

FLORA
BOREALI-AMERICANA;
OR, THE
BOTANY
OF THE
NORTHERN PARTS OF BRITISH AMERICA:

COMPILED PRINCIPALLY FROM
THE PLANTS COLLECTED BY DR RICHARDSON & MR DRUMMOND ON THE LATE NORTHERN
EXPEDITIONS, UNDER COMMAND OF CAPTAIN SIR JOHN FRANKLIN, R.N.

TO WHICH ARE ADDED
(BY PERMISSION OF THE HORTICULTURAL SOCIETY OF LONDON,)
THOSE OF MR DOUGLAS, FROM NORTH-WEST AMERICA, AND OF OTHER NATURALISTS;

BY
SIR WILLIAM JACKSON HOOKER, K.H., LL.D., F.R., A., & L.S.,
MEMBER OF THE IMPERIAL ACADEMY NATURÆ CURIOSORVM, HONORARY MEMBER OF THE ROYAL IRISH ACADEMY, ETC., ETC.,
AND PROFESSOR OF BOTANY IN THE UNIVERSITY OF GLASGOW.

ILLUSTRATED BY NUMEROUS PLATES.

PUBLISHED UNDER THE AUTHORITY OF THE EIGHT HONOURABLE THE SECRETARY OF STATE FOR COLONIAL AFFAIRS.

VOL. I.

LONDON:
HENRY G. BOHN, No. 4, YORK STREET, COVENT GARDEN.

TO

SIR JOHN FRANKLIN, CAPTAIN R. N., F. R. S. &c. &c.

AND TO

JOHN RICHARDSON, M. D., F. R. & L. S. &c. &c.

UNDER WHOSE AUSPICES,

AS COMMANDER AND NATURALIST OF TWO SEPARATE EXPEDITIONS

TO

THE POLAR SEAS,

A GREAT PORTION OF THE MORE RARE AND INTERESTING PLANTS THAT ORNAMENT THIS
VOLUME WERE COLLECTED,

UNDER CIRCUMSTANCES OF SINGULAR DIFFICULTY, HARDSHIP, AND DANGER;

THE WORK,

THUS INDEBTED TO THEIR EFFORTS,

IS MOST RESPECTFULLY DEDICATED,

BY

THEIR AFFECTIONATE FRIEND,

AND OBLIGED SERVANT,

W. J. HOOKER.

P R E F A C E.

CIRCUMSTANCES, over which the Author had no control, have delayed this publication to a most unexpectedly protracted period; during which the materials, originally extensive, (though chiefly obtained by Dr Richardson, Mr Drummond, and the officers of Sir John Franklin's Expeditions, and by Mr Douglas,) have been so very much increased by the contributions of other travellers, that the two volumes, to which the Author has been limited by his Publishers, have not sufficed to include all the plants of these several valuable collections, nor full generic and specific characters of all such as have been introduced. This being the case, the Author has felt no hesitation in leaving out the whole of the *Cryptogamia*, with the exception of the *Ferns* and allied Orders, and also in omitting, towards the latter part of the work, the definitions of those species which are already well known, or accurately described in the several publications that treat of North American Botany. By adopting this plan, several additional collections, received while this work was in progress,* have been noticed in it, (except, of course, those species which belonged to the early Natural Orders,) and thus the *Flora Boreali-Americanana* will be found to contain a more full and satisfactory account of the Botany of the British Possessions in North America, than could have been anticipated, considering the immense extent of territory here embraced.

* The Plants here alluded to are chiefly from North-West America, sent by the late Mr Douglas from his last journeys, by Mr Tolmie, and by the late Dr Gairdner.

With regard to the title "*Flora Boreali-Americana; or the Botany of the Northern Parts of British North America,*" it was adopted in conformity with the titles of the other Natural History publications connected with Sir John Franklin's important Expeditions; but it will be at once seen, from a very slight inspection, that the work is neither a Flora of boreal America, in the sense given to that term by Michaux, as comprehending all the northern half of the New World, nor is it confined to the northern portions of British North America. It was thought right to take advantage of all that was known, and of all the discoveries to which the Author had access, of the vegetation of Canada, the most southern possessions of British North America, and also of the labours of Botanists on the Pacific side of North America (exclusive of California) and in Behring's Straits. This was the more desirable, as these labours had been performed mainly by British Naturalists, from the days of Newenham and Menzies, to those of Beechey and the officers attached to the Hudson's Bay Company's Factories, although their researches may have extended into the territories belonging to the Russian Empire, or been pursued within the yet undefined limits claimed by the United States, and bordering upon California.

This Flora, therefore, is intended to present the vegetation of all that portion of North America Proper, which, commencing with the extreme Arctic Islands, stretches south to the boundary, so far as it has been ascertained, of the United States and California.

That many Plants yet remain to be discovered in so vast a territory, there can exist no question. Such, however, has been the accuracy with which several districts have been explored, that little, likely, is unknown which regards the botany of the Arctic region, especially as its Flora is necessarily very limited by the shortness of the Summer season, and a great similarity prevails in the productions of those high latitudes, throughout Europe, Asia, and America. The same remark may apply to the almost equally inhospitable climes of Labrador, and even of Newfoundland. The more densely inhabited parts of Canada have produced many native Botanists, while the absence of any lofty mountains in its less visited (that is the Western) districts, renders it probable that our acquaint-

PREFACE.

v

ance with Canadian vegetation is tolerably complete ; still it is to be wished that the southern boundary, adjoining the State of Maine and the great Lakes Huron and Superior, were accurately searched, and it can hardly be doubted that this line of country would yield many plants not hitherto discovered in British North America, though known to exist in the United States under similar situations of latitude and of elevation above the level of the sea. Perhaps no part of the continental New World that owns the British sway, has been more strictly investigated than the great valleys of the Red River, Lake Winnipeg, and the Saskatchewan, along with the vast country extending thence northward to the shores of the Arctic Sea ; and this is mainly owing to Dr Richardson's two journeys through those regions, and to the long stay made by Mr Drummond on the Saskatchewan, whose course he followed up to the Rocky Mountains. The southern vegetation here is peculiarly interesting, for it has many plants in common with the Mississippi and Missouri. Between the territory above alluded to, that is, throughout the whole range of the Rocky Mountains, from the boundary of the United States in about lat. 48° , to their northern limit; including, as it does, mountains of from 15,000 to 16,000 feet high, and thence westward to near the shores of the Pacific Ocean, almost the whole is a *terra incognita* to the naturalist : for, with the exception of the usual route of the Hudson's Bay Traders, from the sources of the Saskatchewan to those of the Columbia, by way of "The Committee's Punch Bowl," and thence to the sea, scarcely any part of it has been investigated ; and a more interesting field for the Botanist certainly does not exist in any portion of our North American provinces, as is proved by the researches already made there by Drummond and Douglas,* and by the later ones of Mr Nuttall ; the latter gentleman, indeed, pushed his discoveries in a more southern range of that chain, within the limits of the United States.

* See the Journal of Mr Douglas, published in Hooker's *Companion to the Botanical Magazine*, vol. 2, and that of Mr Drummond, in the same author's *Botanical Miscellany*, vol. 1, p. 178.

Should the favourable reception of the *Flora Boreali-Americana* authorise such a step, and should the materials from this and other parts of our possessions comprised within the range of these volumes, accumulate sufficiently, and within a reasonable space of time, nothing would give the Author more pleasure than to add a third volume, which should include the whole of the *Cryptogamia* and the species discovered since the publication of what is now presented, together with remarks on the Geographical Distribution of the entire Flora of these regions.

FLORA BOREALI-AMERICANA.

CL. I. DICOTYLEDONEÆ.

SUBCL. I. THALAMIFLORÆ. DC.

ORD. I. RANUNCULACEÆ. Juss. DC.

I. CLEMATIS.

Involucrum nullum aut calyciforme sub flore. Sepala 4-8, colorata. Petala nulla aut sepalis breviora. Cariopsis plurimæ in caudam sœpius barbato-plumosam productæ.—Radices perennes. Folia exacte opposita. DC.

1. *C. Virginiana*; scandens, floribus paniculato-corymbosis divisis, foliis ternatis foliolis cordato-ovatis acuminatis sublobatis grosse serratis.—*Linn. Amœn. Acad. v. 4. p. 275. Mich. Am. v. 1. p. 318. Pursh, Fl. Am. v. 2. p. 384. Bigel. Fl. Bost. ed. 2. p. 219. Elliott, Carol. v. 2. p. 44. De Cand. Prodr. v. 1. p. 4.*

Stamina sepalis breviora. In floribus femineis filamenta subulata abortiva adsunt, antheris minutis vacuis. Folia subtus pilosa, semper ternata, foliolis majusculis, sepe duas vel tres uncias longis, in planta Douglasiana multo minoribus, vix unciam longis.

HAB. Grassy or shrubby banks of rivers, from the United States to lat. 55°, disappearing about the south end of Lake Winnipeg. *Drummond*. Banks of the Columbia. *Douglas*.—This has been long cultivated in England, where it proves a hardy plant, well adapted for covering walls and arbours. Its flowers are highly fragrant.

2. *C. Douglasii*; caule erecto simplici unifloro, flore nutante, foliis pilosis bi-tripinnatifidis, lacinia linearibus obtusiusculis. (TAB. I.)

Caulis herbaceus, pedalis, erectus, simplex, striatus, foliosus, parco pilosus, ad nodos lanuginosus, basi squamis membranaceis fuscis tectus. Folia opposita, inferiora etiam connata et subvaginata, quadripollaria, circumscriptione late ovata, o basi usque profunde bi-tripinnatifida, pilosa, ad divisuras segmentorum lanuginosa, segmentia primaria semper exacte oppositis, remotis, et fere petiolatis, reliqua alternis; omnibus linearibus, obtusiusculis; foliorum inferiorum latioribus, superiorum sensim angustioribus. Rachis gracilis, petiolum simulans. Pedunculus terminalia, solitarius, tomentosus, uniflorus. Flos majusculus, cernens, subcylindraceus, basi obtusus. Sepala 4 vel 5, sesquiançiam longa, coriaceo-membranacea, oblonga, obtusiuscula, erecta (quoad axin floris,) apice colummodo patentia, intus glabra intense purpurea, extus

pallidiiora, laxe tomentosa. *Stamina* erecta, sepalis multo breviora: *Filamenta* filiformia: *Antheræ* lineares, flave. *Pistilla* staminum longitudine: *Stylæ* graciles, longi, valde sericeo-hirsuti.

HAB. On the west side of the Rocky Mountains, near the sources of the Columbia. *Douglas*.—This beautiful species of *Clematis* is quite unlike any hitherto described; and I am anxious it should bear the name of its zealous and meritorious discoverer. In general habit it accords with Dr. Candolle's 5th Div. of "Flammulae," (including *C. integrifolia*, *ochroleuca*, and *ovata*.) but in all the species of that group the leaves are simple, whereas here they are deeply divided, almost so in *Peonia tenuifolia*. The primary divisions, indeed, might rather be called pinnate than pinnatifid, but the lowermost leaves, which are simply pinnae, with much broader segments than the rest, show their true nature. In the middle and uppermost leaves, the primary divisions, or pinnae, are in two opposite pairs; so close to the base of the rachis, and so much larger than the rest, that, at first sight, they give the appearance of verticillate leaves.

3. *C. verticillaris*; pedunculis unifloris, foliis quaternatim verticillatis ternatis foliolis cordato-acuminatis sublobatis integerrimis serratisque, petalis acutis.—*De Cand. Syst. Veget.* v. 1. p. 166. *Prodr.* v. 1. p. 10.—*Atragene Americana. Sims*, in *Bot. Mag.* t. 887. *Pursh, Fl. Am.* v. 2. p. 384. *Bigel. Fl. Bost. ed.* 2. p. 219.

s. foliolis obtuse serratis.—*C. obliqua. Douglas, MSS.*

Foliola lateralia semper obliqua, magis minusve obtuse serrata vel plerunque omnino integerrima, parce pilosa. *Pedunculus* e basi peduncularum vetustorum egredieus, foliis duobus stipatus. *Flos* cernuus. *Se-pala* magna, corollina, ovato-lanceolata, acuta, carulea vel purpurea, extus magis minusve pilosa. *Petala* calyce duplo triplo breviora, linearia, quo interiora eo magis distincte antherifera.

HAB. In woods in the central districts, as far north as lat. 54°, ascending the elevated valleys on the eastern declivity of the Rocky Mountains in that latitude. *Dr. Richardson. Drummond*. At Cape Mendocina, on the N.W. coast, in lat. 40°: plentiful. *Douglas*.—Nearly allied to *Clematis* (*Atragene*, *Linn.*) *alpina*, but differing in its acute petals, and in the far smaller and never sharply serrated leaves. This beautiful plant does not appear to be found farther north than lat. 54°, nor south of Pennsylvania, on the east side. It is not included in Elliott's Sketch.

2. THALICTRUM.

Involucrum sub flore nullum. *Pet.* nulla. *Carpella* sicca in caudas non desinentia, nunc stipitata, nunc longitudinaliter striato-sulcata.—*Herbea pereunes; caulis annuus; flores corymbosi-paniculati aut subracemosi, herbacei, albi vel flavi. DC.*

1. *T. clavatum*; hermaphroditum, filamentis clavatis, antheris ellipticis muticis, carpellis inflatis stipitatis laevibus oblongis stylo longioribus, foliolis subtrotundis crenatolobatis glabris subitus glaucis.—*De Cand. Syst. Veget.* v. 1. p. 171. *De Less. Ic.* v. 1. t. 6. *De Cand. Prodr.* v. 1. p. 11.

Tota planta glabra, pedalis ad sesquipedalem. *Caulis* nitidus, ramosus. *Folia* triternata, foliolis (nostris exemplaribus) magnitudine *T. dioica*, et iis similibus, subitus valde glaucis. *Stipelle* nulle. *Panicula* subpauciflora, laxa, pedicellis longis. *Flores* erecti. *Stamina* pauca, brevia, perianthii longitudine. *Filamenta* superne insigniter dilatata. *Antheræ* breves, ellipticae, muticæ. *Pistilla* 8-10 in singulo flore. *Germen* ovatum, stipitatum, gibbum, leve, demum inflatum, in stylo, germine & breviori attenuatum.

HAB. Found only on Portage La Loche, a height of land composed of sandhills, lying in lat. 57°, and separating the waters flowing to Hudson's Bay from those falling into the Arctic Sea. *Dr. Richardson*.—This species of *Thalictrum*, which seems to have been found only in one spot by our American travellers, exactly accords with the figure of *T. clavatum*, in De Lessert's *Iones*, in every particular, except that the leaves in our plant are smaller, which may arise from accidental causes, and that its styles are rather shorter. Both my specimens and the individual figured by De Lessert, have perfect, not monocious, flowers, as

vors, as

described by De Candolle; and it would seem that Michaux's specimens (it does not appear in what part of America they were gathered,) are the authority both for De Lessert's figure and De Candolle's description. I have not seen ripe carpels, nor has De Lessert represented them. Is it not possible that the present may be a state of *T. dioicum?* (with which, in habit and foliage, the plant *entirely agrees*,) having pistils and stamens on the same flower, both of which are differently modified from what we find in the dioecious state.

2. *T. dioicum*; floribus dioicis, filamentis filiformibus, foliolis subrotundis crenatolobatis glabris subtus glaucis.—*Linn. Sp. Pl. p. 768. Pursh, Fl. Am. v. 2. p. 388. Bigel. Fl. Bost. ed. 2. p. 220. Elliott, Carol. v. 2. p. 50. De Less. Ic. v. 1. t. 8. De Cand. Prodr. v. 1. p. 12.—T. levigatum. Mich. Am. v. 1. p. 322.*

Caulis pedalis nunc bipedalis. *Folia* fere omnino ut in *T. clavato*, submollia, membranacea. *Panicula* terminalis, magis minusve longa. *Stamina* numerosa, filamentis filiformibus, antheris linearibus mucronatis. *Germen* oblongo-ovatum, hinc intus planum, stylo stigmateque linearis duplo brevius. *Stigma* dicuidum. *Fructus* semi-ovatus, sulcatus, stylo persistente acuminatus.

HAB. Grassy banks of rivers; most abundant in the central limestone districts, from Canada to the banks of the Mackenzie River, in lat. 67°. Dr. Richardson. Found also on the eastern base of the Rocky Mountains. Drummond; and on the banks of the Columbia. (Mr. Garry.) Not found on the barren grounds, nor on naked alpine situations.—An abundant plant, and, as far as I can judge from the numerous specimens in the different collections, very constant to its character. Dr. Richardson's *T. corynellum* in Frankl. 1st Journ. ed. 2, includes specimens of *T. dioicum* and *T. Cornuti* of this work: some of the former having been overlooked among his specimens.

3. *T. purpurascens*; “floribus dioicis monoicis, filamentis filiformibus coloratis, foliorum segmentis suborbiculatis grosse dentatis glabris subtus glaucis, panicula contracta subaphylla.” DC.—*Linn. Sp. Pl. p. 769. Pursh, Fl. Am. v. 2. p. 389. De Cand. Prodr. v. 1. p. 12.*

HAB. Canada. Linn.—This is probably only *T. dioicum*, with purplish flowers.

4. *T. Cornuti*; floribus plerumque dioicis, filamentis subclavatis, antheris ellipticis sublinearibusve, foliolis subrotundo-ovatis oblongisve trilobis subtus glaucis nervis vix prominentibus, carpellis ovato-oblongis, stigmate filiformi marginibus membranaceis. (TAB. II.)

a. antheris linearis-oblengis.—*T. Cornuti. Linn. Sp. Pl. p. 768. Pursh, Fl. Am. v. 2. p. 388.—T. revolutum. De Cand. Syst. Veget. v. 1. p. 173. Prodr. v. 1. p. 12. Elliott, Carol. v. 2. p. 49.—T. Canadense. “Cornuti, Canad. 186. t. 187.”*

b. antheris ellipticis.—*T. pubescens. Pursh, Fl. Am. v. 2. p. 388. Nutt. N. Am. Gen. v. 2. p. 21.—T. corynellum. De Cand. Syst. Veget. v. 1. p. 172. Prodr. v. 1. p. 12. Rich. in Frankl. 1st Journ. ed. 2. App. p. 21.*

Caulis 3-4-pedalis, ramosus. *Foliola* forma mire varians in iisdem exemplaribus, nunc ovata, nunc cordata, et non raro obovato-oblenga vel cuneata, majuscula, trilobata, lobis plerumque acutis; superne intense viridia, subtus pallidiora, glaeas, glabra vel pubescens. *Panicula* composita, foliosa. *Staminum* filamenta magis minusve elongata et clavata: antheræ elliptice, oblongæ vel linearis-oblengae. *Pistilla* numerosa in singulo flore sternitæ: *germen* nigrum, oblongo-ovatum, subgibbosum; *stylus* breviseulus; *stigma* longum, lineare, margine utrinque membranaceum, dilatatum. *Fructus* maturum non vidi.

HAB. Banks of rivers as far north as lat. 56°, in woody districts the whole breadth of the continent, excluding the barren grounds and alpine tracts.—Variable as this plant assuredly is, it may be at once

distinguished from the species already described by its much larger size, stouter habit, darker colour, its narrower leaves, especially the upper ones, and the more acute and fewer lobes. The structure of the *Stigma* is, I think, different from its congeners: it is longer than the *Style*, with the sides or margins dilated into a brown membrane; the upper surface minutely papillose, as in its affinities. Linnaeus seems to have established this species upon the figure and description of *T. Cornuti*, and to have had no specimen in his herbarium; it is impossible, therefore, to say, with his very imperfect description alone to guide us, what particular plant is intended by that author; but the present seems to be what Pursh had in view for *T. Cornuti*, and it is as well to retain this as a specific name as to reduce it to a doubtful synonym, as De Candolle has done. I have been aided in the other synonyms by specimens from various American Botanists, and there cannot be a question that the North American *Thalictra* will bear to be still farther reduced. *T. carolinianum*, for example, of Bosc and De Candolle, is but a variety, with dioecious flowers, of *T. rugosum* of Ait. and Pursh, or rather is the genuine state of that plant. Let it be remarked, that with the exception of the very doubtful *T. ranunculinum* of Muhl. in Willd. Enum. and of that plant of dubious genus *T. anemonoides*, all the hitherto described species of N. American *Thalictra* are dioecious; or if otherwise, in all that have come under my observation, the stamens appear to be abortive. It is singular, too, that in another genus, *Saxifraga*, there is a species in N. America, (hereafter to be described,) which varies with perfect and polygamous flowers, and in which some of the states have clavate filaments to the stamens.

TAB. II. *T. Cornuti*, a. Fig. 1, Portion of a male plant; fig. 2, Portion of a female; fig. 3, Lower leaf; fig. 4, Pistil; fig. 5, Stamen; fig. 6, Head of pericarps; fig. 7, Single pericarp:—figs. 4, 5, 6, 7, magnified.

5. *T. anemonoides*; radice tuberosa, floribus umbellatis, foliis bitemnatis foliolis cordato-rotundatis trilobis, floralibus oppositis vel ternis, singulo trifoliolato.—*Mich. Am.* v. 1. p. 322. *Juss. in Ann. du Mus.* v. 3. p. 249. t. 21. f. 2. *De Cand. Prodr.* v. 1. p. 15.—*Anemone thalictrioides*. *Linn. Sp. Pl.* p. 763. *Pursh, Fl. Am.* v. 2. p. 387. *Bigel. Fl. Bost.* ed. 2. p. 223. *Curtis. Bot. Mag.* t. 866.

s. *Thalictrum caule unifloro, ex eodem punto foliis quatuor simplicibus instructis.* *Gronov. Virg.* 62. (*Linn.*)

Habitus inter *Thalictrum* et *Anemone*. Folia floralia plerunque opposita (nunc terma quaternava verticillata) non simplicia, ut dicunt Linnaeus et Cl. Bigelow, sed, ut bene habet De Candolle, "petiolo ab ipsa basi tripartito et ideo segmentis petiolulatis, subverticillatis, ovatis, tridentatis (nunc integerrimis, H.) involucrum constituentibus." Sepala petaloidea, alba. Stamina pauca. Pericarpia 7-11, lineari-oblonga, breviter stipitata, sulcata: Stylus vix vilis: Stigma sub sessile, capitatum.

Han. Canada. Linnaeus. Michaux. (s.) *Kalm:* but I have never myself received specimens from any of the British Possessions in North America.—A plant of doubtful genus, agreeing, however, with *T. tuberosum* in general habit and fructification.

3. ANEMONE.

Involucrum 3-phylum a flore distans, foliolis incisis. *Calyx* petaloideus, 5-15 sepalus. *Petala* nulla. *DC.*

1. *A. patens*; molliter sericea, foliis serotinis tripartitis ternatisve, segmentis cuneatis trifidis incisis, lobis lineari-lanceolatis, involucre lineari-multifido, flore erecto, sepalis 5-6, aristis longis barbatis.—*Linn. Sp. Pl.* p. 759. *Gmel. Siber.* v. 4. p. 195. *De Cand. Prodr.* v. 1. p. 16.—(s. ochroleuca.) *Sims, in Bot. Mag.* t. 1994.—*Clematis hirsutissima.* *Pursh, Fl. Am.* v. 2. p. 285.—*Anemone ludoviciana.* *Nutt. N. Am. Fl.* v. 2. p. 26.—*A. Nuttalliana.* *De Cand. Prodr.* v. 1. p. 17. *Nutt. in Journ. of Acad. of Nat. Sc. of*

Philad. v. 5. p. 158. t. 8. (*A. Nuttallii*,) excellent. *Rich. in Frankl. 1st. Journ. ed. 2. App. p. 21.*

HAB. Profusely in the eastern prairie district; and, more scattered, in the central limestone tracts from lat. 45° to 67° on the Mackenzie. *Dr. Richardson.* Valleys in the Rocky Mountains. *Drummond. Douglas.*—There is no difference whatever between this American plant and the *A. patens* which I possess from the Russian Empire, gathered by Dr. Goldbach, and from Silesia on the borders of Poland, by Professor Treviranus. Both are liable to vary in the breadth of the segments of their leaves, and in the colour of their flowers. Mostly, however, these are purple. The pale yellow-flowered variety from Siberia, is cultivated in England; and the fresh juice of that kind, Gmelin tells us, is employed by the inhabitants of Irkutsk to cure deafness, and newly gathered leaves for pain in the head, as vesicatory. The plant affects sandy soils, and its blossoms appear among the earliest of the season. The young buds are eaten by the Marmots, inhabitants of the plains of N. America.—*A. Halleri* comes too near to this species. Its flowers I have often gathered in Switzerland before the leaves have appeared; but since, in both, the flowers continue a long time, they and the leaves are sometimes gathered in perfection together. I possess specimens from Moscow, in which the former year's leaves are present with the vernal flower; quite dead, indeed, and brown, but perfect in form and shape.

2. *A. alpina*; subsericeo-villosa, foliis longe petiolatis bibernatim pinnatifidis, foliolis laciniatis laciniis linearibus acutis involucralibus conformibus, flore erecto, sepalis 6 patentibus, aristis longis barbatis.—*Linn. Sp. Pl. p. 760. Bot. Mag. t. 2007.*—(*A. major.*) *A. sulphurea.* *Linn Mant. p. 78.*—*A. apifolia.* *Willd. Sp. Pl. v. 2. p. 9.*

HAB. Eastern declivity of the Rocky Mountains, lat. 52° to 55°. *Drummond.*—Hitherto unnoticed as a native of America. Mr. Drummond's specimens have the flowers white, with a purplish tinge at the base, and accord with the var. *A. major* of De Cand. Stems from six inches to a foot and a half high. Heads of pericarps very large. Awns long, very silky.

3. *A. parviflora*; foliis tripartitis, lobis cuneatis trifidis crenatisque obtusis, involucralibus sessilibus subconformibus longioribus angustioribus, sepalis 6 ovalibus.—*Mich. Am. v. 1. p. 319. De Cand. Prodri. v. 1. p. 19. Rich. in Frankl. 1st Journ. ed. 2. App. p. 21.*—*A. cuneifolia.* *Juss. Ann. du Mus. v. 3. t. 21. f. 3. Pursh, Fl. Am. v. 2. p. 386.*—*A. tenella.* *Herb. Banks. (non Purshii.)*—*A. borealis.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 22.*

HAB. Eastern primitive district, central limestone tract, barren grounds, and Rocky Mountains, from lat. 45° to the Arctic Sea, lat. 70°. *Dr. Richardson. Drummond.* Labrador. *Pursh. Morrison.*—Very variable in size; the sub-Arctic and Labrador specimens are scarcely more than from two to four inches high: those from Slave River a foot high, with smaller flowers in proportion. These, indeed, seem to be the chief differences between the *A. parviflora* and Dr. Richardson's *A. borealis*. But the Second Expedition has enriched the collection with a series of specimens which show that they gradually merge the one into the other. Richardson's description is excellent. The root is fibrous, but the fibres proceed from an elongated and often procumbent and creeping woody trunk, not at all agreeing with the subdivision in which De Candolle has placed the species. The flowers are white, with a blue tinge at the base of the petals, especially in a young state. Heads of pericarps rounded, very compact, clothed with a great deal of silky tomentum, which especially arises from the base of the seed-vessels, and is easily separated. Styles subulate, naked.

4. *A. Baldensis*; foliis glabratis subcarnosis ternatim partitis segmentis tripartitio-laciniatis, laciniis linearibus obtusis, involucralibus breviter petiolatis conformibus, petiolis

scapoque villosis, flore solitario, sepalis 6-8 patentibus obtusis extus subpilosis.—*Linn. Mant.* p. 78. *De Cand. Prodr.* v. I. p. 19. *Sturm, Deutschl. Fl. cum. Ic.*—*A. fragifera. Jacq. Ic.* v. I. t. 103.

HAB. Arid places on the eastern summits of the Rocky Mountains, lat. 52° to 55°. *Drummond.*—This is again another discovery which goes to prove how much the arctic and alpine vegetation of North America assimilates with that of Europe. The specimens are in every particular the same as my German and Piedmontese ones; or if there be any difference worthy of notice, it is that the leaves are not so fully expanded at the time of the perfection of the flower as in those of the old world. The flowers are strongly tinged with blue in most instances. Root fusiform.

5. *A. nemorosa*; foliis ternatis foliolis integris vel intermedio 3-fido lateralibus bipartitis inciso-dentatis acutis, involucralibus petiolatis conformibus, sepalis 4-6 ellipticis.

a. involucri foliolis subintegris.—*A. nemorosa. Linn. Sp. Pl. p. 762. Mich. Am. v. I. p. 319. Pursh, Fl. Am. v. 2. p. 387. Smith, Engl. Bot. t. 355. Elliott, Carol. v. 2. p. 53. Bigel. Fl. Bost. ed. 2. p. 222. De Cand. Prodr. v. I. p. 20.*—*A. Fischeriana. De Cand. Prodr. v. I. p. 20.* (fide Spreng.)—*A. lancifolia. Pursh, Fl. Am. v. 2. p. 386.*?

b. DC. involucri foliolis lateralibus bipartitis, et ita folium 5-foliolatum.—*A. quinquefolia. Linn. Sp. Pl. p. 762.*

HAB. Canada, and thence to the south end of Lake Winnipeg; not seen to the northward of lat. 53°. *Dr. Richardson.* Country eastward of the Rocky Mountains. *Drummond.* Westward of the Rocky Mountains. *Douglas.*—Flowers white, varying to purple, as in Europe; but the sepals are more constantly 5, and the leaves though occasionally as broad as with us, are usually narrower and disposed to be more compound.

6. *A. deltoidea*; parce hirsuta, foliis ternatis foliolis (involucralibusque sessilibus) rhomboides integris trifidisve inciso-serratis acutis, sepalis 5-6 obovatis. (TAB. III. A.)

Folia radicalia, longe petiolata, ternata, foliolis late-ovatis subdeltoideis, integris, trifidisque. *Scapus* erectus, gracilis, 8-10 pollicaris, parce pilosus, supra medium involucratus. *Involucrum* e foliis tribus sesqui-bi-uncialibus, rhomboides, acutis vel acuminate, subtus marginaque subpilosis, sessilibus, indivisis, sub trifidis basi integerrimis vel inciso-serratis. *Flos* solitarius, majusculus. *Sepala* alba, ovalia vel obovata, obtuse patentia, glabriuscula. *Stamina* numerosa, sepalis multo breviora. *Pistilla* ovata in stylo brevissimo acuminata, basi lanata.

HAB. In thick shady woods of the Columbia, near its confluence with the sea. *Douglas. Scouler.*—I have only seen leaves of this species since the plate was engraved, upon Dr. Scouler's specimens. The habit is that of *A. nemorosa*, but the involucre is very different from that and every other species with which I am acquainted. The flowers are as large as those of *A. Pennsylvania.*

7. *A. Richardsoni*; subpilosa, foliis reniformibus 3-5 partitis, lobis subtrifidis acute dentatis, involucralibus rotundato-cuneatis sessilibus trifidis dentatisque, sepalis 6 patentibus, carpellis compressis glabris, stylis longis deflexis uncinatis. (TAB. IV. A.)—*Hook. in Frankl. 1st Journ. ed. 2. App. p. 21.*—*A. ranunculoides*, var.? *Rich. in Frankl. 1st. Journ. ed. 1. App. p. 740.*—*A. arctica. Fischer, MSS.* (fide specim. ejus.)

Capitulum carpellorum ratione floris majuscum, depresso. *Carpella* numerosa, oblongo-ovata, *stylo* longissimo, fulvo, deflexo terminata, cuius apex extrema (siccatæ precipue) sursum curvata, uncinata.

HAB. Eastern primitive district, shores of Hudson's Bay; barren ground, Rocky Mountains, from lat. 55°

to 68°, in wet mossy ground. *Dr. Richardson. Drummond. Unalashka, and throughout all Siberia. (Dr. Fischer.)*—Numerous specimens of this very pretty species of *Anemone*, gathered during the second Arctic Journey, both by Dr. Richardson and Mr. Drummond, have confirmed the opinion I had formerly expressed, that it is totally distinct from any previously described. Dr. Richardson's description is very excellent, but he had not, during the first journey, seen the ripe fruit, which is highly curious. The numerous long slender styles, all bent downwards, have the appearance of a very coarse and shaggy head of hair. If the extremities of these styles be examined with a microscope, they will be found to be rolled upwards at their very points, and thus uncircumcised in a dry state. When moist, the apex is only slightly curved.

TAB. IV. A. *Figs. 1, 2, 3.* A. Richardsoni: *nat. size*; *fig. 4.* Pistil; *fig. 5.* Stamen; *fig. 6.* Pericarp:—*magnified.*

8. *A. Virginiana*; foliis ternatim partitis, segmentis ovato-lanceolatis trifidis inciso-serratis, involucri involucellorumque petiolatis conformibus, sepalis 5 ellipticis subcoriaceis extus sericeis, capitulo oblongo lanato.—*Linn. Sp. Pl. p. 761. Mich. Am. v. 1. p. 320. Pursh. Fl. Am. v. 2. p. 388. Elliott. Carol. v. 2. p. 54. Bigel. Fl. Bost. ed. 2. p. 223. De Cand. Prodr. v. 1. p. 21.*

Caulis bi-tripetalis, superne in pedunculos divisus, pilis brevibus, sericeis, appressis, magis minusve vestitus. *Folia ampla; radicalia* longe petiolata, omnia pulcherrima reticulatum venosa. *Pedunculi* elongati, 3 vel 4 ab eodem punto, ubi involucrum trifoliatum, foliis radicalibus conforme, petiolatum: pedunculus centralis nudus, laterales bifoliati. *Flores* parvi. *Sepala* acuta, subcoriaceas, pallide flavo-viridias, nunc purpureo-accincta, extus sericea. *Capitula* pericarpii oblonga, nunc fere cylindracea, (raro, in speciminiis ab amicis. *Boott. tereti-globoea.*) *Cariopoides* numerosissime, densissime compactae, subrotundæ, compresse, basi densissime lanatae, stylis acuminatis rectiusculis terminate.

HAB. Central limestone tract, and eastern prairie lands, as far north as lat. 55°, spreading more widely in Canada than to the northward; on rich banks of rivers. *Dr. Richardson. Drummond.*

TAB. IV. B. *Fig. 1.* Pistil; *Fig. 2.* Head of Pericarpe:—*magnified.*

9. *A. multifida*; pilosa, foliis ternatim divisis, segmentis cuneatis tripartitis laciniatis, lacinia linearibus acutis, involucri involucellorumque breve petiolatis conformibus, sepalis 5–8 subcoriaceis ellipticis extus sericeis.—*Poir. in Encycl. HAB. Gulf of the St. Lawrence. *Goldie.* From the shores of Hudson's Bay to the western declivity of the Rocky Mountains, and from the United States to near the shores of the Arctic Sea; common. *Dr. Richardson. Drummond.* West side of the Rocky Mountains, near the sources of the Columbia. *Douglas.*—Variable in size and in the number of peduncles arising from each stem, from 1 to 3, and agreeing with the figures of De Lessert (from plants gathered in the Straits of Magellan) in every particular, except that in those the segments of the leaves are shorter in proportion to the breadth; so that their single-flowered variety has very much the appearance of a large state of *A. Baldensis*. Heads of pericarps, as in that species, roundish-oval, woolly. *Flowers* white, yellow, purple, and deep red.

The species has a very extended range, from the mouth of the St. Lawrence to the sources of the Columbia, west of the Rocky Mountains. It was found at Conception in Chili, during Capt. Beechey's Expedition, at the Straits of Magellan, and Dr. Gillies has gathered it on the Andes of Chili.

10. *A. Pennsylvanica*; subpilosa, foliis tripartitis segmentis bipartitis trifidisve, lacinia lanceolatis inciso-serratis, involucralibus involucellis sessilibus conformibus, sepalis 5 ellipticis obtusis, pericarpis compressis marginatis stylo longo apice recto vel uncinato attenuatis. (TAB. III. B.)—*Linn. Mant.* p. 247. *Pursh, Fl. Am.* v. 2. p. 387. *De Cand. Prodr.* v. 1. p. 21. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 22.—*A. aconitifolia. Mich. Am.* v. 1. p. 320.—*A. dichotoma. Linn. Amer. Acad.* v. 1. p. 155. *Gmel. Fl. Sibir.* v. 4. p. 197. “*Linn. Fil. decad.* 29. t. 15.” *Pursh, Fl. Am.* v. 2. p. 387. *De Cand. Prodr.* v. 1. p. 21.

Radix subrepens, flexuosa, lignosa, parce fibrosa. *Tota planta pilosa*, in caule et petiolis pilis patentibus. *Folia* radicalia longe petiolata, ampla: *Involucrum* illis formæ et magnitudine simile. *Involucella* multoties minora. *Flos* magnus, albus: *Sepala* membranaceæ, extus sericeo-pubescentia. *Stamina* numerosa. *Fructus* rotundatus, magis minusve pilosus vel etiam glaber: *Stylus* persistens, pericarpis multo longior, rectus vel ad apicem uncinatus; statu juniore brevis et semper uncinatus.

HAB. In woody and prairie-tracts by the banks of rivers from Hudson's Bay to the Pacific, and from the United States to near the mouth of Mackenzie's River; not found in the barren grounds. *Dr. Richardson. Drummond. Douglas.*—It is singular that no figure, that I am aware of, should yet have been given (except the one referred to in the “Decades” of the younger Linneus,) of this very common and handsome American plant. De Candolle says that the *A. dichotoma* of Europe is similar to the *Pennsylvanica*, but more slender. My specimens from Dahuria, sent by Dr. Fischer, entirely accord with the American ones: and the *dichotoma* of Pursh, I suspect, is exactly the same. That author, indeed, says, “It is smaller than *Pennsylvanica*, and has a tinge of red;” neither of which marks are at all likely to be constant.

Although named *Pennsylvanica* by Linneus, he only gives Canada as a station for it. And notwithstanding that Michaux speaks of it as an inhabitant of the New England States, and Pursh of Pennsylvania, I have never received it from my correspondents in these countries, and am inclined to consider it rare, except in the more northern parts of America. It does not find a place in Elliott's Sketch, nor in Dr. Bigelow's Flora of the Environs of Boston.

11. *A. narcissiflora*; hirsuta, foliis palmatim partitis, segmentis cuneatis inciso-multifidis, involucralibus subconformibus sessilibus, floribus umbellatis.—*Linn. Sp. Pl.* p. 763. *Gmel. Fl. Sibir.* v. 4. p. 200. *Pursh, Fl. Am.* v. 2. p. 387. *Bot. Mag. t. 1120. De Cand. Prodr.* v. 1. p. 23.—*A. umbellata. Willd. Sp. Pl.* v. 2. p. 1284. ? *De Less. Ic.* v. 1. t. 18. ? (ubi figura differt solummodo involucris simplicioribus.)

HAB. Canada, and North-West America. *Pursh.* I have never seen Canadian specimens, but I possess the plant gathered by Mr. Menzies on the north-west coast of America, where it extends, according to *Dr. Fischer*, as far as Unalaschka. Kotzebue's Sound. *Lay and Collic in Captain Beechey's Collection.*—These N. W. American specimens are clothed with long, copious, and beautifully silky hairs, according with De Candolle's var. ζ , *villossima* from Unalaschka. But I possess individuals gathered on the Altai Mountains equally shaggy; and others from different parts of Europe in various states of hairiness. The specimens in Captain Beechey's herbarium are very small, and have only one flower to each plant.

4. HEPATICA.

Involucrum 3-foliatum, flori approximatum, 1-florum, calycoide; foliis integris. *Sepala* petaloidea, 6–9, duplii triplici serie disposita. *Stamina* et *ovaria* plurima. *Carpella* ccaudata.—*Scapi plurimi, radicales, 1-flori. DC.*

1. *H. triloba*; foliis late cordatis trilobis, lobis cordatis.—*Anemone Hepatica. Spreng. Syst. Veget.* v. 2. p. 660. *Mich. Am.* v. 1. p. 319. *Elliott, Carol.* v. 2. p. 56.—H. Ameri-

HAB. In woods, in the central limestone tracts, from Canada to lat. 52°. Mr. Drummond found it as far north as lat. 55°, in the secluded alpine valleys on the eastern declivity of the Rocky Mountain ridge. *Dr. Richardson.* The varieties grow indiscriminately.—A plant varying much in the lobes of its leaves, rounded, obtuse, oval, or acute, as Michaux has justly remarked. In the young state it is clothed with long, and on the petioles and scapes, spreading, silky hair. There can be no question of the identity of the American and European individuals. Dr. Boott has gathered a var. near Boston, United States, with a five-lobed leaf.

5. HYDRASTIS. *Linn.*

Cal. 3-sepalus, sepalis ovatis. Pet. nulla. Stamina ovariaque plurima. Cariopsides baccatae, plurimæ in capitulum aggregatae, stylo terminatae, 1-loculares, 1-2 spermæ. Semina ovoidea, laevigata. DC.

1. *H. canadensis.*—*Linn. Sp. Pl.* p. 784. *Mich. Am.* v. 1. p. 317. *Pursh, Fl. Am.* v. 2. p. 389. *Elliott, Carol.* v. 2. p. 55. *De Cand. Prodr.* v. 1. p. 23.—*Warneria.* “*Mill. Ic.* p. 190. t. 285.”

HAB. Canada; in water. *Linn.* According to Pursh, and other American Botanists, in shady woods on fertile soil, and among rocks, in the Alleghany tract of mountains. *Michaux.*—We learn from Michaux, that this plant seems confined to the Alleghany chain; and, following its course, extends from Canada to Carolina. It is probably rare, for none of our recent travellers have seen it in Canada, nor have I ever received a specimen. De Candolle, who describes the plant from dried specimens, says that the root (which is bitter, pungent, and tonic, yielding a beautiful yellow dye, whence the name *Yellow-Root*) consists of intensely yellow fleshy tubercles. The stem is herbaceous, simple, single-flowered, bearing two or three leaves, the two lower ones petiolated, the upper one nearly sessile, all of them 3-5 partite, the lobes coarsely toothed, acute. Flowers white, purplish, terminal, pedunculated. Fruit fleshy, red, like that of a *Rubus*, to the herbaceous species of which, Nuttall compares the habit of the whole plant.

6. ADONIS. *Dill.*

Cal. 5-sepalus, adpressus, sepalis interdum basi solutis. Pet. 5-15, ungue nudo. Stam. plurima, ad basin gonophori inserta. Ovaria plurima. Cariopsides plurimæ, monospermæ, secus gonophorum spicatae, ovatae, stylo brevi subaccreto acuminatae. Embryo ovatus, cotyledonibus subdistantibus.—Folia caulina pinnato-partita, lobis multifidis. DC.

1. *A. autumnalis;* calyx glabro, petalis 6-8 concavo-conniventibus calyx vix majoribus, carpellis subreticulatis in capitulum ovatum aggregatis stylo brevissimo coronatis, caule ramoso.—*Linn. Sp. Pl.* p. 771. *Smith in Engl. Bot.* t. 308.

HAB. Cape Charles, Labrador. Captain Robinson, July, 1820.—The specimen gathered in Labrador was given to me, with several other very interesting plants from that country, by the late Mr. Morrison. It is undoubtedly the same as the European plant, but scarcely exceeding two inches in height. It is possible that the seeds may have been brought to Labrador by the Missionaries; but as I have no means of ascertaining this point, I think it safer to introduce the plant as a doubtful native of N. America, than to omit it altogether.

7. RANUNCULUS. Linn.

Cal. 5-sepalus, sepalis basi non solutis, deciduis, intus basi squamula foveolari nectariæ instructa. *Stam.* ovariaque plurima. *Cariopsides* ovatæ, subcompressæ, in mucronem aut cornu semine vix longius desinentes, læves, striatæ aut tuberculatæ, in capitulum globosum cylindraceumve dispositæ. *DC.*

SECT. I. BATRACHIUM. *Pericarpia transverse rugoso-striata. Petala alba, ungue flavo, fovea nectarifera notato.* *DC.*

1. *R. aquatilis*; caule fluitante, foliis submersis capillaceo-multifidis, emersis tripartitis, lobis cuneiformibus apice dentatis, petalis obovatis calyce majoribus. *DC. Prodri. v. 1. p. 27.*

a. *heterophyllum*; foliis emersis tripartitis. *DC.*—*R. aquatilis.* *Linn. Sp. Pl. p. 781. Smith in Engl. Bot. t. 101. Pursh, Fl. Am. v. 2. p. 395. De Cand. Syst. Veget. v. 1. p. 234.*

b. *capillaceus*; foliis petiolatis, omnibus immersis, in laciniis filiformes tenues dissectis. *DC.*—*R. pantothrix.* *Brot.*—*Elliott, Carol. v. 2. p. 56.*—*R. fluviatilis.* *Willd. Sp. Pl. v. 2. p. 1333. CEd. Fl. Dan. t. 376. Bigel. Fl. Bost. ed. 2. p. 227.*

c. *cespitosus*; foliis petiolatis, omnibus emersis, circumscriptione suborbiculatis in laciniis divergentes rigidulas dissectis, petiolis basi late vaginato-auriculatis. *DC.*—*R. aquatilis, var. a.* *Schkuhr, Bot. Handb. v. 2. t. 152.*

d. *stagnatilis*; foliis sessilibus, omnibus immersis, capillaceo-multifidis circinnatis, laciniis abbreviatis, vaginis obsolete auriculatis carpellisque acutiusculis glabriusculis. *DC.*—*R. stagnatilis.* “*Wallr. Sched. 285.*”

HAB. In water, in the eastern, central, and prairie districts, from the United States to near the Arctic Sea, lat. 65°. Dr. Richardson. Drummond.—In all the specimens gathered during the Land Arctic Expedition, the floating leaves are wanting. The var. *z.*, as De Candolle observes, grows short and tufted, having its naturally submerged leaves (left by the evaporation of the water,) capillaceo-multifid, and more rigid than as if constantly under water. The figure in Schkuhr admirably represents this kind of leaf. Var. *z. stagnatilis* is remarkable for its distantly-placed leaves, having an almost orbicular circumscription.

SECT. II. HECATONIA. *Carpella lœvia, ovato-subrotunda, in capitulum subrotundum digesta. Radix fibrosa.* *DC.*

2. *R. Pallasii*; caule repente fistuloso, foliis omnibus petiolatis ovalibus obovatissimis cuneatis tripartitis, calyce trispalo, floribus octopetalis, semen capitulo sphaerico, carpellis crassis ovatis glabris rostellatis.—*Schlecht. Animadv. Bot. Sect. 1. p. 15. t. 2. Sprang. Syst. Veget. v. 2. p. 649.*

of Eschscholtz and Good Hope; and in the little island of St. George, to the north of the Aleutian Isles. *Chamisso*.—Schlechtendal observes that this plant is like none of the species of *Ranunculus* belonging to this section, and that it is allied to *Ficaria* in its triphyllous calyx, and in having more than five petals; but so distinct from all, that it might form a separate genus, were it not for the presence of its nectariferous pore.

3. *R. Flammula*; foliis glabris linearibus lanceolatis subovatisve subintegris, caule de- clinato plus minusve radicante, pedunculis oppositifoliis, carpellis levibus.

a. major; caule altiore, basi solummodo decumbente radicante, foliis lanceolatis ovatisve inferioribus petiolatis serratis.—*R. Flammula*. *Linn. Sp. Pl.* p. 772. *Mich. Am.* v. 1. p. 321? *Pursh, Fl. Am.* v. 2. p. 391. *Bigel. Fl. Bost. ed.* 2. p. 224. *Rich. in Frankl. 1st Journ. ed.* 2. *App. p. 22. De Cand. Prodr.* v. 1. p. 32.

b. intermedia; caule repente gracili, foliis anguste lanceolatis superioribus linearibus integrerrimis.

c. filiformis; caule longe repente filiformi, foliis remotis linearibus integerrimis.—*R. reptans*. *Linn. Sp. Pl.* p. 723. *Fl. Lapp.* p. 236. t. 3. f. 5. *De Cand. Prodr.* v. 1. p. 32. —*R. filiformis*. *Mich. Am.* v. 1. p. 320. *Pursh, Fl. Am.* v. 2. p. 392. *Bigel. Fl. Bost. ed.* 2. p. 224.

HAB. *a.* Canada. *Mr. Goldie.* *b.* and *c.* On the gravelly banks of rivers from Canada to lat. 69°. *Dr. Richardson, Drummond.* Newfoundland. *Mr. Morrison.*—Nothing is more evident than that there exists in Europe, as well as in N. America, a series of varieties, from the small slender creeping *R. reptans* of *Linn.* with linear entire leaves, as figured in the *Fl. Lapp.* of the illustrious Swede, (precisely the *R. filiformis* of Michaux,) to the nearly erect, broadly lanceolate, generally serrated-leaved, common appearance of *R. Flammula*. In the more northern parts of British N. America, indeed, the slender creeping varieties are the most common, (as in the alpine parts of Scotland, upon the stony margins of lakes.) I have only received *a.* from Mr. Goldie, gathered in the southern parts of the Canadian possessions. Farther south, in Pennsylvania and Virginia, it appears, according to Pursh, to be the only kind found. It is singular that Dr. Bigelow should consider it to be introduced in the environs of Boston, where *c.* likewise grows, and varying as he says, with *oval* and *lanceolate* leaves, which latter would bring it to var. *a.* It does not appear that any of the varieties are found on the Rocky Mountains, nor to the westward of them. The *carpels* in all are roundish, sub-compressed, glabrous, and free from hair, terminated by a short, recurved mucro.

4. *R. Cymbalaria*; stolonifera, foliis radicalibus ovato-cordatis petiolatis obtusis grosse cuneatis glabris, scapo uni-trifloro, petalis oblongis calycem sequantibus, carpellis striatis in capitulum (plerumque) congestis.—*Pursh, Fl. Am.* v. 2. p. 392. *Bigel. Fl. Bost. ed.* 2. p. 225. *De Cand. Prodr.* v. 1. p. 33. *Rich. in Frankl. 1st Journ. ed.* 2. *App. p. 23.*—*R. salsuginosus*. “*Pall. Iter.* v. 3. p. 213,” (according to Schlechtendal, because Pallas quotes Amman,) but not of *De Cand.*?—*R. repens*, flore in caule singulari, foliis varie sectis. *Amm. Ruth.* p. 81. t. 13. f. 2.

s. alpina; minor, foliis apice tridentatis, scapo unifloro.—*R. halophilus*. *Schlecht. Animado. Bot. Sect.* 1. p. 23. t. 4. f. 1.?

HAB. Common in moist shady places, from Canada to near the Arctic Sea, lat. 68°, and from Hudson's Bay to the summits of the Rocky Mountains. *Dr. Richardson, Goldie, Douglas, Drummond, Morrison.*—A very singular plant, first detected by Pursh near the salt works of Onondago, New York. Dr. Torrey has

* Pursh considers the synonym of this author, I know not upon what authority, to belong to *R. pusillus*.

sent it to me from Long Island, and Dr. Boott from near Salem, Massachusetts, which is perhaps its farthest limit south. Amman's figures, from Siberian specimens, are admirably characteristic of our plant, which scarcely varies but in its greater or less size, and in the greater or lesser number of teeth to each leaf. But his and Gmelin's synonym are quoted by Smith, in Rees' Cyclopaedia, under *R. saluginoosa*; and, certainly, according to Jacquin's figure of *saluginoosa*, in *Hort. Vindob.* v. 3. t. 31, (sub. nom. *R. rutenici*.) it is very closely allied to our *Cymbalaria*. The whole plant is indeed larger, the leaves 3 or 5-toothed at the extremity, and the heads of capsules are globose. The general habit is similar in both; the flowers alike in structure; the carpels are in both distinctly marked with longitudinal elevated lines. The blossoms of ours are about one-third of an inch in diameter. Pursh cannot, therefore, be deemed correct when he says that those of *saluginoosa* of Pallas in *Herb. Lamb.* "are ten times as large."

Again, the more squalid state of our plant, such as it is found by Mr. Drummond upon the Rocky Mountains, (that is, smaller, with rarely more than 3 large teeth at the extremity of the oblong leaves, and with never more than one flower upon the scape,) approaches so near to the *R. halophila* of Schlechtendal from Siberia, that I can hardly persuade myself that the two plants are distinct. The latter differs, as it appears to me, only in the more cuneate form of its foliage, for as to the teeth, they vary from 3 to 5, which numbers are frequent upon the smaller leaves of the larger variety. Our plant, too, has much affinity with *R. tridentatus* and *nubigenus* of Humboldt; and these, with *R. flagelliformis* of Smith, in Rees' Cyclopaedia, seem to form a small and very distinctly marked family. Smith justly compares the runners to those of the garden strawberry.

5. *R. rhomboideus*; pubescens-hirsuta, foliis radicalibus rhomboideis integris serratis, caulinis palmatis, floralibus profunde laciniatis, calyce patente piloso.—*Goldie in Edin. Phil. Journ.* v. 6. p. 329. t. 11. f. 1. *Rich. in Frankl. 1st. Journ. ed. 2. App. p. 23.*—*R. ovalifolius*. *Pursh in Herb. Lamb.* (fide Richardson.)

HAB. Lake Simcoe, Upper Canada. *Goldie.* In the central limestone and prairie districts, from Canada to lat. 57°. Common in the western parts of Canada. *Dr. Richardson.*—This species seems to be very constant to its character, nor have I found the slightest variation in any of the root-leaves. The heads of fructifications are rounded. *Carpels* roundish, slightly compressed, glabrous, and smooth, with an extremely short and very imperfect, more or less curved style or mucro.

6. *R. glaberrimus*; foliis omnibus petiolatis, radicalibus subrotundis integerrimis vel grosse tridentatis, caulinis subcuneatis trifidis, calyce patente petalis dimidio breviore, fructibus globosis. (TAB. V. A.)

Radix fasciculato-fibrosa. Tota planta hirsutie destituta. Caulis erectus, subepithameus, superne uni-biflorus. Folia omnia (nisi supernum quod subseale) petiolata, subsnculenta: radicalia subrotunda, integra, atque omnino integerrima vel apice dentilis tribus grossis obtusis: caulina cuneata, sere ad medium trifidum: segmentis lanceolatis, obtusis, integris. Pedunculus et calyx etiam glaberrimi. Sepala ovalia, convava, patentia, non reflexa, corolla duplo breviora. Petala 5, ovalia, divisa. Fructus, vix maturus, globosus.

HAB. Common on the mountains around the Kettle Falls, and on the Rocky Mountains, near the limits of perpetual snow. *Douglas.*—This differs from all its congeners by its entirely glabrous stem, leaves, and calyx, by its entire or only 3-toothed, rounded, radical leaves, and by the petiolated, never more than trifid, caudine ones. The whole plant has a succulent appearance, and turns almost black in drying. I have seen it in no collection but that of the indefatigable Douglas.

7. *R. affinis*; foliis radicalibus (plerumque) pedato-multifidis petiolatis, caulinis subscissilibus digitatis, lobis omnium linearibus, caule erecto 1-2 (multi) floro cum calycibus ovariiisque (an semper?) pubescensibus, fructibus oblongo-cylindraceis, acheniis rostro recurvo. *Br.* (TAB. VI. A.)

a. petalis calyce duplo majoribus.—*R. affinis.* *Br.* in *Parry's 1st Voy.* *App.* p. cclxv. *Rich.* in *Frankl. 1st Journ. ed. 2.* *App.* p. 23. *Hook.* in *Parry's 2d Voy.* *App.* p. 384.—*R. arcticus.* *Rich.* in *Frankl. 1st Journ. ed. 1.* *App.* p. 741.

b. petalis calyce subbrevioribus vel nullis, foliisque inferioribus minus profunde divisis.

y. foliis radicalibus exterioribus rotundatis subintegris.

Hab. Universally spread from Canada to the Arctic Sea, and from long. 95° to the western declivity of the Rocky Mountains, and probably it crosses the whole continent. Cape Mulgrave, in N. W. America. (*Lay and Collie in Captain Beechey's Voyage.*) *β.* *γ.* Melville Island, (*Parry,*) and shores of the Arctic Sea, between long. 107° and 150° . *Dr. Richardson.* *Captain Sir J. Franklin.* *Captain Back.* *Drummond.*—I feel quite at a loss to determine whether this should be kept distinct from the *R. auricomus* of Europe or not. All the specimens from our arctic travellers quite agree with the character of Mr. Brown's *affinis*, and with the plant which I have received from Melville Island, through the favour of Mr. Sabine, except that the carpels are not always hairy, and the root-leaves in my *β.* are sometimes almost entire. Yet I must acknowledge that all these coincide with *R. auricomus*, were it not that the pericarps are collected into an oblong head; and this character seems invariable. The lower leaves, except in my var. *γ.* (which scarcely differs from some of the states of *ovalis* but in its oblong fruit,) are pedato-partite, or trifid, yet with a certain degree of regularity. There are 3 or 5 more or less deep and cuneate segments, and these again are usually trifid; the segments broadly oblong or lanceolate. Upwards on the stem, the leaves become more deeply cut into many long, nearly equal, linear segments. The greater number are quite glabrous, except in the upper part of the pedicels and calyx; but in the var. *β.* the whole plant is often pubescent or even hoary. I have not myself seen any specimen of the true *R. auricomus* from N. America; but it is said to be a native of the United States.

TAB. VI. A. *R. affinis.* *a.* and *β.* *Fig. 1.* Head of pericarps; *fig. 2.* Side view of a pericarp; *fig. 3.* Front view of do.:—magnified.

8. R. ovalis; pubescens, foliis radicalibus cordatis basi truncatis ovalibusque integris rarissime fisis crenatis, caulinis subsessilibus digitatis lobis omnium linearibus, caule erecto multifloro, calyce pubescente corallam sequante, fructibus globosis. (*TAB. VI. B.*) —*Rafin.* in *Journ. de Bot.* 1814. p. 268? *De Cand. Prodri.* v. 1. p. 43?

Tota planta pubescens. Radix fasciculatim fibrosa. Folia radicalia, longe, petiolata, petiolis vaginantis, cordata, basi truncata vel sepe fere exacte ovalia, nunc, sed rarissimo, profunde trifida vel etiam palmato-pedatis, margine superne praeципue, crenata: caulina ad basin ramorum seu peduncularum subsessilia, profunde palmatim multifida. Flores mediocres, flavi. Calyx membranaceus, subcoloratus, patens, demum reflexus. Corolla calyce paulo brevior. Petala ovalia. Fructus exakte globosus. Cariopsides omnino ut in R. affini.

Hab. Alpine prairies among the Rocky Mountains, and about Carlton House, lat. 52° to 55° . *Dr. Richardson.* *Drummond.*—Allied to *R. rhomboideus*, but of a stouter habit, more hoary aspect, with the leaves arising from the root far more cordate, and occasionally deeply cleft. This species is not at variance with the short character given in *Journ. de Bot.* of Rafinesque's *R. ovalis*, except that he states the caudine leaves to be lanceolate; by which he means, perhaps, that the segments are so.

TAB. VI. B. *Fig. 1.* Head of pericarps; *fig. 2.* Single pericarp:—magnified.

9. R. brevicaulis; pubescens, foliis radicalibus omnibus cordato-ovalibus integris, caulinis crenatis palmato-multifidis, caule erecto multifloro foliis multo brevioribus, fructibus globosis, petalis 6. (*TAB. VII. A.*)

HAB. Shores of Lake Huron. Dr. Richardson. *Drummond*.—Mode of growth and general aspect of *R. parnassiaefolius*; the leaves being of nearly the same shape, undivided, on long petioles, so that they rise much above the very short stem and flowers. The foliage, too, is very large in proportion to the size of the plant; yet when we come to compare this species with the preceding one, we shall find that there are many essential characters in common, and that it is probably only a variety of it. There are several specimens, however, in the collection, and there is no variation among them.

10. *R. cardiophyllum*; pubescenti-hirsutus, foliis radicalibus rotundato-cordatis basi sub-profundè emarginatis integris multifidisque, caulinis palmato-multifidis lacinias linearibus inciso-crenatis, calyce patente corolla dimidio breviore, fructibus oblongis. (TAB. V. B. Fig. 1, Pericarp :—magnified.)

Tota planta magis minusve pubescenti-hirsuta. Caulis fere pedalis, erectus, strictus, subrobustus. Folia radicalia 3 vel 4, longe petiolata, rotundato-cordata, basi subprofunde emarginata, integra, crenata vel multipartita, lacinias linearibus subintegris; canina fere sessilia, multipartita. Flores majusculi, surei. Calyx membranaceus, subcoloratus, patens, corolla duplo brevior. Petala late ovalia, concava, obtusissima. Fructus oblongus. Cariopoides numerose, subrotundae, parvae, compresae, stylo uncinato longiusculo terminatae.

HAB. From Canada to lat. 55°. In the central prairie and limestone districts. Dr. Richardson. *Drummond*. Alpine prairies in the Rocky Mountains. *Drummond*.—Of all this tribe, the present individual is the tallest, stoutest, and has the largest flower. Its radical leaves are more deeply emarginate at the base than any other; yet I dare not positively pronounce it a good species. It may be considered as holding nearly the same relationship with *R. ovalis*, as *R. affinis* does with *auricomus*.

I have more than once, and that in unison with the ideas of my valued friend Mr. Arnott, had the intention of describing the whole of the last four species as different states of *R. auricomus*: but I felt that I should make myself better understood, and create less confusion, by considering them species, or, if the reader pleases, subspecies, than by enumerating them as varieties. When seen growing by Mr. Drummond, in their respective localities, they appeared to him to be truly distinct; but, at the same time, there are gradations which seem to unite the whole. They all agree in general habit, in the fasciculato-fibrous roots, erect stems, deeply divided caulinine leaves or bracts, in the somewhat coloured thin membranaceous erecto-patent, at length reflexed sepals, and in the shape and structure of the carpels: they vary in the divided or entire root-leaves, in the comparative lengths of the petals, and in the rounded or elongated heads of fruit.

To some of these species or varieties, the *R. cassubicus* approaches very nearly; but it has a more straggling habit, and the root-leaves are more reniform, the heads of capsules rounded, or nearly so, and with fewer carpels. Many of these are probably included in the numerous varieties of *R. auricomus* of Schlechtendal, who considers it certain that the *R. cassubicus* should be united with that plant. One other plant of this group yet remains to be described, namely the

11. *R. abortivus*; foliis radicalibus cordato-subreniformibus late ovatisse obtusis crenatis integris vel trisectis, caulinis plerumque tripartitis segmentis lineari-lanceolatis integris vel incisis, calyce colorato reflexo, fructus capitulo oblongo rotundato.

a. petalis linearibus calyce vix longioribus.—*R. abortivus*. Linn.—*Pursh, Fl. Am. v. 2. p. 392. Bigel. Fl. Bost. ed. 2. p. 225. Elliott, Carol. v. 2. p. 58. De Cand. Prodr. v. 1. p. 34. Schlecht. Animadv. Sect. 2. p. 10.—*R. nitidus*. Walt. Fl. Carol. p. 159; (according to De Cand., though Elliott refers that to *R. sceleratus*;) not of Muhl. and Elliott. *Pursh, Fl. Am. v. 2. p. 392.**

of the Rocky Mountains. Dr. Richardson. Drummond. Mrs. Percival. Mr. Todd. Newfoundland. Mr. Cormack.—Allied to some states of *R. aquilis*, and *R. ovalis*; or, as Schlechtendal well observes, "inter *R. auricomum* and *R. sceleratum* media, ab utroque autem toto ostio diversa." It is distinguished from the foregoing species by its more delicate and membranaceous texture, by the constantly reflexed calyx, the smaller and narrower petals of a pale yellow colour. Heads of pericarp globose, or but slightly elongated. Carpels almost entirely glabrous, tipped with a very short style or mucro—a very imperfect one indeed, as described by De Candolle. From the United States, especially from the neighbourhood of Boston, I possess specimens whose germs have a long and a stout recurved mucro, yet in other respects precisely according with our British North American *R. abortivus*.

12. *R. sceleratus*; foliis glabris petiolatis tripartitis, radicalibus lobis trilobatis obtuse subincisis, caulinis lobis oblongo-linearibus integris, floralibus oblongis, calyce reflexo glabro, carpellis minimis in capitulum oblongum dispositis. Linn.—Engl. Bot. t. 681. Pursh, Fl. Am. v. 2. p. 392. Elliott, Carol. v. 2. p. 59. Bigel. Fl. Bost. ed. 2. p. 225. De Cand. Prodr. v. 1. p. 34.—*Hecatomia palustris*. Lour. Coch. p. 371. De Cand. Syst. Veget. v. 1. p. 227.

HAB. Flooded gravelly banks of rivers, from Canada to lat. 67°. Dr. Richardson. Douglas. Drummond.—Almost entirely glabrous. Schlechtendal indeed mentions a pubescent variety. The species is constant in the form of its radical leaves, cut and divided in a regular manner, in the very leafy stem, the small pale flower, in the oblong compact head of numerous very small rounded carpels, which have scarcely any style, and are furnished with a distinct margin along the back.

13. *R. Purshii*; fluitans, caule elongato, foliis submersis capillaceo-multifidis, emersis reniformibus 3-5-partitis, lobis varie sectis, sepalis reflexis corolla duplo brevioribus, fructu subgloboso, stylo recto ensiformi. (TAB. VII. B.)

a. foliis omnibus capillaceo-multifidis, flore majore, caule fistuloso.—*R. multifidus*. Pursh, Fl. Am. v. 2. p. 736. Bigel. Fl. Bost. ed. 2. p. 228. De Cand. Prodr. v. 1. p. 34.—*R. fluviatilis*. Bigel. Fl. Bost. ed. 1. p. 139. (nec aliorum.)

b. foliis submersis capillaceo-multifidis, natantibus reniformibus palmato-multifidis. (TAB. VII. B. Fig. 1.)

γ. repens, foliis inferioribus lineari-multipartitis, superioribus reniformibus palmato-multifidis. (TAB. VII. B. Fig. 2.)—*R. Purshii*, a.—Rich. in Frankl. 1st Journ. ed. 2. App. p. 23.

δ. repens, foliis omnibus reniformi-rotundatis palmato-tri-quintefidis. (TAB. VII. B. Fig. 3.)—*R. Purshii*, β. Rich. l. c.—*R. Gmelini*. De Cand. Prodr. v. 1. p. 35. (excl. syn. Schlecht.)—*R. Langsdorffii*. De Cand. Prodr. v. 1. p. 34.—*Ranunculus foliis duplicato-trifidis*, caulibus filiformibus declinatis. Gmel. Fl. Sib. v. 4. t. 88. B.

HAB. Common throughout the eastern and prairie districts, from Canada to near the Arctic Sea: never observed floating in deep water, but sometimes spreading over the surfaces of sphagnum bogs, more generally creeping on mud in very sheltered pools of water, in shady places. β. and γ. Lakes and marshes about Slave Lake, Cumberland House Fort. Dr Richardson: and to the Rocky Mountains. Drummond. δ. Bear Lake. Dr. Richardson. Bay of Eschscholtz, on the western shore of extreme Arctic America. Chumiso.—This aquatic plant has a very similar habit with *R. aquatilis*, and, like it, varies exceedingly in the length of the stems and shape of its leaves, according to its situation in deep or shallow water, in more or less flowing streams, and on the almost dry mud, &c. I possess a series of specimens from the *R. multifidus* of Pursh, (a name that is however pre-occupied by a plant of Forskall,) which is a more southern plant, 2 feet long, thicker in its fistulose stem than a goose-quill, and clothed with none but long capillaceous multifid leaves,

to our last mentioned var. which is only 3 or 4 inches in length, with an almost orbicular circumscription to the leaves, having all multifid and linear segments and small solitary flowers, and which seems to be exactly the *R. Langsdorffii** of De Candolle. Intermediate states possess the natant broad foliage, similar to what is so common on the *R. aquatica*. Sometimes there is a little pubescence on the stem and leaves. Richardson has well described my varieties γ , and δ , and particularly noticed the remarkable character of the style. Mr. Brown's *R. inundatus*, from New Holland, appears to be allied to this.

TAB. VII. *Fig. 1.*, *R. Purshii*, β ; *fig. 2*, var. γ ; *fig. 3*, var. δ : *nat. size*; *fig. 4*, Petal; *fig. 5*, Side view, and *fig. 6*, Back view of a pistil; *fig. 7*, Head of pericarps; *fig. 8*, Single pericarp:—*magnified*.

14. *R. laponicus*; foliis glabris, radicalibus longe petiolatis tripartitis lobis dilatatis obtusis grosse dentatis, scapo nunc unifoliato unifloro foliis longiore, calyce 3-sepalo reflexo.—*Linn. Fl. Lapp. t. 3. f. 4. Rich. in Frankl. 1st Journ. ed. 2. App. p. 23. De Cand. Prodri. v. 1. p. 35. Hook. in Parry's 3d Voy. App. p. 121.*

HAB. Mossy woods in the eastern and central districts, and from lat. 50° to the Arctic Sea. *Dr. Richardson*. Mountain swamps; eastern declivity of the Rocky Mountains, lat. 52° to 57° . *Drummond*. Whale Islands in the Arctic Sea. *Licut. Ross*.—A rare plant; being very alpine or very arctic. The lower part of the stem is siliform, and creeps much under ground, throwing out long, white, fibrous radicles. The scape is sometimes furnished with a single leaf, and this is remarkably the case with the specimens from the coast; and it is so figured by Reichenbach. The calyx consists of 3 sepals, and the corolla of 6 (Schlechtendal says 8) spatulate petals; hence it is allied to the genus *Ficaria*, and, like it, it bears gemmæ or little bulbs. Heads roundish, of few carpels, which are margined. Styles as long as the capsules, flattened at the base, and recurved.

15. *R. hyperboreus*; foliis glabris petiolatis trifidis lobis ovali-oblongis divaricatis, lateralibus subbifidis, medio integro, vaginis basi biauriculatis, caule filiformi repente.—*Rottb. in Act. Hafn. 10. p. 458. t. 4. f. 16. Schlecht. Animadv. Sect. 2. p. 12. De Cand. Prodri. v. 1. p. 35. Brown in Parry's 1st Voy. App. p. cclxiii. Hook. in Parry's 2d Voy. App. p. 4; in Parry's 3d Voy. App. p. 29.—R. Gmelini. Schlecht. Animadv. Sect. 2. p. 35. (non De Cand.)—Ranunculus foliis subrotundis trilobis integerrimis, caule repente. *Gmel. Fl. Sib. v. 4. p. 204. t. 83. b. c.**

HAB. Marshes in the Rocky Mountains; lat. 52° to 57° . *Drummond*. Arctic Islands. *Capt. Sir E. Parry. Edwards*. Bay of Eschscholtz, and of Schischmarof. *Chamisso*.—Whole plant quite glabrous in the American specimens, hairy in those of Sweden, which I have received from the late Professor C. Smith. Stems creeping. Heads of *germæ* globose, compact. Each *cariopsis* or *carpel* is distinctly margined on the back, and tipped with a very short inconspicuous mucro.

16. *R. pygmaeus*; foliis glabris 3–5 fidis, radicalibus petiolatis, caulino sessili, caule 1-floro, calyce glabro petalis longiore subreflexo, carpellis subrotundis stylo adunco brevi

* Whilst writing this paragraph, I had the pleasure to receive a letter from Mr. Arnott, dated St. Petersburg, who assures me, that on referring to Gmelin's Herbarium, in the Museum of the Academy of that city, he finds the plant which corresponds with Tab. 83. B. of the "Flora Siberica" to truly our *R. Purshii*, and, he believes, certainly the *Langsdorffii* of Dr. Candolle. It is equally the *R. Gmelini* of Dr. Candolle, whose only authority is the figure of Gmelin, which he cites. But it is not the *R. Gmelini* of Schlechtendal's *Animadv.* p. 35, for which he refers to *Gmel. t. 83. b. f. c.* (though, from a misprint, it is made 830,) not 83. B. That plant again, (*Gmel. 83. b. f. c.*) Mr. Arnott assures me, is *R. hyperboreus*, and Eschscholtz's plant, likewise quoted, which I possess in my Herbarium, is the same species, *hyperboreus*. *R. Gmelini*, therefore, no longer exists as a species.

Animadv. Sect. 2. p. 12.—R. caule unifloro, &c. var. γ . pygmaeus. Linn. Fl. Lapp. p. 187. t. 3. f. 3.

HAB. Moist grassy places, on the high parts of the Rocky Mountains, in lat. 55°. Drummond. Arctic Sea coast, between long. 170° and 140°. Dr. Richardson. About Behring's Straits on Chamisso's Island, and on that of St. Lawrence. Chamisso.—Stem erect, never creeping. Plant glabrous. Heads of carpels oblong. Pericarp subglobose, not margined at the back; by which character and the erect mode of growth it may be known from its affinity, *R. hyperboreus*. From *R. nivalis* it is distinguished by its much smaller size, laxer habit, and especially by the minute, inconspicuous flowers.

17. *R. Sabini*; foliis radicalibus elongato-petiolatis tripartitis, lobis ellipticis lateralibus semi-bifidis, caulinis sessilibus tripartitis linearibus, calycibus hirsutis petala retusa sub-equantibus. Brown in Parry's 1st Voy. App. p. cclxiv.

HAB. Melville Island. Parry. Shores of the Arctic Sea, between Mackenzie River and the Coppermine River. Dr. Richardson.—I find amongst Dr. Richardson's specimens of *R. pygmaeus*, a few individuals of a larger size than the rest, having hairy calyces and larger petals, nearly equalling the sepals in length, and which quite agree with Mr. Brown's *R. Sabini*. They seem indeed almost to form a connecting link between *R. pygmaeus* and *R. nivalis*.

18. *R. nivalis*; foliis radicalibus elongato-petiolatis dilatatis lobatis, lobis subovatis, caulinis subsessilibus palmatis, caule erecto sub-unifloro, petalis obovatis integerrimis longioribus calyce hirsutissimo, stylis rectiusculis ovaria glabra equantibus. Br.

HAB. Lofty parts of the Rocky Mountain chain, lat. 55°. Drummond. Copper Mountains and Arctic Sea coast, in muddy pools which become dry during summer, long. 110°. Dr. Richardson. Arctic coast, near the termination of the Rocky Mountains, long. 140°. Captain Sir J. Franklin. Captain Back. Behring's Straits. Chamisso. Kotzebue's Sound. Lay and Collic in Beechey's Voyage.—This plant is remarkable for the variable form of its root-leaves, and Mr. Drummond made the remark, which is confirmed by all the numerous specimens collected by him in the Rocky Mountains, that this may be at once discriminated from *R. Eschscholtzii*, by these leaves never rising with the flower, and being only fully expanded after the flowers

are in perfection.* The two are very nearly allied in habit; but *R. nivalis* may always be known by the deep brown and very numerous long hairs which clothe its calyx and peduncle. My specimens of *R. frigidus*, given me by Mr. Prescott, from the Altai Mountains, scarcely differ from this species, especially the var. β . The leaves are wedge-shaped, crenato-lobate; the petals more or less obtusely emarginate at the extremity, and the nerves are more frequently anastomosing than in *R. nivalis*. But again, one of my Spitzbergen specimens has notched petals, and I fear the peculiarity of the nervation of the petals is not constant. Hence, I should be much inclined to unite them.

19. *R. Eschscholtzii*; foliis ciliatis radicalibus petiolatis, partitionibus lobatis, caule subbifloro, calyce hirsuto petalis breviore, carpellis oblique ovatis stylo ipsis breviore terminatis. *Schlecht. Animadv. Sect. 2. p. 16. De Cand. Prodr. v. 1. p. 35.*

a. petalis minimis vel abortivis.

HAB. Islands of Unalaschka and St. George, N. W. America. *Chamisso*. Near the regions of perpetual snow, on the borders of streams upon the Rocky Mountains, lat. 52° to 56° . *Drummond*.—Schlechtendal has admirably described this species; and his figure differs in nothing from the greater number of our Rocky Mountain specimens, except in being larger and more luxuriant in all its parts. The var. β , above mentioned is indeed as large as the specimens in Schlechtendal's figure, but the petals are abortive. The author of the "Animadversations" observes that it differs from *R. nivalis* in all the leaves being constantly ciliated, (so they are in our *R. nivalis*), in those of the root being always tripartite, with the divisions constantly lobed, in the calyx always sparingly clothed with fulvous hairs, and the carpels having the styles shorter than themselves. Mr. Drummond's specimens are all in flower. I have not seen the fruit.

20. *R. pedatifidus*; foliis subpuberulis, radicalibus petiolatis palmatim pedatisve in lobos lineares integros partitis, scapo subnudo erecto uni-bifloro, calyce patente subvilloso. (*TAB. VIII. B.*)—*Smith in Rees' Cycl. De Cand. Prodr. v. 1. p. 36. Schlecht. Animadv. Sect. 2. p. 18.*

Species quasi media inter *R. nivalis* vel *Eschscholtzii* et specimina parva *R. affinis*! sed ut mihi videtur, omnino distincta. *Radix* e fibris crassiusculis, subsimplicibus vel solummodo fibrillosis, fasciculatis. *Folia* subciliata et parce pilosa, præcipue sub lente; *radicula* longe petiolata, petiole hasi vaginato, membranaceo, nitido, pallido, pedatum divisa, segmentis palmatis, laevis lineari-oblongis, obtusiusculis. *Caulis* vel *scapus* plerumque unifolius, digitalis in nostris exemplaribus, folio sessili palmatim profunde diviso, superne, vel *pedunculus*, hirsutus. *Flos* terminalis, solitarius, medicocris. *Sepala* ovalia, valde concava, patentia, extus pilosa, pilis albidis nitidis. *Petala* 5, ovalia, calyce paulo longiora, flava. *Germina* in capitulum subrotundum congesta, ova, stylis paulo brevioribus recurvatis attenuata.

HAB. Barren summits of the Rocky Mountains, on the eastern side of the ridge, lat. 52° to 55° . *Drummond*.—This plant has been well described by Sir James E. Smith, from Siberian specimens, and by Schlechtendal from those gathered by Chamisso, in the Bay of St. Lawrence, on the coast of Kamschatka. Our plants are from three to four inches in height, offering no variation in the numerous specimens gathered by Mr. Drummond. The species is allied on the one hand to *R. nivalis*, *Eschscholtzii*, and, I may even add, to *R. Sabinii*, but differing in the constantly pedatifid leaves; and, on the other hand, I possess some single-flowered specimens of *R. affinis*, which show a great affinity with it. Ripe fruit I have not seen.

TAB. VIII. B. R. pedatifidus. Fig. 1, Pistils:—magnified.

21. *R. acris*; adpresso hirsutus vel subglaber, foliis 3–5 partitis segmentis profunde

* This, indeed, does not hold good with the arctic specimens, most of which have their cuneate leaves at the same time with the flowers.

trifidis laciniatis, laciniis lanceolatis acutis summis linearibus, caule multifloro, pedunculis teretibus, calyce patente villoso, carpellis suborbiculatis compressis stylo brevi recurvato terminatis.—*Linn.*—*Smith in Engl. Bot.* t. 632. *Pursh, Fl. Am.* v. 2. p. 394. *Bigel. Fl. Bost.* ed. 2. p. 226. *Schlecht. Animadv. Sect. 2.* p. 21. *De Cand. Prodr.* v. 1. p. 36.

HAB. Banks of rivers in the central limestone district, and eastern primitive range, from Canada to lat. 55°. *Drummond*.—A very variable plant, generally clothed with silky appressed hairs, and on which some excellent remarks are given in Schlechtendal's "Animadversationes."

22. *R. repens*; foliis ternatis, foliolis plerumque petiolatis trifidis, segmentis cuneatis incisis, sarmentis radicantibus, calyce adpresso, carpellis stylo breviusculo recto.—*Linn.*—*Pursh, Fl. Am.* v. 2. p. 394. *Smith in Engl. Bot.* t. 516. *Bigel. Fl. Bost.* ed. 2. p. 227. *De Cand. Prodr.* v. 1. p. 38.

HAB. Quebec. *Mrs. Shepherd*.

23. *R. hispidus*; caule erecto ramoso petiolisque patentim pilosissimis, foliis longe petiolatis ternatis supremis subsessilibus, foliolis trifidis incisis laciniis lanceolatis apice callosis, calyce hispido demum reflexo, capitulis globosis, carpellis orbiculatis, stylo breviusculo recto acuminatis.—*Mich. Am.* v. 1. p. 321. *Pursh, Fl. Am.* v. 2. p. 395. *De Cand. Prodr.* v. 1. p. 39.

Radix, ut in omnibus fere hujusce sectionis, fasciculato-fibrosa. *Caulis* erectus, palmaris ad pedalem, erectus, ramosus, superne praecepit pilis patentibus, hispidissimum. *Folia inferiora, caulinata, et radicalia* praecepit, petiolata, superiora subsessilia, ternata; foliolis fere omnibus sublonge petiolatis obovatis basi attenuatis, trifida vel tripartita, laciniis lato-lanceolatis incisis, apicibus acutis, callosis, nonnunquam distincte, et fere albidis. *Petoli* hispida, rarissime glabriusculi, pilis, ut in caule, patentibus. *Pedunculi* plurimi, pilis erectiusculis hispida. *Calycis sepala* ovalia, parce pilosa, demum reflexa. *Petala* calyco vix dimidio longiora, ovalia, breve unguiculata, flava, venosa. *Pistilla* ovata, stylo vix apice recurvato attenuata. *Capitulum* fructus globosus. *Carpella* majuscula, orbicularia, compressa, distincte marginata, sublente pulcherrime impresso-punctata, stylo brevi rectiusculo terminata.—*Variat* petalis calycem longitudine aquantibus.

HAB. Banks of rivers from Causda to near the mouth of the Mackenzie River, lat. 67°; and from the shores of Hudson's Bay to the Pacific. *Dr. Richardson. Drummond. Scouler. Douglas*.—This seems to be a very little known plant, and one that is by no means, in any publication, correctly defined. Schlechtendal has, I think, confounded it with *R. fascicularis* of Muhlenberg, a very different species. Its nearest affinity is unquestionably to *R. Pennsylvanicus*, the *R. Canadensis* of Jacquin; but that has oblong heads of fruit, and a still shorter style.

24. *R. Pennsylvanicus*; caule erecto ramoso petiolisque patentim hispido-pilosus, foliis longe petiolatis ternatis supremis subsessilibus, foliolis trifidis incisis laciniis lanceolatis, calyce patentissimo demum reflexo petalis parvis longiore, capitulis oblongis stylo brevissimo.—*Linn. Suppl.* p. 272. *Pursh, Fl. Am.* v. 2. p. 392. *De Cand. Prodr.* v. 1. p. 40. *Bigel. Fl. Bost.* ed. 2. p. 227.—*R. Canadensis*. *Jacq. Misc.* v. 2. p. 343. *Ic. Rar.* v. 1. t. 165.

HAB. Found with the last mentioned species, and it is equally diffused, but generally prefers the exposed moist gravelly spots.—There can be no mistaking this plant, which is admirably figured by Jacquin. How it is to be distinguished from *R. hispidus*, I have noticed under the preceding species: but, except in the fruit and flower, it must be confessed that the two are very closely allied. Carpels dotted in both.

25. *R. nitidus*; glabriusculus, foliis radicalibus longissime petiolatis ternatis, foliolis petiolatis profunde trifidis tripartitivis, segmentis lato-lanceolatis trifidis incisis, caulinis supremis sublinearibus integris trifidis, calyce patente demum reflexo subhirsuto, capitulo subrotundo, carpellis orbicularibus compressis marginatis breviter mucronatis.—*Muhl. Cat. (non Walter.) Elliott, Carol. v. 2. p. 61.*—*R. septentrionalis. Pursh, Fl. Am. v. 2. p. 395.*?—*R. Carolinianus. De Cand. Syst. Veget. v. 1. p. 292, Prodr. v. 1. p. 40.*

HAB. Abundant on the lower fertile plains of the Columbia, where it attains the height of from $1\frac{1}{2}$ to $2\frac{1}{2}$ feet, extending to the mountain valleys, where it is of humbler growth. *Douglas*. Canada. *Mrs. Percival*.—Allied to *R. hispidus* and *R. Pennsylvanicus*: but almost quite glabrous in all its parts, and the leaves are of a remarkably thin and membranaceous texture. I have compared it with the *R. nitidus* of Mr. Elliott, whose specimens are from Georgia, and I find it to be in every particular the same. Mr. C. S. Parker finds it on the Ohio; so that, in all probability, it is a general plant in North America.

26. *R. recurvatus*; caule erecto folioso petiolisque patentim villosis, foliis omnibus petiolatis 3-partitis, segmentis ovatis acutis incisis, sepulis patentibus demum reflexis pilosis, petalis ellipticis plerumque abortivis, carpellis stylo uncinato.—*Poiret, Encyc. 6. p. 123. Pursh, Fl. Am. v. 2. p. 394. De Cand. Prodr. v. 1. p. 39. De Less. Ic. v. 1. t. 41. (excellent.) Schlecht. Animadv. Sect. 2. p. 28.*

α . *Nelsonii*, foliorum lobis approximatis, pedicellis adpresso pilosis folii longitudinis.—*De Cand. Prodr. v. 1. p. 40.*

γ . caule foliisque glabriusculis.

HAB. Labrador. *Herb. Banks*. Mouth of the Columbia, *Douglas, Scouler*; near the source of that river, and on the eastern declivity of the Rocky Mountains, lat. 52° to 55° , in woods and shady places. *Drummond*. β . *Unalaschka. Nelson*. γ . Mountain woods, north of the Smoking River. *Drummond*. Canada. *Todd*.—Flowers, generally, as figured by *De Lessert*, with abortive petals. Mr. Douglas's specimens from the North-West coast have the petals thrice as long as the calyx. The style varies in length, but is always recurved. The carpels compressed, margined, minutely dotted. The leaves, stems, and petioles very variable in hairiness. Peduncles, too, sometimes very short, so that the flowers are hid among the foliage; at other times much elongated.

27. *R. fuscicularis*; appresso-pilosus, caule subramoso brevi, foliis longe petiolatis ternatis quinato-pinnatis, segmentis oblongo-obovatis cuneatis pinnatifido-lobatis, calyce patente villoso petalis duplo breviore, capitulis rotundatis, carpellis subrotundis compressis, stylo subaeque longo recurvato. (*TAB. VIII. B.*)—*Muhl. in Bigel. Fl. Bost. ed. 2. p. 226. De Cand. Prodr. v. 1. p. 411. Schlecht. Animadv. Sect. 2. p. 31.*

α . magis hirsutus.

HAB. Canada, to the south end of Lake Winnipeg. *Cleghorn. Dr. Richardson. Drummond*.—A very distinct species, in habit most allied to *R. bulbosus*, especially in the leaves being much more compound than is usual in this genus. Root densely fasciculated, throwing up from its crown many leaves and stems, the latter scarcely exceeding the former in length, and both pubescent or pilose, with appressed hairs. In some of Dr. Torrey's specimens from New York, the outermost leaves are simply 3-lobed; in Dr. Boott's plants, from near Boston, the very outermost of the radical leaves are ternate, with obovate and somewhat incised leaflets; but in most instances these leaflets are again deeply divided, the middle always much petiolate, and itself often ternately divided, so that the whole leaf is pinnated, with four lateral and one terminal (always petiolated) leaflets, and these variously cut, and divided; those of the stem are generally situated on long petioles. The petals are as variable as the leaves, obovate, oval, and oblongo-elliptical,

mostly 5, but sometimes 6 or 7. Carpels large, collected into a globose head, roundish, or inclining to obovate, compressed, quite glabrous, marginated, the margin tapering upwards into a recurved filiform style, flat, broad, and membranous at the base, about equal in length with the carpel.

Dr. Bigelow, or Muhlenberg in Bigelow's Flora of Boston, is the authority for *R. fascicularis*; and our Canadian specimens in every particular agree with those I have received from Dr. Bigelow and Dr. Boott, from Boston. Schlechtendal appears to have seen quite another plant in Willdenow's Herbarium, under this name, which he has figured in his "Animadversiones," and our specimen of the following species so entirely agree with it, that I have ventured to consider them the same.

28. *R. Schlechtendalii*; patente-pilosus, caule subramoso brevi, foliis longe petiolatis cordato-reniformibus tripartitis, lobis obovatis trifidis laciniatis, sepalis pilosis patentibus demum reflexis corolla brevioribus, stylo germinibus subæque longo.—*R. fascicularis*. *Schlecht. Animadv. Sect. 2. p. 30. t. 2.*

Radix fasciculatum fibrosa. *Caulis* spithamei, 2, 3, vel 4 ex eadem radice, superne ramosi, parce foliosi, pilosi, pilis patentibus, versus basin etiam reflexi. *Folia* subhiruta, ciliata, omnia petiolata, mollia; *radialis* petiolis longissimis; *omnia* (nisi in summata caulis, ubi lanceolata trifida vel subintegra,) cordata vel reniformia, tripartita, segmentis obovatis, lateralibus bilobis, lobis bi-trifidis, intermedio trifido, laciniis acutis. *Flores* majusculi. *Sepala* membranaceæ, patentia, demum reflexa, petalis breviora. *Petala* obovata, lineata. *Fructus* non vidi, sed pistillorum *stylus* longiusculus, subcurvatus.

HAB. Eastern declivity of the Rocky Mountains, between lat. 52° and 55° , in rich soils: plentiful. *Drummond.*—This plant agrees in every particular, as far as I can judge without fruit, with the description and figure above quoted of Schlechtendal's *R. fascicularis*, except that his figure represents a slenderer plant, and one of the leaves has the middle lobe petiolated, and the calyx not reflexed. The rest of the foliage, the flowers, the patent hairs, the fasciculated root, and whole habit entirely correspond.—The species likewise approaches in habit luxuriant states of *R. Eschscholtzii*, but the leaves and stalks of *R. Schlechtendalii* are always hairy, and its calyx is never clothed with fulvous hairs.

29. *R. bulbosus*; foliis longe petiolatis ternatis quinato-pinnatis, foliolis tri-quinque-partitis, laciniis trifidis vel incisis, caule erecto basi bulboso, calyce reflexo, petalis obcordatis brevioribus.—*Linn. Sp. Pl. p. 778. Pursh, Fl. Am. v. 2. p. 398. Engl. Bot. t. 15. De Cand. Prodr. v. 1. p. 41.*

HAB. Canada. *Lady Dalhousie.* Newfoundland. *Mr. Morrison.*

30. *R. orthorhynchus*; appresso-pilosus, caule erecto gracili superne ramoso et subfolioso, foliis radicalibus petiolatis ternatis, foliolis linearis-multifidis apicibus albo-callosis, calyce reflexo, stylo carpellis longiore recto stricto. (TAB. IX.)

Radix fasciculatum fibrosa, fibris crassis, descendantibus. *Tota planta* pilis sparsis, arcte appressis, rigidis tecta. *Caulis* pedalis ad sesquipedalem, erectus, gracilis, superne dichotome ramous, ad divisiones ramorum foliaceus, ceteroquo nudus. *Folia* plerumque radicalia, sublonge petiolata, circumscriptione ovata, ternatipinnatifida, foliolis in laciniis plurimis, linearibus, acutis, apicibus callosis, pinnatifidis partitis: *Caulina* sessilia, laciniis magis angusta. *Pedunculi* graciles, elongati. *Calyx* sepala ovalibus reflexa, corolla duplo brevioribus. *Petala* ovalia, flava, minuscula. *Capitula* subrotunda, laxa. *Carpella* late semi-ovata, compressa, minute punctata, margiata, stylo vel rostro carpellis longiore, recto, stricto, sensim attenuata.

HAB. Not unfrequent on the low points of land near rivers, in North-West America. *Douglas.*—This most distinct and interesting species of *Ranunculus* is remarkable for the deeply cleft segments of its leaves, and their linear lobes, which rather resemble those of some species of *Anemone*, or of *Papaver nudicaule*, than any of the North American kinds of *Ranunculus*.

TAB. IX. *R. orthorhynchus*. Fig. 1, Capsule:—magnified.

8. CALTHA. Linn.

Cal. coloratus, 5-sepalus, sepalis suborbiculatis, petaloideis. *Petala* 0. *Stam.* plurima. *Ovaria* 5–10. *Capsule* 5–10, compressæ, patentes, 1-loculares, polyspermæ.—Herbæ perennes, *glaberrima*. DC.

1. *C. palustris*; caule erecto, foliis orbiculato-cordatis reniformibus crenatis, lobis obtusis, sepalis 5–6 ovalibus.—Linn.—Mich. Am. v. 1. p. 324. Pursh, Fl. Am. v. 2. p. 390. Bigel. Fl. Bost. ed. 2. p. 221. Rich. in Frankl. 1st Journ. ed. 2. p. 24.

HAB. Throughout Canada, in the plains; frequent. Labrador. Mr. Morrison. Columbia. Dr. Scouler.

2. *C. asarifolia*; caule suberecto unifloro, foliis cordato-reniformibus crenatis, sinu obtusis, sepalis 6–7 ovalibus.—De Cand. Syst. Veget. v. 1. p. 309, Prodr. v. 1. p. 45.

HAB. Unalaschka, and the Aleutian Isles. Herb. Banks.—Too near, I fear, to the *C. palustris*, which is avowedly a very variable plant.

3. *C. biflora*; caule unifolio bifloro, foliis radicalibus petiolatis reniformibus crenatis, sinu latissimo, sepalis oblongis.—De Cand. Syst. Veget. v. 1. p. 310, Prodr. v. 1. p. 45.

HAB. Banks' Isles, on the North-West coast of America. Menzies.—I have seen no specimens which exactly accord with this, but it seems to me too nearly allied to the following species.

4. *C. leptosepala*; caule erecto plerumque unifloro, foliis longe petiolatis cordatis crenatis, sepalis 8–10 oblongis. (TAB. X.)—De Cand. Syst. Veget. v. 1. p. 310, Prodr. v. 1. p. 45.

Radix fasciculata, e fibris numerosis, crassiusculis, longis, descendantibus. *Caules* palmates vel spithamei, erecti. *Folia* pauca, 4–5, plerumque omnia radicalis, cordato-rotundata, tenui-membranaceæ, sinu acutiusculo, margine, apice præcipue, obsolete crenata: *Caulina* nulla vel solitaria, radicalibus similia sed minoræ. *Petioles* 2–3 uncias longi, basi membranaceo-vaginata. *Flores* solitarii, vel sepissimum bini in singulo caule. *Sepala* 8–10, elliptico-oblonga, alba, extus subcerulea, siccitate sordide-lutea, reticulatim nervosa. *Stamina* numerosa, pistillis longiora. *Pistilla* 8–10, erecta: *Germen* oblongum: *Style* subnullo: *Stigmate* obtuso recurvo.

HAB. North-West coast of America. Menzies. Alpine swamps in the Rocky Mountains, between lat. 52° and 55°. Drummond.

TAB. X. Fig. 1, 2, *Caltha leptosepala*:—nat. size; fig. 3, Petal; fig. 4, Stamen; fig. 5, Pistils; fig. 6, Single pistil:—magnified.

5. *C. natans*; caule procumbente natante, foliis cordato-reniformibus crenatis, lobis subapproximatis postice obsolete crenatis antice dentatis, sepalis ovalibus, capsulis rostro recto. DC.—“Pall. It. ed. min. 3. p. 248.” Gmel. Fl. Sib. v. 4. p. 192. t. 82.

HAB. Creeping on the surface of deep sphagnum bogs, in the woody central districts from Canada to lat. 60°; rare. Dr. Richardson. Drummond.—Flowers of nearly a pure white, according to Dr. Richardson, and less than half the size of *C. palustris*. The specimens of this in the Herbarium are very imperfect, and I must confess that it appears to me an obscure species; indeed the greater number of species in this genus are but imperfectly characterized.

6. *C. arctica*; caule repente, foliis reniformibus crenato-repandis obtusis, folliculis (12–16) imbricatis, stigmate persistente adnato apice recurvo, antheris linearibus viginti pluribus.—Brown in Parry's 1st Voy. App. p. cclxv.

"Affinitate *C. radicanti* accedit; figura foliorum et caule repente convenit cum *C. natante*, quæ facile distinguenda pistillis stamna longitudine et numero superantibus, in capitulum sphaericum dense congestis, stigmatibus rectis simplicibus subsessilibus, antheris ovalibus, floribus albis foliisque aliquoties minoribus, et facie diversissima." *Br.*

HAB. Coast of the Arctic Sea, long. 107° to 150°. *Dr. Richardson. Captain Sir John Franklin and Captain Back. Melville Islands. Captain Sir Edward Parry.*

9. TROLLIUS. Linn.

Cal. coloratus, 5–10–15 sepalus, sepalis deciduis, petaloideis. *Pet.* 5–20, parva, basin versus perforata, 1-labiata. *Stamina* ovariaque plurima. *Capsula* plurimæ, sessiles, subcylindraceæ, polyspermeæ.

1. *T. americanus*; sepalis 5–10 patentibus obtusis, petalis 10–15 staminibus brevioribus. —"Muhl. Cat. 54." *De Cand. Prodr. v. 1. p. 46. Bot. Mag. t. 1988.*—*T. laxus. Salisb. in Tr. Linn. Soc. v. 8. p. 303. Pursh, Fl. Am. v. 2. p. 391. Bigel. Fl. Bost. p. 224.*

HAB. Alpine rivulets on the eastern declivity of the Rocky Mountains, between lat. 52° and 55°. *Drummond.*—This, as all the other species of *Trollius*, is glabrous, erect, and perennial, with both radical and caudine leaves petiolate and palmate, the segments multifid. The flowers are terminal. The sepals (petals of Linn.) so spreading, that the species ill deserves the generic appellation of *Globe Flower*; usually in the wild state about five in number; but in cultivation ten are sometimes observable. *De Candolle* describes them of a yellow colour, and the *Bot. Mag.* represents them of a pale sulphur, tinged with red externally. In the specimens found in the Rocky Mountains, *Drummoud* affirms the blossoms to be white. The petals (nectaries of Linn.) are shorter than the stamens, and from ten to fifteen in number, which character principally distinguishes this from the closely allied species *T. patulus*, in which the petals are from one to five. In *T. asiaticus*, the sepals are also somewhat patent, but the petals are much longer than the stamens.

10. COPTIS. Salisb.

Cal. 5–6-sepalus, sepalis coloratis, petaloideis, deciduis. *Pet.* parva, cucullata. *Stam.* 20–25. *Capsula* 6–10, longe stipitatae, substellatae, membranaceæ, ovato-oblongæ, stylo acuminateæ, 4–6 spermæ. *DC.*

1. *C. trifolia*; foliis 3-foliolatis, foliolis cuneato-rotundatis lobatis mucronato-crenatis, scapo unifloro.—*Salisb. in Tr. Linn. Soc. v. 8. p. 305. Pursh, Fl. Am. v. 2. p. 390. De Cand. Prodr. v. 1. p. 47. Rich. in Frankl. 1st Journ. ed. 2. p. 25.*—*Helleborus trifolius. Linn. Aman. v. 2. p. 355. t. 4. f. 18. Mich. Am. v. 1. p. 325.*

HAB. Canada, and thence to lat. 58°, in dry, sandy, and mossy places. Labrador. *Mr. Morrison.*—The roots afford an agreeable stomachic bitter infusion, and are used by the natives to dye yellow. *Richardson.*

2. *C. asplenifolia*; foliis bibernatis, foliolis pinnatifidis acutissime serratis, scapo bifloro, capsulis brevi-acuminatis. (*TAB. XI.*)—*Salisb. in Tr. of Linn. Soc. v. 8. p. 306. Pursh, Fl. Am. v. 2. p. 391. De Cand. Prodr. v. 1. p. 47.*—*Thalictrum japonicum. Thunb. in Tr. Linn. Soc. v. 2. p. 377. De Cand. Syst. Veget. v. 1. p. 187.*—*Didynamista salviae similis. Thunb. Fl. Jap. p. 364.*

Radix horizontalis, crassinscula, ramosa, ramis subfasciculatis, ubique radiculas fibrosas proferens, superne squamosa. Folia pauca, 3–6, radicalia, longe petiolata, glaberrima, nitida, bibernata; foliolis subunciam longis, subpinnatifido-incisis, acutissime serratis. Scapus foliis brevior, demum valde elongatus, erectus,

striatus, glaber, superne bifidus, biflorus. *Bractea* setacea, plerumque ad basi pedicellorum. *Flores* parvi, albidi. *Calycis sepala* 5, lineari-lanceolata, glabra, reflexa. *Petala* 5, longissima, angusta, filiformia, medium versus dilatata, et ibi concava, cucullata. *Stamina* subdecom. *Filamenta* breviuscula, flexuosa. *Antheræ* subglobosæ, compresse, connectivo lato, loculis subreniformibus oppositis. *Pistilla* 8-10, sessilia: *Germen* oblongum, curvatum, stylo attenuatum: *Stigma* lineare, recurvum, papillosum. *Capsulae* 6-10, longe stipitate, stipitibus subpubescentibus, oblongo-ovate, stylis basi brevi persistente acuminatae, membranaceæ, inflatae, supra plane, binerves, nervo centrali duplicit, nervis lateralis non ad apicem attingentibus, inferne gibbosæ, nervo medio longitudinali; superne ad apicem rima longitudinali dehiscentes, polysperma. *Semina* receptaculis suturalibus, parte superiore capsule inserta, pendentes, 8-10, oblonge, fuscæ.

HAB. North-West coast of America, *Menzies*, *Douglas*. Observatory Inlet, *Scouler*.—There can be no question of the correctness of Mr Salisbury in referring this curious plant to the genus *Coptis*. It has altogether the same habit, and its fruit is equally elevated upon long stalks. The shape of the fruit in both species is, indeed, not unlike that of *Buxbaumia aphylla*. In the present individual, however, there are, besides the superior sutural double nerve, and the lower dorsal one, two lateral nerves, not reaching to the point, and they constitute the margin of the upper or plane surface. The flowers are very different in the two; the calyx in *C. asplenoides* being much smaller than in *C. trifolia*, and always reflexed. The petals are exceedingly long and slender, very different in shape and texture from those of the other species.

TAB. XI. *Fig. 1*, Plant in flower; *Fig. 2*, Plant in fruit:—*nat. size*; *Fig. 3*, Single flower; *Fig. 4*, Anther; *Fig. 5*, Pistil; *figs. 6, 7*, Capsules; *fig. 8*, Section of a capsule:—*magnified*.

11. AQUILEGIA. Linn.

Cal. 5—*sepalus*, deciduus, colorato-petaloides. *Petala* 5, superne hiantia, bilabiata, labio exteriori magno plano, interiori minimo, deorsum producta in calcaria totidem cava, apice callosa inter *sepala* exserta. *Ovaria* 5. *Capsulae* totidem, erectæ, polyspermæ, stylis acuminatæ. DC.

1. *A. brevistyla*; subpubescens, calcaribus incurvis limbo brevioribus, stylis brevibus inclusis, staminibus corolla subbrevioribus.—*A. vulgaris?* Rich. in *Frankl. 1st Journ. ed. 2. App. p. 21.*

Caulis foliisque fere omnino ut in *A. vulgare*. *Flores* duplo minores, caerulei, plerumque pubescentes. *Calycis sepala* ovato-lanceolata. *Petalorum Calcar* apice solummodo incurvum, clavatum, limbo brevius. *Stamina* corolla subbreviora, exteriora basi membrana aucta, interiora omnino membranaceæ, lineari-oblonga, acuta, antheris destituta. *Pistilla* 5. *Germina* lineari-cylindracea, pubescentia, in stylis apice leniter recurvis sensim attenuata, staminibus brevioribus. *Capsulae* 5, unciam longæ, stylo brevi vix duas lineas longo terminatae.

HAB. Western parts of Canada, *Drummond*. As far north as Bear Lake, *Dr. Richardson*.—Well distinguished from *A. vulgaris*, which in its nearest affinity, by the smaller flowers and much shorter styles; and from the *A. carulea* of Dr. Torrey, in his account of Plants from the Rocky Mountains, by its shorter spurs to the corella, which are curved at the apex. It was detected by Dr. Richardson during the first Expedition, and doubtfully referred to *A. vulgaris*.

2. *A. canadensis*; glabra, calcaribus rectis limbo longioribus, staminibus exsertis, stylis setaceis longitudine staminum.—Linn.—*Pursh, Fl. Am. v. 2. p. 372. Bigel. Fl. Bost. ed. 2. p. 219. De Cand Prodr. v. 1. p. 50. Curt. Bot. Mag. t. 246. Elliott, Carol. v. 2. p. 20.*

g. hybrida; calcaribus apice incurvis, stylis brevioribus, floribus plerumque purpureis.

HAB. Throughout Canada, from Hudson's Bay to the Rocky Mountains. Abundant at the mouth of the Columbia, especially about Fort Vancouver. *Douglas*, *Scouler*. *g.* Among the Rocky Mountains, between lat. 52° and 55°. *Drummond*.—The stem, which is branched upwards, and the leaves, are quite glabrous,

th of the
between
glabrous,

glauces; the radical leaves biuncate, leaflets rotundato-crenate, three-lobed, the segments generally bifid and obtuse; those of the stem gradually becoming more simple upward, at length only trifid. Flowers externally of a bright red colour, more or less yellow at the extremities of the petals. The spur is liable to some variation in its relative length and thickness. As the *A. hybrida* of Sims (Bot. Mag. t. 1221,) is justly considered to be the offspring of *A. vulgaris* and *A. canadensis*, so is the present of *A. brevistyla* and *canadensis*; partaking, however, more of the nature of the latter in the general shape and large size of the flower and comparative length of the spur, and showing its affinity with the former in its pubescent leaves and stem, and in the colour of its inflorescence.

12. DELPHINIUM. Linn.

Cal. deciduus, petaloideus, irregularis, sepalō nempe superiore in calcar deorsum producto. *Petala* 4; 2 superiora basi in appendicibus intra calcar contentis producta. DC.

1. *D. exaltatum*; petiolis basi non dilatatis, foliis ultra medium 3-5-7 fidis, lobis cuneiformibus 3-fidis laciniativis acuminatis, racemo stricto, calcare recto longitudine calycis.—*Ait. Hort. Kew. ed. 1. v. 2. p. 244. Pursh, Fl. Am. v. 2. p. 371. De Cand. Prodr. v. 1. p. 54. Elliott, Carol. v. 2. p. 19.*—D. tridactylum. Mich. Am. v. 1. p. 314.—D. urceolatum. Jacq. Coll. v. 1. p. 153. Ic. Rar. v. 1. t. 101.—D. intermedium? *Ait. Hort. Kew. ed. 1. v. 2. p. 243.*—D. alpinum. Waldst. et Kit. v. 3. t. 246.

HAB. Rocky Mountains, between lat. 52° and 56°. Drummond.—I think the above synonyms may with safety be referred to this species. The plant varies sometimes with white flowers, according to Mr. Drummond.

2. *D. simplex*; petiolis basi dilatatis, foliis 3-partitis profunde laciniatis laciniis linearibus cauleque pubescentibus, racemo stricto subsimplici, petalis barbatis, calcare limbo longiore recto.—*Douglas, MSS.*

Caulis erectus, 3-pedalis et ultra, vix ramosus, pubescens, tripartito-multifida, lacinis linearibus acutis, foliorum superiorum angustioribus. *Petiolus* 2-3 uncias longus, basi dilatatus, membranaceus, siccitate sulcatus. *Racemus* longus, strictus, erectus, rachi pedicellisque velutino-pubescentibus. *Flores* intenses cerulei. *Sepala* extus dorso linea longitudinali pilosa. *Calcar* longum, rectum, subulatum, pubescens, sepala duplo longius.

HAB. On the subalpine range, west of the Rocky Mountains, near the Columbia; plentiful. *Douglas*.—Allied to *D. azureum*, Mich., but that has the leaves glabrous, the spikes shorter, and the flowers with a much smaller spur, which is curved upwards.

3. *D. Menziesii*; petiolis basi vix dilatatis, foliis 5-partitis, lobis trifidis linearibus integratis, bracteis 3-fidis, radice grumosa.—*De Cand. Syst. Veget. v. 1. p. 355, Prodr. v. 1. p. 54. Bot. Reg. t. 1192.*—D. tuberosum. Menz. MSS.

HAB. North-West coast of America, Menzies. Kotzebue's Sound. *Capt. Beechey's Collection*. Common under the shade of solitary pine trees, at Puget Sound, the Columbia River, and in California. *Douglas*.—M. De Candolle well observes how nearly this species approaches to *D. pentagynum*, a native of the South of Spain and North of Africa; scarcely differing but in its tuberous roots. To me also it appears to resemble too much the *D. tricornis*.

13. ACONITUM. Linn.

Cal. petaloideus, irregularis, deciduus vel marcescens, sepalō nempe superiore concavo, cassidaeformi. *Petala* 2 superiora (*cuculli, nectaria,*) longe unguiculata, apice in saccum expansa, sub galea recondita.—*Folia palmatisecta.* DC.

1. *A. Napellus*; floribus dense spicatis vel laxe paniculatis, galea semicirculari raro naviculari, sacco cucullorum subconico, calcare brevi crasso inclinato, alis staminum cuspidatis vel evanescentibus, foliorum lobis cuneatis pinnatisectis, ovaris 3 raro 5 glabris vel pilosis. DC.—Linn. Sp. Pl. p. 751. Seringe, Mus. Helv. 1. p. 162. t. 15. f. 41, 42, 50. De Cand. Prodr. v. 1. p. 62.

A. delphinifolium. *A. delphinifolium*, *a. americanum*. De Cand. Syst. Veget. v. 1. p. 980. Reichenb. Monogr. Acon. t. 0. f. 1, 2, 3. Ejusd. Illustr. t. 42.

HAB. Sledge Island, on the North-West coast of America. Nelson. Menzies. About Behring's Straits, as far north as lat. $66^{\circ} 13'$. Chamiso. Cape Mulgrave and Kotzebue's Sound. Capt. Beechey's Collection. Moist mountain prairies, in the Rocky Mountains, between lat. 52° and 56° . Drummond.—This is one of the innumerable varieties mentioned by M. Seringe in De Candolle's *Pradronus*, and which are figured by Reichenbach as so many distinct species. Our plant from the Rocky Mountains is certainly identical with that found by Nelson in Sledge Island, and is principally distinguished by the raceme of flowers being more lax and flaccid than in the common states of *A. Napellus*. *A. Chamissonianum* and *A. semigaleatum* of Reichenbach, do not seem to differ from this state of the plant, which in some points approaches closely to *A. biflorum* of Fischer, in which, however, the upper part or bag of the nectary or encelus is very different, being large, round, very obtuse, and without a spur.

2. *A. nasutum*; nectariis erectis, calcare arcuato, galea conica prona, rostro demisso, racemis subpaniculatis, foliorum lacinii latiusculis. Spreng.—Fischer, MSS. Reichenb. Illustr. Ac. t. 9, 10.—A. Cammarum. "Bieb. Fl. Taur. Cauc. v. 2. p. 15, v. 3. p. 373."—A. Fischeri. Reichenb. Illustr. Ac. t. 22.

HAB. Near the source of the Wallawalla River, a branch of the Columbia, which rises in the Blue Mountains of North-West America. Douglas.—The figures above referred to are very characteristic of Mr. Douglas's plant, especially the *A. Fischeri* of Reichenbach. This species is found in Kamtschatka, as well as in Siberia and the South of Europe.

14. ACTÆA. Linn.

Cal. deciduus, 4-sepalus. *Petala 4*. *Carpella polysperma*.

1. *A. cimicifuga*; ovarii 4 subsessilibus villosissimis, racemis paniculatis, foliis ternatim binternatim sectis, segmentis ovato-lanceolatis inciso-dentatis, carpellis siccis dehiscentibus. DC.—Linn. Amæn. v. 2. p. 354. De Cand. Prodr. v. 1. p. 64.—Cimicifuga foetida. Linn. Syst. Nat. ed. 12. p. 659. Pursh, Fl. Am. v. 2. p. 373. Gmel. Sib. v. 4. t. 70.

HAB. On the North-West coast of America. Pursh.—I have seen no American specimen of this plant, which is very common in Siberia, where its foetid smell has recommended it, as the name implies, for driving away bugs.

2. *A. palmata*; ovarii 12–15 in capitulum subrotundum collectis, racemis dichotome subpaniculatis, foliis palmatifidis, carpellis siccis dehiscentibus.—De Cand. Syst. Veget. v. 1. p. 383, Prodr. v. 1. p. 64.—Cimicifuga palmata. Mich. Am. v. 1. p. 316. Pursh, Fl. Am. v. 2. p. 373. Elliott, Carol. v. 2. p. 17. Bot. Mag. t. 1630.

HAB. North-West coast of America. Menzies in *Herb. nostr.*—Stem two or three feet high, with few and distant palmated and serrated leaves, upper ones sessile. Flowers almost corymbose. In habit and in its simple leaves, very different from the other species of the genus, and Nuttall doubts if it may not prove a distinct genus.

3. *A. racemosa*; monogyna, racemis compositis longissimis, carpellis siccis dehiscentibus, foliis binternatis foliolis inciso-serratis.—*Linn. Sp. Pl. p. 722. De Cand. Prodr. v. 1. p. 64.*—Cimicifuga racemosa. *Bart. Phil. v. 2. p. 12. Elliott, Carol. v. 2. p. 16.*—Cimicifuga serpentaria. *Pursh, Fl. Am. v. 2. p. 372.*

HAB. Canada. *Pursh*.—Remarkable for its tall, erect raceme of white flowers. Smell disagreeable. *Pursh* says it is commonly known by the name of *Black Snake-Root*.

4. *A. rubra*; monogyna, racemo simplici hemisphaerico, petalis staminibus brevioribus acutis, pedicellis fructus baccati indehiscentis gracilibus.—*Willd. Enum. p. 560. Bigel. Fl. Bost. ed. 2. p. 211.*—*A. brachypetala. De Cand. Prodr. v. 1. p. 65. (excl. var. 3.) Rich. in Frankl. 1st Journ. ed. 2. p. 21.*—*A. americana, s. baccis rubris. Pursh, Fl. Am. v. 2. p. 367.*—*A. spicata, s. rubra. Mich. Am. v. 1. p. 308.*

HAB. Canada; from Hudson's Bay to the Rocky Mountains, as far north as lat. 60°, in woods. *Dr. Todd. Dr. Richardson. Drummond*.—Distinguished by its roundish or almost hemispherical head of flowers, short petals, and slender pedicels. "Known by the name of *Red Co-hosh*, and considered by the natives as a valuable medicine." *Pursh*.

5. *A. alba*; monogyna, racemo simplici oblongo, petalis stamina æquantibus truncatis, pedicellis fructus baccati indehiscentis insigniter incrassatis.—*Bigel. Fl. Bost. ed. 2. p. 211.*—*A. brachypetala, 3. De Cand. Prodr. v. 1. p. 65.*—*A. americana, s. baccis niveis. Pursh, Fl. Am. v. 2. p. 366.*—*A. spicata, s. alba. Mich. Am. v. 1. p. 308.*—*A. pachypoda. Elliott, Carol. v. 2. p. 15.*

HAB. Canada. Mich. About Lake Huron. *Dr. Todd*.—Well distinguished as a species, first by Dr. Bigelow, then by Mr. Elliott, from *A. rubra*. The pedicels are remarkably thickened, as large as the peduncle. The berries milk-white, tipped with red, smaller than in the last species, about 8-seeded, on short red pedicels. Dr. Bigelow justly observes that the foliage of these two is exactly similar to that of our European *A. spicata*, with which Michaux confounded them. I possess beautiful specimens of both the American species gathered by Dr. Boott near Boston, U. S.

15. PÆONIA. Linn.

Cal. 5-sepalus, foliaceus, inæqualis. Pet. 5–10, suborbiculata. Stam. plurima. Discus carnosus, ovaria cingens. Carpella 2–5, grossa, stigmatibus bilamellatis crassis instructa, in folliculos capsulares conversa. Semina subglobosa, nitida.—Radices fasciculatæ; folia caulinis binternatim secta; flores ampli, albi aut purpurascentes. DC.

1. *P. Brownii*; herbacea, carpellis 5 glaberrimis erectis, foliis utrinque glabris binternatis, foliolis ternatim divisis pinnatifidis laciniatis, lacinias oblongis foliorum inferiorum præcipue obtusis.—*Douglas, MSS.*

Caulis erectus, ramosus, striatus, herbaceus. *Folia* alterna, sublonge petiolata, binternata: *inferiora*, foliolis, circumscriptione, late cuneatis vel flabelliformibus in petiolo gracili sublongo attenuatis, utrinque glaberrimis, trifidis tripartitiss, segmentis bi-trifidis laciniis ultinis oblongis, obtusis: *superiora* sensim minora, foliolis magis angustioribus pinnatifidis, segmentis magis minusve laciniatis, laciniis omnibus lanceolatis, acutis, minime attenuatis. *Calyx* valde inæqualis, sepals ovalibus, exteriore simillimo sed minore. *Corolla* (inexpansa) purpureo-rubra. *Carpella* 5, erecta, glaberrima, oblonga, vix apice recurva.

HAB. Near the confines of perpetual snow, on the subalpine range of "Mount Hood," North-West America. 1826. *Fl. June, July. D. Douglas.*

ORD. II. MENISPERMACEÆ. *Juss. DC.*1. MENISPERMUM. *Linn.*

Sepala et Petala ordine quaternario bi-seu triseritalia. ♂ *Stam.* 16-20. ♀ *Ovaria* 2-4. *Drupa* baccata, subrotundo-reniformes, 1-spermæ.—*Frutices scandentes. DC.*

1. *M. canadense*; foliis subpeltatis glabriusculis cordatis obtuse angulatis mucronatis, racemis compositis, petalis 8.—*Linn. Sp. Pl. p. 1468. Mich. Am. v. 2. p. 241. Pursh, Fl. Am. v. 2. p. 370. Elliott, Carol. v. 2. p. 715. Bot. Mag. t. 1910. De Cand. Prodr. v. 1. p. 102.*

HAB. Canada. Mich.—Variable in the angles of the leaves.

ORD. III. BERBERIDEÆ. *Vent. DC.*1. BERBERIS. *Linn.*

Sepala 6, squamis 3 extus stipata. *Petala* 6, intus biglandulosa. *Stam.* edentula (vel dentibus 2 instructa.) *Bacca* 2-3-sperma. *Scmina* 2, rarius 3 ad basin lateraliter inserta, erecta, oblonga, testa crustaceum, albumine carnosum, cotyledonibus foliaceis ellipticis, radicula longa, apice capitellata.—*Frutices foliis primariis abortivis et in spinam sepius mutatis, secundariis in axillis fasciculatis. Flores in omnibus flavi. DC.*

* *foliis simplicibus.*

1. *B. vulgaris*; spinis tripartitis, foliis simplicibus obovatis basi attenuatis ciliato-serratis, racemis multifloris pendulis, petalis integris.—*Linn. Sp. Pl. p. 472. Engl. Bot. t. 49. De Cand. HAB. Canada. Newfoundland. Mr. Morrison.—On comparing specimens from Boston, given to me by Dr. Boott, and others from Newfoundland, gathered by Mr. Morrison, with our European plant, I cannot find the slightest grounds for separating them, even into varieties. The same incorrect idea, too, prevails in the United States as in Europe, respecting the injurious effect of the *Barberry* upon the wheat which grows in its neighbourhood.

* * *foliis impari-pinnatis. (MAHONIA. Nutt. DC.)*

2. *B. pinnata*; foliis 3-6-jugis, jugo inferiore a petoli basi distante, foliolis ovato-lanceolatis subdistantibus spinuloso-dentatis uninerviis, racemis erectis, filamentis bidentatis.

a. foliolis sinuato-dentatis undulatis, dentibus paucis.—*B. pinnata. "Lagas. Elench. Hort. Madr. 1803. p. 6." Humb. et Kunth, Nov. Gen. v. 5. t. 484. Don in Bot. Reg. t. 702.—B. fascicularis. Bot. Mag. t. 2396.—Mahonia fascicularis. De Cand. Prodr. v. 1. p. 108. De Less. Ic. v. 2. t. 3.*

b. foliolis obscure dentatis planis subtus glaucis, dentibus numerosis.

HAB. a. Nootka. Nelson. b. Junction of the Portage River with the Columbia. Drummond.—This species is probably liable to much variation in its foliage. The plants figured in the Botanical Magazine and Register are considerably different in this respect, and that represented by Humboldt has the leaves with more numerous and shorter teeth than either, hence approaching nearer to my var. a, of which the foliage

ond.—This
gazine and
eaves with
the foliage

In a dry state, is of a pale but bright green above, glaucous beneath, and perfectly plane; the teeth frequently reduced to cilia. If I am correct in referring this to *B. pinnata*, (and there is but one specimen in fructification in the collection,) its berries are oval, deep blue. Called by Lewis' Company's people, *Mountain Holly*.

3. *B. Aquifolium*; foliis bi-trijugis, jugo inferiore a petioli basi distante, foliolis ovatis approximatis spinuloso-dentatis basi cordatis uninerviis, racemis erectis confertis, filamentis bidentatis.—*Pursh, Fl. Am. v. 1. p. 219. t. 4.*—*Mahonia Aquifolium. Nutt. Gen. v. 1. p. 212. De Cand. Prodr. v. 1. p. 108.*—*B. repens. Bot. Reg. t. 1176.*

HAB. On the Great Rapids of the Columbia River, among rocks in rich vegetable soil. *M. Lewis.* Common along the coast of the Pacific, from lat. 40° to 49°, and throughout the open woody parts of the Columbia, from its confluence with the sea to its source among the Mountains in lat. 52°, long. 118°. *Douglas. Menzies. Scouler.*—An elegant shrub, 3-6 feet high, and growing most luxuriantly in light sandy soil by the banks of rivers. Berry purple, globular, 2-5-seeded; one or two on the raceme generally abortive, and smaller than the others. Nearly allied to the last, but with broader, more cordate, more rigid, and more waved leaflets, much more crowded upon the rachis. Both have a single nerve, or mid-rib, with several lateral nerves proceeding diagonally from the sides, and these are united by reticulated veins.

4. *B. nervosa*; foliis elongatis 5-6 jugis, jugo inferiore a petiolo distante, foliolis ovato-acuminatis remotis spinoso-dentatis 3-5 nervis, racemis elongatis, filamentis 2 dentatis.—*Pursh, Fl. Am. v. 1. p. 219. t. 5.* (excl. fig. florum, quae ad *B. Aquifolium* pertinet.)—*Mahonia nervosa. Nutt.—De Cand. Prodr. v. 1. p. 109.*—*M. glumacea. De Cand. Prodr. v. 1. p. 109.*

HAB. First discovered by *Mr. Menzies*, at the mouth of the Columbia, Fort Vancouver. *Scouler.* Common in shady pine forests on the coast of the Pacific, having the same range, from north to south, as *B. Aquifolium*, but it is not found east of the woody country that skirts the coast. *D. Douglas.*—This is well distinguished from both the preceding species by the 3 or 5 nerves springing nearly parallel with each other from the base of the leaflet, which, moreover, altogether wants the close network-like veining of the others. The leaves, too, are much longer, as well as the racemes; and the flowers much larger. Berries deep blue. Bracts, at the base of the peduncles, several, large, convolute, pungent. I retain the name of *nervosa*, in preference to *glumacea*, because it is the oldest and most expressive appellation, notwithstanding that Pursh in his plate has figured the flowers of *B. Aquifolium* with the leaves of *nervosa*, thus leading De Candolle into the mistake of supposing that his *B. glumacea* was a species distinct from it. The genus *Mahonia* cannot be retained. The teeth of the filaments, which were supposed mainly to characterise it, I have shown to exist equally in *B. heterophylla*, (see *Exotic Flora*, t. 14.); and the glands are present on the petals. Even the simple-leaved species, as they are called, have the leaves jointed upon the footstalk, like the leaf of the Orange, and such a leaf, as is well known, is but a pinnated one, reduced to its most simple state.

2. LEONTICE. Linn.

Sepala 6, extus nuda. Petala 6, intus basi squamulam gerentia. Capsula vesicaria,
2-4 sperma. Semina in fundo capsule inserta, globosa.—Herbae radice tuberosa, foliis
varie sectis, calycibus sape coloratis. DC.

(Div. CAULOPHYLLUM. Mich.—*Caps. vix inflata, per maturitatem demum rupta. Se-*
mina ideo exserta, interdum baccata. Folium cardinum unicum, sub racemo situm,
petiolo ab ipsa basi 3-partito, ramulis tribus, segmenta 3-5 gerentibus. DC.)

1. *L. thalictroides*; folio canino solitario, petiolo e basi fere tripartito, segmentis obovatis apice grosse incisis acuminatis.—*Linn. Sp. Pl. p. 448. De Cand. Prodr. v. 1. p. 110.*

—*Caulophyllum thalictroides*, *Mich. Am.* v. 1. p. 205. t. 21. *Pursh, Fl. Am.* v. 1. p. 218. *Elliott, Carol.* v. 1. p. 411.

HAB. Throughout Canada.—Whole plant turns almost black in drying. *Berries* deep blue, globose, contracted below into a long stipitate base. These are called by the Indians, according to Pursh, *Co-ho-sh*: and the plant is esteemed medicinal.

3. ACHLYS.

Cal. nulla. *Cor.* nulla. *Flores* nudi, in spicam densam dispositi. *Stam.* plurima. *Antheræ* didymæ, globosæ, subuniloculares, bilabiatae. *Stigma* dilatatum, hinc concavum.

1. *A. triphylla*. (TAB. XII.)—*De Cand. Syst. Veget.* v. 2. p. 35, *Prodri. v. 1.* p. 112.—*Leontice triphylla*. *Smith in Rees' Cycl.*

Radix pereunis, obliquè descendens, subrepens. *Folia* duo, tria, vel plurima ex eadem radice; *omnia* radicalia, longissime petiolata, ternata; *foliola* magna, labelliformis, sessilia, valde inequalis, interibus integerrimis, margine superiore grosse sinuato-dentata, dentibus vel lobis obtusis, membranaceæ, viridia, radiato-nervosa, nervis ramosis, venisque minutis, sub lente visis, pulcherrime reticulatim connexis. *Petiolus* sesquipedalis, etiam bipedalis, glaber, nitidus, basi imbricationem squamosam, squamis late ovatis, obtusis, membranaceis, striatis, fuscis. *Scapus* folio longior, erectus, gracilis, nitidus, omnino aphyllus. *Spica* terminalis, cylindraceo-filiformis, erecta. *Flores* ad basin spicæ remotiores, reliqui deusissime approximatæ, omnino nudi. *Cal.* 0. *Cor.* 0: neque *bractea* neque *perianthium*. *Stamina* numerosa, hypogyna. *Filamenta* filiformia, flexuosa, pistillo longiora: *Antheræ* globosæ, didyme, loculis dorso distinctæ, facie superna connectivo nullo, subuniloculares, in labia 2, transversim, a basi sursum dehiscentes, flavae, labii bilobis. *Pistillum*: *Germen* ovatum, glabrum, uniloculare, 1-ovulatum, ovulo globoso, in fundo loculi affixo, erecto. *Stylus* nullus. *Stigma* incrassatum, hinc perforatum vel concavum.

HAB. North-West coast of America. *Mr. Menzies*. In shady pine woods, among moss; common near the shores of the Pacific, about the mouth of the Columbia. *Douglas, Scouler*. Fort Vancouver. (*Mr. Garry*)—What De Candolle took for petals, in examining this plant, in Sir James E. Smith's Herbarium, I presume must have been stamens, from which the anthers had fallen; for, after the strictest examination, both of young and more advanced flowers, I can find no trace of a floral covering. Sir James E. Smith showed much judgment in referring this plant to *Leontice*, from which it scarcely differs in the flowers, except in there being no floral covering. The structure of the anthers is the same in the two, and hence I have removed it from the *Podophylleæ* of De Cand. to the *Berberideæ*, whose stamens have their anthers opening by means of valves. *Jeffersonia*, too, placed by De Candolle in *Podophylleæ*, has equally the cells of the anthera valvular.

TAB. XII. *Fig. 1*, Single flower; *fig. 2*, Back view of a stamen; *fig. 3*, Front view of do.; *fig. 4*, Stamen, with the anther bursting; *fig. 5*, Pistil; *fig. 6*, The same, with the germin cut open to show the ovule: —magnified.

4. EPIMEDIUM. Linn.

tri-quinquloba, tenuia, membranacea, pallide viridia, margino nervisque sub lente pilosa, integerrima, sed subsinuoso-undata, nervosa, ad basin non raro tri-quinquenervia. *Scapus* solitarius, vel duo ex eadem radice, subpedalis, erectus, gracilis, simplex, omnino glaber, apice florifer. *Flores* in racemum laxum dispositi, pedicellis basi minute bracteatis, uni-binnealibus, recurvibus, simplicibus vel furcati, uno vel duo, raro tres ex eodem punto, apice incrassatis clavatis. *Calyx*: *Sepala* 8, exteriora parva, interiora sensim majora; omnia ovalia, concava, pallida, membranacea, tenuissima, ante florescentiam decidua. *Petala* 6, insigniter reflexa, oblongo-obovata, apice cucullata, alba, intus appendice spatulata valde concava, flava aucta. *Stamina* 6, recta, petulis oppositis: *Filanuenta* linearia, plana, extus minuta glandulosa: *Antheræ* longe mucronatae, loculis lateribus, valvulis dehiscentibus. *Pistillum*: *Germen* vel *ovarium* oblongum, glandulosum, glandulis rufis, *stylo* subreque longo attenuatum: *Stigma* capitatum, ad apicem perforatum, subobliquum. *Ovula* unilateralia, in duas lineas imbricatas parallelas approximatim oblique inserta.

HAB. North-West coast of America. *Mr. Menzies*. Common in shady pine woods at Fort Vancouver on the Columbia, Puget Sound, and North California. *Douglas. Scouler*.—This interesting plant has too long lain undescribed in our Herbaria, having been discovered by Mr. Menzies during the Voyage of Discovery of Captain Vancouver. It has again been gathered by Mr. Douglas and Dr. Scouler, and, as far as I know, by no other Botanists. Notwithstanding that the number of the parts of the flower differs from that of our European *Epimedium alpinum*, yet, in all that is essential as regards genus, there is the most perfect accordance. The appendages, or nectaries, to the petals, are much longer and less inflated. Probably some of the smaller *sepals* would be considered by De Candolle as bracteas, for he looks upon the two outer ones in *E. alpinum* as such, but they have all the same insertion, and gradually pass from the smaller into the larger size of the innermost ones.

TAB. XIII. Fig. 1, 1, Plant, nat. size; fig. 2, Bud; fig. 3, Flower; fig. 4, Stamen; fig. 5, Pistil; fig. 6, do.; fig. 7, The same, with the germen laid open to show the ovules; fig. 8, Ovule:—magnified.

, exists in

the stigma, which, besides being deeper cut in *N. Kalmiana* at the margins, has fewer rays, and these rays are green upon a brown ground. I have represented the pistil of both species in the plate of *N. pumila*, in *Flora Londinensis, New Series*.

3. *N. advena*; calyce 6-sepalo, petalis plurimis staminibus brevioribus, pericarpio sultato, foliis erectis cordatis.—*Ait. Hort. Kew. ed. 2. v. 3. p. 295. Pursh, Fl. Am. v. 2. p. 369. De Cand. Prodr. v. 1. p. 116. Bigel. Fl. Bost. ed. 2. p. 216. Elliott, Carol. v. 2. p. 8.*—*Nymphaea advena. Ait. Hort. Kew. ed. 1. v. 2. p. 226. Mich. Am. v. 1. p. 311.*

HAB. Throughout Canada, and as far north as English River, lat. 55° to 56°. *Dr. Richardson.* In lakes and still pools.—Dr. Graham and myself have long observed that the *N. advena*, as cultivated in our gardens, has the leaves sometimes floating, sometimes rising above the water. This circumstance depends probably on the vigour of the foliage. Professor Bigelow says, that in northern latitudes, where the roots can only exist in deep water, the leaves float; in southern, where they can live in shallow water, the leaves are always erect.

ORD. VI. SARRACENIÆ. *De la Pylae.*

CHAR. ORD. *Cal. 5-sepalus, persistens; sepalis basi concavis, extus involucro triphylo etiam persistente stipatus. Cor. pentapetala; petalis basi contractis, unguiculatis. Stamina numerosa, hypogyna, arcte posita, compacta. Filamenta breviuscula: Antheræa dorso affixa, oblongæ, biloculares, facie superiore e basi sursum vix ad apicem dehiscentes. Pistillum unicum, sessile: Germen magnum, globosum, longitudinaliter 5-sulcatum: Stylus columnaris: Stigma maximum, convexum, foliaceum, peltatum, 5-angulatum. Capsula globosa, stylo stigmatoque persistente coronata, quinqueloba, quinquelocularis, polysperma, quinquevalvis, valvis loculicidis. Receptacula 5, singulum in singulo loculo, ex axi centrali progrediens: semina numerosissima tecta. Semina parva, minute tuberculata. Albumen copiosum. Embryo ad basin seminis versus, cylindraceus. Radicula ad hilum spectans.*

Herba paludosa. Radix fibrosa. Folia omnia radicalia, tubulosa, ad apicem appendiculata, appendice subcassidiformi. Scapus uniflorus. Flos magnus, nutans, viridis, flavus, vel atropurpureus.

I. SARRACENIA. *Linn.*

Character eadem ac Ordinis.

1. *S. purpurea*; foliis ascendentibus sursum arcuatis, tubo inflato gibbo, ala latissima, appendice lato-cordata erecta.—*Linn. Sp. Pl. p. 728. Mich. Am. v. 1. p. 340. Pursh, Fl. Am. v. 2. p. 367. HAB. Swampy places about Quebec. *Mrs. Percival.* Lake Huron. *Dr. Todd.* Probably common throughout Canada, and as far north as Bear Lake. *Dr. Richardson.* Newfoundland. *Mr. Morrison.* *M. de la Pylae.* *Mr. Cornack.*—This curious plant is too well known, even in the gardens of this country, to need any specific description here. But no one, that I am aware of, has ventured upon referring the genus to its place in the Natural method, except M. de la Pylae, in the volume of the *Actes de la Soc. Linnaenne*, of Paris, above quoted. It had often been suggested that its nearest allies were the *Nymphaeaceæ* and the *Papaveraceæ*, in which opinion I quite accord; and hence I have placed the

order between the two, from both of which, however, it is separated by very striking marks of distinction. The structure of the whole flower is indeed most singular, but no part of it so much so as the great peltate foliaceous stigma. In the present species I have examined the seeds with much attention: they are ovate, pale reddish brown, minutely tuberculated, having a sharp keel on their under side, inserted by their narrowest point, upon a large club-shaped, or, rather, an oblong and stipitate *receptacle*, which stands out from the central column or axis, into the middle of each cell. The albumen is waxy, but granulated. At its base, near the hilum, and with its radicle pointing to the hilum, is a small entirely immersed *Embryo*, cylindroïdal, cleft at one extremity into two *cotyledones*, notwithstanding that De la Pylaie did not perceive them. The valves of the capsule open from above, between the cells, whose dissepimenta are attached to the centre of each valve and separate from the central axis or column.

ORD. VII. PAPAVERACEÆ. Juss.

1. PAPAVER. Linn.

Sepala 2, convexa, decidua. *Petala* 4. *Stam.* plurima. *Stylus* 0. *Stigmata* 4–20, radiantia, sessilia, super discum ovarium coronantem. *Capsula* obovata, 1-locularis, e carpellis 4–20 in thalami productione membranacea inclusis constans, sub stigmatum corona valvulis brevibus dehiscens. *Placentæ* intervalvulares, intus in dissepimenta incompleta productæ.—*Herbeæ perennes, succo albo fætae. Pedunculi ante florescentiam apice inflexi. DC.*

1. *P. nudicaule*; capsula hispida obovato-oblonga, sepalis setosis, scapis nudis, foliis pinnatifidis, segmentis oblongo-lanceolatis incisis acutis.—*Linn. Sp. Pl. p. 725. Pursh, Fl. Am. v. 2. p. 366. Sims in Bot. Mag. t. 1693. Hook. in Fl. Lond. N. S. t. 214.*

HAB. Barren grounds of North America, from lat. 64° to the Arctic Sea, in lat. 69°. Dr. Richardson. Everywhere upon the shores of that sea, throughout the whole breadth of N. America, and in the islands. Parry. Franklin. Back. Lay and Collie in Beechey's Collection. Labrador. Mr. Morrison. Upon the Rocky Mountains, at a great elevation, between lat. 52° and 55°. Drummond.

2. ESCHSCHOLTZIA. Chamiso.

Receptaculum dilatatum, hypocarteriforme, limbo expanso integro. *Cal.* mitreformis, deciduus. *Cor.* 4-petala, unguibus fauci receptaculi insertis, staminiferis. *Caps.* siliquiformis, bivalvis. *Semina* marginibus valvarum affixa.

1. *E. californica*.—*Cham. in Hore Phys. Berol. p. 74. t. 15. De Cand. Prodr. v. 3. p. 344. Lindl. in Bot. Reg. t. 1168. Hook. in Bot. Mag. t. 2887. Cham. et Schlecht. in Linnaea, v. 1. p. 554.*

HAB. North-West coast of America. *Menzies.* On the same coast, on the dry sandy banks of streams, in the plains of the River Multnomah, in N. lat. 43°, and southward to the Spanish Possessions.—This, which was, long after its discovery by Mr. Menzies, found by the Russian Expedition under Kotzebue, and described by the Naturalists of that voyage, is now become in a few short years, since the journey of Mr. Douglas in 1824–7, one of the most common and most beautiful ornaments to our gardens. Leaves very glaucous, triplinatifid, the segments linear. *Flowers* large, yellow, not much unlike those of *Glaucium luteum*, with a deep orange spot at the base of each petal. *Stigmas* 4, two longer than the other two. *Seeds* globose, almost black, wrinkled, attached to a rather long seed-stalk.

3. SANGUINARIA. Linn.

HAB. Throughout Canada.—Root a powerful emetic, yielding when bruised a bright orange-coloured fluid, whence called *Blood-wort*. Flower at first embosomed in the young convolute leaf, large, white, and appearing very early in the season. Long after the inflorescence, the reniform or cordate, lobed, and veiny leaves continue to grow.

ORD. VIII. FUMARIACEÆ. DC.

1. DIELYTRA. (DICLYTRA. DC.)

Petala 4, 2 exteriora basi squaliter calcarata, aut gibbosa. Siliqua bivalvis, polyperra.—Herbe perennes. Flores racemosi, albi aut purpurascentes. DC.

1. *D. cucullaria*; calcaribus 2 rectis divaricatis acutiusculis, scapo nudo, racemo simplici.—*De Cand. Prodr. v. 1. p. 125.—Fumaria cucullaria. Linn. Sp. Pl. p. 989. Mich. Am. v. 2. p. 51. Pursh, Fl. Am. v. 2. p. 462. Sims in Bot. Mag. t. 1127.—Corydalis cucullaria. Pers.—Bigel. Fl. Bost. ed. 2. p. 263.*

HAB. Throughout Canada; and common on the subalpine regions of the Blue Mountains, in open woody places, North-West America.—Professor De Candolle makes a variety of this plant with divaricated spurs; but in all my specimens the spurs are divaricated when the flowers are fully expanded. Aptly called in America *Dutchman's Breeches*.

2. *D. formosa*; calcaribus 2 brevibus subincurvis obtusis, scapo nudo, racemo subcomposito, stigmate biangulato.—*De Cand. Prodr. v. 1. p. 125. Elliott, Carol. v. 2. p. 177.—Fumaria formosa. Andr. Bot. Repos. t. 393. Sims in Bot. Mag. t. 1355.—Corydalis formosa. Pursh, Fl. Am. p. 462.*

HAB. Nootka Sound. *Mr. Menzies. Canada. Pursh.*

3. *D. eximia*; calcaribus 2 brevibus subincurvis obtusis, scapo nudo, racemo subcomposito, stigmate quadrangulato.—*De Cand. Prodr. v. 1. p. 126. Bot. Reg. t. 50.*

4. *D. foliorum* laciniis angustis linearibus.—*Corydalis canadensis. Goldie in Edin. Phil. Journ. 1822. p. 330. De Cand. Prodr. v. 1. p. 126.*

HAB. Nootka Sound, in Banks. Herb. (*See Ker in Bot. Reg.*) s. Canada. *Mr. Goldie*.—Closely allied as this species is to *D. formosa*, I believe the difference in the stigma will be found constant. *Corydalis canadensis*, which has the flowers white, I am now inclined to consider as a variety of this plant, with the segments of the leaves very narrow.

4. *D. tenuifolia*; calcaribus 2 brevissimis obtusis, scapo nudo uni-trifloro, pedicellis calyce brevioribus, foliis multifidis, lobulis linearibus.—*De Cand. Prodr. v. 1. p. 126. De Less. Ic. v. 2. t. 9. f. b.—Corydalis tenuifolia. Pursh, Fl. Am. v. 2. p. 402.*

HAB. On the North-West coast of America. *Pursh*.—A small plant, with proportionably very large flowers. May not Pursh be mistaken in considering this an American species? He describes it from Pallas' plant in the Lambertian Herbarium; and Pallas' plant, according to De Candolle and De Lessert, is from Kamtschatka.

5. *D. lachenaliaefolia*; calcaribus 2 brevissimis obtusissimis, scapo nudo 3-4 florō, pedicellis calyce longioribus, foliis multifidis, lobis linearibus acutissimis.—*De Cand. Prodr. v. 1. p. 126. Cham. et Schlecht. in Linnaea.*—*Fumaria peregrina.* “*Rudolph. in Mém. de l' Acad. de Petersb. v. 1. p. 379. t. 19.*”—*F. tenuifolia.* “*Ledebour, in Mém. de l' Acad. de Petersb. 5. 1815. p. 550. n. 37.*”—*F. cucullaria.* “*Pall. in Herb. Willd.*”

HAB. Islands off the extreme North-West coast of America, in Behring's Straits. *Pallas.* (*v. Linnaea, v. 1. p. 557.*)—I have seen no specimens of this plant, nor have I an opportunity of consulting the figure of Rudolphi, in the Transactions of the Academy of St. Petersburg. It appears to me that this and *D. tenuifolia* are perhaps too nearly allied to *D. formosa* or *D. eximia*.

2. ADLUMIA. Rafin.

Petala 4, in corollam monopetalam basi bigibbosam fungosam persistentem coalita. *Siliqua* bivalvis, polysperma.—*Herba glauca, et petiolis cirrhosis scandens. DC.*

1. *A. cirrhosa*.—*Rafin. in Desv. Journ. Bot. 1809. p. 169. De Cand. Prodr. v. 1. p. 126.*—*Corydalis fungosa. Vent. Choix, t. 19. Pursh, Fl. Am. v. 2. p. 463. Bigel. Fl. Bost. ed. 2. p. 263.*—*Fumaria fungosa. Willd.*—*F. recta. Mich. Am. v. 2. p. 51.*

HAB. On the borders of Canada. *Mich.* In beech woods. *Pursh.*

3. CORYDALIS. DC.

Petala 4, unicum basi calcaratum. *Capsula* bivalvis, compressa, polysperma.—*Herbae glabrae, saepe glaucae. DC.*

* *Radice tuberosa vel sublignosa, caule simplici, foliis caulinis paucis alternis.*

1. *C. Scouleri*; folio subsolitario racemo subsimplici longiore tri-quadrupinnato, foliolis oblique ovalibus oblongisve decurrentibus integris lobatisque, bracteis oblongis pedicello longioribus. (TAB. XIII.)—*C. peoniæfolia. De Cand. Prodr. v. 1. p. 128.?* *Gmel. Sib. v. 4. t. 33.?*

Radix crassa, sublignosa, tortuosa, collo squamosa. *Folia* perpansa, 1 vel pluria radicalia, 1 vel 2 caulinia. *Folium* caulinum inferius maximum, pedale, 3 et non raro 4-pinnatum, ubique glabrum, siccitate nigricans: *Pinnis primariis* in rachi communi gracili remotis, *secundariis* etiam distantibus, ultimi vel pionulis magis approximatis, oblique ovalibus, tenuibus, membranaceis, subtus glancis, obtusis, basi angustatis decurrentibus, integris, vel iterum magis minusve lobatis partitivis, lobis integerrimis. *Folium* radicale et caulinum superius magis simplicia, multoties minora. *Flores* pendentes, rosei, unciam ad sessiunciam longi, in racemum luxum terminaliem folio breviorem, dispositi. *Bractæ* parvae, oblonge, glabre, pedicello longiores. *Pedicellus* brevissimus, demum post anthesis insigniter decurvus. *Cal.* 2-sepalus, sepalis parvis, ovariis, appressis, membranaceis. *Corolla* longe attenuatum, petalis duplo longius, rectum, apice obtusum. *Petalum* superius acutum, apice recurvum, inferius versus basin subtus gibbosum, apice subtus acute carinatum. *Petala* lateralia ovalia, concava, unguiculata, dorso carinata, apice subapiculata, et ibi coherentia. *Stam.*: *Filamenta* 2, basi dilatata, apice anthers tres gerentia. *Germen* oblongum; *stylus* filiformis, germine brevir; *stigma* capitatum; capitulo apiculato. *Capsula* immatura deflexa. *Semina* lateralia, in duas series disposita.

HAB. In dark shady woods of North-West America; plentiful near the confluence of the Columbia with the sea. *Scouler. Douglas.*—This fine species of *Corydalis* has much affinity with *C. peoniæfolia*, *Gmel. Sib. t. 33*, (a native of Siberia, but, according to Chamisso, extending its range to the borders of America,) especially in its large woody root, in the general appearance of the flowers, and in the obliquely oval leaflets. But in that species the leaves are much less compound, their alternate divisions larger, the raceme is more compound, and, above all, the pedicels are greatly longer than in our plant, both in a state of flower and fruit.

TAB. XIII. *Fig. 1*, Flower; *fig. 2*, Inner and lateral petals; *fig. 3*, Stamens and pistil; *fig. 4*, Young fruit:—magnified.

2. *C. pauciflora*; caule simplici exsquamato, foliis caulinis 2–3 infra medium binternatim sectis, segmentis tripartitis, lobis obovatis, bracteis ovatis acutis, racemo conferto paucifloro.—*Pers. Syn. v. 2. p. 269. De Cand. Prodr. v. 1. p. 127. Cham. et Schlecht. in Linnaea, v. 1. p. 560. De Less. Ic. v. 2. t. 9. f. A.*—*Fumaria pauciflora. Steph. in Willd. Sp. Pl. v. 3. p. 861. F. altaica. "Lebed. in Mém. de l' Acad. de Petersb. v. 5. p. 551."*

HAB. Island of St. Lawrence, in Behring's Straits. *Chamiso.*

* * *Radice fibrosa, caule ramoso, foliis caulinis plurimis alternis. DC.*

3. *C. aurea*; caule diffuso, foliis bipinnatis glaucis, pinnulis pinnatifidis incisisque, segmentis oblongis acutis, bracteis linear-lanceolatis acuminatis subinciso-denticulatis pedicello longioribus, siliquis teretibus torulosis.—*Willd. Enum. p. 740. Pursh, Fl. Am. v. 2. p. 463. Elliott, Carol. v. 2. p. 178.*—*Fumaria aurea. Curt. in Bot. Mag. t. 66.*

HAB. Throughout Canada to lat. 64°, (*Dr. Richardson*;) in the woody country; extending as far as the Rocky Mountains. *Drummond.*

4. *C. glauca*; caule erecto, foliis bipinnatis glaucis, pinnulis subpinnatifidis, segmentis cuneatis incisis, bracteis oblongis acutis pedicello brevioribus, siliquis linearibus planis vix torulosis.—*Pursh, Fl. Am. v. 2. p. 403. De Cand. Prodr. v. 1. p. 128. Bigel. Fl. Bost. cd. 2. p. 262.*—*Fumaria glauca. Curt. in Bot. Mag. t. 179.*—*F. sempervirens. Linn. Sp. Pl. p. 984.*

HAB. Throughout Canada, as far as lat. 64°. *Dr. Richardson.*

4. FUMARIA. *Linn.*

Petalum unicum basi gibbum aut calcaratum. Caryopsis indehiscentia, 1-sperma, stylo post anthesin deciduo, mutica. DC.

1. *F. officinalis*; sepalis ovato-lanceolatis acutis acute dentatis capsulae globosae retusæ vel subcordatae vix longitudine, bracteis pedicello fructifero bis terve brevioribus.—*Arnott, MSS.*

β. diffusa vel scandens, foliorum segmentis latis glaucis. *Arnott.*—*F. media. De Cand. Prodr. v. 1. p. 130.*—*F. officinalis. ? Pursh, Fl. Am. v. 2. p. 463.*

HAB. β. Canada, near Quebec. *Mrs. Percival.* Newfoundland. *Mr. Morrison.*—This variety is often taken for the *F. capreolata*, from which I believe it is really distinct; and I quite agree with my friend Mr. Arnott in uniting it with *F. officinalis*, of which it seems a luxuriant variety.

ORD. IX. CRUCIFERÆ. *Juss.*

Subord. I. PLEURORHIZÆ (ο=). *Cotyledones plane, accumbentes. Radicula lateralis. Semina compressa. DC.*

TRIB. I. ARABIDÆ; seu Pleurorhizæ Siliquosæ. *Siliqua dehiscens, septo linearí seminibus plus minus latiore. Semina ovalia, compressa, sape marginata. Cotyledones plane, accumbentes, septo parallelae. DC.*

1. CHEIRANTHUS. *Br.*

Siliqua teres aut compressa. *Stigma* bilobum aut capitatum. *Cal.* basi bisaccatus. *Semina* 1-serialia, ovata, compressa (o=). *DC.*

* *Floribus flavis.*

1. *C. capitatus*; subasper, foliis linear-lanceolatis magis minusve dentatis vel integris basi longe attenuatis cauleque pube bipartita arctissime appressa strigosis, floribus (majusculis) dense corymbosis, "siliquis pedicello triplo longioribus."—*Douglas, MSS.*—*C. asper. Schlecht. et Cham. in Linnaea*, v. 1. p. 14.

Radiz, ut videtur, annua. *Cauda* basi ascendens et ramosus, demum erectus, pedalis et ultra, acute angulata, tenui subsecaber, pube bipartita suboaristata. *Folia* remotiuscula, 3-5-pollucaria, patentia, linear-lanceolata, magis minusve dentata vel integrerrima, basi in petiolam longe attenuata, pube bipartita, arctissime appressa, strigosa: *suprema* magis angusta, minus basi attenuata. *Flores* majusculi, in capitulum duas uncias latum dense racemosi, flavi. *Pedicelli* 5-6 lineas longi, appresse pilosi. *Calyx* etiam simili modo pilosus, sepali linearibus, 2 basi mucocati. *Petala* limbo ovato, unguis sepalis longiore. *Germen* lineare, rectum. *Stylos* crassiusculus, lineam longum. *Stigma* medioire, capitatum, bilobum, lobis rotundatis. *Siliques* nostris exemplaribus absunt: sed, *Chamissonis* fide, "15 circiter lin. longæ, lineam latæ, compressæ; plurimis ovalis abortu hand perfectis, paucæ modo aderant semina in quoque loculo; valvulae medio nervo exstus prominente a basi ad apicem sunt notatae. *Stylos* aliquam terminans, brevis, vix semilineares, crassus, stigmata capitato, indistincte bilobæ. *Semes* lineam longum, compressum; *cotyledones* accumbentes."

HAB. Common on rocky places of the Columbia, near the sea; and at Puget Sound. *Douglas*. *Chamisso* found it on the coast of California.—I regret that I do not possess the fruit of this plant; but there can be no question of the accuracy of *Chamisso* and *Schlechtendal*, who assure us that the cotyledons are *accumbent*. It must therefore be separated from *Erysimum*, with the species of which, and especially with *E. lanceolatum*, as is well observed, it bears a very close affinity. It is quite a different plant from the *Erysimum asperum*, De Cand., the *Cheiranthus asper* of Nuttall, and which is also supposed to be the *Erysimum lanceolatum* of Pursh; but I know not upon what authority. I am indebted for specimens to M. de *Chamisso*, which agree in every respect with those from Mr. *Douglas*: both are remarkable for the great attenuation of the base of the leaves. It has been found by no other of our North American travellers: but is now cultivated in the gardens of the Horticultural Society, from seeds sent by Mr. *Douglas* from the Columbia.

* * *Floribus purpureis.*

2. *C.?* *Pallasii*; foliis lanceolato-linearibus attenuatis repando-dentatis glabriusculis, caule simplici erecto tereti. *DC.*—*Pursh, Fl. Am. v. 2. p. 136. De Cand Prodr. v. 1. p. 196.*

HAB. On the North-West coast of America. *Pallas in Herb. Lambert. (ex Pursh.)*—"Flowers dark red, the size of *Cheiranthus Cheiri*." *Pursh*. "Flores fere *Matiola incana*. *Siliqua* teretiuscula, stigmata parvo subcapitato." *DC.*—This seems to agree in some particulars with *Cheiranthus pygmaeus*, *DC*, which has *incubent* cotyledons, and is therefore removed to the NOTORHIZEE.

2. NASTURTIUM. *Br.*

Siliqua teretiuscula, abbreviata aut declinata. *Stigma* subbilobum. *Calyx* basi æqualis, patens. *Semina* parva, irregulariter biserialia, immarginata (o=). *DC.*

HAB. In water; Canada. About Montreal. *Cleghorn. Goldie. Dr. Holmes. (ex Herb. Greville.)*—Remarkable for its long submerged stems, bearing leaves of which the lower ones are as finely divided as those of *Ranunculus aquatilis*: the middle leaves are often pinnatifid, with narrow and more or less divided, or deeply serrated segments: the entirely emerged leaves are lanceolate, undivided, serrated. *Pouches* rather obovate than ellipsoid, with a slender style equal to them in length. *Flowers* very pale yellow, almost white. This has been cultivated in the Aquarium of the Edinburgh Botanic Garden by Dr. Graham.

3. BARBAREA. Br.

Siliqua tetragono-anceps, valvis apice muticis, concavo-carinatis. *Calyx* basi æqualis. DC.

1. *B. vulgaris*; foliis inferioribus lyratis, lobo terminali subrotundo, superioribus ob-ovatis dentatis pinnatifidis, siliqua tetragona linearis stylo acuminata.—*Br. in Hort. Kew. ed. 2. v. 4. p. 109. De Cand. Prodr. v. 1. p. 140. Cham. et Schlecht. in Linnaea, v. 1. p. 16.*—*Erysimum Barbarea. Linn. Sp. Pl. p. 922. Engl. Bot. t. 443.*

HAB. Island of Unalashka. *Chamiso.* Mouth of the Columbia. *Douglas. Scouler.*—The upper leaves are liable to vary; and the best character between this and the following species is to be found in the pods, which here are scarcely more than inch long, tetragonal, tapering into a slender style about two inches long.

2. *B. præcox*; foliis inferioribus lyratis, lobo terminali obovato, superioribus pinnati-fidis, lobis linearis-oblungis, siliqua linearis-elongata compressa ancipiti, stylo perbrevi in-crassato.—*Br. in Hort. Kew. ed. 2. v. 4. p. 109. De Cand. Prodr. v. 1. p. 140. Rich. in*

Frankl. 1st Journ. ed. 2. App. p. 25. *Cham. et Schlecht.* in *Linnaea*, v. 1. p. 15.—*Erysimum præcox*. *Engl. Bot.* t. 1129.

HAB. Banks of rivers; abundant from Cauada to lat. 68°. *Drummond*. *Dr. Richardson*.—Pods 2-3 inches long, linear, compressed, with a dorsal nerve to the valve. *Stigma* short, nearly as broad as the valve.

4. TURRITIS. *Linn.*

Siliqua linearis; valvis planis. *Semina in quoque loculo biseritalia*.—*Flores albidi vel purpureo-rosei*.

1. *T. glabra*; erecta, foliis radicalibus petiolatis dentatis pilis ramosis pubescentibus, superioribus lato-lanceolatis sagittatis glabris semiamplexicaulibus glaucis, siliquis anguste linearibus erectis strictis, petalis vix calyce longioribus.—*Linn. Sp. Pl.* p. 930. *Engl. Bot.* t. 777. *De Cand. Prodr.* v. 1. p. 142. *Rich. in Frankl.* 1st Journ. ed. 2. App. p. 26.

HAB. Hudson's Bay to the Rocky Mountains, and as far north as lat. 64°. *Dr. Richardson*. *Drummond*.—Two or three feet high, often much branched. Leaves 4-6 inches long, broadly lanceolate, with two blunt points at the base pointing downwards; hence they are sagittate, entirely glabrous, and mostly quite entire. Flowers small, pale sulphur-colour. Pods 4 inches long, very slender. Style short, stigma two-lobed, seeds in two series.

2. *T. mollis*; erecta, foliis inferioribus spathulatis sinuato-dentatis, superioribus lanceo-lato-sagittatis integrerimis, omnibus caule erector ramoso pedicellisque pilis numerosis patentibus molliter hirsutis, siliquis lineari-clongatis erectis strictis.

Radix annua, subfusciformis, ramosa. *Caulis* erector, superne ramulos plurimos proferens, molliter hirsutus. *Folia radicalia* patentia, spathulata, petiolata, obtusa, grosse sinuato-dentata: *caulina* lanceolato-sagittata, basi semiamplexicaulia, obtusa, integrerima, pubescenti-hirsuta, pilis ramosis stellatisque. *Flores* albi, dense capitato-corymbosi. *Pedicelli* fructus longiusculi, pilosi, pilis patentibus. *Calyx* etiam pilosus. *Petala* cuneata, calyce subduplo longiora. *Siliqua*, vix mature, angusto lineares, unciam et ultra longe, recte vel leviter curvatae. *Style* per breve, angustatus. *Stigma* minutum, obscure fuligineum. *Semina* biseritalia.

HAB. Shores of the Arctic Sea, between long. 107° and 130°. *Dr. Richardson*.—A foot and more high; stem stout. Habit of some states of *Arabis hirsuta*, but the seeds are unquestionably in two rows, and the whole plant is clothed with soft hairs, rather short on the leaves, much longer on the petioles, stem, branches, and pedicels. This plant exists only in Dr. Richardson's collection from the shores of the Arctic Sea. It is perhaps allied to *T. hispidula* of D.C. (*Arabis andicola* of Humb. et Kunth): but that plant has the leaves rough with flocculose down, and is an inhabitant of the Andes of Quito.

3. *T. stricta*; erecta, glabra, foliis lanceolatis, radicalibus petiolatis dentatis, caulinis sagittatis semi-amplexicaulibus subdentatis, floribus siliquaque linearibus elongatis erectis strictis.—*Graham in Edin. New Phil. Journ. July*, 1829. p. 7.

Habitus precedens, sed gracilior. *Radix* annua. *Caulis* 1-pubes ex eadem radice, erecta, glabre. *Folia* omnia (ut et tota planta) glaberrima, nisi quandoque in parte inferiore foliorum radicalium et petiolis, ubi obscure pilosa et ciliata. *Flores* albi. *Petala* obovata, emarginata, calyce duplo longiora. *Siliqua* 2-3 uncias longa, sublati-linearis, stylo brevi, valvis multo angustiore. *Stigma* vix incrassatum, minutum, obscure fuligineum.

HAB. Prairies of the Rocky Mountains, between lat. 52° and 56°. *Drummond*. About Fort Vancouver on the Columbia. *Douglas*.—Flowers pure white, erect as well as the fruit.

4. *T. patula*; erecta, foliis lanceolatis, radicalibus petiolatis dentatis, caulinis sagittatis

sagittatis

semi-amplexicaulibus glabris subdentatis, floribus siliquisque linearibus elongatis patentissimis.—*Graham in Edin. New Phil. Journ. July, 1829. p. 7.* (not *Ehrh. nor Willd.*)

a. foliis radicalibus parce pubescentibus.

b. foliis radicalibus pubescenti-incipientibus.

Facies *T. stricta*; differt insigniter, etiam in cultu, floribus siliquisque patentissimis. *Flores* majusculi, pulcherrime purpureo-rosei.

HAB. a. From Canada to lat. 68°, and from Hudson's Bay to the Rocky Mountains. *Dr. Richardson. Drummond*; and even to Fort Vancouver on the Columbia. *Douglas. Scouler.* b. Highest summits of the Rocky Mountains. *Drummond*.—Pods long, curved. Professor Hornemann has sent me the var. b. from Greenland.

5. *T. retrofracta*; erecta, incano-pubescent vel glaber, foliis lanceolatis, radicalibus petiolatis dentatis, caulinis sagittatis semi-amplexicaulibus glabris subdentatis, floribus cernuis, siliquis linearibus elongatis pedicellisque retrofractis.—*Arabis retrofracta. Graham in Edin. New Phil. Journ. July, 1829. p. 1.*

HAB. Hudson's Bay to the Rocky Mountains; and from Canada to lat. 68°; at the Mackenzie River. *Dr. Richardson. Drummond*.—This is at once distinguishable from the two preceding species, which are its near allies, by the deflexed flowers, (which are mostly pure white, or with a faint purplish tinge,) and by the retrofracted pedicels and pods. The seeds are in two rows, or series, in a young state, and are then quite pendent; afterwards, by their enlargement, they lie more horizontally in the cell, and form but one series, as Dr. Graham remarks: but it would be better to abolish one of the two genera, than, by putting this into *Arabis*, to separate it from *T. stricta* and *T. patula*, with which it is so closely and so naturally allied.

6. *T. diffusa*; glaberrima, glauca, caulis ramosis diffusis, foliis radicalibus spathulatis subintegris, caulinis sagittatis vix dentatis, siliquis linearibus patentibus pedicello duplo longioribus.

Radicis parva, subfusiformis, ut videtur, annua. *Caules* plurimi ex eadem radice, diffusi, glabri, ramosi, subspithamei. *Folia radicata* plurima, in rosulam expansa, parva, spathulata, subintegerrima, petiolo longiusculo: *caulina* majora, subunciam longa, oblonga vel lanceolata, basi dilatata, sagittata, apice obtusa, margine integerrima, vel, hic illic, dente instructa, glaberrima, glauco-viridaria. *Flores* parvi. *Calyx* glaber, sepals ovalibus, equalibus, pedicello glaberrimo triplo brevioribus. *Petala* calyx dimidio longiora, alba, obovata, unguiculata. *Siliqua* vix unciam longa, patentes, lineares, obtuse, stigmate parvo subsessili terminate, nondum mature *semina seu ovula* in duas linearis disposita, exhibentes.

HAB. Shores of the Arctic Sea. *Dr. Richardson*.—This may probably prove an *Arabis*; but in the scarcely mature seed-vessels two rows of ovules are evident, which, however, may, as in *T. retrofracta*, when ripe, arrange themselves in one series. But whether an *Arabis* or a *Turritis*, I know of no species with which it can be confounded. It is probably scarce, as few specimens exist in the collection, and those only in Dr. Richardson's portion of it.

5. ARABIS. Linn.

Siliqua linearis; valvis planis medio uninerviis. *Semina* in quoque loculo 1-serialia, ovalia aut orbicularia, compressa. *Cotyledones* planæ. (o=.) *Flores* albi, aut rarius rosei. *DC.*

* *Semina immarginata, seu parva ala membranacea cincta. DC.*

1. *A. alpina*; subdiffusa, ramosa, foliis pluri-dentatis pube ramosa villosis lanceolatis acutis, radicalibus subpetiolatis, caulinis cordato-amplexicaulibus, pedicellis calyce

glabriusculo longioribus.—*Linn. Sp. Pl. p. 928. Curt. in Bot. Mag. t. 226. Pursh, Fl. Am. v. 2. p. 427. De Cand. Prodr. v. 1. p. 142.*

HAB. In Labrador. Colmaster. Mr. Morrison.—This plant, so abundant on the southern European Alps, I believe grows no where else in America than in the above-mentioned habitat. I have specimens from Greenland, given me by Professor Hornemann.

2. *A. hirsuta*; erecta, foliis dentatis (fere omnibus) pube ramosa hirsutis, radicalibus ovato-oblongis petiolatis, caulinis ovalibus lanceolato-sagittatis, siliquis numerosis erectis strictis.—*Scop. Carn. ed. 2. n. 835. De Cand. Prodr. v. 1. p. 144. Cham. et Schlecht. in Linnaea, v. 1. p. 15. Turritis hirsuta. Linn. Sp. Pl. p. 930. Engl. Bot. t. 587.—T. ovata. Pursh, Fl. Am. v. 2. p. 438.—T. sagittata. Rich. in Frankl. 1st Journ. ed. 2. App. p. 26. De Cand. Prodr. v. 1. p. 143. ? especially var. γ . ovata.*

HAB. Island of Unalaschka. Chamiso. From Hudson's Bay to the Rocky Mountains, and at the Columbia River, on the North-West coast; and from Canada to lat. 65°. Dr. Richardson. Drummond. Douglas. Scouler.—This plant varies much in its stem-leaves, which are more or less oval and oblong, elliptical or lanceolate, or sagittate, pubescent or quite glabrous. It is remarkable for its numerous, erect, shining, very strict pods. I do not see how *A. sagittata* is to be distinguished from it. My European specimens, under that name, quite agree with the British, and with my American *A. hirsuta*.

3. *A. stricta*; foliis radicalibus oblongis basi attenuatis sublyrato-pinnatifidis pilis ramosis hispidis, caulinis paucis lanceolatis basi subattenuatis, petalis oblongis erectis obtusis calyce glabro duplo longioribus, siliquis elongatis erectis.—*Huds. Angl. p. 292. Engl. Bot. t. 614. Pursh, Fl. Am. v. 2. p. 437. De Cand. Prodr. v. 1. p. 144.*

HAB. Labrador. Colmaster; in Herb. Dicks. (Pursh.)—I have never seen American specimens of this.

4. *A. petraea*; caulibus erectiusculis vel diffusis glabris, foliis radicalibus sublonge petiolatis integris dentatis vel lyrato-pinnatifidis, caulinis lanceolatis subpetiolatis integris dentatis, petalis obovatis unguiculatis, siliquis erecto-patentibus.—*Lam. Dict. v. 1. p. 221. De Cand. Prodr. v. 1. p. 145. Cham. et Schlecht. in Linnaea, v. 1. p. 15.—Arabis lyrata. Linn. Sp. Pl. p. 929. Pursh, Fl. Am. v. 2. p. 437. De Cand. Prodr. v. 1. p. 146. Rich. in Frankl. 1st Journ. ed. 2. App. p. 26.—Cardamine hastulata. Engl. Bot. t. 469.—C. petrea. Lightf. Scot. p. 347. t. 15. Linn. Sp. Pl. p. 919.*

HAB. Throughout Canada, extending westward to the Rocky Mountains, between lat. 55° and 60°, and to the islands of the Polar Sea. Goldie. Dr. Richardson. Drummond. Parry, &c. Unalaschka. Chamiso.—Authentic specimens of *Arabis lyrata*, from Dr. Schweinitz and Professor Torrey, and from Dr. Richardson, I have compared with our European *A. petraea*, and find them to be in all respects the same. The plant is doubtless liable to much variation, being sometimes, indeed generally, quite glabrous; at other times the root-leaves and base of the stem are hispid with branching hairs. The pods are mostly nearly erect, but sometimes almost patent; generally scarcely an inch long, at other times full two inches long; mostly with an inconspicuous style, at other times with a very apparent one. Flowers white or lilac. It comes exceedingly near to some states of *A. arenosa*; and I fear cannot specifically be distinguished from it.

5. *A. ambigua*; foliis subglabris, radicalibus sinuato-lyratis, mediis oblongo-ovalibus dentatis, summis oblongo-linearibus integris, caule subsimplici, siliquis erectiusculis.—*De Cand. Prodr. v. 1. p. 146.*

6. foliis glabris, caule basi hispido. DC.—*Cham. et Schlecht. in Linnaea, v. 1. p. 16.*

7. *A. canadensis*; erecta, glabra, foliis lanceolatis remote dentato-serratis sessilibus, siliquis linearibus falcatis pendulis, seminibus lato-alatis.—*Linn. Sp. Pl. p. 920. De Cand. Prodr. v. 1. p. 147. Elliott, Carol. v. 2. p. 148.*—*A. falcata. Mich. Am. v. 2. p. 31. Pursh, Fl. Am. v. 2. p. 437.*

HAB. Canada. *Michaux.*—In size, in habit, and in the general form of its pods, resembling our European *Arabis Turrita*, 1-2 feet high. *Seeds* with a broad wing. This differs from *A. pendula* of Linn. and De Candolle in wanting the auricles at the base of the leaves, and in the smooth not hispid stem.

6. MACROPODIUM. Br.

Siliqua linearis, pedicellata, valvis planis medio uninerviis. *Semina orbiculata*, compreso-plana, ala brevissima cincta. (o=.) DC.

1. *M. laciniata*; foliis omnibus petiolatis laciniato-pinnatifidis, floribus pedicellatis, petalis augustis linearibus.—*Hook. in Bot. Misc. v. 1. p. 341. t. 68.*

Annu. *Caulis* herbaceus, erectus, ramosus, glaber, 2-3-pedalis et ultra. *Rami* alterni, erecto-patentes. *Folia radicalia*, sequi ac *caudina*, *digitalia*, oblongo-lanceolata, acuta, glabra, basi in petiolum longum gracilem decurrentia, sinuato-dentata pinnatifidaque, laciniis patentibus, linearibus, integrerrimis vel subdentatis: *summa* subintegra. *Racemos* terminalis, elongatus, erectus, strictus, dense multiflorus. *Pedicelli* horizontales, 2 lineas longi, glabri. *Calyx*: *sepala* 4, oblonga, basi lata, erecta, membranaceae, pallida. *Petala* 4, calyce triplo longiora, patentia, linearia, alba. *Stamina* 6, 2 parum breviora, calyce duplo longiora. *Filamenta* edentula. *Anthera* dorso prope basin affixa, lineares, siccitate recurrens, plumbeae. *Glandulae* ad basin staminum 4, majuscule. *Germen* gracile, lineare, brevi-pedicellatum. *Stylus* brevis, stigmate parvo capitato terminatum.

HAB. Common on dry rocks about Wallawallah, and at Priest's Rapid on the Columbia. *Douglas.*—No ripe fruit of this fine plant exists in the collection; but its whole habit, its inflorescence, its calyx, petals, anthers, and, above all, the pedicellated germin, indicate this to be a second species of the genus *Macropodium*, of which only one was known before, the *Cardamine nivalis* of Pallas, on which Mr. Brown founded the genus. Excellent specimens of the latter I possess, through the kindness of Dr. Fischer and Professor Ledebour, from the Altai. It differs from the American plant in its perennial root, its shorter simple stems, not exceeding a foot in height, its sessile flowers, shorter and more obovate petals, and shorter anthers, and in the much thicker and shorter germin, with a longer pedicel, and a less divided stigma. This pedicellated germin gives the plant very much the appearance of a *Cleome*, whence it was marked, according to De Candolle, *Cleome nivalis* in Vahl's Herbarium.

7. CARDAMINE. Linn.

Siliqua linearis, valvis planis enerviis saepe elastice dissilientibus. *Semina* ovata, immarginata, funiculi umbilicales tenues. DC.

* foliis omnibus indivisis.

1. *C. rotundifolia*; pubescenti-hirsuta demum glabra, caule erecto flexuoso, foliis subcarnosis angulato-dentatis, radicalibus longe petiolatis rotundato-cordatis, sinu angusto, caulinis ovatis, inferioribus petiolatis superioribus sessilibus, radice fibroso-tuberosa.—*Mich. Fl. Am.* v. 2. p. 30. *Pursh. Fl. Am.* v. 2. p. 439. *De Cand. Prodr.* v. 1. p. 149.—*Arabis rhomboidea*. *Pers. Syn. Pl.* v. 2. p. 204.—*Cardamine rhomboidea*. *De Cand. Prodr.* v. 1. p. 149.—*Arabis tuberosa*. *Pers. Syn. Pl.* v. 2. p. 204. (*fide De Cand.*)

HAB. Rocky Mountains, between lat. 52° and 57° , and thence to Hudson's Bay, in the same latitude. *Drummond*.—My valued friend Dr. Booth has ascertained that the *Arabis rhomboidea* of Pers. is the same as the *Cardamine rotundifolia* of Mich.; a much more appropriate name. Our plant differs somewhat from the United States specimens, in having fewer leaves on the lower part of the stem, in the upper leaves being somewhat broader, and in the pubescence of the foliage, and especially of the stems; but these characters depend perhaps upon age and situation. The flowers, too, are large, the petals rose-coloured. The shape of these petals in both is nearly cuneate.

2. *C. bellidifolia*; foliis glabris erectiusculis crassiusculis, radicalibus petiolatis ovatis integris, caulinis paucis integris aut subtrilobis, siliquis erectis, stigmate subsessili.—*Linn. Sp. Pl.* p. 913. *De Cand. Prodr.* v. 1. p. 150. *Engl. Bot. t. 2355. Rich. in Frankl. 1st Journ. ed. 2. App. p. 26. Cham. et Schlecht. in Linnaea*, v. 1. p. 19.

HAB. Summits of the Rocky Mountains, lat. 52° . *Drummond*. Throughout Arctic America, sparingly. *Dr. Richardson. Captain Sir John Franklin. Captain Back. Captain Sir E. Parry*. Islands of Una-lachka and St. Lawrence. *Chamisso*.—Varying much in the length of the peduncles, sometimes shorter than the leaves, sometimes twice as long. Very nearly allied to this, if not the same, is *C. lenensis*, Andr. sent me by Professor Ledebour.

* * foliis ternatis pinnatis.

3. *C. purpurea*; glabriuscula, foliis radicalibus caulinique trifoliolatis quinatisve foliolis lateralibus ovali-rotundatis acutis, terminali cordato-rotundato 3-dentato, bractea ad basin pedicello inferiori cuneato tridentato sessili, petalis (late purpureis) reticulatum venosis.—*Cham. et Schlecht. in Linnaea*, v. 1. p. 20.

Radix repens, gracilis, fibrosa. Folia, (ut et caulis erectus, digitalis,) hic illic parco pilosa, radicalia plurima, caulinum unicum, omnia sublonge petiolata, trifoliolata vel rarius quinata; foliolis lateralibus oppositis vel alternis, subdecurrentibus, ovali-rotundatis, acutis, terminali cordato-rotundato, tridentato, vel subtrilobo, dentibus acutis. Flores in racemo laxo, subdecem. Petioli 5-6 linea longi, patentes, glaberrimi, inferiora bractea foliacea, sessili, cuneata, tridentata instructa. Calyx glaber, sepals erecto-patentibus oblongis, glaberrimis. Petala late obovata, unguiculata, intense purpureo-rosea, pulcherrime (sub lente) reticulatum venosa, sepalis duplo triplo longiora.

HAB. Islands of St. Lawrence. *Chamisso*. Cape Lisburne, at the northern entrance of Kotzebue's Sound. *Lay and Collie in Captain Beechey's Collection*.—Only one specimen of this very beautiful *Cardamine* exists in our collection. It is distinguished at once by the 3 (5 in Chamisso's plant) roundish leaflets of each leaf, and the deep purple-coloured and reticulated petals, in which latter particulars I know of no species that comes near it.

4. *C. angulata*; foliis omnibus petiolatis ternatis rarius quinato-pinnatis, radicalium subrotundis, caulinorum ovatis lanceolatis angulato vel inciso-lobatis glabris.—*Hook. in Bot. Misc.* v. 1. p. 343. t. 69.

Radix longe repens, fibrosa, perennis. Caulis erectus, simplex, pedalis ad sesquipedalem, herbaceus, glaber,

so, foliis sub-sinu angusto,
o-tuberosa.—
1. p. 149.—

Flores majusculi, in corymbis terminalibus axillaribusque dispositi. Pedicelli graciles, 2-4 lineas longi, glabri. Petala obovata, unguiculata, sepalis plusquam duplo longiora, pallide rosea.*

HAB. Banks of the Columbia. *Scouler. Douglas.*—Somewhat allied, especially in habit, to *C. iacophylla*, (*Gmel. Sib.* v. 3. t. 62,) which differs in having smaller leaflets, from 5-7 on each leaf, and which are distinctly, and with considerable regularity, serrated; whereas, in our *C. angulata*, there are few and distant angular teeth and segments. I have seen it only in Mr. Douglas and Dr. Scouler's collections, who observe that it is not uncommon about Fort Vancouver, on the Columbia.

5. *C. pratensis*; foliis pinnatis, foliolis radicalium plerumque subrotundis, caulinorum linearibus lanceolatis integris, stylo brevissimo vix siliqua tenuiore, stigmate capitato.—*Linn. Sp. Pl.* p. 915. *Pursh. Fl. Am.* v. 2. p. 440. *Engl. Bot.* t. 776. *Rich. in Frankl.* 1st *Journ.* ed. 2. *App.* p. 26. *De Cand. Prodr.* v. 1. p. 151.

6. *C. angustifolia*; foliorum radicalium foliolis lanceolatis basi attenuatis subintegris.

HAB. Hudson's Bay. (*Herb. Banks.*) *Drummond.* Throughout Arctic America. *Dr. Richardson.* Behring's Straits. *Chamisso.* *a.* Igloolik, and others of the islands in the Arctic Sea. *Capt. Sir E. Parry.*

6. *C. hirsuta*; foliis pinnatis, foliolis radicalium petiolulatis plerumque rotundatis, caulinorum lanceolatis subpetiolatis dentatis integerrimisque, petalis (parvis) oblongo-cuneatis, stigmate minuto subsessili.—*Linn. Sp. Pl.* p. 915. *Engl. Bot.* t. 492. *De Cand. Prodr.* v. 1. p. 152. *Rich. in Frankl.* 1st *Journ.* ed. 2. *App.* p. 26. *Cham. et Schlecht. in Linnaea*, v. 1. p. 20.—*C. parviflora?* *Linn. Sp. Pl.* p. 919. *De Cand. Prodr.* v. 1. p. 152. *Gmel. Sib.* v. 3. t. 64.—*C. pennsylvanica.* *Muhl. Cat.* p. 60. *De Cand. Prodr.* v. 1. p. 151. *Pursh. Fl. Am.* v. 2. p. 440. *Elliott, Carol.* v. 2. p. 144.—*C. virginica.* *Linn. Sp. Pl.* p. 915. *Mich. Am.* v. 2. p. 29.—*C. sylvatica.* *Linn.?*—*De Cand. Prodr.* v. 1. p. 152.

HAB. From Canada to the Rocky Mountains, and to the shores of the Arctic Sea. *Drummond. Dr. Richardson. Unalaschka. Chamisso. Columbia. Scouler.*—Those who have been in the habit of observing *C. hirsuta*, as it grows with us, in different soils and situations, and at different seasons of the year, are well aware how liable it is to vary in size and ramification, in the direction of its stems, in the breadth and length and toothing of the leaflets, and somewhat too in the size of its flower. Even the style is more or less distinct, sometimes quite obsolete. The same states occur in North America, whence have arisen the *C. virginica* and *C. pennsylvanica*; this latter being esteemed in Charleston, South Carolina, Mr. Elliott tells us, like the garden Cress, as is our *C. hirsuta*. My specimens of them quite correspond with our European states of the plant. I have placed a mark of doubt against the *C. parviflora* of *Linn.*, because Sir James E. Smith says it is clearly a distinct species; yet he refers to *Gmelin's Fl. Sibirica*, v. 3. t. 64, which perfectly accords with many of my American and English specimens, such as are but varieties of *C. hirsuta*. The species is probably very extensively distributed over the globe. I have it from Nepal and from Chile.* It exists, too, in Persia.

7. *C. digitata*; foliis digitatum-pinnatis, pinnis sessilibus linearibus integerrimis, stylo brevi vix siliqua tenuiore, stigmate capitato.—*Rich. in Frankl.* 1st *Journ.* ed. 2. *App.* p. 26. *De Cand. Prodr.* v. 1. p. 153. *Cham. et Schlecht. in Linnaea*, v. 1. p. 19.

* Probably the *C. flaccida* of *Chamisso* and *Schlechtendal* in *Linnaea*, v. 1. p. 21.

"*Herba glaberrima. Folia digitatim-pinnata; ineriora petiolo longo gracili, pinnisque 7 approximatis: superiora brevius petiolata, pinnis paulo remotioribus: summum sub sessile, pinnis 3 aut 5; pinnis omnibus sessilibus conformibus. Caulis dodrantalis simplex, basi repens, ascendens, superne erectus subflexuosa. Racemi eructi, multiflori. Pedicelli siliquis longiores, patent. Flores saxe magnitudine Card. pratensis. Calyx flavescens. Petala obovata, calyce duplo longiora, alba vel purpurea tincta. Stylus crassiusculus, lineare, longus, stigmate capitulo. Siliqua juniores brevissimae; maturas non vidi.*"—Richardson.

HAB. Arctic America, from the East to the West coast. Dr. Richardson.—To the above excellent description, made by Dr. Richardson from recent specimens during the First Expedition, I have nothing to add, (since the perfect fructification has not even now been detected,) except that the root is creeping and destitute of tubers, in which particulars it differs from *Dentaria heterophylla*, a plant in other respects very nearly allied to it. This species has been found by Chamiso in the Gulf of St. Lawrence, on the Asiatic side of Behring's Straits.

8. *C. Menziesii*; pube stellata canescens, foliis pinnatisectis, segmentis bipinnatifidis, laciinis parvis acutis, siliquis pedicelli longitudine.—*De Cand. Prodr. v. 1. p. 153.*

HAB. North-West coast of America. Mr. Menzies.—A species *Brachylobi Sigymbrii*? DC.

8. DENTARIA. Linn.

Siliqua lanceolata, valvis planis, enerviis, saepe elastice dissilientibus, placentis non alatis. *Funiculi* dilatati. *Semina* ovata, immarginata, 1-serialia. DC.

1. *D. laciniata*; foliis tribus verticillatis breviter petiolatis tripartitis, lobis segmentis linearibus integris grosse serratis laciniatis.—Muhl. Cat. n. 60. Pursh, Fl. Am. v. 2. p. 438. *De Cand. Prodr. v. 1. p. 155.* Bigel. Fl. Bost. ed. 2. p. 254. Elliott, Carol. v. 2. p. 142.—D. concatenata. Mich. Am. v. 1. p. 30.

HAB. Pentanguishene, lat. 48°. Dr. Richardson. Drummond.—Flowers large, of a pale rose colour, or almost white.

2. *D. diphylla*; foliis caulinis 2 alterius ternatis, foliolis ovato-lanceolatis grosse serratis laciniatis.—Mich. Am. v. 2. p. 30. Pursh, Fl. Am. v. 2. p. 438. *De Cand. Prodr. v. 1. p. 155.* Sims in Bot. Mag. t. 1465. Elliott, Carol. v. 2. p. 142.

HAB. Canada. About Quebec. Mrs. Percival. Lake Huron. Dr. Todd.—Flowers rather smaller than in the preceding.

3. *D. tenuifolia*; foliis caulinis breviter petiolatis alternis ternatis vel pinnatim 5-natis, foliolis linearibus acutis integerrimis, radice tuberosa fibrosa.—"Ledebe. Mém. de l' Acad. de Petersb. 5. 1815. p. 547." *De Cand. Prodr. v. 1. p. 156.*—D. tenella. Pursh, Fl. Am. v. 2. p. 439. *De Cand. Prodr. v. 1. p. 155.*—D. trifida. Lam. Ill. t. 562. f. 2. Gmel. Sib. v. 3. p. 272. t. 65.

HAB. Banks of the Columbia. (Herb. Lewis.) Mr. Menzies.—Mr. Menzies' specimens agree precisely with my Siberian ones from Dr. Fischer and Professor Ledebour. They scarcely differ from Dr. Richardson's *Cardamine digitata*, except in the tubercled root, and in having fewer leaflets; and that plant should probably be referred to *Dentaria*, a genus, indeed, which Mr. Brown only considers as a section of *Cardamine*.

9. PARRYA. Br. (*Neuroloma*, Andr. and *De Cand.*)

Siliqua lato-linearis, valvis magis minusve distincte venosis, planis. *Semina* subbiseriata, testa epidermide laxo, late marginata. *Funiculi umbilicales* superne septo adnati. *Stigmatis* lobi approximati.

Herba pubescenti-glandulosa in a., in g. glabra. Radix fusiformis, descendens, radiculosa. Folia fere omnino radicalia, crassiuscula, digitalis et ultra, erecta, lato-lanceolata, acuta, in petiolum longum basi attenuata, margine sinuato-vel inciso-dentata, rarissime subintegra. Scapus florescens foliis paulo longior, fructiferus duplo longior, arctus, teres. Flores magni, speciosi, corymbosi. Pedicelli glabri in a., in g. glanduloso-pubescentes, graciles, calycem excedentes. Calyx; sepala oblongis, erectis, concavis, duabus basi gibbosis. Petala pulcherrime purpureo-rosa, calyce duplo longiora, limbo patente late obovata, venosa, retuso, basi in ungues attenuato. Stamina unguibus petalorum sublongiora: filamenta subulata: Anthera oblongo-lineares. Glandula ad basin filamentorum 4. Pistillum: Germen lanceolatum, in stylum per breve attenuatum: Stigma lobis brevibus erectis approximatis. Siliqua ann. 2 uncias longa, 2 lineas late, sublonge racemosae, erecta, subcurvata, lato-lineares, inter semina subconstricta, paululum torulose, plane-compresso, in a. scabre, in g. glabra. Valve plane, marginata, dorso medio uninerves, venosa, venis nonnunquam obscure. Semina plurima, vix biserialia, hic illic abortientia, pendentia, compressa, teste epidermide laxo, vix corrugato, ala lata, membranacea, alba formante. Cotyledones accumbentes. Funiculus umbilicalis subulatus, in partem septo adnatius.

HAB. Found during the Second Land Arctic Expedition, and then only by Capt. Sir J. Franklin and Capt. Back, to the west of the Mackenzie River. Frequent on the shores of Kotzebue's Sound, and the adjacent coast. *Lay and Collie in Capt. Beechey's Collection.* Island of St. Lawrence. *Chamisso.*—This is a noble species of a beautiful and well marked genus, worthy of bearing the name which Mr. Brown has applied to it, in compliment to an officer of the most distinguished merit, who has, in every voyage, particularly to the Arctic regions, by his own exertions, and by those of his officers, contributed mainly to our present accurate knowledge of the botany of those countries; and whose friendship to myself I am here proud to acknowledge. Capt. Sir John Franklin only met with the plant in flower. Capt. Beechey's collection contains many fine specimens in fruit, from which the figure of that state is represented in this work.

TAB. XV. A. Flowering state of the var. *g. glabra*; B. Fructified state of the var. *a. scabra*: natural size. Fig. 1, Sepal of the calyx; fig. 2, Petal; fig. 3, Stamen; fig. 4, Pistil; fig. 5, Style and stigmas; fig. 6, Siliqua; fig. 7, Seed; fig. 8, Seed deprived of the epidermis of the testa; fig. 9, Embryo:—more or less magnified.

2. *P. arctica*; siliquis linear-oblongis, antheris ovalibus, foliis (fere omnibus) integerimis, pedunculis glaberrimis.—*Br. in Parry's 1st Voy. App. p. ccixix. t. B. Hook. in Parry's 2d Voy. App. p. 388.*

HAB. On the eastern Arctic islands. Captain Sir Edward Parry. Captain Sabine. Captain Ross. Shores of the continent of Arctic America, eastward of the Mackenzie River. Dr. Richardson.—As the *P. macro-*

carpa is confined to the westward of the Mackenzie River, so is the present plant to the eastward of it, and both inhabit the shores of the sea. Mr. Brown's admirable description of this species, in the place above quoted, and the splendid figure of Mr. Bauer in illustration of the characters of the genus, leave nothing to be desired. If I am correct in referring the three *Neurotomata* of M. De Candolle to *P. macrocarpa*, we have as yet but two species of the genus *Parrya* described; but a third, and a more singular one than either of the present, has lately been sent to me from the Altai by Professor Ledebour, under the name of *P. exscapa*, *MSS.* The pedicels almost appear to spring at once from the top of the root, and by the number and size of their flowers to conceal the leaves, as do the pods, which are more than 4 inches long and 3 lines broad. The seeds, however, are scarcely marginated, and the *funiculus umbicalis*, or seed-stalk, is wholly fixed to the marginal receptacle.

TRIB. II. ALYSSINEÆ; seu Pleurorhizæ Latiseptæ. DC.

Silicula longitudinaliter debiscens, septo lato ovali membranaceo, valvis planis aut concavis. *Semina* compressa, sæpe marginata. *Cotyledones* planæ, accumbentes (o=), septo parallelae. DC.

10. VESICARIA. Lam.

Silicula globosa, valvis membranaceis inflatis. DC.

1. *V. Ludoviciana*; stellatim tomentosa, incana, foliis linearis-spathulatis sub integris calyce æquali, siliculis globosis pubescensibus, stylo gracillimo breviori.—*De Cand. Prodr.* v. 1. p. 159.—*Alyssum Ludovicianum*. *Nutt. Gen. v. 2. p. 63.*—*V. globosa?* *Desv. Journ. Bot.* 3. p. 184. (according to the description.) *De Cand. Prodr.* v. 1. p. 159.—*Myagrum argenteum*. *Pursh, Fl. Am. v. 2. p. 434.*

HAB. Cultivated in the garden of the Horticultural Society of London, from seeds sent from North-West America by Mr. Douglas; but the exact station is not mentioned, and it does not occur in the Herbarium.—It quite agrees with my specimens gathered by Bradbury on the hills of the Missouri; and is best distinguished by the length and slenderness of its style from the following species.

2. *V. arctica*; stellatim tomentosa, incana, foliis radicalibus spathulatis reliquis sub-linearibus integerimis, calyce æquali, siliculis globosis stylo crassiusculo longioribus.

a. floribus majoribus, siliculis glabris.—*V. arctica*. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 26.* *De Cand. Prodr.* v. 1. p. 159.—*Alyssum arcticum*. *F. Dan. t. 1520.*

β. floribus minoribus, siliculis pubescensibus.—*V. arctica*. *Hook. in Bot. Mag. t. 2882.*—*V. arenosa*. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 26.* *De Cand. Prodr.* v. 1. p. 160.

HAB. α. Mostly confined to the Arctic shores and islands, eastward of the Mackenzie River, while an intermediate state (that is, with the silicula slightly pubescent,) is found on the summit of a hill 700 feet high, at Bear Lake River. *Dr. Richardson.* β. Hills and dry prairies at Carlton House. *Dr. Richardson.* Upon the Rocky Mountains, *Drummond*. I have received it, gathered in Canada by Mr. Goldie, but without any particular station being given.—Numerous specimens in different states, and cultivation in our gardens, have satisfied Dr. Richardson that *Vesicaria arenosa* should rather be considered a var. of, than a distinct species from, *V. arctica*. My own opinion quite coincides with his, and hence I am led to unite them; nor can I distinguish from *V. arctica*, specimens I have in my Herbarium, gathered in the plains of Mendoza and hills about Cordova, South America, by Dr. Gillies and Mr. Cruickshanks. In these specimens, the leaves are sometimes sinuato-dentate, which again brings the plant near the European *V. sinuata*. All seem to vary with erect and prostrate stems, and with those stems more or less leafy.

3. *V. didymocarpa*; stellatim tomentosa incana, foliis radicalibus late obovato-spathulatis reliquis lanceolatis subintegris, calyce æquali, siliculis magnis inflatis didymis. (TAB. XVI.)

Radix perennis, fusiformis, longe descendens, inferne subfibrosa: superne, ad collum, caules plurimos diffusos, non raro prostratos, proferens. *Hi caules* (ut et tota planta, nisi corolla staminaque,) pilis vel squamulis stellatis numerosissimis incasi, simplices, digitem longi. *Folia radicalia* numerosa, patentes, duas fere tres uncias longa, late obovato-spathulata, obtusiuscula, inferne in petiolum attenuata: *caulina* lanceolata, obtusa, basi attenuata, integerrima, vel raro subinuato-dentata. *Flores* speciosi, in corymbos terminales dispositi. *Calyx* sepalæ oblonga, erecta, equalis obtusa. *Petala* late flava, calycis duplo longiora, obovata, obtusa, basi in unguem attenuata. *Stamina* petalis breviora. *Antheræ* oblongæ. *Pistillum*: *Germen* subrotundum, didymum: *Stylus* longus, filiformis: *Stigma* truncato-capitatum. *Silicula* fere magnitudine *Nucis Avellana*, globosa, profunde didyma, stylo subeque longo terminata; lobis rotundatis, ad septum insigniter contracta. *Dissepimentum* lanceolatum. *Loculi* subhexaspermi. *Semina* subovalia, superne emarginata, fusca, immarginata. *Cotyledones* plano-couvexæ, accumbentes.

HAB. Growing in deep sand upon the Rocky Mountains, between lat. 52° and 57°. *Drummond*. Abundant on the barren sandy plains of the Columbia, at Wallawalla and at the Kettle Falls. *Douglas*.—This is without exception the most singular and most beautiful of the genus *Vesicaria*, having broad leaves, clothed with the curious close stellated pubescence which seems to be almost characteristic of the genus, and large yellow flowers; and a seed-vessel with its two valves separated by so deep a sinus, that, were it not that the whole habit of the plant is completely that of a *Vesicaria*, it might almost form a generic character.

TAB. XVI. Plant:—natural size. Fig. 1, Flower; fig. 2, Petal; fig. 3, Stamens and pistil; fig. 4, Pistil; fig. 5, 6, Fruit:—natural size. Fig. 7, Do, with one of the valves removed at fig. 8; fig. 9, The same:—magnified. Fig. 10, Front view of the dissepiment, with the seeds; fig. 11, Seed; fig. 12, Transverse section of do:—magnified.

11. ALYSSUM. DC. (*Alyssi Sp. Linn.*)

Silicula orbicularis aut elliptica, valvis planis aut centro convexis. *Semina* in quoque loculo 2—4, compressa, interdum ala membrinacea cincta. *Calyx* basi æqualis. *Petala* intigrata. *Stamina* nonnulla dentata. DC.

1. *A. hyperboreum*; caulis herbaceis cæspitosis, foliis ellipticis grosse et acute dentatis subhirsutis, siliculis ellipticis, staminibus majoribus dente acutibus. DC.—Linn. Sp. Pl. p. 910. Willd. Sp. Pl. v. 3. p. 463. Pursh, Fl. Am. v. 2. p. 434. De Cand. Prodr. v. 1. p. 164.—*Draba hyperborea*. Desv.—*Lunaria* foliis ellipticis inconde dentatis. Krasch. Nov. Comm. Acad. Petrop. 1. ann. 1750, p. 388. t. 15. f. 1.

HAB. In North America; *Krascheninikof* in Linn.; and, according to Pursh, on the North-West coast.—I have seen no specimen of this plant, nor do I know in what part of North-West America it was discovered; probably in a high northern latitude, if we may judge from its name. *Krascheninikof* appears to be the only author who has described it, and his work I have not the opportunity of seeing. De Candolle attributes the discovery of this plant to Steller, who travelled in Siberia and Kamtchatka; but I am not aware that his researches extended to the American continent. Its flowers are said to be white.

2. *A. ? dentatum*: foliis radicalibus subruncinato-dentatis linear-lanceolatis, siliculis ellipticis pubescentibus. DC.—Nutt. Gen. Am. v. 2. p. 63. De Cand. Prodr. v. 1. p. 165.—*Draba arabizans*. Pursh, Fl. Am. v. 2. p. 434; not Mich. (according to Nuttall.)

HAB. Canada? Pursh: but Pursh has probably confounded the Canadian *Draba arabizans* of Michaux with the *Alyssum dentatum* of Nutt. which he found in Virginia; and hence it should probably be excluded

from the British American Flora.—The flowers of this are not known, and it may be considered doubtful if any true *Alyssum* is found in North America.

12. DRABA. Linn.

Silicula sessilis, ovalis aut oblonga, valvis planis convexisive. *Semina plurima immarginata*. *Calyx æqualis*. *Petala integra*. *Stamina omnia edentula*. DC.

* *Perennes. Scapi plerumque aphylli.*

1. *D. algida*; flaccida, scapis brevibus nudis patentibus, foliis oblongis planis calybusque pilosis, pilis plerumque simplicibus, siliculis subcorymbosis ellipticis glabris, stylo perbrevi, (floribus flavis).—“*Adams in Herb. Fisch.*” De Cand. Prodr. v. 1. p. 167. Cham et Schlecht. in Linnaea, v. 1. p. 21.

γ. *brachycarpa*, DC.; siliculis brevioribus. De Cand. Prodr. l. c.

δ. *breviscapa*; scapo foliis glabriusculis immerso.

HAB. Sea coast between the Mackenzie and Coppermine Rivers. Dr. Richardson. 2. In deep sand.—I have not had any opportunity of seeing authentic specimens of *D. algida*: but its characters agree with those of our present plant, and, according to De Candolle and Chamisso, it must be very nearly allied to *D. alpina*; so much so, that the latter author doubts if what he describes as the γ. *brachycarpa* be not a dwarf state of *alpina*. De Candolle says that it is known from that species and all the yellow-flowered ones, by its simple not branched hairs. In our plant, however, it must be confessed there are a few branched hairs mixed with the more abundant simple ones. The roots are long and slender, the lower part of the numerous, dichotomously divided branches shaggy with the remains of former years' leaves: the perfect leaves, as well as the stem, are soft and flaccid, oblongo-spathulate, hairy principally at the margin: the scapes scarcely twice the length of the leaves, even when bearing fruit, hairy or glabrous, as is the calyx, even on the same plant. *Pedicels* always glabrous. *Petals* twice the length of the calyx, obovate. *Capsules* elliptical or elliptic-oblong, shortly oval in γ., and sometimes also in δ. *Style* short, but distinct. *Stigma* oblong, lobed. In δ. the flower is quite immersed among the leaves.

2. *D. alpina*; subrigida, scapis nudis pubescenti-hirsutis, foliis lanceolatis planis pilis plerumque ramosis, petalis calycem plusquam duplo longioribus (plerumque flavis) siliculis subcorymbosis oblongo-ellipticis, stylo brevi.—Linn. Sp. Pl. p. 896. Fl. Dan. f. 56. (foliis nimis latis.) Wahl. Lapp. v. 1. p. 173. t. 11. f. 4. (sed stigmate breviore quam in nostr. exempl.) Br. in Parry's 1st Voy. App. p. 265. Rich. in Frankl. 1st Journ. ed. 2. App. p. 27. Hook. in Parry's 2d Voy. App. p. 385.

α. siliculis glabris. “*Herb. Linn.*” Br. l. c.

β. siliculis pilosis. Br. l. c.—D. *alpina*. Br. Spitzb. Pl. in Scoresby's Arctic Reg.

δ. floribus albis.

HAB. From lat. 60° on the Mountains, to the shores of the Arctic Sea, and on the islands adjacent, where it principally abounds, extending westward to Kotzebue's Sound, (*Captain Beechey's Collection*), and the Island of St. Lawrence, (*Chamisso*): found by all the Arctic Travellers. 2. Only on the sea shore, westward of the Mackenzie River. Captain Sir J. Franklin and Captain Hack.—De Candolle says of this, that the flowers are smaller than those of *D. aizoidea*. It is not so in our specimens; they are remarkable for their size and generally fine yellow colour, rarely white, or very pale yellow. The calyx, peduncle, and scape, are liable to vary in their degree of hairiness. This does not appear to grow farther south than lat. 60°, nor did Mr. Drummond or Mr. Douglas find it at the greatest elevation of the Rocky Mountains, where they crossed the chain. In that alpine and southern latitude, the species seems to be replaced by the following very closely allied one.

- e. minor, scapis pedicellisque glabris, floribus intense luteis.

HAB. Rocks on the loftiest of the Rocky Mountains, between lat. 52° and 57°. *Drummond*. Rare on the shores of the Arctic Sea. *Dr. Richardson*.—Closely allied, as De Candolle observes, to the two preceding species; differing from both in its longer, narrower, and more rigid leaves, which are clothed with short, and generally dense, stellated pubescence, and furnished, on the underside especially, with a strong and prominent midrib. In consequence of their firm texture, the former years' leaves remain attached at the base, when they lose their pubescence, becoming bleached and glossy, so as greatly to resemble *D. aizoides*, from which again this species differs by its pubescent, never ciliated, leaves, and far shorter, though yet very evident, style to the capsule.

4. *D. oligosperma*; scapo nudo subpubescente, foliis erectis rigidis subnitidis linearibus ciliatis versus apicem præcipue utrinque stellatum pubescentibus, petalis (albis) calycem pilosiusculum duplo excedentibus, siliculis pubescentibus longe racemosis ellipticis basi apiceque acutis 4-8 spermis, stylo sub $\frac{1}{2}$ breviori.

Radix perennis, tenuis, sublunge descendens, superne multiceps. *Caules* breves, unciam-2-uncias longi, ramosi, inferne foliorum vestigia obsoiti. *Folia* erecta, linearia, obtusiuscula, inferne subattenuata, rigida, nitida, utrinque sed versus apicem præcipue stellatum pubescentia, margine ciliata, pilis simplicibus vel ramosis. *Scapi* terminales, nudi vel raro versus basin unifoliati, rigidiusculi, digitales, pedicellique minute stellatum pubescentia. *Flores* etiam racemosi. *Calyx* glaber, vel parce pilosus, pilis patentibus. *Petala* alba, obovata, basi in ungues attenuata. *Pistillum*: *Germen* oblongum, utrinque attenuatum, stylo subtriplo breviore terminatum: *Stigma* integrum. *Silicula* in racemum laxum, duas uncias longe, elliptice, planae, utrinque acute, pube brevi sparsa tecta, loculis 2-3, rarius 4-spermis. *Stylus* evidentissimus, *silicula* subquadripli brevior, *stigma* integrum capitato. *Pedicelli* fructiferi siliculis paulo longiores.

HAB. Summit of a limestone hill, Mackenzie River, lat. 68°. *Dr. Richardson*.—Unwilling as I am to increase the number of species in this most difficult genus, I yet venture to do so in the case of the present individual, which was found in considerable abundance and perfection, though only in one spot, bearing both flowers and fruit. Although in the three preceding species, if such they may be called, Dr. Candolle designates the style as *brevissimus*, it can only be so in reference to that of his preceding group, the *Aizopoides* family; for the style is assuredly much longer than in any of the following species with naked scapes. Now, in that particular, and in the rigid foliage and generally short stellated pubescence, it approaches *D. glacialis*, whilst its white flowers and general habit assimilate it with the *D. hirta* tribe. It is remarkable for having the lower pedicels of the raceme bearing fruit, whilst the upper ones have perfect flowers. The seeds are mostly two or three in each cell.

5. *D. pauciflora*; scapis aphyllis pedicellisque pilosis, foliis lanceolatis integerrimi pilis furcatis simplicibusque, petalis (flavis) spatulatis calycem hirsutum vix superantibus, ovarii glabris. *Br.* in Parry's 1st Voy. App. p. cclxvi. *Hook.* in Parry's 2d Voy. App. p. 385.

HAB. Melville Island. *Capt. Sabine*. Barrow River. *Capt. Sir E. Parry*. "Dubia species, *alpina*

proxima." *Br.*—What I have taken for this plant in Captain Parry's collection, is smaller than *D. alpina*, has fewer flowers upon the scape, and much smaller and narrower petals.

6. *D. micropetala*; scapis aphyllis pedicellisque pilosis, foliis lato-lanceolatis subvenosis integerrimis pilis furcatis simplicibusque, petalis (albis) anguste-spathulatis calycem pilosum vix superantibus, siliculis ellipticis, stigmate sessili emarginato.—*Hook. in Parry's 2d Voy. App. p. 385.*

β. minor.

HAB. Island of Igloolik. *Capt. Sir E. Parry.* *β.* Sea coast between the Coppermine and Mackenzie Rivers. *Dr. Richardson.*—This has the habit of *D. alpina*, but its flowers more nearly resemble those of *D. pauciflora*. They are, however, white, their petals smaller and still narrower than in the latter species, collected into a dense corymb, or almost head of flowers, which scarcely changes its appearance even when in fruit. Dr. Richardson gathered only two specimens of this, one in flower, which differs only from Capt. Parry's plant in its smaller size, and one in fruit. The *siliculae* are elliptical, purplish brown, glabrous, velvety, crowned (as is the germen) with the sessile and deeply notched stigma.

7. *D. muricella*; scapo nudo velutino, foliis oblongis integris pubescentia caesiо-velutinis, siliculis oblongo-lanceolatis glabris. DC.—*Wahl. Lapp. p. 178. t. 11. f. 2. De Cand. Prodr. v. 1. p. 168. Brown in Ross's Voy. App. p. 193. Rich. in Frankl. 1st Journ. ed. 2. App. p. 27. Hook. in Parry's 2d Voy. App. p. 387.*—*D. nivalis. Liljab.* (not Willd.)—*Pursh. Fl. Am. v. 2. p. 433?*

HAB. Labrador. *Colmaster*, (in *Pursh.*) Arctic shores of America. *Ross. Parry.* Woody country between lat. 54° and 64°. *Dr. Richardson.*—I scarcely see how this may be discriminated from *D. nivalis* and *hirta*. De Candolle has placed it among the *Chrysodrabe*, or those species which have yellow flowers; but he expressly says the blossoms are white, though his var. *β. cesia* has yellow ones.

8. *D. oblongata*; scapis nudis, pubescentia floccosa subhirsutis, foliis caespitosis oblongo-linearis integris ciliatis velutinisque, siliculis elliptico-oblongis velutinis. DC.—*Brown in Ross's Voy. App. (without descr.) De Cand. Prodr. v. 1. p. 169.*—*D. hirta, var. 2. Hook. in Parry's 2d Voy. App. p. 386.*

HAB. Shores of Arctic America. *Ross. Igloolik and Barrow River. Parry.*—I have not seen this species, nor is it known to Botanists except by De Candolle's description. It seems very closely allied to *D. hirta*.

9. *D. corymbosa*; scapis nudis hispidulis, foliis dense caespitosis oblongis basi attenuatis ciliatis subhispidisque, siliculis ellipticis corymbosis hispidulis. DC.—*Brown in Ross's Voy. App. — De Cand. Prodr. v. 1. p. 169.*

HAB. Shores of Arctic America. *Capt. Ross.*—This is mentioned by Mr. Brown as being extremely similar to *D. oblongata* and *rupestrис*; and De Candolle says of it, " *D. oblongata et hirta affinis.*"

10. *D. hirta*; scapis puberulis, folia paucis plerumque dentata gerentibus, foliis radiocalibus oblongis subintegris puberulis, siliculis oblongis pedicellisque glaberrimis, stylo subnullo.—*Linn. Sp. Pl. p. 897. Wahl. Lapp. p. 175. t. 11. f. 3. Hook. in Parry's 2d Voy. App. p. 385. (var. 1.) Rich. in Frankl. 1st Journ. ed. 2. p. 27.*

δ. siliquosa, siliculis 9 lineas longis. *Cham. et Schlecht. in Linnaea, v. 1. p. 23.*

ι. foliis glabriusculis, scapo omnino glabro.

HAB. Arctic and subarctic America, as well as upon the Rocky Mountains; frequent. 2. Unalaschka. Chamiso. 4. Sea shores between the Coppermine and Mackenzie Rivers. DR. RICHARDSON.—A most variable plant, differing, as do the rest of the genus, in the length and breadth of the foliage, in the degree of pubescence, in the form of the silicula, and in the absence or presence of leaves upon its stem; so that to me it appears, on the one hand, readily to pass into *D. rupestris* of Mr. Brown, which here (out of respect to such high authority,) I have ventured to keep distinct; while, on the other, it is difficult to distinguish it from some of the slender states of *D. incana*.

11. *D. rupestris*; scapo nudo vel unifoliato pubescente, foliis oblongo-spathulatis sub-hirsutis ciliatisque, siliculis oblongis pubescentibus vel glabris, stylo per breve, stigmate emarginato.

a. siliculis pubescentibus. BR. in Hort. Kew. ed. 2. v. 3. p. 91. HOOK. Fl. Scot. 1. p. 197. CHAM. et SCHLECHT. in LINNÆA, v. 1. p. 23. DE CAND. PRODR. v. 1. p. 169.—D. hirta. SM. in ENGL. BOT. t. 1338. (not of LINN. nor of FL. DAN.—BR.) SM. in ENGL. FL. v. 3. p. 159.—D. hirta, ♂. alpicola. WAHL. LAPP. p. 175. t. 11. f. 1. HOOK. FL. SCOT. 1. p. 197.—D. hirta, var. 4. HOOK. in Parry's 2d. VOY. APP. p. 386.

♂. siliculis glabris.

HAB. ♂. Rocky Mountains, in stony places, between lat. 52° and 57°. DRUMMOND.—This species was founded by Mr. Brown, on specimens, I believe, from Ben Lawers, in Scotland; where I have gathered for many successive years in great abundance, and it assuredly varies in the pubescence being more or less dense, and more or less branched and stellated. The siliculae are generally pubescent; but sometimes, as is the pedicel, quite glabrous. The latter is the state of the Rocky Mountain plant, and it is probably identical with *A. nivalis* of Willdenow.

12. *D. lapponica*; scapis nudis glaberrimis, foliis lanceolatis integerrimis pilosiusculis, siliculis ovato-lanceolatis pedicellisque glaberrimis. DC.—WILDL. — DE CAND. PRODR. v. 1. p. 169. BR. in Parry's 1st VOY. APP. p. 266. CHAM. et SCHLECHT. in LINNÆA, v. 1. p. 22.—D. hirta, var. 3. HOOK. in Parry's 2d VOY. APP. p. 386.—D. audrosacea. WAHL. LAPP. p. 174. t. 11. f. 5.

HAB. Shores and islands of Arctic America. ROSS. Parry.

13. *D. stellata*; scapis 1-phyllo pubescentibus, foliis ovali-oblongis pube stellata brevi tomentosis, pedicellis puberulis, siliquis oblongis. DC.—JACQ. HORT. VINDOB. p. 113. OBS. n. 54. t. 4. f. 3. DE CAND. PRODR. v. 1. p. 169. CHAM. et SCHLECHT. in LINNÆA, v. 1. p. 22.—D. hirta. JACQ. ASTR. t. 432.

♂. *hebecarpa*; siliculis undique velutino-pubescentibus. DC.

HAB. Unalaschka. CHAMISO. ♂. Arctic America. DR. RICHARDSON.—The figure referred to in Jacquin's Flora Austriaca, I have always conceived to be admirably characteristic of our Scottish *D. rupestris*, especially the upper figure. The var. ♂. is very hairy, and more disposed to be leafy on the stem than the *D. rupestris* of this country.

14. *D. levipes*; scapis nudis monophyllis pubescentibus, foliis ovatis pube stellata brevi tomentosis, siliculis elongato-linearibus pedicellisque glaberrimis. DE CAND. SYST. NAT. v. 2. p. 346. DE LESS. IC. SEL. v. 2. t. 46. f. A. DE CAND. PRODR. v. 1. p. 169.

HAB. Rocky Mountains, between lat. 52° and 57°. DRUMMOND.—A few specimens, well according with De Candolle's description and De Lessert's figure, are in Mr. Drummond's collection.

15. *D. crassifolia*; scapo nudo vel unifoliato, pedicellis calyceque glaberrimis, foliis linearispathulatis subcarnosis, pilis simplicibus ciliatis, petalis apice retusis calycem paulo superantibus.—*Graham in Edin. Phil. Journ.* 1829. p. 182.

a. petalis albis.

b. petalis pallide flavis.

Radi parva, gracilis, descendens, fibrosa, superne multiceps. *Folia* rosulata, fere omnino radicalia, vix unciā longa, linearispathulata, subcarnosa, pallide viridia, integerrima vel paucidentata, glabra, margine pilis simplicibus albis ciliata, basi non raro in petiolum longiusculum attenuata. *Scapi* 2, 3, nonnunquam 4 uncias longi, flexuosi vel curvati, aphylli, vel folium unicum lineare basin versus gerentes, glaberrimi. *Flores* laxè corymbosi, pauciflori. *Pedicelli* subcurvati vel flexuosi, demum patentissimi. *Calyx* sepala ovato-rotundata, glaberrima, viridia ad marginem pallidiora. *Petala* alba, in a. pallide flava, obovata, basi attenuata, apice retusa vel obtusissime emarginata. *Siliculae* glaberrima, elliptico-ovata. *Stigma* sessile, parvum.

HAB. Summits of the Rocky Mountains, between lat. 52° and 57°.—The small size of the whole plant, frequently not rising more than 2 inches above the surface of the soil, the absence of pubescence, its waving scapes and pedicels, and small flowers, would seem to constitute a distinct character: yet the larger specimens offer many points in common with the *D. glabella*. Ph. The general habit is that of *Erophila vulgaris*, but its petals are by no means bipartite, but simply notched.

* * *Caulis foliosus. Annue vel Biennes.*

16. *D.?* *lævigata*; caulinis foliosis simplicibus glabris strictis, foliis radicalibus et caulinis inferioribus petiolatis ovatis basi attenuatis carnosiusculis margine obsolete ciliatis, siliculis oblongo-lanceolatis, pedicellis brevibus quadruplo sextuplo longioribus glabris.—*Cham. et Schlecht. in Linnaea*, v. 1. p. 25.

HAB. Island of St. Lawrence. *Chamiso*.—Of this plant, with which I am wholly unacquainted, Chamisso and Schlechtdal say that it has a very peculiar habit in the absence of the radical tufts of leaves, the simple stem, and in its smoothness and fleshiness.

17. *D. glabella*; foliis radicalibus oblongo-spathulatis, caulinis 2-4 ovatis dentatis vel integris, omnibus caule pedicellisque leviter substellato-pubescentibus, petalis (albis) calyce glaberrimo plusquam duplo longioribus, siliculis?—*Pursh, Fl. Am.* v. 2. p. 434? *Rich. in Frankl. 1st Journ. ed. 2.* p. 27.

HAB. Margins of alpine rivulets in the Rocky Mountains, between lat. 52° and 57°. *Drummond*; and north in the plains. *Dr. Richardson*. Hudson's Bay. *Pursh*.—This has more the habit of *D. crassifolia* than of the following; but it is three or four times the size, and has flowers as large as any in the genus. The siliculae I have not seen.

18. *D. confusa*; caule folioso subramoso pube stellata brevi velutino, foliis oblongis subdentatis, siliculis oblongis pubescentibus pedicello longioribus. *DC*.—“*Ehrh. Beitr.* 7. p. 155.” *De Cand. Prodr.* v. 1. p. 170.

HAB. Rocky Mountains, from lat. 52°; and north in the plains, nearly to the mouth of the Mackenzie River. *Drummond. Richardson*.—This too is a very variable plant, in respect to the number of leaves on its stem, their shape and margin, (entire or toothed,) and the pubescence of the whole plant. It insensibly passes into the following species.

19. *D. incana*; caule folioso simplici vel ramoso pube stellata velutino, foliis ovatis dentatis, siliculis oblongis glabris vel pubescentibus contortis vel strictis.

a. caule erecto stricto.—D. incana. *Linn. Sp. Pl. p. 897. Engl. Bot. t. 388. Fl. Dan. t. 130. Pursh, Fl. Am. v. 2, p. 434.*—D. contorta. *Ehrh.—De Cand. Prodr. v. 1, p. 170.*

β. caule flexuoso.

HAB. a. Labrador. *Pursh, Mr. Morrison.* Bear Lake and the Mackenzie River. *Dr. Richardson.* β. North-West coast of America. *Mr. Menzies.* Islands of St. Lawrence and Unalashka. *Dr. Fischer.*—The more usual state of *D. incana*, such as we find it in the north of England and in Scotland, we have only from Labrador and about Bear Lake. The specimens from the N. W. coast, gathered by Mr. Menzies, will probably prove distinct, both from it and *D. confusa*; for their habit is very different. I possess the same plant from the stations above quoted, sent by Dr. Fischer, with the name "*D. borealis. DC?*" This latter is a Kamtschadale plant, communicated by the same liberal Botanist to De Candolle, who, however, describes it as having only one leaf upon the stem, whereas the plant in question has several. I have seen no fruit.

20. *D. arabisans*; caule folioso subramoso subpuberulo, foliis lanceolatis acutis dentatis, siliculis linearibus glabris pedicello longioribus.—*Mich. Am. v. 2, p. 28. Pursh, Fl. Am. v. 2, p. 134.*

HAB. Lake Champlain. *Michaux. Canada. Pursh? Goldie?*—What I possess, under this name, gathered in the neighbourhood of Montreal by Mr. Goldie, is, I think, only *D. incana*, and I strongly suspect such to be the plant of Michaux. Pursh seems to have confounded Michaux's *D. arabisans* with the *Alyssum dentatum* of Nuttall, as already noticed.

21. *D. Unalashkiana*; caule folioso simplici pubescente, foliis ovato-oblongis integris pubescensibus, siliculis oblongis hirsutulis.—*De Cand. Syst. Veget. v. 2, p. 350, Prodr. v. 1, p. 170.*

HAB. Unalashka. *Dr. Fischer in De Cand.*—“Petala calyce duplo longiora, limbo obovato emarginato.” *DC.*

22. *D. aurea*; pubescens, caule erecto folioso, foliis lanceolatis ovato-lanceolatis acutis integris dentatis, corymbis terminalibus axillaribusque, siliculis oblongo-lanceolatis pubescensibus pedicello triplo longioribus, petalis (flavis) emarginatis, stylo longiusculo. *Vahl.—Fl. Dan. t. 1460. De Cand. Prodr. v. 1, p. 170. Hook. in Bot. Mag. t. 2934.*

HAB. Alpine prairies of the Rocky Mountains. *Drummond.*—Well distinguished by its bright conspicuous yellow flowers and lateral pedunculated corymbs, springing from several of the upper leaves of the stem. One specimen in the collection has white flowers.

23. *D. lutea*; pubescens, caule ramoso folioso, foliis ovalibus caulinis lanceolatis dentatis, siliculis elliptico-oblongis glabris sub 30-spermis pedicello sub-triplo brevioribus, (floribus luteis).—“*Gilib. Fl. Lith. in Ust. del Op. 2, p. 357.*” *Nutt. Gen. Am. v. 2, p. 62. De Cand. Prodr. v. 1, p. 171.*

β. *longipes. DC.*—Pedicellis silicula 4-plo longioribus.—*D. gracilis. Graham in Edin. Phil. Journ. 1828, p. 172.*

HAB. Low grounds from lat. 56° to 66°; *Dr. Richardson; Drummond;* both α. and β.—It has been correctly observed that this differs from the following species only in its glabrous capsules.

24. *D. nemoralis*; pubescens, caule ramoso, foliis ovalibus caulinis lanceolatis dentatis, siliculis elliptico-oblongis pubescensibus sub 30-spermis pedicello subtriplo brevioribus. *Ehrh.—De Cand. Prodr. v. 1, p. 171.—D. muralis, β. nemorosa. Linn. Sp. Pl. p. 897.*

- a. floribus luteis, petalis subintegris.
- b. floribus fere albis, petalis emarginatis.

HAB. a. About Lac la Pluie, and Rocky Mountains, (not found in the low grounds.) *Drummond*. b. North-West coast of America. *Douglas*.

25. *D. muralis*; pubescens, caule ramoso folioso, foliis late ovatis caulinis cordatis sub-amplexicaulibus profunde dentatis, siliculis elliptico-oblongis sub 16-spermis pedicello paulo brevioribus (floribus albis).—*Linn. Sp. Pl. p. 897. Engl. Bot. t. 192. De Cand. Prodr. v. 1. p. 171.*

HAB. About Montreal. *Mr. Cleghorn*.—Petals white, entire or sometimes notched upon the same plant.

Such is the best account I have been able to draw up of the individuals of this most difficult genus, *Draba*. It is to me most unsatisfactory; and all I can offer in its favour is, that, in general, the species of which it is composed have a peculiarity of aspect and growth, by which they are better distinguished than by the characters here laid down. But there are, among the European and Northern Asiatic species existing in my Herbarium, many of which I am quite at a loss to determine whether or not they are different from the North American ones.

13. EROPHILA. DC.

Silicula ovalis aut oblonga, valvis planis. Semina plurima, immarginata. Cal. aequalis. Petala bipartita. Stam. edentula.—Herbe annuae, scapis nudis, floribus albis. DC.

1. *E. vulgaris*; siliculis ellipticis pedicello brevioribus, scapis 5–15-floris.—*De Cand. Prodr. v. 1. p. 172. Draba verna. Linn. Sp. Pl. p. 896. Engl. Bot. t. 586. Pursh, Fl. Am. v. 2. p. 433.*

HAB. Canada. *Pursh*.—I have not seen this in any collection from British America, and am unable to say whether the plant alluded to by Pursh be the common European state of *E. vulgaris*, or, as is more probable, the *E. americana* of DC., which only differs in its longer siliculae, according to specimens sent to me from New York, by Dr. Torrey; and which that gentleman has ascertained to be *Draba hispidula* of Muhlenberg.

14. COCHLEARIA. Tourn.

Silicula sessilis, ovato-globosa aut oblonga, valvis ventricosis. Semina plurima, immarginata. Cal. aequalis, patens. Pet. integra. Stam. edentula.—Flores albi. Folia *sapius carnosa*. DC.

1. *C. oblongifolia*; siliculis subrotundis pedicello dimidio brevioribus, foliis caulinis oblongis integris (vel sinuato-dentatis) sessilibus, summis brevissime auriculatis.—*De Cand. Prodr. v. 1. p. 363. Cham. et Schlecht. in Linnaea, v. 1. p. 26.*

“ Valde similis *Cochlearia officinalis*! Differe videtur: foliis caulinis basi magis angustatis, umplexicanibus quidem, auriculis vero minus productis; floribus minoribus, siliculis stylo breviori apiculatis. An species? Ut congeneres variat habitu et statura.”—*Cham. et Schlecht.*

HAB. Islands of St. Lawrence and Unalaschka. *Chamisso*, Kotzebue's Sound, *Lay and Collie in Capt. Beechey's Collection*.—I possess authentic specimens of this from Dr. Fischer, which confirm the observations above given.

2. *C. anglica*; siliculis elliptico-globosis venoso-reticulatis pedicello dimidio brevioribus, foliis radicalibus petiolatis ovatis integris, caulinis oblongis. DC.—Linn. Sp. Pl. p. 903. Engl. Bot. t. 552. De Cand. Prodr. v. 1. p. 364.

HAB. Shores of the Arctic Sea and islands adjacent, from east to west; Observatory Inlet. Dr. Scouler.—It is often difficult, especially in a dried state, to distinguish this from *C. officinalis*; nor do I think that the two species are generally well understood by Botanists. If the Engl. Bot. fig. t. 552, be the true *C. anglica*, our most frequent Arctic species is certainly that plant. The siliculae are broadly elliptical, the reticulations more or less apparent, the dissepiment sometimes fenestrata, as I find it to be in British individuals.

3. *C. fenestrata*; siliculis ellipticis ovalibus, valvis subcrenatis, dissepimento elliptico-lanceolato, axi sepius fenestrato, foliis radicalibus cordatis integrimis, caulinis spathulato-oblongis subdentatis.—Brown in Ross's Voy. ed. 2. v. 2. p. 193, et in Parry's 1st Voy. App. p. cclxvi. De Cand. Prodr. v. 1. p. 173.

HAB. Shores of the Arctic Sea; Capt. Ross and Sir E. Parry; and it is probably in the other collections; but I confess that I cannot satisfactorily distinguish it from *C. anglica*.

4. *C. officinalis*; siliculis ovato-globosis pedicello dimidio brevioribus, foliis radicibus petiolatis cordatis, caulinis ovatis dentato-angulatis. DC.—Linn. Sp. Pl. p. 903. Engl. Bot. t. 551.

HAB. Arctic shores. Whale Fish Islands? Capt. Sir E. Parry. Coast to the westward of Mackenzie River. Capt. Sir John Franklin and Capt. Back.—One specimen in each of the above-mentioned voyagers' collections, seems to me to correspond in foliage with our European *C. officinalis*, taking the English Botany figure as the type of the species; but neither is in fruit.

5. *C. danica*; siliculis ellipsoideis pedicelli longitudine, foliis cannibus petiolatis deltoides. DC.—Linn. Sp. Pl. p. 903. Engl. Bot. t. 100. Cham. et Schlecht. in Linnaea, v. 1. p. 26.

HAB. Arctic shores. North Somerset. Capt. Sir E. Parry. Westward of the Mackenzie River. Capt. Sir John Franklin and Capt. Back.

6. *C. tridactylites*; siliculis ovato-globosis, foliis caulinis dente unico utrinque grosse subtrilobatis. DC.—Banks' Herb.—De Cand. Syst. v. 1. p. 174.

HAB. Labrador; Herb. Banks; according to Do Candolle.

7. *C. spathulata*; stellatum pubescens, siliculis ellipsoideo-globosis, foliis spathulatis grosse dentatis acutis venosis.—Schlecht. pat. in Herb. Willd.—De Cand. Prodr. v. 1. p. 174. Cham. et Schlecht. in Linnaea, v. 1. p. 27.—C. septentronialis. De Cand. Prodr. v. 1. p. 174. ("excl. syn. Schlecht. pat. in Herb. Willd.")—*Draba* grandis. Langerdorff, MSS.—De Cand. Syst. v. 2. p. 355. De Less. Ic. v. 2. f. 47.

HAB. Aleutian Islands of St. George and St. Paul, i. t. 56°, 57°. Chamisso.—Of this interesting plant I possess beautiful specimens, both from Dr. Fischer and from Chamisso. The latter considers it as the only plant peculiar to the islands just mentioned, and has published an excellent description of it in the *Linnaea* above quoted. In a dried state, the large siliculae are generally pressed flat, whence arose the mistake of considering it a *Draba*. In habit and pubescence it is far removed from the preceding *Cochlearia*.

8. *C. villosa*; siliculis oblongo-lanceolatis stylo apiculatis pedicello dimidio breviori-

bus, foliis oblongis integris basi attenuatis pubescentibus. DC.—Schlecht. in Herb. Willd.
—De Cand. Syst. Veget. v. 2. p. 355. Ejusd. Prodr. v. 1. p. 174.

HAB. Rocky mts. in Unalaschka. (*Herb. Willd.*)—Chamisso, who did not find this plant in Unalaschka, says of it, that it is very nearly allied to the preceding, differing only in the entire lanceolato-oblong leaves and longer silicles.

TRIB. III. THLASPIDEÆ seu Pleurorhizeæ Angustiseptæ. *Silicula dehiscens, septo angustissimo, valvis carinatis navicularibus. Semina ovalia, interdum marginata. Cotyledones planæ, accumbentes (o=), septo contrariae.—Tribus distinctissima, cum Lepidineis solum conferenda, sed distincta seminibus magis compressis et cotyledonibus accumbentibus. DC.*

15. THLASPI. Linn.

Silicula apice emarginata, valvis navicularibus dorso alatis, loculis 2-poly-spermis. Petala æqualia. Cal. basi æqualis.—Flores albi. DC.

1. *T. arvense*; foliis oblongis dentatis, caulinis erectis, siliculis obovato-orbiculatis pedicello breviribus. DC.—Linn. Sp. Pl. p. 901. Engl. Bot. t. 1659. Pursh, Fl. Am. v. 2. p. 435. De Cand. Prodr. v. 1. p. 175.

HAB. Canada. Mrs. Shepherd; but not general in the country.

2. *T. montanum*; foliis subcarnosulis integris, radicalibus obovatis petiolatis, caulinis oblongis sagittato-amplexicaulibus, petalis calyce majoribus, siliculis obcordatis 4-spermis, stylo filiformi. DC.—Linn. Sp. Pl. p. 902. De Cand. Prodr. v. 1. p. 176.—(*T. præcox*. Wulf. et *T. alpinum*. Jacq.)

HAB. Shores of the Arctic Sea, to the westward of the Mackenzie River; Capt. Sir John Franklin and Capt. Back. One specimen was sent with *T. alpestre*, from Canada, by Mrs. Percival.

3. *T. cochleariforme*; foliis subcarnosulis, radicalibus petiolatis ovatis subdentatis, caulinis cordato-amplexicaulibus, petalis calyce majoribus, siliculis oblongis subemarginatis 8-spermis, stylo brevi filiformi.—De Cand. Syst. Veget. v. 2. p. 381, Prodr. v. 1. p. 176. De Less. Ic. v. 2. t. 52.

HAB. Common on the subalpine ridge of the Blue Mountains, and those of the Flat-head River, on the south branches of the Columbia. Douglas.—Except in the larger size of this plant, and in the more numerous seeds of the cells, it scarcely differs from the preceding.

4. *T. alpestre*; foliis integris vel obscure dentatis, radicalibus c.atis petiolatis, caulinis oblongis amplexicaulibus, petalis calyci subæqualibus, siliculis obcordatis 8–12-spermis, stylo filiformi. DC.—Linn. Sp. Pl. p. 903. Engl. Bot. t. 81. De Cand. Prodr. v. 1. p. 176.

HAB. Canada. Mrs. Percival.

16. HUTCHINSIA. Br.

Silicula elliptica, valvis navicularibus apteris, loculis 2-spermis, rarius polyspermis. Cal. æqualis. Pet. æqualia. DC.

H. calycinæ; cano-pubescentes, foliis plerumque radicalibus profunde pinnatifidis longe petiolatis, calycibus persistentibus, siliculis oblongis utrinque attenuatis stylo acuminatis. (TAB. XVII. f. B.)—Dev. Journ. Bot. v. 3. p. 168. De Cand. Prodr. v. 1. p. 178.—*Lepidium calycinum*. Steph. in Willd. Sp. Pl. v. 3. p. 433.

178.—Lepi-

s. foliis inferioribus omnino integris.

Radix lignosa, subfusiformis, longissime descendens, hic illio fibrosa, superne divisa. *Caulis* brevis, vix digitalis, canescens. *Folia* plerumque radicalia, longa petiolata, profunde pinnatifida, fere pinnata, inferiora nonnumquam, in var. β præcipue, integerrima, spatulata, incisa, pubescenti-tomentosa, juniora præcipue, lacinis linearibus acutiusculis vel obtusis; *caulina* paucis, minora, lacinis paniculatis. *Flores* albi, suavissimi, dense corymbosi, pedicellis longitudinaliter subsequentes. *Calyx* brevis; *sepals* lato-ovatis, valde concavis, albo-marginatis, dorso valde pilosis. *Petala* obovata, sublonge unguiculata, obscure nervosa. *Stamina* edentula. *Antheræ* subtrotundæ. *Germen* oblongum, subhirsutum, superne stylo brevi attenuatum. *Stigma* parvum, capitatum. *Fructus* aheet.

HAB. On the Rocky Mountains, between lat. 52° and 57° .— β . Cape Mulgrave in Behring's Straits. *Lay and Collie in Capt. Beechey's Collection*.—Our specimens from the Rocky Mountains agree in every particular with the Altai plant, which I have received from Dr. Fischer. Those from Cape Mulgrave have sometimes all the radical leaves, and occasionally some of the cauline ones, entire.

TRIB. IV. CAKILINEÆ seu Pleurorhizæ Lomentaceæ. *Siliqua aut silicula transverse in articulos 1-2-loculares, 1-2-spermis secedens. Semina immarginata. Cotyledones planæ, accumbentes (o==), septo (dum adsit) parallelae. DC.*

17. CAKILE. Linn.

Silicula biarticulata, compressa, articulo superiore ensiformi aut ovato. *Semina* in loculis solitaria, superioris erectum, inferioris pendulum. DC.

1. *C. edentula*; silicula articulo superiore ovato acuto edentula.—*Bunias* edentula. *Bigel. Fl. Bost. ed. 1.* (1814), p. 157, ed. 2 p. 251.—*Cakile ægyptiaca. Tussac, Fl. des Antilles. v. 1. p. 17.* (sive *De Cand.*)—*C. americana. Nutt. Gen. Am.* (1818), v. 2. p. 62. *De Cand. Prodr. v. 1. p. 185.*—*Bunias maritima. Pursh, Fl. Am. v. 2. p. 434.*

HAB. Canada. *Pursh.* Strand of the sea coast, and also on the shores of the great northern lakes of the St. Lawrence. *Nuttall.*—First distinguished in North America by Professor Bigelow, whose name I therefore retain. I have never seen sp. *Bunias*. According to *De Candolle*, it extends to the West Indian Islands.

SUBORD. II. NOTORHIZEÆ (o ||). *Cotyledones planæ, incumbentes. Radicula dorsalis, nempe medio dorso cotyledonum incumbens. Semina ovata. DC.*

TRIB. V. SISYMBREÆ seu Notorhizeæ Siliquosæ. *Siliqua bilocularis, longitudinaliter dehiscens, valvis concavis carinatis. Semina ovata aut oblonga, immarginata. Cotyledones planæ, incumbentes, septo contrarie. Tribus distinctissima ex characteribus spermis, sed habitu ad Arabideas accedentes. DC.*

18. HESPERIS. Linn.

Siliqua tercariuscula aut subtetragona (vel compressa). *Stigmata* duo, erecta, conniventia. *Cal. basi bisaccatus. Semina* subtriquetra. *Stamina* edentula. DC.

1. *H. matronalis*, pedicellis calycis longitudine, petalis obovatis, siliquis erectis torosis glabris margine non incrassatis, foliis ovato-lanceolatis dentatis, caule cresto subsimplici. DC.—*Linn. Sp. Pl. p. 927.* (et *H. inodora. Ejusd. et Engl. Bot. t. 731.*) *De Cand. Prodr. v. 1. p. 189.*

HAB. Shores of Lake Huron. Dr. Todd.

2. *H. pygmaea*; foliis linear-lanceolatis basi attenuatis integris dentatis, pube bipartita appressa, siliquis numerosis erectis compressis pubescentibus, caule erecto simplici. (TAB. XIX.)—*Cheiranthus pygmaeus*. “*Adams in Mem. Soc. Nat. Mosc.* 5. p. 114.” *De Cand. Syst. Veget.* v. 2. p. 187, *Prodr.* v. 1. p. 137.—C. Pallasii? *Pursh, Fl. Am.* v. 2. p. 436. *De Cand. Prodr.* v. 1. p. 136.

Radix annua, subsusiformis, parce fibrosa. *Planta tota*, (petalis staminibusque exceptis,) pube bipartita, arctissime appressa atque longitudinaleiter disposita magis minusve tecta. *Caulis* solitarius, erectus, simplex, vix digitem longus, nisi fructiferus, ubi spithameus, paululum flexuosus, teres, subangulatus, purpureo-viridis, parce foliosus. *Folia* pleraque radicalia, que numerosissima, patentia, linear-lanceolata, acuta vel acuminate, basi in petiolum longisculum attenuata, integra, subdentata, nunc sinuato-dentata: *caulina* radicalibus similia sed minora. *Corymbus* multiflorus, demum, fructiferus, longe racemosus. *Pedicelli* calycis longitudine. *Calyx* erectus, sepala linearibus obtusis, duobus basi saccatis. *Petala* magna, purpurea, obovata, unguiculata, venosa. *Stamina* calyce paulo longiora. *Antheræ* lineares. *Pistillum*: *Germen* lineare, compressum: *Style* brevis: *Stigma* bilobum, lobis erecto-coniventibus, intus glandulosis, albidis. *Siliqua* numerose, erecte, vel erecto-falcate, linear-ensiformes, compresse, pallide purpureo-fuscae, *stigmate*, nunc obscure bilobo, terminante. *Valva* fere omnino plane, pubescentes, linea media longitudinali elevata notatae, ad marginem sequeles. *Semina* uniserialia, subovalia, pallide fusco-aurantiaca. *Podospermum* gracile. *Radicula* cotyledonibus paululum longior, dorsalis.

HAB. On the north-west shores of America, opposite Kamtchatka. *Herb. Pall.* Bear Lake, and thence to the shores of the Arctic Sea. *Dr. Richardson.* Cape Lisburne and Kotzebue's Sound. *Lay and Collie in Capt. Beechey's Collection.*—The place of growth of the *Cheiranthus Pallasii* of *Pursh*, so nearly corresponding with that of our plant from Captain Beechey's Collections, together with the description of *De Candolle*, taken from the original specimens in Mr. Lambert's Herbarium, give me great reason to believe that it is identical with that which I here figure and describe. Indeed, *De Candolle's* character is at variance only in one point, namely, where he speaks of the *siliqua* as *teretiuscula*, whereas ours are plane. I am assured by my excellent friend Mr. Prescott, that our plant is the same with the *Cheiranthus pygmaeus* of *Adams* and *De Candolle*, and the description is characteristic; but when I came to examine the seeds, I found it necessary to remove it from *Cheiranthus* and the rest of the *Pleurorrhizæa*, and to place it among the *Notorrhizæa*, where I presume it will rank in the present genus, notwithstanding the very flattened nature of the *siliqua*. Its place should be near *Hesperis aprica* of *Poiret* and *De Candolle*, with which it agrees in general habit and size, differing in the narrower leaves, not hispid, but clothed with closely appressed, bipartite hairs, and in the more numerous and greater length of the seed-vessels. This species is probably scarcely found to the south of the arctic circle.

TAB. XIX. *Fig. 1*, Flowering plant, and *fig. 2*, Plant in fruit:—natural size. *Fig. 3, 3, 3*, Leaves; *fig. 4*, Hair; *fig. 5*, Sepal; *fig. 6*, Petal; *fig. 7*, Stamens and pistil; *fig. 8*, Pistil; *fig. 9*, Siliqua:—natural size. *Fig. 10*, Seed; *fig. 11*, Section of do.:—all but *figs. 1, 2, and 9*, more or less magnified.

3. *H. Menziesii*; foliis spathulatis carnosis, pube bipartita appressa, siliquis (junioribus) patentibus, caule brevissimo erecto simplici.

HAB. California. *Mr. Menzies*.—My specimens of this plant are imperfect; but it has a great similarity with the preceding, whence I am led to arrange it here. The root is very long, woody, branched, perennial. The leaves mostly radical, vastly broader than the preceding, and truly spathulate, somewhat fleshy; and, as are the stem, pedicels, and calyx, sparingly clothed with bipartite and appressed pubescence. Flowers rather larger than *H. pygmaea*; but from being ill dried, I am unable to say whether they are purple or not. Young pods much spreading. This has all the appearance of being a truly perennial plant.

HAB. Canada. *Pursh.* Mouth of the Columbia. *Scouler.*

* * * Irio. *Siliqua* teretes. *Semina* ovata, subtriquetra. *Flores* flavi. *DC.*

3. *S. curvisiliqua*; erectum ramosum, foliis lanceolatis pinnatifidis acutis glabris basi sub-
amplexicaulibus, segmentis linear-lanceolatis patentibus, summis subintegris, racemo
fructifer elongato, siliquis linearibus curvatis acuminatis, pedicello duplo longioribus.

Radix parva, annua. *Caulis* erectus, vix pedalis, superne præcipue ramosus, sub lente, pilis min-
tissimis, sparsis scabriusculis. *Folia* 2, 3 uncias longa, lanceolata, acuta, glabra, pinnatifida, basi plerumque
auriculata, semiamplexicaulia, laciniis patentibus, linear-lanceolatis, acutis, integris; *inferiora* subpectinato-
pinnatifida, *superiora* miuora, basi subagittata, reliqua subintegra. *Flores* parvi, corymbosi, flavi. *Calyx*
patens. *Corolla* calyce longior. *Siliqua* longe racemosae, teretes, in stylo brevi acuminate, lineares, fal-
cate, subunciam longæ, subtorulose. *Valvæ* leves, glabrae. *Semina* biserialia.

HAB. Common on the North-West coast of America, lat. 47°, 48°, in sandy soils, near streams. *Douglas.*
—This species belongs to De Candolle's 2d division of his section *Irio*, but that includes no one to which
it can be referred. Its nearest ally is perhaps the *S. sinuatum* of Nuttal's MSS. (from the Arkansas,) which
I possess from that gentleman, but without fruit. The leaves of it are in many respects similar to those of
our plant, but the segments are more numerous and shorter, and the flowers are considerably longer.

4. *S. sophioides*; foliis bipinnatifidis, lobis ovatis lanceolatis incisis, pedicellis (petalis-
que) calyce subbrevioribus, floribus siliisque linear-filiformibus falcatis umbellato-
corymbosis. (TAB. XX.)—*Fischer, MSS.*—*S. Sophia. Cham. et Schlecht. in Linnaea, v. 1.*
p. 28.—*S. Sophia, var? Rich. in Frankl. 1st Journ. ed. 2. App. p. 27.*

Radix crassiuscula, descendens, annua. *Caulis* solitarius, pedalis ad bipedalem, erectus, flexuosus,
ramosus, striatus, subnitidus, ut et folia juniora glandulos-pubescentia. *Folia* plurima radicalia, pinnatifida,
fere pinnata, pinnis iterum pinnatifidis ovatis lanceolatisque, juniora glandulos-pubescentia, *adulta* glabra,
suprema segmenta angustioribus. *Flores* in corymbis umbellatis, pedunculatis, subaphyllis, terminalibus
axillarisbusque. *Rachis* semper glandulos-pubescentia. *Flores* parvi, densi, intense flavi. *Pedicelli* breves,
graciles, plerumque glaberrimi. *Calyx* sepalis ovalibus, glabris, obtusis. *Petala* calyce vix paululum brevi-
ora, obovato-lanceolata. *Antheræ* subglobose. *Siliqua* numerose, dense et ita compactæ, ut fere exacte in
umbellam dispositæ videantur, non raro secunda, biunciales et ultra, pedicello triplo longiores, paululum
falcatae, anguste lineares, teretes; *stylus* brevissimos, stigmateque parvo capitato, terminatæ. *Valvæ* dorso

medio uninervia. *Semina uniserialia, ferruginea, oblonga, ad apicem attenuata. Cotyledones graciles, in-*
cumbentes.

HAB. York Factory in Hudson's Bay, to the shores of the Arctic sea, westward of the Mackenzie River. *Dr. Richardson; Drummond; Capt. Sir John Franklin; and Capt. Back.* Kotzebue's Sound and Bay of Eschscholtz in Behring's Straits. *Chamisso; Lay and Collie in Capt. Beechey's Collection.*—Numerous specimens from very different parts of the interior and extreme north and north-west coast of America, all agreeing in the same characters, have induced me to coincide with my friends Dr. Fischer and Dr. Richardson in considering this species distinct from our European *S. Sophia*, which has generally more divided leaves, more elongated corymbs or racemes, and shorter pods. I have not seen the true *S. Sophia* from any part of North America. The species so called by Pursh, Nuttall considers to be a new plant, allied to *S. album* of Siberia; while Elliott refers it to *S. canescens*. Our plant has much longer pods than any of the present division with bipinnatifid leaves, except *S. persicum*. Dr. Fischer's specimens of *S. sophioides* from Kotzebue's Sound, are precisely the same as ours.

TAB. XX. Plant:—natural size. *Fig. 1.* Flower; *fig. 2.* Stamen; *fig. 3.* Petal; *fig. 4.* Pod; *fig. 5.* Seed; *fig. 6.* Embryo; *fig. 7.* Section of do.:—magnified.

5. *S. canescens*; cano-pubescent, foliis bipinnatifidis, lobis ovatis lanceolatibus obtusis dentatis, petalis calycem æquantibus, siliquis linearibus (brevibus) longe racemosis.

a. *major*; foliorum lobis angustioribus.—*S. canescens.* *Nutt. Gen. Am.* v. 2. p. 68.?
Rich. in Frankl. 1st Journ. ed. 2. App. p. 27. *Elliott, Carol. v. 2. p. 147.* *Torrey in Pl. of R. M. in Ann. of Lyc. N. Y. p. 166.*—Cardamine? Menziesii. *De Cand. Prodr.* v. 1. p. 153?

b. *minor*; foliorum lobis latioribus.

HAB. a. In the low grounds, from lat. 50° to 60°. *Dr. Richardson.* Plentiful about the Saskatchewan and Red Rivers. *Douglas.*—b. In the Rocky Mountains and about Fort Franklin, lat. 66°. *Drummond; Dr. Richardson.* California. *Mr. Menzies.*—I have referred to Nuttall, the original authority, indeed, for this species, with a mark of doubt; because on looking over Dr. Richardson's specimens, he was of opinion that they were distinct from his *canescens*. Nevertheless, his short character sufficiently accords with our plant, save that he describes the pods as clavate, which ours are, only in a slight degree, when the lower seeds in the cells are abortive, occasioning a corresponding contraction in that part of the seed-vessel. I am disposed to think the species has a very extensive range. If Nuttall's and Elliott's plants be the same, it is very common in Carolina and Georgia; and I possess specimens, which I can by no means distinguish from it, gathered near Rio Quinto, in the province of St. Louis, S. America, by Dr. Gillies.

6. *S. brachycarpum*; subglabrum, foliis bipinnatifidis, lobis lanceolatis obtusis integris vel parviter dentatis, petalis calyce majoribus, siliquis linearibus (brevibus).—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 27.*

HAB. From Canada to the Arctic Sea, and across the whole width of the Continent. *Dr. Richardson.* *Drummond.* Great Falls of the Columbia, in low moist soils. *Douglas.*—Habit of *S. Sophia*, but, as Dr. Richardson well observes, easily distinguished by its pods being twice as short, scarcely different from the preceding in that respect, from which again it is separated by its almost glabrous stems and leaves, and in having the petals, in general, but, I think, not always, longer than the calyx. I possess some specimens that I can with difficulty say to which they should be referred.

* * * * * *Arabidopsis. Siliquæ lineares, compressæ, stigmate sessili truncato. Flores albi (vel subrosci) brevissime pedicellati. Pedicelli ebracteati. DC.*

7. *S. humile*; inconspicuous, perenne, caulinis diffusis, foliis integris vel sinuatodentatis radicalibus spatulatis, caulinis lanceolatis basi attenuatis, siliquis linearibus

pedicello quintuplo longioribus tereti-torulosis pubescentibus.—*S. humile*. *Ledebour*, *MSS. ined.*

a. Ledeb.; foliis subintegris.

b. Ledeb.; foliis sinuato-dentatis subpinnatifidis.

Radix sublonge descendens, angusta fusiformis, perennis. *Caulis* rarius solitarii, sepiissime plurimi ex eadem radice, palmates, diffusi, nunc prostrati, simplices vel superne ramosi, pubescens-hirsuti, non raro purpureo flocti. *Folia* omnia magis minusve pubescenti-incans, pube ramosa, versus basim pilis immixta; in *a.* subintegra, in *b.* sinuato-dentata, etiam dentato-pinnatifida; radicalis oblongo-spathulata, obtusa; *caulina* lanceolata, etiam obtusa, rarius subacuta, basi in petiolam attenuata. *Flores* in corymbis parvis terminalibus, majusculi, albi vel pallide purpureo-rosei. *Pedicelli* calycem subsequentes. *Calyx* pubescens-hirsutus, pilis ad apicem longioribus; *sepals* late ovatis, concavis, erectis. *Petala* calyce plusquam duplo longiora, unguiculata, limbo lato, patente, subretuso. *Pistillum*: *germen* cylindraceum, valde pubescens: *Stigma* sessile, obtusum, vix capitatum. *Siliqua* in racemis triuncialibus, pollicem longæ, subcurvatae, lineares, teretes, torulose, pubescentes, in acumen breve terminantes. *Semina* uniserialia, ovalia, fusca. *Cotyledones* incumbentes.

HAB. *a.* Rocky Mountains, between lat. 52° and 57°. *Drummond*.—*b.* About the Mackenzie River, from lat. 60° to 68°. *Dr. Richardson. Drummond*.—This plant has so entirely the habit of some species of *Arabis petraea*, that were it not for the more rounded and torulose pods, I should probably not have ventured to separate them. An examination of the seeds, however, soon convinced me that the plant must be far removed from the genus *Arabis*, as it now stands; and on comparing it with my specimens of *Sisymbrium humile*, communicated by Professor Ledebour, from the Altai, I find them in every respect to correspond; and the two varieties of our North American Travellers precisely agree with the *a.* and *b.* of that excellent Botanist.

8. *S. araboides*; annum, foliis radicalibus lyrato-pinnatifidis, subhirsutis, caulinis linearibus integerrimis catque erecto ramoso glaberrimis, siliquis erectis linearibus strictis pedicello duplo longioribus. (*Tan. XXI.*)—*Arabis lyrata*. *Linn. Sp. Pl. p. 929. Pursh, Fl. Am. v. 2. p. 437. De Cand. Prodr. v. 1. p. 146. Rich. in Frankl. 1st Journ. ed. 2. App. p. 26.*—(These syns. to be expunged from *A. petraea*, p. 42 of this work.)

Radix parva, annua, subfusiformis. *Caulis* erecti, spathulati et ultra, solitarii, vel plurimi ex eadem radice, glabri, subglaci, flexuosi, ramosi. *Folia* radicalia unciam duas tres uncias longa, in rosulam expansa, lyrato-pinnatifida, lobis brevibus inferioribus acutis, parce pilosa. *Caulina* linearia, subunciam longa, integerrima, omnia magis minusve inferne in petiolam attenuata. *Pedicelli* floris longitudine, glaberrimi. *Calyx* omnino glaber, foliolis ovatis. *Petala* oblongo-obovata, calyce plusquam duplo longiora, alba vel purpurascens. *Siliqua* sesquionciam fere ad duas uncias longa, pedicello duplo longior, erecta, stricta, anguste linearis, stylo brevi terminata. *Stigma* parvum, capitatum. *Semina* uniserialia, ovalia, rufo-fusca. *Cotyledones* incumbentes.

HAB. Common on the banks of rivers, from Canada to lat. 68°, and in dry or waste places. *Dr. Richardson*.—Numerous specimens of this plant are in Dr. Richardson's collection, with flowers and fruit. At first I had referred it to what I then considered a variety of *A. petraea*, the *A. lyrata* of Linn. In this opinion I feel almost sure I am correct, and hence I have adopted that synonym above. But the *cotyledons* are decidedly *incumbent*, and the *root* is *annual*. Besides these important characters, by which our plant may be known from *A. petraea*, I find its pods to be more upright, longer, and straighter, especially when perfect. In other respects, particularly in the form of its leaves, and the size and appearance of its flowers, the two are almost identical. Linneus well observes of his *Arabis lyrata*, “*Statura et habitus A. thalianæ, præter quod folia radicalia lyrata, glabra et flores majores.*” And *Arabis thaliana* is equally a *Sisymbrium* having *incumbent cotyledons*.—Whether or not the *Arabis ambigua* of De Candolle, and Chamisso, and

Schlechtendal should be referred hither, as I rather suspect, I do not possess sufficient materials to decide:—it is said to have a biennial root.

TAB. XXI. Plant:—natural size. *Fig. 1*, Flower; *Fig. 2*, Petal; *Fig. 3*, Stamen; *Fig. 4*, Pod; *Fig. 5*, Seed; *fig. 6*, Embryo; *fig. 7*, Section of the seed:—magnified.

* *Erysimastrum*. *Stylus brevis* viz *illus*. *Siliqua tetragona*. *Calyx deciduus*. *Folia nec cordata, nec amplexicaulia*. *Flores distincte pedicellati*.

1. *E. cheiranthoides*; scabriuscum, pube minutissima tripartita, foliis lanceolatis subdenticulatis viridibus, siliquis erecto-patulis pedicello duplo longioribus, stigmate parvo.—*Linn. Sp. Pl. p. 923. Jacq. Austr. v. 1. t. 23. Pursh, Fl. Am. v. 2. p. 436. De Cand. Prodr. v. 1. p. 198. Rich. in Frankl. 1st Journ. ed. 2. p. 27.*

a. ramis elongatis folia multo minora gerentibus.

b. caulibus simplicibus.

HAB. Throughout Canada, and in all the plains westward of the Rocky Mountains, to lat. 67° on the Mackenzie. North-West Coast, lat. 47°, 48°. Douglas. Scouler.—This plant is liable to much variation in its general appearance, depending probably mainly on age and situation. The first year's plant, for it appears to be biennial, would seem to have quite simple stems. In the more usual state, it is much branched, the branches rather short, and bearing leaves not much smaller than those of the stem: whereas, in my var. *b.*, the branches are virgate, and clothed with small narrow leaves.

2. *E. lanceolatum*; pube bipartita appressa ubique incanum asperum, caule subsimplici, foliis lineari-lanceolatis inferioribus plerumque dentatis, unguibus calyce longioribus, siliquis longis erectis, stigmate emarginato.—Br. in Hort. Kew. ed. 2. v. 4. p. 116. De Cand. Prodr. v. 1. p. 199. Cham. et Schlecht. in Linnaea, v. 1. p. 29.—Cheiranthus erysimoides. Linn.—Jacq. Austr. v. 1. t. 74.—an *E. virginatum*? Roth.—De Cand.

HAB. From Canada to the shores of the Arctic Sea, and to the Pacific.—This entirely agrees with my European specimens of *E. lanceolatum*, and also with the figure above quoted in Jacquin; but the leaves are not generally so hoary, nor are the flowers quite so large. Its narrow, more pubescent leaves, shorter pods, and large flowers distinguish this from the simple stemmed varieties of the preceding; its smaller flowers, less hoary foliage, and upright and shorter pods from the following. *Cotyledons* certainly incumbent.

3. *E. (potius Cheiranthus) asperum*; pube bipartita appressa ubique incanum asperum, caule simplici, foliis lineari-lanceolatis integris, radicalibus runcinato-dentatis, unguibus calyce longioribus, siliquis longis patentibus, stigmate bilobo. (TAB. XXII.)—De Cand. Prodr. v. 1. p. 199.—Cheiranthus asper. Nutt. Gen. Am. v. 2. p. 69. (non Cham.) Torrey in Pl. of R. M. Ann. of Lyc. of N. Y. p. 166.

HAB. About Carlton House on the Saskatchewan, lat. 65°. Dr. Richardson. Barren grounds of the Columbia, from the Great Falls upwards. Douglas.—This is a very handsome species, with flowers, as Mr. Nuttall observes, of a bright yellow colour, resembling those of *Cheiranthus Cheiri*, and almost equally fragrant. The pods are three inches long, patent, wavy before they are quite ripe. The great size of the petals, and longer and spreading pods distinguish this from *E. lanceolatum*, to which, in other respects, it is very similar. It seems to have been originally detected by Mr. Bradbury on the banks of the Missouri, at a distance of 1100 miles from its mouth.—I possess that traveller's original specimens, named by Mr. Nuttall,

which precisely accord with these from Carlton House and the Columbia. Dr. Torrey says that the plant is very bitter, particularly the root, and is used as a medicine by the Indians of the Platte. Of the present plant I regret not to have perfect fruit. The seeds in the fully formed, but yet unripe pods, have the embryo not conduplicate, but curved, and the curvature is directed towards the margins of the cotyledons, hence the latter are *accumbent*. Thus will this plant, together with many others, have to be removed from the division of the order in which they are placed, on account of the supposed structure of the embryo. Daily experience proves that primary divisions taken from this character, are neither convenient in practice nor do they guide us to a natural arrangement.

21. CAMELINA. *Crantz.*

Silicula obovata aut subglobosa, valvulis ventricosis cum styli parte dehiscentibus, loculis polyspermis. Stylus filiformis. Semina oblonga, immarginata. DC.

HAB. In the Bay of Eschscholtz. *Chamisso.*

22. BRAYA. *Sternb. et Hoppe.*

Siliqua brevis, teres, torulosa, stylo terminata, valvis subsemicylindraceis. Stigma planiusculum. Dissepimentum medio fissum. Semina quoque loculo subsex. Calyx basi aequalis, sepalis erectis.—Perennes, radice crassa longe descendente. Folia pleraque radicalia, angusta. Scapi breves nunc foliosi. Flores parvi, corymbosi, purpureo-albi.

1. *B. alpina*; foliis glabris, scapo parce folioso, racemis fructiferis capitatis.

a. *europea*; stylo brevissimo.—*B. alpina. Sternb. et Hoppe in Bot. Geselsch. Reg. v. 1. p. 66. t. 1. Hook. Ex. Fl. v. 1. t. 121. De Less. Ic. v. 2. t. 22.*

β. *americana*; stylo longiusculo gracili.

HAB. β. Alpine rivulets among the Rocky Mountains, between lat. 52° and 57°.—The few specimens of this in Mr. Drummond's collection are in an excellent state of fructification, and they differ in no respect from the European plant in my possession from the Carinthian Alps, except in the greater length of the style, which, indeed, is very striking. I have already noticed, in the Exotic Flora, that the genus had been hitherto referred to the *Pleurorhizaceæ*, whereas, its cotyledons are decidedly *incubent*. So short, too, is the seed-vessel, that it has almost as great a claim to be ranged with the *Siliculoseæ* as the *Siliquoseæ*. In habit, it accords with *Parrya*, *Eutrema*, and especially with the following genus, *Platypetalum* of Brown.

2. *B. glabella*; foliis glabris, scapo plerumque folioso, racemis fructiferis laxis elongatis.—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 25. De Cand. Prodr. v. 1. p. 141.*

HAB. Arctic America; on the Copper Mountains; and principally on the shores of the sea between the Mackenzie and Coppermine Rivers. *Dr. Richardson.*—Excellent specimens of this, brought home by Dr. Richardson from the Second Arctic Land Expedition, quite confirm the distinguishing characters given by that gentleman in his Botanical Appendix. He adds, in the margin of his own copy, from notes taken on the spot, that the "scape is sometimes hairy, with bifurcated pubescence, and that the flowers are white, with a slight and partial tinge of purple."

3. *B. pilosa*; foliis pilosis, scapo aphylllo, racemis demum elongatis. (TAB. XVII.)

Radix perennis, fusiformis, lignosa, longe in terram descendens, et versus apicem ramosa, superne ad collum divisa, et plurimas rosulas foliorum sustinens. Folia omnia radicalia, patentia, densa, lineari-lanceo-

lata; obtusa, inferne pauculum attenuata, utrinque marginaque pilosa, pilis plerumque simplicibus. Scapi plurimi ex eadem radice, vix digitem longi, pubescentes, omnino aphylli. Flores majusculi, albi, fragrantes, primum in corymbum compactum dispositi, demum racemosi. Pedicelli breves, vix calyce longiores. Sepala late ovata, concava, aequalia, margine glabro, membranaceo, dorso pubescente. Petala calyce duplo longiora; unguis angusto calyce breviore, lamina fere orbiculari, subretusa. Stamina calycem vix longitudine exceedentia. Antheræ breves, subrotundæ. Germen fere exacte ovale, dense pubescenti-pilosum, biloculare, valvis valde convexis, stylo subdimidio breviore terminalatum. Stigma dilatatum, obscure bilobum. Semina seu ovula sub-8, quoque loculo bisorialia.

HAB. Found only on the sandy shores of the Arctic Sea, at the mouth of the Mackenzie River, lat. 70°. Dr. Richardson.—It is much to be regretted that so interesting a plant as the present, found only in one spot, and that not likely to be again visited by men of science, should be wanting in the very part of the fructification by which alone its genus can be satisfactorily determined. In habit it agrees almost equally well with *Platypetalum* as with *Braya*; but the flowers are larger and far more showy than either, while the germen, and, I may add, the remains (dissepiment) of a former year's capsule, agrees in its comparative length and breadth better with the former than with the latter: but the valves of the germen are remarkably convex, and the style is more than half its length; so that, in all probability, it ought to constitute a new genus. Dr. Richardson compares the smell of the blossoms to that of *Lilac*.

TAB. XVII. A. Plant:—natural size. Fig. 1, Flower; fig. 2, Petal; fig. 3, Stamen; fig. 4, Germen; fig. 5, More advanced germen; fig. 6, The same, with the valve (fig. 7) removed, to show the ovules, or young seeds; fig. 8, Leaf:—moro or less magnified.

23. PLATYPETALUM. Br.

Silicula ovalis, polysperma, valvis convexis. Stylus brevissimus. Calyx subpatens. Petalorum laminae dilatatae. Cotyledones incumbentes. Br.

1. *P. purpurascens*; stigmate bilobo patenti, stylo manifesto, scapis nudis unifoliisque pubescentibus, siliculis glabriusculis. (TAB. XXIII.)—Br. in Parry's 1st Voy. App. p. celxvii.—*Braya arctica*. Hook. in Parry's 2d Voy. App. p. 387.

HAB. Arctic shores and islands of America. *Capt. Ross, Parry, Sabine*; Dr. Richardson; extending even to Spitzbergen, at Heela Cove. (Capt. Parry.)—So completely has this the habit of *Braya*, that, without the perfect fruit, it is scarcely possible to distinguish it. Mr. Brown has admirably described it, both generically and specifically, and there remains nothing for me but give a figure, which I have done, in part from Melville Island specimens, gathered by Captain James Ross, and in part from Dr. Richardson's, which are generally larger, and have the fruit more oblong in most instances, as seen at C, and fig. 6.

TAB. XXIII. A, B, et C. Plants:—natural size. Fig. 1, Flower; fig. 2, Petal; fig. 3, Stamen; fig. 4, Germen; fig. 5, 6, Capsules; fig. 7, Seed; fig. 8, Section of seed; fig. 9, Embryo:—magnified.

2. *P. dubium*; stigmate indiviso subscissili, siliculis scapisque pubescentibus.—Br. in Parry's 1st Voy. App. p. ccxxvii.

HAB. Melville Island. Capt. Sabine.—“Floribus ignotis, dubie generis planta, cuius exemplaria tria in Herb. D. Sabine extant. Cotyledones certe incumbentes et linearis, basibus tamen crus radiculare embryonis vix occupantibus.” Br.

24. EUTREMA. Br.

Siliqua (abbreviata) anceps, valvis carinatis, dissepimento (nonnunquam) incompleto. Cotyledones incumbentes.—(Herba habitu omnino Brayæ et Platypetalii, quibus maxime affine genus, distinguendum facile siliqua ancipi, dissepimento incompleto, et seminum funiculis. Br.)

HAB. Arctic Sea-shore and Islands: first found in Melville Island by Mr. Edwards and other officers
of Captain Ross's Expedition. Coast, eastward of the Coppermine River. DR. RICHARDSON.—The admir-
able description and the inimitable figures of this plant, given by Mr. Brown in the Appendix to Captain
Parry's First Voyage, leave nothing for me to notice, save that the fructified specimens sometimes attain,
if they do not exceed, a foot in length.

2. *E. arenicola*; siliculis lato-linearibus, dissepimento completo, foliis obovato-spathu-
latis. (TAB. XXIV.)—Richardson's MSS.

Radix perennis, fusiformis, inferne fibrosa, superne saepe multicaulis. *Caulis* plerumque breves, sed non
raro innovationibus elongati, ad apicem dense foliati. *Folia* in rosulam expansa, obovata, longe petiolata,
subcarnosa, glabra, integerrima vel parce dentata, viridi vel purpurascens, petiolis subuncinatis longis, basi
dilatatis, membranaceis. *Scapi* digitales, foliosi, foliis subaequalibus obovatis, plerumque integerrimis. *Flores*
in corymbo parvo dispositi. *Calyx* e foliolis 4, basi aequalibus, erectis, lato ovalibus, obtusis, glaberrimis, sub-
viridi-purpureis. *Corolla*: *Petala* obovata in petiolum attenuata, alba, calyx duplo longiora. *Stamina* 6.
Filamenta filiformia, alba: *Anthera* parva, subrotundata, didyma, flavae. *Siliqua* abbreviata, seu *siliqua* 6-8
lineas longa, in racemum disposita, pedicello vix duplo longiora, brevissime stipitata, lato-lineares, ancipiti-
subcompresso, viridi-fusca, stigmate subcapitato fere sessili terminatae. *Valva* sub lente obscure reticulatum
venosae, dorso carinata, uninerves. *Dissepimentum* completum, membranaceum, album, nonnunquam (non
sempre) linea media obscura longitudinali notatum. *Semina* numerosa, 16-20 singulo loculo, subovalia,
pallide rufo-fusca, immarginata. *Podospermum* breve, gracile. *Embryo* luteus. *Cotyledones* plano-com-
presso, paululum canaliculata, incombentes.

HAB. Deep sand upon the shores of Arctic America, between long. 107° and 150°. DR. RICHARDSON.
Capt. Sir John Franklin and Capt. Back.—This has so entirely the habit of *Eutrema Edwardsii*, that, notwithstanding the absence of Mr. Brown's most essential character of that genus, namely the incomplete
dissepiment, I cannot hesitate about referring it there. From its place of growth, in deep and moving sand,
the stems, which are naturally short, present a singular appearance. In the specimen here figured, for example, the stems are remarkably elongated, and exhibit innovations of four years' growth; each year's
shoots having been covered with sand, the succeeding shoots were elongated that the leaves and flower-stalks
might rise to the surface. The stalks which produce flowers I consider to be *scapes*, because, though bearing
several leaves, they die down to the root-stems annually.

b. foliis radicalibus pubescentibus.

HAB. a. California. Mr. Menzies. b. Upon the eastern declivity of the Rocky Mountains, lat. 52° , 56° .
Drummond.—This has the pinnatifid stem-leaves of the British *L. ruderale*; but the radical leaves are bipinnatifid, and in a. remarkably hispid. De Candolle assimilates it to *L. virginicum*, which again leads me to think that he has confounded that plant with the more frequent *ruderale*, to which the present is, I fear, too closely allied. *Cotyledons* decidedly *incubent*.

3. *L. virginicum*; floribus 2-3-andris tetrapetalis, foliis caulinis lineari-lanceolatis inciso-serratis, siliculis ovali-orbicularibus (majusculis) emarginatis patentibus, cotyledoniibus accumbentibus. Linn. Sp. Pl. p. 900. Mich. Am. v. 2. p. 27. Pursh, Fl. Am. v. 2. p. 435. Elliott, Carol. v. 2. p. 140.—*L. Iberis*. Schkuhr, Handb. v. 2. t. 180.

HAB. Canada?—I have not, it must be confessed, any British American specimens of this plant: nor can I aver that it is a native of that country: but as I possess it from the New England States, I can scarcely doubt but it exists in Upper Canada. All that I have yet received from Canada, as *L. virginicum*, prove, however, to be *L. ruderale*; to which, indeed, this plant bears so close a resemblance, that without an examination of the embryo, they can scarcely be distinguished. In the present species, the cotyledons are truly *accumbent*, as represented by Schkuhr. Hence De Candolle has probably confounded the *L. ruderale* with it, for he describes the cotyledons as *incubent*. The flowers are extremely small, and bear petals. The siliculae are larger, and perhaps more nearly orbicular, and the plant is less profusely branched.

28. CAPSELLA. Vent.

HAB. On moist ground, near the Great Falls of the Columbia. Fl. April, May. Douglas.—I long hesitated whether or not I should unite this interesting plant with the genus *Tauscheria* of Dr. Fischer, with which it sufficiently accords in habit, and, in many respects, in the singular structure of the seed-vessel. In both the species of *Tauscheria*, however, of which I have excellent specimens from Dr. Fischer and Professor Ledebour, the *silicula* is truly cymbiform, the margin is curved inwards, and the extremity, instead of being broad and notched, as in *Thysanocarpus*, is narrow and elongated into a beak, like the narrow prow of a vessel. Its perfect embryo I have not been able to examine; but in our plant, this has always its radicle inserted at the back of one of the cotyledons, and then inclines obliquely, so that the greater part of its length is applied to the edge or margin of the cotyledon. In the figure here given, the seed did not occupy the whole of the cavity of the cell, as was the case with more fully ripe capsules, given to me by Mr. Douglas after the plate was engraved, and which, I believe, were produced by plants cultivated in the Garden of the Horticultural Society.

TAB. XVIII. A. *Thysanocarpus curvipes*; and a fructified extremity of a plant:—natural size. Annum. *Radix parva*, subfusciformi-fibrosa. *Caulis* spithameus et ultra, erectus, flexuosus, ramosus, ut et fero tota planta magis minusve glanduloso-pilosus, subvicosus, setidus. *Rami* erecto-pateentes. *Folia* petiolata, trifoliolata, foliolis unclam sesquilunciam longis, oblongo-ellipticis, integerrimis, basi attenuatis; *Petiolae* glandulosi, folio vix longiores. *Folia* suprema vel bractea, simplicia, lanceolata, breve petiolata. *Flores* terminales, numerosae, corymboso-racemosi. *Pedicelli* unclam longi, graciles, pubescentes. *Cal.* e foliis 4, subpatentibus, equalibus, oblongo-lanceolatis, acutis, purpureis, dorso glanduloso. *Petala* pallide sulphurea, fere albida, calyce duplo longiora, longe unguiculata, ungue exserto, limbo late ovato, profunde emarginato. *Stam.* subundecim, antrum curvata, petalis paululum longiora, basi colummodo monadelpha, hinc uniglandulosi, glandula majuscula, subtetragona, carnosia. *Filamenta* filiformia, purpurea, glabra. *Anthera* oblonga, flavo, bilocularis, sicciate curvatae. *Pistillum*: *Germen* lineare. *Stylo* filiformi, purpureo, duplo longius, pubescenti-glandulosum. *Fructus*: *Siliqua* sesquilunciam fere ad duas uncias longa, linear-lanceolata, acuta, toros, inferne in atipito brevi attenuata, ubique pilis vel aculeis brevibus, mollibus, glandulos-viscidis tecta, stylo demum deciduo terminata, unilocularis. *Semina* numerosa, fusca.

HAB. Lake Champlain. DR. Bigelow. About Montreal. MR. Cleghorn.—This very pretty species, rendered particularly elegant by the purple hue of its calyx and the pale sulphur colour of its notched petals, does not seem to be by any means general even in the United States. I have received it only from my friend Dr. Torrey, who gathered it at West Point, near New York, and Mr. Nuttall states it to be an inhabitant of the sandy shores of Lake Erie, and the margins of the Mississippi and the Missouri. DR. Bigelow gives it as an inhabitant of Lake Champlain, which station I have here introduced, from a persuasion that it must grow on the Canadian as well as on the opposite side of the Lake, since I possess specimens from near Montreal, which is quite in its vicinity.

1. *H. canadense*; (*Sect. Lecheoides*;) exstipulata, caule erecto vel ascendente suffruticoso ramose pubescente, foliis oblongis pubescenti-hirsutis subtus incano-tomentosis in margine revolutis, calycibus hirsutis, staminibus sub-20, floribus serotinis apetalis capsulisque reliquis 5-plo minoribus.—*Mich. Am.* v. 1. p. 308. *Pursh, Fl. Am.* v. 2. p. 263. *Sweet, Cistin. t. 21. De Cand. Prodr.* v. 1. p. 269.—*Cistus canadensis* *Willd.*—*Bigel. Fl. Bost.* ed. 2. p. 47.—*Lechea major*. *Linn. Amer. Acad.* v. 3. p. 11. (excl. fig.) according to *Smith*.

HAB. Canada. *Michaux*.—Few persons on seeing an early shoot of this, with its few terminal flowers, having large hairy calyces, ample yellow petals, and capsules half-an-inch broad, would take it for the same plant as it appears at an after period, throwing out many branches from above, these again bearing leafy racemes, with numerous axillary small flowers and shortly downy calyces, without petals, and capsules not larger than a moderately sized pin's head. Yet such is the case, and the plant then looks so much like a *Lechea*, that it has probably been described as such: indeed, certainly so, according to *Smith*, by *Linneus*. Sometimes the whole plant bears only such small flowers; at other times, as in specimens given me by Dr. *Boott*, from the neighbourhood of Boston, the lower part has a few large lateral capsules, while all the branches above produce the small ones in question. Dr. *Bigelow* observes of this plant, that at the beginning of frosts the bark cracks and rolls backwards, at which time the fragments are found connected by a mass of fibrous, icy crystals, and Mr. *Eaton*, in his useful Manual of Botany, remarks, that at the foot of the Pine-rock, New-Haven, in November and December, 1816, he has seen hundreds of these plants sending out broad, thin, curved ice crystals, about an inch in breadth, from near the roots. These were melted away by day, and renewed every morning, for more than twenty days in succession.

2. LECHEA. *Linn.*

Cal. 3-sepalus, bracteis sepalis duobus exterioribus stipatus. Pet. 3, lanceolata. Stam. 3-12, sibi numero teraria. Ovarium 1, subtrigonum. Stigmata 3, vix distincta. Capsula 3-valvis, valvis medio septi aut nerviferis; semina septo nervo adfixa, paucissima, sibi 8; albumen carnosum. Embryo dorsalis rectiusculus, radicula infera, cotyledonibus ovato-oblongis.—Herba boreali-Americanæ incompta, floribus numerosis, parvis, ramis infimis a floriferis sape diversis.

1. *L. villosa*; ramis radicalibus prostratis villosis, foliis oblongo-lanceolatis mucronatis pilosis, panicula brevi foliosa, floribus fasciculato-fibrosis secundis brevissime pedicellatis, caule erecto.—*Elliott, Carol.* v. 1. p. 184. *De Cand. Prodr.* v. 1. p. 285.—*L. major*. *Mich. Am.* v. 1. p. 76. (non *Linn.*) *Pursh, Fl. Am.* v. 1. p. 90. *Bigel. Fl. Bost.* ed. 2. p. 46. *Torrey in Fl. of Mid. Un. St. v. 1. p. 160.*—*L. minor*. *Linn. et Sm. in Rees' Cycl.*—*Lam. Ill. t. 52. f. 2.*

HAB. Canada. *Kalm*; *Pursh*.—Sir James E. *Smith* had long ago, in *Rees' Cycloedia*, recommended the abolishing the name *Lechea major*; *Linneus'* original specimen, (which he afterwards confounded with other things,) being our *Helianthemum canadense*; but it appears that the plant so called by *Michaux*, *Pursh*, and *Bigelow*, is a true *Lechea*; hence, to avoid confusion, Mr. *Elliott*, the estimable author of the Flora of Carolina and Georgia, has given to the latter the name of *villosa*, which has been adopted by *Nuttall* and *Dr. Candolle*. It is the tallest and broadest-leaved of the genus, and, in most instances, the leaves are elliptical, and not unfrequently ternately or quaternately whorled, those of the radical shoots and lesser branches of the stem being the smallest.

2. *L. minor*; ramis radicalibus prostratis villosis, foliis linearibus seu linear-lanceo-

basi flexus.

Han. Gravelly hills, Canada. *Pursh.* North side of Lake Winnipeg. *Drummond.*—Only one specimen of this exists in the collections of our Arctic Travellers; and it has the root-shoots perfect, but the stem and branches have lost all their leaves, and bear only a panicle of ripe capsules. It would hence appear that the upright and flowering branches die down in the autumn; and that our Travellers in passing through the country of this plant, were either too early or too late to meet with it in perfection. It is frequent in the New England States, and in all probability too in Upper Canada. *Lechea racemulosa* Dr. Boott finds in similar situations near Boston, United States; but except in its larger growth, and in having some of the stem-leaves broader, I can scarcely distinguish it from *L. minor*; an opinion in which I am happy to be confirmed by Dr. Torrey. The two remaining American species of this genus, *L. thymifolia*, Mich., and *L. tenuifolia* of the same author, are confined to the more southern of the United States.

3. HUDSONIA. *Linn.*

Obs. In drawing up the account of the present genus, I have derived much assistance from the labours of the Rev. Lewis Schweinitz, in the American Journal of Science, from Dr. Torrey in his Flora of the Northern and Middle Sections of the United States, and from Capt. Le Conte in his Observations on the North American species of the genus *Viola*, published in the 2d vol. of the Ann. of the Lyceum of Nat. Hist. of New York; as well as from numerous authentic specimens that have been communicated to me by Mr. Schweinitz, Dr. Torrey, Mr. Nuttall, and Dr. Boott: those of the latter gentleman from the neighbourhood of Boston, are particularly valuable, not only in consequence of their great similarity with the Canadian plant, but as serving to illustrate the species of Dr. Bigelow's Florula of Boston. Notwithstanding all these aids, so variable are the individuals of which the genus is composed, that even the authors who have had the best opportunities of examining them in their native stations, have been puzzled to distinguish species from mere varieties; and, in describing them from dried specimens, the difficulty is infinitely increased.

SECT. I. NOMIMUM. *Ging. in DC.* *Stigma rostratum, foraminulo ad extremitatem rostro sato; rostrum plus minus recurvum, nunc deorsum marginatum et tunc planiusculum et obliquum, nunc absque margine et tunc deorsum convexiusculum.* *Stylus ab apice ad basin attenuatus. Stamina oblonga approximata. Torus planiusculus. Capsula sapius trigona. Semina 15-27. Folia seminalia saye obovata vel oblonga.* DC.

* *Caules subnulli.*

1. *V. pedata*; subpubescens, stigmate incrassato oblique brevirostrato truncato perforato, foliis multipartitis, segmentis linearibus inferioribus hinc pinnatifidis.—*Linn. Sp. Pl.* p. 1323. *Mich. Am.* v. 2. p. 151. *Pursh, Fl. Am.* v. 1. p. 171. *Elliott, Carol.* v. 1. p. 300. *Curt. in Bot. Mag.* t. 89. *Torrey, Fl. of Un. St.* v. 1. p. 249. *De Cand. Prodr.* v. 1. p. 291. *Schwein. Viol. in Sill. Journ.* v. 5. p. 50. *Le Conte in Ann. Lyc. of N. Y.* v. 2. p. 147.—*V. digitata.* *Pursh, Fl. Am.* v. 1. p. 171.—*V. pinnata.* *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 8.

HAB. Canada, frequent; and as far north as lat. 53° on the Saskatchewan. Dr. Richardson; Drummond.—Flowers blue, sometimes white, according to Le Conte; sometimes pale, with the two upper petals deep red-purple, when it becomes the *V. flabellifolia*, Lodd. Bot. Cab. t. 777.—It comes very near the true *V. pinnata*, but the structure of its leaves is different.

2. *V. palmata*; pubescens, stigmate triangulare-marginato, foliis hastato-cordatis palmato-lobatis, lobis angustis latioribusque raro exterioribus cordatis indivisis.—*Linn. Sp. Pl.* p. 1323. *Mich. Am.* v. 1. p. 171. *Curt. Bot. Mag.* t. 535. *Pursh, Fl. Am.* v. 1. p. 172. *Elliott, Carol.* v. 1. p. 300. *Bigel. Fl. Bost. ed. 2.* p. 95.? *Torrey, Fl. of Un. St.* v. 1. p. 250. *Schwein. Viol. in Sill. Journ.* v. 5. p. 51. *De Cand. Prodr.* v. 1. p. 291. *Le Conte in Ann. Lyc. of N. Y.* v. 2. p. 189.

HAB. Canada. *Le Conte.*—This is allowed by all to be a very variable species. It is seen with its most distinctive characters in Bot. Mag., above quoted. When the leaves are more deeply divided, it has affinity with *V. pedata*; but generally they are less divided; the outer ones, and sometimes the whole of them, are quite entire, when I scarcely know how the species is to be distinguished from *V. cucullata*. The same plant too, at different seasons of the year, may possess all these differently formed leaves. Professor Bigelow seems to be of opinion that it is a state of the latter mentioned species. It does not exist in the collections

of our North American Travellers. Le Conte says it is better known by its habit than any character that can be assigned to it.

3. *V. asarifolia*; stigmate clavato-capitato recurvo immarginato (*Schwein.*), foliis cuculatis lato-cordatis reniformibus nunc sagittatissime et subpalmatis lobatis omnibus crenato-dentatis in petiolam decurrentibus.—*Pursh, Fl. Am.* v. 2. p. 732. (not *Muhl. Cat.*) *Schwein. Viol. in Sill. Journ.* v. 5. p. 54. *Elliott, Carol.* v. 1. p. 299. *De Cand. Prodr.* v. 1. p. 292. *Le Conte in Ann. Lyc. of N. Y.* v. 2. p. 141.—An *V. congener*, *Le Conte, l. c. p. 140.*?

HAB. Canada. *Le Conte*.—Much confusion exists with regard to the present species. Pursh is the original authority for it, and Le Conte cites the plant of Pursh as a native of Canada. The only specimens which I have had the opportunity of seeing are from Mr. Schweinitz, having entire cordate leaves, and varying in their general aspect scarcely at all from *V. cucullata*. It is it which Le Conte brings as a synonym to his *V. congener*, a species scarcely differing, according to his own description, from *V. cucullata*, and to which Nuttall is disposed to refer the *V. asarifolia* of Pursh.

4. *V. cucullata*; stigmate triangulari-marginato, foliis cordatis acutis glabriusculis serratis junioribus praecipue basi cucullatis, rhizomate carnosissimo, petalis oblique flexis, calcare brevissimo.—*Ait. Hort. Kew.* ed. 1. p. 288. *Pursh, Fl. Am.* v. 1. p. 173. *Elliott, Carol.* v. 1. p. 298. (non *Schwein.?*) *De Cand. Prodr.* v. 1. p. 292. *Sims in Bot. Mag.* t. 1795. *Torrey, Fl. of Un. St.* v. 1. p. 251. *Bigel. Fl. Bast.* ed. 2. p. 97. *Le Conte in Ann. Lyc. of N. Y.* v. 2. p. 137.—*V. obliqua*. *Ait. Pursh, Schwein. Torrey.*—*V. papilionacea*. *Pursh.*—*V. affinis*. *Le Conte, l. c. p. 138.* (et tunc *V. cucullata*, *Schwein.*)—*V. sororia** of *Pursh*, according to *Le Conte*.

β. minor; foliis vix unciam longis, petalis subimberbis.

HAB. Throughout Canada; *Lady Dalhousie and Dr. Todd*; and as far north as the Mackenzie River and Bear Lake. *Dr. Richardson; Drummond*, Newfoundland. *Mr. Morrison*. *β. Marshes in the Rocky Mountains. Drummond.*—The flowers are large, of a more or less deep purple colour, and with the claws more or less distinctly bearded. The leaves and petioles are uncertain in the degree of pubescence, and the leaves in their length relatively to their breadth. From these circumstances, often varying in the same individual, together with the greater or less width of the calyxine leaves, and the length of the peduncles in regard to that of the leaves, many varieties, and not a few species, have been made, by which the difficulty of determining the synonyms is not a little increased. Le Conte refers the *V. cucullata* of Schweinitz to his new species *V. affinis*; yet says it differs in no distinctive characters, except the shortness of the peduncles and the broader sepals.—Whether or not my var. *β.* ought to be distinguished, I am not able to say. It does not differ in the stigma. The leaves are much shorter than the scapes or peduncles, and the blade is scarcely more, and often not so much, as an inch long. The flowers, to judge from the dried specimens, are very pale-coloured and almost glabrous.—Mr. Elliott observes that this species is very mucilaginous, and much used by the negroes of South Carolina and Georgia in their soups. The bruised leaves too are employed as an emollient application.

5. *V. Selkirkii*; stigmate? foliis cordatis crenato-serratis pilosiusculis, petalis imberbis, calcare subæque longo crasso obtusissimo.—*Goldie in Edin. Phil. Journ.* 1822. p. 319.

* Willdenow, in *Hort. Berol.* t. 72, is the authority for this species, and his figure and description entirely accord with our plant, except that the flower is much smaller: and it is well known how liable this part is to vary in almost all our *Violas*.

Radix perennis, subrepens. Folia plurima ex codem puncto, longe petiolata, subunciam longa, lato-cordata, basi sinu profundo bilobata, crenato-serrata, facie superna pilis sparsis, subtus omnino glabra, pallidiora. Petioli graciles, glabri. Pedunculi seu scapi foliis vix longiores, medium versus bibracteati, bracteis lanceo-lato-acuminatis, integerimis. Calycis sepala parva, late ovata, acuta, glabra. Petala cerasina, obovata, unguiculata, imberbia: Calcar petalarum limbo subeque longum, crassum, obtusum.

HAB. Hilly ground about Montreal, and only there. *Mr. Goldie*.—In size and general aspect, this species approaches my var. β . of *V. cucullata*, but the claws of the petals are beardless, and the spur is vastly longer, forming indeed its most striking characteristic. I have only seen specimens from Mr. Goldie. He showed them, while in Canada, to Mr. Pursh, who pronounced them to be identical with the *V. Selkirkii* of his MSS. The *V. villosa* of Elliott, according to specimens received from Mr. Schweinitz, comes very near to this, and its spur is often as long. To this *villosa* Nuttall refers the *V. sororia* of Willd., whereas Schweinitz brings it under Nuttall's var. *cordifolia* of Willd., which again he makes a distinct species.

6. *V. ovata*; pubescenti-hirsuta, stigmate marginato, foliis oblongo-seu ovato-cordatis serratis basi nunc grosse serratis i.e. petiolum abrupte attenuatis, sepalis obtusis, calcare brevi obtuso, petalis duobus distinrete barbatis.—*Nutt. Gen. Am.* v. 1. p. 148. *Schwein. Viol. in Sill. Journ.* v. 5. p. 58. *Torrey, Fl. of Un. St.* v. 1. p. 251. *Le Conte in Ann. Lyc. of N. Y.* v. 2. p. 143. *De Cand. Prodr.* v. 1. p. 293.—*V. primulæfolia*. *Pursh, Fl. Am.* v. 1. p. 172. (excl. syn. *Willd.*)

HAB. Canada, (*Le Conte*), as far north as the Saskatchewan. *Drummond*.—Allied to *V. cucullata*, but with much narrower and very downy leaves and petioles, in which latter respect, as well as in its much larger flowers, it differs from the true *primulæfolia* of Linn., of which I have specimens from Pennsylvania; but I am not aware that it has been found so far north as the Canadian possessions.

7. *V. lanceolata*; stolonifera, stigmate marginato, foliis lanceolatis utrinque attenuatis subserratis, sepalis ovatis, petalis imberibus.—*Linn. Sp. Pl.* p. 1323. *Mich. Am.* v. 2. p. 150. *Pursh, Fl. Am.* v. 1. p. 172. *Bigel. Fl. Bost. ed.* 2. p. 94. *Schwein. Viol. in Sill. Journ.* v. 5. p. 64. *Elliott, Carol.* v. 1. p. 92. *Le Conte in Ann. Lyc. of N. Y.* v. 2. p. 146. *De Cand. Prodr.* v. 1. p. 293. *Lodd. Bot. Cab.* t. 211. *Reichenb. Ic.* v. 1. t. 52. f. 106.?

HAB. Canada. *Mr. Schneinitz*. About Lake Huron. *Dr. Todd*.—Loddiges' figure of this beautiful species is very excellent. I quote that of Reichenbach with a mark of doubt, on account of its diminutive size and yellow petals; whereas, in all the specimens I have seen, the flowers, smaller than in any of the preceding species, are almost white, having the lower petal beautifully streaked with dark purple. The leaves are very glabrous and delicate; and distinct, as they may appear at first sight, by their being attenuated both extremities, I have yet some specimens from my estimable friend Dr. Boott, having them so abrupt at the base, that they precisely accord in that, and in every other particular, with some of my specimens of the true *V. primulæfolia* of Linn. I think they will prove identical.—Few Monographs would render so much service to Botanical Science as one on the *Violets*, with figures and descriptions taken from living species, and none is capable of being rendered more interesting or beautiful.

8. *V. blanda*; stigmate marginato, foliis teneris glabriusculis lato-cordatis ovatisque crenatis patentibus sinu profundo, petalis ovatis obtusis subimberibus.—*Willd. Hort. Berol.* t. 24. *Nutt. Gen. Am.* v. 1. p. 149. *Pursh, Fl. Am.* v. 2. p. 172. *Bigel. Fl. Bost. ed.* 2. p. 94. *Schwein. Viol. in Sill. Journ.* v. 5. p. 65. *Torrey, Fl. of Un. St.* v. 1. p. 254. *Le Conte in Ann. Lyc. of N. Y.* v. 2. p. 144. *De Cand. Prodr.* v. 1. p. 294.

HAB. Throughout Canada, very abundant as far as the mountains, and as high north as Fort Franklin, in lat. 66° . *Dr. Richardson*; *Drummond*; *Dr. Todd*.—This species has certainly a very close affinity with

Fort Franklin,
e affinity with

our *V. palustris*. The flowers, too, have the most perfect agreement with the preceding species, being small, white, or nearly so, with the lower petal, and sometimes the two lateral mostly beardless ones, streaked with purple; indeed Professor Bigelow, who has very accurately studied, and very faithfully described, the plants of the neighbourhood of Boston, has found so many intermediate forms of leaf between this and *V. lan-*
ceolata, that he is of opinion they are in all probability one and the same.

9. *V. clandestina*; stigmate marginato, foliis teneris glabris orbiculari-seu reniformi-
cordatis obtusissimis crenato-serratis sinu profundo, petalis anguste ovatis imberibus,
floribus stepe apetalis.—*Pursh, Fl. Am. v. 1. p. 173. Schwein. Viol. in Sill. Journ. v. 5. p.*
65. Torrey, Fl. of Un. St. v. 1. p. 254. Le Conte in Ann. Lyc. of N. Y. v. 2. p. 146.

HAB. About Lake Bourbon and Lake Winnipeg. *Dr. Richardson*.—This was named *V. clandestina* by Dr. Richardson on examining it when recently gathered, and it does seem sufficiently to correspond with the character of Pursh, who is the original authority for it, in everything, except that I do not find the "stolones to be floriferous." Le Conte says that the "peduncles are subtetragonal, branched, with 2-8 flowers, and a pair of stipules beneath each pedicel." In some of our specimens the flowers are apetalous, and the peduncle bent down to meet the earth; in others, there are perfect flowers, in every respect, as far as can be judged from dried specimens, agreeing with those of *V. blanda*. With that species, indeed, Professor Torrey is disposed to unite it, and I see myself no difference but in the much larger size of the leaf and the trifling character above-mentioned. Pursh has, doubtfully, referred *V. rotundifolia* of Michaux to it; and D' Caudolle has considered *V. clandestina* identical with *rotundifolia*: but in this, all the American Botanists differ from him.

10. *V. rotundifolia*; stigmate marginato, radice articulata squamosa, foliis orbiculato-
cordatis sinu (demonum) clauso subtus glabris, stipulis subulato-lanceolatis, sepalis oblongis
angustis obtusis, petalis lateralibus barbatis.—*Mich. Am. v. 2. p. 150. Elliott, Carol. v. 1.*

p. 295. (excl. syn. V. clandestina.)

s. pallens. (*Banks. Herb.*) glabra, sepalis acuminatis. *De Cand. Prodr. v. 1. p. 295.*

HAB. Canada. *Torrey; Le Conte*.—The flowers are described as yellow; which I cannot judge of from the dried plant; nor do I possess specimens, save from Mr. Schweinitz, Dr. Torrey, and Dr. Boott, gathered in the United States. In all these the leaves are large, almost exactly ovato-cordate, with a narrow sinus. Dr. Boott's specimens have imperfect flowers, which appear to bury themselves in the earth, and very thin semipellucid membranaceous leaves: those in flower, from Dr. Torrey especially, have the foliage coriaceous.

* * *Caulibus elongatis.*

11. *V. Langsdorffii*; stigmate marginato? subreflexo obtuso, caulis demum elongatis
basi obliqua, foliis rotundato-cordatis glabriusculis, stipulis ovatis setaceo-acuminatis, imis
fuscis setoso-dentatis, sepalis ovatis subacutis, petali inferi limbo subrhomboidali, calcare
late saccato obtusissimo. DC.—*Fisch. MSS.*—*De Cand. Prodr. v. 1. p. 296. Cham. in*
Linnaea, v. 1. p. 407.

HAB. Island of Uualaschka, (*Fischer*); *Chamisso*.—This is a plant I have only seen in specimens from Dr. Fischer.

12. *V. ochroleuca*; caulis assurgentibus, foliis cordato-rotundatis, stipulis maximis
oblongo-lanceolatis dentato-ciliatis, sepalis subulato-lanceolatis, petalis duabus lateralibus
dense barbatis, calcare longiusculo.—*Schwein. Viol. in Sill. Journ. v. 5. p. 69. Torrey, Fl.*

of *Un. St. v. 1. p. 255.* Rich. in *Frankl. 1st Journ. App. ed. 2. p. 8.*? *De Cand. Prodr. v. 1. p. 297.*—*V. repens.* Schwein. (fide *Le Conte.*)—*V. striata.* Ait. *Hort. Kew. ed. 1. v. 3. p. 291.*? *De Cand. Prodr. v. 1. p. 297.*? *Le Conte in Sill. Journ. v. 5. p. 69.*

HAB. Woody country, from lat. 54° to 64° .? Dr. Richardson. Canada. *Le Conte.*—I do not find this in any of the collections made during the Second Journey of Captain Sir John Franklin, nor do I possess it except from Mr. Schweinitz. It is remarkable for its pale sulphur-coloured flowers, which Mr. Schweinitz reckons by far the largest of the American kinds. It is probably the same with *V. striata* of Aiton; but as we know that species only from a very short and unsatisfactory character, the name *ochroleuca* of the plant so admirably described by Schweinitz, is now universally conceded to it. I quote the synonym of my friend Dr. Richardson with a mark of doubt, partly because it does not exist in the collections of the Second Expedition, though very much of the same ground was travelled over, and partly because he describes the leaves as covered "with numerous minute depressed brown dots," which is not the case with Schweinitz's original specimen of *ochroleuca*; but which is so with the following species, one of the most abundant in the present collections.

13. *V. Muhlenbergiana*; stigmate decurvo acuto, caulis assurgentibus, foliis rotundato-cordatis saepissime ferrugineo-punctatis serratis glabris, stipulis oblongo-lanceolatis ciliato-dentatis, sepalis linear-lanceolatis, petalis duobus barbatis, cornu longiusculo.—*Ging. in De Cand. Prodr. v. 1. p. 297.* *Le Conte in Ann. of Lyc. N. Y. v. 2. p. 148.*—*V. Muhlenbergii.* Torrey, *Fl. of Un. St. v. 1. p. 256.* (fide ejus specim.)—*V. asarifolia.* Muhl. Cat. and *V. uliginosa.* Muhl. et Schwein. (fide Torrey.)—*V. punctata.* Schwein.—*V. canina.* Walt.

s. minor; caulis brevioribus.—*V. debilis.* Pursh, *Fl. Am. v. 1. p. 174.* (excl. syn. fide Torrey.) Schwein. *Viol.* in *Sill. Journ. v. 5. p. 71.* Rich. in *Frankl. 1st Journ. ed. 2. App. p. 8.*

v. albiflora; caulis brevissimis, foliis cordato-ovatis ovatisque dense pubescentibus, floribus albis.

HAB. Labrador, (Schweinitz,) and throughout Canada, as far north as lat. 59° , in the plains, (Dr. Richardson.) North-West Coast. Mr. Mcenzies. *a.* Frequent in the same countries. *y.* Prairies among the Rocky Mountains, rare. Drummond.—Six to eight inches high, throwing out many spreading or assurgent stems from the same root. Leaves in form, size, and stipules, very similar to the preceding; but here the flowers are smaller, and blue, and the whole foliage and calyx (sometimes even the petals) are not unfrequently covered with minute brown dots, impressed on the under side of the leaf. Rarely the leaves are slightly downy; in *y.* exceedingly so all over, as well as the petioles. In a dried state, it is difficult to point out satisfactory characters, by which this species may be distinguished from our *V. canina*, where the leaves and even petals are in many of my specimens marked with similar dots. Do Candolle doubts if his *V. debilis* be not a var. of *canina*. Indeed, I fear the North American *Violæ* have been studied with too little reference to the European ones. This can only be satisfactorily done by cultivation and comparison of the living specimens.

14. *V. rostrata*; stigmate rostrato, rostro subcreto acuto nudo, caulis simplicibus decumbentibus, foliis cordatis glabris, stipulis laevicollatis ciliato-serratis, sepalis subulato-lanceolatis glabris, calcare porrecte longissimo petala imberbia excedente.—Pursh, *Fl. Am. v. 1. p. 174.* Schwein. *Viol.* in *Sill. Journ. v. 5. p. 73.* Torrey, *Fl. of Un. St. v. 1. p. 256.* *Le Conte in Ann. Lyc. of N. Y. v. 2. p. 148.* *De Cand. Prodr. v. 1. p. 298.*

15. *V. canina*; stigmate papilloso subreflexo, caule adultiore adscendente ramoso glabro, foliis cordatis, stipulis acuminatis pectinatim tenuiter laceris, sepalis subulatis, pedunculis glabris, capsula elongata, valvis acuminatis, seminibus pyriformibus fuscis. DC. Linn. Sp. Pl. p. 1324. De Cand. Prodr. v. 1. p. 298.—Var. Rich. in Frankl. 1st Journ. ed. 2. App. p. 8.?

HAB. North-West Coast of America, (De Candolle.) Canada? Dr. Richardson.—Dr. Richardson mentions this with a mark of doubt as a native of North America. No American author seems to be aware of its existence in that country. With regard to the station mentioned by De Candolle, his information is probably derived from Mr. Menzies's specimens, in Mr. Lambert's Herbarium. If so, I possess the same, and have referred them to *V. Muhlenbergiana*; though, I must confess, they have as good a claim to rank with *V. canina*.

16. *V. adunca*; stigmate subreflexo glabro, caule adscendente simpliciusculo, foliis ovatis cordato-ovatisque coriaceis crenatis insigniter fusco-punctatis, stipulis lanceolato-acuminatis profunde dentato-ciliatis, sepalis linear-lanceolatis, petalis duabus barbatis calcare nunc adunco vix longioribus, pedunculis elongatis folia multo superantibus.—Sm. in Rees' Cycl.

HAB. North-West Coast of America. On the plains of the Columbia, Puget Sound, Observatory Inlet. Mr. Menzies; Douglas; Dr. Scouler.—That this is the *V. adunca* of Sir J. E. Smith there can be no question, since Mr. Douglas has compared his specimens with the original ones in the Herbarium at Norwich, shortly previous to the death of its lamented possessor: but the spur, though sometimes, is by no means constantly, uncinate. Generally it is so in the state of bud; and I find it to be remarkably the case with a specimen which has a double spur. But the greater number are straight, thick, and very obtuse. Hence, since Sir J. E. Smith, in other respects, compares it with *V. canina*, it may be supposed to be too nearly allied to that species; but I am of opinion that it is perfectly distinct. It has a more rigid and erect mode of growth. Its leaves are almost coriaceous, and, in all the specimens, (and these from very remote localities,) more ovate, more coriaceous, and so thickly covered with distinct brown dots as to give a dusky hue to the foliage, and to bring the species near to some of the South-West American kinds, which present that appearance in a remarkable degree. The flowers, as Mr. Douglas describes them, are of a fine and very deep purple-blue colour.

SECT. II. CHAMÆLÉLIUM. Ging. in De Cand. Stigma sphæroideo-capitatum, utrinque fasciculis pilorum onustum, foraminulo minuto sublaterali. Stylus compresso-clavatus. Stamina oblonga approximata. Torus planiusculus. Capsula sepe trigona. Folia seminaria sapis subrotunda. Petala 2 ungue barbata. DC.

17. *V. Nuttallii*; stigmate capitato utrinque subpilosso, caulis erectis, foliis ovato-lanceolatis subintegerrimis subpubescens in petiolum longum attenuatis pedunculos æquantibus, stipulis lanceolatis integris, sepalis lanceolato-acuminatis, petalis ovato-lanceolatis, calcare brevissimo. (TAB. XXVI.)—Pursh, Fl. Am. v. 1. p. 174. Schwein. Viol. in Sill. Journ. v. 5. p. 77. Le Conte in Ann. Lyc. of N. Y. v. 2. p. 151. De Cand. Prodr. v. 1. p. 300.

β. major; foliis latioribus, floribus majoribus.—*V. glareosa*. Douglas, MSS.

Radix in terram sublonge descendens, subfasciculatim ramosa. *Caules* plurimi ex eadem radice, erecti, breves, rarius digitem longi, inferne subramosi, graciles. *Folia* fere omoia ad eadem altitudinem attingunt, ovato-lanceolata, nunc lanceolata, subfirma, integerrima vel obscure sinuato-dentata, glabra vel pubescens, pubescens, in petiolum longum attenuata, uninervia, venis lateribus oblique parallelis. *Stipulae* mediocres,

foliaceo-membranaceæ, oblongo-lanceolate, integre. *Pedunculi* folia plerumque subaequantes, bibracteati; glabri, nuno superne pubescentes. *Flos* magnitudine *Viola blanda*, nonnunquam major, ut in β , pallide sed evidenter flavus. *Calyx*, sepalis lanceolatis acuminatis glabris, basi vix productis. *Petala* omnia imberbia, *inferum* late ovatum, obtusum, subtus basi carinatum, calcare brevissimo, vix ullo; *reliqua* oblongo-ovata, unguiculata, oblique patentia. *Stamina* approximata, duobus appendice lata brevi dorsi auctis. *Style* superne incrassatus. *Stigma* utrinque depresso et fusciculo pilorum instructum.

HAB. About Carlton House, on the Saskatchewan, lat. 53°. Dr. Richardson. β . Abundant under the shade of pines on the dry sandy plains of the Columbia.—This seems to be a rare species, only hitherto known from specimens gathered by Mr. Nuttall on the sandy deserts of the Missouri. It differs from all the other described species remarkably, with the exception of the following, and, perhaps, *V. hastata* of Michaux, with which I am unacquainted.

TAB. XXVI. Plant:—natural size. Fig. 1, Flower; fig. 2, Stamen, inclosing the pistil; fig. 3, Pistil; fig. 4, Inside view of a stamen:—magnified.

18. *V. præmorsa*; stigmate capitato utrinque subpiloso, caulis erectis ovato-lanceolatis subintegerrimis pubescenti-hirsutis in petiolum longum attenuatis pedunculo brevioribus, stipulis lanceolatis integris, sepalis lanceolato-acuminatis, petalis ovato-lanceolatis, calcare brevissimo.—*Douglas* in *Herb. Hort. Soc.*—*Bot. Reg.* t. 1254.

HAB. On the dry plains of the Columbia, and on the Multnomah River. *Douglas*. Plentiful about Fort Vancouver. Dr. Scouler.—Habit of the last, differing in the very great degree of long pubescence, in the larger, more highly coloured flowers, and in the peduncles exceeding the leaves in length.

19. *V. canadensis*; plerumque glabra, stigmate capitato utrinque piloso, caule elongato gracili, foliis lato-cordatis serratis acuminatis, stipulis lanceolatis integerrimis, calcare brevissimo.—Linn. *Sp. Pl.* p. 1326. Pursh, *Fl. Am.* v. 1. p. 174. Schwein. *Viol. in Sill. Journ.* v. 1. p. 235. Mich. Am. v. 2. p. 150. Elliott, *Carol.* v. 1. p. 301. Torrey, *Fl. of Un. St.* v. 1. p. 255. Le Conte in *Ann. Lyc. of N. Y.* v. 2. p. 148. Bigel. *Fl. Bost.* ed. 2. p. 97. De Cand. *Prodr.* v. 1. p. 301. Rich. in *Frankl.* 1st *Journ.* ed. 2. *App.* p. 8.

HAB. Throughout Canada, as far as the Rocky Mountains; Newfoundland. Mr. Cormack; Mr. Morrison. North-West Coast of America. *Douglas*; Dr. Scouler.—Flowers whitish, or pale blue, with darker streaks. The North-West American specimens have been called *V. Sculerii* in Mr. Douglas's MSS., but I do not see how they differ from the common state of the plant. They are indeed smaller and quite glabrous.

20. *V. pubescens*; plerumque pubescenti-hirsuta, stigmate capitato utrinque piloso, caule elongato crassissimulo inferne nudo squamigero, foliis lato-cordatis grosse serrato-dentatis, stipulis ovatis subdentatis, calcare brevissimo.—Ait. *Hort. Kew.* ed. 1. v. 3. p. 290. Pursh, *Fl. Am.* v. 1. p. 174. Schneid. *Viol. in Sill. Journ.* v. 5. p. 74. Torrey, *Fl. of Un. St.* v. 1. p. 257. Le Conte in *Sill. Journ.* v. 2. p. 149. De Cand. *Prodr.* v. 1. p. 301.—*V. pennsylvanica*. Mich. Am. v. 2. p. 149.

α . *eriocarpa*; capsula dense villosa-tomentosa.—Nutt. *Gen. Am.* v. 1. p. 150.—*V. criocarpa*. Schneid. *l. c.* p. 75. De Cand. *Prodr.* v. 1. p. 301.

HAB. Throughout Canada, to the mountains.—Flowers yellow. The var. β . is frequently cultivated in our gardens, and differs in no essential particular from α .

21. *V. sarmentosa*; caule stolonifero, foliis reniformi-cordatis crenatis, stipulis lanceolatis integris, pedunculis folia æquantibus, calcare brevissimo obtuso.—*Douglas*, MSS.

HAB. Hilly wooded places near Fort Vancouver, and in the high grounds of Lewis and Clark's River, North-West America. *Douglas*.—My specimens of this are imperfect; and I am not sure that there are not two species among them: the one, probably from which the above character was mainly taken, throwing out wiry stems, like the runners of a strawberry, and bearing leaves, (as does the root,) which are more inclining to oval than reniform, of a coriaceous texture and brownish hue from the numerous small dots which cover both their surfaces, and having a few thick white hairs on the upper side. This is in fruit, and has a ripe and burst capsule upon one of the runners, whose footstalk is equal in length with the leaf. The other plant has no stolones: the pale green, almost reniform, leaves are quite destitute of dots, and have an injured flower arising from the root. Mr. Douglas describes the species as a handsome one, with bright yellow blossoms, marked with brown or red veins.

SECT. III. MELANIUM. DC. *Stigma urceolatum utrinque fasciculis pilorum onustum, apertura magna inferne labello munita. Stylus ab apice ad basin attenuatus. Stamina triangularia connexa. Torus concavus et ideo ovarium paulo inferum. Capsula obsolete hexagona. Semina numerosissima 40–60. Folia seminalia saepius ovata. Petala 3 inferiora ungue barbata.* DC.

22. *V. tricolor*; radice subfusiformi, caulinibus ramosis diffusis, foliis imis ovato-cordatis, stipulis runcinato-pinnatifidis, lobo medio crenato, petalis breviter unguiculatis incumbensibus, calcar: crasso obtuso non porrecto, nectariis brevibus, seminibus oblongo-ovatis.—*Linn. Sp. Pl. p. 1326.*

*. *arvensis*; DC. caulinibus ramosis assurgentibus, petalis calyce vix longioribus flavescentibus caeruleis vel purpureo maculatis.—*De Cand. Prodr. v. 1. p. 303.*—*V. bicolor*. *Pursh, Fl. Am. v. 1. p. 175.*—*V. tenella*. *Schweinitz. Viol. in Sill. Journ. v. 5. p. 78.?*

HAB. I have seen this only in the collection of Dr. Todd, from Lake Huron.—The *V. tenella* of Schweinitz, which I possess from that liberal and excellent Botanist, is smaller than is usual with our *V. tricolor*, but, I think, not specifically distinct.

ORD. XIII. DROSERACEÆ. DC.

1. DROSERA. Linn.

Sepala (potius *Cal. 5-partitus*) *petalaque 5*, inappendiculata. *Stam. 5. Styli 3–5, bipartiti.*—*Herbe in uliginosis sphagnosis crescentes. Folia ciliis glandulosis rubidis irritabilibus ornata.* DC.

1. *D. rotundifolia*; foliis radicalibus orbiculatis patentibus, petiolis pilosis, seminibus arillatis.—*Linn. Sp. Pl. p. 402. Engl. Bot. t. 867. Mich. Am. v. 1. p. 186. Pursh, Fl. Am. v. 1. p. 210. Bigel. Fl. Bost. ed. 2. p. 123. Elliott, Carol. v. 1. p. 355. Torrey, Fl. of Un. St. v. 1. p. 331. De Cand. Prodr. v. 1. p. 318.*—*D. capillaris. Poir. Encycl. v. 6. p. 299. De Cand. Prodr. v. 1. p. 318.*

HAB. Throughout Canada to the mountains, and as far north as the Arctic Circle. Newfoundland. *Mr. Morrison*; *Mr. Cormack*. *Unalashka. Chamisso*.—Numerous specimens, which I possess both from the United States and the British possessions, prove this to be the same as the European *rotundifolia*.

2. *D. anglica*; foliis radicalibus linearis-spathulatis erectis, petiolis elongatis, seminibus arillatis.—*Huds. Angl. p. 135. Engl. Bot. t. 369. De Cand. Prodr. v. 1. p. 318.*

HAB. Near Cumberland House, lat. 54°. Dr. Richardson. North-West Coast of America. Mr. Menzies.—Only two specimens of this are in Dr. Richardson's collection. The true *D. longifolia*, with seeds destitute of arillus, and with shorter leaves than the present, I have received from New York and near Boston; but I have not seen specimens from Canada, where it is yet very likely to be found.

3. *D. linearis*; foliis exacte linearibus obtusis sublonge petiolatis, petiolis longissimis nudis, scapis radicatis 1-3-floris, calycibus glabris, seminibus exarillatis laevibus. (TAB. XXVII. A.)—Goldie in Edin. Phil. Journ. 1822, p. 325. De Cand. Prodr. v. 1. p. 318.

Radix parva, fibrosa, annua, e fibris descendantibus simplicibus, subfasciculatis, crassiusculis, nigris. *Folia* omnia radicalia, subdigitalia, erecta, limbo duas fere tres uncias longo, duas lineas late, exacte linearis, obtuso, inferne in petiolum subeque longum, glabrum attenuato, margine dorsoque pilis longis patentibus, rubris, glandulosis teeto. *Scapus* solitarius, erectus, gracilis, glaber, dum florens, foliis subeque longius vel paululum brevior, plurimque uni-nuno bi-trilobus, denum, fructiferus, folia excedens. *Flores* pedicellati; pedicelli breves, glabri. *Calyx* glaber, profunde 5-sidatus. *Capsula* ovalis, calyce plusquam duplo longior, 3-valvis. *Semina* ovali-oblonga, exarillata, levia, nigra.

HAB. Lake Simcoe, in Upper Canada. Mr. Goldie. It was found sparingly in fruit also in Upper Canada, as well as plentifully in a swamp near Jasper's Lake in the Rocky Mountains, by Mr. Drummond.—It was at my suggestion that Mr. Goldie, on his return from his travels in Canada, published the present plant as a new species in the Journal above quoted. The form of the leaf alone did appear to me quite decisive of a specific difference; but the American Botanists, and especially Dr. Torrey, entertained a different opinion, though I am not aware that the plant is at all known to them; and the able Botanist just mentioned has been disposed to unite it with the *D. longifolia*. It was therefore peculiarly gratifying to me to find amongst Mr. Drummond's rich collection many specimens gathered in the Rocky Mountains, and all possessing the characters detailed by Mr. Goldie, under his *D. linearis*. The name is singularly applicable; for from the blunt apex nearly to the very base of the limb or blade, it retains the same width. It must not be confounded with the American *D. filiformis* (*tenuifolia*, Willd. and Muell.); which has the leaves vastly longer and filiform, and which Dr. Torrey aptly compares to the rare and beautiful *Drosophyllum lusitanicum*.

TAB. XXVII. A. Plant:—natural size. Fig. 1, Capsule; fig. 2, Seed:—magnified.

2. PARNASSIA. Linn.

Sepala 5. *Petala* 5. *Squamae* (an *Stamina abortiva?*) unguibus petalorum opposita, (plerumque) in setas apice glandulosas desinentes. *Stam.* 5. *Antheræ* postice. *Stigmata* 4, sessilia. *Caps.* 4-valvis, 1-locularis, valvis medio septiferis. *Semina* arillata.—Herbie glaberrimæ, habitu et forsitan charactere hinc ad *Swertia* illinc ad *Violam* accedentes. DC.

1. *P. palustris*; squamis setis gracilibus plurimis, foliis omnibus cordatis, caulinis sessili.—Linn. Sp. Pl. p. 391. Engl. Bot. t. 82. Mich. Am. v. 1. p. 184. Pursh. Fl. Am. v. 1. p. 208. De Cand. Prodr. v. 1. p. 320. Rich. in Frankl. 1st Journ. ed. 2. App. p. 10.

HAB. Throughout Canada, as far north as the Arctic Circle, and among swamps in the Rocky Mountains, between lat. 52° and 56°.—Labrador and Newfoundland. Mr. Morrison. Kotzebue's Sound and Bay of Eschscholtz. Chamiso; and Messrs. Lay and Collie in Capt. Beechey's Expedition. Cape Newenham. Nelson.—The broad, truly cordate, leaves, especially the cauline one, readily distinguish this from *P. parviflora*; and the numerous, slender, white pellucid hairs of its scale from all the other species of the genus.

2. *P. parviflora*; gracillima, squamis setis gracilibus subquinque, foliis radicalibus ovatis in petiolum attenuatis, caulinis linearis-oblongo sessili.—De Cand. Prodr. v. 1. p. 320.—P. palustris, s. tenuis. Wahl. Fl. Lapp. p. 74. TAB. XXVII. P.

*Radix parva, annua? fibrosa. Folia fere omnia radicalia, ovata, vel anguste ovata, obtusiuscula, subquinq; nervia, in petiolum subeque longum attenuata, patentia. Caules solitarii vel 3-4 ex eadem radice, erecti, tenues, gracillimi, unifoliati, folio, (seu bractea) parvo oblongo-lanceolato vel sublineari, spithamea ad pedalem, glaberrimi. Flos parvus, terminalis. Calyx inferne cum basi germinis accretus. Sepala patentia, linear-lanceolata, viridia, petali 5 breviora. Petala ovata, brevissime unguiculata, alba, lineata. Stamina et Pistillum ut in *P. palustris*. Squamae 5, obovatae, setis 5, vel rarius 6, gracilibus pellucidis albis terminatae, uno, centrali, longiore, in faciem interiorem decurrente. Capsula ovalis, stigmatibus 4, persistentibus coronata, demum in valvis 4 dehiscentibus; valve medio placentifera. Semina numerosa, parva, fusca, dense imbricata.*

HAB. North America. Banks. Herb. (in *De Cand.*) Sandy banks formed by the floods in the rivers among the Rocky Mountains, between lat. 52° and 56°. Drummond.—Numerous specimens of this pretty *Parnassia* exist in Mr. Drummond's portion of the collection, and all so constant to their character, that I have little hesitation in considering it a good species, and I think too it is the *P. parviflora* of De Candolle. It is remarkable for its slenderness, for the root-leaves being ovate, that of the stem still narrower, and so small as, in most instances, to represent a true bractea. Whether the *P. ovata* & *Belvist* of De Candolle, should be considered the same, as I rather suspect, or not, I have no materials for determining. The flower of our plant is considerably smaller than that of *P. palustris*, so as well to merit the name of *parviflora*.

TAB. XXVII. B.
3. *P. caroliniana*; squamis setis tribus crassis, foliis omnibus latissime ovatis ellipticis, caulinis sessili.—Mich. Am. v. 1. p. 184. Bot. Mag. t. 1459. Pursh, Fl. Am. v. 1. p. 208. Elliott, Carol. v. 1. p. 371. Torrey, Fl. of Un. St. v. 1. p. 326. Bigel. Fl. Bost. ed. 2. p. 121. De Cand. Prodr. v. 1. p. 320.

HAB. About Quebec, Mrs. Percival, and Lake Huron, Dr. Todd; which are perhaps the most northern limits of this fine plant, as well as the most western, at least in that latitude.—The leaves are more coriaceous, and paler beneath than any other species with which I am acquainted: their shape is either broadly ovate or elliptical; but they may vary in form, and I suspect the *P. grandifolia* of Beauvois and De Candolle can hardly be considered different. The *P. asarifolia* of Ventenat I have never seen, nor do the American Botanists themselves appear to be acquainted with it.

4. *P. Kotzebuei*; squamis setis tribus gracilibus, foliis radicalibus caulinique (si adsit) subcordato-ovatis, petalis calyce brevioribus subtrinerviis. (TAB. XXVIII.)—Cham. et Schlecht. in Linnaea, v. 1. p. 549.

Radix fibrosa, perennans. Caules vel scapi nudi seu unifoliati, solitarii vel plurimi ex eadem radice, digitales ad palmarem, erecti, graciles, ut et tota planta, glabri. Folia radicalia parva, lato-ovata, vix subcordata, obtusiuscula, submembranacea, subparallelis nervosa, inferne in petiolum unciam vel duas treas unclas longum attenuata: caulino radicalibus similis, etiam petiolato, basin versus inserto et radicalibus plerumque immixto, nunc nullo. Flos terminalis, solitarius, erectus. Calyx semi-superus, sepals erecto-patentibus, anguste elliptico-lanceolatus, 5-7 nerviis. Petala 5, elliptica, seu ovato-elliptica, alba, sepals subbreviora, nervibus tribus precipiis, 2 magis obscuris marginatae versus. Squamae parvae, petalis opposite, obcordata, flavovirides, setis tribus, raro 4, brevibus gracilibus terminatae: glandulae flavae. Stamina petalis breviora. Filamenta basi insigniter dilatata. Anthera subrotundata, postice. Pistillum ovali-globosum, tertio parte infernum. Stigmata subcessilia, 4, subglobosa, curvata. Capsula, calyce corolla persistentibus cincta, quadrivalvis, valvis ultra medium fissis, stigmata terminata, membranacea, medio longitudinaliter placentifera. Semina numerosa, imbricata, rufo-fusca, oblonga, alia latissima, pulcherrime reticulata circumdata. Albumen nullum? Embryo cylindricus, radicula ad hilum seminis versa.

HAB. Unalasehka, and Bay of Eschischoltz in Kotzebue's Sound, (Chamiso,) at which latter place it was also found by Messrs. Lay and Collie in Capt. Beechey's Expedition. Rocky Mountains, between lat. 52° and 56°. Drummond. Bear Lake, and thence to the shores of the Arctic Sea. Dr. Richardson.—I am indebted for original specimens of this species to Dr. Chamiso, and find ours to correspond in every

particular with them. It is remarkable for the small size, and few nerves upon the petals, the calyx, in almost every instance, overtopping the corolla, and for the leafless scape; or, if a leaf be present, it is situated amongst the other leaves, and is always stalked. With the perfect flowering stems, there not unfrequently appear, upon the same root, the stems and withered capsules of a former year, but still possessing the persistent remains of the calyx and corolla.

5. *P. fimbriata*; squamis lato-cuneatis carnosis crenatis medio intus carinatis nudis, foliis radicalibus longe petiolatis biauriculato-reniformibus, caulino cordato sessili multo supra medium inserto, petalis basi fimbriatis.—*Kon.* in *Ann. of Bot.* v. 1. p. 391. *Smith* in *Rees' Cycl.*—*De Cand. Prodr.* v. 1. p. 320. *Hook. Bot. Miscell.* v. 1. p. 43. t. 23.

Radix subprens, crassa, horizontalis, fibrosa, superne basibus petiolorum vetustorum fuscis vestita. *Caulis* pedales, fere ad sesquipedalem, nunc duo ex eadem radice, erecti, graciles, angulati, glabri, multo supra medium unifoliati. *Folia* radicalia plurima, erecto-patentia, longe petiolata, petiolo superne insigniter dilatato, reniformia, acutiuscula, subcoriacea, radiatim nervosa, lobis ad petiolum curvatis, quasi biauriculata; caulinio parvo, cordato, sessili. *Flos* terminalis, solitarius. *Cal.* subsemisuperus; sepals oblongo-lanceolatis, obtusis, 5-7 nerviis. *Petala* ovalia, brevi-anguiculata, alba, 5-7 nervis, inferne utrinque pulcherrime fimbriata. *Stamina*: filamenta, juniora ut videtur insigniter, demum minus dilatata. *Antheræ* ovales, postice, pallide flave. *Squamæ* majuscule, carnosæ, viridi-flavæ, cuneatæ, basi attenuatæ, paullulum concava, apice crenato-lobate, lobis vel crenis subquinque, facie interna linea media elevata carinata. *Pistillum* ut in reliquo hujusce generis. *Fructum* non vidi.

HAB. North-West Coast of America. *Mr. Menzies*. Elevated swamps in the Rocky Mountains, between lat. 52° and 56°. *Drummond*.—Of this remarkable plant I have given a figure in the Botanical Miscellany: where, however, I have represented the fringe at the base of the petal rather as hairy or glandular processes, than as formed by the substance of the petal itself, which it really is. On this and other species of the genus, minute brownish dots are seen under a microscope, and particularly described, as common to almost all parts of the plant in *P. Kotzebuei*, by Chamisso, sprinkling more especially the petals and scales. Such were very evident on Mr. Menzies's specimens of the present species, and are represented in the Bot. Miscell., but I do not find them in Mr. Drummond's. They are probably analogous to the dots in many kinds of *Viola*, and are of the same colour in both, being sometimes present and sometimes absent in the same species, or in different parts of the same individual plant.

ORD. XIV. POLYGALEÆ.

1. POLYGALA. *Tourn.*

Calycis *sepala* persistenta, 2 interiora alæformia. *Petala* 3-5 tubo stamineo connexa, inferiore carinæformi (forsan e duobus coalitis constante). *Capsula* compressa, elliptica obovata aut obcordata. *Semina* pubescens, hilo carunculata, coma destituta. *DC.*

Ons. North America includes a very considerable number of species of this extensive and beautiful genus; but they are chiefly confined to the United States, and are most abundant in the southern provinces. The list of species in the Canadas is but small, and probably none has a more northern range than the Saskatchewan, in lat. 52°, unless it be the *P. Seneg.* None was found among the Rocky Mountains, and none in North-West America.

SECT. I. TIMUTUA. *DC.* *Capsula* *glabra* *ovali-oblonga*, *vix* *emarginata*. *Racemi* *nunc* *elongati* *floribus* *parvis*, *nunc* *conferti* *spiciformes*, *floribus* *inferioribus* *mox* *deciduis*. *Folia* *alterna* *aut* *verticillata*. *DC.*

1. *P. incarnata*; glauca, racemis spiciformibus oblongis eglandulosis, foliis sparsis raris

subulatis, corollis longe tubulosis, caulis erectis gracilibus subsimplicibus.—*Linn. Sp. Pl. p. 987. Mich. Am. v. 2. p. 52. Pursh, Fl. Am. v. 2. p. 464.*

HAB. Rocky places on the River Niagara, near the Falls. *Douglas*; 1823.—I have only seen specimens of this, which have been kindly communicated to me by Mr. Nuttall, from New Caesarea. It is from four to six inches high, annual, slender, glaucous, with very few, remote, minute, subulate leaves. Flowers flesh-coloured, the petals united into a long slender tube. Capsules ovate, obtuse.

2. *P. cruciata*; racemis capitatis sessilibus compactis, alis patentibus cordatis acutis, foliis oblongo-lanceolatis resinoso-punctatis quadrifarium verticillatis, caule erecto brevi ramisque subbrachiatis patentibus angulis alatis.—*Linn. Sp. Pl. p. 138. Pursh, Fl. Am. v. 2. p. 466. Bigel. Fl. Bost. ed. 2. p. 266. (certe.) Non Nutt. Ell. De Cand.*

HAB. Canada. *Pursh*.—Stem four to six inches high, annual, with spreading branches and broadly lanceolate or oblong, mostly very obtuse leaves. Of this again I possess no Canadian specimens, and there are, unfortunately, two species confounded by authors under this name. I have chosen that of Professor Bigelow, described in his *Flora of Boston*, of which I have specimens from Dr. Boott, and which is likely to be the Canadian species. Pursh's description too, and he is the authority for its being found in the British Possessions, sufficiently accords with our plant. But it then becomes a question whether it is the true one of Linnaeus. It is to be regretted that Sir J. E. Smith has not noticed it in *Rees' Cyclopaedia*: we can only, at a distance from the Linnean Herbarium, have recourse to the original character and reference; the former, unfortunately, is so short as to be equally applicable to more than one individual, "floribus imberibus, foliis quaternis;" but the reference to *Plukenet*, both in the *Amen. Acad.* and in *Sp. Plantarum*, "P. quadrifolia s. cruciata, floribus ex viridi rubentibus in globus compactis," seems to me decisive in favour of our present plant. Dr. Torrey, among the many botanical rarities which he has obligingly sent me from the State of New York, has included a species under the name of *P. cruciata*, which differs in its taller mode of growth, in its truly linear leaves, oblong heads, and *remarkably* acuminate ale to the flowers, which are too of a redder colour. This is probably the *cruciata* of Nuttall; whereas our *cruciata*, and, as I conceive, the true one, is probably his *brevifolia*; though he describes the leaves as being nearly of the same shape in both. Elliott's *P. cruciata* I also consider to be identical with Nuttall's, inasmuch as he describes the stalks as being one or two inches long, the leaves linear, and the ale, or wings, acuminate.

3. *P. verticillata*; racemis gracilibus spiciformibus acuminatis pedunculatis, alis ovato-roundatis obtusis appressis, foliis linearibus acutis verticillatis, caule erecto brachiatum.—*Linn. Sp. Pl. p. 991. Pluk. Mant. t. 438. f. 4. (fig. bona.) Mich. Am. v. 2. p. 53. Nutt. Gen. Am. v. 2. p. 88. Elliott, Carol. v. 2. p. 182. Bigel. Fl. Bost. ed. 2. p. 266. De Cand. Prodr. v. 1. p. 329.*

HAB. Between Sandwich and Amherstberg, in Upper Canada. *Douglas*.—Flowers small, greenish. A slender, graceful, little annual.

SECT. II. SENEGA. *Carina imberbis. Calycis sepala 3 exteriore subæqualia. Folia alterna. DC.*

4. *P. Senega*; subcristata, racemis terminalibus pedunculatis elongatis spiciformibus, alis orbiculatis appressis petala æquantibus, foliis lato-lanceolatis basi apiceque attenuatis marginibus scabris.—*Linn. Sp. Pl. p. 990. Mich. Am. v. 2. p. 53. Pursh, Fl. Am. v. 2. p. 464. Bot. Mag. t. 1051. Bigel. Med. Bot. t. 30, Fl. Bost. ed. 2. p. 265. Elliott, Carol. v. 2. p. 182. Rich. in Frankl. 1st Journ. ed. 2. App. p. 27. De Cand. Prodr. v. 1. p. 330.*

HAB. Canada, as far north as the Saskatchewan. *Dr. Richardson; Drummond; Douglas*. In the Appendix to Capt. Franklin's Journal, however, Dr. Richardson has indicated it as growing still farther

north.—*Stems* arising many from the same perennial root, scaly below, slightly downy, rounded, angled above. The *leaves*, when seen under a microscope, are hairy with very short pubescence, and the edges are decidedly scarious with little, rigid sets pointing forward. *Flower* pale, greenish white. *Capsule* orbicular, scarcely notched, slightly compressed, containing two large, black, dotted, hairy seeds, having a broad white caruncle at the hilum. Dr. Bigelow has well described this species in his *Florula* of Boston, and has detailed its medical properties and history in his valuable American "Medical Botany."

5. *P. polygama*; cristata, racemis terminalibus pedunculatis laxis, alis ovalibus patentibus petala æquantibus obtusissimis, foliis alternis linear-lanceolatis glabris superioribus cuspidatis, caulibus erectis, aliis brevissimis radicalibus sub subterraneis apetalis. (TAB. XXIX.)—Walt. Fl. Carol. p. 179. Pursh, Fl. Am. v. 2. p. 181. Nutt. Gen. Am. v. 2. p. 75. Elliott, Carol. v. 2. p. 181. De Cand. Prodr. v. 1. p. 330.—*P. rubella*. Willd. Sp. Pl. v. 3. p. 875. Pursh, Fl. Am. v. 2. p. 464. Bigel. Fl. Bost. ed. 2. p. 264, "Med. Bot. t. 54." De Cand. Prodr. v. 1. p. 330.

Radix gracilis, sublignosa, perennis? descendens, ramosa. *Caules* nunc solitarii, nunc plurimi ex eadem radice, erecti, angulati, gibri, palmares ad spithamei, simplices, virgati, foliati. *Folia* alterna, erecta, seu erecto-patentia, unciam vel sesquiunciam longa, linear-lanceolata, aduta subooriacea, basi paululum attenuata, *inferiora* subpetiolata, obtusissima, *reliqua* sessilia, *superiora* magis angusta, apice acutissima mucronulata, etiam cuspidata. *Racemi* solitarii, terminales, pedunculati, laxi, unciam vix duas uncias longi. *Pedicelli* breves, graciles, patentes, demum recurvati, ad basin bractes minutissimam suffulti. *Flores* carneo-rosei, mediocres. *Calyx*: sepalis exterioribus minutis, viridibus, erectis, 2 interioribus seu alii, petala sequantibus, late obovatis, obtusissimis, patentibus, pallide roseis. *Carina* purpurea, cristata.—Ad basin caulinis alii *racemi* adiunt, pedunculati, sub-subterranei, pedunculis squamosis; floribus apetalis, vel petalis valde minutis instructis, quorum *capsule* omnino ut in racemis caulinis, sed sessilibus, late ovatis, compressis, truncatis.

HAB. Upper Canada. Mr. Goldie. About Lake Huron. Mr. Todd.—The correctness of Mr. Nuttall, in uniting the *P. rubella* of Willdenow with the *P. polygama* of Walter, can, I believe, scarcely be called in question. The species is a very remarkable one, in many respects, as Pursh observes of his *P. rubella*, approaching to *P. vulgaris*. From the base of the main stems there proceed short stalks, from two to four inches long, bearing a raceme of flowers, which buries itself slightly in the earth. The uppermost blossoms are exceedingly imperfect, and abortive; the lower flowers of the raceme have petals, and perhaps calycine sepals, so altered as to represent a few small scales around a germin, which, to all appearance, comes to perfection and bears seeds. In some of the many specimens I have received from Dr. Boott, the racemes in question are upon leafy stalks, but this is by no means usually the case; others, though more rarely, have the upper flower of the perfect stem apetalous.

TAB. XXIX. Plant:—natural size. *Fig. 1*, Flower; *fig. 2*, The keel; *fig. 3*, Raceme, which arises from the base of the stem; *fig. 4*, Capsule, do.; *fig. 5*, Capsule, from the perfect raceme:—magnified.

SECT. III. CHAMÆBUXUS. Dill. *Calycis sepalum inferius concavo-cucullatum intus ad basin glandulam fovens. Corolla carina subcristata aut apice callosa. Flores pauci, magni. Herba aut suffruticosa. DC.*

6. *P. paucifolia*; floribus ternis terminalibus, carina crenata, foliis ovatis petiolatis, caule simplici basi decumbente inferne nudo squamiger. —Willd. Sp. Pl. p. 880. Pursh, Fl. Am. v. 2. p. 464. Elliott, Carol. v. 2. p. 180. De Cand. Prodr. v. 1. p. 330. Bigel. Fl. Bost. ed. 2. p. 267. Hook. in Bot. Mag. t. 2852. Risch. in Frankl. 1st Journ. ed. 2. App. p. 27.—*P. purpurea*. Ait. Hort. Kew. ed. 2. v. 4. p. 244. (non Nutt.)

HAB. Plains of Canada, as far north as the Saskatchewan. *Mr. Goldie*; *Dr. Richardson*; *Mr. Blair*; (in Bot. Mag.) *Douglas*; *Drummond*; *Dr. Todd*.—This most beautiful species is now cultivated in the gardens of this country.

7. *P. uniflora*; “herbacea pumila, foliis latis ovalibus in petiolum angustatis, floribus imberbis solitariae sparsis pedicellatis.”—*Mich. Am.* v. 2. p. 52. *Pursh*, *Fl. Am.* v. 2. p. 464. *De Cand. Prodr.* v. 1. p. 330.—*P. paucifolia*, var.? *Nutt. Gen. Am.* v. 2. p. 87.

HAB. Borders of Canada, about Lake Ontario. *Michaux*. Islands in Lake Erie, rare. *Douglas*; 1823.—This plant I have never seen. Nuttall doubts if it be distinct from *P. pauciflora*; but then it must be incorrectly described by Michaux, who says that the keel is not crested, and that the flowers are solitary and scattered. De Candolle has only seen a specimen without inflorescence.

ORD. XV. CARYOPHYLLEÆ. Juss.

TRIB. I. SILENEÆ. DC. (*Caryophyllea* Lam.) *Sepala coadita in tubum cylindraceum apice 4-5-dentatum*. DC.

1. DIANTHUS. Linn.

Cal. tubulosus 5-dentatus, basi squamis 2-4 oppositis imbricatis. *Pet.* 5 longe unguiculata. *Stam.* 10. *Styli* 2. *Caps.* 1-locularis. *Semina compressa hinc convexa inde concava, peltata. Embryo vix curvatus.* DC.

SECT. CARYOPHYLLUM. Ser. DC. *Flores paniculati vel solitarii.* DC.

1. *D. repens*; caule unifloro, squamis calycinis binis ovato-lanceolatis acuminatis calyce paulo brevioribus, foliis linearibus glabris.—*Willd. Sp. Pl.* v. 2. p. 681. *De Cand. Prodr.* v. 1. p. 358. *Cham. et Schlecht. in Linnaea*, v. 1. p. 37.

HAB. Bay of Eschscholtz. *Chamiso*. Kotzebue's Sound, in the same Bay. *Lay and Collie in Capt. Beechey's Collection*.—This is probably the only species of *Dianthus* that is really a native of North America, and which shows the affinity of the vegetation of the North-West Coast with that of Siberia in the same latitude, where the present species was originally discovered. *D. Armeria*, enumerated in the Floras of the United States, is allowed by all to be introduced, and the *D. carolinianus* of Walter is a very dubious plant, with which no one seems to have been acquainted but Walter himself. Neither Capt. Beechey's specimens of *D. repens*, nor those communicated to me by Chamiso, nor the individuals in Willdenow's own Herbarium, according to the last mentioned author, possess a creeping root: on the contrary, one which descends deep into the earth, and bears on its summit many stems.

2. SILENE. Linn.

Cal. tubulosus, 5-dentatus, nudus. *Pet.* 5, unguiculata, fauce saepissima coronata, limbo bifido. *Stam.* 10. *Styli* 3. *Capsula* basi triloculares, apice in 6 dentes dehiscentes. DC.

HAB. Throughout the whole of Arctic and subarctic America, north of lat. 54° , and from Labrador to Behring's Straits, found by every traveller: as well as on the more elevated parts of the Rocky Mountains, between lat 52° and 56° . *Drummond*.

SECT. II. BEHENANTHA. *Ottb. MSS. Caulescentes. Flores solitarii aut paniculati. Calyx vesiculato-inflatus. DC.*

2. *S. stellata*; caulis erectis ramosis pubescens, foliis quaternis verticillatis lanceolatis longe acuminate glabris, floribus paniculatis, calycibus vesiculosus pubescens, petalis bifidis.—*Ait. Hort. Kew. ed. 2. v. 3. p. 84. De Cand. Prodr. v. 1. p. 368.—Cucubalus stellatus. Linn. Sp. Pl. p. 592. Mich. Am. v. 1. p. 271. Pursh, Fl. Am. v. 1. p. 315. Elliott, Carol. v. 1. p. 514. Bigel. Fl. Bost. ed. 2. p. 184. Torrey, Fl. of Un. St. v. 1. p. 449.*

HAB. Canada. *Linn. Dry stony places on the Niagara. Douglas*, 1823.

3. *S. inflata*; caulis ramosis, floribus paniculatis, calycibus vesiculato-ovatis, petalis bifidis nudis, unguiculis cuneiformibus, stylis longissimis. *DC.—Sm. Fl. Brit. p. 467. De Cand. Prodr. v. 1. p. 368.—Cucubalus Behen. Mich. Am. v. 1. p. 271. Pursh, Fl. Am. v. 1. p. 315. Engl. Bot. t. 164. Bigel. Fl. Bost. ed. 2. p. 183. Torrey, Fl. of Un. St. v. 1. p. 449.*

HAB. Canada, about Quebec. *Michaux; Mrs. Percival; and (at St. Foy) Mrs. Sheppard*.

4. *S. Douglasii*; leviter pubescens, caulis erectis flexuosis gracilis, foliis remotis longo-linearibus angustis, floribus paniculatis, calycibus obovatis demum inflatis leviter striatis obscure reticulatisque pubescens petalorum limbo bifidis.

Perennis. (*Douglas*.) *Caules simplices vel ad basin colummodo ramosi, pedales, erecti, graciles, leviter sed abique, ut et folia calycesque, pubescens-scabri. Folia ad basin caulinum congesta, caulinam remota; omnia opposita, basi connata, 2-3 uncias longa, linearia, angusta, subsesquilinea lata, uninervia, superne rara, parva. Flores mediores, paniculati; rami sepe triflori, pedicellis longis, bibracteati, bracteis subulatis. Calyx oblongo-obovatus, 5-dentatus, dentibus patulis, pubescens, 10-striatus, basi abruptus, demum membranaceus, obscure reticulatus, inflatus. Petala alba, limbo bifido. Capsula ovata, pallide fusca, nitida, 6-dentata, calyx paululum longior, auctophore longo insidens.*

HAB. Abundant in mountain vallies, above the Grand Rapids of the Columbia, and among the Rocky Mountains, on their western declivity. *Douglas*.—I possess wild specimens of this from the stations now given, and others cultivated in the gardens of the Horticultural Society. In many respects it seems to agree with the *S. Gypsophila* of Desf. and Dr. Cand., and especially as described by Chamiso and Schlechtendal in the *Linnæa*, p. 39; but it does not sufficiently accord to induce me to think it is the same.

SECT. III. OTITES. *Ottb. MSS. Caulescentes. Flores verticillato-spicati. DC.*

5. *S. Scouleri*; pubescens subviscida, caule simplici erecto remote folioso, geniculis nodosis, foliis lanceolatis linear-lanceolatis planis, spica longa, floribus erectis, calycibus oblongo-clavatis 10-striatis, petalis bifidis.

Radix parva, annua, vel biennia, (perennis. Douglas.) Caulis solitarius, erectus, pedalis ad bipedalem, teres, denso sed breviter pubescens, superne subglandulosus, viscidus, ad geniculas insigniter nodosus,

geniculis remotis. *Folia* opposita, basi cincta et caule vaginantis, lato-vel etiam linear-lanceolata, plana, magis minusve obtusa, vel sepe acuminata, utrinque pubescentia, margine scabriuscula; *inferiora* majora, nunc 3-4 uncias longa, basi in petiolula attenuata; *superiora* sensim minora, erecta, sessilia. *Bractæ* ovato-acuminatae. *Flores* subracemoso-spicati, ramis plerumque trifloris, oppositis, et ita verticillati videantur: pedicellis bracteolatis. *Calyx* oblongo-clavatus basi abruptus, glanduloso-pubescentia, apice 5-dentatus, decem-striatus. *Petala* bifida, alba nunc rosea. *Stamina* stylique exserta.—*Capsula* anthophoro longo suffulta, bifida, lacinis demum 3-dentatis.

HAB. North-West coast of America. *Mr. Menzies*. Fort Vancouver. *Dr. Scouler*. Upon the low hills of the Columbia, and in the mountain valleys of the Spokane and Macmillan Rivers. *Douglas*.—This, again, has long lain in the Herbaria of British Naturalists, without having, as far as I can ascertain, been taken up by any author. It exhibits, it must be confessed, a close affinity with *S. viscosa*; but it is smaller in all its parts, less viscid, with more remote pairs of leaves, with a shorter calyx, and a stem that is strikingly swollen at the joints. It appears to be confined to the Columbia River, and its tributary streams; and although approaching the Rocky Mountains, it was not found among them, either by Mr. Douglas or Mr. Drummond.

SECT. IV. STACHYMPHORA. *Oth. MSS.* *Caulescentes. Flores spicati (vel racemosi) axillares, non (aut rarius) oppositi. Calyx 10-striatus.* *DC.*

6. *S. Drummondii*; tota pubescenti-glandulosa viscida, caulinibus erectis simplicibus strictis, foliis remotis linear-lanceolatis, racemo laxo paucifloro, pedicellis elongatis plerumque alternis, calycibus oblongo-cylindraceis erectis.—*S. niceensis*. *Cham. et Schlecht.* in *Linnæa*, v. 1. p. 41.?

Radix perennis, crassiuscula. *Caules* simplices, erecti, strictissimi, teretes, pedales ad sesquipedalem, ubique, ut et tota planta, præter corollam, pubescenti-glandulosi, viscidi, superas præcipue. *Folia* linear-lanceolata, *radicula* latiora, in petiolula attenuata; *caulina* remota sursum sensim minor, opposita, basi conata, uninervia. *Flores* pauci, 3-5 in racemum laxum, raro spicatum, strictissimum dispositi. *Bractæ* subulate. *Pedicelli* alterni, nunc, sed raro, oppositi, unciam sesquiunciam longi, simplices, nudi vel, nunc, bibracteati. *Calyx* oblongo-cylindraceus, pubescenti-viscidus, 5-dentatus, dentibus parvis, striis decem viridis, demum, fructiferus, paulo latior, nunquam inflatus nea clavatus. *Petala* alba, parva, vix calyce longiora. *Capsula* cylindracea, sessilis, calycis longitudine, apice 6-dentata.

HAB. Plains of the Saskatchewan. *Dr. Richardson*; *Drummond*. Common on the elevated, gravelly soils, near Fort Vancouver, and skirting the Blue Mountains. *Douglas*.—I am doubtful whether this species should be referred to the division "Stachymorpha" or "Siphonomorpha" of the Prodromus. It accords in many respects with *S. gallica* of the former division, but it has the flower-stalks vastly more elongated, sometimes opposite, and the calyx more cylindrical; while, on the other hand, it approaches very near to the *S. niceensis* in the latter division, but is far less glutinous, and never has clavate calyces, as in my specimens of *niceensis* from the south of France. Still I suspect it may be the Californian *niceensis* of Chamisso and Schlechtendal, which those authors refer, doubtfully, to the plant of Allioni and De Candolle. From both the species now mentioned ours differs in its remarkably strict habit and small petals.

SECT. V. RUPIFRAGA. *Oth. MSS.* *Caulescentes. Caules stricti. Pedunculi filiformes. Calyces campanulati vel cylindrici.* *DC.*

7. *S. Antirrhina*; glabra inferne pubescenti-scabriuscula, caule erecto valde ramoso, foliis lanceolatis marginibus minute ciliato-scabris superioribus linearibus, floribus parvis paniculatis, calycibus ovalibus glaberrimis, petalis obcordatis coronatis.—*Linn. Sp. Pl.* p. 600. *Dill. Hort. Elth.* p. 422. t. 313. *Pursh, Fl. Am.* v. 1. p. 316. *Elliott, Carol.* v. 1. p.

517. *Torrey, Fl. of Un. St. v. 1. p. 451. Bigel. Fl. Bost. ed. 2. p. 183. De Cand. Prodr. v. 1. p. 376.*

HAB. Common throughout Canada, and from Lake Huron (*Dr. Todd*) to the Pacific at the mouth of the Columbia; apparently, however, confined to the plains.—A nearly glabrous plant, with numerous and very slender branches and peduncles, which are almost capillary, yet quite erect; and remarkable for its short broadly oval, or almost obovate, shining calyx. The blossoms, Dr. Bigelow observes, are probably nocturnal, since he has never seen them expanded in the day. Corolla small, whitish.

SECT. VI. SIRHONOMORPHA. OITH. MSS. *Caulescentes. Flores paniculati raro solitari; pedicelli oppositi breves. Calyx tubulatus. DC.*

8. *S. virginica*; viscoso-pubescent, caule procumbente assurgente ramoso, foliis lanceolatis inferioribus longissime petiolatis basi longe ciliatis, floribus magnis paniculatis, calycibus amplio clavatis, petalis longe unguiculatis latissimis coronatis. DC.—Linn. Sp. Pl. p. 600. Mich. Am. v. 1. p. 272. Pursh, Fl. Am. v. 1. p. 316. Elliott, Carol. v. 1. p. 516. Torrey, Fl. of Un. St. v. 1. p. 450. De Cand. Prodr. v. 1. p. 379.

HAB. Lake Huron. *Dr. Todd*.—There are several specimens of this plant in Dr. Todd's collection, but the corolla is so much withered and faded that I cannot satisfy myself whether it is the *S. virginica* or *pennsylvanica*; nor indeed do I well understand the difference between the two species. The present individual has its petals deeply bifid, on which account I refer it to *S. virginica*: but Elliott assures us that the petals vary in having the limb entire or divided. The colour of *S. virginica* is said to be a bright crimson, that of *P. pennsylvanica*, a bright purple (*Elliott*), purplish white (*Bigelow*). Torrey unites the *S. Catesbeii* of Walt. to this, which, judging from Dr. Schweinitz's specimens, is very different, and more allied to *S. regia*. Bot. Mag. t. 1794.

9. *S. pennsylvanica*; viscidio-pubescent, caulis procumbentibus, foliis linearibus longis, floribus paniculatis, calycibus longis tubulatis, petalis leviter emarginatis subcrenatis. DC.—Mich. Am. v. 1. p. 272. Pursh, Fl. Am. v. 1. p. 316. Bigel. Fl. Bost. ed. 2. p. 183. Torrey, Fl. of Un. St. v. 1. p. 450. Elliott, Carol. v. 1. p. 515. De Cand. Prodr. v. 1. p. 391. Bot. Reg. t. 247.

HAB. Rocky Islands on the north side of Lake Erie, abundant. *Douglas*.—Of this I have seen no specimen, and rely on Mr. Douglas's correctness for its being a Canadian plant. Dr. Torrey refers to it, though with a mark of doubt, the *S. virginica* of Linneaus. Smith has thrown no light on these species in Rees' Cyclopaedia. De Candolle places them in two different subsections, the latter in that "calycibus elongatis clavatis;" and *pennsylvanica* in the division "calycibus longe clavatis." I confess I do not see a difference in this respect.

SECT. VII. *Caulescentes. Pedunculi axillares; pedicelli elongati.*

10. *S. Menziesii*; pubescens, caule erecto ramoso dichotomo, foliis lato lanceolatis basi apiceque acuminatis, pedunculis axillaribus folium vix superantibus, floribus parvis, calycibus obovatis 5-fidis, petalorum limbo bipartito laciniis linearibus. (TAB. XXX.)

Tota planta tenera, pubescent, minuto obtecta. *Caules* epithamei ad pedalem, erecti, flexuosi, teretes, subdense foliosi. *Folia* opposita, bi-rarius triangularis, patentia, lanceolata, uninervia, basi attenuata, sed *inferiora* solummodo subpetiolata; *reliqua* sessilia, apice in acumen subpungens attenuata. *Pedunculi* subbiunciales, foliis vix longioribus graciles, simplices, erecti, alterni vel plurimque oppositi, nudi, nisi supremi, qui bibracteati. *Flores* magnitudine *Silenis quadridentatae*. *Calyx* oblongo-ovatus, basi subattenuatus, apice profunde 5-dentatus seu quinquefidus, dentibus vel paululum majores, acuminatis, obscure decemcostatus, pubescens. *Petala* 5, calyce multo longiora, alba, unguiculata, corona nulla, limbo bipartito, laciniis linearibus,

obtusa. *Stamina* pistillumque anthophoro, germinis longitudiae, suffulta. *Filamenta* 10, subequalia, exserta: *Anthera* oblongo-ovales. *Germe* ovale, obtusum. *Styli* tres, petalorum unguibus vix longiores. *Capsula* membranacea, calyx minor. *Semina* subtriginta.

HAB. North-West Coast of America. *Mr. Menzies*. Straits of Juan de Fuca, in lat. 48°. *Dr. Scouler*. Under the shade of solitary pines, on the low hills of the Okanagan. *Douglas*. Portage d'embarras, Slave River. *Dr. Richardson*.—This species is totally unlike any other with which I am acquainted, somewhat resembling a slender state of *Saponaria ocyoides*, nor indeed does it accord with any of the divisional characters of the genus given by De Candolle: for here the peduncles are throughout solitary and single-flowered, and the stem is leafy to the very summit. Dr. Richardson's specimens are smaller than those from the east side of the Rocky Mountains, and have fewer flowers: but they are not otherwise different.

TAB. XXX. Plants:—natural size. Fig. 1, Flower; fig. 2, Stamens, pistil, and their stalk; fig. 3, Capsule:—magnified.

SECT. VIII. ATOCION. Ott. MSS. *Caulescentes. Flores corymbosi. Calyx clavatus, 10-striatus. DC.*

11. *S. Armeria*; glaberrima glauca viscosa, caule ramoso, foliis ovato-lanceolatis, floribus paniculato-corymbosis, calycibus longe clavatis, petalis obcordatis coronatis.—*Linn. Sp. Pl. p. 601. Engl. Bot. t. 1398. De Cand. Prodr. v. 1. p. 384.*

HAB. Among the plants gathered at Pentanguahene, on Lake Huron, by *Dr. Todd*: probably introduced from Europe.

2. LYCHNIS. *Linn.*

Cal. tubulosus, 5-dentatus, nudus. *Pet.* 5, unguiculata, fauce saepius coronata, limbo plerumque diviso. *Stam.* 10. *Caps.* 1-5-locularis, anthophoro longo vel nullo.

1. *L. apetala*; pubescens, caule simplici, calyce cylindraceo pubescente striato demum inflato et corollam includente, seminibus arillatis.

a. caule subunifloro brevi.—*Linn. Sp. Pl. p. 626. Fl. Lapp. t. 12. f. 1. Fl. Dan. t. 305. Wahl. Lapp. p. 135. t. 7. Rich. in Frankl. 1st Journ. ed. 2. App. p. 18. Br. in Parry's 1st Voy. App. p. clxx. Hook. in Parry's 2d Voy. App. p. 389. De Cand. Prodr. v. 1. p. 386. Cham. et Schlecht. in Linnaea, v. 1. p. 42.—L. uniflora. " Ledeb. Mem. Petersb. v. 5. p. 537.*

b. caule 3-6-floro elongato.—*L. apetala; s. pauciflora. De Cand. Prodr. v. 1. p. 386.—L. pauciflora. Fisch.—L. brachypetala. Cat. Hort. Berol.*

HAB. Labrador (*Mr. Morrison*) seems to be its most southern latitude, in the plains to the east: Fort Norman, (var. β .) in the interior. *Dr. Richardson*. Abundant every where beyond the Arctic Circle, and as far west as Behring's Straits. On the more elevated parts of the Rocky Mountains, between lat. 52° and 56°. *Drummond*.—A very variable plant, with a stem scarcely a finger's length in height, to a foot, or a foot and a half, almost naked, or with three or four pairs of linear obtuse leaves, the lowermost ones spatulate; with from one to six flowers, which are sometimes erect, often drooping; the petals more or less exerted, varying in breadth, almost a deep red: the calyces more or less pubescent. When the capsule is ripe it is always erect, it fills the previously inflated calyx, is five-toothed, one-celled, with the seeds arillated, as described by Wahlenberg, and as observed by Dr. Richardson in recent specimens.

2. *L. alpina*; glabra, paniculis capitatis, calycibus fructibusque obovatis basi attenuatis, petalis bifidis, foliis linear-lanceolatis acutis.—*Linn. Sp. Pl. p. 626. Fl. Dan. t. 65. Pursh, Fl. Am. v. 1. p. 321. Engl. Bot. t. 2254. De Cand. Prodr. v. 1. p. 387.*

HAB. Labrador. *Herb. Banks. et Dicks. (Pursh.) Mr. Morrison.*—This plant, which is abundant on most of the higher alps of Europe and in Iceland, seems to be found upon the American Continent only at the point just mentioned, whence I have received specimens from Mr. Morrison, agreeing in every particular with those of the Old World.

3. AGROSTEMMA. *Linn.*

Cal. tubulosus, 5-fidus, coriaceus. *Pet. 5*, unguiculata, non coronata, limbo integro. *Capsula* 1-locularis, 5-dentatus.

1. *A. Githago*; *hirta*, calyce corollam excedente, foliis linearibus.—*Linn. Sp. Pl. p. 624. Engl. Bot. t. 741. Pursh, Fl. Am. v. 1. p. 321.*—*Lychnis Githago. Lam.—De Cand. Prodr. v. 1. p. 387.*

HAB. Canada. Around Quebec. *Mrs. Percival; Mr. Sheppard.*—Probably introduced from Europe.

TRIB. II. ALSINEÆ. DC.—*Calycis separata* 4—5 libera aut ima basi vix subcoalita. DC.

4. SAGINA. *Linn.*

Cal. 4—5-partitus. Pet. 4—5 aut nulla. Stam. 4—5. Caps. 4—5 valvis, 1-locularis, polysperma. DC.

1. *S. procumbens*; *perennis glabra*, caulis procumbentibus, foliis linearibus mucronatis, pedunculis fructiferis adscendentibus, petalis brevibus obtusis, sepalis ovatis.—*Linn. Sp. Pl. p. 185. Engl. Bot. t. 880. Pursh, Fl. Am. v. 1. p. 190. Elliott, Carol. v. 1. p. 221. Torrey, Fl. of Un. St. v. 1. p. 135. De Cand. Prodr. v. 1. p. 389.*

HAB. North-West Coast of America, in springy ground, on the plains of the Columbia. *Douglas; Dr. Scouler.*—These specimens entirely agree with European ones, only that the number of parts to the flower are more frequently five than four.

5. MOLLUGO. Ser. (MOLLUGO ET PHARNACEUM. *Linn.*)

Cal. 5-partitus. Pet. 0. Stam. 3—5. Styli 3. Capsula 3-valvis, 3-locularis, polysperma.—Folia verticillata, raro opposita. Flores solitarii, gemini vel umbellati. DC.

1. *M. verticillata*; *foliis verticillatis inaequalibus obovato-lanceolatis acutis, caulis decumbentibus dichotomis, pedunculis unifloris verticillatis.*—*Linn. Sp. Pl. p. 131. Mich. s. bipedalis, ramosissimus, omnibus partibus majoribus.—S. ramosissima. Douglas, MSS.
—S. maxima. Wiehe in Reich. Ic. t. 113.

HAB. Canada; about Quebec. *Mrs. Percival; Mr. Sheppard.* On the high grounds of the Red and Assiniboine Rivers. *Douglas.* *s.* Common on the banks of the Columbia at Fort Vancouver, and near the Pacific, in open prairies. *Douglas.*—The seeds in *a.*, as well as in *s.*, have a small narrow border, and are black, with raised points or papillæ of a pale brownish colour. The *S. ramosissima* of Mr. Douglas has been cultivated in our gardens; but I do not find that it affords any specific mark by which it can be really distinguished from *s.* It seems to be the *S. maxima* of Wiehe, both in point of size and in regard to the seeds. In the former character it agrees with the *S. pentandra* of Smith, but that has the seeds with a broader margin.

* * *Foliis oppositis, junioribus in axilla fasciculatis; stipulis nullis. DC.*

2. S. nodosa; foliis subulatis oppositis glabris connatis, inferioribus vaginantibus, superioribus in axillis proliferis, petalis calyce duplo longioribus.—*Linn. Sp. Pl. p. 630.* *Engl. Bot. t. 694.* *De Cand. Prodr. v. 1. p. 394.* *Rich. in Frankl. 1st Journ. App. p. 18.*

s. axillis foliorum superiorum viviparis.

v. fasciculis foliorum axillaribus paucis.

HAB. Upper Canada, to the shores of the Arctic Sea, eastward of the Mackenzie River. *Dr. Richardson.*—The specimens from the Arctic shores differ in no respect from the others, except in having their leaves shorter and more fleshy. The clusters of young leaves, in the axils of the older upper ones, are very numerous and so compact as to appear like gemmæ; they evidently fall out from those axils, and doubtless become new plants. In the individuals from the Mackenzie River, the axillary clusters of young leaves are very few.

3. S. saginoides; glabra, foliis subulatis acutis muticis, pedunculis solitariis longis, petalis calycem æquantibus capsula longioribus.—*Linn. Sp. Pl. p. 631.* *Engl. Bot. t. 2105.* *Mich. Am. v. 1. p. 276.* *Pursh, Fl. Am. v. 1. p. 320.* *Torrey, Fl. of Un. St. v. 1. p. 457.* *De Cand. Prodr. v. 1. p. 394.* *Cham. et Schlecht. in Linnæa, v. 1. p. 46.*—*S. decumbens. Elliott, Carol. v. 1. p. 523.*

HAB. North-West Coast of America. *Mr. Menzies in Herb. nostr.* Islands of Unalaschka, St. Paul, and in the Bay of Eschscholtz. *Chamiso.*

4. S. subulata; glabra vel subpubescens, foliis anguste linearis-subulatis mucronatis, pedunculus solitarius longis, petalis capsulaque calycem æquantibus.—*Swartz, Act. Holm. 1789. p. 45. t. 1. f. 3.* *Engl. Bot. t. 1082.* *De Cand. Prodr. v. 1. p. 394.*—*S. saginoides. Curt.*—*S. procumbens, s. Linn.*

6. LARBREA. St. Hil.

Cal. 5-fidus (potius 5-partitus) basi breviter urceolatis. Pet. 5, bipartita, calyci inserta. Stam. 10, etiam perigyna. Styli 3, (vel 5.) Ovarium 1-loculare, polyspermum. Ovula axi centrali adfixa. Capsula apice 6-valvis, valvis nempe tribus apice bifidis.—Herba glabra habitu Stellariae mediae. Flores parvi albi. DC. Prodr. v. 3. p. 366.

L. uliginosa.—Larbrea aquatica. *St. Hil.* (not *Ser. in De Cand. Prodr. v. 1. p. 393.* quæ est *Ceratium aquaticum. Linn.*)—*De Cand. Prodr. v. 3. p. 366.*—*Stellaria uliginosa. "Murr. Gött. 55."* *Engl. Bot. t. 1074.*—*S. aquatica. Poll. Pal. v. 1. p. 429.* *De Cand. Prodr. v. 1. p. 395.* *Cham. et Schlecht. in Linnæa, v. 1. p. 50.*—*S. graminea, v. Linn.*

a. foliis latioribus, floribus minoribus.

HAB. Island of Unalaschka. Chamisso. *a.* Prairies of the Rocky Mountains, between lat. 52° and 56°. Drummond.—A small plant with altogether the habit of *Stellaria*: from which it is separated on account of its slightly perigynous stamens and petals. This insertion, however, equally exists in some acknowledged *Stellaria*.

7. STELLARIA. Linn.

Cal. 5-partitus. Pet. 5, bifida. Stam. 10, aut abortu 3-8. Styli 3. Caps. 1-locularis, apice 6-valvæ, polysperma. DC.

1. *S. media*; caulis procumbentibus linea laterali alterna pilosa, foliis ovatis petiolatis tenerrimis superioribus sessilibus, pedicellis fructiferis deflexis, capsulis profunde 6-valvibus, calyce piloso vix longioribus.—Engl. Bot. t. 537. Pursh, Fl. Am. v. 1. p. 817. Bigel. Fl. Bost. ed. 2. p. 181. Torrey, Fl. of Un. St. v. 1. p. 453. De Cand. Prodr. v. 1. p. 396.—*Alsine media*, Linn.

HAB. Gathered on the route between Cumberland House and York Factory. Drummond. Lake Huron. Dr. Todd. At the Grande Chaudière, Upper Canada. Pursh, MSS.

2. *S. longifolia*; flaccida ramosa, caule tetragono scabriuscule, foliis linearibus patentibus marginibus scabissime scabris, paniculis terminalibus divaricatis bracteatis, petalis bipartitis calyce acuto trinervi vix longioribus, styli 3-4.—Muhl. Cat.—De Cand. Prodr. v. 1. p. 400. Rich. in Frankl. 1st Journ. ed. 2. App. p. 14. Torrey, Fl. of Un. St. v. 1. p. 452. (excl. syn. *S. longip.* Gold.) Bigel. Fl. Bost. ed. 2. p. 182.—*S. graminea*. Bigel. Fl. Bost. ed. 1. p. 110. Cham. et Schlecht. in Linnaea, v. 1. p. 49.—*Spergulastrum gramineum*. Mich. Am. v. 1. p. 276. De Cand. Prodr. v. 1. p. 422.—*Micropetalum gramineum*. Pers. Syn. Pl. v. 1. p. 500. Pursh, Fl. Am. v. 1. p. 320.

HAB. Canada. Goldie. Lake Huron. Dr. Todd. Woody country from lat. 54° to 64°. The specimens, here noticed, were gathered at Cumberland House Fort and English River, by Dr. Richardson and Drummond. Unalaschka. Chamisso. On the Columbia. Dr. Scouler; Douglas.—After the elaborate and faithful description which Dr. Richardson has given of this plant in the Appendix to the Second Edition of Franklin's Journal, it might be needless for me to offer any farther remark, were it not that, like others of this perplexing genus, it is liable to variation, and it will be seen by the above synonymy what difficulty the American Botanists have found in determining its place. Dr. Richardson has included among his references the *Spergulastrum lanceolatum* of Mich., which, nevertheless, I have ventured to keep distinct; but I am far from saying that they ought not to be united, different as the extremes may appear to be. Indeed my specimens of *S. longifolia*, from Dr. Booth, (which are the same as Professor Bigelow's,) and others from Dr. Torrey, have rather broader leaves than Dr. Richardson's plants, and quite smooth (not scabrous) stems and margins to the leaves: thus, as it were, partaking of the characters of the following species. With regard to the genus *Spergulastrum* or *Micropetalum*, all the American Botanists concur in uniting it with *Stellaria*, the minute or absent petals being a very unimportant character, and decidedly variable in the species of the genus in question. The stamens and petals are perigynous, as in *Larbrea*.

2. *S. borealis*; flaccida ramosa ubique lavis glaberrima, foliis lato-lanceolatis lanceolatisque basi apiceque acutis, paniculis terminalibus foliosis, petalis bipartitis calyce acuto trinervi vix longioribus.

a. panicula foliosa, ut pedicelli axillares solitarii videantur.—*S. borealis*. Bigel. Fl. Bost.

ed. 2. p. 433.—S. lanceolata. Torrey, Fl. of Un. St. v. 1. p. 453. (non Poiret et De Cand.)—Spergulastrum lanceolatum. Mich. Am. v. 1. p. 275.—Micropetalum lanceolatum. Pers. Syn. Pl. v. 1. p. 320.

a. panicula minus foliosa, rarius bracteata.

y. nana; omnibus partibus minoribus.

HAB. *a.* Fort Norman, in lat. 65°. Dr. Richardson. *b.* Throughout Canada, and as far as the Arctic Circle. *y.* On the Rocky Mountains, between lat. 52° and 56°. Drummond.—If I am correct in keeping this plant distinct from the preceding, the name of Professor Bigelow is what ought to be adopted. I possess authentic specimens of his *S. borealis* from Dr. Boott, and am certain that it exactly corresponds with my *a.* Such, too, is the case with the plant of Dr. Torrey, and I presume it is equally the *Spergulastrum lanceolatum* of Michaux. Its petals are sometimes wanting. When the panicles are much elongated, bracts take the place of leaves; and then, especially if the leaves are more narrow than usual, the plant can hardly be distinguished from some states of *S. longifolia*. Nor can it be concealed that it bears a close affinity with our *S. graminea*, being, most probably, what is intended under that name by Chamisso; whilst the variety he mentions with scabrous stems, "qualem in regionibus sylvaticis inter 54-64 gradum lat. bor. observavit Richardson," I have referred to *S. longifolia*. The dwarf state from the Rocky Mountains, I have had the greatest difficulty in distinguishing from *Larrea uliginosa*, for assuredly the stamens and corolla are perigynous; but the leaves are less ovate, the flowers less crowded at the top of the branches; the petals and styles longer. Dr. Richardson had already observed, under his *S. longifolia*, "flores magnitudine *Stellaria uliginosa* (Smith) quo quoque non raro tetragyna."

3. S. longipes; subfasciculata glaberrima glauca, foliis linearis-subulatis patentibus, pedunculis terminalibus dichotomae ramosis, bracteis membranaceis, pedicellis valde elongatis, petalis late obovatis profunde bifidis calyce obtuso obscurae trinervi paulo longioribus.—Goldie in Edin. Phil. Journ. Apr. 1822. De Cand. Prodr. v. 1. p. 400.

a. minor; caulinis foliisque strictioribus.

Planta tota glaberrima. *Caulis* in *a.*, subpatentes, flaccidi, pedales et ultra, in *b.* spathamei, basi decumbentes, dein erecti, subterragoui, ramosi. *Folia* glauco-viridula, sequiunciam ad duas uncias longa, late linearis-subulata, seu o basi latiore sensim acuminata, integerrima, margine subcartilaginea, patentia, in *b.* paulo latiora magisque erecto-patentia. *Pedunculi* terminales, aphylli, dichotome ramosi, ad dichotomias bracteati, bracteis majusculis, late ovatis, albo-membranaceis, dorso solummodo viridibus. *Flores* conspicui, albi. *Sepala* elliptico-ovata, obtusa, viridula, glaucescentia, obscure trinervia, margine lato-membranacea. *Petala* calyce paulo longiora, late obovata, alba, profunde bifida. *Antheræ* fuscescentes. *Capsula* ovato-oblonga, nigra, vel intense fusa, nitida, calycem paulo excedens, usque ad medium trivalvis, valvis raro bifidis. *Semina* parva, subrotunda, fusa.

HAB. Woods near Lake Ontario; Mr. Goldie; thence to the Mackenzie River and Bear Lake. Dr. Richardson; Drummond.—The present *Stellaria* is one, (along with 4, 5, and 6,) of a series of the genus, respecting which I scarcely know whether they should constitute species or rather be described as varieties. Characters, indeed, may easily be detected for defining the extreme appearances of them; but there are, among the numerous specimens which Dr. Richardson's and Mr. Drummond's rich collection can boast, intermediate states which I cannot satisfactorily refer to any. All are distinguished by their rigid erect habit; (except the var. *a.* of the present species,) by leaves, broad at the base, gradually tapering upwards, by their remarkable glossiness, unless when any portion, or the whole of them, be glaucous; by their obscurely-nerved calyx; and by the large, deep, rich brown, or black, very glossy, capsule, which, being longer than the calyx, forms a striking contrast with the pale hue of the rest of the plant. Our present species is distinguished by a larger size than the rest, by its more distant, longer leaves, and especially by the great length of the pedicels of its flower and fruit. Nevertheless, the plants of a humbler growth border upon

Dr. Richardson's and our *S. lata*, which, however, differs in its yet smaller size, shorter foliage, and more acute sepals.

4. *S. stricta*; erecta stricta nitidissima vel subglaucous, foliis linearis-subulatis erectis subcanaliculatis rigidis, panicula terminali, petalis linearibus bipartitis calyce glabro obscure trinervi acutissimo plerunque longioribus, antheris purpureis.—*Rich. in Frankl. 2d Journ. ed. 2. App. p. 15.*—*S. palustris*, *β. Frankl. 1st Journ. ed. 1. App. n. 164.* (excl. syn.)

α. caulis laxe pubescenti-pilosus.—*S. stricta*, *α. Rich. l. c.*

β. caulis glabris. Rich. l. c.—*S. palustris*, *α. Rich. in Frankl. 1st Journ. ed. 1. App. n. 164. var. *α.* (excl. syn.)*

γ. foliis superioribus præcipue glaucescentibus.

HAB. *α.* and *β.* From Lake Winnipeg (*Douglas*) to the Bear Lake, lat. 65°. *Dr. Richardson*; and from Hudson's Bay to the Rocky Mountains, between lat. 52° and 56°. *Drummond*.—It will be readily seen that my third variety, *γ.*, may be supposed to pass into the following species; and there are specimens which do appear, in a dried state indeed, to be intermediate, such as I cannot confidently refer either to the one or to the other. I must content myself with having given the characters of the most marked varieties or species, and leave it to others to judge of their importance. The capsule is similar to that of *S. longipes*.

5. *S. lata*; erecta stricta valde glauca, foliis erectis lanceolatis basi latioribus acutis carinatis laevibus, pedunculis nunc binis unifloris nunc paniculis paucifloris terminalibus, petalis bipartitis calyce glabro pubescente obscure trinervi paulo longioribus, antheris albis vel siccitate luteo-fuscis.—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 16. Hook. in Parry's 2d Voy. App. p. 390.*

HAB. From Great Bear Lake to the shores and islands of the Arctic Sea; *Dr. Richardson*; *Capt. Sir E. Parry*; and upon the more elevated of the Rocky Mountains, between lat. 52° and 56°. *Drummond*.—This is more arctic or more alpine than the preceding, and always smaller; thus situation may account for some difference in its habit.

6. *S. Edwardsii*; erectiuscula, caulis pubescens vel glabris, foliis erectis rigidis lanceolatis basi latioribus seu ovato-lanceolatis inferne margineque spissime laxe pilosis, pedunculis terminalibus uni-floribus, petalis bipartitis calyce glabriuscule acuto obscure trinervi longioribus, antheris purpureis luteo-fuscisve. (TAB. XXXI.)—*Br. in Parry's 1st Voy. App. p. cclxxi. Rich. in Frankl. 1st Journ. ed. 2. App. p. 15. Hook. in Parry's 2d Voy. App. p. 390. Cham. et Schlecht. in Linnaea, v. 1. p. 48.*—*S. nitida*. *Hook. in Scoresb. Greenl. App. p. 411. Cham. et Schlecht. in Linnaea, v. 1. p. 47.*

HAB. Shores and Islands of the Arctic Sea. *Dr. Richardson*; *Capt. Sir John Franklin*; *Capt. Back*; *Capt. Sir E. Parry*; *Mr. Edwards*. Behring's Straits. *Chamiso*; *Messrs. Lay and Colle in Capt. Beechey's Collection*.—A figure of the most distinct appearance of this plant may not be unacceptable to Botanists: but then, I must confess, that when the panicle bears three or four flowers, it is very difficult to form a character by which to distinguish it from *S. stricta*. The colour of the anthers is considered by Mr. Brown of specific importance: but Dr. Richardson's var. *γ.* has the anthers small and white, destitute of pollen. Perhaps in all of this group they are purple when perfect—yellow, dingy brown, or white, when abortive; for I find all these differences in what I should otherwise consider as one and the same species. The plant is plentiful in the extreme North-West America: and Chamiso and Schlechten-dal have devoted two pages of the Linnaea to remarks on what they conceive may be *S. nitida* and *S. Edwardsii*, while they think the *S. dahurica*, of Schlecht. and De Cand., as well as the *S. florida* of

Fisch. and De Cand., very closely allied plants; as are probably some other Siberian ones. For further observations on our plant, I must refer to Mr. Brown and Dr. Richardson, in the works above quoted, and to the Appendix of Capt. Parry's 2d Voyage.

TAB. XXXI. A. B. Plants:—natural size. *Fig. 1*, Flower; *fig. 2*, Petal; *fig. 3*, Stamen; *fig. 4*, Sepal; *fig. 5*, Capsule:—magnified.

7. *S. humifusa*; glaberrima, caulis procumbentibus ramosis, foliis ovatis sessilibus subcarnosis, pedunculis solitariis terminalibus abbreviatis unifloris, petalis bipartitis calyce acutiusculo enervi longioribus.—*Röth. in Act. Hafn. v. 10. p. 447. t. 4. f. 14. Fl. Dan. t. 578. Hook. in Parry's 2d Voy. App. p. 391. Rich. in Franklin. 1st Journ. App. ed. 2. p. 17.*—*S. crassifolia. Cham. et Schlecht. in Linnaea, v. 1. p. 50.* (non Ehrh. et De Cand.)—*S. crassifolia. s. Wahl. Lapp. p. 125.*

HAB. Sandy shores of the Arctic Sea and Islands. *Capt. Sir E. Parry; Dr. Richardson; Capt. Sir John Franklin and Capt. Back.*—I know not how it is that Botanists have confounded this very distinct species with quite another plant, the *S. crassifolia* of Ehrhart, which has the habit of *Larrea utiginosa*, and is found in moist pastures of Germany. Ours is altogether arctic, and so fleshy in its foliage, that, in drying, the leaves always turn brown.

8. *S. gracilis*; glaberrima, caule debili, ramis sterilibus gemmiferis, foliis lanceolatis subsucculentis, pedunculo elongato solitario unifloro axillari vel terminali, sepalis glabris acutis enervibus petalis bipartitis brevioribus.—*Rich. in Franklin. 1st. Journ. ed. 2. App. p. 17.*—*s. foliis minus succulentis siccitate etiam viridibus.*

HAB. About Slave Lake, and between Cumberland House and Hudson's Bay. *Dr. Richardson. Drummond.*—The more usual state of this plant is to have the leaves somewhat fleshy, and like *S. humifusa*, turning brown when dry. Some of Mr. Drummond's specimens from the more southern latitudes, have their leaves still green, and rather less fleshy. Both possess terminal and axillary gemmae, by which the plant increases abundantly. It seems always to grow densely tufted. *Styles 3. Capsule half as long again as the calyx, oblong, thin, membranous, pale greenish-brown, 6-valved.*

9. *S. crispa*; “glaberrima, caulis diffusus, foliis brevissime petiolatis ovatis acuminatis margine repando-undulatis, floribus solitariis axillaribus, petalis calyce multo brevioribus, capsula calycem exaequante.”—*Cham. et Schlecht. in Linnaea, v. 1. p. 51.*

HAB. Unalashka. *Chamiso.*—With this species I am unacquainted. It is probably allied to the subsequent one, of which I regret that only very imperfect specimens are known to me; such, however, as will enable me to draw up the following specific character.

10. *S. ovalifolia*; caule procumbente pubescente, foliis internodio multo brevioribus ovalibus basi apiceque acutis subciliatis, axillis saepe gemmiferis, pedunculo terminali unifloro, petalis calyce acuminato longioribus.

HAB. Kotzebue's Sound. *Lay and Collie in Capt. Beechey's Collection.*—A few injured stems without a perfect flower are all that I possess. These are 5–6 inches long, weak. Leaves $\frac{1}{2}$ of an inch long, broadly oval, acute at both extremities, single-nerved, evidently reticulated when held between the eye and the light. Peduncle terminal, an inch long, solitary, with a single flower, large in proportion to the size of the plant. Calyx glabrous; its sepals acuminate, nerveless, shorter than the white petals, whose shape I cannot well determine.

8. ARENARIA. *Linnaea.*

Cal. 5-sepalus. Pet. 5, integra. Stam. 10, aut abortu pauciora. Styli 3. Caps. 1-locularis apice 6-3-valvis, polysperma. DC.

SECT. I. SPERGULARIA. *Pers.*

1. *A. rubra*; caulis prostratis, foliis angusto-linearibus acutis subcarnosis, stipulis ovatis, fissis, seminibus compressis margine membranaceo nulla.—*Linn. Sp. Pl.* p. 606. *Engl. Bot.* p. 852. *De Cand. Prodr.* v. 1. p. 401. *Bigel. Fl. Bost.* ed. 2. p. 179. *Torrey, Fl. of Un. St.* v. 1. p. 456.—*A. canadensis. Pers.*—*Pursh, Fl. Am.* v. 1. p. 219.

HAB. Canada. *Mrs. Percival.* Between Cumberland House and Bear Lake. *Dr. Richardson.* Newfoundland. *Dr. Morrison.* Straits of De Fuca and Observatory Inlet, on the North-West Coast. *Dr. Scouler.*—This plant varies in the pubescence of its leaves, and in the presence or absence of the mucro. Even in maritime specimens I do not find the seeds margined as in our *A. marina*. In all, the root is annual.—Schlechtendal and Chamisso mention it as an inhabitant of California, and, indeed, I have specimens from almost every part of the world.

SECT. II. ARENARIUM. *Ser. * Foliis gramineis.*

2. *A. nardifolia*; caespitosa, foliis fasciculatis angustissimis linear-setaceis glaberrimis mucrohati, caulis erectis glabris 1-3-floris, petalis obovatis sepula ovata obtusissima 5-nervia superantibus. (TAB. XXXII.)—*Lebed. Fl. Alt. ined.*—An “*A. lychnidea, A. glabra, A. Laxmanni? Fischer. in litt.*” *De Cand. Prodr.* v. 1. p. 402.

Caules caespitosi, inferne decumbentes, ramosi, valde foliosi, deinceps erecti, parce foliosi, ut et tota planta, glaberrima. Folia opposita, inferiora et in ramis sterilibus fasciculata, omnia angustissime linear-setaceae, nitida, rigida, unciam ad 3 uncias longa, recta vel subcurvata, basi subtilata atque connata, apice mucrone curvato terminata. Rami fertiles vix spathulati, spicae 1-3-floris; pedicelli bracteati. Flores majusculi. Calycis sepala 5, ovata, siccissima, margine diaphana, dorso inferne 5-nervia. Pet. obovata. Stam. 10. Capsula late ovata, 3-valvis

HAB. Shores of the Arctic Sea. *Dr. Richardson.*—This belongs to a natural little group of *Arenaria*, with very narrow and long leaves growing in fascicles on the short barren stems; most of them are inhabitants of Asia, (and not the more northern parts,) or the countries of Europe bordering upon it. My specimens of the *A. nardifolia* of Ledebour, from Dr. Fischer and Mr. Prescott, gathered by the former of these Naturalists, exactly correspond with those of Dr. Richardson from lat. 70° of North America: and these again approach so near to the *A. lychnidea* of Bieberstein, from the Iberian Caucasus, that, except in the pubescence of the latter, there is scarcely any difference.

TAB. XXXII. *Fig. 1.* Flower; *fig. 2.* Sepal; *fig. 3.* Capsule; *fig. 4.* Leaves:—all more or less magnified.

* * *Foliis subulatis linearibus.*

3. *A. laricifolia*; foliis subulatis denticulato-ciliatis, caulis undescendentibus 3-6-floris subscabrius, calycibus cylindricis, sepalis oblongis obtusiusculis triplinerviis hirtis corolla duplo brevioribus, capsulis trivalvibus calycem superantibus. DC.—*Linn. Sp. Pl.* p. 607. *Jacq. Austr. v. 3. p. 272. De Cand. Prodr.* v. 1. p. 404. *Pursh, Fl. Am.* v. 1. p. 219. *Cham. et Schlecht. in Linnaea, v. 1. p. 54.*

HAB. North-West coast of America. *Menzies. (Pursh.)* Bay of Eschscholtz and Island of St. Lawrence. *Chamisso.*—This is quite unknown to me as an American plant.

4. *A. juniperina*; foliis subulatis rigidis spinosis, inferioribus subfasciculatis, superioribus distantibus, caulis erectis firmis, sepalis ovatis subuninerviis, petalis obovatis calyce subdupo longioribus, capsulis ovato-rotundis trivalvibus calycem vix superantibus. DC.—*Sm. Ic. ined. p. 85. t. 35. Pursh, Fl. Am.* v. 1. p. 319. *De Cand. Prodr.* v. 1. p. 403.

HAB. Labrador and Newfoundland. (*Herb. Banks. Pursh.*) Between Lake St. Clair and Lake Huron, rare; *D. Douglas*.—I have myself received nothing like this plant of Smith's from the above-named countries.

5. *A. stricta*; erecta, glabra, multicaulis, foliis linear-setaceis uninerviis rigidis patentibus in axillis proliferis et quasi verticillatis, panicula dichotoma patente, petalis obovatis sepalis ovata acutissima 3-nervia superantibus.—*a.* foliis magis erectis, fasciculis axillaribus paucioribus, panicula erectiore.—*A. stricta. Mich. Am. v. 1. p. 274.*? *De Cand. Prodr. v. 1. p. 403. Pursh. Il. Am. v. 1. p. 319. Elliott. Carol. v. 1. p. 521.*—*a.* foliis recurvis, fasciculis axillaribus numerosis, panicula patentissima. (TAB. XXXIII.)—*A. stricta. Bigel. Fl. Bost. ed. 2. p. 180. Torrey. Fl. of Un. St. v. 1. p. 455.*

HAB. *a.* From the United States to the shores of the Arctic Sea, north of the Rocky Mountains. On the Columbia? *Dr. Scouler*.—In characterising many of the species of this division of *Arenaria*, we need the indulgence of those who study the same plants after us, for none are attended with more difficulty, even when, as in our case, we have numerous specimens from various latitudes, soils, situations, and elevations above the level of the sea: for it then becomes almost impossible to say what differences may be caused by local circumstances, and what may be permanent characters. To the species before us, these remarks are peculiarly applicable. What I have here called *var. a.* is what most of the American Botanists take for the true *stricta* of Michaux; and it is named as such in the Herbarium of Dr. Boott, which was compared with that of Michaux: yet the very appellation of "stricta," and the words "foliis erectis" of its original describer, are quite at variance with the plant. Mr. Drummond's, however, and Dr. Richardson's specimens tend to prove that my *a.* and *b.* may pass into each other. It is among the tallest of this group, often nearly a foot high; the capsules are rather longer than the calyx. Dr. Scouler's plant from the Columbia has the peduncles and calyces glandular. The *var. b.* is what I have figured at

TAB. XXXIII. *Fig. 1.* Flower; *fig. 2.* Fruit; *fig. 3.* Seed.—*magnified.*

6. *A. verna*; erecta, cespitosa, multicaulis, foliis linear-subulatis nervosis erectis, panicula erecta pauci-multiflora, calycibus ovatis acutis trinerviis corolla plerumque longioribus.—*Linn. Mant. p. 72. Engl. Bot. p. 512.*

HAB. Between Norway House and Cumberland House. *Dr. Richardson. Drummond. Columbia. Menzies. D. Douglas*.—This quite agrees with our British specimens of *A. verna*; the petals are sometimes longer and sometimes shorter than the calyx, and the latter and the pedicels are sometimes glabrous and sometimes pubescent, and, as it were, glandular.

7. *A. propinqua*; "cespitosa, glandulos-pilosa, foliis linear-subulatis acutis trinerviis, calyce acuto trinervi petalis vix longiori capsula breviori."—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 17.*

HAB. Barren grounds, north of lat. 54°, to the Arctic Sea. *Dr. Richardson.* Summits of the Rocky Mountains. *Drummond*.—Dr. Richardson has fully described this in the place above quoted, and has justly remarked that it has the habit of *A. verna*, but that its flowers are much smaller. The whole plant is, indeed, slenderer, and the hue more glaucous, or sometimes inclining to purple. In the last expedition, specimens were found without the glands, which brings it nearer to some states of *A. verna*, with which perhaps it should be united. It seems again intermediate between it and the following.

8. *A. hirta*; foliis linear-subulatis obtusis bisulcis hirtis, caulinis hirtis 2-3-floris, calycibus 3-nerviis acutis capsula brevioribus, petalis oblongis capsula subbrevioribus. *DC.*—*Wormsk. in Fl. Dan. t. 1646. De Cand. Prodr. v. 1. p. 405.* (excl. syn. *Als. rubella*, *Wahl.*) *Cham. et Schlecht. in Linnaea, v. 1. p. 56.*

HAB. Kotzebue's Sound. *Lay and Collie in Capt. Beechey's Voyage*.—I have specimens of this plant

from Greenland and from Kamtschatka, which differ in no respect from those in Capt. Beechey's collection. The plant is still slenderer than *A. propinqua*. As is the case with that species, Chamisso and Schlechtendal notice two vars., the one glabrous, the other pubescent.

9. *A. rubella*; caulis cæspitosus numerosis, pedunculis terminalibus pubescens, unifloris, foliis linearis-subulatis obtusis 3-nerviis, petalis elliptico-lanceolatis capsulaque 4-valvi calyce lanceolato acutissimo 3-nervi brevioribus.—*Hook. in Parry's 2d Voy. App. p. 391, et in Fl. Lond. N. S. t. 200.*—Alsine rubella. *Wahl. Lapp. p. 128, t. 6.*—*Arenaria quadrivalvis. Br. in Parry's 1st Voy. App. p. cclxxi.*

HAB. Arctic Sea-coast, Dr. Richardson; and summits of the Rocky Mountains, Drummond. Arctic Islands. *Capt. Parry.*

10. *A. Rossii*; glaberrima, "foliis triquetro-subulatis obtusiusculis muticis enerviis florem vix æquantibus, pedunculus unifloris elongatis, petalis oblongis calyces obsolete trinervios paulo superantibus."—*Br. in Parry's 1st Voy. App. p. cclxxii.*— $\beta.$ statura majorè, foliis calycem longitudine superantibus, minus crassis nec adeo obtusis, internodio sæpius brevioribus, nervis lateraliibus omnium manifestioribus, petalis longitudine calycis. *Br. in Frankl. 1st Journ. ed. 2. App. p. 17.*

HAB. Arctic Sea-coast, Dr. Richardson; and upon the summits of the Rocky Mountains, between lat. 54°—57°, Drummond; where the flowers are sometimes apetalous.

11. *A. Pumilio*; glaberrima, cæspitosa, foliis linearis-subulatis obtusis carnosus enerviis flore longioribus margine ciliato, flore solitario subsessili, petalis oblongo-spathulatis calyces trinervios obtussissimos duplo longioribus.—*Br. MSS. Hook. in Parry's 2d Voy. App. p. 391.*

HAB. One of the islands in the Strait of the Fury and Hecla. *Capt. James Ross.*

12. *A. arctica*; cæspitosa, foliis linearibus obtusis curvatis marginibus ciliatis, caulis unifloris, pedunculus piloso-glandulosus, sepalis oblongis obtusis obscure 3-nerviis, petalis (speciosis) obovatis calyce duplo longioribus.—*Steven in De Cand. Prodr. v. 1. p. 404. Cham. et Schlecht. in Linnaea, v. 1. p. 54.*— $\alpha.$ minor; foliis fulcato-curvatis. (TAB. XXXIV. A.)— $\beta.$ grandiflora; magis cæspitosa, floribus magnis. (TAB. XXXIV. B.) $\gamma.$ stenopetala; petalis abortivis linearibus.

Habitus, ut bene monet Cl. De Candolle, *Silenes acaulis*. Cæspitosa, robusta, perennis. *Caules* procumbentes, breves, nunc, in $\alpha.$, subelongati. *Folia* semiunciam longa, linearia, dorso convexa, 3-striata, supra plana, obtusa, margine magis minime ciliata; in $\alpha.$, valde uno latere curvata, in $\beta.$ strictiora. *Pedunculi* terminales, uniflori, pubescenti-glandulosi. *Sepala* ovalia vel oblonga, mollia, obscure trinervia, plerumque, nisi ad basin, glabra, sepe purpurascens. *Petala* in var. $\beta.$ maxima. *Capsula* 3-valvis, calyce subduplo longior. —Var. $\gamma.$ forte distincta species. *Radix* ut videtur, annua; *folia* longiora, remotiora, magis carnosæ. *Caules* etiam pubescenti-glandulosæ. *Petala* linearia (abortiva) calycem vix superantia.

HAB. Island of St. Lawrence. Chamisso. Shores of the Arctic Sea. Dr. Richardson; *Capt. Sir John Franklin and Capt. Back.* Kotzebue's Sound, Lay and Collie in Capt. Beechey's Voyage. $\gamma.$ Coast, west of the Mackenzie River. Dr. Richardson.—This very fine species seems peculiarly to merit the name of *arctica*. Mr. Drummond did not meet with it upon the Rocky Mountains: but in more southern latitudes the *A. obtusa* of Dr. Torrey is found on the higher parts of the same range, and both from a specimen in my Herbarium, and from that Author's own remarks, (See Torrey's Account of Plants from the Rocky Mountains, p. 170,) it is very nearly allied to, if not the same as, the present.

TAB. XXXIV. A. *Arenaria arctica*, a.—Fig. 1, Leaves.—B. var. *b.*, fig. 1, Leaf; fig. 2, Petals and 2 Stamens; fig. 3, Fruit:—magnified.

13. *A. macrocarpa*; cæspitosa, foliis congestis subulato-linearibus planis margine ciliatis, pedunculis terminalibus unifloris foliosis, calycis foliolis linearibus, petalis ovatis calyce duplo longioribus, capsulis elongato-oblongis calyce triplo longioribus.—*Pursh*, *Fl. Am. v. 1. p. 318. De Cand. Prodr. v. 1. p. 405. Cham. et Schlecht. in Linnaea, v. 1. p. 55.*

HAB. North-West Coast of America. *Nelson in Herb. Banks.* (*Pursh.*) Chamiso's Island and Island of St. Lawrence. *Chamiso.*—I have placed this next to *A. arctica*, because, judging from Pursh's description, it must be nearly allied to it. Chamiso, however, keeps it distinct; but says, that in the Bay of St. Lawrence (on the Asiatic side of Behring's Straits) he found a plant that was intermediate between the two in question. The chief distinction from *A. arctica*, appears to me to be in the capsule, which Pursh says is thrice as long as the calyx.

14. *A. fasciculata*; (?) “glabriuscula, cæspitosa, caulinis stricto-erectis, foliis subulatis pungentibus striatis, floribus dense fasciculatis, calycibus subulatis striatis, petalis brevissimis.”—*Pursh, Fl. Am. v. 1. p. 319.*

HAB. Canada; in Mr. Lambert's Herbarium from Kew Gardens. (*Pursh.*)—This plant must be considered very doubtful. The true *A. fasciculata* of Gouan is perhaps one of the rarest of all plants. His Herbarium in my possession proves it to be quite distinct from the plant so named and figured by Jacquin, (*Austr. p. 182.*) which is the *A. fastigiata* of Smith. The Canadian plant Mr. Pursh alludes to, can scarcely be the following, which indeed comes nearer to the *true A. fasciculata* than any other species, inhabiting, however, a widely different part of America, which was a *terra incognita* at the time Mr. Pursh wrote.

15. *A. Franklinii*; ramis erectis fastigiatis numerosis fragilibus, foliis nitidissimis subulato-setaceis, floribus fasciculatis, sepalis subulatis scariosis late uninerviis petala linearioribus oblonga superantibus. (TAB. XXXV).—*A. Franklinii. Douglas, MSS.*

Radix sublonga, descendens, perennia. *Caulis* breves, foliorum vestigia obsoleti, in ramos numerosos, erectos, subpalmare, basin versus divisi. *Rami* valde fragiles, glabri. *Folia* opposita, basi connata, vix unciam longa, subulato-setacea, erecta, nitidissima, albescentia, obscure uninervia, integerima vel sub summa lente minute ciliato-dentata. *Flores* terminales, dense fastigiati. *Pedunculi* breves, foliis seu bracteatis. *Bracteæ* foliis similes, sed paulo minores magisque scariosae. *Sepala* semiunciam longa, subulata seu lanceolatobulata, acuminatissima, membranacea, scariosa, albida, dorso nervo latiusculo obscure viridi notata, margine una integerima, nunc, ut in foliis, minutissime ciliata. *Petala* oblonga, obtusissima, basi attenuata, calyce breviora. *Stam.* 10, vix petala aequalia. *Germen* ovale. *Style* 3. *Capsula* ovali-rotundata, calyce multo brevior, apice 3-valvis, valvis medio bifidis.

HAB. Abundant on barren sandy plains and undulating grounds of the Columbia, from the “Great” to the “Kettle Falls;” and south of that river as far as the source of the Missouri. *Douglas.*—This is the most beautiful, and, at the same time, the most distinct of the genus, remarkable for its fragile stems, and glossy foliage and calyces. Its nearest affinity is assuredly the *A. fasciculata* of Gouan; but that is at once recognized by its decidedly annual root, its coarser, rigid, and more opaque aspect, and, above all, by the leaves and sepals being strongly 3- or 5-ribbed.

TAB. XXXV. Fig. 1, Flower and bractæ; fig. 2, Flower, expanded; fig. 3, Stamen; fig. 4, Capeule; fig. 5, Leaves:—magnified.

* * * *Foliis lanceolatis ovalibus rotundatis.*

16. *A. buxifolia*; pubescens, foliis ovato-oblongis sessilibus, caulinis repentinibus, pe-

dunculis dichotomis subbifloris, sepalis linearibus brevibus obtusis margine membranaceis, petalis calye vix longioribus, capsulis ovatis obtusis calycem & quantibus (5-valvibus?) DC.—Poir. Dict. v. 6. p. 362. De Cand. Prodr. v. 1. p. 411.

HAB. Canada. (Poirer.)

17. *A. Purshiana*; caule dichotomo diffuso, foliis ovalibus subacutis, pedunculis alternis axillaribus solitariis elongatis, calycibus acutis, petalis longitudine calycis. De Cand. Prodr. v. 1. p. 414.—*A. thymifolia*. Pursh, Fl. Am. v. 1. p. 318. (non Sibth. and Sm.)

HAB. Sea-shore of Labrador. Herb. Banks. (Pursh.)

18. *A. lateriflora*; minute pubescens, caule erecto gracili dichotome ramoso, foliis oblongo-ellipticis obtusis ciliatis patentibus, pedunculis lateralibus terminalibusque elongatis bifloris, sepalis ellipticis obtusis enerviis corolla subdimidio brevioribus. (TAB. XXXVI.) —Linn. Sp. Pl. p. 605. Pursh, Fl. Am. v. 1. p. 317. Bigel. Fl. Bost. ed. 2. p. 181. Goldie, in Edin. Phil. Journ. v. 6. p. 327. Cham. et Schlecht. in Linnaea, v. 1. p. 57.

HAB. From the United States to lat. 60°, and from Hudson's Bay to the Rocky Mountains in the woody districts. Dr Richardson; Drummond; and others. Unalaschka (Dr. Fischer).

TAB. XXXVI. Fig. 1, Flower; fig. 2, Sepal; fig. 3, Stamen; fig. 4, Pistil; fig. 5, Leaf:—magnified.

19. *A. macrophylla*; caule gracili erecto dichotome ramoso, foliis patentibus lanceolatis glabris basi apiceque acuminatis, pedunculo terminali 2-3-floro, sepalis ovatis acuminatisimis corolla capsulaque subrotunda multo longioribus.—a. foliis angustioribus. (TAB. XXXVII. A.)—*a.* foliis brevioribus latioribusque. (TAB. XXXVII. B.)

HAB. a. North-West America, in shady woods; and b. banks of the Saskatchewan. Douglas.—Habit of the preceding, yet very distinct. Here the plant is wholly glabrous, the leaves are acuminate at both extremities, the sepals of the calyx are totally different, and longer than the corolla. I possess the same plant from Kamtschatka, gathered by Wormskjold.

TAB. XXXVII. A. *Arenaria macrophylla*, a.—B. var. b.—Fig. 1, Flower, fully expanded; fig. 2, View of the outside of the calyx and corolla; fig. 3, Stamen; fig. 4, Leaf:—all more less magnified.

20. *A. peploides*; glabra, foliis ovatis oblongis acutis carnosis, floribus subsolitariis breviter pedunculatis, sepalis obtusis corollam subæquantibus.—Linn. Sp. Pl. p. 605. Engl. Bot. t. 189. Pursh, Fl. Am. v. 1. p. 317. Torrey, Fl. of Un. St. v. 1. p. 453. Bigel. Fl. Bost. ed. 2. p. 181. De Cand. Prodr. v. 1. p. 413. Rich. in Frankl. 1st Journ. ed. 2. App. p. 18. Cham. et Schlecht. in Linnaea, v. 1. p. 57.—Adenarium peploides. Rafin. De Cand. Prodr. v. 3. p. 366.—*b.* major; foliis unciam longis.

HAB. Sea-shores, everywhere.—*b.* De Fuca's Straits. Dr. Scouler.

9. MERCKIA. Fischer.

Cal. 5-sepalus, persistens. *Cor.* 5-petala, petalis unguiculatis, integris. *Stam.* 5, cum petalis alternantia, filamentis subulato-filiformibus, antheris medifixis subglobosis, loculis appositis. *Styli* 3. *Caps.* sessilis inflata depresso-globosa umbilicata sulcata, imperfecte trilocularis, trivalvis, dissepimentis bipartibilibus; *spermophorum* centrale basale parvum liberum. *Semina* numerosa minuta pyriformia, embryone uncinato peripherico

ex majori parte albumen in include, radicula hilum spectante.—*Herba debilis herbacea effuso-caspitosa.* Folia opposita subpetiolata. Flores pedunculati, terminales et laterales, solitarii. HAB. ad littora maris in regionibus arcticis Asia orientalis et America occidentalis. Cham. et Schlecht.

1. *M. physodes.* Fisch. MSS.—Cham. et Schlecht. in Linnaea, v. 1. p. 59.—*Arenaria physodes.* De Cand. Prodr. v. 1. p. 413.

HAB. Frequent on the sandy sea-shores of the Bay of Eschscholtz. Chamiso.—I am indebted to Dr. Fischer and Dr. Chamiso for specimens of this plant.

CERASTIUM. Linn.

Cal. 5-partitus. *Pet.* 5, bifida. *Stam.* 10. *Styli* 5. *Caps.* 1-locularis, cylindrica aut globosa, apice dehiscens, dentibus 10, circinatis aut adscendentibus. DC.

SECT. I. STREPHODON. Ser.

1. *C. stellaroides*; caule erecto dichotomo ramoso subtrifloro foliisque glabris oblongis acuminatis, pedicellis 1-floris terminalibus, sepalis lanceolatis, petalis semibifidis calyce duplo longioribus. DC.—“Moc. Pl. Nutk. Ic. ined.” De Cand. Prodr. v. 1. p. 415.

HAB. About Nootka Sound. (De Cand.)

SECT. II. ORTHODON. * *Petalis calycem æquantibus vel minoribus.*

2. *C. vulgatum*; hirsutum, suberectum, superne viscidum, foliis ovatis, bracteis herbariis, petalis calycis longitudine, floribus capitatis, calycibus oblongis pedicello longioribus.—Linn. Sp. Pl. p. 627. Engl. Bot. t. 789. De Cand. Prodr. v. 1. p. 415. Pursh, Fl. Am. v. 1. p. 321. Elliott, Carol. v. 1. p. 524. Bigel. Fl. Bost. ed. 2. p. 184.

HAB. At La Grande Chaudière. Pursh, MSS. About the Falls of Niagara, abundant. Douglas.

3. *C. viscosum*; hirsutum, viscidum, diffusum, foliis oblongo-lanceolatis, bracteis margine membranaceis, floribus subpaniculatis, calyce oblonge pedicellis breviore.—Linn. Sp. Pl. p. 627. Engl. Bot. t. 790. De Cand. Prodr. v. 1. p. 416. Pursh, Fl. Am. v. 1. p. 320. Torrey, Fl. of Un. St. v. 1. p. 158. Bigel. Fl. Bost. ed. 2. p. 184. Rich. in Frankl. 1st Journ. ed. 2. App. p. 18.

HAB. Canada. Pursh. About the trading posts, perhaps introduced. Dr. Richardson. Lake Huron. Dr. Todd.

* * *Petalis calycem superantibus.*

4. *C. elongatum*; hirsutum, foliis linearibus internodiis longioribus divaricatis, pedunculis terminalibus elongatis bis trichotomis, bracteis oppositis ovatis, petalis emarginatis calyce acuto duplo longioribus, capsulis subglobosis.—Pursh, Fl. Am. v. 1. p. 321. De Cand. Prodr. v. 1. p. 417. Torrey, Fl. of Un. St. v. 1. p. 460.

HAB. Plains of the Columbia. Herb. Lewis. (Pursh.)—May this not be *C. arvense*? which I possess from Mr. Menzies, gathered in the same country, and which Dr. Torrey says it nearly resembles, but in having longer and narrower leaves, and longer petals.

5. *C. Fischerianum*; hirsuto-subviscosum, caulinis prostratis, foliis ovatis sessilibus dis-

tantibus, floribus dichotomo-subumbellatis breviter pedunculatis, flore solitario longe pedunculato in dichotomia, sepalis lanceolatis obtusiusculis margine scariosis, petalis calyce duplo longioribus, "capsula cylindrica sepalis longiore." (Cham.)—*Ser. in De Cand. Prodr. v. 1. p. 419. Cham. et Schlecht. in Linnaea, v. 1. p. 60.*—*C. alpinum.* "Oed. Dan. t. 6." (fide Ser.)

HAB. Frequent on all the coasts of America, bordering on Behring's Straits. *Chamisso.*—This plant Chamisso and Schlechtendal observe to be nearly allied to *C. viscosum*, and still more to *C. alpinum*; and they even think that the *C. alpinum* of Melville Island, and other arctic regions explored by our navigators, is identical with it. The *Cerastium* brought by Capt. Beechey from Kotzebue's Sound, I unite, without any hesitation, to a very common state of *C. alpinum*.

6. *C. alpinum*; caulis prostratis foliisque elliptico-ovatis magis minusve sericeo-hirsutis, panicula dichotoma pauciflora, pedunculus elongatus, sepalis oblongis obtusiusculis margine scariosis pilosis, petalis calyce duplo longioribus, capsula oblonga sepalis subduplicata longiore.—*Linn. Sp. Pl. p. 628. Engl. Bot. t. 472. Br. in Ross' Voy. ed. 2. v. 2. p. 192. Hook. in Parry's 2d Voy. App. p. 390. Rich. in Frankl. 1st. Journ. ed 2. App. p. 18.—s. glabratum; foliis glabratiss. Hook. in Parry's 2d Voy. App. p. 390. Fl. Dan. t. 979.*

HAB. Arctico America and adjacent Islands. Kotzebue's Sound. *Lay and Collie in Capt. Beechey's Voyage.* s. Duke of York's Bay. *Capt. Sir E. Parry.* Rocky Mountains. *Drummond.*—Dr. Richardson observes, in the Appendix to Capt. Sir John Franklin's 1st Voyage, that a similar plant to this, but with more rigid pubescence, and gathered on the shores of the Arctic Sea, existed in the collection that was lost. It was probably the *C. Fischerianum*, if that be really a distinct species, which Chamisso says is distinguished from *C. alpinum*, among other marks, by its more rigid pubescence.

7. *C. arvense*; caulis basi declinatis, foliis linear-lanceolatis pubescentibus ad basin præcipue, floribus dichotome paniculatis paucifloris, petalis calyce duplo majoribus, capsula oblongo-cylindracea calycem duplo superante.—*Linn. Sp. Pl. p. 628. Engl. Bot. t. 93. Pursh, Fl. Am. v. 1. p. 321. Bigel. Fl. Bost. ed. 2. p. 184.*

HAB. Throughout Canada, and in the Rocky Mountains. *Dr. Richardson; Douglas; Drummond;* and others. *Columbia. Mr. Menzies.*

8. *C. pensylvanicum*; caule suberecto foliisque linear-lanceolatis dense pubescentibus, panicula longe pedunculata dichotoma, corollis calyce duplo longioribus.—*Hornem. Hort. Hafn. p. 435.—C. pubescens. Goldie, in Edin. Phil. Journ. 1822. Rich. in Frankl. 1st Journ. ed. 2. p. 18.—C. arvense. ed. 1. p. 738.—C. tenuifolium. Torrey, Fl. of Un. St. v. 1. p. 460. (fide specim.) an Pursh?*

HAB. In many places in the woody parts of Canada. *Goldie; Dr. Richardson; Drummond.*—This, which, with Mr. Goldie, I was formerly disposed to keep distinct from *C. arvense*, I now think scarcely deserving to rank as a species. It is indeed larger and stronger in all its parts, and the petals are much more conspicuous. But there are intermediate states which diminish the value of those characters.

9. *C. natans*; ubique pubescens-glutinosum, magis minusve arachnoideo-tomentosum, caule erecto superne paniculato, foliis oblongo-lanceolatis acutis, floribus fructibusque nutantibus, petalis calyce superantibus, capsula cylindracea sursum curvata calyce plusquam duplo longiore.—*s. nudiusculum. Rafin. Préc. p. 36.*—*De Cand. Prodr. v. 1. p. 420. Torrey, in Fl. of Un. St. v. 1. p. 459. (excl. syn. C. pubescens. Gold.) Rich.*

in *Frankl. 1st Journ. ed. 2. App. p. 18.* cum descr.—*C. glutinosum. Nutt. Gen. v. 1. p. 291.* (non *Humb.*)—*C. longipedunculatum. Muhl. Cat. p. 47.*—*s. vestitum;* ubique pilis longis mollibus albis arachnoideis tectum.

HAB. *a.* From Canada to lat. 58°, and from Hudson's Bay to the elevated valleys of the Rocky Mountains. *Dr. Richardson; Drummond; Douglas.* Common in North-West America, where the timber has been destroyed by fire. *Douglas.* *a.* About Lake Winnipeg. *Drummond.*—Annual. This is amongst the tallest of the genus, a foot high, very erect; in young plants the flowers are few and somewhat umbellated; the old plants bear large and many-flowered panicles. The leaves are often two inches and more long. Var. *a.* is very remarkable for the loose cobwebby down which covers the whole plant; but as the specimens thus clothed are, though in flower, evidently young, it is probable that this additional covering disappears in age. All our specimens are, indeed, more or less densely clothed with down.

9. *C. rigidum*; hirsutum, caule erecto inferne simplicissimo apice dichotomo, foliis oblongis acutis, pedunculis elongatis, sepalis lanceolatis acutis, petalis bifidis calyce longioribus, capsulis oblongis nitidis calyce duplo et ultra longioribus. *DC.*—“*Lédeb. Mem. Acad. Petersb. p. 514. n. 25.*” *De Cand. Prodr. v. 1. p. 420. Cham. et Schlecht. in Linnaea, v. 1. p. 62.*

HAB. Uralaschka. *Chamiso.*—According to Lédebour, this plant grows to a height of nearly two feet, is erect, rigid, everywhere clothed with patent rigid hairs, and inhabits Siberia. *Chamiso* says that his Uralaschka specimens are similar, but smaller.

10. *C. Beeringianum*; hirtum, superne viscosum, caulis inferne cæspitosus, superne strictis erectis elongatis oligophyllis, foliis oblongis subacutis, floribus dein cernuis, sepalis ellipticis acutis, petalis et capsulis calyce sesquilonigioribus. *Cham. et Schlecht. in Linnaea, v. 1. p. 62.*

HAB. In the Bay of Eschscholtz.

ORD. XVI. LINEÆ. *De Cand.*

1. LINUM Linn.

Flores proportione partium quinaria. Sepala integra. Stylis rarissime 3, cum petalis staminibus sepalisque 5. DC.

* *Floribus flavis.*

1. *L. rigidum*; annum, caule superne ramosissimo acute angulato, foliis linearibus alternis rigidis marginibus scabris, floribus paniculatis, calycibus ovato-lanceolatis acuminatis capsula globosa longioribus bracteisque marginibus aculeato-serratis glandulosis. —*Pursh, Fl. Am. v. 1. p. 210. De Cand. Prodr. v. 1. p. 424. Torrey in Pl. of Rocky Mount. p. 171.*—*L. striatum. Nutt. Gen. v. 1. p. 206,* (fide specim.) non *Walt.*

HAB. Abundant in the plains of the interior, especially about the Saskatchewan. *Dr. Richardson; Drummond; Douglas.*—This is amongst the most distinct of all the species of *Linum*, yet scarcely known to any author, except Pursh and Torrey, and by them only as a native of the Missouri. I possess beautiful specimens from Dr. Boott, gathered near Boston; and I have it from Mr. Nuttall as “*L. striatum*,” gathered at New Haven; but this latter species should have ovate or oblong leaves and blue flowers.—The beautifully spinuloso-serrate and glandular calyces at once characterise the present species.

2. *L. virginianum*; annum, erectum, caule superne ramoso subanguloso, foliis oblongo-lanceolatis margine scabriusculis, racemis elongatis foliosis, floribus unilateraliibus, sepalis late ovatis mucronatis capsula depressa subbrevioribus.—*Linn. Sp. Pl.* p. 399. *Mich. Am.* v. 2. p. 36. *Pursh, Fl. Am.* v. 1. p. 210. *Elliott, Carol.* v. 1. p. 375. *Bigel. Fl. Bost.* ed. 2. p. 123. *Torrey, Fl. of Un. St.* v. 1. p. 330.

HAB. Lake Huron, which is perhaps its most northern range. *Dr. Todd.*

* * *Floribus cæruleis.*

3. *L. perenne*; subperenne, glabrum, ramis erectis virgatis, foliis alternis acutis saepe pellucido-punctatis, floribus suboppositifoliis terminalibusque, filamentis subulatis, stylis ad basin usque liberis, sepalis ovalibus basi obscure 5-nerviis ext. acutis int. obtusis, capsula globosa paulo, petalisque retusis 8-pl., brevioribus.—*Linn. Sp. Pl.* p. 397. *Cham. et Schlect. in Linnaea,* v. 1. p. 71. *Engl. Bot.* t. 40. *Rich. in Frankl. 1st Journ. ed.* 1. p. 735. *Nutt. Gen.* v. 1. p. 206. *Torrey in Pl. of Rocky Mount.* p. 171.—*L. Lewisii. Pursh, Fl. Am.* v. 1. p. 210.—*L. sibiricum et L. anglicum. (Mill.) De Cand. Prodr.* v. 1. p. 427.

HAB. From Canada, (*Mrs. Percival*), throughout North America, among the Rocky Mountains, (*Drummond, Douglas*), to the shores of the Pacific, (*Douglas*), and as far north as the shores of the Arctic Sea, *Dr. Richardson*.—Chamisso and Schlechtendal unite with this, and, I think, justly, *L. austriacum*, *Jacq.*, *L. leue*, *Scoop.* and *L. alpinum*, *Jacq.*; for the differences are indeed very trifling and very inconstant. At the same time, those authors distinguish the *L. perenne* from our British *L. perenne*, (*L. anglicum*, *Mill.* and *De Cand.*) by its "drooping capsule, whereas in *L. anglicum* it is constantly erect;" a character, perhaps, on which too much stress is laid, even were it constant; but in my American specimens, often on the same plant, the capsules are sometimes erect and sometimes drooping. Although this species of Flax is of such general occurrence in North America, Pursh and Douglas both observe that it is never employed by the natives for economical purposes.

ORD. XVII. MALVACEÆ. Br. *De Cand.*—MALVACEÆ. Sect. 1. 2. 3. *Juss.*

1. MALVA. *Linn.*

Cal. cinctus involucro 3-phyllo rarius 5-6-phyllo, bracteolis oblongis setaceisve. Car-pella capsularia plurima in orbem disposita.

SECT. MALVASTRUM. DC. * *floribus purpureis v. carneis.*

1. *M. rotundifolia*; caule prostrato, foliis cordato-orbiculatis obtusissime 5-lobatis, pedunculis fructiferis declinatis.—*Linn. Sp. Pl.* p. 969. *Engl. Bot.* p. 1092. *Pursh, Fl. Am.* v. 2. p. 454. *Elliott, Carol.* v. 2. p. 162.

HAB. About Montreal and Quebec, in cultivated plains. *Mrs. Percival*; *Mrs. Sheppard*; *Dr. Richardson*.

2. *M. Munroana*; herbacea, albido-tomentosa, foliis subrotundis cordatis subquinque-lobis dentatis, involucello setaceo, pedunculis terminalibus paniculatis. *Lindl.*—*Douglas, MSS. in Herb. Hort. Soc.*—*Lindl. in Bot. Reg.* t. 1306.

HAB. Common on the arid, barren, sandy deserts of the Columbia, from the "Great Falls" to the Rocky Mountains, covering the ground with scarlet, as *Papaver Rhæas* does in our country. *Douglas*.

3. *M. rivularis*; caule herbaceo stellato-pubescente, foliis scabriusculis cordatis profunde 5-7-fidis, lobis acutis grosse serratis, pedunculis terminalibus axillaribusque elongatis 6-8-floris racemosis foliosis, calyce stellatum tomentoso, involucellis setaceis, fructu hirsutissimo.—*Douglas*, MSS. in Herb. Hort. Soc.

Perennia. *Caulis* 2-4 pedalis, herbaceus, ramosus, robustus, ramulis stellatum pubescentes. *Folia* ampla, superne levigata, infra pilis raris ramosis scabra. *Pedunculi* stellatum tomentosi, racemosi. *Pedicelli* ad basin folio parvo instructi, breves, erecti. *Floræ* magnitudine *Malva rotundifolia*, albi vel carnea.

HAB. Common on the banks in North-West America, from the ocean to the Rocky Mountains. Fl. June—August. *Douglas*.

* * *floribus flavis.*

4. *M. hederacea*; “perennis, ubique dense stellato-tomentosa incana, caule brevi herbaceo procumbente, foliis petiolatis cordatis integris sublobatisque crenato-serratis subplicatis, pedunculis axillaribus unifloris, petalis dorso marginibusque stellatum pubescens.”—*Douglas*, MSS. in Herb. Hort. Soc.

Planta parva. Caulis versus basin divisi, flexuosi. *Folia* unciam lati, reniformi-cordata, crassiuscula, subrigida, venosa, venis subtus prominentibus, superne depresso, ut folia subplicata videantur, margine vix lobata, crenato-serrata. *Petioi* foliis subbreviores. *Pedunculi* petiolis sessilioribus, graciles, uniflori. *Calyx* 5-fidus, segmentis acutis, ad basin involucellis 3 deciduis setaceis cinctus. *Petala* flava, obovato-cuneata ex obcordata, linea dorsali lata marginibusque exterioribus stellato-pubescentibus. *Caulis, folia, petioi, pedicelli calycisque* stellatum pubescentes, incani.

HAB. Sides of streams, upon their low projecting banks, in the interior districts of the Columbia. Fl. June, July. *Douglas*.—The size, pubescence, foliage, and inflorescence of this plant are very similar to those of a new *Sida* from Tedis in Georgia, which I have received from my friend Mr. Prescott, under the name of *Sida iberica*.

2. HIBISCUS. Linn.

Calyx cinctus involucello saepius polyphyllo, rarius foliolis paucis aut inter se coalitis. *Petala* hinc non auriculata. *Stigmata* 5. *Carpella* in capsulam 5-locularem coalita, valvis intus medio septiferis, loculis polyspermis aut rarius monospermis. DC.

SECT. ABELMOSCHUS. Medik.

1. *H. Moscheutos*; foliis ovatis acuminatis serratis subtus tomentosis, petiolis pedunculisque inter se coalitis, involucellis calycibusque tomentosis, capsulis glabris.—*Linn.* Sp. Pl. p. 975. *Cav. Diss.* v. 3. t. 65. f. 1. *Mich. Am.* v. 2. p. 47. *Pursh*, Fl. Am. v. 2. p. 455. *Elliott, Carol.* v. 2. p. 165.

HAB. Common on land occasionally flooded, and in damp soil on the banks of rivers and lakes; Upper Canada. *Douglas*.

2. *H. palustris*; foliis ovatis dentatis subtrilobis subtus cano-tomentosis, pedicellis axillaribus a petiolo liberis supra medium articulatis. DC.—*Linn. Sp. Pl.* p. 976. *Cav. Diss.* v. 3. t. 65. f. 2. *Pursh*, Fl. Am. v. 2. p. 455. *Elliott, Carol.* v. 2. p. 166. *Bigel. Fl. Bost. ed.* 2. p. 259.

HAB. Canada. *Pursh*.—This, as well as the preceding fine species, has probably its northern limit in the south of Canada. They are found in the adjoining country of the United States, and become more frequent towards the south.

3. SIDA. Cav.

Cal. nudus, 5-fidus, saepe angulatus. *Stylus* apice multifidus. *Carpella* capsularia 5-30, circa axim verticillata, plus minusve inter se coalita, 1-locularia, mono-aut-oligosperma, apice mutica aut aristata. *DC.*

SECT. I. MALVINDA. Medik.

1. *S. malvaeflora*; foliis radicalibus subrotundatis 9-lobatis basi truncatis, lobis apice tridentatis, caulinis 5-partitis, lacinulis linearibus subdentatis, racemo terminali, carpellis muticis. *Lindl.*—*De Cand. Prodr.* v. 1. p. 474. *Lindl.* in *Bot. Reg.* t. 1036.

HAB. Common on the plains of the Multnomah and Umpqua rivers; also near the sea at Cape Orford, North-West America.—If this plant be rightly referred to the *S. malvaeflora* of De Cand., it is a native also of Mexico, and perhaps of all the intermediate country near the coast.

2. *S. coccinea*; stellato-pubescentia incana, caulinis erectis, foliis longe petiolatis profunde tripartitis fere terminali, segmentis lateralibus bipartitis, intermedio trifido, racemis terminalibus foliosis.—*De Cand. Prodr.* v. 1. p. 465.—*Malva coccinea.* “*Fraser's Cat.*” *Bot. Mag.* t. 1673. *Nutt. Gen.* v. 2. p. 81.

HAB. On the plains of the Saskatchewan. *Drummond.*—There certainly is no *involure* to the calyx of this plant, only a solitary linear-subulate *bractea*; hence, with De Candolle, I refer it to *Sida*: but, it must be confessed, in habit and in the rich scarlet hue of its flowers, it much resembles *Malva Munroniana*, with which Mr. Douglas compares it. The *germen* is globose, densely covered with a white, compact, cobwebby substance. *Capsules* 1-seeded, about 6, very compactly and circularly arranged, as in *Malva*, forming a somewhat transversely-oblong fruit, depressed in the centre. The *capsules* are easily separated in maturity, and are indehiscent.

ORD. XVIII. TILIACEÆ. Juss.

1. TILIA. Linn.

Cal. 5-partitus, deciduus. *Pet.* 5, intus aut nuda aut squamula ancta. *Stam.* plurima, filamentis liberis aut subpolyadelphis. *Ovar.* globosum, villosum, 1-stylum, 5 loculis loc. dispermis. *Nux* coriacea, abortu 1-loc., 1-2-sperma. *Cotyledones* sinuato-dentatae.—*Arbores cortice flexili, ligno lavi.* *DC.*

1. *T. glabra*; foliis profunde cordatis abrupte acuminatis argute serratis subcoriaceis glabris, petalis apice truncatis crenatis, stylo petalis aequali, fructu ovato subcostato.—*Vent. Diss.* p. 9. t. 2. *Pursh. Fl. Am.* v. 2. p. 362. *Elliott, Carol.* v. 2. p. 2.—*T. americana.* *Linn. Sp. Pl.* p. 733. *Mich. Arb.* (ed. Am.) v. 3. t. 181. *Bigel. Fl. Bost.* ed. 2. p. 214.—*T. canadensis.* *Mich. Am.* v. 1. p. 306.

HAB. Throughout Canada. (*Lady Dalhousie*; *Mrs. Sheppard*; *Mrs. Percival*;) and in the interior, as far as Norway House; *Dr. Richardson*; *Drummond*; *Douglas*.—The bark of this tree, which is called *Base-wood*, is employed for a variety of economical purposes where a coarse kind of cordage is required: and the wood is used by cabinet and carriage-makers. Mr. Douglas speaks of this as one of the most ornamental and useful trees in Canada.

2. *T. pubescens*; foliis basi truncatis subcordatis obliquis denticulato-serratis subtus pubescentibus, petalis emarginatis, stylo petalis longiore, fructu globoso lavi. *DC.*—

Alt. Hort. Kew. ed. 1. v. 2. p. 219. Vent. Diss. p. 10. t. 3. Mich. Arb. (ed. Am.) v. 3. t. 138.—T. americana. Walt.

HAB. About Quebec. *Mrs. Sheppard.* Shores of Lake St. Clair, and near Sandwich. *Douglas.*

ORD. XIX. HYPERICINEÆ. *Juss.*

I. HYPERICUM. *Linn.*

Capsula membranacea. Styli 3-5 in quibusdam numero variabiles. Stam. plurima basi polyadelpha, raro numero subdefinita. Pet. 5. Sepalæ 5, basi plus minusve coalita et inæqualia.—Herbæ aut suffrutices. Folia opposita, sepe pellucido-punctata, aut margine nigro-punctata. Flores varie dispositi. DC.

SECT. I. ASCYRIA. *Chois.* • *Styli vulgo 5.*

1. *H. acyrodes*; caule erecto tetragono subsimplici herbaceo, foliis ovato-oblongis acutiusculis semiamplexicaulibus minute pellucido-punctatis, sepalis ovatis, stylis 5-7 liberis longitudine staminum.—*Willd. Sp. Pl. v. 3. p. 1443. Pursh, Fl. Am. v. 2. p. 374. De Cand. Prodr. v. 1. p. 545. Bigel. Fl. Bost. ed. 2. p. 279.*—*H. macrocarpum. Mich. Am. v. 2. p. 82.*

HAB. About Montreal and Quebec. *Michaux; Lady Dalhousie; Mrs. Percival; Mrs. Sheppard; Goldie.*—A very fine species, apparently peculiar to the places above-mentioned, and to the New England States, whence I have received specimens. Leaves 3 inches long. Flowers few, terminal, large. Capsules, according to Professor Bigelow, nearly as large as nutmegs, ovate.

2. *H. Kalmianum*; suffruticosum, ramosissimum, ramis erectis tetragonis, foliis linearioribus pellucido-punctatis rigidis margine revolutis, floribus 3-7 in corymbis terminalibus, sepalis oblongis foliacels nervosis æqualibus marginibus reflexis, stylis 5 liberis.—*Linn. Sp. Pl. p. 1101. Lam. Dict. v. 4. p. 148. De Cand. Prodr. v. 1. p. 545.*

HAB. Lake Huron. *Dr. Todd.* Falls of Niagara. *Douglas.* From Lake Winnipeg to Canada. *Dr. Richardson.*

SECT. II. ELODEA. *Chois.*

3. *H. virginicum*; caule tereti suffruticoso subramoso, foliis ovato-ellipticis basi cordatis semiamplexicanilibus pellucido-punctatis, pedunculis 1-paucifloris axillaribus, sepalis lanceolatis, stam. 9-12, stylis 3, capsulis oblongis.—*Linn. Sp. Pl. p. 1104. Andr. Bot. Rep. p. 552. Mich. Am. v. 2. p. 81. Bigel. Fl. Bost. ed. 2. p. 281.*—*Elodea virginica. Nutt. Gen. v. 2. p. 17. Elliott, Carol. v. 2. p. 38.*—*E. campanulata. Pursh, Fl. Am. v. 2. p. 370.*—*H. campanulatum. Walt.*—*H. emarginatum. Lam.*

HAB. Lake Huron. *Dr. Todd.* From Canada to Lake Winnipeg. *Dr. Richardson.*—Petals red.

SECT. III. PERFORARIA. *Chois.*

4. *H. micranthum*; caule tereti punctato purpurascente, ramulis rectis, foliis oblongis obtusis nigro-punctatis, floribus confertis terminalibus, calyx minimo obtuso, corolla nigro-punctata, antheris nigro-punctatis.—“*Chois. Prodr. Hyp. p. 44. t. 5.*” *De Cand. Prodr. v. 1. p. 546.*

HAB. Canada. About Quebec, and Montreal, and Lake Huron. *Mrs. Sheppard*; *Mrs. Percival*; *Dr. Richardson*; *Dr. Todd*.—This seems very closely to resemble *H. corymbosum*, Willd. (*H. punctatum*, Lam.); but that is described as having subacute leaves and lanceolate sepals. I still think it may be the *H. corymbosum* of Bigelow; and perhaps the two are not really distinct. It is remarkable for the black dots scattered over every part of the plant, its compact heads of small pale-yellow flowers, and the small obtuse calyx-segments.

5. *H. perforatum*; caule ancipi, foliis obtusis ovato-ellipticis pellucido-punctatis, floribus paniculatis, calyce lanceolato pellucido-punctato, antheris nigro-punctatis, stylis divergentibus.—*Linn. Sp. Pl.* p. 1105. *Pursh, Fl. Am.* v. 2. p. 377. *Bigel. Fl. Bost.* ed. 2. p. 279.

HAB. About Quebec. *Mrs. Percival*.

6. *H. canadense*; caule herbaceo erecto acute quadrangulo, foliis lanceolatis linearibus subacutis pellucido-punctatis, subtus nigro-punctatis, panicula terminali dichotoma, sepalis lanceolatis acuminatis, stylis 3 brevissimis, capsula conica calycem vix superante.—*Linn. Sp. Pl.* p. 1104. *Mich. Am.* v. 2. p. 79. *Pursh, Fl. Am.* v. 2. p. 378. *Elliott, Carol.* v. 2. p. 24. *Bigel. Fl. Bost.* ed. 2. p. 280. *De Cand. Prodr.* v. 1. p. 550.—*s. minimum*; statura minore, foliis angustioribus, floribus paucioribus.

HAB. Throughout Canada, and to Lake Winnipeg. *Dr. Richardson*. Lake Huron. *Dr. Todd*. Newfoundland. *Mr. Morrison*.—Flowers small, pale-yellow.

7. *H. quinquenervium*; annum, caule herbaceo obscure tetragono, foliis (parvis) ellipticis obtusis obscure 5-nerviis pellucido-punctatis subtus fusco-punctatis, panicula foliosa, sepalis lanceolatis obtusis capsula elliptica brevioribus, stylis 2-3 brevissimis.—“*Walt. Car.* p. 190.” *Mich. Am.* v. 2. p. 79. *De Cand. Prodr.* v. 1. p. 550.—*H. parviflorum*. *Willd. Sp. Pl.* v. 3. p. 1456. *Elliott, Carol.* v. 2. p. 24. *Bigel. Fl. Bost.* ed. 2. p. 280.—*H. muticum*. *Linn.*

HAB. Canada, to Lake Winnipeg. *Dr. Richardson*. Frequent in Upper Canada. *Douglas*.—A small annual species, with slender erect stems, paricipled above. Leaves scarcely half-an-inch long.—*De Candolle* refers to this species also the *H. stellaroides* of Humb., a native of the Andes of South America.

8. *H. ellipticum*; caule erecto herbaceo superne subramoso acuto 4-angulo, foliis ellipticis obtusissimis pellucido-punctatis et obscure fusco-punctatis, corymbis parvis terminalibus, sepalis oblongis patentibus valde inæqualibus nervosis foliaceis, stylis 2-3 arcte in unum coalitis.

Radix repens atque fibrosa, ut videtur perennis. *Caulis* erectus, spithameus ad pedalem et ultra, erectus, subg. sessilis, acute tetragonus, superne columnmodo divisus, ramulis brevibus plerumque sterilibus. *Folia* opposita, uncian. sesquianca longa, fere exacte elliptica, plana, membranacea, obtusissima, pellucido-punctata atque superficie subtus præcipue magis minusve obscure fusco-punctata. *Pedunculus* aphyllus, terminalis, dichotome corymbosus, floribus in axillis sessilibus. *Calyx* foliola 3-5, patentia, inæqualia, foliacea, nervosa atque pellucido-punctata, oblonga vel elliptica. *Petala* flava, obovata-cuneata, calyce vix longiora. *Stamina* numerosa, stylis longitudine. *Germen* ovatum. *Stylis* 2-3, unum arcte coaliti, subulati, obtusi, rarius in floribus e dichotomia corymbi in duos vel tres stylos separabiles, basi magis minusve unitos. *Capsula* ovato-globosa, calyce patenti persistenti brevior.

HAB. Canada to Lake Winnipeg. *Mr. Cleghorn*; *Dr. Richardson*. Lake Huron. *Dr. Todd*.—This *Hypericum*, of which I can find no description, I only know as a native of Canada. I long ago received

specimens from Mr. Cleghorn, and now it has been found by Dr. Todd at Pentanguishene on Lake Huron, exactly on the borders of the United States; and, by Dr. Richardson it was ascertained to extend its range as far as the plains of the Saskatchewan, in lat. 54°. It is difficult to say to what division of the genus it should belong; its unequal calyx allies it with "*Aescyria*," its foliaceous sepals with "*Bathrys*," its habit with "*Perforaria*," where I have placed it. So much are the styles united, that the flowers may be said to be monogynous; yet in the axils of the corymb some of the pistils as they advance to maturity are found to have their styles more or less divided; but I do not observe this to be the case with the upper flowers.

9. *H. Scouleri*; caule herbaceo ramoso inferne terete superne quadrangulo, foliis oblongo-ovatis subcordiacis venosis impunctatis, panicula corymbosa foliosa, calycibus ovatis obtusis petalisque triplo longioribus extus nigro-glandulosis, stylis 3 longitudine staminum numerosorum.

HAB. Abundant in dry gravelly soils and limestone rocks on the North-West coast of America, near the Columbia. DR. SCOULER; DOUGLAS.—Flowers about the size of those of *H. dubium*. Petals, stamens, and styles long, and about equal in length. Leaves of a rigid and somewhat coriaceous texture, turning brown in drying, exhibiting no pellucid dots, except in the youngest, and these often mixed with oblong ones.

ORD. XX. ACERINEÆ. *De Cand.*

1. ACER. *Mench.*

Flores polygami. *Calyx* 5-lobus interdum 5-partitus. *Stam.* rarius 5, sèpius 7-9.—
Folia simplicia. DC.

* *Floribus racemosis*.

1. *A. pensylvanicum*; foliis rotundato-cordatis 3-raro-5-lobis, lobis acuminatissimis, tenuiter acutissime duplicato-serratis, racemis simplicibus pendulis, petalis obovatis, fructibus glabris alis divergentibus.—Linn. Sp. Pl. p. 1496. Mich. Am. v. 2, p. 252. Elliott, Carol. v. 1, p. 451. Torrey, Fl. of Un. St. v. 1, p. 397.—A. striatum. Lam. Dict. v. 2, p. 381. Mich. Arb. (ed. Am.) v. 1, t. 45. Pursh, Fl. Am. v. 1, p. 267.

HAB. Canada, (*Michaux*) most abundant near the southern lakes. DOUGLAS; DR. TODD; MRS. PERCIVAL. Mr. Douglas observes that its northern limit is at Lake Winnipeg, where it is of diminutive stature.—This is a beautiful small tree, with smooth bark, streaked with longitudinal white lines, whence in some parts of the United States it is called *Striped Maple*, while in others it is named *Moose-Wood*, from the circumstance of the Moose-Deer subsisting during severe weather upon its young twigs. The leaves have their lobes singularly acuminated and most finely serrated. Its buds and leaves are among those of the earliest of the American trees to announce the approach of Spring; and, when beginning to unfold, are of a delicate rose-colour, which soon changes to green. The wood is said by Michaux to be white, and used instead of Holly. Horses and cattle are turned into the woods to feed on the young shoots at the latter end of winter.—Racemes long. Flowers large.

2. *A. montanum*; foliis cordatis 3-5-lobis subtus pubescentibus lobis acuminatis grosse inaequaliter serratis, racemis erectis, petalis angustissimis minutis, fructibus glabriusculis alis subdivergentibus.—Ait. Hort. Kew. ed. 1. v. 3, p. 435. Mich. Am. v. 1, p. 253. Pursh, Fl. Am. v. 1, p. 267. Mich. Arb. (ed. Am.) v. 1, t. 47. Bigel. Fl. Bost. ed. 2. p. 379. Torrey, Fl. of Un. St. v. 1, p. 398.—A. spicatum. Lam. Dict. v. 2, p. 381. De Cand. Prodr. v. 1, p. 593.

HAB. Canada, (*Michaux*), to Lake Winnipeg. *Dr. Richardson*. Newfoundland. *Dr. Morrison*.—A small tree, 8–10 feet high, with ample leaves that are coarsely serrated. Flowers very inconspicuous, in long upright racemes. Fruit small, purple-red.

3. *A. macrophyllum*; folii (amplissimis) profunde 5-lobis demum glabriusculis, lobis oblongi subcuneatis obtusiusculis sinuato-incisis, racemis pendulis, petalis obovatis, fructibus pubescentibus alis subdiverticibus glabris. (TAB. XXXVIII.)—*Pursh, Fl. Am. v. 1. p. 267. De Cand. Prod. v. 1. p. 594.*

Arbor 40–90 pedalis, ramis patentibus. *Folia* ampla, non raro pedalia, longe petiolata, profunde palmato-5-fida, crassiuscula, subcoriacea, sinus obtusis, lobis oblongis oblongo-cuneatis, obtusis, lateribus subintegerrimis, intermediis sinuato-lobatis, lobis subacuminatis; *folia juniora* omnino pubescenti-hirsuta, *adulta* fere glabra, nisi subitus et in axillis venarum. *Racemi* longi, penduli, multiflori. *Bractæ* linearis, glabri. *Pedicelli* subfasciculati rachisque glabri. *Calyx* glaber, foliolis ovalibus. *Petala* calyce majora, obovata. *Stam. 10, an semper?* *Filam.* basi hirsuta. *Germina* pilis rigidis aculeiformibus erectis hispidissima. *Fructus* majusculus, hispidus vel subnudus. *Alæ,* nonnunquam 3, erecto-divergentes, margine externo recto, interno convexo.

HAB. North-West coast of America. *Menzies*, in *Herb. nostr.* On the Great Rapids of the Columbia. *Lewis* (in *Pursh*).—Common between 40° and 50° N. lat.; exclusively confined to the mountainous woody country along the coast, which seldom exceeds 2° or 2° 30' of long. *Douglas*; *Dr. Scouler*. Its eastern station on the Columbia is four miles above the “Grand Rapids.” *Douglas*.—This noble tree was unquestionably discovered by our countryman Mr. Menzies, the first Naturalist who visited the coast where it grows; and it could not but be noticed by every succeeding Botanist, for Mr. Douglas observes, “it is one of the most graceful of trees in the country it inhabits, varying from 40 to 90 feet in height, and from 6 to 16 feet in the circumference of its trunk. The branches are widely spreading; the bark rough, brown; the wood soft, but beautifully veined. It contains perhaps as much sap as any species, except *A. saccharinum*, but is not used by the natives. The flowers are yellow, very fragrant, appearing in April and May. It will, at some future time, constitute one of our most ornamental forest-trees in England.”

TAB. XXXVIII. Fig. 1, Fructified branch:—natural size. Fig. 2, Raceme: do.; fig. 3, Stamen:—magnified. Fig. 4, Young leaf:—natural size.

* * *Floribus corymbosis fasciculatisive.*

4. *A. circinatum*; foliis cordatis 7–9-lobis subtus pubescentibus lobis acutissimis atque acutissime inaequaliter serratis radiatim nervosis, nervis in axillis hispidis, corymbis pedunculatis paucifloris, petalis ovatis linearibus calyce brevioribus, germinibus glaberrimis alis patentissimis. (TAB. XXXIX.)—*Pursh, Fl. Am. v. 1. p. 253. De Cand. Prod. v. 1. p. 595.* (inter species “non satis notas.”)

Arbor 20–40 pedalis. *Folia* digitem longa, subbrevi-petiolata, membranacea, cordata, 7–9-lobata, 7–9-nervia, supra glabra, subtus pubescenti-hirsuta, nervis e summo petoli radiantibus, in axillis (ad basin folii) superne hispidis, subtus, in eadem loco, lanatis, sinus acutis, lobis ovatis acutissimis, acutissime serratis. *Corymbi* longe pedunculati, nutantes. *Flores* mediocre. *Calyx* hirsutus demum glaber, foliolis ovalibus. *Petala* ovalia crispata ubi stamina perfecta, et linearia, ut videtur, ubi stamina abortiva, calyce breviora. *Stamina* 8 (10?) *Germen* glaberrimum, bialatum, aliò divaricatisimis, subrecurvis. *Style* 1 in pistillo fertili, 2 in sterili (?) germine longior, filiformis, apice scaber. *Fructus* maturum non vidi.

HAB. On the Great Rapids of the Columbia River. *Lewis* (in *Pursh*). Common along the North-West coast, between lat. 43° and 49°. *Douglas*; *Dr. Scouler*.—This, like the preceding, Mr. Douglas observes, “is exclusively confined to the woody, mountainous country that skirts the shores, and there, among the Pine-forests, it forms almost impenetrable thickets. The branches are pendulous and crooked, often taking

root, as in the case with many species of the genus *Ficus*. Bark smooth, green when young, white when fully grown. The wood is fine, white, and close-grained, very tough, and susceptible of a good polish. From the slender branches of this tree the native tribes make the hoops of their *scoop-nets*, which are employed for taking salmon at the Rupis, and in the contracted parts of the river. Fl. April, May."—This species is remarkable for the nerves radiating from one point. I find flowers of three kinds:—1. Male flowers, with oval crisped petals, and no gland at their base, and no trace of a pistil; in lieu of it, a small tuft of white hairs; the stamens inserted upon a large orbicular fleshy gland. 2. Female flowers, with two styles to the germen, which, with the eight imperfect stamens, are inserted upon the receptacle, but having five small fleshy glands, at the base of which the linear petals are inserted. 3. Flowers with ovate crisped petals, eight perfect stamens, which, with the monogynous germen, are inserted upon a large circular fleshy disk.

TAB. XXXIX. *Acer circinatum*:—natural size. Fig. 1, Male flower; fig. 2, Fertile do.; fig. 3, advanced pistil:—magnified.

5. *A. barbatum*; foliis ovato-cordatis breviter 3-lobis inaequaliter serratis subtus ad nervos pubescentibus glaucisque, pedunculis pilosis masculis ramosis, femeinis simplicibus, calycibus intus barbatis, capsule alis erectis. Ph.—*Mich. Am.* v. 1. p. 252. *Pursh*, *Fl. Am.* v. 1. p. 267. *Elliott*, *Carol.* v. 1. p. 451. *De Cand. Prodr.* v. 1. p. 595. *Torrey*, *Fl. of Un. St.* v. 1. p. 396.

HAB. Valleys near springs on the west side of the Rocky Mountains, about the sources of the Columbia. Douglas.—I rely upon the indefatigable Douglas for the correctness of this name; his specimens, in my possession, being too young to enable me to form an opinion. According to Pursh, it inhabits the country between New Jersey and Carolina. I have seen no authentic specimen; nor am I aware that a figure of it is anywhere published.

6. *A. saccharinum*; foliis cordatis glabris subtus glaucis seu pallidis palmato-3-lobis, sinibus obtusis, lobis acuminatis sinuato-incisis, corymbis breviter pedunculatis nutantibus, fructibus glaberrimis, alis subdivergentibus.—*Linn. Sp. Pl.* p. 1496. *Mich. Am.* v. 1. p. 252, Arð. (ed. Am.) v. 1. t. 42. *Pursh*, *Fl. Am.* v. 1. p. 266. *Elliott*, *Carol.* v. 1. p. 450. *De Cand. Prodr.* v. 1. p. 595. *Bigel. Fl. Bost.* ed. 2. p. 378. *Torrey*, *Fl. of Un. St.* v. 1. p. 398.

HAB. Canada; apparently most common in the southern parts.—My specimens from Dr. Todd, gathered at Lake Huron, which, indeed, are the only ones I possess from British North America, have the leaves more rigid, the sinuses broader, and the margins less divided than in Dr. Booth's specimens from near Boston, and are probably the *A. nigrum* or *Black Maple* of Michaux's *Forest-Trees*. Both are valuable for their timber, and for the quantity of sugar produced by them. Mr. Douglas observes that some of the largest *Sugar-Maples* in America are on *Goat Island* at the Falls of Niagara.

7. *A. dasycarpum*; foliis cordatis saepe basi truncatis glabris subtus glauco-albidis palmato-5-lobis, sinibus obtusiusculis, lobis tenuiori acuminatis incisis serratisque, floribus conglomeratis breviter pedicellatis "pentandris apetalis," germinibus tomentosis, fructu glabro, alis superne latioribus fulcato-incurvis.—*Willd. Sp. Pl.* v. 4. p. 485. *Pursh*, *Fl. Am.* v. 1. p. 266. *Elliott*, *Carol.* v. 1. p. 449. *Bigel. Fl. Bost.* ed. 2. p. 379. *Torrey*, *Fl. of Un. St.* v. 1. p. 396. *Mich. Am.* v. 1. p. 253. *Desf. Ann. du Mus.* v. 7. p. 412. t. 25. *Mich. Arb.* (ed. Am.) v. 1. t. 40. *De Cand. Prodr.* v. 1. p. 595.

HAB. Lake Huron. Dr. Todd.—This forms a large tree, known in the United States by the name of *White* or *Soft Maple*, and is said to yield a good sugar. In the southern States it is very abundant, but rarely within forty miles of the sea. The young leaves and young germens are very downy; but the old

leaves and perfect fruit glabrous. The *alia* are remarkably large, broad upwards, and falcato-incurved, beautifully striated, the striae running in strait parallel lines along the outer margin, and all terminating towards the broad part at the inner margin.

8. *A. rubrum*; foliis cordatis demum glabris subtus glaucis palmato-5-lobis, lobis acuminatis inciso-serratis, sinibus acutis, floribus conglomeratis pentapetalis "pentandris," ovariis glabris, fructus alis subdivergentibus superne dilatatis paululum falcatis.—*Linn. Sp. Pl. p. 1496. Mich. Am. v. 1. p. 258. Pursh, Fl. Am. v. 1. p. 263. Elliott, Carol. v. 1. p. 449. De Cand. Prodr. v. 1. p. 595. Bigel. Fl. Bost. ed. 2. p. 377. Torrey, Fl. of Un. St. v. 1. p. 395.*

HAB. Throughout Canada, (*Pursh; Mrs. Sheppard; Mrs. Percival*,) to the valleys of the Rocky Mountains, and on the west side near the sources of the Columbia. *Drummond*.—This, the *Red Maple*, so called on account of its red flowers and fruit, is a large tree, whose wood is close-grained, smooth, and hard, and used for various kinds of furniture. Elliott observes that "in descending the mouths of our large rivers, this is the last tree we find in the swamps, diminishing as the soil becomes impregnated with salt, until it dwindles to a shrub, and, mingling with the *Myrica cerifera* (*Candleberry Myrtle*) and *Baccharis halimifolia*, finally disappears."

2. NEGUNDO. *Manch.*

Flores dioici. Cal. minimus inaequaliter 4-5-dentatus. Pet. 0. ♂ Flores fasciculati, pedicellis filiformibus. Antheræ 4-5, lineares, sessiles.—♀ Flores racemosi.—Folia compvisa impari-pinnata. DC.

1. *N. fraxinifolium*; foliis 3-foliolatis, foliolis oppositis grosse rariterque dentatis, impari scipius trilobo. *DC.—Nutt. Gen. v. 1. p. 253. De Cand. Prodr. v. 1. p. 596.—Acer Negundo. Linn. Sp. Pl. p. 1497. Mich. Am. v. 1. p. 253, Arb. (ed. Am.) v. 1. t. 46. Elliott, Carol. v. 1. p. 459. Torrey, Fl. of Un. St. v. 1. p. 398.*

HAB. Interior of Canada: abundant about the Red River and Saskatchewan, which latter river, in lat. 54°, is its most northern limit. *Dr. Richardson; Douglas; Drummond*.—This is the *Box Elder* or *Ash-leaved Maple* of the United States. Mr. Douglas informs me that the Cree Indians manufacture a sugar from it. From Dr. Schweinitz I possess a specimen with the leaves having their two lower and the terminal leaflets ternate.

ORD. XXI. AMPELIDÆ. *Humb. et Kunth.*

1. AMPELOPSIS. *Mich.*

*Cal. subinteger. Pet. 5, (ut in *Vite*) ab apice ad basim (more *Cissi*) abscedentia. Stam. 5. Stylus 1. Stigma capitatum. Ovarium disco non immersum, 2-4-spermum. Kunth.—Genus medium inter *Cissum* et *Vitem*.*

1. *A. quinquefolia*; foliis palmato-3-5-foliolatis utrinque glabris, foliolis petiolatis oblongis acuminatis mucronato-dentatis, racemis dichotomo-corymbosis.—*Mich. Am. v. 1. p. 160.—Hedera quinquefolia. Linn. Sp. Pl. p. 292.—Vitis quinquefolia Lam.—Cissus hederacea. Pursh, Fl. Am. v. 1. p. 170. Elliott, Carol. v. 1. p. 305. Torrey, Fl. of Un. St. v. 1. p. 266.—Vitis hederacea. Willd.—Bigel. Fl. Bost. ed. 2. p. 93.*

HAB. Canada. *Michaux*. Lake Huron. *Dr. Todd*.—A well-known plant, being cultivated throughout Europe under the name of *Five-fingered Ivy*, and employed for covering old walls and the sides of buildings, and rendered beautiful in autumn by the deep red-colour of its leaves.

2. VITIS. Linn.

(Dioica et Polygama. Omnes Americana.)

Cal. sub 5-dentatus. *Pet.* 5 apice cohaerentia et instar calyptreæ basi abscedentia simulque decidua. *Stam.* 5. *Stylus* 0. *Bacca* 2-loc., 4-sperma, loculis seminibusve stepe abortivis.—*Folia simplicia. De Cand.*

1. *V. Labrusca*; ramis ferrugineo-tomentosis, foliis cordatis subintegris trilobisve acute dentatis subtus pedunculisque subferrugineis tomentosis.—*Linn. Sp. Pl.* p. 293. *Mich. Am.* v. 2. p. 290. *Pursh, Fl. Am.* v. 1. p. 169. *Elliott, Carol.* v. 2. p. 689. *De Cand. Prodr.* v. 1. p. 634. *Bigel. Fl. Bost. ed.* 2. p. 93. *Torrey, Fl. of Un. St.* v. 1. p. 264.

HAB. Canada. *Pursh*.—This is the *Fox-Grape*, or common *Wild Grape-Vine* of the United States. The fruit is, according to Professor Bigelow, large, purple, and pleasantly tasted; while Torrey remarks that it has a strong disagreeable flavour in a wild state, but that, when cultivated, it is as pleasant as any of the varieties of *V. vinifera*. Two sorts are much esteemed at New York, and known under the name of “*Bland's-Grape*” and the “*Isabella-Grape*.”

2. *V. vulpina*; foliis profunde cordatis acuminatis subæqualiter dentatis utrinque glabris in axillis pubescensibus, racemis laxe multifloris polycarpis, baccis parvis serotinis.—*Linn. Sp. Pl.* p. 293. *Sm. in Rees' Cycl.* n. 9. *Torrey, Fl. of Un. St.* v. 1. p. 264.—*V. cor-difolia. Mich. Am.* v. 2. p. 231. *Pursh, Fl. Am.* v. 1. p. 169. *Elliott, Carol.* v. 2. p. 688. *De Cand. Prodr.* v. 1. p. 634.

HAB. Canada. *Pursh*.—This is the *Winter-Grape* or *Chicken-Grape* of North America. Dr. Torrey considers it to be the true *V. vulpina* of Linn., on account of the glabrous leaves; and his observation is confirmed by Sir J. E. Smith in *Rees' Cycl.*

3. *V. riparia*; foliis profunde cordatis 3-lobis, lobis acuminatis inciso-serratis subtus glabriusculis in axillis nervisque pubescensibus.—*Mich. Am.* v. 2. p. 231. *Pursh, Fl. Am.* v. 1. p. 169. *Elliott, Carol.* v. 2. p. 688. *De Cand. Prodr.* v. 1. p. 635. *Torrey, Fl. of Un. St.* v. 1. p. 265.

HAB. Canada. *Mr. Cleghorn; Mrs. Percival. Lake Huron. Dr. Todd.* Extending to the south end of Lake Winnipeg, in lat. 52°. *Dr. Richardson*.—Some of my specimens of this plant have the leaves so slightly lobed that I scarcely know how they are to be distinguished from the preceding.

ORD. XXII. GERANIACEÆ. Juss.

I. GERANIUM. L'Herit.

Sepala 5, æqualia. *Pet.* 5, æqualia. *Stam.* 10 fertilia, alterna majora. *Glandulae* nectariferæ ad basin stam. majorum. *Carpellorum aristæ* intus glabreæ, demum elastice a basi ad axeos apicem circinatum revolutæ.—*Herbae rarissime suffrutescentes, foliis palmato-lobatis, pedunculis 1-2 floris. DC.*

* *Perennia, pedunculis bifloris.*

1. *G. maculatum*; caule subangulato erecto dichotomo retrorsum pubescente, foliis 3-5-partitis segmentis acutis inferne cuneatis superne inciso-serratis, radicalibus longe

petiolatis superioribus oppositis, petalis integris, staminum filamentis vix basi subciliatis. —*Linn. Sp. Pl. p. 955. Cav. Diss. v. 4. t. 86. f. 2. Mich. Am. v. 2. p. 157. Pursh, Fl. Am. v. 2. p. 448. Elliott, Carol. v. 2. p. 157. Bigel. Med. Bot. t. 8, Fl. Bost. ed. 2. p. 256. De Cand. Prodr. v. 1. p. 642.*—*s. tota planta pubescens-pilosa.*

HAB. Canada. Michaux. s. North-West America. *Douglas.*—Flowers large, handsome, purple.

2. *G. albiflorum*; caule subangulato erecto dichotomo inferne glabro superne piloso-glanduloso, foliis profunde 5-partitis ovato-acuminatis inciso-subpinnatifidis subpilosus, radicalibus longe petiolatis, superioribus oppositis breve petiolatis 3-partitis magis acuminatis, calycibus glanduloso-pilosus, petalis integris (albis) intus filamentisque basi hirsutis. (TAB. XL.)

Radix perennis. Caulis sesquipedalis, erectus, dichotomus, glaber, apicibus ramorum solummodo glanduloso-pilosus. Folia subplosa margine precipue, profunde palmato- et subtetragono-5-rarior-7-partita, segmentis ovatis acuminatis profunde incisis subpinnatifidis, lacinias valde acutis: radicalia longe petiolata, petiolo spithameo et ultra: superiora sensim minora, petiolo breviore; suprema etiam petiolata, 3-5-partita, segmentis angustioribus magis acuminatis magisque incisis. Pedunculi elongati, biflori, pedicellique basi bracteati, pilosi, pilis brevibus patentibus glandulosis. Calyx basi praeceps glanduloso-pilosus; sepals ovalibus obscure nervosis longe mucronatis. Petala magna, obcordata, alba vel ochroleuca, obscure lineata, intus valde hirsuta. Staminum filaments alterna sublongiora, basi hirsuta. Fructum non vidi.

HAB. Valleys in the Rocky Mountains. *Drummond.*—This fine species of *Geranium* seems to hold a middle rank between the American *G. maculatum* and the European *G. pratense*: yet it is, I feel assured, truly distinct from both. In the former, *G. maculatum*, the leaves are much less divided, the segments broader, and the peduncles are quite destitute of glandular hairs: in the latter, the leaves are much more deeply divided, the segments greatly narrower, and more truly pinnatifid. In both, the blossoms are purple; in ours, the flowers are constantly white, even when cultivated, as the plant is in our gardens, and of a firmer texture. The *G. longipes* of De Candolle, according to his description, also approaches our plant.

TAB. XL. Fig. 1, Root-leaf:—natural size. Fig. 2, Petal; fig. 3, Stamen; fig. 4, Calyx and pistil, with the filaments of the stamens:—slightly magnified.

* * *Annum, pedunculus bifloris.*

3. *G. Carolinianum*; foliis ultra medium 5-lobis, lobis inciso-3-5-fidis, pedunculis apice confertis, petalis emarginatis longitudine calycis aristatis, carpellis pilosis, seminibus levibus. DC.—*Linn. Sp. Pl. p. 956. Cav. Diss. v. 4. t. 84. f. 1, et t. 124. f. 2. Mich. Am. v. 2. p. 38. Pursh, Fl. Am. v. 2. p. 449. De Cand. Prodr. v. 1. p. 643. Elliott, Carol. v. 2. p. 157. Rich. in Frankl. 1st Journ. ed. 2. App. p. 27.*

HAB. Throughout Canada to lat. 52°, in the valleys of the Rocky Mountains, and to the westward of that range in the same latitude. *Drummond; Douglas.*—De Candolle says the flowers are white: in our specimens, both wild and cultivated, they are of a delicate rose-colour.

2. ERODIUM. L'Herit.

Sep. 5, exqualia, in calcar seu tubum nectariferum nulla producta. Pet. 5 regularia aut irregularia. Stam. 10, filamentis basi monadelphis, 5 antheriferis, 5 alternis sterilibus. Glandulae 5 ad basin staminum sterili. Carpellorum arista intus barbata, demum elastice spiraliter torta. DC.

1. *E. cicutarium*; caule prostrato aut diffuso hirto, foliis pinnatisectis, segmentis sessilibus pinnatifidis incisis acutis, pedunculis 2-multifloris, petalis inaequalibus.

L'Herit.—*De Cand. Prodr.* v. 1. p. 646. *Engl. Bot.* t. 1768.—*E. cheilanthifolium. Douglas,* MSS.—*Geranium cicutarium. Linn. Sp. Pl.* p. 951.

HAB. Near the "Great Falls" of the River Columbia, in sandy soils and in the valleys of the Rocky Mountains.—The same species I have received from the Baths of Collina in Chili.

ORD. XXIII. BALSAMINEÆ. *A. Rich.*

1. IMPATIENS. *Riv.*

Antheræ 5, nempe 3 biloculares, 2 ante petalum superius 1-loculares. *Stigmata* 5 coalita. *Caps.* prismatico-teretiuscula elongata, valvis a basi ad apicem extrorsum revolutis. *Cotyledones* planiusculæ. *Pedunculi* axillares ramosi multiflori. *Capsula* glabræ. —*Folia alterna. DC.*

1. *I. fulva*; pedunculis 2-4-floris, foliis rhombeo-ovatis obtusis mucronato-dentatis, petalo calcarato cæteris longiore, calcare emarginato resupinato. *DC.*—*Nutt. Gen.* v. 1. p. 146. *Torrey, Fl. of Un. St.* v. 1. p. 249. *De Cand. Prodr.* v. 1. p. 687. *Pursh, Fl. Am.* v. 1. p. 171.—*I. biflora. Walt.*—*Willd. Sp. Pl.* p. 1175. *Elliott, Carol.* v. 1. p. 304.—*I. nolitangere. s. Mich. Am.* v. 2. p. 149. *Bigel. Fl. Bost.* ed. 2. p. 93.

HAB. Throughout Canada; and as far north as Bear Lake; lat. 66°. *Dr. Richardson; Drummond.* Newfoundland. *Mr. Morrison.*

2. *I. pallida*; pedunculis 3-4-floris, foliis rhombeo-ovatis subacutis mucronato-dentatis, petalo calcarato dilatato cæteris breviore, calcare recurvo brevissimo. *DC.*—*Nutt. Gen.* v. 1. p. 146. *Torrey, Fl. of Un. St.* v. 1. p. 248. *De Cand. Prodr.* v. 1. p. 687.—*I. nolitangere. Mich. Am.* v. 2. p. 149. *Pursh, Fl. Am.* v. 1. p. 171. *Elliott, Carol.* v. 1. p. 303.

HAB. Canada. *Mr. Blair.* North-West coast of America, near the Columbia. *Dr. Scouler; Douglas.*—The only specimen I have seen from Canada was gathered by Mr. Blair. The species found on the west side of North America is identical with it, and very distinct from the European *I. nolitangere*, with which it was, for a long time, confounded.

ORD. XXIV. OXALIDEÆ. *De Cand.*

1. OXALIS. *Linn.*

Cal. 5-sepalus, sepalis liberis aut basi coalitis. *Pet.* 5. *Stam.* 10, filamentis basi breviter monadelphis, 5 ext. alternis brevioribus. *Styli* 5 apice penicilliformes aut capitati. *Capsula* pentagona oblonga aut cylindracea.—*Herbæ perennes, caulescentes, stipulate aut aculeas, foliis variis sed nunquam abrupte pinnatis. DC.*

* *Corniculata. DC.*

1. *O. corniculata*; caule decumbente ramoso radicante, pedunculis sub-2-floris petiolo brevioribus, stipulis basi petioli unitis, foliolis obcordatis, petalis emarginatis, stylis longitudine staminum interiorum.—*Linn. Sp. Pl.* p. 624. *Engl. Bot.* t. 1726. *Mich. Am.* v. 2. p. 39.—(s.) *Pursh, Fl. Am.* v. 1. p. 322. *Elliott, Carol.* v. 1. p. 525. *Torrey, Fl. of Un. St.* v. 1. p. 462. *De Cand. Prodr.* v. 1. p. 692.

HAB. Canada. Lake Huron. Dr. Todd. About Montreal and Quebec; Mrs. Percival; Mrs. Sheppard; Mr. Cleghorn; and as far north as the Saskatchewan. Dr. Richardson; Drummond.

2. *O. stricta*; caule erecto folioso, pedunculis umbelliferis 2-6-floris foliis circiter longitudine, stipulis obsoletis, foliolis obcordatis, petalis integris, stylis staminum interiorum longitudine.—*Linn. Sp. Pl.* p. 624. *Jacq. Ox.* t. 80. f. 2. *Mich. Am.* v. 2. p. 39. *Pursh. Fl. Am.* v. 1. p. 322. *Elliott. Carol.* v. 1. p. 525. *De Cand. Prodr.* v. 1. p. 692. *Torrey. Fl. of Un. St.* v. 1. p. 462. *Bigel. Fl. Bost.* ed. 2. p. 258.

HAB. Dry soils in upland woods in the interior, west of the Rocky Mountains. Douglas.

* * *Acetosella*. DC.

3. *O. Acetosella*; acaulis, radice dentata repente, foliolis obcordatis puberulis, scapo folio longiore supra medium bibracteolato, petalis ovalibus obtusis, stylis stam. interiora æquantibus aut superantibus.—*Linn. Sp. Pl.* p. 700. *Engl. Bot.* t. 762. *Mich. Am.* v. 2. p. 38. *Pursh. Fl. Am.* v. 1. p. 322. *De Cand. Prodr.* v. 1. p. 700. *Torrey. Fl. of Un. St.* v. 1. p. 461. *Bigel. Fl. Bost.* ed. 2. p. 257.

HAB. Canada. Pursh; Mrs. Sheppard; Mrs. Percival. Lake Huron. Dr. Todd. North-West coast of America, in woods, frequent. Douglas; Dr. Scouler.—The specimens from the North-West coast have unusually long and branched subterraneous stems.

4. *O. trilliifolium*; acaulis, pedunculis umbelliferis petiolum æquantibus, foliis ternatis foliolis obcordatis glabris, stylis staminum interiorum longitudine.—*O. macrophylla. Douglas. MSS. in Herb. Hort. Soc.* (non Kunth.)

HAB. "North-West America, on the summits of the high mountains near the 'Grand Rapids' of the river Columbia; and also in the valleys of the Rocky Mountains, on moist decayed vegetable soil." Douglas.—"Petiole equal in length with the scape, from 6-12 inches high. Leaves glabrous, very large, and, when the plant is out of flower, they may almost be taken for those of *Trillium grandiflorum*." Douglas.

ORD. XXV. RUTACEÆ. Juss.

TRIB. DIOSMEÆ. *De Cand.*

1. ZANTHOXYLUM. Humb. et Kunth.

Flores hermaphroditæ aut abortu dioici aut monoici. Cal. 3-9-lobus saepius 4-5-partitus. Pet. tot quot calycis lobi, interdum basi connata aut libera, abortu saepè ad minorem numerum reducta imo interdum solitaria, matura bivalvia 1-3-sperma. Semen nitidum. (Gærtn.)—Frutices arborescens saepe aculeati. Folia saepius alterna, saepe punctato-glandulosa. DC.

1. *Z. fraxineum*; foliis impari-pinnatis 3-5-jugis, foliolis ovatis obsolete serrulatis basi æqualibus, petiolis teretibus inermibus, aculeis stipularibus, umbellis axillaribus. DC.—*Willd. Sp. Pl.* v. 4. p. 757. *Pursh. Fl. Am.* v. 1. p. 210. *De Cand. Prodr.* v. 1. p. 727. *Bigel. Fl. Bost.* ed. 2. p. 376.—*Z. ramiflorum. Mich. Am.* v. 2. p. 235.

HAB. Canada. Michaux. "La Grande Chaudière." Pursh.

2. *Z. tricarpum*; foliis impari-pinnatis 3-5-jugis, foliolis petiolulatis oblongo-ovalibus acuminatis serrulatis basi obliquis, petiolis ramisque aculeatis, paniculis terminalibus.

DC.—*Mich. Am.* v. 2. p. 235. *Pursh, Fl. Am.* v. 1. p. 210. *Elliott, Carol.* v. 2. p. 600. *De Cand. Prodr.* v. 1. p. 726.—*Fagara fraxinifolia. Lam.*

HAB. Lachine, near Montreal. *Mrs. Sheppard.*—This was sent to me by Mrs. Sheppard as the *Z. fraxinifolia*; but it has decidedly and strongly sessile petioles, and quite agrees with *Z. tricarpum* of Michaux, which has been only considered a native of Carolina and Georgia.

SUBCL. II. CALYCIFLORÆ. DC.

ORD. XXV. CELASTRINÆ. Br.

TRIB. I. STAPHYLEACEÆ. DC.

1. STAPHYLEA. Linn.

Cal. 5-partitus, disco urceolato basi tectus, lobis oblongis concavis coloratis. *Pet.* 5 sepalis alterna. *Stam.* 5 petalis alterna. *Ovarium* 2-3-lobum. *Styli* 2-3 interdum coaliiti. *Caps.* 2-3-locularis, loculis membranaceis intus dehiscentibus oligospermis, nunc basi nunc per totam longitudinem adnexis. *Semina* ossea subglobosa ad hilum truncata. *Albumen* tenue seu 0. *Cotyledones* carnosæ.—Frutices foliis compositis, impari-pinnatis trifoliati, oppositis (rarissime alternis) ad basin petioli et foliolorum bistipulatis; floribus albis, racemoso-paniculatis. DC.

1. *S. trifolia*; foliis 3-foliolatis, foliolis ovatis acuminatis regulariter serratis junioribus subtus pubescentibus, stylis glabris, capsulis vesicariis.—*Linn. Sp. Pl.* p. 286. *Mich. Am.* v. 1. p. 184. *Elliott, Carol.* v. 1. p. 369. *Pursh, Fl. Am.* v. 1. p. 206. *De Cand. Prodr.* v. 2. p. 2. *Torrey, Fl. of Un. St.* v. 1. p. 325. *Bigel. Fl. Bost. ed.* 2. p. 121.

TRIB. II. EUONYMEE. DC.

2. EUONYMUS. Linn.

Cal. 4-6-lobus, planus, basi disco peltato tectus. *Pet.* 4-6 patentia disco inserta. *Stam.* 4-6, glandulis supra discum prominulis inserta, petalis alterna. *Stylus* 1. *Caps.* 3-5-locularis, 3-5-angularis, valvis medio septiferis; semina in loculis 1-4, pulpa aut arillo involuta. *Embryo* viridis, rectus, in medio albuminis carnosæ.—Frutices ramulis tetragonis, foliis ovatis sèpìs oppositis vix stipulaceis, pedunculis axillaribus. DC.

1. *E. atropurpureus?* ramis lœvibus, foliis ovatis subacuminatis petiolatis serratis, pedunculis divaricatis multifloris, "floribus 4-fidis," fructibus lœvibus.—*Jacq. Hort. Vind.* v. 2. t. 120. *Mich. Am.* v. 1. p. 155. *Pursh, Fl. Am.* v. 1. p. 168. *Elliott, Carol.* v. 1. p. 293. *Torrey, Fl. of Un. St.* v. 1. p. 261.

HAB. Banks of streams about the Columbia. *Douglas.*—My specimen of this, which is in fruit, seems to accord with the *E. atropurpureus*; which, however I have not seen from the British possessions east of the Rocky Mountains.

2. *E. Americana*; ramis lœvibus, foliis elliptico-lanceolatis serratis subsessilibus, pedunculis 1-3-floris, petalis suborbicularis, capsulis verrucoso-echinatis.—*Linn. Sp. Pl.* p. 286. *Mich. Am.* v. 1. p. 155. *Elliott, Carol.* v. 1. p. 292. *Pursh, Fl. Am.* v. 1. p. 168. *Torrey, Fl. of Un. St.* v. 1. p. 261.

HAB. Banks of Lake St. Clair; very common. *Douglas*.—This is called *Strawberry-Tree*, and *Burning-Bush*, in the United States. Its fruit resembles that of our *Arbutus Unedo*, and its bright scarlet-colour renders it a conspicuous ornament of the woods in America.

3. CELASTRUS. Linn.

Cal. minimus 5-lobus. Pet. 5 unguiculata. Stam. 5. Ovarium parvum in disco decemstriato immersum. Stylus 1. Stigmata 2-3. Capsula 2-3-valvis loculicido-trivalvis nempe valvis medio septiferis, septis completis aut incompletis, utrinque in latere interiori basi gerentibus. Semen 1 rectum, arillo magno carnosus plus minus involutum.—Frutices foliis alternis, pedunculis multifloris axillaribus aut in paniculam terminalem approximatis. DC.

1. *C. scandens*; inermis, scandens, glaber, foliis ovalibus acuminatis serratis, racemis terminalibus.—*Linn. Sp. Pl. p. 285. Mich. Am. v. 1. p. 155. Pursh, Fl. Am. v. 1. p. 167. Bigel. Fl. Bost. ed. 2. p. 57. Torrey, Fl. of Un. St. v. 1. p. 262.*

HAB. Canada, frequent in woods and thickets. Known under the names of *Bitter-Sweet*, and *Warwork*.

TRIN. III. AQUIFOLIACEÆ. DC.

4. MYGINDA. Jacq.

Cal. minimus 4-fidus. Pet. 4, patentia. Stam. 4 petalis alterna, iis breviorn. Ovarium subrotundum, liberum aut culycis tubo immersum et in partem adhærens disco corona-tum, 2-loculare, loculis 1-spermis. Stylus brevis aut nullus. Stigmata 4 (an semper?) ideo nunc ad apicem styli, nunc subsessilia. Drupa ovata (verosim. abortu) 1-locularis 1-sperma. Semen ex apice loculi pendulum (vel e basi loculi erectum) albuminosum.—Frutices ramulis tetragonis, foliis oppositis subcoriaceis, pedunculis axillaribus saepius apice trifidis trichotomis, floribus minimis. DC.

1. *M. myrtifolia*; foliis oblongo-ellipticis brevissime petiolatis coriaceis glauris margine serratis revolutis, pedunculis brevissimis 1-3-floris, germe disco tecto, stylo elongato, stigmate solitario capitato subsulcato. (TAB. XLI).—*Nutt. Gen. v. 1. p. 109. De Cand. Prodr. v. 2. p. 19.*—*Ilex myrsinoides. Pursh, Fl. Am. v. 1. p. 119.*—*a. minor*; foliis minoribus densioribus, pedunculis plerumque trifloris.—*b. major*; foliis majoribus sparsioribus, pedunculis plerumque unifloris.

Fruer ramosissimus, glaber. Rami juniores tetragoni, deinceps teretes, rufo-fusci. Folia opposita, approximata, oblongo-elliptica in a. densissima, vix unciam, in b. sepe plusquam sesquunciam longa, brevissime petiolata, coriacea, obscure nervosa, pallide viridia, margine paululum recurva, serrata, serraturis nunc argutis, nunc, foliis junioribus, obsoletis. Pedunculus axillaris, solitarius, 1-3-dorus, pedicellis pedunculo longioribus, ex uno puncto pedunculi, basi bibracteatis, lateralibus iterum supra basin singulo bibracteatis, bracteis parvis, subrotundis, erectis, carnosis. Flores parvi, rubricundi. Calycis tuba turbinatus; limbo 4-fido, segmentis aestivatione imbricatis, demum patentibus late ovatis, obtusis. Corolla 5-petala; petala calycis segmentis alterna et paulo breviora, ovata, sessilia, concava, basi late minime unguiculata. Stamina 4, petalis alternantia et calycis lobis opposita: Filamenta e margine disci breviuscula. Antheræ subrotundæ, flava, interius rima longitudinalis debilescentes. Germen subglobosum, calycis tuba immersum, sed plerumque liberum, disco carnosò pateriformi margine subcrenato staminifero tectum, et cum ore calycis tubi unitum, bilocularis, loculis bioculatis. Ovala subrotunda, angulata e basi loculi erecta. Podospermum clavatum, superne dilatatum. Stylus filamentis subbrevior, erectus. Stigma capitatum, obscure sulcatum.

HAB. North-West coast of America. *Menzies*, (in *Herb. nostr.*) On the Rocky Mountains, and near the Pacific Ocean. *Lewis*, (in *Pursh.*) Common on subalpine hills of the North-West coast; and a. valley of the Rocky Mountains, particularly abundant near the sources of the Columbia, in 52° N. lat. and 118° W. long. *Douglas*.—*a*. Woods of Portage River, east side of the Rocky Mountains. *Drummond*.—I was much gratified in finding, both in Mr. Drummond's and Mr. Douglas's collections, specimens of this interesting plant, which I had long ago received from Mr. Menzies under the name of "*Ilex vomitoria*" of Ait. But that plant it cannot be; the flower, as figured in *Jacq. Ic. Rar.* t. 310, being totally at variance with that of the present species. I still retain it where Nuttall has placed it, in the genus *Myginda*. In many points, indeed, it differs from De Candolle's character of that genus; in none more than in the direction of the ovules. But M. Kunth has shown, that in his *M. myrsinoides* the ovules are, as here, erect; still the situation of the disk makes me think that it ought to be removed from *Myginda*; for here it covers the mouth of the tube of the calyx, as in the genus *Thamneea* of the Order *Brunneaceæ*; there, and there only, uniting the germen with the calyx, in which that germen is, nevertheless, almost wholly immersed. The fruit was, unfortunately, not detected by any of our Naturalists. Pursh describes it as a one-seeded, blackish-purple, ovoid drupe. But his characters of the flower are extremely incorrect, nor is their structure at all like that of *Myginda Rhacoma*, from the West Indies, to which he compares it.

TAB. XLI. A. *Myginda myrtifolia*, a. B. var. *a*. Fig. 1, Peduncle, with a single flower in bud; fig. 2, a 3-flowered peduncle; fig. 3, Flower; fig. 4, Anterior view of a stamen; fig. 5, Posterior view of do.; fig. 6, Vertical section of a calyx and germen; fig. 7, Transverse section of do.; fig. 8, Ovule:—magnified.

5. ILEX. Linn.

Cal. 4–5-dentatus, persists. *Pet.* 4–5, hypogyna (ex Kunth), sepalis alterna, nunc libera, nunc basi in corollam rotatam subcoulita. *Stam.* 4–5, petalis alterna, hypogyna. *Ovarium* sessile, 4-loculare, stigmatibus subsessilibus, 4–5, nunc distinctis nunc in 1 coailitis coronatum. *Bacca* 4–5-pyrena, nucleus oblongis apice umbilicatis 1-spermis. *Semen* iuversum; *albumen* carnosum. *Embryo* in apice nudulans.—*Frutices sempervirentes, foliis saepius coriaceis, pedunculis multifloris, floribus hermaphr., rarissime abortu dioicis aut polygamis.* DC.

1. *I. opaca*; foliis ovatis planis coriaceis acutis sinuato-dentatis spinosis glabris non lucidis, floribus ad basim rameolorum annotinorum sparsis, calycinis dentibus acutis. DC.—Ait. Hort. Kew. ed. 1. v. 1. p. 169. Mich. Am. v. 2. p. 228. Pursh, Fl. Am. v. 1. p. 117. De Cand. Prodr. v. 2. p. 14. Torrey, Fl. of Un. St. v. 1. p. 134. Bigel. Fl. Bost. ed. 2. p. 62.

HAB. Canada. Pursh.—According to Pursh, this *Evergreen-tree* reaches to a height of eighty feet, having a trunk four feet in diameter. Probably it is only in the southern States that it attains this size. Torrey says that, in the middle States, it is but thirty to forty feet in height, and often only a large shrub.

6. PRINOS. Linn.

Omnia *Ilicis* sed flores saepius abortu dioici aut polygami 6-fidi 6-andri, et fructus 6-pyreni.—*Frutices foliis deciduis persistentibusve, pedicellis axillaribus unifloris.* DC.

1. *P. verticillatus*; foliis deciduis ovalibus obovatissimis acuminatis serratis subtus reticulatis pubescentibus, fasciculis florum masculis axillaribus umbelluliformibus, femineis aggregatis utrinque 6-partitis.—Linn. ORD. XXVI. RHAMNEÆ. *Br.*

1. RHAMNUS. *Lam.*

Cal. 4-5-fidus, post anthesin medio saepe circumscissus, basi sub fructu persistente et cum eo adhaerente. *Pet.* lobis calycis alterna aut nulla. *Stam.* ante petala inserta. *Stylus* 2-4-fidus. *Fructus* subexsuccus aut baccatus 2-4-locul., loculis coccis in exsuccis separalibus 1-spermis (rarissime 2-spermis) rima longit. intus dehiscentibus. *Semina* oblonga, ad latum exterius sulco profundo basi latiore notata.—*Frutices* aut arbusculæ, ramis apice interdum spinescentibus, foliis penninerviis, stipulis in aculeum nunquam conversis. *Flores* saepe 1-sexuales. *Fructus* non edules. *DC.*

1. *R. alnifolius*; inermis, erectus, foliis deciduis ovalibus subacuminatis serratis subtus glabriusculis, nervis lateralibus obliquis lineatis, pedicellis 1-floris aggregatis, floribus 4-5-fidis apetalis, stigmate trifido. (*TAB. XLII.*)—*L'Herit. Sert. p. 5.* *De Cand. Prodr. v. 2. p. 25.* *Torrey, Fl. of Un. St. v. 1. p. 263.*—*R. franguloides. Mich. Am. v. 1. p. 153.* *Pursh, Fl. Am. v. 1. p. 166.*—*R. alpinus. Rich. in Frankl. 1st Journ. ed. 2. App. p. 6.*

Frutes, cortice astro-fusco, pelliculo albo tenui tecto. *Rami* foliosi. *Folia* 1-3-uncialis, submembranaceæ, decidua, breviter petiolata, ovalia, apice subacute, vel paululum acuminata, margine serrata, glabra, *juniora* solummodo subtus obscure pubescentia, nervis lateralibus obliquis lineata, venisque numerosis transversalibus reticulata. *Stipula* 2, opposita, membranaceæ, circumvoluta, margine ciliatae, deciduae. *Pedicelli* axillares, uniflori, basi stipulis circumvoluti, 4-5 lineas longi, glabri. *Flores* glabri pallide virides. *Calyx* persistens, tubo brevi dilatato, limbo 4-5-fido, lobis acutiusculis patentibus. *Dicus* tubum occupans planiusculus, margine lato-incrassatus. *Petala* omnino nulla. *Germen* subrotundum, trilobum. *Stylus* brevis, apice trilobo. *Bacca* nigra, magnitudine fructus *Ribis nigri*, calycis basi persistente suffulta.

HAB. Upper Canada (*Douglas*) to Lake Winnipeg, the Saskatchewan and York Factory on Hudson's

Bay. Dr. Richardson; Drummond; Douglas.—The general aspect of this plant, particularly its foliage, is very similar to that of *R. alpinus*, but the flowers are very different, decidedly apetalous, the anthers are much smaller, and the berries larger and much more pulpy.

TAB. XLII. Fig. 1, Fascicle of flowers; Fig. 2, Stipule; Fig. 3, a 4-fid flower; Fig. 4, a 5-fid flower; Fig. 5, Section of do.; Fig. 6, Stamen; Fig. 7, Berry; Fig. 8, Seeds—*magnified*.

2. *R. Purshianus*; inermis, erectus, foliis lato-ellipticis minute denticulato-serratis subtus pubescentibus nervis lateralibus obliquis lineatis, pedunculis axillaribus umbellatis floribusque pubescentibus, calyx 5-fido, petalis minutis cucullatis. (TAB. XLIII.)—*De Cand. Prodr. v. 2. p. 25.*—*R. alnifolius.* Pursh, Fl. Am. v. 1. p. 166. (non L'Herit.)

Frutes seu arbor 10–20-pedalem altus, truncu 9 uncias diametro. *Rami* teretes, nigro-fuscescentes, pubescentes. *Folia* 3–5 uncias longa, petiolata, demum subcoriacea, decidua, lato-elliptica, basi rotundata, raro acutiuscula, nostris exemplaribus nunquam cordata, apice obtusa nunc brevissime acuminata, marginis denticulos minute suberratis, juncta tota magis minuvis pills brevibus tecta, demum subtus solummodo, nervisque præcipue, pubescentia, pallida, nervis lateralibus obliquis linea, venisque obscure transversalibus reticulata. *Petioles* subunciam longi, pubescentes. *Stipulae* cito decidua. *Pedunculi* solitarii, unciates et ultra, crassiusculi, umbellati. *Pedicelli* etiam pubescentes, duas lineas longi, demum, ut et pedunculi fructiferi, elongati. *Calyx* extus pubescens, demum circumcisus: *Tubus* subhemisphericus, disco interno tectus: *limbo* 5-fido, segmentis acutis, erecto-patentibus, intus carinatis. *Petala* minuta, cucullata, apice bifida, in sinus calycis inserta, segmentis breviora, valde concava, cucullata. *Stam.* petalis opposita, et illis fere circumvoluta. *Filamenta* brevissima: *Antheræ* subglobosæ. *Germen* parvum, ovatum: *Style* germe brevior: *Stigma* obtusum, subtrilobum. *Fructus*: *Bacca* lato-obpyriformis, 3-locularis, 3-sperma. *Semina* obovata, atra, nitidissima, dorso convexa, facie interiori linea media elevata, basi ad hilum flava.

HAB. North-West America. Nootka Mr. Menzies. Banks of Kooxkoosky. Lewis, (in Pursh.) Common on the banks of the Columbia, in dry soils near the outskirts of Pine-forests.—If this be the *R. alnifolius* of Pursh, as is very probable, judging not only from the similarity of the leaves to those of our Alder, but also from the country where Mr. Lewis found his specimens, (very near to the Columbia,) the leaves are not “cordate at the base,” nor are the peduncles “twice bifid.”

TAB. XLIII. Fig. 1, Umbel of flowers; Fig. 2, Section of a flower; Fig. 3, Berry:—(natural size.) Fig. 4, Seed:—all but Fig. 3, more or less magnified.

3. *R. oleifolius*; inermis, erectus, foliis perennantibus coriaceis oblongis integerrimis acutis, junioribus subtus pubescentibus nervis lateralibus obliquis remotiusculis, paniculis axillaribus foliosis, floribus glomeratis pentandris, petalis minutissimis, bacca disperma. (TAB. XLIV.)

Frutes ramosus, ramis junioribus angulatis pubescentibus, reliquis teretibus, glabris. *Folia* alterna, brevipetiolata, 3–4 uncias longa, oblonga, perennantia, coriacea, integerrima, acuta, nervosa, nervis lateralibus ambremotis obliquis obscure reticulata, utrinque glabra, junioribus solummodo subtus pube brevi deuse vestita. *Petioles* breves, subpubescentes. *Panicula* axillare, breves, subfoliosæ, floribusque glomeratis pubescentes. *Calyx* 5-fidus, tube subhemispherico discigero, segmentis ovatis erecto-patentibus. *Petala* minuta, cucullata. *Stamina* minuta, petalis circumvoluta. *Filamenta* brevissima. *Antheræ* rotundatae. *Germen* ovatum: *Style* brevis, crassus. *Stigma* obscure bifidum. *Bacca* magnitudine *Pisi sativi*, exacte globosa, bilocularis, disperma. *Semen* magnum, compressum, facie interiori sulcatum.

HAB. North-West coast of America. Mr. Menzies.—This I have long possessed from its estimable discoverer, who found it not only on the banks of the Columbia River, but in California. The flowering specimen is from the latter country; the one in fruit from the former. I ought to observe, however, that there are some discrepancies between the two: the one from the Columbia having larger and greener foliage, and its young leaves are more decidedly velutinous beneath: so that it is possible the two may be distinct.

TAB. XLIV. A. *Rhamnus oleifolius*; from California. B. Portion of the fruit-bearing specimen, from the Columbia:—natural size. *Fig. 1*, Flower; *Fig. 2*, Section of do.; *fig. 3*, Young fruit; *fig. 4*, Section of do.; *fig. 5*, Berry:—magnified.

4. *R. ? cuneatus*; ramis subferrugineo-pubescentibus, foliis oppositis in axillis fasciculatis coriaceis brevissime petiolatis cuneatis obtusis retusis supra glabris subtus pubescentibus albidis reticulatis.—“*Rhamnus*.” *Douglas*, MSS.

HAB. North-West America. Abundant near the sources of the Multnomak River, in sandy soils, growing under the shade of *Pinus Lambertiana*. *Douglas*.—I have retained this in the genus *Rhamnus*, it being so named by Mr. Douglas in the Herbarium of the Horticultural Society: but when its flowers and fruit shall be known, it will probably prove to be something very different, even from the Order *Rhamneæ*. It constitutes a harsh shrub, from four to twelve feet high, with numerous, stout, rigid, terete, opposite, subpatent, and subspiniform branches, very leafy, and clothed with a rusty-coloured down. Leaves, the largest of them scarcely an inch long, and those oblong, cuneate at the base, while those on the younger parts of the branches are more decidedly cuneate, and smaller, all of them opposite, bearing clusters of young leaves and branches in the axils, coriaceous, the margin slightly revolute, entire, the apex obtuse, retuse, emarginate, and sometimes tridentate, glabrous, and very obscurely obliquely nerved on the upper surface; beneath downy, with the nerves oblique, close, prominent, brown, and reticulated with transverse veins, the *areole* of these veins, when seen under a microscope, are filled with a beautiful, short, dense fascicle of hairs, which hairs originate in a circle, and all converge towards the centre of the little tuft, lying nearly flat. From the axils of some of the leaves, and from a terminal pair in others, arises a *peduncle*? clothed with rusty-brown hairs, and bearing a globose bud, or cluster of buds, (apparently of very young flowers,) surrounded by small, rusty, closely-pressed *bractæ*? But of the nature of these flowers I can make nothing. The whole plant yields, even when not rubbed or bruised, a balsamic odour like that of some *Balsam-Poplars*, mixed with a powerful astringency, resembling the smell of young *Birch twigs*.—It is to be hoped that during his present arduous journey through North-West America, Mr. Douglas will obtain flowering and fruit-bearing specimens of this singular plant.

2. CEANOTHUS. Linn.

Cal. 5-fidus, campanulatus, post anthesin medio circumscissus, basi sub fructu persistente, subbadhærente. *Pet.* 5 parva longe unguiculata forniciata, rarius 0. *Stam.* exserta, ante petala. *Styl.* 2-3 ad medium coaliit. *Bacca* exsucca 3-locularis (rarius 2-4-loc.), oculis chartaceis 1-spermis basi perviis latere interiore delhiscentibus. *Semina* ovata sulco destituta.—Frutices *inermes*, *foliis ovatis*. DC.

SECT. EUCEANOOTHUS. DC.

1. *C. Americanus*; foliis ovatis acuminatis trinerviis glanduloso-serratis subtus pubescentibus, thyrsis elongatis, rachi pubescente. DC.—Linn. Sp. Pl. p. 284. Sims, Bot. Mag. t. 1479. Mich. Am. v. 1. p. 154. Pursh, Fl. Am. v. 1. p. 167. De Cand. Prodr. v. 2. p. 31. Torrey, Fl. of Un. St. v. 1. p. 280. Elliott, Carol. v. 1. p. 290. Bigel. Fl. Bost. ed. 2. p. 91.

HAB. Throughout Canada. Michaux.

2. *C. intermedius*; foliis oblongo-ovalibus obtusis glanduloso-serrulatis triplinervibus subtus pubescentibus, paniculis axillaribus corymbosis.—Pursh, Fl. Am. v. 1. p. 167. Elliott, Carol. v. 1. p. 290. De Cand. Prodr. v. 2. p. 32.—C. ovalis. Bigel. Fl. Bost. ed. 2. p. 92.

HAB. Upper Canada. Mr. Goldie. Lake Huron. Dr. Todd.—I possess the *C. ovalis* of Professor Bigelow from my friend Dr. Boott, and it is the same as what I consider to be the *C. intermedius* of Pursh.

3. *C. velutinus*; ramis subpendulis, foliis rotundato-ellipticis coriaceis argute glanduloso-dentatis triplinerviis supra nitidis quasi vernicosis glaberrimis subtus incano-velutinis, racemis terminalibus, ramis thyroideis, inferioribus foliosis. (TAB. XLV.)—*Douglas, MSS. in Herb. Hort. Soc.*

Fruces 3-8-pedalis, ramis teretibus glabris, ramulis junioribus colummodo appresso-pubescentibus. *Folia*, in hoo genere, ampla, petiolata, 3-4 uncias longa, 2½ ad 3 uncias lata, alterna, coriaceas, lato-rotundato-elliptica, basi obtusa, raro subcordata, apice obtusa, margine pulcherrime et argute glanduloso-denticulata, triplinervia, supra glaberrima, nitida, quasi vernice obducta, subtus mollissima, incana, tactu precipue velutina, nervis prominentibus. *Petiolaris* fere unciam longus, tenui-pubescentis. *Panicula* terminales elongatae, ramis glabriusculis, thyrsiformibus, inferioribus, ad basim, folium gerentibus. *Pedicelli* graciles, fasciculati. *Flores* alii, glaberrimi. *Calyx* profunde 5-fidus; *tubo* per breve, *disco* margine incrassato replete, medio pistillifero; *limbi segmentis* erecto-incurvis, ovatis, subcaminiatis. *Petala* patentia, obovata fere cucullata, longe unguiculata. *Stamina* ante petala. *Filamenta* petalarum longitudine. *Antheræ* subglobosæ. *Germen* subrotundum. *Style* elongatus, staminibus brevior. *Stigma* bi-trifida, segmentis subrecurvis. *Bacca* sicca, 2-3-loclaris, 2-3-aspera. *Cocculi* chartacei. *Semina* obovata, nitidissima, atro-fusca.

HAB. Subalpine hills near the sources of the Columbia; and at the "Kettle Falls." *Douglas.*

TAB. XLV. *Fig. 1, Flower; fig. 2, Vertical section of do.; fig. 3, Berry; fig. 4, Seed:—magnified.*

4. *C. lœvigatus*; foliis rotundato-ellipticis coriaceis argute glanduloso-dentatis triplinerviis omnino glaberrimis supraque nitidis et quasi vernicosis, paniculis in ramos breves terminalibus, floribus concretatis.—*C. grandis, Douglas, MSS.*

HAB. Nootka. *Mr. Menzies.* Mountains near the coast of North-West America, between the parallels of 40° and 43° N. lat.? *Douglas.*—My character of this is drawn up from Mr. Menzies's specimen in my Herbarium. In Mr. Douglas's MSS. he notices a *C. grandis* from the station above-mentioned, which is probably the same as the present, although it inhabits a much more southern latitude. Our plant, however, it must be confessed, differs in no respect from the preceding species, except in being everywhere, even upon the young leaves, entirely glabrous; whereas *C. velutinus* has, on the oldest as well as the youngest leaves, a delicate, short, hoary, and almost white tomentum, clothing their underside.

5. *C. thrysiflora*; caule erecto stricto ramisque angulatis, foliis breviter petiolatis oblongis triplinerviis glanduloso-serratis glabris subtus nervis venisque appresso-pilosis, paniculis longe pedunculatis axillaribus thyroideis inferne foliosis, pedicellis brevibus. —“*Eschscholtz, in Descr. Pl. Nov. Calif. in Mém. de l' Acad. Imp. de Petersb. v. 10. 1826.*”

HAB. “North-West coast of America.” *Mr. Menzies, (in Herb. nostr.) New California. Eschscholtz.*—For a knowledge of the name of this very distinct species of *Ceanothus*, I am indebted to Dr. Chamiso, who sent me an authentic specimen from California. Whether Mr. Menzies's plant be from California, or from a higher latitude, as I rather suspect, from the manner in which its station is indicated, I will not take upon me to say. The flowers are surrounded by densely imbricated, ovate, and acute bractæ, in the state of bud, but these drop before the blossoms are expanded. The calyx, Eschscholtz describes to be blue, the petals white. The whole plant turns black in drying.

6. *C. sanguineus*; foliis petiolatis elliptico-ovatis obtusis membranaceis serratis, serraturis subglandulosis, venis lateralibus obliquis basi subtrinerviis, subtus nervis venisque pubescentibus, paniculis axillaribus thyroideis brevi-pedunculatis folia superantibus, pedicellis elongatis.—*Pursh, Fl. Am. v. 1. p. 167. De Cand. Prodr. v. 2. p. 32.*

HAB. On the banks of the Missouri, near the Rocky Mountains. *Lewis, (in Pursh.)* Common on the banks of streams and low hills, from the Rocky Mountains to the Western Ocean, along the valley of the

Columbia. *Douglas*.—This, again, is a species very distinct from any of the preceding. It forms a handsome white-flowered shrub, 4-8 feet high, according to Mr. Douglas. The stems and branches are glabrous, rounded, tinged with purple. Petioles an inch long, slender, very hairy when young. Leaves small when the plant is in blossom, when in fruit, 3 inches and more long, thin and membranous, having three nerves, (two lateral ones, and the mid-rib springing from the base); but these are less strong than in the preceding species, and scarcely differ from the oblique lateral nerves which branch off from the mid-rib. Thyrus many-flowered. Berries dry, brown, 3-lobed, 3-seeded, tipped with the persistent style.

ORD. XXVII. TEREBINTHACEÆ. *Juss.*TRIB. SUMACHINEÆ. *DC.*1. RHUS. *Linn.*

Cal. parvus 3-partitus persistens. *Pet.* 5 ovata patentia. *Stam.* 5 omnia in masc. et hermaphrod, antherifera. *Ovarium* subglobosum, 1-loculare. *Styli* breves 3, aut stigmata 3 sessilia. *Drupa* fere exsucca 1-locularis, nucleo osseo forsan abortu 1-spermo et interdum 2-3-spermo. *Semen* exalbuminosum, funiculo fundo nuceli orto inversum. *Cotyledones* foliaceæ. *Radicula* cotyledonum rimæ superius incumbens. (*Gærtn.*)—Frutices, foliis alternis variis sappiis compositis, floribus saepe abortu polygamis dioicis. *DC.*

SECT. I. SUMAC. *foliis impari-pinnatis.

1. *R. typhina*; foliis 8-10-jugis, petiolis immarginatis ramisque hirsutissimis, foliolis lanceolatis acuminatis grosse serratis subtus pubescenti-pilosis.—*Linn. Sp. Pl.* p. 380. *Mich. Am.* v. 1. p. 182. *Pursh, Fl. Am.* v. 1. p. 204. *Elliott, Carol.* v. 1. p. 360. *Torrey, Fl. of Un. St.* v. 1. p. 322. *De Cand. Prodr.* v. 2. p. 67. *Bigel. Fl. Bost.* ed. 2. p. 118.

HAB. Canada. *Michaux*. Near Quebec. *Mrs. Percival*.—The *R. viridiflora* of Poir. and *De Cand.* (*R. canadensis*, Mill. Dict.) is probably only a less hairy variety of this. Berries velvety, rich-purple.

2. *R. glabra*; foliis 8-10-jugis, petiolis immarginatis ramisque glabris, foliolis lanceolato-oblongis acuminatis serratis subtus albicanibus.—*Linn. Sp. Pl.* p. 380. *Mich. Am.* v. 1. p. 182. *Pursh, Fl. Am.* v. 1. p. 204. *Elliott, Carol.* v. 1. p. 361. *Torrey, Fl. of Un. St.* v. 1. p. 322. *De Cand. Prodr.* v. 2. p. 67. *Bigel. Fl. Bost.* ed. 2. p. 118.

HAB. Canada; and as far north as the Saskatchewan. *Dr. Richardson*.—Berries clothed with a down which is said to contain the malic acid. The leaves are astringent, and used in tanning. I have not ventured to introduce the *R. copallinum* as a native of the British Settlements, because, though found in the adjoining territories of the United States, I have never seen Canadian specimens.

3. *R. venenata*; foliis 5-6-jugis (deciduis) glabriusculis, petiolo aperto, foliolis, ovato-oblongis acuminatis integerrimis.—*De Cand. Prodr.* v. 2. p. 68.—*R. vernix*. *Linn. Sp. Pl.* p. 380. (non *Mat. Med.*) *Mich. Am.* v. 1. p. 183. *Pursh, Fl. Am.* v. 1. p. 205. *Elliott, Carol.* v. 1. p. 362. *Torrey, Fl. of Un. St.* v. 1. p. 323. *Bigel. Fl. Bost.* ed. 2. p. 119, *Med. Bot.* t. 10.

HAB. Canada. *Pursh*.—This is the famous *Poison-Sumach*, *Swamp-Sumach*, or *Poison-Elder*, of the United States. An admirable history of it is given in the *Medical Botany* of Dr. Bigelow, above-quoted. Berries glabrous, almost white.

* * *Foliis trifoliolatis, foliolo medio petiolato.*

4. *R. radicans*; caule radicante, foliis 3-foliolatis, foliolis ovato-rotundatis rhomboideis acutis seu acuminatis glabris integris.—*Linn. Sp. Pl.* p. 381. *Elliott, Carol. v. 1. p. 363. Bigel. Med. Bot. t. 42, Fl. Bost. ed. 2. p. 120. De Cand. Prodr. v. 2. p. 69.*—*R. Toxicodendron, a. Mich. Am. v. 1. p. 183. Pursh, Fl. Am. v. 1. p. 205.*—*R. Toxicodendron, s. Torrey, Fl. of Un. St. v. 1. p. 322.*

HAB. Throughout Canada, to the Saskatchewan. *Dr. Richardson; Drummond.* North-West America on "Mount Hood," and the "Blue Mountains." *Douglas.*

5. *R. Toxicodendron*; caule erecto debili, foliis 3-foliolatis, foliolis ovato-rotundatis subrhomboideis acutis seu acuminatis inciso-angulatis.—*Linn. Sp. Pl.* p. 381. *Elliott, Carol. v. 1. p. 363. De Cand. Prodr. v. 2. p. 69.*—*a. Torrey, Fl. of Un. St. v. 1. p. 323. b. quercifolia. Mich. Am. v. 1. p. 183. Pursh, Fl. Am. v. 1. p. 205.*

HAB. Canada; and, I believe, in the same localities as the preceding. *Pursh; Mr. Cleghorn; Dr. Richardson; Drummond; Douglas.*—American Botanists are at variance with regard to the distinctive characters of this and the preceding species. Nuttall says they are certainly different; but most other authors either unite them, or speak with doubt as to the value of their presumed marks of distinction.

6. *R. lobata*; caule stricto, ramulis brevibus foliosis, foliis trifoliolatis, foliolis ovatis obtusissimis varie lobatis, lobis obtusis, sinibus acutis, paniculis laxis petiolo longioribus. (TAB. XLVI.)

Frutex erectus, 3-4-pedalis, ramis teretes, junioribus colummodo pubescensibus, ramulis numerosis, brevibus, patentibus, foliosis. *Folia* longe petiolata, trifoliolata, foliolis ovatis, unciam ad duas uncias longis, obtusissimis, membranaceis, basi nunc acutis, nunc rotundatis truncatis, subtus præcipue pubescensibus, profunde et varie lobatis, terminali sublonge petiolulata, utrinque subæqualiter lobata, lobis præcipuis subtibus, foliolis lateralibus margine exteriori magis profunde lobata. *Flores* (masculini) flavi, in racemis laxis, folio brevioribus, petiolo longioribus. *Bractea* ad basin ramulorum oblonga, ciliata. *Cal.* profunde 5-partitus, lacinia oblonga. *Petala* 5, cylcis lacinia multo longiora, obovata, basi in unguem sensim attenuata, dorso venosa. *Stamina* 5, exserta, petalii parum breviora. *Filamenta* subulata. *Anthera* majuscule, ovata, pallide flavæ, loculis subappositæ. *Style* parvus, e centro disci pateriformis, in fundo calycis siti, margine elevate crispato.

HAB. Common on the outskirts of woods, in dry soils of North-West America. Plentiful at Fort-Vancouver. *Douglas.*—Although nearly allied, as this assuredly is, to the two preceding species, I nevertheless venture to consider it distinct. Its general habit is very different, having erect straight stems, and numerous small leafy branches. The leaflets, besides that they are deeply lobed, with acute sinuses, are truly ovate, very obtuse, and greatly smaller than in any state of *R. Toxicodendron*, or *R. radicans* which I have seen: the panicles, too, are exceedingly numerous, and large in proportion to the size of the leaf.

TAB. XLVI. *Fig. 1.* Outside view of a male flower; *fig. 2.* View of the upper side of a male flower; *fig. 3.* Stamen; *fig. 4.* Petal; *fig. 5.* Disk from the bottom of the calyx, and style from the male flower:—magnified.

SECT. II. LOBADIUM. Raf.

7. *R. aromatica*; foliis trifoliolatis, foliolis sessilibus inciso-crenatis subtus pubescensibus, intermedio rhomboeo, lateralibus ovato-rhombeis, floribus in amentis compactis dispositis.—*Ait. Hort. Kew. ed. 1. v. 1. p. 367. Mich. Am. v. 1. p. 184. Pursh, Fl. Am. v. 1. p. 205. Elliott, Carol. v. 1. p. 364. Turpin, in Ann. du Mus. v. 5. p. 445. t. 30. Torrey, Fl. of Un. St. v. 1. p. 324.*

HAB. Canada. "La Grande Chaudière." *Pursh*, *MSS.* Thence, as far north as the Saskatchewan. Dr. Richardson.—Mr. Pursh says the *R. suaveolens*, Ait., is only the male of this species. The inflorescence is widely different from that of any other of the genus.

5. TRIFOLIUM. Linn.

Cal. tubulosus persistens eglandulosus 5-fidus, laciniis subulatis. *Carina* alis et vexillo brevior. *Stamina* diadelpha. *Legumen* parvum vix dehiscens saepius ovatum 1-2-spermum calyce brevius et ab eo tectum, rarius oblongum 3-4-spermum calycem paululum superans.—Herbeæ. *Stipula petiolo adnatae.* Folia palmatim tri-aut rarissime 5-foliolata. Flores capitati aut dense spicati, bracteacti, purpurei, albi aut ochroleuci. Petala in quibuedam omnia inter se basi coalita. DC.

SECT. I. LAGOPUS. Ser.

1. *T. altissimum*; glaberrimum, caule erecto elato, foliolis linear-lanceolatis denticulatis petiolo longissimo, supremis subsessilibus, stipulis lanceolato-acuminatis petiolo utrinque adnatis, capitulo oblongo, calycibus glaberrimis, dentibus 4 superioribus tortuosis. (TAB. XLVIII.)—*Douglas, MSS. in Herb. Hort. Soc.*

Caulis erectus, strictus, 2-3-pedalis, herbaceus, striatus, glaber, superne parce ramosus. *Folia* trifoliolata, glabra, *caulina radicalia*que longissime petiolata; *suprema* subsessilia, *omnia* linear-lanceolata, apiculata, subtilissime oblique striata, minute denticulata, pallid viridia, rigida. *Stipulae* magnæ, foliacæ, striatae, longissimæ, linear-lanceolatae, acuminatae, apice integre vel denticulatae, petiolo utrinque per totam fere longitudinem adnatae, cauli appressæ, margine anteriore liberae. *Pedunculi* subterminales, digitæ et ultra longi, glabri. *Capitula* ovalia, multiflora, bracteata. *Flores* majusculi, rubri, inferiores reflexi. *Calycæ* dense dispositi glaberrimi, striati, membranacei. *Tubus* campanulatus, subinflatus, dentibus 4 superioribus æquilibus tubi longitudine, insigniter circa tubum corollæ (utrinque duobus) subspiraliter incurvis et quasi tortuosis, dente inferiore reliquis longiore tubum corollæ aequante, recto. *Corolla* calyce duplo longior; petalis staminibusque in tubum simplicem basi inflatum unitis. *Germen* ovatum, compressum, leviter marginatum, glabrum, monospermum. *Style* longus, filiformis, glaber. *Stigma* obtusum.

HAB. Abundant in North-West America, between the *Spokane River* and *Kettle Falls* of the Columbia. FL. June—August. *Douglas.*—The somewhat spiked heads of flowers, and the great affinity in habit of this plant with the following, have induced me to place it in the family of "Lagopus," although it departs from it in the entirely glabrous calyces. The structure of this calyx is very remarkable: the lower tooth or segment alone is straight, the four upper ones, two on each side the corolla, bend downwards and inwards in a sort of spiral manner, so as to surround the tube of the latter, their points meeting on the opposite side. At first, these teeth appear to be unnaturally twisted and distorted; but when they are examined with care, the mode and direction of the curvature are found to be invariably the same.

TAB. XLVIII. *Fig. 1,* Flower; *fig. 2,* Calyx laid open, and seen from within; *fig. 3,* Front view of the Corolla; *fig. 4,* Pistil:—magnified.

2. *T. plumosum*; sericeo-pubescent, caule elato erecto, foliolis linear-lanceolatis

acuminatis denticulatis petiolo longissimo supremis sessilibus, stipulis lineari-lanceolatis acuminatis petiolo adnatis, capitulis conico-oblongis, calycibus hirsutissimis, dentibus linearibus rectis tubo corollæ longioribus sericeo-plumosis, germine 4-ovulato. (TAB. XLIX.)—*Douglas, MSS. in Herb. Hort. Soc.*

Caulis erectus, strictus, herbaceus, striatus, sesquipedalis ad bipedalem altus, superne subramosus, subsericeo-hirsutus, pili erectis, parce foliosus. *Folia* caulinis longissime pedunculata, *suprema* sessilia, trifoliolata, foliolis linearis-lanceolatis, acuminatis, subrigidis, appresso-sericeis, denticulatis, minute oblique striatis, acutissimis, subpungentibus. *Petioli* 6-8-pollicares. *Stipula* magna, petiolo utrinque adnata, margine anteriore liberae, foliacae, linearis-lanceolatae, acuminatae, subdenticulatae; *superiores* latiores, breviores, *inferiores* angustiores, nonnunquam 3 uncias longe, magis acuminatae. *Pedunculi* terminalis, dense sericei. *Capitula* 3-pollicaria, compacta, conico-oblonga, multiflora, ebracteata. *Flores* albi, primmum erecti, dein, inferiores preceps, subpatentes, semper arcto dispositi. *Calyx* dense sericeo-hirsutus. *Tubus* campanulatus. *Dentes* linearis, elongati, tubo longiores; 2 superiores subbreviores, omnes recti, pulcherrime sericeo-plumosi. *Vexillum* superne latum, acutum. *Petala* filamentaque in tubum subaequale unita. *Pistillum*: *Germen* ovatum, 4-ovulatum. *Style* filiformis alarum longitudine.

HAB. Blue Mountains in North-West America, in alluvial soils. FL June, July. *Douglas*.—In height, and foliage, and general habit, similar to the preceding, but everywhere clothed with silky hairs, which are most abundant on the upper leaves, peduncles, and especially on the calyces. Both ought to rank near to *T. rubens* and *angustifolium* of the continent of Europe, from which they are distinguished by the characters above given.

TAB. XLIX. *Fig. 1*, Flower; *fig. 2*, Corolla; *fig. 3*, Pistil:—*magnified*.

3. *T. arvense*; annum, caule erecto valde ramoso, foliolis spatulato-lanceolatis obtusis, stipulis ovatis longe acuminatis pilosis, capitulis cylindraceis villosissimis, calycis dentibus setaceis persistentibus corolla longioribus demum patentibus.—*Linn. Sp. Pl. p. 1083. Engl. Bot. t. 944. Mich. Am. v. 2. p. 59. Elliott, Carol. v. 2. p. 203. Pursh, Fl. Am. v. 2. p. 478. De Cand. Prodr. v. 2. p. 190. Bigel. Fl. Bost. ed. 2. p. 270.*

HAB. Canada. *Pursh*; *Mrs. Percival*; *Mrs. Sheppard*.

SECT. II. EUTRIPHYLLUM. Ser.

4. *T. pratense*; caulinibus adscendentibus, foliolis ovalibus obcordatisve, stipulis ovatis membranaceis nervosis seta terminatis, capitulis ovatis densis subsessilibus, dentibus calycinis setaceis, inferiore reliquis longiore corollæ tubo dimidio breviore.—*Linn. Sp. Pl. p. 1082. Pursh, Fl. Am. v. 2. p. 478. Engl. Bot. t. 1770. Elliott, Carol. v. 2. p. 202. Bigel. Fl. Bost. ed. 2. p. 271.*

HAB. Canada. *Pursh*; *Mr. Cleghorn*. Lake Huron, *Dr. Todd*; and as far north as the Saskatchewan. *Dr. Richardson*; *Drummond*. North-West America, on the Columbia. *Dr. Scouler*; *Douglas*.

5. *T. Pensylvanicum*; caule ramosissimo flexuoso, foliolis ovato-ellipticis obtusis integerrimis, stipulis aristatis, capitulis ovato-cylindraceis solitariis densis, calycis lacinia infima petalis breviore. DC.—*Willd. Enum. p. 793. Pursh, Fl. Am. v. 2. p. 478. De Cand. Prodr. v. 2. p. 196.*

HAB. Plentiful in dry fertile soils, about Sandwich and Amherstberg, Upper Canada. *Douglas*.—With this plant I am unacquainted. *Pursh* and *De Candolle* both observe that it is very nearly allied to *T. pratense*. It is known in America by the name of *Buffalo Clover*.

SECT. III. TRIFOLIASTRUM. Ser.

6. *T. repens*; caule repente radicante, foliolis obcordatis serrulatis, capitulis axillaribus globosis, floribus subumbellatis post florescentiam deflexis, dentibus calycinis inæqualibus corolla brevioribus, leguminibus tetraspermis.—*Linn. Sp. Pl. p. 1080. Engl. Bot. t. 1769. Mich. Am. v. 2. p. 59. Pursh, Fl. Am. v. 2. p. 477. Elliott, Carol. v. 2. p. 201. Bigel. Fl. Boot. ed. 2. p. 271.*

HAB. Canada, *Lady Dalhousie*; *Mrs. Sheppard*; and from Lake Huron, (*Dr. Todd*), to the Saskatchewan, in lat. 54°. *Dr. Richardson*; *Drummond*.—Abundant in the grassy vallies of the Rocky Mountains and Blue Mountains, on the West side of North America. *Douglas*.—Pursh says it makes its appearance wherever the lands are cleared of timber.

SECT. IV. LUPINASTER. Ser.

7. *T. megacephalum*; adscendens, hirsutum, foliolis 5-7 oblongo-cuneatis mucronatis spinuloso-denticulatis, stipulis magnis ovatis spinuloso-serratis, capitulo (maximo) ovato-globoso, calycis tubo brevissimo, dentibus subulatis longissimis vexillo amplissimo circumvoluto brevioribus, legumine stipitato.—*Nutt. Gen. v. 2. p. 105. De Cand. Prodr. v. 2. p. 204.*—*Lupinaster macrocephalum. Pursh, Fl. Am. v. 2. p. 479. t. 23.*

Caulis decumbentes, fere pedales, vix ramosi, patentem hirsuti. *Folia* longe petiolata, foliolis 5-7 oblongo-vel obovato-cuneatis, basi attenuatis, mucronatis, margine spinuloso-denticulatis, pilis longiusculis magis minusve vestitis, adultis glabris, omnibus subrigidis, oblique pulcherrime venosis. *Stipula* unciam sequiunciam longe, foliacess, striatae, ovatae seu ovato-lanceolatae, versus apicem nonnunquam laciniate, margine spinuloso-serratae. *Capitulum* terminalis, maximum, ovato-globosum, multiflorum, involucro nullo. *Flores* duas fere uncias longi. *Calyx*; tubo piloso, brevissimo, campanulato, dentibus, seu laciinis, setaceis, longissimis, sericeo-plumosis, corolla brevioribus. *Vexillum* amplissimum, ovatum, acuminatum, obtusum, subfusidum, basi latissimo minime unguiculato carinatum alasque omnino obvolvens, liberum. *Ale* carinaque sublineares, subequalis, inferne una cum filamentis 9, in unum corpus coalescunt: *Filamentum* superius liberum. *Anthera* oblonga, flavae. *Pistillum* oblongum, valde compressum, dorso superne hirsutissimum, inferne in stipite attenuatum, dispermum. *Style* filiformis.

HAB. Common on moist elevated grounds, near the sources of the Columbia, and upon the Blue Mountains, North-West America. *Douglas*.—This is a truly magnificent species, no less remarkable for its numerous leaflets than for its great head of very large flowers, and above all, the broad lower half of the *vexillum*, which quite envelops the rest of the floral coverings.

SECT. V. INVOLUCRARUM.

8. *T. microcephalum*; adscendens, ramosum, foliolis obcordatis denticulatis integris emarginatisque, stipulis ovatis acuminatis ciliato-laciniatis, capitulis (parvis) subrotundis, involucro monophyllo multifido, segmentis æqualibus integris, dentibus calycinis 5 æqualibus rectis et lata basi subulatis longitudine corollæ.— α . *hirsutum*; ubique hirsutum. *Pursh, Fl. Am. v. 2. p. 478. De Cand. Prodr. v. 2. p. 207.— β *glabrum*; ubique pilis destitutum.*

HAB. α . First discovered by *Mr. Menzies* in California; then found by *M. Lewis* on the banks of Clark's River, (*Pursh*). About Fort-Vancouver. *Dr. Scouler*.— β . In the same situation as the last, and in the interior of North-West America, near springs. *Douglas*.—This, and the remaining species of the present group, are remarkable for the curious monophylous *involute* with which the heads of flowers are surrounded at the base. There are other *Trifolii* with the same character; and all are, I believe, inhabitants of the New World, and confined to the Pacific side of the great chain of mountains. The present is the least of the kind, having very small heads, and an *involute* cut nearly half-way down into about nine equal, entire, much acuminate, and pungent segments.

9. *T. fimbriatum*; prostratum, glabrum, foliolis oblongis subcuneatis spinulosodenticulatis, stipulis ovato-acuminatis laciniato-spinulosis, involucro monophyllo laciniato-multifido capitulis subglobosis breviore, dentibus calycinis lato-subulatis rectis corolla subdimidio brevioribus.—*Lindl. in Bot. Reg. t. 1070.*

HAB. First detected by Mr. Menzies in California, (in *Herb. nostr.*) Common in the salt-marshes of the North-West coast of America, from Cape Orford to Puget Sound. *Douglas*; *Dr. Scouler*.—Flowers purple, the *verillum* paler than the rest of the corolla.

10. *T. spinulosum*; prostratum, glabrum, foliolis oblongis utrinque acutis spinulosodenticulatis spinulaque rigida terminatis, stipulis ovato-acuminatis spinuloso-serratis, involucro monophyllo laciniato-multifido capitulis subglobosis breviore, dentibus calycinis angusto-subulatis pungentibus rectis corolla paulo brevioribus.—*Douglas*, MSS. in *Herb. Hort. Soc.*

HAB. Very common near springs, in the vallies between *Spokane* and *Kettle Falls*, North-West America. *Douglas*.—This is, as Mr. Douglas observes, "allied to *T. fimbriatum*, but sufficiently distinct. The *verillum* and *ala* are shorter and more acute; the *flowers* smaller, white; the *carina* and *ala* tipped with a fine purple, and the whole plant more slender. It is abundant in the fertile alluvial soils of the mountain-vallies, forming a dense, short sward. It might prove, perhaps, very useful as a *clover*, the herbage being extremely nutritive, and preferred to every thing else by deer and horses."

11. *T. involucratum*; glabrum, suberectum, vix ramosum, foliolis linear-lanceolatis mucronatis spinuloso-denticulatis, stipulis lanceolatis acuminatissimis spinuloso-serratis, involucro monophyllo laciniato-multifido capitulis subhemisphaericis laxifloris breviore, calycibus tubulosis, dentibus brevibus rectis lanceolatis cuspidato-pungentibus corolla paulo brevioribus nunc utrinque basi unidentatis.—*Willd. Sp. Pl. p. 1372.* (non *Kunth*) *Smith*, in *Rees' Cycl. n. 28*.—*T. Willdenovii*. *Spr.*—*T. tridentatum*. *Lindl. in Bot. Mag. sub t. 1070.*

HAB. Specimens in my Herbarium, gathered by Mr. Menzies, are marked "California." Abundant in North-West America, from the mouth of the Columbia to its source in the Rocky Mountains, on dry gravelly soils.—This is unquestionably the *T. involucratum* of Smith, and, as far as can be judged from the description, of Willdenow also; but the species so named by Kunth is widely different, having much larger *corollas*, long setaceous teeth to the *calyx*, and being, as that author remarks, allied in habit to *T. alpinum*. In many specimens that I have examined, both from Mr. Menzies and Mr. Douglas, (those from the latter both wild and cultivated,) I find the teeth of the calyx generally simple; sometimes some of the teeth, rarely all, have a smaller tooth on each side at the base, hence becoming tridentate. Our plant is very erect and slender in its mode of growth, and remarkable for the great length of the tube of the calyx in proportion to its teeth. The *legume* is oblong, two-seeded, and bursts spontaneously and for its whole length, even while yet surrounded by the floral coverings.

12. *T. cyathiferum*; prostratum, ramosum, glabrum, foliolis oblongis obovato-cuneatis mucronatis spinuloso-dentatis, involucro (magnō) monophyllo cyathiformi breviter multifido dentato inter venas transversim rugoso capitulis hemisphaericis multifloris sub-breviore, calycibus oblongis subinflatis membranaceis dentibus setaceis tri-multipartitis corollam æquantibus. (*TAB. L.*)—*Lindl. in Bot. Reg. sub t. 1070.*

Radix parva, annua, subfusiformis, fibrosa. Caules prostrati, glabri, ramosi, pedales ad sesquipedalem. Folia sublonge petiolata, trifoliolata, glabra, foliolis nunc oblongis basi subattenuatis, nunc obovato-cuneatis

vel fere obovata, mucronatis, spinuloso-denticulatis. *Stipulae* ovatae, acuminatae, reticulatae, basi membranaceæ, albide, margine spinuloso-laciniate. *Pedunculi* laterales, terminalesque digitem longi. *Involucrum* magnum, cyathiforme seu hemisphericum, membranaceum, venosum, intra venas transversim rugosum, pallide viride, basi albida, margine multifido, segmentis brevibus latis subtriangularibus inaequaliter denticulatis. *Capitula* hemisphericæ, compacta, multiflora, vix involucro longiora. *Calyx* oblongus, membranaceus, scariosus, albus, minutissime reticulatus atque venosus, subinflatus, dentibus corollam squantibus, setaceis, 2 superioribus brevioribus, 2-3-partitis, 2 lateralibus 3-partitis, inferiore rölikis longiore 3-partito, lacinias trifidæ, segmentis omnibus magis minusvo patentibus. *Corolla* pallide rosea. *Vexillum* oblongum basi latum, vix unguiculatum, rectum, liberum. *Alæ* vexillo vix breviores; *Carina* staminaque in unum corpus coita. *Germen* oblongum: *Style* filiformis. *Legumen* ovali-oblongum, compressum, dehiscent, dispermum. *Semina* subrotunda, compresa, levia.

Hab. Moist valleys in the interior of North-West America, bordering upon the Columbia. *Douglas*.—This is one of the most curious and elegant of the genus. The *involucrum*, in size, colour, and texture, resembles that of *Astrantia*, but is formed of one entire piece or cup, in which the flowers are almost wholly imbedded. The *corolla* is very short, and the *vexillum* quite free from adherence with the other petals.

TAB. L. .Fig. 1, Back view of a flower; fig. 2, Front view of do.; fig. 3, Calyx laid open; fig. 4, Legumen; fig. 5, Seed:—magnified.

6. HOSACKIA. Benth.

Cal. campanulatus, 5-fidus. *Alæ* vexillum subæquantes patentes. *Carina* rostrata. *Style* filiformis. *Stigma* capitatum. *Legumen* cylindraceum, v. subcompressum, rectum, levæ.—Herbæ, foliis impari-pinnatis (rarius simplicibus, H.), foliolis sèpius alternis, stipulis membranaceis minutis aut obsoletis. *Benth.*

1. *H. bicolor*; glabra, decumbens, foliolis suboppositis 7-9 oblongis obovatissive, stipulis cordato-ovatis membranaceis obtusissimis, floribus umbellatis, bracten monophylla vel nulla. *Douglas*, MSS.—*Benth.* in *Bot. Reg.* t. 1257.—*Lotus pinnatus*. *Hook.* in *Bot. Mag.* t. 2913.

Hab. Frequent in low alluvial soils between Fort-Vancouver and the Grand Rapids on the Columbia, and also near the base of Mount St. Helen, in similar situations. *Douglas*.—Neither my dried specimens, nor the recent cultivated ones, which I have examined, exhibit such remarkably patent *alæ* as are figured on this plant in the *Botanical Register*, perhaps because they were not fully expanded. I willingly, however, follow my valued friend, Mr. Bentham, in considering the genus to be distinct from *Lotus*. But if I am correct in referring my fourth species to it, the leaflets are sometimes reduced to a single one; while in the *H. Purshiana*, *Benth.* (*Lotus sericeus*, *Pursh*; *Trigonella Americana*, *Nutt.*) according to my authentic specimens from Mr. Nuttall, there are constantly three leaflets to each leaf, as in *Lotus* there are spurious spongy dissepiments between the seeds. The flowers are yellow, except the *alæ* which are white and waved.

2. *H. decumbens*; pubescenti-hirsuta, decumbens, foliolis alternis 4-5 ovali-subcuncatis acutis, stipulis minutissimis acutis deciduis, floribus umbellatis, bractea 1-3-foliolata.—*Benth.* in *Bot. Reg.* sub t. 1257.—*Lotus incanus*. *Douglas*, MSS.

Hab. Plentiful on gravelly soils near the mouth of the Columbia, at Fort-Vancouver. *Douglas*; *Scouler*; and on the banks of the Multnomah. *Douglas*.—This throws out numerous stems from the root, which are one and a half to two feet long, bearing many umbels of flowers, which are wholly yellow. The *alæ* are even, and narrower than in the preceding species.

3. *H. parviflora*; erecta, glabra, basi præcipue ramosa, foliolis alternis 4-6 oblongo-

obovatis subtus glaucis, stipulis obsoletis deciduis, pedunculis 1-floris, bractea sub flore siccissime 3-foliolata.—*Benth. in Bot. Reg. sub t. 1257.*

Radix annua, parva. Caudex spathamel, erecti. Stipula cito decidue. Pedunculi 2 lineas longi, solitarii, superne unibracteati, uniflori, bracteis plerumque 2-3-foliolatis, flore minute flavo. Alae vix divergentes. Stigma capitatum. Fructum non vidi.

HAB. California. *Menzies.*, (in *Herb. nostr.*) commua on soils where wood has been destroyed by fire, on the shores of the Columbia. *Douglas.*

4. *H. unifoliolata*; decumbens, hirsuta, valde divaricato-ramosa, foliis unifoliolatis rarissime 2-3-foliolatis subsessilibus, foliolis ovalibus basi apiceque acutis, stipulis obsoletis; pedunculo unifloro, bractea sub flore ovata monophylla.

Radix annua, inferne fibrosa. Caudex decumbentes, valde ramosi, subhiruti, ramis divaricatis, flexuosis. Folia fere omnino sessilia, unifoliolata, petiolo articulata, rarissime 2-3-foliolata, foliolis semiunciam longis, ovalibus, subobliquis, basi apiceque acutis, pilosa. Stipula minutissima, acute, cito decidue. Pedunculi breves, 2-3 lineas longi, hirsuti, axillares, solitarii, uniflori, sub calyce bractea ovata (folio similima sed minore) suffulti. Flora minutus, cornu. Calyx hirsutus, tubo obconico, dentibus subulatis corolla vix brevioribus. Corolla flava. Vexillum obovatum. Alae oblongæ, rectæ, subundulatae. Stamina diadelpha, 9-1. Germen lineare, glabrum: Stylus germino brevior, sursum curvatus: Stigma capitatum. Legumen lineari-cylindracea, basi calyce cincta, unciam longa, basi styli terminata, fusca, sub lente pallide punctata, margine superiore præcipue incrassata, unilocularia, loculo isthmis transversalibus spongiosis completis interrupta. Semina 5-6, reniformia, levia, fusca.

HAB. Shores of the Columbia. *Dr. Scouler.*—In size and shape of the *leaflets*, and in hairiness, this species approaches to the *H. decumbens* of Mr. Bentham; in its *flowers*, to *H. parviflora*; and, in the *bracteas*, *calyx*, and *seed-vessel*, to *H. Purshiana*, Benth.; in its almost universally solitary *leaflets*, and in its much branched and divaricated *stems*, it is very unlike any other.

9. PSORALEA. Linn.

Sep. 5, ad medium concreta in calycem 5-sidum persistentem, tubo sepius glandulososo, lobis acuminitis infimo paulo productiore. Stam. 10, sepius diadelpha, decimo interdum basi cum cæteris connexo. Legumen calycis longitudine, evale, 1-spermum, interdum in rostrum desinens.—Frutices aut Herbæ tuberculis glandulosis sepius verrucosa. Folia varia, stipulis petiolo basi adnatis. Flores dispositione variis, cærulei albidi-purpurascens. DC.

1. *P. lanceolata*; subglabra, ramis erectis, foliis 3-foliolatis, foliolis sessilibus linearilanceolatis superne latioribus mucronatis, racemis axillaribus capitatis, pedunculis folio plerumque brevioribus, stipulis linearibus, bracteis ovato-lanceolatis pedicello longioribus, calycis dentibus subæqualibus brevibus acutis, leguminibus globosis hirsutis. (TAB. LI.)—*Pursh, Fl. Am. v. 2, p. 475.*—P. elliptica. *Pursh, Fl. Am. v. 2. Suppl. p. 741,* (fide Nutt.)—P. arcuaria. *Nutt. Gen. v. 2, p. 103. De Cand. Prodr. v. 2, p. 219.*

Radix perennis, subfusiformis, descendens. Caudex herbacei, glabri, superne appressim paululum hirsuti, striati, glandulosi, basi decumbentes dein erecti, subvirgati, pedales et ultra, ramosi; rami alterni, erecti. Folia petiolata, 3-foliolata; foliolis glabris rarius subpilosis, linearilanceolatis superne dilatatis, mucronatis, integerrimis, nunc obovato-cuneatis basi attenuatis, subcarnosis, aenisis, omnibus sessilibus sesquiumcians ad duas uncias longis, utrinque glandulis fuscis obsitis. Petioli foliis longitudine. Stipulae lineares, libere, non cum petiolo adnatae. Pedunculi axillares, solitarii, petioli longiores, folio plerumque breviores. Racemus brevis, capitatus, 8-10-florus. Bracteæ ovato-lanceolatae, glandulosæ, pedicello longiores, post florescentiam

deciduum. *Calyx* brevi-campanulatus, appresso pilosus, glandulosus, dentibus brevibus subequalibus acutis ciliatis. *Flores* parvi, (corulei, Ph.) *Vexillum* subrotundum, unguiculatum. *Carina* obtusa, cum *ala* oblonga obtusis coadunata. *Stamina* diadelpha, 9-1. *Legumen* globosum, magnitudine seminis *Pisi sativi*, glandulosum, pilis albidis appressis brevibus tectum, stylo subulato terminalatum. *Semen* subrotundatum, solitarium, compressum, luteo, fuscum.

HAB. This, which was first discovered by *Lewis* on the banks of the Missouri, is found by *Mr. Douglas* inhabiting dry, parched, and sandy soils, from the mouth of the Columbia to its source: and by *Mr. Drummond* on the east side of the Rocky Mountains, on the Saskatchewan, from Carlton-House to Edmonton-House.—I have followed Mr. Nuttall in considering the *P. elliptica* of Pursh the same as the *P. lanceolata*; but I see no reason why one of these two original names should not be retained.

TAB. LI. *Fig. 1*, Flower; *fig. 2*, Vexillum; *fig. 3*, Ala and carina combined; *fig. 4*, Stamens, including the Pistil; *fig. 5*, Legumen; *fig. 6*, Seed:—natural size. *Fig. 7*, Legume; *fig. 8*, Seed:—all but *figs. 5* and *6*, magnified.

2. *P. physodes*; glabriuscula, foliis pinnatim 3-rarliis 5-foliolatis, foliolis lato-rhomboeovatis acutis mucronatis obscure glandulosis terminali longe petiolato, racemis pedunculatis laxis axillaribus folio longioribus, calycibus valde inflatis hirsutis corolla vix brevioribus, dentibus subequalibus.—*Douglas*, MSS. in *Herb. Hort. Soc.*

HAB. Banks of streams, in open, sandy and gravelly soils, from the Great Falls of the Columbia to the Rocky Mountains. *Douglas*.—This species is well distinguished by its large leaflets and their form, together with the large inflated calyxes, which almost conceal the flowers, and wholly so the elliptical, compressed, scarcely glandular, slightly hairy, 1-seeded legumes.

3. *P. argophylla*; pulcherrime argenteo-sericea, erecta, ramis divaricatis, foliis palmatis-3-5-foliolatis, foliolis elliptico-lanceolatis, spicis pedunculatis folio longioribus interruptis bracteatis, bracteis subbifloris, calycis dente inferiore longissimo. (TAB. LII.)—*Pursh*, *Fl. Am. v. 2.* p. 475.—*P. incana*. *Nutt.* in *Fraser's Cat.* 1813. *Gen. v. 2.* p. 102.

Tota planta, sed præcipue folia juniora, ramuli calyxes bracteisque pilis mollibus appressis pulcherrime argenteo-sericea. *Caules* erecti, ramosi, striati, ramis patentibus. *Folia* 3-sen 5-foliolata, foliolis digitatis, elliptico-lanceolatis, acutis, breve petiolatis, 2-3 uncias longis. *Petiolus* folio brevior. *Stipulae* linearis, libere, semilanciam vel unciam fore longe. *Pedunculi* axillares, folio duplo longiores. *Flores* (purpurei, Ph.; azurei, Nutt.), interrupte et verticillatim spicati, verticillis bracteatis. *Bracteæ* subbiflora, calycis longitudine, lanceolatae. *Calyx* denissimè sericeo-villoso. *Tubus* brevis: *dentes* subulati, 4 superiores subæquals; inferiore elongato petalis longiore. *Vexillum* ovatum, unguiculatum, ad basin lamine bicallosum. *Ala* oblonga, unguiculata, cum carina obtusa unite. *Fructus* mibi ignotus.

HAB. Dry soils on the banks of the Red River, in lat. 50°, (*Douglas*), to the Saskatchewan in lat. 54°, from Carlton-House to Edmonton-House. *Drummond*; *Douglas*.—Few plants can exceed this in beauty; even in the dry state, its silvery hue is quite remarkable, and the flowers are either bright azure-blue, according to Nuttall, or purple, according to Pursh. The former author observes that the stems are rarely branched: such is not the case with our specimens.

TAB. LII. *Fig. 1*, Portion of a spike; *fig. 2*, Flower; *fig. 3*, Vexillum; *fig. 4*, Ala and carina:—more or less magnified.

4. *P. macrostachya*; foliis pinnatim-3-foliolatis pubescensibus, foliolis ovatis mucronatis, petiolis glandulosco-scabris, pedunculis axillaribus folio quadruplo longioribus, spicis cylindraceis rachi bracteis calycibusque hirsutissimis.—*De Cand. Prodr. v. 2.* p. 220.

HAB. Nootka. (*Lagasca* in *De Cand.*)—“*Bracteæ* acuminatae calycis longitudine. *Spica* subramosa.” *D.C.*

5. *P. brachiatæ*; caule erecto flexuoso subramoso patenti-vilosissimo, foliis palmatim 5-foliolatis appresso-hirsutis, foliolis ellipticis, pedunculis axillaribus elongatis folio longioribus, racemis oblongis spicatis laxiusculis, bracteis dentibusque calycis foliacels lanceolatis, floribus erectis. (TAB. LIII.)—*Douglas*, MSS. in *Herb. Hort. Soc.*

Radix fusiformis, crassa, 4–10 uncias longa. *Caulis* pedalis ad sesquipedalem, herbaceus, erectus, flexuoso, parce ramosus ramis patentibus, striatus, crassus, ubique pilla longis patentibus albis valde villosus, *Folia* patentia, palmatim 5-foliolata, longe petiolata, appresso villosa, pilla albida subsericea; foliolis 3 fere tris uncias longis, ellipticis, acutis, basi attenuatis, nonnunquam obovato-cuneatis. *Petiolæ* digitalis et ultra, patenti-villosa. *Pedunculus* axillaris, solitarius, folio longior, patent-pilosus. *Racemus* apicam elongatam bracteosam efformans, 3–4 uncias longus, sequiunciam latu, albidio-vilosus. *Bractæ* forem subsequentes, lanceolatae, foliacæ, virides, superiores subcrenulantes. *Calyx* fere unciam longus, pilla longis albis hirsutus. *Tubus* breviusculus, subcampanulatus, membranaceus, inclusus foliacels 4 superioribus linearilanceolata corolla paulo brevioribus, inferiore majore lanceolata corollam subsequante. *Corolla*: *Vexillum* ovale, album, inferne in unguem attenuatum, ad basin lamina utrinque subcallosum. *Carina* curvula cum ali unita. *Stamina* diadelpha, 1, 0, tube ad apicem in dentibus latè aetheriferis alternis longioribus fiso. *Germen* oblongum, glabrum. *Stylus* longus, subulatus, inferne hirsutissimus, apice sursum curvatus. *Stigma* capitatum.

HAB. Plains of the Saskatchewan from Carlton-House to Edmonton-House. *Drummond*; *Douglas*.—This, Mr. Douglas observes, is the *Nuet de Prairie* of the Canadian "Voyageurs": and, I must confess, that had I been left to judge of the species solely from the figure and description of Pursh, I should have had no hesitation in considering it as *Psoralea esculenta*: but Mr. Douglas, who has compared the plant with Lewis and Clarke's original specimens of *P. esculenta*, in Mr. Lambert's Herbarium, pronounces it to be quite distinct; although the chief differences he mentions are the more slender habit, and longer and laxer spikes of our plant. Again, he observes that the *P. esculenta* of Nuttall, of which an original specimen is likewise in the Lambertian Herbarium, is distinct from both; and, indeed, Mr. Nuttall describes it as nearly stemless. The roots, though stringy, dry, and tough, and containing but little farinaceous matter, are gathered and eaten by the Cree Indians raw, or sometimes roasted.

TAB. LIII. *Psoralea brachiatæ*. *Fig. 1*, Back view of a flower; *Fig. 2*, Front view of do.; *Fig. 3*, The vexillum; *Fig. 4*, Portion of the stamens, and style with the stigma; *Fig. 5*, Pistil:—*magnified*.

8. PETALOSTEMUM. Mich.

Cal. 5-filis, aut 5-dentatus. Pet. 5, unguiculata, inter se subsimilia. Stam. 5 interjecta et cum iis in tubum concreta; vexillum conduplicatum liberum. Legumen culyce tectum 1-spermum indehiscentes.—Herbie perennes Boreali-Americanæ, glandulosopunctate. Folia impari-pinnata. Flores dense spicati, spicis pedunculatis. Pedunculi oppositifolii, terminales, ramo abortivo facti. DC.

1. *P. candidum*; spica cylindrica, bracteis calyce glabro longioribus, foliolis 3-jugis linearis-oblongis glabris.—*Mich. Am. v. 2. p. 49. t. 37. f. 1. Pursh, Fl. Am. v. 2. p. 461. De Cand. Prodr. v. 2. p. 243.*—Dalea candida. *Willd.*—*Psoralea candida. Poir.*

HAB. Banks of the Saskatchewan, and upon the Red-Deer and Eagle Hills of that river. *Drummond*; *Douglas*. On the Red River. *Douglas*.—Petals white. This, and the following, and probably all the species of the genus, have glandular dots on their leaves, as in *Psoralea*.

2. *P. violacea*; spica oblongo-cylindracea, bracteis calyce sericeo-pubescente longioribus, foliolis bijugis anguste linearibus subhirsutis.—*Mich. Am. v. 2. p. 50. t. 37. f. 2.*

Pursh, Fl. Am. v. 2. p. 461. Bot. Mag. t. 1707.—*Dalea violacea. Willd.*—*D. purpurea. Vent. Cels. t. 40.*—*Psoralea violacea. Poir.*

HAB. In the same situations as the preceding species. *Douglas; Drummond.*—*Petals purple.*

3. *P. ornatum*; spica oblongo-cylindracea, bracteis calyce villosissimo longioribus, foliolis 2-3-jugis elliptico-oblongis glabris.—*Douglas, MSS. in Herb. Hort. Soc.*

Radix perennis. Caulis pedalis, glaber, striatus, valde ramosus. Folia pinnata; foliolis uncialibus oblongo-ellipticis obtusis vel retusis, basi nuno subcuneatis, subtus pallidis glanduloso-punctatis, supra, siccitate, pulcherrime seruginosia. Spica solitaria, terminalis, pedunculata, oblongo-cylindracea, crassa, multiflora. Bractea valde hirsuta, subulate, calycibus hirsutissimis longiores. Petala violacea.

HAB. Frequent in the arid Prairies near the Blue Mountains of Lewis River, North-West America. *Douglas.*—This is perhaps the most beautiful species of the genus, and well deserving of the name which Mr. Douglas has given to it. The spikes are large, densely clothed with spreading silky hairs, among which the rose-coloured petals appear. The leaves are perhaps more remarkable in their dry than in their fresh state; for in the Herbarium, the upper-side becomes of a rich verdigris-green. The same change of colour takes place, though in a very inferior degree, in some of the specimens of *P. candidum* in my collection.

9. GLYCYRHIZA. Linn.

Cal. nudus, tubulosus, 5-fidus, lobati, lobis nempe 2 superioribus ultra alios concretis. Cor. vexillum, ovato-lanceolatum, rectum carina biceps aut dipetala recta acuta. Stam. diadelpha. Stylus filiformis. Legumen ovatum aut oblongum, compressum, 1-loculare 1-4-spermum.—Herbae perennes. Radices dulcissima. Folia impari-pinnata. Racemi axillares. Flores carulei violacei aut albi. DC.

1. *G. lepidota*; foliolis oblongo-lanceolatis mucronatis subtus vix strigosis glandulosobublepidotis, racemis spicatis oblongis laxis pedunculatis folio brevioribus, leguminibus oblongis 2-4-seu 6-spermis setis uncinatis echinatis.—*Nutt. in Fraser's Cat. Pursh, Fl. Am. v. 2. p. 480. Nutt. Gen. v. 2. p. 106. Bot. Mag. t. 2150.*

HAB. Banks of the Saskatchewan. *Drummond.*—“This,” Mr. Douglas observes, “has perhaps a greater range than almost any other plant in North America. It is common in the western territories of the United States, (where, on the banks of the Missouri, at St. Louis, it was first discovered by Bradbury,) throughout the temperate parts of the British Possessions, (as about Hudson’s Bay, the Red, Saskatchewan, Assinaboin, and Athabasca Rivers,) and upon all the intervening plains; and is equally abundant on the west side of the Rocky Mountains, from the source of the Columbia to its confluence with the sea, and from Cape Mendocina, in lat. 47°, to Puget Sound on the shores of the Pacific.” It is, therefore, not without reason that Mr. Nuttall suspected this was the *Liquorice*, mentioned by Sir A. Mackenzie as indigenous to the coasts of the Pacific Ocean, which Dr. Richardson determined to be the *Hedysarum Mackenzii*. It will be remarkable if this species should prove the same as a North African one. Mr. Nuttall, indeed, alludes to its similarity with the *G. setifera* of Desfontaines; observing, that, like that, it emits a somewhat disagreeable resinous odour: but he does not say how they differ. I have compared our American species both with Desfontaines’ description and figure, and with specimens gathered by Saltzman at Taugiers; and I confess, as far as can be judged from these authorities, I can find no distinguishing character whatever. The number of seeds is variable in both. The little scales on the underside of the leaves are the same in both, and they are formed by a resinous exudation from the glands, which abound, as in *Psoralea* and *Petalostemon*, and which are scarcely different in colour from the leaf itself.

10. TEPHROSIA. Pers.

Cal. ebracteolatus subaequalis 5-dentatus. Corolla vexillum amplum subrotundum extus

sericeum aut pubesens patenti-reflexum, *ala carinae* obtuse adherentes. *Stamina* varie connexa, monadelpha aut diadelpha, *filam. super.* nunc semi-coalito. *Style filiformis,* *stigma* terminali. *Legumen* saepius sessile compresso-planum lineare polyspermum, valvis planis, seminibus compressis.—Frutices vel Herbæ. *Stipulae a petiolo distinctæ,* *lanceolatae aut subulate, non sagittatae.* Folia in *Tephrosia veris impari-pinnata, in spurie trifoliata aut palmata.* Racemi axillares rarius oppositiflui. Flores abit et purpurantes. DC.

1. *T. Virginiana*; (SECT. BRISSONIA. DC.), herbacea, erecta, foliolis 8-11-jugis ovali-oblongis mucronatis subtus candicanti-villosis, calycibus lanatis.—*Pers. Syn.* v. 2. p. 329. *Pursh, Fl. HAB. Canada. Michaux; Pursh.

11. AMORPHA. Linn.

Cal. 5-dentatus obconico-campanulatus. *Corolla vexillum* ovatum concavum, *ala* et *carina* 0. *Style filiformis, rectus, glaber.* *Stamina exserta, basi imm monadelpha.* *Legumen* compressum ovatum lunulatum 1-loc. 1-2-spermum.—Frutices Boreali-Americanæ. Folia *impari-pinnata, foliolis multijugis pellucido-punctatis saepius basi stipellatis.* Stipulas *caulinæ decidua.* Racemi *spicati elongati, saepius ad apices ramorum subfasciculati.* Flores *ceruleo-violacei.* DC.

1. *A. fruticosa*; subarborescens, subvillosa aut glabra, foliolis elliptico-oblongis, infimis aculeo distansibus, calycis subvillosi dentibus 4 obtusis 1 acuminato, vexillo e glanduloso, leguminibus oligospermis. DC.—*Linn. Sp. Pl.* p. 1003. *Mich. Am.* v. 2. p. 64. *Pursh, Fl. Am.* v. 2. p. 466. *Bot. Reg.* t. 427. *Elliott, Carol.* v. 2. p. 188.—an *A. nana?* *Sims in Bot. Mag.* t. 2112.

HAB. Limestone rocks between Fort-Omaboyne, on the Red River, and the south end of Lake Winnipeg, in lat. 50°, its most northern range. Douglas.

2. *A. nana*; fruticosa, pumila, glabriuscula, foliolis ellipticis longe mucronatis punctis pellucidis majusculis adsparsis, calycis glabris glandulosis dentibus omnibus subulatis, leguminibus 1-spermis.—Nutt. in *Fraser's Cat.* 1813, *Gen.* v. 2. p. 91. *De Cand. Prodr.* v. 2. p. 256. vix *Sims in Bot. Mag.* t. 2112.—*A. microphylla. Pursh, Fl. Am.* v. 2. p. 466.

HAB. Abundant on the plains of the Red River, in lat. 50°. Douglas.—The *Amorpha nana*, figured by Dr. Sims in the *Bot. Mag.* t. 2112, is the representation of a specimen which flowered in Mr. Lambert's garden; from which place also I possess an individual under the same name, and probably taken from the same plant. But this I would unquestionably refer to the *A. fruticosa*. Mr. Douglas' plant is truly distinct from this, having all the teeth narrow-subulate, as described by Mr. Nuttall. The leaves, too, are dotted with large pellucid glands, there are resinous brown glands on the calyx, and it forms an exceedingly compact shrub, with copious foliage, and very small rigid leaflets.

3. *A. canescens*; suffruticosa, humilis, ubique canescens-tomentosa, foliolis ellipticis mucronatis approximatis, spicis subaggregatis, calycis dentibus ovatis acutis.—Nutt. in *Fraser's Cat.* 1813. *Pursh, Fl. Am.* v. 2. p. 467. *Nutt. Gen. Am.* v. 2. p. 92. *De Cand. Prodr.* v. 2. p. 256.

HAB. Abundant on the plains of the Red River, with the preceding. Douglas.—Leaves and calyx covered with a soft hoary tomentum. Flowers brilliant purplish-blue.

12. ROBINIA. *De Cand.*

Calycis dentes 5 lanceolati, 2 sup. breviores approximati. *Cor.* papilionacea vexillo ampio, *carina* obtusa. *Stam.* diadelpha decidua; *ovarium* 16-20-ovulatum. *Stylus* antice barbatus. *Legumen* compressum subsessile polyspermum, valvis planis tenuibus, sutura seminifera marginata.—Arbores *Boreali-Americanæ*, *spinis stipularibus* saepe donatae. *Folia impari-pinnata*, *foliolis petiolulatis basi stipellatis*. Flores albi aut rosei, in racemos axillares saepius nutantes dispositi. DC.

1. *R. Pseudacacia*; spinis stipularibus, ramis virgatis, racemis laxis pendulis leguminibusque glabris, foliolis ovatis. DC.—Linn. Sp. Pl. p. 1043. Lam. Ill. t. 606, f. 1. Mich. Arb. (ed. Am.) v. 2. t. 76, Am. v. 2. p. 65. Pursh, Fl. Am. v. 2. p. 487. Elliott, Carol. v. 2. p. 242, De Cand. Prodr. v. 2. p. 261. Bigel. Fl. Bost. ed. 2. p. 277.

HAB. Canada. Michaux; Pursh. Plentiful in Upper Canada. Douglas.—This, the *False Acacia* or *Locust-tree*, in the rich soils, and with the genial summers of North America, produces a durable and valuable timber: but it is little suited to the soil and climate of Great Britain.

13. PHACA. *Linn.*

Calyx 5-dentatus, *dentibus* 2 superioribus remotioribus. *Carina* obtusa. *Stamina* diadelpha. *Stylus* imberbis. *Stigma* capitatum. *Legumen* subturgidum uniloculare, sutura superiore seminifera tumida.—Herbeæ *foliis impari-pinnatis*, *racemis pedunculatis* *axillaribus*. *Legumina matura saepius resupinata*.

* *Floribus albidis aut ochroleucis.*

1. *P. frigida*; erecta, glabriuscula, parum ramosa, foliolis 4-5-jugis oblongo-ovatis subtus margineque pilosis, stipulis ovato-oblongis ciliatis foliaceis magnis, calycis ore pubescenti, leguminibus stipitatis oblongis inflatis membranaceis.—*a. europaea*; leguminibus hirsutis. Linn. Syst. Nat. ed. 10. p. 1173. Fl. Lapp. ed. 2. p. 227. Jacq. Austr. t. 166. De Cand. Prodr. v. 2. p. 273.—*P. alpina*. Linn. Sp. Pl. p. 1064. Fl. Dan. t. 865.—*b. Americana*; leguminibus glabris.—*P. frigida*. Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.—*c. littoralis*; calycibus leguminibusque nigro-hirsutis, caule humiliore, foliolis subtus pubescenti-incanis.

HAB. *a.* Woody regions of the Rocky Mountains in lat. 52° to 56°, to Slave Lake in lat. 61°. Dr. Richardson and Drummond.—*c.* Arctic shores, westward of the Mackenzie River. Capt. Sir John Franklin and Capt. Back, to Cape Lisburne, in Behring's Straits. Messrs. Lay and Collie in Capt. Beechey's Collection.—This plant, as found in the woody regions of North America, is equal in size with the European, and differs only in its glabrous legumina. In the littoral Arctic regions it becomes much smaller, hoary, and very pale beneath, and with the whole calyx, as well as the seed-vessels, clothed with black hairs.

2. *P. elongata*; caule erecto angulato pubescente parce ramoso, foliolis 8-10-jugis oblongo-cuneatis retusis subtus incanis, stipulis parvis e lata basi acuminatis inferioribus coalitis, pedunculis folio multo longioribus, racemis elongatis laxis, calycibus sericeis, leguminibus coriaceis cylindraceis curvatis sessilibus acutis.—*b. minor*; caule flexuosum.

Radix perennis. *Caules* plurimi, pedales, vel sesquipedales, erecti, stricti, iu*b.* dlexuosi, angulati, incano-pubescentes parce ramosi. *Folia remota*, digitalia; foliolis 8-10-jugis cum impari oppositis alternis vix unciam longis oblongis, basi cuneatis brevissime petiolulatis, apice obtusis vel plerumque retusis, supra glabris, subtus

pubescens; iugis incanis, in junioribus sericeis. *Stipulae* parva, inferiores subcuneatae, superiores libere, duas uncias longae, e lata basi sensim acuminatae, subsericeae. *Pedunculi* axillares, solitarii, non raro spathamei, folio duplo triplo longiores, erecti, stricti. *Flores* in racemum elongatum laxa dispositi, patentes, demum deflexi. *Stipula* lineam longe subulata, sericea, pedicelli per breve. *Calyx* cylindraceo-campanulatus, sericeus, ore obliquo, dentibus late-subulatis brevibus. *Flores* parvi, albi vel ochroleuci, carina solummodo apice purpureo, ut videtur, tincta. *Stamina* diadelpha. *Germen* lineare, sericeum, rectum, subsessile, stylo subulato sursum curvato glabro duplo longius. *Legumen* nuciale et ultra, sessile, coriaceo-cartilagineum, cylindraceum, sursum curvatum, hirsutum, apice acutum, uniloculare, 8-12-spermum, valvis intus spongioso-subhirsutis, suturis angustis æqualibus, minime introflexis.

HAB. Plains of the Saskatchewan. Dr. Richardson; Drummond.

3. *P. flexuosa*; caule decumbente flexuoso angulato parce ramoso, foliolis 6-9-jugis linearie-oblongis obtusis supra glabris subtus appresso-pilosis, stipulis parvis e lata basi acuminatis, inferioribus coalitis, pedunculis folio longioribus, racemis elongatis laxis, calycibus subsericeis, leguminibus coriaceis cylindraceis rectis sessilibus acutis.—*Astragalus flexuosus*. Douglas, MSS. in Herb. Hort. Soc.

HAB. Abundant on elevated and dry fertile soils of the Red River and Assinaboia, lat. 50°. Douglas.—The habit of this is very similar to the preceding, and I am doubtful if it ought not to be united with it. But the leaves are smaller and narrower, the "flowers are purplish and very fragrant," and the legumes are not only smaller than in *P. elongata*, but straight. What Mr. Douglas has considered as a white-flowered variety, I have referred to the latter species. The cell of the fruit is without a dissepiment, nor is there any introflexion or thickening of the sutures on either side of it.

4. *P. collina*; erecta vel diffusa, pilosa, foliolis 9-11-jugis linearibus obtusis basi in petiolulum brevem attenuatis, stipulis purvis oblongis acuminatis, pedunculis folio duplo longioribus, racemis oblongis densis floribus retrofractis, calycibus tubulosis dense hirsutis, leguminibus (immaturis) linearibus pubescentibus etipitatis deflexis.—*Astragalus collinus*. Douglas, MSS. in Herb. Hort. Soc.

Caulis erectus vel declinatus, ramosus, pedalis et ultra, teres, striatus, pubescenti-hirsutus. *Folia* remota, digitalia, subsessilia, 19-23-foliolata; foliolis remotis, unciam longis, angusto-linearibus, obtusis vel retusis, subtus præcipue pilis brevibus alibi curvato-patentibus obsitis, basi in petiolulum brevem attenuatis. *Stipulae* parva, oblonge, acuminatae, subfoliaceae. *Pedunculi* foliis subduplo longiores, pubescentes. *Racemi* 3-4 uncias longi, oblongi. *Flores* arcte dispositi, retrofracti. *Bractæ* subulatae, pedicellis erectis paululum longiores. *Calyx* oblongus, deuso hirsutus, pilis pallidis, tube elongato basi obtuso subgibboso, dentibus subulatis tubo triplo brevioribus. *Corolla* alba, macula magna ut videtur singulo petalo purpurea. *Vexillum* obovatum apice reflexum, alia carinaque longitudine subæquale. *Stamina* diadelpha. *Germen* lineare, stipitatum. *Legumen* (vix maturum) calyx plusquam duplo longius, lineare, compressum? submembranaceum, pubescens, uniloculare, basi in stipitem gracilem calycis longitudine, apicem stylo gracili sursum curvato terminatum, polyspermum.

HAB. On the subalpine range of the Blue Mountains, in dry soils. Fl. June, July, 24. Douglas.—This plant, which, on an inspection of its legumen, must be referred to the genus *Phaca*, rather than to *Astragalus*, where Mr. Douglas had placed it, is remarkable for its narrow linear leaves, for the sudden deflexion of the flower from the summit of the erect pedicel, for the elongated tube of the calyx, and for the short vexillum.

5. *P. pectinata*; glabriuscula, caule decumbente striato, foliis pectinatis rigidis, foliolis 8-10-jugis linearibus subacutis terminali nonnunquam bifido, stipulis hinc longitudinaliter unitis, racemis folio plerumque longioribus, leguminibus sessilibus ovalibus coriaceis

transversim rugosis, sutura superiore crassissima. (TAB. LIV.)—*Astragalus pectinatus*.
Douglas, MSS. in *Herb. Hort. Soc.*—*a. foliis filiformibus*.

Caulis decumbentes, pedales, flexuosi, crassi, fistulosi, striati, glabriusculi, inferae subnudii. *Folia* remota, alterna, digitem longa, pectinato-pinnatifida (!) potius quam pinnata, dorso præcipue appresso-subsericea. *Rachis* compressa nonunquam furcata. *Foliola* opposita vel alterna, 6-8-10-juga secundunciam vel duas uncias longa, linearis, in *a.* fere filiformia, rigidipetula, subacute, basi sessilia, minime articulata, cum substantia rachidis concreta, et ita persistentia, terminali nonunquam bifida, axillis glandula flava cornuta notata. *Stipulae* mediocre, ni-tri-lineares, subtriangulari-acuminates, inferiores marginibus hinc unites, apice solummodo bifidae, superiores libere magis angustiores. *Pedunculi* axillares, solitarii, crassi, striati, glabriusculli, folium subaequantes. *Racemos* lato-ovatus, sub-13-florus. *Flores* magni, albi. *Bractea* minute, ovato-acuminatae, pedicellis paululum breviores. *Calyx* cylindraceo-campanulatus, oblique 5-dentatus, pilosus, pilis sparsis, nigris, appressis: *dentes* breves. *Vexillum* ovatum, attenuatum, obtusum, alis multo longioribus, lateribus reflexa. *Ala* oblonga, subacuminata, unguiculata. *Carina* obtusa, alis brevier. *Stamina* diadelpha, 1-9. *Germen* lineari-oblongum, glabrum, stylo subulato-filiformi glabro triplo brevius. *Stigma* parvum, capitatum. *Legumen* ovale, sessile, inflatum, crassum, coriaceo-cartilagineum, stylo curvato rigido persistente terminatum, uniloculare, 12-14-spermum, bivalve, valvis intus spongiosis, exstus profunde transversim rugosis sutura superiore crassissima. *Semen* rotundato-reniforme, podospermo elongato.

HAB. Pastures of the Saskatchewan, *Drummond*; and on the Red-Deer and Eagle Hills, bordering on that river. *Douglas*.—This is a very remarkable species of *Phaca*, differing from all its congeners in the great length of the flowers, in the singularly thick and wrinkled fruit, and above all, in the structure of its leaves. The leaflets do not appear to be jointed upon the rachis, but to form a continued substance with them, and to be rather deeply-pinnatifid in a pectinated manner, than really compound and pinnated. In proof of this, the upper leaflet, which is, as it were, a prolongation of the rachis, is sometimes forked, and the rachis itself I have observed to be so in two or three instances. The leaflets are therefore persistent, and remain upon the withered rachis, like the segments of a simple leaf. Notwithstanding this peculiarity of structure in the foliage, there is nothing, I think, in the fructification, that would justify a separation of the plant from *Phaca*. TAB. LIV. *Phaca pectinata*. *Fig. 1*, Flower; *Fig. 2*, Stamens and pistil; *Fig. 3*, Ala and carina; *Fig. 4*, Pistil; *Fig. 5*, Legumes:—natural size. *Fig. 6*, Single legume; *Fig. 7*, Legume, bursting open; *Fig. 8*, Seed, with its stalk:—all but *fig. 6*, more or less magnified.

6. *P. podocarpa*; canescens, valde ramosa, diffusa, caule ramisque strintis, foliolis 6-8-jugis lato-linearibus obtusis, stipulis parvis ovatis acuminatis, pedunculis folio longioribus, racemis laxis, leguminibus oblongis coriaceis compressis appresso-hirsutis acuminatis basi in stipitem longum attenuatis, suturis incrassatis.

Radix perennis. *Caulis* diffusi, subpedales, valde ramosi, striati, flexuosi, superne præcipue pubescentes. *Folia* 4-5 uncias longa; *foliolis* 13-19 parvis, remota, 6-7 lineas longis, linearibus seu lato-linearibus, sessiliibus, obtusis, supra glabris, subtus appresso-pubescentibus. *Pedunculi* axillares, folio parum breviores, pilis brevibus appressis obsti. *Racemi* laxi. *Flores* medios, albi. *Calyx* cylindraceo-campanulatus, pubercenti-scaber; ore obliqui 5-dentato. *Ala* carina sublongiora, vexillo breviores. *Germen* lineare, sericeum, stipitatum, superne in styllo filiformi sursum curvato attenuatum. *Stigma* obtusum. *Stamina* diadelpha 1, 9. *Legumen* valde coriaceum, rigidum, cano-hirsutum (vix maturum,) compressum, unciale, basi in stipitem aequum longum attenuatum, apice acuminatum, uniloculare, 12-14-spermum: suturis valde incrassatis, superiore recta, inferiore arcuata. *Semina* podospermo elongato.

HAB. Dry, sandy, and barren grounds, at the Great Falls of the Columbia, rare. 1825. Fl. June—August.—This stands marked, in Mr. Douglas' collection, as a new genus; and there is indeed something very remarkable in the appearance of its legumes, compressed as they are and thickened at the sutures, both above and below, and borne upon a stalk as long as themselves. But it possesses all the essential characters of *Phaca*, where I therefore place it.

7. *P. nigrescens*; obscure appresso-pilosa, caule erecto vel decumbente ramoso striato, foliolis 8-10-jugis oblongis obtusis basi subcuneatis, racemis folio plurumque longioribus, stipulis parvis ovatis subacutis basi connatis, calycis dentibus tubo paulo brevioribus, leguminibus stipitatis oblongis membranaceis compressis glabris.

Radix perennis. *Caulis* nunc erecti strictissimi, nunc decumbentes flexuosi, striati, ramosi, *sepae* purpurascentes, parce pilosi, pilis albis sparsis appressis. *Folia* ramota, digitalia. *Foliola* 17-21, plerumque opposita, vix unciam longa, oblonga, obtusa, basi subcuneata, viridia, in planta siccis fructifera nigrescentia, supra glabra, subtus appresso-pilosa. *Bractea* ovata, acuminata, parvae; inferiores connate, bifidae. *Racemi* axillares, elongati, laxi, brevissime pedunculati, foliis vix excedentes, demum fructiferi longiores. *Flores* parvi. *Bracteae* lanceolatae, acuminatae, membranaceae, pedicellis brevibus longiores ciliatae. *Calyx* campanulatus, superne praecipue pubescentis, 5-dentatus; *dentibus* late-subulatis, *tubo* subeque longia. *Corolla* alba vel ochroleuca. *Germen* lineare, glabrum, stipitatum, stipite tubi calycis longitudine, stylo sursum curvato brevius. *Legumen* uncialia, nutantia, fuso-nigrescentia, oblonga, valde compressa, membranacea, glabra, basi in stipitem calycem duplo longiore attenuata, apice stylo curvato terminata, plerumque recta, nonnunquam paludum falcato-curvata.

HAB. On the Saskatchewan, to the Rocky Mountains, and as far North as Fort-Franklin, on the MacKenzie River, in lat. 65°. Dr. Richardson; Drummond.—Although extremely plentiful in the localities just mentioned, the present *Phaca* does not seem to have been known to any author. Its habit, like many of the North American *Phaca*, is similar to that of several species in that division of *Astragalus* to which *A. canadensis* belongs; but the seed-vessel is here truly that of the present genus, though considerably compressed.

8. *P. ? cespitosa*; acaulis, cespitosa, sericeo-nitens, foliis trifoliolatis longe petiolatis, foliolis lanceolatis, stipulis magnis ovatis albo-membranaceis tenerimis, floribus aggregatis sessilibus, leguminibus oblongo-ovatis teretibus sericeis calyce tectis. (TAB. LV.) —Nutt. Gen. Am. v. 2. p. 98. De Cand. Prodr. v. 2. p. 274.—*Astragalus triphyllus*. Pursh, Fl. Am. v. 2. p. 740. (non Pall.)

Radix perennis, crassa, fusiformis, sublonge descendens, apice multiceps: sed caules nulli vel brevissimi cespitosi. *Folia* numerosa, longe petiolata, undique pulcherrima sericeo-villosa, nitentia, 3- (5, Nutt.) foliolata, foliolis digitatis sessilibus lanceolatis basi attenuatis apice acutis. *Stipulae* ad basin petioli, magna, ovatae, membranaceae, albe, tenerim, cito laceratae. *Flores* aggregate, sessiles ad basin foliorum. *Corollam* perfectum non vidi. *Calyx* cylindraceo-campanulatus, villosus, ore 5-dentato, dentibus subulatis. *Legumen* oblongo-ovatum, teres, coriaceo-membranaceum, sericeum, sessile, apice in stylum filiformem flexuoso attenuatum, calyce persistente fere omnino tectum, uniloculare, intus subspongiosum. *Semina* subdecom, rotundato-reniformia, podospermo longiusculo suffulta.

HAB. Between Carlton-House and Edmonton-House, on the Saskatchewan. Dr. Richardson; Drummond.—The whole habit and the inflorescence of this plant are so much at variance with those of *Phaca*, that I cannot but consider it a very doubtful species of this genus. The fruit, however, accords with it. Pursh, who first described it under the name of *Astragalus triphyllus*, and whose short character perfectly agrees with our plant, seems to have had specimens, like my own, without flowers. He gives it as a native of Upper Louisiana, on the authority of Bradbury. Nuttall describes the corolla as ochroleucous: the leaves as sometimes quinate, (which I do not find to be the case,) and he does not notice the beautifully silvery hue of the whole plant, but calls it "canescens villosus." His specimens are from gravelly hills near the confluence of the Sawannee River with the Missouri.

TAB. LV. *Phaca?* *cespitosa*. Fig. 1, Withered flower; fig. 2, Legume enveloped by the calyx; fig. 3, Legume removed from the calyx; fig. 4, Legume laid open; fig. 5, Seed; fig. 6, Leaf:—all more or less magnified.

* * *Floribus* *purpurascensibus* *aut* *albo et violaceo pictis*.

9. *P. Aboriginorum*; pubescenti-cana, caule erecto parce ramoso striato, foliolis sub-5-

jugis oblongo-lanceolatis obtusiusculis, stipulis ovatis acutis inferioribus connatis majusculis, leguminibus tenui-stipitatis oblique ellipticis acutis membranaceis glabris. (TAB. LVI.)—*Astragalus Aboriginorum.* Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.

“ *Radix teres, longa, flavescens, Glycyrrhiza simili, e qua surgunt caules plures pedales, suffruticosi, erecti, graciles, simplicicauli, pilis molibus canescentes. Folia sessilia (aut brevi-petiolata) pinnata, pubescentia ut in caule sed longiori et densiori; rachide bipanicari filiformi; foliolis plurimumque 11, panicaribus, sessilibus, linearibus lanceolatis obtusiusculis basi attenuatis, utrinque concoloribus, nunc alternis nunc oppositis rariusve verticillatis; stipulis caulinis: inferioribus connatis ovatis acutis; superioribus magis distinctis acuminatis. Pedunculi axillares foliis duplo longiores, pilosi. Racemos erectus, laxus, 15–20-florus, pedicellis erectis calyx et bractea subtulata pilosa brevioribus. Calyx nigrescenti-pilosus, laciniis quinque subulatis aequalibus; superioribus sine obtuso separatis. Corolla albida ceruleoconcreta carina saturate cerulea. Vexillum ungue late horizontali calyce breviori, limbo obcordato erecto. Alae vexillo breviores, carina paulo longiores, ungue tenui linearis, limbo oblongo emarginata ad basin lobo linearis obovato aucto. Carina obtusa, calyx tercia parte longior. Legumen immaturum oblongum, pilis canis adpresso tectum, (nunc glabrum,) pedicelle longitudine calycis sustentatum, stylo brevi incurvo capitato terminatum. Semina 14.” Rich: *Legumen (maturum) uniloculare, nutante, unciam sessiquiniam longum, inflatum, membranaceum, obscure reticulatum, glabrum, subellipticum, acutum, stylo brevi terminatum, inferne in stipitem gracilem calyce duplo longiore attenuatum, sutura hinc plana, marginibus paululum introversis, illuc curvata. Semina subtundo-reniformia, levia, fusco-olivacea, podospérmo breve.**

HAB. From Lake Winnipeg to the Rocky Mountains, and as far north as Bear Lake, in lat. 66°. Dr. Richardson; Drummond.—“ The Crees and the Stone Indians gather its roots in the Spring as an article of food.” Rich.—After the excellent description above-quoted, made from the recent plant, I have little to remark. The perfect fruit, which was unknown to Dr. Richardson, has now been seen in abundance, and proves the genus to be *Phaca*, rather than *Astragalus*.

TAB. LVI. *Phaca Aboriginorum.* Fig. 1, Raceme of fruit:—natural size. Fig. 2, Flower; fig. 3, Alæ and carina; fig. 4, Stamens and Pistil; fig. 5, Pistil; fig. 6, Legume:—natural size. Fig. 7, Transverse section of do.:—all but figs. 1 and 6, more or less magnified.

10. *P. glabriuscula*; glabra vel pilis rarissimis minutis sparsa, caule erecto subsimplice striato, folioli 5–6-jugis linear-lanceolatis subacutis, stipulis ovatis acutis inferioribus connatis majusculis, leguminibus sublonge stipitatis lanceolato-falcatis (vix maturis) compressis membranaceis glabris.

HAB. Valleys of the Rocky Mountains. Drummond.—General aspect very similar to the preceding, of which it may perhaps be a variety; but it is almost entirely, and especially in the leaflets, glabrous; smaller too in all its parts, and the fruit is much narrower, more falcate, and, in the scarcely mature state, exceedingly compressed. It seems to be rare, as very few specimens were gathered, but those are both in flower and fruit.

11. *P. elegans*; subglabra, caule subramoso erecto vel assurgente angulato, foliolis 5–7-jugis oblongis obtusis basi cuneatis supra glabris subtus pilis minutis appressis, stipulis ovatis acutis basi subconnatis, racemo compacto longe pedunculato folium excedente fructifero elongato, leguminibus sessilibus ellipticis inflatis membranaceis, nigro-velutinis apiculatis 3–5-spermis.—*β. minor*; caule ascendente minore, racemo breviore.

HAB. Prairies in the Rocky Mountains, and β. on the higher summits of the mountains. Drummond.—This grows in the plains to the height of a foot, or a foot and a half, erect, having leaflets nearly an inch long, somewhat glaucous beneath, flowers bright and deep purplish-blue, in a compact raceme; these racemes elongate considerably as the fruit ripens, and bear ovate, very densely hairy, blackish legumes, about three-fourths of an inch long. Var. β. is smaller in all its parts, has smaller and rounded racemes, with more

patent flowers, and approaches the *P. astragalina*; but its flowers are always considerably smaller, of a far deeper colour, and the leaflets are much narrower. It is a very elegant species.

12. *P. astragalina*; caule (breviusculo) ascende hirsutulo, foliolis 8–10-jugis ovalibus subtus præcipue hirsutis, stipulis ovatis fere liberis, pedunculis folio longioribus, floribus capitato-racemosis patentibus, leguminibus inflatis stipitatis pendulis ellipticis nigro-hirsutis.—*De Cand. Astr. p. 52. Rich. in Frankl. 1st Journ. ed. 2. App. p. 28. De Cand. Prodr. v. 2. p. 274.*—Astragalus alpinus. *Linn. Sp. Pl. p. 1070. Pursh, Fl. Am. v. 2. p. 472.*—*A. montanus. Jacq. Fl. Austr. t. 131.*

HAB. From Newfoundland and Labrador (*Mr. Morrison*) on the east, to the Rocky Mountains (*Drummond*) and Kotzebue's Sound (*Lay and Collie*) on the west; and to the extreme Arctic regions in the north. *Dr. Richardson; Capt. Sir E. Parry, &c.*

13. *P. bisulcata*; caule subdecumbente glabriusculo, foliis subsessilibus, foliolis 11–13-jugis ellipticis subtus appresso-hirsutis, stipulis ovatis acutis liberis, racemis pedunculatis valde elongatis, floribus nutantibus, leguminibus pendulis stipitatis linearicylindraceis hinc bisulcatis appresso-pubescentibus.

HAB. Plains of the Saskatchewan. *Drummond.*—Stems 1 to 2 feet long, scarcely branched. Leaves 4 to 6 inches long. Leaflets an inch long. Racemes, including the peduncle, 6 to 8 or 10 inches in length, with numerous closely-placed, drooping, rich purple flowers, nearly an inch long; carina and ale pale at their base. Legumes pendent, an inch long, between membranaceous and cartilaginous, narrow, cylindrical, acute at the point, with the style often deciduous, at the base attenuated into a stipe as long as the calyx, one-celled, but having two furrows on the upper side, one on each side of the suture, which form two prominent ridges within the cell. Seeds 5–6, reniform, each upon a slender stalk of about its own length.

14. OXYTROPIS. DC.

Calyx 5-dentatus. *Corolla* *carina* in mucronem exsertum summo dorso desinens. *Stamina* diadelpha. *Legumen* biloculari aut semi-biloculari, sutura superiore introflexa. —*Herbeæ foliis impari-pinnatis, pedunculis axillaribus radicalibus, floribus spicatis.* DC.

1. ACAULES, nempe caulinis subnullis, stipulis petiolo foliolis more solito conjugatis nec verticillatis.

* *Floribus purpurascensibus aut albis.*

1. *O. borealis*; subacaulis, pilis scaporum stipularumque setosis patulis, petiolorum paucis, foliolis elliptico-lanceolatis subtus glabris superne pilosis, scapis folii longitudine, floribus capitatis, bracteis calycis nigro-hispidissimi longitudine. *De Cand. Prodr. v. 2. p. 275.*

HAB. Kotzebue's Sound. *Lay and Collie.*—The specimens from Capt. Beechey's Collection precisely accord with those sent me from the opposite side of Behring's Straits, by Dr. Fischer. One of the individuals has some, apparently monstrous, bracts, which are foliaceous, and longer than the flowers.

2. *O. Uralensis*; acaulis, villosa, vix sericea, foliolis oblongo-lanceolatis, scapis folio longioribus calycibusque hirsuto-lanatis, capitulis multifloris ovatis, floribus patulis, bracteis infimis calyce longioribus cæteris huic æqualibus, leguminibus subdistantibus erectis ovatis acuminatis bilocularibus. *De Cand. Prodr. v. 2. p. 276. Rich. in Frankl. 1st Journ. ed. 2. App. p. 98.*—*Astragalus Uralensis. Linn.*—*Jacq. Ic. Rar. v. 1. t. 155.*

Engl. Bot. t. 46. Hook. in Parry's 1st Voy. App. p. 395.—*a. subsucculenta*; foliis fere glabris.—*y. mino*; glabriuscula, floribus paucis patulis purpurascensibus.

HAB. *a.* Arctic regions and Islands. *Dr. Richardson*: *Capt. Parry*, &c. *a.* Arctic sea-shore to the east of the Mackenzie River. *Dr. Richardson*. *y.* Dry hills and prairies of the Rocky Mountains. *Mr. Drummond*. Labrador. *Mr. Morrison*.—This, it must be allowed, is a very variable plant; nor am I without specimens which exhibit a gradation between it and the following species. *Var. a.* has the leaves very free from hairs, and somewhat fleshy.

3. O. arctica; subacaulis, sericea, stipulis petiolaribus, foliolis oppositis alternisque ovali-oblongis, capitulo subumbellato paucifloro, leguminibus erectis oblongis acuminatis calycibusque nigro-pubescentibus. *Br.*—*a. subumbellata*; capitulis 2-4-floris. *O. arctica*. *Br. in App. to Parry's 1st Voy. p. clxxviii. Hook. in Parry's 2d Voy. App. p. 396. De Cand. Prodr. v. 2. p. 276.*—*O. Uralensis*, *s. microphylla*. *Un. Itin.*—*a. minor*; dense sericea, floribus solitariis. *Hook. in Parry's 2d Voy. l. c.—i. inflata*; foliis leguminibusque inflatis glabriusculis.

HAB. *a.* and *a.* Arctic shores and Islands of North America. *Capt. Sir E. Parry*; *Dr. Richardson*; *Capt. Sir John Franklin*; *Capt. Back*, &c. Labrador. *Mr. Morrison*. Kotzebue's Sound. *Messrs. Lay and Collie*. *i.* Highest summits of the Rocky Mountains. *Drummond*.—The specimen given in the " *Unio Ritteraria*" collection, from Cambre d'Aze and the Vallée d'Eynes in the Pyrénées, under the name of *O. Uralensis*, *s. microphylla*, exactly correspond with the more usual state of our plant. Mr. Drummond's var. from the most elevated ridges of the Rocky Mountains has the leaves, especially the old ones, nearly glabrous, the leaflets narrow; the legume greatly swollen, or inflated, thin and membranaceous, scarcely at all hairy.

4. O. foliolosa; acaulis, incano-villosa, foliis numerosis, foliolis approximatis ovatis seu oblongo-ovatis subacutis, scapis folio longioribus pilosis, capitulis late ovatis (parvis), floribus congestis potentibus inferioribus reflexis, bracteis linear-lanceolatis calyce nigro-hirsuto brevioribus, leguminibus remotiusculis deflexis (vix maturis) cylindraceis acutis nigro-hirsutis.

Radix perennis, subfusiformis, sublonge descendens, apice fibroso-ramosa, superne multiceps. *Folia* numerosa, radicalia digitem longa, erecta vel erecto-patentia; *foliola* 23-25, subarcte-approximata, ovata, seu oblongo-ovata, 3-4-lineas longa acuta, una cum rachide subappressum pilosa. *Petiolum* ad basin patentipilosus. *Scapus* lanceolatus, acuminate, sublonge pilosus. *Scapi* plurimi ex eadem radice foliis longiores, demum fructiferi, duplo longiores, pubescenti-pilos, pilis ad basin longioribus magisque potentibus. *Capitula* late ovata seu subglobosa, ratione plantae parva, floribus compactis, potentibus, inferioribus reflexis. *Bracteæ* herbaceæ, linear-lanceolatae, pilose, calyculis nigro-pilosis breviores. *Dentes calycinæ* subulati, tubi longitudine. *Petala* intense ceruleo-purpurascens, basi fere alba. *Carina* obtusa cum mucrone conspicuo subrecurvo. *Legumina*, vix matura, omnia pendentia, unciam longa, fere exacte cylindracea, acuta, dense nigro-pubescenti-hirsuta, basi in stipitem calycis tubo breviorem attenuata.

HAB. From Carlton-House to the Rocky Mountains, in lat. 54°.—This very elegant species of *Oxytropis* has an affinity on the one hand with *O. montana*, and on the other with *O. caerulea*; agreeing with both in the general shape of the leaflets, and their regular and close insertion upon the rachis, and in the deep-blue colour of the flowers, pale at the base of the petals. From the former it differs in its more compact and tufted growth, smaller heads, and smaller and more patent flowers, and in the drooping, cylindrical, very black, and hairy legumes; from the latter, in its less silvery foliage, more obtuse leaflets, and far shorter and more compact heads of flowers.

5. O. argentata; acaulis, foliolis obovato-lanceolatis sericeo-argenteis, scapis folia

æquantibus, floribus capitatis, bracteis lanceolatis longitudine calycis sericei.—*Pursh*, *Fl. Am.* v. 2. p. 473. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.*—*Astragalus argentatus*. *Pall. Astr. p. 69. t. 48.* (non *A. Missouriensis*, Nutt. fide Cl. Rich.)

HAB. Woody country between lat. 54° and 64° north.—Of this species I have seen no specimen.

6. *O. Lamberti*, acaulis, sericeo-pilosa, foliolis lanceolatis acutis remotiusculis, scapo foliis sublongiore, floribus spicatis capitatisve, bracteis lanceolato-linearibus calyce sericeo brevioribus. *DC.*—*Pursh*, *Fl. Am.* v. 2. p. 740. *De Cand. Prodr. v. 2. p. 277.* *Nutt. Gen. v. 2. p. 98.*—a. floribus majoribus remotioribus patentibus.—*O. Lamberti*. *Sime in Bot. Mag. t. 2147.* *Lindl. in Bot. Reg. t. 1054.*—b. foliolis brevioribus, floribus minoribus congestis erectis.

HAB. a. Canada. *Lady Dalhousie*; *Mrs. Percival*; *Mrs. Sheppard*, b. Dry banks on the Red River and Saskatchewan, (*Douglas*), to the Prairies in the valleys of the Rocky Mountains. *Drummond*.—My Canadian specimens from Lady Dalhousie and Mrs. Percival much more resemble the figures in the *Botanical Magazine* and *Register*, than those from the more western parts of North America: and certainly, as Mr. Lindley observes, approach the *O. grandiflora*, as they do also the *O. ambigua*; both natives of Siberia. Nor is this species far removed, or readily distinguished by words, from some states of *O. Uralensis*.

7. *O. nigrescens*; subcaulis, multiceps, procumbens, foliolis 7–11 ellipticis acutiusculis villosis, stipulis calycibusque nigro-villosis, pedunculis bifloris folii longitudine, leguminibus (ex *Pall.*) oblongis inflatis pubescensibus unilocularibus.—*Fisch. MSS. De Cand. Prodr. v. 2. p. 278.*—“*Astragalus nigrescens. Pall. Astr. p. 65. t. 53.*”

HAB. Island of St. Lawrence, in Behring's Straits. (*De Cand.*)—According to the description this must be very nearly allied to *O. arctica*.

* * *Floribus ochroleucis.*

8. *O. campestris*; acaulis, foliolis multijugis lanceolatis sericeis, scapo superius decumante foliis subaequali (vel longiore), spicis capitatis (nunc elongatis), bracteis calyce paulo brevioribus, floribus erectis, leguminibus erectis ovatis (oblongis) inflatis pubescensibus semilibocularibus.—*De Cand. Prodr. v. 2. p. 278.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.*—*Astragalus campestris. Linn. Engl. Bot. t. 2522.*—*Phaca campestris. Wahl.*—*g. sulphurea*; *DC?* foliolis latioribus, spicis capitatis, floribus majoribus speciosis.—*O. sulphurea. Fischer, MSS.*—*d. spicata*; spicis elongatis, floribus remotioribus.—*e. glabrata*; foliolis glabriusculis subsucculentis.—*t. melanocephala*; minor, calyculis nigro-villosis.

HAB. a. and t. Carlton-House on the Saskatchewan to the Rocky Mountains, (*Drummond*) and as far as the sources of the Columbia. *Douglas.* a. and t. Bear Lake to the Arctic shores and Islands. *Dr. Richardson; Capt. Sir J. Franklin and Capt. Back; Capt. Sir E. Parry, &c.*—In the degree of pubescence, in the form of the leaflets, in the colour of the hairs of the calyx, and size of the flowers, this plant is very variable. The var. *g. sulphurea*, corresponding almost exactly with the *O. sulphurea* of Dr. Fischer, (the *O. campestris* *g.* of De Candolle,) is exceedingly beautiful, not only in the silkiness of its foliage, but in the size and brightness of the corollas.

2. VERTICILLARES, nempe foliolis omnibus aut plerisque subverticillatis seu ex eodem petioli punto 2–3 ortis. *DC.*

9. *O. splendens*; acaulis, foliolis 3–4^{lm} verticillatis lanceolatis acutissimis sericeo-

pilosus, scapo foliis longiore petiolisque patentim pilosus, spicis elongatis, floribus subremotis erecto-patentibus bractea longioribus, calycibus albo-hirsutissimis, leguminibus erectis ovatis acuminatis pubescenti-hirsutis semibilocularibus.—*a. vestita*; valde hirsuto-sericea, bracteis hirsutissimis calyce multo longioribus. *O. splendens*. *Douglas*, MSS. in *Herb. Hort. Soc.*—*a. Richardsoni*; minus hirsuta, bracteis vix longitudine calycis.—“*O. oxyphylla*”? *Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.* (not *Pall.* and *De Cand.*)

Hab. *a.* On limestone rocks of the Red River, and south towards Pembina. *Douglas*. *b.* From Cumberland-House on the Saskatchewan, north to Fort-Franklin and the Bear Lake, and west to the dry Prairies of the Rocky Mountains. *Dr. Richardson*; *Drummond*.—This belongs to the same group of “*Verticillares*” with the true *O. oxyphylla* of Pallas, which I possess from Pallas' Herbarium, through the kindness of Mr. Lambert; and which is at once distinguished from this by its short, broad, and compact head of flowers. It well deserves the name which Mr. Douglas has given it. Its blossoms are bright-blue, in long spikes. In Dr. Richardson's specimens, the fruit greatly exceeds the calyx in length; in Mr. Douglas', it is shorter; but as many of the flowers among the latter are abortive, I suspect that the fruit is imperfect too.

3. CAULESCENTES, nempe caulis elongatis fruticosis, stipulis caulinis nec petiolo adnatis, foliolis conjugatis nec verticillatis. DC.

10. *O. deflexa*; caulescens, adscendens, pilosiuscula, foliolis ovato-lanceolatis pubescens, pedunculus folio multo longioribus, floribus spicatis, leguminibus pendulis hirsutis 1-locularibus apice hiantibus.—*De Cand. Astr. n. 32, Prodri. v. 2. p. 280. Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.*—*Astragalus deflexus*. “*Pall. Act. Petr. 1776. t. 15.*” *L'Hérit. Stirp. t. 80.*—*A. hians*. *Jacq. Ic. Rar. t. 252.*—*A. parviflorus*. *Lam.*—*A. retroflexus*. “*Pall. Astr. t. 27.*”

Hab. Banks of the Saskatchewan. *Dr. Richardson*; *Drummond*.—The flowers of this species are very small; its fruit large and pendulous. The American specimens exactly agree with those in my Herbarium from Lake Baikal.

15. ASTRAGALUS. DC.

Calyx 5-dentatus. *Corolla carina* obtusa. *Stamina diadelpha*. *Legumen* biloculare aut semiloculare, sutura inferiore inflexa.—*Herbae aut suffrutices. DC.*

1. PURPURASCENTES, stipulis a petiolo liberis, floribus purpurascensibus. DC.

* **HYPOGLOTTIDEI, floribus purpleis aut albis, stipulis a petiolo liberis inter se coalitis et ideo quasi bifidis et oppositifoliis. DC.**

1. *A. hypoglossa*; diffuso-procumbens, subpilosus, stipulis (junioribus) concretis oppositifoliis, foliolis elliptico-oblongis 8-12-jugis, pedunculis folio longioribus, spicis capitatis, floribus densis erectis, bracteis calyce nigro-piloso brevioribus, leguminibus erectis capitatis ovatis valde hirsutis, loculis plerumque monospermis.—*Linn. Mant. v. 2. p. 274. Engl. Bot. t. 274. Nutt. Gen. Am. v. 2. p. 90. Rich. in Frankl. 1st Journ. ed. 2. App. p. 28. De Cand. Astr. t. 14.*—“*A. arenarius*. *Pall. Astr. t. 34.*”—*a. caulibus foliolisque longioribus, calycibus pallidioribus. A. agrestis*. *Douglas*, MSS. in *Herb. Hort. Soc.*

Hab. *a.* Dry hills of the Saskatchewan, *Drummond*; and on the Eagle and Red-Deer Hills of that River. *Douglas*. *b.* On the fertile plains of the Red River, and in the south, towards Pembina. *Douglas*.—*a.* is the more frequent American form of this plant. The var. *b.* differs in its more luxuriant growth, and

almost exactly resembles a plant which I possess from the Altai, sent to me by Mr. Prescott, and marked "Astragalus hypoglottidi affinis, sed legumina polysperma, sem. 4-8." It approaches the *A. onobrychoides*.

2. *A. pauciflorus*; decumbens, incanus, appresso-pilosus, stipulis concretis oppositifoliis inferioribus integris, foliolis 3-5-jugis oblongis acutis, pedunculis folio subbrevioribus 2-4-floris, floribus (parvis) laxe racemosis, bracteis pedicelli longitudine, calycis albo-pilosi dentibus tubum æquantibus.

Radix longe descendens, subfusiformis, iignosa, apice divisa, superne caulis pluribus inferne ramosis decumbentibus vel prostratis digitalibus ad pedalis gracilibus incanis instructa. *Folia* etiam incana, pilis brevibus albis appressis; *foliolis* 7-11, 3-raro 4-lineas longis oblongis, vel linear-oblongis, raro ellipticis, acutis. *Stipulae* quasi oppositifoliae secrete, inferioribus integris superioribus sensim magis profunde bifidis foliaceo-membranaceis, appresso-pilosas. *Pedunculi* subunciam vel sesquium longi, folia vix longitudine excedentes incani. *Racemi* 2-3-4-flori, floribus laxis parvis patentibus. *Bractæ* linear-lanceolatae, pedicelli longitudine æquantibus. *Calyx* brevi-campanulatus, villosus, pilis appressis albis; dentibus subulatis, tubum longitudine æquantibus. *Petala* (sicitate) intense cœrulea; vexillo subpurpureante; alis carinaque obtusa inferne fere albida. *Germen* oblongum sericeum. *Legumen* ignotum.

HAB. Among rocks in the more elevated regions of the Rocky Mountains. *Drummond*.—This species, so very different from any with which I am acquainted, belongs to the same division of the genus with *A. hypoglottis*, and should perhaps be placed near to it. It is distinguished by its hoary stems and leaves, by the small number of leaflets, by its few-flowered racemes, and small patent flowers on pedicels, which are about as long as the bracts.

3. *A. vaginatus*; erectus, pubescens, stipulis concretis oppositifoliis, foliolis linear-lanceolatis acutis, pedunculis folio longioribus, floribus dense spicatis nutantibus, leguminibus linearibus rectis. DC.—“*Pall. Astr.* n. 49. t. 36.” *De Cand. Prodr.* v. 2. p. 283. *Rich. in Frankl. 1st Journ.* ed. 2. *App.* p. 28.

HAB. Woody country, between lat. 54° and 64° north. *Dr. Richardson in Frankl. 1st Journ.*—The habit of this is so very similar to that of our *Phaca Aboriginorum*, (*Astragalus Aboriginorum*, Rich., next to which Dr. Richardson has ranged it,) that were the fruit discovered, it would probably prove to be a *Phaca* also. The only specimen I have seen, has the flowers larger than in *P. Aboriginorum*.

* * ONOBRYCHOIDEI, *stipulis a petiolo et inter se distinctis, floribus purpurascensibus dense spicatis capitatis, vexillis linearibus elongatis, leguminibus rectis vel falcatis, radicibus pereunibus (an semper?) DC.*

+ *Leguminibus rectis.*

4. *A. adsurgens*; elongatus, adscendens vel prostratus, glabriusculus, foliolis 8-12-jugis oblongis, stipulis ovatis acuminatis membranaceis, pedunculis folio longioribus, spicis oblongis ovatis rotundatis, floribus densis erectis, vexillo alis vix 1-3 longiore, leguminibus erectis compactis oblongis subtriquetris hinc sulcatis appresso-pubescentibus vix calyce nigro-hirsuto longioribus.—“*Pall. Astr.* n. 44. t. 31.” *De Cand. Prodr.* v. 2. p. 287.—*A. Luxmanni. Pall. Astr.* t. 30? (fide DC.) *Jacq. Hort. Vind.* v. 3. t. 37? (sed spicis elongatis et foliolis angustioribus.) *De Cand. Prodr.* v. 2. p. 287.—*g. robustior*; calycibus albido-pilosis, pilis nigris perpaucis. *A. nitidus. Douglas, MSS. in Herb. Hort. Soc.*

HAB. a. Plains of the Assinaboine and Saskatchewan Rivers, as far as the mountains. *Dr. Richardson; Drummond; Douglas.* b. Common in the mountain-vallies, from the Kettle Falls to the sources of the

Columbia, on the West side of the Rocky Mountains. *Douglas*.—I possess the Asiatic *A. adscurgens* and *A. Larwanai* from Dr. Fischer and Mr. Prescott; but I am unable to distinguish them specifically. Our specimens from America seem to be identical with them. Flowers purple-blue.

5. *A. Labradoricus*; caulescens, procumbens, foliolis ovatis pubescentibus, spicis pedunculatis, leguminibus secundis rectis utrinque acuminatis pendulis. *Ph*.—*De Cand.* *Prod*. v. 2. p. 287.—*A. secundus*. *Mich. Am.* v. 2. p. 67. *Pursh*, *Fl. Am.* v. 2. p. 473. (not *De Cand.*)

Hab. North of Canada. *Michaux*. Labrador. *Colmaster*, (in *Pursh*).—The flowers are described as purple. With the imperfect characters of this plant given in *Michaux* and *Pursh*, it is impossible to say whether it ought not to be referred to some well known species.

6. *A. melanocarpus*; incano-sericeus, caulibus brevibus decumbentibus, stipulis ovatis acutis, foliolis 8–10-jugis ovalibus utrinque acutis nunc obovatis obtusis, racemis capitatis laxis 6–8-floris folio longioribus longeque pedunculatis, floribus patentibus, leguminibus patentibus-elliptico-oblongis coriaceis subunilocularibus nigro-fuscis rugosis.—*A. melano-*
carpon. “*Frazer's Cat.*” *Rich.* in *Frankl. 1st Journ. ed. 2. App.* p. 28.—*A. Missouriensis?* *Nutt.* (excl. syn. *A. argentata*, *Pursh*.)

Radix lignosa, subfusciformis, sublonge descendens, parce ramosa. *Caulis* plurimi, decumbentes, breves, 3–4 uncias longi, suffruticosi, superne præcipue incani, foliosi. *Folia* subdigitem longa; *foliolis* 8–10-jugis, plerumque oppositis, 3–5-linearibus utrinque petioloque pilis numerosis brevibus sericeis appressis, incanis, nitidis, ovalibus, utrinque acutis, nuno obovatis, obtusis. *Pedunculus* folio longior, incanus. *Racemus* ovalis, laxus, 5–9-florus; floribus maiusculis cæruleo-purpureo-subtenuibus albisque. *Bractæ* lanceolato-subulatae, pedicellis brevibus longiores. *Calyx* oblongus, pilis albido appressis subsericeus, dentibus subulatis tubo subdimidio brevioribus. *Vexillum* carina aliquo longius. *Legumen* patens, unciam longum, ovali-oblongum, subcompressum, coriaceum, transversim rugosum, marginatum, nigro-fuscum, breviter acuminatum, demum glabrum, fere omnino uniloculare, polyspermum, sutura paululum inflexa.

Hab. Plains of the Saskatchewan, and Eagle and Red-Deer hills of the same river. *Dr. Richardson*; *Douglas*; *Drummond*.—Dr. Richardson doubts if the *A. Missouriensis* of Nuttall be the same with this plant. The description in many respects accords; but the calyx is said to be clothed with black hairs; and in our specimens the suture of the legumen is so little introflexed, that they seem to have as strong a claim to be ranked with *Phaca* as with *Astragalus*. The species is an exceedingly beautiful one: the flowers being of a deep purplish-blue, varied with white; the leaflets sometimes, as in Mr. Douglas' specimens, about the size, and of the shape, of the leaves of *Thymus vulgaris*; at other times, as in Mr. Drummond's specimens, twice or thrice that size, always thickly clothed with soft silky hairs.

7. *A. caryocarpus*; multiceps, prostrato-assurgens, pilis appressis subhirtus, stipulis ovatis acutis, foliolis 9–12-jugis ellipticis, pedunculis folio brevioribus, racemis capitatis laxis, “leguminibus nuciformi-inflatis rugosis mucronatis glabris polyspermis.”—*a.* calycibus dense pubescenti-hirsutis. *A. caryocarpus*. *Ker* in *Bot. Reg. t. 176. De Cand.* *Prod*. v. 2. p. 287.—“*A. crassicarpus*. *Fraser's Cat.* 1813.”—*A. carnosus*. *Nutt. Gen.* v. 2. p. 100. (non *Purshii*).—*a.* calycibus appresso-pilosis subsericeis, pilis raris nigris. *A. succulentus*. *Rich.* in *Frankl. 1st Journ. ed. 2. App.* p. 29. *Lindl.* in *Bot. Reg. t. 1324*.

Hab. Hilly grounds of the Saskatchewan, especially about Carlton-House. *Dr. Richardson*; *Drummond*; *Douglas*.—Possessing as I do, from Mr. Nuttall, an original specimen of *A. caryocarpus*, (*A. carnosus*, *Nutt.*), and of the *A. succulentus*, from my valued friend Dr. Richardson, I am compelled to say that they are not specifically distinct. Nor can I find any difference between them, except that in the true

A. caryocarpus the calyx is more thickly hairy than in *A. succulentus*: hence I have been led to mark them as varieties. I do not, indeed, possess the fruit of either; that of the former is well known, however; and Mr. Lindley has observed of the latter; " Its fruit is not certainly known. We suspect it to be of the same nature as that of *A. caryocarpus*: at least, there is, in Mr. Douglas' collection, a fruit of such a kind, which does not appear to belong to any other of his species." This certainly goes far towards proving that the fruit is also alike in the two.

†† *Leguminibus curvatis.*

9. *A. succubens*; ubique hirsutus, caule procumbente flexuoso ramoso, stipulis parvis oblongo-acuminatis, folioliis 5-jugis obovatis, pedunculis folio brevioribus, racemis capitatis subovalibus, floribus (majusculis) patentibus laxis, stipulis lanceari-subulatis pedicello brevissimo longioribus, calycibus pilis laxis hirsutis, leguminibus (buncinalibus) lanceari-lanceolatis nitidis glabratibus falcatis hinc carinatis illatis profundissime et subconduplicatim sulcatis bilocularibus polyspermis.—*Douglas, MSS. in Herb. Hort. Soc.*

HAB. On the barren grounds of the Columbia, and near the Wallawalla River, North-West America.
Douglas.—Flowers large, purple and white. The legumes are very remarkable: when spread open, they are broadly lanceolate, but there is, on one side, a deep sulcus, so that a transverse section represents the letter V.

9. *A. diaphanus*; prostratus, diffusus, piloso-scapifer, stipulis parvis ovatis acuminatis, folioliis 5-9-jugis obovatis, pedunculis folio brevioribus, floribus (parvis) laxitatis laxis, bracteis ovatis acuminatis minutis pedicello subbrevioribus, leguminibus subreflexis linearibus compressis falcatis subdiaphanis glabriusculis bilocularibus polyspermis.—*Douglas, MSS. in Herb. Hort. Soc.*

HAB. Abundant on sandy soil near the Great Falls of the Columbia.—Flowers small, scarcely more than half an inch long, "purple," fading, when dry, to nearly white. Legumes scarcely an inch long, much flattened laterally, and falcate; when mature subdiaphanous if held between the eye and the light.

10. *A. lentiginosus*; prostratus, glabriusculus, stipulis parvis ovatis acutatis, folioliis 9-jugis obovatis, pedunculis folio brevioribus, floribus—? leguminibus ovatis acuminatis membranaceis sursum curvatis basi inflatis bilocularibus glabriusculis.—*Douglas, MSS. in Herb. Hort. Soc.*

HAB. Subalpine ranges of the Blue Mountains of North-West America. *Douglas*.—The flowers of this do not appear to have been seen by Mr. Douglas; but the fruit is very remarkable, and, as its discoverer observes, considerably resembles that of *A. tuberosus*, a native of Syria and Cappadocia.

11. *A. inflexus*; diffusus, prostratus, ubique villosissimo-tomentosus, caule flexuoso, stipulis majusculis ovatis acuminatis, folioliis 9-10-jugis ellipticis acutiusculis olivaceous obtusis, pedunculis folii longitudine, racemis laxis late ovalibus, pedicellis brevibus, bracteis longis subulatis calycem membranaceum aequaliter, leguminibus ovato-acuminatis depressis bilocularibus tomentosis sursum insigne curvatis.—*Douglas, MSS. in Herb. Hort. Soc.*

HAB. On the barren sandy grounds of the Columbia, from the junction of Lewis and Clarke's River to the mountains. *Douglas*.—Whole plant, except the large purple corollas, woolly, with long lax hairs. Calyx long, cylindrical, with slender, wavy, subulate teeth, nearly as long as the corolla. Legumes an inch long, ovate, and tapering a little at the base, but much more at the extremity, into a sharp point; compressed, (but by no means flat,) and curved upwards, so as to be almost doubled, like the letter U; with a shallow, but broad furrow below. The calyx is very thin and membranaceous, bursting when the fruit is ripe.

12. *A. glareosus*; depresso, totus molliter hirsuto-tomentosus, caulis brevibus, stipulis oblongis acuminatis appressis membranaceis, foliolis linearis-oblongis 6-jugis, pedunculis folium subæquantibus seu brevioribus 3-4-floris, pedicellis brevibus, bracteis linearibus calyce cylindraceo-elongato nigro-hirsuto dimidio brevioribus, leguminibus--?—*Douglas*, MSS. in *Herb. Hort. Soc.*

HAB. Plentiful on dry gravelly banks of rivers, from the confluence of Lewis and Clarke's River with the Columbia to the mountains. *Douglas*.—This is a very beautiful plant, scarcely five inches high, with densely woolly and whitish foliage, which the large flowers of its numerous peduncles, of a rich purple-blue colour, just exceed in height. The specimens were gathered in April and May, when, it is to be regretted, there was no fruit.

II. OCHROLEUCI, *stipulis a petiolo liberis, floribus ochroleucis.*

(CICEROIDEI, *stipulis nec petiolo nec inter se adnatis, spicis pedunculatis, floribus ochroleucis, radicibus perennibus, leguminibus sessilibus. DC.*)

13. *A. Canadensis*; elatus, subpubescens, erectus vel decumbens, stipulis lato-lanceolatis acuminatis, foliolis sub-10-jugis elliptico-oblongis obtusis, pedunculis folio subæqualibus, racemis elongatis spiciformibus, bracteis subulatis pedicello longioribus, floribus patentí-reflexis, leguminibus erectis oblongis teretibus glabris bilocularibus polyspermis, sutura superiore acuta.—*Linn. Sp. Pl. p. 1066. Pursh, Fl. Am. v. 2. p. 472. Elliott, Carol. v. 2. p. 227. De Cand. Prodr. v. 2. p. 293.*—*A. Carolinianus. Linn.?* et *aliorum?*—*Astragalus orthocarpus. Douglas, MSS. in Herb. Hort. Soc.*

HAB. Throughout Canada, *Mrs. Percival; Mr. Cleghorn*; as far as York-Factory and the Saskatchewan, *Dr. Richardson; Drummond; Douglas*; sparingly seen to the west of the Rocky Mountains, where, however, it was found at the branches of Lewis and Clarke's River. *Douglas*.—Mr. Douglas' *A. orthocarpus* only differs in having the flowers rather more constantly reflexed than usual. The *A. Carolinianus*, according to the authors who are best acquainted with it, seems to be but a more luxuriant state of the present, having a greater number of leaflets. All that I have seen cultivated in our gardeos under the name of *A. Carolinianus*, are what I here call *A. Canadensis*.

14. *A. Purshii*; hirsutissimus, caulis brevibus diffusis, stipulis lanceolatis acuminatis, foliolis 6-8-jugis oblongis, pedunculis folio duplo brevioribus, floribus laxis capitato-racemosis patentibus, bracteis linearis-subulatis pedicello duplo longioribus, calyce elongato membranaceo, alis attenuatis vexillum subæquantibus, germine subsessili linearis pilosissimo.—*Douglas, MSS. in Herb. Hort. Soc.*

HAB. On the low hills of the Spokane River, North-West America. *Douglas*.—"Flowers yellow. Calyx cylindrical; its teeth subulate, equal, half the length of the calyx; vexillum obovate, bidentate; ala long; carina obtuse, purple at the apex." *Douglas*.—It is to be regretted, that this species has not been found in fruit. The flowers are large, an inch and a half long: the whole plant, except the corolla, is very woolly. It flowers in June, and is perennial.

15. *A.?* (an *Phaca?*) *lotiflorus*; incanus, appresso-pilosus, caulis brevibus diffusis, stipulis ovato-acuminatis, foliis sublonge petiolatis, foliolis remotiusculis subsexjugis oblongis obtusis, pedunculis gracilibus folio brevioribus, floribus 3-4 laxis capitatis (parvis flavis), bracteis subulatis pedicello perbrevi longioribus, calyce campanulato albopiloso, dentibus subulatis tubo longioribus, petalis subæqualibus, leguminibus

(vix maturis) erecto-patentibus ovatis acuminatis compressis pilis albis villosissimis unilocularibus (?), sutura superiore recta inferiore arcuata.

HAB. About Carlton-House on the Saskatchewan. *Drummond*.—Very few specimens of this plant are in the Herbarium, and those have the fruit immature. In that state, I find no dissepiment within the legume, and am inclined to think it would be more correctly placed with the *Phaceæ*, and very near to *P. villosa*, (*Astragalus villosus*, Mich.) The size of the two plants is nearly alike, and their general appearance; but in *P. villosa*, (which I possess from Mr. Nuttall,) the leaflets are broader, far more decidedly villous, the flowers more numerous in each head, but of similar colour and structure, and the legumes appear to be the same in both.

(GALEGIFORMES, stipulis a petiolo et inter se liberis, floribus ochroleucis aut albis, leguminibus stipitatis. DC.)

16. *A. Drummondii*; elatus, erectus, caulinus sulcatis foliisque subtus pedunculisque valde molliter hirsutis, stipulis ovatis valde acuminatis, foliolis 13–15-jugis linearis-oblongis oblongis obtusis basi in petiolulum per breve attenuatis, pedunculis folio longioribus, racemis elongatis laxis, bracteis subulatis pedicello longioribus, floribus pendulis, calycibus nigro-hirsutis, leguminibus stipitatis subscinditis cylindraceis glabris paululum fulcati semibilocularibus, sutura superiore obtusa, inferiore introflexa profunde canaliculata. (TAB. LVII.)—*Douglas*, MSS. in *Herb. Hort. Soc.*

Radix perennis. *Caulis* pedales sesquipedales et ultra, fere bipedales, erecti, vel inferne paulo decumbentes, subrobusti, profunde striati sou sulcati, pilis patentibus flexuosis subtomentosi, parum ramosi. *Folia* fere sessilia, digitata; *foliolis* 27–31, fere uncinalibus plerumque oppositis, nunc oblongis, obtusis, nunc linearis-oblongis, subacutis, basi in petiolulum per breve attenuatis, supra glabris late-viridibus, superne margine rachiibusque pilis longis flexuosis hirsutissimis. *Stipulae* semiuncianae longe, e lata basi sensim acuminatae, membranaceae. *Pedunculi* folio longiores, hirsuti, striati. *Racemi* digitatae et ultra, laxi, floribus ochroleucis pendulis. *Bractea* subulate, pilosa, pedicellis longiores. *Calyx* oblongus, pilis nigris albis intermixtis tectus, dentibus brevibus subulatis. *Vexillum* ovatum, attenuatum, obtusum, alis longius. *Carina* obtusa. *Stamina* dia-delta, 1, 9. *Germen* glabrum, zeare, compressum, sublonge stipitatum, stylo curvato terminatum. *Stigma* obtusum. *Legumen* cartilagineum, glabrum, fere duas uncias longum, linearis-cylindraceum, semiliboculare, intus subpongiosum, polyspermum, *sutura superiore* lata, obtusa, prominente, *inferiore* valde introflexa profunde sulcata, ita ut legumen, sectione transversa, bilobum videatur. *Semina* reniformia, glabra, podo-spermo longo filiformi.

HAB. First, I believe, gathered by Mr. Wright, very many years ago, in Hudson's Bay. (*Herb. nostr.*) Eagle and Red-Deer Hills of the Saskatchewan. *Douglas*. Carlton-House. *Dr. Richardson*.—The present very fine species, which Mr. Douglas wishes should bear the name of the indefatigable Drummond, has been long known to me from a specimen gathered more than thirty years ago, by Mr. Wright, son of the late eminent Dr. Wright of Edinburgh, in Hudson's Bay, but which, from its habit, (and being destitute of fruit,) I was led to refer to the genus *Phaca*. Its nearest affinity seems to be with the *A. galeoides*, Nutt., (*A. racemosus*, Pursh and De Cand.): but that, besides being an inhabitant of more southern latitudes, is described as only subpubescent, whereas our plant is so remarkable for its hairiness, that Mr. Douglas in his MSS. has aptly compared it to the *Oxytropis pilosa* of the Old World.*

TAB. LVII. *Astragalus Drummondii*. Fig. 1, Flower; fig. 2, Aka and carina, including the stamens and

* There is another species of *Astragalus* described in Mr. Douglas' MSS. under the name of—" *A. miser*; caulescens, debilis, stipulis acuminatis, folioli linearibus 5–6-jugis subpubescentibus, calycibus nigricantibus.—On low hills of Spokau River, sixty miles from its confluence with the Columbia. Fl. May, June, &c." But of this I have seen no specimen.

pistil; *Ag. 3.* Pistil; *Ag. 4.* Raceme, with fruit:—natural size. *Fig. 5.* Section of a legume; *Ag. 6.* Seed:—all but *fig. 4* more or less magnified.

TRIB. III. HEDYSAREÆ. DC.

16. DESMODIUM. DC.

Cal. basi bibracteolatus ad medium obscure bilabiatus, labio superiore bifido inferiore tripartito. *Cor.* papilionacea; *verillo* subrotundo, *carina* obtusa non truncata, *alis* carina longioribus. *Stamina* diadelpha (9 et 1) filamentis subpersistentibus. *Legumen* constans articulis plurimis ad maturitatem secedentibus compressis monospermis membranaceis coriaceis, non aut vix dehiscentibus.—Herbae aut suffrutices *plerique aquinoctiales*. Folia nunc trifoliolata seu 1-juga cum impari, nunc simplicia dicta nempe ad impar foliolatum reducta ideo unifoliolata. Stipellæ 2 ad basin folioli extremit, 1 ad quodque laterale. Racemi terminales sepius laxi. Pedicelli 1 aut 3 ex bractearum axillis orti filiformes, 1-flori. Flores purpurei carulei aut albi, minores quam in *Hedysaro*. DC.

(SECT. TRIFOLIOLATA, foliis pinnatim 3-foliolatis, foliolo impari ceteris parum majore. DC.)

1. *D. canadense*; caule erecto pilosuscupo striato, foliolis oblongo-lanceolatis glabrusculis, stipulis linearisubulatis, racemis terminalibus terminalibusque simplicibus vel paniculatis, bracteis lanceolatis, leguminis articulis 4-5 rotundato-triangularibus pubescenti-hispidis.—*De Cand. Prodr.* v. 2. p. 328.—*Hedysarum canadense*. Linn. *Sp. Pl.* p. 1054. *Pursh, Fl. Am.* v. 2. p. 481. *Elliott, Carol.* v. 2. p. 214. *Bigel. Fl. Bost.* ed. 2. p. 275. —*a. minor*; foliolis ellipticis. *Hedysarum ciliare?* *Pursh, Nutt.*

HAB. Throughout Canada, as far as Norway-House, in lat 54°.—*Flowers small. Leaflets variable;* in *a.*, 2-3 inches long, broadly lanceolate and gradually acuminate; in *b.* elliptical; and this latter state agrees very well with the character of *Hedysarum ciliare*, in Pursh and Nuttal's Floras.—The *Hedysarum paniculatum*, again, appears to be hardly distinct from the present species.

2. *D. bracteosum*; caule erecto glabro, foliolis oblongo-ovalibus acuminatis glabris, stipulis subulatis, racemo terminali sparsiflоро, bracteis ovatis acuminatis striatis glabris, leguminis articulis subovalibus. *De Cand. Prodr.* v. 2. p. 329.—*Hedysarum bracteosum*. *Mich. Am.* v. 2. p. 73. *Pursh, Fl. Am.* v. 2. p. 482. *Elliott, Carol.* v. 2. p. 213.—*a. cuspidatum*; foliolis margine scabris, stipulis ovato-lanceolatis, leguminis articulis reticulatis glabris margine pubescentibus. DC.—*Hedysarum cuspidatum*. Willd.—*Pursh, Fl. Am.* v. 2. p. 483.

HAB. *a.* Near Fort-Erie, rare; *a.* near Queenstown, on the Niagara. Douglas.

3. *D. acuminatum*; caule erecto simplici parce pubescente, foliis longissime petiolatis, foliolis (amplis) tenui-membranaceis rotundato-ovatis anguste acuminatis subpilosis terminali latissimo longe petiolulato, pedunculo longissimo, panicula elongata subsimplici pauciflora, leguminis stipitati articulis subtribus obtuse triangularibus pubescentibus.—*De Cand. Prodr.* v. 2. p. 329.—*Hedysarum acuminatum*. *Mich. Am.* v. 2. p. 72. *Pursh, Fl. Am.* v. 2. p. 483. *Elliott, Carol.* v. 2. p. 209. *Bigel. Fl. Bost.* ed. 2. p. 275.

HAB. Upper Canada, Lake Huron. Dr. Todd.

4. *D. nudiflorum*; caule erecto simplici glabriuscculo, foliolis lato-ovatis acuminatis,

acapo paniculato glabro radicali caule foliifero altiore, leguminis articulis subrotundotriangularibus glabriusculis.—*De Cand. Prodr. v. 2. p. 330.*—*Hedysarum nudiflorum. Linn. Sp. Pl. p. 1056. Pursh, Fl. Am. v. 1. p. 483. Elliott, Carol. v. 2. p. 209. Bigel. Fl. Bost. ed. 2. p. 275.*

HAB. Canada. About Quebec. Mr. Cleghorn.

5. *D. pauciflorum*; caule decumbente humillimo-filiformi, foliis longissime petiolatis, foliolis lato-ovatis acuminatis pubescenti-ciliatis terminali rhomboideo, stipulis obsoletis, racemo terminali pedunculato paucifloro folium vix excedente.—*De Cand. Prodr. v. 2. p. 330.*—*Hedysarum pauciflorum. Nutt. Gen. v. 2. p. 109.*

HAB. Canada. Mr. Goldie.—My specimen of this from Mr. Goldie exactly accords with an original one in my Herbarium, from Mr. Nuttall. In neither is the panicle shorter, but rather longer, than the leaves.

17. HEDYSARUM. Jaum. DC.

Cal. 5-fidus, lacinii linearis-subulatis subaequalibus. Cor. vexillo ampio, carina oblique truncata, alis carina multo brevioribus. Stam. diadelpha (9 et 1); genitalium fasciculus abrupte infractus. Legumen constans articulis plurimis compressis monospermis orbiculariatis lenticularibus regularibus medio inter se connexis, et ideo ad utramque suturam convexis.—Herbae aut suffrutices. Folia impari-pinnata. Pedunculi axillares simplices. Racemi spicati. Flores majusculi purpurei albi aut ochroleuci. DC.

SECT. LEIOLOBIUM, *leguminum articuli laves, nec echinati, nec (manifeste) pilosi. Calycis laciniae corolla breviores. DC.*

1. *H. boreale*; caule erecto stricto basi decumbente, foliis subsessilibus, foliolis 8–12-jugis oblongis subtus pilosiusculis, stipulis coalitis vaginantibus lacinii subulatis, racemis elongatis longe pedunculatis, floribus numerosis subsecundis subimbricatis reflexis, vexillo alis carina multo brevioribus, leguminis articulis 3–4 suborbicularibus glabris pubescentibus reticulatis compressis.—*Nutt. Gen. v. 2. p. 110. De Cand. Prodr. v. 2. p. 348.*—*H. alpinum. Mich. Am. v. 2. p. 74. Pursh, Fl. Am. v. 2. p. 484. (var. s.) Rich. in Frankl. 1st Journ. ed. 2. App. p. 28. (non Linn.)*

HAB. Northern Canada. Michaux. Woody and barren grounds of North America, from the Saskatchewan to the Arctic Circle, Dr. Richardson, and to the Rocky Mountains, in lat. 54°. Drummond. Kotzebue's Sound, in Behring's Strait. Messrs. Lay and Collie.—This is certainly distinct from the Siberian *H. alpinum*, being greatly taller, with much shorter stipules, nearly sessile leaves, vastly longer peduncles and racemes, and smaller, more deflexed flowers.—The "ragose" appearance noted in the joints of the lomentum of this, by Mr. Nuttall, and of the following, by Dr. Richardson, appears to be owing to veins or bundles of vessels. Mr. Drummond observes that the bears are very fond of the roots of this plant.

2. *H. Mackenzii*; caulescens, decumbens, foliis pinnatis, foliolis oblongis utrinque canescens-pilosis, stipulis vaginantibus, articulis lomenti transversim rugosis pilosis. Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.—*s. foliis supra ovariisque glabris.—H. boreale?* Rich. in Frankl. 1st Journ. ed. 1. App. p. 745.

HAB. Barren grounds, north of lat. 64°, as far as the shores of the Arctic Sea. Dr. Richardson, in the 1st Journ. In the 2d Journ. it was found at the Saskatchewan, about Carlton-House, and thence westward to the mountains. Drummond. Mr. Douglas found it on the Eagle and Red-Deer Hills of the Saskatchewan.—

This has the largest and brightest coloured blossoms, perhaps, of any of the genus: the vexillum is about as long as the carina. *Raceme* short and broad, obtuse, of from 7 to 10 spreading flowers. It is fully described by Dr. Richardson, in the place above quoted, where it is observed that it is the *Liquorice* plant mentioned by Sir Alexander Mackenzie, in his *Voyage to the Arctic Sea*.

18. LESPEDEZA. Mich.

Cal. basi bracteolatus 5-partitus, lacinias subæqualibus. *Cor.* papilionacea, *carina* transverse obtusa. *Stamina* diadelpha (9 et 1.) *Legumen* lenticulare compresso-planum indehiscens monospermum inerme.—*Caulis* herbacei aut suffruticosi. *Folia* 3-foliolata, foliolis integris medio petiolato. *Stipulae* *caulinae* *setacea*. *Spicæ* *pedunculatae* aut *subracemosæ*. *Bractæ* 3-fidae 2-flora. *Flores* *violaceo-purpurei* aut *ochroleuci* *vexillo* *purpleo-maculato* aut *rarius* *albi*. DC.

1. *L. reticulata*; erecta, simplex vel ramosa, foliolis linearibus obtusis mucronatis subtus strigoso-pubescentibus, racemis subumbellatis axillaribus subsessilibus, leguminibus reticulatis calyce majoribus. *Pers. Syn. Pl.* v. 2. p. 318. *De Cand. Prodr.* v. 2. p. 348.—*L. sessiliflora*. Mich. Am. v. 2. p. 70, (var.) *Pursh, Fl. Am.* v. 2. p. 480. (non Nutt.) *Elliott, Carol.* v. 2. p. 204. *Bigel. Fl. Bost. ed.* 2. p. 273.—*Hedysarum reticulatum*. Muhl. in *Willd. Sp. Pl.* v. 3. p. 1194.

HAB. Canada. Dr. Holmes, (Herb. Greville.)

2. *L. polystachya*; erecta, ramosa, villosissima, petiolis brevissimis, foliolis rotundovalibus obtusis, spicis oblongis axillaribus folio duplo longioribus pedunculatis, calycibus corollam æquantibus vix legumine sublongioribus. DC.—Mich. Am. v. 2. p. 71. t. 40. *Pursh, Fl. Am.* v. 2. p. 480. *Bigel. Fl. Bost. ed.* 2. p. 172. *De Cand. Prodr.* v. 2. p. 349.

HAB. Upper Canada. Mr. Goldie. Common about Sandwich. Douglas.

3. *L. prostrata*; prostrata, gracilis, glabra, petiolis subabbreviatis, foliolis ellipticis obtusis mucronatis subtus vix subpubescentibus, racemis axillaribus gracilibus dissitifloris folio longioribus, calycibus corolla brevioribus, leguminibus ovatis subpubescentibus. DC.—*Pursh, Fl. Am.* v. 2. p. 481. Nutt. Gen. v. 2. p. 108. *Elliott, Carol.* v. 2. p. 208. *Bigel. Fl. Bost. ed.* 2. p. 274. *De Cand. Prodr.* v. 2. p. 350.

HAB. Upper Canada. Douglas.—This appears to me to be a nearly glabrous var. of *L. procumbens*, Mich. Am. t. 39. Of this genus, eight species are given as inhabitants mostly of the middle States of North America; and six as growing in the vicinity of Boston. All the latter, it can scarcely be doubted, are equally indigenous to the southern parts of Canada; never extending, perhaps, beyond the great lakes. Hence it is that there is not a single species in Dr. Richardson's or Mr. Drummond's Collection; nor does any one of them inhabit Western America.

TRIB. IV. VICIEÆ. Brown. DC.

19. VICIA. Tourn.

Cal. tubulosus, 5-fidus aut 5-dentatus, dentibus 2 superioribus brevioribus. *Cor.* papilionacea. *Stamina* diadelpha. *Style* filiformis, angulum fere rectum cum ovario conficiens, superne et infra apicem subtus villosus. *Legumen* oblongum, 1-loculare, polyspermum. *Semina* bilo laterali ovali aut lineari.—*Herbae* *sæpius* *scandentes*. Folia

abrupte pinnata pluri-juga, petiolo in cirrum saepius ramosum producto, stipulis saepe sagittatis. Pedunculi axillares aut elongati multiflori, aut 1-flori breves.

* *Floribus pedunculatis.*

1. *V. Caroliniana*; glabriuscula, foliolis 8-10 elliptico-lanceolatis subalternis obtusis mucronatis, stipulis ovato-lanceolatis integerrimis parvis, pedunculis multifloris, floribus distantibus, dentibus calycinis brevibus, stylis apice villosis, leguminibus lanceolatis glabris oblique reticulatis. DC.—“Walt. Fl. Carol. p. 182.” Pursh, Fl. Am. v. 2. p. 472. Elliott, Carol. v. 2. p. 224. De Cand. Prodr. v. 2. p. 355.—*v. parviflora*. Mich. Am. v. 2. p. 69.

HAB. Upper Canada, near the Lakes. *Douglas.*

2. *V. Americana*; glabriuscula, foliolis 8-12 elliptico-lanceolatis obtusis vel retusis nonnunquam denticulatis mucronatis, stipulis semisagittatis profunde dentatis, pedunculis folio brevioribus 6-8-floris, leguminibus linearis-oblongis compressis reticulatis glabris.—Muhl. in Wild. Sp. Pl. v. 3. p. 1096. Pursh, Fl. Am. v. 2. p. 472. Rich. in Frankl. 1st Journ. ed. 2. App. p. 28. De Cand. Prodr. v. 2. p. 355.—*s. minor*; foliolis angustis linearis-lanceolatis subrigidis, pedunculis 2-4-floris.

HAB. Woody country from the Falls of Niagara to Bear Lake. Dr. Richardson: to the Rocky Mountains, *Drummond*. Near the source of the Columbia. *Douglas.* *s.* On the Saskatchewan about Carlton-House, *Drummond*; and at Red River. *Douglas.*—Flowers large, handsome, purple-blue.

3. *V. Cracca*; caulis ramosis, foliis apice cirrhosis, foliolis numerosis oblongis alternis oppositisque puberulis mucronatis, nervis subparallelis simpliciusculis, stipulis semisagittato-linearibus, pedunculis multifloris folium æquantibus vel superantibus, racemis confertis secundis, dentibus calycinis inæqualibus, superioribus brevissimis inferioribus tubo brevioribus, stylis apice pilosis, leguminibus oblongis coriaceis reticulatis compressis glabris, seminibus globosis nigris. DC.—Linn. Sp. Pl. p. 1095. Mich. Am. v. 2. p. 69. Pursh, Fl. Am. v. 2. p. 472. Bigel. Fl. Bost. ed. 2. p. 269. De Cand. Prodr. v. 2. p. 357. Engl. Bot. t. 1168.

HAB. Canada. *Michaux*; *Lady Dalhousie*; *Mrs. Percival*; *Mr. Cleghorn*. Newfoundland. *Mr. Morrison.*

4. *V. gigantea*; subpubescens, siccitate nigricans, caule sulcato, foliolis 20-26 oblongis petiolulatis obtusis mucronatis, stipulis magnis semisagittatis basi profunde dentatis, pedunculis folio multo brevioribus 5-10-floris, floribus congestis, stylo vix barbato, leguminibus lato-oblongis glabris obscure reticulatis.

HAB. Open woods on the Columbia. Dr. Scouler; *Douglas*.—This is a very remarkable plant, with long, trailing, deeply sulcated stems, and one-third of an inch broad, hollow and herbaceous. The leaves are eight or nine inches long, excluding the tendrils; leaflets full two inches, and stipules an inch and a half in length. Flowers apparently purple when recent, about as large as those of *V. Americana*, consequently small in proportion to the size of the plant. Style linear, downy, but scarcely bearded below the stigma. Legumes three inches long, and three-fourths of an inch broad. The whole plant turns nearly black in drying, like the *V. nigricans*, (Hook. and Arn. in Bot. of Capt. Beechey's Voy.), from the western shores of South America; and others, from the Cordillera of the same country.

* * *Floribus subsessilibus.*

5. *V. sativa*; foliis cirrhosis, foliolis 10-12 obovato-retusis vel oblongo-retusis mucronu-

latis pilosis vel glabriusculis, stipulis semisagittato-dentatis, floribus subgeminis sessilibus, calycibus cylindraceis, laciinis lanceolato-linearibus subæqualibus parallelis tubi longitudine, stylis apice barbatis, leguminibus compressis subtorulosis oblongis reticulatis erectiusculis, seminibus subglobosis subvelutinis. *De Cand. Prodr. v. 2. p. 360. Engl. Bot. t. 334. Mich. Am. v. 2. p. 69. Pursh, Fl. Am. v. 2. p. 471. Bigel. Fl. Bost. ed. 2. p. 270.*

HAB. Canada. Mrs. Sheppard. About Fort-Vancouver. *Douglas*.—Probably an introduced plant.

20. ERVUM. Linn.

Cal. 5-fidus, laciinis linearibus acutis, corollam subæquantibus. Stigma glabrum. Legumen oblongum. DC.

1. *E. hirsutum*; foliis cirrhosis, foliolis linearibus obtusis mucronulatis, stipulis semi-sagittatis angustis, pedunculis 3-6-floris folio brevioribus, laciinis calycinis lanceolato-linearibus æqualibus tubo longioribus, leguminibus oblongis compressis subtruncatis hirsutis tenuissime reticulatis dispermis nutantibus, seminibus globosis variegatis. *DC.*—*Linn. Sp. Pl. p. 1039. Engl. Bot. t. 971. De Cand. Prodr. v. 2. p. 366.*—*Vicia Mitchelli*. *Rafin.*—*Elliott, Carol. v. 2. p. 224. De Cand. Prodr. v. 2. p. 360.*

HAB. Cultivated in the garden of the Horticultural Society, from seeds gathered near Fort-Vancouver, (where it was probably introduced.) *Douglas*.—My specimens of *Vicia Mitchelli* from Mr. Elliott himself, prove it to be merely *E. hirsutum*.

2. *E. tetraspermum*; caulibus cæspitosis ramosis, foliis cirrhosis, foliolis 4-6 oblongis mucronulatis, stipulis lanceolato-semisagittatis, pedunculis 1-4-floris filiformibus, laciinis calycinis inæqualibus latiusculis tubo brevioribus, leguminibus oblongis compressis glabris enervis subtorulosis, seminibus subglobosis atris.—*Linn. Sp. Pl. p. 1039. Engl. Bot. t. 1223. De Cand. Prodr. v. 2. p. 367.*—*Vicia pusilla. Muhl. in Willd. Sp. Pl. v. 3. p. 1106. Pursh, Fl. Am. v. 2. p. 471. Bigel. Fl. Bost. ed. 2. p. 270.*

HAB. Grassy meadows, Upper Canada. *Douglas*.

21. LATHYRUS. Linn.

Cal. campanulatus, 5-fidus, lobis duobus superioribus brevioribus. Cor. papilionacea. Stam. diadelpha. Stylus complanatus, apice dilatatus, antice villosus aut pubescens. Legumen oblongum, polyspermum, bivalve, 1-locul. Semina globosa aut angulata.—Herbæ *sepius scandentes. Stipulae semisagittatae. Petoli apice in cirrhum ramosum abeunt. Foliola 1-3-juga. Pedunculi axillares. DC.*

1. *L. pisiformis*; glabriusculus, foliolis 3-4-jugis ovalibus, stipulis inæquilateraliter cordato-hastatis angulis acutis foliolo æqualibus, pedunculis multifloris folio subbrevioribus, (corollis purpureis), laciinis calycinis duabus superioribus abbreviatis, leguminibus linearis oblongis compresso-teretibus subfalcatis, apice ad suturam superiorem acuto.—*Linn. Sp. Pl. p. 1034. Willd. Sp. Pl. v. 3. p. 1093. De Cand. Prodr. v. 2. p. 371.*—*L. maritimus. Bigel. Fl. Bost. ed. 2. p. 268.* (fide specim. ab amiciss. Boott.)—*L. Californicus. Douglas, in Bot. Reg. t. 1144, (certe.) L. venosus. Sweet, Br. Fl. Gard. 2d. Ser. t. 37. (non Willd.) Bigel. Fl. Bost. ed. 1. p. 167, (non ed. 2.) Boott in Herb.*—*Pisum maritimum. Linn. et*

akorum. Engl. Bot. t. 1047. Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.—Gmel. Fl. Sib. v. 4. p. 7. t. 1.

HAB. Throughout North America, in the plains (beyond lat. 40° ?) from Lake Erie in the south, (*Dr. Todd; Douglas*) about Quebec and Montreal, (*Lady Dalhousie; Mrs. Percival*), Saskatchewan, (*Dr. Richardson; Douglas*), to the shores of the Arctic Sea, (*Dr. Richardson*), Newfoundland and Labrador on the east, (*Mr. Cormack; Mr. Morrison*; and Murray Bay, mouth of the St. Lawrence, *Mrs. Sheppard*). North-West America, from the coast of California and the mouth of the Columbia, (*Dr. Scouler; Douglas*) to Kotzebue's Sound in Behring's Strait. *Messrs. Lay and Collie.*—Botanists will see with surprise, and I fear too, with some suspicion of the correctness of the measure, that I have united the well-known *Pinum maritimum* of our shores with a Siberian *Lathyrus*, and have added to the same the most universally diffused Leguminosæ plant in all the temperate and colder parts of North America. I have not done so, however, without the most cautious scrutiny of numerous specimens. Let any one carefully examine the *stylis* of *Pinum maritimum*, and compare it with that of *Pinum sativum*, or any indisputable *Pinum*, and it will be at once seen that they are very different; the former wanting altogether the sharp carinate ridge on the superior side, (caused by the reflexion of the margins,) on the upper part of which the down is produced. If, again, this *style* be compared with that of the true *Lathyrus*, it will be found to accord in every essential particular, though it is not so much dilated upwards as in many. It is a *stylus compressus sursum dilatatus antice villosus aut pubescens*: and it precisely corresponds with the same part of the flower in the American *Lathyrus* above quoted. This being determined, it remained for me to see what were the specific differences between the plants in question. I could find none. Upon the sandy and stony shores, the plant is humble in its growth, and compact; in the woody districts it becomes larger and more straggling. The stipules I always find to be cordato-hastate, with their sides, at the base, unequal (sometimes toothed,) rather than semi-sagittate. The legumes are slightly pubescent in British and American specimens. The leaves and calyx are mostly somewhat downy or hairy, the latter especially on the teeth; but at other times the whole plant is perfectly glabrous. My specimens from the West coast of North America are usually more lax, flaccid, and drawn up, as it were, as if inhabiting woods: others, again, from the same coast, are more compact, and of a firmer texture, exactly corresponding with cultivated specimens from the Horticultural Society's Garden, of which the representation in the *Botanical Register* is excellent. I acknowledge that in calling this plant by the name of *L. pisiformis*, Linn. and Gmelin, I have no other authority than the figure and description of the latter author: but our plant is so entirely in accordance with them, that I think there can hardly remain a doubt on the subject.

2. *L. ochroleucus*; glaberrimus, foliolis 3–4-jugis lato-ovalibus ovatisve, stipulis latis semi-cordatis subhastatis angulis obtusis nunc obtuse dentatis foliolo vix minoribus, pedunculis multifloris folium subæquantibus, (corollis ochroleucis,) laciniis calycinis duabus superioribus abbreviatis, leguminibus (nondum maturis) linear-i-elongatis acuminate compressis glaberrimis.—*L. pisiformis*, var. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 28.*

HAB. Hudson's Bay. *Mr. R. Wright.* From the Red River, in lat. 49° , (*Douglas*), through the whole woody country to Bear Lake, in lat. 66° . *Dr. Richardson; Drummond.*—This plant is, indeed, very nearly allied to the preceding; yet in all the specimens I possess, the stipules are rather smaller (often considerably so) than the leaflets, having at the base only one lobe; the flowers are smaller, ochroleucous, and the whole plant is more delicate and quite glabrous. In Dr. Richardson's *L. pisiformis*, which, indeed he referred doubtfully to the *L. pisiformis* of Willd., the lower stipules are as small as those of the following species; while the upper ones are very large.

3. *L. decaphyllus*; glaber vel pubescens, foliolis 4–6-jugis ellipticis rarius ovatis vel suboblongis, stipulis parvis semisagittatis lanceolatis lobo deflexo stipulam subæquante, pedunculis folii longitudine multifloris, calyce dense pubescente, dentibus duobus

superioribus valde abbreviatis, (corollis purpureis,) leguminibus—?—*Pursh, Fl. Am.* v. 2. p. 471.

HAB. Banks of the Saskatchewan; abundant. *Dr. Richardson; Drummond*. Bushy places in North-West America. *Douglas*.—I doubted whether I might not refer this plant to the *L. venosus* of Muhl. in Willd., since it is described as being similar to *L. piniformis*, "except in the stipules being much smaller;" but then their shape is different, the leaflets are described as much broader, and the whole plant as glabrous. Again, the *L. polymorphus* of Nuttall accords, in some respects; but it is said to be glabrous. In regard to its being the *L. decaphyllus* of Pursh, I can only say that the short description of that author, unsatisfactory as it is, agrees with it, except that the number of flowers upon a peduncle is greatly more than three or four. Still I have been very unwilling to swell unnecessarily the number of species of a genus already too much encumbered with questionable ones. The present individual is large and straggling; many of its leaflets two and a half to three inches long. Stems square, striated, and, as well as the whole plant, sensibly downy. Calyx thickly downy. The stipules, however, afford the most essential character by which this may at once be distinguished from the preceding. They are small, lanceolate, sagittate, the lobe so long and so deflexed that in general the stipule appears to be lanceolate, acuminate at both extremities, and attached by the margin at the middle. In the present, and all the foregoing broad-leaved species, the style is nearly linear, slightly dilated upwards, the lower margin a little recurved, just where it unites with the germen, the rest plane, compressed, with the down occupying a considerable length of the upper and plane surface.

4. *L. stipulaceus*; glaberrimus, caule acute tetragono (vix alato), foliolis 3-jugis ellipticis mucronatis, stipulis ovato-semisagittatis acuminatis magnis, pedunculis 4-6-floris folio longioribus, leguminibus (immaturis) linearibus acuminatis compressis glabris.—"Le Conte in Cat. Pl. New York, p. 92." *De Cand. Prodr.* v. 2. p. 371.

HAB. Upper Canada. *Mr. Goldie*. Lake Huron. *Dr. Todd*.—In foliage, this is intermediate between the preceding broad-leaved species, and the following narrow-leaved one; in the stipules, between *L. ochroleucus*, and *L. decaphyllus*; and it is possible it may be included in the *L. polymorphus* of Nuttall. The stipules are not half the size of those of *L. ochroleucus*, while they are thrice the size of, and greatly broader than, those of the *L. decaphyllus*. I have received the same plant, without a name, both from Philadelphia and New York; but I have no specimen from the British Possessions, save from the localities above-mentioned. The plant well accords with the *L. stipulaceus* of Le Conte, only that its stem is rather acutely 4-angular, than winged, as it is in the following species.—I am still unacquainted with any North-American *Lathyrus* which will entirely agree with the *L. venosus* or *L. myrtifolius*, both of Muhl., in Willd. Sp. Pl., and I introduce them here upon the authority of Mr. Douglas. All the North American *Lathyrus* have their leaves very, and almost equally, veiny.

5. *L. venosus*; caulinis tetragonis non alatis, foliis multijugis, foliolis ovatis obtusis suboppositis mucronatis glabris, cirrhis trifidis, stipulis semisagittato-cvatis, pedunculis multifloris folio brevioribus, leguminibus—? *DC*.—*Muhl. in Willd. Sp. Pl.* v. 3. p. 1092. *Pursh, Fl. Am.* v. 2. p. 471. *Nutt. Gen. v. 2. p. 96.* *De Cand. Prodr.* v. 2. p. 371.

HAB. Common throughout the great chain of lakes in Upper Canada: plentiful on the Red River and the River Winnipeg. *Douglas*.

6. *L. myrtifolius*; caule debili flexuoso tetragono non alato, foliis 2-3-jugis, foliolis oblongo-lanceolatis obtusiusculis mucronatis rigidiusculis glabris venoso-striatis, cirrhis trifidis, stipulis semisagittato-lanceolatis acuminatis margine scabris, pedunculis 3-4-floris folio longioribus, leguminibus—? *DC*.—*Muhl. in Willd. Sp. Pl.* v. 3. p. 1091. *Pursh, Fl. Am.* v. 2. p. 471. *Nutt. Gen. v. 2. p. 96.* *De Cand. Prodr.* v. 2. p. 371.

HAB. Near Fort-Erie, and on the banks of the Niagara to Queenstown. *Douglas*.

7. *L. palustris*; plerumque glaberrimus, caulibus erectiusculis alatis, foliolis 3-jugis oblongo-lanceolatis obtusiusculis mucronatis rigidiusculis, stipulis parvis lanceolatis semi-sagittatis loboque acuminato deflexo acuminatis, pedunculis 3-5-floris, leguminibus latolinearibus compressis acuminatis pubescentibus.—*Linn. Sp. Pl. p. 1034. Engl. Bot. t. 169. Mich. Am. v. 2. p. 66. Pursh, Fl. Am. v. 2. p. 471. Bigel. Fl. Bost. ed. 2. p. 269. De Cand. Prodr. v. 2. p. 371.*—*p. major.*

HAB. Abundant throughout Canada, and as far north as the Saskatchewan. *Lady Dalhousie, Mr. Goldie, Mr. Cleghorn, Mr. Todd.*—*p. Straits of De Fuca, North-West America, in lat. 48°. Dr. Scouler.*—This species entirely agrees with our European *L. palustris*. The stipules resemble those of *L. decaphyllus*.

TRIB. V. PHASEOLEÆ. Br. DC.

22. AMPHICARPÆA. Ell. DC.

Cal. campanulatus 4-dentatus basi ebracteolatus, dentibus æqualibus subulatis. *Corolla* papilionacea, *petalis* oblongis, vexillo lato incumbente subsessili. *Stam.* diadelpha. *Stylus* filiformis. *Stigma* capitatum. *Ovari stipes* vaginula cylindrica vestitus. *Legumen* compressum stipitatum 1-4-spermum.—*Caulis herbacei volubiles. Folia pinnata 1-juga cum impari, foliolis ovatis glabris. Racemi axillares. Bractæ bifloræ. Flores sepe apetalii, caulinæ steriles aut legumina radicalibus dissimilia gerentes, radicules sapius fertiles.* DC.

1. *A. monoica*; racemis pendulis corollatis.—*Ell. Journ. Nat. Sc. Philad. v. 1. p. 373, Carol. v. 2. p. 233. Nutt. Gen. v. 2. p. 113. De Cand. Prodr. v. 2. p. 383.*—*Glycine monoica.* *Linn. Sp. Pl. p. 1023. Mich. Am. v. 2. p. 64. Pursh, Fl. Am. v. 2. p. 485. Bigel. Fl. Bost. ed. 2. p. 276.*

HAB. Upper Canada. *Mrs. Percival.* La Grande Chaudière. *Pursh, MSS.*

23. APIOS. Boerh.

Cal. campanulatus dentibus 4 obsoletis, 1 acuto sub carina elongato. *Cor. papilionacea, carina falcata* linearis vexilli apicem reflectente. *Stam.* diadelpha. *Ovari stipes* tubulo vaginatus. *Stigma* emarginatum. *Legumen* polyspermum et (ex *Pursh*) biloculare, seminibus dissepimento interceptis.—*Herba scandens glabra. Radix tuberosa edulis. Folia impari-pinnata. Racemi axillares. Flores fusco-purpurei odori. Bractæ calyci adpresso caducissimæ.* DC.

1. *A. tuberosa*.—*Mench, Ludg. 2. p. 53. Elliott, Carol. v. 2. p. 232. Pursh, Fl. Am. v. 2. p. 473. De Cand. Prodr. v. 2. p. 390.*—*Glycine Apios.* *Linn.*—*Mich. Am. v. 2. p. 83. Bigel. Fl. Bost. ed. 2. p. 277. Sims in Bot. Mag. t. 1198.*

HAB. Canada, about Quebec. *Lady Dalhousie, Mrs. Percival.*

24. PHASEOLUS. Linn.

Cal. campanulatus bilabiatus, labio superiore bidentato, infer. tripartito. *Cor. papilionacea, carina cum staminibus diadelphis* styloque spiraliter contorta vel rarius incurva. *Ovari stipes* toro vaginulatus. *Legumen* compressum aut cylindricum bivalve intus isthmis cellulosis subdistinctum polymorphum. *Semina* hilo ovali-oblongo.—*Herbea aut suffrutescens sapius volubiles. Folia pinnato-trifoliolata, foliolis basi stipellatis. Racemi axillares. Pedicelli sapius gemini, semper 1-flori.* DC.

1. *P. helvolus*; caule volubili, foliolis deltoideo-oblongis subeiuatiis, pedunculis folio longioribus apice trifloris, corolle vexillis brevibus, alis expansis maximis, leguminibus teretibus erectis. DC.—Linn. Sp. Pl. p. 1017. Mich. Am. v. 2. p. 60. Pursh, Fl. Am. v. 2. p. 470. De Cand. Prodr. v. 2. p. 390.—*Strophostyles helvola*. Elliott, Carol. v. 2. p. 280.—*Glycine helvola*. Elliott in Journ. Ac. Sc. Philad. 1818, p. 385.—*Glycine umbellata*. Willd. ?—Dill. Elth. t. 312. f. 300.

HAB. Near Montreal. Mr. Cleghorn, (in Herb. nostr.)

25. LUPINUS. Tourn.

Cal profunde bilabiatus. *Cor*. papilionacea, vexillo lateribus reflexis, carina ecuminata. *Stamina* monadelpha, vagina integra, antheris 5 parvis subrotundioribus præcocioribus, 5 oblongis serioribus. *Stylus* filiformis. *Stigma* terminale subrotundum barbatum. *Legumen* coriaceum oblongum compressum oblique torulosum. *Cotyledones* crassæ per germin. in folia conversæ.—Herbea aut suffrutescens. Stipula petiolo adnatae. Folia sapius foliolis 5-9 digitatis constantia, rarius simplicia. Foliola ante explicat aut per somnum complicata. Pedunculi oppositifolii terminales. Flores racemoso-spicati alterni aut verticillati, pedicellati aut sessiles. Bractea sub pedicellis.

* Herba annua. Bracteola 2 lateraliter calyci adnatae caducæ aut nulla. DC.

1. *L. bicolor*; annuus, caule ramoso procumbente folioso foliisque pilosis vix sericeis, foliolis 5-7 lineari-spathulatis, verticillis paucifloris, calycibus sericeo-lanatis inappendiculatis, labio superiore bifido, inferiore elongato integro, alis vexillo longioribus, leguminibus polyspermis.—Lindl. in Bot. Reg. t. 1109.

HAB. Common under the shade of solitary Pine trees, near the ocean, on the North-West coast of America, and thence as far east as the valleys of the Rocky Mountains. Douglas.—A humble, procumbent, branching annual, with small purple or blue and white flowers. Specimens of it are in my Herbarium, gathered by Mr. Menzies in California.

2. *L. micranthus*; annuus, floribus subverticillatis sessilibus bracteolatis, calycis labio superiore bifido, inferiore integro, foliolis 5-7 lineari-spathulatis ciliatis, leguminibus 6-spermis transversim sulcatis, caule ramoso, radicibus granulatis.—Douglas in Bot. Reg. t. 1251.

HAB. On the gravelly banks of the southern tributaries of the Columbia, and barren ground in the interior of California.—Of this I possess no specimen, and Mr. Douglas himself observes, "that it has much affinity with the *L. bicolor*, differing in flowering from four to six weeks earlier, in being more slender, in the shortness of its ale, its nearly sessile flowers, fleshy leaves, granulated roots, larger pods, and the colour and size of the seeds."

3. *L. pusillus*; annua, parva, pilosissima, caulinibus brevibus basi ramosis, foliolis 5-7 oblongo-lanceolatis obtusis inferne attenuatis, racemis axillaribus lateralibus terminalibusque sessilibus, floribus alternis ebracteolatis, bracteis longitudine calycis cuius labio superiore bifido, inferiore duplo longiore bidentato, leguminibus hispidissimis dispermis, seminibus orbicularibus planis.—Pursh, Fl. Am. v. 2. p. 468. Nutt. Gen. v. 2. p. 93. De Cand. Prodr. v. 2. p. 408.

HAB. On the barren grounds of the Columbia. Douglas.—This is a very singular species, with short,

sessile, many-flowered racemes. The membrane of the filaments is very large, five of the stamens are elongated and barren, five shorter with linear orange-coloured anthers. Legumes about an inch long, each with two flat seeds.

* * *Herbas perennæ.*

† *Flores cærulei, purpurei, rarius albi.*

4. *L. lepidus*; herbaceus, perennis, floribus alternis pedicellatis ebracteolatis, calycis villosi labio superiore bipartito inferiore acuminato elongato, foliolis 5-7 lanceolatis utrinque sericeis, caule flrido erecto subunifolio. *Lindl.*—*Douglas in Bot. Reg. t. 1149.*

HAB. About Fort Vancouver, on the Columbia, and in the valleys of the Blue Mountains, North-West America. *Douglas*.—This and the following species have the stem so bare of leaves, that it might almost be called a scape; whilst in almost all the succeeding species the stem is very leafy.

5. *L. minimus*; herbaceus, dense sericeo-pilosus, parvus, caule 1-2-foliato, foliolis 7-9 lanceolatis acutis inferne attenuatis, floribus alternis verticillatisque, pedicellis ebracteolatis, calycis labio superiore apice bifido, inferiore integro, radice parva subfusiformi.—*Douglas, MSS. in Herb. Hort. Soc.*

HAB. Mountain-valleys in North-West America, near the Kettle Falls; and very abundant towards the Rocky Mountains, along the course of the Columbia. *Douglas*.—This is a small species, scarcely a span high, and allied to the following, but differing in its very dense and silky foliage, in the stem bearing only one or two leaves, (but several radical ones,) and in the usually verticillate flowers.

6. *L. perennis*; herbaceus, floribus alternis pedicellatis bracteolatis, calycis labio superiore submarginato infer. integro, foliolis oblongis mucronatis subtus subvillosis, radice repente. *DC.*—*Linn. Sp. Pl. p. 1015. Mich. Am. v. 2. p. 55. Pursh, Fl. Am. v. 2. p. 467. Elliott, Carol. v. 2. p. 191. Curt. in Bot. Mag. t. 202. Bigel. Fl. Bost. ed. 2. p. 267. Rich. in Frankl. 1st Journ. ed. 2. p. 27.*

HAB. Canada. *Michaux*. Shores of the Arctic Sea. *Dr. Richardson*. Upper Canada, plentiful. *Douglas*. Cape Mulgrave, in Behring's Straits. *Messrs. Lay and Collie*, in *Captain Beechey's Collection*.—Dr. Richardson's specimens have the leaves more acute, and the plant itself somewhat more hairy than in Dr. Boott's specimens from the United States.

7. *L. Nootkaensis*; herbaceus, caulibus patent-pilosissimis, floribus subverticillatis pedicellatis ebracteolatis, calycis valde birsuti labio utroque integro, bracteis linearibus calyce longioribus pilosissimis, foliolis oblongo-lanceolatis obtusis mucronatis inferne attenuatis subtus sericeis. *Donn, Cat. Cant. Pursh, Fl. Am. v. 2. p. 458. Sims in Bot. Mag. t. 1311, and t. 2136.—s. glaber.*

HAB. a. North-West America. *Menzies, Douglas*. Nootka and Unalaschka. (*Pursh, De Cand.*)—a. and b. Rocky Mountains, north of the Smoking River, in lat. 55°.—Of the only two specimens in Mr. Drummond's Collection, one is quite glabrous; the other densely villous and exactly corresponding with the *L. Nootkaensis*, cultivated in the Horticultural Society's Garden, from seeds brought home by Mr. Douglas, and which I consider to be the true state of the plant. It is well represented in the *Bot. Mag. t. 1311*, except that the raceme being in an advanced state, the bracts are wanting, which appear to me to form an essential character in the species; for here they exceed in length the flower-buds, till these are fully expanded. The var. *s.* of *Bot. Mag. t. 2136*, is said to be fruticose and quite hardy.

8. *L. polypyllus*; herbaceus, elatus, foliolis 11-15 lanceolatis subitus hirsutis, floribus alternis longissime racemosis rarius subverticillatis ebracteolatis, pedicellis bractea lanceolata decidua longioribus, calycis utroque labio integro, leguminibus densissime pilosis.—*Lindl. in Bot. Reg. t. 1097.*—*L. regius. Rudolphi.* (according to Mr. Douglas.)

HAB. Common in plains that are occasionally overflowed at the mouth of the Columbia, and at Puget Sound, sometimes with white flowers. *Douglas, Dr. Scouler.*—This is indeed a splendid plant; and one of the greatest ornaments to our gardens that has been introduced for a long time. It grows 3-4 feet high, with racemes a foot or more long.

9. *L. sericeus*; perennis, caule foliisque sericeo-tomentosus, foliis digitatis, foliolis 7-8 lanceolatis acutis utrinque sericeis, calycibus subverticillatis inappendiculatis, labio superiore inciso, inferiore integro. *Pursh, Fl. Am. v. 2. p. 468. De Cand. Prodr. v. 2. p. 408.*

HAB. Banks of the Kooekooskye, one of the southern branches of the Columbia. *M. Lewis.* On the undulating grounds of the Columbia? *Douglas.*—Flowers pale purple or rose-coloured. Ph.

10. *L. argenteus*; perennis, foliis digitatis, foliolis 5-7 lineari-lanceolatis acutis supra glabris subtus argenteo-sericeis, calycibus alternis inappendiculatis, labio superiore obtuso, inferiore integro. *Pursh, Fl. Am. v. 2. p. 468. De Cand. Prodr. v. 2. p. 408.*

HAB. Banks of the Kooekooskye. *M. Lewis.*—Flowers small, cream-coloured. Ph.

11. *L. ornatus*; perennis, floribus verticillatis appendiculatis, calycis labio superiore bifido, inferiore integro elongato, foliolis 7-12 lineari-lanceolatis undique argenteis sericeis, leguminibus 4-5-spermis. *Douglas in Bot. Reg. t. 1216.*

HAB. Near the source of the Columbia, sparingly: plentiful at Kettle Falls, and in the valleys of the Spokane river. *Douglas.*

12. *L. arbustus*; perennis, floribus alternis pedicellatis bracteolatis, calycis labio superiore bifido, inferiore integro acuto, foliolis 7-13 obovato-oblongis utrinque sericeis, leguminibus 3-5-spermis.—*Douglas in Bot. Reg. t. 1230.*

HAB. Under the shade of solitary Pine and Oak trees, near Fort Vancouver and the Plains of the Multnomah river, North-West America. *Douglas.*

13. *L. laxiflorus*; perennis, herbaceus, undique pilosus, floribus subalternis ebracteolatis, calycis labio superiore integro basi saccato, inferiore longiore ovato-acuminato, carina imberbi, vexillo obcordato, foliolis 7-9 lineari-lanceolatis, stipulis minimis subulatis. *Lindl.*—*Douglas in Bot. Reg. t. 1140.*—a. foliolis linearibus, calyce basi minus saccato.—*L. tenellus. Douglas, MSS. in Herb. nostr.*

HAB. a. and b. Frequent in gravelly soils about Fort Vancouver. *Douglas.*—The gibbous or saccate base to the calyx of this species is very remarkable; in the var. a. it almost becomes a spur, though not so represented in the figure above quoted, which on that account, as well as in the narrowness of the leaflets, agrees better with what I here make the var. b. than with my original specimen of *L. laxiflorus* received from Mr. Douglas.

14. *L. littoralis*; perennis, floribus verticillatis pedicellatis ebracteolatis, calycis labio utroque integro, foliolis 5-7 lineari-spathulatis utrinque sericeis, leguminibus 10-12-spermis

transversim sulcatis, radicibus granulatis.—*Douglas in Bot. Reg. t. 1108, in Bot. Mag. t. 2952.*

HAB. Common on the shores of the Pacific, between 40° and 49° north latitude, or from Cape Mendocino to Puget Sound. *Douglas.*—The granulated roots of this species, when roasted on the embers, yield a farinaceous substance, which is in high esteem among the Chenoak Indians as an article of food, and is called in their language " *Somuchtan.*" *Douglas.*

15. *L. albicaulis*; caule elato foliisque numerosis minute pubescenti-sericeis pube subfulvescente, foliolis 7-9 spatulato-lanceolatis mucronatis, floribus plerisque verticillatis bracteolatis, bracteis subulatis subsessilibus pedicellis sericeos aequantibus, calycis fulvo-sericei labio utroque integro.—*Douglas, MSS. in Herb. Hort. Soc.*

HAB. About Fort Vancouver, on the Columbia. *Douglas.*—Specimens of this, exclusive of the root, are two feet long, erect, clothed (as is the whole plant) with a short tawny silky down, and bearing many short leafy branches. The racemes are from eight to ten inches long, remarkable for their numerous persistent *bracteas*, and the fulvous silky dense spreading hairs with which the calyx and pedicels are clothed. The petals appear to have been purple, and to have changed in drying to a tawny brown. This species is a very handsome and distinct one, although its character, and that of all of the genus, is very difficult to be described in words. On that account, I have much satisfaction in being able to refer to the numerous and excellent figures and descriptions in the Botanical Register, taken from the living plants, of so many of Mr. Douglas's discoveries. The present is one of the few, however, which does not appear to be in cultivation. In the dry state of the plant there is nothing to account for the specific name which its author has assigned to it.

16. *L. aridus*; herbaceus, (sericeo-) hirsutissimus, floribus verticillatis pedicellatis bracteolatis, calycis labio superiore bifido, inferiore integro, foliolis 5-9 lineari-lanceolatis villosis, stipulis subulatis.—*Douglas in Bot. Reg. t. 1242.*

HAB. Dry sandy barren deserts of the Columbia; extending from the Great Falls of that river to the sources of the Missouri. *Douglas.*

17. *L. leucophyllus*; herbaceus, villosissimus, floribus alternis pedicellatis bracteolatis, calycis labio superiore bifido, inferiore integro, foliis digitatis, foliolis 7-9 oblongo-lanceolatis, stipulis subulatis lanatis. *Lindl.*—*Douglas in Bot. Reg. t. 1124.*

HAB. Woodless sandy deserts from the Great Falls of the River Columbia, in North-West America, to the sources of the Missouri, among the Rocky Mountains. *Douglas.*—This is a very fine species, having white flowers, or tinged with pink, and the whole stem and foliage and dense racemes (save the corollas) clothed with compact silky hairs. Mr. Lindley observes that this species should rank next to the *L. alopecuroides* of Desrousseaux, a native of Quito.

18. *L. plumosus*; perennis, (sericeo-) villosissimus, floribus alternis breviter pedicellatis bracteolatis, calycis labio superiore bifido, inferiore integro, foliolis 5-7 lanceolatis, leguminibus glabris 3-5-spermis, bracteis floribus longioribus villosis deciduis.—*Douglas in Bot. Reg. t. 1217.*

HAB. " In North California, lat. 45°, growing in gravelly soil, at the sources of the Wallahwallah river, near the Blue Mountains." *Douglas.*—Allied to the preceding, " from which it is principally distinguished by its larger and less crowded flowers, and by the long, deciduous, shaggy *bracteas*, which clothe the upper unexpanded part of the raceme so closely as to give it a comose appearance." *Lindl.*

† † *Flores flavi.*

19. *L. Sabini*; erectus, (suffruticosus?) elatus, caule glabriusculo striato, foliis pilis brevibus fulvescentibus sericeis, foliolis 9-11 lanceolatis acuminatis basi attenuatis, floribus verticillatis (flavis) ebracteolatis, bracteis longis subulatis sericeis deciduis, calycis pilosissimi basi gibboso, labio superiore brevi bifido, inferiore integro reflexo, pedicellis elongatis, leguminibus sericeo-villosissimis fulvis subtetraspermis stylo persistente terminatis.—*Douglas*, *MSS. in Herb. Hort. Soc.*

HAB. On the Blue Mountains of North-West America, and on the Dividing Ridge of the Rocky Mountains, near the confines of perpetual snow. *Douglas*.—I regret that I possess no notes from Mr. Douglas made from the recent plant of this beautiful species of *Lupine*, which its discoverer has honoured with the name of his friend and patron, Jos. Sabine, Esq. I have heard him incidentally regret that he was not able to send seeds of it to England, for that it was among the most beautiful of the genus, and from its elevated place of growth, near the limits of perpetual snow, very hardy. I think, too, to have heard him say that it was suffruticose.

20. *L. sulphureus*; erectus, caule erecto angulato-sulcato sparse foliisque (valde) sericeis, foliolis 12-14 anguste lanceolatis basi apiceque acuminatis, bracteis subulatis deciduis, floribus verticillatis ebracteolatis, calycis valde sericei basi subgibboso labio superiore bifido, inferiore longiore integro.—*Douglas*, *MSS. in Herb. Hort. Soc.*

HAB. On the Blue Mountains of North-West America, and on elevated grounds near the source of Clarke's River. *Douglas*.—This has some affinity with the foregoing, yet appears to be a distinct species. It is a much slenderer and smaller plant in every respect; the leaves are whitish, the leaflets more numerous and narrower, the flowers smaller and of a pale sulphur-colour.

TRIB. I. AMYGDALÆ. Juss.

1. PRUNUS. Tourn.

Drupa ovata aut oblonga carnosa glaberrima, polline cæsio tecta, putamine compresso, utrinque acuto, ad margines subsulcato, cæterum lœvi.—*Folia juniora convolutiva.* Florum pedicelli *sapienti-umbellato-fasciculati* 1-flori, ante aut post folia evoluti. DC.

1. *P. spinosa*; ramis spinosis, pedunculis solitariis, calycibus campanulatis, lobis obtusis tubo longioribus, foliis obovato-ellipticis vel ovatis subitus pubescentibus argute duplicitoque dentatis, fructibus globosis. DC.—*Linn. Sp. Pl.* p. 681. *Engl. Bot.* t. 842. *Pursh, Fl. Am.* v. 1. p. 333. *De Cand. Prodr.* v. 2. p. 532.

HAB. In hedges: introduced from Europe.

2. CERASUS. Juss.

Drupa globosa aut basi umbilicata carnosa glaberrima, polline cæsio constituta nucleo subgloboso lœvi.—*Folia juniora conduplicate.* Flores nunc pedicellis 1-floris e gemma squamosa plurimi umbellato-fasciculatis insidentes, et tunc foliis præcoiores, nunc rauosoi terminantes et post folia evoluti. DC.

SECT. I. CERASOPHORA. DC. Flores umbellati, pedicellis unifloris e gemmis ortis.

1. *C. pumila*; striata, ramis virgatis, floribus subtimbellatis pedunculatis, calycibus campanulatis brevibus, foliis obovato-oblongis erectis subitus glaucis vix serrulatis glabris, fructuovoato nigro. *De Cand. Prodr.* v. 2. p. 537. (non *Mich. fide Seringe*).—*Prunus pumila.* *Linn. Mant.* p. 73. “*Mill. Ic. t. 89. f. 2.*” *Pursh, Fl. Am.* v. 1. p. 331. *Torrey, Fl. of Un. St. v. 1.* p. 469.

HAB. Canada. (*De Cand.*)—As a native of Canada, I am unacquainted with this plant, unless, as I suspect, it be the same as the *Cerasus depressa*. My specimens from the Garden of the Horticultural Society, and one from M. Serigne, who prepared the specific characters of the genus in *De Caudol's Prodromus Syst. Veget.*, are identical with what I here consider the true *depressa*. The last-mentioned author refers the *C. pumila* of Michaux to *C. depressa*, and says that it is not the same as the *Prunus pumila* of Linn.; yet he quotes it under both. He describes the fruit as black, while Torrey and Pursh say it is red. This plant is compared, by some authors, in its general habit, to *Amygdalus nana*, and such a comparison is equally applicable to *C. depressa*. The difficulties attending the American species of this genus can only be removed by carefully studying the plants in a living state, both during the season of the blossom and the fruit.

2. *C. nigra*; inermis, umbellis sessilibus paucifloris, lobis calycinis obtusis, foliis ovatis acuminatis, petiolis biglandulosis. DC.—“*Loisel. in Duhem. ed. nov. v. 5.* p. 32.” *De Cand. Prodr.* v. 2. p. 538.—*Prunus nigra.* *Ait. Hort. Kew.* v. 2. p. 165. *ed. 2. v. 3.* p. 198. *Sims in Bot. Mag. t. 1117.* *Torrey, Fl. of Un. St. v. 1.* p. 469.

HAB. Canada. *Aiton*. From Fort-William, in lat. 48°, to the Saskatchewan. *Dr. Richardson*, *Drummond*, Lake Huron. *Dr. Todd*.—Newfoundland. *Sir Alexander Cochrane*. These specimens entirely agree with those I have received from Mr. Seringe. The fruit is as large as a moderately sized cherry, and apparently red, hence very nearly resembling the *Prunus Americana* of Marshall and Dr. Darlington, in *Ann. of Lyc. of N. H. of N. York*, but that has no glands to the petioles. The flowers are considerably larger than in the following species, and the leaves, when the fruit is ripe, more than three inches long.

3. *C. Pennsylvanica*; floribus subcorymbosis, pedicellis longiusculis, foliis ovali-oblongis acuminatis membranaceis glabris quasi erosio-denticulatis basi biglandulosis, fructibus subovatis pusillis rubris carne dulci. *De Cand. Prodr.* v. 2. p. 539.—*Prunus Pennsylvanica*. *Linn. Suppl.* p. 252. *Pursh, Fl. Am.* v. 1. p. 331. *Rich. in Frankl. 1st Journ. ed.* 2. p. 18. *Torrey, Fl. of Un. St.* v. 1. p. 468.—*Cerasus borealis*. *Mich. Am.* v. 1. p. 286. *De Cand. Prodr.* v. 2. p. 539.—*Prunus borealis*. *Pursh, Fl. Am.* v. 1. p. 330. *Bigel. Fl. Bost.* ed. 2. p. 193.—“*P. lanceolata*. *Willd. Arb.* p. 240. t. 3. f. 3.”

HAB. Throughout Canada, as far as the Saskatchewan, and from Newfoundland, (*Dr. Morrison*), to Edmonton House in the Rocky Mountains.—*Dr. Torrey* is surely correct in uniting *Cerasus borealis* of Michaux with the *Prunus Pennsylvanica* of *Linn. Suppl.* Indeed Michaux does not appear to have been aware of a *P. Pennsylvanica* having been published, for he takes no notice of it in his *Fl. Bor. Amer.* In De Candolle's *Prodromus*, the *C. Pennsylvanica* is placed in the division “*floribus racemosis*,” but the flowers are umbellate, as in *C. borealis*, *Mich.*

4. *C. depressa*; ramis angulatis depresso-prostratis, umbellis paucifloris sessilibus aggreditis, foliis cuneato-lanceolatis rarer serratis glabris subtus glaucis, fructibus ovatis. *De Cand. Prodr.* v. 2. p. 538.—*Prunus depressa*. *Pursh, Fl. Am.* v. 1. p. 332. *Bigel. Fl. Bost.* ed. 2. p. 192. *Torrey, Fl. of Un. St.* v. 1. p. 470.—*Cerasus pumila*. *Mich. Am.* v. 1. p. 332. (non *Prunus pumila*. *Linn.?*)—*Prunus Susquehanae*. *Willd. Enum.* 519 (fide *Seringe*.)

HAB. Throughout Canada, as far as the Saskatchewan.—A low shrub, according to authors, with spreading branches, and growing in sandy ground. The fruit bears the name of *Sand-Cherries*. (*Ph.*)

5. *C. hyemalis*; floribus umbellatis glabris, calycis lacinii lanceolatis, foliis oblongo-ovalibus obovatis abrupte acuminatis, fructibus subovatis. *De Cand. Prodr.* v. 2. p. 538.—*Prunus hyemalis*. *Mich. Am.* v. 1. p. 284. *Pursh, Fl. Am.* v. 1. p. 331. *Elliott, Carol.* v. 1. p. 542.

HAB. Canada. *Mich.* La Grande Chaudière. *Pursh. MSS.*—This species is unknown to me. The fruit is described as black, astringent, eatable only in winter, and called *Black Choke-Cherry*. But Dr. Darlington doubts if any American Plum is a winter fruit; and he is inclined to think that the *P. hyemalis* of Mr. Elliott at least is the *P. nigra* of authors, his *P. Americana*.

6. *C. Chicasa*; ramis subspinescentibus glaberrimis, floribus subgeminiis, pedunculis brevissimis, calycibus glabris lacinii brevissimis, foliis oblongo-ovalibus acutis acuminatis, fructibus subglobosis parvis luteis. *DC.*—*Mich. Am.* v. 1. p. 284. *De Cand. Prodr.* v. 2. p. 538.—*Prunus Chicasa*. *Pursh, Fl. Am.* v. 1. p. 332.—*P. Insititia*. *Walt. Carol.*

HAB. La Grande Chaudière, according to a MSS. Catalogue of *Mr. Pursh*, communicated to me by Mrs. Percival. But it is not included in Bigelow's or Torrey's Flora, and seems to be a southern species. The fruit is said to be yellow, and known under the name of *Chicasaw Plum*. (*Ph.*)—A plant I have received from Dr. Schweinitz under this name, appears to me not different from *C. borealis*.

SECT. II. LAUROCERASUS. DC. *Flores racemosi e ramis orti.*

7. *C. emarginata*; racemis corymbosis, pedicellis elongatis segmentisque calycinis ovatis obtusis reflexis glabris, foliis ovalibus minute dentato-serratis glabris basi acutis biglandulosis apice obtusis stepe emarginatis, fructu globoso.—*Douglas*, MSS. apud Hort. Soc. Lond.

HAB. On the upper part of the Columbia River, especially about the Kettle Falls. *Douglas*.—This, Mr Douglas describes as a "low shrub, 4-8 feet high, with very red wood marked with white spots, and an astringent fruit.—The leaves are about two inches long, quite glabrous, as is the whole plant. Racemes about the same length as the leaves, and produced at the same time with them, having lower pedicels especially so long as to be corymbose.

8. *C. mollis*; racemis breviusculis calyceque (segmentis reflexis) pubescenti-tomentosis, foliis obovato-oblongis crenatis subtus pubescentibus, fructu ovato.—*Douglas*, MSS.

HAB. North-West coast of America, near the mouth of the Columbia, and on subalpine hills, near the source of that river. *Douglas*. Fort Vancouver. Dr. Scouler.—"A small tree, 12-25 feet high, bearing a considerable resemblance to the *C. pubescens* of Michaux," *Douglas*, MSS.—The young branches are dark brown and downy, the racemes and leaves very downy beneath. Racemes much shorter than in the following species.

9. *C. Virginiana*; racemis erectis elongatis, foliis deciduis ovali-oblongis acuminatis serratis supra nitidis utrinque nudis, petiolis subglabro-glandulosis, fructu globoso atro-rubro.—*Mich. Am.* v. 1. p. 283. *De Cand. Prodri.* v. 2. p. 539. *Mich. N. Am. Sylv. ed. Am.* v. 2. p. 204. t. 88.—*Prunus Virginiana*. *Linn. Sp. Pl.* p. 677. *Pursh, Fl. Am.* v. 1. p. 329. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 18? *Bigel. Fl. Bost. ed. 2.* p. 192. *Torrey, Fl. of Un. St. v. 1.* p. 467.

HAB. Canada?—This forms a large tree, according to Michaux, in the southern states attaining from eighty to one hundred feet in height. It is the *Tawquay-meen-ahtik* of the Crees, according to Dr. Richardson, rising on the sandy plains of the Saskatchewan to twenty feet, but extending as far north as the Great Slave Lake, lat. 62°, where it attains the height of five feet only. Its fruit, termed *Tawquay-mecena*, (or *Choke-Cherry*), is not very edible in a recent state, but when dried and bruised, it forms an esteemed addition to *Pemmican*. As far as I can judge, however, from the numerous specimens I have received from Canada and the British Possessions, these observations will rather refer to the *C. serotina* than to the *C. Virginiana*: for the former is very abundant in the north, while the latter seems to abound in, if it be not wholly confined to, the middle and southern states.

10. *C. serotina*; racemis elongatis demum pendulis, foliis deciduis ovalibus obovatissimis breviter acuminatis opacis neutissime serratis, subtus in axillis barbatis, petiolis subbiglandulosis, fructu globo atro-rubro.—*Loisel. in Durham. ed. nov.* 5. p. 3. *De Cand. Prodri.* v. 2. p. 540.—*Prunus serotina*. *Ehrh. Willd. Sp. Pl.* v. 2. p. 986. "Ejusd. Arb. p. 239. t. 5. f. 2." *Torrey, Fl. of Un. St. v. 1.* p. 467. *Elliott, Carol. v. 1.* p. 551.—P. *Virginiana*. *Mia. et aliar?*—P. obovata. *Bigel. Fl. Bost. ed. 2.* p. 192.—P. *Canadensis*. *Willd. Sp. Pl. v. 2.* p. 986.—*Cerasus Canadensis*. *De Cand. Prodri. v. 2.* p. 539.

HAB. Throughout Canada, and extending from Lake Huron (*Dr. Todd*) as far as north lat. 62°; and from Newfoundland (*Dr. Morrison, Mr. Cormack*) and Hudson's Bay on the east, to the mountain-valleys west of the Rocky Mountains; where, however, by the banks of streams, in sandy soils, it rarely rises more than 2-4 feet high. (*Douglas*).—That Michaux and others have confounded the *C. serotina* with the *C. Virginiana* is quite certain, but it is still with me a matter of great doubt how far the two are entitled to

be ranked as species. The serratures and tufts of hair on the underside of the leaves are undoubtedly variable, and we know how little dependence is to be placed upon the foliage of our own *Cerasus Padus*, a species so nearly allied to this, that M. Seringe (in De Candolle) seems to doubt if it be really distinct.

TRIB. II. SPIREACEÆ. DC.

3. PURSHIA. *De Cand.*

Cal. tubulosus 5-fidus, lobis ovatis obtusis. *Pet.* 5 obovata unguiculata cum staminibus 25 calycis ore inserta. *Ovarium* 1 ("2 ex Br.") oblongum liberum stipitatum pubescenti-glandulosum stylo subulato attenuatum. *Stigma* lineare laterale longitudine fere styli, pubescens. *Oviduum* unicum paulo supra basin insertum in parietem loculi adscendens. *Achenium* (rima longitudinaliter dehiscens, DC.) oblongum utrinque attenuatum, stylo coronatum. *Semen* obovatum. *Integumentum* crassum. *Albumen?* tenue carnosum. *Embryo* erectus. *Cotyledones* ovales. *Radicula* infera.—*Folii* ramis erectis, ramulis brevibus numerosis, genuis squamosis. *Folia* fasciculata simplicia 3-dentata subtus albida. Flores terminales conferti. Petala filamentaque siccitate æruginea.

1. *P. tridentata*. (TAB. LVIII.) *De Cand.* in Linna. Trans. v. 12, p. 158, Prodr. v. 2. p. 541.—*Tigarea tridentata*. *Pursh*, Fl. Am. v. 1. p. 333. t. 15.

Frutex erectus, cortice cinereo rugoso glabro tectus. *Rami* stricti subvirgati, ramulis brevibus fasciculatis omnes. *Folia* fasciculata semper e gemmis elongata ramosis squamosis orta, 6–8 lineas longa cuneata, in petiolum brevem attenuata, apice trideutata, supra glabriuscula, subtus albo-tomentosa. *Stipule* minute triangulares. *Flores* solitarii vel congesti e fasciculis foliorum. *Pedunculus* brvis, glandulosus. *Calyx* extus tomentosus, tubo elongato glanduloso glandulis pedicellaris, limbo 5-fido, paterae, segmentis ovalibus, obtusis. *Petala* 5, calyce inserta, lacinias alterna, patentia, obovata, obtusa, undulata, venosa, siccitate viridescentia, basi in ungues attenuata. *Stamina* 25, ad orem tubi calycis inserta. *Filamenta* filiformia, siccitate sordide viridia. *Anthere* subrotunda. *Pistillum* solitarium, ad basin calycis insertum, et ejus tubo duplo longius, breviter stipitatum. *Germen* ovali-cylindraceum, pubescens atque glandulosum uni-ovulatum superne in stylum attenuatum. *Stigma* lineare, laterale, pubescens. *Capsula* (seu *Achenium*) 6–7 lineas longa, coriacea-membranacea, pubescens, ovata, basi apiceque attenuata, inferne calycis persistente tecta, indehiscens, (longitudinaliter dehiscens, DC.) uniloculari, monospermum. *Loculi* paries longitudinaliter striatus. *Semen* obovatus, nigro-purpureum, prope basin loculi insertum dein erectum. *Integumentum* crassum, extus minute punctatum: *Parenchyma* granulosum intense purpureum. *Albumen* carnosio-membranaceum, albidum. *Embryo* obovatus compressus carnosus albus. *Cotyledones* magne, crasse. *Radicula* infera.

HAB. In the Prairies of the Rocky Mountains, and on the Columbia River. *Lewis*. "Almost the only shrub to be seen through an immense tract of barren sandy soil from the head sources of the Missouri to the Falls on the Columbia, and from 38° to 48° of north latitude." *Douglas*.—It does not appear that any Botanist has ever gathered this highly interesting plant, except the travellers above-mentioned. From Lewis' specimens of the *Tigarea tridentata* of Pursh, preserved in Mr. Lambert's Herbarium, Professor De Candolle established the genus *Purshia* in the Linnaean Transactions. The figure given by Mr. Pursh is sufficiently faithful for the general appearance of a branch; but the details of the fructification were still a desideratum. This I have endeavoured to supply by the aid of the beautiful specimens collected by Mr. Douglas. The covering of the seed presents an appearance which I do not quite understand. It is double. The epidermis, which is thin and membranous, owes its colour to a deep purple granulated pulp lying between it and the inner lining, which latter is opaque and fleshy, whence I have been led to consider it as albumen. The two coats are easily separated from the intermediate pulpy and granulated substance.

TAB. LVIII. *Purshia tridentata*. *Fig. 1*, Flower from a gemma, *natural size*, with three leaves; *fig. 2*, Flower not quite expanded, *magnified*; *fig. 3*, Expanded flower, with the gemma and leaves; *fig. 4*,

Section of a flower, some of the stamens and petals being removed; *fig. 5*, Back view of a stamen; *fig. 6*, Front view of do.; *fig. 7*, Pistil; *fig. 8*, Pistil laid open to show the embryo; *fig. 9*, Capsule with its persistent calyx, natural size; *fig. 10*, Capsule, magnified; *fig. 11*, Capsule laid open to show the position of the seed; *fig. 12*, Seed; *fig. 13*, Transverse section of do.; *fig. 14*, Embryo:—all but figs. 1 and 9, magnified.

4. SPIRÆA. Linn.

Cal. 5-fidus persistens. *Stam.* 10–50 cum petalis toro calyce adhaerente inserta. *Carpella* 1–00, distincta, rariter basi coalita, brevi apiculata, sessilia raro stipitata. *Sem.* 2–6, suturæ interne affixa, exalbuminosa. *Embryo* inversus, cotyledonibus crassiusculis.—*Frutices inertes vel herbae perennes.* Rami alterni. Folia alterna simplicia raro decomposito-pinnatisecta, nervis pennatis vel ternato-palmatis. Flores albi aut rubicundi nunquam flavi. DC.

SECT. I. PHYSOCARPUS. Camb.

1. *S. opulifolia*; foliis cordatis trilobis inciso-serratis petiolatis, corymbis hemisphaericis multifloris, pedicellis gracilibus longis, carpellis (3 v. 2) calyce triplo majoribus inflatis. *Liun. Prodr.* v. 2. p. 542.—*y.* carpellis 2 pubescenti-tomentosis.—*S. monogyna. Torrey in Pl. of Rock. Mount.* p. 194?

HAB. *a.* Throughout Canada: from Lake Huron (*Dr. Todd*) to the Saskatchewan. *Dr. Richardson, Drummond.*—*b.* Fort Vancouver, (*Mr. Menzies, Dr. Scouler,*) and upon rocky banks of streams near the Grand Rapids of the Columbia. *Douglas.*—*y.* Kettle Falls of the Columbia. *Douglas.*—The hairs of the leaves on var. *b.* are beautifully fasciculated.

SECT. II. CHAMÆDRYON. Ser.

2. *S. hypericifolia*; foliis obovato-oblongis 3–4-nervis integris vel dentatis glabris puberulis, nervis pinnatis, corymbis pedunculatis aut umbellis sessilibus, pedicellis glabris puberulis, sepalis adscendentibus. *Ser.*—*Liun. Sp. Pl.* p. 701. *Pursh, Fl. Am.* v. 1. p. 341. *Torrey, Fl. of Un. St.* v. 1. p. 480. *De Caud. Prodr.* v. 2. p. 543.—*g. Plukenetia. Ser.* foliis integerrimis glabris, corymbis sessilibus.

HAB. *b.* Canada. *Pursh.*—I am unacquainted with this, nor, though stated on the same authority to be found in the swamps of New York, has Dr. Torrey ever seen an American specimen. It is probable that this, like so many of the species of this section, is exclusively a native of the Old World. The *S. capitata*, placed here by M. Serizige, unquestionably belongs to the first section, and to *S. opulifolia*.

3. *S. chamaedrifolia*; foliis ovatis ellipticisve inequaliter serratis rarius sublobatis glabriusculis, corymbis hemisphaericis pedunculatis, pedicellis lobisque calycinis reflexis pubescentibus. *Liun. Sp. Pl.* p. 701. *Pursh, Fl. Am.* v. 1. p. 343. *De Caud. Prodr.* v. 2. p. 542.—*a.* foliis ellipticis obtusis glabris vel subpubescentibus.—*S. chamaedrifolia. Pall. Fl. Ross.* p. 32. t. xv. (*fig. med.*)

HAB. North-West coast of America, (but surely not "in Canada,") *Pursh.*—*b.* Sledge Island in Behring's Straits. *Mr. Menzies.* Chamisso's Island in Kotzebue's Sound, (*Chamisso*), and on the mainland

of Kotzebue's Sound. *Lay and Collie in Captain Beechey's Collection*.—This is, according to all accounts, a very variable species. Of the larger and sharp-leaved variety, (*S. ulmifolia*, Scop.) a good figure is given in the Bot. Reg., and that is, as Mr. Lindley justly observes, the original *S. chamaedryos foliis* of Amman, St. Rar. p. 190.

SECT. III. SPIRANIA. Ser.

4. *S. betulifolia*; foliis late ovalibus breve petiolatis glabris superne præcipue inciso-serratis sublobatis subtus pallidis, corymbis compositis latis glabris foliolosis, floribus numerosissimis (parvis), ovaris 5 glabris.—*Pall. Fl. Ross.* t. 16. *Pursh, Fl. Am.* v. 1. p. 342? *Wat. Dendrol.* t. 67. (*fig. bona.*) *De Cand. Prodr.* v. 2. p. 544.—*S. lucida*. *Douglas*, *MSS. apud Hort. Soc. Lond.*—*a.* foliis majoribus magis lobatis subtus pallidioribus.

HAB. *a.* and *b.* Vallies of the Rocky Mountains, in lat. 52°-54°. *Drummond*. In the subalpine regions of Mount Hood, and in the Blue Mountains, near Lewis and Clarke's River, North-West America. *Douglas*.—Stems 1-2 feet high; branches erect, red, glabrous, as is every part of the plant. Leaves 2-3 inches long, membranaceous. Flowers very small and numerous, crowded, forming a flat, broad, compound corymb, white, (*Douglas*), yellowish when dry. This agrees tolerably well with Pallas' figure of the Siberian *S. betulifolia*, as far as can be judged from the fructified state of the plant, which is alone given in the *Flora Rossica*. The leaves and inflorescence in Mr. Watson's representation are very characteristic of our plant. Muhlenberg's and Rafinesque's *S. corymbosa* (see Torrey's *Fl. v. 1.* p. 482), seems to differ from this principally in being slightly downy.

5. *S. salicifolia*; glabriusculis, foliis lanceolatis argute subduplicato-serratis, lobis calycinis triangularibus putulis, racemis elongatis, floribus densis, carpellis 5 glabris. *Linn. Sp. Pl.* p. 700.—*a.* floribus albis.—*S. salicifolia*. *Mich. Am.* v. 1. p. 293. *Pursh, Fl. Am.* v. 1. p. 340. *Torrey, Fl. of Un. St.* v. 1. p. 481. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 19. *De Cand. Prodr.* v. 2. p. 544. *Elliott, Carol.* v. 1. p. 560.—*S. alba*. *Ehrh.*—*Bigel. Fl. Bost.* ed. 2. p. 197. *Wat. Dendrol.* t. 133.—*S. salicifolia*, *y.* paniculata. *Ait. Hort. Kew.*

HAB. *b.* Throughout Canada, and as far north as the Saskatchewan. Newfoundland. *Sir Alexander Cochrane*.

6. *S. tomentosa*; ramis pedunculisque ferrugineo-tomentosis, foliis ellipticis duplicato-serratis sublobatis subtus ferrugineo-tomentosis, panicula confertiflora attenuata, floribus parvis, staminibus corolla rosea vix longioribus, lobis calycinis triangularibus reflexis, carpellis 5 tomentosis.—*Linn. Sp. Pl.* p. 701. *Mieh. Am.* v. 1. p. 293. *Pursh, Fl. Am.* v. 1. p. 341. *Torrey, Fl. of Un. St.* v. 1. p. 481. *Bigel. Fl. Bost.* ed. 2. p. 197. *Elliott, Carol.* v. 1. p. 560.

HAB. Canada, (*Michaux*, *Mrs. Percival*, *Mrs. Sheppard*), and as far as Lake Winnipeg. *Dr. Richardson*, *Mr. Drummond*.

7. *S. Douglasii*; ramis pedunculisque pubescentibus, foliis ellipticis superne grosse inæqualiter serratis subtus incano-tomentosis, panicula confertiflora oblonga obtusa, floribus parvis, staminibus corolla rosea duplo longioribus, lobis calycinis triangularibus reflexis, carpellis 5 glaberriniis nitidis.

HAB. North-West coast of America, about the Columbia and the Straits of de Fuca. *Douglas*, *Dr. Scouler*.—This is unquestionably different from *S. tomentosa*, being much larger in the branches *a.* leaves, with a white (never ferruginous) tomentum. The leaves are serrated only in their upper half, and there very coarsely; the panicle is never attenuated, but very obtuse, the flowers are smaller, the stamens longer, and the capsules are quite glabrous and shining.

8. *S. Menziesii*; ramis superne pedunculis calycibusque triangularibus reflexis laeviter pubescentibus, foliis ellipticis superne grosse inaequaliter serratis subtus concoloribus glabris, panicula confertiflora oblonga obtusa, floribus parvis, staminibus corolla rosea duplo longioribus, ovarialis 5 glabris.

HAB. North-West coast of America. *A. Menzies, Esq.*—The only specimens I have ever seen of this plant are from my valued friend Mr. Menzies. In habit it quite agrees with the preceding species, but it is entirely destitute of the white tomentum on the underside of the leaves and older branches, which are wholly glabrous: the latter are glossy, deep purplish-brown.

9. *S. ariaefolia*; foliis lato-ovatis obtuse lobatis inaequaliter mucronato-serratis subtus pallidioribus hirtis, panicula ampla ramosissima laxa pubescenti-hirsuta, pedicellis bracteatis, lobis calycinis acutis patentibus, carpellis 5 compressis marginatis patentihirsutissimis.—*Sm. in Rees' Cycl. De Cand. Prodr. v. 2. p. 544. Lindl. in Bot. Reg. t. 1365.*—S. discolor. *Pursh, Fl. Am. v. 1. p. 342. De Cand. Prodr. v. 2. p. 545. Torrey in Pl. of Rock. Mount. p. 195.*

HAB. Banks of the Kooskooskye River, North-West America. *Lewis.* Frequent along the coast of the Pacific, from lat. 40° to 49° north, forming part of the underwood of the forests, (*Douglas*), and on the rocky banks of the Spokan, Flathead, Salmon, and M'Gillivray Rivers, in the interior. *Mr. Menzies, Douglas, Dr. Scouler.*—The leaves are more or less hairy, and more or less pale, but never so white as to be "nivetomentosa," or to justify the name of "discolor" being given to the plant, as far as our specimens are concerned; but in the *S. discolor* of Dr. Torrey, according to a sample in my Herbarium, the leaves are snowy white with hairs on the underside.

SECT. IV. SORBARIA. Ser.

10. *S. sorbifolia*; foliis pinnatis, foliolis lanceolatis oppositis duplicato-argute serratis sessilibus. *Linn. Sp. Pl. p. 702. Pall. Fl. Ross. t. 25. Pursh, Fl. Am. v. 1. p. 342. De Cand. Prodr. v. 2. p. 545.*

HAB. On the North-West coast of America, and "probably in Canada," (*Pursh*) but I have never seen a specimen from either of these widely separated regions.

SECT. V. ARUNCUS. Ser.

11. *S. Aruncus*; foliis tripinnatis, foliolis oblongo-ovatis acuminate duplicato-serratis terminali ovato, spicis laxis valde paniculato-ramosis, carpellis glaberrimis.—*Linn. Sp. Pl. p. 702. De Cand. Prodr. v. 2. p. 544.*—*s. Americana. Mich. Am. v. 1. p. 294. Pursh, Fl. Am. v. 1. p. 343. Elliott, Carol. v. 1. p. 561. Torrey in Pl. of Rock. Mount. p. 194.*—*S. acuminata. Douglas, MSS. apud Hort. Soc. Lond.*

HAB. Moist woods, near the source of the Columbia. *Drummond.* Mouth of the Columbia, and at Puget Sound. *Douglas, Dr. Scouler.*—Mr. Douglas is disposed to consider this plant distinct from the *S. Aruncus* of the United States and of Europe; but I confess I can see no difference.

5. GILLENSIA. Mæneh.

Cal. tubulosocampanulatus ore contractus 5-fidus. Pet. 5, lineari-lanceolata, subinæqualia, ex apice tubi. Stam. 10-15 inclusa. Carpella 5 stylo filiformi erecto apice capitulo superata, subconnata in capsulam 5 loc. Semina in loculis 2.—Herbe perennes, foliis trifoliolatis, foliolis petiolulatis serratis, floribus longe pedicellatis ex albo roseis axillaribus terminalibus. Rudices emetico-catharticae. DC.

1. *G. trifoliata*; stipulis linearibus acuminate integris. "Mænch, Suppl. p. 286." *De Cand. Prodr.* v. 2. p. 546. *Torrey, Fl. of Un. St. v. 1.* p. 463.—*Spiræa trifoliata. Linn. Sp. Pl. p. 702. Mich. Am. v. 1.* p. 343. *Elliott, Carol. v. 1.* p. 562.

HAB. Canada. *Pursh.*

TRIB. III. DRYADEÆ. *Vent.*

6. DRYAS. *Linn.*

Cal. 8-9-partitus extus nudus, tubo subconcavo. Pet. 8-9. Stam. 00. Carpella 00, stylo terminali demum in caudam barbato-plumosam desinente. Semen adscendens.—Herba humilissima, foliis indivisis subtus albo-tomentosa, floribus albis (rarius luteis.) DC.

1. *D. octopetala*; foliis oblongo-ovatis profunde crenato-serratis basi obtusis subtus albo-tomentosis venis nudiusculis prominentibus, calycis segmentis linearibus, (floribus albis.)—*Linn. Sp. Pl. p. 717. Engl. Bot. t. 31. Pursh, Fl. Am. v. 1.* p. 350. *De Cand. Prodr. v. 2.* p. 550. *Torrey in Pl. of Rock. Mount. p. 195.*

HAB. High mountains in the North-West parts of Canada. *Pursh.* Rocky Mountains, between lat. 52°-56°, sometimes with double flowers. *Drummond.* Cape Lisburne, in Behring's Straits. *Lay and Collie in Captain Beechey's Collection.* It is found, according to Dr. Torrey, as far south upon the Rocky Mountains as lat. 30°. Shores and Islands of the Arctic Sea, (*Captain Sir J. Franklin and Captain Sir E. Parry,*) but much less frequent than *D. integrifolia*, from which it may always and readily be distinguished.

2. *D. integrifolia*; foliis oblongo-ovatis basi latioribus cordatis integerrimis seu inferne colummodo paucidentatis subtus albo-tomentosis vix venosus, calycis segmentis linearibus, (floribus albis.)—*Vahl, in Act. Soc. Hafn. v. 4. P. 2.* p. 177. *Fl. Dan. t. 1216. Rich. in Frankl. 1st Journ. ed. 2. App. p. 21. Hook. Ex. Fl. t. 220. De Cand. Prodr. v. 2.* p. 549. *Torrey, Fl. of Un. St. v. 1.* p. 492.—*D. tenella. Pursh, Fl. Am. v. 1.* p. 350.

HAB. Island of Anticosti, in the Gulph of St. Lawrence. *Mr. Goldie.* Labrador. *Rev. Mr. Colmaster.* In dry rocky places from lat. 54° to the shores and islands of the Arctic Sea, where it is abundant. *Franklin, Richardson, Parry, Sabine, &c.* Extending westward to Behring's Straits. *Chamiso, Lay and Collie in Captain Beechey's Collection.* Rocky Mountains, between lat. 52° and 56°, especially on the more elevated ridges. *Drummond.*—Leaves much smoother (less impressed with veins), and the whole plant far less glandular than the preceding species. It retains its character for years in cultivation.

3. *D. Drummondii*; foliis ellipticis basi subattenuatis crenato-serratis subtus venisque prominentibus niveo-tomentosis, calycis segmentis ovatis, (floribus luteis.)—*Rich. MSS.*—*Hook. in Bot. Mag. t. 2972.*—*Dryas octopetala. Rich. in Frankl. 1st Journ. ed. 2. App. p. 21.*

HAB. In the woody country between lat. 54° and 64°, and about Slave Lake and Bear Lake, as far as the mouth of the River Bear Lake on the shores of the Arctic Sea in lat. 68°. *Dr. Richardson.* Gravely batters of alpine rivers, among the Rocky Mountains. *Drummond.*—This highly beautiful and little known plant is distinguished from the other species of *Dryas* no less by the colour of its flowers than by the form of its calycine segments.

7. GEUM. *Linn.*

Cal. tubus concavus, limbo 5-fido, extus 5-bracteolatus. Pet. 5. Stam. 00. Carpella exsueca candata in capitulum disposita, stylo post anthesin geniculato, articulo superiore saepe deciduo. Semen adscendens.—Herba, foliis varie pinnatisectis.

* *Calyce reflexo.*

1. *G. strictum*; caule petiolisque patenti-hispidis, foliis radicalibus interrupte lyrato-pinnatis, pinnis ovatis obovatis cuneatis inciso-lobatis serratisque terminali suborbiculari caulinis 5-8natis, stipulis incisis, floribus erectis, petalis calyce paulo longioribus (flavis,) carpellis hispidis, stylo glabro, appendice piloso.—*Ait. Hort. Kew. v. 2. p. 217, ed. 2. v. 3. p. 280. Pursh, Fl. Am. v. 1. p. 351. Rich. in Frankl. 1st Journ. ed. 2. App. p. 21. Bigel. Fl. Bost. ed. 2. p. 207. Torrey, Fl. of Un. St. v. 1. p. 492.*—*G. Canadense. Murr. De Cand. Prodr. v. 2. p. 550.*—*G. aleppicum. Jacq. Ic. Rar. t. 93. (fig. nitidiss.)*—*a. omnibus partibus duplo majoribus. G. macrophyllum. Willd.?*

HAB. Throughout Canada, from Lake Huron (*Dr. Todd*) to the Saskatchewan; and from Newfoundland (*Mr. Cormack, Sir Alexander Cochrane*) to the alpine Prairies of the Rocky Mountains. *Drummond.* —*a. Fort Vancouver, on the Columbia.*—My var. *a.* entirely agrees with what is cultivated in our gardens as the *G. macrophyllum*, and sufficiently so with the description of authors; but I do not find that it differs from the *G. strictum*, (which is indeed a most variable plant,) except in size.

2. *G. Virginianum*; caule hirsuto, foliis radicalibus trifoliolatis interrupte pinnatisve, foliolis lato-ovatis ellipticisve lobatis crenatis inciso-serratisque, caulinis trifoliolatis, foliolis sepe obovato-acuminatis incisis, stipulis subintegris, pedunculis divergentibus, floribus erectis, petalis calyce vix longioribus (albis,) carpellis hispidis, stylo glabro, appendice subchivato basi piloso.—*Linn. Sp. Pl. p. 716. Mich. Am. v. 1. p. 301. Pursh, Fl. Am. v. 1. p. 351. Torrey, Fl. of Un. St. v. 1. p. 493. Bigel. Fl. Bost. ed. 2. p. 206. Elliott, Carol. v. 1. p. 572. De Cand. Prodr. v. 2. p. 550.*—*G. Canadense. Jacq. Hort. Vind. v. 2. t. 275, (fig. bona.)*—*G. album. Gmel. et aliorum.*—*G. geniculatum? Mich.*

HAB. Canada. *Michaux, Pursh.* Lake Huron. *Dr. Todd.*—I have not myself seen specimens from any other part of the British Possessions than Lake Huron; but this is a frequent plant in the United States. The *G. album*, of which I have fine specimens from Dr. Torrey, cannot be distinguished from *G. Virginianum*; the leaves are frequently trifoliolate and pinnate from the same root. Professor Bigelow observes that there are intermediate states between the two species.

* * *Calyce erecto.*

3. *G. rivale*; pilosum, caule erecto simpliciusculo, foliis radicalibus interrupte pinnatis foliolis obovatis inciso-serratis, terminali maximo orbiculari-cordato caulinis trifoliolatis, floribus cernuis, petalis (rubricundulis) erectis obcordatis unguiculatis calycis longitudine, carpellorum capitulo demum stipitato, stylis basi pilosis.—*Linn. Sp. Pl. p. 717. Engl. Bot. t. 106. Mich. Am. v. 1. p. 301. Pursh, Fl. Am. v. 1. p. 351. Bigel. Fl. Bost. ed. 2. p. 206. Torrey, Fl. of Un. St. v. 1. p. 493. De Cand. Prodr. v. 2. p. 551.*

HAB. Canada. *Michaux.* Lake Huron. *Dr. Todd.* Newfoundland. *Sir Alexander Cochrane, Dr. Morrison.* Prairies of the Rocky Mountains. *Drummond.*

4. *G. pubescens*; caule simplici, foliis glabrinculis margine ciliatis, inferioribus pinnatis, caulinis pinnatifidis, superioribus palmatis, laciiniis linearibus incisis, floribus corymbosis. *Pursh, Fl. Am. v. 1. p. 352.*

HAB. On the banks of the Kooskooskye River, North-West America. *Lewis, (ex Pursh.)*—The flowers are said by Pursh, to whom alone this plant seems to have been known, to resemble those of the preceding species.

8. SIEVERSIA. Wild.

Cal. tubus concavus, limbo 5-fido, extus 5-bracteolatus. *Pet.* 5. *Stam.* 00. *Carpella* numerosa caudata in capitulum disposita, stylo recto persistente. *Semen* adscendens.—“Habitus sere, nec omnino, Gei, quod differt stylis geniculatis articulo superiore dissimili saepiusque deciduo.” *Br.*

1. *S. anemonoides*; caule unifloro, stolonibus reptantibus, foliis pinnatis glabris, pinnis ensiformibus apice dentatis, floribus albis, stipulis filiformibus, petalis calye longioribus, stylis barbatis. *DC.*—“*Willd. Berl. Mag.* 5. p. 398.”—*Geum anemonoides. Willd.*—*Pursh, Fl. Am.* v. 1. p. 352. *De Cand. Prodr.* v. 2. p. 553.—*Dryas pentapetala. Linn. Amaen. Acad.* v. 2. p. 353.

HAB. On the North-West coast of America. *Merk.* (ex *Pursh.*)—With this species I am unacquainted. Though given as a native of Kamtschatka, it is not noticed by Chamisso among the *Rosaceæ* of that country described in the Linnaea, nor does it exist in Capt. Beechey's Collection.

2. *S. Rossii*; aristis nudis, foliis radicalibus interrupte pinnatis glabris, pinnis trilobis accessoriis imisque nanis indivisis, caule unifloro subdiphylo, petalarum venis omnibus distinctis. *Br. in Parry's 1st Voy. App.* p. cclxxvi.—*Geum Rossii. De Cand. Prodr.* v. 2. p. 553.

HAB. Melville Island. *Capt. Sir Edward Parry.*

3. *S. humilis?* *Br. in Parry's 1st Voy. App.* p. cclxxvi. in *adnot. Cham.* in *Linnaea*, v. 2. p. 6.

HAB. Island of Unalashika. *Chamisso.*—No specific character appears to have been any where given of this plant. But Chamisso says it differs principally from *S. Rossii*, to which it is too nearly allied, by its hairiness.

4. *S. glacialis*; tota villo denso flavicante vestita, foliis pinnatis, pinnis ovato-oblongis summis imisque minimis, mediis majoribus subundentatis, flore magno unico terminali, carpellorum aristis villosissimis.—*Br. in Parry's 1st Voy.*—*Geum glaciale. Adams, Act. Mosk.* 5. p. 96.—*De Cand. Prodr.* v. 2. p. 553.

HAB. Shores of the Arctic Sea, west of the Mackenzie River. *Capt. Sir J. Franklin.* Cape Lisburne in Behring's Straits. *Lay and Collie.*—The leaflets are often cuneate and 3-toothed; all of them beautifully silky with long fulvous hairs.

5. *S. triflora*; hirsuta, caule nudiusculo erecto simplice trifloro, foliis radicalibus interrupte pinnatis, pinnis cuneatis inciso-dentatis nunc pinnatifidis inferioribus sensim minoribus, petulis (rubicundis) calycem aquantibus, aristis longissimis sericeo-vilosissimis.—*Br. in Parry's 1st Voy. App.* p. cclxxvi. in *adnot. Rich. in Frankl. 1st Journ. ed. 2. App.* p. 21. *Hook. in Bot. Mag. t. 2858.*—*Geum triflorum. Pursh, Fl. Am.* v. 2. p. 736. *De Cand. Prodr.* v. 2. p. 553. *Torrey in Pl. of Rock. Mount.* p. 125.—*Potentilla nivalis. Torrey in Ann. of Lyc. of N. H. of N. York.* v. 1. p. 32. t. 3. f. 1.

HAB. Labrador. *Dr. Morrison.* Newfoundland. *Mr. Cormack.* Plains of the Saskatchewan, Athabasca Lake, and valleys of the Rocky Mountains. *Dr. Richardson, Douglas, Drummond.*—The numerous specimens of this plant precisely accord with Mr. Bradbury's original ones in my Herbarium, and with others from the White Mountains, in the New England States.

6. *S. radiata*; hirsuta, simplex, foliis radicalibus lyrato-pinnatis, foliolis lateralibus paucis minutissimis, terminali maximo rotundato-cordato sinu angusto profundissime radiatinervoso sublobato crenato-serrato, caulinis (3-5) sessilibus cordatis inciso-lobatis, floribus paucis (2-3) erectis, corollis (flavis) calyce longioribus, aristis subpilosis.—*Mich. Am.* v. 1. p. 300. *Pursh, Fl. Am.* v. 1. p. 352. *De Cand. Prodr.* v. 2. p. 554.—*S. rotundifolia. Cham. in Linn.* v. 2. p. 4.—*Geum rotundifolium. Langsd.*—*De Cand. Prodr.* v. 2. p. 552.—*G. calthifolium. Sm. in Rees' Cycl.*

HAB. North-West coast of America. *Menzies.* Uvalachika. *Langsdorff*, (ex *Fisch.*) *Chamisso*.—Closely allied to *S. Pechii*, (*Bot. Mag.* t. 2803), which has not hitherto been found beyond the limits of the United States; but this latter plant is of humbler growth, with a less leafy stem, and the terminal pinna of its radical leaf is truncate at the base.

9. COMAROPSIS. Rich.

Cal. tubus turbinatus, limbus 5-fidus extus non bracteolatus. Pet. 5 non unguiculata. Stam. 00. Carpella pauca apice stylum filiformem elongatum gerentia. Achenia siccus basi non coarctata. Semen erectum.—Herbe habitu Waldsteinie sed calyx nudus. Foliis trisepta fere trifoliolata. DC.

1. *C. fragarioides*; carpellis glabriusculis, scapis ramosis, foliis trifoliolatis, foliolis lato-cuneatis breve petiolatis.—a. petalis calyce longioribus. *C. fragarioides. De Cand. Prodr.* v. 2. p. 555.—*Dalibarda fragarioides. Mich. Am.* v. 1. p. 300. t. 28. *Pursh, Fl. Am.* v. 1. p. 351. *Elliott, Carol.* v. 1. p. 571. *Bigel. Fl. Bost. ed.* 2. p. 202. *Torrey, Fl. of Un. St.* v. 1. p. 491.—*Waldsteinia frag. Tratt. Ros.*—a. petalis calyce brevioribus. *Dalibarda fragarioides. Sims in Bot. Mag.* t. 1567.—*Comaropsis Doniana. De Cand. Prodr.* v. 2. p. 554.

HAB. Canada, in Beech-woods. *Pursh.* About Montreal. Mr. Cleghorn.—The *Comaropsis pedata* of De Candolle I refer to *Rubus*, on account of its truly drupeaceous carpels and pendulous seeds; in which genus, indeed, Sir J. E. Smith, though unacquainted with the fruit, has correctly inserted it.

10. RUBUS. Linn.

Cal. fundo planiusculus 5-fidus nudus. Pet. 5 et stam. 00 calyci inserta. Carpella prima in toro manifeste protuberante non carnoso capitata, stylo sublateraliter superata, in drupellas carnosas conversa. Semen inversum.—Frutices rarius herbæ perennes. Caules biennies (an semper?) saepè radicantes, nunc inermes, nunc sapius aculeati. Folin petiolata nunc pinnata palmata, pinnis sapienti pectiolatis, nunc simplicia lobata indivisave. Fructus edules. DC.

* *Foliis pinnatis ternatis.*

1. *R. strigosus*; caule erecto, ramis teretibus petiolisque setoso-hispidis in ramis junioribus pedunculisque pilis rigidis glandulosis immixtis, foliis ternatis rarius quinato-pinnatis, foliolis ovatis lato-acuminatis sublobatis inciso-serratis subtus cano-tomentosis, panicula 4-6-flora, calycibus dense pubescentibus basi præcipue setosis.—*Mich. Am.* v. 1. p. 297. *Pursh, Fl. Am.* v. 1. p. 346. *Bigel. Fl. Bost. ed.* 2. p. 198. *Torrey, Fl. of Un. St.* v. 1. p. 488. *Rich. in Frankl. 1st Journ. ed.* 2. App. p. 19. *De Cand. Prodr.* v. 2. p. 557.—*R. Idaeus. a. Rich. in Frankl. 1st Journ. ed.* 1. App. p. 739, (excl. syn.)—*R. Pennsylvanicus. Poir.*

" *Caules fusti, subteretes, setia parvis rigidis crebris. Stipula filiformes, basibus brevissime petiolis adnata. Pedunculi striati, setis glanduliferis obsoeti, rarissime aculeis minutis sparsis. Minus clare Cel. Pursh dixit floribus in apice ramulorum axillaribus solitariis. Flores revera in paniculam terminalem, foliosam, paucifloram (4-6) congesti, pedicellis sepe bifloris, flore tamen solitario pedunculato, axillari ad basin pedunculi.*" *Rich.*

HAB. Throughout Canada, from Lake Huron (*Dr. Todd*) to the Saskatchewan. *Dr. Richardson*, *Drummond*, Newfoundland. *Mr. Cormack*. Dry rocky shores on the Columbia River, North-West America. *Menzies*, *Douglas*.—Flowers larger than those of *R. Ideus*. Fruit round, with numerous small acini, not highly flavoured. (*Rich.*) Dr. Torrey says that the fruit is red, very agreeably tasted, and called the *Red Raspberry*. It seems to hold the place of *R. Ideus* in our country.

2. *R. occidentalis*; caulis subteretibus, pedunculis petiolisque aculeatis glaucis, aculeis recurvis, foliis ternatis rarius quinato-pinnatis, foliolis ovatis oblongisve sublobatis inciso-serratis subitus incano-tomentosis, paniculis corymbosis 4-6 floribus, pedunculis calycibusque tomentosis aculeatis.—*Mich. Am.* v. 1. p. 297. *Pursh, Fl. Am.* v. 1. p. 347. *Bigel. Fl. Bost. ed. 2.* p. 198. *Elliott, Carol.* v. 1. p. 568. *Torrey, Fl. of Un. St.* v. 1. p. 489. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 19. *De Cand. Prodr.* v. 2. p. 558.—*Dill. Ehrl. t. 247. f. 319.*—a. foliis majoribus, subitus niveis. *R. leucodermis. Douglas, MSS. in Herb. Hort. Soc.*

HAB. Canada. *Michaux*. Quebec. *Mrs. Sheppard*. Lake Huron. *Dr. Todd*. Near the sources of the Columbia. *Douglas*.—a. North-West coast of America; whence it has been introduced to the Garden of the Horticultural Society of London.—Dr. Richardson observes of this, that the flowers resemble those of the preceding species, and that the form of the leaves is scarcely different, but the branches and peduncles are purple-glaucous and glabrous. Fruit roundish, black and dark purple, sweet and well-flavoured, known as *Wild Raspberry* and *Thimbleberry*. (*Torrey*)

3. *R. spectabilis*; caule erecto ramisque teretibus inermibus seu rarius subacuteatis, foliis ternatis glabriusculis, foliolis ovatis lobatis inciso-pinnatifidis serratis membranaceis, terminali majore longe petiolulato, lateralibus subsessilibus, stipulis linear-setaceis, pedunculis unifloris solitariis, calycis segmentis villosissimis lato-ovatis breve acuminate petalis oblongis (rubris) brevioribus, carpellis numerosis longe aristatis.—*Pursh, Fl. Am.* v. 1. p. 348. t. 16. *De Cand. Prodr.* v. 2. p. 559. *Cham. in Linnæa*, v. 2. p. 7.—R. stenopetalus. *Fischer, (in Herb. nostr.)*

HAB. Banks of the Columbia. *Mr. Menzies*, *M. Lewis*. Unalaschka. *Chamisso*. Banks of streams and shady woods, North-West America; rarely seen farther than a hundred miles from the coast. *Douglas*.—“A strong white-wooded prickly shrub, from 6-10 feet high. Fruit large, oblong, yellowish-white, and well flavoured.” *Douglas*. The calyx is very densely hairy at its base.

4. *R. macropetalus*; hirsutus, caule elato fruticoso, ramis angulatis gracilibus elongatis, petiolis costis subitus pedunculis calycibusque aculeato-setaceis, foliis trifoliolatis, foliolis ovatis inciso-lobatis serratis membranaceis, terminali majore longe (lateralibus brevi-) petiolulatis, stipulis lanceolatis, pedunculis bifloris, calycis segmentis longe acuminate petala (alba) oblonga subsequantibus. (*TAB. LIX.*)—a. foliolis acutis.—*R. macropetalus. Douglas, MSS. apud Hort. Soc. Lond.*—a. foliolis obtusis.—*R. myriacanthus. Douglas, MSS. in Herb. Hort. Soc. Lond.*

Caulis fruticosus, elatus. Rami elongati, graciles, angulato-striati, magis minusve pilosi, aculeati, aculeis

parvis gracilibus subrecurvis uniformibus. Folia longe petiolata, trifoliolata; foliola late ovata, lobata, inciso-serrata, appresso-sparsim hirsuta, acuta, vel in a. obtusa, terminali majore, longe petiolulata, lateralibus breve petiolulatis, costa rubris, basi præcipue, aculeata, pubescenti-hirsuta. Stipula lanceolata, majuscule, 5-6 lineas longæ. Pedunculi folio breviores glanduloso-hirsuti valde aculeati, biflori. Flores magni. Calyx pubescenti-glandulosus, segmentis ovatis longe angusteque acuminatis nunc sub-laciniatis corollam subæquantibus. Petala oblonga, alba. Stam. numerosa. "Fructus oblongus ater." Douglas.

HAB. Banks of rivers and in low woods, in the Valley of the Columbia, North-West America. *Douglas*, *Dr. Scouler*.—Habit of *R. spectabilis*, but differing remarkably in its copious aculei, broad stipules, much acuminate calycine segments, white petals, and black fruit, which latter is well tasted.

TAB. LIX. *Rubus macropetalus*. *Fig. 1*, Petal:—magnified.

5. *R. Menziesii*; caule procumbente terete aculeato glabro, ramis brevibus pubescenti-tomentosum aculeatis, foliis 3-foliolatis, foliolis lato-ovatis sublobatis inaequaliter serratis brevipetiolarum supra hirsutis subtus pallidioribus hirsutissimis, paniculis terminalibus paucifloris, pedicellis calycibusque aculeatis, segmentis calycinis ovatis acutis mucronatis tomentosis corolla (rubra) brevioribus.

HAB. North-West coast of America. *Menzies*.—This appears to be a small procumbent species, having red flowers, small shortly-petioled leaflets, which are exceedingly villous beneath, and very downy branches and peduncles. Its nearest affinity is perhaps with *R. spectabilis*.

* * *Foliis 3-seu pedatim 5-foliolatis.*

+ *Fruticosi.*

6. *R. suberectus*; glabriusculus, caule suberecto angulato aculeato, aculeis sparsis uniformibus, foliis 3-5-foliolatis, panicula laxa pauciflora, segmentis calycinis ovatis acuminatissimis marginibus præcipue pubescentibus.—*Ait. in Tr. of Linn. Soc. v. 11. p. 218. t. 16. Engl. Bot. t. 243. Borr. in Hook. Brit. Fl. ed. 2. p. 243. De Cand. Prodr. v. 2. p. 556.*

HAB. Between Lake Superior and Lake Winnipeg. *Dr. Richardson*. Newfoundland. *Mr. Cormack*.—Although more straggling in its growth and less aculeated than the *R. suberecta* of Europe, I do not see that this differs in other particulars from it. The fruit, Dr. Richardson says, is dark purple.

7. *R. villosus*; aculeatus, caule glabro angulato, ramis junioribus foliis racemisque ubique glanduloso-pubescentibus, aculeis sparsis parvis recurvis, foliis 3-5-foliolatis, racemis elongatis laxis simplicibus multifloris, pedicellis longis gracilibus basi bracteatis, calycis segmentis mucronatis tomentosis.—*Ait. Hort. Kew. ed. 1. v. 2. p. 210. Mich. Am. v. 1. p. 297. Pursh, Fl. Am. v. 1. p. 346. Bigel. Fl. Bost. ed. 2. p. 199, ejusd. Med. Bot. t. 38. Torrey, Fl. of Un. St. v. 1. p. 487. Elliott, Carol. v. 1. p. 567. De Cand. Prodr. v. 2. p. 563.*

HAB. Near Montreal. *Mr. Cleghorn*. Lake Huron. *Dr. Todd*.—This is no less distinguished from all the other Canadian species of *Rubus* by its copious clothing of down, mixed with glandular hairs, than by its long simple racemes of flowers, with their large linear-oblong bractæ, and long alternate and remote pedicels. I possess specimens from the United States, sent me by Dr. Boott and Dr. Torrey; and the species seems more universal in the south than in the north.

8. *R. setosus*; “caule basi erecto dein reclinato hispido, foliis ternatis quinatis utrinque glabris concoloribus.” *Bigel. Fl. Bost. ed. 2. p. 198. De Cand. Prodr. v. 2. p. 563.*

HAB. About Montreal. Dr. Payne, (ex Bigel.)—I have no authentic specimen of this plant, and cannot therefore offer an opinion upon it.

9. *R. trivialis*; caule procumbente sarmentoso aculeato, ramis subinermibus, foliis ternatis, foliolis ovalibus acutis inaequaliter serratis glabris, stipulis linearis-acuminatis, floribus axillaribus pedunculatis solitariis et terminalibus racemosis, calycis segmentis ovatis acutis marginibus albo-tomentosis corolla duplo brevioribus.—*Mich. Am.* v. 1. p. 296. *Pursh, Fl. Am.* v. 1. p. 347. *Bigel. Fl. Bot. ed. 2.* p. 200. *Elliott, Carol.* v. 1. p. 569. *Torrey, Fl. of Un. St.* v. 1. p. 489?—*R. hispidus*.^{*} *Linn.*? *De Cand. Prodr.* v. 2. p. 564.—“*R. flagellaris*. *Willd.*”?—*R. procumbens*. *Muhl. Cat.*? (*Ser.*)

HAB. Canada, near Quebec. *Mrs. Percival*. Newfoundland. *Dr. Morrison*.—My specimens of this plant are almost wholly destitute of aculei upon the young branches; but they agree in every respect with those I possess from Boston, gathered by Dr. Boott, which are the same as Professor Bigelow's plant. The flowers are remarkably large, and I find the calyx to have always a distinct white downy edge. I am inclined to think, judging from the specimens that I have received from Dr. Torrey, and from his description, that he has confounded the *R. trivialis* with the *R. obovatus*, Mich.

10. *R. Canadensis*; “foliis digitatis, foliolis 10–5 seu 3 lanceolatis acuminatis argute serratis petiolatis, caule inermi.” (*Sm. in Rees' Cycl.*) *Linn. Sp. Pl.* p. 707. (excl. syn. *Mill. Ic.*) *Pursh, Fl. Am.* v. 1. p. 347. *Torrey, Fl. of Un. St.* v. 1. p. 488? *De Cand. Prodr.* v. 2. p. 565.—*Cylactis montana*. *Rafin.* in *Sill. Journ.* v. 1. p. 377, et *De Cand. Prodr.* v. 2. p. 568. (fide *Torrey*.)

HAB. Canada. *Linn.*.—Linnaeus could not have well understood this plant, or he would scarcely have referred it to the *R. odoratus* figured in *Mill. Ic.* t. 223. Sir James E. Smith says that it is very unlike all the rest of the genus, having so many leaflets. The plant I have received from Dr. Torrey as the *R. Canadensis* is a var. of *R. triflorus*, Rich. with quinate leaves, which I have also from Dr. Boott, gathered near Boston, and whose leaflets, in a very luxuriant state, may be again divided, so as to accord with the Linnean plant. Michaux does not notice it; nor do I possess any *Rubus* from Canada which quite agrees with Linnaeus's description.

11. *R. obovatus*; caule gracili longe procumbente aculeis setosis copiosis, ramis brevibus, foliis trifoliolatis vel pedatim quinatis semperferventibus, foliolis breve petiolulatis vel subsessilibus obovatis grosse inaequaliter serratis, floribus terminalibus paniculatis parvis, calycis segmentis ovatis acutis corolla duplo brevioribus. (TAB. LX.)—*R. obovalis*. *Mich. Am.* v. 1. p. 298. *Pursh, Fl. Am.* v. 1. p. 349. *Elliott, Carol.* v. 1. p. 590. *Torrey, Fl. of Un. St.* v. 1. p. 490.—*R. semperfervens*. *Bigel. Fl. Bot. ed. 2.* p. 201; (according to a specimen from Dr. Bigelow.)

Caulis longissimus, procumbens, crassitie *pennæ passerinæ*, teres, plerumque valde aculeatus. *Aculei* gracie, subetacei, recurvi, uniformes. *Rami* numerosi, herbacei, erecti, breves, inferne squamosi parce foliosi, gracie. *Folia* longe petiolata, ternata seu pedatim quinata, semperferventia; *foliola* parva, unciam vel sesquiunciam longa, coriaceo-membranacea, nitida, obovata, ad apicem praecipue subaequaliter serrata, utrinque glabra, breve petiolulata, terminali majore petiolulo longiore, lateraliibus patentibus; *petiolis* costatae subtus foliis vetustioribus aculeatis. *Stipulae* linearis-lanceolatae, membranacea, integerrima. *Pedunculus* inermis, subpubescens, gracilis, terminalis, flores 4–5 parvos subpaniculatum dispositos gerens. *Pedi-cellis* pubescentes, nudi, bracteati. *Calyx* pubescens, segmentis ovatis obtusis submucronatis, pubescentibus, mar-

* Seringe, in *De Candolle*, refers the *R. trivialis* of Mich. to *R. hispidus* of Linn. But Sir J. E. Smith says that Linnaeus's plant is more nearly allied to *R. saxatilis*.

ginibus albis. *Petala parva*, lato-ovovata, undulata, alba, calyce longiora. *Fructus* mihi desideratur: sed, teste Cel. Bigelovii, parvus, niger, acerbus.

HAB. Near Montreal. *Mr. Cleghorn*.—This is a very distinct species, of which I have also received specimens from Dr. Schweinitz, with very long slender procumbent shoots, densely covered with curved aculei, which often extend likewise to the petioles and back of the costa of the leaflets. Peduncles slender, and flowers very small. It is probably more common in the south than in the British Possessions. This has the most slender stem of any of the fruticose species, and almost unites the present group with the following. Sir James E. Smith has well remarked, in Rees' Cyclopaedia, that the name of this plant, and the definition of its leaves, "foliis obovalibus," as given by Michaux, are decidedly incorrect: an oval leaf being of the same breadth at each end. *Rubus obovatus* is unexceptionable, and expressive of the shape of the leaflets.

TAB. LX. *Rubus obovatus*. *Fig. 1*, Petal:—magnified.

12. *R. nivalis*; pusillus, frutescens, foliis cordato-trilobis argute dentatis glabris nervis petiolisque aculeatis recurvis, stipulis ovatis acutis, pedunculis brevibus 2-floris, lacinia lanceolatis pilosis. *Douglas*, MSS. apud Hort. Soc. Lond.

HAB. On the high snowy ridges of the Rocky Mountains.—Fruit red. Flowers red? Seeds few, large and wrinkled. A low species, not more than six inches high. *Douglas*.—Of this I have seen no specimens, and cannot be quite sure of its place in the genus.

† † *Herbacei vel suffruticosi*.

13. *R. pedatus*; caule filiformi repente subsimplice, foliis pedato-quinatis inciso-serratis, pedunculo solitario unifloro, calyis segmentis lanceolatis incisis corollam (albam) requanti-bus, carpellis paucis magnis. (TAB. LXI).—*Sm. Ic. Pl. Ined. t. 63*.—“*Dalibarda pedata*. *Steph. Mem. Soc. Mosc. p. 92*.”—*Comaropsis pedata*. *De Cand. Prodr. v. 2. p. 555*.

Caulis longissime repens, filiformis, inermis, raro divisus. *Rami* (seu gemme foliorum) brevissimi, erecti, squamosi, 1-3 folia gerentes. *Folia* alterna, erecta, longe petiolata, pedatum quinata; *foliola* obovata, tenui-membranaceae, inciso-serrata, breve petiolulata, glabriuscula, vix unciam longa. *Petioles* glabri, vel parce pilosi, graciles, basi stipulis 2 ovato-rotundatis membranaceis fuscis suffulti. *Pedunculus* gracillimus, axillaris, solitarius, uniflorus, longitudine foliorum, medium versus bibracteatus, bracteis oppositis membranaceis, fuscis. *Calyx* profunde 5-partitus, segmentis lato-lanceolatis foliaceis planis glabriusculis, lineatis, demum reflexis. *Petala* calycis longitudine, oblongo-ovovata, alba. *Stam.* numerosa. *Antheræ* subrotundæ. *Ovaria* 1-6, glabra, stylo triplo longiore terminata. *Fructus* ex acinus 1-4 seu 5, globosus, ratione floris magnis, valde pulposus rubris, stylis basi persistente coronatis. *Nux* matura ovata. *Semen* obovatum, pendulum.

HAB. North-West coast of America. *Menzies*. Shores of the Columbia, about Fort Vancouver, and as far north as Observatory Inlet, lat. 55°. *Douglas*, *Dr. Scouler*. In shady woods at the roots of rotten trees, on the Rocky Mountains, between lat. 52° and 56°. *Drummond*.

TAB. LXI. *Rubus pedatus*. *Fig. 1*, Flower; *fig. 2*, Fruit; *fig. 3*, Single acinus; *fig. 4*, Nut cut open to show the seed; *fig. 5*, Embryo:—magnified.

14. *R. triflorus*; inermis, caulinus erectis herbaceis, flagellis suffruticosis cauliniferis, foliis ternatis (rarissime pedato-5-natis) acute serratis, stipulis obovatis, panicula subtriflora glandulosa. (TAB. LXII).—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 19*.—*R. saxatilis*, *g. Canadensis*. *Mich. Am. v. 1. p. 298*. *Pursh, Fl. Am. v. 1. p. 349*. *Elliott, Carol. v. 1. p. 590*. *Rich. in Frankl. 1st Journ. ed. 1. App. p. 739*. *Bigel. Fl. Bost. ed. 2. p. 201*. *Torrey, Fl. of Un. St. v. 1. p. 490*. *De Cand. Prodr. v. 2. p. 565*.—*R. ægopodioides*. *Ser. in De Cand. Prodr. v. 2. p. 565*.—*R. Cunndensis?* *Torrey, Fl. of Un. St. v. 1. p. 488?*—*R. pur-viliforus?* *Nutt. Gen. Am. v. 1. p. 308?*

Radix lignosa, dura, valde flexuosa, uigrescens. *Flagelli* procumbentes, teretes, longissimi, crassitie penna-

columbinæ, puberuli, sepe purpurascentes, ad intervalla biplicaria caules alternatis preferentes. *Caulis* herbacei, erecti, e summo radice e flagellis orientes, basi squamis (stipulis) membranaceis, vel fuscis vel viridibus amplexicaulibus obvelata. *Folia* singulis caulinibus 2-4, alterna, ternata, (vel rarius pedatim quinata,) elongato-petiolata. *Stipulae* magne, obovatae, nunc obtusa, nunc acute, sepius acumine brevi, basi attenuata. *Petioles* filiformes antice sulcati, plerumque foliolum impar longitudine superantes, primo glandulis pedicellatis mox deciduis ciliati. *Foliola* subduplicato-serrata, pallide virentia, subtus pallidiore, impar petiolatum, plerumque ovali-subrhomboidea, utrinque sensim acuminatum, acutum, rarissime obovata et obtusum, semper basi attenuato integerrimo; lateralia subeossilia, inaequalia, sepius extus inciso-lobata. *Pubescens* caulis, petiolorum, foliorum et stipularum laxa, breviuscula, magis aut minus rara, et in foliis sepe fere obsoleta. *Flores* erecti, terminales, rare axillares et terminales 2-4, (plerumque 3,) paniculati. *Pedunculi* unguiculares, stricti, singuli folioli caulinis conformi, vel tantum stipulis folii abortivi suffulti, plerumque ebracteati, laterales tamen interdum rudimento folii ut videtur ubi flos alter abortivi uni-vel bi-bracteati. *Calyx* basi 12-costato-angulatus, 5-6-fidus, extus cum pedunculis pube brevi acuta villosus, et glandulis minutis, pedicellatis, deciduis obesus; lacinia sensim elongato-acuminatis intus versus apicem tantum pubescens, sub-anthesis reflexis, mox erectis. *Petala* 5-6, alba, ovalia, obtusa, passim emarginata, ungue lato brevi, calyce paulo altiora. *Fructus* ruber: *Acini* pauci, vix edules. *Rich.*

HAB. Throughout Canada, from Lake Huron to the Saskatchewan and the shores of Hudson's Bay, near York Factory, abundant.—Following this plant, so well described by Dr. Richardson, that excellent Naturalist observes, “*R. saxatilis*, L. in multis cum precedente quadrat, at diverso videtur flagellis sterilibus, nudis aut folia tantum ferentibus, nec nisi ad apices radicantes anno secundo caules emitentibus, aculeis quamvis rari vix unquam nullis, floribus minoribus et calycibus pedunculisque eglandulosis.”—I think the *R. agopodioides*, the *R. parviflorus*, probably, and the *R. Canadensis*, *Torrey*, and *Linn.*? may be referred to the same species.

15. *R. mucronatus*; caule herbaceo piloso inermi, foliis ternato-palmatis concoloribus pilosis, foliolis rhomboidis acutis serratis, stipulis ovato-lanceolatis acuminatis, floribus terminatis geminis, lacinia calycinis lanceolatis acutis puberulis corolla brevioribus. *Ser. in De Cand. Prodr. v. 2. p. 565.*

HAB. Newfoundland. *Le Clerc*, (in *De Cand. Prodr.*)

16. *R. arcticus*; caule herbaceo eretto flexuoso subunifloro pubescente inermi, foliis ternatis glabriusculis obtuse serratis, stipulis ovatis obtusis, pedunculo unifloro, calycis segmentis ovato-lanceolatis, petalis rotundatis retusis, stylis liberis.—*Linn. Sp. Pl. p. 708, Fl. Lapp. p. 162. t. 5, f. 2. Engl. Bot. t. 1585. Curt. in Bot. Mag. t. 132. Pursh, Fl. Am. v. 1. p. 349. Cham. in Linneæa, v. 2. p. 8. De Cand. Prodr. v. 2. p. 565.*

HAB. Labrador (*Pursh, Rev. Mr. Kolmaster**) and Hudson's Bay. (*Pursh*). *Dr. Wright*, in *Herb. nostr. Bay of Good Hope and Chamiso's Island, Bay of Eschscholtz*, in Behring's Straits. *Chamiso*.

17. *R. acanthis*; glabriusculus, caule herbaceo eretto brevi unifloro, foliis ternatis acute serratis, stipulis oblongo-ovatis acutis, pedunculo unifloro, calycis segmentis lineari-subulatis, petalis oblongis integerrimis, stylis approximatis.—*Mich. Am. v. 1. p. 298. De Cand. Prodr. v. 2. p. 565.*—*R. pistillatus*. *Sm. Exot. Bot. v. 2. p. 53. t. 86. Pursh, Fl. Am. v. 1. p. 349. Rich. in Frankl. 1st Journ. ed. 2. App. p. 20.*—*R. propinquus*. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 19* (fide ipsiss. *Rich.*)

HAB. In Sphagnum Swamps, Hudson's Bay, *Michaux*; whence I have also specimens from *Dr. Wright*. From the Saskatchewan, in lat. 53°, to Fort Franklin, in lat. 66°. *Dr. Richardson, Drummond*; and from

* For an interesting collection of Labrador plants, gathered by the Rev. Mr. Kolmaster, I am indebted to my friend Thomas Davidson, Esq. of Nottingham.

Labrador, (*Smith, Dr. Morrison,*) to the woods and swamps of the Rocky Mountains, between lat 52°–56°, (*Drummond*); and to Kotzebue's Sound in Behring's Straits. *Lay and Collie*.—This is assuredly the *R. acaulis* of Michaux, a name which, though not strictly appropriate, it is needless to change. Dr. Richardson observes to me that his *R. propinquua* is the same with *R. acaulis*, growing in woods and producing flagellum which ram among mosses, not upon the surface of the ground, and that the two-flowered peduncle appears to have been accidental. Chamisso justly observes how near this comes to *R. arcticus*, but I think the shorter, not zigzag, and slenderer stems, fewer leaves, larger flowers, and much longer and sharper calycine segments, with the larger and differently shaped petals of the present, will suffice to keep it distinct. I am not able to say whether the clustering together of the styles be constant. Flowers red, fragrant, (*Rich.*) Young flowering plants are scarcely a finger's length in height, but after blossoming, the stems are (especially in the woods) a span or more high, and the leaves much increased in size. The fruit, which I possess on Dr. Wright's specimens, resembles that of *R. arcticus*.

* * * *Foliis simplicibus.*

† *Herbacei.*

18. *R. stellatus*; caule simplice unifloro, foliis cordatis rugosis profunde trilobis tripartitae serratis, stipulis ovatis obtusis, pedunculo (brevi) unifloro, calycis segmentis linearisubulatis, petalis oblongis erectis (rubris).—*Sm. Ic. Pl. Ined.* t. 64. *Pursh, Fl. Am.* v. 1. p. 349. *De Cand. Prodr.* v. 2. p. 564.

HAB. Near Foggy Harbour, on the North-West coast of America. *Menzies*, (ex *Smith*).—Of this very distinct *Rubus*, resembling, however, in habit and in its flowers, *R. acaulis*, but in the leaves more approaching *R. Chamæmorus*, I am indebted for excellent specimens to Mr. Menzies, who appears to be the only Botanist that ever met with it. The representation is excellent in the *Icones Plantarum ineditae* of Sir J. E. Smith.

19. *R. Chamæmorus*; dioicus, radice repente, caule simplice unifloro, foliis reniformicordatis rugosis plicatis 5-lobis, stipulis ovatis obtusis, pedunculo unifloro, calycis segmentis late ovatis, petalis oblongis patentibus (albis).—*Linn. Sp. Pl.* p. 708, *Fl. Lapp.* p. 163. t. 5. f. 1. *Engl. Bot.* t. 706. *Mich. Am.* v. 1. p. 298. *Pursh, Fl. Am.* v. 1. p. 349. *Torrey, Fl. of Un. St.* v. 1. p. 490. *De Cand. Prodr.* v. 2. p. 564. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 20.

HAB. From Lake Winnipeg, in lat. 52°, to the shores of the Arctic Sea; (*Dr. Richardson, Captain Sir J. Franklin, Drummond*;) and from Newfoundland (*Dr. Morrison, Mr. Cormack*) and Labrador (*Dr. Morrison, Meyer*) to the Rocky Mountains, between lat. 52° and 56° (*Drummond*), and to the shores of Behring's Straits and Unalaschka. *Chamisso, Lay and Collie in Captain Beechey's Collection*.

† † *Fruticosi.*

20. *R. odoratus*; caule fruticoso erecto stricto glanduloso-piloso, foliis 5-lobis inaequaliter serratis subtus magis minusve glandulosis, corymbis compositis, calycibus setoso-glandulosis, cuspidatis petalis (roscis) subbrevioribus, stipulis liberis deciduis.—*Linn. Sp. Pl.* p. 707. *Mich. Am.* v. 1. p. 297. *Pursh, Fl. Am.* v. 1. p. 348. *Curt. in Bot. Mag.* t. 150. *Elliott, Carol.* v. 1. p. 570. *Bigel. Fl. Bost. ed. 2.* p. 201. *Torrey, Fl. of Un. St.* v. 1. p. 490. *De Cand. Prodr.* v. 2. p. 566.

HAB. Throughout Canada, and as far as the Saskatchewan. *Dr. Richardson, Drummond*.—A species nearly allied to this is described by Dr. Torrey, under the name of *R. deliciosus*, as inhabiting the more southern regions of the Rocky Mountains. It appears to differ in the absence of viscid glands.

21. *R. Nutkanus*; caule fruticoso erecto flexuoso stolonifero apice glanduloso-piloso basi

nudiusculo, foliis 5-lobis inequaliter dentatis, corymbis simplicibus, calycibus subinermibus cupidatis: laciniis corollæ albae aequalibus, stipulis connatis persistentibus. *Lindl.*—*Moc. Pl. Nutk. Ic.*—*Ser. in De Cand. Prodr. v. 2. p. 566. Lindl. in Bot. Reg. t. 1368.*

HAB. Discovered by *A. Menzies*, *Eag.* in Queen Charlotte's Sound, lat. 51° , on the North-West coast of America, (*Herb. nostr.*) and probably about the same period at Nutka, by *Mocino*. Common from Cape Orford, on the same coast, in lat. 43° , in N. California, to Nutka Sound, lat. 50° , and from the coast, throughout the woody hills, to the head-springs of the Columbia, in lat. 52° . *Douglas*, *Dr. Scouler*. Mountain-woods on the east side of the Rocky Mountains. *Drummond*.—Seringe, in *De Candolle's Prodromus*, who appears to have first described this species, says that the calyx and peduncles are glabrous, which is by no means the case with our plants, for they are glandular and downy, but scarcely setose. Mr. Lindley, after pointing out the essential characters by which this is, in the cultivated plant, distinguished from *R. odoratus*, observes, that in the wild state some of these distinctions disappear. According to Mr. Douglas, its stems, near the ocean, attain to a height of from 4–10 feet, but in approaching the "Dividing Ridge" of the Rocky Mountains, dwindle to 12–18 inches. "The peduncles are covered with glandular hairs, though less copiously than *R. odoratus*, from which it differs in habit, in being of more slender growth and having larger flowers." These flowers are constantly white, sometimes emarginate: the fruit red, insipid.

11. DALIBARDA. Linn.

Cal. tubo brevi concavo, limbo 5-fido extus nudo, lobis dentatis. *Pet.* 5 et *stam.* 00 decidua. *Ovaria* 5–10, stylis brevibus terminalibus. *Achenia* calyce involucrata pauca sessilia sicca intus cartilaginea et subdrupacea. *Semen appensum*.—*Herbae humiles, foliis petiolatis saepius indivisis, pedunculis escapiformibus 1-floris.* DC.

1. *D. repens*; caule repente, foliis cordatis obtusis crenatis pubescitibus, stipulis linearis-setaceis, calycibus pilosis reflexis.—*Linn. Sp. Pl. ed. 1. p. 491. Pursh, Fl. Am. v. 1. p. 350. Bigel. 12. FRAGARIA. Tourn.

Cal. tubus concavus 5-fidus extus 5-bracteolatus. *Pet.* 5. *Stam.* 00. *Carpella* 00 ad receptaculum demum deciduum carnosum-succulentum sparsa exsucca. *Stylus* lateralis. *Semen appensum*.—*Herbe flagellifera, foliis trifoliolatis, foliolis grosse dentatis, receptaculis (seu polyphoros) subrotundis succulentis rubris aut rariis albidis.* DC.

* *Carpellis numerosissimis superficialibus, staminibus numerosis, floribus hermaphroditis.* Ser.

1. *F. vesca*; stolonifera, foliolis plicatis tenuibus subtus pilosis, fructibus pendulis, sepalis post anthesin reflexis, pilis peduncularum adpressis. Ser.—*Linn. Sp. Pl. p. 705. Engl. Bot. t. 1524. De Cand. Prodr. v. 2. p. 569.*

HAB. In woody situations on the North-West coast of America. *Douglas*. Cumberland-House Fort. *Drummond*.

* * *Carpellis paucis in foveolis receptaculi immersis, staminibus paucis, floribus abortu saepem dioicis.* Ser.

2. *F. Virginiana*; abortu dioica, serotina, floribus subcampanulatis, petalis ovatis,

foliis coriaceis non plicatis, petiolis brevibus, pedunculis pedicellisque longitudine foliorum, receptaculis valde tumidis pendulis, stylis longis. Ser.—*Mill. Dict. ed. 8. Sm. in Rees' Cycl.?* *Pursh, Fl. Am. v. 1. p. 357. Bigel. Fl. Boot. ed. 2. p. 202. Elliott, Carol. v. 1. p. 575. De Cand. Prodr. v. 2. p. 570. Torrey, Fl. of Un. St. v. 1. p. 500.*

HAB. Newfoundland, (*Dr. Morrison*), and throughout Canada, as far as the Slave Lake, in lat. 63° .—What I here call *F. Virginiana* is the same as I have received from Dr. Torrey under that name; but I must observe that I do not see how it is to be distinguished from the *F. elatior* of Ehrh. and Smith. It does not appear to me that any dependence can be placed on the direction of the hairs of the petioles and peduncles. I find them often variable on the same plant. If Smith's *F. Virginiana* (in Rees' Cycl.) be the true species, with the hairs of the petioles and peduncles erect, there are only two or three specimens in the whole Collection which have that character, and those were found in the most northern latitudes. The others accord in almost every particular with the *F. elatior* of Smith.

3. *F. Canadensis*; “ major; foliis amplio-ovalibus, lateralibus manifeste petiolatis: pedicellis longis, recurvo-pendulis: receptaculis seminum globosis, favoso-scorbiculariatis, villosis.” *Mich. Am. v. 1. p. 299. Rich. in Frankl. 1st Journ. ed. 2. App. p. 20. De Cand. Prodr. v. 2. p. 571.*

HAB. Woods and hilly places, from Hudson's Bay to the United States. *Michaux*. Woody country between lat. 52° and 64° , north. *Dr. Richardson* (*in Frankl. 1st Journ.*)—This being the only *Fragaria* described as a native of Canada, it was natural that Dr. Richardson should refer his specimens to it. In this he has done correctly; but the species is probably not different from the *F. Virginiana*. Smith does not notice Michaux's plant. Torrey unites it, without hesitation, to *F. Virginiana*. To me it appears that the two may reasonably be considered as one species; and may not this be the origin of our *F. elatior*? which Miller declares to be a native of America.

4. *F. Chilensis*; floribus (magnis) patentibus, foliis late obovatis obtusissimis grosse serratis coriaceis rugosis subtus sericeo-villosissimis, pedunculis calycibusque sericeis.—*Ehrh. Beitr.—De Cand. Prodr. v. 2. p. 571.—Fragaria sericea. Douglas, MSS. apud Herb. Hort. Soc. Lond.—Dill. Hort. Elth. t. 120. (e planta cult.)—a. pedunculis folium subaequantibus 1-4-flori. —β. pedunculis folio longioribus pluries dichotomis, cum pedicello in axillis.*

HAB. North-West coast of America, throughout California, and from Puget Sound to “ Point Budugo,” common along the shores. *Douglas, Dr. Scouler*.—I have the same species gathered by Mr. Macrae in Chili, and Mr. Douglas has seen it also in Juan Fernandez.—This very distinct species of *Fragaria* seems to occupy a great extent of coast on the Pacific. In the really wild state, the flowers are very large, and the under-side of the leaves, as well as calyx and peduncles, are clothed with copious long silky hairs. Whether my var. β , which exists in Dr. Scouler's collection, be a cultivated specimen at Fort Vancouver, or whether its appearance arises from luxuriance of soil, I know not; but it is four times the size of the usual state of the wild plant, less silky, and with numerous flowers upon the tall panicles. In drying, the whole turns almost black, owing to its succulent nature, when recent.

13. POTENTILLA.* *Neestl. Lehm. De Cand.*

(*Potentilla, Comarum, et Tormentilla. Linn.*)

Cal. tubus concavus, limbus 4-5-fidus extus 4-5-bracteolatus. Pet. 4-5. Stam. 00 stylo

* For the determination of the individuals of this genus, and the characters and descriptions of the new species, I am indebted to my valued friend Professor Lehmann of Hamburg, the learned author of “ Monographia Generis Potentillarum.” These new species have already appeared in the “ Stirpium ab J. G. C. Lehmann, primum descriptarum, Pugillus secundus,” printed at Hamburg, 1830.

lateralis donata, in receptaculo procumbente persistente exsucco capitato. *Semen appensum.*

Am.* v. 1. p. 351.

*Tota planta pubescens, junior glanduloso-viscosa. Caules ex eadem radice plures, erecti, teretes, striati, fistulosi, 1-3-pedales. Folia impari-pinnata, radicalia longe petiolata, caulinis breviter petiolata, summa ternata subsessilina. Foliola 7-11, opposita vel subopposita, superiore sensim majora, brevissime petiolata, subrotundo-ovata, basi obliqua grossis inciso-dentatis, incisuris superioribus duplicatis. Stipulae ovatae, acute, inferiores integerrimae, superiores subincisae. Flores erecti, plus minusve pedicellati, in summo caule paniculam subdichotomam confertam constituentes. Calyx villos-viscosus, (sub 5-augulatus,) foliola exteriora lanceolata, acuta, reliquis minora, interiora oblonga, acuta, subintegerrima: tube subhemisphaerico concavo, ore staminifero. Petala pallide flava, rotundato-ovata, integerrima, calyx longiora. Stam. sub-25 basi intus annulo nectariformi cincta. Receptaculum villosum, [sub]sphaericum demum elongatum carnosum, fere ut in *P. palustris.* Ovaria ovata, pallide rosea: style infra medium margine interiore inserto, subulato, flavo, carnosu, paululum glandulosu. Stigma acutum. Achenea ovata, levia, glabra, style persistente lateralisi donata. H.]*

HAB. Woody country, as far as lat. 65°, north, and westward to the Rocky Mountains, on both sides of the "Dividing Ridge." *Dr. Richardson, Drummond, Douglas.* Fort Vancouver, on the Columbia. *Dr. Scouler, Douglas.*—I had long ago received beautiful specimens of this plant from Dr. Boott, gathered in the neighbourhood of Boston, as the *Geum agrimonoides* of Pursh, an acknowledged *Potentilla*, but which Mr. Lindley, who has examined an original specimen, "believes to be distinct," while Dr. Richardson says, "forsitan hujus (*P. arguta*) varietas, foliolis terminaliis subrotundis, proportionatim minoribus." In the year 1824, the plant was published by Dr. Torrey, in his Flora of the Northern and Middle of the United States, as *P. confertiflora*, and by Dr. Bigelow, in his Florula of Boston, as a new genus, under the name of *Boottia*, the character of which consists in a "nectary forming a stellated cavity around the receptacle of the germents, having pits in its five points opposite the narrow segments of the calyx." These pits or cavities are very inconspicuous, and are little more than a depression in each of the sinuses of the five larger segments of the

calyx; while the nectary itself is what exists in most or all of the *Potentillas* in a greater or less degree; but is more distinct in our plant than in many others. It is represented in *Potentilla*, and in the allied genera, *Waldsteinia* and *Comaropsis*, in Nestler's "Monographia de Potentilla," t. 1, and is described by the same author in the character of the family L. c. p. 14, as the "materies staminifera (discus peristomicus) sumnum calycis tubum annulatim incrassata." The insertion of the stamens at the margin of this ring gives the stellated appearance. In *P. rupestris*, the staminiferous cup is small, but its nature is the same. A splendid new East Indian genus has now been dedicated to Dr. Boott by Dr. Wallich, who, like myself, "is proud to reckon so zealous and excellent a Botanist among the number of his best friends;"—(see *Boottia cordata* in Wallich's "Plantes Asiaticæ Rariores," v. 1. p. 52. t. 65.)—Dr. Richardson, by a comparison with the Lambertian Herbarium, proved our plant to be the same with the *arguta* of Pursh, (not Lehmann,) which name is therefore to be adopted. A figure of the species is here given, and an analysis of the flowers, in order that it may be seen how little the genus *Boottia* of Dr. Bigelow is in reality at variance with *Potentilla*. Indeed the whole plant bears great affinity with our *Potentilla rupestris*, from which it cannot naturally be separated. [H.]

TAB. LXIII. *Potentilla arguta*. *Fig. 1*, Petal; *Fig. 2*, Section of a calyx and receptacle of pistils; *Fig. 3*, Front view of a stamen; *Fig. 4*, Back view of do.; *Fig. 5*, Pistil; *Fig. 6*, Receptacle of achenia; *figs. 7* and *8*, Achenia; *Fig. 9*, Section of an achenium:—magnified.

3. *P. supina*; caule decumbente dichotomo, foliis pinnatis, foliolis oblongis inciso-serratis, pedicellis axillaris solitariis.—*Linn. Sp. Pl. p. 711. Mich. Am. v. 1. p. 304. Jacq. Fl. Austr. v. 5. t. 406. Pursh, Fl. Am. v. 1. p. 356. Nestl. Monogr. Pot. p. 38. Lehm. Monogr. Pot. p. 42. Torrey, Fl. of Un. St. v. 1. p. 498. De Cand. Prodr. v. 2. p. 580.*

HAB. Plains of the Saskatchewan. *Dr. Richardson, Drummond.*

4. *P. effusa*; incano-tomentosa, caule adscendente debili, foliis interrupte pinnatis, foliolis oblongis inciso-serratis, floribus dichotome paniculatis, stipulis lanceolatis acuminatis integerrimis, petalis obcordatis calycem acuminatum æquantibus.—*Douglas, MSS.*

Radix lignosa, alba, cortice fusco. Caulis subpedalis, adscendens, debilis, teres, in paniculam dichotoman desinens. Folia radicalia longe petiolata, impari- et interrupte-pinnata, caulina brevius petiolata, summa sessilia, ternata. Foliola majora 5–9, sessilia, opposita, oblonga, inciso-serrata, serraturis obtusis, utrinque incano-tomentosa, superiora sensim majora, terminali sepiissime bidentata, minoria subcuneiformia, apice 2–3-dentata. Calyx incano-tomentosus, foliis exterioribus linearibus minimis, interioribus ovato-lanceolatis, acuminatis, integerrimis. Petala aurea, obcordata, longitudine calycis. Receptaculum villosum: achenis glaberrimis.

HAB. On elevated grounds of the Assinaboyne, and the higher parts of the Red Rivers, plentiful.

5. *P. palustris*; radice repente, caule adscendente, foliis pinnatis, foliolis lanceolatis acute serratis, petalis lanceolatis acuminatis calyce multo brevioribus.—*Scopol. Fl. Carn. ed. 2. v. 1. p. 359. Lehm. Monogr. Pot. p. 52. Torrey, Fl. of Un. St. v. 1. p. 498. De Cand. Prodr. v. 2. p. 583.*—P. Comarum. *Nestl. Monogr. Pot. p. 36.*—*Comarum palustre. Linn. Sp. Pot.* p. 55.—*P. pectinata*. *Fisch.* (sec. exempl. ab ipso auctore communicatum.)—*P. absinthiifolia*. *Douglas, MSS. apud Herb. Hort. Soc. Lond.*

HAB. About the Saskatchewan, and as far north as the Bear Lake, and from Hudson's Bay to the Rocky Mountains. *Dr. Richardson, Drummond, Douglas, Kotzebue's Sound, Lay and Collie*.—The second variety seems to be the more common and the North American specimens agree perfectly with those from Siberia. Less general is the original form of α , such as is delineated in the above-mentioned work of Jacquin, but the transitions between these two forms are as frequent as β , so that α and β may be esteemed the two extremes. Besides these, there occurs, though but rarely, another variety, or rather, more vigorous state of the plant, where the incisions of the leaflets have no entire margin, but appear here and there incised. Lastly, there exists another form, which, in regard to the leaves, holds an intermediate rank between our var. α , and the *P. multifida*, but whose straight erect stem, peculiar pubescence, inflorescence, &c. unite it with *P. Pennsylvanica*.—If this species grows in a sterile dry soil, the leaves are not interruptedly pinnated. Thus, this separation of the lesser leaflets, which, in reality, are the *inferior serratures of the larger leaflets*, only takes place in consequence of a more vigorous growth. (*Lehm.*)—[Dr. Torrey, in the Ann. of Lyc. of N. H. of N. York, v. 2. p. 197, joins to *P. Pennsylvanica* the *P. confertiflora* of his Flora of the Middle and Northern States, and some other *Potentillas* which belong to the *P. arguta* of Pursh and of this work. The tomentum on the underside of the leaves often almost wholly disappears. *H.*]

7. *P. bipinnatifida*; caule erecto, foliis pinnatis, foliolis obovatis pectinatum-pinnatifidis, supra sericeo-argenteis subtus nivo-tomentosis, stipulis rhomboideis incisis, floribus corymbo-confertis.—*Douglas, MSS. apud Herb. Hort. Soc. Lond.*—*P. arguta*. *Lehm. Monogr. Pot.* p. 62. (non *Pursh.*)

HAB. Plains of the Saskatchewan and Red Rivers. *Douglas, Drummond*.—This plant, though nearly allied to the foregoing, is certainly a good species. Besides the above marks, the incisions of the leaflets are deeper, narrower, not erect as in *P. Pennsylvanica*, but patent; the calyces are white, tomentose, and never, as in *P. Pennsylvanica*, mixed with glandular hairs. We have cultivated both plants for many years in the Hamburg Botanic Garden, and both have proved constant in their form. (*Lehm.*)—[Dr. Richardson having satisfactorily ascertained what is the true *P. arguta* of Pursh, I have taken the liberty of altering the name which Dr. Lehmann had given to this plant, and adopting the MSS. one of Mr. Douglas. But I must confess, the plant seems to me only a state of *P. Pennsylvanica* with unusually deeply divided or pectinated leaflets. *H.*]

8. *P. Hippiana*,* (*Lehm.*); caule erecto, foliis pinnatis, foliolis lanceolato-oblongis, in-ciso- et connivent-serratis, supra sericeis subtus incano-tomentosis nitidis, stipulis lanceolatis acuminatis integerrimis, panicula sublachotoma luxa, petalis obcordatia calycem superantibus. (TAB. LXIV.)—*P. leucophylla*. *Torrey in Ann. of Lyc. of N. H. of N. York, March, 1827. p. 197. (non Pallas it. 3. p. 194.)*—*P. dealbata*. *Douglas, MSS. apud Herb. Hort. Soc. Lond.* (non *Ledeb.*)

* "Hippianam cognominare licet hanc stirpem,"—says Dr. Lehmann, in his 'Stirpium primum descriptorum Pugillus secundus,'—"in honorem ejus viri, cui hunc libellum dedicavi; summo autem jure id tribui videtur viro cum litterarum cuiusvis generis peritissimo, tum de juvenibus nature indagande studio incendens optime merito et adhuc merente."

Pulchra et distinctissima species, habitu fere P. Penneyvanica. Caules ex eadem radice plures, 1-2-pedales, erecti, teretes, tomentosi, in paniculam laxam subdichotomam multifloram desinentes. Folia radicata longe petiolata, impari-pinnata, sub-4-juga, caulinis bijuga brevius petiolata; foliola opposita, approximata, sessilia, lanceolato-oblonga inciso-erecto-serrata, supra sericea, subtus incano-tomentosa, nitida, venis elevatis lineata. Stipulae lanceolatae, acuminatae, integerrimae, sericeo-tomentosae. Calycis sericeo-tomentosi, foliolis equali longitudine; exterioribus lanceolatis, interioribus ovato-lanceolatis. Petala obcordata, aurea, calycem paullum superantia. Receptaculum villosum.

HAB. Plains of the Saskatchewan and Red Rivers, and Prairies of the Rocky Mountains. *Drummond, Douglas.*

TAB. LXIV. *Potentilla Hippiana. Lehm. Fig. 1, Flower:—magnified.*

9. *P. sericea*; caule adscendente paucifloro, foliis pinnatis, foliolis ovatis pinnatifidis utrinque tomentosis subtus incanis, stipulis lanceolatis integerrimis.—*Linn. Sp. Pl. p. 710. Nestl. Monogr. Pot. p. 34. Lehm. Monogr. Pot. p. 66. t. 6. De Cand. Prodr. v. 2. p. 582.*— β . *glabrata*; foliolis junioribus et senioribus apice tantum sericeis.

HAB. β . Rocky Mountains, between lat. 52° and 56°. *Drummond*.—Only this variety of the *P. sericea* exists in the Collection, which, except in the marks just given, appears exactly similar to the original Altaic species.—[Judging from the very few individuals in the Collection, it seems to be a very rare species in America. *H.*]

10. *P. anserina*; caule repente, foliis interrupte pinnatis, foliolis argute serratis sericeis, pedicellis axillaribus solitariis longitudine foliorum, stipulis multifidis.—*Linn. Sp. Pl. p. 710. Fl. Dan. t. 544. Engl. Bot. t. 861. Mich. Am. v. 1. p. 304. Pursh, Fl. Am. v. 1. p. 356. Nestl. Monogr. Pot. p. 35. Lehm. Monogr. Pot. p. 71. Torrey, Fl. of Uu. St. v. 1. p. 498. De Cand. Prodr. v. 2. p. 582. Bigel. Fl. Bost. ed. 2. p. 203. Rich. in Frankl. 1st Journ. ed. 2. App. p. 20. Cham. in Linnæa, v. 2. p. 24.— δ . *Grælandica*; glabriusculis, nana, foliis multo minoribus pauci-jugis, foliolis obovatis rubro-virentibus subtus niveis. *Hook. in Parry's 3d Voy. App. p. 125.**

HAB. Throughout the plains, from Lake Huron to the extremo Arctic regions; and from Labrador on the east, to Kotzebue's Sound on the west; and at the Columbia, &c. Whale Fish Islands. *Captain Sir E. Parry, and Captain James Ross*.—[This extensively distributed plant is, as may therefore be expected, very variable: the two opposite extremes may be considered the var. δ , above noticed, whose leaves are scarcely two inches long, and the state found at the Columbia, whose leaves are a foot or more in length, and whose roots are eaten by the Cherokee Indians. *H.*]

11. *P. Drummondii, (Lehm.)*; caule herbaceo subrecto laxe, foliis radicalibus irregulariter subverticillatim pinnatis caulinis bijugis, foliolis obovatis truncatis basi cuneatis profunde inciso-serratis ciliatis glabriusculis, stipulis ovatis integerrimis, petalis obcordatis enlyce duplo longioribus venosis. (TAB. LXV.)

Caulis herbaceus, sesquipedalis, subrectus, latus, teres, fistulosus, subpilosus, paucifoliatus. *Folia radicata* longe petiolata, subverticillatim pinnata 3-5-juga. *Foliola* obovata, profunde inciso-serrata, dente terminali reliqui breviore, truncata, basi cuneata, ciliata, glabriuscula, parallelo-venosa, paria infima et superiora opposita, reliqua terma quaternave verticillata, omnia magnitudine subaequali, semipollucaria. *Folia caulinis* 1-3, valde distantia, breviter petiolata, 2-juga, *foliola* ut in radicalibus, *floralia* ternata sessilia, foliolis lanceolatis acuminatis. *Stipulae magna*, ovatae, acute, integerrimae. *Flores* in summo caule subpaniculati. *Pedicelli* graciles, pilosi, superne pilosissimi. *Calycis foliola* basi valde pilosa, ciliata, acuta, *exteriora* linearilanceolata, *interiora* lanceolata reliquis paullo longiora. *Petalu* calyce duplo longiora, obcordata, aurea, venosa. *Receptaculum* pilosum.

HAB. Alpine woods in the Rocky Mountains, north of the Smoking River, in latitude 56°, scarce.
Drummond.

TAB. LXV. *Potentilla Drummondii*. *Lehm.* Fig. 1, Flower; fig. 2, Stamen:—magnified.

* * *Foliis pinnato-digitatis.*

12. *P. diversifolia*, (*Lehm.*) ; caule adscendente, foliis radicalibus pinnatis subtrijugis quinatisque, caulinis bijugis digitatis ternatis, foliolis cuneiformibus superne grosse inciso-serratis apice sericeo-pilosis, stipulis ovato-lanceolatis integerrimis, petalis obcordatis calyce longioribus.

Radix crassa, lignosa, fusca, superne squamis, e rudimentis petiolorum stipularumque ortis tecta. *Caules* ex eadem radice plures, adscendentes, 3-12-pollicares, teretes, purpurascentes, pilosi, vel glabriuscui, in paniculam subdichotomam pauci-vel multifloram abeuntia. *Folia radicalia* longe petiolata, impari-pinnata, subtrijuga vel quinato-digitata, *cardina* breviter petiolata, bijuga, vel digitata et ternata. *Foliola* approximata, sessilia, cuneiformia, lateralia aspera obliqua, supra glabriuscua impresse venosa, e medio ad apicem grosse inciso-serrata, serraturis apice pilis densis longissimis albis, *subtus* plus minusve pilis longis sericeis instructa; *juncta* subtus sericeo-villosa. *Stipulae* ovato-lanceolatae, subfalcatae, acute, integerrimae, *inferiores* subtus albido-pilosa, *superiores* glabriuscua. *Flores* erecti, plus minusve longe pedicellati. *Pedicelli* teretes, graciles, subpurpurascentes, superne presertim tomentos. *Calyces* pilosi, *folia exteriora* linearis acuta, *interiora* lanceolata acuminata reliqua duplo majora. *Corolla* aurea, petalis obcordatis calyce duplo longioribus. *Receptaculum* villosum: *Achenis* levibus glaberrimus.

HAB. Alpine Prairies, as well as on the higher summits of the Rocky Mountains, between lat. 52° and 56°. *Drummond*. This is one of the *Potentillas* which presents the most varied modifications. The radical leaves of one and the same plant are partly entirely pinnate, partly pedate or digitate; the leaflets either very close together, or, less frequently, rather distant; and though the above-mentioned form of the leaflets remains the predominating one, they nevertheless appear often a little longer or narrower, those beneath either of the same length with the superior ones, or, more commonly, much smaller. The stem-leaves are found varying in the same manner. The pubescence of the plant is also very variable; that of the stem so indistinct that it appears at last almost entirely glabrous. The leaves offer all and every transitions from the sericeous with long hairs to the glabrous state; but even in those whose surface is most glabrous, the points of the segments are still covered with some sericeous hairs, such as are seen on *P. aurea*. The calyx and petals, too, are never glabrous, and the pubescence in general does not depend on the size of the plant, because both few and many-flowered ones are to be met with, exhibiting all the different forms in which this plant is known to us. Another peculiarity may be mentioned, relating to the growth of this plant. The smallest specimens, perhaps from a dry and elevated spot, do not exceed two inches in height, and have but a single stem-leaf and few flowers. From this form upwards to the height of one foot, with a panicle of 16-20 flowers, all intermediate ones may be seen. And indeed all the deviations now specified offer such insensible transitions, that it is quite impossible to fix any where the limits of a variety. The size of the flowers, however, (like those of *P. subacaulis*), exhibits no variation at all: the stem, too, is always more or less tinged with red.

13. *P. pulcherrima*, (*Lehm.*); caule adscendente viloso, foliis impari-pinnatis, foliolis dense congestis ellipticis aequaliter serratis supra adpresso pilosis subtus niveto-tomentosis, stipulis ovatis acutis integerrimis lanatis, petalis obcordatis calyce longioribus.

Radix fusca, lignosa, superne squamis e petiolorum stipularumque rudimentis ortis tecta. *Caules* ut videtur ex eadem radice plures, adscendentes, teretes, sesquipedales et longiores, incano-villosi, subpurpurascentes, in paniculam laxam desinentes. *Folia radicalia* 3-juga, longe petiolata, *caulina* bijuga et ternata, breviter petiolata. *Petioli* supra profunde canaliculati, lanati. *Foliola* sessilia ita quidem approximata ut folium digitatum septenatumque constituere videantur, elliptica, aequaliter serrata, supra viridia adpresso

pilosa, subtus niveo-tomentosa, 1-3 pollices longa. *Stipulae* ovato-lanceolatae, acute, integerrimæ, subtus valde tomentosæ. *Flores* erecti, pedicellati. *Calyces* villosi: pilis patentibus, foliolis calycinis acuminatis apice spachelato-mucronulatis, *exterioribus* linear-lanceolatis, reliquis lanceolatis paulo majoribus. *Corolla* aurea, petalis obcordatis calyce longioribus. *Receptaculum* dense lanatum, pilis achenis longioribus.

HAB. In the Prairies, as well as on dry banks, in the Rocky Mountains, between lat. 52° and 56°. Drummond.

14. *P. rubricaulis*, (Lehm.); caule adscendente, foliis radicalibus pinnatis bijugis caulinis ternatis, foliolis approximatis oblongis pinnatifido-serratis supra glabris subtus tomentosis, stipulis integerrimis, petalis obcordatis calycem subsuperantibus, receptaculo glabriuscuso.

Caules ex eadem radice plures, subpedales, adscendententes, teretes, pubescentes, purpurascentes. *Folia radicalia* impari-pinnata bijuga, *caulina* ternata. *Foliola* oblonga, pinnatifido-serrata, lacinii linear-lanceolati obtusæ, supra late viridia, glabra, subtus tomentosa, infima reliquis multo minorâ 3-4-loba, terminale maximum. *Petiolæ* pilosi, foliorum radicalium 2-3 pollices longi. *Stipulae* ex ovato-lanceolatae, subfalcatae, acute, integerrimæ. *Flores* terminalis, erecti, in paniculam subdichotomam dispositi. *Pedicelli* 1-2-pollicares, graciles, purpurei, pilosi. *Calyces* pilosi, foliolis *exterioribus* sublineariis obtusiusculis, *interioribus* ovato-lanceolatis acutis, reliquis duplo majoribus. *Petala* obcordata, aurea, calycem subsuperantes. *Receptaculum* glabriuscuso: achenis levibus.

HAB. About Bear Lake, in lat. 66°. Dr. Richardson.

15. *P. pulchella*; caulinibus procumbentibus subunifloris, foliis pinnatis subbijugis subtus sericeo-tomentosis, foliolis bi-trilobis vel linearibus integerrimis margine revolutis impari-pinnatifido, stipulis vaginantibus, stylo basi glandulos-dilatato.—Br. in Ross's Voy. ed. 2, p. 193. Hook. in Parry's 2d Voy. App. p. 395. De Cand. Prod. v. 2. p. 582.

Caules ex eadem radice plures, procumbentes, teretes, purpurei, 1½-3 pollices longi, basi glabri, versus apicem densissime lanati. *Folia radicalia* impari-pinnata, subbijuga, *foliola* sessilia, margine revoluta, supra viridæ, pilosa, impresso-venosa, subtus sericeo-tomentosa, *infima* minima, sublinearia, obtusa, integerrima, reliqua 2-3 lineas longa, bi- vel tri-loba, *impari* majore cuneato-obovato pinnatifido, lacinii oblongis vel linearibus, obtusis. *Folia caulina* 1-2-juga, *foliolis* linear-lanceolatis, integerrimis, interdum in folium unicum 3-5-lobus confluentibus. *Stipulae* ovatae, caulem et pedicellorū amplectentes, ochream fere formantes. *Flores* 1-2 terminales brevissimi pedicellati, parvi. *Calyx* subtomentosus: foliolis marginatis, *exterioribus* lanceolatis obtusis, *interioribus* ovatis, acutis, reliquis longioribus. *Petala* lutea obovata, levissime emarginata, venosa, longitudine calycis. *Style* erectus basi glandulos-dilatatus. *Receptaculum* pubescens-pilosum.

HAB. Islands of the Arctic Sea, Capt. Ross, Capt. Sir E. Parry, Capt. Sabine. Shores of the mainland between the Coppermine and Mackenzie Rivers. Dr. Richardson.

* * * *Foliis digitatis.*

16. *P. argentea*; caule adscendente, foliis quinatis, foliolis cuneiformibus superne incisis margine revolutis subtus candido-tomentosis, petalis retusis calyce longioribus. Lehm.—Linn. Sp. Pl. p. 712. Pursh, Fl. Am. v. 1. p. 355. Nestl. Monogr. Pot. p. 48. Lehm. Monogr. Pot. p. 94. Engl. Bot. t. 289. Bigel. Fl. Bost. ed. 2. p. 204. Torrey, Fl. of Un. St. v. 1. p. 497.

HAB. Canada. Pursh.

17. *P. opaca*; caule decumbente filiformi, foliis infimis septenatis quinatisque, foliolis lanceolato-cuneiformibus profunde serratis utrinque prolixè pilosis, petalis obcordatis

calycem aequantibus. *Lehm.*—*Linn. Sp. Pl.* p. 713. *Jacq. Ic. Rar.* t. 91. *Pursh, Fl. Am.* v. 1. p. 355. *Lehm. Monogr. Pot.* p. 105. *De Cand. Prodr.* v. 2. p. 575.

HAB. Labrador. (*Herb. Banks*. fide *Pursh*.)

18. *P. Canadensis*; caule adscendente debili, foliis radicalibus quinatis, foliolis sessilibus obovato-cuneiformibus superne acute serratis candicanti-sericeis, petalis orbiculatis subintegris longitudine calycis. *Lehm.*—*Linn. Sp. Pl.* p. 713. *Mich. Am.* v. 1. p. 303. *Pursh, Fl. Am.* v. 1. p. 354. *Nestl. Monogr. Pot.* p. 58. t. 10. f. 1. *Lehm. Monogr. Pot.* p. 118. *Elliott, Carol.* v. 1. p. 173. *Torrey, Fl. of Un. St.* v. 1. p. 426. *De Cand. Prodr.* v. 2. p. 575.—P. pumila. *Lam.*—P. sarmentosa. “*Muhl.*” et *Bigel.* in *Fl. Bost.* ed. 2. p. 204. (fide specim. ab amiciss. *Boott*.)

HAB. Canada. *Michaux*.—Dr. *Boott's* specimens of “*P. sarmentosa* of *Muhl.*,” (and *Willd.*?), precisely accord with Dr. *Torrey's*, and with *Nestler's* description and figure. It may be a state of *P. simplex* before the appearance of the runners, but the leaflets are broader and much paler, and silky beneath.

19. *P. simplex*; caule sarmentoso, foliis quinatis, foliolis oblongo-ovalibus serratis subtus subpilosis, pedicellis axillaris solitariis longitudine foliorum, petalis rotundatis vix emarginatis calyce pauculo longioribus. *Lehm.*—*Mich. Am.* v. 1. p. 303. *Pursh, Fl. Am.* v. 1. p. 354. *Nestl. Monogr. Pot.* p. 40. t. 9. f. 2. *Lehm. Monogr. Pot.* p. 142. *Elliott, Carol.* v. 1. p. 574. *Bigel. Fl. Bost.* ed. 2. p. 204. *Torrey, Fl. of Un. St.* v. 1. p. 497. *De Cand. Prodr.* v. 2. p. 575.—P. sarmentosa. *Willd.* (fide *Lehm.* ex specim. in *Herb. Willd.*) an *Muhl.*?—P. *Caroliniana*. *Poir.*

HAB. Canada. *Michaux*. About Quebec. *Mrs. F. Mal, W. Sheppard, Esq.*—This should be compared with authentic specimens, and in different states, of *P. Canadensis*, to see if they may not prove the same.

20. *P. gracilis*; caule erecto elato superne corymboso-paniculato molliter hirsuto, foliis longe petiolatis 5-natis superioribus solummodo sessilibus, foliolis lanceolatis profunde pinnatifido-serratis subtus albo-tomentosis, stipulis magnis lanceolatis integerrimis, petalis obcordatis calyce sericeo longioribus.—*Douglas, MSS. apud Hort. Soc. Lond.*—*Hook. in Bot. Mag.* t. 2984.

HAB. Banks of the Columbia and plains of the Multnomah Rivers. *Douglas, Dr. Scouler.*—In habit nearly allied to *P. pulcherrima* of *Lehm.* in this work; but here the leaflets are truly digitate, not pinnated in the slightest degree. [H.]

21. *P. flabelliformis*, (*Lehm.*); caule erecto gracili, foliis novenatis septenatis, foliolis profunde pinnatifidis supra adpresso pilosis subtus incano-tomentosis lacinii linearibus distantibus margine revolutis, floribus corymbosis, petalis obcordatis calyce superantibus. (TAB. LXVI.)

Caulis suberectus, sesquipedalis, gracilis, teres, fistulosus, subpurpurascens, incumbente pilosus. *Folia radicalia* longe petiolata novenata septenata, *caulinis* septenata et quinata brevius petiolata, *summa* ternata. *Foliola* sessilia seorsim sese tegentia, flabellum fere formantia, profunde pinnatifida, supra viridia adpresso pilosa, subtus incano-tomentosa, lacinii remotis, linearibus, obtusis, integerrimis, margine revolutis. *Petioli* lanati foliorum radicalium 3–6 pollices longi. *Stipulae* angusto-lanceolatae, acuminatae, integerrime, subtus lanatae. *Flores* pro planta parvi, breviter pedicellati, in summo caule congesti. *Calyces* incani sublansti, foliolis exterioribus linearibus, interioribus ovatis acuminatis reliquis multo majoribus. *Petala* aurea, obcordata, basi cuneata, calyce duplo majora. *Receptaculum* pilosum.

HAB. Plains of the Saskatchewan. Dr. Richardson, Drummond.

TAB. LXVI. *Potentilla flabelliformis*. Fig. 1, Flower:—magnified.

22. *P. dissecta*; erecta ramosa glabriuscula, foliis quinatis, foliolis pinnatifidis, laciniis integris acutis, floribus terminalibus subcorymbosis. Pursh, Fl. Am. v. 1. p. 355. De Cand. Prodr. v. 2. p. 575.

HAB. Near Hudson's Bay, (Herb. Banks. sive Pursh.)

23. *P. chrysanthia*; caule adscendente, foliis septenatis quinatisve, foliolis ellipticis grosse serratis pubescensibus, stipulis superioribus subincisis, petalis obcordatis calyce duplo longioribus. Trevir, In ind. sem. H. Wratisl. 1828.

Proxime accedit ad *P. intermediate*, differt: caule simplice nec dichotome ramoso superne nudo, foliis magis ellipticis quam ovatis, stipulis latioribus superioribus plerumque incisis, foliolis calycinis inaequalibus, acheniis laevibus nec rugulosis. Planta americana robustior et magis glabrescens quam Sibirica a Cl. Ledebourio mecum communicata.

HAB. Moist Prairies, near the Rocky Mountains. Drummond.

24. *P. concinna*; caule abbreviato paucifloro, foliis radicalibus septenatis quinatisve, foliolis cuneato-ovovatis apice serratis subtus densissime niveo-tomentosis, petalis obcordatis calycem superantibus. (TAB. LXVII).—Rich. in Frankl. 1st Journ. ed. 2. App. p. 20.

Pulchra species. *Caules* ex eadem radice plures, bipinnulares, debiles, uti et petioli et pedunculi lanati. *Folia radicalia* septenata vel quinata cum petiolo longitudine caulinum. *Foliola* 3–5 linearis longa, supra pallide viridia, pila copiosa adpressis subsericea, subtus densissime niveo-tomentosa, tomentum pilla longis mollissimis ultra marginem prorectis mixtum. *Folia caulinis* 1–2, ternata: *foliolis* apice tridentatis, laterali bus sepe integerrimi. *Stipula* sublanata, foliorum *radicalium* membranaceæ, subhyalinae, lanceolate, acuminate, nervoso-striatae, *caulinorum* ovatae, lanceolate, acute, herbaceæ. *Flores* 2–3, terminales. *Calyx* villosus, *foliolis exterioribus* linearibus obtusis, *interioribus* ovato-lanceolatis acuminatis reliquis longioribus. *Petala* obcordata, aurea, calycem superantia. *Receptaculum* hirsutum.

Scand.—3. foliis utrinque villosiusculis paginis concoloribus. Br.*

HAB. Labrador. *Rev. B. Kohlmeister* (*in Herb. nostr.*) Mountains and alpine Prairies, from Carlton-House, to the Rocky Mountains, *Drummond*; and to the shores of the Arctic Sea (*Dr. Richardson*), and islands of the Arctic Ocean, (*Capt. Ross*, *Capt. Sir E. Parry*, *Capt. Sabine*), where also var. β . is found, as well as at Labrador. *Dr. Morrison*.—This species also, in North America, appears, in regard to the pubescence of the whole plant, size, and number of the flowers, a very variable one. Though the size of the petals is subject to many changes, it depends however on that of the calyx, in as much as a larger calyx has always in proportion larger petals.* Another deviation from the usual state of the plant I find in the North American plants of this species, namely, that sometimes (as in *P. subacaulis*) there are found some leaves quinate: those are apparent on vigorous specimens, the flowers of which are numerous and small. In other respects there is no difference. *Lehm.*

33. *P. tridentata*; radice repente, caule adscidente, foliis ternatis, foliolis oblongo-cuneiformibus apice tridentatis supra glabriusculis subitus pubescentibus glaucescentibus.—*Ait. Hort. 34. *P. biflora*; caule erecto apice subbifloro, foliis ternatis tenuissime pilosis, foliolis lateralibus profunde bipartitis terminali bipartito, segmentis linearibus integerrimis margine ciliatis. *Lehm. in Conspect. Pot. Herb. Willd. in Mag. der Gesell. Sieb. Jahrg. p. 297, Monogr. Pot. p. 192. t. 20. Rich. in Frankl. 1st Journ. ed. 2. App. p. 21.*

HAB. Barren grounds, from lat. 64° to the shores of the Arctic Sea. *Dr. Richardson*, (*in 1st Exped.*) Kotzebue's Sound, *Lay and Collie*.—For an accurate and full description of this species, taken from the recent plant, see *Dr. Richardson*, loc. cit. [H.]

* For some further particulars relative to the varieties of this species, see the *Bot. Mag.* under tab. 2982.—H.

NOTE.—In the Botanical Register t. 1412, has just appeared a *Potentilla* from Dr. Richardson, under the name of *P. Misourica* of "Hornemann;" but which I am quite unable to distinguish from Dr. Richardson's original specimens of *P. Pennsylvanica*.—H.

14. SIBBALDIA. *Ledeb.* (SIBBALDIE SPEC. *Linn.*)

Cal. planiusculus decemfidus (laciiniis alternis accessoriis.) Cor. pentapetala : petala linearis-spathulata. Stam. 5-10. Styli laterales, simplices, 5-10. Caryopses 5-10. Receptaculum subnudum.—Eglandulosæ, petalis albis vel flavidis. *Ledeb.*

1. *S. procumbens*; foliis trifoliolatis, foliolis superne æqualibus cuneatis apice grosse dentatis pilosiusculis, floribus corymbosis, petalis calyce brevioribus. *Linn. Sp. Pl.* p. 406. *Pursh, Fl. Am.* v. 1. p. 211. *Torrey, Fl. of Un. St. v. 1.* p. 330. *Engl. Bot.* t. 897. *Cham. in Linnæa*, v. 2. p. 28.

HAB. High Mountains of Canada. *Pursh.* Prairies, and upon the heights of the Rocky Mountains, between lat. 52° and 56°. *Drummond.* *Unalaschka.* *Chamisso.*

15. HORKELIA. *Cham. et Schlecht.*

Cal. campanulatus, semidecemfidus, laciiniis alternis accessoriis. Pet. 5, (parva, Cham.) Stam. 10, biseriata, calycis parietibus inserta. Receptaculum conicum siccum, villosum. Ovaria indefinite numerosa. Styli simplices cum ovario articulati, subterminales. Achenia calyce inclusa. *Cham. et Schlecht.*

1. *H. congesta*; foliis radicalibus pinnatis, foliolis cuneato-oblongis apice incisis, calycis laciiniis exterioribus integerrimis, petalis calyce longioribus.—*Douglas, MSS. apud Herb. Hort. Soc. Lond.*—*Hook. in Bot. Mag.* t. 2880.

HAB. Cape Mendocino, and on the low hills of the Umtqua River, California, lat. 41°-42°. *Douglas.*

16. CHAMÆRHODOS. *Bunge.* (SIBBALDIE SPEC. *Linn.*)

Cal. campanulatus, 5-fidus. Cor. 5-petala : petala obovata. Stam. 5. Styli laterales, (rarius 5) plerumque 10 vel plures. Caryopses 5, 10 pluresve. Receptaculum villosum.—Omnes glanduloso-pilosæ, petalis albis purpureisve. *Ledeb.*

1. *C. erecta*; herbaceæ pubescens, caulinis elongatis racemoso-paniculatis, foliis radicalibus binternato-multifidis, caulinis superioribus 3-5-fidibus laciiniis linearis-filiformibus, floribus pentandris 5-20-gynis, petalis calyce excedentibus.—"Bunge."—*Ledeb. Fl. Altaic.* v. 1. p. 431.—*Sibbaldia erecta.* *Linn. Sp. Pl.* p. 406. *Pursh, Fl. Am.* v. 2. p. 211. *De Cand. Prodr.* v. 2. p. 586.—*Annn. Rth.* p. 85. t. 25.

HAB. About Carlton House on the Saskatchewan, (Dr. Richardson,) and among the Rocky Mountains, between lat. 52°-56°. *Drummond.*

17. AGRIMONIA. *Tourn.*

Cal. tubus turbinatus foveolatus supra lappaceus, extus setis involucriformibus onustus, fauce cum centrali foramine obturata, limbo 5-fido. Pet. 5. Stam. 15. Carpella 2, stylo terminali. Achenia tubo cal. indurato inclusa membranacea, semine appenso.—Herbeæ, foliis pinnatisectis, floribus racemoso-spicatis flavis, bracteis trifidis. *DC.*

1. *A. Eupatoria*; glabriuscula vel hirsuta, foliis interrupte pinnatis, foliolis oblongo-ovatis grosse serratis, fructibus distantibus, tubo calycis campanulato superne setoso. *Linn.*

*Sp. Pl. p. 643. Mich. Am. v. 1. p. 287. Pursh, Fl. Am. v. 1. p. 325. Engl. Bot. t. 1335. Bigel. Fl. Bost. ed. 2. p. 189. Elliott, Carol. v. 1. p. 526. Torrey, Fl. of Un. St. v. 1. p. 473. De Cand. Prodr. v. 2. p. 587.— β . *hiruta*. Torrey.— δ . *parviflora*; racemis gracilibus, pedicellis longioribus, floribus remotioribus minoribus.—A. *parviflora*. Ait. Hort. Kew. ed. 1. v. 2. p. 130? et aliorum?—A. *striata*. Mich. Am. v. 1. p. 287? et aliorum?*

HAB. Throughout Canada, as far as Lake Winnipeg. Dr. Richardson, Drummond, β . and γ . Lake Huron. Dr. Todd.—What I take to be a small flowered variety of this is not uncommon in Upper Canada, and this, I strongly suspect, is the *A. parviflora* of Ait., and probably the *A. striata*, imperfectly described by Michaux, and which he says inhabits Canada; but he observes that the flowers are white. According to my specimens from Mr. Elliott, his *A. suaveolens* is this var., but whether it be the same with that of Pursh, I am not able to determine.

TRIB. IV. SANGUISORBEÆ. Juss.

18. ALCHEMILLA. Tourn.

Cal. tubulosus, tubo apice subcontracto, limbo 8-partito, lobis alternis (bracteolis) minoribus interdum minimis dentiformibus. *Pet. 0. Stam. 1-4. Carpella* 1-2 lateraliter stylum filiformem apice capitatum gerentia, demum sicca indurata monosperma. *Semen* inversum.—Herbæ, foliis palmatim lobatis aut sectis, floribus corymbosis parvis. Genus medium inter Sanguisorbeas et Dryadeas. DC.

1. *A. vulgaris*; foliis reniformibus plicato-concavis 9-lobis serratis, caule petiolisque glabriusculis, floribus dichotomis corymbosis. DC.—Linn. Sp. Pl. p. 178. Engl. Bot. t. 597. De Cand. Prodr. v. 2. p. 589.

HAB. Labrador. Dr. Morrison, Rev. B. Kohlmeister.—This species is known to inhabit Greenland, but, I believe, no other part of the continent of America than that I have now mentioned. *A. alpina*, too, is found in Greenland; but in America it is only doubtfully mentioned by Pursh as having been seen on high mountains in Vermont, and New Hampshire.

19. SANGUISORBA. Linn.

Flores hermaphroditi. Cal. 4-fidus extus basi bisquamatus. Pet. 0. Stam. 4. Carpella 2 intra calycis tubum inclusa, stylo apice penicilliformi superata, in achenia sicca indehisc. 1-sperma conversa. *Semen* inversum.—Herbæ perennes, foliis impari-pinnatis, floribus in spicas densissimas ovatas cylindraceas aggregatis. DC.

1. *S. media*; spicis elliptico-cylindraceis (atropurpureis) staminibus calyce subduplo longioribus, calycibus bracteis foliisque longioribus, foliolis cordato-ovatis obtusis grosse dentato-serratis.—Linn. Sp. Pl. p. 594. Pursh, Fl. Am. v. 1. p. 117. Torrey, Fl. of Un. St. v. 1. p. 176. Sm. Engl. Fl. v. 1. p. 219? De Cand. Prodr. v. 2. p. 594.— β . *minor*.

HAB. Canada. (Linnaeus) Douglas, MSS. Columbia River, on the North-West coast of America. Mr. Menzies, Dr. Scouler. β . At Port Wentworth. Mr. Menzies.—This is assuredly very nearly allied to our European *S. officinalis*; and was described by Linnaeus as a native of Canada, (from which country, however, I have never seen a specimen,) and distinguished by its longer cylindrical spikes, and longer stamens. In these characters, our plants from the North-West coast entirely agree; and I have a beautiful drawing, made on the spot by Mr. Menzies, in which these distinctions are faithfully represented. The spike is a very deep purple colour. At Fort Vancouver, on the Columbia, the leaves attain a length of twelve or fourteen inches, and the stem a height of two feet. At Port Wentworth, they scarcely reach the height of a span.—The style is single, according to Mr. Menzies's figure; the stigma a globose tuft of hairs; and there are three bracteas at the base of the calyx.

2. *S. Canadensis*; spicis longis cylindricis (albis), staminibus longe exsertis, filamentis superne dilatatis, foliolis ovato-oblongis subcordatis grosse serratis.—*Linn. Sp. Pl. p. 169. Mich. Am. v. 1. p. 100. Pursh, Fl. Am. v. 1. p. 126. Elliott, Carol. v. 1. p. 206. Torrey, Fl. of Un. St. v. 1. p. 176. Bigel. Fl. Bost. ed. 2. p. 62. De Cand. Prodr. v. 2. p. 594.*—
3. *latifolia*; foliolis brevioribus latioribus.

HAB. Canada, about Quebec. *Michaux, Mrs. Sheppard, Mrs. Percival.* Newfoundland. *Dr. Morrison.*
3. Observatory Inlet, North-West coast of America. *Dr. Scouler.* Grassy pastures in the vallies of Umanaschka. *Chamisso.*

20. POTERIUM. *Linn.*

Flores monoici aut polygami. *Cal.* basi 8-squamulosus, tubo apice coarctato, limbo 4-partito. *Pet. 0. Stam. 20-30. Ovaria* 2 stylo filiformi et stigmate penicilliformi superata. *Achenia* intra calycem induratum sicca 1-sperma. *Semen* inversum.—*Herbae aut suffrutices. Folia impari-pinnata, foliolis serratis (vel profunde divisis.) Flores in spicas globosae cylindraceae dense aggregati.* DC.

1. *P. Sanguisorba*; herbaceum, caule anguloso foliisque glabris, foliolis 4-5-jugis ovatis subrotundis profunde serratissimis, capitulis subrotundis floribus inferioribus masculis.—*Linn. Sp. Pl. p. 1411. Engl. Bot. t. 860. De Cand. Prodr. v. 2. p. 594.*

HAB. Lake Huron. *Dr. Todd, (in Herb. nostr.)*

2. *P. annuum*; herbaceum annum glabrum, caule erecto dichotomo, foliolis 4-5-jugis ovatis profunde pectinato-pinnatifidis, lacinias linearis-angustissimis, capitulis ovalibus (unisexualibus?)—*Nuttall, MSS. in Herb. nostr.*

Radix parva, annua. *Caulis* erectus, strictus, gracilis, pedalis ad bipedalem glaber, plerunque dichotome ramosus. *Folia* plurima, glabra. *Foliola* 4-5-juga, circumscriptione ovata, ad costam usque pectinato-pinnatifida, lacinias angustissimis linearibus. *Capitula* terminalia, elliptica, ut videtur flavescenti-purpurea, unisexuala?

HAB. Rocks near the "Grand Rapids," on the plains of the Multnomah, frequent. *Douglas.*—The same very distinct species I have received from Mr. Nuttall (who gathered it upon the Red River, in Louisiana) as the *P. annuum* of his MSS.: a name, therefore, which I gladly adopt.

TRIB. V. ROSEÆ. DC.

21. ROSA. *Tourn.*

Calycis tubus apice contractus, limbo 5-partito, lobis per aestivationem upice subspiraliter imbricatis saepe pinnatim sectis. *Pet. 5. Stam. 00. Carpella* plurima, calycis tubo demum baccato inserta, et in eo inclusa, sicca indehiscentia subcrustacea, e latere interiori stylum gerentia, stylis e calycis tubo coarctato exsertis, nunc omnino liberis, nunc in stylum columnarem accretis. *Semen* in *acheniō* solitarium exalbuminosum, inversum. *Embryo* rectus, *cotyledonibus* planiusculis.—*Frutices aut Arbusculæ; foliis saepius impari-pinnatis, foliolis serratis, stipulis petiolo adnatis.* DC.

Div. I. CINNAMOMEÆ. *Setigera vel inermes bracteatae. Foliola lanceolata eglandulosa. Discus tenuis nequaquam incrassatus.* Lindl.

1. *R. nitida*; pumila, armis confertissimis gracilibus, foliolis nitidis anguste lanceolatis

planis. *Lindl.*—*Willd. Enum.* p. 544. *Pursh, Fl. Am.* v. 1. p. 344, et in *Suppl.* p. 749. *Lindl. Ros.* p. 13. t. 2. *De Cand. Prodr.* v. 2. p. 608. *Torrey, Fl. of Un. St.* v. 1. p. 485.—*R. blanda. Pursh, Fl. Am.* v. 1. p. 344. (non *Ait.*)

HAB. Newfoundland. (*Herb. Banks.*) *Dr. Morrison, Mr. Cormack, Sir Alexander Cochrane.*

2. *R. lucida*; compacta, aculeis ramorum stipularibus, foliolis oblongis imbricatis planis lucidis, fructu depresso-globoso. *Lindl.*—“*Ehrh. Beitr.* 4. 22.” *Jacq. Frag.* p. 71. t. 107. f. 3. *Pursh, Fl. Am.* v. 1. p. 344. *Elliott, Carol.* v. 1. p. 563. *Lindl. Ros.* p. 17. *Torrey, Fl. of Un. St.* v. 1. p. 485. *De Cand. Prodr.* v. 1. p. 602.—*Dill. Elth.* p. 325. t. 245. f. 316.

HAB. Newfoundland. *Sir Alexander Cochrane.*—In those specimens which I have received from Sir A. Cochrane, the calyx-tube is naked.

3. *R. Woodsii*; stipulis sepalique conniventibus, foliolis oblongis obtusis glabris. *Lindl. Ros.* p. 21. *De Cand. Prodr.* v. 2. p. 604. *Lindl. in Bot. Reg.* t. 976.

HAB. North of the Saskatchewan, as far as Bear Lake. *Dr. Richardson.*—Of this there is what Mr. Borrer considers a var., with the leaves downy beneath, gathered about Cumberland-House Fort by *Mr. Drummond.*

4. *R. Carolina*; stipulis convolutis, foliolis lanceolatis, sepalis patentibus. *Lindl.*—*Linn. Sp. Pl.* p. 703. *Pursh, Fl. Am.* v. 1. p. 341. *Elliott, Carol.* v. 1. p. 565. *Lindl. Ros.* p. 23. t. 4. *Torrey, Fl. of Un. St.* v. 1. p. 486. *De Cand. Prodr.* v. 1. p. 605.—*R. Caroliniana. Bigel. Fl. Bost. ed.* 2. p. 197.—*R. Pennsylvanica. Mich. Am.* v. 1. p. 296.

HAB. Canada, and as far as the Saskatchewan. *Dr. Richardson, Drummond.*

5. *R. blanda*; elatior, armis deciduis, foliolis oblongis planis, petiolo piloso. *Lindl.*—*Ait. Hort. Kew. ed.* 1. v. 2. p. 202. *Lindl. Ros.* p. 25.—*R. fraxinifolia, a. De Cand. Prodr.* v. 2. p. 606.

HAB. “North-West coast of America.”* *Menzies, (in Lindl.) Hudson's Bay, (Herb. Banks.) Canada, and as far north as the Bear Lake. Dr. Richardson, Drummond.*—The specimens in the Collection accord with an authentic one in my Herbarium from Mr. Lindley. “It varies, however, in the abundance of glands on the underside of the leaves and stipules, nor do I know how *R. acicularis*, Lindl. (*Ros.* p. 144. t. 8,) is to be distinguished. There are specimens from Cumberland-House Fort, gathered by Dr. Richardson, in which the shoots are almost as large and prickly as in *R. jerox.* but not downy. There is, too, a var. *foliolis latioribus serraturis dorso crenatis*, gathered near Bear Lake by *Capt. Back* and *Lieut. Kendall.*—Mixed with *R. blanda*, and its broad leaved var. is a *Rose* unknown to me, of a similar pale hue, with very numerous nearly equal setaceous prickles, petioles slightly hairy, and with a few prickles and setae, leaflets very obtuse, coarsely, sharply, and simply serrated, and naked on both sides. It is probably a species.” *Borrer.*

6. *R. fraxinifolia*; elatior inermis, rami strictis glaucescentibus, foliolis opacis undulatis impubibus. *Lindl.*—“*Bork. Holz.* 301.” *Ker. in Bot. Reg.* t. 458. *Lindl. Ros.* p. 26. *De Cand. Prodr.* v. 2. p. 606.

HAB. North-West coast of America. (*De Cand.*) *Menzies, (in Herb. nostr.) Douglas, Dr. Scouler. Newfoundland, (Herb. Banks.)*—In De Candolle's Prodromus this is stated to be exclusively a native of the North-West coast of America. My specimens are all from that country, and well accord with the figure in the Bot. Register, above quoted. M. Seringe unites the *R. blanda* of Hortus Kewensis with the present species.

* This station probably belongs to the following species.

7. *R. cinnamomea*; elatior cinerea, ramis strictis, aculeis stipularibus rectiusculis, stipulis dilatatis undulatis, foliolis oblongis rugosis subtus tomentosis. *Lindl.*—*Linn. Sp. Pl. p. 703. Engl. Bot. t. 2388. Lindl. Ros. p. 28. t. 5. De Cand. Prodr. v. 1. p. 605.*

HAB. Shores of the Columbia, near its confluence with the sea. *Dr. Scouler.*—Mr. Borrer observes that the specimens resemble the European plant, except that the flower-stalks bear setæ.

8. *R. majalis*; humilior cæsia, ramis strictis coloratis, aculeis sparsis subæqualibus, stipulis linearibus, foliolis oblongis planis subtus glaucis tomentosis. *Lindl.*—*Ietz, Obs. Bot. 3. p. 33. Lindl. Ros. p. 34.*

HAB. From the Saskatchewan to Mackenzie's River. *Dr. Richardson.*

Div. II. PIMPINELLIFOLIE. *Setigeræ armis confertis subconformibus, v. inermes; ebracteatae (rarissime bracteatae.) Foliola ovata v. oblonga. Sepala conniventia persistentia. Discus subnudus. Lindl.*

9. *R. stricta*; ramosissima, ramulis inermibus, fructu elongato pendulo. *Lindl.*—*Muhl. Cat. p. 42. Lindl. Ros. p. 42. t. 7. De Cand. Prodr. v. 2. p. 612.—R. pendulina. Linn. Sp. Pl. p. 705.—R. Carolina. ζ. Ait. Hort. Kew. ed. 2. v. 3. p. 260.—Var. β. foliis subtus pubescens.*

HAB. β. On the Saskatchewan. *Drummond.*

Div. III. BANKSIANÆ. *Stipulae subliberae, subulatae v. angustissimæ, saepius deciduae. Foliola saepius ternata, nitida. Caules scandentes. Lindl.*

10. *R. levigata?* stipulis lineari-lanceolatis semiadnatis, petiolis inermibus, fructibus muricatis. *Lindl.*—*Mich. Am. v. 1. p. 295. Pursh, Fl. Am. v. 1. p. 945. Lindl. Ros. p. 125.*

HAB. Lake Huron. *Dr. Todd.*—Mr. Borrer observes that this species is probably the same as Pursh's *R. levigata*, since it agrees very well with his character; but the leaves are pubescent, and the leaf-stalks have no prickles.

I am indebted to my kind and valued friend Mr. Borrer for the determination of the above species of this most difficult genus. There are still some dubious ones in the Collection, and two or three that are probably new from the Pacific side of the Continent; but till we are supplied with more copious and better specimens, we shall not attempt to define them.

TRIB. VI. POMACEÆ. *Juss.*

22. CRATÆGUS. *Lindl.*

Cal. tubus urceolatus, limbus 5-fidus. Pet. patentia orbiculata. Ovarium 2-5 loc. Styli totidem glabri. Pomum carnosum ovatum dentibus calycinis vel disco incrassato clausum putamine osseum.—Frutices spinosi. Folia angulata aut dentata. Corymbi terminales. Bracteæ subulate deciduae. DC.

1. *C. Crus Galli*; foliis obovato-cuneiformibus subsessilibus nitidis glabris tarde deciduis, cal. lobis lanceolatis subserratis, stylis 2. *DC.*—*Linn. Sp. Pl. p. 632. Mich. Am. v. 1. p. 288. Pursh, Fl. Am. v. 1. p. 338. Elliott, Carol. v. 1. p. 548. Bigel. Fl. Bost. ed. 2. p. 194? Torrey, Fl. of Un. St. v. 1. p. 476. Wats. Dendr. t. 56. De Cand. Prodr. v. 2. p. 626.—Mespilus lucida. Ehrh.*

HAB. Canada. *Pursh.* About Lake Erie. *Douglas.*—I have seen no Canadian specimens of this, which is, however, not unfrequent in the southern States. In the northern, I am disposed to think that *C. glandulosa* has been mistaken for it. I possess beautiful specimens from Dr. Schweinitz, gathered in Pennsylvania.

2. *C. elliptica*; foliis ellipticis inaequaliter serratis glabris, petiolis calycibusque glandulosis, lacinia calycis obtusis, baccis globosis 5-spermis. *Ph.*—*Ait. Hort. Kew. ed. 1. v. 2. p. 168. Pursh, Fl. Am. v. 1. p. 337. Elliott, Carol. v. 1. p. 549. Torrey, Fl. of Un. St. v. 1. p. 475. De Cand. Prodr. v. 2. p. 627.*

HAB. Canada. *Pursh.*—With this species I am unacquainted.

3. *C. punctata*; foliis obovato-cuneiformibus glabris serratis, calycibus subvillosis, lobis subulatis integris. *DC.*—*Ait. Hort. Kew. ed. 1. v. 2. p. 169. Jacq. Vind. v. 1. t. 28. Mich. Am. v. 1. p. 289. Pursh, Fl. Am. v. 1. p. 338. Torrey, Fl. of Un. St. v. 1. p. 476. Wats. Dendr. t. 57. Elliott, Carol. v. 1. p. 548. De Cand. Prodr. v. 2. p. 627.*—*Mespilus cuneifolia. Ehrh.*—?*brevispina. Douglas, MSS. apud Herb. Hort. Soc. Loud.*

HAB. β . Common on the banks of streams on the North-West Coast of America. *Douglas, Dr. Scouler.*—Of the wood of this, and of *Pyrus rivularis*, the Indian tribes on the Pacific make their wedges for splitting trees. Mr. Douglas's plant, thus named, seems to come too near *C. glandulosa*, and its leaves are certainly not unfrequently lobed or angled. Two varieties are in Mr. Douglas's collection from the North-West coast; both, indeed, with short thorns; one is glabrous in every part, the other has the peduncles, calyces, and under-side of the leaves downy.

4. *C. pyrifolia*; foliis ovato-ellipticis inciso-serratis subhirtis, calycibus villosiusculis, lobis linear-lanceolatis serratis, floribus 3-gynis. *DC.*—*Ait. Hort. Kew. ed. 1. v. 2. p. 168. Pursh, Fl. Am. v. 1. p. 337. Elliott, Carol. v. 1. p. 530. Wats. Dendr. t. 61. Torrey, Fl. of Un. St. v. 1. p. 475. De Cand. Prodr. v. 2. p. 627.*

HAB. La Grande Chaudière. *Pursh, MSS.*

5. *C. glandulosa*; foliis obovato-cuneatis angulatis glabris nitidis, petiolis stipulis calycibusque glandulosis, fructibus ovalibus 5-spermis. *DC.*—*Willd. Sp. Pl. p. 1002. (non Mich.) Pursh, Fl. Am. v. 1. p. 337. Torrey, Fl. of Un. St. v. 1. p. 474. De Cand. Prodr. v. 2. p. 627. Wats. Dendr. t. 58.*

HAB. Throughout Canada. From Lake Huron (*Dr. Todd*) to the Saskatchewan. *Dr. Richardson, Drummond, Douglas.*—Perhaps Mr. Douglas's *C. punctata*, β , ought to be referred hither; and if so, it inhabits also the North-West coast of America.

6. *C. coccinea*; foliis cordato-ovatis inciso-angulatis glabris acute serratis, petiolis calycibusque pubescensibus glandulosis, petalis orbiculatis, floribus 5-gynis. *DC.*—*Linn. Sp. Pl. p. 682. Mich. Am. v. 1. p. 288. Pursh, Fl. Am. v. 1. p. 337. Elliott, Carol. v. 1. p. 553. Torrey, Fl. of Un. St. v. 1. p. 474. Wats. Dendr. t. 62. De Cand. Prodr. v. 2. p. 627.*—*C. sanguinea. Pall. Fl. Ross. t. 11?*

HAB. Canada. *Michaux, Pursh.* Near Quebec. *Mrs. Sheppard, Mr. Cleghorn.* Dry shores of Lake Erie, common. *Douglas.*—Fruit red, eatable.

7. *C. cordata*; foliis cordato-ovatis inciso-ungulatis glabris, petiolis calycibusque eglundulosis, floribus 5-gynis. *DC.*—*Willd. Sp. Pl. v. 2. p. 1000. Elliott, Carol. v. 1. p. 554. Torrey, Fl. of Un. St. v. 1. p. 474. De Cand. Prodr. v. 2. p. 628. Lindl. in Bot. Reg. t. 451.*—*C. polifolia. Walt. Carol.*—*Pursh, Fl. Am. v. 1. p. 337.*—*Mespilus acerifolia. Poir.*

HAB. Canada. *Pursh*. Shores of Lake Erie. *Douglas*. Carlton-House, on the Saskatchewan, to the Rocky Mountains, and at the sources of the Columbia. *Drummond*.

8. *C. flava*; foliis obovato-cuneiformibus sublobatis crenato-serratis, petiolis brevibus, stipulis ("cordatis") calycibusque glandulosis, floribus subsolitariis, baccis turbinatis 4-spermis. *DC.*—*Ait. Hort. Kew. ed. 1. v. 2. p. 169.* *Elliott, Carol. v. 1. p. 531.* *Wat. Dendr. t. 59.* *De Cand. Prodr. v. 2. p. 628.*—*C. glandulosa*. *Mich. Am. v. 1. p. 288.*—*C. Caroliniana*. *Poir.*—*Mespilus Michauxii*. *Pers.* (*De Cand.*)

HAB. Island of Orleans in the St. Lawrence. *Mr. Sheppard*.—The only specimen of this plant I have received from the Canadian possessions is destitute of flowers, but its petioles, winged with the decurrent base of the leaves, admirably distinguish the species. The stipules, indeed, are not cordate, nor are they so figured by Watson, nor described by Michaux, except in the young state. It were to be wished that the other American species of this genus were as distinctly marked at the present. But the whole of them require careful comparison, and to be described from recent specimens.

Dr. Morrison's collections from Newfoundland contain the *C. oxyacantha*; but it was probably introduced into that island from Europe.

23. AMELANCHIER. *Medik.*

Cal. 5-fidus. Pet. lanceolata. Stam. calyce subbreviora. Ovarii loculi 10 seu potius 5 bipartiti. Ovula 10 in loculorum partitionibus solitaria. Styl. 5 basi subcoarctata. Pomum maturum 3-5-loculare. Semina 3-5, endocarpio cartilagineo.—Arbusculæ; foliis simplicibus serratis deciduis, floribus racemosis albis, bracteis linear-lanceolatis deciduis. *DC.*

1. *A. Botryapium*; foliis oblongo-ellipticis cuspidatis, junioribus subvillosis demum glabris. *De Cand. Prodr. v. 2. p. 632.*—*A. grandiflora*. *Douglas*, *MSS. apud Herb. Hort. Soc. Lond.*—*Pyrus Botryapium*. *Linn. fil. Suppl. p. 255.* *Pursh, Fl. Am. v. 1. p. 339.* *Bigel. Fl. Bost. ed. 2. p. 196.*—*Mespilus Canadensis*. *Linn. Sp. Pl. p. 185.*—*M. Canad. s.?* *Mich. Am. v. 1. p. 291.*—*M. glabra*. *Nutt. MSS. in Herb. nostr.*—*M. arborea*. *Mich. Arb. Forest. ed. Gall. v. 2. p. 70. t. 66.*—*Crataegus racemosa*. *Lam.*—*Aronia Botryapium*. *Pers. Syn. Pl. p. 39.* *Elliott, Carol. v. 1. p. 557.* *Torrey, Fl. of Un. St. v. 1. p. 479.*

HAB. Throughout Canada; frequent. Newfoundland. *Sir Alexander Cochrane*, *Dr. Todd*. Plentiful on the higher parts of the Columbia. *Douglas*.—In the North-West specimens of this plant, as of the following, the serratures of the leaves are sometimes confined to the extremity.

2. *A. ovalis*; foliis subtrotundo-ellipticis acutis, junioribus subtus subvelutinis adultis glabris, racemo coarctato, petalis obovatis, calyce pubescente. *De Cand. Prodr. v. 2. p. 632.*—*Pyrus ovalis*. *Willd.*—*Pursh, Fl. Am. v. 1. p. 240.* *Bigel. Fl. Bost. ed. 2. p. 195.*—*M. Canadensis*, *a. obovalis*. *Mich. Am. v. 1. p. 291.*—*Crataegus spicata*, *Lam.*—*Aronia ovalis*. *Pers. Syn. Pl. v. 2. p. 40.* *Elliott, Carol. v. 1. p. 558.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 19.* *Torrey, Fl. of Un. St. v. 1. p. 479.*—*B. semiintegritolia*, foliis plerisque apice squaminodo serratis.—*A. parviflora*. *Douglas*, *MSS. apud Herb. Hort. Soc. Lond.*

HAB. Throughout Canada, from Lake Huron (*Dr. Todd*) to the Saskatchewan and Mackenzie Rivers, and as far as the Rocky Mountains. (*Dr. Richardson*, *Drummond*, *Douglas*). *B.* Plentiful about the Grand Rapids, and at Fort Vancouver, on the Columbia, and on the high grounds of the Multnomah River. *Douglas*.—I am sometimes disposed to agree with Dr. Torrey, who suspects this to be only a var. of the preceding. What I consider as the *A. Botryapium* has the young leaves slightly hairy, and the adult ones perfectly glabrous, of a thin texture, and turning black in drying. In my specimen of *A. ovalis*, even

the old leaves are more or less thickly clothed, especially beneath, with a compact yellowish tomentum, exactly as in our European *A. vulgaris*, from which it appears to me not easy to distinguish it. Michaux seems to have included these two and the following species under his *A. Canadensis*. Dr. Richardson observes that "this abounds on the sandy plains of the Saskatchewan. Its wood, named by the Crees *Meesasquat-a-tchik*, is prized for making arrows and pipe-stems, and is thence termed by the Canadians *voyagers bois de flèche*. Its berries, about the size of a pea, are the finest fruit in the country, and are used by the Crees under the name of *Meesaseootoom-meena*, both in a fresh and dried state. They form a pleasant addition to *Pemmican*, and make excellent puddings, very little inferior to plum-pudding."

3. *A. sanguinea*; foliis oblongis utrinque rotundatis argute serratis semper nudis, bracteis stipulisque plumosis, racemis capitatis, calycibus extus glabris. *Lindl.* in *Bot. Reg.* t. 1171.—*A.?* *sanguinea*. *De Cand. Prodr.* v. 2, p. 633.—*Mespilus Canadensis*, γ . rotundifolia. *Mich. Am.* v. 1, p. 391.—*Pyrus sanguinea*. *Pursh*, *Fl. Am.* v. 1, p. 240.—*Aronia sanguinea*. *Nutt.*

HAB. Canada. *Michaux*, *Pursh*. Hudson's Bay. *W. Williams, Esq.* (in *Bot. Reg.*) Columbia. *Pursh*. Lake Huron. *Dr. Todd*. Plains of the Saskatchewan. *Dr. Richardson*, *Drummond*. Newfoundland. *Dr. Morrison*.—What I here consider to be the *Pyrus sanguinea* of Pursh, is principally distinguished from our *A. Botryatum* by its fewer-flowered, much shorter racemes, and the shorter and broader or more ovate petals. The leaves are hairy when young, as in that species. Pursh describes the fruit as red; Mr. Lindley as blackish-purple.

24. PYRUS. *Lindl.*

Cal. tubis urceolatus, limbus 5-lobus. *Pet.* subrotunda. *Styli* stipe 5, rarius 2-3. *Pomum* clusum 5-loc. putaminibus cartilagineis. *Semina* in loculo quoque 2, testa cartilaginea.—Arbores fruticaceæ. *Folia simplicia vel pinnata*. *Cymæ patentes terminales multifloræ*. *Bractæ subulatae deciduae*. *DC.*

SECT. 1. TORMINARIA. *DC.*

1. *P. rivularis*; foliis ovatis integris angulato-subtrilobisque subacuminatis acute serratis subtus pubescentibus, corynibis terminalibus simplicibus, calycibus hirsutis intus densissime tomentosis, stylis (3-4) basi coalitis. (TAB. LXVIII).—*Douglas*, *MSS. apud Herb. Hort. Soc. Lond.*

Arbor 15-25-pedalis, ramis cortice cinereo obtectis, junioribus solummodo subpubescentibus. *Folia* ovata, acuta seu acuminata, subcoriacea, 2-4 uncias longa, magis minusve lata, integra vel subangulata nunc etiam trilobata, acuta et subinæqualiter serrata, *juniora* pubescentia, *adulta* superne glabrescens subtus pubescentia hirsuta nervis prominentibus. *Petioli* graciles unciam sesquiunciam longi, pubescentes. *Corymbi* terminales in ramis junioribus, simplicea. *Pedicelli* longi, fusi, pubescentes-hirsuti. *Flores* majuscule. *Calyx* extus hirsutus, lobis patentibus acuminatis intus densissime lanatis. *Petala* alba, rotundata, unguiculata, patentia, venosa. *Stamina* 20. *Styli* 4, basi coadunati. *Fructus*: *Pomum* parvum vix semiunciam longum, subglobosum, rubrum vel flavum, longum, primum calyx (deumum deciduo) corouatum, 3-4-loculare, loculis non-nunquam abortivis.

HAB. Nootka Sound, and in other parts of the North-West coast of America. *Menzies*, (in *Herb. nostr.*) Abundant on the banks of streams near the ocean, from the mouth of the Columbia northwards. *Douglas*. Observatory Inlet. *Dr. Scouler*.—This is a small tree, of which the wood is employed for making wedges, and is so hard as to be susceptible of a fine polish. The fruit is used as an article of food, and called in the vernacular language of the Chenoak tribe, *Pow-itck*. It flowers in April and May.

TAB. LXVIII. *Pyrus rivularis*. *Fig. 1*, Flower; *fig. 2*, Pistil; *fig. 3*, Stamen; *fig. 4*, Section of the germen; *fig. 5*, Corymb of fruit, (natural size); *fig. 6*, Single fruit:—magnified.

SECT. II. SORBUS. DC.

2. P. Americana; foliis pinnatis, foliolis oblongis acutis subæqualiter serratis demum glabris, pomis globosis (purpureis, *Ph.*, fulvis, *Torrey.*)—*De Cand. Prodr.* v. 2. p. 637.—*Sorbus Americana*. *Pursh, Fl. Am.* v. 1. p. 241. *Bigel. Fl. Bost.* ed. 2. p. 194. *Torrey, Fl. of Un. St.* v. 1. p. 476.—*Sorbus aucuparia*, β . *Mich. Am.* v. 1. p. 290.

HAB. Canada, (*Miehauz.*) and throughout the woody country. *Dr. Richardson*. Newfoundland. *Dr. Morrison*. North-West coast of America as far north as Observatory Inlet, (*Menzies, Dr. Scouler.*) and in the subalpine regions of the high mountains. *Douglas*.—In the leaves and flowers I can perceive no difference between this and the European *P. aucuparia*: in the former plant they are doubtless very conspicuously downy when young. Pursh says the berries are purple, not scarlet, as in the European species. Torrey says they are fulvous. From the garden of the Horticultural Society of London, I possess a *Pyrus* of North America, which appears to hold the same relation to *P. Americana*, that *P. pinnatifida*, Sm. and De Cand., does with *P. aucuparia*, where the pinnales are combined so as to form a lobed or pinnatifid and simple leaf. Whether the *P. microcarpa* of Torrey, (*P. aucuparia*, α . of Michaux,) which has red fruit, be different from this or its European prototype, I am unable to say.

SECT. III. ADENORACHIS. DC.

3. P. arbutifolia; foliis obovato-oblongis lanceolatis crenato-serratis subtus pallidis reticulatis venosis costa supra glandulosa, floribus corymbosis.— α . foliis subtus præcipue junioribus calycibusque tomentosis, fructu rubro. *P. arbutifolia*. *Linn. Jl. Suppl.* p. 256. *Pursh, Fl. Am.* v. 1. p. 339. *Bigel. Fl. Bost.* ed. 2. p. 195. *De Cand. Prodr.* v. 2. p. 637.—*Cratagus pyrifolia*. *Lam.*—*Mespilus arbutifolia*. *Linn. Sp. Pl.* p. 685.— α . erythrocarpa. *Mich. Am.* v. 1. p. 292.—*Aronia arbutifolia*. *Elliott, Carol.* v. 1. p. 356. *Torrey, Fl. of Un. St.* v. 1. p. 478.—*A. pyrifolia*. *Pers.*— β . *melanocarpa*; foliis calycibusque glabris, fructu nigro. *Willd. Sp. Pl.* v. 2. p. 1013.—*Mespilus arbutifolia*, β . *Mich. Am.* v. 1. p. 292.—*Pyrus melanocarpa*. *Willd. Enom.* p. 525. *De Cand. Prodr.* v. 2. p. 637. *Pursh, Fl. Am.* v. 1. p. 339.—*Aronia arbutifolia*, β . *Torrey, Fl. of Un. St.* v. 1. p. 479.—*Aronia melanocarpa*. *Elliott, Carol.* v. 1. p. 557.

HAB. Throughout Canada, from Lake Huron to the Saskatchewan. Newfoundland. *Sir Alexander Cochrane, Dr. Morrison*.—I can by no means consider the *P. arbutifolia*, and *melanocarpa* of authors as really distinct species.

ORD. XXX. ONAGRARIÆ. Juss.

TRIB. I. ONAGREÆ.

1. EPILOBIUM, * Linn.

Calyx 4-phylloides deciduus. *Petala* 4. *Stamina* 8. *Capsula* linearis obtuse tetragona 4-locularis 4-valvis polysperma. *Semina* numerosa, pendula, comosa. *Lehm.*—Herbae. *Folia opposita vel alterna*. *Flores axillares, solitarii aut terminales, spicati, in spicis alterni et unibracteati*. *Corollæ purpureæ, roseæ, subcarneæ, rarer luteæ*. DC.

* The arrangement of the individuals of this and the two following genera, *Gaura* and *Oenothera*, together with the descriptions of the new species, have been kindly undertaken by Professor Lehmann of Hamburg.

SECT. I. CHAMÆNERION. *Petala integra, genitalia declinata.*

1. *E. angustifolium*; caule erecto subsimplici glabro, foliis subsessilibus angusto-lanceolatis subintegerrimis undulatis pellucido-venosis, floribus spicato-racemosis bracteatis, stylo reflexo basi piloso staminibus breviore. *Linn. Sp. Pl.* p. 493. *Engl. Bot.* t. 1947. *Pursh, Fl. Am.* v. 1. p. 259. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 12.—*E. spicatum. Lam. Dict.* v. 2. p. 373. *Torrey, Fl. of Un. St. v. 1. p. 391. Bigel. Fl. Bost. ed. 2. p. 147. De Cand. Prodr. v. 3. p. 40.*

HAB. From Lake Huron (*Dr. Todd*) to north lat. 69°, (*Dr. Richardson*) and from Newfoundland on the east, (*Sir Alex. Cochrane, Dr. Morrison*), to the shores of the Pacific, at the mouth of the Columbia, (*Douglas, Scouler.*) Unalaschka and Bay of Eschscholtz. *Chamisso*.—Dr. Richardson says that the young leaves, under the name of *L'Herbe Frit*, are used by the Canadian voyagers as a pot-herb.

2. *E. opacum, (Lehm.)*; caule erecto pubescente, foliis subsessilibus anguste lanceolatis subintegerrimis opace venosis, floribus axillaribus solitariis pedunculatis, stylo reflexo glabro staminibus breviore.

Medium fere inter *E. angustifolium* et *latifolium*, floribus capsulisque cum *E. latifolio*, foliis cum *E. angustifolio* magis conveientibus. *Caulis* erectus 1-1½ pedalis, teres, laxus, pubescens, simplex, ramulis sterilibus in axillis foliorum. *Folia* subsessilia, sparsa, approximata, anguste lanceolata, acuminata, subintegerrima, pellucido-punctata, opace nervoso-venosa, venis multo rarioribus quam in *E. angustifolio*, supra saturate viridia pilis brevissimis sublente conspicuis obducta, subtus pallidiora, glabriuscula. *Folia* ramulorum semper opposita. *Flores* pauci, in axillis foliorum superiorum pedicellati. *Calycis foliola* linearis-lanceolata, nervosa, tenuissime subciliata. *Petala* obovata, integerrima vel superne erosa. *Stylus* reflexus, glaber, statim adscendentibus brevior: *stigma* 4-partito, revoluto. *Germen* incanum, pollicare. *Capsula* maturam non vidi.

HAB. Banks of the Columbia, North-West coast of America, particularly about Fort Vancouver. *Douglas, Dr. Scouler.*

3. *E. latifolium*; caule suberecto subramoso, foliis ovato-lanceolatis subintegerrimis rigidis aeniis, floribus axillaribus pedicellatis, stylo suberecto glabro staminibus breviore.—*Linn. Sp. Pl.* v. 1. p. 494. *Fl. Dan. t.* 565. *Pursh, Fl. Am.* v. 1. p. 259. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 12. *De Cand. Prodr. v. 3. p. 40.*—*E. venustum. Douglas, MSS. apud Herb. Hort. Soc. Lond.*

HAB. Banks of rivers in the Rocky Mountains, between lat. 52° and 56°, (*Drummond, Douglas,*) to the shores and islands of the Arctic Sea, in every degree of longitude. Labrador. *Dr. Morrison.* Behring's Straits. *Chamisso, Lay and Collie.*—The figure given in the Flora Danica represents very exactly the North American plant, which differs from the Siberian only in the less copious pubescence of its leaves. Amongst the specimens sent by Mr. Douglas, there is one with the name of *E. venustum*, which, however, cannot be separated from the above plant, the differences consisting only in the smaller size of all the parts. In regard to its leaves, it is between *E. latifolium* α . and β . *Pursh.*

SECT. II. LYSIMACHION. *Petala obcordata, genitalia erecta.*

4. *E. alpinum*; caule basi repente bifarium pubescente paucifloro, foliis sessilibus oblongis obtusis subintegerrimis, stigmate indiviso, capsulis sessilibus glabris.—*Linn. Sp. Pl.* v. 1. p. 495. *Fl. Dan. t.* 322. *Engl. Bot.* t. 2001. *Pursh, Fl. Am.* v. 1. p. 260. *Bigel. Fl. Bost. ed. 2. p. 147. De Cand. Prodr. v. 3. p. 41.*— β . *nutans*, caule majori apice nutante, foliis oblongis

denticulatis.—*E. alpinum, nutans. Hornem. Nomencl. Fl. Dan. emend. p. 66. Fl. Dan. t. 1387.*—*E. Hornemannii. Reichenb. Ic. t. 180. De Cand. Prodr. v. 3. p. 42.*

HAB. Alpine rivulets in the Rocky Mountains. *Drummond.* Labrador. *Rev. Mr. Kohlmeister, Dr. Morrison.* $\alpha.$ and $\beta.$ Observatory Inlet, North-West America, lat. 56° .—Like Wahlberg and Hornemann, I am unable to separate the $\beta.$ (*E. Hornemannii* of Reichenbach) from *E. alpinum*, as a distinct species; especially as I possess, amongst several northern specimens, the most evident transitions. A very good figure of $\alpha.$ is given in English Botany, and the North American plant corresponds no less with that figure than with specimens from the Scottish Alps, which I owe to the kindness of Professor Hooker.

5. *E. origanifolium*; caule basi repente glabriusculo apice nutante, foliis subpetiolatis ovatis denticulatis superioribus acuminatis, stigmate indiviso clavato, capsulis pedunculatis glabris.—*Lam. Encycl. Bot. v. 2. p. 376. De Cand. Prodr. v. 3. p. 41.*—*E. alsinifolium. Vill. Fl. Dauph. v. 3. p. 511. Engl. Bot. t. 2000.*

HAB. Alpine woods, sides of rivulets, and shady elevated spots on the Rocky Mountains, from lat. 52° to 56° . *Drummond.* Uralaschka. *Chamiso.*—In habit, especially the small specimens, more nearly allied to *E. alpinum* than to *E. montanum*. This is, in North America as well as in Europe, a very variable plant; it is found in the former country from about five inches to upwards of a foot and more in height, with red and with white flowers, the last often half as large again as in the common form.

6. *E. glandulosum, (Lehm.)*; caule simplici basi repente angulato glabro, foliis sessilibus ovato-lanceolatis subdecurrentibus acutis glanduloso-denticulatis, floribus erectis, stigmate clavato, capsulis sessilibus angulis tenuissime pubescentibus.

Caulis basi repens, dein erectus, simplex, subpedalis, angulatus, multiflorus. *Folia inferiora* ovato-lanceolata, oppositi, repando-subdenticulata, *reliqua alterna*, sparsa, glanduloso-denticulata, *floralia* basi subcordata, *omnia* sessilia, decurrentia, glabra, acuta, sub lente pelticido-punctata. *Calyx* foliola lanceolata, acuta, integerrima, subpilosa, colorata. *Petala* obovata, nervosa, alba, calycibus longiora. *Stamina* brevia, erecta. *Stigma* clavatum. *Capsula* (junior) sessilis, angulis tenuissime pilosis, pilis glanduliferis.

HAB. Cumberland-House Fort, on the Saskatchewan. *Drummond.*—This plant, as to specific character, is almost intermediate between *E. origanifolium* and *E. tetragonum*, approaching the first more in habit, but distinct by its sessile decurrent leaves and sessile capsules. This sessile capsule, which appears, moreover, only somewhat hairy at the angles, the leaves more toothed than serrated, and the simple stem, readily distinguish it from *E. tetragonum*.—[I possess, from the North-West coast of America, gathered by Mr. Douglas and Dr. Scouler, what I consider to be an unbranched variety of *E. tetragonum*; but which yet I am unable to distinguish from *E. glandulosum. H.*]

7. *E. tetragonum*; caule tetragono erecto ramoso, foliis oblongo-lanceolatis serrulatis decurrentibus, floribus erectis, stigmate clavato, capsulis breviter pedicellatis puberulis.—*Linn. Sp. Pl. v. 1. p. 493. Fl. Dan. t. 1029. Engl. Bot. t. 1948. Pursh, Fl. Am. v. 1. p. 259. De Cand. Prodr. v. 3. p. 43.*

HAB. Canada, throughout the plains to lat. 64° , and to the valleys of the Rocky Mountains, frequent. North-West coast, near the sea. *Douglas, Dr. Scouler.*—A very variable plant, with almost simple, or with much branched, totally glabrous or pubescent stems, of which the angular sides appear often more and often less rounded, and even entirely disappearing, on very vigorous specimens, at the base. Of the leaves sometimes only the two pair beneath are opposite, and again, sometimes all the leaves upwards to the head of the stem, are so.

8. *E. coloratum*; radice annua, caule tereti puberulo, foliis lanceolatis acutis serrulatis

subpetiolatis parce pilosis pellucido-lineolatis, floribus erectis, stigmate clavato, capsulis pedicellatis glabriusculis. *Muhl.*—*Willd. Enum. Hort. Berol.* p. 411. *Pursh, Fl. Am.* v. 1. p. 260. *Torrey, Fl. of Un. St.* v. 1. p. 392.

Variat caule simplicissimo et ramoso, foliis serrulatis et magis denticulatis. *Folia colorata, venosa, sublente pellucido-lineolata, linea punctis rotundis pellucidis intermixta.*

HAB. Plains of the Saskatchewan. *Dr. Richardson, Drummond*.—[Dr. Torrey observes how very closely this is allied to *E. tetragonum*. *H.*]

9. *E. minutum*; radice annua, caule suberecto tereti puberulo ramoso, foliis alternis elliptico-lanceolatis obtusis subintegerrimis pellucido-punctatis, floribus cernuis minutis, stigmate clavato, capsulis breviter pedicellatis arcuato-reflexis glabriusculis.—*Lindl. in litt.*—*E. collinum*. *Douglas, MSS. in Herb. Hort. Soc. Lond.* (non *Flor. Friburg.*)

Radix annua, fibrosa. Caulis erectus vel ascendens, vario modo flexus, teres, puberulus, sepiissime ramosissimus: ramis patentibus, junioribus canescensibus. Folia petiolata, elliptico-lanceolata, obtusa, integerima vel leviter repanda: pilis sparsis versus marginem crebrioribus, venoso-nervosa, nervo medio pallido ad apicem fere evanescens, sub lente pellucido-punctata. Flores cernui. Calyx foliola lanceolata, acuta. Petala obcordata, pallide rosea, venosa. Stamina inaequalia. Stigma clavatum longitudine staminum. Germen breviter pedicellatum subcanescens. Capsula glabriuscula (brevior quam in reliquis Epilobiis) arcuato-reflexa.

HAB. North-West coast of America. *Menzies*. Fort Vancouver. *Dr. Scouler*. Near the Grand Rapids of the Columbia, and on moist rocks near springs, on the high mountains. *Douglas*.—In the spring of 1829, we received seed of this species from England, under the name of *E. minutum*, Lindl.

10. *E. palustre*; caule tereti ramoso subhirsuto, foliis sessilibus lanceolatis subdenticulatis oppositis alternisque glabris, stigmate indiviso, fructu pubescente.—*Linn. Sp. Pl.* p. 495. *Engl. Bot. t. 346. Pursh, Fl. Am.* v. 1. p. 260. *De Cand. Prodr.* v. 3. p. 43.— β . *abiflora*; caule tereti simplici glabriuscino, foliis sessilibus linearibus subdenticulatis, floribus cernuis, stigmate indiviso, capsulis pedicellatis elongatis canescensibus.—*E. palustre, var. albescens. Wahl. Pl. Suec.* v. 1. p. 234. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 12, (E. palustre.) *Cham. in Linnaea*, v. 2. p. 554.—*E. lineare. Muhl.*—*E. squamatum. Nutt.?*—*De Cand. Prodr.* v. 3. p. 43?—*E. rosmarinifolium. Pursh?* *Torrey?*

HAB. α . Labrador. *Dr. Morrison.* β . Throughout Canada, and as far north as lat. 64° , and among the Prairies of the Rocky Mountains. *Dr. Richardson, Drummond*.—Amongst several plants sent by Mr. Drummond, only the var. β . was found, distinguished from the primary form by its much smaller, almost white flowers and simple stem, but which is also seen in Northern Germany, in turf soil, with all the intermediate transitions. *E. darvaricum*, Fisch. (*De Cand. Prodr.* v. 3. p. 42,) appertains to this variety.—The var. β . corresponds with the *E. palustre* of Dr. Richardson, and is sometimes branched, when it is identical with the *E. lineare* of Muhl. Cat. and of Bigelow, which De Candolle refers to *E. squamatum*, Nutt.

11. *E. tenellum*; caule filiformi simplici superne pubescente, foliis oppositis sessilibus linearibus elongatis subintegerrimis pellucido-lineolatis glabris margine tenuissime ciliatis, floribus erectis, stigmate indiviso, capsulis pedicellatis gracilibus canescensibus. *Rafin.*—*Desv. Journ. Bot.* 1814. p. 271. *De Cand. Prodr.* v. 3. p. 43.

Affinis *E. palustri*; differt caule stricto elatiore tenuiere, foliis integerrimis interdum repando-denticulatis multo longioribus (2-3 poll. long., 2 lin. lat.) pellucido-lineatis, capsulis gracilibus longe pedicellatis.

HAB. —? [I have not been able to ascertain what specimens in the Collection correspond to this species; the name having been by some accident omitted by Dr. Lehmann in the list which answered to our numbers of reference. H.]

12. *E. oliganthum*; pusillum, caulis simplicissimus apice subunifloris, foliis oppositis linearibus integerrimis. *Mich. Am.* v. 1. p. 223. *De Cand. Prodr.* v. 3. p. 43.

HAB. Hudson's Bay, near Lake Mistissiny. *Michaux*.—Dr. Torrey is disposed to refer this to the *E. squamatum* of Nuttall, the latter author to *E. alpinum*, which seems the more probable since Michaux remarks that he has seen the same species from the Pyrenees.

13. *E. hirtum*; caule tetragono pilosuscule, foliis oppositis serrulatis, pedunculis axillaribus alternis elongatis, calycis lobis angustis longitudine petalarum, stylo exerto, stigmate crasso 4-lobo. *DC.*—*Pursh, Fl. Am.* v. 1. p. 259. *De Cand. Prodr.* v. 3. p. 44. *Cham. in Linnaea*, v. 2. p. 553.

HAB. North-West coast of America. *Pallas, (in Pursh.)* Grassy places in the valleys of Unalaschka. *Chamisso*.—With this I am unacquainted, but it is described as differing from all the Genus in the yellow colour of its flowers, which are said to be as large as those of *E. angustifolium*.

2. GAURA. Linn.

Calyx tubulosus 4-partitus deciduus. *Corolla* 4-petala. *Stamina* 8. *Nux* sub 4-gona 1-4-sperma. *Semina* nuda.

1. *G. parviflora*; caule herbaceo erecto piloso, foliis oblongis acuminatis remote denticulatis margine ciliatis junioribus subvelutinis, spicis elongatis, floribus minutis confertis, fructibus distantibus tetragonis basi apiceque attenuatis glabriusculis.—*Douglas, MSS.*

Caulis herbaceus, errectus, 1-1½-pedalis, angulatus, simplex, superne ramosus, pubescens, pilis copiosis patentissimi mollibus intermixtis. *Folia* sessilia, sparsa, oblonga acuminata, remote denticulata, 2 poll. longa, margine et ad costam pilis longis ciliata, parallele nervosa, juniora utrinque velutina, adulta glabrinseula. *Spica* terminalis, elongata. *Rachis* inferne velutina, versus apicem sensim magis glabrescens. *Flores* conferti, minuti, bracteati. *Bracteæ* subulate, pilose, caducæ. *Calycis* tubus pubescens, germe brevior, cylindricus, apice incrassatus, laciniæ lineares glabriuscule. *Petala* laevis calycinis breviora, linearispathulata, unguiculata. *Stigma* 4-lobum. *Germen* sublineare tetragonum, basi apiceque attenuatum, glabrum.

HAB. Sandy banks of the Wallawallah River, North-West coast of America. *Douglas*.

2. *G. coccinea*; caulis herbaceis decumbentibus, foliis lineari-lanceolatis repando-dentatibus canescentibus junioribus integerrimis, spicis laxis floribus alternis, bracteis linearibus persistentibus, fructibus ellipticis basi teretibus apice tetragonis canescentibus.—*Fraser, Cat. 1813. Pursh, Fl. Am.* v. 2. p. 733. *Spreng. Syst. Veget.* v. 2. p. 234. *De Cand. Prodr.* v. 3. p. 45.

Planta tota cinereo-canescens. *Folia* emula repando-dentatula, ramulorum integerrima. *Flores* non racemosi ut in *De Cand. Prodr.* et *Spreng. Syst. Veget.* sed revera spicati in hac et in omnibus speciebus quas examinavi, in protuberantibus rachidis sessiles. *Protuberantia* bracteæ terminatæ. *Petala* coccinea, obovata, basi cuneata, unguiculata, integerrima, venosa. *Stigma* quadrilobum.

HAB. Plains of the Saskatchewan and Red Rivers. *Drummond, Douglas*.—[I possess an original specimen of this from Mr. Bradbury, gathered about Fort Mandan. II.]

3. *G. marginata*, (*Lchm.*); caulis adscendentibus basi suffruticosus, foliis lanceolatis repando-dentatis subrevolutis utrinque pube adpresso subcandicantibus, floribus in spicis terminulibus verticillatim congestis, bracteis linearibus deciduis, fructibus candicantibus.

Caulis ex eadem radice plures, basi suffruticosi, adscendentibus, teretes, puberuli, apice ramosi. Folia sessilia, caulinata lanceolata, acuta, repando-dentata, margine subrevoluta, utrinque pube adpresso subcandicantia, ramulorum linearia, acuta, integerrima. Spica terminalis, elongata. Flores in rachide angulato verticillatim congesti. Bracteæ deciduae, lineares, acuminatae, longitudine tubi calycis. Calyx canescens: lacinia linearibus tubo brevioribus. Petala spathulata-obovata, unguiculata, rubra, longitudine calycis. Stigma 4-lobum. Germina linearia, tetragona. Fructus —?

HAB. Plains of the Saskatchewan. Drummond.

4. *G. glabra*, (Lehm.) ; caulinibus adscendentibus basi suffruticosis foliisque anguste lanceolatis undulatis glaberrimis, spicis elongatis, floribus alternis, bracteis linearibus persistebus, germinibus linearibus tetragonis glabris.

Caulis suffruticosi, adscendentibus, ramosi, teretes, uti tota planta glaberrimi. Folia crassiuscula, uninervia, avenia, brevissime petiolata, caulinata et ramea inferiora sparsa, anguste-lanceolata, undulata, subdentata, 6-10 lineas longa, 2-3 lineas lata, ramea superiora conferta, linearia, subplana. Flores alterni in spica terminali elongata dispositi. Bracteæ lineares, persistentes, acuta, longitudine tubi calycis. Calyx tubus clavatus, 2 lineas longus; lacinia linearibus tubo longioribus. Petala rubra, spathulata, unguiculata, venosa, longitudine laciniarum calycis. Stamina erecta, filiformia; antheræ lineares, jam in flore adhuc clauso latere dehiscentes. Stylus filiformis, erectus: stigmate demum quadrilobo. Germina tetragona, linearia.

HAB. About Carlton-House, on the Saskatchewan. Drummond.

5. *G. biennis*; caule herbaceo, foliis lanceolato-oblongis acutis denticulatis, floribus irregularibus, petalis obovatis adscendentibus patulis nudis, genitalibus deflexis, stylo staminibus longiore, fructibus obovato-tetraquetratis sessilibus pilosis brevissimis acutis obtusiusculis, nervis crassis depressis et inferne rugis transversis notatis. DC.—Linn. Sp. Pl. p. 493. Mich. Am. v. 1. p. 226. Curt. Bot. Mag. t. 389. Pursh, Fl. Am. v. 1. p. 260. Elliott, Carol. v. 1. p. 446. Torrey, Fl. of Un. St. v. 1. p. 391. De Cand. Prodr. v. 3. p. 44.

HAB. About Montreal. Mr. Cleghorn.

3. GENOTHERA. Linn.

Calyx tubulosus quadripartitus deciduus. Petala 4. Stamina 8, polline viscoso. Capsula cylindrica vel prismaticæ 4-locularis 4-valvis. Semina numerosa nuda.

SECT. I. ONAGRE. DC.—*Stigma quadrifidum. Capsulae prismatico-cylindricæ obsolete tetragonæ, interdum basi, nunquam apice, crassiores.*

§. 1.—*Calyx tubus elongatus cylindricus apice tantum dilatatus, lacinias et petala superans. Stigma luteum, lacinia linearibus.*

a. *Floribus luteis.*

1. *OE. biennis*; caule erecto subramoso, foliis radicalibus oblongo-lanceolatis, caulinis ovato-lanceolatis dentatis glubris s. pubescentibus, petalis obcordatis stamina superantibus, capsulis subcylindricis basi crassioribus valvis dehiscientibus apice integris vel bifidis.—Linn. Prodr. v. 3. p. 46.—*OE. muricata*; caule muricato-strigoso, floribus minoribus. *OE. muricata*. Murr. Comment. Soc. Gott. 1776. t. 6. p. 24. t. 1. Pursh, Fl. Am. v. 1. p. 261. Elliott,

Carol. v. 1. p. 441. *Torrey, Fl. of Uu. St.* v. 1. p. 388. *Fl. Dan.* t. 1752. *De Cand. Prodr.* v. 3. p. 47.

HAB. Throughout Canada, from Lake Huron (*Dr. Todd*) to north lat. 56°. *Dr. Richardson, Drummond.* Shores of the Columbia and Nutka, North-West America. *Douglas, Dr. Scouler.* β. Saskatchewan, (e sem. in *Hort. nostr. cult.*) *Drummond.* Straits of de Fuca. *Dr. Scouler.*

2. *OE. albicaulis*; caule erecto superne ramoso albido glaberrimo, foliis linear-lanceolatis subintegerrimis subtus pubescentibus, petalis rotundatis integris (?) stamina æquantibus, capsulis prismatico-cylindricis truncatis.—*Fraser, Cat.* 1813. *Nutt. Gen.* v. 1. p. 245.

Caulis erectus, superne ramosus, 2-3 pedalis, albidus, nitidus, glaberrimus, ramis longis patentibus. *Folia* sessilia, linear-sublanceolata, acuta, integerrima vel subremote denticulata, supra glabra subtus pubescentia, *caulinis* 2-3 poll. longa. *Flores* axillares sessiles. *Calycis tubus* spice dilatatus laciniis puberulas paulo superans. *Petala* alba, rotundata, integrata (?) calycis laciniis breviora. *Stamina* æqualia. *Antheræ* lineares. *Capsula* obtuse tetragono-cylindrica, truncata, subglabra.

HAB. Banks of the Saskatchewan. *Drummond.*—The above plant must not be confounded with *OE. albicaulis*, (Pursh, *Fl. Am.* v. 2. p. 733, *De Cand. Prodr.* v. 3. p. 51), the *OE. pinnatifida*, Nutt. and Spreng. *Syst. Veget.* which belongs to another section, and has, according to the description, no resemblance at all with the *OE. albicaulis*, Nutt.

3. *OE. pallida*; radice repente, caulis adscendentibus ramosis foliisque linear-lanceolatis acuminatis integerrimis s. dentatis glabris, petalis retusis crenulatis stamina superuntibus, capsulis cylindricis contortis.—*Lindl. Bot. Reg.* t. 1142.

Radix repens. *Caulis* adscendens, 1-1½ pedalis, glaber, pallide viridis, superne ramosus; ramis patentibus. *Folia* linear-lanceolata, acuminata, plerumque remote serrata, rarius integerrima aut (e cl. *Lindl. l. c.*) pinnatifida. *Flores* in superiorum foliorum axillis sessiles, nocte odoratissimi. *Calycis tubus* coloratus, laciniis et petalis subæqualibus. *Petala* alba ungue flavo mox rubescens, retusa, crenulata, staminis superauta, pistillum æquante. *Stamina* æqualia. *Stigma* luteo-vires. *Capsula* cylindrica, curvata, contorta.

HAB. Common over all the dry sandy soil to the west of the Rocky Mountains. *Douglas.*

§. 2.—*Calycis tubus abbreviatus infundibuliformis* s. *obconicus*, *laciniis et petalis brevior*.
Stigmatis laciniæ linears, oblongæ.

a. *Floribus luteis, antheris adnatis.*

4. *OE. leucocarpa*; caule ramoso, foliis rigidis serrulatis inferioribus spathulato-lanceolatis superioribus lanceolatis junioribus subsericatis, petalis leviter emarginatis apice crenulatis calycis tubum dimidio genitalia duplo superantibus, capsulis cylindricis incano-sericeis.—*Comenc. MSS.*

Planta spithamea, habitu foliis floribusque *Helianthemum* simulans, partibus junioribus subsericatis. *Caulis* basi ramosus, ramis adscendentibus simplicibus vel ramosis. *Folia* rigida, glabriusculta, *inferiora* spathulato-lanceolata, *superiora* lanceolata, omnia serrulata, basi attenuata, obtusa aut acuta, plerumque mucronulata. *Calycis tubus* infundibuliformis, laciniis paulo superans. *Petala* late obovata, leviter emarginata, apice crenulata, calycis tubum dimidio genitalia longiora fere duplo, superantia. *Stamina* inæqualia, quatuor petalis opposita eeteris breviora. *Antheræ* oblongæ, adnatae. *Stigma* quadrilobatum, luteum, lobis ovatis. *Capsula* cylindrica, albido-sericea, truncata.

HAB. Dry banks of the Saskatchewan. *Drummond.* Common upon limestone rocks on the Red and Assinaboyne Rivers. *Douglas.*

β. Floribus albis s. purpureis, antheris innatis.

5. *OE. viminea*; caule erecto ramoso foliisque lanceolatis subintegerrimis glaucis glabris, calycis tubo lacinias æquante, petalis integris denticulatis genitalia duplo superantibus, stigmatibus purpureis, capsulis cylindricis apice attenuatis sulcatis pubescentibus.—*Douglas*, *MSS. apud Herb. Hort. Soc. Lond. Hook. in Bot. Mag. t. 2873. Lindl. in Bot. Reg. t. 1220.*

Caulis erectus, 2-3 pedalis, glaber, pallide virens, ramosus, ramis longis tenuibus. *Folia* lanceolata, subintegerrima, glauca, glabra, inferiora in petiolum brevissimum attenuata. *Flores* in superiorum foliorum axillis sessiles. *Calycis* tubus infundibuliformis, lacinias æqualis. *Petala* lilacina, (7-8 lineas longa,) cuneato-rotundata, integra, margine superiore denticulata, calycis tubum lacinias et genitalia duplo superantia. *Stamina* inæqualia, quatuor petalis opposita ceteris breviora. *Filamenta* plana linearia: *antheræ* lanceolatae apice curvatae. *Pistillum* stamna longiora sublongior. *Stigmatis* lacinia intense purpureæ, patentes, oblongae. *Capsula* cylindrica, apico attenuata, truncata, 8-sulcata, glauco-pubescentia.

HAB. Near the River Aguilar, in North California, lat. 43° north, in dry Prairies. *Douglas*.

6. *OE. Lindleyii*; caule adscendente diffuso ramoso, foliis linear-lanceolatis integerrimis glabris, calycis tubo lacinias triplo breviore, petalis integris denticulatis genitalia duplo superantibus, stigmatibus luteis, capsulis cylindricis elongatis utrinque attenuatis puberulis.—*Douglas*, *MSS. in Bot. Mag. t. 2832.*

Caulis pedalis bipedalisque adscendens, diffusus, ramosus, glaber, ramis numerosis, flexilibus, patentibus junioribus puberulis. *Folia* linear-lanceolata, basi attenuata, integerrima, glabra. *Flores* in axillis foliorum superiorum sessiles. *Calycis* tubus infundibuliformis, lacinias triplo brevior. *Petala* lilacina macula purpurea notata, ungue flavo, (7-8 lineas longa,) late obovata, integra, margine superiore denticulata, calycis lacinia tercia parte, genitalia duplo magis, superantia. *Stamina* inæqualia, quatuor petalis opposita ceteris breviora. *Filamenta* plana linearia: *antheræ* lanceolatis apice curvatis. *Stigma* quadrifidum luteum, lacinia elliptica. *Capsula* cylindrica, elongata, utrinque attenuata, puberula.—*Obs.* Descriptio caulis e plantis cultis desumpta est, in speciminiibus spontaneis caulis videtur erectus strictus. In icono operis landati *Bot. Mag.*, genitalia sunt duplo longiora, quam in speciminiibus spontaneis et cultis. Miro errore in eodem libro descriptione hujus et precedentis speciei character *Epilobii* generis (" semina comosa," etc.) pro *OEnothera* charactere insertus est.

HAB. North-West coast of America, about Fort Vancouver, and at the Multnomak River. *Douglas*.

7. *OE. decumbens*; caule adscendente, foliis glauca integerrimis pubescentibus inferioribus late ovatis superioribus ovato-lanceolatis, petalis emarginatis crenulatis, stigmatibus purpurei lacinia reflexis, capsulis obtuse tetragonis a basi inde attenuatis villosis.—*Douglas*, *MSS. in Bot. Mag. t. 2889. Bot. Reg. t. 1221.*

Caulis 1-2 pedalis adscendens, pallide viridis, pilosus, ramosus; ramis diffusis. *Folia* glauca, integerrima, pubescentia, *inferiora* late ovata, obtusa, in petiolum brevissimum attenuata, *superiora* sessilia, lanceolata aut ovato-lanceolata, acuta. *Calycis* tubus infundibuliformis lacinias duplo brevior. *Petala* lilacina (3-4 lineas longa) obcordata, margine crenulata, calycis lacinias duplo, genitalia longiora duplo magis, superantia. *Stamina* inæqualia: *antheræ* oblongæ apice curvatae. *Stylus* stamna longiora æquans. *Stigma* crassum purpureum, lacinia reflexis appressis. *Capsula* obscure-tetragona, a basi crassiore ad apicem usque attenuata, villosa.—Ab omnibus speciebus affiniibus stigmatibus forma differt.

HAB. Dry mountain vallies in North California. *Douglas*.

8. *OE. purpurea*; glaucescens, foliis lanceolatis utrinque attenuatis obtusiusculis, tubo calycis brevi, petalis late obovatis crenulatis purpureis, genitalibus exsertis corollæ multo

brevioribus, stigmatibus crassis brevibus atro-purpureis, antheris flavis, capsulis ovato-triquetris sessiliis angulatis pilosis, seminibus irregulariter lente punctato rugosis. DC.—*Curt. Bot. Mag. t. 352. De Cand. Prodr. v. 3. p. 49.*

HAB. North-West coast of America. *Menzies.*

9. *O. Romanzovii*; subsericeo-glaucescens, caule inferne decumbens, foliis lanceolato-oblongis mucronulatis in petiolam attenuatis, tubo calycis brevissimo, limbo corollæ duplo breviore, petalis late obovatis crenulatis violaceis, staminibus corolla multo brevioribus, antheris viridibus, stigmatibus fere sessilibus inclusis atro-purpureis, capsulis oblongo-cylindricis subtetragonis pilosis, seminibus lente subcubicis squamułosis canis subsessilibus. DC.—*Ledeb. MSS. Hornem. Hort. Hafn. v. 1. p. 133. Don, in Bot. Reg. t. 562.*

HAB. North-West coast of America. *Chamiso*.—I possess no native specimens of this or the preceding species of *Oenothera*; but, judging from the figures above quoted, they appear very distinct in the leaves, in the flowers, and especially in the fruit. Mr. Don (see Bot. Mag. t. 2424) seems disposed to refer the *O. Romanzovii*, which he had previously described in the Bot. Reg., to the Chilian *O. tenella*, a totally different plant; while Mr. Lindley (Hort. Soc. Trans. v. 6. p. 94.) is inclined to consider the plant figured in the Bot. Reg. the same as the *O. purpurea*, and the *O. Romanzovii* of Hornemann the same as *O. tenella*. Hornemann himself says of it "admodum affinis *O. purpurea*."

SECT. II. *OENOTHERIUM. DC.*—*Stigma cruciatum profunde 4-fidum. Calyx tubus cylindricus apice dilatatus. Capsula obovata, clavata, angulata, costis altrenis prominentibus.*

(*Floribus luteis.*)

10. *O. fruticosa*; caule erecto (purpureo-fusco) foliisque lanceolatis denticulatis pilosis v. glabris, racemis spicatis basi nudiusculis, petalis lato-obcordatis staminibus duplo longioribus, capsulis clavatis pilosis 8-angularibus, angulis 4 alatis.—*Linn. Sp. Pl. p. 492. Bot. Mag. t. 332. Elliott, Carol. v. 1. p. 442. Pursh, Fl. Am. v. 1. p. 262. De Cand. Prodr. v. 3. p. 50.*—*O. Canadensis. Goldie, Pl. of Canada, in E. Phil. Journ. 1821. p. 7. De Cand. Prodr. v. 3. p. 52.*

HAB. Island of Montreal. *Mr. Goldie*.—In habit allied to *O. pumila*, but larger, more rigid, though not really fruticose, with flowers an inch and a half or two inches in diameter.

11. *O. pumila*; caule subsimplice herbaceo adscendente pilosiusculo, foliis lanceolatis integerrimis obtusis subciliatis, floribus subspicatis breviter pedicellatis, petalis obcordatis genitalia paullo superantibus, capsulis clavatis 8-angularibus, angulis 4 alatis.—*Linn. Sp. Pl. p. 493. Bot. Mag. t. 335. Pursh, Fl. Am. v. 1. p. 262. Elliott, Carol. v. 1. p. 444. Bigel. Fl. Bost. ed. 2. p. 148. Torrey, Fl. of Un. St. v. 1. p. 390. De Cand. Prodr. v. 3. p. 51.*—*O. chrysanthia. Mich. Am. v. 1. p. 225. (ex descr.)*—*β. minima; O. pusilla. Mich. Am. v. 1. p. 225. (ex descr.)*

HAB. Throughout Canada. *Michaux, Mr. Goldie, Lady Dalhousie*. Saskatchewan? *Dr. Richardson, Drummond*.—This plant is annual, and varies in size from three or four inches, and having, while young, several spreading root-leaves, to the height of a foot or a foot and a half, and furnished only with stem-leaves.

12. *O. riparia*; caule erecto foliisque lanceolatis denticulatis subglabris, floribus subspicatis breviter pedicellatis, petalis emarginatis genitalia paullo superantibus, capsulis cla-

vatis 8-sulcatis costis alternis magis prominentibus.—*Nutt. Gen. v. 1. p. 247. De Cand. Prodr. v. 3. p. 52.*

Caulis erectus, pedalis, sesquipedalis, glabriusculus, subramosus. *Folia* lanceolata, basi in petiolum brevissimum attenuata, denticulata, subglabra, *inferiora* obtusiuscula, *superiora* acuta, *floralia* linearia. *Flores* parvi, ovario basi attenuato breviter pedunculati, subspicati. *Calycis* tubus tenuis, lacinias duplo fere superans. *Petala* parva, vix 2 lineas longa, emarginata, genitalia paulo superantia. *Stamina* pistillum sequantia. *Antherae* linearis. *Capsula* clavata, basi in pedunculum brevem attenuata, octo-sulcata, costis alternis magis prominentibus, subalata.

HAB. Plains of the Saskatchewan. *Dr. Richardson, Drummond*.—May not this be referred to the *OE. pumila* of Linnaeus? The leaves are very slightly toothed indeed.—[H.]

SECT. III. SPHEROSTIGMA. Ser.—*Stigma capitatum integrum aut leviter quadrilobum. Calycis* tubus infundibuliformis s. obconicus. *Capsula* prismatico-cylindrica.

13. *OE. quadrivalvula*; caule adscendente subramoso debili foliisque lineari-lanceolatis subdenticulatis puberulis, petalis integris margine crenulatis, capsulis tetragonis apice attenuatis villosis.—*Douglas*, in *Bot. Reg. t. 1119.*

Caulis 1-2 pedalis, subrectus, debilis, ramosus: ramis elongatis, junioribus pubescentibus. *Folia* glabriuscula denticulata aut integerrima, *inferiora* lineari-lanceolata, obtusiuscula, in petiolum brevissimum attenuata, *superiora* sessilia, linearia, acuta. *Calycis* tubus infundibuliformis brevissimus, lacinias duplo aut triplo magis brevior. *Petala* lilacina macula intensiore notata, 2-3 lineas longa, obovata, integra, margine crenulata, calycis lacinias dimidio, genitalia longiora duplo, superantia. *Stamina* inaequalia. *Antherae* oblonge innatae. *Stigma* globosum, integerrimum. *Capsula* tetragona, apice valde attenuata, villosa.

HAB. Banks of streams, as well as in the open elevated country, west of the Rocky Mountains. *Douglas*, *Scouler*.

14. *OE. Boothii*; caule ramoso, foliis ovatis dentatis superne glabris subtus hirtis inferioribus petiolatis, floribus secundis subspicatis, petalis purvis obovatis integris stamina sequantibus, stylo longe exerto, capsulis cylindricis sulcatis tortis.—*Douglas*, *MSS.*

Caulis spithameus ramosus, junior pubescens. *Folia* ovata, dentata, superne glabra, subtus hirta, *inferiora* petiolata, *superiora* sessilia. *Flores* secundi subspicati odorati (*Dougl.*) *Calyx*—? *Petala* alba (*Dougl.*) 1-1½ lineam longa, obovata, integra, stamina sequantia. *Stamina?* *Antherae?* *Stylus* petala longe superans. *Stigma* capitatum. *Capsula* cylindrica, sulcate, curvata, contorta pubescentes.

HAB. On low exposed gravelly hills, near the branches of Lewis and Clarke's River, lat. 46° north. *Douglas*.—This curious species was named by Mr. Douglas in compliment to Mr. M. B. Booth.

15. *OE. pygmaea*; caule adscendente ramoso, foliis inferioribus petiolatis rhomboideis superioribus sessilibus lanceolatis omnibus dentatis pubescentibus, capsulis subsecundis cylindricis apice attenuatis torulosis.—*Douglas*, *MSS.*

Planta digitalis, habitu plane cum precedente conveniens.

HAB. Barren sands of the interior of North-West America, near the Utalla River. *Douglas*.

16. *OE. spiralis*; caule subsimplice decumbente incano, foliis lanceolatis obtusis integerim strigoso-pilosus incanis inferne attenuatis, spicis foliosis, petalis stamina duplo superantibus, capsulis acute tetragonis acuminatis incanis subspiraliter tortis. (H.)

HAB. North-West coast of America. *Menzies*.—Allied to *OE. Boothii*, but larger in all its parts, and very easily distinguished by its entire hoary leaves, and the acutely four-sided capsules, which are almost spirally twisted.—[H.]

17. *OE. virideescens*; dense incano-tomentosa, caule erecto simplice, foliis ovatis acutis sessilibus grosse dentatis, spicis foliosis, petalis (sicciate atro-viridibus) stamina duplo superantibus, capsula acute tetragonis subhirsutis tortis. (*H.*)

HAB. North-West coast of America. *Menzies.*—I possess only one specimen of this species, and that not in a very good state, but sufficient to show that, though naturally allied to *OE. Boothii*, *contorta*, and *spiralis*, it is nevertheless abundantly distinct.—[*H.*]

18. *OE. contorta*; caule debili ramoso foliisque linearibus integerrimis glabris, floribus minimis, capsulis cylindricis contorto-curvatis elongatis torulosis.—*Douglas, MSS.*

Planta digitalis, habitu Epilobio simillima, Caulis debilis, basi ramosus, glaber. Folia linearia, integerrima, glabra. Flores numerosi, minimi. Calyx infundibuliformis, tubo lacinias sequante. Petala vix lineam longe calycinum tubum sequantia. Genitalia —? Capsula cylindrica, elongata, pollicares et ultra, torulosa, contorta-curvata, Epilobii capsulae simillimae. Semina ovata, angulata.

HAB. Sandy barren soil, on the interior banks of the Columbia River. *Douglas.*—Although the stamens and pistils in our specimens of *OE. contorta* and *OE. pygmaea*, are too imperfect to allow of our determining exactly their form, yet the habit of these plants convinces us that they should be ranged in this section.

4. CLARKIA. *Pursh.*

Calyx tubulosus, quadripartitus. *Petala* 4 unguiculata, cruciata, triloba, aestivatione convoluta. *Stamina* 8, alterna sterilia. *Stigma* quadrilobatum, lobis petaloideis. *Capsula* cylindrica, sulcata, 4-locularis, 4-valvis. *Semina* adscendentia nuda.

1. *C. pulchella*; petalis profunde trilobis.—*Pursh, Fl. Am. v. 1. p. 260. t. 11. Lindl. in Bot. Reg. t. 1100. De Cand. Prodr. v. 3. p. 52. Bot. Mag. t. 2918.*—β. petalis minus profunde lobatis rugulis denticulatis. *Hook. in Bot. Mag. l. c.*

HAB. On the banks of the Kooskoosky and Clarke's Rivers, North-West America. *Lewis.* From the Great Falls of the Columbia to the Rocky Mountains: sometimes with white flowers. *Douglas.*

2. *C. rhomboidea*; petalis integris rhomboideis.—*Douglas, MSS. apud Herb. Hort. Soc. Lond.*

Caulis simplex, teres, gracilis, glaber, subpedalis. *Folia* lanceolata, integerrima, glabra. *Calyx* tubus brevis. *Petala* integra, rhomboidea, calyceum longitudine sequantia, purpureo-rosea. *Filamenta* sterilia 2, 3, + (plerumque 4) basi barbata. *Antheræ* lineares. *Stigma* 4-lobum, petaloideum, purpureum. *Capsula* cylindrica, sulcata, subsessilis, axillaris. *Douglas.*

HAB. In the same places with the preceding. *Douglas.*

TRIB. II. JUSSIEÆ. *DC.*

5. ISNARDIA.

Calycis *tubus* ovatus aut subcylindraceus brevis ovario adhaerens; *limbus* 4-partitus. *Petala* nunc calyce alterna, interdum rudimentaria, nunc nulla. *Stam.* 4 ante lobos calycinis. *Stylus* a basi filiformis deciduus; *stigma* capitatum. *Capsula* obovata aut fere cylindracea tetragonon 4-valvis 4-locul. polysperma, loculicido dehiscens.—*Herbæ aquatice* aut *paludosæ*. *Folia* *integra* *alterna* aut *opposita*. *Flores* *axillares* *sessiles*. *DC.*

1. *I. alternifolia*; caule erecto ramoso glabriuscule, foliis alternis lanceolatis subtus et margine subscabriusculis, capsulis obovato-globosis alato-tetragonis, lobis calycinis magnis

coloratis, petalis calyce paulo longioribus. *De Cand. Prodr.* v. 3. p. 60.—*Ludwigia alternifolia*. *Linn. Sp. Pl.* p. 173. *Bigel. Fl. Bost.* ed. 2. p. 60.—*L. macrocarpa*. *Mich. Am. v. 1.* p. 89. *Pursh, Fl. Am. v. 1.* p. 110. *Elliott, Carol. v. 1.* p. 217. *Torrey, Fl. of Un. St. v. 1.* p. 180.

HAB. Canada. Mr. Goldie, (in Herb. nostr.)

2. *I. palustris*; caule procumbente radicante glabro, foliis oppositis in petiolum attenuatis ovatis acutis, floribus axillaribus solitariis sessilibus apetalis. DC.—*Linn. Sp. Pl.* p. 175. *Hook. in Engl. Bot. Suppl. t. 2593. Torrey, Fl. of Un. St. v. 1.* p. 182. *Bigel. Fl. Bost.* ed. 2. p. 61. *De Cand. Prodr. v. 3. p. 61.*—*Ludwigia nitida*. *Mich. Am. v. 1.* p. 87. *Pursh, Fl. Am. v. 1.* p. 111.—*L. apetala*. *Walt. Carol.*

HAB. Canada, (Pursh,) and as far north as the Saskatchewan. Dr. Richardson, Drummond.

TRIB. III. CIRCAEÆ. DC.

6. CIRCAEÆ.

Calyx brevis, limbo bipartito. *Petala* 2 obcordata. *Stamina* 2 petalis alterna. *Stigma* emarginatum. *Capsula* ovata pilis uncinatis hispida 2-locul. 2-valv. 2-sperma. *Semina* in loculis solitaria erecta.—Herbæ. Folia opposita petiolata. Flores in racemos spicatos terminales et laterales dispositi, pedicellati, alterni, albi. DC.

1. *C. Lutetiana*; caule erecto pubescente, foliis ovatis acuminatis dentatis opacis petiolo longioribus.—*Linn. Sp. Pl.* p. 12. *Engl. Bot. t. 1026. De Cand. Prodr.* v. 3. p. 63. *Bigel. Fl. Bost.* ed. 2. p. 8.—*β. Canadensis*; caule glabro. *Linn.*—*Mich. Am. v. 1.* p. 17. *Pursh, Fl. Am. v. 1.* p. 21. *Elliott, Carol. v. 1.* p. 7. *Torrey, Fl. of Un. St. v. 1.* p. 29.

HAB. β. Canada. Linn., Lake Huron. Dr. Todd. About Montreal. Mr. Cleghorn.

2. *C. alpina*; caule adscendente glabriuscule, foliis cordatis dentatis nitidis petiolorum longitudine.—*Linn. Sp. Pl.* p. 12. *Engl. Bot. t. 1057. Mich. Am. v. 1.* p. 17. *Pursh, Fl. HAB. In pools and still waters, Canada. *Michaux*; as far north as the Bear Lake. *Dr. Richardson,* *Drummond.*

2. *M. verticillatum*; foliis verticillatis pinnatipartitis, lobis capillaceis oppositis, spica terminali foliosa, foliis floralibus omnibus pinnatipartitis flores (8-andros) multo superantibus et a foliis vix distinctis. DC.—*Linn.* *Sp. Pl.* p. 1410. *Engl. Bot.* t. 218. *Mich. Am.* v. 2. p. 190. *Pursh.* *Fl. Am.* v. 1. p. 271. *Elliott.* *Carol.* v. 2. p. 588. *De Cand. Prodr.* v. 3. p. 68.

HAB. Stagnant waters, Canada. *Michaux*.

3. *M. tenellum*; caule simplice subaphyllo basi radicante erecto, foliis squameiformibus alternis integris, summis in axilla floriferis, spica terminali interrupta alterniflora. DC.—*Bigel.* *Fl. Bost.* ed. 2. p. 346. *De Cand. Prodr.* v. 3. p. 69.—*M. nudum.* *Laplaie*, MSS. (DC.)—*Hylus aphyllos.* *Bigel.* MSS. in *Herb. Boott*, apud. nostr.

HAB. In watery places, Newfoundland. *Laplaie*, in *De Cand. Prodr.*—Of this I have seen no specimen from the British Possessions of North America; but it has been found by M. de Laplaie in Newfoundland, and in the Northern United States appears to be not unfrequent. I possess excellent specimens from Mr. Nuttal, Dr. Torrey, and especially from Dr. Boott, and I purpose to illustrate this interesting plant and its affinity *M. procumbens*, *Bigel.* *Fl.* (*Hylas pinnatus*, ejusd. MSS. in *Herb. Boott*,) by figures in the Botanical Miscellany.

TRIB. II. CALLITRICHINEÆ. *Link, DC.*

3. CALLITRICHE. *Linn.*

Flores polyganni, hermaphroditi, dioici aut saepius monoici. *Bractæ* 2 oppositæ petaloidæ ad basin floris (petulu, auct.) *Calyx* non conspicuus, verosimiliter ovario basi adhaerens limbo abortivo. *Petala* 0. ♂. *Stam.* 1. (rarius 2) filamentis filiformibus exsertis, anthera reniformi 1-loculari sutura transversa debilmente. ♀. *Ovarium* bisulcum quadri-loculare, in quolibet loculo uniovulatum. *Styli* 2 filiformes, glandulosi. *Capsula* compressa

bisulca, constans carpellis & concretis per paria approximatis, indehiscentibus, 1-spermis, lenticulari-compressis. *Semina* cum carpella concreta, albumine carnosæ, embryone inverso teretiusculo subincurvo, radicula longa supera, cotyledonibus brevissimis.—Herba annua aquatica tenera glabra. Folia opposita. Flores in axillis solitarii, minimi. DC.

1. *C. verna*; foliis trinerviis superne aggregatis majoribus, fructibus sessilibus, carpello-rum dorso obtusiusculo. DC.—Linn. Sp. Pl. p. 2. Engl. Bot. t. 722.— β . *intermedia*; foliis inferioribus linearibus obtusis aut emarginatis, superioribus ovalibus. Hoffm.—De Caud. Prodr. v. 3. p. 70. Torrey, Fl. of Un. St. v. 1. p. 3.—C. verna. Mich. Am. v. 1. p. 2.—C. aquatica. Bigel. Fl. Bost. ed. 2. p. 2.—C. heterophylla. Pursh, Fl. Am. v. 1. p. 3.

HAB. Lakes and pools, Canada. Michaux. Saskatchewan. Dr. Richardson, Drummond. Bay of Eschscholtz, (a cespitose var.) Chamiso.

2. *C. autumnalis*; foliis omnibus uninerviis per caulem sparsis æquilibus truncatis, fructibus sessilibus, carpellorum dorso alato-membranaceo. DC.—Linn. Sp. Pl. p. 2. Mich. Am. v. 1. p. 2. Torrey, Fl. of Un. St. v. 1. p. 4.—C. linearis. Pursh, Fl. Am. v. 1. p. 3.—C. aquatica, γ . Engl. Bot. t. 722, (fig. dextra.)

HAB. Still pools, Canada; about Hudson's Bay, and as far north as Bear Lake, lat. 66°. Dr. Richardson, Drummond. Mouth of the Columbia. Dr. Scouler.

3. *C. terrestris*; foliis omnibus approximatis brevibus oblongis obtusis subsucculentis, fructibus sessilibus latis brevibus emarginatis. DC.—“Rafin. Med. Spec. xi. p. 358.” De Caud. Prodr. v. 3. p. 71. Torrey, Fl. of Un. St. v. 1. p. 4.—C. brevifolia. Pursh, Fl. Am. v. 1. p. 3.

HAB. Muddy places, near the Saskatchewan. Drummond.—I fear this will prove to be only a variety of *C. verna*, growing in places less watery than usual. The specimens, however, entirely agree with those I have received from Drs. Torrey and Schweinitz, gathered in the United States.

TRIB. III. HIPPURIDEÆ. Link.

4. HIPPURIS. Linn.

Calycis tubus ovario adnatus; *limbus* minimus integer. *Petala* 0. *Stamen* 1 cylceis margini insertum. *Stylus* filiformis antheræ stilec receptus. *Nux* 1-sperma, calycis limbo marginato coronata; endopleura tumida carnosæ (ex Rich.); embryonis radicula cylindracea cotyledonibus longior.—Herbae aquatice, caule simplici, foliis verticillatis linearibus acutis, infimis longioribus, floribus axillaribus sessilibus minimis, nonnullis sape abortu siemineis aut neutris.

1. *H. vulgaris*; foliis 8–12 linearibus acutis apice sphacelatis. Linn. Sp. Pl. p. 3. Engl. Bot. t. 763. Mich. Am. v. 1. p. 1? Pursh, Fl. Am. v. 1. p. 3? Torrey, Fl. of Un. St. v. 1. p. 2. Rich. in Frankl. 1st Journ. ed. 2. App. p. 2.— γ . foliis inferioribus pluries longioribus membranaceis apicibus intactis.

HAB. Pools of water and margins of lakes, from Canada as far north as lat. 60°. Dr. Richardson, Drummond. Newfoundland and Labrador. Dr. Morrison. Cape Hope, in Behring's Straits. Chamiso. β . In deep water, plains of the Saskatchewan. Dr. Richardson, Drummond.—The specimen from New-

foundland has almost setaceous leaves, and seems only to differ from Reichenbach's representation of the following species by its stouter stem. Dr. Richardson's specimens accord in every particular with those of Europe.

2. *H. montana*; tenella, foliis sensim linearibus acutis. *Reichenb. Icon. Bot.* v. 1. p. 71. t. 86. f. 184. *Cham. et Schlecht. in Linnaea*, v. 4. p. 507. *De Cand. Prodr.* v. 3. p. 71.

HAB. Turfy places, Unalaschka. *Eschscholtz, Chamiso*.—This is described and figured as having a stem so slender, that the plant has almost the habit of *Galium*.

3. *H. maritima*; foliis quaternis sensim lanceolatis obtusis apice vix sphacelatis. “*Hellen. Diss. cum Ic.*” *Fl. Dan.* t. 1261. *Reichenb. Icon. Bot.* v. 1. p. 71. t. 86. f. 182. *De Cand. Prodr.* v. 3. p. 72.—*H. tetraphylla*. *Linn. fil. Suppl.* p. 81. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 2.—*H. lanceolata*. *Retz, Obs. fasc.* 3. p. 7. t. 1.

HAB. Hudson's Bay? *Sherard's Herb.* (v. *Pursh, Fl.* v. 2. p. 74.) Mouth of Hayes's River, near York Factory, lat. 57°. *Dr. Richardson, Drummond, Labrador, Dr. Morrison*. Straits of Schismareff, and Bay of Eschscholtz. *Chamiso*. Kotzebue's Sound. *Lay and Collie*.—Not only are the leaves of this species much broader than in *H. vulgaris*; but, as Mr. Brown observes (in Richardson, App. l. c.), their extremities are not sphacelated, or they are so only in a very slight degree. The specimens from Hudson's Bay are a foot and a half tall, bearing leaves more than an inch long; while that from Labrador does not exceed a span in height, with leaves one-third of an inch long.

ORD. XXXII. CERATOPHYLLEÆ. Gray.

Flores monoici. Calyx (seu *perigonium*) *liber multi-* (10–12–) *partitus, lobis aequilibus. Petala* 0.—*MASC. Stam.* 12–20, *filamentis nullis, antheris ovato-oblongis bilocularibus apice 2–3-cuspidatis sessilibus in centro calycis congestis*.—*Fœm. Ovarium* liberum ovatum 1-loculare. *Stylus* filiformis incurvus obliquus. *Stigma* simplex. *Nux* 1-locul. 1-spermum style apiculata indehiscentia. *Semen* ex apice pendulum. *Albumen* 0. *Embryo* rectus, *radicula* supera, *cotyledonibus* 4 verticillatis dñabus latioribus oppositis, *plumula* valde composita (ex Rich. Anal. Fr. p. 46 et 93.)—*Herbæ aquatice subuersæ. Folin* *verticillatu*, *rigidula, in lobos filiformes acutos divisa, secus lobos subserrata*. DC.

1. CERATOPHYLLUM. Linn.

Character idem ac Ordinis.

1. *C. demersum?* nuce trispinosa nempe 1 terminali et 2 lateralibus inaequalibus. DC.—*Linn. Sp. Pl.* p. 1409. *Engl. Bot.* t. 946. *Pursh, Fl. Am.* v. 2. p. 370.

HAB. In streams, Canada. *Mr. Cleghorn*. Near the Saskatchewan. *Dr. Richardson, Drummond*.—This being destitute of fructification, I am unable to say whether it should be referred to *C. demersum* or *C. submersum*.

ORD. XXXIII. LYTHRARIEÆ. Juss.

TRIN. I. SALICARIEÆ. DC.

1. LYTHRUM. Juss.

Calyx cylindricus striatus apice dentatus, dentibus 4–6 latioribus erectis, sinus 4–6 alternis subulatis saepè corniformibus interdum non productis, aut minimis. *Petala* 4–6 ex

apice tubi orta, dentibus erectis alterna. *Stamina* e medio aut basi calycis orta petalorum numero dupla aut aequalia aut abortu pauciora. *Stylus* filiformis. *Stigma* capitatum. *Capsula* oblonga calyce tecta, bilocularis, polysperma. *Placenta* crasso septo adnatæ.—*Herbae aut rarius frutices. Folia integra. Flores axillares purpurei aut albi. DC.*

1. *L. Salicaria*; foliis lanceolatis basi cordatis, floribus spicatis subsessilibus. *Linn. Sp. Pl. p. 600. Engl. Bot. t. 1061.*— β . pubescens. *Pursh, Fl. Am. v. 1. p. 334. De Cand. Prodr. v. 3. p. 83. Torrey, Fl. of Un. St. v. 1. p. 471.*

HAB. β . Canada. *Pursh.* Wet meadows, abundant, in Upper Canada. *Douglas.*

2. *L. alatum*; foliis oppositis ovato-oblongis acutis basi subcordatis arcte sessilibus aut subpetiolatis, ramis virgatis tetragono-alatis, floribus sessilibus minute bracteolatis erectis 6-petalis 6-andris. *DC.*—*Pursh, Fl. Am. v. 1. p. 334. Elliott, Carol. v. 1. p. 545. Bot. Mag. t. 1812. Nutt. Gen. Am. v. 1. p. 303?* *De Cand. Prodr. v. 3. p. 81.*—*L. Vulneraria. Schrank, Pl. Rar. Monac. t. 27.*—*L. Kennedyanum. Humb. et Kunth, Nov. Gen. v. 6. p. 194.*

HAB. Canada. *Mr. Goldie.*—The *L. Hyssopifolia* is also probably a native of the British Settlements, though I have not seen specimens, and have no authority for introducing it. I possess plants of it from the neighbourhood of Boston, U. S. gathered by Dr. Boott.

2. DECODON. *Gmel.*

Calyx hemisphaerico-campanulatus basi ebracteatus, lobis 5 erectis, sinubus 5 alternis patentibus corniformibus. *Petala* 5 lobis erectis alterna. *Stamina* 10 quorum 5 longissima. *Ovarium* sessile subglobosum 3-loculare. *Capsula* calyce obtecta. *Semina* minuta aptera.—*Herba Boreali-Americanæ, pubescens. Folia opposita aut 3 verticillata. Pedunculi 3-aut pluriflori ad originem pedicellorum bibracteati. Petala purpurea. DC.*

1. *D. verticillatus. Elliott, Carol. v. 1. p. 544. De Cand. Prodr. v. 3. p. 90.*—*D. aquaticus. Gmel. Syst. Nat. p. 677.*—*Lythrum verticillatum. Linn. Sp. Pl. p. 641. Mich. Am. v. 1. p. 281. Pursh, Fl. Am. v. 1. p. 334. Torrey, Fl. of Un. St. v. 1. p. 471. Bigel. Fl. Bost. ed. 2. p. 188.*—*Anonymos aquatica. Walt. Cat. p. 137.*—*Nesæa verticillata. Humb. et Kunth, Nov. Gen. Am. v. 6. p. 191.*

HAB. Marshy places, Canada. *Pursh.*

No plant of the NAT. ORD. *Melastomaceæ*, has, to my knowledge, been found in Canada. Boston seems to be the northern limit of the *Rhexia Virginica*.

ORD. XXXIV. PHILADELPHÆ. *Don, De Cand.*

1. PHILADELPHUS. *Linn.*

Cal. tubus obovato-turbinatus, limbus 4-5-partitus. *Petala* 4-5. *Stam.* 20-40 libera petalis breviora. *Styli* 4-5 nunc coaliit inne plus minus distincti. *Stigmata* 4-5 oblonga aut linearia, saepius distincta rarius concreta. *Capsula* 4-5-locularis polysperma. *Semina* scrobiformia inclusa crillo membranaceo oblongo hinc fimbriato.—*Frutices floribus albis pedicellatis corymboso-cymosis subpaniculatis aut rarius axillaris bracteatis. DC.*

1. *P. Lewisii*; foliis ovatis acutis subintegerrimis margine ciliatis, calycis laciniis acutis, stylo longitudine staminum 9-fido, stigmatibus tribus. *Pursh, Fl. Am. v. 1. p. 329. De Caud. Prodr. v. 3. p. 206.*—P. nov. sp. *Douglas, MSS.*

HAB. Common in open Pine-woods, on the North-West coast of America. *Douglas*.—The single specimen I possess of this plant has the flowers so far advanced, that the stamens and petals have fallen; and the description given by Pursh of *P. Lewisii* is so unsatisfactory, that I cannot be sure it is the same. Our plant has the branches slender, twiggy, brown, spreading horizontally, quite glabrous. The leaves are ovate or ovato-oblong, acute or acuminate, entire or slightly toothed, three or five nerves arising from very near the base which is woolly beneath, at the axils of those nerves. Flowers ternate at the extremity, and in the axils of the upper pair of leaves are two single-flowered pedicels, one in each axil. Calyx-segments ovato-lanceolate, acuminate, very woolly at the points. Free portion of the germen glabrous; Style 3- or 4-cleft.

ORD. XXXV. CUCURBITACEÆ. *Juss.*

1. SICYOS. *Linn.*

Flores monoici. ♂. Cal. 5-dentatus, dentibus subulatis. Cor. 5-partita. Filamenta 3? (potius 5, triadelpha.) ♀. Stylus trifidus. Stigma crassiusculum trifidum. Fructus abortu? monospermus sæpissime spinis obsitus, semine obovato.—Pedunculi masculi et feminei saepe ex eadem axilla nascentes. DC.

1. *S. angulatus*; foliis cordatis angulatis denticulatis scabris lobis acuminatis 3–5, cirrhis umbellatis, floribus masculis corymboso-capitatis pedunculo communi longo, femineis sessilibus glomeratis apice pedunculi, fructibus ovatis spinescentibus tomentosisque, spinis obscabris, seminibus basi truncatis apice obtusissimis. *Linn. Sp. Pl. p. 1438. Mich. Am. v. 2. p. 217. Pursh, Fl. Am. v. 2. p. 44. Elliott, Carol. v. 2. p. 663. De Caud. Prodr. v. 3. p. 309. Dill. Elth. v. 1. t. 59.*

HAB. Canada. *Michaux*. Banks of the Columbia, from its mouth to the Kettle Falls. *Dr. Scouler. Douglas*.—The male inflorescence is sometimes in very elongated racemes, as in Dr. Scouler's specimens, and the flowers remote.

2. MOMORDICA. *Linn.*

Flores monoici lutei v. albi, pedunculo filiformi unibracteato (an semper?) ♂. Cal. 5-fidus, tubo brevissimo. Cor. 5-partita. Stam. triadelpha, antheris connatis. ♀. Filamenta 3? (potius 5, triadelpha,) sterilia. Stylus 3-fidus. Ovarium triloculare. Fructus saepe muricatus (an semper?) maturus elasticus dissiliens. Semina compressa reticulata (an semper?) DC.

1. *M.? echinata*; pomis tetraspermis subrotundidis setoso-echinatis, foliis cordatis quinque-lobo-angulatis acuminatis integerriinis scabris. *Muhl. ex Willd. Sp. Pl. v. 4. p. 605. Pursh, Fl. Am. v. 2. p. 444. De Caud. Prodr. v. 3. p. 312.*—Sicyos lobata. *Mich. Am. v. 2. p. 217.*

HAB. Plains of the Red and Assinaboyne Rivers, and banks of the Saskatchewan. *Douglas, Dr. Richardson, Drummond*.—If I am correct in referring this to the plant of Willdenow—and it well agrees with that author's description, so far as it goes—the segments of the corolla are remarkably long and attenuated, and the female flowers of rare occurrence. Of the six specimens in the Collection, possessing numerous racemes, from two to five or six inches long, of male flowers, only one raceme has at its base (as Willdenow

correctly remarks) a solitary female flower. The tube of the calyx is incorporated with the corolla, and the segments resemble slender and rather long bristles, set on to the corolla, and alternating with its segments. I have received the same plant from Dr. Torrey, gathered near New York, without a name. The flowers being in racemes, this plant would, I think, rank more naturally with *Sicyos* than with *Momordica*. But with the fruit I am unacquainted; and it must be confessed that the genera of *Cucurbitaceæ* are very imperfectly defined.

ORD. XXXVI. LOASEÆ. Juss.

1. BARTONIA. Nutt. et Pursh.

Calycis tubus cylindraceus arcte ovarium vestiens, sed forsan liber; limbus 5-partitus persistens. Petala 10 unguiculata calyce inserta. Stam. innumera (200-250) cum petalis inserta, iis breviora, filamentis liberis, externis interdum sterilibus, antheris oblongis. Stylus filiformis striis 3-7 spiralibus notatus et inde stylis 5-7 omnino connexis et spiraliter tortis constans. Capsula oblonga 1-locul. 3-7-valvis, placentis totidem semimum series 2 gerentibus. Semina compressa numerosa.—Herbae pilis barbatis rigidulis tenacibusque pubescentes. Folia alterna interrupte pinnatifida. Flores terminales solitarii ampli albi subvesperem expansi: DC.

1. *B. leivicaulis*; petalis 5, staminibus 5 petaloideis, bracteis nullis, caule levissimo, seminibus alatis. (TAB. LXIX.)—*Douglas, MSS. apud Hort. Soc. Lond.*

Caulis herbaceus, annuus, erectus, 2-3-pedalis, ramosus, lœvis, albidus, subnitidus. Folia lanceolata, sinuato-pinnatifida, sessilia; inferiora leviuscula; superiora sensim minoræ seberrima. Flores terminales, subcongesti, magni, speciosi, "nitidi, flavi." Bractæ nulla, nisi folia suprema parva, integerrima. Calycis segmenta lanceolata-acuminata, longa, demum reflexa, extus secura, intus glaberrima; tubo apice libero. Petala 5, erecto-patentia, 2-uncialia, lanceolata, basi apiceque acuminata. Stamiна numerosa, petalis breviora; filamenta 5 exteriora latiora, subpetalocidea; reliqua filiformia, glabra. Antheræ oblongæ, bilobulares. Germen inferum, subcampanulato-cylindraceum, asperum, obscure 5-sulcatum. Stylus longitudine staminum, filiformis, versus apicem obscure 3-valvis. Stigma obtusum. "Capsula secura, glutinosa, 3-valvis. Semina alata alba." (Dougl.)

HAB. On the gravelly islands and rocky shores of the Columbia, near the "Great Falls," flowering in June and July. *Douglas*.—This is a very beautiful addition to the American Flora, scarcely at all inferior to the *B. ornata* of Pursh and Nuttall, (*B. deceptala*, Sims in Bot. Mag. t. 1487,) which Mr. Lewis and Mr. Nuttall found on the borders of the Missouri, and which the latter author has so well described in his valuable "Genera of North American Plants." From it our plant differs remarkably in the absence of the large, foliaceous, deeply pinnatifid, and inciliated bractæ, in its fewer petals, and winged seeds. Contrary to the habit of *B. ornata*, this and the following species never expand their blossoms in the evening, but during the bright sunshine.

TAB. LXIX. *Bartonia leivicaulis*. Fig. 1, Lower leaf:—natural size; fig. 2, Stamen; fig. 3, Outer petaloid stamen; fig. 4, Calyx and pistil:—magnified.

2. *B. parviflora*; petalis 5, staminibus 5-7 petaloideis, bracteis nullis, caule scabro, seminibus alatis.—*Douglas, MSS. apud Hort. Soc. Lond.*

HAB. Abundant on calcareous rocky situations and micaceous sandy banks of streams, in the interior parts of the Columbia. *Douglas*.—The only specimen I have seen of this is in the Herbarium of Professor Lindley. The flowers are certainly somewhat smaller than in the preceding species, and the stem and

branches are rough: but I scarcely think it other than a var. From the *B. nuda* of Nuttall it differs in the number of its petals. The name would be more applicable to the following species.

3. *B. albicaulis*; petalis 5 obovatis (parvis), staminibus petaloideis nullis, bracteis nullis, caule lœvissimo nitido albo. *Douglas*, *MSS. apud Hort. Soc. Lond.*—*Mentzelia albicaulis. Douglas, in Herb. nostr.*

Annuæ, parva, decumbens, basi præcipue ramis erectiusculis alternis, lœvissimæ, nitidis, albis. Folia remota, lanceolata, sinuata, scabra. Flores nunc in axillis solitarii, plerumque 3–5 congesti ad apices ramorum, parvi, ebracteati. Calycis segmenta subulata, scabra, erecto-patentia, vix 2–3 linea longa. Petala 5, longitudine calycis, obovata, "mucronata," flava. Stamina 30 petalis subbreviora. Filamenta omnia conformia, filiformia, libera, basi dilatata. Anthera subrotundæ, biloculares: Loculi appositi, ad marginem dehiscentes. Germen inferum, unciam longum, cylindraceum, hispidum, uniloculare; receptaculus tribus parietalibus. Ovula uniserialia. Capsula sesquicircum longa, cylindracea, calyce coronata. Semina plurima, tetragona, albuminosa. Embryo immersus, cylindraceus, curvatus; radicula ad hilum versa.

HAB. On arid sandy plains of the river Columbia, under the shade of *Purshia tridentata*. *Douglas*.—Mr. Douglas seemed to be doubtful whether this new plant should be referred to *Bartonia* or *Mentzelia*. It partakes, indeed, in some characters of the one, and some of the other. Mr. Nuttall, who has perhaps alone of any living Botanist had the opportunity of examining both *Bartonia* and *Mentzelia* in a recent state, and who may be considered to have established the former genus, says that "nothing essential separates *Bartonia* from *Mentzelia*, except the augmentation of petals, and the structure of the capsules and seeds." In regard to the augmentation of petals, Mr. Nuttall himself observes that in *Bartonia* their number varies from ten to fifteen. We have shown in the two preceding species, that it is reduced to five, but with five petaloid stamens, or imperfect petals. In the present plant, the petaloid stamens are wanting; and the number of petals exactly accords with *Mentzelia*. Again in *Bartonia*, the seeds ought to be, according to Nuttall, "numerous, arranged horizontally in a double series;" in *Mentzelia*, the "seeds are 3–6, longitudinally arranged." In our plant, the seeds are numerous (25–40, *Dougl.*), placed in a single series.—For a knowledge of the structure of the flowers and seeds of this plant, I am indebted to a beautiful drawing which accompanied the specimen lent to me by Professor Lindley, and made by that admirable Botanist.

ORD. XXXVII. PORTULACEÆ. Juss.

1. PORTULACA. Tourn.

Cal. aut liber aut imo ovario adhærens, bipartitus, demum basi circumscissus et deciduus. Pet. 4–6 æqualia, inter se libera aut ima basi concreta, calyci inserta. Stam. 8–15, filamentis liberis interdum ima corolla adnatis. Ovarium subrotundum. Stylus apice 3–6-fidus, aut stylus 0 et stigmata 9–8 elongata. Capsula subglobosa 1-locularis medio circumscissa. Semina 00 placentæ centrali adfixa.—Herba carnosæ humiles. Folia sparsa integrerrima crassa, in axillis sæpe piligera, circa flores congesta aut subverticillata. Flores horis 9–12 matutinis sole expansi.—Genus heterogeneum et forsan dividendum, sed capsula circumscissa nunc facile distinctum. DC.

1. *P. oleracea*; foliis cuneiformibus carnosis, axillis geniculisque nudis, floribus sessilibus. *Linn. Sp. Pl. p. 638. De Cand. Pl. Gras. t. 123. Elliott, Carol. v. 1. p. 534. Pursh, Fl. Am. v. 2. p. 365.*

HAB. About Norway House, and banks of the Hill River. *Dr. Richardson, Drummond.*

2. TALINUM. *Adans. Juss. (TALINUM et CALANDRINA. DC.)*

Cal. 2-partitus. Petala 5. Stamina plurima. Stylus 1. Stigmata 3. Capsula 3-valvis, polysperma.—Frutices aut suffrutescens (herbaceæ.) Folia alterna crassiuscula, interdum in axillis pilosa. Flores terminales, paniculati aut racemosi. Juss.

1. *T.?* (*Calandrinia?* Kunth,) *Menziesii*; caulescens, foliis linearis-spathulatis, inferioribus longe petiolatis, marginibus nudis, superioribus sepaliisque acute carinatis dorso glanduloso-ciliatis, floribus pedunculatis axillaribus. (TAB. LXXX.)

Radix parva, annua, subfusiformis, fibrosa. Caules erecti vel basi documbentes, digitales, graciles, foliosi. Folia remota, inferiora et radicalia longe petiolata nuda, superiora glanduloso-ciliata: omnia linearis-spathulata. Pedicelli axillares, solitarii, in apice caulinum, folio duplo breviores, superne angulati, angulis pilosoglandulosis. Calyx profunde bipartitus; segmentis seu sepalis ovatis, acutis, acute carinatis, carina marginibusque glanduloso-ciliata. Corollam stamna pistillamque non vidi. Capsula 1-locularis, 3-valvis. Semina plurima, receptaculo centrali affixa.

HAB. North-West coast of America, south of the Columbia. *A. Menzies, Esq.*—Habit of a *Talinum*; but, without having seen the flowers, I am incompetent to refer it to the proper genus. It may be a *Claytonia*.

TAB. LXXX. *Talinum?* *Menziesii*. *Fig. 1*, Root-leaf; *fig. 2*, Leaf from beneath a flower; *fig. 3*, Capsule, with the persistent calyx and peduncle—*magnified*.

3. LEWISIA. *Pursh.*

Calyx 7-sepalus, sepalis submembranaceis. Petala 9-12, interiora sensim minora. Stam. 12-16 hypogyna. Antheræ lineares. Germen globosum. Ovula plurima receptaculo centrali libero affixa. Stylus profunde sexpartitus, laciniis filiformibus. Stigmata obtusa. —*Planta herbacea acaulis. Radix fasciculata. Folia teretia carnosa. Scapi uniflori.*

1. *L. rediviva*. *Pursh, Fl. Am. v. 2. p. 368.*— α . radice sanguineo, flore albo.— β . radice albo, flore roseo. *Hook. in Bot. Misc. v. 1. p. 345. t. 70.*

HAB. α . Banks of Clarke's River, North-West America. *Lewis.* β . Subalpine regions of the Rocky Mountains, on the west side, and abundant at the junction of the Spokane River with the Columbia, in dry stony soils; also on the Flathead and Salmon Rivers, in similar situations. *Douglas.*—The roots of this are gathered in great quantities by the Indians on the west side of the Rocky Mountains, and highly valued on account of their nutritive quality. They are boiled and eaten as *Salep*, or arrow-root, and are admirably calculated for carrying on long journeys: two or three ounces a-day being sufficient for a man, even while undergoing great fatigue.—Unfortunately, I have seen no complete flowers of this plant; so that, Pursh having described it imperfectly, we yet remain ignorant of the characters of the Genus; if, indeed, it should not merge into *Talinum*, which I think very probable.

4. CLAYTONIA. *Linn.*

Cal. disepalus persistens, sepalis ovatis oppositis. Petala 5, obcordata aut obovata hypogyna ræqualia unguiculata, unguibus basi subconnatis. Stam. 5 ad unguis petalorum inserta. Ovarium sessile. Stylus 1 trifidus, ramulis intus stigmatosis. Caps. 1-locularis 3-valvis 3-sperma. Fila conductoria 3 ante fecundationem a placenta centrali ad styli basin directa. Semina sessilia.—*Herba glabra subsucculenta saepius perennes. Folia integerrima, radicalia petiolata, summa saepius opposita sessilia, interdum connata. Racemi terminales. Flores albi aut rosei. DC.*

* *Caule folioso, foliis omnibus alternis, (habitu ad Calandrinias accedens.)*

1. *C. linearis*; caulis ramosus, foliis anguste linearibus obtusis alternis siccitate sub lente 3-nerviis, racemis terminalibus secundis basi bracteatis, petalis integris. (TAB. LXXI.)—*Douglas*, MSS. apud Hort. Soc. Lond.

Radix annua, fibrosa. *Caules* plures ex eadem radice, debiles, assurgentis, filiformes, ramosi, foliosi. *Folia* omnia alterna, 2–3 nucias longa, superiora sensim minor, omnia anguste linearia obtusa subsucculenta, siccitate, sub lente, 3-nervia, nervis venis anastomosantibus. *Racemi* terminales flexuoso-curvati, pedicello infero folio seu bractea lanceolata suffulto. *Calyx* disepalus: *sepalis* ovato-rotundatis obtusis. *Petala* calyce longiora obovata obtusa integra. *Stamina* 5.

HAB. Moist rocky places; on the Great and Little Falls of the Columbia, abundant. *Douglas*.

TAB. LXXI. *Claytonia linearis*. Fig. 1, Unexpanded flower; fig. 2, Flower expanded:—magnified.

2. *C. filicaulis*; caulis ad basin ramosus, foliis inferioribus obovatis acutis reticulatum venosis in petiolum decurrentibus caulinis linearispathulatis, racemis terminalibus, floribus bracteatis, petalis integris. (TAB. LXXII.)—*Douglas*, MSS. apud Hort. Soc. Lond.—*C. parvifolia?* *Moc. Ic. Pl. Nooth.* ined. in *De Cand. Prodr.* v. 3. p. 361.

Radix parva, fibrosa, annua. *Caules* plurimi ex eadem radice, erecti, graciles, filiformes, ad basin solummodo ramosi. *Folia* radicata plurima atque *caulina inferior* obovata, acuta, carnosò-membranacea, 3–5-nervia, nervis venoso-reticulatis, basi in petiolum latiusculum attenuata: *caulina superior* plurima sensim minor linearispathulata. *Racemi* terminales. *Pedicelli* undique versi omnes basi unibracteati; *bractea* parva ovato-lanceolata. *Flores* majuscules. *Petala* calyce duplo triplove longiora, integra. *Stamina* 5.

HAB. Rocks; Nootka and Queen Charlotte's Islands, on the North-West coast of America. *A. Menzies*, Esq. July, 1787. Plentiful on moist rocks of the Columbia, near the ocean. *Douglas*, Dr. *Scouler*.

TAB. LXXII. *Claytonia filicaulis*. Fig. 1, Flower; fig. 2, Root-leaf:—magnified.

* * *Scapo foliis 2 oppositis nunc connatis (Claytoniae veræ.)*

3. *C. Virginica*; radice tuberosa, foliis omnibus (radicalibus paucissimis) linearis-lanceolatis obsolete 3-nerviis venis anastomosantibus, racemo solitario nutante, pedicellis elongatis infimo bracteato, petalis integris. *Linn. Sp. Pl.* p. 294. *Bot. Mag.* t. 941. *Mich. Am.* v. 1. p. 160. *Pursh, Fl. Am.* v. 1. p. 175. *Elliott, Carol.* v. 1. p. 306. *Bigel. Fl. Bost.* ed. 2. p. 98. *Torrey, Fl. of Un. St.* v. 1. p. 259. *De Cand. Prodr.* v. 3. p. 361.—*C. grandiflora*. *Sweet, Br. Fl. Gard.* t. 216.— β , foliis latioribus fere ovato-lanceolatis in petiolum attenuatis. *Torrey, Fl. of Un. St. l. c.*— γ , spathulæfolia. *De Cand. l. c.*—*C. Caroliniana*. *Mich. Am.* v. 1. p. 160.—*C. spathulæfolia*. *Salisb. Parad. Lond.* t. 71. *Pursh, Fl. Am.* v. 1. p. 174.

HAB. α . Near Montreal. *Mr. Cleghorn*. Saskatchewan. *Drummond*— β . Throughout Canada, and as far as the Saskatchewan, *Lady Dalhousie*, *Mrs. Sheppard*, *Drummond*. St. John's, New Brunswick. *Dr. Boott*. On the west side of the Rocky Mountains, under the shade of solitary Pines. *Douglas*.—The petals are very variable in breadth and bluntness. The var. β appears to be more abundant in the British Possessions than α ; and this is observed by Dr. Torrey to be the case in the Now England States.

4. *C. lanceolata*; radice tuberosa, foliis radicalibus (paucissimis) oblongis longe petiolatis, caulinis ellipticis sessilibus omnibus 3-nerviis venis anastomosantibus, racemo solitario nutante, pedicellis elongatis infimo bracteato, petali profunde emarginatis. *Pursh, Fl. Am.* v. 1. p. 175. t. 3. *De Cand. Prodr.* v. 3. p. 361.

HAB. Valleys of the Rocky Mountains, in a rich soil. *Drummond*.—This is a very beautiful species, with the largest flowers of any, and the petals constantly notched. It is, however, in many respects, very similar to the preceding, especially to the var. β ; but here the caulinæ leaves are sessile. The root-leaves are of very rare occurrence, even in the most perfect specimens, and I have never seen more than one upon a root, though as many as three stems have arisen from that root. Very nearly allied to this is the *C. Vestiana*, Fischer, MSS. (*C. Joanniana*, Roem. et Schultes); but that has numerous radical leaves and a large fusiform root.

5. *C. Unalaschkensis*; foliis nervosis summis oppositis sessilibus rhomboe-ovatis, radicalibus petiolatis lanceolato-ovatis acuminatis, racemis geminis, bracteis ovatis, pedicellis solitariis bracteas duplo longioribus, petalis emarginato-bifidis. DC.—*Fischer*, in *Roem. et Schult. Syst. Veget.* v. 5. p. 434. *De Cand. Prodr.* v. 3. p. 361.

HAB. Unalaschka. *Langsdorff*.

6. *C. perfoliata*; radice fibrosa, foliis reticulatim venosis, radicalibus numerosis longe petiolatis late rhomboidibus, caulinis in unum suborbiculare perfoliatum coalitis, racemis fasciculatis, petalis integris aut emarginatis.—*Donn*, *Cat. Hort. Cant. ed.* 4. p. 50. *Bot. Mag.* t. 1396. *Pursh*, *Fl. Am.* v. 1. p. 176. *De Cand. Prodr.* v. 3. p. 360.—C. Cubensis. *Bonpl. Ann. du Mus.* v. 7. p. 82. t. 6. *Pl. Equinoct.* t. 26.—*Limnia perfoliata*. *Haw.*

HAB. First discovered on the North-West coast of America by *Mr. Menzies*. Mouth of the Columbia, and valleys of the Rocky Mountains, (where, however, the specimens are very diminutive,) *Douglas*, *Dr. Scouler*.—This and the next species have very small flowers.

7. *C. parviflora*; radice fibrosa, foliis radicalibus numerosis lineari-spathulatis 3-nerviis venoso-anastomosantibus longe petiolatis, caulinis in unum ovale perfoliatum coalitis venoso-reticulatis, racemis solitariis subcompositis unibracteatis. (TAB. LXXIII.) *Douglas*, MSS. apud *Herb. Hort. Soc. Lond.*

HAB. Abundant along the course of the Columbia, in open parts of the forest where wood has been burned, or the ground turned up by Deer. *Douglas*.—*Flowers* rose-coloured and white. This differs, as Mr. Douglas justly observes, from the preceding, in its linear radical leaves, ovate bracteas, and the profusion of small flowers.

TAB. LXXIII. *Claytonia parviflora*. Fig. 1, Fruit:—natural size.

8. *C. alsinoides*; radice fibrosa, foliis reticulatim venosis rhomboidis acutis, radicalibus plurimis longe petiolatis, caulinis sessilibus, racemis subsolitariis, pedicellis elongatis bracteatis, petalis emarginatis.—*Pursh*, *Fl. Am.* v. 1. p. 176. *Bot. Mag.* t. 1309. *De Cand. Prodr.* v. 3. p. 360.— β . floribus roseis, foliis subenerviis. *De Cand. Prodr.* l. c.—C. Sibirica. *Linn. Sp. Pl.* p. 294? (non *Pall.*) *Bot. Mag.* t. 2243. *Sweet*, *Br. Fl. Gard.* t. 16.

HAB. North-West coast of America. *Mr. Menzies*, *M. Lewis*, *Dr. Scouler*. At the sources of the Columbia, particularly plentiful about Indian villages, where it seems to hold the place of *Alsine media* in our country. *Douglas*.— β . Nootka. *Mocca*.—Whatever the *C. Sibirica* of Linneus may be, which I have no means of ascertaining, this plant is assuredly the same as the one so called in our gardens, in the *Bot. Magazine* (?) and in *Sweet's Brit. Fl. Garden*. Gmelin, who is quoted for the *C. Sibirica* of Linn., describes the root as being as thick as a goose-quill; Sir James E. Smith says it is tuberous; characters better according with *C. Joanniana* of Roem. and Schultes, (the *C. Vestiana* of Fischer in *Herb. nostr.*) and I may

add, too, the *acutifolia* of Ledebour, which is a perennial plant, with a thick tap-root.—It has perhaps a claim to be considered American; at least Gmelin's plant is said to be found at Mount St. Elias, and in the islands between Asia and North America.

9. *C. spathulata*; minuta, radice fibrosa, foliis radicalibus numerosis anguste linearis subspathulatis, caulinis ovatis acutis sessilibus, racemo solitario unibracteato, petalis integris. (TAB. LXXIV.) *Douglas*, MSS. apud *Herb. Hort. Soc. Lond.*

Planta pusilla. Radix e fibris panceis, annua. Caules plurimi ex eadem radice debiles graciles adscendentes. Folia radicalia plurima subunciam longa angusta linearia subspathulata: caulina 2 parva, opposita, ovata, acuta, sessilia. Racemos terminalis solitarius, 4-6-florus. Pedicellus infimus bractea parva lanceolata subfultus. Corolla calyce vix longior.

HAB. North-West coast of America. *A. Menzies*, *Esg.* in *Herb. nostr.*—In the valleys of the Rocky Mountains, common. *Douglas*.—This is the smallest species of the whole genus, and in regard to its character, it seems to hold the same relation to *C. alsinoides* as the *C. parviflora* does to *C. perfoliata*; being essentially distinguished by its exceedingly narrow leaves.

TAB. LXXIV. *Claytonia spathulata*. *Fig. 1*, Leaf; *fig. 2*, Flower-stem; *fig. 3*, Flower; *fig. 4*, Fruit:—
magnified.

ORD. XXXVIII. PARONYCHIEÆ. *St. Hil.*

1. ANYCHIA. *Mich.*

Cal. 5-partitus, sepalis conniventibus apice callosis subsaccatis. Petala et Squamulae 0. Stam. 3-5, filam. distinctis. Stylus nullus. Stigmata 2 subcapitata. Caps. indehiscentia 1-sperma calyce cincta.—*Herbae Boreali-Americanæ erectæ dichotomæ annue, facie Lini cathartici. Folia opposita, basi stipulis scariosis. Flores in axillis ramorum solitarii, ultimi ramis abbreviatis fasciculati.* DC.

1. *A. Canadensis*; caule retrosum pubescente, foliis cuneato-oblongis, stipulis flore longioribus, floribus subfasciculatis. DC.—*A. Canadensis*. *Elliott, Carol. v. 1. p. 307.*—*A. dichotoma*. *Mich. Am. v. 1. p. 113. Pursh, Fl. Am. v. 1. p. 176. De Cand. Prodr. v. 3. p. 369. Torrey, Fl. of Un. St. v. 1. p. 273.*—*Queria Canadensis*. *Linn. Sp. Pl. p. 494. Bigel. Fl. Bost. ed. 2. p. 99.*

HAB. Canada. *Linn.*—I have not seen specimens of this from Canada: but being of frequent occurrence in the adjoining districts of the United States, it is in all probability, independent of the authority of Linnaeus, a Canadian plant; though perhaps confined to the southern parts.—Torrey, and I think with justice, unites the *A. capillacea* of Nuttall with this, as a glabrous variety.

2. PARONYCHIA. *Juss.*

Cal. 5-partitus, sepalis dorso non incrassatis sepius apice mucronatis subcucullatis. Petala seu Squamulae 5 lineares sepalis alterne. Stam. 5. Stylus 1. Stigmata 2. Capsula 1-sperma indehiscentia aut 5-valvis, calyce tecta.—*Plantæ herbaceæ aut suffrutescentes, ramosissimæ. Folia opposita, stipulis scariosis utrinque inter folia binis. Flores cymosi aut glomerati.* DC.

1. *P. sessiliflora*; densissime cespitosa, ramosissima, foliis linearisubulatis acutis superioreibus longioribus recurvis, stipulis folia subaequantibus bifidis, floribus terminalibus sessilibus, calycis segmentis apicibus interne fornientis externe longe aristatis. (TAB. LXXV.)—*Nutt. Gen. Am. v. 1. p. 160. De Cand. Prodr. v. 3. p. 372.*

Radix lignosus fusiformis in terram longe descendens, superne divisa et caules vel ramos iterum dichotome divisos numerosos densissime cespitosos undique foliosos gerens. *Folia* opposita, inferiora brevia, linearia, erecta, imbricata, obtusa, stipulis tecta; superiora longiora subulata, recurva, acuta et etiam mucronata stipulis breviora; omnia crassinscula rigida striata vix nervosa, integerrima. *Stipula* oblonge profunde bifida, alba, scariosa, membranaceae, sepe lacere. *Flores* omnino sessiles in apicibus ramorum, foliis fere immersi solitari. *Calyx* profunde 5-partitus, cartilagineus, pallide viridis; segmentis seu lacinias oblongis canaliculatis, apice intus cucullato-incurvis extus in acumen longum seu aristam attenuatis. *Petala* (seu potius filamenta) abortiva 5, in axillis laciniarum staminibus alternantia. *Stamina* 5, lacinias opposita. *Filamenta* subulata. *Anthera* oblonga. *Germen* globosum pubescens. *Ovulum* 1, ex apice funiculi longi erecti apice incurvi pendens. *Style* filiformis longitudine fere calycis. *Stigma* bifidum.

HAB. Dry banks of the north branch of the Saskatchewan: between Carlton House and Edmonton House: lat. 53°. North. *Drummond*.—Mr. Nuttall, who has admirably characterised this species of *Paronychia*, discovered it on the highest hills of the Missouri, near Fort Mandan, 4° or 5° south of the country where Mr. Drummond gathered it: it is therefore probably not uncommon on the eastern slope of the Rocky Mountains.—Professor De Candolle has not rightly understood Mr. Nuttall's expression, "internal points of the calyx arched, external capillary attenuated." It is not "calycis lobis internis arcuatis externis attenuatis," as in the Prodromus; whence our learned friend has been led to suppose that the segments were unequal, and to express an opinion that the species should belong to the third section, which is so characterised: whereas the segments are perfectly equal.

TAB. LXXV. *Paronychia sessiliflora*. *Fig. 1*, Portion of a flowering-stem; *fig. 2*, Apex of a branch, with a flower; *fig. 3*, Flower laid open to show the stamens, abortive filaments, (petals, *D.C.*) and pistil; *fig. 4*, Pistil, with the germen cut open to show the ovule and seed-stalk; *fig. 5*, Leaves from the lower part of the stem and stipules; *fig. 6*, Single leaf from the same; *fig. 7*, Leaves from near the extremity of a branch and stipules; *fig. 8*, Single leaf from the same:—more or less magnified.

ORD. XXXIX. CRASSULACEÆ. DC.

1. SEDUM. *De Cand.*

Calyx 5-partitus, sepalis ovatis sèpius turgidis foliiformibus. *Petala* 5 sèpius patentia. *Stam.* petalorum numero duplo. *Squamae nectariferae* integræ aut vix ac ne vix emarginatae. *Carpella* 5.—*Herbae aut suffrutices*. Caules sèpius ad basin ramosi. Surculi steriles *folia conferta* gerentes. Folia alterna rarius opposita, carnosa, teretia aut plana, integerrima, rarius dentata. Flores cynosi, nunc albi-purpurei aut cœrulei nunc flavi, in nonnullis 4-aut 6-7-petali et ideo 8-aut 12-14-andri, sed tunc species *Sempervivo* distinæt squamis integris et habitu.

* *Planifolia, floribus luteis.*

1. *S. Rhodiola*; foliis oblongis apice serratis glabris, radice subtuberosa, caule simplici, floribus subcorymbosis sèpius tetrapetalis abortu dioicis. *De Cand. Fl. Fr. ed. 3. v. 4. p. 386. Pl. Grass. t. 143. Torrey, in Pl. of Rocky Mount. p. 206.*—*Rhodiola rosea*, *Linn. Sp. Pl. p. 1465. Engl. Bot. t. 508.*

HAB. Arctic Sea-shore, *Dr. Richardson*, and islands, *Sir E. Parry*. Newfoundland and Labrador. *Dr. Morrison*.—This was first ascertained to be a native of America by Dr. Torrey, on the authority of Dr. James, who found it in the more southern ranges of the Rocky Mountains.

2. *S. spathulifolium*; glabrum, caule erecto, foliis obovato-spathulatis planiusculis acutis

supremis linearibus, cyma terminali foliosa trichotoma, floribus pedicellatis 10-andris, petalis linear-lanceolatis calyce multo longioribus.

HAB. Common on dry rocky places of the Columbia and Salmon Rivers. *Douglas*.—The lower decumbent part of the stem sends forth fibrous roots, the rest is erect, simple, leafy. Leaves, according to Mr. Douglas, for they are almost destroyed in drying, obovato-spathulate, gradually smaller and narrower upwards. Flowers yellow, very similar to those of *S. stenopetalum*, as far as can be judged from the dried state of the plant.

3. *S. Douglasii*; caule erecto superne ramis recurvis prolifico, foliis linear-subulatis acutissimis intus planis dorso subcarinatis margine siccitate membranaceis, cyma dichotoma, floribus sessilibus decandris, petalis anguste lanceolatis calyce duplo longioribus.

HAB. Common on rocky places of the Columbia to the mountains. *Douglas*.—Flowers resembling those of *S. spathulifolium* and *S. stenopetalum*, as far as can be judged from the dried specimens; but the leaves are widely different, and of such a nature that I am doubtful whether the plant should be referred to this or to the third section: those at the base of the stem, and those on the numerous proliferous shoots on the upper part of the stem, remain attached by their broad and almost membranaceous bases, they are thickened in the middle, but thin and scarious at the margin. The root is annual: the plant a span high: the proliferous shoots, which are entirely confined to the upper half, an inch long.

* * *Planifolia, floribus albis.*

4. *S. ternatum*; foliis planis glabris integerrimis, inferioribus obovatis basi attenuatis ternato-verticillatis, summis sessilibus inordinatis, cyma trifida, floribus secus ramos sessilibus, petalis oblongis acutis. DC.—*Mich. Am.* v. 1. p. 277. *Pursh, Fl. Am.* v. 1. p. 324. *Elliott, Carol.* v. 1. p. 529. *Torrey, Fl. of Un. St.* v. 1. p. 463. *De Cand. Prodr.* v. 3. p. 403. *Bot. Mag.* t. 1977. *Bot. Reg.* t. 142.

HAB. Rocks on the Niagara and Lake Erie, common. *Douglas*.

* * * *Teretifolia, floribus flavis.*

5. *S. stenopetalum*; caulibus assurgentibus, foliis sparsis congestis adnato-sessilibus compresso-subulatis acutis, cyma terminali trichotoma dichotoma, spicis recurvatis, floribus sessilibus decandris, petalis linearibus calyce multo longioribus. *Pursh, Fl. Am.* v. 1. p. 234. *De Cand. Prodr.* v. 3. p. 408.

HAB. Banks of Clarke's River and the Kooskoosky. *M. Lewis*. Frequent on the east side of the Rocky Mountains. *Drummond*.—This very distinct species of *Sedum* has been cultivated in the Botanic Gardens of Edinburgh and Glasgow, from seeds brought home by Mr. Drummond.

(CRASSULACEÆ ANOMALÆ. DC.)

2. PENTHORIUM. Linn.

HAB. La Grande Chaudière. *Pursh, MSS.*

ORD. XL. CACTEÆ. *Vent.*

It is greatly to be regretted, that of this interesting family, from the impossibility of drying them, no specimens were collected. Species were met with, if I mistake not, by Mr. Drummond in his route, and certainly by Mr. Douglas on the west side of the Rocky Mountains, as far as the 44th or 45th degree of north latitude, and at a considerable elevation upon the mountains. The species are probably the same as, or nearly allied to, those which Mr. Nuttall detected upon the high mountains of the Missouri, and in the Mandan country:—these are *Mammillaria simplex*, Haw., *M. vivipura*, Haw., and *Opuntia fragilis*, Nutt.

ORD. XLI. GROSSULARIEÆ. DC.

I. RIBES. *Linn.*

Calyx 5-lobus, lacinias plus minus coloratis. Petala 5 parva albida lutea vel rubra. Stamina 5 rarissime 6, filamentis liberis. Styli 1-2-3-4-fidi. Baccæ unilocularis, receptaculis lateralibus. Semina arillata (an in omnibus?) oblonga subcompressa. DC.

* *Caules aculeati. Pedunculi 1-2-3 rarius multiflori. Folia plicativa. (Grossularia.)*
† *Floribus rubris.*

1. *R. stamineum*; setoso-aculeatum vel nudum, spinis tripartitis, foliis suborbicularibus trilobis obtusis, pedunculis bifloris, bracteis late ovatis, calyce cylindraceo 4-partito, lacinias erectis glandulosis, staminibus 4 longe exsertis, germine pedicellisque setoso-glandulosis.—*Sm. in Rees' Cycl.—De Cand. Prodr. v. 3. p. 477.—R. speciosum. Pursh, Fl. Am. v. 2. App. p. 731.—“ R. fuchsoides. Fl. Mex. ined.” (De Cand.)—R. triacantha. Menz. MSS. cum Ic. nitidiss.*

HAB. North California. *Mr. Menzies.* Monterrey. *Douglas, 1831.*—Style very long, entire. Petals cuneate, inserted on the very short tube of the corolla, as long as the segments, the margins involute. Anthers ovate.

2. *R. Menziesii*; aculeatissimum, spinis tripartitis, foliis cordatis basi truncatis 5-lobis serratis venoso-rugosis subtus pubescenti-tomentosis, pedunculo subunifloro, calyce cylindraceo-campanulato profunde 5-fido glanduloso, staminibus 5 inclusis, stylo subexerto, germine pedunculoque aculeatis. *Pursh, Fl. Am. v. 2. App. p. 732. De Cand. Prodr. v. 3. p. 478.—R. ferox. Sm. in Rees' Cycl.—De Cand. Prodr. v. 3. p. 478.*

HAB. Port Trinidad, North California. *A. Menzies, Esq.*—The present and the preceding species are exceedingly beautiful, from their large bright red glandular flowers, and may be considered as holding the

same rank among the Gooseberry as the *R. sanguineum* does among the Currant-tribe. *R. Menziesii* is clothed with long fulvous aculei.

† † *Floribus viridescentibus*.

3. *R. oxyacanthoides*; aculeato-setosum, nudiusculum, spinis 1-3 nunc bini coailitis, foliis cordatis quinquelobis serratis subtus (sepe) petiolisque pubescentibus, pedunculis brevissimis subbifloris, calycis glabri tubo cylindraceo intus hirsuto, limbo patente petalis obovatis longiore, germine pedicellisque nudis.—*Linn. Sp. Pl. p. 291. Pursh, Fl. Am. v. 1. p. 165.* (non Mich.) *Rich. in Frankl. 1st Journ. ed. 2. App. p. 9? Torrey, Fl. of Un. St. v. 270. De Cand. Prodr. v. 3. p. 478.*

HAB. Throughout Canada, and as far as the Saskatchewan, *Michaux. Pursh. Drummond. Newfoundland. Dr. Morrison.*—This varies considerably in the aculei and spines, in their number and colour (more or less bright or fulvous,) and in the more or less dense ramification, and pubescence. Of our plant, Mr. Drummond says the fruit is very similar to the common Gooseberry, equally agreeable, red and green.

4. *R. setosum*; ramis dense setosis, aculeis inequalibus subulatis, foliis subrotundis basi cordatis pubescentibus 3-5-lobis alte crenatis, pedunculis bifloris subbracteatis, calycibus tubulato-campanulatis, lacinias linearibus obtusis patentibus petalis integerrimis duplo longioribus, bacis hispidis. *Lindl. in Hort. Trans. v. 7. p. 243. Bot. Reg. t. 1237.*

HAB. Banks of the Saskatchewan. *Douglas.* (in Bot. Reg.)—My original specimens of this, from the Horticultural Society, have few aculei upon the stem, and the germe generally quite destitute of setæ. The Bot. Register figure approaches much nearer to what I consider the true *R. oxyacanthoides*, only the fruit is hispid. I fear the pubescence and armature afford characters very little to be relied upon in this Genus.

5. *R. triflorum*; aculeis nullis, spinis subsolitariis, foliis cordatis 5-lobis serratis glabris, pedunculis elongatis 2-3-floris, calycis glabri tubo anguste cylindraceo, limbo patente demum reflexo, petalis calye brevioribus, staminibus sublonge exsertis, germine nudo.—*Willd. Hort. Berol. t. 61. Pursh, Fl. Am. v. 1. p. 165. Bigel. Fl. Bost. ed. 2. p. 91. De Cand. Prodr. v. 3. p. 479.*

HAB. Mountainous situations to the west of the Rocky Mountains, rare. *Douglas.*—My specimens of this from Mr. Douglas, are from the Horticultural Society's Garden; they entirely agree with Willdenow's figure. As a species, it seems to be best distinguished from the following, by the constantly smooth fruit, very narrow flowers, and exerted stamens. I have not seen native specimens from the British Possessions; but I have received Pennsylvanian plants from Dr. Schweinitz, both under the name of *R. gracile*, and *R. trifidum*.

6. *R. Cynosbati*; caule inermi (raro aculeato), spinis subgeminis, foliis cordatis 5-lobis serratis subtus petiolisque magis minusve pubescentibus, pedunculis elongatis 2-3-floris, pedicellis divaricatis, calycis tubo ovato cylindraceo (intus basique stylis hirsutis vel glabris), limbo patente, lacinias petala obovata superantibus, staminibus vix exsertis germine setoso-aculeato. *Mich. Am. v. 1. p. 111. Jacq. Hort. Vind. v. 2. t. 123. Pursh, Fl. Am. v. 1. p. 166. Bigel. Fl. Bost. ed. 2. p. 90. Torrey, Fl. of Un. St. v. 1. p. 270. De Cand. Prodr. v. 3. p. 479.*— β . fructu inermi. *R. oxyacanthoides. Rich. in Frankl. 1st Journ. ed. 2. App. p. 7.— γ . ramis nunc aculeatis, pedunculis brevioribus, floribus pubescenti-hirsutis purpurascensibus, fructu aculeato.*

HAB. Canada. Michaux. Mrs. Percival. Mrs. Sheppard. Mr. Cleghorn. 3. Hudson's Bay. Dr. Richardson. 4. Lake Huron. Dr. Todd.—The figure of Jacquin well accords with my specimen received from Canada; but then some of the germens and young fruit, on the same individual specimens, are clothed with setæ, while others are destitute of them; thus, except in the broader tube of the corolla, if that be a constant character, and the shorter stamens, it scarcely differs from the following.

7. *R. divaricatum*; ramis divaricatis setosis demum nudis, spinis 1-3 axillaribus deflexis grossis, foliis subtropundis 3-lobis inciso-dentatis nervosis glabris, pedunculis 3-floris nutantibus, calyce infundibuliformi, lacinia dentum patentibus tubo duplo longioribus, stylo staminibusque exsertis, baccis glabris. *Dougl. in Hort. Trans. v. 7. p. 515. Bot. Reg. t. 1359.*

HAB. A common bush on the banks of streams near Indian villages, on the North-West coast of America, from 45°. to 52°. north lat. *Douglas. Scouler.*—Mr. Douglas has observed that this ranks systematically next to *R. triflorum*, and indeed some of the wild specimens I can scarcely, if at all, distinguish from that species, while other wild ones have, like those in cultivation at the Horticultural Society's Garden, flowers twice or thrice as large, and spines under the gemmae, which are remarkably large and stout, quite unlike those of any species with which I am acquainted. Berry black, smooth and spherical, one third of an inch in diameter, pleasant to the taste.—I have good reason for supposing, that in different soils and situations, this and all the other American individuals of the present group, vary exceedingly; and it is hardly possible to define their limits in words.

8. *R. irriguum*; aculeis axillaribus ternis, foliis cordatis subquinquelobis dentatis ciliatis utrinque pilosis nervosis, pedunculis trifloris glanduloso-pilosis, calycibus campanulatis, lacinia linearibus tubum excurrentibus, baccis glabris. *Dougl. in Hort. Trans. v. 7. p. 516.*

HAB. Moist mountain-rocks, near springs and streams on the Blue Mountains, in lat. 46°. 33', and on the banks of the Spokane River, North-West America. *Douglas.*—Berries spherical, half an inch in diameter, smooth, juicy, well-flavoured. I only possess a native specimen of this in fruit: and judging from the foliage and spines, and from the withered calyx, as well as from the berry, it seems to me that it is closely allied to, if not the same as, *R. triflorum*.

9. *R. saxosum*; caule inermi rarius aculeato, spinis nullis vel solitariis binisve, foliis cordatis 5-lobis serratis glabriusculis, pedunculis brevissimis deflexis 1-2-floris, calycis glabri tubo campanulato, lacinia patentibus demum reflexis corolla duplo longioribus staminis subequalibus, germine nudo.—*R. saxatile. Dougl. MSS. apud Hort. Soc. Lond. (non Pall.)—R. triflorum. Bigel. Fl. Bost. ed. 2. p. 90.*

HAB. Common on the undulating grounds of the interior among stones, (N. W. Amer.?) *Douglas. Lake Huron. Dr. Todd. Saskatchewan. Dr. Richardson. Mr. Drummond.*—This has the same short peduncles as *R. oxyacanthoides*, but a very different and more campanulate calyx; in the latter respect coming near *R. Cynosbati*. It is probably not uncommon in North America, and may have been confounded with some already described species, or it may itself belong to the following species of this group, which seems to be scarcely known except to Michaux, and on account of the vagueness of his character, not to be determined, except by reference to his Herbarium, if indeed it exists there. I have received it from Dr. Boott, gathered near Boston, under the name of *R. triflorum*, and hence, as well as from Dr. Bigelow's description, I suspect it to be the plant of the Florula Bostoniensis: where the fruit is described as resembling a common Gooseberry.

10. *R. hirtellum*; spinulae subaxillari, ramis breviter rarerque hispidulis, foliis parvis semitrifidis lobis paucidentatis, pedunculis unifloris, bacca glabra rubra. *Mich. Am. v. 1. p.*

111. *Pursh*, *Fl. Am.* v. 1. p. 165. *Torrey*, *Fl. of Un. St.* v. 1. p. 269. *De Cand. Prodri.* v. 3. p. 479.

HAB. Stony places by the river Sagney. *Michaux.*

11. *R. lacustre*; caule valde aculeato, spinis multipartitis gracilibus, foliis cordatis profunde 3-5-lobis incisis, racemis 5-8-floris laxis, calycibus rotatis, germinibus pedicellisque hispido-glandulosis. *Pursh*, *Fl. Am.* v. 1. p. 161. *Bigel*, *Fl. Bost.* ed. 2. p. 91. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 8.* *Torrey*, *Fl. of Un. St.* v. 1. p. 270. *De Cand. Prodri.* v. 3. p. 478.—*R. oxyacanthoides*. *Mich. Am.* v. 1. p. 111. *Pers. Syn. Pl.* v. 1. p. 252. (β.)—*R. echinatum*. *Dougl. MSS. in Herb. Hort. Soc. Lond.* et in *Herb. nostr.*

HAB. Throughout Canada to Fort Franklin and Bear-Lake, near the Arctic circle. *Dr. Richardson*. *Drummond*. Mouth of the Columbia. *Scouler*. Mountains of the Columbia and of North California. *Douglas*.—This has the flowers of the Currant, and the prickly stems and spines of the Gooseberry tribe. The fruit is about the size of Black Currants, in pendulous racemes, purple-black, shining, clothed with hairs, unpleasant to the taste. *Rich.*—The *R. echinatum* of Mr. Douglas does not differ in any particular from *R. lacustre*. The tips of the calyx are not black, as described by Mr. Douglas.

* * *Inermia. Racemi plerumque multiflori. Folia plicativa. (Ribesia.)*

+ *Floribus virescentibus.*

12. *R. rubrum*; inerme, foliis cordatis 5-lobis subtus pubescentibus, racemis nutantibus, bracteis obtusis pedicellis brevioribus, calycibus rotatis laciniis obtusis, petalis obcordatis, fructu glaberrimo.—*Linn. Sp. Pl.* p. 290. *Engl. Bot. t. 1289.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 6.*—*R. albinervium?* *Mich. Am.* v. 1. p. 110. *Pursh*, *Fl. Am.* v. 1. p. 163. *Torrey*, *Fl. of Un. St.* v. 1. p. 267.

HAB. Throughout Canada to the mouth of the Mackenzie River. *Dr. Richardson. Drummond*.—This differs in no respect from our European *R. rubrum*: and it is so abundant in North America, that it must have been described by Authors, under some other name. The miserable description we have of *R. albinervium*, accords sufficiently well, except that I find no evidently white or pale-coloured nerves.

13. *R. prostratum*; inerme, foliis profunde cordatis 5-7-lobis glabris lobis acutis incisis duplice-serratis utrinque glabris nudis, racemis erectis laxis gracilibus, bracteis parvis obtusis pedicello glanduloso-setoso multoties brevioribus, calycibus rotatis, germinibus buccisque (rubris) setoso-glandulosis.—*L'Hérit. Stirp.* v. 1. p. 3. t. 2. *Pursh*, *Fl. Am.* v. 1. p. 163. *Torrey*, *Fl. of Un. St.* v. 1. p. 268. *De Cand. Prodri.* v. 3. p. 482.—*R. glandulosum*. *Ait. Hort. Kew. ed. 1.* p. 279. (non *Ruiz et Pav.*)—*R. rigens*. *Bigel*, *Fl. Bost.* ed. 2. p. 9.—*R. glandulosum*. *Rich. in Frankl. 1st Journ. ed. 1. App. p. n. 74.*—*R. laxiflorum*. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 7.*—*β. racemis pubescentibus, pedicellis divaricatis*.—*R. affine*. *Douglas, MSS. in Herb. Hort. Soc.*—*R. laxiflorum*. *Pursh*, *Fl. Am.* v. 2. p. 731.

HAB. Newfoundland. (*L'Hérit.*) *Sir Alex. Cochrane*. Throughout Canada, and as far north as lat. 57°. *Dr. Richardson*. Woods in the Rocky Mountains. *Drummond*.—*β. North-West coast of America. Menzies. Douglas. Drummond*.—This is a truly distinct species, and very constant to its character. *Berries* rather large, red.

14. *R. trifidum*; inerme, foliis glabriusculis modice lobatis, racemis laxe multifloris

pubescentibus, floribus parvis, laciinis calycinis subtrifidis, baccis hirsutis rubris. *Mich. Am.* v. 1. p. 110. *Pursh, Fl. Am.* v. 1. p. 163. *De Cand. Prodr.* v. 3. p. 481.

Foliorum lobi subacuti, inferne non angustati. *Racemi* debiles, fere *R. rubri*, sed floribus minoribus. *Calyx* viridulo-pallens. *Petala* purpurea, spathulata, rotundato-obtusa. *Mich.*

HAB. Near Quebec, and at Hudson's Bay. *Michaux*.—May not this be the same as *R. prostratum*?

15. *R. bractosum*; inerme, foliis longe petiolatis cordatis profunde 5-7-lobis, lobis acuminate incisis duplikato-serratis supra hispidulis subtus resinoso-punctatis, racemis saepe terminalibus demum deflexis, pedicellis (quoad axin) erecto-patentibus pubescentibus bracteas spathulatas excedentibus, calyce rotato glabro, petalis minutis rotundatis, germinibus baccisque resinoso-punctatis.—*Douglas, MSS. apud Hort. Soc. Lond.*

Species insignis, 5-8-pedalis, ramis erectis, glabris, inermibus. *Folia* juniores nunc 3-lobata, adulta et tunc longe petiolata 5-plerumque 6-loba, circumscriptione cordata, ampla, supra hirsutula, subtus glabra pallidiora, punctis resinosis adpersa, lobis acuminatis, subregulariter incisis duplikato-serratis. *Racemi* sepo in ramulis terminalibus primum erecti, fructiferi deflexi, valde elongati spithamei. *Rachis* robusta glabriuscula. *Pedicelli* semi-uncinari longi pubescentes, erecto-patentes, stricti, non raro oppositi, bractea spathuliformi nunc ad basin racemini foliosa lobata distincte petiolata, lobis acutissimis. *Flores* purpurasceni-flavi. *Calyx* rotatus; lobi obtusissimi petalis rotundatis 3-pla majores. *Germen* globosum, punctis majusculis resinosis adspersum. *Bacca* nigra magnitudine (vix matura) *R. rubri*, resinoso-punctata.

HAB. North-West coast of America, at the confluence of the Columbia with the ocean. *Dr. Scouler. Douglas*.—This is a very remarkable species, with leaves nearly as large as, and resembling those of *Acer Pseudo-platanus*: these, as well as the fructified racemes, have a very strong resemblance to the *R. macrobotrys* of Ruiz, et Pav., *Fl. Per.* t. 232: but the flowers are widely different.

16. *R. Hudsonianum*; inerme, ramis erectis, foliis trilobis supra glaberrimis subtus resinoso-punctatis petiolisque villosis, racemis erectis pubescentibus, bracteis brevibus, culycis campanulati laciinis patentibus villosis, germinibus punctatis, baccis globosis glabris (nigris.) *Rich. in Frankl. 1st Journ. ed. 2. App. p. 6.*—*R. nigrum. Rich. in Frankl. 1st Journ. ed. 1. n. 75. (excl. syn.)*— β . racemis longioribus, calycibus glabriusculis. *R. petiolare. Douglas, in Hort. Trans. v. 7. p. 514.*

Frutex tripedalis, inermis. *Cortex* brunnescens, cuticula incano-grisea levigata decidua tectus. *Folia* vix ad medium triloba, paulo latiora quam longiora, inaequaliter grosseque argute serrata, basi integerrimo fere horizontaliter secto, vix unquam cordata, supra glaberrima, venosa, subtus pallidiora pilis brevissimis mollibus albescentibus villosa, et sparsiter punctis resinosis exiguis flavis adpersa. *Petiolus* diametrum folii vix longitudine sequans, antice sulcatus, tenuissime villosus. *Bractæ* parvae, membranaceæ, subulateæ. *Pedicelli* villosi, longitudine fere florum, bracteis duplo longiores. *Flores* parvi, campanulati. *Lacinia calycina* allua, elliptice, obtuse, patentes, extus villosa, nervis tribus anastomosatis. *Petala* exigua, alba, erecta, spatulata. *Germen* obovatum, utrinque leviter sulcatum, glandulæ flavæ exiguis adpersum. *Stylus* etiam sulcatus, quasi ex duobus connatis formatus, stigmatibus binis glandulosis. *Rich.*

HAB. From Hudson's Bay to the Rocky Mountains, in the west, and as far north as lat. 57°. *Dr. Richardson. Drunmond. Douglas. β .* Mountains of the Columbia, above the Kettle Falls. *Douglas*.—Dr. Richardson is quite correct in separating this from *R. nigrum*, to which its fruit, and the peculiar odour of the plant, are very similar. The flowers are much smaller, whiter, with a shorter tube, and with more erect, and, except in the var. β , very downy, narrower segments.

17. *R. floridum*; inerme, foliis resinoso-glandulosis 3-seu 5-lobis cordatis duplikato-serratis, racemis pendulis pubescentibus, bracteis linearibus pedicello longioribus, calycibus

tubuloso-campanulatis glabris laciniis obtusis demum reflexis, germinibus baccisque nigris ovali-globosis glabris.—*L'Hérit. Stirp.* 1. p. 4. *Pursh, Fl. Am.* v. 1. p. 164. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 7. Torrey, Fl. of Un. St. v. 1. p. 267. De Cand. Prodr. v. 3. p. 483.*—*R. recurvatum. Mich. Am.* v. 1. p. 109, (fide *Torrey.*)—*R. Pennsylvanicum. Lam. Dict.* v. 3. p. 49. (*DC.*)—*Ribesium nigrum, &c. Dill. Elth. v. 2. t. 244. f. 315.*

HAB. Throughout Canada, to lat. 54°.—This is, in many respects, allied to *C. nigrum*, of which Mr. Nuttall suspected it to be a “permanent variety;” but its more copious, denser flowers, and especially the long bracteæ and more tubular calyx, will always distinguish it: the solitary pedicel, too, at the base of the flower-stalk, is wanting.

18. *R. cereum*; inerme, foliis (parvis) cordatis lobatis serratis glanduloso-pubescentibus glabris glaucis superne albo-glandulosis, racemis pendulis subcapitatis 3–5-floris, bracteis ovatis germini glabro adpresso, floribus subsessilibus cylindraceo-subangulatis, laciniis calycinis parvis reflexis.—*Douglas, in Hort. Trans.* v. 7. p. 512. *Bot. Reg.* t. 1263. *Bot. Mag.* t. 3008.

HAB. Banks of the Columbia and its southern tributary streams, from the Great Falls to the Rocky Mountains, in gravelly or sandy soils. *Douglas.*—In the small foliage and few-coloured racemes, this resembles the *Grossularia*-tribe; but it is quite destitute of thorns or aculei. The flowers are rather large, white, with a slight tinge of green, slightly downy. White waxy dots, like scales, clothe the upper-side of the leaf, whence the specific name.

19. *R. viscosissimum*; inerme, foliis cordatis obtusis 3–5-lobis inciso-crenatis undique pubescenti-glandulosis viscidis, racemis erectis corymbosis, bracteis linear-i-ovatis pedicellis glandulosi-hirsutis subbrevioribus, calycibus tubuloso-campanulatis laciniis erecto-patentibus obtusis, germinibus fructibusque ovato-oblongis viscido-hirsutis. (*TAB. LXXVI.*)—*Pursh, Fl. Am.* v. 1. p. 163. *De Cand. Prodr.* v. 3. p. 482. *Douglas, in Hort. Trans.* v. 7. p. 511.

Frutex 4–8-pedalis, cortice atro-cinereo obducta. *Folia* cordato-rotundata, utrinque sed subitus præcipue petiolisque pilis brevibus glandulosi-viscidis tecta, 3–5-loba, lobis rotundatis obtusis inciso-crenatis. *Stipulae* magnæ, membranaceæ, fuscae. *Racemi* erecti, subcorymbosi. *Flores* maximi, pallide flavo-virides. *Pedicelli* elongati bracteis linear-i-ovatis membranaceis glabris longiores, glandulosi-hirsuti. *Calyx* tubuloso-campanulatus, inferno glandulosus, superne glaber, laciniis submembranaceis, erecto-patulis, oblongo-ovatis, obtusis. *Stamina* inclusa. *Stigma* bifidum. *Germen* ovale, viscido-hirsutum. *Bacca* oblongo-ovata, nigra, glandulosi-hirsuta.

HAB. Rocky Mountains, *Lewis.*—Common in the recesses of the Rocky Mountains, and on dry plains in partially shaded places towards the sources of the Columbia; also on the summits of the hills near the Spokane and Kettle Falls, at an elevation of 8000 feet above the sea. *Douglas.*—A very fine and remarkable species.

TAB. LXXVI. Fig. 1, Flower:—magnified.

† † *Flores intense rosei.*

20. *R. sanguineum*; inerme, foliis cordatis subquinquelobis serratis venosis supra glabriusculis subitus villosi-tomentosis, racemis laxis pubescentibus folio duplo longioribus, calycibus tubuloso-campanulatis laciniis oblongis obtusis patentibus petala (rubra) integrerrima superantibus, bracteis obovato-spatulatis, baccis turbinatis hirsutis. *Douglas.*—*Pursh, Fl. Am.* v. 1. p. 164. *Sm. in Rees' Cycl.*—*Douglas, in Hort. Trans.* v. 7. p. 509. *t. 13. Bot. Reg.* t. 1349.—*R. malvaceum. Sm. in Rees' Cycl.*

HAB. Abundant on the coast of North-West America, from lat. 38°, to 52°, usually growing in rocky

situations by the sides of streams. *Menzies, Lewis, Douglas, Dr. Scouler.*—This is perhaps the most highly ornamental of the Genus, bearing a profusion of large *racemes* of deep rose-coloured flowers. The fruit is brownish-black, bitter, having tough, leathery, thick skin, with numerous minute angular seeds, adhering together by a small portion of limpid, viscid mucus, and completely destitute of the pulpy substance common to most species of the tribe. *Douglas.*

* * * *Inermia. Racemi pluriflori. Folia in gemmis ambientia. (Flores aureo-flavi.)*

21. *R. aureum*; inerme, glaberrimum, foliis trilobis, lobis divaricatis inciso-paucidentatis petiolo basi ciliato brevioribus, racemis laxis dense multifloris, calycibus tubulatis pedicello longioribus, tubo gracili, lacinii oblongis obtusis, petalis linearibus lacinii calcinis duplo brevioribus, bracteis linearibus longitudine pedicellarum, (stylo integro), baccis glabris. *Pursh, Fl. Am. v. 1. p. 164. Bot. Reg. t. 125. De Cand. Prodr. v. 3. p. 483.*

HAB. Falls of the Columbia River. *M. Lewis.* In light gravelly soils, from the Great Falls of the Columbia to the mountains, and on the southern branches. *Douglas.*—Fruit yellow, seldom black, and of exquisite flavour. *Douglas.*

22. *R. tenuiflorum*; inerme, foliis subrotundis trilobis farinosis, lobis apice obtuse dentatis, racemis pendulis multifloris, calycibus tubulatis glabris pedicello longioribus coloratis, petalis integrerrimis calycis lacinii linearibus obtusis duplo brevioribus, baccis glabris. *Linn. in Hort. Trans. v. 7. p. 242. Bot. Reg. t. 1274.—R. aureum. "Colla, Hort. Rip. Ap. S. t. 1. A. nec aliorum. (Lindl.)—R. flavum. Berl. in De Cand. Prodr. v. 3. p. 483. " — . aureum, var. tubiflorum. Dougl. MSS. apud Hort. Soc. Lond.*

HAB. Common on the rocky tracts of the Columbia, to the Mountains, near the head-water of the Missouri. *Douglas.*—In habit, this species is more erect than *R. aureum*, and has the young wood more thinly clothed with leaves: its whole appearance is also paler during the early part of the year. The leaves are nearly round, 3-or 5-lobed; when young, covered with kind of mealy bloom; when more advanced, cordate at the base; and at all times, in the plants that I have examined, wholly destitute of pubescence. The flowers are not more than half the size of those of *R. aureum*, and have entire, not notched petals. The fruit is the size of the Red Currant, with a thick skin, and a dense mucilaginous pulp, of an agreeable flavour, but possessing little acidity, and far inferior to our cultivated Currants.—There are two varieties, the one bearing black, and the other yellow fruit: the former changes from yellow to red, and finally acquires a deep blackish-purple hue; the latter always retains its yellow colour." *Lindl.*—In the dried state of the specimens, I can perceive no essential difference between this and *R. aureum*.

ORD. XLII. SAXIFRAGEÆ. Juss. De Cand.

(TRIB. IV. *Saxifrageæ veræ. De Cand.*)

1. HEUCHERA. Linn.

Calyx persistens 5-fidus testicatione imbricata. Petala indivisa subinæqualia. Stamina 5. Styl. 2 longissimi distincti longitudine staminum, juniores approximato-subconcreti, dein divergentes. Capsula flore emarcido coronata, inferne calyci adnata, inter stylos dehiscens, 1-locularis, placentis 2 adnatis polyspermis. Semina aspero-punctata rugosave. —Herba. Folia radicalia petiolata palmatinervia lobato-dentata. Caules aphylli. Flores paniculati aut racemosi. DC.

1. *H. micrantha*; scapo inferne petiolisque pilis longis patentibus fulvis villosissimis, foliis subrotundato-cordatis obtuse lobatis mucronato-crenatis nudiusculis, bracteis infimis foliosis incisis superioribus setaceis, panicula laxa, petalis linearibus staminibus longe exsertis duplo brevioribus. *Douglas*, in *Bot. Reg.* t. 1802.

HAB. North-West coast of America. *Dr. Scouler*. Steep rocky banks of the Columbia, near the Grand Rapids. *Douglas*.

2. *H. villosa*; scapo inferne petiolisque pilis mollibus deflexis villosissimis, foliis cordatis acute lobatis mucronato-serratis subincisisque supra nudiusculis subtus ad nervos præcipue villosissimis, panicula laxa, pedunculis capillaribus dichotomis, bracteis linearibus ciliatis, floribus pusillis, petalis longissimis angustissime spatulatis staminibusque longe exsertis.—*Mich. Am.* v. 1. p. 172. *Pursh*, *Fl. Am.* v. 1. p. 188. *De Cand. Prodr.* v. 4. p. 52.

HAB. Upper Canada. *Mr. Goldie*.—The leaves of this are very different from those of *H. Americana*; the flowers, too, are smaller, and the petals singularly long and narrow, their upper or broader part becoming spirally twisted in the dried state.

3. *H. glabra*; scapo folioso, foliis cordatis acute lobatis glabris inaequaliter acute serratis, supremis seu bracteis inferioribus incisis, panicula laxa, floribus parvis, calycibus pubescenti-scabriusculis, petalis linearibus staminibus exsertis subdupo brevioribus. (TAB. LXXIX.) *Willd.* in *Schultes, Syst. Veget.* v. 6. p. 216. *De Cand. Prodr.* v. 4. p. 52.—*Tiarella colorans*. *Graham*, in *Ed. N. Phil. Journ.* July, 1829.

Radix perennis, elongata, obliqua, reliquis petiolorum vetustorum vestita. *Folia radicalia* longe petiolata, cordata, fere omnino glabra, acute lobata, acutaque inaequaliter serrata, serraturis nunc basi dilatatis; *caulina* seu *scapi* breviter petiolata, *superiora* varie incisa. *Petioli* graciles, basi stipulati; *stipulae* adnatae, ut in *genere Rose*, apicibus liberis acuminate ciliatis. *Scapus* seu *Caulis* spithameus ad pedalem et ultra, glaber, superne paniculatus. *Panicula* laxa. *Pedunculi* graciles, patentes, dichotomi, ramis divaricatis, bracteis linear-subulatis. *Flores* parvi, minute pubescenti-scabri. *Calyx* turbinatus; tubus fere omnino basi germinis adhaerens, limbo quinquefido erecto, lacinias oblongo-ovalibus obtusis inaequalibus. *Corolla* 5-petala. *Petala* parva, alba, linearia vel linearispathulata inaequalia, lobis calycinis alternantia iis subdupo longiora. *Stamina* 5 lobis opposita, triploque longiora erecta. *Antheræ* subrotundatae, loculis ad margines dehiscentibus. *Germen* apice liberum, stylis 2 attenuatis, primum coherentibus demum liberis subdivergentibus: *Stigmata* capitata. *Capsula* recurvata, oblonga, membranacea, stylis duobus persistentibus terminata, inferne calyce persistente ampliato tecta, unilocularis, inter stylos dehiscens. *Receptacula* 2 opposita, brevia, parietalia semiuinibus plurimis gerentia. *Semina* oblongo-elliptica, intense fusca, lineatum punctata.

HAB. North-West coast of America. (*Pallas.*) Nootka. (*De Cand.*) In the vicinity of the Columbia River. *Dr. Scouler*. *Douglas*. Rocky Mountains, at Providence and Portage Rivers, in lat. 54°. North. *Drummond*.—I have referred this to the *H. glabra* of Willd., which appears to come from the same country, and which differs, according to the short character given, only in the “*panicula simplex*,” which is probably the case with small or starved specimens.

TAB. LXXIX. *Heuchera glabra*. Fig. 1, Flower; fig. 2, The same laid open; fig. 3, Capsule, fig. 4, Section of do.; fig. 5, Seeds:—magnified.

4. *H. cylindrica*; scapo omnino nudo petiolisque patentim hirsutis, foliis cordatis alte rotundato-lobatis crenatis ciliatis dentibus piliferis basi truncata supra glabriusculis subtus

ad venas præcipue pilosis, panicula compacta cylindracea subspicata, floribus (majuscuis) apetalis, staminibus inclusi. *Douglas, MSS. in Herb. Hort. Soc. Lond.*

Radix descendens, elongata, crassa, squamosa. *Folia* omnia radicalia, longe petiolata, cordata, alte lobata, 2 uncias longa, supra glabriuscule subtus præcipue ad venas hirsuta, lobis obtusis rotundatis, crenato-dentatis, dentibus acutis pilo apiculatis. *Petiolæ* patentia hirsuti. *Scapus* omnino nudus, pedalis ad sesquipedalem, pilis numerosis patentibus obseitus. *Panicula* terminalis, digitalis, vix 8 lineas late, compacta, cylindracea, subspicata, ramis brevissimis bi-triforis, bracteis pedicellis longioribus linearisubulata, ciliata. *Flores* majuscui, sed minores quam in *H. Richardsonii*. *Calyx* pubescenti-hirsutus, turbinatus, 5-lobus: *tubus* inferne germini adnatus; lobis erectis obtusis inaequalibus. *Petala* nulla. *Stamina* 5 lobis opposita: *Filamenta* brevissima: *Antheræ* rotundatae.

HAB. On the declivities of low hills, and on the steep banks of streams on the west side of the Rocky Mountains. *Douglas*.—This is most allied to the following; but abundantly distinguished by the truncate base to the leaves, and the spicate panicle, by having less oblique calyces, very short stamens, and by the absence of petals.

5. *H. Richardsonii*; scapo nudo petiolisque subpilosus, foliis cordatis sinu profundo obtuse lobatis ciliatis crenatis dentibus piliferis utrinque sparsim pilosis, panicula laxe thyrsoidæ, (floribus magnis), calyce ore obliquo, petalis obovato-cuneatis vix calyce longioribus, staminibus subexsertis.—*Br. in Frankl. 1st Journ. ed. 1. App. p. 766. t. 29,* (figura nitidissima.) *De Cand. Prodr. v. 4. p. 52.*

HAB. Dry banks of Rivers, from lat 54°. to 64°. North. *Dr. Richardson*: and west to the Rocky Mountains. *Drummond*.

6. *H. Menziesii*; piloso-hispida, caule folioso, foliis cordatis acute lobatis inciso-serratis, floribus racemosis apetalis, calycibus cylindraceo-infundibuliformibus, staminibus exsertis, ovario libero. (*TAB. LXXX.*)—*Tiarella Menziesii?* *Pursh, Fl. Am. v. 1. p. 919. De Cand. Prodr. v. 4. p. 50.*— β minus hirsuta. *T. triandra. Douglas, MSS. apud Hort. Soc. Lond.*

Radix fibrosa, ramosa. *Caulis* 1-2-pedalis, erectus, simplex vel subramosus, patenti-pilosus, foliosus. *Folia* omnia petiolata, præcipue radicalia, profunde cordata, acuta, tenui-membranaceæ, 5-7-lobata, lobis acutis, acute inciso-serrata, superne pubescens-scabriuscule, subtus ad venas solummodo subhirsuta. *Petiolæ* pilosi, basi stipitata; stipulis majusculis adnatis membranaceis fuscescens. *Racemus* terminalis elongatus, solitarius, multiflorus. *Rachis* pubescens. *Pedicelli* 3-4 lineas longi, basi glabri, unibracteati, *bractea* parva ovato-lanceolata. *Calyx* fere semiunciam longus, infundibuliformis, glaber, vel superne solummodo leviter pubescens basi hinc gibbosus, superne patentim 5-fidus. *Stamina* 3 exserta. *Antheræ* (polline emiso) quadratae, angulis rotundatis. *Petala* 5, linearia, reflexa. *Pistillum*: *Germen* oblongum liberum pubescens, basi attenuatum. *Styli* 2, filiformes, exsertæ. *Stigma* obtusum. *Capsula* membranacea, omnino libera pistilli forma sed major, calyce persistente et sepe longitudinaliter erupta circumvolta, semibivalvis, stylis persistentibus terminata. *Semina* numerosa, subglobosa, punctata, atro-fusca.

HAB. North-West coast of America; at Banks' Isles. *Menzies*. From the Columbia to Puget Sound. *Douglas. Scoulr.* β . Shady woods. *Douglas*.—I have quoted the *Tiarella Menziesii* of Pursh, with a mark of doubt, chiefly because he describes the "raceme filiform and spicate," which is by no means the case. Ours is a remarkably distinct species.

TAB. LXXX. Heuchera Menziesii. *Fig. 1*, Flower; *fig. 2*, Capsule burst, surrounded by the floral coverings; *fig. 3*, Capsule removed from the floral coverings; *fig. 4*, Seed:—*magnified*.

7. *H. longipetala*; scapo pubescente, panicula secunda, petalis linearibus apice revolutis calyce longioribus. *DC.*—“*Moc. Pl. Nootk. Ined. Icon.*” *De Cand. Prodr. v. 4. p. 52.*

HAB. North-West coast of America. (*De Cand.*)

2. TIARELLA. Linn.

Calyx 5-partitus persistens imo ovario basi adhaerens, lobis obtusis. *Petala* 5 calyci inserta unguiculata integra lobis calycis alterna. *Stamina* 10. *Styli* 2 liberi. *Ovarium* 2-loculare. *Capitula* 1-locularis, imo calyci adnata membranacea 2-valvis, valvis inaequalibus (carpello uno interdum abortivo) inter stylos dehiscentibus. *Semina* in fundo capsulae secus margines carpellorum adfixa.—Herbae perennes Mitella facie. Caules erecti nudi aut oligophylli. Folia pleraque radicalia petiolata. Racemi terminales, simplices, floribus distantibus pedicellatis, fructigeris pedicello post anthesin incurvo pendulis. DC.

* *Foliis simplicibus.*

1. *T. cordifolia*; caule aphylo, stolonibus reptantibus, foliis cordatis acutis inciso-lobatis serratis dentibus mucronatis, racemo simplici. *Linn. Sp. Pl.* p. 580. *Mich. Am. v. 1. p. 271.* *Pursh, Fl. Am. v. 1. p. 313.* *Torrey, Fl. of Un. St. v. 1. p. 444.* *Bigel. Fl. Bost. ed. 2. p. 178.* *Bot. Mag. t. 1589.*

HAB. Canada. *Pursh.* About Montreal. *Mrs. Percival.* Lake Huron. *Dr. Todd.*

2. *T. unifoliata*; glabriuscula, caule unifoliato, foliis omnibus petiolatis triangulari-cordatis obtuse dentatis dentibus brevi-mucronatis, panicula laxa, floribus nutantibus, calycibus campanulatis, petalis abortivis. (?) (TAB. LXXXI.)

Caulis pedalis, glaber vel superne solummodo pubescens, erectus, gracilis supra medium unifoliolatus. *Folia* omnia sub longe petiolata triangulari-cordata, membranaceae, 3-5-lobata, acuta, lobis acutis dentatis, dentibus obtusis brevi-mucronatis, superne sparse pilosa. *Panicula* oblonga laxa, pedunculis dichotomis pedicellisque sub erubescens. *Flores* mediocrese sepe deflexi. *Calyx* campanulatus, pubescens, profunde 5-fidus, segmentis obtusis. *Stamina* fertilia 10, (an plura?) exserta; abortiva (an petala?) 5. *Capitula* oblonga, stylis nunc persistentibus, nunc acutis. *Semina* obovato-oblonga, levia, fusco-castanea, nitida.

HAB. Height of land in the Rocky Mountains, near the source of the Columbia, and at Portage River. *Drummond.*—This new species of *Tiarella* has much of the habit of *Heuchera glabra*; but the flowers are smaller, the stem has constantly only one leaf, and that nearly as large as those of the root, and the fruit is truly that of a *Tiarella*. I find constantly ten perfect stamens, and about as many apparently abortive ones, which may be abortive petals. Perfect petals, if any exist, must be very fugacious, as I have never been able to detect them.

TAB. LXXXI. Fig. 1, Flower; fig. 2, Capsule; fig. 3, Seeds:—magnified.

3. *T.?* *Menziesii*; foliis ovatis cordatis acutis dentatis, caulinis alternis distantibus, racemo filiformi subspicato, calycibus tubulosis. *Pursh, Fl. Am. v. 1. p. 313.* *De Cand. Prodr. v. 4. p. 50.*—An *Heuchera Menziesii* nobis?

HAB. “North-West Coast. *A. Menzies, Esq.*”—This, I suspect to be the *Heuchera Menziesii* of the present work; but the character of the inflorescence is at variance with that plant, which leaves me in doubt on the subject.

* * *Foliis compositis.*

4. *T. trifoliata*; caule 1-2-foliato (rarius nudo), foliis omnibus trifoliolatis, foliolis rhombo-ovatis inciso-dentatis dentibus mucronatis, panicula laxa, floribus nutantibus, calycibus (parvis) lato-campanulatis, petalis obovato-lanceolatis. *Linn. Amoen. Acad. v. 2. p. 351.* *Pursh, Fl. Am. v. 1. p. 313.*

HAB. North-West coast of America. *A. Menzies, Esq.* Common on the coast, and in the Rocky Mountains on the west side of the ridge. *Douglas.* Height of land near a large glacier, upon the Rocky Mountains. *Drummond.*—This has very much the habit of our *T. multiflora*; but the leaves are constantly ternate, the leaflets petiolulate, and the stem itself is sometimes a leafless scape, at other times, furnished with one or two leaves, and the flowers are smaller. The alpine specimens, found by Mr. Drummond, differ in no respect from those of the coast, except in being smaller. They are glabrous, as are many of those from the coast, while others are more or less pubescent-hirsute. Two panicles are occasionally produced on the same stem.

5. *T. laciniata*; hirsuta aspera, caule sub trifoliato, foliis trifoliolatis, foliolo medio trifido, lateribus bifidis omnibus lato-lanceolatis laciniato-pinnatifidis, panicula laxa, floribus nutantibus, calycibus brevi-campanulatis, petalis nullis? (TAB. LXXVII.)

Radix subhorizontalis, crassiuscula, fibrosa. *Caulis* spithameum ad pedalem, erectus, flexuosus, hirsuto-scaber, foliosus. *Folia* caulina 2-3, omnia petiolata, radicalia longe petiolata, petiolis gracilibus flexuosis, ternata, foliolis circumscriptione ovatis, seu ovato-lanceolatis, intermedio profunde trifido, lateralibus bifidis, omnibus laciniato-pinnatifidis, hirsutis, pilis appressis alibi rigidis; *superiora* sensim minora, minus incisa. *Panicula* solitaria, numo binis terminalis, oblonga laxa, pubescens-ascabre, bracteata; pedunculis dichotome ramosis divaricatis. *Calyx* brevi-campanulatus, 5-fidus, segmentis acutis. *Petala* (an stamina abortiva?) filiformia, 10? *Stamina* 10, calyce 4-pla longiora. *Filamenta* erecta, filiformia. *Antheræ* rotundata. *Pistillum* liberum. *Styli* 2, elongati, liberi: *Stigmata* obtusa. *Capsula* oblonga, obtusa, membranacea, bivalvis, valvis valde inaequalibus, singulo stylo terminata, unilocularis. *Semina* in fundo loculi secus margines valvarum adfixa, 6-8, globosa, levia; alia abortiva.

HAB. North-West coast of America. *A. Menzies, Esq.*

TAB. LXXVII. Tiarella laciniata. *Fig. 1.* Flower; *fig. 2*, Pistil; *fig. 3*, Capsule; *fig. 4*. Base of the capsule laid open to show the seeds.

3. TELLIMA. Br.

Calyx basi ovario adnatus, parte libera inflata ovata 5-dentata, parte adhaerente conica. *Pet.* 5, calyci inserta laciniata. *Stam.* 10. *Styli* 2 (3) a basi distincti. *Stigmata* subcapitata, angulata. *Capsula* calyci semiadnata, dimidio supero floris persistente vestita, unilocularis, apice 2-(3)-valvis, placentis parietalibus polyspermis.—Genus medium, ex R. Brown, inter Heucheram et Vahliam, a Mitella stylis distinctis et habitu diversum.—Herba perennis. Folia radicalia rotundato-cordata obtuse lobata (nunc composita) dentata hinc inde hispida. Flores livido-rosei majusculi in spicam (potius racemum secundum) dispositi. DC.

1. *T. grandiflora*; foliis cordatis lobatis dentato-serratis, racemo elongato, petulis oblongo-linearibus laciniato-pinnatifidis, stylis 2.—*Douglas* in Bot. Reg. t. 1178. *De Cand. Prodri. v. 1 p. 49.*—*Mitella grandiflora*. *Pursh*, Fl. Am. v. 1. p. 314.

HAB. North-West coast of America. *A. Menzies, Esq.* In shady Pine woods, near springs, along the sea-shore. *Douglas*, Dr. Scouler.—This is a very fine plant, with leaves as large as those of *Malva rotundifolia*, and flowers with inflated calyces, which may be reckoned among the largest of its group. The stems and petioles are generally thickly clothed with fulvous hairs.

2. *T. parviflora*; hirsuto-scabra, foliis ternatis, foliolis inciso-pinnatifidis, racemo brevi, petalis unguiculatis 3-fidis, stylis 3. (TAB. LXXVIII. A.)

Radix parva, subfusciformis, magis minusve fibrosa, tuberifera; tuberibus granulatis. *Caulis* pedalis et ultra, erectus, gracilis, simplex, parce foliosus, scaber. *Folia* omnia (nisi supremum) petiolata, ternata,

parva, utrinque pilis brevibus appressis scabra; *foliolis* ovato-lanceolatis, inciso-pinnatifidis, lacinia obtusis: *caulinis* 2-3, superne sensim minora. *Racemus* terminalis, curvatus. *Flores* mediores, secundi, densi, bracteati, nisi bractea minutissima ad basin pedicellarum inferiorum. *Pedicelli* calycis longitudine, demum recurvi, semper simplices. *Calyx* turbinatus, aequalis, 5-fidus, basi tubi cum ovario adhaerente, extus glanduloso-hirsutus, intus ad lacinias ovatas acutas erectas pubescens. *Petala* 5 patentia, unguiculata, lacinia calycinis alternantia, lamina late obovata, profunde 3-fida, segmentis linearibus obtusis. *Stamina* decem ad oram tubi calycis inserta, inclusa; *Filamenta* per breve, fere nulla. *Antheræ* rotundate. *Ovarium* semi-inferum, uniloculare, receptaculis 3 parietalibus seminiferis, parte superiori libero conico, in stylis 3 brevibus liberis attenuata: *Stigmata* capitata.

HAB. North California. *Mr. Menzies*. Abundant in light gravelly soils, under the shade of sapling Pines, near Fort Vancouver; plentiful on the low hills at the Grand Rapids, and also at Spokane River. *Douglas*. *Dr. Scouler*.—This is a very curious and distinct plant, with something of the habit of slender specimens of *Saxifraga granulata*.

TAB. LXXVIII A. *Tellima parviflora*. Fig. 1, Flower laid open; fig. 2, Stamens; fig. 3, Section of a germen:—magnified.

4. MITELLA. *Tourn.* (*MITELLA et DRUMMONDIA. DC.*)

Calyx campanulatus 5-lobus magis minusve ovario adhaerens. *Petala* 5 calyce inserta lacinianta vel dentata calyce longiora. *Stam.* 10 (nunc 5 et tunc petalis opposita). *Styli* 2 in unicum brevem coaliti. *Stigmata* vix distincta. *Capsula* 1-locularis bivalvis imme calycis basi paulo adhaerens. *Semina* plurima, erecta, in fundo capsulae.—Herbæ perrennes. Folia petiolata, cordata, pleraque radicalia. Flores breves pedicellati in racemum spicatum terminalē laxum digesti, albi aut rosei. *DC.*

1. *M. diphylla*; foliis cordatis subtri-quinquelobatis dentato-serratis radicalibus longe petiolatis, caulinis binis oppositis sessilibus, capsula basi solummodo infera, petalis fimbriato-pinnatifidis. *Linn. Sp. Pl.* p. 580. *Mich. Am.* v. 1. p. 270. *Pursh, Fl. Am.* v. 1. p. 313. *Schkuhr, Handb.* v. 1. t. 120. *Torrey, Fl. of Un. St.* v. 1. p. 446. *Bigel. Fl. Bost. ed. 2.* p. 178. *De Cand. Prodr.* v. 4. p. 49.

HAB. Canada. *Michaux*. About Quebec. *Mrs. Percival*. *Mrs. Sheppard*. Lake Huron. *Dr. Todd*.—This seems to be confined to the southern parts of the British Possessions.

2. *M. nuda*; sœpe stolonifera, decandra, foliis radicalibus reniformi-cordatis teneris obtuse lobatis crenatis subciliatis, scapo tenui aphylo, calyce patente, petalis pectinato-lucinatis, ovario sciminifero.—*Linn. Sp. Pl.* p. 580. *Gmel. Fl. Sib.* v. 4. t. 68. f. 2. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 14. De Cand. Prodr.* v. 4. p. 49.—*M. reniformis. Lam. Ill. t. 373. f. 2. Pursh, Fl. Am.* v. 1. p. 314.—*M. cordifolia. Lam. Dict.* v. 4. *Ill. t. 373. f. 2. (maln.) Mich. Am.* v. 1. p. 270. *Pursh, Fl. Am.* v. 1. p. 314. *Torrey, Fl. of Un. St.* v. 1. p. 446. *De Cand. Prodr.* v. 4. p. 49.—*M. prostrata. Mich. Am.* v. 1. p. 270. *Pursh, Fl. Am.* v. 1. p. 314. *Bigel. Fl. Bost. ed. 2.* p. 179. *De Cand. Prodr.* v. 4. p. 49.

HAB. From Lake Huron to the shores of the Arctic Sea; and from Hudson's Bay to the Rocky Mountains. *Dr. Todd*. *Dr. Richardson*. *Drummond*. *Douglas*.—The plant here characterised, is the acknowledged *T. cordifolia* of all American Authors. A comparison of it with the figure of *Gmelin*, will show that it is the same with his species; consequently the *M. nuda* of *Linnæus*, and among the numerous specimens gathered by the Travellers just-mentioned, many throw out runners, which, again, bearing leaves and scapes, the plant becomes the *M. prostrata* of *Michaux*.

3. *M. pentandra*; pentandra, foliis radicalibus cordatis obtuse lobatis crenato-serratis, scapo aphylo, calyce patente, petalis pectinato-pinnatidis, ovario omnino infero. *Hook. in Bot. Mag. t. 2933. Graham, in Ed. N. Phil. Journ. July, 1829.*—*Drummondia mitelloides. De Cand. Prodr. v. 4. p. 50.*

HAB. Moist alpine woods in the Rocky Mountains. *Drummond.*—I can by no means agree with my learned and valued friend, De Caudolle, that this should form a genus distinct from *Mitella diphylla* and *M. nuda*. In habit, they so entirely correspond, that it would be offering a violence to nature to separate them. Our plant only differs, generically, in the suppression of the five stamens that are opposite the lobes of the calyx, and in the union of the ovary for nearly its whole length; which latter circumstance is very variable, as we have shown in the allied genus *Heuchera*: and the reduced stamens exist equally in the following species, where the ovary is only half inferior:—there is this difference, however, that while in *M. pentandra*, the five remaining stamens are opposite the petals, in *M. trifida* they alternate with them: but even if the present should prove a distinct genus, the name *Drummondia* was previously established as a genus of Mosses. (*Musci Americani. v. 1, 1828, n. 62.*)

4. *M. trifida*; pentandra, foliis radicalibus cordatis obtuse lobatis crenatis, scapo aphylo, calyce campanulato, limbo apice patente, petalis trifidis, ovario semiinfero. (TAB. LXXXII.)—*Graham, in Ed. N. Phil. Journ. June, 1829.*—*M. parviflora. Douglas, MSS. apud Herb. Hort. Soc. Lond.*

Radix perennis, crassa, fibrosa. *Folia* omnia radicalia, longe petiolata, cordato-rotundata, lobata; lobis brevibus obtusis crenatis, supra pilis albis rigidis appressis, subtus nuda. *Petiolæ* pilis rigidis deflexis asperi. *Scapus* spithameus ad pedalem et ultra, aphylla, nuda vel squama parva una alterave instructa. *Racemus* subspicatus, gracilis, demum elongatus. *Pedicelli* brevissimi, bracteæ minutissima linearis quandoque suffulti. *Calyx* campanulatus, parvus, tenuissime pubescens: tubo superne libero 5-fido, lacinia ovatis fere albidis, ad apices patentibus. *Stamina* ad oram tubi inserta, inclusa, lacinia opposita. *Filamenta* brevissima. *Antheræ* subglobosæ. *Petala* patentia, parva, unguiculata, cuneata, profunde bifida. *Ovarium* semi-superum: *Stylæ* 2 breves. *Stigmata* capitata. *Capsula* calye tecta, unilocularis, bivalvis, polysperma: valvis arte reflexis. *Semina* nigro-fusca.

HAB. Alpine rivulets, North of the Smoking River, on the East side of the Rocky Mountains, in lat. 56° rare, *Drummond.* Plentiful in woody situations on the low ridge of the Blue Mountains of Lewis and Clarke's River, West of the Rocky Mountains, in lat. 46°. *Douglas.*—This has petals similar to those of *Tellima parviflora*. Here, as I have already intimated, the five stamens are opposite to the segments of the calyx: and sometimes they are wholly wanting. Again, in other plants cultivated in the Botanic Garden, the petals were wanting altogether, so that little dependence can be placed on the number of these parts in constructing the generic characters.

TAB. LXXXII. *Mitella trifida.* *Fig. 1.* Flower; *fig. 2.* Flower laid open; *fig. 3.* Section of the germen; *fig. 4.* Upper and free part of the germen, with the styles and stigmata; *fig. 5.* Capsule, burst open and exposing the seeds:—*magnified.*

5. CHRYSOSPLENIUM. *Tourn.*

Calycis tubus ovario adhaerens, limbus 4-5-lobus, lobis obtusis. *Stam.* 8-10 sepalis alterna oppositaque. *Stylæ* 2. *Capsula* 2-rostra 2-valvis demum unilocularis polysperma. *Semina* levissima fundum versus capsule nascentia.—*Herbæ annuae?* *Folia* *crassiusculæ* *simpliciæ* *petiolata dentata.* *Flores* *subcorymbosi*, *flavescentes.* *DC.*

1. *C. alternifolium*; foliis alternis reniformi-cordatis crenato-lobatis floribus corymbosis.—*Linn. Sp. Pl. p. 569. Engl. Bot. t. 54. Br. in Parry's 1st Voy. Suppl. App. p. clxxv.*

Rich. in *Frankl.* 1st Journ. ed. 2. App. p. 13. *Hook.* in *Parry's 2d Voy.* App. p. 395.
De Cand. Prodri. v. 4. p. 48.

HAB. In the woody, and principally the barren country of British North America, (*Dr. Richardson*,) to the extreme Arctic Islands. *Captain Sir E. Parry.* On the Rocky Mountains. *Drummond*.—This species seems to be unknown to the Botanists of the United States.

2. *C. oppositifolium*; caulis floriferis erectis, foliis oppositis reniformi-subcuneatis crenatis, floribus corymbosis.—*Linn. Sp. Pl.* p. 569. *Engl. Bot.* t. 490.— β . *Scouleri*; foliis profunde crenato-serratis.

HAB. β . Columbia River, on the North-West coast. *Dr. Scouler*.—The leaves of this are exactly similar to those of *C. Nepalense* of Don's Prod., as well as of Wallich's Cat. n. 48, and I should have referred it to that species, only that the flowers are more distinctly corymbose.

3. *C. Americanum*; caulis gracilibus decumbentibus laxis superne dichotomis, foliis oppositis cordato-rotundatis obscure crenato-lobatis floribus axillaribus distantibus.—*Schweinitz, MSS.* in *Herb. nostr.*—*C. oppositifolium*, *Mich. Am. v. 1.* p. 269. *Pursh, Fl. Am. v. 1.* p. 269. *Elliott, Carol. v. 1.* p. 311. *Bigel. Fl. Bost. ed. 2.* p. 154. *Torrey, Fl. of Un. St. v. 1.* p. 445. (non *Linn.*)

HAB. Canada. *Pursh. Lady Dalhousie. Mr. W. Sheppard. Lake Huron. Dr. Todd. Saskatchewan,* (which seems to be its northern limits,) *Dr. Richardson. Drummond*.—This is assuredly a distinct species from the European *C. oppositifolium*, with which it has long been confounded. Pursh alone, of any author that I have been able to consult, suggesting that if it were compared in a living state with the true *C. oppositifolium*, it would probably prove different. It is a much more inconspicuous plant, of a slender procumbent habit, the upper leafy and flowering branches never forming corymbs, but lengthened out, and bearing distant small leaves, and solitary flowers in their axils. It retains all its characters when cultivated in the Glasgow Botanic Garden. Dr. Schweinitz has sent me the present species, marked *C. Americanum*: but I am not aware that it is anywhere published under that name.

I have followed Jussieu and De Candolle in referring *Adoxa*, which usually stands next to *Chrysosplenium* in the *Saxifrageæ*, to *Araliaceæ*.

6. SAXIFRAGA. * Linn.

Calyx 5-sepalus, sepalis plus minus inter se et saepe cum ovario coalitis. *Petala* 5 rarer irregularia, breviter unguiculata integra. *Stamina* 10, 5 sepalis, 5 petalis opposita; *antheræ* bilocularis. *Capsula* calyci adnata vel libera; *carpella* 2 saepe usque ad stylum coalita. *Semina* numerosa, rugosa vel laevia, in plurimis seriebus disposita. *Spermadrium* ultra nucleus ovoideum non productum.—*Herbeæ perennes vel annuae, sapissime valde polymorphæ in eadem specie. Flores saepius paniculati vel corymbosi, abortu solitarii. DC.*

SECT. I. PORPHYRION. Tausch.—Seringe, in *De Cand. Prod.*

1. *S. oppositifolia*; viridi-purpurascens, foliis ramorum sterilium quadrifarium imbricatis rariter remotis obovatis carinatis ciliatis apice oblique truncatis et 1-3-porosis, floribus

* In the determining of the species of this difficult genus, as well as in the drawings and in the descriptive matter, I have been kindly aided by my valued friend, Dr. Greville.

solitariis terminalibus, calycibus ovario non coalitis, lobis obtusis ciliatis, staminibus corollu brevioribus, seminibus oblongo-triquetris rugosis. DC.—*Linn. Sp. Pl.* p. 595. *Engl. Bot.* t. 9. *Pursh, Fl. Am.* v. 1. p. 311. *Rich. in Frankl. 2d Journ. ed. 2. App.* p. 13. *Don, Saxifr. in Linn. Trans.* v. 13. p. 400. *De Cand. Prodr.* v. 4. p. 19.—*Antiphylla spathulata. Haw. Ennum. Saxifr.* p. 45.

HAB. Newfoundland and Labrador. *Sir Joseph Banks.* Dr. Morrison. Antiscot, in the Bay of St. Lawrence. Mr. Goldie. Rocky Mountains, near the highest summit, between latitudes 52° and 56°. Drummond. Arctic sea-shore, and Islands. Captain Sir John Franklin and Dr. Richardson. Captain Sir E. Parry. Bay of Eschscholtz. Chamisso.—Some of the specimens gathered upon the Arctic Sea-shore, near the mouth of the Mackenzie River, have the flowering stems very much elongated, and so bare of leaves as to give the idea of a peduncle, with flowers remarkably large; while those from the Rocky Mountains have their stems exceedingly short and densely tufted.

2. *S. Eschscholtzii*; parvula dense cæspitosa, foliis actissime imbricatis obovatis concavis pectinatim ciliatis, floribus solitariis brevissime pedunculatis, petalis (calycibus Sternb.) cochleatis ciliatis.—*Sternb. in Rev. Saxifr. Suppl.* p. 9. t. 10. f. 2. *De Cand. Prodr.* v. 4. p. 18.—*S. fimbriata. Don, Saxifr. in Linn. Trans.* v. 13. p. 404. (non Wallich.)

HAB. Cape Newnham, North-West coast of America, lat. 59°. David Nelson (in Herb. Banks.) Behring's Straits. A. Menzies, Esq.—A single specimen of this we detected amongst the stems of *Arenaria laricifolia*, gathered by Captain Sir John Franklin and Captain Back, on the Arctic sea-shore, to the west of the Mackenzie River.—This most remarkable and beautiful little plant, although first described by Sternberg, from Asiatic specimens, in the year 1822, was first discovered by Mr. Nelson, and then during the voyage of Captain Vancouver, in the year 1787, by Mr. Menzies. The tufts do not exceed an inch in height, and in the dry state are of a silvery grey colour. The leaves are thin and scarious when dry, especially at their margins. There is a central nerve, and there arise two opposite lateral ones near the middle, which diverge and meet again just below the point. Our specimens do not possess perfect flowers, but the calyx which surrounds the base of the capsule is not remarkably fringed: hence we are led to consider what Sternberg has described as the segments of the calyx, to be the true petals, which he represents as singularly concavo or cochleate, strongly fringed at the extremity.

SECT. II. AIZOONIA. Tausch.—*Seringe, in De Cand. Prodr.*

3. *S. Aizoon*; pedunculis calycibusque piloso-glandulosis viscidis, foliis rosularum spatulatis obtusis cartilagineo-serratis, floribus paniculato-corymbosis, lobis calycinis latis tubi hemispherici longitudine, petalis obovatis subcontiguis basi sepiissime rubro vel luteo punctatis, stylis divergentibus calyci longioribus, seminibus ovato-triquetris punctato-rugosis. DC.—*Jacq. Austr.* v. 5. t. 438. *Pursh, Fl. Am.* v. 1. p. 310. *Don, Saxifr. in Linn. Trans.* v. 13. p. 392. *Seringe, in De Cand. Prodr.* v. 4. p. 19.

HAB. Labrador. Kohlmeister. Dr. Morrison. Saskatchewan. Dr. Richardson. Drummond.—The specimens differ in no respect from those of Europe.

4. *S. serpyllifolia*; surculis repertibus, foliis rosulatis imbricato-reflexis oblongis obtusis in petiolam attenuatis coriaceis glaberrimis, caule filiformi oligophyllo glanduloso-pubescente unifloro, calycibus obtusis ovario non adhaerentibus, petalis lato-obovatis subtrinerviis.—*Pursh, Fl. Am.* v. 1. p. 310. *Don, Saxifr. in Linn. Trans.* v. 13. p. 405. *De Cand. Prodr.* v. 4. p. 25.—*S. Fischeri. Seringe, in De Cand. Prodr.* v. 4. p. 22.—*S. Eschscholtzii. Cham. in Litt. (fide Seringe.)—S. plunifolia. Cham. in Herb. nostr.—S. bicolor. Sternb. in Herb. nostr.*

HAB. Cape Newnham. *David Nelson*. Behring's Straits. *Mr. Menzies*. Unalashka. *Chamisso*.—This species has had the misfortune to receive various names, and, indeed, to the above list may be added *S. diapensioides* of Fischer, according to Mr. Seringe. It is a singular and well marked species, evidently allied to *S. diapensioides* and *S. cæsia*, wanting, however, altogether, the remarkable glaucous incrustation of those species, and being destitute of pores. The flowers, too, are totally different; solitary upon the extremity of a slender few-leaved glandular stalk, large in proportion to the size of the plant, and apparently of a yellow colour. The calyx is wholly inferior, the petals broad, with three strong nerves, of which the lateral ones are sometimes branched.

SECT. III. DACTYLOIDES. Tausch.—Seringe, in *De Cand. Prodr.*

5. *S. androsacea*; caule subaphyllo 1-4-floro piloso, pilis acutiusculis stepe capitellatis, foliis herbaceis obovato-spathulatis integris rarer tridentatis, lobis calycis ovatis obtusis, petalis obovato-subretusis calyce longioribus albis, stylis per anthesin parallelis, rostris longitudinaliter nervosis, seminibus ovato-subglobosis levibus carinatis. *DC.*—*Linn. Sp. Pl.* p. 571? *Jacq. Austr.* v. 5. t. 389? *Pursh, Fl. Am.* v. 1. p. 310.

HAB. North-West coast of America. *David Nelson*.—We insert this upon the authority of Mr. Pursh, who, indeed, quotes the figure of Jacquin with a mark of doubt, so that it is in all probability a very different species from the true plant.

6. *S. renosa*; subcaulis, foliis simplicibus trifidisque nervosis, scapo unifloro folioso, foliis scapi linearibus integris. *Haw. Enum. Saxifr.* p. 28.

HAB. Melville Island. *Lieutenant Hopner*.—We fear this will prove to be the variety *uniflora* of *S. cæspitosa*, which was described as a native of Melville Island, by Mr. Brown, and who, indeed, has expressed the same opinion.

7. *S. cæspitosa*; cæspitosa, foliis tri-quinqefidis supremis linearibus integris glandulosopubescentibus segmentis lato-linearibus obtusis muticis, caulinis floriferis sparse foliosis pubescenti-glandulosis uni-tri-floris, ovario calycis pubescens tubo adhaerente, petalis obovatis trinerviis calyce duplo longioribus.—*α. cæspitosa*; caulinis bi-tri-floris.—*S. cæspitosa*. *Linn. Sp. Pl.* p. 578. *Gunn. Fl. Norr.* t. 7. f. 3. 4. *Don, Saxifr.* in *Linn. Trans.* v. 13. p. 428. *Pursh, Fl. Am.* v. 1. p. 312.—*S. Greenlandica*. *Linn. Sp. Pl.* p. 578. *De Cand. Prodr.* v. 4. p. 27.—*β. uniflora*; caulinis unifloris. *S. uniflora*. *Br.* in *Parry's 1st Voy. App. Sp. cclxxiv. (non Sternberg)*.—*S. cæspitosa*. *Engl. Bot.* t. 794. *Seringe, in De Cand. Prodr.* v. 4. p. 27.—*S. cæspitosa* var. *vulgo S. Greenlandica*. *Gunn. Fl. Norr.* t. 7. f. 1.—*S. venosa*. *Haw. Enum. Saxifr.* p. 28?

HAB. North-West coast of America. *Pursh, in Herb. Banks*. Kotzebue's Sound. *Messrs. Lay and Collie* in *Captain Beechey's Voyage*. Arctic Sea-shore. *Dr. Richardson*.—*β. Arctic Islands*. *Captain Sir E. Parry*. *Captain Sabine*.—We refrain from quoting many synonyms under this and the following species of *Saxifraga*, because of the great difficulty of ascertaining them correctly. Though we believe them to be truly distinct, and though they are readily distinguished by the eye, yet it seems hardly possible to define their characters in words. The present has a stouter habit than *S. exarata*; the leaves are broader, and, what appears to us the most constant character, the flowers (fewer in number) are of a much larger size. In almost all our specimens the upper part of the stem, and especially the calyx, assume a dark purple or frequently sooty colour, which appearance is well represented in Gunn's figures, above quoted.

8. *S. exarata*; cæspitosa, foliis tri-quinqefidis supremis linearibus integris glandulosopubescentibus segmentis linearibus acutiusculis, caulinis floriferis gracilibus sparse foliosis

tri-quinquefloris floribus (parvis) corymboso-racemosis, ovario calycis pubescentis tubo adhaerente, petalis obovatis trinerviis calyce vix duplo longioribus.—*Vill. Dauph. v. 3. p. 674. t. 44. Don. Saxifr. in Linn. Trans. v. 13. p. 432. Seringe, in De Cand. Prodr. v. 4. p. 27.—S. nervosa. Lapeyr.—Sternb. Rev. Saxifr. p. 52.*

HAB. Frequent upon the Rocky Mountains between latitudes 52° and 56°. *Drummond*.—This entirely agrees with our European specimens of this plant, and we have, under the preceding species, mentioned how difficult it is to distinguish the two.

9. *S. sileniflora*; caulis cespitosus stolonibus brevibus foliis rigidis rosulatis densis tri-quinque-septemfidiis nitidissimis quasi vernicos plurinerviis hirsuto-pubescentibus regnentis linearibus acutuseculis, caulis floriferis elongatis pubescenti-glandulosis superne paniculatis, floribus majuseculis ovario calyci, pubescenti-glandulosi tubo adhaerente segmentis obtusis petalis obovatis trinerviis calycem duplo excedentibus.—*B. uniflora. S. sileniflora. Cham. in Herb. nostr.*

HAB. Behring's Straits. *A. Menzies, Esq.*.—This species differs considerably from any with which we are acquainted. Its inflorescence a good deal resembles that of *S. hypnoidea*, but its foliage is quite peculiar, being extremely harsh and rigid, shining as if varnished, and at the same time sparingly clothed with apparently viscid hairs. We had called this *S. vernicosa* in our own manuscript, but having received specimens of the single-flowered state under the name of *S. sileniflora*, we gladly adopt the name, though it does not appear to be anywhere published. It has indeed been referred incorrectly, in the Catalogue of Captain Beechey's Voyage, to *S. cespitosa*.

10. *S. petraea*; annua, glanduloso-pilosa, foliis carnosis trilobis, radicalibus cordatis, lobis incisis sublonge petiolatis, cauliniis subcuneatis, supremis indivisis, pedunculis ovarialisque inferis glanduloso-hispidis, lacinii calycinis oblongis erectis, petalis obovatis retusis.—*Linn. Sp. Pl. p. 578. Jacq. Ic. Rar. v. 1. t. 81. Don. Saxifr. in Linn. Trans. v. 13. p. 443. Seringe, in De Cand. Prodr. v. 4. p. 34. Hook. in Bot. Mag. t. 3026.—S. rupestris. Willd. Sp. Pl. v. 2. p. 653.—S. Ponte. Sternb. Saxifr. p. 47. t. 18. et t. 11. f. 6.*

HAB. Alpine Rivulets upon the Rocky Mountains. *Drummond*.

11. *S. Laurentiana*; multiceps, foliis radicalibus longe petiolatis reniformibus 5-7-lobato-crenatis longitudinaliter reticulato-venosis glabris, caulis et pedunculis pilis longis intricatis onustis, floribus paucis subcapitatis, bracteis 3-5-lobato-crenatis subinvoluteratis, lobis calycis ovatis obtusis corolla brevioribus, petalis medium versus trinerviis. *DC. —Seringe, in De Cand. Prodr. v. 4. p. 35.*

HAB. Island of St. Lawrence, in Behring's Straits, between Asia and America. *Chamisso*.

12. *S. exilis*; cespitosa, radicalis capillaris, foliis radicalibus palmato-5-lobis petiolatis, cauliniis linearibus integris, petalis obovato-oblongis calyce 5-fido multo longioribus. *DC. —Steph. in Sternb. Rev. Saxifr. Suppl. p. 8. t. 3. f. 1. Seringe, in De Cand. Prodr. v. 4. p. 35.*

HAB. Kotzebue's Sound. (*Fischer in De Cand. Prodr.*)—May not this be a state of *S. cernua*? We possess no authentic specimens, and judge only from Sternberg's figure.

13. *S. cernua*; glabriuscula non glutinosa caule debili ramoso vel simplici, foliis inferioribus reniformibus late dentatis mediis superioribusque bulbillos (abortu florum) gerentibus,

flore saepe subsolitario terminali pendulo, apalis oblongo-lanceolatis inter se vix coaltis, petalis obovato-oblongis vel obovato-retusis et, ce longioribus stylis imperfectis deformatis. DC.—Linn. Sp. Pl. p. 577. Fl. Lapp. t. 2. f. 4. Engl. Bot. t. 664. Don, *Saxifr.* in Linn. Trans. v. 13. p. 364. Seringe, in *De Cand. Prodr.* v. 4. p. 36.

HAB. Arctic Sea-shore and Islands, abundant, where it was found by all the Arctic travellers. Common on the Rocky Mountains. Drummond. Kotzebue's Sound. Messrs. Lay and Collie in Captain Beechey's Voyage.—The specimens from the Rocky Mountains are more leafy, especially on the stem amongst the bulbs, which are very numerous.

14. *S. Sibirica*; caule filiformi adscendente debili, foliis radicalibus reniformibus palmatis petiolatis 7-lobis pilosulis, lobis ovatis, caulinis sessilibus, pedunculis elongatis nudis, lobis calycis ovato-linearibus striatis glabris, petalis cuneato-ovatis, stylis ovario brevioribus. DC.—Linn. Sp. Pl. p. 577. Pursh, Fl. Am. v. 1. p. 313. Sternb. Rev. *Saxifr.* p. 23. et 57. t. 25. Don, *Saxifr.* in Linn. Trans. v. 13. p. 365. Seringe, in *De Cand. Prodr.* v. 4. p. 36.

HAB. Labrador and Newfoundland. (in *Herb. Banks*, sive *Pursh*.)

15. *S. rivularis*; pygmæa, caule debili adscendente, foliis radicalibus subreniformibus crenato-lobatis, petiolis basi dilatatis, superioribus subintegris lanceoletis, lobis cylindricis ovatis latis tubum æquantibus dein brevioribus, petulis ovatis calyce vix longioribus, stigmatibus globoso-depressis, capsula crassa calycem valde excidente stylis divergentibus brevissimis coronata. DC.—Linn. Sp. Pl. p. 577. Fl. Lapp. t. 2. f. 1. Engl. Bot. t. 2275. Sternb. Rev. *Saxifr.* p. 19. t. 12. f. 3. Don, *Saxifr.* in Linn. Trans. v. 13. p. 367. Seringe, in *De Cand. Prodr.* v. 4. p. 37.— β . *hyperborea*; caule lanato subbifloro. *S. hyperborea*. Br. in Parry's 1st Voy. App. p. cxlvii. Seringe, in *De Cand. Prodr.* v. 4. p. 37.

HAB. Labrador. Chataua in *Herb. Banks*. Arctic Sea-shore and Islands, abundant. Kotzebue's Sound. Messrs. Lay and Collie in Captain Beechey's Voyage. Elevated places in the Rocky Mountains. Drummond.

16. *S. nutans*; cespitosa, caule unifoliato, racemo, nutante paucifloro, foliis radicalibus reniformibus longe petiolatis grosse inciso-dentatis pilis rigidis brevibus adpresso onustis, pedicellis brevibus calyceque piloso-glandulosis, lobis calycis lanceolatis acutis trinerviis petalis obovatis triplinerviis, nervis flexuosis ramosissimis. DC.—Don, *Saxifr.* in Linn. Trans. v. 13. p. 368. Seringe, in *De Cand. Prodr.* v. 4. p. 37.

HAB. Unalashka. David Nelson, in *Herb. Banks*.

17. *S. ranunculifolia*; subglanduloso-pubescentis gracilis, foliis inferioribus longissime petiolatis reniformibus tripartitis segmentis lato-cuneatis inciso-lobatis, caulinis paucis, floribus corymbosis pentandris, petalis obovatis calyce acuto glanduloso duplo longioribus. (TAB. LXXXIII.)

Radiz ut videtur perennis, fibrosa. *Caudis* subpedalis, gracilis, erectus, flexuosa. *Folia inferiora* longissime petiolata, petiolis radicalibus ad basin bulbiferis, vix unciam longa, duas nucias fere late, circumscriptione remisoria, profunda tripartita, venosa, membranacea; segmentis late obovato-cuneatis, bi-trilobis, incisis; *Caulina* pauca, sensim minora, trifida, petiolo latissimo dilatato, *Suprema* minuta, oblonga, integririma, bracteiformia. *Panicula terminalis*, compacta, corymbosa. *Flores* albi, magnitudine *S. stellaris*. *Calyx* semi-superus, exstus glandulosus, segmentis ovatis acutis. *Petala* obovata, obtusissima, brevi-nugriculata, calycem duplo superantia, venosa. *Stamina* quinque. *Filamenta* longitudine pistilli, erecta. *Anthera* subglobosae. *Stylis* erecto-patentes.

HAB. Common on the high grounds around the Kettle Falls of the Columbia, and on the Rocky Mountains. *Douglas*.—*S. ranunculifolia* differs in so many points from all the known individuals of the genus, that we scarcely know which to mention as its nearest ally: perhaps the European *S. granulata*. The leaves are deeply tripartite, a very unusual character in the broad-leaved *Saxifrages*; and this, together with the mode in which the segments are divided, and the long petioles, give them the appearance of some species of *Ranunculus*; while the arrangement of the flowers reminds us of those of the genus *Spirea*.

TAB. LXXXIII. *Saxifraga ranunculifolia*. *Fig. 1*, Flower; *fig. 2*, More expanded do.; *fig. 3*, Flower from which the petals have been removed:—*magnified*.

18. *S. Jamesii*; pubescenti-glandulosa, foliis sublonge petiolatis reniformi-cordatis crenato-lobatis obscure venosis superioribus cuneatis subsessilibus, racemis subcompositis secundis, bracteis lanceolatis pedicellis calycibusque glandulosis, petalis spathulatis acutis segmenta calycinis acutiuscula vix superantibus. (TAB. LXXXIV.)—*Torrey, Pl. of Rocky Mountains in Ann. of Lyc. N. York, p. 204.*

Radix perennis, subfusiformis, descendens, rarer fibrosa. *Caulis* palmaris, erectus, foliosus, pubescens, pilis glandulosis parvis immixtis, inferne vestigia petiolorum vestitorum squamosus. *Folia* sublonge petiolata, reniformi-cordata, subcoriaceo-membranaceae, vix distincte venosa, crenato-lobata, dentibus acutis, utrinque sparsim piloso-glandulosa; *superiora* sensim minora; *suprema* ad basin racemi flabelliformia vel cuneata, subsessilia, profunde crenata. *Racemus* terminalis, tres uncia longus, subcompositus, floribus majusculis, secundis. *Bractæ* oblonge, obtuse, integerrime. *Pedicelli* breves calycesque purpurei dense glandulosi. *Calyx* campanulatus, tubo ovato inferne cum ovario adhaerente, lacinias ovatis acutiusculis erecto-patentibus intus etiam glandulosis. *Petala* spathulata, valde acuta, segmentis calycinis vix longiora, patentia, purpurascens, obscure venosa. *Stamina* decem: *filamenta* brevia. *Anthera* oblonge, pubescentes, vix filamentis longiores. *Pistillum* basi solitummodo calyci accretum. *Styli* erecto-patentes.

HAB. Dry rocky situations upon the more elevated of the Rocky Mountains. *Drummond*.—*S. Jamesii* is certainly amongst the most beautiful of its tribe, and appears to have been seen in a growing state by no other Botanists except Dr. James and Mr. Drummond; the former found it in more southern latitudes upon the same ridge of mountains, and it has been well characterised by Dr. Torrey in the work above quoted. Its affinity is unquestionably with *S. Richardsonii*: it has the same habit, nearly the same foliage, and similarly acute petals, but the whole plant is much smaller; its more copious glands are almost entirely confined to the racemes and calyces; the petals are smaller, more decidedly unguiculate, the stamens double in number, and the anthers are oblong.

TAB. LXXXIV. *Saxifrage Jamesii*. *Fig. 1*, Flower; *fig. 2*, The same, more expanded; *fig. 3*, Petal; *fig. 4*, Flower laid open, the petals only being removed; *fig. 5*, Flower with young fruit; *fig. 6*, Pistil:—*magnified*.

19. *S. Richardsonii*; caule glanduloso folioso superne pubescente, foliis longe petiolatis orbiculari-cordatis crenato-lobatis venosis margine venisque subtus glandulosis, glandulis pedicellatis, racenis compositis subspiciformibus, bracteis lanceolatis pedicellisque glandulosis, petalis obovato-ellipticis brevi-unguiculatis acutissimis nervosis segmenta calycinis acuminata subduplicata superantibus 5.—*S. Nelsoniana*. *Hook. et Arn. in Bot. of Beech. Voy. p. 124. t. 29.* (non *Pursh.*)

HAB. Arctic Sea-shore between the Mackenzie and Copper-Mine Rivers, (not Rocky Mountains, as stated by mistake in the "Botany of Beechey's Voyage.") *Dr. Richardson*. Kotzebue's Sound. *Messrs. Lay and Collie*.—This truly handsome plant, the finest of the genus with which we are acquainted, and meriting the name of "pulcherrima species," we are now satisfied is quite different from the *S. Nelsoniana* of Mr. Dou; which, however, we regret to say, we still know only from description. It is, indeed, in habit, in the presence of copious glands, and more especially in the extremely acute petals, unlike any of the species of the genus, except the preceding, *S. Jamesii*; and the two might form a distinct little group.

SECT. IV. MICRANTHES. *Tausch.*—*Seringe*, in *De Cand. Prodr.*

20. *S. nivalis*; foliis ovatis obovatis coriaceis crenatis in petiolum latum attenuatis, scapo nudo, floribus capitatis sessilibus, capitulis rarius ramosis, ovario seminifero, segmentis calycinis erectis obtusis, petalis persistentibus obovatis albis calyce vix dimidio longioribus.— α . floribus dense capitatis. *Linn. Sp. Pl.* p. 573. *Engl. Bot. t. 440.* *Pursh, Fl. Am. v. 1. p. 310.* *Br. in Parry's 2d Voy. App. p. cclxxv.* *Don, Saxifr. in Linn. Trans. v. 13. p. 387.* *Seringe, in De Cand. Prodr. v. 4. p. 38.*— β . capitulis laxis ramosis.

HAB. Arctic Sea-shore and Islands, abundant. Rocky Mountains. *Drummond.* Labrador and Canada. (*Pursh.*)—The American specimens of this plant, it must be acknowledged, are very variable, and in many instances so closely approach some of the varieties of the following species, that we find it difficult to distinguish them. The present is best recognised by its stiff and rigid habit, by the broad persistent petals, which, remaining amongst the deep purple capsules, form a singular contrast with them. Mr. Brown observes, that the *S. longiscapea* of Don, scarcely differs from the variety of *S. nivalis* with a simple few-flowered corymb, figured by Linnaeus in the Flora Lapponica, (t. 2. f. 5.)

21. γ . *S. vernalis*; foliis oblongis obovatis submembranaceis nervosis profunde crenato-dentatis in petiolum latum attenuatis, scapo nudo, floribus paniculato-corymbosis ovario fere omnino supero, segmentis calycinis erectis obtusis, petalis oblongo-obovatis calyce plusquam duplo longioribus.— α . floribus laxe paniculatis, scapo longiore.—*S. vernalis. Willd. Hort. Berol. t. 43. Bigel. Fl. Bost. p. 177.*—*S. Virginiana. Torrey, Fl. Un. St. v. 1. p. 44.*— β . floribus compactis subthyrsoides.— γ . gracilis, corymbo lato subpaucifloro.—*S. elongata. Sternb. Saxifr. p. 9. t. 4.*

HAB. α . and γ . Canada, and to the Mountains. *Lady Dalhousie. W. Sheppard, Esq. Dr. Richardson. Drummond.*— α . On the Columbia, and from Fort Vancouver to the Kettle Falls. *Douglas.*— β . Saskatchewan. *Dr. Richardson and Mr. Drummond.* Canada. *W. Sheppard, Esq. Mrs. Percival.*—Although Willdenow, in describing his *S. vernalis*, considered it to be identical with the *S. Virginiana* of Michaux, we are inclined to a different opinion: the arrangement of the flowers in the panicle being very different in the two: in the present they form an imperfect corymb or a thyrsus: in *S. Virginiana*, as is well described by Michaux, the branches of the panicle have sessile and alternate, and somewhat unilateral flowers. It is our variety β . which in its general aspect bears so considerable a resemblance to *S. nivalis*; but the leaves are of a less coriaceous texture; the flowers are, almost the whole of them, more or less distinctly pedicellate; the petals are longer and narrower, and a much smaller portion of the ovary is adherent with the tube of the calyx.

22. *S. Virginiana*; foliis ovatis coriaceo-membranaceis profunde crenato-dentatis in petiolum latum attenuatis, scapo nudo superne dichotome paniculato, ramis elongatis ascendentibus, floribus spicato-racemosis unilateralibus, ovario libero, segmentis calycinis erectis obtusis, petalis oblongis calyce plusquam duplo longioribus.—*Mich. Fl. Am. v. 1. p. 269. Pursh, Fl. Am. v. 1. p. 310. Elliott, Carol. v. 1. p. 311. Torrey, Fl. Un. St. v. 1. p. 444. Don, Saxifr. in Linn. Trans. v. 13. p. 386. Seringe, in De Cand. Prodr. v. 4. p. 39.*

HAB. Saskatchewan. *Dr. Richardson and Drummond.* Near Montreal. *Dr. Holmes.*—This we consider, from Michaux's description, to be his *S. Virginiana*, and there is something so remarkable in the arrangement of the flowers upon the panicle, resembling that of *Penthorium sedoides*, that we cannot at present but consider it to be distinct from *S. vernalis*. Future observations, however, may prove it to be a variety. It appears to have been found very sparingly during Captain Sir John Franklin's journey, and only upon the Saskatchewan. We have received it from the United States, in two or three instances and from Canada mixed with *S. vernalis*.

23. *S. reflexa*; cano-pubescent, foliis ovatis subcoriaceis opacis inciso-serratis in petiolum attenuatis, scapo nudo, panicula glaberrima compacta corymbosa, petalis obovatis bimaculatis calyce reflexo obtuso vix duplo longioribus, filamentis plurimis abortivis dilatatis petaloideis, ovario libero. (TAB. LXXXV.)

HAB. Shores of the Arctic Sea, between the Mackenzie and Coppermine Rivers. Dr. Richardson.—Together with the harsh and rigid foliage of *S. nivalis*, the present species has a panicle more resembling that of *S. vernalis*; but the petals have two orange spots, similar to those of *S. leucanthemifolia*, and the free calyx is at all times remarkably reflexed. The pubescence gives a whitish or hoary appearance to the whole plant, the panicle excepted; but much dependence cannot probably be placed upon this character, since we find it to be very variable in all the species of the present section.

TAB. LXXXV. *S. reflexa*. Fig. 1, Flower; fig. 2, The same, more fully expanded.

24. *S. integrifolia*; tota planta pubescenti-viscidissima, foliis radicalibus ovatis submembranaceis obtusissimis integerrimis vel laevissime sinuato-crenatis copiose reticulatim venosis, scapo elongato nudo ad apicem paniculato, panicula laxa lata vel contracta bracteata, petalis obovatis calyce patente glaberrimo demum subreflexo duplo longioribus, staminibus brevibus, ovario omnino libero, stylis divergentibus. (TAB. LXXXVI.)

HAB. Near the mouth of the Columbia, North-West coast of America. Dr. Scouler.—The present species appears to us very distinct from any other: it is clothed with a copious pubescence or tomentum, which Dr. Scouler observed, in a recent state, to be extremely viscid. The root is perennial, somewhat woody, throwing out numerous slender black wiry and branching fibres. The leaves are short in proportion to the height of the plant, about an inch long, suddenly tapering into a slender petiole of the same length. The scape is from eight to ten inches in height, quite leafless, rather stout and rigid. In one of our two specimens the panicle is contracted, oblong, with the flowers rather compact upon the primary peduncles: in the other the panicle is very lax, patent, and broad, the main peduncles or branches being two inches in length, slender, and filiform. The stamens are peculiarly short, not half the length of the nearly ripened capsules, which latter have the styles singularly patent, and even recurved. The stigmas are capitate.

TAB. LXXXVI. *S. integrifolia*. Fig. 1, Flower; fig. 2, The same, fully expanded; fig. 3, Petal; fig. 4, Pistil; fig. 5, Fruit:—magnified.

25. *S. hieraciifolia*; scapo stricto subpiloso, foliis petiolatis obovato-spathulatis repandodentatis ciliatis coriaceis, floribus spicatis subsessilibus calycis, lobis ovatis latis tubi longitudo, petalis ovatis rubellis marcescentibus, calycem vix æquantibus, filamentis purpureis, capsula prominente purpurea, carpellis apice divaricatis, stylis brevissimis, stigmatibus subhemisphaericis. DC.—Waldst. et Kit. Pl. Rar. Hung. v. 1. p. 17. t. 18. Sternb. Rev. Saxif. p. 9. et Suppl. p. 5. Don Saxifr. in Linn. Trans. v. 13. p. 383. Seringe, in De Cand. Prodr. v. 4. p. 39.—*S. plantaginifolia*. Hook. in Parry's 2d Voy. App. p. cccxciv.

HAB. Arctic Islands. Capt. Sir E. Parry. Shores of the Arctic Sea, between the Mackenzie and Coppermine Rivers. Dr. Richardson.—The figure in Waldstein and Kitaibel is a very excellent representation (though rather luxuriant) of our Arctic specimens. It is a species, indeed, which appears exactly intermediate between *S. Pennsylvanica* and *S. nivalis*, more, however, allied to the former.

26. *S. Pennsylvanica*; caule stricto striato, striis numerosis parvis, foliis in petiolum attenuatis obovato-spathulatis dentatis ciliatis obtusis flaccidis pilosis non punctato-rugosis, floribus paniculato-corymbosis, lobis calycis ovato-lanceolatis tubo multo longioribus, petalis

angustissimis flavidis calyce longioribus, stigmatibus globosis, ovariis depresso-subdiscoideis, capsulis latis brevibus, stylis minimis abrupte divergentibus. DC.—*Linn. Sp. Pl.* p. 571. *Mich. Fl. Am.* v. 1. p. 269. *Pursh, Fl. Am.* v. 1. p. 211. *Bigel. Fl. Bost. ed. 2.* p. 177. *Torrey, Fl. of Un. St.* v. 1. p. 444. *Don, Saxifr. in Linn. Trans.* v. 13. p. 384. *Seringe, in De Cand. Prodr.* v. 4. p. 39.—*Dill. Ethn.* t. 253, f. 328.

HAB. Canada. (*Linnæus*).—We have never seen specimens of this plant ourselves from British North America, and only give it as a native upon the authority of Linnæus.

27. *S. Dahirica*; glaberrima, foliis cuneato-flabelliformibus in petiolum decurrentibus superne profunde inciso-dentatis, scapis aphyllis laxo paniculatis bracteatis, bracteis linearibus integerrimis, petalis bipunctatis obovatis calyce reflexo subdupo longioribus, filamentis sepe petaloideis.—*Pall. Itin. ed. Gall.* p. 647. t. 32. et. 33. f. 1. *Don, Saxifr. in Linn. Trans.* v. 13. p. 388. *Sternb. Rev. Saxifr. Suppl.* t. 5. f. 2. *Seringe, in De Cand. Prodr.* v. 4. p. 38. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1. p. 124.

HAB. Behring's Straits. *Mr. Menzies*. Alpine rivulets of the Rocky Mountains, between latitudes 52° and 56°. *Drummond*. Kotzebue's Sound. *Lay and Collie in Capt. Beechey's Voyage*.—The broadly cuneate, or rather flabelliform outline of the foliage of *S. Dahirica* is very remarkable. Our specimen exactly correspond with Pallas' figure, and equally with that of Sternberg above quoted. We possess specimens from Chamiso which he gathered in the Bay of St. Lawrence.

SECT. V. ARABIDIA. Tausch.—*Seringe, in De Cand. Prodr.*

28. *S. leucanthemifolia*; pubescens-viscosa, foliis radicalibus oblongo-cuneatis inferne attenuatis grosse inciso-serratis, scapo nudo, panicula ampla laxa ramosa ramis divaricatis, pedicellis capillaris, petalis inaequalibus unguiculatis tribus majoribus bipunctatis.—*Mich. Am.* v. 1. p. 268. *Pursh, Fl. Am.* v. 1. p. 311. *Hook. in Bot. Mag.* t. 2959. *Don, Saxifr. in Linn. Trans.* v. 13. p. 358.—*S. Clusii. Seringe, in De Cand. Prodr.* v. 4. p. 40. *Gouan. Ill. p. 28.* (fide *Seringe*, excl. mult. syn.)—*S. ferruginea, Graham, in ed. Phil. Journ. July, 1828.* p. 318.— β , tota pubescens-tomentosa.

HAB. Behring's Straits. *A. Menzies, Esq.* Rocks on the "Height of Land," in the Rocky Mountains, and at the Portage, near the source of the Columbia. *Drummond.* β . Dundas Island, in Queen Charlotte's Sound; North-West coast of America. *Dr. Scouler*.—The specimens gathered by Mr. Drummond on the Rocky Mountains are in a very advanced and imperfect state; but seeds which he brought to Europe have flourished in the Botanic Gardens of Edinburgh and Glasgow, and from the former the specimens were derived which were figured in the Botanical Magazine.

29. *S. stellaris*; glabriuscula, caule firmulo vix striato, foliis obovato-cuneiformibus in petiolum brevem desinentibus crassiusculis dentatis, bracteis linearibus, floribus corymboso-paniculatis, pedunculis longis filiformibus rigidulis adscendentibus pilos longos raros gerentibus, petalis oblongis acutis, capsulis subvesiculosis nervosis, stylis brevissimis divergentibus, seminibus ovato-globosis fuscis. DC.—*Linn. Sp. Pl.* p. 572. *Pursh, Fl. Am.* v. 1. p. 310. *Engl. Bot.* t. 167. *Seringe, in De Cand. Prodr.* v. 4. p. 40.

HAB. Labrador. *Kohlmeister. Dr. Morrison*. Also in Canada, according to *Pursh*.—We consider it doubtful if the true *Saxifraga stellaris* has been found any where in North America, except at Labrador. From Canada we have never seen specimens, though stated to have been found there by Kohlmeister,

according to Mr. Pursh. In the Arctic Islands, the *S. foliosa* of Brown seems to occupy its place, and upon the Rocky Mountains, and on the North-West coast, the *S. leucanthemifolia*.

30. *S. foliolosa*; foliis radicalibus cuneatis subdентatis, (scapis divisis), ramis apice unifloris infra tectis foliolis nanis fasciculatis, calycibus inferis obovatis, petulorum laciniis cordato-lanceolatis. Br.—*Brown*, in *Parry's 1st Voy. App. p. cxlxxv.*—*S. stellaris*. γ . *Linn.*
Fl. Lapp. ed. Sm. p. 144. t. 2. f. 3.—*S. stellaris*. β . *curnosa*. *Willd. Sp. Pl. v. 2. p. 644.*
Seragine, in *De Cand. Prodri. v. 4. p. 49.*

HAN, Arctic Islands. *Capt. Sir E. Parry. Mr. Edwards. Capt. Sabine.*—How far this may be entitled to rank as a permanently distinct species, we are not able to say. In habit it has many points of agreement with *S. stellaris*, yet we have seen no specimens approaching so near to that plant as to render it by any means difficult to distinguish them. On the continent of North America it does not appear to have been found, but it has been detected as far north as Spitzbergen.

SECT. VI. HYDATICA. Tausch.—Seringe, in *De Cand. Prodri.*

31. *S. spicata*; subpubescens, foliis radicalibus longe petiolatis orbiculari-cordatis grosse acute serratis, petiolo superne dilatato, scapo nudo, racemo subcomposito elongato spiciformi, ovariis liberis, calycibus reflexis.—*Don, Saxifr. in Linn. Trans.* v. 13. p. 354. *Seringe, in De Cand. Prodr.* v. 4. p. 41.—*S. Geum, Pursh, Fl. Am. v. 1. p. 311. (non Linn.)*

HAB. Sledge Island, on the North-West coast of America. *David Nelson*, (*in Herb. Banks.*) Behring's Straits. *A. Menzies, Esq.*

32. *S. punctata*; foliis radicalibus longe petiolatis reniformi-cordatis rotundatis membranaceis pilosis reticulatis profunde grosse æqualiter dentatis immarginatis, dentibus integris discretis (plerumque) acutis, scapo nudo, floribus (parvis) paniculatis, panicula glandulosa bracteata, bracteis minutis linearibus, filamentis sepiissime abortivis petuloloideis, calyce reflexo.—*Linn. Sp. Pl.* p. 574. *Sternb. Saxifr. Suppl.* p. 7. t. 4. *Sm. in Ites' Cyl. Lebed. Fl. Alt.* v. 2. p. 118. *Hook. et Arn. Bot. de Beech.* Voy. p. 114.—*S. hirsuta*, *S. punctata*, *Seringe*, in *De Cand. Prodr.* v. 4. p. 42.—*S. gracilis*. *Sternb. Saxifr. Suppl.* p. 7. t. 5. f. 1.—*S. aestivalis*. *Fisch. in Herb. nostr.* *Gmel. Fl. Sib.* v. 4. p. 161. t. 65. f. 1.

HAB. Summits of the Rocky Mountains, between latitudes 52° and 56° . *Dranunculus*.—This exactly accords with our specimens from Capt. Beechey's Voyage, and those gathered by Chamisso in Kamtschatka, as well as others sent us by Dr. Fischer from the Altai Mountains.

33. *S. Nelsoniana*; subcaespitosa, scapo simplicissimo villis longis mollibus undique tecto, thyrsos ovato, foliis orbiculato-cordatis subpetiolatis inciso-serratis subtus hirsutis, petiolis longissimis filiformibus, sepalis triangulari-ovatis acutis, petulis ovalibus parvis albis. *DC.*—*Dou, Saxifr. in Linn. Trans. v. 13. p. 355.* (nor *Hook. et Arn.*) *Seringe in De Cand. Prodri.* v. 4. p. 41.

HAN. Cape Newnham, on the North-West coast of America. *David Nelson*, (*in Herb. Banks.*)—Upon comparing their specimens of *S. Nelsoniana*, described in the Botany of Capt. Beechey's Voyage, the authors now hesitate in considering it the same with the plant so named by Mr. Don; hence we have excluded that synonym, and their plant will be here found described under the name of *S. Richardsonii*.

34. *S. arguta*; scapo glabro, panicula simplicissima, foliis reniformi-rotundatis inciso-

serratis glabris, petiolis filiformibus, sepalis oblongis acutis, petalis ovatis multinerviis pistillis brevissimis. DC.—*Don, Saxifr. in Linn. Trans. v. 13. p. 356. Seringe, in De Cand. Prodr. v. 4. p. 40.*

HAB. North-West coast of America. *Mr. Menzies*.—“Panicula simplicissima. Flores albi magitudine *S. stellaris*. Petala ovalia unguiculata, multinervosa, punctata? Pistilla brevissima.”

35. *S. nudicaulis*; scapo erecto nudo tereti, foliis remiformibus palmatis glabris, lobis ovatis mucronatis, floribus paniculatis, lobis calycis triangulari-ovatis acutis, petalis obovatis calyce paulo longioribus. DC.—*Don, Saxifr. in Linn. Trans. v. 13. p. 37. Seringe, in De Cand. Prodr. v. 4. p. 37.*—*S. gracilis. Steph. in Sternb. Rev. Saxifr. Suppl. p. 7. t. 5. f. 1.*

HAB. North-West coast of America. *David Nelson*. Behring's Straits. *A. Menzies, Esq.*—Judging of this from the specimens we have received from Mr. Menzies, it appears to be very closely allied to small states of *S. punctata*, and almost exactly to resemble *S. gracilis* of Stephan, above quoted.

36. *S. heterantha*; subpubescens, foliis radicalibus longe petiolatis reniformi-cordutis membranaceis venosis multi-lobatis, lobis breviusculis subtridentatis, dentibus acutis muticis, scapo nudo, floribus paniculatis sepe abortivis, filamentis aliis clavatis aliis petaliformibus, ovario libero, calycibus reflexis, ramis non raro inferne bulbiferis. (TAB. LXXVIII. B.)

Radix perennis, fibrosa, tota planta pubescens. Folia omnia radicalia, longe petiolata, cordato-reniformia sinu profundo, membranacea, venosa, multi-lobata; lobis rotundatis, plerumque tridentatis, dentibus acutis. Petioli digitales et ultra, graciles, erecti, basi longe membranaceo-vaginati. Scapus solitarius, spithameus et ultra, nudus, superne paniculatus. Panicula oblonga, vel ovato-oblonga, laxa; rami nonnquam elongati, et tunc partem versus inferiorem bulbiferi, bulbis seu gemmis in rosulam dispositi, ovati, oblongi, sepissime ad apicem, ut videtur, lacerati. Calyx quinque-partitus, lacinias oblongis, obtusis, cito reflexis. Petala oblonga, obtusa, venosa calyce subdupo longiora. Flores plurimi, abortivi. Stamina numero incerta, nonnquam omnia imperfecta, filamentis filiformibus; nonnquam, ut videtur, perfecta, filamentis clavatis; quandoque filamenta petaloidea antheris nullis. Ovarium omnino liberum, subrotundum, stylis brevibus erecto-divergentibus.

HAB. Common on moist rocks of the River Columbia, from its source to its confluence with the sea. *Douglas*. Cape Disappointment. *Dr. Scouler*.—This has leaves considerably resembling those of *S. rotundifolia*, but they are furnished with a long membranous sheathing base, and altogether radical. The scape resembles that of *S. punctata*, but the panicle and flowers are widely different.

TAB. LXXVIII. B. *S. heterantha*. *Fig. 1*, Flower with abortive stamens, and the filaments filiform; *fig. 2*, Stamen from the same flower; *fig. 3*, Flower with abortive petaloid filaments; *fig. 4*, A petaloid filament; *fig. 5*, Flower with perfect stamens, having clavate filaments, and with petaloid abortive filaments; *fig. 6*, Stamen; *fig. 7*, Petaloid filament; *figs. 8 and 9*, Gemmae, or bulbs from the pannicle:—*magnified*.

SECT. VII. HIRCULUS. Tausch.—Seringe, in *De Cand. Prodr.*

37. *S. hirculus*; pedicellis pilosis, foliis lanceolatis nervosis non ciliatis, sepalis sapissime ciliatis, petalis obovatis nervosis, ovarii oblongis, stylis subnullis, stigmatibus spatulatis junioribus inflexis dein divaricatis. DC.—*Linn. Sp. Pl. p. 575. Engl. Bot. t. 1009. Sternb. Rev. Saxifr. p. 24. Don, Saxifr. in Linn. Trans. v. 13. p. 372. Brown, in Parry's 1st Voy. Suppl. p. cxlxxiii. Seringe, in De Cand. "*Radix* perpendicularis, fibras longas subsimplices demittens, elevans *caulem* unicum, simplicissimum, 2-4-uncialem, foliatum, pubescentem, pilis brevibus strictis purpureo-capitatis, sursum crebrioribus, basi denum glabratum. *Folia* iudivisa, *radicalia* et *caulina inferiora* confertissima, patentia, *superiora* sparsa: *radicaria* cuneato-obovata et subspathulata, acutiuscula, plana, basi angustata in petiolum brevem latiusculum, immerse nervosa, nervis lateribus dichotomis ramis interioribus in extimum margini folii approximatim desinenteribus, apicibus mox infra apicem folii confluentibus, ibique calle subovali in pagina superiore parum elevata aucta, marginibus longitudinaliter ciliatis, pilis subulatis strictis rigidulis brevibus albicantibus, capitulo glanduloso purpurascente denum deciduo apiculatis, terminali dilatato pariter apiculato; *caulina inferiora* conferta, radicalibus subsimilia figura, ciliis marginalibus et paginis glabris; *superiora* sparsa, paulo minora, oblonga, acutiuscula, basi vix attenuata, subsessilia, utraque pagina marginibusque pilis brevibus glanduloso-capitatis isisque calyx et caulis similibus. *Flagella* ex aliis foliorum radicalium et inferiorum caulis solitaria, filiformia, 3-5-uncias longa, angulata vel anguste marginata, arenato-deflexa, pilis glandulosis rarissimis conspersa, aphylla, apice sobolifera: *gemmula* parva, turbinata, e foliis nanis numerosis conniventibus, arte imbricatis, obvatis acutiusculis, immerse nervosis, glabris, marginibus ciliis nonnullis brevibus ornatis; et in ipsis basi radiculis 2-3 simplicibus singulis e vagina (colecariza) membranaceae, primo clausa dein lacerata erumpentibus." *Br.—Flores* terminales, erecti, plerumque solitarii in α , 1-5 in β , pedicellati, majusculi, auri, speciosi. *Pedicelli* laterales, seu exteriore, bracteati. *Calyx* dense glanduloso-pubescent, sepe purpureus, in α . 5-sepalus, omnino liberus, sepalis oblongis; in β , monophyllus campanulatus, tubo cum basi ovarii adhaerente, laciniis erectis ovatis obtusis. *Petala* elliptica seu obovata, obtusa, patentia, sessilia, nervosa, nervis subdichotome ramosis. *Stamina* 10, longitudine fere pistilli. *Filamenta* subnata, erecto-patentia, basibus approximatim fore connexis. *Antheræ* subcordata, bilobæ, flavæ, deciduae, loculis appositis, basi divaricatis. *Ovarium*, in α . liberum seu omnino superum; in β . basi cum calycis tubo adhaerente, late ovatum, subcompressum, utrinque sulcatum, stylis vel rostris 2 brevibus, erecto-patentibus terminatum. *Stigmata* crassa, obtusa. *Capsula* pistillo simillima sed major, calyce corollaque submarcescente filamentisque persistentibus tecta, bilocularis, intra rostra (vacua) dehiscent, ore membranaceo. *Semina* oblongo-ovata, numerosa, levia, fusca.

HAB. North-West coast of America. *David Nelson*. Behring's Straits. *Menzies*. Arctic Islands, gathered by all the Arctic Voyagers. Summits of the Rocky Mountains. *Drummond*. Kotzebue's Sound. *Messrs. Lay and Collie in Beechey's Voyage*.—It is observed in the Linnaean Transactions,* that this most remarkable plant was first discovered, according to Mr. Don, at Cape Newulum, on the North-West coast of America, by Mr. Nelson, during Captain Cook's third voyage; and his specimens still exist in the Banksian Collection. Mr. Don further observes, that Pursh, who named the plant *setigera* after those individuals, is wrong in stating the flower to be small and white, which is indeed quite at variance with the true character, for the blossoms are large and yellow. Dr. Adams found it upon the Caucasian Alps; and both in Baffin's Bay and in Melville Island this species is tolerably abundant; and so familiar was its appearance to the sailors of those expeditions, that they gave it the very appropriate name of *Spider Plant*. Upon the Rocky Mountains it has probably an extensive range, as Dr. James met with it in a latitude far south of the sources of the Columbia. We find a remarkable difference between our Arctic Seashore and Island specimens, and those from the Rocky Mountains of the interior; the former having almost universally a single-flowered stem, an ovary partly inferior and broad calycine segments; while the latter have several flowers on the stem, a free ovary, and narrow sepals or at least a deeply 5-partite calyx; and appearing to correspond in almost very particular with the European state of the plant, as far as can be judged by the figure of Sternberg; still we have only considered the two as varieties.

TAB. LXXXVII. A. A. S. flagellaris, α , and B. B. S. flagellaris, β , natural size. *Fig. 1*, Leaf; *figs. 2, 3*, Flowers of var. α ; *fig. 4*, Flower of var. β ; *fig. 5*, Fruit of var. α , surrounded by the floral covering;—natural size. *Fig. 6*, the same, the petals being removed; *fig. 7*, Transverse section of the capsule; *fig. 8*, Seeds:—more or less magnified.

39. *S. brounialis*; caule adscendentem tenui, ramulis brevibus evolutentibus, foliis subcoriaceis linearibus tenuissime ciliatis mucronatisque, floribus paniceolato-subcorymbosis vel solitariis, pedunculis longis debilibus, sepalis lanceolatis acutiusculis, petalis obovato-oblongis punctis munerosis croceis notatis calyce longioribus, stylis stigmatibusque per anthesin convergentibus. *DC*.—*Linn. 7. ERIOGYNIA.

Calyx turbinatus, quinquefidus. *Petala* quinque vix unguiculata. *Stamina* viginta, ad orem tubi inserta, basi monadelpha. *Antheræ* bilocularis, subrotundæ. *Pistilla* quatuor ad sex, a calyce et inter se libera, lana densissima connexa. *Styli* clongati, decidui, filiformes. *Carpella* tot quot pistilla, libera, oblonga, acuta, versus apicem recurva, intus longitudinaliter dehiscentia. *Septina* scobiformia ad marginem versus apicem valvarum inserta, pendentia. *Nucleus* oblongus. *Albumen* nullum.—Herbæ perennes Americæ borealis, locis frigidis provenientes, Habitù fere Saxifragearum hypnoidearum, stoloniferae. *Folia* rigidissima, coriacea, uninervia, glaberrima. *Flores* albi, racemosi, plerumque bracteati.

1. *E. pectinata*; (TAB. LXXXVIII.)—Saxifraga pectinata. Pursh, Fl. Am. v. 1. p. 312. Sering, in De Cand. Prodr. v. 4. p. 33.

Caulis steriles cespitosi, decumbentes, graciles, rigidi, elongati, stoloniferi; *Folia* rosulata, unciam fere longa, horizontaliter patentia, rigida, subcoriacea, e basi elongata anguste, linearis, trifida, glaberrima, uninervia, nervo tenui superne exarato, segmentis tri-quadrifidis, lacinias linearibus, acutissimis, erecto-patentibus: *Caulis* floriferis erectis, spathameis, foliosis, foliis supremis, ut in sterilibus, divisus. *Racemus* terminalis, elongatus, multiflorus, pubescens-hirsutus: *pedicellis* inferioribus foliosis, superioribus nudis. *Calyx* glaber, quinquefidus, segmentis acutis, tubo brevi obconico. *Stamina* 20 ad orem tubi inserta, basi monadelpha. *Filamenta* subulata, alba. *Antheræ* subglobose, didyme, bilocularis, loculis appositis, longitudinaliter dehiscentibus. *Pistilla* 4 ad 6 fundo calycis inserta, libera, lana copiosa, alba, demum decidua, columnade connexa. *Germen* oblongum. *Stylus* germinis longitudine. *Stigma* obtusum. *Carpella* 4 ad 6, erecta, coriacea, nitida, fusca, oblongo-teretia, apice recurva, acuta, intus longitudinaliter dehiscentia, bivalvia. *Septina* scobiformia, linearis-oblonga, flexuosa, pendula, ad margines valvarum apicem versus inserta. *Nucleus* oblongus, lateraliiter afixus, in arillo pendens, alba. *Testa* tennis, alba. *Albumen* nullum. *Embryo* cylindraceus. *Cotyledones* linearis-oblongi; *radicula* ad hilum seminis versa.

HAB. Behring's Straits. Mr. Menzies. "Height of Land" upon the Rocky Mountains, on the West sides, near the sources of the Columbia. Drummond.—That the present highly curious and interesting plant is the *Saxifraga pectinata* of Pursh, we have no reason to doubt, since it not only agrees sufficiently well with his description, but our specimens from Mr. Menzies are from the same station. A slight examination of the flower and fruit, however, will satisfy any one that notwithstanding the habit and foliage bear a considerable resemblance to an extensive group of true Saxifrages, it can nevertheless not possibly rank with that genus. Even the foliage has some remarkable peculiarities: the texture is extremely rigid, opaque and coriaceous, but not thick, plane on both sides, except that the slender nerve, which is pellucid when the leaf is held up between the eye and the light, is slightly channelled on the upper side; nor does the nerve pass through the centre of the segments at their bases, but traverses them in an oblique direction from sinus to

sinus, in a manner that will be better understood by a reference to the magnified figure, than by a description. In regard to fructification, this plant will hold a middle rank between *Saxifraga* and the following genus, *Leptarrhena*; differing from the former in its free ovaries (connected only by an external woolly substance) and in the arillated seeds,—from the latter, in the two-celled anthers, the deciduous styles, the pendant seeds; and from both, in the number of stamens and carpels. It is from the copious woolly substance, connecting the carpels, that we derive the generic name.

TAB. LXXXVIII. E. pectinata. *Fig. 1*, A flower and bractea; *fig. 2*, Flower fully expanded; *fig. 3*, Ovaries; *fig. 4*, Ovary laid open to show the insertion of the ovules; *fig. 5*, Cluster of carpels; *fig. 6*, Single carpel; *fig. 7*, Seed with its arillus; *fig. 8*, Seed or nucleus taken from the arillus; *fig. 9*, Section of do. showing the embryo; *fig. 10*, Leaf:—all more or less magnified.

8. LEPTARRHENA. Br.

Calyx campanulatus brevis quinquefidus, tubo lato. *Stamina* decem ad orem tubi inserta. *Antheræ* uniloculares bivalves. *Petala* quinque linearis. *Pistilla* duo, libera, in stylum brevem persistentem attenuata. *Stigma* obtusum. *Carpella* duo, intus longitudinaliter delhiscentia. *Senuna* scobiformis ad marginem versus basin valvarum inserta, erecta.—Herbie habitu sere Pyrole locis frigidis America borealis. *Scapus* nudus. Flores racemoso-paniculati. Folia coriacea perennantes integra grosse serrata, petiolis latis vaginantibus.

1. *L. pyrolifolia*; (TAB. LXXXIX.) Br. in Parry's 1st Voy. Suppl. p. cclxxiii. Seringe, in De Cand. Prod. v. 4. p. 48.—L. amplexifolia. Seringe, in De Cand. Prod. v. 4. p. 48.—Saxifraga pyrolifolia. Radix perennis, subsuffrutescens, elongatus, fibrosus. *Caulis* brevis, ascendens, simplex vel ad basin ramosus, duas ad tres uncias longus foliosus, petiolis membranaceis latis omnino tectus. *Folia* elliptica, obtusa, coriacea, plana, duplucato-serrata, nervosa, nervis obliquis, supra nitida viridia, subtus pallida. *Petoli* subunciam longi, insigniter dilatati, canaliculati, subciliati, membranacei, vaginati. *Scapus* spithameus ad pedalem et ultra, erectus, rigidus, foliis parvis vel squamis duabus oblongis serratis instructus, pubescens superne praecipue. *Racemus* compositus, subcorymboso-paniculatus. *Flores* parvi, inconspicui. *Calyx* profunde quinquefidus, pubescens: *Tubus* brevis, segmentis oblongis, obtusus, erecto-patentius. *Petala* linearis, obtusa, vix calycem superantia. *Stamina* decem longitudine petalarum, quinque petalis et quinque segmentis calycinis opposita, distincta. *Filamenta* subulata. *Antheræ* subgloboso-tetragone, dorso affixa, uniloculares, bivalves. *Pistilla* 2, distincta, libera. *Germen* ovatum, uniloculare, pluri-ovulatum, ovulis linearis-elongatis, erectis, prope basin ad marginem valvarum insertis. *Stylus* attenuatus, subdivergentes. *Stigma* obtusa. *Carpella* 2, oblongo-ovata, stylis attenuatis terminata, intus longitudinaliter delhiscentia. *Senuna* non vidimus, sed, (fide ill. Brown,) scobiformis, testa utrinque ultra nucleus ovalem elongata, subulata.

HAN. Unalaschka. (David Nelson in Herb. Banks.) *Chamiso*. Behring's Strait. Menzies in Herb. nostr. "Height of Land" on the West side of the Rocky Mountains, in lat. 52°. Drummond.—The accurate Mr. Brown distinguished this plant as a genus, in his valuable paper on the plants of Melville Island above quoted; and its habit as well as fructification, amply justify him in so doing. We regret that we have not seen perfect seeds. Our specimens from Chamiso and Mr. Menzies are in flower, and the only fertile one from Mr. Drummond, though in fruit, has shed its seeds.

HAB. Throughout Canada, and as far as the Saskatchewan. Drummond. Newfoundland. *De la Pylaie*. Undulating gravelly soils, near Fort Vancouver. Douglas.—The accurate Dr. Torrey has, in my opinion,

VOL. I.

correctly united the *S. Canadensis* of Linnaeus, with *S. Marylandica*. I do not see the necessity even of making a variety of it; and the Linnean character is equally applicable to the one as to the other plant.

2. *S. Menziesii*; caulescens, foliis longe petiolatis cordatis profunde trifidis, segmentis lato-ovatis cuneatis varie lobatis inciso-serratis serraturis acutissimis mucronato-ciliatis, umbellis subcompositis, involucelli foliolis lanceolatis acutis umbellum requantibus. (TAB. XC.)—*Hook. et Arn. in Bot. of Beech. Voy. p. 142.*

Radix subfusiformis. *Tota planta* glaberrima. *Caulis* erectus, spithameus ad sesquipedalem et ultra, erectus, striatus, superne subpaniculatum ramosus. *Folia radicata* et *caulina inferiora* longe petiolata, circumscriptione cordata, profunde trifida, fere tripartita segmentis late ovatis, obtusa cuneatis, varie lobatis, inciso-serratis, serraturis ciliato-mucronatis; *caulina suprema* subsessilis, segmentis lanceolatis, incisis. *Umbella* subcomposite, basi plerumque foliatae. *Umbellula* globosæ, involucellatae, involucelli foliolis lanceolatis acutis umbellulum subæquantibus. *Flores* masculi brevissime pedicellati; *famini* sessiles. *Fructus* aculeatus, ut in genero.

HAB. North-West coast of America. A. Menzies, Esq. On the banks of the Columbia, in dry sandy soils. Dr. Scouler, Douglas.—This is a very distinct species from the *S. Marylandica*, but very nearly allied to the *S. Liberta* of Chamisso in Linnaea, v. 1, p. 253, a native of Chili. If it should prove to be the same, it has then a very extensive geographical range; for that author states it to be the "*S. Marylandica*, of Willdenow's Herbarium, an Humboldtian plant, found at Caripe." The Naturalists of Captain Beechey's Voyage, gathered our plant in California.

TAB. XC. *S. Menziesii*. Fig. 1, Flower; fig. 2, Fruit:—magnified.

3. *S. arctopoides*; subacaulis, foliis longe petiolatis profunde 3-partitis, lacinias elongato-cuneatis lateralibus bifidis intermedio trifido omnibus subciliato-pinnatifidis, pedunculo foliis vix longiore, involuci foliolis foliaceis lanceolatis integerriminis umbella compacta simplici longioribus. (TAB. XCI.)—*Hook. et Arn. in Bot. of Beech. Voy. p. 141.*

HAB. North-West coast of America. A. Menzies, Esq.—This plant has very much the appearance of the genus *Arctopus*, the leaves and segments of the leaves being curiously pinnatifid at the margin, with crowded, acuminate, unequal teeth. The umbel is nearly simple, and scarcely rises above the foliage. The root is fusiform.

TAB. XCI. *S. arctopoides*. Fig. 1, Flower; fig. 2, Abortive pistil:—magnified.

4. *S. bipinnatifida*; caulescens, foliis bipinnatifidis inferioribus longe petiolatis segmentis remotis obovatis seu obovato-lanceolatis acutis inciso-serratis serraturis acutissimis, rachide acutissime dentata, pedunculis elongatis, umbellis compositis subproliferis, umbellulis globosis. (TAB. XCII.)—*Douglas, MSS.*

Radix fusiformis. *Caulis* erectus, gracilis, ramosus, glaber, ut et tota planta, subpedalis. *Folia bipinnatifida*, *inferiora* et *radicata* longe petiolata, petiolo basi dilatato vaginato; segmentis (primaris præcipue) remotis, obovatis, obovato-lanceolatis, varie lobatis inciso-serratisque, serraturis acutissimis. *Rachis* linearis, profunde dentata, dentibus horizontalibus acutissimis. *Folia superiora* sessilia, segmentis omnibus angustis, acuminate. *Pedunculi* elongati. *Umbella* subcomposite, involucro laciniato, lacinias inæquilibus acuminate; radiis gracilibus non raro proliferis. *Umbellula* globosæ, densifloræ. *Flores* famini ut videtur, sessiles.

HAB. Fort Vancouver, on the Columbia. Douglas. Dr. Scouler.

TAB. XCII. *S. bipinnatifida*. Fig. 1, Male flower; fig. 2, Female flower:—magnified.

3. ERYNGIUM. Linn.

Calyx tubus squamulis vesiculisque asper, lobi 5 foliolosi. Petala erecta conniventia oblongo-obovata emarginato-infracta in lacinulam longitudine petali. Fructus seet. trans. subteres obovatus squamatus tuberculosusve, mericarpis ejugatis evittatis semiteretibus, carpophoro per totam longitudinem seminibus adnato.—Herbeæ sapienter perennes et spinoscentes. Folia radicalia et caulinæ busi petiolis plus minus vaginantia. Flores aggregati in capitula subrotundata aut oblonga. Bracteæ inferiores sapienter maiores involucrum conficientes, ceteræ sen paleæ inter flores mixæ. DC.

1. *E. petiolatum*; caule superne diehotomio, foliis parallelium nervosis lanceolatis in petiolum longum attenuatis remote ciliato-spinosis supremis angustis sessilibus, involucri folioli paleisque subulatis ciliato-spinosis rigidis capitulo globoso duplo longioribus.

HAB. Moist soils on the plains of the Multnomah River. Douglas.—Of this I possess but one, and that an imperfect specimen; but sufficient to show that the species is very different from any with which I am acquainted, and from any which I find described in books. The petioles are very long, 4-6 inches in length, linear, dilated into a sheath at the base, slender, above gradually passing into a lanceolate blade with parallel nerves. The heads are quite spinous with the long rigid involucres and paleæ, which much exceed the flowers in length. The calyx is large, with leafy sepals. The germen covered with white, ovate, acute, somewhat inbricated minute vesicles.

* * *Umbellis compositis seu perfectis; Vittis in fructu variis, rarissime nullis.*

HAB. On the low moist soils of the Columbia. *Douglas.*—This is the same plant with that described in the Botany of Capt. Beechey's Voyage. Mr. Douglas remarks that the "stems are from two to three feet high," from which expression it may probably be inferred that it is not a procumbent plant.

7. AMMI. Linn.

Calycis margo obsoletus. *Petala* obovata cum lacinula inflexa, emarginato-biloba, lobis inaequalibus irregulari, exteriora umbellae sepius majora. *Fructus* a latere compressus ovato-oblongus. *Mericarpia* jugis 5 filiformibus aequalibus, lateralibus marginantibus, valleculis 1-vittatis. *Carpophorum* liberum bipartitum. *Semen* tereti-convexum, antice planiusculum.—*Herbe habitu* Dauci, *radice fusiformi*, *foliis pinnatisectis aut multipartitis*. *Umbellæ compositæ multiradiatae.* *Involucra polyphylla*, universale *foliolis trifidis pinnatifidis constans.* *Flores albi.* DC.

1. *A. majus*; caule glabro, foliis pinnatisectis, omnium lobis margine cartilagineo argute serrulatis, inferiorum lanceolatis, superiorum multifidis linearibus. DC.—Linn. Sp. Pl. p. 319. Sibth. Fl. Græca. t. 273. De Cand. Prodr. v. 4. p. 112.

HAB. Newfoundland. *De la Pylaie*, (in *De Cand. Prodr.*)

8. CARUM. Koch.

Calycis margo obsoletus. *Petala* regularia obovata emarginata cum lacinula inflexa. *Stylopodium* depressum. *Styli* deflexi. *Fructus* a latere contractus ovatus aut oblongus. *Mericarpia* jugis 5 filiformibus aequalibus, lateralibus marginantibus. *Commissura* plana bivittata. *Valleculæ* 1-vittatae. *Carpophorum* liberum apice furcatum. *Semea* tereti-convexum antice planiusculum.—*Herbe glabra et sepius pereunes.* *Radix tuberosa edulis.* *Folia pinnatisecta, segmentis multifidis.* *Involucrum utrumque varium.* *Flores albi.* DC.

1. *C. Carei*; radice fusiformi, foliis bipinnatisectis, segmentis infinitimis ramorum decussatis omnibus multifidis, involucro utroque nullo. Linn. Sp. Pl. p. 378. Engl. Bot. t. 1503. De Cand. Prodr. v. 4. p. 115.—*β.* foliorum segmentis lineari-elongatis.

HAB. *β.* Canada. *Mrs. Percival.*—This is probably introduced; but the foliage is considerably different from that of the European plant, the segments being remarkably long and slender.

9. CRYPTOTÆNIA. DC.

Calycis margo obsoletus. *Petala* obovata subintegra in lacinulam inflexum angustata. *Fructus* a latere contractus linear-oblongus stylopodio brevi et stylis rectis coronatus. *Mericarpia* jugis 5 aequalibus filiformibus obtusis, 2 lateralibus ante marginem positis. *Vittæ* plurimæ pericarpio subcorticoso, sed arce adnato, tectæ et carpello transversim scisso tantum visibles. *Semen* tereti-convexum ante planiusculum. *Carpophorum* liberum apice bifidum.—*Herbe pereunes glabrae erctæ.* *Radix non bulbosa.* *Folia trisecta segmentis ovatis grosse dentatis, dentibus mucronatis.* *Umbelle numerose in paniculam fire dispositæ.* *Radii umbellæ et umbellulae pauci, valde inaequales.* *Involucrum nullum.* *Involucella oligophylla.* *Flores albi.* DC.

1. *C. Canadensis*; umbellis infimis ex foliorum superiorum axillis ortis, fructibus oblongis. *De Cand. Prodr.* v. 4, p. 118.—*Sison Canadense*. *Linn. Sp. Pl.* p. 363. *Mich. Am.* v. 1, p. 168. *Bigel. Fl. Bost.* ed. 2, p. 114. *Sium Canad.* *Lam.*—*Chærophyllo* *Canad.* *Pers.*—*Myrrhis Canad.* *Moris.*—*Torrey, Fl. of Un. St.* v. 1, p. 310.—*Conopodium Canad.* *Koch.*

HAB. Canada. Lake Huron and Quebec. *Dr. Todd. Mrs. Percival.*—It is chiefly confined to the more southern parts of Canada in British North America.*

10. SIUM. Koch.

Calycis margo 5-dentatus subinde obsolete. *Petala* obovata emarginata cum lacinula infixa. *Stylopodium* pulvinatum margine depresso. *Styli* divergenti-reflexi apice capitati. *Fructus* a latere compressus vel contractus et subdidymus, stylopodio stylisque coronatus; *mericarpia* jngis equalibus filiformibus obtusiusculis, valleculis et commissura multivittatis. *Carpophorum* bipartitum, cruribus mericarpio adnatis, stylopodio pulvinato margine depresso. *Semen* subteres.—*Herbae plerumque aquatice*. *Folia pinnati-secta segmentis ovatis oblongis dentatis aut multipartitis*. *Umbellae terminales multipartite*; involucro *polyphylllo*, rarius *submonophyllo*. *Umbellulae multifloræ*, involucello *polyphylllo*. *Flores albi*. DC.

1. *S. latifolium*; radice repente, caule sulcato-angulato, foliis pinnatisectis segmentis lanceolatis acuminatis basi inaequilibus serratis rarius pinnatifidis, involucro polyphylllo, dentibus calycis elongatis. DC.—*Linn. Sp. Pl.* p. 361. *Engl. Bot.* t. 204. *Bigel. Fl. Bost.* ed. 2, p. 111. *Torrey, Fl. of Un. St.* v. 1, p. 311. *De Cand. Prodr.* v. 4, p. 124.— β . foliolis profundi inciso-serratis.

HAB. Watery places, Saskatchewan. *Drummond.* β . Straits of De Fuca, North-West coast of America. *Dr. Scouler.*—I find it scarcely possible to distinguish some narrow-leaved states, of what I consider to be this plant, from the following; and I am here again much disposed to concur with Dr. Torrey in thinking they may be only varieties of each other. The present seems to me identical with the European *S. latifolium*.

2. *S. lineare*; caule angulato sulcato, foliis pinnatisectis segmentis 4–5-jngis linear-lanceolatis acute et tenuiter hinc inde serratis, involucro oligophyllo lineari. DC.—*Mich. Am.* v. 1, p. 167. *Pursh, Fl. Am.* v. 1, p. 191. *Torrey, Fl. of Un. St.* v. 1, p. 312. *De Cand. Prodr.* v. 4, p. 125.

HAB. Watery places, Lake Huron. *Dr. Todd.* Canada, to the mountains and the Saskatchewan. *Drummond.* Moist and overflowed grounds of the Columbia. *Dr. Scouler. Douglas.*—The young submerged leaves of this plant are deeply multifid or tripinnate, with very narrow linear-subulate segments.

* This appears, like many other Canadian plants, to be not unfrequent about Boston, U. S.—The nature of this work only admits of my mentioning, under the respective species of plants, the names of those persons who have favoured me with them from the British Possessions. But I am unwilling to wait till the introductory pages of this work go to press without expressing my acknowledgments to my valued friends, Dr. Boott of London, and B. D. Greene, Esq., of Boston, U. S. A., for the valuable assistance rendered me in the numerous and beautifully preserved plants they have sent me from the New England States, which, as may be expected from the vicinity of the two countries, are intimately connected with those of Upper Canada: whilst those from the White Mountains, sent me by the same gentlemen, are almost identical with many from the Rocky Mountains, and from the Arctic regions.

3. S. ? *Douglasii*; caule tereti, foliis pinnatisectis segmentis infimis trisectis cæterisque petiolulatis ovato-oblongis grosse serratis, umbellis oppositifoliis et terminalibus pedunculatis exinvolucratis multiradiatis. *De Cand. Prodr. v. 4. p. 125.*

HAB. North-West America. *Douglas*.—This plant is characterised by Professor De Candolle from a specimen gathered in the Garden of the Horticultural Society of London; and the lower leaves are said to be a foot and a half long. May it not be a luxuriant plant of *Cicuta maculata*?

11. BUPLEURUM. Linn.

Calycis margo obsoletus. *Petala* subrotunda integra arcte involuta lacinula lata retusa. *Fructus* n. latere compressus vel subolidimus, stylopodio depresso coronatus. *Mericarpia* jugis 5 alatis acutis filiformibus aut obsoletis, lateralibus marginalibus, valleculis vittatis aut evittatis levibus granulatissimis. *Semen* tereticonvexum antice planiusculum.—*Herbae* aut frutices glaberrimi. *Folia rarius secta* saepius limbo abortivo et petiolo dilatato mutata in phyllodium integerrima. *Umbellæ compositæ*. *Involucra varia*. *Flores* flavi. DC.

1. *B. ranunculoides*; foliis radicalibus lineari-lanceolatis, caulinis amplexicaulibus cordato-oblongis striatis, involuco sub-3-phyllo inaequali, involucelli foliolis 5 ovatis mucronatis nervosis distinctis. DC.—Linn. Sp. Pl. p. 342. *De Cand. Prodr. v. 4. p. 131.* —*B. angulosum*. Sprng. in Schultes, Syst. Veget. v. 6. p. 366. Hook. et Aru. in Bot. of Beech. Voy. v. 1. p. 124. Cham. et Schlecht. in Linnaea, v. 1. p. 283.

HAB. Cape Mulgrave, in Behring's Straits. Messrs. Lay and Collie, in Captain Beechey's Voyage.

Trib. IV. SESELINÆ. *Fructus sectione transversali teres aut teretiusculus aut mericarpis* dorso subcompressis.

12. SESELI. Linn.

Calycis margo 5-dentatus, dentibus brevibus crassiusculis interdum subobliteratis. *Petala* obovata, in lacinulum inflexum coarctata, emarginata, vel subintegra. *Fructus* ovalis vel oblongus, sectione transversali subteretes, stylis reflexis coronatus. *Mericarpia* jugis 5 prominulis filiformibus vel elevatis crassis corticosis, lateralibus marginantibus et saepe paulo latioribus. *Valleculæ* 1-vittatae, exteriores rarius 2-vittatae. *Commissura* bivittata, rarius 4-vittata. *Semen* subsemiteres.—*Herbae* saepius glaucae, biennes aut perennies. *Folia* pinnatisecta aut teruato-decomposita. *Involucrum* subnullum; *invollucella* polyphylla. *Flores* albi, rurissime flavi. DC.

1. *S. leiocarpum*; foliis longe vaginantibus triternatis seu triternato-pinnatis, foliolis petiolulatis oblongis integerrimis integris trifidis glaucis, caule nudiusculo, umbellula composita radiis universalibus valde inaequalibus, umbellis capitatis, floribus dioicis seu polygamis? fructu (immature) kevissimo oblongo-cylindraceo, involucris involucellisque nullis. (TAN. XCIII.)

Radicis? *Caudis* spithameus, simplex, basi solummodo foliosus. *Folia* longe vaginaria, ad vaginam usque ternata, pinnae seu foliolis primaris divergentibus, longe petiolatis, ternatis seu quinato-pinnatis; pinnae sesquialibus, oblongis, integris seu bi-trifidis, integerrimis, glaucis, sub lente reticulatum venosis. *Umbella* solitaria (an semper?) composita; radis valde inaequalibus; aliis vix unciam longis, aliis 3-4 pollicibus. *Involucra* involucellaque nulla. *Umbellulae* multiflora, capitato-globosæ, flavescentes. *Flores* dioici seu polygamici. *Fructus* (immature) oblongo-subcylindraceus, levissimus, ad commissuras carinatus. *Styli* reflexi.

HAB. On gravelly soils, near Fort Vancouver on the Columbia, North-West America. *Douglas. Dr. Scouler.*—The young fruit is drawn from a recent plant which flowered in the Garden of the Horticultural Society. The flowers of the native specimen appear to be all abortive.

TAB. XCIII. *S. leiocarpum.* *Fig. 1*, Male flower; *fig. 2*, Abortive pistil of the same; *fig. 3*, Umbellule of immature fruits; *fig. 4*, Fruit (immature); *fig. 5*, Section of do.:—magnified.

2. *S. triternatum*; foliis longe vaginantibus ternatis foliolis integris seu bi-triternatis elongatis linear-lanceolatis linearibus integerrimis petiolulatis, caule inferne præcipue folioso, umbella composita, radiis universalibus subæqualibus, umbellis capitatis, floribus dioicis seu polygamis? fructu (immature) oblongo subcylindraceo, mericarpiis jugis 5 elevatis acutis notatis, involucris involuculisque nullis. (TAB. XCIV.) *Pursh. Fl. Am. v. 1. p. 197.* *De Cand. Prodr. v. 4. p. 146.*

HAB. Columbia River. *M. Lewis.* Common on the dry gravelly soil, near Fort Vancouver. *Douglas. Dr. Scouler.*—Cultivated in the Garden of the Horticultural Society, in 1828, from seeds sent home by Mr. Douglas.—This has much of the habit of the last species; but the leaves and young fruit are very different. The root is fusiform. The petals involute, entire. Styles divaricated. Calyx-teeth obsolete. Fruit with five sharply keeled primary ridges.

TAB. XCIV. *S. triternatum.* *Fig. 1*, Portion of a leaf; *fig. 2*, Flower; *fig. 3*, Immature fruit; *fig. 4*, Section of do.:—more or less magnified.

3. *S. divaricatum*; caule dichotomo folioso, foliis petiolatis breve-vaginantibus bi-tri-pinnatifidis lacinii linear-oblongis acutis brevibus, pedunculis lateralibus terminalibusque, umbellarum radiis æqualibus, involucellis linear-subulatis, fructu subrotundo-ovato dentibus calycinis coronato, mericarpiis asperis costis 5 elevatis multivittatis.—*Pursh. Fl. Am. v. 2. p. 732.* *Sims, Bot. Mag. p. 1742.* *Nutt. Gen. Am. v. 1. p. 194.* *De Cand. Prodr. v. 4. p. 146.*

HAB. About Carlton House upon the Saskatchewan. *Drummond. Douglas.*—The root is large, tuberous, subfusiform. Stems about a span high. Flowers yellow. Fruit slightly laterally compressed, ovate, rough, with small elevated points; each achene or mericarpium is crowned with five conspicuous broadly subulate teeth, the surface marked with five prominent elevated lines, two of which are marginal. The styles are deciduous. The carpophorum has two short branches. The vittæ are numerous, and appear to anastomose very frequently, and they abound in a powerfully aromatic oil.

13. *CNIDIUM.* *Cusson.*

Calycis margo obsoleteus. *Petala* obovata emarginata cum lacinula inflexa. *Fructus* sectione transversali subteres. *Mericarpia* jugis 5 æquilibus alatis, ala submembranaceæ, lateralibus marginantibus. *Valleculæ* 1-vittatae. *Commissura* bivittata. *Semen* semiteres. *Albumen* hinc applatum.—Herbe perennes rarius suffruticæ. *Folia* pinnati-ant ternatisecta, segmentis multifidis, lobis linearibus. *Involucrum* varium, involucella *polyphylla*. *Flores* albi aut rosei. *Proxime* accedit ad Seseli, scilicet jugis fructus membranaceo-alatis et calycis margine obsoleti differt. DC.

1. *C. Canadense*; caule angulato flexuoso, foliis bipinnatisectis lucidis segmentis multipartitis, lacinii lanceolatis, involucro utroque oligophylio. DC.—*Sprng. in Schultes Syst. Veget. v. 6. p. 415.* *De Cand. Prodr. v. 4. p. 153.* *Torrey, Fl. of Un. St. v. 1. p. 306.*—

Selimum Canadense. *Mich. Am.* v. 1. p. 155. *Pursh, Fl. Am.* v. 1. p. 192. *Nutt. Gen. Am.* v. 1. p. 180.—*Apium bipinnatum*. *Walt. Carol.* p. 115. (fide *Pursh.*) *DC.*

HAB. Mouth of the St. Lawrence, Canada. *Michaux*.—Of this plant, I regret to say, I know nothing. *Pursh* speaks of it as having white flowers, and as inhabiting the mouths of large rivers from Canada to Carolina.

14. THASPIUM. *Nutt.*

Calycis margo 5-dentatus. *Petala* elliptica in acumen longum inflexum attenuata. *Fructus* a latere non contractus subellipticus. *Mericarpia* convexa jugis 5 alatis, alis subæqualibus, valleculæ striatis 1-vittatis. *Commissura* 2-vittata. *Semen* teres.—Herbe perennes Boreali-Americanæ. *Involucrum* nullum. *Involucellum* 5-phyllum 1-laterale.—*Genus a Smyrnio et Zizia distinctissimum*, Cnilio evidentur ex fructu affine, sed distinctum calyce 5-dentato, petalis non emarginatis, involucellis triphyllis et habitu. *DC.*

1. *T. actæifolium*; foliis biternati-sectis, segmentis ovalibus æquilateriter dentatis, umbellis subverticillatis, lateralibus sterilibus. *DC.*—*Nutt. Gen. Am.* v. 1. p. 197. *De Cand. Prodr.* v. 4. p. 154.—*Ligusticum actæifolium*. *Mich. Am.* v. 1. p. 166. *Pursh, Fl. Am.* v. 1. p. 193.

HAB. Near Tadoussach, on the banks of the St. Lawrence, Canada. *Michaux*.

15. LIGUSTICUM. *Koch.*

Calycis margo 5-dentatus vel obsoletus. *Petala* obovata acuta emarginata cum lacinula inflexa, brevissime unguiculata. *Fructus* sectione transversali subteres vel a latere parum compressus. *Mericarpia* jugis 5 argutis subhalatis æqualibus, lateralibus marginantibus. *Valleculæ* et commissura multivittatae. *Semen* subsemiteres.—Herbae pleræque perennes. *Foliæ decomposita aut ternatisecta*. *Involucrum* varium; *involucella* polyphylla. Flores albi. *DC.*

1. *L. Scoticum*; caule simpliciuscule striato, foliis biternatis opacis, segmentis subrhomboidatis dentato-serratis, involucris linear-lanceolatis 5-7-phyllis. *DC.*—*Lin. Sp. Pl.* p. 359. *Engl. Bot. t. 1207. Mich. Am.* v. 1. p. 157. *Pursh, Fl. Am.* v. 1. p. 193. *Torrey, Fl. of Un. St.* v. 1. p. 313. *Cham. et Schlecht. in Linnaea*, v. 1. p. 390. *De Cand. Prodr.* v. 4. p. 157. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1. p. 115. et p. 125.

HAB. Shores of the St. Lawrence. *Michaux*. *Mrs. Sheppard*. Labrador. *Dr. Morrison*. Newfoundland. *Miss Breton*. Mouth of the Columbia. *Douglas*. Observatory Inlet. *Dr. Scouter*. Behring's Straits. *Chamiso*. *Messrs. Lay and Collie in Capt. Beechey's Voyage*.

16. CONIOSELINUM. *Fisch.*

Calycis margo obsoletus. *Petala* obcordata aut obovata cum lacinula inflexa. *Stylis* demum divergentes reflexi. *Fructus* a dorso compressiusculus non convexus. *Mericarpia* jugis 5 alatis, lateralibus subduplici latioribus marginantibus. *Valleculæ* laterales 3-vittatae, dorsales sepe 2-vittatae. *Commissura* 4-8 vittata, vittis inæqualibus. *Carpophorum* bipartitum. *Semen* hinc planum.—Herbe biennes glabre. *Caules ramosi fistulosi*. *Folia bipinnatisecta, segmentis pinnatipartitis, lobis oblongo-linearibus*. *Umbellæ terminatus multiradiatae, involucro nullo aut oligophyllo*. *Involucelli* foliolis 5-7 linear-subulata umbilicatae.

subæqualia aut longiora. Flores albi.—*Ambigit inter Peucedaneas et Seselineas; ad priores mericarpiis alatis, ad posteriores mericarpiis magis convexis accedens.* DC.

HAB. Canada. Michaux. Pursh.

3. *A. atro-purpurea*; caule levi colorato, foliis bipinnatisectis, segmentis ovatis acutis inciso-serratis sublobatis terminalibus confluentibus, petiolis late dilatatis, ramis et umbellis pubescentibus. DC.—Linn. Sp. Pl. p. 360. Pursh, Fl. Am. v. 1. p. 193. Torrey, Fl. of Un. St. v. 1. p. 316. De Cand. Prodr. v. 4. p. 168.—Angelica triquinata. Bigel. Fl. Bost. ed. 2. p. 68.—Archangelica atro-purpurea. Hoffm. Umb. p. 169.

HAB. Canada. Pursh.—I have myself seen no Canadian specimens of any of the three species of this Genus.

19. ARCHANGELICA. Hoffm.

Calycis margo breve 5-dentatus. Pctala elliptica integra acuminata, acumine incurvato. Fructus a dorso subcompressus, raphe subcentrali, utrinque bialatus. Mericarpia jugis crassiusculis carinatis, 3 dorsalibus elevatis, 2 lateralibus in alam duplo latiore dilatatis. Semen tegumento non adhaerens. Carpophorum bipartitum.—Herbe perennes. Folia pinnatisecta, segmentis late ovatis acutis grosse dentatis terminalibus lobatis. Petioli ampli vaginanti-saccati. Involucrum univ. subnullum, partiale dimidiatum polyphyllum. Flores albi aut subvirescentes. DC.

1. *A. officinalis*; caule glabro tereti striato, foliis bipinnati-sectis, segmentis subcordatis lobatis argute serratis, extremo trilobo, vaginis laxis saccatis, involucelli foliolis umbellulum aequantibus. DC.—Hoffm. Umbel. v. 1. p. 166. f. tit. 19, 20. De Cand. Prodr. v. 4. p. 169.—Angelica Archangelica. Linn. Sp. Pl. p. 360. Engl. Bot. t. 2561. Cham. et Schlecht. in Linnea, v. 1. p. 394.

HAB. Umalaschka to the Bay of Eschscholtz. Chamisso.

2. *A. Gmelini*; caule glabro tereti striato, foliis ternati-sectis, segmentis tripartitis lobis ovatis serratis basi cuneatis, vaginis mediocribus, involucelli foliolis un'ellam florentem subæquantibus. De Cand. Prodr. v. 4. p. 170.—“ Angelica Gmelini. Wormsh. ex Fisch. in litt.—Apium ternatum. Pall. in Spreng. Syst. Veget. v. 1. p. 890 ?”

HAB. Kotzebue's Sound, (according to Dr. Fischer, in De Cand. Prodr.)

Trib. VI. PEUDEDANEÆ. *Fructus a dorso mericarpiorum compressus, raphe marginali, marginibus in alam (simplicem ex duobus) expansis. DC.*

20. FERULA. Linn.

Calycis margo breve 5-dentatus. Petala ovata integra acuminata, acumine adscendente vel incurvo. Fructus a dorso plano-compressus margine complanato dilatato cinctus. Mericarpia jugis 3 dorsalibus filiformibus 2 lateralibus obsoletis in marginem dilatatum abeuntibus. Vitæ in valleculis dorsalibus 3 aut plures, in commissura 4 aut plurimæ. Semen complanatum. Carpophorum bipartitum.—Herba radice crassa, caule elato, foliis supra-decompositis, segmentis sapientiæ in lacinias linearæ fissis. Umbellæ multiradiatae, laterales sepe opposite aut verticillatae. Involuca varia. Flores lutei. DC.

1. *F. feniculacea*; pubescens, caule brevi, foliis supradecompositis, segmentis linearibus angustissimis brevibus acutis, involuero nullo, involucello unilaterali dimidiato digitato segmentis linearibus.—*Nutt. Gen. Am. v. 1. p. 183. De Cand. Prodr. v. 4. p. 174.*—*Pastinaca feniculacea. Spreng. in Schultes, Syst. Veget. v. 6. p. 587.*

HAB. New Fort Vancouver, and barren sandy grounds on the Columbia River. *Douglas. Dr. Scouler.* Low hills near the source of the Wallawalla. *Douglas. Carlton House on the Saskatchewan. Drummond.*—This exactly corresponds with specimens I possess from the "Bluff" of the Missouri, gathered by Mr. Bradbury. The peduncles sometimes arise from the root, more frequently from a short stem: the flowers are yellow in some specimens, in others white, perhaps the consequence of drying.

2. *F. Nuttallii*; parva, subacaulis, glabra, foliis supradecompositis segmentis linearibus brevissimis acutis, involucre nullo, involucello unilaterali dimidiato digitato segmentis linearibus.—*De Cand. Prodr. v. 4. p. 174.*—*F. nudicaulis. Nutt. Gen. Am. v. 1. p. 182.*—*Smyrnium nudicaule. Pursh. Fl. Am. v. 1. p. 196.*

HAB. Plains of the Columbia River. *M. Lewis.* Banks of streams, among stones, at the "Great Falls" of the same River. *Douglas.*—If I am correct in referring Mr. Douglas' specimens to the present species, it is a smaller plant than the preceding, quite glabrous, with shorter segments to the leaves. The root is fusiform, and the whole plant has a good deal the odour of Fennel, but is more aromatic. The Umbelliferous plant, described by Dr. Torrey in the "Plants of the Rocky Mountains," (p. 207,) is very nearly allied to the present, but smaller, and with less compound leaves. Is it hardly possible to determine accurately the Genera of either in the absence of fruit.

3. *F. ? Palmella*; glabra subacaulis, foliis bipinnatifidis sublonge petiolatis glaucis, segmentis linearibus obtusiusculis inferioribus non raro iterum pinnatifidis, pedunculo foliis subbreviore, involucre nullo, involucello unilaterali dimidiato palmato disco florifero.

HAB. About Carlton House, on the Saskatchewan. *Drummond.*—I possess the same species from the Missouri, gathered by Mr. Bradbury. The root is large, thick, subfusiform. The whole plant not more than a span high, glaucous. Petioles long and slender. The involucels are very remarkable, truly palmate, gradually tapering into a broad petiole or ray, and bearing the small umbellule of white flowers on the disk. The immature fruit appears to be that of a *Ferula*.

4. *F. ? Canadensis*; "foliorum segmentis ramosis lucidis linearibus."—*Linn. Sp. Pl. p. 174. De Cand. Prodr. v. 4. p. 174.*

HAB. Canada. *Linnaeus.*—This plant, whatever it may be, seems wholly unknown to recent Botanists.—Two other Umbelliferous plants, allied to the above, and probably referable to *Ferula*, are in the collection

of Mr. Douglas, from the Columbia, but in too imperfect a state to enable me to refer them satisfactorily to this or any other Genus.

21. IMPERATORIA. Linn.

Calyx margo obsoletus. *Petala* obovata in lacinulam inflexa concreta emarginata vel subintegra. *Fructus* a dorso plano vel lenticulari-compressus margine dilatato complanato cinctus. *Mericarpia* jugis subaequidistantibus, 3 intermedii filiformibus, 2 lateralibus obsoletioribus margine dilatato contiguis vel in eundem abeuntibus. *Valleculæ* 1-vittatae, laterales subinde sesqui-vel bivittatae. *Commissura* sepius bivittata. *Carpodium* bipartitum. *Semina* antice plana.—Herbe *glabrae* perennes. Caulis *teres striatus*. Folia *bi-aut trinervi-secta*, *segmentis ovatis oblongis serratis*. Umbellæ *ample composite*. Involucrum *nullum*. Involucella *oligophylla*. Flores *albi*.—Species habitu accidunt hinc ad ultimam Pucedani sect., illine ad Angelicam. DC.

1. *I. Ostruthium*; foliis ternato-sectis, segmentis late ovatis trilobatis inciso-serratis, lateralibus basi inaequalibus, vaginis amplis. DC.—Linn. Sp. Pl. p. 372. Engl. Bot. t. 1380. De Cand. Prodr. v. 4. p. 183.—Pucedanum Ostruthium. Koch.

HAB. Newfoundland. *De la Pylaie*, in *De Cand. Prodr.*

22. PASTINACA. Linn.

Calyx margo obsoletus vel minute denticulatus. *Petala* subrotunda integra involuta, lacinula lata retusa. *Fructus* a dorso complanato-compressus, margine dilatato complanato cinctus. *Mericarpia* jugis tenuissimis, 3 intermedii æquidistantibus, 2 lateralibus margine contiguis. *Vittæ* lineares acuta jugis vix breviores, in valleculis solitariae; in commissura 2 aut plurimæ. *Carpophorum* bipartitum. *Semen* complanatum.—Herbe *radice fusiformi sepius carnosa*, foliis *pinnatisectis*, *segmentis dentatis incisis aut lobatis*. Umbella *composita*, involucra utraque *nulla aut oligophylla*. Flores *flavi*. DC.

1. *P. sativa*; caule sulcato foliis pinnatisectis segmentis ovato-oblongis obtusis crenato-dentatis basi ineisis, extremo trilobo, involueris involucellisque nullis, calycis dentibus obsoletis, fructibus ovalibus, commissura bivittata. DC.—Linn. Sp. Pl. p. 188. Pursh, Fl. Am. v. 4. p. 196. Engl. Bot. t. 556.

HAB. On the Saskatchewan and Red Rivers. *Douglas*. *Drummond*.

23. HERACLEUM. Linn.

Calyx 5-dentatus. *Petala* obovata, emarginata cum lacinula inflexa, exteriora sèpe radiantia bifida. *Fructus* a dorso plano-compressus margine dilatato complanato cinctus. *Mericarpia* jugis tenuissimis, 3 dorsibus æquidistantibus, 2 lateralibus margini dilatato contiguis remotis. *Vittæ* dorsales 4, in valleculis solitariae, commissurales sepius 2, omnes fructu breviores sepius chvlatae. *Carpophorum* bipartitum. *Semen* complanatum.—Herbe *ample*, foliis *pinnatisectis trisectis aut lobatis*; petioli *ample vaginantes*. Umbellæ *multiradiatae*. Involucrum *caducum sepius oligophyllum*. Involucellum *polyphyllum*. DC.

1. *II. latatum*; foliis triseptis petiolulatis subitus tomentosis supremis trilobis, segmentis late ovato-subrotundis lobatis serratis, involucelli foliolis parvis subulato-lanceolatis, fructibus late obcordato-ovalibus, commissura bivittata, floribus radiantibus.—Mich. Am. v. 1. p. 166.

Parsh, *Fl. Am.* v. 1. p. 181. *Bigel.* *Fl. Bost.* ed. 2. p. 110. *Torrey*, *Fl. of Un. St.* v. 1. p. 313.—II. *Sphondylium*. *Cham.* et *Schlecht.* in *Linnæa*, v. 1. p. 394. *Rich.* in *Frankl.* 1st *Journ.* v. 2. *App.* p. 10.

HAB. Canada *Michaux*; and as far north as the Mackenzie River, in lat. 58°. Dr. *Richardson*. *Drummond*. Moist banks of streams, North-West America, where the roots and young stems are eaten by the Chenoak Indians. *Douglas*. *Dr. Scander*. *Unalasehka*. *Chamiso*.—This plant is called *Pehpoon-ahtic*, (dulse stem,) by the Cree Indians; and the young stems are used as Potherb. *Richardson*.

2. *H. Douglasii*; foliis subtus petiolisque scabris superne glabris triseptis, segmentis petiololatis cordatis 3-5-lobis acuminatis dentatis, involuci foliolis plurimis apice subulatis, fructibus obovatis glabris, vittis dorsalibus elongatis subclavulatis, commissura 2 brevibus claviformibus, et 2 aliis minimis subabortivis. *De Cand.* *Prodr.* v. 1. p. 193.

HAB. North-West America. *Douglas*. (ex *De Cand.* fil. in *Prodr.*)—I suspect this is only a variety of *H. tanatum*, which I possess both from Mr. *Douglas* and Dr. *Scander*, gathered in North-West America.

† † *Multijugatae*, nempe *jugis primariis et secundariis domatiae*.

Trib. VII. THAPSIEÆ. *Fructus a dorso mericarpiorum compressus vel subteres, jugis primariis lateralibus sub plano cinnissurali impositis, secundariis plurimis in alam expansis.*

24. LASERPITIUM. *Linn.*

Calycis margo 5-dentatus. Petala obovata emarginata cum lacinula inflexa. Fructus a dorso compressus vel subteres 8-pteris nempe mericarpia jugis primariis 5 filiformibus, secundariis 4, omnibus in alam expansis, valleculis sub jugis secundariis 1-vittatis, carpophoro libero bipartito.—Herbae. *Folia 2-3-pinnatisecta, segmentis integris dentatis incisis.* Umbellæ multiradiatae speciosæ. Involucrum utrinque polyphyllum. Flores albi, rarius flavi.—*Genus alis 8 distinctissimum.* DC.

1. *L. hirsutum*; foliis supra decompositis hirsutis segmentis angustis pinnatifidis, lobis abbreviatis linearibus ensipidatis, involuci foliolis membranaceis apice subtrifidis ciliatis, fractuum alis tenuibus planis. DC.—*Lam.* *Fl. Fr.* v. 3. p. 618. *De Cand.* *Prodr.* v. 4. p. 205. *Hook.* et *Arn.* in *Bot. of Beechey's Voy.* v. 1. p. 125.—*Hall.* *Helv.* n. 795. t. 19.

HAB. Kotzebue's Sound. *Messrs. Lay and Collie in Capt. Beechey's Voyage.*

Trib. VIII. DAUCINEÆ. *Fructus a dorso mericarpiorum subcompressus aut teres, jugis primariis lateralibus plano commissurali impositis, secundariis in aculeos liberos aut in alam basi connatos expansis.* DC.

25. DAUCUS. *Linn.*

Calycis margo 5-dentatus. Petala obovata emarginata inflexa, exteriora sepe radiantia et profunde bifida. Fructus a dorso subcompressus ovatus aut oblongus. Mericarpia jugis primariis 5 filiformibus setulosis, 3 intermediis dorso, 2 lateralibus plano commissurali impositis; secundariis 4 aequalibus magis prominulis alatis in seriem simplicem aculeantam partitis, valleculis sub jugis secundariis 1-vittatis. Semen antice planiusculum.—Herbae sèpius biennæ. *Folia bipinnatisecta.* Involucrum foliolis plurimis tri-ut pinnatifidis,

involucellum foliolis plurimis integris aut trifidis. Flores albi aut flavi, centralis sepe carnosus atro-purpureus sterilis. DC.

1. *D. microphyllus*; caule pilis mollibus retrorsis villoso, foliis villosis bipinnatisectis segmentis in lacinias lineares sectis, involueri foliolis pinnatifidis umbellam parvam confertam subrequantibus nucleis fructus ovati latitudinem subrequantibus apice distincte glochidatis. DC.—“Presl. in Herb. Hænk.” De Cand. Prodr. v. 4. p. 213.

HAB. Nootka-Sound. Hænk. Straits of De Fina. Dr. Scouler. Rocky places of the Grand Rapids of the Columbia, and on the plains of the Multnomah River. Douglas.

SUBORD. II. CAMPYLOSPERMÆ. Albumen intus suto longitudinali ob margines involutos notatum. (Panicifragatae.)

Trib. IX. SCANDICINEÆ. Fructus a latere compressus aut contractus, elongatus sepe rostratus.

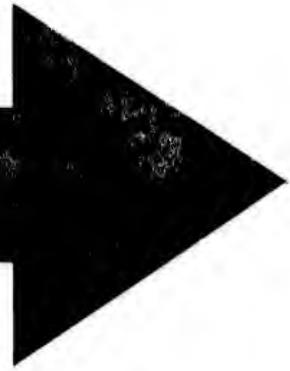

26. OSMORHIZA. Rafin.

Calycis margo obsolete. Petala obovata vix ac ne vix emarginata acuminata brevissimo inflexa. Fructus elongatus basi in caudam attenuatus solidus acuto-angularis, sectione transversali subteres. Mericarpia angulis subsulcatis hispidis, jugis 5 acutis, commissura sulcata, valleculis planis evittatis. Semen teres, anguste involutum, tubo calycino multo brevius. Carpophyllum semibifidum.—Herbie Americanæ perennes. Radices fusiformes odoratae. Caulis ramosus bipartitus. Folia bitermatisecta, segmentis late ovato-lanceolatis inciso-dentatis. Involucrum 2-3 phyllo, involucella scipio 5-phylla, foliolis utrinque lanceolatis ciliatis. Flores albi, centrales umbellulae masculi, extiores fertiles. DC.

1. *O. longistylis*; glabra v. subhirsuta, stylis elongatis subulato-filiformibus fructibus clavatis, involucris persistentibus (TAN. XCVI.)—De Cand. Prodr. v. 4. p. 232.—*Myrrhis longistylis*. Torrey, Fl. of Un. St. v. 1. p. 310.—*Urspermum Claytoni*. Nutt. Gen. Am. v. 1. p. 193. Bigel. Pl. Bost. ed. 2. p. 112.—*Myrrhis Claytoni*. Spr. Sp. Umbell. p. 129. t. 3. f. 6.

Radix crassa, fusiformis, ramosa, Anisi odore. Caulis erectus, ramosus, tereti-striatus, sesquipedalis ad pedalem. Folia inferiora longe petiolata, superiora sessilia, bitermatisecta, segmentis seu foliolis 2-3-mucridibus, ovatis subcordatisque, subacuminatis, pinnatifido-lobatis, serratis, glabris, vel magis minusve hirsutis. Umbella umbellulaque panicifradiata, divaricata. Involucra involucellaque e foliolis subquinque, lanceolato-acuminatis, ciliatis, denum reflexis, persistentibus. Flores albi. Calyx obsolete. Petala obcordata, lacinia inlexa. Styli erecto-divergentes, germinis longitudinem fere dimidiam aequantes. Fructus oblongus obtusus inferne valde attenuatus seu omnino clavatus, stylis longis erectis coronatus, lateraliter compressus, jugis 5 acutis, appresso-hispidis, duobus lateralibus marginantibus. Vittæ nulle Semen antico profunde salutem.

HAB. Throughout Canada, from Lake Huron. Dr. Todd. Quebec. Mrs. Percival. Mrs. Sheppard. Lady D'Albousie; to the Saskatchewan, Dr. Richardson. Drummond. Shady woods, North-West America, in the lat. of the Columbia. Douglas.—Much confusion has existed, and I fear still exists, respecting the two North American species of *Osmorhiza*, both of which, by the less recent authors, have been considered as one, under the name of *Myrrhis Claytoni*. They were separated by Dr. Torrey, and Dr. Bigelow, in their respective publications which appeared in the same year, 1824: so that it is hard to say which has the priority in regard to date. I have preferred the names given by De Candolle, as the most expressive of the essentially distinguishing characters.

ORD. XLV. HAMAMELIDÆ. *Br.*

(Trib. HAMAMELEÆ. *Petala 4. Stam. 8; 4 fertilia, 4 sterilia. Antheræ valvulae dehiscentes. DC.*)

1. HAMAMELIS. *Linn.*

Calyx imo ovario adhaerens 4-lobus, extus 2-3-squamosus. Petala 4 longa ligulæformia,

laciiniis calycinis alterna. *Stamina* fertilia 4 petalis alterna, filamentis brevissimis, antheris adnatis bilocularibus, loculis valvula verticali dehiscentibus; *sterilia* 4 antheris orbatis, filam. crassiusculis ante petala sitis. *Ovarium* apice liberum in stylis 2, rarissime 3, breves desinens. *Capsula* coriacea semilibera 2-locul. apice bivalvis, valvis bifidis. *Arilli* 2 coriacei monospermii elastice superne bivalves. *Semina* oblonga nitida, hilum supero. *Albumen* carnosum. *Embryo* radicula supera, cotyledonibus planis.—*Arbusculæ Ameri- canæ aut Asiaticæ*. Folia alterna, breve petiolata, bistipulata, ovata aut cuneata, penninervia subintegra. Flores in axillis glomerati sessiles, involucro 3-phyllo cincti. Pet. flavi. DC.

1. *H. Virginica*; foliis ovatis subcrenato-repandis basi subcordatis inaequalibus, junioribus pubescentiis, stellata subscabris. DC.—Linn. Sp. Pl. p. 180. Mich. Am. v. 1. p. 100. Pursh, Fl. Am. v. 1. p. 116. Elliott, Carol. v. 1. p. 219. Bigel. Fl. Bost. ed. 2. p. 61. Torrey, Fl. of Un. St. v. 1. p. 122. De Cand. Prodr. v. 4. p. 268.

HAB. Canada. Island of Orleans. Mr. Sheppard.

ORD. XLVI. CORNEÆ. *De Cand.*

1. CORNUS. Linn.

Calycis tubus ovario adnatus, limbus minimus 4-dentatus. *Petala* 4 oblonga sessilia per testicationem valvata. *Stamina* 4. *Stylus* 1. *Drupa* baccata calycis vestigio notata, nucleo biloculari (rarius 3-locul.) *Semina* solitaria pendula. *Albumen* carnosum. *Em- bryonis* radicula cotyledonibus brevior.—Arbores frutices imo Herbae. Folia (*unica spec. exc.*) opposita integra penninervia. Flores nunc capitati aut umbellati et involucrati, nunc corymbosi aut paniculati exinvoluti. Petala alba aut rarius flava. DC.

* *Nudiflora*.

1. *C. alternifolia*; foliis alternis ovatis acutis subtus canis, corymbis patentibus. DC.—Linn. fil. Suppl. p. 125. L'Herit. Corn. p. 10. t. 6. Mich. Am. v. 1. p. 98. Pursh, Fl. Am. v. 1. p. 109. Elliott, Carol. v. 1. p. 210. Bigel. Fl. Bost. ed. 2. p. 58. Torrey, Fl. of Un. St. v. 1. p. 100. De Cand. Prodr. v. 4. p. 271.

HAB. Woods in Canada. Michaux.—I possess no Canadian specimens of this plant. As seen in the Herbarium, and without fruit, it is hardly to be distinguished from *C. alba*, except by its alternate leaves and slender petioles. All the other *Corni* have the leaves opposite. The fruit is purple, smaller than in *C. alba*.

2. *C. paniculata*; ramis erectis, foliis ovatis acuminate glabriusculis, corymbis thyrsoidēo-paniculatis, ovario sericeo. DC.—L'Herit. Corn. p. 9. t. 5. Pursh, Fl. Am. v. 1. p. 109. Elliott, Carol. v. 1. p. 209. Bigel. Fl. Bost. ed. 2. p. 59. De Cand. Prodr. v. 4. p. 271.

HAB. Canada. Pursh.—Drupes white. L'Heritier says this is most distinct in the cymes being elongated into a panicle or thyrsus. The cyme in *C. alba* is sometimes a little elongated, and then I do not see how *C. paniculata* is distinguishable from it. Mr Elliott says he has seen specimens which appear to connect this with *C. stricta*. What I have received from Mr. Schweinitz and Dr. Torrey, as *C. paniculata*, appears to me to be in no way different from *C. alba*.

3. *C. stricta*; ramis strictis, foliis ovatis acuminate utrinque viridibus, adultis glabris

nascentibus vix subtus pubescentibus, corymbis subpaniculatis. DC.—*Lam. Dict.* v. 3. p. 116. L'Herit. *Corn.* p. 8. t. 4. Pursh, *Fl. Am.* v. 1. p. 109. Elliott, *Carol.* v. 1. p. 209. Torrey, *Fl. of Un. St.* v. 1. p. 180. De Cand. *Prodr.* v. 4. p. 272.—C. fastigata. Mich. *Am.* v. 1. p. 92.

HAB. Canada. Pursh.—With this I am unacquainted, as is likewise Dr. Torrey. To me it seems to differ from *C. alba*, according to L'Heritiere, only in the less pale colour, and more glabrous under-surface of the leaf. If *C. fastigata* of Michaux be the same, as authors maintain, no dependance is to be placed on the more or less panicled corymbs. The drupes are described as blue, the flesh or pulp white.

4. *C. sanguinea*; ramis rectis, foliis ovatis brevissime acuminatis concoloribus subtus puberulis, corymbis depresso planis.—Linn. *Sp. Pl.* p. 171. L'Herit. *Corn.* p. 5. Engl. *Bot.* t. 249. Pursh, *Fl. Am.* v. 1. p. 109. Elliott, *Carol.* v. 1. p. 208. Torrey, *Fl. of Un. St.* v. 1. p. 178. De Cand. *Prodr.* v. 4. p. 272.

HAB. Canada. Pursh.—Of this, I have never seen American specimens.

5. *C. alba*; ramis patentibus vel recurvis (an semper?) foliis late ovatis acuminatis pubescentibus subtus canis, corymbis depresso.—Linn. *Mant.* p. 40. Pall. *Fl. Ross.* t. 34. L'Herit. *Corn.* p. 6. Pursh, *Fl. Am.* v. 1. p. 109. Bigel. *Fl. Bost.* ed. 2. p. 58. Rich. in *Frankl. 1st Journ. ed. 2. App.* p. 5. Torrey, *Fl. of Un. St.* v. 1. p. 179. De Cand. *Prodr.* v. 4. p. 272.—C. stolonifera. Mich. *Am.* v. 1. p. 92.— β . foliis majoribus subtus magis hirsutis. *C. circinnata*. Cham. et Schlecht. in *Linnaea*, v. 3. p. 139.

HAB. Throughout Canada, and from Lake Huron to North lat. 69°. (*Dr. Richardson.*) Newfoundland, *Miss Brenton.* North-West coast of America, (*Mr. Garry.*) where, however, the var. β seems to be the most frequent. *Mr. Menzies. Douglas. Dr. Scouler.*—The berries or drupes are described by most authors as white, by Dr. Richardson as lead-coloured; who further says they are named by the Crees *Musquameema*, because the Bears fatten upon them, and *Meethquan-pæneenatik, meenisan*, (red stick berry,) and that Pigeons are fond of this berry, which is considered a good stomachic.—This is the only species of this group of *Cornus* that I have myself received from British North-America, and it does appear to me that *C. stricta*, *C. paniculata* and *C. sericea* are too nearly allied to it, as are some states of *C. circinnata*. The direction of the branches is assuredly variable, the corymb is more or less depressed, and I suspect the fruit is liable to vary in colour. My var. β . borders very closely upon the following species, and that again upon *C. circinnata*.

6. *C. sericea*; ramis patulis, ramulis lanuginosis, foliis ovatis acuminatis subtus subferrugineo-sericeis, corymbis depresso lanuginosis, nucleis compressis. DC.—L'Herit. *Corn.* p. 5. t. 2. Pursh, *Fl. Am.* v. 1. p. 103. Elliott, *Carol.* v. 1. p. 208. Torrey, *Fl. of Un. St.* v. 1. p. 178. De Cand. *Prodr.* v. 4. p. 272.—C. lanuginosa. Mich. *Am.* v. 1. p. 92.—C. alba. Walt. *Carol.*

HAB. Canada. Pursh. Columbia River, North-West America, frequent. *Douglas.*—“Berries blue.”

7. *C. circinnata*; ramis verrucosis, foliis orbiculatis subacuminatis rugosis subtus tomentoso-canis corymbis depresso. DC.—L'Herit. *Corn.* p. 7. t. 3. Pursh, *Fl. Am.* v. 1. p. 108. Bigel. *Fl. Bost.* ed. 2. p. 59. Torrey, *Fl. of Un. St.* v. 1. p. 179. De Cand. *Prodr.* v. 4. p. 272. Cham. et Schlecht. in *Linnaea*, v. 1. p. 139.—C. tomentosula. Mich. *Am.* v. 1. p. 91.—C. rugosa. *Lam. Dict.* v. 2. p. 115.

HAB. Canada. Michaux.

* * *Involucrate.*

8. *C. florida*; arborescens, ramis nitidis, foliis ovatis acuminatis subtus pallidis utrinque nudprese pilosis, floribus umbellatis post folia nuscentibus, involucro maximo, foliolis subrotundis retusis aut fere obcordatis, drupis ovatis. DC.—*Linn. Sp. Pl.* p. 1661. L'Herit. *Corn.* p. 4. Sims, *Bot. Mag.* t. 526. Mich. *Am.* v. 1. p. 91. Pursh, *Fl. Am.* v. 1. p 108. Elliott, *Carol.* v. 1. p. 207. Bigel. *Med. Bot.* t. 28. Ejusd. *Fl. Bost.* ed. 2. p. 57. Torrey, *Fl. of Un. St.* v. 1. p. 178. De Cand. *Prodr.* v. 4. p. 273.

HAB. Canada. Michaux. Pursh. Banks of the Columbia, near its confluence with the Sea. Douglas. Dr. Scouler.

9. *C. Canadensis*; caulibus simplicibus herbaceis, foliis superioribus verticillatis subpetiolatis ovatis venosis, floribus umbellatis involucro multo brevioribus, drupis globosis. DC.—*Linn. Sp. Pl.* p. 172. L'Herit. *Corn.* p. 3. t. 1. Curt. *Bot. Mag.* t. 890. Mich. *Am.* v. 1. p. 91. Pursh, *Fl. Am.* v. 1. p. 107. Bigel. *El. Bost.* ed. 2. p. 57. Torrey, *Fl. of Un. St.* v. 1. p. 177. Beechey's *Voyage*. Unalashka. Chamiso. Kotzebue's Sound. Messrs. Lay and Collie in Capt. Beechey's *Voyage*.— β . Fort Vancouver, on the Columbia. Dr. Scouler.

ORD. XLVII. LORANTHACEÆ. Don.

1. ARCEUTHOBIVUM. M. Bieb.

Flores dioici. *MASC.* sessiles:—*Calyx* 0. *Corolla* monopetala 2–3 raro 4-partita corneocarnosa, lacinias ovatis concavis patentibus. *Stam.* 2–3–4. *Anthera* sessilis medio luciniarum affixa libera subglobosa unilocularis transversim dehiscens membranacea. *Ovarium* 0: sed ejus loco glandula parva 2–3–4-loba.—*FEM.* brevissime pedicellati:—*Cal.* ovalis compressus carnosus bidentatus ovarium uniovulatum fere omnino tegens et ei adnatus. *Cor.* 0. *Stam.* 0. *Stylus* 0. *Stigma* parvum obscure lobatum. *Fructus:* *Bacca* anguste obovata teres breve pedicellata monosperma. *Semen* pulpo viscido pellucido immersum, summo loculo affixum pendens obovato-cylindraceum basi acuminatum. *Integumentum* tenuis. *Albumen* carnosum. *Embryo* immersus, versus busin seminis, axilis cylindricus. *Radicula* ad hilum seminis versa. *Lobi* cotyledonei breves subdivaricati.—*Frutex parvus aphyllus*

subcarnosus in arboribus resiniferis Europæ meridionalis Americæque borealis parasiticus, aphyllus valde prolifere ramosus, ramis oppositis obtuse tetragonis; more Salicorniæ articulatus, articulis superne vaginatis subpelviformibus. Flores terminales atque laterales saepe terni parvi inconspicui.

1. *A. Oxycedri*; (TAB. XCIX.) “Bieb. Fl. Taur. Cauc. Suppl. p 629.” Spreng. Syst. Veget. v. 3. p. 901.—“Razoumowskia Caucasica. Hoffm. Hort. Mosq. 1808. Intr. n. 1. f. 1. a-i.”—Viscum Oxycedri. De Cand. Fl. Fr. ed. 3. v. 3. p. 901. Bigel Fl. Taur. Cauc. v. 2. p. 406. De Cand. Prodr. v. 4. p. 283.

HAB. On *Pinus ponderosa*, West side of the Rocky Mountains. Douglas. On *Pinus Banksiana*, from the Spokane River on the West side of the Rocky Mountains, in lat. 47°, to the Rocky Mountains, and thence to Hudson's Bay on the East, in lat. 57°. Douglas. Drummond.—Mr. Douglas entertained an idea that the specimens in his Herbarium of this curious parasite, gathered on *Pinus ponderosa*, were different from those found on *P. Banksiana*: but the only difference consists in the latter being loaded with female, the former with male flowers, which certainly gives a very different appearance to the extremities of the numerous branches. It is remarkable too, that all Mr. Drummond's specimens, (and they were all found upon *P. Banksiana*,) are male plants. These, and Mr. Douglas' plants, have been carefully compared with European ones, found growing on the *Juniperus Ozycedrus*, some from the South of France, (Languedoc, gathered by M. Bory de St. Vincent,) and others from Caucasus, communicated to me by Mr. Prescott, and I must confess I can perceive no specific difference in them whatever. In general, but not always, those from the old world, are greener or blacker when dry, the American more yellow. I regret that I have it not in my power to consult the Appendix of Bieberstein's Fl. Taur. Cauc., nor the Hort. Mosq. of Hoffm.:—so that I am unable to take advantage of any remarks they may have made respecting characters of this plant, as distinguishing it from the Genus *Viscum*: but as no analysis of the flowers has any where been represented, I have thought it right to figure them here: and if *Viscum album* be considered the type of that Genus, our plant appears to me very distinct, not only in habit, but, remarkably, in the nature of the anthers and in the constantly single and vertical embryo.

TAB. XCIX. A. Oxycedri. Fig. 1, Diandrous male flower; fig. 2, The same, with part of the upper joint of the branch removed to show the two young ramuli; fig. 3, Triandrous male flower; fig. 4, Tetrandrous male flower; fig. 5, Anther; fig. 6, Dehiscent do.; fig. 7, Small branch from a female plant; fig. 8, Female flower; fig. 9, Section of do.; fig. 10, Fruit; fig. 11, Seed enveloped by its viscid pulp; fig. 12, Section of do., showing the embryo:—all more or less magnified.—Figs. 10-12, are from European specimens; the rest from the American ones.

ORD. XLVIII. CAPRIFOLIACEÆ. Juss. (excl. Sect. 2 et 4.)

Trib. I. SAMBUCEÆ. *Corolla gamopetala regularis rotata seu petalis 5 aequalibus basi tantum concretis constans, rarius tubulosa. Stylus nullus. Stigmata 3 sessilia. DC.*

HAB. Canada, and as far as the Saskatchewan.—*a.* Rocky Mountains on the East side. *Drummond.* Shores of the Columbia, near Fort Vancouver, and at its confluence with the sea. *Dr Scouler. Douglas.*—The Rocky Mountain specimens, and, more especially, those from the Pacific, are remarkable for the great size and length of their leaflets: and their being almost constantly seven upon each rachis. But I do not find that these, or the Eastern state of the plant, can in any way be distinguished from the European *S. racemosa*, which I also have from Siberia. The fruit is red.

2. VIBURNUM. *Linn.*

Calycis limbus parvus 5-fidus persistens. Corolla rotata subcampanulata aut tubulosa 5-loba. Stamina 5 æqualia. Stigmata 3 sessilia. Baccæ abortu 1-sperma ovata aut globosa calycinis dentibus coronata. Semen compressum.—Frutices. Folia opposita petiolata. Corymbi (seu cymæ) terminales. Flores albi aut viri subrosei. *DC.*

1. *V. prunifolium*; foliis obovato-subrotundis ovalibusque glabris submembranaceis brevi-acuminatis argute serratis, petiolis marginatis, baccis ovatis (atro-cæruleis).—*Linn. Sp. Pl.* p. 383. *Pursh, Fl. Am.* v. 1. p. 201. *Torrey, Fl. of Un. St.* v. 1. p. 318. *De Cand. Prodr.* v. 4. p. 325. *Wats. Dendrol.* t. 23.

HAB. Lake Huron. *Dr. Todd.*—The specimens accord with those of Dr. Torrey, and with the figure in Watson's *Dendrologia*: but it seems very nearly allied to *V. nudum*. The leaves are broader, and more membranaceous.

2. *V. Lenta*; foliis lato-ovatis acuminatis argute serratis glabris, petiolis margine angustissimo criso, corymbis terminalibus sessilibus, (baccis nigris.) *DC.*—*Linn. Sp. Pl.* p. 384. *Mich. Am.* v. 1. p. 178. *Pursh, Fl. Am.* v. 1. p. 201. *Bigel. Fl. Bost.* ed. 2. p. 116. *Elliott, Carol.* v. 1. p. 365. *Torrey, Fl. of Un. St.* v. 1. p. 318. *De Cand. Prodr.* v. 4. p. 325. *Wats. Dendrol.* t. 21.

HAB. Throughout Canada, to the Saskatchewan. *Dr. Todd. Dr. Richardson. Mr. Drummond.*

3. *V. nudum*; foliis ovali-oblongis basi angulatis obtusiusculis margine revolutis obsolete crenulatis glabris, petiolis squamato-puberulis, corymbo pedunculato exinvolutato. *DC.*—*Linn. Sp. Pl.* p. 383. *Mich. Am.* v. 1. p. 178. *Pursh, Fl. Am.* v. 1. p. 201. *Bigel. Fl. Bost.*

ed. 2, *p.* 116. *Elliott*, *Carol.* *v.* 1, *p.* 365. *Sims*, *Bot. Mag.* *t.* 2281. *De Cand. Prodr.* *v.* 4, *p.* 325. *Wats.* *Dendrol.* *t.* 20.—*V. squamatum*. *Willd. Enum.*—*Wats.* *Dendrol.* *t.* 24.—*V. pyrifolium*. *Poir. et Pursh.* (according to *Richard* in *Boott's Herb.*)

HAB. About Quebec. *Mrs. Percival*. *Mrs. Sheppard*. Newfoundland. *Miss Brenton*. *Dr. Morrison*. Saskatchewan. *Drummond*.—I cannot satisfy myself of permanently distinguishing characters between this and the two preceding species.

4. *V. lantanoides*; foliis orbiculari-subcordatis breve acuminatis dentato-serratis serratis muticis, ramulis petiolis nervisque pulvulento-tomentosis, corymbis terminalibus subsessilibus, floribus exterioribus corymbi maximis abortivis radiantibus, baccis ovatis.—*Mich. Am.* *v.* 1, *p.* 179. *Pursh*, *Fl. Am.* *v.* 1, *p.* 203. *Torrey*, *Fl. of Un. St.* *v.* 1, *p.* 319. *De Cand. Prodr.* *v.* 4, *p.* 310.—*V. Lantana*. β . *grandiflorum*. *Ait. Hort. Kew. ed.* 1, *v.* 1, *p.* 392.—*V. grandifolium*. *Sm.*

HAB. Canada. Lake Huron. *Dr. Todd*. About Quebec. *Mrs. Sheppard*, *Mrs. Percival*.—It is remarkable that few Botanists notice the very large marginal flowers of this corymb, which are remarkably radiant. *De Candolle* places the plant in a division of the Genus "*Corymbi non radiantes*".

5. *V. dentatum*; glabriuscum, foliis ovatis subrotundisve grosse dentato-serratis plicatis, nervis pennatis crassis, corymbis pedunculatis fructibus subglobosis. *DC.*—*Linn. Sp. Pl.* *p.* 384. *Jocq. Hort. Vind.* *v.* 1, *t.* 36. *Pursh*, *Fl. Am.* *v.* 1, *p.* 202. *Elliott*, *Carol.* *v.* 1, *p.* 364. *Bigel. Fl. Bost. ed.* 2, *p.* 116. *Torrey*, *Fl. of Un. St.* *v.* 1, *p.* 319. *De Cand. Prodr.* *v.* 4, *p.* 327.

HAB. La Grande Chaudière. *Pursh*.—I have not seen a specimen of this species from the British Possessions.

6. *V. pubescens*; pubescens-villosum, foliis ovatis acuminatis breve petiolatis grosse dentato-serratis subtus villosi, nervis pinnatis prominulis, corymbis pedunculatis, fructu ovato parvo. *DC.*—*Pursh*, *Fl. Am.* *v.* 1, *p.* 202. *Torrey*, *Fl. of Un. St.* *v.* 1, *p.* 320. *De Cand. Prodr.* *v.* 4, *p.* 327.—*V. dentatum*. β . *pubescens*. *Ait.*—*V. dentatum*, var. semi-tomentosum. *Mich. Am.* *v.* 1, *p.* 179.—*V. Rafinesquianum*. *Roem. et Schultes. Syst. Veget.* *v.* 6, *p.* 630.

HAB. Lake Winnipeg. *Dr. Richardson*. *Drummond*.—I quite agree with *Dr. Torrey* that this is a distinct species from *V. dentatum*, distinguishable by its downy sharp leaves, and very short petioles.

7. *V. ellipticum*; foliis ellipticis obtusis breve petiolatis parallelim venosis superne præcipue grosse serratis subtus (nervis præcipue) valde hirsutis, corymbis densis pedunculatis, ovaris hirsutissimis, baccis ovali-globosis nigris.— β . *ovarii glabris*.

HAB. Common on the branches of the Columbia, near its confluence with the Pacific. *Douglas*.—A small shrub from two to four feet high, with glabrous, pale brown bark. Leaves about two inches long, very hairy beneath, having from three to five principal nerves springing from the base. In most of the specimens the germens are clothed with long hairs; in one, quite glabrous. Berries deep black, large.

8. *V. acerifolium*; foliis cordato-ovatis saepe trilobis laxe serratis subtus velutinis, petiolis eglandulosis junioribus basi stipulaceis subtomentosis, corymbis terminalibus pedunculatis non radiantibus. *DC.*—*Linn. Sp. Pl.* *p.* 384. *Vent. Hort. Cels.* *t.* 72. *Pursh. Fl. Am.* *v.* 1, *p.* 203. *Bigel. Fl. Bost. ed.* 2, *p.* 116. *Elliott. Carol.* *v.* 1, *p.* 364. *Torrey. Fl. of Un. St.* *v.* 1, *p.* 320. *De Cand. Prodr.* *v.* 4, *p.* 327.

HAB. Throughout Canada, from Lake Huron to the Saskatchewan. Dr. Richardson. Drummond Newfoundland. Mr. Cormack. *De la Pylaie*. Fort Vancouver, on the Columbia. Dr. Scouler. Douglas.—Berries black.

9. *V. Oxycoccos*; foliis trilobatis postice acutis trinervibus, lobis divaricatis acuminatis grosse rarerque dentato-serratis, petiolis glandulosis, corymbis radiantibus. DC.—*Pursh*, *Fl. Am.* v. 1. p 243. *Torrey*, *Fl. of Un. St.* v. 1. p. 320. *Bigel.* *Fl. Bost. ed.* 2. p 116. *Rich. in Frankl.* 1st Journ. ed. 2. App. p. 10.—*V. opulus*, β . *Americana*. *Ait.*—*V. opulus*, β . *Pimina*. *Mich. Am.* v. 1. p. 180.—*V. molle*. *Mich. Am.* v. 1. p. 180?— β . *subintegifolium*; foliis subincisis subtus valde pubescentibus.

HAB. Throughout Canada to the Arctic circle. Dr. Richardson, and from Hudson's Bay to the Rocky Mountains. Douglas. Drummond.— β . Columbia. Dr. Scouler. Douglas.—This seems scarcely different from *V. opulus* of Europe, as far as I can judge from the characters given, and from the dried specimens.

10. *V. edule*; foliis trilobatis postice obtusiusculis trinervibus, lobis brevissimis dentato-serratis, serraturis acuminatis, petiolis glandulosis, corymbis radiantibus. DC.—*Pursh*, *Fl. Am.* v. 1. p. 203. *Torrey*, *Fl. of Un. St.* v. 1. p. 321. *Rich. in Frankl.* 1st Journ. ed. 2. App. p. 10. *De Cand. Prodr.* v. 4. p. 328.—*V. opulus*, var. *edule*. *Mich. Am.* v. 1. p. 180.

HAB. Canada. *Pursh*. Saskatchewan, (Drummond.) to Slave Lake, in lat. 60°. Dr. Richardson.—Is this really distinct from the preceding? It appears to differ in no particular, except the broader base of the leaves. The fruit is edible in both. That of *V. Oxycoccos* is said by Dr. Torrey to be sometimes employed as a substitute for Cranberries.

Trib. LONICEREÆ. Br. *Corolla gamopetala plus minus tubulosa sèpius irregularis*.
Stylus filiformis. *Stigma 3 libera aut in unicum concreta*. DC.

3. DIERVILLA. Tourn.

Calycis tubus oblongus basi bibracteatus, limbus 5-fidus. *Corolla* infundibuliformis 3-fida patens calyce duplo longior. *Stam.* 5 subexserta. *Stigma* capitatum. *Capula* oblonga acuta non coronata 1-locularis. *Semina* plurima minuta.—Frutices erecti. Folia *ovata* acuminata *serrata*. Pedunculi axillares bibracteati *sèpius* dichotomi 2-3-*flori*. DC.

1. *D. Canadensis*; foliis breve petiolatis ovatis acuminatis serratis petiolisque glabris. Willd. *Enum.* v. 1. p. 222. Elliott, *Carol.* v. 1. p. 273. Bigel. *Fl. Bost. ed.* 2. p. 69. *De Cand. Prodr.* v. 4. p. 330.—*D. Tournefortii*. *Mich. Am.* v. 1. p. 107. *Torrey*, *Fl. of Un. St.* v. 1. p. 239.

HAB. Throughout Canada to the Saskatchewan, and from Hudson's Bay to the Rocky Mountains.

4. LONICERA. Desf.

Calycis tubus 5-dentatus. *Corolla* tubulosa campanulata aut infundibuliformis limbo 5-fido, sèpe irregularis. *Stam.* 5. *Stylus* filiformis. *Stigma* capitatum. *Bacca* 5-locul. loculis oligospermis. *Semina* crustacea.—Frutices interdum scandentes. Folia *opposita*, interdum connata, *integra* aut in iisdem speciebus subruncinata. Flores axillares dispositione variæ. DC.

SECT. I. CAPRIFOLIUM. *Baccæ solitaria juniores 3-loculares sepe 1-locul. calycis tubo persistente coronatae. Caules scandentes. Flores capitato-verticillati. DC.*

1. *L. hirsuta*; volubilis, foliis late ovato-ellipticis breviter petiolatis pubescentibus ciliatisque, subtus glaucis summis connato-perfoliatis, verticillis capitatis, corollis pubescenti-glandulosis tubo inferne subinflato.—“Eaton. Man. of Bot. ed. 3. p. 341.” ed. 4. p. 352. *Torrey, Fl. of Un. St. v. 1. p. 242. Bigel. Fl. Bost. ed. 2. p. 88. Hook. Bot. Mag. t. 3169.* —*Lonicera pubescens. Sw. Hort. Brit. p. 194. De Cand. Prodr. v. 4. p. 332.* —*Caprifolium pubescens. Goldie, in Ed. Phil. Journ. (1822.) v. 6. p. 328. Hook. Exot. Fl. t. 27.*

HAB. Canada. Mr. Goldie. Mr. Cleghorn. Pursh. (according to a specimen communicated by Mr. Sheppard.) Lake Huron. Dr. Todd.—This appears to hold the place in the more Northern parts, which *L. flava* does in the South; of which, indeed, Dr. Torrey suspects it to be a variety.

2. *L. parviflora*; volubilis, foliis ellipticis sessilibus subconnatis glabris subtus valde glaucis summis connato-perfoliatis, verticillis capitatis corollis glabris tubo basi hinc gibboso, filamentis hirsutis.—*a.* foliis glaberrimis. *L. parviflora. Lam. Dict. v. 1. p. 728. Torrey, Fl. of Un. St. v. 1. p. 245. Bigel. Fl. Bost. ed. 2. p. 87.* —*Caprifolium parviflorum. Pursh, Fl. Am. v. 1. p. 161. Elliott, Carol. v. 1. p. 262.* —*Lonicera dioica. Linn.* —*Caprifolium bracteosum. Mich. Am. v. 1. p. 105.—**b.* foliis subtus pubescentibus etiam tomentosis.—*Caprifolium parviflorum. Rich. in Frankl. 1st Journ. ed. 2. App. p. 6.*

HAB. *a.* and *b.* frequent in Canada, and as far North as the Saskatchewan: and from Hudson's Bay to the Rocky Mountains.—This varies exceedingly in the colour of its flowers, and some of my specimens have their leaves downy with short hairs beneath: so that I cannot help fearing that the following may be only a variety of it.

3. *L. Douglasii*; ramis volubilibus, foliis ovalibus utrinque acutis petiolatis glabris ciliatis extus tomentosis summis connatis, floribus capitato-spicatis, stigmate exerto, staminibus inclusis. *De Cand. Prodr. v. 4. p. 332.* —*Caprifolium Douglasii. Lindl. in Hort. Trans. v. 7. p. 244.*

HAB. Banks of the Saskatchewan. *Douglas. (Lindl.)*—The only specimen of a perfoliate leaved Honeysuckle, which I possess from Mr. Douglas, gathered on the East side of the Rocky Mountains, is the pubescent leaved var. of *L. parviflora*, which at first sight has indeed the appearance of a distinct species, but which may be seen gradually passing into the usual glabrous appearance of the *a.* The great size of the leaves, (six to seven inches long,) mentioned by Mr. Lindley, is probably owing to cultivation.

4. *L. occidentalis*; volubilis, foliis ovalibus subsessilibus glabris ciliatis subtus glaucis summis connato-perfoliatis, floribus verticillato-capitatis, corollis glabris tubo elongato supra basin inflato-gibboso limbo subæquali, staminibus subinclusis. *Caprifolium occidentale. Lindl. Bot. Reg. t. 1457.* —*C. ciliatum. Douglas, MSS. in Herb. Hort. Soc. Lond. (vix Purshii.)*

HAB. About Fort Vancouver, on the Columbia. *Douglas.*—This beautiful Honeysuckle is a great acquisition to our gardens: it is quite different from any of the above species; and if the presence and absence of hairs on the corolla are to be depended on, it is also different from the following species. It inhabits nearly the same country. The flowers are longer than any other British North American species, and of a full orange red.

.5. *L. ciliosa*; foliis subamplexicaulibus sessilibus petiolisque ovatis subtus glaucis margine

conspicue ciliatis, summis connato-perfoliatis, spicae verticillis approximato-capitatis subsessilibus, corolla tubo hirsuto medio ventricoso limbo subæquali. *De Cand. Prodr.* v. 4. p. 393.—*Caprifolium ciliosum. Pursh. Fl. Am. v. 4. p. 463.*

HAB. Banks of the Kooekoosky, North-West America. *Lewis, (in Pursh.)*—The flowers are said to be deep yellow.

6. *L. microphylla*; volubilis, foliis (parvis) breve petiolatis cordatis obtusis rigidis ramisque undique hispido-pilosus subtus pallidis glaucis.

HAB. North-West America. On the subalpine range of Mount Hood, in rocky partially shaded places, abundant. Sparingly at the Grand Rapids, and on steep rocks near "Oak Point," on the Columbia. *Douglas.*—Mr. Douglas' specimens possess no flowers; but, judging from the habit of the plant, it may perhaps safely be referred to this Genus, and to the present division of it. The leaves are scarcely more than six lines long, uniform, exactly cordate, very villous, as well as the twining stem, with brown hispid hairs. It is quite different from any species with which I am acquainted.

SECT. II. XYLOSTEON. *Pedicelli axillares apice bibracteati biflori. Baccæ geminae distinctæ, aut plus minus concretae, juniores 3-locul. rarius adulæ 2-locul. calycis deciduo limbo non coronatæ. Flores breviores. Frutices scandentes et erecti, foliis nunquam connatis.*

7. *L. ciliata*; caule erecto, foliis ovato-cordatis oblongis tenuibus ciliatis junioribus subtus villosis, pedunculis elongato, bracteis 2 ovatis ovaris distinctis triplo brevioribus, corolla basi obtuse calcarata lobis brevibus subequalibus, baccis distinctis divaricatis (rubris).—*Muhl. Cat. p. 22. De Cand. Prodr. v. 4. p. 335.*—*Xylosteum ciliatum. Pursh, Fl. Am. v. 1. p. 161. (excl. syn. *S. album.*) Torrey, Fl. of Un. St. v. 1. p. 245. Bigel. Fl. Bost. ed. 2. p. 88.*—X. *Tataricum. Mich. Am. v. 1. p. 166. (non Linn.)*—*L. Canadensis. Roem. et Schultes, v. 5. p. 260.*

HAB. Throughout Canada to the Saskatchewan, frequent.

8. *L. caerulea*; caule erecto, foliis ovali-oblongis ciliatis subrigidis junioribus præcipue pubescens-lirsutis, pedunculis brevissimis fructiferis reflexis, bracteis 2 subulatis ovario longioribus, corollæ tubo brevi basi hinc gibboso lobis brevibus erectis subequalibus, baccis in unicam globosam blumbilicatam (atro-cæruleam glaucam) concretis. *Linn. Sp. Pl. p. 249. Pall. Fl. Ross. v. 1. t. 37. Gmel. Sib. v. 3. p. 131. Jacq. Austr. v. 5. App. p. 35. t. 17. Sims, Bot. Mag. t. 1965. Rich. in Frankl. 1st Journ. ed. 2. App. p. 6. De Cand. Prodr. v. 4. p. 337.*—*L. villosa. Muhl. Cat. p. 22. De Cand. Prodr. v. 4. p. 337. (excl. syn. X. oblongifolii. Gold.) Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 115.*—*Xylosteum villosum. Mich. Am. v. 1. p. 106. Pursh, Fl. Am. v. 1. p. 161. (descr. mala.) Torrey, Fl. of Un. St. v. 1. p. 243. (excl. syn. X. oblongifolii. Gold.) Bigel. Fl. Bost. ed. 2. p. 88. Rich. in Frankl. 1st Journ. ed. 2. App. p. 6.*—X. *Solonis. Eaton.*—*Lonicera velutina. De Cand. Prodr. v. 4. p. 334.*

HAB. Throughout the woody country, and as far North as lat. 60°. *Dr. Richardson*, to the Mountains in the West. *Drummond.* Labrador and Newfoundland. *Dr. Morrison.*—After a most careful examination and comparison of this with the European *L. caerulea*, I can discover no difference whatever, and Dr. Richardson has found it to agree with Pallas' Siberian specimens, in Sir Joseph Banks' Herbarium. I have the

same from Kamtschatka, gathered by Chamisso. Our plant is identical with the specimens "from near Williamstown, Massachusetts," but not with those from the "Western States of New York," sent to me by Dr. Torrey. The latter are the *L. oblongifolia*. In some of my specimens, especially from Labrador, the umbilici of the ovaries are ciliated, when it becomes the *L. velutina* of De Candolle.

9. *L. oblongifolia*; caule erecto, foliis oblongis ovalibusve subtus præcipue velutino-pubescentibus, pedunculis elongatæ erexit etiam fructiferis, bracteis obsoletis, corollæ hirsutæ tubo basi hinc gibboso limbo inaequali profunde bilabito lubio superiore 4-dentato inferiore subintegro, baccis in unicum globosam blumbilicatam (sicco ceruleo-nigricantem) concretis. (TAB. C.)—*Xylosteum oblongifolium*. Goldie, in *Edin. Phil. Journ.* v. 6. p. 323.

Frutex 4-pedalis, erectus, valde ramosus; ramis cortice cinereo leví tectis, junioribus pubescentibus. *Folia* 2-3-uncialia, membranaceo-subcoriacea, sessilia, seu brevissime petiolata, plerumque oblonga, nonnumquam lanceolata, rarius superno latiora, supra pubescens, juniora præcipue, subtus pubescenti-velutina. *Pedunculi* axillares, oppositi, unciam longi, gracillimi, semper, etiam fructiferi, erecti. *Bractæ* obsoletæ seu nullæ. *Corolla* hirsuta flave (?) *tubus* basi hinc gibbosus; *limbo* profunde in labia 2 inaequalia bifido, labio superiore multo latiore, 4-dentato, inferiore linearis integro patente. *Antheræ* lineares, longæ, versatiles, vix exsertæ. *Germina* 2 in unum urecolatum non raro bifidum concreta, glabra. *Stylus* hirsutus staminum longitudine. *Bacca* ceruleo-nigra, magnitudine seminis *Pisi sativi*, globosa, umbilicus seu calyculus 2 parvis 5-dentatis coronata.

HAB. Island of Montreal in the St. Lawrence. Mr. Goldie. About Montreal. Mr. Cleghorn. Lake Winnipeg. Drummond.—It was at my suggestion that Mr. Goldie published this as a new species, in the Edinburgh Philosophical Journal: yet, although it is there very accurately described, my valued friend Dr. Torrey has referred it to the *L. villosa* of American authors; *L. carulea* of the present work. At this I am the more surprised, because he is not unacquainted with the two plants, and has communicated both species to me, under the name of *Xylosteum villosum*, of Michaux:—that from "Williamstown, Massachusetts," is undoubtedly the true *L. villosa*; that from "the Western part of the State of New York," is certainly our *L. oblongifolia*. This latter differs from the former in its more downy leaves, in the great length of the constantly erect peduncles, in the obsolete bractæ, in the hairy corolla, which, too, is very different in shape, and in the linear anthers. It seems to be a rare species: only three specimens are in Mr. Drummond's collection, one barren, and two with berries.

TAB. C. *L. oblongifolia*. Fig. 1, Two flowers from the connate germeus; fig. 2, Style and stigma; fig. 3, Berry:—magnified.

10. *L. involucrata*; ramis acnte tetragonis, foliis ovatis ovalibusve petiolatis submembranaceis subtus appresse pilosis, pedunculis axillaribus 2-3 floris, bracteis 4, 2 ext. ovatis, int. late orbiculatis demum ampliatis pubescenti-glandulosis, corollis pubescentibus extus basi gibbosis, style exerto.—*Herb. Banks. MSS.* Rich. in *Frankl. 1st Journ.* ed. 2. App. p. 6. (sub *Xylost.*) Lindl. *Bot. Reg. t. 1179.* *De Cand. Prodr. v. 4. p. 336.*

HAB. Woody country between lat 54° and 64°, (but probably confined to the vicinity of the Saskatchewan.) Dr. Richardson. Drummond: thence to the Rocky Mountains. Drummond. Frequent on the North-West coast, lat. 54° to 56°. Douglas. Dr. Scouler.—I am afraid the *L. Ledebourii* of Chamisso can hardly be distinguished from this.

5. SYMPHORICARPU. Dill.

Calycis *tubus* globosus, *limbus* parvus 4-5-dentatus. *Cor.* infundibuliformis subæqualiter 4-5-loba. *Stam.* 5 breve exserta. *Stigma* semiglobosum. *Ovarium* adnatum 4-locul., loculis fertilibus 1-ovul., sterilibus paucæ ovulatis. *Bacca* calyce coronata 4 locul., loculis 2 vacuis, 2 monospermis.—*Frutices* *erecti* *dumosi* *opposite* *ramosissimi*. *Folia* *ovalia*

integerrima. Pedunculi breves axillares uni-aut multiflori. Flores bibracteati parvi albi aut rosei brevissime pedicellati. DC.

1. *S. racemosus*; floribus in racemos subterminales laxos interruptos non raro foliosos, corolla intus dense barbata, stylo staminibusque inclusis.—*Mich. Am.* v. 1. p. 107. *Pursh*, *Fl. Am.* v. 1. p. 107. *De Cand. Prodr.* v. 4. p. 399. *Sims*, *Bot. Mag.* t. 2211. *Torrey*, *Fl. of Un. St.* v. 1. p. 246.—*Xylosteum ciliatum*. β . album. *Pursh*, *Fl. Am.* v. 1. p. 161. (*Nuttall*.)

HAB. Upper Canada. *Nuttall*. *Mr. Cleghorn*. *Mr. Goldie*. Abundant about the Saskatchewan. *Dr. Richardson*. *Drummond*. On the Columbia and at Puget's Sound, North-West America. *Dr. Scouler*. *Douglas*. Nootka. *Dr. Scouler*.—Our specimens have the leaves mostly very glaucous beneath, and they vary considerably in size and outline, the lower ones sometimes being deeply sinuated.

2. *S. occidentalis*; spicis densis terminalibus axillaribusque nutantibus, corolla intus laciniosque dense barbatis, stylo staminibusque subexsertis.—*Rich. in Frankl. 1st Journ. ed. 2. App.* p. 6.

HAB. Woody country, between lat. 54° and 64° , and known under the name of "Wolf-berry." *Dr. Richardson*. Abundant about the Saskatchewan and Red River. *Drummond*. *Douglas*. Fort Vancouver, on the Columbia. *Douglas*.—Dr. Richardson has justly remarked of this plant "*S. racemosi proximus*," and among the numerous specimens in the Herbarium, are some which appear almost as much allied to the one species as the other. But the majority of individuals of the two species are readily enough distinguished; those belonging to the *S. occidentalis*, by their larger, less glaucous, more rigid, and denser foliage, (some of the leaves being two and a half inches long,) by the flowers arranged in dense drooping spikes, larger than in *S. racemosus*, and by the prominent style and stamens.

6. LINNÆA. Gron.

Calycis tubus ovatus, limbus 5-partitus, lacinias lanceolato-subulatis deciduis. *Corolla* turbinata subcampanulata 5-loba. *Stam.* 4 didynama inclusa. *Stigma* globosum. *Bacca* subsicca minima ovato-globosa 3-locularis, loculis ex A. Rich. ovule 2 suspensa gerentibus, ex R. Brown 2 polyspermis sterilibus, tertio monospermo fertili.—*Herbula sempervirens subvillosa repens*, *surculis erectis apice nudis bifloris*. Bractæ 2 sub quoque flore calyculum mentientes. Folia ovalia subdentata. Flores ex alto subrosei. DC.

1. *L. borealis*.—*Linn. Sp. Pl.* p. 880. *Engl. Bot. t. 443*. *Mich. Am.* v. 1. p. 87. *Pursh*, *Fl. Am.* v. 2. p. 413. *Bigel. Fl. Bost. ed. 2.* p. 241. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1. p. 125. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 24. *De Cand. Prodr.* v. 4. p. 340.

HAB. Throughout the woody country, from Lake Huron to the Arctic Circle, and from Newfoundland, (*Dr. Morrison*, *Miss Brenton*,) and Labrador, (*Dr. Morrison*,) on the East, to the Columbia, (*Mr. Menzies*, *Douglas*, *Dr. Scouler*,) *Unalaschka*, (*Chamiso*,) and Kotzebue's Sound (*Messrs. Lay and Collie*,) on the West.—This beautiful and interesting plant seems to have its maximum in British North America. Specimens with the largest foliage are from the Columbia; those with the smallest, and very compact in habit, and bearing the most copious flowers, are from the Rocky Mountains.

ORD. XLIX. RUBIACEÆ. Juss.

Trib. I. HEDYOTIDÆ. *Cham. et Schlecht.*—*Fructus capsularis bilocularis, loculicidodelhiscentia aut subuembranaceus indehiscentia, loculis polyspermis. Sem. non alata, albumine carnoso.*—*Frutices aut Herbae. Folia opposita. Stipulae interpetiolares.* DC.

1. HEDYOTIS. *Lam.*—*Ach. Rich.*

(*Hedyotis et Oldenlandia auct.*—*Houstonia Sp. ovar. infero. Mich.*—*Dunalia. Spreng.*

HAB. Lake Huron. *Dr. Todd.* Abundant about Lake Winnipeg and the Saskatchewan. *Dr. Richardson. Drummond. Douglas.*

3. *H. ciliolata*; “foliis radicalibus ovatis obtusis basi attenuatis marginibus ciliatis caulinis ovato-spathulatis sessilibus, floribus corymbosis terminalibus pedicellatis, pedunculis trichotomis, segmentis calycinis linear-lanceolatis, caule glabro superne ramoso.” *Houstonia ciliolata. Torrey, Fl. of Un. St. v. 1. p. 174.*

HAB. Goat Island, Falls of Niagara. *Prof. Hadley, (in Torrey.)*—With this I am unacquainted.—What particular species of *Houstonia*, of Michaux, Jussieu may have had in view when, in the 10th volume of the Annales du Muséum, he referred the Genus to *Gentianæa*, I have no means of determining: but certain it

is, that all those which I have had the opportunity of examining are referable to the *Rubiaceæ*, and I think to *Anotis* of De Candolle, in which Genus that author has indeed placed the *Houstonia rotundifolia* of Elliott. But *Anotis* is probably not distinct from *Hedyotis*, with which *Houstonia* seems to me entirely to agree, and I have no hesitation in uniting them, especially as I find that such an union has the sanction of Auguste de St. Hilaire, who says of *Hedyotis*, "ce genre pavoit devoir être réuni non-seulement aux *Houstonia*, mais encore aux *Oldenlandia*." Hence I have adopted the character of *Hedyotis*, as given by Achille Richard, in his valuable "Mémoire sur la Famille des Rubiacées."

Trib. II. GUETTARDACEÆ. *Fructus drupaceus, pyrenis 2–5 monospermis. Semina teretia elongata sepius erecta. Albumen carnosum. Frutices aut Arbusculæ. Folia opposita aut rarius terna, cum stipulis interpetiolaribus.* DC.

2. MITCHELLA. Linn.

Calycis tubus ovato-globosus (interdum cum flore altero concretus,) *limbus maximus* 4-dentatus. *Corolla* infundibuliformis, tubo tereti, fauce lobisque patentibus intus hirtis. *Staminum* filamenta tubo adnata fere usque ad faucem, *antheræ* ovatæ vix exsertæ. *Stylus* filiformis. *Stigmata* 4 inclusa. *Bacca* subglobosa, calycis dentibus coronata 4-pyrena, (aut 8-pyrena, ubi bacca due coalescent;) *pyrena* cornæ 1-spermæ. *Albumen* subcartilagineum. *Embryo* minutus erectus cotyledonibus brevissimis.—*Herbæ Americanae glabrae* repentes Liniceæ aut Nerterie facie. *Folia* subrotunda aut ovata. *Stipulae* utrinque solitariae minima. *Flores* axillares aut terminales, nunc gemini et concreti ad apicem pediculi, nunc solitarii sessiles. 1. *M. repens*; foliis subrotundis, floribus ad apicem pedunculi duobus ovario concretis. DC.—Linn. Sp. Pl. p. 452. Mich. Am. v. 1. p. 86. Pursh, Fl. Am. v. 1. p. 101. Elliott, Carol. v. 1. p. 198. Bigel. Fl. Bost. ed. 2. p. 52. Torrey, Fl. of Un. St. v. 1. p. 174. De Cand. Prodr. v. 4. p. 452.

HAB. Upper Canada. Pursh. Dr. Todd. Mrs. Percival. Mrs. Sheppard.—This seems to be altogether confined to the Southern limits of the British Possessions, and to be unknown on the West side.

Trib. III. SPERMACOCEÆ. Cham. et Schlecht.—*Stigma bilamellatum. Fructus siccus aut parce carnosus constans mericarpiis sepius 2, rarius 3–4, monospermis nunc concretis nunc secedentibus indehiscentibus nunc varie dehiscentibus. Albumen carnosò-subcorneum. Frutices aut Herba. Folia opposita. Stipulae basi membranacea apice sepius multisetae.* DC.

3. CEPHALANTHUS. Linn.

Calycis tubus obverse pyramidatus, *limbus* angulatus 4-dentatus. *Cor.* tubulosa gracilis limbo 4-fido, lobis erectiusculis. *Stam.* 4 brevia summo tubo inserta vix exserta. *Stylus* longe exsertus. *Stigma* capitatum. *Fructus* inverse pyramidatus coronatus coriaceus 2 (-4?) locul. 2(-4?) partibilis, loculis 1-spermis indehiscentibus interdum abortu vacnis. *Sem.* oblonga epiphysi callosa supra terminata. *Embryo* inversus in albumine subcartilagineo, *rad.* supera.—*Frutices.* Rami teretes. *Folia* opposita aut terna. *Stipulae* brevces distinctæ aut subconcretae. Pedunculi ex axillis supremis et apice ramorum orti nudi. Capitulum globosum. Flores supra receptaculum sphaericum piligerum sessiles, dense aggregati, sed distincti, ochroleuci. DC.

1. *C. occidentalis*; foliis oppositis ternis ovatis ovalibusque acuminatis, pedunculis capitulo multo longioribus saepius ternis ad apices ramorum. DC.—Linn. Sp. Pl. p. 198. Mich. Am. v. 1. p. 87. Pursh. Fl. Am. v. 1. p. 114. Bigel. Fl. Bost. ed. 2. p. 51. Elliott, Carol. v. 1. p. 186. Torrey, Fl. of Un. St. v. 1. p. 164. De Cand. Prodr. v. 4. p. 538.

HAB. Canada. Michaux. Mrs. Percival.

Trib. IV. STELLATÆ. Ray.—*Flores hermaphroditæ rarius declinati. Corolla rotata aut infundibuliformes, lobis per aestivationem valvatis. Styli duo aut fere a basi distincti aut plus minus in unicum concreti. Stigma capitata. Fructus constans mericarpiis duobus indehiscentibus monospermis. Semina a pericarpio et calyce vix distincta. Albumen cornuum.*—Suffrutices aut saepius Herbae. Folia opposita ad axillam gemmifera, et stipulae foliiformes (vulgo etiam folia dictæ) utrinque 1, 2 aut 3 gemmulis destitutæ verticillum formantes. Radices saepe rubrae et ad rubrum colorem tinctoriae. DC.

4. GALIUM. Scop.

Cal. tubus ovato-globosus aut oblongus, limbus vix ullus. *Cor.* 4-partita rotata, rarissime 3-partita. *Stam.* brevia. *Styli* 2 breves. *Fructus* didymus subrotundus rarius oblongus siccus, constans mericarpiis 2 indehiscentibus 1-spermis.—Herbae ramosæ. Folia cum stipulis verticillata. Inflorescentia varia. DC.

* *Fructibus laevibus glabris.*

1. *G. Claytoni*; caulibus debilibus foliisque quaternis quinque obtusis linear-ellipticis marginibus costaque retrorsum scabris pedunculis axillaribus raro terminalibus 1-2-floris, corollis 3-4-fidis, fructu glabro.—Mich. Am. v. 1. p. 78. Rich. in Frankl. 1st. Journ. ed. 2. App. p. 4. Roem. et Schultes, Syst. Veget. v. 3. p. 222.—G. trifidum. Linn. Sp. Pl. p. 153. (vix. Wahl.?) Pursh, Fl. Am. v. 1. p. 108. Elliott, Carol. v. 1. p. 194. Torrey, Fl. of Un. St. v. 1. p. 165. Bigel. Fl. Bost. ed. 2. p. 56. De Cand. Prodr. v. 4. p. 597. Cham. et Schlecht. in Linnaea, v. 4. p. 221.—G. tinctorium. Rich. in Frankl. 1st Journ. ed. 1. App. n. 40.—“Aparine a. n. 558. Gronov. Fl. Virg. 18. fide Herb. Gronov.” (Rich.)

HAB. Throughout Canada, and as far North as lat. 68°. (Dr. Richardson.) Newfoundland. Dr. Morrison. Miss Brenton. Columbia. Douglas. Dr. Scouler. Unalaschka. Chamiso.—The European *G. trifidum* is a much slenderer plant than the American, and has, as Dr. Richardson well remarks, longer recurved and capillary peduncles; and from which ours is probably distinct.

2. *G. tinctorium*; caulibus decumbentibus foliisque quaternis senis linearibus obtusis marginibus costaque retrorsum scabris, pedunculis axillaribus terminalibusque subcorymbosis plurifloris, corollis 4-fidis, fructu glabro.—Linn. Sp. Pl. p. 153. Pursh, Fl. Am. v. 1. p. 102. Bigel. Fl. Bost. ed. 2. p. 54? Torrey, Fl. of Un. St. v. 1. p. 166. De Cand. Prodr. v. 4. p. 597.

HAB. Canada. Pursh. Mrs. Sheppard. Mrs. Percival. Newfoundland. Dr. Morrison. Miss Brenton. Straits of de Fuca, North-West coast of America. Dr. Scouler.—Nearly allied to the preceding, but according to my specimens from the British Possessions, and others from the United States, a larger and stouter plant, with more numerous flowers on a peduncle, and these peduncles so crowded towards the upper part of the plant as to give it a copiously panicled appearance. It is said that from the root of this the Indians

prepare the red dye with which they colour the feathers and other ornaments of their dress. Some specimens of *G. palustre* of our country, when they have more numerous leaves than usual, are scarcely distinguishable from the *G. tinctorium*.

3. *G. asprellum*; caulis decumbentibus foliosis angulis foliorumque margine et nervo manifeste retro-aculeolatis, foliis senis ovali-lanceolatis acumine flaccido ramulis floriferis versus summitates paucis foliosis, floribus albis brevissime pedicellatis, fructu glabro. DC.—*Mich. Am.* v. 1. p. 78. *Pursh, Fl. Am.* v. 1. p. 103. *Bigel. Fl. Bost. ed. 2.* p. 54. *De Cand. Prodr.* v. 4. p. 598.

HAB. The northern parts of Canada. *Michaux*.—I am unacquainted with this species, if it be really distinct from the preceding. What I have received from the United States, under this name, is identical with the *G. Claytoni* of this work.

4. *G. rubioides*; caule erecto stricto tetragono glabriusculo, foliis quaternis lanceolatis latitudine quadruplo quintuplo longioribus 3-nerviis subtus in nervis et margine sepe scabris, pedunculis axillaribus trichotomis folio multo longioribus in paniculam terminalam dispositis, bracteis ovato-oblongis, fructu glabro. DC.—*Linn. Sp. Pl.* p. 152. *Chan. et Schlecht. in Linnaea*, v. 4. p. 220. *De Cand. Prodr.* v. 4. p. 599.— β . foliis angustioribus longioribus, foliis paucioribus. *G. rubioides*. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1. p. 115 et 125.

HAB. β . Kotzebue's Sound. *Messrs. Lay and Collie*. Abundant in dry elevated soils, under the shade of solitary Pines, in the valley of the Columbia, North-West America. *Douglas*.—The leaves in our specimens are almost as narrow as in *G. boreale*; but the inflorescence and fruit are very different. I have received the same plant from the United States, under the name of *G. Bermudianum*.

* * *Fructu hispido.*

5. *G. boreale*; caule erecto stricto tetragono glabriusculo, foliis quaternis lineari-lanceolatis 3-nerviis glabris, pedunculis axillaribus trichotomis folio multo longioribus in paniculam terminalam dispositis, bracteis obovato-orbiculatis. DC.—*Linn. Sp. Pl.* p. 156. *Engl. Bot.* t. 105. *Pursh, Fl. Am.* v. 1. p. 104. *Torrey, Fl. of Un. St.* v. 1. p. 169. *Rich. in Frankl. 1st Journ. ed. 1. n. 41. De Cand. Prodr.* v. 4. p. 600.—*G. strictum*. *Torrey, Cat. of Pl. of N. York*, p. 23.—*G. septentrionale*. *Roem. et Schultes*, v. 3. p. 253. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 4. Bigel. Fl. Bost. ed. 2.* p. 54. *De Cand. Prodr.* v. 4. p. 601.

HAB. Falls of Niagara. *Torrey*. From Lake Winnipeg to the Rocky Mountains, and to lat. 68° North, abundant. *Douglas. Drummond. Richardson*. Columbia River on the West coast. *Mr. Garry*.—Like European specimens of *G. boreale*, this is liable to considerable variation; but the numerous individuals in the Herbarium prove that the *G. septentrionale* of Roem. and Schultes, and of Dr. Richardson, generally passes into the more usual appearance of *G. boreale*. “The Cree women dye red with the roots of the *G. Claytoni* and *G. boreale* indiscriminately.” *Rich.*

6. *G. lanceolatum*; caule erecto glabro, foliis quaternis ovato-lanceolatis acutis marginibus ciliato-scabris basi trinerviis, pedunculis terminalibus dichotomis divaricatis folio longioribus, floribus lateralibus sessilibus deflexis, corollis acutissimis, fructibus uncinatosetosis.—*Torrey, Fl. of Un. St.* v. 1. p. 163.—*G. Torreyi*. *Bigel. Fl. Bost. ed. 2.* p. 56.—*G. circæzans*, β . *lanceolatum*. *Torrey, Cat. of Pl. of N. York*, p. 23. *De Cand. Prodr.* v. 4. p. 601.

HAB. About Quebec. *Mrs. Percival*. Lake Huron. *Dr. Todd*.—The true *G. circæzans* has not, so far as I am aware, been found in the British Possessions; and our *G. lanceolatum* only in their more southern parts. The leaves are very dissimilar in the two, and Torrey finds these differences to be permanent. My specimens of *G. brachiatum*, from the United States, are not distinguishable from the present.

7. *G. triflorum*; caule procumbente tetragono hispido aut glabriusculo, foliis senis oblongis cuspidatis glabellis margine et secus nervos scabridis uninerviis, pedunculis axillariibus et terminalibus, verticillis longioribus trifloris, floribus pedicellatis, fructibus setis apice uncinatis hispidis. DC.—Mich. Am. v. 1. p. 80. Pursh, Fl. Am. v. 1. p. 104. Elliott, Carol. v. 1. p. 197. Torrey, Fl. of Un. St. v. 1. p. 167. Bigel. Fl. Bost. ed. 2. p. 56. De Cand. Prodr. v. 4. p. 602.—*G. cuspidatum*. Muhl. Cat.—*G. suaveolens*. Wahl.

HAB. From Canada, (Lake Huron, Dr. Todd; Quebec, Mrs. Percival, Mrs. Sheppard,) to the Rocky Mountains, and as far north as lat. 55°. Dr. Richardson, Drummond. West side of the Rocky Mountains to the Pacific. Douglas, Dr. Scouler. Unalaschka. Chamiso.

8. *G. micranthum*; caulibus ramosissimis divaricatis retrorsum aculeatis, foliis brevibus lanceolatis mucronatis glabris, margine carinaque aculeatis, ramulis floriferis divaricato-ranulosis, pedicellis subbifloris, fructibus hispidis. Pursh, Fl. Am. v. 1. p. 103. Torrey, Fl. of Un. St. v. 1. p. 167. De Cand. Prodr. v. 4. p. 602.

HAB. Canada, Pursh, who says it very much resembles *G. uliginosum*.

9. *G. Aparine*; caule debili ramoso retrorsum aculeato-aspero ad nodos viloso, foliis octonis lanceolato-linearibus apiculatis carina et margine retrorsum aculeato-scabris, pedunculis simplicibus bifidisque scabris, fructibus globoso-didymis setis apice uncinatis hispidissimis. DC.—Linn. Sp. Pl. p. 157. Engl. Bot. t. 816. Pursh, Fl. Am. v. 1. p. 103. Bigel. Fl. Bost. ed. 2. p. 57. Torrey, Fl. of Un. St. v. 1. p. 166. De Cand. Prodr. v. 4. p. 608.— β . minor; caulibus vix spithameis.

HAB. "Etchmin," Canada. Mrs. Sheppard. North-West coast of America. Columbia. Douglas. De Fuca. Dr. Scouler. β . Abundant on the elevated soils near Fort Vancouver. Douglas.—My var. β . appears to be the same with that which De Candolle describes, "caule pygmæo, foliis sepius sextoties minoribus."

ORD. L. VALERIANÆ. DC.

1. PATRINIA. Juss.

Cal. limbus truncatus aut erectus brevissimus sub5-dentatus. *Cor.* regularis ecalcarata obtuse 5-loba. *Stam.* 4 imæ corollæ tubo admata lobis alterna, supremo deficiente, rarius 5 omnia nempe adstantia. *Stigma* trigono-capitatum. *Capsula* 3-locul., calycis limbo coronata basi stippissime bracteæ paleiformi admata, loculo 1 fertili, 2 saepius crassis.—*Herbæ perennes*. *Folia* pleraque pinnatiloba. *Flores* corymbosi aurei (nunc albi?) DC.

1. *P. ceratophylla*; caule glaberrimo, foliis omnibus subcarnosis pubescentibus petiolatis radicalibus lineari-lanceolatis integris vel pinnati-aut bipinnati-partitis lobis divaricatis caulinis profunde pinnatifidis lacinias linearibus, panicula elongata, pedunculis ternato-verticillatis (floribus albis.)

Radix fusiformis, crassa. *Caulis* pedalis ad sesquipedalem, erectus, glaber, striatus, nitidus, simplex, crassitie *pennæ anserine*. *Folia* omnia petiolata (petiolis glabris, nitidis) crassiæcula, pubescentia, subtus præcipue; *radicalia* digitalia et ultra, lineari-lanceolata, acuta, integra, vel pinnati-aut bipinnatipartita; lobis divaricatis inæqualibus; petiolis basi valde dilatatis subvaginatis; *caulina* 2 opposita, vel 3-4 verticillata, basi conuata, profunde pinnatifida; lacinias linearibus, integerrimis. *Panicula* elongata, erecta; *pedunculi*

2 oppositi, vel 3-4 verticillati, bracteis linearibus 2-4 basi connatis suffulti. Pedicelli breves floresque congesti, (albi, *Douglas.*) bracteati.

HAB. Common in low wet soils between the Kettle Falls and Spokane, in the vallies on the west side of the Rocky Mountains. *Douglas.*—"The roots," Mr. Douglas observes, "during the spring months, are collected by the Indians, baked on heated stones, and used as an article of winter or spring food. From a bitter and seemingly pernicious substance, it is thus converted into a soft and pulpy mass, which has a sweet taste, resembling that of treacle, and is apparently not unwholesome."—This plant has altogether the habit of *Patrinia*, and its flowers, as far as I can judge of them, for they are scarcely expanded, agree with that genus. But they are observed by Mr. Douglas to be white, whilst those of all the known species of *Patrinia* are yellow.

2. PLECTRITIS. DC.

Cal. margo rectus integerrimus. Cor. tubo basi breve calcarato antice gibboso, limbo 5-fido bilabiato. Stam. 3. Capsula cartilaginea 1-locularis bialata, loculis nempe 3 quorum 2 inanes aperti alæformes (involutæ).—Herba annua glabra, habitu media inter Centranthum et Fediam, sed triandra et fructu singularissimo distincta. Flores rosei monoici verticillato-congesti. Bractæ multifidae laciniæ subulatis. DC.

1. *P. congesta.* De Cand. Prodr. v. 4. p. 631.—*Valerianella congesta.* Lindl. Bot. Reg. t. 1095.—*β. minor;* foliis angustioribus. *Valerianella parviflora.* Douglas, in Herb. Hort. Soc. Lond.

HAB. Banks of streams and moist rocks, along the sea-shore, near the mouth of the Columbia. *Douglas.* Dr. Scouler.

3. VALERIANA. Neck.

Cal. limbus per anthesin involutus deinde evolutus in pappum deciduum multisetum, setis plumosis. Corolla tubo obconico aut cylindrico basi æquali aut gibbo ecalcarato obtuse 5-fido, rarius 3-fido. Stam. 3. Fructus indehiscens, maturus 1-locul. 1-spermus.—Herbæ aut suffrutices. Folia varia, sepe in iisdem individuis diversa. Flores corymbosi, capitato aut paniculati. Cor. fere omnium albae, rarius cærules centes rosei aut flavi. DC.

1. *V. sylvatica;* glabra erecta, caule striato, foliis radicalibus petiolatis ovatis aut subspatulatis indivisis, caulinis pinnatipartitis laciniis ovato-lanceolatis subintegerrimis, floribus hermaphroditis, stigmatis lobis minutis 2-3, fructibus ovatis compressis glabris.—*Banks,* MSS. Rich. in Frankl. 1st Journ. ed. 2. App. p. 2.

HAB. Newfoundland. Sir Joseph Banks. Clear-water River. Rich. in Frankl. 1st Journ. Prairies of the Rocky Mountains, abundant. *Drummond.*—In every respect, save in the hermaphrodite flowers, this agrees with the European *V. dioica*, and if Scopoli's statement be correct, when he says of this latter,—“Millena specimina examinavi et nunquam vidi flores dioicos, sed nunc omnes hermaphroditos, nunc filamento uno above castrato instructos, nunc masculos et femineos in eadem planta, ita tamen ut masculi flores continerent rudimentum germinis et stylis: sine seminibus vero perfectis nullam haec tenus inveni plantam,” I do not see in what respect the two really differ. From *V. Phu* our plant is distinguished by the smaller and shorter fruit, and entire absence of the two hairy lines.

2. *V. pauciflora;* glabra, caule erecto glabro simplici sulcato, foliis radicalibus petiolatis cordatis simplicibus sinuato-crenatis caulinis lyrato-pinnatisectis supremis ternatisectis v. simplicibus, foliolis lato-ovatis acutis sinuato-dentatis, floribus hermaphroditis triandris, fructibus ovatis compressis glabris. (TAB. CI.)—*Mich. Am. v. 1. p. 18. Pursh, Fl. Am. v.*

1. p. 28. *Nutt. Gen. Am.* v. 1. p. 26. *De Cand. Prodr.* v. 4. p. 638.— β . foliolis subintegerrimis.

Radix crassa, subrepens, fibras emittens. Caulis 2-3-pedalis, erectus, simplex, striatus, fistulosus, nitidus, ad nodos solummodo pubescenti-hirsutus. *Folia* (nisi ad ortum foliorum ubi fasciculus pilorum alborum) glaberrima; *radicalia* petiolata, lato-cordata, simplicia, obtusa, sinuato-crenata; *caulinia* pinnatisecta, foliolis pierumque 5; *superiora* sensim minora minusque petiolata, foliolis ovatis acutis sinuato-dentatis, in β . subintegerrimis, terminali latiore majore; supremis ternatisectis vel simplicibus, sessilibus. *Panicula* terminalis, cymosa, sublaxa, pedunculus pedicellisque hinc villosa, bracteata, bracteis oppositis basi connatis linearis-subulatis. *Flores* inter maiores hujusce generis, ut videtur rosei. *Corolla* tubus hinc gibbosus. *Stamina* 3 exserta. *Fructus* ovatus, compresso-planus, glaberrimus, dorso linea 1 elevata, facie superna lineis dubiis, pappo coronatus.

HAB. Woods in the Rocky Mountains, north of the Smoking River, (lat. 56° North,) and on Wolf Plain. *Drummond*. β . Moist rocks and islands of the Columbia River. *Douglas*, *Dr. Scouler*.

TAB. CI. *V. pauciflora*. *Fig. 1*, Flower with bracteæ; *Fig. 2*, Back view of a fruit; *Fig. 3*, Front view of do.:—*magnified*.

3. *V. capitata*; caule erecto glabro ad nodos pubescente, foliis radicalibus petiolatis subrotundis simplicibus, caulinis subsessilibus simplicibus vel ternatim-sectis, foliolis sinuato-serratis ovatis supremo maximo, panicula dense capitata, bracteis longissimis, corollæ tubo elongato, fructu ovato compresso glabro.—*Willd. Herb.—Cham. et Schlecht. in Linnaea*, v. 3. p. 130. *De Cand. Prodr.* v. 4. p. 637. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1. p. 125.

HAB. Kotzebue's Sound. *Chamiso. Messrs. Lay and Collie.* Arctic shores of America, between the Coppermine and Mackenzie Rivers. *Dr. Richardson.*—This is, as Schlechtendal and Chamiso observe, much allied to *V. Tripteris*, but it has a shorter and more compact habit: the flowers are in a dense head, and the bracteæ and tubes of the corollas are considerably longer.

ORD. LI. COMPOSITÆ.

Trib. I. CICHORACEÆ. Juss.

I. SONCHUS.

Involucrum polyphyllum cylindraceum basi saepe dilatatum, squamis appressis imbricatis membranaceis. *Receptaculum* subscrobiculatum vel nudum. *Flosculi* plurimi. *Achenia* linearis-oblonga subcompressa striata. *Pappus* (albissimum) sessilis inaequalis simplex vel scaber.—*Frutices aut Herbae radice perenni rarius annua, foliis saepe pinnatifidis glabris. Flores flavi vel caerulei.*

1. *S. olereus*; radice annua, foliis amplexicaulibus lyrato-uncinatis argute dentatis, pedunculis junioribus tomentosis.—*Linn. Sp. Pl.* p. 1116. *Pursh, Fl. Am.* v. 1. p. 501. *Elliott, Carol.* v. 2. p. 204. *Engl. Bot. t. 843. Bigel. Fl. Bost. ed. 2.* p. 289.

HAB. Throughout Canada, as far as the Saskatchewan. Newfoundland. *Mr. Cormack.* Mouth of the Columbia, North-West America. *Dr. Scouler*.

2. *S. arvensis*; radice perenni repente, foliis basi cordatis amplexicaulibus runcinatis argute dentatis, floribus subcorymbosis, pedunculis involucrisque piloso-glandulosis, acheniis rugoso-punctatis. *Linn. Sp. Pl.* p. 1116. *Pursh, Fl. Am.* v. 2. p. 501. *Engl. Bot. t. 674.* p. 289.

HAB. Newfoundland. *Miss Brenton*.—Probably introduced, as well as the former, from the Old World.

3. *S. pallidus*; racemis compositis, pedunculis squamosis, foliis lanceolatis dentatis glabris amplexicaulibus superioribus acuminatis. *Sm.*—*Willd. Sp. Pl. v. 3. p. 1521. Pursh, Fl. Am. v. 2. p. 502. Sm. in Rees' Cycl. n. 33.*—*Lactuca Canadensis. Linn. Sp. Pl. p. 1119.*

HAB. Canada. *Linnæus*.—Flowers small, yellow. *Pursh*.

4. *S. alpinus*; radice perenni, foliis amplis lyratis basi cordatis lobo terminali maximo triangulari, pedunculis subracemosis involucrisque glanduloso-hispidis (floribus cœruleis).—*Linn. Sp. Pl. p. 1117. Pursh, Fl. Am. v. 2. p. 501.*—*S. cœruleus. Engl. Bot. t. 2425.*

HAB. Canada. *Pursh*.

5. *S. Sibiricus*; radice annua, foliis lanceolatis sessilibus glabris integerrimis dentatis runcato-pinnatifidis, pedunculis squamulosis paniculatis involucrisque glaberrimis (floribus cœruleis).—*Linn. Sp. Pl. p. 1118. Rich. in' Frankl. 1st Journ. ed. 2. App. p. 30. Gmel. Fl. Sib. v. 2. p. 11. t. 3.*

HAB. From Lake Huron, (*Dr. Todd*) throughout the whole central part of British North America, to Fort Franklin in lat. 66°. *Dr. Richardson, Drummond, Douglas*. Plains of the Columbia, near the sea. *Douglas*.—This is liable to much diversity in the form of the leaves. The upper ones indeed are always entire, but varying in their relative length and breadth; the lower ones often toothed, pinnatifid, with narrow segments, frequently runcinate. The flowers are numerous, large, handsome, blue. The blue-flowered *Sou-thistles* constitute the genus *Agathyreus* of Mr. Don.

6. *S. leucophæus*; foliis sessilibus runcinatis acute dentatis glabris, caule paniculato-virgato, pedunculis racemosis squamosis involucrisque glabris (floribus parvis albis, pappo fulvo).—*Willd. Sp. Pl. p. 1520. Pursh, Fl. Am. v. 2. p. 501.*— β . panicula patentissima.

HAB. Lake Huron. *Dr. Todd, Dr. Torrey*, in Herb. Nostr. Etchemne, Canada. *Mrs. Sheppard, Saskatchewan. Drummond*.— β . Columbia River. *Dr. Scouler*.—This, I think, is certainly the *S. leucophæus* of Willdenow, who aptly compares it with the *S. alpinus* of Smith in *Ic. Pl. t. 21*, observing that the stem is more branched and paniculato-virgate, the flowers smaller, white, or bluish, which precisely corresponds with our specimens. I possess the same plant, sent by Dr. Torrey, inadvertently, as *Lactuca hirsuta*,* Muhl. I am doubtful about the genus. The foliage and general aspect are those of a *Sonchus*; while the small flowers and pappus look more like those of *Nabalus*; but the former are not pendent, nor the latter of so deep a tawny hue as in that genus. We have cultivated it in the Glasgow Botanic Garden, from seeds collected by Mr. Drummond; and I possess specimens gathered by the Rev. Mr. Schweinitz in Pennsylvania. My single specimen of var. β . is in a very indifferent state of preservation, and may be a distinct species.

2. NABALUS. Cass.

Flores nutantes. Involucrum cylindricum 5-12-florum e squamis erectis uniserialibus basi squamułosius. Receptaculum nudum. Achenia lineari-oblonga subcylindrica striata. Pappus coloratus sessili scaber.—*Habitus Prenanthidis, sed flores albidi, involucra pluri-flora, flosculi albidi, pappus coloratus fulvus. Folia ampla plerunque petiolata integra sinuata vel pinnatifida.*

* Another specimen sent to me afterwards, by the same Botanist, under the name of *L. hirsuta*, is a true Linnæan *Lactuca*.

1. *N. racemosus*; caule simplici, foliis indivisis integerrimis vel dentatis inferioribus obovato-oblongis longe petiolatis, petiolis alatis superioribus oblongo-ovatis sessilibus semi-amplexicaulibus, racemo elongato composito, pedunculis involucrisque hirsutissimis.—*Prænanthes racemosa*, *Mich. Am.* v. 2. p. 84. *Pursh*, *Fl. Am.* v. 2. p. 500.—*Harpalyce racemosa*. *Don*, in *Ed. N. Phil. Journ.* 1829, p. 308.

HAB. Northern parts of Canada. *Michaux*. Plains of the Saskatchewan. *Dr. Richardson*, *Drummond*.

2. *N. altissimus*; caule ramoso, foliis trilobis petiolatis angulatis denticulatis margine scabris, racemis axillaribus, floribus nutantibus, involucris subquinquefloris. *Pursh*.—*Prænanthes altissima*, *Willd. Sp. Pl.* v. 3. p. 1537. *Pursh*, *Fl. Am.* v. 2. p. 498. *Elliott*, *Carol.* v. 2. p. 256.—*Pluken. Alm.* t. 347. f. 2.

HAB. Canada. *Pursh*. Newfoundland. *Mr. Cormack*.

3. *N. cordatus*; caule superne paniculato, foliis petiolatis cordatis dentatis ciliatis, floribus sessilibus oblongis integerrimis, panicula laxa racemiflora, floribus nutantibus, calycibus 6-fidis 6-floris. *Pursh*.—*Prænanthes cordata*. *Willd. Hort. Berol.* t. 25. *Pursh*, *Fl. Am.* v. 2. p. 498. *Elliott*, *Carol.* v. 2. p. 257.

HAB. Canada. *Goldie*.—Mr. Pursh acknowledges this to be an intermediate species between the preceding and *N. albus*.

4. *N. alatus*; annuus, caule simplici, foliis longe petiolatis acutissimis deltoidicis sinuato-dentatis, petiolis alatis, panicula laxa parva, pedunculis involucrisque pubescenti-hirsutis. (TAB. CII.)

Radix parva, subfusiformis, ut videtur, annua. *Caulis* simplex, erectus, glaber, pedalis et ultra, superne paniculatus. *Folia* sublonge petiolata, membranacea, glabra; *superiora* sparse pubescens, deltaea, acutissima, sinuato-dentata, angulis acutis subdeflexis; *suprema* lanceolata, sessilia, integerrima. *Panicula* parva, laxa. *Pedunculi* pubescenti-hirsuti. *Flores* nutantes, majusculi (albi?) *Involucrum* cylindraceum, foliolis squamiisque pubescenti-hirsuti. *Flosculi* 7-9, apice 3-dentati. *Styli* exserti. *Achenia* linearia, striata. *Pappus* scaber, pallide fulvus; pilis numerosis.

HAB. Fort Vancouver and Observatory Inlet, on the North-West coast of America. *Dr. Scouler*.

TAB. CII. *N. alatus*. *Fig. 1*, Flower; *fig. 2*, Fruit; *fig. 3*, Hair from the pappus:—*magnified*.

5. *N. albus*; foliis radicalibus angulato-hastatis dentatis sublobatis, caulinis subrotundo-ovatis dentatis petiolatis summis lanceolatis, panicula laxa, fasciculis terminalibus nutantibus, involucri 8-phyllo 9-10-flori. *Pursh*.—*Prænanthes alba*. *Willd. Sp. Pl.* v. 3. p. 1536. *Pursh*, *Fl. Am.* v. 2. p. 499. *Sims*, *Bot. Mag.* t. 1079, (excell.) *Elliott*, *Carol.* v. 2. p. 259. *Bigel*, *Fl. Bost. ed.* 2. p. 259.

HAB. Lake Huron. *Dr. Todd*. Quebec. *Lady Dalhousie*, *Mrs. Percival*. Newfoundland. *Mr. Cormack*, *Miss Brenton*.

6. *N. serpentarius*; foliis dentatis asperis (?) radicalibus palmato-sinuatibus caulinis longe petiolatis sinuato-pinnatifidis subtrilobis lacinia intermedia 3-partita summis lanceolatis, racemis terminalibus subpaniculatis brevibus nutantibus, involucri 8-phyllo 12-flori.—*Prænanthes serpentaria*. *Pursh*, *Fl. Am.* v. 2. p. 499. t. 24.

HAB. Lake Huron. *Dr. Todd*. Quebec. *Mrs. Percival*, *Sillery*. *Mrs. Sheppard*. Newfoundland. *Mr. Cormack*.—Our specimens, from the localities now mentioned, so exactly accord with the figure above-quoted of Pursh, that I cannot at all question their being the true *Prænanthes serpentaria*; and

of frequent occurrence in the British Possessions. But I believe I am not singular in thinking that it may be a variety of *N. albus*, to which *N. cordatus* and *altissimus* are too closely allied; from which again our *N. alatus* is chiefly to be distinguished by its winged petioles. *Prænanthes virgata* of Michaux, *P. rubicunda* of Willdenow, and *P. simplex* of Pursh may perhaps, with equal safety, be referred to *N. albus*.

3. LYGOIDESMIA. Don.

Involucrum pentaphyllum, tubulatum, basi squamulis plurimis brevissimis imbricatis munitum, foliolis ligulatis carinatis margine scariosis. *Receptaculum* scrobiculatum. *Flosculi* 5. *Antheræ* basi bidentatae. *Achenia* linearia compressa sulcata apice simplici. *Pappus* capillaris: radiis multiplici ordine copiosissimus (vel paucis) denticulato-serratis (plumosissime) subpersistentibus.—Suffrutices (*seu* herbeæ) Amer. Bor. et Syria, facie Ephedrae, ramosissimi aphylli (*in* L. juncea evidentissime foliosi) squamis (*foliorum* rudimentis) subulatis, patulis sparsis. Flores solitarii sessiles. Pappus carnosus fuscocencens. Don.

1. *L. juncea*; caule ramosissimo striato, foliis lineari-subulatis, pappi pilis numerosissimis scabris. (TAB. CIII.)—Don, in Ed. N. Journ. of Sc. 1829. p. 311.—*Prænanthes juncea*. Pursh, Fl. Am. v. 2. p. 498.

Radix subsufformis, longa, ut videtur, perennis. *Caulis* erectus vel subdecumbens, herbaceus, pedalis ad bipedalem, per totam longitudinem ubique valde ramosus, striatus, subglaucus, ramis erectis vel flexuosis, longis, subvirgatis. *Folia* alterna, fere omnino ad insertionem ramorum, rigida, subglauca, lineari-subulata, striata, integerrima, sessilia sed non amplectantia; *inferiora* 2 uncias longa, *superiora* sensim minora. *Rami* ultimi, seu pedunculi, graciles uniflori, bracteis seu foliis parvis subulatis suffulti. *Flores* terminales, unciam longi, cerulei. *Involucrum* cylindraceum, o foliolis 5, erectis, lineari-oblongis, membranaceis, margine subcariosis, basi squamosis; squamis erectis, imbricatis, brvibus. *Flosculi* 5, majusculi. *Corolla* ligulata, lata, 5-dentata. *Staminum* tubus elongato-cylindraceus: *Antheræ* basi utrinque breve calcaratae. *Stylus* inclusus. *Stigma* exserta, linearia, erecto-patentia, glandulosa-pubescentia. *Achenia* oblonga, striata, ad orem dilatata. *Pappus* sessilis e pilis numerosissimis sub lente scabris.

HAB. Dry plains of the Saskatchewan. Drummond.—There is a peculiarity in the habit of this plant, as Mr. Don justly observes; and I have adopted that Botanist's genus and character of *Lygodesmia*, including, indeed, the *Prænanthes triquetra* of Labillardière, a Syrian plant, with which I am unacquainted. The American *P. pumila*, Baldw. mentioned by Don, (I presume the *P. aphylla* of Nuttall, Nov. Gen. v. 2. p. 123,) is equally unknown to me. With the exception of the leaflets of the involucle not being carinated in our *L. juncea*, it agrees in every point with Mr. Don's *Lygodesmia*: but a second species, next to be mentioned, has a pappus of a very different character, yet is unquestionably the same genus. In neither, however, can the stems be said to be leafless, nor can they be compared to those of *Ephedra*.

TAB. CIII. *L. juncea*. Fig. 1, Flower; fig. 2, Floscule; fig. 3, Anthers and stigmas; fig. 4, Achenium: fig. 5, Portion of the hair of an achenium:—magnified.

2. *L. minor*; caule ramosissimo obscure striato, foliis lineari-subulatis brevibus, pappi pilis sub-16 plumosis.—(TAB. CIII. f. A. quoad fruct.)—*Prænanthes juncea*. Douglas, MSS. in Herb. Hort. Soc. (non Purshii.)

HAB. On gravelly or sandy banks of the Columbia, near Wallawallah, frequent. Douglas.—This is, according to Mr. Douglas, 1-2 feet high. The specimens I possess scarcely exceed 10 inches, and the leaves and flowers are smaller than those of the preceding species; yet in every other respect the plants are so similar that it is scarcely possible to distinguish them until the pappus be examined. This is totally different from that of *L. juncea*; for whereas there it is composed of an infinity of very slender, tawny, and merely scabrous hairs, here it consists of about 16 feathery hairs.

TAB. CIII. A. Flower and portion of a hair from the pappus of *Lygodesmia minor*.

4. LACTUCA. *Linn.* (*part of*)

Involucrum cylindraceum, squamis seu foliolis erectis imbricatis, exterioribus latioribus. *Receptaculum* planum, nudum. *Achenia compressa*. *Pappus* niveus, stipitatus, pilis scabris seu levibus.

1. *L. elongata*; subglabra, foliis uncinatis dentatis subtus glaucis inferioribus petiolisque hirsutis superioribus subintegris, floribus corymboso-paniculatis. *Willd.* *Enum.* p. 817. *Pursh*, *Fl. Am.* v. 2. p. 500. *Elliott*, *Carol.* v. 2. p. 252.—*L. longifolia*. *Mich. Am.* v. 2. p. 85. (fido Elliott.)—*L. hirsuta*. *Muhl. Cat.*—*Nutt. Nov. Gen.* v. 2. p. 124?

HAB. Lake Huron. *Dr. Todd*. Plains of the Saskatchewan. *Dr. Richardson*, *Drummond*.—As the lower leaves of this plant are frequently hairy, especially upon the petioles, I am disposed to believe that the *L. hirsuta* of Muhl. Cat. is the same species, and Dr. Torrey entertains a similar opinion.

5. LEONTODON. *Linn.*

Involucrum imbricatum, foliolis appressis seu exterioribus patentibus. *Receptaculum* planum, punctatum, nudum. *Pappus* stipitatus, simplex.

1. *L. Taraxacum*; involuci squamis inferioribus reflexis, foliis runcinatis dentatis.—*Linn. Sp. Pl.* p. 1122. *Engl. Bot.* t. 510. *Pursh*, *Fl. Am.* v. 2. p. 497.

HAB. Throughout the British Possessions, and on both sides of the Rocky Mountains.

2. *L. palustre*; involuci foliolis erectis appressis, foliis sinuato-dentatis glabriusculis.—*Engl. Bot.* t. 533. *Hitch. in Frankl.* 1st *Journ.* ed. 2. *App.* p. 29.

HAB. Throughout the British Possessions, and from Hudson's Bay to the Pacific.

3. *L. hirsutum*; ubique hirsutum, involuci foliolis erectis appressis, foliis pinnatifidis segmentis inaequilibus remotis acuminatis.

HAB. Menzies Island, and sandy banks of the Columbia. *Douglas*. *Dr. Scouler*.—The leaves of this are very different from any of the numerous varieties of the two preceding species that I have seen; and they and the scapes and involucres are very hairy; the latter clothed with fulvous hairs.

6. APARGIA. *Schreb.*

Involucrum imbricatum, foliolis interioribus aequalibus, exterioribus minoribus. *Receptaculum* nudum, punctatum. *Pappus* plumosus, sessilis.

1. *A. autumnalis*; capo ramoso superne squamoso, foliis lanceolatis dentatis seu pinnatifidis glabriusculis, pedunculus superne incrassatus, involuero subpubescente.—*Willd. Sp. Pl.* p. 1550. *Pursh*, *Fl. Am.* v. 2. p. 497.—*Hedypnois autumnalis*. *Huds.*—*Engl. Bot.* t. 830.—*Leontodon autumnale*. *Linn.*

HAB. Newfoundland. *Mr. Cormack*.—Pursh gives this plant as a doubtful native of the New England States. It is probably also introduced into Newfoundland from Europe.

7. LAPSONA.

Involucrum subcylindraceum; foliolis paucis basi squamu-
losum. *Receptaculum* nudum. *Achenia* oblonga basi attenuata. *Pappus* nullus.

1. *L. communis*; involuci fructu angulato, caule paniculato, pedunculis gracilibus, foliis ovatis petiolatis angulato-dentatis.—*Linn. Sp. Pl.* p. 1141. *Engl. Bot.* t. 844.

HAB. Canada. *Mrs. Sheppard*. Probably introduced from Europe.

8. CICIORIUM. Linn.

Involucr. foliola duplii serie. *Receptaculum* subpaleaceum. *Achenium* erostre, turbinatum, conforme. *Pappus* brevis, biserialis, pilis paleaceis ellipticis obtusis.

1. *C. Intybus*; floribus geminatis subsessilibus, foliis uncinatis.—*Linn. Sp. Pl. p. 1142. Engl. Bot. t. 539.*

HAB. Canada. *Mrs. Percival. Mrs. Sheppard.*—Introduced from Europe.

9. CREPIS. Linn.

Involucr. foliola duplii serie, externa laxa, brevia. *Receptaculum* nudum. *Achenium* teres, sensim in rostrum breve attenuatum. *Pappus* pluriserialis, albus, mollissimus.

1. *C. biennis*; caule clato sulcato, foliis radicalibus obovato-lanceolatis plerumque runcinato-dentatis seu pinnatifidis summis lanceolatis, involucro subsenistro pubescente.—*Linn. Sp. Pl. p. 1136. Engl. Bot. t. 149.*— β . foliis lato-rubis plerumque runcinato-dentatis rarius pinnatifidis nunc omnino integerrimis.

HAB. α . Carlton House, on the Saskatchewan, to the Prairies on the Rocky Mountains. *Drummond.* Lake Huron. *Dr. Todd.*—The radical leaves of this are invariably wider than in any specimens I have seen of the European *C. biennis*, and more entire; yet I dare not venture to consider it a different species.

2. *C. elegans*; humilis glaberrima, radice multicipite, caulinis erectis dichotomis multifloris, foliis inferioribus spatulatis superioribus linearibus, involucris cylindraceis, acheniis tenuissime rostratis.

HAB. "Battures" of the Assinaboyne River. *Drummond.*—Allied to the following, but unquestionably distinct. The stems are numerous from the summit of the fusiform root, 5-6 inches high, dichotomous and leafy, the leaves gradually narrower upwards.

3. *C. nana*; humillima glaberrima, caulinis subnulis, foliis ovatis subrotundatis longe petiolatis flores superantibus, involucris cylindraceis, acheniis in rostrum attenuatis.— α . foliis ovatis acutiusculis integris.—*C. nana. Rich. in Frankl. 1st Journ. ed. 2. App. p. 29. Hook. in Parry's 2d Voy. App. p. 397. t. 1.*— β . foliis subrotundatis plerumque lyrato-pinnatifidis.

HAB. α . Barren grounds from lat 64° to the Arctic Sea and Islands. *Dr. Richardson. Capt. Sir E. Parry.*— β . On the stony debris of the Rocky Mountains. *Drummond.*—The alpine specimens have the leaves usually rounder and pinnatifid.

10. HIERACIUM. Linn.

Involucrum imbricatum, ovatum. *Receptaculum* nudum, punctatum seu pilosum. *Pappus* uniserialis, pilosus, superissime sordide flavescens. *Achenium* erostre, sulcatum.

1. *H. pusillum*; pusillum villosissimum, caule simplici erecto unifloro remote subsiliato, foliis lanceolatis attenuatis acutis integerrimis caulinis linearibus, calye villosissimo. *Pursh, Fl. Am. v. 2. p. 502.*

HAB. Labrador. *Kohlmeister. (Pursh.)*—A very small plant, with flowers the size of a daisy. It strongly resembles *H. alpinum*, and is probably only a diminutive var. of it."

2. *H. venosum*; scapo nudo corymboso-paniculato glabro, pedicellis filiformibus, foliis obovato-lanceolatis supra rarer pilosis subtus nudis margine ciliatis glanduloso-denticulatis,

*venis coloratis, calycibus glabris. Ph.—Linn. Sp. Pl. p. 1125. Pursh, Fl. Am. v. 2. p. 502. Bigel. Fl. Bost. ed. 2. p. 288.—*β. *gracilum*; foliis angustioribus magis petiolatis venis vix coloratis.

HAB. Canada. *Pursh*.—β. About the Saskatchewan. *Drummond*.—The true *H. venosum*, with broader leaves and coloured veins, (such as I have received from Dr. Boot, gathered near Boston,) I have never seen from the British Possessions. But my var. β. I have reason to think is not specifically distinct from it. I must however, state, that, from the varied appearances assumed by the North American *Hieracia*, I fear they are nearly as difficult of determination as those of Europe.

3. *H. gracile*; scapo nudo seu monophyllo glabro superne cymoso-racemoso pubescente involucrisque nigro-pilosus subglandulosis, foliis oblongis obtusiusculis glabris in petiolum longiusculum attenuatis membranaceis integerrimis, floribus parvis.

HAB. On the more elevated Rocky Mountains. *Drummond*.—12-18 inches high, slender, and with a good deal the habit of *H. renosum*; but the foliage is different, the panicle is reduced to a raceme, whose lower pedicels are considerably elongated, and they, in their upper part, and the involucres, are clothed with long black hairs, mixed with some pedicellate glands.

4. *H. albiflorum*; caule folioso inferne molliter deflexo-piloso, foliis lato-lanceolatis integerrimis obtusis in petiolum attenuatis longe albo-pilosis, caulinis remotiusculis sensim minoribus sessilibus, panicula gracili multiflora glabra, pediellis divaricatis, involucris pilis longis albidis sparsis, “floribus albis.”

HAB. Alpine woods in the Rocky Mountains, north of the Smoking River, in lat. 50°. *Drummond*.—This has somewhat the habit of *H. Gronovii*, but it is very different in other particulars. The leaves are clothed with long, shaggy, very soft white hairs, which are copious, and remarkably deflexed on the petioles and base of the stem; while the rest of the stem and the panicle are glabrous, and the involucres has only a few long, scattered, patent hairs.

5. *H. Scouleri*; setoso-pilosum, pilis longis rigidis patentibus fuscescentibus, caule folioso paniculato, panicula ampla multiflora ramis erectis, foliis lato-lanceolatis subcoriaceis rigidis acutis vix dentatis, radicalibus in petiolum brevem attenuatis, caulinis remotiusculis sessilibus, involucris fuscescenti-pubescentibus pube pilis longiusculis glandulosis immixto.

HAB. At the mouth of the Columbia. *Dr. Scouler*.—A remarkable and distinct species; in its very long coarse rigid hairs alluded to *H. echinoidea* of Waldstein and Kitaibel, and to a very singular species from River St. Clair, United States, (*H. longipilum*, of Torrey, in *Herb. Nostr.*.) but there the hairs are nearly an inch long, and remarkably upright and appressed. I possess our present plant also from Dr. Schweinitz, gathered in Pennsylvania.

6. *H. Gronovii*; caule folioso, inferne præcipue patentim piloso superne paniculato, panicula subcompacta, foliis lato-scru obovato-lanceolatis rigide appressim pilosis integerrimis obtusis, inferioribus radicalibusque sublonge petiolatis, caulinis remotis sessilibus sensim minoribus, pedicellis involucrisque pube pilisque glandulosis tectis.—*Linn. Sp. Pl. p. 1127. Mich. Am. v. 2. p. 87. Pursh, Fl. Am. v. 2. p. 503.—H. Murianni. Bigel. Fl. Bost. ed. 2. p. 288.—*β. foliis caulinis numerosis latioribus.—*H. scabrum. Darlington, Fl. Cestr. p. 84.* (sive specim. in *Herb. nostr.*) *Mich. Am. v. 2. p. 86?*

HAB. Canada. *Michaux. Pursh. Mrs. Sheppard. Mrs. Percival. Lake Huron. Dr. Todd*.—From various parts of the United States I have received two states of this species: the one (α.) a slender plant, with few and distant and narrower leaves on the stem, and more petiolated radical ones; and (β.), a much

stouter plant, with broader and more numerous leaves, and larger and more spreading panicles. The latter is the *H. securum* of Dr. Darlington, and probably of Michaux and other authors. Pursh refers the *H. Marianum* of Willd. to the present species, and correctly so, if I may judge by Dr. Schweinitz' specimens. I infer that our plant is the *H. Marianum* of Bigelow, for his description agrees with it, and Dr. Boott's specimens, from Boston, compared with and named "*H. Gronovii* of Michaux's Herbarium," have also, for synonym, *H. Marianum*, Willd.

7. *H. molle*; pilosum, caule erecto simplici folioso, corymbo paucifloro, foliis oblongo-lanceolatis attenuatis inferne paniculatis, radicalibus petiolatis. Pursh, *Fl. Am.* v. 2. p. 503. "Willd. Sp. Pl. v. 3. p. 1577?"

HAB. Labrador. Kohlmeister, (ex Pursh.)

8. *H. paniculatum*; glabriusculum, caule erecto folioso paniculato inferne albo-lanato, pedicellis capillaribus, foliis lanceolatis nudis dentatis membranaceis. Ph.—Linn. Sp. Pl. p. 1127. Mich. Am. v. 2. p. 86. Pursh, *Fl. Am.* v. 2. p. 503.

HAB. Canada. Pursh. Goldie.—A slender, very leafy species, with an ample and much branched panicle.

9. *H. virgatum*; caule erecto simplici villosi, foliis sessilibus lanceolatis acutis glabris subtus pilosis argute dentatis versus apicem integerimis dentibus divaricatis, panicula subcorymbosa, calycibus pedunculisque tomentosis. Pursh, *Fl. Am.* v. 2. p. 503.—"H. Canadense. Mich. Am. v. 2. p. 86."

HAB. Canada. Pursh, (ex Herb. Lamb.)

10. *H. fasciculatum*; glabriusculum, caule erecto folioso simplici glabro, foliis sessilibus oblongis acutis argute dentatis dentibus elongatis, ramis paniculae divaricatis brevibus, pedicellis subfusciculatis pubescentibus. Pursh, *Fl. Am.* v. 2. p. 504.

HAB. Canada. Masson, (ex Pursh.)—"A tall robust plant; flowers of a middling size."

11. *H. macrophyllum*; altissimum, caule erecto folioso hispido sulcato, foliis cordato-semiamplexicaulis ovato-oblongis remote grosse dentatis nudiusculis, nervis venisque subtus pubescentibus, panicula divaricato-corymbosa, pedunculis elongatis nudis calycibusque glabris. Pursh, *Fl. Am.* v. 2. p. 504.

HAB. Canada, ex Herb. Lamb. (Pursh.)—"A very robust plant. Leaves the largest of the Genus. Flowers large."—I am entirely unacquainted with this and the two preceding species of Pursh. One or other of the following species may be included among them.

12. *H. sylvaticum*; caule folioso superne ramoso subcorymboso subviloso, pedunculis magis minusve pubescentibus, foliis ovato-lanceolatis lanceolatis subhirsutis dentatis dentibus erectis, involucris breviter pubescentibus.—Sm. Engl. Bot. t. 2031.—a. foliis ovato-lanceolatis viridibus, dentibus minutis. Hook. Br. Fl. ed. 2. p. 345.

HAB. Pointe Levi, Canada. Mrs. Sheppard.

13. *H. prænanthoides*; caule erecto folioso pubescenti-hirsuto, panicula corymbosa, pedicellis involucrisque piloso-glandulosis, foliis oblongo-cordatis basi semiamplexicaulis, superioribus sensim minoribus ovato-cordatis omnibus grosse remote dentatis.—Vill. Delph. v. 3. p. 108. Engl. Bot. t. 2235.

HAB. Lake Huron. Dr. Todd. About Quebec. Mrs. Sheppard. Mrs. Percival. Cumberland House Fort, on the Saskatchewan. Drummond.—This may probably be the *H. macrophyllum* of Pursh; but the specimens entirely agree with the Engl. Bot. *H. prænanthoides*.

14. *H. umbellatum*; caule erecto simplici valde folioso, foliis linear-lanceolatis glabriusculis dentatis integerrimisque, floribus subumbellatis, pedunculis pubescentibus, involucris glabris.—*Linn. Sp. Pl. p. 1191. Engl. Bot. t. 1771. Rich. in Frankl. 1st Journ. ed. 2. App. p. 29.*

HAB. From Lake Huron, Dr. Todd, to Fort Franklin, on the Mackenzie River, in lat. 66° north, abundant. Dr. Richardson. Drummond.

11. TROXIMON. Nuttall, an Gært.⁸

Involucrum duplex: ext. e foliolis laxe imbricatis ovato-lanceolatis; int. e foliolis 10-12 æqualibus uniformibus, infra medium coadunatis. *Receptaculum* planum, nudum. *Achenia* oblonga, compressa, in rostrum attenuata. *Pappus* pilosus seu scaber, pluriserialis.—*Habitus* Scorzonerae sed folia omnino radicalia.

1. *T. glaucum*; foliis linear-ensiformibus acutis acuminatis integerrimis dentatisque glaucis, flore maximo flavo, corollæ fauce valde piloso.—*Nutt. in Frazer's Cat. 1813. Pursh, Fl. Am. v. 2. p. 505. Rich. in Frankl. 1st Journ. ed. 2. App. p. 29.*—a. involucro lanato.—β. involucro glabro.

HAB. From the Saskatchewan to the Prairies of the Rocky Mountains, and to the shores of the Arctic Sea. Dr. Richardson. Drummond.—I suspect the *T. cuspidatum* of Pursh, (the *marginatum* of Nuttall,) is merely a variety of *T. glaucum*.

2. *T. aurantiacum*; foliis oblongo-lanceolatis obtusis in petiolum longe attenuatis integerrimis sinuato-dentatisque, flore aurantiaco, corollæ fauce vix piloso. (TAB. CIV.)

Radix fusiformis, perennis. *Folia* plurima, omnino radicalia, erecta, glabra vel sublanata, membranacea, oblongo-lanceolata, obtusa, in petiolum longum plerumque purpurascens attenuata. *Scapus* spithameus ad pedalem, erectus, teres, glaber, superne solummodo pubescens. *Flos* terminalis, "aurantiacus" (Drummond), siccitate fere purpureus, erectus. *Involucrum* basi lanosum, duplex: int. e squamis 10-12 erectis, linear-oblongis, æqualibus, obtusis, basi ad medium coadunatis; ext. e foliolis vel squamis 5-6, latolanceolatis, laxe imbricatis, erectis. *Receptaculum* nudum. *Corolla* numerose, ligulatae, calycis foliola excedentes, apice 5-dentatae: *tubus* glabrinervius, ad fancem vix pilosus. *Achenium* oblongum, compressum, leviter striatum, in rostrum attenuatum. *Pappus* e pilis numerosis, æqualibus, albissimis, sub lente scabris.

TAB. CIV. Troximon aurantiacum. Fig. 1, Floret; fig. 2, Involucrum; fig. 3, Inner involucrum; fig. 4, Achenium and pappus; fig. 5, Section of the achenium:—more or less magnified.

HAB. Alpine Prairies of the Rocky Mountains. Drummond.—Whether this Genus be the same as *Troximon* of Gærtner, I am unable to say, having no means of determining. It is, I think, identical with Nuttall's *Troximon*; but that author describes the pappus as *plumose*, which is not the case in my plants, it is only very minutely scabrous. The beak of the achenium, in either species, is not evident till the fruit is ripe.

12. HYMENONEMA. Cass.

Involucrum cylindraceum, foliolis imbricatis, appressis, ovalibus, acutis, coriaceis, marginibus membranaceis. *Receptaculum* nudum. *Achenium* cylindraceum. *Pappus* e pilis paucis scabris æqualibus, basi membranaceo-dilatatis.

1. *H. ? glaucum*; foliis linear-acuminatis canaliculatis glaucis.

HAB. About Fort Vancouver on the Columbia. N. Garry, Esq.—Of this there is only a single specimen, and it appears to be unbranched.

2. *H. laciniatum*; caule ramoso, foliis profunde pinnatifido-laciinatiis, laciiniis angusto-linearibus subfiliiformibus.

HAB. Dry plains of the Columbia, from the Rocky Mountains to the ocean. *Douglas*.—This and the preceding plant evidently belong to one and the same genus, and have entirely the habit of *Scorzonera*; but in both, the hairs of the pappus are few in number (about 10), rather harsh and rigid, of a brownish or tawny hue, singularly dilated at the very base, with the upper part very minutely scabrous. Hence it will be seen to accord in a very important particular with *Hymenonema* of Cassini, (a genus supposed to be peculiar to the eastern parts of the Mediterranean region;) but that author describes the hairs of the pappus as bearded (*barbés*) above, and Lessing calls it featherly. Both our plants appear to be annual.

13. KRIGIA. Willd.

Involucrum polyphyllum, simplex. *Receptaculum* nudum. *Achenium* turbinatum. *Pappus* biserialis; serie ext. coroniformi, e squamis 5–8 membranaceis brevibus; int. e setis paucis (5–24), scabris.

1. *K. Virginica*; glauca, foliis primariis rotundatis integris reliquis lyratis glabris, scapo unifloro glabro demum foliis longiore, calyce glabro. *Nutt*.—*Willd. Sp. Pl. p. 1618. Pursh, Fl. Am. v. 2. p. 504. Bigel. Fl. Bost. ed. 2. p. 289.*—*Hyoseris Virginica. Linn. Sp. Pl. p. 1138. Mich. Am. v. 2. p. 88.*

HAB. Canada. *Michaux. Pursh.*

Trib. II. CYNAREÆ. *Lessing.**

Subtrib. I. CENTAURIEÆ. *Less.*

14. CENTAUREA. *Linn.*

Involucrum imbricatum. *Receptaculum* setosum. *Pappus* simplex aut nullus. *Cor. radii seu floris neutri, si adest, 5-partita.*

1. *C. nigra*; involuci squamis ovatis pectinato-fimbriatis patulis, foliis radicalibus angulato-lyratis, caulinis oblongis, radio nullo.—*Linn. Sp. Pl. p. 1288. Engl. Bot. t. 278.*

HAB. Newfoundland. *Miss Brenton*.—Introduced.

Subtrib. II. CAPNIVINEÆ. *Less.*

15. ARCTIUM. *Linn.*

Involucrum globosum, foliolis squarrosis lanatis. *Receptaculum* paleaceum. *Pappus* simplex, multiserialis, brevis, pilis singulis valde caducis.—*Herbae dichotomaæ, foliis petiolatis ovatis subtus pallidioribus.*

1. *A. Lappa. Linn. Sp. Pl. p. 1149. Engl. Bot. t. 38. (and t. 2478, A. Bardana.)*

HAB. Canada. *Mrs. Percival. Mrs. Sheppard. Lake Huron. Dr. Todd.*

16. CARDUUS. *Linn.*

Involucrum tumidum, imbricatum, squamis spinosis. *Receptaculum* setosum. *Pappus*

* Whilst this portion of the *Compositæ* is in the press, I have the great satisfaction of receiving the valuable "Synopsis Generum Compositarum earumque Dispositionis novæ Tentamen," &c. of C. F. Lessing; and have no hesitation in adopting, as far as possible, the arrangement of so able an observer, and one who has studied this difficult tribe of plants with the greatest ardour, and under very favourable circumstances. I have only to regret, that I could not derive the advantage such a work is capable of affording for the whole of the Order.

plumosus vel scaber.—*Herbo pertotam zonam temperatam divulgata nec non regiones alpinas America tropicæ habitantes, spinosa; capitulis luteis vel purpurascensibus; rachide palcaceo-fimbrillifera.* (*Less.*)

(*Pappus plumosus*. *Cnicus*, *Willd.* *Cirsium*, *Spr.*, non *Gærtn.*)

1. *C. lanceolatus*; foliis decurrentibus rigidis strigoso-hispidis pinnatifidis, lacinia lanceolatis bifidis divaricatis spinosis, involucri squamis lanceolatis patentibus.—*Linn. Sp. Pl.* p. 1149. *Engl. Bot. t. 107.*—*Cnicus lanceolatus*. *Pursh*, *Fl. Am. v. 2. p. 506.* *Bigel. Fl. Bost. ed. 2. p. 292.*

HAB. Newfoundland, *Miss Brenton.*

2. *C. discolor*; pubescenti-lanatus, foliis sessilibus lanceolatis subflaccidis magis minusve sinuato-pinnatifidis spinoso-ciliatis lobis acutis spinosis sèpissime bilobis supra glabriusculis subtus albo-tomentosis, involucro globoso lanato, squamis linearí-acuminatis spinosis, spinis patentibus.—*Nutt. Gen. Am. v. 2. p. 130.*—*Cnicus discolor*. *Muhl. Cat.*—*Willd. Sp. Pl. v. 3. p. 1670.*— β . floribus albis.

HAB. Canada. *Mr. Cleghorn*. *Mr. Goldie*. Banks of the Saskatchewan. *Dr. Richardson*. *Douglas*. *Drummond*. Plentiful on the North-West coast, and about Fort Vancouver. *Douglas*. *Dr. Seouler*.— β . Prairies of the Rocky Mountains. *Drummond*.—The leaves are very variable, especially the radical ones; some are deeply pinnatifid, others quite entire.

3. *C. arvensis*; foliis sessilibus lanceolatis pinnatifido-dentatis spinuloso-ciliatis undulatis glabriusculis, caule paniculato, involucri ovati squamis appressis mucronatis.—*Sm. Engl. Bot. t. 975.*—*Cnicus arvensis*. *Pursh*, *Fl. Am. v. 2. p. 506.* *Bigel. Fl. Bost. ed. 2. p. 291.*—*Serratula arvensis*. *Linn.*

HAB. Throughout Canada to the Saskatchewan. *Mrs. Sheppard*. *Mrs. Percival*. *Drummond*. Newfoundland. *Mr. Cornack*. *Miss Brenton*.—Of this plant, Lessing has constituted the Genus *Breea*, chiefly on account of its dioecious flowers.

4. *C. muticus*; canle alato glabro, foliis sessilibus profunde remote sinuato-pinnatifidis supra glabriusculis subtus pallidioribus arachnoideo-tomentosis segmentis lanceolatis acuminatis spinuloso-laciatis, involucri subglobosi squamis arcte appressis lanatis submucronatis.—*Nutt. Gen. Am. v. 2. p. 374.*—*Cirsium muticum*. *Mich. Am. v. 2. p. 89.*—*Cnicus muticus*. *Pursh*, *Fl. Am. v. 2. p. 506.*

HAB. Banks of the Saskatchewan. *Dr. Richardson*. *Drummond*.

5. *C. pumilus*; caule humili retrorsum piloso 1-3-floro, foliis utrinque viridibus sessilibus semiamplexicaulibus oblongo-lanceolatis pinnatifidis segmentis inæqualiter lobatis spinoso-ciliatis spinisque terminatis, involucri magni subglobosi nudi squamis lanceolatis acuminatis appressis spina brevi terminatis. *Nutt. Gen. Am. v. 2. p. 130.*—*C. odoratus*. *Muhl. Cat.*—*Darlingt. Fl. Cestr. p. 85.*

HAB. Banks of the Saskatchewan, and Prairies of the Rocky Mountains. *Drummond*.—“Flowers large, red.”

6. *C. remotifolius*; caule elato stricto arachnoideo-tomentoso inferne præcipue, foliis

remotis sessilibus semiamplexicaulibus profunde pinnatifidis supra laxe pilosis subtus pubescenti-lanatis segmentis remotis subpinnatifidis lanceolatis inferne sinuato-spinosis lobis omnibus spinosis, panicula paucifoliata, involucri globosi magni squamis numerosis laxis linearibus exterioribus elongatis spina terminatis, interioribus membranaceo-acuminatis.

HAB. Gravely soils on the banks of streams, common in the valley of the Columbia. *Douglas*.—“Three to five feet high.” Stem dark-purple above. In the only specimen in my possession the leaves are very remote, gradually smaller upwards, the margins near the base with many rather stout spines. The outer scales of the involucre are lax and patent, nearly equalling the innermost ones in length.

7. *C. foliosus*; caule erecto simplici (?) robusto striato sublanato, foliis erectis superne numerosis flores excedentibus linear-lanceolatis mollibus irregulariter sinuato-dentatis spinis rigidiusculis inequalibus ciliatis supra parce hirsutis subtus arachnoideo-tomentosis pallidis, floribus magnis glomeratis in axillis foliorum supremorum, subsessilibus involucri squamis linearibus appressis, pappo copiosissimo.

HAB. Prairies of the Rocky Mountains. *Drummond*.—This is a very remarkable species, of which unfortunately only two specimens exist in the collection. The stems are singularly erect and straight, and the leaves also erect, 6-8 inches long, the uppermost very numerous, considerably exceeding, and almost concealing, the flowers.

17. SAUSSUREA. *De Cand.*

Involuci subcylindracei squamae imbricatae muticae. Receptaculum setosum vel paleaceum. Pappus biserialis, serie exteriori brevi piliformi; interiori longa et plumosa. Antheræ caudæ subintegrae. Achenium glabrum.

1. *S. alpina*; foliis lanceolatis dentatis subtus lanatis radicalibus ovato-lanceolatis petiolatis, floribus corymbosis congestis, involuci superne villosi squamis oblongis. *De Cand.*—*Serratula alpina*. *Linn.*—*Engl. Bot.* t. 599.— β . *densa*; caule subdecumbente, foliis glabriusculis densis fere omnibus anguste lanceolatis, corymbis glomeratis.— γ . *remotifolia*; caule erecto striato, foliis glabris rigidis anguste lanceolatis superioribus minutis.

HAB. β . Elevated parts of the Rocky Mountains. *Drummond*.— γ . North of the Saskatchewan to the Bear Lake, in lat. 66° North. *Dr. Richardson*: and extending to Behring's Straits. *Chamisso*.—Two (and if, as I suspect, the following species should be united with it, three) very remarkable states of this plant are in the collection, and all exceedingly different from our British *S. alpina*, which is more robust, and has much broader and more woolly leaves.—Var. β . has the stem decumbent, the leaves copious, crowded, and as long and broad in the upper as in the lower portion of the stem.—Var. γ . is very similar in habit to my specimens from Mont Cenis, and from Norway, (in the *Unio Itineraria*, 1828,) but the leaves are almost entirely glabrous and more rigid.

2. *S. monticola*; paucæ lanata, foliis linearibus integerrimis, foliolis involuci oblongo-cylindracei villosi lanceolatis acutis. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 29.*—*S. multiflora*. *Frankl. 1st Journ. ed. 1. App. p. 747.*

HAB. On the Copper Mountains, in grassy plains, lat 67°, (*Frankl. 1st Journ.*) and on the Arctic coast, between the Mackenzie and Coppermine Rivers, (*2d Journ.*) *Dr. Richardson*.—One specimen only exists in the collection of the 2d Expedition, and this quite agrees with the character given by Dr. Richardson of his *S. monticola*. It has narrower, more rigid and entire leaves, and a more hairy involucre than *S. alpina*.

Trib. III. VERNONIACEÆ. *Less.*

Subtrib. VERNONIEÆ. *Capitula multiflora et homogama aut uniflora, involucro imbricato et multiseriali. Styli rami acuminati. Involucrum teres. Cor. plerumque purpureo-violaceæ aut albae.* *Less.*

18. VERNONIA. *Schreb.*

Capitulum multiflorum. Rachis ebracteolata. Pappus pluriserialis, serie exteriori e setis vel paleis distinctis et crebris constante.—Arbores, Frutices, seu Herbae, plerumque Americanæ, quarum in parte occidentali Americae Septentrionalis ne una quidem, Meridionalis non nisi 0,07 occurunt, facie polymorpha; ramis foliisque alternis rarissime oppositis; capitulis violaceo-purpuris aut albis, rarissime luteis. *Less.*

1. *V. præalta*; altissima, foliis crebris lanceolatis serrulatis scabris, corymbo fastigiato, calycinis squamis acutis vel apice filiformibus. *Willd. Sp. Pl. v. 3. p. 1633. Mich. Am. v. 2. p. 95. Pursh, Fl. Am. v. 2. p. 511. Elliott, Carol. v. 2. p. 267.*—*Serratula præalta. Linn.* —*V. Noveboracensis. Willd. Sp. Pl. v. 3. p. 1632. Mich. Am. l. c. Pursh, l. c. Elliott, Carol. v. 2. p. 269. Bigel. Fl. Bost. ed. 2. p. 294.*—*Serratula Noveboracensis. Linn. Hort. Cliff.*—*Dill. Hort. Ethn. t. 263 et 264.*

HAB. Canada. *Pursh.*—I never had been able to detect any distinguishing character between *V. præalta* and *V. Noveboracensis*, and was therefore very happy to find my opinion of their identity confirmed by so eminent an observer as Lessing.

Trib. IV. EUPATORIACEÆ. *Less.*

Subtrib. I. EUPATORIEÆ. *Capitula homogama ♀. Pappus e pilis vel setis angustissimis constat.* *Less.*

19. EUPATORIUM. *Linn.*

Capitulum pauci-seu multi-nec 4-florum. Pappus uniserialis, non plumosus. Cor. limbo a tubo non distincto. Involucrum pauci-multiseriali. Receptaculum nudum. Achenium 4-5-querum.—Arbores vel Frutices aut Herbae, in Europa et Asia sed longe pleræque in America crescentes, plerumque erecti, ramis foliisque oppositis sive verticillatis, rarius alternis; capitulis violaceis vel albis, corymbosis seu corymboso-paniculatis. *Less.*

1. *E. rotundifolium*; pubescenti-pilosum subscabrum, involucro subsexfloro, foliis sessiliibus subtrotundo-cordatis obtusis venosis crenato-serratis, squamis calycinis acuminatis, corollis albis.—*Linn. Sp. Pl. p. 1173. Mich. Am. v. 2. p. 98. Elliott, Carol. v. 2. p. 300. Pursh, Fl. Am. v. 2. p. 514.*

HAB. Canada. *Pursh. Mr. Goldie.*—The involucra, achenia, and corolla abound in minute, yellow, glandular exudations. Decoctions of this plant are employed in the Southern United States, (where this species is very abundant) as a febrifuge.

2. *E. purpureum*; involucro 12-13-floro, foliis petiolatis 3-5-natimve verticillatis ovato-lanceolatis acuminatis grosse serratis scabriusculis subtus pubescentibus, caule fistuloso, floribus purpureis.—*Mich. Am. v. 2. p. 99. Pursh, Fl. Am. v. 2. p. 515. Elliott, Carol. v. 2. p. 307. Bigel. Fl. Bost. ed 2. p. 297.*

HAB. From Lake Huron, throughout Canada, to the Saskatchewan, abundant.

3. *E. maculatum*; foliis petiolatis quaternis quinque ovato-lanceolatis inæqualiter serratis subtus pubescentibus, caule solido sulcato.—*Linn.*—*Willd. Sp. Pl. v. 3. p. 1760.* *Pursh, Fl. Am. v. 2. p. 514.* *Elliott, Carol. v. 2. p. 308.*

HAB. Canada. *Pursh*.—I have received nothing under the name of *E. maculatum*, which was not at once referable to *E. purpureum*, to which the *E. verticillatum* and *punctatum* of Willd. and the *E. ternifolium*, Ell. (*E. trifoliatum*, Willd.) may probably be with safety added.

4. *E. perfoliatum*; involucro suboctofloro, foliis connato-perfoliatis oblongo-acuminatis crenato-serratis rugosis subtus pubescentibus, caule villosa, floribus parvis albis.—*Linn.*—*Willd. Sp. Pl. v. 3. p. 1761.* *Pursh, Fl. Am. v. 2. p. 516.* *Elliott, Carol. v. 2. p. 302.* *Bigel. Fl. Bost. ed. 2. v. 2. p. 297.* *Med. Bot. v. 1. t. 2.*—*E. connatum.* *Mich. Am. v. 2. p. 99.*

HAB. Throughout Canada.—A well-known bitter, and useful tonic.

5. *E. occidentale*; glabriuscum, foliis alternis breve petiolatis ovatis acuminatis grosse inæqualiter serratis apice integerrimis summis lanceolatis integerrinis, floribus paniculato-corymbosis, involuci pluriflori foliolis linearibus acutis laxis, achenis linearibus angulatis, caule striato.

HAB. On the low hills between the north and south branch of Lewis and Clarke's River, in stony places. *Douglas*.—“Two to four feet high. Flowers white.”

6. *E. ageratoides*; involuci subdecemflori foliolis uniserialibus æqualibus linearibus, foliis longe petiolatis cordato-ovatis neminatis trinervibus grosse serratis, corymbo divaricato multifloro, caule glaberrimo, floribus albis.—*Linn.*—*Pursh, Fl. Am. v. 2. p. 516.* *Elliott, Carol. v. 2. p. 303.* *Bigel. Fl. Bost. ed. 2. p. 298.*—*E. urticaceofolium.* *Mich. Am. v. 2. p. 100.*—*Ageratum altissimum.* *Willd.* (according to *Pursh*)

HAB. Canada. *Michaux*. About Quebec. *Mrs. Percival*.—This appears to be a rare species in Canada, whence I have only received it from *Mrs. Percival*. In the single row of scales to the involucre, it assimilates with the following genus.

19. MIKANIA. *Willd.*

Capitulum 4-florum. Pappus uniserialis, non plumosus. Cor. limbo campanulato. Involucrum 4–5-phylum, uniserial. Receptaculum nudum.—*Frutices vel Herbae Americani, plerumque scandentes; foliis oppositis; capitulis corymboso-paniculatis.* *Less.*

1. *M. scandens*; glaberrima, scandens, foliis cordatis acuminatis subrepando-dentatis lobis divaricatis inæqualibus, cymis pedunculatis.—*Willd. Sp. Pl. v. 3. p. 1743.* *Pursh, Fl. Am. v. 2. p. 517.* *Elliott, Carol. v. 2. p. 292.* *Bigel. Fl. Bost. ed. 2. p. 295.*—*Eupatorium scandens.* *Linn.*—*Mich. Am. v. 2. p. 97.* *Jacq. Jc. Rar. v. 1. t. 169.*

HAB. Canada, *Michaux*; probably in the extreme southern parts. I have never received specimens from the British territories; but it seems frequent in the adjoining New England States.—*Lessing*, who, however, has kept up the Genus *Mikania* in his *Synopsis*, says it should be joined to *Eupatorium*.

20. LIATRIS. *Schreb.*

Pappus pluriserialis, plumosus. Cor. limbo a tubo non distincto. Involucrum multiseriale. Receptaculum nudum.—*Herbae Boreali-Americanæ, perennes, radice fibrosa vel tuberosa; foliis alternis, integerrimis, saepe angustis, glanduloso-punctatis; capitulis multifloris, spicatis vel corymbosis, corymbis imbricatis.* *Less.*

(*Floribus spicatis, radice tuberosa.*)

1. *L. scariosa*; magis minusve pubescenti-scabri, foliis lanceolatis inferioribus longe petiolaratis superioribus linearibus multo minoribus, floribus racemosis remotis, pedicellis bracteatis, involucris globoso-hemisphaericis, squamis obovatis obtusissimis membranaceis coloratis subciliatis, flosculis numerosis, pappo scabro.—*Willd. Sp. Pl. v. 3, p. 1635. Pursh, Fl. Am. v. 2, p. 509. Elliott, Carol. v. 2, p. 280. Sims, Bot. Mag. t. 1709. Bigel. Fl. Bost. ed. 2. p. 293.*—*Liatris squarrosa*. *Mich. Am. v. 2, p. 92.*—*Serratula scariosa*. *Linn. Sp. Pl. p. 1174.*

HAB. Plains of the Saskatchewan and of the Red River. *Drummond. Douglas.*

2. *L. squarrosa*; glabriuscula vel pubescenti-scabra, foliis linearibus obscure trinerviis inferioribus longe attenuatis superioribus minoribus, racemo flexuoso pruincifloro folioso, floribus breve pedicellatis nunc sessilibus, involucris ovato-cylindraceis, squamis magnis patentí-squarrosois exterioribus majoribus rigidis foliaceis trinerviis interioribus membranaceis mucronato-acuminatis vis coloratis, flosculis plurimis, pappo plumoso.—*Willd. Sp. Pl. v. 3, p. 1634. Mich. Am. v. 2, p. 92. Pursh, Fl. Am. v. 2, p. 509. Elliott, Carol. v. 2, p. 282.*—*Serratula squarrosa*, *Linn.*—*β. luxurians*. *L. intermedia*. *Lindl. in Bot. Reg. t. 942.*

HAB. Canada. *Mr. Goldie. Douglas.*—Variable in pubescence, as are the other species of this beautiful and favourite Genus. I fear the *L. intermedia* of the Bot. Reg. can only be considered a luxuriant state of the present. Mr. Goldie's original specimen in my Herbarium do not at all differ from the true *squarrosa*; and the cultivated individual only exhibits longer flower-stalks.

3. *L. punctata*; caule erectiusculo piloso, foliis linearibus marginatis glabris ciliatis utrinque impresso-punctatis, spicis elongatis densis non raro foliosis, involucris subcylindraceis, squamis imbricatis non squarrosois exterioribus rigidioribus omnibus impresso-punctatis pungenti-acuminatis marginibus ciliato-lanatis, pappo valde plumoso. (TAB. CV.)

Caulis pedalis ad sesquipedalem, erectus vel adscendens, striatus, glaber vel rarissime pilosus. *Folia* numerosa, 4-5-pollicaria, linearia, infima basi dilatata, amplexicaulia, superiora sensim minora, omnia linearia, rigida, acuta, uninervia, plana, marginata, margine albido, remote ciliata, pagina utrinque glaberrima, impresso-punctata. *Spica* (seu *racemosus* *spicatus*) elongata, parte inferiori sepe foliosa, densiflora. *Involucrum* latocylindraceum, squamis imbricatis impresso-punctatis margine ciliato lanatis mucronato-acuminatis, mucrone subrecurvo, exterioribus rigidis, viridibus, interioribus magis membranaceis siepe coloratis. *Flosculi* subquinque, pulcherrime rosei. *Achenium* linear-clavatum, subtriquetrum, striatum, pilosum. *Pappus* plumosus.

HAB. Plains of the Saskatchewan, *Drummond*; and on the Red Deer and Eagle hills, in dry soils, common. *Douglas.*—Neither among the numerous individuals in my Herbarium, nor the species described in books, do I find any that agree with this, though its nearest affinity is perhaps to *L. resinosa* of Nuttall. Here, too, without doubt, the impressed dots, so remarkable on the leaves and involucre, are occasioned by resinous glands. The spike generally half as long as the plant.

TAB. CV. *Liatris punctata*. *Fig. 1, Leaf; fig. 2, Flower; fig. 3, Floret; fig. 4, Fruit:—magnified.*

21. PYRROCOMA. Nov. Gen.

Pappus uniserialis, flore longior, fulvus, scaber. *Cor. limbo a tubo non distincto. Involucrum* multiseriale, laxum; *foliolis* *inferioribus* membranaceis integerrimis; *cæt. foliaceis* spinuloso-dentatis.—*Herba Boreali-Americanæ*; *foliis alternis, coriaceis, subspinoso-dentatis, punctato-pellucidis*; *capitulum terminale, solitarium*; *involucris imbricatis*.—Nomen à rugosus *fulvus*, et *rugosus* hair; ob pappi colore derivatum.

1. *P. carthamoides*. (TAB. CVI.)

Radix —? *Caulis* simplex, pedalis, erectus, teres, striatus, pubescens. *Folia alterna, remota, lanceolata, seu oblongo-lanceolata, acuta, pallide viridia, coriacea, obscure pubescentia, medium versus praecipue dentato-seu spinoso-serrata, punctato-pellucida, venosa; inferiora longe petiolata; superiora sessilia. Flores terminalis magnum, solitarium. Involucrum e folioli pluribus laxe imbricatis, sed vix squarrosis; interioribus erectis linearie-oblongis acutis, membranaceis, integerrimis; exterioribus sensim majoribus patentibus, oblongis, sub-spinoso-dentatis, pubescentibus, demum foliis semiglandulosis. Flosculi numerosi, parvi, inconspicui. Receptaculum nudum, (seu Rachis bracteolata. Less.) Corolla tubulosa, basi sensim angustior, limbo 5-dentato, dentibus erectis. Anthera subinclusa, basi nuda (ecaudata), apice appendicula membranacea aucta. Stylus vix corolla longior. Stigmatis laciniæ linearis, exserte, basi teretes nude, demum compressæ, extus dense pilosæ, intus glabre, sulcatae. Ovarium oblongum, teres, substriatum. Pappus e pilis plurimis, uniserialibus, fulvis, scariosis, corollam excendentibus.*

HAB. North-West coast of America. *Douglas*.—A solitary specimen of this plant is all that I have had the opportunity of seeing. In habit, it resembles the genus *Carthamus*; but from the structure of the flosculæ, and especially of the stigmata, I can have no hesitation in referring it to *Eupatorineæ*, near *Liatris*. The pappus, even in the state of early flower, is remarkably long and tawny, inclining to red. The leaves, when held up between the eye and the light, exhibit numerous pellucid dots, which appear to be the areoles of the obscure reticulations.

TAB. CVI. Pyrrhocoma carthamoides. *Fig. 1*, Inner scale or leaflet of the involucrum; *fig. 2*, Intermediate do.; *fig. 3*, Outer do.; *fig. 4*, Flower; *fig. 5*, Corolla, with its stamens, style, and stigmas; *fig. 6*, Extremity of the style and stigmas; *fig. 7*, Anthers; *fig. 8*, Portion of a hair of the pappus:—magnified.

Subtrib. II. TUSSILAGINÆ. *Capitula heterogama, saepe subdioica*. Less.

22. NARDOSMIA. Cass.

Capitula subdioica, mascula radio 1-seriali foemineo cineta, foemina homogama. Cor. ♀ lingulata. Pappus pilosus, marium multo minus copiosor quam foeminarum.—Herbæ Europeæ (et Americæ Arcticæ) perennes, tantum basi ima foliatae, simplices; foliis petiolatis, rotundis, angulatis; capitulis thyrsoides, multifloris; foliolis involucri æqualibus; rachide nuda. Less.

1. *N. frigida*; foliis cordatis inæqualiter dentatis subtus tomentosis.—*N. angulosa*. Cass.—Less. in Linnæa, v. 6. p. 107.—*Tussilago frigida*. Linn.—Fl. Dan. t. 61. Pursh, Fl. Am. v. 2. p. 531.—♂. foliis mangis sinuato dentatis.—*Tussilago corymbosa*. Br. in Parry's 1st Voy. App. p. cclxxix. Rich. in Frankl. 1st Journ. ed. 2. App. p. 33. (in partem.)

HAB. Canada. Pursh. From Lake Winnipeg, in lat. 52°, to Fort Franklin, in lat. 66°. Dr. Richardson.—Very few of the specimens gathered by Dr. Richardson have leaves exactly answering to the above character, and of these, some are nearly ten inches long, independent of the petiole.

2. *N. sagittata*; foliis cordato-vel reniformi-sagittatis sinuato-dentatis subtus tomentosis.—*Tussilago sagittata*. Pursh, Fl. Am. v. 2. p. 332. Rich. in Frankl. 1st. Journ. App. p. 33.

HAB. Hudson's Bay, (Hutchinson in Herb. Banks.) to the swamps in the Rocky Mountains, (Drummond,) and from Lake Superior, in lat. 48°, to Fort Franklin, in lat. 66°, north. Dr. Richardson. Drummond.—A mere variety, I fear, of the preceding.

3. *N. corymbosa*; foliis cordatis profunde sinuato-lobatis angulatis dentatis subtus tomentosis.—*Tussilago corymbosa*. Br. in Parry's 1st Voy. App. p. cclxxix.

HAB. From Fort Norman, on the Mackenzie River, to the extreme Arctic regions. Capt. Sir E. Parry.

Capt. Sabine. Dr. Richardson.—The latter gentleman observes that the flowers are fragrant, probably like those of *Tussilago fragrans* of our gardens, which equally belongs to the present Genus.

4. *N. palmata*; foliis reniformi-cordatis profunde palmato-lobatis lacinias angulatis dentatis subtus tomentosis.—*Tussilago palmata*. *Ait. Hort. Kew. ed. 1. v. 3. p. 188. t. 2. Pursh, Fl. Am. v. 2. p. 331. Rich. in Frankl. 1st. Journ. ed. 2. App. p. 33.*

HAB. From Lake Huron, (*Nuttall*), to the Bear Lake, lat. 67° north, (*Dr. Richardson, Drummond*); and from Labrador and Newfoundland on the East, (*Dr. Fothergill, Kohlmeister, Dr. Morrison*); to the Rocky Mountains, (*Drummond*); and thence to the Pacific, at the mouth of the Columbia. *Dr. Scouler, Douglas.*—This and the three preceding species, it must be acknowledged, are distinguished by very slight characters, and the numerous specimens before me, would, in the varied form of the foliage, lead to the suspicion that they in reality constitute but one species. Of the present, in age, the leaf becomes perfectly glabrous. In the specimens from the more elevated of the Rocky Mountains, the lobes of the leaf are broadly cuneate, and the sinuses very obtuse.

23. ADENOCAULON. Hook.

Capitula heterogama, floribus ♀ paucis, uniserialibus in ambitu, reliquis ♂. Cor. ♀. . . Pappus 0.—Herba perenne, Americana, glandulis pedicellatis adspersæ; foliis subtus albotomentosis, petiolatis; involucris uniserialibus dumum reflexis; capitulis paucifloris, paniculatis, parvis. Less.

1. *A. bicolor*; clatum, foliis cordato-ovatis subtrilobis angulato-dentatis. *Hook. in Bot. Misc. v. 1. p. 19. t. 15.*

HAB. Dense woods at the Straits of De Fuca, and about Fort Vancouver, on the Columbia. Woods on the Portage River, one of the sources of the Columbia, in the Rocky Mountains, lat. 52° north. *Drummond.*—The specimens found by Mr. Drummond are withered stems of the preceding year, and necessarily very bad, from being collected in the depth of winter, and while the snow was deep upon the ground. A second species of this highly curious genus has been detected in Chili by Pöppig.

TRIB. IV. SENECONIDEÆ. Less.

Subtrib. I. AMBROSIEÆ. *Capitula aut monoica aut heterogama, floribus in centro masculis. Rachis in capitulis heterogamis bractolata, bractolis glabris. Antheræ exsertæ. Less.*

(A. AMBROSIEÆ VERE. *Cor. floris ♀ filiformi; achenis calvis, crostribus, involucro saepe inclusis; stylo floris masculi clavato, truncato, apiceque solo penicillato. Less.*)

24. XANTHIUM. Linn.

Capitula homogama, monoica; fæminea biflora, involucro hamato-spinoso cincta. Achenia compressa, singula in loculis singulis involuci demum indurati et bilocularis nidulans.—Herbae Americae vel Europeæ indigenæ, saepe spinosæ; foliis alternis, asperis, varie incisis; capitulis irregulariter glomerato-spicatis; spica terminali, superne mascula, basi fæminina.

1. *X. Canadense*; foliis profunde cordatis basi cuneatis angulatis subdenticulatis scabris, caule maculato superne aspero, fructibus geminis hispidissimis, rostris duobus aculeisque uncinatis. *Spreng. Syst. Veget. v. 3. p. 852.—X. maculatum. Raf. in Sill. Journ. (Torrey, in litt.)*

HAB. Canada? North-West coast of America. *Douglas.*

25. ASTRROSIA. Linn.

Capitula homogama, monoica; *feminae* uniflora, *involucro* inermi (vel spinoso) cincta; *mascula* multi-flora, rachide bracteolata. *Achenium* globosum.—*Frutices vel Herbas Asiae vel Europee indigenæ, foliis alternis, inferioribus nonnunquam oppositis, integris aut saepius divisis; capitulis spicatis, spica lineari, superne mascula, basi lobata et feminea; involucris capituli masculi uniserialibus, gamophyllis.* Less.

1. *A. elatior*; foliis bipinnatifidis glabriusculis, petiolis longe ciliatis, racemis terminalibus paucilatis, caule virgato. Willd.—Linn.—Pursh, Fl. Am. v. 2. p. 581. Elliott, Carol. v. 2. p. 477.

Hab. Canada. Pursh.

2. *A. paniculata*; pilosa, foliis bipinnatifidis summis pinnatifidis, racemis terminalibus, fructibus supra medium spinis brevibus erectiusculis.—Mich. Am. v. 2. p. 183. Pursh, Fl. Am. v. 2. p. 581. Elliott, Carol. v. 2. p. 478.

Hab. Canada. Pursh. Lake Huron. Dr. Todd. Straits of St. Lawrence, and Nutka, North-West America. Dr. Scouler.

3. *A. acanthicarpa*; setis asperis rigidis hispida valde ramosa, foliis bipinnatifidis segmentis linearibus, racemis terminalibus, fructibus spinis rigidis subulatis longis patentibus undique tectis.

Hab. Banks of the Saskatchewan and Red River. Douglas. Drummond. Plentiful on the sandy banks of the Columbia, near Indian Villages and Camps, and at the Grand Rapids. Douglas.—The singularly spinescent fruit of this species, distinguishes it from every other with which I am acquainted.

26. IVA. Linn.

Capitula heterogama, *floribus* *femineis* uniserialibus in ambitu, reliquis *masculis*. *Achenium* obcompressum. *Cor. ♀* tubulosa s. campanulata. *Rachis* bracteolata.—*Herba vel Frutices Americanæ; foliis alternis seu oppositis, trinerviis; capitulis spicatis (nunc axillariis), spica terminali solitaria lineari basi feminea, superne mascula; involucris oligophyllis, uniserialibus.* Less.

1. *I. axillaris*; herbacea, foliis subcarnosis lanceolatis obtusis basi attenuatis integerrimis pilosis v. glabris, capitulis solitariis axillaribus nutantibus. (TAB. CVII.)—Pursh. Fl. Am. v. 2. p. 743.—*β. robustior*; omnibus partibus majoribus.

Rodix annua, parva. *Caulis* erectus, plerumque valde ramosus; *rami* erecti, angulati, glabri, vel pilosi. *Folia* alterna, rarius opposita, subuncinata longa, lanceolata, magis minusve lata, basi attenuata, subcarnosa, rigidissima, obtusa, integerrima, glabra vel piloso-scabra, uninervia. *Capitula* solitaria, axillaria, brevissime podunculata, nutantia. *Involucrum* subhirsutum, e folioli 4-5 in unicum hemisphaericum lobatum coditis. *Flosculi* inclusi, receptaculum paleaceum, paleis linearibus sursum latioribus ciliatis: *Masc.* plurimi, centralis. *Cor.* tubulosa, subinfundibuliformis, dentibus 5 reflexis. *Antheræ* exsertæ, inappendiculatae. *Pistillum* 0. *Fruit.* uniserialis in ambitu. *Cor.* brevis, tubuloso-filiformis, 5-dentata. *Germen* obovatum. *Stylus* lineares, longi, lati. *Achenium* late obovatum, epapposum, pubescentis, nigro-fuscum, corolla persistente brevi coronatum.

Hab. Between Carlton House and Edmonton House, on the Saskatchewan. *β.* Common on the barren grounds, from the "Grand Rapids" of the Columbia, to the Rocky Mountains, in sandy dry soils. Douglas.—Mr. Drummond notices this plant as having the appearance of *Glaux maritima*. If I am right in referring it to Pursh's *Iva axillaris*, it has probably an extensive range, his plant being found, by Bradbury,

in Upper Louisiana. It is a span or more high. Mr. Douglas's specimen is considerably larger and stouter, in all its parts, the leaves almost tapering into a petiole, and the upper ones so much smaller than the lower, that the flowers seem to be arranged in a leafy spike.

TAB. CVII. *Iva axillaris*. *Fig. 1*, Leaf and flower; *Fig. 2*, Flower; *Fig. 3*, Male floccule, with its palea; *Fig. 4*, Female floccule, with do.; *Fig. 5*, Acheneum;—magnified.

Subtrib. II. HELIANTHEÆ. *Capitula, si heterogama, floribus marginalibus, uniserialibus, corollasque lingulatis gerentibus; reliquis ♀; nunquam dioica vel monoica. Rachis bracteolata, aut rarissime in centro ebracteolata. Pappus aut aristatus aut irregularis aut obsoletus aut coroniformis aut nullus. Anthere nigricantes, ecaudatae. Styli rami sepiissime cono acto aut appendiculato lineariter superantur aut ubi truncati sunt apicæ solo pennicillati, ibi achenia calva aut aristata, aut manifeste obcompressa aut compressa.* Less.

1. HELIOPSIDEÆ. *Achenis ecorticatis, exalatis, semper crostibus, calvis, aut pappo coroniformi coronatis; capitulis homogamis aut plerumque heterogamis, floribus marginalibus fuscincis.* Less.

27. HELIOPSIS. Pers.

Radius uniserialis. Achenium angulato-compressum, omnino calvum, glabrum, disco epigyno parvo.—Herbe Americanæ; foliis oppositis, integris vel pinnatifidis; capitulis luteis, solitariis, ramos superne aphyllos terminantibus; involucris imbricatis; rachide conica. Less.

1. *H. scabra*; foliis breve petiolatis ovatis trinervibus grosse serratis apice integerrimis utrinque scarbris, involucro pubescenti.—Dun. in Mem. du Mus. v. 5. p. 57.

HAB. Common on the banks of the Red River, near the "Forks." Douglas.—These specimens agree with original ones of *H. scabra* in my Herbarium, from the Bot. Garden of Montpellier; still I fear it differs from *H. levis*, Pers., only in the more scarious leaves and more downy involucres.

2. *H. balsamorhiza*; subpubescens, foliis radicalibus plurimis petiolatis pinnatis pinnis subpinnatifidis incisis, involucri foliolis numerosis lanceolato-acuminatis imbricatis caulem paucifoliatum subæquantibus, radice crassa balsamifera.

HAB. Common on the gravelly banks of the Columbia, near Fort Vancouver. Douglas.—"The root of this plant is long, thick, subfusiform, woody, and yields a copious limpid juice, not unlike the resin from *Pinus Balsamea* possessing a powerful turpentine-like odour." The leaves are mostly radical, 6-8 inches long, with a sheathing base, and about equal in length with the stem, or almost scapo, for it bears but one or two pair of leaves smaller than those of the root: young achenia compressed and four-angled, quite destitute of pappus. More perfect specimens of this plant than I possess, will, I can scarcely doubt, prove that it and the following deserve to rank as a new genus, to which I would propose the name of *Balsamorhiza*. The habit is totally different from *Heliopsis*, and the flowers resemble those of an *Helianthus*, while the fruit appears to be that of the former genus.

3. *H. terebinthacea*; pubescens, foliis radicalibus petiolatis ovato-lanceolatis sinnatopinnatifidis crenato-serratis, involucri foliolis numerosis lanceolato-acuminatis imbricatis caulem paucifoliatum subæquantibus, radice crassa balsamifera.

HAB. Common at Fort Vancouver, on the Columbia, and in the grounds of the interior. Douglas.—Closely allied to the preceding species, and yielding in its root the same terebinthine juice.

2. RUDBECKIEÆ. *Achenis ecorticatis, erostribus, calvis aut pappo coroniformi integro coronatis; capitulis radiatis, radio neutro uniseriali.* Less.

28. RUDBECKIA. *Cass. Linn. (in partem.)*

Achenium pappo coroniformi calloso crassoque coronatum, sectione transversa quadrata, disco epigyno magno, areola laterali. *Corolla disci* infundibuliformis, dentibus erectis; *radii* abeque ulla genitalium vestigiis. *Antheræ* inclusæ. *Stylus* disci ramis cono brevissimo terminatis.—*Herba hispido-scabra, perennes, ramis oppositis; foliis alternis, integris vel pinnatifidis; capitulis terminalibus solitariis, radio luteo, disco fusco-violaceo; rachide conica; involucris patentibus, circiter biserialibus.* Less.

1. *R. laciniata*; clata, foliis inferioribus pinnatis segmentis lanceolatis incisis summis ovatis, pappo crenato, caule glabro.—Schrad.—Willd. *Sp. Pl.* v. 3. p. 2246. *Mich. Am.* v. 2. p. 144. *Pursh, Fl. Am.* v. 2. p. 575. *Elliott, Carol.* v. 2. p. 451.

HAB. Canada. *Pursh, Lady Dalhousie. Mrs. Sheppard.* From Lake Huron, (*Dr. Todd,*) to the Red River. *Douglas.*

2. *R. columnaris*; setis appressis hispidæ, foliis profunde pinnatifidis segmentis lanceolatis sublacinatis, receptaculo elongato cylindraceo, pappo marginato brevissimo, paleis punctis duobus nigris.—*Nutt. Gen. Am.* v. 2. p. 178. *Bot. Mag.* t. 1801.

HAB. On dry undulating grounds of the Saskatchewan and Red Rivers, abundant. *Douglas. Drummond.*

29. CALLIOPSIS. *Reichenb.*

Achenium obcompressum, omnino calvum, intus curvatum, apice truncatum, anguste bialatum, disco epigyno minuto, alis concoloribus integerrimis. *Stylus* disci ramis truncatis apiceque solo penicillatis.—*Herbea Boreali-Americanæ, glabrae; foliis magis minusve sectis; capitulis geminis vel corymbosis, radio luteo basi macula atro-purpurea notato vel roseo; involucris biserialibus, serie interiori gamophylla, exteriori squarrosa.* Less.

1. *C. Atkinsoniana*; foliis glaberrimis, radicalibus bipinnatifidis, caulinis pinnatis laciinis linearibus spatulatis, flosculis radii basi siccipius maculatis irregulariter trilobis, radice perenni.—*Coreopsis Atkinsoniana.* (*Dougl.*) *Linell. in Bot. Reg.* t. 1370.

HAB. Shores of the Columbia and Meuzies' Island, *Douglas. Dr. Scouler.*—Distinct from *Calliopsis* (*Coreopsis*, *Nutt.*) *tinctoria*, according to Mr. Lindley, in its perennial root, taller more branched stem, and less strongly blotched flowers. The differences are not distinguishable in my native dried specimens.

3. COREOPSIDÆ. *Achenis exorticatis, erostribus, statem nonnullis pappo nec autem coroniformi coronatis, capitulis heterogamis, floribus neutris uniserialibus in ambitu.* Less.

30. COREOPSIS. *Linn.*

Achenium conforme, aristis binis brevibus coronatum, plano-obcompressum, bialatum.—*Herbea aut rarius Frutices America indigenæ; foliis integris vel varie sectis ramisque oppositis; capitulis terminalibus, radio plerumque luteo; involucris polyphyllis, biserialibus; rachide plana.* Less.

1. *C. lanceolata*; foliis oppositis lanceolato-linearibus integerrimis ciliatis inferioribus petiolatis, acheniis orbiculatis scabris alatis apice bidentatis, caule glabro.—*Linn.*—*Mich. Am.* v. 2. p. 137. *Pursh, Fl. Am.* v. 2. p. 567. *Elliott, Carol.* v. 2. p. 433.

HAB. North side of Lake Superior. (*Torrey, in Herb. nostr.*) Lake Huron. *Dr. Todd.*

31. HELIANTHUS. L.

Achenium compressum, conforme, paleis magis minusve deciduis, binis pluribusve minoribus coronatum.—Herbae *sæpe altissimæ, rarius* Frutices, *Americæ indigeni*, foliis *oppositis vel alternis, integris asperis*; capitulis *luteis, solitariis et terminalibus vel corymbosis*; involucris *polyphyllis, imbricatis*; rachide *plana*. *Less.*

* *Foliis plerisque oppositis.*

1. *H. atro-rubens*; asperus, caule superne nudiusculo, foliis ovato-oblongis subspathulatis crenatis triplinervibus scabris, involucri foliolis ovatis acutis imbricatis albo-ciliatis brevibus, disco atro-purpureo.—*Linn. Sp. Pl. p. 1279. Mich. Am. v. 2. p. 140. Pursh, Fl. Am. v. 2. p. 570. Gawl. in Bot. Reg. t. 508. Sims, Bot. Mag. t. 2668.*—*H. diffusus?* *Sims, Bot. Mag. t. 2020.*

HAB. Banks of the Saskatchewan, as far as Edmonton House. *Drummond.*—This fine species is readily distinguished by its leaves tapering at the base so as to be almost spathulate; clothed, as is the stem, with short white rigid hairs, and by the short leaflets of the involucre, which are ovate, acute, scarcely acuminate, imbricated, and ciliated with white hairs.

2. *H. divaricatus*; caule glabro ramosissimo, foliis suboppositis sessilibus lanceolato-ovatis trinervibus scabris, panicula trichotoma gracili parviflora, involuci foliolis lanceolato-acuminatis laxis ciliatis.—*Linn. Sp. Pl. p. 1279. Mich. Am. v. 2. p. 141. Pursh, Fl. Am. v. 2. p. 570.*

HAB. Canada. *Pursh.* Norway House, on the Saskatchewan. *Dr. Richardson. Drummond.*

3. *H. frondosus*; caule inferne glabro, foliis ovatis argute serratis, pedunculis scabris, involucri foliolis squarrosis undulatis frondosis ciliatis, radiis 8-floris. *Ph.*—*Linn. Amæn. Acad. v. 4. p. 290. Pursh, Fl. Am. v. 2. p. 570.*

HAB. Canada. *Pursh. Lady Dalhousie.*—My specimens from Lady Dalhousie agree with those of Dr. Darlington, of West Chester, United States; yet it appears to be a species not well understood, and my Canadian specimens are not very perfect. Pursh says it resembles *H. decapetalus* and *H. multiflorus* in several respects, but is distinct. The American Botanists would render an important service to science, if they would clear up, by an examination of recent specimens, the numerous doubts that exist respecting various of the species composing this genus.

4. *H. trachelifolius*; foliis ovato-lanceolatis acuminatis serratis triplinervibus utrinque scaberrimis, squamis calycinis linearie-lanceolatis exterioribus longioribus. *Ph.*—*Willd. Sp. Pl. p. 2241. Pursh, Fl. Am. v. 2. p. 570. Elliott, Carol. v. 2. p. 424.*—*H. Gigas. Mich. Am. v. 2. p. 141.* (according to *Pursh.*)

HAB. Canada. *Pursh. Mrs. Percival.*—What I consider to be this plant, (for I possess no authentic specimen), has the leaves very much like those of *Campanula Trachelium*, and strongly serrated, and the flower of a pale sulphur colour.

* * *Foliis superioribus alternis.*

5. *H. giganteus*; ramosus, scaber, foliis alternis longe lanceolatis utrinque attenuatis scabris obsolete triplinerviis sessilibus subserratis, pedunculis lateralibus terminalibusque, involuci foliolis lanceolato-subulatis laxis cano-pubescentibus basi præcipue ciliatis.—*Linn. Sp. Pl. p. 2242. Pursh, Fl. Am. v. 2. p. 571. Elliott, Carol. v. 2. p. 426.*

HAB. Saskatchewan and Red Rivers. *Drummond. Douglas.*

6. *H. decapetalus*; foliis ovatis acuminatis remote serratis triplinervibus scabris, involuci squamis lanceolatis subæqualibus subciliatis, radiis denis duodenis. *Ph.*—*Linn. Sp. Pl. p. 1277. Pursh, Fl. Am. v. 2. p. 571. Elliott, Carol. v. 2. p. 425.*

HAB. Canada. (*Kalm, ex Willd.*) *Pursh.*—I am unacquainted with this plant, except it be the same as the following, to which Willdenow says it is "closely allied, but that it differs in the stem, nearly the height of a man, being rough, glabrous below."

7. *H. multiflorus*; ubique scaber, foliis petiolatis grosse serratis triplinerviis inferioribus cordatis superioribus ovatis, involuci foliolis ovatis anguste attenuatis laxis albo-ciliatis.—*Linn. Sp. Pl. p. 1277. Pursh, Fl. Am. v. 2. p. 572. Elliott, Carol. v. 2. p. 426. Curt. Bot. Mag. t. 227.*

HAB. Canada. *Mrs. Sheppard, Saskatchewan. Drummond.*

8. *H. lenticularis*; annuus, foliis ovatis acuminatis grosse serratis hispidis triplinerviis, pedunculis monocephalis æqualibus. *Lindl.*—*Dougl. in Bot. Reg. t. 1265.*

HAB. North-West coast of America, and in the interior about the Columbia, and to the south of that river.—I possess no native specimen of this plant. "It is nearly related to *H. tubiformis*, from which," according to Mr. Douglas, "it differs in not having the leaves cordate at the base, or the peduncle fistulose and thickened. The native tribes that inhabit the interior of North California, apply the grains to the same purpose as that for which we are informed by Nuttall the Indians of the Missouri use *H. tubiformis*. They collect them in the autumn, and dry them on heated stoves, or on wooden troughs, with small embers, stirring them with a stick to prevent their burning. When dried, they are pounded, and made into a sort of cake, which is not unpleasant." *Douglas.*

9. *H. longifolius*; foliis oblongo-lanceolatis obtusis longissime in petiolum attenuatis, involuci squamis patentibus lato-lanceolatis ciliatis, pappo aristis solitariis vel binis inæqualibus validis.

HAB. Common on the low moist soils of the plains of the Columbia, near the ocean; and in the vallies of the Rocky Mountains.* *Douglas.*—Two specimens only of this remarkable plant are in my possession, and in both, the flower is imperfect. The stem is three feet high, simple, striated, and hispid. Leaves remote, somewhat hairy, lanceolate, or linear-lanceolate, very clammy, and as if varnished, especially beneath; the lower ones a foot long, including their petiole, which is about equal in length to the blade; upper ones smaller and sessile. Peduncle elongated, terminal, single-flowered. Flower large. Involucres of numerous, imbricated, broadly lanceolate, strongly ciliated scales. The ray, if any, is not present in my specimens. Tubular florets numerous, yellow. Achenium with a short lacerated margin'd crown, and one or two long and strong persistent slightly downy spines. Mr. Douglas had marked it "*Wedelia?*"

4. **BIDENTIDÆ.** *Acheniis ecorticatis rostratis nunquam pappo coroniformi coronatis; capitulis aut heterogamis, floribus neutris, uniserialibus in ambitu, aut ubi homogama sunt, ibi achenia aristata.* *Less.*

* Since the above was written, I find the same plant in Capt. Beechey's Collection, gathered at San Francisco in California, by Messrs. Lay and Collie. There the ray is present and large, though consisting of few florets. The leaves are less glutinous than in the Columbian specimens.

32. BIDENS. *Linn.*

Achenium exalatum, subcompressum. *Aristæ pappi retrorsum hispidæ*, 2–5, persistentes. —*Herbæ rarius Frutices*, per totam zonem æquinoctialem et meridianalem divulgatae, foliis integris vel varie sectis, ramisque oppositis; capitulis terminalibus solitariis vel corymbosis, discoidicis vel radiatis, radio luteo vel albo; involucris polyphyllis, biserialibus, foliolis exterioribus patentibus; rachide plana. *Less.*

1. *B. cernua*; floribus subradiatis cernuis, involuci foliolis exterioribus flore longioribus, foliis lanceolatis subconnatis serratis.—*Linn.*—*Engl. Bot. t. 399.* *Pursh, Fl. Am. v. 2. p. 566.*— β . minima.

HAB. Throughout Canada; from Lake Huron, (*Dr. Todd*), to the Saskatchewan; *Dr. Richardson*. *Drummond*.— β . Island of Orleans, in the St. Lawrence. *Mrs. Sheppard*.—In this and the following, the stems are often partially clothed with short, coarse, and thick white hairs.

2. *B. chrysanthemoides*; floribus radiatis cernuis, radio involucro subæquali triplo longiore, foliis oblongis utrinque attenuatis dentatis basi connatis. *Ph.*—*Mich. Am. v. 2. p. 136.* *Pursh, Fl. Am. v. 2. p. 566.* *Elliott, Carol. v. 2. p. 429.*

HAB. Fort Vancouver (*Douglas*) and Straits of de Fuca, on the North-West coast. *Dr. Scouler*.—These specimens are larger, and the leaves broader than in *B. cernua*; but I do not think that the two species are distinguished by any decided characters.

3. *B. frondosa*; floribus discoideis, involucro foliolis exterioribus foliaceis flore multo longioribus, foliis ternatis (inferioribus quandoque pinnatis) foliolis lanceolatis serratis.—*Linn.*—*Mich. Am. v. 2. p. 136.* *Pursh, Fl. Am. v. 2. p. 566.* *Elliott, Carol. v. 2. p. 431.*

HAB. Canada, (*Mrs. Percival*), to the Saskatchewan. *Dr. Richardson*. *Drummond*.

4. *B. connata*; floribus discoideis, involuci foliolis exterioribus flore sublongioribus, foliis tripartitis (inferioribus quandoque pinnatis) foliolis lanceolatis serratis.—*Willd. Sp. Pl. v. 3. p. 1718.* *Pursh, Fl. Am. v. 2. p. 566.* *Elliott, Carol. v. 2. p. 430.*

HAB. Woodfield, near Quebec, (*Mrs. Sheppard*), to Cumberland House, on the Saskatchewan. *Drummond*.—In my specimens, both of this and the preceding, the leaves are all ternate, and they only differ in the relative length of the outer leaflets of the involucle.

5. *B. pilosa*; floribus discoideis, involuci foliolis exterioribus longitudine interiorum, foliis inferioribus pinnatis, superioribus ternatis, foliolis oblongis, terminali lanceolato reliquis duplo longiore. *Willd.*—*Linn. Sp. Pl. p. 1166.* *Pursh, Fl. Am. v. 2. p. 566.* *Elliott, Carol. v. 2. p. 431.*

HAB. La Grande Chaudière. *Pursh*.

Subtrib. V. HELENIEÆ. *Capitula nunquam dioica*; si heterogama, floribus ♀ vel neutris uniserialibus in ambitu corollasque lingulatas gerentibus, reliquis ♂. *Pappus multipaleatus*, perfectus, regularis, aut æqualis aut subæqualis, ubi tunc rami stylis ♀ apice truncati sunt, paleis integris sive plumoso-fimbriatis seu pinnatisectis. *Antheræ ccaudatae*. *Achenium erostre*. *Involucrum polyphyllum*. *Less.*

1. GAILLARDIEÆ. Nutt. *Pappi paleis integris*, rachide ebracteolata aut tantum margine bracteolata. *Less.*

33. GAILLARDIA. *Foug.*

Radius neuter. Paleæ pappi uninerviaæ, in aristam longe acuminate. Stylo hermaphroditico rami appendiculati. Rachis tota ebracteolata.—Herbae Boreali-Americanæ, foliis alternis, inferioribus inciso-dentatis; capitulis solitariis, longe pedunculatis, terminalibus, disco bruno, radio luteo. Less.

1. *G. bicolor*; pubescenti-hirsuta ramosa, foliis oblongo-lanceolatis radicalibus sinuato-pinnatifidis in petiolum attenuatis superioribus sessilibus sinuato-dentatis, radio bicolori.—*Lam. Encycl. v. 2. p. 585. Pursh, Fl. Am. v. 2. p. 572. Elliott, Carol. v. 2. p. 449. Sims, Bot. Mag. t. 1602.*—*Gaillardia lanceolata. Mich. Am. v. 2. p. 142.*—*Virgilia helenioides. L'Herit.*—*Sm. Ex. Bot. t. 37.*— β . flore minore.

HAB. $\alpha.$ and $\beta.$ Lake Winnipeg to the Saskatchewan and the Rocky Mountains. *Dr. Richardson. Douglas. Drummond.*— $\beta.$ chiefly in mountain Prairies on the East side of the Rocky Mountains, and on the tributary streams of the Columbia on the West side. *Douglas.*

2. *G. aristata*; pubescenti-hirsuta ramosa, foliis oblongo-lanceolatis, inferioribus sinuato-pinnatifidis in petiolum attenuatis, superioribus sessilibus integerrimis, radio unicolori.—*Pursh, Fl. Am. v. 2. p. 573. Lindl. Bot. Reg. t. 1186. Hook. Bot. Mag. t. 2940.*—*Gaillardia bicolor, var. Nutt.*—*Spreng.*

HAB. Common on the undulating dry soils of the Columbia, from the Ocean to the Rocky Mountains: very plentiful where timber has been burned. *Douglas. Dr. Scouler.*

34. BAHIA. *Lag.*

Radius ♀ aut nullus. Paleæ pappi lineares, truncatæ, inæquales, muticæ. Stylus exappendiculatus. Rachis tota ebracteolata.—Frutices vel herbae Americanæ meridionali (et Boreali) indigeni, foliis alternis vel oppositis, plerumque subtus tomentosis, pinnatifidis vel crenato-lobatis; capitulis corymbosis vel subglomeratis; involucris cylindraceis, pauciseriatis; rachide plana, sœpe paleaceo-fimbrillifera. Lag.

1. *B. artemisiæfolia*; foliis alternis sessilibus profunde pinnatifidis subtus niveo-tomentosis margine revolutis, capitulis fasciculatis inæqualifloris heterogamis, involucris 9-phyllois 1-serialibus cylindraceis. Less. in Linnaea, v. 6. p. 253.

HAB. North California, *Mr. Menzies*: at St. Francisco. *Chamiso (in Herb. nostr.)*

35. TRICHOPHYLLUM. *Nutt. (Eriophyllum? Lag.)*

Radius fæmineus. Paleæ pappi æquales, obovatae, obtusaæ, muticæ. Stylus exappendiculatus. Rachis tota ebracteolata.—Herbae Americanæ, foliis alternis s. oppositis, integris s. palmato-pinnatifidis; capitulis luteis, terminalibus, solitariis, pedunculatis; involucris polyphyllis. Less.

1. *T. lanatum*; foliis oppositis pinnatifidis subtus præcipue tomentosis laciniis remotis marginibus revolutis.—*Nutt. Gen. Am. v. 2. p. 166.*—*Actinella lanata. Pursh, Fl. Am. v. 2. p. 560.*—*Eriophyllum cæspitosum. Dougl. in Bot. Reg. t. 1167.*

HAB. Kootenay River. *M. Lewis.* Near the sources of the Columbia River. *M. Lewis.* Common on dry sandy or gravelly soils, from the head sources of the Columbia to the Western Ocean. *Douglas. Dr. Scouler.*

2. *T. integrifolium*; foliis inferioribus obovato-spathulatis superioribus linear-i-spathulatis integris integerrimisque vel rarissime apice subtriangularis utrinque albo-lanatis.

HAB. With the preceding.—Although mixed with the foregoing species by Mr. Douglas, it must have been so through inadvertence; for the two species are totally distinct in their foliage. With regard to the genus of these plants, I cannot satisfy myself that they should be referred to *Eriophyllum* of Lagasca, a native of South America, and of which the characters are most imperfectly detailed. The involucle in our individuals is not monophyllous, assuredly; though from the dense covering of wool, it may have the appearance of being so.

36. BLEPHARIPAPPUS. Nov. Gen.

Radius pauciflorus scamineus, corollis lato-cuneatis profunde trifidis. *Paleæ pappi* sub-8, linear-i-acuminatæ, fimbriato-ciliatae. *Rachis* bracteolata.—Herbae annuae, ramosæ, Americæ Borealis; foliis alternis linearibus integris; capitulis terminalibus solitariis, radio albo; involucri haemisphærici foliolis uniserialibus æqualibus oblongis seu ellipticis; acheniis pilosis.

1. *B. glandulosus*; hispidus, foliis lato-linearibus superioribus involucrisque glandulosis, glandulis nigris pedicellatis, pappi paleis elongatis basi longe pilosus, rullii acheniis nudis calvis.

HAB. Common on the plains of the Columbia, in sandy soils, under the shade of *Purshia* and *Artemisia*. Douglas.—6 to 8 inches high, vaguely branched, branches spreading; flowers nearly as large as those of *Chrysanthemum Leucanthemum*. The achenes are clavate, those of the ray are sheathed all round by the scarious margins of the leaflets of the involucle, as in the following species, and are quite glabrous, black, and very minutely dotted. Corolla with a few long hairs at the extremity. Stigmas of the florets of the disk linear, long, recurved, glanduloso-pubescent, those of the ray very short.

2. *B. scaber*; foliis angusto-linearibus scabris, involucris subpubescentibus glandulis pedicellatis nullis, acheniis omnibus villosis, pappi paleis breviusculis superne præcipue fimbriato-ciliatis.

HAB. Sandy plains of the Columbia, among *Purshia* and *Artemisia*.—Branches more erect, and flowers much smaller than the preceding. The stigmas of the disk appear considerably different, being short and truncated, nearly glabrous, while the style upwards is very hairy and slightly incrassated.

37. HYMENOPAPPUS. L'Hérit.

Capitulum homogamum. *Paleæ pappi* numerosæ, ellipticæ, muticæ, obtusæ. *Achenium* subpunctato-turbinatum. *Stylus* appendiculatus. *Rachis* tota bracteolata.—Herbae Americæ Boreali indigenæ, albo-lanuginose, foliis pinnatifidis, alternis; capitulis corymbosis (vel solitariis) odoratis, albido-incipitatis; foliolis coloratis. Less.

1. *H. Douglasi*; lana alba decidua tomentosus, ramis elongatis subcorymbosis, foliis bipinnatifidis segmentis linearibus sinuatis, floribus solitariis involucri foliolis sub 20 linearibus pubescentibus capitulo brevioribus, corollis filiformibus apice pilosis pappi paleis linearibus vix longioribus.—*H. scabiosæ*. Dougl. MSS. apud. Herb. Hort. Soc. Lond. (non L'Hérit.)

HAB. Common on the barren dry sandy grounds of the Columbia, from the "Great Falls" to the Rocky Mountains. Douglas.—1 to 3 feet high, copiously branched, the branches elongated so as all to reach nearly the same level, and each terminated by a single rather large white flower. This is very different from the

H. scabiosæus, L'Hérit. (*Rothia Carolinensis*, Lam. Ill. t. 667.) where the flowers are subcorymbose, the leaflets of the involucre very broad, the upper part of the corolla campanulate, and the pappus extremely short.

2. *H. filifolius*; lana alba decidua tomentosus, ramis paniculatis sparsis, foliis bipinnatifidis segmentis filiformibus elongatis integerrimis, floribus solitariis, involuci foliolis sub-12 ellipticis pubescentibus capitulo subbrevioribus, corollæ tubo superne campanulato, pappo brevissimo.—*H. tenuifolius*. Dougl. MSS. apud. Herb. Hort. Soc. Lond. (non Pursh.)

HAB. On the undulating arid grounds of the Columbia, near the Wallawallah, and on the banks of the Spokane and Flat-head Rivers.—18 inches to two feet high, the stem loosely panicle above. This is quite different from the *H. tenuifolius* of Pursh, of which I possess a specimen from Mr. Nuttall, gathered on the Arkansas. That has a remarkably dense corymb of flowers, whereas here the branches form a lax terminal panicle, each elongated extremity bearing a solitary flower. The pappus is extremely minute.

38. PICRADENIA. Nov. Gen.

Radius 8–10 florū, scamineus, corollis obovato-oblongis grosse tridentatis. *Paleæ pappi* 6–7 subimbricatae, ovatae, acuminatissimæ, nultæ. *Achenium* villosum. *Rachis* conica, nuda.—*Herba Americæ Borealis*, radice crassa perenni; foliis alternis linearis-filiformibus rigidis pinnatifidis, glanduloso-punctatis punctis pellucidis; capitulis terminalibus unicoloribus flavis; corollis disci præcipue glandulis valde amaris tectis; involuci subhemisphaerici foliolis imbricatis, externis basi coadunatis.—Nomen *ringens*, amarus, et *amara*, glandula: ob glandulas amarissimas.

1. *P. Richardsoni*. (TAB. CVIII.)

Radix subfusiformis, lignosa, descendens, ramosa, superne divisa. *Caulis* subspithamei, errecti, rigidi, glabri, striati, superne ramosi. *Folia* 3–4 uncias longa, linearis-filiformia, *caulina* pauca; omnia pinnatifida, lacinia paucis, remotis, rariis iterum divisis, glanduloso-atque pellucido-punctatis, obscure unicostatis. *Pedunculi* terminales, uniflori. *Flos* majusculus. *Involucrum* hemisphaericum, impresso-punctatum, glandulosum, subpubescentem; *foliolis* oblongis imbricatis, exterioribus inferne coadunatis. *Rachis* (seu *receptaculum*) conica, carnosæ, punctata, ebracteata. *Florculi radii* ligulati, obovato-oblongi, lutei, tubo præcipue glandulosi, apice dentibus 3 grossis; *disci* tubulosi, 5-dentati, flavi, glandulis valde amaris tecti. *Antheræ* subexsertæ. *Stigmata* inclusa, breviæcula, apice incrassata et hirsuta. *Achenium* oblongum, superne latius, pilosum præcipue apicem versus. *Pappus* paleaceus, paleis 6–7, errectis, ovatis, acuminatissimis, membranaceis.

HAB. About Carlton House, on the Saskatchewan. Dr. Richardson.—Allied to *Hymenoxys* of Cassini, in the nature of the pappus: but very different in the involucre and habit.

TAB. CVIII. *P. Richardsoni*. *Fig. 1*, Involucre; *fig. 2*, Section of do.; *fig. 3*, Floret of the ray; *fig. 4*, Floret of the disk; *fig. 5*, Stigmas; *fig. 6*, Paleæ:—magnified.

39. HELENIUM. Linn.

Capitulum radiatum, radio ♀. *Paleæ pappi* aristatae, acuminatae. *Achenium* multifarium pilosum. *Stylus* exappendiculatus. *Rachis* margine bracteolata.—*Herbæ Americane*, foliis linearibus, integris, puberulis, saepe decurrentibus; capitulis luteis, terminalibus, solitariis, lingulis radii apice trilobis; involucris polyphyllis, uniserialibus; rachide convexa. Less.

1. *H. autumnale*; caule angulato, foliis lanceolatis serratis decurrentibus, disci corollis 5-fidis radii 3–5-fidis.—Linn. Sp. Pl. p. 1120. Mich. Am. v. 2. p. 133. Pursh, Fl. Am. v. 2. p. 566. Elliott, Carol. v. 2. p. 401. Hook. in Bot. Mag. t. 2994.

HAB. Throughout British North America, from Lake Huron nearly to the Arctic Circle, and from Hudson's Bay to the Pacific Ocean.

Subtrib. V. CHRYSANTHEMÆ. *Capitulum heterogamum, floribus uniserialibus in ambitu, . fæmineis seu neutris, quorum saltem nonnullis corollæ lingulatæ s. lingulæformi-bilabiatae sunt; reliquis stylum semper bifidum gerentibus, rarius sterilibus. Pappus nullus aut coroniformis, integer aut rarissime paleis minutis, semilanceolatis, æqualibus constans. Anthera ecaudata. Stylo disci rami, ubi rachis bracteolata est, semper exappendiculati, pubescentia nunquam descendente. Achenium neque rostratum, neque plano-obcompressum et orbiculare, plerumque angulatum atque costatum. Less.*

1. ANTHEMIDEÆ. *Rachide bracteolata. Less.*

40. ANTHEMIS. Linn.

Radius fœmineus. Achenium exalatum, glabrum, angulatum, areola terminali. Pappus coroniformis, callosus, crassus, integer. Corolla tubo piano-obpresso subexappendiculata; disci 5-dentata; radii lingulata, lingula oblonga. Stylus disci ramis exappendiculatis. Involucrum campanulatum. Rachis ampla, convexa.—Herbæ per totam zonam temperatam borealem orbis antiqui divulgatae, foliis alternis, bi-vel tripinnatisectis; capitulis terminalibus, solitariis; radio concolori vel albo. Less.

1. *A. Cotula*; caule ramoso foliisque 2-pinnatis subvillosis, lacinii subulatis 3-partitis, ramis floriferis paniculatis, flosculis paleas setaceas superantibus, seminibus apice nudis. SPR.—Linn.—Engl. Bot. t. 1772. Nutt. Gen. Am. v. 2. p. 171. Elliott, Carol. v. 2. p. 405. Bigel. Fl. Bost. ed. 2. p. 314.

HAB. Lake Huron. Dr. Todd. Quebec. Mrs. Sheppard.—Introduced, but abundant throughout the United States.

41. ACHILLÆA. Linn.

Radius fœmineus. Achenium exalatum, calvum, glabrum, areola terminali. Corolla disci 5-dentata tubo piano-compresso bialata, radii lingulata, lingula brevi. Involucrum cylindraceum. Rachis parva.—Herbæ aut rarius subfrutices per totam zonam temperatam meridionalem orbis antiqui præcipue divulgatae, foliis alternis, rarius pinnatifidis plerumque varie pinnatisectis; capitulis corymbosis; radio plerumque albo, rarius luteo vel purpurascente, 5-decimfloro. Less.

1. *A. multiflora*; caule erecto foliisque elongato-lanceolatis argute pinnatifido-serratis glabriusculis lacinii serrulatis, corymbo terminali composito, radio brevissimo.—A. Ptarmica. Rich. in Frankl. 1st Journ. ed. 2. App. p. 33. (non aliorum.)

HAB. Throughout the woody country, and as far North as Fort Franklin. Dr. Richardson. Drummond.—This is certainly very distinct from the European *A. Ptarmica*, not only in foliage, but remarkably so in its deuse compound corymbs, and the extremely short ray of the flowers.

2. *A. Millefolium*; caule subramoso foliisque 2-pinnatis glabriusculis seu pubescensibus, lacinii linearibus serratis, corymbo composito.—Linn.—Engl. Bot. t. 758. Pursh, Fl. Am. v. 2. p. 563. Elliott, Carol. v. 2. p. 405.

HAB. Throughout the British Possessions, from Lake Huron to the Arctic Sea, and from the Atlantic to the Pacific Ocean.—On the North-West coast this plant is most variable, sometimes with short, narrow, very woolly leaves, and extremely dense laciniae, (as found by Mr. Menzies, Mr. Douglas, and Dr. Scouler, in the North-West, and which I suspect may be the *A. tomentosa* of Pursh), at other times with the leaves remarkably elongated, the lower ones even a foot long, and three inches in diameter, cut into long and glabrous laciniae.

3. *A. tomentosa*; foliis 2-pinnatifidis villosa-tomentosis, foliolis confertis tripartitis sub-transversis, lacinulis linearibus integerrimis, corymbo composito. Spr.—Engl. Bot. t. 2532. Pursh, Fl. Am. v. 2. p. 563.

HAB. On the banks of the Kooskoosky, North-West America. M. Lewis, (ex Pursh.)

2. CHRYSANTHEMÆ. *Rachide ebracteolata*. Less.

42. CHRYSANTHEMUM. Linn.

Achenium exalatum, calvum, epapulosum, teretiusculum, disco epigyno magno. Cor. disci 5, 5-dentata, tubo carnoso, plano-obpresso et subbinato, radii lingulata. Stylus disci ramis exappendiculatus.—Herbæ rarissime suffrutes, per totam orbem terrarum divulgatae, foliis alternis, pinnatifidis vel dentatis, superioribus sessilibus; capitulis solitariis ramosque superne aphyllos terminantibus, radio albo vel luteo; involucris campanulatis imbricatis; rachide conveza nuda. Less.

1. *C. Leucanthemum*; caule subramoso, foliis crenatis serratis, inferioribus obovato-spathulatis superioribus lanceolatis, ramis 1-floris. Spr.—Linn.—Engl. Bot. t. 601. Pursh, Fl. Am. v. 2. p. 507. Elliott, Carol. v. 2. p. 401.

HAB. Canada and Fort Vancouver, on the Columbia, (Mr. Garry); introduced.

2. *C. arcticum*; caule superne nudisculo, foliis subcarnosis cuneatis inferioribus sublonge petiolatis sinuato-pinnatifidis superioribus trilobis.—Linn.—Gmel. Fl. Sib. v. 2. p. 203. t. 24. Pursh, Fl. Am. v. 2. p. 526. Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 116, et 126. Lessing, in Linnæa, v. 6. p. 169.

HAB. Behring's Straits. Steller. Chamiso. Lay and Collie. Fort Vancouver on the Columbia. Douglas. Dr. Scouler. York Factory, Hudson's Bay. Drummond. Arctic Sea coast. Dr. Richardson.—This is a very distinct, and probably entirely a maritime species.

3. *C. integrifolium*; nanum, pilosum, foliis linearibus integerrimis, caule subaphyllo unifloro. (TAB. CIX.) Rich. in Frankl. 1st Journ. ed. 2. App. p. 33. Hook. in Parry's 2d Voy. App. p. 398. Hook. et Arn. in Bot. of Beech. Voy. p. 126. Lessing, in Linnæa, v. 6. p. 170.

"*Radix gracilis, perennis. Folia radicalia conferta, fere pollicaria, linearia, obtusiuscula, integerrima, pilosa. Caulis simplicissimus, digitalis, superne incrassatus, pilis mollibus patentissimis dense tectus, et intordum folio uno altero fere setaceo instructus. Flos pro ratione plante magnus. Calyx hemisphericus imbricatus, squamis elliptico-ovovatis, appressis, viridibus, marginibus membranaceis laceris, umbrino-fuscis. Flosculi radii albi, magni, late elliptici, 3-dentati; disci lutei. Receptaculum pilosiusculum.*" Rich.

HAB. On the Copper Mountains, in lat. 67°. Dr. Richardson. Shores and Islands, probably throughout the whole extent of Arctic America. Dr. Richardson. Capt. Sir J. Franklin. Capt. Sir E. Parry. Chamiso. Messrs. Lay and Collie, &c.

TAB. CIX. *C. integrifolium*. *Fig. 1*, Outer; *fig. 2*, Inner leaflet of the involucre; *fig. 3*, Floret of the ray; *fig. 4*, Floret of the disk; *fig. 5*, Stigmas; *fig. 6*, Leaf.

4. *C.? nanum*; annuum, caule subramoso laxe lanoso, lana decidua, foliis pinnatifidis segmentis linearibus integris, floribus terminalibus solitariis, acheniis obovato-oblongis papulosis.

HAB. North-West coast of America. *Mr. Menzies*.—This was marked “*Anthemis*” by Mr. Menzies, but as I do not find any scales upon the receptacle, I rather refer it to *Chrysanthemum*, notwithstanding that the achene is rough with minute granules or papillæ. The root is small and fibrous. Stem subrect, 3–5 inches high, simple or branched, slender, partially clothed with a deciduous lax wool. Leaves scarcely an inch long; their rachis and segments slender. Flower terminal, solitary, the size of that of a daisy. Leaflets of the involucre elliptical, at length sphaerelated at the extremity. Florets of the ray 8–10, apparently white and entire at the point. Receptacle or rachis of the flower convex. I regret that I cannot give a more full description of this interesting little plant without the destruction of the few specimens which I possess.

43. PYRETHRUM. Willd.

Achenium exalatum, conforme, angulatum. Pappus coroniformis, diametro ei achenii subaequali. Cor. disci ♀, 5-dentata, tubo incrassato, saepius plano-obcompresso et bialato, radii ♀ lingulata, lingula oblonga. Stylus disci ramis exappendiculatis. Involucrum campanulatum. Rachis ampla.—Herba vel rarius frutices, per zonam temperatam australem (principice) divulgata, foliis alternis, rarissime oppositis, plerunque varie pinnatifidis; capitulis solitariis vel corymbosis, radio albo, rarius luteo; involucris campanulatis, imbricatis; rachide planiuscula. *Less.*

1. *P. inodorum*; caule diffuso ramoso, foliis bipinnatis glabris, foliolis linearifiliformibus 2–3-partitis, corona achenii integerrima.—*Sm. Engl. Bot. t. 676*.—*β. nanum*; caule unifloro. *Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 126*.—*P. Caucasicum*. *Willd.* (*fide Lessing*) *Chrysanthemum grandiflorum*. *Hook. in Parry's 2d Voy. App. p. 398*.

HAB. Lake Huron. *Dr. Todd*. York Factory, Drummond; and as far North as Bear Lake, *Dr. Richardson*. *β. Shores and Islands of the Arctic sea*. *Dr. Richardson. Chamisso*.

Subtrib. VII. ARTEMISIÆ. *Capitula nuquam dioica, floribus marginalibus uni-s.-pluriseriatis, fimbriatis, corollas tubulosas aut rarissime obsolete lingulatas gerentibus, ubi tunc (1) aut lingulae ipso tube plano-obcompresso et bialato angustiores, (2) aut flores ♀ pluriseriales, (3) aut achenia plano-obcompressa et orbicularia sunt, (4) aut floribus centralibus masculis stylus simplicissimus est. Pappus aut nullus, aut coroniformis, aut e brevissimis paleis vel pilis, cellulis uniserialibus, suprapositis formatis constans. Antheræ ecaudatae. Stylo ♀ vel ♂ rami semper exappendiculati. Less.*

1. COTULEÆ. *Capitulis multifloris; corollis staminigeris tubum plano-obcompressum et bialatum, stylumque bifidum gerentibus aut teretibus, si achenium aut corolla fimbriata et obcompressa est; rachide ebracteolata. Less.*

44. OMALANTHUS. Less.

Capitulum heterogamum, floribus uniserialibus in ambitu, reliquis ♀ fertilibus. Achenium exalatum, quadrigonum, conforme. Pappus coroniformis, repandus. Cor. ♀; ♀

glabra, plano-compressa, bialata, 3-crenata. *Itachis* ebracteolata.—*Herba Californica*, *facie Santolinæ, tomentosa*, foliis bipinnatisectis alternis; capitulis solitariis vel corymbosis; involucris campanulatis, pauciserialibus; rachide convexa. *Less.*

1. *O. camphoratus*. *Less.* in *Syn. Gen. Compos.* p. 260.—*Tanacetum camphoratum*. *Less.* in *Linnaea*, v. 6, p. 521.

Hab. California. *Menzies*, (in *Herb. nostr.*) *Chamiso*. Columbia. *Douglas*. *Dr. Scouler*. York Factory, Hudson's Bay. *Drummond*. *Douglas*.—This has altogether the habit of *Tanacetum vulgare*; but it is much more robust; and it differs, as Lessing tells us, " corollis femineis plano-obcompressis et inferne alatis."

2. ARTEMISIEÆ. *Capitulis multifloris; corollis staminigeris teretibus stylumque bifidum gerentibus; achenis exalatis, nunquam plano-obcompressis et orbicularibus, rachide ebracteolata*. *Less.*

45. ARTEMISIA. Linn.

Capitulum aut heterogamum, floribus disci ♀, et ♀ in ambitu rachide villosa (*Absinthium*, Tourn.); aut floribus disci ♀ et ♀ in ambitu, rachide nuda (*Abrotanum*, Tourn.); aut floribus omnibus ♀ v. raro in medio 1 ♀, rachide nuda (*Seriphidium*, Bess.); aut floribus staminigeris abortu ovarii sterilibus, ♀ in ambitu, rachide nuda (*Dracunculus*, Bess., *Oligosporus*, Cass.) *Achenium* obovatum calvum disco epigyno minuto.—" *Herbæ per totam orbem terrarum disperse, foliis alternis plerunque varie pinnatifidis; capitulis parvis paucifloris, luteis, spicatis, racemosis vel in paniculam pyramidalem dispositis; involucris imbricatis, foliolis siccis margine scariosis.*" *Less.*

SECT. I. ABSINTHIUM. *Gærtn.*—*Bess.** *Syn. Absinth.*, in *Bulletin, de la Soc. Imp. des Natural. de Moscow*, 1829. n. 8.

1. *A. frigida*; suffruticosa, calathidibus parvis racemoso-paniculatis globosis nutantibus, periclinii squamis exterioribus linearibus incanis interioribus oblongis lanatis, foliis incanoscereis caulinis pinnatisectis laciniis linearibus 3–5-fidis.—*Willd. 3. *A. Ludoviciana* (*Bess. non Nutt.*) ; suffruticosa erecta, calathidibus virgato-paniculatis globosis subcernuis, flosculis nudis, periclinii tomentosi squamis ext. sub lanceolatis membranaceo-marginatis subpinnatifidis, lacinii linearibus acutis margine revolutis subtus candidis remotis divergentibus.—*Nutt. in Spreng. Syst. Veget. v. 3. p. 490. Bess. Monogr. Art. ined. cum ic.*—(*A. discolor. Dougl. in Herb. nostr.*)

HAB. Rocky Mountains, Arctic America. *Dr. Richardson*. Rocky situations, near the Spokane and Kettle Falls. *Douglas*.—I may observe that Mr. Nuttall's *A. Ludoviciana* is a Missouri plant, whence I possess specimens precisely agreeing with his description, and totally different from the present, having large, entire, or rarely pinnatifid leaves, downy on both sides.

4. *A. Hookeriana* (*Bess.*) ; suffruticosa erecta, calathidibus paniculatis globosis nutantibus, panicula thyroidea parum foliosa, periclinii albo-lanati squamis margine scariosis intermedii rotundatis, foliis subtus cauleque candidis, caulinis pinnatifidis, lacinii floralibusque lineari-lanceolatis acutis. *Bess. Monogr. Art. ined. cum ic.*

HAB. Rocky Mountains. *Drummond*.

5. *A. vulgaris*; suffruticosa erecta, calathidibus spicato-paniculatis ovatis cernuis demum erectis, panicula foliosa patente, flosculis nudis, periclinii squamis exterioribus incano-tomentosis, interioribus scariosis nitidis, foliis subtus albo-tomentosis, caulinis pinnatifidis pinnis laciiniatis incisis grosse serratis integrigrise summis ramisque sublinearibus integerrimis.—*Linn. Sp. Pl. p. 1188. γ. vulgatissima*; foliorum laciiniis lineari-lanceolatis inferiorum vix inciso-dentatis, panicula magna erecta.

HAB. Throughout Canada; and as far as the Arctic Circle. *Dr. Richardson. Drummond*. Sandy Plains, West of the Rocky Mountains. *Douglas. γ. North-West coast. Douglas, in Herb. Lindl.*

6. *A. Indica*; suffruticosa erecta, calathidibus racemoso-paniculatis ovatis, panicula foliosa patente, racemis ante anthesin pendulis, flosculis nudis, periclinii junioris subtomentosi

demum glabri squamis exterioribus foliaceis acutis, interioribus membranaceis obtusis, foliis subtus cinereo-tomentosis, inferioribus pinnatifidis superioribus trifidis summis simpli-cibus lacinia lanceolatis inferioribus subdentatis vel incisa.—*Willd. Sp. Pl. v. 3. p. 1846.*
Bess. Monogr. Art. ined. cum ic.—*δ. Canadensis*; folia caulina 3-partita subtus cinerea, margine vix revoluta, periclinii squamae manifeste tomentosæ.

HAB. *β. Canada. Goldie, in Herb. Lindl.*

7. *A. longifolia*; suffruticosa erecta, calathidibus paniculatis ovatis (?), panicula foliosa e spicis thyrsoides axillaribus, flosculis nudis, periclinii scariosis fuscis glabris, foliis superne glabris subtus albo-tomentosis lanceolatis breviter cuspidatis, inferioribus antice inæqualiter serrulatis basi incisis. (specimen juvenile.)—*Nutta?* (?) in *Spreng. Syst. v. 3. p. 488.* *Bess. Monogr. Art. ined. cum ic.*

HAB. North-West America. *Dr. Scouler*.—Of this, Dr. Scouler gathered two specimens, one above described with glabrous involucres; the other with very downy ones. This latter I can scarcely distinguish from what I take to be the true *A. Ludoviciana* of Nuttall.

8. *A. Purshiana* (*Bess.*); suffruticosa adscendens incana, calathidibus paniculatis ovatis, panicula foliosa stricta, flosculis nudis, foliis subtus albidis, caulinis lanceolatis subcuneatis mucronatis integerrimis. *Bess. Monogr. Art. ined. cum ic.*—*α. latifolia*; folia elliptico-lanceolatis $1\frac{1}{2}$ " longis, $\frac{1}{2}$ " latis.—(*A. integrifolia. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30. fide Herb. nostr.*)—*β. angustifolia*; foliis lanceolatis, $1\frac{1}{2}$ " longis, $3^{\prime \prime}$ latis.

HAB. On the plains of the Saskatchewan. *Dr. Richardson. Drummond*.—*β. Red River. Douglas, in Herb. Lindl.*—(This is certainly the *A. integrifolia* of Dr. Richardson, and I presume also of Pursh; but probably it is not the Siberian plant figured by Gmel. Sib. v. 2. t. 48. The leaves are sometimes downy on both sides, sometimes glabrous above, whence I fear it comes too near the following species.—H.)

9. *A. Douglasiana* (*Bess.*); suffruticosa (?) stricta canescens, calathidibus spicato-paniculatis hemisphaericis, panicula subsoliosa, flosculis nudis, periclinii squamis ellipticis, inferioribus apice scariosis, foliis subtus incanis, caulinis lanceolatis acutis integerrimis. *Bess. Monogr. Art. ined. cum ic.*

Ab *A. integrifolia* differt foliis integerrimis, panicula magna, calathidibus minoribus glomerato-spicatis; ab *A. Purshiana* vero caule stricto, foliis acuminatis (non mucronatis,) panicula ramis elongatis, calathidibus majoribus, periclinii squamis apice scariosis (nec incano-tomentosis,) colore totius plantæ minus cano, foliisque supra viridibus.

HAB. North-West America. *Douglas, in Herb. Lindl.*

10. *A. arctica* (*Bess.*); cæspitosa, calathidibus racemoso-spicatis glomeratis globosis, pedunculis apice lanatis, flosculis apice subpilosulis, periclinii squamis superne fuscis scariosis, foliis subsericeis inferioribus pinnatisectis, superioribus trifidis, lacinia radicalium tri-quinquefidiis superioriorum indivisis linearibus obtusis. *Bess. Monogr. Art. ined. cum ic.*

HAB. From Bear Lake to the shores of the Arctic Sea. *Dr. Richardson*.—(Two of the specimens in this collection have the whole plant clothed with long silky hairs. H)—In my first account, I gave the name of *A. borealis* to this plant; but have been convinced by Lessing's work, that it is not the *A. borealis* of Pallas. Its appellation is therefore changed as above, and I only regret not having altered it to *Richardsoniana*, as it is to be feared the present name cannot stand, Lessing having thus called a variety of *A. Chamissoniana*. *Bess.*

11. *A. glomerata*; densissime cespitosa ubique sericeo-villosissima, ramis brevibus arcte foliatis, foliis brevibus 3-5-fido-palmatis lacinia lanceolatis brevi-neuminatis inferioribus sessilibus caulinis late petiolatis, floribns capitatis, receptaculo nudo.—*Lessing, in Linnaea*, v. 6. p. 212. *Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 125.*

HAB. Bay of St. Lawrence. *Chamiso. Kotzebue's Sound. Messrs. Lay and Collie.*

12. *A. cespitosa* (*Bess.*); calathidibus racemoso-spicatis glomeratis globosis, pedunculis apice lanatis, flosculis superne pilosulis, perielinii squamis fuscis seariosis dorso sublanatis, foliis subsericeis radicalibus longe petiolatis emarginatisque inferioribus pinnatisectis superioribus trifidis lacinia illorum 3-5-fidis subincisis, superlorum indivisis linearibus obtusis.

Planta Sibirica habet flosculos pilosulos, perielinii squamas ovatas acutas, et est pedalis. Altera est a littoribus Arcticis Americae, cui flosculi 8 omnino nudis.

HAB. Arctic sea-shore. *Dr. Richardson.*

13. *A. Tilesii*; herbacea, calathidibus racemosis globosis subnutantibus in caule simplicissimo, flosculis nudis, perielinii arachnoideo-tomentosi squamis lateribus seariosis, foliis subtus albo-tomentosis pinnatifidis lacinia lanceolatis subdentatis.—*Ledeb. Mém. de l' Acad. Imp. de Sc. v. 5. p. 568. Bess. Monogr. Art. ined. cum ic. Lessing, in Linnaea*, v. 6. p. 214. *Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 115, et 127.*—Ex littoribus arcticis est var. ϵ . *arctica* (*Bess. Monogr. ined. cum ic.*) foliorum lacinia integerrimis magis distantibus obtusis brevibus, perielinii flosculisque pallidis.

HAB. Unalashka. *Chamiso, in Herb. nostr. Kotzebue's Sound. Messrs. Lay and Collie. Arctic Sea shore, between the Mackenzie and Coppermine Rivers. Dr. Richardson.*

14. *A. Michauxiana* (*Bess.*); herbacea, calathidibus racemosis globosis cernuis in caule simplicissimo, flosculis nudis, perielinii glabri squamis lateribus seariosis nitidis, foliis subtus albo-tomentosis pinnatifidis lacinia inferioribus inciso-dentatis superioribus floralibusque linear-i-lanceolatis. *Bess. Monogr. Art. ined. cum ic.*

HAB. Rocky Mountains. *Douglas. Columbia Douglas, in Herb. Lindl.*

15. *A. Prescottiana* (*Bess.*); suffruticosa, calathidibus spicatis globosis subrectis in ramis simplicissimis, flosculis nudis, perielinii squamis margine seariosis nitidis, foliis subtus incanis margine revolutis pinnatifidis 3-fidis, lacinia divergentibus foliisque summis linear-i-filiformibus. *Bess. Monogr. Art. ined. cum ic.*

HAB. North-West America. *Douglas, in Herb. Lindl.*

16. *A. Chamissoniana* (*Bess.*); herbacea, calathidibus magnis racemosis globosis cernuis in caule simplicissimo, flosculis praecipue basi pedunculisque apice pilosis, foliis subglabris inferioribus 2-pinnatifidis petiolatis, superioribus pinnatifidis sessilibus, lacinia lanceolatis subinciso-dentatis. *Bess. Monogr. Art. ined. cum ic.*—*A. arctica. Lessing, in Linnaea*, v. 6. p. 213. (*fide specim. in Herb. Hook.*) *Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 125.*

Hujus var. β . *sazatilis* (*Bess.* in l. c.) est Rocky Mountains, in qua perielinii squamæ sunt ovatae margine sphacelatæ.—*A. arctica*. (*Lessing in Linnaea*, l. c.) est mea var. γ . *Koraginskiana*, a D. Mertensio lecta, perielinii squamis fuscis sphacelatis obovatis, margine latissimo membranaceo crenato-dentato. Varietates miro modo distinguuntur squamis fere solis perielinii.

HAB. North-West coast of America. *Menzies.*, Kotzebue's Sound. *Chamisso.*, *Messrs. Lay and Collie.* Woods in the Rocky Mountains, in lat. 52°. *Drummond.* Arctic Sea shore. *Dr. Richardson.*—(My specimens from the Rocky Mountains are identical with *A. Norvegica*, from Norway.—H.)

17. *A. biennis*; calathidibus globosis erctis spicatis paniculatis, panicula stricta, foliis radicalibus caulinisque inferioribus 2-pinnatifidis superioribus floralibusque pinnatifidis, ramis laciniiisque linearibus acutis, inferioribus argute inciso-dentatis superiorum subintegerrimis.—*Willd. Phytogr.* p. 11. n. 80.—*A. Hispanica.* *Jacq. Ic. Rar.* v. 1. t. 172.

Cum *A. annua* nequamquam confundenda, cui calathidia vernua la panicula patente ramosa foliorumque laciniae sunt inciso-peccinatae. Proxima potius *A. Tournifortiana*, Reich., a qua tamen duratione bienni, foliorum laciniae (bidenticulatis in altera) flosculinae flavis (purpurascensibus in altera) differt.

HAB. Plains of the Saskatchewan. *Drummond.* Barren plains of the Columbia River. *M. Lewis.*

SECT. IV. DRACUNCULUS. *Bess.* Oligosporus. *H. Cass.*

19. *A. desertorum*; suffruticosa, calathidibus racemoso-paniculatis subglobosis ovatis, periclinii nitidi squamis ovatis subacutis lateribus scariosis, caule erecto stricto, foliis inferioribus (et radicalibus) bipinnatisectis lacinii linearibus, vel pinnatifidis lacinii lanceolatis subtrifidis, vel subspathulato-3-partito-multifidis lacinii lanceolatis vel linear-lanceolatis, caulinis 3-7-partitis semiamplexicaulibus lacinii linearibus vel lanceolatis media pinnatisecta. —*Spreng. Syst. Veget.* v. 3. p. 490. *Bess. Drac. MSS.*—γ. *Scouleriana*; calathidia plus 1" glabra, periclinii squamis interioribus acutiusculis. Folia radicalia 2-pinnatisecta, juniora subsericea, lacinii linearibus elongatis 8"-1" longis $\frac{1}{2}$ " latis. (Reliquis strictior).—δ. *Hookeriana*; calathidia plus 1" glaberrima, periclinii squamis exterioribus acutis. Folia glaberrima, radicalia 2-pinnatisecta lacinii linear-lanceolatis brevioribus 3-6" longis, $\frac{1}{2}$ " latis. Unius speciminis caulis adscendens, aliorum strictus videtur.—ζ. *Richardsoniana*; calathidia (?) incano-sericea, periclinii squamis exterioribus late ovatis. Foliis (radicalia et caulinis inferiora desunt) caulina superiora subsericea, lacinii linearibus 6-9" longis $\frac{3}{4}$ " latis; floralibus simplicissimis 1'. A. virgata. *Rich. in Spreng. Syst. Veget.* v. 3. p. 194. (?)—A. campestris. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*—*A. Canadensis.* *Mich.*—*Nutt.*—Specimen unicum juvenile 1 $\frac{1}{2}$ ' vidi, quod est sola panicula patula, ramis paucis 4". Caulis est violaceus, hirsutus, potius quam incano-sericeus.—η. *Douglasiana*; calathidia (?) glabra, periclinii squamis exterioribus subtrotundis. Folia villosa-subsericea cinerea; (radicalia desunt), caulinis pinnatisecta, lacinii inferiorum 3-fidis, superiorum indivisis linearibus 5-8" longis $\frac{1}{2}$ " latis.

Planta summe polymorpha. A Tana (Don) Bashkiria, regione Altaica et Jemisea prope Krasnojarsk incipiens, partem meridionalem Gub, Ircutensis et Kamtschatka occupant atque per Americam septentrionalem late sese exten'sit.

HAB. γ . North-West coast of America, Fort Vancouver, and Straits of de Fuca. Dr. Scouler. Rapids of the Columbia. Douglas.— δ . et ζ . Throughout Canada, from Lake Huron, (Dr. Todd,) to Hudson's Bay, (Michaux, Douglas,) along the Saskatchewan to the Rocky Mountains. Dr. Richardson, Douglas, Drummond; and thence to the Arctic Circle. Dr. Richardson.—(I think this species will be found to be the *A. Canadensis* of Nuttall, if not of Michaux; the former compares it with *A. campestris*, and says it is Pursh's plant of that name. It certainly is that of Dr. Richardson: and the *A. virgata*, Rich., quoted by Dr. Besser, is the *A. frigida*.—H.)

20. *A. Nuttalliana* (Bess.); suffruticosa, calathidibus racemoso-paniculatis globosis, periclinii squamis exterioribus linear-oblongis marginatis, caule erecto, panicula patula, foliis glabris, inferioribus , caulinis basi indivisis trifidis, lacinis ramisque lanceolatis acutis. Bess. Monogr. Art. ined. cum ic. Bess. Dracunc. MSS.

Ab affinis *A. caudata* et *A. Ammanniana* differt foliis laciniosis lineari-lanceolatis acutis, ab illis et *A. desertorum* periclinii squamis exterioribus linear-oblongis equilongis omnibus lateribus scariosis; a prima panicula magis patula, ramulis apice foliisque cinereis subcericeis; a prima et tertia, foliis caulinis 3-fidis, nec 3-7-partitis ut in *desertorum*. Specimina que vidi sunt 1½ quorum panicula ipsa maximam partem occupat. Folia 1½-1" longa laciinis, ½-¾" latis. Calathidibus sat affinis *A. Dracunculo*.

HAB. Red River. Douglas, in Herb. Lindl.

21. *A. Dracunculus*; suffruticosa, calathidibus racemoso-paniculatis globosis, periclinii squamis exterioribus oblongis marginatis, caule erecto, foliis radicalibus apice trifidis, caulinis lanceolatis lineari-lanceolatis integerrimis.—Linn. Sp. Pl. p. 189. Bess. Dracunc. MSS. — δ , *glauca*; fastigiata. Specimen unicum est 1½, caule rubro, ramis fastigiatis (an destructione apicis caulis?) junioribus incanus. Folia lanceolata, glaucescentia, at vix pubescentia 8"- longa, 1" lata, rami tecti racemis vix 1", apice cernuis, infimis 2", calathidia 1", periclinii squamæ interiores late scariose. Flosculi flavi.

HAB. Plains of the Saskatchewan. Drummond.

22. *A. borealis*; herbacea cæspitosa villoso-sericea vel glabra, calathidibus spicato-racemosis rarius paniculatis hemisphaericis, periclinii squamis ellipticis scariosis, caule simplici, foliis (exceptis summis,) petiolatis, radicalibus lineari-lanceolatis integerrimis, apice 3-5-fidis pinnatisectis bipinnatisectis imo supra decomposito-sectis, lacinis lanceolatis linearibus vel filiformibus, caulinis bipinnatisectis pinnatisectis 5-3-fidis vel linearibus integerrimis.—Pall. It. v. 3. App. n. 129. t. H. h. f. 1. Less. in Schlechtend. Linnæa, v. 6. p. 211. Bess. Dracunc. MSS. Rich. in Frankl. 1st Journ. ed. 2. App. p. 90. Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 125.— α , *Purshii*; sericea, cinerea; folia radicalia lineari-lanceolata integerrima, vel apice 3-5-fida: caulina et floralia linearia: calathidia inferiora pedunculata, superiora subsessilia; periclinii squamæ villosæ, medio fuscescentes, flosculi nudi. Caulis adscendens 6", violaceus, superne villosissimus. *A. spithamea*. Pursh, Fl. Am. v. 2. p. 522; foliis prioris glaberrima: caulina imo floralia inferiora 5-3-fida; calathidia omnia subsessilia, periclinii squama glabra, medio virides. Caules erecti vel obliqui, 3-5, violacei,

basi pedicellique albo-villosi.—*y. Wormskjoldii.* (*Bess. Monogr. Art. ined.*) incana, subsericea: folia radicalia longe petiolata 3–5-fida, laciniis 3–2-fidis, rarius 5-fidis vel indivisis, linearilanceolatis 5"; caulinæ inferiore iis similia, minora et brevius petiolata: floralia 5–3-secta vel simplicissima linearia: calathidia racemosa, e singula axilla gemina, altero subsessili, pedunculi infimi 2–3-flori; periclinii squamae medio fuscæ, flosculi ♂ apice pilosuli. Caulis 15".

HAB. Labrador. Kohlmeister. Dr. Morrison. Arctic Shores of North America. Dr. Richardson. Rocky Mountains. Drummond.—*y.* Columbia River and Islands, North-West America. Douglas. Dr. Scouler. Kotzebue's Sound. Messrs. La*g* and Collie.

There are still some specimens in my collection, which, from the extreme difficulty in characterizing the species of this Genus, and the want of more perfect individuals, I am obliged to leave undetermined. Mr. Pursh gives the "A. Chinensis; foliis inferioribus cuneiformibus obtusis trilobis, superioribus linearibus obtusis, floribus globosis pedunculatis cernuis," (Willd.), as a native of the North-West coast, upon the authority of Mr. Lambert's Herbarium. I possess the true plant, gathered in Kamtschatka by Chamisso, but I have seen no American specimens. (H.)

46. TANACETUM. Linn.

Capitulum homogamum aut heterogamum, floribus ♀ uniserialibus in ambitu, reliquis ♀ fertilibus. *Achenium* angulatum, disco epigyno magno. *Pappus* coroniformis, minutus et hinc inde subnulus, æqualis aut latere exteriori parum manifestior.—Herbae per totam orbem terrarum disperse, foliis alternis, varie sectis; capitulis solitariis aut corymbosis aut corymbo-paniculatis, imbricatis; rachide magis minusve convexa, nuda. Less.

1. *T. vulgare*; capitulis heterogamis corymbosis, foliis bipinnatifidis segmentis lanceolatis inciso-serratis.—Linn.—Engl. Bot. t. 1229. Pursh, Fl. Am. v. 2. p. 522.

HAB. Canada; probably introduced. Mrs. Sheppard.

2. *T. pauciflorum*; caule simplici foliis longiore subunifloro, foliis bipinnatis villosis sessilibus, flosculis omnibus hermaphroditis. Herb. Banks.—Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.

HAB. Woody country, between lat. 54° and 64°, North. Dr. Richardson.—"Ulnaria. Folia bipinnanata et tripinnatifida, laciniis angustis obtusiusculis. Flos plerumque unicus terminalis interdum alter e supraea axilla." Rich. l. c.

3. *T. ? suaveolens*; capitulis homogamis, ramis unifloris, receptaculo conico involucro longiore inferne squamoso, foliis profunde bipinnatifidis laciniis linearibus acutis basi subpectinato-pinnatifidis. (TAB. CX.)—*T. matricariooides.* Less. Syn. Gen. Compos.—*Artemisia matricariooides.* Less. in Linnæa, v. 6. p. 240. (excl. syn. *Tanaceti pauciflori*, Rich. ?).—Santolina suaveolens. Pursh, Fl. Am. v. 2. p. 520.

Radix annua, ramosa, fibrosa. *Caulis* palmaris ad spithameam, basi divisus, apice ramosus, teres, striatus, subhirundinatus, foliaceus. *Folia* alterna, sessilia, circumscriptione oblonga, bipinnatifida, vix pilosa, basi lata pectinato-pinnatifida, laciniis linearibus angustis acutis. *Rami* ultimi, seu *pedunculi*, terminales, sub sesquiuinciam longi, nudiusculi, striati, apice paululum incrassati, uniflori. *Involucrum*, ratione floris magnum, hemisphaericum, foliolis pauci-serialibus subequalibus, oblongis, glabris, marginibus scariosis, albis. *Flosculi* omnino tubulosi, hermaphroditici, flavi, inferiores paleacei, palea scariosis, oblongis, obtusis, superiores nudi. *Corolla* brevis: tubo subtetragono compresso bialato, limbo campanulato, 3–5-dentato. *Styli* anthereaque inclusi. *Achenium* oblongum ovatumve, leue. *Pappus* omnino nullus.

HAB. Banks of the Kooskoosky. *M. Lewis.* Unalaschka. *Chamisso.* Straits of de Fuca. *Dr. Scouler.*—The first I knew of this plant was from Chamisso, who had the kindness to communicate to me an Unalaschka specimen, under the name of *Artemisia matricarioides* of Lessing in the Linnaea. So little does it accord in habit, however, with *Artemisia*, that I was not surprised to find the able Author had removed it from that Genus, in his subsequent work, the "Synopsis Generum Compositarum." With *Tanacetum* I fear it has little more affinity, either in foliage, inflorescence, or in the receptacle or rachis. The habit is altogether that of a *Cotula*, or of an *Anthemis* without ray; but it is probably *sui generis*. Lessing considers the rachis or receptacle to be destitute of scales or bracteas, but I find the extremity only free from scales, the rest is evidently furnished with them.

TAD. CX. T? *suaveolens*. *Fig. 1.*, Involucro and rachis, or receptacle from which most of the florets are removed; *fig. 2.*, Lower floret with its scale; *figs. 3 and 4.*, Upper florets; *fig. 5.*, Achenium; *fig. 6.*, Leaf.—magnified.

Subtrib. GNAPHALIEÆ. *Capitulum saepius uniflorum, rarissime radiatum et biflorum.*
Pappus pilosus vel setaceus, saepissime longus aut nullus ubi achenium erostre et capitulum uniflorum, aut rarissime coroniformis, ubi capitula pauciflora in glomerulos lana intermixta foliisque involucratos dense sunt congesta, aut biserialis, serie interiori paleacea, exteriori coroniformi. Antheræ caudatae. Corolla flori femineo s. neutro, si adest, filiformis, rarissime in capitulis bifloris lingulata. Stylo floris hermaphroditæ vel masculi rami exappendiculati.—Folia alterna, in unico genere opposita, integerrima. *Less.*

47. GNAPHALIUM. Br.

Capitulum multiflorum, floribus & numerosis, pluriserialibus in ambitu. Pappus pilosus, uniserialis, conformis. Stylus & ramis apice solo penicillatis. Achenium erostre. Rachis tota ebracteolata. *Less.*

1. *G. luteo-album*; foliis subamplexicaulibus utrinque cauleque arachnoideo-¹ basi, inferioribus spathulatis superioribus linear-lanceolatis undulatis, floribus densis ² baso-capitatis.—*Linn.*—*Engl. Bot. t. 1002.*

HAB. North California. *Menzies.* Banks of streams on the North-West coast of America. *Douglas.* Columbia and Straits of de Fuca. *Dr. Scouler.*

2. *G. polyccephalum*; foliis linear-lanceolatis acutis sessilibus supra scabris subitus cauleque paniculato albo-lanatis, floribus corymbosis, involuci squamis ovato-lanceolatis acutis.—*Mich. Am. v. 2. p. 127.* *Pursh, Fl. Am. v. 2. p. 524.* *Elliott, Carol. v. 2. p. 325.*—*G. obtusifolium.* *Willd.*

HAB. Canada. *Goldie.* *Lady Dalhousie.*

3. *G. decurrens*; foliis linear-lanceolatis acutis decurrentibus supra scabris subtus cauleque paniculato albo-lanatis, floribus corymbosis, involuci squamis ovato-lanceolatis acutis. *Ives*—*Torrey, Comp. p. 288.*—*G. panicula elongata*, foliis utrinque arachnoideo-lanatis.

HAB. Canada. *Lady Dalhousie.*—*G. panicula elongata*, foliis utrinque arachnoideo-lanatis. Common on the sand of the sea-shore, and on the Islands of the Columbia. *Douglas.*—This differs from the preceding only in its decurrent leaves.

4. *G. sylvaticum*; simplex erectum arachnoideo-lanatum, foliis inferioribus lanceolatis petiolatis superioribus linearibus, spica oblonga multiflora foliosa, involuci squamis margine fuscis.—*Linn.*—*Engl. Bot. t. 913.* *Pursh, Fl. Am. v. 2. p. 525.*

HAB. Canada. *Pursh.*

5. *G. spinum*; caule basi decumbente et ramoso, fertili erecto, foliis linearibus utrinque arachnoideo-tomentosis, floribus axillaribus solitariis vel racemosis, involucri squamis margine fuscis.—*Linn.* (fide *Sm.*)—*Engl. Bot. t. 1193.*

HAB. Labrador. *Dr. Morrison.*—The specimens exactly accord with the figure in English Botany.

6. *G. uliginosum*; ramosum diffusum arachnoideo-lanatum, foliis linear-lanceolatis, floribus glomeratis axillaribus et terminalibus, glomeruli folio brevioribus, involucri squamis unicoloribus interioribus acutis.—*Linn.*—*Engl. Bot. t. 1194.* *Pursh, Fl. Am. v. 2. p. 526.*

HAB. Canada, (*Pursh, Lady Dalhousie, Mrs. Shepherd,*) and to the Saskatchewan. *Dr. Richardson, Drummond.* Sandy shores and islands of the Columbia. *Douglas.*

48. ANTENNARIA. Br.

Capitula aut dioica aut subdioica. *Rachis* tota ebracteolata. *Pappus* uniserialis, ♂ apice clavatus. *Stylus* ♂ aut simplicissimus aut breviter bifidus.—Herbe per totam zonam arcticam divulgata et inde in Europa medium versus descendentes, perennes, tomentosæ; foliis planis, supra sæpius minus tomentosis; capitulis corymbosis, albis; involucris imbricatis, capitulorum famineorum turbinatis. *Less.*

1. *A. margaritacea*; elata simplex, foliis linear-lanceolatis acutis trinerviis sessilibus subtus cauleque lanatis, corymbo multifloro, involuci hemisphaerici squamis ellipticis obtusis opacis albis extimis solummodo basi tomentosis.—*Linn.*—*Engl. Bot. t. 2018.* *Mich. Am. v. 2. p. 127.* *Pursh, Fl. Am. v. 2. p. 524.* *Elliott, Carol. v. 2. p. 326.* *Bigel. Fl. Bost. ed. 2. p. 299.*

HAB. From Lake Huron, (*Dr. Todd,*) to Hudson's Bay and the Saskatchewan; and from Newfoundland (*Dr. Morrison, Miss Brenton*) to the Rocky Mountains (*Dr. Richardson, Douglas*); and from California (*Menzies*) to the Columbia and Nootka Sound. *Douglas, Dr. Scouler.* *Unalaschka, Chamisso.*

2. *A. Carpatica*; subhumilis simplex lanata, foliis lanceolatis trinerviis inferioribus petiolatis, corymbo capitato pauci (6-8)-floro, involuci turbinati inferne lanati squamis obtusis nitidis fuscescentibus superioribus elongatis ejus apicibus albis subopacis.—*α. humilis*; foliis supra glabratibus.—*Gnaphalium Carpaticum. Wahl. Fl. Lapp.*—*Fl. Carpat. p. 258. t. 3.*—*G. alpinum. Willd. Sp. Pl. v. 3. p. 1883.* (fide *Wahl.*)—*β. lanata*; foliis utrinque lanatis. *Wahl. Fl. Succ. v. 2. p. 515.*—*Gnaphalium alpinum. De Cand. Fl. Fr. p. 3312.* (aliorumque fide *Wahl.*)—*γ. pulcherrima*; elata (pedalis sesquipedalis) subargentea, corymbis laxis.

HAB. *α.* Island of Anticosti, in the St. Lawrence. *Goldie.* *β.* Summits of the most elevated among the Rocky Mountains, lat. 52°; and *γ.* Swamps of the plains among the Rocky Mountains. *Drummond.*—The var. *β.* of Wahlenberg differs very slightly from *α.*; but our var. *γ.* is a very remarkable one, a foot and sometimes a foot and a half high, with leaves 4-5 inches long, the whole plant clothed with an almost silky down. The species is, indeed, very different from the *A. alpina.* It sends out no stolones; but the root is branched above, and the fertile stem is sometimes accompanied by one or two erect sterile ones.

3. *A. alpina*; stolonibus brevibus suberectis, foliis subtilibus præcipue albo-tomentosis, radicibus spathulatis, caulinis linearibus, corymbo capitulo, involuci squamis interioribus acutis membranaceis fuscescentibus nitidis. *Br. in Linn. Trans. v. 12. p. 123, et in Parry's Voy. App. p. ccxx. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*—*Gnaphalium alpinum. Linn.*—*Hook. et Grev. in Bot. of Beech. Voy. v. 1. p. 126.*

HAB. Labrador. *Kohluester*, (in herb. nostr.) York Factory, Hudson's Bay, *Douglas*; throughout the Barren Regions to the elevated Rocky Mountains, *Drummond*; and to the extreme Arctic regions, Dr. *Richardson*, Parry, &c.—The male plant, which is very rare, with dense and more woolly foliage, and less glossy iuner scales, is found at Fort Norman by Dr. *Richardson*. Sources of the Columbia, *Douglas*. Una-laschka. *Chamiso*, (in herb. nostr.) Kotzebue's Sound. *Lay and Collie*.

4. *A. dioica*; stolonibus reptantibus, foliis subtus præcipue tomentosis, radicalibus spathulatis basi obscure trinerviis, caulinis linear-lanceolatis, caule simplici, floribus corymboso-capitatis dioicis. *Br. in Linn. Trans. v. 12. p. 123. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*—*Gnaphalium dioicum*. *Linn.*—*Engl. Bot. t. 267.*

HAB. From Canada, (*Lady Dalhousie*), to the extreme Arctic regions; and from Newfoundland (*Miss Brenton*) and Labrador, (*Morrison*) to the dry mountain pastures of the Rocky Mountains. *Drummond*.

5. *A. plantaginifolia*; stolonibus reptantibus, foliis subtus præcipue niveo-tomentosis, radicalibus ovato-spathulatis albis trinerviis, caulinis linear-lanceolatis, caule lanata simplici, floribus corymboso-capitatis dioicis, involuci squamis interioribus obtusis opacis, calycibus dense lanatis. *Br. in Linn. Trans. v. 12. p. 123. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*—*Gnaphalium plantaginifolium*. *Linn.*—*Pursh, Fl. Am. v. 2. p. 525.*—*G. dioicum*, var. *plantaginifolium*. *Mich. Am. v. 2. p. 128.*

HAB. From Lake Huron, (*Dr. Todd*), and throughout the woody country, to lat. 54° (*Dr. Richardson*, *Drummond*); and from Hudson's Bay to the mountain sources of the Columbia. *Douglas*, Dr. *Richardson*, *Drummond*.

6. *A. racemosa*; stolonibus reptantibus, foliis supra cauleque simplici glabris subtus albo-tomentosis, radicalibus ovato-spathulatis, caulinis linear-lanceolatis, floribus racemosis dioicis, rucemis laxis subcompositis, involuci squamis omnibus obtusis nitidis glaberrinis.

HAB. Alpine woods of the Rocky Mountains. *Drummond*.—This is more distinct from *A. plantaginifolia* than that is from *A. dioica*. The upper side of the foliage, the stem, and involucrum are quite destitute of tomentum, and the flowers form lax racemes, their pedicells often again divided. In many respects this plant bears the same relation to *A. plantaginifolia* which *A. alpina* does to *A. dioica*.

Subtrib. SENECONIEÆ. *Capitula nunquam dioica*; si heterogama, floribus marginalibus fæmineis, sapissime uniserialibus, reliquis ♀. *Pappus setaceus, multiradiatus, subæqualis; corolla floribus ♀ aut lingulatae aut rarius filiformes. Antheræ ecaudatae.* Less.

49. ARNICA. Linn.

Capitulum radiatum. Pappus conformis, setaceus, uniserialis. Stylus disci ramis pube longe descendente obssesis, truncatus, aut cono brevi superat. Herba perennæ, in Europa vel in Asia et America boreali crescentes; foliis oppositis, integris, magis minusve hirsutis; capitulis magnis luteis, caudem ramosæ superne aphyllos terminantibus, solitariis vel ternis; involucris campanulatis, biserialibus. Less.

1. *A. montana*; foliis oblongis lanceolatis parallelim nervosis dentatis integerrimisve, caule uni-paucifloro.—*Linn.*—*β. angustifolia*; foliis angustioribus.—*A. montana*, *β. alpina*. *Linn.*—*Br. in Parry's Voy. App. p. ccxxix. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*—*A. angustifolia*. *Vahl*, in *Fl. Dan. t. 1524. Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 126.*—*A. alpina*. *Less. in Linnaea, v. 6. p. 235*, and probably *A. obtusifolia*, *Less.* and *A. Una-*

Inschkiana, *Less.* and *Chamissonis* of the same author (all from Unalaschka. *Chamiso.*)
—*A. plantaginea* and *A. fulgens*, *Pursh*, *Fl. Am.* v. 2, p. 529. (according to Brown.)

HAB. Woody country, from the Saskatchewan to the extreme Arctic regions, and from Labrador to the more elevated of the Rocky Mountains. Unalaschka. *Chamiso.* Kotzebue's Sound. *Lay and Collie.*—In size and foliage, few plants are more variable than this; yet none of our specimens have leaves so broad or so obtuse as those of *A. montana* which I possess from the south of Europe, of which, nevertheless, Mr. Brown, justly I think, esteems it a variety. Some of the specimens from the woody country are two and two and a half feet high, very leafy; while the more alpine and arctic individuals measure from four to five inches, with only a pair or two of leaves.

2. *A. mollis*; caule elato folioso, foliis oblongis obtusis molliter pubescentibus, oblique venosis denticulatis, floribus 1–3.

HAB. Alpine rivulets of the Rocky Mountains. *Drummond.*—In the shape of its foliage, this species has much affinity with the *A. montana*, especially the European variety; but the stem is leafy (with four or five pairs) all the way up; and the leaves are very flaccid and soft, with lax down. The flowers are remarkably large, and of a full orange yellow, in the dry state.

3. *A. Menziesii*; caule elato, foliis cordatis glabris grosse serratis basi attenuatis, inferioribus longe petiolatis, superioribus sessilibus, panicula subtriflora. (TAB. CXI.)

HAB. North-West Coast of America. *Mr. Menzies.* Observatory Islet. *Dr. Scouler.* Alpine woods and rivulets of the Rocky Mountains. *Drummond.*

TAB. CXI. *Arnica Menziesii.*

4. *A. cordifolia*; caule elato, foliis cordatis glabriusculis basi sinu distincto, inferioribus longe petiolatis pari supremo solummodo sessili, panicula 1–3-flora.

HAB. Alpine woods of the Rocky Mountains, on the east side, *Drummond*; and on the west side, in mountain woods between the Kettle Falls and Spokane River, and in the Blue Mountains, *Douglas.*—This appears quite distinct from the preceding, and is very constant in the shape and petiolation of its leaves.

5. *A. ? maritima*; “foliis lanceolatis, inferioribus serratis, caule folioso multifloro.” *Linn.*
—*Willd.*—*Pursh*, *Fl. Am.* v. 2, p. 528.

HAB. North-West Coast of America. *Herb. Banks.* *Pursh.*—See our *Senecio Pseudo-Arnica* for some remarks on this plant.

50. SENECIO. *Less.* (*Senecio et Caerulei* sp. *L.* et *Auct.*)

Capitulum homogammum vel pl. heterogammum. *Pappus* pluriserialis, setaceus, caducus, rectus, subaequalis, conformis. *Stylus* & ramis truncatis, apice solo penicillatis. *Achenium* erostre exalatum, teretiusculum, glaberrimum aut hirsutissimum.—*Herbae vel frutices, per totum orbem terrarum divulgati, polymorphi; foliis alternis, integris vel pinnatifidis; capitulis solitariis vel varie aggregatis; radio luteo, purpureo vel albo; foliolis involuci uniscribribus, basi scapo aliis magis minusve numerosis, accessoriis auctis, linearibus, alternis angustioribus, alternis latioribus, scapo sphacelatis; rachide plana, nuda, vel paleaceo-finibrillifera.*

Less.

* *Involucrum basi bracteolatum.* (*Senecio. L.*)

+ *Floribus flosculosis; radio nullo.*

1. *S. vulgaris*; foliis semiamplexicaulis pinnatifidis dentatis, corymbo coarctato terminali.—*Linn.*—*Engl. Bot.* t. 747. *Pursh*, *Fl. Am.* v. 2, p. 528.

HAB. York Factory, Hudson's Bay. *Drummond.* Newfoundland. *Mr. Cormack.* Labrador. *Morrison.*

2. *S. hieracifolius*; caule elato folioso, foliis amplexicaulibus oblongis inæqualiter mucronato-dentatis subsinuatis glabris, floribus subcorymbosis, involucro basi multisetoso.—*Mich. Am.* v. 2. p. 119. *Pursh, Fl. Am.* v. 2. p. 529. *Elliott, Carol.* v. 2. p. 328.—Erectithes prealta. *Haf.*—*Less.*

HAB. Canada. *Pursh*. Woodfield, near Quebec. *Mrs. Percival*. Saskatchewan. *Dr. Richardson*. Drummond.—I have seen no Canadian specimens of this plant. It is frequent in the United States.

3. *S. atriplicifolius*; caule elato, foliis petiolatis glabris subitus glaucis angulato-dentatis, radicalibus cordatibus, caulinis rhombicis, floribus corymbose erectis, involucris quinquefloris.—*Cacalia atriplicifolia*. *Willd. Sp. Pl.* v. 3. p. 1734. *Pursh, Fl. Am.* v. 2. p. 318. *Elliott, Carol.* v. 2. p. 340.— β . *reniformis*; foliis radicalibus reniformi-triangularibus.—*C. reniformis*. *Willd.*

HAB. Canada. *Mr. Cleghorn*.—My variety β , quite agrees with the *Cacalia reniformis* of Willdenow, except that the involucres are not many-flowered; and the two plants are evidently near allies, if indeed they be really distinct. Mr. Nuttall observes that in both there is a single chaffy scale in the centre of the receptacle. It is not so in my specimens.

4. *S. pauciflorus*; foliis radicalibus longe petiolatis ovato-subrotundis subcordatis dentatis, caulinis 2 remotis pinnatifidis dentatis, pedunculis brevibus subternis umbellatis.—*Pursh, Fl. Am.* v. 2. p. 529. *Rich. in Frankl.* 1st Journ. ed. 2. App. p. 30.

HAB. Labrador. *Kohlmeister*. *Pursh*. Woody country between lat. 54° and 64° . *Dr. Richardson*.—May not Pursh have quoted as a synonym, "*S. tussilagineoides*, Walt. *Fl. Carol.* 208," a native of Carolina? I have seen no authentic specimen of the *S. pauciflorus* of Pursh; but amongst what I consider as a rayless state of *S. aureus*, I find small plants exactly agreeing with the above description.

† † *Floribus radiatus*.

5. *S. Balsamitæ*; clatus, glaber, foliis inferioribus oblongis obscure serratis petiolatis, reliquis lanceolatis lyrate-pinnatifidis, corymbris compositis, involuci foliolis non sphacelatis. *Muhl.*—*Willd. Sp. Pl.* v. 3. p. 1998. *Pursh, Fl. Am.* v. 2. p. 530.— β . *majus*.

HAB. Woody country, from lat. 54° to 64° . *Dr. Richardson*. Woods and river banks on the Rocky Mountains. *Drummond*. β . Fort Vancouver, and on the outskirts of woods near streams, North-West Coast. *Douglas*.—This plant varies from 6–8 inches to 2 feet high. Flowers quite corymbose. The var. β has broader leaves, and is larger in all its parts.

6. *S. lugens*; deciduo-tomentosus vel nudus simplex, foliis integris glanduloso-dentatis, radicalibus oblonga-subspathulatis, caulinis lanceolatis acutis subamplexantibus, corymbo denso, involuci foliolis insigniter sphacelatis. (*TAB. CXIV.*)—*Rich. in Frankl.* 1st Journ. ed. 2. App. p. 31.—*S. Kalmitii*. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1. p. 126. (non Nutt.)

HAB. First detected at Bloody Fall, where the Esquimaux were destroyed by the Northern Indians who accompanied Hearne, whence the specific name is derived. Also from Fort Franklin to the sea-coast. *Dr. Richardson*. West side of the Rocky Mountains, and on the Blue Mountains. *Douglas*. Kotzebue's Sound. *Lay and Collie*.—This appears to be a very northern species, of which an excellent description is given in the place above quoted.

TAB. CXIV. *Senecio lugens*.

7. *S. triangularis*; clatus simplex foliosus glaberrimus, foliis fere omnibus petiolatis deltoideo-acuminatis grosse inæqualiter dentato-serratis, floribus (majusculis) corymbosis, involuci lacinias laxiusculis apice sphacelatis. (*TAB. CXV.*)

HAB. Moist Prairies among the Rocky Mountains. *Drummond*.—A very distinct and handsome species, with leaves singularly truncate at the base, and all, except one or two of the uppermost, petiolate.

TAB. CXV. *Senecio triangularis*. *Fig. 1*, Scale of the involucre; *fig. 2*, Floret of the ray; *fig. 3*, Floret of the disk.

8. *S. Serra*; clatus ramosus glaberrimus, foliis numerosis linear-lanceolatis profunde inaequaliter dentato-serratis, paniculis ramosissimis dense subcorymbosis, involucri foliolis latusculis vix sphacelatis.

HAB. Common on the banks of the Wallawallah, Flathead, and Spokane Rivers. *Douglas*.—"Two to three feet high." My solitary specimen has no root-leaves; but it suffices to show that the species is distinct from any with which I am acquainted. The leaves are copious, and the flowers exceedingly numerous, in a dense corymbose panicle, each of a rather small size.

9. *S. canus*; cano-tomentosus, foliis radicalibus spathulatis integerrimis, caulinis linear-lanceolatis pinnatifidis, involucri foliolis vix sphacelatis. (TAB. CXVI.)— β . foliis supra glabriusculis.

HAB. Banks of the Saskatchewan, rare. *Drummond*. β . Lake Huron. *Dr. Todd*.—The white and hoary surface of the stem and leaves, in this plant, is very striking; though in the var. β , the tomentum is chiefly confined to the underside.

TAB. CXVI. *Senecio canus*. *Fig. 1*, Involucre; *fig. 2*, Floret of the circumference; *fig. 3*, Floret of the disk; *fig. 4*, Portion of the pappus.

10. *S. aureus*; clatus glaber, caule folioso, foliis radicalibus longe petiolatis obovatis rotundatis cordatissime serratis, caulinis lyrato-pinnatifidis lobis serratis basi auriculatis, axillis lanatis, floribus corymbosis.—*Linn*.—*Mich. Am.* v. 2, p. 120. *Pursh*, *Fl. Am.* v. 2, p. 591. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 30. *Elliott, Carol.* v. 2, p. 331.— β . *fastigiatus*. *Schwein. MS. in Herb. nostr.* *Elliott, Carol.* v. 2, p. 331.— β . *gracilis*; foliis radicalibus obovatis.— β . *gracilis*. *Pursh*, *Fl. Am.* v. 2, p. 529. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 30. *Elliott, Carol.* v. 2, p. 329.— γ . *obovatus*. *Willd*.—*Pursh*, *Fl. Am.* v. 2, p. 550. *Elliott, Carol.* v. 2, p. 329.— δ . *Cymbalaria*. *Pursh*, *Fl. Am.* v. 2, p. 580. (according to *Nuttall*.)— γ . *foliosus*; foliis caulinis majoribus magis divisus.— δ . *discoideus*; radii nullis. (an α . *pauciflorus*, *Pursh et Rich.*?)

HAB. Throughout Canada to the Arctic Circle, and from Newfoundland (*Miss Brenton*) and Labrador (*Dr. Morrison*) to the Rocky Mountains and the Pacific. Particularly abundant on Menzies Islands, and at the mouth of the Columbia. *Douglas*. δ . Mackenzie River. *Dr. Richardson*.—This and the following species are remarkable for the woolly hairs in the axils of the leaves.

11. *S. resedifolius*; manus glaberrimus, caule paucissime folioso, foliis radicalibus longe petiolatis exterioribus rotundatis crenato-sinuatibus, interioribus lyrato-pinnatifidis segmentis integris vel bi-trilobis, caulinis oblongis basi pinnatifidis, axillis lanatis, caule 1-3-floro. (TAB. CXVII.)—*Lessing in Linnaea*, v. 6, p. 243.—*Cineraria lyrata*. " *Ledeb. in Mem. Acad. Petersb.* v. 5, p. 576." (*Lessing.*) *Reich. Ic. Bot.* t. 101. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1, p. 126.

HAB. On limestone at the mouth of the Bear Lake River, and about Fort Norman and Fort Franklin, *Dr. Richardson*, Kotzebue's Sound. *Lay and Collie*.—This, as may be seen by the specimens in the Collection, is liable to considerable variation, for, while some of them exactly correspond with my original samples from

Chamisso, gathered in the Bay of St. Lawrence, on the Asiatic side of Behring's Straits, and with the figures in Reichenbach above quoted, others are much larger, of a firmer texture, more leafy on the stem, bearing a greater number of flowers, and approaching some of the dwarf states of the preceding species.

TAB. CXVII. *Senecio reedifolius*. *Figs. 1 and 2*, Leaves; *fig. 3*, Floret from the ray; *fig. 4*, Floret from the disk; *fig. 5*, Hair from the pappus:—magnified.

12. *S. eremophilus*; radio patente, caule elato ruminoso, foliis omnibus glaberrimis pinnatifidis lacinias sublinearibus distantibus semipinnatifidis, floribus corymbosis, bracteis (culiculis) laxis longis involueri cylindrici conformibus.—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 31.*

HAB. On the gravelly banks of Cedar Lake, lat. 54°. *Dr. Richardson*. Woods of the Saskatchewan, rare, *Drummond*, and thence to Fort Franklin, on the Mackenzie River.—The bracteas are less remarkable in the specimens of the second Expedition, than in the solitary individual gathered on the first. May it not be the *S. Canadensis* of Linneus?

13. *S. Canadensis*; corollis radiantibus, foliis bipinnatis linearibus. *Linn. Sp. Pl. p. 1219.* *Pursh, Fl. Am. v. 2. p. 530.*

HAB. Canada. *Kalm*.—All we know of this plant is from Linnaeus' brief description.

* * *Involucrum basi nudum*. (*Cineraria*, L.)

14. *S. frigidus*; deciduo-tomentosus, caule simplici subhumili, foliis oblongis integerrimis, inferioribus obovatis petiolatis, caule ascendente unifloro. (TAB. CXII.)—*Lessing in Linn. v. 6. p. 239.*—*Cineraria frigida*. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 31.*—C. atropurpurea. *Lebed. in Mem. Acad. Petersb. v. 5. p. 574.* (sic! *Less.*)

HAB. Barren country from 64°, to the shores of the Arctic Sea. *Dr. Richardson*. Island of St. Lawrence in Behring's Straits. *Chamisso*.

TAB. CXII. *Senecio frigidus*. *Fig. 1*, Floret of the ray; *fig. 2*, Floret of the disk.

15. *S. Pseudo-Arnica*; deciduo-tomentosus, caule crasso erecto folioso, foliis oblongis dentatis inferne attenuatis, superioribus basi subcordatis semiamplexicaulibus inferioribus in petiolum attenuatis, flore solitario maximo. (TAB. CXIII.)—*Lessing in Linnaea, v. 6. p. 240.*

HAB. Behring's Straits. *Chamisso*. Newfoundland. *Lady Hamilton*. Laürsdor. *Dr. Morrison*.—Lessing quotes under this the *Arnica maritima* of Linnaeus and Pursh, the authority for which is the “*Aster s. potius Helenium maritimum*, &c. of Gmelin, Fl. Sibir. v. 2. p. 173” : but that is described as bearing many branches, and numerous flowers, and I think cannot in any way correspond with our plant, of which all the specimens that I have seen have a simple stem and a solitary flower. May this not be the *Senecio Doronicum* of Pursh?

TAB. CXIII. *Senecio Pseudo-Arnica*. *Fig. 1*, Floret of the ray; *fig. 2*, Floret of the disk.

16. *S. palustris*; simplex vel ramosus lanatus, caule fistuloso, foliis lato-lanceolatis, caulinis lineari-lanceolatis sinuato-dentatis fere pinnatifidis, floribus corymbosis.—*Cineraria palustris*. *Linn.*—*Engl. Bot. t. 151.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 31.*— β . *congestus*; caule simplicissimo, floribus capitatis.—*Cineraria congesta*. *Br. in Parry's 1st Voy. App. p. clxxix.*

HAB. From the Saskatchewan, (*Dr. Richardson, Douglas, Drummond*), to the extreme Arctic islands.— β . Chiefly in the Arctic regions. *Dr. Richardson. Capt. Sir E. Parry, &c.*—I am quite unable to distin-

guish *S. congestus* as a species from *S. palustris*; Mr. Drummond's and Dr. Richardson's specimens show intermediate gradations.

17. *S. Kalmii*; floribus paniculatis, foliis pinnatifidis subvillosis laciniis sinuatis, caule herbaceo. Linn.—Nutt. Gen. Am. v. 2. p. 165. Lessing in Linnaea, v. 6. p. 244.—Cineraria Cunadensis. Linn. Sp. Pl. p. 1244. Pursh, Fl. Am. v. 2. p. 528. (non Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 126.)

HAB. Canada. Kalm. Bay of Eschscholtz. Chamisso.—Lessing compares this with *S. palustris*, from which it only appears to differ in some very slight particulars.

18. *S. integrifolius*; urachnoides-tomentosus, foliis integris, inferioribus oblongo-ovatis spathulatis, caulinis lanceolatis, floribus corymbosis.—Nutt. Gen. Am. v. 2. p. 165.—Cineraria integrifolia. Jacq. Austr. t. 179. Willd. Sp. Pl. v. 3. p. 2032. Pursh, Fl. Am. v. 2. p. 528. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.

HAB. Woody country, in lat 54°, to the shores of the Arctic sea. Dr. Richardson. Rocky Mountains. Drummond.

51. CROCIDIUM. Nov. Gen.

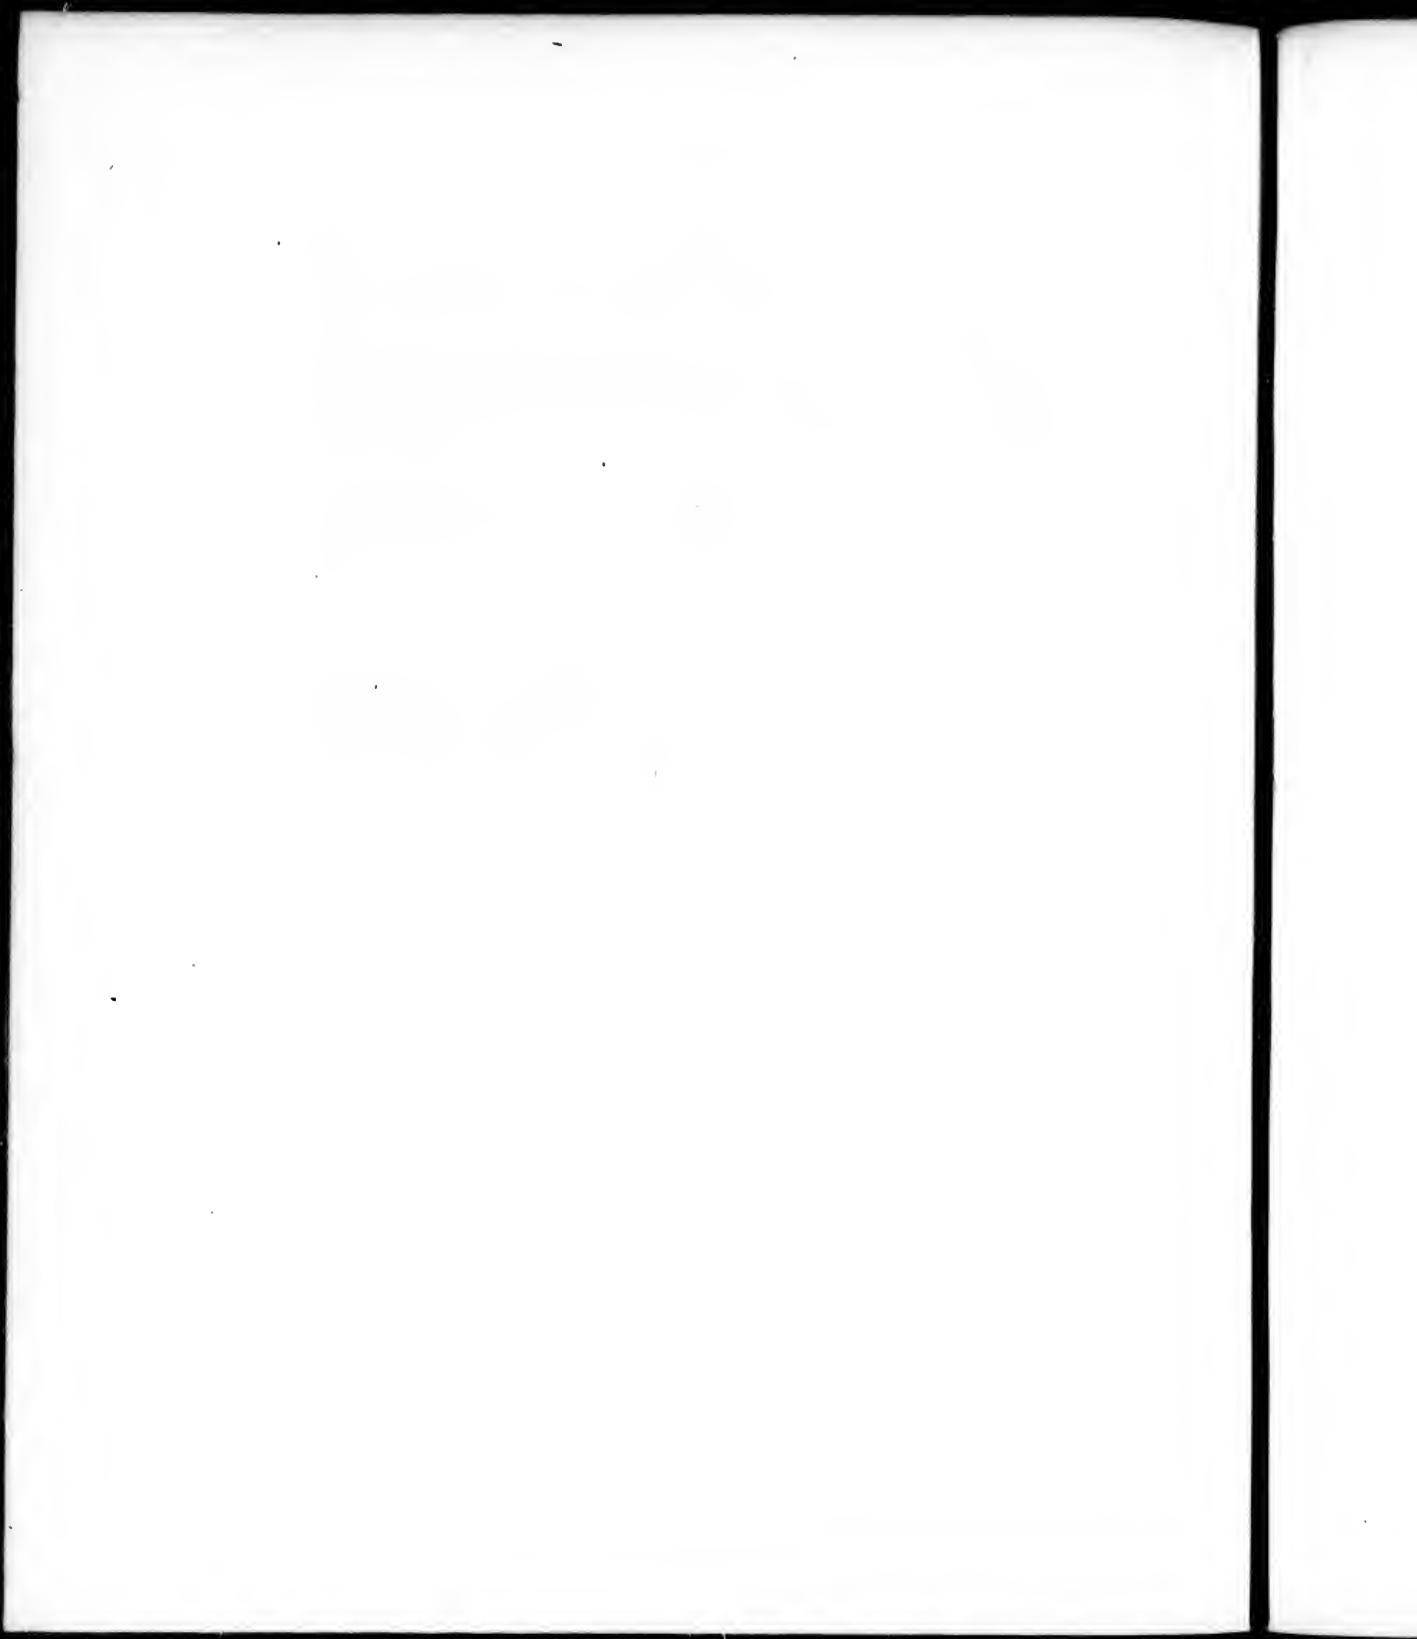

Capitulum homogynum. Disci Achonia pupposa, pappo æquali, setis hirsutulis; radii nuda, obovata, compressa, tuberculosa, crenato-marginata, glaberrima.—Herba annua, humilis. Caules simplices vel ramosi. Folia glabra; radicalia lyrato-pinnatifida, laciniis paucis; caulina parva, linearia, integra vel laciniata; in axillis insigniter lanosa. Flores solitarii in ramos. Involucrum simplex multipartitum, laciniis lanceolatis glabris subpatentibus. Receptaculum conicum, nudum.

1. *C. multicaule*. (TAB. CXVIII.)

HAB. About Fort Vancouver, on the Columbia. Douglas, and Nicholas Garry, Esq.—I am unable to refer to any established genus this plant, which, however, I think will rank with the *Senecionideæ*. As in *Senecio aureus*, the axills of the leaves bear a tuft of woolly hair; but in the present plant this is far more copious and conspicuous; so much so, as to have suggested the generic name, *æqua*, a lock of wool.

TAB. CXVIII. Fig. 1, Flower or capitulum; fig. 2, Involucre and receptacle; fig. 3, Floret from the disk; fig. 4, Anthers; fig. 5, Portion of a seta from the pappus; fig. 6, Floret from the ray; fig. 7, Stigma from do.; fig. 8, Cauline leaf with the wool in the axil:—magnified.

END OF VOL. I.

FLORA BOREALI-AMERICANA.

(ORD. LI. COMPOSITÆ. Linn.; continued from Vol. I.)

Trib. V. ASTEROIDÆ. Less.

Subtrib. I. ASTERÆ. *Less.* *Capitula nunquam dioica, plerunque heterogama, floribus ♀ in ambitu aut uni-aut, si pluriserialibus, corollas tunc lingulatas gerentibus, floris busque ♀ in centro. Rachis plerunque ebracteolata aut, ubi bracteolata, pappus perfectus et multiradiatus. ntheræ ecaudatae.* *Less.*

52. SOLIDAGO.* L.

Radius fæmineus uniserialis. Discus hermaphroditus. Pappus uniserialis, pilosus Achenium teretiusculum, multicostatum.—Herbæ plerunque Americanæ et elatæ, pauciores. Europeæ vel Asiaticæ, foliis alternis integris: capitulis parviusculis luteis plerunque in cymas scorpioides dispositis et secundis; involucris imbricatis, polyphyllis, rachis (seu receptaculum) nuda. *Less.*

* *Racemis secundis; foliis subtriplinerviis.*

1. *S. Canadensis;* caule villoso erecto, foliis lanceolatis serratis triplinerviis scabris, racemis paniculatis secundis recurvis, ligulis abbreviatis. *Ait.*—*Linn.*—*Ait.* *Hort. Kew. ed. 1. v. 3. p. 210.* *Pursh, Fl. Am. v. 2. p. 533.* *Elliott, Carol. v. 2. p. 389.*— $\beta.$ foliis angustioribus, floribus minus secundis.

HAB. Throughout Canada, and from Lake Huron to Fort Franklin, on the Mackenzie River. $\beta.$ Columbia. *Douglas.*—A very polymorphous plant, as Willdenow well observes, varying in the height of the stem, in the entire or serrated leaves, and in the greater or lesser depth of the serratures. One specimen which I possess, tallying with the *S. Canadensis* of Herb. Banks., is from Boston, and has much more numerous leaves.

* A genus, Lessing observes, only differing from *Aster* in its rounded, many-ribbed, not plano-compressed and bicostate *acheniæ*, but easily distinguished by the habit, and by the colour (yellow) of the flowers.—In the determination of the species, attended perhaps with more difficulty than that of the species of any other genus, save its near ally, *Aster*, I have been greatly aided by Dr. Boott. As the Hortus Kewensis was the authority for a considerable number of species, the comparison of specimens with the Banksian Herbarium, where original specimens are preserved, became essentially necessary: and this Dr. Boott has most kindly accomplished for me. Still, as to the limits of the species, or the value of the relative characters, I dare scarcely offer any opinion.

and smaller flowers than our other specimens. The γ. of Herb. Banks. and Hort. Kew. *foliis subtilibus villosis*, we have from Canada. Messrs. Lay and Colley have gathered *S. Canadensis* in California. It is omitted by Michaux.

2. *S. procera*; caule villoso erecto, foliis lanceolatis serratis triplinerviis scabris subtilibus villosis, racemis spiciformibus erectis interruptis mutantibus, ligulis abbreviatis. *Ait.* *Hort. Kew.* ed. 1. v. 3. p. 211. *Pursh, Fl. Am.* v. 2. p. 535. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 33.

Hab. Canada. *Pursh*.—Woody country between lat. 54° and 64°.

3. *S. serotina*; caule erecto tereti hirsuti, foliis linear-lanceolatis glabris margine asperis serratis triplinerviis, racemis paniculatis secundis. *Ait.* *Hort. Kew.* ed. 1. v. 3. p. 211. *Pursh, Fl. Am.* v. 2. p. 535.—β. *minor*; foliis angustioribus.

Hab. Lake Huron. *Dr. Todd*. Newfoundland. *Miss Brenton*. Columbia River and De Fuca, N.W. America. *Dr. Scouler*.—β. Saskatchewan. *Drummond*.

4. *S. gigantea*; caule erecto glabro, foliis lanceolatis glabris serratis margine scabris triplinerviis, racemis paniculatis secundis, pedunculus hirsutus, ligulis abbreviatis. *Ait.* *Hort. Kew.* ed. 1. v. 3. p. 211. *Pursh, Fl. Am.* v. 2. p. 535.—β. racemis breviribus obtusis.

Hab. Canada. *Cleghorn*. Plains of the Red River. *Douglas*. Fort Vancouver. *Dr. Scouler*.—β. Saskatchewan. *Drummond*.

5. *S. lateriflora*; caule erecto pilosuscuto, foliis lanceolatis subtriplinerviis glabris margine scabris, inferioribus subserratis, racemis paniculatis subrecurvis secundis. *Ait.*—*Linn.*—*Ait.* *Hort. Kew.* ed. 1. v. 3. p. 211. *Pursh, Fl. Am.* v. 2. p. 536. *Elliott, Carol.* v. 2. p. 370.

Hab. Canada. *Pursh*.—"Not more than half the size of *S. Canadensis*; flowers larger than any of this division." *Ph.*—Probably all the "triple-nerved" species might, without violence to nature, merge into one.

* * *Racemis secundis; foliis venosis.*

6. *S. altissima*; caule erecto hirsuto, foliis lanceolatis scaberrimis rugosis serratis enerviis, paniculatis secundis. *Ait.*—*Linn.*—*Ait.* *Hort. Kew.* ed. 1. v. 3. p. 212. *Pursh, Fl. Am.* v. 2. p. 536. *Elliott, Carol.* v. 2. p. 571.

Hab. Canada. *Mrs. Percival*. *Mr. Cleghorn*.

7. *S. rugosa*; caule erecto hirsuto, foliis lanceolatis inferioribus adpresso-serratis scaberimis rugosis, racemis paniculatis secundis patentissimis. *Willd.*—*Mill. Dict.*—*Willd. Sp. Pl.* v. 3. p. 2058. *Pursh, Fl. Am.* v. 2. p. 537. *Elliott, Carol.* v. 2. p. 574.—*S. altissima*? *Ait.* *Hort. Kew.* ed. 1. v. 3. p. 213.

Hab. Canada. *Pursh*. Lake Huron. *Dr. Todd*. (Small and young specimens.)

8. *S. villosa*; caule erecto villosa, foliis lanceolatis molliusculis serratis enervibus, racemis paniculatis secundis. *Herb. Banks. MSS.*—*Pursh, Fl. Am.* v. 2. p. 537. *Elliott, Carol.* v. 2. p. 372.—*S. pilosa*. *Mill. Dict.*—*S. altissimum*. β. *Ait.* *Hort. Kew.* ed. 1. v. 3. p. 212.

Hab. Canada. *Lady Dalhousie*. Lake Huron. *Dr. Todd*. Newfoundland. *Miss Brenton*. Labrador. *Dr. Morrison*.

9. *S. nemoralis*; caule erecto tomentoso, foliis caulinis lanceolatis hispidis integerrimis, radicalibus subcuneiformibus serratis, racemis paniculatis secundis. *Ait. Hort. Kew. ed. 1. v. 3 p. 213.* *Pursh, Fl. Am. v. 2. p. 537.* *Elliott, Carol. v. 2. p. 373.*

HAB. Canada. *Pursh. Dr. Holmes. Goldie. Mr. Cleghorn.* Red River. *Mr. Douglas.* Plains of the Saskatchewan. *Drummond.*—The grey aspect of this plant, mentioned by Pursh, is very striking in my specimens.

10. *S. juncea*; caule erecto glabro, foliis lanceolatis glabris margine scabris, inferioribus serratis, racemis paniculatis secundis. *Ait. Hort. Kew. ed. 1. v. 3. p. 213.* *Elliott, Carol. v. 2. p. 375?* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 33.*

HAB. Woody country between lat. 54°, and 64°. *Dr. Richardson.*

11. *S. arguta*; caule erecto glabro, foliis glabris argute inequaliter serratis, caulinis ellipticis, radicalibus obtriangularibus, racemis paniculatis secundis, ligulis elongatis. *Ait. Hort. Kew. ed. 1. v. 3. p. 213.* *Pursh, Fl. Am. v. 2. p. 538.* *Elliott, Carol. v. 2. p. 374.*

HAB. Canada. *Pursh.*—I possess no specimen of this from the British Settlements; but I have very beautiful ones from Dr. Darlington and Mr. Townsend from Pennsylvania, which have been compared with those in the Banksian Herbarium.

12. *S. asperata*; caule paniculato-corymboso, racemis suberectis, floribus adscendentibus, foliis lanceolatis serratis secundis. *Herb. Banks. MSS.—Pursh, Fl. Am. v. 2. p. 528.*

HAB. Canada. *Herb. Banks.*

13. *S. sempervirens*; caule erecto glabro, foliis linear-lanceolatis subcarnosis levibus integerrimis margine scabris, racemis paniculatis secundis, pedunculis pilosis. *Ait.—Linn.* *—Ait. Hort. Kew. ed. 1. v. 3. p. 214.* *Pursh, Fl. Am. v. 2. p. 538.* *Elliott, Carol. v. 2. p. 379.*

HAB. Canada. *Pursh.*—My Herbarium contains only one specimen of this, from Dr. Darlington of West Chester, received as "*S. limonifolia*," which exactly corresponds with *S. Sempervirens* of *Banks. Herb.*

14. *S. caura*; caule erecto pubescens, foliis linear-lanceolatis integerrimis glabris margine scabris, racemis paniculatis secundis. *Ait. Hort. Kew. ed. 1. v. 3. p. 214.* *Pursh, Fl. Am. v. 2. p. 539.* *Elliott, Carol. v. 2. p. 376.* *Plakh. Alm. t. 116. f. 6.*

HAB. Canada. *Pursh.*—Of this, likewise, I possess no British-American specimens; but I have numerous ones from the United States. Pursh says: "It is most generally and principally known among the inhabitants by the name of *Colden-rod*, and used as a wholesome tea. The flowers, gathered when fully expanded and carefully dried, give a most agreeable substitute for tea, which for some time has been an article of exportation to China, where it fetches a high price."

* * * *Racemis erectis; foliis venosis.*

15. *S. bicolor*; caule foliisque ellipticis pilosis, inferioribus serratis, ramis foliolosis, racemis erectis, involucri foliolis obtusis. *Ait.—Linn.—Ait. Hort. Kew. ed. 1. v. 3. p. 216.* *Mich. Am. v. 2. p. 116.* *Pursh, Fl. Am. v. 2. p. 537.* *Elliott, Carol. v. 2. p. 382.*

HAB. Canada. *Pursh.* Saskatchewan. *Drummond.*—Rays of the flowers said to be nearly white: but

the Saskatchewan specimens appear to be yellow, as do some from Dr. Short (Kentucky); while others in the same Collection seem to be white.

16. *S. lanata*; tota arachnoideo-lanata, foliis spathulato-lanceolatis adpresso-serratis inferioribus petiolatis superioribus parvis integrerrimis, racemis erectis terminalibus subsimplicibus, involuci foliolis obtusis glabriusculis.

HAB. Plains of the Saskatchewan, near the Rocky Mountains. *Drummond*.—There is only one specimen of this very well marked species in the Collection. It will rank between *S. bicolor* and *S. petiolaris*.

17. *S. stricta*; caule erecto glabro, foliis caulinis lanceolatis integrerrimis glabris margine scabris, radicalibus serratis, racemis paniculatis erectis, pedunculis glabris. *Ait. Hort. Kew. ed. 1. v. 3. p. 216. Pursh, Fl. Am. v. 2. p. 540. Elliott, Carol. v. 2. p. 383. Rich. in Frankl. 1st Journ. ed. 2. App. p. 33.*

HAB. Lake Huron. *Dr. Todd*. Woody country between lat. 54° and 64°. *Dr. Richardson*. Carlton House on the Saskatchewan. *Drummond*.

18. *S. confertiflora*; (*Nutt. MSS. in Herb. Boott.*) robusta, caule crasso superne pubescente, foliis glabris inferioribus latissimiis ovali-spathulatis serratis acutis marginibus scabris, superioribus sessilibus lanceolato-ellipticis integrerrimis, racemis glomeratis rigidis pubescens-tibus, involuci multiflori foliolis squamosis, radii elongatis 10-12.—*S. squamosa*. *Nutt. Gen. Am. v. 2. p. 161. (non Muhl.)—S. glomerata. Mich.?* (*Boott.*) *Elliott, Carol. v. 2. p. 387?*

HAB. Canada. *Mrs. Sheppard, Mr. Goldie, Lady Dalhousie*.—I have received this very fine and distinct species from about Boston, (*B. D. Greene, Esq.*) and from New-York and New-Jersey. (*Dr. Torrey*.)

19. *S. laevigata*; caule erecto laevi, foliis lanceolatis carnosis integrerrimis undique laevibus, racemis paniculatis erectis, pedunculis squamosis villosis, ligulis elongatis. *Ait. Hort. Kew. ed. 1. v. 3. p. 215. Pursh, Fl. Am. v. 2. p. 541.*

HAB. Canada. *Pursh*.—My specimen from the New England States, which has been compared with the one in the Banksian Herbarium, does not appear to me to differ from *S. Mexicana*, L., of which, too, Pursh seems to consider it a variety.

20. *S. viminea*; caule erecto subpubescente, foliis linear-lanceolatis membranaceis basi attenuatis glabris margine scabris, infimis subserratis, racemis erectis, ligulis elongatis. *Ait. Hort. Kew. ed. 1. v. 3. p. 215. Pursh, Fl. Am. v. 2. p. 541.*

HAB. Canada. *Pursh*.

21. *S. macrophylla*; foliis inferioribus ovatis acuminatis attenuatis inequaliter argute serratis glabris, caulinis lanceolatis utrinque attenuatis subsessilibus serratis, racemis axillaribus pedunculatis foliosis longitudine foliorum, involucris oblongis turgidis multifloris, ligulis subelongatis. *Herb. Banks. MSS.—Pursh, Fl. Am. v. 2. p. 542.*

HAB. Canada. *Herb. Banks. (Ph.)*

22. *S. flexicaulis*; caule (plerumque) flexuoso glabro angulato, foliis serratis glabris, racemis erectis glomeratis axillaribus folio multo brevioribus—a. foliis lanceolatis.—*S. flexicaulis. Linnae. Herb. (fide Boott.) Ait. Hort. Kew. ed. 1. v. 3. p. 317. Pursh, Fl. Am. v. 2. p. 542. Elliott, Carol. v. 2. p. 386.—S. axillaris. Herb. Banks.—Pursh, Fl. Am. v. 2.*

p. 542.—S. cæsia, *Linn.* (not in *Herb. Linn.*) *Ait. Hort. Kew. ed. 1. v. 3. p. 217. Pursh, Fl. Am. v. 2. p. 540. Dill. Elth. t. 307. f. 395.—S. latifolia*; foliis ovatis superioribus minoribus, racemis subpaniculatis.—*Willd.—Pursh, Fl. Am. v. 2. p. 542.—S. latifolia. Linn. Herb. (Boott.)*

HAB. $\alpha.$ and $\beta.$ Througout Canada.—I possess specimens which are exactly intermediate between *S. flexicaulis* and *S. latifolia*, L.

23. *S. Virgaurea*; caule erecto tereti pubescenti (in nostr. exempl. subangulato glabro,) superne (nunc) ramoso, foliis inferioribus ellipticis pilosiusculis serratis, racemis erectis (compositis subsolitariis), ligulis elongatis. *Ait.—Linn.—Engl. Bot. t. 301. Pursh, Fl. Am. v. 2. p. 542?*

HAB. Labrador? *Kohlmeister*; (Surely this must be *S. multiradiata*.) Woody country between lat. 54° and 64°. *Dr. Richardson.* Saskatchewan. *Drummond.*—Our specimens are mostly glabrous, and are nearly a foot high, agreeing with our British var. called *Cambria*. The same is found by Mr. Greene near the summit of Mount Washington, on the White Mountains, U. S.

24. *S. multiradiata*; caule villosuscule, foliis sessilibus lanceolatis glabris ciliatis, inferioribus upice serratis, racemo terminali erecto (dense corymboso) ligulis elongatis numerosis. *Ait. Hort. Kew. ed. 1. v. 3. p. 218. Pursh, Fl. Am. v. 2. p. 542.—S. Virgaurea. Ph.?*

HAB. Labrador. (*Herb. Banks.*) *Kohlmeister. Dr. Morrison.* Bay of Eschscholtz, *Chamiso.* Prairies of the Rocky Mountains. *Drummond.* Mackenzie River and Bear Lake. *Dr. Richardson.*—Most of my specimens of this plant have the terminal raceme forming a broad dense corymb or head; in which particular almost alone does it differ from *S. Virgaurea*; and the Rocky Mountain specimens appear almost intermediate. Chamiso's *S. Virgaurea*, in my Herbarium, from Kotzebue's Sound, is the same as our *S. multiradiata*, and I fear the two can hardly be considered more than varieties.

25. *S. humilis*; gracilis, caule erecto simplici glabro, foliis lanceolatis glabris inferioribus longe petiolatis serratis superioribus linearibus integerrimis, racemo elongato terminali solitario erecto.—*Herb. Banks. MSS. Pursh, Fl. Am. v. 2. p. 543. Rich. in Frankl. 1st Journ. ed. 2. App. p. 33.*

HAB. Woody country between lat. 54°, and 64°. *Dr. Richardson.*—This, although the true plant of the Banksian Herbarium, I am inclined to consider only an elongated and slender variety of *S. Virgaurea*; the very opposite extreme, in the same species, of *S. multiradiata*.

26. *S. elata*; caule piloso tereti, foliis lanceolatis subtus pilosiusculis, racemis erectis, ligulis elongatis. *Herb. Banks. MSS.—Pursh, Fl. Am. v. 2. p. 543.*

HAB. North-west coast of America. *Mr. Menzies.*—I regret that my specimen, which is a very indifferent one, will not allow me to offer any additional character to what I find in Pursh.

27. *S. rigida*; caule foliisque ovato-oblongis pilosis scabris, caulinis integerrimis, infimis serratis, ramis floriferis paniculatis, racemis compactis, ligulis elongatis. *Ait. Hort. Kew. ed. 1. v. 3. p. 216. Pursh, Fl. Am. v. 2. p. 543. Elliott, Carol. v. 2. p. 390.*

HAB. Saskatchewan (*Drummond*) and Red River. *Douglas.* About Carlton House. *Dr. Richardson.*

(*Flores glomerati, fastigiato-corymbosi; radii valde minuti. Folii angustis integerrimis.*
Euthamia, Nutt.)

28. *S. lanceolata*; caule erecto glabro ramosissimo, foliis linear-lanceolatis scabriusculis integerrimis trinerviis, flosculis radii vix disco longioribus.—*Linn.*—*Mant.*—*Ait. Hort. Kew.* ed. 1. v. 3. p. 214.—*Mich. Am.* v. 2. p. 116. (*a.*) *Pursh.*, *Fl. Am.* v. 2. p. 540. *Rich. in Frankl. 1st Journ. ed. 2. App. p. 33.* (*Euthamia*)—*S. graminifolia.* *Nutt. Gen. Am.* v. 2. p. 162. *Elliott, Carol.* v. 2. p. 391.— β . foliis angustioribus. *S. tenuifolia.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 33.* (*non Pursh.*)—*Chrysocoma graminifolia.* *Linn.*

HAB. Throughout Canada to lat. 64°. Columbia. *Dr. Scouler. Douglas.*—This plant seems universally diffused through all the woody country of North America. I possess it from California and from Louisiana. Dr. Gillies found it at Mendoza, in extra-tropical South America. I have referred the *S. tenuifolia* of Richardson to a state of this plant, rather than considered it the *S. tenuifolia* of Pursh, which is a southern plant, its extreme northern limit being, I believe, New Jersey.

53. ASTER.* *Cass Nees.* (*ASTERIS sp. L.*)

Radius foemineus fertilis. Involucrī foliola vel laxa pleraque foliacea, vel imbricata nervo que medio e basi membranacea in apicis discum herbaceum rhombum expando prædicta. Flosculi pisci tubo limbo que discretis. Achenia cuneiformia, compressa, glabra, vel pubescentia et hirta. Pappus simplex, persistens, scaber. Receptaculum alveolatum.
Nees.

SECT. I. ALPIGENI. *Nees. Ast. p. 24.*

1. *A. alpinus*; foliis radicalibus spatulatis caulinisque integerrimis, involucrī foliolis lanceolatis laxis, caule uniflora. *Nees.*—*Linn.*—*Bot. Mag. t. 199.* *Nees, Ast. p. 26.*

HAB. On the more elevated of the Rocky Mountains in lat. 54°. *Drummond.*—Mr. Lindley marks this "exactly *A. alpinus*, var. *Dahuricus*." It also precisely corresponds with my Swiss specimens.

2. *A. salsuginosus*; foliis lato-lanceolatis acutis subintegerrimis venosis inferioribus in petiolum longe attenuatis reliquis sessilibus caule uni-paucifloro, involucrī squamis linearibus acutis pubescentibus subsquarroso disco vix duplo, radio plus triplo longioribus.—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 32.* *Hook. Bot. Mag. t. 2942.* *Nees, Ast. p. 29.*— β . foliis angustioribus.

HAB. Salt plains of the Athabasca. *Dr. Richardson.* Rocky Mountains. *Drummond.* Kotzebue's Sound. *Messrs. Lay and Collie.*— β . N. West Coast of America. *Mr. Menzies.*

3. *A. pygmaeus*; (*Lindl.*) foliis ovato-oblongis obtusis integerrimis glabris, caule unifloro viloso, involucro hemisphærico laxo subsquarroso villosissimo, foliolis linearibus obtusis.—*Lindl. MSS.*

* The whole of my Collection of this extensive Genus has been named by the kindness of Dr. Boott and Professor Lindley; the former of whom may be considered excellent authority for the Linnean and Banksian species: the latter for those of Nees von Esenbeck, whose arrangement I have implicitly followed. Professor Lindley has likewise determined and characterized the new species. For more full characters of the Genus *Aster* and its divisions, as well as other genera of the *Asterae*, than I can here give, I must refer to the valuable "*Genera et Species Asterearum*" of Dr. Nees von Esenbeck.

HAB. Arctic sea-coast. Dr. Richardson.—“*A. salsuginoso affinis*,” (Lindl.) and perhaps only a dwarf, or hairy variety of it.

4. *A. Richardsonii*; radice repente, caule ramoso uni-multifloro ad apicem dense tomentoso, foliis late oblongis remote dentatis subtus breviter pilosis, calycibus squarrosis, flosculis radii numerosis angustis. Spreng. Syst. Veget. v. 3. p. 258. Nees, Ast. p. 30.—*A. montanus*. Rich. in Franklin. 1st Journ. ed. 2. App. p. 32. (non Nutt.)—*A. salsuginosus*. Less. in Linnæa, v. 6. p. 194.—*A. Espenbergenensis*. Nees, Ast. p. 36.— β . *gigantea*; magis tomentosus, caule foliisque profunde serratis duplo triplo majoribus.

HAB. Barren country from lat. 64°. to the Arctic Sea. Dr. Richardson. Kotzehue's Sound. Chamiso (in Herb. Nostr.)— β . About Fort Franklin, on the Mackenzie River.—The *A. salsuginosus*? of Lessing, (*A. Espenbergenensis*, Nees,) is certainly the *A. montanus* of Dr. Richardson.

5. *A. peregrinus*; foliis oblongo-ellipticis ovatis acutis integerrimis glabriusculis, caule erecto folioso 1-3-floro seriatim hirtio, involucri biserialis foliolis lineari-acuminatis hirtis exterioribus herbaceis. Nees.—Pursh, Fl. Am. v. 2. p. 556. Nees, Ast. p. 33.—*A. Tilesii*. Wikstr.

HAB. Unalaschka. Dr. Nelson (in Herb. Banks.) Chamiso.

6. *A. Unalaschkenensis*; foliis lanceolatis ovato-lanceolatis acuminatis subserratis pubescenti-scabris ciliatis, caule erecto 1-3-floro superne sparse villoso folioso, involucri subaequalis foliolis lineari-acuminatis herbaceis villosis. Nees.—Less. in Schlecht. Linnæa, v. 4. p. 122.—Nees, Ast. p. 34.— β .? *major*; foliis acuminatis, caule multifloro.

HAB. Unalaschka. Chamiso.— β . Saskatchewan to the Rocky Mountains. Drummond. Nees seems to consider this as scarcely distinct from *A. Caucasicus*, Willd. and that it may even be the same with *A. peregrinus*.—Specimens of our var. β . in Mr. Drummond's Collection, which Professor Lindley marks “apparently *A. Unalaschkenensis*, Lim.” a species which I have not seen, are larger than *A. Caucasicus*; a foot and a half to two feet high, with very thin, membranaceous, indistinctly veined, and scarcely and only very distantly serrated leaves: the flowers similar, but more numerous.

SECT. II. AMELLI. Nees, Ast. p. 36.

7. *A. biflorus*; foliis lanceolatis serratis scabris, involuci foliolis imbricatis ovatis, caule, subbifloro. Nees.—Mich. Am. v. 2. p. 114. Nees, Ast. p. 39.—*A. strictus*. Pursh, Fl. Am. v. 2. p. 556.

HAB. Labrador and Hudson's Bay. Herb. Banks. (Pursh.)

8. *A. conspicuus*; (Lindl.) foliis oblongis erectis basi angustatis grosse serratis pubescentibus ambitu scabris, caule stricto apice corymboso, ramis erectis pubescentibus monocephalis aphyllis, involuci hemisphærici foliolis squamosis acuminatis exterioribus minoribus. Lindl. MSS.

HAB. Carlton House on the Saskatchewan River to the Rocky Mountains. β —“*A. specabilis* accedit, foliis latis fere omnibus grosse serratis distingendus.” Lindl.

9. *A. Radula*; foliis lanceolatis utrinque attenuatis medio argute serratis rugosis scaberimis, caule angulato glabriusculo corymboso, racemis paucifloris nudiusculis, involuci

foliolis plurifariam imbricatis oblongis acutiusculis apice patulis. *Nees*.—*Ait. Hort. Kew.* ed. 1. v. 3. p. 210. *Pursh, Fl. Am.* v. 2. p. 556. *Nees, Ast.* p. 43.

HAB. Nova Scotia. (*Ait.*) Newfoundland. *Miss Brenton. Dr. Morrison. Mr. Cormack.*

10. *A. ascendens*; (*Lindl.*) foliis oblongo-linearibus subspathulatis elongatis integerimis glabris margine ciliato-scabris, caulinibus ascendentibus simpliciter racemosis v. corymbosis, involucri glabri foliolis numerosis acutis patulis. *Lindl. MSS.*

HAB. Banks of the Saskatchewan. *Drummond*.—“Ab *A. Amello* diversus glabritie longitudine foliorum involucrisque foliolis numerosis angustioribus acutioribus; habita similia.” *Lindley*; who further remarks that it comes nearest to a Caucasian form of *A. Amelus*.

11. *A. spathulatus*; (*Lindl.*) foliis spathulatis obtusis integerrimis, ramorum basi dilatatis amplexicaulibus, caule simpliciter racemoso, pedunculis subaphyllis folio brevioribus, involucri foliolis linearibus acutis erectis tomentosis. *Lindl. MSS.*

HAB. Bear Lake and Fort Franklin, on the Mackenzie River. *Dr. Richardson.*

12. *A. modestus*; (*Lindl.*) foliis lanceolatis acuminatis grosse serratis glabris, caule simplici folioso, corymbo paucifloro foliis supremis breviore, involucri foliolis linearibus acuminatis. *Lindl. MSS.*

HAB. Mountain woods, at the mouth of the Smoking River, lat. 56°. *Drummond*.—“*A. brumalem* nanum refert, sed affinitate *N. Angliae* proximo sequitur.” *Lindl.*

13. *A. Novæ Angliæ*; foliis lanceolatis attenuatis auriculato-amplectentibus integerrimis hispido-scabris, caule stricto corymbo-composito, ramis arcuatis, involucri foliolis laxis angustis. *Nees*.—*Linn.*—*Pursh, Fl. Am.* v. 2. p. 549. *Nees, Ast.* p. 46. *Elliott, Carol.* v. 2. p. 381.

HAB. Canada. *Pursh*.—I possess no northern specimen of this plant. It is common throughout the United States, and is one of the most beautiful of the Genus.

SECT. III. GENUINI.

A. Heterophyllum, *Nees*.

14. *A. cordifolius*; foliis cordatis serratis petiolatis supra scabris subtus pilosis, caule racemoso-paniculato, ramis paucifoliis laxis, involucro uredi imbricato. *Nees*.—*Linn.*—*Pursh, Fl. Am.* v. 2. p. 552. *Nees, Ast.* p. 52. *Elliott, Carol.* v. 2. p. 364.

HAB. Throughout Canada; abundant.

15. *A. paniculatus*; foliis cordatis serratis petiolatis supra scabris subtus glabris, caule ramisque racemoso-thyrsoideis foliosis strictis involucro laxe imbricato. *Nees*.—*Ait. Hort. Kew.* ed. 1. v. 3. p. 207. *Nees, Ast.* p. 53.—var. δ.? floribus majoribus, foliis subcarnosis, infinitis solunmodo subcordatis.

HAB. Canada. *Pursh*. Saskatchewan. *Drummond*.—δ. Slave Lake. *Dr. Richardson*.—“There is,” as Dr. Boott justly observes, “great confusion about the heart-leaved *Asters*. Mr. Nuttall says that *A. paniculatus* is not distinct from *A. undulatus*, and that *A. heterophyllum* is not distinct from *A. cordifolius*.” Professor Lindley remarks, upon one of my specimens from Dr. Short, of *A. paniculatus*, that “it approaches *A. undulatus*.” The probability is that they are all forms of one and the same species; though I must observe that I have myself seen noacknowledged *undulatus* and *heterophyllum* from British North America.

16. *A. sagittifolius*; * foliis radicalibus petiolatis cordato-subsagittatis (vel et profunde cordatis) oblongis glabris inaequaliter serratis margine scabris, caulinis ovato-oblongis in petiolum alatum contractis serratis glabris, caule racemoso-composito, involucro arcte imbricato. *Nees*.—*Willd. Sp. Pl. v. 3. p. 2035. Pursh, Fl. Am. v. 2. p. 551. Nees, Ast. p. 56. Elliott, Carol. v. 2. p. 362.*

HAB. Lake Huron. *Dr. Todd. Montreal. Mr. Cleghorn. Red River. Douglas.*

B. *Homophylli.*

17. *A. Cornuti*; foliis oblongis profunde serratis in petiolum attenuatis supra pube minutissima adpersis subtus glabris margine scabris, caule ramoso-paniculato, involucro laxo imbricato. *Nees*.—*a. caule multifloro, floribus minoribus, radio angustiore, ramis paniculæ longioribus erectis. Nees.—Wendl.—Nees, Ast. p. 58.—A. Tradescanti. Hoffm.—A. patulus. Lam.—A. tardiflorus. Herb. Linn. (fide Lindl.)*

HAB. Canada. *Mr. Cleghorn.*

18. *A. acuminatus*; foliis ovato-lanceolatis serratis in petiolum adnatum decurrentibus supra scabris subtus laevibus, caule racemoso, ramis brevibus thyrsoides simplicibusve, involuci laxè imbricati foliolis lanceolatis. *Nees*.—*Mich. Am. v. 2. p. 109. Pursh, Fl. Am. v. 2. p. 555. Hook. Bot. Mag. t. 2707. Elliott, Carol. v. 2. p. 355.*

HAB. Canada. *Mr. Cleghorn. Mrs. Sheppard. Lady Dalhousie. Mrs. Percival.*

19. *A. præcox*; foliis ovato-lanceolatis patent-serratis in petiolum adnatum attenuatis glabris supra in ambitu scabris basin versus ciliatis, radicalibus ovatis petiolatis, caule ramoso, ramis paucifloris basi nudis, involucro laxo subæquali.—*Nees.—Willd. En. Hort. Berol. Suppl. p. 58. Nees, Ast. p. 62.*

HAB. Fort Franklin, on the Mackenzie River. *Dr. Richardson.*

20. *A. ciliolatus* (*Lindl.*); foliis omnibus ovatis medio argute serratis in petiolum abrupte angustatis ciliatis in ambitu scabris, caule simplici, capitulis axillaribus sessilibus v. brevi-pedicellatis subsolitariis, involuci foliolis erectis apice membranaceis. *Lindl. MSS.*

HAB. Slave Lake. *Dr. Richardson*.—“Valde affinis *A. præcoci*; differt foliis abrupte nec sensim in petiolum angustatis caulinisque radicalibus conformibus conspicue per totum ambitum ciliatis, capitulis subsessilibus dimidio minoribus, involuci foliolis non apice herbaceis, denique statura humili.” *Lindl.*—The very few specimens in the Collection are 6–8 inches high.

* Allied to this is an interesting new species found by Dr. Short, on cliffs of the Kentucky River, which I am anxious should bear the name of its estimable discoverer, an excellent and liberal Botanist. Professor Lindley has favoured me with the following character and remarks:—

“*A. Shortii*; foliis subtus pilosusculis ambitu scabris, caulinis alte cordato-lanceolatis acuminatis pone basin gresso serratis integravice ramulorum cordato-ovatis omnibus petiolatis, petiolis aperis, caule racemoso vel racemoso-composito, involucro imbricato.—Rete foliorum maximum. *A. diversifolia* proximus, inter eam speciem et *A. sagittifolium* collaudus, foliis omnibus cordatis acuminatis petiolatis petiolisque ne minime quidem alatis aperis distinguendus.” *Lindl.*

21. *A. puniceus*; foliis oblongo-lanceolatis amplectentibus acuminatis medio adpresso-serratis supra scabris, caule hispido patulo-racemoso, ramis inferis racemosis, superis simpli-cibus, involueri laxi foliolis linear-i-subulatis æqualibus. *Nees*.—*Linn. Hort. Cliff.* p. 408. *Mich. Am.* v. 2. p. 115. *Pursh. Fl. Am.* v. 2. p. 554. *Elliott, Carol.* v. 2. p. 355.

HAB. Canada to Hudson's Bay.

22. *A. vimineus*; foliis lanceolatis amplectentibus longe acuminatis medio subulato-ser-ratis margine scabris, caule racemoso-composito pyramidali lævi, ramis virgatis apice race-mosis, involueri laxi foliolis lanceolato-linearibus subæqualibus. *Nees*.—*Willd. Sp. Pl.* v. 3. p. 2046. *Nees, Ast.* p. 68.

HAB. Canada. (*Nees*). Lake Huron. *Dr. Todd*.—This is Nees' *A. vimineus*: but Dr. Boott considers it as probably a variety of *A. puniceus*.

23. *A. laxifolius*; foliis anguste lanceolatis utrinque attenuatis mucronato-serrulatis flaccidis supra scabris, caule seabo racemoso-composito angusto, ramis apice racemosis vel subcompositis, involueri foliolis linearibus squarrosis floris primarii subæqualibus. *Nees, Ast.* p. 59.—*A. salicifolius*. *Rich. in Frankl. 1st Journ. App.* p. 748. (excl. syn.)—*A. longifolius*. *Nees, Syn. Ast.* p. 26.— β . foliis angustioribus fere integerrimis.

HAB. Woody country from lat 54° to 64°. *Dr. Richardson*. Rocky Mountains, in swampy places, to Hudson's Bay. *Drummond*. Near Quebec. *Mrs. Percival*.— β . Rocky Mountains. *Drummond*. Slave Lake. *Dr. Richardson*.—This is a very distinct and well marked species. The more northern specimens have the narrowest leaves. I possess the same plant from Philadelphia, sent to me by Dr. Griffith.

24. *A. amplus* (*Lindl.*); foliis oblongo-lanceolatis margine scabris subintegerrimis, caule simplici subcorymboso, ramis unifloris subaphyllis, involucro laxo imbricato. *Lindl. MSS.*

HAB. Rocky Mountains. *Drummond*.—*A. brumalis* affinis: foliis capitulisque multo majoribus, caule simplici subcorymboso ramisque rigidis pilosis fere aphyllos nec virgatis glabria foliosis, bene distinguitur? *Lindl.*

25. *A. blandus*; foliis subimplexicaulibus oblongo-lanceolatis acuminatis serratis glabris, caule pyramidato-ramoso, ramis axillaribus racemifloris folio vix longioribus, pedunculis tomentosis nudis, involueris laxis subæqualibus disco brevioribus. *Herb. Banks. MSS.*—*Pursh, Fl. Am.* v. 2. p. 555. *Nees, Ast.* p. 76.

HAB. Canada. (*Herb. Banks.*)

26. *A. luxurians*; foliis ovali-oblongis vel lanceolatis acuminatis basi attenuata amplectentibus medio argute serratis supra scabris glaucescentibus, caule paniculato, ramis apice corymboso-racemosis, ramulis unifloris, involueri foliolis laxe imbriatis linear-i-lanceolatis acutis. *Nees, Ast.* p. 83.—*A. Novi Belgii. Nutt.* (fide *Nees*).— β . caule magis composito magisque piloso-lineato.—*A. luxurians*. *Spreng. Syst. Veget.* v. 3. p. 538.

HAB. β . Canada. *Mrs. Percival*.—This, which Professor Lindley, and, I doubt not, correctly, refers to *A. luxurians* β . of *Nees*, Dr. Boott considers *A. tardiflorus*, *Nees*, (not *Linn.*) while another, equally quoted by Dr. Lindley under *A. luxurians*, β . Dr. Boott calls *A. Novi Belgii*, δ . *minor*. The three are perhaps not really different.—Nearly allied to this is a specimen of an *Aster* from Dr. Scouler, gathered on the Columbian, which Professor Lindley inclines to refer to *A. asper*.

27. *A. adulterinus*; foliis oblongo-lanceolatis mucronatis amplectentibus lœvibus margine scabris, caule e basi paniculato-decomposito, ramis corymboso-racemosis, involuci obovati subæqualis foliolis spathulato-lanceolatis squarrosis post florescentiam magis auctis. *Nees*.—*Willd.*—*Pursh*, *Fl. Am.* v. 2. p. 558.

HAB. Straits of De Fuca. *Dr. Scouler*.—Dr. Nees von Esenbeck doubts if this may not be a variety of *A. Novi Belgii*.

28. *A. Douglasii* (*Lindl.*) ; foliis linear-lanceolatis versus basin angustatis glabris omnibus (exceptis supremis) serratis, caule racemoso-composito, ramis paucæ foliosis oligocephalis laxæ corymbosis, involuci laxi subæqualis foliolis linearibus acutis. *Lindl.* *MSS.*— α . ramis abbreviatis pleiocephalis, capitulis minoribus.— β . ramis gracilioribus elongatis oligocephalis subnphyllis, capitulis majoribus. *Lindl.*

HAB. α . Common on the N. W. Coast, near the confluence of the Columbia, in open undulating grounds. *Douglas*.— β . De Fuca. *Dr. Scouler*.—" *A. eminenti proximus*." *Lindl.*

29. *A. bellidiflorus*; foliis lanceolatis adpresso-serrulatis margine scabris ramulorum lanceolato-acuminatis subulatis apice recurvis, caule stricto racemoso-decomposito supradecomposito angusto inferne glaberrimo albo-virgato purpurascenteve, ramis apice racemosis racemoso-compositis, floribus confertis, involuci foliolis imbricatis linearibus acutis, interioribus apice stœpe coloratis. *Nees*.—*Willd.* *Hort. Berol.* v. 2. p. 886. *Pursh*, *Fl. Am.* v. 2. p. 554. *Nees*, *Ast.* p. 97.

HAB. Canada. *Mrs. Sheppard*. *Dr. Holmes*. Saskatchewan. *Drummond*. Red River. *Douglas*.—This certainly bears considerable resemblance to *A. laxifolius*, *Nees*, to which indeed Dr. Boott refers it.

30. *A. parviflorus*; foliis lanceolatis acuminatis medio argute serratis supra in ambitu scabris ramulorum (peduncularum) linearibus acutis patentibus, caule racemoso-decomposito ramisque apice corymbosis strictis, involuci foliolis imbricatis linearibus acutis, radii ligulae linearis foliolis involuci interioribus paullo longiore. *Nees*, *Ast.* p. 99.

HAB. Canada. *Pursh*. *Dr. Holmes*.

31. *A. Lamarchianus*; foliis lanceolatis acuminatis adpresso-serratis supra scaberrimis ramulorum lanceolato-acuminatis patentibus, caule piloso-lineato racemoso-decomposito concreto, ramis paniculato-racemosis, involuci laxi subæqualis foliolis linearibus. *Nees*, *Ast.* p. 100.—*A. Tradescanti*. *Willd.*—*A. paniculatus*. *Lam.*

HAB. Canada. (*Lamarch.*) Saskatchewan. *Dr. Richardson*. *Drummond*.—To me this appears very similar to the preceding. *Nees* considers it unlike any species but *A. divergens*.

32. *A. divergens*; foliis lanceolatis acuminatis medio mucronato-serratis in ambitu scabris ramulorum oblongo-lanceolatis basi attenuatis integrerimis mucronulatis patentibus, caule piloso-lineato racemoso-composito, ramis æqualibus patentibus, involuci foliolis imbricatis lanceolatis. *Nees*.—*Ait. Hort. Kew. ed. 1. v. 3. p. 205*. *Pursh*, *Fl. Am.* v. 2. p. 558. *Elliott*, *Carol.* v. 2. p. 357. *Nees*, *Ast.* p. 100.

HAB. Canada. *Mrs. Sheppard*.

33. *A. falcatus* (*Lindl.*); foliis linearibus obtusis falcatis pilosiusculis, caule piloso anguste racemoso subcomposito, ramulis brevibus monocephalis paucifoliis, involuci laxi parum imbricati foliolis linearibus acutiusculis.

HAB. Arctic America. DR. RICHARDSON.—“Facies est omnino *A. hiemalis*, sed vera affinitas cum *A. fragilis*; folia inferiora *Bupleuro falcata* similis.” *Lindl.*

34. *A. Tradescanti*; foliis linearibus acuminatis margine ciliato-scabris inferioribus a medio argute remote serratis ramis; ramulorumque patentibus mucronatis, caule glabriuscule ramoso subcomposito patulo apice simpliciter racemoso, ramis virgatis, ramulis subsecundis, involucro imbricato. *Nees.*—*Linn. Hort. Cliff.*—*Mich. Am. v. 2. p. 115. Pursh, Fl. Am. v. 2. p. 556. Elliott, Carol. v. 2. p. 358.*

HAB. Canada. *Pursh. Dr. Holmes.*

35. *A. ericoides*; foliis linearibus angustis integerrimis glaberrimis, caule glabro racemoso-composito, ramis virgatis, ramulis subsecundis ab apice remotis, involuci brevis foliolis imbricatis apice subulato-patulis. *Nees.*—*Linn. Mich. Am. v. 2. p. 119. Pursh, Fl. Am. v. 2. p. 546. Elliott, Carol. v. 2. p. 348.*

HAB. Canada. *Pursh.* Saskatchewan, and towards the Rocky Mountains. *Drummond.* Red River. *Douglas.*

36. *A. diffusus*; foliis caulinis lanceolatis, ramis oblongo-lanceolatis medio serratis supra scabriusculis margine scaberrimis, caule pubescenti racemoso-composito, ramis recurvato-patentibus, floribus subsecundis confertis, involucro imbricati foliolis acutis. *Nees.*—*Ait. Hort. Kew. ed. 1. v. 3. p. 111. Pursh, Fl. Am. v. 2. p. 558. Nees, Ast. p. 110.*—*A. divergens* β . *diffusus. Nutt.*

HAB. Canada. *Pursh. Mrs. Sheppard. Cleghorn.*

37. *A. miser*; foliis caulinis oblongo-cuneiformibus acuminatissimis medio serratis rameisque ovalibus subintegerrimis supra pubescenti-scabris, caule pubescenti-scabro racemoso-composito ramis erectis, floribus subsecundis confertis, involuci laxe imbricati foliolis acuminatis. *Nees.*—*Linn. Pursh, Fl. Am. v. 2. p. 558. Nees, Ast. p. 111.*

HAB. Canada, *Pursh*, if *Pursh's* plant be the same; but *Nees* excludes the synonym of *Willd.* and *Pursh.*

38. *A. pendulus*; foliis elliptico-lanceolatis cauleque pubescenti-scabris, caulinis medio adpresso-serratis, ramulorum ellipticis integerrimis, caule laxe diffuso racemoso-composito, ramis elongatis flaccidis, involucro imbricato. *Nees.*—*Ait. Hort. Kew. ed. 1. v. 3. p. 205. Pursh, Fl. Am. v. 2. p. 558. Nees, Ast. p. 114.*—*A. divergens* γ . *pendulus. Nutt.*

HAB. Canada. DR. HOLMES.—My Canadian specimen of this, so named by Professor Lindley, only differs from an authentic specimen of *Nees' A. miser* in its more copious flowers.

39. *A. Menziesii*; foliis oblongo-linearibus sessilibus integerrimis scabriusculis incanis, caule incano apice racemoso, involuci foliolis obtusis squarrosis. *Lindl. MSS.*

HAB. North-west coast of America. *A. Menzies, Esq.*—“Ab *A. concolor* vix differt nisi pilis rigidis nec mollibus, necon involuci foliolis squarrosis nec appressis.” *Lindl.* MSS.

40. *A. ramulosus*; foliis linearibus serrulato-scabris basi dilatatis sessilibus ramulorum rectis minoribus, caule piloso erecto angusto racemoso ramulis corymbulosis monocephalivis, involucri squarroso foliolis acutissimis mucronatis. *Lindl. MSS.*— β . incano-pilosus. *A. bienni*, *Nutt.* (qui *Aster* est genuinus *multifloro* affinis) proxime accedit. *Lindl.*

HAB. Saskatchewan to Fort Franklin on the Mackenzie River and among the Rocky Mountains. *Dr. Richardson. Drummond.*—"Capitula duplo majora quam in *A. multifloro*." *Lindl.*

41. *A. multiflorus*; foliis linearibus integerrimis margine serrulato-scabris subtrinervibus ramulorum recurvis, caule pubescente ramoso-composito diffuso, floribus subsecundis, involucri foliolis laxe imbricatis upice recurvis subspathulatis mucronatis. *Nees.*—*Ait. Hort. Kew. ed. 1. v. 3. p. 208. Pursh, Fl. Am. v. 2. p. 546.*— β . ciliatus. *Nees.*—*A. ciliatus. Willd.*—*Pursh.*

HAB. *a. Canada. Pursh.*

42. *A. concinnus*; foliis lanceolatis amplectentibus remote argute serratis margine scabris ramulorum oblongis integerrimis, caule laxe subcorymboso, ramis virgatis dichotomo-paniculatis, involucro arte imbricato. *Nees.*—*Willd. 44. *A. amplexicaulis*; foliis oblongis acutis basi cordato-amplectentibus lucidis margine scabris inferioribus subserratis, caule paniculato-corymboso, ramis dichotome corymbosis coarctatis, involucro arte imbricato. *Nees.*—*Willd. Sp. Pl. v. 3. p. 2046. Nees, Ast. p. 130. Elliott, Carol. v. 2. p. 360.*

HAB. Edmonton House on the Saskatchewan. *Drummond.*

45. *A. rubricaulis*; foliis oblongo-lanceolatis amplectentibus laevibus margine scabris glaucis, radicalibus ovatis in petiolum contractis obtusis, caulinis inferioribus basi attenuatis subserratis, superioribus integerrimis, caule racemoso-composito subpaniculato stricto, involucri disco brevioris foliolis imbricatis lanceolatis, receptaculo pilosiusculo. *Nees.*—*Lam. Enc. v. 1. p. 305. Nees, Ast. p. 131.*

HAB. *Canada. Cleghorn.*

46. *A. cyaneus*; foliis oblongo-lanceolatis amplectentibus laevibus margine scabris glaucis superioribus integerrimis, radicalibus spathulatis obtusis crenato-serratis, caule racemoso-composito subpaniculato, involucri disco brevioris foliolis arte imbricatis ex ovato-triangularibus, receptaculo alveolato-dentato piloso. *Nees.*—*Hoffm. Syn. Ast. p. 23. Nutt. Gen. Am. v. 2. p. 156. Nees, Ast. p. 132. Elliott, Carol. v. 2. p. 358.*

HAB. Rocky Mountains. *Drummond.*

54. EURYBIA.* *Cass.*

Radius fuscineus fertilis. *Involucræ foliola* arcte imbricata disco herbaceo apicis angusto. *Flosculi* disci tubo limboque discretis. *Achenia* elongata prismatica glabra vel pubescentia. *Pappus* simplex rigidulus persistens scaber. *Receptaculum* alveolatum.—*Characteres plurimi Asteris generis, sed differt; involucro subcylindrico arcte imbricato, foliolis apice non foliaceis vel salem leviori costæ expansione præditis, acheniisque linearibus longioribus subprismaticis vel angulatis, nec compressis; habitu denique et pubescentia. Nees.*

1. *E. macrophylla*; foliis cordatis ovatis, radicalibus subtrinervatis, caulinis in petiolum alatum contractis serratis scabris subtus hirtis, caule hirsute ramiave glabro patulo corymboso, ramulis rigidis, involucræ arcte imbricati foliolis oblongo-lanceolatis obtusis. *Nees.*—*Cass. in Dict. des Sc. Nat. v. 37. p. 487. Nees, Ast. p. 140.*—*Aster macrophyllus. Linn.*—*Pursh, Fl. Am. v. 2. p. 552.*—*A. divaricatus. Linn.*—*A. infirmus. Mich. Am. v. 2. p. 109?* (*Nees.*)

HAB. Canada. *Pursh.* From Lake Huron, Dr. *Todd*, to Norway House on the Saskatchewan. *Drummond.*

2. *E. corymbosa*; foliis ovatis inferioribus cordatis serratis petiolatis, caule dichotomo-corymboso, involucræ foliolis imbricatis obtusis exterioribus ovatis. *Nees.*—*Cass. l. c. Nees, Ast. p. 143.*—*Aster corymbosus. Ait. Hort. Kew. ed. 1. v. 3. p. 207. Pursh, Fl. Am. v. 2. p. 552. Elliott, Carol. v. 2. p. 365.*

HAB. Canada. *Pursh.*—*Nees has three other American species not in any American Flora, with which both Dr. *Boott* and myself are unacquainted.*

55. SERIOCARPUS. *Nees.*

Radius fuscineus fertilis. *Involucræ foliola* basi lata subcartilaginea arcte imbricata, apice abrupte herbacea et plerumque patula. *Flosculi* disci pueri conico-cylindracei, tubo limboque confluentibus. *Achenia* brevia, obverse pyramidalia dense sericea. *Pappus* simplex rigidulus persistens. *Receptaculum* angustum, alveolatum, irregulare.—*Differit hocce genus ab Eurybio appendice foliolorum involucri distincta; ab Astere acheniis brevibus dense sericeis et forma flosculorum disci, ab utroque genere cunctisque reliquis Astereis habitu, præsertim ab inflorescentia pendente. Nees.*

1. *S. solidagineus*; foliis lineari-spathulatis obtusis integerimis margine scabris, corymbo paucifloro, involucro squarroso. *Nees, Ast. p. 149.*—*Aster solidaginoides. Mich. Am. v. 2. p. 108. Pursh, Fl. Am. v. 2. p. 542. Elliott, Carol. v. 2. p. 340.*—*Conyza linifolia. Linn.*

HAB. Near Montreal. *Mr. Cleghorn.*

2. *S. rigidus* (*Lindl.*); foliis obovatis (potius oblongo-spathulatis) subtrinerviis integerimis cauleque scaberrimis, corymbo terminali simplici vel composito contracto, involucræ turbinati foliolis adpressis basi nudis, radio pappo breviore. *Lindl. MSS.*

* I follow the learned *Nees von Esenbeck* in the adoption of this and other Genera of his *Asterineæ*; but I must confess that I think the character is much too slight, and the difference in habit by no means sufficient to warrant such a separation.

HAB. Columbia River. Dr. Scouler. Abundant on undulating, dry, gravelly soils near Fort Vancouver, and low hills of the interior. Douglas.—The leaves are remarkably acute, almost mucronate, and they and the stems are quite rough with minute elevated dots. "S. cony soldi proximus." Lindl. To me this species, though very distinct, appears to approach nearest to *S. tortifolius*.

56. TRIPOLIUM. Dod. Nees.

Radius fæmineus fertilis. *Involucrī foliola* interiora ampliora membranacea, colorata, appressa, exteriora in pedunculi foliola decurrentia. *Achenia* cuneiformia, compressa, glutinosa. *Pappus* simplex, capillaris, densus, noduloso-scaber. *Receptaculum* alveolatum. —Herbæ annæ vel perennes, glabrae, in solo salesugininoso crescentes. Folia angusta, succulta, margine saepe scabra, triplinervia vel subavenia. Flores corymbosi albi vel cœrulei. Involucra saepe colorata.—Species Europæ, Asiae Caucasicae, Americae septentrionali indigena. Nees.

1. *T. pauciflorum*; foliis linearibus subcarnosis glabris caulinis subulatis implexicaulibus, caule paucifloro (3-6-floro) ramis subunifloris viscidopubescentibus, involucri hemisphaerici foliolis subequalibus acutis. Nees, Ast. p. 157.—Aster pauciflorus. Nutt. Gen. Am. v. 2, p. 154.

HAB. Marshes of the Saskatchewan. Drummond.

2. *T. angustum* (Lindl.); foliis linearibus serrulato-scabris glabris, caule angusto strictissimo, ramis rectis racemosis, involucri hemisphaerici imbricati foliolis linearibus acutis, radio inconspicuo.—a. ramis oligocephalis.—β. ramis polyccephalis.—Lindl. MSS.

HAB. a. Banks of the Saskatchewan. Drummond.—β. Slave Lake. Dr. Richardson.—"This species differs essentially from *T. subulatum*, Nees (*Aster subulatus*, Mich.) in its stem not being flexuous, in its serrulated leaves, in the form of the leaflets of the involucre, and in the flowers being twice as large." Lindl.

57. GALATELLA. Cass.

Radius fæmineus sterilis. *Involucrī angusti foliola* imbricata angusta, nervo herbaceo sub apice non expanso. *Achenia* conoidea, dense hirsuta vel sericea. *Pappus* rigidulus, tensus, scaber. *Receptaculum* lacero-alveolatum.—Folia conformia angusta; radicalia minora, sessilia, subverticalia, nervosa vel nervia solaque costa media, venis autem nullis divisa, rigidula scabra plerisque punctata, punctis in superficie superiori præsertim obviis insculptis glandulaque granuliformi nitidula viridi fundo soveolæ immersa præditis, quæ glandulæ, in aliis magis in aliis minus conspicuæ, nonnullis omnino deesse videntur, caulis inferne simplex, apice distincte corymbosus, ramis dichotomis, rarius subtrichotomis. Radii ligulae distantes, neutrae. Nees.

1. *G. nemoralis*; foliis lanceolato-linearibus integerrimis enervibus impunctatis scabris, caule apice corymboso, radio elongato. Nees, Ast. p. 173.—Aster nemoralis. Ait. Hort. Kew. ed. 1. v. 3. p. 198.—A. ledifolius. Pursh, Fl. Am. v. 2. p. 544.—β. uniflorus.—Aster uniflorus. Mich. Am. v. 2. p. 110.

HAB. Canada. Pursh. Newfoundland. Mr. Cormack. Dr. Morrison.

2. *G. graminifolia*; foliis angusto-linearibus subtrinervibus margine costaque pilosiusculis impunctatis, ramis terminalibus gracilibus subaphyllis unifloris, involucri foliolis laxis discum

equantibus.—*Aster graminifolius.* *Herb. Banks. MSS.*—*Pursh, Fl. Am. v. 2. p. 545. Rich. in Frankl. 1st Journ. ed. 2. App. p. 32.* (fide *Herb. nostr.*)

Hab. Hudson's Bay. Herb. Banks. Dr. Richardson. Slave Lake. Dr. Richardson.—This is indeed very closely allied to *G. nemoralis* and *G. linifolia*; but there are, besides the costa, two lateral ramified nerves in the leaves, whose margins and costa too are hairy, and the pappus is almost white.

58. TOWNSENDIA. *Nov. Gen.*

Capitulum heterogamum. Flosculi radii ligulati scemei; disci hermaphroditi, regulares. Involucræ foliola pluriserialia imbricata. Pappus uniserialis; radii brevis, paleaceo-subulatus, inaequalis; disci pilosus, pilis elongatis scabriusculis.—*Herba America borealis humili acutis. Radix fusiformis, lignosa, longe descendens; superne æque divisa, reliquæ foliorum vetustorum obtecta. Folia omnino radicalia, numerosa, erecto-patentia, linearia, subspathulata, integerrima, utrinque adpresso-sericea, basi dilatata, et utrinque ciliata. Flos solitarius, foliis inumeris et obtectis, ratione planta magnus. Involucrum ovatum, foliolis sericeis, linearisubulatis, erectis, imbricatis. Flosculi radii ligulati, erecti, pallide rosei, marginibus involuti, apice dentibus tribus conniventibus. Stigma bifidum, purpureum, glabrum. Ovarium oblongum, compressa-triquetrum, pubescens. Pappus brevis sed valde inaequalis, uniserialis, e pilis seu paleis subulatis, basi membranaceis. Flosculi disci tubulosi, lutei. Pappus pilosus, pilis scabriusculis longitudine corollæ. Ovarium sericeum. Receptaculum alveolato-punctatum, nudum.*

1. *T. sericea.* (TAB. CXIX). *Aster? exscapus. Rich. in Frankl. 1st. Journ. ed. 2. App. p. 32.*

Hab. Carlton House upon the Saskatchewan and among the Rocky Mountains. Dr. Richardson. Rare, upon the dry banks of the Saskatchewan and among the Rocky Mountains. *Drummond.*—This highly interesting little plant, no less on account of its habit than its pappus, deserves to be separated from *Aster*, of which, indeed, it was by Dr. Richardson, considered a doubtful species. "The bud is formed in the autumn," and what Dr. Richardson further observed in the living plant, I find to be characteristic of all the specimens in this Collection, that "the florets of the ray are mostly involute, rarely expanded, and always narrow, nearly of the same colour with the pappus and inconspicuous; the flowers, indeed, never fully expanding." I have named the Genus in compliment to *David Townsend, Esq.* of West Chester, Pennsylvania, who having imbibed the most ardent love of Botany from his friend and instructor Dr. Darlington of the same city, has devoted his leisure hours to the science with eminent success. The plant now under consideration is peculiarly worthy of bearing his name, because he has studied and ably discriminated the numerous Pennsylvanian species of the allied Genus *Aster*.

TAB. CXIX.—*Fig. 1, Flowers; fig. 2, Floret of the ray; fig. 3, Portion of the pappus from the ray; fig. 4, Floret of the disk; fig. 5, Portion of a hair from the pappus of the disk; fig. 6, Stigma from the disk; fig. 7, 7, Scales of the involucre; fig. 8:—all more or less magnified.*

59. ERIGERON. L.

Flores ♂ pluriserialis in ambitu ligulati numerosi angusti; reliqui ♀. Involucræ foliola imbricata angusta. Pappus conformis, uniserialis. Cor. ♀ regularis. Achenium erostre.—*Herbe Europeæ, Asiaticæ vel Americanæ, erectæ, ramosæ vel simplices, magis minusve hirsutæ; foliis alternis, inferioribus oblongo-ovatis, dentatis; capitulis albis vel purpureis solitariis vel paniculatis. Nees.*

1. *E. compositus*; subcaulis, foliis radicalibus longe petiolatis tripartitis hirsutis laciniiis cuneiformibus trifidis, scapo unifloro paucifolio foliis linearibus integris.—*Pursh, Fl. Am.* v. 2, p. 535. *Hook. in Linn. Trans.* v. 14, p. 374, t. 13.—*Cineraria Lewisii. Rich. in Frankl. 1st Journ. ed. 2. App. p. 32.*—*E. grandiflorus*; floribus fere duplo majoribus, radiis magis conspicuis.—γ, radii flocculis carneis.

HAB. Backs of the Kootenay, M. Lewis.—α, and β. Barren country between lat. 64° and the Arctic Sea, and on the highest of the Rocky Mountains, in lat. 51°. *Drummond*. Islands of the Columbia, between the Narrows and the great Falls. *Douglas*.—γ. Summits of the Rocky Mountains. *Drummond*.

2. *E. trifidus*; subcaulis, foliis hirsutis radicalibus longe petiolatis trifidis laciniiis integris infimis colummodo raro iterum divisis, scapo unifloro paucifolio foliis linearibus integris. (TAB. CXX.)

HAB. Barren places among the Rocky Mountains. *Drummond*.—This has the flowers equal in size with those of *E. compositus*, β, and the habit is very similar; but the leaves are almost the whole of them simply trifid; a few of those at the base of the stem, or divisions of the stem, being compound.

TAB. CXX.—Fig. 1, Floret of the ray; fig. 2, Floret of the disk; fig. 3, Leaf:—magnified.

3. *E. lanatus*; subcaulis lanatus, foliis radicalibus spathulatis infimis rarissime trifidis, scapo subphyollo superne involucroque densissime lanatis, radiis elongatis patentibus, ncheinis glabris. (TAB. CXXI.)

HAB. Summits of the Rocky Mountains between lat. 52° and 56°. *Drummond*.—This is an extremely beautiful species, most allied, indeed, to *E. uniflorus*, but differing in the dense woolly covering, large flowers, long descending root, and in the scape, rather than a stem, which bears the flower. Corollas of the ray white, or rarely purple.

TAB. CXXI.—Fig. 1, Floret of the ray; fig. 2, Floret of the disk; fig. 3, Radical leaf; fig. 4, outermost do.:—magnified.

4. *E. radicatus*; subcaulis, foliis radicalibus lincari-spathulatis hirsutulis subcarnosis, scapo unifloro paucifolio, involucro lanato, radiis breviusculis patentibus. (TAB. CXXII.)

HAB. Mountains near Jasper's Lake, Rocky Mountains, rare. *Drummond*.

TAB. CXXII.—Fig. 1, Floret of the ray; fig. 2, Floret of the disk; fig. 3, Portion of a hair from the pappus; fig. 4, Leaves.

5. *E. uniflorus*; caule brevi, foliis radicalibus glabriusculis spathulatis, caulinis paucis linearibus superne involucroque dense purpureo-lanatis, radiis erectiunculis involucro paullo longioribus. *Linn. Sp. Pl. p. 1211. Fl. Lapp. p. 250. t. 9. f. 3. (vix Engl. Bot. t. 2416.) Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*—*E. alpinus. Pursh, Fl. Am. v. 2, p. 532.*

HAB. Labrador. *Kohlmeister*. Arctic Sea-shore (*Dr. Richardson*) and adjacent islands, *Capt. Parry, Sabine*, &c. Summits of the Rocky Mountains, *Drummond*, who found one large specimen in the woody region with seven stems from the same root.—This is well distinguished from the preceding by its more glabrous foliage, true stem, the leaves gradually becoming smaller upon it, smaller flowers, and much shorter ray. The involucro and its woolly clothing are, alike, generally purple. It is quite distinct from the *E. uniflorus* of Engl. Bot. which I have reason to believe is only a single-flowered state of *E. alpinus*; nor have I ever seen the true *uniflorus* in Britain.

6. *E. grandiflorus*; ubique lanato-hirsutus, caule subelongato unifloro, foliis radicalibus oblongo-spathulatis caulinis lanceolatis, involucro (apice purpureo nudiusculo) densissime albo-lanato, radiis patentibus involucro duplo longioribus. (TAB. CXXIII.)

Radix descendens perennis, caules 1-5 gerens. *Caulis* foliosus, palmaris ad spithameum, pilosus. *Folia* pilosa, inferiora spathulata; reliqua lanceolata. *Flos* terminalis, solitarius, ratione plantae magnus. *Involucrum* densissime albo-lanatum, foliolis apice purpureis scarosis nudis. *Radii Flosculi* elongati, patentes, albi vel purpurei.

HAB. Summits of the Rocky Mountains. *Drummond*.

TAB. CXXIII.—Fig. 1, Floret of the ray; fig. 2, Floret of the disk:—magnified.

7. *E. alpinus*; hirsutusculus, caule subelongato uni-multifloro, foliis inferioribus spathulatis superioribus lanceolatis, involucro piloso, radiis inconspicuis cretis pappo copioso paullulum longioribus.—*Linn. Sp. Pl. p. 1211. Engl. Bot. t. 464.*— β . foliis angustioribus, ramis elongatis.— γ . *elata*; subpedalis.

HAB. α , and β , and γ , Rocky Mountains in elevated situations. *Drummond*.—This (the var. α .) exactly corresponds with our European *E. alpinus*; but appears to be confined to the mountains of the interior; whereas, in northern Europe it is frequently a maritime species.

8. *E. glabratus*; glabriusculus, caule clato simplici, foliis radicalibus spathulatis caulinis linear-lanceolatis, racemo terminali multifloro, pedunculis elongatis vix corymbosis simplicibus vel ramosis, involuci parvi foliolis angustissimis, radiis inconspicuis pappo copioso immersis.—*E. glabratus*. *Hopp. in Un. It. (Herb. nostr.)*—*E. alpinus*, β . *ramosus*. *Wahl. Lapp. p. 207.*— β . *minor*; pedunculis brevioribus.

HAB. Hudson's Bay to the Rocky Mountains, and from the Saskatchewan to Fort Franklin on the Mackenzie River. *Dr. Richardson. Drummond*.— β . Rocky Mountains. *Drummond*.—I cannot but look upon this as quite distinct from *E. alpinus*, and, variable as it is in size, from 4-6 inches to 2 feet, it is very constant in its inflorescence, a raceme with very long peduncles, and in the very copious pappus, of a slightly tawny hue, which quite conceals the flowers. Wahlenberg notices its affinity with *E. acris*, which is certainly very considerable, insomuch that it may possibly prove to be a variety of it. It is, however, much more glabrous, and has fewer and larger leaves. This species retains all its characters in cultivation.

9. *E. lonchophyllus*; caule clato hispido simplici, foliis longissimis linearibus glabris nervosis ciliatis inferioribus linear-spathulatis, racemo terminali folioso multifloro, pedunculis elongatis foliolosis, radiis numerosis angustis (albis?) pappo copioso vix longioribus.

HAB. Saskatchewan. *Drummond*.—A very remarkable species, of which, unfortunately, there is only a solitary specimen in the Collection. This is 2 feet high; the stem angled, very hispid, with patent rigid white hairs; caudine leaves, several of them 6 inches long, 2-4 lines broad. Flowers similar to those of *E. glabellus*.

10. *E. strigosus*; strigoso-pilosus clatus, foliis radicalibus spathulatis caulinis lanceolatis basi attenuatis, floribus corymboso-paniculatis, radiis (albis) patentibus numerosis involucro parvo piloso vix duplo longioribus. *Muhl. in Willd. Sp. Pl. v. 3. p. 1956. Pursh, Fl. Am. v. 2. p. 534. Elliott, Carol. v. 2. p. 394.*— β . *hispidissimus*.

HAB. Throughout Canada to the Saskatchewan, and to the Rocky Mountains: thence to the shores of the

Pacific. *Dr Richardson. Drummond. Douglas.*— β . Plentiful in the valleys of the Blue Mountains and of the Spokane River. *Douglas.*—The present, though, like the other species, it may not be easy to define its character in words, is a very well marked one to the eye. It is tall and slender, with narrow leaves. The pretty white flowers are about the size of a daisy.

11. *E. purpureus*; pubescens, foliis oblongis tenui-membranaceis dentatis vel integris caulinis amplexicaulibus radicalibus in petiolum attenuatis, floribus paniculatis subcorymbosis, radiis purpureis numerosissimis patentibus involucro glabriusculo subtriplo longioribus. —*Ait. Hort. Kew. ed. 1. v. 9. p. 186. Pursh, Fl. Am. v. 2. p. 533. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*

HAB. From Lake Huron (*Dr. Todd*) to the Arctic Circle, and from Hudson's Bay to the Rocky Mountains and the shores of the Pacific. *Dr. Richardson. Drummond. Douglas.*—This is peculiar for its broad leaves, which are amplexicaul at the base, of a rather deep green colour, and singularly delicate texture, and for its rather large flowers, with copious red-purple rays. Our specimen from the Saskatchewan is truly gigantic, 3 feet high, with radical leaves a span long and 2 inches broad.

12. *E. Philadelphicus*; pubescens, foliis cunento-oblongis rariter inciso-dentatis caulinis semiamplexicaulibus, caule debili simplici superne corymboso, pedunculis elongatis unifloris, radiis capillaceis involucro hemisphaerico duplo longioribus. *Ph.—Linn. Sp. Pl. p. 1211. Pursh, Fl. Am. v. 2. p. 533. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30. Reich. Ic. Ex. t. 184.*

HAB. Canada. *Kahn.* (*Linn.*) Woody country between lat. 54° and 64° . *Richardson.*—I have never received any authentic specimen of this from the American Botanists; but I introduce it on the authority of Dr. Richardson and *Linnæus*. The excellent Dr. Darlington says, that what he has taken for *E. Philadelphicus* agrees, on a careful comparison, also with *E. purpureus*. I am inclined to suspect that the two are one species, and, if so, the present name, in right of priority, should be retained. Reichenbach's figure looks like a small-flowered state of *E. purpureus*.

13. *E. pulchellus*; pubescens-asper, foliis radicalibus spatulatis integris vel serratis caulinis remotis linearibus integerrimis, panicula laxa pauci (3-5) flora, radiis numerosis (albidos vel pallide purpureis) patentibus involucro plusquam duplo longioribus.—*Mich. Am. v. 2. p. 224. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30.*— $\bar{\epsilon}$. bellidifolius. *Willd. Sp. Pl. v. 3. p. 1958. Sims, Bot. Mag. t. 2402.— ϵ . Serpentaria. *Banks, MSS.*— β . foliis profunde dentatis.*

HAB. Woody country, from Canada to lat. 64° .— β . North West Coast of America. *Menzies.*—In all our specimens the ray in the dry state appears to be white.

14. *E. glabellus*; glaber vel pubescens, foliis lato-lanceolatis integerrimis nervosis ciliatis, radicalibus subspathulatis, floribus (inter majores) paucis (3-5) subcorymbosis, radiis (purpureis nunc albis) numerosis patentibus involucro pubescente fere triplo longioribus.—*Nutt. Gen. Am. v. 2. p. 148. Rich. in Frankl. 1st Journ. ed. 2. App. p. 30. Hook. Bot. Mag. t. 2923.*— β . *pubescens*; totus valde pubescens.— γ . *mucronatus*; foliis acutissimis mucronatis.

HAB. From the Saskatchewan, *Drummond*, throughout the woody country, to lat. 64° . *Dr. Richardson.*— β . Prairies of the Rocky Mountains. *Drummond.*— γ . Plentiful on low plains of the Columbia, near the coast. *Douglas. Dr. Scouler.*

15. *E.?* *hyssopifolius*; caule ramis sterilibus paniculato paucis in pedunculos nudos umbras protractis, foliis linearibus integris glabellis ciliatis, radiis involucro cylindraceo multo longioribus. *Mich. Am.* v. 2. p. 123. *Pursh, Fl. Am.* v. 2. p. 534?

HAB. Hudson's Bay and near Lake Mistassini. *Michaux*.—With this I am unacquainted. In some of its characters, it comes near my *E. lönchophyllum*, but the involucre is said to be cylindrical, and the rays much longer than it. Pursh refers it to *Dill. Eth.* t. 806, f. 394, (*E. Carolinianus*, Willd.) evidently no true *Erigeron*, the *Phalacroloma* of Cassini.

16. *E. Canadensis*; caule hispido, foliis lanceolato-linearibus ciliatis acutis, floribus (parvis) in paniculam terminalem oblongam foliosam dispositis, ramis quasi racemoso-multifloris, pedicellis foliolosis, radiis minutis (albis) pappo copioso vix longioribus.—*Linn.*—*Mich. Am.* v. 2. p. 123. *Pursh, Fl. Am.* v. 2. p. 534.

HAB. Throughout Canada. From Lake Huron to the Saskatchewan. Columbia River. *Dr. Scouler*.

17. *E.?* *florifer*; caule breviusculo ramoso piloso, foliis omnibus linearis-spathulatis pilosiusculis integerrimis glaucis, ramis pedunculiformibus unifloris (floribus inter maximos), involucri foliolis exterioribus pubescenti-hirsutis interioribus membranaceis fimbriato-ciliatis, radiis latiusculis (albis?) patentibus involucro duplo longioribus, pappi pilis albissimis incrassatibus hirsutulis.

HAB. Dry rocks and sandy grounds near Priest's Rapids of the Columbia, and Lewis and Clarke's River; N.W. coast of America. *Douglas*.—This is evidently no *Erigeron*, yet it has as little affinity with any *Aster*. The hairs of the pappus are unusually thick and white.

(*Pappus duplex: extus per brevevis subpaleaceus*.)

18. *E. annuus*; foliis radicalibus subrotundo-ovatis profunde dentatis petiolatis, caulinis lanceolatis acutis medio subserratis, corymbo terminali.—*Aster annuus*. *Linn.*—*Erigeron heterophyllum*. *Willd. Sp. Pl.* v. 3. p. 1956. *Pursh, Fl. Am.* v. 2. p. 534.—*Diplopappus dubius*. *Cass. Bull.*—*Stenactis dubia*. *Cass. in Dict. des Sc. Nat.* v. 37. p. 485.—*S. annuus*. *Nees, Ast.* p. 273.

HAB. Canada. *Cleghorn*.—Except in the pappus, this is so entirely an *Erigeron* that I am very unwilling to separate it from that Genus. The outer pappus consists of several very minute acuminate paleaceous scales. It has, like the *E. Canadensis*, been introduced from America into Europe, and thus found a place in our European Floras.

60. DIPLOPAPPUS.* *Cass.*

Radius uniserialis ♀. Discus ♀. Pappus biserialis. Cor. disci regularis. Achenium erostre.—Herbe vel fruticuli Americani, Asiatici vel Africani; foliis alternis, integris; capitulis terminalibus solitariis, colore varie tinctis. *Less.*

* I follow my own inclination, no less than the valued suggestion of Professor Lindley, in uniting *Diplostethium*, Kunth, and *Doellingeria*, Nees, with *Diplopappus*.

* *Pappus conformis, utrinque setaceus.*

1. *D. albus*; foliis linear-lanceolatis subintegerrimis scabris basi longe angustatis inferioribus petiolatis, caule simplici corymboso sebro ramulis subunifloris subaphyllis, involueri foliolis oblongo-linearibus glabriusculis obtusis.— α , radiis albis. *D. albus*. *Lindl. MSS.*—*Chrysopsis alba*. *Nutt. Gen. Am.* v. 2. p. 152.—*Doellingeria? ptarmicoides*. *Nees, Ast.* p. 183.— β , radiis luteis. *D. lutescens*. *Lindl. MSS.* (*in Herb. nostr.*)

HAB. On the banks of the Saskatchewan; but rare. *Dr. Richardson, Drummond*.—Lake Superior. *Dr. Pitcher, in Herb. Torrey*.— α , and β . Banks of the Red River. *Douglas*.—The outer pappus consists of very few and indistinct hairs; the inner has the hairs by no means clavate at the extremity, and therefore it cannot be a *Doellingeria* of Nees von Esenbeck.—Dr. Pitcher finds a single-flowered var. at Lake Superior.

2. *D. canescens*; pubescenti-canus, foliis linear-lanceolatis integerrimis basi valde angustatis inferioribus longe petiolatis, caule simplici corymboso, ramulis unifloris elongatis foliolosis, involueri foliolis angustis acutissimis hirsuto-scabris.

HAB. Between Carlton House and Edmonton House on the Saskatchewan. *Drummond*.—Perhaps a variety of the following.

3. *D. grandiflorus*; canescens, caule subdecumbente infra basin ramoso, foliis linear-oblongis inferioribus spathulatis, ramis plerunque simplicibus unifloris nudiusculis involueri foliolis angustis acutissimis hirsuto-scabris.

HAB. Plains of the Saskatchewan and Prairies of the Rocky Mountains. *Drummond*.—This is nearly allied to the preceding, but the flowers are twice as large, the plant is of more humble and less erect growth, and the ramification is different, less corymbose.

4. *D. linariifolius*; suffruticosus, ramis subcorymbosis unifloris, foliis linearibus patentibus scaberrimis serrulato-ciliatis, involueri foliolis subaxe imbricatis linear-lanceolatis obtusis.—*Diplostephium linariifolium*. *Nees, Ast.* p. 199.—*Aster linariifolius*. *Linn.*—*Mich. Am.* v. 2. p. 110. *Pursh, Fl. Am.* v. 2. p. 545.—*Aster rigidus*. *Linn.*—*Mich. Am.* v. 2. p. 110. *Pursh, Fl. Am.* v. 2. p. 541. *Elliott, Carol.* v. 2. p. 365.

HAB. Canada. *Mrs. Sheppard*. Newfoundland. *Mr. Cornack*.

5. *D. incanus*; totus incanus, foliis linearibus mollibus distantibus acutis mucronulatis, ramis longis corymbosis monocephalidis apice nudis, involueri ovati glandulosi foliolis linearibus multiserialis exterioribus squarrosis. *Lindl. MSS.*

HAB. California and N.W. Coast of America. *Douglas*, in *Herb. Lindley*.—"D. rigido (linariifolio) proximus. *Canis* 2½ pedalis ab ima basi strictim racemosus, pube brevi mollis, foliis valde denudatus. *Radii amæne violacei*."—*Lindl.*

6. *D. filifolius*; incanus, foliis omnibus linear-filiformibus, ramis longis subcorymbosis unifloris, involueri foliolis imbricatis angustis acutis pubescenti-scabris, radiis flavescentibus, pappo albo.

HAB. Common on the Great Falls of the Columbia and barren grounds of the interior. *Douglas*.—Ten inches to a foot high. Leaves very slender, an inch and a half long, almost filiform. Pappus white, exterior very short; ovary hairy.

7. *D. linearis*; humilis, culibus subcapitosis erectis simplicibus apice nudiusculis unifloris,

foliis omnibus linearifiliformibus subspathulatis, flore terminali, involuci foliolis angustis pubescenti-scabris, pappo fulvo.

HAB. Common on dry rocks and sandy grounds near the "Priest's Rapid" of the Columbia, and also on Lewis and Clarke's River. *Douglas*.—Four to six inches high, several stems arising from the same root, and universally bearing one flower. These flowers are old, and the corollas have fallen or are withered, the fruit with the tawny pappus alone remaining.

8. *D. pinnatifidus*; caulis numerosis ex eadem radice erectis superne valde ramosis corymbosis multifloris, foliis subbipinnatifidis pilosis, segmentis angustis linearibus pilo terminali mucronatis, involuci foliolis linearifoliatum mucronatis pubescentibus, radiis luteis.—An *Amellus spinulosus*? *Pursh*, *Fl. Am.* v. 2. p. 564.

Radix lignosa, fusiformis, perennis. Caules plurimi, palmares ad pedalem, erecti, superne corymboso-ramosi, ramis omnibus floriferis. Folia pinnatifida pilosa, lacinia linearibus, dentata vel iterum pinnatifidis, pilo longiusculo terminali mucronatis. Flores copiosi flavi. Ovarium dense villosum. Pappi laciniae validae, inaequales, exteriores etiam minores. Receptaculum alveolatum subpaleaceo-fimbriatum.

HAB. Rocky Mountains near Jasper's Lake, rare. *Drummond*.

* * *Pappus biformis: ext. palmaceus; int. setaceus.* (*Flores flavi.*) *Chrysopsis. Nutt. Ell.*

9. *D. villosus*; caulis erectis patentibus, superne corymbosis, foliis oblongis seu oblongo-spathulatis sessilibus acutis appresso-villosis ciliatis, ramulis floriferis pubescentibus, involuci foliolis linearifoliatum acutis subpubescentibus ext. non raro foliaceis.—*Chrysopsis villosa. Nutt. Gen. Am.* v. 2. p. 151. (*et in Herb. nostr.*)—*Amellus villosus. Pursh, Fl. Am.* v. 2. p. 564.

HAB. Banks of the Saskatchewan. *Drummond*. Common on the Red Deer and Eagle Hills of the Saskatchewan River and banks of the Assinaboyne; also on the low hills west of the Rocky Mountains, to the Pacific Ocean, on dry, rocky, or sandy soils. *Douglas*.—Pappus nearly white. Flowers yellow.

10. *D. hispidus*; totus pilis patentibus hispidus, foliis oblongo-spathulatis basi angustatis subpetiolatis, ramis subcorymbiosis, involuci foliolis angustatis acutis glabriusculis.

HAB. Carlton-House Fort. *Dr. Richardson*.—This appears to be rare, if we may judge from the very few specimens collected. Though most allied to the preceding, it is nevertheless quite distinct. It is smaller and slenderer, the leaves more remote and more attenuated below, and they and the whole plant, even the floral branches, are clothed with long patent rigid leaves. Flowers yellow. Pappus tawny.

11. *D. scaber*; hispido-scaber, foliis grosse dentatis inferioribus ovalibus longe petiolatis, caulinis lato-oblongis, ramis terminalibus subcorymbosis nudiusculis unifloris involucrisque pubescenti-glandulosis, pappo intense fulvo.—*Chrysopsis scabra. Nutt. Gen. Am.* v. 2. p. 151. *Elliott, Carol.* v. 2. p. 339.—*Itilula scabra. Pursh, Fl. Am.* v. 2. p. 531.

HAB. N.W. Coast of America. *A. Menzies, Esq.*—This quite accords in every essential particular with authentic specimens of *Chrysopsis scabra* I have received from Mr. Elliott, and with others gathered at Rio Brazos, in Texas, so that the species must have a very extensive range.

*** *Pappus biformis: ext. brevis: int. setaceus, pilis apice incrassatis. Docollingeria. Nees.*

12. *D. umbellatus*; foliis oblongo-lanceolatis, caule angulato scabro apice corymboso-com-

posito, involucro imbricato.—*Doellingeria umbellata*. *Nees*, *Ast.* p. 178.—*Aster umbellatus*. *Ait. Hort. Kew. ed. 1. v. 3. p. 199*.—*Chrysopsis amygdalina*. *Nutt. Gen. Am. v. 2. p. 153*.

HAB. Canada. Dr. Holmes. Mr. Cleghorn.

13. *D. amygdalinus*; foliis oblongis, caule angustato glabro apice corymboso-composito, involucro laxo.—*Doellingeria amygdalina*. *Nees*, *Ast.* p. 179.—*Diplostephium amygdal. Cass.*—*Aster amygdalinus*. *Lam.*—*Mich. Am. v. 2. p. 109*. *Pursh, Fl. Am. v. 2. p. 549*.—*Chrysopsis humilis*. *Nutt. (excl. syn. Ast. cornifolii, Muhl. et Ast. infirmi, Mich., Nees.)*—*Aster humilis*. *Willd.*—*Pursh, Fl. Am. v. 2. p. 548*. *Elliott, Carol. v. 2. p. 367*.

HAB. Canada. Mrs. Percival. Newfoundland. Miss Brenton. Mr. Cormack.—I am by no means satisfied of the permanency of the distinguishing characters of this and the preceding species.

61. BOLTONIA. L'Hérit.

Radius ♀, uniserialis. *Discus* ♀. *Pappus* brevis, radii pluri-disci bi-setosus. *Cor. disci regularis*. *Achenium* erostre.—*Herba Boreali-Americanæ, erecta; foliis alternis, integris; ramis divaricatis florigeris monocephalis apiceque aphyllis; capitulis parviusculis, radio caruleo; rachide conica; involucris imbricatis*. Less.

1. *B. glastifolia*; foliis inferioribus serratis, floribus breviter pedunculatis, seminibus obcordatis conspicue alatis pubescensibus aristis pappi duabus ipsorum longitudine. *Pursh*,—*L'Hérit. Sert. Angl. p. 27*. *Mich. Am. v. 2. p. 132*. *Pursh, Fl. Am. v. 2. p. 561*. *Sims, Bot. Mag. t. 2381*.

HAB. Canada. Goldie.—My plant does not exactly accord with either of the two species described by Pursh. The seed or achene is oval and glabrous, as in *B. asteroides*; but it has the unequal pappus and the two paleæ longer than the rest, and the broad wings of *B. glastifolia*. Elliott has a third species, whose achene is scarcely winged, and the pappus is as in our plant. May they not all be varieties of the same species? The figures and descriptions of Dr. Sims in the Botanical Magazine, *B. glastifolia* (*t. 2381*), and *B. asteroides* (*t. 2354*), do not at all help to clear the difficulties. There the two species have the most striking resemblance.

62. BRACHYRIS. Nutt.

Radius uniserialis ♀. *Discus* ♀. *Pappus* paleaceus uniserialis, paleis linearibus, 5–8. *Cor. disci regularis*. *Achenium* obconicum erostre.—*Herba perennis, Boreali-Americanæ, erecta; foliis anguste linearibus, integris, punctatis; capitulis solitariis ternis, ramos fastigiatos, caulis terminalibus, radio et disco 5-floris; involucris cylindraceis; rachide nuda*. Less.

1. *B. Euthamiae*. *Nutt. Gen. Am. v. 2. p. 163*.—*Solidago Sarothrae*. *Pursh, Fl. Am. v. 2. p. 540*.

HAB. High grounds of the Saskatchewan (Drummond) and Red Rivers. Douglas.

63. MADIA. Molina.

Radius scamineus, uniserialis. *Discus* hermaphroditus. *Corolla* radii lingulata, lingula triloba tubum superante. *Achenium* erostre, tetragono-compressum, quadricostatum, disco

epigyno parvo. *Pappus nullus*.—Herba *Chilenses et oris occidentalis Americæ borealis*, viscidæ, erectæ; foliis alternis, semiamplexicaulibus, oblongis; capitulis luteis, terminalibus vel axillaribus; rachide plana, nuda; involucris uniserialibus, pubescentibus. Less.

1. *M. viscosa*; capitulis axillaribus solitariis multifloris, radiis conspicuis.— α . capitulis sub sessilibus radiis parvis.—*M. viscosa*. *Cav. Ic. v. 3. p. 50. t. 298. Sims, Bot. Mag. t. 2574.*—*Madia mellosa. Mol.*—*Jacq. Hort. Schoenbr. v. 3. t. 302* (excellent.)—*M. sativa. Mol.*— β . capitulis plerisque pedunculatis, radiis magnis.—*M. elegans. Don, iⁿ Bot. Reg. t. 1458.*

HAB. α . and β . Fort Vancouver on the Columbia. *Dr. Scouler. Douglas*.—The figure in the Botanical Register of *Madia elegans* is strangely altered, by cultivation in rich garden soil, from the form exhibited by the native plants from the Columbia. These differ very slightly from the more usual appearance of *M. viscosa*, as seen in specimens from Chili.

2. *M. glomerata*; capitulis (2-4) glomeratis paucifloris in corymbam terminalem dispositis, radiis obsoletis.

HAB. Plains of the Saskatchewan. *Drummond*.—Aware as I am that *Madia viscosa* is liable greatly to vary, I still cannot bring myself to consider the present as a state of that species. The inflorescence is a true compound corymb, the branches, which are leafy, bearing at the extremity a cluster of 3-5 few-flowered capitula, much narrower than those of *M. viscosa*, and apparently quite destitute of ray. This is the first time that any *Madia* has been found on the east side of the great chain of mountains which separates eastern from western America.

64. CRINITARIA. Cass.

Capitulum homogamum discoideum multi—(pauci-)florum. *Rachis* ebracteolata. *Pappus* pilosus biserialis. *Achenium* erostre, compressum, sericeum.—Herbe per Europam, Asiam meridionalem (et Americanam septentrionalem) crecentes; foliis alternis, confertis, linearibus, subintegerrimis; capitulis luteis, solitariis, ramulos corymbosim dispositos terminantibus; involucris pauciserialibus, foliaceis. Less.

1. *C. viscidiflora*; glaberrima, foliis linear-lanceolatis rigidis integerrimis acutissimis unicuspidatis basi angustatis, floribus fastigiatocorymbosis, pedunculis foliolosis, involuci glutinosi cylindrici 5-florii foliolis imbricatis oblongis exterioribus minoribus.

HAB. A common shrub, 2-4 feet high, on the barren plains of the Columbia, from the Great Falls to the Mountains, and along the Salmon River, N. W. America. *Douglas*.—My specimens of this are small and few. The species is in many respects allied to Nuttall's *Chrysocoma virgata*, but that is "herbaceous," and an inhabitant of swamps of New Jersey, near the coast. From the same author's *C. graveolens* it differs in the leaves being only single-nerved and the branches quite glabrous, not in the least "pulverulently tomentose."

2. *C. humilis*; annua nana vase ramosa, ramis hic illuc hirsutulis, foliis linear-lanceolatis denticulato-ciliatis mucronulato-acutis, floribus axillaribus terminalibusque, involuci glabri foliolis linearibus exterioribus majoribus foliaceis.

HAB. On the banks of the Saskatchewan, between Carlton House and Edmonton House. *Drummond*.—I introduce this small plant (3-4 inches high) into this place with much hesitation; very few specimens are in the Herbarium, and its affinity with *Crinitaria* is highly doubtful. The flowers, however, sufficiently accord with the Genus.

SUBTRIB. II. INULEÆ. *Capitula nunquam dioica; si heterogama floribus marginalibus
femineis sepiissime corollas lingulatas gerentibus, reliquis ♀. Rachis plerunque ebracteolata.
Antheræ caudatæ. Pappus varius, nunquam gamophyllus, hinc inde nullus.* Less.

65. DONIA. Br.

*Capitulum radiatum. Pappus setaceus, uniserialis, valde caducus, conformis, setis rigidissimis, subcorneis. Cor, floris feminei lingulata. Achenium erostre. Rachis ebracteolata.
—Fruticuli Mexicanæ (Americæ septentrionalis) vel Canarienses, saepe viscosi, foliis alternis,
semiamplexicaulibus, oblongis, dentatis; capitulis magnis solitariis, terminalibus, luteis.* Less.

1. *D. glutinosa*; caule herbaceo ("fruticoso" alior.) erecto, foliis obovato-oblongis obtusiusculis cum mucrone ante apicem mucronato-dentatis vel integrerrimis, involucri glutinosi foliolis exterioribus subulatis squarrosis.—*Br. Hort. Kew. ed. 2. v. 5. p. 82. Ker, Bot. Reg. t. 187.*—*Aster glutinosus.* Cass.—*Doronicum. Willd.*—*Grindelia. Spreng.*

HAB. Common on dry soils, from the source of the Columbia to its confluence with the Pacific. Douglas.—Nutka. Dr. Scouler.—Our specimens have a deep, perennial tap-root, but a decidedly herbaceous stem.

2. *D. squarrosa*; caule herbaceo valde ramoso, foliis omnibus oblongis amplexicaulibus serratis subglaucescentibus, involuci glutinosi foliolis exterioribus subulatis squarrosis.—*Pursh, Fl. Am. v. 2. p. 559. Sims, Bot. Mag. p. 1706.*—*Grindelia squarrosa. Rich, in Frankl. 1st Journ. ed. 2. App. p. 33.*

HAB. Woody country between lat. 54° and 64°. Dr. Richardson. Abundant on the banks of the Saskatchewan, between Carlton House and Edmonton House. Drummond. Plains of the Red River and valleys of the Rocky Mountains, on the east side. Douglas.

3. *D. inuloides*; caule basi suffruticoso apice pubescente, foliis glabris radicalibus spathulatis caulinis subovatis serratis basi latioribus subamplexicaulibus, pedunculis pubescentibus, involuci vis: glutinosi foliolis exterioribus subulatis squarrosis.—*Grindelia inuloides. Desf. in Mem. du Mus. v. 5. p. 50. t. 15.*—*β. ramis foliis involucrisque glanduloso-hirtis.*—*Grindelia inuloides. Ker, in Bot. Reg. t. 248.* (excellent.)

HAB. β. Near the sources of the Multnomah River. Douglas.—The leaves of the whole upper part of the stem are ovate, acuminate, cordate at the base, and amplexicaul; and the species appears to me very distinct, although Sprengel has united it with *D. squarrosa*. Mr. Brown seems now inclined to unite his Genus *Donia* with *Grindelia*. I have followed Lessing in keeping them distinct.

4. *D. lanceolata*; herbacea, glabra, foliis rigidis ciliato-dentatis acutis radicalibus lanceolatis longe petiolatis, caulinis linear-lanceolatis petiolatis superioribus acuminatis basi cordatis sessilibus amplexicaulibus, caule erecto simplici, floribus 4-5 subcorymbosis, involuci subtomentosi (non viscosi) foliolis oblongo-linearibus acutis imbricatis erectis exterioribus sensim minoribus.

HAB. Saskatchewan, between Carlton House and Edmonton House. Drummond.—Root fusiform, perennial, clothed above with the fibrous remains of the former year's root-leaves. Stem a foot and a half high.

5. *D. uniflora*; herbacea, subdecumbens, foliis rigidis radicalibus lanceolatis grosse acute dentatis acuminatis longe petiolatis, caulinis oblongo-lanceolatis sessilibus superioribus basi

latrioribus amplexicaulibus, caulibus simplicibus lanatis unifloris, involuci lanati foliolis laxis erectis linearibus acutis exterioribus longioribus. (TAB. CXXIV.)

Radix perennis orassa fusiformis, superne foliorum vetustorum reliquia fibrosis hispida. *Caulis* 3-5 ex eadem radice, spithamei et ultra, basi subdecumbentes, herbacei, lanati, simplices, 1-raro-2-3-flori. *Folia* radicalia, numerosa, lato-lanceolata, acuminata, glabra, juncta laxe lanata, grosse acute serrata, nunc, extima præcipue, omnino integerima, longe petiolata. *Caulinæ omnia sessilia, integerima, inferioribus oblongo-lanceolatis superioribus sensim minoribus magis acuminatis basi latioribus amplexicaulibus. Flos* plerumque solitarius, magnus. *Involuci foliola* subequalia, erecta, laxa, linearia, lanata, acuta. *Radii flosculi* flavi, omnes papposi, pilis numerosis scabris. *Receptaculum* subvalveolatum. *Achenia* pilosa, superne præcipue pilis erectis sericeis.

HAB. Plains of the Saskatchewan and Prairies of the Rocky Mountains. *Drummond*.

TAB. CXXIV.—*Fig. 1.* Floret of the ray; *fig. 2.* Floret of the disk:—magnified.

COMPOSITÆ Omissæ.

Post *Eupatorium occidentale*, v. 1. p. 305, adde

5.* *Eupatorium? grandiflorum*; glabrum, foliis alternis petiolatis cordato-triangularibus acuminatis grosse serratis venosis, paniculæ floribus glomeratis, involuci foliolis multiserialibus linearie-oblongis acutis striatis exterioribus e lata basi subulatis subsquarrosois, acheniis cylindraceis striatis scabridis.

HAB. On the low hills between the north and south branches of Lewis and Clarke's River, in stony places. *Douglas*.—Three to four feet high, herbaceous. *Stem* rounded. *Flowers* large, white, clustered. The leaves bear a considerable resemblance to those of *E. occidentale*, but the flowers are totally different, larger than is usual in this Genus, each of many florets, and with the stigmas less exerted than usual. I possess only a solitary specimen.

Post *Ambrosiam acanthicarpam*, v. 1. p. 309, adde

4. *A. trifida*; elata scaberrima, foliis (amplis) petiolatis integris vel profunde 3-5-fidis serratis segmentis ovali-lanceolatis acuminatis, racemis elongatis paniculatis, fructu supra medium spinis 6 brevibus erectis.—*Linnaeus*.—*Mich. Am.* v. 2. p. 183. *Pursh*, *Fl. Am.* v. 2. p. 581. *Elliott*, *Carol.* v. 2. p. 476.

HAB. Canada. Common. *Dr. Holmes* (*in Herb. Greville*.)

ORD. LII. CAMPANULACEÆ. Br.

SECT. I. CAMPANULEÆ. *Cor. monopetala, regularis. Antheræ liberae. Br.*

1. CAMPANULA. (L.) *Alph. De Cand.*

Cal. 5-fidus, sinibus sepe appendicibus obtectis. *Corolla* apice 5-lobo, vel 5-fida, sepius campanulata. *Stam.* 5, libera, filamentis basi latis et membranaceis. *Style* in alabastro pilis collectoribus (excepta ima basi) tectus. *Stigmata* 3-5, filiformia. *Ovarium* omnino inferum, 3-5-loculare. *Capsula* valvis 3-5, lateraliter dehiscentes. *Semina* sepius ovata, complanata, interdum ovoidea et tunc minima.—*Herbae perennes, rarius biennes v. annue; nunc humiles et caspitanæ, nunc contra 2-3-pedales, erectæ et multifloræ.* *Folia* radicalia a

caulinis siccissime diversa, nempe majora, longius petiolata et obtusa. Flores plerumque pendunculati racemosi rarius spicati v. glomerati, pro ordine majusculi, cærulei vel (in eadem specie) albi. Omnes in hemisphera boreali habitantes. Alph. D. C.

1. *C. dasypantha*; foliis radicalibus ovato-acutis petiolatis crenatis glabriusculis, caulinis sessilibus lanceolatis integris pubescentibus, lobis calycinis ovato-lanceolatis acutis corolla infundibuliformi triplo brevioribus, sinuum appendicibus minimis subulatis. Alph. De Cand.—Bieb. Fl. Taur. Cauc. Suppl. p. 147. Reich. Ic. v. 1. t. 85. Cham. in Limnaea, v. 4. p. 37. Alph. De Cand. Camp. p. 230.

HAB. Unalaschka and Islands of Behring's Straits. Chamiso.

2. *C. petiolata*; glaberrima simplex pauciflora, foliis radicalibus longe petiolatis cordatis rotundatis dentatis petiolatis marginatis, caulinis inferioribus lanceolatis remote dentatis petiolatis, superioribus linearibus integris, lobis calycinis erectis subulatis corolla campanulata duplo brevioribus. Alph. De Cand. Camp. p. 278.

HAB. Slave Lake. Dr. Richardson.

3. *C. linifolia*; caule erecto, foliis radicalibus paucis petiolatis ovatis sinuatis, caulinis linearibus integris, laciinis calycinis longis erectis corolla campanulata ampla duplo vel triplo brevioribus. Alph. De Cand. Camp. p. 179. Hænk. in Jacq. Coll. v. 2. p. 81.—C. rotundifolia, ß. linifolia. Rich. in Frankl. 1st Journ. ed. 2. App. p. 6.—δ. Langsdorffiana; glabra, caule erecto subunifloro, foliis radicalibus ovato-rotundatis integris, caulinis inferioribus obnivato-lanceolatis. Alph. De Cand.

HAB. From Lake Huron, Dr. Todd, throughout the woody country, from lat. 54° to 64°. Dr. Richardson. Common on the N.W. Coast, and on the banks of the Columbia, from its source to its confluence with the sea, and at Puget's Sound. Douglas. Port Wentworth and Sledge Island, Behring's Straits. Mr. Menzies.—δ. Arctic America, from Greenland (Hornemann) to the Aleutian Islands. Langsdorff (in Alph. De Cand.)—My specimens from Mr. Menzies and Douglas exactly correspond with the European ones.

4. *C. rotundifolia*; foliis radicalibus petiolatis cordatis rotundatis crenato-dentatis, caulinis linearibus vel lanceolatis, alabastris erectis, calycis laciiniis subulatis brevibus erectis corolla campanulata triplo brevioribus. Alph. De Cand.—Linn.—Mich. Am. v. 1. p. 108. Engl. Bot. t. 866. Pursh. Fl. Am. v. 1. p. 159. Rich. in Frankl. 1st Journ. ed. 2. App. p. 65. Torrey, Fl. of Un. St. v. 1. p. 236. Alph. De Cand. Camp. p. 68.

HAB. Throughout the woody country, between lat. 54° and 64°. Dr. Richardson, l. c. Near Quebec. Mrs. Percival.—I have seen no specimens from the west side of the Rocky Mountains; and, indeed, all those in Captain Franklin's Collection are referable, I think, rather to *C. linifolia*, if the two be really distinct.

5. *C. dubia*; glabra, caule unifloro, foliis caulinis erectis angustis inferioribus linear-lanceolatis, superioribus longe acuminatis, lobis calycinis subulatis corolla infundibuliformi tubulosa duplo brevioribus. Alph. De Cand. Camp. p. 286. (ct in Herb. nostr.)

HAB. Newfoundland. Dr. Morrison.—I should myself be disposed to consider this a single-flowered var. of *C. linifolia*.

6. *C. pratensis*; caule humili unifloro superne magis folioso, foliis omnibus petiolatis ovato-

acutis suberenatis, laciiniis calycinis longe acuminatis corolla infundibuliformi & brevioribus.
Alph. De Cand. Camp. p. 287.— β . foliis caulinis angustioribus linearibus. *Alph. De Cand.*

HAB. Near the Coast on the western side of Newfoundland. *De la Pylaie* (in *Alph. De Cand. Camp.*)

7. *C. aparinoides*; glabra, caule debili ascendente simplici pauciflora angulis retro-scabro, foliis inferioribus linear-i-ovobatis aliis linear-i-acuminatis remote denticulatis retrorsum secatris, lobis calycinis triangularibus corolla campanulata duplo brevioribus, capsula sphaeroidea. *Alph. De Cand.*—*Pursh, Fl. Am.* v. 1. p. 159. *Torrey, Fl. of Un. St.* v. 1. p. 237. *Alph. De Cand. Camp.* p. 290.—*C. crinoidea*. *Muhl.*—*Bigel. Fl. Bost. ed.* 2. p. 85. *Elliott, Carol.* v. 1. p. 263.

HAB. Canada. *Mr. Goldie*. From Lake Huron (*Dr. Todd*) to the Saskatchewan. *Drummond*.

8. *C. Scouleri*; simplex vel ramosa pauciflora, foliis acute serratis glabriusculis inferioribus ovato-acutis petiolatis mediis ovato-lanceolatis superioribus linear-i-lanceolatis sessilibus, floribus racemosis, calycis glabri lobis subulatis corolla 5-fida infundibuliformi triplo brevioribus, stylo exserto, capsula ovoiden. (TAB. CXXV.)—*Hook. in Alph. De Cand. Camp.* p. 312.— α . *hirsutula*; lobis calycinis magis erectis.— β . *glabra*; lobis calycinis patentissimis, foliis majoribus tenuioribus.

HAB. Fort Vancouver on the Columbia. *Dr. Scouler*. β . Common in partially shaded Pine Forests, on the N.W. Coast. Plentiful about Fort Vancouver. *Douglas. Dr. Scouler*.

TAB. CXXV.—Fig. 1, Flower; fig. 2, Immature capsule:—magnified.

9. *C. planiflora*; glaberrima, caule simplici, foliis sessilibus coriaceis nitidis radicalibus confertis ovatis vel obovato-obtusis crenulatis, caulinis linear-i-lanceolatis acutis subintegris, floribus spicato-racemosis, lobis calycinis ovato-acutis latis erectis corolla campanulato-rotata triplo brevioribus. *Alpd. De Cand.*—*Lam. Dict.*—*Alph. De Cand. Camp.* p. 312.—*C. nitida. Ait. Hort. Kew. ed. 1. v. 1. p. 246. Pursh, Fl. Am.* v. 2. p. 731.

HAB. North America; and Pursh supposes, but upon very vague authority, from Hudson's Bay. I have never seen any plant like it from that country, and the American Botanists seem to be unacquainted with it.

10. *C. Americana*; caule simplici, foliis radicalibus ovato-acutis subcordatis petiolatis serratis, caulinis ovato-lanceolatis utrinque acuminatis serrulatis, floribus longe spicatis, lobis calycinis valde acuminatis patulis corolla campanulato-rotata subbrevioribus, capsula cylindracea sulcata. *Alph. De Cand.*—*Linn.*—*Pursh, Fl. Am.* v. 1. p. 159. *Torrey, Fl. of Un. St.* v. 1. p. 237. *Alph. De Cand. Camp.* p. 314.—*C. acuminata. Mich. Am.* v. 1. p. 108. *Pursh, l. c. Elliott, Carol.* v. 1. p. 262. *Torrey, Fl. of Un. St.* l. c.

HAB. On rocks about the Falls of Niagara. *Mr. Cooper*, (in *Torrey's Fl.*)—I have never seen specimens of this from British America.

11. *C. losiocarpa*; caule unifloro nudiusculo, foliis radicalibus confertis lanceolato-ovo-batis setaceo-denticulatis, petiolis ciliatis, calyce tuba villosa lobis acuminatis denticulatis, corolla infundibuliformi campanulata lobis calycinis duplo longiore, capsula subcylindracea. *Alph. De Cand.*—*Cham. in Linnaea*, v. 4. p. 39. *Hook. et Arn. in Bot. of Beech. Voy.* v. 1. p. 127.—*C. algida. Fisch. MSS.*—*Alph. De Cand. Camp.* p. 338. t. 11. f. 4.

HAB. Summits of the highest of the Rocky Mountains, near Lake La Pierre. *Drummond*. Ungleichl., Sledge and Hedge Islands, in Behring's Straits, Kotzebue's Sound. *Lay and Collie*, in Captain Poochey's Collection.

12. *C. uniflora*; caule unifloro, foliis subintegris inferioribus obovatis petiolatis, mediis obovato-lanceolatis, superioribus rarioribus linear-lanceolatis, calyce villosiusculo, lobis linear-acuteuminatis corolla infundibuliformi subæqualibus, capsula cylindracea. *Alph. De Cand.*—*Linn.*—*Fl. Dan.* t. 1512. *Rich.* in *Frankl. 1st Journ. ed. 2. App.* p. 6. *Iph. De Cand. Camp.* p. 339.

HAB. Shores and Islands of the Arctic Sea, from the eastern to the western extremity. Alpine places in the Rocky Mountains. *Drummond*.

2. SPECULARIA. *Heist.*

Calyx 5-lobus, tubo elongato prismatico vel longe obconico. *Corolla* rotata, 5-loba. *Stam.* 5, inter se libera, corolla dimidio breviora; *filamenta* brevia, membranaceæ, pilosa; *antheræ* filamentis longiores. *Stylus* inclusus, pilosus, pilis secundum ordines 10 dispositis. *Stigmata* tria, filiformia. *Capsula* longe prismaticæ, 3-locularis, 3-valvis, prope apicem vel paulo supra medium partem sitis dehiscentes. *Semina* ovoidea vel lenticularia, subcompressa, nitidissima.—Herbeæ annue, humiles, in regione maris Mediterranei et Europa temperata præcipue habitantes: una species tantum in America. Folia alterna, per caudem æqualiter sparsa parva; inferiora ab aliis parum dissimilia. Flores terminales et axillares, semper sessiles erecti. Corolla cœrulea, rosea vel ex albo et cæsio variegata, sole lucente rotata. *Alph. De Cand.*

1. *S. perforata*; caule erecto simplici, foliis ovato-rotundatis crenatis amplexicaulibus, floribus axillaribus longe foliaceo-spicatis, calyce glabro, tubo obconico lobis erectis lanceolatis, corolla lobis calycinis longiore.—*Alph. De Cand. Camp.* p. 351.—*Campanula perforata*. *Linn.*—*Pursh*, *Fl. Am.* v. 1. p. 160.—*Bigel. Fl. Bost. ed. 2.* p. 85.—*Campanula amplexicaulis*. *Mich. Am.* v. 1. p. 108. *Elliott, Carol.* v. 1. p. 262. *Torrey, Fl. of Un. St.* v. 1. p. 256.

HAB. N. W. Coast of America; about the Columbia. *Douglas. Dr. Scouler.*

SECT. II. LOBELIA. *Corolla irregularis (nunc 5-petala). Antheræ saepe conuate. Br.*

3. LOBELIA. *L.*

Corolla tubo hinc fisco (raro integro) limbo 5-partito. *Antheræ* commutæ. *Stigma* bilobatum (nunc indivisum). *Capsula* bilocularis (raro 3-loc.), apice supero bivalvi.—Herbeæ (vel suffrutices) plerque lactescentes. Folia alterna integra vel laciniatæ, raro fistulosa. Flores racemosi, terminales vel axillares, solitarii, pedicellis vibranteatis v. nudis. Antheræ saepe barbareæ. *Br.*

1. *L. Dortmanna*; foliis radicalibus subcylindricis obtusis bitubulosis, scapo parce folioso, floribus racemosis.—*Linn.*—*Engl. Bot.* t. 140. *Mich. Am.* v. 2. p. 153. *Pursh, Fl. Am.* v. 2. p. 446. *Bigel. Fl. Bost. ed. 2.* p. 87. *Torrey, Fl. of Un. St.* v. 1. p. 239.—*L. paludosa*. *Nutt.*

HAB. Slave Lake, English River, and in a small Lake at the summit of Portage la Loche. Dr. Richardson.

2. *L. Kalmii*; glabra, caule erecto gracili ramoso, foliis linear-i-elongatis subdentatis radi-calibus brevibus spathulatis, racemis laxis paucifloris subfoliosis, pedicellis elongatis biglan-dulosis, calycis glaberrini laciniis subulatis, germine basi attenuato.—Linn.—Mich. Am. v. 2. p. 153. Pursh, Fl. Am. v. 2. p. 446. Bigel. Fl. Bost. ed. 2. p. 86. Torrey, Fl. of Un. St. v. 1. p. 299.

HAB. From Lake Huron, Dr. Todd, throughout Canada to the Saskatchewan and Hudson's Bay, and in saline marshes in lat. 60°. Dr. Richardson.—The *L. gracilis* of Mr. Nuttall (*L. Nuttallii*, Roem. et Sch.), is a still slenderer plant than the present, with smaller flowers, shorter pedicels, bibracteate at the base, but destitute of the two glands upon the pedicel, and the germen is obtuse at the base.

3. *L. Claytoniana*; erecta simplex pubescens, foliis oblongis subintegerrimis ciliatis basi attenuatis, radicalibus obovato-spathulatis, racemo gracili elongato nudo, bracteis solitariis pedicello eglanduloso longioribus, calycis glabri laciniis subulatis tubo corollæ parum breviribus.—Mich. Am. v. 2. p. 153. Pursh, Fl. Am. v. 2. p. 447. Elliott, Carol. v. 1. p. 265. Torrey, Fl. of Un. St. v. 1. p. 240.—*L. pallida*. Muhl.—Bigel. Fl. Bost. ed. 2. p. 86.—*L. spicata*. Lam.

HAB. On the Saskatchewan, apparently rare, as very few specimens are in the Collection. Drummond.

4. *L. inflata*; pubescens, caule erecto simplici vel ramoso, foliis oblongo-ovalibus dentatis inferioribus in petiolum brevem attenuatis, racemis basi foliosis, capsulis globosis inflatis.—Linn.—Mich. Am. v. 2. p. 152. Pursh, Fl. Am. v. 2. p. 448. Bigel. Fl. Bost. ed. 2. p. 86. Elliott, Carol. v. 1. p. 266.

HAB. Lake Huron, Dr. Todd, to the Saskatchewan and Hudson's Bay. Dr. Richardson. Drummond.

5. *L. syphilitica*; subhirsuta, caule erecto simplici, foliis ovato-lanceolatis utrinque brev-acuminatis dentatis infimis in petiolum attenuatis, racemo elongato basi folioso, calycis hirsuti laciniis subulatis tubo corollæ brevioribus sinibus reflexis.—Linn.—Mich. Am. v. 2. p. 151. Pursh, Fl. Am. v. 2. p. 447. Elliott, Carol. v. 1. p. 256.

HAB. Lake Huron, abundant. Dr. Todd.—Flowers blue, vastly larger than any of the preceding species, and next in size to those of *L. cardinalis*.

6. *L. cardinalis*; glabra, caule erecto simplici, foliis lato-lanceolatis serratis, racemis elongatis secundis, floribus erectis, calycis glabri laciniis subulatis tubo elongato corollæ brevioribus, staminibus exsertis.—Linn.—Curt. Bot. Mag. t. 320. Mich. Am. v. 2. p. 151. Pursh, Fl. Am. v. 2. p. 448. Bigel. Fl. Bost. ed. 2. p. 85. Torrey, Fl. of Un. St. v. 1. p. 242.

HAB. Throughout Canada, from Lake Huron to the Saskatchewan. Dr. Richardson. Drummond.

4. CLINTONIA. Dougl.

Cal. superus, pentaphyllus, subæqualis. *Corolla* monopetala, bilabiata, labio inferiore cuneato trilobo superiore erecto bipartito. *Stamina* in tubo connata, incurva. *Antheræ* connatæ, duabus apice setigeris. *Ovarium* siliquiforme triangulare, contortum, uniloculare, placentis duabus parietalibus. *Capsula* arida, chartacea, polysperma, in valvulis tribus lo-

riformibus dehiscentes.—*Herba annua, procumbens, microphylla. Flores solitarii, axillares.*
Lindl.

1. *C. elegans. Dougl. in Bot. Reg. t. 1241.*

Herba annua procumbens, parum ramosa, glabra. Caulis teres, angulatus. Folia sessilia, ovata, trivenia. Flores solitarii, axillares. Ovarium sessile, longe acuminatum, foliis 4-5-plo longius, triangulare, contortum. Corolla cærulea, labio inferiore medio macula alba. Antheræ cæruleæ. Stigma conicum, barba papillosa circumdatum. Capsula foliis multoties longiores. Pollen ovale medio sulcatum. *Lindl. t. c.*

HAB. Common on overflowed grounds, near the sources of the Multnomack, and in the vallies of the western side of the Rocky Mountains. *Douglas.*—I have preferred giving Professor Lindley's remarks upon this interesting plant, made from living specimens, to any I could offer from the dried one. The same able Botanist observes that it exhibits an instance of unilocular fruit with parietal placentæ, in an Order which has multilocular fruit and axile placentæ; yet, what is very remarkable, this deviation from the normal structure of the Order is unaccompanied by any corresponding irregularity in the other parts of the fructification. As cultivated in the London Horticultural Society's Garden, "it forms one of the most beautiful annuals with which we are acquainted. Notwithstanding the want of spreading foliage to give its flowers effect, the latter are of so brilliant a colour, that the plants, when grown in broad patches, resemble a carpet of silver and blue."

ORD. LIII. VACCINIEÆ. *De Cand.*

1. VACCINIUM. *Linn.*

Cal. ovario adhærens limbo 4-5-dentato. Cor. 1-petala, ovata, campanulata seu rotata limbo 4-5-fido. Stam. 8, perigyna. Antheræ bicornes apice poris delhiscentes, dorso non raro bisetosæ. Ovarium subglobosum. Stylus simplex. Stigma obtusum. Baccæ globosa, 4-5-locularis. Semina pauca, minuta. Frutices humiles. Folia sparsa latiuscula, decidua vel persistentia exstipulata. Flores sape ante folia, solitarii vel racemosi, nutantes, inodori, sapissime incarnati. Baccæ plerunque edutes.

A. corollis ovatis seu campanulatis. Vaccinium.

* *Foliis deciduis. Floribus racemosis.*

1. *V. resinosum*; foliis brevi-petiolatis ovali-oblongis integerrimis opacis subtus præcipue resinoso-punctatis, racemis lateralibus secundis bracteatis, corollis ovatis subangulatis.—*Ait.*—*Mich. Am. v. 1. p. 230. Bot. Mag. t. 1288. Pursh, Fl. Am. v. 1. p. 286. Elliott, Carol. v. 1. p. 498. Bigel. Fl. Bost. ed. 2. p. 150. Torrey, Fl. of Un. St. p. 416.*

HAB. Canada. *Pursh. Mrs. Sheppard.* Lake Huron. *Dr. Todd,* to the Saskatchewan. *Drummond.*

2. *V. corymbosum*; ramis floriferis subaphyllis, foliis oblongo-lanceolatis integerrimis junioribus pubescentibus, racemis compactis bracteatis, corollis ovato-cylindraceis.—*Linn.*—*Pursh, Fl. Am. v. 1. p. 286. Elliott, Carol. v. 1. p. 498. Bigel. Fl. Bost. ed. 2. p. 150. Torrey, Fl. of Un. St. v. 1. p. 416.*—*V. dimorphum. Mich. Am. v. 1. p. 231.*—*V. amænum. Ait.—Pursh.*

HAB. About Quebec. *Cleghorn. Mrs. Percival.* Lake Huron. *Dr. Todd.* Newfoundland. *Dr. Morrison.*—*Pursh describes the berries as black, Bigelow, as being covered with a blue powder.*

3. *V. Pennsylvanicum*; foliis sessilibus ovali-lanceolatis subserrulatis junioribus nervis pubescentibus, racemis fasciculatis subterminalibus, corollis ovatis.—*Lam. Dict.* v. 1. p. 72. *Mich. Am.* v. 1. p. 232. *Torrey, Fl. of Un. St.* v. 1. p. 416.—*V. tenellum*. *Pursh, Fl. Am.* v. 1. p. 288. *Bigel. Fl. Bost. ed.* 2. p. 150. (non *Ait.*)

HAB. From Lake Huron, *Dr. Todd*, throughout Canada to the Saskatchewan. *Drummond*. *Dr. Richardson*, Newfoundland. *Dr. Morrison*.—This appears to be a very common species in Canada, judging from the number and various localities of the specimens that have been sent to me. Some of these, indeed, so far as can be judged in the dried state, seem to be very nearly allied to *V. corymbosum*, differing chiefly in the smaller size, more frequently serrulated leaves which are most copious on the flowering branches, and the shorter corollas. Berries clothed with a blue farina.

4. *V. Canadense*; foliis oblongo-lanceolatis integerrimis subtus præcipue pubescentibus ad nervos patentii-hirsutis, floribus fasciculato-racemosis, corollis ovatis.—*Rich. in Frankl.* 1st Journ. ed. 2. App. p. 12.

HAB. Throughout Canada from Lake Huron (*Drummond*), to Bear Lake, (*Dr. Richardson*), and from Missinabie River, Hudson's Bay (*Mr. Bolton, Douglas*) to the source of the Columbia, (*Drummond*), and thence probably to the mouth of that river, (*Douglas*).—Of this, the flowers, fruit, and the foliage, in shape, very much resemble those of *V. Pennsylvanicum*, but the leaves, especially below, and in the oldest state, are clothed with a rather copious pubescence, and the nerves are rendered more conspicuous by the abundant spreading hairs. Berries as in the preceding species.

* * *Foliis deciduis. Pedunculis unifloris.*

5. *V. uliginosum*; foliis obovatis obtusis integerrimis subtus glaucis venosis, floribus sub-solitariis, corollis ovatis.—*Linn.*—*Engl. Bot.* t. 581, (foliis nimis acutis.) *Mich. Am.* v. 2. p. 235. *Pursh, Fl. Am.* v. 1. p. 288. *Rich. in Frankl.* 1st Journ. ed. 2. App. p. 12. *Bigel. Fl. Bost. ed.* 2. p. 153. *Torrey, Fl. of Un. St.* v. 1. p. 417.

HAB. From the Saskatchewan and Hudson's Bay to the extreme Arctic shores and islands. *Dr. Richardson, Drummond*. Newfoundland. *Mr. Cornack*. *Dr. Morrison*. Labrador. *Dr. Morrison*. N. W. coast of America, probably far north of the Columbia. *Mr. Menzies*. *Unalashka*. *Chamisso*.—In the low lands this plant does not appear to exist south of the Saskatchewan. In the United States, the summits of the White Hills of New Hampshire, where it was first detected by Dr. Bigelow, and Dr. Boott, is the only known station for it. A variety, slightly downy on the underside, found in Greenland, is the *V. pubescens* of Hornemann in *Fl. Dan.*, of which specimens are in my Herbarium.

6. *V. salicinum*; foliis cuneato-lanceolatis cuspidatis integerrimis glaberrinis subcoriaceis reticulato-venosis, floribus solitariis breviter pedunculatis axillaribus. *Cham. in Linnæa*, v. 1. p. 525.

HAB. *Unalashka*. *Chamisso*, (in Herb. nostr.)—This has remarkably narrow and cuspidate leaves.

7. *V. myrtilloides*; foliis ovalibus utrinque acutiusculis subserratis opacis membranaceis junioribus ad nervos subpubescentibus, floribus ovato-globosis axillaribus solitariis.—*Mich. Am.* v. 1. p. 234. *Pursh, Fl. Am.* v. 1. p. 288.—*V. angustifolium*. *Ait. Hort. Kew. ed.* 1.— β . *macrophylla*; foliis majoribus. *V. Myrtillus*, var. *Sm.* in *Rees' Cycl.*—*V. membranaceum*. *Dougl. MSS.*— γ .? *rigidum*; foliis subcoriaceis.

HAB. Canada to Hudson's Bay. *Michaux*. Newfoundland and Labrador. (*Ait.*) Lake Huron. *Dr. Todd*. Hills and alpine woods of the Rocky Mountains. *Drummond*. Summit of the high mountains of the Grand Rapids and vallies on the west side of the Rocky Mountains; a common fruit, purplish-brown, and much esteemed by the natives. *Douglas*.— β , and γ , N. W. Coast. *Mr. Menzies*.—*Michaux*'s name is certainly very applicable to this plant; more so than his character of the leaves (*folia angusto-lanceolata*). On the other hand, Aiton's character, especially of the leaves (*elliptico-lanceolata*), is more correct than his name; hence I have preferred *Michaux*'s, though the *Hortus Kewensis* has the right of priority. I am doubtful about *Mr. Menzies*' plant, which has thicker and more coriaceous, and somewhat shining foliage.

8. *V. Myrtillus*; ramis acute angulatis viridibus, foliis ovatis serratis glaberrimis nitidis, floribus solitariis.—*Linn.*—*Engl. Bot. t. 456.*— β . *microphyllum*; foliis 2–3 lineas longis.

HAB. Unalaschka? *Chamisso*.— β . Alpine woods near the Height of Land and Columbia Portage. *Drummond*.—The specimens have no flower, but there can be no question of this plant being a variety of *V. Myrtillus*. *Chamisso*'s specimen from Unalaschka were so imperfect that he could not determine whether they really belonged to this species or not; their leaves are said to be entire at the margin, or with a very few and obsolete teeth.

9. *V. cæspitosum*; pusillum, ramis cæspitosis, foliis obovatis basi cuneatis membranaceis serratis venosis nitidis, floribus (numeriosis) solitariis, corollis oblongis suburceolatis, anthera-rum poris longe tubulosis. (TAB. CXXVI.)—*Mich. Am. v. 1. p. 234.* *Pursh, Fl. Am. v. 1. p. 288.*— β , foliis majoribus.

Radicis longè descendens. *Caulis* breves, cæspitosi. *Folia* densa, parva, obovata vel oblongo-ovata, basi cuneato-attenuata, serrata, membranacea, reticulatim venosa. *Flores* numerosi, solitarii, pendentes. *Pedicelli* breves. *Corolla* oblonga, suburceolata, 5-dentata. *Anthera loculi* superne valde producti, tubulosi, dorso longissime aristati. *Bacca* magna, globosa, caruleo-crescens, edulis.

HAB. About Hudson's Bay. *Michaux*. Dry elevated spots, and in pine woods of the Rocky Mountains; about Lake Winnipeg, and on the Saskatchewan. *Drummond*. In the vallies on the west side of the Rocky Mountains. *Douglas*.— β , N. W. Coast. *Mr. Menzies*.

TAB. CXXVI.—*Fig. 1*, Flower; *fig. 2*, Stamen; *fig. 3*, Pistil.

10. *V. ovalifolium*; foliis ellipticis muticis membranaceis integerrimis glabris subtus præcipue venosis, ramulis angulatis, floribus ante folia bracteatis solitariis, corollis oblongo-ovatis. (TAB. CXXVII.)—*Sm. in Rees' Cycl.*

Frutex 10–12-pedalis. *Rami* teretes, glabri: *ravuli* angulati. *Folia* adulta unciam longa, elliptica, membranacea, glabra, subtus præcipue venosa. *Flores* axillares, solitarii, pendentes, e fasciculis foliorum juniorum terminalium, bracteati; bracteis ovatis, concavis, caducis. *Corolla* ovato-oblonga, suburceolata. *Antheræ loculi* superne longe producti tubulesi, dorso bi-setosæ. *Bacca* cæsio-nigra.

HAB. North-west Coast of America. *Mr. Menzies*. Columbia River, near its confluence with the Sea, (*Dr. Scouler*), and on the mountains of the Grand Rapids. *Douglas*. Woods at the junction of the Portage River and the Columbia.

TAB. CXXVII.—*Fig. 1*, Tuft of young leaves, and a flower; *fig. 2*, Front view of a stamen; *fig. 3*, Back view of do.; *fig. 4*, Flower:—magnified.

11. *V. parvifolium*; foliis ellipticis mucronatis integerrimis membranaceis glabris subtus glaucis venosis, caule ramiisque acute angulatis, floribus solitariis, corollis globosis. (TAB. CXXVIII.)—*Sm. in Rees' Cycl.*

Tota glabra. *Caulis* acute tetragonus, angulis fere alatis, ramis acute angulatis. *Folia* alterna, subdisticha, elliptica, mucronata, membranacea, integerrima, glabra, supra obscure subitus magis venosa subglauca. *Flores* axillares, penduli. *Pedunculi* superne incrassati. *Corolla* globosa, 5-fida. *Antheræ* fero ut in *V. ovalifolia*. *Bacca* rubra.

HAB. North-west Coast. *Mr. Menzies*. Common at Fort Vancouver, and along the sea-shore of the Columbia, in shady woods. *Douglas*. *Dr. Scouler*.

TAB. CXXVIII.—Fig. 1, Flower; fig. 2, Anther:—magnified.

* * * *Folii sempervirentibus*.

12. *V. Vitis Idæa*; foliis obovatis subtus pallidis punctatis marginibus parum revolutis subintegerrimis, racemis brevibus terminalibus nutantibus, corollis campanulatis, antheris muticis.—*Linn.*—*Engl. Bot.* t. 598. *Mich. Am.* v. 1. p. 229. *Pursh*, *Fl. Am.* v. 1. p. 269. *Bigel. Fl. Bost.* ed. 2. p. 150. *Torrey*, *Fl. of Un. St.* v. 1. p. 418.

HAB. Canada (*Pursh*), and from Newfoundland (*Dr. Morrison*, *Miss Brenton*) and Labrador (*Dr. Morrison*) to Hudson's Bay (*Douglas*). Bear Lake. *Dr. Richardson*. N.W. Coast. *Menzies* (in *Herb. nostr.*) *Unalashka*. *Chamiso* (in *Herb. nostr.*)

13. *V. ovatum*; ramis hispidis, foliis ovatis vel ovato-lanceolatis coriaceis glabris nitidis margine serratis revolutis, racemis brevibus axillaribus nutantibus, corollis campanulato-globosis 5-dentatis, dentibus calycinis majusculis acutis.—*Pursh*, *Fl. Am.* v. 1. p. 290. *Lindl.* in *Bot. Reg.* t. 1354.

HAB. Columbia. *Menzies*. *Lewis*. Common in rocky places on the N.W. Coast, from lat. 40° to 49°. *Douglas*. *Dr. Scouler*.—Fruit black and pleasant. *Douglas*.

14. *V. obtusum*; repens, foliis parvis utrinque rotundatis obtusis mucronatis integerrimis glabris coriaceis, pedunculis axillaribus solitariis unifloris. *Pursh*, *Fl. Am.* v. 1. p. 290.

HAB. North-West Coast. *Menzies*. (in *Herb. Banks*, according to *Pursh*).—This is placed by *Pursh* among the species with evergreen persistent leaves; but it is a plant unknown to myself, as it was to Sir James E. Smith.

B. Corollis rotatis. Oxycoccos.

15. *V. Orycoccus*; repens filiformis, foliis persistentibus ovatis acutis coriaceis glabris aeniis subtus glaucis, pedunculis 1-4 elongatis terminalibus, corollis 4-partitis.—*Linn.*—*Mich. Am.* v. 1. p. 228. *Engl. Bot.* t. 319.—*Oxycoccos vulgaris*. *Pursh*, *Fl. Am.* v. 1. p. 263. *Torrey*, *Fl. of Un. St.* v. 1. p. 394.—*O. palustris*, *a.* *Pers.*—*Rich.* in *Frankl.* 1st Journ. ed. 2. App. p. 12.

HAB. Canada. *Pursh*. Swampy places, from Lake Huron (*Dr. Todd*), Newfoundland (*Mr. Cormack*, *Miss Brenton*), Labrador (*Dr. Morrison*) to the Rocky Mountains, (*Drummond*), and to the Arctic sea-shore. *Dr. Richardson*, Captain Sir E. Parry, &c.

16. *V. macrocarpum*; repens, ramis erectis, foliis persistentibus oblongis coriaceis glabris venosis subtus albidiis, pedunculis lateralibus elongatis basi bracteatis aphyllis, corollis 4-partitis.—*Ait.*—*Bot. Mag.* t. 2086. *Bigel. Fl. Bost.* ed. 2. p. 154.—*V. Oxycoccos*, *β.* oblongifolium. *Mich. Am.* v. 1. p. 228.—*Oxycoccos macrocarpus*. *Pursh*, *Fl. Am.* v. 1. p. 263. *Torrey*, *Fl. of Un. St.* v. 1. p. 393.

HAB. Lake Huron. Dr. Todd. Throughout Canada to the Saskatchewan. Dr. Richardson. Drummond. Newfoundland. Dr. Morrison. Mr. Cormack. Miss Brenton. Plentiful in swampy grounds near the confluence of the Columbia with the Pacific, where its berries are boiled and eaten by the natives under the name of *Soo-labich*. Douglas.

SUBCL. COROLLIFLORÆ. DC.

ORD. LIV. ERICEÆ. Juss.

1. GAULTHERIA. L.

Cal. 5-4-fidus, basi carnosus infra bracteatus. *Corolla* ovata, limbo brevi 5-4-fido. *Stam.* 10-8. *Filamenta* plana saepè hirsuta, imæ corolle inserta v. hypogyna. *Antheræ* apice bifidæ, lobis bioristatis vel muticis. *Discus* hypogynus 5-10-dentatus vel nullus. *Capsula* calyce baccato inclusa, 5-locularis, valvis medio septiferis. *Semina* angulata.

1. *G. procumbens*; caule procumbente, ramis erectis inferne nudis, foliis obovatis basi attenuatis ciliato-serratis, floribus aggregatis subterminalibus nutantibus, disco hypogyno 5-dentato, filamentis pilosis, antheris bisetosis.—Linn.—Mich. Fl. Am. v. 1. p. 249. Pursh, Fl. Am. v. 1. p. 283. Elliott, Carol. v. 1. p. 501. Bigel. Fl. Bost. ed. 2. p. 164. Torrey, Fl. of Un. St. v. 1. p. 412.

HAB. Lake Huron. Dr. Todd. About Quebec. Mrs. Percival, Mrs. Sheppard; and this seems to be its most northern limit.

2. *G. Myrsinoides*; humilis, ramis caespitosis radicantibus, foliis late ovatis ciliato-serratis, floribus solitariis pluri-bracteatis, corolla vix calycem longiori, antheris muticis, filamentis glabris, disco hypogyno nullo. (TAB. CXXIX.)

Caulis brevis, ramosus; *rami* plurimi, caespitosi, procumbentes, longe radicantes. *Folia* late ovata, coriaceo-membranacea, nitida, vénosa, ciliato-serrata. *Flores* minutæ, solitariæ, axillares. *Pedunculi* perbreves, bracteati, bracteis 4-5 ovatis. *Calyx* basi carnosus, limbo 5-fidus. *Corolla* vix calyce longior, 5-fida, subcampanulata. *Filamenta* pistillo paulo breviora, glabra. *Antheræ* oblongæ vix apice bifidae, aristis nullis. *Discus* hypogynus nullus. *Ovarium* depresso-globosum, 5-lobum, calycis basi carnosa incrassata insidens. *Style* cylindraceus. *Stigma* simplex. *Fructus*; *capsula* 5-locularis, 5-valvis, calyce ampliato baccato rubro tecta; valvis medio septiferis. *Semina* numerosa, reniformi-angulata, exarillata, nitida, fusca. *Albumen* carnosum. *Embryo* axialis, cylindraceus.

HAB. Rocky Mountains, between lat. 52° and 54°. Drummond.—This beautiful little plant is loaded with scarlet berries, which its discoverer describes as "delicious, and resembling the pine-apple in flavour." The anthers differ from those of the other known *Gaultheria*, but the rest of the fructification and the habit entirely correspond with the present Genus. I ought to observe that the flower is drawn from the only two blossoms I could find on the whole of the specimens, and that appearing at an unusual season (while the fruit is in perfection) they were probably smaller than usual, scarcely a line in length, and quite concealed among the foliage.

TAB. CXXIX.—Fig. 1, Leaf; fig. 2, Flower; fig. 3, Corolla; fig. 4, Stamens and Pistil; fig. 5, 5, Back and front view of a stamen; fig. 6, Pistil; fig. 7, Section of the ovary; fig. 8, 8, Fruits; fig. 9, Section of a capsule which has burst, surrounded by the fleshy calyx, and seated upon its thickened base (as in *G. procumbens* and *G. hispida*); fig. 10, 10, Seeds; fig. 11, Section of a seed:—magnified.

3. *G. hispidula*; caule repente filiformi hispido, foliis parvis late ovatis subintegerrimis ciliatis aveniis subtus præcipue hispidis, floribus solitariis 4-fidis, filamentis suborbiculatis pubescentibus, antheræ loculis bioristatis, disco hypogyno nullo.—*Muhl.*—*Torrey, Fl. of Un. St. v. 1. p. 413.* *Bigel. Fl. Bost. ed. 2. p. 165.*—*G. serpyllifolia. Pursh, Fl. Am. v. 1. p. 283. t. 13. (fig. mala).*—*Vaccinium hispidulum. Mich. Am. v. 1. p. 223. t. 23.*

HAB. Swamps. Newfoundland. *Dr. Morrison. Miss Brenton.* Throughout Canada, and as far as the banks of the Saskatchewan (*Dr. Richardson*), and thence to the Height of Land on the Rocky Mountains, and to the sources of the Columbia on the West side. *Dunnmond.*

4. *G. Shallon*; subrecta, foliis subcordato-ovatis acutis serratis coriaceis marginibus rufisque junioribus hispidis, racemis secundis elongatis multifloris bracteatis, pedicello infra medium bibractento, corollis ovato-globosis viscidis glandulosis, antheræ loculis bisetosis, disco hypogyno nullo.—*Pursh, Fl. Am. v. 1. p. 284. t. 12. Hook. Bot. Mag. t. 2843. Lind. Bot. Reg. t. 1411.*—*G. fruticosa. Menzies, (in Herb. nostr.)*

HAB. North-west Coast. *Mr. Menzies. Dr. Scouler.* Common over a vast extent of country, from Cape Mendocina to Puget Sound, but never extending 100 geographical miles from the coast. *Douglas.*—A truly beautiful plant, with the leaves often 4 inches long, and racemes still longer, of a delicate waxy appearance. The fruit is much esteemed by the natives, and made into cakes, which keep for a great length of time. It is now introduced by Mr. Douglas and Dr. Scouler to our gardens, where it is a great acquisition, bearing copious blossoms and abundant fruit.

2. ARBUTUS.

Calyx parvus, 5-partitus. *Corolla* ovata v. globosa limbo 5-dentato reflexo, basi stipe diaphana. *Stam.* 10 basi corollæ inserta. *Antheræ* loculi apice poro dehiscentes, dorso aristato. *Discus hypogynus* decangularis. *Stigma* obtusum. *Bacca* 5-locularis, polysperma, nunc *Drupa* subglobosa, putamine 5-loculari, loculis monospermis.

* *Bacca polysperma. Arbutus.*

1. *A. laurifolia*; arborea, foliis oblongis utrinque acuminatis acute serratis glabris, racemis axillaribus secundis sessilibus solitariis. *Linn. Suppl. p. 238. Pursh, Fl. Am. v. 1. p. 282.*

HAB. North America. *Linnæus*; and Pursh suspects on the N. W. Coast, at the Columbia; which is the more probable, as no true *Arbutus* (excluding *Arctostaphylos*) is found on the East side of the Rocky Mountains.

2. *A. Menziesii*; arborea, foliis ovalibus integerrimis vel subserratis coriaceis petiolatis glaberrimis subtus glaucis, racemis elongatis compositis paniculatis densis pubescentibus, baccis rugosis polyspermis.—*Pursh, Fl. Am. v. 1. p. 282. Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 143.*—*A. procera. Dougl. MSS. in Hort. Soc. Lond.*

HAB. North-west Coast. *Mr. Menzies.* Common at Puget Sound, Columbia River, and N. California, attaining a large size in hilly situations. *Douglas.*—This is so closely allied to *A. Andachne*, especially to my specimens from southern Taurin, that I have hesitated about keeping it distinct. The leaves are perhaps larger; but the figure of that species in *Bot. Register*, t. 113, admirably represents our plant.

3. *A. tomentosa*; fruticosa erecta, foliis brevi-petiolatis acutis coriaceis ovalibus ovatis nunc subcordatis integerrimis junioribus pubescenti-tomentosis, racemis compositis brevibus terminalibus congestis folio brevioribus. (TAB. CXXX.)—*a. hispida*; ramis setosis, setis longis

patentibus.—*Pursh, Fl. Am. v. 1. p. 282.* *Hook. in Bot. of Beech. Voy. v. 1. p. 144.*—*Arctostaphylos tomentosa. Douglas, MSS.*—*β. nuda;* ramorum setis nullis.

HAB. Columbia. *Menzies.* Common on rocky places of the N.W. Coast, from California in the south, to Puget Sound in the north. *Douglas.*—This plant has, perhaps, a considerable geographical range. From Professor Lindley I possess a specimen gathered at Vera Cruz. Not having seen the fruit, I am doubtful whether this species belongs to the present or to the following division of the Genus.

TAB. CXXX.—*Arbutus tomentosa.*—*Fig. 1, var. α.; fig. 2, Flower and bracteæ; fig. 3, Stamen, magnified; fig. 4, var. β.:—nat. size.*

* * *Drupa putamine 5-loculari, loculis monospermis.* Arctostaphylos.

4. *A. alpina;* caule procumbente, foliis obovatis basi attenuatis serratis membranaceis marcescentibus reticulatim rugosis, racemo paucifloro terminali.—*Linn.*—*Engl. Bot. t. 2030.* *Pursh, Fl. Am. v. 1. p. 283.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 18.*

HAB. Newfoundland. *Mr. Cormack. Dr. Morrison. Canada. Pursh.* Throughout the woody country, from lat. 54° to 64°. *Dr. Richardson.* Alpine swamps of the Rocky Mountains. *Drummond.*—Berries black.

5. *A. Uva Ursi;* caule procumbente, foliis obovatis integerrimis coriaceis nitidis semiperviridentibus basi attenuatis subtus præcipue reticulatis, racemo terminali foliis breviori.—*Linn.*—*Mich. Am. v. 1. p. 249.* *Pursh, Fl. Am. v. 1. p. 283.* *Bigel. Fl. Bost. ed. 2. p. 165.* *Torrey, Fl. of Un. St. v. 1. p. 411.* *Rich. in Frankl. 1st Journ. ed. 2. App. p. 13.*

HAB. Throughout Canada, and as far as Fort Franklin on the Mackenzie River. *Dr. Richardson.* Common on the North-west Coast. *Douglas. Dr. Scouler.*—On the shores of the Columbia, the leaves are dried at the fire, pounded or bruised by the natives, and mixed with tobacco to render it more mild. It is the *Ise-salath* of the Chenoak Indians.

3. ANDROMEDA. L.

Cal. 5-partitus, coloratus. Cor. campanulata vel ureolata, limbo 5-dentato reflexo. Stam. 8–10 basi corollæ inserta. Antheræ bicornes, apice poro gemino dehiscentes. Capsula 5-locularis, 5-valvis, polysperma, valvis medio septiferis.

* *Foliis sempervirentibus.*

1. *A. hypnoides;* procumbens humilis, foliis laxè imbricatis linearis-subulatis, pedunculis solitariis unifloris terminalibus, corolla campanulata 5-fida obtusa, styllo ovato-acuminato, antheris aristis 2 longissimis.—*Linn.*—*Pursh, Fl. Am. v. 1. p. 281.* *Hook. Bot. Mag. t. 2936.*

HAB. North-West Coast. *Nelson, in Herb. Banks. (Pursh.)* Labrador. *Dr. Morrison. Kohlmeister.*

2. *A. Stelleriana;* caule filiformi procumbente, foliis 4–6-furiis linearibus patentissimis obtusis supra planis dorso obtuse carinatis, pedunculo brevi terminali subsolitario arcuato, calyce 5-phyllo, corolla lato-campanulata subpentapetala, styllo ovato-acuminato, antheris aristis duabus longissimis. (TAB. CXXXI.)—*Pall. Fl. Ross. v. 2. p. 58. t. 74. f. 2.*—*Menziesia Stelleriana. Fisch. in Herb. nostr.*—*Erica Stelleriana. Willd.*—*Spreng.*

Caulis filiformis, procumbens, inferne radicans; ramis erectisculis subsimplicibus. Folia 4–6-faria,

linearia, integerrima, obtuse, patentissima, plus minus reflexa, supra plana, subtus dorso obtuse canaliculato. *Pedunculus* subsolitarius, terminalis, brevis, curvatus, uniflorus. *Flos* nutans. *Calyx* pentaphyllos, foliolis ovalibus obtusis valde concavis. *Corolla* lato-campanulata, profunde 5-partita, fere 5-petala. *Filamenta* subulata. *Antheræ* didymæ, dorso aristis duabus longissimis deflexis. *Ovarium* globosum, rugosum. *Stylus* basi insigniter incrassatus.

HAB. North-West Coast of America, probably on Banks' Islands. *Mr. Menzies* (in *Herb. nostr.*)—I am indebted for a small but original Pallasian specimen of this beautiful plant to Dr. Fischer, with which this exactly corresponds.

TAB. CXXXI. *Andromeda Stelleriana*.—*Fig. 1*, Flower; *fig. 2*, Corolla; *fig. 3*, Pistil; *fig. 4, 5*, Anthers; *fig. 6, 7*, Leaves:—*magnified*.

3. *A. lycopodioides*; caule filiformi diffuso vase ramoso, foliis quadrifariis arête imbricatis appressis ovatis brevibus crassis obtuse carinatis, pedunculis subgeminis axillaribus, corollis campanulatis.—*Pall. Fl. Ross.* v. 2. p. 55. t. 73. *f. 1*. *Cham. in Linnaea*, v. 1. p. 516.

HAB. Unalashka. *Chamiso*.—At first sight this plant resembles a small state of *A. tetragona*, but it is truly distinct; much slenderer in all its parts, the branches more diffuse and flexuous, the leaves not furrowed on the back, the flowers fewer but larger, and the corolla more campanulate.

4. *A. cupressina*; caule subcresto valde subpinnatum ramoso, foliis quadrifariis arête imbricatis appressis lato-lanceolatis carinatis, pedunculis solitariis lateralibus.

HAB. Rocky Mountains north of the Smoking River, lat. 46°. *Drummond*.—This partakes of some of the characters of the preceding and following species, yet is quite distinct from both; it has nearly the same firm and stout habit as *A. tetragona*, and is about of the same size; but, like *A. lycopodioides*, it wants the dorsal sulcus. Its leaves are longer and narrower than either, and distinctly, and often rather sharply carinated. It is probably a rare, and exclusively an alpine species; very few specimens are in the Collection, and those mostly in fruit. *Capsule* bearing the dissepiment in the middle of the valves, as is probably the case with all the quadrifariately-leaved species, hence they are true *Andromedæ*, not *Menziesia*, whither Dr. Fischer is disposed to refer them. The beautiful *A. ericoides*, which I have received from Dr. Fischer and Chamiso, and *A. Redowskii*, which I possess from Professor Lehmann, seem to be exclusively Siberian plants, and not to have been found on the opposite or American side of Behring's Straits.

5. *A. tetragona*; caule subcresto fere pinnatum ramoso, foliis quadrifariis arête imbricatis appressis ovato-lanceolatis subtriquetris sulco dorsali, pedunculis solitariis axillaribus sparsis, corollis ovato-campanulatis.—*Linn.*—*Pursh, Fl. Am.* v. 1. p. 290. *Hook. Bot. Mag.* t. 3181.

HAB. From lat. 54° to the Arctic Islands (*Dr. Richardson*, *Captain Sir E. Parry*, &c.) and from Labrador on the east (*Kohlmeister*, *Dr. Morrison*), to the Rocky Mountains, both on the east and on the west side (*Douglas*). Unalashka. *Chamiso*.—Its southern limit is perhaps lat. 44°, where *Mr. Douglas* finds it on Mount Hood of the Columbia River.

6. *A. polifolia*; foliis linear-lanceolatis subtus glaucescenti-albidis, pedunculis aggregatis unifloris terminalibus.—*Linn.*—*Mich. Am.* v. 1. p. 254. *Engl. Bot. t. 713*. *Pursh, Fl. Am.* v. 1. p. 291. *Bigel. Fl. Bost. ed. 2.* p. 167. *Torrey, Fl. of Un. St.* v. 1. p. 419. *Rich. in Frankl. 1st Journ. ed. 2. App.* p. 13.

HAB. From Lake Huron (*Dr. Todd*) to the Arctic sea-shore. *Dr. Richardson*. Newfoundland. *Dr. Morrison*. Labrador. *Pursh*, *Kohlmeister*.—The more northern specimens are smaller, and have much narrower leaves.

7. *A. calyculata*; foliis oblongo-ellipticis obtusis serrulatis squamuoso-furfuraceis subtusque præcipue ferrugineis, racemis terminalibus foliosis secundis, pedicellis bracteatis, corollis ovato-cylindraceis.—*Linn.*—*Mich. Am.* v. 1. p. 254. *Pall. Fl. Ross.* v. 2. p. 33. t. 71. *J. L. Elliott, Carol.* v. 1. p. 485. *Torrey, Fl. of Un. St.* v. 1. p. 419. *Bigel. Fl. Bost.* ed. 2. p. 166. *Rich. in Frankl. 1st Journ.* ed. 2. *App. p. 13.*

HAB. From Lake Huron (*Dr. Todd*), throughout the woody, and part of the barren country. *Dr. Richardson, Drummond*. Newfoundland. *Miss Brenton*.

** *Foliis deciduis.*

8. *A. racemosa*; foliis elliptico-lanceolatis membranaceis serrulatis glabris, spicis terminalibus secundis simplicibus v. ramosis, bracteis linear-lanceolatis, calycibus acutis, corollis cylindraceis, antheris aristis quatuor.—*Mich. Am.* v. 1. p. 255. *Pursh, Fl. Am.* v. 1. p. 204. *Elliott, Carol.* v. 1. p. 492. *Bigel. Fl. Bost.* ed. 2. p. 167. *Torrey, Fl. of Un. St.* v. 1. p. 420. —*A. paniculata*. *Linn.*

HAB. Canada. *Pursh*.—The flowers are said to be very fragrant.

9. *A. ligustrina*; pubescens, foliis obovato-lanceolatis acutis integerrimis, ramis floriferis terminalibus paniculatis subaphyllis, floribus secundis, corollis subglobosis pubescentibus, antheris maticis.—*Muhl.*—*Elliott, Carol.* v. 1. p. 490. *Torrey, Fl. of Un. St.* v. 1. p. 421. —*Vaccinium ligustrinum*. *Linn.*—*Andromeda paniculata*. *Willd.*—*Mich. Am.* v. 1. p. 254. *Pursh, Fl. Am.* v. 1. p. 295.—*Lyonia paniculata*. *Nutt.*

HAB. Canada. *Pursh*. Saskatchewan. *Drummond*.—The Genus *Lyonia* is distinguished by Mr. Nuttall from *Andromeda* by the 5 valves of the capsule being closed by 5 other, and marginal narrow ones. But these narrow marginal ones appear to be only a parenchymatous substance filling up the spaces formed by the introflexion of the true valves, and generally falling away when the capsules have burst; but not unfrequently remaining attached to one or other of the valves. Dr. Torrey informs us that Mr. Nuttall himself now hardly considers the Genus tenable.

4. MENZIESIA. Sm.

Cal. 4-5-partitus seu 5-phyllo. *Cov.* monopetala urceolata v. campanulata, limbo 4-5-dentato. *Stam.* 8-10, basi corollæ inserta. *Antheræ* muticæ, apice poro gemino dehiscentes. *Capsula* 4-5-locularis, 4-5-valvis, polysperma, dissepimentis e marginibus introflexis valvarum.

* *Foliis persistentibus.*

1. *M. cærulea*; decandra, foliis linearibus obtusis denticulatis, floribus (3-6) fructibusque longe pedunculatis, calycibus acuminatis, corollis ovoidicis subpubescentibus (roseis), stigmate incrassato capitato inclusa.—*Sw.*—*Engl. Bot.* t. 2469. *Pursh, Fl. Am.* v. 1. p. 265. *Cham. in Linnæa*, v. 1. p. 515. *Bigel. Fl. Bost.* ed. 2. p. 149. *Torrey, Fl. of Un. St.* v. 1. p. 394. —*Andromeda cærulea*. *Linn.*—*A. taxifolia*. *Pall. Fl. Ross.* v. 2. p. 64. t. 72. f. 2.

HAB. Labrador. *Sir Jos. Banks. Kohlmeister. Dr. Morrison*.—It is not certain that this is found anywhere in North America, except Labrador. In the alpine interior its place is taken by other allied and equally beautiful species. On the N.W. Coast, Chamisso only detected *M. Aleutica*, which is, perhaps, the one seen by *Steller*, whom Pallas mentions as having found *M. cærulea* "on the islands and continent of America, opposite Kamtschatka."

2. *M. Aleutica*; foliis linearibus obtusis denticulatis ciliatis, floribus (10-15) breviter fructibus longe pedunculatis, calycibus acuminatis, corollis (ochroleucis) glabris subglobosis, stigmate cum stylo claviformi sequali.—*Cham. in Linnæa*, v. 1. p. 515.—*M. phyllofolia*. *Fisch. in Herb. nostr.*

HAB. Unalaschka. *Chamiso.*

3. *M. glanduliflora*; decandra, foliis linearibus obtusis obsolete glandulosis glanduloso-serrulatisque, floribus (4-6) longiusculi-pedunculatis, pedunculo calycibus acuminatis corollisque globoso-conicis (flavis) glanduloso-pubescentibus, stylo inclusu. (TAB. CXXXII.)

HAB. Rare in the Alpine woods and mountains north of the Smoking River, lat. 56°. *Drummond*.—A very beautiful and distinct species, 6-7 inches high, with each one of its copious and subfasciculated branches bearing 3-6 gracefully drooping yellow flowers, clothed, as well as the peduncles, with a rather thick glandular down.

TAB. CXXXII.—*Fig. 1*, Flower; *fig. 2*, Corolla; *fig. 3*, Calyx and pistil; *fig. 4, 4*, Stamens; *fig. 5*, Upper, and *fig. 6*, Under side of a leaf:—magnified.

4. *M. empetriformis*; decandra, foliis linearibus obtusis glanduloso-denticulatis suhtus canaliculatis, floribus (10-12) longe pedunculatis, calycibus glabris obtusis, corollis campanulatis (roseis) glabris, stylo inclusu.—*Sm. in Linn. Trans.* v. 10. p. 380. *Pursh, Fl. Am.* v. 1. p. 252.

HAB. Nutka on the N. W. Coast of America. *Mr. Menzies*. Pursh gives the Rocky Mountains, and near the mouth of the Columbia River, as other stations, upon the authority of *M. Lewis*.

5. *M. Grahamii*; decandra, foliis linearibus obtusis obsolete glanduloso-denticulatis, floribus (10-12) longiusculi pedunculatis, calycibus obtusis, corollis brevi-campanulatis (roseis) glabris, stylo filiformi exerto.—*M. empetriformis*. *Grah. in Bot. Mag.* t. 3176. (nec *Sm.*)

HAB. Alpine woods and open elevated situations of the Rocky Mountains, lat. 55°. *Drummond*.—On comparing the specimens of this plant with the original *M. empetriformis* from *Mr. Menzies*, I cannot but think them truly distinct. The latter is a much stouter and taller plant, the branches clothed with a smooth white shining bark, the leaves are flatter and thinner towards the edges, the margins distinctly toothed, and so curved back as to form a dorsal groove ("concave beneath," *Sm.*), the flowers are longer, and the style is included.

6. *M. intermedia*; decandra, foliis linearibus obtusis obscure glanduloso-serratis, floribus (4-7) sublonge pedunculatis, calycibus acuminatis basi subglandulosis, corollis (pallide roseis) cylindraceo-campanulatis glabris, stylo inclusu.

HAB. Woods and open places in the Rocky Mountains. *Drummond*.—The longer and less expanded corolla, included style, and acuminate calycine segments, distinguish this from *M. Grahamii*, as do the campanulate corolla, nearly entire leaves, and smaller size of the whole plant, from *M. carulea*.

* * *Foliis deciduis.*

7. *M. ferruginea*; octandra, foliis oblongo-lanceolatis utrinque acutis apice glandula apiculata ciliato-serratis supra pilis longis appressis strigosis subtus pallidis glabriusculis ad costam paleaceis paleis subulatis, pedunculis glanduloso-pilosis, calyce 4-lobo lobis rotundatis fimbriato-glandulosis, corolla ovato-cylindracea.—*Sm. Plant. Ic.* t. 56.

HAB. North-West Coast. *Mr. Menzies*. Mouth of the Columbia. *Douglas*. *Dr. Scouler*.

8. *M. globularis*; octandra, foliis obovatis obtusis glandula mucronatis basi attenuatis minute ciliato-serratis supra subpubescentibus subtus glaucescentibus glabris costæ paleis subulatis minutis, pedunculis glandulosis, calyce 4-lobo fimbriato glanduloso, corolla globoso-campanulata.—“*Salisb. Parad. Lond. t. 44.*” *Pursh, Fl. Am. v. 1. p. 264.* *Torrey, Fl. of Un. St. v. 1. p. 395.*—*M. Smithii. Mich. Am. v. 1. p. 295.*—*M. ferruginea, ß. Sims, Bot. Mag. t. 1571.*

HAB. Alpine woods north of the Smoking River, in lat. 50°. *Drummond*.—This plant, which does not appear to be known to any or the living American Botanists, seems nevertheless to have an extensive range, being found in Pennsylvania by Muhlenberg, according to Pursh, and on the high mountains of Virginia and Carolina by Michaux, according to Pursh and Dr. Sims, for Michaux's Flora given no station. It has been cultivated in the English Gardens, and the Botanical Magazine exhibits an excellent representation of our plant. The constantly obovate, more membranaceous leaves, glaucous beneath, the comparatively obsolete glands and hairs, and the different shape of the corolla, will surely abundantly distinguish this species from the true *M. ferruginea*, which is, besides, exclusively a native of the shores of the Pacific. The latter becomes almost black when dry; the former remains of a delicate green.

5. KALMIA. L.

Cal. 5-partitus, persistens. Cor. rotato-campanulata, limbo 5-fido patente. Fovulae 5 sub limbo, anternas biporosas recipientes, extus totidem tuberculis prominule. Stam. basi corollæ inserta. Antheræ muticæ. Caps. 5-locularis, 5-valvis: dissempenta e marginibus introflexis valvorum.

1. *K. latifolia*; foliis petiolatis alternis ternatisque coriaceis ovali-lanceolatis acutis utrinque viridibus, corymbis terminalibus pubescenti-glaucis viscidis.—*Linn.*—*Mich. Am. v. 1. p. 258.* *Curt. Bot. Mag. t. 175.* *Pursh, Fl. Am. v. 1. p. 296.* *Bigel. Fl. Bost. ed. 2. p. 169.* *Elliott, Carol. v. 1. p. 431.* *Torrey, Fl. of Un. St. v. 1. p. 422.*

HAB. Canada. *Pursh*.

2. *K. angustifolia*; foliis petiolatis ternatis oblongo-ellipticis obtusis coriaceis subtus subferrugineis, corymbis lateralibus terminalibusque, pedunculis calycibusque pubescenti-glandulosis. *Linn.*—*Mich. Am. v. 1. p. 257.* *Curt. Bot. Mag. t. 331.* *Pursh, Fl. Am. v. 1. p. 296.* *Bigel. Fl. Bost. ed. 2. p. 170.*

HAB. Throughout Canada, to Hudson's Bay. *Michaux.* *Mrs. Pereival.* Newfoundland. *Mr. Cormack.* *Miss Brenton.*

3. *K. glauca*; ramis ancipitibus, foliis oppositis subsessilibus oblongis coriaceis glaberriuis marginibus revolutis subtus glaucis, corymbis terminalibus, pedunculis calycibusque glaberrimis.—*Ait. Hort. Kew. ed. 1. p. 64. t. 8.* *Mich. Am. v. 1. p. 257.* *Curt. Bot. Mag. p. 177.* *Pursh, Fl. Am. v. 1. p. 296.* *Bigel. Fl. Bost. ed. 2. p. 170.* *Torrey, Fl. of Un. St. v. 1. p. 423.*—*ß. rosmarinifolia*; foliis linearibus marginibus magis revolutis subtus vix glaucis. *Ph.*—*γ. microphylla*; foliis vix semipollicaribus subovalibus.

HAB. *α.* and *β.* throughout Canada, from Lake Huron, extending beyond the woody regions, but scarcely, I believe, to the Arctic Circle. Newfoundland. *Mr. Cormack.* *Dr. Morrison.* *Miss Brenton.* On low swampy grounds of the Columbia, near the Pacific, rare. *Douglas.*—*γ.* Swamps in the Rocky Mountains. *Drummond.*

6. EPIGÆA. L.

Cal. 5-partitus, bracteis tribus suffultus. *Cor.* hypocrateriformis, tubo intus hirsuto, limbo putente quinquefido. *Stam.* basi corollæ inserta. *Antheræ* rimis geminis longitudine descentes. *Stigma* sublobatum. *Caps.* 5-locularis, 5-valvis, polysperma; valvarum marginibus introflexis *dissepimenta* formantibus.

1. *E. repens*; ramis petiolis nervoquo hirsutissimis, foliis cordato-ovatis integerrimis, corollis cylindricis.—*Linn.*—*Mich. Am.* v. 1. p. 250. *Pursh, Fl. Am.* v. 1. p. 297. *Elliott, Carol.* v. 1. p. 501. *Bigel. Fl. Bost. ed. 2.* p. 164. *Torrey, Fl. of Un. St.* v. 1. p. 428.

HAB. Newfoundland. *Mr. Cormack. Dr. Morrison.* Throughout Canada, (*Michaux, Mrs. Percival, Mr. Sheppard.*) and as far as the Saskatchewan. *Drummond.*

7. RHODORA. L.

Cal. 5-dentatus, persistens. *Cor.* calyci adnata, ringens, subdipetalu; petalo superiore profunde bi-tripartito, inferiore latiore bilobo. *Stam.* declinata; filamenta inaequalia. *Antheræ* biporosæ. *Caps.* 5-locularis, 5-valvis, loculis polyspermis; dissepimentis e marginibus introflexis vulvorum.

1. *R. Canadensis*.—*Linn.*—*Mich. Am.* v. 1. p. 259. *Curt. Bot. Mag.* t. 744. *Pursh, Fl. Am.* v. 1. p. 298.

HAB. Canada, near Sorel. *Michaux.* About Quebec. *Mrs. Percival. Mrs. Sheppard. Lady Dalhousie.* Newfoundland. *Mr. Cormack.*

8. RHODODENDRON. DON. Torrey.

Cal. profunde 5-partitus, persists. *Cor.* infundibuliformi-campanulata, rarius rotata, limbo 5-lobo patente lobis nunc subinæqualibus. *Stam.* 5-10, hypogyna, sepe declinata. *Antheræ* apice biporosæ. *Stigma* capitatum. *Capsula* 5-locularis, 5-valvis; dissepimentis e marginibus introflexis valvarum. *Semina* arillata.

* *Floribus pentandris (foliis decidnis.)*

1. *R. nudiflorum*; subnudiflorum, foliis lanceolato-oblongis utrinque glabriusculis concoloribus nervo supra liruginoso subtus setigerò marginè ciliatis, floribus amplis non viscosis, tubo laciniis longiore, calycis dentibus brevibus ovali-subrotundis, staminibus longissime exsertis. *Ph.*—*Torrey, Fl. of Un. St.* v. 1. p. 424.—Azalea nudiflora. *Linn.*—*Curt. Bot. Mag.* t. 180. *Elliott, Carol.* v. 1. p. 240. *Bigel. Fl. Bost. ed. 2.* p. 82.—A. periclymenoides. *Mich. Am.* v. 1. p. 151. *Pursh, Fl. Am.* v. 1. p. 153.

HAB. Canada. *Pursh.*

2. *R. viscosum*; foliosiflorum, ramis hispidis, foliis oblongo-ovoatis uetus utrinque glabris concoloribus nervo setigerò marginè ciliatis, floribus viscosis, tubo laciniis duplo longiore, calycis dentibus brevissimis rotundatis, filamentis corollæ vix longioribus. *Ph.*—*Torrey, Fl. of Un. St.* v. 1. p. 424.—Azalea viscosa. *Linn.*—*Mich. Am.* v. 1. p. 150. *Pursh, Fl. Am.* v. 1. p. 153. *Elliott, Carol.* v. 1. p. 241. *Bigel. Fl. Bost. ed. 2.* p. 82.

HAB. Canada. *Pursh.*

* * *Floribus plerumque decandris.*

3. *R. maximum*; foliis oblongis acutis subtus discoloribus, umbellis terminalibus, calycis laciniis ovalibus obtusis, corollis campanulatis. Ph.—Linn.—Bot Mag. t. 951. Mich. Am. v. 1. p. 259. Pursh, Fl. Am. v. 1. p. 297. Elliott, Carol. v. 1. p. 433. Bigel. Fl. Bost. ed. 2. p. 168. Torrey, Fl. of Un. St. v. 1. p. 426?

HAB. Canada. Fursh. N.W. Coast. Mr. Menzies. Douglas.—Specimens without flower, with leaves a span long, and probably belonging to this species, were gathered by Mr. Douglas on the summit of the high mountains of the Grand Rapida, and on those forming the subalpine region of Mount Hood, but rarely.

4. *R. Lapponicum*; humile, procumbens, ramis divaricatis, foliis persistentibus ellipticis obtusis rigidis foveolato-punctatis subtus discoloribus lepidotis marginibus reflexis, floribus umbellatis 5-8-andris, corollis rotato-infundibuliformibus.—Wahl. Lapp. p. 104. Torrey, Fl. of Un. St. v. 1. p. 426. Hook. Bot. Mag. t. 3106.—Azalea Laponica. Linn. Fl. Lapp. p. 89. t. 6. f. 1. Pall. Fl. Ross. v. 2. p. 52. t. 70. f. 1.

HAB. Norton Sound. Nelson. Barren grounds from lat. 65° to the Arctic sea-shore, Dr. Richardson, and Islands, Capt. Sir E. Parry. Summits of the Rocky Mountains, north of the Smoking River, lat. 56°. Drummond. Labrador. Dr. Morrison.—This has been detected on the White Mountains of New Hampshire, United States, by Dr. Bigelow, and Dr. Boott, from whom, as well as from Mr. Greene, who gathered it in the same locality, I have fine specimens.

5. *R. Kamtschaticum*; humile, procumbens, foliis persistentibus obovatis ciliatis venosis nitidis, calycibus amplis foliaceis, corollis rotatis, staminibus longioribus.—Pall. Fl. Ross. v. 1. p. 48. t. 33. Cham. in Linnæa, v. 1. p. 513.

HAB. Unalaschka. Chamisa. Banks' Island and Port Edgecombe, N.W. Coast. lat. 59°. Mr. Menzies, (in Herb. nostr.)

6. *R. albiflorum*; erectum, foliis deciduis elliptico-lanceolatis integerrimis membranaceis glabris in apicebus ramorum pedunculisque fasciculatis, calycibus subfoliaceis hispidis, corollis (albis) rotato-campanulatis, staminibus 10 erectis equalibus. (TAB. CXXXIII.)

Frutex 2-3-pedalis, erectus, ramosus, cortice fusco glabro tectus. Folia in apicebus ramorum fasciculata, decidua, membranacea, elliptico-lanceolata, glabra, brevissime petiolata, stipulata; stipulis ovatis, membranaceis, concavis, deciduis. Pedunculi fasciculati, laterales et terminales, unciam longi, appresso-setosi, uniflori. Calyx persistens, tubum corollae exquans, 5-partitus, appresso setosus, lobis oblongo-lanceolatis subfoliaceis. Stamina 10, exigua, erectissima. Filamenta subulata, inferne hirsuta. Ovarium 5-lobum. Stylus hirsutus. Stigma 5-lobum. Capsula coriacea, hirsuta. Semina scrobiculata.

HAB. Alpine woods of the Rocky Mountains. Drummond.—A very beautiful and most distinct species, which would be a great ornament to our gardens if it could be introduced.

TAB. CXXXIII. Rhododendron albiflorum.—A. Flowering specimen, nat. size; fig. 1, Flower; fig. 2, Calyx, stamen, and pistil; fig. 3, 4, Anthers; fig. 5, Section of the ovary; fig. 6, Stigma, magnified.—B. Portion of a fruit-bearing branch, with gemmiferous scales, whence the leaves of the following year arise; fig. 7, Capsule, with its persistent calyx; fig. 8, Capsule, bursting; fig. 9, 10, Seeds, covered with the arillus; fig. 10, Seed deprived of the arillus; fig. 11, Embryo;—magnified.

9. AZALEA. *Don. Hook.* (*Azaleæ Sp. L.*)

Cal. 5-partitus. *Corolla* brevi-campanulata, regularis. *Stam.* 5, basi corollæ inserta, recta, æqualia. *Antheræ* rima longitudinali dehiscentes. *Caps.* 2-3-valvis, 2-3-locularis; dissepimentis e marginibus introflexis valvarum.—*Frutex humilis, procumbens, ramosissimus; foliis persistentibus parvis coriaceis nitidis. Flores parvi, racemosi, terminales, rosei.*

1. *A. procumbens*.—*Linn.*—*Pursh, Fl. Am. v. 1. p. 154. Engl. Bot. t. 865. Bigel. Fl. Bost. ed. 2. App. p. 82. Torrey, Fl. of Un. St. v. 1. p. 232.*

HAB. Barren grounds from lat. 65° to the Arctic Islands. *Dr. Richardson.* Captain Sir E. Parry, &c. Newfoundland and Labrador. *Dr. Morrison.* Banks' Islands and Mount Edgecombe, lat. 54°. N.W. Coast. *Mr. Menzies.*—This has been found on the White Mountains of New Hampshire by Drs. Bigelow and Boott, and by Mr. Greene.

10. LEDUM. *L.*

Cal. 5-lentatus persistsens. *Pet.* 5, patentia. *Stam.* 10, receptaculo inserta. *Filamenta* capillaria æqualia, recta. *Stigma* 5-lobum. *Capsula* 5-locularis, 5-valvis, valvis e basi sursum dehiscentibus. *Semina* numerosa scrobiculata.

1. *L. palustre*; foliis oblongis linearibus margine revolutis subtus ramisque junioribus ferrugineo-tomentosis, stamina 5-10 corolla longioribus. *Mich.*—*a. angustifolium*, foliis linearibus, floribus decandris.—*L. palustre. Linn.*—*Pursh, Fl. Am. v. 1. p. 30. Hook. in Fl. Lond. 2d Ser. t. 210. β. latifolium*; foliis oblongis staminibus non raro 5.—*L. latifolium. Ait.*—*Jacq. Ic. Rar. v. 3. p. 464. Pursh, Fl. Am. t. 1. p. 300. Bigel. Fl. Bost. ed. 2. p. 172. Torrey, Fl. of Un. St. v. p. 437.*

HAB. Chiefly in the more northern and barren regions. *Dr. Richardson.* Newfoundland. *Miss Brenton.* *Mr. Cormack.* Labrador. *Dr. Morrison.* Kohlmeister. Hudson's Bay (*Dr. Richardson*) to the Arctic sea-shore and Islands (*Dr. Richardson.* Captain Sir E. Parry, &c.); often, however, mixed with specimens which cannot be distinguished from *β.* Cape Newenham. N. W. Coast, lat. 59°. *Mr. Menzies.* Rocky Mountains. *Drummond.* Fort Vancouver on the Columbia. *Dr. Scouler.* Chamiso's Island in Behring's Straits. *Chamiso.*—Much used as a substitute for tea: the narrow-leaved var. is said by *Dr. Richardson* to be preferred.

ORD. LV. MONOTROPEÆ. *Nutt.*1. TOLMIEA. (*nov. Gen.*)

Calyx profunde 5-partitus, laciniis longis linearibus denum foliaceis persistentibus. *Cor.* 5-petala, petalis obovatis patentibus deciduis. *Stam.* 10 hypogyna. *Antheræ* basi insertæ, biloculares, longitudinaliter dehiscentes, fissura superne latiore. *Ovarium* globosum liberum. *Style* elongatus, (siccitate) spiraliter tortus. *Stigma* dilatato-capitatum. *Capsula* 5-loba, 5-locularis, loculis medio longitudinaliter dehiscentibus. *Receptacula* axilia. *Semina* numerosa, scrobiculata.—*Frutex glaber, ramis lignosis cortice laxe deciduo obtectis. Folia*

sparsa decidua, in ramos articulata, lanceolata, mucronata, omnino sessilia, oblique obscure venosa. Pedunculi axillares, solitarii? uniflori, folio breviores, bracteati; bracteis linearibus.

1. *T. occidentalis.*

HAB. North-West Coast of America. *Mr. Menzies.*—Muoh as the flowers of this interesting plant accord in general structure with *Pyrola*, I can by no means consent to its forming a species of that Genus. The habit is totally different, and more like that of a *Kalmia* than a *Pyrola*. I have seen no other specimens in my Herbarium, except those (not very perfect ones) from Mr. Menzies. I have named the Genus in honour of *Mr. Tolmie*, one of my most zealous Botanical pupils, and now resident, as Surgeon in the Hudson's Bay Company's Service, in Puget Sound, N.W. America, where, it is to be hoped, he will rediscover this plant, and enable us more fully to illustrate its history.

2. PYROLA. L.

Cal. 5-fidus, seu 5-partitus. Pet. 5 decidua, erecta v. patenta. Stam. 10. Antheræ apice insertæ, pendulæ, apice subbicornes poris duobus superne dehiscentibus. Ovarium subglobosum 5-lobum. Stylus rectus vel curvatus. Stigma 5-lobum, nunc annulatum. Capsula 5-locularis, loculis medio longitudinaliter dehiscentibus. Receptacula axilia. Semina numerosa, scrobiculata.—Herba vix suffrutescens, humiles. Folia sempervirentia, subrotunda, rarius oblonga, longe petiolata, integerrima vel dentata. Scapus nudus vel squamosus, simplicis. Flores racemosi rarius uniflori, albi, lutescentes vel rubicundi.

* *Stylus rectus. Stamina erecta.*

1. *P. uniflora*; caule unifloro, foliis orbicularibus serratis, stigmate magno lobis 5 erectis.—*Linn.*—*Engl. Bot. t. 146. Mich. Am. v. 1. p. 251. Pursh, Fl. Am. v. 1. p. 299. Bigel. Fl. Bost. ed. 2. p. 173. Torrey, Fl. of Un. St. v. 1. p. 454. Rich. in Frankl. 1st Journ. ed. 2. App. p. 18.*

HAB. From Lake Huron (*Dr. Todd*) throughout Canada to lat. 64° (*Dr. Richardson*), and from Newfoundland (*Mr. Cormack*, *Dr. Morrison*, *Miss Brenton*), and Labrador, (*Kohlmeister*, *Dr. Morrison*) to the woody country in the Rocky Mountains. Observatory Inlet (*Dr. Scouler*), and near Mount St. Helens on the West Coast, in shady woods, but not nearly so common as on the east side of the Rocky Mountains. (*Douglas*.)

2. *P. minor*; foliis ovato-rotundatis crenatis, floribus racemosis styli inclusi longitudine, stigmate dilatato lobis 5 radiatis.—*Linn.*—*Engl. Bot. t. 158, et t. 2543 (P. rosea.) Pursh, Fl. Am. v. 1. p. 299. Torrey, Fl. of Un. St. v. 1. p. 434.*

HAB. Canada. *Mrs. Percival.* Woods in the Rocky Mountains. *Drummond.* Barren country from lat. 64° to the Arctic Coast (*Dr. Richardson*) and Islands (*Captain Ross*). Labrador. *Dr. Morrison.* Observatory Inlet, N. W. Coast. *Dr. Scouler.* Uralaschka. *Chamisso.*—The American plant exactly accords with the European. Petals rounded, concave, not spreading.

3. *P. secunda*; foliis ovatis acutis, floribus racemosis omnibus secundis, stylo exerto, stigmate dilatato 5-lobo.—*Linn.*—*Engl. Bot. t. 307. Mich. Am. v. 1. p. 250. Pursh, Fl. Am. v. 1. p. 299. Bigel. Fl. Bost. ed. 2. p. 174. Torrey, Fl. of Un. St. v. 1. p. 434. Rich. in Frankl. 1st Journ. ed. 2. App. p. 18.*— β . foliis angustioribus acuminatis.

HAB. Throughout Canada to the Mackenzie River (*Dr. Richardson*), and from Newfoundland (*Mr. Cor-*

mack, Miss Brenton), and Labrador (*Dr. Morrison*), to the Height of Land on the Rocky Mountains (*Drummond*), and the shores of the Pacific, at the mouth of the Columbia (*Douglas*), and Observatory Inlet (*Dr. Scouler*). Bay of Eschscholtz. *Chamisso*.— β . Woods of Portago River, near La Grande Côte. *Drummond*.

* * *Stylus declinatus. Stamina adscendentia.*

1. *P. chlorantha*; foliis (parvis) rotundatis subintegerrimis petiolo brevioribus opacis subitus precipue venosis, racemo paucifloro, calycis (parvi) lacinias ovatis, antheris poris tubulosis, stylo decurvo subflexuoso exerto annulato, disco lacinias 5 erectis. (TAB. CXXXIV.)—*Sv. Kongl. Acad. Handl.* p. 190. t. 5. *Nutt. Gen. Am.* v. 1. p. 273. *Rich. in Fruct. 1st Journ. ed. 2. App. p. 13. (excl. syn. P. asarifoliae Mich.) Don. in Wern. Trans. v. 5. p. 232.*—*P. convoluta.* Banks. (fide *Don*.)—*P. asarifolia.* *Torrey, Fl. of Un. St. v. 1. p. 433. (excl. syn. Mich. Pursh et Gold.)*

Radix subrepens, gracilis. Folia radicalia aut subradicalia, orbicularia, rarius elliptica, petiolo duplo breviora, coriacea, opaca, integerim vel obscure crenata, vix $\frac{1}{2}$ unciam longa, supra obscure venosa, subitus venis reticulatis magis conspicuis. Scapus spithameus, nudus vel squama parva solitaria instructus. Racemosus 5-6-florus. Flores unidice versi inajuscili. Calyx parvus. Petala subpatentia elliptica. Antherea poris tubulosis. Stylus declinatus subflexuoso.

HAB. Lake Winnipeg (*Douglas*) to the Saskatchewan and the Rocky Mountains, thence to Bear Lake. *Drummond*. *Dr. Richardson*. Newfoundland. *Miss Brenton*. Labrador. *Dr. Morrison*.—This is most allied to *P. rotundifolia*; but the leaves are smaller than their smallest state in that species, and singularly opaque. The flowers are nearly the same in size, but the calyx is much smaller and more appressed; the anthers have two tubular horns, at the top of which the pores are situated. The style is shorter and less flexuous. It agrees in every respect with an original specimen from Swartz, and in America seems to be peculiarly abundant in the latitude of the Saskatchewan, from Hudson's Bay to the Mountains. The *P. chlorantha* of Hook. in Parry's 3d Voy. App., should be referred to *P. rotundifolia* δ . *pumila*.

TAB. CXXXIV.—*Fig. 1. Flower; fig. 2. Stamen; fig. 3. Back view of an Anther; fig. 4. Pistil:—magnified.*

5. *P. rotundifolia*; foliis subrotundis coriaceis nitidis reticulatis petiolis brevioribus, scapo bracteato, racemo plurifloro, calycis foliolis elongatis membranaceis, antherea poris non tubulosis, stylo decurvo flexuoso exerto, stigmate annulato, disco lacinias 5 erecto.—*Linn.*—*Engl. Bot. t. 213. Mich. Am. v. 1. p. 251?* *Pursh, Fl. Am. v. 1. p. 299. Bigel. Fl. Bost. ed. 2. p. 173. Torrey, Fl. of Un. St. v. 1. p. 432.*— β . *asarifolia*; foliis majoribus reniformi-rotundatis.—*P. asarifolia.* *Mich. Am. v. 1. p. 251. Pursh, Fl. Am. v. 1. p. 299. Goldie in Ed. Phil. Journ. v. 6. p. 226. Don, in Wern. Trans. v. 5. p. 230.*— γ . floribus purpureo-roseis.—*P. incarnata.* *Fisch. MSS. in Herb. nostr.*— δ . *pumila*; minor, stylo breviore minus flexuoso.—*P. pumila.* *Horn. in Linnaea, v. 1. p. 514.*—*P. Grælandica.* *Horn. Fl. Dan. t. 1817.*

HAB. α . β . γ . (which all appear to grow in the same situations) from Lake Huron (*Dr. Todd*) throughout Canada to Bear Lake (*Dr. Richardson*), and from Hudson's Bay to the Rocky Mountains. *Drummond*. North-West Coast. *Douglas*. Unelaschka and Kotzebue's Sound. *Chamisso*.— δ . Labrador. *Dr. Morrison*. Arctic Islands. *Capt. Sir E. Parry*.—Very numerous specimens of this plant in my Herbarium have satisfied me that, in regard to foliage, this is a very variable species, and that none of them can with propriety be

separated from *P. rotundifolia*; whilst some have their leaves less than an inch in length, others are more than $2\frac{1}{2}$ inches long, and full 3 inches broad. The flowers are the same shape in all, and essentially distinguished from *P. chlorantha* by the much larger and more membranaceous calyx, by the anthers destitute of tubular pores, and the longer and more flexuous style. Sometimes the flowers are white, at other times deep rose-colour, with the anthers quite red. There cannot be a question, I think, but the broader and reniform-leaved variety is the true *P. asarifolia* of Michaux, though some of the American Botanists have taken the *P. chlorantha* for it, which could hardly have suggested Michaux's name.

6. *P. occidentalis*; foliis subrotundis membranaceis obsolete denticulatis petiolo simplici duplo longioribus, racemo paucifloro, lacinis calycinis oblongis obtusis, stigmatis disco 5-lobo. *Don, in Wern. Trans.—Brown, MSS. in Herb. Banks.*

HAB. Sledge Island, on the N. W. Coast. *Nelson*.—With this I am unacquainted, unless, as I cannot help suspecting, it may be my var. *pumila* of *P. rotundifolia*, with which it sufficiently accords, and which is found in Unalaschka. Mr. Don says it resembles *P. minor* in general habit, but is much smaller, and possesses characters widely different.

7. *P. bracteata*; foliis lato-ovatis acutis integerrimis seu lèvissime crenatis coriaceis acutis nitidis, scapo subbisquamioso, racemo bracteato, bracteis lanceolatis acuminatis flore longioribus, calycis segmentis attenuatis alabastro longioribus.

HAB. N. W. Coast. *Dr. Scouler*.—Of this I regret I possess but one specimen, and that only in bud, bearing two scapes, more than a span long; bracteas very long and much acuminate, as are the calyx-segments. Leaves 2 and $2\frac{1}{2}$ inches long.

8. *P. elliptica*; foliis ellipticis membranaceis opacis obscure dentatis petiolo sublongioribus, scapo nudiusculo, calycis parvi lacinii ovatis, antheræ poris brevi-tubulosis, stylo decurvo flexuoso exerto, stigmate annulato disco lobis 5 erectis. (*TAB. CXXXV.*)—*Nutt. Gen. Am. v. 1. p. 273. Don, in Wern. Trans. v. 5. p. 233. Torrey, Fl. of Un. St. v. 1. p. 433.—P. rotundifolia. Mich. Am. v. 1. p. 251.*

HAB. Lake Huron, *Dr. Todd*, throughout Canada, *Mrs Percival*, to the Saskatchewan, *Dr. Richardson. Drummond*.—Well distinguished by Mr. Nuttall from *P. rotundifolia*, being very different in the foliage. The flowers are intermediate between those of *rotundifolia* and *chlorantha*, having the calyx of the latter, and the longer style of the former; the cells are a little produced below the pores. Blossoms exceedingly fragrant, white.

TAB. CXXXV.—Fig. 1, Flower, before the full expansion; fig. 2, Flower expanded, fig. 3, Petal; fig. 4, 4, Anthers; fig. 5, Pistil.

9. *P. dentata*; foliis oblongis coriaceis opacis remote dentatis inferne angustatis longitidine petioli, scapo nudo, racemo subsecundo, petalis erecto-patentibus, antheræ loculis pauculum productis, stylo deflexo flexuoso exerto. (*TAB. CXXXVI.*)—*Sm. in Rees' Cycl.—Don, in Wern. Trans. v. 5. p. 235.*

HAB. Nutka Sound, N. W. Coast, and Columbia River. *Mr. Menzies.*

TAB. CXXXVI.—Fig. 1, Flower; fig. 2, Anther; fig. 3, Pistil:—magnified.

10. *P. picta*; foliis ovatis subserratis, floribus secundis, antheræ poris contractis tubulosis stylo curvato, stigmate truncato disco 5-lobo.—*Sm. in Rees' Cycl.*

HAB. Nutka Sound, N. W. Coast. *Mr. Menzies*.—A solitary specimen of what I take to be this plant, I possess from Mr. Menzies, but I feel almost inclined to unite it with the preceding, differing, as it does, only in the more secund and more numerous flowers, and in the shorter leaves more abrupt at the base, with some obscure pale blotches on the upper side, and a reddish tint beneath.

11. *P. aphylla*; foliis nullis, scapo basi squamato squamis lanceolatis membranaceis, rameo elongato subsecundo, antheræ poris tubulosis, stylo deflexo flexuoso, stigmate annulato disco dentibus 5 elongatis erectis. (TAB. CXXXVII.)—*Sm. in Rees' Cycl.*—*Don, in Wern. Trans. v. 5. p. 227.*

Annuus. *Radix* repens, ramosa, fibrosa, fibris tomentosæ. *Folia* omnino nulla! *Scapus* erectus, pedalis, simplex, angulatus, inferno præcipue squamis lanceolatis erectis in axilla non raro geminiferis, superne spiraliter tortus. *Racemus* terminalis, elongatus, subsecundus; floribua majusculis nutantibus. *Pedicelli* longitude florum, basi bracteæ parva munita. *Calycis* laciniæ ovatae acute, petalis ovalibus concavis patulis 3-plo brevioreæ. *Stamina* sursum inclinata. *Filamenta* basi dilatata. *Antheræ* oblongæ basi acute, medio et lateribus sulcatae, superne cornibus duobus brevibus apice poro dehiscentibus. *Ovarium* globosum; stylus arcte deflexo flexuoso, apice annulato, disco dentibus 5 erectis.

HAB. North-West Coast. *Mr. Menzies*. Fort Vancouver. *Dr. Scouler*. Plentiful in the dark shady pine woods among *Hypnum*, from Cape Mendocino to Puget Sound: it does not exist beyond 100 miles from the Coast. *Douglas*.

TAB. CXXXVII.—*Fig. 1*, Flower; *fig. 2, 3*, Stamens; *fig. 4*, Capsule; *fig. 5*, Stigma:—magnified.

3. PTEROSPORA. Nutt.

HAB. Shady woods, Canada. *Lady Dalhousie.* Lake Huron. *Dr. Todd.*

5. CHIMAPHILA. *Pursh.*

Calyx liber, profunde 5-fidus. *Petala* 5, concava. *Stam.* 10. *Filamenta* erecta, me-
dio disco orbiculato hirsuto vel ciliato. *Antheræ* medio affixe, basi breviter bicornes
poris dehiscentes. *Ovarium* liberum, 5-lobum. *Style* perbrevis, crassus. *Stigma* pelta-
tum, planum, dilatatum, 5-lobum. *Capsula* 5-locularis, ab apice dehiscens. *Semina*
minuta, scrobiculata.—Suffrutices caulescentes, ramosæ. *Folia opposita, subverticillata,*
nunc alterna, coriacea, oblonga, dentato-serrata. Pedunculi terminales, bracteati vel nudi,
uniflori vel umbellati.

1. *C. umbellata*; foliis verticillatis cuneato-lanceolatis serratis immaculatis basi in petiolum
per breve angustatis, umbella subquinqueflora.—*Pursh, Fl. Am. v. 1. p. 30. Nutt. Gen.*
Am. v. 1. p. 274. Pyrola umbellata. Linn.—Mich. Am. v. 1. p. 251. Curt. Bot. Mag. t.
778. Bigel. Fl. Bost. ed. 2. p. 174. Torrey, Fl. of Un. St. v. 1. p. 485. Don, in Wern.
Trans. v. 5. p. 243.

HAB. Lake Huron. *Dr. Todd.* Quebec, *Mrs. Percival*, and to the Saskatchewan and Rocky Mountains, in lat. 53°. *Dr. Richardson, Drummond;* also from near the sources of the Columbia (*Drummond*) to the Pacific. *Douglas, Dr. Scouler, Mr. Menzies.*

2. *C. maculata*; foliis subverticillatis lanceolatis acuminatis grosse serratis brevi-petiolatis
discoloribus superne variegatis, umbella 3-4-flora.—*Pursh, Fl. Am. v. 1. p. 300. Elliott,*
Carol. v. 1. p. 505. Nutt. Gen. Am. v. 1. p. 275.—*Pyrola maculata. L.—Mich. Am. v. 1.*
p. 251. Bigel. Fl. Bost. ed. 2. p. 175.

HAB. This was gathered in the route from New York to Cumberland House Fort, on the Saskatchewan; but whether in British America, or, as is probable, in the United States, is not mentioned.

3. *C. Menziesii*; foliis alternis rarius oppositis seu subverticillatis ovato-lanceolatis acutis
serratis discoloribus superne immaculatis, pedunculo bracteato 1-2-floro, stylo distincto.
(TAB. CXXXVIII.)—*Pyrola Menziesii. Br. in Herb. Banks.—Don, in Wern. Trans.*

Suffruticosa. *Caulis* basi decumbens, gracilis, flexuosa, squamosus, squamis late ovatis, concavis,
membranaceis. *Folia* subunciam longa, plerumque alterna, coriacea, semperferventia, brevi-petiolata, acuta,
serrata, subtus purpurascens, supra viridia, unicoloria. *Pedunculus* terminalis, bracteatus, plerumque bi-
florus; bracteis late ovatis, concavis, membranaceis, fuscis. *Flores* majusculi, nutantes. *Calyx* laciniæ
oblongo-lanceolatae. *Petala* ovalia demum patentissima. *Filamenta* disco piloso. *Style* quam in 2
speciebus precedentibus longior. *Stigma* planum, margine obscure 5-lobum.

HAB. N.W. Coast. *Mrs. Menzies*. On high woody grounds at the base of Mount Hood, near the great Falls of the Columbia; not common.—Nearly allied to the preceding, but the leaves are much shorter. The peduncle has large concave bracteas, and I have never seen more than two flowers on any specimen.

TAB. CXXXVIII.—Fig. 1, Flower; fig. 2, Flower with the petals spread open; fig. 3, Stamens; fig. 4, Pistil:—magnified.

[Obs. When I published my *Tolmiea*, in the preceding part of this work, I was not aware that it was already described and figured by M. Bongard, in his *Vegetation de Sitcha*, under the name of *Cladothamnus pyrolifolius*, p. 37. t. 1,—a name which, of course, must be preferred to mine.]

ORD. LVI. JASMINEÆ. Juss.

1. LIGUSTRUM. L.

Cal. minutus, 4-dentatus. *Cor.* tubo brevi limbo 4-fido. *Stam.* 2. *Filamenta* brevia. *Stylus* brevissimus. *Stigma* bifidum. *Bacca* globosa, unilocularis, 2–4-sperma.—Frutices. *Folia interdum perennia*.

1. *L. vulgare*; foliis elliptico-lanceolatis glabris, panicula coarctata.—*L.*—*Engl. Bot. t. 764.* *Mich. Am.* v. 1. p. 3. *Pursh, Fl. Am.* v. 1. p. 7. *Torrey, Fl. v. 1.* p. 7.

HAB. Canada, (not indigenous.)

2. FRAXINUS. L.

Flores sœpe polygam. *Cal.* 4-partitus v. nullus. *Cor.* 4-partita v. tetrapetala v. null. *Stam.* 2. *Fructus:* *Samara* pendula basi monosperma.—*Arbores regiones temperatas habitantes.* *Folia opposita pinnata.* *Flores apetalii et polygami* (*Fraxinus*), *vel hermaphroditii subtetrapetali* (*Ornus*, *Scop.*)

1. *F. sambucifolia*; foliolis sessilibus ovato-lanceolatis serratis rugoso-nitidis basi rotundatis inæqualibus axillis venarum subtus villosis, floribus nudis (*Pt.*), samaris ellipticis basi obtusis apice emarginatis (*Mx.*)—*Willd.*—*Mich. N. Am. Sylv.* (ed. *Philad.* 1819) r. 3. p. 122. *Pursh, Fl. Am.* v. 1. p. 8.

HAB. New Brunswick and Nova Scotia. *Michaux.* Canada. *Willd.*

2. *F. epipetra*; foliolis ad summum 4-jugis oblongo-ovalibus acuminatis subintegris, capsulis obverse lanceolatis apice obtuse emarginatis ima parte teretibus apteris. *Mich. Am.* v. 2. p. 56. *Pursh, Fl. Am.* v. 1. p. 8.

HAB. Canada. *Pursh.*—I give this as a native of the British possessions on the authority of Pursh, who, however, makes no reference to *Michaux*, *Flora Bor. Am.*, where the species first appears, and where it is said to be a native of Virginia and Carolia. What I have called *F. epipetra*, in the *Companion to the Bot. Mag.*, from Drummond's N. Orl. Coll., (n. 210,) has the leaves quite entire; the ripe samarae are $2\frac{1}{2}$ inches long, terete at the base; wing very long, (as described by Elliott, and figured by Gertner,) and of nearly the same width to the very apex. Pursh quotes "*F. discolor*, Mich. Arb. Forest;" but in my ed. of the *Sylva* there is no such plant, either under that name, or under *F. epipetra*; there, however, is an *F. discolor* of Muhl. referred to *F. Americana*, L. (*F. acuminata*, Lam.)

3. *F. Americana*; foliolis petiolatis oblongo-ovatis acuminatis integerrimis vel grosse serratis subtus pallidioribus, floribus calyculatis, capsulis basi teretibus ala linear-lanceolata obtusa laeviter emarginata. L.—Willd. Sp. Pl. p. 1102.—*F. acuminata*. Lam.—*Pursh*, Fl. Am. v. 1, p. 9. Elliott, Carol. v. 2, p. 672. Mich. N. Am. Sylv. v. 3, p. 118. Bigel. Fl. Bost. (ed. 2.) p. 380.

HAB. Canada (*Ph.*) to the Saskatchewan. *Drummond*.—This is the only *Ash* noticed in the *Boston Flora* of Dr. Bigelow; but I have seen no specimens from Canada exactly according with Pursh's description, that is, having the leaflets entire, shining, and glaucous beneath. Some of the leaves are deeply serrated.

4. *F. pubescens*; foliolis petiolatis elliptico-ovatis serratis subtus petiolis ramulisque tomentosis, floribus calyculatis (*Ph.*), samaris oblongis obtusissimis emarginatis sensim in basin brevem teretem attenuatis.—*Walt.*—*Ph. Fl. Am.* v. 1, p. 9.—*F. tomentosa*. *Mich. N. Am. Sylv.* t. 119.— β . foliolis subintegerrimis.

HAB. Canada. *Ph.* Saskatchewan. *Drummond*.— β . Banks of the Columbia. *Douglas*, *Dr. Scouler*.

ORD. LVII. APOCYNEÆ. Br.

1. APOCYNUM. Br. APOCVNI sp. L.

Cor. campanulata. Tubus denticulis 5 acutis inclusus, lacinia limbi oppositis. Faux nuda. Stam. inclusa. Anthera sagittatae, medio stigmati cohaerentes, lobis posticis polline vacuis. Ovaria 2. Styli subnulli. Stigma dilatatum, apice conico. Squamæ 5 hypogynæ. Folliculi graciles, distincti.—Herbæ perennes, erectæ. Folia opposita, membranacea. Flores cymosi. Br.

1. *A. androsæmifolium*; foliis ovatis supra glabris, cymis terminalibus lateralibusque, tubo corollæ calycem bis superante.—*Linn.*—*Mich. Am.* v. 1, p. 121. *Rich. App.* p. 9.

HAB. Canada and throughout the woody country; Hudson's Bay. *Dr. Wright*.—Leaves pubescent beneath in all my specimens which are from various parts of N. America.

2. *A. cannabinum*; foliis oblongis utrinque acutis glabris, cymis paniculatis, calyce tubum corollæ æquante. *Linn.* (TAB. CXXXIX.)—*Br.*—*Torrey*, *Fl. v. 1*, p. 276. *Ell.*— β . foliis subtus pubescentibus. *A. cannabinum*. *Mich. Am.* v. 1, p. 122? *Ph. Fl. Am.* v. 1, p. 179?—*A. pubescens*. *Torrey*, *Fl. v. 1*, p. 276. (vix *Br.*)

HAB. Canada. Lake Huron. *Dr. Todd*.—Michaux seems to have misled some of the American Botanists by describing the underside of the leaves as "*candidanti-tomentosa*";—a circumstance common enough in *A. androsæmifolium*, but of rare occurrence in *A. cannabinum*, of which I have only seen one specimen, and that from Lexington, Kentucky, with its leaves downy beneath. The two species are truly distinct in the shape of their leaves, and the relative length of the calyx and corolla.

TAB. CXXXIX.—*Fig. 1*, Fruit;—nat. size.

3. *A. hypericifolium*; foliis cordato-oblongis glabris sessilibus mucronatis, cymis folio brevioribus, calycis tubum corollam sequante.—(TAB. CXL.)—*Ait. Hort. Kew. v. 1. p. 304. Pursh, Fl. Am. v. 1. p. 179. Torrey, Fl. Am. v. 1. p. 276.*—*A. Sibiricum. Jacq. Hort. v. 3. p. 66. (non Pall.)*— β . foliis latioribus.

HAB. Throughout Canada to the Saskatchewan. *Dr. Richardson, Drummond.* Lake Huron. *Dr. Todd.*— β . West side of the Rocky Mountains. *Douglas.*—This is a stouter and more upright-growing plant, and less branched, than the preceding; but the upper leaves are sometimes acute at the base, and slightly stalked, and then it is with difficulty distinguished from *A. cannabinum*. Of the var. β . Mr. Douglas observes that the flax is used by the tribes residing on the west side of the Rocky Mountains to make their fishing-nets. They are strong, buoyant, and answer the purpose extremely well.

TAB. CXL.—*Fig. 1.* Flower; *fig. 2.* Stamens; *fig. 3.* Pistil:—*magnified.*

ORD. LVIII. ASCLEPIADEÆ. Br.

ASCLEPIAS. Br. Ascl. sp. L.

Mich.*— β . *minor*; umbellis laxis paucifloris, foliis subtus præcipue pubescenti-tomentosis, coronæ foliolis obovatis cornu angustiore minus evidenter rostrato. (TAB. CXLI.)

HAB. β . Carlton House Fort. *Dr. Richardson.* Plains of the Red River and banks of the Assinaboine. *Douglas.*—The usual state of this plant I have not seen from British America; nor am I sure that I am correct in considering this a variety of that species. It is smaller in every part; the leaves very downy beneath, and more obtuse at the base; and there are the differences mentioned above in the inflorescence and flowers. The shape of the horn, however, in the solitary specimen I have from Mr. Douglas, is much broader, and more like that of the true *A. variegata*, than it is in Mr. Drummond's plants.

TAB. CXLI.—*Fig. 1.* Flower; *fig. 2.* Leaflet of the Corona with its horn:—*magnified.*

3. *A. Douglastii*; caule subsimplici, foliis cordato-ovatis acutis subtus umbellis multifloris calyce corollisque dense tomentosis, coronæ foliolis ovatis longe acuminatis cornu longioribus intus bidentatis. (TAB. CXLI.)

HAB. On low points of land on the banks of streams, west side of the Rocky Mountains; rare.
Douglas.—Leaves somewhat resembling the last species, but broader and more coriaceous. The flowers thrice as large, and also remarkable for the great length of the coronal leaflet.

TAB. CXLI.—*Fig. 1*, Flower; *fig. 2*, Leaflet of the corona with its horn.

4. *A. nivea*; caule erecto simplici, foliis lato-lanceolatis acuminatis membranaceis glabris subtus pallidioribus, umbellis multifloris laxis, coronæ foliolis truncatis dentatis cornu brevioribus, folliculis levibus.—*Linn.*—*Bot. Mag.* t. 1187. *Pursh*, *Fl. Am.* v. 1. p. 181.—*P. phytolaccoides*. *Lyon*.—*Pursh*, *Fl. Am.* v. 1. p. 180. *Elliott*, *Carol.* v. 1. p. 319. *Torrey*, *Fl.* v. 1. p. 280.

HAB. Canada. *Dr. Holmes*.—I have received the fruit, which is very rare and had not been seen by Dr. Torrey, from Dr. Darlington. The figure in the Bot. Magazine is excellent; and I think I am correct in uniting Pursh's *A. phytolaccoides* with *A. nivea*.

5. *A. viridiflora*; caule simplici pubescente, foliis ovalibus oblongis lanceolatisve subsessilibus apiculatis subtus præcipue pubescens, umbellis lateralibus densissime multifloris subsessilibus, coronæ foliolis oblongis retusis erectis appressis dorso canaliculato longitudine columnæ cornu nullo. (TAB. CXLII. A.)—*Raf.*—*Pursh*, *Fl. Am.* v. 1. p. 181. *Torrey*, *Fl.* v. 1. p. 264.—*A. obovata*. *Ell.*—*B. lanceolata*; foliis elongato-lanceolatis crispatis. (TAB. CXLII. B.)—*A. longifolia*. *Mich.*?—*A. lanceolata*. *Ives*, in *Sillim. Journ.*

HAB. Head of Lake Erie. *Mr. Goldie*. About Carlton House Fort, both α . and β . *Dr. Richardson*, β . Banks of the Red River. *Douglas*.—Exceedingly variable in the form and length of its leaves. The species agrees with *Gomphocarpus* in the absence of the horn to the leaflets of the corona, but differs in the smooth follicles. The leaflets of the corona are singularly erect, oblong, rotuse, channelled down the back; the margins incurved and united by their lower half with the neck of the column, each having a small auricle on either side, at the top of the juncture.

TAB. CXLIII.—*Fig. 1*, Flower; *fig. 2*, Portion of the corona, seen from within:—*magnified*.

6. *A. incarnata*; pubescens vel glabra erecta ramosa, foliis oblongis lanceolatisve, umbellis terminalibus plurimis sœpe geminis, columnæ elongata, coronæ foliolis erectis ovalibus obtusis cornu subulato incurvo brevioribus.—*L.*—*Mich. Am.* v. 1. p. 115. *Elliott*, *Carol.* v. 1. p. 320. *Bot. Reg.* t. 250. *Torrey*, *Fl.* v. 1. p. 281.

HAB. Throughout Canada to the Saskatchewan. *Dr. Richardson*, *Drummond*.—Extremely variable in the length, and breadth, and downiness of the foliage; generally quite glabrous. Frequently, when the stem is otherwise glabrous, a hairy line runs along one side of it. The figure in *Bot. Register* is excellent. All that I have received from the American Botanists as *A. amena*, I cannot distinguish specifically from the present; indeed, the species of this genus have been very ill defined, and require careful revision. The leaflets of the corona and the horn appear to afford some of the best marks of distinction. The *A. amena* of Sweet's *Fl. Garden*, t. 82, seems to me referable to a deep-coloured state of *A. Syriaca*.

7. *A. quadrifolia*; caule erecto simplici paucifoliato, foliis ovatis acuminatis ciliatis oppositis subverticillatisque petiolatis, umbellis terminalibus solitariis v. geminis laxis, corone foliolla patentibus oblongis obtusis intus basin versus bidentatis cornu longioribus. *Jacq. Obs.* 2. p. 23. *Pursh, Fl. Am.* v. 1. p. 183. *Elliott, Carol.* v. 1. p. 319. *Torrey, Fl.* v. 1. p. 283.

HAB. Canada. Dr. Beck.

* * *Folia sparsa seu verticillata.*

8. *A. tuberosa*; erecta ramosa pilosa, foliis alternis lanceolatis sub sessilibus, umbellis numerosis terminalibus laxis, corone foliolis erectis lanceolatis intus bidentatis longitudine cornu subulati stricti.—L.—*Mich. Am.* v. 1. p. 117. *Pursh, Fl. Am.* v. 1. p. 183. *Elliott, Carol.* v. 1. p. 325. *Bot. Reg.* t. 76. *Torrey, Fl.* v. 1. p. 285.

HAB. Lake Huron. Dr. Todd.—Readily distinguished by its alternate leaves and bright orange-coloured flowers.

9. *A. verticillata*; erecta simplex gracilis, foliis sparsis verticillatisque linearibus, umbellis terminalibus axillaribusque, columnæ breviuscula, corone foliolis ovalibus cucullatis cornu curvato brevioribus.—(TAB. CXLIV.)—L.—*Mich. Am.* v. 1. p. 116. *Pursh, Fl. Am.* v. 1. p. 183. *Elliott, Carol.* v. 1. p. 324. *Torrey, Fl.* v. 1. p. 284.

HAB. Abundant on the alluvial plains of the Red River, and banks of the Saskatchewan, near Carlton House. Douglas.

TAB. CXLIV.—*Fig. 1.* Flower; *fig. 2.* Leaflet of the corona, with its horn:—*magnified.*

ORD. LIX. GENTIANÆ.* *Juss.*

Trib. I. SWERTIEÆ. *Inflorescentia racemiformis. Sepala sublibera, membrana scariosa intracalyicina juncta. Anthere immutata, rima loculorum sursum dehiscente. Capsula corolla marcescente plerumque cincta, placentis l. cum endocarpio valvulae connatis (semina ex ipsis valvulis oriunda,) l. in sutura valvularum spongiosis unilocularis, l. rarissime placenta centrali bilocularis. Corolla cereula, ochroleuca, l. purpurascens, saepissime punctis conspersa.—Herba, pleiaeque zonam arcticam subarcticam, tractusque alpinos, paucæ temperatas terras incolentes.*

I. GENTIANA. L.

Foveæ epipetalæ glanduliferæ O. Filamenta basi æqualia. Stigmata terminalia. Capsula unilocularis, placentis cum endocarpio connatis.

Sectio I. CYANE, Ren.—*Corollæ plicâ intermedia auctæ, e glandulosæ, lobi cum tubo continui. Stigmata distincta, revoluta. Capsula stipitata. Testa saepius ala discolori cincta. Herbae perennes.*

* I am indebted to the kindness of Dr. Grisebach for the following account of the British North American *Gentianæ*, which he has drawn up purposely for this work.

• *Corolla clavata apice crenivente.*

1. *G. Saponaria* (*L.*); caule ascendente, foliis ovato-lanceolatis obovatisque margine scabris, floribus aggregatis subsessilibus bracteatis, calycis integræ lobis tubum subrequantibus, corollæ cyanæ lobis ovatis obtusis plicis (fissa) duplo longioribus, antheris connatis, seminibus anguste latibus. *L. Sp. Pl.* 1. p. 330, (*excluso citat. Plukn.*) *Lam. Encycl.* 2. p. 637. *Ait. Hort. Kew.* 2. p. 111. *Sims Bot. Mag.* t. 1039 (excl. syn. *Froel. et Mich.*) *Pursh. Fl.* 1. p. 185. (excl. cit. *Audr.*)—*G. Catesbeii*. *Walt.* p. 109. *Nutt.* 1. p. 172.—*G. fimbriata*, *Vahl. Symb.* 3. p. 46.— β . *linearis*; foliis linear-lanceolatis, antheris demum liberis.—*G. Catesbeii*. *Ell.* 1. 339.—*G. linearis*. *Froel. Mon.* p. 37. *Pursh.* 1. p. 186.—*G. Pneumonanthe*. *Mich.* 1. p. 170.—*G. pseudopneumonanthe*. *H.* 5. et p. 146.—*G. puberula*. *Mich.*? 1. p. 170.

HAB.— β . has been collected in Canada, (*Mrs. Percival.*) in the neighbourhood of Quebec, and at Lake St. Charles. *Mr. Sheppard*, I have seen specimens of the broad-leaved var. from as far northward as Mary-land; but it undoubtedly occurs with its variety β . at the above-mentioned places, as they by no means specifically differ from each other. I am certain that this is the true *G. Saponaria* of Linneus; for his diagnosis, and the drawings which he quotes, viz. those of Catesby (*Carol.* 1. t. 70) and of Morison (*vol. 3. sect. 12. t. 5*) leave no doubt of it. The quotation of Plukenet is, however, erroneous. The drawing of Catesby also proves that *G. Catesbeii* (*Walt.*) is identical with our species; and it is natural that Froelich found fault with that drawing, from the absence of the plicæ, which may be easily overlooked in this species, but not in the following. *G. Saponaria* is much rarer than the following, which has been often taken for it as well by American as European botanists. The variety β . may be still commoner than α . which has been quite overlooked by some of the American botanists; as, for instance, Mlchaux, Elliot, and lately, Beck. This species is always of lower growth, but scarcely smaller-flowered, than the following: the leaves are somewhat coriaceous; the flowers almost all terminal and crowded: nevertheless, these characters, though valuable in general, are not constant in all cases; but I have not found that the variations which take place in the proportions of the lobi and plica corollæ, ever exceed certain bounds. There are, besides, most valuable characteristic differences afforded by the seeds of these species: *G. Saponaria* L. has oblong-winged seeds, the wing of which is narrow on both sides, and long and attenuated towards the ends; the seeds of *G. Andrewsii* are orbicular, and very broadly and equally winged; while those of *G. ochroleuca* have no wing at all. The connexion of the anthers, and the length of the lobi calycis, are of much less consequence. By the investigation of Sir W. Hooker, (in the *Companion to the Bot. Mag.* p. 171.) it has been proved that *G. Pneumonanthe* of the American authors is merely a variety of this species; and however distant they may seem to stand when studied only in their common forms, nevertheless the variety β . of *G. Saponaria* is so similar in some cases to *G. Pneumonanthe*, that it is very difficult to distinguish them. For in those forms in which the plicæ is quite entire, (as, for instance, in that of Dr. Boott, in the Hookerian herbarium, quoted by himself,) it is impossible to find out any decided difference in the structure of the corolla. I examined authentic specimens from Silesia, the lobi corollæ of which were blunt and somewhat converging. On the other hand, *G. Saponaria* has sometimes an open corolla, as *G. Pneumonanthe* commonly has. But there is a minute character, which seems to be most constant, and certainly has an important connexion with the whole of the species—viz. a distinct roughness on the margins of the leaves, so that they appear serrated under a magnifying glass, while *G. Pneumonanthe* is always entirely smooth: I think that that roughness is the remains of those seaceous forms, which exist almost in all American species of *Gentiana*.

2. *G. Andrewsii* (Grisb.); caule ascendente, foliis ovato-lanceolatis acuminatis margine

scabris, floribus aggregatis subsessilibus bracteatis, calycis integri lobis tubo brevioribus, corollæ cyanea plica fissa-subbiloba lobos corollæ oblitteratos excedente, antheris connatis, seminibus late alatis. *G. Saponaria*. *Froel.* p. 32 (*excl. synon.*) *Nutt.* 1. p. 172. *Elliott*, 1. p. 339. *Beck*, p. 239.— β , *linearis*; foliis anguste lanceolatis, clycicis lobis tubum subsequantibus, caule asperisculo. *G. Catesbeii*. *Andrews Bot. Rep.* 6. t. 418. *Aiton Hort. Kew.* 2. p. 112.

HAB. Both forms occur in Canada. *Mr. Cleghorn*. Lake Huron. *Dr. Todd*.—It is indeed with regret that I must apply a new name to a plant so well known, and widely dispersed; but it seemed necessary to call that plant of Linnaeus which has been proved to be identical with that of Walter *G. Saponaria*. The confusion of these species arose from Froelich's Monograph, who confounded this species with *G. Saponaria* of Linnaeus, of which he knew only the variety β ; but that did not agree with Linnaeus's diagnosis, and was therefore described by him as a new species. The confusion increased, when Michaux took the *G. ochroleuca* for Linnaeus' *G. Saponaria*. The *G. puberula* of the former is now a doubtful synonym, all species of this group being occasionally rough. If Pursh was right in referring it to *G. linearis*, F., it belongs to *G. Saponaria*, L., and would differ from *G. Pneumonanthus*, Mich. merely by the form of the plica; but as *G. Andrewsii* is the commoner plant of the two, it is probable that Michaux designated by his *G. puberula* the variety β of the latter, in which case his name should be adopted. It is desirable that this question should be determined by the inspection of Michaux's herbarium. Pursh does not seem to have well examined these species, as he quotes for his *G. Saponaria* the plates as well of Andrews as of Sims. He may have considered both the narrow-leaved varieties as one species, viz. his *G. linearis*, and the chief forms of both species as belonging to a second. This makes indeed the synonym of *G. puberula* Mich. the more doubtful: the corolla in both forms is described by Pursh in the same way, and indeed most unsatisfactorily. The best description of *G. Andrewsii* has been published by Elliott.

3. *G. ochroleuca* (*Froel.*); caule ascendente, foliis ovato-lanceolatis obovatisque margine scabriusculis, floribus terminalibus aggregatis sessilibus bracteatis, calycis integræ lobis inaequalibus tubum æquantibus, corollæ ochroleuca lobis ovatis obtusis, plica integra acuta brevissima, antheris liberis, seminibus exalatis.—*G. major virginiana*. *Pluku. alm.* 166. t. 186. f. 1.—*G. villosa*. *L. sp. pl.* 1. p. 330.—*G. Saponaria*. *Walt. p. 109. Mich.* 1. p. 176.—*G. ochroleuca*. *Froel.* p. 35. *Pursh*, 1. p. 185. *Elliott*, 1. p. 340. *Beck*, p. 239. *Sims*, *Bot. Mag.* 1531.

HAB. Canada. *Mr. Goldie*. Grows in sandy fields.—The two preceding species prefer a fat and somewhat humid soil. It is remarkable how much the form of the leaves varies in these species. The most frequent form of *G. ochroleuca* is perhaps an obovate leaf, but the broadest part is also very often near its base; I have seen many specimens with cordato-lanceolate leaves. Mühlberg, however, sent to Willdenow a specimen, the leaves of which are almost orbicular. It never occurs so narrow-leaved as the varieties of the preceding species, but generally the form of the foliage is analogous to that of *G. Saponaria*, while *G. Andrewsii* has commonly longer and narrower leaves, the broadest part of which is near their base. With respect to the similar variabilities of the corolla, see the excellent observations of Sir W. Hooker, in the *Companion to the Bot. Mag.* l. c.

* * *Corollæ sensim ampliata aperta.*

4. *G. affinis* (Griseb.); caule ascendente, foliis margine scabris inferioribus obovato-oblongis obtusis, superioribus lanceolatis acutiusculis, floribus subsolitarii sppositis pedi-

cellatis bracteatis, calyce integro, corollæ cyaneæ lobis oblongo-lanceolatis plicam apice fiseam triplo superantibus, antheris liberis, seminibus ovalibus alâ tenui cinctis.

Habitus G. Pneumonanthis. *Herba* ascendenti-erecta, pedalis. *Caulis* solitarius, striato-subangustatus, pennam corvinam crassus, simplex, plerumque hirsutiusculo-scaber. *Internodia* inferiora semiuncialia, superiora sensim longiora. *Folia* erecto-patentia, glabra, margine ad lensem serrulata, substantia foliarum uaque ad punctum connationis producta, inferiora obtusissima (10" longa, 4" lata), cetera oblongo-lanceolata et lanceolata, rigidiuscula, obsolete 3-5uncialia (unciam longa, 1½"-2½" lata.) *Flores* solitarii in super-ordinibus axillulis; inferiores longius pedicellati, tres summi approximatim, singuli bracteati. *Sepala* foliacea, subaequalia, membranâ intra calycina duplo breviori conglutinata, oblongo-linearia, acutiuscula, corolla duplo breviora, distantia (hinc membrana illa aucta), calyx truncatus, integer, turbinatus. *Corolla* (facie *Gentiana Pneumonanthis*) cyanea, lobis oblongo-lanceolatis, obtusis, patentibus, tubo triplo brevioribus. *Genitalia* inclusa. *Antheræ* ovales, basi obtuse cordata. *Ovarium* oblongo-lineare, utrinqua attenuatum, stigmatibus connatis, sub anthesi erectiuscula. *Capsula* elliptico-oblonga, in brevem stipitem attenuata, corollam marcescentem æquans. *Semina* creberrima, plana, ovalia, alâ tenui æquali circumdata.—Differt a *G. Saponaria* s., cui proxima: inflorescentia, sepalis acutiusculis nec acuminatis, corollæ loborum ac tubi figurâ, antheris liberis, earum seminum formâ; a *G. adscendente*. Cervant. mscrpt. floribus bracteatis, corollæ lobis oblongo-lanceolatis nec obovatâ, rotundatis, caulo scabro; a *G. triflora* Pall. floribus pedicellatis, plica apice fissa, foliis margine scabris, inferioribus latioribus, canale scabro, seminibus alatis; a *G. angustifolia* Mich. inflorescentia, floribus bracteatis, corollæ lobis obtusis, foliis margine scabris, latioribus, etc.; a *G. Pneumonanthe*, L. antheris liberis cordatis, plica apice fissâ, foliis margine scabris, inferne densioribus, pedicellis oppositis.

HAB. Carlton House to Edmonton House. *Mr. Drummond.* Vallerys of the Rocky Mountains. *Mr. Douglas, Mr. Drummond.* Abundant in the mountain vallerys, between Spokane and Kettle Falls, in alluvial deposits. *Mr. Douglas.*—There is a variety in which the under leaves are reduced to scales. This species stands indeed very near those above mentioned.

5. *G. angustifolia* (Mich.); caule flexuoso, foliis linearibus obtusis (hinc cuspidatis) margine levibus, flore unico terminali pedunculato ebracteato, calyce integro, corollæ cyaneæ lobis ovato-oblongis obtusis plica multifidâ duplo longioribus, antheris connatis demum liberis.—*Mich.* 1. p. 177. *Pursh*, 1. p. 186. *Beck* p. 240.—*G. purpurea*. *Walt. Carol.* 109.—*G. porphyritis*. *Walt. App.*—*Gmel. Sib.* v. 5. p. 462.

HAB. Canada. *Mr. Goldi*+. It grows in sandy fields and pine barrens.—*G. frigida*, H. and K., has been found by Chamisso on the opposite shore of Behring's Strait, at the Gulf of St. Lawrence, and must undoubtedly occur also on the American side, although it does not seem yet to have been detected.

6. *G. Sceptrum* (Griseb.); caule stricto elato, foliis oblongo-lanceolatis elongatis obtusis margine levibus, pedunculus axillaris oppositus 2-3-floris, calyce integro, corollis cœruleis, plica vix producta integrâ, antheris liberis. (TAB. CXLV.)

Caulis 3-4-pedalis, pennam ansorinam (inferne cygneam) crassus, strictus, teres, striatus, glaberrimus, foliosus, prætor inflorescentia simplex, siccitate flavescentia. *Internodia* inferiora sesquiuncialia, superiora subaequalia 2-3 uncialia folia æquantia l. paulum excedentia. *Folia* erecta, cauli approximata, inferiora elongato-lanceolata (bluncialia), media oblongo-l. elliptico-lanceolata, basi lata, connata, apice obtusa, (2-2½ unc. longa, 10-12 lin. lata,) superiora elliptico-oblonga (sesquiuncialia, unciam lata,) omnia septemnervia, nervo medio prominente, levia, glaberrima, margine subrevoluto levii. Ex superioribus axillis enascuntur *pedunculi* oppositi, nudi, erectiusculi l. apice subcernui, inferiores folium superantes, superiores

vix squantes, 2-3-flori, floribus sessilibus in involucro duarum bractearum, (raro 1-flori, flore bilobato.) *Flores* oblique erecti. *Sepala* fallacea, distantia, inæqualia, ovata, lanceolataque, unciam longa, membrana intracalycinæ duplo breviori. *Corolla* fere biuncialis, ex basi attenuata sensim ampliata, lobis erectis late ovatis, obtusiusculis, tubo quinque brevioribus, plica truncata l. breviter triangulari. *Stamina* tubo breviora, antheris incumbentibus sagittatis. *Germe* oblongo-lineare, utrinque attenuatum, stylo recto longiusculo. *Capsula* elliptico-oblonga, in stipitem aque longum attenuata, stigmatibus duabus crassis atris reflexis coronata, corollam marcescentem auctam æquans. *Semina* oblonga, flavo-brunnea, testa grossa areolata, altero latere tenuissime alata, altero exalata, apice et basi processu aseiformi instructa.

HAB. Plentiful in low moist soil near Fort Vancouver. **Mr. Douglas.** Swamps in woods near the Columbia River. **Dr. Gairdner.**—This is one of the most beautiful and distinct species of the genus; it has no resemblance whatever with any individual of the group *Cyane*, and stands nearer, as regards habit, the group of *Celanthe*, Ren., to which belong *G. purpurea*, L. and some other species: it is especially like a new one of that group from Kamtschatka, but differs from all of them by the long-stalked capsules. The singular inflorescence contributes much to elucidate the pseudo-verticilli of *G. lutea*, L.

TAB. CXLV.—Fig. 1, Flower laid open:—nat. size.

7. *G. platypetala* (Griseb.); caule ascendentे, foliis abbreviatis ovato-subrotundis, flore unico terminali sessili, calycis integri lobis ovatis acuminatis, corollæ cœruleæ lobis reniformibus mucronatis plicam triangularem integrerrimam duplo superantibus, antheris liberis.

Radix repens, annulis densis obsessa, superno foliorum emarginatorum vestigii tecta. *Caulis* plures ex eadem radice, spithamei, inferni nudi, superne denso foliosi. *Folia* ovato-subrotunda l. ovato-oblonga (8" longa) internodia superantia. *Flos* in folia suprema immersus. *Calyx* patulus, 5-fidus, rubicundus, corolla duplo brevior, sepalis membranâ intracalycinâ basi connexis. *Corolla* basi lata, sensim ampliata, unciam longa; lobis erecti, vix 2" longi, ex basi angustiori dilatati, apice fero truncati, cuspidato-mucronati, medio latiores quam longi. *Plica* acutissima. *Genitalia* tubo multo breviora. *Antheræ* incumbentes. *Ovarium* elliptico-lineare. *Capsula* elliptico-oblonga.

HAB. In the island of Sitcha, where it was found during the second expedition of Capt. Kotzebue, I have seen specimens in the herbarium of Chamisso, and am not aware that it has been as yet described by Russian botanists.—This constitutes, together with the two following species, a small, but very remarkable and distinct group. Their general appearance is similar to *G. septentrionalis*, Pall.; they have a thick and creeping root, often marked by singular rings, formed by concentric ruptures of the epidermis;—these gradually loosen, and afterwards become contracted; the stem is low and ascending, sometimes more than one grows from the same root; their leaves are short, roundish, and bent downwards; the flowers have no peduncle whatever, they are always solitary at the summit of the stem, the calyx being in immediate connexion with the uppermost leaves; the seeds seem to be angular and not winged; at least such is the case in *G. calycosa*.

8. *G. calycosa* (Griseb.); caule ascendentے, foliis abbreviatis ovato-l. cordato-subrotundis margine scabriusculis, floribus solitariis terminalibus sessilibus, calyece integro, lobis latissime foliaceis inæqualibus, corollæ cœruleæ lobis ovato-oblongis acutis, plica multifida, antheris demum liberis. (TAB. CXLVI.)— β . *stricta*; caulis cæspitosus, strictissimus, simplicissimus, foliis acutioribus duplo brevioribus internodia æquantibus, radice fasciculata, hinc annulata.

Radix repens, crassa, nigra, absquo annulis. *Caulis* cæspitosi, æquales, laxi, spithamei, basi squamis involuti, teretes, sulcato-striati, simplices l. parco ramosi, ramis alternis flexuosis cuuli similibus. *Internodia* uncialia, superiora paullum longiora. *Folia* intima squamæformia, ovata, obtusa, connato-vaginantia:

superiora sensim majora, ex basi cordata l. late ovata subrotunda l. rotundato-triangularia, obtusissima, 3-nervia, margine ad lumen serrulata, horizontaliter patentia, summa fiori approximata. *Flores* solitarii in apice caulis et ramorum immersi. *Calyx* tubus turbinatus, (4" longus) membrana intracalycina formatus; lobi ejusdem fere longitudinis, foliacei, late ovati l. cordato-triangularares, basi supra incumbentes, obtusissimi, longiores dimidiata corollam sequentes. *Corolla* clavata, (unciam longa, dimidiata unciam lata.) *Lobi* ovato-oblongi, apice triangulari acuto, tubo triplo breviores, plica triangulari multifida acutissima duplo longiores. *Genitalia* dimidiata corollam aquantia. *Antheræ* juniores connatae, demum libere, oblonge, sagittatæ, incumbentes. *Germen* oblongo-lineare, apice longo attenuatum, stigmatibus revolutis. *Capsula* elliptico-oblonga. *Semina* triangularia, 3-carinata, oblonga, striato-asperiuscula, altero latere acuta.

HAB. Both forms occur at Mount Rainier, on the north-west coast. Mr. Tolmie.—The structure of the lowermost leaves is remarkable; they are commonly reduced to little scales, the opposite pairs of which are so far coherent as to form a loose vagina round the stem of three or four lines in length. I saw a similar abortion in *G. Pneumonanthe*, L., but the vagina did not proceed so far. The same peculiarity occurs in the following species.

TAB. CXLVI.—A. var. β . *Fig. 1*, Flower laid open:—slightly magnified.

9. *G. Menziesii* (Griseb.); caule erectiusculo, foliis abbreviatis oblongo-ellipticis obtusis margine levibus, flore unico terminali sessili, calye dimidiato utrinque latissimo, corollæ lobis cordato-dilatatis triangulari-acutis, plica brevi 2-3crenata, antheris liberis.

Radix crassa, apice squamosa. *Caulis* solitarius, simplicissimus, pedalis, striatus, inferne squamatus, superne foliosus. *Internodia* subaequalia, uncinalia. *Folia* patentia, connata, ex basi subobliqua, semi-ovata, late ovalia, obtusa l. obtusiuscula, 8-5-nervia, (unciam longa, 8" lata.) *Vaginae* calycine subaequales, late ovata l. ovato-oblongæ, spicæ hinc processibus viridibus (sepolorum rudimentis instructæ. *Corolla* uncinalis, clavata, lobi ex basi transverse truncata dilatata, spicæ triangulari acuto, tubo duplo breviores, plica brevissima l. truncata crenulata. *Stigmata* elongata, revoluta. *Germen* oblongo-lineare.

HAB. North-West Coast. Mr. Menzies.—This plant is most like *G. platypetala*, from which it differs by the form of the leaves and of the corolla, the base of which runs to a point in this species, while it is very large in *G. platypetala*, and also by the form of the *lobi corollæ* and the *plica intermedia*, as is stated in the diagnosis.

10. *G. glauca* (Pall.); caule humili ascende, foliis obovato-spathulatis glaucis margine leviusculis, floribus paucis terminalibus, calye integro, corolle pallide cæruleæ lobis ovatis obtusis plicam integrum multo superantibus, antheris liberis, seminibus tenui ala cinctis. (TAB. CXLVII.)—Pall. Ross. 2. p. 104. t. 93. f. 2.—*G. cespitosa*. Graham, in Edinburgh Philos. Journ.

HAB. In the Rocky Mountains. Mr. Drummond.—This does not differ at all from the Asiatic plant. The circumstance of the existence of this species in the Rocky Mountains, is a valuable contribution to the laws of the geographical distribution of the Gentians; the greater part of those species which adorn the short summer of the Arctic Zone being again to be met with in the similar climate of the higher mountains of lower latitudes. Many examples of this fact are known with regard to European species, but scarcely one among those of the new continent, all the numerous species of the Andes being confined to those latitudes. *G. glauca*, however, affords an instance of a similar distribution to that above quoted; Steller having detected it in Behring's Island, Pallas in Kamtschatka, and Chamiso on both shores of Behring's Strait. Now, though the spot where Mr. Drummond found it, in the Rocky Mountains, lies under the same latitude with Kamtschatka, it is not to be forgotten that the isothermal line declines there to the south.

TAB. CXLVII.—*Fig. 1*, Flower; *fig. 2*, the same laid open; *fig. 3*, capsule; *fig. 4*, seeds:—magnified.

Sectio II. CHONDROPHYLLA, Bg.—*Corolla plica intermedia aucta, eglandulosa, infundibuliformis. Stigmata distincta, revoluta. Capsula longe stipitata. Testa appressa, exalata. Folia margine cartilaginea.*

11. *G. prostrata* (Hk.); caule basi ramoso, ramis unifloris, foliis ovali-spathulatis recurvato-obtusatis margine lœvibus apice muticis, calycis lobis ovato-lanceolatis erectis, ploris parvulis bifidis, capsula juniori elliptico-oblonga basi attenuata adulta basi ovata apice attenuata.—*G. prostrata*. *Henk. in Jacq. Coll. 2, p. 66. t. 17. f. 2. Froel. p. 75.*—*G. aquatica, a.* *Froel. p. 78? ex descr.*—*G. nutans*. *Bg. in Mém. de l'Acad. de Moscou, v. 7. p. 292. t. 11. f. 2. (forma elongata flore nutante.)*

HAB. Rocky Mountains. *Drummond*. Bay of Good Hope, Russian America. *Chamisso*.—There are two forms of this species, both collected by Mr. Drummond,—one scarcely an inch long, with two or three branches, and quite identical with the *G. prostrata* of the German Alps,—the other three to six inches high, with many ascending branches of equal length, and the leaves more distant; besides, the flowers are larger, but they are not drooping in the specimen from the Rocky Mountains, as in those collected by Chamisso. The latter form is peculiar to North America, but by no means specifically distinct. This species is very similar to *G. humilis*, Stev. or *aquatica* of many authors, but it differs by the small bifid plicæ, the form of the fruit and the leaves, and a short style, the latter having no style, oblong-lanceolate leaves, an obovate capsule, and roundish plicæ, nearly as long as the lobes of the corolla. Some other species, which stand next to *G. humilis*, have been well analyzed by Mr. Bunge. *G. prostrata* has been found by Mr. Darwin, at the Straits of Magellan!

Sectio III. TRETORRHIZA, Ren.—*Corolla plica intermedia bifida aucta, eglandulosa, hypocrateriformis. Stigmata distincta, revoluta. Capula sessilis. Testa appressa exalata.—Herbae perennes.*

12. *G. Douglasiana* (Bong.); caule a basi ramoso tenero, foliis ovalibus cordatisque margine leviusculis, calyce integro, corollæ albae lobis oblongis obtusis tubo duplo brevioribus. (*TAB. CXLVIII.*) *Bongard, Veg. de Sitcha, p. 38. t. 6.*— β . *patens*, ovario obovato stiligerō, caule altiori, ramis stricte patentibus nudiusculis subfastigiatis, corolla profundius partita, plica longiori. (*TAB. CXLVIII. B.*)—*G. trichotoma*. *Menz. mscr. in Herb. Hook.*

HAB. In swamps; abundant at Fort MacLoughlin, Millbank Sound, N.W. Coast. *Mr. Tolmie*. In the island of Sitcha. *Mr. Mertens*. β . in the marshes of the N.W.C. *Dr. Scouler*, *Mr. Menzies*. Near Fort Vancouver. *Mr. Garry*.—The dried plant has always a somewhat dirty yellow colour. The plate of Mr. Bongard, though representing with great precision the specimens which had been collected by the late Mr. Mertens, does not well express the appearance of the common form, as those specimens were not yet quite developed: the flowers are not so crowded; the internodia are longer; the branches elongated, rather feeble, and commonly one-flowered. As the fruit has not been seen by Mr. Bongard, I add the following notes to his description:—*Capsula elliptico-oblonga*, apice attenuata, compressa, superne marginata, corollam equans. *Semina nigra*, oblonga, angulata, exslata, utrinque acuta, lœvia, juniora pilosula, valvula utrique binis seriebus juxta suturas inserta.—The appearance of the variety β . is very singular, and the characters of its germen seem to be constant; but I sometimes saw a short distinct stylus also in the common form, and the shape of the leaves is quite identical.

TAB. CXLVIII.—A. var. α .—B. var. β .—Fig. 1, Flower; fig. 2, The same laid open.

Sectio IV. ARCTOPHILA.—*Corolla plica intermedia destituta, inter basi. filamentorum glandulifera, infundibuliformis. Stigmata distincta, revoluta. Capsula sessilis. Semina globosa, exalata.*—*Herba annua. Glandulae corollinæ hinc inde abortu desunt.*

13. *G. aurea* (L.); caule humili basi in ramos cauli similes diviso superne aubsimplici, foliis septennerviis, imis elliptico-oblongis basi attenuatis, caulinis late ovatis obtusiusculis, sepalis margine lævibus vix basi junctis inæqualibus versus apicem ampliatis corollam subæquantibus, corollæ 5-v. 4-fidæ albee lobis ovato-lanceolatis cuspidatis setula terminatis tubum campanulatum sensim ampliatum subæquantibus.—*L. Sp. Pl. I. p. 331.*—*G. involucrata. Fries, in Act. Hafn. 10. t. 1. f. 2. A. B.*

HAB. Greenland. Vahl, jun.

14. *G. aleutica* (Cham. et Schlecht.); caule humili a basi ramoso, foliis obscure trinerviis, imis spathulatis, caulinis ovatis acutis, calycis lobis linearis-oblongis inæqualibus margine scabris tubum æquantibus, longioribus corollæ tubo subbrevioribus, corollæ 4-fidæ violaceæ lobis ovatis acutiusculis muticis (margine hinc setulosis) tubo campanulato sensim ampliato duplo brevioribus. *Cham. et Schlecht in Linnaea, I. p. 175.*—*G. Unalaschkensis. Bg. in Nouv. Mém. de la Soc. de Moscou, I. p. 240. t. 9. f. 2.*

HAB. Unalaschka. Chamisso.

15. *G. arctophila* (Griselb.); caule humili basi in ramos cauli similes diviso superne simplici triflori, foliis obscure 3-nerviis, imis obovato-oblongis basi attenuatis, caulinis ovato-oblongis acutis, sepalis margine scaberrimis vix basi junctis inæqualibus, majoribus corollæ tube brevioribus, corollæ 4-fidæ cæruleæ lobis ovato-triangularibus basi superincumbentibus acutissimis setula terminatis (margine lævibus) tubo ex basi lata sensim æqualiter ampliato triplo brevioribus. (TAB. CXLIX.)—*G. densiflora; floribus tribus terminalibus approximatis, foliis caulinis cordato-ovatis l. cordato-lanceolatis obtusiusculis, sepalis duobus maximis corollæ tubum æquantibus l. superantibus, minoribus anguste lanceolatis abbreviatis. (The colour of the flowers is, perhaps, also different, since all the corollæ of this variety have kept their bright blue, as the colour was stated by Mr. Drummond; while the specimens from the Arctic sea-coast have now whitish flowers, with a violet tint here and there.) TAB. CXLIX. B. B.*

Radix tenuis, simplex, curve descendens. *Caulis* basi infra ramificationem folia quibusdam rosulatus; rami inæquales, partim decumbentes, partim descendentes, medius plerumque major erectiusculus 2-3uncialis, minores unciales, omnes 3-(arius 1) flori, unico pari foliorum instructi, teretiusculi. *Folia* ima obovato-oblonga obtusa l. elliptico-oblonga acutiuscula, margine ad lentem tenuissime serrulata, (6-8" longa, 3" lata;) caulina supra medium ramum sita, ovato-oblonga, sessilia, acuta, sepe acutissima, (6-9" longa, 2-4" lata.) *Pedicelli* laterales ex axillis foliorum caulinorum 2-6" longi; *pedunculus* terminalis 8-12" longus, ebracteatus. *Calyx* fere ad basin divisus, sepalis foliis caulinis simillimis. *Corolla* fere uncialis, infundibuliformi-hypocrateriformis, tube basi 2", apice 4" lato. *Filamenta* alata, basi latiora. *Antheræ* parva, oblongæ, violaceæ, incumbentes. *Ovarium* oblongo-lineare, stamina corolleque tubum æquans. *Stigmata* 2 oblongo-linearia, revoluta, ovario imposita, quam in ceteris *Arctophilis* longiora. *Capsula* oblongo-linearis, corollam marcescentem æquans, seminibus minutissimis fuscis applanatis invibus exalatis in utraque valvula biserialibus.—*Species* ludit sepalis inæqualibus; etiam scapis unifloria cæspitosis.

HAB. Arctic Sea-Coast. **Dr. Richardson.** **3.** Rocky Mountains. **Mr. Drummond.**—This affords another instance of the occurrence of the same species at the level of the sea in the north, as well as at a certain height in lower latitudes. It approaches nearly to *G. propinqua*, Rich., but it seems to differ constantly, since its exterior habit, and the manner of its ramification, is indeed anything but analogous. In Chamisso's specimens of the latter species, the lobes of the corolla are lanceolate, and not superincumbent, at their base; but, among that great series of specimens which have been collected on Capt. Franklin's expedition, are to be found flowers wholly similar to those of *G. arctophila*, differing, indeed, only in having their corolla always much slenderer and narrower at the base of its tube, as well as somewhat serrated at its lobes.

TAB. CXLIX.—A. var. α . B.B. var. β .—*Fig. 1*, Flower of β ; *fig. 2*, The same laid open:—*magnified*.

16. *G. propinqua* (Rich.); caule gracili basi flagellifero superne subsimplici, foliis imis spatulatis, superioribus oblongo-lanceolatis lanceolatisque acutis, sepalis margine lăvibus basi junctis valde inæqualibus, binis ovatis acutis tubum corollæ æquantibus, binis lanceo-lato-linearibus brevioribus, corolle 4—(5?)-fidæ cæruleæ lobis ovato-lanceolatis acuminitatis simis setula terminatis (marginè hinc setulosis) tubo obconico fere duplo brevioribus. (**TAB. CL.**)—**Richardson in Narr. of a Journey by Frankl.** p. 734.—**G. Rurikiana. Cham. et Schlecht. in Linnæa**, 1. p. 176.—**G. setiflora. Bg. l. c. p. 242. t. 9. f. 4.**— **β . *densiflora***; floribus terminalibus aggregatis a foliis floralibus involucratis, foliis caulinis ovato-oblongis obtusis, foliis radicalibus spatulatis rosulatis, flagellis erectiusculis foliosis apice densifloris caule dimidio minoribus, caule humiliori.

HAB. Alpine swamps in the Rocky Mountains (**Mr. Drummond**), together with the variety. Cumber-land House to Bear Lake, and Bear Lake River. **Dr. Richardson.** Escholtz's Bay. **Chamisso.**—This species is chiefly characterised by a great many small branches or flagella, which rise from the axillæ of the radical leaves, and from the inferior ones of the stem. They are very slender, one or two inches long, commonly with one pair of leaves and one terminal flower, which is considerably smaller than the flowers of the stem. There are specimens with twenty such branchlets. This species grows along with *G. acuta*, Mich., some forms of which are so strikingly like this plant, that one would easily think them not specifically different, the more so as the beard of *G. acuta* sometimes almost totally disappears, and the existence of glands between the filaments in the section *Arctophila* is also variable. The cuspidate lobes of the corolla, however, afford a character which never fails.—The original specimens did not present a 5-cleft corolla; but this is a point of no value at all in this group of *Gentianæ*, and Chamisso's and Richardson's plants are quite the same. In the drawing of Mr. Bunge, the shape of the leaves, and of the lobes of the corolla, is not well given.—The variety β , is in fact so similar to *G. aleutica*, Cham., that it is impossible to distinguish them in any other way than by the calyx, the lobes of which are regular in the latter, and united in a tube half as long as themselves. Also, the leaves of the stem are still larger and more stem-clasping. It seems that the constancy of these characters is still to be proved by investigations on the spot. Transition forms between that variety and the common appearance of *G. propinqua*, Rich., are frequent.

TAB. CL.—*Fig. 1*, Flower; *fig. 2*, The same laid open:—*magnified*.

17. *G. quinqueflora* (Lam.); caule vegeto a basi ramoso, ramis oppositis, foliis imis obovato-linearibus paucis, ceteris cordato-ovatis (acutissimis) 5—7 nerviis, calycis corolla quadruplo brevioris lobis subulatis æqualibus margine scabriusculis tubum æquantibus, corollæ 5 fidæ cæruleæ lobis triangularibus acutissimis setula terminatis (margine lăvibus) tubo

obconico quadruplo brevioribus.—*Lam. Encycl. 2. p. 643. Bot. Mag. t. 3496.*—*G. quinquefolia. L. Sp. 1. p. 333.*—*G. amarelloides. Mich. 1. p. 177. Pursh, 1. p. 186.*

HAB. Canada. *Mrs. Percival.*—The specimens differ somewhat from the common form, in having blunt leaves and a divaricating inflorescence.

18. *G. tenuis* (Griseb.); caule stricto subsimplici, foliis linearibus obtusis (mucronatis), sepalis margine scaberrimis basi vix junctis inaequalibus longioribus tubum corollæ eequalibus, corollæ 4-fidæ albidae (?) lobis oblongis obtusissimis mucronulatis tubo cylindrico duplo brevioribus. (TAB. CLI.)

Radix tenuis, descendens, ramosa. *Caulis* spithameus l. pedalis, strictissimus, subsimplex, teretiusculus, a basi ad apicem regulariter foliosus, basi rubricundus. *Internodia* ima semiuncialia, cetera uncialia, hinc ossequiuncialia. *Folia* exakte linearia, basi latiscula, apice rotundato mucronulato, l. cuspidato, l. acuminate, obsolete trinervia, margine ad lentem croberrime serrulata, obscure viridia, basi connato-amplexantia, (unciam longa, 1-1 $\frac{1}{2}$ " lata.) *Flores* tenues, parvi, in axillis superioribus subsessiles, erecto-apressi; terminalis longius pedicellatus. *Sepala* lanceolata, acuminate. *Corolla* siccæ albida, infundibuliformi-hypocrateriformis, (3" longa, 1 $\frac{1}{2}$ -2" lata.) *Glandula* inter basin filamentorum. *Copilli* hinc 3-5 tenues in lobis corollæ. *Genitalia* tubula sequantia. *Antheræ* rotundæ, incumbentes. *Germen* ellipticum, stigmatibus parvulis vix revolutis. *Capsula*—?

HAB. At the Mackenzie River. Cumberland House to Bear Lake. *Dr. Richardson.*—There is no species of the least analogy with this in the group of *Arctophila*, the appearance being exactly that of *G. Amarella*, or *G. acuta*; but as glands occur between the filaments, which have not been observed in the group of *Endotricha*, and on the other hand, as there is seldom a trace of a beard in the corolla, it will be more convenient to bring this species into this group, although it must be observed that it unites most naturally with that of *G. Amarella*. Besides, it differs from the latter by the peculiar form of the leaves, and of the lobes of the corolla.

TAB. CLI.—Fig. 1, Flower; fig. 2, Pistil:—magnified.

Section V. ENDOTRICHÆ, Bg.—*Corolla* plica intermedia destituta, eglandulosa, hypocrateriformis, corona fimbriarum aucta. *Stigmata* distincta, revoluta. *Capsula* sessilis. *Semina* globosa, exalata.—*Herba annua.*

19. *G. tenella* (Fries); caule basi ramoso, ramis nudis elongatis unifloris, sepalis obtusis duobus majoribus, corollæ 4-fidæ tubo cylindrico lobos subæquante.—*Fries, in Act. Hafn. 10. p. 436.*—*G. glacialis. Thom. App. Vill. Delph. 1. App. 532.*—*G. dichotoma. Pall. Ross. 2. p. 110.*—*G. borealis. Bg. l. c. p. 257. t. 10. f. 2.*

HAB. At Behriog Strait, on the shore of the sea at Kotzebue's Sound. *Chamisso.*—This form is a foot high, and very straight; the sepalæ are almost as long as the corolla: on which differences Mr. Bunge established his *G. borealis*. But the same appearance occurs not only in Norway, but sometimes also in the Alps, and there is no constancy in these characters.

20. *G. acuta* (Mich.); caule gracili erecto ramoso, foliis connato-vaginantibus, inferioribus oblongo-spathulatis, superioribus oblongo-lanceolatis acutissimis, calyce subæquali corollam dimidiâ vix æquante.—*Mich. Bor. Am. 1. p. 177.*—*G. plebeja. Bg. l. c. p. 250. t. 9. f. 5.*—*G. Amarella. Richards. in Narrat. l. c.—β. stricta, caule 2-4 pedali, racemis axillaribus strictis elongatis erectis, calyce inæquali, foliis æqualibus, floribus siccis flavescentibus.*

HAB. α . and β . Canada to the Rocky Mountains and Slave Lake. *Michaux*, *Dr. Richardson*, *Douglas*, *Drummond*.—The common appearance is much more slender than in the drawing of Mr. Bunge, the leaves are narrower and the branches shorter; but the same form as that from Unalaschka occurs also in the Rocky Mountains.

This species is extremely like our *G. Amarella*; it seems, however, to differ constantly in the way the leaves embrace the stem. In *G. Amarella* the lamina of the two leaves ends at that point where they are affixed to the stem, so that they are separated from each other by an interspace formed by the stem; while in *G. acuta* the bases of both leaves touch each other without any interspace, so that the substance of the leaves itself is somewhat connate: this character seems to be invariable throughout all those numerous forms in which these species are so rich; the upper leaves of *G. acuta* are, besides, always longer and more acute, and the leaves near the root are more or less spatulate, while in *G. Amarella* the leaves are always more equal in the same individual; the beard of *G. acuta* is longer and thinner, so as to disappear almost wholly here and there; the flowers are somewhat smaller; the calyx is shorter and more unequal; the stem more angular, and commonly almost winged. Besides, most of its forms are much stiffer, taller, and more branched; the stem often produces such slender and numerous branchlets from the under axille as has been mentioned above of *G. propinqua*.—*G. acuta*, Nutt., which has been doubtfully referred to *G. campestris*, certainly is the species of Michaux, which seems the only one of *Endotrichæ* widely dispersed through the northern parts of the new continent, and the varieties of which are as manifold as those of *G. Amarella*.

Sectio VI. CROSSEOPETALUM, Froel.—*Corolla*, *plica intermedia* *destituta*, *glandulis interbasin filamentorum auctæ*, *lobi cum tubo continuo* *l. expansi* *margine fimbriati*. *Stigmata* *lata orbiculata* *distincta*. *Capsula stipitata* *l. basi attenuata*. *Testa exalata* *aculeis molibus tecta* (*l. rarius lavis*).—*Herbæ annuae et perennes*.

21. *G. detonsa* (Fries.); caule stricto, pedunculis superne nudis, foliis oblongo-lanceolatis linearibus basi attenuatis, corollæ lobis tubum subequalibus oblongis rotundatis margine versus apicem serratis medio ciliato-pechinatis basi integerrimis, seminibus aculeatis.—*Fries*, in *Act. Hafn. l. c. t. 1. f. 3.*—*G. brachypetala*. *Bg. l. c. p. 225. t. 11. f. 3.* (*specimen defloratum*)—*G. ciliata*. *Gunn. Norv. 2. p. 88. t. 2. f. 3-5.*—*G. serrata*. *Gunn. 2. p. 101. (forma cor. 5-fida.) Fl. Dan. 317.*—*G. barbata*, radice bienni, caule erecto ramoso, foliis caulini longissime acuminatis, corolla duplo majori, stigmatibus ovario obovato impositis (in planta sibirica; in americana plerumque ovarium ellipticum et stylus conspicuus.)—*G. barbata*. *Froel. p. 114. Sims, Bot. Mag. t. 639.*—*G. ciliata*. *Pall. Ross. 2. t. 92. f. 2.*—*G. simplex*, radice bienni, caule simplici unifloro gracillimo superne nudo, corolla ut in β , foliis imis linearispathulatis, superioribus linearibus. *G. barbata*, *simplex*. *Bg. l. c. p. 224. t. 9. f. 1.*—*G. intermedia*. *Richards. ms.*

HAB. Huron Lake. *Dr. Todd*. Slave Lake, passing into β . *Dr. Richardson*. Edmonton House to Carlton House on the Saskatchewan. *Mr. Drummond*, Arctic sea-shore. *Dr. Richardson*.— β . Canada. *Mrs. Percival*, *Mr. Sheppard*. Huron Lake. *Dr. Todd*. Banks of the Maitland River. *Mr. J. Macnab*. Cumberland House to Bear Lake. *Dr. Richardson*. Saskatchewan and Rocky Mountains,—with forms passing into α . and β . *Mr. Drummond*.—The name given by Fries is the oldest one for this polymorphous species; the variety, which has been nicely drawn by Mr. Bunge, proving that there are no certain limits between *G. barbata*, Froel. of the Altai, and *G. detonsa*, Fries, of the Arctic Zone and Lapland. This was the more clearly shown by the large collection of American specimens which I have been able to examine:

even the shape of the ovarium, which I considered before to afford constant characters, is here not less liable than the regularity or irregularity of the calyx, as well as the large size of the flower. It seems to depend upon the nature of the locality, whether the root be biennial or annual.—The American *G. barbata* differs somewhat from the Altai form, by the lower leaves being more blunt, and by having a distinct style and nearly equal calyx. Though these characters are by no means constant, one may form, on these grounds, an American variety; but we find, here and there, specimens which are quite identical with some Siberian ones; besides, the variety β . occurs in both countries.

22. *G. crinita* (Froel.); caule stricto multifloro folioso, foliis cordato-lanceolatis, pedunculis superne nudis elongatis, corollæ lobis oblongis rotundatis margine fimbriatis, fimbriis deorsum longioribus basi lobi nullis, ovario ovato-lanceolato, seminibus aculeolatis. *Froel.* p. 112. *Pursh.* 1. p. 188. *Beck.* p. 240. *Bot. Mag.* t. 2031.—*G. fimbriata*. *Andr. Bot. Repos.* t. 509.—*G. ciliata*, Americana. *L.*

HAB. Canada. *Mr. Goldie*.—This is widely dispersed throughout the United States.

23. *G. ventricosa* (Griseb.); caule stricto gracili, foliis caulinis ovato-oblongis obtusis, calyce inaequali alato ventricoso corollam involvente, corollæ lobis æqualiter crenato-fimbriatis. (TAB. CLII.)

Radix annua, tenuis, ramosa. *Caulis* pedalis, strictus, glaber, teres, striatus, præter ramos quosdam inaequales unifloros secundos simplex, superne gracilis. *Internodia* ima uncialia, cetera sensim longiora, 2–3-uncialia. *Folia* margine ad lentem tenuissime scabrida, ima rosulata obovato-subrotunda l. obovato-oblonga, in petiolam attenuata, (4–6" longa,) caulinis ovato-oblonga obtusa, (uncium longa, 4"–6" lata,) *Rami* pedunculares, flexuosi, simplices, uno pari foliorum a flore remoto instructi; *pedunculus* terminalis 1 florus, bracteatus, (3–4 uncialis.) *Calyx* clausus, ovoideus, (9" longus, 4–5" latus,) acuminatus, corollam tertia parte supracris, lobis tubum æquantibus, binis lanceolatis acuminatissimis longe mucronatis, binis ovatis acuminatis paulo minoribus latius alatis (alii per sepa, cetera per scarioram membranam intra-calycinam formantur.) *Corolla* inclusa, convoluta, 4-fida, lobis ovato-oblongis, tubum sensim ampliatum æquantibus, elegantissime æqualiter crenato-fimbriatis, obtusa. *Filamenta* brevissima (1–2" longa,) lata, membranacea, sub apice tubi inserta. *Antheræ* ex tubo exsertæ, introrse, loculis basi distantibus extrorsum connectivo membranaceo cum filamento contiguo juncti. *Ovarium* elliptico-oblongum, stamna paulum superans, styllo nullo, *stigmatibus* orbiculatis 2-lamellatis. *Capsula* ignota.

HAB. Grand Rapids of the Saskatchewan. Between Cumberland House and Hudson's Bay. *Drummond*.—One of the most remarkable species: the appearance is exactly like *G. utriculosa*, but from the structure of the flower, it is nearest *G. detonsa*.

TAB. CLII.—*Fig. 1*, Flower; *fig. 2*, Corolla; *fig. 3*, Corolla laid open; *figs. 4, 5*, Back and front view of a stamen; *fig. 6*, Section of a calyx.—magnified.

2. PLEUROGYNE. ESCHSCHOLZ. ap. CHAM. *Linnæa*, 1. p. 190.

Foveæ epipetalæ glanduliferæ 0. *Filamenta* basi æqualia. *Stigmata* lateralia (ad suturas valvularum decurrentia.) *Capsula* unilocularis. *Corolla* rotata, corona fimbriarum brevissima aucta.

1. *P. rotata* (L. sub *Swertia*); foliis lanceolatis linearibusque, calycis lobis lanceolato-linearibus corollam æquantibus, ovario acuto, seminibus suturæ valvularum insertis.—*L. Sp. p. 438. t. 1. f. 4.—γ. Americana, caule humili fastigiato-ramosissimo, ramis 1-3-floris, foliis oblongo-linearibus obtusis, imis rosulatis.

HAB. Between Cumberland House and Hudson's Bay. *Drummond*. Kotzebue Sound. *Captain Beechey*. Eschscholtz Sound. *Mr. Von Chamiso*; γ. Labrador. *Dr. Morison*.—The variety δ . grows in the Altai. See an account of the confusion of synonymy of this species in Chamiso and Schlechtendal (*Linnæa* 1. p. 188.) where they have stated all points with their usual exactness.—The *Swertia* of Mr. Pursh are quite doubtful; his *Swertia pusilla* is certainly *Sw. Stelleriana*, Cham. Schlecht.—another species of *Pleurogyne*, which I do not consider specifically distinct from *Sw. Carinthiaca*, Wulf; Mr. Pursh states that he has seen specimens of it from Labrador in the Banksian herbarium, but as the variety γ. of *Pl. rotata* is indeed very similar to it, I did not deem it convenient to follow his statement, not having seen specimens from that country. There are specimens of our plant scarcely an inch high, the sepals being sometimes larger than in the common form; *Pleurogyne Stelleriana* differs from them only by its blunt ovariun, broader leaves, shorter sepals, and the insertion of the seeds being analogous to *Gentiana*.

3. SWERTIA. L.

Fovea epipetala glandulifera, fimbriis cincta. *Stigma* terminale, ovario impositum, continuum, reniforme. *Capsula* unilocularis, seminibus indefinitis valvulis affixis. *Corolla* rotata pentamera absque corona.

1. *Sw. perennis* (L.); caule basi ascendente, petalis elliptico-oblongis coriaceis sepala lanceolata duplo superantibus, foveis binis, fimbriarum crista distinctis, seminibus alatis.—*L. Sp. Pl. l. p. 328. Engl. Bot. t. 1441. Jacq. Austr. 3. t. 243.*—β. *obtusa*; petalis latioribus obtusioribus, foliis radicalibus obtusioribus, caulinis plerisque alternis.

HAB. β. N.W. Coast. *Mr. Menzies*.—There is no difference from the Altai form. I have examined the same variety collected at Konigsberg, and its characters are not constant.—*Swertia fastigiata*, Pursh, may be another species of this genus; it seems, however, more probable that it is a *Frasera*, as Mr. Pursh refers the genus to *Tetrandria*.

4. FRASERA. Walt.

Fovea epipetala glandulifera fimbriis cincta. *Stigmata* distincta, stylo imposita. *Capsula* unilocularis, compressa, seminibus subdefinitis magnis alatis, valvularum suturæ affixis. *Corolla* rotata decidua tetramera.

1. *F. Carolinensis* (Walt.); caule erecto tereti glabro, foliis oppositis verticillatisque oblongo-lanceolatis, racemo elongato densifloro, calyce corolla longiore, fovea orbiculari solitaria.—*Walt. Car. p. 87. Torrey, p. 187. F. Walteri. Mich. Am. v. 1. p. 97. Pursh, v. 1. p. 101. Ell. Car. v. 1. p. 205.—F. verticillata. Muhl. Cat.*

HAB. Shores of the Columbia. *Douglas*.—[*Hook.*]

2. *F. speciosa* (Dougl. ms.); caule erecto tereti sulcato glabro, foliis quaternis oblongo-linearibus acutiusculis, racemo elongato densifloro, calyce corollam æquante, foveis elliptico-oblongis binis. (TAB. CLIII.)

Radix perennis, pollicem crassa, apice comosa, etiam foliorum vaginis tecta, partim emortuorum nigriscentibus. *Caulis* strictus plurimum orgyarum, inferne digitum crassus, dense foliosus, simplex, superne in racemum pedalem abieens, (siccus cum tota planta flavidus.) *Internodia* caulis 2-3 uncialia, axis racemi

1½-uncialia. *Folia* radicalia semipedalia, unciam dimidiata late, in latum petiolum attenuata, acuminata, acutiuscula, 7-9 nervia, glabra, caulina quaterna, conato-vaginantia, 4 uncias longa, *floralia* sensim minora, summa sesquuncialia. *Inflorescentia* racemosa, verticillastri distinctis composta: *pedunculi* communes quaterni, axillares, uncales, apice cyma umbelliformi blbracteata terminati, flore centrali longius pedicellato internodium axis superante: eodem modo caulis summus terminalatur, pedicello ultimo 1½-unciall, bracteato. *Sepala* 4 linearis, acuminata, obtusiuscula, vis basi juncte, 9" longa. *Petala* oblongo-elliptica, obtusa, albida, apice punctata, erecta, basi barbata, fimbriarum crista foveas cingentibus longis pectinatis. *Filamenta* basi in annulum brevem connexa et abrupte arcuato-dilatata, demum connectivi apici inserta. *Anthera* introrsa, loculis oblongis connectivo duplo longioribus, obcordata. *Ovarium* ovale stylum tenuem superans, stigmate breviter bilobo. *Capsula*?

HAB. On the low hills near Spokane and Salmon Rivers and subalpine parts of the Blue Mountains, near the Kooskooska River, N.W.C. Douglas.—[This is quite distinct from the preceding, much larger in every part, with longer petals and constantly 2 oblong foveae upon each of them.—Hook.]

TAB. CLIII.—*Fig. 1*, Flower; *fig. 2*, Petal;—*magnified*.

3. *Fraseria albicaulis* (Dougl. ms. sub *Swertia*); caule ascendentē tereti pilis albidis brevissimis scabrido, foliis oppositis linearibus obtusis, racemo densifloro, calyce corollam sequante, fovea neari unica. (TAB. CLIV.)

Radix perennis, foliorum emarginatorum vaginis tecta. *Caulis* ex basi ascendentē stricte erectus, pedalis, simplex, foliis paucis et apice racemo denso instructus. *Internodia* 4-8-uncialia, præter inflorescentiam plerumque in toto caule bina. *Folia* elongato-linearia, nervosa, pilis quam in caulo brevioribus densioribus subalbescentia, alto conato-vaginantis, *radicalia* duo 3-4-uncialia, 3-4" lata, *caulina* 3-uncialia patula, *floralia* minora, paucissima ex inflorescentia exserta. *Inflorescentia* racemiformis, ex verticillastri 2-4 approximatim cymaque densa umbelliformi terminali constituta, accedente hinc verticillastro in sequentibus axillis, 4 uncias remotis; *pedunculi* verticillastri communes, plurimumque in utraque axilla bini, alter semiuncialia densa umbellula terminatus, alter minor pauciflorus; pedicellis brevibus conferitis, centrali longiori. *Sepala* linearia, acuminata, sublibera. *Petala* 8-4" longa, caerulea, oblongo-lanceolata, acuminata, unincervia, fovea dimidium petalum sequante, crista fimbriarum brevi ad basin petali producta. *Filamenta* tenuia; *anthera* ad indolem precedentis speciei. *Ovarium* oblongo-ellipticum, apice attenuatum, stylum tenuem sequans, stigmate breviter bilobo. *Ovula* oblonga, alata, pauca, (sutura affixa.) *Caps.*?

HAB. In the Mountain Vallyes between Spokane and Kettle Falls, in moist soil. Mr. Douglas.

TAB. CLIV.—*Fig. 1*, Flower; *fig. 2*, Petal; *fig. 3*, Stamen; *fig. 4*, Pistil;—*magnified*.

5. HALENIA. Borkh.

Petala basi calcarata, glandulis fundo calcarum impositis. *Stigmata* terminalia. *Capsula* unilocularis, seminibus indefinitis suturis valvularum affixis. *Corolla* breviter campanulata.

1. *H. deflexa* (Sm. sub *Swertia*); caule erecto folioso, foliis 3-5 nervis, radicalibus oblongo-spathulatis in petiolum aequo longum attenuatis caulinis oblongo-lanceolatis acutis subsessilibus, calcaribus cylindricis obtusis curvo-descendentibus corolla duplo brevioribus. (TAB. CLV.)—*Swertia corniculata*. Mich. Am. 1. p. 97.—Sw. Michauxiana. R. S. 6. p. 130.—Sw. Americana. Spreng. Syst. 1. p. 861.

HAB. Spencer Wood, Canada. Mrs. Percival, Mr. Sheppard. Norway House to Canada. Dr. Richardson, Drummond. Lake Huron. Dr. Todd. Rocky Mountains. Drummond.—This species is very nearly allied to *H. Sibirica*, Borkh., and since both vary much in the form of their leaves as well as in

their ramification, their characters require much to be explained. *H. deflexa* differt: caule vegetori, strictiori, magis vidente, alato nec angulato; rami aut abbreviatis aut elongatis strictis, nec laxis patulis apice cornutis; folia majoribus, plerumque latioribus, imis confertis obovatis longe petiolatis late videntibus, nec elliptica parvulis, sub anthos jam emarginatis; calcaribus corolla duplo brevioribus curvo-descendentibus, denum curvo-subascendentibus crassiusculis, nec corollam sequantibus stricte patentibus slentibus piliformibus.

TAB. CLV.—Fig. 1, Flower; Fig. 2, Stamen; Fig. 3, Pistil; Fig. 4, Capsule; Fig. 5, Section of do.; Fig. 6, Seed; Fig. 7, Section of do.; Fig. 8, Embryo:—magnified.

2. *H. Brentoniana* (Griseb.): caule humili erectiusculo diffuse ramoso, foliis 3–5-nerviis elliptico-oblongis acuminatissimis in petiolum attenuatis, summis subsessilibus oblongo-lanceolatis, cyma terminali umbelliformi 3-flora, flore centrali longius pedicellato, calcaribus crassiunculis obtusis curvo-descendentibus l. subhorizontalibus corolla brevioribus. (TAB. CLVI. A.)

Radix curvo-descendens, annua. *Caulis* triuncialis, obsoletō tetrapterus, glaber, siccus obscurō ceruleo-viridescens. *Rami* erecto-patentes, cauli similes. *Internodia* inferiora brevisima, superiora 4–6–8" longa. *Folia* patentissimum 1–1½" longa, 4–8" lata, glabra, subinéqualia, ima longius petiolata, spathulato-oblonga, acuta, media elliptico-oblonga, acutissima, subaequalia, floralia minora. *Pedicelli* brevissimuli, verticillastri ascendentes cum cyma terminali et cum inflorescentia ramorum confluentibus. *Sepala* 4 oblongo-lanceolata, acutissima, corollam dimidiā sequantia. *Corolla* campanulata-cylindrica, (5" alta et lata) lobis ovato-triangularibus acutis erectis tubum sequantibus. *Calcar* corolla fere duplo breviora. *Anthera* flava, parvula, nutantes. *Ovarium* ovato-oblongum acutum, stylo nullo, *stigmatibus* vix distinguendis.

HAB. Newfoundland. *Miss Brenton*, Dr. Morrison.

TAB. CLVI. A.—Fig. 1, Flower:—magnified.

3. *H. heterantha* (Griseb.); caule humili erectiusculo ramoso, foliis 5-nerviis, imis spathulatis petiolatis, superioribus ovato-subrotundis subcessilibus apice rotundatis apiculatis, floribus confertis, calcare tenui corolla triplo breviori, floribus inferioribus ecalcaratis. (TAB. CLVI. B.)

Radix curvo-descendens, annua. *Caulis* 4-uncialis, in ramos sequales plerosque oppositos divisus, ascendenti-erectus, glaber, teretiusculus l. alii binis ex foliis decurrentibus tenuibus fere anceps. *Internodia* inéqualia, ima 4" longa, media uncialia, supra semiuncialia. *Folia* ad lentic serrulata, inéqualia, (8" longa, 6" lata,) sed inferiora longius petiolata, obtusiora. *Cyma* terminalis umbelliformis 3-flora, pedicellis inéqualibus 1–4 linearibus, cui accedunt verticillastra 2–6-flora. *Sepala* 4 ovato-oblonga, acuminata, juniora recurvata, corollam dimidiā sequantia. *Corolla* ochroleuca, breviter campanulata, lobis ovato-triangularibus acutis erectis 2–3" longis tubum rotundatum sequantibus; *calcar* obliquo descendens rectiusculum; *flores* ecalcarati minores. *Anthera* globulose parvula, filamenti latitudinem subæquantes. *Ovarium* ovale, stigmatibus sessilibus erectis brevibus connatis. *Capsula* corollam marcescentem fere duplo excedens, elliptico-oblonga. *Semina* magna, albida, globosa, levissima, (sutura affixa.)

HAB. Newfoundland. *Miss Brenton*.—This is a most remarkable species, on account of the absence of the calcare in the lower flowers, which are also much smaller, at the same time that the branches are more slender, on the top of which these flowers are crowded. This abortion, however, affords no reason to doubt of the constancy of the generic characters of *Halenia*, since the genus is as well limited by the structure of its ovary and by the insertion of its seeds, as by its spurs; also, the form of the corolla itself is constantly different from *Swertia*.

TAB. CLVI. B.—Fig. 1, Flower:—magnified.

Tribus II. ERYTHRACACEÆ.—*Inflorescentia dichotoma, caule per florem alarem dichotomia terminato. Sepala sublibera. Antheræ sœpæ spirales, rima loculorum sursum dehacente (Chironieis rima loculorum deorsum dehiscente, hinc abbreviata, plerumque utriusque loculi contigua.) Stylus distinctus deciduus (raro 0), stigmate variabili. Capsula unilocularia l. marginibus introflexis semibilocularia, placentis suturalibus, l. placenta centrali bilocularia. —Corolla rubra, alba, l. flavæ, eglandulosa, infundibuliformis, demum supra capsulam torta, l. decidua. Herbas plereque annuae, per totum terrarum orbem dispersæ, in temperatis australioribus utriusque hemisphaeræ frequentiores.*

6. CICENDIA. Adans.

Corolla regularis, 4-fida. Antheræ immutatae. Stigma indivisum. Capsula unilocularis l. semibilocularis.

I. *C. exaltata* (Griselb.); caule ascendente, stricto ramoso, foliis lanceolato-linearibus, corollæ tubo gracili lobos oblongos obtusos æquante, stylo nullo, capsula semibiloculari. (TAB. CLVII. A.)

Radix annua. Coulis spithameus, glaber, obsolete tetragonus l. alis drabibus tenuissime fure anceps, gracilis, basi ascendens, stricto dichotomo ramosus. Internodia 1-2 uncialia. Inflorescentia quater dichotoma, pedicella alaribus nudis internodia subequalibus. Folia cuulinæ lanceolato-linearia, acuminata, internodis duplo breviora, superiora minora, omnia nervosa, basi 1-1½" lata, nervo medio subtus conspicuo decurrente. Folia 2 florala sub quavis ramifications cyme, pedicella obrectatis. Corolla infundibuliformis, tubo curvo gracilis. Calyx corollæ tubo subbrevior, lobis ovato-oblongis acutis inæqualibus tubum subequalibus. Filamenta brevia, tubo supra medium inserta, antheris oblongis erectis, loculis connectivum inæquantibus domum patentibus crispati (nec spiruliter torti). Ovarium ovato-oblongum, obtusum, stigmate vix distinguendo. Capsula oblongo-linearis, calyce duplo longior, basia, inferno corollæ emarginata vestigis vestita. Semina minutissima, rotunda, basia.

HAB. Near mountain springs and streams, not uncommon between the Kettle Falls, "and Narrows" of the Columbia River, N.W.C. Douglas.—It differs somewhat from the genus, and even from the tribe, by the absence of any style; but, besides the characters taken from the flower, the Erythracaceæ are so well marked by their inflorescence, that I am of opinion the present would be the most convenient place for this species. I have seen only one specimen, which was already in a very advanced state. *Excacum pulchellum*, Pursh, which I have not yet obtained, may be another North American species of this genus, with which *Orthostemon*, Br., may perhaps be not improperly joined, as it seems to differ only by its stigma, the characters of which are at least variable in *Erythraea* and *Canscora*.

TAS. CLVII. A.—Cicendia exalata.

Tribus III. CHLORE.E.—*Inflorescentia dichotoma. Corolla eglandulosa, rotata, demum circa capsulam marcescens. Antherarum loculi distincti. Stylus distinctus, deciduus, stigmate variabili. Capsula unilocularis l. semibilocularis.—Herbas plereque annuae, Europe et America incolæ, Europearum floribus plerumque flavis, Americanarum sœpius roseis.*

7. SABBATIA. Adans.

Flos 5 (-12)-merus. Antheræ erectæ, demum recurvæ. Stigmata bicururia, demum spiraliter torta. Capsula unilocularis, valvulis parum introflexis.

I. *S. gracilis* (Salisb.); caule teretiusculo effuse paniculato, ramis alternis, foliis linearis.

bus inferioribus ovatis lanceolatisque, calycis corollam fere sequantis tubo brevissimo, lobis subulatis, corollæ 5-fidae roseæ lobis elliptico-oblongis obtusis.—*Chironia campanulata*. *L.* sp. 1. p. 272. *Willd!*—*Ch. gracilis*. *Mich. Am.* 1. 146.—*Sabbatia gracilis*. *Salisb. Paradise. London.* t. 32. *Pursh*, 1. p. 137.—*S. campanulata*. *Torrey*.

HAB. Canada. *Willd. herb.*—The specimens originate probably from Mühlberg, but lately botanists seem not to have met with it in British North America. *S. paniculata*, Ell., is very near, and it differs especially by a very short calyx and white flowers, both characters of not much value in *Sabbatia*: besides, however, the filaments of the latter and the leaves are shorter; the inferior ones more blunt.

2. *S. angularis*; caule tetragono paniculato, ramis oppositis, foliis cordato-ovatis basi connatis obtusis, calycis tubo brevi, lobis lanceolatis acutis corolla brevioribus, corollæ roseæ 5-fidae lobis obovato-ellipticis obtusis.—*Chironia angularis*. *L.* sp. 1. 272. *Mich.* 1. p. 146.—*Sabbatia angularis*. *Pursh*, 1. p. 137.

HAB. Canada. *Mr. Goldie*.—The leaves are sometimes smaller and longer, as well as the lobes of the corolla. There occur also white-flowered specimens.

TRIBUS IV. MENYANTHIDÆ.—Æstivatio corollæ induplicativa. Capsula unilocularis. Corolla apparatu glanduloso instructa, decidua.

8. MENYANTHES. L.

Semina in nervo medio utriusque valvulae 1-serialia. Capsula juxta suturam valvularum ruptilis.

1. *M. trifoliata*; foliis ternatis.—*L. Sp. Pl.* 1. p. 208. *Engl. Bot.* t. 495.

HAB. Canada. *Mrs. Percival*, *Mr. Cleghorn*, *Mr. Sheppard*. Newfoundland. *Miss Brenton*, *Dr. Morrison*. Labrador. *Miss Brenton*. Lake Winnipeg and Saskatchewan. *Dr. Richardson*. Rocky Mountains. *Mr. Drummond*. North West Coast. *Dr. Scouler*. Sitcha. *Mr. Mertens*.

9. VILLARSIA. Vent.

Placentæ suturales. Capsula 2-valvis, valvis demum bifidis.

1. *V. Crista galli* (Menz. sub *Menyanthide*); scapo elato, foliis late reniformibus crenatis emarginatis a petiolo distinctis, floribus paucis congestis.—*Hook. bot. misc.* 1. p. 45. t. 24. *Bongard Vég. de Sitcha*. p. 98.

HAB. Port Edgecombe. *Mr. Menzies*. Sitcha. *Mr. Mertens*.

2. *V. pumila* (Dougl. sub *Menyanthide*); scapis humilibus unifloris, foliis elliptico-oblongis integerrimis obtusis in petiolum attenuatis. (TAB. CLVII. B.)

Rhizoma repente, crassiusculum, radices filiformes tenuissimas simplices deorsum emittentes, apice hinc divisum petiolorumque vaginis alternis tectum. Petioli unciales, erecti, tenues. Folia 1-1½ uncias longa, semiunciam lata, subrepanda, nervo medio subtus conspicuo cum petiolo confluente. Scapi erecti, tenuissimi, 1-2 unciales. "Flores albi, venis rubris, fibrillis flavis." Dougl. Calyx bracteatus, tubum corolle subsequans, lobis oblongis obtusis tubo calcyno duplo longioribus. Corolla rotata, aperta, tubo infundibulari lobis ovalibus duplo brevioribus; faux corolla cum basi loborum fibrillat. Antheræ subglobosæ, incumbentes. Ovarium basi glandulis minutis cinctum, pubescens pilosa undique tectum, ovatum, stylum sequans; stigmata linearia, patentia, 2" longa. Ovula minutissima suturis affixa? Capsula—?

HAB. Common near springs and on marshy ground in the Valleys of the Rocky Mountains, between Kettle Falls and Spokane *Douglas*.—Not having seen the fruit, it is still doubtful to me whether this be really a *Villarsia*, or perhaps a *Menyanthes*, as, in the dried germen it is indeed difficult to make out where the ovules are attached. But from the calyx-leaves, as well as from a great analogy of structure with *V. ovata*, Vent., it will be more convenient to refer it to this genus.

TAB. CLVII. B.—*Fig. 1*, Corolla laid open; *Fig. 2*, Stamen; *Fig. 3*, Calyx and pistil; *Fig. 4*, Germen laid open; *fig. 5*, ovules:—magnified.

10. LIMNANTHEMUM. Gmel.

Placenta suturales. Capsula evalvis, demum maceratione aperta.—Folia natantia. Petala fugitiva.

1. *L. lacunosum* (Vent. sub *Villarsia*); foliis supra asperiusculis subtus spongioso-asperimis, corolla alba glabra nuda, glandulis epipetalis breviter stipitatis, stylo brevi crasso, calyce capsulam vix æquante, seminatis muricatis ecarinatis.—*Menyanthes trachysperma*. Mich. 1. p. 126? an hujus forma *macrophyllum*?

HAB. Norway House to Canada. *Drummond, Dr. Richardson*.—The germination of this plant is quite analogous to that of *Trapa natans*, so remarkable on that account. On the top of each branch there arise three groups of different organs—viz. on one side, a leaf; on the other, the umbel of flowers; and below, a great many thick, short, and simple radicles, each of which is able to produce a new plant: the latter organs are, in *Trapa*, analogous to those which De Candolle took for stipulæ, but which Röper has declared to be a sort of root—a theory which is fully proved by the present case.

Oad. LX. POLEMONIACEÆ. Juss.

1. POLEMONIUM. L.

Cal. 5-fidus, persistens, lacinii acutis. Cor. campanulata rotata, 5-partita, fundo clausa valvis 5 staminiferis, limbo plano, lacinii rotundatis. Filamenta basi dilatata. Capsula ovato-trigona, trivalvis. Semina plurima angulosa.

1. *P. cæruleum*; erectum, foliis pinnatis plurifoliolatis, floribus erectis.—*L.*—*a. vulgare*; caule solitario elato, foliolis majoribus, floribus paniculato-racemosis speciosis. *P. cæruleum*. Auct.—*B. humile*; caule solitario 2–3 unciali ad spithameam, foliolis minoribus, floribus corymbosis speciosis. *P. cæruleum*, nanum. *Hook. Spitz. Pl. in Linn. Trans.* v. 14.—*P. humile*. *Willd. Herb. ex Ræm. et Sch.* p. 311. *Lindl. Bot. Reg. t. 1304*.—*P. Richardsoni*. *Grah. in Bot. Mag. t. 2800*. *Hook. et Arn. in Bot. of Beech. Voy.* p. 128.—*P. speciosum*. *Fisch. ms. in Herb. Reg. t. 1303*.—*P. pulchellum*. *Bunge, in Herb. Nostr.* (e mont. Altaic).—*P. cæruleum*, formæ 2, 3, 4, 5, et 6. *Chamiso, in Herb. Nostr.*—*P. moschatum*. *Wormsk. in Herb. Nostr.*—*P. pulcherrimum*; caulinis aggregatis humilibus gracilibus, foliolis parvis, floribus corymbosis duplo triplove minoribus, lacinii subacutis. *P. pulcherrimum*. *Hook. in Bot. Mag. t. 2979*.—*P. acutiflorum*. *Willd. Herb. ex R. et S. Syst. Veg. v. 4. p. 792*.

HAB. *a.* Canada (*Mr. Sheppard*) to the bases of the Rocky Mountains (*Drummond*) and Arctic Coast.

Dr. Richardson.— β , and γ . From lat. 66°, to the Arctic sea-coast, in deep sand, both in the north (*Dr. Richardson*), and in N. W. America, Kamtschatka, &c. *Menzies, Chamisso, Langsdorff, Lay, and Collie*.—Few plants are more variable, and few more extensively distributed in the temperate and colder regions of the northern hemisphere, than the present; from Kamoon and Kolghur, in Northern India, to Spitzbergen and the Arctic sea-shores of Europe, Asia, and America. I have long hesitated whether or not I should consider the var. γ , as distinct from the true *caruleum*, but I fear it presents no valid points of difference. The species is met with of all sizes, in all states of hairiness, and with all sizes of the flower. In specimens from poor Douglas's last communications, are some from New Albion, which I would refer to var. γ , but with the corolla shorter than the calyx! In another specimen from the same country, with the habit and flowers of *pulcherrimum*, the leaflets are as large as in the common state of *P. caruleum*, and as acute, or nearly so, as those of Dr. Wallich's specimen from India.

2. PHLOX. L.

Cal. 5-fidus, subcylindricus, persistens, lacinias angustis. Cor. hypocrateriformis, tubo cylindrico. Stam. inæqualia tubo inserta. Antheræ sagittatæ. Stigma trifidum. Capsula ovato-triangularis, trivalvis, loculis submonospermis.

1. *P. maculata*; tota glabra, caule erecto maculato, foliis lanceolatis superioribus ovatis longe acuminatis sessilibus margine scabriusculo, paniculæ oblongæ ramis conferatis abbreviatis, dentibus calycinis breviusculis erectis acutis, corollæ laciñis rotundatis.—*Jacq. Hort. Vind. t. 127. Pursh, Am. v. 1. p. 149. Torrey, v. 1. p. 228.*—*P. paniculata. Ait.*

Hab. Upper Canada? *Mr. Sheppard*.—The specimen from Mr. Sheppard is certainly the *P. maculata* of American authors, but I do not see how it is to be distinguished from *P. paniculata* of the *Hort. Kew.*

2. *P. divaricata*; decumbens, pubescens, ramis divaricatis laxis paucifloris, foliis ovato-lanceolatis supremis alternis, dentibus calycinis subulatis, corollæ laciñis obcordatis.—*L.*—*Bot. Mag. t. 163. Mich. Am. v. 1. p. 144. Ph. Am. v. 1. p. 150. Elliott, Carol. v. 1. p. 248. Torrey, p. 229.*

Hab. Canada. *Mrs. Percival.*

3. *P. speciosa*; erecta ramosa frutescens, glabra, foliis linearibus acuminatis pungentibus basi dilatatis subciliatis margine callosis supremis alternis, floribus corymbosis, sepalis acuminatis margine membranaceis tubo corollæ subæquabilis, laciñis corollæ cuneato-oblongis integris. *Lindl.*—*Ph. Am. v. 1. p. 149. Lindl. Bot. Reg. t. 1351.*— β , caule foliisque pubescentibus.—*P. humilis. Dougl. ms.*— γ , *elatior*; caule foliisque glaberrimis.—*P. Sabini. Dougl. ms.*

Hab. a. N.W. America. Plains of the Columbia. *Lewis, Douglas*.— β . Subalpine range of the Rocky Mountains near perpetual snow, and on the Blue Mountains, N.W. Am.— γ . Limestone Rocks of the Blue Mountains. *Douglas*.—In deference to the opinion of Professor Lindley, I retain this as a species; but I must confess it borders too closely on *P. subulata*, and that again I have elsewhere observed, (*Comp. to the Bot. Mag. v. 1. p. 172.*) I am totally unable to distinguish from *P. setacea*, to which belongs *P. nivalis*, Lodd and Sweet. Dr. Lindley has already noticed its affinity with our next species, *P. Sibirica*, L., which indeed is very close, and probably they might all be safely considered as belonging to one and the same species. The leaves in this latter, however, are more flaccid, the lower ones are constantly marcescent, and the corymbs are fewer flowered.

4. *P. Sibirica*; humilis perennis basi suffruticosa, foliis linearibus subflaccidis mucronatis villosis, inferioribus marcescentibus, pedunculis subternis, calycis lanati laciniis subulatis tubum corollæ subæquantibus, corollæ laciniis cuneatis integris vel emarginatis.—*L.*—*Gmel. Sibir.* 4. p. 87. t. 46. f. 2. *Hook. et Arn. in Bot. of Beech. Voy. v. 1.* p. 128.

HAB. Kotzebue's Sound. *Lay and Colfie*.—These specimens, from Captain Boehey's Voyage, differ in no respect whatever from the numerous Siberian and Daurian ones in my herbarium, and from others gathered by Redowski, probably also on the American side of Behring's Strait. Besides the differences alluded to under the preceding species, this is certainly less shrubby than *P. speciosa* and its more immediate allies. The old marcescent leaves are numerous, and peculiarly flaccid and waved.

5. *P. Douglassii*; humilis pubescens dense cæspitosa basi fruticosa lignosa, ramis numerosissimis erectis, foliis arctis subulatis rigidis erecto-patentibus mucronatis inferioribus marcescentibus strictis albidis, floribus terminalibus solitariis subsessilibus, calycis villosi laciniis subulatis rigidis mucronatis corollæ tubo brevioribus, corollæ laciniis obovatis obtusis. (TAB. CLVIII.)— β , foliis subsquarrosois.

HAB. N.W. America: common on the limestone range of the Blue Mountains, and on the Rocky Mountains, near the confines of snow. *Douglas*.—A most beautiful species, bearing copious and almost sessile blossoms, and intermediate in habit, as it were connecting the *P. speciosa*, *subulata*, &c. with the little *P. Hoodii*.

TAB. CLVIII.—*Fig. 1*, Flower; *fig. 2*, Leaves:—magnified.

6. *P. Hookeri*; fruticosa, ramis alternis elongatis pubescentibus dense foliosis, foliis fasciculatis subulato-acicularibus rigidis pungentibus inferioribus marcescentibus albidis, floribus numerosis sessilibus terminalibus lateralibusque, calycis laciniis acicularibus corollæ tubo gracili elongato brevioribus. (TAB. CLIX.)—*P. Hookeri. Dougl. ms. apud Hort. Soc. Lond.*

HAB. Common on arid, sandy, and rocky soils near the narrows of the Okanagan and Priest's Rapid of the Columbia. “Flowers bright yellow!”—A very singular and most distinct species.

TAB. CLIX.—*Fig. 1*, Flower; *fig. 2*, Leaves:—magnified.

7. *P. Hoodii*; nana multicaulis densissime cæspitosa, foliis arcte imbricatis erectis argenteo-nitidis subulatis mucronatis rigidiusculis margine lanatis inferioribus marcescentibus albidis, floribus terminalibus sessilibus solitariis, calycis lanati laciniis lato-subulatis brevibus tubo corollæ brevioribus, corollæ laciniis obovatis integris.—*Richards. in Frankl. Journ. App. ed. 2. p. 6. t. 28.*

HAB. Sandy plains, Carlton House Fort, and other places in lat. 54°. (*Dr. Richardson*) to the Rocky Mountains. *Drummond*. Eagle and Red Deer Hills on the Saskatchewan, abundant. *Douglas*.—“This beautiful species is a striking ornament to the plains in the neighbourhood of Carlton House, forming large patches, which are conspicuous from a distance. The specific name is a small tribute to the memory of my lamented friend and companion, whose genius, had his life been spared, would have raised him to a conspicuous station in his profession, and rendered him an ornament to any science in which he might have chosen to direct his attention.” *Richards. l. c.*

8. *P. Richardsoni*; nana multicaulis densissime cæspitosa, foliis arcte imbricatis erecto-subincurvis carnosiusculis laxe lanatis oblongo-lanceolatis obtusis cum mucrone marginibus

insigniter plicato-reflexis, inferioribus marcescentibus demum nigrescentibus, calycis lanati laciniis lato-subulatis mucronatis tubo corollæ brevioribus, corollæ laciniis rotundato-cuneatis integris. (TAB. CLX.)

HAB. Arctic sea-coast, July, Aug., 1826. Dr. Richardson.—Flowers most abundant, and of a brilliant lilac colour. It must be allowed that Dr. Richardson, and Messrs. Drummond and Douglas, have been pre-eminently successful in discovering new and beautiful species of the Genus *Phlox* in N. America, especially if we take into account the *P. Drummondii* (from the southern extremity of that vast country), which is now the pride and ornament of our gardens. It is much to be lamented that these more hardy species from the north have not yet been introduced alive to our collections; for there is no doubt, from the rich variety in the colour of their blossoms, and the great quantity of flowers yielded by every little tuft, that they would be nearly, if not quite, as ornamental as *P. Drummondii*.

TAB. CLX.—*Fig. 1*, Flower; *fig. 2*, Leaves:—*magnified*.

S. GILIA. Cav.

Cal. campanulatus, 5-fidus, margine et sinubus membranaceis. Cor. infundibuliformis v. subcampanulata, limbo 5-partito, laciniis obovatis integris. Stam. ad faucem v. vix intra tubum inserta. Antheræ ovato-subrotundæ. Capsulae loculi polyspermi. Benth. in Bot. Reg. sub t. 1622.

1. *G. (Sect. Dactylophyllum) pharnaceoides*; foliis oppositis basi membrana connatis profunde palmato-partitis laciniis setaceis, corollis calyce duplo longioribus. (TAB. CLXI.) Benth. l. c.

HAB. Sandy soils at Okanagunca and Wallawallah, rather rare: flowers white, delicate. Douglas.—Mr. Douglas afterwards saw this curious species (and another of the same section) more abundantly in California. They and the *G. pusilla* have the habit of *Arenaria*, as observed by Mr. Bentham: perhaps still mere that of *Spergula*.

TAB. CLXI.—*Fig. 1*, Flower; *fig. 2*, Leaves:—*magnified*.

2. *G. (Sect. Ipomopsis) pulchella*; caulis strictis superne paniculatis, foliis carnosis arachnoideis pinnatifidis laciniis remotis linearibus planis acutis, corollis elongatis tubulosis limbi patentia-reflexi laciniis ovato-lanceolatis.—Dougl. ms.—Benth. l. c.—Ipomopsis elegans. Lindl. Bot. Reg. t. 1281. (excl. Syn. Sm. Mich. et. Pers.)

HAB. Banks of the Spokane River, N.W. America, particularly near its junction with the Columbia. Douglas.—A tall and very handsome plant, but which, we fear, is now lost to our gardens. Mr. Bentham has well distinguished it from the *Gilia coronopifolia*, Pers. (*Ipomopsis elegans*, Sm.) which is a native of the southern United States.

3. *G. (Sect. Eugilia) inconspicua*; caule gracili paniculato-ramoso calycibusque pubescenti-glandulosis, foliis pinnatifidis inferioribus bipinnatifidis laciniis linearibus remotis, floribus subsolitariis, calyce corollæ tubum æquante, corolle laciniis ovatis.—Dougl. in Hook. Bot. Mag. t. 2883. Benth. l. c.—G. parviflora. Spr.—Ipomopsis inconspicua. Sm. Ex. Fl. t. 14.—Cantua parviflora. Ph. Am. v. 2. p. 730.

HAB. Southern branches of the Columbia, growing under the shade of *Purshia tridentata*, and various species of *Artemisia*. Douglas.

4. *G. (Sect. Eugilia) capitata*; glabra, gracilis ramosa, foliis bi-tripinnatifidis segmentis linearibus acutis, floribus dense capitatis, calyce tubo corollæ breviore, corollæ laciniis linearibus.—*Hook. Bot. Mag. t. 2698. Lindl. Bot. Reg. t. 1170. Benth. l. c.*

HAB. N.W. America; Rocky Mountains to the Pacific, following the course of the Columbia. Frequent in potato fields about Fort Vancouver. *Douglas, Dr. Scouler.*

5. *G. (Sect. Eugilia) congesta*; lanata subsimplex, foliis bipinnatifidis carnosis laciniis linearibus obtusis, floribus (albis) densissime capitatis capitulis racemosis, calycibus 5-dentatis bracteisque dense lanatis.—*Phacelia furcata. Dougl. ms.*

HAB. Sandy plains of the Columbia. *Douglas.*—A span high, with a rather stout stem, and singularly fleshy leaves. The whole, especially the very dense capitula, is very woolly. Corolla white, with a yellow eye. *Douglas.* German obovato-trigonous. Stigma 3-fid.

4. NAVARETIA. R. et P.—ÆGOCHLOA. Benth.

Cal. tubulosa-campanulatus, basi membranaceus, apice 5-fidus, laciniis inæqualibus rigidis, integris multifidis, spinosis. *Cor. hypocrateriformis* calycem subæquans, limbo 5-partito, laciniis oblongis integris. *Stam.* inter partem superiorum tubi inserta. *Antheræ* ovato-subrotundæ. *Caps.* loculi polyspermi.—Herbæ plerumque glutinosæ fætidæ. Folia pinnatisecta, segmentis incisis acutissimis. Flores dense capitati, bracteis inciso-multifidis spinosis suffulti. *Benth. l. c.*

1. *N. intertexta*; erecta ramosa, foliis glabris pinnatisectis, segmentis linearis-subulatis acutissimis incisis divaricatis subspinosis, calycis sublanati dentibus plerumque multifidis, corollis calyce subbrevioribus, staminibus exsertis. *Benth. l. c.* (sub Ægochloa.)

HAB. New Albion, N.W. America. *Douglas.*

2. *N. pungens*; viscoso-pubescent, foliis pinnatisectis segmentis integris incisive, laciniis lanceolato-linearibus acutissimis spinosis, bracteis ciliato-hirtis basi dilatatis, dentibus calycinis lanceolatis subintegris, corollis exsertis, staminibus tubo inclusis. *Benth. l. c.* (sub Ægochloa.)—*Gilia pungens. Dougl. in Hook. Bot. Mag. t. 2977.*

HAB. Mountain Vallies near the sources of the Multnomack, a southern tributary of the Columbia, N.W. Am. *Douglas.*

5. COLLOMIA. Nutt.

Cal. campanulatus 5-fidus v. sub-5-partitus, lobis lanceolatis linearibusve æqualibus integris. *Cor. hypocrateriformis*, tubo tenui exerto, limbo patente 5-partito, laciniis oblongis integris. *Stam.* versus medium tubi inserta. *Antheræ* ovato-subrotundæ. *Caps.* loculi 1-2 spermī.—Herbæ. Flores dense capitati, bracteis late ovatis integerrimis suffulti. *Benth. l. c.*

1. *C. heterophylla*; pubescens, caule erecto ramoso, foliis inferioribus pinnatifidis incisis superne sensim magis integris, involucris omnino integris, capitulis paucifloris. *Dougl. in Hook. Bot. Mag. t. 2895. Lindl. Bot. Reg. t. 1347. Benth. l. c.*

HAB. Frequent on the subalpine hills of N.W. Am, and about Fort Vancouver. *Douglas, Dr. Scouler.*

2. *C. grandiflora*; foliis lato-lanceolatis nitidis inferioribus siccissime serratis glabris superioribus ramisque junioribus pubescentibus, capitulis viscosis, corollæ limbo obliquo erectiusculo tubum subæquante.—*Dougl. in Bot. Reg. t. 1174. Hook. Bot. Mag. t. 2894. Benth. l. c.*

HAB. Columbia River, N.W. America, from the source in the Rocky Mountains to the mouth. *Douglas, Dr. Scouler.*

3. *C. linearis*; foliis lineari-lanceolatis lato-lanceolatis opacis plerumque glabris, ramis superioribus patentissimis pubescentibus, corollæ limbo patente tubo gracilimo triplo breviore.—*Nutt. Gen. v. 1. p. 126. Dougl. in Bot. Reg. t. 1168. Hook. Bot. Mag. t. 2893. Benth. l. c.*

HAB. From the Saskatchewan to Fort Franklin and the Rocky Mountains. *Dr. Richardson, Drummond.* From Lake Winnipeg, across the Rocky Mountains, to Menzies' Island in the Columbia, thirty miles from the Pacific. *Drummond, Douglas, Scouler.*

4. *C. gracilis*; glanduloso-pubescentis, caule valde ramoso, foliis lineari-oblongis obtusis inferioribus oppositis, calycis 5-partiti laciniis longe subulatis tubum corollæ æquantiibus. *Dougl. ms.—Benth. l. c.—Gilia gracilis. Hook. Bot. Mag. t. 2924. β. humilior; foliis inferioribus latioribus.—Collomia humilis and C. bellidifolia. Dougl. ms.*

HAB. N.W. America, Vallies of the Mountains near the Kettle Falls, and β. Fort Vancouver, and at the Multnomack. *Douglas.*

ORD. LXI. DIAPENSIACEÆ. *Lindl.*

I. DIAPENSIA. *L.*

Cal. 5-partitus, 3-bracteatus. Cor. 1-petala, regularis, aestivatione imbricata. Stam. 5 æqualia, filamentis dilatatis ad summum tubi corollæ insertis, limbi laciniis alternis; antheris 2-locularibus transversim dehiscentibus ecalcaratis. Stigma sessile. Capsula cartilaginea, 3-locularis, infra medium trivalvis, medio placentifera, dissepimentis e medio valvarum. Semina plurima minuta, areolata.—Suffrutices arctici, humiles, cæspitosi, prostrati. Folia parva imbricata sempervirentia.

1. *D. Lapponica. L.—Torrey, Fl. v. 1. p. 231. Hook. in Parry's 2d. Voy. App.—D. obtusifolia. Salisb. Parad. Lond. t. 104. Pursh, Am. v. 1. p. 147.*

HAB. Labrador. *Dr. Morison, Miss Brenton.* Whale Island, Arctic America. *Captain Sir E. Parry.* Mouth of the Great Fish River. *Capt. Back.*—This does not appear to exist on the Pacific side of the Rocky Mountains, nor further to the west than the Great Fish River. The only station in the United States is the White Hills of New Hampshire, whence I have received it from Dr. Boott and Mr. Greene.

ORD. LXII. CONVOLVULACEÆ. *Juss.*

I. CONVOLVULUS. *Jacq. Br.*

Cal. 5-partitus, nudus, v. bracteis 2 minoribus imbricatis. Corolla campanulata, 5-

plicata. *Stamina* limbo breviore. *Ovarium* 2-loculare (raro 3-loculare?) loculis dispermis. *Stylus* indivisus. *Stigma* 2, filiformia. *Capsula* valvata.—Herbæ (raro frutices) volubiles v. prostratae, sæpius lactescentes. Br.

1. *C. arvensis*; caule angulato-striato, foliis sagittatis subauriculatis, pedunculis sæpius unifloris apice bibracteatis, sepalis ovato-rotundatis, corolla alba aut rosea. *Chois.*—*L.*—*Pursh, Am. v. 1. p. 144.* *Torrey, v. 1. p. 224.*

HAB. Canada. *Mrs. Percival, Lady Dalhousie.*

2. *C. pandurus*; volubilis pubescens, foliis lato-cordatis integris lobatisve panduriformibus, pedunculis longis, floribus fasciculatis, calycibus glabris muticis, corollis tubulato-campanulatis. *Mich. Am. v. 1. p. 138.* *Ph. Am. v. 1. p. 144.* *Elliott, v. 1. p. 254.* *Torrey, Fl. v. 1. p. 225.*

HAB. Canada. *Pursh.*

2. CALYSTEGIA. Br.

Cal. 5-partitus, bracteis duabus foliaceis inclusus. *Cor.* campanulata, 5-plicata. *Stam.* subæqualia limbo breviore. *Ovarium* semibilobulare, 4-spermum. *Stylus* indivisus. *Stigma* 2 obtusa (teretia v. globosa). *Capsula* unilocularis.—Herbæ lactescentes, glabrae, volubiles v. prostratae (extra tropicum provenientes). Pedunculi solitarii uniflori. Br.

1. *C. sepium*; foliis sagittatis acutissimis posticis obtusis truncatisve integris, bracteis acutis calyce longioribus dimidio corollæ brevioribus, pedunculo angulato petiolum superante. Br.—*Ph. v. 1. p. 142.*—*Convolvulus sepium.* *L.*—*Torrey, v. 1. p. 225.*—*C. repens.* *L.*—*Mich.*—*Ell.*

HAB. Canada to the Saskatchewan, *Pursh, Dr. Todd, Dr. Richardson*; and to the Rocky Mountains, *Dr. Drummond*. Shores and Islands of the Columbia. *Dr. Scouler, Dr. Gairdner.*

2. *C. spithameus*; pubescenti-tomentosa, caule erecto, foliis oblongo-ovatis basi cordatis, pedunculis unifloris folio longioribus, bracteis ovatis acutis, laciinis calycinis lanceolatis.—*Ph. Am. v. 1. p. 143.* *Hook. Ex. Fl. v. 1. t. 97.*—*C. tomentosa.* *Ph. l. c.*—*Convolvulus spithameus.* *L.*—*Elliott, v. 1. p. 251.* *Torrey, Fl. v. 1. p. 225.*—*C. stans.* *Mx.*

HAB. Canada to the Saskatchewan. *Mr. Cleghorn, Mrs. Percival, Dr. Richardson, Drummond.*

3. CUSCUTA. L.

Cal. raro 4-fidus. *Cor.* globoso-urceolata, limbo 5-fido, marcescens. *Ovarium* 2-loculare, loculis dispermis. *Caps.* bilocularis, circumscissa.—Herbæ aphylla, volubiles, parasiticæ. Flores aggregati, subcapitati v. spicati, unibracteati. Squamae 5, epipetalæ, infra filamenta, iisdemque oppositæ, raro deficiente. Br.

1. *C. Americana?* floribus pedicellatis globoso-campanulatis 5-fidis, filamentis subulatis, corollæ laciinis brevioribus infra basin squama fimbriata, stylis gracilibus exsertis.—*L.?*—*Ph.?*—*Mich.?*—*Torrey, Fl. v. 1. p. 289.*—*C. arvensis.* *Beyrich, in Herb. Nostr.*

HAB. N.W. America. *Douglas.*—This I believe to be the *C. Americana* of Dr. Torrey. The flowers though small, are larger than in our *C. Epithymum*.

2. *C. umbrosa*; floribus sessilibus campanulatis 5-fidis, filamentis subulatis corollæ laci-nii longioribus infra basin squama fimbriata, stylis brevibus crassis inclusis.—*C. umbrosa*. *Beyrich*, in *Herb. Nostr.*—*C. Europaea*. *Torrey*, v. 1. p. 230?—*C. Americana*. *Griswold*, in *Herb. Nostr.*

HAB. Canada. *Mrs. Percival*. Norway House Port? *Drummond*. N.W. Coast of America. *Dougl-as*.—The *Cucute*, both of the old and the new world, are in a sadly confused state. The present species is probably frequently called by the American authors *C. Americana*. Of this, I am certain, that it is the *C. umbrosa* of Beyrich (whose name I therefore adopt), and the *C. Americana* of Dr. Griswold; but whether it is the Linnean plant of that name, I have no means of ascertaining. Mr. Drummond's specimens are too imperfect for determination. The flowers of the present species are larger than either of our two British ones.

ORD. LXIII. HYDROPHYLLEÆ.* Br.

(*Br.* in *Prodri. Flor. Nov. Holland*, p. 492. *Benth.* in *Linn. Trans.* v. 17. p. 272.)

1. HYDROPHYLLUM. L.

Cal. 5-partitus persistens. *Cor.* campanulata 5-fida, intus striis 5 melliferis marginatis filaments amplexantibus. *Stam.* exserta, medio barbata. *Stig.* bifidum. *Caps.* globosa, 1-locularis, 1-sperma; *seminibus* tribus abortivis.

1. *H. virginicum*; foliis pinnatifidis, laci-nii ovali-lanceolatis inciso-serratis, fasciculis florum conglomeratis, pedunculis petiolo longioribus.—*L.*—*Mich. Am.* v. 1. p. 134. *Ph.* v. 1. p. 134. *Bot. Reg.* t. 331. *Elliott*, v. 1. p. 232. *Torrey*, *Fl.* v. 1. p. 219.

HAB. Canada. *Mrs. Percival*, *Mrs. Sheppard*, *Dr. Holmes*. N.W. Coast of America. *Dr. Scouler*, who observes that the roots are eaten by the Indians.

2. *H. appendiculatum*; foliis infimis pinnatisectis, caulinis palmato-lobatis, racemis laxissimis, calycis hispidi sinibus reflexo-appendiculatis. (*Benth. l. c. p. 273.*)—*Mich. Am.* v. 1. p. 134.

HAB. Canada. *Cleghorn*. [*H.*]

3. *H. Canadense*; foliis palmato-lobatis angulatisve, florum cymis laxis, calycibus glabris. (*Benth. l. c. p. 273.*) *L.*—*Mich. Am.* v. 1. p. 133. *Ph.* v. 1. p. 134. *Torrey*, v. 1. p. 220.

HAB. Canada. *Pursh*.

4. *H. capitatum*; foliis pinnatisectis, segmentis inciso-dentatis, laci-nii calycinis lanceolatis ciliato-hispidis. (*Benth. l. c. p. 273.*) *Dougl. ms.*

HAB. Fort Vancouver. *Douglas*.—This is very different from the *H. macrophyllum* of Nuttall, of which I have noble specimens from Dr. Short.—[*H.*]

* The characters, with remarks on the genera and species of this and the following order (*Boragineæ*), have been kindly drawn up for this work by Dr. Lehmann. I have only added a few species which have since been received by me from British N. America, and made a few alterations suggested by Mr. Bentham's valuable paper on the first of these two orders, lately published in the Linnaean Transactions.

2. EUTOCA. Br.

Cal. 5-partitus, persistens. *Cor.* subcampanulata; membranulæ tubi decem, par paria filamentis alternantes. *Stam.* exserta. *Stylus* bifidus. *Caps.* polysperma, unilocularis, bivalvis, valvis indivisis medio placentiferis.

1. *E. Franklinii*; foliis pinnatifidis bipinnatifidisve pilosis, lacinis lanceolatis integerrimis dentatis ciliatis, spicis racemosis in summo caule confertis, staminibus corolla sublongioribus.—*Br.* in *Richards. App. to Frankl. Journ. ed. 2.* p. 51. t. 27. *Hook. Bot. Mag.* t. 2985.

HAB. From the Saskatchewan to the Bear Lake and English Rivers. *Dr. Richardson*; and in burnt woods from the Grand Rapid to the Rocky Mountains. *Drummond*.

2. *E. sericea*; foliis pinnatifidis semibipinnatifidisve sericeis, laciiniis lauceolatis integerimis, racemis in summo caule confertis, staminibus corolla duplo longioribus. *Lehm.*—*Grah. in Bot. Mag. t. 3003.* *Benth. l. c. p. 278.*—*E. pulchella.* *Lehm. in Pugil. Pl. II.* p. 18.

HAB. Sandy debris of the Rocky Mountains. *Drummond*.

3. *E. Menziesii*; erecta foliis linearibus lanceolatisve integerimis quandoque trifidis pinnatifidisve, placentis 20-multiovulatis. (*Benth.*) *Br.* in *Richards. App. to Frankl. Journ. ed. 2.* p. 51. *Benth. l. c.*—*E. multiflora.* *Dougl. in Bot. Reg. t. 1180.* *Lehm. l. c. p. 19.*—*E. echinoides* et. *E. glomerata.* *Dougl. ms. (fide Benth.)*—*E. congesta.* *Dougl. in Herb. Nostr.*—*Lehm. l. c. p. 18.*—*Hydrophyllum lineare?* *Ph. (Br.)*

HAB. First discovered in California by *Mr. Menzies (Herb. Nostr.)*. Interior of the Columbia, N.W. Am. *Douglas*.—Dr. Lehmann, whom I was able to supply only with imperfect specimens of this species, was disposed to separate them into two; but I feel assured that Mr. Bentham has done correctly, in reducing all the supposed species of Mr. Douglas to one, which is indeed very variable in the form of the leaves. [H.]

3. NEMOPHILA. Bart.

Cal. persistens 10-partitus laciniis alternis minoribus reflexis. *Cor.* campanulata 5-loba. *Nectarium*, foveolæ 10 ad marginem faucis. *Stamina* corolla breviora. *Stylus* bifidus. *Caps.* 1-locularis.

1. *N. parviflora* (*Dougl.*); foliis pinnatifidis lobis paucis latis subdentatis, calycis sinubus breviter appendiculatis, corollis calycem vix superantibus, placentis biovulatis. *Benth. l. c. p. 275.*

HAB. First found in California by *Mr. Menzies*. Banks of the Columbia. *Douglas, Scouler*.—Perhaps not really distinct from the following, which Mr. Bentham thus characterizes:—" *N. pedunculata*; foliis pinnatifidis, calycis sinubus breviter appendiculatis, corollis calycem vix superantibus, placentis 6-ovulatis." [H.]

2. *N. pedunculata* (*Dougl.*); caule dichotomo ramoso, foliis subpinnatifido-quinquelobis pilosis: lobis obtusis, pedunculis alaribus solitariis nutantibus.

Caulis herbaceus, succulentus, procumbens? retrorsum setoso-hispida, dichotomo-ramosus, ramis di-varicatis. *Folia* opposita, petiolata, remote, pinnatifida, 3-loba, adpresso-pilosa, reticulato-venosa; lobis obovatis integerrimis vel grosse dentatis. *Petioles* folia dimidio breviores, setosi. *Pedunculi* alares, solitarii, teretes, filiformes, retrorsum setoso-hispida, subpolleares, nutantes. *Calyx* persistens 10-partitus: laciniis setoso-ciliatis, alterius majoribus erectis, lanceolatis, acutis; alterius minoribus, linearibus, reflexis. *Corolla* minuta longitudine calycis, 5-loba; lobis integerrimis. *Stamina* corolla breviora; *filamenta* tubo inserta glabra; *antheræ* lanatis. *Capsula* magno-ludine pilis, ovata, acuta, pubescens.

HAB. Columbia River, N.W. America. *Douglas.*

4. PHACELIA. Mr.

Cal. 5-partitus. *Cor.* subcampanulata 5-fida basi intus 5-sulcata. *Stamina* exserta. *Stylus* filiformis bipartitus. *Caps.* 4-sperma 2-valvis: valvula singula dissepimento dimidiata.

1. *P. heterophylla*; erecta hispida, foliis inferioribus petiolatis pinnatifidis laciniis lanceolatis integerrimis nervosis: impari elongata, superioribus simplicibus, racemis bifidis densifloris, laciniis corollæ integerrimis. *Ph. Am.* v. 1. p. 140. *Nutt. Gen.* v. 1. p. 117. *Ram. et Schult. Syst. Veget.* v. 4. p. 180.

HAB. Banks and Islands of the Columbia, near the ocean. *Dr. Scouler, Douglas.*—Mr. Bentham unites this (and no doubt the following) with the *P. circinata*, Jacq. Fil. Ecl. 1. 185. t. 91; and adduces the following synonyms:—*Heliotropium pinnatum*. *Vahl.* *Hydrophyllum Magellanicum*. *Lam.* H. aldea. *R. and S.* Aldea pinnata. *R. and P.* A. circinata. *Willd.* *Phacelia Peruviana*. *Spr.* P. Californica. *Cham.* P. rudis. *Dougl. ms.*

2. *P. hastata* (*Dougl.*); erecta tomentosa, foliis petiolatis lineatis acutis: radicalibus linear-lanceolatis, caulinis lanceolatis elongatis basi utrinque auriculatis, racemis terminalibus corymbosis bifidis, laciniis corollæ integerrimis.

Caulis subpedatus, herbaceus, teres, erectus, simplex, tomentosus, basi rudimentis petiolorum tectus. *Folia* petiolata, supra tomentosa, tomentum pilis rigidis adpresso intermixtum, nervis impressis parallelo-lineata, subtus tomentosa, ad nervos protuberantes adpresso pilosa; *radicalia* lineari-lanceolata in petiolum elongata, acuta, integerrima; *caulina* elongato-lanceolata, basi auriculata, ita quidem ut fero hastata appearant. *Petioles* canaliculati, hispida, foliorum inferiorum circiter pollicares, versus apicem caulis sensim breviores. *Flores* in racemis terminalibus corymbosis dispositi: *Racemi* bifidi, secundi, imbricati, multiflori, ante anthesis revoluti. *Pedunculi* ac pedicelli calyce dimidio breviores hispida. *Calyx* 5-partitus: laciniis linearibus obtusis, hispido-ciliatis, 3-nervibus. *Corolla* campanulata, (pallide rosea?) calycem superans, venis saturatioribus picta, laciniis integerrimis. *Filamenta* corolla duplo longiora in medio pilosa; *antheræ* ovatae incumbentibus. *Ovarium* hispidum. *Stylus* ad medium usque bifidus, glaber, longitudine staminum: *stigmatibus* simplicibus.

HAB. Barren sandy plains of the Columbia, and on the Blue Mountains; N.W. America. *Douglas.*

3. *P. ramosissima* (*Dougl.*); erecta hispido-glandulosa, foliis petiolatis imparipinnatis, foliolis oblongis pinnatifido-incisis, spicis terminalibus circinatis globosis.

Caulis herbaceus, erectus, teres, fistulosus, hispidus, pilis glanduliferis. *Folia* alterna, petiolata, imparipinnata: pinnis superioribus confluentibus. *Foliola* oblonga, obtusissima, pinnatifido-incisa, hispidiuscula, pilis glanduliferis. *Spica* in summo caule ramisque, circinate, subglobosa, floribus confertissimis. *Calyx* sessilis, profunde 5-partitus: laciniis obovato-lanceolatis, acutis, 3-nervibus, pilis molibus glandul-

feris ciliatis. *Corolla* calyce duplo longior, glabra, venosa : lacinia rotundata integerrima; genitalia corolla duplo longiora, cum germine, glabra.

HAB. Dry rocky plains of the Columbia, near the Priest's Rapid, "and at the Stony Islands," N.W. America. *Douglas.*

ORD. LXIV. BORAGINEÆ.* *Juss.*1. HELIOTROPIUM. *L.*

Cor. hypocrateriformis: fauce pervia (in nonnullis barbata); *Limbi* lacinia plicatura simplex vel dente instructa interjecta. *Stigma* subconicum. *Nuces* 4, uniloculares, cohaerentes, basi clauseæ. *Receptaculum* commune manifestum nullum.

1. *H. Curassavicum*; caule herbaceo, foliis suboppositis lanceolatis obtusissimis obsolete venosis glabris glaucis, spicis conjugatis solitariisve.—*L.*—*Lehm. Asper.* v. 1. p. 34. *Nutt. Gen.* v. 1. p. 112. *Elliott.* v. 1. p. 745.

HAB. Valleys of the Blue Mountains (far removed from the sea). *Mr. Douglas* found it there only.—[In one of my specimens from Mr. Douglas's last journey, the leaves are nearly an inch broad, and the spikes quaternate and quinate: in all, the leaves are much broader than in any specimens I have ever seen of *H. Curassavicum*.] (*Hook.*)

2. MYOSOTIS. *L.*

Cor. hypocrateriformis: fauce squamis brevibus instructa. *Limbus* 5-partitus obtusus. *Stamina* inclusa. *Nuces* 4, uniloculares, fundo calycis affixæ, basi perforatæ.

a. *nucibus levibus glabris.*

1. *M. alpestris*; foliis lanceolatis acutiusculis obsolete trinerviis hirsutis, racemis ebracteatis, pedicellis in fructu patentibus calyce 5-fido clauso paullo longioribus, limbo explanato tubo longiore.—*Schmidt, Bohem. Cent.* 3. *Lehm. Asper.* v. 1. p. 86.—*M. lithospermifolia. Horn. H. Hafn.* v. 1. p. 173.—*M. suaveolens. Waldst. et Kit.*—*M. rupicola. Engl. Bot. t. 2559.*

HAB. Common in the Rocky Mountains. *Drummond.* Arctic sea-shore. *Dr. Richardson.*—The American plant corresponds exactly with the European one, and varies also with blue and white flowers.

2. *M. palustris*; calyce satis rectis appressis fructifero campanulato patente pedicellis divergentibus breviora, corollas limbo plano tubum excedente, pube caulis patente (vel nullo),—var. *micrantha*; caulis pube appressa.—*M. lingulata. Lehm. Asper.* v. 1. p. 110. *inter species in quas inquirendum esset.*—*M. cæspitosa. Schultz. Flor. Starg. Suppl. p. 11. Spreng. Syst. Veget.* v. 1. p. 557. (excl. synon.)

HAB. Canada. *Mrs. Percival, Mrs. Sheppard.* Newfoundland. *Dr. Morrison, Mr. Cormack.*—This plant, though in my opinion only a variety, is, however, as such, a very distinct one.

3. *M. versicolor*; foliis lanceolatis obtusiusculis hirsutis, racemis ebracteatis, pedicellis in fructu erecto-patentibus calyce 5-fido acuto clauso brevioribus, limbo patente tubo breviore.—*Pers. Syn.* v. 1. p. 156. *Engl. Bot. t. 480. Lehm. Asper.* v. 1. p. 93.

* By Professor Lehmann.

HAB. N.W. Coast. *Douglas*.—(There are specimens in the collection of this, or a closely allied species, a foot in height, with the young spikes densely capitate, the flowers twice or thrice larger than the usual appearance of *M. versicolor*, and with the hairs of the spikes yellowish.—H.)

4. *M. flaccida* (Dougl.); caule erecto ramoso, foliis linearibus calloso-strigosis, spicis ebracteatis bifidis, calycibus 5-partitis in fructu arcte adpressis clausis basi apiceque hispidissimis.

Planta annua. Caulis erectus, 1-1½ pedalis, teres, adpresso-pilosus, ramosus, ramis erecto-patentibus, in spicam bifidam dosinotibus. Folia sessilia, linearia, (1-1½ poll. longa 1½ lin. lata,) acutiuscula, integririma, calloso-strigosa, unnervia, patentia. Spica caulem et ramos terminantem, ebracteata, multiflora, ante anthesis revoluta, dein elongata, flaccida. Flores subsecundi, sessiles, crescente fructu, distantes. Calyx 5-partitus; laciniae linearibus obtusis basi apiceque hispidissimis, floriferi erecti, fructiferi clausi, rachis arcte adpressi. Corolla (ut videtur) flava, glabra. Tubus longitudine calycis. Limbus brevis, planus, laciniae integrerrimae. Nucæ 4, ovata, acuminato-rostellatae, glaberrimæ, fuscoc-nitide.

HAB. N.W. Coast, in dry plains. *Douglas*.

β. *nucibus rugosis.*

5. *M. glomerata*; caule erecto foliisque spathulato-linearibus hispidis, spicis solitariis axillaribus subpedunculatis bracteatis glomeratis, floribus confertis, calycibus hispidissimis, nucibus dorso rugosis. (TAB. CLXII.)—*Null. Gen. Am. v. 1. p. 112.*—*Cynoglossum glomeratum. Fras.*—*Pursh, Am. v. 2. p. 729.* *Lehm. Asper. v. 1. p. 176.*

HAB. Barren sands of the Columbia, near Lewis and Clarke's River. *Douglas*. About Carlton House Fort. *Dr. Richardson*.—One of the most beautiful species, with white flowers of the size of those of *Anchusa officinalis*. All the spikes are not, as said in Nuttall's description, *bifid*, but (according to my specimens) only the superior ones; the inferior ones are *simple*. In the description now referred to, the bracts of the spikes are not mentioned, which are linear, hispid (hispidissime); the inferior ones of the length of the calyx. The inflorescence is rather a spica terminalis composita e spiculis alternis approximatis simplicibus bifidisque, than what is called spica axillare, which becomes more evident since the leaf at the base of the spikelets (quite of the same structure as the stem-leaves) is not affixed to the stem, but at the branch of the spike.

TAB. CLXII.—Fig. 1, Flower; fig. 2, Pistil; fig. 3, Fruit; fig. 4, Single acheneum, anterior view:—magnified.

6. *M. leucophœa* (Dougl.); caule erecto, foliis lanceolato-linearibus supra sericeis subtus strigosis, spicis in summo caule congestis paucifloris, calycibus hispidissimis, nucibus,..... (TAB. CLXIII.)

Planta pulcherrima. Radix peronis. Caulis erectus, subpedalis, angulatus, inferne pilis adpresso-pilis, superne pilis patentibus tomentoso-hispidus. Folia sessilia, alterna, lanceolato-linearia, acuta, integerrima, supra sericea, subtus strigosa, trinervia, nervis lateraliibus submarginalibus obscurioribus. Spica plures in apice caulis axillisque foliorum superiorum densissime congestæ, hispidissimæ, paucifloræ. Calyx 5-partitus, 4 lineas longus: laciniae linearibus obtusis uninerviis intus apico tomentosis. Corolla magna, alba. Tubus calyce paullo longior, glaber. Limbus 5-partitus, planus, laciniae obovato-subrotundæ. Antheræ supra medium tubi adnatae. [Nucæ 4, subvibiculatae, ovatae, acute, glabre, levæ, dorso planæ, marginibus subalatis. Semen ovatum, obtusum.—Hook.]

HAB. Arid barrens of the Columbia, and of its northern and southern tributaries. *Douglas*.

TAB. CXLIII.—*Fig. 1*, Flower; *Fig. 2*, Calyx with the pistil; *Fig. 3*, Corolla laid open; *Fig. 4*, Pistil; *Fig. 5*, Fruit; *Fig. 6*, Single achene; *Fig. 7*, the same cut open showing the seed:—*magnified*.

7. *M. fulva*; hispida, caule erecto, foliis oblongo-linearibus obtusis v. acuminatis calloso-strigosis, racemis demum valde elongatis, calycibus pilis flavis hispidissimis 5-partitis sessilibus fructiferis ampliatis laciniis erectis, nucibus 2 (alteris abortientibus) reniformi-ovatis rugosis nigris.—*Hook. et Arn. in Bot. of Beechey's Voy. v. 1. p. 38.*

HAB. Dry prairies of the Columbia. *Mr. Tolmie*.—These specimens entirely agree with the original ones from Chili. The species is indeed very distinct and well-marked, remarkable for the large size of the calyx, especially when in fruit. (*Hook.*)

8. *M. Chorisiana*; caulibus filiformibus adscendentibus subramosis, foliis sessilibus angusto-linearibus calloso-strigosis, racemis terminalibus secundis, calycibus hispidis in fructu erectis apice barbatis, nucibus verrucosis rugosis.—*Cham. in Lin. v. 4. p. 444. Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 152.*

Caulis ex eadem radice plures, adscendentes, ramosi, subpalmares, incumbenti-pilosæ. Folia sessilia, angusto-linearia, acutiuscula, utrinque strigosa, 3-nervia, nervis lateralibus obscuris. Racemi multiflori, in summo caule ramisque secundi, bracteati, floribus infimis axillaribus. Calyces brevi-pedicellati, erecti, 5-partiti: laciniis lanceolato-linearibus, hispidis, apice fulvo-barbatis. Pedicelli sub calyce incrassati. Corolla parva, flava. Tubus calycem subsuperans: Limbi laciniis rotundatae, integrimæ. Nuces rugosæ, verrucose.

HAB. Columbia. *Dr. Scouler*.—This was found in California by the officers of Captain Beechey's Voyage. (*Hook.*)

3. ECHINOSPERMUM. Lehm.

Cor. hypocrateriformis: fauce squamis brevibus instructa. Limbus 5-partitus, obtusus, patulus. Nuces 4, uniloculares, echinatae, columnæ centrali affixæ, basi imperforatae.

a. *fructibus nutantibus vel deflexis.*

1. *E. Virginicum*; foliis ovato-oblongis acuminatis nervoso-venosis, supra scabris subtus pubescentibus, racemis divaricatis bracteolatis, nucibus aculeis glochidiatis dense asperis.—*Lehm. Aper. v. 1. p. 117. Rochelia Virginiana. Ræm. et Schult. v. 4. p. 108. Torr. Am. v. 1. p. 208. Myosotis Virginica. Lin. Sp. Pl. v. 1. p. 189. Pursh, Am. v. 1. p. 194. Nutt. Gen. Am. v. 1. p. 112.*

HAB. Canada to the Saskatchewan. *Dr. Richardson, Drummond*.

2. *E. diffusum*; caule foliisque hirsutis: radicalibus petiolatis oblongo-lanceolatis, caulinis superioribus ovatis obtusis sessilibus, racemis erectis simplicibus bracteatis, nucibus aculeis glochidiatis undique adspersis.—*Lehm. Pugil. II. p. 29. Myosotis diffusa. Dougl. ms.*

Caulis subpedalis, erectus, teres, hirsutus, apice in ramulis racemiferis divisus. Folia integerrima, utrinque hirsuta, sub 3-nervia: nervo medio subtus protuberante radicalia longe petiolata, oblongo-lanceolata, obtusiuscula; caulina sparsa conferta, inferiora radicalibus simillima sed minora et brevius petiolata; superiora sessilia, ovata, obtusa. Racemi simplices, hirsuti, erecti, bracteati. Bractæ inferiores ovato-lanceolatae, longitudine pedicellarum, superiores lineares, breviores. Pedicelli subsecundi, 3 lin. longi, hirsuti.

suti, floriferi erecti, in fructu nutantes. *Calyx* 5-partitus, lacinia oblongo-linearibus, obtusissimis, hirsutis, patentibus. *Corolla* alba? magna: *tubus* calye paullo longior sensim ampliatus, fauco subclausa, forniciis papillosis. *Limbus* 5-lobus: lobis obovatis, rotundatis, venosis, tubo duplo longioribus. *Filamenta* inclusa brevissima: *antheris* ovatis. *Nuces* 4, aculeis glochidiatis undique adspersa.

HAB. N.W. America. *Douglas*.

3. *E. floribundum*; foliis subsessilibus linear-lanceolatis acutatis subciliatis utrinque pubescens, radicalibus lanceolatis petiolatis, racemis bifidis bracteolatis, nucibus glabriusculis aculeis glochidiatis serie simplici margine dispositis. (TAB. CLXIV.)—Lehm. *Pugil*. II. p. 24.

Caulis herbaceus, 1½-2-pedalis, strictus, teres, fistulosus, pills adpressis subhirsutus. *Folia* integerrima, utrinque pubescentia subciliata; *radicalia* lanceolata, acuta, in petiolum longitudine folii attenuata; *caulina* sparsa, approximata, linear-lanceolata, longe acuminata, infima in petiolum decurrentia, reliqua sessilia. *Racemi* axillares, pedunculati, in summo caule paniculati, bifidi, bracteolati, multiflori. *Pedicelli* pilosi; floriferi longitudine calyceis erecti; in fructu calyee duplo longiores refracti. *Bractea* lanceolata, minuta. *Calyx* 5-partitus, hirsutus, lacinia ovato-lanceolatis obtusis. *Corolla* cærulea, magnitudine florum *Myos*. patustr. *Tubus* longitudine calyceis. *Limbus* planus: lacinia rotundatis. *Antheræ* ovatae, basi bifidae, in tubo subsessiles. *Pistillum* tube brevior: stigma capitulo. *Nuces* 4, ovatae, acute, glabriuscule, aculeis subulatis apice glochidiatis versus marginem simplici serie disposita.

HAB. Lake Pentanguishene to the Rocky Mountains. *Drummond*.

TAB. CLXIV.—Fig. 1, Flower; fig. 2, Pistil; fig. 3, Fruit; fig. 4, Single achennium:—magnified.

4. *E. deflexum*; foliis oblongo-lanceolatis obtusiusculis hirsutis, racemis erecto-patentibus inferne bracteolatis, nucibus aculeis basi connatis apice glochidiatis serie simplici margine dispositis.—Lehm. *Asper.* v. 1. p. 120.—*Rochelia deflexa*. 6. *L. corymbosum* (*Lehm.*); caule erecto piloso, foliis ovatis acutis in petiolum attenuatis glabriusculis margine et subtus pilosis, floribus racemoso-corymbosis, laciinis calycis lanceolato-linearibus elongatis acutis.—*Lehm. Pugil. II.* p. 27.—*Pulmonaria pilosa.* *Cham. in Linnæa.*—*Lithosp.* denticulatum. *Hook. et Arn. Bot. of Beech. Voy.* p. 128.

Caulis ex eadem radice plures, erecti, simplices, subpedales, fistulosi, pilosi. *Folia radicalia* late-ovata longe petiolata; *caulina* alterna, ovata, acuta, in petiolum attenuata, integerrima, venosa, supra glabriuscula, subtus et margine pilosa, suprema sessilia. *Petiolus* planus, pilosus, basi caulem subamplectens. *Flores* terminales in racemis corymbosis 5-8-floris dispositi. *Racemi* simplices vel bifidi, corymbosi, hirsuti, basi bracteatae lanceolatae, acuminatae, hirsuta instructi. *Calyx* 5-partitus, laciinia lanceolato-linearibus, acutis, 2-3 mm. longitudine tubo corolla. *Corolla* infundibuliformis, cerulea, semiplicicaris. *Tubus* limbo subintus pilosus. *Limbus* 5-lobus; lobis rotundatis. *Filamenta* brevissima, membranacea, fauci in-sertis linearibus. *Stylus* subulatus, basi compressus, longitudine corollæ: *stigma* capitulato.

HAB. Fort-William to the Rocky Mountains. *Drummond.* Hudson's Bay. *Douglas.* Kotzebue's Sound. *Zay and Collie.*

Sectio II. *Floribus subsolitariis luteis, corolla intus ad basin annulo barbato cincta.* (BATSCHIAE.)

7. *L. incisum*; caule herbaceo simplici erecto, foliis linearibus revolutis sericeo-villosis, corollæ tubo longissimo, limbi laciiniis fimbriatis. (TAB. CLXV.)—*Lehm. Asper.* v. 2. p. 303. *Rich. App.* p. 5.—*L. longiflorum.* *Spr. Syst. Veg.* v. 1. p. 544.—*Batschia longiflora.* *Pursh. Am.* v. 1. p. 132. *Nutt. Am.* v. 1. p. 114.

Caulis erectus, subpedalis, strigosus. *Folia* alterna, sessilia, linearia, margine revoluta, utrinque sericeo-villosa, bipollices longa. *Flores* in axillis foliorum superiorum subsessiles. *Calyx* hirsutus, 5-partitus: laciinia linearibus, acuminatis, 3 lineas longis. *Corolla* dava. *Tubus* angustus, subpentagonus, superne ampliatus, pollicem superans, fauce instructa prouberantiis 5 planis, rotundata. *Limbus* 5-lobus, laciiniis fimbriatis.

HAB. Banks of the Saskatchewan to lat. 55°. *Dr. Richardson, Drummond;* and Eagle and Red Rivers: also in the valleys of the Rocky Mountains, near the sources of the Athabasca. *Douglas.*—[This species has a most extensive range. I possess specimens gathered by Bradbury on the Missouri, and at Galveston Bay, by Drummond (n. 304 of his 3d Texas collection).—H.]

TAB. CLXV.—*Fig. 1*, Flower; *fig. 2*, Pistil:—*magnified.*

8. *L. Mandanense*; caule decumbente hirsuto, foliis lanceolato-linearibus sericeo-strigosis margine revolutis, floribus pedicellatis, corollæ limbo fimbriato-crenato. (TAB. CLXVI.)—*Spr. Syst. Veg. v. 1. p. 544.*—*Batschia decumbens. Nutt. Am. v. 1. p. 114.*

Affinis precedentem, differt foliis latioribus, floribus dimidio brevioribus et habitu omnino diversa.—*Radix* lignosa multiceps. *Caulis* decumbentes, hirsuti, 4–6 pollicares, superne in ramis floriferis dichotomo-vel trichotomo-divisi. *Folia* lanceolato-linearia, obtusissima, margine revoluta, sericeo-strigosa, 5–9 lineas longa, suprema longiora et latiora. *Flores* breviter pedicellati in axillis foliorum superiorum. *Calyx* 5-partitus laciniis linearibus, acutis. *Corolla* semiplicaris: *Limbus* planus, laciniis fimbriato-crenulatis. *Stamina* summo tubo inserta. *Stylus* longitudine tubi: *stigma* bilob.

HAB. Mountains and Plains of the Saskatchewan. *Drummond.*

TAB. CLXVI.—Fig. 1, Flower; fig. 2, Pistil:—magnified.

9. *L. hirtum*; caule herbaceo erecto simplici hirto, foliis linear-lanceolatis obtusis, floribus ovato-lanceolatis rotundato-obtusis utrinque hirtis, corollæ tubo calyce subæquante, limbo integerrimo.—*Lehm. Asper. v. 2. p. 804.* *Torr. Am. v. 1. p. 204.* *Spr. Syst. Veg. v. 1. p. 544.*—*Anchusa hirta. Mühlb. Cat. Plant. Am. Sept. p. 19.*—*Batschia Gmelini. Mich. Am. v. 1. p. 180.* *Pursh. Am. v. 1. p. 182.*—*B. Carolinensis. Gmel. Syst. Nat. v. 2. p. 315.*—*B. Caroliniana. Ræm. et Schult. Syst. Veg. v. 4. p. 52.*

HAB. Upper Canada. *Goldie.* Lake Huron. *Dr. Todd.*—This species is also found as far South as Galveston Bay, Texas. (No. 310 of Mr. Drummond's 3d collection.)

10. *L. canescens*; caule herbaceo erecto subsimple villoso, foliis oblongo-lanceolatis obtusis emarginatis utrinque adpresso villosiusculis, junioribus candicantibus demum scabriusculis, corollæ tubo calyce duplo longiore, limbo integerrimo.—*Lehm. Asper. v. 2. p. 305.* *Torr. Am. v. 1. p. 203.* (excl. syn. *Anchusa virg.*)—*Anchusa canescens. Mühl. Cat. Plant. Am. Sept. p. 19.*—*Batschia canescens. Mich. Am. v. 1. p. 180. t. 14.* *Pursh, Am. v. 1. p. 182.*—*B. conspicua. Rich. App. ed. 1. p. 49.*

HAB. Canada to the Saskatchewan. *Dr. Richardson, Drummond, Douglas.*

11. *L. sericeum*; caule basi suffruticoso erecto trichotomo-ramoso superne villoso, foliis oblongo-lanceolatis obtusis supra sericeis subtus subviloso-canescens, corollæ tubo calyce duplo longiore, limbo integerrimo.—*Lehm. Asper. v. 2. p. 306.*—*Lithospermum Virginianum. Moris. Hist. 3. Sect. 11. t. 28. f. 4.*—*Anchusa Virginica. L. Sp. Pl. v. p. 191.*—*Batschia sericea. Ræm. et Schult. Syst. Veg. v. 4. p. 748.*

Affinis precedentem, differt caule apice trichotomo-diviso, foliis integerrimis (nec emarginatis) majoribus magis sericeis, corollis duplo fere majoribus.

HAB. Banks of the Saskatchewan. *Dr. Richardson, Drummond, Douglas.*

Sectio III. *Corolla fauce nuda, foliis radicalibus post florescentiam non excrecentibus.* (LITHOSPERMÆ vera.)

12. *L. officinale*; caule erecto ramis numerosis, foliis lanceolatis acutis nervosis scabris subtus oppresse hirsutis, corollæ tubo longitudine calycibus nucibus brevissimis impunctatis. *L.*—*Lehm. Asper. p. 313.* (excl. syn.)—*L. latifolia. Muhl. Cert.. p. 18.* *Torrey, Fl. p. 202.*

HAB. Falls of Niagara. *Mr. Greene.* Quebec. *Mrs. Sheppard.*—(I quite agree with my friend Dr. Torrey, that *L. latifolium* of American authors is a very distinct species, and exclusively a more southern plant.)—*Hook.*

13. *L. ruderale* (Dougl.); caule herbaceo stricto hirsuto, foliis linearibus acuminatis strigosis, spicis foliosis, corollis villosis, tubo longitudine calycis. *Lehm. Pugil. II.* p. 28.

Caulis herbaceus, strictus, angulatus, sulcatus, simplex, apice ramosus, 1-1½-pedalis, hirsutus. *Folia* sparsa, conferta, sessilia, acuminata, strigosa, versus marginem et ad nervum medium subtus hispida: *inferioria* linearia, erecta, bipinnicaria et ultra: *superiora* linear-lanceolata, erecto-patentia. *Ramuli* spica solitaria, folios, pauciflora terminati; *florilus* subsessilibus. *Calyx* hirsutus, 5-partitus; lacinias inaequalibus, erectis, linearibus. *Corolla* extus villosa, flava. *Tubus* longitudine laciniarum calycis longiorum cylindricus: lacinias limbi ovatis rotundatis. *Filamenta* tubi corollae inserta: *anthera* oblongis usque ad saucemorrectis. *Style* longitudine tubi, stigmato simplici.

HAB. Gravelly banks of the Columbia and Multnomack Rivers. *Douglas.*

14. *L. angustifolium*; caulibus herbaceis procumbentibus, foliis linearibus undique strigosis, floribus sparsis lateralibus axillaribusque, fructibus turgide, ovatis nitidis impresso-punctatis.—*Mich. Am. Bor.* v. 1. p. 130. *Ph. Am.* v. 1. p. 131. *Lehm. Asper.* v. 2. p. 309.

HAB. Head of Lake Ontario. *Goldie.* Canada. *Dr. Holmes.* Norway House on the Saskatchewan. • *Drummond.*—In fruit, and only one specimen gathered. (Drummond's plants, from Brazosia and San Filipe in Texas, III. n. 297 and 306, are probably the same species.)

15. *L. lycopoides* (Lehm.); caulibus herbaceis procumbentibus ramosis folisque ovato-lanceolatis denticulatis setoso-ciliatis utrinque hirtis, floribus sparsis lateralibus axillaribusque, nucibus ovato-trigonis basi emarginatis dorso convexis rugosis.—*Lehm. Pugil. II.* p. 28.

Caulis procumbens, teres, hirtus, di-vel trichotomo-ramosus: ramis adscendentibus. *Folia* sessilia, ovato-lanceolata, acuta, utrinque e punctis sparsis callosa hirta, undulato-denticulata, denticulis callosis setosis. *Flores* laterales axillaresque breviter pedicellati. *Calyx* hispidissimus, 5-partitus, lacinias lanceolatis, 2 lineas longis, in fructu cornutus, subinflatus. *Corolla* longitudine calycis, flava, glabra, limbo erecto micinim. *Genitalia* inclusa. *Nuces* ovatae, trigone, acute, brunneæ, dorso convexe, rugosæ.

HAB. Straits of de Fuca, N.W. America. *Dr. Scouler.*

7. ECHIUM. L.

Cal. 5-partitus. *Cor.* infundibuliformis vel campanulata: fauce ampliata nuda. *Limbi* lacinias in plurimis inaequalibus. *Nuces* 4, uniloculares, turbinatæ, gigartoideæ, scabré, fundo calycis affixæ, basi imperforatae.

1. *E. Menziesii*; caule herbaceo erecto retrorsum hispido, foliis sessilibus acutis hispidissimis, inferioribus angusto-lanceolatis, superioribus ovato-lanceolatis, racemis multifloris imbricatis hispidissimis, staminibus corolla parva subtubulosa multo brevioribus.—*Lehm. Pugil. II.* p. 29.

Radix simplicissima. *Caulis* herbaceus, erectus, angulatus, sulcatus, retrorsum hispidissimus, 1½-pedalis, ramosus. *Folia* sessilia, obscure 3-nervia, undique e punctis callosis hispidissima. *Radicalia* et *caulinia inferiora* angusto-lanceolata (3 poll. longa, 4 lin. lata) acuta, integerrima: *superiora* ovato-lanceolata.

Racemi caulem et ramos terminantes, solitarii, multiflori, secundi, obrectati, hispidissimi, ante anthos in revoluti. Calyx hispidissimi, 5-partiti: lacinis linearibus, aequalibus. Corolla subtubulosa, glabra, flavescens? Tubus cylindricus, calyce dimidio longior, apice paulo inflatus. Limbus erectus, 5-lobus, inaequalis: lobis tribus reliquis duplo latioribus. Filamenta brevissima, aequalia, versus basin tubi inserta. Stylus filiformis, glaber, longitudine staminum: stigmate capitato. Nucæ 4, incurva, ovata, trigone, rugosissime.

HAB. N.W. Coast of America. *Mr. Menzies.*

[OBS. I have received *Lycopersis Europa*, *Borago officinalis*, and *Symphytum officinale*, from Canada, gathered by Mrs. Percival, but I fear they cannot be considered natives.

ORD. LXV. SOLANEÆ. Juss.

1. SOLANUM. L.

Cal. 4-5-rarius 10-fidus. Cor. subrotata, plicata, 4-5-rarius 10-fida. Antheræ conniventes, apice poro gemino dehiscentes (interdum inaequales.) Baccæ subglobosa, 2-(rarius 3-4-) locularis.—Herbes v. frutices inermes v. aculeati. Folia indivisa v. lobata, nunc imparipinnata. Inflorescentia varia, sapius extra-axillaris. Br.

1. *S. nigrum*; inerme herbaceum, foliis ovatis repandis, corymbis subumbellatis pedunculatis lateralibus nutantibus.—L.—Ph. Am. v. 1. p. 156. Ell. Car. v. 1. p. 80. Torr. Fl. v. 1. p. 235. Hook. et Arn. in Bot. of Beech. Voy. v. 1. p. 152.

HAB. Canada to Hudson's Bay and the Saskatchewan. Dr. Richardson. Drummond. N.W. America. Douglas. Scouler.—This is called var. *Virginicum* by the American Botanists; but it seems to differ in no respect from the European plant of the same name.

2. *S. triflorum*; inerme herbaceum procumbens, caule hirsuto, foliis lato-lanceolatis pinatifidis segmentis ovatis acutis, pedunculis lateralibus bi-trifloris hirsutis.—Nutt. Gen. Am. v. 1. p. 128.—a. *major*; foliis glabris.—b. *minor*; foliis subitus hirsutis.

HAB. a. About Carlton House Fort. Dr. Richardson. b. In the Garden (a weed) of Carlton House Fort, and entrance of Badger's Hole, and thence to Edmonton House. Drummond.

2. PHYSALIS. L.

Cal. 5-fidus. Cor. subrotata. Stam. basi corollæ inserta. Antheræ longitudinaliter dehiscentes. Baccæ bilocularis, calyce inflato colorato tecta.

1. *P. Pennsylvanica*; herbacea pubescenti-villosa, foliis ovatis subcordatis repondo-dentatis, floribus pedunculatis subsolitariis nutantibus, calycibus hirsuto-viscosis.—L.—Ph. Am. v. 1. p. 157. Torrey, Fl. v. 1. p. 234. Ell. Car. v. 1. p. 273.—P. viscosa. Jacq.

HAB. Lake Huron (plentiful). Dr. Todd.

2. *P. grandiflora*; herbacea pubescenti-viscosissima, foliis (inferioribus præcipue) longe petiolatis ovato-lanceolatis acuminate marginé undulatis, pedunculis subsolitariis, floribus magnis albis nutantibus, calycibus fructiferis globosis.

HAB. Sandy banks of the Saskatchewan, (sparingly). Drummond. Near old encampments where fires have been made, on the shores of Lake Winnipeg (Dr. Richardson), and Red River (rare). Douglas.—I

cannot find the description of any species which corresponds with this. It is remarkable for the great size and white colour of its flowers, which are nearly an inch broad. The whole plant is exceedingly viscid. A bad specimen, apparently of the same species, is found by Mr. Sheppard at Port au persil, below Murray Bay, Canada, and sent to me as *P. lanceolata*, from which, however, I consider it perfectly distinct.

3. NICOTIANA. L.

Cal. tubulosus, 5-fidus. *Cor. infundibuliformis* v. *hypocrateriformis*, limbo 5-fido. *Stigma capitatum*. *Caps. bilocularis* apice 4-fariam dehiscens.—*Herbae v. suffrutices. Flores terminales, racemosi. Br.*

1. *N. nana*; 2-3-uncialis, foliis lanceolatis pilosis, radicalibus quam flores solitarii longioribus, corolla calyce longiore, lacinia obtusis.—*Lindl. in Bot. Reg. t. 833.*

HAB. N.W. America. *A. Menzies*, *Esg. (Herb. nostr.)* Rocky Mountains. *W. Bird, Esg.*—A singularly dwarf and almost stemless species, originally discovered by the excellent Menzies.

2. *N. quadrivalvis*; annua, cauli humili eructo diffuse ramoso, foliis lanceolatis breviusculis acutis sessilibus nunc basi auriculatis, calycibus campanulatis tubo corollæ paululum brevioribus subinflatis clausis segmentis acuminatis, corollæ limbo patente planiusculo segmentis acutis, capsula globosa 4-valvis. *Nutt.*—*Ph. Am. v. 1. p. 141.* *Nutt. Gen. v. 1. p. 132.*

HAB. Mr. Nuttall was informed that it grew spontaneously on the banks of the Columbia, but probably the following species was there taken for it, if, indeed, the two be really distinct. Pursh gives the present as an inhabitant of the Missouri, and of the Mandan and Ricara Rivers, on the authority of Lewis' Herbarium. The foliage yields an excellent tobacco, but the most delicate kind is prepared by the Indians from the dried flowers. (*Ph.*)

3. *N. multivalvis*; herbacea viscido-pilosa, foliis lanceolatis inferioribus petiolatis, floribus axillaribus solitariis, calyce multipartito, capsula multiloculari, corollæ laciiniis obtusis alte venosis.—*Lindl. Bot. Reg. t. 1057.*

HAB. Abundant within the recesses of the Rocky Mountains, and westward to the Pacific Ocean, in all dry light soils, *Douglas*, who further observes that it is greatly esteemed by the different tribes for smoking, and is the only vegetable which the natives of the Columbia cultivate.

[Obs. I have received the *Hyoscyamus niger* from Canada, sent by Mrs. Percival. It is doubtless an imported plant.]

ORD. LXVI. OROBANCHEÆ. Juss.

1. OROBANCHE. L.

Cal. bracteatus, varius. *Cor. ringens; labium sup. integrum v. bilobum: inf. trifidum, laciiniis subæqualibus. Stamina basi planiuscula: Antheræ bilocularis. Stigma sèpissime bilobum. Caps. unilocularis, bivalvis, placentifera, placentis 2 v. 4. Semina numerosa rugosa.*—*Plantæ aphyllæ plerumque parasitæ.*

* *Calyx cyathiformis*, 3-dentatus. *Antheræ basi obtusæ facie anteriori dehiscentes. Placenta 2.*—*BOSCHNAJAKIA. Bunge.*

1. *O. glabra*; glaberrima, caule squamato basi incrassato reticulato, squamis cordatis

acutis (siccate) intense fuscis opacis, calyce cyathiformi obliquo tridentato, corolla tubo inflato, labio superiore elongato integro, inferiore abbreviato obscure trilobo. (TAB. CLXVII.) —*Boschnajakia glabra*. *Bunge*, in *Herb. nostr.*—*Stellaria lathraoides*. *Fisch.* in *Herb. nostr.*

HAB. N.W. Coast of America. *Mr. Menzies* (*Herb. nostr.*) Great Slave Lake to Fort Franklin on the Mackenzie River. *Dr. Richardson*.—This, and the following, with *O. Americana*, L. (which I possess from various parts of the United States, and from Mexico,) doubtless constitute a good genus, *Boschnajakia* of Bunge: but I regret I do not know where that author has described it. His specimens from Eastern Siberia are precisely the same as those gathered by Mr. Menzies and Dr. Richardson, and are remarkable for the very imperfect lower lip of the corolla, by which the species is at once distinguished from *O. Americana*, as well as from the following.

TAB. CLXVII.—*Fig. 1*, Fruit; *fig. 2*, Side view of a Flower; *fig. 3*, Calyx; *figs. 4 and 5*, Fruit:—magnified.

2. *O. tuberosa*; glaberrima, caule squamato basi tuberoso, squamis ovatis acuminatis (siccate) intense fuscis opacis, tubere reticulato areolis tuberculiformibus pentagonis, spica densa, floribus unibracteatis, calyce cyathiformi obliquo 3-dentato, corolla tubulosa bilabiata, labii erectis, superiore ovato integro, inferiore 3-lobo breviore, lobis ovali-oblongis obtusis erectis. (TAB. CLXVIII.)

Parasitica. *Caulis* erectus, simplex, digitalis et ultra, squamosa, basi in bulbum reticulatum incrassatum squamis laxiuscula fuso-nigrescentibus. *Floræ* in spream elongatam congesti erecti, paululum curvati. *Stamina* inclusa. *Filamenta* basi barbata. *Antheræ* ovata, erecta, apiculata, facie anteriori dehiscentes, rimis longitudinalibus superne junctis. *Germen* ovali-subrotundum: *Stylus* supra curvatus. *Stigma* subquadrilobum.

HAB. N.W. Coast of America. *A. Menzies*, Esq.—This is remarkable for its decidedly tuberous roots, and by that character, as well by the very dark brown opaque (not pale brown and shining) scales of the stem, it may readily be known from the *O. Americana*, L., which has not, I believe, yet been detected in British North America.

TAB. CLXVIII.—*Fig. 1*, Side view of a flower; *fig. 2*, Front view of do.; *fig. 3*, Pistil; *fig. 4*, Stamen; *fig. 5*, Back view of an anther; *fig. 6*, Front view of do.:—magnified.

* * *Calyx plerunque 5-fidus*. *Antheræ* basi acuminatæ, lateraliter dehiscentes. *Placentæ* 4.—*OROBANCHE VERA*.

3. *O. Ludoviciana*; pubescens-glandulosa, caule brevi simplici v. subramoso, spica elongata densiflora, calyce inæquali profunde 5-fido bibractento laciniis linearibus, corolla intus extusque pubescens tubo elongato curvato, labiis subæqualibus, sup. bifido inferiore trifido, lobis acutiusculis, staminibus inclusis.—*Nutt. Gen. v. 2, p. 58.*

HAB. Plains of the Saskatchewan (rare.) *Drummond*. New Caledonia. *Douglas*.—Mr. Drummond met with the same plant in Texas, (1st Coll. n. 69). Mr. Douglas' specimens are taller, more generally branched, and more hoary with down: the calyx is often 6-cleft, the upper lip of the corolla sometimes nearly entire; but I do not see that they are otherwise different from those of the eastern side of the Rocky Mountains.

* * * *Caulis fasciculatum ramosus, floribus solitariis (non spicatis) ebracteatis*.—FASCICULATÆ.

4. *O. comosa*; pubescens, caule brevi densissime fasciculatum ramoso, ramis squamosis,

calyce 5-partito ebracteato laciniis subulatis, corollæ tubo longe exerto curvato labiis elongatis recurvis, superiore oblongo bifido, inferiore tripartito laciniis linearis-oblongis apice bidentatis, antheris pilosis. (TAB. CLXIX.)

HAB. Banks of the Columbia. *Douglas*, *Dr. Scouler*, *Dr. Gairdner*.—Stem short, with broad scales bearing copious fasciculated, or almost corymbose branches, which have subulate scales.

TAB. CXLIX.—*Fig. 1*, Flower; *fig. 2*, Stamens; *fig. 3*, Pistil; *fig. 4*, Capsule:—magnified.

5. *O. fasciculata*; pulverulento-pubescent, caule brevi fasciculatum ramoso, ramis seu pedunculis nudis unifloris, calyx 5-fido ebracteato lobis triangularibus acutis, corollæ tubo longe exerto curvato, labiis erectis concavis brevibus obtusis, superiore bifido, inferiore trifido lobis integris, filamentis glandulosis, antheris glabris. (TAB. CLXX.)—*Nutt. Gen. v. 2. p. 59.*

HAB. About Carlton House Fort on the Saskatchewan. *Dr. Richardson*. Columbia. *Dr. Scouler*.—Well distinguished from the following by Mr. Nuttall.

TAB. CLXXX.—*Fig. 1*, Flower; *fig. 2*, Stamen; *fig. 3*, Pistil:—magnified.

6. *O. biflora*; pubescens-glandulosa, caule brevissimo parce fasciculatum ramoso, ramis seu pedunculis valde elongatis nudis unifloris, calyx profunde 5-fido lobis subulato-acuminatis, corollæ tubo longe exerto curvato, labiis erecto-patentibus concavis, superiore bifido, inferiore trifido, lobis integris, filamentis inclusis glabris, antheris ciliatis.—*Nutt. Gen. v. 2. p. 59.*—*O. uniflora*. *L.*—*Mich.*—*Ph.*—*Ell.*

HAB. Canada. *Ph.* Newfoundland. *Miss Brenton*.

2. EPIPHEGUS. *Nutt.*

Polygama. *Cal.* abbreviatus, 5-dentatus. *Cor. floris steriles* ringens, compressa, 4-fida, labio inferiore plano: *floris fertiles* minuta 4-dentata, decidua. *Caps.* truncata, obliqua, 1-locularis, subbivalvis hinc dehiscens.—*Aphylla, parasitica ad radices Fagi*.—*Nutt.*

1. *E. Americana*. *Nutt. Gen. Am. v. 2. p. 60.*—*O. Virginiana*. *L.*—*Mich. Ph.*—*Ell.*

HAB. Canada. *Mr. Cleghorn*, *Mrs. Percival*, *Mrs. Sheppard*. New Brunswick. *Mr. Kendal*.

ORD. LXVII. SCROPHULARINÆ. *Juss.*

HAB. Canada. *Mrs. Percival*. Lake Huron. *Dr. Todd*. Saskatchewan. *Dr. Richardson*, *Drummond*.—Probably introduced; yet both Pursh and Torrey observe that it springs up in great abundance in

* A desire not to extend the present work beyond the two volumes announced in the prospectus, has induced me to omit the generic and specific characters, and particular references of well-known plants. Without such an arrangement, it would be impossible to include all the species, even of phanerogamous plants, within the prescribed limits; the number having considerably accumulated since the commencement of the work.

newly-cleared lands, especially after the woods have been destroyed by fire, though not a plant had previously been seen within the compass of a hundred miles.

2. *V. Blattaria*. *L.*—*Mich.*—*Pursh.*—*Ell.*—*Torr.*

HAB. Lake Huron (abundant). *Dr. Todd.*

2. SCROPHULARIA. *L.*—*Benth.* l. c.

1. *S. Marylandica*. *L.*—*Ph. Ell.*—*S. nodosa*, var. *Mich.*

HAB. Canada. *Mrs. Percival*, &c., and thence to the Pacific. *Douglas*, *Dr. Scouler*.

TRIB. ANTIRRHINEÆ. *Chavannes*. *Benth.* l. c.

3. LINARIA. *Tourn.* *Benth.* l. c.

1. *L. vulgaris*. *Moench.*—*Antirrhinum Linaria*. *L.*—*Nutt.*—*E. Bot. t.* 658.

HAB. Canada, naturalized. *Mrs. Sheppard*. *Mrs. Percival*.

2. *L. Canadensis*; erecta glabra glauca, foliis linearibus obtusis, floribus racemosis, labio inferiore maximo palato obsolete, calcare subulato, stolonibus procumbentibus.—*Spreng.*—*Hook. Bot. Mag. t.* 3473.—*Antirrhinum Canad.* *L.*—*Ph.*—*Ell.*

HAB. Canada. Ph. Plentiful in the swampy soils between Fort Vancouver and the Grand Rapids. *Douglas*.

TRIB. SALPIGLOSSIDEÆ. *Benth.* l. c.

4. COLLINSIA. *Nutt.*

Cor. basi supra gibba, limbo valde irregulari 5-fido. Caps. globosa, 4-valvis. Benth l. c.

1. *C. grandiflora*; caule erecto, foliis linear-oblongis basi angustatis, pedunculis verticillatis floribus brevioribus, corollæ laciniis dilatatis retusis, calyce glabro corolla duplo breviore.—*Lindl. Bot. Reg. t.* 1107.

HAB. Dry gravelly banks of the Columbia. *Douglas*. *Dr. Scouler*. *Dr. Gairdner*. Wallacet River. *Mr. Tolmie*.—Probably the *C. violacea* of Nutt., of which I possess specimens from the author, is not distinct from this. The form of the leaves, and shorter peduncles, will readily distinguish it from *C. verna*.

2. *C. pauciflora*; caule prostrato, foliis oblongo-lanceolatis infimis ovatis petiolatis, pedunculis axillaris solitariis floribus multo longioribus, corollæ laciniis subacutis integris, calyce pubescente corollæ subæquali.—*Lindl. Bot. Reg. t.* 1082.

HAB. Moist places of the Columbia, from its source to the Pacific. *Douglas*. *Dr. Scouler*. *Dr. Gairdner*. Saskatchewan. *Dr. Richardson*. Lake Winnipeg. Captain Back.

TRIB. DIGITALEÆ. *Benth.* l. c.

5. CHELONE. *L.*—*Benth.*

Cor. labium superius amplum concavum. Stamen quintum præsens sterile. Semina membranacea alata. Benth. l. c.

1. *C. glabra*; foliis ovato-lanceolatis inæqualiter serratis, floribus dense spicatis, corollæ limbo contracto.—*L.*—*Mich.* *Ph. Nutt.* *Ell.*—et var. *β. lanceolata*. *Nutt.*

HAB. *α.* and *β.* Canada. Newfoundland. *Dr. Morison*. New Brunswick. *Mr. Kendal*.

2. *C. ramosa*; foliis ovatis acuminatis serratis, superioribus amplexicaulibus cordatis, pedunculis nudis trifloris pubescentibus. *Dougl. in Bot. Reg. t. 1211.*

HAB. Mountain woods near springs and rivulets, N.W. America. *Douglas (Bot. Reg.)*

6. PENTSTEMON.* *L'Hérit. Benth.*

Cor. laciniae subplanæ. Stamen quintum præsens sterile. Semina nuda. Benth. l. c.

1. *P. glandulosus*; elatus glanduloso-pubescentis, foliis radicalibus ovatis grosse dentatis, caulinis cordatis acutis amplexicaulibus subintegerrimis, calyce capsulam glabram subæquante, corolla speciosa, filamento rudimento glabro.—*Lindl. Bot. Reg. t. 1262.*

HAB. Undulating ground of Lewis and Clarke's River, near the *Forks*, among small stones (not common). *Douglas*.—Mr. Douglas' native specimens are in fruit. The flowers as shown in the Bot. Reg. are very large, and pale purple.

2. *P. serrulatus* (Menz. ms.); caule glabro, foliis omnibus argute serratis superioribus ovatis subbastatis, panicula bi-trifurcata, filamento sterili barbato. *Sm. in Rees' Cycl. n. 5.*

HAB. N.W. Coast of America. *A. Menzies, Esq.*—My specimens of this are not very perfect; but it seems to have many characters in common with the following.

3. *P. diffusus*; caule ramoso, foliis ovato-oblongis glabris inaequaliter serratis, pedunculus axillaris multifloris, calycibus turbinatis lacinias laceris aristatis. *Dougl. in Bot. Reg. t. 1132.*

HAB. Common on limestone Rocks of the Columbia at the Grand Rapids. *Douglas*.—Flowers numerous, large, purple.

4. *P. venustus*; caule suffruticoso erecto glabro, foliis sessilibus rectis ovato-lanceolatis acuminatis denticulatis glabris, floribus paniculatis, corollis ventricosis ciliatis, calycibus glaberrimis, antheris pilosis. (*Lindl.*)—*Dougl. in Bot. Reg. t. 1309.*

HAB. Gravelly channels of rivulets near the Blue Mountains and near the source of the Wallawalla River.—This fine species, with large pale purple flowers, bears the name of *P. suffruticosus*, Dougl. ms. in my herbarium. Dr. Lindley points out its near affinity with *P. diffusus*, from which, he observes, it differs "caule magis erecto, foliis sessilibus longioribus rectioribus, corollæ colore obscuriore, calycibusque glaberrimis."

5. *P. glaucus*; caule herbaceo glabriuscule, foliis omnibus glaberrimis radicalibus lanceolatis petiolatis integerrimi denticulatis, caulinis bracteisque ovato-lanceolatis sessilibus amplexicaulibus, panicula thyrsoides, corollis inflatis calycibusque extus glandulosopubescentibus, filamento sterili porrecto barbato. (*Lindl.*)—*Grah. in James. Journ. July, 1829. p. 348. Bot. Reg. t. 1286.*—*P. gracilis. Bot. Mag. fol. 2945.* as to the description, not the figure.

HAB. According to Dr. Graham, the seeds of this were sent to Edinburgh by Dr. Richardson, from Mr. Drummond's collection; but it does not appear to exist in the Herbarium. By some misunderstanding, I

* Of this difficult, and now (mainly by the labours of Mr. Douglas) extensive genus, I gladly avail myself of the characters drawn up by Dr. Lindley, in the Bot. Reg., from living specimens of the majority of the species. The distinguishing marks are with difficulty recognizable in dried specimens.

was induced to believe that Dr. Graham's plant was the same as one of Mr. Drummond's, of which I then had a drawing, (*P. gracile*, Nutt.); and I inadvertently gave Dr. Graham's description with that species. With *P. glaucus* I am entirely unacquainted, unless it be, as I cannot help suspecting, from the figure and the two lines of hairs described by Dr. Graham within the under lip, a variety of *P. pubescens*. Flowers varied with white and purple.

6. *P. ovatus*; herbaceus, floribus caule pedunculique glanduloso-pilosus, foliis cordato-ovatis amplexicaulis glabris grosse dentatis, inferioribus longe petiolatis, corollis tubulosis, filamento sterili apice barbato basi unidentato.—*Dougl. in Bot. Mag. t. 2003.*

HAB. Grand Rapids of the Columbia. *Douglas.* Wallamet River. *Mr. Tolmie.*—Flowers moderately large, of a bright ultramarine blue.

7. *P. pruinosus*; foliis cæsiis, radicalibus petiolatis integris dentatis, caulinis dentatis sessilibus, bracteis superioribus integris, floribus verticillatis, calycibus bracteisque villosis, corollis glabris calyx duplo longioribus, limbi laciiniis rotundatis integris. (*Lindl.*)—*Dougl. Bot. Reg. t. 1280.*

HAB. Junction of the Okanagan River, and on the high banks of the Columbia, near the Priest's Rapid. *Douglas.*—Flowers rather small, brilliant blue.

8. *P. Richardsonii*; caule herbaceo, foliis sessilibus pinnatifidis, calycibus glandulosopubescentibus, laciiniis ovatis acutis, corollæ labio superiore bilobo, inferiore trilobo transverso, pedunculis racemosis bi-trifloris. (*Lindl.*)—*Dougl. in Bot. Reg. t. 1121. Hook. Bot. Mag. t. 3391.*— β . minor.

HAB. On the Columbia and its tributary streams. *Douglas.*—Flowers large, purple.

9. *P. triphyllus*; herbaceus humilis, foliis ternis quaternis glabris incisis, inferioribus oblongis, floralibus integerrimis, pedunculis bi-trifloris calycibusque arachnoideis, corollæ aciniis oblongis obtusis, labii inferioris æqualibus. (*Lindl.*)—*Dougl. in Bot. Reg. t. 1246.*

HAB. Rocks of the River Wallawalla, near the base of the Blue Mountains, N.W. America. *Douglas.*—Flowers much smaller than the preceding, bluish purple.

10. *P. Scouleri*; suffruticosus, foliis obovato-lanceolatis serrulatis supremis integrerrimis obtusis, floribus solitariis racemosis, corollis (speciosis) ventricosis serrulatis, antheris lanatis. (*Lindl.*)—*Dougl. in Bot. Reg. t. 1277.*

HAB. N.W. Coast of America. *Menzies* in Herb. nostr. Rocks and mountains about the Kettle Falls, and near the sources of the Columbia. *Douglas.*—Flowers large, pale purple. In drying, the whole plant becomes black.

11. *P. deusatus*; caule subsimplici ascendente glabro, foliis inciso-serratis, radicalibus ovato-oblongis, proximis spathulatis, caulinis oblongis acutis sessilibus, supremis subintegris, calycibus glabris, limbi plani laciiniis retusis supremis minoribus. (*Lindl.*)—*Dougl. in Bot. Reg. t. 1318.*

HAB. Lewis and Clarke's River, between the Forks and its confluence with the Columbia, and at the junction of Spokane River. *Douglas.*—Flowers pale sulphur-yellow.

12. *P. confertus*; foliis integerrimis glabris, radicalibus spathulatis acuminatis longe pe-

tiolatis, superioribus sessilibus ovalis acuminatis, verticillis multifloris confertis subaphyllis, corolla calycе longiore. (Lindl.) Dougl. in Bot. Reg. t. 1260.

HAB. Mountain Pine woods, in dry sandy soils, between Salmon River and the Kettle Falls of the Columbia, and in the valleys of the Rocky Mountains, at an elevation of 7000 feet above the level of the sea. Douglas.—*Flowers* small, crowded, sulphur-yellow.

19. *P. procerus*; herbaceus, caule erecto stricto subsimplici, foliis lanceolatis Integerimis, inferioribus petiolatis superioribus sessilibus subconnatis, floribus verticillato-spicatis, calycis segmentis membranaceo-laciniatis mucronatis, filamento sterili edentulo. —Dougl. in Bot. Mag. t. 2954. Grah. in Ed. Phil. Journ. July, 1829.

HAB. Plains of the Saskatchewan to the Rocky Mountains. Dr Richardson. Drummond. Banks of the Columbia, between Fort Vancouver and the Grand Raps. Douglas.—Walamer River. Mr Tolmie.—Habit of *P. confertus*, but the flowers are blue-purple, variegated with a redder tinge. Mr Douglas' specimens are very luxuriant, 2-3 feet high, those from the Saskatchewan 1 foot to 10 inches.

14. *P. attenuatus*; caule stricto apice piloso, foliis radicibolis ellipticis acutis petiolatis, superioribus ovato-oblongis amplexicaulis sessilibus, omnibus glabris integerimis, panicula stricta, calycibus corollisque pubescentibus, capsulis glauco-rimis. (Lindl.) Dougl. in Bot. Reg. t. 1295.

HAB. Mountains of Lewis and Clark's River. Douglas.—*Flowers* moderately large, pale-yellow.—My specimens, however, under this name from Douglas, have decidedly purple flowers: and are perhaps rather referrible to the following.

15. *P. acuminatus*; caule ascendentem foliisque glabris vixle glaucis, horum radicibus ovato-oblongis longe petiolatis integerrimis subcoriaceis, caulinis bracteisque cordatis acuminatis sessilibus amplexicaulis, fasciculis florarum subsessilibus, sepalis acuminatis glaberrimis, corollis tube infundibulari fauce inflata, limbi laciniis latis retusis. (Lindl.) Dougl. in Bot. Reg. t. 1285.— β , minor.—*P. nitidus*. Dougl. in Hook. Herb.

HAB. Barren sandy plains of the Columbia. Douglas.— α . Red Deer and Eagle Hills, and other dry places of the Saskatchewan and Assinaboine and Red Rivers. Dr Richardson. Douglas.—*Flowers* rather large, bright purple.

16. *P. pubescens*; caule pubescente erecto, foliis lato-lanceolatis lanceolatis serratis infimis subspathulatis supermis basi subcordatis, panicula laxa erecta, pedunculis plurifloris, corollæ tubo elongato, labio superiore bifido breviore, inferiore porrecto trilobatus filamentoque sterili apice dense fulvo-barbatis. Ait. Hort. Kew. v. 2. p. 360. Mick.—*Ph.*— α , latifolius. Sims, Bot. Mag. t. 1424.— β , angustifolius.

HAB. Upper Canada. Lady Dalhousie. Lake Huron. Dr Tordt.—*Flowers* white suffused with purple and red. I cannot distinguish the *P. levigatus* specifically from the present. Nutall justly observes, that both are hairy (they have two bright yellow tufts) on the base of the lower lip within: as also has *P. glaucus*. Grah.

17. *P. gracilis*; caule erecto gracili, foliis magis minusve serratis glabris, inferioribus spathulatis caulinis lanceolatis basi subcordatis, panicula laxa stricta pubescente, pedunculis plurifloris, corollæ tubo elongato labio superiore bifido breviore, inferiore porrecto

3-lobo intus nudo, filamento sterili fulvo-barbato.—*Nutt. Gen. v. 2. p. 522. Hook. Bot. Mag. t. 2945. (excl. descr. et syn. P. glauci.)*

HAB. Red River and the Saska, " " " *Dr Richardson. Drummond. Douglas.*—Flowers long, purplish-blue, slightly tinged with green beneath.

18. *P. speciosus*; glaucus, glaber, foliis integerrimis; radicalibus spatulatis; caulinis lanceolatis subundulatis sessilibus, floribus verticillatim paniculatis, corollæ lobis subæqualibus rotundatis, rudimento glaberrimo. (*Lindl.*)—*Dougl. in Bot. Reg. t. 1270.*

HAB. On the high sandy banks of the Columbia, near Oskanagan, and on Spokane River. *Douglas.*—A splendid species, with very brilliant blue flowers slightly tinged with blush.

19. *P. Tolmiei*; humilis herbaceus cœspitosus glaberrimus, foliis lanceolatis acutis subcoriaceis integerrimis marginatis sessilibus sub lente impresso-punctatis inferioribus petiolatis, verticillis florum racemosis densis, pedicellis plurifloris brevibus, corollis parvis, limbi laciniis acutis subæqualibus, capsulis fuscis calycem æquantibus.

HAB. Mt. Rainier, N. of the Columbia *Mr Tolmie.*—A very distinct species, scarcely a span high, with woody horizontal roots, sending out copious fibres below, and above numerous tufted stems. The specimens are all in fruit: one withered corolla alone remaining, which is scarcely half-an-inch long, with acute segments to the limb. Inflorescence almost spicate.

20. *P. frutescens*; caule fruticoso, ramis angulatis superne pubescentibus, foliis lanceolatis obsolete denticulatis sessilibus glabriusculis, racemis terminalibus subcorymbosis, filamento sterili longitudinaliter barbato. (*Ph.*)—*Lamb. in Linn. Trans. v. 1. p. 250. Ph. Am. v. 2. p. 428. Digitalis dasymatha. Pal. MS. (fide Lamb.)*

HAB. Unalaschka. *Pallas.* North-west coast. *Lewis. (fide Pursh.)*—A most beautiful shrubby plant, with leaves 3-4 inches long and 1 inch broad. I know not in what particular part of the N.W. coast Lewis gathered it. Pallas is reported to have found it also in Kamtschatka; but notwithstanding I have received several collections from these three stations, I have never been so fortunate as to obtain a specimen; nor have I ever seen one.

21. *P. Menziesii*; fruticosus humilis vase ramosus, foliis glabris obovato-cuneatis obtusis coriaceis apicem versus serratis brevi-petiolatis, racemis terminalibus, floribus speciosis oppositis tubuloso-campanulatis.—*Gerardia fruticosa. Ph. Am. v. 2. p. 423. t. 18.*

HAB. Nutka. *A. Menzies, Esq.* In great abundance in the Pine forests of the Rocky Mountains. *Lewis. (ex. Pursh.)* I am not sure how far Mr Lewis' stations for plants, as given in Pursh, are to be depended upon. Mr Douglas does not appear to have found this in any of the numerous Pine forests of the Rocky Mountains which he traversed; and my only specimens are from Nutka, where the fine species was gathered by Mr Menzies so long ago as 1788.—Flowers as large as in the preceding species.

22. *P. Douglasiæ*; fruticosus humilis, ramis subfustigiatæ erectis, foliis glaberrimis obovato-lanceolatis acutis coriaceis integerrimis sessilibus, racemis terminalibus, pedicellis oppositis, capsulis nigrescentibus calyce paululum longioribus.

HAB. Blue Mountains of N.W. America. *Douglas.*—Allied to the last, but quite distinct. Leaves $\frac{1}{2}$ to $\frac{3}{4}$ of an inch long, almost black in drying, the old withered ones pale yellow-brown. Calycine segments ovato-lanceolate, slightly serrated, much paler than the dark-coloured capsules. There are no flowers on any of my specimens.

23. *P. Gairdneri*; fruticosus humilis minute puberulus, ramis subfastigiatis erectis strictis, foliis alternis linearis-spathulatis (supremis linearibus) coriaceis integerrimis sessilibus, racemis elongatis, pedicellis alternis (!) bracteatis, capsulis rufo-fuscis calyce concolori paululum longioribus.

HAB. Blue Mountains of N. W. America, where it was gathered by Mr Douglas, but communicated to me by Dr Gairdner.—The above four well-marked species constitute a very natural group of *Pentstemon*, or probably a distinct genus, of humble growth and with decidedly fruticose stems; the lower part quite woody. The present individual differs remarkably from the rest, in the leaves and pedicels being alternate; but the capsule is altogether that of *Pentstemon*, and the mode of growth similar to the preceding species. I have named it in compliment to Dr Meredith Gairdner, an accomplished naturalist and surgeon in the H. B. C. possessions on the Columbia, whence he has lately been obliged to visit the Sandwich Islands for the recovery of his health.

TRIB. GRATIOLEÆ. *Benth. l. c.*

7. MIMULUS. L.

1. *M. guttatus*, *De Cand.*—*Hook. et Arn. in Bot. of Beech. Voy. p. 152.*—*M. luteus. Ph. 1. p. 426.* (*excl. syn.*) *Curt. Bot. Mag. t. 1501.*

HAB. Moist woods, N.W.C. from California to Unalaschka; and from the a to the mountains.—This is readily known from the Chilean *M. luteus*, now common in our gardens, by the more copious flowers, of which the floral leaves are so small that they constitute a bracted raceme, by the shorter peduncles and broader and more inflated calyx when in fruit.

2. *M. moschatus* (Dougl.); caule diffuso foliisque petiolatis ovatis dentatis glandulosovillosis, pedunculis geminis foliis brevioribus, calycibus tubulosis fructiferis oblongis dentibus lanceolatis inaequalibus, corollæ limbo subaequaliter 5-lobo lacinia inferiore pubescente.—*Lindl. Bot. Reg. t. 1118.*

HAB. Moist springs about Fort Vancouver. *Douglas.*

3. *M. propinquus* (Lindl.); annuus, undique glanduloso-pubescentis, caule decumbente tereti, foliis ovatis dentatis supremis sessilibus, pedunculis axillaribus folio brevioribus pubescentibus, corollæ lobis obtusis: fauce pubescente; tubo calyci æquali.—*Lindl. Bot. Reg. t. 1330.*

HAB. N.W. America, according to Dr Lindley, who considers it to have sprung from seeds sent by Mr Douglas; but there is no such plant in his Herbarium, nor among his notes, and it has so striking a resemblance with *M. parviflorus* from Chili (*Bot. Reg. t. 874*), that I cannot but suspect that there is some mistake as to its origin. Mr Benthams quotes the figure doubtfully under *M. glabratus*, *H. B. K.*, a native of Mexico.

4. *M. floribundus* (Lindl.); patenti-pilosus diffusus viscosus gracilis basi præcipue ramosus, foliis cordatis petiolatis dentatis, pedunculis axillaribus solitariis ex omnibus fere foliis iisque longioribus, calycibus ovatis 5-carinatis dentibus brevibus subaequalibus.—*Lindl. Bot. Reg. t. 1125.*— β minor. *M. peduncularis.** *Dougl. Met.*

* I may remark, that Mr Benthams, whose opinion is so important in this family, considers the *M. peduncularis* of Dougl. a good species, to which, in a note in his "Scroph. Ind." he gives the following character:—"pubescens humilis, foliis petiolatis ovatis acutis subdentatis basi acutis rotundatis, calycibus (parvis) ovato-tubulosis, dentibus brevibus acutis subaequalibus."

HAB. Moist rocks of the Columbia, towards the mountains. *Douglas*.

5. *M. alsinoides* (Dougl. mst.); gracilis glaberrimus diffusus, foliis omnibus petiolatis ovatis cordatisque sinuato-dentatis, pedunculis axillaribus unifloris folio duplo triplove longioribus, calycibus ovatis dentibus perbrevibus subæqualibus, corolla flava maculis purpureis.— β . *minimus*; caule subnullo 1-3-floro. *Benth. in Scroph. Ind. adnot. p. 29.*

HAB. N.W. Coast. *Menzies* (in *Herb. nostr.*). Tongue Point and other moist rocky places of the Columbia. *Douglas. Dr Scouler*.

6. *M. Scouleri*; glaberrimus, caule erecto basi ramoso, foliis petiolatis lanceolatis dentatis 5-nerviis floralibus brevioribus subovatis, pedunculis folio brevioribus, calycibus demum inflatis.

HAB. Columbia River. *Dr Scouler*.—There are no flowers to these specimens, but the leaves are very different from any of the preceding in shape, and very unlike the *M. ringens* in nervation and in the calyx.

7. *M. roseus* (Lindl.); erectus, pubescens-viscidus, foliis ovato-acuminatis 5-nerviis sessilibus inferioribus præcipue dentatis subæqualibus, corollæ laciniis lato-oblongis obtusis subæqualibus.—*Lindl. Bot. Reg. t. 1591. Hook. Bot. Mag. t. 3353. M. Lewisii. Ph. Am. 2. p. 427?*— β . *glabrior*.

HAB. β . Mountains N. of the Smoking River (*Drummond*); apparently very rare, or too early for the blossoming; for there are only two specimens in the collection, and only one in flower; and these are more glabrous than Mr Douglas's specimens, which, as far as I know, were all gathered in California.—I think the *M. Lewisi*, *Ph.* is probably a dwarf state of this species.

8. *M. ringens*. L.—*Bot. Mag. t. 426. Ph. Am. 2. p. 426.*

HAB. Throughout Canada to the Saskatchewan.

9. *M. primuloides* (Benth.); caule perbrevi parce hirsuto stolonifero subulato, foliis sessilibus obovatis nervosis obscure dentatis glaberrimis, pedunculo elongato solitario terminali, calycibus tubulosis breviter dentatis.—*Benth. l. c. p. 29.*

HAB. N.W. Am. *Douglas* (last journey).—A very beautiful little plant, with a habit something like *Pyrola uniflora*.

8. GRATIOLA. L.

1. *G. Virginica*. L.—*Ph. Am. 1. p. 12.*

HAB. Canada. *Mrs Percival*. Lake Winnipeg. *Dr Richardson*. Plains of the Red River; and sandy soil on the N.W. Coast. *Douglas*. Walla-Wallah River. *Tolmie*.

9. LIMOSELLA. L.

1. *L. aquatica*. L.—*E. B. t. 357.—L. subulata*. *Eat. Am. Bot.*

HAB. York Factory, Hudson's Bay. *Drummond*.—This is quite the same with our European plant. Eaton's *L. subulata*, according to specimens received from Mr Greene, only differs in its narrower leaves, in which state it is sometimes found in Europe.

TRIB. VERONICEÆ. Benth. l. c.

10. VERONICA L.—Benth.

1. *V. alpina*. L.—*E. Bot. t. 484.*— β . *Wormskioldii*; elatior simplex, foliis multo majoribus, calyce capsulaque glanduloso-hirsutissimis. *Hook. Bot. Mag. t. 2975.* var. *Unalaschkensis*. *Cham. et Schlecht. in Linnæa. v. 2. p. 556.*—*V. Wormskioldii*. *R. et S.*

HAB. *M. Rainier*. N. of the Columbia R. *Mr Tolmie*.— β . Alpine Prairies of the Rocky Mountains. *Drummond*. Labrador. *Dr Morison*. *Unalaachka. Chamiso*.—It is frequent in Greenland.

2. *V. nutans* (Bong.).; corymbo terminali caule simplicissimo nutante, foliis sessilibus ovatis serratis acutiusculis, capsula subglabra calycem subæquante.—*Bong. Veget. de Sitcha. p. 39.*

HAB. *Sitcha, N.W.C. Bongard*.—The specimen which M. Bongard has kindly sent to me appears to differ from *V. alpina* β , only in being more glabrous, and in having the upper part of the stem drooping; but that author rather compares it with *V. Stelleri*, to which he says it is "maxime affinis, sed distincta caule semper nutante, corymbo paucifloro, floribus triplo minoribus, corolla intus glabra, capsula subglabra (nec pilosa), calycem vix superante (nec sesquiloniore), stylo calyce multo breviore terminata."

3. *V. Stelleri* (Pall.); caule simplici hirsuto, foliis sessilibus cordatis serrato-crenatis obtusis, racemo brevi, bracteis crenatis pedicello brevioribus, calyce hirsuto.—*Link. in R. et S. Syst. Veg. v. 2. Mant. p. 102. Cham. et Schlecht. in Linnæa. 2. p. 557.*

HAB. *Unalaachka. Chamiso*.—The habit and leaves are those of *V. Ponæ*, and the capsule similar to that of *V. alpina* β , from which the foliage and longer style, and larger and more pedicellated flowers, will distinguish it.

4. *V. serpyllifolia*. L.—*E. B. t. 1075. Ph. Am. 1. p. 11.*

HAB. From Unalaachka in the north, throughout British America (in the Rocky Mountains, becoming var. *humifusa*), and thence south, throughout the whole Continent of America, to the Falkland Islands.

5. *V. Beccabunga*. L.—*E. B. t. 635. Ph. Am. 1. p. 11.*

HAB. Canada to Norway House.

6. *V. Anagallis*. L.—*E. B. t. 781 Ph. Am. 1. p. 11.*

HAB. Throughout Canada, to the Rocky Mountains. *Drummond*. N.W.C. *Douglas*. *Sitcha. Bongard*.

7. *V. scutellata*. L.—*E. B. t. 782. Ph. Am. 1. p. 11.*

HAB. Canada to English River. *Dr Richardson*. Abundant in N.W. Am. *Douglas. Tolmie*.

8. *V. Chamaedrys*. L.—*E. B. t. 623.*

HAB. Canada. *Mrs Sheppard*.—Scarcely indigenous.

9. *V. peregrina*. L.—*F. Dan. p. 407. Ph. Am. 1. p. 11. Cham. et Schlecht. in Linnæa. 2. p. 559.*

HAB. Throughout Canada to Mackenzie River. *Dr Richardson*. Common on the margins of lakes, and still streams in N.W. Am. *Douglas. Dr Scouler*.—This, like the *V. serpyllifolia*, extends over the whole of the New World, and I possess specimens from the extreme point of S. America, gathered by Mr Darwin. *Chamiso* and *Schlechtendal* refer to it, as synonyms, *V. Romana*. L., *V. Xalapensis*, *Chilensis*, and *Peruviana*. *Humb.*, *V. Marylandica*. *Murr.*, *V. Caroliniana*. *Wall.*, and *V. carnosula*. *Lam.*

11. WULFENIA. *Jacq.*

Cal. 4-5-partitus. *Cor.* tubulosa subbilabiata, fauce hirsuta, labio superiore integro, inferiore 3-lobato. *Stam.* 2, labio superiorie adpressa. *Stylus* simplex; *stigmata* obtuso. *Capsula* compressa, bivalvis, superne ad marginem utrinque dehiscens. *Semina* plurima. —Herbae foliis plerisque radicalibus petiolatis. Flores racemosi, bracteati.

1. *W. reniformis* (Dougl. Mst.); foliis radicalibus longe petiolatis reniformibus crenatis, scapo bracteato laxe racemoso, calycibus 4-partitis longe ciliatis. (TAB. CLXXI) *Benth.* in *Scroph. Ind.* p. 46, (in not.)

Rhizoma perennis, repens, fibra copiosa emittens. *Folia* radicalia longe petiolata, coriaceo-membranacea, glabra vel pilis decidua sparsa hirsuta, reniformia v. cordato-reniformia, crenata. *Petiolus* digitalis, glabra vel decidue-pilosa. *Scapus* flerifer longitude foliorum, demum fructiferus elongatus, foliis subduplo longior, erectus, nudus vel nudiusculus. *Flores* in racemum laxum dispositi, bracteati, bracteis ovatis pedicello brevioribus. *Calyx* 4-partitus, lacinias ovato-lanceolatis acutis planis appressis longo ciliatis. *Corolla* calyce duplo longior, subinfundibuliformi-tubulosa, cerulea, limbo subbilabiato, labio superiore integro, inf. 3-lobato, lobis subaequalibus. *Stamina* 2, fauci hirsuta inserta, filamentis subulatis exsertis. *Antheræ* magno, dorso affixa, bilocularis. *Ovarium* subglobosum compressum. *Stylus* filiformis, tubo corollæ brevior. *Stigma* obtusum. *Capsula* elliptica nigra membranacea obscure reticulata compressa, bilocularis; superne ad marginem utrinque dehiscens, ut in *Veronica* plerisque. *Disseminatione* marginibus introflexis valvarum nro coherentibus.

HAB. Common about the Grand Rapids of the Columbia, and in the valleys of the Blue Mountains. *Douglas*. Woods N.E. of Fort Vancouver. *Dr Gairdner*.—A genus differing in habit, but in fructification nearly allied to *Veronica*.

TAB. CLXXX. *WULFENIA RENIFORMIS*.—Fig. 1, Flower; f. 2, the same laid open; f. 3, Capsule; f. 4, Transverse section of do. below the middle:—magnified.

12. GYMNANDRA. *Pall.*

Calyx bipartitus, spathaceus v. 0. *Cor.* labium superius integrum: inferius 2-3-partitum. *Stam.* 2 ad basin labii superioris, exserta. *Capsula* bilocularis, “loculis monospermis.”—Herbae siccitate nigricantes. *Folia* radicalia petiolata, caulinæ superiora bracteiformia. Flores spicati densi, bracteati.

1. *G. Gmelini* (Cham. et Schl.); foliis radicalibus subrotundo-aut elongato-ovatis basi parum attenuatis obtusiculis grosse inequaliter crenatis, staminibus labio superiore duplo brevioribus, stylo illo breviore. *Linnaea*, 2. p. 561.—*G. ovata*. *Willd. Mag. Ges. Nat.* t. 10. f. 8.—*G. reniformis*. *Willd. l. c.*—*G. borealis*, var. *Pall.*—*Lagotis glauca*. *Gartn.*—*Bartsia Gymnandra*. *Willd.*—*Ph. Am.* 2. p. 430.

HAB. Unalashka. *Chamiso*.—Whole plant very glabrous, succulent, and thick. If this is really the plant of Lewis, mentioned by Pursh, it is also found in the Columbia.

2. *G. Stelleri* (Cham. et Schlecht.); foliis radicalibus oblongis utrinque infra vero magis attenuatis acutis inequaliter obtuse serratis, staminibus sere longitudine labii superioris, stylo illo longiore.—*Linnaea*, 2. p. 563. *Hook. et Arn. in Bot. of Beech. Voy.* p. 128.—*G. minor*, *G. dentata* et *G. gracilis*. *Willd. l. c. p. 393, et seq. t. 9.*—*G. borealis*. *Pall.*

HAB. Bay of St Lawrence. *Chamiso*. Coast of the Arctic Sea. *Dr Richardson*. Immarook, Kotzebue's Sound. *Lay and Collie*.—Glabrous like the last.

3. *G. rubra* (Dougl. mst.) ; foliis radicalibus longe petiolatis late ovatis subcordatis obtusis profunde duplicato-crenatis, caulinis minoribus superioribus sessilibus sensim in bracteis ovatis abeuntibus, spica gracili densa tota lanato-hirsuta, calycibus nullis, corollis parvis, staminibus styloque longe exsertis. (TAB. CLXXII)

Radix e florib. crassiusculis, simplicibus, descendentibus. *Caulis* erectus, pedalis, foliosus, simplex, superne præcipue tomentosus. *Spica* elongata, bracteata. *Bractea* flore longiores, inferiores majores, lanatae. *Calyx* omnino nullus. *Corolla* parva, subcoriaceo-carnosa, rubra? extus intusque hirsuto-lanata; tubo brevi, limbo profide quadripartito, lacinia superiore majore; 3 inferioribus minoribus inequalibus omnibus erectiunculis. *Stamina* 2, longe exserta. *Filamenta* glabra, *Anthera* magnoe. *Ovarium* ovatum lanatum. *Style* gracilis stamina superans. *Stigma* obtusum.

HAB. Banks of M'Gillivray's and Flathead Rivers, near the Kettle Falls of the Columbia, and in the valleys of the Rocky Mountains. *Douglas*.—The absence of a calyx, the succulent nature of the corolla, together with its small size and very short tube, might perhaps justify the making a new Genus of this plant; but its habit is entirely that of the other *Gymnandreae*, and till we are acquainted with the fruit, I prefer leaving it where its discoverer had placed it. The petioles, and even the leaves themselves, are partially clothed with deciduous hairs.

TAB. CLXXI.—*GYMNANDRA RUBRA*.—Fig. 1, Bractea; fig. 2, Corella; fig. 3, Pistil:—magnified.

13.? ROMANZOFFIA. Cham.

Cal. 5-fidus, inferus persistens. *Cor.* hypocrateriformis, decidua. *Filamenta* imo tubo inserta. *Stigma* simplex. *Caps.* ovata, obtusa, bivalvis, bilocularis, dissepimento valvulis contrario, polysperma. *Cham.*

1. *R. Unalaschkensis* (Cham.); hirsuto-lanata, foliis longe petiolatis reniformi-cordatis profunde 5-rarius 7-lobis, floribus subcapitatis, pedicellis flore brevioribus post anthesin erectis, calycibus capsulam superantibus.—*Hor. Phys. Ber.* p. 71. t. 14. *De Cand. Prodr. v. 1. p. 319. Cham. et Schlecht. in Linnaea.* 2. p. 608.

HAB. Unalaschka and islands in Behring's Straits. *Chamiso. Langsdorff*.—I am not aware that any of our British Naturalists have gathered this species.

2. *R. Sitchensis* (Bong.); parce pilosa, foliis longe petiolatis reniformibus sub-9-lobatis, floribus laxe racemosis, pedicellis flore longioribus demum subpatentibus, calycibus capsulam duplo brevioribus.—*Bong. Veg. de Sitcha.* p. 40. t. 4.— β . *gracilis*; triplo minor.

HAB. Sitcha. *Bongard*. Fort Vancouver (*Mr Garry*) and Observatory Inlet. *Dr Scouler*.— β . Trinidad, N.W. America. *Mr Menzies*.—A larger and very different species from the preceding, having smaller flowers, very slender pedicels much elongated in fruit, and a calyx only half the length of the capsule. Mr Mezzies was certainly the first to discover and distinguish this curious genus, and his original specimens and very accurate description are in my possession. I am aware that Mr Bentham does not consider this genus to belong to *Scrophularineæ*, and that Choisy is disposed to refer it to *Hydroleaceæ*, whilst *Mr Don* makes of it, and *Sibthoria*, a separate Order, *Sibthoriaceæ*: but in habit it so much resembles the *Veronicaeæ* group of the present Order, and the capsule and whole aspect have so striking an affinity with our *Wulfenia reniformis*, that I prefer for the present to place it here, notwithstanding the regular corolla and five stamens.

TRIB. GERARDEÆ. *Benth.*14. GERARDIA. *L.*

1. *G. purpurea* (L.) ; foliis linearibus acutiusculis planis margine scabris, floribus breviter pedunculatis, calycibus subnerviis dentibus acutis tubo dimidio brevioribus, corollis glabris ample campanulatis, basi breviter tubulosis. *Benth. Syn. Gerard. in Hook. Comp. to B. Mag. 1. p. 208.—Ph. Am. 2. p. 422.*

HAB. Lake Huron, Dr Todd, to the Saskatchewan. *Drummond.*

2. *G. longifolia* (Nutt. *Tr. Am. Ph. Soc.* 5. 180.) ; foliis anguste linearibus margine scabris, floralibus flores superantibus, pedunculis calyce multo longioribus, calycibus subnerviis dentibus lanceolatis acutis tubo vix brevioribus, corollis glabris ample campanulatis basi breviter tubulosis. *Benth. l. c. p. 208.—G. aspera. Dougl. Ms.*

HAB. Pastures of the Red River, *East*, not on the "West," side (*Benth.*) of the Rocky Mountains. *Douglas.*—Plant more scabrous than the preceding; leaves narrower, peduncles much longer, and flowers larger.

TRIB. RHINANTHEÆ. *Benth.*15. ORTHOCARPUS. *Nutt.*

Cal. tubulosus v. campanulatus, 4-fidus. *Cor.* bilabiata, clausa; *lab. sup.* minore compresso, marginibus inflexis; *inf.* concavo obsolete 3-dentato. *Antherarum loculi* tenues, mutici, inæquales. *Caps.* bilocularis, bivalvis, loculicide dehiscentia. *Semina* marginata.

1. *O. bracteosus* (Benth.) ; caule duro pubescente, foliis lanceolatis apice lineari-trifidis, floralibus spicatis, bracteis latis divaricato-trifidis rigidis, dentibus calycinis lanceolatis rigidis viridibus corollæ (purpurascens) tubo brevioribus. *Benth. in Scroph. Ind. in not. p. 13.*

HAB. N.W. Coast. Columbia and Puget Sound, *Douglas*; Wallamet. *Tolmie.*—1-2 feet high. Corolla rather large, broad at the upper end, much exserted, pale-purple.

2. *O. strictus* (Benth.) ; caule duro hispido, foliis lanceolatis integris trifidis, floralibus distantibus longe spicatis, bracteis divaricato-trifidis laciniis longe lanceolatis corollas superantibus, dentibus calycinis lanceolatis brevissimis viridibus, corollis (luteis) glabris, tubo longe exerto. (*Tab. CLXXIII*) *Benth. l. c. p. 13.*

HAB. Plains of the Saskatchewan and mountain Prairies. *Drummond.* Red River; and N.W. America, at Puget's Sound, and Mount St Helen's. *Douglas.*—A foot to a foot and a half high, simple, or slightly branched, very leafy. Flowers yellow, resembling those of *Melampyrum pratense*.—May this not be the original *O. luteus* of Nuttall? from the Mandan country.

Tab. CLXXII.—*Fig. 1*, Flower; *fig. 2*, Fruit enclosed in the calyx; *fig. 3*, Fruit burst open; *fig. 4*, Seed:—*magnified*.

3. *O. hispidus* (Dougl.) ; subramosus, piloso-hispidus, foliis e basi lanceolata longe subtrifidis laciniis lineari-subulatis, floralibus distantibus, bracteis viridibus corollas superantibus, calycis dentibus lineari-setaceis viridibus corollæ (flavescens) tubo glabro brevioribus. *Benth. l. c. p. 13.*

HAB. Common on the low mostly grassy plains of the river Columbia. *Douglas.*

4. *O. tenuifolius* (Benth.); piloso-pubescent, foliis 3-5-fidis, laciniis linearisubulatis, floralibus latissimis incisis, floribus dense spicatis dentibus calycinis brevibus subulatis. *Benth. l. c. p. 12.*—*Bartsia tenuifolia. Ph. Am. 2. p. 429.*

HAB. N.W. Coast. *Mr Menzies.* Mounts Hood and St Helen's, and in the valleys of the Rocky Mountains. *Douglas.*

16. CASTILLEJA. *Mut.*

Cal. tubulosus compressus hinc fissus. *Cor. tubulosa* compressa bilabiata; *lab. sup.* linearis canaliculata; *inf.* brevissimo dentato. *Antherrum loculi* tenues mutici inaequales. *Caps.* ovata compressa. *Sem.* membrana reticulata laxa obtecta.

1. *C. coccinea* (Kunth); pilosa, foliis plerisque incisis calycibus utrinque fissis segmentis latis integris retusis corollam subæquantibus vel vix brevioribus. *Benth. ms.*—*Euchroma coccinea. Nutt.*—*Bartsia cocc. L.*—*Ph. Am. 2. p. 429.*—3. bracteis lutescentibus. *Ph. l. c.*

HAB. Throughout Canada to the Saskatchewan.

2. *C. hispida* (Benth. ms.); piloso-hispida, foliis plerisque incisis calycibus utrinque praesertim infra fissis segmentis apice bifidis laciniis oblongo-linearibus corolla parum brevioribus. *Benth.*—*C. coccinea. Dougl. ms. and Lindl. Bot. Reg. t. 1136.*

HAB. Common on dry soils of the N.W. Coast, especially about Fort Vancouver. *Douglas. Dr Scouler. Tolmie. Dr Gairdner.*—This western plant seems to me scarcely to differ from *C. coccinea*, except in being more villous, rather than hispid. Bracteas sometimes full yellow, as is the case with the preceding. Mr Bentham remarks (ms.): "Flowers of *C. pallida*; foliage of *C. coccinea*. Nearly allied to this is the *C. parviflora*, Bong. *Veg. de Sitch.* p. 40," but of which no specific character is given; there is however the observation, "valde affin. *C. coccinea*, a qua autem tam habitu quam floribus duplo minoribus differt." The author has kindly sent me specimens, but the flowers do not appear to be fully developed.

3. *C. septentrionalis* (Lindl.); pilosa v. rarius glabrata, foliis plerisque incisis calycibus utrinque praesertim infra fissis segmentis apice bifidis laciniis ovatis corollam æquantibus. *Benth. Lindl. Bot. Reg. t. 925.*—*Bartsia pallida. Mich. Ph. et auct. Am. Sept.*

HAB. Rocky Mountains. *Drummond.* Arctic Sea-Coast. *Dr Richardson.* N.W. Coast. *Douglas* (last journey).—The species of this genus are liable to much variation, and their essential characters difficult to be determined; hence there is much confusion among authors. Chamisso and Schlechtendal consider the *C. septentrionalis* of Lindley, and the European *pallida* (Lindley's *Sibirica*) to be identical. I will not attempt to decide the point from dried specimens, where the flowers cannot satisfactorily be examined, but content myself with Mr Bentham's definitions, made from our own specimens.

4. *C. pallida* (Kunth); glabra tomentosa vel apice pilosa, foliis caulinis plerisque integris, calycibus utrinque praesertim infra fissis segmentis apice bifidis, laciniis oblongis linearibus corollam æquantibus v. vix brevioribus. *Benth.*—*Hook. et Arn. in Bot. of Beech. p. 128.*—*C. Sibirica. Lindl. Bot. Reg. t. 925 (in descr.)*—*Bartsia pallida. L. et auct. Europ.*—*Bartsia acuminata. Ph. l. c.*

HAB. Pastures of the Rocky Mountains; and throughout Canada to Hudson's Bay and Fort Franklin on the Mackenzie River. *Drummond. Dr Richardson.* N.W. Coast, to Behring's Straits. *Chamisso. Menzies.*

ties. Tolmie. Labrador. (*Ph.*).—Extremely variable in size, in the width and incision of the leaves and bracteas, and in the colour of the latter: so that I fear the following is scarcely a distinct species. Probably Pursh's *Bartsia acuminata* is only a narrow-leaved state of the present.

5. *C. miniata* (Dougl. mst.); *glabra v. apice pilosa*, foliis caulinis integris calycibus utrinque presertim infra fisis, segmentis apice bifidis lacinias lanceolatis oblongisive corollæ tubum vix sequantibus. *Benth.*

HAB. Blue Mountains, N.W. America. *Dougl. Tolmie.*—“The flower, though generally altogether shorter than in *C. pallida*, has yet usually the whole upper lip exserted from the calyx.”

17. EUPHRASIA. L.

1. *E. officinalis*. L.—*E. Bot. t. 1413. Ph. Am. 2. p. 430.*— β . var. *rotundifolia*, laxiflora.—*E. latifolia. Ph. l. c. (non L.)*

HAB. Canada and Newfoundland, to lat. 64° N. (*Dr Richardson.*) β . Prairies of the Rocky Mountains. *Drummond.*

18. BARTSIA. L.

1. *B. alpina*. L.—*E. Bot. t. 361. Ph. Am. 2. p. 430.*

HAB. Labrador. *Kohlmeister. Dr Morison.*

19. RHINANTHUS. L.

1. *R. Crista Galli*. L.—*E. Bot. t. 637. Ph. Am. 2. p. 429.*

HAB. Newfoundland, and throughout Canada, to the shores of the Slave Lake, and to Fort Franklin. (*Dr Richardson.*) Prairies of the Rocky Mountains. *Drummond. Fort Vancouver on the Columbia. Dr Scouler.*

20. MELAMPYRUM. L.

1. *M. sylvaticum*. L.—*E. Bot. t. 804. M. Americanum. Mich. M. lineare. Lam. Ph. Am. 2. p. 430.*

HAB. From Lake Huron, and throughout Canada, to the plains of the Saskatchewan. *Dr Richardson. Drummond.*—I quite agree with Mr Bentham, who considers this plant identical with our European *M. sylvaticum*; varying, however, much in the breadth of the foliage, and in the entire or toothed bracteæ.

21. PEDICULARIS. L.

§ I. PERSONATE. *Stev. labio inferiore erecto.*

1. *P. capitata* (Adams in *Mem. Nat. Cur.* 5. p. 100); subpubescens, caule brevi subaphyllo, foliis pinnatis pinnis inciso-pinnatifidis, floribus peniculis capitatis, corolla calyce quadruplo longiore corollæ clausa; labio inferiore duplo breviore, galea obtusa, stylo exerto. *Stev. Monogr. Pedicul. in Mem. Soc. Imp. Mosc. v. 6. p. 19. t. 3. f. 2.*—*P. Nelsonii. Br. in Rich. App. p. 743. Hook. in App. to Parry's Second Voy. p. 402. t. 1.*—*P. verticillata. Ph. Am. 2. p. 426. (non Willd.)*

HAB. Arctic Sea-shore and Islands. *Dr Richardson. Capt. Sir E. Parry. Behring's Straits. Langsdorff. Chamisso. Beechey.*

2. *P. lanceolata* (Mich.); caule erecto folioso, foliis oppositis lanceolatis duplicato-inciso-crenatis, floribus dense spicatis, corollæ clausæ (calyce triplo longioris) labiis sub-equalibus, galea subrostrata. *Ph. Am.* 2. p. 425. *Stev. l. c. p. 18. t. 4. f. 2.*—*P. Virginica.* *Poir.*—*P. pallida. Nutt.*— β . corolla breviore.

HAB. Canada. *Mr Goldie.*— α . St Clair Bay, Upper Canada. *Mr J. McNab.*—Upper Canada is probably the northern limit of this fine species.

§ II. VERTICILLATÆ. *Stev.*—*foliis quaternis.*

3. *P. Chamissonis* (Stev.); glaberrima erecta simplex, foliis quaternis pinnatifidis inciso-serratis, floribus verticillatis in spicam interruptam, corollæ galea uncinata. *Stev. l. c. p. 20.*

HAB. Unalashka. *Langsdorff and Chamisso. (Herb. nostr.)*

4. *P. verticillata* (Linn.); foliis quaternis pinnatifidis lacinii obtusis, floribus verticillato-spicatis, corollæ galea recta obtusa labium inferius subæquante, calyce quinque-dentato. *Stev. l. c. p. 24.* *Cham. et Schlecht. in Linnæa.* 2. p. 582. *Hook. et Arn. Bot. Beech.* p. 128.

HAB. Kotzebue's Sound. *Beechey. Chamisso. Sitcha. Bongard.*

§ III. FAUCIDENTES. *Stev.*—*Cor. lab. sup. utrinque infra med. dentato.*

5. *P. Wlassowiana* (Stev.); corollæ labio superiore antice rectilineo, denticulo infra medium. *Stev. l. c. p. 27. t. 9. f. 1.*—*P. macrodontis. Rich. App. p. 24.*—*P. palustris. Hook. et Arn. Bot. Beech. p. 128.*

HAB. Plains of the Saskatchewan; and York Factory, Hudson's Bay. *Dr Richardson. Drummond.* N.W. Coast. *Mr Menzies.* Kotzebue's Sound. *Beechey.*—"Readily distinguished from *P. palustris* by the smaller flowers, without any tooth at the apex, but only one on each side, near the base." (*Benth.*) Mr Bentham also remarks that probably Wahlenberg's Swedish, and Chamisso's N. American *P. palustris*, belong to this species, as is certainly the case with Dr Arnott's and my "*P. palustris*" from Kotzebue's Sound. On the other hand, Turczaninow's Dahurian specimens, under the name of *P. Wlassowiana*, are a var. of *P. palustris*.

6. *P. palustris* (Linn.); corollæ labio superiore denticulo infra medium, galea dilatata gibba. *Stev. l. c. p. 28. E. Bot. t. 399.*— β . parviflora. *Benth. mst.*

HAB. Newfoundland. *Dr Morison.*— β . Carlton House Fort. *Dr Richardson.*

§ IV. ROSTRATÆ. *Stev.*—*Cor. lab. sup. basi edentulo, rostrato.*

7. *P. surrecta* (Benth. mst.); erecta glabra, foliis pinnatisectis segmentis lanceolato-linearibus subcartilagineo-serratis, spicis elongatis multifloris, calycibus tubulosis 5-dentatis, dente supremo minore lateralibus altius crenatis corollæ galea fornicate calycem subdupo superante in rostrum subulatum surrectum calycem plus triplo superantem desinente. *Benth.*

HAB. N. West Interior. *Douglas* (last journey).—"Corollæ duplo maiores quam in sequente."

8. *P. Groenlandica* (Retz, *Obs. 4. t. 1*); erecta glabra, foliis pinnatisectis segmentis lanceolato-linearibus subcartilagineo-serratis, spicis elongatis multifloris, calycibus tubulosis 5-dentatis dente supremo minore lateralibus altius connatis, corollæ galea forniciata calycem vix superante in rostrum subulatum surrectum calycem duplo superantem desinente. *Benth.*—*Stev. l. c. p. 32. Ph. Am. 2. p. 426.*

HAB. Plains of the Columbia and N.W. Coast. *Lewis. Douglas.* Labrador. *Dr Morison.* Alpine marshes of the Rocky Mountains, and York Factory, Hudson's Bay. *Drummond.*

9. *P. contorta* (Benth. mst.); erecta glabra, foliis pinnatisectis segmentis linearibus inciso-serratis, spicis laevisculis, calycibus campanulatis lacinia suprema parva lateralibus utrinque basi latis connatis apice linearibus integris, corollæ tubo calycem æquante, galeæ arcuatae rostro linearí in labium inferius latissimum decurvo, apice vix surrecto. *Benth.*

HAB. Mt. Rainier, N. of the Columbia River. *Tolmie.*—A very fine species; the neck of the root very thick and woody, and bearing copious stems and leaves, the former 10 inches to a foot high.

10. *P. racemosa* (Dougl. mst.); adscendens glabra, foliis petiolatis lanceolatis duplicito-serratis, racemis elongatis laxis, calycibus hinc fassis brevissime bifidis membranaceis obtusis, galeæ arcuatae rostro subulato deflexo suberecto, labio latissimo. *Benth.*

HAB. Abundant on the summit of the high mountains of the Grand Rapids of the Columbia; *Douglas*: gathered also in his last journey. Mt. Rainier; north of the Columbia. *Tolmie.*—A most distinct and remarkable plant, frequently with lax axillary leafy racemes. Allied to *P. teucriifolia*, *carnosa*, and *resupinata*. (*Benth.*)

11. *P. ornithorhynchos* (Benth. mst.); foliis ad basin caulis approximatis pinnatisectis, segmentis profunde pinnatifidis laciniis inciso-dentatis, calycibus ovato-inflatibus breviter quinquefidis, laciniis integris subdentatisque, corollæ tubo calycem vix superante, labio patente, galea falcata-rostrata rostro tenui recto. *Benth.*

HAB. Mt. Rainier, N.W. America. *Tolmie.* "A *P. rostrata* cui affinis est differt foliis magis dissectis, calycis forma et corollæ labio minor."—A humble growing plant, its scapes, or almost naked stems, scarcely more than 6 inches high, with copious foliage at the base, more than half the length of the scape.

12. *P. Lapponica* (Linn.); caule erecto simplici, foliis lanceolatis pinnatifidis laciniis lanceolatis incisis, calycibus ovatis brevissime dentatis subtus fissis, corollæ galea uncinata, spica capitata laxa.—*Stev. l. c. p. 35. Ph. Am. 2. p. 309. Rich. App. p. 24.*

HAB. Labrador. *Kohlmeister.* *Dr Morison.* Barren grounds between lat. 64° and the Arctic Sea. *Dr Richardson.*—Corolla primulaceo-flava; labio inferiore latiusculo reclinato trilobo, lobo intermedio minore recurvo, lobis omnibus erosio-dentatis; galea in rostro brevi deciso deorum spectante attenuata. *Stigma exsertum.*

§ V. BICUSPIDATÆ. *Stev.*—*Cor. lab. sup. basi edentulo, galea brevi apice bidentata.*

13. *P. Canadensis*. Linn.—*Ph. Am. 2. p. 425. Stev. l. c. p. 41.*— β . spica elongata. *P. gladiata*. *Mich. Ph. Nutt.*

HAB. Canada. *Mrs Percival. Cleghorn. Goldie*: and from Lake Huron, *Dr Todd*, to the Grand Rapid of the Saskatchewan, near Lake Winnipeg. *Douglas.*

14. *P. euphrasioides* (Steph.); caule ramoso, foliis pinnatifidis infimis bipinnatifidis laciniis oblongis dentatis, racemis terminalibus laxis, calyce obtuso subtus fiso supra brevissime tridentato, corollæ galea convexa bidentata.—*Gmel. Sib.* 3. t. 43. *Stev. l. c. p.* 42. *Ph. Am.* 2. p. 424.—*P. Labradorica. L.*—*P. ramosa. Wormskjold in Herb. nostr.*

HAB. Moist mossy places. North of the Saskatchewan to the Arctic Sea-shore. *Dr Richardson.* Woods of *Pinus Banksii* in the Rocky Mountains. *Drummond.* Labrador. *Kohlmeister.* *Dr Morison.* Kotzebue's Sound. *Beechey. Chamisso.*—*Dr Richardson* thus describes the flower from living specimens:—“ *Cal. pedunculatus glabriusculus bilobatus, sinus superiori obtuso, sinus inferiori profundiori acuto labile unidentatis. Cor. flava, tubo calyco fore duplo longiori; labio inferiori 3-lobo, lobis rotundatis integerrimis; galea rostrata decisa bidentata; pistillo exerto.* ”

15. *P. nasuta* (Bieb.); foliis radicalibus longe petiolatis bipinnatifidis, laciniis angustis, scapo erecto subunifolio, spica capitata foliosa, calyce quinquefido pubescente, corollæ galea arcuata brevissime rostrata bidentata. *Stev. l. c. p.* 43. t. 15.

HAB. Sitcha. *Bongard*, who observes that his specimens are the same with the original ones in Bleberstein's Herbarium from Kamtschatka.

16. *P. Sudetica* (Willd.); foliis pinnatifidis laciniis lanceolatis serratis, spica densa, calyce quinquefido, corollæ galea obtuse bidentata. *Stev. l. c. p.* 44. t. 15. f. 2. *Rich. App. p.* 25. *cum descript.*

HAB. Bear Lake to the Arctic Sea-coast. *Dr Richardson.* Kotzebue's Sound. *Beechey. Chamisso.*—Of this plant Mr Bentham remarks, that the flowers are rather shorter, and the galea rather broader, especially near the base, than in the Sudetian plant.

§ VI. EDENTULÆ. *Stev.*—*Cor. lab. sup. omnino edentulo galea brevi.*

17. *P. Langsdorffii* (Fisch. mst.); foliis bipinnatifidis radicalibus copiosis c. inorum rachi dilatata, spica densa lanata, calyce quinquefido corolla quadruplo breviore, galea obtusa truncata (nunnquam sub apice dentata). *Stev. l. c. p.* 49. t. 9. f. 2. (1823.) *Cham. in Linnaea*, 2. p. 584.—*P. arctica. Brown, in Parry's First Voy. App. p. CCLXX.*—*P. purpurascens. Spreng.*—*P. hirsuta. Rich. App. p.* 25. (*sive specim. in Herb. nostr.*)— β . *elatior*; foliis paucioribus, spica elongata laxiore, galea majore (an spec. distincta?).— γ . spica maxima elongata, foliis bipinnatifidis, segmentis angustis.—*P. lanata. Hook. et Arn. in Beech. Bot. p.* 128.—*an Cham.?*

HAB. Behring's Straits. *Menzies. Langsdorff. Chamisso. (Herb. nostr.) Melville Island. Sir E. Parry.* Summits of the Rocky Mountains, abundant. *Drummond.*— β . Bear Lake River to the Arctic Sea. *Dr Richardson.*— γ . Kotzebue's Sound. *Beechey.*—*Chamisso in the Linnea (l. c.)* considers the more common woolly spiky state of the plant to be a distinct species (*P. lanata*): but it is that latter var. which Dr Fischer himself marked in my Herbarium as his *P. Langsdorffii*; and Steven's figure affords an accurate representation of the more usual form of the plant. My var. β . has a different appearance, and a longer, more incurved, and blunter upper lip; whilst my var. γ . has a short and narrow upper lip, and leaves which are finely cut in a pinnatifid manner.

18. *P. hirsuta* (Linn.); lanata, caule folioso, foliis pinnatifidis, rachi in petiolum foliaceum dilatata, spica foliosa, calyce quinquefido hirsuto, corollæ calyce duplo longioris galea

obtusissima. *Stev. l. c. p. 51.* *Rich. App. p. 25.* *Hook. in Parry's 2d. Voy. App. p. 402.* *Fl. Dan. t. 1105 (bona).*

HAB. Arctic Islands, frequent; from the Continent I have seen only one specimen, and that of gigantic growth (a foot tall), from Bear Lake, gathered by Dr Richardson in his second journey. The "*P. hirsuta*" of the former journey I refer to *P. Langsdorffii* (*arctica*, Br.). The present may be at once recognised by the remarkable dilatation of the petiole, of which the rachis is an equally broad continuation; and on this, at the margins, are set the little segments, or rather pinnales, like the teeth on the broad snout of a sword-fish, at regular distances. This character has not escaped the notice of Wahlenberg. The flowers are smaller, and much paler coloured than in the preceding.

19. *P. flammea* (Linn.); *humilis*, foliis præcipue radicalibus pinnatis pinnis ovatis retro-imbricatis dentatis, calyce 5-fido (glabro, *Stev.*), spica brevi, corollæ galea obtusissima rotunda, labii inferioris laciniæ linearibus.— α . galea purpureo-fusca. *Fl. Lapp. t. 4. f. 2.* *Ph. Am. 2. p. 426.* *Stev. l. c. p. 51.*— β . corolla tota flava.

HAB. Labrador. *Kohlmeister* (*Ph.*). Arctic America. *Dr Richardson.* α . and β . Summits of the Rocky Mountains. *Drummond.*—In all our American specimens, and in many European ones, the calyx is decidedly, but not thickly, woolly.

20. *P. versicolor* (Wahl.); foliis pinnatis pinnis retro-imbricatis, calyce 5-fido pubescente, corollæ galea obtusa antice angulata. *Stev. l. c.*

HAB. Islands of N. W. America. (*Steven.*)—Except in the larger flowers and larger size, generally, of the plant, and the minute angle in front of the galea, this species comes very near *P. flammea*.

21. *P. bractosa* (Benth. mst.); erecta clata, foliis pinnatisectis segmentis lanceolatis inferioribus distantibus pinnatifidis laciniis serratis, spica elongata densa, bracteis membranaceis ovatis acuminatis, calycibus quinquefidis pilosis, corollæ galea obtusa subincurva antice acuta vel vix obsolete dentata. *Benth.*—*P. alata*. *Ph. 2. p. 425?* (*non Willd.*)

HAB. Shady alpine woods of the Rocky Mountains. *Drummond.* N.W. Am. *Douglas* (last journey).—A very fine plant, 2 feet and more high; some of the leaves are 6 inches, and even longer, and some of the pinnae four inches; spike long and dense.

Mr Pursh gives the *P. recutita* as a native of the N.W. Coast, on the authority of Mr Menzies, "and probably throughout Canada." But, doubtless, some very different species has been mistaken for it.*

* Among the notes on the N. American species of *Pedicularis*, kindly communicated to me by Mr Bentham, and from which I have greatly profited, is the character of a very beautiful new species, found by Mr Douglas in North California, with the flowers much resembling those of *recutita*:—

P. (Edentula) densiflora (Benth. mst.); erecta clata, foliis ampliis profunde pinnatifidis pinnatisectis segmentis ovali-oblongis pinnatifidis, laciniis oblongis inciso-dentatis, spica densa multiflora, calyce inqualiter 5-dentato, corollæ galea recte obtusa antice hiente, labio minimo.

HAB. N. California. *Douglas.*

petiolum sensim attenuatis, tubo stamineo flavo. Hook. Bot. Mag. t. 3622. Ph. Am. 1. p. 186. Rich. App. p. 6.— β . *minus*; foliis ovato-spathulatis petiolatis, tubo stamineo flavo.— γ . *latifolium*; foliis latissime ovatis petiolatis, tubo stamineo purpureo-nigro.

HAB. a. Woody country of the Hudson's Bay territories to Carlton House Fort, and in Prairies of the Rocky Mountains. Dr Richardson. Drummond. Common along the beach at Stikine Sound and Clarence's Straits, N. W. America. Tommie.— β , and γ . Dry banks about Fort Vancouver on the Columbia. Dr Scouler. Dr Gairdner. Tommie. Sitcha (Bongard) and N. W. American Islands. Pallas.

2. *D. frigidum* (Cham. et Schlecht.); foliis oblongo-ovatis integerrimis subrepandis, umbellis paucifloris, pedunculis umbellatis divaricatis, bracteis lanceolatis, filamentis in tubo brevissimo connatis. Linnæa, 1. p. 217. Hook. et Arn. in Bot. of Beech. Voy. p. 129.

HAB. Kotzebue's Sound. Beechey. Arctic sea-shore. Sir John Franklin and Captain Back. West side of the Rocky Mountains. Douglas.

3. *D. dentatum*; foliis lato-ovatis grosse dentatis longissime petiolatis, umbellis paucifloris, pedunculis umbellatis subrectis, antheris sessilibus vel annulo brevissimo solummodo unitis.

HAB. N. W. interior (last journey). Douglas.—This appears a very distinct species, and to have white flowers.

2. ANDROSACE. L.

1. *A. septentrionalis*. L.—Bot. Mag. t. 2021. Cham. et Schlecht. in Linnæa, 1. p. 217. Hook. et Arn. Bot. of Beech. Voy. p. 129.—*A. occidentalis?* Nutt. Gen. Am. 1. p. 118.—*A. elongata*. Rich. App. p. 5. (non L. and Jacq.)

HAB. From Fort William on the Saskatchewan to the heights of the Rocky Mountains, and to lat. 68° on the Mackenzie River. Dr Richardson. Drummond. Bay of Escholtz in Behring's Straits. Chamiso. Beechey.—An exceedingly variable plant, from 1 to 9 inches high. Leaves toothed, pinnatifid or entire. Peduncles with a single flower, or an umbel either few- or many-flowered; the pedicels short or elongated. In Dr Richardson's *A. elongata*, the calycine teeth are much smaller than in the Linnean *elongata* (though certainly a little larger than is usual in *septentrionalis*); the involucre is much smaller and the peduncles more upright.

2. *A. Chamæjasme. Wulf.*—Cham. et Schlecht. in Linnæa, 1. p. 318. Hook. et Arn. Bot. of Beech. Voy. p. 129. Rich. App. p. 5.

HAB. Islands of Behring's Straits. Menzies. Chamiso. Cape Newenham (Nelson in Herb. nostr.) and Kotzebue's Sound. Beechey. Heights of the Rocky Mountains. Drummond; and from Fort Norman to the Arctic coast. Dr Richardson.

3. DOUGLASIA. Lindl.

*Cal. obconicus, angulatus, 5-dentatus. Cor. infundibularis, tubo ventricoso, limbo plano 5-partito, fauce callo linearí sub utroque sinu. Ovarium uniloculare, placenta centrali libera pedicellata fungilliformi, margine 5-dentato; ovula 5, dentibus placentæ opposita. Capsula vestita, unilocularis, 5-valvis. Semina 2, concava, scrobiculata.—Cæspites suffruticosi (*Americæ borealis*), foliis linearibus indivisis, floribus umbellatis solitariisque.* Lindl.

1. *D. nivalis* (Lindl. in *Brande's Journ. Jan. 1828*, p. 389.) ; foliis pubescentibus brevissima stellata incana. *Lindl. Bot. Reg. t. 1886.* *Hook. Ic. Plant. t. 180.*

HAB. Near the sources of the Columbia, at an elevation of 12,000 feet above the level of the sea. *Douglas.* 1827.—Specimens were also gathered by Mr Douglas in his last journey, in another part of the interior; but the locality is not mentioned.

2. *D. arctica*; glabra, foliis pilis brevibus simplicibus ciliatis.

HAB. Arctic Sea-shore, between the Mackenzie and Coppermine Rivers. *Dr Richardson.*—This is probably very rare, as only one specimen exists in the collection. It is quite distinct from the preceding, though agreeing exactly in habit, in the form of the leaves and flowers, and in the repeatedly dichotomous and densely tufted stems; thus confirming the interesting Genus, which, whether we consider its beauty or its localities, has so appropriately been dedicated to the talented and unfortunate Douglas.

4. PRIMULA. L.

1. *P. nivalis* (Pall. *It. t. 9. f. 2.*); foliis spathulato-lanceolatis planis dentatis glabris nudis, umbella multiflora erecta, involucri foliolis basi condutatis.—*Lehm. Prim. p. 67.* *Cham. et Schlecht. in Linnaea, 1. p. 215.*

HAB. Behring's Straits. Cape Newenham (*Nelson*); and Mount Edgecomb. *Menzies* (*in Herb. nostr.*). Uunalashka. *Chamiso.*

2. *P. farinosa* (L.); foliis cuneato-lanceolatis crenato-dentatis subtus dense farinosis, umbella multiflora, pedicellis patentibus, calyce oblongo-ovato, corollæ laciniis obcordatis attenuatis subdistantibus tubo subdimidio brevioribus.—*E. Bot. t. 6.* *Rich. App. p. 5.*

HAB. Canada (*Goldie*) to the Rocky Mountains (*Drummond*); and to lat. 66° on the Mackenzie River. *Dr Richardson.*

3. *P. Scotica* (*Hook.*); foliis obovato-lanceolatis denticulatis subtus dense farinosis, umbella subcapitata pluriflora, calyce ventricoso, corollæ laciniis late obcordatis approximatis tubo subdimidio brevioribus. *Hook. Fl. Lond. N. S. t. 33.* *Brit. Fl. ed. 4. p. 94.*

HAB. Labrador. *Miss Brenton.*—This lady has kindly communicated to me specimens of the *Primula*, now under consideration, from Labrador, precisely agreeing with our *P. Scotica* which had hitherto only been found in the extreme northern parts of Scotland, and on the Alps of Koordistan (*Fischer in Herb. nostr.*). The whole plant is as mealy as *P. farinosa*: flowers deep purple-blue, in almost capitate umbels, with broader and more approximate segments to the corolla and more distinct glands at the mouth of the tube.

4. *P. Hornemanniana* (*Lehm. Prim. p. 55. t. 4.*); foliis obovato-spathulatis dentatis nudis vel cum scapo calycibusque ventricosis parce farinosis, umbella pauci-1-6-flora, corollæ laciniis obovato-cuneatis tubo subdimidio brevioribus.—*Rich. App. ed. 1. n. 58.*—*P. stricta.* *Horn. Fl. Dan. t. 1385.*—*P. Mistassinica.* *Mich. Am. 1. p. 124.* *Ph. Am. 1. p. 137.* *Lehm. Prim. p. 63. t. 7.* *Hook. Bot. Mag. t. 2073.* *Cham. et Schlecht. in Linnaea, 1. p. 213.*—*P. pusilla.* *Hook. in Ed. Phil. Journ. 6. p. 322. t. 11. f. 2.* *Ex. Fl. 1. t. 68.* *Bot. Mag. t. 3020.* *Rich. App. ed. 2. p. 5.*—*P. farinosa, β. stricta.* *Wahl. Lapp. p. 60.*—*P. farinosa. Sm. in Lian.* *Fl. Lapp. n. 79.*—*β. omnino efarinosa, calycibus nigricantibus.*

HAB. a. Canada (*Dr Todd, Goldie, Mrs Sheppard, Mr M'Nab*) to Great Bear Lake (*Dr Richardson*);

and from Labrador (*Dr Morison*) in the East, to the Rocky Mountains (*Drummond, Douglas*) ; and the North-West Coast to Fort Vancouver (*Mr Garry*).—*a*. Unalaschka. *Chamisso*. Arctic Sea-coast. *Dr Richardson, Sir John Franklin, Captain Bach*.—A plant with so very extensive a range, may be expected to vary somewhat, as is really the case, in the outline of its leaves, the length of the pedicels, and the relative length and breadth of the laciniae of the corolla and tube. Its more usual form is so exactly that of the European *P. Hornemanniana* (*P. stricta*, Horn.), that I can have no hesitation in considering it the same, and in adopting that name as the most appropriate. The arctic state of the plant, as found by Chamisso and Dr Richardson, in two very different localities, exhibits not the smallest traces of maliness, and the calyces are almost black : the leaves too, in the specimens of Dr Richardson, are most frequently quite entire ; those from Chamisso generally toothed.

5. *P. saxifragifolia* (Lehm.) ; foliis obovato-cuneatis petiolatis serrato-lobatis, umbella 2-3-flora, calycibus profunde 5-partitis tubo triplo brevioribus, limbi laciiniis semibifidis. *Lehm. Prim. p. 89. t. 9. Hook. et Arn. in Bot. of Beech. Voy. p. 128.*

HAB. Unalaschka. *Menzies* (in *Herb. nostr.*). *Chamisso*. Cape Newenham. *Nelson* (in *Herb. nostr.*). Kotzebue's Sound. *Beechey*.—A very distinct and well-marked species.

6. *P. Sibirica* (Jacq.) ; foliis ovatis subovatis tenui-petiolatis integerrimis v. obsolete dentatis, umbella pauciflora laxa, involucri 2-3-phylli foliolis auriculatis vaginantibus. *Gmel. Sib. 4. p. 46. f. 1. Lehm. Prim. p. 60. t. 5.*—*P. Norvegica. Retz.—Lehm.*—*P. integrifolia. Oed. Fl. Dan. t. 188. (non L.)—P. Finnarchica. Willd.—Wahl.—P. Egalicensis. Horn. Fl. Dan. t. 1511. Lehm. Prim. p. 64. t. 7.*

HAB. Barren country between lat. 60° and 69°, in clayey soil, by river-banks and in marshy grounds. *Dr Richardson*.—This very distinct and well-marked species does not appear to have been found in the second expedition. I have carefully compared Dr Richardson's specimen with authentic ones of the European *P. Norvegica*, the Asiatic *P. Sibirica*, and the *P. Egalicensis* from Hornemann himself, and there can be no question about the propriety of referring them all to one and the same species. *P. rotundifolia*, Pall. It., and *P. intermedia*, Ledeb. in *Mém. de l'Acad. des Sc. de Petersb.*, may also be cited as synonyms.

5. TRIENTALIS. L.

1. *T. Americana* (Ph.) ; foliis terminalibus (reliquis abortivis squamæformibus) lanceolatis serrulatis petalisque acuminatis. *Ph. Am. 1. p. 254. Rich. App. p. 12.*—*T. Europea. Mich.* ;—var. *Americana. Torr.*

HAB. Canada to the Saskatchewan, frequent. Labrador and Newfoundland. *Miss Brenton.*

2. *T. latifolia* ; foliis terminalibus (reliquis abortivis squamæformibus) ovatis integerimis petalisque vix acuminatis.

HAB. N. W. America. About Fort Vancouver. Walla-wallah River. *Tolmie*.—I can neither refer this Western plant to our European *Trientalis*, nor to the one of Eastern America. The leaves are almost exactly ovate, slightly acuminate or rather acute, and in some of the specimens two inches broad.

3. *T. arctica* (Fisch. mst. in *Herb. nostr.*) ; caule folioso, foliis obovato-cuneatis integerrimis petalisque obtusissimis.—*T. Europea. Cham. et Schlecht. in Linnaea, 1. p. 224. Hook. et Arn. in Bot. of Beech. Voy. p. 116. (excl. syn. E. Bot.)*

HAB. Western shore and islands, from Sandy Bay, in Clarence Straits (*Tolmie*), to Unalaschka. *Langsd. Vol. II.*

dorff. Chamisso (in Herb. nostr.).—The same plant is found at Kamtschatka by Pallas, Langendorff, and Beechey.—The long leafy stem, and obovate very obtuse foliage, give a remarkable appearance to the plant; and I cannot but think that this very northern *Trientalis* is, like the preceding, a really distinct species. It has quite the habit of a *Samolus*. In all, the number of the parts of the flower varies from 6, which is most usual, to 7. In this and the preceding, the margins of the leaves are quite entire, in the *T. Americana* and *Europea* slightly (but when seen under a microscope distinctly) serrulated.

6. LYSIMACHIA, L.

1. *L. stricta*, Ait.—*L. racemosa*, Mich. Ph.—*L. bulbifera*, Curt. Mag. t. 104.

HAB. Canada, to the Saskatchewan. Dr Richardson. New Brunswick. Mr Kendall.

2. *L. revoluta* (Nutt. Gen. Am. 1. p. 122); caule tetragono ramoso, foliis oppositis sessilibus rigidis linearibus marginibus revolutis, pedunculis subterminalibus unifloris. Torr. Fl. 1. p. 212.

HAB. Falls of Niagara (Nuttall and Torrey, in Herb. nostr.). Lake Huron. Goldie. Dr Todd.—I have received the same plant from Dr Schweinitz from Pennsylvania, and from English gardens, as the *L. angustifolia*, Mich., but whether it be so or not I have no means of determining. The *L. quadrifolia*, Bot. Mag. t. 660 (*L. longifolia*, Ph.) much resembles it also. It is of a very dry and harsh character, and Dr Torrey not unaptly compares its aspect with that of *Hypericum galloides*: but the foliage is larger and coarser. Young leaves frequently arising from the axils of the older ones, give them an appearance of being verticillate.

3. *L. ciliata*, L.—Ph. Am. 1. p. 210.

HAB. Throughout Canada to the Saskatchewan. Dr Richardson; and on the N. W. Coast, on the Columbia, and at Puget's Sound. Dr Scouler. Douglas. New Brunswick. Mr Kendall.

4. *L. hybrida*, Mich.—Ph. Am. 1. p. 135. Torr. Fl. 1. p. 75.

HAB. Canada. Dr Holmes. Except in the much narrower leaves, this does not differ from the preceding.

5. *L. thrysiflora*, L.—E. Bot. t. 176. Mich.—*L. capitata*, Ph. Am. 1. p. 135.

HAB. From Lake Huron to the Mackenzie River. Dr Richardson. Plentiful near Spokane and Flathead Rivers of the Columbia. Douglas.

7. GLAUX, L.

1. *G. maritima*, L.—E. Bot. t. 13. Ph. Am. 1. p. 176.

HAB. Marshes near the sea, Canada. Pursh. Murray Bay. Mrs Sheppard. Newfoundland. Dr Morison. West Coast, north of the Columbia. Dr Scouler. Tolmie. Salt marshes in the plains of the Saskatchewan. Drummond.

8. SAMOLUS, L.

1. *S. Valerandi*, L.—Ph. Am. 1. p. 158.

HAB. Canada. Pursh. In all moist grounds, near springs and streams, from the Atlantic to the Pacific oceans. Douglas. Mount Edgecomb, N. W. Coast. Dr Scouler.

ORD. LXXII. PLUMBAGINEÆ. Juss.

1. STATICE. L.

1. *S. Armeria*. L.—*E. Bot. t. 220. Ph. Am. 1. p. 212.*

HAB. Sea-shores, probably in every latitude; on the extreme Arctic Coasts and Islands; and in Labrador, Newfoundland, and N. W. America; and the barren country of the interior.

2. *S. Caroliniana*. Walt.—*Ph. Am. 1. p. 212.*

HAB. Newfoundland, *Miss Brenton*; and probably elsewhere on the South-eastern Sea-shores.—Scarcely different from the European *S. Limonium*, to which Sprengel refers it.

ORD. LXXIII. PLANTAGINEÆ. Juss.

1. PLANTAGO. L.

1. *P. major*. L.—*E. Bot. t. 1558. Ph. Am. 1. p. 98. Rich. App. p. 4.*— β . foliis ovalibus longe petiolatis subintegerrimis.

HAB. From Lake Huron (*Dr Todil*) to lat. 68° . *Dr Richardson*. Newfoundland, *Miss Brenton*. Labrador, *Dr Morison*. Sitcha, *Bongard*.— β . Fort Vancouver and Observatory Inlet, *Dr Scouler*.—It is perhaps a var. of this that Pursh mistook for the *P. cincinnata*, Lam. (*P. maxima*, Jacq. Ic. t. 20.)

2. *P. cordata* (Lam.); foliis cordatis longe petiolatis sinnato-dentatis glabris, spica elongata laxiflora, capsula subrotundo-ovata biloculari loculis dispermis. *Ph. Am. 1. p. 182.*—*P. Kentuckensis*, Mich.

HAB. Canada. *Ph.*

3. *P. lanceolata*. L.—*E. Bot. t. 507. Ph. Am. p. 98. Rich. App. p. 4.*— β . spica cylindrica 1-2-pollicari.— γ . *latifolia*; foliis latioribus siccatate magis viridibus, spica elongata 3-5-pollicari.

HAB. β . Fort Norman to Arctic Sea-shore. *Dr Richardson*. N. W. Coast, *Menzies*.— γ . Plains of the Saskatchewan, Athabasca, and Red Rivers. *Dr Richardson*. *Douglas*. *Drummond*.—Besides the var. discovered by Dr Richardson, in the first journey, with the spike more cylindrical, and the bracteas perhaps generally obtuser, another and more remarkable variety, as I consider it, was found in the second journey, in the vicinity of the Saskatchewan, with broader leaves, of a pale green colour when dry, and with the spike generally 4-5 inches long. In other particulars the plants agree with the European *P. lanceolata*.

4. *P. macrocarpa* (Cham. et Schlecht. in *Linnæa*, 1. p. 106); foliis longe lanceolatis erectis basi in petiolum latissimum attenuatis, spica elongata cylindrica laxiflora, capsula maxima biloculari disperma integra accidente. *Bong. Veg. Sitcha*. p. 42.

HAB. Unalashka. *Chamiso*. Sitcha. *Bongard*. Stikine, N. W. Coast, lat. $56^{\circ} 30'$. *Tolmie*.—A very remarkable plant, with singularly large capsules, in their ripest state, showing no disposition to dehisce. Leaves a foot or more long, a little shorter than the scape.

5. *P. maritima*. L.—*E. Bot. t. 175. Ph. Am. 1. p. 99.*—var. foliis pauci-dentatis.

HAB. Point Levy, Canada. *Mrs Sheppard*, Newfoundland and Labrador. *Dr Morison*. N. W. Coast, and from the Columbia to Unalaschka. *Dr Scouler*. *Tolmie*. *Chamisso*. *Bongard*.— β . Newfoundland. *Miss Brenton*.—The remote but large and strong teeth in our var. bring the state of the plant near *P. Coronopus*, of which it may be a var.

6. *P. pauciflora* (*Ph. Am.* 1. p. 99); foliis lineari-lanceolatis integerrimis glabriusculis, scapo tereti foliis breviore, spica pauciflora interrupta, bracteis ovatis acutis glabris.—*P. elongata*. *Ph. Suppl.* 11. p. 729 (according to Nutt.).

HAB. Labrador (*Ph.*) ;—but I have great doubts about this plant. The original *P. elongata*, gathered by Bradbury in Upper Louisiana, which Nuttall pronounces to be the same with *P. pauciflora*, is identical with *pusilla*, which I have never seen from British N. America, and I should think is a very unlikely inhabitant of Labrador.

7. *P. gnaphalioides* (Nutt. *Gen. Am.* 1. p. 100); tota longe sericeo-villosa, foliis lineari-lanceolatis acutissimis, spica elongata cylindrica densiflora, staminibus inclusis, capsula biloculari disperma.—*P. Lagopus*. *Ph. (non Linn.)*— β . bracteis longissimis spinulosis.—*P. aristata*. *Mx.*

HAB. N. W. America. *Menzies* (*in Herb. nostr.*). Common on the barren plains of the Columbia. *Douglas*.—The Columbia is probably the northern limit of this fine species. It is an inhabitant of the Southern United States. Mr Nuttall gathered it in Arkansas; Mr Drummond at San Felipe in Texas (Coll. III. n. 354); and the var. *aristata* in the same place (Coll. III. n. 358). Mr Nuttall has proved that the *P. aristata* is only an accidental var. of his *P. gnaphalioides*.

SUBCL. IV. MONOCHLAMYDEÆ.

Div. 1. *Flores plerumque hermaphroditi*.

ORD. LXXIV. NYCTAGINEÆ. Juss.

1. OXYBAPHUS. L'Hérit.

Cal. 5-fidus, campanulatus. *Cor.* infundibuliformis. *Nux* pentagona, monosperma, calyce explanato persistente circumdata.

1. *O. hirsutus*; caule erecto subsimplici inferne præcipue pilis longis densissimis articulatis hispido, foliis sessilibus ovatis angulato-dentatis parce hirsutis, calycibus pubescenti-tomentosis.—*Allionia hirsuta*. *Ph. Am.* 2. p. 728.

HAB. About Carlton House Fort on the Saskatchewan. *Drummond*.—Bradbury (from whom there is an authentic specimen in my herbarium) discovered this plant in Upper Louisiana. The present inhabits a much more northern station, the most northerly perhaps of any of the genus; of which the species are more frequent in the south.

2. ABRONIA. Juss. (*Taiceratus*. L'Hérit.)

Involucr. multiflorum, polyphyllum. *Cor.* infundibuliformis basi ventricosa persistens. *Stam.* 5, filamenta basi in urceolum parvum coalita. *Nucula* pentagona.

1. *A. mellifera*; magis minusve viscida, foliis ovatis petiolatis subsinuatis, floribus glabris, perianthii limbo undulato (luteo-albo). *Dougl. in Bot. Mag. t. 2879.*—A. Menziesii et vespertina. *Dougl. mst.*

HAB. Sandy barrens of the interior about the Great Falls of the Columbia, Mount Hood, and the junction of Lewis and Clarke's Rivers, and interior of N. California. *Douglas.* Moist banks of the Walla-wallah River, very frequent. *Tolmie.*—A particularly variable plant, perhaps too nearly allied to the following, with which it agrees in the colour of the flowers, but differs in the foliage; this latter again exactly resembles that of *A. umbellata* (Ex. Fl. t. 194), differing little but in the yellowish-white and downy, not red and glabrous, flowers.

2. *A. arenaria* (Menz.). viscidissima, subhirsuta, foliis cordatis seu rhomboe-cordatis integerrimis, floribus pubescentibus, perianthii limbo undulato. *Hook. Ex. Fl. t. 193.*

HAB. Sandy sea-shore, N. W. America (last journey). *Douglas.* Mr Menzies was the first to discover this plant in California.

ORD. LXXV. AMARANTHACEÆ. *Juss.*

1. AMARANTHUS. *L.*

1. *A. paniculatus*. *L.*—*Willd. Amaranth. p. 32. t. 32. f. 2. Ph. Am. 1. p. 207.*

1. *S. herbacea*. *L.*—a. caule erecto. *S. annua*. *E. Bot. t. 415. Ph. Am. 1. p. 2.*

HAB. Salt marshes in the plains of the Saskatchewan.

2. *S. radicans*. *Sm. E. Bot. t. 1691. et t. 2467. (S. fruticosa,—not of Linn.)*

HAB. Straits of De Fuca, N. W. America. *Dr Scouler.*

2. CORISPERMUM. *L.*

Flores hermaphroditæ ebracteati. Cal. 0. Cor. 0. Squamula hypogyna inter caulem et germen, v. 0. Stam. 1-5. Stigmata 2. Caryopsis compressa, verticalis. Albumen centrale. Embryo periphericus, dicotyledoneus. Radicula basilaris, descendens.—Herbæ annuae, ramosæ, lanuginosæ; foliis angustis planis integerrimis sessilibus alternis; floribus axillaribus sessilibus, solitariis; caryopse elliptica compressa, uno latere plana, altero convexa marginata. Ledeb.

1. *C. hyssopifolium* (Stev.); foliis caulinis floralibusque submucronulatis uninerviis,

floribus squamula hypogyna auctis, caryopse glabra alato-marginata rostellata. *Ledeb. Fl. Alt.* 1. p. 10. *Pall. Fl. Ross.* 2. p. 112. t. 98. f. A. *Ph. Am.* 1. p. 4.— α . *gracile.* β . *robustius.* δ . *rubricaulis.*

HAB. α . Sandy banks of the Saskatchewan and Athabasca and Red Rivers. *Drummond. Douglas.*— β . Same situations on the Athabasca (*Drummond*), and on the Columbia (*Douglas*).— δ . Great Slave Lake. *Dr Richardson.*—A very variable species, as is the European plant of the same name. Our var. α ., which is considerably hairy, would include the *C. canescens* of Kitábel, and the *C. pilosum*, Pall., is probably scarcely different from it; whilst var. β . is the same as *C. Redowskii* Fisch. (in Herb. Hook.), and *C. hyssopifolium*, var. *Requelen* (in Herb. Hook.); and var. γ . is the *C. nitidum*, Kit. (in Herb. Hook.).

3. EUROTIA. *Adans.*

Flores monoici ebracteati. Masc. Cal. 4-sepalus, inappendiculatus. Cor. et squamula hypogynæ nullæ. Stam. 4. receptaculo inserta. Fœm. Cal. tubulosus semibifidus, villo densissimo involutus, demum bicornis. Cor. et squamula hypogynæ 0. Stigmata 2, basi connata. Utriculus compressus, herbaceus. Semen verticale, integumentis tenuibus. Radicula descendens.—Fruticulus erectus, pubes stellata vestitus. Folia sparsa petiolata, membranacea, oblonga. Flores glomerato-spicati, terminales et laterales. *Ledeb.*

1. *E. ceratoides*. *Ledeb. Fl. Alt.* 4. p. 239.—*Diotis. Willd.*—*Ceratospermum papposum. Pers.*—*Axyris ceratoides. L.*—*Axyris fruticosa, &c. Gmel. Sib.* 3. t. 11. f. 1.—*Krascheninnikovia ceratoides. Gildenh. in. Nov. Com. Petrop.* 16. t. 17. f. 1-6 et f. 13.—*Diotis lanata. Ph. Am.* 2. p. 602.

HAB. Plains of the Saskatchewan. *Drummond.*—Pursh distinguished this from the European *E. ceratoides*, by its long woolly tomentum: but in this particular there is really no difference. The leaves are generally narrower in the American plant, but both these characters are variable.

4. BLITUM. *L.*

1. *B. capitatum. L.*—*Ph. Am.* 1. p. 4.

HAB. Lake Huron and various parts of Canada, to Hudson's Bay and Great Slave Lake. *Dr Richardson.*

2. *B. chenopodioides* (*Nutt.*); foliis hastatis subtendatis basi attenuatis, glomerulis axillaris bracteatis, seminibus punctatis non baccatis. *Nutt. Gen. Am.* 1. p. 4.

HAB. Carlton House upon the Saskatchewan. *Drummond.*—A curious and very distinct annual, with small leaves and flowers, first detected by Nuttall on dry soils near the banks of the Missouri. Flowers in small axillary glomeruli, each flower consisting of one stamen and one pistil, with a punctato-reticulated ovary; its deeply bipartite style is subtended by a membranaceous reticulated oblong bractea. Perianth 0.

5. CHENOPODIUM. *L.*

1. *C. maritimum?* *L.*—*E. Bot.* t. 633. *Ph. Am.* 1. p. 198.

HAB. Arctic sea-coast. *Dr Richardson.*—I am uncertain about this species. It is scarcely an inch long, procumbent, very slender, with 4 to 6 or 8 leaves. Flowers axillary and clustered.

2. *C. calcicoliforme*; annum erectum alternatim ramosum glaberrimum, foliis linearisubulatis carnosis supra planis, floribus glomeratis in spicam foliosam seu bracteatam

dispositis, bracteis ovato-lanceolatis acuminatis, sepalis 4-5 carnosis calceoliformibus acutis.

HAB. About Carlton House Fort. *Drummond*.—Eight to ten inches high, with copious spiniform branches. Flowers small: each sepal is slipper-shaped, thick and fleshy.

3. *C. album*. L.—*E. Bot. t. 1723. Ph. Am. l. p. 198.*— β . *viride*. *C. viride*. *Curt.*
—*C. ficiifolium*. *E. Bot. t. 1724.*

HAB. From Lake Huron to the Saskatchewan and the Rocky Mountains, and to Bear Lake. *Dr Richardson*, Columbia, near old camps. *Douglas*. *Dr Scouler*.—Extremely variable in size and ramification, and in the shape of its leaves.

4. *C. rubrum*. L.—*E. Bot. t. 1721.*

HAB. About the Saskatchewan. *Drummond*. Newfoundland. *Dr Morison*. Straits of De Fuca, N. W. C. *Dr Scouler*.—These specimens quite agree with the figure in *E. Bot.* Seeds very small.

5. *C. glaucum*. L.—*E. Bot. t. 1454.*

HAB. Cumberland House Fort and garden at Edmonton House, and to Hudson's Bay. *Drummond*. *Dr Richardson*.

6. *C. urbicum*. L. ?—*E. Bot. t. 717.*—*C. intermedium*. *Mert. et Koch*.

HAB. Lake Huron, Lake Winnipeg, and plains of Red River and Saskatchewan, to the Bear Lake. *Dr Richardson*. *Drummond*.—This I have received from the American botanists as *C. hybridum*: but that species has a more panicled inflorescence, with divaricating branches. The present exactly accords with the *E. Bot.* *C. hybridum*.

7. *C. humile*; parvum ramosum decumbens, foliis inferioribus ovato-spathulatis superioribus oblongis vel linearibus omnibus integerrimis petiolatis, floribus axillaribus glomeratis, glomerulis globosis.

HAB. Marshes of the Saskatchewan.—This is a small spreading plant, scarcely more than three inches in diameter, glabrous, turning almost black in drying. Glomeruli of flowers about as large as a small pea, very compact, and arising from the axil of almost every leaf.

8. *C. ? zosterifolium*; ramis copiosis plerumque oppositis divaricatis, foliis saepe oppositis linearibus integerrimis, floribus glomerato-spicatis axillaribus terminalibusque, spicis subsfoliosis.— β . foliis lineari-oblongis.

HAB. N. W. C. of America. *Menzies*. Columbia and Straits of De Fuca, (in salt marshes?) *Dr Scouler*.—A very singular-looking plant, with flowers so much injured by pressure that they cannot be satisfactorily examined. Branches generally opposite, and decussate, reddish, the midrib of the same colour. Leaves mostly opposite also, 3-4 inches long, and scarcely a line wide in α , broader and shorter in β ; all quite entire. It may possibly be an *Atriplex*; and perhaps a luxuriant state of *A. Gmelini*.

9. *C. ? spinosum*; fruticosum, ramis spinescentibus glabris, foliis fasciculatis obovatis carnosis subsessilibus, floribus polygamis?

HAB. Interior of North California. *Douglas*. 1826.—The specimens are very imperfect. The plant is evidently shrubby and spiny, clothed with pale-coloured, glabrous bark. Leaves scarcely half an inch long. There are a few terminal flowers, exactly like the male flowers of an *Atriplex*, or *Chenopodium* with an abortive pistil.

Grayia polypodioides. *Hook. & Arnott. Vol. q. Beccy's Voyag.*
Hook. Journ. t. 271.

TRIPLEX. L.

1. *A. canescens* (Nutt.); dioica diffusa argenteo-furfuracea, foliis oblongis obtusis integrerrimis basi attenuatis, masc. florum glomerulis spicatis axillaribus terminalibusque, fém. glomerulis paucifloris axillaribus sessilibus quorum sepalis dorso spinoso-cristatis.—*Nutt. Gen. Am.* 1. p. 197.—*Calligonum canescens. Ph. Am.* 2. p. 370.

HAB. Salt marshes of the Saskatchewan and of Slave River. *Dr Richardson. Drummond.*—First detected by Lewis on saline hills of the Missouri. Goats are said to be very fond of it. It has been cultivated in the Belfast Botanical Garden from seeds brought home by Mr Drummond.

2. *A. patula*. L.—*E. Bot.* t. 936.—var. *foliis magis argenteo-furfuraceis.*

HAB. Banks of the Walla-wallah, and in the valleys of the Blue Mountains, N. W. America. *Douglas.*

3. *A. littoralis*. L.—*E. Bot.* t. 708. *Hook. et Arn. in Bot. of Beech. Voy.* p. 129.

HAB. Kotzebue's Sound. *Beechey.*

4. *A. angustifolia*. Sm. *E. Bot.* t. 1774. *Cham. in Linnaea*, v. 6. p. 569.

HAB. Bay of Escholtz. *Chamiso.* Saline marshes of the Saskatchewan. *Drummond.* Newfoundland. *Miss Brenton.*—Perhaps merely a var. of the preceding, having the leaves exceedingly variable.

5. *A. Gmelini* (Meyer); annum erectum viride, foliis oblongo-linearibus subintegrerrimis, calycibus formineis herbaceis bipartitis ovato-rhombeis acutis integrerrimis disco lœvibus. *Bong. Veg. de Sitcha.* p. 42. *Gmel. Sib.* 3. p. 72. t. 14. f. 2.

HAB. Sitcha and Kotzebue's Sound. *Bongard.*—A very dubious species, and the specimens which have been kindly sent me by M. Bongard seem to be identical with those of Chamiso, which the latter author describes as var. *obtusa nana* of *A. angustifolia*, from the Bay of Escholtz.

BATIS. L.

1. *B. ? vermiculata*; fruticosa ramosissima, foliis alternis elongatis linearibus teretibus carnosis, amentis masculinis terminalibus, squamis cuspidatis.

HAB. Common on the barren grounds of the Columbia, and particularly near salt marshes. *Douglas.*—Four to six feet high. A very remarkable shrub, of which the male catkins alone appear to have been found. These are rather more than half an inch long, clothed with peltate, pedicelled angular scales, of which the upper angle is elongated into a mucro, and beneath which are 3? or 4? sessile 2-celled anthers. The leaves are an inch to an inch and a half long, slender, fleshy and vermicular.

Polyg. p. 81*. *Ph. Am. 1. p. 270*.

HAB. Canada. (*Ph.*) *Dr Holmes*.

§ 6. AVICULARIA.

12. *P. aviculare*. *L*.—*E. Bot. t. 1252*. *Ph. Am. 1. p. 269*.

HAB. Throughout Canada, to lat. 65° , frequently with larger foliage and more erect stems. (*P. erectum*, Willd.) Newfoundland and Labrador. *Dr Morison*. *Miss Brenton*. *Sitcha*. *Bongard* (sub nom. *P. buxifolii*, Nutt.). N. W. America. *Douglas*. *Tolmie*.—A most variable plant, from two inches to a foot or more in height or length, for the stems are sometimes erect, sometimes procumbent. Leaves from 2 or 3 lines to 2 inches long. Nuttall says his *P. buxifolium* (*P. avic. latifol.* *Mx.*) has 5 stamens, not 8, as is usual.

13. *P. Paronychia* (Cham.); suffruticosum, inflorescentia dense capitata, floribus axillaribus in apicibus confertis magnis 8-andris, stylo germinis longitudine, stigmatibus 3 filiformibus brevibus, achenio lanceolato triquetro levi, foliis linear-lanceolatis margine revolutis, nervo subtus prominente canaliculato utrinsecus hirsuto, ochreis basi vaginantibus longitudine foliorum. *Cham. et Schlecht. in Linnaea*, 3. p. 52. *Hook. et Arn. in Bot. of Beech. Voy. p. 158*.—*P. confertiflorum*. *Dougl. mst*.

HAB. N. W. America, in the sand of the sea-shore from California (*Chamiso*, *Beechey*), to the Straits of De Fuca. *Mr Menzies*. *Douglas*.—A remarkably fine and very distinct species, discovered by Menzies during the voyage of Captain Vancouver. Flowers forming a large dense capitate spike.—The same, or a very nearly allied species, was found by Mr Drummond at Apalachicola in West Florida.

14. *P. tenuie* (Mich.); floribus axillaribus sessilibus solitariis majusculis, achenio acutangulo faciebus ovatis medio sublevibus nitidis versus angulos punctato-rugulosis, ochreis capillaribus deciduis, foliis linear-filiformibus acutissimis (superioribus floriferis

sensim minoribus bracteiformibus), caule herbaceo erecto dichotomo, ramis elongatis spiciformibus. *Meissn. Polyg. p. 91. Ph. Am. 1. p. 270.*—*P. filiforme. Bart.*—*P. linifolium. Muhl.*—*Spreng.*

Hab., Canada. (*Ph.*) Sandy banks of the Saskatchewan. *Drummond.* North W. America. *Douglas.* Walla-wallah River, where the small annual root is eaten by the natives.—6 inches to a foot high, stiff and wiry.

15. *P. coarctatum* (Dougl. mst.); annum dichotomum erectum v. diffusum, foliis linearibus vel lineari-lanceolatis acutis marginibus revolutis, ochreis basi vaginantibus folio brevioribus, floribus trigynis axillaris in foliis superioribus coarctatis, achenio ovato-trigono minutissime punctato.—*P. lineare. Menz. mst.*— α . floribus folio brevioribus.— β . floribus folio longioribus.

Hab., N. W. America. *Menzies. Dr Scouler.* On the sandy barrens of the Columbia and its branches, and on the higher branches of the Multnomah. *Douglas.*— β . Prairies at Nisqually Bay, N. W. America. *Tolmie.*—This seems a very distinct species of the "Avicularia" section, and to be wholly confined to the Pacific side of America. Stems from 3 inches to a foot long, slender and wiry.

§ 7. POLYGONELLA. Nutt.

16. *P. articulatum* (Willd.); erectum ramosum rigidum 8-andrum trigynum, foliis parvis linearibus, ochreis truncatis, pedunculis terminalibus racemosis articulatis, bracteis ochreiformibus, floribus nutantibus 5-sepalis. *Ph. Am. 1. p. 272.*

Hab., Canada. (*Ph.*) About the Saskatchewan. *Dr Richardson. Drummond.*—A very remarkable species, which Meissner, as well as Michaux, seem to think should form a distinct genus.

5. ERIOGONUM. Mich.

Involucrum tubulosum, campanulatum vel cyathiforme, vix angulatum, subæqualiter 6-dentatum, multiflorum. *Receptaculum* bracteolis intra pedicellos instructum. *Perianthia* exserta, profunde 6-fida. *Benth. in Linn. Trans. v. 17. p. 407.*

§ 1. UMBELLATA. Benth.

1. *E. spherocephalum* (Dougl. mst.); caule ramoso folioso, foliis fasciculatis verticillatis oblongis basi angulatis subtus albo-lanatis, pedunculis subsimplicibus, involucro sub-solitario late campanulato tomentoso multifloro, perianthiis extus sericeo-pilosus. (TAB. CLXXV.)—*Benth. l. c. p. 407.*

Hab., Common on the Columbia River, on rocks of the "Stony Islands," and Priest's Rapid. *Douglas.*—A small shrub, with leafy branches, and capitate umbels of yellow flowers.

TAB. CLXXV. ERIOGONUM SPHEROCEPHALUM. *Fig. 1*, Involucrum with flowers; *f. 2*, Single flower; *f. 3*, Pistil:—*magnified.*

2. *E. flavum* (Nutt. in *Fras. Cat.*); foliis ad basin caulis approximatis spatulato-obovatis oblongis subtus vel utrinque albo-lanatis, pedunculo apice breviter umbellato, involucris ad apices radiorum solitariis late campanulatis lanatis multifloris, perianthiis sericeo-villosis. *Benth. l. c. p. 408.*—*E. sericeum. Ph. Am. 1. p. 277.*

HAB. Summits of the Blue Mountains. *Douglas*.—Leaves all radical, as they mostly are in the eight following species, densely woolly beneath. Scape a span or more high. Heads of flowers in dense yellow umbels, with short rays.

3. *E. crassifolium* (Benth.); caule brevissimo incrassato vaginis foliorum villosissimis obtecto, foliis radicalibus petiolatis oblongis basi longe angustatis crassis supra tomentoso-pubescentibus subtus albo-lanatis, scapo apice breviter umbellato, involucris sessilibus vel ad apices radiorum solitariis campanulatis lanatis multifloris, perianthiis sericeo-villosois. (TAB. CLXXVI.)—*Benth. l. c. p. 408.*

HAB. Carlton House Fort on the Saskatchewan. *Dr Richardson*.—A beautiful and very distinct species, with a long thick tap root, very woolly at the neck among the leaves. Umbels more or less lax or compact. Flowers yellow.

TAB. CLXXVI. *Eriogonum crassifolium*. Fig. 1, Involure with flowers; f. 2, Single flower; f. 3, Pistil:—magnified.

4. *E. cæspitosum* (Nutt. *Journ. Ac. Nat. Sc. Phil. 7. p. 50. t. 8. f. 2.*); caule brevissimo vaginis foliorum glabriusculis obtecto, foliis radicalibus oblongo-linearibus basi longe angustatis supra leviter subtus dense albo-tomentosis, scapo apice breviter umbellato, involucris sessilibus vel ad apices radiorum solitariis campanulatis lanatis. *Benth. l. c. p. 408.*

HAB. Alpine spots among the Rocky Mountains, at an elevation of 10,000 feet. *Drummond*.—A small tufted species, with the habit of a *Primula* or *Androsace*. Flowers full yellow.

5. *E. ovalifolium* (Nutt. *l. c. p. 50. t. 8. f. 1.*); foliis ad basin caulis approximatis subrotundo-ovalibus basi in petiolum angustatis utrinque dense albo-lanatis, involucro ad apicem pedunculi solitario globoso multifloro vel paucis sessilibus, perianthiis glabris vel basi vix pubescentibus. *Benth. l. c. p. 409.*

HAB. Summits of the Blue Mountains, N. W. America. *Douglas*.—Stems short, much branched, tufted; the lower leaves black and decayed, the upper ones broadly spatulate and white on both sides, with dense wool. Scape 3-5 inches, with a circle of leaves above the middle: in other words, the upper portion of the scape is a single ray of an involucrated abortive umbel.

6. *E. Tolmieanum*; suffruticosum basi ramosum, ramis brevibus tortuosis foliosis, foliis ovatis in petiolum attenuatis supra viridibus glabriusculis subtus albo-tomentosis, scapo nudo gracili, involucris multifloris perpaucis in umbellam parvam capitata 1-2 foliosam congestis campanulatis sub trifidis pedicellis multo brevioribus.

HAB. Banks of the Walla-wallah River, among *Artemisia*. *Tolmie*.—Habit of the preceding, but smaller and of slenderer growth. Scape quite naked. Flowers small, yellow, appearing at first sight to be densely capitate. Each involucrum is almost sessile, and crowded with flowers, which are much protruded: and one or two leaves arise from the base of the umbel.

7. *E. stellatum* (Benth.); foliis ad basin caulis approximatis ovalibus basi in petiolum longe angustatis supra glabriusculis subtus canescensibus, pedunculo apice simpliciter vel bis umbellato, involucris in umbellula paucis villosulis sexfidiis, lacinias lanceolatis tubo longioribus reflexo-patentibus, perianthiis glabris. (TAB. CLXXVII.)—*Benth. l. c. p. 409.*

HAB. Blue Mountains of the N. W. Interior. *Douglas*.—My specimens of this have the leaves (of which two or three arise from the scape) exactly like those of *Stachys oleifolia*, slightly downy, and only so beneath. Umbels frequently compound and lax.

TAB. CLXXVII. Fig. 1, Involucrum with flowers; f. 2, Single flower; f. 3, Pistil:—magnified.

8. *E. umbellatum* (Torr. in Ann. Lyce. N. Hist. 2. p. 241); foliis ad basin caulis approximatis oblongo-linearibus subtus vel utrinque albo-lanatis, pedunculo apice umbellato, involucris ad apices radiorum solitariis late campanulatis lanatis multifloris dentibus tubo brevioribus, perianthiis glabris. *Benth. l. c. p. 410. t. 18. f. 2.*

HAB. On the high grounds of Salmon River, and valleys near the Kettle Falls on the Columbia. *Douglas*.—Scape about a span high.

9. *E. heracleoides* (Nutt. l. c. p. 49); foliis ad basin caulis approximatis spatulato-oblongis subtus albo-lanatis, pedunculis elongatis apice blumbellatis, involucris in umbellula plurimis pedicellatis late campanulatis lanatis multifloris, perianthiis glabris. *Benth. l. c. p. 410.*

HAB. North-west Interior, above the Kettle Falls of the Columbia. *Douglas*.—My specimens of this fine plant are 1½ foot high, and the leaves, including the petioles, 3-4 inches long. Umbels large, yellow?

10. *E. compositum* (Dougl. mst.) ; foliis ad basin caulis approximatis longe petiolatis ovatis basi rotundatis cordatis supra demum glabratissimis subtus dense albo-lanatis, pedunculo longissimo nudo apice breviter biumbellato, involucris breviter pedicellatis campanulatis multifloris. *Benth. l. c. p. 410. t. 17. f. 10. et in Bot. Reg. t. 1774.*

HAB. Common on the gravelly banks of the Columbia, and of the N. W. interior generally, especially on the Blue Mountains. *Douglas*.—A fine and stout species, with large compound umbels of yellow flowers.

§ 2. LATIFOLIA. *Benth.*

11. *E. nudum* (Dougl. mst.); foliis ovatis margine undulatis basi rotundatis v. subcordatis supra arachnoideo-lanatis demum glabris subtus albo-lanatis, pedunculo 2-3-chotome paniculato, capitulis lateralibus terminalibusque, involucris in capitulo 1-3 sessilibus tubuloso-campanulatis glabris, bracteolis vix plumosis. *Benth. l. c. p. 413.*—*E. arachnoideum*. *Hook. et Arn. in Bot. of Beech. Voy. p. 158. (non Eschsch.)*

HAB. Plains of the Multnomah River, and between the "Grand Rapids" and "Great Falls" of the Columbia. *Douglas*.—A stout-growing plant, 1-3 feet high. Differs from *E. latifolium* (of California) in being more glabrous, and in the inflorescence. Bracteas beneath the involucres and ramifications, ovate. Teeth of the involucrum short, obtuse. Bracteoles setaceous, scarcely exerted. Segments of the perianth nearly equal.

12. *E. elatum* (Dougl. mst.); foliis amplis oblongis undulatis supra villosulis subtus velutinis, involucris glomeratis pedicellatis tubuloso-campanulatis glabris. *Benth. l. c. p. 413.*

HAB. Plains of Multnomah and Cape Mendocino, New California; common. *Douglas*.—Leaves very large, 5-6 inches long without the petiole.

§ 3. MICRANTHA.

13. *E. strictum* (*Benth.*); suffruticosum, foliis parvis oblongo-ovatis basi in petiolum

longe angustatis subtus vel utrinque albo-lanatis, pedunculis strictis gracilibus subdichotomis, involucris parvis sessilibus terminalibusque paucifloris glabriusculis, dentibus brevissimis subæqualibus. *Benth. l. c. p. 414.*

HAB. Columbia River and Blue Mountains. *Douglas*.—"Suffrutex basi cæspitosus, dense foliosus. Pedunculi scapiformes, juncei, pedales et ultra, basi simplices nudi, a medio 2-3-chotomi, ramis omnibus strictis rigidis erectis tenuibus. Bractæ parvæ, lineares. Involucra pauca, secundum ramos sessiles, plerique ad apices ramorum terminalia, vix lineam longa. Perianthia exserta, lacinia exterioribus domum valde auctis."

14. *E. niveum* (Dougl. mst.) ; suffruticosum, foliis oblongis basi angustatis pedunculoque albo-lanatis, bracteis patentibus, involucris tenuibus niveis paucifloris, dentibus alternis minutis. *Benth. l. c. p. 414.*

HAB. Rocky and sandy soils near the "Great Falls" of the Columbia and valleys of the Blue Mountains. *Douglas*.—"Suffrutex basi cæspitosus, foliosus. Folia sero E. flavi. Pedunculi scapiformes, pedales et ultra."

15. *E. dichotomum* (Dougl. mst.) ; suffruticosum, foliis oblongis basi angustatis pedunculoque albo-lanatis, bracteis brevibus appressis, involucris crassiusculis dense lanatis plurifloris sessilibus, dentibus brevibus subæqualibus. *Benth. l. c. p. 415.*

HAB. Common on the banks of the "Great Falls" of the Columbia, and of the river Utalla, N. W. America. *Douglas*.—"Affine E. niveo, sed rigidum strictum. Bractæ involucro dimidio breviores, appressæ. Involucra tubulosæ, duplo majora quam in E. niveo. Flores exserti, magnitudine fere E. compositi. Filamenta basi pilis paucis donata. Ovarium glaberrimum."

16. *E. decumbens* (Benth.) ; suffruticosum, foliis ovatis petiolatis utrinque cano-tomentosis, pedunculi ramis flexuoso-floccoso-lanatis, bracteis involucrum æquantibus patentibus, involucris crassiusculis dense lanatis plurifloris sessilibus, dentibus recurvo-patentibus alternis minutis. *Benth. l. c. p. 415.*

HAB. Columbia River. *Douglas*. Walla-wallah. *Tolmie*.—"Rami foliiferi elongati, duri, dense tomentosi. Folia pollicariæ, petiolo 1-2-pollicari. Bractæ inferiores oblongæ, foliaceæ, ultra pollicares, superiores lineares. Involucra forma sere E. nivei, magnitudine E. dichotomi. Species habitu distinctissima."

17. *E. vimineum* (Dougl. mst.) ; annuum, foliis subradicalibus petiolatis ovatis subtus tomentosis, pedunculis scapiformibus divaricato-ramosissimis apice involucrisque glaberrimis. *Benth. l. c. p. 416.*

HAB. Barren grounds of the Columbia, near the base of the Blue Mountains. *Douglas*.—"Pedunculi scapiformes, coquiphres, basi sublanati, 6-8-pollicares. Rami tenues, virgati. Involucra tenuia, cylindrica, sessilia, dentibus brevibus obtusis subæqualibus. Perianthia breviter exserta, laciniaæ exterioræ per anthesin patulae obovatae, interioræ erectæ dimidio angustioræ."

N. ab E.

1. *T. Californica* (Hook. et Arn. in Rot. of Beech. Voy. p. 159); hermaphrodita, foliis perennantibus oblongo-lanceolatis vix acutis penninerviis reticulato-venosis glabris, pedunculis axillaribus simplicibus, floribus pluribus, umbella subcapitata, pedunculis folio brevioribus.—*Laurus regia*. Douglas, inst.

HAB. N. W. America. First found by Mr Menzies in New California, south of the Columbia. Douglas.—Mr Douglas observes, that "this elegant evergreen tree, which attains the height of 40 to 120 feet, and from 2 to 4 feet in the diameter of its stem, forms the connecting link between the gloomy Pine-forests of N. W. America and the tropical-like verdure of California. The foliage, when bruised, gives out a most powerful camphor-like scent; and even during severe hurricanes, I have been obliged to remove from under its shade, the odour being so strong as to occasion violent sneezing. The hunters often make use of a decoction of the leaves, which they take without any bad effect; indeed it stimulates the system, and produces a glow of warmth."—Flowering specimens are in Mr Douglas' collection from California, which prove this plant to be a true *Tetranthera*.

ORD. LXXX. ELÆAGNEÆ. Juss.

1. ELÆAGNUS. L.

1. *E. argentea* (Ph. Am. 1. p. 114); inermis, foliis ovato-oblongis utrinque acutis argenteo-lepidotis, floribus fasciculatis nutantibus, fructibus globosis. Rich. App. p. 5.

HAB. Canada. Mrs Sheppard; and from the Grand Rapids of the Saskatchewan to the Rocky Mountains, and to lat. 69° near the coast. Dr Richardson. Drummond. Hudson's Bay. Nuttall.—This is indeed very nearly allied to some *Elæagni* of the Old World, particularly to *E. parvifolia*, Wall., *E. orientalis*, L., and to some specimens in my herbarium of *E. angustifolia*. The leaves seem to be variable in shape; but I think in our plant the flowers are more drooping than in those just mentioned, and the fruit more globous and as mealy as the leaves. "It is the *Wau-pisk-keemena* of the Cree Indians. The bark peels off in the winter, the moment it is thawed, which is not the case with other plants." Rich. inst. Drummond observes that the flowers are very fragrant. The branches and leaves are alternate.

HAB. Throughout Canada to Fort Franklin on the Mackenzie River, and from Newfoundland and Hudson's Bay to the Rocky Mountains. Dr Richardson. Drummond. N. W. Coast. Mr Menzies.

2. *S. argentea* (Nutt.) ; foliis oblongo-lanceolatis utrinque dense subargenteo-lepidotis. (TAB. CLXXVIII.)—*Hippophae argentea*. Ph. Am. 1. p. 113.

HAB. Saskatchewan; between Carlton and Edmonton House Forts. Dr Richardson. Drummond.—This is a species very distinct from the preceding, at once known by its more spreading branches, narrower leaves covered on both sides with copious somewhat silvery scales, and pellucid fruit, of so bright a red that the Indians call the plant *Methoo-meeva*, or *Bloody Berry*. Pursh mentions its great similarity with *Eleagnus argentea*; but here the leaves are much narrower, less silvery, and they, as well as the branches, are opposite: and the flowers and fruit are extremely dissimilar.

TAB. CLXXVIII. SHEPHERDIA ARGENTEA. A. Male Plant. Fig. 1, Flower; f. 2, Flower laid open.—B. Female Plant. Fig. 3, Female flower; f. 4, Ditto, laid open, showing the pistil; f. 5, Stigma; f. 6, Fruit (nat. size); f. 7, Fruit; f. 8, Fruit laid open; f. 9, Seed:—magnified.

1. COMANDRA. Nutt.

Perianthium suburceolatum, tubus ovario adhærens, limbo 5-4-partito. *Stam.* 5 vel 4 petalis opposita summo tubi inserta. *Discus* perigynus tubum investiens, 5-lobum, lobis cum staminibus alternantibus. *Fructus* subdrupaceus, 1-spermus, perianthii limbo coronatus.—*Suffrutices glaberrimæ, basi subsarmentosæ, erectæ, Boreali-Americanæ: foliis alternis integerrimis. Pedunculi axillares terminalesque. Flores umbellulati parvi.*

1. *C. umbellata* (Nutt. *Gen. Am.* 1. p. 157); caule ramoso, foliis lanceolatis subrigidis, umbellulis in paniculas foliosas terminales dispositis, perianthii laciniis oblongis erectis. (*TAB. CLXXIX. A.*)—*Rich. App.* p. 8.—*Thesium umbellatum. L.*—*Ph. Am.* 1. p. 177.
—*T. corymbulosum. Mx.*

HAB. From Lake Huron to the Saskatchewan, and to the Rocky Mountains. *Dr Richardson. Drummond. Douglas. Dr Todd.* Dry banks of the Columbia River. *Tolmie. Gairdner.*—This species is correctly described by Mr Nuttall, except that he considers the five laciniae of the perianth as the five petals of a corolla inserted upon the edge of a tubular calyx, which most assuredly is not the case. He well observes the curious tuft of hairs by which each anther is attached at the back to the segment of the perianth. The fruit seems to be chartaceous, enveloped by the thickened tube of the perianth, and thus somewhat drupaceous. In this species it is only the lower part of the tube that is united with the ovary: and the persistent upper free portion of this tube forms a sort of neck at the top of the fruit.

TAB. CLXXIX. A.—*COMANDRA UMBELLATA.* *Fig. 1.*, Umbel of flowers; *f. 2.*, Flower laid open; *f. 3.*, Segment of the perianth, with the stamen, exhibiting the tuft of filaments at the back of the anther; *f. 4.*, Fruit (*nat. size*); *f. 5.*, Fruit, —magnified.

2. *C. livida* (*Rich. App.* p. 9); caule simplici, foliis ellipticis flaccidis, umbella solitaria axillari pedunculata triflora, perianthii laciniis brevibus patentibus. (*TAB. CLXXIX. B.*)

HAB. From Lake Winnipeg to the Rocky Mountains, and to lat. 69° on the Mackenzie River. *Dr Richardson. Drummond. Newfoundland and Labrador. Miss Weston. Dr Morison.*—This is a very distinct species, and has been well described by Dr Richardson. Here the whole tube of the calyx is incorporated with the germen; the limb short and spreading. Filaments, also, and style very short. There is ripe fruit upon the specimens, but pressed and injured. The single seed, however, appears to be attached near the middle to a funiculus, which rises from the base of the cell.

TAB. CLXXIX. B.—*COMANDRA LIVIDA.* *Fig. 1.*, Umbel of flowers; *f. 2.*, Single flower; *f. 3.*, Segment of the perianth, with the stamen; *f. 4.*, Fruit (*nat. size*); *f. 5.*, Fruit; and *f. 6.*, Fruit cut through transversely, containing the seed:—magnified.

HAB. Canada. Dr Beck.—Shell or Shag-bark Hickory. “A very large and valuable tree, with the bark separating in large flat scales or plates. *Nut* with a thinner shell than that of most other species, and of fine flavour. *Pericarps* thin, globose, depressed at the summit. Timber much prized in consequence of the fineness of its grain and elasticity of the fibre.” *Beck.*

2. *C. amara* (Nutt.); foliolis plerumque 9 ovato-oblongis acuminatis acute serratis utrinque glabris, fructu subgloboso, nuce lœvi mucronata testa fragili.—*Juglans amara*. *Mich. N. Am. Sylv.* 1. p. 170. t. 93. *Ph. Am.* 2. p. 637.

HAB. Canada. Dr Beck. Dr Holmes.—The *Bitter-nut, White or Swamp Hickory*.—A large tree. Nut small, almost obcordate, with bitter and astringent kernels. Beck.—Probably other species of *Carya*, found in the northern U. States, may also exist in Canada; but I have received no specimens of them, nor any information concerning them.

ORD. XCI. AMENTACEÆ. Juss.

TRIB. I. SALICINEÆ. Rich.

1 SALIX. L.

§ 1. CINERÆ. *Amenta ovata et ovato-cylindracea, præcoccia. Stam. 2. Ovarium pedicellatum. Folia ovata obovata lanceolatæ incana, v. rugosa, v. lana alba pilisive griseis vestita, plerumque integerrima: saepe marginibus revoluta. Fruticuli (S. rostrata excepta). Barrett. mst.*

1. *S. candida* (Willd.); foliis lanceolatis v. linear-lanceolatis rigidiusculis acutis apice obsolete serrulatis supra ramulisque arachnoideis subtus niveo-tomentosis margine tenui revolutis, stipulis ovato-lanceolatis deciduis petiolam æquantibus, amentis oblongo-cylindraceis erectis, floribus densis, squamis obovatis obtusis fuscis pistillo duplo brevioribus longissime villosis, ovariis lanceolatis albo-lanatis stylo longioribus, stigmatis lobis bifidis. *Ph. Am.* 2. p. 608. *Rich. App.* p. 37. *Salict. Wob.* p. 181. t. 91.— β . foliis magis rugosis. *Rich.*

HAB. Throughout the woody country. Dr Richardson. *Drummond. Douglas*.—A beautiful species; the catkins very compact, white, with dense wool, tipped with the deep coloured style and stigmas, and subtended by the dark scale, with long delicate hair. In the ripe catkins, the pistils are nearly half an inch long, and three or four times as long as the style. A shrub 4-6 feet high.

2. *S. Drummondiana* (Barratt, mst.); ramis elongatis strictis glabris subrobustis, foliis obovato-oblongis rigidiusculis integerrimis vel apice obsoletissime serrulatis margine tenui revolutis, stipulis ovatis longitudine fere petioli longe persistentibus, amentis cylindraceis erectis compactis, squamis ovato-lanceolatis fuscis longe sericeis pistillo plusquam dimidio longioribus, ovariis ovatis acuminatis dense pilis brevibus sericeis nitidis, stylo breviusculo, stigmatis lobis brevibus bifidis vel integris.— β . ovariis glabris.

HAB. Marshes and prairies of the Rocky Mountains. *Drummond*.—Branches long and rather stout, clothed with a glabrous, rich brown, glossy, wrinkled bark. Leaves two inches long, an inch broad above the middle, quite free from pubescence, and very slightly wrinkled; below white, with dense tomentum; the costa yellowish-brown, nearly glabrous. Stipules white beneath, like the leaves. Catkins about an inch or rather more long in the flowering state, twice as much in fruit. Pistils spreading, very crowded:—in β . quite glabrous, and in this var. the silky hairs of the scales are longer than in the usual state of the plant.

3. *S. villosa* (Don? in *Ph. Herb. Canad.*); ramis foliisque junioribus lana arachnoidea villosa, foliis lato-lanceolatis acutis subrigidis integerrimis margine parum revolutis,

adultis superne glabris subtus glaucis albo-lanatis demum glabriusculis, stipulis semi-cordatis petiolo sublongioribus, amentis fœmineis (fructiferis) bi-triuncialibus ellipticis erectis, squamis oblongo-ovatis fuscis capsula lanceolato-acuminata pubescenti-tomentosa quadruplo brevioribus, stylo brevi, stigmatis lobis bifidis.—*S. acutifolia*; foliis magis acutis vel subacuminatis.

HAB. Canada. Ph. ? Rocky Mountains. *Drummond*; thence to the Arctic Sea-coast.—♂. Fort Franklin on the Mackenzie River. *Dr Richardson*.—Leaves from two to four or nearly five inches long. Mature female catkins very large. I regret not to have perfect specimens of this plant. Indeed I should not have ventured to introduce it, were it not that Dr Barratt considers it to be the same as *S. villosa* of D. Don, in "Pursh, Herb. Canad."

4. *S. Scouleriana* (Barratt, mst.); ramis strictiusculis fuscis subrobustis demum glabris, foliis obovato-lanceolatis integerrimis submembranaceis margine planis supra nudiusculis subtus argenteo-sericeis, amentis oblongo-cylindraceis demum recurvatis densifloris, squamis obovatis nigro-fuscescentibus sericeo-villosis pistilli dimidio longioribus, ovarii ovato-lanceolatis acuminatis sericeis, stylo obsoleto, stigmatis lobis integris.

HAB. North West America, on the Columbia. *Dr Scouler*. Fort Vancouver. *Tolmie*.—Bark dark-brown, almost black in the older specimens. Young leaves silky on both sides: adult ones (rarely exceeding an inch in length) nearly glabrous above, beautifully silky beneath. Catkins an inch and a half long, drooping: the silky germs are much concealed by the large dark-coloured scales.

5. *S. Hookeriana* (Barratt, mst.); ramis valde robustis pubescentibus, junioribus dense tomentoso-lanatis, foliis late obovatis fere subrotundatis rigidiusculis serratis margine planis supra (adultis) nudiusculis subtus tomentoso-lanatis, stipulis —? amentis cylindraceis crassis, squamis longe densissime lanatis, ovarii longe stipitatis lanceolatis glaberrimis, stylo breviusculo, stigmatis lobis integris. (TAB. CLXXX.)

HAB. Near the Grand Rapids of the Saskatchewan, rare. *Douglas*. N. W. Coast of America. *Scouler*.—A stout but low growing shrub, with very thick straight branches. The male catkins look like a dense cylindrical mass of wool, which entirely conceals the scales, the stamens only being protruded beyond the wool. The leaves are 2-3 inches long, one inch to an inch and a half wide, clothed with greyish woolly down beneath. Pistils perfectly glabrous, even its stipes; and the lobes of the stigma are always entire.

TAB. CLXXX. A. Branch of a male plant; f. 1, Scale and stamens. B. Branch of a female plant; f. 2, Scale with its pistil:—figs. 1 and 2 magnified.

6. *S. speciosa* (Hook. et Arn. in Bot. of Beech. p. 130); ramis densissime (sæpe flavo-) sericeis, foliis oblongo-lanceolatis subovatis acutis vel acuminatis integerrimis supra nudiusculis subtus petiolisque niveo-tomentosis, stipulis persistentibus linear-lanceolatis subulatis membranaceis fuscis petiolo longioribus, amentis elongatis crassis densissime sericeis, squamis nigrescentibus longitudine fere ovarii pilis longis mollissimis sericeis, ovarii ovato-acuminatis sessilibus sericeis; stylo longissimo, stigmatis lobis linearibus bipartitis.

HAB. Kotzebue's Sound. *Beechey*. Fort Norman and Fort Franklin on the Mackenzie River. *Dr Richardson*. On the very elevated of the Rocky Mountains. *Drummond*.—The foliage of this remarkably handsome *Salix*, which were all Dr Arnott and myself were acquainted with from Kotzebue's Sound, we have fully described in the Flora above quoted. In the present collection are fine flowering and fruiting

specimens. The aments are 3-4 inches long, and nearly $\frac{3}{4}$ of an inch in diameter, most beautifully clothed with long, yellowish-white, silky hairs, beyond which the very long slender brown styles, equal in length with the ovary, are protruded.—There is another Willow, also gathered at Fort Franklin by Dr Richardson, with the habit of the present; but the stems are less silky, the young leaves (there are no adult ones) almost glabrous, and not in the least woolly even beneath, the catkins equally silky and beautiful with the present, though shorter, and the styles equally long; but the ovary is quite glabrous.—This and the two following, which Dr Barratt is inclined to refer to his *PROSTRATE*, I bring, on account of their affinity with *S. candida* and *S. Hookeriana*, to this section.

7. *S. Barrattiana*; ramis subrobustis flexuosis cicatricatis, foliis obovato-oblongis acutis basi coriatis mollibus glanduloso-serrulatis utrinque (subtus praecipue) pubescenti-sericeis junioribus argenteo-sericeis, stipulis semiovatis glanduloso-serratis petiolo longioribus, amentis cylindraccis masc. ovali-oblongis, fem. elongatis densifloris pulcherrime sericeis, squamis nigrescentibus ovarium subequantibus longe sericeis, ovarii lanceolatis brevi-stipitatis sericeis stylo longioribus, stigmatis lobis fissis. (TAB. CLXXXI.) *S. Helvetica?* Barratt, mst.

HAB. Alpine swamps in the Rocky Mountains. **Drummond.**—A species equal in beauty to, but not excelled by, the *S. speciosa* and *S. lanata*, which latter it resembles in many respects. It forms a dwarf shrub, with rather tortuous, stout, and nearly glabrous branches, clothed with dark-brown bark, and marked with the scars of former years' leaves. Leaves 2-3 inches long, blunt and cordate at the base, and, amongst the silky clothing, the margin will be found to be minutely serrated, and the serratures glandular (especially near the base) as are those of the stipules more distinctly; from these glands proceed a powerful balsamic smell. Male catkins 2 inches long, splendidly silky. Stamens 2. Female catkins 4 inches long, flexuous, very silky.—I name this species in compliment to Dr Barratt, of Middletown, Pennsylvania, who has devoted the same attention to the Willows of N. America, that Mr Borrer, and the late Mr Crowe, and Mr Anderson, have done to those of Britain, and who kindly undertook the task of looking over the whole of the collection here described, and referred them to his own mst. section of the "*Salices Americanae*." I only regret that I could not induce him to undertake the descriptions of them likewise. But I have profited by many of his observations that have been liberally communicated to me.

TAB. CLXXXI. A. Branch of a male plant; *f. 1*, Scale and stamens from the amentum. B. Branch of a female plant; *f. 2*, Scale and pistil from the amentum; *f. 3*, Base of a leaf and stipules:—*figs. 1-3 magnified.*

8. *S. adenophylla*; ramis brevibus subrobustis lanatis, foliis ovatis basi cordatis acutis subcorinceis fere omnino sessilibus reticulatim venosis argute serratis serraturis elongatis glanduliferis lana sericea dense obsitis demum aetate nudiusculis, stipulis ovato-cordatis grosse glanduloso-serratis, amentis foemineis elongatis pedunculatis, capsulis ovatis acuminatis glaberrimis, stylo elongato, stigmatis lobis fissis.

HAB. Labrador. **Dr Morrison.**—I know no species like this, well marked as it is by the copious long narrow serratures to the leaves tipped with a gland, so that the leaf looks as if it were fringed with pedicellated glands. These leaves are an inch or more long, clothed, even when fully grown, with long silky tomentum on both sides, but which is deciduous on the oldest leaves. Mr Borrer hints at its probable affinity with *S. satida* De Candolle Fl. Fr., but that is now referred by its author "and Duby, in the *Fl. Gallica*," to *S. vacciniifolia* of Sm., with which this has little in common. The catkins are old, but the capsules retain the form of the ovary, and are perfectly glabrous.

9. *S. rostrata* (Rich.); ramis erectis strictiusculis pubescentibus (demum glabris), foliis lato-seu obovato-lanceolatis acutis integerrimis serratis submembranaceis demum subcoriaceis supra nudiusculis subtus glaucis cano-pubescentibus, stipulis semicordatis dentatis, amentis macr. breviusculis cylindricis densifloris, stem. demum valde elongatis laxis, squamis oblongis membranaceis apice pilosis stipitis vix longitudine, ovaris anguste lanceolatis sericeis longe acuminatis longissime stipitatis, stylo perbrevi, stigmatis lobis bifidis vel integris. Rich. App. p. 37 (excl. syn. *S. phyllicifoliae*, Sm.).

HAB. From Hudson's Bay to the Prairies of the Rocky Mountains, and to Fort Franklin on the Saskatchewan. Dr Richardson. Drummond. Douglas. Head waters of the Columbia. Douglas.—Copious specimens of this plant show that it is, like other Willows, subject to much variation, and the appearance of the young und old foliage, and young and old female catkins, are very different. The colour of the bark is sometimes pale-yellow or deep-brown, sometimes almost black. The lax female catkins, the long, narrow, silky germen, and above all the great length of the styles, are its best distinguishing features. Dr Barratt finds the same species about Middletown, Pennsylvania, and it is probably not uncommon in the United States. It is the largest of the "CINEBÆ" group, being sometimes ten feet high.

§ 2. DISCOLORÆ. *Amenta ovalia vcl cylindrica præcoccia, glabra, sericea vel piloso-lanata. Squamae nigricantes. Stam. 2. Germina stipitata subpubescentia. Folia subcoriacea decidua serrata v. denticulata subtus glauca pubescentia, supra glabra, nitida.* Burratt, ms.

(The species of this group constitute large spreading shrubs and small trees, and are the first to put forth their catkins in the spring.)

10. *S. discolor* (Willd.); "foliis oblongis obtusiusculis glabris remote serratis apice integerrimis subtus glaucis, stipulis deciduis lanceolatis serratis, amentis subcoccaneis diandris oblongis tomentosis, squamis oblongis acutis atris pilosis, germinibus subsessilibus lanceolatis tomentosus, stylo mediocri, stigmatibus bipartitis." Ph. Am. 2, p. 613. Muhl. in Ann. of Bot. 2, t. 5, f. 1. *Salict. Wob.* p. 279.— β . foliis subtus magis glaucis, stylis longioribus.

HAB. Lake Winnipeg and Saskatchewan. Dr Richardson. Douglas. Newfoundland. Miss Brenton.— β . Norway House Fort. Dr Richardson.—Branches with female catkins and young foliage, from the Saskatchewan, are marked as truly *S. discolor* of Willdenow, by Dr Barratt; and one or two specimens with older foliage, gathered at another period, and in another part of the country, are supposed to be the old foliage. The Newfoundland specimen exactly accord with United States specimens sent me by Dr Barratt. Our var. β . has, besides the characters above alluded to, a less silky germen, and it may perhaps constitute a new species.

11. *S. Richardsoni*; ramis brevibus glabriusculis, foliis obovato-lanceolatis integerrimis glabris subtus glaucis junioribus ciliatis, stipulis parvis deciduis lanceolatis dentatis, dentibus glandulosis, amentis scamineis solitariis terminalibus oblongo-cylindraceis densifloris, squamis oblongis fuscis longe pilosis, ovaris ovato-lanceolatis acuminatis glabris, stylo longissimo, stigmatis lobis linearibus recurvis bipartitis. (TAB. CLXXXII.)

HAB. Fort Franklin on the Mackenzie River. Dr Richardson.—This appears to be a very distinct species, remarkable for the great length of the style. It is to be regretted that very few specimens were procured of it.

TAB. CLXXXII. SALIX RICHARDSONI. Fig. 1, Scale and pistil:—magnified.

§ 3. *GRISSEA*. *Amenta cylindracea subbrevia praecoccia*. *Stam. 2. Germina sessilia v. stipitata griseo-sericea. Folia lanceolata serrata, subitus griseo-sericea siccitate nigricantia. Fructices ramis fragilibus cortice intense amara*. *Barratt, mst.*

12. *S. petiolaris* (Sm.); foliis lanceolatis serratis junioribus griseis subtus pilis brevibus sericeis, ovarii stipitatis ovato-lanceolatis valde sericeis, stigmatis subsessilis lobis bipartitis, squamis villosis stipite vix longioribus. *E. Bot. t. 1147. Salict. Wob. p. 45. t. 23. Ph. Am. 2. p. 616.*

HAB. Lake Winnipeg. *Dr Richardson.*

13. *S. rosmarinifolia* (L.); foliis linear-lanceolatis sericeis (junioribus præcipue) integerrimis v. paucidentatis dentibus minutis glandulosis, amentis brevibus oblongis curvatis laxis, germinibus stipitatis sericeis lanceolato-acuminatis, stylo longitudine stig matis bipartiti linearis, squamis brevibus villosis. *E. Bot. t. 1365. Salict. Wob. p. 173. t. 87. Ph. Am. 2. p. 612.*

HAB. Saskatchewan. *Dr Richardson.*

§ 4. *VIMINALES*. *Amenta cylindrica, praecoccia. Germina subsessilia sericea. Folia linearia v. lanceolata glabra v. pubescens. Fructices v. Arbusculæ, ramis longis flexilibus.*

14. *S. viminalis*. L.—*E. Bot. t. 1898. Salict. Wob. p. 265. t. 133. Ph. Am. 2. p. 608.*

HAB. Canada. *Dr Holmes. Mrs Sheppard.*

15. *S. purpurea*. L.—*E. Bot. t. 1388. Salict. Wob. p. 1. t. 1. Rich. App. p. 37?*

HAB. Cumberland House Fort. *Dr Richardson.*

§ 5. *FRAGILES*. *Amenta cylindrica, laxa, acuminata, coætanea. Squama viridi-flava, pubescentes v. glabra. Stam. 2-5. Germina glabra. Folia lanceolato-falcata serrata, denticulata v. integerrima. Barratt, mst.*

16. *S. fragilis*. L.—*E. Bot. t. 1807. Salict. Wob. p. 53. t. 27. Rich. App. p. 37.*

HAB. Woody country. *Dr Richardson. Labrador. Dr Morrison.*

17. *S. lucida* (Willd.); foliis adultis ovato-oblongis tenui-acuminatis basi rotundatis subcoriaceis nitidis glabris stipulisque semiovatis glanduloso-serratis, amentis cylindraceis erectis pedunculatis, stam. 3-5, bracteis oblongis membranaceis, germinibus ovatis acuminatis stipitatis glabris, stylo breviusculo, stigmatis lobis bifidis. *Ph. Am. 2. p. 615. Muhl. in Ann. of Bot. 2. t. 5. f. 7. Salict. Wob. p. 63. t. 32.—β. foliis lanceolatis.*

HAB. Throughout Canada (*Mrs Sheppard, Cleghorn*), from Lake Huron (*Dr Todd*) to the Saskatchewan and Jasper's Lake in the Rocky Mountains (*Drummond*), and to the Columbia River (*Douglas, Scouler, Dr Gardner*), and as far north as Fort Franklin on the Mackenzie River. *Dr Richardson.*—This is perhaps one of the most generally diffused of all the Willows in British N. America, and is nearly allied to our European *S. pentandra*.

18. *S. nigra* (Willd.); foliis lanceolatis utrinque acutis serrulatis concoloribus glabris junioribus parce ad nervos præcipue puberulis, stipulis exiguis deciduis, amentis elongatis

Iaxis flexuosis, stam. 5, filamentis basi barbatis, squamis oblongis villosis patentibus, germinibus ovatis stipitatis fuscis glabris vel basin versus subsericeis, stigmate sessili lobis bifidis. Ph. Am. 2. p. 614. Muhl. in Ann. of Bot. 2. t. 5. f. 5. Salict. Wob. p. 280.

HAB. Canada. Cleghorn.—This very distinct species is extremely common in the Southern United States; rare in the North.

19. *S. falcata* (Ph.) ; foliis longissimis anguste falcato-lanceolatis acuminatis serratis unicoloribus glabris junioribus præcipue ad nervos subsericeis, stipulis magnis latolunatis serratis deflexis, amentis femineis elongatis multifloris laxiusculis, squamis deciduis, ovarii ovato-acuminatis stipitatis glabris, stylo brevissimo, stigmatis lobis subintegris. *Ph. Am. 2. p. 614. Salict. Wob. p. 270.*

HAB. Canada. About Quebec. Mrs Sheppard.—The long, falcate leaves, and large, broadly lunate, reflexed stipules, readily distinguish this species. I am not acquainted with the male catkins.

20. *S. longifolia* (Willd.) ; foliis linear-lanceolatis acutissimis (quandoque spinuloso-) serratis concoloribus glabris junioribus sericeis, amentis pedunculatis erectis, masculis compactis, stem. laxiusculis, squamis oblongis obtusis pallidis extus glabris intus basique lanatis femineis valde deciduis, ovarii ovatis longe acuminatis brevi-stipitatis glabris, stigmate per breve sessili lobis bifidis. *Ph. Am. 2. p. 613. Muhl. in Ann. of Bot. 2. t. 5. f. 6.—S. rubra. Rich. App. p. 37 (non Huds.).—β. foliis plerisque sericeis.*

HAB. Canada (Cleghorn), to the Mackenzie River, Dr Richardson; and at Jasper Lake in the Rocky Mountains, growing in drifting sands. Drummond.—A. N. W. America, on the Columbia (Fort Vancouver, Tolmie) and its tributary streams near the mountains. Douglas.

§ 6. CORDATA. Amenta ovata, cylindracea, coarctanea. Squama rubra v. fusca. Stam. 2-3. Germina stipitata glabra. Folia cordata (?) glabra. Stipula cordata serrata. Prutices majuscules, ramis dichotomis, flexilibus. Barratt, mst.

21. *S. cordata* (Willd.) ; “foliis oblongo-lanceolatis acuminatis basi cordatis (v. acutis) argute serratis glabris subitus pallidioribus, stipulis amplis ovato-subrotundatis cartilagineo-serratis, amentis coarctaneis subtriangularibus, squamis lanceolatis lanatis atris, germinibus pedicellatis lanceolatis glabris, stylo brevissimo, stigmatibus bifidis.” *Ph. Am. 2. p. 615. Muhl. in Ann. of Bot. 2. t. 5. f. 8. Salict. Wob. p. 277.—β. balsamifera; foliis rigidioribus subitus magis glaucis.—S. balsamifera, Barratt, mst.—S. cordata. Rich. App. p. 37.—γ. Mackenzieana; foliis obovato-lanceolatis.—S. Mackenzieana. Barratt, mst.*

HAB. Moist woods and prairies of the Saskatchewan. Drummond.—A. Lake Winnipeg and the Saskatchewan. Dr Richardson.—γ. Great Slave Lake and the Mackenzie River. Dr Richardson.—So variable are the leaves of this plant in point of size, shape, and texture, that all kinds may be seen between lanceolate and almost exactly cordate. It is only fair to observe, that Dr Barratt is disposed to consider the β. and γ. good species; but I really do not possess sufficient materials to give satisfactory characters. The branches vary from bright yellow to deep brown.—Another state probably of this plant is found by Mr Douglas on the Columbia River with quite entire leaves.

22. *S. rigida* (Willd.) ; “foliis oblongo-lanceolatis acuminatis basi subcordatis rigidis glabris argute serratis, serratura infima elongata, petiolis villosis, stipulis amplis cordatis

obtusis glanduloso-serratis, amentis coctaneis subtriandris, squamis lanceolatis atris lanatis, germinibus longe pedicellatis lanceolatis glabris, stylo brevissimo, stigmatibus bipartitis." *Ph. Am.* 2. p. 615. *Muhl.* in *Ann. of Bot.* 2. t. 5. f. 4. *Salict. Wob.* p. 277.—*S. cordata.* *Mz. Am.* 2. p. 225.— β . *incana.* *Barratt, mst.*— γ . *longifolia.* *Barratt, mst.*

HAB. Between Fort Franklin and Cumberland House. *Dr Richardson.*—This again comes very near the *S. cordata*; but Dr Barratt refers the specimens without hesitation to *S. rigida*, W. and Ph.

23. *S. prinoides* (Ph.); "foliis ovali-oblongis acutis remote undulato-serratis glabris subtus glancis, stipulis semicordatis inciso-dentatis, amentis præcoccibus (?) villosis, germinibus pedicellatis ovatis acuminatis sericeis, stylo longo, stigmatibus bifidis." *Ph. Am.* 2. p. 613. *Salict.* 17th. p. 79. t. 40.

HAB. Silery, near Quebec. *Mrs Sheppard.* New Brunswick. *Mr Kendall.*—These specimens, which are barren, exactly correspond with what is named *S. prinoides*, from the United States; but they are also equally the same with what is named, in my Herbarium, *S. cordata*, by Mr Borrer, from Mr Anderson's garden. *

§ 7. ARBUSCULE. *Fructices parva regiones arcticas v. alpinas habitantes. Amenta catanea.* *Barratt, mst.*

24. *S. planifolia* (Ph.); "erectiuscula divaricata, ramulis levigatis, foliis oblongo-lanceolatis utrinque acutis medio serrulatis glaberrimis patentibus planis discoloribus, stipulis nullis." *Ph. Am.* 2. p. 611.— β . foliis unicoloribus.

HAB. Labrador. *Ph. Miss Brenton.* Mackenzie River and Bear Lake. *Dr Richardson.* Swamps at Lac la Pierre. *Drummond.*—If this be the true *S. planifolia*, as Dr Barratt suspects, it is a low growing shrub, with obovato-lanceolate, entire leaves, very glaucous beneath, especially the younger ones, downy, as well as the young branches. The ovary is ovato-acuminate, sessile, and very shortly stipitate. Style short; lobes of the stigma bifid. Pursh was unacquainted with the flowers, and there must still be great doubt about the species.— β , though not marked as a var. by Dr Barratt, has the leaves of the same colour on both sides, and decidedly serrated.

25. *S. acutifolia* (Willd. *Sp. Pl.* 4. p. 669); foliis lanceolatis utrinque acutis subcoriaceis glaberrimis subtus glaucis serratis, amentis coctaneis erectis cylindricis densifloris, squamis oblongis pilosis, ovarii sessilibus ovato-acuminatis sericeis, stylo brevi, stigmatis lobis bipartitis.

HAB. Saskatchewan to Fort Franklin on the Mackenzie River. *Drummond.* *Dr Richardson.*—Mr Borrer considers this to be the same as true *S. acutifolia* of Willdenow, from the Caspian Sea. Bark sometimes pale, sometimes deep brown, not "pruinose" in the dried specimens.

26. *S. pedicellaris* (Ph.); "ramis levigatis, foliis obovato-lanceolatis acutis integerrimis utrinque glabris concoloribus, stipulis nullis, amentis coctaneis pedunculatis glaberrimis, squamis oblongis pedicello duplo brevioribus vix pilosis, germinibus ovato-oblongis longissime pedicellatis glabris, stigmatibus sessilibus bifidis." *Ph. Am.* 2. p. 611.

HAB. Saskatchewan to Fort Franklin on the Mackenzie River. *Dr Richardson.* *Drummond.*—This plant is referred by Mr Borrer to *S. pedicellaris* of Pursh, with whose description it seems to agree, except that the leaves are more obtuse.

27. *S. depressa*. Hoffm.

HAB. Labrador. Dr Morrison. Fort Vancouver on the Columbia. Dr Scouler.—Specimens from these localities are so named by Dr Barratt; but they are, it must be confessed, in a very imperfect state, of which a description would probably tend to mislead.

28. *S. fusca*. L.—Sm. Engl. Bot. t. 1960. *Salict. Wob.* p. 165. t. 83.—*S. repens*. E. Bot. 133. *Salict. Wob.* p. 167. t. 84. *Ph. Am.* 2. p. 610.

HAB. Fort Franklin on the Mackenzie River. Dr Richardson.—Specimens with male catkins only.

29. *S. Myrsinoides* (L.); *humilis*, foliis ellipticis undulatis serratis nitidis glabris v. *hirsutiusculis* venis prominentibus, amentis brevibus laxis, ovarii sessilibus lanceolatis laxe sericeis stylo duplo longioribus, stigmatibus bifidis. Sm. E. Bot. t. 1360. *Salict. Wob.* p. 119. t. 60. Rich. App. p. 37. *Ph. Am.* 2. p. 617.

HAB. Swamps and woods among the Rocky Mountains; and in the barren country north of lat. 64°, to Fort Franklin. Dr Richardson.

30. *S. desertorum* (Rich.); foliis ellipticis obovato-lanceolatis deoduo-villosis venosis subtus glaucis, amentis oblongis erectis densifloris, floribus erectis, squamis ovalibus fuscis longe lanato-villosis ovarii ovati dense lanati sere longitudine, stylo brevi, stigmatibus lobis bifidis. Rich. App. p. 37.

HAB. From the Saskatchewan (Drummond) to Fort Franklin. Dr Richardson.—A very elegant species, with copious catkins. Yet there are some varieties, as it appears, which have a very different aspect, with much larger, more woolly leaves, and longer and looser catkins.

31. *S. Stuartiana* (Sm.); ramis strictis brevibus, foliis lanceolatis utrinque acutis integrerrimis subtus præcipue sericeo-villosis demum adultis nudiusculis, amentis coctaneis subelongatis pedunculatis, squamis brevibus fuscis sericeo-villosis, ovarii lanceolatis subsessilibus sericeo-lanatis, stylo brevi, stigmatibus lobis fisis. E. Bot. t. 2586. *Salict. Wob.* p. 143. t. 72.—*S. arenaria*. Hook. et Arn. in Bot. of Beech. p. 125.— β amentis laxioribus, floribus foecmineis magis remotis.

HAB. Kotzebue's Sound. Beechey.— β . Mackenzie River. Dr Richardson.—If the *S. Stuartiana* be really distinct from *S. arenaria*, this must be referred to the former species, from which it seems to differ only in the more lax nature of the catkins.

32. *S. Lapponum?* L.—Hook. et Arn. in Bot. of Beech. p. 129.

HAB. Kotzebue's Sound. Beechey.—Specimens very imperfect.

§ 8. PROSTRATE. *Frutices humiles, regiones arcticas vel alpinas habitantes, subrepentes vel prostratae. Amenta coactanea pedunculata.* Barratt, inst.33. *S. reticulata* (L.); foliis sublonge petiolatis orbiculari-ellipticis obovatissimis serratis adultis glabris reticulatis supra rugosis subtus glaucis, amentis pedunculatis cylindraceis multifloris, squamis latissimis retusis purpureo-fuscis glabris aenatis ovario sericeo-tomentoso sessili duplo brevioribus, stigmatibus lobis sessilibus bifidis. E. Bot. t. 1908. *Ph. Am.* 2. p. 610. *Salict. Wob.* p. 133. t. 67. *Cham. in Linnaea*, 6. p. 542.

HAB. Fort Franklin to the Arctic Shores and Islands. *Dr Richardson. Sir E. Parry, &c.* York Factory, Hudson's Bay. *Drummond.* Labrador. *Dr Morrison.* Unalaschka. *Chamisso.*

34. *S. nivalis*: nana repens, foliis parvis brevi-petiolatis lato-ellipticis-obovatisve integerrimis glabris reticulatis supra lœvibus subtus glaucis, amentis pedunculatis subquinque-floris, squamis obovatis retusis pallide viridi-fuscis venosis ovarii sessilis sericeo-tomentosis fere longitudine, stylo brevi, stigmatis lobis bipartitis.

HAB. Near the summits of the peaks in the Rocky Mountains.—A small plant, intermediate, as it were, between *S. reticulata* and *S. herbacea*, yet very distinct from both, especially in the very few-flowered aments, the larger, paler coloured, and veined scale, and the evident, though short, style. Leaves small, quite entire.

35. *S. vestita* (Ph.); foliis brevi-petiolatis obovatis obtusis vel lato-ellipticis serratis reticulatis supra adultis glabris rugosis subtus pilis longis deciduis pulcherrime sericeis, amentis pedunculatis elongato-cylindraceis compactis multifloris, squamis brevibus pallidis late ovatis retusis ovarisque lato-lanceolatis sericeo-tomentosis, stylo nullo, stigmatis lobis bifidis. *Ph. Am.* 2. p. 610.— $\beta.$ *nana*; glabra, foliis multo minoribus amentis paucis (6-8)-floris.

HAB. Labrador. *Kohlmeister. Dr Morrison.*— $\alpha.$ and $\beta.$ on the more elevated of the Rocky Mountains (*Drummond*), where it varies from a few inches to 3-4 feet in height, and in the length of the leaves from a $\frac{1}{2}$ to 2 inches. These leaves are generally beautifully silky beneath.

36. *S. cordifolia* (Ph.); foliis lato-ovalibus obovatis basi acutis v. *cordatis* obtusis integrermis junioribus subsericeis adultis petiolatis glabris leniter reticulatis subtus glaucis, amentis pedunculatis cylindricis densifloris, stipulis ovali-oblongis fuscis brevibus ovarisque ovatis acuminatis dense sericeo-villosis, stylo elongato, stigmatis lobis elongatis bifidis. *Ph. Am.* 1. p. 611. *Salict. Wob.* p. 277.—*S. obovata?* *Ph. Am.* 2. p. 611.

HAB. Labrador. *Kohlmeister. Dr Morrison.* High parts of the Rocky Mountains. *Drummond.*—The plant thus named for me by Mr Borrer, who is probably acquainted with the original plant cultivated by Mr Anderson, little deserves the appellation of *cordifolia*, its leaves being more frequently acute than retuse at the base. Many of the specimens approach very near to the following.

37. *S. arctica* (Br.); foliis obovatis obovato-lanceolatisve obtusiusculis basi acutis v. obtusis leniter reticulatis petiolatis integrermis junioribus subsericeis adultis glabris, amentis faemineis pedunculatis cylindraceis multifloris, squamis nigrescentibus late ovato-subrotundatis luxe sericeo-hirsutis ovarium ovatum sericeo-lanatum æquantibus, stylo elongato, stigmatis lobis elongatis bipartitis. *Br. in Bot. of Ross's Voy.* ed. 2. v. 2. p. 194 (not *Pall.*), and in *Melv. Isl. Pl.* p. cclxxii. *Rich. App. p. 37.* *Hook. et Arn. in Bot. of Beech.* p. 129.

HAB. Throughout the barren country of N. America, from lat. 61° to the shores and extreme islands of the Arctic Sea. *Captain Ross. Dr Richardson. Sir E. Parry, &c.* Kotzebue's Sound. *Beechey. Labrador. Miss Brenton.*—This plant has a disposition to turn almost black in drying, and the catkins have a peculiarly dingy or sooty hue, from the dark colour of the large scales and of the elongated styles and stigmas.

38. *S. Uva Ursi* (Ph.); “depressa, foliis spatulato-obovatis obtusis integrermis,

inferne margine sparse glandulosis glabris supra nitidis, stipulis nullis, amentis serotinis laxis, squamis oblongis ciliatis, germinibus ovatis pedicellatis glabris, stylo bipartito, stigmatibus bifidis." *Ph. Am.* 2. p. 610.—S. Ammanniana? *Rich. App.* p. 37.

HAB. Labrador. *Kohlmeister*. *Dr Morrison*. Hudson's Bay. *Dr Wright*. Woody country between lat. 54° and 64°. *Dr Richardson*.—My Labrador specimens thus referred to this plant, are too imperfect for me to venture to offer a character from them. Dr Richardson's " *S. Ammanniana?*" appears to me to be the same with this.

39. *S. retusa* (L.); humilis, foliis brevissime petiolatis obovatis v. oblongo-cuneatis obtusis retusis integerrimis parallelo-venosis glaberrimis nitidis, amentis pedunculatis, squamis brevibus atris sericeis, ovarii ovato-conicis brevi-pedicellatis, stylo mediocri, stigmatis lobis bifidis. *Hook. et Arn. in Bot. of Beech.* p. 130.—S. serpyllifolia. *Scop.*—*Jacq. Austr.* p. 298.—S. anglorum. *Cham. in Linnaea*, 6. p. 540, et in *Herb. nostr.*; (excl. syn. *S. arcticae*. Br.).

HAB. Kotzebue's Sound. *Beechey*. Arctic Sea-shore. *Dr Richardson* (whence, however, only one specimen was brought home).—A very distinct and beautiful species, with glossy, strongly nerved, perennial leaves, the skeleton nerves remaining in the lower parts of the stem. Ovaries and fruit very large in proportion to the size of the plant.

40. *S. herbacea* (L.); nana, foliis orbicularibus serratis glabris venosis, amentis paucifloris sessilibus, squamis parvis glabris, ovarii sessilibus lanceolatis glabris, stylo brevi, stigmatis lobis bifidis.—*E. Bot. t. 1907. Salict. Wob.* p. 123. t. 62.

HAB. N. W. Coast. *D. Nelson*. (*Ph.*) Labrador. *Dr Morrison*. Arctic Islands. *Sir E. Parry*.

41. *S. polaris* (Wahl.); nana, foliis orbicularibus subintegerrimis glabris venosis, amentis sessilibus paucifloris, squamis magnis nigricantibus villosis, ovarii sessilibus ovatis brevibus dense lanatis, stylo perbrevi, stigmatis lobis fisis. *Wahl. Lapp.* p. 261. t. 13. f. 6.—?—var. leiocarpa. *Cham. in Linnaea*, 6. p. 542.

HAB. Unalaschka. *Chamiso in Herb. nostr.*—Chamiso doubts if this be the true *S. polaris* of Wahlberg, on account of the glabrous ovary. It does not seem to have been elsewhere found in Arctic America; but I have specimens gathered by Sir Edward Parry's officers in Spitzbergen.

(Many specimens of *Salix* yet remain in the British N. American Herbarium, in too imperfect a state to be determined. Chamiso quotes the *S. arctica* of Pallas (not Br.), a very dubious species it must be confessed, as a native of Unalaschka, and *S. glauca*, L. and Koch. (*S. sericea*, Vill. and Ser.), of Chamiso's Island and Cape Espenberg, in Behring's Straits. Bongard, in his "*Veget. de Sitcha*," gives the following brief character of "*S. Sitchensis*," Sanson, *mst.* :—" amentis fructiferis breviter pedunculatis, pedunculo subfoliato; capsulis ovato-lanceolatis tomentosis pedicellatis, pedicello nectarium 2-3-superante, stylo elongato, stigmatibus bifidis (?); foliis oblongo-ovatis obsolete crenulatis, supra pubescentibus, subtus cano-tomentosis."—A single specimen, with foliage only, which M. Bongard has kindly communicated to me, does not enable me to refer it to any previously described species).

2. POPULUS. L.

1. *P. balsamifera* (L.); ramis teretibus, foliis ovatis cordatis acuminatis subæqualiter serratis glabris subtus pallidis reticulatis, amenti mæse. squamis fimbriatis parce pilosis,

*stem. ovaris ovato-globosis stigmatis lobis maximis. Ph. Am. 2. p. 619. Rich. App. p. 38. Pall. Ross. 1. t. 41. Trew, Ehret. t. 46.—*α. pedunculo *scm.* pubescente, florum pedicellis vix perianthii glabri longitudine, foliis?—β. pedunculo *scm.* glabro, pedicellis pistillo longioribus, foliis cordatis acuminatis basi truncatis.—γ. amentis ubique (etiam ovarii) pubescenti-tomentosis, floribus sessilibus, foliis exacte cordatis acuminatis.—an species distincta?

HAB. Canada. *Mrs Sheppard.* Throughout the woody country to the Great Slave Lake, and the south branch of the Mackenzie River, called *Rivière aux Liards*, from the great quantity of this tree which grows there. It constituted the greater part of the drift timber observed on the shores of the Arctic Sea. *Dr Richardson.*—β. Newfoundland. *Miss Brenton.*—δ. Banks of streams, N.W. America, attaining to a very large size, 60-140 feet high, and 9-20 feet in diameter. *Douglas.*—The trees in general, I fear, and the Poplars in particular, have not received that degree of attention that they deserve from the writers on American Botany. The leaves are very liable to vary, and it is remarkably the case with this species, as may be seen by the figures of Trew and Pallas; but they are never white on the underside, as described by Willdenow, &c. The flowers, too, are liable to vary, if I am correct in referring my two varieties to the present species. The γ., from the Pacific side of America, will probably prove a distinct species; but I possess only one specimen, and that with nearly perfect fruit: the amentum is a span long, and the capsules as large as peas, all over downy, and they are quite sessile. The leaves and flowers, both of β. and γ., are very similar in form to those of *P. monilifera*, but the toothing and under surface are considerably different. My specimens of *P. balsamifera*, from Kamtschatka, have the foliage orbicular, with scarcely any acumen.—Dr Richardson observes that the trunk of this attains a greater circumference than that of any other tree in the northern parts of America.

2. *P. candicans* (Ait.); foliis cordatis acuminatis subtus albidis subtriplinerviis, stipulis resinosis ramis teretibus. *Ait. Hort. Kew. ed. 1. v. 3. p. 406. Ph. Am. 2. p. 618.*

HAB. Canada. *Dr Hope.* (*Ait.*)—Of this species I am ignorant, and Willdenow, Pursh, and Michaux, have added nothing to the brief character given by Aiton. Indeed Michaux's figure and description, in the *N. American Sylva*, are alike unsatisfactory on the subject of the Poplars. From Dr Schweinitz I have received the following species, under the name of *P. candicans*. May they not in reality be one and the same?

3. *P. grandidentata* (Mich.); ramis teretibus, petiolis superne compressis, foliis rotundato-ovatis vix acuminatis grosse irregulariter seu angulato-dentatis basi saepē biglandulosis glabris junioribus densissime cano-tomentosis, amentis scamineis longis laxis, ovarii lanceolatis, stigmatis lobis linearibus. *Mx. Am. 2. p. 243. N. Am. Sylv. p. 243. t. 99. f. 2.* (good as to the fully formed leaf).

HAB. Canada. *Ph. Mrs Sheppard.* Lake Huron. *Dr Todd.* New Brunswick. *Mr Kendal.*—The foliage puts on very different appearances at different periods of its growth, the young leaves being clothed with very dense white tomentum, and margined with rather small and nearly regular teeth; as they advance in age, the down disappears, and the teeth become very large, and irregular.

4. *P. tremuloides* (Mx.); ramis teretibus, foliis parvulis suborbiculatis breviter acuminatis serrulatis ciliatis basi saepē biglandulosis, squamis masculinis pulcherime sericeis, ovarii lanceolatis, stigmatis lobis linearibus. *Mx. Am. 2. p. 243 (1803). N. Am. Sylv. p. 242. t. 99. f. 1.*—P. trepida. *Willd.* (1805).—*Ph. Am. 2. p. 618. Rich. App. p. 38.*

HAB. Canada (*Mx. Mrs Sheppard*), as far as lat. 64°. *Dr Richardson. Douglas.* New Brunswick.

Mr Kendall. Newfoundland. *Miss Brenton*.—The wood is remarked by the Crees to burn better in a green state than that of any other tree. In other respects it is worthless.

(The *P. leavigata*, Willd., received the name of *Canadensis*, from an idea that it was introduced into France from Canada; but that is mere conjecture, and as I have never received specimens except from the United States, I do not venture to introduce it. The *P. monilifera*, Wats. Dendrol. t. 102, is a good representation of this plant, and I strongly suspect that Michaux's plant of that name is no other. The female flowers very much resemble those of *P. balsamifera*, but the leaves are very different.)

SUBORD. II. BETULINEÆ. Rich.

3. BETULA. L.

1. *B. populifolia* (Ait.); "foliis deltoidibus longe acuminatis inæqualiter serratis glaberrimis, amentis foem. cylindraceis, squamis lobis lateralibus oblongis, decurvo-falcatis, intermedio breviori, petiolis glabris." *Hort. Kew. ed. 1. v. 3. p. 336. Mich. N. Am. Sylv. p. 91. t. 71. Ph. Am. 2. p. 620.*

HAB. Canada. PH.—My own specimens of this are all from the United States; and I confess that, except in the narrower and rather more compact female catkins, and the smaller scales (for the shape is the same in the two), I cannot see how it differs from the European *B. alba*. The leaves are the same in both.

2. *B. papyracea* (Ait. *Hort. Kew. ed. 1. p. 337.*); foliis subcordato-ovatis brevi-acuminatis subæqualiter serratis subtus punctatis glabris nunc ad axillas venarum hirsutis, amentis foemineis lato-cylindraceis, squamarum lobis lateralibus oblongis decurvo-falcatis intermedio subbreviori. *Ph. Am. 2. p. 621.*

HAB. Canada. (PH.) Lake Huron (*Dr Todd*) to lat. 65°. *Dr Richardson*. *Drummond*. *Douglas* (who observes it is rare to the west of the Rocky Mountains).—Mr Drummond's specimens have only the male catkins perfect, and no leaves. In my specimens from Dr Torrey (Massachusetts) the female catkins are pendent, and the leaves are slightly downy beneath on the nerves, and have there, in the axils of the nerves, generally a dense woolly tuft. My specimen from Atabasca, gathered by Douglas, has the female catkins erect, the leaves quite glabrous, and the young branches rough with resinous warts. In all, the leaves are dotted beneath, in consequence of copious resinous exudations.

3. *B. occidentalis*; ramis rufo-fuscis copiose resinoso-verrucosis, foliis late rhombo-ovatis sublobatis grosse inciso-serratis sub lente appresso-hirsutulis v. nudis subtus pallidioribus epunctatis, nervis paucis remotis, amentis foem. lato-cylindraceis, squamis lobis ovato-oblongis lateralibus decurvo-falcatis intermedio longiore.

HAB. Straits of De Fuca. *Dr Scouler*. Near springs on the west side of the Rocky Mountains. *Douglas*; and on the east side, from the mountains to Edmonton House. *Drummond*. One specimen is in the collection from the Arctic coast.* (?) *Dr Richardson*.—This Birch does not agree with any described species, and it is probably confined to the west coast, and to the immediate vicinity of the Rocky Mountains, forming a low, small brush-wood, 6-10 feet high, and never exceeding a few inches in the diameter of its trunk. Mr Drummond considered it to be the *B. nigra*, but its bark and leaves are quite different; the latter remarkable for the few and remote nerves, which spring from the mid-ribs: besides, *B. nigra* is a southern tree of great size. The main branches are erect, and somewhat virgate, clothed with a red-brown bark, a little inclining to purple, copiously sprinkled with resinous warts in all the specimens. Petioles $\frac{1}{2}$ to $\frac{2}{3}$ of

* There has probably been some mistake in the station of this.

an inch long, adult leaves 2-2½ inches, broadly ovato-rhomboid, rather acute than acuminate, of a harsh and dry but not thick texture, slightly lobed at the margin, and inciso-serrate, the serratures coarse and sharp, paler beneath, but never, either in the old or younger state, dotted. Male catkins resembling those of the preceding, 1-2 inches long.

4. *B. excelsa* (Ait.); "foliis ovatis acutis serratis, strobilorum squamis lobis lateralibus rotundatis, petiolis pubescentibus pedunculo brevioribus." *Hort. Kew. ed. 1. v. 3. p. 337.*
Ph. Am. 2. p. 621.—*B. lutea.* *Mx. N. Am. Sylv. 2. p. 103. t. 73.*

HAB. Abundant in the forests of New Brunswick and Nova Scotia. *Michaux.*—I have never been so fortunate as to receive satisfactory specimens of this plant, either from British N. America, or from the United States; from its qualities and properties, however, as related by Michaux, it would seem to be a distinct species; but the figure of this latter author, and specimen of foliage which Mr. Kendal sent from New Brunswick, marked "Yellow Birch," seem to differ in no respect from the following: and Bigelow (*Fl. Bost. p. 856*) observes of *B. excelsa*, "it has considerable resemblance to *B. lenta*, but the cuticle has a yellowish colour."—It will be seen by Michaux's figure that the lateral lobes of the scutella of the catkin are as in the following species.

5. *B. lenta* (L.); foliis ovatis seu oblongo-ovatis brevi-acuminatis basi oblique cordatis obtusis argute subduplicato-serratis nervis approximatis parallelis, subtus petiolis villosulis, junioribus sericeis, amentis brevi-pedunculatis scemineis fructiferis ellipticis, squamis glabriusculis nervosis lobis lateralibus ovato-rotundatis patentibus intermedio elongato. *Ph. Am. 2. p. 621.* *Mx. N. Am. Sylv. 2. p. 106. t. 74.*—*B. carpinifolia.* *Ehrh.*

HAB. Abundant in Nova Scotia, New Brunswick, and in Canada, where it is known by the name of the "Cherry Birch." *Michaux.* *Mr. Kendal.*—It is a pity that Ehrlhart's appropriate name of *carpinifolia* cannot be preserved to this species. It is reckoned among the most beautiful and valuable of the genus. The leaves are often, but by no means universally, furnished with a tuft of wool in the axils of the veins.

6. *B. pumila* (L.); "humilis, foliis orbiculari-ovatis serratis subtus (junioribus praecipue) ramulisque pubescentibus, amentis scemineis cylindraceis." *Willd. Sp. Pl. t. 4. p. 467.* *Jacq. Hort. Vind. t. 122. (non Dict. des Sc. Nat. cum Ic.) Ph. Am. 2. p. 622.*

HAB. Canada. (*Linn.*) Newfoundland. *Miss Brenton.* Labrador. *Dr Morrison.*—I have seen no plant corresponding exactly with the *B. pumila*, except one specimen from Newfoundland, and another, less distinctly marked, from Labrador; but these I can only consider a downy state of *B. glandulosa*. The *B. pumila* of *Dict. des Sc. Nat.* seems to be undoubtedly the European *B. fruticosa*.

7. *B. glandulosa* (Mx. Am. 2. p. 18); humilis, ramis resinoso-punctatis v. laevibus glabris, foliis obovatis seu subrotundo-ovatis obtuse serratis glabris, amentis scemineis lato-cylindraceis breviusculis, squamis trifidis lobis oblongo-subovatis intermedio parum longiore. *Ph. Am. 2. p. 621.*

HAB. Canada and Hudson's Bay. *Michaux.* *Goldie.* Grand Saline and Mountains of Providence, and from Lake Winnipeg to Fort Franklin. *Dr Richardson.* *Drummond.* Labrador and Newfoundland. *Miss Brenton.* *Dr Morrison.*—Leaves from $\frac{1}{2}$ to 2, or rarely an inch long, varying in width, and somewhat in the length of the petiole: so that some of the specimens, it must be confessed, come very near to the following. I have selected the best characters I have been able for distinguishing them.

8. *B. nana* (L.); humilis, ramis resinoso-punctatis v. laevibus glabris, foliis suborbicularibus grosse dentatis glabris, amentis scemineis brevibus cylindraceis, squamis profunde

*trifidis lobis oblongo-subobovatis subæqualibus. E. Bot. t. 349. Ph. Am. 2. p. 622.—
β. flabellifolia; foliis cuneato-flabelliformibus dentibus profundis acutis.*

HAB. Sphagnous swamps, Hudson's Bay and Canada. *Michaux.* Labrador. *Dr Morrison. Miss Brenton.* Fort Franklin on the Maekenzie River. *Dr Richardson.* Kotzebue's Sound. *Chamiso (in Herb. nostr.) Beechey.*— β . Newfoundland. *Mr Cormack.*—Smaller in all its parts than the preceding, and the leaves constantly more orbicular, and nearly sessile. The scales, too, of the female amentum appear to be more deeply cleft, and the segments more equal.— β . is a very beautiful variety, with broadly cuneate leaves, semicircular at the extremity, and, there only, deeply, regularly, and sharply toothed. From Sweden, Mr R. B. Bowman has sent me *B. nana*, with the young branches decidedly pubescent, thus bearing the same relation to the usual state of the plant, that *B. pumila* does to *B. glandulosa*.

4. ALNUS. L.

1. *A. glutinosa. Gértn.*—*E. Bot. t. 1508. Ph. Am. 2. p. 622.*

HAB. Interior of Canada and the N. W. Coast. *Ph.*—Willdenow gives this as a native of N. America, and Pursh speaks of this as "a large tree, known every where under the name of *Alder*;" but I have seen nothing like our common *Alder* from any part of N. America, and I presume the *A. viridis* has generally been mistaken for it.

2. *A. crispa* (Ait. *H. Kew. ed. 1. v. 3. p. 339*) ; pedunculis ramosis, foliis ovatis acutis subundulatis, venis subtus pilosis, axillis nudis, stipulis subrotundo-ovatis.—*B. crispa. Mx. Am. 2. p. 181. Ph. Am. 2. p. 623.*—*A. undulata. Willd.*

HAB. Newfoundland and Hudson's Bay. *Aiton.*—Of this I know nothing, unless it be, as Nuttall has suggested (*in Herb. nostr.*), a state of *A. incana*.

3. *A. viridis* (DC.) ; foliis ovatis acutis ad margines inciso-sublobatis argute inæqualiter serratis utrinque glabris v. ad venas subtus pilosiusculis et nunc in axillis venarum lanatis, amentis junioribus cylindraceis, fructiferis ovalibus. *Cham. in Linnæa, 6. p. 538.*—*Betula ovata. Schrank.*—*Willd.*—*Alnus incana, glabrifolia. Hook. et Arn. in Bot. of Beech. p. 117 and 129.*—*A. glutinosa. Rich. App. p. 36. an Ph.?*— β . foliis majoribus marginibus magis inciso-lobatis.

HAB. Canada, throughout the woody and barren country, and to the Rocky Mountains. *Dr Richardson. Drummond. Siteha. Bongard.* Kotzebue's Sound. *Chamiso. Beechey.*— β . N. W. America, from the mountains to the sea. *Douglas. Scouler. Tolmie.*—The specimens of α . correspond entirely with the European plant of the same name, and the exactly ovate acute leaves, finely and deeply serrated, and the longer, cylindrical, and (apparently) green, young female catkins, will readily distinguish it from *A. glutinosa*. Dr Richardson's specimens, from his first journey, have the leaves quite young; but I think I cannot be mistaken in referring them here. The Columbia specimens have the leaves usually large, but retaining their true character.

4. *A. incana* (Willd.) ; foliis ellipticis subovatisve integris vel margine obscure lobatis obtusis vel acutiusculis argute serratis subtus pubescensibus, amentis junioribus cylindraceis, fructiferis ovalibus.—*Betula incana. L.*—*Pall. Ross. 1. p. 64.*— β . foliis subtus ad nervos pilosis v. etiam glaberrimis.—*Betula serrulata. Ait. Hort. Kew. ed. 1. p. 338.*—*Alnus. Ph.*

HAB. α . and β . throughout Canada (*Mrs Sheppard*), to the Saskatchewan and Fort Franklin. *Dr Richardson. Douglas. Drummond.* New Brunswick. *Mr Kendal.* Newfoundland. *Miss Brenton.*—The

leaves are generally larger than, and of a different shape from, the preceding. In the degree of pubescence on the under surface of the leaves, the greatest variation appears, and the most downy kind in every particular corresponds with the European *secana*, so that I have no hesitation in considering the *A. serrulata* (which indeed is sometimes quite glabrous) a var. of it.

5. *A. rubra* (Bong. *Veg. de Sitcha*, p. 44); foliis ellipticis marginibus undique obtuse lobatis lobis obtuse serrulatis subtus ad nervos præcipue puberulis siccitate subferrugineis, amentis fœm. junioribus cylindraceis, fructiferis ovatis.—*A. castaneæfolia*. *Dougl. Mst.*

HAB. Sitcha. *Bongard*. Dry rocky banks of the Columbia, near the Grand Rapids, common (*Douglas*), and below Fort Vancouver. *Dr Scouler*.—This is a perfectly distinct species, and well characterized by Dr Bongard, who observes that it is called "Red Alder" by the Russians inhabiting the colony at Sitcha. The margins of the leaves are so deeply and regularly lobed that they might almost be called pinnatifid, and these lobes and the serratures are singularly blunt. There is nothing peculiar in the catkins. Indeed the fructification of the different species of Alder exhibit very little variation.

SUBORD. III. PLATANEÆ. *Juss.*

5. PLATANUS. *L.*

1. *P. occidentalis*. *L.*—*Ph. Am.* 2. p. 635. *Mich. N. Am. Sylv.* 1. p. 55. t. 69.

Am.* 2. p. 633. *Mich. N. Am. Sylv.* 1. p. 11. t. 1.

HAB. Canada, to Lake Winnipeg (which Mr Douglas considers its northern limit, and where it attains only a height of 10-20 feet). *Dr Richardson. Douglas*.

6. *Q. Garryana* (Dougl. mst.); foliis latissime obovatis utrinque obtusis sinuato-pinnatifidis siccitate nigricantibus supra glabris subtus petiolis ramisque dense fusco-pubescentibus lobis latis obtusissimis, fructibus sessilibus, cupula perbrevi-hemisphaerica dense squamosa squamis ovato-acuminatis pubescentibus, glande ovata obtuse cum umbone conico.

HAB. N. W. America. *Menzies* (in *Herb. nostr.*) Plentiful on the plains near Fort Vancouver, on the Multnomah, and at Puget Sound. *Douglas*. *Dr Gaillard*. *Tolmie*.—Forty to eighty feet high, 3-5 in diameter: the wood good, and well adapted for ship-building. This Oak, which I believe to be a very distinct species, has not only the underside of the adult leaves, but the petioles and branches, clothed with a dense dingy-coloured down. The leaves, too, are much broader than in *Q. alba*, the scorns are sessile, and the cups much shallower. There is an Oak in Mr Drummond's third collection of Texas plants (No. 342), named "Yellow Post Oak," distinguished by the downy leaves and the size of the acorn, in which the leaves and sessile acorns agree with those of the present species very closely; but the branches are glabrous, and the cups are much deeper, and clothed with larger and more hoary scales.—Mr Menzies also detected *Q. Garryana* in California, where Mr Douglas, besides the *Q. agrifolia*, Ned., gathered also a third species, with leaves somewhat like the present, but narrower, and with narrower lobes, nearly glabrous beneath, and much smaller acorns. These three are, as far as I know, the only Oaks yet discovered in N. W. America.

7. CASTANEA. L.

1. *C. chrysophylla* (Dougl. mst.); foliis sempervirentibus lato-lanceolatis acuminatis coriaceis integerrimis glabris subtus aureo-farinosis.

HAB. Common on the Grand Rapids of the Columbia, to Cape Orford, and near Mount Hood; constantly inhabiting the hills.—This is a most splendid evergreen tree, varying in height from 20 to 70 feet, with leaves 4-5 inches long, full green above, below of a rich golden yellow. These leaves are quite entire. The spikes or catkins of flowers scarcely exceed an inch in length, including the peduncle, and they are solitary in the axils of the upper leaves; sometimes all the flowers on a catkin are male; sometimes the two or three lower flowers are female. Fruits 2-3, crowded, densely clothed with acicular prickles.

8. FAGUS. L.

1. *F. ferruginea* (Ait.); monœcias, foliis oblongo-ovatis acuminatis remote dentato-serratis basi acutis v. obtusis, fructus aculeis ferrugineo-tomentosis reflexis. *Ph. Am.* 2. p. 624. *Mich. N. Am. Sylv.* 3. p. 21. t. 106.

HAB. Canada, New Brunswick, and Newfoundland.—This is the "Red Beech," of the inhabitants, and I, like Dr Torrey, have only seen this one species from any part of N. America; but Michaux, and American authors, describe another species as also inhabiting Canada, namely—

2. *F. sylvestris* (Mich.); "foliis acuminatis obsolete dentatis margine ciliatis." *Mich. N. Am. Sylv.* p. 18. t. 107.—*F. sylvatica*. *Ph. Am.* 2. p. 625 (*not Linn.*).—*F. sylvatica*. *B. Nutt. Gen. Am.* 2. p. 216.

HAB. Canada. *Michaux*, who calls this the "White Beech," from the difference of the colour of the wood in the two kinds; but neither in Michaux's figure, nor in the description of authors, does their appear any marks by which this can be separated botanically from the preceding. In both, the leaves vary somewhat in shape, but are at all times much larger and longer and more toothed than in the European Beech, which has, moreover, the prickles of the fruit straight, and not clothed with ferruginous down.

9. CARPINUS. L.

1. *C. Americana*. Willd.—*Ph. Am.* 2, p. 623.—*Mich. N. Am. Sylv.* 3, p. 28, t. 108.
HAB. Canada.

10. OSTRYÀ. Micheli.

1. *O. Virginica*. Willd.—*Ph. Am.* 2, p. 623.—*Carpinus Ostrya*. *Mich. N. Am. Sylv.*
p. 31, t. 109.

HAB. Canada, to Lake Winnipeg. *Dr Richardson*. New Brunswick and Nova Scotia. *Michaux*.

11. CORYLUS. L.

1. *C. Americana* (Wahl.); foliis subrotundo-cordatis acuminatis, involucris nuce globosa multo majoribus limbo maximo dilatato foliaceo grosse dentato. *Ph. Am.* 2, p. 634.— β . amentorum (utriusque sexus) squamis densissime sericeo-villosis.

HAB. Canada.— β , N. W. Coast. *Menzies*. *Douglas*. *Scouler*.—Readily distinguished by the remarkably large leafy limb to the involucre of the fruit. Of the var. β , I have seen no fruit. It may probably constitute a new species.

2. *C. rostrata* (Ait.); foliis cordato-ovalibus acuminatis, involucris inferne sericeo-hispidis nuce globosa multo majoribus in tubum longissimum angustum apice incisum desinentibus. *Ph. Am.* 2, p. 635.

HAB. Canada, to the Saskatchewan. *Dr Richardson*.

ORD. XCII. MYRICEÆ. Rich.

1. MYRICA. L.

1. *M. Gale*. L.—*E. Bot.* t. 562. *Ph. Am.* 2, p. 620.

HAB. Throughout Canada, and to Fort Norman on the Mackenzie River. *Dr Richardson*. New Brunswick. *Mr Kendall*. Labrador and Newfoundland. *Miss Brenton*. *Dr Morrison*.—The young buds, Dr Richardson says, are used by the Indians to dye their porcupine's quills.

2. *M. Californica* (*Cham. in Linnaea*, 6, p. 535, et in *Herb. nostr.*); ramis angulatis, foliis anguste lanceolatis acutis basi in petiolum brevem attenuatis adultis præsertim serratis glabrescentibus coriaceis punctis minutis resinosis adspersis margine reflexo obsolete nervosis, amentis axillaribus solitariis, fructibus tuberculatis nudis.—*M. Xalappensis*. *H. and K.*?

HAB. N. W. Coast. *Menzies*. Swamps of Puget Sound. *Douglas*.—I do not think this differs as a species from *M. Xalappensis*. Our specimens of what we consider that plant, gathered in Mexico, are quite the same as Chamisso's, so that this species has a very extensive range.

2. COMPTONIA. Gærtn.

1. *C. asplenifolia*. Ait.—*Ph. Am.* 2, p. 635.—*Liquidambar aspl.* L.

HAB. New Brunswick and Canada, to the Saskatchewan. *Dr Richardson*. *Drummond*.

ORD. XCIII. CONIFERÆ. Juss.

I. PINUS, L.

1. *P. Banksiana* (Lamb.* *Pin. t. 3*) ; foliis geminis uncialibus rigidis curvatis linearibus acutis dorso tereti supra canaliculatis marginibus (sub lente) scabris, strobilis subbiuncialibus ovato-acuminatis recurvis ramo adpressis plerumque binis, squamis obtusis levibus dorso superne gibboso. *Ph. Am. 2. p. 642.* — *P. rupestris. Mich. N. Am. Sylv. 3. p. 117. t. 136.*

HAB. Dry sandy soils, Canada, to lat. 64°, and even beyond that, on the sandy banks of the Mackenzie River. *Dr Richardson.*

2. *P. inops* (Sol. in *Ait. Hort. Kew. ed. 1. v. 3. p. 367*) ; foliis geminis breviunculis (biuncialibus) obtusiusculis rigidis supra canaliculatis subtus teretibus marginibus serrulatis, strobilis recurvis ovato-oblongis longitudine foliorum, vaginis brevibus, squamis compactis obtusis infra apicem aculeo subulato patente instructis. *Lamb. Pin. t. 12. Mich. N. Am. Sylv. 3. p. 120. t. 139. Ph. Am. 2. p. 641. Bong. Veget. de Sitcha, p. 45.* — *P. distorta. Dougl. mst.* — β . foliis minus rigidis.

HAB. Sitcha. *Bongard* (in *Herb. nostr.*). Shores of the Pacific, from the confluence of the Columbia northwards. Observatory Inlet. *Dr Scouler.* — β , growing close to the snow on Mount Rainier. *Tolmie.* — This forms a "low scrubby" Pine in N. W. America; on Mount Rainier, near the snow, not exceeding 10 feet in height. The specimens exactly agree with the same species from the United States.

3. *P. resinosa* (Sol. in *Hort. Kew. ed. 1. p. 367*) ; foliis geminis elongatis (4-5 uncialibus) acutis supra leniter canaliculatis dorso teretibus marginibus asperis, vaginis elongatis, strobilis ovato-conicus basi rotundatis subsolitariis subbiuncialibus, squamis superne conico-convexis. *Lamb. Pin. t. 19. Ph. Am. 2. p. 642.* — *P. rubra. Mich. N. Am. Sylv. 3. p. 112. t. 134.*

HAB. Canada.—N. W. America, along with *P. Lambertiana. Douglas.*

4. *P. Strobus* (L.) ; foliis quinis gracilibus subtriuncialibus acute triquetris margine superne scarbiunculis supra glaucis, vaginis nullis, strobilis folio longioribus subcylindraceis levigatis curvato-pendulis, squamis laxis magnis latissimis planis. *Lamb. Pin. t. 32. Ph. Am. 2. p. 644. Mich. N. Am. Sylv. 3. p. 159. t. 145.* — *P. monticola. Dougl. mst.* — *Lamb. Pin. descr. sine Ic.*

HAB. Nova Scotia and Canada, to the Saskatchewan and east side of the Rocky Mountains. *Drummond*; and on the west side, from the source of the Columbia to the alpine range of Mount Hood. *Douglas.* — This is the well-known "Weymouth Pine" of our plantations. I cannot perceive the slightest difference in the *P. monticola* of Mr Douglas and the present. The cones and foliage are exactly similar.

5. *P. Lambertiana* (Dougl. mst.) ; foliis quinis subelongatis 4-5 uncialibus rigidiusculis acutis acute triquetris unicoloribus margine subasperis, vaginis nullis, strobilis maximis (pedalibus et ultra) oblongis, squamis laxis latissimis planis. — *Lamb. Pin. t. 34.* — β .? foliis brevioribus.

* I quote from the imperial 8vo edition, published by Messrs Weddel in 1832; the only edition, save the first, that I have the opportunity of consulting.

HAB. From N. lat. 43° , in N. W. America, to California. First seen at the head-waters of the Multnomah in 1825. *Douglas*.—A "Height of Land" in the Rocky Mountains. *Drummond*.—The giant of the N. W. American forests, being sometimes 215 feet in height, 57 feet 9 inches, in circumference, at 3 feet from the ground, and 17 feet 5 inches, in circumference, at 34 feet from the ground; whilst the cones are from 12 to 16 inches in length, and 11 inches in circumference in the thickest part!—A Pine in many respects similar to this was found by Mr Drummond in very elevated situations of the Rocky Mountains, near the "Height of Land," yet there growing 50 and 60 feet high. The leaves are, however, shorter (2 or 3 inches) and more rigid, and the specimens have the closest affinity with those of the European *P. Cembra*. No cones of it exist in the collection.

6. *P. Sabiniana* (Dougl. mst.); ramulis squarrosis, foliis ternis prælongis pedalibus acutis unicoloribus clorso tereti supra linea acuta elevata margine scabris, vaginis in adultis brevibus, strobilis subrotundo-ovatis maximis, squamis patentibus laxis latissimis apicibus longe acuminatis incurvis spinescentibus. *Lamb. Pin. t. 80.*

HAB. N. W. America; inhabits moist vegetable deposits of New Albion, at a great elevation above the sea. *Douglas*. Fallatine hills. *Dr Gairdner*.—A tree from 40-120 feet in height, and 2-12 feet in circumference. Cones 9-11 inches long, and 5 to 6 inches in diameter.

7. *P. (Abies?) Menziesii* (Lamb. *Pin. descr. sine Ic.*); foliis acutis planis subtus argenteis undique versis, strobilis cylindraceis, squamis scariosis margine erosis."

HAB. N. W. America. *Menzies* (in *Herb. Lamb.*).

8. *P. (Abies) nobilis* (Dougl. mst.); foliis (uncialibus) linearibus falcatis supra linea media exarata subtus pallidioribus linea media elevata, strobilis erectis ovato-cylindraceis (6-7 uncialibus, 3-unc. lat.), squamis compactis latissimis, bracteolis lato-spathulatis arcte imbricato-deflexis squamas tegentibus apice erosis cum acumine subulato rigido. *Lamb. Pin. descr. cum Ic.*

HAB. N. W. America. *Douglas*. Brought to Fort Vancouver by the Indians, under the name of *Twick-tuck*, from the Great Falls of the Columbia. *Dr Gairdner*.—A beautiful and handsome Spruce, with singularly fine cones, of which the scales are entirely concealed by the largo reflexed and imbricated bracteoles each tipped with a spine about three lines long. These cones resemble in many respects those of *P. Picea*, but are much broader, and have much larger and more reflexed bracteoles.

9. *P. (Abies) Douglasii* (Sabine, mst.); foliis anguste linearibus (uncialibus) obtusis supra linea media exarata subtus albidis linea media elevata marginibus reflexis, strobilis erectis ovatis (triuncialibus), squamis paucis laxis latissimis, bracteolis obovato-lanceolatis squamam superantibus 3-fidis, lacinia media spiniformi lateralibus membranaceis erosis longiori. (TAB. CLXXXIII.)

HAB. N. W. America, a common timber. *Douglas*. *Dr Gairdner*.—The cones of this are very unlike those of any other species, scarcely three inches long, composed of few (about 30) large broad lax scales, and each subtended by a bracteole longer than the scale, deeply trifid at the apex, the two lateral laciniae acuminate and toothed or erose on their outer edge, the middle longer than these, and constituting a straight rigid spine, about a quarter of an inch long. Mr Douglas observes, that the principal part of the gloomy forests of N. W. America, in the valleys of the Rocky Mountains, and throughout the interior skirting those

mountains, is composed of this species. It attains a height of from 150 to 200 feet, and a circumference of from 20 to 50 feet.

TAB. CLXXXIII. Fig. 1, Male catkins; f. 2, Cone:—nat. size; f. 3, Leaves:—magnified.

10. *P. (Abies) Balsamea* (L.) ; foliis linearibus (uncialibus) obtusis supra linea media exarata subtus albidis linea media elevata marginibus reflexis, strobilis erectis cylindraceis (4-5-uncialibus) resinifluis, squamis latissimis compactis, bracteolis obovatis dentatis obtusis squamam fere aquantibus. *Lamb. Pin. t. 41. Ph. Am. 2. p. 639.*—*Abies balsamea.* *Mich. N. Am. Sylv. p. 191. t. 150.*

HAB. Canada and Nova Scotia, to the Saskatchewan. *Dr Richardson.*

11. *P. (Abies) grandis* (Dougl. mst.) ; foliis (uncialibus) linearibus obtusis supra linea media exarata subtus albidis linea media elevata marginibus reflexis, strobilis erectis ovali-cylindraceis (6-uncialibus, 2-3-uncins lat.) resinifluis, squamis compactis latissimis, bracteolis ovatis brevi-acuminatis cuspidatis marginibus erosis squama multo brevioribus. *Lamb. Pin. App. descr. sine Ic.*

HAB. N. W. America. *Douglas.*—The cone of this, Mr Lambert remarks, resembles that of *P. Cedrus*, but I think much more that of the preceding, *P. Balsamea*, and *P. Webbiana*, and it is in like manner densely coated with a resinous substance.

12. *P. (Abies) lasiocarpa*; foliis linearibus obtusis (uncialibus et fere sesquiuncialibus) unicoloribus supra linea media exarata subtus linea media elevata marginibus paululum incrassatis, strobilis ?, squamis latis subrotundatis extus dense fusco-pubescentibus, bracteolis late obovatis vix denticulatis squama subduplo brevioribus apice mucronato-acuminatis.

HAB. Interior of N. W. America (last journey). *Douglas.*—There are no entire cones accompanying the solitary specimen of this plant; but the scales and bracteoles, lying with the leaves, are considerably different from any other species with which I am acquainted. The former are clothed with a dense almost ferruginous down. The leaves, too, are longer than in any other American species.

13. *P. (Abies) alba* (Soland. in Hort. Kew. ed. 1. v. 3. p. 371); foliis curvatis brevibus tetragonis (vix uncialibus) strobilis (3-uncialibus) pendulis oblongis subattenuatis obtusis, squamis late obovatis tenuibus integerrimis. *Lamb. Pin. t. 36. Ph. Am. 2. p. 641. Rich. App. p. 36.*—*Abies alba.* *Mich. N. Am. Sylv. 3. p. 128. t. 148.*

HAB. Throughout Nova Scotia and Canada, to within twenty miles of the Arctic Sea, and on the Coppermine River; in lat. $67\frac{1}{2}^{\circ}$ it attains a height of twenty feet and more. *Dr Richardson.*—This is the most northern tree met with by Dr Richardson in his Arctic journeys. See an interesting notice of the uses of this tree among the Crees and Esquimaux, in Richardson App. above quoted. Young cones pale green; old ones pale brown.

14. *P. (Abies) nigra* (Ait. Hort. Kew. ed. 1. v. 3. p. 370); foliis rectis brevibus tetragonis (semiauncialibus), strobilis pendulis ovatis obtusis (uncialibus v. paulo ultra), squamis crassis lignosis obovato-ellipticis laxiusculis apice eroso-denticulatis. *Lamb. Pin. t. 37. Ph. Am. 2. p. 640. Rich. App. p. 36.*—*Abies nigra.* *Mich. N. Am. Sylv. p. 176. t. 147.*

HAB. Newfoundland, Nova Scotia, and throughout Canada, to lat. 65°, where it terminates with the *Betula papyracea*. Dr Richardson.—It grows in swampy situations. Cones deep purple, at length brown.

15. *P. (Abies) rubra* (Lamb. *Pin.* t. 38); "foliis solitariis subulatis acuminatis, strobilis (pendulis) oblongis obtusis, squamis rotundatis subbilobis margine integris."—*P. Americana rubra*, &c. Wangen. *Beyt.* 75. t. 16. f. 54.

HAB. Nova Scotia and Newfoundland. Wangen. (in Lamb.)—This is a very dubious tree, according to Mr Lambert. Pursh says it is nearly related to the preceding.

16. *P. (Abies) Canadensis* (L.); ramulis pubescensibus, foliis brevibus (6 lineas longis) linearibus tenuibus obscure denticulatis subtus glaucis, strobilis parvis (vix folio longioribus), squamis paucis rotundatis integerrimis. Lamb. *Pin.* t. 45. Ph. Am. 2. p. 640.—*Abies Canadensis*. Mich. N. Am. *Sylv.* 3. p. 185. t. 140.—? foliis angustioribus.—*P. taxifolia*. Lamb. *Pin.* t. 47.

HAB. Canada, extending to the most northern regions, according to Pursh. N. W. America, Dr Scouler, as far as Millbank Sound and Stikine. Tolmie.—? N. W. America. Menzies.—This well-known Hemlock Spruce is readily distinguished by its small terminal cones. My specimens from N. W. America, which are in fruit, do not seem to differ from those of Eastern America, and I am led to consider the *P. taxifolius* of Mr Lambert probably a variety of the present species.

17. *P. (Larix) pendula* (Soland. in Ait. *Hort. Kew.* ed. 1. v. 3. p. 369); foliis fasciculatis deciduis, strobilis oblongis squamarum marginibus inflexis, bracteolis panduriformibus acumine attenuato. Lamb. *Pin.* t. 49. Ph. Am. 2. p. 645.

HAB. Canada. Ph. Newfoundland. Miss Brenton. N. W. America. Douglas.—Mr Douglas' specimen, gathered in his last journey, has neither cones nor flowers, and the leaves are longer and slenderer than any other *Larix* I have ever seen.

18. *P. (Larix) microcarpa* (Du Roi); "foliis fasciculatis deciduis, strobilis subrotundis paucifloris, squamis inflexis, bracteolis ellipticis obtuse acuminatis." Lamb. *Pin.* t. 50. Ph. Am. 2. p. 645.—*Larix Americana*. Mich. N. Am. *Sylv.* 3. p. 213. t. 153.

HAB. Hudson's Bay. Ph. From York Factory to Point Lake, in lat. 65°, where it only attains a height of from 6-8 feet. Dr Richardson. Lake Huron. Dr Todd.—I should fear this can only be distinguished from the preceding by its shorter leaves and smaller cones.

I am unacquainted with the affinities of the two following species—

19. *P. Mertensiana* (Bong. *Veg. Sitcha*, p. 45); "foliis (solitariis) linearibus obtusiusculis basi in petiolum attenuatis integerrimis, squamis coni reniformibus integris."

HAB. Sitcha. Bongard.—Leaves 5 lines, and oblong cones 1½ inch, long.

20. *P. Sitchensis* (Bong. *Veg. Sitcha*, p. 45); "foliis (solitariis) linearibus subtetragonis acuminatis mucronatis, squamis coni oblongis obtusis tenuissime denticulatis."

HAB. Sitcha. Bongard.—Leaves 7-8 lines, ovate cones 1-1½ inch, long.

TAXODIUM. Richard.

1. *T. ? sempervirens* (Lamb. *Pin.* t. 64); "foliis distichis linearibus acutis perennantiibus coriaceis glabris opacis." Lamb.

HAB. N. W. Coast of America. *Menzies*.—This seems a very doubtful *Taxodium*, of which I have seen no specimen.

CUPRESSUS. L.

1. *C. thyoides* (L.); ramis patentibus tetragonis, foliis lato ovatis-acuminatis quadrifariam imbricatis dorso convexis medio tuberculatis, galbulis magnitudine pisi minoris globosis subsessilibus, squamis subumbonatis levibus. *Mich. N. Am. Sylv. 3. p. 207. t. 152.*
Ph. Am. 2. p. 646.—*Thuja sphæroidalis*. *Rich.*

HAB. Canada. *Mrs Sheppard*. Cumberland House Fort. *Drummond*.—There is but one specimen in Mr Drummond's collection, and that is mixed with *Juniperus Sabina*, with which the leaves have the greatest affinity, but from which the fruit at once distinguishes it.

2. *C. Nutkatensis* (Lamb. *Pin. n. 60. sine Ic.*); ramis suberectis tetragonis, foliis late ovatis acuminatis quadrifariam imbricatis dorso carinatis etuberculatis, galbulis magnitudine pisi majoris globosis ramos breves terminantibus, squamis umbonatis levibus.—*Thuja excelsa*. *Bong. Veget. de Sitcha*, p. 46.

HAB. N. W. Coast of America. Nutka. *Menzies*. Observatory Inlet. *Dr Scouler*. Sitcha. *Bongard* (*in Herb. nostr.*).—The branches are sometimes a little compressed. Mr Bongard's plant has the fruit of a *Cupressus*, and it is altogether the same species as that here characterized. It has a near affinity with the preceding, but that has shorter and more spreading and flatter branches, and leaves with a tubercle at the back, and smaller fruit.

THUJA. L.

1. *T. occidentalis* (L.); ramis ramulisque ancipitibus patentibus, foliis late ovatis obtusis arcte 4-fariam imbricatis intermediis planis medio tuberculo notatis, strobilis nutantibus. *Mich. N. Am. Sylv. 3. p. 226. t. 156.* *Ph. Am. 2. p. 646.*

HAB. From Lake Huron, to the Saskatchewan. *Dr Richardson*.—This is the American *Arbor Vitæ*.

2. *T. gigantea* (Nutt. *Pl. of Rocky M. p. 52*); ramis ramulisque compressis erectis, foliis ovatis acutis arcte 4-fariam imbricatis intermediis convexis puncto impresso etuberculatis, strobilis arcte reflexis.—*T. Menziesii*. *Douglas*, *mst.*—*T. plicata*. *Lamb. Pin. n. 61 (in partem)*.

HAB. North West America. *Menzies*. (*Herb. nostr.*) Common from the source of the Columbia to its confluence with the sea, and thence north to Nukta Sound. *Douglas*. *Scouler*. *Wyeth*. Wallamet. *Tolmie*.—A truly distinct species from the preceding, in the characters above given. Mr Lambert seems to have confounded it with a different species said to have been found by Don Luis Néé in New Spain: for his characters, probably taken from that species, do not agree with Mr Menzies' original specimens from Nutka, which he has nevertheless considered as the same. The branches are longer, slenderer, and more upright than in *T. occidentalis*, yet less flattened or ancipitate, of a deeper green colour. The leaves are always destitute of a tubercle, and the cones are much more drooping; in short, bearing the same relation with it, that *Cupressus Nutkatensis* does with *C. thyoides*. It attains a height of 60 to 170 feet, and 20 to 40 feet in the circumference of the trunk. *Douglas*.

JUNIPERUS. L.

1. *J. communis*. L.—*E. Bot. t. 1100.* *Ph. Am. 2. p. 647.* *Rich. App. p. 38.*—*J. nana*. L.—*E. Bot. Suppl. t. 2743.* (*J. nana*.)

HAB. Newfoundland. Lake Huron, to the barren country of the Hudson Bay Co.'s territories, and on the West Coast, as far as Sitcha. *Bongard*. Summit of Mount Rainier. *Tolmie*.— β . in the most exposed and sterile situations.

2. *J. Sabina* (L.) ; ramulorum tetragonorum foliis quadrifariam dense imbricatis ovatis acutis v. acuminatis concavis seu subcarinatis dorso basin versus glandula oblonga quandoque obsoleta instructis ; ramorum teretium foliis plerumque acerosis squamiformibus remotis appressis v. patulis, baccis nigro-pruinosis. *Mich. Am.* 2. p. 246. *Nutt.*—*Ph. Am.* 2. p. 647.—*J. Virginiana*. *L.*—*Mich. N. Am. Sylv.* p. 221. t. 155. *Ph. Am.* 2. p. 647. *Nutt.*— β . *humilis*; *procumbens*.—*J. Sabina*. β . *Willd.*—*Ph.*—*J. prostrata*. *Pers. Rich. App.* p. 38.—*J. repens*. *Nutt.*?

HAB. Throughout Canada, to the Saskatchewan.— β . in poor rocky soils, especially in the north. *Dr Richardson*. In the Rocky Mountains. *Lewis*. Lake Huron. *Nuttall*.—In Eastern America Botanists have enumerated five species of Savin-leaved Juniper; *J. Sabina* (which also abounds in Europe, and in Northern Asia), *J. Virginiana*, *J. Bermudiana*, *J. Barbadensis*, and *J. prostrata*; but I must confess that among all the specimens I have received from various countries included between the 53d and 32d degrees of latitude, I can recognise only one species by any botanical characters, and that one differs in no respect from the European *J. Sabina*, to which I unhesitatingly refer it. If there are other species, I have not seen them, and the descriptions of authors are so vague and unsatisfactory, that I have in vain sought for distinguishing marks in their characters and observations. The leaves certainly differ considerably in different specimens; but not more so than they frequently do on one and the same individual. Thus, Bigelow observes that (in *J. Virginiana*) "a singular variety appears in the young shoots, especially those which issue from the base of the trees: this consists in an elongation of the leaves to five or six times their usual length, while they become spreading, acerose, considerably remote from each other, and irregular in their insertion, being either opposite or ternate, so that they have been repeatedly mistaken for individuals of a different species." He adds too, that the leaves of *J. Virginiana* resemble *Savin* in their medicinal properties.—I may here observe that the Savin-leaved Junipers of the Old World are as unsatisfactorily characterized in books as those of the New; and equally demand a careful investigation of the Botanist. In all, upon the older branches, the leaves are elongated, acrose, and distant where the shoots have been vigorous and lengthened, short and blunt and compact, and giving a tessellated appearance, when the shoots are short and stunted.—Again, with regard to the more usual form of the American species, *J. Virginiana*, as it is generally called, (though the Linnean character does not accord with it), we can understand, from its mode of growth, why this plant, which in some situations is a tree 40 or 45 feet high, should in others become a small prostrate shrub. Michaux remarks that "the most striking peculiarity in the vegetation of it is that the branches which are numerous and close, spring near the earth, and spread horizontally, and that the lower limbs are, during many years, as long as the body of the tree. The trunk decreases so rapidly that the largest stocks rarely afford timber for ship-building of more than 11 feet in length."—Very far north, Dr Richardson tells us that "it grows close to the ground, and sends out flabelliform branches 2 yards long, which are very ornamental in thin rocky soils."

3. *J. occidentalis*; ramis ramulisque patentibus teretibus, foliis arcte 4-fariam imbricatis subrotundo-ovatis obtusis valde convexis paulo infra medium glandula oblonga conspicue resiniflue notata.—*J. excelsa*. *Dougl. mest.*—*Ph. Am.* 2. p. 647. (vix *Bieb.*)

HAB. N. W. America. Banks of the waters in the Rocky Mountains. *Lewis* (in *Ph.*) Common on the higher parts of the Columbia, at the base of the Rocky Mountains, where it attains a height of 60-80 feet, and a diameter of from 2-3 feet. *Douglas*.—Mr Douglas' collection, in my possession, contains only two specimens of this plant, without flowers or fruit. From the locality, there can scarcely be a doubt of its being the *J.*

excelsa of Pursh; but that it is the *J. excelsa* of Bieberstein, from Tauris, is a question; and indeed the latter author himself says of his plant, "diagnosis a *J. Sabina* difficillima, quamvis specie omnino differat." From *J. Sabina* our present species may be readily known by the more spreading branches and branchlets, and by both being perfectly *terete*, by the rounder and more convex leaves, and, above all, by the large gland on every leaf, constantly exuding a transparent resin, which concretes in drops upon the foliage. There are no acerose leaves on the older branches whatever, but the old leaves form lozenge-shaped scales or tubercles, with the resinous gland still very conspicuous.

TAXUS. L.

1. *T. baccata*. L.—*E. Bot. t. 746*. *Nutt. Gen. Am. p. 246*.— β . minor. *Mich. Am. 2. p. 245*.—*T. Canadensis*. *Willd. Ph. Am. 2. p. 647*. *Nutt.*

HAB. Lake Huron. *Nuttall*. Mountainous parts of N. W. America. *Douglas*. *Dr Scouler*.— β . Canada, to the Saskatchewan. *Dr Richardson*. *Drummond*. Newfoundland. *Mr Cormack*. *Miss Brenton*.—In the eastern parts, the Yew seems to form a low shrub; but on the Columbia, Mr Douglas assures us, it attains a size fully equal to that of Europe. As was the case with our ancestors, the Indians make their bows of its wood.

Stigma simplex capitatum. Germen lanceolatum compressum bialatum, dorso carinatum. Fructus: Achenium oblongum compressum, utrinque subalatum; infimum superne bidentatum.—Herba annua? aquatica, maritima? vel salsuginosa, oræ occidentalis America borealis. Radix fibrosa fibris simplicibus. Folia radicalia graminea membranacea, tenera, striata, linearia, 6-8-uncias longa, basi vaginantia, spathacea.*

1. *H. gramineus.* (TAB. CLXXXV.)

HAB. Wet plains of the Columbia. *Dr Scouler.*—This is an extremely curious plant, and certainly the type of a new genus, to which I have assigned the present name, from the remarkable circumstance of the female flowers or pistils (for they are perfectly destitute of any kind of floral covering), of the extremity of the spadix, having a short style, those about the middle a longer one, and those at the base, especially among the roots, where the spatha and the spadix have their origin, with a style two inches and more long, slender and filiform! It is to be regretted that very few specimens were preserved, and those having, as far as can be seen, only female flowers.

TAB. CLXXXV. *Fig. 1*, Spadix and spatha; *f. 2, 3, 4*, Female flowers; *f. 5*, Fruit; *f. 6*, The same laid open; *f. 7*, Seed:—*magnified*.

5. PHYLLOSPADIX. Nov. Gen.

Dioicus? MASC.?—Fœm. *Spadix e spatha curvata (foliorum basi) inclusa, canaliculata, hinc supra florifera, marginibus foliiferis, foliis seu squamis oblongis subimbricatis; floribus nudis, serie singula subimbricatis, sessilibus. Ovarium sessile, lato-ovatum, subglobosum. Stylus breviusculus, crassus. Stigma capitatum. Fructus?—Herba oræ occidentalis America borealis, aquatica, radice nodosa fibris albidis, veterum foliorum reliquiis, vestita. Caules breves vaginati. Folia linearia, elongata, graminea, subcoriacea, siccitate nigrescentia, nervosa, obscure costata, integerrima. Spatha lata, convoluta, curvata, spadicem includens.*

1. *P. Scouleri.* (TAB. CLXXXVI.)

HAB. Dundas Island in the Columbia River, N. W. America. *Dr Scouler.*—This is a second new genus of *Naïades* which has rewarded Dr Scouler's researches in the north-west shores of America. Its nearest affinity is doubtless with *Zostera*, from which the separated male flowers, the single style and stigma, and the curious leafy border to the spadix, will at once distinguish it.

TAB. CLXXXVI. *Fig. 1*, Spatha, including the spadix; *f. 2*, Side view of the spadix removed from the spatha; *f. 3*, The same, front view, the margins spread open; *f. 4*, Spatha, from which the spadix has been removed; *f. 5*, Single pistil:—*more or less magnified*.

HAB. Canada (*Ph.*), to English River; *Dr Richardson*; and from Hudson's Bay to alpine lakes in the Rocky Mountains. *Drummond*. N. W. Coast, Columbia. *Dr Scouler*.

ORD. VII. SMILACEÆ. Br.

1. SMILAX. L.

1. *S. rotundifolia* (L.); caule tereti striato flexuoso aculeato fruticoso scandente, foliis brevi-petiolatis subrotundo-ovatis acutis subtus concoloribus, umbellis paucifloris brevis-

sime petiolatis. *Ph. Am.* 1. p. 250.—*S. caduca?* and *S. quadrangularis?* *Willd.*—*Wats.* *Dendrol.* t. 109.

HAB. Canada. *Pursh. Drummond.*—This was only gathered with ripe fruit by Mr Drummond. What I have received from the United States' botanists as *S. caduca*, does not seem to differ from this species, and Dr Torrey (*in Herb. nostr.*) quotes the *S. quadrangularis* of Willd. as the same plant.

2. *S. peduncularis* (Muhl.); herbacea subsimplex, caule inermi erecto subscandente (siccate) angulato, foliis sublonge petiolatis ovato-subcordatis teneris glaberrimis sensim acuminatisimis 7-9-nervis subtus pallidioribus subglaucoscentibus, pedunculis longissimis folium longe superantibus, umbellis multifloris, ovarii loculis biovulatis. (TAB. CLXXXVII. B.)— β . foliis basi acutioribus.—*S. herbacea.* *L.*—*Bot. Mag.* t. 1920.

HAB. Canada, to Lake Winnipeg and Red River. *Douglas.*—I think it will be found that *S. herbacea* is only a var. of the present species.

TAB. CLXXXVII. B. *Fig. 1*, Female flower; *f. 2*, Ovary cut through vertically, showing two of the cells, each with two ovules.

3. *S. lasioneuron*; herbacea subsimplex, caule inermi erecto subscandente siccitate angulato, foliis cordato-rotundatis obtusis cum acuminulo 9-nerviis supra glaberrimis subtus subglaucoscentibus nervulis pilosis, pedunculis petiolum parum superantibus folio multo brevioribus, umbella multiflora. (TAB. CLXXXVII. A.)

HAB. Carlton House Fort on the Saskatchewan. *Dr Richardson.*—This is an herbaceous species, and allied to the last, though truly distinct, not only in the form of the leaves, and the downiness of the under-surface, but in the comparatively very short peduncles.

TAB. CLXXXVII. A. *S. LASIONEURON.* *Fig. 1*, Flower.

2. STREPTOPUS. Mich.

1. *S. distortus* (Mx.); foliis oblongo-ovatis amplexicaulibus marginibus nudis subtus glaucis, pedicellis elongatis distortis geniculatis, sepalis longe acuminatis reflexis, antheris acutissimis integris, stigmate truncato. (TAB. CLXXXVIII. A.)—*Ph. Am.* 1. p. 232. *Torrey.* 1. p. 353.—*S. amplexifolius.* *De Cand.*—*Uvularia.* *L.*

HAB. Canada, to the Saskatchewan, and from Newfoundland and Hudson's Bay to the Rocky Mountains, and thence to the Columbia, and north to Fort M'Laughlin and Siteha, on the N. W. coast. *Dr Richardson. Drummond. Bongard. Tolmie, &c.*—The most careful comparison of this and the European *S. amplexifolius* have satisfied me that the two plants offer no specific distinction whatever. I prefer, however, Michaux's name as much more characteristic.

TAB. CLXXXVIII. A. *S. DISTORTUS.* *Fig. 1*, Flower; *f. 2*, Outer and inner sepal, with the stamen. *f. 3*, Pistil.

2. *S. roseus* (Mx.); foliis oblongo-ovatis amplexicaulibus marginibus ciliatis subtus concoloribus, pedicellis breviusculis reflexis, sepalis angustis acuminatis apicibus patentibus, antheris apice bifidis, stigmatibus trifidis. (TAB. CLXXXVIII. B.)—*Mx. Am.* 1. p. 201. *t. 18.* *Ph. Am.* 1. p. 232. *Torrey.* 1. p. 352.—*Uvularia rosea.* *Pers.*—*Bot. Mag.* t. 1489.

HAB. From Lake Huron to the Saskatchewan. Dr Todd. Dr Richardson. Drummond. N. W. Coast, from the Columbia to lat 58°. Douglas. Tolmie. Dr Scouler. Bonnard.—Readily distinguished from the preceding by the ciliation, and by the colour of the under surface, by the shorter and not peculiarly distorted pedicels, and by the smaller flowers, with narrower, more erect, and more distinctly placed sepals; and especially by the bifid anthers and trifid stigma, in which latter particular it seems to connect this genus with the following.

TAB. CLXXXVIII. B. Fig. 1, Flower; f. 2, Sepal and stamen; f. 3, pistil:—magnified.

3. UVULARIA. L.

1. *U. lanuginosa* (Pers.); foliis ovatis acuminatis sessilibus impunctatis ciliatis inferioribus amplexantibus junioribus subtus pedunculisque binis terminalibus pubescentibus, perianthii basi acuta foliolis linear-lanceolatis, stylo glaberrimo. Ker. Bot. Mag. t. 1409.—*Streptopus lanugin.* Mx.—Ph. Am. 1. p. 232. Torrey. 1. p. 353.—*Uvularia puberula.* Rich. App. p. 10, cum descr. (certe) an Mich. Am. 1. p. 199?— β . major; foliis majoribus basi cordatis amplexantibus sepalisque obtusissimis distincte reticulatim venosis.

HAB. Woody country, Lake Winnipeg, to the Rocky Mountains. Dr Richardson. Drummond.—Columbia River, N. W. Coast. Tolmie. Gairdner.— β . Between Norway House and Cumberland House Fort. Dr Richardson.—This plant is certainly rather an *Uvularia* than a *Streptopus*; and, besides the following, there are several nearly allied species in Northern India, such as *Uvularia Hamiltoniana* and *U. calcarata*, &c. of Wallich. The stem in all is rather tall, dichotomously branched, the leaves broad, distichous, the flowers more or less drooping, more or less clustered, and terminal; the sepals nectariferous, the anthers oblong obtuse, the stigma trifid. What Michaux's *Uvularia puberula* is, I am unable to say, probably, as Dr Richardson conceives, the present plant; but Michaux says, "affinis *U. sessilifolia*," which is certainly not the case with our plant. Sir James Smith confounded it with the following species, from the shores of the Pacific.

2. *U. Smithii*; foliis ovatis acuminatis sessilibus nitidis punctatis ciliatis glabris junioribus subtus ad nervos puberulis, pedunculis terminalibus binis styloque pubescentibus, perianthii basi lata truncata foliolis lanceolatis. (TAB. CLXXXIX.)—*U. puberula.* Sm. in Rees. Cycl. (not Mich.)

HAB. Nutka Sound. Mr Menzies. Dr Scouler.—This appears to be a very distinct species in the flowers, of which we find a remarkable approach to the *U. calcarata*, where the base of each sepal forms a nectariferous spur, while in ours it forms an angle, thus giving the peculiar truncated appearance to the base of the flower. The leaves are shining, very pellucid, beautifully reticulated with transverse veins, and marked all over, and on both sides, with small brown dots. It is probably rare. I possess but one specimen from each of the above travellers; but I must observe, that the species of this genus appear liable to much variation; and some of the western specimens of *U. lanuginosa* are a little more obtuse than usual at the base, and a little downy at the lower part of the style.

TAB. CLXXXIX. Fig. 1, Portion of a leaf; f. 2, Sepal and stamen; f. 3, Pistil:—magnified.

3. *U. perfoliata* (L.); foliis perfoliatis ellipticis cum acuminulo, flore terminali solitario pendulo, perianthio campanulato intus papilloso, antheris acutis. Sm. Ex. Fl. 1. p. 95. t. 49. Ph. Am. 1. p. 281. Bot. Mag. t. 955.—*U. perfoliata, minor.* Mx. Am. 1. p. 190.

HAB. Canada. Pursh.—I possess garden specimens of this species, which appear distinct, and others from Boston, United States; but I have received none from Canada, or any part of British N. America.

4. *U. grandiflora* (Sm.) ; foliis perfoliatis elliptico-oblongis acutis, flore terminali solitario pendulo, perianthio longe campanulato intus nudo, lacinias acuminatis, antheris longe linearibus obtusis. *Sm. Ex. Fl.* p. 99. t. 51. *Bot. Mag.* t. 1212. *Ph. Am.* 1. p. 891.—*U. perfoliata, major.* *Mx. Am.* 1. p. 199.—*U. lanceolata.* *Willd.*

HAB. Lake Huron, to the Saskatchewan. *Dr Todd.* *Dr Richardson.* *Drummond.*—The much longer and more acuminate and yellower sepals, free from papillæ, and the very long and obtuse anthers, will readily distinguish this from the preceding. The *U. flava*, Sm. (*Ex. Fl.* t. 50), from Carolina, however, seems almost intermediate, having larger and longer and yellower flowers, like the present, and papillose sepals and pointed short anthers, like the former.

5. *U. sessilifolia* (L.) ; foliis sessilibus oblongo-subovatis acutis, flore terminali solitario pendulo, perianthio oblongo-campanulato intus laevi lacinias obtusis, antheris linearibus obtusis. *Sm. Ex. Fl.* 1. p. 101. t. 52. *Mx. Am.* 1. p. 199. *Ph. Am.* 1. p. 233.

HAB. Now Brunswick (*Mr Kendall*), and throughout Canada to the Saskatchewan. *Dr Richardson.* *Mr Drummond.*

4. SMILACINA. Desf.

1. *S. borealis* (Gawl. *Bot. Mag.* t. 1403) ; foliis subradicalibus obovato-oblongis acutis plerunque ciliatis, scapo glabro folia longe superante umbella pauci-(3-6)-flora ebracteata, perianthii campanulati nutantis lacinias lanceolatis. *Ph. Am.* 1. p. 232.—*Dracæna borealis.* *Ait. Kew. ed.* 1. t. 5.

HAB. New Brunswick. *Dr Todd.* Newfoundland. *Dr Morrison.* Canada. *Pursh.* *Mrs Percival;* to the Saskatchewan. *Dr Richardson.* *Drummond.*—Flowers yellowsish-green.—This is very different from the *S. umbellata* (Mx.), which has much smaller and more copious white flowers, whith spreading obovate sepals, and was gathered by Mr Drummond in the Alleghanies, where Michaux first discovered it; but its northern boundary is within the States.

2. *S. uniflora* (Menz. *mst.*) ; foliis subradicalibus 2-3 obovato-lanceolatis acutis subtus margine pilosis, scapo pubescente unifloro longitudine foliorum, perianthii hirsuti latocampatali erecti lacinias obovato-lanceolatis. (*TAB. CXC.*)—*S. borealis.* *β. uniflora.* *Roem. Syst. Veget.* v. 7. p. 307.

HAB. N. W. America, from Fort Vancouver to Observatory Inlet, and on mountains of the interior. *Mr Menzies.* *Douglas.* *Dr Scouler.* *Tolmie.*—An extremely different species from the last, much smaller, with narrower foliage, and a solitary flower almost twice the size of that of *S. borealis*, and much more hairy. The berries are, when recent, of a fine rich blue colour (*Douglas*). Root very long, and stoloniferous.

TAB. CXC. *Fig. 1.* Sepal and stamen ; *f. 2.* Pistil.—*magnified.*

3. *S. trifolia* (Desf.) ; caule alterne trifoliato, foliis oblongo-lanceolatis acutis basi angustata amplexantibus, racemo simplici terminali laxo. *Ph. Am.* 1. p. 233.—*Convallaria.* *L.*—*Torrey.* 1. p. 354. *Gmel. Sib.* 1. t. 6.

HAB. Swamps throughout Canada, to Bear Lake and the Rocky Mountains. *Dr Richardson.* *Drummond.* Newfoundland. *Mr Cormack.* Labrador. *Miss Brenton.*—This is certainly the same as the Siberian plant of the same name.

4. *S. stellata* (Desf.); caule alterne plurifoliato, foliis ovali-lanceolatis acutis basi subrotundatis, racemo simplici terminali. *Ph. Am.* 1. p. 232.—*Convallaria*. *L.*—*Torrey*, 1. p. 354. *Bot. Mag.* t. 1043.

HAB. From Lake Huron to the Saskatchewan, and from Hudson's Bay (*Dr Wright*) to the Rocky Mountains. *Dr Richardson*, *Drummond*, N. W. Coast and interior. *Douglas*, *Tolmie*, *Dr Scouler*.—The berries are esteemed poisonous; the root is employed as an emetic. (*Richardson*.)

5. *S. racemosa* (Desf.); caule alterne plurifoliato, foliis sessilibus oblongo-ovalibus acuminate, racemo terminali composito. *Ph. Am.* 1. p. 234.—*Convallaria*. *L.*—*Torrey*, 1. p. 354. *Bot. Mag.* t. 899.

HAB. Throughout Canada to the Saskatchewan and the Rocky Mountains. *Dr Richardson*, *Drummond*, N. W. America. *Dr Scouler*.—More or less pubescent. The largest of the N. American species (the leaves a span and more long), with the smallest and most copious flowers.

5. *S. bifolia* (Roem.); caule alterne bi-trifoliato, foliis ovato-cordatis sessilibus vel petiolatis, racemo simplici terminali, floribus tetrandris tetraspelinis.—*Convallaria*. *L.*—*Mich.*—*Bot. Mag.* t. 510. *Torrey*, 1. p. 233.—*Maianthemum Canadense*. *Desf.*—*Convall.* *Canad.* *Ph. Am.* 1. p. 233.

HAB. Throughout Canada to Bear Lake; and from Hudson's Bay and Newfoundland to the Rocky Mountains. N. W. America, frequent. *Douglas*, *Dr Scouler*, *Tolmie*.—A very common and a variable plant. More or less downy or glabrous. Leaves sessile or petiolate, (in some of the specimens from Fort Simpson and from Sitcha, on the N. W. coast, the petiole is 3-4 inches long,*) broadly cordate or narrow ovato-cordate. There is no reason whatever for considering the American plant different from the European one.

5. POLYGONATUM. *Desf.*

1. *P. multiflorum*, *Desf.*—*Convallaria*. *L.*—*E. Bot.* t. 279.— β . *Americanum*; floribus brevioribus foliis subtus plerumque pubescens.—*Convallaria multiflora*. *Ph. Elliott*, *Torrey*.—*P. pubescens*, *P. canaliculatum*, *P. hirtum*, *P. latifolium*, and *P. angustifolium*, of *Ph.* (*Convallaria alior.*), may perhaps all be safely referred to this.

HAB. Canada, *Pursh*, to the Saskatchewan. *Dr Richardson*, *Lady Dulhousie*.—All the specimens of *Polygonatum* that I have received, under very different names, from the United States botanists, it appears to me, are referable to the European *P. multiflorum*: but the leaves are generally downy beneath, and the flowers are certainly shorter and greener, not so slender in proportion to their length, nor so much contracted near the middle (more cylindrical), as in the European specimen. In the dried specimens, the rounded succulent stem, from shrinking, becomes more or less angular or channelled, whence seems to have arisen the *P. canaliculatum* of Muhlenberg. The *P. angustifolium* (*C. biflora*, *Walt.* and *Torrey*) is only a narrow leaved var.—The single specimen found at the Saskatchewan is in fruit, and is quite glabrous on both sides of the foliage.

* This is *S. bifolia*, var. *Kamtschatica* of Bongard in *Herb. nostr.*, and appears to be pretty constant to its character in the very northern regions, both on the Asiatic and American side. I have the same from Kamtschatka, from Pallas' Herbarium.

ORD. VIII. MELANTHACEÆ. Br. Lindl.

1. LEIMANTHIUM. Willd.

1. *L. hybridum* (Roem.); panicula racemosa elongata, sepalis orbicularibus undulatis longe unguiculatis, glandulis connatis. *Gray. Melanth. Am. Sept. Rev.* p. 116.—*Melan-*
thium hybrilum. Walt.—Ph. Am. I. p. 242. Torrey. I. p. 367. Nuttall.—M. racemosum.
Mich.

HAB. Upper Canada. *Mr Goldie* (*in Herb. nostr.*)—Nuttall describes the leaves as elliptic-oblong: Torrey, as they are in our specimens, long and linear.

2. *L. Nuttallii*; racemo compacto denum elongato, bracteis subulato-lanceolatis basi membranaceis pedicellos floriferos superantibus, sepalis ovatis undulatis unguiculatis, foliis linearibus conduplicatis marginibus scaberrimis, bulbo tunicato.—*Amianthium Nuttallii. Gray. I. c. p. 123.—Helonias angustifolia. Nutt. (non Mx.) and H. paniculata.*
Nutt. (sive Gray.)

HAB. N. W. Coast. *Menries.* Common both to the north and south of the Columbia, on dry gravelly soils. *Douglas. Dr Scouler. Tolmie. Dr Gairdner.*—"Poison or Death Camass" of the Cherokees, from the violent effects of the roots, which create vomiting. Bulb about the size of a chestnut. Stem 1-2 foot high, sparingly leafy. Pedicels much elongated, erect after flowering. Capsules (of three slightly combined follicles) half an inch and more long, oblong-triangular, surrounded at the base with the withered perianth, and terminated by the three nearly erect persistent styles, opening at the top between the styles. Seeds, about two perfect ones in each cell, oblong somewhat 3-angular, the angles almost forming wings. The sepals are distinctly clawed, and at the top of the claw is a depression, where the sides, lapping over a little, give the appearance of two small scales: but the nectary is rather a depression than an appendage. The habit of the plant is extremely like that of *Helonias angustifolia*, but the sepals are of a very different structure.

2. ZIGADENUS. Mich.

1. *Z. chloranthus* (Rich. App. p. 12); scapo pauci-folioso, racemo subsimplici, sepalis obovatis obtusis, glandula obcordata profunde emarginata.—*Z. commutatus. Schult. Syst. Veget. I. p. 1500. Hook. et Arn. in Bot. of Beech. p. 161.—Z. glaberrimus. Ker, Bot. Mag. t. 1680. (not Mich.)—Z. glaucus? Nutt. Pl. of Rocky M. p. 56. Gray. I. c. p. 113.—Melanthium glaucum? Nutt. Gen. I. p. 232.—Z. major; foliis longioribus, scapo paniculato.—Z. speciosus. Dougl. mat.—Z. glaberrimus. Hook. et Arn. in Bot. of Beech. p. 160. (not Mich.)*

HAB. Upper Canada. *Nuttall*? *Goldie*; to Great Bear Lake, and to the Rocky Mountains. *Dr Richardson. Drummond.*— β . Rocky Mountains (with α), and to the valleys on the west side. *Drummond. Douglas. Murray Bay, Canada. Mrs Sheppard.*—(To this var. I would refer the Californian *Z. glaberrimus* of the Bot. of Beechey's Voy.)—I am quite satisfied that the *Z. glaberrimus* of Bot. Mag. is this plant, and that it is a very distinct species from the real *glaberrimus* of Mx., of which I have Georgian specimens from Dr Torrey, in which the sepals are ovo-lanceolate, and the two glands are apart from each other and very conspicuous: here they are combined into one obcordate gland. The species is, however, liable to considerable variation in the size, in the more or less leafy stem, in the length of the leaves, and in the more or less paniculated raceme. I do not know whether to infer from the following remark of Nuttall that he

considers the *Z. chloranthus* to be identical with his *Z. glaucus* or not. "Why," he says, "this species (*Z. glaucus*) should have been changed to the name of *chloranthus*, by Richardson, I am at a loss to conceive, since the flower is more white than any other colour." He does not, however, adduce it as a synonym: and further remarks—"the northern plant is probably something different."

2. *Z. elegans* (Ph.); scapo subnudo, bracteis linearibus, petalis acutis. *Ph. Am.* I. p. 241.

Hab. Waters of Cokablaishkit River, near the Rocky Mountains. *M. Lewis* (in Ph.). In the valleys of the Rocky Mountains, near the sources of the Columbia, and on the banks of the Saskatchewan and Red Rivers. (?) *Douglas*, *n.s.t.*—I have no specimen in Mr Douglas' collection, but there can scarcely be a question that his plant is *Z. chloranthus*, whatever Pursh's may be.

3. *Z. glaucus* (Nutt. in *Pl. of Rocky M.* p. 56); "bulbo tunicato, foliis glaucis gramineis marginatis, racemo plerumque simplici paucifloro, floribus hermaphroditis, petalis rotundatis unguiculatis bimaculatis, seminibus subulato-alatis."—*Melanthium glaucum*. *Nutt. Gen. Am.*, 1. p. 232.

Hab. Banks of the St Lawrence, around the Cataract of Niagara, and on the borders of Lakes Erie and Huron. *Nuttall*.—This seems to be only known to Mr Nuttall, if it be really distinct from *Z. chloranthus*.

3. XEROHYLLUM. *Mich.*

1. *X. tenax* (Ph.); foliis longissimis tenacissimis linearis-acuminatisimis marginibus scabris subtus glaucis, racemis longissimis densifloris, pedicellis erectis, filamentis filiformibus perianthium superantibus, bracteis membranaceis. *Ph. Am.* I. p. 243. t. 9. *Gray. l. c. p. 129.*—*X. setifolium*. *Lindl. Bot. Reg. t. 1613.* (vix *Mx.*)

Hab. High lands of the Rocky Mountains (*M. Lewis*), and summits of the hills around Mount Hood, Mount St Helens, and the Cascade Mountains. *Douglas*. Near the summit of Mount Rainier. *Tolmie*.—Stem 2-4 feet high. Leaves 2-3 feet long, drooping, chiefly from the root: having, as Mr Douglas remarks, the habit of *Bonaparteja juncea*. It is one of the greatest ornaments of the western mountains, and the natives make baskets, hats, pouches, bags, bottles, mats for sleeping on, &c., of its strong foliage. Racemes a foot and more long. Capsules trianguli-orbiculari, 3-celled, 3-seeded, seeds oblong, triangular, and somewhat winged at the angles.

4. HELONIAS. *Linn.*

1. *H. dioica*. *Ph. Am.* I. p. 243. *Gray. l. c. p. 132.*—*H. lutea*. *Ait.*—*Bot. Mag. t. 1062.*—*H. pumila*. *Jacq.*—*Veratrum luteum*. *L.*

Hab. Canada. *Gray.*

5. VERATRUM. *L.*

1. *V. viride*. *Ait. Hort. Kew. ed. 1. v. 3. p. 422.* *Ph. Am.* I. p. 242. *Gray. l. c. p. 118.*—*V. album*. *Mich. Am.* 2. p. 249. (an *Linn.*?)—*Helonias viridis*. *Bot. Mag. t. 1096.*—*V. parviflorum*. *Bong. Veg. de Sitcha*, p. 48. vix *Mx.*—*V. Lobelianum*. β . *Eschscholzianum*. *Schult. Syst. Veg. v. 7. p. 1555.*—*V. Eschscholzii*. *Gray. l. c. p. 119.*

Hab. Canada, to the Saskatchewan and the Rocky Mountains. *Drummond*; and from the Columbia on the west side to Stikine. *Douglas*. *Dr Scouler*. *Tolmie*. *Dr Gairdner*.—The north-western plant is the same as the eastern one; and probably the *V. Lobelianum*, β . *Schultz* (*V. parviflorum*, *Bong.*), from Nor-

folk Sound, and from Sitcha, is merely a small flowered variety. The original *V. parviflorum* is a Carolina plant. Again, the *V. angustifolium* of Pursh (foliis longissimis linearibus carinatis), of which the original specimens are from the high mountains of Virginia and Carolina, that author has, in his Suppl., considered to be also a native of Canada, because he found a specimen in Sherard's herbarium, marked "Phalangium Canadense," &c.; but this, I fear, is not alone sufficient authority for introducing it into a Flora of British America. I have a Mexican *Veratrum* (*V. officinale*, Klotzsch, mat.) which, in the foliage, well agrees with Pursh's *V. angustifolia*. Perhaps the *V. viride* is not really distinct from the European *V. album*. Gawler says the sepals are broader; but they vary in the American plant considerably.

6. TOFIELDIA. Huds.

1. *T. palustris* (Huds.); racemo ovato denso, floribus fructibusque erectis, pedicellis ad basin tribracteolatis, scapo nudo vel raro inferne subunifoliato. *E. Bot. t. 536.*
Gray. l. c. p. 184.—*T. borealis*. *Wahl.*—*T. pusilla?* *Ph. Am. 1. p. 246.*

HAB. Labrador (*Dr Morrison*), and Hudson's Bay to Bear Lake Rivers; in the north, and to the Rocky Mountains. *Dr Richardson. Drummond.* Lake Mistassini? *Ph.*—Flowers pale yellowish-white.

2. *T. coccinea* (Rich. *App. p. 11*); racemo spicato ovato-globoso, floribus subsessili- bus, fructibus arte reflexis involucratis, involucro triphylo, scapo bi-trifoliato folio unico supra medium. *Hook. et Arn. in Bot. of Beech. p. 130. t. 30* (29 in text, by mistake). *Gray. l. c. p. 135.*—*T. borealis*. *Cham. in Linnaea. 6. p. 584 (non Wahl.).*— β . *major*; pedicellis longioribus involuci foliolis alternis.

HAB. a. Barren grounds from lat. 64° to the shores of the Arctic Sea; about Jasper's Lake on the Rocky Mountains, and on the west coast, north of lat. 58°, to Unalashka. *Mr Menzies. Nelson. Dr Richardson. Drummond. Chamiso.*— β . Mackenzie River. *Dr Richardson.*—This plant is readily known from the preceding by its more glaucous leaves and leafy scape; by the sessile flowers, deeply tinged with red, and the larger bracts, which form a complete involucre beneath the flower; and, above all, by the singularly de- flexed dark-purple fruit. I possess it from Siberia, from Pallas' herbarium, where it is mixed with *T. palustris*, though most assuredly a totally distinct species. The var. with more elongated pedicels, of which only two specimens were gathered by Dr Richardson on the Mackenzie River, must not be confounded with *T. cernua*, Sm., a plant of Gmelin, which has the flowers drooping but the fruit erect; but it is the same with "*S. cernua?* Sm." of Turczaninow, in *Herb. nostr.*, gathered "in alpe Kawoktu," in Siberia.

3. *T. glutinosa* (*Ph.*); racemo coarctato, pedicellis 1-3-nis basi tribracteatis superne calyculo seu involucro monophyllo obscure trifido sub flore, scapo parce folioso apice pedicellisque glanduloso-scabris. (*TAB. CXCI.*)—*Ph. Am. 1. p. 246.* *Sm. l. c. p. 246.*
Gray. l. c. p. 138.—*Narthecium glutinosum*. *Mz. Am. 1. p. 210. t. 8. f. 2.*

HAB. Throughout Canada, to Hudson's Bay and Bear Lake, *Dr Richardson*, and to the Rocky Mountains. *Drummond. N. W. Const. Menzies. Stikine and Sitcha. Bongard. Tolmie.*—I doubt if the *T. pubens* of the United States be really different from this, except in the less viscid or not viscid glands.

TAB. CXCI. Fig. 1, Flowers:—magnified; f. 2, Raceme of capsules:—nat. size; f. 3, Young cap- sule; f. 4, Single ripe capsule:—magnified.

7. MEDEOLA. L.

1. *M. Virginica*. *L.*—*Ph. Am. 1. p. 244. Bot. Mag. t. 1316.*—*Gyromia. Nutt. Torr.*

HAB. Canada. New Brunswick. *Mr Kendal.*

8. TRILLIUM. L.

1. *T. petiolatum* (*Ph. Am.* l. p. 244); foliis cordatis obtusis longe petiolatis, flore sessili, petiolis sepalsque lanceolatis erecto-patentibus, caule per breve vaginato. (*TAB. CXII.*)

Hab. N. W. America. Waters of the Koos-kooesky. *M. Lewis.* Common on the springy banks of the Spokane River, near its confluence with the Columbia. *Douglas.*—This is the most distinct of all the species, remarkable for its cordate, net rhomboidal leaves, and the great length of the petioles. In the structure of the flowers it comes nearest to *T. sessile*; but the sepals are nearly as long as the petals, and more erect. Petals dark purple.

TAB. CXII.. *Fig. 1.*, Petal; *f. 2.*, Stamens and pistil:—*magnified*.

2. *T. erythrocarpum*. *Mich. Am.* l. p. 216. *Hook. Bot. Mag.* t. 3002 (*not Gawl.* t. 855).—*T. pictum*. *Ph.*

Hab. Canada.—Readily distinguished by the short but distinct petiole to the leaves.

3. *T. ovatum* (*Ph. Am.* l. p. 249); pedunculo erecto, petalis (pallide purpureis) oblongis calyce linearis paulo longioribus, foliis ovatis sensim acutis arcte sessilibus.

Hab. Columbia River. *M. Lewis.* Woods about Fort Vancouver. *Dr Gairdner. Douglas,* whose specimens have pale purple flowers, and quite answer to Pursh's character.

4. *T. cernuum*. *L.*—*Ph. Am.* l. p. 249. *Bot. Mag.* t. 945.

Hab. Canada. *Kalm.* Nova Scotia. *Menzies.* Newfoundland. *Mr Cormack;* and from the Saskatchewan to Mackenzie River. *Dr Richardson. Drummond.*

5. *T. erectum*, *L.*— α . flore atro-purpureo. *Ph. Am.* l. p. 245. *Bot. Mag.* t. 470. *T. rhomboideum. Mx.*— β . petalis albis. *Mx. Am. l. c. Bot. Mag.* t. 1027.— γ . petalis ochroleucis. *Hook. Bot. Mag.* t. 3250.—*T. pendulum. Willd.*

Hab. α . Lake Huron, and throughout Canada, frequent.— β . Canada. *Mrs Sheppard. Mrs Percival.*— γ . Canada. *Mr Cleghorn.*

6. *T. obovatum* (*Ph. Am.* l. p. 245); pedunculo erecto, petalis obovatis obtusiusculis planis patentibus calyce vix longioribus et latioribus, foliis ovato-rhombeis acuminatis arcte sessilibus. *Ph. l. c.*—*Hook. et Arn. in Bot. of Beech.* p. 117. *Reichenb. Hort. Bot.* l. p. 21. t. 29.—*T. Kamtschaticum. Pall. Herb.*

Hab. Canada. (?) *Ph.* Columbia; about Fort Vancouver, abundant. *Tohnit.*—The original plant is from Kamtschatka, and our Columbia specimens quite agree with them: but I have not seen any Canadian specimens that can exactly be referred to it. At the same time, I am not sure if this be permanently distinct from *T. grandiflorum*.

7. *T. grandiflorum*. *Salisb. Parad. Lond.* t. 1. (*excl. Syn.*) *Ph. Am.* l. p. 246.—*T. erythrocarpum. Bot. Mag.* t. 855. (*non Mx.*)—*T. rhomboideum. var. grandiflorum. Mx.*

Hab. Lake Huron and throughout Canada. New Brunswick. *Mr Kendal.* Columbia River, N. W. Coast. *Douglas. Dr Scouler.*

ORD. IX. LILIACEÆ. Juss.

1. LILIUM. L.

1. *L. Philadelphicum*. *L.*—*Ph. Am.* 1. p. 229. *Bot. Mag.* t. 519.— β . floribus 2-4 subumbellatis.

HAB. Lake Huron (*Dr Todd*), throughout Canada to the Saskatchewan and Prairies of the Rocky Mountains. *Dr Richardson. Drummond.*— β . Observatory Inlet, on the N. W. Coast. *Dr Scouler.*

2. *L. Canadense*. *L.*—*Ph. Am.* 1. p. 229.— α . uniflorum. *Bot. Mag.* t. 229.— β . pluriflorum. *Bot. Mag.* t. 858.— γ . parviflorum.

HAB. α , β . Canada.— γ . N. W. Coast. Columbia and Walamet Rivers. *Douglas. Tolmie.*—My N. W. American specimens have much smaller flowers, of a redder hue, and are more disposed to be revolute; yet I dare not venture upon making them distinct. One specimen of this var. has the leaves very broad and obtuse.

3. *L. superbum*. *L.*—*Ph. Am.* p. 230. *Bot. Mag.* t. 936.— β . uniflorum. *L. Carolinianum*. *Ph.?*—*Bot. Reg.* t. 580.

HAB. Canada. *Ph.*— β . Saskatchewan. *Dr Richardson.*—Of the α , a single flowering specimen only was found. Its leaves are an inch broad: the flowers exactly agreeing with the figure of *L. Carolinianum* in *Bot. Reg.* above quoted, except in being rather more spotted. Are the two really distinct?

2. FRITILLARIA. L.

1. *F. Kamtschatcensis* (Fisch. in *Herb. nostr.*); radice omnino granulata, foliis verticillatis subquaternis lato-lanceolatis tenui-membranaceis supremis oppositis solitariisve, floribus terminalibus 1-2 cernuis unicoloribus, sepalis lato-lanceolatis arcte nervosis nervis lamellatis glandulosisque, capsulis obtuse 5-angulatis. (TAB. CXCIII. A.)—*Lilium Kamtschatcense. L.*—*Lamb. in Linn. Trans. v. x. t. 12. Hook. et Arn. in Bot. of Beech.* p. 118.—*L. quadrifoliatum. Meyer in Reliq. Hænk. Fasc. 2. p. 126.*

HAB. N. W. Coast, on the beach. Observatory Inlet, to Stikine Sound, Sitcha, and Unalaschka. *Chamiso. Dr Scouler. Tolmie. Bongard.*—Both in this and the following species there is an evident elongated depression or nectary near the base of each sepal, the stigma is trifid, and the habit is altogether that of a *Fritillary*, rather than of any *Lilium*. Voyagers to Kamtschatka (where this species seems more abundant than on the American coast) bring home small white granulated esculent roots, dried on strings; these are the bitter tubers of this *Fritillary*, which are also copiously eaten by the Indians of Stikine, and known by the names of Koch or N. W. Rice; but Mr Tolmie says they are bitter and nauseous.

TAB. CXCIII. A. Fig. 1, Sepal and stamen of *FATILLARIA KAMTSCHATCENSIS*; f. 3, A lamella from the sepal:—magnified; f. 8, capsule:—nat. size.

2. *F. lanceolata* (*Ph. Am.* 1. p. 230. excl. syn.); radice bulbo parvo bulbillifero, foliis verticillatis subquaternis anguste lanceolatis crassiusculis supremis oppositis solitariisve, floribus terminalibus 1-2 cernuis luteo purpureo-que tessellatis, sepalis obovato-oblongis laxe nervosis elamellatis, capsulis profunde 5-alatis. (TAB. CXCIII.)—*Lilium affine. Schult. Syst. Veget.* 7. p. 400.

HAB. Head waters of the Missouri and Columbia. *M. Lewis* (*in Ph.*). Nutka Sound. *Menzies*. Fort Vancouver on the Columbia. *Douglas*. *Tolmie*.—Habit of the preceding, but smaller and of a more rigid texture throughout. Leaves much narrower. Flowers tessellated. Sepals with much laxer nervation, the nerves quite destitute of lamellæ and glands. Capsule and roots also exceedingly different.

TAB. CXCIII. B. *FATILLARIA LANCEOLATA*. *Fig. 1*, Sepal and stamen; *f. 2*, Pistil:—*magnified*; *f. 3*, Capsule:—*nat. size*.

3. *F. ? pudica*; foliis alternis linear-lanceolatis, flore terminali solitario pendulo campanulato, sepalis obovato-spathulatis sessilibus, stigmate integro.—*Lilium pudicum*. *Ph. Am.* 1. p. 228. t. 8.

HAB. Head waters of the Missouri. *M. Lewis*. Common on the banks of streams from the Great Falls of the Columbia, to the valleys of the mountains near the source of the Missouri. *Douglas*.—Habit of *Fritillaria*, and the sepals have an obscure nectary; but the stigma is simple. Perhaps it should form a distinct genus, which might include *F. Fleischeri*, Stend. et Hochst. from Smyrna, and *F. tulipiflora*, Bieb., which have altogether the habit of the present plant.—A small and very graceful species, with a solitary terminal very drooping flower, according to Pursh of a pale yellow colour.

3. ERYTHRIONUM. L.

1. *E. Americanum* (*Gawl. Bot. Mag.* t. 1113); foliis oblongo-seu elliptico-lanceolatis punctatis, pedunculo unifloro, sepalis oblongo-lanceolatis obtusis ad medium reflexis, stylo clavato trigono, stigmate triangulari integro.—*E. Dens Canis*, var. *Mx.*—*Willd.*—*E. lanceolatum*. *Ph. Am.* 1. p. 230.—*E. flavum*. *Sm. in Rees. Cycl.*

HAB. Canada, frequent.—Leaves distinctly dotted with minute papillæ, which are indistinct or wholly wanting in the following species. What I have for *E. albidum*, Ph., from Drs Beck and Torrey, seems merely a white-flowered var. of this, with less conspicuous papillæ on the leaves.*

2. *E. grandiflorum* (*Ph.*); foliis oblongo-seu elliptico-lanceolatis vix punctatis, pedunculo 1-paucifloro, sepalis lanceolatis valde acuminatis fere ab ima basi reflexis, stigmate tripartito.—*a. minor*; caule unifloro, flore flavo.—*E. grandiflorum*. *Ph. Am.* 1. p. 231. *Lindl. Bot. Reg.* t. 1786.—*B. giganteum*; caule 2-5-floro, floribus flavis.—*E. giganteum*. *Lindl. l. c. ad calcem*.—*y. albiflorum*; caule elatiori unifloro, flore albo.—*δ. Smithii*; caule elato unifloro, flore purpureo-roseo.—*E. revolutum*. *Sm. in Rees. Cycl.*

HAB. *a.* N. W. America. Banks of Koos-koosky River. *M. Lewis*.—*a.* and *β.* Summit of the low hills near the junction of Spokane River with the Columbia, and in the valleys west of the Rocky mountains, often in blossom before the snow has disappeared. *Douglas*.—*γ.* Fort Vancouver. *Menzies*.—It will be seen that the indefatigable and venerable Menzies was the first to discover this fine and very distinct species, though he only appears to have found a pale purple-flowered variety. Specimens in my collection bear from 1 to 4 flowers, and they are so described in Douglas ms. The colour of the blossom seems very variable.

* I possess from Dr Boott a very remarkable state of this plant, or a distinct species, from Vermont, U. S., *E. bracteatum*, Boott, ms. The leaves are lanceolate, and taper gradually into the foot-stalk. The flower is small ($\frac{3}{4}$ of an inch long), greenish, and there is a bractea on the peduncle, indicating a disposition to bear more than one flower. Only one specimen was found.

4. CALOCHORTUS. Ph.

Flores erecti, explanati, patentes. Sepala glabra, convoluto-acuminata. Pet. majora, rotundata, plana, medio barbata, basi maculata glabra. Stylus 0. Stigmata 3. Caps. triangularis, coriacea. Semina serie simplici affixa, plana, testa suberosa.—Bulbi tunici, foliis convoluto-acuminatis rigidis. Lindl.

1. *C. macrocarpus* (Dougl. *Hort. Trans.* 7. p. 276. t. 8); caule 3-5-phyllo bifloro, petalis præter fasciculum pilorum glabris, capsulis erectis linearis-oblongis. *Lindl. Bot. Reg. t. 1152.*

HAB. N. W. Interior. Great Falls and southern branches of the Columbia. *Douglas.*—One of the most lovely of plants; flowers large purple.

2. *C. nitidus* (Dougl. *Hort. Trans.* 7. p. 277. t. 9. A); caule 2-3-phyllo quadrifloro, petalis interioribus præter pilorum fasciculum sparse lanatis, capsulis erectis ovalibus.

HAB. N. W. Interior. Vallies of the Blue Mountains, and mountainous district of the Columbia, and about Spokane River. *Douglas.*

3. *C. elegans* (Ph. Am. 1. p. 240); caule 1-folio 1-5-floro, petalis interioribus obovatis intus toto pilosis, floribus subcernuis.—*Cyclobothria elegans.* Benth. *Lindl.*— $\alpha.$ minor; caule unifloro. *Dougl.* in *Hort. Trans.* v. 7. t. 9. B. (*left-hand figure.*)— $\beta.$ major; caule 3-5-floro. *Dougl. l. c. t. 9. B.* (*right-hand figure.*)

HAB. $\alpha.$ Recesses of the Rocky Mountains, near the regions of perpetual snow. *Douglas.*— $\beta.$ In the vallies of the Columbia. *Douglas.* Banks of the Wallamet. *Tohnie.*—My specimens from the Wallamet agree with the larger variety of Mr Douglas, but are still larger, a foot high, and with flowers full twice the size of $\alpha.$ In other respects the two plants accord. The blossoms appear white, with a bluish tinge. Mr Bentham refers this to *Cyclobothria* of Sweet: but it appears to me, if the two genera are to be kept separate, that this is more naturally allied to *Calochortus*. The flowers can scarcely be called drooping, and the seeds, which are said to differ in the two genera, are not known in this plant. But be that as it may, the name *Calochortus* must be retained to the present species, being the very one on which the genus was founded.

ORD. X. ASPHODELEÆ. L.

1. ANTHERICUM. L.

1. *A. serotinum.* L.—*E. Bot.* t. 793.—*Lloydia. Salisb. Lindl.*—*Nectarobothrium. Ledeb.*—*Rhabdoecrinum. Reich.*

HAB. Unalashka. *Chamisso* (*in Herb. nostr.*). Northern Arctic Coast, rare. *Dr Richardson.*—Only four specimens were gathered by Dr Richardson, and the flowers varied from 1-3 on a stem.

2. ALLIUM. L.

1. *A. striatum.* Jacq. *Ic. Rec.* 2. t. 366. *Bot. Mag.* t. 1035. and 1524. *Ph. Am.* 1. p. 222. —*Ornithogalum bivalve.* L.

HAB. Cultivated in the Bot. Garden of Glasgow, from seeds received from the N. W. Coast.

2. *A. cernuum*. *Roth*.—*Bot. Mag. t. 1324. Ph. Am. 1. p. 222.*

Hab. Lake Erie. *Mr Goldie*.

3. *A. stellatum* (*Fraser, Cat.*); bulbo oblongo-ovato, foliis radicalibus linearibus, scapo elongato tereti, umbella erecta multiflora laxè fastigiata, sepalis (roseis) oblongo-ovatis acutis longitudine staminum, ovario trilobo, lobis superne bicristatis. (*TAB. CXCVI.*)—*Gawl. Bot. Mag. t. 1576.*

Hab. Plains of the Saskatchewan. *Drummond*. Nutka, where the bulbs are used as an esculent.—A foot to a foot and a half high. Bulb ovate, gradually narrowing upwards, and, as well as the lower part of the leaves, sheathed with a lacerated membrane. Leaves shorter than the scape, linear, flat, all arising from the root. Umbel of from 10 to 16 rather small, bright rose-coloured flowers. Sepals ovate, acute. Germen of 3 lobes, each with a double wing-like crest at the top, which remains and forms part of the fruit, and which is the most striking mark of the species. Seeds pitted.

TAB. CXCVI. Fig. 1, Flower; f. 2, Perianth laid open; f. 3, Pistil; f. 4, Fruit:—*magnified*.

4. *A. reticulatum* (*Fraser, Cat.*); bulbo oblongo extus dense reticulatum fibroso, foliis radicalibus, umbella erecta multiflora dense fastigiata, sepalis ovato-acuminatis (albis) stamina superantibus, ovario apice breviter sexfido. (*TAB. CXCV.*)—*A. stellatum. B. Gawl. Bot. Mag. t. 1840.*—*A. angulosum. Ph. Am. 1. p. 223. Rich. App. p. 10. (non Linn.)*

Hab. Woody country, especially about Carlton House Fort. *Dr Richardson. Douglas*. Interior of Columbia, and along the N. W. Coast, to Nutka. *Menzies. Douglas*.—The species of *Allium* in the present collection, though few in number, are extremely puzzling. The Carlton House specimens of the present plant seem to correspond exactly with the *Allium stellatum. B. Gawl.* (which is considered the *A. reticulatum* of *Fraser*), especially in the densely matted fibrous coat to the roots, which occasioned the specific name: but Dr Richardson's specimen of *A. angulosum*, which I refer to this, and some of the north-west specimens, have not this fibrous covering to the root; but as it is but loosely attached, it may have been accidentally removed. This plant is remarkable for the white, glossy flowers; in shape, and in that of the leaves, very much resembling *A. stellatum*, of which Mr *Gawler* seemed inclined to consider it a variety; but the sepals are narrower, the stamens shorter, and the double crest upon the lobes of the germen and capsule are very much more indistinct. These plants can be but ill understood without figures and analysis of the flowers.

TAB. CXCV. Fig. 1, Flower; f. 2, Perianth laid open; f. 3, Pistil; f. 4, Capsule:—*magnified*.

5. *A. acuminatum*; foliis linearibus brevibus paucis radicalibus, scapo humili tereti, umbella pluriflora patente, sepalis roseis subovalibus acuminatissimis basi gibbosis interioribus minute serrulatis apicibus recurvis, staminibus perianthio duplo fere brevioribus, ovario 3-lobo, stigmate brevi trifido. (*TAB. CXCVI.*)

Hab. Nutka Sound, plentiful (*Menzies*); thence south to the Columbia and Cape Mendocina. *Douglas. Tolmie*.—A very distinct, small growing species: flowers of a full rose-colour, remarkable for the much acuminate and recurved apices of the sepals, giving the flowers somewhat the appearance of an *Uropetalon*.

TAB. CXCVI. Fig. 1, Flower; f. 2, Two sepals and stamens; f. 3, Pistil:—*magnified*.

6. *A. Douglasii*; bulbo late ovato foliis binis lanceolato-falcatis striatis basi longe angusteque attenuatis, umbella multiflora patente, sepalis (roseis) ovatis longe anguste

acuminatis coriñatis rectis stamina subæquantibus, ovario trilobo, stylo integro.— α . foliis scapo brevioribus. (TAB. CXCVII.)— β . foliis scapo longioribus.

HAB. α . N. W. Coast, on the low hills. *Douglas*.— β . In the Snake country. *Tolmie*.—The flowers of this a good deal resemble the preceding in shape and colour, but the apex of the sepals is not recurved, the stamens are longer, and the leaves are totally different, being more than half an inch broad, in the dry state thick and somewhat coriaceous, indicating that in the recent plant they are thick and fleshy. Mr Douglas had marked it *A. fragrans*; but with the *fragrans*, Spreng. (*A. inodorum*, Gawl.), it has no sort of affinity whatever.

TAB. CXCVII. Fig. 1, Flower; f. 2, Sepals and stamens; f. 3, Pistil:—magnified.

7. *A. Schœnopræsum*. L.—E. Bot. t. 2241. Rich. App. p. 10.—*A. Sibiricum*. L. Mant.?

HAB. Canada. *Mrs Sheppard*. *Lady Dalhousie*. Throughout the woody country to Bear Lake (Dr Richardson), and to the Prairies of the Rocky Mountains. *Drummond*. Newfoundland. *Dr Morrison*. Walla-wallah and Wallamet Rivers, on the N. W. Coast. *Douglas*. *Tolmie*.—This seems to be a most abundant species in N. America, yet not noticed by Pursh or Nuttall. I do not see how *A. Sibiricum* is to be distinguished from the present.

8. *A. Canadense*. L.—Ph. Am. 1. p. 225.

HAB. Canada. *Pursh*; but I have never seen a specimen from British North America.

2. HESPEROSCORDON. Lindl.

Perianthium subcampanulato-rotatum, bifidum, cum pedicello articulatum. *Stamina* 6, fertilia, filamentis dilatatis membranaceis æqualibus, e fauce exortis, basi subconnatis. *Squame hypogynæ* 0. *Ovarium* sessile (?), 3-loculare, polyspermum, apice 3-glandulosum. *Stylus* teres, cum ovario articulatus. *Stigma* simplex. *Capsula* tri-locularis, 3-valvis, polysperma, valvis medio septiferis. *Semina* nigra, angulata, suberustacea.—*Herba* (*Boreali-Americanæ*) *cormis* *induviatæ*. *Flores* *umbellati*. *Lindl.*

1. *H. Lewisii*; umbella multiflora, floribus densis campanulatis laciniis apice patentibus.—*H. hyacinthinum*. *Lindl.* Bot. Reg. sub fol. 1293.—*Brodiaea grandiflora*. *Nutt.* Gen. 1. p. 215. (non Sm.) (TAB. CXCVIII. A.)

HAB. Plains of the Missouri. *M. Lewis*. N. W. America. *Menzies* (in *Herb. nostr.*). Plains of the Columbia, and to California. *Douglas*. Wallamet River. *Tolmie*.—I have changed the name of Dr Lindley, though unwillingly; because I think the colour is not "sky-blue;" at least the well-dried specimens have exactly the same colour as those of *H. lacteum*, Lindl. Bot. Reg. t. 1639; and I doubt very much if this latter plant, from California, be really anything more than a small and lax-flowered variety of the present. In both, the germs taper very much at the base, and the fruit is really stipitate.

TAB. CXCVIII. A. Fig. 1, Flower; f. 2, The same laid open:—magnified.

3. CAMASSIA. Lindl.

Bulbus *tunicatus*. *Flores* *coerulei*, v. *purpurei*. *Perianthium* *explanatum*, hexaphyllum, foliolis 5 superioribus *ascendentibus*, sexto *decurvo*. *Stam.* 6, *hypogyna*, *æqualia*; *filamenta* *glabra* *ascendentia*. *Ovarium* 3-loculare polyspermum. *Stylus* *declinatus*. *Stigma* *obsolete* 3-dentatum. *Capsula* *chartacea*, 3-locularis, 3-valvis, loculicido-dehis-

cens. *Semina cuique loculo 6, subrotunda, nigra, nitida, raphe et chalaze corrugatis.* *Lindl.*

gium Quamash. *Ph. Am. I. p. 226.*—*P. esculentum.* *Nutt. (in part; not Fraser.)*—*B.*
floribus albis.—*Scilla esculenta.* *B. fl. albo.* *Hook. Bot. Mag. t. 2774.* (*not Scilla escul.*
Gawl. Bot. Mag. t. 1574.)

HAB. N. W. America. Vallies of the Rocky Mountains. *M. Lewis.* Between the Mountains and the Pacific, from the parallel of 38° to 50° N.—This is assuredly a very distinct plant, both as to genus as well as species, from the *Silia esculenta*, Fraser, with which Pursh (in *Bot. Mag. t. 1574*) and Mr Nuttall confounded it, and led others to do so too. Both are eaten in their respective countries by the Indians, the present one by the Chonooks, who toast the roots on heated stones, and, when dried or compressed into cakes, they form a great article of consumption during the winter months.

4. TRITELEIA. *Hook.*

Perianthium tubulosum, subinfundibuliforme, marcescens. Stam. 6, duplice serie inserta: superioribus petalis oppositis. Squama hypogynæ nullæ. Ovarium saepius stipitatum, raro sessile, polyspermum; stigmate trilobo.—*Herbæ (Austro- et boreali-Americanæ) cormis indutiatæ.* *Flores umbellati.* *Lindl.*

1. *T. grandiflora* (*Lindl. Bot. Reg. sub fol. 1293*); foliis linearibus glaucis scapo erecto bipedali brevioribus, involucro pedicellis æquali, pedicellis strictis perianthio infundibulari vix æqualibus, ovario breviter stipitato, filamentis 3 decurrentibus basi callosis, umbella pauciflora. (*TAB. CXCVIII. B.*)

HAB. Plains of the Columbia and Wallamet Rivers. *Douglas.* *Tolmie.*—I do not see how the *T. laxa* of Mr Bentham, in *Hort. Trans. v. 1. N. S. t. 15. f. 2, and Lindl. Bot. Reg. t. 1685*, (both of which figures accurately represent ours, the original species of the genus,) can be distinguished from the present. It is a beautiful plant, with the habit of the following genus.

5. BRODIEÆ. *Sm.*

Perianthium tubuloso-campanulatum, sexfidum, persists. Stam. 3, ad faucem et laciniis 3 int. opposita, cum squamis 3 (stam. abortivis) alternantia. Ovarium 3-gonum, basi attenuatum. Stylus filiformis. Stigma trifidum. Capsula obovata, stipitata, 3-locularis, loculicido-trivalvis. Semina cuique loculo 4-5, peltata.—*Flores umbellati.*

1. *B. grandiflora*; pedicellis umbellatis bracteas longe superantibus, squamis perianthii oblongis obtusissimis integris. *Sm. Linn. Trans. v. 10. p. 2. Bot. Reg. t. 1183.* *Bot. Mag. t. 2877.* (*non Ph., nec Nutt.*)—*Brodiæa coronaria.* *Salisb. Par. Lond. t. 98.*

HAB. N. W. America, New Georgia. *Menzies.* Puget Sound, and dry plains of the Wallamet and of the Columbia, west of the Rocky Mountains, to the Pacific Ocean. *Douglas.* *Dr Scouler.* *Tolmie.* *Dr Gairdner.*

2. *B. congesta* (*Sm. Linn. Trans. v. 10. p. 3. t. 1*); floribus subcapitatis, bracteis pedicellis superantibus, squamis perianthii lanceolatis acutis bifidis.

HAB. N. W. America; the same stations as the preceding. *Menzies.* *Douglas.* *Tolmie.*—The smaller

flowers, shorter limb, larger bracteas, and bifid scales at the mouth of the flower, readily distinguish this species from *B. grandiflora*, the only ones found in N. W. America.

ORD. XI. PONTEDERIACEÆ. Kunth.

1. PONTEDERIA. L.

1. *P. cordata*. L.—*Bot. Mag. t. 1156. Ph. Am. 1. p. 223.*

HAB. Canada. *Ph.* From Lake Huron (*Dr Todd*), to the Saskatchewan. *Dr Richardson. Drummond.*

2. LEPTANTHUS. Mx.

Spatha uniflora. Perianthium coloratum inferum, tubo longissimo gracili, limbo 6-partito exquali. Stylus apice incrassatus. Capsula unilocularis, trivalvis, polysperma. Semina receptaculis tribus filiformibus valvarum medio affixis inserta.—*Herba aquatica, foliis alternis gramineis stipulatis, floribus solitariis axillaribus.*

1. *L. gramineus. Mx. Am. 1. p. 25. t. 5. f. 2. Hook. Ex. Fl. v. 1. p. 94. t. 94.*—*Heteranthem. Vahl.—Ph. Am. 1. p. 32.*—*Schollera graminifolia. Willd.*—*Commelinia dubia. Jacq. Obs. Bot. v. 3. p. 9. t. 39.*

HAB. Canada, growing with *Valisneria* and *Najas*, sent thence by *Mr Kippin* to the Glasgow Botanic Garden.

ORD. XII. RESTIACEÆ. Br.

1. ERIOCaulON. L.

1. *E. septangulare. With. (anno 1801). E. Bot. t. 733. Hook. Fl. Lond. N. S. t. 52.*—*E. pellucidum. Mich. Am. 2. p. 166 (anno 1803).*

HAB. Canada. *Michaux. Mrs Sheppard*; and to the Saskatchewan. *Dr Richardson. Drummond. Newfoundland. Dr Morrison.*—It is quite certain that this northern *Eriocaulon* of the New World, is the same as that found in the lakes of Scotland and Ireland in the Old World; the oldest name, therefore, must have the preference.

ORD. XIII. JUNCEÆ. Juss.

1. LUZULA. DC.

1. *L. melanocarpa* (Desv. *Journ. t. 5. f. 2.*); caule elongato, foliis latis glabris, corymbo decomposito, pedunculis elongatis ramis 3-5 floris pedicellis unifloris, sepalis ovatis acutissimis capsula ovali-trigona obtuse mucronata longioribus. *Torr. Am. 1. p. 366.*—

Juncus melanocarpus. *Mx. Am.* 1. p. 190. *Ph. Am.* 1. p. 298. *Rich. App.* p. 11.—*L. parviflora*. *Desv.* (*Juncus, Retz.*) *Bong. Veget. Sitch.* p. 49.— α . *floribus fuscis, capsulis* intense badiis.— β . *floribus capsulisque pallidis*.

HAB. Canada (Mr.), and throughout the woody country to the prairies of the Rocky Mountains. *Dr Richardson.* Labrador. *Dr Morrison.* N. W. America, from the Columbia to Kotzebue's Sound. *Beechey. Bongard. Douglas. Dr Scouler.*—The pale flowered and pale fruited var. is found abundantly at the Columbia River, but is not confined to the west coast. I have received the same state from the White Hills of New Hampshire. Indeed very many of the *Luzula* and *Junci* vary in the same manner.

2. *L. pilosa*. *Willd.*—*Torr. Am.* 1. p. 365.—*Juncus. L.*—*Muhl. Gram.* p. 200. *E. Bot. t. 736.*—*Luzula vernalis. De Cand.*— β . *floribus pallidis*.

HAB. Canada (Mrs. Sheppard), to the Saskatchewan. *Dr Richardson. Douglas.*

3. *L. campestris*. *Desv.*—*Torr. Am.* 1. p. 365.—*Juncus. L.*—*E. Bot. t. 672. Mich. Am.* 1. p. 190. *Ph. Am.* 1. p. 298.— α . *vulgaris*; *florum glomerulis rotundatis densis cymoso-paniculatis intense fuscis.— β . *paleescens*; *florum glomerulis rotundatis densis cymoso-paniculatis pallidis. *L. paleescens. Wahl.*— γ . *congesta*; *floribus dense capitatis fuscis, capitulo solitario.—*L. congesta. Lej.*—*E. Bot. Suppl. t. 2718.****

HAB. Woody and barren country. *Dr Richardson.*—*Newfoundland. Mr Cormack.* New Brunswick. *Mr Kendal.* Kotzebue's Sound, Behring's Straits. *Beechey.*— β . Lake Winnipeg, to the Saskatchewan, and prairies and Lake of the Woods, Rocky Mountains. *Drummond.*— γ . Bear Lake. *Dr Richardson.*

4. *L. comosa* (Meyer, in *Reliq. Henk. Fasc.* 2. p. 145); *foliis planis pilosis, floribus spicatis distichis, spicis elongatis pedunculatis corymboso-paniculatis rarius subsessilibus, perianthii lacinii lanceolatis acuminato-subulatis interioribus brevioribus capsulam triquetro-ellipticam acutiusculam vix equantibus.*—*L. campestris?* *Bong. Veget. Sitcha,* p. 49.

HAB. N. W. America. Nutka Sound and Port Mulgrave. *Henke.* From the Rocky Mountains to the Pacific Ocean. *Douglas. Dr Scouler. Bongard?*—This seems to take the place of *L. campestris* on the west side of the Rocky Mountains. The elongated spikes of flowers, sometimes compact, sometimes remote, give the appearance of a *Carex* to this *Luzula*. I have from the White Mountains, New Hampshire, a var. of the pale-flowered *L. campestris*, very nearly approaching this, which nevertheless seems to be a good species.

5. *L. spicata*. *Desv.*—*Torr. Am.* 1. p. 366.—*Juncus. L.*—*E. Bot. t. 1176.*

HAB. Kotzebue's Sound, Behring's Straits. *Beechey.* Rocky Mountains. *Drummond.* Labrador. *Dr Morrison.*

6. *L. hyperborea* (Br. *Metv. Isl. Pl.* p. clxxxiii); *spicis multifloris subumbellatis pedunculatis sessilibusque (nunc omnibus sessilibus), bractea umbella foliacea; partialibus omnibus fimbriatis, capsulis obtusis perianthium acutum subaequantibus, caruncula basilaris seminis obsoleta, foliis planis.* *Br.*— α . *major*; *foliis angustioribus, bracteis partialibus insigniter albo-fimbriatis (an forma *L. campestr.*?). Hook. in Parry's 2d Voy. App.* p. 405.—*L. hyperborea. Br. l. c.*—*L. campestris. Br. Spitzb. App.* p. 75.—*Juncus arcuatus.*

Hook. in Scoresb. Greenl. App. p. 410.—*Juncus campestris. Solandr. in Phipps' Voy.*—
β. minor; foliis latioribus, bracteis partialibus vix fimbriatis. Hook. l. c.

HAB. *α.* and *β.* Arctic Sea-shore. *Dr Richardson;* and Arctic Islands. *Sir E. Parry, &c.*—*α.* Most elevated of the Rocky Mountains. *Drummond.*—The first variety, as I have stated in the Appendix to Sir Edward Parry's second voyage, is perhaps too near *L. campestris*; and the second var. almost seems to unite the first with the following; yet I think they are distinct.

7. *L. arcuata* (*Hook. Fl. Lond. N. S. t. 159.*); *foliis canaliculatis pilosis (pilis saepe obsoletis), panicula subumbellata, floribus glomeratis, glomerulis 3-5-floris, pedunculis nutantibus, bracteis membranaceis fimbriatis, capsula ovato-globosa sepalis lato-lanceolatis breviori. Hook. in E. Bot. Suppl. t. 26. Cham. et Schlecht. Linnaea, 3. p. 375. Hook. et Arn. in Bot. Beech. p. 131.*—*β. major; spithamea et ultra.*

HAB. N. W. America. Kotzebue's Sound. *Chamiso. Beechey.* Summit of Mount Rainier. (var. *β.*) *Tolmie.* Summits of the Rocky Mountains. *Drummond.*—The Mount Rainier specimens are much larger than our European *L. arcuata*, and than that from the Rocky Mountains, and the leaves are broader, and the flowers deeper brown; they seem to connect the species with *L. spadicea*.

2. JUNCUS. De Cand.

1. *J. arcticus* (*Willd.*); *repens aphyllus, scapo tereti laevi opaco rigidiusculo apice pungente, florum fasciculo laterali sessili, perianthii laciniis ovato-lanceolatis acutis capsula elliptica trigona mucronata brevioribus. Svensk. Bot. t. 479. f. 5.*—*J. compressus. β. Hoenkei. Meyer in Herb. Hook. et in Relig. Hoenk. Fosc. 2. p. 141.*—*J. Hoenkei. Meyer Syn. Junc. p. 10.*—*β. gracilis; floribus subterminalibus paucis 1-3. J. platycaulos. (H. B. K.) β. aphyllus. E. Meyer in Herb. nostr.*

HAB. Arctic Sea-coast. *Dr Richardson.* Point Mudge, in Bohring's Straits. *Hænke.*—*β.* At a great elevation on the Rocky Mountains. *Drummond.*—My specimens have been named *J. compressus* (*H. B. K.*), *β. Hænkei* of Meyer, by the learned Meyer himself; but they correspond so exactly with the true *J. arcticus*, from Lapland, and Iceland, and Greenland, that I cannot entertain a doubt of this being the same. As it is a very arctic or very alpine species, I have omitted one of the two stations given by Hænke, his "Nutha-Sund vel Portu Mulgrave."—*β.* has very few flowers to each slender culm, and those generally near the apex, which thus seems to form a bracteæ.

2. *J. Balticus* (*Willd.*); *repens aphyllus, scapo tereti laevi opaco rigido apice pungente, floribus paniculatis, panicula brevi laterali, perianthii laciniis subaequalibus ovato-lanceolatis acutis longitudine capsule elliptica mucronatae. Hook. in E. Bot. Suppl. t. 2621.*—*J. arcticus. Hook. Fl. Lond. N. S. t. 151. (non Willd.)*—*J. compressus. (H. B. K.) Cham. in Linnaea, 6. p. 369. et in Herb. nostr. (non Jacq.)*—*J. complanatus. Schult.*—*β. laxa; panicula bi-triunciali valde ramosa laxa.*—*J. glaucus. Rich. App. p. 11.*

HAB. Unalaschka. *Chamiso.* N. W. America. *Menzies.* Saskatchewan River, near the mountains. *Douglas.* Slave Lake. *Dr Richardson.*—*β.* Throughout Canada to the Saskatchewan. Labrador. *Dr Morrison.*—A taller and more harsh and rigid plant than the preceding, with the fascicles of flowers on branched peduncles, so as to constitute a panicle.—This, which is also Chamiso's *J. compressus*, *H. B. K.* (*Herb. nostr.*), is unquestionably the same plant as the *J. Balticus* of England and Sweden.—The *β.* is a very remarkable variety, with a much larger and looser panicle, and remote flowers. It does not seem to

bear fruit, and is perhaps a morbid state of the plant. Its quite smooth stems, and deep-coloured flowers, readily distinguish it from all forms of *J. effusus* and *glaucus*.—The very sportive character of this and the preceding species, as shown in the present collection, almost induce me to return to my former opinion, that they are not really distinct.

3. *J. effusus*, L.—*E. Bot. t. 836. Ph. Am. I. p. 236.*— β . *gracilis*; *panicula minore*.

HAB. Canada. *Mrs Sheppard. Mrs Percival.* Newfoundland.— α . N. W. Coast. Columbia. *Douglas. Dr Scouler.*— β , is a very slender plant, and with a few-flowered panicle; but the flowers and fruit are the same as in α .

4. *J. filiformis* (L.); *repens* nphyllus, scapo gracili filiformi tenuiter striato flaccido, panicula subsimplici laterali versus medium scapi, sepalis unicoloribus pallidis subequalibus lanceolatis capsula obovata micronata nitida pallida parum longioribus. *E. Bot. t. 1173. Ph. Am. I. p. 236?* not *Mx.*— β . *Pylai?* *De la Harpe in Mem. Soc. H. N. S. p. 110.*

HAB. Saskatchewan to Bear Lake and English River. *Dr Richardson. Drummond.*—The *J. filiformis* of Pursh is probably the *J. setaceus*, Rostkow, a different species, according to specimens from Dr Torrey, gathered in Middle Florida; being a larger and harsher plant, with very rigid glossy sepals, spreading nearly horizontally around the almost depresso-globose mercurated capsule. I have excellent specimens, however, of the true *J. filiformis*, from the United States, gathered by Mr Groene on the White Hills, New Hampshire. It seems, therefore, in America, to be an alpine or very northern species.

5. *J. acutiflorus* (Ehrh.); caule erecto foliisque subcompressis articulatis, panicula terminali decomposita, capitulis 5-6-floris, sepalis inequalibus lanceolatis acutis capsula anguste ovatam subacuminatam æquantibus. *E. Bot. t. 2143.*— β . *pelocarpus. Meyer Syn. p. 30. et in Herb. nostr.— β . *minor*; *capitulis 1-2-floris.*—*J. Canadensis?* *Gay.*—*Schult. Syst. Veg. 2. p. 211.*?*

HAB. Canada, to the Slave Lake, and to the marshy ground in the Rocky Mountains. *Dr Richardson. Drummond.*— β . Canada. *Dr Richardson. Mrs Sheppard.*—I am quite unable to distinguish this American *Juncus* from our European *J. acutiflorus*. The whole habit of the plant, the flowers, and the fruit, are the same. It is also nearly allied to *J. lampocarpus*, but that has larger flowers and capsules, and the latter especially of a much darker colour. The var. β , is a smaller plant, and has the capitula very few-flowered.

6. *J. polyccephalus* (Mich. *Am. I. p. 192*); caule erecto foliisque subcompressis articulatis, panicula terminali decomposita, capitulis unijugulis multifloris densissimis globosis, floribus triandris? sepalis subequalibus lanceolatis neutissimis rigidis capsula oblongo-lanceolatam acutam triquetram nitidam æquantibus. *Ph. Am. I. p. 237. Torr. Am. I. p. 364.*— β . *paradoxus?* *E. Meyer.*—*Bong. Veg. Sitcha, p. 49.*—*J. nodosus. L.?*— α , *crassifolius*; major, foliis multo crassioribus et conspicue compressis. *Mich. l. c.—subvar. 1. macrocephalus;* capitulis paucis magnitudine fere nucis *Avellanae.* *J. globosus. Herb. Banks.*—*subvar. 2. capitulis mediocribus numerosis.*— β . *tenuifolius*; minor gracilior, foliis subfiliformibus. *Mich. l. c. J. echinatus. Muhl.*—*Rich. App. p. 11.*—*J. nodosus. Torrey. Am. I. p. 361.*—*J. Roskowii. E. Meyer Syn. p. 26. et in Herb. nostr.*—*J. macrostemon?* *Gay in Schult. Syst. Veg. v. 7. p. 216.*— γ . *pumilus;* subdigitalis gracillimus, capitulis paucis 1-3.

HAB. a. N. W. Coast, frequent. *Douglas*.— β . Canada, to Bear Lake. *Drummond*. *Dr Richardson*.— γ . Moist woods in the Rocky Mountains. *Drummond*.—Readily known in its various states by the dense and globose capitula, and the narrow, sharp, rigid sepals. The name *echinatus* would have been very appropriate to this species.

7. *J. ensifolius* (Wikstr. *Act. Holm.* 1825, p. 1); caule compresso erecto folioso, foliis linearl-acumulatis ensiformibus (lateraliter planis) articulatis subflaccidis caulem floriferum subaequantibus, capitulis terminalibus plerumque solitariis subglobosis multifloris, floribus densissime compactis, bractea exteriori folacea basi membranacea capitulum plerumque superantibus, sepalis lanceolatis acuminatis nitidis capsulam ellipticam mucronatam aequantibus.— α . *minor*; capitulo solitario. *Cham. et Schlecht. Linnæa*, 3, p. 373. (*et in Herb. nostr.*)—*J. Mertensianus*. *Bong. Veget. Sitcha*, p. 40. (*et in Herb. nostr.*)—*J. fulcatus*. *E. Meyer*. (*sive E. Meyer in Herb. nostr.*)— β . *major*; capitulis geminis ternis etiam subpaniculatis.

HAB. N. W. America. Sitcha (*Bongard*), to Umaluscha. *Chamisso*. Alpine swamps of the Rocky Mountains, north of the Smoking River. *Drummond*.— β . Sources of the Columbia River, in the Rocky Mountains.—An extremely interesting plant, with the leaves, in the dried state at least, flattened at two sides, and thus ensiform as in *Iris* and *Siegrinchium*; this, however, may in some measure be owing to pressure, and some of the more luxuriant specimens, in their inflorescence, approach the preceding species; though the usual form of the plant so nearly resembles *J. castaneus*, that Drummond marked it as probably a variety.

8. *J. uliginosus* (Sibth.); caule erecto v. decumbente saepe radicante velisque setaceis obscure articulatis panicula subsimplici irregulari, capitulis pauci- v. pluri-floris, sepalis oblongis equalibus subacute capsulam ellipticam aequantibus. *L. Bot.* t. 891.— α . *minor*; erectus, floribus intense fuscis.—*J. fusco-ater*. *Schreb.* (*sive E. Meyer in Herb. nostr.*).—*J. bulbosus*. *L.*.—*J. alpinus*. *Vill.*.— β . *subtilis*; caule radicante, floribus subbinatis.—*J. subtilis*. *Meyer Syn.* p. 81.—*J. fluitans*. *Mx.*

HAB. a. Arctic Sea-coast. *Dr Richardson*.— β . Canada. *Bosc*.—These specimens send out copious radicles, chiefly from the base of the plant. The stems are 3-5 inches high, erect. Paniclo very little branched, with very few, 2-4 capitula, and these few-flowered.

9. *J. Richardsonianus* (Schult. *Syst. Veg.* v. 7, p. 201); “foliis subulatis nodoso-articulatis, paniculis paucifloris (3-5-floris), capsulis ovalibus calyce obtuso hexagonalio longioribus.” *Brown in Rich. App.* p. 11, *sive nom. J. affinis. (non Gaud.)*

HAB. Woody country to the Mackenzie River. *Dr Richardson*.—I am not acquainted with this plant. Perhaps I may have included it under *J. acutiflorus* (*J. pelocarpus*, *Meyer*).

10. *J. bufonius*. *L.*.—*E. Bot. t. 802. Ph. Am.* 1, p. 238.

HAB. Throughout Canada to Bear Lake. *Dr Richardson*. *Drummond*. N. W. Coast, abundant. *Dr Scouler*. *Douglas*.

11. *J. tenuis*. *Willd.*—*Ph. Am.* 1, p. 228.—*J. gracilis*. *E. Bot. t. 1724*—*J. bicarinis*. *Mx.*—*Ph.*

HAB. Lake Huron, to Bear Lake, and from Hudson's Bay to the sources of the Columbia, in the Rocky

Mountains. *Dr Richardson. Drummond.*—This is a well marked species, though allied to *J. bufonius*, and it seems most abundant throughout N. America. The leaves are slender, setaceous, several from the root. Stem from 8 inches to 2 feet, slender, but rigid, bare leaves up to the panicle near the top, where is one leaf immediately beneath the foliaceous bracteas. In the axils of the forks of the dichotomous panicle are 2 or 3 large nearly sessile flowers, and 2 or 3 unilateral ones, from the upper or inner side of the branches, the under or outer side being bare of flowers. Sepals green, with white, membranous margins.

12. *J. castaneus* (Sm.); caule erecto tereti folioso, foliis supra canaliculatis subitus teretibus (siccitate planis), capitulis plurifloris subbinis sessilibus v. pedunculatis bracteis majoribus foliaceis capitulis longioribus, floribus sessilibus v. pedicellatis, capsulis ovalitrigonis sublonge mucronatis perianthium superantibus. *E. Bot. t. 90. Rich. App. p. 11. Cham. et Schlecht. Linnaea, 3. p. 374.*— α . floribus capsulisque intense fuscis.— β . floribus capsulisque pallidis.—*J. Lehmanni. E. Meyer in Herb. nostr.*

HAB. York Factory, Hudson's Bay; Edmonton House Fort, on the Saskatchewan, to the Rocky Mountains. *Drummond*; and to Bear Lake. *Dr Richardson.* N. W. Coast, from Unalashka to Kotzebue's Sound. *Chamiso. Beechey.*

13. *J. Menziesii* (Br. in *Herb. Banks*); caule erecto tereti folioso, foliis linearis-acuminatis supra canaliculatis, capitulis terminalibus globosis 1-3, bractea exteriori plerumque foliacea et capitula superantibus, sepalis lato-ovatis obtusis capsulam obovatam nitidam muticam æquantibus.

HAB. N. W. Coast of America. *Menzies, in Herb. Banks.* Common near the confluence of the Columbia, and thence to Puget Sound. *Douglas.*—A span to nearly a foot high, the stem rigid, the leaves slightly so. Heads of flowers generally too large. Sepals unusually broad.—A very distinct species, with the habit of the preceding.

14. *J. biglumis* (L.); foliis radicalibus linearis-subulatis compressis (non canaliculatis) basi in vaginam sensim dilatatis, capitulo terminali bifloro flore altero pedicellato plerumque involucro foliaceo breviore, capsula turbinata retusa sepalis obtusis longiori. *E. Bot. t. 898. Cham. et Schlecht. Linnaea, 3. p. 374.*

HAB. Arctic Sea-coast and Islands. *Dr Richardson. Sir E. Parry. Mr Edwards.* Rocky Mountains, north of the Smoking River. *Drummond.* Bay of Good Hope, Behring's Straits. *Chamiso.*

15. *J. triglumis* (L.); foliis radicalibus linearis-subulatis canaliculatis bitubulosis vaginis supra auriculatis, capitulo terminali 3-floro bracteam membranaceam æquantibus, capsula elliptica acuta sepalis obtusis longiori. *E. Bot. t. 148.*

HAB. Arctic Sea-coast. *Dr Richardson.* Alpine swamps in the Rocky Mountains. *Drummond.*

ORD. XIV. HYDROCHARIDÆ. Br.

I. VALISNERIA. L.

1. *V. spiralis*. L.—*V. Americana. Mx.—Ph. Am. 1. p. 602.*

HAB. Canada.—Living plants were sent from near Montreal, by *Mr Kippin*, to the Glasgow Botanic Garden, where we had the opportunity of examining flowering specimens, and ascertaining that they were the same as the European species.

2. UDORA. Nutt.

Dioica. Spatha bifida. Masc. Cal. 3-partitus. Cor. 3-petala. Stam. 9, 3 interiora.—Fœm. Cal. 3-partitus, tubo longissimo. Pet. 3. Filamenta sterilia 3. Utriculus subtri-spermus. Semina cylindrica. Nutt.—Herba aquatica, foliis verticillatis.

1. *U. verticillata*. Spreng.—*Udora Canadensis. Nutt. Gen. Am. 2. p. 242. Elodea. Mx. Serpicula verticillata, L.—Muhl.—S. occidentalis. Ph.*

HAB. Canada, (Michaux. Cleghorn. Goldie.) to the Saskatchewan. Dr Richardson. Drummond.—I have retained the name of *verticillata* to this, originally given to an East Indian *Udora*, from a conviction, as far at least as can be conveyed by the dried specimens, that the plants of the Old and of the New World are the same species. It extends throughout the whole continent of America, from the lat. of York Factory, Hudson's Bay, in the north, to Buenos Ayres and Valparaiso in the south. The leaves vary much in size and direction, so that probably the *U. (Elodea) Granatensis*, and *U. Orinocensis* of Humboldt and Kunth, are mere varieties. Certainly my specimens from British Guiana are the same as those from Canada.

ORD. XV. ORCHIDÆ.* Juss.

§ I. MALAXIDÆ. Lindl.

1. MICROSTYLIS. Nutt. Lindl.

1. *M. monophyllum* (Lindl. Gen. Orch. p. 19.); caule unifolio, racemo gracili elongato, pedicellis flores æquantibus.—*Lindl.—M. brachypoda. Gray, MSS. in Herb. nostr.—Malaxis monophyllum. Willd.—Ophrys. L.*

HAB. Near Montreal. Goldie in *Herb. nostr.* Halifax. Goldie (ex Lindl.)—A very distinct species from the following, (a European plant,) and first found in N. America by Goldie, and since by Dr Torrey and Gray, in the United States, at Oneida county, New York.

2. *M. ophioglossoides* (Nutt.); caule unifolio, racemo obtuso capitato multifloro, pedicellis flores longe superantibus, labello tridentato.—*Lindl. Bot. Reg. t. 1290. (var. β.) Gen. Orch. p. 19. Malaxis ophiog. Ph. Am. p. 592. Loddig. Bot. Cal. p. 1116. M. unifolia. Mx.*

HAB. Canada, to the Saskatchewan. Dr Richardson. Newfoundland. Dr Morrison. Nova Scotia. Menzies.

3. *M. diphyllum* (Lindl. Gen. Orch. p. 19.); foliis duobus ovatis lanceolatis acutis lœvibus, scapo triquetro, labello subrotundo acuminate acumine lacinias haud superante.—*Malaxis diphyllus. Cham. in Linnæa, 3. p. 34.*

HAB. Unalaschka. Chamisso.—This is equally unknown to me as it is to Dr Lindley.

2. LIPARIS. Rich.

1. *L. liliifolia* (Rich.); foliis binis oblongis acutis plicatis racemo paucifloro multo

* I have followed entirely the arrangement of Dr Lindley, to whose invaluable *Genera and Species of Orchideous Plants* I refer for the characters of the Genera, so far as that work is published.

brevioribus, scapo angulato, labello maximo obovato mucronato recurvo discolore, sepalis linearibus patentissimis. *Lindl. Bot. Reg. p. 882. Gen. Orch. p. 28. Malaxis, Sw.—Ph. Am. 2. p. 592. Bot. Mag. p. 2004.*—*Ophrys, L.*

HAB. Canada. Ph.

2. *L. Loeselii* (Rich.); foliis binis ovato-oblongis obtusis plicatis racemo paucifloro multo brevioribus, scapo angulato, labello ovato integerrimo concolore, sepalis petalique linearibus inaequalibus. *Lindl. Gen. Orch. p. 28, in Bot. Reg. t. 882. Malaxis, Sw.—M. Correana. Benth.—Nutt. Am. 2. p. 196. Liparis, Spr.—Ophrys Loeselii. L.*

HAB. Canada, (*Goldie*) to Carlton House Fort, on the Saskatchewan. *Dr Richardson.*—The *L. Correana* differs in no respect from our European *L. Loeselii*. The American plant is indeed often much larger, (I have specimens more than a span high,) but Dr Richardson's specimens do not exceed ours.

3. CORALLORHIZA. Br.

1. *C. innata* (Br.); scapo pauci (6-9-) floro, floribus parvis, labello oblongo subintegro, calcare ovario adnato obsolete.—*Hook. in Fl. Lond. N. S. t. 142. Rich. App. p. 33.*—*C. odontorhiza. Nutt. Gen. 2. p. 197. C. Wisteriana. Conrad in Journ. Acad. Phil. 6. p. 145. Cymidium. Ph.—β. labello immaculato. Corallorrhiza verna. Nutt.—Journ. Ac. Nat. Phil. 3. p. 136. t. 7.—C. innata. Eat.*

HAB. Lake Huron, (*Dr Todd*) throughout Canada, (*Cleghorn, Mrs Sheppard*,) to the Saskatchewan. *Dr Richardson. Drummond. Douglas.* Newfoundland. *Miss Brenton.*—Copious specimens which I possess of this plant, from the above localities, precisely accord with our European *C. innata*. A small slender species, about a span high.

2. *C. multiflora* (Nutt. *Journ. Ac. Nat. Phil. 3. p. 138. t. 7.*); scapo multi-(15-30)-floro, labello cuneato-ovali tripartito recurvo maculato, calcare tuberculiformi ovario adnato. *Hook. Exot. Fl. t. 174. C. innata. Nutt. Gen. 2. p. 197. (fide Nuttall.)*

HAB. Canada. *Cleghorn. Dr Todd. Mrs Sheppard. Lady Dalhousie.* New Brunswick. *Mr Kendall. Columbia and Observatory Inlet. N. W. America. Douglas and Dr Scouler.*—Much larger and stouter than the preceding, with which it had been confounded by Nuttall; a foot and more high, with more numerous flowers, and an evident spur, but adnate with the ovary.

3. *C. Mertensiana* (Bong. *Veg. Sitcha, p. 47.*); scapo multi-(10-20)-floro, labello ovato-oblongo subemarginato, prope basin dente incurvo utrinque instructo, calcare subelongato omnino libero.

HAB. N. W. America. *Sitcha, Bongard.* Fort Vancouver and Nusqually. *Dr Scouler and Tammie.*—Habit and size of the preceding, yet very different. It is generally more slender, the sepals and petals much narrower; but the most distinguishing feature is the very evident spur to the base of the lip, not at all adnate with the ovary.

4. AMPLECTRUM. Nutt. Lindl.

1. *A. hyemale* (Nutt. *Journ. Acad. Phil. p. 139.*). *Corallorrhiza hyemalis. Nutt. Gen. 2. p. 198. Cymbidium, Willd.—Ph. Am. 2. p. 593.*

HAB. Between Norway House and Cumberland House Fort, on the Saskatchewan, *Drummond*; rare, and with fruit and good foliage; but no flower.—Flowers similar to those of *Corallorrhiza*. Root tuberous, with a single elliptical leaf from the summit of the tuber, the scape springing from beneath. This is doubtless the northern limit of this fine Orchideous plant; but it does not appear to have been found in Canada.

§ II. VANDEÆ. *Lindl.*

5. CALYPSO. *Salisb.*

1. *C. borealis*. *Salisb. Par. Lond. t. 89. Hook. Ex. Fl. t. 12. ejusd. Bot. Mag. p. 2763. Ph. Am. 2. p. 593.* C. Americana. Br.—*Nutt.*—*Limodorum. Willd.*—*Cypripedium bulbosum. L.*

HAB. Canada to Bear Lake River. *Cleghorn. Goldie. Dr Richardson*; and from Hudson's Bay (*Douglas*), to the Rocky Mountain. *Drummond. Nova Scotia. Menzies. N. W. America. Mr Lewis. Menzies. Douglas. Tolmie.*

§ III. OPHRYDEÆ. *Lindl.*

6. ORCHIS. *L. Br. Lindl.*

1. *O. spectabilis* (L.); foliis binis oblongis obtusis scapi longitudine, bracteis foliaceis floribus longioribus, labello lanceolato calcari clavato pendulo æquali. *Lindl. Gen. Orch. p. 267. Ph. Am. 2. p. 587. Hook. Ex. Fl. p. 69.* *O. humilis. Mx.*—*Habenaria. Spr.*

HAB. Throughout Canada. *Dr Todd. Lady Dalhousie. Goldie.*—This is the only true *Orchis* found in Eastern N. America.

2. *O. aristata* (Fisch. *mst. in Herb. nostr.*); foliis ovato-lanceolatis acutis caule subdiphylo longioribus, spica ovata densiflora, sepalis acuminatissimis, labello ovato acuto levissime versus apicem trilobo lateribus deflexo, calcare crasso pendulo labello longiore, bracteis herbaceis acuminate floribus longioribus, tuberibus palmatis. *Lindl. Gen. Orch. p. 262. O. acuminata. Hort. Gor. (Herb. nostr. ex Acad. Imp. Petersb.) non Desf.—O. latifolia. L.?* var. *Beerigiana. Cham. in Linnaea, v. 3. p. 26.*

HAB. Unalaschka. *Chamisso.*—This is rightly separated by Dr Fischer from *O. latifolia*.

7. GYMNADENIA. *Br. Lindl.*

1. *G. (?) tridentata* (*Lindl.*); folio solitario radicali oblongo obtuso, caulinis 2-3 multo angustioribus et minoribus, spica brevi laxiuscula, sepalis campanulatis, labello plano truncato obsolete tridentato (nunc integro obtusiusculo) sepalorum longitudine, calcare filiformi arcuato ovario paulo longiore. *Lindl. Gen. Orch. p. 227. Habenaria trid. Hook. Ex. Fl. p. 81.* *Orchis trid. Willd.*—*Ph. Am. 2. p. 587.*— β . *labello integro.*—*Orchis clavellata. Mx. Am. 2. p. 155. Ph. Am. 2. p. 586.*— γ . *folio lineari-oblongo, caule elatiore* (labello integro). *Platanthera tipuloides. Lindl. Gen. Orch. p. 285.* *Orchis tipuloides. L.*—*O. gracilis. Fisch.*

HAB. Canada. *Goldie. Mrs Sheppard. Mrs Perceval.*— β . Newfoundland. *Miss Brenton.*— γ . Lake Huron. *Dr Todd.*—The base of the cells of the anthers are by no means so approximate as in the original

Gymnadenia of Mr Brown, *G. conopsea*. It is not unfrequent to find the lip quite entire, and more or less acute, and the narrow-leaved var. of this, is, as it appears to me, the *Platanthera tipularioides* of Lindl. *Orchis gracilis*, Fisch. in *Herb. Hook.*

8. PLATANTHERA. Rich. Lind.

1. *Labelum indivisum, subintegerimum.*

1. *P. obtusata* (Lindl.); folio solitario oblongo-ovobato, caule monophyllo, spica laxiuscula, sepalo supremo latissimo, petalis subtriangularibus acuminatis obtusis, labello linearis-subacuminato basi bituberculato calcariis conici arcuati acuti longitudine. (TAB. CXCIX.) Lindl. Gen. Orchid. p. 284. Habenaria, Rich. App. p. 38. Orchis, Ph. Am. 2. p. 284.

HAB. Nova Scotia. Menzies. Canada. Mrs Perceval. Mrs Sheppard (at Cape Torment), to Carlton House Fort, on the Saskatchewan and alpine swamps of the Rocky Mountains, and thence to Bear Lake and Fort Franklin. Dr Richardson. Drummond. Labrador. Dr Morrison. N. W. Coast. Menzies. Douglas. Kotzebue's Sound. Beechey.

TAB. CXCIX. Fig. 1. Side view of a flower; f. 2. Front view of do.; f. 3. Upper sepal; f. 4. Petal; f. 5. Anther.

2. *P. elegans* (Lindl. Gen. Orch. p. 285); foliis binis oblongo-lanceolatis, caule squamis parvis ramentaceis, spica longa densa cylindracea, bracteis linearis-subulatis florum longitudine, sepalis campanulatis acuminatis obtusis, petalis labelloque carnosis ovato-linearibus obtusis subæqualibus, calcare filiformi arcuato ovario longiore. Lindl.

HAB. N. W. America. Valleys of the Blue Mountains. Douglas. Fort Vancouver. Tolmie.—Flowers white and fragrant. Root an undivided tuber. Stem a foot and a half high. Flowers small. Pollen-glands very large.

3. *P. Hookeri* (Lindl. Gen. Orchid. p. 286); foliis radicalibus binis suborbiculatis carnosis, scapo nudo, spica stricta multiflora, sepalo superiori ovato lateralibus lanceolatis reflexis, labello lanceolato acuminato glabro sepalis parum longiore, calcare subulato arcuato compresso ovario duplo longiore, anthera triangulare angulis basi obtusis.—Habenaria orbiculata. Hook. Ex. Fl. t. 145. (non Pursh). Habenaria Hookeri. Torrey, Herb.—Gray, New or rare plants, St. of New York, p. 229.

HAB. Upper and Lower Canada. Dr Todd. Goldie. Lady Dalhousie. Drummond.

4. *P. orbiculata* (Lindl. Gen. Orchid. p. 286); foliis radicalibus binis suborbiculatis (ovalibus) tenui-membranaceis, scapo bracteato, racemo laxo multifloro, sepalo superiori orbiculari lateralibus ovatis, labello linearis-subpathulato basi pubescente sepalis fere duplo longiore, calcare arcuato compresso clavato ovario duplo longiore, anthera lobis basi utrinque productis liberis. (TAB. CC.)—Orchis orbiculata. Ph. Habenaria, Torr. Compend. p. 318.—H. macrophylla. Hook. in Ed. Phil. Journ. v. 6. p. 331. Gray, New or rare Pl. St. of New York, p. 228.

HAB. Canada. In moist shady woods. Island of Montreal. *Mr Goldie*, *Lady Dalhousie*. *Mrs Percival*; to the Saskatchewan. *Drummond*.—This fine species, having been but ill defined by its first describer (*Pursh*), has been much misunderstood, and the preceding plant was by myself, as well as by other botanists, both in America and in Europe, mistaken for it. From collateral evidence, however, Drs Torrey and Gray were led to consider the present as the true *orbiculata*; and the correctness of their ideas has been confirmed by the latter botanist, on his recent examination of the original *Purshian Herbarium*, in Mr Lambert's possession, whereupon he writes:—" *Orchis orbiculata*, Pursh, is, as I suspected, the *macrophylla* of Hook. and Goldie. The other species, *orbiculata* of Hook. (*Hookeri nobis*) is not in Pursh's original *Herbarium*; but it exists in the Canadian Collection of Pursh, without a name." The latter plant has been correctly figured already in the *Exotic Flora*; which, together with our accompanying plate of the present species, will, I trust, clear up all future difficulty on the subject of these two species.

TAB. CC. Fig. 1. Flower; f. 2. Side view of an anther:—*magnified*.

5. *P. Menziesii* (Lindl. *Gen. Orch.* p. 286); foliis radicalibus binis subrotundo-oblongis erectis, caule sub-bisquamato, racemo laxo paucifloro, sepalis obtusissimis, petalis truncatis labello linearis obtuso brevioribus, calcare pendulo obtuso apice inflexo ovario subæquali. *Lindl.*

HAB. N. W. Coast of America. *Menzies*. (*Herb. nostr.*)—Scape about a span high.

6. *P. Schischmareffiana* (Lindl. *Gen. Orch.* p. 286); foliis radicalibus binis obovato-lanceolatis canaliculatis, spica subsecunda multiflora, bracteis oblongis obtusis ovarii longitudine, sepalis oblongis obtusis, petalis labelloque carnosis ovatis obtusis, calcare arcuato greciæ labello longitudine. *Lindl.* *Habenaria*, *Cham. in Linnæa*, 3. p. 29. Spir-anthes? *Unalaschkensis*. *Spr.*

HAB. Unalaschka. *Chamiso* (*in Herb. nostr.*)

7. *P. Königii* (Lindl. *Gen. Orch.* p. 286); caule folioso, foliis inferioribus oblongo-lanceolatis obtusis emarginatisque superioribus linearibus spicam sere æquantibus, spica densa cylindracea, bracteis herbaceis floribus æqualibus, labello subrhombœ-lineari obtuso calcare inflexo obtuso longiore. *Lindl.*—*a. petalis ovatis acutis*. *O. Königii*. *Retz.*—*Fl. Dan.* t. 333.—*b. petalis cordatis acuminatis*. *O. dolichorhiza*. *Fisch. ms.*

HAB. *b.* Unalaschka. *Langsdorff*.

8. *P. herbiola* (Lindl. *Gen. Orch.* p. 287); caule folioso, foliis inferioribus oblongis acutis superioribus lanceolatis acuminatis, spica densa cylindracea, bracteis herbaceis acuminatis floribus longioribus, labello linearis-lanceolato basi bidentato medio unituberculato calcare clavato duplo breviore. *Lindl.*—*Habenaria*. *Br.*—*Orchis Ph. Am.* 2. p. 574.—*O. fuscescens*. *Ph.*—*O. scutellata?* *Nutt.* (*fide Lindl.*).

HAB. Between Norway House and Canada. *Dr Richardson*. *Drummond*. The tubercle upon the lip is very prominent, and affords a remarkable character.

9. *P. hyperborea* (Lindl. *Gen. Orch.* p. 287); caule folioso, foliis lanceolatis strictissimis acutis, spica laxiuscula subsecunda, bracteis linearis-lanceolatis acutis flore longiori-

bus, sepalis deflexis, petalis labelloque linearibus obtusis subæqualibus calcaris obtusi penduli longitudine, radicibus longissimis carnosis. *Lindl.* *Habenaria hyperborea*. *Br.* —*Rich. App. 2. p. 33.* *Orchis. L.*—*Ph.*

HAB. Rare in Canada. *Dr Todd.* From the Saskatchewan to Fort Franklin. *Dr Richardson.* *Drummond.*

10. *P. dilatata* (*Lindl. Gen. Orchid. p. 287*); caule folioso, foliis lanceolatis gramineis, spica elongata cylindracea densa laxaque, bracteis linear-lanceolatis acuminatis floribus æqualibus longioribusque, sepalis ovatis obtusis, petalis minoribus conformibus membranaceis, labello rhomboideo linear-lanceolato obtuso calcaris obtusi longitudine. *Lindl.* *Habenaria. Hook. Ex. Fl. t. 95.*—*Gray, New or rare Pl. St. of N. York, p. 231.*—*Orchis. Ph. Am. 2. p. 588.*—*Habenaria borealis. Cham. in Linnaea. 3. p. 28.*—*Orchis agastachys. Fisch. mst.*— β . *angustifolia*; caule gracili.

HAB. Newfoundland. *Miss Brenton.* Throughout Canada, from Lake Huron to the Saskatchewan, and Hudson's Bay, abundant. N. W. America, about Fort Vancouver. *Douglas.* *Tolmie.* *Dr Scouler.*— β . Canada. *Cleghorn.*—I fear that this, which is a very common and highly variable plant, especially as regards its lax or dense growth, and size of the flowers and bracteas, and the breadth of the leaves, is only a luxuriant state of *P. hyperborea*, to which Dr Richardson has rightly referred his more northern plant. It seems probable also that *P. Königii* and *P. Huronensis* are too nearly allied to it.

11. *P. Huronensis* (*Lindl. Gen. Orch. p. 288*); caule folioso, foliis inferioribus oblongis superioribus gramineis, spica laxa tenui, bracteis acuminatis florum longitudine vel longioribus, labello ovato-lanceolato calcaris incurvi compressi longitudine. *Lindl.*—*Habenaria. Spr.*—*Orchis. Nutt.*

HAB. Lake Huron and Michigan. *Nuttall.* Quebec. *Mrs Sheppard.* Newfoundland. *Miss Brenton.*—Dr Lindley well observes of this, " *P. dilatata et P. borealis proxima, sed floreæ fere minores quam in P. herbivola.*"

12. *P. leucostachys* (*Lindl. Gen. Orch. p. 288*); caule folioso, foliis oblongo-lanceolatis obtusis, spica longissima densa, bracteis florum longitudine, sepalis ovatis obtusis, petalis membranaceis linearibus emarginatis, labello rhomboideo linear-lanceolato calcare filiformi arcuato duplo breviore, antheræ lobis parallelis rostellum maximo plicato. *Lindl.*

HAB. N. W. America. Plentiful in the valleys of the Blue Mountains. *Douglas.*—Habit of *P. dilatata*, 1½ to 2 feet high. Flowers white.

13. *P. gracilis* (*Lindl. Gen. Orch. p. 288*); caule folioso, foliis linearibus acuminatis obtusis debilibus patentibus, spica laxa elongata, bracteis angustis acuminatis floribus inferioribus remotis longioribus, petalis obliquis acuminatis obtusis, labello linearis obtuso calcaris apice inflati obtusissimi longitudine. *Lindl.*

HAB. N. W. America. *Menzies.*—" *Caules debiles, 1½-2-pedales. Folia 3-poll. longa, parum acuminata, nullo modo aucta.*"

14. *P. stricta* (Lindl. *Gen. Orch.* p. 288); caule folioso stricto, foliis ovato-lanceolatis internodiis duplo longioribus, spica laxa elongata, bracteis linearis lanceolatis floribus longioribus, sepalum dorsali latiore, petalis ovatis acuminatis obtusis, labello linearis-obtuso calcare apice inflato obtusissimo duplo longiore. *Lindl.*

HAB. N. W. Coast of America. *Douglas.* Observatory Inlet. *Scouler.*—"Priora differt habitu stricto, foliis brevioribus (2½ poll.) latioribus et magis acuminatis, domum calcare duplo breviore."

15. *P. graminea* (Lindl. *Gen. Orch.* p. 289); caule folioso, foliis strictis inferioribus linearis-lanceolatis obtusiusculis superioribus acuminatis, spica laxiuscula, bracteis acuminatis floribus brevioribus, petalis obliquis apice truncatis tridentatis labello rhombeo-lanceolato undulato venoso tenuibus calcare clavato arcuato duplo brevioribus. *Lindl.*

HAB. N. W. America. *Menzies.* Upland swamps, at Millbank Sound. *Tolmie.* "Glandula maxima pollinis squales."—I possess the present and the two preceding species, which, but for the opinion of Professor Lindley, I should have been disposed to unite with my narrow-leaved var. of *P. dilatata*, from Canada.

2. *Labellum incisum.*

16. *P. holopetala* (Lindl. *Gen. Orch.* p. 291); caule folioso, foliis ovato-lanceolatis acutis, spica laxa multiflora, bracteis linearis-lanceolatis ovarii longitudine, sepalis suborbiculatis obtusis supremo galeato, petalis linearibus acuminatis obtusis integrerrimis, labello lanceolato margine lacero calcare filiformi duplo breviore, ovario rostrato. *Lindl.*—*Habenaria blephariglottis. Hook. Ex. Fl.* p. 87. (nec aliorum, *fide Lindl.*).

HAB. Canada. *Goldie.*—Notwithstanding the high authority of Dr Lindley, I am still disposed to consider this as a very trifling variety of the following, only marked by having entire petals and small flowers. The toothing of the petals is, in the true *blephariglottis*, often nearly obsolete.

17. *P. blephariglottis* (Lindl. *Gen. Orch.* p. 291); caule folioso, foliis inferioribus huncelatis canaliculatis sensim decrescentibus, spica oblonga multiflora densa, bracteis foliaceis linearibus acuminatis floribus brevioribus, sepalis rotundato-oblongis lateralibus reflexis, petalis spatulatis dentatis, labello oblongo plano fimbriato medio papilloso calcare recto pendulo triplo breviore, ovario longissimo rostrato. *Lindl.*—*Orchis blephariglottis. Willd. (fide Lindl.) an alior.?*

HAB. Canada. *Schweinitz.* *Lady Dalhousie.* *Mrs Perceval.* *Mrs Sheppard.* Newfoundland. *Miss Brenton.*—Intermediate in the character of labellum and petals, between the preceding and following species.

18. *P. ciliaris* (Lindl. *Gen. Orch.* p. 292); caule folioso, foliis inferioribus ovato-lanceolatis supremis minimis, spica oblonga densa multiflora, bracteis acuminatis ovario brevioribus, sepalis reflexis ovato-subrotundis obtusis, petalis linearibus reflexis apice incisis, labello oblongo margine capillaceo multifido calcare arcuato duplo breviore, ovario colorato longissime rostrato. *Lindl.*—*a. floribus aureis. Lindl.*—*Habenaria ciliaris. Br.*—*Orchis, L.—Ph. Am.* 2. p. 585. *Sims, Bot. Mag.* p. 1668.—*β. floribus niveis. Lindl.*—*Orchis blephariglottis. Ell. et alior. (Lindl.).*

HAB. *a.* Canada. *Goldie (in Herb. nostr.).*

3. *Labellum tripartitum, laciniis indivisia.*

19. *P. rotundifolia* (Lindl. *Gen. Orch.* p. 292); folio solitario radicali subrotundato plano, scapo nudo, spica pauciflora laxiuscula, bracteis obtusis ovario brevioribus, sepalis petalisque obtusis, labello trilobo lobis lateralibus subfalcatis intermedio obcordato, calcare acuto labelli longitudine. *Lindl.*—(*TAB. CCI.*)—*Habenaria, Rich. App.* p. 33. *Orchis, Ph. Am.* 2. p. 588.

HAB. Hudson's Bay (*Herb. Banks.*) Island of Anticosti. *Goldie.* Newfoundland. *Mr Cormack.* Canada. *Lady Dalhousie;* to Carlton House Fort on the Saskatchewan; and to Jasper's Lake in the Rocky Mountains. *Dr Richardson. Drummond.*—Leaves spotted, Mr Drummond observes, like those of *Orchis maculata*. Flowers pale dirty white.

TAB. CCI. Fig. 1. Flower:—magnified.

4. *Labellum tripartitum, laciniis incisis.*

20. *P. incisa* (Lindl. *Gen. Orch.* p. 293); caule folioso, foliis obovato-oblongis sursum decrescentibus, racemo oblongo multifloro, bracteis linearibus acuminatis supremis floribus longioribus, sepalis oblongis lateralibus deflexis, petalis erectis oblongis denticulatis, labello unguiculati subrotundi laciniis cuneatis inciso-denticulatis intermedia majore calcare duplo breviore. *Lindl.*—*Habenaria, Spr.*—*Orchis, Willd.*—*Ph. Am.* 2. p. 589.

HAB. Sillery, Canada. *Mrs Sheppard.*—Perhaps only a stunted var. of the following.

21. *P. fimbriata* (Lindl. *Gen. Orch.* p. 293); caule folioso, foliis oblongis sursum decrescentibus, racemo oblongo multifloro, bracteis linearibus acuminatis supremis floribus subæqualibus, sepalis oblongis obtusis lateralibus deflexis, petalis erectis oblongis obtusis incisis, labelli unguiculati subrotundi laciniis cuneatis inciso-dentatis intermedia majore calcare duplo breviore. *Lindl.*—*a. grandiflora.*—*Habenaria, Br.*—*Hook. Ex. Fl.* t. 224. —*Orchis grandiflora. Bigel.* (*Habenaria, Torr.*—*Platanthera, Lindl.*)—*β. floribus minibus. P. crispa. Lindl.*

HAB. *α.* and *β.* Abundant throughout Canada. *Mrs Perceval. Mrs Sheppard. Cleghorn.* Newfoundland (chiefly *β*). *Miss Brenton.*

22. *P. psychodes* (Lindl. *Gen. Orch.* p. 294); caule folioso, foliis inferioribus oblongis obtusis supremis angustissimis acuminatis, racemo laxe multifloro, bracteis foliaceis floribus longioribus, sepalis retusis lateralibus deflexis, petalis emarginatis, labello unguiculato tripartito laciniis cuneatis capillaceo-multifidis subæqualibus, calcare ovario duplo breviore. *Lindl.*—*α. laciniis labelli omnibus multifidis. Lindl.*—*Orchis psychodes. L.*—*Ph. Am.* 2. p. 585.—*Habenaria, Spr.*—*Habenaria lacera. Br.*—*Orchis, Ph. Am.* 2. p. 586.—*β. lacinia intermedia labelli indivisa. Lindl.*

HAB. *α.* Canada. (*Pursh*), Sillery. *Mrs Sheppard.*—Probably not distinct from the preceding. On the subject of this species, my valued friend Dr Gray thus writes to me, after an examination of the Banksian and Gronovian Herbaria: “As to *Orchis psychodes*, there is still a great confusion of synonymy, or would

be if you were to go back to the original, which would now be scarcely proper. You will see by the *Sp. Plant. ed. 1.*, that the species is founded on a plant of Kalm, from Canada; and that a plant of Gronovius from Virginia, is referred to it. The *O. psychodes* of Willdenow, and as far as I know, of almost all later botanists, is the *O. lacera* of Mx.—Now, I find that the Gronovian plant is *O. cristata*, Willd. (the small-flowered, yellow, New Jersey species)—the specimen from Kalm, in *Herb. Linn.*, from which the detailed description is drawn, is *O. fimbriata*!—a specimen with more crowded flowers, and rather smaller than usual."

9. PERISTYLUS. Lindl.

(*Omnia Platantheræ, sed calyx semper campanulatus et calcar brevissimum sepius scrotiforme.*)

1. *P. Chorisianus* (Lindl. *Gen. Orch. p. 297*); foliis binis lato-ovatis acutis, spica pauciflora laxiuscula, bracteis ovatis acuminatis floribus longioribus, sepalis ovatis obtusis membranaceis patentibus, petalis carnosis subrotundo-ovatis conniventibus, labello ovato canaliculato obtuso apice cucullato, calcare brevissime subtereti. *Lindl.*—*Habenaria. Cham. in Linnæa, 3. p. 31.*

HAB. Unalashka. *Chamiso* (*in Herb. nostr.*).

2. *P. bracteatus* (Lindl. *Gen. Orch. p. 298*); caule folioso, foliis oblongis obtusis vel retusis sursum angustatis et acutioribus, spica laxa, bracteis foliaceis acuminatis floribus duplo triploque longioribus, petalis linearibus erectis, labello linearis truncato subcuneato angulis apice nunc productionibus, calcare inflato brevi. *Lindl.*—*Habenaria. Br.*—*Pursh. Am. 2. p. 587. Hook. Ex. Fl. t. 175.*

HAB. From Lake Huron (*Dr Todd*) to the Saskatchewan, and to swamps in the Rocky Mountains. *Dr Richardson. Drummond.*—Notwithstanding the greater size of this plant, (sometimes a foot high,) and its large foliaceous bracts, I am much disposed to concur with Dr Lindley in the opinion that it is not really distinct from *P. viridis* of Europe, of which I have specimens from the Altai, and from the Highlands of Scotland, which can scarcely be distinguished from it. I may add too, that Mr Drummond, who must have been familiar with *P. viridis*, marked his Rocky Mountain specimens by that name.

§ IV. ARETHUSEÆ. Lindl.

10. ARETHUSA. Sw.

1. *A. bulbosa*. L.—*Ph. Am. 2. p. 591. Hook. Ex. Fl. t. 170. Bot. Mag. t. 2204.*

HAB. Canada. *Pursh. Lady Dalhousie. Mrs Perceval. Goldie. Newfoundland. Mr Cormack.*

11. POGONIA. Juss.

1. *P. ophioglossoides* (Ker, *Bot. Reg. t. 148*); radice fibrosa, scapo unifloro, folio bracteaque elliptico-lanceolatis, petalis exterioribus oblongo-ovatis, labello disco papilloso margine dentato. *Hook. Ex. Fl. t. 70.*—*Arethusa. L.*—*Ph. Am. 2. p. 592.*

HAB. Canada. *Pursh*. *Lady Dalhousie*. *Mr Cleghorn*. Newfoundland. *Dr Morrison*.—Flower rose-colour.

2. *P. pendula* (Lindl. *Bot. Reg.* t. 908); foliis ovatis squamiformibus amplexicaulis, floribus subsolitariis cernuis, labelli lobo medio oblongo crispato, caule angulato. *Lindl.*—*Triflora pendula*. *Nutt.*—*Arethusa*. *Willd.*—*Ph. Am.* 2. p. 590.—*A. trianthophora*. *Sw.*—*A. parviflora*. *Mx.*

HAB. Canada. *Goldie*. *Douglas*. *Nuttall*.—Flowers white. Plant 2-4 inches high. Lindley has certainly correctly referred this curious little plant to *Pogonia*.

12. CALOPOGON. Br.

1. *C. pulchellus*. *Br. Hort. Kew. ed.* 2. v. 5. p. 204.—*Cymbidium*. *Willd.*—*Ph. Am.* 2. p. 592.—*Limodorum*. *Curt. Bot. Mag.* t. 116.—*L. tuberosum*. *Mx.*

HAB. Canada, frequent. Newfoundland. *Miss Brenton*. *Dr Morrison*.

13. EPIPACTIS. Hall.

1. *E. gigantea*; elata, foliis ovato-lanceolatis marginibus scabris, floribus solitariis axillaribus nutantibus, labello sepalis petalisque acuminatis.—(TAB. CCII.) *Douglas mst.*

HAB. N. W. America. On the subalpine regions of the Blue and Rocky Mountains. *Douglas*. Columbia River, about Fort Vancouver. *Dr Scouler*.—Two to 3 feet high; stem leafy to the top; leaves 5-6 inches long, the lower ones sheathing and very obtuse, the rest much acuminate. The colour of the flowers appears to be greenish-brown, like those of *E. palustris*; but in the large axillary flowers, it most resembles *E. pallens*, from which it may be at once known by its drooping flowers, acuminate sepals, petals and labellum, as well as by the leaves, which are moreover, very rough, with minute harsh serratures at the margin.

TAB. CCII. Fig. 1, Flower, side view; f. 2, Front view of do.; f. 3, Column and lip:—magnified.

§ V. NEOTTIEÆ. Lindl.

14. SPIRANTHES. Rich.

1. *S. cernua* (Rich.); foliis linear-lanceolatis radicalibus basi attenuatis superioribus sensim minoribus vaginantibus, spica densa, floribus demum cernuis bracteis brevioribus, sepalis petalisque coherentibus labello oblongo integerrimo apice dilatato crenulato inferne pulcherrime venoso brevioribus. *Lindl. Bot. Reg.* t. 283.—*Neottia*. *Willd.*—*Bot. Mag.* t. 1568. *Ph. Am.* 2. p. 589.

HAB. Canada; to the Saskatchewan and the Lake of the Woods in the Rocky Mountains. *Dr Richardson*. *Drummond*. Newfoundland. *Dr Morrison*. *Miss Brenton*. N. W. America. *Menzies*. Fort Vancouver. *Douglas*. *Drummond*.—At first sight resembling stout plants of the European *S. festalis*; but the spikes are much more dense, the bracteas and flowers larger, and the lateral sepals cohere with the upper one and the petals, for nearly their whole length.

2. *S. gracilis*; foliis radicalibus ovatis petiolatis, scapo elongato vaginis subfoliosis

squamatis, spica gracili laxa, floribus bracteas superantibus, sepalis lateralibus liberis labello oblongo-subspathulato crenulato paullo longioribus.—(TAB. CCIII.)—*Bigel. Bost. ed. 2. p. 322.*—*Neottia tortilis. Ph. Am. 2. p. 589 (non Sw.).*—*Ophrys aestivalis. Mx. Am. 2. p. 157.*

HAB. Canada, and from Lake Huron, (*Dr Todd*) to Fort Franklin, on the Mackenzie River. *Dr Richardson. Drummond.*—Dr Bigelow has well described this plant, and remarked that the radical leaves frequently falling off, cause it to appear leafless at the time of flowering; and it is this imperfect state evidently, that Michaux has described, and when he says, "scapo folioso, foliis lanceolatis neutriisimis," he alludes to its leaf-like scales. Pursh completely misunderstood Michaux, or he would never have referred the plant to *Neottia tortilis* of Swartz, which has linear radical leaves a foot long, and a scape 2 feet high; and he has copied the character of *N. tortilis* from Swartz and Willdenow. The present species is frequent in the United States. I possess specimens from Drs Schweinitz and Boott, and from Mr Greene.

TAB. CCIII. Fig. 1, Flower; f. 2, Labelium:—magnified.

3. *S. decipiens*; foliis radicalibus ovatis, scapo pubescente squamoso squamis subfoliaceis, spica multiflora laxiuscula, bracteis flore brevioribus, labello ovato acuminate obtuso basi concavo apice conduplicato, anthera gynizoque acuminatis. (TAB. CCIV.)

HAB. Lake Huron. *Dr Todd.* Lake Simcoe, and near the sources of the Columbia River. *Drummond.* Fort Vancouver and Straits of De Fuca. *Dr Scouler.*—This plant has so completely the habit of the *Goodyera pubescens* of American Botanists, that if I had not observed that its sepals were more acuminate, I should have been satisfied that it was that plant. But on looking into the flower, I find the column and anther and pollen to be completely those of a *Spiranthes*. Root or caudex creeping, jointed, with lateral fibres, resembling a *Scolopendra*. The leaves are in like manner frequently tessellated, or mottled with dark green on a pale green. Scape 8 inches to a foot high. Spike downy. Sepals ovato-lanceolate, acuminate, but rather obtuse, petals lanceolate, cohering with the upper sepal. Lip parallel with the column, ovate and concave at the base, then tapering gradually into a long, narrow, canaliculated, obtuse, nearly straight point. Column short. Stigma square near the base, tapering upwards into a long sharp acumen, the gynizus; anther, from the back of this, fixed and parallel with it, ovate, very convex above, terminating in a very sharp apex, opening with two cells and casting the pollen-mass on the back of the gynizus. This pollen-mass consists of a long subulate connectivum, to which are fixed, one on each side, a double row of compact cohering grains, the whole being pyriform, full yellow.

TAB. CCIV. Fig. 1, Flower; f. 2, Column and lip; f. 3, 4. Different views of the column; f. 5, Upper side of a pollen mass; f. 6, Underside of do.:—magnified.

15. GOODYERA. Br.

1. *G. repens* (Br.); foliis ovatis subunicoloribus, labello ovato sublonge acuminate acumine modice recurvo, columná brevissima. *Hook. Fl. Lond. N. S. t. 144.*—*Neottia. Sw.—Ph. Am. 2. p. 589.*—*Satyrium. L.*

HAB. Mountain woods of the Rocky Mountains (*Drummond*) and from the Saskatchewan to Fort Franklin. *Dr Richardson.*—Smaller than the following, with the leaves thinner, rarely reticulated with white veins. I have in vain sought for a distinctive character in the sepals; they appear to me to be of the same shape in both species, and even the lip presents but little character. The acumen is, however, longer and less recurved in the present individual, and the column is always very short.

2. *G. pubescens* (Br.); foliis ovatis plerumque albo-reticulatis, labello ovato brevi-acuminato acumine arcte reflexo.—*Lindl. Coll. Bot. t. 25. Bot. Mag. t. 2540* (mala).—*Neottia. Willd.*—*Ph. Am. 2. p. 590.*

HAB. Canada. *Pursh.* *Dr Todd.* *Mrs Sheppard.* *Mrs Perceval.* Newfoundland. *Miss Brenton.*

16. LISTERA. Br.

1. *L. cordata* (Br.); caule bifolio, foliis oppositis cordatis, sepalis ovato-oblongis, racemo glabro, labello linearis basi utrinque unidentata apice bifida lacinias linearis-acuminatis, columna per breve. *Hook. in Pl. Lond. N. S. t. 143.*—*Epipactis. Sw.*—*Ophrys. L.*—*E. Bot. t. 358.*—*Mx.*— β . sepalis labelloque angustioribus.

HAB. Newfoundland and Labrador. *Dr Morrison.* Lake Winnipeg to the Saskatchewan. *Dr Richardson.*— α . N. W. Coast; from De Fuea to Uinalaschka. *Chamiso.* *Bongard.* *Dr Scouler.* *Tolmie.*—This, according to Nuttall, is found so far south as New Jersey in the United States. The N. W. specimens have certainly narrower sepals and lip than the others.

2. *L. convallarioides* (Nutt.).—caule bifolio, foliis oppositis orbiculari-ovatis, racemo pubescente, sepalis anguste lanceolatis demum reflexis, labello oblongo-obcordato bifido cum mucrone intermedio obtuso lacinias brevibus obtusissimis, columna elongata cylindrica. (*Tan. CCV.*)—*Epipactis. Sw.*—*Ph. Am. 2. p. 591.*—Listera Eschscholtziana. *Cham. in Linnaea. v. 3. p. 33.*

HAB. Near Quebec. *Torrey (in Herb. nostr.).* *Mrs Perceval.* Lake Huron. *Dr Todd.* Shady woods in mountain swamps at the base of the Rocky Mountains. *Drummond.* N. W. America. *Menzies, in Herb. Banks. (Ride Boott.).* Clarence Straits. *Tolmie.* Uinalaschka. *Chamiso (in Herb. nostr.).*

TAB. CCV. Fig. 1, Flower:—magnified.

§ VI. CYPRIPEDIEÆ. Lindl.

17. CYPRIPEDIUM. L.

* *Scapigera.*

1. *C. humile*, *Sw.*—*Ph. Am. 2. p. 596.*—C. acaule. *Ait. Bot. Mag. t. 192.*— α . petalis flavescenti-viridibus vel fuscouscentibus, labello purpurascente, intus venis saturatis purpureis. *Rich. t. c.*— β . labello flavescenti-albo. *Rich. t. c.*

HAB. New Brunswick. *Mr Kendall.* Newfoundland. *Miss Brenton.* *Dr Morrison;* und (α . and β .) from Canada to Fort Franklin on the Mackenzie River. *Dr Richardson.*

** *Caule foliato.*

2. *C. spectabile* (*Sw.*); sepalis subæqualibus lato-ovatis obtusis, petalis lanceolatis planis longioribus, labello petalis longiore ventricoso subsulcato, stamine sterili cordato-ovato

obtuso.—*Lindl. Bot. Reg. t. 1660. Ph. Am. 2. p. 594.*—*C. album. Ait.*—*Bot. Mag. t. 216.*—*C. Canadense. Mz.*—*C. Calceolus. γ. L.*

HAB. Canada. *Pursh. Dr Todd. Mrs Perceval. Mrs Sheppard.*—Flower the largest of any of the N. American species. Sepals and petals white, lip tinged with purple.

3. *C. pubescens* (Willd.); sepalis lanceolatis, stamine sterili triangulari acuto, labello petalis breviore subtus superneque convexo-gibboso lateraliter compresso. *Hook. Bot. Mag. folio 3024* (ad calcem); *t. 3024. A. Ph. Am. 2. p. 594. Rich. App. p. 34.*—*C. parviflorum. Bot. Mag. t. 911 (non Willd.).*

HAB. Canada to the Saskatchewan. *Dr Richardson. Drummond.*—Sepals narrow, greenish-brown, streaked with purple. Lip yellow.

4. *C. parviflorum* (Salisb. in *Linn. Trans. 1. p. 77. t. 2. f. 2.*); sepalis lato-ovatis, stamine sterili triangulari acuto, labello petalis breviore supr々 subtusque planiusculo. *Hook. Bot. Mag. t. 3024. Ph. Am. 2. p. 594.*

HAB. Newfoundland. *Miss Brenton*; and throughout Canada to Lake Winnipeg and the Rocky Mountains. *Dr Richardson. Drummond.* N. W. America, in the Blue Mountains.—Very nearly allied to the preceding, and often confounded with it. Sepals broader, and, as well as the petals, chocolate-coloured. Lip deeper yellow, flattened as it were above and below, the sides swelling out. It is, I believe, the more generally diffused of the two species in British N. America.

5. *C. passerinum* (Rich. *App. p. 34.*); sepal superiori ovali-subrotundo petala oblonga obtusissima labellumque obovatum ore rotundatum contractum subaequante, stamine sterili elliptico-cordato obtuso.—*C. parviflorum. Rich. App. ed. 1. p. 340 (excl. syn.).*

HAB. Pine woods, from the Saskatchewan to lat. 58°, and in the Rocky Mountains. *Dr Richardson. Drummond.*—A very remarkable and most distinct species, found, as far as I know, by no naturalist except those now mentioned. It is admirably described by Dr Richardson.

6. *C. arietinum* (Br. *Hort. Kew. ed. 2. v. 5. p. 222.*); calyce trisepalo, stamine sterili orbiculari-spathulato, labello saccato-calcarato. *Br. in Bot. Mag. t. 1560.*

HAB. Canada; Montreal (*Messrs Chandlers and Buckingham*). *Goldie.* Portage of the Grand Rapid of the Saskatchewan. *Drummond.*—Only two or three specimens were gathered, and those in fruit; but roots were brought home which flowered in the Belfast Botanic Garden.—A small species, readily distinguished by the distinct sepals and lip coming to a deflexed point at the apex below, so as, in some directions, to resemble the head of a sheep or ram.

7. *C. guttatum* (Sw.) ; caule diphylo, stamine sterili ovato emarginato deflexo, sepal superiori ovato petalisque lanceolatis labellum ovali supra depresso ore patulo subsequantibus. *Reichenb. Ic. Bot. t. 210.*

HAB. Two specimens only, with withered flowers, were gathered by *Dr Richardson* at Fort Franklin, on the Mackenzie River. *Unulaschka*, most abundant. *Chamiso.*—Flower rather small, beautifully mottled with purple and white. The leaves always turn black in drying.

ORD. XVI. IRIDEÆ. Juss.

1. IRIS. L.

1. *I. versicolor*. L.—*Bot. Mag. t. 21.*

HAB. Canada. *Pursh.*

2. *I. Virginica*. L.—*Bot. Mag. t. 703.*—*I. hexagona*. *Walt.*—*I. lacustris?* *Nutt.*

HAB. Canada. *Pursh. Cleghorn*; to the Saskatchewan. *Dr Richardson. Drummond.* New Brunswick. *Mr Kendall.*

3. *I. tridentata*. Ph.—*I. tripetala*. *Walt.* (*not Thunb.*) *Bot. Mag. t. 2886.*

HAB. Canada. *Mrs Sheppard.*—Mr Herbert observes, “there are intermediate forms between *tridentata*, of which the petals are nearly obsolete, and *Virginica*, for the most part with a naked unbranched stalk, furnished below with a great foliaceous bract, sometimes with a short secondary branch proceeding from it.”

4. *I. Caurina*. Herb. mst.

HAB. Canada. *Cleghorn. Goldie. Dr Todd.*—Under this name, Mr Herbert has marked in my Herbarium specimens of an *Iris*, of which I will not venture to draw up a character from the dried specimens; but which will doubtless be a subject of remark in the *Monograph of Iridæa*, preparing for the press by that zealous botanist. The note made by Mr Herbert, is to the following effect: “*Iris Caurina*, W. H., caule simplici vel ramulo inferiore minore brevior;” and further, “this plant has certainly the aspect of *I. tridentata*, but its petals are perfect, and the main distinction between its flower and that of *Virginica* is thereby removed, the tridentate petal being only an imperfection. The sub-equal fork characterizes *I. Virginica*.”

1. CAREX.* L.

The following valuable list, with characters and descriptions of new species of the British North American *Carices*, is entirely the work of my inestimable friend Dr Boott. The paper was accompanied with a letter, from which I make the following extract:—

"After months and months," says Dr Boott, "of intermittent study of *Carex*, I have completed the list of British and North American species, for publication in your British North American Flora, and if the deepest interest in the subject avails much, I can offer that as a recommendation of my humble labours. I have made the sketch as concise as possible, and, therefore, I hope you will publish it as I send it, letting me bear the responsibility of its defects. In a genus comprising so many species, I have thought it advisable at once to annex a full description of the new species. It will give an additional value to your admirable work; and, to afford space, I have inserted nothing on the known species, but what is essential to their being recognised, leaving synonyms to be gleaned generally from works that are easy of access to all. I have re-

* Vide Mémoires Acad. Imp. des Sc. de St Petersb. tom. 1. 1831. p. 195. "Cyperaceæ novæ. C. A. Meyer."—Mém. de l'Acad. Imp. des Sc. de St Petersb. 6 series, tom. 2. p. 168. "Bongard Obs. sur la Veg. de l'Isle de Sitcha."—Silliman's Journal. "Caricography. C. Dewey." vols. 7, 9, 10, 11, 28, 29, 30.—Monograph of the N. American Sp. of Carex. L.D. de Schweinitz. Edit. by J. Torrey, in Annals of Lyceum of Nat. Hist. N. York, 1825.—Mon. of N. American Cyperaceæ. J. Torrey, 1836.—Michaux, Fl. Bor. Am. 2. p. 169.—Muhlenberg des ub. Gram. et pl. cal. Phil. 1817.—Willdenow, Sp. pl. 4, 207.—Schkuhr, riedgraff, (opus exsumum).—Kunth Cyproraphia. Stuttgart, 1837.—Goodenough, in Lin. Trs. 2, 126; 3, 76.—Rudge, Lin. Trs. 7, 96.—Hoppe and Sturm, Caricologia Germanica, 1895.

sorted to measurements in my descriptions, as affording something like precision in character, and I have taken the scale of Vahl in his paper in *Act. Holm.* as my standard. This has given me trouble, but *labor ipsa voluptas*. I shall go on and prepare a monograph of the genus, describing a few new species in a paper for the Linnean Society this winter. I find the grouping of the (perhaps) 550 species of the *Carex* in one list, a puzzling thing. I have not affected to arrive at anything like natural grouping in the list of the British North American species, but have availed myself of some simple characters, to throw them into as reasonable a succession as I could. In a note at the beginning, I have made a reference to the principal works to be consulted; but for the sake of brevity, I have not quoted, under each species, all these works. For instance, I have not referred to any author beyond the one who first described the species; and, therefore, you will not find Willdenow nor Kunth quoted, except in those cases where it was essential. Had I done so, it would have swelled the paper to an inconvenient size. I have quoted Schkuhr's admirable figures, giving the numbers of the fig. and not the lettering.

"To do honour to the intrepid men who have so much exalted the character of our race by their arctic voyages, I have called the new species generally after them, including the name of Dr Richardson's gallant though humble friend, Hepburn; you will find it necessary, therefore, to change a few of the names I have affixed to the specimens forwarded to you by Hornemann. *C. fuscicolor* is *C. Liddoni*; *C. varia*, var. from North America and the Rocky Mountains, is *C. Mossi*; *C. integra* is *C. Hopperi*. I cannot find any authority for admitting *C. squamosa* and *C. sparganioides* as natives of British America."

136. *C. nigra. Allion.*—*Schk. f. 115.*

HAB. Labrador. Schweinitz. Torrey.

137. *C. Tolmiei* (Boott); spica mascula 1, scamineis 4-8 fusco-nigris ovatis oblongo-cylindricisque approximatis, superiori sessili, reliquis pedunculatis bracteatis evaginatis inferiori remota nutante, stigmatibus 3, perigyniis triquetro-ellipticis cylindrico-rostratis ore obliquo indiviso obsolete nervosis nigro-fuscis colore pallido intertinctis squama fusca lanceolata brevioribus et longioribus.

HAB. Columbia River. Tolmie.

Culmus 1-1 ½ pedalis, triqueter, glaber, firmus, strictus, basi foliatus, reliquis laceratis pallidis rudimentisque fuscis striatis foliorum tectus, pars spicas gerens 3-4 pollicaris. Folia 1-2 lineas lata, firma, carinata, superiora longiora culmo breviore, superne margine scabra, apice triqueta acuta. Bractæ foliacæ, fusco-auriculate,

evaginantes : inferiores 1-1½ lin. late culmum evantes, sursum decrescentes. *Spica mascula* 6-8 lin. longa ½ lin. lata, squamis oblongis obtusis fuscis, nervo pallido. *Spica faginea* (rarius flocculis masculis paucis, nisi apice instructæ) 4-8, tres ad octo lin. longæ, 2 lin. late, superiores ovatis sessiles et brevi-pedunculatas, inferiores oblongo-cylindricæ longius pedunculatum, infima subrotundata nutans, basi laxiflora ; squamis nigro-fuscis concoloribus, vel nervo pallidiori ; inferioribus lanceolatis acutis perigynio longioribus, superioribus ovatis acutisculis et breviribus. *Perigynium* 1½ lin. longum, ½ lin. latum, triquetrum, ellipticum vel ova- tum, rostro nigro cylindrico, ore oblique indiviso, nigro-fuscum colore pallido variegatum. *Achenium* ½ lin. longum, ¼ lin. latum, obovato-triquetrum, castaneum, basi styli terminatum.

138. *C. nigella* (Boott) ; spicis masculis 2 inferiori bracteata squamis lanceolatis mucronatis ferrugineis, scemiteis 2-3 spadiceis oblongis approximatis erectis pedunculatis bracteatis evaginatis, perigyniis triquetro-ellipticis cylindrico-rostratis ore obliquo bidentato fuliginosis basi pallidis squama nigra concolori lanceolata mucronata brevioribus, stigmatibus 3.

HAB. Columbia River. *Tolmie*.

Radix repens, fibris lignosis lanatis. *Culmus* subpedalis, acute triquetus, superno scabriusculus, basi foliatus, foliis marcidis rudimentisque foliorum atriaris fascis tectus, pars spicas gerens bipollucris. *Folia* 1-2 lin. late, marginis scabra, culmo brevior (marcida culmum subsequantia) apice triquetra acuta. *Bracteae* foliacæ, nigro-auriculatæ, evaginantes, inferior culnum evantes. *Spica mascula* 2, 4-6 lin. longæ, 2 lin. late ; squamis ferrugineis lanceolatis mucronatis. *Spica faginea* 2-3, spadiceo-purpureæ concordes, ellipticæ vel oblongæ, basi attenuatae, 5-7 lin. longæ, 2 lin. late, approximate, superior sessilia (uno exemplo apice parco mascula), reliqua pedunculatae erectæ, squamis lanceolatis acutis mucronatis perigynio (principue inferioribus) longioribus. *Perigynium* 1½ lin. longum, ¾ lin. latum, triquetro-ellipticum, cylindrico-rostratum, obliqua bidentatum, enervium, impresso-asperatum, spadiceo-purpureum basi pallidum. *Achenium* ½ lin. longum, ¼ lin. latum, oblongo-obovatum, stramineo-pallidum, basi styli æquali terminatum.—Aff. *C. Tolmiae*, dif. perigynio bidentato squamis omnibus lanceolatis mucronatis, spicarum numero.

5. ERIOPHORUM. L.

* *Spike solitary.*

1. *E. alpinum*. L.—*E. Bot.* t. 311. *Gray, Gram. et Cyp. Part I.* n. 87. *Bigel. Fl. Bost. ed. 2.* p. 23.—*E. Hudsonianum*. *Mx.*—*Trichophorum alpinum*. *Ph.*—*T. Hudsonianum*. *Nutt.*

HAB. From Hudson's Bay to Lake Mistassins. *Mx.*—I possess mountain-specimens of this plant from the United States; but I have never had the good fortune to see any from British North America, nor do I know the authority for it, save that of Michaux above quoted.

2. *E. vaginatum*. L.—*E. Bot.* t. 873. *Rich. App. ed. 2. p. 2.*—*Gray, Gram. et Cyp. Part I. n. 88.*—*E. caespitosum. Host, Gram. t. 38. Ph.*— β . foliis culmo duplo brevioribus.— γ . perigynii pilis fulvis.

HAB. Newfoundland. *Mr Cormack.* Canada (*Mrs Perceval*) to Fort Enterprise. *Dr Richardson.* *Drummond.*— β . Saskatchewan.— γ . Newfoundland. *Mr Cormack.* Lake Huron. *Dr Todd.*—This is certainly a highly variable species, not only in the length of the leaves, which are generally shorter, though sometimes twice as long as the culms, but also in the spikes, which, according to some of Mr Drummond's specimens, do vary not only in the length of the hairs, but also in the form of the spike, being sometimes oblongo-ovate, and sometimes spherical. Thus I am not surprised at Dr Torrey, who remarks in his valuable account of North American *Cyperaceæ*, that *E. capitatum* is very difficult to be distinguished from *E. vaginatum*.

3. *E. capitatum*. *Host*,—*Engl. Bot. t. 2387. Br. App. to Parry's 1st Voy. p. 284. Hook. in Parry's 2d Voy. p. 407.*—*E. Scheuchzeri. Roth.*—*E. Chamissoi. Mert. in Mem. Acad. Petersb. 6th Ser. 1. p. 203. f. 3. Torr. Cyp. p. 237.*— β . foliis scabris.—*E. callithrix. Cham. et Mey. Cyp. Nov. in Mem. Acad. Petersb. 6th Ser. 1. p. 203. t. 23.*

Labrador. *Miss Brenton.* Newfoundland. *Mr Cormack.* From Quebec (*Mrs Sheppard*) to the swamps on the summits of the Rocky Mountains (*Drummond*), and to the Arctic coasts and islands. *Dr Richardson.* Uralaschka. *Chamisso.*— β . St Lawrence, Ithring's Straits.—See the remarks on the preceding species. My authentic specimen of *E. Chamissoi* precisely accords with *E. capitatum*.

** Spikes several.

4. *E. Virginicum*. L.—*Mx.*—*Ph.*—*Gray, Gram. et Cyp. Part I. n. 89.*

HAB. Canada to the Saskatchewan. *Mrs Sheppard. Dr Richardson.*—Readily distinguished by its nearly sessile spikes, and constantly tawny hairs.

5. *E. polystachyon*. L.—*E. Bot. t. 563. Ph.*—*Hook. in Parry's 2d Voy. p. 407. Gray, Gram. et Cyp. Part I. n. 90. Torrey, Cyp. 339.*—*E. polyst. β . Rich.*

HAB. Canada to the Rocky Mountains, and to the Arctic sea-shore and islands.

6. *E. angustifolium*. *Roth.*—*E. Bot. t. 564. Ph.*—*Br. in Parry's 1st Voy. App. p. 274. Hook. in Parry's 2d Voy. p. 407. Rich. App. ed. 2. p. 2.*—*E. tenellum. Nutt.*—*E. polystachyon var. tenellum. Gray, Gram. et Cyp. Part I. n. 91.*

HAB. Canada to Arctic America.—I have the same difficulty in determining the limits of the many-spiked *Eriophora* of North America, as regards those of Britain (as expressed in *Brit. Flora*, ed. 4. p. 30), *E. Virginicum* alone excepted. Dr Torrey indeed observes, that the present species is easily distinguished from *E. polystachyon* by its narrow triangular leaves, one-leaved involucle, and narrow nut. This is the case with the extreme states of the plant; but Dr Torrey proceeds, "Mr Brown thinks that the Arctic plant, collected in Parry's 1st voyage, may prove a distinct species, between *E. angustifolium* and *E. polystachyon*;" and further, "he notices two varieties of it, one with smooth, the other with scabrous peduncles,"—thus appearing to include the *E. pubescens* of Smith.

7. *E. gracile*. Roth.—*E. Bot. t. 2402.* Hook. in Parry's 2d Voy. p. 407. Torrey, Cyp. p. 241.—*E. triquetrum*. Hoppe.

HAB. Saskatchewan to Arctic America. Dr Richardson. Drummond. Capt. Parry.—Specimens of this entirely accord with the *E. gracile* of Europe, and yet scarcely differ, except in being more slender in every part, from the preceding.

8. *E. strictum* (Br.); spicis pedunculatis involucro brevioribus, squamis acutiusculis tenuissime ciliatis, foliis strictis planis apice triquetro, culmo teretiusculo. Br. in Rich. App. ed. 2. p. 3. Torrey, Cyp. p. 342.

HAB. Subarctic America. Dr Richardson.—“*Dubia* species, *E. tenello* (Nutt.) proxima.” Br.—I am unacquainted with this plant.

2. *C. arundinaceum*.—Vilfa. Trin. Diss.—Gram. Ic. t. 55. Hook. et Arn. in Bot. of Beech. Voy. p. 131.—Colpodium latifolium β. Kth.

HAB. Kotzebue's Sound. Beechey. Cumberland House Fort, and Hudson's Bay. Drummond. Bear Lake to the shores of the Arctic Sea. Dr Richardson.—Of this little known grass, Dr Richardson has the following description in his notes made on the recent plant—" *Calyx* of 2 unequal valves, which are ovato-lanceolate, boat-shaped, concave, scarcely acuminate, compressed, quite smooth and entire, reddish-brown and shining; smaller valve half the size of the other. *Corolla* of 2 nearly equal valves, of similar colour and consistence with the calyx, equal to, or rather longer than the larger valve of the calyx; its outer valve embracing the inner, and a little longer: both obtuse, compressed, serrulated at the keel, otherwise smooth, somewhat membranaceous at the margin and edges, and there entire. *Stamens* 3. *Styles* 2? perhaps united. *Stigmas* plumose, branching? *Seed* loose. This seed appears to be oblong, and there are 2 or 3 lanceolate, pointed membranaceous scales.—I should be disposed to refer it to *Cinna*, if it had only one stamen and one style; as it is, it possesses all the characters of *Vilfa* or *Colpodium*."

3. *C. pauciflorum*; panicula erecta spicæformi angusta pauciflora, gluma perianthium superante uniflora cum rudimento pedicellato, valvis subæquantibus acutissimis carina superne præcipue aspera unifloris, perianthio obtuso valvis apice dorso marginibusque asperulis, foliis linearí-acuminatis subrigidis siccitate complicatis vel marginibus involutis.

HAB. Between Fort William and Cumberland House Fort. Dr Richardson.—Smaller and much slenderer than *C. latifolium*, with a very narrow few-flowered panicle, the floret of a much paler and greener hue, the glumes sharper and constantly longer than the perianth; and there is always a distinct but abortive pedicellate floret present, arising from the base of the inner valve of the perfect one.

17. VILFA. Beauv.

1. *V. cuspidata* (Torr. mst.); culmis numerosis gracilibus vaginisque glabris, foliis

subdistichis angustis involutis tenuissime elongatis, paniculis elongatis angustissimis exsertis, glumis subæqualibus acutissimis carina scabris unifloris absque rudimento, perianthii exserti valvula exteriori paululum longiore trinervi cuspidata.

HAB. Banks of the Saskatchewan, near the Rocky Mountains. *Drummond*. Plains of the Red River. *Douglas*.—Mr Drummond's specimens are named *V. cuspidata* by Dr Torrey, and considered by him a new species. Its nearest affinity is with *V. vaginiflora*, Torr. (in *Gray, Gram. et Cyp. Part I. n. 3.*) and *P. involuta*, Torr. (*in Gray, Gram. et Cyp. I. c. n. 4.*) ; the foliage and habit bearing a considerable resemblance, but the panicle is much elongated, the flowers smaller, more rigid, and considerably different in structure.—*V. clandestina* (*Spr., and Torr. Fl. p. 90.*) agrees with this in so many respects, that I am not sure that they are really distinct; but my authentic specimens of *T. clandestina* are in a very imperfect state.

2. *V. tenacissima*. *H. B. K.*—*Trin. Gram. Ic. t. 60.* *Sporobolus*. *Beauv.*—*Agrostis*. *Jacq.* β . *fuscicolor*; panicula ramis longioribus glumis valde inæqualibus.

HAB. β Common on Menzies' Island, N. W. America, and on the higher parts of the Columbia River.—There is only one specimen of this plant, which may probably prove distinct from that to which I have referred it. The culma and foliage sufficiently accord, however, and the panicle is very similar; but the branches are longer, the flowers rather larger, more deeply coloured and brown, and the valves of the calyx (or glume) very unequal. Indeed in the United States specimens of the true *V. tenacissima*, I find the calyx valves much more unequal than is represented in the figure of *Trinulus*, or described in Dr Torrey's Flora.

18. AGROSTIS. L.

1. *A. alba*. *L.* *E. Bot. t. 1189.*—*Ph.*—*Torr. Fl. p. 85.*—var? valvula flosculi e medio dorso setigera. *Nees. in Herb. nostr.*

HAB. var. Moist ground and banks of streams near the confluence of the Columbia River. *Douglas*.—Certainly this plant has so exactly the appearance of our well-known *Agrostis alba*, that we hardly dare venture to consider it distinct, although the back of the valve of the corolla constantly bears a slender awn rather longer than the flower, and very conspicuous. The valves of the glumes too are very rough on the keel.—The European *A. alba* has sometimes a short awn from the corolla.

2. *A. vulgaris*. *Sm. E. Bot. t. 1671.*—*Ph.*—*Torr. Fl. p. 85.*—*A. polymorpha*. *Huds.*—*Gray, Gram. et Cyp. Part II. n. 108.*

HAB. Common on banks of streams, N. W. Coast. *Douglas*. Observatory Inlet. *Dr Scouler*.

3. *A. exarata* (*Trin.*) ; radice fibrosa, culmis erectis simplicibus vaginisque sulcato-striatis et glabris, foliis linearibus acuminatis planis retrorsum scabris, panicula ramosa erecta contracta, ramis semiverticillatis adpresso-erectis hispidis, glumis acuminatis carina denticulatis florem muticum duplo superantibus, superiore paulo breviore. *Trin. Gram. Unif. 205.* *Ejusd. Ic. t. 27.* *Bong. Veg. de Sitcha, p. 52.*— β . *minor*; perianthio univalvi. *A. Drummondii*. *Torrey, inst.*

HAB. Unalaschka. *Chamisso*. Sitcha. *Bongard*.— β . Valleys of the Rocky Mountains, on the east and on the west side of the dividing ridge. *Drummond*. *Douglas*.—The var. β . is probably a distinct species; but knowing how sportive are the flowers of several species of *Agrostis*, I prefer considering it a var. of *A.*

exarata. The plant is smaller, and the leaves shorter; yet the flowers seem entirely to correspond, except in the absence of one of the valves of the corolla. Dr Torrey calls it *A. Drummondii*, *mat.*, but remarks its close affinity with *A. exarata*, Trin. and the one-valved corolla. According to Bongard, the *A. exarata* is sometimes furnished with an awn arising from above the middle of the inner valve of the corolla.

4. *A. rubra*. L.—*Wahl. Lapp.*—*Trin. Gram. Ic. t. 33.*

HAB. Millbank Sound. N. W. Coast America. *Mr Tolmie*.

409.—*Melica. Spr.*

HAB. Arctic Sea-coast and Islands. *Dr Richardson. Parry. Sabine.* Kotzebue's Sound. Beechey.

27. AIRA. L.

1. *A. flexuosa*, L.—*E. Bot.* t. 1519. *Ph.*—*Torr. Fl.* p. 132. *Gray, Gram. et Cyp.*
Part I. n. 43.

HAB. Canada. *Ph. Mrs Sheppard.* Newfoundland and Labrador. *Dr Morrison.* N. W. Am. *Douglas.*

2. *A. Danthonioides* (*Trin.*) ; glumis perianthia inaequaliter denticulata dorso aristata excedentibus, aristis geniculata glumis longiore, foliis angustissimis. *Trin. in Act. Petrop.* 1830. 6. 57. *Kth. Agrost.* p. 290.

HAB. Low plains of the Columbia, near Fort Vancouver. *Douglas.* N. W. Am. (*Kth.*)—A very peculiar grass, of which I have seen no authentic specimen, but which I refer here at the suggestion of Dr Gray.

3. *A. atro-purpurea*, *Wahl.*—*Bong. Veget. de Sitcha,* p. 54.—*Avena, Link.*—*Aira alpina, Vahl, in Fl. Dan.* t. 961.

HAB. Sitcha. *Bongard.*

4. *A. latifolia*; panicula laxa, pedicellis scabriusculis, glumis opacis lato-ovatis acuminate complicito-carinatis glaberrimus flosculos (2) superantibus, perianthi valv. ext. 4-nervio apice 4-dentato eroso, arista infra medium inserta superiori glumis aequali inf. breviore, foliis lato-linearibus acutis glabris. (TAB. CCXXVII.)

HAB. Rocky Mountains. *Drummond.*—A very remarkable species, which Drs Torrey and Gray are disposed to refer to *Avena*: but it seems to me rather to have the character of *Aira*. It is remarkable for the breadth of the leaves, and for the large, opaque (not glossy), purple-green colour of the glumes. The awns are almost wholly included. The florets at the base, as well as the pedicel of the upper floret, are villous with long white hairs: the inner valve of the perianth is bicarinate, with a strong nerve at each carina, and scabrous.

TAB. CCXXVII.—*Fig. 1.* Spikelet; *f. 2.* Florets; *f. 3.* Outer valve of the perianth; *f. 4.* Inner valve of do.:—*magnified.*

5. *A. elongata*; panicula longissima composita gracili, ramis appressis scabris, glumis linearis-subulatis carinatis 3-nervulis (carina scabra) flosculos 2 multo superantibus, perianthii valvula exteriori apice 4-dentato obsolete 4-nervio arista stricta longissima perianthium multo superante, foliis angustissimis setaceis rigidis. (TAB. CCXXVIII.)

HAB. Sandy islands of the River Columbia. *Douglas.*—This, too, in the opinion of Messrs Torrey and Gray, should be referred to *Avena*: but it must be recollected that every Agrostographist has his own views respecting the limits of *Aira*, *Trisetum*, and *Avena*. The present plant is very different from every species in those genera with which I am acquainted. Its leaves are slender and setaceous. Culms, including the panicle, two feet and more long: of which the panicle itself occupies about one-half. The glumes are pale, tinged with purple, glossy, the carina green and scabrous.

TAB. CCXXVIII.—*Fig. 1.* Spikelet; *f. 2.* Florets; *f. 3.* Outer valve of the perianth; *f. 4.* Inner valve of do.:—*magnified.*

28. TRISETUM. Br. Kth.

1. *T. subspicatum*, Beauv.—Richards, App. ed. 2, p. 3. Br. in Parry's 1st Voy. App. p. 292.—Trisetum airodes, R. & S.—T. molle, Kth.—Gray, Gram. et Cyp. Part II. n. 166.—*Trin. Act. Petrop.*—Avena mollis, Mx.

HAB. Canada. Mx. Labrador. Dr Morrison. Rocky Mountains, Drummond, to the Arctic Sea-shore and Islands. Dr Richardson. Sir E. Parry.—A variable plant, in size, from 4 inches to a foot high, in the denseness or laxness of the inflorescence, in the hairiness, and in the more or less purple colour of the glumes.

2. *T. cernuum*; panicula laxa nutante, glumis tri-quadrifloris superiore paulo longiore (modo latiore,) pilis calli brevibus, racheos medium valvulae attingentibus, perianthii bisubulatis supra medium longe aristatis, ovario barbato. *Trin. in Act. Petrop.* 1830. 6. 61. Bong. Veg. Sitcha, p. 54.—Avena cernua, Kunth, Agrost. p. 306.

HAB. Sitcha. Mertens. Columbia River. Dr Scouler.—Our Scoulerian specimen precisely accords with an authentic one in my herbarium from the Imperial Academy of Petersburg. It is a tall growing grass, 2-3 feet and more high, with leaves more than half an inch broad. The panicle almost a foot long, the branches slender, drooping, lax, the awn very long and slender, the outer valve of the perianth has the two terminal teeth long, and remarkably slender.

29. AVENA. L.

1. *A. versicolor*, Vill. Delph. 2. p. 142. t. 4. f. 5. Kth. Agrost. p. 300.—A. Scheuchzeri, Poll.—Host, Gram. 2. p. 52.

HAB. Rocky Mountains. Drummond.—The only difference I can perceive between these specimens and European ones, is that the panicle is longer (3 to 5 inches) and the spikelets more erect.

2. *A. striata* (Mx.); panicula subsimplici erectiuscula, spiculis 3-4-floris, flosculis basi barbatis superiore saepè tabescente, glumis inæqualibus levissimis, perianthii valvula ext. coriacea 7-nervia, glabra bicuspidata cuspidibus subulatis, arista subtortili perianthio subduplo longiore, foliis linearis-acuminatis angustis, ligula brevi truncata. Mx. Am. 1. p. 23.—*Trisetum purpurascens*, Torr. Fl. 1. p. 127. Gray, Gram. et Cyp. Part I. n. 46.

HAB. Montreal. Paine. (Torrey). Canada to the Saskatchewan and to the Rocky Mountains.—The limits between *Avena* and *Trisetum* do not appear to be well defined: but the habit of the present species (most distinct indeed in point of specific character) is so much that of the preceding, that I think it more natural to place it with the *Avena*.

HAB. Saskatchewan to the Rocky Mountains and to Slave Lake. *Dr Richardson*. *Drummond*.—A very distinct and well marked species.

9. *P. flexuosa*, *Wahl*.—*Host*, *Gram. Austr.* 4. t. 26. *Bongard*, *Veg. Sitcha*, p. 55.—*P. laxa*, *Wahl*. (*vide Kth.*)

HAB. Lake Winnipeg to the Rocky Mountains and to the Arctic Sea-coast. *Dr Richardson*. *Drummond*.

—Specimens from the Rocky Mountains and from Bear Lake have larger spikelets and broader leaves; whilst others have more erect spikelets and very narrow leaves: but the structure of the flowers seems to be the same in all.

10. *P. laxa*, Haenke.—*Host, Gram. 3. t. 15.*—*P. flexuosa*, Sm. E. Bot. t. 1123.

HAB. Hudson's Bay to the Arctic Islands. Dr Richardson. Drummond.—Many of our specimens so entirely agree with the description and figures of the European *P. laxa*, that it is impossible not to consider them as identical.

11. *P. arctica*, Br. in Parry's 1st Voy. App.—*Hook. in Parry's 2d, 3d, and 4th Voy.*—*Hook. et Arn. in Bot. of Beech. Voy. p. 132.*—*Poa flexuosa*, β. *Trin. in Act. Petrop. 6. l. 378.*—*P. laxa*, Br. in Ross' Voy. 2. 192.

HAB. Labrador. Dr Morrison. Rocky Mountains to the Arctic Sea-shores and Islands in every direction. Dr Richardson. Drummond. Sir E. Parry, &c.—Some of my specimens from Kotzebue's Sound are a foot high, others are scarcely 4 inches. I must confess myself frequently at a loss to distinguish *P. arctica* from *P. laxa*, and these again from some forms of *P. flexuosa*. A viviparous state of *P. arctica* with greenish flowers is in the collection from the Arctic Sea-coast.

12. *P. alpina*, L.—E. Bot. t. 1003.

HAB. Labrador. Miss Brenton; and from the elevated grounds of the Saskatchewan to Bear Lake and the Rocky Mountains. Dr Richardson. Drummond.—A most sportive plant in different localities; varying from 3 inches to 2 feet in height; with the leaves broader or narrower (sometimes, when dry, rigid, and with margins involute); the panicle erect or spreading; the spikelets opaque or glossy, broadly ovate and acute to oblong and almost obtuse, and, according to Kunth, with from 4 to 10 florets in each calycine glume: in our specimens, however, even those with the longest spikelets are about 4-flowered. Kunth enumerates 5 varieties of this species, and adduces very many synonyms.

13. *P. pratensis*, L.—E. Bot. t. 1073.—β. *stricta*; foliis angustioribus paniculisque strictis.

HAB. Saskatchewan to Bear Lake. Dr Richardson. Drummond. Greenland. Hornemann.—β. has a very different appearance, and may perhaps prove a distinct species. It is from Carlton House Fort.

14. *P. crocata*, Mx. Am. 1. p. 68.—*P. fertilis*, Host, Gram. Austr. 3. p. 10. t. 14.—*P. serotina*, Gaud. et Auct. Am.—Gray, Gram. et Cyp. Part II. n. 120.

HAB. Canada. Mr Whitlaw. (Nuttall). Goldie. Mrs Sheppard. Lake Winnipeg to the Rocky Mountains. Dr Richardson. Drummond.—Our specimens precisely accord with the figure of Host above quoted.

15. *P. nemoralis*, L.—E. Bot. t. 1265. Torr. Fl. 1. p. 111. Hook. et Arn. in Bot. of Beech. Voy. p. 132.—var. *glauca*. *P. glauca*, Sm. E. Bot. t. 1720.

HAB. Saskatchewan, and plains of the Red River. Drummond. Douglas. Slave River. Dr Richardson. Rocky Mountains. Drummond.—As in Europe, so in N. America, this plant seems liable to great variation. From the Rocky Mountains are specimens 2-3 feet high, and stout in proportion, with very broad leaves, and flowers larger and more crowded than usual. The same mountains, however, afford what appears to be exactly an intermediate state.

16. *P. compressa*, L.—E. Bot. t. 365.—Ph.—Torr.—Gray, Gram. et Cyp. Part I. n. 59.

6. *F. rubra*, L.—*E. Bot. t. 2056.—Bongard, Veg. Sitcha, p. 55.—F. duriuscula, Hook. et Arn. Bot. of Beech. Voy. p. 132.—var. 1. spiculis hirsutis.—var. 2. racemo subsimplici, spiculis valde hirsutis paucifloris nunc flosculis viviparis.*

HAB. Canada. *Mrs Percival. York Factory, Hudson's Bay. Drummond. Kotzebue's Sound. Beechey. Greenland (Hornemann).*—Var. 1. Fort Vancouver.—var. 2. Cumberland House Fort, Bear Lake, and Arctic America. *Dr Richardson. (viviparous.) Saskatchewan to Hudson's Bay. Drummond. Greenland. Hornemann.*—In the more northern latitudes this species frequently becomes very hairy in its flosculles, and of a dark purplish colour. I have referred the *F. duriuscula* of the Bot. of Beech. Voy. hither, because, like all my specimens which possess a root at all, that root is creeping.

7. *F. Richardsoni*; humilis, racemo simplici brevi, spiculis approximatis compressis ovatis tri-quadri-floris dense villosis, glumis inæqualibus (majore flosculo breviore), perianthii valvula ext. lato-ovata subcompresso-carinata in aristam perbrevem acuminata, foliis brevibus angusto-linearibus planis, radice repente. (TAB. CCXXX.)

Radiz repens stolonifera. Culnus basi geniculatus, digitalis ad epithameam, versus basin præcipue foliosus. Folia 1-3 uncias longa vix ¼ lineam lata, angusto-linearia, obtusa, flaccida, plana. Racemos unciam sequi-

unciam longus, simplex vel rarisime subcompositus. *Spiculae* 6-8, approximatae, ovatae, breviter pedicellatae, dense pilosæ. *Glumas* oblongo-ovatae, cymbiformes, obtuse, inæquales, flosculis breviores, tri-quadrifloræ, compressæ. *Flosculi* compressi; *perianthii* valvula exterior late ovata, complicate-carinata, fusco-purpurea, marginæ hyalina, apice in aristam perbravent sensim acuminata: interior bicarinata, ad carinas hirauta.

HAB. Arctic Sea-coast. Dr Richardson.—This appears to be a very distinct species from any with which I am acquainted.

TAB. CCXXX.—Fig. 1. Spikelet; f. 2. Calycine glumo; f. 3. Perianth; f. 4. Anterior view of the inner, and f. 5. posterior view of the inner valve of the perianth:—magnified.

8. *F. (Schoenodorus) pratensis*, Huds.—*E. Bot. t. 1592. Torr. Fl. 1. p. 121. Gray, Gram. et Cyp. Part II. n. 125.*

HAB. Dry plains of the Columbia, and towards the mountains. *Douglas.*

9. *F. (Schoenodorus) borealis* (Mert.); panicula laxa erectiuscula ramis, primariis subverticillatis, spiculis oblongis sub-4-floris, glumis subæqualibus longitudine fere spiculæ, flosculis teretibus basi fasciculato-pilosis, perianthii valvula exteriore 7-nervi apice breviaristata lacerata interiore apice bidentata, foliis lato-linearibus planis asperis. (TAB. CCXXXI).—Mert. et Koch, *Fl. Germ. 1. p. 664. Kth. Enum. p. 404.*

HAB. Carlton House Fort, on the Saskatchewan.—This fine grass is considered by Dr Torrey to be the same with the *F. borealis* of Mert. and Koch; and it must be confessed that it agrees pretty well with their description; but I have no authentic specimen of that plant by which to certify the opinion, and there are some slight discrepancies. The culm in our specimens is as thick as a swan's quill, 3-4 or more feet high, leaves 8-10 inches long, broadly linear-acuminate, rough to the touch. Panicle a foot and more long, almost quite erect, as well as the subverticillate slender branches. Spikelet erect, $\frac{1}{2}$ to $\frac{2}{3}$ of an inch long, scattered or subfascicled, sessile or pedicellate, generally 4-flowered. Glumea unequal, convex, rounded at the back, not keeled, the outer one shorter than the florets, acute, entire at the point, the middle nerve reaching beyond the point, so as to form a short awl, there are besides, on each side, two short lateral nerves; the inner glume as long as the whole spikelet of florets, torn at the point, aristate, the middle nerve reaching beyond the point; there are besides, 2 lateral nerves reaching to the apex, and 2 intermediate shorter ones. Florets cylindrical, closely placed, with a tuft of white hairs at the base of each; outer valve of the perianth jagged at the point, shortly aristate, with 7 nerves reaching to the summit: the inner lanceolate, the margin inflected, with 2 strong, green, ciliated, nerves at the flexures, running out so as to form a bifid apex; upper floret smaller than the rest.

TAB. CCXXXI.—Fig. 1. Spikelet; f. 2. Inner glume; f. 3. Outer do.; f. 4. Perianth:—magnified.

10. *F. (Schoenodorus) nervosa*; panicula erecto-patens laxa, spiculis oblongis compressis remote 7-8-floris glumis inæqualibus levibus, superiore longitudine fere flosculi, flosculis scabris linearis-oblongis acute carinatis conduplicato-compressis acutis nervosis, nervis 5 elevatis, foliis planis linearibus.—(TAB. CCXXXII.)

HAB. Nutka Sound. Dr Scouler.—Root creeping. Culma cespitose, 1½-2 feet high, slender, wiry. Leaves flaccid, linear. Panicle 3-4 to 6 inches long, lower branches long and capillary. Spikelets oblong, the flowers remote, and the rachis peculiarly zigzag. These florets are remarkable for being very much con-

pressed; the outer valve completely conduplicate, with a sharp keel, the lateral form (being thus doubled) is linear-oblong, with one nerve at the keel, and two very prominent ones on each side; the apex rather acute, the whole scabrous; inner valve bifid at the point, prominently two-keeled at the back, the keels scabrous.

TAB. CCXXXII.—Fig. 1. Spikelet; f. 2. Glumes; f. 3. Floret:—magnified.

11. *F. scarella*; panicula erecta, ramis patentibus, spiculis 3-4-floris teretibus minute scabellis, perianthii valvula exteriore 5-nervi in aristam per breve acuminata, interiore apice bifida, marginibus inflexis ad flexuras nervosis, foliis plerisque radicalibus angusto-lineariis ad vaginam cito deciduis. (TAB. CCXXXIII.)—*F. scarella*, *Torr. Mst.*

Culmi pedales, erecti, cespitosi, striati, subunifoliati, glabri; folio anguste lineari-acuminato vix duas uncias longo, vagina longissima sub lente scabriuscula: reliqua folia etiam glabra, plerisque radicalia, membranaceo-vaginata, angusto-linearia, 3-4 pollicaria, ad vaginas articulata, cito decidua. Panicula composita, 3-4 pollicaris, erecta; rami patenties, versus apicem spicigeri. Spicula viridi-purpuree, 3-plerumque 4-flora, ovata, $\frac{1}{2}$ unciam longa, extus tactu vel sub lente minute scabrella. Glumaæ inaequales, acute, flosculis subdupo breviore, enerves, muticæ. Flosculi teretes; perianthii valvula exterior quinque-nervis, in aristam per breven sensim acuminata; interior lanceolata, plana, marginibus inflexis ad flexuras unincervibus scabris, apice bifida.

HAB. Alpine districts of the Rocky Mountains. *Drummond*.—This is a very distinct, and highly peculiar species. There is seldom more than one leaf on the culm. The rest are radical, and have broad membranous sheathing bases, from the top of which the blade of the leaf is very deciduous. The texture of the florets is soft and membranaceous.

TAB. CCXXXIII.—Fig. 1. Spikelet; f. 2. Perianth:—magnified.

38. BROMUS. L.

1. *B. purgans*, L.—*Rich. in Frankl. 1st Journ. ed. 2. App. p. 3. Torr. Fl. 1. p. 128.*

This appears to me, judging from the specimens before me, to be a species that varies much according to age and locality. In its more usual form the panicle and spikelets very much resemble our European *B. erectus*; but the great breadth of the hairy leaves will at all times distinguish it. As has been already suggested in the Botany of Capt. Beechey's Voyage, p. 119., probably the *B. pubescens* of Muhl., the *B. Canadensis*, Mich., the *B. ciliatus* of Linn., and the *B. purgans* are all vars. of one and the same species. It will be seen in the "Flora of the Northern and Middle United States," how doubtful Dr Torrey himself is about those reputed species. The following are what I should enumerate as vars. In speaking of the hairiness of the florets, I would be understood as alluding to the outer valve of the perianth: the inner is always beautifully ciliated at the flexure of the margin.

a. *vulgaris*; panicula elongata laxa, spiculis angustis 6-8-floris viridis, flosculis sericeo-villosis.—HAB. Canada to the Saskatchewan. *Goldie*. *Dr Richardson*. Red River. *Douglas*. Columbia. *Dr Scouler*.—subvar. a. flosculis glabris vel ad nervos tantum rarius ciliatis.—HAB. Fort Norman. *Dr Richardson*.

b. *pallidus*; panicula densa subcorymbosa, spiculis paulo latioribus magis compressis pallido vircentibus 6-7-floris, flosculis marginibus sericeo-villosis.—HAB. Saskatchewan to the Rocky Mountains. *Drummond*.

c. *purpurascens*; panicula elongata laxiuscula, spiculis latioribus 6-8-floris viridi-purpurascensibus marginibus praecipue sericeo-villosis.—HAB. Bear Lake to the Arctic sea-coast. *Dr Richardson*.

d. *longispicata*; panicula densa subcorymbosa, spiculis latioribus biuncialibus viridi-purpurascensibus marginibus praecipue sericeo-villosis.—HAB. Rocky Mountains. *Drummond*.

2. B. Sitchensis (*Bong.*) ; panicula patula (denum patente?) nutante, spiculis 5-7-floris, flosculis lanceolatis setis terminalibus rectis valvula paullo brevioribus, ligula oblonga producta. *Bong. Veget. Sitcha*, p. 55.

HAB. Sitcha. *Mertens.*—“Maxima affinis *Br. pendulino*, *Sesse*, (Roem. et Sch. 2. p. 644,) cui et habitu simillimus (nam radii inferiores longi, in speciminitibus junioribus nostris patuli tantum, denum fortasse patentes) differt polosimum setis, flosculorum longioribus, ligula magna rotundata (nec brevi truncata,) ut in *Br. pendulino*, et foliis majoribus.” *Bongard.*

39. CERATOCHLOA. *P. Beauv.*

1. C. brevi-aristata; panicula elongata laxa subnutante, spiculis lanceolatis ancipiti-compressis glabris (sub lente scabris), glumis subaequalibus acutis submuticis nervosis, perianthii valvula exteriore acute carinata multinervi brevi-aristata, foliis lato-linearibus villosulis, vaginis villoso-tomentosis. (TAB. CCXXXIV.)

HAB. Dry elevated ground of Lewis' and Clarke's River, and near the sources of the Columbia. *Douglas.*—Culm 2-3 feet high, near the base as thick as a swan's quill. Leaves very broadly linear-acuminate, slightly hairy. Ligula ovate, membranaceous white. Panicle 8-10 inches long, slightly compound, erect, or a little drooping to one side. Spikelets inclined (not drooping), an inch or an inch and a quarter long, lanceolate, remarkably compressed, sharply 2-edged, of a harsh and rigid texture, of a pale uniform green colour, minutely scabrous, more so on the keel. Glumes moderately unequal, lanceolate, acutely carinate, gradually coming to a point, not aristate, shorter than the florets, outer about 5, inner about 9-nerved. Exterior valve of the perianth complicate-compressed, sharply carinate, 9-or more nerved, having a very evident, but short, straight awn, from between the slightly bifid points. Inner valve scarcely half so long as the outer, narrow, lanceolate, bifid at the point, the margins sharply inflexed; at the flexures there is a strong ciliated green nerve. Stamens 3. Filaments, apparently, in the advanced state of the flower, incorporated with the ovary, for I can in no instance trace them, till they become free at the top of the crest of the germen. Anthers (abortivo?) small, ovate. Ovary and young fruit oblong with a deep furrow in the inner face, crowned with a 3-lobed whitish hairy crest. Allied to *Ceratochloa unioloides*, Beauv. (which has been found in Texas by Mr Drummond, No. 376, of his 3d Coll.) but very different in the foliage and in the presence of a distinct awn to the florets.

TAB. CCXXXIV.—Fig. 1. Spikelet; f. 2. Glumes; f. 3. Perianth; f. 4. Outer view of an inner valve of do.; f. 5. Immature fruit:—magnified.

2. C. grandiflora; panicula subsimplici laxa, spiculis valde compressis subancipitibus pubescenti-scabris 10-11-floris, glumis subaequalibus acuminatis vix aristatis 9-nerviis carinatis, perianthii valvula exteriore compresso-carinata 9-nervi arista stricta valvulae dimidio longitudinis terminata, foliis lanceolato-linearibus vaginisque hirsutulis. (TAB. CCXXXV.)

HAB. Common on the plains of the Columbia. *Dr Scouler. Douglas.*—Allied to the last in its compressed florets, but quite distinct. The spikelets are in some of the specimens much longer than in any species of the genus I am acquainted with. Although the florets are carinated they are less so than in the preceding species, and more remote on the rachis: the awn, too, is far longer than in that species. The inner valve is gradually attenuated into a long ueumen, deeply bifid at the point. In the flowering spikelets, the filaments may easily be traced to the base of the ovary; but in a more advanced state, the lower part of the filaments pro-

bably deliquesces, while the upper seems to adhere, by a glutinous substance, to the crest of the ovary, and then the portion above the ovary seems to have its origin from the top of that body, and to continue there till nearly the perfection of the fruit. The hypogynous scales are 2, broadly obovate, large, but so thin and delicate, that I cannot trace them in the more advanced state of the flower. From an examination of more than one spikelet, it would appear that the lower florets bear abortive stamens, with small and short anthers; the upper ones abortive pistils, with very large linear anthers. In both, the inner valve of the perianth adheres to the ovary as it advances to maturity.

TAB. CCXXXV.—*Fig. 1.* Spikelet; *f. 2.* More advanced do.; *f. 3.* Inner view of inner valve of the perianth; *f. 4.* Ovary and stamens from a lower floret; *f. 5.* Do., and hypogynous scales from an upper floret:—*magnified*.

1. *B. spicatum*, Hook. et Arn. *Bot. of Beech. Voy.* p. 403.—*B. boreale*, Presl, in *Reliq. Haenk.* 1. p. 280.—*Uniola spicata*, L.—*Torr. Fl.* 1. p. 105. *Gray, Gram. et Cyp. Part I.* n. 49.—*U. stricta*, *Torr. in Am. of Lyc.* 1. p. 55.—*U. multiflora*, Nutt.—*Festuca distichophylla*, Mx.—*Ph.*—*Poa Michauxii*, Kth. *Enum.* p. 325.

HAB. Plains of the Red and Saskatchewan Rivers, to the Rocky Mountains. *Dr Richardson. Drummond. Douglas. De Fesa, N. W. Coast. Dr Scouler. Nutka. Mertens.*—We have observed in the Botany of Beechey's Voyage, that this plant is bisexual, and there is a slight difference between the flowers of the two sexes, which has led to the separation of the species.

41. TRITICUM. L.

1. *T. (Agropyrum) junceum*, L.—*E. Bot. t. 814.*

HAB. Rocky Mountains. *Drummond.* Low plains of the Columbia. *Douglas.*

2. *T. (Agropyrum) repens*, L.—*E. Bot. t. 909. Torr. Fl.* 1. 135.—*a. vulgare*.—*β. minus*; spica breviore.—*γ. purpurascens*; spica parva, spiculis purpurascensibus, flosculis aristatis.—*δ. subvillosum*; spica elongata, spiculis subvillosis.—*ε. nanum*; spica breviore, flosculis subsericeo-villosos.—*ζ. dasystachyum*; elatum, spicis majoribus, spiculis dense sericeo-villosos.

HAB. *a.* Saskatchewan to the Rocky Mountains and to the Mackenzie River. *Dr Richardson. Drummond.* Arid barren grounds at the junction of Lewis and Clarke's Rivers with the Columbia.—*β.* Rocky Mountains. *Drummond.*—*γ.* Bear Lake to the Arctic sea-coast. *Dr Richardson.*—*δ.* Fort Norman, on the Mackenzie River. *Dr Richardson.*—*ε.* Arctic sea-coast. *Dr Richardson.*—*ζ.* Carlton House Fort, on the Saskatchewan. *Dr Richardson.*—All the above I am quite disposed to consider as mere forms of one and the same species, varying according to soil, locality, &c. The last var., *dasystachyum*, very much resembles the *T. dasyanthum*, Spr. (*Agropyrum, Schultes Mant.* p. 400.) but that from its obtuse florets and involute leaves, I would rather refer to a hairy state of *T. junceum*.

3. *T. (Agropyrum) caninum*, Schreb.—*E. Bot. t. 1372. Torr. Fl.* 1. p. 136.—*β. Gmelini* (Ledeb.); aristis validis demum patenti-reflexis. *Ledeb. Ic. Pl. Ross. Altaiic. Illustr. t. 248.*—*Bromus strigosus*. *Bieb.*

HAB. Lake Winnipeg to the Saskatchewan. Dr Richardson. Drummond. Plains of the M. Assiniboin river, N. W. Am. Douglas.— β . Near the great falls of the Columbia, N. W. Am. Douglas.—The α , β . has so remarkable an appearance from its strong horizontal, almost reflexed awns, that at first sight, I did not hesitate to consider it a distinct species, as others have done with the same state of the plant; for it is, according to authentic specimens in my Herbarium, the *Agropyrum agilopoides* of Ledebour's mat. (in Herb. nostr.) from the Altai; and the *Bromus strigosus*, Rich. from the mountains of Taurie; but Ledebour has determined correctly, we doubt not, that it is a variety of *T. caninum*.

42. ELYMUS. L.

1. *E. arenarius*, L.—*E. Bot. t. 1672. Hook. et Arn. Bot. of Beech. Voy. pp. 119, 132.*

HAB. Canada. (Quebec.) Mrs Perceval. Labrador. Dr Morrison. Miss Brenton. Saskatchewan to Bear Lake, and the extreme Arctic shores and islands. Dr Richardson. Drummond. Sir E. Parry. N. W. Am. from the Columbia to Kotzebue's Sound. Dr Scouler. Douglas. Capt. Beechey.

2. *E. mollis*, Br. in Frankl. Journ. ed. 2. App. p. 3.—*E. mollis*, Trin. in Spreng. N. Entd. 2. 72? Bong. Veget. Sitcha, p. 56?—*E. dasystachys*. Trin. in Ledeb. Ic. Pl. Ross. Alt. Illustr. t. 249.— β . spicis minoribus hirsutissimis, spiculis 2-3 floris.

HAB. Saskatchewan to Bear Lake and the Arctic shores, and β . Garry's island. Dr Richardson. Drummond.—Ledebour's *E. dasystachys*, from the Altai mountains, is precisely the same as our *E. mollis*; and his β . of that plant seems to be the same as our β . The flowers of the largest specimens are always smaller than those of *E. arenarius*, which has nevertheless frequently very soft and hairy spikes. I have never seen authentic specimens of the *E. mollis* of Trinlus; Bongard says that it scarcely differs from *E. arenarius*, except in its plane leaves.

3. *E. hirsutus* (Presl); culmo compresso? vaginisque glabris, foliis scabris subtus hirsutis, spica erecta, spiculis hirsitis trifloris, glumis sub-quinquenerviis, palea inferiore quinque-nervia scabra arista brevirore. Presl, in Reliq. Haenk. 1. p. 264.

HAB. Nutka Sound. (Presl).—Affinis *E. Europeo* (Presl).

4. *E. Sibiricus*, L.—Bong. Veget. Sitcha, p. 56. Schreb. Gram. 1. t. 21, f. 1. Gmel. Sib. 1. t. 28.

HAB. Sitcha. Mertens.—“Floaculi et involucella in gramine barum regionum superne ciliatui.” Bong.

5. *E. Canadensis*, L.—Ph.—Torr. Fl. 1. p. 137. Rich. App. p. 3. Gray, Gram. et Cyp. Part I. n. 63.—*E. Philadelphicus*. L.—*E. glaucifolius*. Willd. Ph.— β . spicis fuscescentibus dense villosis.

HAB. Canada to the Saskatchewan. Slave River. Dr Richardson.— β . Rocky Mountains. Drummond.—This should be compared with authentic specimens of *E. Sibiricus*. What I have from Ledebour as that species, does not seem to differ; but the spikes are in a starved state, while those from Gouan's Herbarium are precisely the same. The figures of Gmelin and Schreber by no means disagree with our *E. Canadensis*.

6. *E. Virginicus*, L.—Mx.—Ph.—Torr. Fl. 1. p. 137. Gray, Gram. et Cyp. Part I. n. 60.— β . *submuticus*; glumis flosculisque brevissime aristatis.

HAB. *a.* Cumberland House Fort, on the Saskatchewan. *Drummond*. Common on the shores of lakes and rivers to the east of the Rocky Mountains, but never found to the west of that range. *Douglas*.—The true *E. Virginicus* I possess from various parts of the United States, and even as far north as Boston, with the glumes and outer valva of the florets tapering into a long awn; but all the specimens found by Mr Drummond and Mr Douglas have scarcely an awn at all: yet I can perceive no other difference. The *E. Dahuricus* of Turczaninow (in *Herb. nostr.*) from Dahuria, I cannot distinguish from *E. Virginicus*.

7. *E. villosus*, *Muhl.*—*Ph.*—*Torr. Fl.* 1. p. 138. *Gray, Gram. et Cyp. Part I.* n. 62.

HAB. Canada. *Goldie*.—Dr Torrey and the American Botanists, I believe, are disposed to consider the *E. striatus*, Willd., as identical with *E. villosus*. The whole genus needs a very careful revision.

8. *E. Europæus*, *L.*—*E. Bot. t.* 1317.

HAB. Canada. *Mrs Percival*.—I have closely compared this specimen from Canada with our own *E. Europæus*, and it entirely accords; but I must at the same time remark that *E. villosus* appears to me to be a hairy state of the same plant.

Gray, Gram. et Cyp. Part I. n. 87.

HAB. Saskatchewan. *Drummond.*—This is perhaps the northern limit of this handsome grass. It is more frequent in the south, and according to Knuth, it extends to the West Indies and South America, and is the *A. stipoides*, H. B. K., and the *Sorghum parviflorum* of Hamilt. *Prodri. Fl. Ind. Occ.*

(Add at p. 233, after *Alopecurus aristulatus*:

2° *A. cæpitosus (Trin.)*; pusillus, thyrsos cylindraceo-oblongo, glumis ad basin usque fassis acutiusculis glabriusculis pectinatis, valvula truncato-obtusa, stylis inferne connatis. *Trin. Gram. Ic. t. 241.*

HAB. Rocky Mountains. *Drummond.*—A very small species, scarcely 3 inches high, with lax, somewhat interrupted and lobed spikes of a tawny green colour: the glumes fringed or pectinated at the keel, and as well as the perianth truncated at the top. The awn is scarcely longer than the valve. It is beautifully figured by Trinius in the work above quoted, and, I presume, from specimens which I gave to the late Mr Prescott; but no station is mentioned further than that the specimen is " boreali-Americanum."

And at p. 239, after *Vilfa tenacissima*:

3. *V. depauperata (Torr. mst.)*; rigida, culmo brevi dichotome ramoso striato glabro fere toto viginato, foliis linearis-subulatis viginis margine membranaceis, ligulis ovatis obtusis, racemo composito sub-paniculato paucifloro, glumis inæqualibus ovatis obtusis membranaceis enervibus perianthio & brevioribus, perianthii valvulis subæqualibus lanceolatis chartaceis acutissimis. (TAB. CCXXXVI.)

Tota glaberrima, rigida. *Culmus* 4-6 uncias longus, decumbens, supra basin dichotome ramosus, teres, striatus, per totam fere longitudinem viginatus; *rami* geniculati, flexuosi, articulis sesquiuincubilibus. *Folia* parva, inferiora vix unciam, superiora 2-3 lineas longa, linearis-subulata, rigida, striata. *Vagina* ad marginem membranacea. *Ligula* obtusa, in marginem viginarum decurrente. *Panicula* parva subsimplex, fere racemus, vix unciam longa, erecta, 8-10 flora. *Pedicelli* breves, striati, glabri, creuti. *Spicula* erecta. *Glumæ* inæquales, ovatae, obtuse, membranaceæ, subhyalinae, dorso obscure uninervio, perianthio & breviores. *Perianthii* valvulae subchartaceæ, æquales, concavæ vix carinatae, lanceolatae, obscure trinerviae; exterior acutissima nuda; interior apice bifida.

HAB. N. W. America. Barren sandy parts of the Columbia from Menzies' Island upwards. *Douglas.*—A very distinct species from any I have seen. Dr Torrey considers its place as between *V. virgata* and *V. viginifolia*.

TAB. CCXXXVI.—Fig. 1. Spikelet; f. 2. Glumes; f. 3. Perianth:—magnified.)

CL. III. ACOTYLEDONEÆ.

ORD. I. FILICES.

TRIB. I. POLYPODIACEÆ.

1. POLYPODIUM. L.

1. *P. vulgare*, L.—*E. Bot.* t. 1149.—*Ph.*—*Rich. App.* p. 39.— β . *Americanum*; minus, fronde angustiore, laciniis remotioribus. *P. Virginianum*, *Linna. Sp. Pl.* p. 1345 (excl. *Syn. Plum.* &c.). *Ph.*— γ . *occidentale*; frondis laciniis acutis acute serratis. *P. vulgare*, *Virginianum*. *Bong. Veg.* *Sitcha*, p. 57.

HAB. δ . Canada. *Pursh*, *Mrs Perceval*, *Mrs Sheppard*; to the Saskatchewan and Slave River. *Dr Richardson*, *Drummond*;— γ . N. W. Am. On rocks and decayed wood, common near the confluence of the Columbia with the sea. *Douglas*, *Sitcha*. *Mertens*. (*in Herb. nostr.*)—The common state of this plant throughout the United States and in British N. America, is to be smaller than the European form, with narrower and more oblong fronds, with laciniæ more distant, and the sori nearer the margin. This is no doubt the *P. Virginianum* of Linneus and authors, as far as regards the Virginia plant, on which Linneus founded his character:—the synonyms which he has adduced, or at least that of Plumier, belong I think rather to the following. The Columbian and Sitcha variety is different from any I have seen, yet cannot in my opinion be distinguished as a species from this, which we know is a very variable Fern. Mertens' plant from Sitcha described by Bongard, is identical with the Columbian one.

2. *P. intermedium*; fronde ovali-lanceolata membranacea pellucida fere ad rachin pinnatifida, laciniis oblongis acutiusculis serratis glabris, venulis (3-4) distinctis liberis vel rarissime sub margine anastomosantibus, soris ovalibus solitariis. *Hook. et Arn. Bot. of Beech. Voy.* p. 405. *Plum. Fil.* p. 60. t. 77.

HAB. Columbia. *Dr Scouler*.—On referring to Plumier's figure above quoted (a W. Indian Plant), to see how far it agreed with any N. American Fern (Linneus having referred to it as his *P. Virginianum*), I find it agrees so well with this plant, that I have little hesitation in considering it the same; and the more so from observing that the species is also a native of St Vincent, whence I have received specimens from the late Mr Guilding.

3. *P. (Marginaria) Californicum*, *Kaulf.*—*Hook. et Grev. Ic. Fil.* t. 56. *Hook. et Arn. Bot. of Beechey's Voy.* p. 161 and 405.

HAB. N. W. America. Moist Rocks, Columbia river. *Dr Scouler*.

4. *P. Phegopteris*, L.— α . *minus*; subrigidum, pinnarum infimarum laciniis omnibus sub-integerrimis, venulis fere omnibus simplicibus, soris densis marginatis, *E. Bot.* t. 224. *Schkuhr*, *Fil. Tab.* 20.— β . *intermedium*; tenuis, pinnarum inferiarum laciniis crenatolobatis venulisque furcatis, soris submarginalibus.—*P. connectile?* *Mx.*—*Willd.*—*Ph.*— γ . *majus*; tenue, pinnis distantibus inferiarum plurimum laciniis remotiusculis elongatis pinnatifidis, venulis plurimi furcatis.—*P. Phegopteris*, γ . *Schkuhr*, *Fil. t. 20. b.*—*P. hexagonopterum*, *Mx. Am. 2. p. 271. Ph.*—*P. cruciatum*, *Kaulf.* (*fide Presl.*)

HAB. α . Canada. *Lady Dalhousie*. *Mrs Perceval*.— β . Canada. *Mrs Perceval*; and thence to the Saskatchewan. *Dr Richardson. Drummond*. N. W. Am. Columbia River. *Douglas*. Portage, and near the sources of the Columbia river. *Drummond*.— γ . Canada. *Goldie*.—Of the two first varieties that I have here noticed, I have not the slightest doubt of their belonging to one and the same species; and with regard to the third (var. γ), among the larger specimens of β , which I have seen, are some which appear to constitute quite a connecting link between α and γ . This latter seems to be rare in British America; more frequent in the United States, where it is sometimes called *P. connectile* and sometimes *P. hexagonopterum*. The larger the plant, and the more remote the pinnae, the greater the disposition in the fronds to become compound, and the more the veinlets become branched or forked:—then too the decurrent triangular lobe of the rachis is more developed and more remarkable.

5. *P. Dryopteris*, L.—*E. Bot. t. 616. Rich. App. p. 39.*—*Nephrolium, Mx.*—*P. calcareum*, *Pl.*— β . *rigidius*. *P. calcareum*, *Sm. E. Bot. t. 1525. Bong. Veg. Sitcha*, *p. 57*.

HAB. Canada. *Mrs Perceval*, to the Rocky Mountains and to Bear Lake. *Dr Richardson. Drummond*.— β . High Mountains of the Rapids of the Columbia. *Douglas*.

2. GYMNOGRAMMA. Desv.

1. *G. triangularis*, Kaulf.—*Hook. et Grev. Ic. Fil. t. 315. Hook. et Arn. Bot. of Beech. Voy. p. 161 et 405.*

HAB. Columbia. *Douglas*.—A single specimen only of this is in the Herbarium of Mt Douglas, mixed up with other Ferns of the Columbia. It was probably found to the south of that river towards California, a country which the species is known to inhabit.

3. WOODSIA. Br.

1. *W. Ilvensis*, Br. in Linn. *Trans. v. 11. p. 173.—E. Bot. t. 2016. Sw.—Pl. Am. 2. p. 600. Rich. App. p. 39.*—*Polypodium, Sw.*—*Nephrodium rufidulum, Ph. (cert.)*

HAB. Canada to Hudson's Bay, Bear Lake and the Rocky Mountains. *Pursh. Goldie. Lady Dalhousie. Dr Richardson. Douglas. Drummond*.

2. *W. hyperborea*, Br. c. p. 173, cum Ic.—*Pl. Am. 2. p. 600.—Polypodium, Sw. Presl. E. Bot. t. 2023.*

HAB. Canada to the Saskatchewan. *Pursh. Dr Richardson. Drummond*.

3. *W. glabella* (Br.); frondibus (lanceolato-linearibus) pinnatis glaberrimis, pinnis triangularibus pinnatifidis imis dilatatis lacinii cuneiformibus, rachi nuda stipite squamato. (TAB. CCXXXVII.) *Br. in Rich. App. p. 39.*

HAB. Great Bear Lake. *Dr Richardson*.—A very distinct species, always retaining the character above given by Mr Brown.

TAB. CCXXXVII. Fig. 1. Pinna; f. 2. Sorus; f. 3, 4. Capsules; f. 5. Seeds:—*magnified*.

4. PHYSEMATIUM. Kaulf.

1. *P. obtusum*.—*Aspidium obtusum, Willd.—Schkuhr, Fil. t. 21. and t. 43. b. p.—Ph.*

Am. 2. p. 662.—*Polypodium, Sw.*—*Woodsia Perriciana, Hook. et Grev. Ic. Fil. 1. t. 68.*—*Alsophila Perriniana, Spreng.*

HAB. West side of the Rocky Mountains, near the sources of the Columbia, *Drummond*: and elsewhere on the higher parts of the Columbia. *Douglas*.—This is the *Alsophila Perriniana* of Sprengel, and it is perhaps by some mistake that it is said to be a native of St Thomas. It seems however to have a wide range in N. America, yet to be found nowhere plentifully.—The Genus is distinguished from *Woodsia*, to which it is very nearly allied, by the presence of an hemispherical indusium which covers the whole sorus and then splits from the top into several laciniate segments.

5. CISTOPTERIS. *Bernh.*

1. *C. fragilis, Bernh.*—*Athyrium, Rich. App. p. 39.*—*Cyathea, E. Bot. t. 1587.*—*Ph. —*β. *laciiniis latoribus minus divisus. C. tenuis, Schott.*—*Aspidium tenue, Willd.*—*Ph. —Nephrodium, Mx.*

HAB. Canada, *Mrs Perceval, Goldie*; to Slave Lake and to the Rocky Mountains. *Dr Richardson, Drummond*.—This species varies a good deal in North America; but not more so than it does in Europe. The *C. tenuis* is only a form with broader and less deeply divided laciniae.

2. *C. montana, Link*,—*Aspidium, Sw.*—*Schkuhr, Fil. t. 63.*

HAB. Shady alpine woods by streams in the Rocky Mountains. *Drummond*.—This is quite new to the Flora of N. America. The specimens entirely accord with European ones. The species cannot indeed readily be mistaken, well marked as it is by its small exactly triangular and much divided frond, with the fructification precisely resembling that of *C. fragilis*.—May not the *Aspidium atomarium*, Muhl. and Willdenow, be a variety of this plant?

3. *C. bulbifera, Bernh.*—*Aspidium, Sw.*—*Schkh. Crypt. t. 57.*—*Ph. —Nephrodium, Mx.*

HAB. Canada. *Mrs Sheppard, Goldie*.

6. ASPIDIUM. *Sw.*

1. *A. (Lastrea) Thelypteris, Sw.*—*E. Bot. t. 1018. Schkh. Fil. t. 52.*—*A. thelypterooides, Sw.*—*Nephrodium, Mx.*—*Aspidium Noveboracense, Sw.*—*Ph. —Schkh. Fil. t. 46.*

HAB. Canada. *Michaux, Mrs Perceval, Mrs Sheppard*.—The *A. Noveboracense* is quite identical with *A. Thelypteris*.

2. *A. (Lastrea) Goldianum, Hook. in Ed. Phil. Journ. 6. p. 333. Hook. et Grev. Ic. Fil. t. 102.*—*A. Filix Mas, Ph. Am. 2. p. 662.*

HAB. Canada. *Dr Holmes*. About Montreal. *Goldie, Mrs Perceval, Mrs Sheppard*.—This is a most distinct species, and though apparently rare in British N. America, seems to be common in the United States, whence it is not unfrequently sent as *A. Filix Mas*: and there is every reason to believe that this is what Pursh had in view for that plant.

3. *A. (Lastrea) marginale, Willd.*—*Ph. —Schkuhr, Fil. t. 45. b.*

HAB. Canada. *Mrs Sheppard, Mrs Perceval*, to the Saskatchewan. *Dr Richardson, Drummond*.

4. *A. (Lastrea) cristatum, Sw.*—*E. Bot. t. 2125 (not t. 1949.) Ph.*

HAB. Saskatchewan. Dr Richardson. Drummond.—The specimens are barren, but the form of the plant is so remarkable, as to leave not the shadow of a doubt as to its being the real *A. cristatum*, which, moreover, is frequent in the United States.

5. *A. (Lastrea) fragrans, Sw.*—*Hook. in Parry's 2d Voy. App. p. 410.*—*Nephrodium, Rich. App. p. 39. Hook. et Grev. Ic. Fil. t. 70.*

HAB. Saskatchewan to the Arctic Sea-coast and Islands. Dr Richardson. Sir E. Parry. Drummond.—Some of the specimens from about Bear Lake are nearly a foot in length.

6. *A. (Lastrea) spinulosum, Willd.*—*E. Bot. t. 1460. Bong. Veget. Sitcha, p. 57. Ph. Am. 2. p. 663.*—*A. intermedium? Willd.*—*Ph. β. A. dilatatum, Willd.*—*E. Bot. t. 1461. Bong. Veg. Sitcha, p. 57. Ph. Am. 2. p. 663.*—*A. dumetorum, Sw.*—*Nephrodium expansum, Presl, Reliq. Haenk. 1. p. 38.*

HAB. Newfoundland. Miss Brenton. Canada, (Mrs Perceval, Lady Dalhousie,) to the Rocky Mountains. Dr Richardson. Drummond. Columbia River. Dr Scouler. Douglas.—In America this plant, although at all times easily recognised, is as variable as in England; and it is equally impossible, as with us, to limit the marks of the varieties.

7. *A. (Polystichum) Lonchitis, Sw.*—*E. Bot. t. 797.*

HAB. Rocky Mountains. Drummond.

8. *A. (Polystichum) munitum (Kaulf.)*; frondibus pinnatis, pinnis linear-lanceolatis spinoso-acuminatis subfalcatis basi sursum auriculatis mucronato-serratis, serraturis sub-appressis rarissime bidentatis, stipite rachique subtus et basin versus paleaceis.—*Kaulf. Enum. p. 230. Hook. et Arn. Bot. of Beech. Voy. p. 162, and 405.*—*Nephrodium Plumula, Presl, Reliq. Haenk. 1. p. 33.*

HAB. N. W. America. Menzies. Douglas. Dr Gairdner. Nutka. Mertens.—The most common of all Ferns on the N. W. Coast, between the parallels of 40° and 49° n. lat., in the moist grounds of the dark shady Pine Forests. The roots are roasted on the embers, and constitute an article of food. The fronds are used as garlics by the Indians. Douglas.

9. *A. (Polystichum) acrostichoides, Sw.*—*Ph.—Schkh. Fil. t. 30.*—*Nephrodium, Mx.*

HAB. Canada. Mrs Perceval. Mrs Sheppard.

10. *A. (Polystichum) aculeatum, Sw.*—*E. Bot. t. 1562. (ic. mal.) Hook. Br. Fl. ed. 4. p. 384.*—*A. vestitum, Sw.*—*Schkuhr, Fil. t. 43. Bong. Veg. Sitcha, p. 57. (et in Herb. nostr.) Nephrodium setigerum, Presl, Reliq. Haenk. 1. p. 37.*

HAB. Portage, and sources of the Columbia, west side of the Rocky Mountains. Drummond. Nutka. Haenke. Sitcha. Mertens.—This is a rare plant in N. America; and the form is precisely that which I have characterized as the *Asp. aculeatum* in "British Flora," ed. 4. v. 1. p. 384, a state exactly intermediate between *A. lobatum* on the one hand, and *A. angulare*, Sm., on the other. Pursh records it as an inhabitant of the Green Mountains, Vermont; Mertens discovered it at Sitcha: and my correspondent, Dr W. F. Macrae of Montreal, Canada, has lately communicated specimens to me which he had the good fortune to

detected in the Essex Mountains, State of New York. Dr Bongard's *A. vestitum*, which there is every reason to believe is the true *vestitum* of Sw., has the most perfect conformity with this and with Mr Drummond's specimens.

7. ONOCLEA. L.

1. *O. sensibilis*, L.—*Mx. Am.* 2. p. 272. *Ph.*—*Schkh. Fil. t.* 102.— β . *O. obtusilobata*, *Schkh. Fil. t.* 103.—*Ph.*

HAB. Lake Huron, *Dr Todd*, to the Saskatchewan. *Drummond*.

8. STRUTHIOPTERIS. Willd.

1. *S. Germanica*, Willd.—*Beck, Fl.* p. 456.—*Onoclea Struthiopteris, Schkh. Fil. t.* 105, and *O. nodulosa*, *eiusd. t.* 104.—*Osmunda Struthiopteris, L.*—*Struthiopteris Pennsylvanica, Willd.*—*Ph. Am.* p. 666.

HAB. Canada to the Saskatchewan. *Dr Richardson. Drummond. Douglas.*—After a very careful comparison of the N. American *Struthiopteris* with the European, I am compelled to consider them, as Dr Beck has already done, one and the same species.

9. ATHYRIUM. Presl.¹

1. *A. Filix-femina*, Roth.—*Asplenium, Bernh.*—*Nephrodium, Mx.*—*Aspidium, Sw.*—*E. Bot. t.* 1459. *Schkuhr, Fil. t.* 58.—*Asplenium Athyrium, Schkuhr, Fil. t.* 78.—*Aspidium asplenioides, Sw.*—*Ph.*—*Nephrodium, Mx.*— β . fronde angustiore. *Aspidium angustum, Willd.*—*Ph.*—*Athyrium angustum, Presl, Reliq. Haenck. l. p. 39.*— γ . fronde angusta oblongo-lanceolata rigidiori, pinnis pinnulisque remotioribus.

HAB. α , and β , Throughout Canada, *Goldie, Mrs Perceval, Lady Dalhousie*; to the Saskatchewan and to the alpine woods of the Rocky Mountains. *Dr Richardson. Drummond.*— β . *Nutka. Mertens.*— γ . Common on the N. W. Coast, by the shady banks of streams.—This species in America, as in Europe, varies in the breadth of its fronds: the Columbian var. is the most striking of these forms, but it is evidently not a distinct species.

10. ASPLENIUM. L.

1. *A. (Camptosorus) rhizophyllum*, L.—*Mx.*—*Ph. Am.* 2. p. 666.

HAB. Canada. *Pursh, Goldie*, to the Saskatchewan. *Drummond.*—The reticulated venation of this plant, forming elongated hexagonal areoles, is very remarkable, and quite different from that of any other *Asplenium*, but very similar to some of the exotic *Scolopendria*, with which the plant agrees in its undivided fronds. Presl has constituted of it the genus *Camptosorus*.

2. *A. Trichomanes*, L.—*E. Bot. t.* 576. *Mx.*—*A. melanocaulon, Willd.*—*Ph.*

HAB. Canada, *Pursh, Mrs Sheppard, Mrs Perceval*; to the Saskatchewan. *Dr Richardson. Drummond.* Damp rocks of the Columbia and Puget's Sound. *Douglas.*

3. *A. viride*; fronde pinnata pinnis rotundato-ovatis obtuse serratis basi cuneatis, rachi concolor. *Huds.*—*E. Bot. t.* 392.

HAB. Moist shady rocks on the Rocky Mountains. *Drummond.*—This is quite new to America.

4. *A. ebeneum*, Willd.—*Ph. Am.* 2. p. 666.—*A. polypodioides*, Sw.—*A. trichomanoides*, Mx.

HAB. Canada. *Mrs Sheppard*.

5. *A. marinum*; fronde pinnata, pinnis oblongis obtusis inciso-serratis basi superiore rotundata et subauriculata inferiore truncata.—*L.*—*E. Bot. t.* 150.

HAB. New Brunswick. *E. N. Kendall, Esq.*—This species again is now, for the first time, ascertained to be a native of N. America. It may perhaps be frequently found among maritime rocks. I have specimens I can scarcely distinguish from it, from the West Indies.]

11. BLECHNUM. L.

1. *B. boreale*, Sw.—*E. Bot. t.* 1159. *Ph. Am.* 2. p. 669. *Bong. Veg. Sitcha*, p. 58.—*Lomaria spicant*, Desv.—*Presl*.—*Lomaria crenata*, Presl, *Reliq. Haenk.* 1. p. 51.

HAB. N. W. Coast. *M. Lewis*. (*Ph.*) Observatory Inlet. *Dr Scouler*. Nutka. *Mertens*.—I am aware that an opinion prevails that this plant should be referred to *Lomaria* (*Stegania*, *Br.*): but the indusium is certainly not marginal. The fructification may be considered that of *Blechnum*, the habit that of *Lomaria*.

2. *B. doodioides*; fronde elongata lanceolata pinnata, pinnis suboppositis basi lata ex-auriculata lato-lineari-oblongis sensim acuminatis paululum falcatis versus apicem obscure serratis infimis parvis rotundatis superioribus multo angustioribus soriferis, soris continuis vel scepissime interruptis.

HAB. Interior of N. W. America. *Douglas*.—Of this plant two specimens were sent to me by the late Dr Gairdner, (then resident at Fort Vancouver on the Columbia,) which were gathered in the interior by Mr Douglas: but whether in the Hudson's Bay territories, or, as is possible, in N. California, I am uncertain. I am disposed to believe in the former country, because there is nothing of the kind in Mr Douglas' Californian Herbarium. It is a very distinct plant, almost combining the character of *Woodwardia*, or *Doodia*, with those of *Blechnum*. The veins are obliquely parallel with the costa, forked, and not anastomosing in the sterile pinnae: when the fructification appears, the lower branch of a vein anastomoses with the vein immediately above it, and in the interior of that vein (next the costa) the sorus is formed. In the lower of the fertile pinnae, the indusium frequently stands unconnected and more or less distant, as in *Woodwardia*, but generally forming a continued line, from the union of the adjoining indusia. The stipes is dark purple, the upper (fertile) pinnae are so narrow that the sori occupy nearly the whole surface, as in *B. boreale*.

12. PTERIS. L.

1. *P. aquilina*, L.—*E. Bot. t.* 1679. *Ph. Am.* 2. p. 688. *Agardh, Recens. Sp. Gen. Pter. p. 49.*—*P. caudata*, Ph.—*P. lanuginosa*; fronde subtus dense tomentosa. *Bong. Veget. Sitcha*, p. 58.—*P. lanuginosa*, Hook. et Arn. in *Bot. of Beech. Voy.* p. 405.—non *Bory*? et *Agardh*?

HAB. New Brunswick. *Mr Kendal*. Newfoundland. *Miss Brenton*. Canada. *Pursh, Mrs Sheppard, Mrs Perceval*, to the Saskatchewan. *Drummond*.—*P.* Very common from Cape Mendocino to Puget Sound, and in the open woods and undulating grounds in the interior of Columbia. *Douglas*.

2. *P. (Allosorus) atro-purpurea*, L.—*Mx.*—*Schkuhr*, *Fil. t.* 100. *Ph.*—*P. gracilis*, *var. nana?* *Rich. App.* p. 39.

HAB. Canada to the Saskatchewan. *Dr Richardson. Drummond.*— β . N. W. Am. *Douglas.* Observatory Inlet. *Dr Scouler.*

†† *Spicis pedunculatis.*

9. *L. clavatum, L.*—*E. Bot. t. 224. Ph. Am. 2. p. 652.*— β . *monostachyon*; spica solitaria, pedunculis brevibus. *Hook. et Grev. Lycop. in Bot. Misc. v. 2. p. 875.*— γ . *tristachyon*, spicis subternis, ramis fastigiatis, foliis subintegerrimis. *L. clavatum, Mx.*—*L. aristatum, γ. tristachyon, Nutt.*—*Hook. et Grev. l. c. p. 876.* *L. tristachyon, Nutt. (non Ph.)*— δ . foliis omnino integerrimis muticis.

HAB. Newfoundland. *Miss Brenton. Dr Morrison.* Throughout Canada to the Saskatchewan. *Dr Richardson. Drummond.* Interior of the Columbia. *Douglas.*— β . Rocky Mountains, north of the Smoking River. *Drummond.*— δ . N. W. America, from Observatory Inlet, *Dr Scouler*, to Stikine; and on Mount Rainier. *Toomie.*—A very variable plant, and very extensively distributed over many parts of the world.

B. STIPULATE.

* *Ramis compressis cum foliis distichis decurrentibus coadunatis, stipulis uniseriatibus.*

10. *L. complanatum, L.*—*Schkuhr. Fil. t. 168. Ph. Am. 2. p. 652.*—*L. tristachyon, Ph. (non Nutt.)*

HAB. Canada. *Pursh. Goldie. Mrs Perceval.* From Lake Huron, *Dr Todd*, to the Saskatchewan. *Dr Richardson. Drummond.* Newfoundland. *Miss Brenton. Dr Morrison.* N. W. Coast of America. *Menzies.*

11. *L. alpinum*, L.—*E. Bot.* t. 234.*Hab.* Elevated parts of the Rocky Mountains. *Drummond.*** *Foliis distichis, stipulis biserratis semper superioribus.*

12. *L. Douglasii*; repens dichotome ramosum, foliis distichis ovalibus uninerviis nitidis integerrimis, stipulis conformibus paululum falcatis apiculatis, spicis terminalibus cylindraceis, squamis cordato-acuminatis inferne ciliatis. *Hook. et Grev. in Bot. Misc.* v. 12. p. 396.—*L. ovalifolium*. *Hook. et Grev. Ic. Fil.* t. 177. (non Desv.)

Hab. Near springs in woody places, N. W. America. *Douglas.*—An extremely distinct and well-marked species, which I have never received from any collector except *Mr Douglas*.

ORD. III. MARSILEACEÆ. *Br.*

1. ISOETES. L.

1. *I. lacustris*, L.—*E. Bot.*—*Ph. Am.* 2. p. 671.*Hab.* Saskatchewan. *Drummond.*

2. MARSILEA. L.

1. *M. vestita*; foliolis cuneatis subobliquis petiolisque appresso-hirsutis, involucris ovalibus hirsutis axillaribus pedunculo subreque longis. *Hook. et Grev. Ic. Fil.* t. 159.

Hab. Common on Menzies' Island and sandy banks of the Columbia, near the Grand Rapids. *Douglas.* *Dr Scouler.*—The same species is found at Talisco, Mexico, by the Naturalists of Capt. Beechey's Voyage.

ORD. IV. SALVINIACEÆ. *Bartl.*

1. SALVINIA. L.

1. *S. natans*, L.—*Schkuhr, Fil.* t. 173. *Ph. Am.* 2. p. 672.*Hab.* Floating on stagnant waters, Canada, *Pursh.*

2. AZOLLA. Lam.

1. *A. Caroliniana*, Willd. *Sp. Pl.* p. 451. *Ph. Am.* 2. p. 672.—*A. microphylla*, Kaulf. —*Hook. et Arn. Bot. of Beech. Voy.* p. 162.

Hab. Canada, on the still waters of Lake Ontario. *Pursh.*—I have not seen British North American specimens of this singular aquatic. But I do not think the Californian *A. microphylla* of Kaulfuss differs from this, nor this probably from the original *A. Magellanica*.

ORD. V. EQUISETACEÆ. Rich.

1. EQUISETUM. L.

1. *E. fluviatile*, L.—*E. Bot. t. 2022. Hook. et Arn. in Bot. of Beech. Voy. p. 40*.

HAB. N. W. America. Columbia River. *Dr Scouler*; who observes that the young shoots are eaten in the Spring as asparagus.—This species extends south into California; and Dr Beck gives it as an inhabitant of Buffalo, N. York, and of the shores of Lake Ontario.

2. *E. sylvaticum*, L.—*E. Bot. t. 1874. Ph. Am. 2. p. 651.*

HAB. Canada. Cleghorn, Lady Dalhousie; to Fort Franklin on the Mackenzie River. *Dr Richardson. Drummond.* Newfoundland. *Miss Brenton. Mr Cormack. New Brunswick. Mr Kendal.*

3. *E. umbrosum*; caulibus sterilibus pluristriatis superne scabris verticillatim ramosis, ramis strictiusculis summis subcorymbosis, fertilibus simplicibus demum elongatis verticillatim ramosis ut in sterilibus.—*Meyer in Willd. Sp. Pl. 5. p. 3.*

HAB. Saskatchewan to the Rocky Mountains. *Drummond. Canada. Mrs Perceval.*—The young fertile specimens of this plant from the Rocky Mountains, are marked "*E. Drummondii*, Hook." (Brit. Fl. ed. 4, p. 393, et E. Bot. Suppl. t. 277); and indeed at first sight I could perceive no difference: but on examining these specimens carefully, I found on several of them incipient branches, budding out from the base of the sheaths. There cannot be a doubt, therefore, but these belong to the same species as the specimens from Carlton House Fort, which Dr Richardson has correctly named "*E. umbrosum*," Meyer and Willd., and which exhibit fertile and sterile branches from the same creeping root, both throwing out the horizontal branches. There are likewise fully developed sterile stems in the collection. Now these last, and the simple (unbranched) fertile plants, are so like our British *E. Drummondii*, that if we only suppose our fertile plants of the latter not sufficiently advanced to throw out the branches (and there are comparatively few specimens which have yet come under my observation), we shall see that the two so-called species are identical, and the name of *Drummondii* must give place to *umbrosum*. Willdenow notices its affinity to *E. sylvaticum*:—that is, in the peculiarity of the fertile stems throwing off the spike and then branching and becoming similar to the sterile ones: for the two species are totally distinct.

4. *E. arvense*, L.—*E. Bot. t. 2020. Ph. Am. 2. p. 651.*

HAB. Lake Huron, *Dr Todd*; to the Rocky Mountains and the Saskatchewan. *Dr Richardson. Drummond.*

5. *E. linosum*, L.—*E. Bot. t. 929. Beck, Fl. p. 446.*—*E. uliginosum*, Willd.? *Ph. Am. 2. p. 651.*— β . *Candelabrum*; ramorum verticillis numerosis superioribus plurimis spicigeris.

HAB. Watery places of the Saskatchewan; and β , growing in water about Winnipeg. *Dr Richardson. Drummond.*—The var. β , has a very curious appearance: it bears copious whorls about 2 inches long, 16-20 branches in a whorl, and 7 or 8 of these upper whorls bearing spikes, which are much smaller and much less advanced than the terminal one of the stem.

6. *E. palustre*, L.—*E. Bot. t. 2021.*

HAB. Canada; from Lake Huron, *Dr Todd, Mr Cleghorn, Mrs Perceval*; to the shores of the Arctic Sea. *Dr Richardson, Drummond, Sir John Franklin, Capt. Back.*

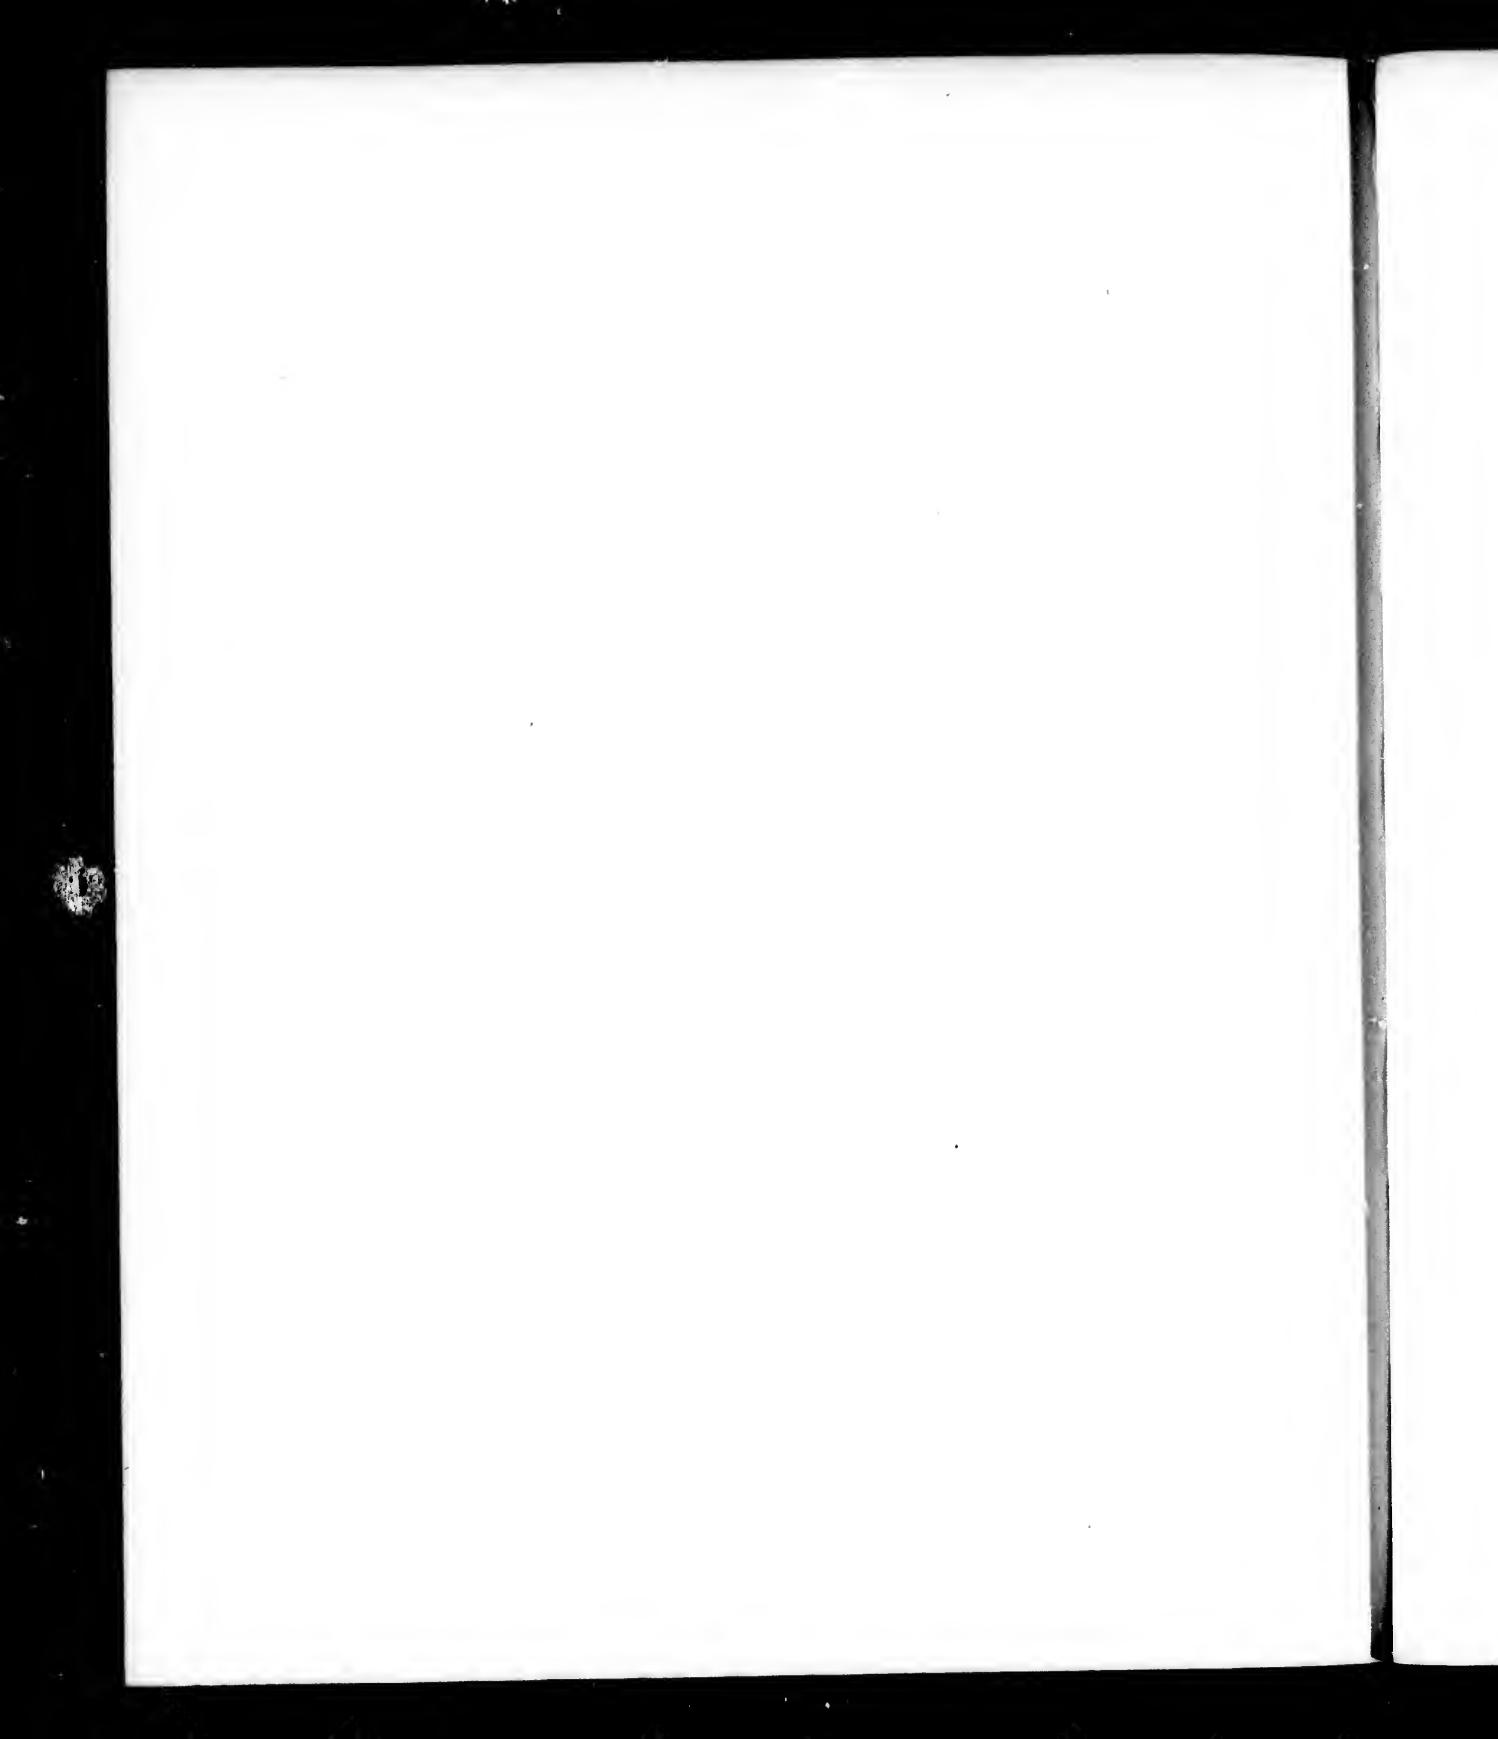

7. *E. hyemale*, L.—*E. Bot. t. 915. Ph. Am. 2. p. 652. Hook. et Arn. Bot. of Beech. Voy. p. 404.*

HAB. Lake Huron, (*Dr Todd,*) to the Slave Lake: and from Hudson's Bay to the Western Ocean, (Columbia), *Douglas, Dr Scouler.*

8. *E. variegatum*, L.—*E. Bot. t. 915.—S. minus, caulibus debilibus flexuosis. E. scirpooides, Mx. Am. 2. p. 281. Willd.—Ph. Am. 2. p. 652.*

HAB. Frequent in Canada, *Goldie, Mrs Perceval*; and thence to the Saskatchewan, *Dr Richardson, Drummond*; and to the Arctic Islands, *Sir E. Parry*.—*S. about the Saskatchewan.—The two forms of this plant above alluded to are also found in Europe.*
