks. The guides know the country and are reliable. Picnicking here is very enjoyable. Day after day may be delightfully passed rowing on the lake, wandering over the islands and catching bass to the heart's content.

Life here is peculiarly adapted for ladies desiring something a shade more romantic and several shades less fashionable than the favored places of resort in the States. Those seeking wilder recreations have only to bring their own traps and penetrate deeper into the forest, there is a country extending to the polar regions scarcely trodden by the feet of any but the aborigines and the hardy trapper. Much that has been told of this country is untrue, consequently we were disappointed, because misinformed. The pleasures for pleasure are great, but depend upon the ingenuity of the tourist for development. C. M. ROOP.

For Forest and Stream.

WINTER FISHING IN LAKE PEPIN.

HIBERNATING AND ANADROMOUS FISHES, ETC.

THE lake was closed here about four weeks ago, and since that time the weather has been almost like an Indian Summer, and no snow of consequence. The fishing through the ice commenced just as soon as it was strong enough to hold up a man. The pike-perch and pickerel are the fish sought. As stated in a previous article the pike-perch select their spawning grounds just as soon as the lake is frozen, and penetrate deeper into the forest, than do the fish. It is a fact that they are never taken on the same grounds in the Summer. I believe that no other fish selects its bed so long before spawning, and remains so long watching it. The pickerel will sometimes make a foray among and scatter them, but they are sure to return again as soon as the pickerel is caught out. The most successful bait is the brook chub. To obtain this bait the various streams in all this part of the country have been nearly depopulated and robbed of their beautiful little finny tribes. Another method, (not very commendable,) of taking these fish is to build over a hole cut through the ice a small shanty made close and warm. Then the fisherman seats himself over the hole and angles an artificial minnow, made bright and attractive, until a fish is alighted in sight, when the crucial spear quickly darts down and brings the suffering fish out of the water. These shanties are often provided with a stove, and thus the fisherman is enabled to continue his cruel sport in all weathers. Spawning fish has no attractions for me, and somehow I utterly detest it. It is cruel and barbarous, besides very un-sportsmanlike, at least it seems so to me. Taking them through the ice with hook and line is bad enough. There seems, however, some shadow of excuse for their taking them in the Summer, but few are caught in any way. Sometimes whole seasons will pass and not fifty taken in the entire lake; and being, as everybody knows, a very choice fish, it is hard to resist the temptation to take them when and at whatever season they can be found. The reason for their scarcity in the lake during the Summer is this: like the salmon, they delight in running water in warm weather, consequently they flee to the rivers until the time to select their spawning beds, when they will again seek still water. There has been, however, seasons when myself and others have caught a good many of these fish with rod and line, but I believe the great mass of them seek running water. They are always very plenty in the Summer, just out of the lake and into the brook.

The pike and pickerel are the only fish taken here in the Winter. It is strange to many what becomes of the countless numbers of other game fish that through these waters in the Summer season. Bass, which are so numerous there, are never seen in the Winter. I am quite sure that not a single bass was ever caught here through the ice. I have for years tried all depths of water to raise one, or to discover one, but have thus far failed. I must believe, then, that they hibernate. The halibut of the Muskegon I believe was taken a few years ago discovered in the Potomac, but I believe the halibut also belongs to the striped bass, (*Sebastes haudius*), for the most diligent search for them in the Winter has also been without avail. Sometimes a catfish is taken in the Winter, but very seldom. They are very numerous in the Summer and bite readily at most any bait. But they disappear in the Winter, into the mud I believe. The rogeons seek their shelter in the mud, and remain during soft winter months. The Catostomus or suckers seek mud bottoms, half bury themselves and remain in a semi-dormant state. But the most numerous of all the fishes in this lake, and in the Upper Mississippi, is *A. clupea*, called here the skip jack. It is one of the most beautiful fresh water fishes known, averaging, perhaps, about two pounds in weight. They are not regarded with much favor for the table, although they are very good to eat, and are very soft in winter weather. They are great biters, and game to the last; just as gamey as a black bass, only they will not hold out as long. They take the fly readily and afford fine

sport. This fish is remarkable from the fact that it contains so much blood. It will bleed more and longer than any other fish known of its size. Anglers save and retain them for the purpose of obtaining a large amount of blood under foot becomes tolerable. They swarm the lake in countless millions, but are all gone in the Winter. Some years ago Oliver Gibbs, Jr., expressed to me the opinion that these fish migrated to the ocean. Since that time I have observed them as closely as possible, and have now also come to the conclusion that they are an anadromous fish, they entirely disappear at the last of the season, and return again in May and the first of June, this being their spawning season. The young remain the second season, when they are of sufficient age to make the long journey with the old fish.

Now, if it be a fact that this fish is anadromous in its habits, it is certainly a very interesting fact. If it be true that they actually make the journey of nearly two thousand miles to and from the ocean, it would appear conclusively that shad and salmon would do the same, so that if the salmon were introduced into the tributaries of the Upper Mississippi we might reasonably expect them to retain their anadromous habits and become plenty in these streams. The same can be said of the shad. This fish, I have no doubt, will become numerous in those waters within a very few years. Meantime, more ought to be introduced.

The lake of Lake Epoufay contains nearly thirty species. Some of these are rare and little is known, I believe, of their natural history. Of such more anon.

Lake City, Dec., 1864.

For Forest and Stream.

TURTLE HUNTING.

HERE are three kinds of turtles which I have hunted, and these are the hard shelled, the soft shelled, and the snapping turtle. The former is much the more common, and the latter the rarest. The hard shelled is about a transverse diameter and a half long, and nearly three-quarters of the same in vertical diameter from the highest point of the upper shell, said diameter passing through the middle of the hump of the head. The head is small, and the upper shell is very convex longitudinally, and even more so transversely. The head is small, shaped like a snake's, and the neck not very long. The claws are slightly curved and not so strong or sharp as those of either of the other varieties. The upper shell is dark brown, with some dull yellowish broken lines, both longitudinal and transverse. The top of the head is marked with black, the sides being colored longitudinally with greenish, yellow, or curved stripes. The under parts of jaws and throat are greenish yellow, and the belly is yellow. It lies in the mud during the cold Winter weather, and in the warm days of March comes out to sun itself on the logs of the creeks and bayons. Soon after when the weather gets warmer, it is to be found floating on or near the surface of the water, usually near the edges of the growth of water plants which fringe the shore, and often lying among the plants, its body concealed by the lily leaves, and its small greenish head so harmonizing in color with the leaves and in shape with the buds, or as yet unfolded leaves, that a person may easily pass many of them without recognizing one. In May the female turtle goes ashore (sometimes for several hundred yards) and digs a hole in the earth, in which to lay her eggs, which number from one to three to four.

Having deposited them, she covers them with the loose earth previously removed, and returns to the water, leaving the eggs to the care of the sun and soil. A good sized turtle of this kind weighs about thirty pounds. The soft shelled or leather-backed turtle receives these names from its upper shell being about as soft and flexible around its edges as a piece of hickock sole leather. It is about a transverse diameter and a half long, and its greatest vertical diameter (intersecting the oblique) is about one-third as great. Its neck is large, long, flexible, and ends in a head of about its own diameter, which head terminates in a pointed snout, something like a pig's; its claws are very strong, sharp, and much curved; its back is dark brown, with a marked olive green, and is rather lighter at the edges; its belly is white; and the back of its head and neck is colored like the dorsum of a snake. The soft shelled turtle is seldom found on logs, but among or near lilies, particularly where there is brackish water; its head and neck are easily mistaken for a piece of a dead and water logged branch; it is quicker and shyer than either the hard shelled or snapping turtle. A forty pound turtle of this kind is large, but I am credibly informed of one which weighed sixty pounds. The snapping turtle is proper and much more than the soft shelled, and is a little broader and much more deep in proportion to its length; its upper shell is heavier gray or brown mud color, as it is dry or wet; the claws are very strong, sharp, much curved, and like those of the soft shelled turtle, terminate in very long, large, strong flippers; its neck looks rougher and more dirty than that of the soft shelled turtle, nor has it any of the brighter coloring sometimes seen there. It is a snapping turtle, and like the soft shelled, but is sometimes found on logs among lilies, or in the shallow water near the shores of creeks and lakes. Turtles of either of these species (if properly cooked) make soup as good as that from green turtle, but the southern people prefer the soft shelled, and esteem the snapping turtle rather more than the hard shelled. Turtle's eggs are also better eating than those of domestic fowl.

To hunt the turtle, you need an easy, paddling canoe or boat; the Delaware River shooting skiff being considered the best; it should be about thirteen feet long, and if clinker built, the outer edges of the boards should be bevelled, to prevent the lapping of the water in the sharp angles, (as even that slight noise is enough to startle a turtle, and when startled he goes off like a fish). If used by canoeing, which all means take a light canoe, suitable for two people, and what they need to carry, namely, two paddles, one pole, twelve to fifteen reed logs, with a hook of best steel, three-sixteenths of an inch in diameter, and a shank of six inches at one end of the pole, round bend, sharp point two inches from shank, and one inch and a half from bottom of bend. This pole should be marked at every six inches, so that one can tell instantly which

way the point of the hook is turned when it is out of sight. Add to this a rifle, and pistol of large bore, and you have your equipment for turtle shooting. Your hat, paddles, clothes and bait should be of neutral tint. When you reach your shooting ground (a creek or bayou with weeds, lilies water lettuce, logs, and stumps along the shores), one man should sit near the bow in such position as to be able to shoot quickly and with little motion; that is to say, he should face diagonally toward the shore near which he expects to see turtle, and with rifle ready, examine the willows and logs over an unusual appearance. On the edge of the weeds which he is passing, and also giving a glance forward now and then, as he may get a shot at some turtle fifty or sixty yards up stream on a log, and which would not allow him to get any closer. When he sees the head of a turtle half hidden among the weeds, if he brings his rifle up quickly the turtle will be yards away before he can fire, but he must raise it very quietly, with as little motion as possible, and not over an unusual appearance. If he can't see the head, (as the motion of the boat may have brought leaves across the line of fire), but can see where he thinks the body is, then let him fire, and immediately take the pole and stand ready to hook up the creature as soon as the bow of the boat reaches the spot where he sank. Of course no noise of any kind must be allowed, for you often hunt half a day without a shot; so great care must be taken to have no noise at all, but you can rattle. The paddler's duty is to keep the boat close to the weeds without letting it rustle against them, to paddle quietly, to keep on the look out for turtles, and on seeing one, to put the boat in the most favorable position for the shooter, to check her as much as possible without noise, and on the shot being fired, put the bow of the boat as quickly as possible over the spot where the turtle sank, and keep it there while the shooter looks for and hooks up. He must be constantly on the watch for a sign from the shooter, as he being in the bow, will probably see the turtle first. If the boat should pass a turtle and the paddler be unable to attract the shooter's attention without searing the cloudfou, he may use the pistol. Even on windy days there are among the tortious creeks sheltered places where one may find turtles; but a drop of rain, a gust of wind, or a noise taken to have a turtle on the bank, will cause the turtle to get up or two in the top of your hat. If you see the turtle's back only, try to fire at such an angle that the ball will range toward his head; if it ranges toward his tail, you will lose four out of five. You had better look for a turtle for half an hour (as one of my friends did last Winter and got him) than to go in after him; for if he takes hold of your limbs you will have no pleasure in it, and you will lose many pounds of live turtle, hanging to your finger bone; putting his head out of the shell and holding it there while some one cuts it off; and even then you will not get off much easier. Moreover, the bottoms of many of the Southern creeks are so dark, and the waters so full of impurities, that you can see nothing when you go down, but an amber colored sheen, if the sun is shining. So you will have to wait to light about the middle of the day, and in the morning, alligators, sharp snags, and the turtle's strong sharp mandibles, is not sufficiently encouraging to warrant the attempt, particularly as you will fail to find the turtle in three cases out of four, when you cannot feel him with the hook. An old soft shell will sometimes have quite a quantity of moss growing on its back, and I am told that this holds good as to the others, but have never seen it.

A. HENRY.

For Forest and Stream.

SPORT IN THE BROWN TRACT.

WE had been paddling slowly up the river, (the Beaver) all day, fishing at the numerous spring-holes, and as the night closed around us, we found ourselves at the "Branch," pretty well tired out and ready to camp anywhere. We ran up to a small cove, and our boats and our fish (of which we had a pretty good string) cleaned, and after a short discussion it was decided that myself and two companions, with Asa, our guide, should go to Uncle Chauncey Smith's cabin, over a half mile "carry," while our second guide, Danfred, with our fourth man, should "float" as far as Little Rapids in hopes of obtaining a deer, and we would sleep without cover, as it was not very pleasant to think of, as it looked more like rain every instant. Our guide lighted a candle and started off, we following in Indian file. The way was rough and the light from our single candle cast but sickly rays on the path.

And we stumbled on, now slipping on some stone, overgrown with moss, or falling headlong over the trunk of some prostrate tree, half way up the bank. After what seemed the longest half mile I ever walked, the cabin of Uncle Chauncey here in sight and our "Jordan" was traveled. As we caught sight of the old log-house, standing in the clearing, far away in the wilderness, we hailed it as a "haven of rest," glad enough to have got over the infernal "carry" without breaking our necks.

This cabin was erected by Uncle Chauncey Smith, and here he has spent much of his time of old, and has lived for the last fifty years. It stands on the road opened through the woods to the shore of Lake Champlain, which was built in the hope that people would come in and settle. But they didn't, and consequently the bridges are down most of its entire length, though I believe this last Summer the bridges have been rebuilt as far as Little Rapids, some three miles from here. But very likely when the spring freshets come, they will be carried off, and parties coming up the river will have to go as usual by boat. The land has been cleared to some extent around the house and some few vegetables were raised here, but it is fast growing up again to a wilderness, and unless some one comes here to live, (which is not very likely,) it will soon be back to its original state. The place is not an inviting spot for camping, although a great many parties seek its shelter, as it saves the trouble of building a tent, and some seasons stands in trout. The house consists of a main building of logs with shingled roof and a rear part with bark roof, and stands close to where the road crosses the branch; so much for the outside.

Pushing open the door to the main building we enter. It

certainly is not very inviting. Everything smells mouldy and looks dirty. An old stove, nearly worn out, stands at one end of the room, with the rafters all graced by a round board table with seats. A match, one or two old candlesticks and a few old broken dishes stand on it, and from pegs driven into the wall hang old powder horns, mims the powder, rusty guns, frying pans, and all the odds and ends that could be thought of. Leading out from the back of the room are two closets or cobs, with bunks like a steamboat, with dirty ticks filled with hay and covered with damp furs. In the rear of the room and some bunks filled with freshly cut hay from grass which grows around the cabin, and as the glass was out of the one window in the room, the air was muel better. There was also an old stove in this room, and as the punkies and mosquitoes were plenty, we started a smudge in the hopes of smoking them out.

Going back to the front part Asa soon had supper cooking and the savory smell of trout and coffee filled the room, and we were soon stowing away our evening meal with keen appetites. After supper pipes were lighted, and sitting around the old stove we listened to our guide while he told us yarns connected with his life. For nearly forty years he had been more or less in the woods. Not a place but what he had visited, and the moose, deer, bear and wolf were slain were no stranger to him.

He helped build the road through the woods, and moose were as plenty as deer then, and many a one fell before his unerring rifle. But the pipes were smoked out at last, and wrapping our blankets around us we were soon in the land of dreams. In the middle of the night we had a tremendous thunder storm and I awoke to find the water coming down in a shower on my head. Unfortunately I had laid down under a hole in the bark roof, and had duly discovered it when pretty well but it was too late to move much, so drawing my rubber blanket over me I let it rain and soon went to sleep again. In the morning, after a hearty breakfast, our guide returned to his boat, which he was to paddle up to the rapids, while we three were to walk three miles by the road to the same place. When we got to a certain place, designated by Asa, we were to leave the road and strike off to the left to find the river.

The morning was lowering and close, and the air was alive with winged varmints, who settled down on us in clouds. The grass and bushes which lined the road were very wet, adding greatly to our discomfort.

At last we reached the path from the main road, going off towards the river. The trail was rather blind, in fact so blind that I was a little doubtful, but we concluded to try the road, and strike the way was rough, and the trees were lying across our path in every direction. The trail grew more and more obscure and at last was lost on the edge of a swampy piece of ground, but we kept on, some of the time in mud and water up to our knees, and at last we heard the roar of the falls, and raising our voices, soon heard our guide answering. At last we reached the river, and were soon ferried over, and rejoined our companion at the camp. The road and trail had been all night in the rain, "many deer" had they seen, but they had secured four men, besides the ducking they got by the rain. If there is anything that will give a man the "blues" I think it is a rain storm in the woods, especially if you have a poor camp, as was the case here.

Once more taking our boats we were soon on the "level," and we found most excellent fishing. We took all the trout that we could use to advantage, and the evening, returned the paddles. Soon we arrived at another set of rapids, up which the guides waded with the boats, whilst we walked over the mile carry. We amused ourselves as best we could till the boat arrived, when once more we were sailing up the lower outlet of the lake, which, being full of rocks and stones, made slow going, but at last we struck more open water.

What a beautiful scene it was, that lovely sheet of water, lying so calm and still, with the green foliage environing it to its very edge. The clouds had rolled away and patches of blue sky were peeping out here and there. The water lilies were in full bloom, making the air redolent with their sweet perfume. The mosquitoes and flies gave us little trouble for the first time since we struck the woods. As we were about to strike camp, the evening shadows came on space and we must find a camping place for the night. Danfred said there was one just above on the left hand side, with a good spring handy, so we concluded to try it. We ran our boats into a small stream that came down through the lilies, barely wide enough for a boat, and landed. I followed the path up through the "second growth" and reached the camp, or rather where the camp had been, for the water had turned the ground into a bog. The men, who were on space and we must find a camping place for the night, suggested tying our rubber blankets together and making a frame work of poles and covering it with them, as that would keep off the dew. So at it we went, and soon had a comfortable shelter over us. Cutting some young raspberry bushes, which grew in profusion around the camp, we made us some good beds. A fire was soon crackling in the grate, and the guide, our supper, we lately reclined on our blankets, or lents helping hand. The men, indeed, we gladly retired to our blankets, and one by one dropped off to "dreadland," but somehow the more I courted the "God of Sleep" the wider awake I grew.

At last a loun gave us a little touch of melody, and as his mocking laugh came floating over the lake it started my homesick computation, who was just snoring melodiously.

"Oh God's sake what's that?" he exclaimed, starting up on his elbows.

"Only the cry of a panther around the camp, and as you sleep on the outside you will be the first victim."

"Mean, wasn't it in me? but, then, I could not sleep and wanted company."

"Is your rifle loaded?" said I; "if not, you better put in a charge and let him have it if it comes too near."

"The loon let out my friend's regular 'blood freezer.'" This time our friend started to his feet, thoroughly frightened, and thinking I had carried the joke far enough, I calmed him down and quiet was once more restored.

I lay awhile listening to the wind sighing through the treetops, and at last dropped off into slumber, which I had so long wished for.

F. B. Hartford, Ct., 1874.

CATS—We have received from our Florida correspondent, Fred Beverly, the skin of the panther which he mentions in his article of Dec. 17th, as having been shot by him during a recent Winter campaign in Florida. The animal measured eight feet in length when alive.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

REPORT OF THE MAINE FISH COMMISSIONERS.

WE are indebted to E. M. Stillwell, Esq., for this report, to which we referred to last week. It is quite valuable as showing the progress of fish culture in that State. The following summary will probably embrace all its essential news to the general reader, but we shall have occasion to refer to it again:

"Our rivers are capable of being so stocked with salmon by yearly contributions of young fry to their waters, that no protection would be needed, but simply fishways to allow the grown up fishes to ascend to their utmost tributaries, that all, from the river mouths to their inland fastnesses, might have the opportunity to catch and consume.

Two hundred thousand salmon eggs was our dividend from \$700 invested in the Bucksport Breeding Works. In addition, 250,000 eggs were placed to our credit as a gift from the United States Government, through her Commissioner of Fish and Fisheries, Prof. Baird, making a total of 450,000 eggs. These were distributed and planted in several localities in the State. The reports that have been received from the rivers and ponds where the salmon fry have been planted are of the most favorable description. More legislation is needed to protect the young fish. The Commissioners give a condensed description of land-locked or fresh water salmon, and its "habitat." As a table fish, they are of a richer flavor than the sea salmon; as a game fish they have no equal. The Commissioners speak very particularly of the blue-black trout as a stock fish, to be put into ponds, to afford an unlimited supply of food for trout and land-locked salmon. It is a great mistake to allow these fishes to be taken all; the great bulk of the Rangely trout is to be attributed mainly to them. The blue-black is to be kept and the myriad of snells are to be stocked with trout or land-locked salmon.

In the autumn of 1869, several ponds were stocked with black bass, and the fishes have grown and multiplied wonderfully. There was an abundance of these fishes in all the ponds in which they were placed, but the commissioners are not always successful in being able to find parties living near these ponds to catch them, at reasonable prices. As the case is now presented, the best method is to purchase of dealers in Massachusetts, and have the fishes delivered at the desired localities here.

Five years ago, the Commissioners of Fisheries for Maine made the attempt to have fish-ways constructed over the dams on the Penobscot River. Their efforts and the wishes of the people were defeated by the determined opposition of the mill owners. The case was taken to the courts, and the commissioners in behalf of the State triumphed, but the fish-ways are not yet built.

At the expiration of the statute of limitation exempting the owners of the Augusta dam from the execution of the law enforcing fish-ways, the Commissioners were solicited for an immediate enforcement of the law. A notice was served upon the owners and occupants of the dam at Augusta of a hearing, and a hearing was duly held. When the survey was made by E. A. Brackett, the engineer whose patented fish-way it was proposed to use, the Hon. James W. North, Mayor of Augusta, and Col. DeWitt, the representative of the Messrs. Sprague, were present. A thorough explanation of the intended fish-way, its location, place of entrance into the canal, all was talked over, and met the entire approval of the agent of the mill owners. So soon as the plan could be got ready, they were served by an officer, with an order requiring the fish-ways to be constructed according to plan and specifications annexed, by the first day of September, on Col. DeWitt, who represented the mill owners as their agent and engineer. On the 28th of October, the fish-ways were constructed, and no apparent objection being evident of complying with the order of the Commissioners, the matter was placed in the hands of the County Attorney and the mill owners were indicted by the Grand Jury.

Two fish-ways have been finished in Machias, and another will be built.

The Commissioners urge the necessity of a more uniform system of fishing laws for the State, especially in the matter of close time; the punishing of offenders who hang around the waters and destroy the fish; that no charter be granted for the construction of any dam on brook, stream, river or outlet of pond, without making it imperative on the parties or applicants that they build a fishway, and a more rigid enforcement of the law forbidding the throwing of sawdust and other waste into rivers.

The report closes with a summary of the year's operations at the Bucksport Salmon Breeding Works, under the direction of Charles E. Adams, formerly fish commissioner. He placed in the pond, this year, 590 living salmon; but from this small supply of breeding salmon were obtained a large number of eggs, and at a lower cost than ever before.

The whole number of salmon of all kinds recaptured, was also much greater than in former years. The 590 salmon placed alive in the pond in the Summer, were reduced by known deaths to 562, and of this number 519 were caught in the Fall—187 males, 341 females. Total number of eggs taken, 3,089,000. The cost of the season's work up to the time of distributing the eggs (March next) may be estimated at about \$6,000, which gives \$2 per thousand as the cost of collecting, developing and packing the eggs. When compared with the cost in previous seasons, this shows a very satisfactory progress in the direction of economy, in the face of a smaller number of breeding salmon purchased and of a higher price paid for them.

On the 25th day of October there were received 100,000 eggs, which had been shipped by Mr. Stone, of California, nine days before. On unpacking, the temperature of the interior of the box was found to be 70° F., that of the air, at the time and place being 50° F. As might be expected, the inner portions of the package were in a very unhealthy state and very few of the eggs therein proved good. Those eggs in the outer portions of the package were however, in

very good condition. The whole number of bad eggs picked out to this date is 63,600. Of the 37,400 remaining, about one half are hatched out, making for the most part strong, healthy fish.

AMERICAN FISH CULTURISTS' ASSOCIATION.—The next meeting of this association will be held in New York, February 9th, 1875, at No. 10 Warren street. As the past year has been one of activity and progress in the science of fish culture, it is expected that this meeting will be one of the most interesting and instructive ever held by the Association.

MEDAL TO SETH GREEN.—The New York State Agricultural Society has presented an elegant gold medal to Seth Green. It is over two inches in diameter and very heavy. Around the edge are the words "New York State Agricultural Society," inside is a wreath of corn, wheat, &c., containing the inscription, "To Seth Green for his services to the State, in fish culture. Rochester, 1874." On the reverse is a figure of Ceres. It is a very elegant affair, and the greatest beauty of it is, it is well deserved.

T. C. Bergen, of Bergen Park, Jefferson county, Colorado, is constructing a fish breeding establishment at his place, with a lake containing an area of seventy-five acres. When the lake is ready it will be stocked with Bear Creek trout, and as these are already acclimated, good results may be looked for. Fish culture, at no distant day, is destined to be an extensive and profitable industry in Colorado.

THE SPAWNING SEASON.—Here are some timely words printed in the *Western Rural* from Dr. W. A. Fraai, of Elgin, Illinois:—

"We are now in the season for the spawning of the trout. Many people over the State as well as in other States have built hatching houses and are intending hatching their own trout eggs. There seems to be a larger interest now taken in fish culture than ever before; but from all appearances the water is much more abundant there than here in Illinois, or adjoining States, and to get a description of water, as I do from Colorado, would almost make one dissatisfied with his own home, especially if he is a lover of fishing or fish.

The season for spawning of the salmon trout is now past, and their eggs will commence hatching next month; it requires nearly the same length of time that it does the trout, or from seven to eight days, according to the temperature of the water. White fish are another fall spawning fish which grow in our fresh water, but it requires only about half the time to hatch a white fish egg that it does those of trout.

Perhaps a word in relation to building trout ponds may be a benefit to some. Many persons have had trouble with crawfish burrowing through their dams, where they have built these dams not only from a muck soil that does not allow the hole to fill up after the crawfish has burrowed through; and a leak once started only grows larger in a soil of this kind.

When gravel cannot be got, a brick wall of four inches, laid up in the centre of the dam, will prevent crawfish from going through; but where gravel can be secured it is preferable to an embankment, as anything burrowing in the gravel, the material fills up after them, and if but a thick covering of gravel, say two feet, can be put on the side of the embankment, it will be found equal to all emergencies. If sink or muskrat should give trouble, the bank should be coated on both sides with gravel, as neither of these animals will burrow in this material.

A matter of a good deal of importance to those who are hatching their own trout eggs is to secure the spawn from early spawning fish, as the eggs from these bring fish that spawn early, and it is much pleasanter handling trout in the early Fall, than in December and January, to secure one's eggs, as it is anything but pleasant to have the hands in the water for an hour or two when the thermometer is down to zero. And now a word in relation to trout eggs; they cannot be shipped for some thirty days after being taken and impregnated. To move trout eggs ten days after being impregnated, ten miles, would result in a loss of 90 per cent.; but trout eggs thirty days after impregnation will stand a ten days' journey, properly packed, with a loss of but very few.

P. B. Downs, Esq., one of the Maryland Fish Commissioners, placed a large quantity of salmon a few weeks ago, in Marsh Run, Maryland. Since that time he has stocked the Conococheague, near Hagers-town, with 7,000 salmon. We trust that the experiment will be successful. In regard to the salmon placed in the Delaware two or three years ago, we have heard nothing this year that would indicate the success of the experiment; but why it should fail in such a river, apparently so well adapted to salmon, we cannot language.—*Germania Telegraph*.

LEESBURG, VA., December 25, 1874.

EDITOR FOREST AND STREAM:—I am engaged in slow length along. The filters, aqueducts and a carbonized hatching trough have been made, and will be down, we hope, by the 3d of next January. The spring to be used has a temperature of about 52° all the year through, and has had trout in it for two or three years. It will fill all the year a pipe three inches in diameter. We mean to make three plank ponds, small, but large enough, we think, for 200 or 300 breeders, 500 or 600 yearlings, and 500 or 600 fry.

—Our excellent contemporary, *Der Waldmann*, of Leipzig, Germany, contained some spirited hunting sketches last week. One, the boar chase, was described in the most graphic manner, and the article was illustrated in a manner worthy of any enterprising journal. This is one of the most valued of our exchanges, and is in every way worthy the support of sportsmen.

—A bear was recently shot at Uxbridge. It was of immense length, but was evidently half starved.—*Toronto Globe*.

[Yes; he was very long—without food.—Ed. F. & S.]

Natural History.

For Forest and Stream.

ROAMERS.

THERE have been a number of Southern birds killed far beyond their usual Northern and Eastern limits this year, and two of them deserve especial mention from the fact that they hardly come within the term "occasional visitors" to the region where they were found. An canvas backed duck, (*Pelecanus californicus*), was shot from a small flock of ducks, eight in number, I believe, in Casco Bay, within three miles of the City of Portland, Maine, a red headed duck, (*Fuligula ferina*), being obtained from the same flock, which was approached on the water by a sailboat. Both these ducks were males, the red head being in very good plumage, and the canvas back was apparently a young bird; they were killed in October last.

In Cumberland county, Maine, a common vulture, (*Cathartes aura*, or turkey buzzard, was caught in a trap, and kept alive for many weeks, finally coming into the possession of Lincoln Daniels, Taxidermist, of Portland, who killed it, and now has the skin mounted in a most artistic manner. And in this connection let me speak in favor of those much maligned birds, the turkey buzzards, so seldom favorably spoken of; being anatomized as "foul," "stinking," &c., which opprobrious epithets are mainly due to the fact that sometimes when caught, or suddenly alarmed, they disgorge their food, which food gives forth a strong and disagreeable odor. The scent of the bird is no stronger than that of a crow; nor is it so disagreeable to my olfactory nerves as the scent of a noble and noble bird. Compared with our National bird the turkey buzzard appears favorably in many respects. An eagle is noble only in appearance, and not noble in character; having great strength which he uses as a tyrant, he does not hunt for food if it can be obtained by robbery, nor will he make an effort to capture living game if dead can be found. I once saw an eagle alight near the body of a skunk which had been dead many days, and commenced a meal in the most disgusting manner, by my attempt to approach. Once only have I seen an eagle capture live food. It was an eel; and caught in a small stream which was "alive with them," at a place where the water was so shoal that the eagle did not immerse its body, nor drop from above as does the osprey, but flapped along close to the water's surface with dangling legs, and finally succeeded in picking up a large eel in its usual backward manner. From among the myriads which had been partially enclosed at that place by the receding tide. At that time immense numbers of eels were driven into this stream by the abundance of bluefish at its mouth; (and a stuffed eelskin was very taking in trolling for bluefish.) Against this one instance of an eagle getting a fresh dinner honestly, I have witnessed many times a robbery, or attempts at such, by eagles, and will mention one incident in which the coward was defeated.

One day in Springs I was standing on the shore of a lake, (or as named by the people of its vicinity, pond, although upwards of six miles in length), my attention was attracted by the loud and repeated cries of a loon, or great Northern diver, (*Columbus glacialis*), but not perceiving the bird I brought into requisition a small pyxide in which the eel had disappeared under water, and at the same time an eagle alighted on a tree of an islet within sixty rods of the loon. The presence of the eagle tended to confirm my first impression that they were alarm notes which the loon had sounded, and not a call to its mate; and I watched with the glass, interested to ascertain the cause of apparent alarm that a loon might have at the sight of an eagle, thinking that possibly the loon had a nest on the islet where the eagle alighted, although very early in the season, (April). The loon reappeared, and quietly proceeded to fish without changing its location. After repeatedly diving it was finally successful, as I judged from its movements, the distance preventing me from seeing if there was a fish held in the bill. The eagle had remained motionless on the tree, and I had shut him out of my field of vision, when suddenly he appeared, making a dash for the loon, rising slightly above the water and repeating the attack, while the loon, instead of diving and thus avoiding its foe, with raised body and extended wings, beat off the assailant, who, after several attacks, being vigorously repulsed each time, retired in defeat. During the contest the loon kept up its cries continuously, and I believe that there had been an encounter previously, when my attention was first attracted by the cries of the loon.

It was these incidents to show "what's in a name" for the eagle has been much exalted in poetry and history, and I have heard many persons avow that they would never kill an eagle, because "he is such a noble fellow, and our National bird you know." Although not attempting to exalt the vulture, I would save him from abuse. Vultures are not more "filthy" in person than eagles, and the results of my examinations of a few show that the former are generally less infested with vermin, and that the latter are not more dainty in choice of food, nor is their flight so graceful as that of the turkey buzzard.

To this day it is the popular (and most erroneous) belief that vultures feed solely from carrion, and discover their food by the sense of smell. I believe that they cannot distinguish the air and cannot discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the vultures had discovered meat, and they will discover a freshly slain animal quite as quickly as a putrid one. Once discovered, they never wait for meat to decay, which would be but a short time, however, in a Southern climate, ere commencing a meal. I have left freshly killed game, and found on my return less than two hours afterward that the v

subject, as to their points and utility for sporting purposes. My breed runs from twenty-one to twenty-two inches high at the shoulder, are closely curled all over the body; color, very dark liver; tail thick at the root, and tapers to a sting at the point, free from feather underneath; the legs are well furnished all round; they are very firmly built, looking as square as a cart horse, when adult; the head is larger than, in most other spaniels, with a rich, dark brown eye face from the eye to the nose perfectly smooth; the head is crowned with a large top knot, which is one of their principle characteristics; ears from twenty-four to twenty-six inches long from point to point, but in a very good specimen they will measure thirty inches, or even more. They are high-mettled, courageous dogs, that will jump from any height into the water, and face it in the coldest weather as often as any reasonable man would let them. I consider that where a sportsman only keeps one dog, and where his bag may be made up of, say a dozen kinds of game, an Irish water spaniel is the most suitable, as they will hunt well, keeping within easy distance, they will drop to wind or shot, and retrieve your game as tenderly as any other breed. For wild fowl or rabbit shooting they are invaluable, and can stand the severest cold without injury, seldom contracting rheumatism, on account of the protection afforded by their oily coat. They will live in water, and dive like ducks, either after wild fowl, or anything thrown in for them. As a companion for man, they are not to be beaten. I could relate numerous stories of their sagacity and tricks, but must not take up too much of your valuable space. Suffice it to say, that they are good curies, may be trained to act as valet, errand boy (if you will allow the term) and anything that any other dog can be taught. Just one fact and I have done. Some years ago I was walking out with a friend and an old dog named Boatwain. To let my friend see some of the old dog's tricks, I allowed others, but my friend came down on the grass by the roadside, and after walking on over a mile we went him back for it; a man who was breaking stones on the road saw him go back, and guessed that he was sent for something we had left, as he returned with the knife. The man layd him, throwing the dog some of his dinner which he had with him. Boatwain put the knife down to eat the meat, which the man as quickly picked up and pocketed, but when the dog had eaten the food he looked round for the knife, not finding it, with something more than himself he understood how matters were, and going to the man he reared himself up against him, growling very menacingly, until the man got so frightened that he threw the knife on the ground, glad to get Mr. Boatwain to retire quick, which he did, bringing the knife safely to my hand. J. S. SKIDMORE.

BEAGLES.

LAGRANGE, MO., December 21, 1874.

EDITOR FOREST AND STREAM.—I send in your paper a good many inquiries for beagles. The best way to obtain one would be to get in communication with the master of a pack in England, and draft from his pack. Kent is the best county in England for them, and I have known of a pack there all under eleven inches in height and perfect at their work. A beagle may be quite a good sized dog, or very diminutive; the smaller, if healthy and well furnished, are the most valuable. Any one writing for beagles for his country should distinctly say, rabbit beagles, in contradistinction to the beagle used for hunting the hare, which in England is crossed with the harrier. E. W. H.

For Forest and Stream.

ON THE DEATH OF "DASH," THE CHAMPION OF AMERICA.

THE famous old hero has gone to his rest, We will welcome him here never more; He has hunted his best, and he quickly sleeps, While the hearts that have loved him are sore.

No more will he answer his master's caress, No more will he waken his pride; With a break in his voice, and tears in his eyes, He will tell you the old dog has died.

How lonely he'll be without his old friend, How deeply for Dash will he mourn; And saddened will many a sportsman's heart be, When they hear that our champion has gone.

His fame will live after him many a year, (Old hero, so faithful and brave); And his memory will ever be green in our hearts, As the grass that grows over his grave.

Farewell dear old friend! The last, sad good by Has been said, and you're now of the past; Your mission fulfilled, you have laid yourself down, And saved life's enigmas at last. B. L. R.

December 11, 1874.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.		
Pompano.	Trot (black bass).	Sheepshead.
Sauger.	Drum (two species).	Talifish.
Group.	Kingfish.	Sea Bass.
Lochfish.	Striped Bass.	

FISH FOR MARKET.—Codfish is still abundant at 8 cents per pound, as the Long Island fishermen are yet doing a good business. Halibut is down to 20 cents per pound. Blue fish from Norfolk, Virginia, is coming in profusely, and sells at 10 cents; striped bass from the Hudson River and Newburyport, Massachusetts, brings from 18 to 25 cents per pound, according to size. Snails are so common as to overstock the market; they come from Maine, retail price 15 cents per pound. White perch is abundant at 15 cents; king fish, from Key West, at 18 cents; Spanish mackerel, from Florida, at 50 cents; Shad, from Savannah, which is profuse enough to supply the demand, bring \$1 each, though few will exceed two pounds and a half in weight. Red snappers, from Savannah, sell at 20 cents per pound; and hardshell crabs at \$2 per 100, while the soft shell variety bring \$1 per dozen.

Probably the greatest catch of eels on record is that made by Reeves & Aldrich's seine in Shinnecock Bay a few days ago. The bay had been closed for some time, and when the serf broke over the beach, the eels started for the salt water, when the seine was cast and 2,500 dozen were taken at one haul, 150 dozen of which weighed at least three pounds each. During the night over 4,000 dozen were taken.

Large numbers of eels are being caught in nets about the shores of Staten Island. They are readily sold in the New York market at from 10 to 12 cents per pound.

Now, concerning eels, we have a story of our own to relate:

BARNES, MINN., January 15. An exchange says: "A Minnesota flouring mill was stopped the other day by a gorge of fish and four tons of them were removed; the boys never have to spit on their bait in Minnesota."

This extract brings to mind a somewhat similar instance that occurred years ago on the stream where we were raised, the Norton Creek, in Lower Canada, only in this case the fish were eels on their annual fall migration to the salt water. The mill was old fashioned, bucket-rigged, undershot power, and the time, late in the afternoon, running with a full head on. Boy fashion, we were leaning over the hopper, asking questions of the good natured Mr. McGillon, now of Burr Oak, Wis., when the rapid motion of the buzzing stones began to lessen sensibly. Pushing down the gate and letting the full power on, started them up again for a few moments, but they began to go slower and slower, till finally they stopped stock still. We, as at his wits end, the oiled the shafts, we raised and lowered the gate, but no use; the stones would not revolve, and with a lantern we descended into the wheel room, and then by a ladder into still lower depths, a horrible place, that always reminded us of those fearful "bone orchards," the catacombs of Rome, a foul-smelling, slimy, damp, musty place, sixty feet long by twenty to thirty wide, and three feet deep below the wheels with dead and withering eels, crushed by the cogs of the wheels as they passed through. The wheels were gorged full, every bucket had all it could hold; above the wheels, the water was alive with the crawling creatures uninjured, and the "race" above the mill, a stream six to eight feet broad, was full of eels, till it struck the broad river, twenty rods above. The water was running over the dam, and how many got safely down stream cannot be computed. The rush was over by daylight, and the miller and his assistants (by all the boys in town, went to hoisting the game from the lower decks into daylight. They filled a large store-room four feet deep with eels, about half of them bruisd, but in very good order. Word was sent to the different villagers near by, and about noon the *habitués* in their little two-wheeled carts began to arrive. The word was given, "help yourselves," and such a jabbering of French, such a slashing among the eels, and such a "ho ho ho" as no eel has not been heard or smelt before or since around that isolated little town.

This is a "fish story," but it is as true as that the old mill stands on its solid rock foundation yet; as true as that the Norton creek (the stream on which we first wet a line) still rolls its amber-colored current to the St. Lawrence, and many middle-aged Montreals—boys then—will remember the facts and the incidents of the "eel fresher."

HAVLAND.

—The Islip oysterman report that oysters are rather scarce this season, but unusually fine.

—During the last whaling voyage of the barque Nile of New London, a whale was captured, in the head of which was found the head of a Scotch gun harpoon, marked "True Love, 1861." This ship True Love has not cruised for eight years, and the whale must have carried the iron for that period, if not longer.

—The Atlantic Works of East Boston, have contracted with Messrs. Joseph Church & Co., of Fall River, to build for them a steam vessel for engaging in the porgy business.

—Four Gloucester fishing vessels have been lost this season in the Grand Bank fishery—three of them with all of their crews. A fifth is now given up as lost with her crew of thirteen men.

—Our esteemed correspondent, E. J. Hooper, Esq., of San Francisco, has written a very interesting article on some of the principal fishes of California, in one of the California journals. These contributions are of much value to science, so we hope to hear further from Mr. Hooper.

—Every river and stream in Florida abounds in fish of numerous varieties. Shad catching commences in December and lasts until May, when you get North. Numbers are sent to Savannah and the interior of Georgia and to Charleston. Shad were so plentiful last Winter in Jacksonville that they sold two for twenty-five cents. Our mullets begin to appear in July. In August and September they are in their prime, some of them weigh as much as four pounds. They are so plentiful that we have known six of them to sell for twenty-five cents, and in St. Augustine they are still cheaper. A great trade could be done in these fish; they are so fat that the oil alone would pay for extracting, or they could be salted and packed in barrels to be exported, as mackerel are treated. The roes dried in the sun are a great delicacy, and if known in the Northern markets would command a price of from 2,000 to 3,000 cents have been caught at one haul of a small seine. Our mullet here much resemble the West Indian calpepper, so highly prized there, and we think is the same fish. In the West Indies the fish as caught are cleaned and seasoned with black pepper, stuffed with bread crumbs, wrapped in a banana leaf and baked; it is then a delicious dish fit for the gods. The fish is brewed with shrimps seven months during the Summer. They are usually retailed at ten cents per quart, but only a limited quantity can be sold at that price. They are large and fine, and a profitable business could be carried on in putting and canning them during the season. Of sheepshead, bass, croakers, brim and perch, we have an inexhaustible supply. Young hickory shad and bony fish through the St. John's River in such quantities that a person can catch barrels with a common cast net.—Florida Agriculturist.

STRIPED BASS FISHING AT NIAN TIC.

New York, December 21, 1874.

EDITOR FOREST AND STREAM.—It was my good fortune last Nov. to spend a week at Niantic, fishing in the river of the same name for striped bass, one of the most beautiful and gamest fish taken on our coast, and the fishing at this point is the more attractive, as it is done from a bridge not twenty yards from the hotel on the flood tide, and from below the railroad track at the ebb, and trawling at night over five hundred yards of sparkling and clear water, as can be found in Lake Champlain. The stream is very rapid, and from the bridge the line sweeps a whole width of the river at this point of the channel. A small fish called mummy-clags are used for bait, hooking them through the month, thus permitting them to use their gills, and in this way they live for hours. Some of the craft here use small eels for bait. The bass ran from five to seven pounds when I

was there, as the school fish were running up the river, but one gentle man trawling at night struck a bass which carried his rod under the boat, and not long before a fish weighing thirty-five pounds was taken by the landlord, and he recently wrote me that he had struck a bass which carried away his tackle, after trying to drown the fish for half an hour. The hotel is exceedingly comfortable, and the rooms and beds excellent, and the fishing ground within call of the dinner bell. Blood Point, one mile from Niantic, is a famous resort for fishing for large striped bass, and one was taken there while I was at Niantic weighing over fifty pounds. Niantic is six miles this side of New London, and is reached from East Lyme, Conn., and is one mile from that place. A fish called hickory shad were in the Niantic River by thousands, but could not be persuaded to take the hook although Mr. D. B. Road, the proprietor of the hotel, tried them repeatedly with "bad fish," but I have since learned at Barnes' point that they will bite a piece of red wax, and would afford sport, as they are about two pounds in weight and very game, although not considered a good fish for the table. The comfort in fishing from this point (no spray nor wetting) must commend it to the angler, properly equipped with rod and reel. F. C. F.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—President Ferry of the Yale navy and Capt. Otis of Harvard, are said to be much in favor of the New London course for the next regatta, and the *Saratoga* says that two-thirds of the colleges are of the same mind. The New London hotels would accommodate 1,000 guests, while the neighboring villages, easily accessible by steam and rail, would quarter the rest.—Springfield Republican.

NATIONAL AMATEUR ASSOCIATION.—A meeting of the Executive Committee of the National Association of Amateur Oarsmen will be held at the Astor House, New York, Saturday, Jan. 3, 1875, for the purpose of appointing a time and selecting a course for the next national regatta. Any communications received by me before that date will be duly presented to the Committee.

Very respectfully,
J. C. PINKERTON,
309 Chestnut St., Philadelphia
Secretary Ex. Com.

—Sadler, the English oarsman, has agreed to row Brown, on Bedford Basin, in June or July next.

—A despatch from Koeckland to the Press says that during the late blow the yachts *Beeswax* and *Medora* went ashore at Dix Island. The *Medora* was sunk and the *Beeswax* was a total loss. The *Medora* was raised.

THE CLASSIFICATION OF YACHTS OF DIFFERENT RIGS.

THERE is a very strong feeling among yachting men against mixed races, that is to say, races in which yachts of different rigs compete together, yawls and schooners being either of the same or different rig, or a reduction of tonnage; and there can be no doubt that many reasons it would be better to have separate matches for the various rigs; although at the same time we would regret very much if mixed races were entirely abolished. It is quite true that in a schooner's day when there is a great deal of reaching, the two-sticker, even without claiming any allowance, is quite as much a match for the cutter as the latter is for the former when there is much turning to windward, and that therefore the result of a race between these two rigs depends chiefly on the direction of the wind and the shape of the course. The yawl is in somewhat the same position as regards meeting a cutter, the only difference being that she is better on a wind than a schooner, but not so good in reaching. In very strong breeze she is or ought to be as good as a cutter, on every point of sailing, and in fact, as her rig is not so different a cutter, so do her sailing points. It has been frequently proposed to class cutters and yawls together and race schooners alone, but to this the owners of cutters object on the grounds that they cannot meet them with a reasonable chance of success at the present reduction of one-fourth of their tonnage. That this is true in a strong gale and a heavy sea is undoubtedly, but under ordinary circumstances it is so or becomes to be so, that the result of a race between these two rigs—have succeeded in beating some of our fastest cutters, and one in particular, the Florida, appears to be too much for anything at present afloat, but this does not prove the rig to have an undue advantage with its present allowance, as it may be that the vessel herself is an extraordinarily good one, and might be even more formidable rigged as a cutter. Racing yachts of different rigs together has been the means of improving at least two of these rigs so much that we think it would be unwise in the interest of yachting to utterly abolish the practice. If schooners had not been forced to meet cutters, it might never have been thought necessary to build vessels so close-winded as *Cetonia*, *Sea Belle*, etc.; and if they did not occasionally race together we would have no means of knowing how much we had improved our present points of sailing. We had perhaps perfectly just and proper for the cutter men to say they have no chance against a schooner in a beam wind; but if so the owners of schooners might equally object to meeting cutters in a dead beat to windward, so that it appears as if the justice (or injustice if the word is preferred) was equally balanced, but yet the complaints are generally on the cutters' side. It is perhaps with some such view as this, comparing the various rigs that so many yacht clubs now give prizes in mixed races for each rig, and a better plan for doing so, and at the same time giving satisfaction to all could not be devised; but when two or three prizes are given of different values, the first vessel of any rig saving her time should take the largest prize, the next yacht of different rigs saving their times taking the other two, and not, as is sometimes the case,

A WEEKLY JOURNAL,

DEVOTED TO FISH AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INFLUENCE IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK. 135 SOUTH THIRD STREET, PHILADELPHIA. 103 & 104 MADISON ST., CHICAGO.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 31, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guarantee of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen apartment from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

HAPPY NEW YEAR!

TO the readers of FOREST AND STREAM we extend our second New Year's greeting. Much useful and pleasant intercourse have we enjoyed during the twelve months past. Much we owe to many of our patrons, who have identified themselves with the interests of the journal they support by contributions, freely given, to the general fund of information gathered for the common good. It is a pleasure to conduct a paper where such kindly sympathy is so generally manifested, and where words of good cheer and friendly encouragement accompany nearly every missive received by mail. It will be our aim always to fill up the measure of our recompense to them, and as rapidly as our increased resources will justify the outlay, we shall add to our attractions in quantity, quality, variety, and embellishment. To the Smithsonian Institution, the State Fish Commissioners, the leading fish culturists, the officers of sportsmen's clubs, and army officers on the frontier, we are specially indebted for information not otherwise available. Were it not invidious to mention names, we would gladly designate individuals who have rendered us most servicable aid. It is our ambition to produce a journal that shall dignify the efforts of its founders, and be worthy the support of the estimable class of society for which it caters. When it shall have attained that high-standard of excellence to which we aspire, we shall be willing to accept the pecuniary reward that follows success, though we shall ever prefer a good name and fair record to the highest emoluments.

The recurrence of the New Year is not only a season for friendly greetings, but for good resolves: and each good resolve, whether carried out or not, brings the world one step nearer to the Millennium, and the Era of Perfect Man. If, therefore, our friends would hasten the coming of the beatific day, let them resolve at once to subscribe for FOREST AND STREAM, and recommend it to those who love the pursuits of the field and whatever tends to elevate man physically, mentally, and morally. As the welcome Holiday, with its joyous festivities, closes upon us, let us determine to make the coming year one of substantial progress in these respects, so that we may approach as near as possible to the ideal standard. And with this sentiment upon our lips, as the year of 1874 goes down forever, we wish you all a HAPPY NEW YEAR.

LIEUTENANT WHEELER'S REPORT.

THE annual report of Lieutenant George M. Wheeler, Corps of Engineers, on the work accomplished by the expedition under his command in California, Nevada, Utah, Arizona, Colorado, New Mexico, Wyoming and Montana, has been published by the Government. It is a very important document, as it presents in a concise form the characteristics of the regions surveyed, and their flora and fauna. The collections made of the latter are very large and important. In 1873 the work of the party devoted to natural history may be deduced from the fact that they secured seven Indian crania, one hundred and sixty mammals, one thousand and two hundred bird skins, five hundred birds eggs, twenty-five birds nests, fifty birds crania, skeletons and sterna, one hundred and forty-five reptiles, five hundred and five fish, five hundred beetles, (Coleoptera); one hundred and fifty butterflies, (Lepidoptera); five hundred grasshoppers, (Orthoptera); thirteen lots of flies, (Diptera); thirteen lots of bugs, (Hemiptera); twelve lots of worms, leeches, larvae, &c., seven lots of ants, (Formica); fifty-five lots of shells, land and fresh water; twenty-four lots of dragon flies, (Neuroptera); twenty-eight lots of bees and wasps, (Hymenoptera); twenty-six lots of spiders, scorpions, &c., (Arachnida); and fifteen thousand plants, embracing at least one thousand and five hundred species.

This collection contains many new as well as many rare species, seldom to be found in public museums. As in former years, the plan has been continued of distributing the specimens to eminent scientists. The fossils of the regions traversed were also scrupulously sought, so the consequence is that several new species of the fauna of the past were found, among the most interesting being four species of the *Toxodontia*. The report on the paleontological collection has been made by Prof. Cope, and to those fond of that class of information it will prove very interesting, as the characteristic distinctions and affinities of each animal are given in detail. One of the results of the examination of the field season of 1874, was the discovery of an extensive series of deposits of the Eocene Age, a fact which would prove that the portion of New Mexico now drained by the Chama River and its tributaries was an extensive lake of fresh water in the Tertiary period. This lake received the remains of the fauna of its shores, and preserved them in its deposit.

The upper formation is a moderate thickness of rather soft marine rocks, containing numerous shells, *Aerolites*, *Gastropoda*, and *Cephalopoda*, including *Oysters*, *Bivalves*, and *Ammonites*, resembling *A. placentis* most, with sharks' teeth.

A considerable number of species of *Vertebrata* have been obtained, a large majority of which are *Mammalia*. While it is premature to attempt to determine fully the character of the fauna, enough has been ascertained to indicate marked differences from that of the Bridger group of Wyoming. It is peculiar in the entire absence of the genus *Pulcoyosops*, so characteristic of the former, and its replacement by *Bathmodon*, which has never been recorded from the Bridger formation. The abundant species of *Hyrachyus* of the Bridger are here represented by a single one of small size, which occurs but rarely, while its companion, *Hypopodus*, is very rare, or wanting. While game mammals are abundant in both, the *Amelias* and *Silvius* have not yet rewarded the examinations. The characteristic genera of the New Mexican fauna are *Bathmodon*, *Cope*; *Hyposyus*, *Leidy*; and *Phenacodus*, *Cope*, genera which it shares with the *Bathmodon* bed of the Green River formation of the Bear River, Wyoming. There is in all respects so close a resemblance between these deposits as to lead to the belief in their horizontal identity, and with other reasons, to give to the Southern basin a higher antiquity than belongs to the celebrated Bridger series. The interesting fact that the teeth of six or seven species of sharks and one *Ostrea* have been deposited with the mammalian remains indicates that the marine Cretaceous rocks formed the coast-material of this lake, and the earlier period of its deposit is probable on various grounds, to be considered at a future time. The facts are all confirmatory of the view already expressed that the population of the Bridger epoch was derived by migration from a Southern region.

Perhaps the most important addition to paleontological science obtained during the course of the investigation is the discovery of four species of two new genera, *Celanodon* and *Ectoganus* of *Toxodontia*, an order which has not been heretofore identified as having existed on the North American continent.

These important facts in science were not obtained without suffering much from hunger, heat and hardship; and the fact that the party prosecuted their mission with enthusiasm under all adverse circumstances, entitle them to the kind consideration of the scientific world.

TALLY ONE.—The following note from an advertiser is similar in its purport to others that we have printed from time to time, and to several that we have never published. It is valuable testimony to the usefulness of FOREST AND STREAM as an advertising medium on sportsmen:—

VAPARARAO, Ind., December 24, 1874.

EDITOR FOREST AND STREAM:—

Your valued order goes to-day. Since I began to advertise in your paper my trade has kept me at work night and day. I miss it will have to take out the advertisement, or let my gun rust; have no time for shooting, or anything else. But, on the second thought, let it run, because I would be a public benefactor, and am nearer that when making a good shooting jacket than any other time. Yours truly, W. H. HOLBROOK.

NEWFOUNDLAND.

ON the first page of our paper will be found this week a very interesting sketch of a trip across Newfoundland, in the year 1822. It is taken from notes forwarded to us by Mr. Alexander Murray of St. John's, Newfoundland, who has just returned from a scientific exploration of the interior of the island. In it the naturalist will find many important facts, as it shows the distribution of the indigenous flora and fauna, and the hunter and angler will find it a mine of information, as woodcraft, the best means of camping out, exploring dress and equipments, the best mode of securing a fire when no matches can be procured, and how to avoid water or detect its presence by the cry of sea birds, are given in detail.

This is the very class of knowledge sportsmen require, so we would advise them to peruse the article with care. The present sketch will be followed by others from week to week, until we have made that interesting country more familiar to our readers than it is to its own inhabitants. This region is little known here, owing to its distance and comparative isolation, but this we intend to reverse, as it has many attractions for sportsmen and all lovers of primitive nature.

THE BREECH LOADER.

WE resume this week sketches of the principles, peculiarities and characteristics of the breech shot gun. The controversy as to the best material for barrels, and how best it should be worked, which commenced in the infancy of the art, has not yet abated. Opinions are as adverse now as they were then, and scarcely two of the trade can be found to agree.

Mr. Greener, Jr., in his work on breech loaders, insists upon the superiority of the laminated steel introduced by his father. He says:—

"It is an established fact that hard barrels can be made much lighter, that better shooting can be got of them, that they are more lasting, and that they retain superior shooting qualities longer than those made from soft metal."

He describes how this laminated steel is made, as follows:—

"Having collected a sufficiency of mild steel scraps, such as cuttings of saws, waste from steel pen making, old coach springs, and the immense variety of pieces arising from the various manufactures of tools, they are cut into pieces of equal dimensions, polished in a revolving drum by their friction against each other until quite bright, and then placed for fusion on the bed of an air furnace. The parts first fused are gathered on the end of a similarly fabricated rod in a welding state, and these gather together by their adhesion to the remainder, as they become sufficiently heated, until the bloom is complete.

"The steel is then removed from the furnace and undergoes the effect of a three-ton forge hammer and tilt, until it forms a large square bar; it is then reheated and conveyed to the roll-mill, where eventually it is reduced to the size of rod desired. A certain number are bundled together, welded, and then drawn again in the rolling-mill. After the addition of any number of times. All of which seems plain and convincing enough.

"But, on the other hand, J. D. Douglal, 50 St. James' street, London, the inventor of the celebrated Lockfast breech-loader, in his excellent work, "Shooting Simplified," says:—No.

He says that steel is the most unfit metal possible to be used, because it is the most treacherous metal used in gunnery, and he quotes Sir William Armstrong's parliamentary evidence on his own cannot to support the assertion. He says that the term laminated steel is improper. "There is no steel in it. The repeated white heats to which it is brought remove all carbonization from the metal. No barrel of steel thin enough for a fowling-piece could be made, unless at such expense as would be absurd, and would be very unsafe."

"Mr. Douglal further says that hard barrels do not, but that the soft barrels do, shoot the best and wear the longest. He prefers barrels made of silver-steel, a metal which like the laminated steel, he says, has no steel at all in it, but only has the name for commercial purposes. He adds, that the "silver-steel" barrels are certainly the safest of all. They combine the softness once so much desired in flint guns, with a hard, cold-chambered surface, outside and inside, and possess an elasticity beyond all barrels whatever. For light guns they are, consequently, incomparably the best." And so Mr. Douglal uses the silver-steel, with occasionally Damascus, and also the barrels of Liège.

"Now, who shall decide when these Doctors of Arms disagree? What non-professional shall dare assert which of these great guns is wrong?"

"But when criticising barrels, there are certain *indicia* of workmanship which should always be observed. They should be well filed, highly polished, and entirely smooth on the outside. On the inside, they should be thoroughly smooth, to prevent rust, as the less liable they are to rust, the better they can be kept, and the longer they will last.

"To inspect the barrels, hold them up against a steady, not a glaring light, put your eyes at the rear, and turn them very slowly around. If they are unevenly filed, leaving hollows and swells on the surface, the broken rays of light will disclose the fact.

"Examine the interior of them in the same way to see that no asperities have been left by the boring-lie. If nothing of this kind appears, it may be concluded that the barrels are good; for the labor and expense necessary to bring them to this perfection would not be bestowed upon unworthy material.

"It has been said that every gun in the world, like every man in the world, has its own idiosyncrasies of temper and of habit.

"This is to be taken, of course, in the sense in which it is said. No two barrels shoot exactly alike. Nor does the same gun at all times shoot exactly the same, under precisely similar conditions.

"Railroad engineers say the same of their engines, and ladies, although not exactly in those words, say so of their sewing machines. Why this should be, unless it is caused by molecular changes, can not be conjectured.

Hunt of the Irish Team.

IMMEDIATELY after the conclusion of the International Rifle Match at Creedmoor last September, between the American and Irish teams, Major Arthur B. Leech, the Irish Captain, expressed a desire on behalf of several of the members and their ladies, to visit the remote West on a short hunting excursion. Whereupon the editor of the FOREST AND STREAM offered his services, which were accepted by Maj. Leech in a courteous note, and then immediately set about arranging an acceptable programme of the trip. He entrusted the management of the Western division to G. W. Dorman, Esq., of Hannibal, Missouri, while with much telegraphing and correspondence, he essayed to make pleasant the journey between New York and Hannibal. Railway companies responded with generous alacrity, and provided passes and special coaches; the Erie railway placing at their disposal its finest palace car, costing \$10,000, which was soon after burned at Clifton, Canada. Receptions were arranged at Buffalo and Toledo, and a committee of railway officials and prominent citizens was delegated from Hannibal to go up the Wabash and Great Western Road as far as Decatur, and escort the distinguished guests to their first objective point, Hannibal, where lodging cars, dogs, hunters, tents, provisions, and all necessary equipments for the hunt were to be in readiness, provided conjointly by private parties and the Missouri, Kansas and Texas R. Co. Thence the party were to proceed to Kansas and the Indian Territory, and the hunt would begin.

Doubtless the programme and journey would have been carried out through all its agreeable continuity, had not several of the Irishmen decided to postpone the start in order to compete for the Bennett Challenge Cup on October 2d. Meanwhile, Major Leech himself, the ladies, and those not participating in the rifle match, went on a visit to Niagara Falls, and thence proceeded to Buffalo by telegraphic order, where they awaited the arrival of the rear guard on Monday noon, October 4th. This delay of six days unavoidably threw the machinery of the pre-arrangement altogether out of gear, so that when the ranks of the excursionists were closed up and numbers told off, it was found that no provision whatever had been made for the party (now comprising ten gentlemen and three ladies), all of whom were left standing at fault in the inhospitable depot shed, while the trains that should have borne them westward sped away! This fiasco so discouraged the visitors that all but five of the gentlemen and the editor of this journal, returned to Niagara Falls by the first train!

The decision of Major Leech to postpone the start dashed the ardor of the "emigrant" Maj. Leech, the distinguished chief, and the ladies, all of whom were actually in the chase at home, being left out, the hunt of the "Irish Team," as such, then and there practically received its coup de grace. The *clat* of the tour was lost in the decimation. The honorable fragment could not maintain the importance or command the consideration of the distinction which to the interviewing public was proportionately abated. Reception committees, where they were of course wiped off. Railway officials and delegates to committees, who had held themselves in readiness to meet appointments, found their professional duties pressing upon them. Special cars were commandeered. And so the original programme lapsed. The issue was unfortunate, and the disappointment great in all quarters. However, those who remained were most cordially received by the "Forester Club," of Buffalo, and made happy at their hospitable headquarters, until the departure of the midnight train for the West. The names of the undaunted were Rigby, Milner, Bagnall, Johnson and Kelly, and the number included four of the best shots in the "team." They spoke of their reception at Buffalo as one of the most pleasant of their American experiences. Arriving at Toledo with twenty minutes to spare, they found a crowd of several hundred citizens awaiting them in the depot. The head of which were His Honor, Mayor Jones, Rev. Father of Hanniu, Mr. Loeke, ("Petroleum V. Nasby") of the Toledo *Blade*, Superintendent Malcolm, and other officers of the Toledo, Wabash and Great Western Railroad. All courtesies that were possible under the circumstances were extended to them, and Father Hannin and others accompanied them forty miles to the Journey West. Fifty miles east of Hannibal, Mr. Dorman (*quies*) met them with a special car; but, alas! the courtesy extended to a meagre half dozen guests, expended itself upon a beggarly account of empty seats. At Hannibal, a few citizens, faithful in patient waiting since the Tuesday previous, received them and escorted them to the Planter's Hotel. The following morning they were joined by Mr. Edward Hope, of LaGrange, with a complement of six painters and setters, in charge of a kennel of six pointers and setters. The dogs were assigned to such quarters and erro on board the train, as no Eastern road that we wot of ever provided. Hearts that have wept and bled over the neglect and indignities that valuable canines have suffered elsewhere within their experience, would have leaped for joy now. The party, increased to nine, resumed their journey. The quantity of baggage, gun cases, and numerous packages was formidable. During three days of continuous travel, the Irishmen had been going West, and they now began to think that this was "a great country!" They longed for the *ultima thule*, still two days' journey beyond. No wilderness yet appeared, and civilization, with its populous towns, its magnificent farms, and elegant residences, kept pace with their progress, and seemed as ripe here as in the East. Pontiacs, and vast, and numerous, met them in the older States in the East. At Sedalia, Mo., passenger Superintendent Brown joined the party, with his dog, and at Schell City the first hat was made, and two days were spent over quail and prairie chickens, with a wagon load of birds as the result. Accommodation and table were found here at the R. R. Co.'s refectory, surpassed by none at the East. Potatoes, fockeries and aquaria embellished a shaded lawn, and vases of flowers up with luxuriant flowers. One morning here, while the *Team* were at breakfast, some inquisitive maddler carelessly handed a gun to the reception room adjoining, and the charge went off, making an ugly hole in the wall. Ten days afterwards, one of the country papers announced that the Lord Mayor of Dublin

had accidentally fired off a gun in the dining room, and gave near killing a servant girl! The honorable distinction that had given the party such wide-spread renown still clung to this humble fragment of riflemen in their isolation on the prairies of the far West.

An additional day's journey brought them to Cheyona, on the Kansas line, two miles from the Indian Territory. Here, within a circuit of thirty miles, was to be the principal theatre of adventure. Wagons, saddle horses, guides, hunters, cooks, more dogs, tents and provisions were counted off by the party, was now increased to thirteen. Supt. Brown had returned to Hannibal. A party of five drove over the open prairie brought them to their first camp on Cabin Creek, in the Indian Territory, an ample supply of birds for supper having been secured on the route. All traces of civilization were left behind as soon as the fire was crossed. Most exhilarating was the ride into the "Nation" over the long undulating sweeps of prairie, broken only by occasional groves of oak and long stretches of timber that fringed the beds of creeks now dry. Brown for the most part and seared by the long continued drought, the dry grass swept the knees; but here and there at intervals, where fires had run over large areas some weeks before, the blades were of intensest vivid green, looking like compacted sward at a distance, but under foot sent and scattered, affording no sustenance for the deer that usually ranged these regions. Grasshoppers, crickets and fires lit the country, and the only sign of animal life was seen. Occasionally a ground squirrel or crowish scrambled into its hole, and a solitary buzzard sailed lazily overhead. Smokes from numerous fires hung over the horizon, or belched upward in thick volume from behind some intervening knoll. In the swales, where the seeds of ranker grass afforded food for straggling flocks of prairie hens, the dogs would sometimes make a point, and a half dozen birds would drop from the sportsman's gun; and a nuttut residue flying a half mile or more out of sight and harm's way. Atmospheric effects were sometimes weird. While elevated objects stood out with remarkable distinctness, the refraction was such that the unaccustomed eye could hardly determine whether they were far off or near. They lost their distinctive outlines in a kind of mirage, so that a solitary bush that crested a knoll was mistaken for an antler ridge, and looked like a mountain range, or the stacks of hay. Toward sundown, when these objects cast their lengthened shadows, illusions were intensified, and then the vivid green of distant grass patches glowed in the light with a coppery hue that dazzled the eye. Very different to the Irishmen were these prairie experiences from the renderings of their native woods.

The hunt of the "Team" in the West had excited among the sportsmen an interest greater than mere curiosity, for the desire was general to know whether they ranged as creditably in the Field as at the Range; whether their practice would challenge favorable comparison with our own. In short, the hunt was regarded by many as a sort of field trial, which was to test their endurance of the rough vicissitudes of the bush and bivouac, and their ability to shoot over our head as far as they could see him as easily as they could pick the centre of a target at 1,000 yards range.

The discipline imposed upon them was severe from the outset. The brawny borderers who took them in charge catered for them in their own rude fashion. No duties filled their provender kit. The commissary was barren of canned fruits, condensed milk and preserved meats. A single string of onions and a jar of pickles were the only luxuries. Hard tack, salt pork, butter, tea and sugar filled the mess tin, and the mess tin was the camp at night it was a toss for the four places in the single tent. The two wagons accommodated four lodgers more, and the remainder of the party had choice of the best spots around the fire. Fifteen miles they had to travel the first day over the scathed prairie before they found any water at all, and when they pulled up at a creek which ran full in Spring, they found only a shallow puddle in the center of the stream, across which they waded, and vigorously, stirring up the mud in a roily slaver of swam. Here they were compelled to spread their blankets. Fortunately, a two-gallon keg, brought from town, furnished sufficient good water for the tea kettle. For the chicken stew six quarts of doubtful fluid were carefully skimmed in the cups from the surface of the puddle. The horses drank sparingly at the brink, and then lay down to the knees in the slough. The second night the party found a better water would have sold them at a high figure, for all were thirsty. The guides had tested two of the customary camping places, and at each found the creek beds dry and cracked, with small dead fish scattered about where the water had soaked in and left them. A third attempt disclosed a considerable puddle, and camp was accordingly made the timber hard by. There was no other water for within several miles. Green ome riddled thick on its surface. The thirsty horses blew a snarl circle into it with their nostrils, and were soon satisfied. For culinary purposes the liquid was not so sweet. Experimental tests were not assuring; and so, a frying pan and tea kettle were dispensed with. Each man cut a stick and toasted his meat over the hot coals. A Hiner (of the Tenn) had been invited to cook for the party, and he cooked the game, together with the birds that had dropped to the ground, made a most ample and delicious repast. It would have made the Lord Mayor of Dublin choke with envy to see his countrymen among that charmed circle of fourteen, squat on their haunches around the fire in the dry bed of the creek, each with his bit of a stick pointed toward the common centre of heat and happiness, watching with gaze intent the cooking of their savory fare. It was a sight that And he would have given King Kelly, of Castle Bar, credit for being no "greenhorn" had he seen him slyly whip off a generous cut of the tenderloin from the carcass beside him, and smile sardonically when others complained that their pieces were tough! With a small mouthful of whiskey to wash down their supper, the Irishmen were not invited to cook for water after a hard day's work, and himself back on the "ould sod." When all were satisfied, the guides wrapped the carcasses (what remained of it) in its hide, and swung it up on a sapling, out of reach of the coyotes. The debris was fed to the dogs, and right royally they feasted then. Commend us these dogs for patient waiting! With what schooled self-denial they lie with their noses toward the tempting viands, restraining whine and nicker until their masters have done!

Cheerily dashed the dancing freight through the branches of oak and cottonwood, glancing afar out on the treeless prairie, where hunters, outlaws and vigilantes constantly roved; but no one feared its betrayal. It would

"I quote the following passage from Mr. Greener's work, because it has especial reference to American sportsmen:—

"The usual size for breech loaders is nominally No. 12 gauge; that means to take the No. 12 cartridge case. But the size or bore of the barrel is left partly to the discretion of the maker, who bores it according to his own fancy. Thirteen bore is the actual size generally adopted, but some makers prefer twelve and even eleven bore. All these sizes could be adopted for correct shooting, as the inside of a cartridge case is exactly eleven bore. There is only one particular size that is suitable; and this has to be found out by repeated trials at a target. All first class shooting gun barrels will be found marked thirteen bore. This mark is at the breech end, stamped at the proof house. In all cases when barrels are not bored up to the size before being proved, the proof-house people mark them the size under. For instance, supposing the barrels to be thirteen and a half gauge, they mark them No. 13; and again, if the No. 12 plug will not pass easily down the barrels the whole length, they still mark them No. 13. These marks are looked on by some as denoting the exact bore of the gun, but this can not always be depended on.

All breech loading barrels are line-bored after they have received the proof mark, in order to remove the indications caused by stamping them on the proof. It happens that they are marked thirteen and gauge full twelve.

"Some Americans will insist upon having their guns marked twelve at the proof. This is a great mistake. It is impossible for us to make a really first-class shooting gun so marked. The same remarks apply to guns of ten bore. These should be marked eleven bore, which allows the barrels to be, when finished, just under ten bore. We would strongly recommend all purchasers of breech loaders to state the size of cartridge case they wish to use, and leave the question of the bore to the gunmaker."

ANOTHER SPORTSMEN'S CONVENTION.—We cheerfully comply with the request of the committee to publish the following call for a Convention to meet at St. Louis next 12th January, and will do everything in our power to further its objects. The call embodies the resolutions adopted at the organization of the National Sportsmen's Association at Niagara Falls last September, but as they are long, and we have already published them in this journal, we have omitted them in that part of the Circular indicated by asterisks. (*)

St. Louis, December 1st, 1874.

To the Sportsmen of Missouri.

Realizing the great and growing necessity of a concerted effort on the part of amateur sportsmen throughout the State to secure to our game and fish that intelligent and reasonable protection against unseasonable and wholesale destruction which is requisite to prevent their total extermination, the "Missouri Sportsmen's Club and Game Law Association" of the city of St. Louis, at a regular meeting thereof, held November 12, 1874, adopted the following resolutions:

"Resolved, That this Association issue a call for a mass convention of amateur sportsmen of the State, to be held at the Madison House, in Jefferson City, on Tuesday, January 12, 1875, at 7 o'clock, P. M., then and there to take steps towards organizing a State Association, under the jurisdiction of, and in harmony with, the National Sportsmen's Association of the United States.

"Resolved, That all amateur sportsmen throughout the State, independent of local organizations, be and they are hereby invited to attend and participate in the deliberations of the convention, and that all organized clubs be requested and urged to unite with this club in sending full delegations to the convention, and in taking such action as will insure a large representative attendance.

"Resolved, That C. C. Smith, J. D. Johnson, John W. Munsey, Basil Duke, Charles H. Turner, Edward P. Lindley, and W. H. Wadsworth, be and are hereby appointed delegates of this Association to said convention; also, as an executive committee, with full authority to issue addresses, carry on correspondence, and to arrange all necessary details for the meeting of the proposed convention."

The game birds and animals are slowly disappearing from our State as they are from other Western States, and as they have already disappeared from many of the Eastern States. At the rate of decrease now, and without the intervention of strict laws rigidly enforced, our fields and forests will soon be barren of every species of game, and the pleasures of the sportsman destroyed.

By the proper organization of a State club, and of active local clubs in every part of the State, and by securing the passage and enforcement of such laws as are suggested by the resolutions of the National Association, we can not only maintain the present supply of game, but increase it in a ten-fold ratio within a reasonable period. The foregoing suggestions apply with equal pertinency to the fish in our streams and lakes.

As a majority of us use the gun and rod possess equal attractions, and the same end and profit of use, either are being dissipated and destroyed by unnecessary men. It devolves upon sportsmen to save to themselves their sport, and they can do it now only by a united and organized effort.

The convention will meet at the time and place specified in the resolutions, and we depend upon the true sportsmen of the State to make it a success in point of numbers and influence and the work it will accomplish. Let there be an individual representation from every county, and by all means a large representation from each organized club in the State.

All communications on the subject of the convention addressed to W. H. Wadsworth, 218 Walnut street, St. Louis, Mo., will meet with prompt attention. C. C. Smith, J. D. Johnson, John W. Munsey, Charles H. Turner, Edward P. Lindley, W. H. Wadsworth, Basil Duke, Committee.

OUR FLORIDA EXPEDITION.—A telegram from our correspondent "Al Fresno," dated at Punta Rassa, West coast of Florida, says:—"All well; start for the interior this morning." We have anticipated frequent notes of progress from him, but it is evidently intended to defer communicating with this journal until a complete narrative can be furnished in detail. Writing is not easy under the conditions in which an explorer generally finds himself.

have required the courage of a formidable party to storm that camp. Four good Indian fighters, born and bred on the Plains, fourteen guns good and true, with reserve of rifles and pistols, and ammunition unlimited, two steep banks of the creek for barriers—the advantage was all in favor of the entrenched.

The bark of the prowling coyote was heard only in the distance. A solitary screech owl alone vouchsafed a recognition of their presence. And so all slept securely and serenely. The piercing stars looked down through the frosty night air with a cold white light, and those who were not nickered pulled their blankets closer under their chins and turned the other side to the fire.

The morning nail lays the substratum for the day's achievements. A good "square" men fortifies against fatigue and prepares for an arduous march or protracted hunt, although an empty larder is no mean incentive to exertion. Precious little time was devoted to culinary art-craft, when the few deer, for although unskinned, provisions were ample, the lack of water of other drinkables was severely felt.

When the teams were hitched up, the company took up the line of march for Big Cabin Creek. No birds were to be shot at this day, for larger game was sought. Only half and buck shot were dealt out to the fusiliers, and the distant range of hills, where the deer were to be hunted, became a landmark of more than ordinary interest.

The correct method of jumping or bounding deer is for two horsemen to flank the ravine or draw, and following it to its head, take the quarry on either side when it rises. Two sportsmen with a hound, though not mounted, are almost equally sure of their game, if they be dead shots, so that the struck deer will drop before running far.

It would be doing the party injustice, however, to convey the impression that the three men were usually assigned to each, one stationing himself at the head, and the other two walking up the sides. Sometimes the party would become scattered over an area of a couple of miles, each member hunting pretty much on his own hook, picking up a prairie hen at old times, and scanning the country closely for deer.

On the occasion, while on the march, the two wagons were about a mile apart, following parallel ridges. "Fire!" rumbled through the bottom, and three or four stragglers covering the intervening space. The only horseman was far in the rear galloping leisurely along the edge of the draw, when some one looking that way, saw two deer suddenly leap from the rank, dry grass, with a blue puff of smoke following from the saddle; then the deer, apparently unhurt, scurried along the open prairie, heading towards the party, the horses, and their heads, leading as he ran.

ually, and it seemed as though the game was sure to get away, there being only three men in the remaining wagon to intercept them. Two of these jumped out and ran over a knoll which the deer were now skirting, and the wagon thus lightened, made good time over the course. The horses had good mettle, and were withal somewhat frightened. The driver, an old borderer named Green, was gray-headed, and made it his job to keep the draw, being on one side of it, and the wagon on the other, not six rods distant. All did their level best, and the way that old six-seat Conestoga clattered over the gullies and oopher holes was a caution. Blankets and overcoats rattled out, ensheens were spilled over the sides, and demijohns and pickle jars danced on the bottom. Down on his knees and bounding in a fashion that defied all certainty of aim, with the reins flying to scy on the necks of the horses, Green gradually drew on the game and making a spurt, let them have it with both barrels at close range. The blue smoke streamed off in a double pennant, as pursuers and pursued both vanished around the knoll!

After a short interval the stragglers came up, and mounting the ridge, saw in the far distance two dingy little objects that looked like mice, just disappearing from sight in a fringe of timber! The best shooting the Team had in Kansas, some twelve miles Northeast of Chetopah. Here were a good many straggling farms, with frequent open fields not wholly stripped by the grasshoppers. Quails, rabbits and prairie hens were so numerous that a single day's hunt yielded two wagon loads to ten guns. The advance of the hunters on this occasion was like the march of an invading army.

Altogether, as we saw of the season was most unpropitious by reason of the drought and grasshoppers. It was sickening to see the corn stalks standing stark and stripped in the field, the grass everywhere burned to a crisp, and the farmers carting water for miles for household purposes. But more sorrowful than all was the emigration eastward. All day long wagons kept coming into town bringing families who had abandoned their desolate farms on the far off prairies, literally eaten out of house and home, and despairing of sustenance or relief.

Whatever the "Team" saw and what they did, more than has been told in this brief narrative, must be left to the chief chronicler of their Western trip, if such there be. Their prairie experiences were novel and for the most part entertaining, and will never be regretted. Their cheerful pleasant recollections of their reception at St. Louis, Hannibal, Le Grand, Quincy, and Chicago, and will not forget the courtesies extended by Mr. Munson, the Superintendent of the Chicago, Burlington and Quincy Railroad. Messrs. Bagwall and Milner subsequently excused their trip to Colorado, and when, at last, all embarked for Erin, they carried with them the good wishes of many friends, and un concealed regrets at leaving our hospitable land. The Hunt of the "Team" will long be remembered, and talked about in those sections which they visited; and many a person in the back country has gathered from the words some vague rumor connected with their visit which possibly may not be satisfactorily explained. For instance there is Mistress McTearthy, who read the caption of a paragraph in a local paper thus—"The Irish team in the West." "Begorra!" said she, "they're everywhere. The whole country's full of 'em, if it isn't for the byes, what'd become of the railroads, the crops, and the canals? The more power! If them grasshoppers comes this way again, the West will not hold the half of them."

FINE PICTURE.—Mr. R. M. Shurtleff, one of our most truthful delineators of scenery, has finished a painting of Au Sable Lake in the Adirondacks. This charming sheet of water, embosomed in rugged mountains, and surrounded by towering crags richly clad in verdure and foliaceous shrubbery, is one of the most picturesque basins in the Northern woods and is the resort of large numbers of Summer tourists and the lovers of the lake. The transferring of this beautiful tarn to the canvass is therefore one which will interest all who are acquainted with its tranquil beauties, and the stern character of its surroundings. Mr. Shurtleff has treated his subject with the greatest care, and has followed nature almost literally. He has made no attempt at presenting masses of striking colors, but has kept entirely to the quiet, cool and sedate hues so appropriate to the subject. His portrayal of the scene is almost photographic in thoroughness, and with this is combined a softness of touch and a breadth of composition which display his power to the highest advantage, and prove him to be an artist of a very high order of excellence.

—One of the handsomest papers ever issued in this country was the Christmas number of the *Deity Graphic*. The illustrations were indeed splendid specimens of the pictorial art, and the illuminated cover and typographical accessories gave it an air of elegance most pleasing to the eye.

—The General Office of the Erie Railroad Company has been moved to the old location, foot of Duane street. The new quarters are elegantly fitted up, and afford the most ample and convenient facilities for the transaction of the business of that great corporation.

—A California blaw has raised sixty tons of eabbages on three acres of land, and got \$4,000 in gold for the crop.

Shot Gun and Rifle.

GAME IN SEASON FOR JANUARY.

Hares, brown and gray. Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Fowl.

Under the head of "Game and Fish in Success" we can only specify in general terms the several varieties, because the laws of States vary so much that were us to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designing game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the terms of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.

DEC. 31ST.—FURS AND SKINS.—THE QUOTATIONS ARE:

Table with columns: According to size, color and quality, Northern and Eastern, Western, Southern. Lists prices for various furs like Beaver, Raccoon, Mink, etc.

GAME IN MARKET.—Venison from Minnesota is now becoming quite abundant, and the price is down to 20 cents per pound by the saddle, and mutton from Nebraska brings the same price.

Wild turkeys from Illinois, Ohio, and Michigan, bring from 20 to 25 cents per pound, according to quality. Ruffed grouse have now become so common that they retail at from 60 to 87 cents per brace; prairie chickens bring only the same price, while quail bring from \$2 to \$2.50 per dozen. Wild geese are not very plentiful, and retail at \$2.50 per brace. Mallard ducks are \$1.25 per brace; blackbirds 87 cents; redheads \$1.25; canvas backs \$2.50 to \$3; sandpiper from Virginia are quite plentiful at \$1 per dozen. English hares are worth \$3 per brace; Canada hares 75 cents, and Connecticut rabbits 60 cents.

—Close season for nearly all kinds of inland game after January 1st. Water fowl are in season until after their Spring migration. In Florida the shooting season for deer, woodcock, quail, turkeys, snipe, &c., continues until March.

NEW YORK.—December 28th, L. I., Dec. 28th.—We are spending our time in duck hunting, rabbit shooting and fox hunting. A party of us commenced a fox hunt on the 23d December, killing one per day during the week past, on Christmas Day killing two. We have a range of hills about one mile east of this village, barren sand hills excepting some large swamps. The hunters started reynard on the east end of the hills. The range of hills is about seven miles in length. One can stand upon most any of the highest peaks and see the race between the hounds and reynard, and it is a chase worthy of the extreme west end of the hills. We have the great Pointe Bay on one side, a large pond on the other, between bay and pond a narrow sandy beach of eight rods in width. This is the place where reynard gets slaughtered. The foxes are plenty, and the hunt is to continue until after New Year's Day. A fox can be started in less time than it takes to write this after arriving on the ground.

M. V. B. S.

MARYLAND.—December 28th.—Sportsmen have had good sport in shooting ducks from the railroad bridge crossing the Gunpowder River, Maryland. Recently three gentlemen from Baltimore are said to have killed there in two hours forty-one canvas backs and seven red heads.

INDIANA.—Valparaiso, Dec. 24th.—Quail shooting good; pheasants plenty, but a hard cover to shoot in; prospect good for plenty of birds next season.

MINNESOTA.—Shakopee, December 16th.—Yesterday, the 15th, the time was spent in killing deer in this State. It is pretty much all other game is shut out now for another year, sportsmen will have to lay by their fowling pieces and rifles, unless they indulge in target practice now and then. That deer will continue to be slayed right along in certain localities until the approach of February, as in days past, there can be no question. Yet, as the Fall and Winter weather has been a little favorable, on account of a scarcity of snow and but few damp days during the past six weeks, there will be a greatly diminished number killed compared to the past few years. As the penalty for violating the law is severe, it is just possible that some of our great hunters will be a little careful about how they pop over the bounding doe from hillside and ravine, even if meat is scarce. These "antlered specimen" hunters will hardly be so anxious to supply the market with deer during the winter, that kind this year. There are other hunters, however, that trouble some of our would-be hunters extra-ordinarily, if the signs are correct, as this specimen item from the Wright county Eagle affirms:—

—The Tignor, or the Wild Hunter of the Big Woods, returned home last week with his skin full of burnt powder and poor whiskey. One eye was nearly blown out, and he looked so badly that he had to be carried during the day by his neighbors, and had an attack of the Jim-Jum. If the "Old Sport" that has "done" the Adirondacks in his palmer days will come out this way he will probably

good old subject. He's a crack shot, as is also his son, Al, who is one of our locomotive engineers. Mr. Wm. Garlock, master mechanic at Denison, Texas, tumbles over wild turkeys and chickens with great pleasure, and is one of our sportsmen. Mr. M. P. Cogswell, contracting agent at Emporia, Kan., and a reader of FOREST AND STREAM, is a fine shot, and a winner of some medals, owns a fine brood flock and good dog, and knows every inch of the Neosho Valley, and can take you in a quail and quack grounds at any time. And so can Pete Harris, our trapper master on the Neosho Division. Mr. L. Stafford, and Geo. Voss, track masters, also are both good shots and own brood flocks. Conductors P. D. Watson and J. H. Doyle you will find in the field with their dogs and guns, whenever they can get a day off. Some of our station agents are also sportsmen, and own fine dogs and guns. Mr. Dorwin, our General Passenger Agent, does not shoot much, but he takes particular pains to look after the interests of sportsmen going over our road. In fact a sportsman is welcome among us all. He is one of us so soon as known. Whenever I get a few days off I generally make for the Neosho Valley, where quail, rabbits, chickens and ducks are very plentiful. During snipe season there are millions of them. The station agents are all on the shoot, and I always have a splendid time.

So far as the transportation of sportsmen is concerned, we try to please always, and when I can do anything personally towards their comfort it is a pleasure. As for the transportation of hunting dogs, our baggage men all seem to exert themselves to do their best. Some of our dogs are from Texas continually, and accompany baggage men over the road as a sort of recreation. I have had some very fine dogs, and have made trips from point to point here. Therefore, there seems to be a sort of mutual feeling between hunting dogs and all of our employes generally. If you should have any inquiries from any parties or persons desiring to come out our way, I will be glad to correspond with them, and give them what information I can in the way of advice. As their dogs will not have good care, I am free to say, and I for once will try and make their trip pleasant, officially and personally. I have had some splendid trips down in the beautiful Indian Territory, among the wild turkeys, (where I have seen them in great droves) and deer and prairie chicken. There is beautiful country, and full of game of many varieties, splendidly watered by rivers both large and small, well timbered, and a mild climate. Small shooting is very good, and I have often made a bag of from twenty to thirty quail a day, not including several dozen chickens and ducks. I can say that the sportsmen will find a welcome in any town on this line no matter how fraterally.

JAS. D. BROWN, G. T. A.

LOADING GUNS.

Boston, December 18, 1874.

EDITOR FOREST AND STREAM:— In your issue of November 12th your correspondent "Side Lever," in a very sensible article on "Loading Guns," occupies, as I believe, an important position, in assuming that a gun chambered with a square shoulder is unworthy of notice. My own experiments, though not very extensive, have led me to exactly the opposite conclusion, and as the matter possesses some interest possibly for sportsmen, as well as gunmakers, I will trouble you with a few thoughts on the subject, hoping to hear from some of our friends—namely, Mr. Editor, you may dread the possibility of a prolix and interminable discussion. "Side Lever" says he is a complete convert to a certain system of boring practiced in England, naming one firm in particular whose guns all will admit rack descended high. I should be pleased to know what that system is, and will venture the assertion that if he will carefully examine any dozen or more of guns, from the finest quality down, by any of the English makers he will find that the fact of their guns being imported in quantities, he will find large chambers and deep shoulders and shallow, and finally, some amongst even the finest with the despised, contracted taper, with no shoulder whatever. On any of these plans, possibly used and then a gun may shoot well, and I refer to it only as showing that even the best English makers have, as yet, no exclusive, well established system, par excellence. This is in some degree disagreeable.

Again, "Side Lever" says, "If the shell is put in a bore made the same size as the inside of the shell, from the muzzle to within three and one-half inches of the breach face, &c." Now, if I correctly understood that proposition, I can only say that I have never met with a gun bored in that manner, and have no use for, believing it would be perfectly useless as a breech loader. It is not necessary to have a bore of the diameter of the taper to be perfectly gas tight. I can also use the paper shell (which I do) so in upward shooting by turning it down well, finding that the rapid explosive force of the charge forces the paper when thus turned down to fill more tightly the gradual taper than when not turned at all, so that even with these shells I have not experienced any trouble from leakage. I have too known many very fine breech loaders, the best quality, by the most noted English makers, and in later days several capital breech loaders; but the gun I refer to is by far the best I have ever shot, and I am satisfied that a proper taper is better than the best shoulder. I feel the more confident in my opinion, from the fact that the deductions from my limited experiments are more than confirmed by those of the well known gunmaker, Mr. Wm. B. Schofield, the maker of the guns imported to shore, who shoots here both extensive in number and extensive in character, and have had him to abandon entirely the square shoulder in favor of the taper or constrictive pin. He has lately ordered quite a number of the finest guns for several of our best sportsmen, and with a marked improvement in every instance. I do not know the exact size of his taper, but have the impression that it differs from the English standard taper, in that it is more extensive in number and easily kept clean, which cannot be predicated of any square shoulder. Other ideas suggest themselves, but I have already occupied too much of your space and patience, and will conclude by hoping that "Side Lever" may be induced some time to give a gun chambered on the Schofield plan a fair trial, in which case I am convinced he will abandon the square shoulder in favor of the UNDER GRIP.

RUBANS D'ACIER.

New York, December 24, 1874.

EDITOR FOREST AND STREAM:— I notice in your issue of this week that one of your correspondents in details to answer the questions of "N. B." about his Rubans Dacier gun. Either your correspondent writes ironically, or he misunderstands "N. B.'s" questions. To my idea the whole difficulty arises from the wrong spelling of the words. Rubans Dacier, which are French, and being correctly written, Rubans Dacier, signify in English "laminated steel." This being established, it can be seen in the preceding editorial copy of having a gun of the dimensions given, and the kind of game he would shoot with it. Yours truly, M. L.

WANTON SLAUGHTER.

New York, December 21, 1874.

I was pleased to see in your issue of the 17th inst., the remarks of disapprobation you made about the killing of the great Northern Diver, described by Mr. Boardman. He stated that the Indian, in about an hour, killed thirty divers. Permit me to ask for what reason or purpose did the Indian kill them? Was it for food? I fancy not. He must indeed have been driven to the verge of starvation to kill them for sustenance. Wilson says "they are never eaten," and I will vouch for the fact that the flesh is very unpalatable, tough and rank. Was it for profit? I hardly think so, although in some arctic countries the inhabitants use the skins for clothing. Was it for the sake of science? Emphatically no; for if that had been the object in view he would never have slaughtered such numbers. But I think I can conjecture the reason. It was for wanton sport, and the honor of having killed so many birds, generally difficult of capture. It is a sad fact that people calling themselves sportsmen, measure their abilities according to quantity and not quality. Probably that man thought he was doing well, and was anxious to get in a killing thirty loons at an air hole in the ice, when at any other season of the year he would have been able to obtain one without strategy. I consider it very cruel, as well as cowardly, to attack poor birds while in such a helpless state, they being entirely deprived of their natural means of defense—i. e., escape. Now, if that Indian was able at any season besides Winter to shoot a single loon in the way which I cite, I should admire him for his skill; but I cannot do otherwise than deprecate the mode he adopted to kill so many harmless creatures. I say harmless, for I know of no case where they have been injurious to man.

Again, the loon's cry is one of the wildest, but not unpleasant sounds heard in the woods, to my thinking. Last Summer I spent some time in the Adirondacks, and I did not fail to cry, for at times it filled me with poetic and romantic feelings, as the song school and re-echoed through the valleys of the Horseshoe Pond region.

The great Northern Diver is one of the handsomest birds we have; but if it is stalked and killed in such numbers, when unable to escape, it will soon become a *rara avis*. It is no characteristic of a lover of nature to take life wantonly for mere sport, for he takes no more than is necessary to accomplish the increase of knowledge, which is the end of science.

I hope, Mr. Editor, you will always, through your columns, show that the pleasure and merit in sporting lie in the intelligence displayed in strategy and the skill used in capture. And on the other hand, cry down all wanton cruelty attending sport, for then it rather debases than elevates the true sportsman. C. H. EAGLE.

MARSHALLTOWN, IOWA, December 24th, 1874.

EDITOR FOREST AND STREAM:— I send you the score of a shoot which was had in this city on the 23d. Four hundred birds were provided for the occasion. William Barnes brought down eight out of ten birds, and won the \$25 prize. Below is the score:—

Table with columns: Name, Score, Prize, Name, Score, Prize. Lists winners like H. D. Hall, H. P. Williams, H. Reed, J. K. O'Neal, A. V. Potter, A. O. Neal, John O. Neal, J. R. Bowler, J. F. Chase, and their respective scores and prizes.

In shooting off ties:—First prize, William Barnes; second, Hank Anson; third, divided between R. H. Barnhart and F. H. Griswold; fourth, J. K. O'Neal; fifth, between P. Woodruff and J. Backhaus; sixth, between S. Anson and J. Forey. Referee, J. J. Welch. Sooner, a representative of FOREST AND STREAM. There was about a foot of snow on the ground, which fact accounts for the poor scores, the white birds being very hard to see. The shooting was from a ground trap, at the distances named above. Yours, J. E. HENNINGES.

The "Sinissippi Club," of Rockford, Illinois, has elected the following officers and directors:—President, W. D. McAfee; Vice President, A. C. Spafford; Secretary and Treasurer, H. P. Holland. Directors—J. R. Perkins, W. D. McAfee, Geo. Lincoln, E. N. Hill, H. P. Holland, A. C. Spafford, and D. W. Miller. The Club now numbers about 200 members, and they are all pledged to each other to aid in prosecuting and punishing all persons who unlawfully scine for fish in Rock River or its tributaries, or hunt for game at other than the times prescribed by law.

National Pastimes.

—Skating was permitted on the Central Park lakes for the first time this Winter on Saturday, December 26th, when there was quite a rush to the park. By night the ice was cut up so as to be useless, and since then the thaw has prevented any resumption of the sport. At the Capitoline Lake, Brooklyn, there was excellent skating all last week, up to Saturday night, when the ball went down. At Prospect Park there has not yet been any skating, Central Park for once getting the lead of Brooklyn.

—The President of the Amateur Base Ball Association has appointed the following delegates to the recent convention on the several committees:—

On Printing—Messrs. Carpenter, Root and Clark. On Nominations—Messrs. Cummings, Geaw and Rennecke. Judiciary—Messrs. Hagner, Myers, Dawson, Malue, Moran, Stone, Hovey, Johnson and Hill.

On Basis of Representation—Messrs. Kelly, McCormick, Irving, Stockman, O'Rourke, Murphy, Colwell, Mulcahey, Purcell, Lamarache and Davidson. On Junior Branch—Messrs. Dillon, Hayes and Gasland.

—Curling was indulged in by the Brooklyn clubs during last week, and a lively programme was prepared for the week before New Years, but the thaw which set in on Saturday stopped all the fun.

—The following club matches have been arranged for the season of 1874-5 by the Grand National Curling Club, the winners of each to receive a medal: Caledonian of New York against Yonkers, Burns of New York against Thistle of Brooklyn, New York against St. Andrews of New York, Caledonian of Brooklyn against Thistle of New York, Jersey City of New Jersey against Empire City of New York, Paterson of New Jersey against Ivanhoe of Paterson, Burns of Ogdensburg, N. Y., against Four Brothers of Canada, Caledonia of Buffalo against Burns of Cleveland, Thistle

of Detroit against Orchard Lake of Michigan, Granite of Detroit against Thistle of Chicago, Milwaukee against Chicago. The great game of the season between the North and South will be played, if the ice permits, on January 7th, and will embrace members from every club, entries to which close on January 4th.

—On Wednesday, January 6, Maurice Vignaux and Joseph Dion are to contest for the championship medal won by the former at the late tournament. The match will be played at Tammany Hall, and a close contest and fine display of the beauties of the French three-ball game is anticipated.

Chess.

CHESS DIRECTORY.—For the information of chess players visiting the metropolis, we publish the following directory of chess resorts in New York, Brooklyn and Jersey City, &c.:

Chess Players' Headquarters—Cafe International, 294 Bowery.

Up-Town—Knickerbocker Cottage, 467 Sixth avenue.

Down-Town Chess Club—Cafe Cosmopolitan, 14 Second avenue.

Turner Hall Chess Club—Nos. 66 and 63 East Fourth street.

Brooklyn Chess Club—Mercantile Library, Montague street.

Jersey City Chess Club—No. 81 Montgomery street.

Crossen & Libraire's Chess Rooms—Corner Nassau and Fulton streets.

New Brighton Club—At Captain Taylor's, Tompkinsville avenue.

Christian Union Rooms—Fulton avenue, opposite Elm Place, Brooklyn.

THE NEW CHESS TOURNAMENT.—The moves on the boards of the Cafe Tourney add about two or three games a week to the record, in about ten times the number, and the result is tedious progress. THE BROOKLYN CLUB.—Dr. Barnett still leads in the Brooklyn Chess Club to-day. Saturday nights the rooms are well attended, but not so frequently during other nights of the week. A NEW CHESS MAGAZINE.—It is stated that Mr. Charles A. Alberg contemplates starting a new chess magazine, to be called *The American Chess World*. No one is more competent for the task, and with the facilities he possesses in his unequalled library of chess works, and his practical knowledge of everything appertaining to the game, the magazine would no doubt be a success. It will be issued from New York. He will be assisted by several chess writers, including Mr. M. Monro.

THE NEW BRIGHTON CLUB TOURNAMENT.—The tourney in progress at Captain Taylor's residence is rapidly reaching an interesting point. Thus far the Captain has the lead, with 17 victories and but 2 defeats, Mr. Heydenreich having the same record of victories, but one more defeat. Next to him stands Mr. Kechle, with 13 won games and 6 lost, and Mr. Bagley with 9 victories and 7 defeats. All the others have lost more than they have won.

A TOUGH PROBLEM.—The Hartford *Times* in its Christmas number gives diagrams of a set of problems which are to be solved in "a quarter of a move," a half a move, three quarters of a move. One of the problems necessarily is, "What is a quarter of a move?"

—The Cleveland, (Ohio), Chess Club has reorganized, with thirty-five members, H. D. Updegriff, Esq., President. The club will extend a hearty welcome to chess players who may give them a call.

Canada.

—The Governor General of Canada has presented a handsome medal to the Studley Quoit Club, they defeating all competitors in the matches of last year. The medal is of massive silver, bearing on the obverse a portrait of Countess Dufferin, surrounded by the inscription "Earl of Dufferin, K. P., K. C. B., 1873," on the reverse the Dufferin coat of arms, and the motto "per vias veritas." The rim of the medal bears the inscription "Presented by His Excellency the Governor General. Studley Club, 1874." A gentleman who is so devoted to fostering physical prowess ought to be popular.

Another letter from Muskoka, written by Francis Jenkins, and dated Dec. 5, says: "I have shot eighty-three deer, three bears, and six wolves this Fall, and the best time is to come for deer shooting, besides fur, other, marten, mink, and other small furs. On Monday I am off for a three weeks' camp with two young gentlemen from New York."

—When Mr. James Addy was elected Captain of the Port Hope Base Ball club, he accepted upon condition that swearing and intoxicating liquors should be prohibited on the ground and at all meetings of the club. The terms were complied with and strictly enforced. This example is worthy of imitation.

—"Bendigo," formerly a prize fighter, and champion of England, delivered a religious address recently to a crowded audience at the London Cabmen's Missions, at King's Cross. It says he was converted two years ago as if by a miracle.

—At a recent meeting of the Galt club the following officers were elected: Patron, James Young, Esq., M. P.; President, Thomas Easton; Vice President, Andrew Buid; Secretary and Treasurer, Robert Easton; Committee of Management, Robert Reid, John Mitchell and Alexander Mills, Representative Member, George Denholm. In the International Bospiel, which will take place in February, the club will be represented by two rinks.—*Canadian Sportsman*.

A farmer named Bernier, of Sie. Brigitte de Laval, while out shooting partridge recently, found himself suddenly face to face with a panther, seven feet long, which he shot on the spot.

—Belleville Curling Club is pitted against the Port Hope Club this season, to play for the Royal Caledonian medal. —The London Curling Club has secured a new rink.

INTERNATIONAL EXHIBITION—FAIRMOUNT PARK, PHILADELPHIA.

The Horse and Course.

Two races came off over the track of the Bay District Association of San Francisco, Cal., Dec. 19, to witness which turfmen gathered in goodly numbers. The first event was a match pacing contest, five miles out for \$250 a side, between Henry White's black gelding Onward and Peter Brandner's bay gelding Fisherman. The latter, who had been a strong favorite in the pools, was the winner, coming in about four lengths ahead, under the whip, in 13:03. A trotting match, mile heats, three in a five, for \$1,000, followed between O. A. Hickok's black mare, Sisson Girl, and L. Dorr's brown gelding, Sam Bruno. The latter carried off the first heat, but the mare won the other three and the money. Time, 2:27, 2:34, 2:34, 2:34.

The horses Lady St. Clair and Onward recently competed in a five-mile race in harness, in California, and it is supposed that the former made the best five-mile time on record, having gone over the ground as follows: Time—First mile, 2:36.1. Two miles, 5:18.1. Three miles, 7:55. Four miles, 10:25.1. Five miles, 12:44.

The American Jockey Club will hold their meeting next year on the first Saturday in June, and this will last seven days, the racing being on Tuesdays, Thursdays, and Saturdays until the meet is finished.

A new jockey club has been organized at Louisville, Ky. Fine grounds just outside the city, on Third street, have been purchased, a club house, grand stand, stable, etc., built, and a liberal programme will soon be out, in which the new association will offer \$10,000 in purses, to be added to stakes to be opened and run for at their first meeting in June next.

A German correspondent of the Pall Mall Gazette writes: "The Committee on Horse Breeding of Landes-Oekonomisches Collegium, now sitting at Berlin, has unanimously agreed that government prizes are indispensable if the home breeding of blood horses and racing is to be preserved without the corruption involved in the English betting system. The committee has also resolved that the breeding of blood horses is not only a gentlemanly sport, but that it is the most necessary condition for the proper development of all horse breeding, that of farm horses included. The committee proposed further in favor of the establishment of State committees for horse breeding, especially of a Prussian committee.

Robert Bonner has purchased of Richard Poston, of Lexington, Ky., his famous three year old mare Lady Stout, paying \$15,000. In the last Fall meeting at Lexington the mare made the fastest time for three year olds on record there.

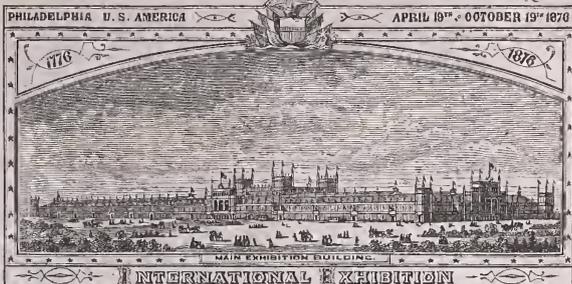

Sir John Astley, of the London Jockey Club, proposes to rule that no horse which has not been in England three months be allowed to run in handicap races. A number of races have been won of late by French horses, and as the proposed ruling appears to be inspired by this fact, the French turfmen are gratified at the indirect testimonial in favor of their horses.

A number of trotting associations in the West have recently met in convention and organized a circuit of trotting clubs for Ohio and Indiana, fixing the dates for the holding of the different meetings so as to avoid collision among themselves. The new circuit comprises Cambridge City, Piqua, Fort Wayne, Peru, Dayton, and Columbus. It is expected that Zanesville and Newark will also join, thus permitting horses to go through this circuit without loss of time and thence to Cleveland, Buffalo, Rochester and the great Eastern trotting meetings. It is estimated that close on \$100,000 will be given in purses for trotting in the new circuit.

Aberner Turner of Nashville, Tenn., a well-known Southern turfman and owner of racehorses, died last week in that city at an advanced age. He was one of the oldest members of the Nashville Blood-Horse Association, and owned, among many other good horses, Paralee, Plush, Nashville, Viscount and Velocepede. He was esteemed for his integrity and honorable character.

DISINFECTANT.—Infected stabling may harbor and retain the infection for months, or even years, and although by thoroughly cleaning and making use of disinfecting means the contagion may be destroyed, yet it would not be wise to occupy such stables immediately after such supposed or alleged disinfection.

HORSE'S MANE FALLING OUT.—The Country Gentleman says: "The shedding of hair from a horse's mane and tail can be prevented by washing the parts affected a few times in carbolic soap. One of the oldest members of the Nashville Blood-Horse Association, one gilt, well mixed and rubbed in, will prevent the falling of the hair. We have found it effectual."

DIMENSIONS OF THE BUILDING. Length (East and West) 1,850 ft.; Width, 461 ft.; Height, 70 ft.; Height of Central Towers, 120 ft. Main Entrance on Elm Avenue. Area covered, 936,768 square feet, this divided into parallel zones, lengthwise of the building. Corridors and Stairs will occupy parallel sections crossing the building. This arrangement will bring the products of each class from the whole world into the same line.

ART GALLERY.

DIMENSIONS OF THE BUILDING. Length, 325 feet; Width, 210 feet; Height, 39 feet. Height of Dome above the ground, 150 feet. Materials—Granite, Glass, and Stone. Site—Lansdowne Plateau. Shares of Centennial Stock, \$10.00.

BARNUM'S HIPPODROME.

Old folks, young folks, and little folks, have you been to the Hippodrome of Mr. Barnum, who is lavish of his thousands and tens of thousands that he may provide an entertainment that will suit all. He invariably succeeds in pleasing all tastes. He takes you back to old Roman games; he gives you "Blue Beard" in a magnificent pantomime, as never produced before in extent and gorgeousness; he brings the celestials to our doors, with their characteristic manners and customs. Donnybrook Fair is done in true Irish style. One entertainment after another is brought forward so quickly that he must have Aladdin's lamp, and all the gift of earth, air and water at his command. So effective and wonderful are the changes, that you appear to be in dreamland, and do not wake up to the painful reality of all until the performance is over. Then you have material enough to keep the mind and thoughts at work for days. Chat with and write to friends to hasten and see all these wonderful things, for fear it may be illusion. The animals and birds from the Turf, Temperate and Frigid Zones are here to be viewed without fear. Both entertainments under one roof; no admission to all. We must not forget the contorts Mr. Bond, the Primo Minister of this great establishment, to whose energy thousands are indebted for their subsistence.

For Sportsmen.

For a hearty young fellow who has some chance to get occasionally a day for amusement, there can be no more gratifying New Year's present than a double barreled breech loading shot gun. Until of late years these were luxuries imported from the extravagant shops of European makers, and only to be indulged in by the wealthy. But American inventive skill and facility in the use of machinery for work done elsewhere by hand, have changed all that. The Menagings now make a breech loading shot gun for \$75 which for all practical purposes is equal to the average imported gun of double or treble the price. It is simple, compact, not likely to get out of order, and safe; and it shoots well.

HURST'S Natural History

For Object Teaching in Schools, AND PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various Animals and Birds in groups at a glance, never however violating their natural instincts. We offer these views not as pictures only, but as studies from nature. One of the great elements in our modern system of education is object teaching. The marvellous fidelity of the stereoscopic transfers—the animals and birds from their natural habitat to the rooms of the student, and the fresh view of our homes, where the rain fails to leave a lasting impression of the form, color, habitus, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen with its appropriate rocks, woods or water, and coloring from the originals.

- 1. Wild Cat, or Bay Lynx..... *Lynx baileyi*.
- 2. Snowy Owl..... *Nyctaleus nyctaleus*.
- 3. American Hawk..... *Buteo borealis*.
- 4. Wild Pigeon..... *Columba virginiana*.

Dealers supplied at a liberal discount, and can be arranged in this new educational enterprise. If we can arrange our arrangements so as to make them impart instruction to the mind, it will be a step in advance in education.

TESTIMONIALS.

CORNELL UNIVERSITY, ITHACA, March 14th, 1870. I must congratulate you upon your success in this new educational enterprise. If we can arrange our arrangements so as to make them impart instruction to the mind, it will be a step in advance in education. E. R. CORNELL.

WASHINGTON, D. C., March 15th, 1870. I am much pleased with the success you have met with in giving to the stuffed specimens a very decided appearance of life. I hope you may be able to continue the Series, and I have no doubt they will furnish interesting means of information and instruction in regard to the wild animals of New York. SPENCER F. BAIRD.

STATE HOUSE, BOSTON, Mass., March 15th, 1870. I have examined carefully the "Stereoscopic Studies of Natural History," and judging by the first ten numbers, should say that they will prove very great value both as object lessons for students, and as most interesting suits for the parlor Stereoscope. The descriptions and color of the animals and birds, and the general treatment are most perfect. I decidedly recommend them to the public attention, and trust they will meet with the success which you have earned. EDWARD A. SAMUEL, Curator of Zoology in Mass. State Cabinet.

PEABODY ACADEMY OF SCIENCE, SALEM, Mass., March 19th, 1870.

I have shown your Stereoscopic views to the Directors of the Academy and the editors of the "American Naturalist," Dr. Packard and Mr. Morse. They concur with me in praising their truthfulness and the fact which you have displayed in surrounding the specimens with natural objects and scenery of their native haunts. They are certainly better fitted, not only as parlor and drawing-room illustrations, but as educational illustrations for the use of schools and colleges, than anything we have yet seen. A. HYATT.

CORNELL UNIVERSITY, FRESHMAN'S ROOMS, ITHACA, March 19th, 1870.

I have received the Stereoscopic Views of objects in Natural History, and have enjoyed them greatly. They are marvellous in their truthfulness and their wonderful fidelity, both as regards the animals and their surroundings; and I think they can not fail to be of great service to the study of Natural History, both by attracting students to it, and next by perfecting them in it. ANDREW D. WHITE. These Stereoscopes are sold wholesale and retail by FOREST AND STREAM PUB. CO., 17 Chatham St., (City Hall Sq.) P. O. box 2833.

American Wild Fowl Shooting. BY JOSEPH W. LONG. Describing the habits, and methods of shooting wild fowl, with instructions concerning guns, blinds, boats and decoys; the training of water retrievers.

This book is written in plain English, and in a most attractive style. A broad, and at the same time accurate view, is taken of duck shooting in all parts of the country. The habits and feeding grounds of the mallards, blue-winged teal, pin-tail, wood, gadwall, and cootler; red-heads, buff-heads, and other kinds of ducks, geese, swans, &c., have been carefully and ingeniously studied and given to the reader. In their chapters the author has furnished information for the young, as well as for the practical sportsman. "A book for sportsmen, by a sportsman."—Argus. "Tells where to find game in the morning, in the afternoon, and in the evening."—Sax. "Almost indispensable to the sportsman."—Arcadian. Published by J. B. FORD & CO., 27 Park Place, N. Y. For sale by all booksellers and the leading gunsmiths. Price \$2. Sent by mail by the Publishers. Also for sale at the office of Forest and Stream.

For Havana and New Orleans. Phila. and Southern Mail Steamship Company's REGULAR SEMI-MONTHLY LINE.

EAST FREETOWN, MASS. Trout eggs and young fish for stocking ponds, &c. Bristol County, Trus. Geo. F. PARLOW, New Bedford, Mass., or EDWIN POUNSVILLE, East Freetown, Mass. Nov. 26

HUNTER'S AND TRAPPER'S ILLUSTRATED PRACTICAL GUIDE TO THE USE AND CARE OF ARMS AND AMMUNITION; MAKING AND USING TRAPS, ENARES AND NETS; BAIT AND BAITING; POISONING; BIRD LIFE; PRESERVING, SKINNING, DRESSING, TANNING AND DYEING SKINS AND FURS; FISHING; AND A FULL SET OF ENGRAVINGS. 30 CENTS.

Foxhunter's Manual, a guide to collecting, preparing, preserving and mounting animals, birds, reptiles, insects, &c. New revised illustrated edition, 50 cents.

Dog Training. A complete guide to breaking and training up a dog, how to teach all wonderful and amazing tricks, successes of famous dogs, &c. Illustrated, 25 cents. Of booksellers, or by mail, JESSE HANEY & CO., 119 Nassau street, N. Y. Dec. 23

Sportsmen's Goods.

SCHUYLER, HARTLEY & GRAHAM, 19 Maiden Lane, 20 & 22 John street, N. Y. BREECH LOADING GUNS A SPECIALTY.

We would call the attention of the public to our large assortment of

Breech-Loading Shot Guns, Manufactured by the following celebrated makers: Messrs. W. & C. SCOTT & SON, (winners at the International Gun Trial of 1873); P. WEBLEY & SON, W. W. GREENER, WESTLEY RICHARDS, J. HOLLIS & SONS, and other makers.

A full line of the PISTOLS and RIFLES CONSTANTLY ON HAND. DIXONS & HAWSEY'S SHOOTING TACKE. To insure good shooting, from Breech-loading Guns, we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS, manufactured by the Union Metallic Cartridge Co., Bridgeport, Conn. These shells are the cheapest and best in the market, can be easily re-packed with ordinary caps, without the use of the implements necessary in priming all other styles of shells. BUSSEY'S PATENT OYSTER PIGEON AND TRAP, WITH CASE, AND 100 BIRDS.

Black's Patent Cartridge Vest. This Vest affords the best arrangement yet in carrying cartridges. So evenly distributed that the weight is not felt. Cartridges are carried with this vest, which is especially adapted when breech-loading guns are used as when carrying head up the weight is thrown forward, and bad shooting is the result. In ordering send measurement around the chest. Price \$7.50.

AGENTS FOR THE UNION METALLIC CARTRIDGE COMPANY'S AMMUNITION, WARRANTED THE BEST IN THE MARKET. SEND FOR CIRCULAR.

Sportsmen! Your attention is called to a GOOD'S OIL TANNED MOCCASINS, the best thing ever worn by sportsmen. Not injured by wetting and drying—always soft and easy to the feet, and VERY DURABLE—being made of the very best of stock in three different styles, and warranted the genuine article, different from anything before offered. Illustrated Circular and Price List, free. FRANK GOOD, 129 Elm st., Manchester, N. H.

CHAS. REICHE & BRO., IMPORTERS AND DEALERS IN ALL KINDS OF BIRDS, ANIMALS & FOWLS, Mocking Bird Food, &c., 55 Chatham Street, 8d door from N. William. NEW YORK. WE GIVE THE HIGHEST PRICE FOR LIVE BEAVER, OTTER, BEAR, WILD CAT, MOOSE, ELK, ANTELOPE AND ALL KINDS OF WILD AMERICAN ANIMALS AND BIRDS. HENRY REICHE, CHAS. REICHE, SCIOPE, DEALER IN ALL KINDS OF Foreign and Domestic Birds. Constantly on hand a large stock of cages, seeds, gravel, squirrels, globes, gold, fancy fishes, and shells. Special attention given to modeling and art. Orders promptly attended to. 74 East Tenth street, N. Y. D-23

Holiday Sport. A GRAND PIGEON TOURNAMENT AT DEXTER PARK, Chicago Ill. Open to all Sportsmen. FROM DEC. 25TH TO JAN. 2D. PLENTY OF BIRDS. Dec 27. HAVANA LOTTERY. EXTRAORDINARY DRAWING OF 1874-DEC. 18TH.

Only 16,000 Tickets—One Prize to every 7 Tickets. 2017 prizes of..... \$1,200.00 2 prize of..... 500.00 1 prize of..... 100.00 2 prizes each of..... 50.00 1 prize of..... 25.00 4 prizes each of..... 10.00 12 prizes each of..... 5.00 473 prizes each of..... 500 Circulars with full information sent free. Tickets for sale and prize cashed by P. C. DEVLIN, Stationer and General Agent, 30 Liberty street, New York.

MEAD'S PATENT SAFETY EXPLOSIVE BULLET, METALLIC CARTRIDGES. Caliber—22, 32, 44, 46, 50, &c. Also BOMB SHELLS for 12 and 16 gauge Shot Guns. JOHN P. MOORE'S SONS, GUN DEALERS, 30 Broadway, New York. Send for Circular, describing these on weekly Bears.

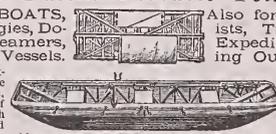

REMINGTON'S SPORTING, HUNTING, and TARGET BREECH LOADING RIFLES, also MILITARY RIFLES, CARBINES, PISTOLS and SHOT GUNS, of uniform system of Breech Mechanism. Acknowledged by Military Authorities, Sportsmen, and "Crack Shots," to be superior to all other Arms in the world, as to accuracy, simplicity, ease of manipulation and durability. The Target Rifle was winner of nearly all the principal matches at "Creedmore," including the famous International Match (see official report in Army & Navy Journal Oct. 3, 1874.) Also Breech Loading Double Barrelled Guns, Pistols, Rifle-Cases, Cartridges, &c., &c. Send for Illustrated Catalogues & treatise on Rifle shooting &c., free to any address. "Vernier" Gauges for sighting Military Rifles just out, \$2 50 each. E. REMINGTON & SONS, Manufacturers, 281 & 283 Broadway, New York. ARMOY, N.Y. P. O. Box, 3994.

JOSEPH C. GRUBB & CO., 712 Market St., Philadelphia.

AGENTS FOR THE SALE OF THE CELEBRATED CENTRAL-FIRE BREECH-LOADING GUNS MADE BY James Purdey, No. 314 1/2 Oxford Street, London. Desire to inform Dealers and Sportsmen who may wish to purchase these Guns, untrapped for Finish, Durability and Power, that they have a supply of 10 and 12 bore, and will import special guns to order at short notice. They have also in store the largest and best assortment in the United States of Breech-Loaders made by E. M. KELLY & CO., WESTLEY RICHARDS, W. & C. SCOTT & SON, W. W. GREENER, P. WEBLEY & SON, and other well-known English makers, besides those of American makers. An extensive assortment of everything appertaining to the use of Breech-Loaders. Also, Bussey's Patent Oyster Pigeon and Trap, a perfect substitute for live pigeons in shooting matches. SEND FOR PRICE LIST. July 23

Hegeman's Patent Portable Folding Boat. For use as LIFE-BOATS, LIGHTERS, Dingies, Dories, on board Steamers, Yachts and other Vessels. Also for Sportsmen, Tourists, Trappers, Exploring Expeditions, Parties camping Out, &c. &c. These safe and perfectly portable boats will admit of the roughest usage. A very light, strong and durable frame of ash or other tough wood, with canvas cover, and can be folded in one-eighth space, for transportation, and carried in a light buggy wagon, on horseback, or by single person, and can be unfolded ready for use, in three minutes. Seats neatly folded, packed and shipped by express anywhere at same rate of freight as ordinary goods.

DR. RADWAY'S Sarsaparilian Resolvent. THE GREAT BLOOD PURIFIER. FOR THE CURE OF CHRONIC DISEASE, SCROFULA, HEREDITARY OR CONTAGIOUS. BE IT SEATED IN THE Lungs or Stomach, Skin or Bones, Flesh or Nerves. CORRUPTING THE SOLIDS AND VIOLATING THE FLUIDS. Chronic Rheumatism, Scrofula, Glandular Swelling, Hacking, Dry Cough, Catarrhes Affecting, Bleeding of the Lungs, Dyspepsia, Water Bruish, The Doloric, White Swellings, Tumors, Ulcers, Skin and Hip Diseases, Female Complaints, Cold, Dropsy, Scurvy, Salt Rheum, Bronchitis, Constipation, Kidney, Bladder, Liver Complaints, &c. PRICE \$1 PER BOTTLE.

R. R. R. RADWAY'S READY RELIEF. THE CHEAPEST AND BEST MEDICINE FOR FAMILY USE IN THE WORLD. One Fifty Cent Bottle. Will cure more complaints and prevent the system against more sudden attacks of epidemics and contagious diseases than one hundred dollars expended for other medicines or medical attendances. The moment Radway's Ready Relief is applied externally—or taken internally according to directions—pain from whatever cause, ceases to exist. In all cases where pain or discomfort is experienced, or if seized with Influenza, Diphtheria, Sore Throat, Scurvy, Hoarseness, Billious Colic, Inflammation of the Bowels, Stomach, Lungs, Liver, Kidneys, or with Croup, Quinsy, Fever and Ague, or with Neuralgia, Headache, The Doloric, Toothache, Earache, or with Lamago, Pain in the Back, or Rheumatism, Diarrhoea, Cholera Morbus, or Dysentery, or Burns, Scalds, or Bruises, and with Strains, Cramps, Spasms, the application of RADWAY'S READY RELIEF will cure you of the worst of these complaints in a few hours. Price 25 cents per box. Sold by Druggists.

DR. RADWAY'S REGULATING PILLS. Perfectly tasteless, elegantly coated for the cure of all disorders of the stomach, liver, bowels, kidneys, bladder, nervous diseases, headlache, constipation, colic, flatulency, indigestion, dyspepsia, biliousness, bilious fever, inflammation of the bowels, piles, and all derangements of the internal viscera. Warranted to exert a positive cure. Price 25 cents per box. Sold by Druggists. DR. RADWAY & CO., 32 Warren St., N. Y. \$10, \$50, \$100 Shares in Wall Street often leads to fortune. Send for a copy of the Wall Street Review and Pamphlet, showing the various methods of operating. J. HICKLING & Co., Bankers and Brokers, 72 Broadway, N. Y. Dec 23 \$10 to \$1000 Invested in Stocks and Gold pays 200 per cent a month. Pamphlet free. Tumbidge & Co., Bankers, 2 Wall street, N. Y.

Trout business for Sale. One of the largest Establishments in the country. WELL STOCKED WITH TROUT. Having a Dwelling for Superintendent, OFFICE and READING ROOM, SHOW and STOCK TANKS, WORK SHOP, ICE HOUSE, HATCHING HOUSE, Five Small Ponds and Three Large Ponds (of an area of over nine acres). The property consists of more than fifty acres. The ponds are fed by about 100 Lively Springs, rising on the premises, some of which register 45 and 46°. The volume of two cubic feet of water passes over the lower dam, with a fall of fourteen feet, continuously, and hardly varies, and never freezes, making a good water power that might be utilized. On the farm is a Favorite Pic Nic Grove, with dancing platform, &c. STOP, ICE HOUSE, and telegraph office, and ABOUT ELEVEN HOUSES FROM NEW YORK. For further particulars address the Editor, or "PISCICULTURIST," Forest and Stream Office. Nov 12

HAVANA LOTTERY. IMPORTANT NOTICE. For the coming drawings, commencing January 5, we have reduced the prices of tickets as follows: Wholesale \$20; \$10; \$5; 1-5; 1-10; \$2; 1-20; \$1. Drawings take place every seven days. We are prepared to fill all orders. Circulars sent upon application. Highest price paid for Spanish Bank bills, Governments, &c. TAYLOR & CO., Bankers, 11 Wall street, New York

BREECH LOADING Central Fire Rifles & Shot Guns. Gentlemen intending to spend the Winter in Florida, or the Southwest, and desirous of hunting in other sections, should supply themselves with Breech Loading Central Fire Rifle and Shot Gun, which combines the accuracy and range of the Rifle, with the quickness and certainty of the Shot Gun, and is adapted to KILLING GAME OF ALL SIZES. Shot Hares, 10 or 12 Gauge, Rifle Barrels, 40, 41, or 50 Calibre. Using Ely's or Metallic shot cartridge case, and American Metallic ball cartridges. Also BREECH LOADING Central Fire Double Rifles of 40, 44, or 50 calibre. Send for price list. JOSEPH C. GRUBB & CO., 712 Market St., Philadelphia.

J. D. DOUGALL, Breech Loading Gun and Rifle Maker TO THEIR R. H. H. the Prince of Wales and Duke of Edinburgh, 59 St. James's Street, S. W., LONDON.

MANUFACTURER OF HIGH-CLASS BREECH LOADING SHOT GUNS AND EXPRESS RIFLES. Send for Illustrated and Descriptive Pamphlet, free, by post. Oct. 28

JOHN RIGBY & CO., INVENTORS AND MANUFACTURERS OF THE FINEST Breech Loading Shot Guns Double and Single Express Rifles. Long Range Match Rifles, &c 24 SUFFOLK STREET, DUBLIN, AND 72 ST. JAMES STREET, LONDON.

Now Ready! Annie Edwards's Powerful Story, ESTELLE.

1 vol., 12mo. Cloth, Price \$1.50. Paper, \$1.00. "Mrs. Edwards is one of the brightest and freshest of the novel writers of the day."—Journal, Boston. For Forest and Stream.

CANADA, FAREWELL.

CANADA, farewell!
Farewell to joy! farewell to youth!
My sad forebodings show no ruth,
My thirsty soul discerns no well
Of promise in my future fell.
My native land, farewell!

Canada, farewell!
We part, and I, whom woes betide,
As sadly wander from thy side,
As if I went my life to sell;
For fortune's harsh decrees compel
My native land, farewell!

Canada, farewell!
Farewell, thy streams and glassy lakes,
Thy Summer's suns and Winter's flakes,
Each hill and vale, and grassy dell,
One parting glance, I hear my knell,
My native land, farewell!

Canada, farewell!
Farewell thy clouds and azure skies,
Thy forests, where rare beauty lies,
And blooming flowers, loved so well;
I'm reft with grief I ne'er can tell.
My native land, farewell!

Canada, farewell!
I leave thee for a foreign shore,
And though I see thee never more,
Yet am I forced to break the spell
That binds me to thy side so well,
My native land, farewell!

Canada, farewell!
Farewell, bright land I loved with zest,
Grief fills my heart, and weeps my breast;
The saddest thoughts my bosom swell.
Canadian borders, fare thee well!
My native land, farewell!

ROB. BERTRAM.

INTERIOR EXPLORATIONS—FLORA,
FAUNA, AND GEOLOGICAL FORMA-
TION.

[Continued from December 31st.]

CHAPTER II.

SEPTEMBER 10th.—From the first we had now and then crossed over marshes and open rocky spots in the forest. As we advanced these latter became more frequent. The change of sylvan scenery as we passed from one to another was enlivening and interesting, and afforded the luxury of a breeze that freed us from the host of blood-thirsty flies.

Early in the day, the ground descending, we came unexpectedly to a rivulet about seventy yards wide, running rapidly over a rocky bed to the northeast, which we forded. The bed and shelving banks are formed of granite mica and transition clay slat rocks. Some of the latter inclined to serpentine, greenstone, red sandstone of the coal formation, sand, and beds of fine yellow clay. The water was in some parts brought into a very narrow compass by the rocks projecting from the sides. Large birch and spruce trees overhanging the banks, and rendered the scenery pretty. It abounded with fine trout, some of which we caught. The sand was everywhere marked with tracks of deer. The roaring of a cataract of some magnitude was heard in the northeast. From the position and course of this stream, we inferred that it was a branch of the river which runs into Clode Sound into Bonavista Bay; and my Indian supposed, from his recollections of the reports of the Indians concerning Clode Sound River, that canoes could be brought up from the sea coast to near where we were.

Leaving this rivulet, the land has a considerable rise for several miles. The features of the country then assume an air of expanse and importance different from heretofore. The trees become larger and stand apart; and we entered upon spacious tracks of rocky ground entirely clear of wood.

Everything indicated our approach to the verge of a country different from the past.

We soon found that we were on a great granitic ridge, covered not as the lower grounds are with crowded pines, and green moss, but with scattered trees, and a variety of beautiful lichens or reindeer moss, partridge berries, *Vaccinium bunifolium*, and whortleberries, loaded the ground. The *Xylosteum villosum*, a pretty erect shrub, was in full fruit by the sides of the rocks; grouse, (*Tetrao abius*), the indigenous game bird of the country, rose in coveys in every direction, and snipes from every marsh. The birds of passage, ducks and geese, were flying over us to and fro from their breeding places in the interior, and the sea coast; tracks of deer, of wolves fearfully large, of bears, foxes, and martens, were seen everywhere.

On looking back towards the sea coast, the scene was magnificent. We discovered that under the cover of the forest, we had been uniformly ascending ever since we left the salt water at Random Bar, and then soon arrived at the summit of what we saw to be a great mountain ridge that seems to serve as a barrier between the sea and the interior. The black dense forest through which we had pilgrimage presented a novel picture, appearing spotted with bright yellow marshes and a few glossy lakes in its bosom, some of which we had passed close by without seeing them.

In the westward, to our inexpressible delight, the interior broke in sublimity before us. What a contrast did this present to the conjectures entertained of Newfoundland! The hitherto mysterious interior lay unfolded below us, a boundless scene, emerald surface; a vast basin. The eye strides again and again over a succession of northerly and southerly ranges of green plains—marbled with woods and lakes of every form and extent, a picture of all the luxurious scenes of natural cultivation, receding into invisibility. The imagination hovers in the distance, and clings involuntarily to the undulating horizon of vapor, far into the west until it is lost. A new world seemed to invite us onward, or rather, we claimed the dominion, and were impatient to proceed to take possession.

It was manifested on every hand that this was the season of the year when the earth here offers her stores of productions; land berries were ripening, game birds were fledging, and beasts were emerging to prey upon each other. Everything animate or inanimate seemed to be our own. We consumed unsparingly our remaining provisions, confident that henceforward with our personal powers, which felt increased by the nature of the objects that presented themselves, aided by what now seemed by contrast—the admirable power of our fire-arms, the destruction of one creature would afford us nourishment and vigor for the destruction of others. There was no will but ours. Thoughts of the aborigines did not alter our determination to meet them, as well as everything living—that might present itself in a country yet untrdden, and before unseen by civilized man. I now adopted as well for self-preservation as for the sake of accomplishing the object of my excursion, the self-dependent mode of life of the Indian both in spirit and action.

To look around before we advance. The great exterior features of the eastern portion of the main body of the island are seen from these commanding heights. Overland communication between the bays of the east, north and south coasts, it appears might be easily established. The chief obstacles to overcome, as far as regards the mere way, seem to lie in crossing the mountain belt—of twenty or forty miles wide on which we stood, in order to reach the open low interior. The nucleus of this belt is exhibited in the form of a semi-circular chain of insulated paps, and round-backed granitic hills, generally lying northeast and southwest of each other in the rear of Bonavista, Trinity, Placentia, and Fortuue Bays. To the southward of us in the direction of Piper's Hole, in Placentia Bay, one of these conical hills, very conspicuous, I named Mount Clarence, in honor of His Royal Highness, who, when in the navy, had been in Placentia Bay. Our view extended more than forty miles in all directions. No high land, it has been already noticed, bounded the low interior in the west.

September 11th.—We descended into the bosom of the interior. The plains which shone so brilliantly are steppes or savannas, composed of fine black compact peat mould, formed by the growth and decay of mosses, principally the *Sphagnum capillifolium*, and covered uniformly with their wiry grass, the *Euphrasia officinalis*, being in some places intermixed. They are in the form of extensive gently undulating beds stretching northward and southward, with running waters and lakes, skirted with woods, lying between them. Their yellow green surfaces are sometimes uninterrupted by either tree, shrub, rock, or any inequality, for more than ten miles. They are elegered everywhere upon the surface by deep beaten deer paths, and are in reality magnificent natural deer parks, adorned by woods and water. The trees here sometimes grow to a considerable size, particularly the larch; birch is also common. The deer herd upon them to graze. It is impossible to describe the grandeur and richness of the scenery; and which will probably remain long undefaced by the hand of man.

Our progress over the savanna country was attended with great labor, and consequently slow, being only at the rate of five to seven miles a day to the westward, while the distance walked was equivalent to three or four times as much. Always inclining our course to the westward, we traversed in every direction, partly from choice, in order to view and examine the country, and partly from the necessity to get round the extremities of lakes and woods, and to look for game for subsistence.

It was impossible to ascertain the depths of these savannas, but judging from the great expanse of the undulations, and the total absence of inequalities on the surfaces, it must often be many fathoms. Portions of some of the marshes, from some cause under the surface, are broken up and sunk below the level, forming gullies and pools. The peat is there exposed sometimes to a depth of ten feet and more without any rock or soil underneath; and the process of its formation is distinctly exhibited from the dying and dead roots of the green-surface moss descending linearly into gradual decay, until perfected into a fine black compact peat, in which the original organic structure of the parent is lost. The savanna peat immediately under the roots of the grass on the surface is very similar to the perfected peat of the marshes. The savannas are continually moist or wet on the surface, even in the middle of Summer, but hard underneath. Roots of trees, apparently where they grew, are to be found by digging the surfaces of some of them, and probably of all. From what was seen of their edges at the water courses they lie on the solid rock, without the intervention of any soil. The rocks exhibited were transition clay slate, mica slate, and granite.

One of the most striking features of the interior is the innumerable deer paths on the savannas. They are narrow and take directions as various as the winds, giving the whole country a chequered appearance. Of the millions of acres here, there is no one spot exceeding a few superficial yards that is not bounded on all sides by deer paths. We, however, met some small herds only of these animals, the savannas and plains being in the Summer season deserted by them for the mountains in the west part of the island. The Newfoundland deer, and there is only one species in the island, a variety of the reindeer, *Cervus tarandus*, or cariboo; and, like that animal in every other country, it is migratory, always changing place with the seasons for sake of its favorite kinds of food. Although they migrate in herds, they travel in files, with their heads in some degree to windward, in order that they may, by the scent, discover their enemies, the wolves; their senses of smelling and hearing are very acute, but they do not trust much to their sight. This is the reason of their paths taking so many directions in straight lines; they become in consequence an easy prey to the hunter by stratagem. The paths tend from park to park through the intervening woods, in lines as established and deep beaten as cattle paths on an old grazing farm.

Owing to the great abundance of the birch trees, (*Betula*

river), all the brooks and lakes in the basin of the interior have been formerly and many are still inhabited by beavers, (*Castor fiber*), and these mark the usual places been destroyed by Indians. The bark of the birch trees, together with that of a dwarf willow, which abounds at the edge of the waters, is the favorite food of the beavers. They also subsist on the large roots of the white water lily, (*Nymphaea odorata*), called by the Indians beaver root, which they detach in pieces from amongst the mud at the bottom of the lakes and pools. They sometimes, although seldom here, eat the bark of the spruce fir, (*Pinus balsamifera*). They obtain the bark from the exterior of the birch trees, by cutting through about two feet above the ground, and thus causing them to fall. The side on which a tree is intended to fall is cut two-thirds through, the other side one-third. Sometimes, as happens with the most experienced wood-cutter, a tree slips off the stem and will not fall to the ground owing to the support from the branches of adjacent trees. The work has then to be performed over again above the first cutting, as we saw had happened with the beavers in several instances; some of the trees thus brought to the ground were fifteen inches and upwards in diameter. The tree being felled, every branch by additional gnawing becomes accessible, and by sub-dividing, portable.

The sagacity displayed by the beavers in constructing their houses has been often described; but it is in their draining operations, and their reason is evinced. They frequently drain up a stream, by cutting high trees, and planting them along their margin and build their houses—with one always immersed or dipped into the margin of the lake thus formed. They also, by damming, raise the level of natural lakes—to accommodate the surface to some eligible site near the margin, or on an island or rock, chosen to build their house upon. On first witnessing the extent of work performed of one of these dams, it is difficult to persuade oneself that it has not been done by man. The materials used are trunks of trees gnawed down by the beavers themselves for the purpose, mud, sticks, stones, and swards. Their houses are formed of the same material, and resemble in their exterior a hemispherical mud-hovel—of from eight to ten feet in length—such as human beings, in some parts, dwell in, but without a visible door, or aperture for the escape of smoke. They have different abodes for Summer and Winter, occupying the former for four or five months, and the latter seven or eight months of the year, according to the temperature of the seasons. These are sometimes several miles apart. A Winter house differs from a Summer one—principally in being larger and more substantial. The chief entrance of both is under the surface of the water in the lake; that of the Summer house about two feet, that of the Winter about three feet. A house has often a second set of houses at the other side. If the ground will permit, also under water for egress and ingress to and from the adjoining woods. If the entrance of the Winter house was placed nearer to the surface than is stated, it might be frozen up from the outside during the severity of the Winter, and a stop put to the egress and ingress into and out of the lake. In Summer the beavers can travel up and down the brooks, swim round the lake, go into the woods for fuel, for food, and to their houses to rest. In Winter the whole surface of the country, land and water being sealed under snow and ice, instinct directs these animals to concentrate at one accessible spot underneath a stock of provisions to subsist on during that season. It is easier for them to build a house close to where a Winter stock of food is to be procured, than to carry this to the house occupied in Summer, around which much of the food has probably been consumed. A family of beavers consists generally of two old, and two, three or four young, will commence early in September to build a house for the Winter, and soon afterwards to collect a stock of provisions. They fell tree after tree in the manner described as near as possible to the Winter house, gnaw the branches into portable pieces, carry them one by one to the margin of the lake, swim with them to near the front entrance, and then divide them into the hollows of their houses. If inclined to do, they stick one end in the mud and even lay stones upon it. In October or November, by the time the lakes are frozen over, and snow covers the ground, the house is completed and the Winter's stock of birch wood, with the bark on, placed around the entrance. Now in retirement they dive through to the bottom of the lake and bring up, at intervals, to within the house a piece to eat of the bark, when struck they go in and bring in another. Thus is the winter spent, at the termination of it, when the ice disappears, the hundred pieces of wood, that seven months before were covered with bark are now to be seen deposited on the dam entirely peeled. The senses of hearing and smell, especially of the former, of the beaver, are exquisitely fine. It requires the utmost precaution and vigilance of the hunter to steal within shot of them without detection, and this must be always done from the landward. Their sense of sight is weak, and they seldom appear abroad during the day. On account of the value of its skin the beavers are the chief object of chase with the Indians. These people having made themselves acquainted with the different spots throughout the Island where these valuable animals abound most, hunt over these alternately and periodically, allowing them three years to regenerate. We shot many of them for food.

(To be continued.)

For Forest and Stream.

NORTH SHORE OF LAKE SUPERIOR.

BY PARSON SIDNEY WILMOT.

Leaving the little "City of Pines," where the Northern Pacific Railroad crosses the Mississippi River at just about the geographical centre of this great State, just after an early breakfast, we reached before dinner the "Zenith City of the Unsalted Seas." This is the name a witty Congressman gave Duluth. Meantime to ridicule its Western ambition and dampen its enthusiasm, he really gave the name and plucky title by at the head of lake navigation its best advertisement. We were bound for our first trip on the great Lake, and visions of big trout, such as the "Fishing Tarric" of the Nepigon had described, danced before our eager eyes. On the staunch Canadian steamer Ontario we had put our boat and luggage for a quick passage to Silver Island, designing to work our way back along shore by a "white-ash breeze," when the gentle zephyrs which roar from the northeast would not fill our sails.

"We" were Captain Grant, of twenty years experience on the rugged coast—a good fisherman, an efficient camp

manager, an experienced sailor, with the rare fault of cautiousness amounting to timidity—Join, a clever and powerful half-breed; "good boy Fred," and the "Rector," by whose invitation I was glad to be the pioneer of the "Braiuer Forest and Stream" in the wonderful regions your editor has so graphically reported to the angling world. On the same steamer with us were Bishop Whipple, of Minnesota (undeniably the true apostolical succession, for his slouch hat bristled like a porcupine with hooks given him in all parts of the world, and a more graceful and energetic whipper of trout streams, and a more generous and companion one could not be found in his large lake-dotted diocese; while, would his divinity side have thought could they have seen his dashing wading, his quick whirling of his two hands into a Japanese butterfly when we bragged of our big trout before he saw it, and heard his camp yarus; this is a long, awkward sentence, but angles lives spin out when they don't expect it sometimes)—Judge Wolff, of Red Wing, a most worthy companion of his Bishop, and three younger gentlemen, no green hands at sport, with a fine outfit and outfit—grand old Captain and little Indian. Our boyhood's dreams even never compassed a grand outfit or more engaging company.

Our famous rivals for the "speckled beauties" of the North Shore were to stop at Prince Arthur's Landing, one hundred and seventy-five miles from Duluth, and as we were going twenty miles further, and intended to be gone the same time from both, we entered into a friendly and keen competition in fishing. In the cold, foggy air on deck we needed more clothing than in a quiet morning here with the mercury at zero; but in the cabin was abundant good cheer, and any quantity of that expectant sportsmen's talk which so happily whisks away the hours. Fish and fishing stories; comparing tackle; snapping killing hooks; *snapping* Indian Join for all the rest of the coast; time passed by. At ten o'clock we had a fine race to disembark, and at midnight eagerly carried our boat out at Silver Island, launched and landed her, and pulled for a camp-ground a quarter of a mile from the wharf.

We had dreamed of soft, green sward, of romantic camps, of overhanging trees, of sheltered harbors. The best place the rocky town offered was a rough point where, scraping the shore, a strong wind, if it could find an inlet on a little level, though strong ground. But that was that to contestants! We slept the sleep of the weary, and a good breakfast, cooked by our camp fire, assured us that the jolly joys of "roughing it" had indeed begun. It seemed amazing to us that Join and the Captain were so cool about sport. They enjoyed camp for camp's sake, and were not eager to cast a line. We were. Nor was our zeal diminished at seeing some of the speckled trout which had been caught so early that morning by a gentleman fishing off the rocks, who informed us that such fish were occasionally taken morning and evening miles away from any stream. After looking about the rough mining town, we rowed down shore a mile to pay our respects to General Sibley, the President, and Captain Dree, the efficient superintendent of the rich and wonderful mine which, although situated on a small island half a mile off shore, gives it name to the town on the main coast of the bluff shore, as bold as the sea-coast of New Hampshire, with water clear as the ocean at Isle of Shoals, the eager Rector took with a trolling line a beautiful lake trout weighing seven pounds, which we weighed at once with our club scales taken for that purpose. He was much set up; and we walked our turn. On the same trip we lost a new spoon and a small tin. Returning over the same route, on the way, after some one described the rocks in ten feet of water two rods before we reached it, and it was soon fished up by another spoon. We had just finished our early supper when I saw some boys fishing from the rocks a hundred yards from camp. One had hooked, but lost, a big trout. My turn was coming. I wish I could say I took my first ounce rod, with most delicate line and daintiest fly. "Forget not," says the Bible, "to be thankful in these." "Forgetting" the rule, I was, I think, "grace" toward the mark" of perfection in appointments and practice in the high art.

But, Brother Hallowell, "I cannot tell a lie, I did it with my" common joint-pole, an ordinary bass line and reel, and a small snelled hook baited with a piece of pork. Of course, I shall change my name when, in the future, I write for critics, eyes some account of exploits with the hook. It is *not* lost, but the hook is in the park in my hand. Standing on a rock thirty feet from the water, I saw a large fish playing about the boy's beef-baited lines, as if undecided which to take. The moment I offered it he took mine. I'm sure for the moment I shouted like a Methodist, rather than the sedate person I really am; but as he started for deep water with a reel, making such music as I never heard before, I realized that all my small experience was to be utilized if I would land him. I coaxed "Bub" to take out my watch to time the fight, and held that twitching, determined nose as near the top of the water as I could and away from numerous sharp rocks. Much of the time I could see him, and he was evidently so gamey a number of fishermen removed their lines to give me full play. How he rushed! Twice he leaped from the water. Three times he scudded from side to eighty feet into the lake, and I saw that I was a long time well tied; for the unfortunate "Rector" had his snelled line all reeled off and ran away with by a large fish a few minutes before I struck mine. At last he submitted to be towed gently along shore to a spot where I could clamber down by some coarse vines to a shelving rock, for I did not dare risk lifting his main weight in the air. "Bub" a good specimen of that enterprising country man who will lay out an ounce of gold for a man who will speak to him kindly, held my pole until I got down and then handed it to me. Glad enough was I to find my fish was not unhooked in the transfer. The sight of me drove him off in his last fierce dash for liberty, but he came back again subdued. I had no gaff nor landing net, and the waves were dashing nearly to my knees on the shelving rock. Bringing him carefully up on the crest of a big wave we waded him well, I kept him in, and the reflex light left him flapping at my feet. Grabbing him as lustily as ever a boy did his first shiner, and removing the hook, I ran at once to camp to weigh him—to get all the honest weight I could—while he was wet. I think he lost two ounces of blood, as the hook was deep in him; but I was glad to note him at four pounds fourteen ounces, while Bob stuck to it five pounds six, fair enough. He was twenty-two inches long, and I kept him in, and the reflex light left him flapping at my feet. Grabbing him as lustily as ever a boy did his first shiner, and removing the hook, I ran at once to camp to weigh him—to get all the honest weight I could—while he was wet. I think he lost two ounces of blood, as the hook was deep in him; but I was glad to note him at four pounds fourteen ounces, while Bob stuck to it five pounds six, fair enough. He was twenty-two inches long, and I kept him in, and the reflex light left him flapping at my feet. Grabbing him as lustily as ever a boy did his first shiner, and removing the hook, I ran at once to camp to weigh him—to get all the honest weight I could—while he was wet. I think he lost two ounces of blood, as the hook was deep in him; but I was glad to note him at four pounds fourteen ounces, while Bob stuck to it five pounds six, fair enough. He was twenty-two inches long, and I kept him in, and the reflex light left him flapping at my feet. He was twenty-two inches long, and I kept him in, and the reflex light left him flapping at my feet. Grabbing him as lustily as ever a boy did his first shiner, and removing the hook, I ran at once to camp to weigh him—to get all the honest weight I could—while he was wet. I think he lost two ounces of blood, as the hook was deep in him; but I was glad to note him at four pounds fourteen ounces, while Bob stuck to it five pounds six, fair enough. He was twenty-two inches long, and I kept him in, and the reflex light left him flapping at my feet. Grabbing him as lustily as ever a boy did his first shiner, and removing the hook, I ran at once to camp to weigh him—to get all the honest weight I could—while he was wet. I think he lost two ounces of blood, as the hook was deep in him; but I was glad to note him at four pounds fourteen ounces, while Bob stuck to it five pounds six, fair enough. opposite Joek's Lake outlet. It is one of the hundred or more tributaries that go to make up the volume of West Canada Creek. This latter stream is one of the most remarkable of the many beautiful flowing waters of New York, drawing from a watershed nearly equal to that of the Hudson, converging at Hinchley's Mills, two miles above the celebrated falls of Trenton, millions of feet annually of the timber of its upper forests into marketable lumber, and continuing to flow for miles before it enters that river, twenty miles below, a volume of water equal to its own above that point. Nowhere on the Metcalf is the hand of civilization visible. No settler's habitation has ever been seen on its banks. The bear, the wolf, the panther, and the owl form the population of the forest, and the speckled trout sports in teeming swarms in its cold and pellucid waters. The voice of the hunter, the trapper, and the fisherman are occasionally heard here; but the lowing of kine, the prattling of children, and the sound of church bells never reach this lonely scene. This was the paradise to which our footsteps trended.

Sunday, July 20th.—The morning broke lowering, but there was no more rain. The drift of the clouds was to the eastward, so that there was promise of good weather before the day should be over. When in camp on Sunday morning, we were told by a French hunter that we might spend the day as men brought up in a Christian land should do; but a party *en route* for the wilderness, like an army, must move according to circumstances. It is from no lack of reverence for the Christian Sabbath that we take up our line of march to-day. If we wait we may not have as favorable weather to-morrow. So at eight o'clock A. M. we are packed and ready for a start. The supplies and baggage go on Wilmut Lake, two miles distant, by a light lumber wagon drawn by two stout horses up a mountain road, where the rise is at least 500 feet to the mile. The party on foot precede the wagon. At nine we are at the lake, where Frank French, the warder of the log castle that overlooks that beautiful sheet, awaits us with his large boat. Wilmut Lake is situated as nearly as a lake can be, at the top of a mountain. Its waters are of crystal purity and icy coldness, and its trout are the best of any in the wilderness. The lake is, however, private property, and none are permitted to fish it but its owners. We cross the lake to the commencement of the trail on the opposite shore. At ten we are packed for the camping ground, still two miles distant. Five good stout packers accompany us to bear the heaviest burdens. Each member of the party shoulders his own traps with such ease as the general luggage is to be carried. Our friends Babcock and Van Hook are the guests at French's, volunteer to accompany and see us settled in camp, and they, too, shoulder packs. The scene, as the fourteen heavily laden pedestrians defile through the forest, singing, "O, 'nint you glad we're going in the wilderness," was picturesque. At eleven o'clock we were at Snag Lake, a pretty sheet of water a half mile long and a quarter broad, where we made our first halt. The trail, to the foot of the lake, leading over jagged rocks and through a bed of wind-fallen wood, difficult one, and we pushed again to rest at the foot. Thence we tramped to the Metcalf without further halt. We reconnoitered a little for a good camping place and finally selected one on a heavily wooded knoll between the two principal pieces of stillwater, the stream immediately in front of the camp being rocky rapids. A pretty view opens beyond the stream to the north. On the north the ground slopes abruptly to the rapids. A cold spring stream, furnished up with an abundant supply of the purest water, tumbling at the foot of the knoll at the West. As by magic the scene is transformed. The howls of axes resound in the front and the leafy monarchs are soon falling around us. Our habitation is to be fifteen feet long by nine deep in the clear and eight feet high in front. Well jointed logs form the superstructure. The rafters are of spruce or balsam, and are placed thus: one above the logs of smooth spruce bark. By four P. M. the structure is complete. The cracks are well chinked and stuffed with moss and a bed of sweet hemlock boughs supplies the place of both floor and bed. A bright log fire is soon ablaze in front, and a heavy supper of bacon, eggs, crackers, and Bermuda onions having been disposed of, we lay down on our haikuets, with hearts as glad as the birds above the logs of smooth spruce bark. We placed these enjoyments before us, as any that worship within ethereal walls. The grand old anthems, "Old Hundred" and "Coronation," are sung in concert by the party, and then all compose themselves for sweet sleep and pleasant dreams.

Monday, July 21st.—After a quiet night's rest, unbroken by howl of wolf or howl of owl, we were up betimes. Breakfast at six and then the camp being fully formed, the first business of the day was to place, at which the following "orders" are promulgated:—

- GENERAL ORDER NO. 1.—CAMP TO-DAY, ON THE METCALF.
- I.—The camp is christened "Camp Todd" in honor of our absent and lamented comrade, Captain W. D. Todd, the efficient A. G. and F. A. C. of the memorable Fire Lake party of 1872.
 - II.—The attendance of all members of the party is compulsory.
 - III.—Asst. Adj. Genl.—Captain Josiah L. Foote.
 - Chief Chaplain.—Jas. S. Sherman.
 - Chief Clerk.—Chas. Schuchman, Sanford F. Sherman.
 - IV.—The position of First Assistant Cook, (the illustrations of Chief of the Indian Service, should be filled under the operation of the Indian Service rules not administered by the Government of general army and navy regulations.) The duties of the Assistant Cook, under the direction of the Chief Cook, perform such duties as Assistant Cook as shall be assigned him, and no appointment of Assistant will be made until the duties of the Chief Assistant are fully understood, and the daily duties of dish-washers, assisted by the Landress as Chief Wiper.

By order of the Chief of Expedition.

J. L. Foote, A. A. G.

At eleven A. M. our ears were saluted by sounds rare to this wilderness—the merry voices of young women. The Indian girls, at the invitation of the French warder, the Indians soon emerged from the thickets that surrounded our camp a bevy of blooming girls. They were the Misses Babcock and Van Voorst, who were sojourning at Wilmut Lake with their fathers, our volunteer aids of yesterday, and had come two miles over the mountain to make us a neighborly call. Frank French accompanied them as guide, and young Frank Babcock came also, being young gentlemen of our party and their prettiest to entertain their guests. They staid to dinner with us, and a good dinner it was. The competing candidates for assistant cook did so well that they were all brevecd as assistant cooks, and Capt. Foote, for his surpassing skill and expertness, was given linear rank in that honorable office.

Just as the dinner-time was sounded, there were two other arrivals in camp, viz.: Mr. J. B. French, of New York, with Giles Becraft as guide. They were *en route* for

Little Rock and some unexplored lakes beyond. We had this party of fifteen at our dinner-board—a party greater in number than had ever before assembled on the Metcalf's banks—and a merrier party never gathered together anywhere. Our lady friends, with their escort, left us at four P. M., much to the regret of all, and especially of the young braves of the party, whose admiration for caution and sobriety, even the charms of the wilderness could not abate. This afternoon several of the party went out on the stream to fish. Abbott and young Sanford Sherman had the honor to open the dance with the trout. They came in early with sixty-six in number. Jas. Sherman and Green soon followed with a couple of dozen, and Giles Becraft brought in sixty-six. Thus in a short time and with little effort we had a two-day's supply, proving of excellent quality for selection for a fishing ground. Trout for supper—the first we had eaten on the trip—royally cooked by Brevet-assistant Green, with fitting accompaniments from our huntorialarder, and the meal was pronounced by all, "The best yet."

In preparation for the camp fire-to-night stupendous feats of chopping, filling and log-rolling were performed under the engineering of the French warder, and the aid of our young army. The weight, not less than a ton was impelled up the hill and into its place for a back-log. His fellow was placed on top, and one but little less in bulk mounted on spruce andron for a forestick. Ample store of dry balsam was piled on these, and we defied cold and storm. "Early to bed" is our motto in the wilderness, and before ten o'clock the party was snoring in discordant but able-bodied concert.

Tuesday, July 22d.—After a night's sound sleep, the party rose "like giants refreshed." With that tendency to barbarism which men are apt to feel when living a life close to nature, we resolve ourselves into a band of Modocs. We have no lava beds for our haunts; but this forest fastness, with its mountain precipices, its treacherous morasses and its rushing waters, afford us an equally safe retreat from our enemies. We are so long deluded the Modoc, that we have no fear of the nation. To be sure, we have no war paint; but the rare and luscious which we have brought to ward off the attack of the musketoes, will answer for facial decoration; a blue jay which Clark Bailey shot yesterday furnishes the feathers, and if the boys continue to tear their clothes, as they have done the few days past, they will soon enough come to *breach* cloths. Nothing is now wanting to complete the Modoc costume, save the hair, and the hair is to be cut. This is readily had. Behold, therefore, in all the paraphernalia of "Big Injun," the array, as follows: "Chief Modoc," "Captain Jake"—Sherman, Sen.; "White Stocking Joe"—Foote; "Snouty-face Clarke"—Bailey; "Hunky Inj"—Jas. Sherman; "Shack Nobby Ned"—Green; "Smoke-out Bill"—Abbott; "Schonchitu Santeef"—Sanford Sherman; "Steamboat Frank"—Young Babcock.

These names, like those of the true Modocs, have a personal significance, well understood by the members of the party. Two of our jaunty young braves, namely—Shack Nobby Ned and Hunky Inj—went over to Wilmut to-day to return the young ladies' call. Nothing else eventful occurred. Farrell and Giles started after breakfast on their trip of discovery and exploration; and Bailey went to the stream to get the remainder of the party lunched and snoozed alternately till dinner time. For this meal we had jerked beef, stewed, with eggs and crackers, fried trout, succotash, stewed dried fruit, and the never absent Bermuda, with a cup of good strong tea for beverage. "The best meal yet." White Stocking and Smut Face came in at dinner time with sixty-two trout, and Smoke Out brought in sixty-one soon after. So we were still to be full of fish ahead on our trout supply. At nightfall our young braves returned, bringing in two welcome recruits, viz. Mr. C. P. Kirkland, Jr., of New York, and his nephew, Charles Kirkland Seward, of Utica. They were immediately adopted into the tribe, assigned places in the wigwam, and christened respectively in the Indian fashion as Bald Head Charley and Sandy Clarkey. Supper over, a huge fire was built in honor of the new comers; but what was meant for joy was soon, alas, turned to tears; A zephyr sprang up in the north. Northern zephyrs are not, as a general rule, bad things in July; but when your camp is an open one, and being due North, with a roaring fire in front, they may make more discomfort than Arctic blasts. The inmates of the camp were soon smoked out, and took refuge in the soft places of the surrounding forest. The smoke did not do us any harm, and the fire, for congenial retreats, and so left us free from that pest. Towards morning, as the fire burned down, the uneasy slumbers, "laying around loose" in the forest, gradually crawled back to the shanty, where, after a few hours' comfortable sleep, they were again equal to breakfast duty.

Wednesday, July 23d.—A good square meal—"the best yet"—fully restored the physical equilibrium. At eleven A. M. we were up, and the morning was broken by the Will-mart ladies. They were accompanied this time by Mrs. Lewis H. Babcock, mother of the young ladies of that name before spoken of. Mrs. Babcock has visited at different times most of the lakes in this part of the wilderness, and is an enthusiastic lover of wood life. She made a visit to-day to Little Rock Lake, two miles north of our camp, and on her return, she had the ladies and the young men of the party, and Nobby Ned noted as their escort back to Wilmut, while Smut Face, White Stocking, and Hunky Inj started up the stream on an expedition to Big Rock Lake to hunt for deer. Big Rock Lake is situated three miles from our camp. To reach it the boys wade up the Metcalf a mile till they reach the mouth of Big Rock outlet, thence up the rocks that compose the bed and borders of that stream until they are within two days' march, and then take to boat for deer to hunt.

Thursday, July 24th.—To-day an accident occurred which caused some concern at first, but which the skill of our master mechanic converted into a triumph of art. The spout of our family coffee pot melted off under the fierce heat of our camp fire, and as cooking utensils are not numerous in camp, nor the means of replenishing the stock of hand tools, it was likely to be a serious loss, had it not been for the incident. The damaged utensil was turned over to Smut Face for inspection. Fortwith, from the depths of his pack, he fished up a small lump of solder, which, by some kindly providence, he had been impelled to put there while packing up his traps for the trip. A piece of spruce wood from the bark of a neighboring tree furnished the resin, a bullet mold made a severe pattern, and the skill of our master mechanic, the spout was restored, and we were all happy in the possession of a serviceable coffee pot.

There is nothing like necessity to stimulate ingenuity, and the woods is the school to furnish the stimulus. For his success, "Smut Face" was immediately commissioned "master mechanic of the expedition, to be obeyed and respected accordingly."

Friday, July 25th.—The usual round of eating was gone through with to-day, each meal closing with the unalloyed expression on the part of all—"The best we have had yet."

Bald Head Charley, who previously to his adoption of savage life, had been a distinguished member of the New York bar, showed himself so efficient to-day in dish washing duty, it being "his wash," that the dignity of dish washer in chief was conferred on him, with the approbation of the whole party; and thus it proved to the world, in the face of its prejudices, that some good may be got out of even a lawyer.

Our chief of duty dropped his first line to the fish. The communication seemed most welcome, for he came in before two o'clock with his basket full to the brim. He had gone further down the stream than any others of the party, and had struck a rift where the trout fairly leaped into his basket. Others of the party from about up and down stream also caught in large supplies, and the camp was kept still two days ahead in its store of fish.

Eating, fishing and sleeping are good things in their way; but variety is the spice of life, and we began to want a little of this sort of seasoning. Music has charms for any situation, and it occurred to the fertile brain of our admirable Assistant Adjutant General, that with all the musical talent in our party, we might have, with little preparation, a band of music. No better instrument nor performers were lacking to a full orchestra. So, obtaining an investment from our chief of the office of "Band-master," "White Stocking Joe," extemporized quite the most remarkable band that ever played in this wilderness. The cast was as follows:

- First Horn, (the dinner horn).....White Stocking Joe.
- Second Horn.....Capt. Joe.
- First Trumpet.....Schack Nobby Ned.
- Second Trumpet.....Schonchitu Sanford.
- Military post.....Smut Face.
- First Kettle Drum, (camp kettle).....Hunky Inj.
- Second Kettle Drum, (cat's paw).....Smoke-out Bill.
- Drum Major of the band.....Santeef.
- Band-leaders.....The remaining Modocs.

This evening being the first of the organization there was a grand serenade in camp. The band was complicated in excellent terms, from a high stump, by Captain Jeek, who, not being quite up in the vernacular of the Modocs, spoke in such Dutch, which answered as well, and corresponded admirably with the music. Such was the envy which the performance excited among the other musicians of the forest, that even the frogs ceased to pipe and the musketoes to hum, and if there were any wolves within a mile of the camp, they must have died of chagrin to have had their own performances so completely outdone by a company of mere tyros.

R. U. SHERMAN.

(To be continued.)

THE RED RIVER COUNTRY.—The Chatham New Brunswick Advertiser, published by D. G. Smith, Esq., formerly editor of "Quip," a sort of provincial Punch, is printing some interesting letters from the Red River Country, Manitoba. We make a few extracts:—

Two distinct classes of half-breeds are, in this region, designated as English half-breed, and French half-breed. The former peculiarly seem to draw the distinction; the English half-breed taking more after the white race, and the French half-breed more after the Indian. This would almost seem a problem curious enough for a Darwin genius to investigate for solution. Then, again, the English half-breed seems to take naturally to the cultivation of the soil, is provident and staid, whilst, while the French half-breed cares little or nothing for agricultural pursuits, and is fond of buffalo, galloping over the prairies, fiddling, dancing, and horse-racing.

The riding uniform of a French half-breed is thus described:—"Fur cap, capote or carinoo shirt, leggings and moccasins to match, flint-lock guns, and mounted on roving little Indian ponies, caparisoned with a gorgeously worked beaded saddle-cloth, and beaded saddle. The ponies are never out a wall for a week, and the mode of riding is except when racing, or chasing the buffalo."

Buffalo hunting begins with the setting in of Winter, and dog teams with small encoires, called also toboggans, are used. The dogs are generally of the Esquimaux breed, and are called "Inskins." The dogs are fed once a day with fish, or about a pound of pemmican. This keeps them in good condition. The inhabitants of Red River, Scotch or half-breed, wear a cap of tawny moose or buffalo skin, Summer and Winter. They are the fortunate possessors of a splendid country. As regards the soil, it is one of the gardens of the earth.

A curious custom of Red River is, that on New Year's Day, whether at a wedding, a chance meeting, a dance, in "calling," or otherwise, the men and women kiss each other as the New Year salutation. From the highest to the lowest, Indian woman and white woman, used to take the kiss as a matter of course, even from entire strangers. The custom is becoming obsolete, however. The advent of so many strangers is making reforms in many ways.

The half breed, like his half-brother the Indian, is generally an inordinate eater. An Indian and a half-breed sat down on one occasion to test their gastronomic abilities on a cooked fish, weighing close on twenty five pounds. They finished it, leaving only the head and bones. Not yet full they devoured a quantity of pemmican—and yet seemed hungry. At a citizen's ball in the village, now town, now city of Winnipeg, a stout half-breed sat at the supper table, and taking up a fork, deliberately transferred a whole duck from the dish to his plate, and after totally demolishing it, proceeded to partake of his supper with a keen appetite.

CHLORAL FOR HEADACHE.—Dr. E. M. Nolan, in the Atlantic Medical and Surgical Journal, describes the following cure of a very painful headache in a lady. He dissolved fifteen or twenty grains of chloral in very little water, and with the tip of a finger rubbed it upon one of her temples until she could sensibly feel the burning, and the skin was reddened. The part rubbed was no larger than a silver dollar. The pain was entirely relieved and remained so. This Doctor Nolan also used this method of applying chloral for headache with success in many other cases. Sometimes rubbing on one temple, and sometimes on both. No permanent sign is left.

AN EPITHAM FOR "LO."—Loathe the poor Indian.

the buck's hoofs and kill the deer, the buck charged me six or seven times, making me get behind trees, until the dog attracted his attention in the rear. The battle lasted some five minutes, and was pretty close, till I brought it to an end by shooting the deer through the heart, as the buck had knuckled down the dog under his feet, and was doing his best to "disconcert" him. I dressed the dead buck, fed the liver to my belt, and hurried to camp to examine it before it could freeze. I found it contained many of the oval leech-like worms above mentioned, and like the doe's its liver was disfigured and drawn out of shape by the parasites. I have preserved some of the cills with the worms complete, also empty cills and portions of the diseased liver, and when I reach home, where I have facilities for examining them, I will write you more fully on the subject.

P. S.—The mercury is below zero, and writing in a shanty with the door open to admit light (and cold) is detrimental to navigating a pen. Very truly yours, J. H. BARRY.

We have often seen these "blood-suckers" (as hunters call them,) in the livers of deer killed in mid-Summer, and always regarded their presence as a condition or indication of ill health, and a strong argument against the eating of venison killed out of season. By Autumn we had supposed the deer got rid of these parasites in some mysterious way, we never heard any one attempt to explain how, but the fact as stated above affords proof positive that their presence is not confined to any particular season, and naturally suggests the inquiry whether such presence renders the carcass unhealthy or unfit for food. Worms are also found in the nostrils of deer in the Spring, when they are lean and sickly, thereby destroying their sense of smell; and old hunters have told us that there is an oil bag in their hind leg, near the fetlock, in the hollow of the joint, which the deer break, and applying the contents to their noses, thereby relieve themselves. As deer depend more upon the sense of smell than sight for protection against enemies, their lives would be measurably imperilled by these worms stuffing up their nostrils, did not nature thus provide a remedy. We mention this at the risk of appearing credulous, and exposing our own ignorance. We have never seen the subject referred to in works of natural history, and would like to be informed in regard to it by any one competent to corroborate or give an intelligent explanation of these statements.—[Ed.]

For Forest and Stream.

THE BIRDS OF NEWFOUNDLAND.

[CONCLUDED.]

Wild Geese and Ducks.

BY far the most common species of geese in Newfoundland is the Canada goose—*Branta Canadensis*. They arrive in vast numbers in April and May, but the greater proportion pass on to the Northern regions to breed. Some, however, remain for this purpose in Newfoundland. There is a marked difference in color between the sexes, the male being a light grey, the female dark grey, almost black. There is perhaps no finer table bird than the Canada goose, and none, with the exception of the partridge, which is more attractive to the sportsman. It is no easy matter to entice them within gun shot. When on the wing the Canada goose may often be "drilled" from a long distance by imitating its cry, or "cranking," as the settlers phrase it. The more usual method, however, is the following.—The sportsman secures himself by the edge of any pond on which geese are seen, and keeps throwing a glove or stick in the direction of the geese, each time making his dog retrieve the object thrown. Soon this process arouses the curiosity of the geese, who begin to swim towards the object. Should the sportsman have no dog, he must act the part of one by crawling on his hands and knees in and out of the bushes—a method which, if continued for any length of time, becomes anything but pleasant. The stuffed skin of a fox, however, will answer the same purpose admirably, especially when the geese are near the shore, by tying it to a long stick, and imitating the motions of a dog retrieving any object. It has been observed that when on the wing, either in flocks or in pairs, a leader or leaders, and the rule here is to fire at the hinder bird, not only because the geese is the fattest, but because the leader will generally hover over his dead mate for some time, and thus his affection often proves fatal to the husband, as a second barrel will bring him down. This bird, like the domestic goose, is long-lived, the average length of life being from forty to fifty years.

The present wild geese is very common on the Southern and Western shores of Newfoundland, but is rarely seen North of St. George's Bay. From Port-au-Port they cross to Anticosti and thence pass up the Labrador shore.

Ducks.—Perhaps the finest table bird found here is the black duck, or common wild duck of the island, which lays from ten to fifteen eggs and breeds on the borders of lakes and rivers. It is no easy matter to get within gun shot of this shy bird, as "it will wind you like a deer." There is another duck here called by settlers the "Pie Duck," the eggs of which is considered good eating. It is one of the first to arrive in Spring and remains till the end of the Fall. It is a curious fact that this duck makes a hole in a rotten tree and there builds its nest, sometimes near the ground, often at a height of twenty feet. This species is the American golden eye.

Long-tailed Duck, or Loon.—This handsome bird is very abundant along the coast in Fall and Spring, but does not breed here. Our settlers call them "hoods" from the resemblance which their clamorous cry, in a flock, has to a pack of hounds in full cry. This cry is "wind you like a deer" or "cov-cov-wit-wit" and when borne on the wind from a distance it really has some resemblance to the cry of a pack of hounds. These "hoods" are most expert divers, and when the day is dull and cloudy, or with snow upon the ground, it is almost impossible to kill them, as they dive at the flash with the rapidity of lightning. On bright days, however, they can be shot as easily as non-diving birds.

American Eider Duck.—This species is called "the sea duck" by our settlers, and until the last few years was the most abundant species of ducks in Newfoundland. The increase of population and the destruction of its eggs have greatly reduced its numbers. So abundant was they at one time that it was nothing uncommon for a settler to kill from fifty to a hundred at one shot. Sometimes as many as twenty are still knocked down at a single shot.

King Eider.—The adult male of this species is a large, handsome bird, much sought after by ornithologists. Here it is called "the king bird," and is often shot during the periodical migrations in company with the eider duck.

Harlequin Ducks.—The male and female of this species are called by our settlers "lorris and ladies," and are beautiful birds, and perhaps the most expert of divers. The sportsman is amused to find that out of these birds can escape the shot of his percussion gun by diving, though sitting quietly on the water at a distance of but twenty yards. Sometimes, too, it fires at a flock on the wing, and is delighted to see the whole flock drop apparently "stone dead" into the water; but presently his astonishment is great when he sees the little harlequins all on the wing unhurt, and just out of the range of his second barrel. Other species of ducks occasionally met with here are the surf duck, the American scoter and the velvet duck.

Stormy Petrel.—The stormy petrel, or Mather Carey's Clucker, is a common Summer migrant, and breeds on many of the islands round the coast. Wilson's stormy petrel is also seen occasionally. Three species of shearwaters are met with in the Gulf of St. Lawrence, on the Banks of Newfoundland, or in the Straits of Belle Isle. They are rarely if ever seen on the island near the coast, and their breeding places are probably some of the sub-tropical islands on the Banks, where formerly the great auk found a favorite resort.

Gulls.—Fifteen species of gulls have been observed in Newfoundland, of which the ring-billed gull is the most common, its local name being "the squelzy gull." No sooner are the gulls seen, but this one is locally so. No sooner is a dead or dying bird visible on the water than it is espied by these gulls, who gather round in noisy circles and speedily devour everything but the bones and feathers. Bonaparte's gull and the ivory gull are seen occasionally in the Straits of Belle Isle and on the Northwest coast of Newfoundland.

Great Northern Diver.—This bird is called here the "Loon," its proper name being "Loon." It is a common Summer migrant, and at that season nearly every lake is tenanted by a pair of "loos." It is believed that the same pair return to their pond or lake year after year for a long period, unless they are disturbed. They are not so awkward as they are very awkward walkers, though wonderfully strong on the wing; and breed on the lakes of the interior.

Having formerly in a separate paper in FOREST AND STREAM described the great auk, once so abundant among these shores, and now believed to be extinct, I need not now return to the subject. The little auk and the common guillemot, or murre, are periodical migrants here and breed on the islands and north coast of the island. Altogether, upwards of two hundred species have been identified as belonging to the avifauna of Newfoundland; and doubtless future observers will add greatly to the number. M. HARVEY.

MISPLACED CONFIDENCE.—A crack shot and good fellow from New Orleans, while hunting along the railroad track a short distance from that city, discovered a large alligator swimming across a bayou to the place where he was standing. This was a strange proceeding, as alligators usually do quite the reverse, but this one, being very large and looking so tame, he thought it a challenge, and gave him a ball just back of his flippers. The old fellow turned back at this, recrossed the bayou, about twenty yards wide, and crawled up the bank, when a second shot laid him out. Just then a party of track repairers ran up to look at the game and offer congratulations to our mighty hunter expected, when what was his surprise to find himself instead of the alligator surrounded and in imminent danger of having "his head punched" by an angry crowd. He had killed their pet, one they had been feeding for two years. The alligator had crossed over, seeing a man standing there, in friendly expectation of something to eat, and became a victim to misplaced confidence. Full apologies and explanations were made and grumblingly accepted.

However, I would not advise any of your readers to attempt to domesticate an alligator. They may do very well to waste provisions on, but as playthings would not probably prove a success. *

—The following amphibious story is going around—

A shower of white toads took place in Larinee county, Colorado, lately. The shower embraced a strip of country half a mile wide and several miles in length. From a distance the frogs, as they bounced along the ground, looked for all the world like hail-stones. After the storm the frogs hopped about over the country in droves of ten hundred.

JACKSON, MISS., December 22, 1874.

ERROR FOREST AND STREAM.

Our issue of December 17th contains an article on "Suicide of a Scorpion," in which the English correspondent thinks he makes a good showing in the affirmative of the "mooted question, whether animals purposely commit suicide." It is another instance of what a German scientist would call "a fact not very well observed."

The scorpion killed himself, but he did not commit suicide, and the English correspondent himself never attacked his "pet" with a botanical lance, being his prisoner with the "focused rays of the sun," and naturally the scorpion runs away, even tissing (?) and spitting (?) in a like resort.

Now, what is more natural for the tortured arachnid than to strike at the object giving it pain, and as "focused rays" are not substantial things, the sting enters its own body unintentionally, which I take to be a rational explanation of the occurrence. Yours truly, GEO. C. EVANES.

WONDERFUL LEAP BY A DEER.—An Irish journal gives an account of a tremendous leap taken by a deer belonging to Mr. Galbins, the master of the Tighlonagh Sloughlands, County Limerick. The master of a few mornings since was in the paddock engaged in separating the bucks from the does, when one of the former (his best) quietly walked up to the boundary wall, which is thirteen feet high, and cleared it at a bound. Loth to lose such an animal, Mr. Galbins decided on hunting him, and accordingly two good hunters and six couple of picked hounds were selected, and laid out once outside the wall. They immediately hit the deer, and he ran for two hours till the hunt was safely taken. The jump over the wall was certainly an extraordinary performance. An English red deer stands about four feet high, so that this animal must have cleared more than three times its own height.

Woodland, Lawn and Garden.

PHOSPHATIC FERTILIZERS.

TO one of our correspondents, who asks us for a work on pure fertilizers we can say that the only book we know of which will give him the desired information, laid down scientifically, is a large and expensive work by Campbell Morfit, chemist and author. London: Tucker & Co. 1873. This book covers the whole ground he seeks information upon. After some considerable study on our part, we can give the following concise, reliable, and practical observations of our own, which we believe we can give on the whole subject of fertilizers. We have found in very many works of speculative knowledge that they are to be depended on in the direct ratio only of their truthfulness, not of their apparent theoretical truth. Theory is not always founded on fact, as it should be.

A story is told of Dr. Henslow, when Professor of Botany at Cambridge, that there was brought to him by a farmer a few fossils. He saw at once, being somewhat of a geologist, that they were of the same age as fossils usually are, of carbonate of lime, but of phosphate of lime. He drew in a long aspiration and said:—"You have found a treasure—not a gold mine. This is bone earth, which we are at our wit's end to procure for our grain and pulse, and which we are importing all the distance from Buenos Ayres at considerable expense. Only find enough of this and you will increase the food supply of England immensely."

It is a well known fact in the chemistry of agriculture that every phosphate of lime is not limited to the bones of animals. In the great laboratory of the world we find instances of deposits of the pure phosphates of lime very rare, and then on a small scale. The specimens thus found are only seen in cabinets as curiosities. The highest grades I have ever seen were from Spain and Canada, and were termed *superphosphates*, and contained ninety per cent. of phosphate of lime.

A mineral phosphate, such as is used among our own commercial concentrated manures is made from lime intermingled with chalk, gypsum, silica, manganese, and a crude collection of grosser material, which are reduced to a pulp with sulphuric acid. Of this mass may be made a good, bad, or indifferent phosphate by the addition of bones, feculent matter, road scrapings, manure, &c. OLLIFORD QUELL.

EUCALYPTUS GLOBULOSA.—This tree is a rapid grower, and it attains a gigantic size. It may be seen in St. Jose, California, of a great height. From a letter just received from a friend at that place I make this extract:—"The tree you inquire concerning is what we call the 'blue gum,' what you call it I don't know. It attains the height of sixty feet in six or eight years; it grows like a race horse. The leaves are of a gummy, sticky character, and they smell like camphor, very strong. This tree will not stand frost. It has failed to live in Georgia; attempts to cultivate the same having proved abortive. This is given upon the highest authority." If you will call to mind a circumstance that occurred at Washington a few years ago and at the Smithsonian Institute, called the "sun flower mania," in which Prof. Maury claimed such wonderful powers for the sun flower, you will find a kindred mania in the *Eucalyptus globosa*. Maury claimed that several miasmatic localities were completely purified and made healthy by growing the sun flower in abundance. Of the value and virtue of the sun flower almost every one knows, while of this new claimant we know but little, and would be the first to advise its propagation could we be assured that it would meet only a few of its claims, which we are sorry to know are fabulous. Florida, the paradise of cotton, will not grow this tree, and we have still to regard it as one of the plants whose location and abode must ever be *outra mer* for all we can do with it as an embellisher of our cold Western and New England homes. As the FOREST AND STREAM has acquired the reputation of a truth teller, we have given to all who would love this wonderful tree a short notice of only a few of its claims, which we are sorry to have noted, are correct and truthful, and may be applied to the sun flower. We shall at another time give an article in greater detail on this wonderful tree, and we doubt not our friends and readers will be amused and instructed by it. OLLIFORD QUELL.

WESTERN AGRICULTURAL LIFE.—What can be pleasant, says an exchange, than the life of a Western farmer? At daybreak he gets up and examines the holes around his corn hills for cut worms, and then he steps soundly along with larva with a hoe handle until breakfast. The forenoon is devoted to watering the potato bins with a solution of Paris green, and after dinner all hands turn out to pour boiling water on the chinch bugs in the corn and wheat fields. In the evening a favorite occupation is scalding peach trees to discourage the curculio, and after a brief session of family devotion, the silvino of the night is spent in flying coleoptera, all the folks retire and sleep soundly till aurora reddens the East and the grasshoppers tinkle against the panes and summon them to the labors of another day. Eternal vigilance is the farmer's motto, and our Western friends should add to their morning exercises a few barrels of several good fertilizers, in small quantities, and these pests, however troublesome, will entirely disappear. We have been making some of our experiments with six or seven fertilizers for quite a number of years, and with the very best success. From our experiments we know our Western farmers can find relief from too violent exercise, provided they will use the simple remedies we propose.

ANSWERS TO CORRESPONDENTS.

H. P. E., Jersey City Heights.—In answer to your inquiry of December 14th, I would say that the minute white speck upon the leaf you sent me is the skeleton of the scale insect, a common parasite of the apple species. They were doubtless alive when you sent them, but had died on their way to me. An examination with the microscope gives them the definition above, and they can be easily exterminated by the use of pretty warm soap and water. Remove your pot to a place where you can water the leaves and stem of the ivy with a fine rose jet garden hose, and wash the surface of the leaves. Do not water on good garden soil; repeat twice a year. Use a tea inch pot, with a hole in the bottom. Do not water on the soil, but water the good garden soil, and then give the ivy pot somewhat warm. The ammonia you speak of is well; use it once a

month. A better material is carbolic water, weak, and Gould's fertilizer, a quarter of a pound to four quarts water, gives you just what you need. Do not use alcohol in any form about your plants.

ANTHON GIBCO, Ill.—To your question as to commercial fertilizers, we will say: The State Board of Agriculture of Massachusetts has issued a circular to manufacturers, importers and dealers in all kinds of commercial fertilizers calling explicit attention to the act passed by the late Legislature, chapter 206, which requires every fertilizer offered for sale to be accompanied by a printed analysis, and that every manufacturer or importer shall take out a license before presenting to sell the article, paying annually the sum of \$30 therefor, and to file with the Board a paper stating the names of his principal agents, and also the name and composition of such fertilizers. Persons failing to comply with the above conditions will be fined \$50 for the first offence, and \$100 for each omission thereafter committed. This is a necessary protection for all farmers who are desirous of using a good reliable fertilizer. So many humbugs are thrown upon the markets, with so many wonderful names, and whose effects, as claimed, are extraordinary, and beyond not only precedent, but so utterly devoid of truth, that we are happy to inform all readers of the FOREST AND STREAM that all reasonable information of those fertilizers which we know to be reliable from actual experimental use only, will be mentioned in this paper. We have used numerous fertilizers for the past forty-four years, and know whereof we speak. Some are good and reliable—others are good for nothing, utterly worthless.

WALTER EVERETT, Ohio.—Will grow the thorn wren, of the kind sent as a specimen. For full directions and management of a hedge made of this kind, I refer you to one of the earlier numbers of FOREST AND STREAM. The twig you sent is one of eleven species of hawthorn, and is the *Oxyanthus Crataegus*; or common hawthorn. Has a hardy, robust trunk, branching from the bottom upwards; grows ten to fifteen feet high, armed with thorns; obtuse, tripart, with sawed leaves, and white flowers in numerous clusters from the sides and ends of the branches. The seed is in bunches, bright red berries, and are called haws. It is the least beautiful of the ten other kinds.

OLIVIO QUILL.

The Kennel.

COMFORT FOR DOGS.

WE have had occasion from time to time to refer to the negligence of railroads in providing such accommodations for hunting dogs as would enable them to have comfortable quarters and to be fed and watered in a proper manner. The only road in the country that makes any provision for such animals, as far as we can learn, is the Missouri, Kansas and Texas Railroad, and the fact that all its directors and agents are lovers of manly pastimes is probably one great reason why it stands so pre-eminent over all others in this matter. We should very much like to be able to extend this compliment to all attaches of railway lines, for we should then expect them to have some consideration for sportsmen, and provide some means of having their dogs properly attended to.

To the greater number of railroad employees, a gentleman traveling over their route in quest of hunting fields is looked upon as a nuisance to be tolerated only because there is no law to prevent his assuming a place among other mortals; but his dogs, if he has any, are looked upon as vile creatures that ought to be starved, placed in the vilest cranny of a baggage car, kicked about and maltreated generally, as if their presence were odious, and the taking of their life by torture a duty. No matter how valuable the animal may be, he is left uncared for, unless his owner attends to him, or hires a man to do it. This general maltreatment of highly prized dogs shows that the greater number of railway companies have little respect for gentlemen interested in field sports, or at least, if they have, that it ceases when the latter enter the cars.

This is a serious wrong which should be rectified; and it can be if gentlemen will only insist on their rights, as they do in England, France and Germany. Valuable dogs represent a certain amount of money, and as money is property, it must follow that dogs are also property, and that any injury done to them by the negligence of railroad employees, under whose care they may be placed, ought to be as liable to punishment as the injury done to any other species of property.

To this general assertion of negligence we except the gentlemen connected with the above mentioned railroad, for we know by experience that they pay sportsmen the most assiduous attentions, and treat their dogs in the most considerate manner. Every gentleman passing over their route to enjoy himself among the game birds and animals that are so dense in the country through which it passes, receives those kindnesses and courtesies that make traveling so pleasant.

Indeed, the fact that a gentleman is also a sportsman, causes him to become the centre of attraction to the employees. This is such an exceptional case that we feel it our duty to call attention to the fact, so that the managers of other roads may be made aware of how much their kindness, humanity and genial courtesies are appreciated by all sportsmen who have come in contact with them. If other railroad magnates would follow their lead they would endear themselves more to the public, and materially increase their revenue.

—Dr. Treadle, of Philadelphia, has a Daclsbund of imported stock, and has made arrangements to procure others.

—Twenty-four greyhounds of choice breeds were recently sold in England for upward of \$7,650.

CARING FOR DOGS.

"Carcactans," a very prominent English writer on dogs, gives the following advice in the *Fancier's Gazette* as to the proper mode of feeding and cleaning these animals:—

Taking first the matter of food, it will be well to bear in mind that the dog is what may be termed a compound animal—that is to say, he will not only exist and thrive in the very extremes of climate, but will eat and flourish on either animal or vegetable food, singly or combined, either in a crude state or cooked; it may therefore be accepted as a rule that a mixture of animal and vegetable food will be found more conducive to health than an entire diet of either the one or the other. Then again, change of food will in most cases be found advantageous. Some dogs of a high nervous temperament require very careful treatment in order to put on flesh, and will consequently require greater indulgence in the choice of food than an animal of coarser habit, and in some cases it will even be necessary to resort to tonics. Very poor feeders may be got into condition by means of cod liver oil, the daily dose depending chiefly on the size of the patient; a tablespoonful will not be too much for a St. Bernard or a mastiff, while half a teaspoonful will be found sufficient for a small terrier. Another capital flesh maker is crushed linseed, which should be as fresh as it possibly can be obtained; a handful boiled up with the daily stir-about, or soup, to mix with the biscuits or gruel, is not only found very advantageous. We have always found dog biscuits of great assistance as a change of food, sometimes given hard and sometimes soaked; when soaked they require mixing with the soup in which flesh has been boiled, milk, or Liebig's Meat extract. This latter we have been using of late with wonderful effects, and as it may now be obtained at trifling cost, it is well worth the attention of those who desire to get their dogs quickly into form, as it is undeniably wholesome and possesses the additional attraction of being easily prepared; all that is necessary is to mix an ounce or an ounce and a half of the extract in a quart of hot water. Milk should only be used with very young puppies, and then it must be boiled, as otherwise it is almost certain to breed worms. After, there is nothing that will condition dogs so quickly as scraps from the table, if you only have sufficient; the quantity of food a dog requires much depends on the size and habit of the individual, and the amount of exercise he receives, that no rule can be laid down; but, generally speaking, unless a dog is a very gross feeder—in which case very little meat should be given—it will be found best to give but two feeds a day of as much as he will eat.

We next come to exercise, which not only tends to keep in health, but brings out that muscular development which is so greatly admired in every variety; indeed, in some classes, it forms a most important feature; and a bull terrier or a greyhound, however good otherwise, would stand little chance with most judges if such were deficient. It is an easy matter to get muscle on a bull terrier; they are so courageous, so enduring, so hardy, and so full of life; various means may be employed, and so long as he gets the exercise he needs, he will be all right.

Dogs that are regularly supplied with plenty of good, dry, clean, wheat straw, will require but little washing, especially if they are in the habit of taking an occasional swim. When, however, a tub is necessary, avoid ordinary soap, as it destroys all natural gloss and has the effect of making the coat look dull, besides which there is always a slight portion of the soap left on, however carefully he may be rinsed, which will do him dirt afterwards like a castor-oil. The various carbonic soaps are far superior. We have tried most of them, and give the preference to Brown's, which undoubtedly improves the gloss, keeps the skin sweet, destroys the parasites, and cures surfeit and slight cases of mange. Large, smooth-haired dogs will be much benefited by a constant use of the flesh brush, and hand rubbing afterwards. When the coat is rough and coarse, it will be improved by the constant wearing of a thick jacket, similar to a greyhound sheet. Small doses of arsenic are sometimes used, but this should only be practised under direction of a medical man, or one who has had considerable experience. Another plan, which is almost as good and perfectly harmless, is to give a ball of common tar and oatmeal every day for a week, the quantity to be regulated by the size of the dog, a ball the size of a large walnut for a pointer, two for a mastiff, and one for a terrier.

The tails of terriers are occasionally too plentifully furnished with hair, especially on the under side, and when such is the case it is generally fined down by means of a little powdered resin taken in the hands, through which the tail is quickly and repeatedly drawn. This far we think it only fair and right that exhibitors should bring their favorites up, showing to the best advantage, but there are dogs resorted to in "getting dogs up," which cannot be too severely condemned. The most common of these are the faking of the ears of dogs that are supposed not to be cut, trimmed, or otherwise manipulated; cutting the strings in the upper lip of bull dogs, in order to shorten the face; or making "stage" wrinkles by means of a lead pencil; painting or staining the coat; curling with hair tongs the ears of retrievers and many other articles, which, when cleverly done, are so difficult of detection that it is perhaps best not to mention them at all.

MORE VALUABLE IMPORTED DOGS.

We take the liberty of publishing the following private letter, as it contains information that will interest our readers. As soon as "Rock" arrives in America we shall give his description and pedigree:—

Boston, December 23, 1874.

I see you gave the pedigree of Mr. Smith's Dart, and my friend Luther Adams, Esq., has imported her dam, Dora, a very beautiful bitch, from Mr. Llewellyn, and has now on the way, also from him, Rock, called one of the most beautiful dogs in England, and quite celebrated as a winner here. From Mr. Beckell's description of him—which Mr. Adams has just been reading to me, in a letter announcing his shipment—he will worth a long journey to see. Beckell expresses a wish that some of your New York sportsmen may see him, and speaks of his head as very noble, and altogether I believe him to be the best dog yet imported. Mr. Adams is a man of great energy, and imports solely for his own gratification and use; but if you think it will be any gratification or amusement to hear of first-class dogs, I will try to send you the pedigree of both Dora and Rock, which are first-class, and doubtless Mr. Adams will be pleased to show the dogs to any gentlemen visiting Boston.

W. H. C.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

Pompano. Snapper. Grouper. Rockfish.	SOUTHERN WATERS.	
	Trout (black bass). Drom (two species). Striped Bass.	Sheepshead. Tailorfish. Sea Bass.

FISH IN MARKET.—Shad are now becoming quite plentiful, so retail at forty-five cents each. Halibut is so scarce that the market cannot be supplied, hence it brings twenty cents per pound. Smelts are coming in most profusely and bring only ten cents per pound. Bluefish and kingfish are limited in number. Blackfish are rather common and retail at the usual price. Codfish bring from eight to ten cents per pound; lobsters ten cents and hard shell crabs in good condition, are worth \$3 per 100.

—At New Bedford and New London King Kalakaua found many personal acquaintances in the ship captains and old whalers who crowded in to shake hands with him.

—Philadelphia is the great catfish market of the country. There is a party at Deep Landing, Prince Frederick county, Maryland, who has a pond capable of holding 6,000 bushels of these fish, which he catches and keeps therein for market.

WINTER FISHING.—Employment is being provided this winter for a good many in this county and Gloucester by Mr. Edmund S. Tozer, of Newcastle, who is going largely into the frozen fish business. Bass, eels and trout are taken through the ice and shipped in a frozen state to the American market. The bass are taken by being dipped with nets out of large holes made through the ice, the eels are taken out of their winter quarters in the mud by iron traps, and the trout are caught with the hook and line.—*Chatham (N. B.) Advance.*

The following summary of the loss of Gloucester fishing crews and men during the fishing season of 1874 is given by the *Gloucester Advertiser*. During the year there have been sixty-eight lives and ten vessels lost, against 74 lives and thirty-one vessels in 1873. Of the ten vessels lost last year the crews of seven were saved. The heaviest losses have been in the Grand and Western Bank fisheries, sixty-three lives and five vessels having been lost in their prosecution. For the first time in ten years the Georges fishery has been pursued without the loss of a vessel, and but two lives have been sacrificed. One vessel has been lost in the Bay of St. Lawrence; two employed in the Newfoundland herring fishery; one vessel and three lives in the shore fishery and one vessel in the menhaden fishery. The total tonnage of the ten vessels lost was \$3,747 tons; their value, \$49,100; insurance, \$41,875; insurance on outfits, \$3,000. Of the sixty-eight men lost, eighteen were known to be married, leaving eight hundred widows and thirty-seven children.

—For several months four exquisite photographs of large size, illustrating the History of a Salmon, have hung upon our sanctum walls, keeping constantly in remembrance those past familiar experiences to which these bear the marvellous resemblance. Often in the intervals of office labor we have gazed upon them with the earnest and eager longing of a salmon angler, tempted, but debarred from sport; but we have found their influence rather soothing than otherwise, not breeding discontent or rendering irksome the hours of editorial duty. The freshness and freedom of the wildwood had been brought into our presence, and we were rendered happy by reason of sylvan pleasures already vouchsafed to us, instead of dissatisfied because circumstances prevented their immediate enjoyment.

These photographs are transcripts of those remarkable oil paintings by Walter M. Brackett, Esq., the Boston artist, which were sold in London last Spring at a magnificent price—\$5,000, we believe. Still, we have always felt that they were not sufficiently appreciated, even by the enthusiastic connoisseur who became their possessor; at least, no newspaper criticist that we ever saw, here or abroad, has ever done them full justice. The realities that are developed on the canvas seem to lie beyond the scope and conception of the merely dispassionate art critic or cold anatomist. Exactly wherein the pictures are truthful, none but the practical angler can perceive or understand; just as there are certain intelligences in the babe that a mother alone can discover and be conscious of. To the man who has thumbed these rough pages of nature every year until they have become perfectly familiar, there is not only an inner consciousness of marvellous accuracy in every detail of situation, color, shade, anatomy, and contingency, but each hour's study brings some new development that assures, surprises, and delights. Of course, these photographs lack the dramatic force and vivacious sparkle which colors give them; nevertheless, shut out from mental view all other objects, let but these absorb the thoughts, and it is easy enough to fancy oneself beside the salmon pool before us, carefully studying every vantage ground of approach and attack, choosing a strategic base of operations, and devising the most subtle artifices to lure the monarch from the secret depths below. Directly in front is a long stretch of river, with a big projecting rock in the immediate foreground, so near, in fact, that we are to imagine ourselves standing on it, and we can see the moss that clings to it in place; wet and glistening with the spray and dampness of the river. Away up above is a cascade, whose tumbling foam presently subsides into a glassy, eddying surface that indicates both depth and strength of current, and then pouring through a contracted channel between two ledges, flows past our feet with a full translucent volume and a marked descent that suggests approach to a rapid below. At the lower edge of our rock is a sharp cut ripple, and then a little eddy that circles into still water at its base. It is just at this spot where a salmon would be likely to rest after surmounting the rapid that we detect

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INVESTIGATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
125 SOUTH THIRD STREET, PHILADELPHIA,
104 & 106 MADISON ST., CHICAGO.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 30 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 7, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted. All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts. Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and confidence of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will ponder to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

THE "BIG HUNT."

COL. WM. C. McCARTY, of Texas, has been in this city for several days completing his arrangements for the Great Western Hunting Expedition that has been announced for the coming season. He is at the Fifth Avenue Hotel. We have several communications upon this subject which we shall print, as soon as we obtain from the Colonel a detailed statement of his plans and programme, and we shall be pleased to give him a fair field and full opportunity to combat the strictures of our correspondents who have written down the enterprise. We are somewhat surprised to learn how complete his preliminary arrangements are, and how much he has accomplished. He has written contracts with all steam lines, railroads, hotels, wagoners, escort, &c., from Glasgow, Scotland, to California, and endorsements of his scheme from high and intelligent authority.

FINE STOCK.—Mr. M. M. Barker, our Western representative, in acknowledging the courtesies extended him by the big-hearted sportsmen of the region he has visited, refers to a pleasant visit to the "Highland Stock Farm" of Mr. L. W. Towne, at Clarence, Shelby Co., Missouri. Mr. Towne has a herd of about forty head of short horns, many of them of the celebrated "Princess" stock. He has several imported bulls, and his cows are deep milkers, whose pedigrees are recorded in the American Herd Books. He has thirty Berkshire sows, which he is breeding to imported boars. Such enterprise in improving the stock of the country is most creditable. In due time he will, we presume, announce a sale, when parties wishing any of his cattle or hogs can obtain them.

NEW ARCTIC EXPEDITION.—The steamer Bloodhound, a Newfoundland sealing steamer has been purchased by the British Government for the new Arctic expedition to be sent out next May, via Baffin's Bay, under Captain Markham and Sir L. McClintock. The Bloodhound is one of the best of the steam sailing fleet. She was built two years since, and is admirably fitted for encountering ice. The plan is to station one steamer within Baffin's Bay as a reserve, and push on with the other as far north as possible; then by sleigh parties to endeavor to reach the North Pole. It is said the Bloodhound is to have the post of honor, and will carry the adventurers to the extreme northern point

OUR RIFLE CLUBS.

THE city of New York and its suburbs have now four well organized rifle clubs. The largest and oldest of these is the National Rifle Association, which has a membership of about 1,400. This is the parent club, and under its fostering care the others have been nurtured into active life.

The second is the Amateur Club, one thoroughly known throughout this Continent as well as Europe, for to it we are indebted for the victory which crowned the American riflemen in the last international contest. This is devoted specially to long range shooting, and the development of rifles having both lightness, power, and a low trajectory. This is in contradistinction to the former, which aims to secure accuracy with military rifles, and to teach our National Guard to become good marksmen. Both are doing excellent work, for one improves our weapons, and the other advocates instruction in their use.

The third is the Irish-American Rifle Club, which is composed principally of journalists and officers of the National Guard, but it includes also one of the greatest musicians as well as the most popular dramatist in the country. It will enter upon the contests next year with a small but good array of riflemen, and will, no doubt, make a good record.

The Scottish-American Club is composed of much the same material as the former, and in members both are about equal, for the reason that it is material and not numbers that are required. The Scots have several good shots among them, but they expect to have better ere the next season closes.

The last is the American Rifle Club of Mount Vernon, which was recently organized and gave its first exhibition last Christmas Day. This embraces several officers and members of the National Guard, and it therefore promises to do much good.

These clubs ought to be able to infuse a large amount of enthusiasm into our young men and induce them to pay more attention to rifle exercises. The great objection to their work is the want of energy displayed by the National Guard—those who should be first to foster such a manly accomplishment—and the lack of anything like practical interest in it by men who have both the time and means to become good marksmen. While the National Association is open to all who pay \$3 per annum, the other clubs are somewhat exclusive, and only a certain class of people are adopted as members; but all who are enrolled among the latter must also be members of the former to entitle them to the use of the range at Creedmoor. By this means the efficiency of the former has been increased, yet the receipts do not by any means keep pace with the expenses. The State and City authorities knowing its financial condition and the good work it is accomplishing, should support it rather liberally, inasmuch as all its efforts are directed toward a patriotic purpose. The means at command should always be sufficient to keep the Creedmoor range in proper repair and make any needed improvements.

This range is now devoted entirely to the use of the Amateur Club, as those who are to engage in the contest with our Hibernian friends practice quite frequently, and intend to continue the practice all Winter, so that they may be prepared to meet any emergencies that may arise in the Green Isle. The active members of the team are to be raised to twenty, and from this number are to be selected those who are to take part in the next international contest.

This match is to be for a cup or badge instead of money, and this will take away from it any menial accessories, and prove that it is one to test skill and to obtain honor, rather than one to garner the "root of all evil."

Our riflemen are buoyant in their confidence, yet they do not assume to assert that they are sure to be the victors, but they do express the determination to leave no effort untried to fit themselves for the contest. If the clubs now in existence carry out their programmes with the enthusiasm with which they have inaugurated them, they will be able to send a team across the Atlantic whose chances of returning victorious will be very large.

TRAITS OF NEWFOUNDLAND FISHERMEN.

THE speech of the Newfoundland fisherman is full of phrases derived from his every day employments. To make an engagement for a term of service is to "ship" with Mr. So-and-so. Even servant girls are said to "ship for six months," when they engage with a mistress. A young man "ships" himself to a sweetheart when they are affianced; and a church is said to have "shipped" a new parson; or perhaps he is called the "skipper" of the church. The master of the house, whatever his occupation, is invariably "the skipper," and the mistress is "the woman." "How's the woman?" is the usual way in which a man is asked regarding the health of his wife. Gaining an advantage over a man is called "getting to windward of him." "Mr. Blank is a terrible knowin' man; there's no gettin' to windward of him." Is a man prosperous?—he is said to be "making headway;" if the reverse, he is "going to leeward." To initiate any undertaking is described as "getting it under way," and to live manly and parsimoniously is "to go very near the wind." There is a word of meaning in the Newfoundland proverb: "The big fish eat the little ones." Thus pitifully add with a sort of mournful cynicism, do they at times describe their own forlorn condition at the end of a fishing season, when in payment of their debts the whole proceeds of their toil go to the store of the wealthy merchant, while they are half starving

during Winter. Of profitless talk, it is said in reproof, "words fill no nets." A dull, plodding man, who succeeds in spite of deficiency, by honest industry, is said to "get on by dint of stupidity and hard work," a most expressive description.

Another peculiarity of the Newfoundland fishermen, derived from their sea-faring habits, is an inordinate fondness for flags. Every merchant has his flag flying on his storehouse or wharf, as though a state of active warfare existed; while at the principal harbors, the approach of each vessel is signalled by a flag, be it schooner, brig, brigantine or ship. On Signal Hill, overlooking St. John's Harbor, three masts are erected, and at times, when a number of vessels are approaching the port, these, with their yards, look like a draper's shop, with the various flags streaming in the wind. Flags, however, are utilized in other ways. When an important personage has "crossed the bourne whence no traveller returns" the flags are hoisted half mast; but when a wedding takes place all the hunting in the place floats in the breeze. His "sealing guns," (used in shooting seals on the ice), whose report is like that of a small cannon, are brought out and fired continuously, and evidently afford the greatest delight on these joyous occasions. In the "outports," as all places but St. John's are named, it is usual to catch the happy couple in a net, as they emerge from the church—a symbolic act, perhaps—indicating that both are netted for life. In these "outports," too, church bells are few and far between, and the time for each service is indicated by hoisting on a pole a flag, on which is emblazoned the mitre or the cross. Each school house, too, has its flag-staff; and when the flag is hoisted the scholars are seen coming along the path—"creeping like snails unwillingly to school."

Near the shores Newfoundland is rocky, the ground being everywhere covered with stones of all sizes. The word stones, however, is rarely used, the smallest pebble and the largest boulder being alike called a "rock." Boys invariably speak of "firing rocks," but never of throwing stones. A servant was asked how she had been spending her time lately. Her reply was: "Why, I has been heavin' rocks out of them raisins for the best part of an hour." Thus "stoning fruit" is "heavin' rocks" in Newfoundland. So abundant are the rocks in some places, and so scanty the soil, that suitable ground for the burial of the dead cannot be found, and amid huge boulders the graves are made by soil brought from a distance; or where this is not possible, the coffin is laid upon the rock, above ground, and then walled in and covered. It is not very uncommon for a grave to be dug less in depth than the coffin. Of course this is true only of certain localities.

Among the primitive population of the "outports," there is, among the Protestant portion, a wonderful passion for choosing names taken from the Old Testament, and these, at times, the oddest and most uncommemorative can select. Isaacs, Rubens, Daniels, Azariahs, and Isaiahs are plentiful as "rocks;" but it is rather startling to be introduced to Miss Lo-Ruhamah Tucker or Miss Lo-Ammi Squires, and to be told that the little flaxen-headed girl you are trying to make friends with rejoices in the name borne by one of the daughters of the patriarch Job, Keru, Happauch, or that the baby's name is Jerusha. To those not quite familiar with scripture names, it may be well to say that the first two are to be found in Hosea I. Ch. 6, v. and 9 v. It is on record that one child was baptized Beersheba, entered in the marriage register in due time as Bathsheba, but always called Bertha by her neighbors. A clergyman of the Church of England relates that once, in beginning a service, in a private house, in an "outport," a woman near him, intending no offensive familiarity, lifted up a corner of his surplice, and after examining it with finger and thumb, pronounced it aloud, "a beautiful piece of stuff." Under similar circumstances he was startled, on another occasion, in the middle of his sermon, by an old woman in the chimney corner calling out to some young ones: "My gracious, girls, I've forgot the loaf! Julia go out to the next house and hang on the bake pot." It must be understood that these incidents occurred in some of the primitive outlying settlements, far from the centres of civilization, where the people seldom see a clergyman, and are quite unaccustomed to the solemnities of religious assemblies. They welcome eagerly the rare visits of clergymen, in these scattered hamlets, and whole batches of children, of various ages, are baptised by him at the same time. So cold is the weather in Winter, in the more northerly part of the island, and so wretched their houses, that in order to keep it the loaf from freezing at nights, it is the practice to wrap it in the blanket and take it to bed when retiring.

The population is a mixed one, nearly half being descendants of Irish settlers, the rest English, most of them sprung from progenitors who came originally from Devonshire, Dorsetshire and Hampshire. The descendants of the latter retain many of the peculiarities of speech which still distinguish the peasants of Devonshire. They say, "It's took no notice to sbe," that is no notice of her. "Did 'ee want anything w' I?" They speak of their "handes" and "postes;" of their cows being "alossed" and their bread "amade." They will say, "Mubbe I's gown home." The parson is "parson," and they ask him to "bide a spurt" with them. A "spel" is either a short continuance of labor or a time of rest. Short distances are, in common speech, measured as "spells." Thus "two shoulder spells" is the distance a man would ordinarily carry a burden on his shoulders, resting once in the midst. The word "obedience" is sometimes used for "obedience." Thus children are directed to "make their obedience," that is, to bow,

or rivers. The inhabitants of a settlement are called "liviers," and if any district be uninhabited there are said to be no "liviers" in it. An expressive phrase is used to indicate a fall in the temperature, "Today is a jacket colder than yesterday." "How do times govern in St. John's?" is a common question which is answered by recounting the price of fish, oil and provisions. "Praise the fair day at Newfouland," is a Scotch proverb which has its counterpart in Newfoundland: "Praise the bridge that carries you over." The folly of lazy, shiftless expeditents is well expressed by saying: "He sits in one end of the tilt and burns the other." When admiration of a benevolent man is expressed, he is described as "a terrible kind man" or the weather is commended by saying "it's a shocking fine day." Clever, in Newfoundland, means strong-of-large. A "clever man" is a stout, large man; a "clever baby," is a hearty, big baby. A singular use of the word "accommodation" is common. A person of bad repute is said to have "a very bad accommodation," or a servant on leaving his master requests "an accommodation," evidently a corruption of "recommendation."

With all their primitive and often amusing peculiarities and local customs, the fisherfolk of Newfoundland have many sterling qualities of head and heart; and all they want to put them on a level with corresponding classes in other countries more advanced in the arts of civilized life, is education. No one could live among them without liking them. In simplicity of character, warmth of heart, kindness and hospitality, they are unsurpassed.

FLORIDA ROUTES.—The increase in the number of tourists traveling to Florida every year, to enjoy its balmy climate and tropical scenery, and to avoid the fierce blasts of our Northern Winters, has caused the steamer and railroad companies to make every effort that would add to the comfort of travelers. In order to place such a trip within reach of all classes of invalids the Pennsylvania Railroad Company has made such terms with connecting roads, as far as Jacksonville, that excursion tickets for the round trip from New York to Jacksonville can now be purchased for from \$50 to \$80, according to the route selected. The Pennsylvania Railroad Company is entitled to the thanks of the public for its enterprise and energy.

REPLY.—In order to obtain all possible information relative to the advantages of each style of rifle manufactured in the United States we have addressed letters to every manufacturer of arms containing specific questions, but we are sorry to state that few indeed have responded, and they are those whose weapons are best known. We return thanks to Lieut. Metcalfe, of the Springfield Armory, the Remington Company and the Whitney Arms Company, for their prompt alacrity in answering our note. If the other companies would benefit themselves as well as an inquiring public they ought to respond, even if their answers are only partial.

All officers of the Army and Navy, by authority of the higher powers, will be permitted to make collections of the fauna of any portion of the world in which they may be stationed for the benefit of the Zoological Society of Philadelphia. This interest in science will be highly appreciated by all interested in the natural history collections of our country.

A. B. Lamberton, of Rochester, has accepted an invitation to read a paper at the next annual meeting of the National Sportsmen's Association at Cleveland in June next. His subject will be on Nomenclature.

HOW TO RAISE QUAIL.

We reproduce from our issue of Feb. 12, 1874, the following article, in order to serve the interests of many of our readers at the present time, and also to supply in part the demand for this particular issue of our paper, which is now out of print.—Ed.]

OFFICE OF WEST JERSEY PROTECTIVE SOCIETY,
February 10th, 1874.

EDITOR FOREST AND STREAM:—

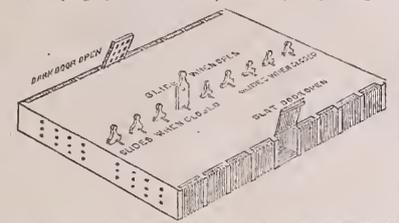

I have been requested by a fellow member of the West Jersey Protective Game Society to give you a slight sketch of my small experience in the raising of partridges, with the hope that others who have, or do interest themselves, in the laudable pastime of raising and protecting game, may derive some benefit, however small, from my slight experience.

There are three ways of raising or protecting partridges in this country, and everyone who is interested in the protection of game, should, if possible, adopt one of these three ways according to his means and time. The first and most common way is to feed the birds by throwing out either screenings of oats, rye, wheat, or some corn, in some place where the birds are in the habit of roosting. This should be done with some discretion, otherwise it would become expensive and burdensome to a poor man to feed birds every day. If, however, it is done two or three times before the heavy snows of the Winter have set in, the birds will be likely to remain in the neighborhood, and when the snow has entirely prevented them from getting their food, a few days feeding at such times will enable them to outlive the storm and Winter. This plan is very commonly adopted all over the country, and when judiciously managed, has been found to be of great success. But I will here add, if more extensively carried on, it would greatly increase the amount of game. I would suggest to those who have farms, and who either lease them or employ their own farmers, that a small reward of five or ten dollars to their tenants or farmers for their trouble in protecting and feeding the birds over the Winter, would insure many more birds for the Fall shooting, and would be well worth the outlay.

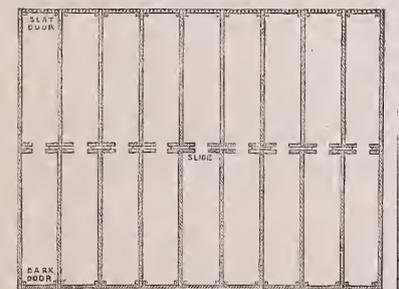

The second plan is the more expensive and troublesome, and depends much upon the means and accommodation one has at hand to carry it out. The plan is that of putting the birds in a room or loft, and arranging bushes around the room so that when frightened, the birds can hide in the bushes. The plan is objectionable for several reasons, and should not be adopted unless one has no other means at hand. It is objectionable because the birds are kept together and thus are liable to pack in the Spring, and hence all your time and trouble goes for naught, and it is also at fault because it makes it difficult to clean the room, and when you wish to turn the birds out of a box, in a desirable place, (which is the only proper way, and not as is often done by opening a window and letting them fly out), the birds are liable either to hurt themselves when thus frightened, or to be injured by being too roughly handled. If no other way, however, is feasible, this plan of rising birds should be adopted.

The third and last plan, and the one in which I have had the most experience, is perhaps the most expensive and troublesome, but is by far the most desirable; it is the keeping and raising of birds in pairs in boxes. In raising birds, light, air, cleanliness, and proper food, are the first and most important essentials to be looked after, in order to have the birds in good condition to turn out in the Spring.

The box in which these birds are confined should be made as follows:—It should be seven feet wide by ten feet long and one foot high; let the top be padded with some soft substance like cloth or muslin, so that when frightened, the little fellows will not hurt their heads against the top of the box or flying up. The trouble, however, of padding can

be avoided by making the box lower, but this is not desirable, as the birds have very little room to use their wings; and I have found on letting them out in the Spring, that from their long confinement, they have not for several days regained the full use of their wings. Divide this box in the middle by a piece of board running the whole width of the box and divide each half thus made, lengthwise, by nine partitions, (or as many as you wish,) this will give you twenty separate boxes, each one foot by three and a half feet long. The partition, running the whole length of the box, gives you a light and dark box, which communicate by a door with a slide which can be gently raised and shut down at your discretion. The object of the boxes is, that while the birds are in one box you can clean the other without disturbing them, and when you approach the front of the boxes they will run from the light to the dark box. The communicating door being gently closed enables you to throw in feed or clean the boxes as you wish.

The front door to each box or partition should be its entire width, and made of slats half an inch apart, and should be hung on hinges from the top and fastened at the bottom; this enables you to clean the partitions more readily and also feed the birds. The sides of the dark box should be bored with half inch auger holes for ventilation, as also the back door of the dark box, which is the same width, and hung and fastened like the door of the front box.

The communicating door is large, enough only to let one bird pass through at a time, and the slide that covers this door is lifted up from the top, and regulated or kept up by a little wooden pin. These boxes can be made for fifteen or twenty dollars, and I have found from experience are excellent both for air, light, &c., and are most handy. Care should be taken to see that the boards on the inside are smooth, so that the birds cannot hurt themselves. The next important step is the food.

The best food is mixed bird seed, and occasionally a little wheat; wheat, itself, is too strong, as is also corn for birds confined in this way. Gravel and sand should also be thrown on the floor of the box and occasionally a clod of dirt. A zinc bath tub, three inches high and six inches long, with the edges turned down, so that they cannot cut their feet and heavy enough not to turn over, should be put in the box with fresh water every morning. This is very important, as the birds on coming out of the dark box will be observed almost invariably after feeding to take their

bath, and I am satisfied, from experience, that their condition is greatly improved by it. The box should also be cleaned every morning, as nothing is more injurious to the health of a bird thus confined than a dirty box. In such a box, with the capacity I have just described, I could clean all the boxes, water and feed all my birds without frightening or disturbing them, in the space of ten minutes. In two or three instances, where I have given the above directions to the building of boxes, to other gentlemen desiring to raise birds, I have in each case been told that not a single bird has been lost, although it was their first experience in raising them.

The next step is the letting out of the birds. This is most important, as you may have all your Winter's trouble and labor fruitless if the proper precautions are not taken at the proper time. The time, therefore, and the way in which the birds are to be let out, are two very important steps in the object you wish to achieve.

As soon as the snow is well off the ground and the grass commences to start, then let them out in some thick cover by pairs or in fours, two cocks and two hens, and at the interval of a day or two between each pair or fours, as the case may be. Thus, by letting them out in pairs during the season, and by pairs or fours, you obtain two objects, which are desirable. The first is, that birds confined in a box and regularly fed, will migrate several miles, unless they are able to get their food when first let loose, and it would not be amiss for one or two days to drop some food at the box door, as they are almost sure to come back if they are not able to feed themselves. By letting them out in loose cover you give them a warm place at night and a place to resort to from their mortal enemy, the hawk. Secondly, by letting them out by twos or fours you enable the female to change her master, if she so wishes, which is often the case, and you prevent that which is more important, the whole covey from "packing," as it is called. Packing is where a covey, instead of pairing and breeding, stay together, and so travel all through the breeding season. Should this happen, all your pairs are taken for nothing. This I have seen occur twice, and entirely from the fact, I think, of their being let out too late, which was done during the latter part of the month of June. Whereas, birds kept in the same box and a part of the same covey let out in the early part of the month of May, all paired off and had their young. I would, therefore, advise their being let out as soon as the Spring has well set in. They thus get food and warmth, (for the change is great for them, from a covered roost in the open air) and protection from the hawk. A swamp is an excellent place to let them out. In conclusion, I would advise that no bread should be given as food, as I have known it at times to have killed many birds, and on opening them have invariably found the bread caked in their crops.

Under the method I have just described, I have raised eleven coveys out of twelve pairs of birds let out, and again six coveys out of six pairs turned out, and also six coveys out of eight pairs turned out.

I have recommended the birds being paired in the boxes for the reason that when the breeding season commences, about the end of February, the birds will commence to fight, and I have lost in one night all my birds, except one cock and hen, which were so cut up as to be of no use. As you never know when such a disaster may take place, it would be safer to pair them as soon as you get the birds.

I would advise all clubs to use this system of raising birds; the expense can be more easily borne, and as it will be under one person's direction, it would therefore be more likely to be successful.

If, Mr. Editor, you should think this article worthy of your paper, I will live in the hope that some trustworthy person, having read it, will be induced to try it, and thus attain the object for which it is written, viz: the successful raising and breeding of partridges.

PROTECTOR.

WISCONSIN POULTRY ASSOCIATION.—The Wisconsin State Poultry Association will hold its annual exhibition at Milwaukee, February 26th, and will continue it until March 5th. Besides the premiums for poultry, some excellent ones have been prepared for cage birds and household pets, such as guinea pigs, white mice, dormice, squirrels, rabbits, ferrets, minks, cats, and dogs. The Association prizes for dogs are \$5 for first and \$3 for second, for each variety exhibited, and FOREST AND STREAM has added three special prizes in the shape of three of its yearly subscriptions, for the best hound, setter and pointer in each of those classes. Many prominent sporting gentlemen in Chicago and Milwaukee have promised to aid the society rather liberally, and to exhibit their animals besides. The managers of this exhibition are enterprising gentlemen and deserve much praise for their effort to improve many of the domestic animals of their State.

Grasshopper-eaten Kansas settlers are migrating to Florida in considerable numbers.

The temperature at New Smyrna, Florida, on Christmas Day, was sixty-four degrees at 7 A. M., seventy-six at 2 P. M., and sixty-nine at 9 P. M.

A meeting was held in Detroit last week for the purpose of having the next regatta of the National Amateur Association at that place. The sum of \$1,500 is needed to bear the expenses, and it is supposed that this amount can be readily raised. *Wilkes' Spirit* says:—

The citizens of Saratoga are intent upon securing the return of the collegians to Saratoga Lake for the next regatta. A meeting was held last week, and it was then resolved to increase the facilities of transportation to the lake by building a railroad thereto. The meeting was adjourned to last Wednesday evening, and the sub-committee on stock subscriptions has issued an appeal to the citizens to come forward and subscribe, so that the road can be paid for in cash, thus diminishing the cost of construction. Messrs. Ferry of Yale, Van Duzer of Harvard, and Rees of Columbia, have visited Saratoga with a view of ascertaining what would be done to further the interests of the regatta. We trust the Saratoga folks will not overlook the necessity of providing a faster boat to accompany the race, quite as important to the success of the regatta as the accommodation of visitors in getting to and from the lake.

for me or two months, fishing being their principal business. As these trappers were good boatmen, I hired them. They had then three or four salmon (7 weighing ten or twelve pounds. We have met with several trappers here who trap all the winter, and live pretty much like Indians. They have a "saw boat," (contain some steel traps, fishing lines, nets, etc., and a long rifle, with a little bar for balls, and a coon's skin cap. They live in "shoabags," made of plank, poles, or rods, as chance directs, and they "rig the run" or the variants in one or two nights. One old fellow was camped on Belle Canton Island, and while we were there caught eleven muskrats and seven coons in one night, which was a goodly work, I suppose. He had a "skinder" (i. e. a more proper name) of doing up Little Tennessee, to get a few bear, as their skins are more valuable.

I rather fancy the life would be much more conducive to physics than engineering. With a good oar gun and a rifle I could have the best wild game for food. The fishermen I hired have a boat fifty feet long, with a horse on it, a cooking stove, two porcelains, and a place to keep live fish in all the time. The nets fishing tackle, etc., together they would have a good time, if they would only wait occasionally and keep a change of clothes. There were nearly two pounds of a fat taken from the salmon (7) by guess. There were two lobes eight or ten inches long, and from one and one half to two inches wide and about one inch thick. You can estimate the number probably. I killed a pheasant, two hares and a squirrel the other day, and we have, as often as much game as we can eat. How would you and your family like to join us in an outfit on the water? Yours truly, A. B. C.

The salmon of the Western rivers is known to us as the pike-perch.—Ed.

LEXINGTON, KY., December 28, 1874.

EDITOR FOREST AND STREAM:—

At the annual election of officers, December 26, for the Hunter's Club, the following were elected: R. E. Tipton, president; Major John R. Viny, vice president; J. M. Taylor, secretary and treasurer; Horace C. Craig, Frank Waters, Dr. B. W. Dudley, directors. By order of the president, I have notified the members of the Executive Committee to meet at Lexington, Ky., on Wednesday, December 30, to arrange the programme for the meeting of the Kentucky State Sportsmen's Association at the Hotel Tuesday, Jan. 1, at Park City. Numbers are constantly joining the Association, and it promises to be one of the largest of State Associations. Will send programme when published. J. M. TAYLOR, Sec. Ky. S. S. A.

A HUNTING TRIP.

NEW YORK, December 21, 1874.

EDITOR FOREST AND STREAM:—

Some twenty years ago my two brothers and myself decided to go to Chicago on a hunting expedition, taking with us "sid" Smith, a well known shot who had secured the contract in a quiet way over a distance of fifty miles from his home, but who had never been on the great prairies of the West. Fully equipped with all sorts of "shootin' iron" and a brace of setters, we left New York in December, 1854, via Erie R. R., and reached Chicago in due time, and having hired a wagon and noble team of white horses, we started out in full spirits for the Kankakee River, in crossing the woods and soft places on the prairie had to wade forward as advanced guards to make depth of soundings. After prying out the vehicle several times the harness gave way, and we had no alternative but to walk. That night we stopped at a Hoosier's house, whose hair was down his back, and who said there had not been a harrier that way for five years. So Sid Smith, to oblige him, offered to perform the task, and a pair of sheep-shears were produced, a radical change was made in the appearance of the backwoodsman entirely satisfactory to him, but being out in trousers, is not the present style of venting the hair. We dined on raccoon meat, and our appetites found no fault with the fare. We traveled forty miles on foot, and I had just entered a woods for quail, when I was startled by the snipping of the twigs, and saw a noble deer not twenty feet from me. I was sent my gun, loaded with No. 10 shot, and was discharged in his forequarters, but he gave a short and headed off, and was soon out of sight. Nevertheless, deer were plentiful to the tamarack swamps, and we took three noble specimens here. Such a thing as going such a distance from home, at that time, was almost unknown, and we were the objects of much curiosity wherever we stopped on our game. On our return by Lake Erie we took a very large, but very old steamer, and as she was very heavily loaded, and a severe sea coming on, we were near going to the bottom. The stateroom adjoining ours was occupied by two young men, one of whom had recently married, and he was constantly bemoaning his fate, expecting his wife would soon be a widow. On our trip to the Salt Ste Marie, the steamer General Jackson, on which we were passengers, exploded her boiler, and we were obliged to land, but we were not out of venison and game, and kept our neighbors supplied for weeks after our return. F. C. F.

ANOTHER GUN CHALLENGE.

JACKSONVILLE, Ill., December 28, 1874.

EDITOR FOREST AND STREAM:—

I am authorized by the president of the Kit Carson Sportsmen's Club, Macon, Mo., to offer in his behalf a challenge to any club in the United States, for one hundred dollars and upwards in field shooting. The locality to be mutually agreed upon, either in Missouri, Illinois, or Kansas, and the date not to be later than the 1st of May, and chosen from the respective club. The game to be anything in season. M. M. B.

PLAIN QUESTIONS PLAINLY ANSWERED.

PORTLAND, Me., December 23, 1874.

EDITOR FOREST AND STREAM:—

In your paper of 17th inst. I see that "Chick Cook" asks a few questions of "Sportsmen," and as I claim to belong to the brotherhood, will answer them according to my views, hoping others will do likewise. 1st. "Is there any real satisfaction in shooting Wilson (English) snipe during the Spring light?" Don't know, never having tried it. It is one of the best snipe to do it here in Maine, and might be as much in Shrewsbury, 2d. "Are we not working against our own interests in shooting wild fowl during the Spring?" I don't think we are; the case is not parallel to that of snipe. The eggs in the female are not far towards development at the time of our Spring coast shooting of wild fowl. Wood ducks are protected with us, and an attempt to prohibit the shooting of any wild fowl during the Spring flight would cause such an outcry as would endanger all our game laws. 3d. "Has not last Summer's experience proved to most sportsmen the need to abolish Summer woodcock shooting?" No; but it has proved to many of them the need to abolish eight snow storms in April. 4th. "Is it sportsmanlike to encourage the trapping of wild pigeons during the time they are migrating?" No; I suppose they are very kind, but at no time, I consider it better to be on the safe side, and give way to wild pigeons will be sought through the Legislature of the States where they breed. Mac.

TO AVOID WET FEET.—Here is another way to prevent water from getting through shoes. The composition also makes a good harness dressing. Take neatfoot oil, one and one-half pints; beeswax, one ounce; spirits of turpentine, four ounces; and stir well cold. Spread and rub this composition over the leather while it is damp; leather will absorb oil and grease better when damp than when dry. For the soles, take pine tar and rub it in before the fire until the soles will absorb no more. Three or four applications will be needed. The durability of the soles will be much increased.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

A MODEL YACHT.—Mr. Joseph B. Van Deusen is constructing at Williamsburg a centreboard schooner yacht for Mr. William T. Garner, of the New York Yacht Club, and owner of the dainty Magic. The new schooner will eclipse the famous Sappho in the matter of dimensions, and will be built after that peculiar principle observed in the Columbia, and last year perfectly developed in the steam yacht Ideal. She will be as long as the water line, 138 feet on deck, more than 140 feet over all, 30 feet 4 inches breadth of beam, 9 feet 4 inches depth of hold, and about 330 tons burden. Her centreboard will be 30 feet long by 14 feet wide. The vessel is to have a draught of 6 feet, but with her centreboard down she will draw about 31 feet 6 inches, considerably more than the load draught of the largest keelboat yacht. Her rig will be that of a sloop and full schooner. The sails will be as long as they are able to procure, reaching 100 feet if they can be procured. The topmasts will be 50 feet in length, so that if the Brooklyn Bridge is ever thrown across the East River, and the new yacht is then aloft and wants to go that way, they will require to be hoisted. In all details the new yacht will be constructed in the most approved manner. Not an improvement which can be satisfactorily introduced will be omitted by her constructor. It is expected that this craft will be fully finished and ready to go into commission by the 1st of June next. It has been decided to christen her the *Mobawk*.—*Herald*.

—The Clipper Boat Club of Pittsburg will have a new house that will cost \$5,000. It will be made out of the steamer Milner, which has recently been engaged in the trade of the Upper Missouri.

—The yacht Tidal Wave, Commodore Wm. Voorhis, sailed on the 27th December for St. Thomas from Bermuda.

—The Pickwick Boat Club of Hoboken have elected A. M. Hopkins, President; M. Dast, Vice President; H. H. Sierck, Treasurer; J. H. Reekie, Captain; Robert Taylor, Lieutenant.

—The American yacht Josephine, N. Y. C. Captain Phoenix, with Messrs. Talboys and Croker on board, arrived at Barbados from Marlborough December 9, remained there one week and sailed December 13 for Trinidad.

—There is now on exhibition at the Rooms of the Maritime Association, 64 Beaver street, a most ingenious invention for detecting a leak in vessels. It is the invention of J. D. Leech, and is worthy of a visit from parties interested in nautical matters.

—The sloop Red Jacket has been added to the Brooklyn Yacht Club.

—An international four-oared race for \$5,000 and the championship of the world is to be arranged between a picked four selected by Bernard Biglin of this city and the English champion four. The English four will probably be J. M. Sadler, Robert Bagnall, Thomas Winship, and James Lumsden, with Boyd and Taylor for substitute. The Hon. Bernard Biglin will select John Biglin of this city, Thomas Elliott of Greenpoint, L. L. Josh Ward and Hank Ward of Cornwall, N. Y., with Evan Morris of Pittsburg, Pa., for substitute.—*Times*.

YACHTING IN FLORIDA.—NO. 1.

EDITOR FOREST AND STREAM:—

The December wind is busy to-night driving the snow flakes into many a curling drift, and now and then with mischievous impulse trying to force a few of the dainty missives from the frozen North, under the doors and in at the windows; but the storm only enhances the cheeriness of the glow within, and the bright flames of burning birch wood crackle as merrily as a camp fire, and carries one's mind back to many a bivouac among the forests of Lake Superior, Nova Scotia and Northern New York. But pleasant and varied as are these memories of our northern rugged woodland, we will not use our hull ourselves with associations of the sighing of the wind in the pines and spruces, but turn to recollections of the sunny land, where the huge palmetto leaves rustle even now to gentle airs, and with every breeze, and tall cypress arms form a scene that has little in common with the outlines of snow that lie far and wide about us.

Fleeing a year ago from the cold, your correspondent found himself steaming rapidly away from one of the long wharves of the lower St. John on a small impetuous little yacht, one of the busy, bustling kind, imbued with the restless spirit of small things usually possess and exhibit, to stay in that place and do nothing.

It was a day for idling, and the rapid puff was not in harmony, so leaning over the small bow cock that just held a bell and two easy chairs, the order was given to old Paul, the well known pilot, to slow up, and Paul conveyed the same to the engineer, when the sharp ripple at the bow lost its rustle, the engine breathed more comfortably, and with a wide, lively wake spreading behind, and the golden rays, we laid back in our seats and determined to abandon northern haste, and learn laziness in earnest, in fact to do nothing as hard as possible. And the lesson was very easy. The slow drifting clouds, the currentless river, the gentle wind, and all about was peaceful and free from suggestion of haste, and coming fresh from driven clouds and hurrying storms, it was enough to take in sunshine and repose, leaving the engine and the propeller to progress. The afternoon found us at Palatka, where the ladder was reinforced, ice purchased and a boat obtained. At twilight we pushed on, turning into the narrower and more picturesque channels, where the forest crowded out to the water's edge, and sprays of flowering vines hung far over the flood, lost in vain admiration of their mirrored beauty and grace.

The water was deep even to the shore, and we cut the bends of the stream close under the foliage that rustled with the breeze made by our motion, while views of remarkable beauty opened every moment before us, each in deeper shade and more mysterious beauty as the rapid darkness came on. As later every form on shore was lost in the dense blackness of night, it became a wonder to us how old Paul could thread the devious and narrow channel, but on we sped, only halting ashore once to get out of the great river boat going by "the chief" some sailing like a levathan breathing flame, and with wide open furnaces casting broad bars of light over the water, and rows of colored signal lamps far above the bright cabin windows, she made a striking scene against the night as she sped on, hearing a gay throng of pleasure seekers to the upper river.

We were not anxious, however, to get on. There was a wealth of beauty by the way, that few on the great stream would see, and after feeling our way for a time, old Paul rang to "stop her," "back her," and our little boat drifted against a wood wharf, that no one but our pilot could have found with no sign to mark it under the forest blackness, and here tied up to a decayed dock, we did not envy the passengers going "on time." Our superior comfort on shore there would be a rush for seats, and a scramble for food, and a long cue of tired men and women waiting to learn from a patient purser that there were no more state rooms, no more beds on the floor, and no more blankets for a curl up under the dining tables. We were not at the mercy of negro stewardesses, not to be snubbed by magnificent waiters; we were as independent as chimney sweeps in a crowd. Your correspondent was invited to the boat (steamer) and to sleep in the cabin, "on his own light and midnight," and chief of ordinance, (one Scott and one Remington), while Madame was in command of our cabin passengers, (maid and one child), and reigned supreme over a culinary department consisting of two spirit lamps at night and a fire on shore in the day time.

Just at the time we tied up hot tea was singing on one lamp, and (thank to Leilig), on the other, and with good supper, deified meats and canned luxuries, there was a good roll laid away, and the events of the day came in pleasant retrospect through the cheering medium of sparkling wine. At dawn we clambered onto the old wharf. A wood road ran back from it through the forest to a settler's house. Birds were singing gaily, among them our familiar Summer friends; but many strange notes came from the low ground. Following what seemed to be the sound of an axe, a woodpecker was found, an earlier workman than the lazinesses. It was one of the large fellows that are sometimes seen on southern trees; as large as a teal duck, a gay handsome bird, with a bill like iron, and a head that enables them to exercise the full long considered impossible, of saving wood with a hammer. Ducks, herons, water turkeys, ospreys, and other birds followed the narrow water to the their flight, stirring about the tree tops as they found us occupying their solitude, and saying hard things of us in their own way, while high up on a venerable express limb sat several ducks, rather an unusual sight, and there they sat while we made a fire and cooked our breakfast, and only moved off when a ball went very near them.

Nothing can equal this mode of enjoying the southern rivers. From the lofty decks of the steamers a good deal is seen, but every moment one is hurried ruthlessly away from some spot where there is every temptation to linger, and then left to while away hours at some landing where preceding crowds have gathered every flower, and alarmed every bird with pistols and parangs.

After a leisurely breakfast on shore, as free from care as gypsies, we went on board, put easy chairs on deck, and laid our guns before us, and steamed on through scenes of great beauty, and variety, now and then getting a duck gratis, which was picked up and enjoyed by our men who cooked them in the furnace under the boiler.

About noon we reached Lake George and found it very rough, but leaving the channel we followed an unusual route through the islands and ventured out, our yacht rolling a good deal, but we soon came under the west shore and found the channel as smooth as the shore. The water was wonderful springs that are so beautiful. Leaving the yacht, we poled in a flat skiff over a shallow bar, and up the stream that flows from the spring. It passes through water lilies, and they were swarming with duck and mall, while in the water that was as clear as air were shoals of fish, bass, mullet, long savage looking gar fish and huge catfish. They would not bite, but were easily pumched away in one's hand, and were as good as the fish obtained. Half a mile from the lake the stream ended in a curve under a high bank, and here by hard rowing we chased the spring, and looked down into a white wall of foam churned through water that seemed too ethereal to support our skiff. It was a dizzy overlook down into this deep pool, where long weeds whirled and swayed forty or fifty feet below us in the swell of the current, and where shoals of large fish would sweep out from under rocks and be swept rapidly about like shadows. The water rose with such force as to make a high boiling current, where skillful rowing could poise a boat, only to slide away with a rapid balloon-like motion that was not at all pleasant. Fine palmettos laid surrounded this wonderful pool with a fit and beautiful shade, but they were just then a heap of smouldering ash, having burnt out away for cotton grounds that many of them have been taken for. Further on, a mile beyond the small clearing, Yaoudal hands have rarely marked a more weird scene, nor ignorance more surely damaged the value of a rare possession; but so it is in Florida; all hands from the jewelled one that wrote its owner's name in a font at St. Augustine, to the cracker's livery palm, are against the ancient, the curious and the beautiful, and are long and long, and are so effective means, and the old walls will fall before want of a better and give way to pine fences as has the old and mysterious "Treasury wall" at St. Augustine. (A disgraced fact).

Full of regret at the useless loss of these trees we let our boat drift down the stream, startling again the water fowl and the fish. A pale faced cracker boy came alongside in a dug-out and tried to hard to sell a two cent turkey for a price that fell very rapidly, but we left it with him, as he would be cooked over a spirit lamp, or to be safely done by the fireman under the boiler.

Steaming on we found the mouth of the upper St. John, now a narrow river, flowing with some current through dense forest, where new forms of vegetable life abound, and seem to strive to cover over the river with plants that float in miniature islands with the stream, and vines that

reach o' tlike carrels of green from the leaf-laden shores.
 The animal life does not abound here as it did a few years ago. Every man and boy on the steamboats does "shootin' in Florida" with some arm; pistol, champagne corker, orange pipe or rifles, and so on from the sparrow to the carrion buzzard in, except in the abundance of lead shooting. All are wild, and fit on just out of range, and even the stupid alligator slips from his mud bank after one or two shots.

The tropical character of this noble river is chiefly seen above Lake George. North of this lake the northwest winds, the cold storm winds of the country, pass only overland from the front of the hills, and in mid-winter sometimes bring a very unpleasant chill, one that renders orange culture precarious, blighting in some years the new buds; but south of this the winds having my westerly direction pass over more or less of the Gulf, and are disarmed by the warmth and moisture of that body of water of their blighting chill and dryness, and about Enterprise snow and frost are practically unknown; palms, palmettos, bananas and orange trees assure forms of vigor that render them very beautiful to the northern eye, and the refluxes from Winter flits an assured promise of gentle air and golden sunshine.

The river is very crooked, bending sharply around points, cutting deeply into the banks, forming deep boiling pools, where fish are seen breaking constantly. The shores are usually low; a point ten feet high is known as a bluff, and such are sought by settlers for homes, possessing all the freedom from insects, diseases, and dampness that can be expected where the sun of almost perpetual Summer broods during many months a full crop of amoyances. The driest and most desirable places are found upon the shell mounds, where one strata upon another of shells form elevations of very considerable extent. These shell formations are of great interest, and puzzle the keenest minds with their layers of different shells, each distinctly defined in character, and differing in its color, form and size.

The water from rivers, bays and lagoons and perfect sections of this character, and the strata are plainly seen in even and distinctly marked lines, not always level, but extending in long, unbroken elevations and depressions; showing that some disturbing upheavals have raised and lowered the deposited shells after they were imbedded in their present order.

Some of the strata, lying perhaps six inches in thickness, are composed of bivalve shells almost exclusively, much crushed and broken, but cemented quite firmly; other strata are without shells of this form, being composed of conical, convolute shells of about one inch on each angular side; but these differ again—in some the shells are fresh, but little broken, and not firmly cemented; in others crushed in fine fragments, and strongly united with the lime made by their partial decomposition. All these varieties may be seen overlying one another in a vertical height of four or five feet, and the different bands of color form lines that are visible as far as the face of the formation is exposed.

Upon these shell lands there are found numerous conical mounds, regular in form, rising from ten to thirty feet, evidently of human origin, supposed to have been, like the pyramids of Egypt, burial places for the distinguished and some say that they have left no other record. The arrow heads, axes, and other works of rude art, found in these mounds, are those of the stone age, which on this continent is extended to the present time among some remote Indian tribes; but some of these implements are found imbedded in a conglomerate so firm and stone-like that they convey to the mind of the ethnologist an impression of as remote antiquity as surrounds the bone caves and gravel deposits of Europe.

A great deal of learning has been exhausted upon these remains; but full examination has not yet been made, and many links in the chain of unwritten history may be supplied when a full comparison of these mounds and the works they contain is made with the corresponding discoveries of the old world.

As the more minute peculiarities of our pre-historic antiquities are known, it is to be feared that the untravellers of the maza thus surrounds the deeply interesting questions of unity or diversity of races; and it is not unlikely that secrets are hidden in the shell mounds of Florida that may, when discovered and interpreted in the broad light of future knowledge, tell many a curious tale of wandering tribes and far fetched arts and customs.

Half lost in vain theories and surmises aroused by these peculiar remains, a group that were not infrequently taken aside, and our minds given up to the fantastic speculations of the first voyagers who were sought the fountain of youth, carrying so much of wit and cruelty with them that it is fortunate for the present that they did not find any elixir of the kind; and to the more vague but pleasant fancies of the race that still earlier possessed this alluring land and roamed freely, with no more idea of a couping and uncouping race than occurs to us now in our period of supremacy.

But this is drifting, and we would not be left without anchorage in the realities of speculation. We really went rapidly against the stream, and after a long day of full enjoyment our craft to a bank, and in our small but snug cabin made pleasant plans for the morrow.

L. W. L.

BISHOP'S CANOE VOYAGE.

NEWBERN, N. C., December 29, 1874.

EDITOR FOREST AND STREAM:—
 The paper canoe "Mara Theresa" arrived at Newbern three hours after the yacht Julia reached her anchorage ground off that city—the day after Christmas.

When the *Nick Lindmark* newspaper telegraphed to Judge West that the canoe had left for Currituck Sound via the Albemarle and Chesapeake Canal and North Landing River, our people decided to solicit a party to intercept the solitary voyager, and bring him, with his paper craft, up the New-River. The canoe was too small to be sighted at a long distance, and not a citizen of Newbern had ever seen the canoe man. J. E. West and a party of gentlemen explored the banks of Currituck Sound for six days, and returned after having losing the beautiful yacht Julia during a hurricane at Ocracoke Inlet. On the night that the yacht was rolling on the shoals and dragging anchor with cables weighted with iron bars, the paper canoe was safely lodged in the rushes on Body Island beach.

The yacht was sent out upon a second expedition under Capt. Brown. Another severe gale was encountered, but the vessel was blown ashore without under water. Had she reached Hatteras Inlet before the gale broke upon her, she would have been lost without doubt. "That night the paper canoe was near the signal officer's quarters at Cape Hatteras Light House. The day after, Mr. Bishop heard from a fisherman of the three handed mites' capture of the Julia in search of his fifty-eight pound

craft, and finding the wind too strong to cross the shoals of Pamlico in his boat, he walked fourteen miles down the beach to Hatteras Inlet and back again through the sands, but the yacht could not be found. The next day he was in the water, and paddled fourteen miles to Hatteras Inlet, crossed it on one oar, safely, and camped in a deserted fisherman's camp five miles south of the Inlet. This camp was eleven miles from any habitation southward to Ocracoke Inlet. The next morning by moonlight the canoeist got under way, rowed eleven miles to Ocracoke Inlet, across it five miles to Portsmouth, and reached Capt. Mason's hotel quarters in Currituck Sound, from which place he reached this city via Morehead City, coming inland from the landing on the cars, accompanied by the canoe.

Eighteen miles from Newbern is a curious hunting ground. Little lakes are found in the great swamps, and thousands of wild fowl feed in those retired localities. Deer are numerous on the ridges. There is not, probably, a better hunting ground between Newbern and the end of Florida. To explore this hunter's paradise, Commodore Vost has chartered carts to take provisions down to the lakes from the nearest railroad station to the hunting ground. His guest, of the paper canoe, and me or two friends of the Judge will have tonight for the camp. After the hunt is over, Mr. Bishop will continue on through Hogue, Stamp, and Masomoro Sounds to Cape Fear. H.

NEWBERN, N. O., December 30, 1874.

EDITOR FOREST AND STREAM:—

I have to acknowledge the receipt of Mr. Harris' favor of the 19th and that of Mr. Haddock of the 21st, upon my arrival here from Cape Sound via Beaufort and Morehead City. The trials experienced in crossing the points of the great shoals in Pamlico Sound nearly exhausted my poor stock of patience. I would be two and three miles from land in only twelve inches of water, with the wind blowing freshly, when the canoe would ground on a "hump" in six inches of water, the seas would wash over the low sides each time, and as long as I could find water enough for the propellers and headway could be kept upon the boat, I did not have much trouble. Having heard that the yacht Julia was cruising for me, I made every effort to get as far south as Ocracoke Inlet, but two severe storms and fresh northerly, as well as southerly winds, made old Pamlico too rough for traveling upon with my open canoe. I have received no news, and have received much kind attention from the people of Beaufort from the interior have called to examine the paper boat. I have not yet met, out of hundreds of oystermen, fishermen and sailors, who have examined the canoe, one person who dares to get into her and row across a creek; yet I can travel, with about one hundred pounds of baggage, across every inlet (as I have done) from Cape Hatteras to this latitude, not excepting Hatteras and Ocracoke. It is only the idea possessed by my visitors that paper is the last thing that should be put into the water, that makes them afraid of this beautiful design of Rev. Baden Powell, elaborated and made durable by the genius and patience of Waters, of Troy. I am a novice at rowing. When I received my canoe at the builder's hands on the waters of the Hudson, at Troy, young Waters showed me how to feather the oar correctly. My experience has been gathered in sailing boats. If I, who am inexperienced in this rowing of small boats, and am a stranger to the drill and discipline of boating organizations, can get so well in these rough waters, how much better could the trained canoeist do the same work? We are to examine an interesting hunting ground near Newbern, a description of which I will send you us soon I reach my next post office, at Smithville, Cape Fear. Very truly yours, N. H. Bisson.

Rational Pastimes.

—*Bell's Life*, of Dec. 19th, has an article on "Base Ball in America," containing the proceedings of the Championship Committee in awarding the pennant to the Boston Club. They give the record in full of games won and lost, so it seems that they regard the game as worthy of regular space in their columns.

—Chapman has succeeded from the Captaincy of the Atlantic nine, an acknowledged position as Lieutenant and right field in the St. Louis nine, where he is to help Graffen in the business of the club, and assist Pearce in the field.

—Old Charley Fabor is to Captain the Atlantic nine in place of Chapman. Barlow will catch, Rossman pitch, Craze, Patterson and Nichols play the bases, Kessler short-stop, and Booth, Fabor and Clark play the out-field. All Brooklyn players.

—The White Stocking Club of Deering, Maine, champion juniors of that State, won ten games and lost four during 1874. Their best game was their 10 to 2 match with the Mountainers of Portland. Bodge, Fish and Ramsey led the score at the bat.

—A co-operative nine of selected local experts is to be started in St. Louis to rival the stock company imported team. The make is a good one.

—New Haven is to have a professional club to be known as the Elm City Club. They are to knock spots out of the Hartford crew. So Arnold says.

—Skating was lively on New Year's day at all the metropolitan resorts; even Prospect Park being opened to the public for the first time this season on that day.

—The Ice Boat Club of Brooklyn launched their craft at the Capitoline Lake on Jan. 5th. Next week a race is to take place between Mr. Decker's Fly Away, Capt. Haddock's "Nondescript," and Mr. Chadwick's Lady of the Lake. Ten times round the lake for the pennant will be the course and the prize.

—Speaking of tenpins, a correspondent says: "You see, while a man chooses a ball he can handle with a graceful swing of his right arm, the girls are bound to select the biggest one they can reach." "Toting" it to the starting place, they go on waddling run half way down the alley, and then let go their burden with a spiteful shove, give a sigh of relief, straighten up and walk back with a dignified and unconcerned air, as if they didn't care where that ball went or whether it knocked down any plus or not."

—The New Jersey Athletic Association will offer valuable gold medals and the title of amateur champion to the winners of the one-mile and the 100-yard races, which are to be contested next May. There has been much rivalry among the amateur walkers of the New York and New Jersey clubs. D. M. Stearns claims the New York and his record of a mile in seven minutes is the best in America.

—A ten-mile walking match for the amateur championship took place at Franklin Park, Boston, last week, between J. P. Bruce and Frank White. Bruce walked the ten miles in one hour and forty-two minutes, defeating his antagonist by about a mile.

—The Tecumseh Base Ball Club of Dunville, Ont., Canada, won five games and lost three during 1874. Their nine included Cunningham, Smith, Smithers, Price, Hisele, Bickell, Ainsden, Samsby and McDonald. Their best game was the 15 to 13 match with the Maple Leaf Club of Jarvis.

—J. M. Holman, a member of the Philadelphia Univers-

sity Base Club, aged seventeen years, walked fifty miles in twelve consecutive hours in Philadelphia, last week. This is certainly good walking for a lad of his age.

CORNELL UNIVERSITY, December 31, 1874.

EDITOR FOREST AND STREAM:—

I looked in your issue of the 17th a communication from Yale College, signed "K." I wish to make a correction. It is Cornell University that the Yale Chess Club is playing with and not Cornell College. The latter college is located somewhere in Iowa, I believe. With the assurance of most Yale men, he takes it for granted that they are to vanquish us, and hopes that Cornell will set differently from Williams, and not back out when almost beaten, or worse than that, after. If I think a little more consideration on the part of "K." would hurt him. A Philonian.

—Columbia College has followed the lead of Harvard and organized a rifle club. It is hoped that an intercollegiate rifle match will take place at an early day.

Billiards.

THE FOUR-HANDED MATCH.—The loose way in which matches are made and announced is illustrated in the case of the match said to have been made up and forfeit deposited, in which Rudolph and Vignaux were to have played Garner and Daly. Vignaux, in a card to the *Upper*, says: "I will not play in such a match, but I am ready to play with Mr. Garner or Mr. Daly separately, and for any sum no matter how large; the game to be played on a table of H. W. Collender's manufacture, furnished with his combination cushion."

—The billiard event of last week was the defeat of Joe Dion by Vignaux at Tammany Hall on Dec. 30th. Vignaux marking his play by the splendid run of 192, and another of 116. The summary is as follows: Tammany Hall, N. Y. City, Dec. 30th, 1874. Match announced between Joe Dion and the champion of America, Maurice Vignaux, 600; Joseph Dion, 538. Average—Vignaux, 12.24-48; Dion, 11.10-48. Best run—Vignaux, 192; Daly, 64. Ulfere, John T. Reeves. Umpires—for Vignaux, Isadore Gayraud; for Dion, George T. Stone. Marker, R. E. Wilmarth.

THE BROOKLYN PROFESSIONAL TOURNEY.—On Monday, Jan. 4th, the Deau Brothers, of Brooklyn, inaugurated a tournament at their rooms, corner of Fulton avenue and Smith street, which was arranged for the purpose of affording the Brooklyn people an opportunity of witnessing the play of the most noted of the professionals of the country, in a series of exhibition contests together. The weather on the first night was bad; but the attendance was such as to crowd the hall. Seats were reserved for ladies, but none were present during the match. The first contestants were Rudolph and Daly. They began play in a match of 300 points up at the French game, the result of the contest being the success of Daly by a score of 300 to 252. Daly's best run was 121, and next best 72. Up to the twenty-second innings he did not score double figures, Rudolph leading at that time by 184 to 49. Then came the 121 run, and shortly after that of 72, and this gave him the lead. Rudolph's best run was 60. The winner's average was but 9.31; very poor for an exhibition match. On Tuesday Joe Dion and Garner were to play. On Monday after the game, Rudolph played an exhibition of "fancy" shots, which quite astonished the crowd. This is the first time he has played in Brooklyn for some years.

Chess.

CHESS DIRECTORY.

Chess Player's Headquarters—Café International, 224 Bowery. Chess, Up-Town—Knickerbocker Cottage, 467 Sixth avenue. Down-Town Chess Club—Café Cosmopolitan, 112 Second avenue. Turner Hall Chess Club—Café Cosmopolitan, 112 Second avenue. Brooklyn Chess Club—Mercantile Library, Montague street. Jersey City Chess Club—No. 41 Montgomery street. Christian & Mahan's Chess Club—No. 107 Broadway and Fulton streets. Crossen & Mahan's Chess Club—At Capt. Taylor's, Tompkinsville avenue. Christian Union Chess Rooms—Fulton avenue, opp. Elm pl., Bk'lyn.

THE CAPE TOURNEY.—Mr. Mason, who thus far leads the score in the tourney still in progress at the Café International, appears to be over anxious to handle that fifty dollar prize which he is so near winning, judging from the columns of *Wilkes' Spirit*. It will be time enough to talk about awarding the prize and closing the tourney when he has played and won all his games with his adversaries. He has yet to play D. Barlow and Mr. Pennington, and close six games other players. Thus far he leads; Delmar being second and Alberone third. Mr. Todd finished up all his games in three weeks, and yet he only played evenings. Why cannot the others do likewise?

THE BROOKLYN TOURNEY.—Dr. Barnett and Messrs. Spence, Homer and Thayer still have the best record in the club tourney.

THE CHRISTIAN UNION ROOMS.—These rooms are occupied by several noted experts of Brooklyn during the afternoons, prominent among whom are Messrs. Thompson and Doctor Alfred.

THE BRITISH CHESS ASSOCIATION CHAMPIONSHIP.—The contest between Messrs. Wislizenus and Mr. Donnan, the great English players, is still the principal topic of interest in chess circles. The London *Field*, in his comments on the play in the match, says: "Compared with other matches, and remembering that a slight shade of difference in strength, often arising only from a difference in the state of health, has sometimes been sufficient to decide by much larger majorities the issue between two players of nearly equal force, we may call this match with more close one, and it would have been perhaps closer still had Mr. McDonnell been in good form. That there was a considerable falling off in the latter gentleman's play became more manifest in the ending game, which used to be considered his great force. On several occasions, when his strong powers of resource and patience had carried him out of the opening and middle part of the game (of which his opponent possesses a profound knowledge) with an advantage, upon analysis he would have been sufficient to win, his faculties of calculation seemed to fail him at the last moment, when victory did not depend so much upon judgment as upon accuracy of reckoning. On the whole the games were, however, fair specimens of well-contested match games between high-class players, and reflected a great amount of credit upon the winner, who exhibited the same superior qualities of endurance, depth and judgment which distinguished his play in the competition for the championship of the British Chess Association, of which he was the conquering hero twice in succession.

Prize List! FOREST AND STREAM, A Weekly Journal, DEVOTED TO Out-door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of The Fish Culturists' Association of America.

Remitting Money.—Checks on New York City banks and bankers are best for large sums; make payable to the order of FOREST AND STREAM PUBLISHING COMPANY, 17 CHATHAM STREET, NEW YORK. Post Office Money Orders for \$5.00 or less are clean and safe also. When these are not obtainable, register letters, advising stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

Forest and Stream Publishing Company 17 CHATHAM STREET, N. Y. Post Office Box 2323.

HURST'S NATURAL HISTORY PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various Animals and Birds in grotesque attitudes, never before relating their natural instincts.

We offer these views not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural haunts to the rooms of the student, and the first of our homes, where they cannot fail to leave a lasting impression of the form, color, habits, and locality of the specimens.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen with the appropriate rocks, woods or water, and coloring from the originals.

TESTIMONIALS.

CORNELL UNIVERSITY, ITHACA, N. Y., March 1870. I must congratulate you upon your great success in this new educational enterprise. If we can arrange our management so as to make the most of the attention to the mind, it will be a step in advance in education. EZRA CORNELL.

WASHINGTON, D. C., March 18th, 1870. I am much pleased with the success you have met with in giving to the stuffed specimens in very decided appearance of life. I hope you may be able to continue the Series, and I have no objection to furnishing means of information and instruction in regard to the wild animals of New York. SPENCER F. BAIRD.

STATE HOUSE, BOSTON, Mass., March 18th, 1870. I have examined carefully the "Stereoscopic Studies of Natural History," and judging from the very valuable, both as objects lessons for students, and as a more interesting mode for the public. The illustrations, the delineations, position, and color of the different groups and the general treatment are most perfect. I cordially thank you for the privilege of examining them, and trust you will meet the encouragement which you have earned. EDWARD A. SAMUEL, Curator of Zoology in Mass. State Cabinet.

PROBANDY ACADEMY OF SCIENCE.

SARLEM, Me., March 18th, 1870. I have shown you my Stereoscopic views to the Professor of the Academy and the editors of the American Acad. and Mr. Peck and Mr. Peck and Mr. Peck. They concur with me in praising their truthfulness and the taste which they have displayed in surrounding the specimens with natural objects and scenery of characteristic fitness. They are certainly better fitted, not only as prior and drawing room illustrations, but as educational illustrations for the use of schools and colleges, than anything we have yet seen. A. HYATT.

CORNELL UNIVERSITY, PRESIDENT'S ROOM, ITHACA, MARCH 19th, 1870. I have received the Stereoscopic Views of objects in Natural History, and have enjoyed them greatly. They have surprised all who have seen them by their wonderful fidelity, both as regards the animals and their surroundings, and I think they can be used to great service to the study of Natural History, first by attracting students to it, and next by perfecting them. ANDREW D. WHITE.

These Stereoscopes are sold wholesale and retail by FOREST AND STREAM PUBLISHING CO., 17 CHATHAM ST., (City Hall Sar.) P. O. box 2323.

STANDARD AMERICAN BILLIARD TABLES OFFICE AND WAREHOUSES No. 738 BROADWAY. American Wild Fowl Shooting. BY JOSEPH W. LONG. Describing the habits, habits, and methods of shooting wild fowl, with instructions concerning guns, ammunition and decoys; the training of water retrievers, &c. The book is written in plain English, and in a most attractive style. A broad, and at the same time accurate view, is taken of duck shooting in all parts of the country. The habits and feeding grounds of the mallard, blue-winged teal, pintail, wood, gadwall, and coot; red-headed, buff-headed, and other kinds of ducks, geese, swans, &c., have been carefully and ingeniously studied and given to the reader. In thirty chapters the author has furnished information for the young, as well as for the practical sportsman. "A book for sportsmen, by a sportsman."—Argus. "Tells where to find game in the morning, in the afternoon and in the evening."—Sun. "Almost indispensable to the sportsman."—Accident.

Open to all Sportsmen. FROM DEC. 25TH TO JAN. 2D. PLENTY OF BIRDS.

HAVANA LOTTERY. EXTRAORDINARY DRAWING OF 1874-DEC. 10TH.

Only 16,000 Tickets—One Prize to every 7 Tickets. 2007 prizes of \$1,200,000. 1 prize of 500,000. 1 prize of 100,000. 2 prizes each of 50,000. 4 prizes each of 25,000. 12 prizes each of 10,000. 473 prizes each of 500.

MEAD'S PATENT SAFETY EXPLOSIVE BULLET, METALLIC CARTRIDGES. Callers—22, 32, 34, 44, 49, &c. Also, BOMB SHELLS for 12 and 16 gauge Shot Guns. JOHN P. MOORE'S SONS, GUN DEALERS, 230 Broadway, New York.

REMINGTON'S SPORTING, HUNTING, and TARGET BREECH LOADING RIFLES, also MILITARY RIFLES, CARBINES, PISTOLS and SHOT GUNS, of uniform system of Breech Mechanism.

Acknowledged by Military Authorities, Sportsmen, and "Crack Shots," to be superior to all other Arms in the world, as to accuracy, simplicity, ease of manipulation and durability. The Target Rifle was winner of nearly all the principal matches at "Creedmoor," including the famous International Match (see official report in Army & Navy Journal Oct. 3, 1874.) Also Breech Loading Double Barrelled Guns, Pistols, Rifle-Cases, Cartridges, &c., &c. Send for illustrated Catalogues & treatise on Rifle shooting &c., free to any address. "Vernier" Gauges for sighting Military Rifles just out, \$2 50 each.

JOSEPH C. GRUBB & CO., 712 Market St., Philadelphia.

PURDEY POP LEVEL.

CELEBRATED CENTRAL-FIRE BREECH-LOADING GUNS

James Purdey, No. 314 1/2 Oxford Street, London.

Desire to inform Dealers and Sportsmen who may wish to purchase these Guns, unsurpassed for Finish, Durability and Power, that they have a supply of 40 and 42 bore, and will transport specimens to order at short notice. They have also in store the largest and finest assortment in the United States of Breech-Loaders made by E.M. REILLY & Co., WESTLEY RICHARDS, W. & C. SCOTT & SONS, W. W. GREENE, W. WEBLEY & SONS, and other well-known English makers, besides those of American makers. An extensive assortment of everything pertaining to the use of Breech-Loaders. Also, Bussey's Patent Cyto Pigeon and Trap, a perfect substitute for live pigeons in shooting matches. SEND FOR PRICE LIST.

Hegeman's Patent Portable Folding Boat.

For use as LIFE-BOATS, LIGHTERS, Dingies, Dories, on board Steamers, Yachts and other Vessels.

Also for Sportsmen, Tourists, Trappers, Exploring Expeditions, Parties camping Out, &c. &c.

These safe and perfectly portable boats will admit of the roughest usage. A very light, strong and durable frame of ash or other tough wood, with canvas cover, and can be folded in one-eighth space, for transportation and carried in a

light buggy wagon, on horse-back, or by single person, and can be unfolded ready for use, in three minutes! Coats neatly folded, packed and shipped by express anywhere, same time of freight as ordinary goods.

Above cuts show the Boat folded and unfolded.

JOHN HEGEMAN, Ballston Spa, Saratoga Co., N. Y.

DR. RADWAY'S Sarsaparilian Resolvent.

THE GREAT BLOOD PURIFIER.

FOR THE CURE OF CHRONIC DISEASE, SCROFULA, HEREDITARY OR CONTAGIOUS. BE IT SEATED IN THE Lungs or Stomach, skin or Bones, Flesh or Nerves.

CHRONIC Rheumatism, Scrofula, Glandular Swelling, Hacking, Dry Cough, Cancerous Affections, Bleeding of the Lungs, Dyspepsia, Water Brash, The Doxorens, White Swellings, Ulcers, Skin and Hip Diseases, Female Complaints, Gout, Dropsy, Scalds, Itchings, Bronchitis, Consumption, Kidney, Bladder, Liver Complaints, &c. PRICE 51 PER BOTTLE.

R. R. R. RADWAY'S READY RELIEF.

THE CHEAPEST AND BEST MEDICINE FOR FAMILY USE IN THE WORLD. One Fifty Cent Bottle

Will cure more complaints and prevent the system against more sudden attacks of epidemic and contagious diseases than one hundred dollars expended for other medicines or medical attendance.

The moment Radway's Ready Relief is applied externally—or taken internally according to directions—in all cases where pain or discomfort is experienced, or if seized with Influenza, Diphtheria, Sore Throat, or with Croup, Quinsy, Fever and Ague, or with Neuralgia, Headache, Tic Dolorens, Bilious Colic, Inflammation of the Bowels, Stomach, Lungs, Liver, Kidneys, Spleen, from whatever cause, or with Nausea, or with Lumbago, Pain in the Back, or Rheumatism, Diarrhoea, Cholera, Spasms, or any of the various affections of the bowels, or with Strains, Cramps, or Spasms, the application of RADWAY'S READY RELIEF will cure you of the worst of these complaints in a few hours.

DR. RADWAY'S REGULATING PILLS. Perfectly rest-les, elegantly coated for the care of all disorders of the stomach, liver, bowels, kidneys, bladder, nervous disease, headache, constipation, costiveness, indigestion, dyspepsia, biliousness, bilious fever, inflammation of the bowels, piles, and all derangements of the internal viscera. Warranted to effect a positive cure.

Price 25 cents per box. Sold by Druggists. Dr. RADWAY & Co., 32 Warren St., N. Y.

\$10, \$50, \$100 Shares in Wall Street often leads to fortune. Send for a copy of the Wall Street Review and Pamphlet, showing the various methods of operating. J. RICKLAND & CO., Bankers and Brokers, 72 Broadway, N. Y.

SHELDON & CO., NEW YORK.

LIVE QUAIL AND WILD TURKEYS. A gentleman now in North Carolina would be pleased to assist any party desiring a quantity of live quail, or wild turkeys in pairs, male or female, or as required. Address E. M., care P. C. Thomas, Thomasville, N. Carolina.

Trout business for Sale.

One of the largest Establishments in the country. WELL STOCKED WITH TROUT.

Having a Dwelling for Superintendent, OFFICE and READING ROOM, SHOW and STOCK TANKS, WORK SHOP, ICE HOUSE, HATCHING HOUSE, Five Small Ponds and Three Large Ponds (of an acre or over per acre).

The property consists of over fifty acres. The ponds Are Fed by about 100 Lively Springs, rising on the premises, some of which register 43 and 45°. The volume of two cubic feet of water passes over the lower dam, with a fall of fourteen feet, continuously, and hardly varies, and never freezes, making a good water power that might be utilized.

Favorite Pic Nic Groves, with dancing platform, &c. The location is about 800 feet from depot, express and telegraph offices, and

ABOUT ELEVEN HOURS FROM NEW YORK. For further particulars address the Editor, or "PISCICULTURIST," Forest and Stream Office.

HAVANA LOTTERY. IMPORTANT NOTICE.

For the coming drawings, commencing January 5, we have reduced the price of tickets as follows: Whole \$201, \$101, \$51-5, \$11-10, \$21-20, \$11

Drawings take place every seven days. We are prepared to fill all orders. Circulars sent upon application. Highest price paid for Spanish Bank bills, Governments, &c.

TAYLOR & CO., Bankers, 111 Wall street, New York.

BREECH LOADING Central Fire Rifles & Shot Guns.

Gentlemen intending to spend the Winter in Florida or the Southwest, and desirous of hunting in either section, should supply themselves with a Breech Loading Central Fire Rifle and Shot Gun,

Which combines the accuracy and range of the Rifle, with the quickness and certainty of the Shot Gun, and is adapted to

KILLING GAME OF ALL SIZES. Shot Barrels, 10 or 12 Gauge. Rifle Barrels, 40, 44, or 50 Calibre. Using Ely's or Metallic shot cartridge case, and American Metallic ball cartridges. Also

BREECH LOADING Central Fire Double Rifles Of 40, 44, or 50 Calibre. Send for price list.

THE ROARING KILL.

For Forest and Stream.

Far up in the forest glen,
Where the feathered sweet ferns grow,
Nestle nook, whose charms I ken,
Whence the gurgling fountains flow,
Ethereal chamber, perfumed still,
Birth-place of the "Roaring Kill."

Cloud wreaths veil the mountain's head,
Trickle down his shaggy beard,
Mingling dew drops, gently spread,
From each delfie, many a rill;
Eubbling, tinkling, many a rill;
Wayward, roaring, "Roaring Kill."

Blend'd rills, to music sweet
Ripple 'neath the wildwood shade,
Mark the hours, with flying feet,
Through the sunshine-dappled glade,
Nodding trees, on either hill,
Greet the bonnie "Roaring Kill."

Like misshapen giants old,
Sturdy boulders guard the way,
These the rising flood enfold,
Crested o'er with pearly spray,
Free born, naught can stay its will,
Fict and strong the "Roaring Kill."

Smooth it glides by meadows green,
Spangles o'er the pebbly tread,
Slips the tangled roots between,
Where the light glancing willows bend
Past the busy, clattering mill,
Leaps the buoyant, "Roaring Kill."

Of its full grown beauty chary,
Lingers now with hidden face,
Till the dusky hue'd Sockarie
Clasps it in a glad embrace.
Glossy birdings, softly trill,
Love songs to the "Roaring Kill."

Across Newfoundland.

INTERIOR EXPLORATIONS—FLORA, FAUNA, AND GEOLOGICAL FORMA- TION.

[Continued from January 7th.]

CHAPTER III.

GEESSE, (*Anas Canadensis*), and ducks, the black duck (*Anas boschas*), are met with in great numbers in the interior, the ducks in particular in the central parts of the island. There, remote from man, they breed undisturbed on the edges and islands of the ponds and lakes. The geese moult soon after their arrival in the Spring; and, owing to the loss of their pinion feathers, are unable to fly during the Summer or breeding seasons; but they can then run faster than a man on the marshes, and if surprised at, or near a pond, they will plunge in and remain under water with their bills only above the surface to permit of breathing, until the enemy has passed by. They feed on berries—preferring that of the *Empetrum nigrum*, and the seeds of grasses. Both the old and young become enabled to fly in September; and as soon after that as the frost affects the berries and causes the seeds of the grasses on the marshes and savannas to fall to the earth, or otherwise when the snow falls and covers the ground, they collect in flocks—and fly off to the Southern shores of the island and from thence to the Gulf of St. Lawrence. They remain there until December, and then assembled, take flight in immense flocks to the southern parts of America, to return in the Spring. The ducks do not quit the interior for the sea coast so early as the geese; that is, not until the pools and ponds in which they obtain their food are frozen over, and they are the last of the birds of passage seen here! Loons of two species breed in the interior, almost every lake, as observed, nearer to the sea coast, being occupied during the Summer season by a pair of them. Likewise the common sea-gull, early in the Spring, which fly off to the sea in July and August. Curlews breed on the barren hills;

snipes, (jack,) a kind of godwit (called yellow legs,) and bitterns on the marshes; but the first had now all gone to the sea coast. The red-breasted thrush, (*Turdus migratorius*), breed in the scanty woods, near to where berries abound; they fly off in flocks to the coast in September, and from thence to the more southern countries. There are several species of hawks and owls here; of the former genus, one species was very small.

The rivers and lakes abound with trout of three or four kinds, differing in size and color. In one of the source branches of Gauder River which we crossed, we caught some small fish, apparently salmon fry. A species of fish larger than the trout is said by the Indians to be found in several of the large lakes.

We were nearly a month in passing over one savanna after another. In the interval there are several low granitic beds, stretching as the savannas, northerly and southerly. During this time we shot only a few deer, but many geese, ducks, and beavers, which, with trout, constituted our principal food. When we had no game to subsist on, the killing of which, although certain, was irregular, we subsisted on berries, which some spots produced in prodigal abundance. I longed for bread for about ten days after our stock was consumed, but after that did not miss it.

When we met deer in a herd, we seldom failed in shooting the fattest. The venison was excellent; the fat upon the haunches of some of them was two inches in thickness. We shot them with ball or swan shot, according to distance. The leading stag of a herd is generally the fattest, he is as tall as a horse, and must sometimes be shot at full speed, sometimes by surprise. The ball having pierced him, he bounds, gallops, canters, faults, stands, and tosses his antlers; his sinewy limbs quiver, unwillingly bend, and he stretches out his graceful corpse. Should the ball have passed through his heart, he falls at once, probably balanced on all fours. There is regret as well as triumph felt in taking possession of the noble vanquished; the broad spreading hoots of the deer are admirably formed for preventing their sinking into the marshes. A single deer on the plain, when there are no others near to give the alarm, may be approached and knocked down by a blow on the head with an axe or tomahawk from a dexterous hunter. We happened to see a solitary stag amusing himself by rubbing his antlers against a larch tree on a plain; my Indian, treading lightly, approached him from behind, and struck him on the head with his axe, but did not knock him down; he of course galloped off. The flesh of the beaver is by the Indians esteemed the finest of all quadrupeds of the chase, and that of the young beaver justly so—in taste it is more like lamb than any other meat. In butchering it, with the skin is flayed off the lining of fat, which is sometimes two inches thick round the body. Beavers are commonly shot on the water; they seldom come out of their houses by day, but are abroad all night; before sunrise the hunter posts himself undiscovered as near as possible to the leeward side of their house, the beavers at that time come out, one following another; directly any of their heads appear above the water, it is fired at either with ball or shot, and sometimes a whole family is thus killed in succession; if any escape, their return to their house is watched before sunrise next morning in like manner as their departure was in the evening—their bodies float to the shore. The black duck shot in the interior remote from the sea, is the finest bird for the table in Newfoundland. The trout are easily caught in the rivulets in the interior, they being so unacquainted with enemies as to take the artificial fly merely by holding out the line in the hand without a rod. No country in the world can afford finer sport than the interior of this island in the months of August and September. The beasts of the chase are of a large class, and the cover for all game excellent.

The waters which we crossed contributed something to the rivers of the north, and sometimes to those of the south side of the island. We occasionally crossed some of the large lakes on rafts when our course lay across them and the wind happened to be fair, and there appeared nothing to induce us to go round their extremities. We

accomplished this by fastening together three or four trunks of trees with withes, and held up a thick bush for a sail, and were blown over. There was, of course, considerable risk to our accoutrements attending this primitive mode of navigation. The proportion of water to land in the savanna country is very great. In some directions northward one half seems to be lakes, of every size and form; in other directions, one third, and seldom less. The marbled, glossy surface, as it appeared from the rising ground, was singularly novel and picturesque.

In some of the forests, strips of the trees are all borne down in the same direction—that to the earth—by wind, and the havoc displayed is awful. Such parts were almost impassable; the way through the woods elsewhere, except by the deer paths, is obstructed by wind-fallen trees and brushwood. There are extensive districts remarkable for abundance of berries towards the centre of the island, which attract great numbers of black bears. The paths or beats of these animals throughout their feeding grounds are stamped with marks of antiquity seemingly coeval with the country. The points of rocks that happen to project in their way are perfectly polished from having been continually trodden and rubbed. Although we had seen fresh tracks of wolves every day, and were sometimes within a few yards of them in the thickets, yet we only caught a glimpse of one of them. They lie in wait among the bushes and listen for the approach of deer, and rush upon them. When they saw man instead of deer, they immediately fled. There are two kinds of wolves here—one large, that prowls singly or in couples; another small, sometimes met with in packs.

Taking a general view of the mineralogy of the savanna territory, the rocks of the savannas are granitic quartz and chlorite greenstone—the same as already noticed—mica, chlorite, and transition clay slates. The granite is pink and grey, and sienitic. It throws itself in low beds lying northerly and southerly, higher than the savannas, and also appears with the greenstone and slate rocks at the edges of the lakes and other water courses. It occurs of a globular structure on the verge of the savanna country westward of that branch of Clode Sound River which we crossed. The balls are round, and vary in size from a few inches to a fathom and upwards in diameter. In the whole of this savanna territory which forms the eastern central portion of the interior, there rises but one mountain, which is a solitary peak or pap of granite, standing very conspicuous about forty-five miles north from the mouth of the west Salmon River of Fortune Bay on the south coast. It served as an object by which to check our course and distance for about two weeks. I named it Mount Sylvester, the name of my Indian. The bed of granite, of which Mount Sylvester is a part, is exposed in a remarkable manner to the northeast of that pap near Gower Lake. Here are displayed the features of the summit of an immense mountain mass, as if just peeping above the earth; huge blocks of red, pink, and gray granite—often very coarse grained, and of quartz—but compact and granular, lie in cumulous and confused heaps, over which we had to climb, leap, slide, and creep. They sometimes lie in fantastical positions, and upon an enormous mass of gray granite may be seen, as if balanced on a small point of contact, another huge mass of red granite more durable in quality, and this crowned by a third boulder. Their equilibrium invites the beholder to press his shoulder to them to convince him of his feebleness. These masses seem to be the remaining modules of strata or beds that once existed here; the more perishable parts having long since crumbled and disappeared, thus evincing the power of time. Quartz rock, both granular and compact, the latter sometimes rose colored, occurs, associated with granite. On the summit of a low, bristly ridge, formed principally of granular quartz, nearly half way across the island, are two large masses of granular quartz, standing apart at the bottom and nearly meeting at top; seen at a distance from the north or south, they have the appearance of one mass with a hole through it. Hence, this spot is called Rock Hole by the Indians. Plates of mica, six inches and up

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

PROF. BAIRD'S REPORT.

COMPARATIVE VALUE OF ANADROMOUS AND OTHER FISHES.

In reference to the fresh water fishes most worthy to attract the attention of the General Government or of the States, the distinction between resident species and those that are anadromous, or which spend a part only of their life in the fresh waters and remainder in the ocean, must be clearly borne in mind. The species which belong exclusively to fresh water, such as the brook trout, the lake trout, the land locked salmon, the whitefish, the black bass, &c., are well worthy of attention, and by judicious treatment can be introduced into new waters, or their numbers greatly increased in any particular locality. But, after all, there is a direct relationship between the number of any kind of fish of a given weight and the amount of water needed to furnish a supply sufficient to add definitely to that weight of food; and when the limit has been reached, we cannot, without feeding artificially, advance upon the proportion. When the waters are pure and constantly renewed, and a suitable supply of healthful food is furnished regularly, large numbers of fish may be kept and cultivated, where not one in ten thousand would find an ample supply of natural food, but, as a general rule, the expense of feeding is such as to render the sale at comparatively high prices necessary for a satisfactory result.

It must be remembered, too, that however rapidly certain fish, especially the salmon, are able to multiply in new waters, there is a limitation to their increase, as shown by the experience of the Potomac River. This fish was introduced into this stream in 1854 by Mr. William Shriver, of Wheeling; several mature fish having been transported in the water tank of a locomotive from the Ohio River, at Wheeling, to Cumberland on the Potomac. Not many years after, the young fish began to distribute themselves in numbers, and in time they became so numerous that they interfered with the new game. Starting at the headwaters of the river, the bass found immense numbers of *Cyprinidae* such as chubs, minnows, suckers, &c., as also of crawfish, insect-larvæ, and the like, which had been previously, for the greater part, undisturbed, except, perhaps, by the pickerel, and, having an ample supply of food, in accordance with the theory of natural selection, they multiplied to a prodigious extent. Year by year they tended their limit towards the mouth of the Potomac, until at the present time they are found in great abundance near Washington, and form a very attractive object of sport.

I am, however, informed by residents on the Upper Potomac and its tributaries that the bass are becoming scarce, and that their numbers are much less than a few years ago, while, as a concomitant, the immense schools of smaller fry, formerly so abundant, have disappeared, a mishap in some localities being a rare sight. This is a very natural consequence, and must produce its result. In the increasing scarcity of herbivorous fish, the bass will be driven to feed more and more upon each other, and after a time a certain average will be established, perhaps the same as that existing in the waters of the Mississippi Valley and elsewhere, where, although indigenous, they are in proportion fewer than in the Potomac River.

An entirely different condition of things prevails with the anadromous fish, among which we may enumerate as best known the shad, the herring, or the fresh water herring, the salmon, the smelt, and probably the striped bass. These fish spend the greater part of their existence in, and derive their chief growth from, the sea. At certain seasons of the year, when fat and plump, they enter the rivers and proceed usually as far as the obstructions will permit, or until they find the proper spawning grounds; here the eggs are discharged, fertilized, and hatched. The adults either return immediately to the ocean or after a certain interval. The young fish spend a certain period in the fresh waters, feeding, it is true, but on minute organisms, which are always procurable in abundance.

Shad and herring enter the rivers and spawn in the Spring, and the young return in the Autumn. The eastern salmon enter the rivers in the Spring, and spawn in the Autumn, the eggs not hatching until late in the Winter. The young remain for one and some of them even for two years, and then go down to the sea. After a certain interval these fish return to their birth place, the shad, at the age of three or four years, weighing from three to five pounds; the salmon after the same interval, weighing from nine to twelve pounds; this immensely rapid growth having taken place in the ocean, and not requiring anything in the way of human intervention. For this reason it is that the efforts necessary to the multiplication of anadromous fish may be limited to securing a proper passage of the adults to and from their proper spawning grounds, or, in addition, to the securing of their eggs in numbers, and placing the young when hatched, and after a suitable interval, in the water where they are to pass the period of their incubation. Nothing, therefore, is asked of the waters but the right way, the adults rarely taking food of any kind while in the rivers. Their sustenance during this period is derived from the surplus of fat in their own bodies, and the exhaustion produced by this period of abstinence, especially with its accompaniment of the development of the eggs and their fertilization, being made up by the voracity of their feeding on returning to the ocean.

The species just mentioned live in the ocean and run up into fresh water to spawn; the list being capable of considerable addition. Other fishes, again, live in large bodies of fresh water, as lakes, and run into tributary streams or onlets for a similar purpose, and are thus anadromous likewise. The *Coregonus* or whitefish, are almost universally anadromous; as also the landlocked salmon, the coquassa trout, or blue-back, the fresh water smelt, &c.

In this connection it may be interesting to refer for a moment to the difference in habits between the common eel and the species just referred to. This, like the others, is an anadromous fish, or better, perhaps, eudromous, the order of its movements being reversed. The eggs of eels, for the most part, are laid in the sea, and the young, after a short interval, enter the mouths of rivers and streams in early Summer and pass up as far as an open passage will permit. The act of the curious visitor to the falls of the river, where the water sheer and rapids are struck as much by the immense number of young eels swarming against

the rocks and attempting to climb over their surface as by any other feature, the numbers to be seen being simply incalculable.

After reaching a suitable place of abode, in fresh water, the eels remain, as is supposed, for at least three years, growing to a considerable size. After becoming sufficiently mature, their instinct, probably that of reproduction, carries them seaward again during the Autumn; and it is at this time that various forms of fish dams and fish weirs are called into requisition. The simplest kind consists of two lines of stone wall, forming the sides of a rude dam, made so as to converge and bring the angle down stream, through which the passing water falls into a sort of basket. This consists of a frame with lattice work at the bottom, so arranged that while the water passes through, the fish are forced up over the slats, arranged so as to form a series of slides, and fall into a receptacle beyond, where they are taken sometimes by wagon loads. The most productive result of this mode of fishing consists of eels intercepted in their seaward movement, although other fish are often taken. It is very destructive to young shad and is very properly interdicted by the laws of Pennsylvania and New Jersey, in their shad rivers.

The laying of the eggs, it is supposed, takes place in the Autumn, or Winter, and the young begin to move up in the Spring, or early Summer.

In further reference to the history of the eel, we may state that its precise mode of copulation and of reproduction was entirely unknown until recently, but that at the present time the view is maintained by very high authority, principally that of Italian physiologists, that the eel is strictly a hermaphrodite; that is to say, that both the male and female organs are found in the same animal. These are said to be developed to the proper degree in Winter, and the eggs discharged from the ovary fertilized by the seminal fluid from the testicles, and leave the body in a condition for further development.

TEXAS RIVERS FOR STOCKING.

SHREVEPORT, COOK CO., TEXAS, JANUARY 1, 1875.

EDITOR FOREST AND STREAM:—I see from the column of your paper that a second shipment of fish first, and since the first, has been made by the U. S. Fish Commissioner to S. W. Texas, and in both cases it seems that they were for the Brazos and Colorado Rivers. I should like to know if Northern Texas is not entitled to a portion of the appropriation? If fresh water is necessary for salmon, we of the Trinity and Red Rivers are far ahead of the Brazos River in that line. Very respectfully,
G. H. RASDALE.

—The first Penobscot salmon of the season was received by Shattuck & Jones, 123 Faneuil Hall market, Boston, on the 26th ult. It weighed 12 1/2 pounds, and was sold to the St. James Hotel at a dollar and a half a pound—a pretty good price for hard times!

We see this item in a Boston paper, but no comment on the violation of the law regulating the close season, which is from November 1st to April 1st in the State of Maine.

Natural History.

For Forest and Stream.

THE MOA.—*Dinornis Robustus*.

ONLY a few years ago paleontologists, and scientific men in general, were aroused by the rumor of a new discovery, one calculated to tax our "belief in wonders" to the utmost, and to wipe away the slurs of discredit cast upon the founders of those tales of the heroic lays in which the *Loe* figured so prominently and to such good purpose. And not unlike this light of other days is our quasi new discovery, a huge giant bird towering far above the tallest living creature and vying with many even in strength. It has been found more plentifully in New Zealand than elsewhere, and the numerous traditions that are familiar to the natives and told to the traveler, tend to throw a glamour of mystery and romance around this epic of greatness that makes the subject of more than passing interest. Incredible were the stories told concerning them, and every fresh discovery would be the sign for some new tale that would be suddenly remembered by the natives. They also believed that these huge birds had lived within their own memory, and that still in the far interior they roamed in herds, safe in their own strength and the unapproachable character of their retreat. They knew it as the *Moai*, and remembered that its superb plumage was worn as a gala dress by their ancient kings, and that the bones were eagerly sought after for implements of various kinds. For long years their stories were laughed at by casual visitors, and not until the visit of Rev. William Colenso was any belief placed in these strange rumors. His curiosity, however, being aroused, he made the attempt, and after great labor excavated three or four specimens of this wonderful bird, which were followed by the important discoveries of Rev. W. Williams, the results of which were published at that time in the *Tasmanian Journal*, (1842), and republished at great length in the "Annals of Natural History," and up to the year 1846 numerous specimens of one that gradually bring the mine nearer and nearer to the fountain head of splendor; and thus the interest was kept up by the small finds of Muckell, Earl and Wakefield, until 1846, when Mr. Walter Mantell drew aside, as it were, the veil of the past and these huge atoms of a by-gone age appeared rearing their pillars of bone-like monuments to perpetuate their memory into the all time. Mr. Mantell resided in Wellington for several years, and penetrated the interior with the sole purpose of obtaining, if possible, a live specimen of the huge bird, so much spoken of by the natives, and while prosecuting his search he made a magnificent collection of its remains, amounting to over eight hundred bones of this and other species. From the position of some of these bones, the shank and legs being found standing erect, and just protruding from the soil, it is evident that the birds were not covered by other huge forms, they were covered by the soil and held by a grasp that only released its hold when all but the semblance of their power had passed away. The location of these ossiferous deposits is described as follows in the notes of Mr. Mantell:—"Near

Waikonaui, seventeen miles north of Otago, there is a head land called Island Point, about three quarters of a mile in length and 150 feet high; it consists of sandy clay distinctly stratified and traversed by dykes of columnar trap, the columns being at right angles to the sides of the veins. In a little bight south of Island Point, on the side of the bar which milts that headland to the mainland, at the entrance of the river Waikonaui, in front of the native Kaibe, named Makutu, is situated the site of a terraced deposit where bones of moas and other birds of various kinds have been obtained in such number and perfection. This bed is about three feet in depth and not more than a hundred yards in length, and lies immediately on a stratum of blue clay. Its inland boundary is obscured by vegetation, and appears to be of very limited extent; the bed is submerged and only visible when the tide is ebbing. It consists almost wholly of decayed vegetable matter and its surface is studded with the undisturbed roots of small trees, which appear to have been burnt to the ground at some remote period. It is a light, sandy, elastic earth of a blackish-brown color and emits a strong, fetid odor when first collected, from the large quantity of animal matter it contains. I conceive it was originally a swamp, or *swamp* (as I call it) which the *N. C.* (New Zealand) once grew luxuriantly. It is now covered by a thin layer of sand when exposed at low water." This, then, is the tomb of this bygone race. Years before they probably frequented the low lands in droves, and perhaps fleeing from some still larger form, sought security on the marshes, and there huddled together they sank, their very limbs dragging them down, and such tremendous struggle only enlarging the grave that was to ensnare them and perpetuate into future ages the wonders of "primeval greatness."

Speaking of his excavations on the west shore of the North Island and about sixty miles southwest of New Plymouth, Mr. M. says:—"Between the two bluffs near the embouchure of the river there is a sand flat about 200 yards across, and this on my first visit was strewn with the bones of (*moai*) moas and other birds, and two species of seals. I here saw deep openings made near the foot of the ancient cliff, on the top of which is the Pa, or native village of Ohlwahtakotoko; and at the same level as the flat on which I had observed the strewn fragments of bones, I came to a regular ossiferous deposit. The bones, however, profert, were as soft and plastic as putty, so that if grasped strongly they changed as it were by magic into clay pipe, and it was necessary to dig them up with great care, and expose them to the air and sun to dry before they could be packed and removed."

The finding of human remains among them tends to show that some of the wonderful traditions were founded on fact, and in the immediate vicinity of the sand flat at Te Rangatoape M. Mantell found circular beds of ashes that contained ancient bones of several animals as well as those of man and the moa, and near them were dug up portions of obsidian, flint, fishing lines, stones and a whale bone. Some of the moa bones were cut with the evident intention of securing the marrow, and these facts, with many others, one of which is, that the name of the bird is used in many of their old songs, points to the truth of the belief that they were well known to the natives who first appeared on the island, 600 years ago. And if other proof were wanting, mound upon mound was opened and found to contain masses of bones of the moa and man charred and burnt and thrown together, the remains of some barbaric feast, that not only shows that the two were contemporaneous, but that cannibalism evidently prevailed among them, and Dr. Mantell says:—"In case 15 of the British Museum are fragments of a human clavicle, radius and some phalangeal bones, lower jaw, teeth and other bones of dogs and some pieces of moa bones. These relics, which have manifestly been subjected to the action of fire, contained no traces of gun powder or ferruginous impregnations so constant in the fossil bones from the fluvial deposits, nor of the menachinite with which all the bones from the sand beds are more or less permeated."

And from the same spot egg shells were taken charred and bent out of shape by the action of heat. Some of the eggs found were of wonderful size, and were Waikonaui numbers of eggs were found by Mr. M., the largest being four inches in diameter, showing it to be much larger than that of the ostrich.

In a report to the French Academie des Sciences, M. Isidore Geoffroy St. Hilaire, describes three enormous fossil eggs from Madagascar, and some bones belonging to the same bird.

The Captain of a merchant vessel, trading in Madagascar, one day discovered a native using for domestic purposes a shell which much resembled an egg, and upon examination it proved to be one. The native stated many such were to be found in the interior of the island, and eventually procured the eggs and bones exhibited by M. St. Hilaire. The largest of these eggs is equal in bulk to 135 hen's eggs and will hold two gallons of water. I hear a sign from the gastronomic world, a slight regret that he did not furnish a specimen of the goodly lot of these monster eggs. At the present time no perfect specimens are possessed in the United States, beyond the fragment of bone or indifferent cast brought home by the interested traveler, but this want in our scientific midst will soon be remedied by the prompt and energetic action of the Museum of Natural History, as they have succeeded in purchasing at great expense over sixteen specimens of a slightly smaller representative species in perfect condition, which are now on their way from New Zealand, and will soon grace the halls of the new building west of the Park. Photographs of them can now be seen at the Museum, and the sight is almost beyond belief, some of them towering eighteen and nineteen feet above the ground and supported by huge masses of bone that seem more like the trunk of a tree than the legs of a bird. Beside them the columns of support thin from the weight of the bones. In the present time no perfect specimens are possessed in the United States, beyond the fragment of bone or indifferent cast brought home by the interested traveler, but this want in our scientific midst will soon be remedied by the prompt and energetic action of the Museum of Natural History, as they have succeeded in purchasing at great expense over sixteen specimens of a slightly smaller representative species in perfect condition, which are now on their way from New Zealand, and will soon grace the halls of the new building west of the Park. In the present time no perfect specimens are possessed in the United States, beyond the fragment of bone or indifferent cast brought home by the interested traveler, but this want in our scientific midst will soon be remedied by the prompt and energetic action of the Museum of Natural History, as they have succeeded in purchasing at great expense over sixteen specimens of a slightly smaller representative species in perfect condition, which are now on their way from New Zealand, and will soon grace the halls of the new building west of the Park. Photographs of them can now be seen at the Museum, and the sight is almost beyond belief, some of them towering eighteen and nineteen feet above the ground and supported by huge masses of bone that seem more like the trunk of a tree than the legs of a bird. Beside them the columns of support thin from the weight of the bones. tures of the fabled unicorn. This is a very exceptional case and shows that nature is sometimes erratic in her efforts to produce variety or develop new phases of creation.

—Of the sagacity of the wolf in pursuit of its prey we read the following anecdote in *The Amusement Philologique sur le Language des Bêtes*—

A gentleman on his journey through one of the southern provinces of France perceived a wolf that seemed to be watching a flock of sheep. He informed the shepherd of it, and advised him to set his dogs instantly at him. "I shall do no such thing," says the shepherd. "The wolf you see is plotted there only to divert my attention, and to give me the opportunity of my setting the dogs on this one to carry off a sheep." The gentleman, curious to ascertain the fact, engaged to make good the loss, and the event happened as the shepherd had foreseen and predicted. It is singular that, although the wolf at all other times loses his senses in perfection, especially smouldering, yet if caught in a pitfall or taken by any other device, he is for some time astonished that he may be destroyed without resistance or much difficulty.

For Forest and Stream.

POMPANO AND CAVALLI

I OBSERVE in a late number of your paper that your interesting correspondent "Perse" identifies the cavalli with the pompano. Now, however reluctant I may feel to differ with one of such wide range of experience as your correspondent evinces, I must aver, notwithstanding that the fishes known by these names on the south coast of East Florida, where I resided for a year or more, are far from being identical. Some of the differences will prove easy to notify as concisely as I can, and as thoroughly as my knowledge and recollection will admit of.

It is true that a small cavalli and a pompano resemble each other quite closely, both in color and shape—being of a beautiful greenish-golden taint, with bodies much compressed laterally, and narrowing very rapidly and singularly between the dorsal and caudal fins. Here the characteristics of the two fishes are entirely different, and seem to differ in a species of white fish inhabiting the lakes of northwestern Minnesota—a much smaller than the common white fish of the lakes, (*Coregonus albus*). The cavalli is one of the most voracious of the scaly inhabitants of the deep—he truly "bites like a steel-trap and pulls like a horse." The pompano, on the contrary, never takes the bait, at least I have never captured one with the hook and line, and have never known of one's being thus taken. I have often surmised that the cavalli, or perhaps more properly *carallo*, was so-called by the old Spanish inhabitants of that region from the circumstance that when in pursuit of his prey he often makes long and rapid leaps upon the surface of the water not unlike the bounding of a spirited horse. In conclusion, I must state that I am unable to declare that the fish here called pompano is the genuine one, and that name, having never seen a technical description of the same. However this may be, he is certainly so-called by the biminois, ichthyophagous inhabitant of that clime, commonly yclept "cracker," a name, by the way, in which you Floridian doth exceedingly rejoice, as any stranger may readily find out by thus accosting him.

Winchester, Va., Jan., 1875.

THE CAVALLI NOT POMPANO.

New York, January 6, 1875.

EDITOR FOREST AND STREAM:—Cavalli and Pompano—Hobcock and Norris, and your interesting correspondent "Perse" to the contrary—are not the same fish. Norris' cuts of fish in his work I think are excellent, and his Pompano and Cavalli were good, for Pompano, but it is not the pleasure of the Cavalli, which does not run in such a graceful line from the dorsal fin to the mouth, but drops quickly off from the top of the head to the mouth, very like a whale. The pure white mark of the Pompano is very nice to bite at, but the Pompano does not bite either hot or dry, and in Indian River can only be gotten by calling in the natives to use the cast net. The Cavalli gets to be heavier than the largest Pompano, takes bait or fly, either white water, brown hackle, or red, but anything in a very good sport, and after being killed the meat is very good for the color of salted mackerel) but for charka. A prominent mark on the Cavalli is just above the caudal fin, a saw-like protuberance, which feature is not found on the Pompano. Get Fred Beverly to send you samples of both fish—one Cavalli—and he need not stop to count the Pompano. Yours truly, B. HASKELL.

THE CANADIAN SEA TROUT—*Salmo Canadensis*—(HAMILTON SMITH.)

EDITOR FOREST AND STREAM:—There is much difference in opinion among those who have written upon this subject, most of them taking it to be identical with the brook trout, (*Salmo fontinalis*) and others pronouncing it to be a distinct species. I think it never has been described by a scientific observer, except Hamilton Smith, who gives it the above name, which seems the proper one, as the species in question is apparently confined to Canadian waters. H. E. Percy, of Nova Scotia, whose account of the fish may be found in Herbert's book, calls it *Salmo trutta*, which is the sea trout of Europe. Gilmore, Ledl, Adams, Colonel Hay and others copy from Herbert, and give the same name, though *Salmo Canadensis* is a red spotted fish, and *Salmo trutta* is not. Moreover the European species goes to the weight of eleven pounds, while the American, which seems the proper one, reaches half that weight. Thaddeus Norris, in his "American Angler's Book," writing from personal experience, points out the difference between the Canadian and European sea trout, which is well marked, and also that between the former and the brook trout, which is much less so. In fact they are chiefly different in color and form, which often arise in the same species from different conditions of food and water. These are the only differences which I myself have been able to detect; (not being a scientific observer) but they are sufficient to enable me to distinguish at once between the two, when taken, as they often are, from the same river. Mr. Norris believes that *S. trutta* is to be found in the Arctic seas on this side of the Atlantic, having seen specimens brought home by Dr. Horn from Eschscholtz.

made in connection with H. E. Percy, in the *British Journal of Nat.*

not History, Vol. 6, p. 247, describes a single specimen of a sea trout taken in Labrador, which he names *Salmo trutta*. Prof. Baird, in his report for 1873, mentions this species of Dr. Storer as occurring from Labrador to Nova Scotia. The "Fishing Tourist," by Charles Hallock, also mentions these two species as distinct, though Mr. Hallock, like the others, calls our sea trout *Salmo trutta*. Until the two have been compared and described by competent authority, we must remain in doubt as to their identity.

However thin may be their habits are different. The brook trout makes its permanent home in fresh water, and is rather a stationary fish. The sea trout is anadromous; like the salmon, it lives most of the year in the ocean, only ascending the rivers in Summer for spawning purposes. Like the salmon also, I have found that the sea trout would only take the fly while in the pools, and it took the fly under water, as the salmon usually does. This was the opinion of Percy and myself, and as to the sea trout never ascends into purely fresh water; but I have taken them with the fly well up the Restigouche, at least thirty miles above the tide, in company with brook trout and salmon parr. Both were of small size—less than a half a pound, and I imagine the sea trout had not yet visited the sea. In the Nouvelle, another river of the Bay of Chaleurs, famous for large sea trout, none being taken by me, and indeed I never found no brook trout, but the sea trout were of remarkable size, vigor, and hearty, and all our party agreed that on the table they were superior to their cousins, the brook trout. In the Taberniac, another famous trout stream of New Brunswick, where I killed the sea trout and brook trout in the same water, in July, I found them of all sizes, from a few ounces to two pounds, and they were all equally active and vigor than those of the Nouvelle, though much more numerous.

On Prince Edward's Island, in the middle of July, I found the sea trout well up the rivers in company with brook trout. They varied in size from two pounds down to two ounces, and as elsewhere took a fly at night and morning with eagerness, often two or three being landed at once. I was told that these trout can be taken in June at the mouths of most of the rivers in the Dominion, either with fly, bait, spoon, or artificial minnow—that is, when in the humor to feed. As with all trout, there are times when they cannot be tempted. These are adult fish from two to five pounds in weight. In July and August they run up the rivers to spawn, and do the salmon, which they more resemble in habits than they do the brook trout.

I have often wondered why this desirable species should not have been introduced into American waters in these days of pisciculture. From its habit of seeking its native stream for spawning, it would seem to be as practicable as the restoration of the salmon. The reason may be that it is confounded with the brook trout, to which I think it superior in many points—in size, in game qualities, and in its habits. It is also superior to the brook trout in being less liable to extermination by poachers, being absent at sea for a large part of the year, and the economic advantage of finding its food there without cost to any man. Whether or not this is done, the Canadian trout offers, in its native waters, the very finest of sport, at little trouble or expense.

S. C. CLARKE.

ANOTHER SPECIMEN.

SALEM, Mass., January 5, 1875.

EDITOR FOREST AND STREAM:—A specimen of the *Delavrus lentiginosus*, or Bittern, was shot in an orchard in the southern part of this city last week. Besides the time of year, the locality is in the midst of a thriving neighborhood, over a mile from fresh water. This bird was taken by the same person who saw the rail, noticed in your last issue. Yours truly, T. H. L.

BUZZARDS IN MAINE.

New York, January 11th, 1875.

EDITOR FOREST AND STREAM:—In a late issue, your correspondent, Roemer, speaks of a turkey buzzard having been caught in Cumberland county, Maine, and he also adds, "I know of no authenticated instance of a vulture being seen so far East and North previous to the one above mentioned, and deem it an incident of interest to naturalists." I am unable to give any personal experience in regard to the matter, but I find in the appendix to Samuel's Birds of New England,—"Cathartes aura, turkey buzzard—accidental; one taken at Calais, Maine; George A. Boardman, two in Massachusetts, 1863." It also gives the black vulture (*C. atratus*) as being found in one case at Calais by that same gentleman. Considering this authentic, I inclose it. C. H. EAGLE.

A QUERY.

ALBANY, N. Y., January 9th, 1875.

EDITOR FOREST AND STREAM:—Has it never been suggested to you that the much talked of blue back trout of Rangely are identical with the "red" of the Adirondacks? I have never seen either, but have heard a great deal about both, and what I have heard I am of the opinion that they are the same. Hoping that this note may elicit some definite information about the "forest fish," I will not at present further allude to the matter. Yours, G. D.

Woodland, Lawn and Garden.

PLANT TREES IN CITIES.

ONE of the greatest inducements for tree culture in all our cities, and the planting of forests in all our spare places, will be found in the healthful exhalations of oxygen. A well known chemical fact, that trees absorb carbonic acid gas and give off oxygen—the first being injurious to life, the last an indispensable agent to the same—should be an inducement for a general planting of trees in and about our towns and cities. It is of little use to apply many of the most costly disinfectants in our now so crowded so long as the most necessary and most important of all. Of what use is it to throw here and there a little chloride of lime into a few cold seeps of the purlieu, where the scavenger's cart is almost an unknown vehicle, and the debris of filth is allowed to accumulate in heaps at the corners of our streets? Is there any healthy element evolved from this state of atmosphere? When we consider the immense amount of gas given off in all our closely inhabited places, we must think, see the necessity of a reformation of this state of things if we would live free from sickness—I had almost said if we would live at all. Yet the advocates for sunlight in cities are so progressive that they would remove every green tree or source of shade that may stand in their way. All this, too, in full knowledge of the fact that it requires more than two acres of forest to purify the air of a city of five hundred inhabitants. Upon this startling proposition, a city of some six hundred thousand inhabitants would require four hundred thousand acres of trees and vegetation to absorb or take up the carbonic acid and other foul gases generated by the people.

The wind removes a very large portion of foul odors from our large cities, and were it not for this great agent of Providence our cities would soon become uninhabitable.

With these things in mind, we, as agriculturists, the gardener, and the philanthropist, have not the mission, a responsibility, that they should perform?

As our cities are compactly and densely filled with four and often six stories of buildings, the pure currents of air

high winds do not purify the atmosphere to a sufficient degree to insure perfect health, much more to make sanitary progress unnecessary.

Upon this ground we say to our health commissioners, and to all whose duty it may be, to give a careful examination to the real necessary precautionary matters that lay directly within their path of duty as guardians of the public health.

First, we would recommend a thorough and careful removal of all kinds of offal from the streets of our cities, and the keeping of the streets clean in the future. Then cause to be planted, under the supervision of the city for ester, if there is one, or a suitable committee, as many flower trees in all our streets and parks as is practicable. This will yield a twofold benefit to the dwellers in our cities. These streets not used as warehouses for commerce, as marts for busy life, should rejoice in a deep and beautiful as well as healthful greenness. Do you say—"What, use up our streets, plant trees in all our thoroughfares, make a grove of our drive ways?" Truly, most truly, and give you cheerfulness and better health in return. One well known principle of the chemistry of agriculture is the absorption by the roots of large trees of obnoxious fermentation. The sun, in its scorching rays, sets free many elements of disease, and the roots of the wayside trees take up these gases and the offal matter washed about their roots by the rains of our Summer months. Were not this the case, a greater degree of sickness would prevail than is generally observed in our cities.

I have before me a letter from a friend in Paris, who says—"Paris has many parks and green spots covered with trees, and the boulevards are considered the most healthy parts of the city, for the reason that the oxygen given off tends in a great degree to counteract the noxious vapors and gases, otherwise dangerous in the extreme. The death rate, in consequence of epidemics, has been very low, and in a few years has been reduced from one in thirty-four, as it formerly was, to one in thirty-nine, as it is to-day."

We are sorry to say that in none of the cities of the United States has the true consideration of these facts of such vital importance been given. Those who have been charged with carrying into effect the best sanitary measures, seem to have overlooked this inexpensive and simple means of giving health and comfort to our citizens.

In our next we shall endeavor to show something that should be done as a duty, and which will prove remunerative as well as highly sanitary. OLLIVOD QUELL.

ANSWERS TO CORRESPONDENTS.

G. B. R.—In all work among the pines, remember this fact: that their leaves are their very life. Nature has established a rule in the case of the pine tree, it would seem, for our guidance and observation. In the woods Nature does all the pruning necessary in her own time and way. As the trees grow up tall, the smaller unnecessary limbs are circled by a growth of bark around the twig, which girdles it, and kills it by stopping the sap. It is easily broken, and drops off. Your case is different, as you desire to cut away the lower branches of the tree. The best time to do this is from the 1st to the 15th of June. Some sap will exude at almost any time of cutting; but you can favor your trees much by using a Keen edged knife in making a smooth cut. If the branch is small, an inch or larger use a fine saw, and cut smooth, either in December or June, and take a solution of collodion, or colored paint, or even melted grafting wax (put the wax on hot) to prevent a too great exudation from the tree. Pine trees can be made into good looking hedges by early clippings; but we recommend the tree as God made it, and think man's operations upon the same as no improvement.

THOMAS FUGENSON, Bridgeport, Conn.—The spiral of water sent came to hand safely. The plant, or figure, as you term it, is quite common to all our rivers, and in all fresh water ponds. It is one of the most simple forms of polyp or hydra. It is quite frequently seen by the naked eye. Some are very distinct, and are beautiful when seen under a good lens. Its body is cup shaped, surmounted with eight long tentacles, which it has the power of retracting. The manner of its reproduction is a wonderful illustration of one of the great laws of Nature. It reproduces young ones by the process of budding, and the buds (as in the specimen sent) may often be seen protruding from the sides of their parents. So tenacious is it of life that it may be cut into several pieces and each part will grow into a perfect hydra. It looks like a little tree growing in the clear, still water. Also, in the water sent, came another common object for the microscope, probably too minute to have been noticed by you. A parasite called the filiozoan, is often found growing over the sides of pickered and other fish of our ponds. In shape it much resembles a bed bug, and is about the same size.

"A LONG ISLAND FARMER" is informed that large apple trees, such as the ones that trouble him and will not bear, probably will bear if treated as follows:—As your tree is large—you say eighteen inches in diameter—five feet from the body of the tree open a trench one, or more feet wide, and cut off smoothly nearly all the roots extending through the trunk and limbs of the tree, and extend from your manure, clay or loam, equal parts, one half part of charcoal dust and lime, and one pound of potash dissolved in warm water. Mix immediately this wash, and apply two or three times. Your tree will give you a good account if the above is faithfully performed.

MINERVA MORRIS, Westfield, Mass.—The trouble with your plants is, I think, from your description, wood lice, present in great numbers. I have known them to clear a pot in a single night, and soon as the seed leaves appear. When wood lice appear, some persons imagine that their seeds have never come up, for it requires the use of the magnifying microscope to detect the minute stalks when deprived of their leaves. It was after several trials and considerable study that I at last ascertained the cause to be the presence of myriads of these pests in the soil at the bottom of the pots. They sometimes infest hot beds and frames in the same manner. They may be destroyed by having boiling water poured over the soil. OLLIVOD QUELL.

EUCALYPTUS GLOBULUS.

OUR attention was first called to the investigation of this so-called wonderful production of Nature by the receipt of a letter from a reader of FOREST AND STREAM, asking if the facts announced in a number of the New York Herald of last October could be depended upon as reliable information. Not wishing to give our sanction or approval to anything bearing upon the special department of this journal, we withheld our opinion until such time as we felt we could give our many readers all information appertaining to the growth, culture, and value of this tree. In a former article we briefly answered three or four queries concerning it, and since then we have come into possession of the following history of this tree, which we hasten to place before our readers for thought and investigation. Of late there have been many varied and wonderful stories told concerning this so-called gum tree. It is found growing to a great height in Australia, California, and other places upon the Pacific coast. If we were to believe even some of the wonders attributed to it, we should be credulous indeed. It is a most wonderful purifier of the atmosphere, says one account. No malaria can exist where it grows, says another, while a third one says one or two of these trees will suck a swamp dry, so great are its powers of absorption.

Now this would be truly wonderful were it only a reliable statement; and as a fact connected with agriculture and sanitary progress, a most invaluable discovery for the prevention of disease.

We have not the least doubt of the healing properties of the *Eucalyptus globulus* being great and valuable, and hope, as it becomes better and more truthfully known, that we shall be able to place much of the unwritten history of this tree before our readers.

Desiring to make a full test of the value of this tree, the French government has caused it to be planted to a considerable extent in Algeria. They are now growing well, and with promise of future good. They are also growing quite well in the Cape of Good Hope, in some portions of Spain, and in several other places. We have taken much pains to secure valuable correspondence from these places, and our readers may be assured that all the reliable information we may receive upon this interesting subject will be communicated to them at an early date.

While we believe that this tree possesses great healing powers, yet we think its powers of absorption greatly overrated. That it attains a height of 300 feet, and a circumference of fifty feet, we think not an error. When, however, we are told that one tree takes up in its capillary circulation ten times its own weight of water in a day, we shall be pardoned if we prefer to await further information and investigation before we tell our readers this as a sober fact. An article we saw in an English paper says that the dried leaves of this tree are of great value, and that a decoction made from them is superior to quinine.

Now we deduct about twenty per cent from these newspaper facts, and strike something of a sensible balance in favor of the virtues and highly medicinal value of this wonderful production of Nature, and are satisfied with the result. We are in possession of many wonderful statements concerning this tree, which we shall verify or prove false in the course of time, and the result of which researches we shall endeavor to certify, in due place before our many readers of FOREST AND STREAM. Our Northern friends may rest assured of one fact—it will be found utterly impossible to grow this medicinal tree in nearly if not all of our States. OLLIPOD QUILL.

NEW YORK, January, 1875.

EDITOR FOREST AND STREAM.

Observing in last week's FOREST AND STREAM a communication from your scholarly contributor, "Ollipod Quill," regarding this tree, it has occurred to me that a short description of my own experience, and in confirmation of his remarks, might not be interesting. Some years since while purchasing, rather extensively in San Jose and San Francisco, cuttings and plants of the diverse varieties of numbers *Morus nubicola*, *M. alba* and *M. morretii*, for a plantation in Southern California, I noticed in one of the nurseries' establishments a number of seedlings of the Eucalyptus, or as it is generally termed in California, the Australian Gum Tree. Attracted more by the desire for variety than any knowledge of the species, I bought a number and had them shipped to Los Angeles. Several weeks after their arrival, a pressor of other matters prevented me from getting them out, and when I did so, it was with little hope of preserving them. The roots, however, had been well protected, and to my astonishment, the following year my little seedlings had become tall saplings. In three years two of them had attained a height of over thirty feet, with a proportionate diameter, and by this time they have so become landmarks for the country around. It so happened that one of the trees had been planted at the upper end of a row of orange trees, consequently at each irrigation of the oranges, its roots were well moistened. The companion tree was just across the road, and not wishing to ditch through this, the tree was left to take its chances. The result was that the tree which had received the water grew to head, making it top-heavy and inclining. The other, on the contrary, while attaining equal height and girth, was perfectly symmetrical and conical, thus demonstrating their adaptability for a dry climate. During the second and third years of their growth there was scarcely rain fall sufficient in Southern California to ripen grain, and one of these trees furnished for nine months a drop of water. This is not to be wondered at, however, when we consider that they are impervious to the arid and almost waterless plains of Central Australia. It is this resin, I imagine, which prevents their successful production in Florida, which country is, in all probability, too wet for them. They seem to revel in drought, like the cactus, of which the padres locate their fences when water was too valuable to be applied to hedge growth. With regard to the standing forest, I would state that at San Gabriel, on one occasion as late as March, we had a frost, sudden and unexpected, which killed my dearly cherished pineapple, bananas, and coconut palms, and the succeeding year ice formed half an inch thick, killing to the ground the yearling orange trees, but not affecting those that had formed their hard bark, or the gum trees. As something peculiar, I would mention that the orange trees were killed at San Gabriel, but the branches on the side, and no subsequent attempt to transplant one of these trees was ever successful. The seed is now grown in immense quantities in California, and the seedlings, which are easily removed with the earth ball on the roots, can be purchased for a dollar or two per hundred.

Trusting that I have not pressed upon your contributor's patience, and hoping to hear from him "scientifically," regarding this new immigrant, I am, Yours truly,

W. M. T.

—A MONSTER SALMON.—Some time ago I was looking through the "Annals of the Poor Masters," a well known book of references on early Irish history, when I came across the following under the year 1714:—"A salmon was caught in Chain-Mic-Nois this year, which was twelve feet in length, twelve hands in breadth without being split, and three hands and two fingers was the length of the fin of its neck."—*Land and Water.*

The Kennel.

THE DACHSHUND.

We give this week a full length portrait of the Dachshund, of which so much has recently been written. He is not a handsome fellow, but he has an honest physiognomy, and they say that the uglier his "mug" the better he attends to business.

Of this peculiar breed of dogs, Caracetas, an authority on kennel matters, says that they were formerly used almost entirely for hunting the badger, but are now employed in Germany and France in a similar manner to rabbit beagles. As an auxiliary to the gun, they are particularly suited to the dense forests of Germany and France, where a sure nose and a slow foot take a higher place in the sportsman's consideration than a fleet foot and indifferent power of scent.

The dachshund in external appearance is certainly one of

Every hound over ten inches at the shoulder ought to be rejected. The Germans are only beginning to understand what a thoroughbred dog is, and any traveler who announces his wish to possess a dachshund in certain parts of Germany can have almost any number of mongrels at an hour's notice, and many such are imported; but the thoroughbred hound is almost as rare abroad as in England, and is on the Continent becoming scarcer every day.

The dachshund is sometimes said to be a delicate dog, and the extermination by disease of some very large packs in Germany within the last twenty years affords some ground for such an opinion. In this country, however, they seem to be as hardy as most breeds, except that, in spite of their very thick short coats, they are subject to rheumatism. If, however, when they come in wet from a swim, or on a rainy day, they can be rubbed over once; this will give very little trouble.

Our readers will feel with us their indebtedness to Herr

THE BADGER HOUND, DACHSHUND, OR BASSET.

the most extraordinary of all the known varieties of the *canis familiaris*, and if it is taken up and made anything like so fashionable a hobby as the fox-terrier, the mastiff, or the pug, there is no telling to what lengths of canine extravagance or distortion he may not arrive. In appearance this hound looks like a strange admixture of the terrier, the bloodhound, the bull dog, and the beagle, but, strange to say, he does not show much likeness to either.

Like most other breed of dogs, the head is the chief consideration. It must be long, straight, and narrow down to the muzzle, but should run rather broader at the end of the snout; flews moderate, ears medium in size, thin, soft in texture, set on low, and falling close to the cheek, but set rather square in front, barrel round and cloddy; body long, and back slightly arched. The neck should be thick, and the eyes neither too large nor too small. After the head, the most important properties lie in the legs and feet, which are crooked as rams' horns; indeed, it is no easy matter to describe the standard of excellence on this point. It will be noticed that they are exceedingly big in bone, out at elbows, in at knees, and the muscles well developed. We cannot say that we think these crooked legs a beauty in any breed. *En contraince*, we consider it an exaggerated deformity originating from rickets, that is now fixed in the breed, like the short face of the pug or the pendulous ears of the hound; but so it is, and as we find him so must we speak of him. His color is generally an exceedingly brilliant black-and-tan, but some capital red specimens are shown at times. The coat is of much greater importance, however, than color, and cannot be too short, soft, or bright. The average weight of these curious little hounds is sixteen pounds, bitches rather less; and the height ten to eleven inches; while the chest is little more than the length of a "snipe's nose" from the ground.

Another English writer says their popularity is not to be wondered at, when we consider that from their great strength, small size, keen nose, and cleverness, they can be, and are, used by sportsmen in England for almost every field sport. They are seldom required to draw a badger or fox, but I am informed one unearched badger not long ago near Bedford which had beaten several fox-terriers. A sportsman wrote to me the other day he used them with pleasure for shooting snipe, pheasant, and partridge. They have been taught to retrieve successfully, their fine noses and muscular jaws more than counterbalancing their small size. But, I believe, they will be found most useful, as beagles. In spite of their low stature, they get over the ground at a fair pace, and hardly ever have a check.

On the other hand, they are good dogs as ladies' pets. They are very good-tempered unless provoked, have skins as sweet as pugs, and will learn as many tricks as poodles. The history of the breed can be definitely traced to the sixteenth century, but it is probably that a search in MSS. would carry it farther back still. The dachshund of 1500, as far as we can gather from the engravings of the time, was a heavier dog than those exhibited now, with a head that on the very low body looks tremendous, and long ears.

Fr. Von Ivernois, the editor of the *Gohlis-Leipzig Waidmann*, for his very disinterested offer and generous consideration, (contained in the subjoined letter) in facilitating the importation and purchase of this peculiar breed of dogs by American sportsmen. We quote:—

GOHLIS-LEIPZIG, December 7, 1874.

EDITOR FOREST AND STREAM.

Allow me to inform you that the article about the dachshund (not dachshund, as your printer composed) interested me very much, as I am myself very fond of these dogs, and possess several of them. As you required addresses of gentlemen possessing such dogs, I will be glad to give you any desirable information, or to provide such dogs for you or any of your subscribers who might want some. The price will be about twenty dollars apiece, from Leipzig, and of course the further expense will fall to the gentlemen who want them. It would not at all be difficult for me to find somebody who would undertake to bring them over to America. For instance, I am sure that Mr. Hagenbeck, in Hamburg, or a sportsman, would undertake the transport. Perhaps you will have somebody who will take care of them during the voyage. I would send you only capital dogs, and should want only to know if you prefer lively dogs, or dogs which are known as very useful in digging out foxes and badgers, as very often the oddest dogs are the best. If any of your subscribers reflect about my offer, he can be sure to get what he wants, as I would not undertake it for the sake of profit, but especially for the interest which I have in America, in which country I have many relatives, in the American sports, and your esteemed paper in particular. I remain, dear Sir, yours very truly,

FR. VON IVERNOIS.

—ANOTHER CHALLENGE.—Mr. E. W. Hope, of La Grange, Missouri, is now in the field with another challenge, in order to prove the superiority or training of his breed of setters, which are reputed to be fine animals. He offers to test his pair of liver and white English setters against any *watched* brace of the setter of any breed in the country, on condition that the animals are tried on pinnated grouse and quail; the trial to come off on or after the first of November, 1875. Mr. Hope's dogs are only house broken, and have not yet pointed a bird, as they are only eight and a half months old. Setters competing with them must be of the same age, or within one month of it. Persons wishing to accept the challenge can write to him for details. As Mr. Hope expresses a desire to take his dogs to any State where birds are plentiful, it should be an easy matter to arrange for a friendly contest. Those who have the best strains of blooded animals should not hesitate to accept the gauntlet thrown down in so general a manner.

—FITS CAUSED BY IMPROPER FEEDING.—Fits, when the dog is not suffering from an attack of the distemper, can be almost always attributed to a too great allowance of stimulating food and a want of exercise while the animal is young. We too often see setters and pointers reared in cities suffering from these attacks brought on by improper diet and a lack of daily liberty. The fits generally occur on the dog being taken out for a walk after he has been kept in the stable or chained to his kennel for several days, his food being flesh, or in a great part animal matter. Carried away by his spirits the freedom is too great for him to bear and the exertion too strong for his unaccustomed nature to stand, causing an unusual flow of blood to the head, resulting in a convulsion.

When the animal is taken a quick relief can be given by an injection of two drachms of ether, four scruples of ladanum to three ounces of cold water; these materials not being at hand, wait until the dog has recovered from the fit, take him home, give him an ounce of Epsom salts and change his diet to good, wholesome food, with less flesh, administering a daily tea-spoonful of Huxham's tincture of bark as a tonic.

SYMPTOMS.—Correspondents communicating with us in reference to the ailments of their dogs through our column of answers to correspondents will please carefully state exact symptoms—the nature of previous feeding, age of the animal, &c.—that we may be able at once to give intelligent advice. Disease, especially distemper, in dogs is scarcely ever alike; the deviation and extent of the same in a great measure depends upon the former manner of treatment, care and diet.

VACCINATION TO PREVENT DISTEMPER.—We have heard that a gentleman in Des Moines, Iowa, whose name we have lost, has been in the habit for the last twelve years of vaccinating his pups with cow virus to prevent distemper, and found it eminently successful. We should like to have some testimony on this point from anyone who may know about it.

THE DOG SHOW AT DETROIT.—The sportsmen of Michigan opened their first exhibition of sporting and other thoroughbred dogs at Detroit, January 14th, and will continue it one week in order to enable all who have valuable animals to display them. While the prizes to be given are not very large, as they range only from one to ten dollars, yet the show will, no doubt, be very successful, for money is still a secondary consideration to gentlemen who are proud of their dogs. We hope to hear that the exhibition has proven more important than was anticipated, and that every effort has been made to make it an important event to sportsmen. We should deem ourselves obliged if some correspondent would send us a description of the show, and the character of the animals attending. Among the varieties of dogs to which prizes are to be given are stag hounds, beagles, fox hounds, greyhounds, pointers, setters, clumber spaniels, water spaniels, Newfoundland, sheep dogs, terriers, Italian greyhounds, couch dogs, Esquimaux dogs, and for the best specimens of any breed not included in this list.

PRIZE DOG BOOK.—HISCOPE, JR., our English correspondent, has just issued in London a very convenient volume for all interested in the best strains of English dogs. It includes all the prize dogs of England, and their pedigrees, colors, ages and performances. Over 4,000 dogs are included in the list, and from this we should infer that the volume was complete in every detail. As thoroughness is a characteristic of this gentleman, we doubt not but his book will meet with a ready sale in this country as well as in Great Britain.

A DOG ADOPTING A RACCOON.—A gentleman in North Carolina writes:— I know of rather a queer case of adoption. Mr. Carson has a pointer bitch which last Summer adopted a young raccoon, took such a violent liking to it as to neglect her puppies, and not being satisfied when it was out of her sight.

—This brief story of the faithfulness of a dog will serve as a counterpart to the affecting exhibition of canine fidelity and intelligence shown by Cæsar's dog, who so closely attended the dead body of his master after the recent fatal accident in this city. At the time of the funeral of the late Captain B. F. Willard, in North Berwick, quite recently, his faithful dog howled so mournfully that he had to be chained in the barn to lessen the sound. When he was let loose he searched the premises to find his master, and not finding him, he tracked the removal of the body to the grave-yard, where he discovered his master's grave, a half mile or more from the house. And now he daily goes to the grave and mounds and howls for his lost owner.

A GUIDE'S STORY OF A DOG.

HARTFORD, December 7, 1874.

EDITOR FOREST AND STREAM:—

Last Summer, while in our spring camp, lying on our bed of spruce boughs, smoking our pipes, preparing to our voyage into the "land of dreams," our talk drifted, naturally enough, into the reasoning power (or instinct, if you like it better) of dogs. Many years were spun on the subject—some pretty tough ones—but the following one, true in every particular, by our guide, Carl, I will give in his own words, as near as I can remember.

"A number of years ago," he began, "I started on a hunting trip, with no other companion than my faithful dog. I found myself towards the close of a hard day's tramp off to the southwest of Smith's Lake, far from shelter of any kind. Being pretty well tuckered, I hastily constructed a shelter of boughs to keep off the heavy dews, and making a little fire of logs, I swallowed what little grub I had, giving my old dog a bite at the same time, and with my feet to the fire prepared for a good snooze till daylight. My dog always laid with one paw across my body, and with his lion for a watch I always felt as safe as I did at home in bed with my wife. How long I slept I don't know, but suddenly a sharp tap at my ear awoke me. I sat bolt upright, grabbed my rifle, and listened. Not a sound did I hear. I peered out into the intense darkness my fire had burned low, expecting to see the eyes of some wild animal—now nothing. Still the dog kept tugging away at me. I arose, and without knowing why stepped off to the left of my fire, when, without a moment's warning, I heard a tremendous crashing, and down with terrific force came a mighty headlock, falling with a noise like thunder directly across my shelter of a moment before, and which would have crushed me to a jelly and deprived Mrs. A.— of the best husband—and us of the best guide in the North Woods." "I shot out one of the legs," "Well, I don't know about that," responded Carl, "but how did the old dog know that tree was going to tumble? that's what I want to know." Question is open. F. B.

ADAPTATION OF THE DOG TO THE GAME.

POMFRET CENTRE, Conn., January 4, 1875.

EDITOR FOREST AND STREAM:—

It is an old adage that experience is the best teacher, and it is by the experience of adepts that those of less experience are benefited. Now, in New England, for instance, let us see what kind of game birds we have to rely on for our sport. In years gone by we have had woodcock in abundance; but how is it now? In this vicinity, if one were to depend on them alone I fear he would get but few good days' sport in a shooting season. Quail are liable to fall every few years, and though they may be quite plenty this season, the coming Winter is liable to thin their ranks so seriously that it will take them a series of years to recuperate. Snipe here are only found in certain localities in sufficient numbers to back good sport, and but few sportsmen are so located as to be able to get even a day's satisfactory sport annually. But ruffed grouse, the most noble game bird of America, inhabits every part of New England, and is the only one we can rely on to stand the severity of our Winters, and which the sportsmen of New England will eventually have to rely on for what sport he will obtain in the field over his petted pointer or setter. Now, then, what kind of dog is best adapted to their pursuit? English hounds of scores of prizes dogs, and to fast feet the wind, and we infer to obtain a prize at their most rapid dog shows be most so. But is this the dog best calculated for New England shooting? By no means, as far as my experience goes. In England their shooting is mostly in "open," or nearly so, where the dog can be seen at long distances, and if the dog has a good nose and is quite staunch, it is all that is there required. But not to go any further, our ruffed grouse are usually found in the most dense covers, and such a dog requires constant checking to keep him within proper distance, and this bird is so shy that though it might bear the presence of the dog, the sound of the human voice is almost sure to flush him. To pursue him successfully, a diligent, quiet, steady, easy controlled dog is absolutely requisite—one that carries a high head and draws on scents slowly, with the utmost caution, and is able to point his game without shedding from thirty to one hundred yards, with the wind in his favor, and have sufficient judgment when trailing before the wind to not approach too near his game before coming to a firm stand. With a dog of this description, and this alone, can ruffed grouse be successfully shot in sufficient numbers to make good sport. If the sportsman understands their habits, and is a good shot, and has a dog of the description I have mentioned, he can now find a better sport in almost any part of New England, even if he does not find a game bird of any other kind. The impetuous, fast, dashing dog will do for the West, or far woodcock and quail here, where the covers are not too dense. But I have often thought what a fast dog gambol in speedy range, he seemed to live in a gentle scating powers, more especially in extreme hot weather, when he gets more heated than his less impetuous companion.

I know that Frank Forester claimed in his "Field Sports" that little sport could be got after ruffed grouse; but he was an Englishman, and doubtless accustomed to fast dogs, and perhaps did not fully understand their habits, or care to work for them. I never shall forget a remark of a friend of mine years ago, when with another friend we were not quite shooting. I had prepared to flush a ruffed grouse, and made after it, and had just bagged it and got back in car shot. W. says to H., "Where is old Allan?" He replied, "Gone, I suppose, after that fat, as usual. He'll be hanged if I don't wish all the partridges were to the Red Sea." By and by this same individual obtained a good partridge dog, and eventually became as fond of this sport as myself, and I often jokingly remind him of that remark.

For me there is no sport that equals ruffed grouse shooting. Respectfully yours, ETHAN ALLAN.

Answers to Correspondents.

Wm. H. McD., Dover.—Will attend to your wishes and have matter prepared.

S. San Francisco.—The false muzzle of the Rigby rifle is grooved like the rifle.

S. W. C.—Please give in your issue the close trap for partridge in Maine. Also, close season for ruffed grouse from January 1 to September 1.

C. A. S., Shakopee.—Do I understand that a Remington rifle less than 38-100 calibre shoots nothing but a rim fire copper cartridge? 2. Will a 32-100 shoot a self-loading, central fire shell? Ans. 1. Yes. 2. No.

Gorham, St. Louis.—What can I do to prevent the barrels and action of my breach loader from rusting after getting wet while shooting? Ans. Use mercurial ointment or Beilmonty oil. The farmer is the best.

BEAUMONT, New Hope, Penn.—Is there a machine in successful operation for hatching fowl's eggs? Do you know of a Frenchman on Long Island who has one? Ans. Eugene Fretter, dentist, 130 Bowery, has one in successful operation at his place on Long Island.

O. H. E., Pontiac.—Can you tell me whether the following papers are still published, and their address, viz: *The Sunday Era* and the *Shepherd's Era*? The *Era* is published in Ann Street, New York. The other we have never heard of.

C. L. M., Haverde.—The fish you sent us for examination were in a most dilapidated condition, so that identifying them specially is difficult. They are sticklebacks, and as near as we can judge, the *gasteroides quadriceps*, or two-spined stickleback.

STEWART, Baltimore.—Can you refer me to any book that gives an illustration in building and rigging small boats and yachts? Ans. Have never seen such a work, although we have made frequent inquiries. A book of this kind would be useful.

SMEDLEY, Morristown.—Where is the most convenient place I could procure a pack basket; such as spoken of on page 338, third column of FOREST AND STREAM? Ans. Pritchard Brothers, Fishing Tackle makers, 64 Fulton street, New York.

F. O. DEML, Brooklyn.—I should like to be informed how spruce stools should be painted to keep them from rotting. I have tried to paint them with a lead paint, but it is pointed out that each one may represent a different one of the above named varieties? Ans. Copy from mounted specimens at a taxidermist's.

A. J. T., Westboro, Mass.—Please inform me of the best place for our club to obtain black bass to stock our pond, what time in the Spring they should be moved, the expense, &c. &c. Ans. If you will write to Fred Mather, Honeoye Falls, N. Y., or to Collins, Catskills, N. Y., you will secure both fish and information.

J. D. C., Saranac Lakes.—We have had a dispute, and all parties agree to be satisfied with your decision. In shooting long distances would you have to elevate a rifle more on a cold day than on a warm day to strike the same target? Ans. Certainly you must have a higher elevation on a cold than a warm day. Colonel Goldsworthy informs us, that where he hit the target with his rifle, he had to elevate it more on a cold than on a warm day. The reason for this elevation is the rarity of the atmosphere.

FRANK.—For treatment of distemper fits, a strong emetic should be given, followed by an opening of the bowels with four or five grains of calomel and one-quarter grain of opium. After this insert a stagon on the head and move every morning. This is for the first stages of the disease. Should they occur at a later stage, the services would be to put the poor animal out of his misery and out of ten never recover.

H. W. Buffalo.—I desire you to give the address of party or parties dealing in small stores for camping purposes. I have scanned your advertising columns, but find no hints on the subject. I want to camp out in the Spring? Ans. Pond & Duncklee, Boston, camp stores, \$15.00. We advertised this firm for several weeks. Advertisement has since been withdrawn. W. W. W.—I have a quarry which, at one time, was a good and sweet

singer, but for the past month or two has stopped singing. Can you give me any information as to what will restore its singing? Ans. Probably moulting. Put a little saffron in his drinking water, and keep the cage covered with a cloth for a few days, and keep it cool, drafts, and bang in the sun or hot or too dry. Canaries frequently have intervals of silence, and old birds lose their song.

J. W., Leesburg, Va.—How many eggs (ova) of the pike-perch, or Western salmon, are contained in two lobes or sacs eight or ten inches long, one inch thick, and one and a quarter to two inches wide? Ans. Fish culturists estimate the number of eggs by measuring the number of lobes, and then multiplying it by cubic measure; then estimate the number of cubic inches in the lobes, and divide the result by two, and in half, and keep on dividing until you get a small portion, say one-sixteenth or one-thirty-second, and then count the eggs in this portion.

W. H. P., Nassau.—Can you inform me where I can procure some wild rice, such as grows in the lakes of Minnesota? Ans. Will have to send to the Chippewa Agency near Fall, when the rice is ripe. All the crop of wild rice of 1874 was parched long ago by the Indians. Perhaps there may be a single bush still left, known which, any one of our Minnesota subscribers will oblige by notifying us. Wild rice grows abundantly in Wisconsin, but is not harvested, we think.

I. L. S., New York.—Please inform me what shoe you think is the best for a ten or fifteen mile walking match? I had a pair of shoes made the same as the army shoe, but am told they are too heavy. How would the Indian moccasins do, and how could I get a pair? Ans. A pair of the useful moccasins, broad, low, with a low, large heel, with the feet in the wool socks, and woolen BUCKLES having much character, grass particle where there are no struts. For Canadian, apply to G. D. Sullivan, Barrie, Ontario; for buckskin, to H. A. Bromede, or A. Moyne, St. Paul, Minn.

GRONERONT, Hixbridge, Mass.—Do you think it possible that a distinct species of speckled trout, differing only in size from the common brook trout, can be found in Massachusetts? There is a large brook in this vicinity that I have felt sure I have caught, but have never known to be caught, a lake exceeding one-quarter pound in weight. Brooks flow into the same pond on either side, in which large trout are often caught. Do you think it is to be accounted for by its being a different branch of the *Salmo Fontinalis* family? Ans. Brook trout have peculiarities in certain places, which seem at first sight to entitle them to be regarded as distinct from the ordinary trout. Naturalists have at different times described and named local families of trout, which are, however, but the general opinion at present seems to be that there is only one family, and that the local peculiarities are occasioned by depth and volume of water, temperature of water, color of bottom, food, &c.

S. S. K., Oakland, Cal.—Can you tell me whether any American made muzzle loading rifle for long range was used at Creedmoor during the late shooting there, with which you are well acquainted? It seems curious to me that none should have, as yet, appeared to compete with the breach loaders. Ans. No American muzzle loaders were used in the match. In this connection we may note that many of our first-class riflemen assert that, take any gun, use proper fitting bullet with plenty of powder, and it will be found that the grooves and twist make use of the same principle as the breech loader. The rifling may be different, but the general opinion at present seems to be that there is only one family, and that the local peculiarities are occasioned by depth and volume of water, temperature of water, color of bottom, food, &c.

R. S. D., Dubuque, Iowa.—As I look to your paper for all information in regard to sporting matters, I take the liberty of asking you where the Scherwinger & Daly breach loader is manufactured, and who are their agents in this State? For the Fish side of the Fish and Game, Scherwinger & Daly breach loader is manufactured in Prussia. Scherwinger & Daly, 84 Chambers-street, N. Y., are the agents in this city. John Hartig is the local agent in your city. The only Fox gun we know of is the Fox side action (not side lever) breach loader, which has not what is called a break down action, but has invariable barrels to the right on the same principle as the American gun, and is very much like a company is now being organized. Address P. O. Ober, Wrentham, Mass.

G. H. J., Boston.—Who makes the ten dollar Creedmoor target pistol that has lately come into the market, and where can I obtain one? Has the second edition of "Modern Breach Loaders," by W. W. Greener, been published yet? If so, what is the price? What is the best form of pickered trap for fishing through the ice? Ans. 1. The title "Creedmoor" attached to guns and pistols does not signify an official endorsement by the National Rifle Association. The pistol you name can be bought of H. C. Squires, No. 1 Courtland-street, New York. 2. The second edition has not been issued, as yet, in this country; price \$3.50. 3. This paper has described three or four kinds of tip-up for fishing through the ice, but the cheapest, easiest made, and most efficient, all in all, is a simple ten foot sapling stuck into the ice at an angle with the line and bait hanging over into the water. Hang a bit of red flannel on the top of the sapling.

A. K., Baltimore.—I have been called upon for official evidence that the salmon fisheries of the Columbia River last year—1873—amounted to \$4,000,000. I took the statement from your paper of June 18, 1874. Have you any evidence of its correctness other than the general reliability of the National Rifle Association? Some of our fishermen are very much dissatisfied because our commissioners have been spending the time and money of the State on what said fishermen are pleased to call "fancy fish." In endeavoring to show the impropriety of placing salmon under this head, I quoted the above statement. If you have any figures on this subject be so kind as to give them. Ans. Statement referred to is given solely on the authority of our correspondents, and is not intended to be believed, but before the estimate much too high, though fully convinced that the demand were large enough, the salmon fisheries would be worth up to \$10,000,000. The supply of fish seems inexhaustible to the writer, who has personally examined the fisheries of the Columbia River. His investigation would classify the value of this industry during 1873 as follows: Commercial salmon, \$300,000; fresh salmon sold in local markets, \$50,000; a total of \$350,000. At present, it is said, the business of catching is suffering from being overdone.

J. E. S., Philadelphia.—I have an English setter bitch, twelve months old, which is very much prostrated with symptoms which, to me, are strange. She is naturally very delicate, scarcely ever having a good, steady, and shows a decided inclination at times to vomit, and is very quiet or dumpy. She for two or three days has had some fever and a cough quite violent at times, which ceases when she attempts to move, copious discharge of matter from her eyes, and an excessive and exhaustive diarrhea, the feces being black and very unnatural. I should conclude from her general condition a case of distemper, but a total absence of any discharge from her nose, and a moderately good appetite, which condition in all my experience with distemper, I have never observed, seems to preclude such conclusions. The diarrhea seems to be at variance with general symptoms. She however has attacks of shivering, and a hurried respiration, which seem almost unmistakable indications. I have given her an ounce of castor oil with five drops of laudanum, and a four-ounce powder, 3 grains of nitrate of silver, 2 grains of opium, 2 drachms of digitalis, 4 grains, continuing the same for three or four days, decreasing the dose a third if it causes vomiting, at the same time giving once a day a teaspoonful of Huxham's tincture of Peruvian bark, to promote an appetite, and to stimulate the general tone of the system. From the delicate nature of your dog, we fear distemper will go hard with her. The nature of the disease, from the symptoms, appears to be a case of distemper; if it does not, look out for fits, treatment for which see to salmon as you wish.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUR DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
(Post Office Box 2832.)
138 SOUTH THIRD STREET, PHILADELPHIA,
104 & 106 MADISON ST., CHICAGO.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 30 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 14, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will wander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them improper with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

REPORTS.

WE have been favored with the sixth annual report of the Museum of Natural History, and a photograph of the handsome structure in process of construction on the corner of Seventy-seventh street and Ninth avenue, which is to contain the treasures now stored in the old building. The report speaks in the highest terms of the financial condition of the museum fund, and the increasing number of subscribers. The membership fee of \$10 defrays the current expenses at present, while all subscriptions of \$100 and upwards are reserved for increasing the collection. During the last eleven months the membership has increased from 350 to 1,100, and it promises ere long to be sufficiently large to enable the managing committee to secure the aid of scientific gentlemen to classify and arrange the various families and species.

The museum has received a very handsome donation from Miss Catharine L. Wolfe, the daughter of its late President, in the shape of a rare conchological collection, numbering 50,000 specimens, and a scientific library of 1,000 volumes. Mr. Withaus has also given 8,000 specimens of the American coleoptera, representing 2,000 species.

The Smithsonian Institution has furnished some birds' nests; sixteen skeletons of the moas, or gigantic fossil birds of New Zealand, the largest of which is over ten feet high, have been secured; and \$13,000 have been subscribed, chiefly by the trustees, for the purchase of new faunal collections. A mineralogical department has also been added, and it now numbers 7,000 specimens.

The educational work of the museum is evident from the fact that teachers take pupils there to give them instruction, and that as high as 10,000 people sometimes visit it daily. An edifice of this sort should be supported liberally in a financial way, for it is not only a credit to our city and State, but also one of the highest educational institutions in the land in all matters pertaining to natural history.

We have received a pamphlet on the natural history of the muridae found along the route of the Northern Boundary Survey, prepared by Dr. Elliott Coues, the naturalist of the expedition. The technical description of each species is ample, yet concise, and is probably the most complete issued thus far. The ground covered by the report is a

belt of country extending along the parallel of 49° north, from the Red River of the north to the Rocky Mountains, representing the northern boundaries of the Territories of Dakota and Montana. Of the muridae, the genera sigmodon, ochetodon, myodes, and canniculus are not represented, as the first two are southern and the others Arctic, yet all the species and genera are introduced to complete an account of the group.

COLLEGE CONTESTS.

COLLEGE students, who are now recognized as our highest types of mental and physical culture, as a class, have taken a very prominent interest in rifle practice of late. Harvard and Columbia will soon have rifle teams, and other colleges will, no doubt, follow their lead; for if any one thing animates our students it is a generous spirit of rivalry, and the desire to uphold the honor of their alma mater in all manly accomplishments. In that case, intercollegiate rifle contests will become as much a part of the physical curriculum as boating or base ball is at present, and will be prosecuted with the same vigorous enthusiasm.

By devoting a share of their attention to this exercise, students would become adepts in a virile accomplishment, one which would prove of use to them in many ways, besides its cultivation of the eyes and nerves, and imparting to them a steadiness and confidence in certain cases of danger.

It has one decided advantage over other exercises to them, especially boating, and that is that they need not forget their studies or go into long and severe training to become experts at it. They have plenty of leisure to practice after school hours, and Saturdays, and that is time enough to enable them to become excellent marksmen in a very limited period. The matches between the English Universities and schools are as interesting as any event at Wimbledon, except, perhaps, those between the three Kingdoms, and the victors receive as much applause and are as proud of their laurels as if they were the crew of the winning boat in the great aquatic contest.

If the competition is so keen between the students of Britain, and their victories are so much applauded, we do not see why the same conditions should not exist here. We are fain to believe that our colleges can produce rifle teams that will equal, if not excel, those of Great Britain, from the fact that but few young men are found here who are not acquainted with the use of fire arms, and that they have many opportunities for practice.

Every prominent seat of learning in the country should, then, organize rifle clubs, engage in friendly contests with each other for a pennant or cup, and when they have proved their power challenge their trans-Atlantic kindred to a trial of skill. This would cause rifle exercise to attain a vigorous existence in this country, and would, at the same time, give the students a delightful source of recreation and an accomplishment of general utility.

THE INTERNATIONAL TEAM.

BUT little has been done recently toward organizing the American International Team for 1875. Since the close of the Fall matches, the gentlemen most conspicuous in rifle practice have been confined to business, so that they have had but little opportunity for completing any arrangements for the coming contest, yet the general understanding is that the team is now composed of those who participated in the international match, and those then known as the reserves.

Positions in the team are open to any citizen of the United States who proves himself a better marksman than any member now in the selected number; and in order that the best shots may be chosen, an opportunity will be afforded to all persons who desire to compete for a place.

The matter of carrying out the next international match, on the part of the Americans, is now under consideration, as the Amateur Club have delegated all their interest and power in the premises to their Executive Committee, who are to complete the arrangements. The President of the National Rifle Association, at the request of the Amateur Club, has been authorized by the Board of Directors to appoint a committee of five members from the Association to co-operate with the Executive Committee of the Amateur Club, in completing details. This Committee was appointed at the meeting at the Astor House last Tuesday evening, and consists of M. T. Malone, Wm. C. Church, Henry Fulton, Hon. D. W. Judd, E. H. Sandford, Gen. Molineux was added to the committee for the short term.

This joint committee are not bound to accept as representative men, the gentlemen now known as the American Team; hence they will hear the claims and carefully consider the qualifications of all desiring a place, and will use their best judgment in selecting the next team.

It is well known that many men are now practising at private ranges in order to test their own skill, and a few of these may prove better marksmen than some of those engaged in the recent match, hence the final selection can not be made until it is found that the present team cannot be excelled. Besides the performance of this duty, the joint committee have also to secure the means to pay the expenses of the team while abroad. The sum needed will probably amount to \$13,000, as some presents are to be made to the Hibernian Riflemen, to reciprocate their kindness while here, and to show the esteem in which they are held. This amount can, of course, be readily secured, so that little difficulty will be encountered in that direction. After the team has been organized they are to select a Cap-

tain. The choice now is Col. Gildersleeve, one of our best shots, and a typical American riflemen, and one besides who has both experience and a thorough knowledge of his duties. If he will accept the position he will, undoubtedly, be the next commander. This team will leave here in June, probably about the early portion, and shoot the match near Dublin at a date early enough to enable them to participate in the Wimbledon contest.

The Irish and American riflemen will encamp together at the latter place, as the former are making all necessary preparations for the comfort of their visitors. This will make their tarry in England most pleasant, as they will have the companionship of genial and admiring friends, and their large experience in "Conchling" on that treacherous range.

The fear that our men would not be enabled to compete in the Military matches at Wimbledon is now dissipated, for Major Leech, in a recent letter to Col. Wingate, states that the order in vogue, not to permit any persons using a rifle under forty-five calibre, to compete in such matches, has been rescinded. This has been done, no doubt, in compliment to our riflemen, and to enable them to test their skill.

The programme as outlined thus far is working very satisfactorily, hence we may rest assured that our team will make a good name for themselves across the Atlantic, and return with honors, if not with the laurels of victory.

THE GREAT HUNTING AND SCIENTIFIC EXPEDITION.

WE give this week the promised report of Col. Mcarty

to the objections raised by several of our correspondents to his contemplated hunting expedition to Texas, Oregon, and California. We find that while the Colonel accepts the strictures as correct on general principles he decides emphatically that his critics reason from false premises. Moreover the details of his programme as given by us about a month ago, led our readers to suppose that the hunting would be commenced in May, when in reality it will not begin until the later part of June or the first of July. We are free to say that the Colonel's views not only accord with our own as gathered from personal experience, but are endorsed also by residents of Texas and other sections of the remote West, and we think that he has successfully met the objections raised, as may be determined from a perusal of his letter which we herewith append.

Besides, this expedition was not originally designed merely as a chase after game, but included in its comprehensive programme a penetration into some of our richest archaeological and otherwise scientific fields of investigation. We shall perhaps be able not only to discover new geographical features, new minerals, and new species of flora and fauna, but possibly new races of men and ruins of ancient villages and cities—

FIFTH AVENUE HOTEL, NEW YORK, JANUARY 11th, 1875.

EDITOR FOREST AND STREAM:—

In several issues of your journal, printed subsequent to the announcement on December 3d of my hunting expedition through the West, I am glad to see an ever-ready destroyer of game; and now propose to meet in detail all the seeming objections that have been raised by the writers.

I will preface my remarks by stating a fact, which I presume they will know, that from the earliest period such parties as the one proposed have been in vogue in Great Britain, and Europe generally, and particularly in Africa and India.

Royal parties annually hunt all varieties of game in preserves so contracted, and with the game so tame, that to call it sport would be a satire in our own vast country, where our creatures are free to roam over thousands of miles of area. As an illustration, a certain English Lord has told me within a fortnight that during the previous season he had killed in his own preserves over 1,200 pheasants. Now this noblemen might be branded as a slaughterer, and yet his acquaintance has been courted by all the crack shots of Chicago.

If this gentleman destroyed 1,200 birds, how many do you estimate must be annually killed in Great Britain? Do you suppose for one instant that this hunting party of our contemporaries any such destruction? I do not think even the Impitation. We go for sport, and not for slaughter, nor to secure skins; but to shoot game in season when it is in the flesh. I am an old sportsman, and a lover of Nature in all her features; and have you ever seen one such who would wantonly destroy game without he had use for it?

The gentlemen who object to my action forget that the seasons are three months earlier in Texas than in the East, and consequently, that the game is developed much sooner; that our quail hatch in February or wild turkey in March, our grouse in the same month, usually raising two broods per annum, and that the buffalo calves in April. No hunter ever shoots a buffalo cow with a calf, or an old bull; but only young heifers and young bulls are killed, and they are nuisances to the herdsman of Southwestern Texas. If all the buffaloes were killed, it would save the owners of cattle from a grievous annoyance, as it would check all depredations on their ranches by the fierce red warriors who follow in their path. With the extermination of the former the Indian would cease his work of rapine and murder, and by this the government would save millions of dollars and the precious lives of many of its best citizens.

But this explanation has little to do with the immediate question. My object is to show that we do not wish to wantonly exterminate the game, so I herewith give a detailed programme of the contemplated trip, that all may understand that we are not only true hunters and anglers, but also a private corps in search of science, health, and pleasure.

OUR PROGRAMME.

We leave Glasgow, Scotland, May 1st, per steamship "State of Nevada," specially chartered by me for this trip; arrive in New York about the 10th, when we will remain some seven or eight days, making short excursions about the city and bay; thence to Niagara Falls by the Erie or New York Central Railroad, remaining one day; thence to Chicago, arriving a few days; then take a steamer, specially chartered, and proceed to Lake Superior, fishing the rivers and lakes for two weeks; then return to Chicago, and after a rest of five days start for Texas, where we are to join our wagon train. Hunters and commercial already provided for the journey. Thus, you see, takes us into the middle of June, when wild turkeys and quail are full grown, fawns have lost their spots, and buffalo calves are brown. After hunting through Western Texas for fifty or sixty days in quest of buffalo and other varieties of game, we will reach Pueblo, Colorado, and thence proceed up the railroad to Colorado Springs, where we will rest for a few days, and those who are so inclined can visit the Twin Lakes and fish for the speckled trout as uninter-

THE BREECH LOADER.

THE breech loader is not bored in the same manner as the muzzle loader. It the latter is bored true, it is of little consequence what the bore is, as it can be made to shoot well if the right charge of powder and shot is so selected as to suit the particular size of the bore.

In a breech loader the charge is started in a eleven horn cartridge case—that is, the exact size of a twelve cartridge case inside—and compressed into a twelve bore barrel. A certain amount of compression is necessary to obtain strong and close shooting. The penetration or pattern can not be improved by increasing the amount of powder and shot beyond a certain charge.

There is no efficacy whatever in the very long barrels which once were used, and they are consequently discarded.

The material of which a barrel is composed is but one branch of the question. Upon material depends safety, of course, but that may be taken for granted in the barrels of all reputable makers. When a barrel built by one of these happens to burst, inferiority of metal is the last cause to which it may be attributed. Upon the material and its manner of being worked depends the pattern or figure of the barrel. That is purely a matter of fancy.

But the important question is, how well does the barrel shoot?

The quality of the metal in the barrels undoubtedly has something to do with their shooting. For all we know—I mean we are not in the trade—it may have a great deal to do with it. But so long as the best barrel makers use metals of precisely opposite qualities, without producing any very marked difference in the shooting of either, we may be permitted to think that one sound metal, well worked, is quite as good as another.

The good shooting of barrels depends almost entirely upon the boring, and the art of boring is no longer a secret confined to a few of the craft. The formula has become the common property of the trade in this as well as in all other countries.

Therefore, there is hardly any well-defined difference in the shooting of any of the guns, English or American. Certainly there is no one man, in either England or America, who has succeeded in making a barrel boring as to make him stand far above all the rest of his competitors, as Maunton did.

But the guns of one maker may be found to shoot better, as a rule, than the guns of another maker.

When this is the case, it is to be attributed, not to any exclusive knowledge in boring, but to the fact that more labor and skill are given to make the barrels shoot better; and that they are targeted until they do shoot up to their very best. These barrels cost more because of this extra attention. And the maker who does this the most conscientiously, deserves the best price and most reputation.

I believe that the muzzle loader has been developed to its utmost shooting capacity. I think everything has been got out of it that there is in it, and the proof of it is, that for ten or fifteen years preceding the breech loader, the muzzle loader was put on a stand, and it was a perfect wonder of its kind. There was no one maker indisputably better than another. The shooting of all their best guns was pretty much the same.

This perfection and equality of shooting was transferred to the breech loader, so soon as the gun was strong enough to stand it. And the only problem now is, whether in future, owing to the structural differences in the guns, the breech loader may be found to shoot better than the muzzle loader ever did. I think it will. It must—if there is anything in the saving of windage, and the theory of rifles, which puts a ball in the larger breech to exit through a smaller muzzle—gain power thereby. One seems as pertinent and as applicable as the other.

THE SELECTION OF A BREECH LOADER.

Formerly, when about to select a gun, the purchaser had but few points to determine before making a choice. Now he has many. For the time being, at least, he must become a participant in the "war of the breech loaders," to the extent of choosing one, and thereby being deemed an antagonist of all the rest.

He who is not for us, as against us, is the maxim of the makers and the dealers; and, therefore, to select a gun, and to advise how to select it, are embarrassing undertakings.

In selecting a breech loader, there are other things to be considered beside the shooting of the gun.

The safety of it is first to be considered. There is more machinery in it than in the muzzle loader, and to that extent, if not so perfectly, it is more dangerous. It is, in principle, it is more dangerous and must be less durable.

The principle is a prime consideration; for if a gun, no matter how well-made or high priced, is built with a working movement which is all strain and all friction, it must speedily wear out, and the money paid for it is thrown away.

The durability is another consideration. The best breech loader will wear out sooner than the muzzle loader of later, because there must be some strain and some friction. Durability, therefore, will depend upon the excellence of materials and the finish of the work.

The shooting of the gun is a consideration of course, and has been already fully discussed. And, finally, the price is a controlling consideration. It is a very serious mistake—and one which is made by the majority of purchasers—to suppose that in buying a breech loader there is nothing to be considered but the price and the shooting. And to this mistake we owe the controversies which fill our sporting papers.

Each of these points will be noticed, that the purchaser may see their importance.

That a man should consult his safety, first of all, when selecting a life-taking weapon, needs no argument. All other matters of price or performance are subordinate to this.

That the principle of the gun should be sound, and that the durability will depend upon the principle, the material, and the work, will not be denied.

It is no economy to buy a low-priced gun, with an unsound principle, or of inferior workmanship, because it will soon become useless.

As to the shooting of the gun, the man misleads himself who says that because a cheap gun will shoot as well as a high priced gun, the cheap gun may as well be taken.

The price of the gun, I have put last to devote most space to it; but the buyer will always put it first after safety.

ons in the tributaries, climb Pike's Peak, or hivoice in the "Garden of the Gods," thence proceed via Denver, Cheyenne, Ogden, and Salt Lake City to the Yosemite Valley and the Big Trees. After enjoying the magnificent scenery of the latter region and fishing to our hearts' content, we will take a steamer at San Francisco for Oregon, and tackle the noblest of all fish, the salmon, in its favorite haunts among the rapids of the noble Columbia. After this the weather will not permit of much more fishing, so we accordingly return to San Francisco, thence move east of the Rocky Mountains, and spend a portion of our time in Kansas to enjoy Fall shooting among the grouse, deer, antelope, bear, and elk. We then proceed to St. Louis, remaining there a few days, thence to Chicago to enjoy Fall duck shooting for a brief period, and then return to New York via Washington, where we will stop a few days, reaching England in time for the holidays.

I hope that with this explanation and programme your readers will be satisfied. I know every inch of the ground over which we propose to hunt and fish, and feel no hesitation in saying that we will bag all the game we wish, while the artists and camera men who accompany the party will find constant work for brush and camera and geological hammer. I am, yours, very respectfully,
Wm. C. McCarty.

We append several letters on this subject—
NEW YORK, December 30, 1874.

EDITOR FOREST AND STREAM:—

Allow me a word on the subject of the great hunt, proposed by Colonel McCarty. On most subjects there are honest differences of opinion, which have for their foundation seeming truths, as they appear such to one side or the other; but upon this subject I cannot see whereon a single respectable argument can be based in the defense of the proposed hunt, or more properly speaking, the proposed slaughter.

For cool effrontery and impudent assurance, it certainly excels any proposition I ever heard of. Either Col. McCarty has misunderstood the character of the better class of Englishmen of wealth and leisure (for none other have the time and means to devote to a hunting trip in this country), or else I do. For I would be sorry to be forced to believe that any party of English sportsmen, who are so fond of their hunting pleasures and privileges, and so careful in their protection of game at home as to make it a criminal offense to shoot either fur or feather, even when in season, excepting by the owner of the land and those whom he invites, should deliberately come to this country and recklessly slaughter our choicest game, for the barren pleasure of telling of great deeds and wonderful prowess. I have no doubt, if the hunt is to be upon the immense tracts of Creedmoor, rather than upon the poor, thin animals of early Summer. No true sportsman ever shoots game from necessity cannot be utilized when killed, while it is notorious that not one-tenth of the game killed upon these hunting excursions is ever put to any better use than as manure to the little spot of ground upon which the unfortunate creatures may fall. True sportsmen, like true soldiers, fight only while the battle lasts. After the fight is over, the soldier is changed to the good Samaritan, and humbly binds up the wounds of his adversary. So should the true sportsman cease from strife during that reproductive and recuperative season which nature intends for the multiplication of game. We have enough of game murderers already upon our Western plains, without seeking the immigration of more. At the same time we have a heavy levy to make for all who are shot at the right time, and in a proper manner. The moral sense of the community should be aroused to stop what already exists in the shape of indiscriminate slaughter of game. Are there, or should there be, one code of laws for the protection of game east of the Mississippi River, and perfect un-restricted license west of that river? Either Burt's humanity is illegal interference with the progress of his business, or his license is confined within too narrow geographical limits. Either restraint is wrong here, or license is wrong there. I fancy no true sportsman will hesitate long to decide as to which is truly wrong. Like the prodigal, we have been recklessly extravagant with our game, but it is inevitable that total annihilation must ensue, if the influx of young game is not prevented to replace that which is killed during the proper shooting season; nor will it do to ignore the value of our game, and stealthily re-charge the murderous practices, while such outspoken enterprises for its slaughter are afoot. Since becomes criminal in the face of such unwarrantable acts. The Government has a pecuniary, as it should have, a moral interest in this question. Already the Indians are complaining of a scarcity of game, and the moral sense of the community is enflamed to be destroyed by reckless hunters, it will have to be compensated for by provisions of the Government. Every buffalo killed means a barrel of flour or an ox to the Government. Let us hear, then, from all true sportsmen in condemnation of the proposed hunt. There is wide spread intelligence enough in this country to understand this question in all its bearings, and I have no doubt that the moral sense of the community, and all such proposed slaughters will sink into the same disgrace as poisoning or stealing.
Wm. C. Mead.

NEW YORK, December 23, 1874.

EDITOR FOREST AND STREAM:—

In your paper of 17th inst. your correspondent, relative to the "Big Hunt," has my ideas exactly, only he has fired off his gun while I was taking aim. I think he has hit the critter just where he ought to fly. It is simply a big blunder, and should properly be called a "big drake," only equally by Barua's famous Buffalo Hunt, which collapsed over at Hoboken some years ago, as you will probably remember. Bergh ought to take hold of this matter, and prevent such wanton cruelty to the beasts and birds.

I don't want to be personal, but I must say that I think the Colonel is "looney" on this matter. Why, the programme is thushly as Barua's "Blue Beard," and is an atrocity which should make every genuine sportsman go on guard to protect their game from such wanton destruction. I was somewhat surprised to find that you could even treat the matter with forbearance. I expected you would go off like a fired cannon, and rip the projectile to tatters. You certainly esoot, on reflection, think it otherwise than an atrocious blunder. I say atrocious, because such wholesale, purposeless slaughter certainly entitles it to that epithet. A man who would do such "murder of the innocent," should never be permitted to handle anything worse than a "putty blower." He should be kicked if he hit anything with that. Indignantly yours, C. H. COLE.

Per contra, we have several letters of endorsement, among which is the following from OLD SCOUT, a correspondent with whom our readers are familiar:—

NEW ROCHELLE, N. Y., January 11th, 1875.

EDITOR FOREST AND STREAM:—

A gentleman upon my recent rides me as follows:—"A sportsman would tell the sports to the Big Hunt that they have license to kill as much game in Texas as they can, and I am almost induced to offer a premium for every antelope they kill, but am too poor. But it will not be well for Texas to have those Englishmen see our good lands and loving herds. You know they go heavy on beef, and we have plenty for all. Come on! Suppose you come down with them. I am not afraid that Texas will hold her own with any country they see, California not excepted."

A Dallas paper also says welcome. I guarantee the sports a heavy welcome in Texas, and may join them in this "promised land."
OLD SCOUT.

THE DESTROYED MAILS.—

The mails destroyed on the Baltimore and Potomac Railroad last week, included mails of the following dates and cities: New Orleans, evening of the 4th instant and morning of the 5th; Charleston, S. C., 5th; Wilmington, N. C., 6th; Nashville 5th; Richmond, Va., 7th; Savannah 6th; Galveston 4th, and Memphis 5th. Such of our correspondents as may find us seemingly derelict, can readily divine the cause if their favors were sent by any of the mails named above.

"When the question of the price of the gun is settled by him, the question of the simplicity and durability of the movement, between guns of the same price, will come next to be settled.

"On the question of price, I have some very decided opinions. To my mind, there should be something more to a sportsman in his gun than a mere tool wherewith he works. It should be something higher to him than a mere matter of wood and iron. There should be an element of fine art in it. A fine gun is the work of an artist. It is a fine picture to him who can trace the lines of beauty in its graceful swell, and appreciate the delicate taste displayed in its unobtrusive ornament.

"Sportsmen, and particularly American sportsmen, as a class, should reflect that the nearer to art they raise all things connected with their sport, the more they ennoble themselves and enhance their pleasure.

"Believing this firmly, as I do, I have a work of earnest, advice to the shooter starting on his career. Even as old Polonus advised his son, as to the purchase of his dress, so do I advise the sportsman as to the purchase of his gun; 'Let it be costly as thy purse can buy.'

"I do not say this to encourage a lavish waste of money, but as I would to encourage any of the refinements of civilized life.

"The man of limited means, however, can not indulge in high figures. He must take an article within his reach. Very often the unavoidable expenses of his sport make sad havoc with his small resources, and to hold him to a high priced gun would be to debar him altogether from the field.

"The cheap guns only are within the reach of a majority of buyers in America. But because they are cheap, that is no reason why they should be worthless; and no reason why the buyer should be cheated, as he constantly is.—
From "Glean's" work on Guns.

VARIETY OF TARGETS.—

We have received a communication from a very valued correspondent, and an authority on rifle practice, on the new system of targets adopted in various portions of the country, but especially those used by the American Rifle Club of Mount Vernon. We thoroughly agree with his premises, that one general system of targets should be used throughout the Union, in order that we may have some means of determining the accuracy of the shooting of the different clubs and noting their progress when compared with the Creedmoor practice. If each club has its own system of marking, we can make no satisfactory deductions of its marksmanship; hence, under present conditions, it would be best for all to adopt the Creedmoor style of targets, as they are cheap, simple, and easily managed.

The introduction of the Wimbledon targets into this country is impolitic, owing to their cumbersome and intricate character, their expensiveness, and our want of trained markers. In England the latter are members of the regular army, and are placed under the strictest discipline, so that any wrong act or violation of duty can be promptly punished. These conditions being wanting here, every club should adopt the Creedmoor rules, in order to avoid confusion and to secure unity and simplicity.

A MATTER FOR EMULATION.—

We to-day had the pleasure of looking over a fine lot of live western quail (200) en route per Adams Express for Towanda, Pa. They are in answer to a philanthropic order of A. E. Chamberlin. The birds have been selected with unusual care in regard to health and hardiness, and the proper proportion for breeding purposes. Mr. C. proposes to turn them out in the vicinity mentioned about the 10th of February, in time for them to take advantage of St. Valentine's day. And he hopes to have a numerous progeny as the result when his friends come to see him in the Fall.

How many sportsmen are there in that neighborhood who will properly appreciate this generous effort of our friend to advance the interest of the fraternity?

POULTRY EXHIBITION.—

The last week has been devoted to the second annual exhibition of the New York Poultry Association, at Utica. A good effort was made to get up a bench show of dogs. We acknowledge the receipt of a complimentary ticket to attend the exhibition.

THE "ANIMAL KINGDOM."—

This journal, which is doing so much to foster a love of the animal world, and to suppress all species of cruelty exercised toward our dumb slaves of the brute creation, is, we are glad to know, receiving a liberal support from all lovers of kindness and humanity. Mr. Russell has retired from the paper, and all the work is now done by the editor.

The following shows the number of visitors to Florida during the Winter season for the years named extending from December 1st to May 1st: 4,000 in 1869; 7,000 in 1870; 14,000 in 1871; 20,000 in 1872; 25,000 in 1873. The season, 1874-5, the number is expected to reach 35,000.

But manure, obtained from caves in the West India islands, is on sale at Jacksonville, Fla.

WISCONSIN STATE ASSOCIATION.—We have received the following notice with request to publish it:—

TO THE SPORTSMEN OF WISCONSIN:—The first meeting since its organization, (on the 15th day of August last) of the "Wisconsin Club Association for the Protection of Fish and Game," will be held at the city of Madison on the first Tuesday of February next, being the 24 day of February, 1875. You are earnestly requested to be present at said meeting, as representatives of club, or otherwise, and aid in the perfection and development of our organization.
R. H. STRONG, President.

M. T. BAILEY, Recording Secretary.

The Chatham Inspector of fisheries captured nets, used illegally, last week.

SHARKING.—A correspondent describing the fun to be had at Esperanza, Florida, says that a party went to the beach one day and returned in half an hour with the following details:—

"Two bushels of the finest clams, any number of fat mullets, bass and other fish, a bushel of fat stone-crabs, and any number of fat sea-crabs—small fish in any quantity. Meantime the sea-birds, of every variety, were flying above their heads, and all of the finest on our Southern coast. Some of the party, who had now become weary of such sport, put out a shark line, baited with a mullet, just off the bench of the liner, and within two hundred yards of the vessel. In fifteen minutes, they had a large shark, whose liver it was computed by some of the fishermen present would yield fifteen gallons of oil. Again the line was baited, but this time with shark instead of mullet. By the time the boat, which carried out the line, could return to the beach the line "surged" again, and another monster was hauled up, floundering, jerking, and otherwise affording sport to the captors. Each of these were dispatched, when hauled up, with a rifle. Thus the sport continued, a large shark hauled up about every fifteen minutes, and it is computed that the number actually caught would have yielded, by simply boiling the livers on the spot, about eighty gallons of oil, worth from seventy-five cents to one dollar a gallon.

It is probable that from the 1st of June to the 1st of November, each year, sharks could be caught each day to yield at least one hundred gallons of oil. The apparatus for boiling which could be constructed on the spot, and the oil transferred to barrels, without the need even of a shed, except for the comfort of the operators. The fishermen think that sharks can be captured the whole year round."

QUEER FISHING.

DANVERSPORT, MASS., December 29, 1874.

EDITOR FOREST AND STREAM:—

I have been somewhat amused by the novel way in which flounders are taken along our shores for ten or twelve days at this season of the year. The fishermen procure three taken at a single net. A piece of rod flannel tied to the meshes near the bottom, the other with a pole, on the end of which a strip of the same material is fastened. One holds the net on the bottom, where it can be seen, while the other draws his strip of flannel slowly over the bottom towards the net, and the flounders, eagerly following, are quickly dipped up. In this way large numbers are taken. I have seen three taken at a single net. Will some of your generous correspondents give the reason why these silly fish are so easily enticed by the rod flannel at this time only? A. F. G.

ACKNOWLEDGMENT.

STUDIO, 41 TREMONT ST., BOSTON, January 6th, 1875.

MY DEAR HALLOCK:—

The FOREST AND STREAM has overwhelmed me. I am more than delighted with the history of that season. You are the only person who seems to comprehend what I tried to do in the painting of those pictures. I had really begun to think I failed to express what I felt; but your sympathetic brain has proven that I did at least suggest something near what I tried to put upon canvas. I am indebted for the encouragement it gives me to know that there are some people who can understand. I have gratefully read the sketch of my net, and will some of your generous correspondents give the reason why these silly fish are so easily enticed by the rod flannel at this time only? A. F. G.

Yachting and Boating.

All communications from Secretaries and Friends should be mailed no later than Monday in each week.

The Friendship Boat Club has elected the following officers for the ensuing year: President, James F. Daly; Vice President, J. O'Carroll; Corresponding Secretary, William Dittmar, Jr.; Recording Secretary, Albert Saner; Treasurer, M. J. Murray; Captain, W. J. Huntley; Delegates to Aquatic Convention, J. S. Murray, J. McCartney, J. L. McCahill.

A new boat club has been organized in Hoboken, with Charles Kahn as President, Benjamin Baptiste, Jr., as Treasurer, and Charles Buck as Secretary.

The rowing Association of American Colleges held a special meeting at the Allen House, Hartford, Ct., Jan. 13, at 10 A. M.

The Executive Committee of the National Association of Amateur Orsman held a meeting at the Astor House, this city, January 2. The resignation of Mr. Pinkerton as Secretary was accepted, and Henry W. Garfield of the Mutual Club of Albany, N. Y., was elected to fill the vacancy. It was decided to hold the next annual regatta on the same water as last year, Troy, N. Y.

The Schuylkill Navy held their annual meeting January 14, when the following officers were chosen: Commodore, Jas. M. Ferguson; Vice Commodore, John Hockley, Jr.; Secretary, Jonathan Gillingham; Treasurer, Frank W. Murphy; official log-keeper, W. R. Tucker.

At the annual meeting of the Madison Yacht Club held on the 6th inst., the following officers were elected for the ensuing year: Commodore Chas. G. Mayers; Vice Commodore, John Gallagher; Recording Secretary, Julius Zehner; Corresponding Secretary, James E. Fisher; Treasurer, Henry Purvell; Secretary, Geo. A. Patterson; Stevard, Amos Packer; Regatta Committee, Wm. G. Pittman, Sidney Poote, Rufus B. Smith; Club House Committee, M. T. Bailly, John Coscott, Phil. Dunning. The club is in a flourishing condition, and promises good sport the coming season. Several new boats will be added to the fleet.

LYNN YACHT CLUB.—The following are the officers elected at the annual meeting of the Lynn Yacht Club: Commodore, C. La. Babb; Vice Commodore, C. S. Purinton; Fleet Commander, G. H. Clifford; Secretary, W. E. Neal; Treasurer, Henry W. Marks; Measurer, J. M. Taylor; Trustees, S. J. Roney, Q. A. Townes, S. T. Downs; Regatta Committee, E. C. Neal, G. F. Thorndike, Frank L. Earl, F. U. Hay and C. H. Clifford.

—Robert Bagnall and Thomas Wisnup tried their mettle against W. Lumsden and R. W. Boyd in a pair-oared race in England December 21st. The latter were the winners, owing to a certain extent to the action of a steamer that nearly ran down the former. Time of race 24m. 25s.

—To all who know anything about ocean sailing, the advantage of the southern passage across the Atlantic will be patent, while if any doubts are entertained on the question, perhaps a fact which last winter supplied would set them at rest. Some twenty or more ships left England at the same time for an American port. One of the ships, the *Huguenot*, being in ballast and somewhat poorly manned, made the southern passage and experienced pleasant weather, and beat all the other vessels, which had been detained by the severe gales of the higher parallels of latitude. —*Hulligan Reporter.*

YACHTING IN FLORIDA—NO. 2.

OUR third day on the little stream found us among the prairies that lie on either side of the river below Lake Monroe. They were low plains with groups of trees like hickories and oaks, and a few cypresses, defining the curves and retracings of the idle river, reminding us of the pictures of eastern scenes of desert and palms. Herds of half wild cattle were seen upon them, and sometimes a wild turkey would seek cover, not by light, but by running like the wind. A little back from the river on wet places out of rifle range were groups of white herons, the most stately and beautiful of birds, and great flocks of large cranes, with long white necks, and long legs, and their huge black and white wings, and seek quiet further apart from the river. No bird is so showy and conspicuous as the egret, and it was long our ambition to get one for the plumage, but they were very wary, and only settled down in wet places remote from any cover of trees or brush. Fortune, however, at last did better for me than patience and perseverance, (patience any imputation in favor of the fickle goddess) for while waiting in a boat, a stroke alarmed by a steamer, came laboring over the river, urging their way with powerful pinions against a gale of wind. "They saw us, and tried to steer clear by turning their course several points into the wind, but they made too much leeway to save their distance, and one fellow came down before my gun, and sent up a cloud of spray from the river in his fall.

"Get 'um quick" exclaimed old July, my faithful boatman, as the alligator may carry him down, and get 'um quick we did, bringing in as magnificent a mass of green, black and white plumage as nature ever adorned a bird wild, arousing some speculations as to what a great economy would result, and what a vast amount of envious and toilsome strife and ambition would be saved, had poor bare humanity been as comfortably and superbly clothed, without the toil of the needle, or the costly fabrics of fashion. These reflections did not impress July, who at once explained his "get 'um quick" counsel as inspired by an experience that had impressed him very deeply. A gentleman hunting from Enterprise shot a duck which fell in the water. As he was about taking it in, a large gator appropriated the bird. The gentleman in turn gave the beast a peppering of shot for his sake, enraging him, without any serious injury; when he turned on the boat and took out a piece of the side, mangle and all, so dangerous that it they only made their way home in it by careening the broken side high out of water. These ill-mannered fellows often deprive the hunter of game that falls in the water, and the foregoing incident teaches the imprudence of irritating them with shot.

The fishing about the outlet of Lake Monroe is very good, but gar and catfish play the mischief with trolling gear, and carry away spoils most annoying. Bass are the best fish obtained, here known as trout by those who cannot even imagine the rapid mountain streams wherein our northern beauties seize our dainty flies.

In one of the eddying pools I took bass so rapidly that in less than half an hour the bottom of the skiff was alive with them, which to avoid waste were given to the steward of a steamboat, and abundantly supplied the table for a hungry crew.

In the springtime the herons assume, to adorn their season of love-making, a plumage of remarkable beauty. It commences at the base of the neck, and extending backward between and over the wings, the long airy plumes of dainty feathery sprays hang down gracefully behind the bird, and give a very stylish addition, a *be* "pamier," to a bird that never saw a fashion plate, and has no trouble with its hairdresser.

To obtain these exquisite decorations for the race so sadly neglected by nature in regard to the adornments so lavishly on the inferior creations, these "angel birds" are assiduously hunted, and are consequently so wild that only by strategy can they be shot on any of the borders of the river.

From our deck we noticed that numbers of blue, white and lesser herons alighted and constantly perched upon the trees standing at the end of a shallow water way that extended from the river into the prairie; so with the hope of gaining some shots, we ordered a halt. The steamer was tied to a tree, and we launched a skiff and paddled through the water lilies or "bonnets" (as the huge leaves are called), starting flocks of duck, rail and birds, and disturbing the stasias of numerous alligators and turtles. The only shelter was afforded by the trees, and we were obliged to hide ourselves as well as we could, draping our hats with Spanish moss, and disposing it about, for concealment.

After a time all the turmoil we had caused ceased. The ducks came one by one, and dodged about under the reeds and lily leaves, while inquisitive blackbirds flitted near with impertinent airs, and changed our ideas of concealment with unbounded slang. An alligator that had been seen swimming in the water, and which we had been told a ripple, and eyed us with long curiosity as interlopers, and drifted almost against the boat; but we were after herons, and would only shoot them, after the manner of the western man, who "when he went a catin' went a catin'," and would not accept a bass or pike in lieu of the wide-mouthed bullhead. Animal life was abundant all about, with little evidence of fear, and, watching it, we were able to realize how deadly and aggressive such creatures as Audubon realized in thus studying birds and animals when free in their own haunts.

Nothing seemed aware of us but the herons. They came from remote points, and seemed about to perch on the old trees, where so many were seen, but swept by and went on to other retreats. It was hardly possible for them to discover us, and we could not divine any cause for their wary

movements unless they were warned by the angry scolding of the blackbirds that hovered about with incessant sharp cries. A shot or two reduced these pests to comparative silence, when a blue heron sailed up, poised for a moment on a bare limb, and then fell lifeless into the pool below.

Hoping for other shots we did not gather it in, but it was not long before an alligator slowly swam toward the dead bird, and would probably have carried it away, but for the arrival of a Mead explosive ball in his head, he turned the water for a moment like a propeller wheel, and then sought the bottom to die among the weeds, and again all was quiet. But we waited in vain; herons sailed about over the marshes, but none came near, until weary and snubbed we pulled back to the yacht, glad to get chert and ice.

Our plan was to go above Lake Monroe, but the water was too low on the bar, and our boat could not get over. We visited Mellenville, where shade were being taken in enormous quantities; and then anchored abreast the site of the old Enterprise wharf, and landed, to visit once more, after several years absence, the Blue Spring, thence which none can be more beautiful. It has been often described, but it is not easy to convey an idea of the deep opaque tint of the water, nor of the peculiar effect of the round pool, and its overhanging shade of live oaks, cypresses, and vines. It is about eighty feet in diameter, and very deep. There is no motion to the blue water, but a large stream flows away from it, showing the volume of the spring. The water leaves traces of white sulphur along the brook, which falls some twenty or thirty feet to the lake, affording a perfect place for running water and shower baths. A small over the stream, and only bathing convenience, but in time this will undoubtedly be developed into one of the most beautiful resorts on the river, and prove one of the most healthful and agreeable.

We remained over night at the Mellenville wharf, and visited some gardens conducted by people of taste and skill, and saw many evidences of the capacity of this soil and climate to produce almost every luxury. Potatoes were cast her glories of golden sunlight, and varied foliage on flourished trees from danger of frost, and beautiful flowers rewarded very little care with profuse bloom. The garden was a small tree in the open air, and the oleander made shade for a party.

Strawberries were ripe while ours were under deep snow, and it was not easy to put faith in the idea that the cold March winds were leaping drifts that would for many a day rest upon the snow that fell in the winter.

Turning northward, we gave our course to the current, and went rapidly on. At times we would fit to a tree, and leaving the yacht, row quietly up some of the small and unfrequented streams that join the river. Here all was as wild as when the Indians pursued game with their stone arrow heads, and took fish with bone spears, and nature seemed to revel in her own power and beauty, and cast her glories of golden sunlight, and varied foliage on every hand. The huge straggling leaves of the palmettos swayed and glistened like shields hiding a woodland host. Cypress trees held their light foliage high against the sky, and graceful vines hung in long curves from them to the dense undergrowth of novel form. Creeping plants held their bloom over the water on dead trunks, and air plants and ferns found resting places on the old oaks, in whose upper branches the white stone with their polished leaves. All this would be double and treble, were the dividing line between the beautiful reality and the most beautiful image below, was so hidden by trailing vines and aquatic plants that the vistas of the narrow streams became dreamy and indistinct as they extended far away into an uncertainty of waving moss and deceptive shadows.

Again we would go on miles in advance of the yacht, and were busily with the stream, often sailing upon our broad backs of the water, and frequently getting a few fish, we could wait until overtaken, the oar skiff behind the steamer, and enter the snug cabin to find shelter, rest, and all the comforts needful. No life could be more enjoyable. We were not confined to a limited district as when in camp, and yet there was the same freedom, and the same opportunities for seeing and sharing wildwood pursuits.

How varied in variety the scenes each hour, and new temptations and anticipations of pleasure, and from one point to another, all with little or no fatigue. This steat yachting must develop as one of the most popular of all indulgences. With our great lakes, connected by safe and navigable routes, and rivers of endless extent and unlimited variety, through which one may wander from the tropics to the far north, and find all climates and all seasons, and all the pleasures of the tropics, and all the temptations for this luxurious life. Whatever opportunity may impel one to wandering, in a yacht all the comforts and conveniences can be carried. The botanist can at leisure and undisturbed, unfold his cases of plants; the artist can sketch and not have to gather up the disorder of camel and studio; the geologist may ballast his craft with stone, and the ethnologist gather relics and form a museum *en route*, for the naturalist and the artist it is perfection. His rods need not be unjointed, or his guns unclean, he can stuff his specimens, load shells, and the dainty flies by a window before which new and varied scenes are passing, and after a hard day's tramping come back to abundant comforts. As yet there are but few of these dainty craft afloat, and few are aware of the charming life they offer.

The fleet and dainty private yacht *Falcon*, on the St. Johns, was pleasant to see, and we were glad to see it, and in time many more will follow in her wake.

Of course there is a good deal of expense inseparable from steam yachting, but very complete launches and small yachts are now put about in perfect trim for hardly any greater cost for purchase or maintenance than is represented by each of hundreds of fine carriages that are to be met with on the fashionable avenues of our great cities, and the same is applicable to the same species of pleasure, and abandoning all ambition for the luxuries of cruising, and seeking only plain and needful arrangements, a small family or a few gentlemen may make summer or winter trips with no more cost than is incurred by hundreds of pleasure parties who find far less of comfort and independence than they would commanding their own yacht and their own movements.

A man of as much skill as is required to make a successful sportsman, can do a great deal in attending to his own boat, so that the cost and annoyance of having two men may be avoided; but unless our inspection laws are made more liberal, he must provide himself and his men with expensive licenses, and be sometimes compelled to take his men from a guild or union commanding needlessly high wages. All this, however, is in course of revision, and

Prize List!

FOREST AND STREAM,

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

Is the OFFICIAL ORGAN of the Fish Culturists' Association of America.

The Publishers of FOREST AND STREAM

In order to stimulate the development of MANLY and ATHLETIC EXERCISES,

AS OP FISHING, SHOOTING, ARCHERY, CRICKET, FOOTBALL, and CROQUET.

Offer the following prizes for clubs of three or more subscribers.

Single Subscription per Annum \$5

Starting Clubs.—Agents, and others interested, are advised that we do not insist upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 60 days will be entitled to same premiums as if all were sent together.

CRICKET.

For \$20.00, four copies, one year, with one best spring bat, one College bat, one Dark cricket ball; price \$25.00.

For \$25.00, five copies, one year, with a complete cricket set; one College bat, one polished hat, Clay-sword; one Dark cricket ball; one set of stumps; price \$35.00.

FOOTBALL.

For \$15.00, three copies, one year, with one Rugby outfit; price \$20.00.

FISHING RODS.

For \$15.00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$20.00.

For \$30.00, twelve copies, one elegant rod; suitable for trout, black bass with fly, or for trolling bass or pickerel; as fine a rod as can be made; German silver tipped, with three tips; price \$35.00.

CROQUET.

For \$20.00, four copies, one year, with very handsome set of croquet; price \$27.00.

For \$25.00, five copies, one year, with superb set of croquet; price \$30.00.

For \$30.00, six copies, one year, with the finest set of croquet made; price \$34.00.

TABLE CROQUET.

For \$10, two copies, one year, with handsome set of Table Croquet, 8 balls and 8 mallets, in wooden box. This game can be played on dining room or other table.

For \$15, three copies, one year, with the handsome set of Table Croquet manufactured, made of cocco.

REMINGTON RIFLE AND SHOT GUN.

For \$75.00, fifteen copies, one year, with one Remington Deer rifle; price \$85.00.

For \$100, twenty copies, one year, with one Target rifle, 35-inch octagonal barrel, to be used for sporting, hunting, or target shooting; price \$100.00.

For \$100, twenty copies, one year, with one Remington double barreled, breech-loading shotgun, one of the best guns ever offered to American sportsmen; price \$125.00.

SHARPE RIFLE.

For \$100, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$100.00.

WARD-BURTON RIFLE.

For \$200, forty copies, one year, with one Ward-Burton rifle magazine gun for large game, price \$90.00.

SINGLE AND DOUBLE BARREL MUZZLE LOADING SHOT GUNS.

For \$30.00, four copies, one year, with one American single barrel gun, perfectly safe, blue barrels, walnut; price \$10.00.

For \$35.00, seven copies, one year, with one American double barrel gun, hand and reliable gun every way; price \$18.00.

For \$50.00, ten copies, one year, with one double barrel live trap gun; a nice gun every way for boys; price \$26.00.

For \$75.00, fifteen copies, one year, with double barrel English laminated steel barrels, handsome finish; price \$15.00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of 25 per cent. will be made on all clubs of three and upwards.

Send Every article is of the finest quality and will be sent free of expense.

Remitting Money.—Checks from New York City banks and bankers are best for large sums; make payable to the order of FOREST AND STREAM, Publishers, 17 CHATHAM STREET, New York. Post Office Money Orders for \$5.00 or less are cheap and safe also. When these are not obtainable, register letters, or bank stamps for postage and registry's put in the money and seal the letter in the presence of the postmaster, and take the receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

HURST'S STEREOSCOPIC VIEWS OF NATURAL HISTORY

For Object Teaching in Schools, AND PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various Animals and Birds in grotesque attitudes, never however violating their natural instincts. We offer these views as so pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The startling reality of the stereoscopic transfers the animals and birds from their natural habitat to the rooms of the student, and the first of our lessons, where they cannot fail to leave a lasting impression of the form, color, habits, and locality of each specimen.

- 1. An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen with its appropriate rocks, woods or water, and coloring from the original.
- 2. Wild Cat, or Bay Lynx..... Lynx Rufus.
- 3. Snowy Owl..... Bubo Nyctala.
- 4. Great Horned Owl..... Bubo Virginianus.
- 5. Wild Pigeon..... Ectopistes Migratoria.
- 6. Northern Partridge..... Falco Concolor.
- 7. American Golden Plover..... Pluvialis Americanus.
- 8. Woodchuck..... Marmota Monax.
- 9. Red Necked Grebe..... Podiceps Rubicollis.
- 10. Great Blue Heron..... Ardea Herodias.
- 11. American Swallow..... Cygnus Americanus.
- 12. Red Shouldered Hawk..... Bubo Hyemalis.
- 13. Great Blue Heron..... Ardea Herodias.
- 14. Wild Fronted Goose..... Anser Albifrons.
- 15. Long Eared Owl..... Otus Americanus.
- 16. American Golden Plover..... Pluvialis Americanus.
- 17. Horned Grebe..... Podiceps Cornutus.
- 18. Golden Eagle..... Aquila Chrysaetos.
- 19. Prairie Warbler..... Dendroica Cerulea.
- 20. Spotted Sand Lark..... Totanus Macularius.
- 21. Marsh Harrier..... Circus Ureyensis.
- 22. American Golden Plover..... Pluvialis Americanus.
- 23. Great Horned Owl..... Bubo Virginianus.
- 24. Great Lion, or Diver..... Colymbus Glauclius.
- 25. American Deer (Albino)..... Cervus Virginianus.
- 26. The American Bittern..... Ardea Minor.
- 27. Old Wife, or Squaw Duck..... Fuligula Glauclialis.
- 28. The Wild Turkey..... Meleagris Gallopavo.
- 29. The Beaver..... Castor Fiber.
- 30. Common American Snipe..... Scolopax Wilsoni.
- 31. The East Breasted Shearwater..... Puffinus Macrurus.
- 32. The Canada Goose..... Anser Canadianus.
- 33. The New York Ermine..... Putorius Vobrovoensis.
- 34. Red Breasted Siskin..... Peucaea Aedon.
- 35. Pinnated Grouse..... Tetrao Canadensis.
- 36. Joe Sand Hill Crane..... Grus Americana.
- 37. American Black Duck..... Anas Boschas.
- 38. Red Tailed Buzzard..... Buteo Borealis.
- 39. Buffle Headed Duck..... Fuligula Albeola.
- 40. North American Partridge..... Tympanuchus Phasianus.
- 41. Virginia Partridge..... Ortyx Virginianus.
- 42. Common American Gull..... Larus Zonophorus.
- 43. Grey Fox..... Urocyon Vulpinus.
- 44. Red Head..... Fuligula Erythrocephala.
- 45. Ruffed Grouse..... Tetrao Umbellus.
- 46. The Tazooon..... Peucaea Aedon.
- 47. The Whistler..... Fuligula Canadensis.
- 48. Brown or Bald Eagle..... Halioetus Locomotilis.
- 49. Red Fox..... Vulpes Vulpes.
- 50. Wood Duck..... Anas Sponsa.
- 51. American Barn Owl..... Scops Falcatriceps.
- 52. Sparrow Grouse..... Tetrao Canadensis.
- 53. Northern Lynx..... Lynx Boroides.
- 54. Black Duck..... Anas Boschas.
- 55. Blue Winged Teal..... Actitis Macularia.
- 56. Little Scaup Owl..... Bubo Asio.
- 57. American Opossum..... Didelphis Virginiana.
- 58. Blue Jay..... Cyanus Americanus.
- 59. Ptarmigan..... Tetrao Albus.
- 60. Shoveler, or Spoonbill..... Anas Cypella.
- 61. Muskrat..... Fiber Zibeticeus.

Prices: By the Dozen, in Elegant Case, \$3.00. Dealers supplied at a liberal discount. Sent by mail, in the original boxes, and parts of sets always on hand.

TESTIMONIALS.

CORNELL UNIVERSITY, ITHACA, MARCH 14th, 1870.

I must congratulate you upon your great success in this new educational enterprise. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education.

WASHINGTON, D. C., March 13th, 1870.

I am much pleased with the success you have met with in giving to the student specimens a very decided appearance of life.

I hope you may be able to continue the Series, and I have no doubt they will furnish interesting means of information and instruction in regard to the wild animals of North America.

SPENCER F. BAIRD.

STATE HOUSE, BOSTON, MASS., MARCH 18th, 1870.

I have examined carefully the "Stereoscopic Studies of Natural History," and judging by the first ten numbers, should say that they will prove of very great value, both as object lessons for students, and as most interesting sets for the parlor. The descriptions, the delineations, position, and color of the objects, and the treatment are most perfect. I cordially recommend them to the public attention, and trust you will meet the recognition which you have earned.

EDWARD A. SAMUEL, Curator of Zoology in Mass. State Cabinet.

PEABODY ACADEMY OF SCIENCE, SALEM, MASS., MARCH 19th, 1870.

I have shown your Stereoscopic views to the Directors of the Academy and the editors of the American Naturalist, Dr. Packard and Mr. Morse.

They concur with me in praising their truthfulness, and the taste which you have displayed in surrounding the specimens with natural objects and scenery of characteristic interest. They are certainly better fitted, not only as parlor and drawing room illustrations, but as educational illustrations for the use of schools and colleges, than anything we have yet seen.

A. HYATT, CORNELL UNIVERSITY, PRESIDENT'S ROOMS, ITHACA, N. Y.

I have received the Stereoscopic Views of objects in Natural History, and have enjoyed them greatly. They have furnished all the amusement and instruction which I desire, both as regards the animals and their surroundings; and I think they can not fail to be of great service to the student, and to the teacher. I trust that your students to it, and next by perfecting them in it.

ANDREW D. WHITE, These Stereoscopes are sold wholesale and retail by FOREST AND STREAM PUB. CO., 17 Chatham St., (City Hall Bldg.) P. O. box 2932.

MISFIT CARPETS.

GOOD SECOND HAND AND MISFIT CARPETS, RICH Patterns, Very Cheap, at the OLD PLACE, 112 FULTON STREET, between William and Nassau. Sent home and laid free of charge.

SCHUYLER, HARTLEY & GRAHAM, 19 Maiden Lane, 20 & 22 John street, N. Y. BREECH LOADING GUNS A SPECIALTY.

We would call the attention of the public to our large assortment of

Breech-Loading Shot Guns, Manufactured by the following celebrated makers: Messrs. W. & C. SCOTT & SONS (winners at the International Gun Trial of 1879); P. WIBLEY & SON, W. W. GREENER, WESTLEY RICHARDS, J. HOLLIS & SONS, and other makers.

A full line of fine PISTOLS and RIFLES CONSTANTLY ON HAND. BLAXNS & HANCKLES'S SHOOTING TACKLE. To insure good shooting from breech-loading Guns, we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS, manufactured by the Union Metallic Cartridge Co., Eastport, Conn. These shells are the cheapest and best in the market, can be easily re-amped with ordinary caps, without the use of the implements necessary in priming all other styles of shells. BUSSEY'S PATENT GYRO PIGEON AND TRAP, WITH CASE, AND 100 BIRDS.

Black's Patent Cartridge Vest. This Vest affords the best arrangement yet in carrying cartridges, so evenly distributed scarcely felt. Cartridges are carried with this vest, which is so light and so easy to wear as when carrying head up the weight of the vest forces the weight of the cartridges forward, so that bad shooting is the result. In ordering send measurement around the chest. Price \$7.50.

AGENTS FOR THE Union Metallic Cartridge Company's Ammunition, WARRANTED THE BEST IN THE MARKET. SEND FOR CIRCULAR.

Sportsmen! Your attention is called GOOD'S OIL TANNED MOCASINS, the best thing ever worn by sportsmen. Not injured by wetting and drying—always soft and easy to the feet and stock in three different styles, and warranted the genuine article, different from anything before offered. TO A FAVORITE DOG—DYING.

BY ONE OF THE CA-NINE MUSES.

"FAREWELL! Farewell! but this I tell
To thee, thou wedding guest,
He prayeth well who loveth well
Both man, and bird and beast.

"He prayeth best who loveth best
All things, both great and small;
For the dear God that loveth us,
He made and loveth all.—Ancient Mariner.

I.
Humble, gentle, suffering creature,
Though unlike in form and feature
To our race,
Nathless to my simple seeming
Thou hast human fondness beaming
In thy face.

II.
Father, mother, child and servant
Sorrow fully stand observant
Of thy pain;
Pitifully strive to heal it
(Almost as thyself they feel it),
But in vain.

III.
Heav'n above us and above thee;
Does the God who loves us love thee?
Who can say?
Close beside us thou dost follow;
Can such sympathy be hollow?
Surely nay.

IV.
Can the law be so unheaven,
To deny all chance of Heaven,
To thy kind?
We had rather much receive it,
Than to coldly dis-believe it—
Thou hast mind.

V.
Can great nature's God unjust be?
Heaven for both there is—there must be
Room for thee
In the fair celestial region;
This at last is my religion;
Come with me.

I. V.

For Forest and Stream.

Three Weeks on the Magnetawan

AT THE BEAVER DAM.—NUMBER THREE.

"DID you ever see any beaver in any of your trips, Frank?" inquired Ned of me one morning after breakfast. "I don't mean dead ones, but a regular nest of 'em that never were meddled with by traps."

"No, but I have often heard of their curious habits and homes," answered I. "There are not many found in the States East of Colorado now, I believe; it must be a queer sight!"

"I don't see a great deal of difference between them and the muskrats you see so many of at nights," rejoined he. "They're bigger, of course, and pay me better, for their fur's worth twenty times that of a rat, but they live like each other nearly, and look the same a little ways off in the water."

"Do you trap many up here?" asked I, for Ned's stories possessed an air of *realness* that was very interesting, and I enjoyed drawing him out.

"Y-as," said he, slowly, as if about to commit himself on the subject. "I get some every year, but I know just where to go, and sort of raises my crop from Spring to Fall, and that saves trouble in gatherin' of it," chuckling to himself; then turning to me, he continued: "If you like, and they'll keep quiet about it down in the settlements as you go out, I'll show you some beaver to-day, and maybe give you a chance at some deers; 'ts a grand place for 'em up there."

"Up where?" demanded I. "I want to see beavers bad enough, but don't care about a ten-mile tramp until to-morrow, for I suppose we'll have to travel through brush and over rocks, as usual, when we leave the bent. How far is it?"

"Now, I expected you'd think itj was a long ways off,"

answered Ned, getting on his feet. "You remember the spring where we drank after chasing the fawn yesterday; he!—he!—(chuckling again)—it makes me laugh to think of that fun, how the little thing did jump. Well, there's a path comes out there that runs back, I guess, near to Nipissing; we'll follow that up and strike the meadow in half an hour, and I'll warrant you'll be glad you went. It lies about three quarters of a mile from Shesheep thataway," pointing northwest.

"Only an hour's time, you think, from camp? Well, suppose we keep quiet until after dinner and go then," said I. "That'll be time enough, won't it?"

"Plenty, plenty," rejoined he. "You won't want to stay more than an hour, but it's as pretty a spot as I know of hereabouts, so we must allow for your wanting to look it all over."

The morning slipped away in idleness, and when dinner was over Ned laid the birch in the water, and putting in the axe, called to me to come.

Heading our boat up and across the lake we soon reached the spring, and then lifting the canoe out, laying it bottom up on the bank, we took our guns and prepared for our walk through what I afterward found to be the densest growth of brush I ever saw. Ned started in first, and being delayed by trying the string of my moose skin, he was hid from sight. Before I could follow back he came, however, before I was ready, and pitching the axe on the ground near me, blurted out:—

"Dang the thing in the brush, anyhow! 'I'll leave it with the boat, I guess, after all."

"What's the trouble now," asked I. "You'll want it to cut up that deer I'm going to kill, and it won't do to be without the axe."

"Well, I shan't lug it along," rejoined he smartly. "I slipped up just now in there and near sat down right on the edge; I guess we shan't want it after all, and its unhandy with my gun to carry through such a thicket; if you're ready, suppose we go!"

"Heave ahead, then," said I, laughing, "and look out for my eyes with the branches."

Plunging into the thick undergrowth that skirted the shore I followed behind in his search for the old path—what do I say? Path! There was no path! About every ten rods, if you looked sharp, you might have seen an old blaze on a tree on either hand, or else a small one cut off entirely, forming a stake, but the cuts were made so long ago that the moss nearly covered them, or they had become black with age and discolored sap. Old windfalls without leaves, and new ones with thick branches and foliage lay across the path; large rocks stood in the middle of it, and old broken stumps around it. Looking ahead you could not trace its direction, while the soil underfoot was unbroken, save by the occasional track of some animal. Twice we were bewildered completely, and then I would sit down and let Ned skirmish around to find the sign, starting again at his call, from some unexpected quarter, for me to follow. We were fully one hour getting over that three quarter mile, and I was beginning to consider the whole thing a delusion, when Ned, who was in advance, suddenly made a frantic grab at some bushes with his un-employed hand and simultaneously slid into a small muddy hole concealed by dead leaves and moss.

"Now," growled he, drawing his leg out of mud nearly to the knee, "I've found it at last, I reckon. I thought it wasn't far away; see there," pointing off in the brush. "Them pools are made by the outlet of the dam, and it 'aint more than thirty rods off. I'm all right now, but look out you don't slide in when you come over," so saying, he scamped off the mud and picked his way across, followed by me.

A few minutes struggle with the branches and I could see an opening in the leaves ahead, and knew we were near the meadow.

"Whist!" said Ned, in an undertone, as I stopped near him. "If we go still we may see some beavers on the dam and mabbe a deer in the grass; look out for the small sticks, and if you shoot, remember me ahead."

Creeping cautiously along we were soon at the edge of the opening, and what a picture it was! Right before me was erected such a perfect dam across the small sluggish stream that I mechanically looked for the homes of the men who had built it, but saw nothing except the tall green grass of the meadow, through which the stream crept, on its way to the lake we had left coming from the one whose blue water I could catch glimpses of nearly half a mile away. At the lower end of the opening, where we were crouching, the beavers had erected the dam, twenty feet or more in width. The stream thus interrupted flowed back, forming a pool, as near as I could judge, about forty feet long, and at the deepest not over four feet. It was clear of all grass, except at the upper and shallower end, where the current came in, which was so slow as to cause no perceptible motion; the only noise was the dropping of the overflowing water below the dam, which formed the succession of pools into one of which Ned had put his foot when coming up. I looked everywhere for the animals themselves, but could see, to my regret, neither any beaver, or what surprised me more, any houses. Fresh green stalks were floating, showing recent work on their part, and I noticed discoloration in the water, but no life. Disappointed, I turned to Ned for an explanation, and saw him scanning the upper verdant part and the bed of the little stream; in a moment he "bobbed" down, and with the motion, I saw a disturbance in the grass at that cut, and was gratified to see an animal resembling an overgrown muskrat, in all that I could observe, sink into the water and swim directly towards us, showing only his head, but leaving a "wake" behind from his flat "rudder." Just as I was certain of a good square sight at him, without any seeming alarm from us—for I, for one, was verily holding my breath—he sank like a stone, so silently that he seemed to melt from our sight. Expecting his re-appearance every second, I never moved, when, to my horror, Ned arose from his stooping position and deliberately commenced to cross on the dam.

"Hold on," called I. "We'll scare them all if we show out, so let's wait a little."

"No use now," answered he: "There 'aint many around, and you'll only waste time. I want to show you the dam and then go on to the lake beyond; see there!" pointing downward, "aint that curious work to do with teeth and tails; see how they've cut down trees from each side for a brace and then dragged the smaller ones over. I've built many a corner for n cabin myself, but never see logs lay better than them. The limbs are gnawed off close, and see how the water has sucked the trash and mud between the chinks. They're about as cute things as ever I see; there you can see how its been slapped down and dried, and how little water leaks out. I should like to see them at work some time."

"What became of that fellow that went down just now?" asked I. "I don't see any houses or place for him to hide, and he's been under now over five minutes."

"He's safe enough somewhere," replied Ned. "They stay under like a frog, but he's heard us, I guess, and swum back up among the weeds, or in some place under the dam; its curious how they stand it, but they breathe somehow. I heard 'Lame Joe' down in Maquabeec's camp tell how he saw a moose stay under once long enough, he said, to drown him; he waited until he came out and then lost him, but I think he was lying, for he said, 'dear hoir,' and I guess 'twant twenty minutes, after all."

"Moose here!" exclaimed I; "that's news to me!"

"'Twant near here," rejoined he; "there's no moose short of the Nipissing line; Joe's tribe come from up there."

"How long has this colouy been in here?" inquired I. "I don't see any houses."

"They'll be up before Fall," answered Ned. "I was traveling through here near May, I think, or last of April, and I see the dam was just begun, so I kept quiet, and mean to get all the fur myself next year if John don't find it, but he won't leave his canoe unless he has to, so I'm safe enough, I guess. I know of some more down near Onite that's a bigger family than this."

Crossing over on the dam, we examined the tracks on the edge and then sat down to rest and speculate on the wisdom of the creatures in thus artificially preparing a retreat from their foes. I cannot remember their exact expressions in regard to the wisdom of the hunters before us, but he interested me exceedingly by his quaint ideas as to the wonderful instinct displayed by animals that, to use his expression, "seemed to reason like a man." The squirrels with their Winter's store of food, the duck or partridge leading him away from her young; the dumb language in the expression of his dog's eye at certain times, and the cunning of the creatures he trapped, were all commented upon, and though my own mind differed, it made me feel and know more distinctly that influence upon brute and man, to the source of which there is but one path and no return, yet I could not but let his shrewd questions and statements remain unanswered, for his simple metaphysics were even stronger than mine.

"Suppose we cut across the meadow and take a peep at you lake," said he, rising; "it's a pretty piece of water as we have hereabouts; be ready with your gun as we go up the creek—(using a Yankee word)—if there's any deer they'll jump away mighty quick."

The grass in some spots reached to my waist, and as we picked our way across the little hummocks, I looked more to where I was to take my next step than along the sedgy stream.

"Ah!" exclaimed Ned, under his breath, as there was a rustle in the grass, "stopping down, bowed his head nearly to his knees, 'shoot quick' (to me), but before I could get my rifle into any kind of aim, into plain view came a noble buck that, without a halt, leaped gracefully away over logs and ground to the shelter of the alder brush beyond. As he reached the cover I heard the shrill whistle from Ned's fingers in his mouth and instantly the deer stopped, and I could just see the red patch of hide among the leaves; the deer was no more, and I was advanced, and Ned would try to get me, but for my own safety, and I expected his rifle was raised to his cheek, and with the light crack that a Ballard makes, the spot vanished, as I thought, unalarmed. Sliding in a cartridge Ned sprang across the brook, alighting in a foot of water, and called to me to follow.

"What's the use?" cried I. "The deer's gone."

"Why, sir," answered he, "that fellow's so dead he never moves; and let's look at him."

Returning to the dam, I crossed again, and following the line of his shot, found the deer doubled up under the bush, having literally dropped in his tracks; there was the small hole back of the shoulder, from which blood was oozing in drops, and the beautiful object that five minutes before was full of life was now lying with glazing eye and protruding tongue—dead. How quiet the creature had been!

"Will you believe me now?" laughed Ned, drawing his knife over the deer's throat and turning the head down. "You kin see he never turned round by the track; that blood's too thick for that; one, two, three—(counting)—four spikes, and look how his hoofs are worn; this meat won't be very tender, Frank; he's been run too hard by something or other; it's an old deer, for all of his spikes. Lay still there now till we come back from the lake, old man, and then we'll cut you."

"How about the axe, now?" said I. "You were to bring that and let me kill the deer, and you've done neither, but if you hadn't shot he'd been running yet, I think; let's go on."

We were soon out of grass and among the tall pines that skirted the shore of the lake; the ground was covered with quantities of "sawdust" that made it very slippery, and was so soft from the wash that it seemed like walking on mud; the water lapped the beach softly, uniting with the low hum of the pines in one of nature's best duets, praising her own charms. The air was cooler there in the shade and laden with delightful fragrance, for the day had been warm and still. How wild everything seemed, and yet how natural! A pair of loons were floating, within easy shot, as unconscious of my presence as wooden decoys would have been. No danger of a Yankee word seemed to me, and I discovered and I had the picture to myself. At the upper end, where the pads and weeds grew, I was not surprised to see another deer wading, nibbling here and there, and solemn raising his head. It seemed perfectly in keeping with the place for him to be there, and it wanted only an Indian in his canoe to complete a picture I had seen years ago in my book at school representing the wilderness, drawn from the artist's imagination, and which I had thought existed there alone, but here it was before me!

"Aint it a pretty pond?" said Ned, coming up behind. "Very few have been here, and it's a grand place for deer; see you're one in the water, and likely there's more round the point; mind the loons here to the left, and see the flappers in the cove across," pointing to some young ducks. "If you want that deer you can get him as he comes around, but you must go now."

"See here, Ned," said I, "I'm not going to lug more than a quarter of that venison we've got already, through that confounded brush back to Shesheep, and you can't carry more than two, so what's the use of killing another; let's start him up and let him run, it'll be one more for next year."

"Just as you say," replied he. "I never like to kill more than I want, but you never miss him next Summer. I supposed you'd like to kill him anyway, but let's go back and dress him."

Back we went to where the buck lay, and together dragged him to a limb strong enough to bear his weight. Cutting some inner bark of a young cedar, Ned twisted a strong rope, and passing one end through his "gambrels," we knotted it and hoisted him up through the downward. I rested my gun against the trunk of a tree, and Ned, after he had dropped down on some moss near by to rest, for my walk had tired me and the day had been very warm; the air was laden with the incense of the forest and made one feel disinclined towards exertion of any kind, so I lay on my back with half shut eyes watching the trees and running over in my mind the events of the day.

Since I first took to the woods, years ago, when a boy, I had delighted to examine the lives of their diversified characters respect what we see in our own human lives every day, and the simile never seems unnatural to me. Whoever is reading this has no doubt often stood as I have done, close to the trunk of some giant of the forest, and looking upward has seen its hundred arms stretch in every direction to catch the sunlight and the rain that will feed and give life the sap, the stuff of its life to strengthen and warm it for the winter, and then would have seen the cat paws from the massive trunk to the topmost little spray, and yet

it has been scientifically proved that trees grow as some men die—from the top downward! Did you ever read the lover's story in Tennyson's "Talking Oak," without feeling how little it was removed from reality? When you are deep in the woods on some of your excursions have you ever thought of those expressive lines of our own Longfellow?—

"This is the forest primeval, the murmuring pines and the hemlocks,
Bearded with moss—stead green indistinct in the twilight,
Stand like Druids of old with a solemn and prophetic
And mysterious aspect, that rest on the soul as the bosom."

Ned has not finished the deer yet. Let us go a little further. Longfellow's name brings up to us the most beautiful story, taken in all, of our American continent. What—"Evangeline" In a country, almost on a parallel with our camp on Shesheep was her home before the exile began. She grew up there the pride of Grand Pré, and just before the world was bright and full of promise to her, persecution came, and the agony of her life began. Her father is at rest, with the sea nearly covering his grave, and with the affection that "hoped and endured, and was patient" to keep her heart from breaking, she wanders on her fruitless search for the lover she never saw again until the plague was taking his life away, and her's was very near his end. She must have passed near this spot in her flight, for many say that Gabrielle had become a "bour-de-Bois," and we will imagine she came here on her search. How these old trees must have grieved to have seen the streaks of gray on the yet youthful forehead, for what could have been a sadder sight! She has been away up in the Michigan forests and found nothing but the ruins of the hunting lodge, and with utter despair in her heart is now striving to find rest under the veil of the Church in Piedmont. We miss the birds with their songs and the beauties of the earth and sky but mockery to her with her sorrow, and the goodness of all things bitterness to her heart? Your spirits and mine, friend, are burdened with little care in the wilderness, and it is well that it is so, for there are few places that a person wishes less to be in when bowed with care and grief than in the shadow of these great trees. You and I might have been tempted by the God and the man, we miss of her own desires have fallen from her eyes, and with the resignation that we learned in her childhood from Father Polician, she is going where she can find rest in alleviating the sufferings of others that she can understand so well.

Her wanderings o'er land and water are over, and she is waiting for the release that is unconsciously so near. Rene Leblanc is dead, and with him all the friends of her youth, and if at all remembered, but as a dream. What a kind of feeling is in that cry of anguish and hope, "I clasp the dying man when it can bring to his last hour the vision of his early days with her in old Acadia, and peace to her eventful life!"

The trees in the spacious yard of the hospital at Fourth and Spruce were whispering and nodding to each other this Summer the same as when that cry went out, and I never pass the spot without stopping for a moment to look on the few that still stand and think of the changes that then. They are older and stouter, and have kept their places in the city, as perfect specimens as their fellows that were whispering above me when I lay resting near the Beaver Dam.

Evangeline's story is but the imagination of a gifted man, but in how many ways it can be applied to our advantage. Some can see nothing but little things, while others see beauty and thought even in a single leaf; but there is nothing more interesting to me in the study of the book of nature than the wonderful free forms. From the slender delicate sprout a foot high, in the immense oak or pine. I wonder how they will look centuries hence if undisturbed!

"You take the shoulders and go first; I'll follow with the quarters," called Ned, bringing me to my feet. "You'll have to leave the rest unless I come back, which 'aint likely. Go easy, and mind you hold your gun steady. It'll be heavy walking back."

"I should say so, my friend," rejoined I, remembering our coming in, and now I had twenty-five pounds or more additional. The lake was reached in safety, except that I fell once, bringing the shoulders down on my own head and a few minutes later Ned had shot me, and with the venison stowed and skinning "campward" in our boat, I felt better for the sights of the day, and was amply rewarded for all toil by my experience at the Beaver Dam.

MUSIC

For Forest and Stream.

HUNTING IN ALABAMA.

SEEING in one of the late numbers of FOREST AND STREAM that attention is being drawn to the wilderness regions of Alabama, and as I have lately returned from the above mentioned locality, I have thought that a few jottings on the subject might prove interesting and useful to sportsmen at large, and to those in particular who contemplate hunting in Alabama during the present Winter.

Choctaw county, Alabama, lies between the Tombigbee River and the Mississippi line. The famous Sumpter county lies just north of it, Washington county to the west, and the counties of Wilcox, Wilcox, and the other side of the Tombigbee River, and these counties are equally wild and as sparsely settled as Choctaw. The lower edge of the county is about eighty miles north of Mobile, as the crow flies. The county town is Butler, which lies a little to the north and east of the centre of the county. The nearest railroad and telegraph station is at York, Sumpter county, Alabama, distant thirty-eight miles. There are several other towns of very moderate size in Choctaw county, the principal of which are Bladon Springs, Mount Sterling, and Tompkinsville.

The routes most favorable for getting into this county are from the North and East, *viz* Montgomery, Alabama, where you take the Western Alabama Railroad to Selma; change cars there, taking the Alabama Central to Demopolis, or, if it be not there, to York, Alabama, and then you can be hired to carry you through the woods and swamps and over the hills to Butler. If the boat be at Demopolis, stop there, and go down the river (Tombigbee) to Tuskolohoma, where a conveyance can be procured to carry you to Mount Sterling or Butler, the former distant four, and the latter eight miles.

From the west you go to Meridian, Mississippi, which is forty miles from Butler, and you can take the cars thence to Butler, Alabama, or hire a carriage and drive over to Butler.

The most pleasant way is from the South. Go to Mobile, and there take the boat up the river "Bigbee," as they call it, to Bladon Springs Landing (Bladon itself is four miles from the river; conveyance thither from the landing can always be procured from Mr. Heron, who owns the warehouse there and keeps the landing), or on to Tuskolohoma, as before. At Tuskolohoma, Mr. Henry Galnes, the proprietor, will give you every information and afford every facility to the visitor.

If you stop at Bladon, that staunch sportsman and magnificent shot, Mr. James T. Staples, will be sure to show the sportsman plenty of game, and take pleasure in making his stay agreeable. I must not, however, forget my friend, Dr. J. S. Evans, late County and Probate Judge of Bladon, a fine old veteran sportsman likes the music of the hounds as well as the music of the strings. A strike upon the favorite double barrel and buckshot, the Doctor can, with his glasses on, drop a buck as neatly as most of his neighbors. The visitor will find him a cordial, warm-hearted gentleman, who will do all he can to make his sojourn agreeable and profitable.

At Bladon there is a hotel, said to be a good one, for Bladon is a favorite resort for the pleasure seekers of New Orleans and Mobile, its mineral springs being famous for rheumatism and other ills that flesh is heir to. I believe Bladon boasts the only hotel in the county. If the visitor goes to Butler he will have to depend upon the kindness of the people. There are some who keep what is called "a house of entertainment," where the traveler can obtain food and lodging. But with the exception of Mr. S. H. Butler, there is no one who keeps a string course. A few days the sportsman will probably be taken in hand by the members of the Hound Dog Club, all of whom are gentlemen as well as sportsmen, and will take the pains and have pleasure in making the stranger comfortable. The most prominent of these gentlemen are Mr. Wm. Caruthan, Dr. Britting, Dr. Mills, and Mr. Yeatman, the editor of the Choctaw Herald.

Speaking of the Hound Dog Club, I must give the origin of the title, for there is no actual club in existence at Butler, though some dozen or so of the gentlemen have a cabin at "Bucksport," some seven miles from Butler, where they camp but every few weeks during the season.

It seems that a certain Methodist brother—a good man, and very zealous, but somewhat indiscreet—once took occasion to say that he had spent in feeding worthless hound dogs of the neighborhood, considerable money in a church, that both the pastor and the building would be kept in better trim. Now as the gentlemen who owned hounds were the very ones who had contributed all, or nearly so, of the funds which had actually been paid in, they felt hurt. Of course, they said nothing; but the church has come to a stand still for lack of means, for their worship is elsewhere. They finally became ruder as a jest, and one of the parties proposed that they should hereafter be known as the Hound Dog Club, and it has been so ever since. Every sporting visitor becomes a member, by courtesy. There are no fees, no officers; only members, and they will all welcome any gentleman who goes there to hunt.

My welcome to Butler was not so pleasant as I have depicted above. On the 21st of September, I had engaged a cavalcade of some forty soldiers and half a dozen teams, I arrived in Butler about eleven o'clock P. M. We had had a very hard march, for the roads were bad and the men had to push every wagon up each hill, and by the time we had made thirty miles all hands were pretty well used up, and my men were so tired out that they would not even build a fire to make themselves some coffee.

Just as I arrived, I saw some dozen or more nicely dressed ladies, each one neatly escorted by a cavalier, wending their way homeward from a dance "at the academy," and the clear, sweet laughter of the ladies, and an occasional note of the violin, were quite a change from the gloominess and loneliness of the forest, through which we had for some hours been making our toilsome way to the end of pitch pine (pitch pine) woods. Knowing that Butler was a county town, and never having heard of any county town in the South which did not possess some kind of a hotel, the undersigned had made no arrangements for the evening, though he fortunately had brought his blanket. After awhile, having escorted the ladies home, the revellers returned to see what was up, and I made inquiries as to a place to sleep and a chance to get something to eat, and I found that the hotel was closed. A rather chilling negative was all the information we could obtain—evidently blue coats were not favorites. Meanwhile, the men had bivouacked on the porch of an old store, and my lieutenant, spying the door of a store opened for a moment, rushed in and purchased two small cans of oysters and a duo of sardines.

As we could obtain lodging nowhere, we pitched our tent by the roadside, and proceeded, with the aid of some exorable water from the "public well" in the court house square, to make a supper on canned oysters, uncooked, and sardines, for we were out of bread. We then had our blankets on the ground, and slept "the sleep of the just."

With the first beams of the morning sun, the reveille was blown, and the mat-tat of the drum awoke the stillness of the crisp, chilly air. We soon had breakfast cooked and eaten; it was simple, but good, and relished. We then went into camp. I soon got things in order, and did nicely, and was independent. After awhile, finding that if we were soldiers we were very respectable people, a change came over the spirit of their dreams, and I know they regretted their want of hospitality.

As the day wore on, perhaps some of your city readers would like to know the price of provisions in Butler, so I will give a short schedule. Elegant beef, five to six cents per pound; Spring chickens, ten cents, and full grown ones fifteen cents apiece; eggs, ten to fifteen cents per dozen; fresh butter, twenty-five cents per pound; wild turkeys, \$1.25 (if they were big ones) apiece; venison ham, fresh, from seventy-five cents to a dollar; dried and smoked meats, eight to ten cents.

What do you think of that? There is not much likelihood of starvation in that country, is there? And yet it is very much the same as was the case when the American asked the Englishman, who grumbled at the prices in this country, "Why he came over here if articles only cost sixpence in England," and received the reply, "Because the sixpence was not in his money." So in Butler, all the food you can get for the most money is scarce, and food is cheap except meat—*i. e.*, pork and bacon. The favorite food of but part of the country is hog and hominy, bacon and

greens, corn bread and spare ribs, and usually the stranger is made very welcome.

The country is very uneven. We found it literally up one hill and down the other. The teamsters used to say if you wished to stop on the top of a hill the hind wheels must be on one side and the fore wheels on the other, else the wagon would not keep its place. The soil is a sticky red clay, very muddy in wet weather, and very dusty in dry. About one sixth of the country is under cultivation; perhaps hardly so much. The rest is covered with a heavy growth of oak, hickory, gum, holly, and pine.

The game to be found consists of deer, bear, an occasional "cat" (*i. e.*, wild cat, or catamount)—raccoon, opossums, wild turkeys, ducks, quail (partridge), geese, snipe, and woodcock in their season, and many others. Deer and turkeys are particularly abundant, and very little trouble one can have rare sport. Squirrels are as thick as hops.

There are a considerable number of small lakes throughout the country, and these are full of fish. The river also contains many varieties in abundance, including the white, or channel cat, and the "buffalo."

One more subject of interest, and I will close. Many going to Alabama will remember that along the rivers and in the swamps there is a very deadly, and vicious of swamp fever, congestive chills, and fever, and ague will rise before their eyes, and they will hesitate and fear, lest the seeds of immediate attack or future illness be implanted in their systems. In the Summer and Autumn, on the river banks and in the swamps, the miasma is powerful, a single night's exposure often entailing a troublesome attack of typho-malarial fever, the fever of the country. But in the upland during these seasons, and anywhere in the West, there is no danger whatever, and the visitor from the North need have no fears. A prophylactic, in the shape of a wine glass of good spirits, with two or three grains of quinine dissolved therein, and taken before one leaves the house in the morning, will render the sportsman fever-proof during his sojourn; or a two grain quinine pill, and a cup of hot coffee afterwards, will answer the same purpose, speaking in a much better way.

In speaking of the various places in Choctaw county, I mentioned Mount Sterling and Tompkinsville, as well as Bladen and Butler. I ought not to close this article without letting the reader know that he will probably find Mount Sterling the most agreeable place of residence in the county. It is the one place in the whole South where ardent spirits are not sold as a beverage. The wealth, the refinement, and the aristocracy of the county seem to have centered here. In saying this I do not reflect upon other parts of the county. I only mention what is universally conceded to be the case. A stranger going there and calling on Mr. Prince, or Mr. Taylor, or Mr. Glover, or any of half a dozen others, will not be disappointed.

At Tompkinsville, or at its landing on the river, "Marshall," I am sure a gentlemanly stranger will find an agreeable companion in Capt. James Bryant of that ilk.

Choctaw county and its vicinities, like all other places, has its good and its bad sides. It is a perfect wilderness outside of the little villages (the county town contains less than fifty buildings, counting stores, dwellings, barns, and all), and one is as much out of the world as in the heart of the Adirondacks. The mails are carried on horseback, and vary from once to twice per week, according to which town you are in. In very wet weather there is no mail at all.

So if one wishes good hunting, with a fair prospect of finding plenty of game; if he wants a pleasant place of sojourn, pleasant friends, and good contrabands, he cannot do better than spend the Winter in Choctaw. If he be a true sportsman, he will not expect the luxuries of the large cities; but he can always get plenty of pure, fresh air, and good hearty food. He will meet a warm welcome, and, if he be a good fellow, will not leave the country without having made many good friends, and with very little regret; and I left it with regret, and I shall not soon forget the pleasant friends I met and left there.

ACROSS NEWFOUNDLAND.

INTERIOR EXPLORATIONS—FLORA, FAUNA, AND GEOLOGICAL FORMATION.

[Continued from January 14th.]

CHAPTER IV.

OCTOBER 7th.—The nights and mornings were now frosty, and the vegetable kingdom had put on its Autumnal coloring of various tints. The waters as well as the air were becoming more chilly every day. A favorable change of wind did not now bring the accustomed mildness of temperature.

We had been occupied since the 11th of September in traversing the southern and middle ridge in the westward, being so much dissociated from previous ones. On several days, and about the centre of the island. On arriving on it, this ridge proved to be a serpentine deposit, including a variety of rocks, all lying in nearly vertical strata alternating. The conspicuous points were the large angular blocks of quartz rock, lying on outgoings of the same, ranged along the summit. This rock was very porous, owing to much dissociation from previous ones. All the highest parts of the ridge were formed of this quartz rock, and were extremely sterile. The other rocks were noble serpentine—varying in color from black green to a yellow, and from translucent to semi-transparent, in strata nearly a yard wide—steatite, or soap stone, *serio antique*, *diabase*, and various other magnesian rocks. Sterile red earthy patches, entirely destitute of vegetation, were here and there and much dissociated from previous ones. On these lay heaps of loose fragments of asbestos, rock, wood, bark, cork, rock leather, rock horn, rock bone, and stones light in the hand, resembling burnt clay, *canis multus albis*, the whole having the appearance of heaps of rubbish from a pottery, but evidently detached from adjoining strata and veins. I could not divest myself from the feeling that we were in the vicinity of a quiescent volcano.

The beaches of many of the lakes of the neighborhood, as already noticed, are formed of disintegrated fragments of those rocks. At one lake in particular, which in consequence denominated Serpentine Lake, the beauty and interesting appearance of some of the beaches, composed entirely of rolled fragments of those rocks of every kind and color, the red, yellow, and green prevailing, may be fancied better than described. A part of the eastern

shore is formed of a hard, greenish, gray rock, in large, loose flugs, indented straight grooves, which, when struck as we tread upon them, emitted a sound like pieces of metal. Serpentine Lake is comparatively small, being about two miles and a half in length and one in breadth. It is known to the Mickmack Indians by the Indian name for it, or Stone Pipe Lake, from their procuring here *terre antique* and other magnesian rocks, out of which they carve or elude tobacco pipes, much prized by them.

In the woods on the margin of Serpentine Lake we found an old birch rind canoe of the Mickmack Indians, the same as those used by these people at the sea coast. It had been brought up from the Bay of Despair at the south coast of the island, by them to the God by River, which flows through this and into the King lakes. From the circumstance of finding this canoe here, we inferred that the portages between Serpentine Lake and the sea coast were not very extensive or difficult. Here, then, is a route of the Indians by which the centre of the island may be approached with the same canoe, and close by are the sources of rivers that flow to the north coast. There was an inhabited herdsman's house at the south end of Serpentine Lake, and we shot several of the tamest deer that I ever found. There were several herds of deer around. The white headed eagle was also an inhabitant of this part.

This interesting ridge and district, which forms the centre nearly of Newfoundland, I designated Jameson's Mountains. Judging from the rise in the land for about thirty miles to the eastward, they are about 1,200 feet above the level of the sea. Future travelers may easily reach Jameson's by the route mentioned. On the 10th of October, 1846.—Being now upwards of 110 miles from the most inland part of Trinity Bay, about ninety miles of the distance being across the savannas, we had not yet seen a trace of the Red Indians. It had been supposed that all the central parts of the island were occupied by these people, and I had been daily looking out for them. They were, however, more likely to be fallen in with farther to the westward. It was the intention to have first reached the Bay of St. Lawrence, and was just half way to George's Bay. We had for some time past felt severely the effects of continued excessive exertion, of wet, and of irregular supplies of food. My Indian, and only companion, complained much of the never ending toil, and would willingly have gone out to the sea if I had yielded to his wish. But with me it was now or never, and I had apprehensions of being overtaken by a fever, and might easily reach St. George's Bay, and keep my Indian at the toll-gate toll. I had sometimes to encourage him by promises of future reward, sometimes to excite his emulation by allusions to the fame of the Indian hunters for enduring fatigue and hardships beyond what the white man could bear, and again to picture the shame consequent on his leaving me in the country to perform alone what we had set out to do together.

In the west mountain succeeds mountain in irregular succession, rugged and bleak. Encumbered with many additional mineralogical specimens, we took our departure from the interesting central mountains. Immediately on the west they are succeeded by *gneiss*, and next to that comes the hungry granitic territory, still almost as barren to imagination as at the creation. There are occasional marshes, and some of the less exposed spots produce ground berries in great plenty. A species of fern, or Indian sea, is met with here, different from that commonly found at the sea coast. It is a more perfectly formed shrub, with smaller, rounder, and more numerous leaves; lichens grow everywhere, from the edge of the lake to the mountain top; and deer now begin to appear in small herds in every direction.

October 11th.—While surveying a large lake in the southwest, we described a faint column of smoke issuing from amongst islands near the south shore, about five miles distant. The time we hoped had at last come to meet the Red Indians. Rivers rise here, as they had throughout our journey, owing to our track being central, that ran to both sides of the island; but it could not be seen to which side this lake contributed its waters. The Red Indians had reported not to frequent the south side of the island. It was too late in the day to reconnoitre across my Indian went in pursuit of a herd of deer in another direction, we having no provisions for supper. At sunset he did not meet me at the appointed wood in a valley hard by, nor did he return by midnight, or at all. I dared not exhibit a fire on the hill as a beacon to him, in sight of the strange encampment. His gun might have burst and injured him; he might have fled, or been surprised by the party on the lake.

October 12th.—At daybreak the atmosphere was frosty, and the slender white column of smoke still more distinctly seen. There were human beings there, and, deserted, I felt an irresistible desire to approach my fellow creatures, whether they should prove friendly or hostile. Having put my gun and pistols in the best order, and no appearance of my Indian at noon, I left my knapsack and all instruments, and went through thickets and mud and mire towards the nearest part of the lake, about two miles distant. The white sandy shore, formed of disintegrated granite, was much trodden over by deer and other animals, but there were no marks of men discernible. The extent of the lake was uncertain; but it was apparent that it would require two days at least to walk round either end to the nearest point of the opposite shore to the occupied island. I therefore kept on, until I was well advanced, when the party were, by firing off my gun, if the party were Red Indians, they would in all probability move off quickly on hearing the report, and they having no firearms my fire would not be answered. If they were other Indians, my fire would be returned. I fired. By and by the report of a strange gun traveled among the islands from the direction of the smoke, and thus all my doubts and apprehensions were dispelled. I was the first to see the first man, and I had heard of several by name, except by my Indian and myself, for more than five weeks, and it excited very peculiar feelings.

In about an hour my lost Indian unexpectedly made his appearance from the direction where we had parted on the preceding evening, brought to the spot by the report of my gun. He accounted for himself, that after having shot a stag about two miles from the spot, he applied to my Indian, who attempted to get around the west end of the lake to reconnoitre the party on the island, but found the distance too great, and, getting benighted, had slept in the woods.

Soon afterwards, to my great delight, three appeared among some woody islets in front, which precluded the view of the other side of the lake, a small canoe with a

man seated in the stern, paddling softly towards us with an air of serenity and independence possessed only by the Indian. After a brotherly salutation with me, and the two Indians kissing each other, the hunter proved unable to speak English or French. They, however, soon understood one another, for the stranger, a Mountaineer from Labrador, could speak a little of the Mickmack language, his wife being a Mickmack. The Mountaineer tribe belongs to Labrador, and he told us that he had come to Newfoundland, hearing that it was a better country than his own, and that he was now on his way hunting from St. George's Bay to the Bay of Despair to spend the Winter with the Indians there. He had left St. George's Bay a month before, and expected to be at the Bay of Despair in two weeks hence. This was his second year in Newfoundland; he was accompanied by his wife only. My Indian told him that I had come to see the rocks, the deer, the beavers, and the Red Indians, and to tell King George what was going on in the middle of that country. He said St. George's Bay was about two weeks' walk from us if we knew the best way, and invited us over with him in his canoe to rest a day at his camp, where he said he had plenty of venison, which was readily agreed to on my part.

The island on which the Mountaineer's camp was lay about three miles distant. The varying scenery as we paddled towards it, amongst innumerable islands and inlets, all of granite, and mostly covered with spruce and birch trees, was beautiful. His canoe was similar to those described to have been used by the ancient Britons on the invasion by the Romans. It was made of wicker work, covered over outside with deer skins sewed together stretched on it, nearly of the usual form of canoes, with a bar or beam across the middle, and one on each end to strengthen it. The skin covering, flesh side out, was fastened or laced to the gunwales with thongs of the same material. Owing to decay and wear it requires to be renewed once in from six to twelve weeks. It is in these temporary canoes that the Indians of Newfoundland, at the present day navigate the lakes and rivers of the interior. They are easily carried, owing to their lightness, across the portages from one water to another, and when damaged easily repaired. There were innumerable granite rocks in the lake a little below and above the surface; on one of these our canoe struck and rubbed a hole through the half decayed skin, and was attended with some risk to our persons. The Indians of Newfoundland, at the centre of a wooden islet, at which we arrived before sunset. The approach from the landing place was by a mossy carpeted avenue, formed by the trees having been cut down in that direction for firewood. The sight of a fire, not of our own kindling, of which we were to partake, seemed hospitality. It was occupied by his wife above, seated on a deer skin, busy sewing together skins of the same kind to renew the outside of the canoe we had just found, which required it. A large Newfoundland dog, her only companion in her husband's absence, had welcomed us at the landing place with signs of the greatest joy. Sylvan happiness reigned here. His wigwam was of a semi-circular form, covered with birch rind and dried deer skins, the fire on the fore ground outside. Abundance and neatness pervaded the encampment. On horizontal poles over the fire hung quantities of venison steaks, being somewhat dry. The hostess was cheerful, and a supper, the best the chase could furnish, was soon set before us on sheets of birch rind. They told me to make their camp my own, and use everything in it as such. Kindness so elegantly tendered by these people of Nature in their solitude commenced to soften those feelings which had been fortified against receiving any comfort except that of my own administering.

The venison and the soup was so good, that the hunters could not be surpassed. A cake of hard deer's fat, with scraps of suet, toasted brown, intermixed, was eaten with the meat; soup was the drink. Our hostess, after supper, sang several Indian songs at my request. (To be continued.)

NOVEL DEER CHASE.—A valued contributor, who is a keen sportsman, sends the following item clipped from the *Stratford* (Canada) *Dispatch*.—

As Dr. Billings, of this town, was riding along near Mount Carmel, he descried a deer on the road, and shouted at it, expecting to see a fine run across the fields. The deer was so frightened, he was so rapidly jumping the fence, it struck the fence-ride and fell back. The doctor kept on shouting all the while, and the confusion of the animal became so great that each succeeding attempt was no more successful than the first. Seeing this, the Doctor reined his horses in a corner of the fence, jumped out of his buggy, made for the deer, and actually caught it, but had no sooner touched it than he found himself in the ditch. As he two or three times and down it got away from him; but, being a doctor, he fought on scientific principles, and in his endeavors to ent the earotid artery inflicted a wound on its neck. The confused and now wounded animal ran off ten or twelve rods and actually came back to the very same spot to jump the fence, and with the same ill-success as before. The Doctor closed in and caught it a second time, and after another series of ups and downs, succeeded in the earotid artery, and in his frantic mania, when the deer's life-blood soon effused, and it sunk a victim to its captor's pluck. After the excitement was over the Doctor found himself too much exhausted to lift his prize into the carriage. By resting some time, however, he was able to do so; and that being done, he drove home, we will not say a bigger, but certainly a pleased, muddy, and bloody man.

—The following clipping, from the *St. Louis Republican*, contains some hints that may be of service to some of our New Jersey Fox hunters.—

Mr. R. S. Macdonald, a modern Nimrod, is in the habit of receiving letters, instructing him on sporting affairs, in the following style:—

"I have a fox that will chase your pack of hounds and run a conon up a tree. I offer you and your chasers my fox for \$6. I will guarantee that he will not lose his brush. Come and see my fox, at the southeast corner of Eleventh and Washington streets. I have a fox that will chase your pack of hounds and run a conon up a tree. I offer you and your chasers my fox for \$6. I will guarantee that he will not lose his brush. Come and see my fox, at the southeast corner of Eleventh and Washington streets. I have a fox that will chase your pack of hounds and run a conon up a tree. I offer you and your chasers my fox for \$6. I will guarantee that he will not lose his brush. Come and see my fox, at the southeast corner of Eleventh and Washington streets. I have a fox that will chase your pack of hounds and run a conon up a tree. I offer you and your chasers my fox for \$6. I will guarantee that he will not lose his brush. Come and see my fox, at the southeast corner of Eleventh and Washington streets."

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

THE FISHERIES OF MICHIGAN.

WE have received from Geo. H. Jerome, Esq., the able Superintendent of the State Fisheries, the first annual report of the Fish Commissioners of Michigan, which, covering entirely new ground, as it does, is exceedingly interesting. This opens with a review of fish culture, its progress, development, and its economical and commercial value. The action of fishermen who wantonly destroy the denizens of our waters is criticized in proper terms, and the best means of checking their depredations and preserving an important article of food are duly explained.

In reviewing the indigenous fishes of the streams and lakes of Michigan, they place the white fish (*Coregonus albus*) at the head of the fresh water species. While this is found in several interior basins, yet the Great Lakes afford the only supply extensive enough to meet the wants of commerce; but owing to the rapacity of some men, even this fish is now diminishing in these great depots. A strong effort has been made to propagate this species, and with fair results so far.

The next in importance to the preceding are the lake trout, including what is known as the Mackinac trout, salmon trout, *Nemayush*, and *Salmo siskiwitae*. These several varieties, differing in size, color, and general appearance, are undoubtedly congenic, all being of lacustrine habits and non-migratory.

The black bass (*Crystes nigricans*) is found in almost every part of the State—in the lakes and rivers, and in waters varying greatly in depth, size, and temperature. It does not seem to be as highly appreciated as other species of fish, although it is of good flavor, and a favorite with many anglers owing to its pluck, endurance, and resolution. It is hardly capable of standing much variety of water and temperature; an abundant propagator, and a careful protector of its young; and it is, besides, less trouble than most fishes to prepare its ova for the stocking ponds.

Of the grayling (*Thymallus tricolor*), it is said that it is extremely gamey, beautiful, and in grace of motion equal to any of its tribe. Its true value is not yet fully decided, as its qualities as an article of food have been criticised. Its habitat is the Au Sable, the Muskegon, Hecsey, Pine, and Boardman—indeed, very many of the streams and rivers of Central and Northern Michigan, possibly a majority of them, are believed to abound in the grayling. It is said that they have been caught weighing four and a half pounds. Their average catch, as reported, is from one half to two pounds. Sixteen grayling, from nine to fourteen inches long, have been at the State Fishery for the last nine months. They have occupied one of the small spring ponds in company with several hundred speckled trout of about the same age and size, where at all times there have existed, as far as observation and appearance can decide, the greatest friendship and concord. They rise to the surface to take their food a trifle less sharply than the trout, and show about an equal percentage of growth. They eat all kinds of food that are prepared for the trout—river, lights, heart, kidney, etc.

Of the brook trout (*Salmo fontinalis*), the report says:—“Until attention was called to the general subject of fish propagation, it was currently reported that the genuine *Salmo fontinalis* had no domicilium in the State. But later investigations verify the fact that he not only exists here, and that, too, in many portions of the State, but that he is here in all the intimate vestiture of his prime and glory. Specimens have been shown the commission, obtained from the streams of Northern Central and Northern Michigan, equalling in every respect their New England, New York, Pennsylvania, and Rocky Mountain congeners. *Salmo fontinalis*, as its name implies, is a fish of the streams, the *fontaines*. Mountainous and hill-side springs, and bubbling brooks—pure and swift rivulets, having gravelly and rocky beds, where the water, in its dashing, splashing flow, of very necessity becomes in large measure oxygenized, for probably no species is a larger consumer of oxygen; these are the natural haunts of the ‘speckled beauties.’ And their culture in any other class of waters will ever most likely be attended with but indifferent success. The brook trout being thus particular, always preferring to ‘take his clear and cold—a slow grower, an unprofitable breeder, and little regarding the convenience of fish culturists as to spawning periods (the late Fall and Winter months), and wildal being in a pre-eminent sense an amateur fish, none of the commissions of the several States, Michigan included, have deemed it advisable to enter this species in their vocabulary of food producing fishes. And though left thus to private or individually associated enterprise, no apprehension whatever is felt but that his great beauty, vivacity, gamyness, and par excellence platter reputation, will long keep him from being numbered with the extinct fauna.”

Other species of fish, such as the pike and pickerel, the white rock, green bass, perch, sun fish, catfish, bull head, sturgeon, suckers, and several more varieties, are also found in the waters of the State; but as they are not deemed valuable for the table, the commissioners hope to replace them by food fishes.

The work of transplanting edible fishes to the waters of Michigan has been prosecuted assiduously. The first species to receive attention was the *Salmo salar*, 40,000 ova of this fish being hatched out in 1873 near Clarksville, and placed in several streams and lakes. The next lot was 180,000 eggs, received from Bucksport, Maine, and these were also distributed in the best manner. About 15,000

young fry of this number were lost during their transportation to Lake Superior.

A small beginning has been made in introducing the land locked salmon (*Salmo sebago*). About 3,000 ova were received from Prof. Baird, and of that number the greater portion were hatched and are now in the streams.

In 1873 the State received 80,000 eggs of the California salmon (*S. quinnat*), and a large percentage of these were hatched. The greatest loss was from the malformation of the alevis. The young fry grew rapidly, and after absorbing the sac were placed in convenient streams and ponds. Those at the State hatching house are quite domesticated, and feed from the hand. They are fed principally on the kidneys, livers, and lights of beves. Some 750,000 more eggs were received in 1874, and only a few of these, comparatively speaking, proved unproductive.

The shad (*Alosa praeestabilis*) has been largely experimented with; but the time is yet too early to note the results. Of this fish, the commissioners say:—

“It spends more time in salt water than salmon; it does not go so high up to the sources of streams and rivers for spawning, very frequently spawning in estuary or brackish tidal water; the fry are not injured by salt water; indeed, their early in efforts are seaward. None are found, as is the case with the salmon, in the inland lakes. Besides, admitting the possibility of successful colonization for States already supplied with whitefish, salmon, trout, black bass, and other choice varieties, the need of such importation is very manifest.”

Those enumerated are all the foreign species that have been introduced. It is suggested that eels be experimented with, as the probability is that they would thrive well.

Of the indigenous varieties, the whitefish has received the most attention, over a million and a half of eggs having been hatched in the Winter of 1873-4, and deposited in over two hundred lakes. Arrangements have been made to distribute between two and three million eggs the current year.

The total expenditures, from May 12th, 1873, to December 1st, 1874, have been only \$9,313, including hatching house, overseer's house, ova, and salaries.

The report closes with suggestions as to the preservation of fish, and these are so practicable that the Legislature will no doubt act upon them. We must congratulate the people of Michigan upon having commissioners who are so attentive to the public welfare, and so zealous in the prosecution of their duties.

The report very properly includes an appendix, with the game and fish laws of the State, which feature we urge the commissioners of other States to adopt in their reports.

FISH CULTURE IN MASSACHUSETTS.—The annual report of the commissioners on inland fisheries has been submitted. We give a brief abstract:—

“The commissioners say that the law in regard to smelts, passed last Spring, has proved very beneficial; that a fishway to permit the easy passage of salmon is building at Turner's Falls. They also say that they never expected any fish to go over any fishway if bred below and not above it, as migratory fish always return to the place where they are hatched. Fishways are to be built in Carver and on the Westfield and Agawan rivers, and on the Shawshine in the towns of Bedford and Billerica. A fishway is also proposed upon the Nashua River. The number of shad spawn taken at North Andover last year was 6,249,000; hatched and turned in above Lowell, 1,950,000; above Lawrence dam, 800,000; sent to Neponset, R. I., 455,000. At South Hadley, 3,016 shad were taken, and 44,566,000 spawn. The average from each shad taken at South Hadley was 22,691 spawn. Of those taken at South Hadley, 2,300,000 were put in the Connecticut at Bellow's Falls and Smith's Ferry, and placed between. The artificial hatching of trout has been very successfully carried on during the past year, 290,000 in various brook streams, and hatched with a loss of four per cent. Of land locked salmon, 5,500 spawn were hatched and distributed; and of 200,000 Sacramento salmon spawn, presented to the State by Prof. Baird, only 7,000 were hatched. Reports were received from the various parties to whom spawn were sent, reporting their successful hatching and rearing.”

FISH CULTURE IN PENNSYLVANIA.—Gov. Strafford, of Pennsylvania, is a reader of FOREST AND STREAM, and hence this passage in his recent message to the Legislature:—

“A growing interest in the cultivation of fish by artificial means is manifested throughout the country, and it is a pleasure to note that our people are devoting themselves to the investigation of this novel and important subject in a manner that will establish the success or failure of the experiment in the various waters of the State. The labors of the Commissioners of Fisheries continue to afford substantial reasons for encouragement. During the past year 376,000 California and 137,000 Kennebec salmon. These streams were selected because it is the habit of the salmon to migrate to and from the sea. If it is found that these valuable fish return to these rivers the State will be amply repaid for the entire expense incurred in aid of fish culture. Under the superintendence of the commissioners, 85,000 salmon trout were distributed in different bodies of water where the chances for growing food and the indulgence of their peculiar habits were most promising. These fish are rapid in their growth, increase very fast, attain a large size, and are a delicate article of food. A general distribution was also made of a large number of black bass, a very prolific, choice, and beautiful fish, that grows and multiplies with marvelous rapidity in our streams. The hatching of shad was resumed last Spring, and 3,000,000 of young fish were turned into the Susquehanna. The Commonwealth appropriated a fund to be expended jointly with the fish commissioners of New Jersey in hatching shad to be placed in the Delaware. The Legislature of New Jersey, I regret to say, failed to make a similar appropriation, and in consequence no shad were hatched for that river. There were no obstacles whatever to the ascent

of shad in the Delaware as they come in from the sea, the river is said to be particularly adapted to their wants, and with proper co-operation the supply of shad may be immeasurably increased; and I trust, therefore, that our sister State will combine with our commissioners in replenishing the river.

“The success of the fish way to the Columbia dam does not correspond with the public expectation, and some fears are entertained that the dam may prove an insuperable barrier to the ascent of the shad. Alterations in the fish way have been made with very little additional cost, that will prove an effectual test of the process now on trial, and if it is discovered that the shad will not or cannot make the transit some other channel will have to be opened to enable the fish to ascend, for now that it is demonstrated that these fish can be propagated artificially to an extent that will make them a constant and unflinching source of cheap and excellent food, every form of experiment should be exhausted before the enterprise is abandoned.”

MASSACHUSETTS ANGLER'S ASSOCIATION.—The most interesting and instructive meeting ever held by this association, was that of Wednesday evening, 13th inst., in their rooms, corner of Washington and Essex streets, Boston. After the regular routine business and election of 20 new members, the members present, of which there was a goodly number, were addressed by Hon. E. A. Brackett, one of the Massachusetts Fish Commissioners, who was followed by Benj. P. Ware, Esq., of Marblehead, in one of the most forcible and lucid addresses ever delivered before the association, on the preservation of the deep sea fisheries, a subject vital to the interests of Massachusetts. Mr. Ware took decided stand against trawling, as simply tending to the ultimate extermination of the cod, haddock and pollock fisheries on our coast, and as being destructive to their habits. He also pointed out some of the evils of mackerel sailing, supporting his arguments by undoubted facts and figures.

LABOR APPROPRIATIONS.—The House of Representatives shows its interest in the culture of fishes by appropriating \$67,500 for the propagation of food fishes. This sum is larger by \$50,000 than the one given last year, and proves that our legislators have some idea of advancing the prosperity of the nation. They also allow a Government vessel to be used in the Summer for investigating the marine inhabitants of our coast, and they second the able efforts of Prof. Baird in bringing to light the economic and commercial resources of our waters. They could not expend money for any more practical purpose, for the development of our food fishes is one of the most important public enterprises inaugurated in a long time.

TRANSPORTING AND HATCHING.

ROCHESTER, January 12, 1875.

EDITOR FOREST AND STREAM.—Mr. M. A. Green, assisted by myself, has succeeded in inventing a new method for transporting and hatching nearly all kinds of fish eggs. We have been experimenting for the last three years, and find that we can hatch one million fish eggs in a barrel of water, and can hatch one million of the following four kinds of fish spawn, namely—brook trout, salmon trout, white fish and salmon, and find it perfect success. The temperature of your room can be so regulated that you can hatch them in from fifty to one hundred and fifty days. We have carried 100,000 salmon trout spawn from the New York State Hatching House to the Pennsylvania State Hatching House at two different times, on our trip we had seventeen die and on the other only two. By using this invention with the proper management, spawn can be carried 180 days' journey without any more loss than if they remained in the hatching house, and by this same invention they can be hatched in any spare room of your house from the cellar to the garret. Yours,

SETH GREEN.

Fish Commissioners of States will oblige us by sending in their Annual Reports as soon as published.

Natural History.

THE PERIDICIDÆ.

BY J. B. BARNES.

OF the *Peridicidæ*, or Partridge family, there are seven genera, two of which are European, viz: the *Peridix* and *Coburnix*. Of the other five genera, the *Oryzix*, (*Bonix*), *Oreortyx*, (*Baird*), *Lophortyx*, (*Bon*), *Callipeza* (*Wagler*), and *Perdix*, there are upwards of forty varieties distributed throughout the entire United States and portions of South America.

The *Ortha Virginianus*, (*Will.*), has probably been the cause of more controversy by various writers as to what name it should bear than any other game bird of the entire United States. The cause for such wide and various differences of opinions is not otherwise to be seen in any other species of a later date are equally bewildered. In portions of New York, and in nearly all of New England, as well as in many of the Western States, it is called *quail*, while in Pennsylvania and in the South it is called a *partridge*. Where the ruffed grouse is called *partridge* this bird is called *quail*, and where the quail is called a *partridge* the ruffed grouse is invariably termed *quail*. Neither of these names can be correctly applied to any of our American species by early writers, on account of its close resemblance to the *Tetra ocellaris* (*Linn.*) of Africa, of which there are several species, only one of which, however, is found in Europe. Foreign writers tell us that at certain seasons of the year these birds are so numerous along the shores of the Bosphorus and in some of the islands of the Grecian Archipelago, during the migrating seasons, the sky may be said to be raining quails. They commence

The Kennel.

CARE OF DOGS.

NEW HAVEN, JUN. 9, 1875.

EDITOR FOREST AND STREAM:—
In one of your papers of the 7th instant an article referring to sportsmen travelling on the cars with their dogs; and glad you have taken the subject up; hope you will push the matter and have the railroad managers put some kind of a tariff on dogs. I went into the western part of Iowa last Summer and I cost me over \$30 to get my dog out there and back. Now where did that money go to? To the railroad? No, my dog went to the baggage masters, and I had to feed and water my dog every day. They would not do it, because they claimed they did not have time.
R. W. A.

It is always understood, we believe, that dog fairs are the perquisites of baggage masters; and sportsmen, so far as we knew, have paid them most cheerfully. Railway officials have tacitly permitted baggage masters to receive these perquisites, as the companies are thereby relieved of both responsibility and care of the animals. All that sportsmen have asked has been the assurance that their dogs will be well cared for in consideration of the money paid. But this is not enough. We are striving to accomplish two things—first to have a regular tariff for dog fares, that gentlemen may know exactly what they are to pay; and second, to have provision made for the comfort of the dogs and proper quarters assigned them, that they may know who is to be held responsible for their neglect. As the dog would occupy an anomalous and intermediate position between persons and cattle, it would cheerfully be agreed to by the sportsmen that companies should not be held responsible in fancy prices for the accidental death or maiming of the dogs, although damages might reasonably be recovered for willful neglect as to food, water, and shelter from heat or cold.

The value of this kind of property has increased within the past two years to a very large sum, and measurably by the importation of dogs at a valuation of \$300 to \$1,000 per head. Surely, owners must be respected in this property and in the right that ought legally to pertain to it. In a very short time, if not now, this growing interest, and the multiplication of sportsmen, will compel recognition. By taking the subject into immediate consideration, railway companies will not only avoid censure but receive an income that will form no inconsiderable item of their revenue.

THE DETROIT DOG SHOW.—At the Union Exposition, under the auspices of the Michigan Poultry Association, which closed to-day in Detroit, one of the most interesting features was the Dog Show; about twenty-five species shown, with 120 entries. This being the first Dog Show in the State, the Michiganers took quite an interest in it, making it a decided success. The other attractions consisted of about 400 coops, poultry and pigeons; the Horticulture and Agriculture Departments; the Fish Department being represented by aquariums of N. W. Clark.

—A correspondent writes to inform us that the Central Railroad of Iowa, which runs north and south through the "best chicken grounds of the West," and has its headquarters at Marshalltown, is accustomed to extend all possible facilities to sportsmen who travel that way, and take good care of their dogs. Marshalltown is noted for its fine field shots and splendid pointers and setters. The sportsmen there are about organizing a strong hunting club for active work in that section.

—Almost every dog who ever had a bright dog can tell curious stories of dog behavior. A gentleman in Erie, Pa., furnishes the *Observer* this funny anecdote: "Mrs. J. has for some time past been the owner of a fine Esquimaux dog. A few months ago Mrs. J. became the mother of a beautiful little girl, of whom the dog at first was very jealous. His better nature, however, soon asserted itself, and he became very fond of the child. A few weeks ago baby was crying loud and long. Jogging came up stairs in evident distress of spirit, willing to answer to the child's cry; but finally, as if a sudden thought had startled him, trotted quickly down stairs. He presently returned with a bone, well picked, of course, in his mouth, which, standing on his hind legs, he gravely presented to the baby."

DORSON, January 9, 1875.

EDITOR FOREST AND STREAM:—
I promised some time since, Mr. Adams consenting, to send you the pedigree and some account of the splendid brace of setters imported by him Mr. Llewellyn. Rock has not yet arrived, and it will be advisable to give a description of him at present. His breeding and performance are first class, and it is sincerely to be hoped that no accident has happened to this splendid dog, destined to be, in my opinion, the greatest acquisition to our means of improving our breed of setters. It may not be out of place to say here that whatever may be the opinions of our sportsmen as to the merits of the late dog controversy, the propriety of bringing it before the public, and the courtesy, or want of it, with which it was conducted, that it is generally admitted by gentlemen who have had the opportunity to examine Mr. Llewellyn's superb kennel, that it is difficult, if not impossible, to find in England a kennel that can turn out fifty to one hundred as fine dogs as his. It is not to be supposed that his are the only good dogs in the kingdom; but it is sufficient for our purposes that they are first class of their kind, and bred with great care and without regard to expense. Dora, whose pedigree I now inclose, was imported from Mr. Llewellyn by Mr. Adams in May, 1874, he being to Prince, a dog so well known as not to require further notice here except to state that unless some recent change has occurred he is not to be purchased from Mr. Llewellyn except at a price that would appear fabulous. On the 22d of May Dora had some pups. These are now scattered, some having gone to the West as Missouri and Iowa, where she hopes to hear of their stock in the time. Mr. Adams has reserved two—Duke and Duns—and may one travel far in this country to find their equals. Dora herself, though for several years past withdrawn from the field for breeding, still hunts and points beautifully, and has a peculiar, light, and graceful gait, which must be seen to be appreciated. She is remarkably fine and handsome, has a soft and full eye, and is considered by our sportsmen here altogether the best bitch in these parts. Your readers will notice that Mr. Smith's Dart, whose pedigree you gave some weeks since, is out of her by Prince, and must be a good one. Of Rock, hoping for his safe arrival, I will write at some future time.
Yours Ours.

—A nondescript flat fish, half shark, half ray, eight inches long, five wide, and one and one sixteenth thick, has been found on the San Paulo (Brazil) coast, among rocks constantly bathed by the sea. It lives on the sea urelins (*schizidia*), attacks them, and breaks off their spines with a bony beak, and when they are disarmed devours their flesh among the rocks, securing itself while doing so in a crevice by means of two strong fins, fortified by bony plates from the shoulders. Its back is rough, and covered with spines. It appears altogether unknown to science, but as it looks very much like a bat the fishermen call it a sea bat.

—It is announced, that Prof. Edward S. Moore, the naturalist of Salem, will sail from San Francisco in March on a trip around the world, with the special purpose of examining those Japanese and Australasian shells which come within his course of study. He will deliver a course of lectures in San Francisco just before starting.

FOOD OF DOMESTICATED GAME BIRDS.

WHITEFIELD HOUSE, CALHOUN, EDG.,
JANUARY 1, 1875.

EDITOR FOREST AND STREAM:—
When the proposal of introducing the prairie fowl and ruffed grouse on a large scale into this country became a prominent topic, the opinion of Mr. Teasdale, of the London Zoo, was asked, and he wrote therein that it was utterly hopeless, as it would be necessary to insure their access to bring over an immense district of prairie land, and the food pertaining to the same. Though he is a very sound authority and of great experience in most branches of poultry, I found myself bound, from frequent observation, to differ from him, for many reasons. No one can deny that the great variety of game and other birds which we have sent to Australia and our antipodes have, in the main, succeeded beyond expectation. Did they find their native and natural food? Certainly not. On the other hand we see how well parrots, which are fruit eaters, and hundreds of other birds, thrive well in cages and menageries in this country on a diet quite new to them. Our pheasants and barn door fowls, both hens and cocks, never had the offer of maize till a few years ago. They may all prefer it, and they do better on it than any other grain. Your prairie hen and ruffed grouse have many plants in common with black game. It is an old botanical axiom that "similar ground affords similar plants." Thus your marshy ground may not produce the identical cranberry as ours, but they both produce plants of the same genus, which would be eaten by both your grouse and ones indifferently. Our black cock and gray hen find their food in the same grassy pastures, chiefly sheep walks, where there is no or little heather, and abounds most on the flat land of the Scottish heather, where there is not a tree nor bush for miles. These noble birds feed chiefly on the seeds of rushes and coarse grasses, but as the season advances they take long flights in search of hick, hazel and alder, the catkins and buds of which they eat in abundance, after which they select the fresh acorns, and acquire a strong resinous taste, and become unmanageable. The black cock is the wildest and most wary of our British grouse. I'll they have attained their full plumage and the cocks assume the black feather, (for both cock and hen are brown alike till September), they are the most stupid of birds, and are to be killed up. After the month they are very shy, and only to be got by driving or creeping up to them—what we call "stalking."

Mr. P. Castang, of London Hall Market, the well known dealer in pheasants and wild fowl, has frequently observed to me, that the more wild a bird or beast is by nature, the more tame it is when domesticated. He is quite right. They have less fear. "Wild as a hawk," is an old expression, yet they are tame as a hen's wrist. I have dozens of pheasants which will eat out of my hand, but not one of the farm yard hen will. I saw a striking instance a few days since (Dec. 20). I was shaving at my bed-room window, which looks on a lawn where the keeper feeds the poultry, and there were among them some thirty or forty pheasants from the neighboring wood. There was a foot of snow on the ground, and I was sitting on the lawn, and the peculiar appearance of the pheasants, as they were more than half deep, and their long tails raised on the surface of the snow. One very black looking bird I could not make out. The pheasant pecked at it, and it came right to the house and sat on the kitchen door step. It was a splendid black cock. I shouted for the house maid to feed it, and having no corn in hand, she gave it some bread and butter and a lump of coal, which it ate heartily. I then learned that a gamekeeper on the adjoining estate had sent a hen with a few eggs which had been sent him from Scotland. Only five hatched. The foster mother and the chicks, when about half grown, were set in a coop on the edge of a heathery mountain. A young horse knocked over the coop, which killed the hen and three chicks. Two survived, but could not force the death of the foster parent, and being estranged, had doubt by a similar note to that they had heard of, they deserted the mountain and came down and joined the fowls of a cottager, where they have remained ever since. They generally eat, when not feeding, on the house top, and as it is on a much frequented public road, to the wonder of passers by, most of whom take them for some fancy fowl. They have already won the functions of the local chaunticleer, and when the time comes for hens to set we expect certain results. I went the next day to see them, and while viewing myself at the cottage fire, one of the birds came into the porch and fed out of a dish with two kittens. The old woman said they eat anything with apparent indifference, but had maize given them once a day along with the hens. I have no doubt that your prairie hen, &c., might be reared with equal ease and success.
JACKSON GILLEAN.

THE TWIN LAKE TROUT.

PHILADELPHIA, JANUARY 13, 1875.

EDITOR FOREST AND STREAM:—
The trout of Twin Lake in the South Park, Colorado, is not the blue back of the Rangely Lake, Me., but a very distinct fish, the *Salmo pleuriticus*, which occurs in nearly all the streams which head in the Rocky Mountains. A larger and finer trout—the *Salmo espinosus*—coincides with it in some of the headwaters of the same. Dr. Yarwood has placed in Utah Lake by the *Salmo virgatus* of Rio Grande, while it is identical with it in some of the headwaters of the same. Dr. Yarwood has written an interesting account in your paper. See note on page 303 of your last issue. Yours very truly,
E. D. CORP.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, JAN. 17, 1875.

- Animals received at Central Park Menagerie for the week ending January 16th, 1875.
- One Lion, *Cylopus torquatus*. Presented by Mrs. Mary L. Bell. Captured at South Anahoy, N. J.
- One Gray Squirrel, *Sciurus carolinensis*. Presented by Master G. K. Harroun, Jr.
- One Costimandi, *Nasua narica*. Presented by Dr. J. M. Lordly.
- One Red Squirrel, *Sciurus hudsonicus*. Presented by Master J. F. Webster.
- One small Alligator. Presented by Mr. Geo. M. Ashley.

W. A. CONKLIN.

TO TRAP FOXES.—The *Furriers' Journal* contains the following recipe for trapping foxes:—

"Set a steel trap in a woodchuck hole, having the trap nicely covered with bark, leaves, etc., to make the place look natural. Put the trail inside of the hole, so that the fox will have to pass over the trap to get it."

grating early in the Spring, so that by the 1st of May they spread themselves over Europe, returning again in the month of September. The inhabitants, who watch for their coming as eagerly as our American sportsmen do for their migratory birds, net them in great numbers and sail them to the bazaar and market of different countries. It has been said, but with how much truth the sportsman must judge for himself, that Dr. Franklin, prior to his *ete voyage*, was supplied with twenty barrels thus prepared. Louis Figuier tells us that the "Bishop of the Island of Capri, situated in the Bay of Naples, receives an annual income of nearly \$8,000 from the duty he has imposed upon trading in quails killed on the island, which all birds sold in the markets of Naples." From which has received the name of "Bishop of the Quail."

Our bird is the *Ortyx Virginianus*, (Bon.) not a quail, and very easily be known by having the under parts whitened with brown, anteriorly each feather with several rows, obtusely V shaped bands of black; forepart of the side of the breast and in front below the black collar, all pinkish red; top of the head reddish; lower part of neck streaked with white and black. This is the most delicately distributed bird of the partridge family in the United States, of which there are none in the old world, existing only in the mountains of England and the Pyrenees. On this point, however, we are told that our quail, which by the way is a very pugnacious one, either roys or drives off the English bird. The meat of the *Ortyx* quail (*Telusa californica*) is very dark in fat, while that of our partridge, or quail, as it is called in this State, invariably lean and very white. The English quail is much longer lived than our bird, living usually from seven to eight years, while the latter seldom reaches five. Another marked difference is in flying. The foreign bird does fly more than one half as swift as the American, and more than one third as far. Strictly speaking, there is no bird in America which could be called quail; but as our regulations names, as well as everything else, in kind of partridge, it has received the name of quail, by which it will undoubtedly be known while there is one in the world. The genus to which it belongs is the *Ortyx*, more resembling the bob white of the United States, Mexico, South America, and the West India islands. Another species, the *Ortyx texanus* (Law), is very similar to *Ortyx Virginianus*, and is found in Southern Texas and the valley of the Rio Grande. From its general appearance and markings, one would take it to be our bob white, though somewhat smaller, the chief difference to a close eye being in the color of the iris, which is gray in the former and more extended, and conspicuous mottling of the iris. This light mottling is, perhaps, more distinct in female than the male. The stripe behind the eye has a black, and the feathers on the top of the head are dark, margined with brownish yellow instead of being dish and black.

The *Oreortyx pictus* (Baird), or plumed partridge of California, also called a quail, resembles the *Ortyx Virginianus* somewhat; but this species has a crest, or better known as a top knot, which is usually from three to three and a half inches in length. It is the only species of quail which closely with the exception of the crest, which is much shorter, and, like that of the male, consists of straight feathers. This bird inhabits the mountainous parts of California and Oregon toward the coast. Another genus, the *Lophortyx Californicus* (Bon.), also called California quail, inhabits the plains and lowlands of Florida and Oregon, and takes the place of the bob white in the mountainous parts of the latter State. This species is the most numerous of the quail partridge family of the far West, and yet is very seldom taken to be the same species which inhabits the mountain ranges. The meat of both are the same as that of our bob white, while their habits are nearly identical. They lay from twelve to fifteen eggs, and are said by some to have two broods each year; but on this point there is some doubt. The species of the *Lophortyx gambelii* (Nuttall), also called the California quail, resembles our bird very closely with the exception of the crest, which is longer than its bill and head, while the *L. Californicus* has a crest not more than half this length. One (*L. gambelii*) is found in the mountains, while the *L. Californicus* is

"The former species is easily known from the latter having vertex and occiput light, smoky, olive brown, and the latter having the vertex and occiput dark, and the snout, feathers of breast with narrow black and orange spots, body obscuro plumbeous. The *L. gambelii* has the vertex and occiput clear, chestnut brown; forehead black-spotted in the belly black; more of the belly feathers in black edges; sides of body chestnut, and has a crest purplish black feathers."—Baird. This species is very rare in parts of Sonora and on the Upper Rio Grande and in the Colorado of California, and in these limits it is said to replace *L. Californicus*, which is peculiar to the stern slope. This species is called in some localities here it exists as Gambel's partridge. Of the California era there is but a single species, termed the *Callopteryx gambelii* (Gray), which inhabits the valley of the Rio Grande, and is very abundant on the broken table lands and mesquite plains. This bird, unlike the species mentioned above, has a crest of soft, broad, elongated flattened hairs. Hunters and naturalists term it the blue partridge, and it may be said to be the only one of the West-partridge family that bears the name of partridge instead of quail. From very meagre information obtained by me which have closely observed this bird, it is of a fish tint, with no marked contrast of color. The male partridge, *Cyanocephalus mexicanus* (Gould), of which there are two species, one of which is found on the Upper Rio Grande, while the other species, *C. ocellatus*, is found in the Rio only, and differs as widely from its North American ally as the ruffed grouse does from the common prairie hen, and may be said to be the most beautifully marked species of the entire partridge family.

The reader will observe that all the birds mentioned here, from the Rio Grande west to the Pacific coast, are red, while those in the Eastern United States are not. It is not too remarkable that the *Ortyx Virginianus* or bob white, and *O. texanus* ought to have been considered a different generic rank. Of the partridge family, legs and toes do not possess that coat of scales which is found in the pheasant family. Of the grouse family, it is feathered, while in the partridge family it is bare. The pheasant family we have but one species indigenous to this country, and that the subject of the previous article, viz: "The Wild Turkey."—*Ed. Forest Journal*.

HEATING GAME BY RUNNING.

IT is a well-known fact that any disturbance of the vital fluids of animals used by man as food, is injurious to the tenderness and succulence of the flesh; and will, in fact, if carried to excess, cause it to putrify in a short time. This would prove that the elements of putrefaction exist in the blood, and that it is aroused into action by any violent churning of the corpuscles.

Experiments varied and extensive enough to enable general deductions to be made from them have been tried, and they have proved conclusively that the flesh of those animals killed instantly and without any previous excitement, contains a most important nutritive and digestive element called glycogenic, and that it is entirely wanting in those that have been run much or worried largely previous to being slaughtered.

An eminent English medical authority states that the flesh of animals killed while they are laboring under excitement or irritation has somewhat transformed the elements of its particles, and that it is therefore very unhealthy and injurious to man. This has been proven by the meat of hares that have been killed after a long chase by dogs, and cattle that have been marched long distances. If the latter have been overdriven ere being driven to the abattoir, their flesh is apt to produce gastric diseases in those who partake of it. But it does not need the testimony of this famous Esculapius to prove the truth of this assertion, for it has long been known among hunters, especially those who live largely on the fruits of the chase, that deer run by dogs are not so edible as those that are not, hence they often kill a pursuing hound to prevent the flesh of the animal from being rendered unpalatable. For this reason also, some of our best frontier hunters adopt still hunting entirely, using hounds only to track a wounded animal or to rouse it from its lair or covert.

Dear, even, that are frightened badly, have the fluids of their body so disarranged that their flesh is rendered tough and difficult of digestion.

The lesson to be deduced from these remarks is, that animals used for food should not be run, rendered excited or angry, or maltreated in such a manner as to arouse their fears ere being killed, if we would avoid unpalatable meat and liability to severe gastric diseases, which frequently lead to death. Not only should hunters take note of this, but also butchers and drovers, for any negligence on their part in such a matter may be the cause of serious sickness among those who partake of the flesh of worried or sorely fatigued animals.

CALIFORNIA RIFLE CHALLENGE.

THE challenge published in the FOREST AND STREAM two months ago, in which Co. E, 1st Regt. California N. G. offered to shoot against any military team in the United States at 200 and 500 yards, and which was subsequently accepted by Co. D 12th Regt. N. Y. S. N. G., is likely to result in a series of matches that will have a very desirable effect on rifle practice among the members of the National Guard and prove a matter of interest to the general public. The Californians, as will be seen by the appended letter, are ready and willing to test their skill at the earliest opportunity. Though novices, comparatively, in marksmanship, they have made a good record for themselves, and will, therefore, give our Eastern Guardsmen plenty to do to excel them.

Co. D will, in all probability, accept the terms proffered, so that there is no danger of the match being broken off. We shall publish the final acceptance of the challenge in a few days, and the date on which the contest is to be decided.

We have received the roster of Co. E, and that contains some sixty-nine names, showing that they have a goodly number to select their team from. Their rivals we understand have not more than half that number, so that the Pacific riflemen have an advantage in that case.

The following is the formal acceptance by the Californians of the terms proposed by Co. D:—

ARMORY CO. E, 1st INF. REGT., N. G. C.,
SAN FRANCISCO, December 30, 1874.

To Capt. H. H. Smith, J. H. Wood, A. Wood, A. D. Farrell, and T. J. Dolan, Committee of Co. D 12th Regiment, N. Y. N. G.

GENTLEMEN.—We hereby acknowledge notice of your acceptance of our challenge by your letter in the FOREST AND STREAM of the 10th of December.

We accede to the conditions published with your acceptance, but suggest the following modifications:—

We would prefer an earlier day for the match than that named by you, say the first Saturday of May, as above the middle of May the Brigade is ordered out to shoot, and in its time we have our annual company target shooting. We are armed with Sharp's 50 calibre rifle. We desire that the shooting shall be conducted according to the Creedmore rules; and the team shall be taken from the men on the Company roll December 1, 1874.

We should like you to appoint some competent person to superintend the shooting here, and we will do the same at Creedmore. Enclosed is a copy of our roll of the above date. With these suggestions we leave it entirely in your hands to draw up all the terms and forward them to us.

Your obedient servants,
H. J. BURNS, Captain,
V. C. POST, 1st Sergeant,
W. E. MERRILL, 2d Sergeant,
C. NASH, Corporal.

THE Columbian Society, devoted to pigeon culture, will hold its second annual exhibition in this city on February 25th.

—The proposed geological survey of the State of Massachusetts, it is expected will extend over a period of fifteen years, and cost \$25,000 per year.

PROTECTION OF GAME.

MONTHLY MEETING OF THE NEW YORK SOCIETY FOR THE PROTECTION OF GAME.—HORATIO SEYMOUR ON FISH CULTURE.—ELECTION OF OFFICERS.

THE regular monthly meeting of the New York Association for the Protection of Game was held last Monday at the residence of Mr. Robert B. Roosevelt, No. 26 East Twentieth street, the President, Mr. Royal Phelps, in the chair. A communication from the Denver (Col.) Shooting Club was received, stating that an organization had been formed for protecting game on the eastern slope of the Rocky Mountains.

Two letters of enquiry from dealers in game were read, asking the President up to what time the sale of venison, partridge, grouse, &c., was allowed by law. Mr. Phelps answered these inquiries by stating that the sale of venison was prohibited after the end of January, trout after March 15th, partridge, grouse, &c., after March 1st.

The association, through its Secretary, has issued the following warning:—

Under the provisions of the Game laws of the State of New York, (chapter 209 of the laws of '83) it is unlawful for any person to sell, expose for sale, transport, or have in his or her possession in this State, after the same has been killed, any moose, wild deer, or fresh venison, save only during the months of September, October, November, December and January, under a penalty of fifty dollars for each offense.

The New York Association for the protection of Game gives notice that it will prosecute all dealers in game, and other persons who violate the foregoing provisions, after conviction.

THOMAS N. CUTHBERT, Secretary,
No. 52 Wall street.

The Secretary also read the following proposed amendment to the act for the preservation of moose, wild deer and fish, passed April 26, 1871:—

The second section of the act shall be amended so as to read as follows:—

SECTION 2. No person shall kill or expose for sale, or have in his or her possession after the same has been killed, any wild duck, goose, or snipe, between the 1st day of May and the 1st day of September, or any woodcock between the 1st day of January and the 1st day of September, nor any English or Wilson's snipe, by snipe, plover, brant, meadow snipe, waterfowl, snipe, sandpiper, or sandrider, between the 1st day of January and 1st of July, under a penalty of \$5 for each bird so killed or had in possession.

The Secretary announced that in the Supreme Court, before Judge Van Brunt, he was that day successful in a suit against Messrs. Middleton & Carman, of Fulton Market, for selling trout out of season, and resulting in a fine of \$2,500. The counsel, Mr. Whitehead, said that all suits, except one, against violators of the game laws, brought during the year, had been conducted to a successful issue, and that seven cases were at present pending in the courts.

The chairman announced that the invested funds of the association amounted to \$3,400 in five-twelves.

Mr. Alexander Hamilton, Jr., and Mr. George Schieffelin were elected to membership, and the resignation of Mr. Townsend Cox was reconsidered, in compliance with the desire of that gentleman. Ex-Gov. Seymour, who was present as a guest of the association, was introduced and requested by the President to say a few words in regard to fish culture. Mr. Seymour remarked that if he had not run well through the State, he walked a good deal of it. He had gained quite a reputation as a fisherman, which he thought he hardly deserved. As one of the Fish Commissioners he would say, in case the Legislature granted the necessary appropriation, they would be in a position to stock all the streams of the State with fish. If we can thus multiply this species of food artificially to an indefinite extent we will contribute much to the comfort and happiness of the people of the State. We are now engaged hatching various kinds of fish in our place at Rochester, and in a short time we will be able to give out enough to all those who may apply for it.

Mr. Seymour was, on motion, unanimously elected an honorary member. The annual election of officers was then held, and resulted in the choice of the following ticket:—President, Royal Phelps; Vice President, Robert B. Roosevelt; Counsel, Charles E. Whitehead; Secretary and Treasurer, S. T. Cuthbert; Executive Committee, Francis H. Palmer, B. L. Swan, and C. Gilbert.

After transacting some further business of an unimportant nature the members adjourned to the dining room, where supper was partaken of.

The next monthly meeting will be held at the residence of Mr. Benj. L. Swan, No. 5 West 20th st., on the 23d Monday in February.

The Illinois State Sportsmen's Association, J. V. Le Moine, president, held its semi annual meeting at Chicago on the 12th inst.

The chief object of the meeting was to receive the report of the Executive Committee, who were instructed at the meeting of June last to prepare and submit the draft of a new Game law. In calling the meeting to order, Mr. Le Moine expressed the hope that members of the association would use their endeavors to secure the passage of the new law, as the law now existing was entirely inadequate to the proper protection of game throughout the State. He then read the bill reported by the Executive Committee, as follows:—

SECTION 1. It shall be unlawful for any person or persons to hunt, or pursue, kill or trap, net or ensnare, destroy or attempt to kill, trap, net, ensnare, or otherwise destroy any wild buck, doe, or fawn, wild turkey, prairie hen or chicken, ruffed grouse (commonly called partridge or pheasant), between the 1st day of January and the 15th of August in each and every year; or any quail between the 1st day of January and the 1st day of October; or any woodcock between Jan. 1 and July 1; or any wild goose, duck, snipe, brant, or other waterfowl, between April 15 and August 15.

Sec. 2. It shall be unlawful for any person or corporation to buy, sell, or have in possession in any of the animals, wild fowls, or birds mentioned in Section 1 at any time when the killing, trapping, netting, ensnaring, or destroying of such animals, wild fowls, or birds shall be unlawful.

Sec. 3. Any person or corporation violating any of the provisions of the two preceding sections shall forfeit and pay a fine of \$15 for each wild buck, doe, or fawn thus killed, trapped, netted, ensnared, or otherwise

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INFLUENCE IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[POST OFFICE BOX 2332.]
125 SOUTH THIRD STREET, PHILADELPHIA,
104 & 105 MADISON ST., CHICAGO.

Terms, Five Dollars a Year, Strictly in Advance.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. When advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 21, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with an oblique name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts. Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentleman sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and continuance of that portion of the community whose refined intelligence enables them to be properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

COXSAINS FOR THE COLLEGE REGATTA.

THE delegates to the intercollegiate rowing convention decided with propriety when they selected Saratoga Lake as the locality of their next contest. That place is now so identified with those deeds of aquatic prowess for which our students are famed that its desertion for another locality would be a serious disappointment to the public and we doubt not to the greater number of the contestants themselves. It has many advantages over all other places in the East, and these are so evident that a discussion of other resorts seems scarcely to have been worthy of attention. All know what magnetic effect a large throng of spectators has on men engaged in virile deeds, how it spurs them on to action and sustains them in their arduous labor, and nowhere, in this country, can such a large and enthusiastic throng be found as at the City of Springs. It is also in a central locality, and easy of access from all Eastern States, and has ample room to accommodate visitors—advantages which no rivals can show.

The objections raised against the lake are more imaginary than real, and will be entirely overcome if the boats carry coxswains, for in that case there will be no excuse for those collisions which sometimes mar the pleasure and result of the contests. Each crew should by all means carry a coxswain, for his usefulness will more than counterbalance his weight, and he will at the same time enable the best men to win, for his presence will prevent one boat from crowding on another and taking its place. Allowing that the time of the race may be a little slower than if coxswains were not carried, yet this is much better than to be driven out of it entirely, as is frequently the case, and then being embroiled in verbal contests and petty feuds which are so unbecoming to gentlemen and so very unnecessary. We therefore hope that this simple method of obtaining a fair race will be adopted and that those bickerings of the past so destructive to moral and bon homie will be unknown in the future.

—Average mid-day temperature at New Smyrna, Florida, for the month of December, 71 degree; 7 o'clock A. M., 61 degrees; 9 o'clock P. M., 64 degrees. No rain during the month, but very heavy dews.—Report of Maj. Geo. S. Alden, Signal office, for Forest and Stream.

hought, sold, or in possession, and a fine of \$10 for each wild turkey, partridge or chicken, wild grouse, pheasant, quail, woodcock, wild geese, duck, snipe, brant, or any other wild bird, trapped, netted, captured, or otherwise destroyed, bought, sold, or in possession as aforesaid.

Sec. 4. No person shall at any time within this State, kill or attempt to kill, trap, net, ensnare, or destroy any robin, bluebird, swallow, warbler, kingbird, hawk, whippoorwill, cuckoo, woodpecker, cat bird, brown thrasher, red bird, kinglet, red, blue jay, junc, thrush, lark, cherry bird, yellow bird, oriole, or bobolink, or any other bird, of such birds, or any other; and every person so offending shall be fined not more than \$20 for each offense, to be sued for and recovered as provided for in section 7 of this act.

Sec. 5. No person shall at any time within the State, with trap, snare, or net, take, or attempt to trap, snare, or net, any wild turkey, partridge, chicken, Virginia partridge, bluebird, grouse or quail, and anyone so offending shall be fined and pay a fine of \$25 for each and every offense, to be sued for and recovered as provided in section 7 of this act.

Sec. 6. It shall be unlawful for any person to destroy or remove from the nest of any prairie chicken, grouse, or quail, with intent to violate, any eggs of such fowl or birds, or for any person to buy, sell, or have in possession, or traffic in such eggs, or willfully destroy the nest of any such birds or fowls; penalty, \$5.

Sec. 7. All prosecutions and suits for violation of the provisions of this act shall be brought by any person in the name of the people of the State of Missouri against any person or persons violating the same, before any Justice at the Peace of the county in which such violation has been taken place, or before any court of competent jurisdiction; one-half of the amount recovered in any such suit shall go to the school treasury of the township in which this act shall have been violated, and the other half shall go to the complainant. The interest of the complainant in the suit so stated shall not affect his competency as a witness in any such suit.

Sec. 8. All suits under this act shall be commenced within one month from the time the offense was committed.

On motion the season for snipe was extended to 1st May. Delegates were appointed to attend the National Sportsmen's Convention, to be held in Cleveland, Ohio, next June.

GAME LAWS IN INDIANA.—The sportsmen of Indiana are busily engaged in organizing a State Sportsmen's Association, in order to provide better means for the protection of game and fish. A large meeting was held at Indianapolis last week for this purpose, Judge Byron K. Elliott in the chair, and S. T. Beck, Secretary. On motion a committee of five was appointed to inquire into the proposed amendments before the legislatures, and to draft such resolutions as they deem necessary, to be submitted to the Legislature at its present session. Mr. Winston P. Noble suggested that a committee be appointed to look after the game law especially, and allow the first committee to attend to the fish law exclusively. Judge Elliott was in favor of this separate committee. He also desired that some law be passed for the protection of hunting dogs. A committee, consisting of Mr. S. T. Beck, Mr. Alex. C. Jamison, Mr. E. Bomberger, Judge B. K. Elliott and Mr. O. H. Porter was appointed to correspond with clubs for the purpose of calling a convention of delegates to form a State Association. The meeting then adjourned.

At a meeting held at Binghamton, N. Y., of which interested in field sports and in favor of enforcing the laws for the preservation of fish and game, the Otsego Club, of Broome county, was organized, and the necessary steps taken to join the State Sportsmen's Association. The following officers were elected:—President, Geo. W. Keudall; Vice President, James S. Gillespie; Treasurer, George A. Kent; Secretary, James Harrison.

The Missouri Sportsmen's Club and Game Law Association, of St. Louis, has been in existence one year. It has a membership of over one hundred prominent business and professional gentlemen. Through its influence, the last Legislature passed laws protecting game and fish, which, if properly enforced, will be beneficial to the State. It is now raising funds to secure suitable club rooms that shall be a credit to its members and the city, and funds have been liberally subscribed for the purpose.

TO ADVERTISERS.—Dealers in the various descriptions of goods required by sportsmen for the coming season are unwittingly doing themselves damage by delaying to advertise. We who are in constant communication with sportsmen in every section of the country, understand their requirements perfectly. We know that it is their habit to prepare their outfits and select their localities many weeks in advance of the season, and they are even now addressing daily letters of inquiry to us as to preferred Summer resorts and angling grounds. Rifle clubs, too, are preparing for practice at the ranges as soon as warmer weather permits. Boat builders are receiving orders for yachts and all craft. New ball clubs are organizing, and require their outfits. If dealers will only examine our Correspondents Column each week, they will see how multifarious are the wants of our readers, and how little they seem to be informed as to where the articles they need are to be obtained. We freely give such assistance as we can, but we think it the duty of tradesmen to advertise their goods, and in this way serve themselves and intending purchasers. Any letters of inquiry carry the apology that the editors have examined our columns in vain for what they want. Really, advertisers do not yet appreciate the value of FOREST AND STREAM as a medium, or they would use our columns more liberally. Notwithstanding, we have repeatedly published the voluntary testimony of such firms as Andrew Clark & Co., Kimball & Co., Ward Burton & Co., H. Holdbird, C. F. Orms, Frank Good, and Clarke & Alder, that our paper amply repaid their investments, and rapidly increasing circulation week by week makes the arduous still more positive. The great advantage of this paper over ordinary journals is in the fact that every one of its readers is a user and buyer of articles pertaining to some one of the various pastimes which it is specially devoted. All parts of the paper are mined with careful scrutiny, and no inquiry ever went unheeded in its columns without an answer. The Advertising Department should be a complete compendium and directory

for all sportsmen's goods, out-door resorts, hotels, and routes of travel. We print landlords' cards at most reasonable rates, because they especially serve the necessities of our readers. Owners of shooting boxes and angling resorts will be greatly benefited by keeping their cards in our paper during the entire season, there being a uniform charge of \$10 for any period not exceeding six months. We wish to make this a special feature for the present year. It will save us the trouble of answering five hundred inquiries, and enable all our readers to select localities for themselves. We confess to an ordinary degree of self-interest in this matter, but cannot but feel annoyed that advertisers and purchasers, so persistently in search of each other, should be groping in the dark, when we can aid them so much by the light we offer.

THE "BIG HUNT."

WE have received a half dozen additional communications protesting against Col. McCarty's contemplated hunting expedition this year, but as they were written prior to the publication of Mr. McCarty's disclaimer and explanatory letter printed in our issue of Jan. 14th, and raise no new points of objection, we cannot afford space for them. We have one letter from a United States Army Officer stationed near the Texas border, who says the scheme is a good enough one, "if the route were practicable." It seems to think that McCarty intends to go due West across the Rocky Mountains. In order to define exactly the route to be taken, Col. McCarty has prepared the following sketch in detail:—

FIFTH AVENUE HOTEL, NEW YORK, Jan. 19, 1875.

EDITOR FOREST AND STREAM:— You desire to be assured of the practicability of our route from Dallas to Denver. Well, from Dallas we pursue a northwesterly course for thirty-five miles, through some of the "Trinity" south of Fort Worth, known as the "Cross Timbers" of Texas. This we follow for some twenty miles, through a country abounding in deer, from some turkeys to bears. From there we go west towards the Brazos to Westford, and in passing near the elevated plains and gentle slopes we encounter the golden plover in countless thousands, which affords range by its food, the cathartids, and its feathered legs. This is a most valuable bird. After leaving the city of Westford we travel again North-west, to Fort Richardson, twenty-eight miles, where we camp for several days, sending out parties to hunt on the Clear Fork of the Trinity and the Brazos Creek valley for turkey, partridge, grouse or bear. From this point I will detail parties to hunt the Lost Valley and Turkey Creek country. These twenty-eight miles, which we camp for the Salmata and the burning of Warren's skin. Here we camp, and hunt turkey, deer, antelope, bears, cougars and small game. After resting and hunting for several days, we go on through Beckham to Fort Griffin. Here we camp for several days, and prepare for good by the road to civilization for two months, for we will not again see a white man until we cross the Snake River. After leaving Griffin we proceed to the forks of the Brazos, and make a short camp up on the valley. Here we will have the cream of the buffalo hunt for 30 miles up and down the Double Mountain and Salt Fork of the Brazos through Carter's Valley by the Copper Mines and Raven Roost Lake. The buffalo, antelope, deer, wolf, and wild turkeys by thousands here abound. After all these pleasures, we will pass on to the head of the Brazos; from thence by Mackenzie's trail to Fort Bascom, New Mexico, from thence up the Valley of the Rio Grande to Pueblo, where we fish.

At this point we leave our teams and take the railroad and proceed to Colorado Springs and the "Garden of the Gods." While at this place, those scientifically inclined, can inspect the Silver Mines, climb Pike's Peak, or hunt eagles in the arroyos, &c. Here the hunter first finds his richest and rarest game, the brook trout, which abounds in the Twin Lakes, in Chalk Creek and the South Platte—in fact, in all the streams around. From Colorado we reach Denver by rail, sixty miles. Now, Mr. Editor, as I have given you my programme for a portion of the trip, and I hope satisfied my many inquiring friends that I am acquainted with the ground, and that I have a practicable route to Denver from Texas, I will at some future time give you the remainder of the trip to California, and Oregon.

Your sarcastic friends do not seem to understand that we are some thousand miles further South than they, and that everything, even to the wild state again, will be more sportsman and gentleman, not pot hunters, as they assume, and I think that they and entirely misunderstand the better class of English gentlemen; in fact, do not think he understands who are English gentlemen, or their habits.

Yours very truly, W. C. MCCARTY.

We have another batch of letters, pro and con, which limited space prevents our printing in this issue.

FLORIDA.—We compile our current Florida news chiefly from the Jacksonville *Floridian* and the St. Augustine *Press*. The former is devoted to the agricultural interests of the State, and the latter to local gossip and general news. Both are of value to Northern people who contemplate either a settlement on a temporary sojourn in the Flowery Land. Editor Whitney, of the *Press*, pays special attention to sensible topics, watering place pastimes, hotel whisperings, town improvements, home statistics, distinguished arrivals, big vegetables, fish stories, marvels, antiquities and rumors. He also kindly acts as local factotum for FOREST AND STREAM.

The foregoing is original; what follows is borrowed.— No locality in the State presents a finer opportunity for yachting than the bay at St. Augustine. There are numerous fine yachts which convey parties to the many points of interest; among which we would suggest a trip to the North beach; the Sand hills; the locality where Gen. Ogleshorpe planted his guns; the South beach; the North River, or a visit to Fish's Island; the old and new light houses on Anastasia Island. The new light house is one hundred and sixty-five feet high from low water mark. The old light house was built more than a century ago. It will soon be mentioned as a relic of the past. The Coquina quarries are but a short distance from the lighthouses. The formation of Coquina rock extends along the coast for one hundred miles.

A pleasure trip also is one to Matanzas, where there exist the ruins of a Fortress, which are supposed to be of more remote origin than any structure in the Ancient City. A party left here on Tuesday of last week for this locality

composed of Rev. Mr. Reynolds and a number of his family, Mr. J. Bakely, of Philadelphia, and Mr. Mollison. Mr. Mollison tells us of the gloriously good times they have there. The fishing is excellent, especially the blackfish, which are very large, some weighing as high as two pounds. Sheepshead and sea bass are also successfully

The hunting party composed of D. Edgar, N. Edgar and Chas. J. Cary, which left here some six weeks ago for Halifax River, returned on Monday last, after having some good hunting, and killed during their absence some forty deer.

Hon. Joseph W. Savage and Bishop Manly, of Mobile, arrived at St. Augustine last week.

The largest shipment of Florida oranges ever made by one boat at one time was carried on the City Point last week from the St. Johns, and returned principally for the north-east. There were 800 packages, numbering about half a million of oranges. In the lot were 4,000 taken from a single tree, grown by a lady residing near Palatka; she was paid for them \$107, or at the rate of two and a half cents a piece.

Several new steamers have been placed on the St. Johns this season.

The Palatka *Herold* of the 26th ult. says:—Mr. William Hargrove of this place sold his oranges for \$9,500. This grove is situated five miles above Palatka, on the east side of the river. The grove numbers 300 bearing trees, and has yielded this season 75,000 oranges.

OUR FLORIDA EXPLORATION.—Through a Jacksonville letter, we learn of the successful journey of our special Florida Commissioner, "Al Presco," from Cedar Keys along the west coast, and by way of the Caloosahatchee River to Lake Okechobee, which he has succeeded in reaching by a new route which has been believed altogether impracticable. Evidently our correspondent has had no opportunity for communicating notes of his travels; but we hope soon to lay an instalment of them before our readers. The subject-matter must prove interesting, and will prove valuable, whether published now or after the expedition is completed.

Shot Gun and Rifle.

GAME IN SEASON FOR JANUARY.

Hares, brown and gray. Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Fowl.

Under the head of "Game, and from 1865 to 1868" we can find this species in general terms the several varieties, because the laws of States vary so much that we are unable to particularize; we could do so only so far as to publish those entire sections that relate to the laws of game in question. This would require a great amount of our space. It is therefore to be founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempt to assist them will only create confusion.

FUR TRADE.—Despatches from Ottawa, Canada, say that the fur market is dull. Traders say a great deal of fur is held back by trappers, owing to the reduced prices and in anticipation of the figures advancing. A number of fur dealers are in that city buying winter stock. Muskrat skins have advanced from five to fifteen per cent, and beaver skins have fallen fifteen per cent.

JAN. 21ST.—FURS AND SKINS.—THE QUOTATIONS ARE:

Table with columns: According to size, color and quality, Northern, Eastern, Western, Southern. Rows include Beaver, dark per pcc; Beaver, pale; Bear, black; Bear, brown; Badger; Cat, hoarse, black; Fisher; Fox, white; Fox, cross; Fox, red; Fox, blue; Fox, gray; Fox, black; Lynx; Marten, dark; Marten, light; Mink, dark; Mink, pale; Mink, black; Otter; Muskrat, full; Muskrat, white; Muskrat, spring; Muskrat, kit; Raccoon; Seal, fur; Skunk, black; Skunk, short striped; Skunk, long striped.

In Florida, the close season for deer is from March 1st to October 1st; quail and turkeys from April to August, though we think they should not be killed after 1st March. Fishing is better in February and March than earlier in the season. The best game fish—the channel bass, or red fish—is not taken much before March, and the whitefish, pigfish, and salt water trout are more numerous later in the season; so also the sheepshead, though it is less fit for the table in March, being about to spawn.

New York.—Painted Post, January 15th.—I saw an article in a late issue of the FOREST AND STREAM relating to an antlered doe. Last November I had the good fortune to assist in killing a yearling doe with horns. They I saw at quite a very advanced age. They were very large, and gave appearance of being about two inches long from the skull. I have killed yearling bucks with horns no larger than these. I sent the head to Elliott Cowes, of the Smithsonian Institute. Deer have not been so plenty here before in twenty years; over seventy-five have been killed in this town alone during the past season. Ruffed grouse here is also been very abundant, while foxes are so plenty as to be

The first thing to find out about a boat is her age. Five years is about as old as is desirable under ordinary circumstances, as boats, as they are built now-a-days, begin to get old when they pass this age. However, if a boat is very strongly built and has been well used, she may be some years older before showing signs of decay. But it is not best to buy a very old boat, as the repairs will cost almost as much as it would to build a new one. The timbers should be examined closely and the planks all sounded and the condition of the batts carefully noted. The planks near the garboard should be particularly observed, as there will be a leak there if they are not pretty sound, which cannot be stopped without putting in new planks. If the boat has a center board the case should be examined round the bottom, as it is a great place for leaks.

The kind of fastening used is also an important item to look to. Copper is undoubtedly the best, as there is no rust from it. The great objection to it is the high price. Builders seem to favor galvanized iron, as it is much cheaper than copper and does not rust to any extent. But a boat fastened with common iron is to be avoided, as the rust eats right into the wood. A boat painted white cannot be kept looking decent after she is a few years old if fastened in this way.

Laytrunks are not near so good as smooth sealed boats. They are not so strong and are much more easily strained. If they once begin to leak it is almost impossible to stop them. They can be built ever so much cheaper than the others, and always sell a good deal lower, but they are growing more unpopular every day, and there are not many of them built except small ones. So long as a boat's hull is in good condition, the state of the rigging and spars is of minor importance, as the expense of putting these in shape is not very great.

There are many who get tired of their boats and do not take the trouble to keep them looking decent, neglecting to paint them each season. When they want to sell they find it hard work, as people are apt to judge a good deal from outside appearances. This is foolish, as boats under these circumstances may be in first rate condition otherwise, and the expense to the buyer of repainting should not prevent him from buying as he may get a bargain.

READY ABOUT.

SOMETHING NEW FOR YACHTMEN.—In our issue of 27th August, 1874, speaking of "The Commodore's Signal Book and Yachtsmen's Yacht Manual," we strongly recommended the work to our aquatic friends in these words:—"The book has evidently been compiled with great care, and from official sources, and we hope that its reception this year will warrant its becoming an *Annual*. No expense has been spared in rendering it most attractive, and the paper, typography, printing of the charts and general excellence and taste of the work throughout, render it by far the handsomest volume of the kind we have ever seen."

We are glad to find that our remarks have been endorsed by the Yachting Fraternity, and that the work will henceforth appear as "Manning's Yachting Annual." Mr. Manning is Secretary of the Jersey City Yacht Club, and one of its Directors, and is also either a member or an honorary member of many of our principle Yacht Clubs. With the facilities which he possesses, combined with his ability and energy, the work must take and hold a place in yachting literature, which has never been supplied up to this time. "Hunt's Universal Yachting List," an annual which our English coasters have to be satisfied with, is "nowhere," and our American yachtsmen have good reason to thank Mr. Manning for his work, and be proud to possess a copy of it. To insure accuracy and obtain full information in the preparation of this manual book forms of Register and Record are sent to every secretary, measurer, yacht owner, builder, and sailmaker, one form for each yacht to each; Mr. Manning thereby obtains five returns for every yacht.

COLLEGE REGATTA.—The Rowing Association of the American Colleges met at Hartford last Thursday. The following delegates were present:—

- Amherst—R. M. Smith, G. W. Clark.
- Brown—S. J. Woodbury, E. Lawton.
- Columbia—E. L. Rapallo, J. K. Rees.
- Cornell—Chas. Harmon, — Ensign.
- Dartmouth—S. B. Wiggins, J. Foster.
- Harvard—H. S. Van Duzer, S. D. Warren, Jr.
- Princeton—A. A. Alexander, B. Noell.
- Trinity—W. J. Roberts, J. Billington.
- Williams—F. Johnson, C. Gilbert.
- Wesleyan—V. H. Down, H. C. Hermanns.
- Yale—G. H. Ferry, R. J. Cook.

The first business transacted was to vote on the legality of the assemblage, as the regular meeting should not come off until April.

The New York city college had no delegates present, as it does not intend to be represented in the regatta.

After the election of some officers a discussion of the rules for rowing in races was inaugurated. The most important question in this was the rule which requires every boat to take its own water, from buoy to buoy, and not to wash any competitor; and also, in case of a foul, to give the referee the right to order another race, except in case the boat fouled shall be the winner. Committees from New London and Saratoga were present to present the claims of each place as the scene of the regatta. The New London committee was headed by Mayor Waller, and presented a written statement, as to its showing of advantages. It was voted to hold the regatta on Wednesday, July 14, but the hour was not named. Columbia moved that it be held at Saratoga, and on that motion speakers were excluded, and the members of the association held a private session, which was quite successful. In the secret session there was a tie between Saratoga and New London, and the chair voted in favor of Saratoga. The convention

unanimously adopted the report of the committee of the whole.

At the evening session a long discussion arose on a motion of Harvard to allow coxswains, and it was agreed that with coxswains better time can be made. Cook, of Yale, opposed the motion as forcing too radical a change. The motion prevailed—Yale, Wesleyan, Dartmouth and Cornell alone opposing it. Subsequently Cook moved that it be left optional with crews to take coxswains or not. This was passed by the casting vote of the chair. Columbia voted for it, as well as for the original motion. Mr. Ferry, of Yale, moved that each course be buoyed on each side at least once in each eighth of a mile, and was passed, Columbia and Harvard opposing. It was voted to have two authorized witnesses, not college men, to view the race and testify in case of disagreement. It was also voted to give each college a judge, also to tax each one \$25 and give the usual prize colors.

The regatta committee selected were:—Eustis, of Wesleyan; Dayton, of Princeton; and Ferry, of Yale. Adjourned to meet at Springfield, April 7.

ROYAL HALIFAX YACHT CLUB.—The annual meeting of this club was held at the Club House, Renfrew-street, Halifax, on Monday the 11th of January. The meeting was well attended and much enthusiasm was manifested by those present in the welfare of the institution. The medals given by His Excellency the Governor General for competition in 1874, and won by the yachts *Squirrel* and *Cygniet*, were presented to their respective owners. The following gentlemen were elected elite boaters for 1875:—

- Commodore—Alex. W. Scott, Esq., yacht *Cloud*.
- Vice-Commodore—Nixon Green, Esq., yacht *Petrel*.
- Rear Commodore—C. A. Hutchins, Esq., yacht *Kate*.
- Treasurer—William Compton, Esq.
- Secretary—F. C. Sumichrast, Esq.
- Assistant Secretary—W. D. Creighton, Esq.
- Auditors—William Lawson and W. W. Groom, Esqrs.
- Sailing Committee—James Kerr, John Muir, C. B. Bullock, W. G. Wiswell, Thos. Wesson, Esqrs.
- House Committee—Flag Officers and Secretary, F. W. Bullock, W. W. Groom, J. K. Murray, Esqrs.
- Measurers—D. McPherson and Thomas J. Bentley, Esqrs.

MR. BISHOP'S CANOE CRUISE.

PAPER CANOE, "MARIA THERESA," LAKE WILKINSON, N. C., January 13, 1875.

EDITOR FOREST AND STREAM:—Having followed the intricate water courses into the head from Bentons, past Boggs, Reber, Brown, New River, New Topsail, Old Topsail, Rich and Queen's Inlets, I could not proceed further inland to Cape Fear, on account of the short waters and numerous bays of "season" systems. At the Emma Nixon plantation, twelve miles from Wilmington, the canoe was put on a cart and hauled to the city, from which I reached Lake Waccamaw, by rail thirty-four miles. This beautiful lake at Flemington Station is eleven miles long by five miles wide. Mr. Short owns nearly twenty thousand acres of land in this vicinity. The crooked Waccamaw flows out of the lake into the sea, and with the Pedro, flows past Georgetown, S. C. There it is less than one hundred miles from land from this point to Georgetown, the river is so crooked that I must follow its current one hundred and sixty-five miles to reach the city, and one hundred and eighty-five miles to reach the sea coast.

To-day I will follow the river seventeen miles; yet at night I shall be only four miles from the point of departure. From the Lower Waccamaw the Pedro will be reached by paddling through Bull's Creek; from my course will be through the rice plantations of that river to the sea. I hope to reach Charleston in about fifteen days' time, via Bull's Bay and interior passages along the coast. I have received so much kind attention from the people of North Carolina that I shall never regret having passed through the sounds and coast rivers of their State.

I remain, very truly yours, N. H. B.

The Colleges.

—The Yale Record says the new college boat house will certainly be finished in time for use in the Spring—a very handsome building. The lower story will be occupied principally for storing boats, the upper story will contain the club room and dressing rooms, and is surrounded by a very broad veranda, which will be a delightful lounging place during the Summer term. The roof is steep, with projecting windows, and gives the building something the look of a Swiss chalet. The interior arrangements will be very complete and perfect.

HARVARD UNIVERSITY, January 11, 1875.

EDITOR FOREST AND STREAM:—The Christmas recess having ended we are back at our old routine. The cold weather has put a stop to all out of door sport, and we have to resort to the "gym" entirely for exercise. New rowing benches are now being put up in the gymnasium, which are said to be very great improvements on the old ones, as they give one who is "coaching up" a chance to practice all the movements required, as well as the boat itself. There is a report that the "Giant" of '77 thinks of trying for the "Varsity." He will probably need to train hard in order to stand a chance with those who are already in good rowing trim. MARTIN.

HARVARD UNIVERSITY, January 15, 1875.

EDITOR FOREST AND STREAM:—The Freshman class held a meeting on Wednesday last to take action in regard to boating matters. Mr. Otis, of the "Varsity," addressed the meeting. It was voted that a crew be sent to the next regatta, and several hundred dollars were subscribed on the spot to defray expenses. There are quite a number of men already at work in the gymnasium, and it is probable that the "Varsity" will be a very strong crew.

The Chess Club, at their regular meeting, voted to have a tournament for determining the champion player of the club. Each member who hands in his name is to play a game with each other contestant, and he who wins the most games will receive the first prize and the champion cup, the next best player taking the second prize. The prizes are very handsome sets of chessmen.

The Juniors are not very enthusiastic over boating matters, and at the meeting last week only about a baker's dozen were present. The Collegiate Rowing Association endowed an unusual degree of unanimity and good feeling between the colleges at the recent meeting, although the transactions were not entirely satisfactory to Harvard, nor to what she deems for the best interests of college boating. The Summer course, if the proposed conditions are agreed to, and the buoyed course, will undoubtedly prove satisfactory to all. The substitution of the regatta rifle of the National Rowing Association is a decided improvement. The final vote in regard to coxswains is decidedly contradictory to the previous decision of the members; but as it is the will of the majority, "so let it be." It seems as though all boats should be, as near as possible, on the same footing, and this can not be if some are allowed to leave their

coxswain at home. It is hardly probable that those colleges who voted for coxswains will be very eager to avail themselves of the privilege of carrying them when it is absolutely certain that Yale, Amherst, Columbia, Wesleyan, and others will row without them. All admit that coxswains are desirable, but reasons of expense, &c., overcome any petty considerations, such as the success of the next regatta and the introduction of better principles. MARTIN.

PRINCETON COLLEGE, January 9th, 1875.

EDITOR FOREST AND STREAM:—The intercollegiate literary contest has resulted very satisfactorily, as far as Princeton is concerned, Mr. A. Marquand, '74, having been successful in obtaining the first prize in essay writing on this occasion.

The gymnasium possesses new attractions this term, in the shape of four handsome Colander fashioned billiard tables, the gift of Mr. Pine, of New York, who has already extended his hospitality to the students of Princeton by the magnificent present of \$100 to the '77 boat crew last Spring.

Two of our oarsmen—Misses Ely, class of '77, a member of the University crew, and Reid, '74, of the Freshman crew—distinguished themselves by walking from this place to Washington, D. C., during the past vacation. They made excellent time, and performed the feat very creditably, notwithstanding the bad condition of the roads.

Both the University and Freshman crews have begun work in the gymnasium. QUINCY.

PRINCETON COLLEGE, January 16, 1875.

EDITOR FOREST AND STREAM:—The regular meeting of the Princeton Boating Association took place to-day. The report of the delegates to the Regents Convention, which met at Hartford, on Wednesday, was read, and unanimously adopted. Though, unfortunately, unsuccessful in her efforts to introduce rowing with coxswains, Princeton has much to congratulate herself on, in securing other advantages paramount, almost, to this. The principal honor that she received was the election of Mr. J. C. Dayton, '73, as the second member of the Regatta Committee, which is composed of three representatives—one from each of three colleges belonging to the association. The subject of coxswain was discussed by Captain Nicoll to whom, who showed very clearly that although it might be better for all the colleges to row with coxswain, if they would so agree, still, Princeton will not suffer any inconveniences or disadvantages from those which may befall the other colleges. The contrary, she is possessed of many advantages, perfectly apparent to any one familiar with her rowing course, which no other college possesses. The semi-annual election of officers of the Association also took place to-day. A. Alexander and B. Hall, '75, were re-elected respectively, president and vice president; F. Marlow, '76, was elected secretary, and W. A. Butler, Jr., '76, treasurer. QUINCY.

NEW HAVEN, January 16, 1875.

EDITOR FOREST AND STREAM:—The Junior appointments were announced a few days since. They are too long for publication, and hence only the highest are given:

Philosophical Orations—John B. Gleason, Arthur T. Hudley, William W. Hyde, John Kendrick, George W. Rollins, Edwin D. Worcester.

High Orations—Elisha S. Boston, David W. Brown, George E. Bushnell, George E. Conyer, Leverett H. Sage, Charles H. Wilcox, Frank A. Gaylord.

In all, they number sixty-five, which is about the usual quota for a class numbering what '75 does. On Wednesday the Literary Board was to be elected from the Junior classes. There are to be chosen five editors for the coming year, who shall conduct the Yale *Literary Magazine*, for the student, and said to be the best college magazine published in the country. The titles of the two Junior societies, the following ticket will in all probability be elected: J. B. Gleason, E. P. Howe, W. W. Hyde, J. M. Marvin, E. R. Smith. The ticket is generally decided upon in a society caucus before the election, and the meeting of the class is merely for form, as the non-voters in a class do not vote in the matter, although nearly constituting one half of the class. All college is discussing the "Promenade," which is to occur on the 24th of February. Fine music has been engaged and an abundance of invitations sent out. On Monday evening next the Princeton gives his first reception to the Seniors of all the departments.

About the Rowing Association which met at Hartford and passed so many good resolutions which will follow out, will surely result in a fair race, a word must be said. We are glad to notice that less wrangling and needless dispute over trifles was indulged in than ever before. The way in which the mooted questions were met and discussed is surely creditable to the delegates. We are sorry that any new colleges were admitted, as the number in the association before was large enough, and we applaud the action of our delegates with the best of feelings. We are glad that Saratoga was re-elected, as well as that the regatta will be held on the 14th of July, and we hope that the final decision may be in its favor. The committee who have the whole matter in charge is constituted as follows: J. E. Eustis, '74, of Wesleyan; J. C. Dayton, '73, of Princeton; and G. H. Ferry, '73, of Yale. To them we all look for a successful regatta, and may we not be disappointed. K.

National Pastimes.

For Forest and Stream. MY FIRST CURLING MATCH.

THE memory of my first curling match carries me far back to the early years of rising manhood, long before I had thought of crossing the sea. That now separates me from that Scotland I could not tell. I was only a few miles distant between me and the scene where I first saw spurs, as remembrance carries me over the quarter of a century of intervening time. The figures of those who took part in that little drama of my youth appear to me now more vividly as the years pass by; and now that the snell breath of the "ruler of the varied year" sharpens the air and braces the relaxed nerves, I am polishing the salus staves for work in the "Glen Park" memory as I think that I may have away to the picturesque valleys of Tulliallan.

We were to play a neighboring parish a two-rink match for our own glory and the benefit of the poor, a bow of meal having in the good old fashion been made the stake. It is a pity, by the way, that in these hard times of misery and want, the same custom is not in vogue here. I hope yet to see it introduced, were it only that the game might be transferred to American soil. I am sure that the money which his charitable intent to recommend it, and which is indissolubly associated with the pastime in the mind of many an Old Country cur'er. But to return, I was but a stripling at the time of which I write, and plumed myself not a little upon being chosen to play in a parish match. The skip of our rink, Tom Kennedy, a farmer in the neighborhood of Kilmarnock, had undertaken to teach me the game in which he professed to be an expert. I was to be taught by dint of patience and the strictest attention to his instructions, I might be a credit to him yet. I had arranged to sleep at his house the night before the match, and as clear of his fireside on the long Winter evening is as clear before my eye at this moment as the reality was then, "Fast by the ingle, bleazin' finely" we sat, while the old man, pipe in hand, and with the flickering o'er and lighting up his enthusiastic face, dilated upon the bonnie days of his earlier years, and explained the almost miraculous

shots he had played. Like many another crick, he had been great in his dot, and had, ye' know, a fair right hand to boast than some I have met since. "Ere we then, though his buffets were "wearing thin and bare," he could do rather more than hold his own as a skip against any player in the countryside. Early in the morning he was at my door. "Haste 'e, man, an' rise; the parritch is mald ready, an' his gain to be a graun' day for curlin'!" "I'll be doon in a jiffy," I replied, and jumping into my clothes, I was down stairs in a few minutes. Hurrying through breakfast in a style which we were both doomed to regret ere long, and which did no justice to the gudewife's preparations or cookery, we were soon ready to start. Mrs. Kennedy wrapped Tom up warmly. "Noo gudeman ye'll dae. Young bluid's het enech 'e' fise!, but ye'll be wane the wa'p o' yer gravat 'ere ye get to the loch, for there's a snell wind blawin'." There's yer besom, as braw a man as ye'er mad; an' both o' ye be sere an' play weel. An' ye' pair's usin' meel, an' the bow o' meel than theither ne'er do wells." Tom laughed at his wife's parting injunction, as we stepped out on our walk to the woods surrounding the place of the coming strife. It was indeed a lovely morning. The air was sharp and frosty, and the landscape coated with a thin covering of rime glittered under the dimly visible morning sun. We tramped cheerily along, Tom devoting most of the time to giving me a few words of advice. He could weel advise, as he was somewhat of a fluter, and began his discourse accordingly.

"Play as tho' ye were playin' for life an' no for a bow of meel, an' niver think o' finer folk. Keep yer mind on the gem and the chaunel staves an' yer'e on me, and try to dae as I tell ye."

Such was the burden of his song. He told me how to play certain imaginary shots, and illustrated his instructions by anecdotes of his own career, but he invariably reverted to the main point, "Dae as I tell ye," sometimes identified by the addition, "an'—the consequences." It was all that I remembered of his "words of wisdom," and even that little was in danger of being occasionally forgotten. As we neared the loch, we overtook the other two players of our rink, Tom's landlord and the minister of the parish. "Gnid' morn, to," said, Tom began, "the ice suld be gude enech for us to set that boe'ies hame wi' a flea f'ir his lug. The boe'ies ma' be 'dae as I tell ye," sometimes identified by the addition, "an'—the consequences." It was all that I remembered of his "words of wisdom," and even that little was in danger of being occasionally forgotten.

"Gnid' morn, to," said, Tom began, "the ice suld be gude enech for us to set that boe'ies hame wi' a flea f'ir his lug. The boe'ies ma' be 'dae as I tell ye," sometimes identified by the addition, "an'—the consequences." It was all that I remembered of his "words of wisdom," and even that little was in danger of being occasionally forgotten.

As we neared the loch, we overtook the other two players of our rink, Tom's landlord and the minister of the parish. "Gnid' morn, to," said, Tom began, "the ice suld be gude enech for us to set that boe'ies hame wi' a flea f'ir his lug. The boe'ies ma' be 'dae as I tell ye," sometimes identified by the addition, "an'—the consequences." It was all that I remembered of his "words of wisdom," and even that little was in danger of being occasionally forgotten.

and at last Tom succeeded in cluffing the vanquished into throwing down the gamulet for another match. "Ye'll hae the pair rates doon to naething afore we're done wi' ye," said he as we bade them all good bye. When we reached home Mrs. Kennedy's salute was, "Weel, gude-morn, did ye won? But I see ye hae, tho' ye're laith tryin' sair to look dooce and gium. Come awa' an' no keep the beef an' greuce stamin' any langer." And "beet an' greuce" we had in a style which is but poorly imitated by the "soured beef and cabbage" of the curlers' dinner in America.

I left on the following morning, and was never again fortunate enough to play under my old skip. He is dead now, but Bogie will never have a more enthusiastic or finer curler. He is the foremost figure in the happy memories associated with my first curling match, and I cannot say that I ever met his equal, though it is just possible that the eyes of youth may magnify his prowess. Seeing him stand beside the ice holding his stick firmly to the side, and indulging in the most frantic contortions of body and feature, as though by his own motion he would lead direction to the stones, is one of the most vivid of my early curling recollections. Even now his staitawr though aged form, is recalled to me whenever I see a skip swaying to and fro in the same strange fashion, as if trying to make the will of the curler reach the roaring stones.

CURLING.—The event of last week among the curlers of the metropolis was the grand match North vs. South, it being the fifth game of the series which has thus far been held at Central Park. The division made thus far between the north and south of the Clyde as opponents, and, as heretofore in these matches, the South bore off the palm. The emblem of victory is the medal presented in 1870 by Mr. Dalrymple of St. Andrew's Club, which so far has always been won by the Southern players. The following is the score of the game:—

SOUTH.		NORTH.	
Rink.	Skip.	Rink.	Skip.
1. J. Fisher, Cal., N. Y.	15	D. Bailey, Jersey City	33
2. S. McCouche, St. And.	35	W. Ferguson, St. And.	32
3. G. Lester, N. Y. C.	35	J. Anderson, Barns.	19
4. A. Love, Jersey City	18	J. Adie, N. Y. C.	32
5. J. K. Smith, Irvington	29	P. Scott, Cal., N. Y.	31
6. R. H. Neeld, Irvington	29	J. H. B. B. B. B.	29
7. A. Barr, Thistle	27	J. Watt	25
8. J. Stevens, Jersey City	25	A. McIntosh, Cal.	25
9. J. B. Neeld, Irvington	25	J. H. B. B. B.	25
10. D. Meeks, Barns.	20	G. Frazier, Yonkers	25
11. D. Reid, N. Y. C.	20	A. Robertson	25
12. G. Tompkins, N. Y. C.	20	D. Foulis, Cal.	25
13. J. Kellock, Yonkers	20	J. Stewart, Yonkers	25
14. D. Manson	20	W. E. McIntosh	25
15. G. Clemerson, St. And.	20	W. C. Clark, N. Y.	25
Total	408	Total	688

In addition to the Dalrymple Medal for the winning side, the Hoagland flag to the skip making the best score over his opponent was won by Mr. D. Bailey, of Jersey City, while a silver medal to the second best skip was won by Mr. G. Clemerson, of the St. Andrew's club, Mr. Binley skipping for the North in Rink No. 1, and Mr. Clemerson for Rink No. 15 on the South side. After the match, the players enjoyed a good and substantial dinner at the Casino, which was in turn followed by speeches and songs.

The following games have been played at Central Park:

January 8—Caladonian vs. Yonkers	81 to 58
January 9—New York vs. New York	59 to 60
January 9—St. Andrew vs. Ivanine	59 to 47
January 9—New York vs. Thistle	82 to 53
January 10—Caladonian vs. New York	72 to 61
January 11—Fifehead vs. Dumfriesshire	81 to 29
January 11—Caladonian (Brooklyn) vs. Thistle	45 to 23
January 11—New York vs. Thistle (Brooklyn)	37 to 25
January 11—St. Andrew vs. Barns	45 to 31
January 12—New York vs. Caladonian	77 to 51
January 12—Thistle (Brooklyn) vs. Caladonian	67 to 25
January 12—Caladonian vs. Caladonian (Brooklyn)	60 to 28
January 12—Thistle (Brooklyn) vs. Caladonian	61 to 26
January 12—Company D vs. Company D	37 to 15

At the recent meeting of the New York Caladonian Club the Treasurer's report showed a balance in hand of \$33,872.78, showing good financial management of the club affairs. The election for committees for 1875 resulted as follows:—Games Committee—John West, James Grimmond, A. F. Dykes and D. B. Fleming; Library Committee—Robert A. Gynn, S. G. Hagen, J. Wood, B. Hamilton, Jr., and A. Dykes; Reception Committee for 1875—John Henderson, Kenn. Mackenzie, and Angus Cowan. It was resolved to have, as in former years, a curling match, as also a checker match.

A closely contested and well played game of base ball on ice took place January 16th on the large lake at Prospect Park, the occasion being the return game of the season between sides chosen by Messrs. Barnie and Bucee. Good pitching was shown by Burdock and Cassidy, and excellent catching by Dunn and Barnie. In the first inning Barnie's side got the seven runs, but afterwards they only added a single, three blanks in succession falling to their share of Burdock's tossing. The score below gives the figures:—

BUCKE'S SIDE.				BARNIE'S SIDE.			
R.	B.	P.	A.	R.	B.	P.	A.
Burdock	0	0	0	Cassidy	0	0	0
Clair	2	1	0	Dudge	1	0	3
Raynor	1	0	0	Barnie	0	0	2
Wells	3	0	0	Wells	0	0	0
Dunn	1	0	0	Quinn	0	0	2
Reddy	1	0	0	Spelman	0	0	1
Gough	0	0	0	Wells	0	0	0
Chart	0	0	0	Eliester	0	0	0
Crosby	0	0	0	Ganier	0	0	0
McLaughlin	0	0	0	Wells	0	0	1
Total	7	4	15	Total	8	5	15

There is every prospect of there being an "Elm City nine" among the contestants for the whip pennant next season. Mr. W. S. Arnold, of Middletown, with untiring energy has been canvassing New Haven for some time for subscriptions, in order to put the affair on a sound basis. The money needed is \$3,000, and it is very likely that it will be raised, and that the following players will be engaged for the season:—Banker, of the Eastons, catcher; Britt, of the Atlantics, pitcher; Lathan, of the Torontos, first base; Dorseher, of the second base; Boyd, of the Hartfords, third base; J. Ryan, of the Baltimores, left field; Odell, of the Atlantics, centre field; Tipper, of the Hartfords, right field; with Tommy Barlow, of the Hartfords, short stop, and Nichols, of the S. B.'s of Bridgeport,

to substitute and change pitcher. This will be a good team to start out with, and if the present expectations are realized some good games may be expected between this team and the Yale nine. If the required amount is subscribed, measures will be taken to prepare a new ground, located on Howard avenue, and conveniently reached by the line of horse cars going to West Haven. The project is surely worthy of trial, and if Manager Arnold succeeds in his attempt, to him, and to him only, will belong all the credit and advantages which may eventuate.

Billiards.

A CHALLENGE TO ENGLAND.—Chris. O'Conner, who, by general consent, seems to be the leader of the American billiard world at present, has issued the following challenge to English billiard players. He says:— "I will wager \$5,000 that I can produce two billiard players from New York city who will beat any two English players under the following conditions: Two games of 1,000 points each to be played. One the English game, on an English table; the other the American game, on an American table. The player who makes the greatest number of points in the two games to be declared the winner. I will give or take \$500 to have the games played in London or New York.

Messrs. Roberts and Cook, or Bennett, ought to promptly accept this.

THE CLEVELAND TOURNAMENT.—This exhibition of billiard skill will be opened on January 25th by Messrs. Vignaux and Rudolph, the two greatest players now in this country. Afterwards they will travel West for a week or two, giving exhibitions there, returning by way of Albany by February 5th.

ANOTHER TOURNEY IN BROOKLYN.—The Brooklyn Eagle says that Mr. Samuels has effected arrangements with Messrs. Rudolph, Vignaux, Garnier, and Ubassy, and these three with others are to appear in that city shortly in a regular prize tournament, in which money prizes amounting to \$500 will be contested for. The arrangements will be such as to give ladies free admission and reserved seats in a special compartment of the hall. With the incentive of money prizes, a degree of interest will be imparted to the tourney exceeding that of any ordinary exhibition of games as far as the contest are concerned.

Chess.

CHESS DIRECTORY. Chess Player's Handicappers—Cafe International, 234 Bovey. Chess Club—Townsend-Kaechterberg Cottage, 467 Sixth avenue. Down Town Chess Club—Cafe Metropolitan, Second Avenue Turner Hall Chess Club—Nos. 66 and 68 East Fourth street. Chess Club—Meridian Library, Montague street. Jersey City Chess Club—No. 81 Montague street. Crossen & Lubate's Chess Rooms—Corner Nassau and Fulton streets. New Brighton Chess Club—At Capt. Taylor's, Tompkinsville, L.I. Christian Union Chess Rooms—Fulton avenue, opp. Elm st., 125 Yr.

BOSTON CHESS CLUB.—The annual meeting of the Boston chess club was held at the club rooms in Hamilton place. The following officers were elected for the ensuing year: President, Rufus Sawyer; Vice Presidents, P. Ware, Jr., J. J. Weatherly, Treasurer, Smith Wright; Secretary, John B. Rhodes; Executive Committee—W. A. Garber, C. Chadbourn, A. Hill, D. B. Hallett, and Thomas H. Webb.

THE BROOKLYN CLUB TOURNEY.—The following is the score of the tourney of this club up to Saturday:—

Player.	Games Played.	Won.	Lost.
Spence	17	13	4
Dr. Barnett	14	12	2
Harcourt	14	11	3
Ellwell	12	9	3
Phillips	16	8	8
Mason	10	7	3
Thayer	10	5	5
Perrin	7	5	2
Thompson	7	5	2
Schierero	8	3	5
Peck	8	2	6
Wells	7	1	6
Seaver	0	1	8
Leonard	0	0	0
Wells	0	0	0

THE NEW YORK TOURNEY.—In the record of won games at this tourney the score to date stands as follows:—

Player.	Games Played.	Won.	Lost.
Delmar	47	39	8
Albion	48	38	10
Mason	43	37	6
Perrin	39	32	7
Dr. Barnett	39	22	7

The tourney will close the first week in February.

New Publications.

BOOKS RECEIVED. REPORT OF THE TOPOGRAPHICAL SURVEY OF THE ADIRONDACK WILDERNESS FOR THE YEAR 1873. By Verplanck Colvin. Published by Weed, Parsons & Co., Albany. This highly interesting report is by far the most valuable yet issued on the laws and romantic spot of our State, that mark which is the elysium of mountaineers, anglers, tourists and all lovers of primitive, luxuriant Nature. This volume gives in detail an account of mountains, of lakes and streams, and describes the principal topographical features of the region and the work of the surveying parties. Sketches of the most prominent scenery are given, besides a panoramic view of the principal mountain peaks, and maps of the different sections, with their ponds, streams, forests and ridges. As the work is devoted specially to the labors in detail of the surveying parties, no extracts would give an idea of their mission, technical terms and descriptive scenes being mingled together. The difficulties encountered by the surveyors we can imagine from the sketches, which show them toiling through Mud Lake, or braving their path through the dense forests. The report is complete enough to entice the most fastidious critic; so we may feel assured that the Legislature will not regret the amount of money it expended on this survey. The value of the minerals discovered alone ought to more than counterbalance the cost of the expedition. Of the zoology of the region, the author has had some tracks were found in the most remote parts; but as that animal is now nearly extinct, a law should be passed forbidding its being killed at any season. The beaver, wolf, fox, deer, and other animals were found quite abundantly, the deer being especially numerous. When the park is laid out it will be one of the finest resorts in the world for tourists and sportsmen, and will reflect much credit on the taste and generosity of our legislators.

Prize List!

FOREST AND STREAM,

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c., &c.

It is the OFFICIAL ORGAN of

The Fish Culturists' Association of America.

The Publishers of FOREST AND STREAM

In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,

OR OF

FISHING, SHOOTING, ARCHERY, CRICKET, FOOTBALL, and CROQUET.

Offer the following prizes for clubs of three or more subscribers.

Single Subscription per Annum \$5

Starting Clubs—Agents, and others interested, are advised that we do not insist upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 60 days will be entitled to same premiums as if all were sent together.

CRICKET.

For \$20.00, four copies, one year, with one best spring bat, one Colgate ball, one Dark cricket ball; price \$7.50. For \$25.00, five copies, one year, with a complete cricket set; one Colgate bat, one polished bat, Clayshaw; one Dark cricket ball; one set of stumps; price \$12.00.

FOOTBALL.

For \$15.00, three copies, one year, with one English football; price \$6.00.

FISHING ROADS.

For \$15.00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7.00. For \$60.00, twelve copies, one elegant rod; suitable for trout, black bass with fly, or for trolling base or pickerel; one fine rod as can be made; German silver tipped, with three trout; price \$25.00.

CROQUET.

For \$20.00, four copies, one year, with very handsome set of croquet; price \$7.00. For \$25.00, five copies, one year, with superb set of croquet; price \$10.00. For \$30.00, six copies, one year, with the finest set of croquet made; price \$14.00.

TABLE CROQUET.

For \$10, two copies one year, with handsome set of Table Croquet, 8 balls and 8 mallets, in wooden box. This game can be played on dining room or other tables.

For \$15, three copies one year, with the handsomest set of Table Croquet manufactured, made of cocco.

REMINGTON RIFLE AND SHOT GUN.

For \$75.00, fifteen copies, one year, with one Remington .30-06 rifle; price \$28.00. For \$100, twenty copies, one year, with one Parrot rifle, 5-mch. octagonal barrel, to be used for sporting, hunting, or target shooting; price \$36.00. For \$120, twenty copies, one year, with one Remington Double barreled, breech-loading shot-gun, one of the best game ever offered to American sportsmen; price \$45.00.

SHARPE RIFLE.

For \$100, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$40.00.

WARD-BURTON RIFLE.

For \$90, forty copies, one year, with one Ward-Burton rifle magazine gun for large game, price \$30.00.

SINGLE AND DOUBLE BARREL MUZZLE LOADING SHOT GUNS.

For \$30.00, four copies, one year, with one American single barrel gun, perfectly safe, bare barrels, walnut; price \$10.00. For \$35.00, seven copies, one year, with one American double gun; handy and reliable gun every way; price \$15.00. For \$50.00, ten copies, one year, with one double bore (no twist) barrel gun; a safe gun every way for target shooting; price \$20.00. For \$75.00, fifteen copies, one year, with one double gun, English laminated steel barrels, handsome the best; price \$25.00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of 25 per cent will be made on all clubs of three and upwards.

Every article is of the finest quality and will be sent free of expense.

Remitting Money—Checks on New York City banks and bankers are best for large sums; make payable to the order of FOREST AND STREAM PUBLISHING COMPANY, 17 CHATHAM STREET, New York. Post Office Money Orders for \$5.00 or less are cheap and safe also. When these are not obtainable, register letters, mixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

HURST'S SCIENTIFIC ILLUSTRATIONS

Natural History

For Object Teaching in Schools, AND PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various Animals and Birds in grotesque attitudes, never before violating their natural instincts. We offer these views to our patrons only as studies from nature. One of the great moving elements in our modern system of education is object teaching. The interesting illustrations of the microscope transfers the animals and birds from their natural habitat to the rooms of the student, and the first view of our home, where they cannot fail to leave a lasting impression of the form, color, habits, and locality of each specimen.

- An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen with its appropriate rocks, woods or water, and coloring from the original.
1. Wild Cat, or Bay Lynx. Lynx Rufus.
2. Snowy Owl. Nyctaleus Nyctaleus.
3. White-tailed Eagle. Haliaeetus Leucocephalus.
4. Wild Pigeon. Columba Virginiana.
5. Northern Parula. Parula Carolina.
6. American Golden Plover. Pluvialis dominica.
7. Woodchuck. Marmota Americana.
8. Red-necked Grebe. Podiceps Cornutus.
9. American Swan. Cygnus Americanus.
10. Red Shouldered Hawk. Buteo Lineatus.
11. Great Horned Owl. Bubo Virginiana.
12. White Fronted Goose. Anser Albifrons.
13. Long Eared Owl. Otus Americanus.
14. Great Horned Owl. Bubo Virginiana.
15. Horned Grebe. Podiceps Cornutus.
16. Golden Eagle. Aquila Carolinensis.
17. Prairie Wolf. Canis Lupulus.
18. Spotted Sand Lark. Tringoides Macularia.
19. Marsh Wren. Tringa Solitaria.
20. Malleted Duck. Anas Platyrhynchos.
21. Great Horned Owl. Bubo Virginiana.
22. Great Lion, or Diver. Colymbus Glacialis.
23. American Deer (Albino). Cervus Americanus.
24. The American Bittern. Ardea Herodias.
25. Old Wife, or Squaw Duck. Fuligula Glacialis.
26. The Wild Turkey. Meleagris Gallopavo.
27. The Beaver. Castor Fiber.
28. Common American Snipe. Scolopax Wilsoni.
29. The Bare Necked Woodpecker. Picus Canadensis.
30. The Canada Goose. Anser Canadensis.
31. The New York Ermine. Putorius.
32. Red Breasted Sapsucker. Picopicus Redbreast.
33. Pinnated Grouse. Tetrao Canadensis.

TESTIMONIALS.

LOCALITY, UNIVERSITY, LYNN, March 14th, 1870. I am glad to congratulate you upon your great success in this new educational course. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education.

WASHINGTON, D. C., March 18th, 1870. I am much pleased with the success you have met with in giving to the student specimens of very decided appearance of life. I hope you may be able to continue the Series, and I have no doubt they will furnish interesting means of information and instruction in regard to the wild animals of New York.

STATE HOUSE, DORCHESTER, Mass., March 18th, 1870. I have examined carefully the illustrations in your studies of Natural History, and judging by the first ten numbers, should say that they will prove of very great value to the student. I should be glad to see the most interesting sites for the parlor Stereoscopic. The delineations, position, and color of the different groups are all excellent and are most perfect. I should daily recommend them to the public attention, and trust you will meet the encouragement which you have earned. EDWARD A. SILLIET, Curator of Zoology in Mass. State Cabinet.

PEABODY ACADEMY OF SCIENCE, SALEM, Mass., March 19th, 1870. I have shown your Stereoscopic views to the Directors of the Academy and the Editor of the Atlantic Naturalist, Dr. Packard and Mr. Morse. They concur with me in praising their truthfulness and the fact which you have displayed in surrounding the specimens with natural objects and scenery of characteristic lines. They are certainly better fitted, not only as parlor and drawing-room illustrations, but as educational illustrations for the use of schools and colleges, than anything we have yet seen.

CONNELL UNIVERSITY, PRESIDENT'S ROOMS, ILLICA, March 19th, 1870. I have received the Stereoscopic views in your studies in Natural History, and have enjoyed them greatly. They have surprised all who have seen them by their perfect quality, both in the drawing and in the surrounding circumstances; and I think they can not fail to be of great service to the study of Natural History, first by giving students to see and next by presenting them in it. ANDREW D. WHITE.

These Stereoscopes are sold wholesale and retail by

American Wild Fowl Shooting.

BY JOSEPH W. LONG

Describing the habits, and methods of shooting wild fowl, with instructions concerning guns, blinds, boats and decoys; the training of water retrievers, &c.

This book is written in plain English, and in a most attractive style. A broad, and at the same time accurate view is taken of duck shooting in all parts of the country. The habits and feeding grounds of the mallards, blue-winged teal, pin-tail, wood-gull, and coveler; red-tailed, mallard, and other kinds of ducks, geese, swans, &c., have been carefully and ingeniously studied and given to the reader.

In thirty chapters the author has furnished information for the young, as well as for the practical sportsman.

"A book for sportsmen, by a sportsman."—Argus.

"Well where to find game in the morning, in the afternoon, and in the evening."—Sun.

"Almost indispensable to the sportsman."—Academy.

Published by J. B. Ford & Co., 27 Park Place, N. Y. For sale by all booksellers and the leading gunsmiths. Price \$2. Sent by the Publishers.

Also for sale at the office of Forest and Stream.

For Forest and Stream.
WON'T WE MAKE THE TURKEYS SING?

BY MRS. EUNICE R. LAMBERTON.

WON'T we make the turkeys sing,
By and by, by and by;
As we shoot them on the wing,
You and I, you and I?

When the hazy moonlight streams
O'er their flight, o'er their flight,
With its mellow Autumn beams
All the night, all the night?

Crack the rifle swift and sure,
When they rush, when they rush,
Out from covert dense, or moor,
'Mid the brush, 'mid the brush.

Won't we track them as they run,
Spindle-shanked, spin the shanked,
Catching health as well as fun,
Never flanked, never flanked?

Chase them o'er the river wide—
Blaze the gun, blaze the gun,
Drop them on the grassy tide,
One by one, one by one?

Gobble, gobble, end aloud,
With a wail, with a wail,
Bag them, drag them home as proof
Of our skill, of our skill.

Won't we make the turkeys sing,
By and by, by and by;
As we shoot them on the wing,
You and I, you and I?

Rochester, N. Y., Jan., 1875.

For Forest and Stream.
Vernon.

A SEQUEL TO "SANTA MONICA."

IT was a perfect Californian Winter day. The sun, undimmed by cloud, was sinking slowly to his rest in the broad bosom of the Pacific. The last wagon, piled high with boxes of oranges intended for the next day's upward-bound steamer, had vanished behind the mission buildings, and the rumbling of its heavy wheels became indistinct as its dusty trail settled again to earth. The week's work was done, and yet the heavily-laden trees to the right and left of the house scarce showed the abstraction of their golden fruit. From the broad verandah whereon I inclined in a bamboo chair, in all the luxury of idleness and content, a fair picture of a lovely land presented itself. On the right, and scarcely half a mile distant, the little village of San Gabriel nestled under the protecting shadow of its church, the largest and best preserved of these monuments of the country's earlier colonization. Its dark hued orchard, in which orange trees of sixty years' growth were still paying rich tribute to the padres, was surrounded by a cordou of lighter hued but equally aged olive trees, the whole crowned by a clump of noble date palms, planted nobody knows when, or by whom.

To the left, the eye ranges unchecked for miles over verdant pastures until it rests upon old Mount San Bernardino, which, with snowy crest, stands like a giant sentinel at the entrance to the valley. In front, the range of lower hills which form the southern boundary of the valley open for a space to allow the San Gabriel River to find its way to the sea, which, although twenty miles distant, seems from the glimmer of the sun upon the water and the half mirage caused by the wide bed of sand beyond, to be washing the base of the hills. Directly in the gap an immense cottonwood tree has assumed the fantastic shape of a ship under full sail, ever there yet ever sailing. For hours I watch the phantom craft, expecting momentarily to see it disappear behind the point; but there it stands, receiving the heavy freight of day dreams with which I load it, until it comes to seem almost part and parcel of my destiny. Behind the house, the valley slopes upward, covered with well kept vineyards and orange orchards, until the timber

belt is reached, and the dark masses of the Sierra Madre tower for thousands of feet above all. The tinkling of the sheep bells as the flocks seek the nightly protection of the corral, and even the monotonous chant of the celestial, Aho, as he prepares the evening meal, sound musical. The little terrier, Jack, in vain endeavors to entice the sober eyed setter, Rose, to a game of rumps, as she partakes of her master's reverie, and dreams with him of other days and scenes. A row of ungainly muscovy ducks come waddling up the little stream which passes the house, and the scattered chickens, satiated with grasshoppers, come in from the fields to seek digestion on the roosts. Truly, this must be Eden, and the peace that of Paradise.

The pounding of horses' hoofs upon the hard road and stopping at the gate, disturbed my dreams, and the figure of a horseman passing between the two tall *Eucalyptus*, or Australian gum trees, which stand at the entrance to the grounds, attracted my attention. The figure bestriding the little *mulo*, with feet almost touching the ground, seemed familiar, and in a minute the hank form of my old friend Grizzly Bill was unfolding himself from his mule and grasping me by the hand.

"Como te va? I'm mortal glad to see you, Capitano."

Since my residence in the valley I had jumped the intermediate grades and been promoted at once to that of captain; the fact of my being able to take a Henry rifle to pieces and put it together again had been seized upon as an excuse. Said Bill, as he breveted me—

"We can't be calling people mister here, and as it's gone out of fashion to call every one above the rank of vaquero, Don, you must have some handle to your name. We'd make you a colonel at once, but two in the family might mix things."

Glad as I was to see Bill, the tidings he brought me set my heart thumping most violently.

"We left Santa Monica," said he, "the day before yesterday, and stopped last night with Don Andreas, at San Fernando. The Colonel he went on to Los Angeles with the senoritas this morning, and I pushed on through the mountains and across the Arroyo Seco without going to the Pueblo. They'll all be here to-morrow, and then I guess, Cap, you'll have more of a house full than you've had yet."

After supper, we took our pipes and sat on the verandah, while Bill good naturedly answered my thousand and one questions about my friends.

"I say, Cap, this almost beats Santa Monica. Who'd a thought you'd have made the place look like this in a year?"

"Well, there has been a good deal of work done," said I, as I looked with some pride at the neatly trimmed vineyard, where not a weed was visible, and at the rows of orange trees and the well appointed outbuildings; "but then, you see, I had the advantage of some one else's start. I find that if you do your work well in this country, and fight the gophers, everything flourishes. Plenty of water and don't spare the plow points, is my motto. Do you think Col. Forrester will be pleased?"

"More nor that, Cap. It's no use talking, it takes you Eastern chaps to make things look slick. Why your house is more homelike than the Colonel's, and if Miss Nita don't like your fixins, why dog my cats if I don't think she ought to be valloped," and Bill puffed furiously at his pipe at the bare idea of any one not liking Vernon.

With the exception of an occasional run up to Santa Monica, the past year had been spent in hard labor, and now my dear friends were to make me a visit, leaving behind them on their return my little comradita, who was to link her fortunes, for weal or woe, to mine. In the dim twilight I can just see the phantom ship against the lighter ground of the Western sky. Everything set, royals above to gallant sails! Whither was she bound; to bring me my bonny bride, or to carry her away to unknown seas? Was this day dream, the brightest of them all, to go with the rest? The twilight deepened into darkness, the weird

ship vanished, and Bill's cheery voice broke the silence.

"The Colonel asked me to tell you, Cap, that he nought have to go up to Lyttle Creek Canon while he was here, to see about his timber lands, and he thought as if you weren't too busy you might go along, and we'd have a hunt. Old Glenn, who crossed the plains with me, has got a good cabin at the forks, where the senoritas could stay, and as you can't do much huntin' after you're married, you know, you'd better make the *pasear* while you kin."

Go? Of course I'd go; with nothing to do for a week, what could be more delightful than a camping expedition with Nita and the Colonel, to say nothing of the Senora and Donna Inez and Pablo. The latter couple were married now, and joined the expedition to see the last of their little sister. Bill declined my offer of a bed, preferring to roll himself in his blankets on the verandah, and, after seeing his mule fed, I swung in a hammock by his side until the increasing chilliness of the night air warned me to retire indoors.

It was late the following day before my eager eyes discerned the wagons crossing the plain which lies between Los Angeles and San Gabriel, and old Bill thought me dejected as I jumped on my horse, which had been saddled all day, and dashed down the road to meet my friends. How natural they looked! First came the familiar old spring wagon, with my dear little comradette seated by her father, with the Senora behind, and Donna Inez, followed by the ambulance driven by Pablo, with the baggage and old Juana, who could not leave her *chicote*, perched on top.

The ladies were escorted into the house, and with some little trepidation I showed the Colonel the home I had prepared for his daughter. It was undoubtedly owing to the excellent lessons derived from his experience which enabled me to make so good a display. In spite of the thousand and one annoyances which beset the new comer, the *unlearning*, the total abandonment of all pre-conceived ideas, which becomes an absolute necessity to the agriculturist in this country, I had achieved the success of making two blades of grass grow where one flourished before, and was proportionately elated. The climatic effects and the changes of the seasons are so new to the Eastern man that it is at first difficult for him to realize the fact that his harvesting begins when his planting would at home, and that his stock really requires more of his attention and care in the Summer than the Winter.

The Colonel approved of everything, and prophesied not only a lovely home, but a certainty of income. One portion of my enterprise surprised even him, and I mention it here merely to show the extreme hardness of the orange tree in this climate. On my first arrival in Los Angeles, a street was about to be carried through one of the orange orchards of the place. For a comparatively small sum I purchased all the trees which came in the way of the proposed improvements, and with the aid of some Chinese gardeners successfully transplanted some fifty of them to San Gabriel. The following year they were covered with thick foliage, and on the third the majority of them bore a paying crop of oranges.

The house, a cross between the native *hacienda* and an East Indian bungalow, excited the warmest expressions of admiration from the ladies, and little Nita, with moistened eyes, thanked me for all I had done for her.

In the evening we gathered on the verandah and discussed the proposed expedition to Lyttle Creek, and it was finally agreed that we should start on the following day. For hour after hour we sat, watching the moon gradually rise over the mountain peaks, whose snow covered summits glistened like silver in the bright beams; and the oranges almost sparkled amid the bright green foliage. Gradually the whole valley was lighted, and my old ship loomed up in strong relief against the gleaming horizon. I called Nita's attention to it, and tried to impart to her some of my own superstitious feelings, at which she laughed and called me a silly *genio*.

At high noon on the following day we started out our

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

PROF. BAIRD'S REPORT.

DIFFERENT METHODS OF MULTIPLYING FISH.

As far as the actual multiplication of fish is concerned, we have to deal especially with four principal methods. The first, and simplest, consists in transferring fish of both sexes, whether still young and requiring further growth, or fully mature, and especially at about the period of their spawning, from one locality to another, where they can make themselves at home, and in due course of time increase and multiply. This method has been more especially practiced in the United States in the case of black bass, pickerel, pike perch, yellow perch, sturgeon, or fresh water herring, the brook trout, etc., and to some extent, indeed, the white fish, or Coregonus albus, and, indeed, is almost the only method by which it is possible satisfactorily to accomplish the desired object; the efforts of pisciculturists not having been very successful in impregnating the eggs (excepting with the white fish) and hatching them out, although there would be no particular difficulty in regard to the alewife.

A second method, quite similar to the first, consists in simply collecting and penning up the mature fish in a suitable enclosure at the time of spawning, and keeping them until the operation of reproduction is accomplished, but without taking any special charge of the eggs themselves.

The third is that especially practiced by the Chinese, of collecting the fertilized spawn, after it is laid, either by gathering it from localities under the water, where it has adhered, or by straining it out while floating. The first method is in some instances assisted by introducing bunches of oyster brush into the water frequented by the gravid fish, so as to furnish convenient objects of adhesion, and such as can be readily handled for the purpose of removing the eggs from them. The eggs thus secured may then be transferred to any given locality and allowed to hatch naturally, or they may be prepared and attended to until the hatching of the young, when these are either allowed to escape into the water at once, or else they are fed for a short time and then consigned to the ponds or streams which it is desired to stock.

All these methods are inferior in convenience as well as in economical results to the fourth, which is adopted by most fish culturists throughout the world. This consists in taking up the eggs, after they are laid, and immediately, in pressing out eggs from the body of the female into a dish, and then by repeating the operation with the male, so as to force the seminal fluid into the same vessel. In some cases the eggs and milt are stirred together in a certain amount of water; in others, what is called the dry method is adopted, a discovery usually credited to a Russian, M. Vrasnik, in which no water is used with the eggs, but the milt is slightly diluted with water and poured upon them. By this method a much larger proportion of eggs is impregnated. The movements preliminary to this treatment of the eggs taken from the living fish are very varied. In many instances a careful watch is kept over localities where the fish are likely to spawn; and when the experienced observer notices that the operation of spawning is about to take place, he captures the usually inactive pair by means of nets or other suitably constructed apparatus, and proceeds with the work of extraction and fertilization. This is said to be the principal method by which the eggs of the salmon are obtained in Germany and elsewhere for the national and private establishments, and is liable to the disadvantage of great uncertainty, and to a dependence upon conditions of the atmosphere and of the water that may materially interfere with the general result. Most of the doings in connection with the hatching of small quantities of this nature, being done at a table, locally, and the fertile fish stripped of their eggs and milt. This operation is always fatal to the shad, their delicacy of constitution not enduring such rough handling with impunity. It has also been adopted in some cases for salmon, having been adopted by Mr. Livingston Stone in obtaining their eggs during the season of 1872.

A much more satisfactory and efficient method consists in enclosing the eggs in a tin, and until their eggs and milt are sufficiently matured to allow the process of artificial fecundation to be initiated. With trout such an inclosure is usually permanent, but for salmon it is generally temporary. This treatment is also adopted with the whitefish which are taken in the Detroit River in the Fall of the year, while running up to spawn from the deep water of the lake, placed in enclosures for marketing purposes, and kept there for sale, from time to time, during the Winter. Indirectly, under these circumstances, they furnish the opportunity for artificial impregnation and hatching on a very large scale.

The simplest mode of obtaining salmon for the purpose in question is that adopted by Mr. Samuel Wilmot, at New Castle, Ontario. This gentleman, observing a few years ago that a few salmon were in the habit of coming up a small stream to a favorite spawning ground, conceived the idea of penning them there, and controlling them during the period of reproduction. He accordingly built a house over a basin in which they collected, or adjacent to the spawning ground, and erected a dam below it, so that after they had passed above a gate could be dropped and the fish imprisoned. In this way he has been able to secure a large number of salmon, and with them has carried out, for the most part, his labors in connection with salmon hatching.

A more feasible method than any which can be conducted out on a much larger and more efficient scale, is that now practiced by Mr. Charles G. Atkins at Bucksport. This consists in securing the living salmon by any means at his command, the most ready being their purchase at the salmon weirs at the mouth of the Penobscot River, where they are taken in considerable numbers and kept alive for any length of time. These are brought in suitable floating cans to Bucksport, transported on trucks to the hatching establishment, and placed in a pond of about 150 acres, where they find ample room for their movements.

As already explained, it is not necessary to provide the brooding salmon with food, since they do not take it during the spawning season; and they exist for the several months necessary to retain them with comparatively little mortality. Mr. Atkins' experiment was initiated in 1871. In 1872 he had nearly 600 fish by the 1st of July, of which very few were lost. In the months of October and Nov-

ember he took from these fish 1,600,000 eggs, very few of the fish being injured in the process. They were then placed in the water and permitted to return to the sea, the precaution being taken to affix a metallic tag corresponding to the number, weight, and sex of the fish, and the date as recorded, so that if recaptured at any time some idea might be gained of their rate of growth, movements, and migrations.

The eggs thus obtained, whether of salmon or of trout, are hatched out in contrivances which vary with the kind of fish, and which will be more especially referred to hereafter. Suffice it to say that metallic tags are hatched in boxes which float on the water of the stream adjacent to the camp where the fish are captured and fertilized; this being accomplished within a week, and after a further detention of a few days, or until the yolk bag is absorbed, they are turned into the middle of the stream at night while the predacious fish are most quiet or lying near the shore, and soon find hiding places for themselves.

The eggs of salmon and trout require a period of from two to four months for development, this being in the Winter season. This process consists in placing them in boxes, with the bottom composed of parallel glass slats or of solid boards, lined with gravel, over which water of uniform temperature is allowed to flow continuously until the exclusion of the young takes place. Sometimes trays are used with wire gauze bottoms, either singly or in tiers, and the water caused to flow either from above downward or the reverse. After this the young are sometimes transferred to some other receptacle until the yolk bag is absorbed, when they are either introduced into rivers and streams or else retained in ponds and fed artificially for a greater or less length of time.

The key note to the treatment of the anadromous fish lies in the now well established axiom that each will always endeavor to return to spawn, if possible, to the very spot where it was first introduced into the water as a young fish, and that it will make every effort to accomplish this result; sometimes incurring even loss of life by persistent labor to this end. This is fully believed by all who have given attention to the subject, and in this we have the guarantee of success in any attempt to stock a particular body of water. It is true that the labor would in many cases be a protracted task, since the reaper might be, as already explained, and probably would be, a party having no interest in common with the sower. So universal, however, is the principle just enunciated, that we are assured that if three streams empty into the same bay on the coast, or are tributary to the same principal river, and all are equally eligible for the maintenance of anadromous fish, although destitute of them, one of these may be stocked and abundant with fish, while the others which have been neglected will be almost entirely unvisited, or will possibly become supplied very slowly and after a long period of time.

—The Massachusetts Anglers' Association has now about 550 members.

—The Hon. E. A. Brackett and Benjamin P. Ware of Marblehead addressed the Boston Anglers' Association, Wednesday evening, last week. Regarding the preservation of deep sea fishing, Mr. Ware said that trawling would ultimately exterminate the cod, haddock and pollock fisheries on our coasts. The evil of mackerel seining was also mentioned.

The American Geographical Society held their annual meeting at the hall of the Historical Society, New York, on Tuesday evening, the President, Hon. C. P. Daly, in the chair. The Hon. Robert B. Roosevelt addressed the Society on "The Geographical Distribution of Fish in the United States."

Natural History.

THE POMPAÑO, (Bothrocara pompano), HOLBROOK. THE CAVALLI, or GREVALLE, (Caranx defension) DEKAY.

THE above are certainly distinct species, though probably belonging to the same family. The first is a bottom fish, solitary, and usually taken at night with nets, rarely takes the hook, and seldom reaches three pounds in weight.

The cavalli goes in schools on or near the surface, takes bait troll, or red rag, with eagerness, and grows to the weight of ten or twelve pounds.

The pompano on the table is one of the most delicious of fishes, being both rich and delicate. The cavalli is dry and tasteless, like the dolphin. The two species much resemble each other, and are often confounded. Even so accurate a writer as Holbrook does so.

The principal structural differences are these: In the pompano the first dorsal is represented by six spines, the snout is truncated, the mouth rather small and toothless. The cavalli has two dorsal fins, a sharper snout and a larger mouth, with conical pointed teeth. In color, both are changeable, the prevailing colors of the pompano being blue and silver, and of the cavalli green and blue. Both are very brilliant fishes. That the pompano will sometimes take the hook, I know, having taken one of two and a half pounds weight with clam bait while fishing for sheephead on the bottom, near Mosquito Inlet, East Florida.

Our boatman, who had fished those waters for twenty years or more, said it was the first pompano he had ever seen taken with the hook there. The cavalli we used to take almost every day in April and he pointed out the difference between the two species at once. He also said that they spawned at different periods. My single specimen was a most active and vigorous fish, and gave as much fight for his size as any fish I ever killed. When, however, read of pompanos being taken with the hook in great numbers, of their jumping into boats, and of their occurrence as far North as Holme's Hole, I think the cavalli is the fish indicated.

S. C. CLARKE.

—The sum of \$75,000 was paid out for sponges in Key West during the months of November and December last year.

THE GRAYLING.

NOUVELLE, BONAVENTURE, CANADA, JANUARY 9, 1875.

EDITOR FOREST AND STREAM:—

I enclose to you the dorsal fin of a grayling which I caught in the river Terne, in Shropshire, England, about eighteen months ago. It is a celebrated place for this fish, and the Leintwardine Club, which controls this river, is very exclusive, so that the fish has a rare and plentiful supply. Please compare it with the Michigan fish, and kindly inform me whether they are identical, or only similar. Grayling are a very game fish, and I should like to see them introduced into this neighborhood.

Yours truly,

CAPT. J. M. G.

We thank you for the grayling fin. We have never seen one before, and are glad to compare it with that of the American grayling, which lies before us. We sent one of the latter to the London Field some months ago, by whose editors it was compared with theirs, and the points of difference noted. These are very decided. We reprint from FOREST AND STREAM of August 13th the statement as transferred from the columns of the Field:—

"The fish shows some qualifications which are very distinct from our grayling. The eye is much larger, rounder and more prominent; in the British grayling this is lozenge-shaped and sloping back, a peculiarity which the artist could hardly have shown. The dorsal fin is much larger in our grayling, is very large in the Michigan one. The snail fin, too, is much more extended and lengthy, and the ventral fins longer and more numerous. In the Michigan fish, the dorsal fin is very long along the dorsal fin, whereas in ours they run to the whole length of the fish; and the description of the colors shows them to be more brilliant, varied and marked. In fact there is very little doubt that the Michigan grayling is not our grayling."

IS THE CANADIAN SEA TROUT A TROUT?

EDITOR FOREST AND STREAM:—

I fully agree with your observing correspondent, Mr. S. C. Clarke, that "there is much difference in opinion among those who have written on this subject." Hamilton Smith, I think, without a scientific description, gave it the specific name of *Canadensis*. Mr. Perley, also without giving its specific characteristics, refers it to *S. trutta*, a species common to the North of Europe, and entirely different. Scudder, in his "American Angler's Book," tried to establish it as a new species, and succeeded for the time, as he thought, in doing so, according to the specific name given by Hamilton Smith. Now, Mr. Editor, and you, Mr. Clarke, and readers generally of the "American Angler's Book," as a prelude to an acknowledgment of my error, and before I "come down," let me give you an account of the fish, and its name, as I have known it, and as it was found along the coast, and thus show why I have gradually changed my convictions.

I had been told by my canoeists that they had never seen a trout without spots, but the very next Summer after issuing the first edition of my book, I found on the Nepisiguit, in June, trout without the semblance or vestige of a red spot, with perfectly bright silvery sides; some of them no longer than six inches, and no "finger marks," as it is usual on brook trout of that size. In July, 1869, when with Dr. Wood, of Pongkebec, I explored the Grand Cascadelle to find the pools where the huge salmon of that river rise to the fly, we also found trout, some of them weighing four pounds, without spots, and as bright as the fresh run silver-sided salmon. They were the finest fish I ever ate; did not cloy after feeding on them a few days, and no bad cooking of our *Horticultural* Indians could spoil them. We frequently ate old "bunks" of trout after coming in from our evening's salmon fishing. These were trout fresh run from the sea, where their food had, to a great extent, been the same as that of our evening's salmon fishing. In the early part of the same Summer I made the acquaintance of Mr. Venning, Inspector of the New Brunswick Fisheries, who told me that, in his estimation, I had done him no longer than justice in calling it a species different from *S. trutta*, and suggested that I should take trout frequently during my trip and observe how this bright-sided fish grew darker later in the season and higher up the rivers, and how from indistinct spots it at last clotted itself in those of bright vermillion, with the orange colored belly of the brook trout. Mr. Venning being the only intelligent, close observer of this fish, in all its changes, I have ever met with, and being so becomingly skeptical as to there being two species, I was anxious to correct any error I might have made by a single Summer's observation of the fish some years before.

After leaving the Grand Cascadelle, I fished for trout in the neighborhood of Delouche, in the Joqueux, and later in the season on the Nepisiguit. On the last named river, about eight miles from its mouth, a small stream, known as the Pabineau, enters, after passing through some low, still pools, bordered by water grasses and lily pads. This is a famous place for trout in August. Here I took them of all shades, generally the deeply tinted among the lily pads, and the brighter, fresh run fish at its swift outlet into the Nepisiguit. At the end of my Summer's fishing I was thoroughly convinced that the sea trout is becomingly skeptical as to there being two species, I was anxious to correct any error I might have made by a single Summer's observation of the fish some years before.

So of course I cannot now agree with Mr. Clarke "that the brook trout makes its permanent home in fresh water, and that 'the sea trout is anadromous' in the same sense in which we regard the salmon. There is no sea trout, but the sea trout has had been at sea, or in the salt water, or has been feeding on pretty much the same kind of food that salmon do; or telling how long it takes for a sea trout to clothe itself in its bright spots and hues of the brook trout, but I conclude from my observations here recorded that they are one and the same fish.

The matter of food, as will admit, has much to do with the migration of animals, terrestrial and aquatic, and the brook trout acts up to its length in deserting its native stream, where food is scarce in Winter, and for the time becoming a sea trout. And although really the same species, I consider the local names "sea trout" who fresh run, and "brook" or "river trout" when they have been up some time) as quite appropriate.

CAVALLI, OR POMPAÑO.—In answer to "B. Huckle's" The fish depicted by Norris is called by both names in the New Brunswick market; but is done by the former amongst the Creole fishermen, and almost exclusively by the Americans by the latter name.

FRESH FISH.—In answer to a query by "G. D."—I have always heard the trout fish, which come in October and November into the rapids of the Inlets connecting the Saranac lakes to spawn, spoken of as a small specimen of *Coregonus-c. l.*, white fish. THADDEUS NORRIS.

—The Des Moines (Iowa) Register says that among the curiosities presented by the California salmon planted in the Des Moines River at that place, Wednesday, were some malformations singular enough for an embryo of wonders. General Baker has some of them preserved in alcohol. One fish has two heads, one has two tails, one is double both in head and tail, but the only one that is truly One. One of the most singular is precisely like a California black-cracker, having four fins fashioned like legs, and antennae instead of fins.

—Vinal N. Edwards, of Wood's Hole, Mass., has during the past two years, collected for the Smithsonian Institute at Washington, 117 different varieties of fish, including several species never before taken on this coast.

—A countryman from the interior of the State ate so many clams the other day, at Fulton Market, that it caused his stomach to rise and fall with the tide.

DOES WITH HORNS.—We clip the following paragraph from the Minotier, (Michigan) Times. It is the fourth instance of like character that has come within our notice within a month—two from Canada, one from Minnesota, and this. Evidently the occurrence is so common as to be no more regarded as a phenomenon.—

"Mr. Sam. Keeler, of Wexford, killed a deer a few days ago which is a natural curiosity. It was a doe, and was as big as a pair of horns about a foot long, with three prongs, as you ever saw. It was brought down here by a gentleman, and sold to Otto Bauman, Mr. Ed. Wheeler purchasing the horns.

WOBURN, MASS., JANUARY, 1873.

EDITOR FOREST AND STREAM:—

In regard to your inquiry for information of antlered deer in your issue of Dec. 17th, 1872, I would say, that in a seven year period, I have spent during the hunting seasons in the woods hunting and trapping. I never saw or heard of an antlered doe, or cow moose. With the woodland caribou is different. The cow often has horns, but they are not as large or as thick as the males. They are often found with more spikes, as it were, one on each side, as on a bull. We killed a cow caribou on Black River, in Winters ago, that had quite large horns, with a few spikes on each side. The horns were very smooth. For instance: I have known of bull moose and caribou being killed in April with full grown horns, whereas it is generally supposed they are then without them. The first of July I have known of bull moose being killed with full grown horns.

In regard to their shedding their horns, it depends very much on the condition of the animals. If they are fat, they shed early, and as they get on longer. In Maine the caribou are very plentiful, and many are killed every year. Last month and this year a number killed but a short distance from the Forks of the Kennebec, and it was my good fortune to be there. For me, there is no wild meat so good as a fat caribou, Judger and tender than deer or moose, there is a peculiar flavor, richer by far than either the others. This I fall across in the Bald Mountains, in the vicinity of the Forks, where they go to feed on the moss. My experience is that caribou, as well as moose and deer, are much plumper now than seven years ago. E.

ROCHESTER, JANUARY 15, 1873.

EDITOR FOREST AND STREAM:—

Your correspondent, J. H. Batty, sends you an account of some "oval, leech-like worms" which he found in the livers of two deer, killed in November and December last, and he remarks, incidentally, that "the gall of the doe was wanting." It may be worth stating that the gall bladder does not exist in all the mammalia, and that it is absent in the cervidae. The liver now referred to, are, as stated in your editorial comments, quite common in the deer. They are found also in other animals, and are known as the liver fluke, "Fasciola hepatica," or "Distoma hepatica" of some writers. These flukes sometimes exist in great numbers, and have proved very destructive to sheep, causing the disease known as the rot. I have often found them in the livers of deer, without appearing to affect the condition of the animal. They are sometimes encysted, and again portions of the liver are softened and broken down by their presence.

The history of this parasite is supposed to be as follows: The liver fluke is the sexually mature animal. Its eggs contain embryos, which, after escaping from the deer, undergo several transformations, and become as length "cercariae," or minute animals with a tail. The cercaria is aquatic, and may be taken into the stomach of the deer while drinking or feeding upon aquatic vegetation. Finding its way into the liver, the cercaria changes into the large, flat, oval, tailless fluke. The parasites referred to are existing in the nasal sinuses of deer are the larvae of an insect analogous to the bot, which make their temporary sojourn in these cavities. These larvae are also found in sheep. It is quite improbable that the larvae of the insect in the deer by the way of the foot glands, as supposed by "old timers." W. W. E.

BOSTON, MASS., JANUARY, 1873.

EDITOR FOREST AND STREAM:—

In the issue of December 31st, 1872, "C. F. T.'s" question, "Will you be kind enough to give me a description of a Florida Water Turkey, that I so frequently spotted in the Everglades, State of Florida," answered by a "Florida Water Turkey," *Fulica americana*, having the local names of "snakebird," "darter," &c. Allow me to add that the Florida cormorant—*Graculus Floridanus*—is also known by the local name of "water turkey," and is more abundant than the anhinga. In some parts of Florida the cormorants are commonly called "bigger geese," as well as "water turkey." The Florida cormorant differs markedly from the anhinga, in being apparently the most casual observer, except that it is only at a distance that one sees them, when their mode of flight and general resemblance to each other in form and habits is such as to account for their receiving the same local name. The Florida cormorant is thirty inches in length; extent of wings, nearly four feet; three and one-half pounds weight; plumage, glossy green above, and blue and white below, with a blackish bill; stout, dark colored and hooked; gape, reddish orange; feet nearly black, and eyes bright green. The anhinga is three feet in length; extent of wings, less than four feet; about three pounds weight; plumage, neck and body, green, with prominent white markings on back and wings; head and neck much resembling the heron's bill rather slender and pointed; yellow feet and bill; paler eyes, orange eyes, carmine. The neck and breast of the female of a light brown color. These general descriptions, which are short and easily compared, exhibit the most marked differences between two birds which bear the same local name. If one wishes to procure "water turkeys" in Florida, he will find it easier to obtain a half dozen cormorants than a single anhinga, as the former are less wary and much more numerous than the latter. ROAMER.

BOSTON, MASS., JANUARY, 1873.

EDITOR FOREST AND STREAM:—

Had your correspondent "Roamer" been with me upon the shores of Magnolia Lake, Canada, he would have seen a pair of the same species as the white-headed one, too, captures its prey with all the grace, skill, and activity one could wish for. For although it is true that the bald eagle is something of a tyrant—and show me power and daring that is wholly free from tyranny—yet when occasion demands he will pat forth such skill and strength that cannot help command admiration. It was a perfect day, and the lake comes now so close we can see the fish, and dash the surface into a cloud of spray, rises from out the foam. Not, however, in vain that skill and speed exerted, for as we can plainly see, he holds in those powerful talons a good-sized fish. Lifting upon a tall, leafless tree that commands an extensive view, he sends forth such screams as alone the loon can rival. I can assure you

the movements of this bird were anything but awkward or slow. Who has ever read that description of Androon, I think, of the capture of a swan by a pair of bald eagles, and can't you call this bird devoid of skill, daring, or activity? I think your correspondent wrong in his statement that the eagle will not capture live food if he can find dead. For it is only when he cannot capture live prey that he resorts to another's spoils, and it is only when driven to the last stages of hunger that he will satiate himself with carrion.

Birds of prey, and especially eagles, have ever been my admiration and study. I have had various kinds of hawks and owls in captivity, and in different stages of domestication, from a cooper's hawk that would strike every time, being flown from my hand, a male red-tailed hawk, that once earned death to all our chicks, if let loose to that eagle of the night, the great horned owl. I now have alive a couple of eagles, both mature and perfect specimens. One is a bald eagle, full seven feet in all extent, the other a magnificent specimen of the golden eagle, with wings nearly eight feet from tip to tip. And they can, single handed, master and kill in a very short time, the largest Thomas cat. My friends can put against them.

P. S.—As an item of interest, I would say that I have a white crow, mounted and in good order in my cabinet. It is a perfect albino in every respect.

CURE FOR RATTLESAKE BITES.

A valued correspondent has sent us the following memorandum of a cure for rattlesnake bite, from Dr. James Thacker's Military Journal during the Revolutionary War:—"Soon after my arrival here, a soldier had the impudence to seize a rattlesnake by the tail. The reptile threw its head back and stuck its fangs into the man's hand. In a few moments a swelling commenced, attended with severe pain. It was not more than half an hour when his whole arm to his shoulder was swollen to twice its natural size, and the skin became of deep orange color. His body, on one side, soon became affected in a similar manner, and a nausea at his stomach ensued. The poor man was greatly and justly alarmed; his situation was very critical. Two medical men beside myself were in close attendance for several hours. Having procured a quantity of olive oil, we directed the patient to swallow it in large and repeated doses, until he had taken one quart, and at the same time we rubbed into the affected limb a very large quantity of mercerol ointment. In about two hours we had the satisfaction to perceive the favorable effects of the remedies. The ailments symptoms abated, the swelling and pain gradually subsided, and in about forty-eight hours he was happily restored to health."

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, NEW YORK, JUN. 24, 1873. Animals received at Central Park Menagerie for the week ending January 24th, 1873:— Three Lions, two males and one female. Bred in the menagerie. One Opossum, *Dulophis virginiana*. Presented by E. F. Hoffman, M. D. W. A. CONKLIN.

Woodland, Lawn and Garden.

TREATMENT OF SOILS.

A FEW words about the treatment of land, although a January article will not be found out of place in the coming Spring months. When land has been found in good condition, we have had little trouble to keep it so by judicious management, without the use of a large quantity of manure. If, however, you have good manure, or can obtain it easily, nothing as a stimulant should be substituted for it. There may arise cases when it would be difficult to procure manure, and for a time it may even be quite necessary to do without it, and to use a rotation of crops as one of the means of fertilizing the soil. It is a well known agricultural fact that clover, turnips, cabbages, etc., draw their nourishment in no small degree from the air, while cereals and corn exhaust the soil upon which in the main they depend for support. Clover should always be followed by a crop of cereals, and this plan alternated year by year.

We generally find that soils which have been top-dressed with manure, or treated with plaster, are overrun with a dense mass of roots, grass, and weeds. Corn and grain grow well upon this soil, and potatoes remarkably well. To have good crops upon such land, your best way is to plow deep, and give it a moderate dressing of wood ashes, plaster of Paris, or lime, either of which will improve it. This admixture should be spread over the plowed field and harrowed in, and the whole rolled in carefully. You may plant this with corn, sowing the furrows with superphosphate of lime, and the surface with a mixture of your own land with wheat, oat, clover seed, red top, timothy, or other field grasses, which will give you good remunerative crops. When the second cut, or rowen, is light, it should be left as a fertilizer upon the ground, and will be found as valuable as a thin top-dressing of ashes or manure. It will be found that salt added to grass lands in small quantities, when united with well rotted manure, and also clay and sand in small quantities, are beneficial; they readily commingle with the soil and render the same capable of bearing first rate crops, especially of grass and clover. Such lands require, in a greater or lesser degree, muck, nicely pulverized. This treatment will be found beneficial to almost any soil. Prepared muck with freshly added clay is to be used when it can be readily obtained. Almost any of the good fertilizers will give good results upon such lands, and you have no more experiments with what are called phosphates and fertilizers, preventives of insect depression, and the like. After a close study and use of these "aids to agriculture" for fifteen years, we can not recommend more than half a dozen that can be used and depended upon as coming up to the claims set forth for them. We are not inclined to introduce or recommend anything that we believe to be worthless, or not perfectly reliable.

In all meadow lands of a cold, clayey character, you need not use this muck dressing; but should place sand and ashes, or even fine gravelly soil upon the land, which I have seen used with good results. Anything that opens the clayey, damp soil to the air will be found a fertilizer, as it changes the character of meadow lands very considerably. When good drainage can be had it should never be omitted, as this alone will often change the character of the future grasses.

The reverse treatment for all soils which present open granules of sand should be given. In such places I have recommended the free use of meadow soil, and even coal ashes, with good advantage. To a certain extent, coal ashes have a fertilizing quality, for there is a place for everything created. In all cases of mixed soils, remember that

the most thorough working of them is an absolute necessity. Would you enhance the probability of a good crop of cranberries on your old meadow, put on the loose, refuse sand, and take your surplus brush trimmings, old shavings, and the debris of all your farm, burn them, and stir the ashes and sand in and well incorporate the same. Let your neighbors laugh if they will. What is that to you? Tell him who wins laugh, and while you are adding to your old meadow by this treatment you are giving all elements and nitrogen to your soils, without which no crops are perfected, and no plants grow. OLLIPOD QUILLS.

ANSWERS TO CORRESPONDENTS.

J. H., Paris, Maine.—I carefully examined many varieties of the hollyhock plant during 1873, and found no indications of it, either for or against the fact. I do not think we have reason to fear the development of a fungus known in England as *Puccinia malvacarum*. We do not think this disease, if a disease it be, is communicable to a great extent, as supposed to be by certain of our correspondents, who say it was first observed at Bordeaux, France, April, 1873. "It was seen," so says a correspondent, "in Germany in October." As far as we can learn, this fungi only appeared upon badly fertilized plants. We shall give it future consideration.

A NEW JERSEY FARMER.—The package of earth sent I find to be what is called "green sand marl." It may be used to advantage upon your ground; put from four to six tons of it upon an acre of land. Add to one ton of marl two bushels of air-slacked lime. Mix when you haul out your marl. A better fertilizer than any you can find is Gould's fertilizer. A single one fourth of a shovelful placed in the hill will give you potatoes free from worms, and as many in a hill as will satisfy any reasonable man. It will be found the cheapest manure you can use.

J. BALLARD, Richmond, Indiana.—Your lands are like large tracts found in the northeast part of your State, called "sandy uplands." This land can be improved and made valuable for the future. Plant your spare land with the different seeds of the pine, oak, hemlock, and other forest trees. If the soil be ever so sandy they will grow these seeds. Unless this land is very poor indeed, it can be made to grow good clover when cleaned of the little pines you speak of. The location being not over forty miles from a large city, seems to me to be a consideration not to be lost sight of. Any other information relative to this subject will be given on application by letter.

J. M. B., Islip, L. I.—"What fertilizer is the best for giving a good crop of potatoes, and how shall I use it?" There are three or four good fertilizers which I have successfully used and can recommend. I have used Gould's fertilizer for fourteen years, and consider it one of the best, if not the best, to be had. It costs about \$60 per ton. OLLIPOD QUILLS.

The Kennel.

COMFORT FOR DOGS—WE HAVE SECURED IT.

Now let every sportsman and owner of fine hunting dogs thank the FOREST AND STREAM for its persistent endeavors to secure a recognition of canine rights, and congratulate themselves and us upon our complete success. The Missouri, Kansas and Texas Railway Company, always regardful of the comfort of sportsmen and their dogs, have taken the initiative in establishing a regular tariff of fares for dogs over their route from Hannibal, Mo., to Denison, Texas, as will be seen by the schedule herewith appended. This example will be followed without delay by the Pennsylvania Railway Company, who control the routes from New York to Chicago, and a schedule will be issued shortly. This statement is based on private information from official sources. The link between Chicago and Hannibal will doubtless be filled by the C. B. and Quincy Company, and then there will be a continuous dog route to Texas, over which sportsmen can transport their animals for a sum not to exceed \$15, which will not be considered excessive by gentlemen of means. At all events, the safety, comfort, and attendance thus secured is worth vastly more, as any thorough sportsman will admit. Full information regarding the new arrangements will be found in the accompanying letter and schedule:—

SEBASTIA, MO., JANUARY 23d, 1873.

EDITOR FOREST AND STREAM:—

Communications from various sportsmen on the subject of the transportation of dogs have from time to time been observed in the columns of FOREST AND STREAM, and we have taken considerable interest in the matter. We have always endeavored to offer accommodations to those animals that would meet the wants of sportsmen, as well as satisfy and please them. We shall on the first proximo revise our rates, making them still more liberal, and thinking it might be of interest to the fraternity, I enclose you a printed copy of them. To any sportsman anticipating a trip out our way, we shall be pleased to mail copies free of charge, accompanied by maps, printed rates of fare, etc., and would also further state that our baggage men are instructed to treat dogs kindly, and to use every precaution in handling guns. For the transportation of the inter we make no charge. Yours truly and fraternally, JAMES D. BROWN, General Ticket Agent.

MISSOURI, KANSAS AND TEXAS RAILWAY.

The following tariff will be collected by train baggage men on all dogs and other live animals:—

Hannibal to Denison, 576 miles.....	\$4 25
Hannibal to Sedalia, 143 miles.....	1 00
Sedalia to Parsons, 165 miles.....	1 25
Parsons to Junction City, 150 miles.....	1 25
Parsons to Muskogee, 116 miles.....	1 00
Parsons to South Canadian, 159 miles.....	1 50
Parsons to McAlester, 714 miles.....	7 50
Parsons to Limestone Gap, 304.....	1 75
Parsons to Aroka, 231 miles.....	1 75
Parsons to Cadis, 341 miles.....	3 75
Parsons to Denison, 373 miles.....	3 75
Vinita to Denison, 323 miles.....	1 75

One cent per mile will be collected on intermediate points. No collection made less than twenty-five cents. To take effect February 1st, 1873. THOS. DORWIN, Gen. Passenger Agent.

Approved: C. H. CHAPPELL, Gen. Superintendent. J. C. CURLEY, Gen. Baggage Agent.

CHALLENGES AND FIELD TRIALS.—During the past year not a few challenges for trials of skill between pointers and setters have been published in the *FOREST AND STREAM* and other journals devoted to field sports, and, to our knowledge, not one has been accepted, owing to some quibble or misunderstanding either on the part of the challenger or the proposed acceptor; in fact, the only attempt at anything like a field trial took place under the management of the Tennessee State Sportsmen's Club, which we understand was very creditable to the projectors.

In these published challenges there appeared to be a lack of earnestness coupled with what is regularly called "a great deal of bluff," and a desire for publicity joined thereto. It will be best hereafter, in view of keeping unmeaning and boastful offers for matches from the columns of sportsmen's journals, to require some proof or earnest that the person holding them forth is sincere, and we would ask our contemporaries to carry out some such arrangement as this for their own protection.

In regularly planned field trials under the management of Kennel Clubs and Sportsmen's Associations it would not be necessary, as the societies themselves would be ample proof of earnestness.

At present every sportsman's dog in the best that ever entered the field, and will be so until systematic bench shows and field trials can decide their real merits one above another.

DOG SHOWS.—It is evident that exhibitions of the best blood of the American kennels will be no common, or long, as they are now in England. Some four or five exhibitions have been held during the past year, and of these that held at Memphis was undoubtedly the largest and most thorough in classification. The people of the Southern States have always been acknowledged as leaders in all matters pertaining to hunting and in their appreciation of fine dogs, but those of the West are now following them up rather vigorously, and promise soon to equal, if not exceed them in the number and character of their hunting kennels.

—Mr. L. E. Smith, of Stratroy, Canada, won the beautiful silver ice-warehouse pithler at the Detroit dog show, on the 15th instant, with his imported English setter bitch Dart and her puppy, he also took first prize for English setters with Dart. The show was a great success, nearly 200 setters and pointers competing.

71 BROADWAY, JUNE 13, 1875.

EDITOR FOREST AND STREAM:—

I give below a remedy for runaway dogs that may be of value to some of your readers. It has worked first rate in several cases that I know of. I have also tried it on a young dog of my own with great success, when fogging, and even "roosting" did no good.

Take a piece of bromide of potash, or for a large dog, a piece of a base ball cub, about eighteen inches long, suspend it to the collar so that it will be evenly balanced, about the height of his chest. It is no protection, except when he attempts to run, and then it is a severe one. A few days will cure the most obstinate cases. Yours truly,

WAKEMAN HOLBERTSON.

The remedy suggested above has long been employed by the Equinians and the settlers along the Labrador and Greenland coasts. The big suspended stick is called a "clog," and is used to prevent imposition by the strong upon the weaker dogs, which are kept in large numbers for the purpose of drawing the comestibles, or sleds. A clog will prevent a fight quicker than anything else. The more energetic the motions of the dog, the more he gets rapped upon the knees.—Ed.

A NECESSITY FOR PEDIGRES.

PHILADELPHIA, January 22, 1875.

EDITOR FOREST AND STREAM:—

A prominent sportsman of our acquaintance remarked to us a few days since that the time was fast drawing near when it would be a difficult matter to dispose of a setter or pointer in the United States, unless a voucher for pedigree could be furnished with the sale. "Too many dogs looking like the best of their kind, and the palmer of the respective breeders as nearly bred," he added, "and the sportsman is rapidly becoming educated to the fact that the only certain way of producing purely bred stock is to require a record of the dog he purchases."

We have ourselves noticed this increasing desire on the part of our sportsmen to possess finely bred field dogs, and shall continue to urge, as we have done heretofore, the necessity of demanding a pedigree—sworn to, if necessary, by the only sure way of improving our breed of setters and pointers in America. There is no doubt but that we are a great distance behind our English cousins in the breeding of superior sporting dogs, and we have yet much to learn from them; but we cannot see why, in a few years, we may not be able to show pointers and setters bred on this side of the Atlantic that will compete either on the bench or in a field trial with the best of theirs. If our present indiscriminate method of crossing when the characteristics of the two strains are entirely at variance with one another and unsuited for blending, cease, and an intelligent, scientific course of breeding is followed. Not a small part of our American stock of setters at the present writing have remote pointer blood in their veins, which, although not visible to the unexperienced eye, eventually crops out, showing the taint in its worst possible form. We consider the crossing of setters and pointers, notwithstanding the excellence of either the sire or dam in the union, to be radically wrong, from which nothing but harm can result. Why is it, when both these classes of field dogs are obtainable in all their purity, that a cross is advised, and attention is given to keeping each separate breed free from any blood, except of its own kind?

We confess we should be pleased to award the palm of superiority to our American breed of setters and pointers, if they deserved it, as it is natural for us to favor them in every particular; but we cannot in justice compare them to the finely bred animals we have lately seen sent to this country by the painstaking and scientific English breeder.

Again, why is it that the sportsman who regards the American setter as better than the English one, when asked the pedigree of his animal, although he has an imperfect knowledge of his dog's descent and opposes the keeping of such records, will so often reply "His sire or dam, grand-sire or granddam, came from England or Ireland?"

We cannot be too earnest in our advice that some system and care should be given to breeding the dogs in America. Bench shows will greatly tend to this end, where the sportsmen of the country can meet and interchange notes and ideas, and select the proper animals to breed from best suited for their particular stock. Hono.

CANIS MAJOR AND CANIS MINOR.

BOSTON, January 13, 1875.

EDITOR FOREST AND STREAM:—

I find in your issue of the 14th that Ethan Allen has anticipated a few ideas I had proposed to send you on "The Dog for New England Sportsmen." To content myself with a formal acknowledgment of his very sensible suggestions. He is good authority in such matters, I will not say, for although personally an entire stranger to me, I have seen here quite a number of capital dogs of his breed. I have a very high estimate of the ultimate benefit to be derived from the recent importations of splendid setters by such genuine sportsmen as Dr. Rowe, Mr. Raymond, and Mr. Adams; but, in my opinion, if the sportsman would, in my humble opinion, we should find all English bred and English bred dogs practically useless for our covering shorth. Even the next generation will require careful and persistent breeding to tone down their inheritance of speed, a quality which our English cousins have assiduously cultivated in their dogs for a long time. In the West, possibly, you will not get so much of this quality, but in New England, thanks to the unceasing settlement of our sportsmen, that a game hunter, even in July, is nearly always to be found, and the natural result of raising the price of this splendid game bird to one dollar during the last season, thereby ensuring its certain extinction, we are pretty well narrowed down to a doubtful supply of Bob White, and a reasonably certain one of that mostly wild of all game birds, the ruffed grouse. For the latter party, and I can claim some experience in the matter—namely me to the whole country. On the dry leaves of an Autumn woodland the stealthy footstep of a pinner would be none too useless for this wary game. I have in the last five years tied quite a number of setters, most of them fairly good on other game, but found them invariably too rash for myself. I have at last got one nearly perfect on them, and I do not find myself at any disadvantage on what struggling woodcock occur, or on Bob Whites, when broken up. In the open I am unwilling to admit a faster dog would be preferable, but one can't have all the good qualities in one skin. And this reminds me of a sensible article on pointers in your issue of Dec. 3d, with which I was much pleased. I shot over an admirable dog of this breed for nearly ten years, finding him, even after long periods of rest, always steady, careful, and pleasant to hunt, and I am sure to be forced to believe that the hardy and strong breeds of these dogs have nearly run out in these parts, as I still believe them to be the best dogs for very young or very old sportsmen, and in fact for all good fellows in cities who love the dog and gun, but have only a yearly vacation of a week or so to indulge their inclinations. Good sport pointers, adapted to a general shooting outfit, to sell well, and I hope to see some fresh stock imported from an established and noted kennel, like, for instance, Mr. Whitehouse's. There used to be good pointers in New York and New Jersey. Have they gone out with the setter epidemic? It may not be out of place here to enter a protest against Sommer woodcock shooting. Unless some action is taken this kind of bird will soon be a thing of the past, and the dog, and rather kill one woodcock than half a dozen any other bird, but would willingly sign off for three years to give them a chance to fill up their ranks.

Your interesting and instructive correspondent, "Olliphant Quill," in an answer to Belle May, in your issue of Dec. 24th refers to a fern, which he calls Canis Minor, or the little dog fern. Now, everything in the woods is interesting to me, and I have a list of ferns, but do not recognize any by this name, nor can I find it in "Gray." Will be kind enough to inform me if it has any other name, and if what sub order, tribe and genus it belongs? UNDER GUP.

THE DETROIT POULTRY, DOG, AND FISH SHOW.

DETROIT, Mich., January 13, 1875.

EDITOR FOREST AND STREAM:—

The fourth annual exhibition of the Michigan State Poultry Association is now in successful operation at Young Men's Hall in this city, and the management, having combined with it an exhibition of dogs, birds, fish culture, and pomological productions, the affair has proved one of the most interesting ever held in this State. It is far from being confined to the Society beyond their expectations. This is a very desirable feature, as the Society are enabled to free themselves from debt and place them on a sound foundation. The number of entries of poultry of all kinds is upwards of five hundred; of dogs, one hundred and fifty; of birds and other entries, over one hundred. Among the dogs, the different breeds of setters largely predominate, and among the birds, the setting shovels by Joseph Nell, of Buffalo; J. C. Goodenough, of Ontario; John Davidson, of Monroe; M. A. Fine Gordon setter—Joseph Nell, Buffalo. English setters by John E. Long, Detroit, and Messrs. Smith and Sly. Mr. Davidson, of Monroe, had the largest individual collection, numbering nine splendid dogs. There were also beagles, fox hounds, greyhounds, singlehounds, water spaniels, pointer spaniels, Newfoundland, shorthairs, terriers, &c., &c. There are many fine dogs not entered for premiums—a beautiful Cocker spaniel, owned by Harry C. Jolkeley, Monroe, and a number of others of merit. The fowls, though not quite so large an exhibition as last year, comprise some fine specimens of the best varieties known, notably the coops of Mr. Wright, of Detroit; A. H. West, W. H. Chappell, Dr. Clarke, E. G. Smith, W. M. Campbell and others. The brooding, cooking, game, and bantam classes had the greatest numbers, while black Hamburg, Houdans, Crevecoeurs, game and others were in fine display. There were about fifty pairs of pigeons shown by E. A. Noble and A. H. West.

To our mind the most interesting feature of the Fair was the exhibition by Mr. N. W. Clarke, of Plymouth, Mich., of his fish hatching apparatus and tanks, and also of his fish, from which he has been able to spawn up to full grown trout and salmon, showing the growth and progress of the fish admirably, and forming a most interesting study. I shall devote a paper at some future time to this interesting system of Mr. Clark's, and describe at length the details connected with this subject. A large tank in this department contained half grown specimens of white fish, pickerel, bass, and other fairly luxuriant of our great lakes. The novelty of the exhibition attracted large numbers of visitors. I am indebted to Mr. John E. Long, president; E. C. Steiner, secretary; Mr. Wm. Wright and others for courtesies during the Fair, which has in every respect been a complete success. KEUKA.

NOTICE TO CORRESPONDENTS.—Hereafter answers that would properly come within the scope of our Kennel Department will be found therein.

CAPTAIN FOR SALE.—What kind of a dog would you recommend for the sole purpose of retrieving duck, and what would the dog cost? Can I get a first-class W. & C. Scott gun, No. 10, in good order at second hand?

Answer.—A large size spaniel is a good duck retriever. There is a strain of dogs bred on the Chesapeake, which are superior. They can be bought for about \$40, and we will undertake to send one to you if you order it. 3. Yes, a strictly first class spaniel at \$200. Second class, at any price. The gun we speak of is at our office.

Dr. P. West Philadelphia.—In the *FOREST AND STREAM* of January 11th I read a notice from Hon. Fr. von Ivernois, of the *Gohlis-Leipsig Waidmann*, giving some information about duck-hounds. Will you give the full address of the above named gentleman, and also what lines of steamers would bring dogs over from Germany, what care they would receive en route, and in whose care they are placed on board ship, and the cost of passage?

Answer.—Dogs are placed in cage boxes on the steamers, and arrangements must be made with the steward (with

Company's sanction) for care, feeding, &c. Freight charges about \$1. The full address of the gentleman asked for is Fr. von Ivernois, Editor of the *Gohlis-Leipsig Waidmann* of Gohlis-Leipsig, Germany. To make special arrangement for transportation, care, &c. of dogs, write to August Balten 33 & 34 Admiralitäts Strasse, Hamburg.

E. R. of W. H.—I was out rabbit hunting with a beagle hound, and when in the woods but a short time the dogneted in a very peculiar manner, running in and out among the bushes as though he scented a rabbit, and giving two or three leaps, he fell in a fit, as I supposed. He seemed to recover himself, and I called him by name and he came up to within a few feet of me, but he did not touch me, and began to bark and growl at me, and thinking him mad, I shot him dead. Now this being an annual season for a dog doing mad, I would like to have your opinion whether he was mad, or whether it was a fit?

Answer.—No doubt the poor fellow had an epileptic fit, from which he would have recovered. He showed no evidence whatever of hydrophobia. Sportsmen should not act hastily in such cases, as rabies is very uncommon.

W. P. T.—What is the best diet for a small bull terrier about a year old, not obtaining very much regular exercise? Shows some tendency to mope, and has lost much flesh?

Answer.—Buy Hutchinson, Dinks and Mayhew on treatment of dogs, and study up. Perhaps he has worms.

J. F. Spaulding's Crossing.—A friend of mine has a dog, which I would be much obliged if you would classify and give the correct cross. He has been told that it was a full blooded pointer, also that he was a cross between a pointer and bull, also a cross between a pointer and cock. What is he? Description: Age, about one year; color, black and white, with small black spots between large black ones; height, 22 inches; hair, short; has a dock; a savage looking dog in general, in general build he is massive, tall long and smooth, ears short and pointed?

Answer.—Half Dalmatian (or coach dog) and half dog. Can't specify any closer.

The Horse and Course.

The following stakes are opened to be run for at the meetings at Jerome Park during 1875 and 1876, and will close at the rooms of the American Jockey Club March 1. For the Spring meeting of 1875 there are five stakes and handicaps open. The Fordham Handicap, for all ages, of \$50 each, half forfeit, and only \$10 if declared out; which the club add \$500, distance one mile and a quarter; the Westchester Cup, a sweepstakes for all ages of \$50, play or pay, with \$1,500 added, winners of \$2,000 and up to 100 to carry five weight; the Grand National Handicap Sweepstake, a sweepstakes of \$100 each, half forfeit, with \$200 added, only \$20 if declared out, distance two miles and a half; the Juvenile Stakes, for two-year-olds, of \$100 each, half forfeit, with \$500 added, half a mile; the Jockey Club Handicap Sweepstakes of \$100 each, half forfeit, and only \$20 if declared out, with \$1,000 added, two miles. For the Fall meeting of 1875 there is one stake open, a Post Stake of \$200 each, half forfeit, with \$2,000 added, distance four miles. For this stake any number of subscriptions may be made by the same person, and any subscriber will be entitled to run horses of which he is not the owner. The Annual Sweepstakes of 1876, to be run at the Fall meeting, will also close March 1. It is a stake for three-year-olds of \$250 each, \$100 forfeit, the club to add \$1,000 to the stakes, winners of any three-year old take of \$2,000 to carry five pounds extra; distance two miles and an eighth.

A match for \$100, to sleighs, was commenced at the Fleetwood Park on Saturday afternoon, but after two heats the race was postponed until Monday, when it was finished. The horses engaged were G. Walker's brown mare Lady Annie and John Hastlett's bay mare Young Thorn. The betting before the race was two to one on Lady Annie. She won the first heat, but was beaten the second. When the horses were brought on the track Monday Young Thorn was the favorite. She won to make quite a record by taking the third and fourth heats. Lady Annie was entirely out of fix, and made a very poor race, pulling a shoe off three times during the race. Best time, 2:38.

The Charleston races opened on the Washington Course on the 20th inst. The first race was for the Jockey Club purse of \$450 free for all; \$100 to the first, \$50 to the second; two miles. The starters were Granger, Prussian and Jack Frost. The former was the victor. Time—3:52. The next race was the Carolina Stakes for three-year-old distance, one mile. Volcano, Mainsail and Pimlico, were the contestants, but victory fell to the first in 1:52. The next race was for a purse of \$900 by three-year-olds. Boston, Denver, Mainsail and Warfar, were the competitors. The former won in 1:56. The second day's races were well attended. The first race was won by Volcano in two straight heats, beating Katie Lee. Time 1:52, 1:52. The second was a burdle race of two miles, in which six started, and was won by Jim Hinton, Busy Bee second and Midnight third. Time—4:04. The third was a dash of one and one-eighth miles. Five started, and the race was won by Starbright, Flower Girl second and Mildew third. Time—2:04.

The two mile and repeat trial, at San Francisco, of the trotting stallion Sam Hardy, shows him to be one of the best, if not the best, stallions in the country. He was driven by Tom McClellan, and had running horses to accompany him in each heat. He is said to have trotted the first heat in 4:47, and repeated in 4:45, without making a break. Some parties timed the last mile in 2:32. This beats any record, either pacing or trotting.

On the 9th of January a dash of three-fourths of a mile, for a purse of \$1,000—\$600 to the first, \$250 to second, \$150 to third—was run on the Oakland course, near San Francisco, and won by Chittawan in 1:54, beating Katie Peace by a head. The time is said to be the best ever made at all weights.

Cracked Heels, according to *Lind and Water*, often arise from derangement of the digestive organs, and in many cases may be easily cured by giving the horse a few crabs and keeping him scores from the country. A good ingredient to use is—Glycerine, four ounces; iodide of potassium, two drachms. Grease or oil should be avoided. A little sulphur—say half an ounce—and about a scruple of iodide of sulphur may be given daily, mixed with the food.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

Table with columns: Date, Boston, New York, Charleston. Rows for Jan 28, 29, 30, Feb 1, 2, 3, 4.

YACHTING IN FLORIDA—NO. 3.

WE awoke at our mooring at Orange Bluff, and found a fair bright morning. As soon as the sun was well up my cronies of the evening before came with their guns on their shoulders, followed by half bred hounds.

Here under a superb oak, with wild orange trees all about, we made a camp for the ladies, and then took skiffs for a stretch over shallow water. We landed at last in a tangle of orange trees, palmettos, vines and cypress, all forming a beautiful mass of foliage, with a carpet of moss.

From this cool retreat we worked our way to a more open upland, where a few scattered pitch pines cast a meager shadow. The ground was sandy, sometimes bearing a little wire like grass, with here and there some pretty wild flowers of unfamiliar form and unknown names.

Our course led along the edge of a cypress swamp, keeping a few rods from it. As we followed along after the hounds, which were now slowly beating about under the large oaks, I came upon a fine specimen of John Foster and John Lee, some idea of "jumping deer." The deer, here very numerous, hide and harbor in the swamps during the day.

At night they come into the "pine open" to feed, returning idly as dawn approaches, leaving on the dew a trail that remains until the sun is well up. The hounds strike this scent, and dashing into the swamp, alarm the deer in their day repose. They will not run long in the wet ground, where vines and grasses hamper them, but break out and make for the scrub islands, which are upland thickets of thorn and rough low trees, where they find refuge and rarely leave it.

The dogs followed a number of trails, but no deer came out for a long time, and we were about turning back when a large buck burst from the swamp with a hound at his heels and almost jumped on Foster, who pitched up his gun and fired within ten feet, but the buck saw the sudden movement and dodged so quickly that a shot through his ear was Foster's only mark.

It was now midday, and the grass too dry to retain a trail, so we made our way back to our boat. The guides staggering under the load of game, while I found load enough in adding the deer's porous guns to my own.

We rowed back to the yacht and found that some fish had been taken, while the engineer came in with a wild cat he had shot as it was skulking along the river's edge seeking fish.

We lunched under the bearded oak, and then Madame started on a shopping expedition in the yacht to the one store at Valusia, seven miles down the river, to get fresh supplies for the domestic purposes of the boat.

White and lesser herons were lighting on some trees in some low islands not far away, seeming preparing to roost there; so embarking again in a boat I had Foster leave me concealed among the overhanging vines, where I crouched down with a vivid sensation that it was just the haunt for moccasins and alligators.

The plumage of the white heron, or "angel bird," fills one with endless admiration, so pure and light are its sprays. These birds were all winging their way on, but I was free from stings. Lying then in careful order, we started to pull back to meet our steamer. The darkness came, and we were well on our way before her light was seen. She came after us, but we told Paul to leave

us to row to Orange Bluff, so she turned about and went dashing by us, leaving us rocking in her wake.

She was tied fast when we came to her, and calling for a light, we came quietly alongside, holding our white birds up to show like phantoms against the darkness. They were hung in the cabin, much to the delight of our little passenger, whose fancy was charmed with the beautiful birds. Orange Bluff we found very pleasant, and the kindly hearted resident of the place offered to take us with his family, we concluded to spend the yacht home and enjoy his hospitality.

The fishing was excellent, and from here we made excursions of very great interest. Two Indian mounds are here of marked character, which have been examined by Dr. Wyman and others.

There are no public houses near here, and all is undiscovered, so it was a privilege we fully appreciated in sharing Mr. Wyman's company.

Other trips were made, and of them, perhaps, more some other time. One can hardly go amiss in Florida, and there to seek natural interests, and leave Saratoga trunks, and watering place amusements and dissipations behind. Those who want the resources of fashion will do well to linger in Jacksonville or St. Augustine, and leave yachting and Bohemianism to the easily pleased lovers of wild life.

L. W. L.

—The Smedley Brothers, foot of Court street, Brooklyn, have just finished a twenty-foot boat for Captain Hopkins, of Brooklyn, and have in progress of construction two others, the first, twenty-five feet long, for Mr. Meeker, of Antboy, N. J., the second, twenty-two feet in length, for a New York gentleman.

The prizes won last season by yachts of the Brooklyn Club, it is reported, will be presented at the February meeting.

The schooner Tarolin, N. Y. Y. C., Messrs. H. A. Keel and H. A. Kent, Jr., will leave port in a few days for a lengthened trip to the West Indies.

Mr. P. McGiehan, of Pampano, N. J., is building a small cabin sloop for parties in Cambridge, Mass. She is 28 feet on deck, 10 feet 6 inches beam and 4 feet depth of hold. The sloop yacht Playful, B. Y. C., is in winter quarters at this yard. Mr. McGiehan is at work finishing a sloop, 48 feet over all, 14 feet 6 inches beam and 5 feet hull. She is intended for a gentleman in one of the New York lakes.

The steam yacht building at Keppert, N. J., for Mr. Ricker, of Elizabeth, is 89 feet over all. At the next meeting of the Eastern Yacht Club, to be held February 9, it is probable that the members may take into consideration the present "sailing regulations" with a view particularly to ascertain if any advantageous changes can be made in the rules as to "sails to be carried in races" and "allowances"; and as it is desirable to ascertain, as early as possible, the views of yacht owners and others interested on these subjects, such gentlemen are requested to state them in writing to Secretary Henry B. Jackson, No. 114 Federal street, Boston, previous to the 2d prox. With regard to "sails carried in races" the following suggestions have been made—

- First.—To leave the rule as to masts stands.
Second.—To alter only the clause relating to gafftopsails, restricting the same to "working gafftopsails" or "gafftopsails to be set aloft."
Third.—To do away with all balloon sails.
Fourth.—To allow the lower sails only, viz.—For schooners, mainsail, fore-and-aft, boom, and the jib; for sloops, mainsail, fore-and-aft, jib and flying jib.
Fifth.—Same as No. 4, with the addition, "Boats to be carried as usual when "working" or "to be set aloft."
Sixth.—Same as No. 4, with the addition, "Working gafftopsails" (which would allow "gafftopsails" to be set aloft.)
Seventh.—Same as No. 4, with the addition, "Working gafftopsails" (which would allow "gafftopsails" to be set aloft.)
Eighth.—Same as No. 4, with the addition, "Gafftopsails set aloft."
Ninth.—Sloops in the allowed to carry balloon jibtopsails as a studding sail or fore-and-aft boom, but not from the mast.

The following objections have been made to these suggestions:— To the second.—That the lower sails of some yachts are small, and they require the racing topsails, that the topsails of some of the smaller yachts are necessarily too short to admit of being set aloft to advantage.

To the third.—That the working staysails, gafftopsails and jibtopsails are large in some yachts as to be in effect "balloon sails," and generally the impossibility of detaining properly what are "working" and what "balloon sails."

To suggestions 4, 5, 6, 7, 8 it is objected that such rules would be likely to multiply yachts, and that the tendency would be to increase the size of the lower sails to extravagant dimensions.

Regarding "allowances," the following suggestions are made:— First.—To retain the present system.

Second.—To return to the original system of area. Third.—To adopt the "mean between the old and new system of displacement." Fourth.—To adopt a system of area, to be ascertained by adding the beam and draft together, and multiplying such product by the length, such area to be applied to a new table of allowances, to be prepared by those favoring the adoption of this suggestion.

It has also been suggested, with reference to the mode of measuring for length:— First.—To retain the present mode "on water line." Second.—To measure the length "on deck over all." Third.—To take the "mean between the above two measures."—Herald.

—The officers of the Savannah Boat Club of Brooklyn, for the current year are:—President, Charles A. Good; Vice-President, James A. Pickett; Secretary, W. H. Girdler; Treasurer, John Kelly; Secretary, W. H. Girdler; A. Kelly; Treasurer, Jessie L. Wheeler; Captain, John Keppel; Investigating Committee, Geo. Hathorn, Robert H. Orr, Frank Adee; Trustees, Fred. A. Fox, John M. Ranken, C. B. Elliott, A. W. Fliske, Richard Dixon.

—The amateur regatta, to be held in Troy this Summer, will for a moment that held there last year, which is saying a good deal. The Laureate and Ulysses clubs will spare no pains to make it a success. A larger number of clubs will be represented than last year. The Beaverweys, of Albany, who won the association prize, will have the same etc.—

—Mr. D. Cronan's clipper brig, "Elsie," Capt. Lovegrove, arrived yesterday morning from Havana, P. R., having been only 30 days absent from this port. This vessel has made seven trips to Porto Rico and back in 11 months and 31 days, three weeks of which time she was laid up undergoing extensive repairs. Her performance is hard to beat.—Herald for Reporter, 19th.

STARTS.

BOSTON, JANUARY 4, 1875.

ENTIRE FOREST AND STREAM.

All those who are interested in yachting must know that one of the most important things in a race is to get a good start. Now, where there are twenty or more boats entered for a race, it is almost impossible to get them off fairly, except by a flying start. At the City Regatta held in Boston last Summer, some of the boats were half a mile ahead of the others at the start, and a good many captains did not hear the signal for starting, (a steam whistle) but took their cue from the other boats which were near enough to hear it. Of course there was a good deal of grumbling and protest were awarded. This trouble could all be avoided, by adopting the rule of the Eastern Yacht Club in regard to starting, which seems to give general satisfaction. The yachts start in irregular order, and the time of each is taken as it passes the Judges' boat. As the City Regatta always brings together more boats than any other, it would be well for those who have charge of the matter to attend to this in time, and thus prevent the occurrence of another middle life like that of last year. Yours, &c., HEART ABOTT.

Answers To Correspondents.

Anonymous Communication Not Noticed. E. H. D., Philadelphia.—Thanks for your article on Fox Hunting in Virginia. Be kind enough to give us your city address, as we desire to communicate with you.

STRATTON, N. Y.—Can you tell me where I can get a distel map of Filled and Hamilton counties and papers, &c. Ans. Send to Colton & Co., 172 William street, N. Y. Price about 75c.

ALBY HELLENSTERN, Milwaukee.—Will you please tell me where you think the best place in Wisconsin can be found and obliged? Ans. "Home-bone—there's no place like home."

W. H. P., Nassau.—If any one wants wild rice, not parched, I can get it for them in any quantity, provided they order early in the Summer, so I can make the necessary arrangements at the Agency to procure the requisite supply.—THOMAS P. CANTWELL, Balaclava, Minn.

C. A. A., New York.—A notice in a recent number of your paper alludes to a map of the United States, compiled from the coast survey data, and published in Philadelphia. Please state by whom? Ans. E. Lloyd Map Publishers, Philadelphia.

W. H. McD., Dover, Del.—Won't you please give me cuts of the new Wimbledon targets in your valuable paper, and oblige me by attending to them in ride shooting? Ans. Have tried for three weeks to procure diagrams. Will probably print them in our next.

G. W. R., Brooklyn.—Do you know where I can purchase some brown wing curlew decoys, suitable for shooting the iron wing curlew in Florida? Ans. Order through any gunsmith. Prices range from \$12 to \$18, according to finish.

H. C. BRIDGES, Oesau, Iowa.—Can a pawn, on being played to the eighth square, be substituted only for any piece previously taken, or can a player have two queens, three rooks, &c., on the board at the same time? Ans. The moment a pawn reaches the eighth square it can be changed for any piece, so that the player changing it, can have two queens on the board or three rooks and any other pieces.

A. G. P. A.—Where can I go for a two weeks' excursion from Feb. 1 and get some good shooting? How is Cherrituck Sound? Ans. Most too late for Cherrituck. The club members returned two weeks ago. You can go to Florida and back in two weeks, and have half the time for shooting. Round trip to Jacksonville from New York and return via Pennsylvania Railroad, \$35 cheap.

E. P. R., Brooklyn.—I have a Remond first-class sporting rifle, and desire to know the advantages with shot shell, or have you heard of any person having any trouble in extracting the shells, or are there any other drawbacks to it? Ans. Gunsmiths and sportsmen speak of the Remond rifle as a very perfect weapon. An excellent rifle at a very low price is the Ballard, sold by Messrs. Read & Sons, Boston. Price \$12.

J. SCOTT, Gravenhurst, Muskoka, Canada.—Will you please give a description of the Wimbledon target, and how they count the points? Ans. An interesting description of the Wimbledon target, and its difference from that used at Creedmoor cannot be given without engraving which we hope soon to place before our readers. The points are counted as follows: Bullseye, 5; centre, 4; inner, 3; outer, 2.

C. E. L., Lockport.—Will you be so kind as to inform me, through your valuable paper, how that beautiful dark blue color is produced on rifle telescopes? Is it done by heating, or by some chemical process? Ans. The article is placed in a solution thin, and entirely covered with home dust, which is heated slowly and afterwards oil, or if required, it is allowed to soak in oil.

T. H. E., Niasco, Cal.—I send you the weight of a dozen California quail, six males and six females: Weight of males, 2 9/16 pounds; females, 2 pounds. They were averaged from seventy-one birds in good condition. Please give the weight of Eastern quail from Eastern and Western States, if there is any difference? Ans. Western quail take in a lump only weighed in three instances, in our presence, 21 pounds per dozen.

SHOOTING CLUB, Denver.—Has the Supreme Court of New York State decided that the possession of game out of season, although bought before the season closed, is in violation of the law? If so, in what case or cases? Ans. We enclose to you a copy of Judge Judd's decision in favor of the People vs. J. H. Raley, in a suit covering the question you refer to us. Counsel for the New York Society for Protection of Game has published a statement that in only one case out of seven had the prosecution failed. Quite possibly these cases may be appealed daily to the Supreme Court, but we do not understand if any such case has yet been before it.

L. C. L., Most Haven.—Would you inform me, through your most valuable paper, if there is any in existence that has the gas lighted up by electricity, and turned off and on by the same, and how it is constructed? Ans. The company I have mentioned has been in existence for some time, but has been very impracticable and expensive, if used on a large scale. The necessity of employing lamp cleaners and lighters would still exist, and the liability to breakage of the circuit of electricity would involve a host of disasters, such as total darkness, &c. of the entire city.

R. H. D., Canadawana.—In the International golf trial of 1873, I was asked, how far the target, what size and brand shot was used? Ans. Five yards; diameter of target, 30 inches. The target was composed of forty sheets of tough hardware wrapping paper, as nearly like that used at the British gun trials as could be obtained. 2d. There is no record of size or brand of shot. The charge was 1 1/2 oz. of shot and 1/4 oz. of drugging powder. Full reports of the golf trial were published in the 7th of Field and Stream. You probably did not regard a trial at that time as any sense a test of merit.

AMATEUR.—Please inform me of the best route to St. Augustine Florida, and the expense? Ans. To reach St. Augustine from New York there are four distinct routes—all rail to Jacksonville, thence by boat to Tocoi (forty miles up the St. John's River daily), from thence by rail, fourteen miles, in St. Augustine; or by steamer to Charleston, Savannah, or Fernandina, and by boat or rail thence to St. Augustine. Steamers to Charleston Savannah three times a week; and to Fernandina every week. Fare through by steamers, \$31.75; via "rail," \$40.75. By reference to an advertisement in these columns, it will be seen that the Pennsylvania Railroad issues excursion tickets to Jacksonville and return for \$30.

A WEEKLY JOURNAL, DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF FORESTS, PRESERVATION OF FISHES, AND THE RECREATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY Forest and Stream Publishing Company, 17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK, (Post Office Box 8822), 125 SOUTH THIRD STREET, PHILADELPHIA, 101 & 106 MADISON ST., CHICAGO.

Terms, Five Dollars a Year, Strictly In Advance.

A discount of twenty percent. allowed for five copies and upwards.

Advertising Rates. In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 28, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted. All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

FIELD CLUBS.

THE number of societies in England and France that devote a large share of attention to making collections and notes of the flora and fauna of their immediate region seems very large to us, on this side of the water, to whom such organizations are unknown; and the fact that they do not exist is somewhat of a disappointment, even if they would accomplish only a small fraction of the work done by the clubs abroad. The latter have furnished some of the most interesting notes on the habits and peculiarities of plants and animals to the more pretentious natural history societies, from the fact that they have had an opportunity of seeing the objects they study under varied conditions. Besides their contributions to science, the members have enriched their own minds, and given themselves a source of pure pleasure unlimited in capacity.

In this country, where many peculiarities of our flora and fauna are unknown, owing to the nascent condition of our scientific associations, and consequently their limited time for study and examination, such societies would do much good by their investigations and collections. They could, for instance, make notes on all the remarkable trees, shrubs and flowers in their neighborhood, the migration of birds, the hibernation of quadrupeds, and their mode of procuring food in severe Winters. These would prove a valuable contribution to our scientific lore, and be read with much interest by all classes of persons. So far, we know only of one club of this class in the country, and that is the New England Society, of Orange, New Jersey. That its members have not been idle is evident from a neat publication called the "Rabbit Portfolio," which they have recently issued. This contains a description and a history of all the notable trees in their neighborhood, and is handsomely illustrated with photo-engravings. The first number contains the "Valley oak" (Quercus albus), the "Hill-vor elm" (Ulmus Americano), and the buttonwood (Platanus Occidentalis).

The pretty volumes are named in honor of Dr. Babbitt, who was the first to plant shade trees in Orange and its vicinity. If we had more societies of this sort they would prove most valuable auxiliaries to the scientific corps now so actively engaged on this continent.

CLOSE TIME FOR DUCKS.

The New York Association for the Protection of Game, at their meeting January 18th, proposed some amendments to the Game Laws of New York, which do not quite meet the requirements of the case.

It is a well known fact among the sportsmen and baymen at the south side of Long Island, that ever since the duck law has been changed from October 20th, as it formerly existed, to September 1st, the shooting has been attended with exceedingly poor success.

As the law now stands, the gunners commence a brisk fusillade September 1st as the very first flock endeavors to alight in the bay; the consequence is, that the ducks are driven away, while if they were allowed to alight and remain undisturbed on the feeding grounds until about the 20th of October, the shooting would undoubtedly be good until the freezing of the bay drove the birds south. Most of the birds driven from Long Island during the Fall of 1873 took refuge in Barnegat Bay and other bays further south. Last Fall the ducks were very scarce all along the coast from Long Island to Cape May. These facts can be corroborated by gentlemen who have spent several weeks every year for many years gunning on the coast of Long Island and New Jersey.

We are not prepared to say why the ducks were so few last Fall, unless the warm weather kept them back; but when they did arrive, as the weather grew colder, it was evident to anyone that the cause of their hurried departure from our shores was the result of the vigorous fire opened upon them before they had a chance to "open a trade," as it is called, between the local feeding grounds. The law, we understand, was changed to September 1st in New York, to allow a chance to those who wish to shoot teal, which are very scarce at any time. All the gunners with whom we have conversed on the subject, agree that the 20th of October is the very earliest time that the Fall duck shooting ought to commence on Long Island.

If laws are not speedily enacted to suit the habits of the game and then vigorously enforced, the time is not far distant when we may as well "put our decoys out" on the Central Park skating pond as in the bays of Long Island and New Jersey.

AMERICAN RIFLES AT WIMBLEDON.

THE impression created on the Irish riflemen during their visit here may be readily inferred from the interest they have taken in the Amateur Club. They have already made preparations to receive their American rivals and friends at Wimbledon during the great shooting festival; but more than that, knowing that under the Wimbledon rules our riflemen would not be allowed to compete, as they use a rifle of 44 calibre instead of 45, as the former demand, they opened a correspondence with Capt. Midway, Secretary of the Wimbledon Association, and explained this fact to him, and he was kind enough to have the rule rescinded, so that our "team" can now show their power with the American breech loader. An important fact for our men to consider, were it not already understood, is that breech loaders will not be allowed to be loaded from the muzzle, it being considered a violation of the principles on which they are made. This, however, is a matter of small moment, as it was only done in an exceptional case here. The action of the Irish team in preparing the way for their American rivals and friends may be deduced from the letter of Mr. Rigby, which we append, as well as the response of Capt. Midway to his note of inquiry. Our riflemen are certainly under a marked obligation to Mr. Rigby for the personal interest and effort he has taken in the matter:—

Dublin, December 30th, 1874.

EDITOR FOREST AND STREAM.—During my stay in New York I became aware that almost all the American rifles used at Creedmoor were of a calibre smaller than the limit prescribed by the rules of the National Rifle Association of Great Britain, and that consequently American riflemen visiting England would be unable to use their own rifles in the competitions at Wimbledon. Immediately on my return, I wrote to the Council at London, representing this fact, and suggesting that the rule limiting the calibre might be altered. I took occasion at the same time to put another question, viz: whether in a competition open only to any breech loading rifle it would be permitted to a competitor to load through the muzzle. This was the subject of an undecided protest under consideration of your National Rifle Association at the time. I received the following reply to these questions:—

NATIONAL RIFLE ASSOCIATION, No. 12 PAUL MALL, EAST, December 9th, 1874. {

MY DEAR SIR:—In reply to your letter of the 18th ult., which I submitted to the Council of the R.N.A. in direct to state—'as that it will not be permitted to a competitor to load his rifle in the manner described by you, viz: 'inserting an empty cartridge case, closing the breech, and then loading through the muzzle.' The limitation of the minimum calibre to 45 in 'any rifle' will no longer be enforced.

Believe me, yours truly,

E. ST. JOHN MIDWAY, Sec'y N. R. A.

I think the Council of the National Rifle Association of Great Britain have shown good judgment in their decisions on both points, and am, sir, yours faithfully,

JOHN RIGBY.

FOREST AND STREAM has reached Russia, on its way to the Antipodes, our first subscription from that country having been forwarded to us last week through the Publishing House of G. P. Putnam's Sons.

—Seven more surgeons have located near the Boston Common since the coasting carnival began. If the studding continues, they anticipate a good business.

GOD REGATTA RULES.

THE decisions of the recent Intecollegiate Rowing Convocation will do away with nearly all the abuses usually incidental to races between the university boats, so that the contests will in future be devoid of the acrimony and ill feeling engendered by collisions, unfair decisions, and the other mishaps liable to occur at any time under the old rules. One very important change is placing the entire race, from the time of the start, in charge of the referee, and another is that every boat leaves its water at its own pier, thus preventing all danger of washing. The buoying of the course is a considerable idea, as that will check fouling, which seems to have become unfortunately common of late, and will do much to keep up that moral which induces every club present to struggle hard for supremacy, as a victory then, where all perillances are ruled out, will depend entirely on skill, muscle, and perseverance.

A definition of what constitutes a foul is a matter that the rules should be more specific about, for it is not really necessary that one boat should touch another to consider it a foul, for one may cross the line of another, or force it from its course, and yet it is a foul in reality as much as if both collided. The following conditions, if accepted, might, however, check any such action as this:—

If in any race in which more than two boats start, a foul takes place, and the boat adjudged by the umpire to have been fouled reaches the winning point ahead of all other crews, the race shall be decided as the boat came in, disqualifying the boat that committed the foul; but in case the boat fouled does not come in ahead of all the other crews, the race shall be rowed over again between the boat decided to have been fouled and the other boats which came in ahead of the fouled boat; or in case the referee is unable to decide which boat has committed the foul, the race shall be rowed over by all the boats; unless, in either of the last two cases, the referee shall decide that the boat which came in first had a sufficient lead at the foul to warrant the race being assigned to it.

The fact, however, that boats have been unusually prone to collision of late, may prevent a recurrence of such acts, as the crew guilty of careless conduct would leave themselves liable to severe criticism. The idea seems to prevail that such action is either premeditated or the result of want of skill or power, and therefore an indication of weakness; so we may conclude that the coming college regatta will be the best contested ever seen in our waters, and that nothing that wisdom can prevent will arise to mar its harmony. The only obstacle apparent at present is the absence of coxswains, and if the regatta committee understand the importance of their position they will permit these to be used, or else select a course so broad that there cannot be even the most remote excuse for fouling. The latter is somewhat difficult to do, so the former seems the readiest mode at command to escape from the dilemma.

THE ADIRONDACK SURVEY.

THE surveys of the Adirondacks have revealed beauties which the region was not supposed to possess, and have proved that the mountains which dot it so thickly have a much higher altitude and more rugged grandeur than their most warm admirers ever imagined. In speaking of the result of the expedition authorized by the Legislature to survey it, Mr. Venpauck Colvin says in his admirable Report:—

"The Adirondack wilderness may be considered the wonder and the glory of New York. It is a vast natural park, one immense and silent forest, curiously and beautifully broken by the gleaming waters of a myriad of lakes, between which rugged mountain ranges rise as a sea of granite billows. At the northeast the mountains culminate within an area of some hundreds of square miles; and here savage treeless peaks, towering above the timber line, crowd one another, and, standing gloomily shoulder to shoulder rear their rocky crests amid the frosty clouds. The wild beasts may look forth from the ledges on the mountain sides over unbroken woodlands stretching beyond the reach of sight—beyond the blue hazy ridges at the horizon. The voyager by canoe, beholds lakes in which these mountains and wild forests are reflected like inverted reality; now wondrous in their dark grandeur and solemnity; now glorious in resplendent Autumn color of pearly beauty. Here—hither, hither, south to the smoky echoes the wild melody of the loon, awakening the solitude with deep-mouthed bay, as he pursues the swift career of deer; the quivering note of the loon on the lake; the mournful hoot of the owl at night; with rarer forest voices have also to the lover of nature their peculiar charm, and form the wild language of this forest."

"It is this region of lakes and mountains—whose mountain core is well shown by the illustration 'the heart of the Adirondacks'—that our citizens desire to reserve forever as a public forest park, not only as a resort of rest for themselves and for posterity, but for weighty reasons of political economy. For reservoirs of water for the canals and rivers; for the amelioration of Spring floods, by the preservation of the forests sheltering the deep Winter snows; for the salvation of the timber—our only cheap source of lumber supply should the Canadian and Western markets be raised by fire, or otherwise lost to us—its preservation as a State forest is urgently demanded."

"In the verification of my previous discovery of the Joffest pond source of the Hudson, we obtain the definite and permanent settlement of an interesting question, and hand over to Geography the course of the mighty river from the lone lakelet spring, downward by steps of foam, to its broad, haughty and historic tide. From the loftiest lakelet of New York the water descends, gathering volume at every rapids, till in full breadth it swells before the barriers and piers of the metropolis, floating the richly burdened ships of all the nations."

"To the number of those chilly peaks amid which our principal rivers take their rise, I have added by measurement a dozen or more over four thousand feet in height, which were before either nameless or only vaguely known by the names given them by hunters and trappers. The names and measurements will be found in the table of altitudes. It is well to note that the final hypsometrical computations fully affirm my discovery that in Mount Haystack

THE "BIG HUNT."

Letters of protest and approval still continue to come in respecting the coming "Big Hunt," as it is called. We print some "speecheen bricks" to-day. Several correspondents will pardon us for not printing their communications, because they raise no new points not already covered by previous letters.

EDITH FOREST AND STREAM:— I wish to call the attention of sportsmen to several points in the letter of Col. McCarty, which appeared in your issue of January 14th, and pass a few friendly strictures upon your introductory remarks.

You must intend to satirize the expedition when you say "we shall be able not only to discover new acrobatic features, new minerals, new species of flora and fauna, but possibly new races of men, and ruins of ancient villages and cities." Mark Twain never wrote anything more humorous. Nothing is more absurd than to call this hunting raid of the Colonel and his party, scientific. I cannot believe that you wrote the paragraph in sober earnest.

Does the Colonel mean to put America on a level with Africa and India? Hunting expeditions have left England for these savage countries, and why should not one come to America, is his inevitable logic. He, in common with other Englishmen, no doubt thinks that we have no science, no civilization, and no rights. And "come," say you, "there are new races of men to be discovered, new species of birds and animals." This is rich. It really makes one laugh. We have no naturalists, no sportsmen. Eye, ear, and nose of the best of an organized band of slandering expeditions, headed by scientific men, known and respected the world over, but what of these, when compared with an English hunting, not scientific expedition, headed by one McCarty.

Come, stay out bona; leave not one alive; "they are a nuisance," for the Colonel says so, and he ought to know, for he is not an Englishman; and what is there that an Englishman does not know? Hear his philosophy—"Externalize the sin, and the Indian will cease his work of robbing and murdering, and the Government will save millions of dollars, and the precious lives of many of its best citizens." Prolongation! If this man's impudence does not need checking, then I am at fault in writing this letter.

Mr. McCarty, the sportsman of America will be glad to welcome you to their "preserves," if you prove to be a gentleman and a sportsman, but will not if you are an Englishman, or an organized band to slaughter our game. We emphatically protest against you and your party coming to our game regions without ever saying "by your leave." For one I am not willing to give up our game to foreign intruders. Your proposition is the most dishonorable imaginable. Were you to come with half a dozen good fellows, well equipped, but when you propose to go on a hunting expedition and call into our port, including and scattering your three hundred in our forests and upon our streams, killing our game without regard to use or value, we will not say welcome. We are democratic, but not enough to permit any nation to come in armies, burn our forests, take our animals, fishes, and birds captive. Reflect that it is our game which you propose to kill, and it is for our interest to protect the objects of the chase. You and your party, in your flying trip through our best game regions, having no future care or interest in preserving the game, may, if so disposed, wantonly destroy it. Should you persist in carrying out your programme, as published, we, the sportsmen of America, may be compelled to assemble and denounce your proposed invasion of our hunting grounds and destruction of our property. The sportsmen of England are prejudiced from such depredations by law, and most strictly do they enforce that law. Now, sir, we have but one remedy in view of your brazened proposition, and that is to ask Congress to protect us in our rights. The game of America is a part of her wealth, and belongs to her people, while the game of England belongs to the aristocracy of that country. Americans would be erected for stealing should they attempt such a raid in our domains as you propose to carry out in the United States. Sir, as I am writing a plain letter, you are deliberately organizing a thieving party. Should you come as you propose, you will not be recognized by American sportsmen. I have consulted several of our sportsmen, and they all denounce in bitter terms your project. It is to be hoped that you may have sufficient good sense to see the matter in its proper light, but should you determine to put your theory into practice, then there will be resolutions of censure and condemnation at every State meeting, and at our National Sportsmen's Convention, to be held at Cleveland, Ohio, in June next. We are in earnest. This is written with no ill will to you, or the men of leisure and wealth who compose your party, but in self-defence of our sportsmen and game, and in the interest of humanity.

Mr. Lamberton argues from false premises in the supposition that Col. McCarty is an Englishman, he being native and to the manner born, and his ancestors for five generations before him. We don't see how an act of Congress can be made to prohibit foreigners from hunting on or passing through our territory unless it subverts the first principles of the Republic.

71 BROADWAY, N. Y., January 21, 1875.

EDITH FOREST AND STREAM:— I see in your valuable paper that Col. McCarty has answered a number of your correspondents very fully. I think Mr. Mead and others write in a very silly strain. They had better devote their time to putting an end to daily poaching going on under our noses. I am in the habit of visiting the Adirondack region every summer, and I have never yet seen the spot where poaching was not a daily practice of the countrymen, or most of the visitors. There is plenty of room for their services nearer home, without going into things they do not understand.

Yours truly, WAKEMAN HOLBERTON.

REVOLUTIONARY.—The citizens of Lexington, Massachusetts, have resolved to celebrate the Hundredth Anniversary of the "Battle of Lexington" on the 19th of April next. No locality can be more appropriate for commemorating the opening scenes of the Revolution, than the very spot where the first blood was shed. It is proposed to arrange for the celebration of the day regardless of the broad historic interest which pertains to the event. The citizens of the country generally are invited to join in the observances. The prominent features of the day will consist of an oration, the unveiling of the statues of John Hinckock and Samuel Adams, who had sought refuge from British proscription in Lexington, and were under its protection on that day—and a public dinner. It is expected that the occasion will be honored by the presence of the Executive of the United States, the State of Massachusetts, representatives of the different departments of the National and State governments, literary, and other organizations, and distinguished individuals of the Republic, whose words of eloquence and wisdom will add interest to the occasion.

A series of international pigeon matches are to come off at Monaco, Italy, this week. Messrs. James Gordon Bennett, G. Lorillard and C. Livingstone are on the Committee of Arrangements.

Shot Gun and Rifle.

GAME IN SEASON FOR JANUARY.

Hares, brown and gray. Wild duck, geese, brant, &c. FOR FLORIDA. Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Fowl.

Under the head of "Game and Fish in Season" we can only specify the general terms the several sportsmen, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in season. This would require a very large number of our space. In concluding game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States with reference. Otherwise, our attempts to assist them will only create confusion.

GAME IN MARKET.—Venison sells from 18 to 20 cent per pound; ruffed grouse, \$1 per brace; prairie chickens 75 cents; quail, \$2 to \$2.50 per dozen; canvas backs, \$2 to \$2.50 per brace; red heads, \$1.50 to \$1.75; mallards, \$1.50; black ducks, \$1.25; wildgeese, \$1; hares, 75 cents; rabbits, same price; wild turkey, 30 cents per pound; and wild geese, \$3 per brace.

—We repeat the following notice for the information and guidance of marketmen and others:

Under the provisions of the Game laws of the State of New York, chapter 89 of the laws of '84 it is unlawful for any person to sell, expose for sale, transport, or have in his or her possession in this State, after the same has been killed, any moose, wild deer, or fresh venison, during the months of September, October, November, December and January, under a penalty of fifty dollars for each offence.

The New York Association for the protection of Game gives notice that it will prosecute all dealers and other persons who violate the foregoing provisions, after the first instant.

THOMAS N. CUMBERY, Secretary, No. 53 Wall street. January 18, 1875.

The sale of trout is not permitted until March 15th. The sale of grouse, quail, &c., is forbidden after March 1st.

—The snow in the Adirondack woods is two feet deep, and the ice on the lakes a foot and a half thick.

—The lumber for the new hotel at Cedar Keys, Florida, has been ordered, and the building will be pushed forward at once.

—The Kent County Sportsmen Club has just been organized in Michigan with twenty-four members and the following officers:—

President, E. S. Holmes; Vice President, Martin Hornum; Secretary, A. J. Holt; Treasurer, A. C. Horton; Board of Directors, L. H. Hascall, George S. Batts, A. B. Turner, J. S. Stewart, Henry Widdicombe, its headquarters are at Grand Rapids. Preservation of game and fish will receive its special attention.

—The sportsmen of York, Pa., last week organized a club for the protection of game, with the following officers for the year 1875:—President, H. L. Fisher, Esq.; Vice Presidents, A. H. Nes, Geo. Karg, A. H. Glaz, P. L. Wickes, Esq., John L. Blackford, Esq.; Secretary, Edward Stuck; Cor. Sec'y, Geo. A. Heekert; Treasurer, Alfred Gartman. Adjourned to meet at the call of the President.

—The sportsmen of Grand Rapids, Michigan, have organized a club called the Kent County Sportsmen's Club, and have announced their readiness to second a call from other clubs, to start a State Sportsmen's Association, to fully represent the interest of Michigan in the session of the National Sportsmen's Association at Cleveland in June next. Keep the ball in motion. The work goes bravely on. Yours, B.

—The Hannibal, Mo., Shooting Club has elected the following officers for the coming year:—P. A. Hickman, President; G. W. Hewitt, Vice President; W. S. Hallock, Corresponding and Recording Secretary; J. K. Hayward, Treasurer; K. Bachman, W. R. Kelley, J. Van Brown, Executive Committee.

THE INTERNATIONAL RIFLE MATCH.—A meeting of the National Rifle Association and the Amateur Rifle Club was held on No. 194 Broadway, on Saturday afternoon to make the requisite preparations for the forthcoming international rifle match, which is to take place at Dublin in June next. Colonel Wingate was made Chairman and Mr. Bruce Secretary. After stating the objects of the meeting the Chairman read a letter from Major Leech, of the Irish team, asking that the American team be his personal guests during the match. This it was resolved to decline, with suitable expressions as imposing too heavy a burden on the Major. A committee on Finance was appointed consisting of General Woodward, Colonel Gilderclieve, Mr. Judd and Mr. Alvord, to report a plan for raising the necessary funds to pay the expenses of the team. The Chairman, General McMahon, Captain Fulton and Mr. Collins were appointed a committee to devise the selection of a team, and the joint committee adjourned to meet next Saturday afternoon at the same place.

RIFLE RANGER IN MASSACHUSETTS.—Adjutant General Cunningham in his annual report to the Legislature commends the building of a rifle range at the State Camp Ground at Framingham, Mass. He says:—

"The subject of a rifle range for the militia is receiving considerable attention throughout the State. It is found upon examination, that the State Camp Grounds afford the opportunity of procuring thereon a rifle range 1,000 yards long, and it could be made undoubtably the best range in the country.

—Lieut. Macnechta, of Cobourg has received the gold medal awarded by His Excellency Lord Dufferin to the Canadian marksman making the highest score at Wimbledon last winter. The medal is very handsome on one side of which is near the outer edge, in letters, "The Dufferin Medal, 1874," and in the centre a beautiful executed figure of a rifleman, in officer's tunic, kneeling in the act of shooting. On the obverse is a finely executed laurel wreath enclosing the following:—"For the highest score made at Wimbledon." Lieut. Macnechta was lucky enough to win no less than four prizes, which he brought home with him from Wimbledon, and this is the fifth secured by him from the Wimbledon match of 1874.

we have another mountain of 5,000 feet altitude. It may not be uninteresting, also, to remark that the difference between the altitudes of Mt. Marcy, and Mt. Washington, of the White Mountains of New Hampshire, is found to be quite 800 feet. Mt. Marcy, Mt. MacIntyre and Mt. Haystack, are to be remembered as the three royal summits of the State. Mt. Skylight, though lying upon the very limit of 5,000 feet I have found to be twenty-five feet lower than Mt. Haystack; yet it should be mentioned that a computation based upon a single vertical angle, from Mt. Marcy would show Skylight to be but 9 15-100 feet below the limit of 5,000 feet. This will be finally settled by reciprocal vertical angles to be hereafter measured."

The new passes and routes for trails across the mountains which we have explored will be found to greatly facilitate travel, especially the route by Lake Tear, the summit-water, at the south of Mt. Marcy, which renders the climbing of the peak unnecessary to those merely desirous of crossing the range; while upon the shore of the lakelet spring, a hut can be constructed for the shelter of parties, till clouds clearing away from the summit of Marcy announce a favorable day for the ascent. The trail by the new Carthage pass, by which the water of Avalanche Lake may be avoided, will be found of equal value, while the new route which I have discovered to the summit of Mt. Seward, from the north by Amersand Pond, makes that grand peak easily accessible, without the labor of climbing over all the minor summits at the south. Our trail from Bartlett mountain to the summit of Mt. Haystack will be found useful to those desirous of visiting that remarkable mountain.

"The hydraulic power of the region, practically its most important topographical feature, has been studied with the results heretofore detailed. The absolute necessity of the reservation of these waters for the Champlain ship canal has, I trust, been made apparent; it was first brought before the public in my previous reports. The statistics of areas of water sheds; of flow per minute in cubic feet of these streams of the wilderness are the first ever made, and are recommended to legislative consideration. It is just to grant of the Hudson pass by which the water of Avalanche Lake waters of the Hudson and St. Lawrence was first suggested by Prof. E. Emmons, not only for the purpose of obtaining better canoe or bateau navigation through the wilderness."

Of the Zoology of the region he says:—"As a matter of zoological and general interest, I may mention that in a few of the most remote portions of the wilderness we have met with indications of the moose, which, to some of the guides, seemed unmistakable. This gigantic deer is, however, almost extinct in the Adirondacks, and I would suggest that it be made, in future, unlawful to kill or destroy the animal in any season. Beavers also, are still to be found in one or two localities, and should be similarly protected by law. The bear, panther and wolf, etc., are still sufficiently abundant, and afford support to some trappers, who make them almost their sole object and means of livelihood. The common deer are extremely plentiful in some sections, and almost wanting in others—their absence in localities being attributable to the want of food for the animals, which, when soon sends those (which are not driven to water and killed) to less disturbed feeding grounds."

"Almost all of the new lakes mapped, abound in immense speckled or brook trout—some of them of wonderful size and weight, reaching three and four pounds—true *salmo fontinalis*. As a matter of special interest, I may mention our discovery of huge trout in one of the brook inlets of the Adirondack Park, on the north side of Keene. This is probably the highest point at which trout are found within the State, Lake Colden being over 2,700 feet above the sea.

In reference to the Adirondack Park he says:—

"In regard specifically to the proposed park or State forest reserve and the great portion of it to be taken for that purpose, a brief statement will be sufficient. I would recommend that at present only the high mountain region—the heart of the Adirondacks—be taken. This section includes Mt. Marcy and all the great peaks of 4,000 and 5,000 feet altitude, and is indisputably valuable for agriculture. The region which I thus suggest as the nucleus of the park is bounded on the east by the Schoonmaker valley and Pass, from the north to the south by the Adirondack Park, from the north by the Adirondack Park, from the west by the Saranac Lakes; on the west by the Raquette River and Long Lake; and on the south by what is known as the Carthage Road, extending from Long Lake to Root's. The area thus separated would afford the State the control of the Catlin Chain and outlet of Long Lake—the key to the western waters which I have so often recommended for favors of the Champlain."

The area of the section thus recommended is not far from 600 square miles or 384,000 acres, and with but trifling exceptions consists of abandoned lands, unremunerative and almost valueless—the only lumbering or timber cutting being along a few of the low-land or lake valleys.

It forms but a small portion of this northern forest region, is acknowledged to be cold, sterile and useless for farming; it embraces the sources of the Hudson River and lakes already used as reservoirs by lumbermen; and besides contains the highest mountains of New York—a region of wonderful beauty and picturesqueness which, under control as a park, and preserved from ruthless desolation by fire, can be made as profitable to this State by travel and traffic as Mt. Washington and the White Mountains are to New Hampshire."

SEVERE WEATHER IN ENGLAND.—A letter from Jackson Gillbanks, Esq., Whitefield, Eng., says:—

"We have not had such storms in England &c. Great Britain, for forty or fifty years. The frost and snow are terrible. A great want of cattle food—such as maize, Canadian peas, &c., (as our hay and corn crop was only about one quarter of average) and yet the arrivals from America of such stuff are very scarce. Your American farmers might have made a fortune out of us, if they had sent plenty over, but I suspect your shipping is not flourishing, and your governors content with living from hand to mouth."

In Kansas the coal deposits are found near the surface. When the owner of a deposit wishes to open a coal yard, he sticks up a sign near the spot, "Coal for Sale," and the purchaser digs for himself and carts away what he wants,

much like to hear this question discussed, but I am in favor of a general law on game birds and make the close time for New England from January to October. What do you say? SANJES.

PROTECTING RABBITS.

STATEN ISLAND SHOOTING ASSOCIATION, 1
TONT RICHMOND, January 30, 1875.

EDITOR FOREST AND STREAM:—I send you one of our posters, which we have just authorized, and which speaks for itself. You will see that rabbits are mentioned. This is a county law which we had passed in 1873, and several parties have been brought up and fined for violating it. The fine is a heavy one, and we shall demand the whole amount in all cases, as we are inclined to hoping the destruction of these little animals, which have been practised in former years in our country. If any person has any doubt about our enforcing this law, they can let it be brought to our notice, and we will show them how earnest we are in the matter. We only ask to have them protected during the close season, after which time we are happy to have anyone join us in the sport. Let other clubs do likewise. Respectfully Yours, MONTMERE.

BEEF, MUTTON, COOTS AND COONS.

BROOKFIELD HOUSE, BOSTON, January 9, 1875.

EDITOR FOREST AND STREAM:—The following very interesting specimens were lately shipped by G. F. Frankland, Toronto, Canada, to L. Bekkap & Co., Boston, where their remarkable qualities attracted much attention: Six mutton, five quarters beef, one veal, one goat, four coons and one bear. The two heaviest quarters beef weighed respectively 423 lbs. and 476 lbs., and by our market men are said to be the minutest and handsomest ever passed the loads of Faneuil Hall Market. The heaviest mutton turned the scales at 214 lbs. The condition of the coons and bear gave evidence of good living in the Muskoka region, from which they came. The entire lot were skillfully dressed, and reflected credit on the ability and enterprise of our provincial neighbors.

By the way, dear FOREST AND STREAM, I should like to say to "R. L. N." and "S. K. S." and others, I have been much interested in their discussion on cool shooting; in fact the discussion is more interesting to me than the cool shoot (?). I am an old cool shooter. I might say a retired cool shooter—I always retire when the sea is rough. They both are practically correct, as far as they have carried their statements, but they don't tell it all. The boys here want me to write and tell how I do it. They say I got sea sick and gave a man two dollars to row me ashore. There must be some mistake about that; but, if anybody wishes my opinion on cool shooting, they must address me confidentially and enclose stamp. Yours, &c., M.

PETERBOROUGH, January 21, 1875.

EDITOR FOREST AND STREAM:—

We are about forming a sporting and game protective club in this town. Our inaugural meeting takes place on Wednesday evening next, (27th) a report of which I will give you for publication in FOREST AND STREAM. Your excellent paper is the best, the most readable amount of good, not only in the United States, but in Canada, wherever it is read. I think we shall be able to say that we owe the existence of our club to FOREST AND STREAM, and I have no doubt many other sporting clubs can trace the origin of their existence to the same source. Claiming your indulgence in trespassing on your time, I am, very respectfully, C. A. Post.

CHARGES FOR SHOT GUNS.

MONTREAL, January 20, 1875.

EDITOR FOREST AND STREAM:—

I am often annoyed at parties asking you the best charges for their guns, and rarely, if ever, stating the weight of their pieces. I will give you a simple rule which is the result of my own experience, and one that I think has not yet been in print. The charge of shot for any gun not exceeding No. 10 bore, to be one ounce. If no over No. 5, one ounce and a quarter if under that number. The number of pellets in an ounce of shot decrease so rapidly from No 5 upwards, that the extra quarter is necessary to make a small pattern. Charge of powder to be half a drachm for every pound weight of gun, which would give 31 drachms for a six and a half pound gun, and 5 drachms for a ten pounder. The charge I have used for years is four drachms Oerle & Harvey's No. 5 diamond grain and 14 ounce of shot. My favorite gun is 10 bore, weighing eight pounds, and one of the best guns that could be made to order in England. I had it made by George Gibbs, of 29 Corn street, Bristol, and though it has had five seasons' hard shooting, has not a spot of rust inside. Of course the browning has long since left the outside of the barrels. With 4 drachms powder and 14 oz. of No. 3 shot, a duck or a grouse has a poor chance at seventy-five yards, when both straight and the difference between my 30 inch gun and my 28 inch, both by same maker, game gauge, and each exactly eight pounds weight. It is a mistake to overload a gun, as, so soon as a gun begins to recoil unpleasantly, it is good bye to steady shooting. I am a tolerably strong man, and for many years accustomed to march in those long distances with the Mafford rifle, and thoroughly accustomed to heavy recoil, but never could stand more than one-half a drachm to the pound weight of the gun. If I have above scale of charges will be tried by some of your readers. I will guarantee that they will find them extremely effective. I am, yours truly, ROYAL.

CONICAL BASE SHELLS.

Boston, January 19, 1875.

EDITOR FOREST AND STREAM:—

It has just occurred to me, in connection with your notice of the new conical base shell, that a long time ago—several years, I think, the subject being at that time the topic of conversation amongst several sportsmen—it was stated by one of them, that a shell of this description had been made and tried with a measurable degree of success by what I will know and skillful mechanic, Mr. P. Mullin, of New York. I think it was stated that Mr. Mullin found a large increase in penetration. I have not been queried why the shell has never been brought out, but possibly Mr. Mullin can be asked to explain that for himself, as I believe he still works and prepares in your day, as he well deserves to. UNDER GIMP.

TWO FLATTERING TESTIMONIALS.—We take the liberty of publishing the following extracts from business letters sent to this office:—

WHITNEYVILLE ARMOY, Whitneyville, Ct.,
January 24, 1875.

EDITOR FOREST AND STREAM:—

We have subscribed to and read with great interest your paper during the past year, and expect to derive from its further perusal a great deal of useful information which will enable us to make still further improvements in our sporting rifles. E.

The Whitney Arms Company not only use the very best materials in their manufacture, but take great pains that no guns shall leave the Armory that are not perfect. S. W.
59 ST. JAMES STREET, LONDON, E.
December 26th, 1874.

EDITOR FOREST AND STREAM:—

We should like to have an advertisement run for another year. I am glad to learn, from the many inquiries that I receive, that the paper has such a widespread circulation. J. D. DUNNELL,
Dunnaker by Special Warrants to their R. H. II. the Prince of Wales and Duke of Edinburgh.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.
Trout (black bass).
Herring (two species).
Kluger's
Striped Bass.
Shad.
Tullibee.
Sea Bass.

FISH IN MARKET.—Fish in general is rather scarce owing to the blocking of the rivers and harbors with ice. Smelts are coming in from Maine and Nova Scotia. Striped bass, caught through the ice and weighing about fifteen pounds, sell readily at twenty-five cents per pound; halibut is very rare and not much required, as it brings thirty cents per pound; Cod brings ten cents per pound; fresh mackerel twenty cents; Spanish mackerel forty cents; salmon trout twenty-five cents; bluefish fifteen cents; salmon forty-five cents; lobsters twelve cents; whitefish twenty cents; scollops \$2 per gallon.

Considerable sport is now obtained in Eastern Massachusetts fishing for smelts through the ice with hook and line. At Milton, Weymouth, Ipswich, Newburyport, and other places large numbers are caught, and of good size, but are full of spawn. A lot recently caught at Milton weighed two pounds to the dozen. Some have been shown in Boston that weighed a half pound each, a size that shows the beneficence of the new law. These fish will bite as fast as the line can be lowered. The close season begins March 15th.

A party of gentlemen spent a couple days, week before last at the Senter House, Centre Harbor, N. H., fishing for pickerel through the ice in that part of Lake Winnepesaukee called the Basin. They captured two hundred and twenty-five pickerel, none very large, their weight varying from one to two and three-quarter pounds. The sport was heightened by the offer of a silver medal for the largest fish, which was captured by Mr. Shapleigh of Boston, and leather medal for the smallest, taken by Dr. Young of Dover, N. H.

The preparation of fish for market has attracted much attention of late from dealers in the piscatorial pabulum, and they have made so many improvements in its preservation that all the old modes have been relinquished. We see no longer the masses of oily codfish suspended from the smoke house in process of curing, as it is now deemed a piece of unnecessary labor and a means of preservation apt to injure the flavor of the finny tribes. In Gloucester, Massachusetts, according to the Advertiser, dealers now strip the best species of codfish of the skin and bones and then pack it in boxes. This leaves the clear article all ready for cooking, without a particle of waste. The experiment has proved very successful, and the demand for this prepared codfish, as it is called, is increasing each month. A dealer says that it is his opinion that in a few years this will constitute the principle form in which dried fish will be sold. The saving of freight, and the labor of trucking and handling the refuse matter, would form a large item in the course of a year. Beside this, the uniform quality of the fish put up in this manner commends itself at once, both to the purchaser and consumer, and are weighty arguments in its favor. The fish thus prepared looks very nice and inviting, as a visit to any of the establishments will at once prove convincing. Then, again, the labor which the preparing and boxing furnishes our people, is one worthy of consideration, and bids fair of greatly increasing in the years to come. As an illustration of the demand for prepared codfish, it may be stated that one firm, in a single month, put up and sold eleven hundred quintals, amounting when ready for market to ninety-four thousand pounds. The amount paid out for the labor of preparing it was \$470, an item which would have been lost to Gloucester if the fish had been sold according to the old method.

The following is the text of an act which is now being passed through the Legislature of this State. It is of the utmost importance, and we trust will meet with no opposition, but pass through smoothly and become a law:—

The people of the State of New York, represented in Senate and Assembly, do enact as follows:—

SECTION 1.—No person shall set a pound net, or arrange a ground fixture for catching fish in any part of the Great South Bay, or its tributaries or bays, bays, or waters connected therewith, nor in any of the estuaries or rivers and kills emptying into the Upper or Lower Bay of New York, or in any of the bays or rivers connected with Long Island Sound, nor take any fish by any such device.

Any person offending against the provisions of this section shall be liable to a penalty of \$25 to \$500 for each offence, and imprisonment of from one to thirty days, and the net so used shall be adjudged to be destroyed.

Any person shall be authorized to remove and destroy any such nets or fixtures connected therewith, and shall not be liable in any action or proceeding for so doing. All monies paid as fines under this section shall be divided, the one half to the informer, and the other half to the school fund of the town where the offence was committed.

The Fishermen's Co-operative Association of the east end of Long Island at their annual meeting, held last week at East Marion, elected the following named officers for the current year.—President, W. H. Tullih; Vice Presidents, George M. Vail, Charles H. Brown and J. A. Clark; Secretary and Treasurer, Daniel C. Brown; Collector, H. H. C. Tullih; Executive Committee, D. G. Vail, George E. Udel and Benjamin L. Potter. It was resolved that the funds of the association should be deposited in the Southold Savings Bank, in readiness for the defence of members in the exercise of their rights of fishery in the waters of the State of New York.

—Clam diggers at Ipswich, Mass., earn \$4 per day.

THE MASKING OF MUSKOKA.

CHATEAUBERT, January 14, 1875.

EDITOR FOREST AND STREAM:—The communication in the Muskoka Region, published in the FOREST AND STREAM on the 31st ult., says that he does not believe that there are any maskinonge in Muskoka, except in the Severn River. He is mistaken, for there are plenty of them in Moon River, which is a branch of the Miguquois River. The Miguquois is the outlet of Muskoka Lake and empties into the Georgian Bay, where the Moon River also empties. Adam Rolph and a party of five or six gentlemen from Toronto succeeded in killing seventeen maskinonges in about three hours last Fall, in Moon River, about five miles below Bala. They averaged twenty pounds each. They caught them with the trawl spoon ball.

We have now about three feet of snow, which is rather unusual for this time of year. The ice on the lakes is not very safe yet, on account of there being no snow on it; therefore no fishing done yet.

Yours truly,

This paper has repeatedly mentioned the maskinonge of Moon River.—Ed.

NEPIGON TROUT.

NEWCASTLE, Ontario, January 11, 1875.

EDITOR FOREST AND STREAM:—

The communication in the last number of FOREST AND STREAM, from your clerical correspondent, in reference to his trip on North Shore of Lake Superior, reminds me of a circumstance which occurred to me when on a fishing tour to the Nepigon three years since. I one day went out to fish the east side of the river, from Cameron's Pool to Camp Alexander, and when about half a mile above the latter place, and wading in water about three feet deep, I hooked, as I thought, a very large trout. I was fishing the edge of the lode, by the side of a very swift current. The fish at once struck for the current, and before I could turn him to the eddy had run out fully forty yards of line. This was repeated four or five times before I could get a sight, and I began to think I had hold of one of the enormous pike which are found by Camp Alexander. However, at length succeeded in bringing to view two beautiful trout. As I could not land them, in consequence of brush, and it was impossible to get them into the landing net, I called to a young fellow from St. Catharines, who came with me, and asked him to come to my assistance. He noticed the lower one which I seized the other around the gills, and by that means secured them both. They were exactly the same length—twenty-one and three-quarter inches—one weighing four pounds twelve ounces, the other four pounds four ounces. I was at the time using two gandy salmon flies on a coarsish line of double gut, a scissor footed, hair and silver tinsel, and six or eight yards long, and multiplying reel. Had I been using one of your twelve ounce rods, I am quite satisfied, although a fly fisher of thirty years' experience, I could not have landed these fish. My heaviest trout during the trip of ten days, was five pounds nine ounces, and during that time I only caught one that weighed less than one pound.

I found the trout very capricious about their food, some days taking, by very well, whereas on others they would not look at it, but would take grasshoppers greedily. They would take a small trolling spoon, but that they never refused was a minnow, but on my next trip to Lake Superior I intend to take prepared minnows from home. Some gentlemen may say "Why not use artificial minnows?" I did so, but in consequence of the large size of the fish, and the rough and rocky nature of the stream, I found that after killing three or four trout, my bait was utterly destroyed, and moreover I have come to the conclusion that natural baits are preferable to artificial. Yours, J. J. R.

OPENING OF THE SALMON SEASON IN IRELAND.—Net fishing opened on the Sligo River on the 1st of January. On the first and succeeding days some fine fish were taken. The first arrival of salmon for the season in London was on the 5th January, when the market price was as high as 10s. per pound. Since then the price had fallen 5s. per pound.

Rational Pastimes.

—The Paterson and Jersey City Curling Clubs had a contest last Tuesday, which resulted in favor of the latter.

—Curling is the great pastime now in vogue in Canada, and is enjoyed alike by all classes.

—Companies B and A. of the 79th Regt., played a curling match at the Central Park last week. The former were victors by a score of 33 to 25. Several impromptu games were also played by the citizens.

—Skating was excellent on Saturday last at all the resorts in New York and Brooklyn, the ladies flocking in great numbers to the Capitoline Lake. The storm of Sunday stopped sport for a day, but on Tuesday the ball was up again at the Capitoline and Prospect Park lakes, at the former of which the Sunday School of the Tabernacle church congregated in full force.

—On Saturday, January 23d, another ball match was played on the ice at Prospect Park, the score being as follows:—

Barnie's Side	3	2	6	1	2	1	10	1	0-20
Brookside Side	1	2	1	3	0	3	0	3	3-18
First base by errors—Barnie's Side, 12; Brookside's Side, 11. Runs earned—Barnie's Side, 12; Brookside's Side, 2. Umpire, Mr. Chadwick. Time, 1 hour, 14 minutes.										

—The Victoria Skating Club, of Montreal, intend having their Grand Annual Tournament at the end of next month. Medals are given by the Governor General to the best lady and gentleman skaters in the Dominion, and as all the clubs have been requested to send competitors and have signified their intention of doing so, we may expect the finest exhibition of fancy skating that has ever taken place in America. Beside their champion prizes the directors give several others to members of the club, which now numbers 2,600 subscribers. The following distinguished persons are among the honorary members:—The Hon. W. L. Lord Monek, Gen. Sir W. A. Miles, Bt., K. C. B., H. H. H. Monek, Prince Arthur, H. I. H. The Grand Duke Alexis of Russia; His Excellency the Earl of Dufferin; the Right Honorable the Countess of Dufferin. We acknowledge the courtesy of a kind invitation to be present at the Tournament at the guest of the Club.

The coasting track on Boston Common is worn a smooth as glass, and a sled that was timed showed a speed of one mile in 53 seconds! Bridges are erected over thin course to enable pedestrians to cross in safety, and great warning bells are rung when the sleds are coming. The policemen wear the track every morning so as to get a fresh glare of ice. Why can't we have coasting in Central and Prospect Parks, where the danger is not half so great?

POINT RICHMOND, Staten Island, Jan. 20, 1875.—The Mullin Base Ball Club of Port Richmond were the victors of an elegant silver-mounted bat, presented by the Staten Island Shooting Association. This bat was offered by the above association to be competed for at their festival, which took place last Thanksgiving at Sea View Park, and was won by the above club, beating their opponents twelve runs, and making them champions of the North Shore. The presentation took place last evening at Butler's Hotel, Dr. Rogers making quite a lengthy speech in bestowing the gift, which was replied to by Mr. E. M. Barlow, a young member of the bar, in a very neat and creditable address. Several speeches followed, when all hands retired to the large dining room, where a sumptuous supper was in waiting, and for which much credit is due to Mr. F. D. Lawyer, the worthy host. The Association will offer a solid silver ball next season for competition at their annual festival.

MORTIMER.

—Wm. H. Brewer, the catcher of the new Centennial Club of Philadelphia, is wintering in Troy. He led the average of the Philadelphia Club last season.

The Colleges.

—At a meeting of the Yale Freshman class the selection of the chess crew was placed in the hands of the following committee:—Hossteter, Wilcox and Greene. Officers of the class boat club elected:—Pres., Talt; Sec., Law; Treas., McAlpine.

—A. Marquand, the winner of the first essay prize on "Utharimus" at the literary contest in New York, was stroke of the Princeton crew at the last intercollegiate regatta.

—It is rumored that the amount which Amherst College, as residential legatees, will receive from Mr. Williston's estate, has been considerably over-estimated. It is said that instead of \$288,000, (the first estimate,) \$150,000 is all that can reasonably be expected, as the outstanding debts were considerable.

—The following are the best games played by the champion Yales during 1874:—

April 15, Yale vs. Hartford, at Hartford.....	2	to	12
May 6, Yale vs. Hartford, at New Haven.....	4	to	6
May 27, Yale vs. Hartford, at New Haven.....	3	to	8
June 5, Yale vs. Knickerbocker, at New Haven.....	4	to	5
June 20, Yale vs. Hartford, at Hartford.....	0	to	7
July 1, Yale vs. Hartford, at Hartford.....	5	to	7
July 1, Yale vs. Baltimore, at Baltimore.....	5	to	7
July 14, Yale vs. Harvard at Saratoga.....	4	to	0
July 15, Yale vs. Harvard, at Saratoga.....	7	to	4

The season's summary is appended:— Games won—Yale, 7; opponents, 11. Professional games won—Yale, 6; opponents, 11. College games won—Yale, 4; opponents, 6. Amateur games won—Yale, 3; opponents, 6. Scores in professional games—Yale, 51; opponents, 39. Scores in College games—Yale, 43; opponents, 16. Scores in amateur games—Yale, 38; opponents, 8.

The club averages of those who played in a majority of the games are as follows:—

	No. of Games.	Times at bat.	Runs.	Home runs.	Average.	Put out.	Times Assisted.
Hutchins, F. I.....	17	83	52	15	.457	24	4

Soudler, I. S. H.....	14	61	9	1	.148	15	1

THE HARVARD CHESS CLUB.—The chess tourney of this club was opened on January 19th under the management of a committee consisting of Messrs. Green and Stimson, '75, and Humason, '77. The following rules have been adopted:—

"The tournament shall be open to all the members of the Club, irrespective of their having passed the entrance examination. Every contestant shall play one game with every other contestant; and the one winning the greatest number of games shall receive the first prize, together with the Challenge Cup; and the victor in the next largest number of games shall receive the second prize. No more than five minutes shall be allowed for any move. If any contestant retire before having completed his series, all games played by him shall be thrown out of the calculation.

The prizes will consist of sets of chessmen, of a minimum value of five dollars each.

PRINCETON COLLEGE, Jan. 25, 1875.

EDUCATION FOREST AND STREAM.

Last week both the University and Freshman crews began practicing on the patent rowing weight in the gymnasium. The University, on account of the experience of its members, pulling excellent, steady strokes, in good time. The Freshmen are fast, acquiring the skill and muscle requisite to their success as good oarsmen. Possessing admirable natural qualities, and evinced great aptitude in learning to row well, the latter are making very flattering progress. The crews are pretty definitely decided upon. Hull, '75; Farnham, '76; Biddle, '73; Ely, '77; Nicoll, '77, Captain, are almost certain to represent Princeton at the next regatta. The sixth man, with a substitute, will be chosen early in the Spring, so that the regular crew will have every opportunity for practicing and training together.

The following named men will probably compose a part of the Freshman crew:— Stevenson, Captain; Reed, Van Lennex, Karge, Savage. The remaining two and a substitute are about decided upon, but they have not been officially announced as yet.

This noon the class of '75 held their election for Class Day Orators, &c. After considerable noise and confusion the following were elected to all the respective offices:— Karge, New Jersey, Class Day Orator; A. Alexander, New York, Presentation Orator; G. A. Endlich, Penn., Class President; Jas. Peinewill, Del., Master of Ceremonies; J. P. Coyle, Penn., Memorial Orator; W. H. Blinn, New York, Class Historian.

Messrs. McLean, H.; Robco, Ohio; Johnson, Maryland, were chosen as Editors of the Class Day Herald. The following were elected as members of the Class Day Committee:—Harvey, N. J.; C. M. Fleming, Penn.; Cummins, Del.; Hutchinson, N. J.; Scribner, New York; Kynahan and Cuss, Penn. The result of the election seems entirely satisfactory. The right men seem to have been chosen for the right places.

I have neglected to mention before that the University nine has begun its practice in the gymnasium. Some of its members gave abundant proof the first day that they still retain their former skill in throwing and

catching well. The beautiful throws of Jacobin, in particular, have elicited much admiration. The prospect for gaining the lost championship seems unusually fair at present.

I should like to have you correct a mistake made, not only in your own paper, but also in several other prominent New York papers, where *Heath* being one of them. Princeton members of the Regatta Committee are J. C. Dreyton, '73, of Philadelphia, and not J. C. Dreyton, '73.

QUINCY.

Chess.

CHESS DIRECTORY.

Chess Player's Headquarters—Cafe International, 234 Bovey. Chess, Up-Town—Knickerbocker Cottage, 467 Sixth Avenue. Down-Town Chess Club—Cafe Cosmopolitan, 14 Second Avenue. Turner's Chess Club—Nos. 66 and 68 East Fourth street. Brooklyn Chess Club—Meyers' Library, Montague street. Jersey City Chess Club—No. 81 Montgomery street. Trossen & Cahlan's Chess Rooms—Corner Nassau and Fulton streets. New Brighton Chess Club—At Capt. Taylor's, Tompkinsville avenue. Union for Christian Work Chess Rooms—Fulton avenue, opp. Elm place, Brooklyn.

THE COSMOPOLITAN CLUB TOURNEY.—The fourth annual tourney of the Down-Town Chess Club of New York has ended, and the successful contestants are Mr. P. T. Doyle of Hoboken, Mr. Grauberg, Mr. Anders, Mr. Laracy, and Mr. Rosenbaum. The record, with the prizes won, is as follows:—

	Wpn.	Loat.	Prize.
Doyle.....	12	1	1st prize, Walnut Chess Table.
Grauberg.....	11	11	2d prize, Gold Medal.
Anders.....	11	2	3d prize, Microscope.
Laracy.....	8	4	4th prize, Travelling Chess Board.
Rosenbaum.....	8	4	5th prize, Opera Glass.

WESTMINSTER PAPERS.—This noted English chess journal announces in its January number the publication of Woodward's work on chess, and also extends that Captain Kennedy is about to issue a new edition of his "Waifs and Strays from the Chess Board."

Referring to the centennial tournament in Philadelphia, the same journal says:—"The New York Congress of 1857 brought prominently before the world a Morphy in one branch of the game, and a Loyd in the other. The fame of both, and the consequent renown of American Chess, now extends from shore to shore, from world to world. We trust the Philadelphia committee will give History an opportunity to repeat itself in 1876, an opportunity for which, if there is any truth in tradition, the genius of history is ever on the watch."

THE ENGLISH PROBLEM TOURNEY.—The London Field of December 26th, in commenting on the Problem Tourney, says:—

"The judges in this tournament pronounced their final decision in the course of last week respecting the special prize for the best four-move problem, and we are pleased to announce, as a consolation to some of our readers who vainly tried to solve it, that the award was declared in favor of the problem published in our issue of July 25, 1874, belonging to the set bearing the motto "Look after the Caly," which set, consisting of five problems, had already been crowned with the first prize as the best collection in the competition. The problem committee, having thus settled all the prizes, proceeded to open the envelopes containing the names of the winners, of which the following is a list:—

First prize, £25 (motto "Look after the Caly"), Lieut. S. A. Sorensen, Copenhagen.

Second prize, £15 (motto "Ultima Thule"), Dr. Conrad Bayer, Olmutz.

Third prize, £10 (motto "Hoc ardua vincere doct"), Mr. J. H. Finlison, Huddersfield.

Fourth prize, £5 (motto "Why so, prithee?"), Mr. W. S. Pavit, Rotterdam.

Fifth prize, £4 (motto "The best laid schemes of mice and men gang aft agley"), Mr. Th. M. Brown, Brooklyn, U. S.

Sixth prize, £3 (motto "All's well that ends well"), Mr. Wilhelm Nielsen, Copenhagen.

Seventh prize, £2 (motto "Auf Wiedersehen"), Mr. C. Nadebman, Tassin, Germany.

Eighth prize, £2 (motto "Ludimus effigiem belli"), Capt. J. Luigi Rossati, Milan, Italy.

Ninth prize, £1 (motto "Work for money, but think for honor"), Mr. A. Frei Schmidt, Honolulu, Hawaiian Islands.

Special Prizes.—For the best four-move problem, £7 (motto "Look after the Caly"), Lieut. S. A. Sorensen, Copenhagen.

For the best three-move problem £5 motto "Where's the master? Play the men!"), Mr. F. Healey, London.

For the best two-move problem, \$3 (motto "Imagine"), Mr. J. King, London.

—Herr Kosch has taken charge of the new chess column of the Paris Messenger, and this is what he promises to do in his opening article to his readers:—"Our aim is to be the means of communication, the speaking medium between the amateurs of America and those of the old continent. We trust that our articles, although dated from a distant point, will not prove to be devoid of interest to our colleagues in the New World. We shall inform them regularly of all that takes place in Europe in chess circles, of the rising celebrities, of the fine games that are played, and, above all, of the superb problems that are here brought to light. At no distant period the principal players of our continent (in reply to the courteous invitation made by the Philadelphia committee) will come to meet the friendly welcome of their American colleagues at the contest for the 'championship of the world.' The tournament, which will take place during the Philadelphia exhibition, and which promises to be Homeric, will place in opposition a phalanx of competitors superior in number and in talent to all those who have been represented up to the present day in the annals of chess-playing. We shall not fail to inform our readers of the preparations made by the European players in view of this great event."

—At the annual meeting of the Palisade Boating Club of Yonkers, the following officers were elected:—M. F. Rowe, President; W. H. Guernsey, Vice President; B. F. Vermilue, Recording Secretary; R. G. Jackson, Corresponding Secretary; E. Underhill, Treasurer; H. H. Thayer, Captain; C. H. Harriott, Lieutenant; E. Jackson, W. H. Stewart, W. F. H. Getty, W. H. King, and H. B. Starr, Trustees. The Treasurer's report shows a balance of \$475 on hand. The club roll comprises the name of forty active and twenty-one honorary members. The number of miles rowed by members last season was 5,429.

Billiards.

—It is stated that parties are willing to back Rudolph in a match with Garnier to the amount of \$10,000.

—A professional tourney for \$1,500 worth of prizes is to be held at Sannell's, in Brooklyn, early in March, in which Rudolph, Vignaux, Garnier, Daly, Ubassy and the Dions will take part.

—The challenge that Garnier addressed to Rudolph has since been addressed to Maurice Vignaux, with this difference, that while Rudolph was allowed but five days to cover that \$1,000 forfeit, Vignaux is accorded fifteen. As to table, stake, stakeholder, etc., the terms of the two challenges are identical.

—George E. Phelan will in a few days remove his warerooms from No. 7 Barclay street to a location a trifle farther north.

—The room at the corner of Broadway and Thirty-second street, from which Ubassy, Vignaux & Strauss have withdrawn, has passed to the hands of Charles Durand, its former owner. It is reported that Francois Dubois has accepted the position of supervisor there, and will not go with Rudolph.

—The Jeffersonian Billiard Rooms, No. 17 Chatham street, have just been refitted with entirely new tables of Griffith's manufacture, Delaney's patent cushions, and are now under the sole control of Major William H. Lewis, who is a general favorite with the editors, lawyers, and compositors of Printing House Square. The Major avers his determination to make his place in every sense acceptable to his patrons.

SMALLER BALLS.—Philadelphia billiard saloon keepers are introducing smaller balls. The prevailing size of balls in this country is 2 1/4ths. This has been the rule by common consent since October of 1860. Many years before that the balls were much smaller here at the East, a trifle larger at the West, and much larger at the South. Except in Mexico and South America, where, however, the tables are still 6x12, larger balls are used in this country than in any other. In England, where the table has an inside measurement of 6x12, the standard balls for match-playing are 2 1/4ths in diameter. In France, where the tables are about the same size as here, balls are not known by their size. They are sold by weight, and the demand is for 19oz. balls.

New Publications.

MAGAZINES.

The Popular Science Monthly: D. Appleton & Co., New York. With its usual punctuality, comes this welcome guest for February, well filled with thirteen sterling articles, many of which are made more interesting by graphic illustrations of the text. The article on the relation of women to the new era, in particular, is so thoughtful a paper of the current issue, which embraces a varied and valuable table of contents.

The Pterological Journal for February is 'now out, and among its noteworthy articles are those on "The Proper Study of Mankind," "The Reign of Fannies," "Signs of Character," and "Contrasts of Child Expression." The work is very readable, especially to those versed in pterology.

The Science of Health, Monthly for February is quite an interesting number, the contents including an article by Dr. Thrall on Diptheria; another explanatory of the philosophy of secretion and excretion; warnings against quacks and medical impostors will not attract attention. Mr. Delano has a well written chapter on Hygiene to the School Room. Altogether the number is very instructive in a hygienic point of view.

The Nassau Literary Magazine for January, conducted by the Senior Class of Princeton College, contains several well considered, conservative articles, which display both critical taste and a broad knowledge of the subjects treated. "Gosche and Rousseau," "The Life of Edmund Spenser," and "Glimpses at the Indians" are capital articles, and equal to those which appear in more pretentious magazines. We congratulate the students of Princeton on their little brochure, but we would recommend that the Greek quotation *enka boula &c.*, be translated into English, as it has a pedantic look.

—A MOST VALUABLE GIFT.—We acknowledge the receipt through Gen. Humphreys, Chief of United States Engineers, at Washington, D. C., of a most valuable package of Government Maps, which will be of immense service to us in the preparation of the weekly issues of FOREST AND STREAM. Aside from their intrinsic value, such a token of appreciation of our journal and its efforts, coming from so distinguished a source, is most grateful and encouraging. To the officers of the Army, both at Headquarters and on the frontier posts, the FOREST AND STREAM has long been indebted for valued contributions and useful miscellaneous service. We find among them the most enthusiastic lovers of field sports and intelligent observers of natural objects.

CANINE SAGACITY.—A black-and-tan dog, on its morning trip to this city with its master, has been, of late, frequently assailed by a bigger dog in State street. Friday morning the little dog came with a big comrade, but the State street dog did not appear. Nothing disturbed the two dogs sat down and waited awhile, then the big dog deliberately hid himself behind a tree, and the little one, barking furiously, ran towards the city past the home of his enemy. No fighting dog appeared, and the little one repeated the maneuver, this time calling out his assailant. The little dog ran straight to his friend, who lay perfectly still until pursued and pursued were within a rod of him, when he flew out from his tree and killed the big dog. The little dog then gazed tranquilly at his fallen foe, and the avenger plodded slowly back toward Willbraham.—Springfield Republican.

—Mr. Willis Russell, the successful hotel keeper of Quebec, is now engaged securing a charter from the Quebec Legislature, for the purpose of establishing a Joint Stock Company, to carry on the hotel business in Quebec on a second plan. The company intend to build on one of the finest sites in the Upper Town, a construction of a gigantic nature to meet the wants of the present and future travel of Quebec.

DUCK SHOOTING AT STONY Brook, on north side of Long Island; boats, stool, &c. furnished by the S. B. Hotel; plenty of ducks, also good bird shooting. S. J. SMITH,

ILLUSTRATED NATURAL HISTORY.—The following testimony to the truthfulness and beauty of "Hurst's Views," merely supplements the expressed opinions of many of our readers, who delight in the field of practical natural history. The views are taken from mounted specimens in life-like attitudes, with a landscape in exact imitation of the native haunt of the bird or animal. We refer to the advertising columns of the FOREST AND STREAM for list of views and prices.

SHARPE, Minn., December 30, 1874.

EDITOR FOREST AND STREAM:—

"The twelve 'Hurst's Views' received this morning and I must say that they surpass anything in the stereoscope line I ever saw. It is better than going to a menagerie or museum, as here you see the birds in their natural state. It brings the true sportsman immediately amid scenes wherein he loves to dwell, and during the close season he can be constantly reminded of the many happy days he may have passed in the field. C. A. S.

HURSTS OF

Natural History

For Object Teaching in Schools, AND PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of **Animals and Birds of North America.**

To these will be added a second series of faunistic specimens, and various Animals and Birds in grotesque attitudes, never before violating their natural instincts.

We offer these views not as pictures only, but as studies from nature. One of the best moving elements in our modern system of education is object teaching. The moving idylls of the stereoscope transfer the animals and birds from their natural habitat to the rooms of the student, and the first look of our images, where they cannot fail to leave a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of live and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen with its appropriate rocks, woods or water, and coloring from the originals.

- 1. Wild Cat, or Bay Lynx..... Lynx rufus.
- 2. Snowy Owl..... Strix Nyctea.
- 3. Great Horned Owl..... Bubo Asio.
- 4. Wild Pigeon..... Ectopistes Migratoria.

Prices: By the Dozen, in Elegant Case, 16 00
Retail, 25 cents each. The above prices are for the first series of 60 numbers and parts of sets always on hand.

TESTIMONIALS.

CORNELL UNIVERSITY,
ITHACA, March 16th, 1870.
I must congratulate you upon your great success in this new educational enterprise. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education.

WASHINGTON, D. C., March 18th, 1870.
I am much pleased with the success you have met with in giving to the stuffed specimens a very decided appearance of life.
I hope you may be able to continue the Series, and I have no doubt they will furnish interesting means of information and instruction in advance in education.

STATE HOUSE, BOSTON, Mass., March 18th, 1870.
I have examined carefully the "Stereoscopic Studies of Natural History," and judging by the first ten numbers, should say that they are of very great value both as object lessons for students, and as a most interesting series for the parlor Stereoscope. The illustrations are of the highest quality, and the descriptions and general treatment are most perfect. I cordially recommend them to the public attention, and trust you will meet the encouragement which you have earned.
EDWARD A. SAUER,
Curator of Zoology in Mass. State Cabinet.

PEABODY ACADEMY OF SCIENCE,
SALEM, Mass., March 19th, 1870.
I have shown your Stereoscopic views to the Directors of the Academy and the editors of the American Naturalist, Dr. Packard and Mr. Morse.

They are much interested in printing their truthfulness and the facts which you have displayed in surrounding the specimens with natural objects and a series of characteristic landscapes. They are especially gratified not only as parlor and drawing room illustrations, but as educational illustrations for a set of schools and colleges, than anything we have yet seen.

A. HYATT,
CORNELL UNIVERSITY, PRESIDENT'S HOUSE.

I have received the Stereoscopic Views of objects in Natural History, and have enjoyed them greatly. They have surprised all who have viewed them, and wonderful fidelity, both as regards the animals and their surroundings; and I think they can not fail to be of great service to the study of Natural History, first to attracting students to it, and next by perfecting them in it.
ANDREW D. WHITE.

These Stereoscopes are sold wholesale and retail by
FOREST AND STREAM PUBL. CO.,
17 Chatham St., (City Hall Sq'r) P. O. box 2832.
