6. The key control points for the inundations above Valenciennes are (1) Lock No. 11, (2) Enemy earth dam. E.14.d.3.5.

7. The drainage problem in the City of Valenciennes was, for a time, serious on account of

(1) Lock No. 12 being blocked.

(2) Sluices at E.8.d.7.4. being partly closed.

(3) Bridge debris dam at E.4.c.1.0.

Sluices (2) have been opened full and the dam (3) has been cleared so that the city is now free from any danger of streets being flooded.

8. Locks 12 and 13 hold the Escaut Canal to approximately normal level but there is no flow. 90% of the water passing through Valenciennes flows down the Canal de Decharge and reaches the Escaut Canal again below Lock 13 at Bruay after passing over low dams at W.23.c.1.9. and W.17.a.9.1. The other 10% flows down the old Escaut River and formerly was diverted East at W.11.d.25.00. into the floods in W.12. etc. It is now taking its normal course again into the Canal de Decharge.

9. The Escaut Canal W.L. between locks 13 and 14 is rising and may soon overflow its banks at the lower end unless relieved by opening the control points at Lock 14.

(COPY)

VIII Corps Inundation Situation
(Nov. 11, 1918.)

1. Fresnes lock No. 14, R.20.d.3.9. and accompanying barrage intact but blocked. Drop in waterlevel-1′ 6″.

Enemy earth dam in old river, R.20.c.7.6.—No drop in water level.

2. Bridge debris dams in Condé

1. R.8.d.90.25 has drop of 1′ 6″

2. R.8.d.45.25. has drop of 6″

3. The floods South East of Condé in E.15.16. etc., are emptying into the Haisne River.

Valenciennes railway station as the Canadians found it; note the inundations in the right foreground.

(i) Through 10′ gap in S. Canal bank R.10.c.9.5.

(ii) Through two sluice gates in S. canal bank R.9. c.8.2., partially opened.

There is only a 6″ head at these openings, so that complete drainage is impossible through these openings, as the main flood is deep

4. The Haisne River has a heavy flow and is blocked as follows:—

(i) Bridge debris dam R.9.c.45.10 — 1′ drop

(ii) 4-way siphon under Ascaut Canal at R.15.a. 15.85 — partially blocked by floating debris, etc.

(iii) Large enemy earth dam at R.7.d.8.6. just above junction with Escaut. Immediately above this dam there is a 50′ gap in the South Bank, through which the river is pouring and flooding R.7., Q.12, 6,5, etc. There is also a gap 20′ wide, through the South bank immediately below the dam and part of the flood finds its way back into the river through this gap.

There is a 2′ drop in water level at this dam.

5. Hergnies lock No. 15 and accompanying weir are intact as far as the masonry is concerned. Both gates are partially damaged and there is no water control there or at the weir. The drop in water level at this lock is 6″.

6. Crown of metalled road at Hergnies-Odonez crossing only 18″ above water level on each side. There is no obstruction in the Escaut canal at this point but any increase in the canal discharge from above might flood the road.

There is a bridge debris dam in the Jard canal on this road crossing holding up 18″ of water.

7. Photographs show Rodignies lock No. 16 apparently intact, but holding up a small head of water.

8. Lock in Condé R.9.c.2.3. on Mons-Condé canal intact, but blocked. Water level in Mons-Condé canal 2′6″ lower than water level in Escaut canal and escapes into Jard canal around North end of Condé.

RECOMMENDATIONS. In order to clear the inundations from the Valenciennes-Condé area and so prepare the channels for the expected winter floods, the following steps seem necessary, provided the channel is clear further downstream in Fifth Army area:

(a) Demolish earth dam at R.7.d.8.6. and close upper gap, leaving lower gap open as long as flood flows into Canal.

(b) Clear away all obstructions in locks at Rodignies, Hergnies and Fresnes (in that order) taking care to retain water control if needed.

(c) Clear away the bridge debris dam in Condé (mentioned above) and also the siphon obstructions.

(d) Open fully the sluice gates at R.9.c.45.15. and leave these open, as well as the gap at R.10.c.95.45. as long as the flow is towards the Canal.

(e) Clear away bridge debris dam in Jard Canal at Hergnies-Odonez crossing and any other obstructions in either Jard or Escaut Canals which may be found.

G. L. SHANKS, Lieut. R.E.,
Inundation Officer,
att'd. Canadian Corps.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. August 1920 No. 8

Dates of Professional Meetings

The Western Professional Meeting will be held under the auspices of the Calgary Branch, at Banff, on August the 14th to 18th inclusive.

The Seventh General Professional Meeting will be held in Niagara Falls, September 16th, 17th, and 18th, and the Eighth General Professional Meeting will be held in Halifax, October 13th, 14th and 15th.

The Annual and Annual General Professional Meeting will be held in Toronto on February 1st, 2nd and 3rd, 1921.

Tentative Program, Western Professional Meeting at Banff

August 14th to 19th, 1920

His Honour the Lieutenant-Governor, R. G. Brett of Alberta has been asked to give the opening address, which will be replied to by S. G. Porter, M.E.I.C., Lethbridge, Alta., and P. Turner Bone, M.E.I.C., Chairman of the Calgary Branch, and each Chairman of the Western branches has been asked to be present or send a representative, and say a few words on behalf of their respective branches.

Paper on "Concrete in Alkali Soils" by A. S. Dawson, M.E.I.C., chief engineer, Department of Natural Resources, C.P.R., and a member of the Special Committee on Concrete and Alkali Soils. The entire committee will also be present and take part in a general discussion of this subject.

An Illustrated Lecture on "Power Development at Niagara Falls" or "Hydraulic Turbine Design" by F. H. Martin, designing engineer, Winnipeg River Power Company.

A paper on "Architectural Engineering" by R. P. Blakey, provincial architect of Alberta; discussion will be led by G. Fordyce, architect of Calgary, Alta.

A paper on "Legislation effecting Engineers" by F. H. Peters, M.E.I.C., Commissioner of Irrigation, Calgary. Discussion of this very important matter will also take place.

Illustrated Lecture on "Banff in Winter" by J. M. Wardell, A.M.E.I.C., superintendent of road construction, Parks Branch, Department of the Interior, headquarters at Banff.

Papers by Major W. G. Swan, D.S.O., M.E.I.C., chief engineer Vancouver Harbour Commission, on "Vancouver Harbour and Proposed Development", and "Railway Construction of the Royal Engineers in Palestin" by Major Walkem, M.E.I.C., of Vancouver, B.C. have also been promised.

A paper is expected on "Powdered Coal" by H. A. Mackay, M.E.I.C., chief engineer, Manitoba Bridge and Iron Works, Winnipeg.

Many prominent members have been asked to attend, but as yet a full return has not been received of those who will be present and other addresses will be asked for from among those who attend.

An invitation has also been sent to the American Society of Civil Engineers, who are holding their annual convention at Portland, Ore., from August 10th to 12th inclusive, asking as many of their members who are able to return via Banff to stop off and attend our meeting. It is hoped that perhaps a few speakers may be obtained from among their number.

Mr. Pat. Burns has kindly offered to donate a steer, which will be roasted at a barbecue one afternoon and evening of the meeting.

It is also expected a trip will be arranged to the Bank Head Coal Mine, which is only a short distance from

Banff, also a trip to Johnson Canyon, and perhaps to Lake Minnewanka.

The attractions at Banff need no advertising, and it goes without saying that any who attend will have a pleasant time from the standpoint of pleasure as well as professional advancement.

Ontario General Professional Meeting

September 16-17-18, 1920. Niagara Falls

While the programme of the meeting is still incomplete, the membership of *The Institute* will be pleased to learn that many interesting features have already been definitely arranged for.

Thursday, September 16th

Registration, 10 a.m. The events are scheduled to commence on Thursday morning with registration of member in attendance, introductions and renewal of old acquaintances.

Luncheon 12.15. Welland Ship Canal 2.00 p.m. After the opening luncheon there will be given an illustrated talk on Canadian Inland Waterways and the construction of the Welland Ship Canal, followed by a trip over the works now partly completed returning in time for dinner; after which a brief entertainment will be put on by the Niagara Peninsula Branch closing in sufficient time for visitors to view the magnificent illumination of the Canadian Falls from the Power House of the Ontario Power Company.

Friday, September 17th

Professional Session 9.15 a.m. Friday morning will be taken up with hydraulic and electrical professional papers and reports of progress of the Executive of the Ontario Provincial division conducted by its officers. The Executive reports will deal with subjects of special interest to younger members of whom it is sincerely hoped there will be a large representation.

Luncheon 1 p.m. Adjournment will be made to the Administration Building in Queen Victoria Park for a complimentary luncheon kindly tendered by the Department of Highways of the Province of Ontario.

Queenston Power Development 2.30 p.m. A trip of inspection over the Construction work of the Queenston Power Development is planned for the afternoon. Visitors will see in operation some of the largest excavating units of their kind in the world.

Formal Dinner Dance, 7.00 p.m. There will be a formal dinner at the Clifton in the evening. This will be followed by an Institute dance, given by the Branch.

Saturday, September 18th

Continuation of Professional Session, 9 a.m. Continuation of Professional papers, visits to neighbouring power houses, side trips to points of scenic interest, golf, and indoor and outdoor baseball will constitute the programme for Saturday morning, with a closing luncheon at one o'clock.

Week End Dance, 9 p.m. Those who remain over for the week end will enjoy the regular Saturday evening dance at the Clifton.

The programme has been arranged throughout so that it will be specially interesting to ladies as well as to members young and old. Ample accommodation has been secured for all visitors and there is all prospect that the meeting will be most successful in every way.

It is expected that several different types of bridges will be in the course of construction on the Niagara Power Development of the Hydro-Electric Power Commission of Ontario at the time of the Ontario General Professional Meeting at Niagara Falls, September 16th, 17th and 18th.

Perhaps the one of greatest interest to engineers is the reinforced concrete arch bridge which carries the main line of the Grand Trunk and the Niagara Division of the Michigan Central Railroad over the power canal.

This bridge, when completed, will provide for six tracks—four for the Grand Trunk and two for the Michigan Central Railroad.

It is designed for Cooper's E-70 loading and contains 10,000 cubic yards of concrete and 300 tons of steel. The span is 72 feet on a skew of 47 degrees. The total length is 172 feet and the total width 136 feet.

Among the other bridges, attention is drawn to the bascule type of bridge at Chippawa. This is a highway bridge over the Welland River and has a lift-span of 100 feet. The piers and abutments were carried to rock about 35 feet below the water surface.

There are several temporary timber and timber and steel bridges carrying highway and railway traffic, pending the construction of the permanent bridges.

Baseball Challenge

The spirit of the Niagara Peninsula Branch is reflected in the letter which follows and which shows that the members of the Branch, in addition to assuming the responsibility of a general professional meeting, are willing to compete for athletic supremacy against any Branch in Canada.

As there will be a sufficient number from many of the Branches to provide several baseball teams, it is hoped and fully expected that the challenge of the Niagara Peninsula Branch will be met by a number of the other Branches. Hamilton, Toronto, Montreal and possibly Peterboro' should not let this opportunity pass. Acceptances of this challenge are now in order.

Niagara Peninsula Branch,
16th July, 1920.

My Dear Mr. Keith:

The Niagara Peninsula Branch hereby challenge any branch of *The Institute* to a game of "in-door out-door baseball" to be played at the time of the professional meeting to be held in Niagara Falls, September 16th, 17th and 18th. It is probable that the game will be played on Saturday morning. If a sufficient number of teams wish to play, a tournament can be arranged; and there is room for several games playing simultaneously on the grounds of the Queen Victoria Park Commission.

I hope that I am not too late to have this challenge in the August issue of *The Journal.*

Thanking you in advance,

I am, Yours very truly,

(*Sgd.*) F. W. CLARK, A.M.E.I.C.,
For Athletic Committee.

Alberta Association of Professional Engineers

A copy of an Act assented to by the legislature of Alberta on April 10, 1920, appeared in last month's number of *The Journal.*

Pursuant to this act, a meeting of the members of the association formed under its provisions was called and met in the Board of Trade rooms at Calgary on July 10 with thirty-three members present.

F. H. PETERS, M.E.I.C.
President Alberta Association of Professional Engineers

F. H. Peters, M.E.I.C., whose efforts are largely responsible for the passing of the Alberta Act as well as for promoting the similar acts in other provinces throughout the Dominion, addressed the meeting, pointing out that the first stage of organization has been successful beyond the hopes of those who were responsible for its inception.

Over one hundred members have been admitted and it is hoped the membership will reach double that by the end of the year. A number of applications have been received in addition to those of the members admitted, which have not yet been dealt with. It remains for the membership to make efforts to get every qualified engineer in Alberta into the organization, and to pull together to uphold the ideals common to the profession, building up the prestige of the calling and securing such further protection by law as may seem necessary.

Mr. Peters gave a historical sketch showing that the development of the separate profession of engineering has not as long a history as some of the other professions and that consequently the engineers have been somewhat belated in securing recognition at law. This condition is rectifying itself through our efforts, and it remains for its members to prove themselves by their ability and touch with public matters, to be worthy of a recognized legal position as Professional Engineers.

Following the talk by Mr. Peters, on a suggestion from A. S. Dawson, M.E.I.C., the members present made themselves known individually by rising in turn, giving name, business and place of residence.

A draft of by-laws was discussed, item by item, and suggestions as to desirable amendments were made, so that the final draft met the ideas of the members present and conforms to the legal requirements.

During this discussion, great evidence of unity of purpose and desire to avoid situations which might work hardships on minorities appeared among all present. This feeling was pithily substantiated in a short talk by R. A. Brown, supt. of Calgary Municipal Railway, who pointed out that helpful co-operation, and a desire that the stronger branches should yield to weaker branches on points affecting the weaker, would be a pre-requisite to the success of the association as a whole and if ever this spirit should leave us, we might as well shut up shop as an effective organization.

The result of a ballot was made known, and the following were declared elected.

President, Fred H. Peters, M.E.I.C., commissioner of irrigation, Calgary, (Civil).

Vice-President, Lawrence E. Drummond, manager of Mountain Park Colliery, Edmonton, (Mining).

Secretary-Treasurer and Registrar, R. S. L. Wilson, A.M.E.I.C., professor of civil engineering in the University of Alberta, Edmonton.

Members of Council:

Civil: Sam. G. Porter, M.E.I.C., superintendent of C.P.R. canals, Lethbridge.

R. J. Gibb, M.E.I.C., city engineer, Edmonton.

Mines: O. E. S. Whiteside, manager of International Coal and Coke Co., Coleman, and President of Canadian Mining and Metallurgical Institute.

N. C. Pitcher, professor of mining engineering at the University of Alberta, Edmonton.

Electrical: R. A. Brown, superintendent of Calgary Municipal Railway, and power superintendent.
R. B. Baxter, superintendent of plant, Alberta Government Telephones.

Mechanical: W. G. Gray, chief engineer, Medicine Hat, power plant.

F. W. Hobson, chief boiler inspector for Alberta.

A nominating committee of one member from each of the four branches was named. In accordance with the by-laws this committee must place on the ballot any name suggested by ten members. They must provide at least two names for each vacancy. The by-law providing this method of nomination was framed in the hope that no one could ever feel that a small coterie was trying to run the association.

Meeting of Concrete Investigation Committee of the Institute

A special meeting of the members of the concrete committee of *The Institute* and others interested in the subject of concrete in Alkali Soils, will be held at the Paliser Hotel, Calgary, on Saturday morning, August 14.

Consideration will be given at the meeting to the matter of procedure in the formation of a Research Bureau for the investigation of the effect of alkali on concrete structures, as suggested at a meeting held in Winnipeg on June 4.

The following express the results of the consideration of this subject as taken from the minutes of the Winnipeg meeting:

1. The matter of alkali action was most important.
2. Field and laboratory experiments under efficient direction was essential.
3. Arrangements should be made at once for the formation of an Advisory Council to superintend operations, this council to have representatives from all interested organizations.
4. That formal request be made to the Research Council for the sum of $15,000, or if Canada Cement Company desire to contribute this sum that it be divided between the two.
5. That a field man be selected at once and that field experiments be undertaken without delay.
6. That Advisory Council meet once a year at any convenient centre.
7. That when funds are on hand a central laboratory be established with competent chemist in charge to devote his entire time to laboratory work in connection with the alkali program.

At the special meeting to be held in Calgary further consideration will be made on the subject in an endeavour to draft definite recommendations to be presented by *The Institute* Committee of the Western Professional Meeting to be held at Banff on the following Monday.

It is specially requested that any who are unable to attend this meeting send in their comments by mail to A. S. Dawson, M.E.I.C., chief engineer Dept. Natural Resources, C.P.R. Calgary, who will present same to the meeting.

D. Stuart McKenzie, M.E.I.C.

Winnipeg, July 13/20. *Chairman, Institute Committee.*

Thanks of the Ontario Provincial Division

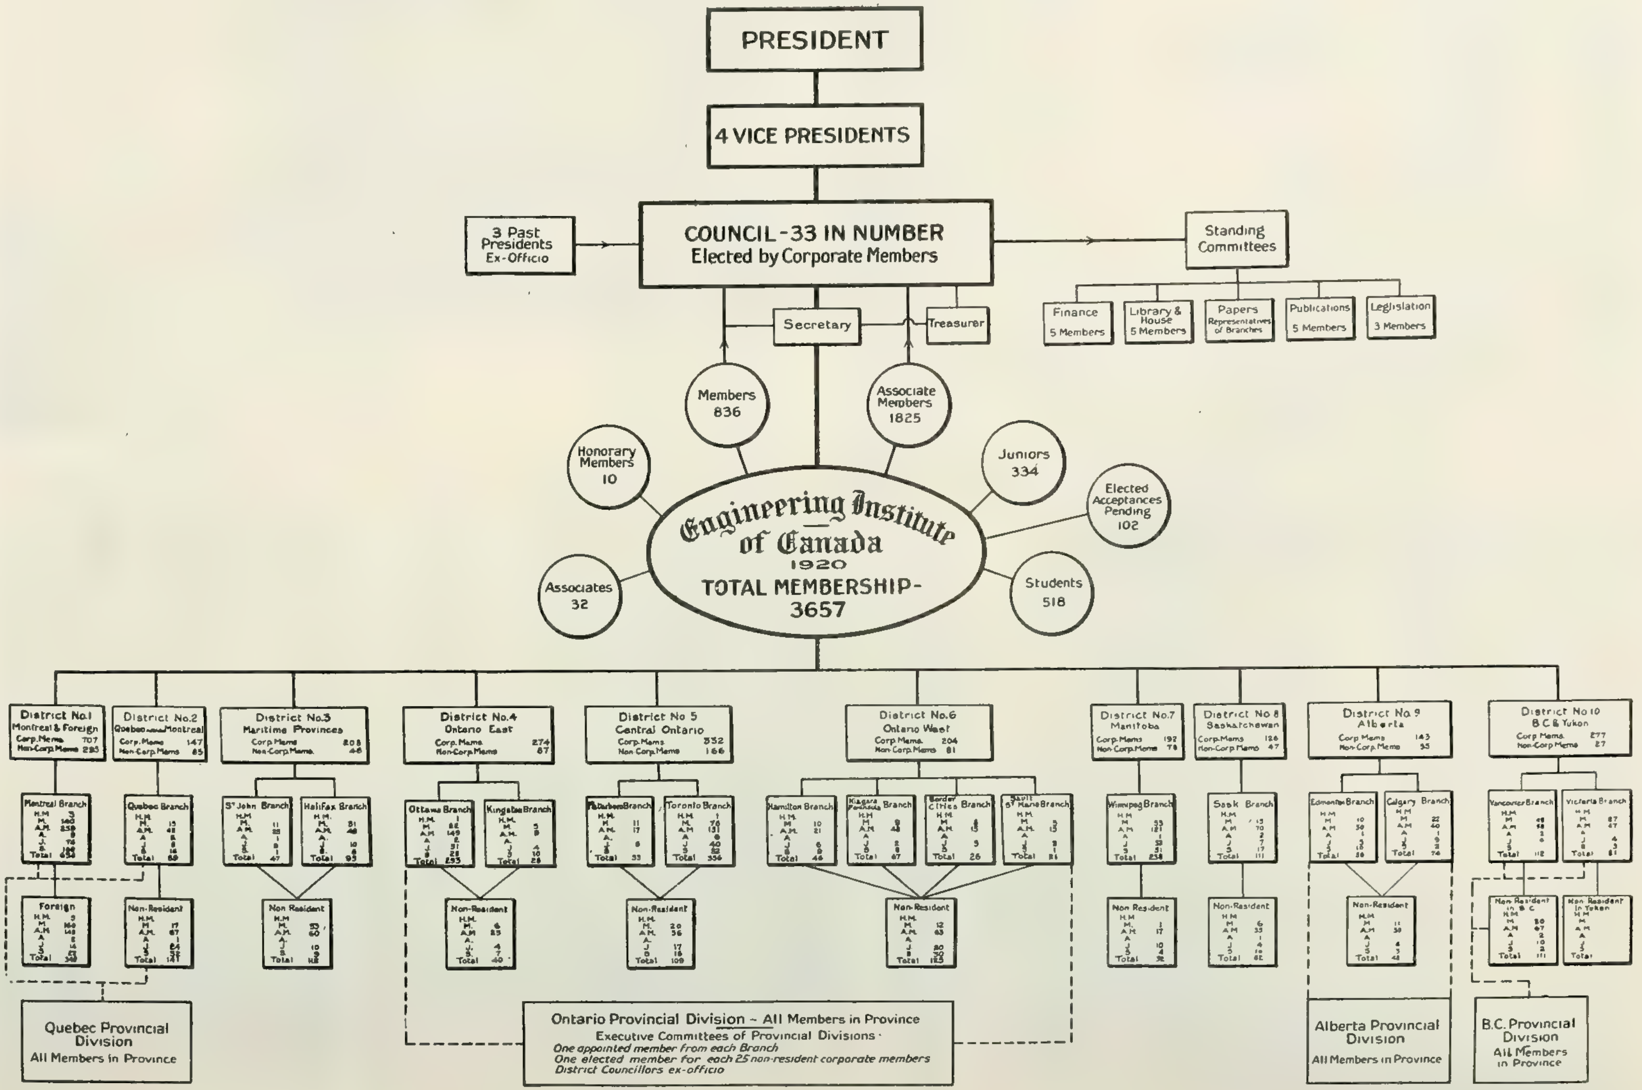
The Executive Committee of the Ontario Provincial Division desire to thank the members for their response to the Executive's circular of June 1st, asking for a contribution towards the financing of the work of the Executive for this year. At the present writing about $300. has been received.

The Secretary-Treasurer has endeavored to send an acknowledgement to every remitter, but owing to the great number of changes in addresses which have occurred lately, besides the possibility that some remittances have never reached Mr. Lambe, any gentleman who has not received an acknowledgement is asked to advise the Secretary to that effect.

Quebec Bridge Report

The final report on the design and construction of the Quebec Bridge by the board of engineers of the Canadian Government, C. N. Monsarrat, M.E.I.C., Chairman, briefly referred to in a previous issue of *The Journal* is worthy of further reference and is a compilation of which both the board of engineers and the Government through the Minister of Railways and Canals may well be proud. It is issued in two volumes, volume one being devoted to the history of the bridge, a general narrative regarding the construction, the erection of the super-structure and the substructure, in all two hundred and fifty nine pages on heavy coated stock. Volume two contains one hundred and eleven plates of details, the whole making a complete and consistent record of this monumental undertaking. These two bound volumes will occupy a worthy place in the official records of the Dominion Government, and constitute a record of achievement of which all concerned may well be proud.

Organization Chart
of the
Engineering Institute of Canada



ELECTIONS AND TRANSFERS

Elections and Transfers

At the meeting of Council on July 29th, the following elections and transfers were effected:—

Members

Duff Andrew Abrams, of Chicago, Ill. (B.S. Univ. Ill.) Professor in chg. of research Laboratories Lewis Inst., Chicago; James Rawson Anglin, of Westmount, (B.Sc., Arch. McGill Univ.) President, Anglin-Norcross Limited, Montreal; Archibald Welch, of Welland, Ont., Managing Director, The British American Shipbuilding Co. Ltd., Welland, Ont.

Associate Members

Romeo Sadi Amiot, of Chicoutimi, Que., Engineer on Construction of Highways, Provincial Government; Bowman Shepard Atkins, of Shawinigan Falls, Que., (Mass. Inst. of Tech.), City Engineer, Shawinigan Falls, Que.; Arthur Westendale Barker, of Winnipeg, Man., Supt., Fire Service Water Works, Winnipeg; Harold Arthur Bowden, of Edson, Alta., Instrumentman Maintenance G.T.P.Ry.; Fred Aubrey Burgar, of Niagara Falls, Ont., (C.E. Rennslaer Polytech. Inst.), Supt., of Construction on Water Power Developments, H.E.P.C. Toronto, Ont.; John Gordon, of Winnipeg, Man., (E.E., Armstrong Coll., Newcastle), Asst. Electrical Engineer, Can. Gov. Rlys. (Western Lines); Harry Louis Hayne, of Alberni, B.C., Asst. engineer on constrn. of E-N.Ry. extension of Great Central Lake; James Bertram Hayes, of Halifax, N.S., (B.Sc. Dalhousie Univ.) Field Engr., in charge of constrn., N.S. Tramways & Power Co. Ltd., Halifax, N.S.; Harold Chapman Johnston, of Montreal, (B.A. Sc. Univ. of Toronto) Vice President and Gen. Mgr. H. C. Johnston Co. Ltd., Montreal; David Gardner McKean, of Winnipeg, Man., Asst. to Chief Engr. The Greater Winnipeg Water District, Winnipeg, Man.; Arthur Anthony McLaren, of Niagara Falls, Ont., (B.Sc. Queen's Univ.) Hydro Electric Power Commission, Res. Engr.; William George Quade Munn, of Peterboro, Ont., Chief Draughtsman Hamilton Co. Ltd., Peterboro, Ont.; Harold Storey Nicklin, of Guelph, Ont., (B.A.Sc. Univ. of Toronto) Asst. Loans Officer Dept., S.C.R., Guelph, Ont.; Philip Carleton Perry, of Regina, Sask., Asst. Res. Engineer, Regina, Sask.; Frank R. Purvis, of Prince George, B.C., with S. S. Magaffin Co. as Camp Foreman; Léon Alfred St. Pierre, of Outremont, Que., (B.A.B.Sc. (C.E.) Laval) Designing and erecting work Dominion Bridge Co.; Gordon J. Smith, of Kingston, Ont., (B.A., B.Sc. Queen's Univ.) at present engaged in commercial enterprise; Victor Hugo Todd, of Vancouver, B.C., Granby Cons. Mining, Smelting & Power Co. Ltd., Vancouver, Exploration & Surveys & Estimate on harbour power sites, hydro electric plants; George E. Warren, of Chicago, Ill. (B.S. (C.E.) Univ. of Illinois) engineer-manager of American Concrete Pipe Association.

Juniors

Andrew Matthew Abram, of Prince Rupert, B.C., Instrumentman, maintenance of way, G.T.P. Ry.; Earl Gaynel Asker, of Peterboro, Ont. (B.Sc. Univ. of N.B.) Draftsman Can. Genl. Electric Co. Peterboro, Ont.; Thomas Havelock Dickson, of Halifax, N.S. (At present attending Dalhousie Univ.); Maurice Frank Ferling, of Chester, N.S. (B.Sc., B.E.) Queen's Univ.) Can. Land Surveyor; Ian Macdonald Machum, of Timmins, Ont., (B.Sc. Univ. of N.B.) taking Students' Test Course with C. G. E. Co. Ltd.; Arthur K. McIntosh, of Kingston, Ont., Attending Queen's Univ.; Melvyn Lattham Wilson, of Montreal (B.Sc. McGill) Demonstrator in Mech. Eng'g Dept., McGill University.

Associate

Arthur Lewis Clark, of Kingston, (B.Sc., Worcester Polytech. Inst., Ph.D.) Dean of Faculty of Applied Science, Queen's University.

Transferred from the Class of Associate Member to that of Member.

Charles Jules Desbaillets, of Montreal, Que., (Elec. Eng., Bienne, etc.), Engr. in chg., Montreal Water Board; Henri Augustin Dupré, of Ottawa, Ont., (Assoc. Civil & Mech. City & Guilds, London Inst., and Tech. Coll. Darmstadt, Germany) Asst. Director, Supt. Electricity and gas insp. Dept. of Trade & Commerce; J. E. Grimmer, of Temiskaming, Que., (B.A.I., M.Sc. Univ. of N.B.) Town Engineer, Temiskaming, Que.; Robert Alexander Cecil Henry, of Ottawa, Ont., (B.A., B.Sc. McGill Univ. 1912) Asst. Engr. Dept. Rys. & Canals, Ottawa, Ont.; John Garnet Reid, Lieut. Col. (D.S.O.), of Lanigan, Sask., Asst. Engr., C.P.R. Constr. Western Lines; Frank P. Vaughan, of St. John, N.B., Engr. and Mgr. The Vaughan Electric Co. Ltd., Electrical Engrs. St. John, N.B.

Transferred from the Class of Junior to that of Associate Member.

Cecil B. C. Donnelly, Lt.-Col. R.G.A., of Victoria, B.C., (D.L.S. & M.L.S. Undergrad. Univ. of Manitoba); Herbert Dixon Fyfe, of North Vancouver, B.C., (S.P.S. Toronto) structural engr. J. Coughlan & Sons, Vancouver, B.C.; Stanley Roma Lamb, of Winnipeg, Man., res. engr. in charge of constrn. C.P.R. Western Lines; James Kenneth McKay, of Clyde River, N.S., charge of party on road survey with N.S. Board of Highways in Yarmouth & Shelburne; Hugh Peters, of Esquimalt, B.C., (R.M.C. Kingston) Asst. Eng. [illegible] P.W.D.

Transferred from the Class of Student to that of Associate Member.

Frederick Owen Hodgins, Lt. Col., of Camberley, England, Grad. (Honors) R.M.C., not yet demobilized.

Transferred from Class of Student to that of Junior.

Leo. B. Brown, of Camrose, Alta., (B.Sc. Univ. of Alberta) Hydrometric Engr. Irrigation Branch, Dept. of Interior, Calgary, Alta.; Kenneth Neil Cameron, of Marion, Mass. (B.A.Sc. Toronto) Asst. Eng. Marconi Wireless Tel. Co. of America on installation of equipment.

AN ACT RESPECTING THE ENGINEERING PROFESSION

PROVINCE OF NOVA SCOTIA

WHEREAS, It is considered advisable to establish by legislation the qualifications necessary to permit persons to act or practise as Professional Engineers in the Province of Nova Scotia.

NOW, THEREFORE, Be it enacted by the Governor, Council and Assembly, as follows:—

Short Title.

1. This Act may be cited as the "Nova Scotia Engineering Profession Act."

Interpretation.

2. In this Act, unless the context otherwise requires the expression:—

(a) "Professional Engineer" means any person registered as a Professional Engineer under the provisions of this Act.

(b) The practice of a Professional Engineer within the meaning of this act embraces advising on making measurements for, laying out and the design and supervision of the construction, enlargement, alteration, improvements or repairs of public and private utilities, railways, bridges, tunnels, highways, roads, canals, harbours, harbour works, river improvements, lighthouses, wet docks, dry docks, dredges, cranes, floating docks, and other similar works, steam engines, turbines, pumps, internal combustion engines and other similar mechanical structures, airships and aeroplanes, electrical machinery and apparatus, chemical and metallurgical machinery and works for the development, transmission or application of power. Buildings for the housing and installation of machinery and appliances for the development of hydraulic or electric power, engine sheds, freight houses, coal pockets, warehouses and factories, machine shops, the steel frames of large buildings, and other buildings and structures of Engineering character or for Engineering purposes, mining operations and apparatus for carrying out such operations, municipal works, irrigation works, water works, water purification plants, sewerage works, sewage disposal works, drainage works, incinerators, hydraulic works, and all other engineering works.

(c) Subsection (b) shall only apply when the work to be done involves an expenditure of at least twenty-five thousand dollars.

(d) The execution as a contractor of work designed by a Professional Engineer, or the supervision of the construction of work as a foreman or superintendent, or as an inspector, or as a roadmaster, track master, bridge or building master, or superintendent of maintenances shall not be deemed to be the practice of a Professional Engineer within the meaning of this Act.

(e) "The Association" means the Association of Professional Engineers of the Province of Nova Scotia.

(f) "Council" means the Executive Council of the Association.

(g) "President" means the President of the Association.

(h) "Registrar" means the Registrar of the Association.

(i) "The Secretary" means the Secretary-Treasurer of the Association.

(j) "Board" means the Board of Examiners of the Association.

The Association of Professional Engineers of the Province of Nova Scotia.

3. (a) All persons registered as Professional Engineers under the provisions of this Act shall constitute the Association of Professional Engineers of the Province of Nova Scotia and shall be a body politic and corporate with perpetual succession and common seal.

(b) The head office of the Association shall be at Halifax.

4. The Association shall have power to acquire and hold real estate not producing at any time an annual income in excess of ten thousand ($10,000) dollars, and to alienate, mortgage, lease or otherwise charge or dispose of such real estate or any part thereof as occasion may require, and all fees, fines and penalties receivable and recoverable under this Act shall belong to the Association.

5. The Association may pass By-Laws not inconsistent with the provisions of this Act for:—

(a) The government, discipline and honour of the Members.

(b) The management of its property;

(c) The maintenance of the Association by levying and collecting fees not in excess of $5.00 per annum;

(d) The examination and admission of candidates to the study and practice of the profession.

(e) All other purposes reasonably necessary for the management of the Association.

6. All By-Laws or Amendments thereto shall become effective only after ratification by two-thirds majority of the votes received from the members of the Association in good standing, and after approval by the Governor-in-Council.

Who May Practise.

7. (a) Only those persons who are members of the Association hereby incorporated and registered as such under the provisions of this Act, or who have received a license from the Council of the Association as hereafter provided, shall be entitled, within the Province of Nova Scotia, to take and use the title of "Professional Engineer," or any abbreviation thereof, or to practise as a "Professional Engineer."

(b) Any person residing in the Province of Nova Scotia at the date of the passing of this Act, who is at that date and has been for three years previously practising Professional Engineering as defined in this Act shall be entitled to be duly registered as a member of this Association without examination, provided that such person shall produce to the Council within one (1) year of the passing of this Act, satisfactory credentials of having so practised. Persons who at the time of the passing of this Act have been acting for a period of not less than three years as Mechanical Superintendents of Industrial, Manufacturing or Mining plants having an installation of one hundred (100) or more horsepower shall be deemed to be Professional Engineers and eligible for registration as such.

(c) Any person who comes to reside in the Province of Nova Scotia and who at that time is a duly registered member of an Association of Engineers similarly constituted of any other Province of the Dominion of Canada, may become a duly registered member of the Association without payment of fee for that year, providing he shall produce to the Council a Certificate of membership in good standing in such other Association and an application for Transfer of Registry endorsed by the Registrar of that Association.

(d) Any person not otherwise qualified as hereinbefore mentioned, residing in the Province of Nova Scotia and who may desire to become a registered member of the Association shall make application to the Council and shall submit to an examination, or shall submit credentials, in lieu of examination, whichever the Council may decide, and shall be admitted to Registry as a member of the Association on payment of prescribed fees after the Council shall have certified in writing that such examination or credentials have been found satisfactory to it.

(e) Any person not residing in the Province of Nova Scotia who is a registered member of an Association of Engineers similarly constituted of any other province of the Dominion of Canada can obtain from the Registrar a license to practise as a Professional Engineer in the Province of Nova Scotia, and upon payment of a fee of one dollar. In the event of such person being unable, by reason of emergency or neglect on the part of the Registrar or for any other good and sufficient reason, to obtain such license within three (3) months of his making application therefor, he shall be entitled to practise as a Professional Engineer in the Province for such period of three months without holding such license.

(f) Any person who is not a resident of Canada, but who is a member of any Engineering or Technical Organization or society of

[illegible]

service.

[illegible]

Partnership.

[illegible]

Administration

[illegible]

(b) The President shall be elected annually and shall hold office [illegible]

[illegible]

Suspension for Misconduct

[illegible]

Penalties

[illegible]

Evidence

[illegible]

Examinations

[illegible]

(d) As soon as possible after the close of each examination the members of the Board who shall have conducted such examination shall make and fyle with the Secretary a certificate stating the result of such examinations, whereupon the Council shall notify each candidate of the result of his examination and their decision upon his application.

(e) A candidate failing on examination may after an interval of not less than six months be examined again;

(f) The Council shall, from time to time, prescribe the fees payable by candidates for examination.

Registration Without Examinations.

15. The Council shall consider an application for registration or license from any person who submits proof of qualifications possessed by such person by virtue of experience, training or examination by another examining body of recognized standing.

16. The Council shall have power to establish conjointly with any Council of any Association similarly constituted in one or more of the Provinces of Canada, a Central Examining Board, and to delegate to such Central Examining Board all or any of the powers possessed by the said Council respecting the examination of candidates for admission to practise, provided that any examination conducted by such Central Examining Board shall be held at least in one place within this Province.

17. The Board shall examine all degrees, diplomas, certificates and other credentials presented or given in evidence for the purposes of obtaining registration or license to practise, and may require the holder of such credentials to attest by oath or by affidavit on any matter involved in his application.

18. The Registrar shall issue a certificate of registration or a license to practise to an accepted candidate upon written instructions from the Council, and upon payment in advance of the prescribed fee by the candidate. The certificate or license shall state the specialty or specialties of the person to whom it is issued.

19. The Registrar shall keep his register correct in accordance with the provisions of this Act and the rules and regulations of the Council.

20. (a) Each person who is registered or licensed to practise shall pay in advance to the Secretary-Treasurer or any person deputed by the Council to receive it, such annual fee as may be determined by the By-Laws of the Association, which fee shall be deemed to be a debt due by the practitioner and to be recoverable with the costs of same in the name of the Council in any court of competent jurisdiction.

(b) If any registered practitioner omit to pay the prescribed annual fee within six months of the date upon which it became due, the Registrar, after ten days notice by registered letter, shall cause the name of such practitioner to be erased from the register, and such practitioner shall thereupon cease to be deemed to be a registered practitioner; but such practitioner shall at any time thereafter, upon paying such fee, be entitled to all his rights and privileges as a registered practitioner from the time of such payment;

(c) The Registrar shall not be required to issue a license to practise to any non-resident practitioner otherwise entitled to such license unles the fee provided for by the By-Laws of the Association shall have been previously paid.

21. Any person entitled to be registered under this Act who shall neglect or omit to be so registered shall not be entitled to any of the rights and privileges conferred by the provisions of this Act so long as such neglect and omission shall continue.

22. In case of any refusal by the Council to register the name of any person as a member of the Association, or of refusal to issue a license to practise, the person aggrieved shall have the right to apply to a Judge of the Supreme Court, who, upon due cause shown, may issue an order to the Council to register the name of such person, or to grant him a license to practise, or to make such other order upon such appeals as may be warranted by the facts, and the Council shall forthwith comply with such order. Such order when so made shall be final.

23. If the registrar makes or causes to be made any wilful falsification in any matters relating to the register, he shall forfeit a sum of not less than one hundred dollars ($100.00) nor more than two hundred dollars ($200.00).

24. If any person shall wilfully procure or attempt to procure himself to be registered or licensed under this Act, by making or producing, or causing to be made or procured, any false or fraudulent representations or declarations, either verbally or in writing, every such person so doing, and every person knowingly aiding and assisting him therein, shall forfeit and pay a sum of not less than one hundred dollars ($100.00) nor more than two hundred dollars ($200.00).

25. All penalties imposed under this Act, or any of them, and all sums of money forfeited shall be recoverable with costs under the provisions of the law respecting summary convictions.

26. Any information for the recovery of any such penalty or forfeiture may be laid by any member of the Association or by any person appointed by the Council.

27. Any sum forfeited under this Act being recovered shall belong to the Association for the use thereof, under this Act.

28. No prosecution shall be commenced for any offence against this Act after one year from the date of committing the offence.

29. The following persons are hereby constituted a Provisional Council of the Association:—

President — C. E. W. Dodwell, Halifax.

Vice-President — D. H. MacDougall, New Glasgow.

Councillors — Allan, J. L., Dartmouth; Bowman, F. A., Halifax; Brown, T. J., Sydney Mines; Doane, F. W. W., Halifax; Dyer, A. F., Halifax; Faulkner, F. R., Halifax; Macnab, I. P., Halifax; Matheson, W. G., New Glasgow; Morrison, W. P., Dartmouth; Odell, C. M., Glace Bay; Robb, D. W., Amherst; Roland, J. W., Halifax; Sexton, F. H., Halifax; Smith, K. H., Halifax; Wheaton, L. H., Halifax.

The duties of the Provisional Council shall be to provide the register called for by this Act, to enter therein the names of those who are entitled to registration and who apply therefor under the provisions of Section 7, clause "b," and to call within six months from the coming into force of this Act the first General Meeting of the Association for those purposes and any other organization purposes of the Association; they shall have the powers conferred in this Act on the Council of the Association. Their powers shall cease on the election of the regular Council of the Association.

30. No provisions of this Act restricting the practice of the profession or imposing penalties shall take effect until one year after the passing of this Act.

31. Every person registered under this Act shall have a seal, the impression of which shall contain the name of the Engineer and the words "Registered Engineer, Nova Scotia," with which he shall stamp all official documents and plans.

32. The activities of the Association are hereby restricted to the functions necessary to the administration of this act.

33. Nothing in this Act contained shall be construed as affecting the rights and privileges of any person who has been granted any certificate or who may hereafter be granted any certificate pursuant to any provision of the Coal Mines Regulation Act, Chapter 10 of the Acts of 1918.

* * *

Note

In the Alberta Act as printed in the July number of *The Journal* enclosed, Page 363 No. 22, first section, the phrase "Who has been convinced of a criminal offense" should read "Who has been convicted of a criminal offense".

CORRESPONDENCE

Appreciation from Chemical Engineers

Editor, *Journal*:—

Dear Sir:

I take pleasure in enclosing copy of the resolution of thanks passed by our Council in recognition of the cordial reception and generous entertainment which you accorded us while in Montreal. We especially appreciate the use of your hall for our meetings after our unfortunate experience at the Hotel.

Very truly yours,

J. C. OLSEN,
Secretary.

American Institute of Chemical Engineers,
Office of Secretary, Polytechnic Institute,
Brooklyn, N.Y.
July 24, 1920.

*

At a special meeting of the Council, held July 4th, 1920, on board the Steamship Saguenay, it was unanimously RESOLVED that the thanks of *The Institute* be transmitted to

R. N. Monk, and Fraser S. Keith
and
The Engineering Institute of Canada

for the cordial reception and generous entertainment of *The Institute* at MONTREAL, CANADA, June 28th and 29th, 1920, and it was further

RESOLVED that this resolution be spread upon the minutes and a copy be sent as a token of esteem and appreciation.

DAVID WESSON,
President.

J. C. OLSEN,
Secretary.

* * *

A Tribute to the Institute

Editor, *Journal*:—

"I have been away nearly four months nearly the whole of which time I spent in Mexico and the Southwestern United States, and hence got out of touch with things in Canada. On my return I was greatly pleased to hear of the success of *The Institute* in its campaign for Legislation; from what I can learn Ontario is the only important province that remains doubtful and it for self protection will soon be forced to join the others.

Permit me to express my opinion that *The Institute* has done more to advance the welfare of the engineering profession than any similar body on the Continent. Please accept my sincere congratulations for the remarkable results so far achieved and my best wishes for the future."

J. A. REID, M.E.I.C.

Cobalt, July 14th, 1920.

EMPLOYMENT BUREAU

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Vacant

Four Designers

Four designers for reinforced concrete work, two instrumentmen, two electrical engineers. Box 132.

Chemical Engineers

Chemical engineer.—Montreal industrial company requires services of a young chemical engineer acquainted with fuel and steam problems. Salary $2000 to $[illegible]. Box 134.

Two Draughtsmen

Two draughtsmen for reinforced concrete design or general construction work required by Montreal construction firm. Box 1[illegible].

Mechanical Draughtsman

Mechanical draughtsman wanted for metal working industrial concern in Ontario. Salary $150.00 per month to start. Box 137.

Three or Four Young Engineers

Three or four young engineers wanted for Water Board, situated in the Province of Quebec. Must have had office experience. Salary $125.00 to $175.00 per month. Box No. 139.

Mechanical Engineer

Mechanical engineer for experimental work in large pulp and paper mills in province of Quebec; salary $200 per month, depending on qualifications, state training, experience, age, and references. Box 141.

Designer

Designer wanted for general civil engineering designing, in Montreal. Salary about $200.00 per month. Box 142.

Construction Engineer

Engineer or superintendent familiar with construction work in connection with construction of dam 400 feet long and 30 feet high; work will take at least twelve months. Applicant should be used to handling men, rock work, etc. Salary $300 per month and board. Box 143.

Young Engineer

Young engineer with some experience in designing and with more than the average ability at computing. Steady position with good prospects. Box 145.

Two Assistant Structural Engineers Wanted

Two Assistant Structural Engineers for the Welland Ship Canal, Department of Railways and Canals, at a salary of $175 per month and bonus, to assist in the design and construction of lock gates, valves, safety appliances and operating machinery.

Applicants to be graduates in engineering, with experience in structural and mechanical design, estimate.

and construction; preferably experience in the design of hydro-mechanical appliances.

Application forms to be forwarded to The Secretary, Civil Service Commission, not later than August 14th.

* * *

The Forests Products Laboratories of Canada, Dept. of the Interior, invite applications for the following positions, through *The Engineering Institute:*—

Chief Division of Timber Tests

To be responsible under the direction of the Superintendent for the work of the Division of Timber Tests, to plan, lay out and conduct scientific investigations and research relating to the mechanical properties of timber and timber products, to design special apparatus for use in such research, to supervise laboratory tests and analyze results, to act as a representative of the Laboratories at meetings of technical societies, etc., and to present papers, etc.

Salary $2700 per annum with bonus of $240 per annum if married. Annual increase of $120 per annum to maximum of $3180.

Assistant Chief Division of Timber Tests

To assist the Chief of the Division of Timber Tests, to assume responsibility during the absence of the chief, to supervise the work of the staff, the preparation of materials for testing, the making of laboratory tests and the computations of the results, to be responsible for the condition and accuracy of testing apparatus, to design special apparatus, to prepare articles for publication, etc.

Salary not yet determined.

Timber Testing Engineer

Under direction to discharge the duties of a Timber Tester, and to be responsible for the efficient performance of such duties by Timber Testers and Assistant Timber Testers, as an assistant supervisor in the testing laboratory or in charge of a computing staff, to conduct minor investigations, etc.

Salary not yet determined.

* * *

Applications are invited from persons possessing the necessary qualifications for the position of

Junior Radio Electrical Engineer or Junior Electrical Engineer

in the Radiotelegraph Branch of the Department of the Naval Service at a commencing salary of $1680 per annum, rising by annual increments of $120.00 to $2040. per annum. Also Cost of Living Bonus as authorized by law.

Qualifications required: — Education equivalent to High School graduation and either 1. Graduation in electrical engineering from a school of applied science of recognized standing with two years of experience in Radio telegraph or Electrical Engineering work or, 2. Four years of experience in Radio telegraph or Electrical Engineering work; supervisory ability, good hearing. Preference will be given to applicants with Radio Engineering experience.

Applications must be in the handwriting of the persons applying (or if otherwise the reason therefor to be given) and on forms supplied by the Commission, which may be obtained at any Post Office or from the Secretary of the Civil Service Commission, and are to be mailed to the Deputy Minister, Dept. of the Naval Service, Ottawa, immediately.

Length of residence in the locality must be stated. Applicants must describe the position as indicated above and must not vary description in making application.

In considering application, preference will be given to persons who have been on active service Overseas in the recent war, in the Military or Naval Forces of His Majesty or of any of the Allies of His Majesty, who have left such service with an honourable record, or who have been honourably discharged. Returned soldiers must produce their Discharge Certificates or a certified copy of the same.

W. Foran,
Secretary,
Civil Service Commission of Canada.

*

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

Air Certificate Examiners

Two Air Certificate Examiners for the Air Board at an initial salary of $2,940 per annum, which will be increased upon recommendation for efficient service at the rate of $180 per annum until a maximum of $3,300 has been reached. This initial salary will be supplemented by whatever bonus may be provided by law.

Note: If board, lodging, or ordinary clothing is supplied, the value thereof shall be deducted from the above compensation.

Duties.—Under the direction of the Superintendent of Certificate Branch, Air Board, to examine, approve, and recommend the issue of licenses to air pilots, navigators, and engineers; to examine, approve, and recommend the issue of certificates of airworthiness of flying machines; to examine, approve, and recommend the issue of licenses to aerodromes; to assist in the selection of, and make recommendations in connection with air routes; to conduct examinations in the theory and practice of air pilotage and air navigation; and to perform other related work as required.

Qualifications.—Education equivalent to graduation from a university of recognized standing; two years of experience in flying various types of flying machines; commercial air pilot's and air navigator's certificates; extensive knowledge of the theory of flight and the piloting and design of flying machines and of the construction rigging, and overhauling of all types of flying machines and of the construction and maintenance of aerodromes; ability to conduct examinations in the theory and practice of air pilotage and air navigation and to make through inspections and investigations into the proper construction and rigging of aeroplanes and engines; and to supervise such work.

Examination.—Subjects and Weights as follows: Education, Training and Experience, 4; Oral Interview, if necessary in the opinion of the Commission, 1.

(*Sgn.*) W. Foran, *Secretary.*

Situations Wanted

Industrial Plant Engineer

Industrial plant engineer, A.M.E.I.C., sixteen years experience, design and construction, of industrial plants, steel plants, coal mining plant etc. desires executive engineering position. Will be pleased to furnish full particulars as to experience and references. Box 38 P.

Civil Engineer

Civil Engineer, S.P.S. graduate, war veteran, with twelve years' practical experience in field and office on railroad, hydraulic, sewerage and general municipal work wishes permanent position as township or municipal engineer within hundred miles of Toronto. Box 20-P.

Members' Exchange

FOR SALE.—Keuffel & Esser Railroad Transit 6½" hor. circle and 5" Vert. circle in good condition, complete with case. Price $120.00.

Aneroid barometer 3" diameter. In leather case in good condition. Price $30.00.

Stadia Rod in good condition. Price $20.00.

Box 2-A.

FOR SALE.—Set of Transactions of Institution of Civil Engineers, Great Britain, from the year 1881 to the present time. About one dozen volumes in this set (which comprises most valuable engineering record for past 40 years) are bound. This should be worth $100 to any member who is acquiring an engineering library. Box 3-A.

Capital or Partner Wanted

"Firm of consulting engineers require small capital for development of interests already established, with partnership if desired.

"Could amalgamate advantageously with commercial interests. Box 4-A.

Trade Inquiries

Engineer Canadian municipality requires names and addresses of firms manufacturing 60", and under, concrete sewer pipe. Full information from the Secretary.

OBITUARIES

Lieut. John Macdonald, Jr.E.I.C.

Late JOHN MACDONALD, Jr.E.I.C.

Word has been received from his brother George A. Macdonald, Vancouver, of the death on May 13th, of Lieut. John Macdonald, Jr.E.I.C. in West Africa due to maleria. The late Mr. Macdonald served his apprenticeship in the engineering profession in Inverness, Scotland, and on coming to Canada was engineer with the Central Alberta Railway, and at the time of the war with the Canadian Pacific Railway. He enlisted in 1915 and was for sometime district officer at Quebec, and subsequently camp engineer at Valcartier, serving overseas with the Canadian Engineers, being demobilized in March 1919. Following demobilization he proceeded to London, England at his own expense and offered his services to the British Government volunteering to go to Russia. His offer was not accepted however, as at that time all Canadians were withdrawn from Russia. He was offered and accepted the offer of assistant maintenance engineer on the Government Railway at Sierra Leone, and left for West Africa in November 1919 where his untimely death occurred. The late Lieut. Macdonald joined *The Institute* as a Junior in April 1913.

*

C. T. Evans, Jr.E.I.C., of Windsor, Ont., died on May 9th, 1920. Mr. Evans was born at Windsor in 1888, studied mechanical engineering at the University of Michigan for two and a half years. During the University vacations in 1909-11 he was employed as layout man in the Tool Designing Department, Cadillac Motor Car Company, Detroit, Mich.; checker Chassis Department, Packard Motor Car Company, 1911; designer, General Motors Company, Experimental Department, 1911-1912.

PERSONALS

F. P. Adams, A.M.E.I.C., who returned from overseas recently, is now city engineer of Chatham, Ont.

*

E. Blake Allan, S.E.I.C., has accepted the position of junior assistant to the road engineer, Hamilton, Ont.

*

H. H. Charles, A.M.E.I.C., has been appointed division engineer of construction for St. Louis County, Minnesota.

*

Gerald M. Ponton, A.M.E.I.C., has opened offices in Montreal as a consulting mining engineer and metallurgist at 14 Place Royale, Montreal.

*

J. C. Ball, A.M.E.I.C., of the Niagara Peninsula Branch, has recently resigned from the Welland Ship Canal staff and has taken up contracting.

E. P. Muntz, A.M.E.I.C., of the Niagara Peninsula Branch, has the congratulations of the Branch upon the arrival of a baby girl on June 28th.

*

Major G. L. Mattice, M.E.I.C., has joined the staff of Lockwood, Greene and Co., of Canada, Limited, Industrial Engineers, taking charge of a new department, that of selling engineering service.

*

N. A. Pearson, A.M.E.I.C., formerly with the Dept. of the Interior Irrigation Branch, Calgary, Alta. has accepted a position as draughtsman and designer with the Braden Copper Co. Sewell Rangua, Chila, S.A.

*

Chas. L. Archibald, A.M.E.I.C., consulting engineer and architect, St. John, N.B. has been retained by the International Construction Company Limited, St. John, N.B. as consulting engineer.

*

E. C. Little, S.E.I.C., has accepted a position with D. G. Loomis and Sons, Limited, engineers and contractors in connection with their work for the Nova Scotia Power Commission.

*

Brig. Gen. C. H. Mitchell, D.S.O., M.E.I.C., Vice-President of *The Institute*, has been appointed a member of the Commission appointed by the Ontario Government to investigate the Hydro-Radial situation.

*

A. L. Ford, M.E.I.C., W. Pearce, M.E.I.C., and L. C. Charlesworth, M.E.I.C., have been appointed representatives of *The Engineering Institute of Canada* at the forthcoming convention of the Western Canada Irrigation Association to be held at Lethbridge.

*

L. N. Seaman, A.M.E.I.C., Chief of the Division of Timber Tests (Forestry Branch Dept. of Interior Canada) Forest Product Laboratories of Canada, has been appointed timber testing expert for the Indian Govt., Headquarters at Dehra Dun, United Provinces, India.

*

John F. Cassidy, A.M.E.I.C., has joined the organization of J. O. Giroux and Co., general contractors of 6 Spadina Road, Toronto, as secretary-treasurer; Mr. Cassidy took an active part in the organization of the company.

*

Capt. W. S. Lawson, M.E.I.C., has resigned from the Militia Headquarters Staff, Ottawa, to accept a position as inspecting bridge engineer, Canadian Northern Railway, Eastern Lines, covering the territory between Port Arthur and Lake St. John.

*

Alex. Milne, A.M.E.I.C., of the Niagara Peninsula Branch and Superintendent of the St. Catharines water works, has been elected first President of the newly formed Canadian Branch of the American Water Works Association; R. L. Dobbin, M.E.I.C., of the Peterboro Branch has been elected Secretary of the Canadian Section.

C. E. Fraser, Jr.E.I.C., has left the employment of the County Highway Department of the United Counties of Stormont, Dundas & Glengarry, Finch, Ont., where he was employed as chief assistant engineer and is now with the Morin Brothers Bituminous Paving Company on street paving in Brockford, Ont.

*

A. Frigon, A.M.E.I.C., professor of electrical engineering at the Ecole Polytechnique, also consulting engineer, is leaving for two years in Europe and will stay some time at the Ecole Supérieure d'Electricité of Paris and the Institute Electro-Technique of Grenoble. The Cercle Universitaire gave him a dinner before leaving.

*

C. O. Foss, M.E.I.C., chief engineer, St. John and Quebec Railway, has been appointed by Premier Foster of New Brunswick as one of the three members constituting the personnel of the newly created Hydro-Electric Commission of New Brunswick, the object of which is to proceed with the development of water powers in that Province.

*

Captain R. D. Thexton, Jr.E.I.C., is now section engineer with the Federated Malay States Railway on construction work at Kuala Lumpor. Captain Thexton was formerly a member of the Ottawa Branch; he hopes to write an article for *The Journal* on railway construction as carried out in the Far East, and such an article would be of interest to our many railway engineer members.

*

C. B. Thorne, M.E.I.C., in addition to being elected to the first Board of directors of the new Riordon Company, Limited, occupies the position in the new company of vice-president and technical director. Since joining *The Institute* Mr. Thorne has evinced a keen interest in the engineering profession and has taken an active part in discussing and assisting in promoting the welfare of *The Institute.*

*

E. C. Gaines, M.E.I.C., of the Mead Morrison Mfg. Co. of Chicago, will sail on August 24th, for Sydney, Australia to have charge of the above Company's interests in Australia and New Zealand.

The Company has several contracts for coal handling equipments to be erected in those countries, and as the work will require a considerable amount of structural steel it is the intention to have all of the structural work fabricated in Australia.

*

Major W. H. Hunt, A.M.E.I.C., was gazetted lieutenant Royal Engineers in June 18th, 1915. appointed second in command 156 Field Coy. R.E. and attached 16th Division, and served in France 1915 and 1916; was gazetted captain on the 6th of January 1916; was wounded at Loos. He served through the Somme Offensive in September 1916 with the 16th Division at the capture of Guillemont and Ginchy. Captain Hunt was in hospital for four months after being gassed, and afterwards was O.C. "B". Company, R.E., Training Centre at Newark, England, during 1917. During 1918 until the evacuation of the Allied Forces on September 28th 1919 he served with the North Russian Expeditionary Force. On November 1st, 1918 he was gazetted major. Major Hunt's last position was with the C.R.E., Volunteer Force North Russia. He was also awarded the Military Cross. For two years Major Hunt served in the South African War as O.C. Machine Gun Section, 15th Batt. Imperial Yeomanry.

•

A. F. Macallum, M.E.I.C., has been appointed a member of the Ontario Government Commission to investigate the Hydro Radial situation. Mr. Macallum graduated from the University of Toronto in [illegible] as civil engineer, later obtaining the degrees of B.A.Sc. and C.E. After experience with the Toronto, Hamilton and Buffalo, Minneapolis and St. Paul, and Canadian Pacific Railways, Mr. Macallum was appointed engineer in charge of waterworks at Midland, Grimsby, and Bridgeburg, and later was consulting engineer to New Toronto and North Toronto in connection with sewer construction. In 1909, Mr. Macallum was appointed city engineer of Hamilton, Ont., and during his tenure of this office, till 1916, was in charge of many important public works, including the rebuilding of the water works system, construction of new asphalt plant, construction of sewage disposal system, etc. In 1916, Mr. Macallum was appointed to his present position of Commissioner of Works, Ottawa.

•

H. R. Safford, M.E.I.C., President of the American Railway Engineering Association and Assistant to the President of the Chicago, Burlington, and Quincy Railroad, has recently been highly honoured by his alma mater, Purdue University, Lafayette, Indiana; the degree of Doctor of Engineering, honoris causa, being conferred. As their distinction has only been conferred by the University three times previously in the whole course of its history the distinction is the more notworthy. A splendid tribute was paid to Dr. Safford by the Dean of the University.

•

R. H. Murray, A.M.E.I.C., engineer of the Bureau of Public Health has been appointed Director of the Division of Sanitation of the Provincial Bureau of Public Health of Saskatchewan recently formed to co-ordinate those activities of the Bureau which aim at providing a healthy environment for the people of the Province. He will be responsible to the Commissioner of Public Health for the direction of the work on water supplies, milk supplies, treatment and disposal of sewage and trade wastes, refuse destruction, and all sanitary matters concerning which the individual looks to a central authority for protection.

The organization and construction of Union Hospitals will also come under the Division of Sanitation for the present.

Mr. Murray, who graduated as a civil engineer twelve years ago has specialized in public health engineering.

Before going to Regina in 1912 as engineer to the Bureau of Public Health, Mr. Murray was assistant engineer on the main drainage works of Glasgow, Scotland, and Toronto, Ont.

He joined the overseas forces in 1915 and served for four years as Sanitary Officer with the Egyptian Expeditionary Force, and with the [illegible] Division of the Imperial Forces in France.

Mr. Murray is an Associate Member of the Institution of Civil Engineers, and a member of the Royal Sanitary Institute.

BRANCH NEWS

Toronto Branch

H. A. Goldman, A.M.E.I.C., Secretary-Treasurer.

In accordance with the policy recently adopted to broaden the activities of the Branch, the Papers Committee has made arrangements for the members to visit the following engineering works:

Saturday, July 17th, 2.30 p.m.—*The New Union Station.*

Members will please assemble at the main entrance of the new station.

Tuesday, July 20th, 2 p.m. — *The Toronto Harbor Works.*

Members will assemble in front of the Harbor Commission Building at the foot of Bay Street, at 2 p.m.; they will board the Harbor Commission Steam Yacht Bethelma, and will be taken around to the various parts of this important engineering work. The trip will take about three hours.

Thursday, July 29th, 2.30 p.m.—*Baldwin's Canadian Steel Corporation, Ltd.*

Members will assemble at the main entrance of the plant at Ashbridges Bay district.

Tuesday, August 24th, 2.30 p.m. — *The Island Filtration Plant.*

Members will assemble at the front of the Harbor Commission Building where transportation to the Island will be provided for them.

It is anticipated that all members of the Branch who can possibly do so will avail themselves of this opportunity to take in these visits, as they are likely to prove very pleasant and interesting as well as instructive and useful.

For another series of visits announcements will be sent out later.

Hamilton Branch

J. A. McFarlane, A.M.E.I.C., Secretary-Treasurer.

At a meeting of the Branch Executive held on July 15th, a Branch Committee on Policy was appointed with the following members: [illegible], M.E.I.C., Hamilton Bridge Works; H. U. Hart, M.E.I.C., Canadian Westinghouse Company Limited; [illegible], M.E.I.C., consulting engineer, Hamilton.

This committee will act in conjunction with the central committee on this important subject.

Niagara Peninsula Branch

Rex P. Johnson, A.M.E.I.C., Secretary-Treasurer.

There will be no further regular meetings of the Branch till after the Professional Meeting in September.

The shortness of the "Branch News" column in this issue is not an indication of a period of quiet in Branch affairs. On the other hand, there are a large number of members working hard, individually and as committee men, in preparation for the Professional Meeting. Members are referred to the news items prepared by the Publicity Sub-committee of the Professional Meeting Committee for advice about the Meeting.

R. T. Gent, M.E.I.C., is the hardest working "Institute" man in Canada these days. He is Chairman of the Finance Sub-committee. S. R. Frost, A.M.E.I.C., Secretary of the Professional Meeting Committee; A.D. Heuther, Secretary of the Entertainment Sub-committee and D.T. Black, A.M.E.I.C., Secretary of the Publicity Sub-committee are also doing some very good work.

Saskatchewan Branch

J. N. de Stein, M.E.I.C., Secretary-Treasurer.

The fourth Annual Summer Meeting of the Saskatchewan Branch was opened in Saskatoon, on July 15th, Dean Dr. P. H. Ling welcoming the assembled Members on behalf of President C. H. Murray of the University of Saskatchewan, who unfortunately had to be absent. Dean Ling expressed his appreciation of our profession keeping in close touch with the University, especially owing to the recent donation of a scholarship by the Branch to the Engineering Faculty of the University of Saskatchewan. He welcomed the members as a body of scientific men and assured them of the co-operation of the University in all their problems, a co-operation further demonstrated very splendidly in the large amount of assistance that our Concrete Committee is getting from the University.

At the conclusion of this address the regular business meeting convened with the Chairman, Professor A. R. Greig, M.E.I.C., presiding.

The question of legislation which unfortunately has not been obtained yet in Saskatchewan occupied the members and a report was on hand about a recent interview with the Premier of the Province. It appears that the Government might be inclined, owing to the fact that other Provinces have obtained legislation, to submit this matter to the next session of the House, and copies of the several bills enacted so far in other Provinces were requested by the Government. The whole question was left in the hands of the Executive Committee to further confer with the Government in this difficult question.

The next point of interest taken up by the meeting was the report of the Committee on Salaries of Engineers. Owing to the fact that none of the members of the Committee were engineers in private practice the arranging of a schedule of fees for consulting engineers was handed over to a newly formed Committee. A comprehensive schedule for engineers on municipal employment and Government was arrived at, which proposed schedule, it is hoped, will be published in the next number of *The Journal.*

The question of non-support of the parent Council of the coming Western meeting at Banff was touched upon and it was the opinion of the majority of the members that the explanation made by the Secretary was sufficient in this matter and that the action of the Council should not be criticized. The Executive was instructed to appoint the Committees for the various sessions of the next Annual Meeting to be held in Toronto so that the proposed sectional meetings would be taken care of.

A resolution regarding the appointment of a commission to enquire into the question of irrigation in the Province was passed and forwarded to the Government.

Professor C. J. MacKenzie, A.M.E.I.C., Chairman of the Concrete Committee of the Branch reported concerning contributions from the Research Council and our committee intends to take up this question at the coming Banff meeting.

At the conclusion of the business session the Members adjourned to a luncheon served in the large dining room of the University and tendered by the local members to the visiting members. After this the regular session was resumed at which R. W. E. Loucks, A.M.E.I.C. gave a splendid paper on the Natural Resources of Saskatchewan. Mr. Loucks outlined the resources of our Province in the various branches and created a very favorable impression of the wealth of our Province.

Professor C. J. MacKenzie, A.M.E.I.C., opened the discussion and complimented Mr. Loucks on the paper outlining the fact that we should certainly know the assets and liabilities of our Province.

Wm. T. Thompson, M.E.I.C., followed with an illustrated lecture on the "Great North Land" paying special attention to the Hudson route the completion of which he most earnestly emphasizes, as being of incalculable value for our western Provinces.

The meeting then adjourned and the visiting members were entertained by the local members in a splendid way at the Provincial Exhibition.

Altogether a splendid and very satisfactory meeting was held and it was only very regretfully that everybody parted with the promise to try and attend the Banff meeting.

C. W. Craig, M.E.I.C., of Calgary, had promised to be present but excused himself by wire urging our members to attend the Banff meeting.

Calgary Branch

Arthur L. Ford, M.E.I.C., Secretary-Treasurer.

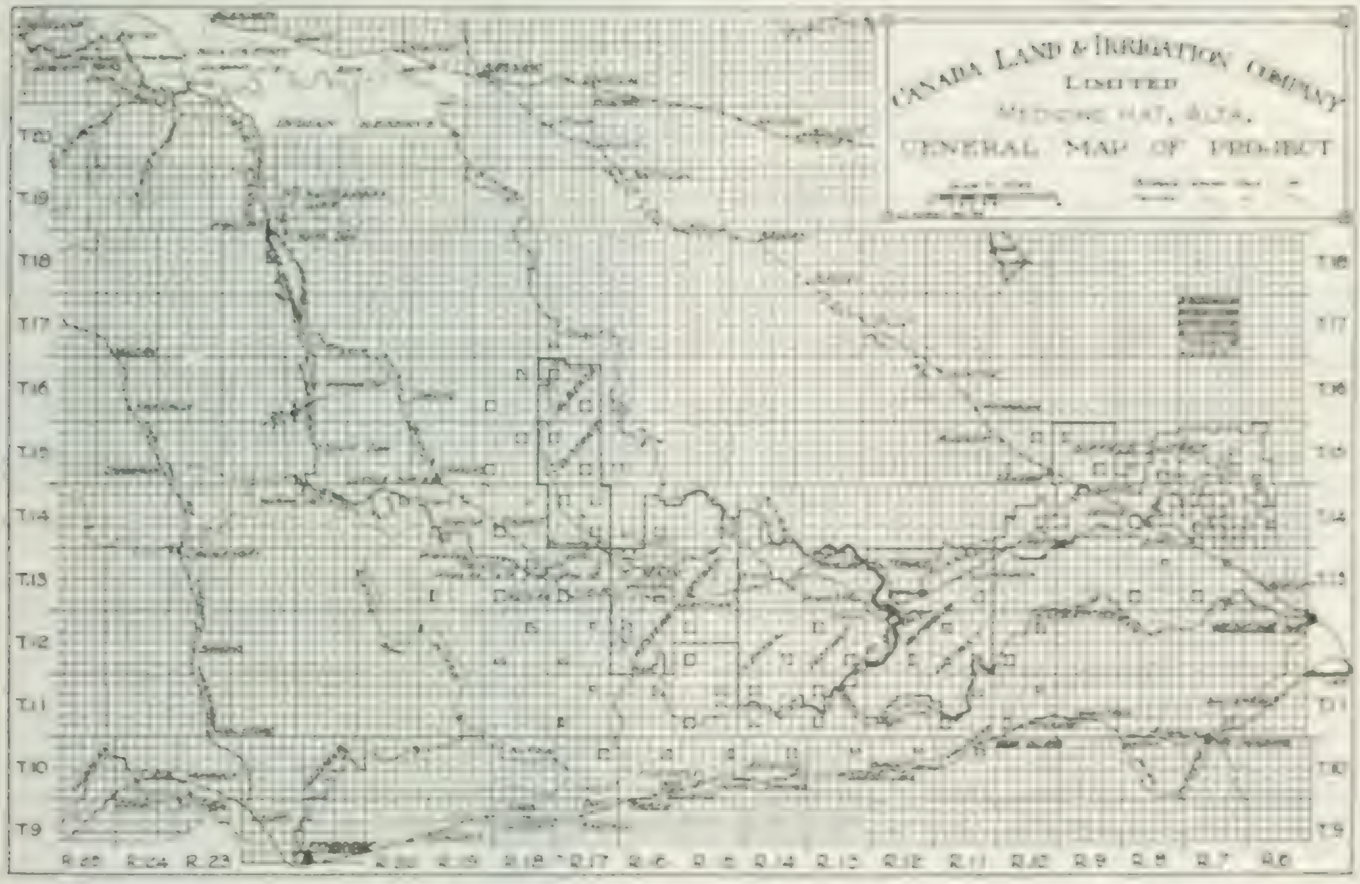
The new Hillhurst bridge which is being built for the City of Calgary has been interesting many of the members of the Calgary Branch. This is a reinforced concrete structure of five spans, of 102 feet each in the clear, carrying a 40 foot roadway and two 6 foot sidewalks over the Bow river from Ninth street to Tenth street west. The type is the earth filled arch and the arches are elliptical with an 18 foot rise. The work is progressing favorably and the south abutment is now poured and work proceeding on pier one.

The river is at the high water stage during July, but as soon as it starts to recede, work will be pushed on the other piers. The foundations for the bridge are noteworthy as the south abutment had to be carried to a depth of 40 feet below water level before bed rock was struck. The estimated cost of the bridge was $210,000, and it is being built by the Fegles Construction Co., of Fort William, under the supervision of G. W. Craig, M.E.I.C., city engineer, and J. F. Greene, M.E.I.C., consulting engineer.

The Irrigation Project of the Canada Land & Irrigation Company, Limited, is now in operation.

It is over a year ago since water was first turned from the Bow River through the intake gates south of Carseland, and since then, whenever weather conditions would permit it, the Inlet Canal has been steadily filling up Lake McGregor, the first and largest reservoir in the Company's system. This reservoir is 23 miles long and from a half mile to two miles in width, and contains, at full capacity, 300,000 acre feet of water, enough to supply the entire tract with water for a full irrigation season.

This spring the water passed through the outlet gates at the south dam of Lake McGregor, and after partially filling a smaller basin, the Little Bow Reservoir, it was brought on to the first unit of the project, and is now irrigating about four thousand acres of land near the Town of Vauxhall. The distance from the intake to the edge of the irrigated tract is 110 miles, and considering that water is running in the canal for the first time, the results have so far been entirely satisfactory. Very few breaks of any kind have occurred, and the loss from seepage is very small. The Canal banks and fills have had ample time to properly settle and it is undoubtedly due to this fact that so little trouble with breaks and seepage has been experienced. Evaporation losses have been comparatively large, especially during the short spell of hot weather recently experienced. At present there is no way of measuring these losses, but a system is being installed by way of which it will be possible to determine them with some degree of accuracy.



Canada Land & Irrigation Company, Limited

On account of the slow grades in the Main Canal no cutting of any kind takes place, and the water, after standing for some time in the reservoirs, arrives on the land well warmed, entirely free from silt, and able to give the most beneficial results when used to irrigate growing crops.

*

J. F. Greene, M.E.I.C. of C. O. Howe & Co., consulting engineers, and a member of the Manitoba Branch of *The Institute*, is a sojourner among the residents of the Calgary Branch this summer. Mr. Greene brought his family with him to recuperate amid the Alberta sunshine from the rigours of the savage Winnipeg winters which they have been enduring for the last few years.

When not engaged in strenuous games of tennis, Mr. Greene may be found around the new Hillhurst bridge, for which structure he is consulting engineer, or around other works of reinforced concrete, or works presenting problems which require an engineering solution.

Vancouver Branch

J. N. Anderson, A.M.E.I.C., Secretary.

At the general meeting of the Branch held on July 5th, A. D. Creer, M.E.I.C., was elected to fill the vacancy in the Vancouver Branch Executive caused by the resignation of L. L. Brown, M.E.I.C. At the same meeting a resolution, moved by A. D. Creer, M.E.I.C., and seconded by Major G. A. Walkem, A.M.E.I.C., was passed as follows:

"That the Secretary (of the Branch) be instructed to write all members of this Branch pointing out to them the great desirability of all members of this Branch applying for membership to the 'The Association of Professional Engineers of the Province of British Columbia', and further that they be urged to make this application at once." In accordance with this resolution a letter quoting the resolution and giving the address of the Registrar of the Association has been sent to all Branch members.

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary.

Members of the Victoria Branch of *The Engineering Institute of Canada* were the guests of the B.C. Electric Railway Company at Jordan River on Saturday, when the party, about 30 strong, including engineers well known to the public of Victoria, were conducted over the works from which the district obtains its main supply of electrical energy.

Leaving Victoria at 8 a.m. by motor cars, Jordan River, a distance of 43 miles by road, was reached at 10 o'clock, which is an indication of the excellent condition in which the roads were found.

Upon reaching its destination the inspection was commenced at the power house, situated near sea level, and in which the 4,000 h.p. Pelton wheels are installed and driven by water under a head of 1,150 feet.

After inspecting the power house, the visitors ascended by means of the inclined railway to the forebay, or balancing reservoir, and after admiring the wonderful outlook across the Straits to the Olympic Mountains and to the Pacific Ocean, sat down for lunch.

After the appetites had been satisfied, A. E. Foreman M.E.I.C., public works engineer and Chairman of the Victoria Branch of *The Engineering Institute of Canada*, rose in his place to express the thanks of the visitors to the company whose guests they were, and particularly to those officials present, A. T. Goward, manager, and G. M. Tripp, A.M.E.I.C., E. N. Horsey, A.M.E.I.C., and C. A. Cornwall, M.E.I.C. (of the engineering staff), who were so ably entertaining them and making them acquainted with the details of a most interesting engineering undertaking.

The remarks of the chairman were heartily endorsed by the gathering in the usual way, and Mr. Goward replied for the company and officials, who, he said, were only too pleased to be given the chance to show the undertaking to the public through the gentlemen present, who could appraise at its proper value, and who would be able to speak of the immense amount of capital sunk in the work by the company.

Victoria Branch visit to Jordan River Power Development

After lunch, aboard motor and horse-drawn cars on a narrow gauge railway, the trip was made to the concrete dam, six miles away. A six-mile scenic railway journey following the contour of the hillside and alongside the flume through which the water flows from the dam to the forebay; up the narrow valley, with its steep and thickly timbered slopes, a new view exposed as each corner was rounded, to the huge concrete construction which holds back the water, thus making a lake some three or four miles long, at an elevation of 1,450 feet above the sea.

One remark was very general by all those attending, that both the company and the public were losers by the lack of knowledge of the work done at Jordan River to provide the energy, which, after being received through the forty odd miles of transmission lines and adapted to public needs, is so unconcernedly switched on to drive a vacuum cleaner or similar convenience.

The return journey was commenced after a most enjoyable day, everyone feeling that it had been worth while making the trip, both to appreciate properly the magnitude of the undertaking from an engineering standpoint, and also to realize the very large amount of money that had been spent by the company to develop natural resources within a few miles of the city, and about which little was known.

Preliminary Notice

of Applications for Admission and for Transfer

22nd July, 1920

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in August, 1920.

FRASER S. KEITH, Secretary.

*The professional requirement are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALISON—JOHN GARDNER ROBB, of Niagara Falls, Ont. Born at Toronto, Ont., March 18th, 1880; Educ., Graduate S. P. S., 1903; summer 1901, sewer system, Cobourg, Ont.; summer 1902, D.L.S. party, Sask.; 1903-12, with Riter-Conley Mfg. Co., Pittsburg, Pa., office and field duties, dfting, survey and constrn.; 1913, with Havana Elect. Rly. The St. Lawrence Route and Welland Ship Canal

Alex. J. Grant, M.E.I.C., Engineer in charge, Welland Ship Canal.

Before describing the works required for the construction of the Welland Ship Canal, and the work done thereon to date, a brief statement tracing the origin, development and construction of the canals that now form the navigation system connecting the Great Lakes with the Atlantic Ocean via the St. Lawrence Route is, in a measure, essential to a clear and comprehensive understanding of the Ship Canal project. We, and our cousins to the south of us, use our canals, and benefit by them, and until recent years we boasted of them as being unparalleled in the world, but few among us have taken the trouble to investigate the magnitude of the work accomplished in their construction by our forefathers during the past one hundred years. It is interesting from a professional point of view, and also instructive of the political and commercial development of this great country, and the marine transportation on the Great Lakes.

Advance proof of paper to be read at the General Professional Meeting, September 16th.

Canadian Canal Systems

The Canadian canals may be divided into six groups, as follows:—

1. The St. Lawrence River Canals, including the Welland and Sault Ste. Marie Canals.
2. The Ottawa River Canals. The route of the proposed Georgian Bay Canal between Montreal and French River Harbour, on the Georgian Bay, Lake Huron.
3. The Rideau Canal, Ottawa to Kingston.
4. The Trent Canal, from Lake Ontario to the Georgian Bay, Lake Huron via the Trent and Severn Rivers.
5. The Richelieu River Canals, from the St. Lawrence to Lake Champlain.
6. The Red River Canals.

St. Lawrence River Canals

The first of these groups, and the only one dealt with in this paper, is the most important, as it forms a great chain of inland navigation, extending about 2,339 miles from the Straits of Belle Isle Westward to Duluth, at the head of the Great Lakes. It passes through some of the best agricultural and mineral lands in the interior of the continent, and provides them with navigation facilities for internal and external traffic such as are enjoyed by no other inland region of equal size. At the head of the great chain is Lake Superior, about 385 miles long from west to east, and 602 feet above the sea. At its eastern end it narrows in to the St. Mary's River, which carries its surplus waters to Lake Huron through a course of 59 miles, in which are rapids, overcome by the American and Canadian Ship Canals. Lake Huron is about 220 miles long from North to South, and 581 feet above the sea. At its southern end it narrows into a channel 82 miles long, and known as the St. Clair River, St. Clair Lake and Detroit River, through which the surplus waters of the Lake flow into Lake Erie. A ship channel has been dredged through the sand flats of these rivers and lake.

Lake Michigan is the same elevation as Lake Huron, and joins it at its head, but does not form a link in the main chain of inland navigation.

Lake Erie is about 243 miles long, from the western end, at the mouth of the Detroit River, to its eastern end at the head of the Niagara River, and is 572.5 feet above the sea level. The eastern end of the Lake overlaps the western end of Lake Ontario, and at the eastern end of the peninsula thus formed is situated the Niagara River, which crosses the peninsula in a north and south direction, and carries the surplus waters of the Lake on to Lake Ontario. In a distance of thirty-five miles it falls 326 feet. Communication between the Lakes is obtained by the Welland Canal, which crosses the peninsula about fifteen miles West of the Niagara River.

Lake Ontario, the most eastern of the Great Lakes, is about 160 miles long, from Port Dalhousie, the end of the Welland Canal, to Tibbets' Point, and is 246 feet above the sea level. At Tibbet's Point, Lake navigation ends, and river navigation begins.

The waters of the Lake Plateau, about 270,000 square miles in extent, flow out of Lake Ontario at the rate of about 220,000 C.F.S., by the St. Lawrence River, which carries them for 750 miles to the Gulf of the same name. For the first 182 miles of its course, as far as Montreal, it is crossed by spurs of the Laurentian Mountains, which act as dams, and divide the river into a series of long still water reaches, separated by rapids, with a total fall of 221 feet between Lake Ontario and Montreal. The rapids are overcome, in a descending order by the Galops, Morrisburg, Farran's Point, Cornwall, Soulanges and Lachine Canals. Below Montreal the river, with a fall of 25 feet, widens out at intervals into broad expanses of shallow water till it meets the tidal flow about 50 miles below the city, and from there continues broad and deep to the Gulf, a further distance of 500 miles.

History of St. Lawrence Canals

This great and historic river is the natural outlet for the export and import traffic of the Lake region, and provides the only route for a continuous descending channel from the Great Lakes to the Ocean. In all probability the first excavation undertaken for Canal purposes upon the St. Lawrence, was begun in 1700 by the Rev. Dollier de Casson, Superior of the Seminary of St. Sulpice, Montreal, who undertook to cut a channel providing a depth of 18 inches for a combined canal and mill race, but without locks, from Lachine to Montreal, via the Little River St. Pierre, and the small lake of the same name. The work was arrested by the failure of the contractor, Gédéon de Catalogne, in 1701. Various unsuccessful attempts were made to revive the work between 1717 and 1733, but the scheme was finally abandoned on account of its cost. The first Canal and lock on the route opened for traffic was the small canal, and lock 38 feet long, 8¾ feet wide, 9 feet lift, for 2½ foot draught, built at Sault Ste. Marie by the Northwest Fur Company in 1798.

The first lock canals built on the St. Lawrence were the Haldimand Canals, built by the Royal Engineers, for military purposes, 1779-1783, around the lower and upper rapids between Lakes Sts. Louis and Francis. These locks were 40 feet long, 6 feet wide, with 2½ feet of water on the sills. They were enlarged (1800-1804) to 110 feet long, 12 feet wide, with 4 feet depth on the sills.

After the War of 1812, a joint commission of Upper and Lower Canada reported in favor of a canal system with four feet depth of water for the St. Lawrence River, and in 1821 Government commissioners were appointed to build the Lachine Canal, which was completed in 1825. The first canal was 28 feet wide on the bottom, and 4½ feet deep, with locks 100 feet long, and 20 feet wide.

Shortly after the opening of the canal the Royal Engineers, then constructing the Rideau Canal, recommended for the St. Lawrence larger and wider locks and double the depth of water. It was not, however, until 1834 that Upper Canada began the construction of the Cornwall canal, and twenty-three years had elapsed after the opening of the first Lachine Canal before the last of the St. Lawrence Canals for 9 foot depth were completed and opened by Upper and Lower Canada for traffic in 1848, between Montreal and Prescott. The locks of these canals has a length of 200 feet, and a minimum width of 45 feet.

Welland Canal

In 1816 the Parliament of Upper Canada appointed a joint committee of both Houses to report upon inland navigation, and in 1823 a Commission reported in favor of constructing the Welland Canal for the class of vessels then navigating the Lakes.

The first canal, however, was built as a private enterprise, by the Welland Canal Company, formed by the late Honorable William Hamilton Merritt, and incorporated with a capital of £40,000 for that purpose in January, 1824. It completed the canal, via the Twelve Mile Creek, to Port Robinson in November, 1829 (four years after the opening of the Erie Canal), when two vessels, one British and one American, were taken from Lake Ontario to Port Robinson, on the Chippawa River, by forty wooden locks, 110 feet long, 22 feet wide, and 8 feet depth of water. At Port Robinson the schooners descended the Chippawa to the Niagara River, and thence to Lake Erie.

The ridge dividing the Twelve Mile Creek and the Chippawa River involved a cut 70 feet deep and two miles long, in order to feed the Canal from the River. Owing to slides occurring in the cut, due to encountering quick sand strata in the bottom, it became imperative to seek a source of water supply higher than the Chippawa River. The configuration of the country between Port Robinson and Lake Erie, as well as that of the Grand River was found to be so favorable that by building a dam six feet high across the river, water was obtained at a height sufficient to excavate the canal channel through the deep cut above the level of the quick sand strata. The feeder was twenty-seven miles long, and crossed the Chippawa River on a wooden acqueduct four miles above Port Robinson, where connection was made with the river by two locks.

In 1831 the Government of Upper Canada loaned the Company £50,000 for improving the canal, and continuing it from Port Robinson to Port Colborne, on Lake Erie, and in 1833 was opened what may be considered as the present Canal between Port Colborne and Allanburg, but fed from the Grand River.

In 1834 the legislature decided to purchase the canal from the Company, and after the Union of Upper and Lower Canada an Act was passed to enlarge it for nine feet navigation, and to complete the remainder of the St. Lawrence Canals, only one of which had been begun by Upper Canada before the Union. The first work done on the Welland was the enlargement of the Canal between Port Dalhousie and the feeder junction, (one mile south of Welland). The forty wooden locks were, by increasing the lifts, replaced by twenty-seven stone locks, each 150 feet long, 26½ feet wide, and 9 feet depth on the sills. The feeder from the Junction was also enlarged, and the Port Maitland Branch built which afforded an outlet to Lake Erie at Port Maitland. This route was opened for navigation in 1845. The section of the canal between the feeder junction and Port Colborne was then enlarged, and opened for nine feet navigation in 1850.

As the completion of the second canal coincided with the completion of the St. Lawrence Canals in 1848, a boat about 140 feet long, 26 feet beam, and 9 feet draught could then for the first time pass via the St. Lawrence Route from Montreal to Chicago.

In 1853 it was decided to increase the navigable depth to 10 feet, which was done by raising the locks and banks, but it was not until about 1881 that the Canal was fed from Lake Erie.

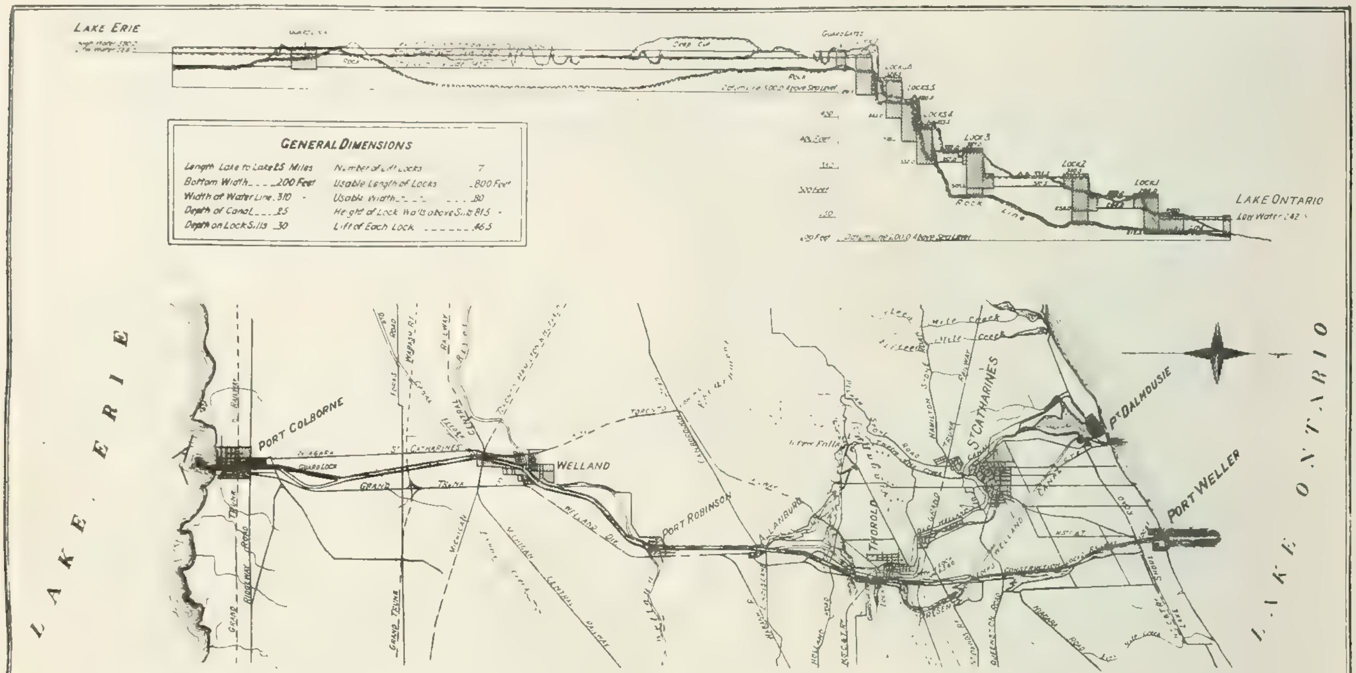
The Second Welland Canal

Twenty-two years later Upper and Lower Canada had completed the 9 foot navigation improvement of the St. Lawrence system, the Dominion of Canada took up the question of inland navigation, and appointed a commission in 1870 who, in their report of February, 1871, recommended a uniform scale of navigation for the St. Lawrence and Welland Canals, with locks 270 feet long, 45 feet wide, and 12 feet depth of water on the mitre sills. The work was proceeded with on these dimensions, but before any locks were built Parliament, in 1875, ordered the canals to be deepened so as to pass vessels drawing fourteen feet of water, but did not change the length or width of the lock chambers. Unfortunately the new Welland Canal was constructed on this plan, and completed to 12 feet depth in 1882, with Lake Erie as the feeder, at a cost of about 14 millions of dollars. The additional two feet cost about two more, so that the change from nine feet to fourteen feet draught cost about 16 millions of dollars. The canal was opened to traffic for fourteen feet navigation in 1887, and the St. Lawrence River Canals in 1901, when the Northwestern Steamship Company, of Chicago, placed a fleet of four steamers in commission between Chicago and Europe. On more than one occasion the boats were loaded slightly over the 14 foot limit.

The short-sighted policy of 1870 left the Welland canal as much or more out of date in 1887 than it was when the improvements were begun in 1872, whereas a moderate increase in the length of the locks alone would have enabled a large part of the Lake fleet even of 1901 to descend to Montreal, instead of being confined to the Upper Lakes, to the manifest disadvantage of the St. Lawrence Canals which, with the present Welland Canal, cost Canada up to the 31st March, 1919, [illegible] on capital construction, and [illegible] for repairs and maintenance. These amounts do not include the original cost and maintenance charges of the Port Colborne Breakwaters, built by the Public Works Department, and the aids to navigation built and maintained by the Marine Department between Port Colborne and Montreal.

These canals, locks and river channels are entirely inadequate for use by the Great Lake steamers of today, and can now be considered as of little more than barge size. The improvement of the St. Lawrence Canals to such dimensions as would carry ships of at least 25 feet draught has been the dream of many, and the special hope of those localities, and those persons deeply interested in enterprises that would be specially benefitted by such a development. During the past quarter of a century two very exhaustive surveys have been made to determine the feasibility and cost of such a waterway, and another is now being carried out.

Concurrently with the opening of traffic for vessels drawing fourteen feet of water via the St. Lawrence, the Departments of Railways & Canals and Public Works began improvements to Port Colborne Harbour, consisting of deepening it to twenty-two feet, constructing a million bushel modern elevator, and building of large breakwaters. The construction of these works, and public agitation for the building of a Canadian deep waterway via the Welland Canal and St. Lawrence River, versus the Georgian Bay Route, finally led to exhaustive surveys being made for a ship canal across the Niagara Peninsula. These surveys were carried out between 1907 and 1912,



THE WELLAND SHIP CANAL

SCALE OF MILES

Surveys for Routes from the Great Lakes to the Atlantic

In 1897 the United States Government appropriated funds to make surveys and examinations of deep waterways betwwen the Great Lakes and the Atlantic. The Board of Engineers appointed for this purpose submitted their report in 1900, covering the estimated cost of a waterway 21 feet deep, with locks 600 feet long and 60 feet wide, and for a waterway 30 feet deep, with locks 740 feet long and 80 feet wide. Among other routes investigated by the board was the St. Lawrence—Champlain Route, which followed the river to the foot of Lake St. Francis, and thence across country to Lake Champlain and the seaboard via the Hudson River.

In 1904 the Public Works Department appointed a Board of Engineers to investigate the feasibility and probable cost of a deep waterway from the Great Lakes to the Seaboard via the French and Ottawa Rivers. The Board reported in 1909 that a twenty-two feet waterway, with locks 600 feet long, 60 feet wide, and 20 feet depth on the sills, would cost about $100,000,000.00.

under the direction of J. L. Weller, M.E.I.C., superintending engineer of the Welland Canal. Several routes were examined, but all were found unsatisfactory except the one via the Ten Mile Creek, on account of the poor material found at the sites of the large structures. When the route of the Ship Canal was finally adopted, and the Government had decided to proceed with its construction, Mr. Weller was transferred from the present canal to the position of engineer in charge of the surveys, design and construction of the new Canal, under W. A. Bowden, M.E.I.C., chief engineer, Department of Railways & Canals, which position he continued to fill until the work was closed down in 1917, owing to the European War.

Welland Ship Canal

The Ship Canal, as finally located, follows the valley of the Ten Mile Creek between its mouth, about three miles east of Port Dalhousie, and Thorold, crossing the present canal below Lock No. 11, where the water level of both is at elevation 382.0. Between Thorold and Allanburg a new cut will be made for the purpose of straightening the alignment of the canal between these points. The Ship Canal will again leave the present one below Lock No. 25, where the water levels of both are at elevation 569.0, the extreme low water level of Lake Erie above sea level. From Allanburg to Port Colborne on Lake Erie, it will follow closely the course of the present canal.

The total length of the canal will be twenty-five miles and for all practical purposes of navigation, it is a straight line throughout. It is 2¾ miles shorter than the present one. The fall of 325½ feet between the Lakes is to be overcome by seven locks of 46½ feet lift each. The direct line of the canal down the face of the escarpment, and the topography of the lower plateau, permitted the adoption of these high lifts, which constitute a peculiar feature in the design of the canal, and has no precedent in actual construction for locks of their size. The few locks required permit a rapid descent into Lake Ontario and diminish the time required for vessels to pass through the canal. The usable dimensions of the locks are 800 feet long, 80 feet wide, with 30 feet depth on the sills. The canal will be made 200 feet wide on the bottom, with 2 to 1 slopes, and for the present will be excavated to a depth of twenty-five feet only. All structures, however, will be built for 30 feet depth, so that the canal, at some future date, can be enlarged by simply dredging out the canal prism and harbour entrances.

The above dimensions on the canal prism give a wet section of about four times the immersed section of a ship of 75 feet beam and 22 feet draught, which may be expected to use the canal on its completion, and when completed to the 30 feet depth the ratio of channel to the immersed section of the largest ship will be about 3½.

At the Ontario end of the canal Port Weller Harbour is being formed by two earth embankments extending one and one-half miles out into the lake, where the depth is 30 feet at extreme low water. The banks are being formed from the materials excavated from the canal prism, and will be protected on their inner and outer slopes with rock. The banks are parallel to one another, and provide a channel 800 feet wide, and 5,000 feet long, which, at the entrance, is narrowed to 400 feet wide by two converging lines of reinforced concrete crib work. From the shore the harbour channel extends inland about one-half mile, gradually narrowing from 800 to 200 feet in width to Lock No. 1, 9,500 feet from the harbour entrance. The Harbour docking is being built of reinforced concrete cribs. The docking on the west side of the harbour is connected with Lock No. 1 by a long entrance pier of reinforced concrete. Above Lock No. 1 the canal follows the bed of the creek to Lock No. 4. Lock No. 2 is situated about one and one-half miles above Lock No. 1, where the rock surface was fortunately found at an elevation slightly below that required for the lock foundations. Lock No. 3 is located just north of the present canal, or about 2½ miles South of Lock No. 2. The rock at this point is about twenty feet lower than required for the foundation of the structure.

As a lockage requires about 70 acre feet, it is essential that there be a large pondage area above each lock, in order to avoid drawing down the levels as little as possible when filling the locks. For this purpose the configuration of the valley east of the canal was fully made use of in creating regulating ponds above the locks. That above Lock No. 1 has an area of 107 acres, No. 2, 200 acres, and that above No. 3, 140 acres. The surplus flow through the canal will be regulated by weirs at the side of the locks.

Locks Nos. 4, 5 and 6 are twin locks in flight, one will be used for up-bound vessels, and the other for down-bound vessels, a double flight being necessary in order to save long delays to vessels passing through these locks. They are situated on the face of the escarpment, and in order to create a regulating basin of 86 acres above Lock No. 6 an earthen dam, with a maximum height of 75 feet, and about 3,300 feet long, extending from the head of Lock No. 6 across the present canal above Lock No. 19 to the high ground East of it will be built, with a concrete core wall of selected material from the canal excavation.

Welland Ship Canal completed portion
Harbour Wall Port Weller.

The head of Lock No. 7 is opposite Peter Street, Thorold, or opposite Lock No. 24 of the present canal, the distance between the foot of the Lock and the head of Lock No. 6 being only about 3,000 feet. It is fed from a small pond of twenty-seven acres formed by flooding the upper end of the Ten Mile Creek Valley lying East of the canal. This pond, however, will have direct communication through the channel of the present canal with the summit level of the Ship Canal above the twin Guard Gates, which are located about a quarter of a mile above Lock No. 7, where the main line of the Niagara, St. Catharines & Toronto Railway crosses the Canal.

Between the Guard Gates and Allanburg a new channel, on a direct line, will be excavated, and the present canal between these points abandoned. From Allanburg to Port Robinson the present canal, known between these points as "the Deep Cut", (maximum depth 80 feet), is being widened on the west side, and deepened for twenty-five feet draught.

Between Port Robinson and Welland it is proposed, instead of straightening and enlarging the present canal, and building a new aqueduct to carry the Ship Canal over the Chippawa at Welland, to raise the level of the river permanently about six feet, to the summit level of the canal, elevation 568.0, by means of a dam across the river at Port Robinson, which would be provided with stop-log sluices for allowing freshet and other surplus waters to flow through the dam back into the river, and out into the Niagara at Chippawa as at present. The river valley would then be used as the canal channel from Port Robinson to Welland, and the present aqueducts dredged out.

From Welland to Ramey's Bend the present canal will be deepened, and widened along its Western bank, and a new cut made across the point that forms the bend for the purpose of straightening the canal opposite the point. From Humberstone, immediately south of Ramey's Bend, to Port Colborne, the Canal will be deepened, and widened on the west side.

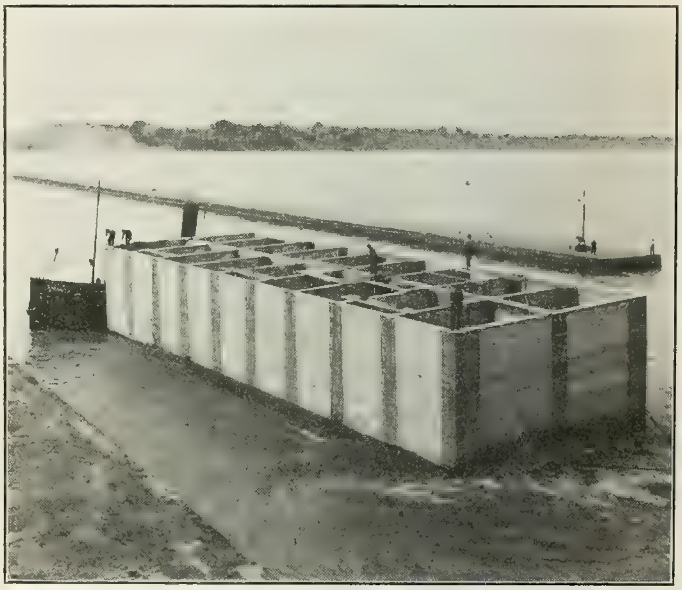
The improvements to Port Colborne Harbour will consist of deepening the inner and outer harbours to the twenty-five foot depth, and the entire removal of the old guard locks and supply weir at the North end of the Harbour. A new guard lock will be built in the new cut north of Humberstone, and a supply weir built across the section of the present canal that will be abandoned, at Ramey's Bend. It is also proposed to build a new western breakwater, extending 2,000 feet further out in the lake than the present one, for better protection to the Harbour during high gales. The new breakwater would consist of a rock bank, built from the rock excavation north of Port Colborne.

There will be thirteen highway bridges, three combined highway and electric railway bridges, one electric railway bridge, and five steam railway bridges across the canal. These bridges will have 80 feet clear spans where they cross the foot or head of locks, and 200 feet clear spans where they cross the canal prism. They will all be bascule bridges, except where local conditions will permit the economical and satisfactory use of the old reliable swing bridge. The electric railway bridge, a swing span carrying the main line of the Niagara, St. Catharines & Toronto Railway over the canal at the Guard Gates has been completed, and the substructures for several of the bascule spans are being built.

For the economical construction of the canal between Lake Ontario and Thorold the Government built and operates a double track standard gauge railway between these points, along the West side of the Canal. It connects with the Grand Trunk Railway at Merritton, and with the Niagara, St. Catharines & Toronto Railway at Thorold and Port Weller, and is equipped with a complete interlocking and block signal system, and a telephone train despatching service.

During the working season of 1915, 1,700,000 cubic yards of excavated material were handled over the railway to the Port Weller Harbour embankments, together with a large quantity of other material that was deposited as back-fill behind the structures. There were also 270,000 tons of crushed stone for concrete, sand, cement, and other miscellaneous freight taken over the railway. As an instance of the volume of traffic taken over the line during the middle of 1915, there were 5,917 loaded and empty trains moved in July, or an average of 228 trains per day. As many as 360 trains have been handled over the line in twenty-four hours.

As the construction of the Canal is only begun, and very few of its structures under construction, the time is not opportune for a highly technical discussion of the problems involved in their design and construction, and that of the machinery for their operation, the plans for the latter being only of a tentative character at present. A brief description of the main features of the more important ones will, therefore, only be alluded to now.



Welland Ship Canal towing Concrete Crib from Port Dalhousie Harbour.

Reinforced Concrete Cribs

The standard cribs are 110 feet long, 38 feet wide, and 34 feet high, divided into 18 compartments by one longitudinal and eight cross walls. The front and rear walls vary from 12 inches thich at the top to eighteen inches thick at the bottom, and the end walls from 15 inches to 21 inches, and the longitudinal and cross walls from 10 inches to 14 inches. Along the face of the cribs a heavy wall, about 7 feet high, is built of reinforced concrete blocks and mass concrete. The blocks are 9 feet long, 9 feet 3 inches wide, and 3 feet high, and are supported at the face by the wall of the crib, and at the rear end by concrete beams built between the cross walls of the crib. Above these blocks the wall is finished to coping level in mass concrete.

A standard crib contains 934 cubic yards of concrete, and 120,000 lbs. of steel rods, three-quarter inch diameter, and weighs approximately 2,000 tons.

Each crib is built to its full height upon a floating pontoon about nine feet high, and so constructed that when the crib is finished the sides and ends can be released and allowed to float away, while the heavily ballasted bottom sinks to the bottom below the crib.

Before the pontoon is released from the crib temporary wooden bottoms are fitted in each compartment, for the purpose of floating the crib into position on removal of the pontoon. When the crib has been sunk, by filling it with water through valves in the temporary bottoms, the latter are released, and recovered for use over again. The crib is then filled with shale and rock from the harbour excavation.

When the crib seats have been dredged out, three rows of stone, broken to macadam size are deposited through a pipe on the lines of the face, back and centre longitudinal walls, for the purpose of providing as nearly as possible a level foundation for the crib to rest upon when sunk in position. This method of building and sinking the cribs has proven satisfactory. There will be forty-six cribs required for the Port Weller Harbour docking, eighteen of them have been built and sunk in place.

Locks

Locks Nos. 1, 2, 3 and 7 are single locks, each $46\frac{1}{2}$ feet lift. Locks Nos. 4, 5 and 6 are twin locks in flight, each $46\frac{1}{2}$ feet lift. The Guard Lock is a single lock, with a variable lift between nothing at extreme low water of Lake Erie, to several feet at high water.

The locks are designed to pass vessels of 800 feet in length, and 80 feet in breadth, with a maximum draught of 30 feet. In general, they will only have one service gate at the head, and one at the foot. In addition to the service gates, Locks Nos. 1 and 4 will be provided at their lower end with unwatering gates, and the guard lock will also have unwatering gates at each end of it.

Welland Ship Canal. West Wall Lock No. 1.

As a guard against accident the gates will be protected by ship fenders placed below the lower gates, and above all gates, where required.

The upper gates are placed on top of the breast walls which correspond in height to that of the sill. These walls will remove the cause of probably nine-tenths of the accidents which occur on the present canal, namely, vessels carrying away the upper gates of the locks by striking them while entering from the lower reach. If a vessel goes ahead too far in the Ship Canal locks, she will strike against the breast wall, and damage herself instead of the gate.

Welland Ship Canal. Lower West Entrance Wall Lock No. 1 in process of backfilling, looking south.

Filling the Locks

To fill and empty the chambers, one culvert 14 feet wide and 15 feet high, with an area of 210 square feet, running lengthwise of the lock, will be built in the base of each wall. Each of these culverts will be controlled by Tainter or Stoney valves at their intake and outlet ends. At the locations of the valves the culverts are divided into two parts by a middle pier, it being considered undesirable to attempt to control the whole culvert with one valve. The side wall culverts open directly into lateral culverts 26 in number. Each of these laterals has an area of 12 square feet, and discharges horizontally into the lock chamber. The floors of the side wall culverts and their laterals are at the same elevation as the top of the lower gate platforms.

Welland Ship Canal, Lock No. 1. Looking towards Breastwall.

The intake and valve chambers controlling the culverts in both walls are located side by side, on the east side of the locks, and immediately in front of the regulating dams at the head of the raceways beside the locks. The water feeding the culverts in the west walls is passed through a syphon culvert under the chamber floor immediately in front of the breast walls. This method of drawing water from the regulating ponds instead of directly from the canal above the locks will tend to prevent the formation of objectionable currents in the upper entrances of the locks. All the culverts discharge directly into the lower entrances of the locks, and as the two streams flowing in opposite directions will meet each other squarely in the centre of the channel, hey will tend to destroy each other, and be forced to pread out, and take a new, and comparatively quiet leparture down the canal. In this manner it is not xpected that vessels waiting below the locks will be eriously inconvenienced by the currents and surges esulting from emptying the locks.

The middle wall of twin locks Nos. 4, 5 and 6 is 60 eet wide at the bottom. In its base are two separate nd independent culverts of 210 square feet area each, with 26 laterals per lock chamber. These culverts are controlled at the upper and lower end of each lock by large valves, in the same manner as the culverts in the side walls of the single and twin locks. This control is necessary in order that the twin lock chambers may be independent of each other.

The culvert area is such that if all the valves be fully opened at once the lock chamber can be filled and emptied in about 8 minutes. At this rate of filling or emptying, the level in the lock chamber would change at an average vertical rate of 5.8 feet per minute. The method of filling and emptying locks through culverts in the side walls has proven very satisfactory in practice, as the vessel is subjected to very little surge in filling the chamber, and none at all when emptying it.

The lower gates will be 81 feet 6 inches high, and the upper ones thirty-five feet high. They will be made of steel of the horizontal girder, double skin type, and will probably be operated with steel cables.

Records kept by the Superintending engineer of the Sault Ste. Marie Canal show that the time required to pass a vessel through the lock 900 feet long, 60 feet wide, 25 feet depth on sills and 29 feet lift is about 28 minutes between Stop Posts above and below the lock. The actual time of filling the chamber is ten to eleven minutes.

The time to pass vessels between the Stop Posts of the Ship Canal Locks will probably be somewhat less than required at the Sault Ste. Marie lock, and the estimated time of passing a loaded freight vessel through the Canal from Lake to Lake is eight hours, as against fifteen to eighteen hours in the present Canal.

Weirs

At Locks 1, 2 and 3 regulating raceways will be built on the east side of the locks, for controlling the service flow of the canal, and emptying the reaches when required. The raceway will consist of a concrete lined channel, whose level will be about midway between the upper and lower levels. The flow through the raceway will be controlled at the upper end by a dam, with a series of large valves in the base of it for emergency use, and the emptying of the upper pool. Normal regulation will be obtained through shallow stop log sluices on the crest of the dam. The dam controlling the lower end of the sluiceway will be a stop log dam, with deep sluices. The controlling weir for Lock No. 6 will be built in a rock channel, excavated in the rock at the east end of the high earth dam that forms the pondage of Lock No. 6. The flow through the weir will then pass down the present canal to No. 3 Pond. The supply weir at Lock No. 7 will be located on the site of Lock 24 of the present canal.

Welland Ship Canal. Lock No. 2, looking south.

Cost

The estimated cost of the Ship Canal in 1912 was $50,000,000.00. The expenditure to the 31st March 1920, including cost of surveys, engineering expenses and right-of-way was $20,270,[illegible]. The quantities of several of the main items involved in the construction of the Canal are as follows:—

Earth excavation	Cu. Yds.	19,500,000 – 40%	completed
Rock excavation	"	6,000,000 – 22%	"
Watertight embankments	"	1,400,000 – 30%	"
Concrete, all kinds	"	2,400,000 – 20%	"
Steel reinforcing	Lbs.	16,500,000 – 5%	"

Welland Ship Canal. Lock No. 1, from Upper Entrance Wall.

Progress of the Work

For the purposes of construction the canal has been divided into nine sections. Section No. 1 is at the Lake Ontario end of the canal, and Section No. 9 at the Lake Erie end. During the Fall of 1913, Sections Nos. 1, 2, 3 and 5 were placed under contract. The first three sections include the Lake Ontario entrance, the seven lift locks, guard gates, eight bridges, and the canal prism between the Lake and Thorold. Section No. 5 embraces the deepening and widening of the "Deep Cut" on the summit level between Allanburg and Port Robinson.

Welland Ship Canal. Lock No. 2, looking south from Concrete Plant.

Welland Ship Canal. Port Weller Harbour, July 29, 1915.

Owing to the European War the work on the canal practically ceased in 1916, and in the Fall of 1917 the contracts were cancelled, and the work entirely closed down. After the Armistice, November, 1918, the Government decided to resume work on a small scale, and arranged with the former contractors, — The Dominion Dredging Company, Section No. 1; Messrs Baldry, Yerburgh & Hutchison, Section No. 2; Messrs Doheny, Quinlan & Robertson, Section No. 3; and the Canadian Dredging Company, Section No. 5, for the resumption of the work, and which has been continued in a more or less intermittent manner, due to labour troubles, and other causes, since January, 1919.

On Section No. 1 the excavation is about 75% completed, and the concrete work 67%. Lock No. 1, including its upper and lower entrance piers, is about 75% built. The concrete built in these structures to date amounts to 178,000 cubic yards.

On Section No. 2 the excavation is about 77% completed, and the concrete work 30%. Lock No. 2, with its upper and lower entrance piers is about 67% built. About 210,000 cubic yards of concrete have been built in these structures to date. At Lock No. 3 only part of the breast wall has been built.

On Section No. 3 about 60% of the excavation has been taken out, and 5% of the concrete built. Locks 4, 5, 6, 7 and the Guard Gates are located on this section, but no part of these structures are built, except short sections of the upper entrance piers of Lock No. 6.

On Section No. 5 about 77% of the excavation has been taken out, and wasted between the present and old canals North of Allanburg.

The engineering work is under the direction of W. A. Bowden, M.E.I.C., chief engineer, Department of Railways & Canals, and Alex. J. Grant, M.E.I.C., engineer in charge, at St. Catharines. W. H. Sullivan is principal assistant, and next in authority to Mr. Grant. F. E. Sterns, formerly of the Panama Canal Staff, is in charge of designs. For carrying out the engineering superintendence and construction of the works a field force has been established on each contract, with a resident engineer in charge, who has under him several assistant engineers, instrumentmen, inspectors, etc. The resident engineers on the different contracts are, E. P. Johnson, Section No. 1; F. C. Jewett, Section No. 2; F. S. Lazier, Section No. 3; and H. W. Bruce, assistant engineer, Section No. 5.

Increase of Trade

In 1901 the total tonnage passing through the Welland Canal was only about 620,000 tons. In 1914 it had increased to 3,860,000 tons, indicating that since the completion of the 14 feet navigation system in 1901 the St. Lawrence route has gradually drawn more heavily year by year upon the Great Lakes—Atlantic Seaboard trade, and will undoubtedly do so to a greater degree when the Ship Canals are completed through to Montreal, as many of the Western States as far West as Idaho and South to Kansas look upon the St. Lawrence as their natural waterway to the sea, and most direct route to Europe, and from the evidence submitted to the International Deep Waterways Commission this summer, the people of fourteen of these States appear determined to leave no stone unturned to obtain in the near future the construction and completion of the St. Lawrence Ship Canals as an international undertaking, in the firm belief that a Ship Canal to the sea via the St. Lawrence has now become an imperative necessity for the proper economic development of their import and export trade.

This western trade is, at present less than 10% of the vast volume of tonnage that annually passes down the Detroit River, and it is only a portion of it that the St. Lawrence Route and Montreal can compete for against the Erie Canal and railway interests, and those of the ports of New York, Baltimore, etc., who have constantly affirmed that the western trade should not be permitted to descend to Lake Ontario if it were possible to avoid it. They have always contended that once on that level it would be likely to find its way down the St. Lawrence to the Seaboard, and have consequently always been antagonistic to any canal scheme for uniting Lakes Erie and Ontario, even by a route through the State of New York.

The Role of the Welland Canal

These views have been confirmed by the increasing traffic through the Welland Canal since 1901, and if this ever-increasing trade is considered to be of so much importance by the shrewd, far-seeing people of New York, and other Atlantic Seaboard States, who are ever alive to the interests of the Erie Canal, and their seaports, there is every reason to believe that it would be equally beneficial to the people of Canada to secure and retain the control of the lion's share of it by the completion of the Ship Canals, that would in all probability place the St. Lawrence Route beyond the reach of successful competition. A long step towards this end would be the completion of the Welland Ship Canal during this decade.

The Design of the Queenston-Chippawa Power Canal

T. H. Hogg, A.M.E.I.C., Assistant Hydraulic Engineer, Hydro-Electric Power Commission

The power canal for the Queenston-Chippawa Development is one of great interest both from the economic as well as from the hydraulic side. A history and detailed account of the design will not be given in this paper but rather a general description of the economics and hydraulics of the canal that is under construction, together with certain details of the methods that were employed in attacking the problems of design.

The canal is divided into four sections, a profile and typical cross-sections of which are shown in Fig. 1. The first of these is the Welland River section 21,000 feet in length, with a bottom slope 0.000119 and side slopes of 2 to 1. This is being excavated by means of dipper dredge and cableway. The earth section which follows the river section is 6,250 feet long with a bottom slope of 0.0001208 and is to be rip-rap lined with finished side slopes of 1.5 to 1. For each of these sections a roughness factor of .035 in Kutter's formula was used. The earth section of the canal was originally designed as a concrete lined section of much smaller cross-sectional area but a study of the economic, constructional and operating conditions indicated the advantages of the larger section with the rip-rap lining would be sufficient to compensate for the cost of the extra excavation. This portion of the canal has a capacity of over 15,000 c.f.s. with uniform flow at the assumed roughness factor of 0.035, and extreme low water in the Niagara River at Chippawa.

At the end of the earth section is located a transition 300 feet long in which the trapezoidal cross-section is changed to the rectangular rock section of 48 feet finished width with concrete sides and bottom. Beyond this are the control works, which are described in the paper by M. V. Sauer, A.M.E.I.C.

The rock section proper is 36,252 feet long and is divided into two parts by the Whirlpool section which has a length, including transition, of 2,450 feet. The rock portion of the canal has the water section with concrete lined sides and bottom with a finished width of 48 feet. The bottom slope is [illegible] and the roughness factor used in Kutter's formula 0.014. This value is conservative in view of the proposed method of placing the concrete lining. With the steel forms that are to be used and the special provisions being made for alignment of the forms, a smooth plane surface will be obtained on the concrete lining.

T. H. HOGG, A.M.E.I.C.
Assistant Hydraulic Engineer, Hydro-Electric Power Commission

For [illegible] feet the concrete lining will be carried up 32 feet above the finished grade of the canal; for the next 11,500 feet the lining will be [illegible] feet high, and for the remainder 30 feet high, except in the Whirlpool Section where it is carried up to elevation [illegible]. For the greater part of the time the water surface will be above the top of this concrete lining but the friction loss will be reduced by the lower velocities that will then exist in spite of the greater roughness of the unlined rock. Numerous hydraulic

Advance proof of paper to be read at the General Professional Meeting, September 17th.

studies have been made to determine the surface slopes in the canal for various discharges and for various water levels in the Niagara River. In cases where the water surface was above the top of the concrete lining a composite roughness factor was used in which the proportions of the wetted perimeter on the lining and on the rock surface were taken into account. Roughness factors as high as 0.019 resulted in some of these instances.

Determination of Depth and Slope

The depth and slope of the rock section were fixed by an economy study and the decision to use a concrete lining throughout its length was also reached in the same way. The method of arriving at the economic section of the canal will be explained later.

An examination of the profile of the canal (Fig. 1) indicates that the rock surface falls far below the grade of the canal about Sta. 333, rising again to grade about Sta. 349. This occurs in the Whirlpool Section, which is located at Bowman's Ravine or the Whirlpool Gully. Here it is necessary to carry the canal partly on fill and to use a trapezoidal cross-section on account of the foundation upon which the canal is carried .A concrete lining is essential on account of the high velocities. The cross-section is shown in Fig. 1, where it will be seen that the bottom width is 10 feet and the side slopes 1½ to 1. The slope of the bottom is the same as that of the rock section, viz., 0.0002113.

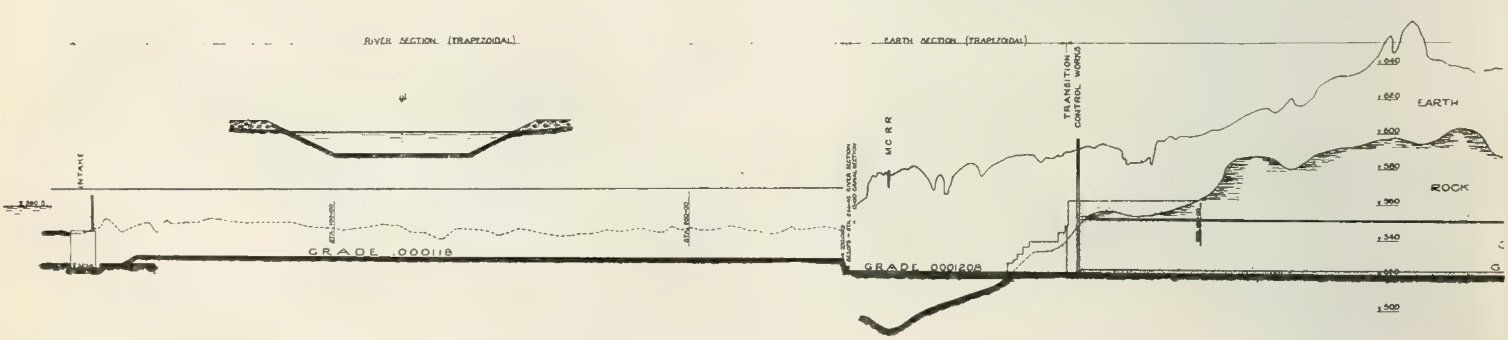
The Whirlpool section of the canal was designed to have the same cross-sectional area at the lowest possible operating water level as that of the rectangular rock section. This minimum water level would be somewhat above elevation 542, which is the elevation of the curtain wall at the screen house. The area of the cross-section below elevation 542 is the same for both and for greater elevations the Whirlpool section has the greater area so that there is no danger of the canal capacity being "choked off" at this point.

In locating the Welland River section the river course was closely followed so as to take advantage of the area of the natural channel. This necessitated leaving in, all the bends that occurred in the unimproved stream. As the deflection of these curves is not great they will not produce any appreciable loss.

The first important change in direction occurs at the beginning of the earth section at Montrose and is followed by a second bend at the Michigan Central Railroad crossing at Montrose. In addition to these there are only five changes of direction in the rock section of the canal, the deflections of which are 51°, 27°, 31°, 33° and 46°. The radius of curvature in every case is 300 feet and this radius is used for the inside and outside of the bend as well as for the centre line. That is, the curves of the two sides and the centre line of the canal are not concentric, resulting in a greater width of canal at the middle of the bend than at either end, the expectation being that the energy losses will be less than in a bend with concentric curves. It is probable that a shorter radius than 300 feet would give even better results, but this minimum was fixed by the size of the electric shovels that are being used for the excavation of canal.

The question of surges of the water surface in the canal, due to changes of load on the plant, is of great importance. This problem has received an amount of study proportionate to its importance, but on account of the limited space of this paper, it will be sufficient to say that the sides of the canal and the floor of the screen house will be built to such an elevation that with the worst combination of conditions the water will always be contained within the sides of the canal.

Observations of river stage at Chippawa have been available since 1902 and show a minimum W. S. elevation of 558.5, which low stage was reached only on two days.



An examination of the past records of Lake Erie stage indicate that as low a stage as 556.0 may be possible at Chippawa. This latter water level is therefore treated as extreme low water and the canal is designed to carry full load at this stage of the river.

While the low water conditions control the size and slopes of the canal, on the other hand the mean water conditions were assumed to be those on which the economic proportions should be based.

Design of Canal Section

Certain limitations were met with at the outset. The Welland River section of the canal had to be maintained as a navigable stream, and as the excavation is in earth this portion of the canal was therefore designed for a low non-scouring velocity. The minimum width of the rock section was fixed by the type of electric shovel used for excavating this portion of the canal and was placed at 48 feet.

The problem thus resolved itself into selecting the best proportions for the trapezoidal earth section and the best depth and slope for the 48 foot rock section. The procedure in the latter case is the one that will be described.

It is, of course, possible to design any number of canals 48 feet wide, but with depth and slope varying so that all will give the same discharge at low water. For a low velocity the wetted cross-section must be deep but its slope may be moderate. For a high velocity the depth of the wetted cross-section will be small but the slope may be so great that the depth of the cut at the down-stream end may be greater and the total cost of excavating greater than for the low velocity design.

The procedure in determining the economic depth was as follows:

First, the design of a number of cross sections for velocities of 3, 4, 5, etc., feet per second, the determination of the required slope of the bed in each case to give the full load discharge with uniform flow, and the determination of the variation in cost of these canals with low water velocity.

Second, the determination of the friction loss in each of these canals with the river stage at its mean value. This friction loss represented so much lost power, which was, of course, small in amount for the lower low water velocities, and greater as the low water velocity increased up to a certain point.

Third, the plotting of the differential curves for items 1 and 2 thus showing the variation in delta cost with low water velocity and the variation in delta power with low water velocity. From these two differential curves a third curve can thus be obtained giving the value of delta-cost by delta-power plotted against low water velocity. Thus there is obtained what will be called an economy curve, showing for any given low water velocity, the rate at which further gains in power may be made at any low water velocity by enlarging the canal slightly and so cutting down velocity and friction loss.

Fourth, the selection of the best low water velocity from this economy curve. This step will now be explained.

The gain in power which results from a slight enlargement of the canal comes as a result of the reduction in friction loss. The additional cost for power house equipment is so small, within the limits in which we are working, that they can be neglected. It is reasonable then to continue the enlargement of the canal until the interest charges on the cost of excavation for the last horse power gained are equal to the average value of the power from the whole plant, including interest, depreciation, operation and maintenance. By stopping short of this point we would be in a position to gain more power at a cost less than the average that we were willing to pay for the power from the whole plant. It is interesting to note that the

QUEENSTON CHIPPAWA DEVELOPMENT

CANAL - ROCK SECTION

ECONOMIC STUDIES

economic velocity determined in this way is but slightly greater than the minimum cost at which the canal could be built to get the required discharge at low water. The minimum cost occurs for a velocity somewhat greater than the economic velocity.

The advantage for this method of attack is that it permits an economic size to be adopted for the canal without the inclusion in the estimate of the cost of anything that does not vary with the low water velocity. In this case, the width of the rock cut being fixed, the earth excavation does not vary with the various designs for the rock section and as a matter of fact in computing the cost of rock excavation only that below some assumed horizontal plane at a lower elevation than natural rock surface but above canal grade was considered.

Figures 3 to 6 illustrate a typical economic canal study. The studies from which these figures are taken were for a canal of smaller capacity and greater roughness than the one being built, so that the curves show the method only and do not apply to the present canal.

Figure 3 shows the results obtained in designing for various low water velocities. These designs can be made only when a previous study for the earth section has been completed so that the elevation of water surface at the end of the earth section is known.

Figure 4 shows friction losses and lost power due to friction. The method of obtaining the first derivative of the lost power curve is also indicated.

Only the variation in cost, not total cost, is shown in Figure 5. It is evident that the shape of the curve is the same whether we include the whole cost or only that part which varies with low water velocity. In either case the first derivative will have the same value.

The determination of the form of the economy curve Figure 6 is explained above.

The procedure in the economic design of the earth section of the canal was similar to that for the rock section but somewhat more complicated by reason of the fact that certain changes in the design of the earth section involved changes in the excavation throughout the length of the rock section. The differences in procedure were thus largely a matter of properly taking care of all the variations in cost.

It is the intention at a later date to present a complete detailed description of the methods and analyses used in determining the various hydraulic features of this work. At that time there will be submitted the calculations covering the economics and hydraulic characteristics, so that these may become a permanent record for use on similar work.

Hydraulic Installation of the Queenston-Chippawa Development

M. V. Sauer, M.E.I.C., Hydraulic Engineer of Design, Hydro-Electric Power Commission.

The purpose of this paper is to describe briefly the pertinent features in the Hydraulic Installation of the Queenston Development with a short discussion of the reasons that led to the various designs adopted. On completion of the work and after the plant has had a thorough workout, it is expected that a paper will be presented to *The Institute* covering in fuller detail the complete layout, with a full comparison of the results obtained in operation as against those predicted in the design and determined by the various mathematical analyses employed therein.

The features to be touched on in this paper cover:—

Canal Control Gate,
Ice Chutes,
Screens,
Removable Gates,
Penstocks,
Johnson Valves,
Turbines,
Governor System,
Control Pedestals,
Service Units.

Canal Control Gate

A single motor-operated vertical lift roller gate for the purpose of controlling or entirely shutting off the flow will be installed at the upper end of the canal near Montrose where the earth section of the canal merges into the rock section. The combination of span and head make this gate the largest ever built and particular attention is being paid to the roller design in order to secure bearing loads well within safe, structural and operating limits. The clear width is 48 feet and the height of the gate is 42½ feet.

Volume of Water Delivery

It is of course essential that the canal shall deliver sufficient water to the power plant under the most adverse conditions of water level in the Niagara River. The canal is therefore designed to deliver a quantity of water equal to its rated capacity when the river is at its lowest stage.

The general arrangement of the control gate is shown in Fig. 1. It will be noted that the lift is extended to a point 14 feet above the water level and this has been done in order to permit a patrol tug to pass freely up and down the canal when the gate is in normal position, i.e. wide open.

Advance proof of paper to be read at the General Professional Meeting, September 17th.

The gate will be counterweighted and operated by a motor connected through a worm drive to the two main hoisting gears, and the motor will be provided with distant as well as local control so that the gate can be operated from the power house if required.

M. V. SAUER, M.E.I.C.
Hydraulic Engineer of Design, Hydro-Electric Power Commission.

The gate itself will be made up with horizontal trusses spanning the opening and vertical beams to which the skin plate will be rivetted. It is not important that the gate be absolutely watertight when closed although "stanching" bars will be provided to insert between the skin plate and the end guides which will make it practically tight.

A comparative analysis of costs and operating conditions was made on the single gate as against two gates with an intermediate pier, and it was found that the cost of a single gate and superstructure did not exceed the cost of the twin gates, on account of the additional construction required by the intermediate pier and the necessary widening of the canal to keep down the velocity to normal. When the added advantage of having a clear unobstructed waterway was taken into account as well as the simplified operation of a single gate in place of two, the decision was entirely favorable to the single large gate.

FIG. 2

Ice Chutes

It is expected that the intake as designed will take in water from the Niagara River, absolutely free from floating ice, but to take care of any ice that may form on the surface of the canal or the Chippawa River channel a small ice chute is being provided at the lower end of the forebay. It consists simply of an opening through the screen house provided with a drop gate which can be lowered below the water surface for a depth of 12 feet. The discharge over the gate is carried through the screen house and down the cliff and under the power house to the lower river in a reinforced concrete pipe 10 feet in diameter.

An elaborate design of ice skimmer has been made up which if found necessary can be installed later on. This consists, in general, of a reinforced concrete horizontal pivoted leaf which can be raised or lowered in accordance with the water stage so that floating ice will be skimmed off the surface to a discharge channel, at the same time allowing the clear water to pass underneath. Provision is now being made in the outer wall of the curve in the canal immediately above the forebay so that this skimmer can be installed in the future if it is found that sufficient capacity is not provided in the smaller ice chute through the screen house.

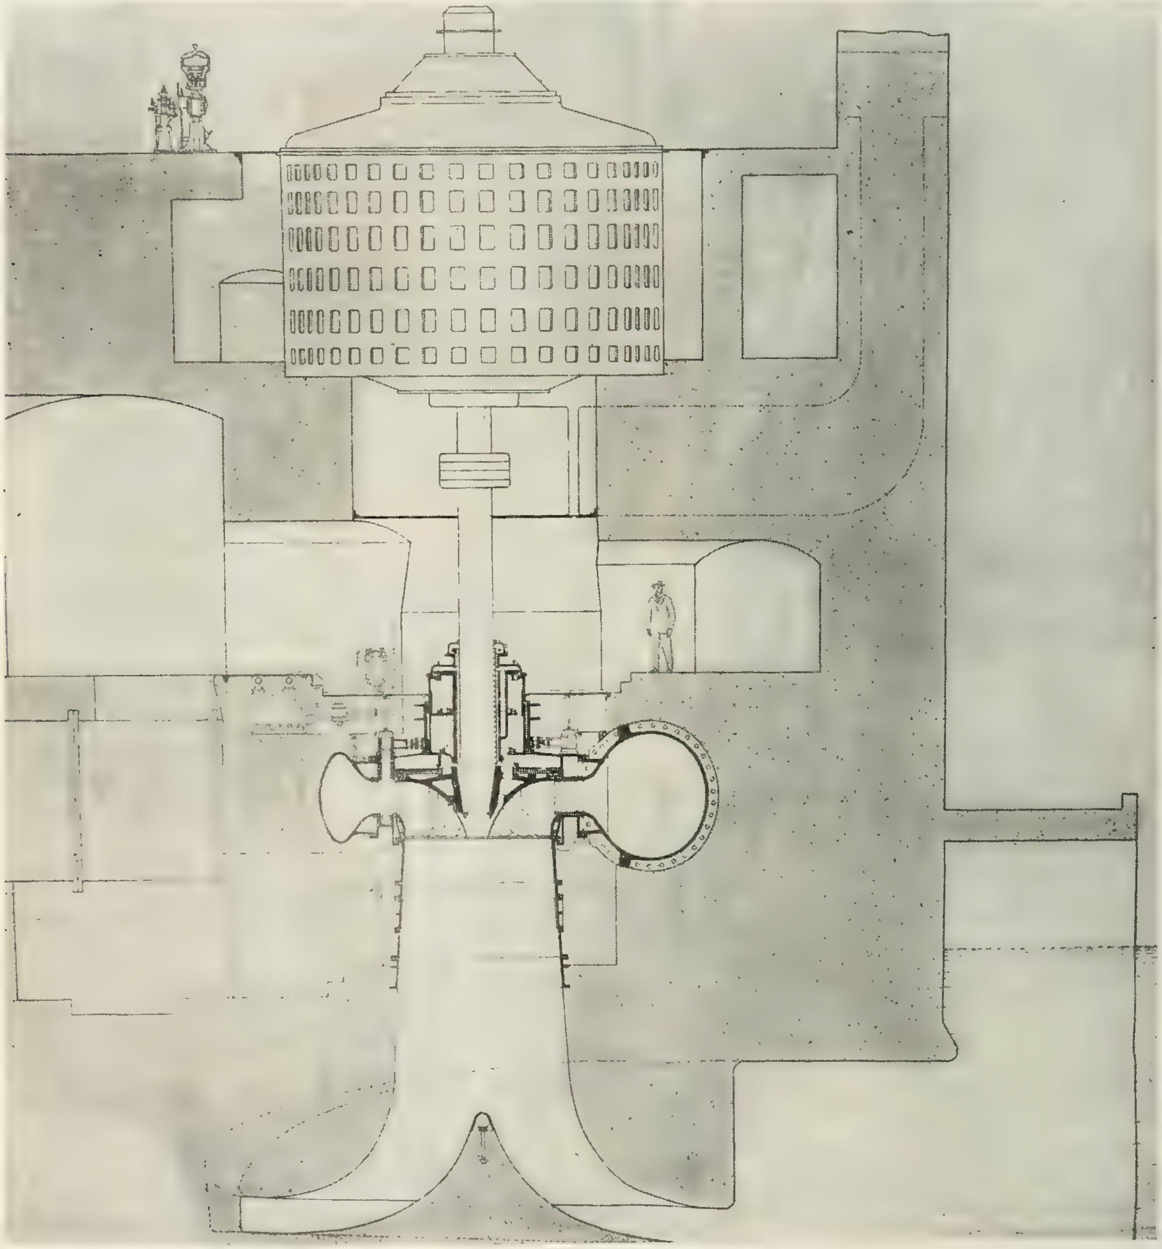

Fig. 3. Section through Power House.

Screens

The only features of the screens worthy of comment are the wide bar spacing of 4½ inches in the clear and the layout of the bars and frames which are so designed that the whole frame with the bars attached is removable thus leaving a completely unobstructed passage when they are removed. There are three bays of screens for each penstock and two frames in each bay. The tops of the screens are eight feet below the normal surface of the water and the maximum velocity of water through the screens is 2.25 feet per second. With these provisions it is not anticipated that anchor ice will cause much trouble.

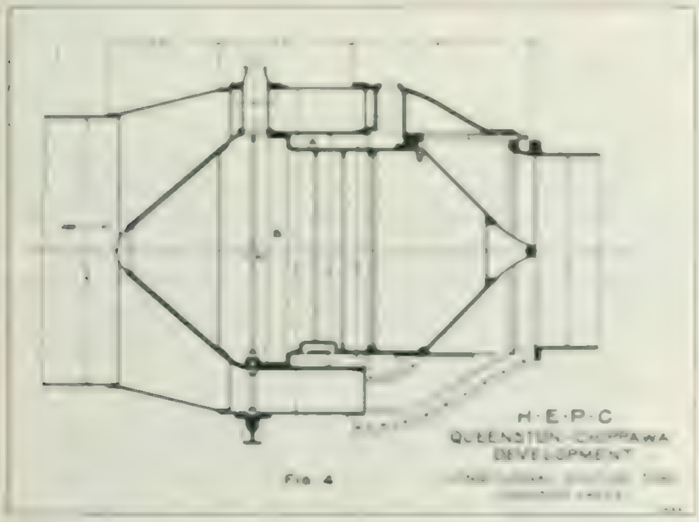

Fig 4

Removable Drop Gates for Penstocks

In view of the fact that a Johnson valve is to be installed at the lower end of each penstock adjacent to the turbine it has been decided to omit permanent gates in the screenhouse at the penstock entrances. To take care of any failure in the valves, removable structural gates made up in sections will be provided which can be lowered into any penstock entrance by means of an electric travelling crane in the screenhouse.

Penstocks

The quantity of water used by each turbine at full load and under normal head is approximately 1800 cu. ft. per sec., and in the design of the penstocks, the diameter was fixed by plotting up various curves showing the value of lost power due to varying velocities and their consequent friction losses as against the carrying charges on the corresponding penstocks. By this means a diameter of approximately 15 feet was found to give the best value, but so great a diameter at the lower end required a plate thickness of over 1½ inches and this was considered beyond the limit for safe field rivetting. On this account the diameter of the upper two-thirds of the pipes was made 16 feet and the bottom third 14 feet which made the construction work feasible and at the same time gave the nearest economical results. The total loss through the screens, penstocks and valves is 1.25 feet using a value of C = 110 in the Hazen & Williams formula. The loss is considerably reduced by the use of butt girth joints with an outside cover plate as against the customary practice of using inside and outside courses.

Johnson Valves

Figure 4 shows a longitudinal section through the Johnson hydraulic operated valves which are located at the lower end of the penstocks. The operation of these valves is very simple, no outside power being required, the valve being opened or closed by means of the penstock pressure. The valve plunger is of the differential type and seats against a ground-in ring in the neck of the body. The annular chamber A and the central chamber B are connected through a control valve and piping either to the penstock pressure or to the atmosphere. Admitting penstock pressure to A and atmosphere to B opens the valve while the reverse operation closes it.

The advantage of a valve of this type is the simplicity of operation. Furthermore, because of its circular section it can be built for any head and thus located at the lower end of a penstock, obviating by this arrangement the necessity of emptying and filling the penstock for each shut down.

FIG. 5

Turbines

Five turbines are at present under contract, which is one half the ultimate installation. They are each of 50,000 H.P. rated capacity of the vertical, spiral case, single runner Francis type and will operate at a speed of 187½ R.P.M. This gives a specific speed of 36. The maximum guaranteed efficiency is 90% although in view of recent practice it is expected that this efficiency will be exceeded. On model runners of homologous design tested at Holyoke 91% was obtained. The inlet diameter of the scroll case is 10 feet and the diameter of the runner is 10′5″ at the inlet. Figures 2 and 3 show the turbine setting and it will be noted that an open space has been left in the power house foundations below the runner so that by removing a section of the draft tube the runner can be taken out from below, thus obviating the necessity of dismantling the generator when a renewal of the runner is necessitated. The runner is designed for a capacity of 61,000 h.p. and is "gated back" to a maximum capacity of 55,000 h.p. The reason for this is that the turbines, which will normally operate at or near full rated load, will also therefore operate at their maximum efficiency. Special taps have been provided in the crown plate and from the annular spaces around the discharge side of the runner to which gauges can be attached and a record kept of the varying pressures at these several points. This will furnish an indication of the wearing away of the runner seal and show when renewals of seal rings are necessary. Connections from these chambers to the scroll case and draft tube will allow readjustment of the downward thrust when required.

The runners and spiral casings are cast steel and a test pressure of 260 lbs. per sq. in. is required in the latter.

Governor System

The centrifugal head, relay valves, and hand control for each governor will be located on the generator floor while the main automatic valve control will be located directly under the governor stand at the level of the turbine regulating cylinders. The advantages of this arrangement are the short piping between the main valve and the regulating cylinders and the separation of the two main parts of the governors, giving freer access for repairs and maintenance. The pressure fluid will be water, probably treated with Bichromate of Potassium, which will prevent rusting of the wearing parts and at the same time give a lubricating value to the water. A central pumping system will be used, with duplicate motor driven multistage centrifugal pumps, either one of which will have sufficient capacity for all the governors. The pressure fluid will be piped to all the governors through accumulator tanks, one located near each governor so as to eliminate any inertia effects through the piping system. The pump motors are automatically controlled by relay switches which are controlled by pressure variation in the system. As a further safeguard for preserving continuous operation in the event of failure of the pumps or motors penstock pressure can be turned into the governor system. When the plant is finally extended to its full capacity a complete duplicate pumping system, similar to the one above described will be installed and interconnected with the present system.

Control Pedestals

A control pedestal as shown in figure 5 will be set up adjacent to each generator, and on this will be mounted the various indicating instruments and control handles shown on the diagram. The principal use for such an arrangement is that the communicating devices between the floor operator and the chief operator in the control room, together with the local control and indication, will be located in such a way that the floor operator can handle the machine while in touch with the chief operator.

A telegraph communication, similar to a ship telegraph and a loud talking telephone, both communicating with the control room will form the principal means of communication. In addition to this a signal lamp mounted at the top of the column over the control pedestal will enable the chief operator to call the floor operator to the unit as required. The air brake and Johnson valve control will also be mounted on this pedestal. The location of this pedestal adjacent to the governor places the control of all the pertinent features of the unit within easy reach of the operator, while at the same time he will be in communication with the control room. The various indicating instruments shown will at the same time be under his observation.

Service Units

For furnishing heat, lights, and power service to the plant two service units, each of 2500 h.p. capacity will be installed. Each of these consists of a vertical turbine running at 500 r.p.m. direct-connected to a generator. The turbines are supplied by a single 5 foot diameter penstock branching into two pipes at the turbines, each branch being provided with a Johnson valve. It is expected that the service plant will be duplicated when the power house is completed to its full capacity.

Electrical Features — Queenston-Chippawa Development

E. T. J. Brandon, A.M.E.I.C., Electrical Engineer Hydro-Electric Power Commission

A — General

A novel feature of the generating room is that the main floor is level with the top of the generator frame. Space between this floor and the floor at the bottom of the generator is utilized for cooling air, power leads and piping. The generating room is approximately 60 ft. wide x 60 ft. high, the units being spaced at 50 ft. centres. The space devoted to transformers and low and high voltage switching is approximately 90 ft. wide x 100 ft. high, the equipment belonging to each generating unit occupying the corresponding 50 feet taken by the generator.

B — Generators

These are 45,000 k.v.a., 12,000 volt, 25 cycle, 187½ r.p.m., vertical shaft generators with thrust bearings and direct connected exciters. The thrust bearings to be used are designed to carry a load of about one million pounds. Five such units have already been contracted for. In the neighborhood of 100,000 cubic feet of air per minute will be required to cool the generators at full load. The air system is completely enclosed so that the cooling medium can be taken from and discharged to the outside air without mixing with the air inside the station. It is interesting to note that the weight of air passing through the generator every 3 hours equals the complete weight of the generator itself.

C — Transformers

In the present installation there will be fifteen 15,000 k.v.a., 25 cycle single phase transformers which will be used for transforming from generator voltage of 12,000 to a nominal voltage of 110,000. Taps are however, provided in high voltage windings to permit operation at 132,000 volts.

D — Switching Equipment

Provision is being made for operation on the "unit" system, that is, the generator, bank of transformers and transmission line will be considered as a unit, and have the same capacity so that in case of emergency a unit may be operated to full capacity without utilizing either the high or low voltage busses. Provision will also be made so that units may be operated in parallel on either the high or low voltage bus, current limiting reactors being installed between generators at 12,000 volts. With 8 units paralleled without current limiting reactors it will be possible to obtain about 2,800,000 k.v.a. in a fault. Such a condition with busses at 24-inch centres would impose mechanical forces tending to separate the busses of the order of one and one-quarter tons per lineal foot. However, oil switches have not been developed as yet which will rupture such large amounts of energy and it is not intended that the units would be operated all tied together without reactors. The two limits of operation are, operating the units entirely separated and with 8 units paralleled as above. The former imposes a possible short circuit k.v.a. of probably 500,000 and 350,000 on the low and high voltage circuits respectively, while the corresponding short circuit k.v.a. for the latter are 2,800,000 and 1,800,000.

EDGAR T. J. BRANDON, A.M.E.I.C.
Electrical Engineer of the Hydro-Electric Power Commission

Synopsis of paper to be read at the General Professional Meeting, September 17th.

The General and Economic Features of the Queenston-Chippawa Development

H. G. Acres, M.E.I.C., Hydraulic Engineer, Hydro-Electric Power Commission

Although the active promotion of the Queenston-Chippawa Power Project commenced in 1914, it was not until 1917 that the grave power shortage, created by the demand for munitions and war materials, reached such proportions that the then existing government authorized the commencement of actual construction. At this time a shortage of skilled and common labor had manifested itself, the cost of labor, plant and construction materials was rising rapidly, and conditions on the whole were such that the undertaking of this project could not have been justified wholly as a commercial venture. On the other hand, the Allied Nations were in the midst of a bitter struggle, which at that time might well have been expected to last for another five years or more. With this possible, it was generally conceded that the resultant exhaustion of man-power would transform the final stages of the struggle into a war of munitions, with a resultant imperative demand for large additional supplies of electric power for their manufacture. It was therefore evident that if 200,000 horse-power could be made available through the agency of the Queenston-Chippawa Development by the year 1921, a factor would be introduced which would have a vital bearing on the success of the Allied Arms. For this reason the construction of the Queenston-Chippawa Development was undertaken primarily as a war measure.

When, however, the crisis of the war passed in July of 1918, and peace came in the following autumn, it became necessary to reconsider the status of the project, and transform it as far as possible from a war scheme designed to meet an urgent and immediate need, to a commercial scheme, embracing as many as might be of the elements of true conservation, and an ultimate maximum of economy in the production of power. Space is not available to cover the steps of this transformation in detail, suffice to say that it resulted in the final development as it stands to-day, with permanent works designed for the installation of plant up to an aggregate of 500,000 horse-power capacity, whenever the necessity arises, as dictated by the public need.

Selecting a Location

From the combined viewpoint of conservation and ultimate economy, the ideal Niagara Development would be one which would utilize the whole of the future available water under the gross head of 327 feet existing between Lake Erie and Lake Ontario. Several schemes, approximating this ideal in varying degree, have been advanced during the last 20 years, and of these the most practicable and promising was one, known as the Jordan-Erie scheme, which involved the intaking of water near Morgan's Point on Lake Erie, the building of an open waterway across the Niagara Peninsula to the brink of the escarpment above Jordan Harbour, thence carrying the water to the power-house at Lake Ontario level through a mile of pipe. Studied from an engineerings tandpoint, this scheme was open to serious objection for three main reasons; first, the unfavorable intake conditions at the Lake Erie end; second, the structural difficulties and un-

H. G. ACRES, M.E.I.C.,
Hydraulic Engineer, Hydro-Electric Power Commission.

avoidable head loss in connection with the 24-mile canal; and third, the regulation difficulties attendant upon the control of a mile long water column in the penstock connection between the head of the canal and the power-house, where something over 16 feet of penstock would be necessary for each foot of effective head. The economic effective head for this scheme worked out slightly less than 300 feet, the bulk of the losses being, of course, taken up in the long canal.

The problem was, therefore, to find if possible some feasible location which would obviate the main objections to the Jordan-Erie scheme. During the course of the

Advance proof of paper to be read at the General Professional Meeting, September, 17th.

subsequent investigation, it developed that by far the best intake conditions would be obtained at the mouth of the Welland River at Chippawa, and also that suitable power-house locations were obtainable in the gorge between Foster's Flats and Queenston, which would require only about 18 inches of pondage connection for each foot of effective head, thus reducing the regulation problem to one of minor importance. Fig. 1 illustrates the comparative layout and location of these two schemes.

Pressure Canal versus Open Canal

Having tentatively solved the intake and regulation problems, it remained to determine whether or not it was feasible to construct a suitable waterway between the Chippawa intake and the power-house location above Queenston. An exhaustive series of surveys and core-drill borings established the fact that it would be entirely feasible to connect these two points by either the open canal or the pressure tunnel type of waterway, and the next problem was to determine which of these two types of waterway would be the more suitable from the combined viewpoint of pure hydraulics, structural difficulties and hazards, and comparative cost.

In the matter of comparative cost, carefully compiled estimates indicated that throughout the full range of assumed carrying capacities, the open canal had a decided advantage over the pressure tunnel.

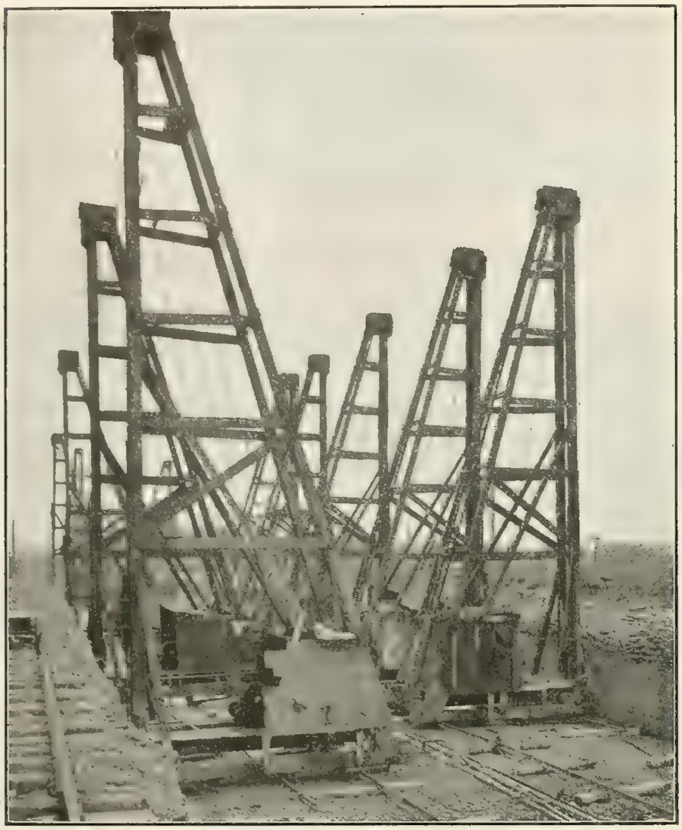
Pressure Tunnel Disadvantages

In the matter of structural difficulties and hazards the following main points were given consideration in the case of the pressure tunnel:—

(a) The necessity of driving the headings at an acute angle through the various limestone, shale and sand-stone formations, involving the certainty of a heavy overbreak and expensive timbering and lining.

(b) The unfavorable conditions as regards the disposal of excavated material.

Fig 1



Battery of Marine Drills Sta. 391 + 44, June 1st, 1920

(c) The unknown water hazard and the impossibility of predicting the cost of unwatering within reasonable limits of accuracy.

(d) The difficulty and hazard attending the driving of, and maintaining a pressure tunnel of unprecedentedly large diameter in the clay formation of the Whirlpool Ravine.

(e) The difficulty in connection with the construction of a distributing chamber in the shale and sand-stone at Queenston.

As against the above, the difficulties and hazards in the case of the open canal were limited to two main points; first, the removal of the earth overburden in the canal prism, and second, the permanent holding of the slopes subsequent to such removal. While it may never be possible to establish finally the comparative importance of the above points on the basis of actual construction, the fact remains that the work already accomplished on the open canal has demonstrated beyond doubt that the overburden can be removed with no more difficulty than was anticipated and that the means originally devised will hold the banks safely within the limits of the predetermined slopes.

Hydraulic Comparison

In the matter of purely hydraulic comparisons, the first point to consider is that both types of waterway of necessity would have the same point of intake at Chippawa and the same point of discharge at Queenston, so that they are exactly on a par as regards the utilization of available gross head, neither having any primary advantage over the other in this regard.

Since 1902 the water level at Chippawa has been observed and recorded twice daily, and Fig. 2 shows the mean daily elevations for the ensuing period compiled in the form of a duration curve. The following facts are deducible from this curve.

(a) The mean level for the entire period is about elevation 560.8.

(b) A level of elevation 559.5 or higher is obtained for nearly 99% of the entire period.

(c) A level of elevation 561 or higher is obtained for a little more than one-third of the above period.

(d) That it is reasonable to assume that the effective operating range of levels lies between elevations 559.5 and 561.

As to the possibility of the carrying capacity of either type of waterway being seriously affected by a permanent lowering of the natural levels of the Chippawa-Grass Island pool, due to present and future diversions of water therefrom, it is essential to consider two facts; first, that any diversion for power purposes from the pool itself will be largely compensated for by the intercepting effect of the diversion works, and second, that the level of the pool can be controlled independently to compensate for any diversion whatever, whether from the pool itself, from the upper reaches of the river, or from Lake Erie direct.

Travelling Derrick in Canal at Sta. 451 + 5, May 6th. 1920

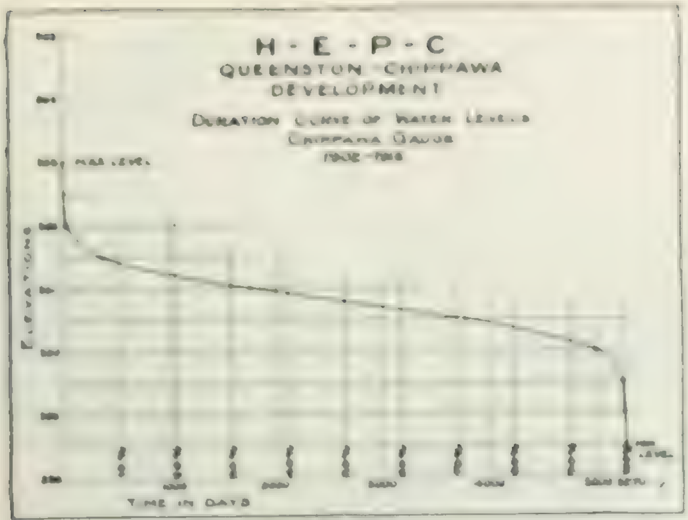


Fig. 2

In Fig. 3 an effort has been made to show in graphic form a comparison of the head losses chargeable to each type of waterway under discussion. In making this comparison, a possible extreme low elevation of 558 has been assumed for head-water, and the open canal losses calculated on this basis for a carrying capacity of 15,000 sec. ft. On the basis of this loss a tunnel was designed of the requisite diameter for the same capacity of 15,000 sec. ft.

These curves have been computed for the extreme range of possible operating levels, elevations 558 minimum and 561 maximum. The shape of these two pairs of curves illustrates clearly the basic difference between the two types of waterway. Under the assumed conditions the tunnel and canal curves for the head-water elevation 558 and 15,000 sec. ft. discharge have a common point of origin. As the discharge drops off, however, it is seen that the canal delivers any fixed discharge to the forebay at a consistently higher elevation than in the case of the tunnel. This is simply due to the inherent characteristics of the two types of waterway. In the case of the pressure tunnel, the discharge area is necessarily constant and any gain in head is due to decreased friction only. In the case of the canal the reduction in velocity not only reduces the friction losses, but the retardation of flow increases the effective discharge area of the canal section. By reason of this extra factor, the open canal has an advantage over the tunnel ranging as high as 5 feet of head loss. When the high discharges involved in the problem are considered, it is evident that this difference in head loss is a very important factor.

The curves shown on Fig. 4 have been plotted on a different basis, but with the same factors involved. In Fig. 3 head-water level and carrying capacity have been assumed constant and forebay level the variable. In Fig. 4 head-water and forebay level are the constants and carrying capacity expressed in horse-power is the variable. In this latter curve forebay level is assumed constant at the fixed minimum elevation for peak load capacity and from this common point the comparative carrying capacities of the two types of waterway have been calculated for specified levels of head-water in the Chippawa-Grass Island Pool.

Here again the two curves have a common point of origin at the point of extreme minimum capacity, but from this point on the canal characteristically pulls away as the head-water level rises, until at the maximum operating level of elevation 561 the canal has an advantage over the tunnel of 20,000 horse-power in carrying capacity. This gain is due to the fact that the tunnel can only realize the gain of a trifling increase in gross head, and a resultant trifling increase in pressure gradient, as the level of head-water rises, whereas the canal gains a material increase in natural gradient and effective discharge section. This increase in carrying capacity is therefore gained by the canal without any reduction of operating head at the forebay, whereas the tunnel can gain the extra capacity only at the expense of a reduced operating head.

Conclusions Favour Open Canal

The conclusions which may justifiably be drawn from the above discussion are; first, that starting from the common basis of equal loss and carrying capacity at extreme minimum head-water level, the open canal will deliver the required quantity of water to the forebay with a materially less loss of head than the pressure tunnel, for any head-water level above the assumed absolute minimum; second, that starting from the common basis of a fixed minimum forebay level, the canal will deliver a constantly increasing quantity of power in proportion as the level of head-water rises above the assumed extreme minimum level, which the pressure tunnel cannot do to any appreciable extent by reason of its inherent hydraulic characteristics, and finally, that the open canal is the only agency, under the above conditions, which can make automatically available the large quantities of excess power resulting from any temporary or permanent increase in the level of the Chippawa-Grass Island Pool, above the extreme minimum level which has been used as a basis of comparison.

The above were the primary reasons which led to the final choice of the open canal for the connecting waterway between Queenston and Chippawa. This canal as now being constructed, consists of 4½ miles of the improved

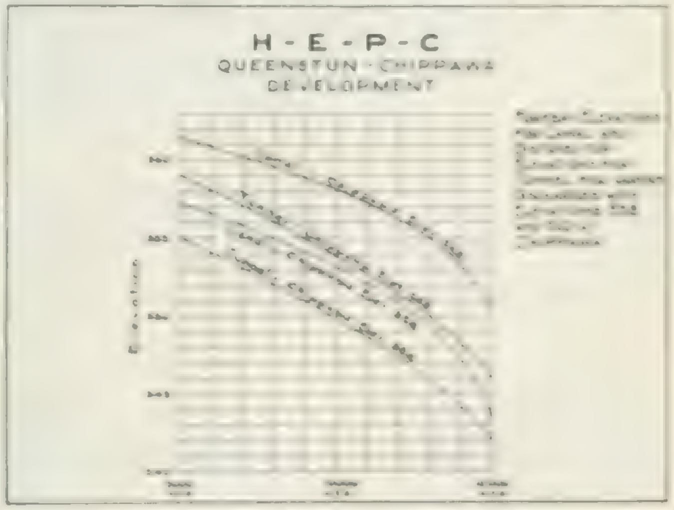

Fig. 3

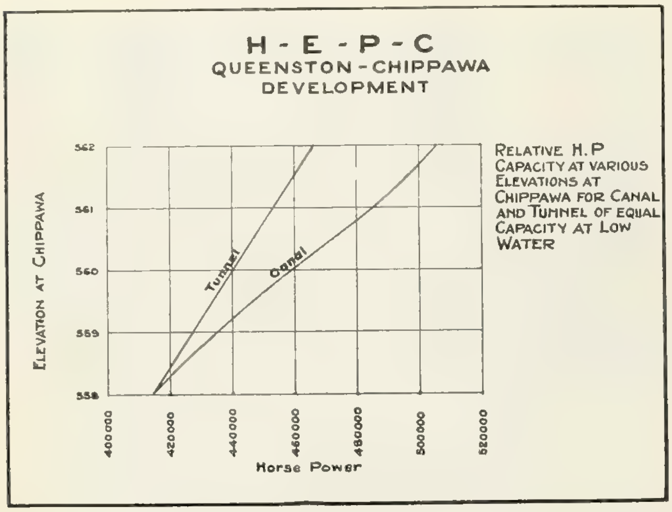

Fig. 4

natural channel of the Welland River and 8½ miles of dry excavated section from a point on the Welland River near Montrose to the forebay site above Queenston. Besides being only about half the length of the alternative Jordan-Erie Canal, the average operating head for equal quantities of water carried is about six feet greater at Queenston than it would have been at Jordan Harbour, despite the fact that the elevation at the point of intake is about 9 feet lower, and the elevation at the point of discharge about 2 feet higher, than would have been the case with the Jordan project.

Another distinct advantage of the open canal is the fact that it can effectively and inexpensively take advantage of any water which might now or in the future be available from the Welland Canal system. This open waterway would furthermore furnish the only means, in connection with the upper reaches of the Welland River, of reclaiming the unused 9 ft. of head in the Niagara River above Chippawa. This would involve a very heavy expenditure, but the value of power will not always be judged by present standards and the time may well come when this extra power may be considered worth reclaiming at a capital cost per horse-power ten times greater than is considered justifiable at the present time. These are more or less remote contingencies, but the fact remains that the choice of the open type of waterway, and the layout of the rest of the scheme will enable effective advantage to be taken of these conditions whenever the public need may become sufficiently acute. When this happens the extreme limit of conservation will have been realized in the matter of utilizing the gross difference in level between Lake Erie and Lake Ontario, and the anticipatory provision made in the present design will have justified itself.

Public Benefit from the Power Project

In considering this phase of the problem, it should be realized that under co-operative municipal ownership, a block of power delivered to the out-going lines at Niagara is not valued by what it can profitably be sold for at so many dollars per horse-power per annum, but by what it means to the individual citizen as an agency for increasing his comforts, conveniences and general standard of living and for facilitating increased commodity production. Such conditions tend toward the building up of the greatest asset any country can possess, an increasingly prosperous and contented population. The influence of Niagara Power on the wealth and prosperity of the community at large will therefore be measured more effectively by the maximum amount of power which can ultimately be produced and utilized, rather than by considering the power itself as the ultimate commodity which is to be produced as cheaply as possible in limited quantities and sold at a corresponding profit. In other words the secondary profit derived from a widely diversified use of power throughout the community must take precedence over any primary profit derived from its direct sale as a commodity, if the true interests of conservation are given proper weight.

It is not within the scope of this article to cover any details of design, construction methods and installation, but as regards the canal, the most vital feature of the plant design, original methods of attack were devised, with the assistance of R. D. Johnson, which involved an interesting application of the graphic calculus. Th s in turn led to a similar application of the graphic calculus to the penstock design and a practically rational method was devised for determining the economic diameter.

Capacity of Units

The decision to fix capacity of the units at 50,000 rated horse-power was governed by three primary considerations; first, the rapidly increasing demand for power necessitated the development of power in blocks of a magnitude not hitherto conceived; second, by reason of the economy in first cost which results from making the capacity of the individual unit a maximum for any given head; and third, because the lineal power-house space in the gorge was limited, having regard to tail-water levels and the possibility of further extensions.

Shovel No. 1, Canal Excavation Looking S. at Curve Sta. 443, Feb. 5th, 1920

As the design now stands each unit comprises about 10 per cent of the ultimate installed capacity, and the power house will contain something over 1800 horse-power of effective capacity per foot of length, a figure which has not hitherto been approached, as far as is known.

Summary of Construction Methods

In conclusion it might be of interest to make some reference to construction methods and to summarize briefly the reasons which lead to the adoption of the type of construction plant which is now operating on the work.

A careful study of construction methods in connection with the excavation of earth and rock in the canal was plant required. The operation of electric and steam driven excavating machinery was witnessed and studied in various parts of Canada and the United States and a large amount of information with reference to output, operating cost, working conditions, etc. was obtained and carefully analyzed.

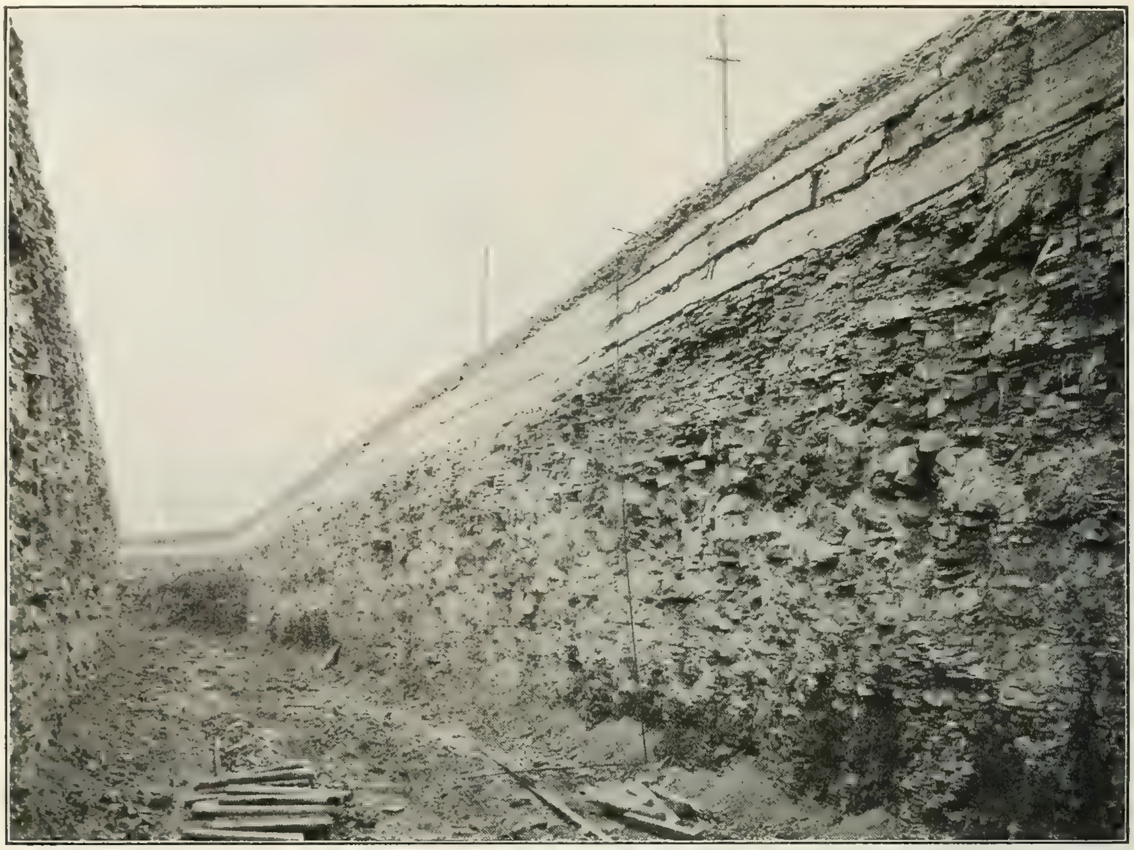
The most important decision arrived at in connection with the purchase of this plant was that with reference to the use of the largest type of shovel that could be obtained. These shovels are removing the full depth of overburden while working from solid rock bottom, a face averaging 40 feet in height, with a maximum of 80 feet. It was furthermore necessary to use these shovels in the rock cut, where they are lifting and loading into cars up

No. 2 Shovel opposite Sta. 267 + 57, looking south. May 5th, 1920

necessary by reason of certain existing conditions which would have a vital influence upon excavation cost. These conditions were first, the availability of cheap electric power for operating construction plant; second, the large quantities of earth and rock to be removed, which made it possible to consider the use of excavating machinery of the heaviest type and largest capacity obtainable; and third, the unusually good facilities available for the disposal of spoil, within short hauling distance, along the crest of the Niagara escarpment.

Having the above conditions in mind, the Commission's engineers spent several months in collecting and studying data in connection with the type of construction to 70 feet above shovel grade. The rock cut, being only 48 feet wide would not permit the carrying of loading tracks down to a sufficiently low elevation to reach the loading range of an ordinary railroad shovel and it is certain that excavation by plant or drag-line would have very materially increased the cost and seriously delayed the date of completion of the rock work.

In the earth work it was demonstrated beyond any doubt that on the bulk of the work railroad shovels would have been useless on account of the soft bottom and on some sections of the work it is doubtful if the overburden could have been removed by any possible means other than by these large shovels working from rock.



Rock Walls before Scaling South to Sta. 443, June 1st, 1920

The economy of this construction plant is rather plainly indicated by the fact that in 1917, when work commenced with railroad type shovels, direct labor cost comprised 29% of the total unit cost of excavation. To-day, with labor costing 250% more than in 1917, the labor cost per yard of excavation has only increased 4% over the 1917 figure of 29%. This would appear to indicate that the saving of man power resulting from the use of the large excavating units has practically off-set the 250% increase in labor expenditure. In the month just past (July) 500,000 cubic yards of earth and rock were removed and finally disposed of in 26 working days, with a total working force of 2,000 men, not more than half of whom were engaged in the direct excavating operations. These two facts alone would indicate that the type of construction plant on the Queenston-Chippawa Work has fully justified the decision which led to its adaptation, and that the results being achieved would not otherwise have been possible.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. September 1920 No. 9

Dates of Professional Meetings

The Seventh General Professional Meeting will be held in Niagara Falls, September 16th, 17th, and 18th, and the Eighth General Professional Meeting will be held in Halifax, October 13th, 14th and 15th.

The Annual and Annual General Professional Meeting will be held in Toronto on February 1st, 2nd and 3rd, 1921.

Banff Meeting a Great Success

As the time between the holding of the Western Professional Meeting at Banff and that of going to press did not permit of including a complete account of the meeting held under the auspices of the Calgary Branch of *The Institute,* the following night-letter signed by Arthur L. Ford, M.E.I.C., Secretary-Treasurer of the Calgary Branch will give an idea of the splendid success of the meeting.

Banff, August 18, 1920.

Camp opened Friday night, the fourteenth, for the convenience of members wishing to take advantage of the weed-end at Banff, and by Saturday noon there were seventy-six registered in attendance.

Sunday was a beautiful day spent by delegates in sightseeing trips and bathing in sulphur springs. Business programme opened Morning by R. S. Stronach, A.M.E.I.C., Superintendent of Parks and preliminary speeches by representatives from all across Canada indicated that meeting organized to bring all engineers together was considered as fulfilling the great requirements of present time to bring about co-operation between all branches of professional men. The important feature of this morning was a paper on "Concrete in Alkali Soils" by A. S. Dawson, M.E.I.C., which resulted in the following resolution.

"That fifteen thousand dollars per annum for three years be secured for investigation purposes by specialists engaged to devote entire time to work."

"That existing committee be authorized by Council to make definite application for necessary funds from all interested bodies."

"That work be carried on under jurisdiction of existing committee who will act in advisory capacity."

"That Council be asked to ratify this manner of dealing with the problem."

Monday afternoon was spent in seeing more of scenic beauty of Banff with result that all came back Tuesday morning very much refreshed to carry through morning's business programme. In the afternoon delegates were entertained at Alpine Club by C. H. Mitchell, M.E.I.C., Vice-President of *The Institute.* In the evening delegates viewed special moving pictures of Banff and Jasper Parks and later enjoyed an informal dance arranged by ladies reception committee. On Wednesday a most excellent paper was read by R. P. Blakey on "Architectural Engineering," and later two hours of keen and interesting discussion developed on subject of legislation for engineers. This discussion developed a fine feeling of co-operation and unanimity of opinion extending from Pacific to Atlantic coast. Attitude of parent Institute and complicated position in Ontario were very ably set forth by Vice-President Mitchell and J. B. Challies, M.E.I.C. In the afternoon a unique entertainment was provided by delegates witnessing first demonstration by Air Board of

Canada of ability to perform aerial reconnaissance and survey in mountain regions; new feature of inviting not only Institute members, but also all other scientific professional men and bringing them together under canvas proved an unqualified success and brought forth most flattering comments from delegates. Total registration was one hundred and fifty including large number of ladies whose presence contributed very largely to success of camp. Everybody enthusiastic, repetition next year.

ARTHUR L. FORD, M.E.I.C.

Provisional Programme for the General Profession Meeting of the Engineering Institute of Canada, Halifax, N.S.

Wednesday, Thursday, and Friday, Oct. 13th, 14th, 15th.

Headquarters of the convention will be at the Nova Scotia Technical College, Spring Garden Road, Halifax, N.S., and all business sessions and reading of papers will take place there.

Wednesday, October 13th, Opening Session 10 A.M.

Addresses of welcome by the Lieutenant Governor and Mayor.

Business Session.

Paper, Professor F. H. Sexton, M.E.I.C. on "Secondary Technical Education."

Luncheon.

Afternoon Session.

Trip to the Halifax Ship Yards.

Evening Session, 8 P.M.

Papers, by F. H. Williams, A.M.E.I.C., Moncton, on "Electric Welding of Iron and Steel," illustrated by lantern slides.

A paper by J. W. Roland, M.E.I.C., on "Road work in Nova Scotia."

Thursday, October 14th, Morning Session, 10 A.M.

A paper by D. W. Robb, M.E.I.C., on "The Development of the Steam Engine in the Maritime Provinces."

A paper by H. S. Johnston, A.M.E.I.C., on "The Development of the Sheet Harbour Water Power."

Afternoon Session, 2.30 P.M.

This time has been allotted to the Nova Scotia Association of Professional Engineers for their first business meeting, including the election of permanent officers to replace those appointed provisionally by the Act.

Evening Session.

Dinner, arrangements for which will be announced later.

Friday, October 15th, Morning Session, 10 A.M.

Papers by the New Brunswick Branch.

Luncheon.

Afternoon Session.

Visit to the new Automatic Exchange of the Maritime Telegraph & Telephone Company, Limited.

On account of the present difficulties of hotel accommodation, members are requested to advise the Halifax Branch at the earliest possible date of their desire for accommodation, and where possible state the date on which they propose to arrive.

Report of Remuneration Committee

To the President and Council of
The Engineering Institute of Canada.

Since the "Committee on Remuneration" was appointed last April for the purpose of reporting to you on the question of a proper scale of remuneration for engineers, two meetings of the Committee have been held at the headquarters of the E.I.C. in Montreal. On account of the nature of the work carried on by the members of the engineering profession, and also on account of the spring and summer being the busy season for the profession, the attendance at these meetings was small. However, a certain amount of work has also been done by correspondence and considerable progress has been made.

A very great deal of work along the lines being undertaken by this Committee has been done during recent years by committees appointed by other engineering organizations and by Branches of *The Institute.* Your Committee has examined many of the reports prepared by these bodies, and has concluded that it would be an unnecessary duplication of work to prepare a salary or fees schedule. Of the many reports prepared that of the "Engineering Council" on "Classification and Remuneration of Engineers" dated December 15th, 1919, seems to your Committee most nearly to meet the needs. This report is concise, it avoids multiplicity and duplication of details, the classifications are distinct enough to be easily followed, and the rate of remuneration seems to be fair.

There are some classes in the profession which are not included in the report, but the proper remuneration for such classes would be easily established by comparing the importance and responsibility of the work with that of the class with corresponding work in the report.

Your Committee has asked the Executive Committees of the several Branches of the E.I.C. throughout the Dominion to act as Committees to review the report of the Engineering Council, and to make such suggestions as may occur to them in regard thereto. As soon as the reports have been received from these Committees your Committee will take these into consideration for a final report.

This Committee has not attempted to do any work towards preparing a schedule of fees for consulting engineers. Should the Council so desire we shall be pleased to report thereon.

A. H. HARKNESS, M.E.I.C.
Chairman, Remuneration Committee.

Seventh General Professional Meeting

Conducted by the Ontario Provincial Division under the auspices of the Niagara Peninsula Branch

The Clifton, Niagara Falls, Ontario,
September 16th, 17th and 18th, 1920.

OFFICIAL PROGRAMME

Thursday, September 16th.

9.00 A.M Registration at the Clifton.

12.30 Noon Luncheon at the Clifton (Tickets obtained when registering, $1.50). H. B. R. Craig, M.E.I.C., Chairman of the Ontario Provincial Division, Chairman.

Address of Welcome by H. P. Stephens, Esq., Mayor of the City of Niagara Falls, Ontario.

H. B. R. CRAIG, M.E.I.C.
Councillor, Chairman Ontario Provincial Division,
District Engineer Dept. Public Works, Windsor, Ont.

Reply by R. A. Ross, Esq., President of *The Institute.*

Illustrated Talk "The St. Lawrence Route and the Welland Ship Canal," by Alexander J. Grant, M.E.I.C., Engineer-in-Charge, Welland Ship Canal.

2.30 P.M. Inspection of the Welland Ship Canal by invitation of the Department of Railways and Canals. An excursion has been arranged to inspect the canal construction with special attention to Lock 1 and Port Weller Harbor. Cars will leave the top of Clifton Hill at 2.45 p.m.

7.00 P.M. Dinner at the Clifton, A. C. D. Blanchard, M.E.I.C., Chairman. (Tickets obtained when registering, $2.00).

Dinner will be followed immediately by an entertainment provided by the Niagara Peninsula Branch.

10.00 P.M. Adjournment to the hotel balcony to witness the illumination of the Canadian Falls.

W. P. NEAR, M.E.I.C.
Chairman Niagara Peninsula Branch, City Engineer,
St. Catharines, Ont.

Friday, September 17th.

9.00 A.M. Continuation of professional papers.

R. A. Ross, President of *The Institute*, Chairman.

"Design of the Queenston-Chippawa Power Canal," by T. H. Hogg, A.M.E.I.C., Assistant Hydraulic Engineer of the Hydro-Electric Power Commission.

"Hydraulic Installation of the Queenston-Chippawa Power Development," by M. V. Sauer, M.E.I.C., Hydraulic Engineer of Design.

N. R. GIBSON, A.M.E.I.C.
Vice-Chairman Niagara Peninsula Branch, Hydraulic Engineer The Niagara Falls Power Company, Niagara Falls, N.Y.

"Electrical Features of the Queenston-Chippawa Power Development," by E. T. J. Brandon, A.M.E.I.C., Electrical Engineer of the Hydro-Electric Power Commission.

"General and Economic Features of the Queenston-Chippawa Power Development," by H. G. Acres, M.E.I.C., Hydraulic Engineer of the Hydro-Electric Power Commission.

Motion Pictures.

A. C. D. BLANCHARD, M.E.I.C.
Councillor, Convenor Programme Committee, Chief Field Engineer, Hydro-Electric Power Commission.

1.00 P.M. Luncheon at the Administration Building, Queen Victoria Park. W. [illegible], M.E.I.C., Chairman. This luncheon is given by the Department of Highways, Province of Ontario, to members, ladies and guests in attendance.

Official photograph. (Immediately after the luncheon.)

2.30 P.M. Inspection of Queenston-Chippawa Power Development by invitation of the Hydro-Electric Power Commission. An itinerary has been arranged to inspect the Canal, Forebay and Power House now under construction. Cars leave the administration building immediately after the taking of the official photograph.

R. P. JOHNSON, A.M.E.I.C.
Secretary-Treasurer, Niagara Peninsula Branch, Office Engineer, Hydro-Electric Power Commission.

7.00 P.M. Banquet at the Clifton. Tickets obtained when registering, $4.00. W. P. Near, M.E.I.C., Chairman of the Niagara Peninsula Branch, Chairman.

Toasts.

9.00 P.M. Dancing in the ball-room, at which those present at the dinner will be guests of the Niagara Peninsula Branch.

Saturday, September 18th.

9.00 A.M. Professional session continued. Lt.-Col. R. W. Leonard, M.E.I.C., Past President of *The Institute*, Chairman.

"Demonstration of the Gibson Method of Measuring the Flow of Water in Closed Conduits for Determining the Efficiency of Hydraulic Turbines," by N. R. Gibson, A.M.E.I.C.

Alex J. GRANT, M.E.I.C.
Member Executive Niagara Peninsula Branch,
Engineer in Charge Welland Ship Canal.

"Activities of the Division," Conducted by officers of the Ontario Provincial Division.

10.30 A.M. Arrangements have been made for visiting, during the morning, the following Power Plants:

(a) Ontario Power Company.
(b) Toronto and Niagara Power Company.
(c) Niagara Falls' Power Company (American Side).

W. H. SULLIVAN, M.E.I.C.
Member Executive Niagara Peninsula Branch,
Assistant Engineer in Charge Welland Ship Canal

At the last mentioned plant visitors will see the three new 37,500 H.P. units installed in 1919, and now in successful operation. These are the largest hydro-electric units in the world.

1.00 P.M. Luncheon at the Administration Building, Queen Victoria Park Commission. This luncheon is given by the Park Commission to members, ladies and guests.

Visiting members may avail themselves of the privileges of the courses of the Niagara Falls' Golf and Country Club at Lewiston and the St. Catharines' Golf Club at St. Catharines. Green tickets may be obtained from the Committee.

A trip to the peach orchards.

Scenic attractions available for visitors are listed elsewhere.

F. S. LAZIER, M.E.I.C.
Member Executive Niagara Peninsula Branch,
Resident Engineer Sections 3 and 4, Welland Ship Canal.

Baseball—Spectacular baseball competition has been arranged to take place in Queen Victoria Park, starting at 10.30 a.m., with entries from several Branches.

Registration for Saturday's excursions should be made with the Committee Friday evening or as early as possible Saturday morning.

Notes

Members are requested to register promptly.

The time given in this programme is DAYLIGHT SAVING TIME.

Points of Scenic and Historical Interest

Reached via International Railway,
Northbound cars from Upper Bridge

Brock's Monument and Queenston Heights
The Niagara Glen.
The Whirlpool and Spanish Aerocar
The Whirlpool Rapids.

Reached via International Railway
Southbound cars from Upper Bridge

Chippawa Village and the Welland River
Clifton Aeroplane Flights
Dufferin Islands and the Cascades
The Falls of Niagara
Under the Falls—Table Rock
Queen Victoria Niagara Falls' Park

Special Notes

Ladies accompanying members are invited to participate in every proceeding of the professional meeting, including, particularly, excursions and functions arranged by the Branch.

Any changes from this programme will be announced at the meeting.

H. L. BUCKE, M.E.I.C.

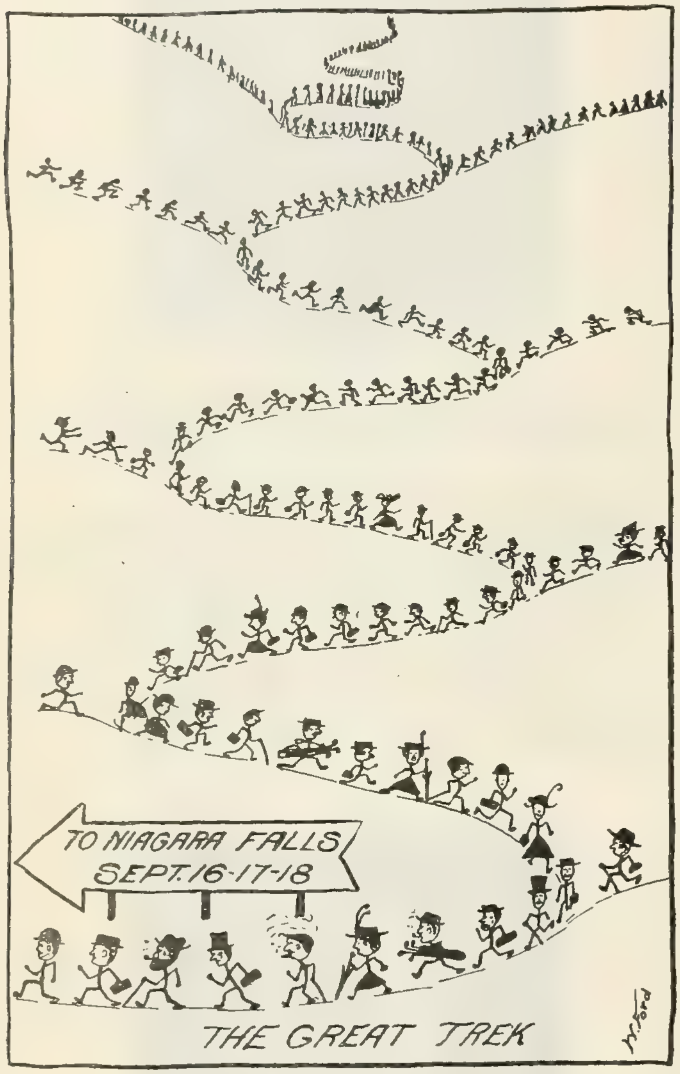
The attention of members is directed to the professional papers and to the advertising section in the September *Journal of the Engineering Institute*, which is published as a special Niagara Peninsula Branch Number.



Moncton Branch

For some time members of *The Institute*, resident at Moncton, have felt that the establishment of a Branch there, would stimulate further interest in the profession and enable engineers in that vicinity to keep in closer touch with the activities of their fellow members throughout Canada and to promote greater fraternity than is possible where no organization exists. After considerable discussion and several meetings it was decided to forward an application to Council for the establishment of a Branch. The application is as follows:—

"We the undersigned, Corporate Members of *The Engineering Institute of Canada,* resident within twenty-five miles of Moncton, respectfully request that the Council grant permission to establish "The Moncton Branch of *The Engeering Institute of Canada.*"

J. G. Dryden	F. B. Tapley
F. B. Fripp	H. J. Crudge
J. D. McBeath	J. Edington
E. G. Evans	W. B. Mackenzie
W. A. Duff	M. J. Murphy
R. H. Emmerson	S. B. Wass
Fred. H. Williams	W. R. Devenish

This application was presented at the Meeting of Council, June 22nd, and heartily approved together with the assurance of Council that every possible assistance would be given the Branch in connection with its establishment.

It has been arranged, in view of the consent of Council, to call an organization meeting to be held at Moncton on Monday, October 11th, thus ensuring the Branch's establishment before the General Professional Meeting, at Halifax, October 13th, 14th and 15th. It is expected that a large gathering of engineers will be present, as during recent months engineering activities in and about Moncton had been unusually great. The Secretary of *The Institute* will be present at this meeting and will give an address on Institute affairs.

Advertising in the Journal

Quality advertising rather than quantity has been the foremost thought in the minds of the Board of Management since the inauguration of *The Journal*. It is the earnest desire to keep the advertising pages of *The Journal* on a high plane and with that in view the greatest care is exercised in supervising advertising matter so that if possible no statement may appear which could be considered in any way to be misleading, although not from intent, possibly due to inadvertence on the part of the copy writer. Further, only reputable firms are considered so that members can be referred with confidence to the advertisers in *The Journal* as reliable firms with whom they can safely deal.

The advertising pages contain much valuable information and members are urged to consult this source of information freely and when dealing with or communicating with advertisers refer to *The Journal* as the source.

In the present issue a special section is being devoted to the Niagara Peninsula and to firms which supplied material and equipment to the great engineering undertakings, around which will centre the technical features of the General Professional Meeting at Niagara Falls in September. In addition a number of our regular advertisers who have special positions also supplied material and equipment although their advertisements do not appear in that section.

The engineer as a purchasing power is just beginning to be appreciated. More and more will it be realized in the future that the technical man is a deciding factor where engineering materials and equipment are required.

ELECTIONS AND TRANSFERS

At the meeting of Council on August 24th, the following elections and transfers were effected:—

Members

George Leonard Freeman, of Mattawa, Ont. (B.S. in C.E., Maine Univ.), Mgr. of Engr'g., Kipawa Co.; George Paxton Napier, of Victoria, B.C., Asst. Public Works Engr., Prov. of B.C.

Associate Members

Charles Wesley Burroughs, of Montreal, Que. (B.Sc., Queen's Univ.), Consltg. Engr.; Albert Grainger Cornell, of Winnipeg, Man., Asst. Engr. Reclamation Br., P.W.D. of Manitoba; Joseph Dumont, of Quebec, Que., Engr. Quebec Prov. Govt. (Highways); Charles Allen Fox, of Montreal, Que. (B.Sc. McGill Univ.), Sales mgr. and engr. for H. H. Robertson Co.; Charles Frederick Gray, of Winnipeg, Man., consl. engr. and Mayor of Winnipeg; Frederick Brackenridge Hazel, of Winnipeg, Man. (B.Sc. St. Andrews, Scot.), Draftsman for Manitoba Drainage Commn. Winnipeg; Sydney Arthur Hustwitt, of Toronto, Ont. (B.A.Sc. Univ. of Toronto), Res. Engr. Toronto Harbour Commission.; James Patrick Hynes, of Toronto, Ont., arch. for Hynes, Feldman & Watson, of Toronto and Montreal; Ernest Ian Walter Jardine, of Winnipeg, Man.; William Johnston, of Winnipeg, Man. Chief Engr. & Supt. of Steam Power with Winnipeg Elec. Ry. Co.; Frank White Smith Kennedy, of St. Catharines, Instr'man with Hydro-Elec. Power Commission on Chippawa Development Scheme.; Cecil George John Luck, of Montreal, Que., Asst. Instructural Dept., G.T.R.; Harold Riviere Lynn (Major) of Edmonton, Alta., Res. Engr. on Kleanza Greek, Usk., B.C.; Louis Henry Marrotte, of Montreal, Que. (B.Sc., McGill Univ.), Supt. of operation, Mont. Public Service Corp.; Gerald Marryat, of Montreal, Que.; James Sims Mitchell, of Paris, Ont. (B.A.Sc. Univ. of Toronto), Asst. Engr., Dept. of Public Highways, Ontario,; Harold Robinson McClelland, of Montreal, Que., vice-pres. N. E. McClelland & Co., Ltd., naval architects; Peter John McCuaig, of Winnipeg, Man. (B.A.Sc. Univ. of Toronto) with Winnipeg Elec. Ry.; Ned Franklin Nutter, of St. John, N.B. (B.C. Worcester Polytechnic Inst.) with Western Union Telegraph Co.; Alexander Vivian Polson, of Winnipeg, Man. (B.A. Univ. of Manitoba) Asst. Maintenance Engr., Winnipeg Electric Ry. Co.; James Quail, of Winnipeg, Man. (Diploma S.P.S., Toronto), Mgr. Can. Bridge Co. Ltd., Winnipeg; George Jabez Rayner, of Victoria, B.C., Engr., Canadian Puget Sound Lumber Co., Victoria; Brent Trevelyan Rodd, of Dundee, Man. Municipal Engr., Municipality of Springfield; Gerald Steele Roxburgh, of Winnipeg, Man. (B.Sc. Univ. of Toronto), Engr., Featherstonhaugh & Co., Winnipeg; Grant Simmons Sherman, of Shelburne, N.S., Res. Engr. on highway bridge, Annapolis to Granville, N.S. Highway Board; Stanley Shupe, of Oshawa, Ont. (B.A.Sc., Univ. of Toronto), Engr. Board of Works, Oshawa Ont.; David Smith, of Dauphin, Man., Asst. Dist. Engr., Good Roads Dept., Manitoba; Evan Roy Stewart, of Calgary, Alta. (B.A.Sc., Univ. of Toronto), Asst. Hydraulic Engr., Dept. of Interior, Calgary; John Bernard Wass, of Montreal, Que., Chief Draftsman, Valuation Dept., C.P.R., Montreal; George Hart Waring, of St. John, N.B., Gen'l. Mgr., Union Foundry & Machine Works, Ltd., West St. John, N.B.; Stanley Gregson Webb, of St. John, N.B., Mgr. and owner, The Webb Elec. Co., St. John, N.B.; Thomas Ted Wilson, of Dauphin, Man., Dist. Engr., Good Roads Board, Manitoba.

Juniors

Blair Edmundston Bayne, of Moncton, N.B.; Frank Carl Christie, of Yorkton, Sask. (B.A.Sc. Univ. of Toronto); Orville Mervyn Falls, of Toronto, Ont. (B.A.Sc. Univ. of Toronto) Designer and Draftsman for Baker & Wynne-Roberts, Toronto; Melvin Alan Montgomery, of Prince Rupert, B.C., Engr. with G.T.P. Rly.; Ernest E. Smith, of Sault Ste. Marie, Ont. (B.A.Sc. Univ. of Toronto), Engr. Algoma Steel Corpn.; Aubrey Arnold Turnbull, of Digby, N.S.

Associates

Arthur Macnamara, of Winnipeg, Man. Chief Inspector, Manitoba Bureau of Labor; Arthur Stuart Perrin, of Hamilton, Ont., Mgr. Can. Gen. Elec. Co., Hamilton.

Transferred from the Class of Associate Member to that of Member.

Edward Harrison Harrison (Capt.) of Lingfield, Surrey, Eng., Engr. with R. B. Matthews; Murray Calder Hendry, of Morrisburg, Ont. (B.A.Sc. Toronto Univ.), Engr., Hydro-Elec. Pr. Commission of Ont.; Olivier Odilon Lefebvre, of Montreal, Que. (B.A.Sc., Polytech. Univ.), Chief Engr. for Quebec Streams Commission; James McGregor, of Glasgow, Scot., Chief Engr. and Officer i/c of Harbour survey party, Gold Coast Colony, W.A.; John Hamilton Rychman, of Chicago, Ill., Designing Engr., Bureau of Engr's. P.W. Dept., Chicago, Ill.

Transferred from the Class of Junior to that of Associate Member.

Frank Eugene Victor Dowd, of Montreal, Que., Asst. Supt. of Sewer Dept., Montreal; George Macleod, of Vancouver, B.C., Instrumentman for Vancouver Harbour Commission; Sydney Clarence Mifflen, of East Wabana, Nfld. (B.Sc., C.E., McGill Univ.), Asst. Res. Engr. for Dom. Iron & Steel Co., Wabana Mines, Nfld.; John Earle Pringle, of Hamilton, Ont. (B.A.Sc. Univ. of Toronto), Asst. Engr., Kipawa Pulp & Paper Co.; Clarence Victor Putnam, of Ottawa, Ont. (B.Sc., Queen's Univ.), Asst. Chief, Organization Branch, Civil Service Commission, Ottawa.

Transferred from the Class of Student to that of Associate Member.

Edwin Victor Deverall, Capt., M.C., of Toronto, Ont. (B.A.Sc., Univ. of Toronto), Structural Engr. with Dom. Bridge Co., Toronto; Neil John Maclean, of Penticton, B.C., Res. Engr. on constrn., Kettle Valley Railway; Ivor Francis Rees Roche, of Westmount, Que. (B.Sc., McGill Univ.), Asst. Engr. Lignite Board of Canada; James Archibald Tom, of Guelph, Ont. (B.A.Sc., Toronto Univ.), Asst. Engr. to City of Guelph, Ont.; Hubert Gray Welsford, of Winnipeg, Man.

Transferred from the Class of Student to that of Junior.

Joseph Matthew Conroy, of Ottawa, Ont. (B.Sc., McGill Univ.), Test Dept., Can. Genl'. Electric, Peterboro, Ont.; L. Ludger Delorme, of St. Leonard, Port Maurice, Que., Civil and Chem. Engr. with J. J. Joubert & Co. Ltd.; Edward Walter Francis, of Westmount, Que.; Oswald Slemens Luney, of Niagara Falls, Ont. (B.Sc., Queen's Univ.).

EMPLOYMENT BUREAU

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Hydraulic Designer

Hydraulic designer wanted. Salary $200.00 to $400.00 per month depending on ability and experience. Box 109.

Ass't Civil Engineer for British Honduras

Asst. Civil Eng'r. wanted for Public Works Dept. of British Honduras. Candidate should be a properly qualified engr. with a general knowledge of roads, bridges, buildings and with some drawing office experience. Preferably unmarried and between the ages of twenty-eight and thirty-five. The duties will necessitate his travelling on horse back and in boats along the coast and on rivers. Transport expense will be paid and a subsistence allowance of three dollars a night while travelling. No quarters are provided. Free transportation from Canada. Salary $2,430 (American) per annum. Further information may be obtained from Sir Geo. E. Foster, Minister of Trade and Commerce, Ottawa, Ont. Box 146.

Mechanical Draughtsman

Mechanical draughtsman required for pulp and paper company in Province of Quebec. $225 per month. Box 148.

Instrumentman

Instrumentman familiar with laying out and supervising town work. Salary from $150 to $175 per month. Box 149.

Four Railway Draughtsmen

Wanted, four railway draughtsmen at $175.00 per month, temporary employment. Box 150.

Draughtsman

Draughtsman required for city engineering department. Salary $130 per month. Box 151.

Three Young Engineers

Three young engineers required for temporary work on bridge inspection. Salary $125 per month and expenses. Box 152.

Draughtsman

Draughtsman for work on steam and electric hoists, location, Province of Quebec, rate $150 per month. Box 153.

Surveyor

Surveyor to take charge of small party on water storage work on the Sturgeon River. Salary $150.00 per month. Box 154.

Civil Engineer

Recent graduate civil engineer for consulting engineer's office in Ontario. Initial salary $150 per month. Give full details of experience with references. Box 155.

Civil Engineer

Graduate civil engineer, must be an O.L.S., for consulting engineer's office in Ontario. Initial salary $250 per month. Give full details of experience, with references. Box 156.

Designing Engineer

Fully qualified designing engineer preferably with selling ability for construction work in Malay States. Applicant should be experienced in construction of concrete buildings, and must be Canadian or British. Commencing salary $800. (Strait Settlement), equal about $400.00 American per month. Engagement will be made on a regular contract basis with furloughs and all travelling expenses paid. Box 157.

Structural Draughtsman

Structural draughtsman of superior ability capable of doing individual work; permanent work of good opportunity for the right man. Salary to start $173.00 to $200.00 per month. Box 158.

Civil Engineer for Dam Construction

Civil Engineer as assistant for construction work on dam in the Province of Quebec; salary $150.00 per month. Box 159.

Members Exchange

We have a request from one of our members for copies of the May "Journal", 1920. Any member not wishing to hold this number will confer a favour by mailing his copy to the Secretary.

PERSONALS

I. Blake Allan, S.E.I.C., has recently been appointed jr. assistant to the road engineer of Hamilton, Ontario.

•

E. L. Holmgreen, Jr.E.I.C., has taken a position with the Manitoba Power Commission, Winnipeg, Man.

•

H. A. Elgee, M.E.I.C., has recently returned to London, England, after an absence of eight months in Africa and India.

•

G. F. Layne, Jr.E.I.C., has been appointed assistant mechanical engineer with Price Brothers and Company, Ltd., at their plant in Kenogami, Que.

•

D. G. Anglin, A.M.E.I.C., has recently accepted the appointment of assistant engineer with the Anglin-Norcross Company, Ltd., contracting engineers, of Victoria St., Montreal.

•

William Ford, A.M.E.I.C., has left the valuation department of the Grand Trunk Railway to take a position in the construction department of the Northern Electric Company, Shearer Street, Montreal.

•

Harry F. Barnes, A.M.E.I.C., has now left the Chinese Government Engineering College, Tangshan, North China and has accepted a position with the Department of Public Works, Shanghai, China.

•

A. J. Lawrence, A.M.E.I.C., of Outremont, has since June 1st been visiting Chicago and other points for the Northern Electric Company, Montreal, in connection with the new Machine Switching Telephone System.

•

Capt. W. A. Ervine Grim, M.E.I.C., has been for some time with the United Sugar Companies of Los Mochis, Sin., Mexico, a new company formed recently. Some $2,000,000 are to be expended within the next two years on plant, railways and irrigation. Captain Grim is in charge of construction of both broad-gage and 60cm lines, and expects to start work on surveys for the irrigation canals shortly.

Re Baseball Challenge

Editor, *Journal*:—

I note with a great deal of pleasure in the August issue of *The Journal* the so-called challenge of the Niagara Peninsula Branch of *The Institute* to a game of "Indoor-Outdoor" baseball to be played at the time of the professional meeting at Niagara Falls, probably on Saturday morning, September 18th.

As the suggestion originated with some of our Toronto members, we regard Mr. Clark's letter as an acceptance of *our* challenge.

I have asked Mr. H. L. Seymour to act as Captain of the Toronto Branch team and have requested him to make all arrangements. Yours very truly,

R. O. Wynne Roberts, M.E.I.C.
40 Jarvis Street, Toronto, Ont.

BRANCH NEWS

Halifax Branch

F. R. Faulkner, M.E.I.C., Secretary-Treasurer.

At a meeting of the Executive of the Halifax Branch a Committee on Policy was appointed to assist the central Committee in its work. It was moved by W. P. Morrison, A.M.E.I.C., seconded by J. L. Allan, M.E.I.C., that H. W. L. Doane, A.M.E.I.C., L. H. Wheaton, A.M.E.I.C., and Ira P. Macnab, M.E.I.C., be appointed. This was duly carried.

St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

C. O. Foss, M.E.I.C.
Member Executive St. John Branch.

Charles Orrin Foss, M.E.I.C., was recently appointed a member of the New Brunswick Electric Power Commission and subsequently chosen chief engineer of that Commission.

Mr. Foss was born in Wentworth, New Hampshire, on March 20th, 1850. He was educated at Dartmouth College and was engaged in general engineering work at Concord, N.H., with Charles C. Lund, C.E., under the firm name of Lund and Foss. In 1880 he was made chief engineer of the Texas Trunk Railway with headquarters at Dallas, Texas. Soon afterwards Mr. Foss contracted malaria and was forced to leave Texas and return to Concord, where, upon the death of Mr. Lund, he became associated with F. A. Merrill under the firm name of Foss and Merrill, civil engineers.

In 1881 Mr. Foss became chief engineer of the Des Moines, Oscola and Southern Railway with headquarters at Oscola, Iowa. In 1883 he was made chief engineer of the Nova Scotia Central Railway, which, after many financial interruptions, was completed from Middleton, N.S. to Lunenburg, N.S. in 1889. In 1902 this road was acquired by McKenzie and Mann and became a branch of the Halifax and Southwestern. Mr. Foss remained with this line in various capacities till 1904 when he joined the staff of the National Transcontinental Railway in New Brunswick. In 1905 he was made assistant district engineer in District "A", and, with the exception of a few months in 1907 when he was temporary district engineer at Kenora, Ont., he remained with this line till as district engineer he turned over his district completed and ready for operation on the last day of Dec. 1913.

During 1914 and until May 1917, Mr. Foss took his first vacation in 35 years and attended to various private affairs in which he had become interested. In May 1917 he became a director and chief engineer of the St. John and Quebec Railway, which title he still holds. In June 1918, he was appointed a member and afterwards Chairman of a Commission to gather data regarding possible water powers in New Brunswick, the other members being B. M. Hill, M.E.I.C. and K. H. Smith, A.M.E.I.C. This commission made a very thorough report to the New Brunswick Government this year. In July 1920 Mr. Foss received his present appointment.

Mr. Foss is a member of the Executive of the St. John Branch, Engineering Institute of Canada and of the Council of the Association of Professional Engineers of the Province of New Brunswick.

*

Chas. S. Bennett, Jr.E.I.C., recently severed his connection with the Dominion Public Works Department at St. John, N.B. to join the Fraser, Brace and Company, Limited, of New York.

*

Henry F. Morrisey, Jr.E.I.C., has been appointed resident engineer, Marine Department at St. John, N.B., in place of Gordon S. MacDonald, A.M.E.I.C., who resigned recently.

*

At the July meeting of the Municipal Council of St. John, N.B., a report and sketch plans were submitted by a Committee of the St. John Branch of the *Engineering Institute of Canada* dealing with the proposed construction of a Court House and Municipal Building in the Centre of the City. The Council decided to have detailed plans prepared for a Civic Centre, with the idea of proceeding with the first Section, or Court House, as soon as practicable.

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

At a recent meeting of the Executive Committee the following appointments were made:—

A. C. Tagge, M.E.I.C., Vice-Chairman, Industrial Section.

Alex. Wilson, A.M.E.I.C., Vice-Chairman, Electrical Section.

F. A. Combe, M.E.I.C., Vice-Chairman, Mechanical Section.

J. H. Valiquette, A.M.E.I.C., Vice-Chairman, Civil Section.

The Papers and Meetings Committee is actively preparing the programme for next season's meetings and a number of very interesting papers have been promised. One of the first to be presented will be, in all probability, by a prominent consulting engineer of New York with a continent-wide reputation.

*

W. S. Lockhart, A.M.E.I.C. has been appointed a superintendent in the electrical branch of the town department of the Riordon Company, Limited, Kipawa, Ont.

Kingston Branch

W. P. Wilgar, M.E.I.C., Secretary-Treasurer.

A Committee on Policy to assist the central Committee has been appointed by the Kingston Branch. The personnel of the Committee will be; the Chairman of the Branch, Alexander Macphail, M.E.I.C.; and the Secretary, W. P. Wilgar, M.E.I.C.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary-Treasurer.

At a meeting of the Executive Committee of the Peterborough Branch, the following members were appointed a Committee on Policy. Jas. Mackintosh, A.M.E.I.C., Chairman; B. L. Barnes, A.M.E.I.C. and A. P. Millar, A.M.E.I.C.

Border Cities Branch

J. E. Porter, A.M.E.I.C., Secretary-Treasurer

On July 22nd, the Border Cities' Branch gave a dinner at the Windsor Club in honor of the Members of *The Engineering Institute* from other Branches, who were attending The St. Lawrence Tidewater Convention being held in Detroit.

The guests of the evening were Messrs. C. R. Coutlee, M.E.I.C., J. B. Challies, M.E.I.C., A. B. Lambe, A.M.E.I.C., and A. J. Matheson, M.E.I.C. of Ottawa, and Col. H. J. Lamb, M.E.I.C. of Toronto.

Following the last touches of an appetizing meal, Mr. Craig called upon Mr. Coutlee to give the members a short address and Mr. Coutlee did,—tracing the Canal System and the St. Lawrence River to the Atantic, pointing out the natural obstacles and the vast amount of work that had already been done, which should be credited to the Canadian Government, also pointing out the fact that the present Canal System is not used to capacity, illustrating his point with his famous canal story Toot-Toot.

Mr. Mattheson also gave the members a short address.

A. B. Lambe, A.M.E.I.C., in addressing the members, called attention to the plans for the September Professional Meeting at Niagara Falls, urging the fullest possible attendance. Mr. Lambe also pointed out the recent recognition of engineers in Ontario Provincial Government appointments and commissions, showing the growing tendency of the public to recognize the engineer as a business man as well as a technical man.

Col. H. J. Lamb, M.E.I.C., a former well known resident of the Border Cities, emphasized the necessity and the advantage of the get together meetings and that too little stress was being placed on good fellowship amongst the engineers.

Mr. Challies then outlined the work being done by the Advisory Conference Committee towards Legislation, pointing out the many obstacles that had to be overcome in finding a common footing for a workable and satisfactory professional act in Ontario. Mr. Challies also emphasized the advisability of encouraging all members to take part in the discussions at branch meetings rather than leave it to a few leaders.

This suggestion was immediately put into effect by Mr. Craig calling upon several members of the branch. Messrs. Keith, Henderson, Anderson and Kirkpatrick, lately resident within the branch, responded in good form and well within the spirit of the meeting.

No further remarks were possible from other members due to Messrs Brian, Thorne and Stevens, the old celebrities, taking the floor. The meeting closed wth imany expressions of appreciation from all sides of the table.

The intention was a get-together become-acquainted meeting. Mr. Coutlee started the ball arolling by his happy faculty of presenting his facts and illustrating them in his humorous manner.

This spirit prevailed throughout the meeting and the Border Cities Branch hopes that the opportunity for such an enjoyable and entertaining evening will soon occur again.

Sault Ste. Marie Branch

Geo. H. Kohl, A.M.E.I.C., Secretary-Treasurer

Early in January 1920 foundation work was begun on a large structural steel mill which is being added to the Algoma Steel Corporation's Plant. Great credit must be given to the management for the initiative shown in the establishment of this much-needed branch of the Canadian Steel Industry.

The new mill, the first of its kind in Canada, will be electrically operated throughout. It will be 1,750 feet long, made up of the following units: 2 Pit Furnace, 40-inch Blooming Mill, 3 Re-heating Furnaces, 35-inch Roughing Mill, and 28-inch Finishing Mill. The estimated cost is $7,000,000. The annual production will be in the vicinity of 550,000 tons of rails and structural steel. This amount, of course, is not in addition to the present output. The new mill will largely supplant those now in use. The existing Blast Furnaces and Open Hearths will furnish sufficient material for the increased production. When beginning operations, 24-inch structural shapes will be the largest size rolled, although provision is made for an ultimate size of [illegible] sections. The latest rolling-mill practice has been followed throughout in the design, and every means has been taken to reduce manual labor to the minimum, and to provide safe working conditions for employees.

For reasons not made known by the management, foundation work was temporarily suspended on July 1st. At that date, [illegible] of the total [illegible] cubic yards of concrete was in place. The following percentages give the above date and these stages of construction:

Pit Furnace Foundations	[illegible]	completed
40-inch Mill & Motor Foundations	[illegible]	"
Reheating Furnace Foundations	[illegible]	"
35-inch Roughing Foundations	[illegible]	"
28-inch Finishing Mill Foundations	[illegible]	"

The [illegible] Company of Montreal and New York placed all foundations.

(Submitted by [illegible], A.M.E.I.C.)

Saskatchewan Branch

J. N. de Stein, M.E.I.C., Secretary-Treasurer

4th Summer Meeting, Saskatchewan Branch.

Canadian Section of the American Waterworks Association

At a recent meeting of the Canadian Section of the American Water Work Association, the following executive was elected.

Chairman: Alex. Milne, A.M.E.I.C., St. Catharines.
Vice-Chairman: F. H. Pitcher, M.E.I.C., Montreal.
Sec.-Treas.: H. G. Hunter, M.E.I.C., Montreal.
Trustees: R. L. Dobbin, M.E.I.C., Peterborough.
Arthur Surveyer, M.E.I.C., Montreal.
W. C. Harris, Toronto.

Preliminary Notice

of Applications for Admission and for Transfer

20th August, 1920

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in September, 1920.

FRASER S. KEITH, Secretary.

*The professional requirement are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ADDISON—GEORGE DICKSON, of Vancouver, B.C. Born at Brierly Hill, Eng., 12th Feb. 1879. Educ. King Edward Grammar School, Stourbridge, Eng. and apprentice to R. Blackadder, Dundee; 1895-99 asst. engr. on mtc. Caledonian Rly.; 1899-04, draftsman, James Bay Rly.; 1905-09 with C.N.Rly., as draftsman to div. engr.and ch. draftsman to dist. engr.; 1910-16, draftsman ,C.N.R.Rly.;1916-19, ch. asst. draftsman C.Nor.Rly., Toronto; 1919-20 ch. draftsman, C.National Rly.; Okanagan Br.; at the present time, ch. draftsman, Vancouver Harbour Comm'rs.

Reminiscences

Pioneer Life in the West

H. J. Cambie, M.E.I.C.

In connection with my Professional Record, it might be of interest to some members of the E.I.C. to give a few reminiscences of events which have occurred during a long, busy life.

I was born in the County Tipperary, Ireland, in 1836, and brought up on the banks of the River Shannon (Lough Dearg) and, terrible as is the unsettled state of that country at present, with the almost daily murders which are taking place, the same sort of things were common during my childhood, and were just as brutal, differing only in frequency.

Irish Life in the Thirties

My father's house consisted of an old castle, supposed to have been built about 800 years ago, to which had been added, in later years, a lean-to of a more modern type, which made it a comfortable residence. A courtyard in front of the house was enclosed with high walls, and during part of my boyhood, if any visitor came after dark, he had to ring a bell outside the courtyard gate and give an account of himself to someone at an inaccessible window, and if satisfactory he was admitted to the courtyard and to the hall door. But I do not remember a case when the visitor was not admitted.

The walls of the "old castle" part of the building gave evidence of the unsettled state of the country many centuries before our time, for my father had occasion to make repairs to certain rooms during my lifetime and in doing so, to pull out pieces of the walls. At one of these places he found the skeletons of two girls and on two other occasions, the skeletons of men. These were rather gruesome finds, but were not supposed to point to murders, for the tradition was that the Anglo-Saxons who overran that country, with King John's followers and their descendants, were at enmity with the original inhabitants, the Celts, for several centuries and if they buried their dead in grave yards, they would be desecrated, consequently they sometimes built their bodies up in the walls of their dwellings.

Arrival in Canada

In 1852 I came with my parents to Canada, sailing from Liverpool to Philadelphia in the "City of Manchester," the first ship of the Inman Line — now known as the American Line, and took eighteen days on the passage, landing on May [illegible].

The next day we travelled by rail to Perth-Amboy, and thence to New York by boat. On that evening and the next, the lower end of Broadway and the Battery were lit by arc lights on high poles. The carbons were just such as are in use today, but the electricity for each was furnished by a large number of cell batteries. They were found to be unreliable and very expensive and were abandoned in two or three days. I saw the lights myself, but only knew of the batteries by hearsay. Of course they did not come into actual use for nearly thirty years later, when the dynamo had been invented.

The Hudson River Railway had not been built, so we came by steamer to Albany and thence by rail to Buffalo, which was a hard night journey, as Pullman sleepers did not come into use for fifteen years or more afterwards. Next day we took a small ferry boat from Buffalo to Chippawa, about two miles above Niagara Falls, and from there to Queenston we travelled by a railway which was, I believe, the only one then operating in the Province of Upper Canada (Ontario) and is worth describing.

The line was on very much the same location as that occupied by the electric railway of late years. We were carried in an old fashioned English type of coach, with two or three compartments, each of which had seats for six or eight persons. It ran on wooden rails, reinforced with iron straps, and was drawn by one horse, driven by a man sitting on the front of the car, and we jogged along quietly. This seems a primitive sort of railway, but was a great convenience. The Northern Railway from Toronto to Collingwood was then under construction, as also the Great Western Railway from Windsor to Niagara Falls, but neither of them was completed for traffic for a couple of years afterwards, and the Grand Trunk did not even get a charter till the following year, 1853.

From Queenston we crossed the lake to Toronto on a side wheel steamer, called the "Chief Justice" with a long protruding snout, which was intended to pass under ice, lift it, break it up and throw it clear of the paddle wheels.

The Saxby Tide

My experiences for the next twenty years were just like those of any other engineer employed continuously on explorations surveys and construction. One incident, however, may be worth mentioning which seems to have dropped out of memory now. I refer to "*The Saxby Tide*" of October 1869.

Some three or four years previous to that time, Mr. Saxby, an Astronomer at Greenwich, while compiling the Nautical Almanac, became aware of the fact that on a certain day in October, 1869, the Earth, the Sun, the Moon and the planet Mars, would be all in a line, which would undoubtedly cause an extraordinary tidal wave.

As contractor's agent, I was at that time, October 1869, ballasting the western part of the Windsor and Annapolis Railway, preparatory to handing it over to the Company for operation. As the tides in the Bay of Fundy have, at ordinary times a great range, amounting at springs to about 50 ft. and we expected them to be, then, quite out of the common, we made such preparations as were possible, but the tide exceeded our utmost expectations. Large areas had been reclaimed from the sea by the French, and the dykes had been extended, as well as strengthened, by the English, after it had passed into their hands, and had held good for over 100 years, so it was hard to believe they were not safe. But when the Saxby Tide came in, it had a "bore" of such size and force that the dykes offered no resistance, and miles of them were swept away in a moment and the "bore" rushed on, wiping out fences, railway tracks, etc. and killing cattle which were pasturing on the after-grass. On the Annapolis end of the railway, the damage was not very great, but on the other end of the line, near Wolfville, and especially on the Grande Pré (the scene of Longfellow's poem of "Evangeline") the devastation was appalling.

Early Exploration in the Canadian West

Coming to the mountains of British Columbia in 1874, I had a few experiences out of the common.

In 1875 I was instructed, by Mr. Marcus Smith (my Chief) to make an exploration and survey for a line to Bute Inlet, by way of the Homathco River, passing through the country of the Chilcotin Indians. About ten years previously Mr. Waddington had obtained from the Provincial Government, a concession to build a trail by another branch of this river, from Bute Inlet to the Cariboo gold mines, and during the year 1863, built about thirty miles inland from tide water, at which point his men came in contact with the Indians of the Interior.

So far they had been assisted by the Coast Indians with their canoes, who lived on fish to a great extent, were lazy and had no ideas of morality, but the Indians of the Interior, who lived on meat, acquired by hunting in the woods, and on the mountains were a much braver race and jealous of their wives and families — and Waddington's men offended them deeply.

They ceased work in the Autumn of 1863, and when they returned to work in the Spring of 1864, the Indians descended on their camp at night, dropped the tent on them while sleeping and stabbed sixteen men to death, while tangled under the canvas. A company of volunteers was sent out, well armed, to punish them but needless to say, clerks from offices in Victoria could not overtake Indians on the mountainside.

I am not, however, writing an account of the Waddington Massacre, except insofar as my personal experiences are concerned. An armed survey party passed through, accompanied by a magistrate, in 1872, by another branch of the Homathco, but saw little or nothing of the Indians. I went through their country in 1875, approaching it from the interior where the country was open and sufficiently free from timber to enable us to ride on horseback.

Mr. W. T. Jennings and I went with survey parties, together, to a point near Tatla Lake and parted there, he going North East towards Fort George, while I turned South West towards Bute Inlet.

Experiences with Indians

Before making an actual survey, I went for a four or five days ride into the Pass, accompanied by Mr. M. Eberts, my assistant, and a couple of packers, a Frenchman and a Mexican. We took with us some blankets, clothes and tobacco as presents for the Indians if we should meet any. On our second day out from the main party, we found a band of thirty or forty Indians camped on a sandbar between a lake and a swamp and putting up (smoking) fish for the next Winter. We offered them presents which they scorned, ordered us to turn back, and one man got up on a stump, gesticulated wildly and made a most impassioned speech. So we packed up our presents and proceeded on our way for another couple of days ride.

On our return, about three days after, we passed over a mountain spur about two miles away from the Indian Camp, and could see them on the sandbar, men, women and children, at their various occupations. When we reached there, however, every soul had disappeared, even the horses and dogs — and though often there afterwards, I never discovered where they had gone.

Our pack horses were running loose and I called to the packers to lead them by the halters, which they did, as the Indians were evidently very hostile and might stampede them. So we passed on quietly and had gone, say a couple of miles further, and were in a narrow defile between two hills and riding in single file, when I heard a noise behind and on looking back saw a dozen or more Indians coming full gallop on horseback, with very scant clothing but each one armed with a Hudson Bay Company's musket, having a barrel over three feet long and a knife or some other weapon in a belt—when they came close they opened out into two columns, one passing at each side of us, and when the last man came even with me (one on either side and about 6 feet away) they stopped dead, throwing their horses on their haunches. No one spoke—we kept on our even way, a fast walk, and soon left them behind. I confess that, knowing these men to be of the same families who had murdered Waddington's party ten years before, it gave me a cold chill down my spine, but I kept outwardly calm, knowing that any sign of weakness would be very bad.

When we had travelled another mile or two, our friends repeated the operation, and when they pulled up next me, one of the Indians opened a conversation in "Chinook" and said they would accept the presents offered them five or six days before. This I absolutely refused to consent to, and stuck to it, notwithstanding sundry threats, but on the advise of a priest who came to visit them a few days later, consented to hand them over.

The priest, Father Maréchal, had only been visiting them for a few months and had already acquired a considerable influence and helped me in every way. This party of Indians left us for some hours, but when we were camping for the night, rode up again, asked for supper and were refused. We did not however pitch our tents, but laid them on the ground and slept on top of them, with one rifle between Mr. Eberts and me, and one axe between the two packers, and insisted on the Indians keeping at a distance.

They followed us to our main camp next day and we afterwards became good friends, after I had an interview with their Chief, and assured him they, and especially their women, should be treated with every respect.

We were greatly amused at these women, who had not been allowed to visit the settlements, and when they came round our camp on Sundays, refused at first to look in a mirror, but after a week or so consented, and then all of them removed the large bone nose rings which they wore — though they had seen them in each others noses all their lives.

A number of the men came to my camp one Sunday, shortly after, and told me they had come from Mr. Jennings' camp, thirty miles away, to ask me if I believed in Hell, as it had been described to them by the priest and illustrated by Mr. Jennings. On being pressed for an accurate description it appeared, Mr. Jennings had burnt something in a soup plate, which I afterwards found to be brandy, and as it was in a brilliant sun, they could not see the flame, though its burning power was good. I backed up Jennings' description, and gave them a similar exhibition to their very great satisfaction.

I referred just now to a conversation in "Chinook," which was a jargon said to have been devised by some Hudson Bay Company voyageurs, and which all travellers in this country used, when I first came to British Columbia. It consisted of about 200 (?) words, mostly French, a few English, a few Spanish and some Indian words. It was most useful, for I have had, in one party, men who spoke only French, others only English, others Spanish (Mexican packers) and Indians of two different tribes. That is, five languages in a party of twenty or twenty-five, and our "official" language was Chinook.

During the years 1876-1878 explorations and surveys were made continuously under my charge through all the Passes in the Cascade Mountains, from the Pacific Coast towards the Yellow Head Pass, and the route from Burrard Inlet, via the Fraser and Thompson Rivers, was selected as the most favourable.

Exploring the Peace River District

But in 1879, the Minister of Railways, Sir Charles Tupper, and the Chief Engineer, Sir Sandford Fleming, determined to put off construction for a year, for various reasons, and in the meantime make as complete an exploration of the Peace River country as was possible in one season, examining it from various points of view — as to the obstacles in the way of railway construction, as to its suitability for settlement and agricultural pursuits, and as to its mineral possibilities from a geological standpoint, before actually letting contracts for the work of construction on another route, and so fixing the location, irrevocably.

In carrying out this idea, I had the honour of leading into that country, a party of most distinguished men: Rev. D. M. Gordon, who was till lately Principal of

Queen's University at Kingston, the late Dr. G. M. Dawson, assistant director of the Geological Survey with Mr. McConnell, his assistant, who was afterwards director of the Geological Survey, also Mr. H. A. F. Macleod, who with myself, was to report more particularly on the engineering features of the ground we traversed.

We came from Ottawa to San Francisco by rail, thence to Victoria by boat. There I chartered the "Princess Louise," a steamer belonging to the Hudson's Bay Company, which took us to Port Simpson, the natural outlet for a line from the Skeena River Valley, and one of the finest harbours on the Pacific Coast of Canada. Thence we proceeded across the country, by canoes on rivers and lakes, and on foot over mountain trails, etc. to Fort Macleod, on Crooked River, a small tributary of the Peace.

At Fort Macleod we patched up an abandoned boat of the Hudson's Bay Company, caulked the seams with leaves, etc. and drifted down the Crooked River, the Parsnip and the Peace to Rocky Mountain portage—about one hundred and fifty miles—one man baling all the time. At the other end of the portage (opposite Hudson Hope) we made a raft and drifted on it nearly one hundred and fifty miles further, to Fort Dunvegan, where we scattered.

The slopes of the valley facing the South, are generally devoid of timber, but largely covered with bushes bearing berries, which at the time of our passing were just ripe, and bears of all varieties had gathered there to feed on them. In drifting on a boat of raft, we made no noise and had an opportunity to see them at close range. I remember being struck with admiration at seeing a large grizzly, lying on her back and playing with two cubs, as I have seen an acrobat at a circus, tossing a child about.

From Fort Dunvegan, we scattered — Mr. Macleod and I hired the few horses, (six), which the Hudson's Bay Company had, to carry our provisions, and travelled South about fifty miles to, approximately, the place now known as Grande Prairie, all the way through excellent land. There we parted, he going West and I going East.

I crossed Smoke River and its branches to Sturgeon Lake where there was a band of Cree Indians, and then to Lesser Slave Lake, passing through a country, all of which was fit for cultivation and settlement if the climate should not prove too rigorous.

From Lesser Slave Lake we returned to Dunvegan by the regular Hudson's Bay trail, crossing the Peace at what is now known as the town of Peace River — but there was not even a single inhabitant there at that time.

We reached Lesser Slave Lake on a July evening, and in front of the Fort, at the head of the Lake, there is a large flat, flooded at times, on which grew coarse grass — on this were several mowing machines at work, also horse rakes, and men stacking the hay, as well as some milch cows grazing, and all this, seen in the light of the setting sun, seemed to me, after some months in the wilds, to be one of the most peaceful and beautiful scenes I had ever witnessed.

The country from Peace River Crossing to Dunvegan was over a plateau of indefinite extent, at an elevation of several hundred feet above the Peace River, and all of it fit for settlement.

All the way from Lesser Slave Lake to Dunvegan, a distance of perhaps one hundred and twenty miles, we did not meet a human being at that time, nor in all that country, except about three Indian families and those Crees at Sturgeon Lake.

All the members of our party assembled again at Dunvegan, early in September and made a joint report, which was wired to Ottawa from Battleford, the nearest telegraph station. And we then each took up our journey for home, breaking up the best informed, most congenial and happiest party, with which it was ever my good fortune to be associated.

One of the Pioneers

Before leaving the subject of my Peace River trip, it might not be amiss to mention my meeting there with an Irishman, who assisted me for a few days while making my way southward from Hudson's Hope on the Peace, across a couple of spurs of the Rockies to Pine River.

He was an intelligent and educated man and, sitting round our camp fire at night, we had reminiscent chats, when he told me that he had been adopted and brought up by a maiden aunt in Ireland. But when grown up to man's estate, he decided that he was not adapted for an old maiden lady's pet, and so came to British Columbia with the rush to the Cariboo Gold Mines, about 1860.

He mined in many of the camps, doing fairly well, but acquired bad habits — and despite good resolutions, returned to them again and again, and was going down hill. So he decided to retire to the wilds and live by hunting and trapping, far from temptations.

When I met him he had a nice little shack about the size of a ship's cabin and, having some tools, he had made it comfortable, clean and neat. He had a good supply of provisions, ammunition traps, etc. also a net with which he was catching white fish in a nearby lake and drying them as feed for his dogs, during the coming Winter.

Once a year he went out to the banks of the Peace River to meet a trader, sell his furs and lay in supplies for another year, and he suggested to me that he was now living an abstemious life, like a gentleman, and without temptation.

In my official report of this trip I commenced with an itinerary and mentioned his surname only (Mr. Axxxx) as one who had assisted me, and then went on to describe the country.

Some three years afterwards I had a letter from a newspaper editor, who had read the report, and had come to this country in the Cariboo days, with a young Irishman of that same name, whose aunt was now old, in bad health and anxious to be reconciled to a long lost nephew, if he could be found.

I had his receipt for money, with his signature, still in my note book, tore the page out, sent it to his friend the editor, and he turned out to be the very man wanted.

Through the kindness of some of the Hudson's Bay Company officials, we found him, after a two years' search. He went back to Ireland, was with the aunt for some time before her death, and she left him a competency.

My newspaper friend told me, many years after, that while in Ireland, he again fell into bad habits and had come back to British Columbia and gone once more to Peace River, to lead the life of a hermit, free from temptation.

I have mentioned him as a type, with several of whom I came in contact, at odd times in the mountains, who could not trust themselves to live among their fellows.

In 1917, after a lapse of just thirty-eight years, it was my privilege to visit this country again, and to travel by railway in a sleeping car from Edmonton to Peace River and shortly afterwards to travel by motor from there to Dunvegan. In all this motor trip from Peace River Crossing to Dunvegan and on to Spirit River (formerly known as Ghost Creek) there were good country roads, for we made ninety miles in about seven hours, and all the way was through, or in sight of, wheat fields — and the houses were sufficiently close to each other to support schools at reasonable distances.

This was a wonderful transformation in thirty-eight years, and on this latter trip, I was permitted to descend the Peace River some three hundred miles farther North, on Lord Rhondda's boat, the "D. A. Thomas" to Fort Vermillion, and found the country for all that distance, as fertile as that round Dunvegan, and saw splendid grain crops raised at the experimental farm at Vermillion.

I returned to British Columbia by the Pine River Pass, with a pack train of about thirty animals. We had been delayed by various causes and only reached its summit October 1st 1879. There we were caught by a fall of snow, which ended the feed for our poor animals, with still two hundred miles to go, except for one night on a prairie covered with lupins, which stood above the snow.

On reaching the Nechaco River, we obtained a boat and taking most of our baggage, descended it and the Fraser River, for over one hundred miles with ice forming along the shores, and ran all the rapids without a pilot, except the Fort George Canyon, till we reached civilization at Quesnel Mouth.

Building the Canadian Pacific Railway

In the end of 1879 the Government at Ottawa decided to adopt, as the route for the Canadian Pacific Railway, a line through the Yellow Head Pass and via the Thompson and Fraser Rivers to Port Moody on Burrard Inlet, and at once called for tenders for the construction of that portion, extending from Emory's Bar, five miles west of Yale (the head of river navigation) to Savonas Ferry, at the outlet of Kamloops Lake (the beginning of inland navigation) a distance of one hundred and twenty-eight miles.

This was devided into four contracts, and I, having been identified with the canyons of the Fraser, which had been pronounced by some prominent engineers as impracticable for a railway, was given charge of Contract 60, which embraced those canyons.

The work was allotted to the lowest tenders, which were all by Canadians, but before construction was actually commenced, they were severally bought out by Andrew Onderdonk, a young man from the United States only about thirty years of age, a clever engineer, of excellent organizing ability, who had splendid financial backing.

We, the engineering staff, came from Ottawa to British Columbia via the Union and Central Pacific Railway and by boat to Victoria, which was the only available route at that time.

As soon as snow had gone, at the end of April, we proceeded to Yale to locate the line and lay out the work.

Up to that time, we had been given as our standard, a maximum of four degree curves and one per cent grades, except in one or two special cases, where we might be allowed to consider something sharper and report on them.

We had located about two miles, with the above as a standard, when I received a telegram from the chief engineer to "locate the cheapest possible line, with workable curves and grades."

I stopped the survey at once and with Mr. T. H. White, my principal assistant (who is now chief engineer of the Canadian National Railway in British Columbia) spent a day examining the ground at sundry critical points, and adopted eight degree curves as our maximum, with one per cent grades. The conformation of the ground was such that steepening of grades could not reduce the work much, but sharpening of curves could do wonders in avoiding tunnels and other expensive works, and we considered eight degree curves the sharpest we were then justified in adopting for a transcontinental line.

In order to reduce the amount of excavation we in many places built the line along the face of bluffs where there was good foundation for walls, but no building stone available till it should come by train, so trestles were built with steps cut in the rock for the posts. We built many such, with the outer post thirty or more feet in height and the inner one very short, or perhaps without a post at all, but the end of the cap resting directly on the rock.

There was a special design made for each bent of every trestle and, though some of them were not replaced for ten or twelve years afterwards, not one of them ever failed or caused an accident.

Labour Difficulties

One of Mr. Onderdonk's greatest difficulties was the shortage of labour. Employment agents in San Francisco sent up men who had never done a day's work before, and we often saw broken-down bar-keepers, or men of that class, in cuttings, with fashionable but shabby clothes and perhaps patent leather shoes. So early in 1882 he had two ship-loads of Chinese coolies sent over to the work, one thousand in each ship, and coming as they did in sailing vessels in Winter, they had to be kept below decks the greater part of the time with the hatches on. On reaching the railway, they looked well and in good condition but after a few days work many developed scurvy, the result no doubt of bad ventilation on board ship, and I am confident five per cent of them, or more, died. As soon as a man was taken ill his comrades would not touch him, or wait on him, consequently very few recovered. His friends would not even bury his body ; that had to be done by white men.

Contract 60 was completed early in 1884, and my work for the Government came to an end. I at once, however, entered the service of the Canadian Pacific Railway Company and took charge of construction from Savona, eastward.

I had then been ten years in the service of the Government, in British Columbia, on the explorations and surveys for the selection of a route, and on construction, and had the pleasantest relations with my Chiefs, Hon. Alexander Mackenzie, Minister of Railways till 1878, who loved to be talked to, and so saved the trouble of studying reports, my dear old Chief, and life long friend Sir Sandford Fleming, and later my dear friend Sir Collingwood Schreiber.

The track from the West was connected with that from the East at Craigellachie, three hundred and fifty miles from Vancouver, on November 7th, 1885, but it was not opened for traffic till July 1886.

At the driving of the last spike, by Sir Donald A. Smith, there were present, as the British Columbia contingent, Marcus Smith, representing the Dominion Government; M. J. Haney, representing Onderdonk, and Major Rogers and myself, representing the Company's work Eastward through British Columbia.

Extension of the Canadian Pacific to Coal Harbour

Early in 1886, the Railway Company decided to extend the line from Port Moody, the Government terminus, along the shores of Burrard Inlet to Coal Harbor, where the City of Vancouver was afterwards laid out and built, and this extension came under my charge, as engineer of the Pacific Division, which was most gratifying to my personal vanity, for the following reason.

In 1877 while I was in charge of a survey of the line from Yellow Head Pass to Burrard Inlet, the chief engineer, Sir Sandford Fleming, applied to the Admiralty for reports on the various terminal ports in British Columbia, which it was possible to reach with a railway line, and more particularly on Burrard Inlet. These reports were to be by some of the naval officers who had charted the Coast, many years before, and were then, most of them, on the retired list with the rank of admiral. The naval officer (admiral) then in command at Esquimalt was also asked to report on these harbours. He consulted with people on Vancouver Island who were personally interested in, and partisans of other routes, and by their advice he made a trip to Yale and the Fraser Canyons, and reported that he had inspected that line and could state from personal knowledge, that it was impracticable for a railway. Also that he had been advised to the same effect by prominent engineers and that it was therefore useless to report on Burrard Inlet as a terminal harbour for that line, so he passed it over without a report.

It was, therefore, must gratifying to me, whose opinion as to this harbour and route had been treated slightingly by so prominent a person as the admiral on the station, that I should have charge of the extension of the line to this place and the building of the first wharves and terminals.

I continued as engineer of the Pacific Division of the C. P. R. from 1886 to 1903, and superintended the replacement of the wooden bridges by steel and masonry — and most of the trestles by fills with walls where necessary, and have finally retired from the service in 1920, having been over sixty-seven and a half years at work, and having had the happiest and most interesting life which was possible, and for which I am duly thankful.

As most of those under whom I served on the Canadian Pacific Railway are still in charge of the destinies of that Company, it would hardly be fitting in me to refer to them or say how highly I appreciate them.

The Development of the Steam Engine in the Maritime Provinces of Canada

D. W. Robb, M.E.I.C.

Although Nova Scotia, New Brunswick and Prince Edward Island, the Maritime Provinces of Canada, are more widely known for the extent and importance of their fisheries, lumbering, mining and some departments of agriculture, particularly apples, potatoes, etc. than for mechanical and engineering achievement, it is interesting to find that in the early development of steam engines for steamers, locomotives, and later in connection with electrical apparatus, a department of engineering which has contributed more towards the rapid progress of the world during the nineteenth century than any other; the little provinces by the sea were among the first on this side of the Atlantic.

When we remember that the first practical steam engines were built by Watt from 1775 to 1800 and that we are only now celebrating the centenary of Stephenson who started the steam locomotive on its triumphant career, it may surprise many of us to find that as early as the years 1844-48 and 1854, John Waring and John Smith, pioneer engineers of St. John, N.B., designed and built marine engines for steamers running on the

---

Advance proof of paper to be read before the Eighth General Professional Meeting at Halifax, October 14, 1920.

St. John River. Stationary engines were built by Fleming & Humbert at St. John, N.B. as early as [illegible] and locomotives were built by Mr. Fleming before [illegible]. One of Mr. Fleming's locomotives hauled a train for the late King Edward, then Prince of Wales, when he visited Canada in 1860.

It may be interesting to give a few particulars in regard to the steamers and engines referred to above. I am indebted to Captain R. Retallick of St. John, who has sent me, through Geo. H. Waring, grandson of John Waring one of the pioneer engine builders referred to above, the following particulars:

The steamer "Reindeer," for service on the St. John River, was built in 1844. Her engines were compound, the high pressure cylinder being horizontal with Stephenson link motion and the low pressure cylinder oscillating. Captain Retallick states that this was the first compound engine that was run successfully, (probably he means for marine service), but it must have been among the first compound engines built for any purpose. This engine was designed by Tippitts and Waring—built by John Smith at St. John, N.B., and must have been of good design and construction as it was transferred to the steamer "Antelope," also a river boat, in 1861 and later installed in the steamer "Admiral," which was broken up in the year 1915, so that this engine passed the scriptural "three score and ten".

The steamer "John Waring" was built in 1848 at Woodstock, N.B. by Mr. McConnel. The engines were built by John Waring and had two high pressure cylinders. The boat was a side wheeler as the water is very shallow at Woodstock. The "John Waring" was launched under steam and came direct from Woodstock to Indiantown, just above the reversing falls at St. John, about 140 miles. She was considered very fast.

The next steamer, Captain Retallick states, was the "Anna Agusta" built at Fredericton. The engine was a horizontal low pressure, or single cylinder engine, placed on one side of the boat with the boiler on the opposite side and was built by Fleming and Humbert of St. John. She was a side wheeler also.

One of the earliest steamers was the "St. John" built at East St. John. She was a side wheeler. The engine was built by John Smith. Captain Retallick says it, (the reciprocating part of the engine), looked like a saw mill gate or sash moving up and down. This boat was launched under steam and managed to paddle around into St. John Harbour under her own power, but the hull was so full aft, that she would not steer. Later, after a new stern was added, making her about 24 feet longer, she worked satisfactorily.

George Fleming of Dysart, Scotland, who served his apprenticeship at Dunfermline, grandfather of the present owners of the Phoenix Foundry and Locomotive Works, established at St. John in 1835, and built quite large marine engines for service on the St. John River, Bay of Fundy, and later for the Prince Edward Island service—two of these boats, the "Rothesay" and "David Weston" for river service were famed all over Canada for their speed. The old records of the Company show that Mr. Fleming supplied an engine to Brazilian [illegible] in [illegible], price [illegible] pounds, and in 1840 an engine and mill [illegible] for [illegible] pounds and an engine for George Younger, price [illegible] pounds. The Flemings are said to have built the first steam fog whistle used in any part of the world, which was designed by a St. John man, and was placed on Partridge Island, St. John Harbor.

In the early sixties and seventies, a number of well known engineering concerns in the Maritime Provinces built stationary steam engines for the many large saw mills in New Brunswick and Nova Scotia, as well as for factories, mines and various other purposes. Among the most prominent of these may be mentioned, Geo. Fleming & Sons, John Smith, Harris & Allen, and Allen Brothers of St. John. The Pictou Foundry, established by Mr. Davies, Sr., in [illegible], who came from the old country as Master Mechanic of the General Mining Association.—J. Matheson, formerly located at Chatham, N.B., and later at New Glasgow, and his son W. G. Matheson. The Truro Foundry and Machine Company. The Burrell Johnson Iron Works of Yarmouth, N.S. which built tug boats and small steamers, marine engines of considerable size, Waterworks engines, etc. The Montgomery Iron Works at Halifax and Moir Symonds. The Montgomery company built a few locomotives which were used on the Intercolonial Railway.

From [illegible] to [illegible] the use of electric power for lighting, tramways and other purposes began to develop extensively in the United States and to some extent in Canada. Among the first to foresee and take advantage of the increasing demand for improved high speed engines suitable for driving electric dynamos direct from the engine shaft, was the Robb Engineering Company of Amherst, N.S. This concern, working in collaboration with the General Electric Company, Westinghouse Company and other manufacturers of electrical apparatus, succeeded in producing combined steam engines and electric machines in compact form, adapted to the various services for which electricity was required. The first of these engines was designed and built by the Robb Engineering Company at Amherst, N.S. in 1890-91 under the direction of E. J. Armstrong, who was a pupil of the late Professor John E. Sweet of Syracuse, New York, one of the best known designers and builders of high speed engines and a great educationist in mechanical engineering.

Mr. Armstrong was able, during the few months he spent at Amherst, through his thorough knowledge of the inter-changeable system used in building high speed engines and his natural ability as a draftsman and shop instructor, to organize a department of the Robb works so that they were able to build, with Maritime Province boys, engines for electric service which were equal to the best produced in the United States or elsewhere. He also enabled this Canadian shop to develop its own steam engineering and drafting departments in which engines were designed and supplied for electric work, not only throughout Canada, but, being among the first in this field, was able to furnish engines of this type to Great Britain, Spain, Australia, India, South America, British Guiana and several of the West India

Islands. The exceptional compliment was paid to these works of receiving an order for a compound electric engine for use and educational purposes in the Manchester Technical School at Manchester, England.

The steam turbine has to a considerable extent, supplanted the reciprocating steam engine for large electric units where steam furnishes the motive power. Oil and gas engines are making considerable headway for the smaller units and to some extent for marine use.

The tremendous development of water powers in Canada has also restricted the use of steam engines for electric production, but as yet the marine field is to a very large extent held by the steam engine. In passing it will no doubt be of interest to mention that the triple expansion engines to be installed in Nova Scotia's two largest ships, 8100 tons each, were built at Amherst. One of these ships the " Canadian Mariner " was launched from the Halifax Shipyards on the 4th of September and the other is well advanced in construction.

There is no doubt that steam engines will continue to be built and used for ship propulsion for some time to come, or until the rapid changes constantly taking place in engineering construction bring forth something better or more efficient and economical.

Concrete in Alkali Soils and Waters

A. S. Dawson, M.E.I.C., Chief Engineer,
Department of Natural Resources, Canadian Pacific Railway.

The action of alkali soils and alkali waters on concrete is not a recent development, and is one of extreme importance, not only to engineers and chemists, but to all governments, corporations, and individuals, whose money is being used in the construction of works in districts where certain conditions exist.

The question was studied some fifty years ago by members of an International Association of Testing Materials, on the coasts of France and Algiers. It has been discussed in the United States for some fifteen years by the American Society of Testing Materials, the American Society of Civil Engineers, the Bureau of Standards, and the United States Reclamation Service, as well as by some universities and engineers specializing in concrete work.

In Western Canada the subject is of still more recent birth, and has had the attention of many interested parties since about 1913.

The general effect of these investigations has not been to condemn concrete as a structural material, but in some measure to confine it to its proper field, and to prevent its mis-use. Concrete has been found so generally serviceable and beset with so few disadvantages, that its use has been generally recommended without any reservations.

Actual results have, however, proven conclusively that concrete has its limitations as a structural material, where certain ground and water conditions are known to exist.

In 1918, the subject received considerable attention at a Professional Meeting of the Western Branches of *The Engineering Institute of Canada,* at Saskatoon; and the writer then presented a paper on behalf of a Committee appointed by the Calgary Branch of *The Institute.* This paper is also written on behalf of that Committee.

Read at the Western Professional Meeting, Banff, August 16th, 1920.

Causes of Disintegration of Concrete

The general usual causes of the disintegration of concrete may be summarized as follows:—

(1) Bad workmanship.
(2) Poor and unsuitable materials; and badly graded and proportioned mixtures, including the amount of water used.
(3) Alternate wetting and drying out, and alternate freezing and thawing out.
(4) Destruction and removal of the protecting outer skin from various causes.
(5) The presence of an excess of alkali salts.

It is unnecessary to mention the effects of frost before setting, the erosion of the outer skin by excessive velocities and other mechanical agencies, which to a great extent can be provided against during construction and subsequently, by various well known methods.

This paper deals primarily with the effects on concrete of alkali soils and alkali waters.

Origin of Alkali Salts

First, a brief summary of the origin of alkali salts will be of interest to members who may have forgotten some of their earlier knowledge of chemistry.

The "Alkalis" as they are called, are carried into the soil with the other elements which form its inorganic bulk by the pulverization of rocks and minerals; by the decomposition of inorganic sediment held in solution by water; by glacial action; seepage from rivers and numerous other sources.

Alkali in the popular sense is a term used to designate the soluble salts that have accumulated in the arid and semi-arid regions. In the humid districts these salts are leached out of the soil, and removed through natural drainage channels.

Oxygen acts on potash, soda, lime, and magnesia and forms what are known as the "alkali bases".

Oxygen unites with potassium and forms potash.

Oxygen unites with sodium and forms soda.

Oxygen unites with calcium and forms lime.

Oxygen unites with magnesium and forms magnesia.

But—

Oxygen unites with silica and forms silicic acid.

Oxygen unites with carbon and forms carbonic acid.

Oxygen unites with phosphorus and forms phosphoric acid.

Oxygen unites with sulphur and forms sulphuric acid.

These acids, called metallic and mineral acids, have a great affinity for the alkali bases forming "salts"; and this is where the whole trouble with alkali soils begins.

These mineral or metallic acids attack the alkaline bases with the following results.

Silicic acid forms silicate of potash, soda, lime, and magnesia.

Sulphuric acid forms sulphate of potash, soda, lime, and magnesia.

Carbonic acid forms carbonate of potash, soda, lime, and magnesia.

Phosphoric acid forms phosphate of potash, soda, lime, and magnesia.

The salts usually present in greatest amounts in the soils and waters in the middle West, are the sulphates, carbonates, and chlorides of sodium, magnesium, and in a small degree the calciums.

It is the carbonate of soda, or what is commonly called sal-soda which forms what is generally termed "Black Alkali", and the sulphate of soda commonly called "Glauber Salt" which constitutes what is termed "White Alkali". Numerous other salts are of course formed by combining the alkali bases and the mineral acids, but these are not so important in this connection.

When water is brought into the question, the distribution of these salts is largely aided by the fact that the alkalis are extremely soluble in water. When these solutions are brought to the surface evaporation takes place, and an accumulation of alkali salts become evident.

Importance of Sulphates and Chlorides

Chemists have as yet been unable to agree on the determination of the exact reactions which are the cause of the disintegration of concrete; but investigation has shown that the sulphates and chlorides appear to be by far the most active salts found—and it is generally now admitted that magnesium sulphate, magnesium chloride and sodium sulphate are the most active salts found in alkali soils and waters.

The magnesium sulphate acts on the calcium hydrate of the cement, forming calcium sulphate, and the latter combines with the alumina of the cement, forming calcium sulpho-aluminate, whose crystallization gives rise to swelling and cracking in the material, and a corresponding destruction of all cohesion. Similarly, sodium sulphate combines with the calcium hydroxide of the cement, forming soluble sodium hydroxide. This also brings up the question of the difference in the susceptibility of various cements to these destructive agencies.

Action of Ground Water

It has been determined by several chemists that the action of the ground water seems to be a chemical change—converting the lime of the cement into a sulphate and carbonate, accompanied by the removal of silicic acid, alumina and lime, and usually destroying the cohesiveness of the concrete.

The formation of sulphates of lime and aluminates of lime, results in an immense increase of volume, and a corresponding total destruction of all cohesion.

To offset this, the magnesium hydrate may have a tendency to fill the pores of the concrete, and in this and other ways, may gradually become more impervious,—thus checking somewhat the disintegrating effects.

A working theory generally now accepted, is as follows:—

The chemical reaction of alkali that is destructive to cement work is a double decomposition between the various alkali salts and calcium hydroxide, the latter being an unavoidable constituent and probably the binding constituent of all set cement, whether the cement is classed as "Portland", "Natural," or "Slag". This reaction removes a greater or less amount of the calcium hydroxide, the amount depending upon the salts present, the concentration of the solution, the rate of percolation and imperviousness of the cement, and the solubility of the reaction products; and deposits in its place, in most cases, a molecularly equivalent amount of other compounds, which have good cementing properties, but occupy more space than the calcium hydroxide. This increase of space occupied disrupts the cement, causing it to bulge, crack, and crumble.

Analysis of Alkali Action

The following conclusions are now generally accepted.

I. The disintegration of cement by alkali salts is principally due to reactions between these salts and the calcium hydroxide necessarily present in set cement.

As a result of these reactions, relatively insoluble new compounds are formed in the body of the cement structures.

It has been shown that these new compounds have greater weight and require greater space than the calcium hydroxide replaced.

In order to obtain the necessary space the new compounds force apart the particles of the cement, thus weakening or breaking the binding material.

1. The compounds resulting from these reactions with the various destructive salts are as follows:

a. With sodium sulphate the resulting compounds are sodium hydroxide, which is soluble and therefore is removed by leaching, and gypsum, which is relatively insoluble and therefore accumulates in place of the calcium hydroxide.

b. With magnesium sulphate the resulting compounds are magnesium hydroxide and gypsum, both of which are insoluble and accumulate in place of the calcium hydroxide.

c. With sodium carbonate the soluble sodium hydroxide and the insoluble calcium carbonate are formed. In this case there is little increase in the space required, but the silicates and aluminates are also attacked and dissolved. This solvent action is especially marked upon the silica. This loss of silica must weaken the cement; but there is little, if any, crumbling due to expansion.

2. The additional material, requiring increased space, consists in part of dry matter and in part of combined water, which is taken up by the cement during its exposure to the alkali solutions.

a. This increase in dry matter is brought about by the formation of the sulphates, magnesium hydroxide, and carbonates, as shown by the reaction given in paragraph 1, a, b, and c.

b. Part of this increased amount of combined water is due to the fact that the new compounds, gypsum, magnesium hydroxide, etc., require more water for crystallization than did the calcium hydroxide which they replaced. This further assists in the disruption of the cement.

c. A part of this increased amount of combined water is due merely to the continued action of water upon the incompletely hydrated cement. This amount should serve to set free more calcium hydroxide, and thus to a certain extent repair the damage due to loss of binding material and to expansion.

II. A certain weakening, not a disruption of the cement, is due to the loss of a portion of the binding material, crystallized calcium hydroxide, which is merely dissolved and removed in solution.

III. In order for destructive action to become marked, the alkali solutions must percolate through the cement work, or at least must penetrate beyond the surface.

IV. When the action is strictly confined to the surface, as when briquettes of neat cement are immersed in a still solution, the tensile strength may be increased. In such cases the expansive action closes up the pores, making the surface more nearly impervious and preventing the alkali from penetrating further.

V. When cracks are started by the expansive action, due to alkali salts; wetting and drying, or freezing and thawing, will hasten the destruction of the cement, by extending the cracks already started.

Preventive Measures

VI. Any measures that hinder the penetration of the alkali solutions into the interior of the cement will delay the destructive action. For this purpose both soap and aluminum sulphate have been tried, and have been found to afford some protection. The soap, however, in itself had a slightly injurious effect on the tensile strength of the cement.

The efficiency of these and of other water-proofings is being further studied, and results may be expected later.

The mixing of cement in weak solutions of sulphuric acid, di-sodium phosphate, magnesium fluoride, and oxalic acid has been shown by laboratory tests to increase the alkali-resisting qualities of concrete. The effects of most of the alkalis have also been shown to be less pronounced on neat cement briquettes than on sand cement briquettes, and in fact somewhat proportional to the amount of sand used.

Conditions Found in Practice

In practice, the worst conditions are generally found on types of structures whose design has necessitated their being backfilled on one side, and subjected to ground water from the same direction — and at or below the original ground surface. These conditions seem to be aggravated where the structures are subjected to dry and wet surroundings — exposed to sun and shade during the winter months, — and where alkali salts are most in evidence, and the ground wet. The facts that the deterioration starts on the surface extending inwards, and that the water being carried by the structures has analytically been shown not to be responsible for the trouble, would indicate that the deterioration was primarilly caused by the ground water and its effects on the concrete. These effects vary in a degree from the surface spalling off in what results in a pile of loose gravel below— to a condition where the mass becomes of a slimy consistency, like so much lime mortar, and mud. As a rule samples in what might be termed an intermediate stage get harder if permitted to dry out in the air — when they become coated with white powdery salts.

Either the disintegration is due to soluble compounds which are leached out of the concrete leaving it inert, or it is due to the disruption caused by the crystallization of the salts in the pores, or by chemical action of the substances in solution with the constituents of the concrete.

Any conditions which will tend to carry the salts from the soil, to the concrete, will hasten the disintegration action and lessen the percent of alkali necessary to cause destruction.

A volume could be written on the chemical phases of this subject, and it would all be interesting; but as previously stated, this paper deals primarily with the experimental work done to date by a Committee of the Calgary Branch of *The Institute*.

Experimental Work by the Concrete Committee

In October 1918, 270 concrete blocks and 180 cylinders were made at Calgary, under close supervision.

These blocks were moulded in wooden gang moulds, 10″ x 10″ x 30″ long, and the cylinders in steel moulds, 8 inches in diameter and 16 inches long. Two hundred and sixteen blocks were made, using Western Cement, and 54 from Owen Sound Cement. All were carefully marked for identification purposes.

All materials used were analyzed physically and chemically.

The gravel was from what is known locally as the Carseland Pit, a well graded, bank-run material. The water was from a City of Calgary main. Samples of soil and ground water were procured from each hole in which a specimen was placed.

The blocks were made in three series.

(A) Screened, sized and washed. The sand was supposed to grade uniformly from fine to coarse — not to exceed 40% by weight passing a No. 50 screen, and not more than 30% by weight passing a No. 100 screen, and the voids were not to exceed 35%.

The gravel was supposed to be uniformly graded in sizes from ¼" to 2" in diameter, and the voids not to exceed 40%.

(B) Bank run material, washed.
Bank run material unwashed.
Each series of blocks were made in two mixes.
First, 1 — 2 — 4.
Second, 1 — 1½ — 3.
Of each mix, three blocks were plain.
Three were treated with two coats of soap and alum.
¾ lb. of castile soap, per gallon of water, heated to 180 deg. F.

2 oz. of alum to one gallon of water, heated to 100 deg. F.

1 coat of hot alum solution.

1 coat of hot soap solution.

1 coat of hot alum solution, after 24 hrs., all well brushed in.

Three were treated with water gas tar and coal gas tar as follows:—

First coat, refined water gas tar of thin consistency.

Second coat, same, and immediately after the first.

Third coat, refined coal gas tar, applied hot, after coats one and two, were well soaked in.

Fourth coat, same as third, after third coat set.

The blocks were taken from the moulds in 48 hours and cured for 28 days, after which they were placed in the ground 22 inches, with 8 inches exposed, at the following points:

(1) On top of a high hill in Calgary, where no alkali conditions were likely to exist, and where there would be no ground water in contact with them.

(2) Near a sewer, in a low lying plot of ground, in Burns-land, Calgary, generally wet, and where alkali conditions had given evidence of being bad.

(3) At Strathmore, in a low lying plot, once a slough, where alkali conditions seemed bad, and where they would probably be wet most of the time.

(4) Near Brooks, in a low lying place, where the alkali conditions were apparently very bad, and where they would be wet most of the time from seepage water from an irrigation ditch.

The cylinders which were all made of Western Cement, were buried at the foregoing points, and 62 were placed in the Calgary City Hall Laboratory.

Conclusions to Date

1st. Laboratory test cylinders are all relatively lower in strength than field tests because of the difficulty of maintaining a uniform degree of moisture.

2nd. The blocks and cylinders located in the Calgary district show no disintegration as yet because of the fact that the ground conditions were relatively much dryer than normal.

3rd. The blocks at Cassils show a much greater disintegration than those at other locations because of the greater concentration of soil solutions. Those at Strathmore show the next greatest degree of disintegration, because of less concentration of soil solutions and possible drying out at certain seasons.

4th. In a concrete of high density, where absorption of the alkali ground water appears to be mainly at the surface of the concrete, the action appears to be relatively slow and is largely in the nature of surface action, gradually extending to the interior.

In a concrete of low density and relatively high porosity the action is more rapid as it appears to take place simultaneously throughout the structure.

The more porous concrete is subject to the action of other disintegrating forces of a physical nature, such as frost action and the crystallization of salts in the pore space.

A dense concrete mixture, through some property not determined, such as low percentage of pore space or the character of this pore space, results in a greater resistance to the action of the alkali ground water. Apparently this is true in either mixture 1-1½-3 or 1-2-4. Chemical action takes place over relatively small distances, direct contact of the reacting elements being necessary. The more porous concrete allows this more intimate contact throughout the structure; and consequently more rapid action takes place.

5th. The presence of alkali soil solutions does not retard the setting of the cement.

6th. The action is undoubtedly more rapid in weaker mixtures and mixtures of low density.

7th. No apparent difference in results was found in blocks and cylinders made of Eastern and Western cements.

Continuation of Experiments

The investigations are being continued on several lines that may give further information.

Blocks after approximately twenty months curing in the Calgary district on which no alkali action has as yet become apparent, have been transferred to the Cassils location, and action of alkalis will be noted.

New blocks and cylinders are being prepared from gunite, and these after curing will be placed in the Cassils location and action noted.

Some tests are being made on waterproofing compounds at the present time.

The important practical phase of this matter is to have further investigation work carried on by competent chemists and engineers, working in close co-operation with one another; and in the meantime for all those concerned, to make use of the existing data, and take all possible precautions and remedial measures to prevent further deterioration to the existing works. In this connection the following points should be noted.

Desirable Features for Concrete in Alkali Soils

(1) Efforts should be made to get the densest possible mixture, and in this connection the smallest quantity of water consistent to good work should be used; in other words: a quaking mixture should be made of a workable mix i.e. to a consistency that will permit of the concrete flowing around the reinforcement with thorough puddling, and not so as to cause the finer particles to be carried to the top in suspension and the heavier ones to settle. About one gallon of water to each cubic foot of concrete in place is a fair average for a good mix.

(2) The best possible materials procurable should be used — and the best graded mixtures. All bank run material or river gravel should be screened out and remixed in proper proportions — based on proper tests made as to voids.

(3) It is desirable that all material should be washed, and it is almost essential that the sand should be washed; and in this connection it would be folly to assume that sands can be properly selected and passed on, without proper tests having been made on them.

(4) More care should be exercised in making field joints, using ½″ of 1 to 2 grout on the junctions between the old and new work.

(5) Where chutes are used, they should be on easy slopes and kept down to the shortest possible length.

(6) The time of mixing is an important factor, and it is now generally conceded that the best results are obtained from machine mixing for a period of about 1½ to 2 minutes continuous revolving of the mixing drum.

(7) Backfilling with sand and gravel with the coarser material next to walls and plenty of weep holes are all extremely desirable, and particularly on such types of structures as have been previously mentioned, and are more easily subjected to alkali conditions.

(8) Closer supervision of all work done, by men who really *know* the concrete business is essential.

(9) Proper seasoning and protection from the elements, and not too early removal of the forms. It is important to remember that the methods and operations adopted in mixing concrete, are just as important factors affecting its density, strength and permanence, as are the qualities of the materials used.

(10) The use of gunite and gun driven asphalt at normal temperature or heated are being tried out, and are both likely to prove effective methods — not only of damp-proofing and waterproofing, but of preventing the ill effects of alkali salts on concrete structures.

Extract from 'LIME AND CEMENTS', *second edition by Earnest A. Dancaster B.Sc., A.I.C., London Eng., 1920.*

Super-Cement

"A variety of Portland cement was introduced by Mr. J. F. Goddard in 1915 under the name of SUPER-CEMENT. This cement is manufactured from Portland cement clinker by grinding in with it treated gypsum instead of the ordinary gypsum used for regulating the setting time. Super-cement was originally intended to be a waterproof Portland cement, that is to say, an ordinary Portland cement to which material was added in order to render it waterproof, thus obviating the disadvantage of having to entrust the mixing of the waterproofing compounds to possibly careless or ignorant workmen. It was soon found, however, that the cement prepared in this manner not only produced a waterproof mortar, but the latter was also much stronger than ordinary Portland cement mortar, thus differing from the usual waterproofing materials, which tend to weaken the cement with which they are used. The increase in strength is specially marked in the case of cement and sand mortar, and the difference increases with time. This cement requires more water to produce a paste of 'normal' consistency than does ordinary Portland cement, and the mortar is both denser and harder. It is too soon to say definitely in what manner this addition of the treated gypsum acts upon the cement, but it certainly is neither a mere water repellent nor a pore filler. The main effect appears to be to bring about a more complete hydration of the cement particles. A number of tests with this cement have been carried out by the author, and also by others, and it has been found that the same clinker invariably yields a stronger cement when ground with the treated gypsum than it does when ground in the ordinary way.

The following tensile and crushing results were obtained by Messrs. David Kirkaldy & Son. Both the Portland cement and the Super-cement were made from the clinker, but the former was ground with ordinary gypsum and the later with the treated material.

Summary of Tests

Tensile Strength

Ordinary Cement

Neat cement. Gauged with 23% water.		3 parts standard sand, 1 part cement. Gauged with 9% water.	
Age 7 days	660 lbs.	Age 7 days	371 lbs.
" 28 "	843 "	" 28 "	425 "
" 90 "	806 "	" 90 "	453 "
" 6 mos.	872 "	" 6 mos.	845 "

Super-Cement

Age 7 days	746 lbs.	Age 7 days	408 lbs.
" 28 "	865 "	" 28 "	471 "
" 90 "	899 "	" 90 "	501 "
" 6 mos.	894 "	" 6 mos.	511 "

Crushing Strength

Ordinary cement. 1 : 3.			*Super-Cement. 1 : 3.*		
Age	7 days	[illegible] lbs.	Age	7 days	[illegible] lbs.
"	28 "	4470 "	"	28 "	[illegible] "
"	90 "	[illegible] "	"	90 "	[illegible] "
"	6 mos.	[illegible] "	"	6 mos.	[illegible] "

The tensile tests given below were carried out for the Author:

Tensile Strength

Ordinary Portland Cement

Neat cement. Gauged with [illegible]% water.			*3 parts standard sand, 1 part cement. Gauged with 10% water.*		
Age	7 days	592 lbs.	Age	7 days	263 lbs.
"	28 "	[illegible] "	"	28 "	314 "
"	90 "	[illegible] "	"	90 "	[illegible] "

Super-Cement

Age	7 days	703 lbs.	Age	7 days	398 lbs.
"	28 "	[illegible] "	"	28 "	[illegible] "
"	90 "	814 "	"	90 "	[illegible] "

This cement may truly be described as a waterproof cement. It is found that a slab one inch thick, made of a mortar composed of 1 part by weight of Super cement to one part of washed sand, will keep back water under a pressure of over 300 lbs., per square inch. The cement is also petrol proof, a similar slab having been found to keep back petrol under a pressure of 50 lbs., per square inch for 67 days. At the end of this period the test was stopped and the slab broken, when it was found that no penetration had taken place. Advantage has already been taken of this property, a number of storage tanks for petrol having been built with Super cement reinforced concrete at various aerodromes. It is probable that when this material becomes more widely known it will be not only universally used where ever waterproof cement work is required, but also in ordinary work where a high quality of reinforced concrete is desired."

It is not the purpose of this paper to attempt to discourage in any way the rapidly growing use of cement in its manifold forms of application, but rather with the belief that "Forewarned is Forearmed" by calling attention to the dangers which exist, and the necessity of taking all possible steps to avert trouble and financial loss.

The whole question serves as an illustration of the inter-relation of chemistry and engineering which exists on many of the Public Works being carried on at the present date.

Discussion on Western Concrete Conditions

Following the reading of his Paper on Concrete in Alkali Soil by [illegible] Dawson, M.E.I.C., at the Western Professional Meeting at [illegible]

By [illegible], M.E.I.C.

I was in Saskatoon when this question was discussed and I had the more or less honour on that occasion of giving our experiences in Manitoba. At that time I learned for the first time of the extent to which the work had been carried on in Alberta by the Calgary branch and I congratulated them then, and I wish to congratulate the Committee again on the work they have done, and especially Mr. Dawson on the very clear way he has put this subject to us. It is clear to me at least, but perhaps it is not so clear to those who are not familiar with, or do not realize the seriousness of the subject. I do not want to go into the matter in too much detail. There is some difficulty in deciding just how this subject can be tackled. People who are not interested in the subject do not seem to realize the seriousness of the matter and it is a very difficult thing to obtain their interest and co-operation. In Manitoba we cannot come before you with a description of any field experiments. We have not done any as yet, but unfortunately we have practical demonstrations which were carried on in spite of ourselves, which are exceedingly serious. Since the meeting in Saskatoon, we have had an experience on the new aqueduct and as this is a kind of a family gathering I think I am perfectly safe in speaking freely on it. I was appointed as a member of a Commission to look into the question about a year ago. Some of this structure has only been in the ground three years. A great deal of this aqueduct has been drained but this four miles was not under-drained. The particular section is eight feet pressure pipe, about eight inches thick in the barrel and was constructed in place. Some of the other parts are lock joint pipe construction. This pipe had been built by the use of metal forms, which as you know, necessitate the use of a bolt to tie the outside and the inside forms together. When the forms are removed, the bolt has to be taken out, which leaves a hole through the barrel; this is grouted up and the repair made. The first evidence was in one of these bolt holes. W. G. Chace, M.E.I.C., the chief engineer, noticed this condition and a repair was made, the surface of the pipe being plastered over and this is where the first action came. We inspected this area and found this action had gone on under the patch. I mentioned this for the reason that one of the members of the Committee went over it and made the assertion that the damage was solely on account of the patch. We went over the line and in some places there was no action whatever and other places it was very slight. About a year after, I mention the fact it was a year because it took a year before any action could be obtained from one of the Commissioners of the district, who were vitally concerned in the structure, on which they had spent so much money, a meeting of our Commission was held. At this meeting there were five members of the Commission and four of us were absolutely at one in our opinion it was a serious matter. One of the

Committee took absolutely the opposite ground and made a most wonderful display of demonstrating his position. He assured the Commissioners that when concrete was put into place, the action of the air had a certain oxidizing and put an armour around the surface, which was absolutely impregnable and assured them he knew it was all right and they need not worry at all. He told them the expenditure we four recommended was absolutely ridiculous and he said that the question of alarming them was a perfectly insane thing on our part. A member of our Commission, told the water Committee, that he had not the faith in this armour that this other gentleman had, and explained that doctors would assure patients that as long as they kept breathing they would keep alive, but a great many people died notwithstanding. He said, "That is our position in this matter", and he said, "This action is going on whether you believe it or not." Now in our municipal work in Winnipeg, there was a report presented by the Inspector of Sewers, and he has reported an enormous amount of alkali action in the city sewers. There are forty-four and a half miles of our sewers in Winnipeg just about ready to collapse. That is a frightful condition. I speak from personal knowledge of these things, a rather unpleasant knowledge I may say. I have been down in many of these structures and it really is a most disturbing condition. You can go along these large trunk sewers, put your hand right into the surface and go right through to the clay on the outside. When you consider the fact, that you cannot drain these structures and there is no way of getting at them, the problem is a very serious and a very difficult one. When this report was presented to the council, one of the aldermen, who was a former mayor of the City, got up and remarked, "This report we have received from our Superintendent of Sewers makes me tired. There is too much of this scientific investigation going on altogether." That is a serious thing to say. I have a letter on my file from an official of our province, I am getting personal here but I think I should, I have a letter on my file in my office, in which he does us the honour to say that our whole investigation is done with one object and that only, and that is to defend bad work. There is no such thing as alkali action, the whole thing is bad work, and we are trying to cover it up. You can see our difficulty.

The Committee of *The Institute* has been in operation for some little time. I think this is the first year it has been called a Committee of the Western provinces acting as an Institute Committee. Heretofore we have had our various provincial Committees. I am a member of our own, Mr. Dawson of Alberta and Prof. MacKenzie of Saskatchewan. Now we feel that this matter has got to be tackled on a thoroughly organized basis and we wish to present a statement of our attitude on the matter in the form of a resolution which we will put before the meeting and which will be open for discussion. We want to have the thing in shape so that we can transmit it to the council. This is the form in which we have expressed our feelings in the matter.

"That fifteen thousand dollars per annum for three years be secured for investigation purposes by specialists engaged to devote their entire time to work."

"That the existing committee be authorized by Council to make definite application for necessary funds from all interested bodies."

"That work be carried on under jurisdiction of existing committee who will act in advisory capacity."

"That Council be asked to ratify this manner of dealing with the problem."

I would therefore move this resolution. We have put it in this form so that it might be passed and that we might get the authority or at least the endorsement of this meeting. The resolution can then be transmitted to the council at *The Engineering Institute in Montreal.* (Applause.)

Prof. C. J. MacKenzie, A.M.E.I.C.: I take great pleasure in formally seconding that motion.

The Chairman: You have all heard the resolution. I do not think I need go into the details. The substance is that the sum of $15,000.00 be secured from the various parties interested in this work, that is, $15,000.00 per annum for a certain period, three years, this amount to cover cost of organized investigation.

All in favour of that resolution.

(The resolution was put to the meeting and declared carried unanimously.)

Some Notes on The History of Investigating Alkaki Action on Concrete

Discussion of Mr. Dawson's Paper on Action of Alkali on Concrete.

Professor C. J. Mackenzie, A.M.E.I.C.

I do not propose to enter into a detailed discussion of the paper we have just heard at this late hour, for as your chairman has suggested, a thorough analysis would take more time than we have available.

First, let me congratulate Mr. Dawson on his very interesting paper, which shows that he and his associates have done a large amount of investigation work and are well aware of the importance of the Alkali Problem. Mr. Dawson has told us that this problem has been recognized for the past fifteen years, and we know that the similar one of Sea Water Action dates back to a much earlier period, but on account of the fact that alkali action is restricted to the Western areas of Canada and United States, it has remained a comparatively local problem to the engineering profession, with the consequence that considerable confusion of ideas and misunderstanding has existed.

In the past there have been many men, reputable engineers and others, who contended that there was no such thing as Alkali Action on Concrete, and, due to the complexity of conditions for a long time we were not able to submit positive proof to the contrary. For instance, one structure would be found standing up under alkali conditions, while another would be materially disintegrated. Again on the same structure one portion would be affected while the remainder would be unaffected. Naturally this led to the contention that the disintegration was due to either bad workmanship, bad material, or both. But we may now say that the first phase of the investigation has been passed and I do not think that anybody who will go into the results of experiments available today, can deny that even a good, well made concrete will be affected by Alkali Ground Waters of certain concentrations.

In the past there were numerous engineers who made concrete of excellent quality which afterwards was badly disintegrated on exposure to alkali conditions. These engineers knew well that the concrete was of a high grade, but when asked by those who doubted the action, for the exact qualities of the concrete, were unable to submit strength tests, etc.

Our Saskatchewan Committee on Alkali started some investigation work over a year ago with the object of clearing up the above points if possible. Accordingly we mixed concrete blocks under rigid laboratory control in the shape of cubes of 12″ sides. These we exposed to actual field conditions in Saskatoon, and I have photos here today taken after one year's exposure, showing that in this short time concrete of far better than ordinary 1–2–4 concrete is being gradually disintegrated by alkali waters whose concentration is about 1%.

The other question of the doubters which needed answering was, "How do you explain the fact that a portion of your structure shows signs of disintegration while contiguous portions are unaffected?"

The answer to this is now available as follows. Disintegration is caused when the concentration of the alkali solution reaches a certain strength, and it has been clearly proved that the concentration in the ground varies, for some reason not yet determined, as much as 100% in only a few feet. We found that in the same trench one series of blocks was decidedly affected while only 25 feet away another series of equal and similar quality showed no effect whatever. Chemical analysis of the ground water at these two points showed that in the former the concentrations were 20 to 100% greater than in the latter. This clearly answers the above question. I should like to state here that Mr. G. M. Williams of the Bureau of Standards, Washington, who has done more work on this problem than any other investigator in America, pointed out the above conclusion previous to our own inspection.

Now that we have passed the first phase in this problem when we can say with assurance that even the best concrete if exposed to alkali action of sufficient concentration will be eventually disintegrated, we must look forward to the next phase which for a successful end must be participated in by both chemist and engineer, and I believe that it will be a major problem for both. The chemist will be asked to discover the exact reactions that take place and to provide, if possible, a remedy. The engineer must adapt all findings of the chemist to practice, investigate thoroughly the relative part played by grading of aggregate, consistency, mix, permeability, etc., and further, providing the chemist can find no remedy (and this is by no means guaranteed), the engineer must still carry on and evolve standards of practice for concrete work in alkali soils.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. October 1920 No. 10

Dates of Professional Meetings

The Eighth General Professional Meeting will be held in Halifax, October 13th, 14th and 15th.

The Annual and Annual General Professional Meeting will be held in Toronto on February 1st, 2nd and 3rd, 1921.

Remuneration of Engineers

The report of the Committee on Remuneration of Engineers of *The Institute*, presented to Council at the August meeting and published in the September Journal, shows a decided leaning towards the recommendation to adopt the report of the Committee on Classification and Compensation of Engineers of Engineering Council, issued under date of December 15th, 1919. Inasmuch as this report has not yet been published by *The Institute* and for the benefit of the members who have not yet seen a copy of it the many points of the report covering classification and compensation are reproduced. It will be seen that eight grades are recommended.

Professional Service

Grade 1.—Chief Engineer

Duties.—To act in chief administrative charge of a technical organization, or of a main division thereof; to determine the general policies of the organization under the limitations imposed by law, regulation, or other fixed requirement; to have final responsibility for the preparation or reports, cost estimates, designs, and specifications and for the construction, maintenance, or operation of engineering works or projects; to have full charge of the collection and presentation of data for and the conduct of valuation proceedings; to conduct or direct the most comprehensive lines of engineering research.

Qualifications.—Training and experience of a character to give substantial evidence of engineering knowledge and ability or of executive capacity of highest order along lines of work similar to those involved in the position to be occupied and of at least twelve years' duration, of which at least four years shall have been spent in duties of Engineer, or their equivalent, and at least five years in responsible charge of important work or projects. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing or, in absence of such degree, at least four years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Grade 2.—Engineer

Duties.—Under general administrative direction and within the limits of the general policies of the organization, to have responsible charge of and to initiate and determine policies for a major subdivision of an organization; to prepare for final executive action reports, cost estimates, designs, specifications, and valuation studies and data; to have immediate charge of the construction, maintenance, or operation of engineering works or projects of major importance; to conduct or direct major lines of engineering research; or to furnish for executive action expert or critical advice on engineering works, projects or policies.

Qualifications.—Active professional practice or executive charge of work for at least eight years, of a character to demonstrate a high degree of initiative and of ability in the administration, design, or construction of engineering work or projects of major importance, of which at least three years shall have been spent in duties of Senior Assistant Engineer, or their equivalent, and at least three years in responsible charge of work. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing or, in absence of such degree, at least four years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Grade 3.—Senior Assistant Engineer

Duties.—Under general administrative and technical direction, to be in responsible charge of an independent division of an engineering [illegible] engineering [illegible] studies and computations necessary for the preparation of [illegible] estimates, designs, specifications, [illegible] to have immediate charge of the construction, [illegible] engineering works or projects, or to conduct [illegible] engineering research.

Qualifications.—Active professional practice or responsible charge of work for at least five years, of which at least three years shall have been spent in duties of Assistant Engineer, or their equivalent, with at least one year in responsible charge of work. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing or, in absence of such degree, at least four years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Grade 4.—Assistant Engineer

Duties.—Under specific administrative and technical direction, to be responsible for the conduct of the work of a minor subdivision of an organization; to collect and compile data for specific items of engineering studies; to take immediate charge of field survey parties and of the design and construction of minor engineering work; to lay out and develop work from specifications and to supervise the work of a drafting or computing force; or to conduct specific tests or investigations of apparatus, material, or processes.

Qualifications.—Experience for at least two years in duties of Junior Assistant Engineer or their equivalent. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing or, in absence of such degree, at least four years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Grade 5.—Junior Assistant Engineer

Duties.—Under immediate supervision, to perform work involving the use of surveying, measuring, and drafting instruments; to take charge of parties on survey or construction work; to design details from sketches or specifications; to compute and compile data for reports or records; to inspect or investigate minor details of engineering work, or to perform routine tests of apparatus, material, or processes.

Qualifications.—No experience required other than that involved in securing a professional degree upon the completion of a standard course of engineering instruction in an educational institution of recognized standing, but in absence of such degree, a high school education, or its equivalent is required and at least four years' experience in the use of surveying, measuring or drafting instruments, or the computation and compilation of engineering data, together with evidence of a knowledge of the fundamentals of engineering science sufficient, with further experience, to qualify for the higher professional grades. The completion of each full year of such standard course of engineering instruction shall be considered as the equivalent of one year of experience.

Sub-Professional Service

Grade 6.—Senior Aid, Office

Duties.—[illegible]

Qualifications.—Experience for at least five years in [illegible] ing, drafting, and computing, of which at least three years shall have been spent in the duties of [illegible]. Education equivalent to graduation from high school. The completion of each full year of a standard course of engineering instruction in an educational institution of recognized standing shall be considered as the equivalent of the experience otherwise required, with the provision, however, that at least one year shall have been spent in the duties of [illegible].

Grade 6.—Senior Aid, Field

Duties.—To direct work of field party on surveys or construction; to keep survey notes and engineering records; to supervise construction or repair work; to direct the work of computing surveys and estimates; to direct the work of making minor engineering computations.

Qualifications.—Experience for at least five years in the use and care of surveying instruments, of which at least three years shall have been spent in the duties of [illegible]. Education equivalent to graduation from high school. The completion of each full year of a standard course of engineering instruction in an educational institution of recognized standing shall be considered as the equivalent of the experience otherwise required, with the provision, however, that at least one year shall have been spent in the duties of [illegible].

Grade 7.—Aid, Office

Duties.—To prepare [illegible] drawings where design is furnished; to plot n[illegible] and prepare maps; to design simple [illegible]; to make computations and compile data for reports and records; to check plans, surveys, and other engineering data.

Qualifications.—Experience for at least two years in [illegible], drafting, and computing. Education equivalent to graduation from high school and familiarity with the use of the slide rule, and of logarithmic and other simple mathematical tables. The completion of each full year of a standard course of engineering instruction in an educational institution of recognized standing shall be considered as the equivalent of the experience otherwise required.

Grade 7.—Aid, Field

Duties.—To use surveying instruments and to adjust and care for same; to compute surveys and estimates; to make minor engineering computations; to inspect [illegible] construction or repair work.

Qualifications.—Experience for at least two years in the duties of [illegible]. Education equivalent to graduation from high school and familiarity with the construction, operation, and care of surveying instruments. The completion of each full year of a standard course of engineering instruction in an educational institution of recognized standing shall be considered as the equivalent of the experience otherwise required.

Grade 8.—Junior Aid, Office

Duties.—To trace and letter maps and plans; to make simple tracings from sketches and data; to make minor calculations.

Qualifications.—Education equivalent to graduation from high school.

Grade 8.—Junior Aid, Field

Duties.—To run tape or leveling rod; to perform other miscellaneous subordinate duties in survey party in field or office, as directed.

Qualifications.—Education equivalent to graduation from high school.

Experience Equivalents for Post-Graduate Work

The completion of each full year of post-graduate work in the specific subject of study or investigation appropriate to a particular service or branch of service shall be considered the equivalent of one and one-half years of general experience, but such substitution shall not thus be made for more than four years of such experience or be considered as reducing the requirements in any grade of the number of years engaged in the conduct or direction of responsible work.

An examination of the schedule shows that the minimum experience requirements for the various grades may be briefly summarized as follows:

Service	Grade	Experience in Years With Degree in Engineering	Experience in Years Without Degree in Engineering
Sub-professional	8—Junior Aid	0	0
	7—Aid	0	2
	6—Senior Aid	0	5
Professional	5—Junior Assistant Engineer	0	4
	4—Assistant Engineer	2	6
	3—Senior Assistant Engineer	5	9
	2—Engineer	8	12
	1—Chief Engineer	12	16

Some Title Equivalents in Common Use

The following table illustrates the practicability of adapting the proposed classification to any particular grade or branch of the engineering service and in such a way as to clearly retain a description of the relative rank.

Professional Service

1.—Chief Engineer

Chief Engineer	Deputy Chief Engineer
State Engineer	Deputy State Engineer
City Engineer	Deputy City Engineer
Chief Engineer of Maintenance of Way	Director, etc.

2.—Engineer

Electrical Engineer	Division Engineer
Mechanical Engineer	District Engineer
Mining Engineer	Sewer Engineer
Chemical Engineer	Topographical Engineer
Bridge Engineer	Landscape Engineer
Sanitary Engineer	Hydraulic Engineer
Tunnel Engineer	Geodetic Engineer
Maintenance of Way Engineer	Structural Engineer
Signal Engineer	Valuation Engineer
Highway Engineer	Designing Engineer, etc.

3.—Senior Assistant Engineer

Senior Assistant Electrical Engineer
Senior Assistant Mechanical Engineer
Senior Assistant Mining Engineer
Senior Assistant Chemical Engineer
Senior Assistant Bridge Engineer, etc.

4.—Assistant Engineer

Similar to Senior Assistant Engineer

5.—Junior Assistant Engineer

Engineer Inspector, etc.

Sub-Professional Service

6.—Senior Aid

Office:		Field:	
	Chief Draftsman		Chief Instrumentman
	Chief Computer		Chief Inspector

7.—Aid

Office:		Field:	
	Draftsman		Instrumentman
	Computer		Inspector

8.—Junior Aid

Office:		Field:	
	Junior Draftsman		Rodman
	Tracer		Tapeman

Schedule of Salaries Suggested for Discussion

Grade	Total Years Experience Required to Qualify With Professional Degree	Without Professional Degree	Salary Range Minimum	Salary Range Maximum
8—Junior Aid	....	0	1,080	$1,560
7—Aid	....	2	1,680	2,400
6—Senior Aid	....	5	2,520	3,240
5—Junior Assistant Engineer	0	4	1,620	2,580
4—Assistant Engineer	2	6	2,700	4,140
3—Senior Assistant Engineer	5	9	4,320	5,760
2—Engineer	8	12	5,940	No limit
1—Chief Engineer	12	16	8,100	No limit

Applying the average proposed salary to the present incumbents of these positions as reported in the State and Municipal services, it will be found that there would be a resulting increase in annual compensation totaling about $5,500,000 as compared with a total increase of $2,500,000 recommended by the service heads, against which should, however, be charged the economy growing out of the increased efficiency brought about by a restoration of morale.

The Committee is not prepared at this time to recommend the adoption of any definite schedule of compensation, and it is not at all clear as to the wisdom of fixing even a minimum limit on the highest grades of service or of keeping the maximum of one grade below the minimum of the grade above, all of which questions are now receiving its

[illegible]

[illegible]

In order to secure information as to the situation at present date the Secretary of *The Institute* communicated with Mr. Alfred D. Flinn, Secretary of Engineering Council, as to the present status of the report and as to whether changes were proposed. To this communication Mr. Flinn replied:

September 10th, 1920.

Dear Mr. Keith:—

In connection with the work of Council's Committee on Classification and Compensation of Engineers you will probably be interested to learn that the replies so far received to circular letters sent to Engineering and Technical Societies, Civil Service Commissions, Mayors, Governors, and Engineering Heads of Government Bureaus, have been favorable. These letters requested the endorsement in the case of engineering societies, and the adoption in the case of government bureaus, of the proposed classification as standard and asked for an expression of views regarding the compensation schedules suggested.

Committees of the National Societies are considering the question of endorsing the proposed classification, which has already been formally endorsed by several local societies. Government Bureaus and Civil Service Commissions have been greatly interested in the work and in a number of cases have recommended the adoption of the classification.

This note is sent you with the idea that you may wish to publish this information in connection with the December 1919 report of Council's committee, of which, I believe, you have a copy.

Cordially yours,

(Signed) Alfred A. Flinn.
Secretary.

The Council of *The Institute* has requested the Committee to prepare a schedule of fees for consulting engineers.

Niagara Falls Branch—Esto Perpetua

Members of *The Institute* to the number of nearly three hundred are richer by many happy memories through having had the privilege of attending the seventh Professional Meeting of *The Institute* held at Niagara Falls, September 16th, 17th and 18th. The report of the meeting, which appears elsewhere in *The Journal*, shows a nicely balanced programme, carefully arranged, and carried out with splendid attention to detail. These features combined with an ideal setting and splendid weather conditions, made this one of the most satisfactory good fellowship gatherings that *The Institute* has yet held. Congratulations in the superlative degree are due to all who had a part in contributing to the success of this meeting and particularly the officers and members of the Niagara Peninsula Branch, whose courage in planning, executive ability in arranging, and whose energy and enthusiasm in carrying out the many numerous details, reflect the greatest credit, the results achieved being a tribute to their genius. Everyone who attended was loud in his praises of the men of the Niagara Peninsula Branch, and words fail to express the real gratitude due them from *The Engineering Institute of Canada*. If all the members of *The Institute* could be inspired to the same zealous pitch that directed those responsible for the Niagara Meeting, there is no reasonable ambition which *The Institute* might strive to reach that could not easily be accomplished.

For the first time in the history of *The Institute* ladies were particularly invited to participate in all the functions on the programme, and their presence there in such large numbers added to the cheerfulness of the gathering and established a precedent which will, no doubt, be continued.

As far as the records go, this, too, was the first time that engineers included on their programme sports of any kind, and now that, as President Ross stated, we are starting to be human, a programme of sports may yet be a regular feature of our meetings.

To those who experienced their first attendance at a professional meeting of *The Institute*, the gathering was more or less of a revelation, resulting in many a resolve to attend all similar gatherings.

The formal votes of thanks passed to various men and organizations whose kindness and courtesy meant much to the success of the convention, do not fully express the deep sense of gratitude which members of *The Institute* feel.

These votes of thanks were, to:—

The Premier and Cabinet of the Government of Ontario, and particularly to the Hon. F. C. Biggs, Minister of Public Works and Highways of Ontario, for his personal attendance and his kindness in attending the convention and giving an address outlining the policy of the Department of Highways and for so kindly entertaining the Members of *The Institute* and their guests at Luncheon at the [illegible] on Friday, September 17th.

The Chairman of the Hydro-Electric Power Commission and many of the staff in supplying transportation facilities for inspecting the Queenston-Chippawa Power

Development so ably described by Engineers Acres, Hogg, Sauer and Brandon in their addresses and in their papers published in *The Journal* of *The Institute*, and for supplying automobiles which throughout the convention were constantly at the disposal of ladies and guests, and for their courtesy in arranging a visit to the peach orchards.

The Hon. J. D. Reid, Minister of Railways and Canals of the Federal Government for transportation to the Welland Ship Canal, and for facilities of inspecting the Welland Ship Canal under the personal supervision of Mr. Alex. J. Grant, M.E.I.C., Engineer-in-charge.

The Queen Victoria Park Commission, Mr. P. W. Ellis, Chairman, Mr. John H. Jackson, M.E.I.C. Superintendent, for giving the splendid luncheon on Saturday.

The Collegiate Institute of St. Catharines for supplying the lantern used at the Professional Meeting.

The St. Catharines' Golf Club for extending the courtesies of their club.

The various Power Companies for the privilege of visiting their plant and arranging trips thereto, including the Niagara Falls Power Company, Niagara Falls, N.Y., The Toronto Power Company, and the Ontario Power Company.

The Members of *The Institute* whose hard work and constant attention to detail resulted in such a successful gathering including the officers of the Ontario Provincial Division and particularly the Officers and Members of the Niagara Peninsula Branch whose time and energy have been so freely given.

The management of the Clifton Hotel, for courtesies extended.

All others who did so much to add to the comfort and enjoyment of the convention and contributed towards making it one of the most successful yet held.

Seventh General Professional Meeting

Niagara Falls, Ontario, September 16-17-18.

One of the most successful General Professional Meetings ever held by *The Engineering Institute of Canada* has just been concluded under the auspices of the Ontario Provincial Division at Niagara Falls, Ontario.

The meeting was favoured in many respects. Within a few miles of Niagara Falls are the two largest engineering works at present under construction on this continent, if not in the world. The inspection of these undertakings formed an important part of the programme of the meeting, particularly as the inspection had been provided for by the reading of papers on various features of both the Welland Ship Canal and the Chippawa-Queenston Power Development at the formal sessions. The preparation and arrangements for the meeting made by the Executive of the Niagara Peninsula Branch were most thorough, and the success of the meeting is due very largely to the unsparing work of the Niagara Branch Members. An important factor was the weather, bringing sunshine every day to the Convention and adding very considerably to the enjoyment of those present.

Opening of Technical Session

The proceedings of the Professional Meeting were opened at 11.30 on Thursday September the 18th in the Convention Hall of the Clifton. H. B. R. Craig, M.E.I.C., Chairman of the Ontario Provincial Division Niagara Falls, presiding, when an address of welcome was given by H. P. Stephens Esq., Mayor of the City of Niagara Falls, Ontario. Mr. Stephens spoke of the appropriateness of Niagara Falls as a place of convention for *The Engineering Institute*, and paid tribute to the greatness of the contribution of the engineers to the progress of humanity. He spoke also of the success which has been demonstrated here of practical engineering in the development of the great natural resources, the great difficulties which have been successfully overcome, and the great benefit, not only to this district, but to other portions of the Province.

R. A. Ross, M.E.I.C., President of *The Engineering Institute* responded on behalf of *The Institute*, and in a brief but happy speech told of the great development, especially in electrical engineering in recent years. In a reminiscent vein he spoke of the construction of a dynamo forty years ago, which lighted two arc lights;—sometimes the arc lights burned, sometimes the dynamo.

The paper of the day was that of Alex J. Grant, M.E.I.C. Engineer in charge of the Welland Ship Canal; Mr. Grant's paper is printed in full on page 425 of the September *Journal*. Following the reading of Mr. Grant's address, the Chairman expressed the indebtedness of the meeting for this most interesting talk on the Welland Ship Canal.

Informal Luncheon at the Clifton

The professional meeting was followed by an informal luncheon at the Clifton when several announcements were made by W. P. Near, M.E.I.C., chairman of the Niagara Peninsula Branch. The programme for the afternoon's excursion to the Welland Canal and an invitation from Mrs. W. B. Burgoyne to the Flower Show at St. Catharines was read.

Inspection of Welland Ship Canal

In the afternoon the convention adjourned to an inspection of the Welland Ship Canal in electric cars provided by the courtesy of the Minister of Railways and Canals. The first part of the journey was through the upper table-land between Niagara Falls and Thorold, and passing several of the immense plants which have sprung up in the neighbourhood of Niagara Falls in the past few years due to the cheap power obtainable. Leaving the cars at the crossing of the Welland Ship Canal the party proceeded on foot to inspect the progress on the upper locks. One of the unique features of the Welland Ship Canal is the remarkable flight of three twin locks climbing the escarpment.

These locks compare in size with the gigantic locks of the Panama Canal and in some respects involve engineering problems of much greater magnitude.

The work on this section on the Welland Ship Canal is at present practically at a standstill, partly on account of labour troubles and partly on account of the shortage of cement, but the scale of the undertaking is quite evident from the work which has already been accomplished.

The electric cars having been shunted to the double track construction railway of the Welland Ship Canal, the party embarked for the second stage of the inspection tour. An excellent feature of this part of the programme was the provision of guides familiar with the construction features of the Canal in each car. Points of interest were announced by megaphone, and in this way the inspection, through naturally brief, was entirely satisfactory, and illustrated once more the thoughtfulness of the Niagara Branch in attention to the details which mean so much.

The cars were drawn to Port Weller and a thorough inspection of the lower locks was made by the party on foot. The immense size of these locks is not apparent at first glance, but every member of the party had the scale of the locks brought home after climbing to the top of the lock walls, descending to the mooring tunnel with final exit by ladder.

Dinner and Entertainment

Following the inspection of lock No. 1 the party returned by the electric line to the Falls. At one place on the return journey the cars were held up on the siding and a number of the more enterprising members of the party made a scientific investigation of the windfalls in the adjoining apple orchard; this orchard by the way, being part of the estate of a past President of *The Institute*.

The first day of the convention was brought to a most enjoyable close by a dinner at the Clifton, A. C. D. Blanchard, M.E.I.C., Chairman, followed by an excellent entertainment provided by the Niagara Peninsula Branch. The good fellowship and spirit of the whole meeting was strongly in evidence and the various songs called for by the entertainer were given with great heartiness including that which was announced as the new national anthem of Canada. At 10 o'clock the gathering adjourned to the hotel balcony to view the illumination of the Canadian Falls; a sight, the beauty of which will remain one of the chief memories of a remarkable meeting.

Continuation of Professional Session

On the morning of Friday, September the 17th the Professional session was continued, R. A. Ross, M.E.I.C., President of *The Institute* in the chair.

The first paper to be read was that of T. H. Hogg, A.M.E.I.C., Assistant Hydraulic Engineer of the Hydro Electric Power Commission on "The Design of the Queenston-Chippawa Power Canal." This paper is printed in the September number of *The Journal* on page 433, but in the course of his remarks and the discussion which followed, Mr. Hogg added some very interesting details. On account of the danger from ice jams, the power house at Queenston will have no opening to admit water lower than 50 ft. to prevent any possible flooding, such as that caused by the great ice-jams of 1909.

Following Mr. Hogg's paper, M. V. Sauer, M.E.I.C., Hydraulic Engineer in Design of the Hydro Electric Power Commission read his instructive paper on "Hydraulic Installation of the Queenston-Chippawa Power Development." This was followed by "Electrical Features of the Queenston-Chippawa Power Development," by E. T. J. Brandon, A.M.E.I.C., Electrical Engineer of the Hydro Electric Power Commission and "General and Economic Features of the Queenston-Chippawa Power Development" by H. G. Acres, M.E.I.C., Hydraulic Engineer of the Hydro Electric Power Commission. These papers have been printed in the September number of *The Journal* on the following pages:—440, 446, and 454. Mr. Brandon enlarged considerably on the synopsis of his paper published last month and gave an account of the new power house as it will be when completed.

Following the reading of the four papers, all illustrated by lantern slides, a short discussion followed, and after a vote of thanks had been passed, the meeting adjourned to the Refectory of the Parks Commission in Queen's Park, where the convention were the guests of the Department of Highways of the Province of Ontario for luncheon.

Lunch at the Refectory

Deputy Minister, W. A. McLean, M.E.I.C., in a brief address introduced the Hon. F. C. Biggs, Minister of Highways in the Province of Ontario. Mr. Biggs eulogized the Park Commissioners and Supt. J. H. Jackson for the great work they are doing at this frontier, and hoped soon to see the river boulevard extending from Lake Erie to Ontario. He stated that in his department he has 30 graduate engineers, and by a recent act of the Ontario Legislature all county road superintendents in future must be graduate engineers; each engineer has from 50 to 100 miles to supervise. Much preliminary work has been done this year on the provincial road systems, but by 1921 the Government expects to be ready to go ahead in earnest.

The Ontario Government has a policy somewhat different from that in vogue in some parts of the United States and Canada. The policy in Ontario is to assume responsibility as soon as roads are taken over, put them in decent condition as soon as possible, and gradually convert the 2000 miles into permanent highway, beginning with the heavy traffic sections.

The province pays 60% of the cost of these roads under the Provincial County system and 40% of the county roads. These two classes of roads are in the hands of the county councils and are 9,000 miles in extent. Were it not for the good work done by the counties, the roads of the Province would to-day be in a worse condition than they are at present; the rural people should receive credit for what they have done in the past, for they keep up their roads with no help from the province.

Mr. Biggs stated that during the war motor traffic greatly increased and people were too busy winning the war to give much attention to roads. This year the great problem had been to get material, and many contracts have been cancelled owing to inability to get cement. Labour is very expensive but this would not be serious if it were efficient. He expressed the hope that the time will soon come when everyone will have to give 100% efficiency.

Inspection of Queenston-Chippawa Development

Immediately after the luncheon, the official photograph of the meeting was taken in front of the Refectory, following which the party were taken on four electric cars to view the Chippawa-Queenston Power Canal.

As on the previous day guides provided with megaphones were on each car to announce features of interest, and this feature was appreciated fully as much on this inspection tour as on that of the previous day. Proceeding for a short distance on the Niagara St. Catharines and Ontario line the cars were transferred to the double track construction line of the Hydro Electric Power Commission where they were taken in tow by one of the powerful electric locomotives used on construction work. Passing along the banks of the Canal, an excellent view was had of several channellers at work in the bottom of the canal, facing the rock for final excavation. It was explained that in the rock section the canal was being excavated 10 ft. at first, and then shot to grade, the work on the last 30 ft. being done by the large Bucyrus electric shovels, the largest in the world. Two of these shovels were seen at work by the party, and proved of very great interest. Each machine weighs 400 tons; has a capacity of 8 yards with an 80 ft. hoom, and can load cars 65 ft. above grade.

After the work of the shovels had been inspected at close quarters, the party was taken along the bank of the canal, passing the great crushing plant to the forebay, where the drilling at present in progress was inspected. At the forebay drillers are at work preparing to blast off the overhanging face of rock above the power house site, and it was of interest to note that drills both of the standardized piston drill type, and also of the more modern hammer-drill were at work.

An excellent view was had of the excavation at present under way for the power house, and a vivid impression was carried away by every member of the party of the immensity of this undertaking; one that has great possibilities for the people of Ontario.

Banquet

A banquet was held at the Clifton after the return from inspecting the Queenston-Chippawa Development, W. P. Near, M.E.I.C., Chairman of the Niagara Peninsula Branch presiding. After the toast to the King, proposed by the Chairman, W. F. Tye, M.E.I.C., past President of *The Institute* proposed to the health of the Province of Ontario. In his speech Mr. Tye referred to the engineering undertakings which had been inspected by those present during the past two days. He mentioned the remarkable fact that the whole of the work on the Chippawa-Queenston Power Development is being done by engineers, and while expressing a doubt as to the possible future value of the equipment, stated that this was the most complete he had ever seen.

In coupling the toast of the Province of Ontario with the name of Hon. F. C. Biggs, Mr. Tye spoke of the enormous importance of cheap transportation, and referred to Mr. Biggs as the one man who could do more to reduce this cost than any other in the Province.

In replying to the toast of the Province of Ontario, Mr. Biggs made a brief reference to the policy of the present Ontario Government, and after a sketch of the remarkable possibilities of the Province and the suitability

Seventh General Professional Meeting,

of Niagara Falls for an engineering convention, took up the question of transportation particularly comparing haulage by motor truck with transport by train, he was of the opinion that up to 100 miles the former method had the advantage both in convenience and cheapness.

In proposing the toast of "Sister Societies", Professor Peter Gillespie, M.E.I.C., made reference to the common aims of the Professional Engineering Societies in the United States, and *The Engineering Institute of Canada* and made a strong plea for international co-operation. In a witty speech of reply, F. S. Carman, President-elect of the American Society of Mechanical Engineers, dwelt on the importance of co-operation, and the value of the human side in engineering service.

The final toast of the evening was that of "*The Engineering Institute of Canada*", proposed by C. H. Rust, M.E.I.C., Past President of *The Institute*. In proposing the toast, Mr. Rust mentioned that this was his first opportunity of attending a gathering of *The Institute*, on account of his absence in the West for several years. He congratulated *The Institute* and the Niagara Peninsula Branch on the splendid programme provided, and mentioned his gratification at the fact that every member of the staff working on the Hydro Development is a Canadian, and a graduate of a Canadian University. R. A. Ross, M.E.I.C., President of *The Institute* replied to the toast, the key-note of his speech being that the engineer of the present day is too unselfish. A beaver, emblem of *The Institute*, builds his dam for his own family. The engineer builds work for other people. Using witty illustrations, Mr. Ross pointed out the necessity of self advertisement, and advised the engineers to be more assertive. Mr. Ross congratulated the gentlemen responsible for the evening's entertainment, and the Niagara Branch in general, one of the youngest Branches of *The Institute*, but one of the best. Mr. Ross gave it as his conviction that *The Engineering Institute of Canada* is now alive from stem to stern, and a good deal busier than it was a few years ago; it is a good Society because it is busy.

Following the toast to *The Engineering Institute*, the meeting adjourned, to continue a most enjoyable evening by dancing. The arrangements made for the dance were admirable, and the bachelors from other Branches were well looked after by the Niagara Peninsula Executive. The programme of the dance was varied by the music of the bagpipes, which inspired two members present to dance the highland fling, meeting with approval upon all sides.

Saturday Morning Professional Meeting

On the morning of Saturday, September 18th, the Professional Session was continued at 9 o'clock with A. C. D. Blanchard, M.E.I.C., in the chair, when a very interesting demonstration of the Gibson Method of Measuring the Flow Water in Closed Conduits for Determining the Efficiency of Hydraulic Turbines, was given by Norman R. Gibson, A.M.E.I.C. This method has been developed quite recently by Mr. Gibson, and has been acclaimed as an outstanding achievement in connection with the measurement of water flow. An exhaustive test has been made recently at Cornell University, comparing the Gibson Method with the usual volumetric method of measurement, and while the result of this test has not been officially announced, it is understood that the Gibson Method is found to be the most accurate of any devised to date. Mr. Gibson demonstrated by means of a small model of the apparatus used, and his address was followed with much interest by those present.

Inspecting Power Houses and Peach Orchards

The reading of Mr. Gibson's paper concluded the Professional Session, the remainder of the morning being spent in various trips arranged by The Niagara Peninsula Branch. Those interested in peach orchards, and this included a large number of the ladies present, were given the opportunity to inspect one of the large orchards near Queenstown. Trips had also been arranged to inspect the plants of The Ontario Power Company, Toronto & Niagara Power Company and Niagara Falls Power Company, (New York). Of these three power plants, the last mentioned proved the best drawing card on account of the three 35,000 kilowatt, units installed at present the largest operating hydro-electric units in the

Niagara Falls, Ontario, September 16-17-18 world. A party of fifty-five was taken to the American side of Niagara Falls in motor cars to the plant of The Niagara Falls Power Company, where a thorough inspection was made under the guidance of officials kindly provided by the Company; these gentlemen were most obliging in supplying information.

Luncheon at the Refectory

The convention later assembled at The Refectory in Queen's Park for luncheon as the guests of The Park Commissioners.

In a brief speech, introducing P. W. Ellis, Chairman of the Park Commission, J. S. Jackson, A.M.E.I.C., made a brief reference to the public spirit of the members of the Commission, stating that these gentlemen gave their services for nothing, and that starting with a small loan from the Ontario Government thirty-five years ago, the Commission had gradually taken hold of the entire frontier from Lake Ontario to Lake Erie, and had been successful in raising the annual revenue from $25,000 per annum to over $250,000. per annum.

Mr. Ellis, after welcoming *The Engineering Institute of Canada* as the guests of The Park Commission, made a brief reference to the days when he was President of The Canadian Manufacturers Association, and attended a banquet at the University of Toronto. At this time the University did not include The School of Practical Science, and, noting that in the majority of cases the speeches were of the soothing order, he asked if they realized that the students were to go out to develop the resources of the world, and that their surroundings in the University should not be too luxurious, at the same time making a strong plea that S.P.S. be made a part of the University. Next day, Mr. Ellis was gratified to receive a letter from the Chancellor of the University, and not very long thereafter the School of Practical Science became the Engineering Faculty of the University of Toronto.

Mr. Ellis then passed to the work of The Park Commission. He stated that it was the purpose of the Commission to receive American tourists with open arms, and to return them to their native land—without money, but with more than a dollar's worth for every dollar they had spent. He alluded to the great historical interest of the Niagara frontier, hallowed ground from Niagara-on-the Lake to Fort Erie. Mr. Ellis also drew a vivid picture of the scenic beauties of the Niagara district, with particular reference to the Niagara Falls, and Niagara Glen, and in concluding the description of the Niagara district, Mr. Ellis alluded to the enormous industrial wealth, due directly to the power from the Niagara Falls. Mr. Ellis gave a brief history of the achievements of the Park Commission. The Commission has at present control of the whole frontier along the Niagara River, and while the principal achievements have been in connection with the park and boulevard, plans are under way for a very great extension of the work. The right-of-way of the railway from Queenston to Niagara Falls has been acquired by the Commission, and it is planned to extend the boulevard, first to Queenston, finally to Niagara-on-the-Lake, with chalets at Niagara Glen, Queenston and Niagara-on-the-Lake. Bungalows for summer residents are to be built, and it is planned to improve the facilities at the Glen by providing an elevator, ponies, guides, etc. The work of the Commission is also to be enlarged above the Falls. The boulevard will be extended to Fort Erie, where another chalet will be built; it is planned to name the chalets after battles in the late war, whose names are sacred in Canada. Bathing facilities will be improved at Dufferin Island, and two real gondolas will be provided. The Refectory will be enlarged, and in many other ways the work of the Commission greatly entended.

In concluding his speech, Mr. Ellis stated his conviction that the beauty of the Niagara Falls district is one of its greatest assets, and that the policy of the Commission was to preserve this beauty to the greatest extent possible. The plans outlined, might seem visionary, but it was the intention of the Commission to have the programme completed in three years and paid for in forty years.

The Great Baseball Game

After a vote of thanks, moved by C. H. Rust, M.E.I.C., the members adjourned to witness an interesting baseball game when an all star Toronto team were able to pull off a decisive win over an International team composed of members of *The Institute* from Niagara Falls, with two experts from St. Catharines and one from Philadelphia.

To describe the game accurately would take more space than *The Journal* would permit. It seemed to be the consensus of opinion that the Toronto team were just a little bit better than the International.

Spectacular plays were pulled off by "Chuck" Macdonald who put up a stellar game, playing second base for the Toronto team. In fact the whole Toronto team were right on their toes all the time.

The last out was made on a sensational play with Niagara Falls et al. at bat. A high line drive was just reached by the pitcher of the Toronto team and knocked up into the air, to be caught by Johnston, the short stop, who made a quick dive for it.

Special mention should be made of some of the players on the International team. Bond, playing third base, had never been in a baseball game before, but handled himself like an old timer and learned immediately the art of talking back to the umpire. The final score was 9—3, favour Toronto.

The players were as follows:—

International	Toronto
Frost, 1b.	Caldwell, c.
Clark, c. (Capt)	Seymour, p. (Capt.)
Near, ss.	McIntyre, 1b.
Lowry, rf.	Macdonald, 2b.
Bond, 3b.	Johnston, ss.
Donnelly, cf.	Stevens, 3b.
Sherron, 2b.	Grant Jack, lf.
Swift, p.	Jack, cf.
Johnson, lf.	Amos, rf.

Umpire

Fred Berger, Campbellford, Ont. who was umpire, as far as can be learned escaped without serious injury.

Registration

The registration is one of the largest, if not the largest, ever recorded at a summer professional meeting. The list does not include the ladies, who were in attendance in large numbers took part in every function, and whose presence added greatly to the success of the meeting.

Seventh General Professional Meeting, — Niagara Falls, Ont., Sept. 16, 17, 18, 1920

EMPLOYMENT BUREAU

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Graduate Civil Engineer

Graduate Civil Engineer, A.M.E.I.C., with 10 years experience on construction, maintenance, superintendence and contracting on railway and building work and 5 years on hydraulic work, desires position with operating department of a Pulp Industry. Salary $300.00 per month. Full particulars of experience and references furnished. Apply box 40-P.

Civil Engineer

Civil Engineer, A.M.E.I.C., and Quebec Land Surveyor, with several years' experience, on railroad, hydraulic, municipal and surveying work, for personal reasons, wishing a change, seeks employment. Single. Box 41-P.

Mechanical Engineer

English engineer visiting Canada wishes to settle in the Dominion and wishes to get into touch with a large organization requiring services of experienced mechanical engineer; was chief engineer of large plant at Nottingham, England, with sole charge of engines, boilers, pumps, etc., also charge of building extensions, etc., 30 years continuous experience. Box 42–P.

Situations Vacant

Structural Engineer

Structural engineer wanted by a structural steel co. in Ontario; technical man with considerable experience in detailing, designing and estimating on structural steel; to take charge of designing and oversee small drawing room; must be fast, accurate and reliable; salary $275.00 to $300.00 per month. Box 161.

Engineer for Construction Work in India

Young Canadian Engineer about thirty years of age, unmarried, required for engineering position in India; work necessitates knowledge of concrete construction. Salary in neighbourhood of $5000 per annum. Box 162.

Geometry, Freehand Drawing and Lettering Assistant

Assistant for department of descriptive geometry freehand drawing and lettering for large Canadian University; salary $125.00 to $150.00 per month. Box 163.

Junior Engineer for Pulp and Paper Company

Junior engineer with at least one year's experience to look after water records and do general office work, draughting, etc., for large pulp and paper company in Ontario. Salary $150.00 per month. Box 164.

Draftsmen for Hydro Electric Work

Two field draftsmen wanted immediately for hydro electric work, in Ontario; salary $150.00 per month. Box 165.

Member's Exchange

Transactions Inst. C.E. For Sale

Set transactions Inst. C.E. 1881 to date 12 vols. for sale, are bound, should be worth $100.00 to any member acquiring eng library. Box 3-A.

Transactions

Books—Transactions A.M.I.E.E. 1904-1918 *Journal* of The Institute of Electrical Engineers, England, 1893-1913. Box No. 5-A.

Journals Wanted

We have an enquiry from one of our members who is very anxious to have a complete set of *The Journal* for Nos. 1, 2, 3 and 4 of Volume 1. Any member who has these journals and does not require them for binding purposes could rest assured that they would be appreciated if sent in. Box 6-A.

For Sale

Transit light mountain Keuffel and Esser, suitable for railway construction, first class condition, $175.00; also Dump Level, good condition, $65.00, or sell both together for $225.00. Box 7-A.

Dumpy Level For Sale

12" Dumpy level by Baker & Company, High Holborn, London. This level is in good condition; has exceptionally good lenses and a comparatively new tripod. Although well worth $100.00 may be had for $60.00. Box 8-A.

OBITUARIES

Thomas Matthew Schenk, A.M.E.I.C.

Mr. Schenk died in Halifax on Friday the 3rd of September, 1920, after an illness of five weeks of typhoid fever, leaving a widow and two children.

He was the only son of Capt. E. G. Schenk, for many years Commander of the Commercial Cable Company's Repair Ship "MacKay-Bennett". Capt. Schenk's elder brother, A. O. Schenk, M. Inst. C.E., is now, and has been for many years, chief engineer of the Swansea Harbour Board, Wales.

Mr. Schenk was admitted to *The Institute* as a Student April 17th, 1909, Junior, January 13th, 1913, and as an Associate Member June 27th, 1916. At the time of his untimely death — he was only thirty two years of age — he had been on the staff of C. E. W. Dodwell, M.E.I.C., district engineer, Public Works Department of Canada, at Halifax, N.S., for eleven and a half years; first as draughtsman and junior, and for the past seven or eight years as assistant engineer.

His was an exceptionally fine character, clean-living and scrupulously honourable, absolutely trustworthy, conscientious, loyal and efficient, and his death is a severe loss, not only to the Halifax Staff of the Public Works Department, but to the Department, as a whole.

Major R. Douglas Galbraith, M.C., S.E.I.C.

Major R. Douglas Galbraith, M.C., S.E.I.C., a widely-known Canadian soldier, and prominent in University of Toronto graduate life, died at the Toronto General Hospital on Saturday, Sept. 11, following a long illness. He entered the hospital last May to secure relief from the abdominal ailment from which he was suffering, but after a series of operations failed to recover. He was twenty-seven years old, and was a son of the late Dean John Galbraith, who was long the head of the Faculty of Applied Science of the University of Toronto. Major Galbraith was a graduate of the University, and after the war planned to follow his profession as a civil engineer. He is survived by one brother, Lieut. John Galbraith, M.C., A.M.E.I.C., of Seattle, and a sister, Mrs. F. S. Jamieson, 150 Albany avenue. Sir Frederick Stupart, Director of the Observatory, is an uncle. The funeral takes place to-morrow afternoon.

Major Galbraith began his military career in the Mississauga Horse, and commanded the North York Company of the 127th Battalion, York Rangers, during the last year of the war. He joined the York county unit, which became a battalion of railway troops, in 1917 as an engineer officer. His first service was in the Somme in 1916, as an officer of the 6th Machine Gun Company.

He won his Military Cross in March, 1918, at Villers Brettoneaux.

Major Galbraith seemed to bear a charmed life all through the war, although he suffered many bereavements. His father died during the first year of the war. On his return to Canada he picked up a paper in Halifax, where he read the first news of the death of his mother, who had died while he was at sea on the way home. A romance in his life was tragically ended by the German bombing of the Canadian hospital at Doullens, where the brave young woman to whom he was engaged to be married was serving as a nurse. She was instantly killed while on duty with her patients.

Edward Ashley Wilmot, M.E.I.C.

Edward Ashley Wilmot, M.E.I.C., died in Victoria, B.C., Sept. 4, 1920, in his 75th year. The late Mr. Wilmot was for upwards of twenty years in the employ of the Provincial Government as a civil engineer, and for fourteen years he held the important position of Provincial Inspector of Dykes. From 1892 until 1899, he was city engineer of Victoria, and since 1899 he had been engineer in charge of the construction and of the maintenance and management of dykes for the Provincial Government, and in that connection made a highly creditable and commendable record.

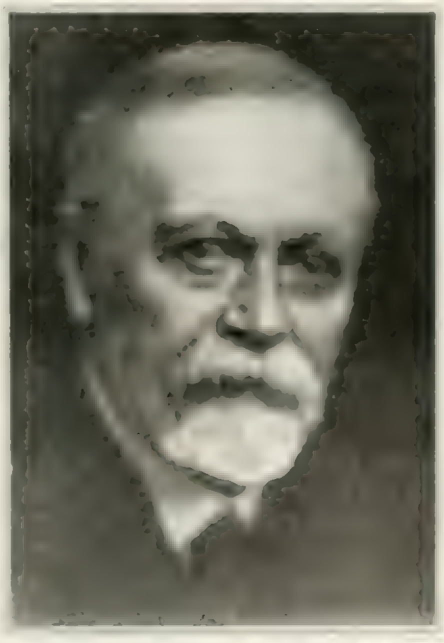
The late Mr. Wilmot was widely recognized as an able and successful representative of the profession. He did military service during the period of the Fenian raid of 1866, and received a Fenian Raid medal awarded by the Dominion Government to survivors. He was educated first at Sunbury Grammar School, and afterwards at the University of New Brunswick. His father, Hon. Robert Duncan Wilmot, represented Sunbury County in the Senate from the time of Confederation until 1880, and in 1885 was appointed Lieutenant-Governor of New Brunswick.

The deceased, who was born in St. John, N.B., on November 4th, 1845, is survived by a widow and four sons, Hugh Humphry, of Victoria, Ashley Neal, of Vancouver, Robert Percy, of Victoria and [illegible], of Bradford, Ont.

Dr. William Hodgson Ellis, M.E.I.C.

Dr. William Hodgson Ellis, M.E.I.C., former Dean of the Faculty of Applied Science of the University of Toronto, died at Lake Joseph, Muskoka, on August [illegible].

Born at Bakewell, Derbyshire, England, son of a physician of note and a grandson of the Rev. Wm. Ellis, the famed missionary to Madagascar, he came to Canada when young and attended the University of Toronto, receiving the degree of B.A. in 1867 and M.A. in 1868. Pursuing his medical studies at the same time, he went to England and in 1871 obtained the diploma of Licentiate of the Royal College of Physicians, with the distinction of F.S.C., F.I.C. and F.R.S.C. He was appointed to the chair of chemistry in Trinity Medical School, and became lecturer of chemistry in Toronto S.P.S. In 1887 Dr. Ellis resigned his connection with Trinity for the professorship of applied chemistry in the S.P.S., becoming dean in 1914. The Dominion Government made him public analyst for Toronto; in 1895 the University of Toronto elected him a senator.



Dr. William Hodgson Ellis, M.E.I.C.

Dr. Ellis had early joined the University Corps of the Queen's Own, and served as a [illegible] with the regiment in the Fenian Raid of 1866. He participated in the battle of Ridgeway.

Beside his widow, two sons, Major (Dr.) Arthur Ellis, C.A.M.C., who had a distinguished career in France, and Capt. Harold Ellis, C.E.F., secretary to the Minister of Militia and Mrs. Crooks, wife of Alex. D. Crooks, a Toronto barrister, survive.

PERSONALS

B. A. Johnston, Jr.E.I.C., is now with The Good Roads Department of the Province of Manitoba.

*

Briton O. Smith, A.M.E.I.C., has recently joined the staff of the De Laval Steam Turbine, Trenton, N.Y.

*

Chas. Errington, S.E.I.C., is at present in the Dominion Civil Service, Water Power Board, at Calgary, Alta.

*

W. C. MacDonald, A.M.E.I.C., is at present with The Bedford Construction Co., Royal Bank Chambers, Halifax, N.S.

*

A. W. G. Clark, Jr.E.I.C., has recently been appointed general manager of the Edmonton Cement Co., Ltd., Edmonton, Alta.

*

W. G. MacNaughton, A.M.E.I.C., has been recently appointed manager of the Spruce Falls Company, Ltd., Kapuskasing, Ont.

*

W. G. Calbert, A.M.E.I.C., has been appointed engineer in charge for the Mead Pulp & Paper Company of Port William, Ont.

*

V. J. Melsted, A.M.E.I.C., is leaving Winnipeg for a long holiday in British Columbia and will be resident for some time at Salmon Arm, B.C.

*

Donald Ross-Ross, Jr.E.I.C., has accepted a position with the planning department of the Canadian Rubber Company, Papineau Square, Montreal.

*

I. Matheson Fraser, Jr.E.I.C., has left McGill University, and is now employed as draughtsman with the Dominion Engineering Works, Lachine, Que.

*

R. Norman Coke, Jr.E.I.C., has recently accepted a position with the traffic engineer for the Western Division of the Bell Telephone Company, Toronto, Ontario.

*

A. E. MacGregor, Jr.E.I.C., has recently left Ottawa and is now with the Engineering Branch of the Department of Soldiers Civil Re-Establishment, Toronto.

*

W. E. Joyce, A.M.E.I.C., has accepted a position as resident engineer for Rondout Creek Bridge, Kingston, N.Y., taking charge of this work for the Kingston Shipbuilding Corporation.

*

Capt. L. Kirk Greene, S.E.I.C., has accepted a position with the Wolseley Motor Co., (Commercial Branch) Birmingham, England, and left on the 18th inst. to assume his new duties.

J. E. Openshaw, A.M.E.I.C., has recently returned from a visit to England where he was successful in securing a number of agencies for engineering supplies. It is his intention to open an office in Montreal in the near future.

*

Major W. T. Wilson, A.M.E.I.C., who has been residing at Ottawa since his return from overseas, sailed for England early in September en route to Mesopotamia where he has accepted a position with the Imperial Government.

*

Edmund Grummitt, A.M.E.I.C., formerly instructor in mechanical and architectural drawing for the Department of Soldier's Civil Re-establishment, is now employed as a draughtsman with the Welland Ship Canal, St. Catharines, Ont.

*

Professor L. M. Arkley, M.Sc., M.E.I.C., who has for a number of years occupied the Chair of Assistant Professor of Mechanical Engineering, University of Toronto, has accepted the position of Professor of Mechanical Engineering in charge of that department at Queen's University.

*

R. Lawrence Weldon, Jr.E.I.C., M.Sc., has recently left the engineering department of The Laurentide Company Limited of Grand'Mère, Que., to join the Fort Frances Pulp and Paper Company Ltd., of Fort Frances, Ont., as resident engineer, in charge of engineering and construction work.

*

A. D. Creer, M.E.I.C., has formed a partnership with A. R. MacKenzie, (Assoc. M. Inst. C.E.,) in the practice of civil engineering and valuation and has opened an office at 517 Metropolitan Building, Vancouver, B.C. It is intended to specialize in water power development, water supply, sewerage, railway construction, irrigation, and land development and valuation.

*

Capt. C. B. R. Macdonald, A.M.E.I.C., returned to England from Canada about the middle of September. Capt. Macdonald has spent the last year, on his return from overseas, gaining further Canadian engineering experience and returns to England to accept a position with a contracting firm of which his uncle, Lt.-Col. A. C. Macdonald, D.S.O., M.E.I.C., is head.

*

H. L. Swan, A.M.E.I.C., has recently gone into practice with A. P. Augustine, A.M.E.I.C., in Pencticton, B.C., as Civil Engineers, Architects and land Surveyors.

Mr. Augustine and Mr. Swan have both been recently registered as "Professional Civil Engineers" under the British Columbia act. They have also been recently elected members of the American Concrete Institute.

*

Col. F. M. Gaudet, M.E.I.C., has recently been appointed head of the Public Safety Department of the City of Montreal, this appointment including the control of the Police and Fire Services.

Colonel Gaudet has had a distinguished career as an engineer and administrator. He was responsible for the recruiting of the famous 22nd Battalion, and was

Commanding Officer of this Battalion overseas. Colonel Gaudet is one of the five members of the administrative commission for the City of Montreal, and this appointment is evidence of the value placed on his service in this connection.

•

Chas. Evan Fowler, M.E.I.C., delivered a lecture recently to the Detroit Engineering Society on "Harbours and Harbour Bridges", with particular reference to the proposed Detroit-Windsor bridge. Mr. Fowler's lecture was illustrated with lantern slides, showing harbours all over the world, together with views showing long span bridges. At the recent Great Lakes-St. Lawrence Tidewater Congress held in Detroit, Mr. Fowler was one of the leading speakers. In addition to being a member of *The Institute*, Mr. Fowler is a member of The American Society of Civil Engineers. His experience extends over thirty years in the design and construction of bridges and harbours, both on this continent and abroad. He is an author of ten publications on engineering design and construction.

•

Hugh B. Walkem, M.E.I.C., has retired from the service of the Canadian Pacific Railway, with which he has been connected for forty years, and is now resident at Haney, B.C.

Mr. Walkem was born in Montreal in 1858 and has been with the C.P.R. since 1882. He first served under A. J. Hill as a rodman, was later on location and construction in connection with the Thompson Section, B.C., also on the Shuswap Section, B.C., under Major Rogers, later Mr. Walkem joined the staff of H. A. Cambie and rose to asst. engineer on the extension of the Canadian Pacific Railway, from Port Moody to Vancouver. Mr. Walkem was placed in charge of the Direction of the Terminal Works of the Canadian Pacific Railway at Vancouver and later rose to take charge of permanent way, locating and construction of branch lines, etc., in the Western District.

•

F. W. Cowie, M.E.I.C., chief engineer of the Port of Montreal, has recently completed the first part of the work in connection with electrifying The Montreal Harbour Terminal Railway, having a total trackage of 58 miles. The system being installed is the 2400 volt, D.C. system, which has proved so satisfactory on many lines in the United States, and, nearer home, on the electrified lines of the Canadian National Railways in Montreal. The overhead system has been installed with catenary suspension, wooden poles being used where development is not yet complete, and steel poles where permanent conditions exist. The system has been divided off into half mile sections, with a view to anchoring each section indepedently. It is intended to have electric locomotives of a type similar to those in use on the Canadian National Line through Mount Royal Tunnel, weighing 83 tons each. The power house will be erected centrally and will eventually have a capacity of 3,000 kilowatts.

BRANCH NEWS

Ontario Provincial Division

A. B. Lambe, A.M.E.I.C., Secretary.

Following Mr. [illegible]'s demonstration at the General Professional Meeting, Niagara Falls, a meeting of the Ontario Provincial Division was held. A. B. Lambe, A.M.E.I.C., Secretary of the Division gave a brief survey of the work of the Division in regard to organization, legisation and remuneration.

Two of the Ontario Branches have prepared schedules—Toronto and Niagara Peninsula, and the latter has been to a large extent adopted by the Hydro Electric Power Commission. Council, however, takes the stand that as the salary question is nation-wide, the schedule should be discussed by a general committee of the Institute.

The schedule favoured by the committee appointed by Council is that recently published by Engineering Council (printed on page [illegible] of this issue), which is considered concise, simple and fair. With regard to consulting engineers' fees Mr. Lambe stated that the committee is still working on the question and would present its report at the annual meeting 1921. The legislation problem in Ontario is being considered by a committee having two members from the Engineering Institute of Canada, and two each from other technical organizations. The Toronto Branch is doing good work by keeping in touch with the Ontario Government as to the appointment of engineers for all engineering positions.

Fraser S. Keith, Secretary of *The Institute*, stated that the Branches will be given an opportunity to make recommendations before the final report of the Committee on Remuneration is presented, also that the report of the Committee on Policy will be presented at the October meeting of Council.

Toronto Branch

H. A. Goldman, A.M.E.I.C., Secretary-Treasurer.

Syllabus of Subjects for Winter Session 1920-1921

Oct., 1920, 7 Opening Meeting.—Business and Chairman's Address.
14 Open Night.—Discussion on Questions of Policy.
21 C. D. Dean, A.M.E.I.C.—General Oil Refining Practice (Moving Pictures) Mining Bldg. University.
28 Open Night.—Discussion on Committee's Report on Fees and on Remuneration Committee's Interim Report.

Nov., 1920, 4 F. M. Dawson, A.M.E.I.C.—Cement and [illegible] (Illustrated).
11 Public Meeting in Physics Building, jointly with the Canadian Deep Waterways and Power Association. Addresses on "St. Lawrence Deep Water Route".

18 Open Night.—Discussion on Committee's Report on Zoning. H. L. Seymour, AM.E.I.C.

25 L. W. Wynne Roberts, A.M.E.I.C.—Mesopotamia, (illustrated).

Dec., 1920, 2 Open Night.—Discussion on Committee's Report on Ethics. T. D. Mylrea, A.M.E.I.C.

9 B. F. Haanel, M.E.I.C.—Peat Fuel.

16 J. T. Burt-Gerrans.—Electro-Chemistry and the Engineer (illustrated).

Jan., 1921, 6 Open Night.—Discussion on Committee's Report on Engineers and Sociology. T. L. Crossley, A.M.E.I.C.

13 F. A. W. Taylor.—Super-heaters and economisers, (illustrated).

20 W. Gore, M.E.I.C.—Reservoirs (illustrated).

Feb., 1921, 1, 2 & 3.—Annual Convention of *The Engineering Institute of Canada* in Toronto.

10 Arthur Hewitt.—Toronto Gas Works (illustrated).

17 Murray A. Stewart, A.M.E.I.C.—City Street Paving.

24 R. B. Young, A.M.E.I.C.—The New Theory of Concrete Mixtures; a practical method of proportioning based thereon. T.V.McCarthy,A.M.E.I.C.—Experience with this method on a large power development.

Mar., 1921, 3 Open Night.

10 A. T. Clark & T. M. Jones, A.M.E.I.C.—Design of Centrifugal Pumps (illustrated).

17 T. H. Hogg, A.M.E.I.C.—Description of Hydraulic Power Plant of Hydro-Electric Power Commission.

24 J. Morrow Oxley.—Some Points in the Economics of Building Design (illustrated).

31 C. Nelson Gain.—Pulp and Paper Works (illustrated).

April, 1921, 7 Open Night.

14 W. E. Douglas, A.M.E.I.C.—Engineers and Contractors.

21 F. A. Gaby.—Hydro Radial Railways.

28 Frank H. Keefer.—K.C., M.P.,—St. Lawrence River Deep Waterway and Power Development.

May, 1921, 5 Open Meeting.—Reports. Election and installation of Officers for ensuing year. (Nominations for Chairman, Deputy Chairman, Secretary and three Committeemen to be sent to Mr. Goldman on or before March 17th, 1921).

Note: Watch announcements in press each week.

List of Subjects in Reserve

L. M. Arkley, M.E.I.C.	Purchase and burning of coal on B.T.U. basis.
H. G. Acres, M.E.I.C.	Additional information re Chippawa Power Scheme.
W. R. Worthington, A.M.E.I.C.	Sewerage Works.
P. W. Ellis,	Engineering Features of Queen Victoria Park Developments. (Illustrated).
N. R. Gibson, A.M.E.I.C.	Measurement of velocity of Water Flow in Closed Conduits. (Illustrated).
George A. Sherron,	Modern Concrete Road Construction and Machinery. (Illustrated).
J. C. Krumm, A.M.E.I.C.	Railway Location.
R. R. Knight, M.E.I.C.	Steel Forging and Heat Treating Furnaces.
T. T. Black, A.M.E.I.C.	Forms for Concrete Work.

Internal Combustion Engines.
Foundations.
Mechanical Transportation.
Mechanical Excavators.
Alignment Charts.
Shrinkage or Expansion in Earth works.
Essential Specifications and Conditions.
Rights and Wrongs of Public Ownership.
Economics in Engineering.

Niagara Peninsula Branch

Rex. P. Johnson, A.M.E.I.C., Secretary-Treasurer.

The members of the Branch feel as if they were out of a job. The Professional Meeting has gone off with a bang exceeding our best expectations, and everybody in the Branch feels great satisfaction at the success of the gathering which was conceived almost a year ago and given official sanction by the Branch members last December.

Committee meetings of exasperating frequency and extending to late hours are already forgotten as a thing of the past and only the still late convivial evenings of the meeting have a place in our memories, at least most of us remember them very distinctly.

We wish to thank those firms whose interest in the meeting prompted some very acceptable gifts of inspiration and F. H. Hopkins & Co., The Lyman Tube and Supply Co., The Canada Cement Co. and the Dominion Dredging Co. are to be numbered among the good fellows. Drummond McCall presented the committee with a cheque which was applied to entertainment along the same lines.

It is in order here to call attention to a very important feature of the committee work which was not in evidence at the time of the meeting. This is the fine work done by the Finance sub-committee headed by R. T. Gent, M.E.I.C.

The Committee were very much pleased at the large contribution and especially by the many older and prominent engineers who took the time to come long distances and it is with some pride that we feel that we made the meeting interesting and enjoyable for them as well as for the younger members.

The captain of the winning baseball team promised to write a story about the Saturday afternoon game and we are referred to another page for this account. Mr. Wynne-Roberts should feel gratification at the result even if the origin of the challenge did require explanation in the September *Journal*.

The impromptu parade headed by Mr. Grant during the dance intermission and done to the strains of the pipes was much appreciated and H. L. [illegible] had his own way about the pipes.

A financial statement will be published in the November *Journal* for the information of members.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.

A special meeting of the Winnipeg Branch of *The Engineering Institute of Canada* was held in the Engineering Building, September 9th, 1920. W. M. Scott, M.E.I.C., in the Chair and 61 Members present.

The meeting was called to receive and consider the report of the Special Salary Committee, and to make arrangements for the trip of inspection to the Manitoba Rolling Mills at Selkirk.

It was moved by W. P. Brereton, M.E.I.C., seconded by D. A. Ross, M.E.I.C. and carried:—

That the date of the inspection trip to the Manitoba Rolling Mills be left to H. A. Mackay for any time after the 14th inst., preferably on Wednesday.

Mr. Brereton conveyed the invitation from Mr. Martin, President of the Manitoba Gypsum Company, to the Members of the Branch, to pay a visit to his plant. It was moved by D. A. Ross, M.E.I.C., seconded by J. G. LeGrand, A.M.E.I.C., and carried:

That the time of the visit to the Gypsum plant be left to the Executive to decide the date, such date to be within the current month.

At the request of the Chairman, H. A. Mackay, A.M.E.I.C., assumed the chair, as he was convenor of the Special Salary Committee. Mr. Mackay stated that eleven meetings of the Special Committee had been held, and a great deal of thought and energy had been put on its, as well as many hours of discussion.

The report was then read by the Secretary.

It was moved by W. P. Brereton, M.E.I.C., seconded by J. M. Leamy,, M.E.I.C. that the report had adopted by the Branch as presented.

An amendment was moved by A. J. S. Taunton, A.M.E.I.C., seconded by W. M. Scott, M.E.I.C. and carried:—

That the words "that recommended" be struck out in the last line of the clause dealing with organization on page 3, and that there be substituted therefor "one approved."

Mr. Brereton then altered his original motion to comply with the amendment, which was carried unanimously.

It was moved by A. W. Smith, A.M.E.I.C., and seconded by E. Brydone-Jack, M.E.I.C., that copies of the report be sent to the Council of *The Institute* and to all Branch Secretaries for their consideration, and that each Branch take similar action in preparing and submitting a similar report.

It was moved by E. Brydone-Jack, M.E.I.C., seconded by Geo. [illegible], A.M.E.I.C., and unanimously carried.

That a hearty vote of thanks be tendered to the Members of the Salary Committee for their successful efforts in the preparation of the Salary Report during the past summer.

It was moved by A. W. Smith, A.M.E.I.C., seconded by W. P. Brereton, M.E.I.C., that a special committee consisting of the Nomination Committee and Executive of the Branch, be appointed to nominate the Remuneration Committee, the latter to consist of five Members and to report back to the ordinary general meeting on September 16 next. Carried.

D. A. Ross, M.E.I.C., then gave notice of motion that at the regular meeting on October 7th, he would move that Paragraph 13 of the by-laws covering Standing Committees be amended by adding thereto Clause G—remuneration committee. Clause [illegible]: The Remuneration Committee shall be responsible for taking all reasonable steps to assist the members in obtaining salaries in accordance with the schedules adopted from time to time by the Branch, and for recommending such revision of said schedule as may seem advisable.

On Mr. Scott pointing out that notice of motion could only be given at a regular meeting it was agreed to have this notice of motion presented at the next regular meeting, being September 16th.

The meeting adjourned at 10 p.m.

Edmonton Branch

C. C. Sutherland, A.M.E.I.C., Secretary-Treasurer.

At a general meeting held in August, and after a scrutiny of ballots, the following Gentlemen were declared elected to the executive of the Edmonton Branch, and will take office at the first general meeting held in October.

Chairman —	D. S. Carter, A.M.E.I.C.,
Vice-Chairman —	A. W. Haddow, A.M.E.I.C.,
Sec.-Treas. —	C. C. Sutherland, A.M.E.I.C.,
Councillors:	J. Robertson, A.M.E.I.C.,
	Wm. H. Hunt, A.M.E.I.C.,
	[illegible], A.M.E.I.C.,
Ex Officio	[illegible], M.E.I.C.,
	R. J. Gibb, M.E.I.C.

Mr. Sutherland has already taken office as Secretary and all communications should be addressed to him at City Engineer's Department, Civic Block, Edmonton.

New Brunswick News

First General Meeting of The Association of Professional Engineers of the Province of New Brunswick.

The first General Meeting of the Association of Professional Engineers of the Province of New Brunswick was held on September 10th, in the Board of Trade rooms in St. John. The attendance was representative of all sections of the Province and every branch of engineering. Those present were:—Harry F. Bennett, A. R. Crookshank, C. O. Foss, F. G. Goodspeed, J. A. Grant, A. Gray, G. G. Hare, G. N. Hatfield, W. J. Johnston, C. C. Kirby, G. S. Macdonald, H. F. Morissey, G. G. Murdoch, E. J. Owens, A. G. Tapley, E. A. Thomas, F. P. Vaughan, J. A. W. Waring, S. R. Weston and B. Wilson of St. John, G. W. Arnold of Sussex, D. F. Maxwell of St. Stephen, C. B. Brown, Jr., F. O. Condon, C. H. F. Donkin, W. A. Duff, J. A. Ellis, E. G. Evans, F. B. Fripp, J. D. McBeath, G. C. Torens, and S. B. Wass of Moncton, K. S. Pickard of Sackville, M. W. Black, B. M. Hill and John Stephens of Fredericton, N. A. MacKenzie and G. Stead of Chatham, R. J. Sandover Sly of Campbellton.

The provisional president, C. C. Kirby, M.E.I.C., occupied the chair. The minutes of the organization meeting held in September 1919 were read and adopted. The reports of the provisional council and the secretary-treasurer dealing with the progress of the Legislation and the passing of the Act as well as the financial standing of the Association were read and adopted. The registrar reported that 92 engineers had been registered.

The By-Laws which had been prepared and distributed by the provisional council were taken up and thoroughly discussed. The By-Laws as amended were adopted and ordered printed.

The election of Officers resulted as follows:—

President: C. C. Kirby, M.E.I.C., divisional engineer, C.P.R., St. John, N.B.

Vice-President: C. B. Brown, M.E.I.C., chief engineer, C.N.R. Moncton.

Councillors:

St. John District,	J. A. Grant, A.M.E.I.C., of the J. A. Grant and Co. Ltd., general contractors, St. John, N.B. (1922)
	F. P. Vaughan, M. E. I. C., manager of The Vaughan Electric Co., Ltd., St. John, N.B. (1921)
Moncton District,	S. B. Wass, A.M.E.I.C., dist. engineer, C. N. R., Moncton, N.B. (1923)
	J. Edington, M.E.I.C., city engineer, Moncton, N.B. (1921)
Fredericton District,	B. M. Hill, M.E.I.C., provincial highway engineer, Fredericton, N.B. (1923)
Chatham District,	Geoffrey Stead, A. M. E. I. C., dist. engineer, Public Works, Canada, Chatham, N.B. (1922)

Auditors: J. A. W. Waring, A.M.E.I.C., asst. engineer, C.P.R., St. John, N.B.

F. G. Goodspeed, M.E.I.C., dist. engineer, Public Works, Canada, St. John, N.B.

Nomination Committees for 1921, St. John District, (Counties of St. John, King's, Queen's and Charlotte)

G. G. Murdoch, M.E.I.C. and G. G. Hare, M.E.I.C. Moncton District, (Counties of Albert, Kent and Westmorland) J. D. McBeath, M.E.I.C., and E. G. Evans, M.E.I.C.

Fredericton District, (Counties of York, Sunbury, Carleton, Victoria, and Madawaska) H. M. Armstrong, and M. W. Black, A.M.E.I.C.

Chatham District, (Counties of Restigouche, Gloucester, and Northumberland) R. J. Sandover Sly, A.M.E.I.C. and G. E. Martin, A.M.E.I.C.

The President thanked the Association for their expression of confidence in him as it showed him that the members were pleased with the work of the provisional council and that work had not been light during the organization period. He compared the progress in New Brunswick with that of the other provinces and asked for the support and co-operation of every member.

A vote of thanks was extended to the provisional officers for their services in preparing the Act and putting it through the Legislature.

A vote of thanks was extended to the editor of the Canadian Engineer for the 350 copies of the Act which he had presented to the Association.

At the close of the business session the members adjourned to the supper room at Bond's restaurant where members of the St. John Branch E.I.C. joined with the members of the Association for supper.

After the delightful repast the Chairman, G. G. Murdoch, M.E.I.C., proposed the toast to the King and then welcomed all visiting members to the city and congratulated all on the very enthusiastic and business-like meeting which had consummated the Association of Professional Engineers in New Brunswick. He felt that men of such high standing in the profession could not come together as they had today without widespread results for the betterment of the Profession. He expressed the pleasure the St. John Branch had in being able to join with the outside men in furthering the cause of the Professional Engineer.

C. C. Kirby, M.E.I.C. in proposing the toast to the Engineering Profession dwelt on the standing of the profession in the community and the country at large, on the gradual development which is taking place over the American continent in making the public realize the importance of thoroughly trained engineers. He took up the several phases of the report of the "Engineering Council" on classification and remuneration and urged the necessity for co-operation to bring about better social and financial conditions for the profession.

D. F. Maxwell, M.E.I.C., replied to the toast and congratulated the Association on its choice of president. He drew attention to the great responsibilities of engineers in the expenditure of large sums of money, and yet he did not understand why engineers did not sit in the parliaments of the country where their advice would be valuable in determining the economic use of the people's money. He eulogized the profession as a whole on the magnificent part it had played during the late war.

Geoffrey Stead, A.M.E.I.C., in moving a vote of thanks to Mr. Kirby for his thoughtful address, compared the salaries of young and inexperienced railroad men to engineering graduates with ten years experience who were getting smaller salaries.

C. O. Foss, M.E.I.C., in seconding the vote of thanks became reminiscent of the [illegible] years he had spent in the profession and the uphill work of the engineers in convincing the public of its need for scientific men to safeguard life and property. He felt however that the recent advances made would soon bear fruit and that the engineers would receive the appreciation they rightfully deserved.

The Chairman in tendering the vote of thanks expressed the feelings of everyone present that the address illustrated to all the necessity for united action in order to obtain results. Mr. Kirby's address was thoroughly appreciated.

After the singing of the National Anthem the members proceeded to the St. John Exhibition.

Preliminary Notice

of Applications for Admission and for Transfer

20th September, 1920

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in October, 1920.

FRASER S. KEITH, Secretary.

*The professional requirement are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AUGER—ALBERT, of Prince Rupert, B.C. Born at St. Boniface, Man., Feb. 14th, 1889; Educ., B. A. 1908, B. C. E. 1913, Univ. of Manitoba; 1908, rodman, G.T.R. & N.T.C. Rlys.; 1909 (summer), concrete & piling inspector, N.T.C.; 1912 (summer) instr'man same company; 1913-15, dftsman, bridge engr's office, G.T.P.; 1915-19, constrn. engr. for Tremblay McDiarmid Company on constrn. new Winnipeg aqueduct; 1919 to date, with G.T.P., dftsman and designer, June 1920 appointed asst. engr.

References: J. G. Legrand, G. C. Dunn, J. A. Heaman, W. S. Fetherstonhaugh, E. E. Brydone-Jack, W. G. Chace, W. H. Tobey.

BEACOCK—VICTOR ALONZO, of Toronto, Ont. Born at Oro, Ont., Sept. 8th, 1892. Educ., B.A.Sc. Toronto, 1915; April to July 1915 and July 1919 to date with H.E.P.C. of Ontario, Municipal Dept., personally in charge of street lighting installation, Windsor, Ont. and at present assisting on the Niagara system, principally in connection with distribution systems.

ENTERED AT THE POST OFFICE, MONTREAL, AS SECOND CLASS MATTER

VOLUME III MONTREAL, NOVEMBER 1920 NUMBER 11

Secondary Technical Education

A discussion of present and proposed methods of training in industry; vocational training, what it has accomplished in Great Britain and America, and the part to be played by engineers.

Read at the Eighth General Professional Meeting, Halifax, N.S., October 14, 1920

Professor F. H. Sexton, D.Sc., LL.D.

Educated and trained engineers may have a preconceived idea that little may be gained by consideration of secondary technical education. But with this notion, they have not a proper conception of the significance and importance of this phase of education which is one of the most effective instruments for human good and improvement. If general education is defined as preparation for life, technical education may be defined as preparation for making a living. Such short and simple definitions may be open to most serious objections when closely analyzed, but they do possess the advantage of brevity and differentiate the aims and purposes of these two divisions of education so that the limitations of that portion dealt with in this paper will be recognized.

Professional Training

We are well acquainted with the training for the professions, especially that of the engineer. For generations the best thought of educationists has been given to this problem, because the fundamental ambition of society in education has been to train leaders. Courses have been carefully planned, pruned, cut, adjusted, and re-adjusted so that a boy could cram enough knowledge and acquire such specific habits of working and thinking in the space of four years after he had completed his high school curriculum, that he would after a few years of experience develop into a competent lawyer, physician, clergyman, or engineer. High school and collegiate school courses have been modified to suit the underlying motive for carrying the youth into and through the university to his degree. With the evolution of industry and society, the college requirements have been modified to some degree, but not to any alarming extent in recent years. No doubt, engineering courses need some considerable adjustment to modern demands and needs, but these come slowly because of the tendency of universities to be ultra-conservative and to perpetuate jealously certain ideas and methods. On the whole, college training is eminently satisfactory, and is still producing the desired results in good measure.

As engineers are fully cognizant of the particulars of higher college training, the less explored and exploited field of secondary technical education will now be explored. This includes organized effort on the part of public or other authority, acting outside the sphere of regular professional training in college courses, to fit people for occupational fitness. It includes technical high schools, trade schools, industrial art schools, continuation and part-time schools, correspondence schools, mechanics' institutes, corporation schools, vestibule schools and up-grading schools in industry, commercial colleges, university extension courses, home economy training centres, women's institutes, and a host of other institutions and classes. The underlying motive of attempting to fit people for useful vocations is the point of differentiation by which industrial and technical education is classified. The institutions and organizations mentioned are of a secondary nature because they are supplementary to the common or primary schools in the public school system and do not attempt work of a university grade.

Engineers have been deeply concerned in training for their own profession, and rightly so. In this respect they have been following the policy of the general public which for centuries has been mainly concerned with the education of leaders. Private munificence has erected thousands of magnificent university buildings that rival and surpass the palaces and castles of old. Millions upon millions of dollars have been donated to endowments in order that the experts of the world might be assembled and maintained to impart their knowledge to ambitious youths. Huge sums have been subscribed and bequeathed to scholarships in order that special talent that appeared among the poor and lowly might be developed for leadership. The principal concern has been to train *leaders* in human endeavor. The public school curriculum has been modified to meet the college entrance requirements and all education has been more or less subordinated to the one end. It was thought necessary that everyone should learn to read, write, and become proficient in the elements of arithmetic, history, and geography, but the common faith was anchored in the belief that if a few leaders were trained all would be well.

The Importance of Leadership

Leadership is assuredly the most important factor in the success of industrial enterprise, commercial undertaking, social effort, or any human organization, but it is only a factor. Any leader must have a trained and orderly collection of individuals co-operating with and subject to his will if the desired results are to be attained. In earlier pioneer days every person was more independent and self-sufficient than at present. With the introduction of the factory system, the manufacture of power, the growth of cities, the development and transportation and engineering, we have grown more and more dependent one on another. Every person has become highly specialized and renders service to the whole community in exchange for a living for himself. He no longer builds his own house and barn, raises his own food, and makes his own clothes. He works with others to make a product or render a service of which he does not observe the distribution or see the direct result. The radical changes in industry have produced profound changes in society of which we are only half aware. We follow the crowd breathlessly and know that we are on our way, but we do not stop either to consider our relations to the rest of the mob or to exert ourselves to make the procession more orderly and effective. We are so interdependent that each should be much more carefully prepared to render his fullest service to all and to develop his utmost power. Our leaders must prove their fitness to guide the way, and the rank and file must be shown exactly how to perform their functions. Our training for leadership is fairly satisfactory, but we have sadly neglected to provide adequate facilities for those who perform the humbler tasks in life.

The Need for Vocational Training

Never has there been such an insistent and widespread need of education in endless variety for all the people who do not hold directive and administrative positions. Class consciousness of the men and women who worked for wages was growing apace before the war. During the great struggle they came to a full realization of their position in the social and industrial structures and this fact was emphasized and over-emphasized by their own leaders and people in the highest authority. Then came the serious and vociferious crescendo on the importance of labor and the diminuendo on capital and management. We are now in the midst of a turmoil of re-adjustment of relations and understanding, and general conditions must be stabilized before further progress can be made.

The establishment of co-operative good-will between capital, labor, and management is our immediate task. Suspicion, ill-will, misunderstanding, and even hatred are rampant. The only solution for this muddle is education, and the great field of secondary technical education must be exploited quickly and to the limit. Our primary education needs some refurbishing and improvement in efficiency and financial support, but is sound in the main. Technical education both for better work and better citizenship is demanding our best attention and action.

Engineers as they develop come more and more to handle men. In the early part of their career they may be mainly concerned with materials, stresses, machinery, and instruments, but as they rise higher they surround themselves with a staff of men through whom they have to work to accomplish their plans. Their immediate subordinates are men who have had special training in universities or in the college of hard knocks. Each has his special aptitudes and powers, and in a good organization each is fitted into his best sphere of action and authority. Below the staff, however, are the masses of mechanics and laborers by whose immediate efforts the carefully planned work is carried out. Every engineer knows the difference in results accomplished by a sullen, slacking, incompetent gang, and a loyal, energetic, skilful crew. How can we expect the proper and satisfactory effort on the part of the rank and file of labor when it has not had half a chance to be trained for its work? We cannot,—and for this reason engineers should be deeply concerned in the problem of secondary technical education.

Vocational Training a Successor to the Apprenticeship System

Not many years ago the apprenticeship system was widespread and provided a method of training for skilled workers that met the needs of that stage of industrial development. It was wasteful of time and effort on the part of the indentured apprentice, but it did turn out competent workmen. With the extreme specialization of work, however, trades were divided into many different occupations, until men's vocations were limited to the routine production of special machines. Emphasis was placed on production until the chief consideration was the equipment and output of a plant and the human workers were almost forgotten. The apprenticeship system faded away almost altogether and no one had any time to teach anybody else anything. The craftsmen from the apprenticeship system were used up as foremen and now they are fast disappearing. These steps have left industry in a parlous state, and the chief instrument for re-establishing satisfactory conditions seems to be technical education.

It may be said that this sounds well, and that the statement regarding conditions and needs is accepted; but how can such training be carried out—what must be done? I would say bluntly that every worker should be trained for his job and for proper living when he is off of his job. He must be educated so that he may develop himself to the utmost as a productive wage-earner and as an independent, self-respecting, and community-respecting citizen.

The Industrial High School

In spite of all kinds of educational advantages offered all over the world, most boys enter gainful occupations between the ages of fourteen and sixteen. This is largely due to the sudden maturing of youth during adolescence and the desire to play a man's part in the world. This condition will persist. It is wise and necessary that our high schools and academies should be broadened, and that technical courses preparing ambitious boys for skilled trades and vocations should be provided. This will give the boy with special aptitudes for industrial and commercial work an equal opportunity with those of scholastic tendencies who are forging ahead to college to fit themselves for the professions. A comparatively large number of gifted boys who now leave at the end of the common school course, because there seems to be nothing more of value and interest, will flock into vocational courses when they are provided. In some communities where such schools were established, the high school attendance practically doubled. The purpose of the ordinary high school is to teach, but the vocational high school must teach and train similtaneously. The latter type usually gives as many hours of instruction in general and cultural subjects as the other, and adds shop work and laboratory. The change from mental to physical work prevents fatigue, and the boy in the technical school secures his general knowledge with occupational training in addition.

Such industrial high school courses as I have mentioned are of interest to the engineer because the youths trained there will have the power to develop rapidly to positions as foremen, superintendents, and staff assistants. However, we may be sure that no matter how many schools like this are provided which require full-time attendance, the great mass of boys will leave school at the age of fourteen or fifteen and enter business or industry. This will not be from economic necessity in most cases, but because of that restless spirit which is characteristic of adolescence and which prompts a boy to act as a man. The tragedy will lie in the fact that some few years later the men will find a wall stretched across their paths of promotion and then will bitterly rue the day when they flung educational opportunity away.

Day Classes in Working Hours

The great human need now confronting us is the proper preparation of the huge number of youthful workers from fourteen to eighteen years of age for efficient production and responsible citizenship. This is the field of secondary technical education. The effort to exploit this field should be made by industry and public educational authorities working hand in hand. Great strides are being made in the United States in this direction; nearly half of the States have passed legislation requiring boys and girls between fourteen and sixteen or fourteen and eighteen to attend continuation classes if they are at work. They are usually compelled to attend special schools in the daytime for four to eight hours a week and are paid for it by their employers just as if they were engaged in productive work. The instruction is adapted to their vocations, but they are all given vital courses in English and civics. This will have a tremendous effect in raising the standard of intelligence of the workers and in making them keen, well-informed, independent citizens. Ontario has also passed such legislation and the other Provinces will quickly follow her lead.

This is of general interest to engineers because they must have well-trained and intelligent workers to carry out their plans effectively, but their chief concern should be about the education in which they should participate to train their workers for greater and better production. Most engineers are more prone to give orders and directions to men under them than to try to impart the training and knowledge that would do away with so many detailed instructions. Most of them seem to enter the teaching profession, but they should be engaged in some form of education which concerns their workers.

Failure of Scientific Management with the Human Element

Scientific management was hailed as a panacea which would give the highest production and completely satisfied workers. The trouble was that it lacked humanity. It tried to standardize human action in the same manner as we standardize products and methods of production. It was systematic rather than scientific, and it took for granted that men were actuated by the one motive of securing the greatest financial reward. Adam Smith and John Stuart Mill based their laws of political economy on the same basis, and we now find that their tenets do not exactly fit modern conditions. We were amazed at workmen protesting against the use of the stop watch and scientific management methods, and requesting a return to wages on an hour basis, even when it meant smaller pay envelopes. Human beings cannot successfully be regarded and treated as machines. Labour recently has demanded the right of self-determination, whatever it means by this term, and refuses to have itself regarded as a commod ty. All the new plans for industrial democracy and representation of labour in management are due to the pressure and demands of labour and have not been free gifts from employers and corporations.

Present Status of Organized Labor

Through fighting organizations, labour has placed itself in a more advantageous position than it ever possessed before, nor is the end yet in sight. Wages have advanced to unheard of levels, so that contracts have become speculations and corporation profits often assume the form of a mirage. Labour is in danger sometimes of pushing its demands to the extent of practically confiscating productive industry. The laboring classes often come to the point where they depend more on their organization to secure satisfactory wages than upon their own skill ability, or productive capacity. High wages have promoted system, efficiency, and labour-saving machinery to an unprecedented degree. Very often employers and managers have resorted to these helps rather than to new methods of increasing the power and knowledge of the individual workers. There is no resource of more value than the undeveloped powers of human beings. Very little attention has been paid to this in the immediate past, but the late war showed us the wonderful results that may be achieved by adequately training men and women for their specialized work.

What Great Britain Accomplished in Vocational Training

When Great Britain entered the struggle against the Central Empires, there arose immediately an enormous demand for special operatives to manufacture munitions. The machine-tool processes called for a fineness of operation and an accuracy of measurement that was most uncommon in the work of the ordinary machinist. There was only one way to get the desired number of workers and that was to train them. Millions of men were drawn into the army and it was necessary to draft women to a large extent into the factories. Their power to perform the refined tasks of production was almost unknown. Special sections of the shops and special machines in the factories were set aside under skilled instructors for training purposes. Part of the efforts of the corporations were strictly educational. The training was carried out under wholly practical conditions and from the very start the production of the worker was commercial. All the work was on regular parts which went into the output of the factory.

The success of the training efforts was amazing. In a few days or weeks, green employees were making fuse-caps, shells, cannon, and all the machines of war which require so much accuracy and fineness. Women showed surprising capacity for intricate and exact machine-tool work, inspecting, and assembling, and in many respects were more satisfactory workers than men. The results were so gratifying that training schools were established in all kinds of factories, shipyards, arsenals, and all manner of productive enterprises. Industry itself became a more intensive and more comprehensive educational agent in technical training than public authority ever had been.

Corporation schools were also developed for older employees to fit them for occupations requiring more knowledge and skill and for positions of greater responsibility. The organizations for training green workers were called "vestibule schools" and those for older workers "upgrading schools." The Ministry of Munitions collected and disseminated the information concerning the various efforts in industrial training.

Results in the United States

When the United States entered the war the same acute need of a huge number of new skilled operatives presented itself. The United States Council of National Defense organized a Section on Industrial Training and the British authorities immediately gave it the benefit of their experience. When the Vice-President of Production of the greatest munitions plant in America was shown the illustrations of British women making a highly specialized product, he said, "Your plan is good, but it wouldn't work here." An hour later, however, he was convinced that it should be given a trial and soon the company was spending money at the rate of $500,000 per year in training work alone.

The Curtiss Aeroplane Co. was informed that there was no part of an aeroplane or its engine which the women in Great Britain were not making successfully and it immediately organized one of the most successful training plans for its workers in the United States in which it finally expended money at the rate of $470,000 per year. All kinds of industries in the United States followed suit. Perhaps one of the most outstanding examples was that of the Emergency Fleet Corporation in training shipyard workers.

Before the war American shipbuilding had become absolutely decadent. The ship construction programme in the war called for hundreds of thousands of riveters, ship-fitters, chippers, caulkers, oxyacetylene and electric welders and workers in dozens of other specialized occupations. The Corporation organized an Education and Training Section which was immediately given the task of training men to increase the number of workers in 61 shipyards from 50,000 to half a million.

Details of the splendid accomplishment cannot be given in this paper, but the magnitude of the work can be appreciated from the mere statement that 1100 instructors were educated who in turn actually trained 80,000 men for shipyard work. The time and cost to train men for their work was found to be surprisingly short and small. For example, riveters were developed from green men in 21 yards in 28 days, at an average cost for instruction of about $25.00. The average length of training period in 21 yards for 20 different occupations was 19 days. Such startling results as these make employers see the great possibilities of industrial training for all their workers. Many corporations since the war have maintained their training departments, and many other companies have established some form of definite vocational instruction. The Goodyear Rubber Co. has organized and developed a university at Akron, Ohio, which now has about 5000 students, the majority of whom are employees of this concern. Examples could be multiplied by scores, but no great good would be accomplished in further repetition.

Training Returned Soldiers

The retraining of disabled returned soldiers was another great development of secondary technical education due to war conditions. Thousands of men with shattered nerves and crippled bodies returned from overseas and could not resume their former occupations. In other wars such men have been turned adrift with more or less inadequate pensions and have been left to make their own readjustments and complete their own re-establishment in civil life. It is stated that most of the British pensioners of the Crimean war died in the workhouses. In the present struggle, however, secondary technical education was employed as an instrument to place these disabled veterans back on their feet as independent productive citizens.

Canada has achieved a proud record in this great work. Special trade schools were organized by the government to train men for a large variety of occupations where technical knowledge was necessary as well as trade skill. To prepare men for other vocations, they were given short intensive apprenticeships in industry. In the special schools, the training was carried out under practical commercial conditions, while the related science, drawing, mathematics, and theoretical knowledge was imparted at the same time. The men and their dependents were supported during training. After a period of six to eight months the men had acquired enough skill and knowledge to engage in their new occupations at a living wage, and continue in a vocation where their physical disability was little or no handicap. In Nova Scotia we have found about 4000 men who were either physically disabled by war so that they could not efficiently take up their old occupations or who enlisted under 18 years of age and hence had no occupation. These men have been trained for over 250 worthy, gainful vocations. Of those who have satisfactorily completed the courses, over 80% are now working away in industry and commerce as useful, self-respecting citizens. The results achieved in this direction have been most striking and we can rest assured that there is only a handful of seriously disabled men from the war for whom some proper niche cannot be found in the busy world where he can continue to work as a normal member of the community.

Necessity for Instruction

The evident lesson from the successful applications of secondary technical education to the benefit of the individual and society is bluntly that every man should be trained for his job. Engineers are constantly employing men who are supposedly qualified to perform specific duties and the results are only too commonly disappointing. Engineers and the concerns for which they plan and execute are prone to hire the few competent men away from each other and to discharge constantly the incompetent ones. This produces high labour turnover, exorbitant labour costs, discontent, disloyalty, and a train of attendant ills. The workers themselves are not to be blamed in too great a measure for being incompetent, because there is now no one to teach them the proper way to do their work. The school system offers little to prepare boys or men for their occupations and industry is concerned mainly with production.

A Task for Engineers

It seems, therefore, as if engineers would have to assist in the task of making men fit for their jobs while they are working. The laborer will have to be shown carefully how to shovel dirt, drill a hole, perform a factory operation and whatever else he [illegible] out for while he is earning wages. It does not take long, and often it does not cost as much as it does to discharge him and take on another worker. He must not be shown simply to perform a narrow line of routine duties with the single idea that he is to be made a more efficient machine so that his greater production may result in a reward that is shared in some proportion by his employer and himself. He should be trained so that he may work more effectively and derive more human satisfaction from work well done. Every man should know more about his work than his daily duties demand. Industry must render some of the educational service that characterized it in the days of indentured apprenticeship. Engineers as trained and educated directors of work will have to assist in providing opportunities for definite formal training in industry. If they want competent men they will have to help make them.

There is no factor in constructive or productive work today which is capable of more improvement than the labour factor; no part of the organization so susceptible of advancement as the mass of human beings at the bottom of the scale who perform the actual work. The avenues for promotion to the ambitious and able man must be opened, and some of the knowledge and skill necessary for promotion must be given him on the job in the form of industrial training. The schools do not give it, and probably never will render the whole of this service. It seems proper that industry shall be held responsible for giving the worker operative skill while the schools impart the general and technical knowledge necessary for the development of the worker's intelligence and for his understanding of the duties of citizenship. But there is the world's work crying out to be done today and the engineer must have men to do it. In this emergency he cannot wait for the leisurely development of the public school system. In addition to his tasks of tearing the treasured minerals from the protecting bosom of the earth, choking the rushing river into submission to his will, guiding the lightning flash to light his way and directing the forces of nature to the service of man, he must also assume part of the burden of bringing the minds of all those who work with him to greater wisdom and better understanding.

The Legal Phases of Irrigation Development in Alberta

A history of irrigation law in general, developments in Alberta, how an irrigation district is formed, procedure under present laws.

Read at the Western Professional Meeting, Banff, B.C., August 1920.

H. B. Muckleston, M.E.I.C.

The history of human development, and especially that phase of development which we term civilization, is very clear in teaching that it is not good for mankind to grow up in a country where nature is too generous.

Where man has been forced to work hard for his living he has usually developed; where sustenance comes too easily he has seldom advanced and too often has even retrograded. Ancient history is full of illustrations of this phenomenon, but it is unnecessary to go further afield for illustration than the Spanish-American republics. Mexico—Guatemala on the one hand and Chile or the Argentine on the other, shew this tendency in the fullest degree. Both were colonized by the same people at about the same time, yet the lapse of only a few generations has produced something near barbarism in the one case and a relatively high civilization in the other.

Among the features which distinguish barbarism from civilization the most prominent is the existence of what we call law, in reality merely "the rules of the game". In a state of absolute barbarism every man is sufficient unto himself. He gets his own food, makes his own weapons and clothes, builds his own shelter, is his own doctor, priest, and ruler, and when he dies manages to get along without any undertaker.

Civilization connotes initiative, enterprise, community spirit, co-operation and team play, and its first necessity is a code of the rules under which the team works, otherwise the game cannot go on.

It is significant that if we examine the earliest beginnings of civilization of which we have record, we find invariably an obstinate bias in favour of countries where irrigation was a necessity of existence. (According to Sir William Willcocks the garden of Eden was an irrigated farm) and hence it is not surprising that the oldest legal document which has come down to us, the law of Hammurabi, King of Assyria and a contemporary of Abraham, is a code regulating the use and distribution of water.

The Common Law

Such a law has always been a necessity in a civilized state as witness "the shot gun policy" of not very remote days in the West, but the requirements are not the same in all climates, and accordingly we find a very wide variation in the terms and doctrines of the law as applied under different conditions. The law changes as the conditions change but the law is conservative and the process is slow. English common law differs from the Roman law in that it is not reduced to a code, but is the slow outgrowth of judicial decisions rendered during many centuries. Most of Canada and the United States was first colonized by Englishmen, and these colonists brought with them the English common law as they knew it. In so far as this law governed the use of water it did so under the doctrine of Riparian Rights.

By this doctrine a riparian owner was entitled to have a stream flow by his property undimished in quantity and unchanged in quality or to be compensated for any change. He did not own the water but he did have a measure of right in it.

The growth of modern civilization has subjected this doctrine to a severe strain, and naturally has resulted in a slow modification of the fundamental idea, and it is not surprising to learn that one of the earliest of these modifications is found on the east coast of England, where a form of meadow irrigation has been practised since Roman times. In Eastern Canada and the humid states, the doctrine of riparian rights still holds more or less unaltered from its original form, but in the Western states it has been much modified by statute and court decisions till at present in some of the arid states the law relating to the use of water is in a disconnected, fragmentary and unsatisfactory condition.

Federal Legislation

In Western Canada we are more fortunate. Irrigation development here was of much later date than South of the line and we had the experience of the arid states to guide us and point out the legal troubles which we might expect. We were then able to forestall these difficulties by legislation along proper lines.

Irrigation in the territory which is now comprised in the province of Alberta and Saskatchewan began early in the history of its settlement by the construction of numerous private systems on the streams heading in the foot hills and in the mountains. These schemes were small and scattered. Settlement was sparse and little or no legal trouble was experienced. However, the shadows of coming law suits were in sight, and as a result of much study of the subject in all its phases, legislation was decided on and the "North-West Irrigation Act, 1894" was the result. In 1898 this was repealed and the "North-West Irrigation Act, 1898" substituted. This Act has been the basis on which all subsequent development of irrigation in the Northwest Territories and afterwards in Alberta and Saskatchewan has taken place.

Irrigation Act 1898

Following the usual formal clauses and the necessary interpretation paragraphs this statute enacts that "The property in and the right to the use of all water........ ....shall be deemed to be vested in the Crown" unless some prior right was established. The Act thus completely extinguishes the common law doctrine of riparian rights and forestalls all possible litigation over water rights.

The Act then provides a mode of acquiring a right to use water from any surface supply, provides for publication of notice of application and for construction of the necessary works, gives to irrigation canals the right of eminent domain, and specifies the incidental powers of the applicant. It then provides for a license to use the water for the specified purpose and no other, and for cancellation for non-user under certain conditions. Sufficiently drastic penalties for infraction are provided to deter the wilful from violating any of its provisions.

In general the main provisions of the Act are:—

1. All surface waters belong to the Crown.
2. The right to divert and use must be acquired in a stipulated manner.
3. The water when diverted for irrigation purposes is pertinent to the land, and neither can be transferred without the other.
4. License depends on beneficial use, and water hogging is made impossible.
5. Licenses take priority according to date of application, and each higher licensee is entitled to full supply before any lower licensee may divert any.
6. Provision for settlement of disputes as to quantity as between licensees.
7. Provision for forfeiture in case of non-user.

The Act divides the various uses for which water may be diverted into five classes: domestic, municipal, industrial, irrigation and other purposes. Rights of whatever class have precedence according to date of filing application, but, subject to this provision, they take precedence in the order named. In case all water from any source is appropriated the law provides that applicants requiring water for a higher purpose may have rights for a lower purpose extinguished on paying just compensation to the holder thereof.

As no statute is automatic and machinery must be provided for its administration, the Act, therefore, empowers the Government to make the necessary regulations to ensure that its provisions will be carried out. It also vests in the responsible Minister of the Crown the power to survey the sources of supply and the lands on which the water may be used.

Acting under the provisions of the Act the Department of the Interior has carried out hydrometric surveys on all the important streams, springs, and other surface sources in Alberta and Saskatchewan and now has records extending back for variable periods. Under this Act also the Department of the Interior has fixed the duty of water, carried out extensive surveys to determine where the available water can best be used, surveyed reservoir sites and done the preliminary engineering work for a number of projects, some of which are now either in actual operation or in various stages of construction or organization.

Provincial Legislation

Apart from a small host of minor private schemes, the first developments undertaken were under corporate control. Of these the C.P.R. projects are easily in first rank by reason of size and in point of time. There were some disappointments and failures but on the whole the development of irrigation was steady, and about 1915 the time had arrived when the settlers themselves were ready to undertake large projects on a co-operative basis. Before this could be done further legislation was required of a kind which lay within the Provincial sphere of action.

Prior to 1905, when the Provinces of Alberta and Saskatchewan were carved out of what had been the Northwest Territories, such legislation was a function of the federal authorities, and the Irrigation Act as originally passed provided for the organization of irrigation districts, but on the creation of the Provinces these powers passed to the Provincial legislatures.

The first Irrigation District Act for Alberta was passed in 1915, and subsequently amended from time to time. In 1920 the subject was reopened, the Act of 1915 was repealed and a new Act substituted which is now the law of the Province.

Irrigation District Act, 1920

In framing legislation of this kind the subject must be viewed from many angles. The object of such Acts is to facilitate the formation of associations or societies through which the settler can better his condition. It should also make extremely difficult or even prevent the opposite. Good legislation makes progress easy, rapid and sure, bad legislation invites certain and lingering disaster. Regulation is quite as essential to success as facilitation.

The existing Irrigation District Act is the result of very careful consideration of similar legislation in the various arid states of the Union and is an attempt to avoid the pitfalls which their operation has revealed and to stick to the well beaten trails which experience shews have led to success. It probably is not perfect. Legislation in a new country seldom is, and time will probably reveal defects which can be corrected, but it is an attempt to start these districts on the road with the right foot foremost, and to provide a competent guide, philosopher and friend for the journey.

The Act is very complete and if any contingency has not been foreseen and provided against it is not for want of study and care in framing.

The Act is divided into seven parts as follows:—

I. General provisions; formation of districts, their organization, regulation and financing; construction of works or other means of supply of water; striking and collection of rates and assessments;

II. Elections;

III. Provision for making, revision, appeals from and confirmation of the assessment roll;

IV. Provides legal machinery for the enforcing and recovering of rates and assessments, and distress and sale of lands in default;

V. Change of content of district and procedure in the event of dissolution of a district;

VI. Gives power of eminent domain and provides for arbitration;

VII. Execution against the district.

Finally the usual powers are vested in a responsible Minister to make regulations for carrying out the provisions of the Act.

Irrigation Council

The Act creates a body known as the "Irrigation Council", consisting of not more than three members, in whose hands is placed the operation of the Act. This Council is given very wide powers of control over the affairs of the districts which may be exercised at its discretion. Thus, it may forbid any act or course of conduct proposed to be done or entered into by any district; it has absolute control of all borrowed money, contracts and assessments, and it may engage expert advice and assistance in any matter at the expense of the district.

Probably the easiest way to illustrate the working of the Act is to trace some imaginary district through the various steps it must take up to the time it is actually in working order, and then perhaps to follow its trail a little further along the road while it is shaking down to a smooth running machine performing the service for which it was intended.

Most of the large areas suitable and properly situated for irrigation have been or will be surveyed by the Department of the Interior, and the irrigable and non-irrigable lands have been or will be more or less completely determined.

Petition for District

The available supplies of water have also been carefully measured and recorded, so we may assume, in the case of our imaginary district, that most of the preliminary engineering work has already been done, and that our district has in its possession enough information on which to base a decision to go ahead under the Irrigation District Act. The first step is to circulate a petition addressed to the Minister of Public Works praying that the proposed district may be erected. This petition must set out by parcels not larger than a quarter section the lands which the proposed district will include. When any quarter section is subdivided between different owners, each such parcel must be shown. The petition must be signed by persons who are of legal age and collectively own at least half the proposed district. The word "owner" is defined as the registered owner having a freehold estate in possession in land. The petition is forwarded to the Minister accompanied by a sufficient sum to defray preliminary expenses, and sufficient evidence to prove the project feasible, including the report of a competent engineer. As previously stated the federal government have already satisfied themselves as to the feasibility and the Commissioners' report is probably accepted as satisfactory.

If, on examination the Minister is satisfied, he causes a notice to be published in the Alberta Gazette to the effect that petition has been received and gives the proposed district a name. Similar notice is also published for three weeks in a local newspaper. Two weeks is then allowed for kicks, and if none are received directions are immediately issued to take a vote of those interested as to whether further steps are to be taken. At the election the franchise belongs first to the purchaser (if any), second, if there be no purchaser, to the owner or occupant ("occupant" is defined as any person occupying land exempt from taxation). It will be noticed that while the petition must be signed by the *owner*, at the election a purchaser has the vote before the owner. At the same time a board of trustees consisting of three members is elected.

Formation of District

Should the vote prove that two-thirds of those voting favour the formation of the district the Minister by order in Council forms the area into an irrigation district and declares the name of the trustees. The Act provides that the issue of this order shall be conclusive evidence that every requirement of the law has been observed and forbids any Court to question the validity of any of the proceedings up to this point.

The publication of the order *ipso facto* makes the board a body corporate with all the corporate powers necessary for its business.

Within thirty days the board must meet and organize for business by electing one of its members as Chairman and by appointing a Secretary, and a Treasurer or a Secretary-treasurer, and an Engineer who must be a corporate member of the E. I. C. or some other body requiring similar qualifications for membership.

District Assessment Roll

The next step is the preparation of the assessment roll of the district. The Act requires that this be done by the Secretary with the assistance of the Engineer, and details exactly what data this roll shall contain and the form in which it is to be set out. As soon as this roll is completed the Secretary sends to each owner or occupant a notice setting out his land, the irrigable area and the non-irrigable area and a statement of the last date on which complaints will be received, which must be not less than twenty days from the date of mailing the notice. At a previously notified time and place the Board sits as a Court of Revision to hear complaints and act upon them. The roll is then amended as directed by the Court, and in default of appeal, becomes the revised assessment roll of the district, valid and binding upon all parties concerned. Any complainant has right of appeal to a judge of the district court who shall hear and decide such appeals and whose decision is final. As finally amended by the judge the roll becomes the revised assessment roll and can only be altered by the board by by-law for cause, and subject again to appeal to the judge.

While this is going on, the Board may take the necessary steps under the Irrigation Act to acquire a water right and get the necessary authority to construct its works, or it may instead, or in addition, and with approval of the Council, enter into a contract with some other party, corporation or district, which already possesses such right or authority. If thought advisable this step may be postponed until after the debenture by-law is voted on.

As soon as the assessment roll is finally completed, the board is required to submit to the Council an estimate of the cost of the proposed work, preliminary expenses, annual charge for maintenance and operation, cost if any of any contract as above mentioned, and the annual interest charge on the debentures. Should this meet the approval of the Council the board is directed to prepare and submit to the electors a by-law to raise by loan the necessary amounts.

Should there be a two-thirds vote in favour of the by-law the Minister may consent to the proposed loan by an order in writing. This order is filed with the executive Council of the Province and becomes conclusive evidence that everything has been properly done, and beyond question the legality of the debentures.

The form, life, interest and terms of repayment must be approved by the Provincial Treasurer and the debentures when issued are a charge or lien upon all land, whether irrigable or not, within the district, including buildings and improvements, except land exempt from taxation by the Province, and upon all property of the board and all rates levied by the board, but has no priority over previous encumbrances.

The debentures are constituted legal investments for trust funds under "The Trustee Act".

The next step is the issue and sale of the debentures and we will assume that this difficult task has been safely accomplished. The Act provides that the proceeds shall be deposited in some chartered bank to the credit of a special account in the name of a special trustee appointed by the Lieut.-Governor in Council, and only paid out on requisition by the Board with the approval of the Irrigation Council.

Meanwhile the Engineer will have been busy extending the preliminary surveys and making additional ones, and, if this has not already been done, securing a water right, and we will assume that the district is now in a position when it can go ahead with the construction work. Except in a small undertaking this work of construction will probably be done by contract, so the next step is the advertising and the receipt of bids. Under the provisions of the Act the Council probably will require that the bids be placed before it, perhaps accompanied by a recommendation from the Board. If it approves of the bidder and his prices, the contract will be let and the work will start. Estimates will be rendered in the usual way and requisitions made on the Lieut.-Governor in Council for the necessary funds, by the Board and with the approval of the Council.

Raising Funds for Current Expenses

About this time some interest may be due and owing, so the Board proceeds to raise the money with which to pay it.

The Act directs that not later than the 1st of February in each year, the Board shall make an estimate of the amount required during the coming year in order to:—

1. Pay the instalments of principal and interest on outstanding indebtedness; and

2. Pay running expenses including salaries, wages, upkeep, maintenance and operation; and

3. The estimated costs of collection, if any.

These estimates must be submitted to the Council and if approved by it, and payments of the amounts are not to be otherwise provided for, the Board is directed to strike an irrigation rate, which must be equal upon all irrigable land within the district as shown on the revised assessment roll. This rate, although calculated on the basis of the irrigable areas, constitutes a lien or charge upon all land in any parcel up to one quarter section, in which there is any irrigable land, and takes priority over everything except first mortgages and claims of the Crown.

From this rate and the assessment roll, a collectors' roll is made up, and a notice is delivered or sent by mail to each person whose name appears thereon. The Treasurer or some person specially appointed for the purpose by the Board is constituted collector.

In all probability some rate payers will be delinquent from some cause or other and, therefore, provision is made for forcible recovery of unpaid rates. Should they be unpaid after a fixed date, the board must add to them by way of penalty five per cent which is legally made part of the rate and collectible in the same way, and is compounded from year to year.

The rate payer is given 30 days in which to pay up from the date of mailing the notice and if he fails the rate may be levied by distress upon:—

(a) All goods and chattels within the district, the property of the owner or occupant or the purchaser or any person occupying the land in question; or

(b) The interest of any person benefitted in any goods or chattels found on the land and in any goods or chattels to possession of which he is entitled by contract or performance of any condition; or

(c) Any goods or chattels on the land title to which is claimed in any of the following ways:—

1. By execution against any person benefitted, or
2. By purchase, gift, transfer or assignment from any person benefitted, in any manner; or
3. By the wife, husband, daughter, son, daughter-in-law, son-in-law of any person benefitted or by any relative in any degree who lives on the land as member of the family; or
4. By virtue of any instrument made for defeating distress.

These are much wider powers than a municipality has for tax collection and it should be more difficult to evade payment of irrigation rates than taxes. However, should the payment of the rates be evaded and no chattels or goods be available for distraint, the Act provides for judicial seizure and sale of the lands concerned in the same way and under similar provisions, as to procedure, as municipalities follow in case of delinquent taxes.

These are the powers given to the board to be exercised on delinquent ratepayers, and by way of ensuring that they are exercised without fear, favour or affection, the Act provides a penalty up to $1000.00 for failure in duty in this respect.

Changes in a District

The Act provides a method of changing the content of an irrigation district either by inclusion or exclusion. In brief the process is much the same in its working as the initial steps in organization. First, a petition addressed to the Board signed by owners of at least half the land affected. Second, action by the Board, after hearing complaints, (if any) either by way of concurrence or the contrary. Third, consent of the Minister of the Interior and the Minister of Public Works for the Province. Fourth, financial adjustment if any be required. Fifth, an order by the Minister of Public Works effecting the change.

Should the change be by exclusion and there be any outstanding debentures against the land affected the prior consent of all the debenture holders is necessary.

A district can be dissolved by a very similar process after petition and vote of the electors, but no district may be dissolved if there are any outstanding debenture debts and dissolution requires a 3-5 vote only instead of 2-3 required for formation.

The Act gives the Board very wide powers of expropriation of land. These are the same as if the irrigation system were a public work within the meaning of the "Public Works Act", and are exercised in just the same way.

Should any Board neglect payment of its due debts, the Act provides a process whereby writs of execution against the district may be enforced.

Finally, as the Board is human and may wilfully or through error do the wrong thing, or do things in the wrong way, or may be guilty of malfeasance in office, the Act gives the Lieut.-Governor in Council power at any time and from time to time to appoint an Official Trustee, who may be the Irrigation Council, to take over the assets, functions, powers and duties of the Board, and to continue in office during pleasure.

As all acts of the Board must be reported to the Irrigation Council for its approval before becoming effective, the additional proviso should make it well nigh impossible for a district to get itself into any very serious trouble.

Water Users' Districts

The above Act provides a simple and, it is hoped, effective machinery for the creation and functioning of irrigation districts. However, there is an inherent desire in most humans to paddle their own canoe when they can, and sometimes when they can't, and the probability is that in all districts, especially the larger ones, there will be a certain amount of dissatisfaction with the way things are run, with the cost of distributing the water, and the manner in which it is distributed. There will be complaints of discrimination and a feeling that a small area could do these things better if given its share of water in bulk. (This is quite as true in the case of corporate projects, probably more so.) Accordingly another act entitled "The Water Users Districts Act" was passed which provides for the organization of such areas into water users districts.

The processes of organization are essentially the same as for irrigation districts and need not be repeated. These organizations are essentially operating and not constructing agencies, and their sole purpose and function is to act as retailers of water purchased from the irrigation district or company as wholesaler.

The above is an outline description of the legal machinery now in existence in Alberta under which all future development will probably go on. The days of development by corporation are probably gone for good, and the only other way open is by direct Government construction and operation. The experience of the Federal Government of the United States in this particular has not been such as to warrant any optimistic ideas on these lines in this country, and if we are to have progress in development in Alberta it will probably be along mutual co-operative lines with perhaps something of Government aid in certain highly complicated or very extensive schemes, when the construction and operation of the whole as one district is impracticable.

The surest way to help others is to train them to help themselves, see that they don't cut themselves with unfamiliar tools and keep a fatherly eye on their progress.

As the true value of most technical papers lies in the discussion much more than in the matter, the author hopes that his remarks will be freely discussed and criticised to the end that the most good may come of it. The paper is more an attempt to marshal the legal facts than to discuss, explain, condemn or favour the actual legislation. Whether this be good or bad, advanced or retrograde he leaves to the discussion to bring out.

Electric Welding

History and survey of electric welding methods, concluding with research work by the writer.

Read at the Eighth General Professional Meeting, Halifax, October 13th, 1920.

Fred H. Williams, A.M.E.I.C.

Electric Welding is one of the most useful of recent developments in the fabricating of iron, steel and other metals. It made great strides during the late war, when the necessity of rapid fabricating of materials, the repairing of broken parts and the building up of the worn surfaces of machinery of all kinds, were of such great importance.

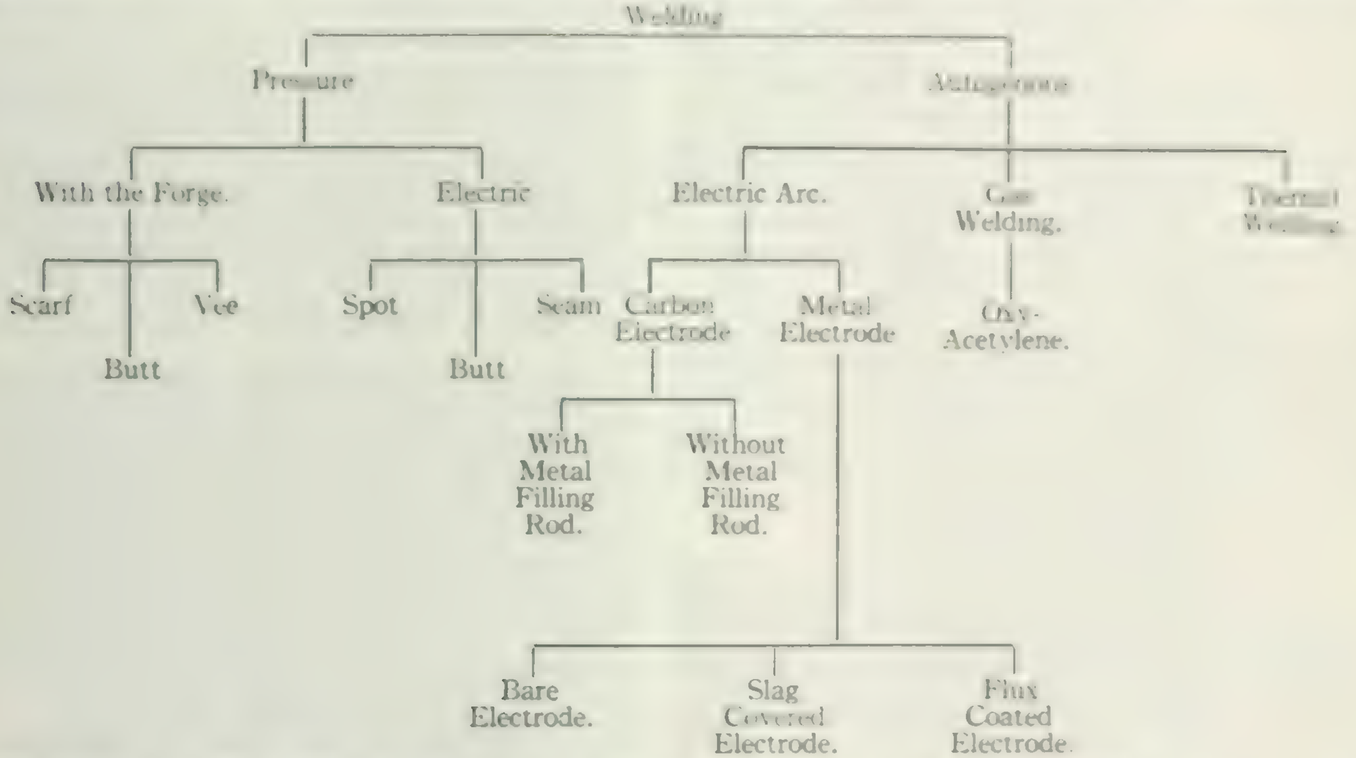
The demands of labour for more money and less working hours are resulting in many industries turning to the Electric Welding process for help in keeping the costs of operating and manufacturing down to the lowest level possible.

Many articles on the Art of Electric Welding have been written by men in various callings of life and it would be somewhat presumptuous of the writer to attempt to cover more than one or two phases of this most interesting and useful art in the short time available. A general review of the history of welding and the development of the electrical portion of welding will probably be about all that can be reviewed from what has already been written, in order that an understanding of welding may be had by the present meeting, without too much repetition.

The Encyclopedia Britannica has a very good description of the progress of the art of welding and for those who wish a more detailed account, the writer would suggest a perusal of its columns. The following brief and rapid review will however give a general idea of the most important features of this very interesting subject.

Welding (namely, the action of the verb "to weld") is the same as "to well", to boil or spring up, the history of the word being to boil, to heat to a high degree, to heat hammer iron, and has developed from the necessity of man requiring means of joining metals together other than the mechanical fastenings by bolts, rivets, clamps, hinges etc.

The following will give a comprehensive idea of the relation that the various methods of welding bear to one another:—



The steps by which this development has been brought to its present stage of perfection (some of which are still useful and of more or less importance commercially) may be briefly considered as follows:—

Pressure Welding

The process of uniting metallic surfaces by pressure exercised when they are in a semifluid condition, consists of heating the ends of the parts to be welded to a proper temperature and fusing them together by pressure, either by the smith's hammer and anvil, or, later, by the steam or air hammer, hydraulic press, etc. This is known as pressure welding. For successful welding care must be taken that the surfaces are made clean, and that the joints are rapidly brought together. Variations in the forms of this type of welding are many, depending upon the work in hand and the practice of the blacksmith or the shop wherein the work is done. The most common terms applying to the welds made by pressure welding are 'Scarf', 'Butt', and 'Vee'.

Scarf Welding

It is styled 'Scarf' welding where the two ends are made diagonally flat to give more surface for the weld (the end being slightly convex to allow the dirt to be forced out of the interior of the weld, should any remain, when the pressure is applied and thus assure as nearly a perfect welded joint as possible). The ends, in this case as well as in the others, are upset to give sufficient metal after the weld has been made, to enable the smith to finish the welded part in proportion to the adjacent parts, giving the finished article a neat appearance and sufficient strength for its requirements. Further care has to be taken to see that the surfaces are clean, chemically viz., free from oxides, and mechanically viz., free from dirt that the weld may be thorough.

In the case of Scarf, Butt and Vee welds these two conditions are obtained in the first instance by using fluxes of sand for wrought iron and borax for steel (the flux forming a slag which is forced from the joint upon the application of the pressure), in the second by using a clean hollow fire and brushing off, previous to joining, any particles of dirt that may adhere to the surfaces. Thoroughness in this respect should be rigidly applied in all welding.

Butt and Vee Welding

Butt and Vee welds are similar except that in the butt weld the surface is somewhat less than the scarf weld and the vee weld has more surface to be welded, involving the greater possibility of slag inclusions and requiring more care in preparing the end to be welded.

Temperature for welding is a most important factor, especially owing to the fact that each grade of iron or steel requires to be handled at a different temperature. In iron the ends may be melted, but in steel a low heat is required, that is, not over a moderate white heat must be used. Steel does not weld as readily as iron nor is the weld as reliable. Oxidation of the metal must be avoided as burnt metal cannot be welded.

As pressure welding proved limited in its uses, a further development was made, and welding without pressure resulted, (this is known as Autogenous Welding). In the first method, (pressure welding), a comparatively low heat and high pressure is required whereas in the second method, (autogenous welding), a comparatively high temperature and low or no pressure is necessary.

It may here be noted that while many new methods of welding have been developed, viz., Electric, Gas and Thermit, and great improvements resulting thereform, the heretofore described pressure welding is still much in use at the present time and while it is superseded in some of its uses by these new methods, it will without doubt retain much of its present usefulness and not, in time, become an antiquated process.

Pressure Welding (Electric)

In 1886 Elihu Thomson brought forward the process of resistance welding, which is a form of pressure welding wherein electric current of low voltage is used to produce the heat required for the welding, and pressure either by hydraulic or some mechanical contrivance is brought to bear for pressing the rods, wires, plates etc. together. The current may run as high as 100,000 amperes and the voltage as low as two or three volts or even lower.

There are two types of this kind of welding, viz., "Butt" and "Spot", the latter may be extended into what is termed "Seam" welding, or a continuous series of spot welds.

The heavy current required for "Butt" and "Spot" welding or, what may be termed and is known as resistance welding, makes the use of short leads to the plates or points of contact necessary, especially when alternating current is used. This is overcome by making these leads part of the secondary winding of the welding transformer (Thomson).

Butt welding is extensively used at the present time in various lines of manufacture, in the making of wire hoops, rubber tires (wherein the centre is a wire core butt welded), the welding of rods etc.

Spot welding is also in use extensively in various places, for instance, plate welding where it is used in the place of rivets (in this it is sometimes made continuous, that is, the spot welds are so close together that it becomes one continuous weld, it is then known as "seam" welding). Fence and various wire fabrications are also accomplished by this method; spot welding of sheet metal articles of numerious shapes such as helmets, cooking utensils etc., is carried on to a very large extent commercially, enabling the production of many useful articles, and simplifying as well as cheapening the manufacture of the same.

In the case of armour plate, this method is used to anneal portions for cutting or drilling. The current is passed through the spot to be softened and the portion brought to a red heat, by reducing the current gradually, the surrounding metal retains its hardness while the spot under the terminals is softened.

The bonding of rails and the welding of various alloys are accomplished by this process of Elihu Thomson. The field is not yet fully developed and many possibilities remain to be developed and commercialized.

By means of a rotary converter and transformer for changing and reducing the high Direct Current to very low voltage Alternating Current, the spot welding process is used for welding the bonds to the rails for the return circuit of Direct Current Electric Railway Systems.

Autogenous Welding (Gas Welding, Oxy-Acetylene)

In 1820 the oxy-hydrogen blowpipe was used for producing "limelight", later to fuse platinum and was finally utilized in lead burning and various forms of welding. The oxy-hydrogen process of welding was improved subsequently by using acetylene in the place of hydrogen. With oxy-acetylene and its higher temperature, a larger field was opened up. Cutting of metal parts by its flame is one of the uses of the oxy-acetylene flame. Improvement in the design of the apparatus concerned therewith has resulted in the use of this method of welding in almost every branch of metal work at the present day. There is considerable competition between it and the electric process, and so close has this contest between these two methods become, that it would be unfair to give either the position of leader. The rapid progress of the art of electric welding, as in the last few years, will necessitate on the part of the promoters of the oxy-acetylene process, much study and expenditure of energy if they is to keep even with the electric process.

Other gases have been used but none have as yet approached the oxy-acetylene in usefulness.

Autogenous Welding (Thermit)

The next form of welding originated in 1894 when C. Vautin found that when finely divided aluminum was mixed with such compounds as metallic chlorides, oxides, sulphides etc. and ignited, exceedingly high temperatures resulted from the rapid oxidation of the aluminum, about 3000 degrees C. being obtained.

It remained, however, for H. Goldschmidt to utilize this discovery in a practical way. He welded two bars of steel by combining molten iron, the two ends of the bars thereby producing a solid joint. The heat for this joint, or weld, was obtained by the rapid oxidation of finely divided aluminum and iron oxide. This process was termed "Thermit Welding".

Pure metals such as iron, chromium, manganese etc. were obtained from their oxides etc., by this method of reduction, and made use of in welding.

Thermit for welding iron and steel is made by mixing iron oxide with finely divided aluminum in a crucible lined with magnesia and having a cover to retain the molten mass during reaction, until poured. The molten mass, after the reaction, consists of two layers, the upper oxide of alumina, or corundum, and the bottom layer practically pure iron. The position of the molten iron relative to the slag necessitates the pouring of the iron through the bottom of the mould that surrounds the ends to be welded. Steel punchings are sometimes added to the charge before the reaction takes place, to absorb some of the excessive heat and to reduce the amount of iron oxide that otherwise would be required to fill the mould

The mould is prepared by building up a wax form to the shape of the finished weld around the ends to be welded and, surrounding this with the material used for building up the mould. The wax is then melted, withdrawn and weighed, in order that the required charge for the work which bears a certain relation of this may be calculated. Magnesium ribbon or wire is used to ignite the charge.

Care must be taken to prevent slag filling the mould, as would happen by premature pouring, and also to pour the metal sufficiently hot to melt the ends of the pieces to be welded. Preheating is used on large welds to avoid chilling of the fluid metal which would prevent the uniting of the ends and the molten metal.

This method of welding has been used to a great extent in welding large castings and girders, as well as smaller parts such as rails, bonds on rails, rims of fly-wheels, spoke and hubs of locomotive drivers etc., engine frames etc. It is much used at the present day, and where failures in its use occur, it is generally due to some foreign cause, miscalculation of the charge etc., or its use in places where a successful weld could not be obtained owing to the faulty design of the casting to be welded. It must be remembered that the resultant weld is cast metal and should be considered as such in designing its use.

Autogenous Welding (Electric Arc)

In 1874 Werdermann suggested the use of the flame gases of the electric arc blown upon the work by air or otherwise. This was later developed by Zerener, who utilized the effect of a magnet in blowing the flame of the arc upon the work, puddling the metal where the welding was being done. This meant that the method could be used only in working downward, no vertical or overhead work could be accomplished in this way. This method is now practically abandoned.

Arc welding really had its start in 1881 when de Meriteus used it for welding parts of storage batteries together. The metal parts (lead) were laid on a support or plate which was made the positive side of the arc and a carbon was used as the negative pole, the arc being established by touching and breaking the contact, the heat of the arc melting the ends or edges of these lead pieces and welding them together by the fusion of the same.

The next step in electric welding was by Bernardos and Olszewski who used the carbon as the positive and the work as the negative. A metal rod was used for filling in the necessary additional metal for making the weld, the arc being drawn long enough to allow the rod to be gradually fed into the flame of the arc by hand, the heat of the arc melting both it and the ends of the parts to be welded. The whole mass was then allowed to cool slowly, thus completing the weld. This form of electric welding is not completely satisfactory owing to the very high heat of the arc setting up strains that, in cast iron especially, are very dangerous, also a very much higher current is required, seldom less than 150 amperes and often 300 or 400 amperes.

The difficulties in using the carbon arc arise from the above causes and in addition to these, many kinds of work are impossible of accomplishment, due to the impurities of the carbon being deposited in the weld along with the metal. In the case of cast iron these result in a very hard brittle metal, impossible to machine.

An improvement over this method was developed by Slavianoff when he utilized the metal rod not only to provide the metal for filling or building up the weld, but also as the means to start and hold the arc. The metal rod may be either the negative, or the positive side of the arc. Later, the use of the rod as the negative was generally adopted, unless the work was very thin, in which case the reverse would enable the operator to keep the heat on the work low enough to prevent it from becoming overmelted.

In making the work positive the heat imparted to it is much higher, in proportion to the energy delivered, than when the work is negative. This is due to the comparatively recently noted fact that the positive side of the arc is the hotter.

A longer arc is required for the carbon electrode than for the metallic, it being in some instances as much as 3 inches. The voltage necessary to maintain the arc is proportionately higher and generally is about 150 volts.

Returning to the carbon arc welding process, this method, attributed to Bernardos, was the first to be used commercially in the welding of metals on a small scale, in about 1888, and shortly after Slavianoff brought forth the use of the metallic electrode as a process of great possibilities.

Rapid development in the art of arc welding, however, has been made in the last few years, and the greatest strides occurred during the last war, when speed in everything was so completely the order of the day. The development made then has proved so completely the advantages of arc welding that it is now being used in almost every plant of any size in Canada and the United States, and in every kind of iron and steel fabrication, as a glance at the following list of some of the present day applications of the electric arc for welding and cutting will illustrate:—

Applications of Electric Arc Welding

Steel Mills:—

Clearing the rolls of cobbles.
Building up wobblers.
Filling in steel forgings.

Foundries:—
- Cutting off risers and sinkheads.
- Repairing casks.

Machine Shops:—
- Filling up blowholes in partially machined castings.
- Repairing broken castings.
- Building up worm parts of crank pins.
- Welding broken crank shafts.
- Welding tool steel to mild steel shanks for lathe and other machine tools.
- Building up collars, or replacing metal that has been machined off by mistake.

Steam Railroad Shops:—
- Fabricating the greater part of fireboxes.
- Repairs to fireboxes, boiler and other plate parts.
- Welding in flues to the flue-sheet.
- Repairing engine frames, cylinders, crank pins etc.
- Building up slide-bars, guides, link gear parts, crank pins and various parts that are worn so much that it is inadvisable to shim them up, or compensate in other ways.

Electric Railways:—
- Fabricating gear cases.
- Repairing motor frames and armature shafts.
- Building up worn parts on motor frames, armature shafts, brake-beams and truck parts.
- Repairing frogs, crossings, turnouts and building up low rails at joints where wear is especially prevalent.

Ship Yards:—
- Repairing marine boilers.
- Welding tanks.
- Welding angle irons, handles, catches and numerous small fittings to the ship's plate.
- Welding broken parts of all kinds.

Electric Arc Welding today is principally by means of the metal electrode, and the welding plant may use either alternating or direct current for the welding.

The alternating current apparatus is a transformer with the primary winding suitably designed for the line voltage where it is to be used, and the secondary to give about 90 to 100 volts on open circuit and 20 to 30 volts on short circuit or when the arc is drawn.

The direct current apparatus is of many kinds. In general, however, the manufacturers are more or less at one in the principal features required for electric welding, through they may differ somewhat as to design.

The first welding outfits used were of the resistance type. In this a resistance was used to control the current, the voltage remaining constant. Taps in the resistance enabled the use of various sizes of electrodes. The regulation was somewhat crude as the drop across the resistance varied with the current. Extreme variations were checked. The regulation of the voltage across the arc and the current through it give approximately a constant rate of heating.

The next step was the use of D. C. generators, in which various arrangements were used in design to obtain a suitable regulation of the arc, and many of these are being used with satisfactory results today. These D. C. generators may be motor or belt driven and, in cases where electric power is not at hand, a gasoline or steam engine may be used for motive power.

It is a question in some minds as to which is the better current to use, alternating or direct. Both have advantages and disadvantages, and it seems that, for the present, the direct current is the more patronized. The writer has the idea that a mere visual examination of welds, or their test by pulling to the breaking point, without microscopic examination results in opinions of small advantage, and that a continued study of welds in actual work, with the microscope, will be the only method of determining the better of these two currents, for welding purposes.

The alternating current welding transformer is a newer development than the direct current generator and it has many advantages, viz:—No moving parts, and much smaller size in comparison to the current output. It has one great disadvantage, viz. a very low power factor, in some cases being as low as .35.

There are many types of D.C. welding sets and a few types of A.C. welding sets. The general method of procedure in welding is as follows:—an arc is established with the metal electrode, and as the rod is vaporized or melted by the arc, it is brought nearer the work and is kept close enough to maintain the arc until the whole rod is fed into the weld. It is kept moving in a circular motion, puddling the molten metal deposited by the arc, in order to obtain a neat weld, free from impurities. This operation and the neat appearance of the weld, as well as a good, clean, sound deposit, depends much upon the operator. Care should be taken to get standard reliable machines and the best welding wire. It will be shown by some of the microphotographs that the operator, welding apparatus, and wire may be the best and still a poor weld be the result, due to the poor material that is being welded.

The electrode for the general run of work may be Swedish or pure iron rods, sizes 3/32″, 1/8″, 5/32″ and 3/16″ round, and 14″ to 18″ in length.

The advantages of electric welding over gas welding are that in the former, the heat is kept low and localized and, in most cases, the preheating of any part of the work is unnecessary, whereas in gas welding, the adjacent parts are preheated by the gas before the weld can be made. The extreme heat from the gas affects the structure of the metal several inches back from the weld, and ofter results in a course crystaline structure of the parent metal.

The art of electric welding is now just beginning to be one of the indispensable factors in the iron and steel industry. It is to be most valuable to those who will value it most and who endeavour to find out why failures occur.

It is possible that the following photos will be of some service to those who are following the same line of research that the writer has under- taken, as they are intended to show that the material to be welded is an important factor.

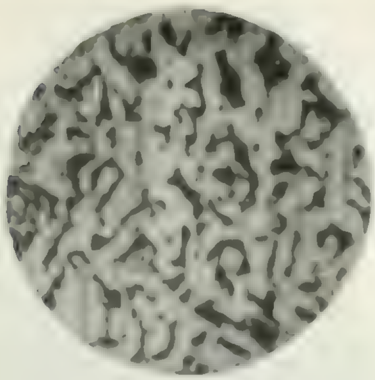


Figure 1.

Figure 1.—This is a cross section of a piece of boiler plate, the photograph was taken about one inch from the weld and is about [illegible] carbon steel. The light area is the ferrite and the dark is the pearlite. There is no apparent indication of ghost lines or impurities in this steel. The weld is shown in a following photograph and is very good, showing no impurities in the parent metal or the deposited metal. The next photograph show the change in the structure due to the heat of the arc. Magnification 100x.

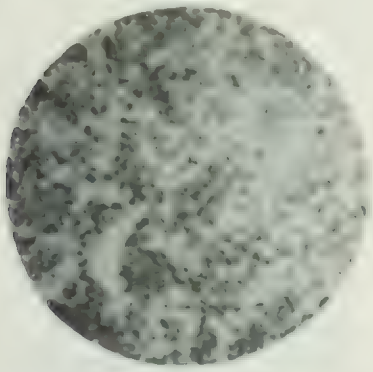

Figure 2.

Figure 2.—The structure shown in this photograph is that of the annealed portion of a piece of boiler plate taken between the weld and the original metal. In the weld, the area effected by the heat of the arc extended $\frac{3}{4}''$ from the line of the weld and graded off on the one hand to the original metal and on the other hand to a more refined structure close to the weld, both of these stages are illustrated in this paper. This weld was 70% bright fracture and 30% dull fracture when broken. The efficiency of the weld over the original was 89%. There were no apparent ghost lines in the best portion of the plate and they appeared very faintly in the remaining portion. It would thus be apparent that a very slight appearance of the ghost lines would cause poor welds. Further investigation of these lines is being conducted by the writer. Magnification 100x.

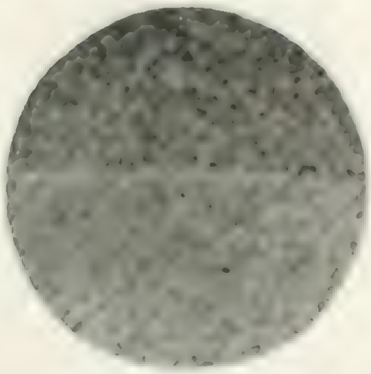

Figure 3.

Figure 3.—This photograph shows a good weld, the light side is the deposited metal and is of good structure. The dark is the parent metal and is in a more refined state than it was originally. The comparatively coarse structure of the original plate is first annealed by the heat of the electric arc as is shown in a preceding photograph, then as it cools off the portion near the weld becomes more refined and the line of the weld is very pure iron. The line of the weld is the narrow line diagonally across the photo. This weld was very strong and was 89% efficient as compared with the plate. When tested the break occurred through the weld and the fracture was clean and bright for about 70% of the area. Magnification 100x.

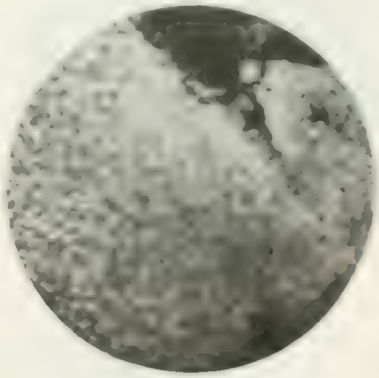

Figure 4.

Figure 4.—This shows a cross section of a weld at the edge of the bead showing that there was not a complete weld at this point. The welded metal shows slag of some kind separating the deposited metal and the original plate. This is probably an oxide of iron due to the plate not being properly cleaned and to an improper position of the electrode when the weld was made. The microphotograph shows up what could not be seen by the naked eye and gives a clear idea of what is taking place and is a means whereby the welder can be shown where he is going wrong. The change in the structure of the plate from the original to the structureless metal at the weld quite different from that shown in a preceding photo. To determine whether there is a fault in this result would require some time and study which if not already done, will be to the advantage of all concerned. This would give an idea as to whether the welder or the material is at fault. Magnification 50x.

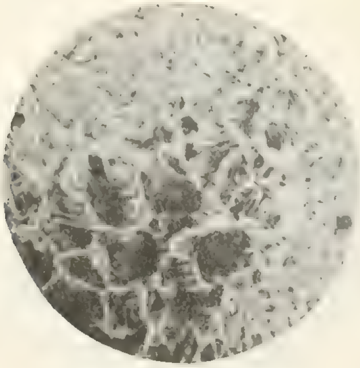

Figure 5.

Figure 5.—This photograph is a weld made with the electric arc on ½″ boiler plate, the close grain metal on the two sides of the point of coarse grain crystals is the deposited metal, the point is the parent metal and is not strong due to its coarse grain. A break would occur across this point providing that the welded metal was weak. The electrode used was "Quasi Arc" and the heat from the weld produced many grains of manganese silicate in the deposited metal weakening the same so that the combination of the course structure of the parent metal and the poor deposited metal gave a very low tensile strength viz. 28,000 lbs. per sq. inch when tested. Magnification 100x.

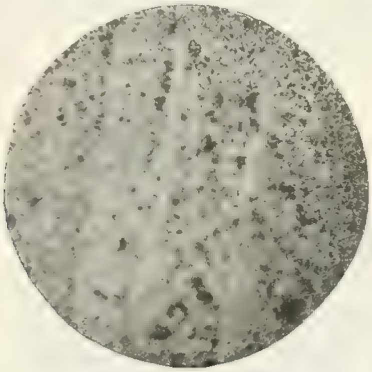

Figure 6.

Figure 6.—This is a microphotograph of the ghost-lines in a piece of ½″ boiler plate. These lines occur in the centre of the plate and extend to within about 1/8″ of either surface of the plate. The occurrence of these lines depends upon the quality of the plate and the location of the same in the section of the steel billet when rolled. A few spots (dark) show up in this photograph, but when the plate is subjected to a high heat the spots increase in number and size. In electric welding they extend into the welded metal and are the cause of much defective welding that is often attributed to other causes than this, the right one. The writer has found that in welding two plates together end to end, the effect of the heat from the electric arc changes these ghost lines into dark spots to a depth of at least 1/8″ and that the impurities from the molten portion of the plate extends into the deposited metal quite extensively and forms a sort of chain along which the line of break can take place providing no weaker link is offered. Several examples of the above statements are included in the following pages. Magnification 50x.

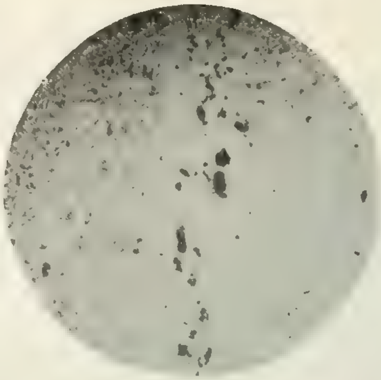

Figure 6A.

Figure 6*a*.—This shows the effect of the heat of the electric arc in electric welding upon the ghost lines in boiler plate. This line of dark spots extends along the location of the ghost lines about 1/8″ back from the line of weld and vanishes in the ghost line itself. These dark spots are a combination of manganese, silicon and iron; they are very brittle and therefore not satisfactory constituents to be included in the weld. The writer is including a microphotograph (Fig. 6*b*) showing the line of a fracture in a weld along a series of these spots, very clearly indicating that these form a constant source of weakness in welding, and that care should be taken whenever it is possible to avoid designing welds that assist the formation of these spots. It will be noticed that some of these spots are composed of two colours, the lighter of which is a sulphide of either manganese or iron or of both; this sulphide is ductile and does not effect the deposited metal as the silicate. The formation of these spots clearly indicates their composition, viz. the varying size of each in the group shows that they are not alumina spots which are small and even in size. Magnification 50x.

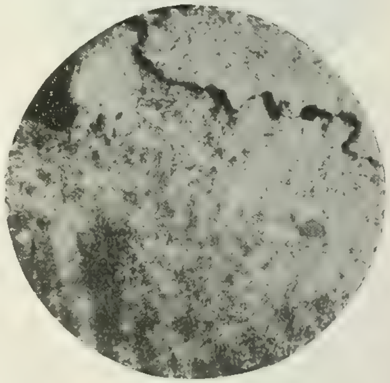

Figure 6B.

Figure 6*b*.—This shows a section through a tube and tube sheet, that to visual examination gave no indications that any break occurred in the weld during tensile stress. It will be noted that the thin line of rupture zig-zaged along the line of least resistance viz. the irregular row of silicate inclusions showing that the strength of the portions of silicate are the weak points in a weld. This portion of the break is in the deposited metal and runs along the edge of the original plate near the end where a mixture of silicate and sulphide occurs. The coarse area to the right is the original plate annealed by the heat. The light gray spot near the top of the photograph is a spot of sulphide, this, together with the silicate, originates in the ghost lines of the tube sheet. Magnification 100x.

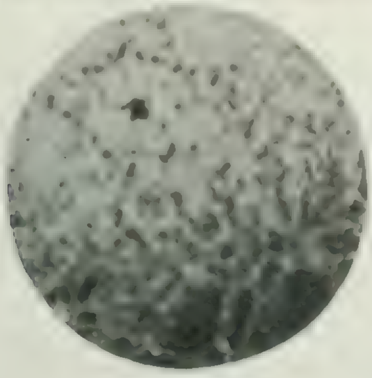

Figure 7.

Figure 7.—This photograph show the silicates in the weld and how they are arranged so as to aid in a rupture should a strain be put on the metal. The line of weld is shown in the lower part of the photograph at the right. The original plate was ½" boiler plate and the electrode was the "Quasi Arc" mild steel. Magnification 100x.

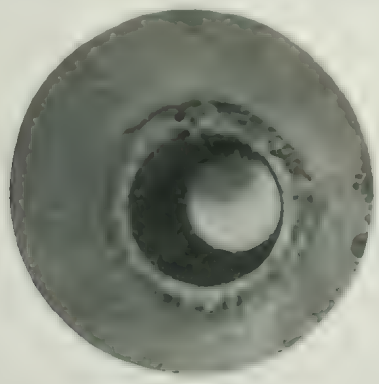

Figure 8.

Figure 8.—Showng one method of welding a boiler tube in the tube sheet. The tube extends through the sheel 1/8" and is weided. Considerable care must be taken in making this weld as the plate and surface of the tube must be perfectly clean in order to ensure a good weld. This method is easily executed and is sufficiently strong enough for the service required of it. The disadvantage is that the flames and hot gases are obstructed from entering the tube, also on account of the ends projecting beyond the tube sheet they are subjected to the flame and liable to rapid deterioration from the same. Tensile tests on this form of welding have in cases shown that the weld was stronger than the tube. The line of breaking is sometimes through the tube but generally the tube shears along the weld close to the tube surface. Magnification .5x.

Figure 9.

Figure 9.—This photograph shows front view of a tube welded into a tube-sheet after the same had been tested. The test gave a good tensile strength and this would appear to be a good method of welding. The tube and sheet were chamfered after the tube was rolled into place and the weld made on the beveled edge on both the tube and the sheet. The plate used was ½" boiler plate and as the weld was in the region of the ghost line that have been described herein it would be doubtful whether the percentage of welds could be relied upon. The writer has taken photos of the weld in this type of weld and has included a typical case in this paper. They all indicate that this is not as satisfactory a method as when the tube is welded to the outer 1/8" of the plate. It will be noticed that but a slight portion of the weld fractured and that where it did that the structure of the break was full of defects. Considerable portion of the weld gave away at the junction of the two metals and showed a poor weld, there were a lot of impurities which prevented a good weld. This is the result of the impurities in the plate and would be overcome if the weld was made in the proper place. The other way of overcoming this fault is to see that the very best plate be used. It must however be free from these ghost lines that cause the trouble. Magnification .5x

Figure 10.

Figure 10.—This is a tube welded into a tube sheet in a way to avoid the effects of the ghost lines that are prevalent in ½" boiler plate. The sheet is drilled for the tubes and chamfered about 1/8" deep, the tube rolled in, cut off even with the face of the plate and turned over

with a suitable beading tool. The tube is not beaded as is the usual practice and the edges are left as nearby square as possible. The weld is then made by welding the end of the tube to the sheet, filling the vee made by the chamfer and the end of the tube. It will be noted that the weld takes place without the range of the centre of the ½″ plate and thus clear of the ghost line infected centre of the plate. The tubes welded thus give strength, a nearly flush surface of plate and a clear entrance for the gases to enter the tube. Tests show that a good weld is obtained and that the tube shears first, the weld for the most part does not give away as it does in other cases. Magnification .5x.

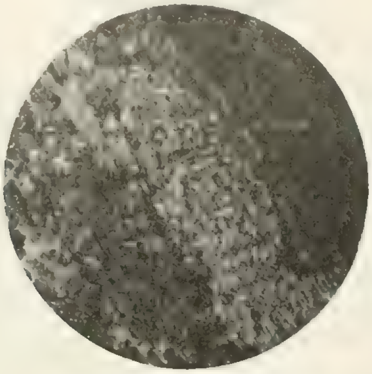

Figure 11.

Figure 11.—This is a photograph of a cast iron weld with a pure iron electrode with the electric arc and gives a clear idea of the structure that will always be found in a weld of this kind. The white lace work through the centre is a bank of cementite made by the uniting pure iron with an impure (high carbon) iron; this is brittle, has a strength of about 5,000 pounds per square inch, a very low strength even for a cast iron weld. The deposited metal at the top is similar to the ordinary deposit from a pure iron electrode, the bottom is the cast iron parent metal. Magnification 75x.

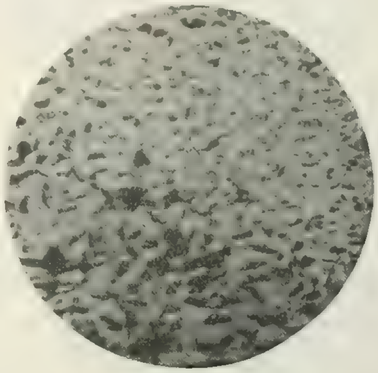

Figure 12.

Figure 12.—This is a photograph of a cast iron weld made with the electric arc with a cast iron electrode. The dark portion of the photo is the parent metal and it will be seen that it is not as uniform a structure as the deposited metal, also that the deposited metal is nearly a pure iron deposit that the graphite (dark areas) are small and not closely connected. This weld is easily machined and has a good tensile strength. No preheating nor after heating was required to get these results. Magnification 100x.

Hydro-Electric Power Development in New Brunswick

Outline of works on Musquash River and Shogomoc Developments, report by consulting engineers; proposed Lepreau Development.

Read at the General Professional Meeting, Halifax, October 15th, 1920.

C. O. Foss, M.E.I.C., Member and Chief Engineer N.B. Hydro-Electric Power Commission.

The great value of Hydro-Electric Power both as regards economy in cost and flexibility in operation has long been appreciated by the observant and thinking class, but the heavy initial cost of development and the difficulty of obtaining such broad powers of expropriation by private companies as are necessary to deal successfully with attempted holdups by human greed are such that private enterprise and private capital have been deterred from going into such developments to any great extent in the Maritime Provinces.

The Province of Ontario was the first to fully appreciate this truth and to undertake such development on a large scale as a government measure. This government has spent roughly fifty millions to date and though there has been more or less criticism and there has lately been a radical change of government, yet the work of enlarging and extending the system goes on and the Commission is expending some forty to fifty millions on what is known as the Chippawa development, which will add 275,000 H.P. The success and popularity of Hydro development in Ontario under a government commission, together with the rapidly mounting cost of coal and the difficulty of obtaining same, made the governments of the Maritime Provinces quite willing to lend a favorable ear to the solicitation of the federal authority, first the Conservation Commission and a little later to the earnest advice and assistance of the Dominion Water Powers Branch of the Interior Department. This Branch was established in 1911, and has been highly active and efficient from its inception. This department has been very fortunate in having had a most enthusiastic and highly efficient staff from the Minister and Deputy Minister down through the superintendent and district engineers.

Work Now Under Way

The Maritime Provinces are particularly fortunate in having had a district engineer sent here of the ability and enthusiasm of the present incumbent, K. H. Smith, A.M.E.I.C. Without wishing to give him any credit which is not fully due I but state my firm conviction that his excellent work and convincing personality have hastened hydro-electric development in these Provinces by some years, for we are a conservative people and have to be shown, and he has shown us. This is not said to flatter or throw bouquets for Mr. Smith has only done his duty, but has done it so well that those of us who are aware of this fact have every right to say so. In the Maritime Provinces Nova Scotia has taken the lead and is already engaged in the actual work of constructing a plant at Margaret's Bay for supplying power to this city and vicinity. In New Brunswick we are following closely, for we shall have actual construction work under way within a very short time. The most important development that we are undertaking, that on the Musquash River, is almost identical with that at Margaret's Bay in most of the salient features.—

They are both situated on the first bay West of the respective cities of Halifax and St. John.

They are nearly the same distance from these respective cities.

In both cases one stream is diverted into another; and the strangest coincidence is that the amount of power is identical — 8000 horse power.

Two of the three turbines at the Musquash River plant will operate under practically the same head as those at the tide water plant at Margaret's Bay.

The design will be made by the same firm of constructing and consulting engineers, Messrs. C. H. and P. H. Mitchell, of Toronto, in our case subject to the final approval of Henry Holgate, M.E.I.C., consulting engineer of Montreal.

The cost will be practically the same in both cases.

Features of Construction

The proposed construction will be of the simplest character — earth dams, earth spillways heavily paved, spilling into lateral depressions which will deliver the water back into the stream a considerable distance below the toe of the dam; earth canals for part of the distance from the dam to the power house in the case of the West Branch of the Musquash and the Shogomoc; concrete intakes and wood stave pipe laid on a bed graded in the same way as a railway road bed; at the East Branch concrete intake at the forebay and wood stave pipe on graded bed to the power house. In the case of the East Branch there will be three side dams:

One 400 feet long and 6 feet high
One 150 " " " 6 " "
One 40 " " " 6 " "

These will be left two feet below the top of the main dam so that in the remote possibility of an accident to a storage dam they will be overtopped and swept out, thus ensuring the safety of the main dam.

In the case of the dam on the West Branch we shall have the same safeguard arranged in a slightly different way.

At the Shogomoc the construction will be practically the same: protection against possible accident to storage dams will be provided by enlarging the section of the canal just below the dam and leaving the lower bank considerably below the crest of the dam which will act as an emergency spillway.

As Mr. Holgate, the consulting engineer to the Commission, has found it impossible to attend to the details of design and construction the Commission at his suggestion and upon his recommendation have engaged the firm of C. H. and P. H. Mitchell of Toronto to design and supervise the construction of the works; they have designed and are supervising the work at Margaret's Bay as above noted. To show the feasibility of the work above generally described the principal parts of their report to the New Brunswick Electric Power Commission are given below:

General Report on The Hydro-Electric Power Projects proposed on the Musquash and Shogomoc Rivers, New Brunswick.

[illegible] September, [illegible]

Messrs.

The New Brunswick Electric Power Commission,
St. John, New Brunswick.

Gentlemen:

Arising out of a request from your chief engineer, Mr. [illegible] through your consulting engineer, Mr. Holgate of Montreal, we have examined into the Hydro Electric Power Projects which you have in contemplation on the Musquash and Shogomoc Rivers. This we have done with the purpose of assisting your chief engineer in co-operation with the consulting engineer, and this report is intended to place before you in a preliminary manner, the results of this examination, especially as to the feasibility of construction and operation of the projects and the economic features involved in them.

We found on our preliminary interview with your consulting engineer and upon consultation with your chief engineer that the projects had already been advanced to the stage of asking for tenders for the main dams and canals based upon plans and specifications already prepared by your chief engineer, and the consideration of these is not included in this report except with respect to their general relation to the projects especially as to probable costs where included in the general estimates.

The general data based upon stream measurements and surveys already done has been placed in our hands by the consulting engineer and we have also had before us various maps and plans made from special surveys of the power sites done under the direction of the chief engineer. In addition to these we have both personally examined the locations and proposed sites of the various structures in company with the chief engineer. We have also discussed questions of water supply and [illegible] with Mr. K. H. Smith of the Water Power Branch of the Dept. of the Interior, and had access to his records and the information on file in his office at Halifax.

The Musquash Development

On September [illegible], we visited the vicinity of the proposed power development on the Musquash River, seeing the proposed sites of the main dam, canal and spillway on the West Branch, and the proposed site of the dam and intake on the North-east Branch. We also examined the possible site of the generating station. The whole scheme as outlined by your chief engineer appears quite feasible for development from a constructional point of view as well as attractive in its economic features.

The watershed of the two branches of the Musquash River above the power dam sites has been measured from maps as 140 square miles, approximately evenly divided between the two branches. As complete data for precipitation and run-off for this area has not been definitely obtained, the calculations for available water have been based on comparisons with similar watersheds adjacent. The precipitation over this area is known to be in excess of that of St. John which averages about 46 inches of rainfall per year, and the run-off is exceptionally high. The storage possibilities of the river seem to be excellent and while the dependable controlled flow has not yet been determined it seems conservative to allow 360 cubic feet per second as the continuous available water for power purposes. Assuming this amount evenly divided between the two branches, the flow available for power on each river would then be 180 cubic feet per second.

The proposed generating station site is on the coast road about twelve miles West of St. John and the tail water level of the plant would be at tide water although above low tide on account of the river estuary.

On the West Branch of the Musquash the gross hydraulic head to tide proposed is 125 feet but the period of low tide is much greater than that of high tide, so that with pipe losses etc. it would appear to be safe to say that the net head available as a working head would be about 117 feet.

In the same manner, on the North-east Branch, the gross head available is about 100 feet, of which we consider about 95 feet available as net working head.

It is proposed to incorporate the development of these two branches with separate units in the one station, one unit under one head and two units under the other as outlined below.

In estimating power available, the load factor of the system must be taken into account, especially in a system dependent on storage such as these powers are. The load factor in an hydro-electric power system is the relation of the average power demand to the maximum power demand. In this case we consider that the load factor of the whole development should be taken as about 40%, that is, the average continuous load is 40% of the maximum demand at any time. For economic reasons it is proposed to distribute or apportion the two parts of the development so as to make the West Branch work on a 66% load factor and the North-east Branch on a 27% load factor, the combined plant then being on a 40% load factor as proposed.

The Musquash generating station which we propose would under these conditions then contain three identical generating units, one being operated by the water from the West Branch and two being operated from the water of the North-east Branch. The two units would together produce under average conditions 8675 horse power and this power would make about 21,500,000 kilowatt hours available for sale in St. John, allowing for all generating and trsanmission losses.

The sites for intakes, pipe lines, and power station are all adapted for development purposes, and are conveniently situated for efficient operation.

It is proposed that transmission of power to St. John would be on duplicate circuits carried on a line of steel towers at generator voltage, 13200 volts. This will make the most economical transmission arrangement and would permit of use of power between the generating station and St. John without the use of complicated equipment. Provision is being kept in mind in this for subsequently changing the line over to higher voltage in case it is desired to connect other future stations in this locality to this as a main line to St. John.

The receiving station in St. John would make the power available for distribution in St. John.

The Shogomoc Development

The consideration of the Shogomoc Power Development can, to a great extent, parallel the foregoing regarding the Musquash Power.

The Shogomoc River empties into the St. John River approximately forty miles above Fredericton and about twenty miles from Woodstock.

The Shogomoc watershed is about 95 square miles in area above the proposed power dam site. The water supply after the complete storage system is installed as proposed, is estimated to be about 130 cubic feet per second, based upon the precipitation and run-off factor for this region. It is borne in mind, however, that under the conditions of the four successive low precipitation years of 1912 to 1916 it is estimated that only 120 cubic feet per second would have been available as continuous flow but as this exceptional condition has only occurred for the one period since 1874, 130 cubic feet per second might reasonably be taken as a working figure.

The power site was visited by us on September 14th. and the dam site and canal and pipe line routes were gone over. It appears quite feasible to secure a good arrangement of these portions of the work. The generating station would be located on a rock ledge on the bank of the St. John River and the surge tank, for hydraulic control, would be located on a ledge on the high bank behind the generating station.

The gross head to be obtained in this development would be about 285 feet and allowing for the usual hydraulic losses the average net head would be about 270 feet; (this is without reference to the short period during which the high water of the spring freshet on the St. John will temporarily reduce it). Under these conditions the output would be about 8000 horse power at 40% load factor, considered on the same basis as already outlined. This would produce about 19,000,000 kilowatt hours, power available for sale on the system.

There would be two units proposed in this plant, each having about 4000 h.p. output. The electric power would be stepped up at the generating station through transformers suitable for 33000 volt transmission.

Time of Completion

In working out a time progress programme of construction it is to be borne in mind that the time required for construction of the electrical machinery is largely the determining factor. Again on the long pipe lines and storage scheme such as comprised in these developments the various preliminary delays incident on getting the hyrdaulic system into operation must preferably be done in moderate weather and not in winter time.

It is highly desirable then that the plants should be ready for testing out and got ready for operation not later than the 1st. of December 1921 and earlier if possible; if this cannot be accomplished, delay due to the second winter would ensue. This can be best done by letting the contracts for the machinery by December 1st. of this year. If such is to be done it would be necessary to have specifications in the hands of the electrical and hydraulic machinery manufacturers by the latter part of October at the latest.

Conclusion

The two projects on the Musquash and Shogomoc Rivers are entirely feasible of construction from both an engineering and economic standpoint and the cost of power per kilowatt hour delivered is quite low and compares very favorably with other projects of similar hydro-electric undertakings.

The Lepreau Development

The investigations of the New Brunswick Water Power Commission which was appointed in June 1918 led to the plan of developing the Lepreau for supplying the City of St. John and vicinity and after the passage of the Electric Power Act in April last the surveys of that stream were pushed by the writer, who, in conjunction with Mr. Holgate had the plans of work at two sites, Lower Falls at the tide in Lepreau village and Big Falls, two miles up the stream, practically ready for tenders by the first of July. It was found that two reports had been made on the possibilities of power development on the Musquash, but the information contained in these reports was rather vague. It was also reported that it is feasible to divert the West Branch into the East but it was added that this diversion would have to be near Sherwood Lake and this is so far up the stream that half the drainage area would be lost, so that it was not thought worth the cost of development for what we could get. However, it was decided to make a barometrical reconnaissance, with the result that it was found to be possible to divert the West Branch at a point only about a mile from the tide. With this arrangement we can develop as much power in one power house as in the two we had under contemplation in the Lepreau, and as this is seven miles nearer St. John the writer recommended the development of the Musquash first, and this was approved by Mr. Holgate. As soon as this power has been absorbed, which I am sure will be almost as soon as it is developed, we can proceed with the development of the Lepreau, and when this has been absorbed we can go to the Magaguadavic. From these three streams we can deliver the following amounts of power, based on minimum seasonal rainfall:

Musquash,	12 miles from St. John	3000 h.p.
Lepreau,	19 " " "	12000 h.p.
Magaguadavic,	30 " " "	15000 h.p.
		30000 h.p.

In the case of the Shogomoc we can develop 8000 h.p. and as much on the Pokiok though two sites will have to be developed on the latter, as follows:

Shogomoc, 40 miles from Fredericton	8000 h.p.
Pokiok No. 1 at St. John River 37 miles from Fredericton	3000 h.p.
Pokiok No. 2, 38 miles from Fredericton	5000 h.p.
	16000 h.p.

For supplying the towns along the North Shore the Tetagouche flowing through a deep gorge in the rock falls 337 feet in the lower eight miles of its course and this can be developed in 4 steps:

No. 1	105 feet	3100 h.p.
2	132 "	3900 h.p.
3	66 "	1950 h.p.
4	35 "	1050 h.p.
		10000 h.p.

However, the Commission does not have to start construction on this stream, as it is practically assured that the Commission will be able to purchase current from the Bathurst Lumber Co. for a year or more until they have so increased their plant as to require all the power they can generate at their power house on the Nepisiguit.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. November 1920 No. 11

Date of Annual General Meeting

The Annual and Annual General Professional Meeting will be held in Toronto on February 1st, 2nd and 3rd, 1921.

The Officers' Ballot for 1921

The following is the report of the Nominating Committee, on the Officers' Ballot for 1921, approved by the Council of *The Institute* at an adjourned meeting held on Thursday, September 30th and herewith published in accordance with the regulations for the information of the membership of *The Institute.*

President: J. M. R. Fairbairn, M.E.I.C., Montreal.

Vice Presidents: Walter J. Francis, M.E.I.C., Montreal; Arthur Surveyer, M.E.I.C., Montreal; A. A. Dion, M.E.I.C., Ottawa; E. G. Matheson, M.E.I.C., Vancouver.

Councillors:

District No. 1: Major F. L. C. Bond, M.E.I.C., Montreal; Lt.-Col. A. E. Dubuc, M.E.I.C., Montreal; F. P. Shearwood, M.E.I.C., Montreal; K. B. Thornton, A.M.E.I.C., Montreal.

District No. 2: A. B. Normandin, A.M.E.I.C., Quebec; S. S. Oliver, A.M.E.I.C., Quebec.

District No. 3: C. C. Kirby, M.E.I.C., St. John, N.B.; S. B. Wass, A.M.E.I.C., Moncton, N.B.

District No. 4: G. B. Dodge, M.E.I.C., Ottawa; Lt.-Col. Alexander Macphail, M.E.I.C., Kingston.

District No. 5: (Three years) R. L. Dobbin, M.E.I.C., Peterborough; C. R. Young, M.E.I.C., Toronto.

District No. 5: (Two years) A. H. Harkness, M.E.I.C., Toronto; Lt. R. H. Parsons, M.E.I.C., Peterboro.

District No. 6: (Three years) H. B. R. Craig, M.E.I.C., Windsor; A. J. Grant, M.E.I.C., St. Catharines.

District No. 6: (One year) A. C. D. Blanchard, M.E.I.C., Niagara Falls; M. E. Brian, A.M.E.I.C., Windsor.

District No. 7: T. R. Deacon, M.E.I.C., Winnipeg; W. M. Scott, M.E.I.C., Winnipeg.

District No. 8: H. S. Carpenter, A.M.E.I.C., Regina; A. R. Greig, M.E.I.C., Saskatoon.

District No. 9: Major H. B. Muckleston, M.E.I.C., Calgary; S. G. Porter, M.E.I.C., Lethbridge.

District No. 10: H. L. Johnston, M.E.I.C., Armstrong; Col. A. W. R. Wilby, A.M.E.I.C., Victoria.

Engineering Remuneration

It is hoped that the final report of *The Institute's* Committee on Classification and Remuneration of Engineers will go before Council at the regular November meeting. Owing to the summer season, and the fact that some of the Branch Executives have not reported, the Committee considered it desirable to postpone this final report to another month. The Branches who have reported, however, are unanimous in the approval of the suggestion of *The Institute's* committee regarding the adoption of Engineering Council's report on Classification and Remuneration of Engineers.

The progress report of the Committee from the Chairman, A. H. Harkness, M.E.I.C., of Toronto, presented to the meeting of Council on October 26th is as follows:—

"In the interim report of your Committee on Remuneration, your attention was called to the action this Committee had taken in requesting the Executive Committee of each Branch of *The Engineering Institute of Canada* to examine the report of the Engineering Council on "Classification and Remuneration of Engineers" and to express an opinion as to the desirability of using this report as the basis of the report of *The Engineering Institute of Canada*. Favorable replies have been received from the Montreal and Toronto Branches, and the Border Cities Branch prefers to leave the question in the hands of the Committee. As the different Branches are again getting active after the summer holidays, more replies should be received in the very near future. You will of course be aware that the Manitoba Branch has already drawn up a schedule of fees to which they have adopted the Classification of the Engineering Council.

It is the intention of the Chairman of your Committee to have a meeting of the Committee in time to have a final report on salaries for the next meeting of the Council.

The Toronto Branch has a large "Fees" committee at work. Its report will be complete within a couple of weeks. By using this as a basis it will probably be possible to include in our report a schedule of fees."

Formation of Moncton Branch

An important step forward in engineering circles in the Maritime Provinces was taken on the evening of Oct. 11th, at a meeting of engineers held in the City Hall, Moncton, N.B., at which a local branch of *The Engineering Institute of Canada* was formed.

The meeting was addressed by Fraser S. Keith, Secretary of *The Engineering Institute of Canada*, who gave a concise amount of the history of *The Institute* from its incorporation in 1887 down to the present day, and remarked on the development of its policy which gave it today the important place it holds in the industrial and economical progress of the country. He impressed upon those present the desirability of taking part in its activities and thus increasing the usefulness of *The Institute* to the local members of the engineering profession and to the public generally.

At the conclusion of the address, bye-laws for the government of the branch were discussed and adopted.

The bye-laws adopted by the new Moncton Branch follow closely the standard Branch bye-laws with the exception that, following the recent movement to give greater scope to Junior Members, a clause was passed giving power to Junior Members to vote and hold all offices with the exception of Branch Chairman.

The following executive committee for the management of the branch was elected:

Chairman — W. A. Duff, M.E.I.C.
Vice-Chairman — J. D. McBeath, M.E.I.C.
Sec.-Treasurer — M. J. Murphy, A.M.E.I.C.
Committee—Reid McManus, A.M.E.I.C., R. G. Gage, J. Edington, M.E.I.C., F. B. Fripp, A.M.E.I.C., S. B. Wass, A.M.E.I.C., H. J. Crudge, A.M.E.I.C.

After the election of officers, Mr. Keith was tendered a hearty vote of thanks for his address. The members thereafter adjourned to the Green Lantern Cafe where supper was served.

Institute Year Book

In the preparation of *The Institute* Year Book it is of the utmost importance that complete and accurate information should be available regarding every member. The Year Book is a standard work of reference and every member owes it as his duty to *The Engineering Institute of Canada* to supply full details regarding his present address and occupation to the secretary. It was the original intention of making a personal appeal by letter, but it was felt that an announcement in *The Journal* would be as effective.

All Members, Associate Members, Juniors and Students, whose position as well as mailing address were not given in the last Year Book, or who have made changes since July 1st, 1919, are urged to write at once to the secretary, giving full information regarding change of position and address, or to fill out the form which will be found in the advertising section of the Journal.

New Honorary Member

Brig.-Gen. Henry Norlande Ruttan, C.M.G., M.E.I.C., was unanimously elected to honorary membership in *The Institute* at a meeting of Council held on October 28th, 1920. His election to honorary membership is a tribute to the high place which General Ruttan occupies in the engineering, military and civic life of the Dominion. General Ruttan was one of the charter members of the Canadian Society of Civil Engineers, his name being included as one of those who constituted the corporate body under the charter granted June 23rd, 1887, of which body he was president in 1910.

Engineering and Physics

The relationship between engineers and physicists received some consideration at the January meeting of *The Engineering Institute of Canada* at Montreal, but no definite policy resulted.

The question is not a simple one, for the domains of physics and engineering only partially overlap. Thus Lord Kelvin might justly have been ranked both as a great physicist and as a capable electrical engineer. On the other hand, it would scarcely be correct to describe as engineers either Newton, Faraday, Rayleigh, Maxwell, Stokes or Rutherford. These are some of the great pioneers in science whose imaginations open new fields of experience and thought which gradually become accessible to engineers with most far reaching applied results.

One effect of the Great War has been to create a greater respect and a closer liaison between physicists and engineers, and this effect is not likely to be transient.

Recently in England nearly all the leading physicists have enrolled themselves in the new Institute of Physics, and a code of professional conduct has been laid down, regulating among other questions that of consultations.

It is an immediate question for physicists in Canada whether they will join the Institute of Physics as individuals, whether they will form a Canadian branch, or whether they would prefer in addition, or as an alternative to join a physics section of *The Engineering Institute of Canada*.

An interesting forward movement has been made in the authorization of a course in Engineering Physics by the Corporation of McGill University. This is a new venture, not merely at McGill, but at any University.

The scheme is an excellent one but it is likely to prove abortive unless the schools of Canada vastly improve their training in mathematics so as to send students to the university capable of availing themselve of such a course, since the requirements for matriculation limp hopelessly behind the required standard. Yet there is no reason why the abler boys of Canada at the age of eighteen should not have a sound knowledge of mechanics, analytical geometry and the calculus, for what is done in Western Europe can be done in Canada.

The new course is a wise blend of honour mathematics and physics in arts with the electrical engineering course in applied science.

When the whole ground is covered, in five years, and a suitable thesis in research work has been presented, the student will have obtained his B.Sc. and his M.Sc. in engineering physics.

Such a man can find an interesting and fairly lucrative career in many lines of work.

Certainly he will be welcomed as a professor in mathematics or physics or electrical engineering in any University in Canada. The importance of well trained professors with a wide outlook can scarcely be overrated. For the greatest asset of Canada today is young Canadians, and that will always be the case.

It is however only too probable that men trained in the new course will be snapped up by the great research laboratories of the famous electrical companies of the United States and elsewhere.

The worst export for Canada is its best brains. The only remedy is a large output of able and well trained men, and sufficient posts to hold the best of them in the Dominion.

Recent developments of radio-work, the wide use of thermionic tubes or valves, or high frequency transmission along existing wires, raise problems which neither the electrical engineer nor the physicist alone can solve. Sometimes it is better to work in double harness, in other cases the combined training in a single man will prove the more effective.

In any case we have to develop the ardent enthusiasm of our young radio amateurs so as to obtain highly trained and no less enthusiastic expert pioneers who will solve the many problems linking engineering and physics.

It is not sufficiently understood by schoolmasters, parents, boys and the public, that an honour course in mathematics and physics (Arts) is a most advantageous opening for a career at the present time.

For the training of a good sound engineer the faculty of applied science is an admirable school. Something more is today needed for those with special gifts. In particular the needs of research work and of research institutes require careful consideration, and I cannot lay down my pen with better grace than by quoting a statement by a leading authority, one of the chief physicists in the United States, who writes, "The difficulty of getting properly qualified research men is as conspicuous in the United States as it is in Canada. Money, apparatus and laboratories are easier to get than men. Almost everybody recognizes this, including men in industries, who have some experience of the methods and results of research. Our council has this problem very seriously in mind and we have some plans under consideration for attempting to capture a large number of promising undergraduates in our universities. It is, however, exceedingly difficult to say whether or not much can be done in this way."

A. S. EVE, D.Sc.

Righteousness versus Religion

Engineers have written over one hundred and fifty thousand books on engineering and allied subjects during the past seventy-five years, but as far as we have any record, no engineer has heretofore dared to become an author in the religious field until a few months ago when C. E. W. Dodwell, M.E.I.C., chairman of the Halifax branch of *The Engineering Institute of Canada*, with a strong courage of his convictions, a well stored mind and a literary pen of a high order, issued his book, "RIGHTEOUSNESS versus RELIGION".

In a signed copy presented to *The Institute* under date of September 28, Mr. Dodwell has inscribed the following:—

> *"Presented by the author to the Library of The Engineering Institute of Canada, less as a specimen of a dangerous and undesirable versatility of genius than as a warning to other members who may be tempted to stray from the terra firma of their legitimate activities into the stormy waters of religious controversy."*

The author's reason for producing this book, is in part explained in the preface as follows:—

> "For many years I have been looking in vain for such a presentation of the case of Righteousness versus Religion as I have here essayed. Had I been successful it is needless to say that I should not have emulated other fools in 'rushing in where angels fear to tread' into the glare and pillory of public criticism.
>
> For many years also, I have been profoundly convinced that we are on the wrong road to our ultimate good; that we have been using not merely inadequate, but wrong, means to the accomplishment of the object of our existence; that nothing will set us and keep us in the right path, short of the gradual, but ultimately complete demolition of the mischievous errors, falsities and debasing superstitions, the ignorance, hypocrisy and narrow-minded bigotry and intolerance that constitute modern dogmatic Christianity, and upon the ruins the establishment of Righteousness based upon Science, Experience, Reason and Common Sense. We must cast away the dogmatic, or religious accretions of Christianity and re-establish it in the Righteousness, Simplicity and Beauty which its founder taught and preached and lived for and died for.
>
> Jesus was 'immeasurably the best ethical teacher that the world has ever known,' but no dogmatist. Contrast the Golden Rule and the Sermon on the Mount, on the one hand, with the Athanasian, the Nicene and the Apostles' creed, on the other!"

In the initial chapter, under the heading of "Religion" Mr. Dodwell expresses his point of view in the quotation, "*Primus In Orbe Deos Fecit Timor*" In the Beginning, Fear created the Gods.

It is not intended to analyze Mr. Dodwell's book at this time, nor to review it to any extent. It is an exceedingly cleverly written and interesting book, revealing to a considerable extent the modern trend of thought as opposed to dogmatic orthodoxy.

As would be naturally expected from an engineer the conclusion is that more works and less faith are the need of mankind at the present time.

Every member of *The Institute* should read this book which is published by The Stratford Company, Boston, Mass. and which can be secured through a local bookseller or by dropping a card to the secretary of *The Institute*.

Livening Society Meetings

Every engineer who has attended engineering-society conventions knows how tiresome they are apt to be. Every society officer who has made up the program of such a meeting knows the difficulty of the job. The former remembers how often the programme is along list of dreary papers presented in an uneasy manner by men unaccustomed to public speaking; the latter is usually bound by the tradition that such a programme is a necessity which he cannot avoid. In the specialist societies, such as those devoted to water-works, testing materials and concrete, long lists of papers are to be expected. They need not be dreary, in fact they rarely are, and the men who deliver them and those who listen are equally expert and equally interested. But in the general societies, particularly the local ones whose members are of all branches of engineering and whose bond of sympathy is the fact that they are all members of the same profession, the problem is different, albeit the solution is generally the same. The consequences are that only a minority of those present are interested in any one paper and that the papers have to be multiplied interminably to offer something to everybody.

The Engineering Institute of Canada seems to have taken a step forward in its so-called "professional meetings" which well may be looked into by other societies. These are held in various parts of the Dominion and are under the direction of the local branch. They attract engineers of every specialty. Instead of trying to present a rounded survey of the state of the art and science of engineering, the program is centered on one or two of the outstanding engineering works of the district, which are made the subject of complete explanatory papers and the scene of actual inspection. At Niagara, for instance, the Welland canal and the Queenston-Chippawa power project, both of such importance that no engineer worthy of the name can afford to be ignorant of their details, were the only subjects discussed outside of a short session devoted to purely professional matters which also had universal appeal. The consequence is that those who attended the meeting learned something about these two great works and at the same time were not bored at any of the sessions. Better everything about something than something about everything.

In addition, the Canadian engineers emphasize the social side of their meetings. To be sure, in the past there have been criticisms that certain of our technical-society meetings are nothing but junkets, which only those with abundant leisure can enjoy. But there is a happy medium which permits the fullest of social intercourse, the necessary mingling of men of a common interest, and at the same time provides enough solid technical matter to justify a busy man spending his time and money. So at Niagara there were luncheons and dinners and smokers—in fact, only at breakfast was the visitor required to seek out food on his own resources. At the end of the three days these engineers knew each other better, which is a requisite of professional interrelation, and they had learned besides some things which were useful in their work.

There is no intention of claiming that only in Canada are these things done, or that there they are always done. But this is a recent instance of a pleasant and profitable society meeting which stands out among the many that it is the duty of a technical editor to attend. Now that the winter season is coming on, with its sectional and state society meetings all over the country, it seems a good time to call the attention of programme makers to the possibilities before them. Let them not be bound down to the tradition of having only dry descriptive papers, but seek out some subjects which will interest everyone and emphasize them. Then if they provide opportunities for the men to get together between sessions, they will find that their members will go home better pleased and more inclined to come again.

(Editorial, Engineering News-Record, Oct. 14, 1920.)

Convention at Halifax

Of eight general professional meetings of *The Institute* three have been held in the Maritime Provinces, showing that the men down by the sea have a full appreciation of the advantage to be gained by such gatherings. The Eighth General Professional Meeting held in Halifax, on October 13th, 14th and 15th, lacked no single feature that has contributed to the success of other professional meetings as far as the results achieved from the good work of the officers of the Branch in conjunction with the St. John Branch, were concerned. Greeted by the most delightful weather imaginable and by an earnest group of Halifax engineers, the visitors from outside the city were made to feel from the time of their arrival that the city and all that appertained thereto, was theirs. One notable feature in connection with the engineers' relations to men in public life, is the fact that it is immediately apparent to a non-resident that members of the engineering profession in the Maritime Provinces are in closer personal contact there with the men in public life than in other Canadian provinces. Following the precedent established by his predecessor, Mayor Schofield of St. John, was in attendance. Mayor Parker, of Halifax, welcomed as giving the freedom of the city to those gathered at the meeting. He placed his automobile and those of the city at the disposal of members, and personally conducted a party to St. Margaret's Bay. Then that good friend of engineers, Lieut.-Governor MacCallum Grant, who referred to President Dodwell, of the Halifax Branch, as the leading citizen of Halifax, not only welcomed the visitors to Nova Scotia, but took a personal interest in the meetings and was present on several occasions. The attendance of one hundred and twenty-five is as large a proportional representation as we have yet had at any professional gathering. The papers read were all interesting and contained much valuable information being on widely divergent subjects illustrating the breadth of interest of the engineers' work.

Eighth General Professional Meeting

Halifax, N.S., October 13th, 14th, 15th

Morning Session, October 13th

C. E. W. Dodwell, M.E.I.C., Chairman of the Halifax Branch of the E.I.C., was in the Chair and opened the Meeting. He stated that His Honour the Lieutenant-Governor and His Worship the Mayor of Halifax were present and had kindly consented to give a word of welcome to the engineers present; Mr. Dodwell eulogized both the Lieut.-Governor and Mayor Parker as being zealous in all good works and in the forefront of all activities that make for the interest and betterment of our citizens.

Continuing Mr. Dodwell stated that *The Engineering Institute of Canada,* founded in 1887, thirty-three and a half years ago, as The Canadian Society of Civil Engineers, with Headquarters at Montreal, had now a membership of four thousand engineers, engaged in developing the country, from the Atlantic to the Pacific, with branches in all the leading centres of population throughout the Dominion. There are now no less than nineteen branches, the nineteenth coming into existence on the 11th instant. These branches are in Halifax, Moncton, St. John, Montreal, Quebec, Ottawa, Kingston, Peterborough, Toronto, Hamilton, Windsor, Niagara Falls, Sault Ste. Marie, Winnipeg, Regina, Calgary, Edmonton, Vancouver and Victoria, and without exception all are doing good work for the development of the country.

On behalf of *The Engineering Institute of Canada* on the whole, and of the Halifax Branch in particular, he extended to His Honour the Lieut.-Governor and His Worship the Mayor of Halifax a cordial and respectful welcome.

His Honour MacCallum Grant, Lieut.-Governor of Nova Scotia, opened his remarks by extending to those Members present who were from out of town a welcome to the City by the Sea, and made some fitting remarks about the City itself. He then replied to some of Mr. Dodwell's remarks. He hoped he could live up to all the things Mr. Dodwell had said about him. In referring to the City itself he said that it was a little at a disadvantage being so far East, but a great deal of money had been spent in developing the town. He made a few brief remarks about the explosion of a few years ago and how it had hindered the city in a great many ways but helped it in others. He also mentioned the fact that nearly $20,000,000 had been spent in the construction of the new ocean terminals. The Lieut.-Governor also said that in all Canada one could not find a better body of men than engineers, nor men who were better informed. He thought we ought to cultivate and know better the engineer. In conclusion Mr. Grant said "I give you all a very warm welcome and if outside of Halifax we have the credit of being 'Blue Noses', we have red blood in our veins and the welcome which I extend to you comes from the heart. I intend to keep this button, which has been given me, as a memento of this meeting this morning."

The Mayor also extended a warm welcome to the engineers present to Halifax. He asked the members present to pay a visit to the North End of the city, to see what has been accomplished in the way of building since the explosion. And for this purpose he offered to put three cars at the disposal of the engineers. He also hoped they would pay a visit to the Hydro-Electric Power Plant at French Village.

After thanking the Lieut.-Governor and the Mayor for their cordial welcome Mr. Dodwell announced that, in order that the engineers could take advantage of the proposed trip to the Halifax Ship Yards, cars had, through the kindness of I. Macnab, M.E.I.C., been arranged for and would be at the Technical College at 2.30 sharp.

R. A. Ross, M.E.I.C., President of the E.I.C., from Montreal, was then asked to give a few remarks. Mr. Ross said this was entirely unexpected and a new item on the programme. He began by making a few amusing remarks about advice which had been given him when coming to this, his first visit, to Halifax. In referring to what engineers had done Mr. Ross said they had certainly developed the cities wonderfully but he would like to see this development spread into the country more. He said that not long ago two thirds of the people were in the country, now two thirds are in the cities. Mr. Ross said he welcomed these meetings, and especially the Professional Meetings; the meetings held recently at Niagara Falls and Banff had been most successful.

F. A. Bowman, M.E.I.C., of Halifax then read a paper by D. W. Robb, M.E.I.C., of Amherst on "The Development of the Steam Engine in the Maritime Provinces," (published in the October *Journal.*)

Following the reading of Mr. Robb's paper, Mr. Dodwell said that the paper was a very interesting and valuable contribution to the literature of the E.I.C. and had a proper place in *The Journal* of the Inst. "Mr. Robb has given us some very interesting facts and figures in regard to his subject and it is very gratifying to know of the development of the Steam Engine in the Maritime Provinces."

Mr. Bowman made some interesting and appropriate remarks and comments on the paper.

Mr. Macnab said he had served an apprenticeship with the Robb Engineering Works and spoke in the highest terms of the engines they had turned out, both as to the high grade of workmanship and the utility of the engines. He said that at the present time the Halifax Tramway Co. had in use two old engines made by these people which they had fixed up and which are now working quite as well as any new engine.

C. H. Wright, M.E.I.C., said that Prof. Nicholson of McGill University had paid a high tribute to the engines of the Robb Engineering Co. which were in use in the Mechanical Department of the College. He said they were pioneers in the development of the steam engine.

Mr. Wright offered a vote of thanks to Mr. Robb for this excellent paper. The vote was seconded by G. G. Murdoch, M.E.I.C., of St. John.

Mr. Dodwell presented the vote of thanks; he suggested that the Secretary of *The Institute* convey to Mr. Robb a vote of thanks.

Mr. Dodwell announced that Fraser S. Keith, the indefatigable Secretary of *The Institute*, from Montreal, was present and asked that Mr. Keith give a few words about the activity of the Central Office and the Branches.

Mr. Keith spoke in very high terms of Halifax. He spoke briefly on the work of the parent Branch of *The Institute* in Montreal and said he considered the work of the outside Branches of great importance. He gave a very interesting account of the recent meetings in Niagara Falls and Banff. Mr. Keith said this was the third Meeting of *The Institute* that he had attended in the Maritime Provinces and he expressed his opinion that these meetings are most valuable in promoting good-fellowship, etc.

Mr. Keith also spoke very forcibly on the salaries paid engineers at the present time and said the newly appointed special Committee on "Classification and Remuneration" was doing everything in its power to bring about a different schedule of salaries for the different grades of engineers. He pointed out that this Committee, and in fact *The Institute* itself, was doing everything possible to help the individual. He hoped everyone in Canada would realize what a splendid organization they had in the E.I.C.

Mr. Ross said that the engineer had always given service first without enough thought to his remuneration. He thought the time was past for this sort of thing and that the engineer must demand more money and a better status, and to gain this they must work together in a body.

A telegram was read from A. Gray, M.E.I.C., of St. John regretting that he would not be able to be present.

Mr. Ross expressed great regret at Mr. Robb not being present. He thought the latter's paper was of historical value to *The Journal*.

W. Rodger, A.M.E.I.C., made a few brief remarks relative to his connection with the steam engine and his experience with the Robb Engine in particular.

The Meeting adjourned at 12.30.

Evening Session, October 13th

In Mr. Dodwell's absence, F. A. Bowman, M.E.I.C., was in the Chair.

Papers were to be read by F. H. Williams, A.M.E.I.C., of Moncton and Frank Vaughan, M.E.I.C., of St. John, but as the papers were on the same subject—"Electric Welding of Iron and Steel"—Mr. Vaughan offered to hold his paper over until Friday morning.

Mr. Williams then read his paper (printed in this issue of *The Journal*), lantern slides being shown in illustration.

In comment on Mr. William's Paper Mr. Bowman said he thought there was no occasion for him to say very much, that the paper spoke for itself and gave forth some most enlightening views on the subject of electric welding of iron and steel. He thought both the paper and the preparation of the slides had meant a tremendous amount of work to get them into such a shape.

Mr. Bowman then extended a hearty vote of thanks to Mr. Williams for his reading of the Paper and showing of the lantern slides.

The Meeting adjourned at 10 o'clock.

Morning Session, October 14th

Mr. Dodwell not being present G. G. Murdoch of St. John was in the Chair and extended a hearty welcome to Mayor Schofield of St. John who was present. Mr. Bowman made some announcements relative to the programme for the day and also that of Friday.

Prof. Sexton then read his paper on "Secondary Education", (printed in this issue of *The Journal*).

In his introductory remarks he explained the meaning of his subject, saying that Secondary Education was the preparation for life, that one might include almost everything in that, except the sermon and admonition of the ministers who prepare us for the next life. Technical Education is preparation for making a living, and "I think you will agree with me," he said, "that this fills up a lot of consideration in this life — we hope it will not in the next".

"You will know what I am talking about in Secondary Education if you know that I am talking about people who work in the skilled and semi-skilled operations, and this education comes above the primary or common school education and prepares one for his job."

Following the reading of Prof. Sexton's paper Mr. Bowman, in a few brief words, expressed his appreciation, and gave an interesting account of the Telephone Company's experience in applying this technical education to their employees, or operators.

Mr. Bowman said he thought, as Prof. Sexton had said, that this was a subject in which engineers should be most deeply interested. He thought that firms and corporations did not take enough interest in the individual employees working under them, and that the only way to obtain satisfactory work was to teach the employees. The Telephone Company had a dummy switch-board on which the operators began their training. After weeks of this training they were taken in groups by a teacher and put on the regular boards and were educated right there.

R. McColl, M.E.I.C., then made a few comments on Prof. Sexton's paper. It gave one a great deal to think about, but it was his opinion that the general public and the Government did not take the matter seriously enough, even though there was a good deal of talk in favour of this technical education. He thought the colleges and schools, generally, had been a failure in a way. Their teaching was too systematic and they had not been teaching the students to think for themselves. Contrary to what Prof. Sexton had said in his paper relative to

"Leaders", Mr. McColl said that there never was there such a dearth of Leaders and never so much need of them.

Mr. Murdoch, on behalf of the Meeting, extended to Prof. Sexton a hearty vote of thanks for his very excellent Paper.

A Paper was then read by H. S. Johnston, A.M.E.I.C., on "The Development of the Sheet Harbour Water Power".

On account of the late hour there was no time for discussion and the Meeting adjurned for lunch.

Luncheon at Commercial Club

Members of the Halifax Branch who were also members of The Commercial Club of Halifax very kindly invited out-of-town members to a luncheon. Following the luncheon R. A. Ross, M.E.I.C., President of *The Engineering Institute of Canada*, was introduced by C. E. W. Dodwell, M.E.I.C., who gave a condensed history of the E.I.C. and the newly created Association of Professional Engineers of Nova Scotia. Mr. Ross gave a very interesting speech on the work of the Administrative Committee in Montreal, of which he is a member. Mr. Ross told of the difficulties accompanying the work, and gave a sketch of the financial arrangements which had been introduced by the Commission, and the efforts to improve the financial standing of the City. He outlined the work of the Charter Commission which is drawing up the formation of government for the city. The proposed Charter will provide for nine elected representatives, from whom the Mayor is to be chosen; the city manager, who will be responsible for all executive work. It is proposed to abolish the present system of wards, and it is hoped that the proposed form of government will be a success. Mr. Ross remarked on the fact that part of Montreal's population wished to have a political regime, and part to have a business regime, and concluded with the quotation that one could do a great deal for the community if it were not for the people in it.

Morning Session, October 15th

In Mr. Dodwell's absence F. A. Bowman, M.E.I.C., was in the Chair.

A Paper was read by C. O. Foss, M.E.I.C., of St. John on "The Progress of Hydro-Electric Development in New Brunswick," (printed in this issue of *The Journal*); this paper was illustrated by Lantern Slides.

Mr. Bowman, in making comment upon the paper, said he was sure the members present had listened with a great deal of interest to the paper which Mr. Foss had read. He said one thing that struck him as most interesting in connection with both papers which had been read on this subject, was the fact that both New Brunswick and Nova Scotia had a very much larger supply of hydraulic power than we ever imagined. And he said that we might consider that we are a great deal better off in water power than we thought.

Rod. McColl, M.E.I.C., said he appreciated Mr. Foss's Paper very much, but he thought it unfortunate that the author had to read such a paper from New Brunswick when he came from Nova Scotia. He thought the Government of Nova Scotia had made a great mistake in letting such a man go to another Province when it would have been to the advantage of the Province to keep a man such as Mr. Foss in it, with his knowledge of the development of water power.

He asked a few questions in regard to the extent of storage, etc., they had for this Water Power, which questions were answered by Mr. Foss.

Mr. Wright thought a chance should be given to discuss Mr. Johnston's paper, which had been read the day before.

Mr. McColl, too, wished to discuss the paper in question but as another paper had to be read at the Morning Session the Acting Chairman thought the time was too limited for this, unfortunate though it was.

Mr. Wright moved that a vote of thanks and an expression of appreciation be given Mr. Johnston for the preparation of his paper and slides, which must have entailed a tremendous amount of thought and labour.

The vote of thanks was seconded by Mr. Murdoch of St. John, who thought the vote of thanks ought to cover both papers which had been read on this subject—The Development of Water Power in both Nova Scotia and New Brunswick.

An excellent paper on "The Electric Welding of Iron and Steel" was then read by Frank Vaughan, M.E.I.C., of St. John, the paper being illustrated by a large number of Lantern Slides.

Mr. Vaughan, before beginning his paper, said he regretted that his paper overlapped with that read by Mr. F. H. Williams a few evenings previous, but he hoped that his paper would give some information that had not already been given.

Mr. Bowman said that when the Meeting started he was sorry that he, as a member of the Papers Committee had let two papers overlap, but that now he was very glad that both papers had been read, that though of the same subject, neither infringed on the other and both gave very excellent and detailed information and a wide conception of this work. He thought that the amount of work expended in getting up papers and slides in this connection showed that it could not be characterized as anything else but a labour of love.

Mr. Ross said he wished to echo everything that Mr. Bowman had said, and more too. He thought the papers did not overlap but were complementary to one-another. He also said that with the two papers published in *The Journal* engineers would have two of the most interesting articles they could possibly have on the subject.

Mr. Ross then asked a few questions in regard to the details of the paper, which were answered by Mr. Vaughan.

Mr. Macnab of the Tramway Company said that the paper appealed to him, especially the practical nature of it, on account of some similar work which he had had to do in connection with his company. As a matter of economy he thought the electric welding business was something that should engage the attention of every man who has anything to do with any kind of mechanical work. He said in their company they could show what electric welding could do in a mechanical plant. He said also that he had been trying to see if he could do anything in the matter of "flats" on cast iron wheels, building them up with this process.

Mr. Vaughan said he thought the building up of car wheels had been used quite extensively by this process. "Of course", he said, "cast iron is pretty hard to build up by any process and it is really a matter of experience. All welding depends entirely on the operator and as the operator acquires the experience he becomes expert. Not being a practical welder myself I am not in a position to tell you myself."

Mr. Hatfield of St. John said he had had some little experience with the process. He said they had welded some of the heavy frames that had broken on their locomotives, but in this case he thought acetylene was used. He said heavy welding was extensively employed even in motor trucks.

Mr. Macnab moved a vote of thanks to Mr. Vaughan for his paper. He said he thought it had shown a great amount of work and thought that Mr. Vaughan was entitled to the thanks of the Meeting for such a splendid paper and for the splendid way in which he had given it.

The vote of thanks was seconded by W. P. Morrison, A.M.E.I.C.

Votes of Thanks

Mr. Murdoch offered the following vote of thanks:

To His Honour Lieutenant-Governor MacCallum Grant,

His Worship Mayor J. S. Parker of Halifax,

His Worship Mayor E. A. Schofield of St. John.

The Nova Scotia Tramways & Power Co., (I. P. Macnab) For cars to shipyards and free transportation on cars to members.

The Halifax Shipyards (Mr. McClurg, general manager) and Mr. D. E. O'Brien, A.M.E.I.C., chief engineer), for the visit to the plant.

The Naval Authorities, for permission to visit His Majesty's Canadian Dockyards and conducting party through submarine, etc.

Dr. F. H. Sexton, Principal of the Nova Scotia Technical College.—use of building and also for his excellent paper on "Secondary Technical Education".

The Maritime Telegraph & Telephone Co., (W. A. Winfield and F. A. Bowman, M.E.I.C.).

Authors of Papers:—

D. W. Robb, M.E.I.C.;
Prof. F. H. Sexton;
F. H. Williams, A.M.E.I.C.;
H. S. Johnston, A.M.E.I.C.;
Frank Vaughan, M.E.I.C.;
C. O. Foss, M.E.I.C.

Nova Scotia Powers Commission (K. H. Smith, M.E.I.C.), trip to St. Margaret's Bay.

Halifax Branch Officers and Committees.

These votes of thanks were seconded by C. C. Kirby of St. John.

R. A. Ross, M.E.I.C., President of the E.I.C., made a few remarks before the closing of the Meeting, chiefly in regard to his first visit to Halifax.

He said he would like to stay in the city for a week or two and just poke around. He said the trip was a treat to him and that he was going away with a very clear idea of what the people here are doing, and hoped that if another Meeting was to be held here next year he would be able to attend.

He thought the Meeting was a very successful one and said "you are going to have a very strong organization down here some of these days and it is going to be a great thing for all of you".

Mr. Bowman, in concluding the Meeting, said that at the first Meeting, two years ago, one hundred names had been registered. At the St. John Meeting a year ago they went a few better than that, and at the present Meeting there were one hundred and twenty-five names on the Register.

As there was nothing further on hand to discuss, Mr. Bowman moved that the Meeting be adjurned.

Banquet

The functions of Friday's session were drawn to a close by a banquet held at the Green Lantern. This was a successful and enjoyable function, with over one hundred present. Among the guests were His Honour Lieutenant Governor Macallum Grant, Mayor Schofield of St. John, Mayor Parker of Halifax, and the Honourable E. H. Armstrong. Following the toast to the King, proposed by Mr. Dodwell, Professor Sexton proposed the health "Our distinguished guests." This toast was responded to by Lieut-Governor Macallum Grant, the Honourable E. H. Armstrong, Commissioner of Public Works, Chairman of the Nova Scotia Power Commission, Mayor Schofield of St. John, and Mayor Parker of Halifax, all of whom welcomed the engineers to Halifax very heartily. The Honourable E. H. Armstrong gave an interesting speech, and spoke on behalf of the provincial government, referring particularly to the Highways system, stating that, as in every sphere of public work the integrity of the engineers in charge of this work was a vital point. The toast to visiting members was proposed by K. H. Smith, M.E.I.C., and replied to by George Hare, M.E.I.C., city engineer of St. John, N.B., Geoffrey Stead, A.M.E.I.C., district engineer of the Public Works Department of Chatham, N.B. The Chairman called upon other members present for a speech, including F. W. W. Doane, M.E.I.C., city engineer, Halifax; H. S. Van Scoyoc, A.M.E.I.C., of Montreal; S. B. Wass, A.M.E.I.C., of Montreal; Mr. McAllum of Montreal, and Fraser S. Keith, Secretary of *The Engineering Institute*. Mr. Keith paid a high tribute to the Maritime Province engineers, especially to C. E. W. Dodwell, Chairman of the Convention meeting, to whom he referred as the father of engineering legislation in Canada.

Eighth General Professional Meeting,—Halifax, N.S., October 13, 14, 15, 1920

REGISTRATION

Allan, J. Lorn, Dartmouth, N.S.
Archibald, E. M., St. John, N.B.
Ashley, Barrington Passage, N.S.
Baker, E. Douglas, Halifax.
Barnes, H. C. R., Dartmouth, N.S.
Bayne, B. E., Moncton, N.B.
Beattie, A. E., Halifax.
Belliveau, J. E., Halifax.
Bethune, R. J., Antigonish.
Black, R. A., Truro, N.S.
Blois, E. B., Halifax.
Boswell, M. L., Halifax.
Bowman, F. A., Halifax.
Bray, J. L., Breton, N.S.
Buchanan, K. N., Halifax.
Cameron, K. G., Sydney, N.S.
Campbell, I. G. W., Truro, N.S.
Chapman, E. W. G., Truro, N.S.
Cooke, L. A., Halifax.
Copp, W. P., Halifax.
Cox, O., Halifax.
Crooks, C. M., Halifax.
Crookshank, A. R., St. John.
Curtis, A. C. R., Chicago.
Dawson, R. L., New Glasgow, N.S.
Dewolfe, Wm. J., Halifax.
Dickson, T. H., Pictou, N.S.
Doane, H. W. L., Halifax.
Dobson, A. L., New Glasgow, N.S.
Dodwell, C. E. W., Halifax.
Donkin, R. T., Halifax.
Doucette, A. L., Halifax.
Dryden, J. G., Moncton, N.B.
Dyer, A. F., Halifax.
Farnham, M.B., Halifax.
Faulkner, F. R., Halifax.
Foss, C. O., St. John.
Freeman, J. R., Halifax.
Freeman, Phil. A., Halifax.
Freeman, R. P., Halifax.
Fripp, C. F. B., Moncton, N.B.
Garnier, L., Halifax.
Goudge, M. F., Halifax.
Grant, Maccallum, Halifax.
Gray, F. W., Halifax.
Handy, E. F., Halifax.
Hayes, J. B., Halifax.
Hayes, St. C., Halifax.
Hayes, W. H., Halifax.
Hare, G. G., St. John.
Hare, W. G., Halifax.
Hatfield, G. N., St. John.
Heckle, G. R., Montreal.
Hunter, Wm. L., Halifax.
Innes, C. W., Halifax.
Jennings, F. P., Halifax.
Johnston, Harold S., Halifax.
Keith, Fraser S., Montreal.
Kerr, F. B., Halifax.
Kirby, C. C., St. John.
Leaver, Chas., Imperoyal, N.S.
Lewis, Chas., Yarmouth.
Lumsden, J. F., Halifax.
Macdonald, A. T., Halifax.
MacKenzie, N. K., Halifax.
Mackenzie, A. J., St. John.
Maclean, H. L., Halifax.
Maclean, M. J., Halifax.
McColl, Rod., Halifax.
MacMillan, M. J., Halifax.
Macnab, Ira P., Halifax.
MacNearney, C. A., Halifax.
Mahon, I. W., Halifax.
Marshall, Geoffrey J., Halifax.
Matheson, W. G., New Glasgow, N.S.
McMinn, G. D., Halifax.
Mechin, F. C., Imperoyal, N.S.
Moore, R. C., Halifax.
Morrison, W. P., Dartmouth, N.S.
Murdoch, Gilbert G., St. John.
Murray, R. R., Halifax.
North, V. E., Halifax.
O'Brien, D. E., Halifax.
O'Brien, F. G., Halifax.
Palmer, F. H., Halifax.
Parker, J. S., Halifax.
Peppard, Hugh, Springhill, N.S.
Picking, S. W., Halifax.
Poole, J. N., Halifax.
Putnam, H. N., Halifax.
Robertson, Chas. R., Halifax.
Rodger, N., Halifax.
Roland, J. W., Halifax.
Ross, R. A., Montreal.
Schofield, E. A., St. John.
Sexton, F. H., Halifax.
Smith, K. H., Halifax.
Spence, W. N., Halifax.
Stairs, Gordon, Halifax.
Stead, Geoffrey, Chatham, N.B.
Stiles, R. D., Halifax.
Stokes, Thos., Halifax.
Sutherland, Alex., Halifax.
Tapley, F. B., Moncton, N.B.
Thorne, E. L., Jr., Halifax.
Thurber, G. S., Chatham, N.B.
Turnbull, A. A., Digby, N.S.
Uniacke, R. F., Ottawa.
Van Scoyoc, H. S., Montreal.
Vaughan, Frank P., Halifax.
Walton, C. R., Halifax.
Wass, S. B., Moncton, N.B.
Wheaton, L. H., Halifax.
Whitman, C. O., Halifax.
Wickwire, D. S., Halifax.
Williams, Fred. H., Moncton, N.B.
Wilson, C. H. J., Halifax.
Wilson, W. R. C., Antigonish, N.S.
Winfield, W. A., Halifax.
Winter, F. H., Halifax.
Wright, C. H., Halifax.

Elections and Transfers

The following elections and transfers were effected at the adjourned meeting of Council held on the 28th September:—

Members

R. G. Gage, B.Sc. (Queen's Univ.) of Moncton, N.B., signal and elec. engr., Can. Nat. Rlys.; Jas. McGowan, (Shaw Street College, Liverpool) of Vancouver, B.C., Supt. engr., C.P.O.S. lines and B.C. Coast service, C.P.R.; J. W. Morris, B.A.Sc. (McGill Univ.) of St. John's, Nfld., Supt., elec. dept., Reid Nfld. Co.

Associate Members

J. G. R. Alison, (Grad. S.P.S.) of Niagara Falls, Ont., Bridge inspector, Hydro-Elec. Power Comm., Niagara Falls; A. M. Bremner, of Prince Rupert, B.C., chief draftsman, office of div. engr., G.T.P. Ry., Prince Rupert; M. T. Cantell, (Tech. Coll. Brighton, Eng.) of Winnipeg, Man., consulting engr., Munic. of Fort Garry; J. H. Clark, of Truro, N.S., senior transitman, Halifax div., C.N.R.; C. L. Foss, of Enniskillen, N.B., res. engr., St. J. & Que. Rly.; J. T. Fullerton, B.Sc., (C.E.) (McGill '14,) with Fullerton & Bell-Irving, civil engrs., Vancouver, B.C.; R. H. Goodchild, B.A.Sc., (McGill Univ.) of Calgary, Alta., with Dom. Govt. making irrigation, inspection and surveys in Sask. and Alta.; F. C. Higgins, B.Sc. (Acadia Univ. '14) of Ottawa, Ont., technical intelligence officer, Can. Air Board; J. A. Jette, B.A.Sc. (C.E., Laval Univ.) of Montreal, Asst. engr., City of Montreal, Water Works dept.; R. A. Kirkpatrick, (McGill Univ.) of Nelson, B.C., senior asst. engr., D. P. W., Kootenay Dist., B.C.; H. M. Lyster, B.Sc. (McGill Univ. '13), salesman and estimating, bldg. materials, H. H. Robertson Co. Ltd., Montreal, Que.; C. A. Macvey, (Univ. of N.B.) of Fredericton, N.B., first asst. engr., Prov. of N.B., D. P. W.; E. B. Martin, B.Sc. (Univ. of N.B. '12) of Moncton, N.B., comm'r. of streets and sewers dept., City of Moncton; R. McManus, B.Sc. (Mass. Inst. of Tech.) of Moncton, N.B., private practice; A. G. Scott, B.Sc. (McGill Univ. '14) of Montreal, Que., structural draftsman, Lockwood, Greene & Co. of Canada, Ltd.; R. L. Waycott, of New Glasgow, N.S., field engr., N.S. Steel & Coal Co.; Jas. Whitelaw, (Heriot Watt Tech. Coll.) of Moncton, N.B., asst. engr. in chief engr's office, C.N.R.; K. O. Whyte, of Montreal, Que., draftsman, Dominion Bridge Co., Montreal.

Juniors

A. F. Belding, (Univ. of N.B.) of Fredericton, N.B., asst. bridge engr., Prov. of N.B.; D. W. J. Brown, of Sydney, N.S., with Dominion Iron & Steel Co. Sydney, N.S. in mech. drafting office; W. H. Chisholm, B.Sc., M.E. (N.S. Tech. Coll.) of Halifax, N.S., with Nor. Elec. Co., Halifax Branch, sales dept.

Transferred from the Class of Associate Member to that of Member.

F. A. Brown, (Glasgow Tech. Coll.) of Auckland, New Zealand, consulting elec. & mech. engr., Northern Coal Co.; W. Dickson, B.Sc. (McGill Univ.) of Montreal, Que., asst. engr., Montreal Water Works dept.

Transferred from the Class of Junior to that of Associate Member.

C. R. McCort, B.A.Sc., (C.E.) (Univ. of Toronto), of Grand Mere, Que., supt. [illegible], Laurentide Co., Grand Mere, Que.

Transferred from the Class of Student to that of Associate Member.

J. G. Caldhaw, of Calgary, Alta., field [illegible] on reclamation work, Comm. of Irrigation, Calgary, Alta.

CORRESPONDENCE

Enquiry re Correspondence Course

Editor, *Journal:*—
Dear Sir:

I would be very glad if you would advise me of the efficiency or otherwise of the structural engineering and other correspondence courses sold by the Wilson Engineering Corporation, Hanover Mass., and if in the opinion of any of our members the courses are worth the money asked for them.

Yours truly,
K. M. Chadwick, A.M.E.I.C.

1534 Elford St.,
Victoria, B.C.
Sept. 27th, 1920.

Editorial Note:—Will members kindly forward the desired information to Mr. Chadwick.

LIBRARY NOTES

The Profession of Engineering

The following list of books and papers by Engineering Council has been compiled in response to requests, especially from parents and vocational advisers of high school boys, for information concerning the principal branches of engineering, the education and training requisite therefor, and the possibilities for making a livelihood therein.

Those works which are followed by a code number may be consulted by the general public in Engineering Societies Library, 29 West 39th Street, New York.

Engineering as a Career—Edited by F. H. Newell and C. E. Drayer—D. VanNostrand Co. 1916. [illegible]. (A collection of papers originally published in the "Cleveland Plain Dealer" and the "Scientific American" on various phases of engineering work.)

Opportunities in Engineering—Charles M. Horton—Harper & Bros. 1920. [illegible].

Engineering as a Career—Robert McCullough—David Williams Co. 1911. 620 M 139 E. (Subject matter based upon a series of addresses given before technical schools and associations of engineer assistants; published for information of parents.)

Engineering as a Career—Percival and A. A. Marshall, P. Marshall & Co., London 1916.

Addresses to Engineering Students — Edited and Published by Waddell and Harrington, Consulting Engineers, Kansas City, Mo., 2nd Edition 1912. 620 W 118 A. (Purpose of book is to give engineering students a broad conception of the profession.)

Engineering as a Profession — Milo S. Ketchum.—Bulletin of University of Colorado, 1916. No. 6. General Series No. 98.

Engineering as a Profession — Dean William G. Raymond, University of Iowa.—University Extension Bulletin No. 3. New Series No. 73, April 11, 1914.

Retraining Canada's Disabled Soldiers

By Walter E. Segsworth, formerly Director of Vocational Training, published by the King's Printers, in 200 pages.

This book describes in a very interesting way the remarkable work that has been done by the Department for Soldier's Civil Re-establishment in Canada. The Dominion has a good record in connection with this work, and great credit is due to the self-sacrificing men who have done so much for our returned soldiers. Among these may be mentioned Professor H. E. T. Haultain, M.E.I.C., whose work in the Toronto district is well known.

The scope of the book is indicated in print from the arrangement. Organization, Work Shops, Interviews, Industrial Reprinting, Industrial Surveys, Medical Aspects, Care of the Blind, Statistics, Costs, and After Care. There are also several very interesting appendices: Statistics to December 31st, 1919, Bibliography, Length of Courses In Other Countries, etc.

Standard Specification of Steel Highway Bridges

Received from Canadian Engineering Standards Association "Standard Specification of Steel Highway Bridges", published by the Association. This Specification is based on that published by *The Engineering Institute* (then The Canadian Society of Civil Engineers) in 1912 and has been brought up to date by a special committee which the chairman is G. H. Duggan, M.E.I.C. The new Specification has been drawn up to agree as far as possible with the Standard Specification of the American Railroad Engineers Association, and the American Society for Testing Materials. Copies may be obtained from Captain R. J. Durley, M.E.I.C., Secretary of the Canadian Engineering Standards Association, Room 112, West Block Parliament Buildings, Ottawa.

OBITUARIES

Ernest George Henderson, M.E.I.C.

Ernest George Henderson, M.E.I.C., president and general manager of the Canadian Salt Company and past-president of the Canadian Manufacturers' association, passed away in the Royal Victoria Hospital, Montreal, on October 13th, following an attack of pneumonia.

Mr. Henderson, who was 62 years of age, underwent an operation, and was doing fairly well, but pneumonia set in and his death resulted.

Mr. Henderson was born in Holywood, County Down, Ireland, on September 14th, 1858, the fourth son of the late Rev. Henry Henderson and S. Jane Henderson. He was educated in Hillbrook School and College, Belfast. Later he became an articled pupil to the engineer of the Belfast and County Down Railway, continuing this work for four years before his appointment to the position of assistant engineer of the Ulster division of the Great Northern Railway of Ireland. In 1883 Mr. Henderson came to Canada and was engaged on surveys and construction work on the main line of the C.P.R., and on re-measurement of certain sections of that railway north of Lake Superior where disputes had arisen between the C.P.R., and some of the contractors. In 1888 he was appointed assistant engineer of the C.P.R. at Toronto and later resident engineer at London. Under Mr. Henderson's direction the C.P.R., line between Windsor and London was constructed. Mr. Henderson left the employ of the C.P.R., in 1893 to superintend the construction of the plant of the Windsor Salt Works which was organized about that time by Sir William Van Horne and his associates. Mr. Henderson became, from the outset, general manager of the company and later was elevated to the presidency.

In spite of his heavy business responsibilities, Mr. Henderson found time to devote a great deal of attention to other interests. For many years he has been active in the affairs of the Canadian Manufacturers' Association and served as president of that body in 1916. At the time of his death he was a member of the C.M.A., executive. Mr. Henderson was for several years a member of the Windsor Board of Education and served as chairman, and was at one time president of the Windsor Board of Trade and later a member of the executive of the Border Chamber of Commerce. As a member of the Essex Health Association, with the late Dr. Smith, former collector of customs, Mr. Henderson shared a large measure of the credit for the construction of the tuberculosis sanatorium at Union-on-the-Lake. He was a delegate to the provincial and general synods of the Anglican church for twenty-five years and a member of the executive committee.

Mr. Henderson was intensely patriotic and devoted to the furtherance of every cause calculated to advance the interests of the British Empire. In the Sportsmen's Patriotic Association and the Soldiers' Aid he gave splendid service. The Children's Aid Society is another organization in which he was deeply interested.

Mr. Henderson was one of the original members of the Canadian Society of Civil Engineers, being elected a Member in January 1887; he was also a Member of the Institution of Civil Engineers of Ireland, the American Society of Mechanical Engineers and of several clubs. In politics he was a prominent Conservative.

At the weekly meeting of the Border Chamber of Commerce on October 14th, reference was made to the passing of Mr. Henderson and the following resolution was carried and placed upon the records of the organization, upon motion of Col. E. S. Wigle and Mayor F. B. Winter:

"Be it resolved at this general meeting that the members of the Border Chamber of Commerce deeply deplore the passing of Mr. E. G. Henderson, one of its oldest, ablest and most energetic members a true patriot, a sterling citizen and a staunch and faithful friend; and that the secretary be instructed to convey our sincerest sympathy to the wife and family of our late friend and fellowworker."

Harold Worsley Ebb Canavan, M.E.I.C.

Harold Worsley Ebb Canavan, M.E.I.C., one of the leading authorities on irrigation in Canada, died of pneumonia at Neihart, Montana, on September 22nd. Mr. Canavan was born in Toronto in 1867, and was a member of St. Andrew's Lodge, A.F. and A.M., and of the Benevolent Protective Order of Elks. For seven months previous to his death, Mr. Canavan was manager of the Flohart Silver Mines, Niehart, Montana. The late Mr. Canavan was educated at the Toronto Collegiate Institute. A civil engineer by profession he was one of the most prominent members of *The Engineering Institute* in Victoria, in which he was elected a Member on Oct. 12th, 1912. He had met with singular success in his chosen vocation. From 1884 to 1893 he was engaged in the Surveys Department of the C.P.R. and the Dominion Government in the Province of Manitoba, and was associated with the International Boundary Commissions in Alaska from 1893 to 1897. He resigned from the Government service in the latter year to enter private practice in Klondyke, Atlin and Alaska until 1904, when he opened a practice in Victoria, being a member of the firm of Canavan and Mitchell until the day of his death. One of his outstanding local achievements was the making of the first and most comprehensive development for the irrigation scheme of Saanich from Elk Lake.

The funeral took place in Victoria under the auspices of St. Andrew's Lodge, No. 49, A.F. and A.M. Mr. Canavan leaves a widow, three sons and three daughters.

Charles LeBaron Miles, M.E.I.C.

Charles LeBaron Miles, M.E.I.C., a well known railway location and construction engineer, died suddenly in Calgary, Alta., on Monday, September 13th-1920, from heart failure due to acute indigestion. He was active in his profession until the last week of his life, which ended practically 50 years of continuous service.

The deceased was born in Magerville, N.B. in 1850, and was descended from the United Empire Loyalist stock of the Miles and Perley families of Connecticut, U.S.A. He was a well known civil engineer, having started in the early days on railway survey work, which took him from New Brunswick to the Crow's Nest Pass, while in the service of the C.P.R.

Just before the Indian outbreak of 1885, Mr. Miles was at Blackfoot Crossing where the party was surrounded by Indians under Chief Crowfoot. Later, Mr. Miles walked from MacLeod to Regina and reported to Ottawa the conditions in the West, being one of the first to herald of the Indian rebellion.

From 1882 to 1885 he worked on the construction of the C.P.R. on the north shore of Lake Superior. He also served on the construction of the C.N.R. and the G.T.P. in New Brunswick and Nova Scotia.

The late Mr. Miles came to Calgary in 1912 and was a remarkably active man, considering his advanced age. He was in the civic service for a time on the construction of the Centre street bridge, and a member of the engineering firm of Hablin and Miles Ltd., at the time of his death.

He is survived by his wife, three sons and two brothers. His sons are: H. R. Miles, M.E.I.C., of Lethbridge, divisional engineer, who is covering his father's old surveys in the Crow's Nest country, E. L. Miles, M.E.I.C., of Toronto, Assistant chief engineer to the Toronto and York Roads Commission, and B. P. Miles, of Lethbridge, formerly an engineer with the G.T.P. Rly., and the C.P.R., and now in the mercantile business.

Mr. Miles possessed a remarkable memory for details in connection with his early experience in railway work, and was well known for his many stories of Western life in the early days. He also had a good supply of Eastern stories, and loved to recite Dr. Drummond's "Habitant" which he learned almost entirely by heart.

Mr. Miles was one of the original charter members of the former Canadian Society of Civil Engineers, having been admitted an Associate Member in 1888 and a Member in 1890.

John Cole Gwillim, M.E.I.C.

John Cole Gwillim, M.E.I.C., died in Kingston on August 19th. Mr. Gwillim's health had been uncertain for a considerable period, improving in the summer when he was exploring mineral lands in British Columbia and failing on his return to duty at Queen's University.

The late Professor Gwillim was born in 1868 at Laver Court, Clifford, Herefordshire, England, and at the age of 13 came to Canada with his parents, settling near Winnipeg. After preparation at St. John's College, Winnipeg, he entered McGill where he took the mining engineering course, and graduated in 1895. Until 1903 he was engaged in the practice of his profession as a mining engineer in the West, part of the time as a member of the Geological Survey. In 1903 he was called to Queen's University where he occupied the chair of mining engineering. In the summers he continued his field work in the West, for a number of years exploring the coal lands of the Canadian Pacific railway, and later the oil fields of Alberta for the same company. His last work in the field, done in 1919, was the exploration of the Peace River oil field. As a scientific explorer he had few equals in Canada and as a teacher he was beloved by his colleagues and students. Mr. Gwillim was elected a member of the Canadian Society of Civil Engineers on January 14th, 1904.

In October, 1900, Prof. Gwillim was married to Miss Jane Birch, Vancouver, B.C. who survives with one daughter.

PERSONALS

Garnet Rankin, S.E.I.C., is at present employed in the City Architect's Department, Toronto, Ontario.

*

Walter P. Copp, A.M.E.I.C., has been appointed Professor of Engineering at Dalhousie University, Halifax, N.S.

*

E. Ian W. Jardine, A.M.E.I.C., formerly of Winnipeg, is now with the Hydro-Electric Power Commission, Toronto, Ont.

*

John H. Curzon Esq., A.M.E.I.C., has recently been appointed to the staff of the University of Toronto as demonstrator.

*

Morris Knowles, M.E.I.C., recently gave an illustrated talk on City Planning to the Chamber of Commerce, London, Ontario.

*

F. W. Townsend, A.M.E.I.C., formerly of Regina, is now with the London & Pacific Petroleum Co., Ltd., at Talara, Peru.

*

H. L. Bunting, A.M.E.I.C., has left for England, and for the present will be resident in Nuneaton, Warwickshire, England.

*

C. Harry Fox, A.M.E.I.C., has been promoted from division engineer, Canadian Pacific Railway, to assistant district engineer, Canadian Pacific Railway, Manitoba division.

*

J. P. Robson Esq., A.M.E.I.C., has recently joined the staff of the Wayagamack Pulp & Paper Company Ltd., Three Rivers, Que.

*

G. F. Layne Esq., Jr.E.I.C., is at present employed in the technical department of Price Bros. & Co., Ltd., at Kenogami, Que.

*

John A. Macdonald, S.E.I.C., formerly at Halifax, N.S., is at present resident in La Paz, Bolivia, in connection with mining work.

*

R. F. Macdonald Esq., A.M.E.I.C., formerly with B. F. Goodrich Co., Akron, Ohio, has joined the staff of Harrington Howard & Ash, in Akron, Ohio.

*

Brigadier-General H. T. Hughes, A.M.E.I.C., is at present in Belgium in connection with the work of the Canadian Battle Exploit Memorials Committee.

*

H. T. Hazen Esq., M.E.I.C., in addition to being engineer of Maintenance of Way, C.N.R., will temporarily perform the duties of chief engineer, C.N.R. at Toronto.

*

G. P. Cole, M.E.I.C., has resigned from the Public Works Department and has accepted an appointment with the Mesopotamian government on irrigation development.

J. P. Anglin, M.E.I.C., addressed the annual meeting of the Royal Architectural Institute of Canada, on October 2nd in Ottawa on "Labour and the Building Construction Industry".

*

Reid McManus, A.M.E.I.C., has been elected a member of the Legislature of New Brunswick, and is the only engineer at present representing the province in its Legislative Assembly.

*

George W. Hudson, formerly with Dominion Foundry & Steel Company, of Hamilton, Ont., has accepted a position as demonstrator in laboratory work at Queen's University, Kingston, Ont.

*

John R. Dunbar, S.E.I.C., formerly with the Geodetic Survey in Nova Scotia has accepted a position with the engineering department of the Canadian Westinghouse Co., Ltd., Hamilton, Ont.

*

Peter Gillespie, M.E.I.C., who for nine years has been Associate Professor in the Department of Applied Mechanics in the Faculty of Applied Science, University of Toronto, has been promoted to the rank of Professor.

*

W. L. Reford Stewart, S.E.I.C., has recently been transferred from Kitchener to Montreal, his present address being c/o Lockwood Greene & Company Ltd., Canadian Consolidated Rubber Company, Guy Street, Montreal.

*

D. G. Calvert, A.M.E.I.C., recently on the engineering staff of Proctor & Gamble Company, Cincinnati, Ohio, has been appointed resident engineer of the construction of the Fort William Paper Company's Plant at Fort William, Ontario.

*

Lieut. J. F. Brett, Jr.E.I.C., who has been employed by the City of Montreal, since his return from overseas in March 1919, as asst. engr. P.W.D. was nominated by the administrative com'n. on Sept. 25th, as designing engr on the Montreal Water Board.

*

J. J. Macdonald, M.E.I.C., has recently been promoted from position of designing engineer to chief engineer of W. Alban Richards & Company Limited, engineers and contractors, London. Mr. Macdonald now has charge of several contracts, including the grain elevator at Bristol, costing $1,000,000.00.

*

Brig.-Gen. C. J. Armstrong, C.M.G., C.B., M.E.I.C., has been appointed Hon. President of the Montreal Infantry Association, which was formed at a mass meeting of the infantry officers of the Montreal active militia held recently. At the same meeting Brig.-Gen. G. E. McCuaig, C.M.G., D.S.O., A.M.E.I.C., was appointed President of the association.

*

B. L. Barnes, M.E.I.C., of the Can. General Electric Co., Peterborough, has been notified recently that he has been appointed a member of the Committee on Electrical Machinery of the A.I.E.E., for the year beginning August 1st, 1920. This is one of several technical committees formed to promote and coordinate Institute activities in their respective fields, and to recommend standardization and nomenclature to the Standards Committee.

J. A. Heaman, M.E.I.C., has recently been appointed assistant chief engineer, Western Lines, Canadian National Rys., and Grand Trunk Pacific Ry., Winnipeg. Mr. Heaman was born at Memphis, Tenn., was educated at Collegiate Institute, London, Ont., and McGill University, and has been with the Grand Trunk Pacific Rly., and Grand Trunk Rly., since graduation, having risen from resident engineer to his present position of assistant chief engineer of the combined Western Lines.

W. J. Dick, M.E.I.C., published some months ago a pamphlet on "Pulverized Fuel, Its Use and Possibilities", through the Commission of Conservation, Ottawa. The demand for this pamphlet has been very great, and indicates the interest taken in the search for a low price fuel of high efficiency. Mr. Dick, formerly mining engineer to the Commission of Conservation, is a recognized authority on Canada's fuel and power problems, and his research work has gone far towards indicating the methods by which these problems must be solved.

Samuel J. Hungerford, M.E.I.C., has been appointed vice-president, operation and maintenance, of the Canadian National Rys., headquarters at Toronto. Mr. Hungerford was born near Bedford, Que., in 1872, and has been in railway service since 1886. Mr. Hungerford has been successively assistant foreman, general foreman, superintendent of C.P.R. Locomotive Shops, Winnipeg, and in 1910 was appointed superintendent of rolling stock, Canadian Northern Ry., at Winnipeg. In 1918 Mr. Hungerford was appointed general manager of the Eastern Lines, C.N.R., and in December, 1918, assistant vice president, operation, construction and maintenance, Canadian National Rys., Toronto.

Joseph Gaston Legrand, M.E.I.C., has recently been appointed bridge engineer, Western Lines, Canadian National Rys., and Grand Trunk Pacific Ry., Winnipeg. Mr. Legrand was born at Sompuis, Marne, France, in 1861, and held positions both in connection with military engineering work in France and construction of mining plant in Wales. Mr. Legrand has been in Canada since 1891, and has been with the Grand Trunk Pacific Rly., since 1906. During his service with the Grand Trunk Pacific Rly., Mr. Legrand has been responsible for the design of its permanent bridges, stations, locomotive houses, coaling and fuel oil stations, power and heating plant, warehouses and wharves. He is a member of the American Railway Engineering Association.

F. W. W. Doane, M.E.I.C., city engineer, Halifax, N.S., has been appointed a member of a commission of three, to enquire into the Nova Scotia highways situation, of which commission Mr. Justice Mellish is chairman. The commission is empowered to inquire into:

(1) All such acts and transactions as relate to the construction of Federal Aid Roads (so-called) in the Province of Nova Scotia, including (but not so as to restrict the generality of the foregoing), the question of the correctness of the measurements of quantities and the classification of materials actually removed from the Federal Aid Road known as St. Margaret's Bay Road, and from other Federal Aid Roads in said Province.

(2) whether the roads mentioned are [illegible] in cost and whether the extent of the work [illegible] necessary;

(3) the purchase of machinery and other materials acquired by or for the Provincial Highway Board, and to report to the Lieutenant-Governor.

EMPLOYMENT BUREAU

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Vacant

Instrumentman

Instrumentman for two or three months. [illegible] experience advisable. Salary depending upon qualifications; about $6.00 a day, and expenses. Box 166.

Civil Engineer for Railroad Location

Civil Engineer. Of good experience on railroad location and construction. Wanted by a railway company of Quebec to take charge of a locating party in district of Lake St. John and between Chicoutimi and Quebec. Employment of several years for competent man. Salary $250.00 a month. Box 168.

Assistant Engineer for Railroad Location

Assistant Engineer. To take charge of the instrumental work on locating survey of a railroad in district of Lake St. John and Chicoutimi. Salary, $150.00 a month. Box 169.

Railway Draughtsman

Draughtsman for railway office in Montreal. Several years experience necessary. Salary about $175.00 per month. Box 171.

Transitman

Transitman at about $[illegible] per month, and leveller at about $125.00 per month for railway in Quebec. Salary proportionate to experience. Box 172.

Mechanical Draughtsman

Mechanical draughtsman, familiar with machine layout and design, also general maintenance work, preferably with pulp and paper mill experience, for large pulp and paper Company in northern Ontario. Salary $150.00 to $[illegible] per month, depending on experience. Box 175.

Two or three Designing Draughtsmen

Two or three designing draughtsmen for timber and steel construction plant at Niagara Falls. Salary about $[illegible] per month. Box [illegible]

Mechanical Engineer for Pulp and Paper Company

First class mechanical engineer for Pulp and Paper Company in Ontario. Electrical experience desirable. Salary about $5000.00 a year. Box 177.

Salesman

Young man with thorough knowledge of steam power plant equipment wanted as sales engineer. Previous selling experience preferable, applicant should not be over thirty years of age. State experience, education, age, married or single, present occupation. Box 178.

* * *

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

Superintendent, Aircraft Repair Section

1624. A Superintendent for the Aircraft Repair Section, Air Board at Camp Borden, at an initial salary of $2,940 per annum, which will be increased upon recommendation for efficient service at the rate of $180 per annum, until a maximum of $3,300 has been reached. This initial salary will be supplemented by whatever bonus is provided by law.

Duties.—Under direction to lay out and direct the work of overhauling, repairing, assembling, and erecting aeroplanes, seaplanes, and flying boats and to direct the work of making aircraft parts from plans and specifications; to supervise the work of an aircraft repair section whether employed upon construction or repair work; and to perform other related work as required.

Qualifications.—Education equivalent to high school graduation; at least ten years of experience as a carpenter or similar woodworking tradesman; five years of which shall have been in a supervisory capacity; extended experience in the construction, rigging, and repair of aircraft; ability to handle men.

Examination.—Subjects and Weights as follows: Education, Training, and Experience, 4; Oral Interview, if necessary in the opinion of the Commission, 1.

This position was advertised September 2nd, 1920, and is now readvertised.

Situations Wanted

Civil Engineer

A.M.E.I.C., 14 years with Canadian Railway Company, Draftsman, Instrumentman, and Engineer in charge, thorough training in Building Construction and Quantity Surveying, desires position in Eastern Canada. Box 43-P.

Construction Engineer

Construction Engineer, B.Sc., A.M.E.I.C., with 17 years experience on design and detail of bridges and structures, steel and concrete, superintendent and engineer of buildings and public work, desires position, as construction engineer with corporation, or as superintendent with contractors or as designer with consulting engineers. Full particulars of experience and references furnished. Box 44-P.

Reinforced Concrete Design

Reinforced concrete designs and estimates, plans executed. Box 44-P.

Members' Exchange

Transaction Inst. C.E. For Sale

Set transaction Inst. C.E. 1881 to date 12 vols. for sale, are bound, should be worth $100.00 to any member acquiring eng. library. Box 3-A.

For Sale

Transit and level for sale. Box 9-A.

BRANCH NEWS

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

The following programme has been arranged for the first half of the 1920-21 season.

Oct. 14—"Some Problems of a Consulting Engineer", By T. Kennard Thomson, M.E.I.C.

Oct. 21—"Pipe Casting by the Centrifugal Process", By Andrew F. Macallum, M.E.I.C.

Oct. 28—Moving Pictures.

Nov. 4—"Modern Superheater Practice", By H. B. Oatley.

Nov. 11—"Commercial Air Service in Canada", By H. P. Hamilton.

Nov. 18—"Heating and Ventilation of Paper Machine Rooms", By E. A. Ryan, A.M.E.I.C.

Nov. 25—"Some Financial Aspects of Canadian Forest Resources", By R. O. Sweezey, M.E.I.C.

Dec. 2—"The St. Francis River Water Storage", By A. Duperron, A.M.E.I.C.

Dec. 9—"13,000 Volts Surge Protectors", By Read & Cunha.

Dec. 16—"Overall Thermal Efficiency in Everyday Engineering Practice", By G. P. Cole, M.E.I.C.

Meetings are held every Thursday evening at 8.15 p.m. sharp. Visiting members from out of town who are able to attend any meetings are requested to communicate with any of the members of the Reception Committee, as it is the desire of the Montreal Branch to extend a cordial welcome to members from other Branches.

On October 14th, T. Kennard Thomson, M.E.I.C., gave an address on "Some Problems of a Consulting Engineer". There was a very large audience, in fact so great that a large number of the audience had to stand.

The first part of Dr. Thomson's address was devoted to a discussion on the water power possibilities at Niagara Falls. The five pioneer companies which went into Niagara power, developed about 600,000 horse power at a cost of about 65 million dollars, or about 100 dollars per horse power. The Canadian "Hydro", backed by the Province of Ontario, bought much of this power from the pioneer companies at from nine to ten dollars per horse power, borrowed money by the hundreds of millions, built transmission lines and retailed this power at from 1½c. to 3c. per kilowatt hour, corresponding to $100.00 to $200.00 per horse power. Not having enough power to supply the demand the Hydro commenced the Chippawa Creek development, involving the construction of a canal about 12½ miles long, with a capacity of 10,000 cubic feet per second, giving a head of 300', resulting in an output of something less than 300,000 horse power. If the Hydro had simply extended their intake and corrected the discharge, a head of about 200' could have been obtained at the falls, thereby obtaining two-thirds of the power without the expensive canal construction. The additional 100,000 horse power will cost Ontario from $500.00 to $1000.00 per horse power, as against $100.00 per horse power of the five pioneer companies, and $50.00 per horse power as could be obtained by a dam proposed by Dr. Thomson in the Lower Niagara River, in the rapids at Foster's Flats, some four miles below the falls, taking advantage of the drop of 102 feet in the Niagara River from the base of the falls to Lewiston. The construction of such a dam would involve no serious engineering difficulties and will permit the entire use of the minimum flow of the river, which is about 22,000 cubic feet per second. This will develop two million horse-power at a cost of less than $100,000. The speaker emphasized the present ice troubles in the neighbourhood of Niagara Falls and stated that they would be largely obviated if the proposed dam were constructed.

He illustrated his talk with a number of lantern slides showing various phases of the proposed scheme.

In the second part of his address Dr. Thomson showed a number of slides illustrating the history and growth of the City of New York from the time of the first settlers to the present day, and he discussed methods of improving traffic conditions by building elevated roadways around the water-front and a proposed sextuple tunnel to take the place of the twin highway tunnel under the Hudson River, the construction of which has recently been commenced. He also showed slides illustrating his scheme of reclaiming many square miles of land and diverting the East River.

The second meeting of the season was held on October 21st. at which a paper by A. F. Macallum, M.E.I.C., on "Pipe Casting by the Centrifugal Process" was read by F. W. Hudson, of the National Iron Corporation of Toronto in the absence of the author. The chair was taken by Mr. Combe and a "standing-room-only" audience was present.

After dealing with the history of cast iron pipe manufacture the author stated that the present specifications for cast iron pipe are based on iron having a tensile strength of 19,000 pounds. When higher standards are given under the present foundry practice and mixtures, the pipe is apt to be brittle. On account, however, of new methods being adopted in manufacturing cast iron pipe, consideration is being given to the revision of the specifications to meet these new conditions. This new pipe, developed by de Lavaud, a French engineer, is now being manufactured and introduced in this country, after exhaustive tests with the ordinary standard cast iron pipe. The new type of pipe involves the application of the principle of centrifugal force to molten metal when poured into a permanent mould. A regulated quantity of molten metal is introduced into a revolving water-cooled cylindrical mould, whereby the centrifugal force exerted the molten metal is spread uniformly upon the inner surface of the mould. Within a few seconds the pipe is withdrawn from the mould at a red heat. The pipe is brittle after leaving the mould on account of the outer surface being chilled, but after passing through an annealing furnace it becomes tough and much stronger than ordinary cast iron pipe. It also has a decided contrast in structure to pipe cast in sand moulds and has not the segregation of impurities often found in sand cast pipe. As a consequence the pipe is a homogeneous, dense, fine-grained iron throughout, having no water or gas bubbles, and has a very high tensile, cross-bending and resistance to shock values. It can therefore be made very much thinner than the sand moulded pipe, for example, a 12 ft. length of 6 in. pipe weighs 280 lbs. as compared with 430 lbs. for a sand cast pipe of the same diameter. The author also dealt with a number of other advantages of this process of manufacturing pipes, and the method was well illustrated by means of a moving picture film specially prepared for the purpose.

•

At the formation of "Electrical Co-operative Association of the Province of Quebec" held in Montreal, the following members of the Montreal branch were elected to the executive of the new Association:—

President, K. B. Thornton, A.M.E.I.C., Montreal Public Service Corporation; Vice-Presidents:—J. B. Woodyat, A.M.E.I.C., Dr. L. A. Herdt, M.E.I.C., Consulting Engineers:—J. M. Robertson, M.E.I.C., DeGaspe Beaubien, A.M.E.I.C.

The new Association plans to unite the interests of the manufacturer, the contractor-dealer, the jobber, and the central station.

Kingston Branch

W. P. Wilgar, M.E.I.C., Secretary-Treasurer

The annual meeting of the Kingston Branch of *The Engineering Institute* was held in Carruthers Hall, on Thursday, October 14th., Colonel Macphail in the chair.

After the presentation of the financial report the following officers were elected:—

Chairman: J. M. Campbell, M.E.I.C.

Vice-Chairman: Alexander Macphail, M.E.I.C.

Secretary-Treasurer: W. P. Wilgar, M.E.I.C.

Branch Executive: Chairman, Vice-chairman, Secretary and A. L. Clark, A.E.I.C.

Committee on Policy: Chairman, Vice-chairman, Secretary, L. M. Arkley, M.E.I.C., D. W. Munn, A.M.E.I.C.

Committee on Remuneration: Chairman, Vice-chairman, Secretary, W. L. Malcolm, M.E.I.C., D. W. Munn, A.M.E.I.C.

Committee on Meetings and Papers: Convenor: D. S. Ellis, A.M.E.I.C.; Secretary: A. Jackson, A.M.E.I.C.; Members: A. L. Clark, A.E.I.C., L. T. Rutledge, A.M.E.I.C.

The following were elected Affiliates of the Kingston Branch:— T. F. Twiss, Royal Military College, Kingston Ont.; F. H. Day, Royal Military College, Kingston, Ont.

The first professional meeting of the Branch will be held in Carruthers Hall, on Tuesday, November 2nd, and future meetings on the first and third Tuesdays of the month.

The committee on Meetings and Papers has in hand the preparation of a programme for November and December,—lectures on technical subjects of interest to the different branches of the profession.

*

Professor D. S. Ellis, A.M.E.I.C., has designed and installed several important additions to the Hydraulic Laboratory at Queen's.

*

T. S. Scott, M.E.I.C., has a contract on the provincial highway construction at Brockville, Ont.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary-Treasurer.

The opening meeting of the Peterborough Branch was held in the Board of Trade Rooms, on Thursday, October 14th, 1920. R. H. Parsons, M.E.I.C., City Engineer and Chairman of the Branch presided.

The Speaker of the evening was Hon. W. A. McLean, M.E.I.C., Deputy Minister of Highways for Ontario, who described the provincial highway system to the large audience present. By means of motion pictures and lantern slides the making of various types of roads and pavements was shown in detail.

Mr. McLean was accompanied by George Hogarth, M.E.I.C., chief engineer of the Highways Department, who also addressed the meeting.

Among those present were the reeves of the surrounding townships, the warden of the County, and the mayor of the City.

Before the meeting, the guests were entertained at a supper in the Empress Hotel Grill Room by the members of the Branch. Mr. McLean, in a short speech told of the interest he felt in the affairs of *The Institute*, and complimented the local Branch on the progress since its inception a year ago.

Henry Holgate, M.E.I.C., who is making a report on the water power situation on the Trent watershed, was also present, and congratulated the Branch on its active appearance.

Toronto Branch

H. A. Goldman, A.M.E.I.C., Secretary-Treasurer.

At a meeting of the Executive Committee of the Toronto Branch, held on September 30th, a resolution was adopted to appoint a Membership Committee to inaugurate a campaign to raise the membership of the Branch to at least five hundred.

The following members were appointed to the Membership Committee:— Messrs. W. E. M. Bonn, A.M.E.I.C., A. E. K. Bunnell, A.M.E.I.C., H. J. Caldwell, C. D. Dean, A.M.E.I.C., T. U. Fairlie, A.M.E.I.C., F. B. Goedike, A.M.E.I.C., E. A. Gibson, A.M.E.I.C., W. J. Smither, A.M.E.I.C., E. M. Proctor, A.M.E.I.C., R. B. Young, A.M.E.I.C., J. Jack, A.M.E.I.C., A. B. Jupp, A.M.E.I.C., M. A. Stewart, A.M.E.I.C., Geo. Phelps, A.M.E.I.C., I. H. Nevitt, M.E.I.C., J. M. Oxley, A.M.E.I.C., O. H. Shenstone, Jr.E.I.C., E. Dean Wilkes, A.M.E.I.C. Mr. J. M. Oxley to convene the first meeting.

The Committee has the power to increase its membership.

*

The Opening Meeting of the Toronto Branch was held at the Engineers' Club on Thursday, October 7th, 1920 at 8.15 P.M. The Chairman, R. O. Wynne-Roberts, M.E.I.C., presided.

Mr. Wynne-Roberts delivered an excellent address on the work that *The Institute* could and should do. He outlined ten questions on policy which should form the ground work for discussion at the meeting on October 14th, when the whole evening will be given up to a discussion of the policy for the E.I.C. He urged all members to assist in the canvass for new members. The aim is to bring the membership up to 500. The number at present stands at 330.

Mr. Wynne-Roberts lamented the fact that many engineers are remaining outside of any organization. Special emphasis was placed by the Chairman upon the necessity of *The Engineering Institute* participating more actively in matters pertaining to public welfare, municipal improvement and the development of Canada's natural resources. In connection with this phase, Mr. Wynne-Roberts suggested for discussion the advisability of securing men of acknowledged prominence to address *The Institute* upon such matters as labor questions and economic subjects.

The speaker referred to the duty of engineers to bring all parties together in cases of dispute between Capital and Labor, in so far as engineers are the middlemen. "Our meetings should be forums of public discussion," stated Mr. Wynne-Roberts.

In outlining a policy for the future discussion of the local Branch members, the Chairman suggested that the annual dues be doubled. If adequate funds are not forthcoming, it is the opinion of the Chairman that the activities of *The Institute* will suffer curtailment. He hopes that the members will feel the necessity of dealing with this matter in conjunction with the canvass for new members.

Various other matters of policy dealing with organization details were outlined in the Chairman's address. Brief reference was made to the proposed annual convention in Toronto next February.

A regular meeting of the Branch was held at the Engineers' Club on Thursday, October 14th, 1920 at 8.15 P.M. R. O. Wynne-Roberts, M.E.I.C., presided.

After Mr. Wynne-Roberts called the attention of the meeting to the fact that A. F. Stewart, M.E.I.C., is being transferred from Toronto to Moncton, the following resolution was carried:—Moved by C. H. Rust, M.E.I.C., seconded by H. K. Wicksteed, M.E.I.C., "That the Secretary be instructed to convey to Mr. Stewart the appreciation and thanks of the Branch for the activities and useful work performed by Mr. Stewart while a member of this Branch, and also express the regrets of the Branch for his removal to another city, and wishing him success in his new field of activity."

Mr. Wynne-Roberts then outlined his ten points on the policy of *The Engineering Institute of Canada*:

1. To what extent should *The Institute's* policy be revised with regard to the economic welfare of its members? In other words, what can *The Institute* best do to protect its members in the matter of adequate remuneration?

2. Should the members of *The Institute* be divided into different grades? If grades are desirable, are the present titles sufficiently expressive to indicate what they mean?

3. Should all members resident in Canada be attached to branches, regardless of location of residence?

4. Should *The Institute's* future policy be to grant home rule to the Provinces and to the Branches with reference to local business, and thus relieve the council of some of its work?

5. Should the Branches constitute the starting-point in all matters relating to business and to the nomination and election of all representatives? In other words, should the Branches be the nursery and training school, and service thereat be an essential qualification for election to all offices?

6. Should our annual dues be doubled so as to enable *The Institute* in all its ramifications to carry on aggressive work more effectively and on a larger scale?

7. Should other recognized technical societies be encouraged to affiliate with *The Institute* so as to have one great Canadian organization, representative of all classes of professional engineers, and, if so, how is this desirable consummation to be attained? Also, what is necessary to be done to induce absentee engineers to join?

8. Should *The Institute* take a more prominent part in the conservation of Canadian resources and in the promotion of engineering enterprises?

9. Should *The Institute* persistently urge upon the government and other public bodies the importance of appointing one or more engineers on commissions or investigations concerning matters relating to engineering?

10. Should *The Institute* adopt a policy of participating in work which has for its object the improvement of the country's social fabric?

A lively discussion followed in which a large number of members took part. Debate on question 1 was postponed and debate centred chiefly around questions 2, 4, 7 and 10. The opinion of the meeting was in favour of changing the present grades of membership in *The Institute*, alternative suggestions being made. A greater measure of home-rule for Branches was also favoured. In connection with question 10 the following resolution was moved by T. L. Crossley, A.M.E.I.C., seconded by Geo. Phelps, A.M.E.I.C., and carried: "That a committee be formed whose functions be to report from time to time on subjects dealing with Social Service, Education, Public Utilities, and other matters of community or national welfare, to keep in touch with movements along these lines and to inform the members on occasion [illegible] of matters pertaining to these subjects whenever occasion may call for it."

The following members were appointed to this Committee: Messrs. Bradley, Barnell, Carson, Phelps and Crossley; Mr. Crossley to convene the first meeting.

Niagara Peninsula Branch

Rex P. Johnson, A.M.E.I.C., Secretary-Treasurer.

The first meeting of the Branch Executive for this season was held on Oct. 14th. The most important feature of the meeting was the determined stand taken by the Committee in regard to *The Institute's* work in connection with salaries.

The Chairman of the Remuneration Committee of *The Institute* has asked the Branch Executive to act as a committee of the Branch on this subject and advise his committee of the findings and opinions of the Niagara Peninsular Branch.

The Executive determined to immediately study this matter as individuals and hold a special meeting at as early a date as possible. The Secretary was instructed to secure for each member of the Executive certain published data on classifications and salaries of engineers and this has been sent for. Upon the receipt of this, a week's time is to be given for study before the special meeting is held. By the time the November *Journal* appears the committee will have completed their investigations and members will be advised of the result at the first opportunity.

In connection with salaries the subject of "Policy of *The Institute*" is also to receive the attention of the Executive and it is expected that some concrete proposals will be set forth for the consideration of *The Institute's* Committee on Policy.

The executive feel that these two matters, "Remuneration" and "Policy" are the most important phases of activity upon which *The Institute* should centre its energy. It is realized that Legislation for the Province of Ontario is going to take a long time to secure and there are some doubts as to its benefits when it is secured.

This, then, leaves "Salaries" as the channel offering the greatest prospect of an improved condition of the engineering profession in the community. The temper of the Executive Committee of the Niagara Branch on this subject is not mild in any sense and a determination has been made in a very positive manner to throw the whole weight of our influence into getting something done and done soon.

Border Cities Branch

J. E. Porter, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Border Cities Branch was held in the Auditorium of the Chamber of Commerce, Windsor, Ont., Oct. 1st.

M. E. Brian, A.M.E.I.C., gave the members a brief account of the Ontario Professional Meeting at Niagara.

H. Thorne, M.E.I.C., reported the progress of the Membership Committee and J. J. Newman, M.E.I.C. that of the Town-Planning Committee since last meeting.

A. J. Stevens, M.E.I.C., addressed the meeting, giving an interesting description of the navigable waterways of Western Canada. He prefaced his address by a brief historical sketch from the discovery of the Hudson Bay to more recent dates. Mr. Stevens then described the various water routes and navigable channels.

A large portion of the address was devoted to a description of the movable dam and lock for navigation in the Red River at the foot of St. Andrews Rapids Lockport, Manitoba, reference being made to local conditions determining its location and its economic necessity. The dam is of the camera type, first used on the River Seine, France, and not previously used in America. The lock and dam have fully met all expectations and proven a great benefit to the city of Winnipeg.

Many photographs and illustrations were used to illuminate the address.

At the conclusion mention was made of the many engineers employed in the design of various parts and the execution of the contract work.

A hearty vote of thanks was moved to Mr. Stevens by J. C. Keith, A.M.E.I.C., seconded by G. F. Porter, M.E.I.C.

D. A. Molitor, M.E.I.C., then gave notice of motion, after considerable discussion, that at the next regular meeting he would move to have the bye-laws of the Branch, Sec. 8, Paragraph 1, changed so as to read "Ordinary Meetings shall be held on the second Friday of every month from October 1st to 31st, inclusive or on other days as the executive Committee may determine."

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.

A special meeting was held on the 7th. September to hear the report of the Salary Committee. The Committee, which has been working on the matter during the summer months, presented a very full and complete report. The report included a complete classification of the various branches of engineering activities in the Province, together with minimum salary for each position.

The report divided engineering work into two main classifications: professional and sub-professional, each of these classes being further sub-divided and the minimum salary being allocated to each class. The report was very thoroughly discussed and was adopted by the meeting with practically no amendments.

The meeting was one of the largest ever held and there was no doubt of the attitude of the members on this matter and their full sympathy and approval with the finding of the Salary Committee.

The first general meeting of *The Institute* was held on the 16th. September, when the Hon. A. B. Hudson, Attorney General of the Province, read a paper before the Branch on "Popular Forms of Government". The paper was listened to with great interest by the members present and a long and interesting discussion took place, indicating the interest the members felt in this subject.

Mr. Hudson traced the forms of government from ancient history down to the present date, with a brief forecast of what might be in the future and, taking as his example the two most well known forms of government, namely, the British and American, discussed the differences and the advantages and disadvantages of the systems.

The business of the meeting included the appointing of a Remuneration Committee, with instructions to carry out the report of the Salary Committee.

The Paper Committee have this year secured a complete series of papers for presentation at the meetings of the Branch and an interesting and successful session is to be anticipated.

On 12th. October the members of the Branch extended a complimentary Smoker to the students of the Engineering Faculty of the Manitoba University. The Smoker was very well attended, the students being in strong evidence. The concert included a large number of musical items, together with chorus singing, which was enthusiastically entered into by the students.

Saskatchewan Branch

J. N. de Stein, M.E.I.C., Secretary-Treasurer.

The Saskatchewan Branch began the season 1920-21 under very favorable auspices with a regular meeting on October 14th, at which Capt. E. A. Baker, M.C., Croix de Guerre, was a guest of the Branch. Captain Baker is General Secretary of the Canadian National Institute for the Blind and in charge of the Federal Government Department caring for blinded soldiers.

After the monthly dinner of the Branch, the business meeting was called to order, presided over, in the absence of Chairman Prof. A. R. Greig, M.E.I.C., and Vice-Chairman W. R. Warren, M.E.I.C., by D. A. R. McCannel, A.M.E.I.C., a member of the Branch Executive.

A number of important questions were discussed: legislation, participation at the program of sessional meetings in connection with the Annual Meeting of *The Institute* in February 1921, salary schedule and fees for engineers in private practice, etc.

At the conclusion of the business session a paper was read by C. W. Dill, M.E.I.C., superintendent of highways for the Provincial Government on "Present and Future Road Development in Saskatchewan". This is the first of a series of papers arranged by the Branch, taking up questions of public interest. In view of the Federal Road Grant for Saskatchewan, amounting to about $1,800,000, making a total expenditure in the Province of about $4,500,000 in order to gain the Federal grant, this is rather an important question. The extensive discussion following the excellent paper, demonstrated the general interest of the members.

* * *

R. C. F. Chown, A.M.E.I.C., engineer of construction for the Saskatchewan Government, hopes to return to England for the practice of his profession.

Lt.-Colonel A. C. Garner, M.E.I.C., chief surveyor Land Titles Office, Regina, returned from a lengthy exploration trip into Northern Saskatchewan.

J. Marshall, A.M.E.I.C., is resident engineer for the Town of Gravelbourg on construction of sewer and water supply.

F. H. Small, A.M.E.I.C., formerly with the Dept. of Highways, Regina, is superintendent of construction with the I. U. McManus Co., of Moose Jaw.

C. F. Wilkins, A.M.E.I.C., formerly resident engineer with the Parsons Engineering Company of Regina, has been appointed building inspector for the C.P.Ry. in Southern Saskatchewan.

The Association of Professional Engineers of Nova Scotia

The first regular general meeting of the Association of Professional Engineers of Nova Scotia, was held in the Technical College, Halifax, October 14th, 1920, commencing at 2.30 P.M., with an attendance of thirty-five.

The President of the Provisional Council, C. E. W. Dodwell, M.E.I.C., then opened the meeting with a few well chosen remarks. He sketched the history of the formation of the Association from the inception of the idea up to the present time. This movement, he stated, had started in Canada thirty.four years ago. In 1887 a General Committee of the Canadian Society of Civil Engineers met in Montreal, and later a Committee was formed in Nova Scotia of which only two are now alive, Mr. Matheson and himself.

At this time an Act respecting the Engineering Profession became law in the Province of Quebec, but met with defeat in the Province of Nova Scotia. About two years ago the matter was again brought up at the Annual Meeting of *The Engineering Institute* in Montreal, and each province was asked to send to Montreal a delegate to form a Central Committee to prepare a uniform Bill for introduction to all the Legislatures of the Dominion.

This Committee met in Montreal in April 1919 and he, (Mr. Dodwell), had been selected by the Nova Scotia engineers to represent them. The Committee held three sessions, working very hard, and as a result drafted a Bill which with some few amendments to suit local conditions had been presented to the Nova Scotia Legislature. This Bill with some further amendments made in the Legislature became law on the 22nd of May 1920.

The successful passage of the Bill, Mr. Dodwell attributed to two facts viz that it was introduced by Mr. Daniels the Attorney General, and the fact that D. H. McDougall, M.E.I.C., consented to act as Vice-President. (Mr. Dodwell was very modest in not mentioning his own efforts, which undoubtedly aided materially in obtaining a successful result.)

Mr. Dodwell stated that in fifteen states of the United States Engineering Acts had been passed, and that Great Britain also was becoming very much interested in Engineering Legislation.

The financial statement was then read by the Secretary, Mr. Morrison. It was received and adopted. The Secretary also stated that from a list of 330 engineers which he had compiled that 216 applications for membership had been received, and that 187 had been approved.

The Bye-Laws were then taken up clause by clause and with a few amendments were adopted on motion of Mr. Winfield, seconded by J. L. Allan, M.E.I.C.

It was decided to issue Convention Stamps with the Bye-Laws and not have any more copies printed until after the next meeting when further amendments might be made.

J. L. Allan, M.E.I.C., and K. H. Smith, M.E.I.C., were appointed auditors.

The Scrutineers report was then received with the following results:

President: C. E. W. Dodwell, M.E.I.C.

Councillors: Prof. F. H. Sexton, W. P. Morrison, M.E.I.C., Prof. Faulkner, M.E.I.C., K. H. Smith, M.E.I.C., I. P. Macnab, M.E.I.C., J. W. Roland, M.E.I.C., A. F. Dyler, A.M.E.I.C., F. A. Bowman, M.E.I.C.

The above list constituted the eight members of Council which were elected by the members by ballot.

The members selected by the Governor in Council were as follows: J. L. Allan, M.E.I.C., T. J. Brown, M.E.I.C., W. G. Matthewson, M.E.I.C., C. M. Odell, M.E.I.C., D. W. Robb, M.E.I.C., L. H. Wheaton, A.M.E.I.C.

It was moved by F. W. W. Doane, M.E.I.C., seconded by P. A. Freeman, M.E.I.C., and carried unanimously that D. H. MacDougall, M.E.I.C., be Vice-President.

The President in his closing remarks said that he hoped that the Association would be able to show that the Legislature had not made a mistake and that the Engineering Association would be fully worthy of being deemed a regular profession.

Moved by F. A. Bowman, M.E.I.C., seconded and carried that the meeting adjourn to come together again at the Annual Meeting to be held in Halifax on the third Thursday of January, at such time and place as may be fixed and determined by Council in accordance with clause one of the Bye-Laws.

Members of Council for 1920

Preliminary Notice

of Applications for Admission and for Transfer

[illegible] October, 1929

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in November, 1929.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:— [illegible]

[illegible] (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra [illegible]

[illegible]

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

[illegible]

[illegible]

DALKIN—GEORGE ROBERT, of Montreal, Que. Born at Co. Durham, England, Dec. 4th, 1889; Educ., Technical College, Darlington, England. Assoc. Member Inst. Mech. Engrs., England; 1905-10, ap'ticeship as mech. engr., Teasdale Bros. Ltd., Darlington, England; 1910-11, dftsman with above firm; 1911-12, on mech. staff of Cleveland & Durham Electric Power Co., on design & lay-out of electric power stations; 1912-16, on staff of City Engr., Edmonton, 1912-14, chief drftsman on underground constrn., 1914-16, office asst. in charge of underground constrn.; 1916, sapper, Can. Engrs.; 1916-18, Imperial Munitions Board, Engr'g. Dept.; 1918 to date, with Jardine & Co., Montreal, on design and lay-out of mach. for wooden ships, and other marine and mech. engr'g. work. Now junior member of firm.

Railway Construction with the Royal Engineers in Palestine

Bridging the Suez Canal, building the Desert Railway, difficulties in maintenance, fighting the Turks, commercial possibilities of the Desert Railway.

Lt.-Col. G. A. B[illegible], M.E.I.C.

Read at the Western Professional Meeting, Banff, B.C., August, 1920

You will all remember in the spring of 1915 the wonderful attack that the Turk made on the Suez Canal. They came down from Palestine and brought their transport and field artillery one hundred and fifty miles across the Sinai Desert. It was a most wonderful feat and it awoke the British to the danger of attack from that quarter.

The British troops were held on the West bank of the Suez Canal. The Suez Canal runs North and South, and not East and West as is generally supposed. When the Turks got to the Suez Canal after marching across the Sinai Desert they were exhausted. They had no water, as there was no water on the Sinai Desert that human beings could drink, and they were "all in". The British did not cross to attack them, but the Turks made an attack on the British across the Canal. Some of them managed to get across by swimming. They had a few collapsible boats they had brought with them, which they launched, and they actually launched a mine in the Bitter Lakes, which mine damaged a ship. This part of the campaign was not a credit to the British Army; in fact a high official sent out from England sarcastically asked the General in charge whether he was defending the Suez Canal or whether the Suez Canal was defending him.

Bridging the Suez Canal

The bridge to cross the Suez Canal was put in by the Egyptian State Railways. In peace time, before the War, to take care of the heavier rolling stock and heavier traffic the Egyptian State Railways found it necessary to replace a number of their iron bridges. They had three bridges up in the Soudan, which they used to bridge the Canal. Two piers were built in the Canal an equal distance from each bank, and two of the spans were used as fixed spans and formed the shore part of the bridge. The third span was the longest and was a swing span. One end of it was pivoted on the concrete pier on the West side of the bank, and the other end was permanently carried by means of a floating pontoon equipped with hydraulic jacks to raise and lower the bridge a slight amount. The bridge stayed open all day, or when traffic was passing through the Canal. The railway was allowed so many hours at night to pass their traffic across the bridge. When the time came the span was swung around into place and lowered from the ponton on the east pier. When the operation of transferring from the east to the west bank, or vice versa, was finished the end of the bridge was jacked up once more, the pontoon taking the weight, and it was swung open. This was feasible because there is practically no tide in the Mediterranean, the extreme being one foot or perhaps eighteen inches.

The Desert Railway

A new defense scheme was decided on, and it was resolved to run light railways out into the Desert, and to make the advance posts fifteen miles from the Canal. About six or eight of these railways were constructed, starting from various points along the canal, from Port Said to Suez. They were two foot gauge, with the track in sections on steel sleepers, the whole being laid down in sixteen foot lengths. These, however, did not prove very satisfactory. They found that they could not transport large forces of men and provisions on railways of that kind. Their usefulness is extremely limited, and about one year after the attack it was decided to build a standard gauge railway 40 kilometres, or roughly 25 miles, out into the Desert.

Kartara, which was forty kilometers from Port Said, was chosen as the point to start the railway. This place is at the end of the caravan route, over which route from time immemorial armies from Egypt have gone out to attack Palestine, and armies from Palestine have come down to attack Egypt. It runs near the sea coast, and is undoubtedly the very path that Joseph and Mary with the infant Jesus went over on their flight into Egypt. The Sinai Desert is the desert where Moses and the children of Israel are reputed to have wandered for forty years, and the only way to cross the Desert is by the route above mentioned, which follows the sea. Not that the sea helps any, because an immense sand dune has been washed up by the Mediterranean, but under certain circumstances transport might be brought along in boats.

Construction Methods

In the construction of the railway we did not follow the English method but used what we call the American construction. We had 75 lb. steel rails, standard sleepers made of fir, jarrah wood, or in fact anything that was available at various times. Some of the sleepers were hardwood and were hewed, but the most of them were sawn. The rails for the first section of the line came from the States, but eventually a rolling mill was started in India and the last material all came from there. We used bearing plates under each rail, we broke joints, and we built the railway in every way equal to the best American practice.

Owing to the unlimited space which we had we were able to adopt one standard frog for the whole system — a No. 7. When we first started out we had a few eights and one or two tens, but these were afterwards taken up and nothing but No. 7 frogs used. I dare say that this is the first time on record where a railway has been built, all sidings and yards put in, with only one style of frog.

We got our railway material landed at Port Said or Alexandria. At Alexandria or Port Said if it came from America, and at Suez if it came from India. If it was landed at Alexandria it was hauled by the Egyptian State Railway and unloaded on the west bank. If it was landed at Port Said or Suez it was put into lighters and brought up to Kantara, where we unloaded it. Eventually we built our own docks and unloaded all this material right at the site of Kantara.

Rolling Stock

Our rolling stock consisted firstly of locomotives which were built in England fifty years ago; to be more exact in 1868, which the Egyptian State Railway found much too light for their ordinary traffic, and which they practically scrapped. These were stored at the back of the round-houses when the War broke out and they were resurrected, overhauled in the shops in Cairo, and delivered to us to operate the military railway. The trucks were old trucks, also requisitioned from the Egyptian State Railway, but what we called stiff-legged stock — no bolsters, and very hard on the track. These were supplemented later by four wheeled coal wagons built in England, and with this stock the campaign was conducted. Later on a few more Baldwin locomotives were got from the Egyptian State Railway, and some more freight locomotives from the London & Northwestern, but these were not very satisfactory. You can imagine that with this class of stock on a new railway over a desert derailments would be frequent.

Labour

The entire railway was built with hand labour. There was not a mechanical appliance on the job. The labor was done by Ascaries, who are natives who have served their time in the Egyptian Army and have been transferred to the reserve. After their transfer to the reserve they are still liable to serve a year, and they were called up for the particular purpose of working on the construction of the railway. Besides these to do the rough work we eventually enlisted 56,000 of the fellahin. These however were not for railway purposes alone, but were to do the general work required in a campaign of this kind, such as handling the army supplies, doing the sanitary work, cleaning camps, etc.

The Ascaries, whom we used principally in building the railway, are very fine men. They were divided into gangs under their native officers, and one, two or three gangs, as the case might be, worked on a shift. The skilled work was either done or supervised by a company of the Royal Engineers. There were actually two companies on construction, each consisting of 240 sappers. These men did the spiking, bolting up, and the skilled work generally required in the construction of a railway, while the Ascaries carried the rails, the sleepers, did the earth work, and generally all the rough labor. These men used a basket and what is called a fass. A fass is something between a hoe and a mattock. It has a wide mouth and the basket is put between the feet and the sand raked into it with the fass. One man will fill baskets for twelve or fifteen men, and it is incredible what a lot of work they will do in this way.

We worked double shifts; that is one railway company worked eight hours, when the other took over, and we built roughly a mile a day. The material was all loaded on railway trucks down in the Canal, in units consisting of a complete quarter of a mile of track; that is enough sleepers, rail, spikes, bearing plates, etc. to lay a complete quarter of a mile. When the construction gang went out in the morning they took two of these with them, and their day's work was completed when these had been unloaded and put in the track.

Difficulties with Sand

In the Sinai Desert it very seldom rains, and for one hundred and fifty miles we never had a culvert or a bridge except at the Wadi El Arish or "Ancient River of Egypt". The line was not ballasted except with sand, and while sand makes a very excellent bed it has its disadvantages. In the Spring we get a hot wind from the South for three days at a time, and this wind is so strong that the particles of sand are carried and they actually flail you. To go against the wind you have to hold up your hand to protect your face. During that time the sand drifts like snow. It would fill up the cuts, and not only that but it would undermine the sleepers, so that when the storm was over you would find your cuts half filled and your banks had blown away. That, fortunately, only happened during the months of January, February, March and April.

Coping with Sand Difficulty

There grows on the Sinai Desert a shrub called Camel Thorn. This shrub is very much like our sage brush. We used to send out gangs to scour the desert and to gather this camel thorn, which was brought in by means of camels to the side of the railway. We made hedges of this by sticking the ends of the shrub in the sand. The hedges would be in three or four successive rows, starting from the tops of the banks alongside the cuts and continuing outward. On the slopes or fills we started a row about a foot below the top of the bank, and if the fill was high enough we continued rows right down the bank, three feet apart.

We found that this was very effective to take care of the individual storm which was blowing at that time, but sand is not like snow, and if you allow it to pile up, the result is that you just raise your bank a little and then the sand drifts into the cut as badly as ever.

Another trouble was that this shrub used to dry out rapidly after it was planted, and the sparks from the locomotive set it on fire and it burnt up.

As I said, sand is not like snow. You cannot let your cuts fill up and trust to the Spring to thaw them out. After each storm we went into the cuts and shovelled them well back; that is we removed the sand from the sleepers for about five feet from each end. This gave us some such way to take care of the sand storm. To do this on the line between Kantara and Rafa, which is 150 miles, we had 3,000 men of the Egyptian Labor Corps.

That will be one of the problems in the commercial operation of the line, how they are going to keep it clear of sand. The sand on the desert shifts all the time. The slightest wind blows it and there are some parts of the desert where the sand is extra fine, where it is impossible to keep it clear. A branch of the railway ran four miles down to the sea, to a general hospital. Eventually as the campaign progressed this hospital was taken out and moved further up the line, but the track was left there for the Winter. In the Spring when we went to remove the steel we found that the sand had filled the cuts in some places so that the telegraph wires were completely covered. No snow plow is any good to handle this. A street sweeper or something of this kind might do the work. There was a suggestion to rig up a tank car and spray the sides of the fills with a mixture of water and cement, and thus stop the sand from blowing and the ties undermining. We had no facilities for trying that experiment, however, but undoubtedly it will be tried some time.

Although the original idea was only to run the railway out to Pelusium it was finally decided, after the attack of Romani, to run right across the Desert. Some companies of the Royal Engineers were brought out from England, and they were amalgamated and formed into what was called the Railway Operating Division of the Royal Engineers. They took over after the construction parties and operated the railway.

When I joined the Royal Engineers I told them that I was a Mechanical Engineer, presuming that they would put me in the mechanical department, but that is not the British Army's way, and they gave me charge firstly of the maintenance of the railway — a Civil Engineer's job — then charge of the construction of a portion of the double tracking, constructing of the yards, etc. Eventually we double tracked the line.

The operation of the railway was a hard proposition. No water could be got for our locomotives and we had to rig up water tanks and haul the water across the Desert for the locomotives, for the working parties out ahead, and for 10,000 troops out ahead of the working parties acting as a screen together with their camels, etc. The water was got from the Sweet Water Canal after it had been chlorinated and purified by the water companies of the Royal Engineers. Eventually they ran a 10" and 12" lap welded steel pipe across the Desert. This was absolutely necessary for the operation but did not help in the construction very much.

We had fights at various places along the line where the Turks made a stand. The first was at Romani, the second at El Arish, the third at Rafa, the fourth at Gaza, and the fifth and final one seven miles north of Jerusalem.

Floods

The work started in January 1916, and we were about a year and a half getting to Rafa — 135 miles. When we got to Rafa the character of the country changed. Instead of sand we got clay, and instead of absolute dryness we got torrential rains between November and May.

This country is not timbered, as there is no timber in Palestine or Syria. The rain that falls in the Judean hills all goes down around the end of the Dead Sea and into the Mediterranean through the Wadi Ghuzza near Gaza.

As it was impossible to get steel for bridges, and as the railway had to be pushed forward, instead of building permanent bridges we made deviations and went through the bottoms of the wadis. When we saw a heavy rain, or what was practically a cloud burst, we looked out for trouble. We got out first trouble about the first of November, when the troops were pretty well forward. I was stationed in Kantara at the time. I had resident engineers at various parts of the line, and I got word from Gaza, from my engineer there, that the river was in flood and was running four to six feet over the track. We had anticipated something like this and we put a watchman on the East bank with a telephone. His duty was to walk across to the other bank and back every half hour. He started across one night on dry sleepers, but before he got within a hundred yards of the other shore the water had started to come up, and he had to run, and before he was safely to the bank there was water over the track. It was impossible to actually do anything when the flood was on but prepare for its subsidence. We gathered huge bodies of laborers on either side of the wadi with sand bags, which they filled, and as the water started to go down we followed it out. The track was buried in debris of all kinds — dead camels, dead Turks, artillery trucks, telephone reels, mud, hay, etc. etc. The natives carried this all away with their hands, eventually picking up the track bodily with their hands, instead of using jacks, and packing underneath with sand bags. They worked in the water, rolling up their "gharabies", and as they wear no shoes or stockings this work was not a hardship on them.

Eventually we got the whole line lifted and packed except for a space in the center, where the water was still roaring through like a mill race. We built here a culvert consisting of twelve 75 lb. 36 foot steel rails laid on sleepers and sand bags on each end for about twelve feet, leaving a 12 foot sluice in the center. We then worked a construction train across, and while it looked as if it would derail every minute, and the track sank and squirted water up into the engineer's face, by going dead slow we got across safely. We then picked up the low places and ordered a freight train which was waiting at the end, forward. We got a pusher engine on the back of this, and by going dead slow managed to work this train across. Between trains we would better our track and eventually would get it into shape for fast running once more. The first train that went through wakened the Engineer in Gaza and he came out of his tent to see what was the matter. He had not figured on getting a train through for a week, and this particular train was got through in just over twenty-four hours. This could not have been handled in this way except for the fact that we had plenty of labor. Until we got the bridge finished on the 16th of February we had this trouble, and I think we must have used a quarter of a million sand bags there, at roughly a shilling each.

Our next trouble was the cotton soil. When we had the rain there was a portion of the track from Ascalon to Lydda that would almost entirely disappear. To look at it you would not know a track was there. Although the country was full of sand we could not spare the personnel or the equipment at that time to operate ballast trains. as we had to feed about 300,000 troops at the front. We therefore let the line sink, cleaning the mud off the top of the rails as best we could, until we thought it was absolutely dangerous, and then we would pick it up.

The country through there is all old Biblical country. We ran a spur out to Beer Sheba, which is where Abraham and Sarah lived and is the first place mentioned in Genesis. We ran through Gaza, which was where Samson carried away the pillars of the temple, and Delilah is reputed to have come from about six miles away, at a place also on the line.

The old crusaders used Ascalon as their headquarters. From there they marched up and down the coast and from it attacked Jerusalem. Lydda is where St. George, the patron saint of England, is supposed to be buried. The burial place is now a mosque.

To go back to the campaign and leave the railway for awhile.

Fighting the Turks

We fought at Romani, which is twenty-five miles from Kantara. We again fought at El Arish, which is about two-thirds across the Sinai Desert; we fought at Rafa, which is on the border of Asia Minor; and for five months we lay holding a line from Beer Sheba, through Gaza, and down to the Mediterranean. We attacked once here and were repulsed. Eventually however we defeated the Turks severely here and they retreated to a line seven miles north of Jerusalem and seven miles north of Jaffa on the coast. They held the line from the Mediterranean to the Jordan River, right across the Judean hills. The Germans had when they retreated destroyed the railway going up to Jerusalem. They had started also to build a railway down to Gaza to meet us, but they did not get it completed as far as that. We took this line and eventually took the Jerusalem line, but we could make very little use of it as it was metre gauge with very light rails. We eventually standardized it. The British held the line from North of Jerusalem to the Red Sea from about Christmas 1917 until the final advance in September 1918, when they drove back and absolutely wiped out the Turkish army.

Rebuilding Narrow Gauge Lines

During the period mentioned we extended our line through the cotton soil up to Lydda, where we met the French railway — a metre gauge — running from Jaffa to Jerusalem. We took this up and re-laid it with standard gauge track. We first tried to operate the metre gauge to feed our men in Jerusalem and in the valley of the Jordan, but were not able to get very much tonnage over the railway. From Artuf to Jerusalem is a straight

2% grade without a let up except at crossing places—roughly 50 kilometres. This railway runs up a canyon which compares very favorably for its scenery with the Kicking Horse Canyon, except that it is a dry watercourse for ten months of the year.

The French when they built this railway never tunnelled a hill; they went around. They used little steel and brought stone-masons from Bethlehem and built retaining walls where we would tunnel. They did most excellent work, and they had miles and miles of cut stone retaining walls, which must have taken infinite labor to build. When we standardized this road we tried to follow their curves and grades, but with our heavy rolling stock and 75 lb. steel we found the curves were so sharp that we had extreme difficulty. It was figured out that we would be able to haul 15 wagons at 10 tons each with one locomotive, instead of which, owing to the curvature, all we could handle was 10 wagons with two locomotives. I was supplied with a push trolley for inspection purpose, pushed by two natives who ran along the rails, and I would ride up to Jerusalem on one of the trucks with the trolley, and ride back almost to Lydda without a push from the Arabs who operated the trolley.

In the operation of the main line before it was double tracked I think we made a record. With passenger trains, hospital trains and goods trains we one day operated twenty-six trains each way over a single track. This could only be done where stations are close together, and we put them on this section of the line every $4\frac{1}{2}$ kilometers.

We had lots of personnel, as we drafted men who had had experience in railway operation from the fighting units.

Maintenance

The uncertainty about maintenance of track in Palestine is that you can never tell where the water is coming. We would build a culvert where we had a washout, and the next rain would wash the track out a couple of hundred feet up the line, while this culvert would be practically dry. Eventually we got over the water difficulty by using our Egyptian labour corps to build a little canal on each side of the track, from Rafa practically up to Ludd.

I am often asked if the road will be a paying proposition. It was built as a war measure. Palestine, and especially lower Syria, is a marvellous country. The Turks had taken all the young men away and left only the women and the old men behind. The people of the country use a wooden plough drawn by a little donkey yoked with a heifer, just the same as they did in the days of Christ, and merely tickle the soil, turning it up three or four inches. They sow their seed on the ground before ploughing, and when the ploughing is done the villager puts his plough over his shoulder and takes it home to the village. They get enormous barley crops there. On the ditch we dug we threw the spoils pretty well out of the track. The natives came along and sowed their grain in this soil, and where it was scattered out the barley came six or seven feet high, that you could not push your way through, whereas in the field it was thin and not more than two feet high, but was good barley and a good crop. It shows that if modern agricultural machinery were used to plow this country thoroughly, an immense amount of grain could be grown. They also have magnificent olive and orange groves.

It will undoubtedly also be a connecting link between Africa and Asia, and eventually, if the country is administered by England, I have no hesitation whatever in saying that it will be a paying proposition.

Before we finished we ran an express on this that started from Jerusalem in the afternoon about three o'clock and got to Cairo, over the Egyptian State Railways, by one o'clock the next day. This is different from the old days when tourists and pilgrims used to visit Jerusalem. They used to go up by boat to Jaffa, and some times if the surf was rolling they had to wait and make two or three trips before they could land.

We did not have many wrecks, taking everything into account. I dare say that this was the only line that was platted with what I call a sleeper diagram. We would get a cargo of Douglas fir ties, then a cargo of Australian hardwood, then a cargo of jarrah wood from Asam. I knew just where these sleepers were used, and if there was a derailment at any point where the Douglas fir or hardwood sleepers were laid I did not bother about it. If the jarrah wood, I ordered out big gangs, because I knew that for the distance that the derailed truck or trucks were dragged (and it was usually a half a kilometre) that every one of those ties would be broken, so that we would have to tear up the entire track and replace it.

There were no brakes on the trucks – not even hand brakes. They used three links for coupling up and had what they called shunting poles for use at the stations. You can imagine when you rode in the guards van at the end of a train of this kind, and the locomotive would take up slack, the jerk at the end was tremendous. Very often the train pulled apart, when the back part of the train would run down the grade until it came to an up-grade, when it eventually came to rest.

The building of the railway was a great feat, principally through the difficulties encountered. It was very hot, the water difficulty was tremendous, and altogether the building was a magnificent feat, and it gave me a great respect for the Royal Engineers. I had the idea that they had set rules and they had to stick to those rules. This may apply to the field companies, but the railway troops certainly could get out and do a job when they wanted.

Practical Applications of Electric Welding

Survey of electric welding methods, resistance, carbon arc, metallic arc and quasi-arc; methods of application, tables of power consumption, etc.; training the welder, protection devices.

F. P. Vaughan, M.E.I.C.

Read at the Eighth General Professional Meeting, Halifax, N.S. October 15th, 1920.

Electric Welding is a subject that should be of particular interest to the engineer, and during the late war, much research work was carried on in an effort to conserve both material, and labor, by manufacturers of war material and by the possibilities offered by its application to the ship-building industries, and as a direct result, much of the ignorance and mystery, in which this subject was surrounded, has been cleared away, and we find to-day, that electric welding is rapidly taking its place in modern engineering, and Industrial work.

The Resistance Process

The Resistance or Incandescent process, known as the Thompson process, is especially adopted for manufacturing work, where more or less standard welds are to be made, and is used for butt lap and spot welding and also special methods, known as ridge, point, and projecting welding.

This process consists of passing a large amount of current through the two pieces of metal at the point to be welded; the current being largely in excess of that which the metals can carry. The point of greatest resistance is the point to be welded and it is there that the maximum amount of heat is developed, this being sufficient to fuse and weld the metals together.

In making welds it is important that the distribution of the temperature over the face of the joint should be as uniform as possible.

It is not practical to butt weld two pieces of different areas, on account of the necessity of uniform temperature distribution, as the smaller piece will become much hotter than the larger one; For the same reason it is not practical to butt weld very large surfaces, as the current will not distribute itself uniformly over the section. The current usually employed in this type of welding varies from 40 amperes, with a machine for welding small wires together, up to 7,000 amperes, for a machine to butt weld wheel tyres.

To obtain these large current values it is necessary to use alternating current, owing to the difficulty and expense of obtaining direct current apparatus for these large current outputs. The voltage required at the weld varies with this class of work, but is usually from 5 to 6 volts. The parts to be welded are held between two clamps which are a part of the welding machine and terminals of low voltage and high amperage. The clamps are brought together under pressure, completing the circuit through the metal to be welded, the current passing to the metal from one clamping electrode to the other. These clamping terminals are usually water cooled.

(1) While it has been generally supposed, that spot welding was limited to metal not more than three-eighth of an inch in thickness, until the recent developments made by the General Electric Co., Mr. J. M. Wood of the above company states that this supposed limit was due rather to the capacity of the apparatus which had been available for doing the work and that the General Electric Company had developed a machine with a welding current capacity of 100,000 amperes at 20 volts and a pressure capacity of 75,000 lbs. The maximum current at which it has been used is about 72,000 amperes and a maximum pressure 30,000 lbs. The maximum thickness of material welded was three thicknesses of one inch plate.

The welding of mild steel gives the best results; butt welds with hard steel up to about 75% carbon can also be successfully carried out, although in the latter case the points of connection of the material to the welder are inclined to become glass hard and often have to be annealed to prevent fracture. The strength of iron and mild steel welds is greater than the material itself, but with high carbon steel wires, the weld strength is only about 60% of the ordinary material. Copper, gun-metal, brass, (if percentage of zinc is not too high), aluminum, nickel silver and their respective alloys butt weld under proper working conditions.

The spot welding of light, solid and hollow ware metal articles has revolutionized the ordinary methods of construction, where drilling and riveting used to be employed and there is hardly an industry, manufacturing or repairing metallic articles where an electric welding plant cannot be used to great advantage. The rapidity of the work and the low power consumption of the spot welder is remarkable, owing to the short time the current is flowing for the actual welding. H. Lemp, states that the energy required to bring iron to the welding temperature is approximately 7 H.P. minutes per cubic inch of metal.

(1) G. E. Review, Vol. XXI No. 12 1918

Electro Percussive Welding

This process as originally developed was for work of small sections. It depends upon the discharge of a large capacity condenser through the points to be welded, together with a forging effect which is practically simultaneous. The apparatus consists of a small direct current generator in parallel with a condenser usually of the electrolytic type, suitable resistances and inductances together with a forging machine or welding tool.

One of the chief advantages in this type of welding is that welds can be made without any apparent change in the metals to be welded. The process being practically instantaneous, metals of different melting temperatures can be welded and also material of unequal sections. There is also a saving in time as the operation is very rapid. D. Hamilton, and L. Oberg state that the power used in the weld is one sixteenth of that required for butt welding.

Electro-percussive welding has already found application in the joining of aluminum wires, the welding of platinum and nickel, platinum and copper.

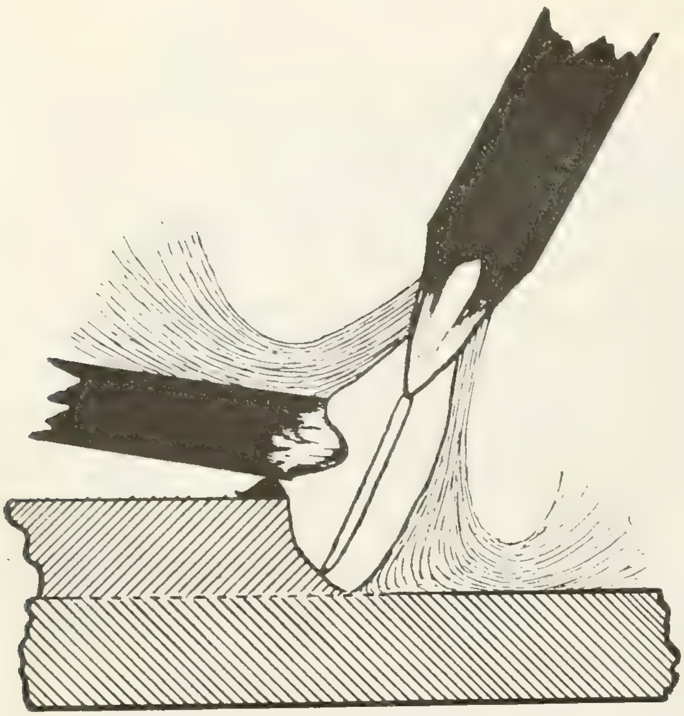
(2) D. F. Miner of the Westinghouse Co. states that within the last year equipment has been developed which successfully welds stock up to [illegible] inch. The same principle is used but stored electromagnetic energy replaces electrostatic energy, the total time required for the weld being only one-tenth of a second. Tests show strength of weld [illegible] lb. per sq. inch for steel to steel and 40,000 lbs. per sq. inch for copper to steel and a thorough fusion without oxidation.

Carbon Arc (Barnados) Process

This is probably one of the oldest methods of arc welding, having been in use for thirty-five years, the Barnados patent having been granted in 1885. In this process, the heat of the arc is utilized to bring the metals to be joined to a welding temperature and melt a filler of the same material, which is introduced into the joint, to fill the space between the metals to be welded. The system is used at present for practically all kinds of repair work and is extensively employed in iron and steel construction work, ship yards and railway repair work, foundries, boiler shops and general engineering work. The work includes the dismantling of iron and steel buildings, bridges and ships by cutting through the girders with the arc, the welding of cast iron and steel, building up of metal surfaces, as a means of saving worn machinery and parts, such as shafts, frames, cracked spindles and etc., melting and cutting scrap metal, filling holes in castings and has many other applications too numerous to mention.

The electric carbon or graphite arc is used for the production of a high temperature ranging from 6,000° F to 7,000° F. In welding with a carbon or graphite arc, direct current is usually employed in preference to alternating current, although the latter is sometimes used.

(2) Journal A. I. E. E. [illegible]



The parts to be joined are connected to the positive side of the circuit and the carbon electrode to the negative.

This has two advantages.

First. The greatest amount of heat in an electric arc is liberated at the positive pole.

Second. Particles of carbon are not carried into the weld and which is a condition to be avoided in making a good weld.

The operator holds the carbon or graphite electrode by means of an insulated holder and strikes an arc by touching the work with the carbon electrode and drawing it back quick by forming an arc of suitable length. The operator then moves the electrode from side to side of the weld, giving a semi-circular motion, while at the same time moving the electrode along the weld. This process as originally used, was improved by adding a fused metal filler to the molten surface of the metal. The carbon or graphite electrode process is generally employed where fast melting is required and to heat over a large area, (such work as filling in large holes in castings etc.), and is always used in cutting. The carbon arc requires a large current, generally from 250 to 600 amperes and 50 to 100 volts; very heavy welding and cutting requiring up to 1500 amperes. A graphite or hard carbon electrode about ½ to ¾ inch in diameter sharpened to ¾ inch point is used for average work, and lighter or heavier electrodes are used depending on the requirements of the work. The maximum currents for carbon electrodes are approximately as follows:

¼ inch..........	100 amperes
½ inch..........	300 amperes
¾ inch..........	500 amperes
1 inch..........	1000 amperes

It is necessary on account of the large area heated by the flame of the arc to use extreme care, so as to avoid stresses and distortion due to temperature changes. When cutting metal, the carbon electrode must be used; the arc is held in one position long enough to fuse the metal and allow it to run off. The arc is then advanced slowly along the desired line, the molten metal dropping out below. The width of a cut with a skilful operator is only slightly wider than the diameter of the electrode.

(3) The length of a 250 amp. arc should not be less than ½ inch and for a 500 ampere arc, should not be less than ¾ inch. The maintenance of excessive arc lengths causes the exposed hot metal to be rapidly oxidized or burned. For most purposes a 250 ampere arc should not exceed a length of 1 inch and 500 ampere arc should not be more than 1½ inch long. The surfaces to be welded should be chipped clean, and where they are scarfed the angle should be wider enough to enable the operator to draw an arc from any point without danger of short-circuiting the arc.

On account of the intense glare and heat produced, the operator must wear gauntlet gloves and a shields, completely covering the head and shoulders to protect the skin and eyes.

(4) Tests on a 25 kw. d.c. generator direct connected to a gasoline engine and mounted on a truck required 20 minutes to cut through a 15″ I—beam, and required 250 amperes at 90 to 100 volts.

Tests on an alternating current plant consisting of 4-20kw. single phase transformers connected in multiple required 650 amperes at 50 volts and in an 8 hour day, 10 ft. of steel piling were cut, the cut varying from ½ inch at the centre of the pile to 3½ inches at the ends. The consumption being 250 kw. hours. By this method $10.00 a day was saved, to say nothing of the time.

Cutting Mild Steel.

The Metallic Arc Process (Slavinoff)

About 90% of the electric arc welding that is accomplished today is by this process a modification of the Barnardos process, differing in that an iron or steel electrode instead of carbon is used, this being melted by the arc and serving to fill the space between the pieces to be welded. The metals to be joined are clamped in position and connected to the positive side of the circuit. The edges of the joint are beveled either from one or

(3) Elec. World. Vol. 74-22. O. N. Eschnolz.

(4) S.H.B.E.E. Sec. 22, P. 1730.

both sides, the bevel being so chosen to permit the insertion of the electrode to within less than 0.125 inch of the surface to be welded. Chemical composition, electrode covered or bare, not over carbon 0.18%, manganese 0.50%, phosphorus 0.05%, sulphur 0.05%, silicon 0.08%. For welding iron and steel the metallic electrode should be iron wire or high grade as soft and pure as possible; for welding other metals, the electrode should be in general the same metal as the metal to be welded; the composition of the welding electrode is an important factor in determining the success of the weld. Cost of metal electrode, 8 to 12c. per lb., bare, 20 to 75c. per lb. covered.

In the Bernardos process it is difficult to prevent absolutely the introduction of carbon into the weld; this is prevented in a large degree by the Slavianoff process, as by using a small arc the carbon deposit is greatly reduced and the heat is only spread over a small area, enabling the operator to deposit the metal very accurately on the edges of sheets and plates etc. The metallic arc process requires a comparatively low value of current, viz. 50 to 200 amperes and an arc voltage of 20 volts.

The metal deposited by this method is more uniform, and a weld so made is slightly stronger and has a smoother and more regular appearance than one made by the carbon electrode. For these reasons the metallic electrode is usually employed when strength and appearance is important.

The current values corresponding to the various electrode sizes are given in the following table and while they may be varied slightly under certain conditions they represent safe average. The arc should be kept constant in length to insure uniformity in the metal deposited.

Arc Welding Mild Steel.
(Metal Electrodes.)

Thickness of Plate	Diameter of Electrode	Current	Rate of Welding
1/16 inch	[illegible]	[illegible] amperes	[illegible] feet per hour
1/8 "	[illegible]	[illegible]	[illegible]
3/16 "	[illegible]	[illegible]	[illegible]
1/4 "	[illegible]	[illegible]	[illegible]
5/16 "	[illegible]	[illegible]	[illegible]
3/8 "	[illegible]	[illegible]	[illegible]
1/2 "	[illegible]	[illegible]	[illegible]
5/8 "	[illegible]	[illegible]	[illegible]
1 "	[illegible]	[illegible]	[illegible]

In welding a seam the electrode should be moved in a semi-circular path, advancing along the seam. For long seams the edges should be 1/8" apart at the end where the weld is started and the space should be 1/8" plus 1 1/2% of the length at the far end. Tack welding is another method of handling expansion. In starting the arc the electrode should just touch the work and immediately be withdrawn to the proper distance. It is necessary to be sure that the arc plays over the entire surface of the joint.

The metal is fused by the direct impact of the arc, and if the molten metal merely runs ahead of the arc over the solid metal of the work it will not result in a weld. The metallic electrode used is generally 14 inches to 18 inches long, and may be gripped either at one end or the middle to suit the operator. The operation of overhead welding is the same as in normal welding, but requires considerable skill and practice on the part of the operator. If the arc length is kept constant, the metal will be successfully deposited.

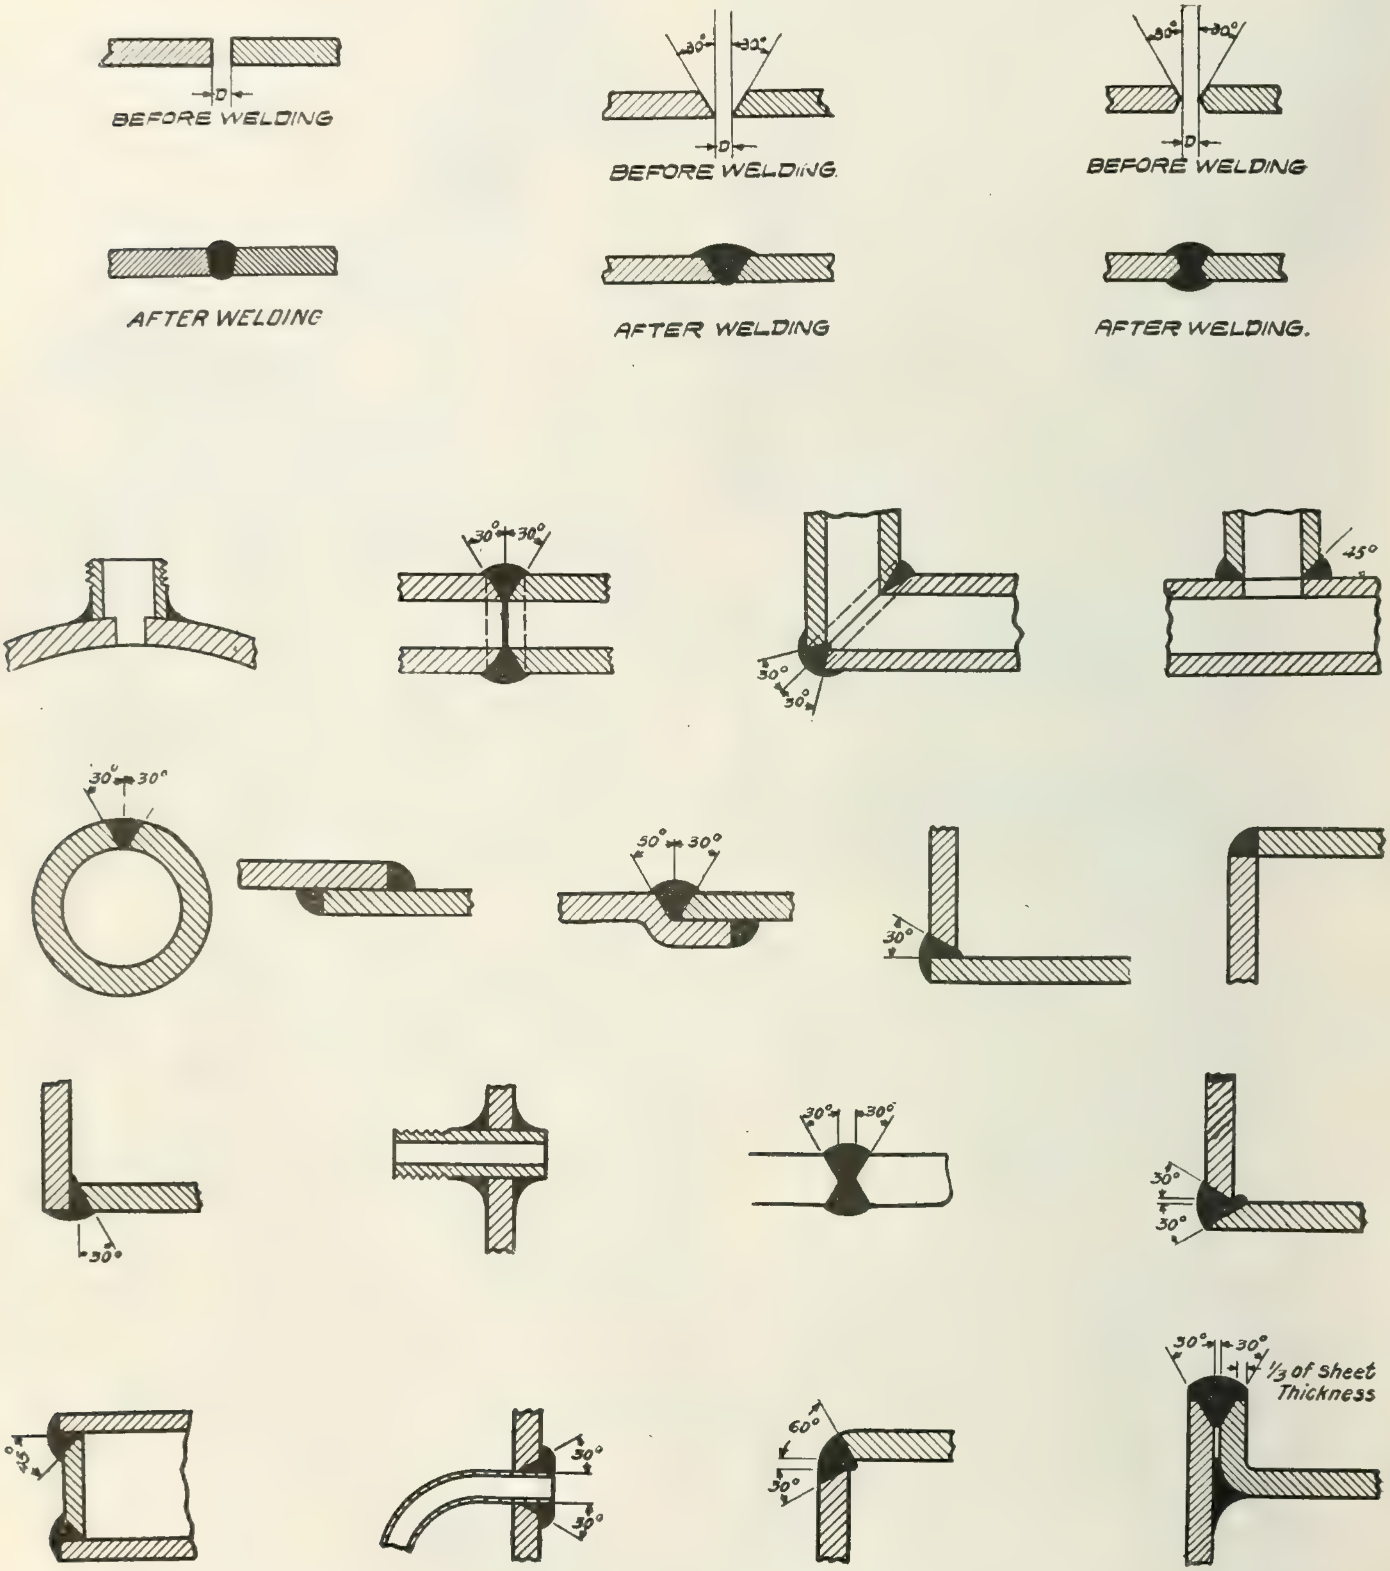
Double Bevel used on thickness above one half inch.



Method of making various types of weld

Preparation of the Weld

In the preparation of the weld it has been found that metal that is clean is much more likely to make a good strong weld. Scale, rust, grease, sand, and foreign matter will contaminate the weld and such inclusions necessarily weaken it or else make it hard. Impurities also may make the metal porous and spongy, due to liberation of gas; pieces of foreign matter may prevent the molten metal filling all parts of the weld.

Various methods of cleaning are in use, viz: pickling for small parts, washing with gasoline or lye, boiling with lye, sand blasting, chiseling, scratch brushing etc., the method depending on the local conditions.

Preparatory to welding locomotive tubes to the sheets, it is sometimes advantageous to send the locomotive out on a run to burn off the grease and then clean off the oxide and soot by sand blast; another method is to heat the boiler to normal steam pressure and then clean by sand-blasting or scratch brushing. Washing with lye will also remove grease.

In welding heavy sections where it is necessary to deposite several layers of metal, the surface of the preceding layer should, always be cleaned before starting the next.

There has been a good deal of discussion with regard (5) to the use of a flux in electric welding and it has been the source of considerable discussion for some time. The early metallic electrode was a mixture of pulverized carbon and borax, together with other materials of more or less imaginary benefit, while the present flux-covered electrodes contain various additional elements to assist in producing high class welds. While undoubtedly such coatings have more or less beneficial effects under certain conditions it is the experience of a great majority of welders, that flux of any kind is unnecessary in welding, and further that it is a source of danger, in that there is a liability to contaminate the weld. By keeping the work clean, and if care is taken in the operation of the arc, a good weld can be made without flux, and if these attentions are lacking, flux will not make a good weld.

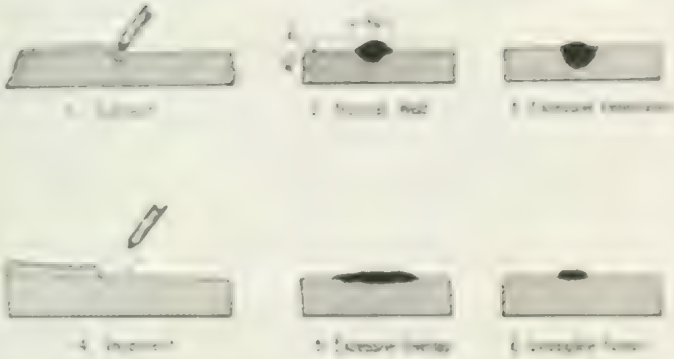
Above 1/8 to 1/2	[illegible]
Above 1/2	[illegible]

In all electric welding care must be taken, (6) otherwise there is apt to be extreme penetration which is caused by excessive current and improper electrode material and has a tendency to weaken the weld; on the other hand if the current is too low overlap and small penetration results.

The diameter and character of the electrode used must be carefully selected, for if the electrode has too high a melting point in comparison with the metal to be welded, extreme penetration will result; on the other hand if the electrode material has a low melting point compared with the work itself, overlap and small penetration result.

For a good weld it is necessary to have good diffusion of the fused metal into the work. To secure good penetration, a short arc should be used together with the conditions as set forth above.

The following sketches show some of the conditions referred to:



General Electric Automatic Welder

One of the most recent developments in metallic arc welding apparatus, which is just being placed on the market by the General Electric Co., is the G. E. Automatic arc welder.

General Electric Arc Welder

14" Shaft with 5 ft. increased [illegible] in diameter by Automatic Arc Welding Process

This is a device for automatically feeding a bare wire electrode into the welding arc at the exact rate required, which permits of a metal building process with minimum attendance. This device consists of a small direct

(5) G.E. Review, vol. 21-22, p. 550, J. A. Seede.

(6) Elect World, vol. 74-13, 1919, O. H. Eschholz.

current motor, geared to feed rolls, and electrically connected across the welding arc through control, with the result that the speed of the motor and consequently the rate at which the wire is fed into the arc varies with the voltage across the arc with, therefore, constant current. The length of the arc can be maintained at a minimum, with the result that the metal has little opportunity of being oxidized. The metal deposited is of higher and more uniform character than is possible with hand operation.

This method is especially recommended for building up shafts, car wheels, welding tanks, seam work and etc. in all of which applications it produces a more effective weld and is 2 to 5 times as fast as the hand process. The machine has few moving parts, is entirely automatic and self-adjusting to the demands of the work, and maintains a uniform arc length and weld throughout the entire operation. It is adjusted to operate continuously unwatched for long periods and can be used on any D.C. welding current outfit.

Quasi-Arc Welding

A system of welding which has found particular favor in England is known as Quasi Arc Electric Welding. The Quasi Arc Co. of London, England, were the pioneers of electric welding as applied to ship construction and were the originators of the coated metal electrode. The Quasi Arc Electrode according to the British patent specifications 11,079,12 and 13,538,12 consists of a steel wire core with an aluminum wire running beside it, and is covered with a wrapping of blue asbestos suitably treated.

In making a weld or reinforcing a worn surface by this process, the electrode is held in an insulated holder, connected by flexible leads, to the positive pole of a generator. An arc is struck between the work, which is connected to the negative side of the circuit and the electrode; this arc is immediately destroyed and a quasi (or partial) arc formed and maintained owing to the blue asbestos covering passing into the molten state and acting as a secondary conductor maintaining electrical connection between the work and the matallic core of the electrode.

The welding operation is continued by holding the point of the electrode just under the surface of the molten slag; the quasi arc is thus maintained and metal is deposited on the work continuously and with regularity. Blue asbestos being a ferrous silicate and an acid flux, can in a molten state combine with and remove oxide and scale from the work, so that it is not necessary to clean the same in order to obtain a good junction, between the electrode metal and the work. The molten steel and adjacent work from the time of fusion until in a solid condition are covered with this acid flux so that oxygen from the atmosphere is prevented from entering the weld oxidizing the steel and forming gas holes, an additional aid being the presence of the aluminum wire, which readily takes up oxygen. The slag formed on the weld is most useful as it covers the weld uniformly and allows the steel to cool much more slowly, thus adding to its mechanical strength; when cool is easily removed. The heat of the arc is localized to the weld and the junction between the work and the welding metal is complete and free from oxide inclusions and shows a gradual diffusion of carbon from the work into the metal.

The following tables give the comparative strength of rivited and quasi-arc welded joints.

Table showing Comparative Tensile Tests of Quasi-Arc Electrically Welded Joints, against Riveted Joints.

The Quasi-arc process has been authorized by the British and Foreign Admiralties, Lloyds Register of shipping and the British Corporation for the Survey of Shipping for use in the more important parts in ship construction.

Training

Electric welding is an art and as such requires special training to obtain satisfactory results, just as much so as in any other of the trades. The welder must be thoroughly familiar with the proper use and manipulation of the apparatus and understand certain fundamental principals, which must be observed. The degree of success attained in electric welding depends almost entirely upon the skill and intelligence of the operator. Some workmen become experts in a compartively short time, while others experience considerable difficulty and are never able to produce satisfactory results.

A good electric weld has great strength and can also be quickly made. On the other hand, a poor electric weld may have very little strength and may be very deceptive in appearance. It is therefore very important that the electric welder should be well trained and thoughly skilled before being employed on important construction work.

In the majority of cases when welds have been tested and proved faulty, the fault has been traced to one of the following causes:

Current too low.
Arc too long.
Incompetent operator.
Incorrect size or faulty electrode.

The value of the welding current has a considerable effect on the ultimate tensile strength of the weld, and with welds of 100 amperes and over, the tensile strength may vary as much as 50% with a difference in the welding current of 20 to 30%.

In the United States during the late war, there was a demand for skilled welders for the Emergency Fleet Corporation and for this reason the General Electric Co., established a school for training of commercial electric welders and were able to turn out a finished welder in 4 to 8 weeks, depending on the ability of the pupil. The G. E. Co. will maintain this school for the benefit of their customers. Similar schools were also established and are maintained for the same purpose by the Quasi-Arc Co., Brooklyn, N.Y., and the Lincoln Electric Co. of Cleveland, Ohio.

Protection for the Welder

In electric welding the operator must be protected from invisible infra-red rays, visible light rays and invisible ultra-violet rays, generated by the arc and also from drops of hot metal which splatters from the weld.

Ultra-violet rays radiating from the arc produce an effect similar to sunburn if any part of the operator's body is exposed to the rays for many minutes at a time, for this reason it is necessary for the operator to wear closely woven clothing. For the protection of the hands and wrists, gloves, mittens or gauntlets are used; these are sometimes made of asbestos. For the protection of the neck and head, a helmet made of metal or non-conducting material is used. Helmets are provided with an opening in front, containing suitable colored lenses; the colour of the lenses being such as to protect the eyes properly, against the injurious rays of the electric arc. These consist of various combinations of red, blue, amber, glasses of various tints, so that combinations can be made to suit the various kinds of arc welding.

Colored goggles are sometimes used but mostly by welding inspectors, who are not continuously exposed to the effects of the arc.

Metallurgy of Arc Welds

The metallurgy of the arc welds as shown by the microscope may be of interest.

(7) W. E. Ruder of the General Electric Co's Research Laboratory says: The physical properties of a weld will depend upon five district factors, viz:

(1) Crystal structure, (2) Gas-holes, (3) Slag Inclusions, (4) Impurities, (5) Composition.

From the study of the crystal structure of a large number of welds it appears that a very fine grain is produced by rapidly depositing the metal in thin layers, but as the plate heats up the grain changes to an entirely coarse structure, and columnar crystals begin to form with their resulting brittleness. Gas-holes are to be found in all electric welds and are an important source of weakness. Carbon is one of the worst offenders in producing gas holes. The carbon in the plate is also an important factor in this connection. Welds made on carbon free iron with a carbon free electrode showed only an occasional small gas hole. Slag inclusions are a common source of weakness in welds, particularly where covered electrodes are used by inexperienced workmen.

Impurities: microscopic examination reveals the presence in most welds of a large number of lines or plates, which bear a close resemblance to those seen in iron that has been highly nitrogenized.

Nitrogen is one of the most effective elements for making steel brittle, as little as 0.05% will reduce the elongation on a 0.2% carbon steel from 25% to 2%. It is confined to regular steel only in very small amounts varying from 0.02% in Bessemer steel to 0.005% in open hearth. The elimination of these nitrides and oxides must be accomplished before the weld can be made ductile.

Other impurities that may occur in a weld are sulphur and phophorus. It is doubtful if enough sulphur will remain to do any great harm, but phosphorus forms a dangerous phosphide eutectic with iron, and should be kept at an absolute minimum both in plate and electrode. Sufficient research work has not been carried out to warrant satisfactory conclusions as to the results brought about by the intentional addition of such elements as nickel, chromium, manganese, cobalt, copper, molybdenum, and tungsten.

Theory of Arc Welding

(8) The theory of metallic arc welding and the process by which the transfer of metal which occurs has been investigated by R. G. Hudson of the Massachusetts Institute of Technology and Harvard University, and O. H. Escholtz research engineer of the Westinghouse E. Mfg. Co. and a photographic record of the mechanism of metal transfer from electrode to plate indicates that 80% of the metal is carried across the arc in liquid form by molecular forces. O. H. Escholtz points out that there may be three somewhat distinct causes for the flow of metal across the arc.

First: The occluded or generated gases in the end of the electrode may blow out a certain quantity of liquid metal.

Second: Complete vaporization of the metal and its transport into the arc stream.

Third: The liquid metal may be transported by the ordinary molecular forces that cause surface tension and adhesion of one substance to another. Mr. Escholtz believes the last cause to be the effective one.

(7) [illegible]

(8) [illegible]
[illegible]

He estimates that of the total energy required per pound of electrode carried away, 60% goes into liquidation of material, approximately 26% into vaporization of some portion of this liquified material, and about 14% into ordinary thermal losses.

A cycle of deposition would appear to be as follows:

(1) After forming the arc, appreciable time is required to liquify the electrode end.

(2) The liquified end assumes a globular form, enlarges, decreasing the arc length and arc voltage, while increasing the arc current.

(3) When the globule has enlarged sufficiently to bridge or short circuit the arc stream, the arc voltage drops to practically zero, and the arc current increases to short current value.

(4) The short circuit condition exists until the globule is no longer in contact with the wire electrode.

(5) At the instant of detactment the current decreases, while the voltage rises sufficiently to re-establish the flow of the welding current in the partially deionized arc gases.

Equipment

With regard to current supply for spot or butt welders, if single phase alternating current is available, no difficulty is experienced in connecting a welder direct on to the mains, but with two or three phase supply, there is always the difficulty of maintaining a balance, if only one phase is connected to a welder, particularly if it is of large size.

The most suitable method of connecting single phase current from a polyphase supply without unbalancing, is to employ a synchronous or induction motor driving a generator, or if a direct current supply is available a D.C. motor can be used or a single phase rotary employed; the efficiency of the latter is the highest of all types of converting apparatus and the results are highly satisfactory.

For arc welding, direct current is usually preferable to alternating current, and with certain systems, direct current only can be employed. The direct current generator designed to supply a single arc welding plant can be arranged to work with a drooping voltage characteristic, which limits the current of the generator when short circuited to about 20 to 25% above the normal full local current. One of the latest developments along this line by the General Electric Co. is the new type Arc Welding Generator, which embodies the characteristic of constant energy output, the Westinghouse Co. have developed a similar machine the short circuited current being a full load welding current.

The high economy with both systems of welding, especially when working of single phase AC supply is due to the very small light load losses and the fact that power is only consumed when the machine is actually welding.

There are now on the market a number of different types of electric welding apparatus; which can be divided into three main classes, viz:

Motor generator sets, gasoline engine driven sets or power driven.

Welding Structural Steel

(10) The welding of structural steel work is another advance that has recently been made in the application of electric welding and offers unlimited possibilities.

While the building erected was not a large one, being a warehouse 40′ x 60′, there is no reason why this method cannot be applied to all classes of building construction.

In the 40 ft. span roof trusses the contract price for rivetting would have cost $85.00 per truss, whereas the welding was done at $50.00 a truss, allowing the same profit as for the rivetting. Actual test proved conclusively that the welded steel structure were stronger than rivetting. The trusses were designed for a live load of 40 lbs. per sq. foot, each truss supporting a panel 800 sq. ft. They were tested at a load of 120 lbs. per sq. foot or a total of 48 tons on the two trusses.

The official reports of the building Dept. of N.Y. says. "From the above it is evident that electric welding is a dependable method of uniting structural members and is stiffer than rivetting, if the work is properly performed.

(11) An electrically welded freight car which was built in 1911, before electrical arc welding was in universal use, was built by spot welding in two thirds the time required to rivet a similar car. Tests on the completed car showed that it was much more rigid than with rivetted construction and that it showed no slip or permanent set. The car was loaded to 150% capacity and the usual tests applied and proved satisfactory in every way.

It was placed in actual service by the Burlington Road, and has been in operation since that time.

Sheet Harbour Hydro-Electric Powers

Hydro-Electric Power for Pictou County, Nova Scotia, various schemes proposed with tables of run-off, etc., details of two principal schemes, at Malay Falls and Tidewater.

Harold S. Johnson, A.M.E.I.C.

Read at the Eighth General Professional Meeting, Halifax, Oct. 14th, 1920

One of the most eminent engineers on the North American Continent has recently written,—

"The coal costs all over the world have advanced from 80 per cent to 300 per cent, and there is now no relief in sight to correct the ever-increasing tendency to still higher prices."

"Based on present day costs of construction material, labor and coal, a kilowatt hour from central steam stations will cost an average of one and a half times the cost of a kilowatt hour from water power."

These statements are particularly applicable at the present time to the County of Pictou, Nova Scotia. This county has derived its power to date mainly from coal fired units, and due principally to the increased cost of coal, industrially the County is suffering from excessive power costs. In an endeavor to alleviate this situation, the Nova Scotia Power Commission has been investigating the Sheet Harbour Rivers with a view to the transmission of hydro power to the County and the following forms a synopsis of the writer's report and proposals as made to the Commission.

Pictou County

No other part of Nova Scotia outside of the Sydney section, is so distinctively industrial as what may be termed the "Five Town District" of Pictou County, comprising the towns of Pictou, Westville, Stellarton, New Glasgow and Trenton. The foundation of these towns was laid in the years from 1798 to 1809.

Thorburn, a coal mining centre is next in size to the five towns mentioned. The balance of the County's population is mainly rural, being concentrated more particularly along the valleys of the main rivers.

The County population in 1901 was 33,459. In 1911, [illegible],858. The county area is 1124 square miles, and it stands third in Nova Scotia in density of population per square mile, by the 1911 census having 31.9. Omitting the five towns first mentioned, and also Thorburn, the balance of the County population becomes 15,000 which may be termed rural and which statistics would show to be living in about 3,000 dwellings. At the most, it would never be possible for more than 1500 of these to receive the advantages of the distribution of power to rural districts. Assuming a consumption of 300 kilowatt hours per annum per capita, which records indicate as being the average in similar districts in Nova Scotia, the total annual power used would be 450,000 kilowatt hours. This figure will be used later.

The power at present used in Pictou County is mainly consumed in the five towns first mentioned, and more particularly in Stellarton, New Glasgow and Trenton.

Pictou operates a steam municipal plant for power and lighting service. The cost of operation, without including fixed charges, was 7.5c. per kilowatt hour in 1919, and has naturally increased since then. The power rates charges range from 15c. to 8c. per kilowatt hour at the consumers' meters. For lighting the charges are 16c. per kilowatt hour with a maximum discount of 12½ per cent. The maximum load on the plant is 250 kilowatt, average load 40 kilowatt, kilowatt hours per year generated 398,000.

The Pictou County Electric Company situated in Stellarton operates a tramway system, supplies the lighting service for Westville, the domestic lighting and some small power for Stellarton, the entire lighting service in Trenton and New Glasgow, and a very considerable small power load in New Glasgow. In 1918, the cost of power at its switchboard, without including fixed charges, was [illegible], and at the present date is at least 10c. Such costs are very largely due to the nature of the load carried, the nature of the diversity factor, etc. The maximum load at the switchboard is 580 kilowatt, average load 275 kilowatt, total consumption 1,440,000 kilowatt hours. Power charges are from 12c. to 9c. less 10 per cent, for lighting 17c. to 15c. less 10 per cent.

The Eastern Car Company, in the town of Trenton, has a most efficient, economical and well arranged steam power plant, supplying its own demands for power. Its load factor is high,— 51.4 per cent. The maximum load carried is 880 kilowatt, average load 457 kilowatt, total consumption per annum 3,362,000 kilowatt hours.

The Nova Scotia Steel & Coal Company in Trenton, also operates its own steam power plant for the supply of its own power needs. Its maximum load would be 3000 kilowatt, if fully electrified, average load 1250 kilowatt, load factor 41 per cent, annual consumption 9,200,000 kilowatt hours.

The Acadia Coal Company in Stellarton, operates a modern and up-to-date power plant. This plant is steam turbine driven, operating two 3-phase, 50-cycle, 3,150 volt, 1500 kilowatt A.C. generators and one 4,000 kilowatt generator with same characteristics. The motor driven equipment is 50-cycle. The power is used for the Company's coal mining operations in all its pits. It is fully believed that this plant stands in the first rank, for its size, in efficiency, economy and service. It is hoped and planned to utilize this plant as a steam standby and reserve, in connection with the hydro system. The 50-cycle machines, however, cause complications, as the Nova Scotia Power Commission's standard will be 60-cycle but as described later, arrangements will be made to take care of this. The plant's load factor is high — 53.4 per cent. The maximum load is 2,400 kilowatt, average load 1,283 kilowatt and annual consumption 9,438,000 kilowatt hours.

In addition, in the "Five Town District", there are smaller industrial plants, producing their own power, with capacities between 30 kilowatt and 200 kilowatt in electrical terms. Their costs for power range as high as 12c. per kilowatt hour. The consumption of all these smaller plants runs about 3,776,000 kilowatt hours annually.

Typical load curves have been obtained for each individual plant and a summation made; the maximum load is 7,480 kilowatt, the yearly average load 3,362 kilowatt, the average working day load 3,981 kilowatt, the yearly load factor 45 per cent, the daily working load factor 53.2 per cent.

The distribution of sectional consumption to total consumption is represented in the table given herewith. It is, therefore, apparent that the Nova Scotia Steel & Coal Company with its subsidiary, the Eastern Car Company and its controlled plant, the Acadia Coal Company, exert a predominating influence on the power demand.

Sectional Consumption in Percentage of Total.

Refer. No.	Consumer	Total Consumption 100%	Total Consumption 100%
1	All Plants etc., outside last 4........	12.8%	18.92%
2	Pictou County Electric Company.....	6.12	
3	N.S. Steel & Coal Co.	37.35%	81.08%
4	Eastern Car Co......	11.69%	
5	Acadia Coal Co......	32.04%	

It is difficult to make any estimate of the possible increase in future years in the present power consumption of 29,500,000 kilowatt hours. An extension to rural districts as already noted would only give 450,000 kilowatt hours. We all hope that the Nova Scotia Steel & Coal Company will expand through its merger with the British Empire Steel Corporation. With cheap power, there is no doubt that new industries will spring up and existing industries extend their activities. A survey has led the writer to believe that the consumption may be 41,000,000 kilowatt hours in six years from the advent of cheaper power into Pictou County, an increase in six years of 41 per cent.

The present operation costs for power in Pictou County, without including fixed charges, range from 1.65c. to 12c. per kilowatt hour. As will be shown later, it is proposed to supply hydro power to Pictou County at an initial estimated cost of 1.25c. An estimate has been made that there would be a saving annually to Pictou County with the bringing in of hydro power based on present power consumption of $500,000 or about $1,350 per day.

For a continuous dependable output, all of the hydro powers of Nova Scotia are very much dependent upon storage reservoirs. Pictou County is particularly lacking in natural storage reservoirs, such as lakes, and there is available in its rivers no water power in capacity sufficient to satisfy its demand. Recourse has, therefore, been had to the Sheet Harbour Basin, as the nearest source of supply.

Location, Geology, Climate, etc.

Reference to the Map No. 1 shows that the drainage basins of East River and West River, Sheet Harbour are contiguous, discharging into separate inlets from a common estuary on the south eastern coast. The East River drainage basin has an area of 228 square miles. The basin is 54 miles as the crow flies from Halifax and 45 miles from New Glasgow. The nearest railway is at Upper Musquodoboit, 28 miles distant, but coastal steamers call at both East and West River harbours.

The basins are well timbered, particularly the East River Basin, which has not been cut for some 23 years. The East River lies in a deep valley, with the crests of the enclosing slopes distant one half mile to one and a half miles from the river.

From meteorological records of the nearest stations and by balancing, the average precipitation in the basins for the four years from October 1, 1915 to October 1, 1919 was estimated to be 46.77". Fortunately for our purposes, comparison of records, etc. would tend to show that these first three years of the four constitute a period of exceedingly low precipitation and consequently low run-off. It is also fortunate that records are available as taken by the Dominion Water Power Branch, co-operating with the Nova Scotia Power Commission, for the daily run-off for these same four years. This period while far too short to give a reliable basis for estimation of dependable flow, is of particular value in this instance due to three years of the four being what may be called "dry years".

The run-off records will be referred to later under the reference to "Dependable Flow". It might, however, be stated that the maximum flow recorded for East River Sheet Harbour is 3550 cubic feet per second, and the minimum has been as low as 25 second feet making absolutely certain the necessity for very large storage basins to obtain the maximum use of the water available.

Storage Possibilities — East River

A glimpse of the general map will show how studded with storage sites these basins are. Unfortunately none are very large. In the East River valley, storages are available of greater or lesser extent on Governor Lakes, Rocky Lakes, Sloane Lake, Como Lake, Fraser Lake, Lake Mulgrave, Anti Dam Flowage, Ten Mile Lake, Lochaber Stillwater, Diamond Lake, Smith Lake, Fraser Lake and Abraham Lake. Their very number is disconcerting for operation. However, the latter four are small and will not be initially developed. The first nine will all be developed. The unfavorable position of the largest lake area — Governor Lakes, will be noticed and also the Rocky Lakes. The very favorable position of Mulgrave Lake and its feeders, Como Lake and Fraser Lake gives considerable advantage for prolonged power peak periods.

Lochaber Stillwater has a present area of 730 acres and the development plans make this what might be called the head pond for the river system, as its dam will also

be the head power dam. The level will be raised 20 feet over present level, having then a conservatively calculated surface area of 1350 acres, forming a pond about 5½ miles long and 1¼ mile wide. It is proposed to allow for a drawdown of three feet on this which would give an available storage of 4050 acre feet. It is not intended to use the other 17 feet even as seasonal storage, but simply to give power head. In addition to Lochaber Stillwater, Ten Mile Lake when developed, has not been

considered in arriving at a figure for dependable flow, but will be considered wholly as reserve in case of extreme drought conditions and to account for losses beyond those foreseen and allowed for. It is known that the storages assumed are very conservative in quantity, and there is no doubt that the extensive surveys necessary will show that considerable greater quantities of storage will be available. No account has been taken of flowage, and it is believed that this with the conservative estimates made will balance losses of water due to evaporation, seepage, ice formation, etc., etc. — and will be more or less in quantity depending upon how quickly the water is let down, upon the season of the year, the shape of the river channel, the nature of the river channel, etc. Careful estimates made show that it is certain that the storages can be filled to the capacities proposed.

The tabulation of these storages for East River — shows that 52,496 acre feet proposed to be developed for use and 7,130 acre feet developed for reserve, and the possibility for the future development of some 5,000 acre feet additional.

East River Sheet Harbour-Hydro-Powers Storage Basins and Details.

Refer No.	Storage	Storage Acre-Feet to be Developed and Used	Storage Acre-Feet Developed for Reserve

The West River is similarly endowed with natural storages but more particular reference will not be made to them, as the intention is to confine the detail to the East River.

Dependable Flow with Storage and Auxiliary Steam Plant

To obtain the results under this heading for East River, a series of diagrams have been plotted as shown in Figure 2.

Diagram 1 is a hydrograph showing the average run off per month in cubic feet per second from October 1915 to October 1919 (both inclusive) based on the actual readings as taken on the Malay Falls gauge for the East River Basin. The ordinate gives not only a scale in cubic feet per second but also in continuous kilowatt of power delivered at Pictou County based upon the amount of water used under a net head of 195 feet from Lochaber Stillwater to Mean Sea Level, which head will be referred to under a subsequent heading. Across this diagram, there are drawn horizontal lines of constant flow — 350 second feet — 450 second feet and 550 second feet which are referred to in the formation of the other diagrams. As an example, take the month of December, 1915, the average run off per month was 1127 second feet, which might have given, delivered in Pictou County, under 195 feet head — 16,023 continuous kilowatt of power. It has already been pointed out that the period the diagram covers was probably a very low runoff period, as low as and possibly lower than any other that occurred in 31 years.

Diagram 2 is a hydrograph showing storage available and quantity of this storage used during the whole period under discussion to maintain a continuous regulated flow of 350 cubic feet per second. As ordinates, there have been shown the various storage proposed to be developed and used. All these storages have been reduced to their equivalent flow in cubic feet per second if allowed to discharge themselves completely in one month. It is apparent that with storages alone under the worst conditions of which we know, it would not be wise to depend upon obtaining a greater flow than 350 second feet continuously throughout the year. Diagram 2 shows also that the most economical use (in obtaining the greatest amount of power for the capital invested in creating storages) is not being made of the storages for at least three years out of the four shown. The proportion of blank space in diagram 2 to "hatched" space plainly indicates this.

Diagram 3 is prepared similarly to 2, except that a continuous flow of 450 second feet is assumed. It is apparent that in September and October 1916, there was not sufficient storage even using Lochaber Stillwater to maintain this flow. It does show, however, a much greater use being made of the storages available during the other low water periods under discussion, but even yet it is felt that a flow can not be assumed giving the greatest possible economic use of the run off that the basin affords during year after year of varying precipitation. This is evidenced by the large amount of unused storage in the summer of 1918 and 1919.

Diagram 5 is prepared again similarly to 2 and 3 using, however, a continuous flow of 550 second feet, but considering no use being made of Lochaber Stillwater storage — nor of Ten Mile Lake emergency storage not shown. It is very apparent from diagram 5 that during the months of August, September, October and November 1916 and September and October 1917, there would be a very considerable deficiency of storage. We will, therefore, supply all deficiencies to maintain 550 second feet from storage up to the end of July by which time, it should be possible to know the nature of the summer low water flow, then dropping to some point of continuous flow which will carry through until such time as the Autumn rains again replenish. For the summer of 1916, it will be noticed that this figure was 150 second feet for the months of August, September and October. For August and September, 1917, this figure was 300 second feet. During the summer of 1918 and 1919, the flow of 550 second feet could be maintained from storage and natural flow. Now examining diagram 5, it is apparent that we are approaching the point of the greatest use of the storage available. However, during the summers of 1916 and 1917, it would not be possible with storage only to continue to supply the same amount of power as during the summers of 1918 and 1919. As all industrial operations are based upon a continuous, uninterrupted supply of power, and as further storage is not available, it is, therefore, proposed to make use of the Acadia Coal Company's steam plant in Stellarton to supply this deficiency, acting mainly as reserve for cases such as the summers of 1916 and 1917, also partly as a guarantee against interruptions to the power supply through accidents to transmission lines or machinery, caused by changing winds, ice accumulations, lightning, etc., all beyond the present control of man.

Diagram 4 is to visualize the amount of such steam power that would have to be supplied to carry through the deficiencies of storage. During August, September and October 1916, there was only 150 second feet continuous flow giving 2,081 continuous horse power delivered. The balance between that and the normal supply of 7,631 continuous horse power by 550 second feet of water would have to be made up by steam power, or a quantity equivalent to 5,550 continuous horsepower for three months. Similarly in August and September 1917, the steam plant would operate to produce 3,470 continuous horse power for two months. The "double sectioned" spaces in diagram 4 represent steam power supplied, the "single sectioned" hydro power supplied.

We will, therefore, conclude to calculate upon a continuous regulated flow of 550 second feet with the use of the Acadia Coal Company's plant as a steam reserve.

Similarly for the West River, with the aid of steam reserve, a regulated flow of 300 second feet has been assumed under a net head of 73.5 feet, where with storage only not more than 150 second feet could be depended upon.

Flow and Heads for Respective Developments

In all calculations — total losses from the water entering the turbines to the power at the low tension side of the Terminal station in Pictou County have been assumed as 34 per cent made up as follows,—

Turbine	15 % loss.
Generator	6 % loss.
Transformers up	2½% loss.
Transmission line	8 % loss.
Transformers down	2½% loss.
	34%

A direct summation is actually incorrect, but we are erring on the safe side. It is hoped and it may yet be possible to cut these losses to 25 per cent.

For the East River, the present normal level of Lochaber Stillwater is 175.00 — taking mean sea level as zero datum. This it is proposed to raise to 195.0. To utilize the drop fully, therefore, between Lochaber Stillwater and mean sea level, there would be available 195 feet gross head. The endeavour has been to regulate as completely as possible the entire run off of the river. Consistently then, it should also be the intention to utilize to the limit this 195 feet of gross head available.

As developed more fully later, this has been done in two proposals,—

1. By means of one development only, with the whole gross head of 195 feet utilized, which on account of various hydraulic losses would be reduced to a net head of 185 feet. The generating station would be at Tidewater. This development for brevity will be referred to as No. 1 Tidewater.

2. By means of two developments of which the upper with generating station at Malay Falls would have a gross head of 80 feet, — reduced to 76.5 feet net head at the turbines — referred to as No. 2 Malay Falls. And a lower development with 114.5 feet gross head reduced to 112.5 feet, with generating station at Tidewater and referred to as No. 2 Tidewater. The total gross head utilized is therefore, 194.5 feet, and the total net head 189 feet. The net head obtained on account of lower hydraulic losses is four feet greater than under the first proposal.

Remembering that 350 second feet is the maximum continuous flow available with storage only and 550 second feet with steam reserve and storage and having the net heads, and assumed losses, we can arrive at the kilowatt hours, delivered per annum in Pictou County both for the alternative East River developments and the West River as shown below.

Kilowatt Hours Delivered in Pictou County.

Scheme	Storage Regulation, Only	Stor. Regulation and Steam Reserve		
		Hydro	Steam	Total
West River Tidewater Development	5.431,000	8,060,928	2,801,472	10,862,400
No. 1 Tidewater....	31,903,920	40,945,360	9,190,800	50,136,160
No. 2 Malay Falls..	13,192,560	16,932,744	3,798,422	20,731,166
No. 2 Tidewater....	19,403,400	24,896,352	5,594,705	30,491,057
Total No. 2......	32,595,960	41,829,096	9,393,127	51,222,223

As before stated the total estimated present consumption of power in Pictou County is 29,500,000 kilowatt hours, and it is very probable that this would not become all hydro for possibly two years after its advent, though this period would be materially shortened with the adoption of a proposal later advanced.

Examining the table given, there are three combinations that would supply Pictou County alone for a period of possibly two years from the introduction of hydro power and cover a period of about four years from the present date. The word "alone" is used advisedly, for if there were demand for a block of power over Pictou County's needs, than the combinations listed below would be too small in every case.

1. No. 1 Tidewater complete without steam reserve and using storage only.
2. No. 2 Tidewater and No. 2 Malay Falls without steam reserve and using storage only.
3. No. 2 Tidewater alone with steam reserve and storage.

A serious objection applies to both No. 1 and No. 2. Being without the expense of steam reserve, either would give lower unit power costs, and either would have the advantage of lower capital investment due to lessened machinery, and lower water conduit costs, capacity being necessary for only 250 second feet against 300 second feet with steam reserve. Neither combination, however, utilizes the full capacity of the river, and neither combination would allow for expansion beyond Pictou County's present consumption. Even the addition of the West River development without steam reserve would only give 5,431,000 kilowatt hours which is too small to justify the additional investment. It must, therefore, be apparent that both Combination 1 and Combination 2 must be ruled out.

Combination No. 3 — No. 2 Tidewater with steam reserve and storage — would appear the logical development for present needs. It involves the valuable steam reserve, promises the final utilization of the full value of the river, and provides opportunity for expansion,—

the matter of capital invested has to be considered, and the annual fixed charges contingent thereon. These are considered later.

Proposed Types of Development

Figure No. 9 covers the East River from Tidewater to Lochaber Outlet — a distance of 3 miles.

A close study has been made of all types of and location for developments. Conditions on the West side of East River through lack of roads, difficulty of access, deep river inlets, low heights above and near the river and wide creek valleys prejudice developments on that side, and affect seriously the matter of canals and pipe lines. It was also found that economic development meant the sacrifice of a considerable amount of the 116 feet gross head.

The East side presents better opportunities. Even here extensive investigation was necessary to decide the location of the water conduits, — and the most economical type to be adopted — whether pipe or canal. Preliminary investigation showed the necessity of two developments to utilize the 116 feet gross head, — involving two generating stations, and a consequent approximate doubling of

Figure 9

1. By the building of the No. 2 Malay Falls development.

2. By the building of West River Tidewater development. It would also, of course, call for the development of all the storages.

If there were in sight a demand for a block of power outside of Pictou County's needs at the time of beginning construction, then the choice comes to either,—

1. No. 1 Tidewater with steam reserve and storage.

2. No. 2 Tidewater and No. 2 Malay Falls with steam reserve and storage.

The first involves less annual operation charges and will give better and easier operating conditions as compared with the second proposal. On the other hand

operating staff and therefore operation charges. There are also the greater electrical difficulties attendant upon tying two generating stations, which while easily overcome, bring more complicated design and additional capital charges. The annual operation charges for a typical generating station would be approximately $18,000 — covering salaries, wages, supplies, etc., for the generating station only. It would then appear that equitably the sum of $18,000 capitalized at say 6 per cent would represent approximately the additional capital that might be invested towards the attainment of one generating station in place of two. This represents the sum of $300,000. After considerable investigation, a scheme using one generating station to develop the full gross head of 116 feet was obtained, and comparisons of investment involved will be made later.

We have then two proposed schemes which are,—

1. Single Development with head dam at Lochaber Stillwater and generating station at Tidewater. For brevity, reference will be made to this development as before said as No. 1 Tidewater.

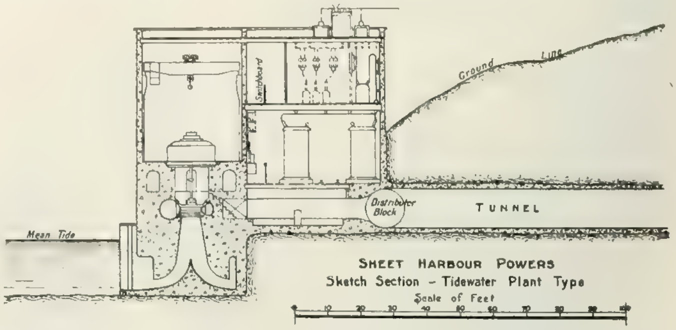
2. Two developments with the Upper Head dam situated as above at Lochaber Stillwater and with the generating station just below Malay Falls. This development will be referred to as No. 2 Malay Falls. The lower development will have the head dam a short distance above Ruth Falls and the generating station at Tidewater, located exactly as for No. 1 Tidewater. Development scheme No. 2 requires a control station. It has been recommended that the Tidewater station be this control, mainly on account of its accessibility to the outside world, its central position, having in mind the possible future West River development, the lessened handling required on transformers weighing possibly ten tons each, and its priority for construction in the development of the complete scheme.

The details of developments may be summarized as follows,—

No. 1 Tidewater Development

Eight different sections were studied for the head dam for this development, which would also form the head dam for the alternative No. 2 Malay Falls development. The final location would be at the head of Marshall Falls and of sufficient height to raise Lochaber Stillwater twenty feet, forming as aforesaid a head pond 5½ miles long and averaging ¾ mile wide. The overflow section of the dam would be of mass concrete, the East end being retaining wall section with concrete core wall and earth body. Provision would be made for a log run, fish way and unwatering sluices. The foundation would be on bedrock.

The water conduit is not taken from the dam but at a distance to the West, consisting of a canal with the entrance flared to lessen hydraulic entrance losses, protected by a boom and with provision made to close off the water with stop logs. The canal would be concrete lined and made of sufficient size so as to allow for a drawdown on the pond of three feet and still not increase the velocity beyond the economic limit. The sides would be on a 45°slope, so as to obviate the necessity of forms for the lining, and to take care of any ice pressure that might develop. For the first 1200 feet this canal is common to both No. 1 Tidewater and No. 2 Malay Falls developments. For the power scheme under description the canal continues down the valley as shown in Map No. 4 at varying distances from the river following contour 190. In places where the canal crosses a deeper creek valley, it is more economical to cross on a fill rather than follow around the contour. The canal length is 20,900 lineal feet terminating in concrete headworks set well down into the crest of the hill. To obviate the necessity of wasting a large amount of water at a time of the year when the water should be conserved through driving logs down a river obstructed with large boulders, and with rapids and falls, it is proposed to carry the log drives down the canal, discharging them just above the headworks at the end of the canal into a timber log sluice carried across the bog, over the road and down to the main river, discharging a short distance above the generating station. The limits on the upper river have not been cut for 23 years, and within probably 5 years, the cut will be begun.



SHEET HARBOUR POWERS
Sketch Section – Tidewater Plant Type

From the headworks at the end of the canal, which will be housed and provided with trash racks, closing gates and gate mechanism,— a 10′ 6″ wood stave pipe — 5500 feet long — will carry the water to the crest of the hill above the power house, here it will enter a steel thimble surrounded with a concrete block and forming a part of a vertical pipe carried to a height of about 50 feet to form a surge tank. On account of the very steep slope, the consequent necessity of heavy anchorage, and the vibrational effect from heavy surges, instead of the usual penstocks, it has so far been considered that a penstock tunnel should be built, carried down as a shaft from the surge tank,— 12 feet in diameter, lined with concrete, (figure 4), and then carried horizontally to the transformer house wall, this section being an arched tunnel, and which will discharge into a steel distributor in a concrete block from which branch two six foot and two 4′ 6″ diameter steel pipes controlled with hydraulic valves placed next to the spiral — steel cased — vertical shaft turbines set in mass concrete,— as shown in the sketch, and connected directly to the three phase, 60-cycle alternating current generators with exciters also on same shaft. The water discharges from the turbines through concrete draft tubes into a tailrace excavated to the river with provision made to utilize the low tide level. It will be noticed that a different type of draft tube is proposed, it being intended to make use of either the Moody Flaring type or White's Hydraucone both of which have recently been utilized in the two new 37,500 horse power turbines at Niagara Falls and where there has been attained the remarkable efficiency of 90 per cent from the canal headworks to the tailrace, due in part to this new type of draft tube, which regains as high as 72 per cent of the velocity head of the water when leaving the turbine runner, and which also tends to reduce to a minimum the vibrational effect often present in curved draft tubes with long penstocks. The type shown in the section is Moody's Flaring type. The superstructure will probably be of concrete. Back of the power house above the steel distributing pipes will be placed the "transformer house", holding the low tension switching equipment, low tension bus bars, transformers and high tension switching equipment, lightning arresters, etc. Due consideration will be given to an outdoor transforming installation, which is increasing in favour, but which does not appear as yet as being applicable to the conditions here in Nova Scotia.

No. 2 Malay Falls Development

The head dam, canal entrance and [illegible] feet of canal will be similar to the alternative No. 1 Tidewater Development first described. The canal will terminate in a concrete headworks, housed, with trash racks, ice run, closing gates and gate mechanism. From this will exist a 10' 6" wood stave pipe of a total length of [illegible] feet laid on a graded foundation, and connecting near the power house to a differential surge tank on the crest of the hill elevation 17[illegible], from thence carrying on in 10' 6" wood stave pipe to a generating station similar to that described previously,— distributing the water, however, through two 7-foot steel pipes to the two turbines. No service transformers will be necessary in this station, so the structure back of the power house will be comparatively small, housing only the low tension switching equipment, properly protected, and from the low tension bus bars the current will be transmitted to the control station at Tidewater. The station will be placed just below Malay Falls, and the tailrace discharge will be into the river at a normal elevation of 115, where a pond will extend to the head dam for No. 2 Tidewater Development, just above Ruth Falls.

No. 2 Tidewater Development

Referring again to Map No. 4 of the whole valley, the head dam is a short distance above Ruth Falls where a four foot drop occurs. The dip and strike of the exposed bedrock are such as to make an extremely good dam foundation. The dam would be of mass concrete of a maximum height of 34 feet, having both overflow and retaining wall section. Provision would be made for fishway, trash and ice way, and for unwatering sluices. The crest of the overflow section would be elevation 114.5. The pond formed would be 2½ miles long. On the eastern end of the dam, there would be the splayed entrance to the canal, protected by a boom. The normal section of the canal would be 11 feet wide at the bottom with 45° side slopes — lined with 6 inches of concrete and made sufficiently deep so as to allow for a drawdown of one foot on the pond without increasing the maximum velocity to a point causing uneconomical friction head loss. A greater drawdown should not be necessary as the operation of the two plants should always be such that the amount of water passing through the turbines of the two generating stations would be approximately the same. The course of the canal would follow contour 115 along the side hill below the road. Such a canal in first cost would be considerably cheaper than a wood stave pipe of equal capacity and would involve only a fraction of the friction head loss of the wood stave pipe for such a distance as this — 8300 lineal feet. The canal would terminate in a concrete headworks on the hillside above Tidewater at approximate elevation 114.0; it would be housed and provided with the usual trash racks, ice run, gates and gate mechanism. It will have been noticed that no provision is being made in the head dam at Ruth Falls for a log chute. The intention is to bring all log drives down the canal, discharging the logs just above the headworks, by means of a motor operated log roll, into a timber sluice using just sufficient water to "grease" the steep chute, and discharging into the river just above the generating station. The headworks would be protected from bark and trash by another set of special racks. Due to the short distance from the headworks to the turbines, and also on account of the open canal, a surge tank would not be necessary according to present calculations. Also, similarly to No. 1 Tidewater development it has been recommended that the penstock instead of being the usual wood stave or steel pipe or pipes should be a permanent penstock tunnel in the form of a 12 foot diameter shaft and arched tunnel, concrete lined, running to the wall of the "transformer" house, and operating through a steel distributor to two 7-foot pipes to the two turbines. Otherwise the generating station and transformer house would be similar to that for No. 1 Tidewater development except that it is smaller with two machines instead of four of No. 1 Tidewater. Of the two stations under No. 2 Scheme, this would be the operating control. The necessary transformers would, therefore, be placed here.

Summary of Schemes Proposed

The two generating stations under No. 2 Scheme would be approximately four miles apart, with the Tidewater station as operation control and Malay Falls as water control. With both plants in operation, an addition to operating expenses would be necessary for the salary of an operating superintendent, which might be avoided under No. 1 Scheme with one development, where a chief operator would suffice. A wharf would be built on the East bank of the river, about 400 feet below the Tidewater generating station, which could very conveniently be reached by small ocean going vessels, as there is a swing span in the steel highway bridge, a mile below the wharf. The heavy machinery and transformers for the Tidewater station could be very easily handled, therefore, and at a minimum of expense. There are apparently no suitable gravel and sand available in the valley above Tidewater. At the mouth of the river estuary, it is understood that clean washed gravel and sand are available which could be taken out by steam shovel, loaded onto scows, brought up to and unloaded at the wharf, carried up the 170 ft. hill from Tidewater by an inclined hoist to storage bins, for distribution to the points where wanted. Such an arrangement would possibly prove more economical that the use of crushed aggregate, and would solve a problem of considerable consequence where larger quantities of concrete are necessary.

Turbines and Generators

With due regard to economics, it has been the endeavour to plan the development so as to obtain the maximum capacity of the river as a power producer, utilizing the whole of the gross head available between Lochaber Stillwater and Tidewater, and cutting down hydraulic losses to the economic limit. Consequently also the turbine characteristics should be arranged to obtain the highest possible efficiency — not at one particular point of the machine capacity, but through all the normal operating range. By using a high specific speed, it is possible to obtain a lower cost for generating machinery, and also a relatively high turbine efficiency, but unfortunately only over a very small range of the machine capacity, — around [illegible] per cent of that capacity, — and dropping off rapidly towards both half load and full rated load. To conserve water, we would, therefore, be inclined to sacrifice extremely high efficiency to a fairly flat efficiency curve between one half load and full load, and also so to select the number of the turbines and therefore their individual capacities that at no time would it be necessary to operate a "wheel" at less than half its rating. It has been shown that the summation of all present loads in Pictou County gives a working day load factor of 53.2 per cent. 50 per cent has been used in allowing for total machine capacity, when in the usual generating station design it is customary to use from 33 1/3 per cent to 40 per cent. It is also necessary to allow for turbine ratings to take care of short duration peaks, running 25 per cent over the average peak, and this is particularly necessary for loads such as those that would be given by the Nova Scotia Steel & Coal Company and to a lesser extent by the Acadia Coal Company and the Eastern Car Company. The generators would be rated in kilovolt amperes, at 90 per cent power factor and up to this short duration 25 per cent overload, as it is the latest practice to rate them for the maximum load carried even for short periods. The 90 per cent power factor would be gained through the utilization of the Acadia Coal Company's steam plant as a reserve, and consequent also upon arrangements proposed later incidental to hydro power being supplied that Company.

The machines to be used would then be,—

No. 1 Tidewater	— 2 — 4300 h.p. turbines.
	2 — 8000 h.p. "
	2 — 3350 K.V.A. Generators.
	2 — 6250 K.V.A. "
No. 2 Malay Falls	— 2 — 5000 h.p. turbines.
	2 — 4000 K.V.A. generators.
No. 2 Tidewater	— 2 — 7500 h.p. turbines.
	2 — 5800 K.V.A. generators.

The turbine efficiencies would approximate at least at

1/2 rated capacity	— 80.5 per cent.
5/8 " "	— 84.5 " "
3/4 " "	— 87 " "
7/8 " "	— 88 " "
Full " "	— 84 " "

and it is hoped that these may be increased materially by the use of the draft tube previously described.

The generators will be three phase, 60-cycle, 6600 volts, and with these characteristics, the generating stations will be adaptable for connection to any general system of distribution for the whole Province, and conform, therefore, to the main characteristics of the St. Margaret's Bay stations of the Commission.

Electrical System and Transmission Lines

In No. 2 Scheme, the 6600 volt current from Malay Falls station would be carried to the Tidewater control station on the poles of the main outgoing transmission lines running from the control station to Pictou County. At the control station, the current passes to the low tension busses, designed of sufficient capacity not only to carry the maximum low tension current of the two plants of No. 2 Scheme, but also that of the future West River station. Two banks of three single phase transformers would step up the voltage from 6600 volts to 44,000 volts, and with the usual protective devices, the current would pass to the transmission lines. Similarly for No. 1 Scheme except that there would be avoided the paralleling of stations necessary under No. 2 Scheme.

Referring to the general map, from present information and data it would be proposed to carry finally two aluminum circuits on one line of steel poles, following the river along the canal right of way and then practically due North on the East side of Lochaber Stillwater between Rocky and Sloane Lakes, into Pictou County, to Sunnybrae on the railway, thence along the railway right of way to Eureka, thence North, again along the railway right of way to the main terminal station in the near vicinity of the Acadia Coal Company's steam plant outside Stellarton,—making connection through transformers to the power house of the Pictou County Electric Company for the supply of power to them. Due to the use of 50-cycle current by the Acadia Coal Company, frequency changers would have to be installed, which could be reversed to turn the 50-cycle Acadia Coal Company's current into the main transmission line as necessary. The usual step down transformers would of course be present.

From the terminal station, the line would continue across country West of New Glasgow to opposite the Nova Scotia Steel & Coal Company's plant, spanning the river to a substation with transformers for the supply to Nova Scotia Steel & Coal Company and the Eastern Car Company.

From this substation a 13,200 volt single circuit will be carried back across the river, following the road on steel poles to Abercrombie Point, spanning the basin on special steel structures to an out door substation on the outskirts of Pictou, for the supply of Pictou and vicinity.

Power would be metered for sale and payment at the low tension side of the switchboards of the various substations. The total length of the line to Trenton substation would be 56 miles, and from Trenton substation to Pictou substation about 7¾ miles. Detailed surveys may modify the general route but not the main proposals.

Steam Reserve and Proposal for Prior Utilization

For supply to the Acadia Coal Company, frequency changers are proposed to be installed, which would be utilized when necessary to take power from the steam reserve.

If either No. 1 or No. 2 scheme complete were adopted, the construction period would be from 20 to 24 months.

If the Tidewater station of No. 2 scheme were initially adopted the construction period would be 12 to 15 months. From the present date, at the very best, there would be a period of two years before the advent of hydro power to alleviate the present high power cost situation. To relieve this situation during the hydro-construction period, a proposal is advanced on which a memorandum has been prepared by Professor J. F. Lumsden, Electrical Engineer to the Commission, of which the following is a synopsis,—

The Nova Scotia Steel & Coal Company has been proposing the immediate electrification of its plant, obtaining the power necessary at 60-cycles from the Acadia Coal Company's steam plant by the installation of a new 3000 kilowatt, 60-cycle steam turbine driven generator, and at the same time supplying the Eastern Car Company; 60-cycle current being used so as to conform to the hydro standard. To do this, in addition to generating machinery at 2150 volts, there would be necessary transformers at the power end from 2150 volts to say 13,200 volts, substation at Trenton to reduce to say 2300 volts, and transmission line from Stellarton to Trenton — 3¼ miles long. All of these would have to be scrapped or used elsewhere with the coming in of hydro power. It is, therefore, proposed that the Nova Scotia Power Commission proceed immediately with the installation of Stellarton, Trenton and Pictou substations, and transmission line from Stellarton to Pictou,— all of a permanent nature and of the final hydro-standard.

Without increasing total capital expenditure for the complete system, the Nova Scotia Power Commission could complete this portion earlier and supply power to consumers from the Acadia Coal Company's plant at least 12 months sooner than would be otherwise possible, and during this period prospective consumers would electrify their plants and connect to the lines, so that later with the complete hydro in operation, the initial load would be beyond the "development period" stage, in other words the usual awkward small load "development period" would be materially shortened, and during this shortened period only a small fraction of the final fixed charges would have to be carried.

The Nova Scotia Steel & Coal Company and the Eastern Car Company would also be saved a considerable capital expenditure for substations, transformers and transmission lines.

An agreement would, of course, be necessary that the Acadia Coal Company supply the Commission with all the power available over and above the requirements of the three companies.

The power available at present from the steam plant is	7000 K.W.
The present maximum demand of the three companies is, (including transmission losses)	6534 K.W.
The balance available is, therefore	466 K.W.

This is a small margin. The town of Pictou's maximum alone is 250 kilowatt, but it is hardly possible that the Nova Scotia Steel & Coal Company will draw more than a fraction of the maximum for some time after this line is in operation, so that it is estimated that the steam plant could both supply the town of Pictou's maximum demand of 250 kilowatt, the Pictou County's Electric Company's maximum of 500 kilowatt and a portion if not the whole of the smaller companies' loads, during the 12-month period before the hydro enters.

It will be noticed that the full capacity 7000 kilowatt is considered available from the steam plant, though only

Data, Capital and Operating Costs and Reductions.

the one new 4000 kilowatt machine at 60-cycle is to be installed, the remainder — 2 — 1500 kilowatt machines— remaining 50-cycle. It is hoped that the Acadia Coal Company will take the hydro power,— and that ultimately frequency changers,— consisting of synchronous motor generator sets, will be installed, allowing for the change from the hydro 60-cycle to the mine 50-cycle. If the e were installed immediately, the full 7000 kilowatt capacity would become adaptable for Pictou County. When these synchronous motor generator sets are obtained, it is proposed that the aggregate capacity be such as to carry not only the rated kilowatt load of the sets, but also sufficient reactive K. V. A. so that by their proper operation, the power factor of the transmission lines from Sheet Harbour can be maintained at 90 per cent. To do this the 60-cycle end of the sets would have to have their aggregate rating increased 1000 K.V.A. To further the proposal advanced, it is proposed to instal one at least of the two frequency changing sets at the present time, so that the full capacity of the plant may be available. It is estimated that the Acadia Coal Company's load at 50-cycle will never drop below 1500 kilowatt on the average, so that no advantage would be gained by the installation of more than one of the 1500 kilowatt sets immediately.

Capital Expenditure, Operating and Fixed Charges

The information under this heading is tabulated below. Only three arrangements are considered,—

1. No. 2 Tidewater development with complete storage, utilizing steam reserve, but with only one circuit transmission line on steel poles capable of carrying a future additional circuit.
2. No. 1 Tidewater Scheme complete with entire storage, steam reserve, and two circuit transmission on single line of steel poles.
3. No. 2 Scheme complete of two developments with storage and steam reserve and two circuit transmission.

The first division of the table shows data already referred to. It will be noted that the final capacity of both schemes is almost identical — approximately 51,000,000 kilowatt hours, also that the No. 2 Tidewater development with steam reserve and storage will supply the complete present Pictou County load.

The estimated capital expenditure with No. 1 Scheme complete costing actually $50,000 more than No. 2 Scheme complete,— but on "paper" being about $250,000 cheaper due to capitalizing of saving in operation charges.

The capital expenditures per horse power installed is shown both on the 50 per cent load factor as figured and on the usual 40 per cent, due allowance being made for additional generating machinery, enlarged water conduits, etc. It should be noticed particularly that these unit costs are closely comparable with pre-war figures in spite of the present enormously increased construction costs.

In various divisions, figures are given for initial expenditure, it being intended that no more money be invested initially than necessary to cover the initial power demand. In No. 1 Scheme — a machine would be left out,— and in both No. 1 and No. 2 complete—one circuit of the line would be held over, etc.

The next division covers annual operation and fixed charges, both final and initial,— the initial being without allowance made for the use of steam and having lessened fixed charges. The Nova Scotia Power Commission will sell power at cost but must include in this cost not only interest on the capital expenditure, but also annual sinking fund payments, and an approximate equal annual payment into a "depreciation fund" for renewals.

The next division covers the maximum sale price per kilowatt hour for various annual consumptions — progressing according to the plant capacities.

The heading describes the last division. It is felt that those customers who are sufficiently enterprising to become motorized quickly so as to avail themselves of hydro-power during the "development period", should not be penalized for those who delay. A reasonable way to affect equalization would be by deferring payments into the sinking fund during the "development period" — say three years,— during which the load would build up to its normal proportions. With an initial rate of 1.25c. per kilowatt hour, the No. 2 Tidewater plant would require a load of 19,000,000 kilowatt hours to cover the annual charges, and which it could under the worst conditions known, carry without the use of steam reserve. Similarly at 1.15c. per kilowatt hour, complete Scheme No. 1 would require a load of 27,500,000 kilowatt hours, which it could carry without the use of steam reserve.

Conclusions

1. Present steam power costs in Pictou County range from 1.65c. to 12c. per kilowatt hour without fixed charges included. The present consumption is approximately 29,500,000 kilowatt hours. Hydro-power can be furnished, at from 1.25c. to 1.15c. per kilowatt hour. This would mean a saving of $500,000 per year to Pictou County or $1350 per day.

2. During the hydro construction period a marked alleviation of high power cost conditions might be made with the adoption of the proposal advanced for prior utilization of the steam plant.

3. With no other load than that of Pictou County, it would be wisdom to proceed initially with the Tidewater plant of No. 2 Scheme, allowing for increasing demands over its capacity to be met by the installation of the Malay Falls Development, and later the West River development.

4. With an initial load in sight of 40,000,000 kilowatt hours annually, the complete No. 1 Scheme should be proceeded with, this might ultimately be increased beyond its 51,000,000 kilowatt hour capacity by the West River Development.

The writer's thanks are very much due to Professor J. F. Lumsden, acting as Electrical Engineer to the Commission, for material aid in the preparation of the original report, and also to the Nova Scotia Power Commission, through its Chief Engineer, K. H. Smith, M.E.I.C., for permission to use the matter of the original report which has just recently been submitted to the Commission.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. December 1920 No. 12

Date of Annual General Meeting

The Annual and General Professional Meeting will be held in Toronto on February 1st, 2nd and 3rd, 1921. The Annual General Meeting is announced for January 25th at Montreal, as provided in the by-laws, and will be adjourned to Toronto.

Remuneration

This is a burning subject with many members, or rather, the lack of what is considered adequate remuneration, and is the cause of considerable unrest at the moment.

Although *The Institute* Committee on Remuneration and Classification of engineers has been hard at work for some months and is being loyally supported by a number of the Branches, so many are the considerations and so varied the investigations being carried out, that it has been impossible for the Committee to complete its work and report what members of the Committee consider a satisfactory schedule. Active work is being continued however, which the profession in general and members in particular will receive with due appreciation and with the expectation that the results will be highly beneficial. The Committee on Policy has been asked to submit suggestions as to the best method of bringing into effect the various schedules which *The Institute* will adopt.

Innovation at Professional Meetings

Commencing with the annual meeting held at Ottawa the precedent of holding, in conjunction with the annual meeting, a general professional meeting, has developed a definite procedure which has already become firmly established as an attractive means of providing an interesting annual gathering.

At Montreal a year ago the large attendance and general enthusiasm made it one of the most notable gatherings that engineers have yet held in this country. At that time it was generally understood that the next annual meeting would be held in Toronto and shortly after, the proposal having been approved, the officers and members of the Toronto Branch set about planning for an even greater assembly of engineers than any previously held. A strong committee of the Branch has been hard at work for months, a partial result of which is embodied in the general tentative programme published in another column of this issue. The Toronto Branch will have entire charge of the details of the professional side of the meeting and members are assured of sessions full of interest and sufficiently attractive to justify making a long journey to be present.

A notable feature of the professional meeting and a departure from usual practice, is a division of the programme into sectional sessions, which will enable a greater number of papers to be presented and enable members to hear those in which they are most particularly interested. There will be no sectional sessions while papers of general interest are being presented.

Other details are well in hand giving promise of surpassing all previous gatherings. The Committee of the Branch having this work in hand includes: Col. H. J. Lamb, M.E.I.C., Chairman; H. L. Seymour, A.M.E.I.C., Secretary; O. M. Falls, Jr.E.I.C., Assistant-Secretary; H. G. Acres, M.E.I.C., J. R. W. Ambrose, M.E.I.C., E. T. J. Brandon, A.M.E.I.C., W. A. Bucke, A.M.E.I.C., J. B. Carswell, A.M.E.I.C., Willis Chipman, M.E.I.C., Geo. Clark, A.M.E.I.C., J. R. Cockburn, A.M.E.I.C., E. L. Cousins, A.M.E.I.C., T. L. Crossley, A.M.E.I.C.,

F. A. Dallyn, A.M.E.I.C., F. A. Gaby, M.E.I.C., Peter Gillespie, M.E.I.C., C. B. Hamilton, M.E.I.C., A. H. Harkness, M.E.I.C., H. E. T. Haultain, M.E.I.C., L. C. Krumm, A.M.E.I.C., T. R. Loudon, M.E.I.C., G. A. McCarthy, M.E.I.C., James McIlwraith, M.E.I.C., W. A. McLean, M.E.I.C., James Milne, M.E.I.C., C. H. Mitchell, M.E.I.C., P. H. Mitchell, A.M.E.I.C., T. D. Mylrea, A.M.E.I.C., J. M. Oxley, A.M.E.I.C., Stewart A. F., M.E.I.C., Wm. Storrie, M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., C. R. Young, M.E.I.C.

Thirty Fifth Annual General and Professional Meeting, Toronto

1st, 2nd, and 3rd February, 1921

The Annual General Meeting will be called in Montreal on Tuesday, January 24th, when scrutineers and auditors will be appointed after which the meeting will adjourn to meet at King Edward Hotel, Toronto, on Tuesday February 1st.

PROGRAMME

Tuesday, February 1st.

9.00 A.M.	Registration at King Edward Hotel.
9.30 A.M.	Address of Welcome.
10.00 A.M.	Calling to Order Annual Business Meeting.
12.45 P.M.	Adjournment until 2.30 P.M.
1.00 P.M.	Luncheon.
2.30 P.M.	Resuming of Annual Business Meeting. Reception of Reports: New Business, etc.
3.45 P.M.	Reception of Reports of Scrutineers.
4.00 P.M.	Address of Retiring President.
4.30 P.M.	Inauguration of Incoming President.
4.50 P.M.	Closing of Annual Meeting.
5.00 P.M.	Reception, King Edward Hotel.
8.00 P.M.	Smoker, King Edward Hotel.

Wednesday, February 2nd.

9.15 A.M.	Opening of Professional Meeting. (Sectional Sessions).
12.45 P.M.	Adjournment.
1.00 P.M.	Luncheon.
2.15 P.M.	Resuming of Professional Meeting, (General Papers).
5.00 P.M.	New Business and General Discussion.
6.00 P.M.	Adjournment.
7.30 P.M.	Annual Banquet of the Institute, King Edward Hotel.

Thursday, February 3rd.

9.30 A.M.	Excursions.
2.15 P.M.	Resuming of Professional Meeting. (General Papers).
5.00 P.M.	New Business and General Discussion.
6.00 P.M.	Closing of Professional Meeting.
8.30 P.M.	Dance to be given jointly by the Engineering Society of the University of Toronto and E.I.C. at Hart House.

Engineering Standards

The work undertaken by the Canadian Engineering Standards Association, the establishment of which is the result of the vision and enterprise of a number of members of *The Institute*, is being conducted on a basis which will in a few years enable Canada to have proper standard specifications for many phases of engineering activity for which we have heretofore been dependent upon Great Britain and the United States. One of the chief functions of this organization is to harmonize British and American engineering practice, and this offers a wide field of usefulness.

All of the standard specifications of *The Engineering Institute of Canada* have been turned over to the C.E.S.A. to be revised and brought up to date as they may require. It is intended to keep copies of the various specifications of the C.E.S.A. at the headquarters of *The Institute* for the convenience of members, as it is not intended that *The Institute* shall issue further specifications.

British Engineering Conference

Members of *The Institute* will be interested to know that during the coming summer a general engineering conference will be held at London, England, under the auspices of the Institution of Civil Engineers. An invitation to attend this gathering is embodied in a letter from Doctor J. H. T. Tudsbery, Secretary, reproduced herewith.

* * *

The Secretary,
The Engineering Institute of Canada,
176 Mansfield Street,
Montreal, Canada.

My dear Sir,

I am directed by the Council to inform you that it is proposed to hold at this Institution in the Summer of next year, probably at the end of June, another general Engineering Conference — the series of which was unfortunately broken by the European War. At these Conferences which have been generally of three days' duration, questions are introduced, with a view to discussion, on important problems of the day arising in or affecting the various departments of Engineering, including the Education and Training of Engineers and in the past these discussions have enjoyed very considerable support and success.

The Council now wish me to say to you, and through you to the members of *The Engineering Institute of Canada*, that any members of your Society who may be in England at the time of the Engineering Conference referred to are cordially invited to take part in it, and to contribute to the discussion of the subjects that may be submitted at the Conference.

I am,
My dear Sir,
Yours faithfully,
J. H. T. TUDSBERY,
Secretary.

The Institution of Civil Engineers,
Great George Street, Westminster, S.W.I.
29 October, 1920.

Engineers' Extending Influence.

It was been claimed in the past, that one of the greatest features in the failure of the engineering profession to exert a proper influence outside its own sphere has been due to unwillingness to take part in activities outside the immediate work of the profession. The importance of the engineer as a factor in the industrial, economical and even social life of the nation is neither known or appreciated to any extent outside his own profession. While the charge that engineers have not interested themselves in other activities may be true of a large number, there are many in the profession whose public spiritedness and active participation in all worthy causes is not surpassed by the members of any of the other learned professions, and in proportion to the extent that this becomes true or otherwise, of the great majority of the profession will our influence broaden or merely continue to increase at a slow rate.

There are hundreds of men in *The Engineering Institute of Canada* capable of writing authoritative editorials on the many phases of the profession's activities wherein the general public is affected, which would be quoted by the daily press throughout the land. If each branch of *The Institute* would undertake two such editorials a year, there would thus be three available for each issue of *The Journal.* By sending galley proofs of these to the various newspapers for reproduction and comment, there would result a much greater interest in the profession on the part of the public.

Some of our members are doing splendid work in contributing on subjects affecting social matters. In this connection it is timely to point out that the title of a corporate member of *The Institute* represents a standing in the profession and should be used by all members when contributing articles. The November issue of "Social Welfare" the organ of the Social Service Council of Canada, is a striking example of the manner in which engineers are taking a prominent part in discussing social problems. In this issue appear articles by four members of *The Institute:* "The Protection of the Family Shelter by Statute", by H.L.Seymour, A.M.E.I.C., "Private Ownership and Municipal Politics versus Public Enterprise in the Housing Problem", by F. A. Dallyn, A.M.E.I.C., "Modern Living Conditions and the Play of the People", by A. G. Dalzell, A.M.E.I.C., and "A National Solution of the Housing Problem", by C. J. Yorath, M.E.I.C. The work of our members in this direction will no doubt be an incentive to others to similar efforts, and thus continue to extend the influence of the profession.

Meeting of the Main Committee of the Canadian Engineering Standards Association

A meeting of the Main Committee of the C.E.S.A. was held in Ottawa on November 8th, the following members being present: H. H. Vaughan, M.E.I.C., Chairman; Dr. E. Deville, A. A. Dion, M.E.I.C., Prof. L. W. Gill, M.E.I.C., Dr. L. A. Herdt, M.E.I.C., Col. W. J. Keightley, Dr. J. B. Porter, M.E.I.C., Dr. A. B. Macallum and R. J. Durley, M.E.I.C., Secretary.

In accordance with Minute No. 75, the Executive Committee recommended the re-nomination of Dr. Porter as nominee of the Institution of Civil Engineers, and A. Boyer as nominee of Laval University. These recommendations were unanimously approved, and Dr. Porter was re-appointed on the Executive Committee.

Distinctive Mark of the Association

The Secretary reported that, in the opinion of the Registrar of Trade Marks, the Association cannot register its distinctive mark as a trade mark, as the Canadian Trade Marks Act makes no provision for the registration of collective trade marks, or trade marks other than those intended to identify the product of a single firm or organization. It would thus appear that if no special steps are taken the use of the Association's distinctive mark will only be protected to the extent that, if applied to an article not in accordance with C.E.S.A. Specifications, such application would constitute a false trade description, and the parties so using the mark would be liable accordingly on action being taken by the purchaser.

Considerable discussion took place, and it was suggested by Dr. Herdt that the distinctive mark of the Association might possibly be registered as a label in a somewhat similar manner to that of the Pulp and Paper Association, being used on the letterheads and publications as well as on articles purporting to be in accordance with C.E.S.A. Specifications. The Secretary was requested to see the Registrar of Trade Marks again regarding this matter and report further. In the meantime, the use of the distinctive mark on letterheads and title pages was authorized with a view of bringing the mark so far as possible to the knowledge of the public.

Nomination of Member of Main Committee by Board of Railway Commissioners

Regarding the suggestion that the Board of Railway Commissioners should be asked to nominate an *ex-officio* member on the Main Committee in the same way as is done by other important Government Departments, this was unanimously approved, and the Secretary was directed to write to the Board accordingly.

Report re Sectional Committee on Rail and Track

The Chairman, J. M. R. Fairbairn, M.E.I.C., reported that at a recent meeting of this Committee, it was decided that since important action on the part of the A.R.E.A. was shortly expected, it was desirable for the Sectional Committee to be informed as to the policy of the A.R.E.A. before drafting its own specification, and such information was accordingly being awaited.

Report re Sectional Committee on Wire Rope

The two Sub-Committees on Wire Rope have not yet been able to meet, but a draft Specification has been prepared and is under consideration and criticism by all members of both Sub-Committees. It is expected that arrangements will shortly be made for a joint meeting of both Sub-Committees, at which members' comments will be considered.

Specifications now in force in Canada for wire strand have been collected and tabulated, and the work of the Sub-Committee is proceeding.

Report re Sectional Committee on Steel Bridges and Construction

The Secretary reported that the Specification for Steel Railway Bridges prepared by this Sub-Committee has been published and is available for distribution. A considerable number of free copies have been sent out, and the specifications for bridge material have been published as a separate pamphlet.

The personnel of this Sub-Committee has been appointed, and preliminary information has been gathered in preparation for the first meeting, which it is hoped will shortly be held. Various suggested amendments to the E.I.C. Specification are being circulated amongst members for their consideration.

Report re Electrical Sectional Committee

Dr. Herdt reported that two meetings of the Special Committee on Canadian Electrical Code had been held, and laid its Report before the Main Committee for action.

Letters from F. A. Gaby, M.E.I.C., J. M. R. Fairbairn, M.E.I.C., and other members of the Main Committee not present, were presented in this connection, expressing approval of the Special Committee's Report, and a full discussion took place, especially with regard to the answers given by the Special Committee to the various questions embodied in their Terms of Reference.

On the motion of Dr. L. A. Herdt, M.E.I.C., seconded by Professor L. W. Gill, M.E.I.C., the Report of the Special Committee was unanimously adopted, and it was accordingly resolved that the formulation of specifications relating to the proper construction, methods of testing, and approval of appliances, fittings and materials used in connection with interior installations should be first dealt with, as it was felt that this work would be a necessary preliminary to the consideration of installation rules. It was further decided that a Sub-Committee should be formed to work under the Electrical Sectional Committee, and to undertake the work as recommended in the Special Committee's Report.

On the motion of Professor Gill, seconded by Colonel Keightley, it was unanimously resolved that the formation of a Sub-Committee should be proceeded with, with membership generally in accordance with the Report of the Special Committee.

The Chairman of the Electrical Sectional Committee presented for final approval the Report of the Sub-Committee on Transformers dealing with Single-phase Distribution Transformers. Dr. Herdt stated that the Electrical Sectional Committee desired the attention of the Main Committee to be drawn to the fact that this document embodies the decisions reached by representatives of the leading transformer makers and users in Canada as to certain points in transformer construction in regard to which agreement was very necessary. The document is, however, not a complete specification, inasmuch as it does not deal with many points of transformer construction in regard to which the practice is already standardized or as to which no agreement is at present likely.

After discussion, during which hearty appreciation of the work carried out by the Sub-Committee on Transformers was expressed, it was resolved on the motion of Mr. Dion, seconded by Professor Gill, that the Report of the Sub-Committee on Transformers, dated July 13, 1922, as forwarded through the Electrical Sectional Committee, be approved, and that the Secretary be directed to arrange for its publication and issue, the title as presented being changed to read as follows: "Standard Requirements for Single-Phase Distribution Transformers." It was further decided that the Report when published should include the necessary lists of Committees concerned, and should also include a brief preface describing its origin and preparation.

One meeting of the Sub-Committee on Incandescent Lamps has been held. The general scheme of the proposed specification has been outlined and individual points of importance are being studied by small panel committees in preparation for the next meeting of the Sub-Committee.

A draft specification has been prepared for Telegraph and Telephone Wire in accordance with the recommendations of the meeting of 12th March, and has been circulated to the members. Their comments and replies will be considered at the next meeting of the Sub-Committee which it has been impossible to arrange for earlier, as a number of the members are away on construction work during the Summer, but which has been called for the 17th inst.

On a recommendation of the Electrical Sectional Committee, at its second meeting on September 20th, the formation of a Sub-Committee on Wood Poles for Transmission Lines with the following membership was unanimously authorized:

Chairman: G. E. Templeman, chief engineer, Electrical Commission of City of Montreal;
E. T. J. Brandon, A.M.E.I.C., Hydro-Elec. Commission, Toronto;
A. A. Dion, M.E.I.C., Ottawa Electric Co., Ottawa;
W. J. Duckworth, G.N.W. Telegraphs, Toronto;
J. G. Glassco, M.E.I.C., Winnipeg Light & Power Dept.;
H. Hulatt, G.T.R. Telegraphs, Montreal;
L. A. Kenyon, A.M.E.I.C., Montreal Light, Heat & Power Consolidated, Montreal;
J. McMillan, C.P.R. Telegraphs, Montreal;
W. H. Winter, Bell Telephone Co., Montreal;
W. R. Warren, A.M.E.I.C., Saskatchewan Government Telephones, Regina;
Nominees of
Alberta Government Telephones,
Manitoba Government Telephones,
N.B. Telephone Co.,

Maritime Telephone & Telegraph Co.;
C.N.R. Telegraphs;
Toronto & Niagara Power Co.;
Dominion Power & Transmission Co.;
B.C. Electric Co.;
Canadian Electrical Association;
Canadian Lumbermen's Association, and
Winnipeg Electric Railway Co.

It was decided, in accordance with the original suggestion of the officers of the Hydro-Electric Power Commission, and in accordance with the views of the Electrical Sectional Committee, that the Sub-Committee should be asked to consider the possibility of drawing up Canadian specifications for the purchase of wood poles for transmission lines and also for their preservative treatment, and if thought desirable, should proceed to draft these specifications.

In accordance with a recommendation of the Electrical Sectional Committee at its second meeting on September 20th, the formation of a Sub-Committee on Watt Hour Meters was unanimously authorized, with the following membership:

Chairman, Prof. L. W. Gill, M.E.I.C. Dept. of Labour, Ottawa; P. A. Borden, Hydro-Elec. Commission, Toronto;
R. J. Cochrane, City Electrician, St. John;
A. G. Grier, Can. General Electric, Toronto;
E. Holder, Shawinigan Water & Power Co., Canadian Electrical Ass'n.;
S. L. B. Lines, Chamberlain & Hookham Meter Co.;
Scott Lynn, Sangamo Meter Co.;
E. G. Ratz, Can. Westinghouse Co.;
E. J. Turley, A.M.E.I.C., Montreal Light, Heat & Power Co.;
J. H. Trimingham, A.M.E.I.C., Southern Canada Power Co.;
F. T. Wigman, Packard Electric Co.
Nominees of:
Electric Inspection Branch, Dept. of Trade & Commerce;
Can. Associated Mfgrs. of Elec. Supplies;
Ass'n. of Mun. Elec. Utilities of Ont.;
Ferranti Meter & Transformer Mfg. Co.;
Toronto & Niagara Power Co.;
City Electrician, Winnipeg.

It was further decided, in accordance with the original suggestion of the Canadian Electrical Association, that the Sub-Committee on Watt Hour Meters be requested to consider the advisability of preparing specifications for Watt Hour Meters.

Sectional Committee on Steel

The Special Committee on Steel Forgings, under the Chairmanship of G. D. Macdougall, M.E.I.C., has sent a questionnaire to a number of firms and parties interested and the replies are now coming in.

Sectional Committee on Cement and Concrete

The Secretary reported that the Sectional Committee had held its first meeting in Toronto on November 5th, at which the organization work had been completed.

The Secretary of the Sub-Committee on Cement reported a communication from the Chairman of the Sectional Committee advising that he had requested Professor E. Brown, M.E.I.C., to take the chairmanship of the Sub-Committee, but that no final answer had yet been received, and that if Professor Brown found himself unable to undertake the work, Professor Peter Gillespie, M.E.I.C., would himself act as Chairman.

The Committee expressed approval of Professor Gillespie's action, and approved his appointment as Chairman of this important Sub-Committee, in case Professor Brown cannot take the position.

Sectional Committee on Machine Parts

The Secretary of the Sub-Committee on Gearing reported that this Sub-Committee had presented for consideration, through Mr. Goldie, the Chairman of the Sectional Committee. a report, but that since receiving this communication, C. B. Hamilton, M.E.I.C., had written stating that the A.G.M.A. would probably recall the standard in question for some slight modification. In view of this and in order to give an opportunity for the matter to come before the C.E.S.A. through the American Engineering Standards Committee, it was decided that no action was advisable at present.

Adoption or Approval of Standards

Discussion followed as to the general policy to be pursued by the Association in regard to the adoption or approval of standards formulated by standardization authorized outside of Canada, as to whether these should be formally adopted, re-printed with permission, and published by the C.E.S.A., or whether they should simply be approved, and announcements, periodical or otherwise, issued advising the public of this fact, giving a general idea of the standards so approved, and referring to the original source for further information. No definite decision was reached, the opinion of the Committee being that each case would probably have to be decided upon its merits.

Sectional Committee on Mining Machinery

Sub-Committee on Mining Drill Chucks and Steel

The Committee felt that in view of the importance of this subject at the present time, it was desirable that the work of the Sub-Committee should be proceeded with with as little delay as possible. The Chairman of the Sectional Committee undertook to confer with the Chairman of the Sub-Committee regarding this matter.

Standardization Rules for Electrical Machinery

Professor Gill drew the attention of the Committee to the British Standardization Rules for Electrical Machinery as revised September 1917, and to the Standardization Rules of the American Institute of Electrical Engineers, as revised 1918, pointing out that while these Rules were in many respects in accord, they were not completely so, and that the latter had received very wide acceptance in Canada. Professor Gill pointed out that the A.I.E.E. Standardization Rules were, as a matter of fact, referred to in several places in the C.E.S.A. Committee's Report on Distribution Transformers and that certain of these provisions would undoubtedly have great influence on the work of many of our Electrical Sub-Committees.

The formation of this Sub-Committee on Standardization Rules for Electrical Machinery was unanimously approved, and the Chairman of the Electrical Sectional Committee was requested to nominate its members, such nominations to be subject to the approval of the Main Committee before becoming effective.

International Aircraft Standards Commission

The Secretary reported that a Convention regarding this Commission is to be held in Paris in November, and, with the approval of the Air Board, a request has been addressed to Air Commodore R. K. Bagnall-Wild, Director of Inspection, Air Ministry, who will be one of the British Delegates, to represent the interests of the Canadian Government and of the Canadian members of the various Advisory Committees of the Commission. It is understood that at this meeting the United States will be for the first time be among the countries represented, and that the future status and activities of the Commission, together with its relation to any technical commissions or bodies operating under the Air Convention, will be thoroughly worked out.

Representation of Air Board on Main Committee

The Secretary reported to the Main Committee the correspondence with the Air Board regarding its nomination of an *ex-officio* member on the Main Committee, a letter dated November 3rd, 1920, having been received requesting the appointment of Lt.-Col. E. W. Stedman, Director of Technical Staff, Air Board. Col. Stedman's nomination was welcomed, and his appointment as *ex-officio* member of the Main Committee was unanimously approved, such appointment to continue during the pleasure of the Air Board.

Engineering Institute of Canada

A letter from the Council of *The Engineering Institute of Canada*, dated October 27th, was laid before the Committee, in which it is suggested that certain changes be made in the E.I.C. Specification for Roadbed and Ballasting. As at the third meeting of the Main Committee, this Specification was considered, and it was decided at that time no action was advisable, the Secretary was directed to communicate with the Secretary of the E.I.C. informing him that while it was not considered advisable to proceed with the revision of this specification at the present time, the suggested amendment would be brought to the attention of any committee which might be in future appointed to deal with the question.

The Secretary reported receiving a communication from the E.I.C. forwarding an appeal from the American Institute of Weights and Measures inviting action in opposition to the compulsory adoption of the metric system. The Secretary's reply to this was approved.

American Engineering Standards Committee

The Secretary reported that various activities of the A.E.S.A. are of interest to our Main Committee as involving possibilities of co-operation. Among these may be mentioned the formulation of a national electrical code covering both life and fire hazard, the possibility of adopting or approving the American standards on reports, gearing, the preparation of Anglo-American Standards for structural steel sections, etc.

Attention was drawn to an interesting feature of the A.E.S.C. work, the system of group representation. For example, the Electrical Manufacturers Council has been admitted to representation on the Main Committee of the A.E.S.C. and comprises the Electric Power Club, the Associated Manufacturers of Electrical Supplies, and the Electrical Manufacturers' Club. Similarly the Fire Protection Association, the National Board of Fire Underwriters, Underwriters' Laboratories, and the Associated Factory Mutual Fire Insurance Company. The Committee was of opinion that possibly, as the work of the C.E.S.A. develops, some arrangement of this kind might be found advantageous, although it is not clear how it could be carried out without a modification of the Charter.

Discussion followed as to the course to be pursued in cases where co-operation with the A.E.S.C. appeared desirable, but where divergence from the American practice appeared necessary in order to suit Canadian conditions, and it was considered that in such cases complete independence of specifications would be essential.

European Standardization Bodies

The Secretary reported that in accordance with the decision of the Executive Committee, correspondence has been initiated with the following with a view to the exchange of publications and information:

Belgium, Association Belge de Standardisation, Brussels;
France, Commission Permanente de Standardisation, Paris;
Holland, Central Normalisatie Bureau, Delft;
Sweden, Sveriges Maskinindustrieforening, Stockholm;
Italy, Comitato Generale per l'Unificazione nell' Industria Meccanica, Milan;
Switzerland, Standards Committee, Verein Schweizerischer Maschinen-Industrieller, Baden.

Cordial replies have been received from Belgium, Sweden, Switzerland and Italy.

Financial Statement

The Meeting concluded with the appointment of auditors and the presentation of the financial statement to October 31st 1920, the latter being approved.

CORRESPONDENCE

Importance of Physicists Recognized

Editor:—*Journal.*

In a recent Number of *The Journal* of *The Engineering Institute of Canada*, there is an interesting article by Professor A. S. Eve of McGill University.

The new course at McGill described by Professor Eve is only one indication of the tremendously increased prestige that physics has gained during the last few years. Many other indications of this might be cited but at this time I wish merely to point out that Professor Eve was in error when he stated that this course was a new venture in any university. There has been a similar course in the Massachusetts Institute of Technology for a number of years. Also such a course was adopted by the Faculty of Applied Science at Queen's University two years ago and students have already graduated in the work of this course and a number of others are enrolled in the course.

We anticipate that the growing need for physicists in Canada will be met, partially at least, by the adoption of this course. It is expected that the majority of those who graduate will undertake post-graduate work later.

Yours very truly,

A. L. Clark, A.E.I.C.

Editorial Note

In speaking of the course in engineering physics at McGill University as a new venture, Dr. Eve had reference to the fact that for the first time there has been established a five year course in Engineering Physics leading to the degree of M.Sc. combining a high standard of Honour Mathematics and Physics with a sound training in Electrical Engineering.

* * *

Addresses Wanted

The records of *The Institute* show that the present addresses of the following members are missing. It is highly desirable that as many of these addresses as possible be in the hands of the Secretary.

Members

Arendt Angstrom	Sir Chas Hartley
J. W. Astley	Ed. A. Hebert
A. E. Ashcroft	Ira G. Hedrich
John R. Barlow	Robt. E. Hunter
W. W. Bell	Adolphe Jacquemart
F. F. Busteed	R. R. Keely
C. M. Caniff	B. B. Kelliher
Cyrus Carroll	L. R. Ord
Oscar Englund	J. N. C. Patton
J. P. E. Eude	E. H. Pierce
E. A. Forward	W. J. Press
Chas. Garden	B. J. Saunders
F. J. George	Owen W. Smith
John H. Gray	P. W. Sothman
	Robt. C. Stewart

EMPLOYMENT BUREAU

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Vacant

Young Industrial Engineers

Manufacturing firm has openings for prospective industrial engineers. Successful applicants would undergo course of intensive training for about six months. Expenses paid during period of instruction. Sound knowledge of industrial and economic principles required. Age, under 27 years. Box 180.

Engineer for Pulp and Paper Company

Paper Mill in Western Ontario requires 1919 or 1920 graduate to act as assistant to resident engineer. Mechanical graduate preferred but this is not essential. Duties partly draughting, otherwise general work in connection with alterations and additions proposed. Excellent opportunity to become familiar with Paper Mill Engineering. Good opportunities with company for advancement both in engineering and operation. Salary $150.00 to $200.00 per month depending on qualifications. Apply Box 182.

Mechanical Engineer

Wanted, a mechanical engineer, either travelling extensively or with good connections, to handle machinery, plant, etc., on commission. Box 183.

Draftsman

Draftsman for municipality in Quebec, preferably speaking French and English. Salary $30 per week. Box 184.

Electrical Draftsmen

Station layout electrical draftsmen for Ontario, should have experience in station layout, preferably with knowledge of electrical construction work. Permanent position. Salary $150 to $200. Box 185.

Land Surveyor

A young Ontario Land Surveyor with registered certificate, preference will be given the applicant who is also a graduate of a recognized Engineering School. Application must be in by December 1st, 1920.

Apply: E. R. Gray, City Engineer, Hamilton, Ont.

Hamilton, Nov. 18th, 1920.

Civil Service of Canada

The Civil Service Commission of Canada hereby give notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

Patent Examiner Mechanical Engineering

Patent Examiner, Mechanical Engineering, at an initial salary of $1,980 per annum which will be increased upon recommendation for efficient service at the rate of $180 per annum until a maximum of $2,800 has been reached. This initial salary will be supplemented by the bonus provided by law.

Note.—Patent Examiners appointed to act as members of a board of five to advise the Chief of Patent Office in the hearing of appeals, shall receive an additional salary of $20 per month while so appointed.

There is one vacancy at present in this class in Examiner's Division, of the Patent and Copyright Office, Ottawa.

Assistant Engineer

An Assistant Engineer at an initial salary of $2,100 per annum which will be increased upon recommendation for efficient service at the rate of $120 per annum until a maximum of $2,580 has been reached. This initial salary will be supplemented by whatever bonus is provided by law.

The only vacancy at present in this class is at Cornwall, Ontario, in the Ontario–St. Lawrence Canals Branch, Department of Railways and Canals.

Research Engineer

A Research Engineer, Natural Resources Intelligence Branch, Department of the Interior, Ottawa, at an initial salary of $1,800 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,280 has been reached. This initial salary will be supplemented by whatever bonus is provided by law.

Duties.—Under direction, to make research investigations relating to the natural resources of the Dominion; to write articles for publication; to devise promotional plans for developing public interest in natural resources, and to perform other related work as required.

Dominion Analyst

A Dominion Analyst at an initial salary of $1,800 per annum, to be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,400 has been reached. This initial salary will be supplemented by whatever bonus may be provided by law.

Duties.—Under direction, to make chemical, physical, and microscopical examinations and analyses of foods, drugs and fertilizers for the purpose of administrating legislation affecting the adulteration and standards of commercial products; and to perform other related work as required.

PERSONALS

George Phillips, A.M.E.I.C., is now with the Department of Naval Service, Ottawa.

G. D. MacKinnon, A.M.E.I.C., has been elected president of the Rotary Club at Sherbrooke, Que.

N. C. Cameron, A.M.E.I.C., has accepted a position with the Imperial Tobacco Company of Canada Ltd., Montreal.

H. W. Tate, A.M.E.I.C., has accepted a position with the Toronto Transportation Commission, Kyle Bldg., Toronto.

G. W. F. Ritson Evans, A.M.E.I.C., is at present with the Great Eastern Paper Co., Ltd., River Madeleine, Gaspe, Que.

Geo. Hull, A.M.E.I.C., has accepted an appointment with the Mesopotamian Government on irrigation development.

Arthur Fairbairn Smith, S.E.I.C., formerly of Chicago, is now production engineer of the McKinney Company, Evanstown, Illinois.

G. S. Conway, A.M.E.I.C., has recently sailed for England, and will be resident for some time in [illegible]-on-Tyne, Durham, England.

F. A. Dallas, A.M.E.I.C., has been appointed secretary-treasurer of the Automatic Telephone and Time Recorders Ltd., Toronto.

H. H. Pinch, A.M.E.I.C., formerly with Harstone Bros., Winnipeg, is now with the Grand Trunk Rly., Valuation Commission, Montreal.

G. M. Thorpe, S.E.I.C., has accepted a position with the International Nickel Co., of Canada, Ltd., as assistant surveyor, at Creighton Mine, Ont.

Thomas W. McMillen, A.M.E.I.C., has been appointed rating engineer Pennsylvania Compensation Rating & Inspection Bureau, Harrisburg, Pa.

L. T. Rutledge, A.M.E.I.C., has been recently appointed assistant professor of mechanical engineering, Queens University, Kingston, Ont.

J. H. Hooper, A.M.E.I.C., formerly of Port Colborne, has been appointed chief engineer for the Standard Steel Construction Co., Ltd., Welland, Ont.

*

Gerald O. Case, A.M.E.I.C., formerly vice-president of the Tidal Engineering Corporation, New York, is now with the F. W. Loughran Co., New York.

*

E. V. Deverall, A.M.E.I.C., has been temporarily transferred from the Toronto office to the Montreal office of the Dominion Bridge Co., Ltd., Lachine, Que.

*

U. R. Moore, Jr.E.I.C., formerly with the Chase Tractors Corp'n Ltd., Toronto, has accepted a position with the Toronto Harbour Commissioners, Toronto, Ont.

*

J. W. Porter, M.E.I.C., formerly with the Canadian National Railway, Winnipeg, is at present engaged with the Grand Trunk Railway Arbitration Commission, in Montreal.

*

M. L. Walker, Jr.E.I.C., formerly with the Brompton Pulp and Paper Co., has accepted a position in the engineering department of the Imperial Oil Co., Ltd., at Sarnia, Ont.

*

Fred. H. McKechnie, A.M.E.I.C., has been appointed vice-president of the Engineering Equipment Co., Ltd., this company has been organized recently to deal in mining and industrial machinery.

*

Chas. Robertson, A.M.E.I.C., recently severed his connection with the Department of Railways and Canals, joining the firm of Schultz Co., Ltd., manufacturers, builders and contractors, Brantford, Ont.

*

C. Collingwood, A.M.E.I.C., late of Kamloops, and until recently with the Irrigation Department of Public Works in Mesopotamia, has accepted a position with Messrs. Wilkinson & Son, London, England.

*

Major G. R. Turner, A.M.E.I.C., formerly of Fredericton, N.B. is at present taking a two year course of military engineering in England, and is stationed at Brompton Barracks, Chatham, England.

*

R. F. Hayward, M.E.I.C., formerly general manager of the Western Power Co., of Canada Ltd., Vancouver, B.C., has resigned his position to accept that of general manager of the Chilean Rly. & Light Co., Santiago, Chile.

*

W. B. McDonald, M.E.I.C., has resigned his position as chief engineer for the town of Barrie, to accept a position as resident engineer with the Department of Public High ways of Ontario, with charge of the Hamilton, London section.

*

E. S. Winslow, A.M.E.I.C., has recently been appointed general sales manager, Canadian Ingersoll-Rand Co., Ltd. Mr. Winslow has been assistant to the general manager of the same company for the last five years, and had an important part in this firm's munition production during the war.

Norman M. Campbell, A.M.E.I.C., has been appointed president of the Engineering Equipment Co., Ltd., which has been organized to deal in mining contracting, and industrial machinery and supplies. He was formerly general sales manager of the Canadian Ingersoll-Rand Co., Ltd., more recently sales manager of the General Combustion Co., Ltd., Montreal.

*

Awarded Telford Medal

P. L. Pratley, M.E.I.C., has been awarded the Telford Gold Medal of the Institution of Civil Engineers (Great Britain) for his paper "The Design and Erection of St. John Arch", upon which honour he is receiving the hearty congratulations of his fellow-engineers.

P. L. PRATLEY, M.E.I.C.

Mr. Pratley was born in Liverpool, England, in 1884 and was educated in the same city, graduating from the University of Liverpool as Bachelor of Engineering, later taking the degree of Master of Engineering. After coming to Canada Mr. Pratley was for some time draughtsman with the Locomotive and Machine Company of Montreal, later joining the staff of the Dominion Bridge Company, Limited. Specializing in bridge design, Mr. Pratley was engaged by the Government Board of Engineers for the Quebec Bridge; later he was designing engineer for the St. Lawrence Bridge Company, also in connection with the Quebec Bridge. In Dec. 1910, Mr. Pratley was appointed assistant designing engineer, Dominion Bridge Company. In addition to his connection with the design of important bridges Mr. Pratley has had charge of design of several large steel structures. Besides to being a Member of *The Engineering Institute* he is a Member of the Institution of Civil Engineers.

LIBRARY NOTES

Correction

On page 556, November Journal reference was made to new Specification for Steel Highway Bridges issued by the Canadian Engineering Standards Association, this should have read "Specification for Steel Railway Bridges."

Journal of the Town Planning Institute of Canada

The first number of the Journal of the Town Planning Institute of Canada has just been received. The Institute, which includes many members and associate members of *The Engineering Institute of Canada*, has for objects both the study of civic design and the training of town planners; this interesting journal will be of value in knitting together the membership from coast to coast. The first number is introductory, explains the objects of the publication and contains a number of reports of interest to the town planning brotherhood. The editor, Alfred Buckley, M.A., Town Planning Branch, Commission of Conservation, Ottawa, is to be congratulated on this first number of what promises to be a valuable addition to the technical publications of the Dominion.

OBITUARIES

Stanley A. Button, A.M.E.I.C.

Stanley A. Button, A.M.E.I.C., who died August 2nd, 1920 at Brandon Hospital, was born at Forest Gate, Essex, England, November 1881, and served his time as articled pupil to J. Ashby & Company, engineers and contractors, Lowestoft, England. For four years following 1903, Mr. Button was with W. Patterson Ltd., engineers and railway contractors of London, England, as assistant estimator and supervisor of works in the London district. Coming to Canada in July 1907, Mr. Button was successively, instrumentman with the Manitoba Government Telephone Conduit System, and resident engineer in charge drainage district number 5 and 8, Manitoba Government. In 1912 Mr. Button was appointed engineer on the Manitoba Good Roads staff; in 1914 he was appointed district engineer in charge of the Varden Good Roads Board of Manitoba, comprising 84 Townships. During his connection with the Good Roads Board Mr. Button prepared systems and repairs on work amounting to $140,000,000 of reinforced concrete bridge culverts. Mr. Button was elected an Associate Member of *The Engineering Institute of Canada* on May 21st, 1918.

The late Charles LeBaron Miles, M.E.I.C.

BRANCH NEWS

Halifax Branch

F. R. Faulkner, M.E.I.C., Secretary-Treasurer

The regular November meeting of the Halifax Branch was held at the Green Lantern, Wednesday, November 17th. In the absence of C. E. W. Dodwell, M.E.I.C., Chairman of the Branch; F. A. Bowman, M.E.I.C., presided.

No formal paper had been prepared for the meeting and the evening was spent in an animated discussion of fees and salaries in the engineering profession. The Secretary read extracts from reports of Committees of other Branches and of other organizations in order that the members could form an idea as to what had already been done.

The discussion was participated in by the majority of those present, and it was evident that the consensus of opinion was in favor of taking some official action. Accordingly, on motion of Messrs. Allen and Rodger, a committee of five was appointed to bring in a report on a classification of Engineers on which a schedule of salaries and fees could be based. The committee was then elected by ballot as follows:

F. R. Faulkner, M.E.I.C., F. W. W. Doane, M.E.I.C., Ira P. MacNab, M.E.I.C., W. A. Winfield, M.E.I.C., A. F. Dyer, A.M.E.I.C.

They were instructed to have a preliminary report ready for the next meeting. The meeting then adjourned.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer

Fraser S. Keith's most interesting address delivered at the formation meeting of the Moncton Branch has incited an interest in *The Institute* as well as our Branch which will be sure to bear fruitful results and a number of engineers have signified their intention of joining at an early date.

The regular Monthly Meeting was held in the City Hall on November 4th and great interest was manifested by those present, numbering about twenty-five. It was decided to hold meetings twice a month and alternate meetings to take the form of a Luncheon at which outside speakers would be invited to give short addresses. A Committee of five were appointed to work with the Executive to select a programme for the future meetings. The five elected were Messrs. A. F. Stewart, M.E.I.C., F. B. Tapley, M.E.I.C., F. Williams, A.M.E.I.C., K. S. Pickard, A.M.E.I.C. and W. B. MacKenzie, M.E.I.C. These Members met with the Executive on November 8th and selected an Entertainment Committee of three, composed of R. McManus, A.M.E.I.C., Chairman, J. Whitelaw, A.M.E.I.C. and E. G. Evans, M.E.I.C., and a Papers Committee of five composed of R. G. Gage, M.E.I.C., Chairman, F. B. Tapley, M.E.I.C., K. S. Pickard, A.M.E.I.C., W. B. MacKenzie, M.E.I.C., and F. Williams, A.M.E.I.C. These Committees are to arrange the programme of future meetings and there is no doubt that our Branch will forge ahead being in such capable hands.

*

A. F. Stewart, M.E.I.C., formerly of the Toronto Branch is now located in Moncton, holding the position of chief engineer of the Canadian National Railways, and will be a most valuable acquisition to our Branch. He has manifested a deep interest at our meetings, and what will be Toronto's loss will undoubtedly be our gain.

*

C. B. Brown, M.E.I.C., formerly located at Moncton as chief engineer, Canadian National Railways, has been promoted to the position of engineering assistant to the vice-president, Can. Natl. Rlys., and will have his headquarters at Toronto. While his departure will be regretted by all, still, his well earned promotion is deservedly popular. Mr. Brown has always taken a very keen interest in all matters relating to the engineering profession and was elected Vice-President of the Professional Engineers Association of New Brunswick at their first meeting. Mr. Brown leaves Moncton for his new field of endeavours with the best wishes of all. Prior to his departure for Toronto his staff presented him with a silver tea and coffee service, the following address being read by J. S. O'Dwyer, M.E.I.C.:—

Moncton, N.B.,
November 18th, 1920.

C. B. Brown, Esq.,
Late Chief Engineer,
Canadian Government Railways,
Moncton, N.B.

Dear Mr. Brown:—

On this, the eve of your departure to a larger sphere of action at the Head-quarters of the Canadian National Railway, we, your former employees in the Moncton Offices, wish to express to you our unfeigned regret at losing you as our Chief,—your gain is certainly our loss,—and to tender you our most sincere congratulations on your preferment. The past seven years under your supervision will ever remain a pleasant memory with us.

We feel that we may, in your case, fittingly quote from the tablet to the memory of the celebrated Architect of England's Valhalla—

"If you would see his monument, look about you".

Will you kindly accept, for yourself and your charming consort, the accompanying souvenir, with our very best wishes to you, Mrs. Brown and family, for health and happiness in your new home.

Signed on behalf of the Staff."

Mr. Brown in a few well chosen words thanked the Staff for their gift and good wishes.

*

Dr. Martin Murphy, M.E.I.C., a Member of the Ottawa Branch, and formerly consulting engineer of Canadian Government Railways and a past president of *The Institute* spent a few days in Moncton lately, visiting his son, M. J. Murphy of the Moncton Branch.

*

Reid McManus, A.M.E.I.C., Member of the Executive Committee of the Moncton Branch, resigned his position as a Member of the Hydro-Electric Power Commission of New Brunswick to accept the nomination as Member for Westmorland County in the Provincial Legislature and was successful in his election polling a very large vote. It might further the interests of the Engineering Profession if more Members would taken an active part in our politics.

St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

A regular meeting of the St. John Branch was held in the Old Post Office Building, Nov. 11th., C. C. Kirby, M.E.I.C., occupied the chair and twenty-four members were present.

The Advertising and Employment Committees reported activities. The Civic Centre Committee which was appointed to aid the Municipality in taking definite steps towards the erection of new City Buildings, reported that the preparation of preliminary plans was well advanced, that the Municipality has voted $1500 for competitive plans, a call for which would be made on information gathered by this committee and approved by the Municipal Council.

The Concrete in Sea Water Committee reported having completed the casting of test blocks and the placing of these in the water for observation.

A Committee consisting of G. H. Waring, M.E.I.C., R. H. Cushing, M.E.I.C., C. L. Archibald, A.M.E.I.C., and A. G. Tapley, A.M.E.I.C., was appointed to interview the School Board and Council on the inadvisability of using an area set out for a Public Square for the location of a new school building in West St. John.

An Entertainment Committee consisting of G. N. Hatfield, A.M.E.I.C., A. G. Tapley, A.M.E.I.C., G. G. Murdoch, M.E.I.C., Jas. Gilchrist and D. L. Hutchinson, was appointed to assist in the preparation of a comprehensive programme for the season.

C. O. Foss, M.E.I.C., chief engineer of the New Brunswick Electric Power Commission read a paper on the "Progress of Hydro-Electric Development in New Brunswick" (printed in the November *Journal*), with recent additions due to changes in design at one of the sites.

In addition to the information given in the published copy of the paper, Mr. Foss stated that the Commission had been authorized by the Executive Council to accept the tender of the New Brunswick Contracting Company for the sum of $248,000, this to include the grading of the embankment for the pipe lines and the construction of mass concrete dams on the West and Northeast Branches of the Musquash River. Future contracts will call for smaller storage dams on each of the rivers, wood stave pipe lines 8 feet and 10 feet in diameter and approximately 10,000 feet long, power house with equipment, and twelve miles of transmission line to a sub-station at or near St. John. The construction of the pipe lines, power house and transmission lines is in the hands of Messrs C. H. and P. H. Mitchell of Toronto and it is expected that contracts will be let for this work before the end of November. The total cost of the power is estimated at $157 per horse power developed.

Mr. Foss stated that the pipe line will be of New Brunswick black spruce which he believes can be used more cheaply and serve equally as well as imported material. The areas where the pondage and storage basins will be located were burned over 17 years ago and are practically barren, and it is not anticipated that any large sum will be required to compensate for the riparian rights.

Already industries are seeking information as to the time when the power will be available, the cost to them, and the amount they will be able to get. Other powers will be developed shortly to carry out the purpose of the Commission to electrify the entire Province.

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer

On October 28th the meeting was devoted largely to the presentation of a number of motion pictures. The first picture screened was entitled "Salmon Fishing in New Brunswick". Another film pictured the various processes of paper manufacturing, starting from the wood pulp and going right through to the finished product. Another film which was received with very great interest and much applause was one entitled "McGill University,—What it is and does for Canada". Other films featured the mining of salt, goat-hunting in the Rocky Mountains, and some views taken on the Barmen Overhead Mono-Rail Railway System. During the intervals between the films short addresses were given by Messrs. Dodwell of Halifax, and Keith and Busfield of Montreal, each dealing with different phases of The Company's activities. There was an attendance of about 225 members and guests at this meeting and the Chair was occupied by Mr. Duchastel.

On November 4th, an extremely interesting paper was presented by H. B. Oatley of New York, on "Modern Super-Heater Practice". This paper will be published in *The Journal*.

On November 11th an address on "Commercial Aviation in Canada" was given by R. R. Dewilde, the Montreal aviator, in the course of which he stated that both Canada and the United States were far behind Great Britain and other European countries in the post-war development of aviation. The slow development in Canada was attributed to lack of capital and general distrust of aviation as a practical and safe method of transportation, coupled with a comparatively small population and immense distances. The slow development in the United States he attributed to the fact that they, having failed to become parties to the Peace Treaty, had also failed to adopt the air regulations provided at Versailles, adopted by all the Allies except the United States. Owing to this there had been little Government control of flying in the United States, with the result that pilots who should have been prohibited from flying had carried passengers in machines about which they knew nothing, many of them in a state of neglect, with the result that there had been a comparatively large number of accidents. So far as Canada was concerned, working under the Versailles aerial regulations, the accidents had been so few that figures had not yet been tabulated.

The author quoted figures as to the results of the past year's experience of highly developed commercial aviation in and from England during this period, when the number of accidents had been so few as to make it appear that aviation transport was becoming one of the safest methods, as well as the speediest even if still the most expensive. During a recent recorded period of seven months there had been 400 machines engaged in England which had made 35,000 flights, covering 593,000 miles, with 64,000 passengers and 67,000 pounds of freight. In all of these there had only been eighteen accidents, resulting in the killing of three flying personnel and the injuring of five, while only one passenger had been killed and three slightly injured.

As to the expense the author considered that the high cost, especially in Canada, was due to the restricted turn-over, due to lack of support, which meant that the overhead costs were tremendous in comparison to the work done. The lack of aerodrome facilities also tended to make the costs high. As the use of air service increased he considered that ground costs would decrease so that the more aviation was used as a practical service the less would the relative cost become, and it was hoped that the present extremely high insurance rates would be gradually decreased. In his general address Mr. Dewilde gave a sketch of the growth of aviation and spoke of the tremendous advances that have been made during the war in this line of enterprise, with the result that a number of the reconnaissance and bombing machines that had been developed during the war had since been turned over for commercial purposes. He also spoke of the future of the work in Canada, especially with regard to survey work for timber limits, the mapping of undeveloped regions, and aerial photography.

There was an attendance of over one hundred at the meeting and there was an animated discussion in which many members took part. S. F. Rutherford, A.M.E.I.C., presided.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary-Treasurer.

Annual banquets are, generally speaking, accurate gauges of an organization's progress. They tell unmistakably, whether it has moved forward during the twelve months, or the reverse; whether it has lived up to the ideals laid down at its foundation.

The first annual banquet of the Peterborough Branch was held on Thursday, November 11th, and it revealed concretely that there had been considerable progress during the last year. The Branch has blossomed from uncertain infancy into sturdy childhood, and the untiring efforts of its officers have shown fruit.

The Chairman of the Branch, R. H. Parsons, M.E.I.C., presided, and introduced the principal guests of the evening, who were, Julian C. Smith, M.E.I.C., and Frederick B. Brown, M.E.I.C. of Montreal, R. O. Wynne-Roberts, M.E.I.C. of Toronto, and A. J. Grant, M.E.I.C., of St. Catharines.

The Chairman read telegrams of regret from President R. A. Ross, M.E.I.C., and Dr. L. A. Herdt, M.E.I.C., who had promised to attend; but at the last moment were unable to do so.

The Chairman, after the toast to the King had been fittingly honored, referred to the date on which the banquet was being held, and proposed a toast to "Armistice Day" which was honored in silence.

C. E. Sisson, M.E.I.C., one of the members of the Executive Committee of the Branch, proposed the toast to *The Institute*. He recalled the installation of the Branch a year ago, and said there had been found, as is usually found, returns about equal to the effort spent in the work. Some misgivings were experienced by electrical engineers, who feared that they would lose their identity in the larger body, but this had all been disproved. The officers and members had put forth their best efforts, and progress had resulted. He read the motto of *The Institute* and declared that it should have the attention of all the members.

Julian C. Smith, M.E.I.C., responded in part as follows,—"On behalf of the President and Members of Council of *The Institute*, I wish to express their appreciation of the efforts of the Peterboro Branch during the past year. No other Branch has done better."

Mr. Smith told how twenty years ago he had joined *The Institute* in Montreal, then composed largely of civil engineers as a "mere electrical engineer," and had worked up through the various offices, until at present he was a member of the Council.

The officers of the past as well as the present had only one object, to advance the engineering profession in Canada. As the population of Canada increased, *The Institute* would undoubtedly become enlarged, until it would equal in size the national engineering societies of Europe and the United States.

He urged on the members that to be successful, not only must there be a large membership, but the highest types of engineers must be in office.

Frederick B. Brown, M.EI.C., also responded to this toast, and referred to the part that engineers were taking in the city government of Montreal. He also described the work of the City Commission, and the many reforms that it had introduced.

Mr. Brown's advice to the Peterborough Branch was embodied in the following words,—"All education is self-education. Self-education begins with self criticism, and ends with self control."

Mr. Brown told a few humorous anecdotes in his own inimitable style.

The toast to the Branches was proposed by P. P. Westbye, M.E.I.C., member of the Executive Committee of the Peterborough Branch, who told of the awakening of the engineers from coast to coast.

R. O. Wynne-Roberts, M.E.I.C., Chairman of the Toronto Branch responded, and brought greetings from his brethren. He congratulated the local Branch on its growth, and drew attention to the policy of *The Institute* in encouraging the Branches in every way possible.

Alex. J. Grant, M.E.I.C., represented the Niagara Peninsula Branch, and outlined the work of that branch during the past year.

At the conclusion of the Toasts the Chairman drew the attention of the members to the Annual Meeting of *The Institute* in February, some of the details of which were announced by Mr. Wynne-Roberts.

During the evening several solos by Walter Evans, were much enjoyed. W. H. Barry accompanied him at the piano. Both of these gentlemen, are Affiliates of the Branch.

G. H. Duggan, M.E.I.C. Past President of *The Institute* arrived on the early morning train with Messrs. Smith and Brown, but was unable to remain for the banquet. He accompanied the other visitors on a trip through the works of The Wm. Hamilton Co. and the Canadian General Electric Company, through the courtesy of P. P. Westbye, M.E.I.C. and E. G. Patterson, respective managers of the two plants.

At noon the guests were entertained by Mr. Patterson at a luncheon at the Empress Hotel, the party including the members of the local Executive Committee.

During the afternoon, other manufacturing plants, and objects of interest were visited.

Toronto Branch

H. A. Goldman, A.M.E.I.C., Secretary-Treasurer.

Meetings of the Toronto Branch of *The Engineering Institute of Canada* are held every Thursday evening at 8.15 p.m. sharp. The members of the Branch and visitors are showing their appreciation of the excellent programme arranged for the season by attending in large numbers and taking an active part in the discussion following each lecture. This is a tribute to the efforts of the Executive Committee of the Branch.

On Thursday, October 21st, C. D. Dean, A.M.E.I.C., of the Imperial Oil Co., Ltd., addressed the Branch on General Oil Refining Practice. The economic and engineering features of plant layouts were outlined by the speaker, who pointed out that the location of plants depended chiefly on transportation, fuel and water facilities. The mechanical equipment of plants was extensively discussed. A series of moving picture films were thrown on the screen to illustrate all the processes from the crude oil stage to the refined product.

On Thursday, October 28th, at a regular meeting of the Branch, the Chairman, R. O. Wynne-Roberts, M.E.I.C., extended a hearty welcome to the students who were present, and expressed the hope that more students would in the future avail themselves of the benefits to be derived from attending the meetings of the Branch.

J. M. Oxley, A.M.E.I.C., Chairman of the Committee appointed to review the City of Toronto Building By-laws, submitted his report on behalf of that Committee. It was decided that the report be accepted and copies forwarded to the City Architect.

A. H. Harkness, M.E.I.C., Chairman of the Fees and Remuneration Committee, in reporting the progress made by that Committee, stated that the proposed adoption of Engineering Council's classification had been approved by all the Branches that had answered the enquiries of the Committee regarding same. Prof. C. R. Young, M.E.I.C., suggested that, in forwarding this report to headquarters of *The Institute*, they should impress upon Council the urgent necessity of so placing the matter before the employers of Engineers, that they can be prevailed upon to grant the proposed remuneration.

The speaker of the evening, P. W. Ellis, Chairman of the Queen Victoria Park Commission of Niagara Falls, then addressed the Branch on the functions and activities of that Commission. The Commission are trying to satisfy the existent demand for a national playground along the Frontier. Last year 80% of the million and one half people who visited the Frontier from the United States crossed into Canada. This showed their appreciation of the natural beauties of the district on the Canadian side.

In referring to the finding of the Committee on Conservation of Natural Resources in the United States that there would be no coal left in that Country in about one hundred years, the speaker pointed out that this was of vast importance to Ontario, since Ontario is credited with 51% of the products of Canadian industry. In view of the fact that every electrical horsepower is approximately equivalent to 20 tons of coal, the 350,000 h.p. being distributed in Ontario from Niagara Falls represents at present prices for coal an equivalent money value of $100,000,000 per annum. It might, therefore, be advisable in the future to impose an embargo on the use of coal in Ontario for purposes for which electrical power could be utilized. The development of Niagara as a power centre was described from its inception.

Capt. J. B. Bond, assistant superintendent of the Queen Victoria Niagara Falls Park, then gave a lantern slide display of that district in which the various scenic, engineering and constructional undertakings were portrayed in a most interesting manner.

Mr. Ellis then gave a brief but very interesting talk to the students present on "Cause" and "Pep" in Business, which was highly appreciated by them.

On Thursday, November 4th, F. M. Dawson, A.M.E.I.C., of Super-cement (America), Ltd., addressed the Branch on Super-cement.

Some years ago, the U.S. Bureau of Standards found, by means of microscopic analysis, that large masses of unhydrated cement remain in all mixtures of concrete. Mr. Dawson stated that in the effort to reduce this amount of unhydrated material it was found that by the addition of a certain material to the clinker during the manufacture of Portland Cement, the desired result—that of greater hydration—had been obtained. Photomicrographs, comparing concretes made from Portland Cement and Super-cement, were thrown on the screen, to show that concrete made from Super-cement contained more hydrated particles than that made from Portland Cement. As a result the density and waterproofing quality of the mixture would be increased and the strength augmented. This had been fully borne out by a series of tests extending over several years. The product so obtained had been named Super-cement. Messrs. E. M. Proctor, A.M.E.I.C., G. A. McCarthy, M.E.I.C., W. J. Smithers, A.M.E.I.C., Frank Barber, A.M.E.I.C., J. M. Oxley, A.M.E.I.C., J. C. Krumm, M.E.I.C., W. Storrie, M.E.I.C., and R. B. Young, A.M.E.I.C., took part in the discussion which followed.

In reply to questions, Mr. Dawson further stated that Super-cement required the same amount of water—for the same consistency—as for Portland Cement Concrete. Although it set more slowly than Portland Cement Concrete yet the normal excess of strength was 10% in 29 days and 16 to 20% in 3 months. A 1:3 mortar of Super-cement had the strength and waterproofing quality of a 1:2 mixture of Portland Cement. The material also offered great resistance to the action of sea water. Tests were being made to determine the effect of alkali waters on it.

On November 10th an Open Forum Meeting of the Toronto Branch was held in the Mining Building, University of Toronto. O. E. Fleming, Chairman of the Canadian Deep Waterways and Power Association, Major A. C. Lewis, Secretary of the Association, and E. L. Cousins, A.M.E.I.C., manager and chief engineer of the Toronto Harbour Commissioners, were invited to discuss the economic and engineering phases of the St. Lawrence Canalization and Power Project.

Mr. Fleming gave a general outline of the whole scheme for the canalization and power development. Of the 2,700 miles of waterways throughout the Great Lake route only 97 miles had to be canalized. The power project should be constructed at the same time as the Canal, as this would be the most economical course. The four million horsepower to be developed could be marketed as it was needed.

Mr. Cousins in discussing the engineering features of the proposed scheme stated that, in view of the meagre data at present available, no engineer was justified in hazarding even approximate figures for the cost and earnings of an undertaking of such magnitude. But as it would be a potential factor in the development of the country, its value could not be estimated in dollars and cents. He emphasized the fact that a 30 foot canal should be built, otherwise the ultimate expenditure for the new Welland Ship Canal and the Toronto Harbour development would be wasted.

Major Lewis gave some interesting figures to show the saving that could be effected in transportation as a result of the canalization.

*

Members of *The Institute* will be interested to learn of the formation of an E.I.C. Students' Committee in "Junior School," Toronto, to co-operate with the Executive of the Toronto Branch.

The object of the Committee is to create interest in the affairs of *The Institute*, to direct attention to the regular meetings of the Branch to which all Students are invited, and to increase the student membership by bringing in keen live undergraduates.

A. M. Reid, S.E.I.C., Chairman of the Committee has been appointed to the "Membership Committee of the Toronto Branch".

*

Brig.-Gen. C. H. Mitchell, M. E. I. C., has been selected as the sole arbitrator for the purpose of fixing the rate at which The Electrical Development Co. shall supply power to the Hydro-Electric Power Commission.

*

Arthur Hewitt, General Manager of the Consumers Gas Co., Toronto, has extended an invitation to any engineers in Canada who wish to visit and inspect their Station "B", the largest and newest in Canada. Parties not larger than 25 will be guided through the Works.

Hamilton Branch

J. A. McFarlane, M.E.I.C., Secretary-Treasurer

The first general meeting of the Hamilton Branch of *The Engineering Institute of Canada* was held on October 26th, 1920 in the Assembly Hall, Hamilton Public Library.

The meeting, which was well attended and a most successful one, was called to order by H. U. Hart, M.E.I.C., Chairman, promptly at 8.15 P.M.

Mr. Hart thanked the members for electing him as Chairman and promised to use every effort to make the coming year a successful one. He briefly outlined the work and announced that the Papers Committee had a good programme in view and speakers promised for nearly all meetings on subjects which would be interesting to the members. He then introduced Major Alex. Lewis, Secretary of the Canadian Deep Waterways and Power Association. Major Lewis spoke on the St. Lawrence river project, the great international scheme whereby ocean going vessels can reach the Great Lakes. He considered this question as one of the greatest before the Canadian people since Confederation and a solution of the transportation problem for Canada. The speaker discussed the question from the point of view of the general public, not going into any of the engineering features, and discussed his subject under the following headings:—

1. Present transportation conditions
2. The remedy
3. The cost of the undertaking
4. Method of financing

Major Lewis' splendid address was enjoyed by all present and the general discussion which followed was supported by a number of speakers. A hearty vote of thanks was tendered Major Lewis for his interesting and able address. In responding he referred to the very great assistance given by the City of Hamilton to the Commission in furthering this project.

H. B. Dwight, A.M.E.I.C., Chairman Papers Committee, reported that his committee had been successful in securing papers for the winter months, also that it was decided to hold the Annual Dinner in December.

F. W. Paulin, A.M.E.I.C., was elected Chairman of the Membership Committee and he has rallied to his assistance a number of good lieutenants and an active membership campaign is being carried out.

Applications of several affiliates were considered and their names added to the present membership.

It was decided to hold the November meeting on Wednesday November 17th. Geo. Hogarth, M.E.I.C., chief engineer Department of Public Highways of Ontario will be the speaker; he will talk on public highways with special reference to Hamilton as a highway hub.

*

A very successful meeting of the Branch was held in the Assembly Room of the Public Library on Wednesday Evening November 17th. H. U. Hart, M.E.I.C., Chairman, presided and introduced Geo. Hogarth, M.E.I.C., chief engineer of the Department of Public Highways who gave an interesting and enlightening talk on the new Provincial Highways. The meeting was largely attended and the lecture was enjoyed by all present.

Mr. Hogarth first outlined briefly the work being undertaken by the Government, stating that 1820 miles of roads had been taken over and their intention was first of all to make these roads passable for traffic. Maps showing the roads were distributed and showed at a glance the entire system. The construction of new roads would be carried out as opportunity and funds permitted. The work being done at present would be chiefly developing the present highways especially those leading from cities. During the past few weeks a paved road from Hamilton to Dundas had almost been completed. A break had been left at Hodder's at the railroad crossing as it was the intention to construct a subway. In the next few years great improvement would be noticed in the roads especially those in the vicinity of cities. The Toronto-Kingston Highway had been greatly improved during the past season and was now in such condition that a 20 ton roller could travel safely the whole length of the road. The work in the Eastern division had been summed up and the totals were 136 miles of road graded, 136 miles gravelled, 40¼ miles of macadam road, 630 concrete culverts constructed, 17 bridges built and 1250 men, 936 teams, 16 steam shovels and 21 crushers used in the work. The enterprise would have been carried out on a larger scale but for shortage of materials and the difficulty in getting contractors to engage in the work for the Government.

Mr. Hogarth then went into details of construction and used upwards of 100 lantern slides to illustrate his remarks. He showed cross sections of standard types of highway adopted, sections of roadbed before and after being repaired, apparatus used in the various operations and pictures of culverts and bridges of which the Rouge River Bridge proved to be the most interesting. The same type of bridge would be used on the Toronto-Hamilton Entrance and it was hoped that all bridges on this work would be completed early next Spring. Slides showing portions of the Hamilton St. Catharines road, the proposed road up the mountain on the Hamilton Brantford Highway, also portions of completed sections of various roads all proved interesting to the audience.

An interesting discussion followed which brought out many features in regard to road building.

A vote of thanks was tendered Mr. Hogarth for his splendid address.

The December meeting will take the form of a dinner and a committee consisting of Messrs. Hart, Palmer and Paulin was appointed to make all arrangements.

The applications of a number of affiliates were approved and their names added to the Membership list.

Chas. Robertson, A.M.E.I.C.—Box 29 Brantford, Ont., formerly of Peterboro, Ont., and E. V. Deverall, A.M.E.I.C., of the Hamilton Bridge Works Company drawing office staff, formerly of Montreal, have been added to the membership.

Niagara Peninsula Branch

Rex P. Johnson, A.M.E.I.C., Secretary-Treasurer

Members of the Niagara Peninsula Branch made a visit and inspection of the works of the Ontario Paper Co. and the Beaver Board Co. at Thorold on Saturday afternoon, Oct. 23.

At the plant of the Ontario Paper Co. the visitors were shown the process of making newsprint from pulp wood logs to the finished product, rolled and cut to size for shipping.

The pulpwood logs are floated up to the grinders placed in hydraulic presses and forced against great revolving grindstones driven by direct connection to motors. A very special feature of these motors is that they are operated at 12,000 volts, an unusual high distribution voltage, and therefore requiring no transformers.

The most interesting and spectacular part of the process was the paper machine. In the first section of the machine the finely ground pulp is run in a thin sheet over a wide, inclined screen which allows part of the water to fall out and carries the remaining pulp with sufficient fluidity to flow on to the rolls and be conveyed through a series of these on a broad canvas belt. Each set of rolls removes more water until the pulp passes into a stage of being a very thin wet sheet of paper about twelve feet wide and travelling at a great speed. The critical stage in the process is where this wet sheet leaves the supporting canvas belt and passes over a great number of large revolving steam drying cylinders to the rolling and cutting stage. The visitors were very much interested in watching the operators start the paper over the steam rolls after a break in the sheet. This required great skill and speed on the part of the operators, not only in starting the very fragile sheet, but in leading it through the series of steam cylinders.

The output of this mill is 240 tons of newsprint per day.

The works of the Beaver Board Co. were visited next and a process very similar to that of the Ontario Paper Co. was witnessed during the grinding and tank stages. The process of rolling out the pulp into paper differed in that the thickness of the paper was much greater and the travel over the rolls and drying cylinders slower. The product resulting from this process is a stiff cardboard, four layers of which are pasted together to form beaver board. The equipment for making and testing the finished product was viewed with great interest by the engineers.

The appreciation of the Branch is extended to the two companies for granting the opportunity of seeing their processes.

Border Cities Branch

J. E. Porter, A.M.E.I.C., Secretary-Treasurer

A special dinner meeting of the Border Cities Branch and the Border Chamber of Commerce was held in the Chamber of Commerce Auditorium on Wednesday Evening, November 3rd.

H. B. R. Craig, M.E.I.C., Chairman of the Branch, introduced Charles E. Fowler, M.E.I.C., M.Am. Soc. C.E., consulting civil engineer of New York. Mr. Fowler gave a very interesting illustrated talk on "Harbours and Bridges of the World". He took his audience on a trip down along the Pacific Coast from Vancouver, B.C. to Valparaiso, Chile, and then up along the Atlantic Seaboard, stopping long enough at the principal seaports to point out the interesting features.

At New York the Brooklyn, the Manhattan, the Queensborough, and Hellgate Bridges were shown in detail. Mr. Fowler having slides showing some of these bridges under construction.

The audience was then shown bridges and harbours of the Old World, particular mention being made of the architectural lines and the strength of some of the bridges built many years ago for foot and wagon traffic, but which with some very minor changes are now handling heavy trains and motor trucks.

Returning to Canada, Mr. Fowler showed many scenes along the St. Lawrence River and the Great Lakes and emphasized the need of the much talked of "Lakes to Ocean Route". In his opinion, Montreal had the best harbour commission laws and regulations of the North American Continent, if not of the World. Toronto was commended very highly for the harbour improvements they were carrying on.

Sketches of the proposed international bridge between Detroit and Windsor, a proposal which Mr. Fowler has fathered, were next flashed on the screen. This project was briefly outlined.

A hearty vote of thanks to Mr. Fowler, was moved by A. Simmers of the Chamber of Commerce and seconded by A. J. Riddell, A.M.E.I.C.

*

The Border Cities Branch held the regular monthly meeting in the auditorium of the Chamber of Commerce, Friday Evening, November 12th, H. B. R. Craig, Chairman, of the branch presiding.

After the regular business of meeting, the speaker of the evening, J. J. Newman, M.E.I.C., O.L.S., addressed the branch on "Practical Workings of the Ontario Drainage Act from the Engineer's Standpoint". Mr. Newman traced the history of agricultural drainage from the drainage of the fenlands in England at the time of the Roman Conquest to the present time.

Coming down to the drainage laws of Ontario, he showed the development from scattered sections through the municipal act as the law existed prior to 1894. About the year 1891 a Royal Commission was appointed to enquire into the workings of the drainage laws, as litigation at that time was more prevalent than useful drains. This commission brought in a report with recommendations from which the Government drafted the drainage act of 1894, and this act forms the basis of the present drainage act.

Mr. Newman then took up the workings of the various sections of the present drainage act as it affects the engineer, commencing with section No. 3 which is the section under which new work is undertaken by petition, and ending with section No. 90 which section gives the municipality power to assume a drain constructed under the Ditches and Watercources Act and make it a municipal drain.

A hearty vote of thanks was moved by L. T. Bray, A.M.E.I.C., seconded by C. A. MacDonald, S.E.I.C., to Mr. Newman for his instructive and excellent address.

On motion of D. A. Molitor, M.E.I.C., seconded by A. J. Riddell, A.M.E.I.C., the Branch bylaws section No. 8, paragraph 1 were amended by substituting in said paragraph "the second Friday of every month" in place of "the first Friday of every month".

M. E. Brian, A.M.E.I.C., then gave the meeting much appreciated information re the gas situation in the Border Cities at the present time.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.

At the regular meeting held on 21st. October a paper was read by J. A. Davies, engineer of the Manitoba Steel Foundries, Limited, on Electric Furnace Operating. Mr. Davies dealt with the various essential requirements for the successful operation of electric furnaces and described particularly the equipment at the rolling mills at Selkirk.

The Mining Institute of Canada held their annual meetings on the 25th., 26th. and 27th. October in Winnipeg. A large attendance of outside members was present, among whom were several members of *The Engineering Institute.*

*

On 2nd. November, at the invitation of the management, through T. R. Deacon, Esq., M.E.I.C., the members of the Branch visited the Manitoba Rolling Mills at Selkirk and inspected the electrical furnace and the new open hearth steel furnace which is being operated with pulverized coal, being the pioneer installation of this kind of furnace in Canada. Over fifty members took advantage of the opportunity and a very interesting afternoon was spent.

On 5th. November Professor J. W. Dorsey, A.M.E.I.C., read a paper on electrical transmission. Professor Dorsey's paper dealt with the necessity of fully utilizing all power resources in Canada to save to the country the excessive amount of money which is now being spent on American fuel. He pointed out that the efficient utilization of the available power resources of Canada depended upon the economical and efficient means of transmission of energy. He discussed at length the well known theoretical advantages of direct current transmission at high voltages and proposed a scheme by which this could be done at constant potential instead of the constant current method which up to the present time has been used for high voltage direct current transmission. While this method would necessitate the development of extra high voltage direct current machines he claimed that by a special method of "rectifying commutation" devised by him the direct current machines could be built for voltages approaching those for which alternating current machines are now built, and in fact suggested even higher voltages might be possible. The means of developing these machines was only lightly touched upon, the paper confined itself chiefly to the efficiencies in transmission to be obtained by high voltage, direct current and operating advantages which would accrue through the use of this method.

Owing to the length of the paper it was impossible to discuss fully Professor Dorsey's paper and it was decided to continue the discussion at the regular meeting on the 2nd December. Due to the publicity which Professor Dorsey's scheme has lately been given in the public press, the meeting was largely attended, the room being packed to capacity.

•

On Thursday, 4th November, the Engineering Society of Manitoba University gave a dance at the Fort Garry Hotel, to which members of the Branch were invited. A large number accepted the invitation and an enjoyable evening was spent by all.

Vancouver Branch

J. N. Anderson, A.M.E.I.C., Secretary-Treasurer.

The Vancouver Branch held a dinner on Saturday, 16th October, in the University Club, Lt.-Col. R. Leckie, D.S.O., Head of the Operations Branch, Dominion Air Board, being the guest of honour.

Earlier in the day the First Annual General Meeting of the Association of Professional Engineers of the Province of British Columbia was held, and this social meeting proved a very delightful ending to an outstanding day among Engineering events in this City.

Professor E. G. Matheson, Chairman of the Vancouver Branch, presided.

Those present were Lt.-Col. R. Leckie, D.S.O.; the following Victoria members, Messrs. A. E. Foreman, D. O. Lewis, J.B.Holcroft, H.M.Bigwood, Smith and Icke; the following Vancouver members and engineer friends: Major R. W. Brock (Dean of the Faculty of Applied Science, University of B.C.), Major W. G. Swan, D.S.O., Major G. A. Walkem, Major C. R. Crysdale, Messrs. Wm. Anderson, S. Anderson, J. N. Anderson, Bates, Blackman, P. P. Brown, Connell, Creer, Dalzell, Devey, Dunbar, Frew, Frith, Irwin, Jamieson, Lighthall, Muirhead, McMurray, Philip, Powell, H. L. Robertson, Scott, Smith, Smeltzer, Smaill, Stirratt, Swift, Snodgrass and Todd.

The only toast was that of the King.

In introducing Lt.-Col. Leckie, the Chairman congratulated the guest of honour on his epoch—making flight from Halifax to Winnipeg, a distance of over 2000 miles, and reminded those present of the Colonel's splendid record as an airman during the War, he having been the first to attack successfully and bring down a Zeppelin from a sea-plane.

Lt.-Col. Leckie, in opening his remarks, said he wished to speak, not as a soldier but as a citizen, and that he would confine his talk to Civil Aviation.

Then followed a most interesting description of the Halifax-Winnipeg flight, during which the audience learned of the frequent dangers and occasional humours of the undertaking, and the constant need of grim endurance. Col. Leckie had for his companion Major Hobbs of Vancouver, to whom he paid a high tribute. The flight was made by seaplane on account of the large areas of water in the Eastern part of Canada, it being stated that two-thirds of the world's fresh water was in Canada, largely east of Manitoba.

The organization of the Dominion Air Forces, Military and Civil, was explained, and the speaker proceeded to discuss Civil flying, pointing out that stunting, whilst of great military significance, was entirely uncalled for in civil or commercial practice. Statistics of British and Canadian Commercial flying were quoted, showing the great strides which aviation has made, and also the safety with which large numbers of passengers have been carried, the fatalities being as low as .01 per 1000 in Britain in the course of 230,000 miles flown.

Col. Leckie has given much attention to the economic side of his profession, and his studies have led him to these findings.

The depreciation due to "wear and tear" on high-power war type aircraft limited the life of the machine to approximately 600 flying hours, while a good pilot averaged a crash every 700 flying hours.

From this it was deduced that a war type machine put in the field for a period of six months and flown 300 hours was depreciated approximately 60 per cent, so that before flying can become a profitable business project the lifetime of a plane must be very considerably increased. Extensive alterations are therefore required in the design and construction of machines.

Before and during the War, aircraft were built of glued wood, piano wires and fabric. This was undoubtedly good business during the War when the average life of a plane in France was 100 flying hours; but with peace conditions the speaker was of the opinion that the design and construction of aircraft was the work of the engineer, he being the most fully equipped by training to produce the necessary all-metal plane which would fulfil the conditions imposed on aircraft.

Under the terms required by the Allies, Germany was called upon to deliver to the Allies or to destroy all aircraft; but this condition has not prevented the Germans, largely engineers and chemists, from producing since the War, many valuable adjuncts to the aeroplane, and it is known that Germany has now a large number of newly constructed, so-called commercial aircraft, and further has successfully built all-metal aeroplanes.

The speaker stated that he was not one of those optimists who imagined the last war has been fought, and that he was fully of the opinion that the next one would be under such conditions that aircraft would be the essential arm of warfare. When it was understood that a commercial craft can be turned into the most complete military machine in about an hour it behooved Canada, if she would hold her place in the World's affairs, to consider this fact. The cost of such a vessel as H.M.S. "Hood" would cover 800 bombing planes, a statement which, when considered, must give food for thought and at once show the full import of the civil or commercial flying machine.

Unfortunately, as yet, no aircraft factories have been established in Canada, but Col. Leckie looked to the time, at no distant date, when this would be remedied and hoped that the engineer would play the most prominent part in putting Canada in the forefront of aircraft manufacturers.

A vote of thanks to Lt.-Col. Leckie was moved by Major Swan, seconded by Mr. Lewis and responded to with musical honours.

*

The first General Meeting of the Association of Professional Engineers of the Province of British Columbia was held in the Auditorium, Board of Trade Building, Vancouver, B.C. on Saturday 16th October, at 2.30 p.m.

There was a large turnout of members, all branches of engineering being well represented as were also the various parts of the Province.

Professor E. G. Matheson, Provisional President, outlined the history leading up to the passing of the B.C. "Engineering Profession Act" early this year, and gave a full report of the work done by the Provisional Council appointed by the Lieut.-Governor-in-Council, which has examined the credentials and registered over 400 Engineers.

Draft By-laws were submitted to the meeting and ratified after some amendments had been made.

The following Nominating Committee was appointed to nominate candidates for the Council for 1921-1922: Messrs. R. W. Brock, J. N. Anderson, A.M.E.I.C., A. S. Wooton, C. Brakenridge, M.E.I.C., O. W. Smith, M.E.I.C., G. S. Elridge, T. H. Crosby, W. W. Fraser, J. F. Frew, P. P. Brown, M.E.I.C., P. Philip, A.M.E.I.C.

This Committee will also nominate candidates for the Council for 1920-1921, under a special provision in the By-laws for the election of the first regular Council.

Eighth General Professional Meeting, Halifax, N.S.

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary-Treasurer.

The Branch opened its season on Thursday October 21st, with a meeting to which the public were invited, when Colonel R. L. Leckie, D.S.O., Director of Civil Aviation, had kindly consented to speak on his experiences during the flight across Canada and on Aviation generally.

Unfortunately the distinguished aviator was recalled to Vancouver on Air Board business almost immediately after his arrival in Victoria, and so was unable to attend, but he had prevailed upon Major Hobbs, who had been his companion during the first stage of the flight, from St. Johns to Winnipeg, to take his place and address the meeting in his stead.

A. E. Foreman, M.E.I.C., the Branch Chairman, presided and introduced the speaker. With him on the platform were N. A. Yarrow, A.M.E.I.C., and Mr. Marriner, the general manager of Yarrows Ltd., Scotland.

Major Hobbs opened his remarks by outlining the organization of the Air Board at Ottawa, and gave a short synopsis of the work of the three branches, Military, Civil and Operations.

61	K. [illegible]	[illegible]

Speaking of the flight across Canada, the speaker stated that they had hoped to get through sooner, but that bad weather had held them up time after time. The actual flying time was 48 hrs. 20 minutes for the journey of about 3300 miles, from the Atlantic to the Pacific.

Ill-fortune overtook them soon after leaving St. John's when they ran into a gale blowing fifty miles an hour. Fog and engine trouble delayed them at various times between Ottawa and Winnipeg.

The portion of the flight from Winnipeg to the Coast was not dealt with by the Major, who had not taken part in it, and the reports of which were not at the time complete, but it had been completed satisfactorily and without difficulty.

The use of wireless to give an aviator his location was described, and the work of the R.N.A.S. during the war was touched upon, patrols upon the "cobweb system" being described.

In speaking of the construction of aeroplanes the Major said that it was necessary to get away from the flimsy construction of the essentially war-time machine and standardize a type which would deteriorate less rapidly.

Figures were given to show that aerial travel was not the dangerous experience people generally supposed, in England where a year's figures were available the proportion of passengers killed to the number carried was one per thousand. At present Canadian casualties were three times this number, but this condition would soon be remedied.

The vote of thanks to the speaker was proposed by Mr. Yarrow and seconded by D. O. Lewis, M.E.I.C., the mover recalling the pioneer journeys across the continent in earlier days by wagon and railway; he reminded his audience that this flight just completed was also a pioneer adventure.

*

A. E. Foreman, M.E.I.C., the Chairman of the Branch, has resigned his post as Public Works Engineer for British Columbia to take a position with a large firm of United States engineers, as their representative for the Province with headquarters in Vancouver. It is the hope of the members of the branch that Mr. Foreman's active support will not be lost, but that his new position will still enable him to take the same active interest in local matters affecting the engineerin profession which he has previously done.

*

The Papers Committee, under the chairmanship of Capt. W. M. Everall, A.M.E.I.C., have every expectation that the list of subjects to be dealt with during the winter, will be of such a varied character that members in each branch of the profession will find their pet subject included. A full list will appear later.

*

A particular effort is being made to interest young men who are starting their career in engineering, in *The Institute*, with a view to their admission as Students. It is felt that there are many such who have not had the opportunity to go to the University but are beginning as juniors in drawing offices who should be encouraged to enter the students grade and then work up in the meantime for their examinations to qualify as Juniors.

Elections and Transfers

At a meeting of Council on Nov. 23rd, the following elections and transfers were effected:—

Members

Bertram, H. Graham, B.Sc., (Queen's '10), of Dundas, Ont., Ch. Engr., John Bertram Sons & Co.; Fraser, Daniel Macfarlane, (Heriot Watt College), of Toronto, Ont., Estimating Engr., Can. Gen'l Electric Co.; Phillips, Thomas Caleb, (Univ. of Wales & Engr'g Academy), of Ottawa, Ont., Consltg. Engr. to the Dept. of the Naval Service, Canada.

Associate Members

Addison, George Dickson, of Vancouver, B.C., Ch. Dftsman., Vancouver Harbor Comm'rs.; Auger, Albert, B.A., B.C.E., (Univ. of Manitoba), of Prince Rupert, B.C., Asst. Engr., G.T.P.; Belcher, John Tresilian, B.A.Sc., (Univ. of Toronto '14), of Cameron Falls, Ont., Dftsman. and office asst., H.E.P.C.; Buchanan, Frank Montgomery, B.A.Sc., (Univ. of Toronto '15), of Montreal, Que., Mgr. of Road Dept., Dom. Tar & Chem. Co., Montreal; Calvin Jonathan David, B.A., B.Sc. (Civil), (Queen's Univ. '07), of Montreal, Que., Supt. of Docks for the Century Coal Co., Montreal; Clifford, Arthur, LePoer Trench, (Engr'g Dept. Univ. Coll., London, England) of Hamilton, Ont., Checker in dftg dept., Hamilton Bridge Works Co.; Creighton, Charles Pearse, B.Sc. (E.E.), (McGill Univ. '20), of Cedars, Que., with McDougall & Pease, Consltg. Engrs.; Greer, John, B.A., B.E., (Royal Univ. of Ireland '10), of Montreal, Que., Asst. Engr., Portland Div'n., G.T.R., on Valuation of bridge substructures; Hanley, Alphonsus Edward, B.Sc., (McGill Univ. '13), of Montreal, Que.; Harrison, Thomas Francis, of Kingston, Ont., Engr. on bridge surveys, C.N.R., Kingston, Ont.; Hollaman, John Emmanuel, (Glasgow & West of Scotland Tech. Coll.), of Hamilton, Ont., Ch. Asst., in charge of Engr'g Dept., Hamilton Harbour Comm'rs.; Jepson, Thomas Cecil, B.Sc., (Cambridge Univ. '11), of Toronto, Ont., Ch. of party and instr'man on surveys, York Township; Kean, David Jacques, C.E. (S.P.S. Toronto, '09), of Whitby, Ont., County Road Supt., County of Ontario; Lester, James Frederick, (York Place Science School, Brighton, England), of Winnipeg, Man., Asst. Supt., Sydney E. Junkins Co., Constructors & Engrs., Winnipeg; Lester, Leonard William, (School of Science & Arts, Brighton, England, College de Dieppe, Dieppe, France), of Winnipeg, Man., Surveying Engr., Manitoba Power Comm'n.; Lynch, Goria, B.Sc. (C.E.), (Queen's '15), of Creighton Mine, Ont., Asst. on Engr. Staff, Mines Branch, International Nickel Co. of Canada, Copper Cliff, Ont.; Murray, Alexander Durand, (McGill), of Montreal, Que., Valuation Dept., G.T.R., Montreal; Paget, Benj. Walter, of Capreol, Ont., Res. Engr. in Ruel Sub. Div., Capreol to Foleyet, C.N.R.; Paget, James R., of Winnipeg, Man., Res. Engr., C.P.R., Weyburn-Lethbridge Branch Line; Parkinson, Norman Frederick, B.A.Sc. (Honors), M.A.Sc., (Univ. of Toronto '13), of Ottawa, Ont., Deputy Minister, D.S.C.R., Ottawa; Robinson, Frederick Algernon, (Diploma School of Science, Univ. of Toronto '08), of Toronto, Ont., Secretary, Hydraulic Dept., H.E.P.C., Toronto; Tidy, William Edgar, of Capreol, Ont., Concrete

Inspector & Res. Engr. on mtce of way, C.N.R., [illegible]; Walter Charles, (Great Southern & Western Rly. Tech. Inst., Dublin, Ireland), of Ottawa, Ont., Mech. Engr., Comm'nr. of Lights Branch, Dept. of Marine, Ottawa; Wilson, Walter [illegible], B.Sc., (Cornell Univ.), of Montreal, Que., Chem. Engr., Standard Chemical Co., Montreal.

Juniors

Campbell, George Wilfred, of Winnipeg, Man., Asst. to Dist. Engr., Reclamation Dept., Manitoba Govt.; English, William Campbell, of Peterboro, Ont., Can. Gen'l. Electric Co., Peterboro; Goulet, Siroy, (Mount St. Louis Scientific Course), of Peterboro, Ont., Ch. Mech. Dftsman., & Asst. to Mech. Engr., Can. Gen'l Electric Co., Peterboro, Ont.; Horton, Rowland Osborne Charles, (Royal Masonic School, Bushey, England, Cambridge Junior Cert. '10, Senior Cert. '11), of Winnipeg, Man., Struct. detailer, Dominion Bridge Co., Winnipeg; King, Perry, of Niagara Falls South, Ont., H.E.P.C. (Niagara Developments Lands Surveys); Madgett, George Henry, (Collegiate Inst., Hamilton, Ont.,), of Hamilton, Ont., Designing Engr., W. J. Westaway, Hamilton, Ont.; Mansbridge, Alfred Swatton, of Walkerville, Ont., Dftsman., Trussed Concrete Steel Co. of Canada Ltd., Walkerville, Ont.; Scanlan, Charles Edward, (London Univ. '05), of Vancouver, B.C., Charge of party on mtce., C.N.R.; Shanly, James, (McGill Univ.), of Kenogami, Que., Dftsman. & Asst. Engr., Price Bros. & Co., Kenogami; Wilcock, William Stanley, B.A.Sc., (Univ. of Toronto), of Flesherton, Ont., Asst. Surveyor, Dept. of Mines Surveys, International Nickel Co., Copper Cliff, Ont.; Wilson, Thomas Henry, (First Class Diploma, Mech. Engr'g, City & Guilds of London), of Norwood, Man., Chief Engr's Office, C.N.R., Winnipeg.

Transferred from the Class of Associated Member to that of Member

Farmer, Frank Harvey, B.Sc., (Liverpool Univ.), of Winnipeg, Man., Dist. Engr., Canadian Westinghouse Co., Winnipeg; Kaelin, Frederick Thomas, (Federal Technical University, Zurich, Switzerland), Ch. Engr., Shawinigan Water & Power Co., Montreal; Mackenzie, Chalmers Jack, M.C., B.E. (Dalhousie Univ.), M.C.E. (Harvard '10), of Saskatoon, Sask., Professor of Civil Engr'g., Univ. of Saskatchewan; Thornton, Kenneth B., (Technical College, London), of Montreal, Que., Chief Engr. & Operating Mgr., Can. Light & Power Co., Ch. Engr., Montreal Public Service Corp'n., and General Mgr. both companies; also Consltg. Engr., Montreal Tramways Co.

Transferred from the Class of Junior to that of Associate Member

Bovey, John Francis, (Tech. Coll. [illegible]), of Montreal, Que., Designing Engr., Montreal Water Board; Cooper, Ralph H., ([illegible]), of Winnipeg, Man., Consltg. Civil Engr., Winnipeg; Hutchison, Walter Beamish, ([illegible] S.P.S. Toronto), of Calgary, Alta., Special Inspecting Engr., Irrig. Branch, Dept. of the Interior, Prov. of Sask.; Jones, Wilmott Henry, B.C.S. (Univ. of Manitoba '14), of Winnipeg, Man., Engr. & Mgr., Can. Insulation Co. Ltd., Winnipeg; Layne, Geoffrey Francis, B.Sc. (Honours, McGill Univ. '14), of Kenogami, Que., Mech. Engr'g Asst., Technical Dept., Price Bros. & Co. Ltd., Kenogami; Murray, A. H., C.E. (McGill Univ. '1?), Struct. Engr., J. Pringle & Son, Montreal; Plummer, Alex. Alfred, of Vancouver, B.C., Contracting Engr., Vancouver, B.C.; Saunders, Walter Laidlaw, (S.P.S. Toronto), of Conrad, Sask., Instr'man on constrn., C.P.R., Conrad, Sask.; Slinn, William Harmon, B.Sc., (Queen's '10), of Sherbrooke, Que., Asst. engr. on constrn., Cape Constrn. Co., Sherbrooke, Que.; West, Charles William, B.A.Sc., (Univ. of Toronto '10), of Thorold, Ont., Asst. Engr., Dept. Rlys. & Canals, Section 2, Welland Canal.

Transferred from the Class of Student to that of Associate Member

Allan, Edward Blake, B.A.Sc., (Univ. of Toronto '16), of Hamilton, Ont., Asst. to Road Engr., Hamilton, Ont.; Lyons, Edward Leslie, B.Sc., (McGill Univ. '1?), of Montreal, Que., with J. M. Robertson, Consltg. Engrs., Montreal; McIntosh, Ernest Donald, B.Sc., C.E., (McGill Univ. '19), of Carleton Place, Ont., Asst. Engr., Consltg. Engr'g Dept., G.T.Ry.; Meikle, Angus Urquhart, M.C., B.Sc., (Queen's '12), of Ottawa, Ont., with the D.S.C.R., Ottawa.

For transfer from the Class of Student to that of Junior

Clarry, Arthur Reeser, B.A.Sc., (Univ. of Toronto '19), of Kingston, Ont., Instructor of Chemistry, R.M.C., Kingston, Ont.; Elderkin, Karl Osler, B.Sc., (Mech.), (McGill Univ. '20), of New Glasgow, N.S., Dftsman., Nova Scotia Steel & Coal Co., New Glasgow, N.S.; Emrey, Desmond Joseph, (Queen's Univ.), of Kingston, Ont.; Milot, Camille, B.A.Sc., C.E., (Laval Univ. '19), of Quebec, Que., Dept. of Public Works, Bridge Division, Quebec; Rowan, John Cuthbert, of Winnipeg, Man., Dftsman., Dom. Bridge Co., Winnipeg; Ryan, Charles Wilbert, B.Sc., (McGill Univ. '16), of Lisbon Falls, Me., Supt. for Turner Constrn. Co., on new addition Worumbo Mfg. Co., Lisbon Falls, Me.

Preliminary Notice

of Applications for Admission and for Transfer

14th Nov., 1930

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the applicant.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in December, 1930.

FRASER S. KEITH, Secretary.

---

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated from an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option: Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: Geography, History (that of Canada in particular), Arithmetic, Geometry (Euclid Books I-IV and VI), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as AFFILIATE shall be one who by his pursuits, scientific acquirements or practical experience is qualified to cooperate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print up to [illegible] in. in size, 25 cents plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library,

29 West Thirty-ninth Street, New York, N.Y.

ALCOHOL. Wood Alcohol—A New Industrial Monarch. Sci. Am., vol. 121, no. 19, Nov. 8, 1919, p. 462, 3 figs. Its production and utilization in United States during and since war.

ALLOYS ALUMINUM. Ternary Alloys of Aluminum with Magnesium and Copper (Ueber ternäre Legierungen des Aluminiums mit Maghesium and Kupfer), Rudolf Vogel. Zeitschrift fur anorganische und allgemeine Chemie, vol. 107, no. 1, July 29, 1919, pp. 265-307, 43 figs., partly on 4 supp. plates. Tests made with binary and a number of ternary alloys showed that tendency to binary combinations is very prevalent among metals but that combinations of three metals are less frequent.

Some Tests of Light Aluminum Casting Alloys—the Effect of Heat Treatment, P. D. Merica and C. P. Karr. Dept. Commerce, Technologic Papers Bur. of Standards, no. 139, Oct. 21, 1919, 31 pp., 16 figs., partly on supp. plates. Tensile properties and hardness of a number of different compositions of light aluminum casting alloys, comparison of their resistance to corrosion, and determination for a few commonly used compositions of resistance to action of alternating stresses.

Study Common Aluminum Alloys, Robert J. Anderson. Foundry, vol. 47, no. 19, Nov. 15, 1919, pp. 827-828. Discussion of relative merits of various aluminum alloys used for casting purposes.

Tempering of Various Aluminum Alloys (Contribution à l'étude de la trempe de certains alliages d'aluminium), Léon Guiller, Jean Durand and Jean Galibourg. Comptes rendus des Séances de l'Académie des Sciences, vol. 169, no. 11, Sept. 15, 1919, pp. 58-511. Experimental study of processes which were employed during war giving various degrees of hardness to duralumin.

COPPER. Copper Silicon Alloys -(Sur les alliages cuivre-silicium), A. Sanfourche. Revue de Métallurgie, vol. 16, no. 4, July-Aug., 1919, pp. 246-256, 1 fig. Formation, composition, methods of analysis and diagram of state.

See also Alloys, Aluminum.

IRON. The Electrical Properties of Iron Alloys, E. Gumlich. Elecn., vol. 83, no. 2163, Oct. 31, 1919, pp. 494-495. Report of committee appointed by Verband Deutscher Elekrotechniker to investigate magnetic properties of iron in so far as they depend on chemical constituents and thermal treatment. Translated from Elektrotechnische Zeitschrift.

MAGNESIUM. *See Alloys, Aluminum.*

SILICON. Limit of Combination of Silicon with some Metals of Iron Family (Sur la limite de combinaison du silicium avec quelques métaux de la famille du fer), A. Sanfourche. Revue de Métallurgie, vol. 16, no. 4, July-Aug. 1919, pp. 239-245. Experimental. It was found that richest combinations manifest tendency to partial dissociation until equilibrium was established according to general equation MxSiy=Mx Siy—z+Siz.

See also Alloys, Copper

TIN-ANTIMONY-ARSENIC. The Ternary Alloys of Tin-Antimony-Arsenic, J. E. Stand. Metal Indus., vol. 15, no. 14, Oct. 3, 1919, pp. 268-275, 19 figs. Most perfect structural arrangement of crystals is said to have been found in alloy containing 70 and 85 per cent tin, 25 and 18 per cent antimony, and 4 to 5 per cent arsenic.

TIN-THALLIUM. Thallium-Tin Alloys (Ueber Thallfum-Zinu-Legierungen), Paul Fuchs. Zeitschrift für anorganische und allegemeine Chemie, vol. 107, no. 4, July 29, 1919, pp. 308-312, 2 figs. Metallographic report of Institute of Physical Chemistry at Goettingen University. Crystallization curves.

ALTERNATORS

Characteristics of Alternators (Remarques sur les caractéristiques d'alternateurs), M. Doligez. Bulletin de la Société Française des Electriciens, vol. 9, no. 82, July, 1919, pp. 485-498, 6 figs.

ALUMINUM

Aluminum in Aeronautics (L'aluminum dans l'Aéronautique), M. Grard. Aéronautique, vol. 1, no. 5, Oct., 1919, pp. 183-187, 7 figs. Introductory statement giving statistics of world production of aluminum and its physical and chemical characteristics. (To be continued.)

Industrial Uses of Aluminum (Quelques applications industrielles de l'aluminium), Jean Escard. Revue d'Electrométallurgie, vol. 13, no. 3, May and June, 1919, pp. 63-72. Aluminum paper, aluminum powder, aluminum photo-powders, and uses of aluminum gas industry.

ALLOYS *See Alloys, Aluminum.*

AMMETERS

British Standard Specification for Recording (Graphic) Ammeters, Voltmeters and Wattmeters. British Eng. Standards Assn., no. 90, Oct. 1919, 14 pp., 1 fig. Limits of error varies from 1.5 to 2.5 per cent. of maximum scale value for voltmeter. Corresponding figures for ammeter and wattmeter are 3 to 3.5 per cent. respectively.

British Standard Specification for Indicating Ammeters, Voltmeters, Wattmeters, Frequency and Power-Factor Meters. British Eng. Standards Assn., no. 89, Oct. 1919, 24 pp., 3 figs. Specifications include both indicating and graphically recording instruments.

AMMONIA

ANALYSIS LIQUOR. The Estimation of Cyanogen Compounds in Concentrated Ammonia Liquor— 11. The Estimation of Thiocarbonate. Percy Edwin Spielmann and Henry Wood. J. Soc. Chem. Indus., vol. 38, no. 20, Oct. 31, 1919, pp. 369T-370T. Colorimetric method outlined in Jl. of Soc. of Chem. Indus., 1919, pp. 38T-43T, extended to include determination of thiocarbonate.

OXIDATION. The Oxidation of Ammonia, W. S. Landis, Thirty-fifth General Meeting of Am. Electro-chem. Soc., Apr. 3, 1919, pp. 283-303, 4 figs. Historical account of development of various process.

Catalytic Oxidation of Ammonia (Etude de L'oxydation catalytique de l'ammoniaque), Paul Pascal and Eugene Decarriere. Bulletin de la Société chimique de France, vol. 25 and 26, no. 9, Sept., 1919, pp. 489-507, 7 figs. Experimental study made by varying form of catalytic agent, temperature of reaction, duration of contact and composition of gaseous mixtures submitted to catalysis.

AMPLIFIERS

See Vacuum Tubes.

ASH HANDLING

See Coal Handling.

ASYNCHRONOUS MACHINES

Methods for Testing Asynchronous Machine (Perfectionnement aux méthodes d'essai des machines asynchrones), J. le Monier. Revue générale de l'Electricité, vol. 6, no. 10, Oct. 18, 1919, pp. 499-500, 2 figs. How to prevent errors resulting from difference of frequency used in tests as compared with normal frequency of machine.

ATOMIC STRUCTURE

The Structure of Atoms (La structure des atomes), A. Berthoud. Revue générale des Sciences, vol. 30, no. 20, Oct. 30, 1919, pp. 578-588, 2 figs. Scientific basis of electron theory of matter. Conference made before general assomoly of Swiss Soc. of Nat Sci.

The Nature of the Forces between Atoms in Solids, Ralph W. G. Wyckoff. Jl. Wash. Acad. Sci., vol. 9, no. 19, Nov. 19, 1919, pp. 565-592. It is emphasized that only arrangement of outside electrons has bearing on phenomena usually included under term chemistry. Several typical compounds are considered with reference to nature of forces producing them. Solid substances are classified, according to nature of forces of combination, into molecule-forming, polar and valency compounds.

Atoms and Molecules, Jean Becquerel. Sci. Am. Supp., vol. 88, no. 2,285, no. 8, 1919, pp. 260-263, 11 figs. An elementary explanation of modern methods of proving their existence.

AUDION

See Vacuum Tubes.

AUTOMOBILES

ENGINES. Varied-Duty Engines in Bude Series. Automotive Industries, vol. 41, no. 16, 1919, pp. 764-766, 5 figs. Construction details of series of eight models, of four cylinder L-head type.

Darracq 8-Cylinder, 20 hp. Engine Has American Features. Automotive Industries, vol. 41, no. 16, Oct. 16, 1919, pp. 756-758, 5 figs. Model exhibited at Paris show has increased accessibility of engine parts of integral manifolds and cross shaft for driving water pump and generator.

An Unusually Powerful Six-Cylinder Engine. Automotive Industries, vol. 41, no. 15, Oct. 9, 1919, pp. 728-731, 7 figs. Particulars of Fiar engine.

Suère Eight Cylinder Engine Only 1.77 by 3.54. Automotive Industries, vol. 41, no. 16, Oct. 16, 1919, pp. 760-761, 6 figs. Shown at Paris exhibit. V-type motor, of two castings, said to have smallest bore for number of cylinders ever built in France, and to have been designed for quantity production.

REAR AXLE DRIVE. Rear Axle Drive (Hinterachs-Antried), Franz Böhm. Motorwagen, vol. 22, no. 20, July 20, 1919, pp. 341-344, 9 figs. Details of spur bevel wheel with sector shaped bent teeth; advantages of Gleason design.

TYPES. The 10 h.p. Day-Leeds. Autocar, vol. 43, no. 1254, Nov. 1, 1919, pp. 731-733, 9 figs. Principal specifications are: 10 h.p., four cylinders, 64 x 100 mm.; two-bearing crankshaft, pumpfed trough lubrication; inverted leather cone clutch; three-speed and reverse gear box; semi-elliptic front and back springs.

FIAT. Fiat Has Six and Two Four Cylinder Models. Automotive Industries, vol. 41, no. 16, Oct. 16, 1919, pp 754-755 and 781, 5 figs. Changes from pre-war practice by Italian maker are said to include adoption of detachable head, semi-floating rear axle, lighting and starting system and detachable steel wheels.

The Eight-Cylinder 20 h.p. Guy. Autocar, Oct. 25, 1919, pp. 652-655, 11 figs. Specifications 20 h.p.; two blocks of four cylinders each, set at 90 deg.; four-speed and reverse gear; long semi-elliptic springs, rear underslung.

Overland-4 Design Has High Production Merit. Automotive Industries, vol. 41, no. 15, Oct. 9, 1919, pp. 704-708, 9 figs. Spring suspension, which by overhang extends distance between spring supports to 130 in. on 100-in. wheelbase, is noted as radical change made from usual practice.

The New 11 h.p. Riley. Autocar, vol. 43, no. 1254, Nov. 1, 1919, pp. 727-730, 11 figs. Principal specifications are: 11 h.p., four cylinders, 65-8 x 110 mm. bore and stroke; fabric-faced cone clutch; four-speed and reverse gear box; semi-floating bevel driven rear axle; half-elliptic springs.

The 15-9 h.p. Rouston Hornsby. Autocar, vol. 43, no. 1253, Oct. 25, 1919, pp. 646-648, 5 figs. Specifications: 15.9 h.p., four cylinders; three-speed and reverse gear box on rear axle; three-quarter elliptic rear, semi-elliptic front springs.

TRUCKS. *See Motor Trucks.*

AUTOMOBILE SHOW

Paris Show Indicates Trend toward American Practice, W. F. Bradley. Automotive Industries, vol. 41, no. 16, Oct. 16, 1919, pp. 751-753 and 773. Automobile exhibition shows among principal changes use of taper bearings, detachable cylinder heads, aluminum pistons, pressed steel axles, unit power plants, battery ignition and electric lighting and starting.

Overhead Valve Engine in the National, Automotive Industries, vol. 41, no. 14, Oct. 2, 1919, pp. 656-660, 8 figs. Peak is 71 B.hp. at 2,600 r.p.m.; speed range from 3 to 65 miles per hour is provided on high gear, ratio being 4 to 1.

Plant. Experimental Brick Plant of the Nova Scotia Steel & Coal Company, Ltd., A. Dawes. Iron & Steel of Canada, vol 2, no 10, Nov. 1919, pp. 269-271, 3 figs. Machinery consists of dry-pan clay mill, elevator, wire screens, pug mill, auger brick-machine, dies and wire brick-cutting machine.

Silica. Apparent vs True Specific Gravity of Silica Bricks, Leon R. Office. Jl. Am Ceramic Soc., vol. 2, no 10, Oct. 1919, pp. 833-835. Of 27 samples tested 22 showed slightly higher, 2 same, and 3 a lower true specific gravity. By taking average of differences, true specific gravity is found to be 0.011 higher than apparent specific gravity.

Slag-Lime. Manufacturing Slag-Lime Brick by a New Process at Illinois Plant. Brick & Clay Rec., vol. 55, no. 10, Nov. 4, 1919, pp. 858-859, 2 figs. Process is similar to that followed in manufacture of sand-lime brick.

BRIDGES

Hell Gate. Hell Gate Bridge, New York, Frank W Skinner. Engineering, vol. 108, no. 2804, Sept. 26, 1919, pp. 412 and 416-418, 6 figs., partly on 2 supp. plates. Specifications for rivets; yard assembling of trusses. (Continuation of serial.)

Portable, Military. Portable Military Bridges, C. E. Inglis. Engr., vol. 128, no. 3326, Sept. 26, 1919, pp. 310-312, 11 figs. Evolution of type which became in later stages of war standard bridge for rapid advance work. Paper read before British Assn. for advancement of Science. Also in Contract Rec., vol. 33, no. 46, Nov. 12, 1919, pp. 1044-1049, 6 figs.

Timber. Report on Methods and Equipment Used in Renewing Timber Bridges in Whole and in Part. Ry. Maintenance Engr., vol. 15, no. 11, Nov. 1919, pp. 398-399, 1 fig. Résumé of present practice. Committee report presented at Convention of Am. Ry. Bridge & Building Assn. Also in Ry. Rev., vol. 65, no. 18, Nov. 1, 1919, pp. 642-644.

BRITANNIA METAL

Some Notes on the Constitution and Metallurgy of Britannia Metal, F. C. Thompson and F. Orme. Metal Indus., vol. 15, no. 14, Oct. 3, 1919, pp. 276-278, 7 figs. Heat treatment. Brinell impressions and etchings showing structure of tin alloys with small quantities of antimony and copper known as Britannia metal.

BRONZES

High-Resistance. High-Resistance Bronzes (Bronzes à haute résistance). Fonderie Moderne, vol. 12, no. 5, May, 1919, pp. 113-116, 1 fig. Suggestions in regard to drying molds, utilizing waste and soldering. From Bulletin Technologique des Arts et Métiers.

Effect of Phosphorus. The Effect of Phosphorus on Bronze, William Owens. Metal Indus., vol. 15, Oct. 10, 1919, p. 293. Philip's specification that for bearings limiting values of copper and phosphorus be made 84.5 to 91 per cent. and 0.37 to 0.85 per cent., respectively, is recommended.

BRUSH HOLDERS

Defects to be Avoided on Yoke Supported Brush Holders, J. A. Horton. Elec. Traction, vol. 15, no. 11, Nov. 15, 1919, pp. 772-775, 18 figs. Defects and errors are illustrated by diagrams and it is suggested that when manufacturing wooden brush-yokes work should be done to correct drawings.

BUREAU OF MINES

Description and Activities of the Pittsburgh Station Bureau of Mines, E. E. Thum. Chem. & Metallurgical Eng., vol. 21, no. 7, Oct. 1, 1919, pp. 432-436, 7 figs. New laboratory building costing about $1,000,000 has been dedicated to service of public at Pittsburgh by Bur. of Mines. Its activities cover wide range of subjects of importance to chemical and metallurgical enterprise.

BURNERS, OIL

See Furnaces, Oil Burners.

CABLES

Electric High-Tension. High-Tension Electric Cables (Notes et remarques sur les cables électriques à haute tension), M. Lebaupin. Bulletin de la Société Française des Electriciens, vol. 9, no. 82, July, 1919, pp. 447-458 and (discussion) pp. 458-464, 1 fig. Concerning installation, testing and exploitation of network of cables transmitting energy at 15,000 and 5 000 volts.

High-Tension Cables for Gotthard Traction, (Hochspamungs Rabel für die Gotthard-Tracktion), Markus Dumermuth. Schweizerische Bauzeitung, vol. 74, no. 16, Oct. 18, 1919, pp. 193-196, 7 figs. It is noted that in order to judge electric strength of high-tension cable it is necessary to know the quality of insulating material and especially the stress of the inner-most layer of insulating material. Calculation of dependence of this stress on voltage, diameter of cable and thickness of layer of insulating material is discussed.

Hoisting. Selection and Care of Hoisting Cables. Contract Rec., vol. 33, no. 44, Oct. 29, 1919, pp. 998-1001, 1 fig. Defects to which ropes and chains are subjected and measures to be taken to prevent accidents in hoisting operations.

Submarine. Notes on the Localisation of Breaks or Faults in Submarine Cables, J. F. Lloyd. Elecn., vol. 83, no. 2163, Oct. 31, 1919, pp. 498-500, 1 fig. How to calculate combined apparent resistance due to polarization and earth current.

CABLEWAYS

Cableway Built in 1915 for Transportation of Supplies to Army in Alsace (Transporteur funiculaire de Retournemer), F. Mertz. Génie Civil, vol. 75, no. 18, Nov. 1, 1919, pp. 417-421, 13 figs. Cableway was nearly 4 miles long. It was operated electrically.

Spans Simplify Coal Storage, John Sinclair. Gas. Rec., vol. 16, no 9, Nov. 12, 1919, pp. 67-71, 6 figs. Instances where cableways are said to have proved extremely flexible in storing and reclaiming coal for public utilities.

CANALS

Construction Railroad. Construction Railroad Along the Queenstown-Chippawa Canal, Harry Gardner. Eng. World, vol. 15, no. 10, Nov. 15, 1919, pp. 11-14, 7 figs. Railway system consists of double track main line, single-track loading line and three yards on west side of canal and single-track pump line on east side.

Head Gates. Discharging Coefficients for Canal Head Gates, J. S. Longwell and Julian Hinds. Eng. & Contracting, vol. 52, no. 20, Nov. 12, 1919, pp. 552-555, 11 figs. Points out limitations to be observed in application of formula $Q = A\,C\,\sqrt{2gh}$ where Q is discharge, A is area of orifice, C is coefficient determined by experiment, and h is effective head. Also in Eng. World, vol. 15, no. 9, Nov. 1, 1919, pp. 31-35, 5 figs.

Wasteways. Electrically Operated Wasteways of the Tieton Canal, C. F. Gleason. Jl. Electricity, vol. 43, no. 10, Nov. 15, 1919, pp. 464-465, 2 figs. There are five waste ways located at about two miles intervals, each being of sufficient capacity to discharge total flow of canal.

CARBON ACTIVATION

The Activation of Carbon, N. K. Chaney. Can. Chemical Jl., vol. 3, no. 11, Nov. 1919, pp. 372-375. Nature of amorphous carbon as construed from study of defensive methods against toxic gases used in warfare.

CARBONIFEROUS DEPOSITS

Pre-Cambrian and Carboniferous Algal Deposits, W. H. Twenhofel. Am. Jl. Sci., vol. 48, no. 287, Nov. 1919, pp. 339-352, 5 figs. Suggested method of origin of deposits of laminated type occurring in Lower Huronian of Michigan and in Pennsylvania and Permian of Kansas and Oklahoma.

CARGO VESSELS

See Ships, Freight.

CARS

Accidents. Accidents Caused by Hand and Motor Cars, J. L. Walsh. Ry. Signal Engr., vol. 12, no. 11, Nov. 1919, pp. 391-393, 1 fig. Importance of proper inspection and repair is emphasized and it is suggested that rules governing this class of operation be more generally enforced. Paper read before Eighth Annual Safety Congress.

Dump. The Economic Disposal of Waste Material, Howard L. Beach. Off. Proc. Ry. Club Pittsburgh, vol. 18, no. 7, Sept. 25, 1919, pp. 183-197 and (discussion) pp. 198-204, 4 figs. Illustrating various types of dump cars.

Freight. Economics of Freight Car Maintenance, L. K. Sillcox. Ry. Rev., vol. 65, no. 19, Nov. 8, 1919, pp. 682-685. Value of retirement program, as drastic as conditions will permit, is emphasized particularly, as it may be instrumental in keeping weakly constructed cars out of heavy trains in main line service.

Lighting. *See Train Lighting.*

Safety Type. Electric Railway Service with the Safety Type Car, E. A. Palmer. Proc. Pacific Ry. Club, vol. 3, no. 5, Aug. 1919, pp. 7-11. Operating data of several electric companies in California.

Street Railway. *See Street Railways.*

Wheels. Car Wheels and Cause of Defects, W. F. Tidswell. Official Proc. Car Foremen's Assn., Chicago, no. 165, Oct. 1919, pp. 39-57, 6 figs. Failures discussed are sharp or worn flange, shelled out, burnt chill, either from sliding or from brake application, worn tread, worn through chill, chipped flange, chipped rim, etc.

CASE-HARDENING

Improvements in the Case-Hardening Process, D. Hanson and J. E. Hurst. Proc. Steel Treating Research Soc., vol. 2, no. 7, 1919, pp. 20-24 and 38-49, 6 figs. Experimental. It was found that ordinary methods of case hardening at or above 900 deg. cent. tend to lead to formation of hyper-eutectoid layer in the case, which is frequent source of flaking and grainding cracks.

CAST IRON

Contraction. Effects of the Contraction of Iron, Ernest Schwartz. Foundry, vol. 47, no. 19, Nov. 15, 1919, pp. 836-838, 2 figs. Cores which do not break up as casting sets and faulty designs are mentioned among principal causes of cracking of castings due to contraction.

Stresses. Study on Stresses in Cast Iron based on various Burdens (Beiträge zur Kenntnis der Spannungen im Grauguss unter Zugrundelegung verschiedener Gattierungen), Otto Banse. Stahl und Eisen, vol. 39, no. 22, May 29, 1919, pp. 596-600, 4 figs. Tests show that measurements of outer frame parts vary considerably in various burdens. Tests are said to show also that next to proper burden dry sand casting is one of means to avoid stresses.

Synthetic. Synthetic Cast Iron, Charles Albert Keller. Eng. & Indus. Management, vol. 2, no. 17, Oct. 23, 1919, pp. 515-520, 4 figs. Its origin and development.

CAST STEEL

Correct Heat Treatment of Cast Steel, Alvin N. Conarroe. Am. Drop Forger, vol. 5, no. 11, Nov. 1919, pp. 538-541. Discussion of changes which take place in steel testing during heat treatment and effect of cooling.

SAFETY. Dangerous and Safe Practices in Bituminous Coal Mines, Edward Steidle, Dept. Interior, Bur. Mines, miners' circular 22, 1919, 110 pp., 181 figs. Based on reports of State mine departments.

ELECTRICAL EQUIPMENT. Electricity Applied to Coal Mining, C. B. Reed. Coal Industry, vol. 2, no. 11, Nov. 1919, pp. 510-513. Discussion of development of mining machines to present types designed according to conditions in different seams. Reference is made to electric haulages, crushers and equipment

COKE

HEATING. Why and How Coke Should Be Used for Domestic Heating, Henry Henry Kreisinger and A. C. Fieldner. Dept. Interior, Bur. Mines, Technical Paper 242, 1919, 19 pp., 1 fig. Based on experiments conducted at Bur. of Mines on burning of coke and other fuels in house-heating furnaces.

OVENS. Making Coke for the Blast Furnace, W. F. Sutherland. Can. Machy., vol. 21, no. 19, Nov. 18, 1919, pp. 479-485, 16 figs. Operations of ovens installed at Hamilton plant steel company of Canada.

Coke Oven Plant at Hoyland Silkstone Collieries. Colliery Guardian, vol. 117, no. 3049. June 6, 1919, pp. 1343-1344, 4 figs. Plant comprises Luhrig coal washery and 37 Semet-Solvay ovens with power plant and other auxiliaries.

OVENS, BY-PRODUCT. The By-Product Coke Ovens at Anyox, B. C., and the Cassidy Colliery of the Granby Consolidated Mining and Smelting Co. Iron & Steel of Canada, vol. 2, no. 10, Nov. 1919, pp. 272-276, 6 figs. Following by-products are obtained: Benzol, toluol, solvent naptha, crude naptha and xylol. Operation of ovens is described.

The By-Product Coke Plant of the Algoma Steel Corporation at Sault Ste. Marie, Ontario, Wm. Seymour. Iron & Steel of Canada, vol. 2, no 10, Nov. 1919, pp. 262-268, 8 figs. Addition of 50 Wilputte ovens, increase of coal storage space and installation of additional primary cooler.

STEAM PRODUCTION. The Use of lump Coke for Steam Production (Die Verwendung von gestücktem Koks zur Dampferzeugung), Alfred Stober. Stahl und Eisen, vol. 39, no. 20, May 15, 1919, pp. 525-531, 4 figs. Article refers to publication on this subject by writer in Stahl und Eisen of Aug. 24, 1916, pp. 820-825 and relates his experiences after this period with coke fuel. Comparison of Steinmüller, Babcock and Siller types of furnace. (To be concluded.)

See also Refractories.

CODES, ELECTRIC

See High-Potential Systems.

COLLOIDAL FUEL

See Pulverized Coal.

COLLOIDS

Contribution to the Study of Non-Metallic Colloidal Particles (Contribucion al estudio de particulas coloidales no metalicas). Teofilo Isnardi, Contribucion al Estudio de las Ciencias fisicas y matematicas, Universidad de la Plata, no. 38, Dec. 1918, pp. 289-300, 2 figs. Application of absorption of solutions to determination of shape of particles.

COLUMNS

Stresses in Rods under Axial Pressure, Bent by Single Loads (Beanspruchung axial gedruckter, durch Einzellasten gebogener Stabe), Karl Arnstein. Eisenbau, vol. 10, no. 7, July 1919, pp. 151-156, 5 figs. Equations.

COMMUTATORS

The Trueing of Commutators, W. F. Sutherland. Power House, vol. 12, no. 18, Nov. 5, 1919, pp. 483-486, 9 figs. Illustrating methods used.

COMPASSES

The Electrical Gyro Compass, O. B. Whittaker. Eng. World, vol. 15, no. 10, Nov. 15, 1919, pp. 39-43, 7 figs. Principle of operation, manufacture and inspection. Abstract from lecture delivered before Am. Soc. of Mech. Inspectors.

New Gyroscopic Compass (Ein neuer Kreiselkompass), O. Martienssen. Zeitschrift für Instrumentenkunde, vol 39, no. 6, June 1919, pp. 165-180, 16 figs. Description and theory of new model, with reference to former study published in Zeitschrift f. Instrumentenkunde, vol. 32, p. 309, 1912.

COMPRESSORS

ECONOMY. Some Elements of Economy in Air Compression, Wm. Carter. Can. Min. Jl., vol. 40, no. 44, Nov. 5, 1919, pp. 825-829 and 831. Greatest value of water jacketing is seen in its effect on lubrication and resultant wearing qualities of machine. (Concluded.)

MOTOR PROTECTION. Electro-Pneumatic Device for Electrically Driven Air Compressors, Geo. J. Duckett. Elecn., vol. 83, no. 2163, Oct. 31, 1919, pp. 504-505, 3 figs. Suggested automatic arrangement in form of decompressor for releasing cylinder compression on starting up motor allowing normal current to flow and thus saving starter contacts.

ROTARY. A Perfected High-Pressure Rotary Compressor, Chester B. Lord. Mech. Eng., vol. 41, no. 11, Nov. 1919, pp. 877-878 and 905. Excessive end pressure said to be overcome by floating plates at ends of cylinder held in intimate contact with rotor by pressure generated by machine itself. A volumetric efficiency of 92 per cent is claimed.

CONCRETE

DISTRIBUTION. Distribution of Concrete by inclined Chutes—III. Engineer, vol. 128, no. 3326, Sept. 26, 1919, pp. 300-301, 2 figs. Traveling plants.

Installations for Distributing Concrete by Gravitation (Instalaciones para distribuir el hormigon por gravitacion), R. Eiriz Sequeiros. Ingenieria, vol. 23, no. 7, Oct. 1, 1919, pp. 277-294, 11 figs. Considerations in regard to selection of slope and mechanical details.

MOTION-PICTURE STUDY. Better Concrete—I, II, Nathan C. Johnson. Sci. Am. Supp., vol. 88, nos. 2284 and 2285, Oct. 25 and Nov. 8, 1919, pp. 236-237 and 251, and 276-277, 15 figs. Oct. 25: Motion picture studies of existing conditions; suggested improvements. Nov. 8: Motion picture studies of air voids, effects of violent stirring, disintegration and softening.

REINFORCED. Notes on Reinforced-Concrete Construction, Geo. Allen. Mech. World, vol. 66, no. 1712, Oct. 24, 1919, p. 200. Waterproofing; properties of reinforcing bars. (Concluded.) Paper read before Junior Instn. of Engrs.

Transversal Shrinking of Reinforced-Concrete Structures (Sur les effets transversaux du retrait dans les ouvrages en béton armé), G. Guillaumin. Comptes rendus des séances de l'Academie des Sciences, vol. 169, no. 10, Sept. 8, 1919, pp. 465-467. Calculations based on empirical equations developed from experimental measurements. Reference is made to previous communications in Comptes rendus.

SEA WATER. Concrete in Sea Water, J. L. Harrison. Concrete, vol. 15, no. 5, Nov. 1919, pp. 198-200, 4 figs. Deductions from investigations made in Philippine Islands.

STEEL, BOND. Bond Between Steel and Concrete, M. O. Fuller. Concrete, vol. 15, no. 5, Nov. 1919, pp. 201-203, 5 figs. Tests made both with concrete tamped paralel to axis of steel and with concrete tamped normal to axis. Comparison of results presented show that concrete vertically tamped possesses much higher bond stress.

CONDUCTIVITY

Measurement of the Conductivity of Solutions, H. I. Schlesinger and F. H. Reed. Jl. Am. Chem. Soc., vol. 41, no. 11, Nov. 1919, pp. 1727-1732, 1 fig. It is pointed out that even though minima obtained in measurement of resistance of solution by usual method may be perfectly sharp, results may nevertheless be incorrect and criteria for determining reliability of measurements and methods for overcoming some of difficulties encountered are suggested.

CONDUCTORS

British Standard Specification for Dimentions of Insulated Annealed Copper Conductors for Electric Power and Light, Including Pressure Tests. British Eng. Standards Assn., no. 7, July 1919, 33 pp. Specification does not deal with composition, quality or durability of insulating material used as dielectric.

CONDUITS

The Economical Design of Water Conduits, W. T. Taylor. Engineer, vol. 128, no. 3326, Sept. 26, 1919, pp. 293-296, 3 figs. Graphs for determination of conduit cross section.

CONSTRUCTION STANDARDS

Is There Need for Further Standardization in American Construction Activities? Earnest T. Trigg. Jl. Engrs. Club Philadelphia, vol. 36, no. 180, Nov. 1919, pp. 418-423. Review of results obtained from use of construction standards already adopted. Possibilities for further development in engineering, commercial and business practice, legislation and city-planning standards.

CONTACTS

Contacts and Contact Material, H. von Fleischbein. Telephone Engr., vol. 22, no. 5, Nov. 1919, pp. 19-20, 3 figs. Devices developed with view of preventing welding of contact points and neutralizing effect of dust on contacts. Translated from "Elektrotechnische Zeitschrift."

CONTRACTS

Contracts—A Comparison of "Cost-Plus" with other Forms, Ernest Wilder Clarke. Eng. World, vol. 15, no. 1, Nov. 15, 1919, pp. 15-17. Based on writer's experience during past few years with "cost-plus" form of contract.

CONTROLLERS

Improvements in Contactor Types of Industrial Controllers, H. D. James. James. Elec. Jl., vol. 16, no. 11, Nov. 1919, pp. 489-493, 12 figs. Explaining action and operation.

CONVERTERS

Improvements in the Starting and Controlling of Rotary Converters. Elecn., vol. 83, no. 2163, Oct. 31, 1919, pp. 492-493, 5 figs. Scheme of connections of self-synchronizing converters of General Electric Co., Ltd. Essential features are specially designed synchronizing switch and choking coils.

CONVEYORS

Notes on the Uses of Spiral Conveyors. Coal Trade Jl., vol. 50, no. 35, Aug. 27, 1919, pp. 1048-1049. Tables of capacities based on tests and experience with screw conveyor installations.

DRILLING MACHINES

Recent Machine Tool Developments—VI, Joseph Horner. Engineering, vol. 108, no. 2804, Sept. 26, 1919, pp. 400-403, 18 figs. High-speed sensitive drilling [illegible].

DROP FORGING

The Anatomy of a Drop Forging, Leslie Aitchison. Am. Drop Forger, vol. 5, no. 11, Nov. 1919, pp. 531-538, 12 figs. Points out how drop forgings [illegible] steel ingot and explains different types of forgings.

DRYDOCKS

See [illegible].

DRYING

See [illegible].

DURALUMIN

The Micro-Mechanism of the Ageing of Duralumin, Zay Feffries. Metal Indus., vol. 15, no. 14, Oct. 3, 1919, pp. 278-280. Observations concerning heat treatment of duralumin.

DYNAMICAL SYSTEMS

On Hamilton's Principle and the Modified Function in Analytical Dynamics, G. H. Livens. Proc. Roy. Soc. of Edinburgh, vol. 39, no. 2, 1918-19, pp. 113-119. Concerning analytical questions involved in derivations of modified Lagrangian function for dynamical system.

EARTHQUAKES

The Propagation of Earthquake Waves Through the Earth and Connected Problems, C. G. Knott. Proc. Roy. Soc., of Edinburgh, vol. 39, no. 2, 1918-19, pp. 157-208, 9 figs. Determination of laws of propagation of seismic waves based upon method of calculation in which no assumptions are made between velocity of propagation and distance from earth center.

EARTH SLIDES

Earth Slides in Winnipeg Aqueduct Construction, Douglas L. McLean. Can. Engr., vol. 37, no. 21, Nov. 20, 1919, pp. 469-471, 7 figs. Bearing tests said to have demonstrated instability of soft, dark clay, analysis of which showed 15 per cent. of moisture and water of combination.

EDUCATION

The Education of the Workingman, W. L. Grant. Queen's Quarterly, vol. 27, no. 2, Oct. 1919, pp. 159-168. How in England and Scotland education of adult workman is being linked up with trained minds of universities. Paper read before College and High School Section of Ontario Educational Assn.

EJECTORS

Water Ejector—Theory and Design, E. J. Laschinger. Jl. South African Instn. Engrs., vol. 18, no. 3, Oct. 1919, pp. 54-58, 2 figs. Including equations which establish radius with regard to quantities, size of jet and throat efficiency expressed in terms of ratio of available head to lift.

ELECTRIC-CAR CONTROLLER

Electro-Magnetic, Walter S. Goll. Jl. Cleveland Eng. Soc., vol. 12, no. 1, July 1919, pp. 49-57, 2 figs. Construction and operation of electric-car controller.

See also Controllers.

ELECTRIC DRIVE

MACHINES. Electric Power in Engineering Works, G. W. Stubbings. Eng. & Indus. Management, vol. 2, no. 17, Oct. 23, 1919, pp. 526-528, 3 figs. Illustrating installations of motor driving gear running-in machines, drills, buttoning machines, presses, etc.

See also Rolling Mills and Mills, Auxiliary Drives.

ELECTRIC FURNACES

See Furnaces, Electric and Ferro-Alloys.

ELECTRIC POWER SUPPLY

Electric Power Supply During the Great War—II, Arnold B. Gridley and Arnold H. Human. Jl. Instn. Elec. Engrs., vol. 57, no. 285, Aug., 1919, pp. 541-546. Electrical plant manufactury.

LIMITS. Limits of Alternating Current Power Transmission (Ueber die Grenzen der Kraftübertragung durch Wechselströma), Elektrotechnischer Anzeiger, vol. 30, no. 75, July 22, 1919, pp. 349-350. Comparison of advantages and disadvantages of d. c. and a. c. for long distance transmission.

ELECTRIC POWER TRANSMISSION

BUSSES. California 220-Kv. Transmission Bus. Elec. World, vol. 74, no. 14, Oct. 4, 1919, pp. 743-745. Proposal to interconnect high-tension systems of that state, of which a 220-kw., 1100-mile, 1,500,000-kw. line shall form backbone.

CIRCUITS. Electrical Characteristics of Transmission Circuit—IV, Wm. Nesbitt. Elec. Jl., vol. 16, no. 11, Nov. 1919, pp. 485-489. Table showing approximate voltage limitation resulting from corona based on F. W. Peck's formulae.

HIGH-TENSION LINES. Cost of Building a 33,000 Volt Line. Elec. World, vol. 74, no. 15, Oct. 11, 1919, pp. 798-799, 4 figs. Steel pole line 32 miles in length equipped with no. 1 Copper wire is said to have been erected in middle west at price of $3.181 per mile in 1918 when labor cost was particularly high.

An Extension of the Step-by-Step Method of Transmission Line Computation. Frederick Eugene Pernot. University of Cal. Publications in Engineering, vol. 2, no. 4, July 10, 1919, pp. 131-138. Carying through analytical solution with receiving end voltage and current represented merely by symbols without assuming any values for them.

See also High-Potential Systems.

ELECTRIC RAILWAYS

FREIGHT. Trolley Freight in New England, R. E. Cosgrove. Elec. Traction, vol. 15, no. 11, Nov. 15, 1919, pp. 750-752. Growth of trolley freight in New England. There are now 175 scheduled daily freight cars operating in New England over 1750 miles of track, giving employment to 850 people. Paper read before meeting of New England Street Ry. Club.

NEW YORK STATE. Electric Railways of New York State. Elec. Ry. Jl., vol. 54, no. 14, Oct. 4, 1919, pp. 688-690. Report of conference of executives on condition of industry held at Syracuse on Sept. 18 under auspices of "Committee of Ten," New York Elec. Ry. Assn.

ELECTRICAL MACHINERY

Cooling Devices for Electric Machinery (Neuere Kühleinrichtungen für elektrische Maschinen). Elektrotechnischer Anzeiger, vol. 36, nos. 61 and 62, June 19 and 22, 1919, pp. 279-280 and 283-284, 11 figs. Description of types made by Brown,Boveri & Co., Siemens- Schuckert-Werke and Allegemeine Elektrizitats-Gesellschaft. (To be continued.)

ELECTRICITY

DISTRIBUTION. National Distribution of Electrical Energy (Une distribution nationale d'énergie électrique). F. Scoumanne. Revue générale de l'Electricité, vol. 6, no. 18, Nov. 1, 1919, pp. 594-608, 4 figs. Discussion of economical advantages and mechanical possibilities of establishing such a system. Question if treated in general without reference to conditions in any particular nation.

Electricity as an Industrial Power. Hastings Read. Indus. Australian & Min. Standard, vol. 62, no. 1610, Sept. 18, 1919, pp. 547-559, 19 figs. Western Censtralian government scheme of distribution from central station.

DOMESTIC USES. Domestic Uses of Electricity (l'Electricité au foyer), W. Vaillancourt. Revue trimestrielle Canadienne, vol. 5, no. 19, Nov. 1919, pp. 293-310. Comparative costs of heating, washing, etc., by electricity and coal. Figures in Canada, United States and Norway are given.

INERTIA. Inertia of Electricity (La Inercia de la Electricidad), Racardo Gans. Contribucion al estudio de las ciencias, fiscias y matematicas, Universidad acional de la Plata, no. 38, Dec. 1918, pp. 225-230, 4 figs. Criticism of claims made by P. de Heen in Mémoire de la Société Royale des Sciences de Liège, vol. 6, 1905, p. 24, where in article on matter, its origin, its evolution and its end he claims to have observed centrifugal forces developed by electric current flowing through spiral wire. Writer claims that forces observed by de Heen were well-known electromagnetic forces between mobile and fixed parts of circuits.

ELECTRIFICATION, RAILWAY

AUSTRALIA. Railway Electrification in Australia. Ry. Rev., vol. 65, no. 18, Nov. 1, 1919, pp. 631-638, 10 figs. Upwards of 200 miles of line have been electrified in carrying out scheme of ultimately intended to cover entire system of state-owned lines as well as to concentrate in one large project greater portion of power development needed by industries of common-wealth.

FRANCE. Results of Electrification of French Railways, Fred W. Scholz. Telephone Engr., vol. 22, no. 5, Nov. 1919, pp. 38-40, 3 figs. Troubles caused to telephone service through interference of railway lines. Translated from Annales des télégraphes et téléphones.

SOUTH AFRICA. The electrification of the South African Railways. Ry. Gaz., vol. 31, no. 18, Oct. 31, 1919, pp. 561-565, 7 figs. Report presented by Merz and McLellan, consulting engineers to South African government railways. Economic aspect of electrification is studied and from analysis of local conditions system of electrification is developed. Also in Elecn., vol. 83, no. 2164, Nov. 7, 1919, pp. 520-521.

SPAIN. Electrification of Spanish Railway (Electrification de los Ferrocarriles Espanoles), D. Luis Sanchez Cuervo. Revista de Obras Publicas, vol. 67, no. 2293, Sept. 4, 1919, pp. 437-440. Economical aspect of problems. (To be continued.)

SWITZERLAND. Electrification of Swiss Railways, F. Dossenbach. Jl. Electricity, vol. 43, no. 10, Nov. 15, 1919, pp. 469-470, 1 fig. Present development and plans for future electrification.

UNITED STATES. The Prospects of Railroad Electrification in American and Abroad. Street Ry. Bul., vol. 19, no. 11, Nov., 1919, pp. 427-429. High cost and inadequate supply of fuel in Europe make, in opinion of writer, railroad electrification there inevitable.

FIRE HAZARD

Dry Cell Batteries. Fire Hazard of Dry Cell Batteries, H. I. Miner. Quarterly of the Nat. Fire Protection Assn., vol. 13, no. 2, Oct. 1919, pp. 148-150, 1 fig. Due to their becoming short-circuited.

FIRE HYDRANTS

The Care of Fire Hydrants in Winter Weather in Montreal, T. W. Lesage. Quarterly of the Nat. Fire Protection Assn., vol. 13, no. 2, Oct. 1919, pp. 137-138 1 fig. Organization of staff of inspectors.

FIRE PROTECTION

Aeroplanes. *See Aeroplanes, Fire Protection.*

Building Construction. Building Construction and Fire Protection, J. Grove Smith. Contract Rec., vol. 33, no. 45, Nov. 5, 1919, pp. 1022-1025. From report on fire waste in Canada of Dominion Fire Commissioner.

Equipment. Railway Fire Protection Equipment, C. R. Knowles. Ry. Rev. vol. 65, no. 18, Nov. 1, 1919, pp. 645-648, 2 figs. Agents in use on railway are enumerated to be: Bicarbonate of soda, caustic soda and sulphuric acid, carbon-tetrachloride, dry sand and water. Paper read before Am. Ry. Bridge & Building Assn. Also in Ry. Maintenance Engr., vol. 15, no. 11, Nov. 1919, pp. 404-407, 5 figs.

See also Gas Masks and Sulphite.

FLAME VELOCITY

Flame Velocity in Inflammable Gases, J. D. Morgan. Engineering. vol. 108, no. 2808, Oct. 24, 1919, pp. 535-536, 7 figs. Derivation of expression establishing proportionality between flame velocity and gas pressure during combustion of inflammable gases.

FLUORESCENCE

Conditions of Excitation of Fluorescence (Sur les conditions d'excitation de la fluorescence), L. Bruninghaus. Comptes rendus des séances de l'Académie, vol 169, no. 12, Sept. 22, 1919, pp. 531-534. From experiments it is concluded that phenomena of phosphorescence and fluorescence are characterized by property that intensity of luminosity is maximum when solution is highly diluted and exciting radiation very feebly absorbed.

FORGING

American Practice. Making and Heat-Treating Heavy Forgings. Machy. (Lond.), vol. 15, no. 379, Oct. 30, 1919, pp. 129-135, 11 figs. Examples of American practice in production of heavy gun ingots and forgings.

Plant. Allis-Chalmers Heavy Forging Plant. Am. Drop Forger, vol. 5, no. 11 Nov. 1919, pp. 527-530, 7 figs. Equipped with 3000-ton hydraulic press, 1000-ton press and series of hammers. Attention is called to features of design which permit of future expansion of plant. Also in Blast Furnace & Steel Plant, vol. 7, no. 11, Nov. 1919, pp. 533-536, 7 figs.

Temperatures. Forging Temperatures and Rate of Heating and Cooling of Large Ingots, F. E. Bash. Blast Furnace and Steel Plant, vol. 7, no. 11, Nov. 1919, pp. 561-565 and 573, 3 figs. Results of tests claimed to show that an optical pyrometer can be used to determine when an ingot is ready to forge. Data offers suggestions for proper heating.

FOUNDRIES

Cast Steel. Examples of Practical Utilization in Founding Industry of Results of Physical and Chemical Tests (Exemples d'utilisation dans la pratique Industrielle de la fonderie de fonte des résultats d'essais physiques et chimiques, J. Seigle. Fonderie Moderne, vol. 12, no. 5, May 1919, pp. 107-111, 13 figs. Graphs indicating physical properties of cast steel of various composition, From Bulletin de la Société de l'Industrie Minérale.

Comparisons. Foundry Comparisons, H. G. Barrett. Foundry Trade Jl., vol. 21, no. 214, Oct. 1919, pp. 738-743, 11 figs. Concerning different types of runners, and various operations in founding brass and malleable cast iron. Paper read before Lond. Branch of Instn. of British Foundrymen.

See also Furnaces, Electric.

FREQUENCY

Standardization of Frequency in Italy (Della Unificazione delle Frequenze in Italia), U. del Buona. Elettrotecnica, vol. 6, no. 26, Sept. 15, 1919, pp. 550-552. Value of 50 periods proposed as standard for whole of Italy by Committee of Associazione Elettrotecnica Italiana.

FRICTION

Weighing of the relative Friction Between Two Solids (La pesée d'un frottement pendant le glissement relatif des deux solides en contact), Jules Andrade. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 15, Oct. 13, 1919, pp. 638-639. Suggested experiment.

FUEL

Comparative Costs. Some Phases of the Fuel Problem, George A. Orrok. Elec. World, vol. 74, no. 15, Oct. 11, 1919, pp. 801-803, 3 figs. Comparative costs of coal and oil in heat equivalents and relation of prices of coal to price of oil in heat equivalent.

Economy. Fuel Economy. Chem. News, vol. 119, no. 310, Oct. 24, 1919, pp. 195-198. Committee report of British Assn. for advancement of science. (To be continued.)

See also Coal Conservation.

Supply. Present Fuel Supply from an Engineering Standpoint, H. M. Chance. Jl. Engrs. Club Philadelphia, vol. 36, no. 180, Nov. 1919, pp. 414-417. Calls attention to fact that while mines, equipment and coal resources are adequate to supply any possible demand, nevertheless ability of operator to mine is limited in part by labor shortage and principally by in adequate and irregular car service and by irregularity in purchases by consumers.

FURNACES

Combustion Control. Method and Apparatus for Controling Combustion in Automatically-Stoked Furnaces (Méthode rapide et appareils de contrôle des foyers à chargement automatique), Marcil Chopin. Génie Civil, vol. 75, no. 18, Nov. 1, 1919, pp. 421-425, 3 figs. Schematic arrangement of Chopin system.

Electric. Electric Furnaces, J. H. Stansble. Foundry Trade Jl., vol. 21, no. 214, Oct. 1919, pp. 703-707 and (discussion) pp. 707-708. Notes on Stassano, Rennerfelt, Heroult, Girod, Hering "Pinch" and Greaves-Etchells furnaces. Paper read before Birmingham Branch of Instn. British Foundrymen.

Large Electric Steel Melting Furnaces, Victor Stobie. Elecn., vol. 83, no. 2164, Nov. 7, 1919, pp. 526-528, 4 figs. Observations in regard to wiring diagram and shapes of furnaces transformers and automatic electrode regulators. Abstract of paper read before Instn. Elec. Engrs.

Modern Electric Furnace Practice in Foundries, W. E. Moore. Mech. Eng., vol. 41, no. 11, Nov. 1919, pp. 874-876. Comparative operating costs are presented which bring out marked economy of electric furnace processes over converter process of producing liquid steel.

Production of industrial Metals in the Electric Furnace (Herstellung von industriell verwertbaren Metallen im Elektroofen), H. Baclesse. Elektrotechnischer Anzeiger, vol. 36, no. 13, 16, 18, Feb. 13, 23 and Mar. 2, 1919, pp. 61-62, 75-76 and 85-86. Tests made were mostly laboratory tests; metals tested were baryum, calcium, beryl, cobalt, nickel, titans, manganese, and chrome. (To be continued.)

Uses of Electric Furnace in Modern Chemical and Metallurgical industries (L'électrothermie à haute température dans les industries chimiques et métallurgiques modernes), Jean Escard. Industrie Electrique, vol. 28, no. 656, Oct. 25, 1919, pp. ??? Extraction of metals, notably aluminum copper; preparation of ferroalloys. (To be continued.)

Heat Treating. Heating Furnaces and Annealing Furnaces, W. Trinke. Blast Furnace & Steel Plant, vol. 7, no. 11, Nov. 1919, pp. 539-543, 9 figs. Selection of fuel for a given furnace in conjunction with selection of equipment for its economical combustion. Natural gas as a furnace fuel. Also in Am. Drop Forger, vol. 5, no. 11, Nov. 1919, pp. 541-545, 7 figs.

Oil Burners. The Function of Oil Burners in the Operation of Furnaces, Henry J. N. Voltmann. Jl. Am. Steel Treaters Soc., vol. 2, no. 2, Nov. 1919, pp. 110-115 and (discussion) pp. 115-116. Observed that application of burners to existing furnaces without making proper provision in furnace brickwork to maintain conditions necessary for properly heating product, is in long run a waste of time.

Open-Hearth. Improvement of Heat Economy in Furnaces, especially open-hearth Furnaces (Verbesserung der Wärmewirtschaft von Ofenfeuerungen, insbesondere von Martinöfen), W. Tafel. Stahl und Eisen, vol. 39, no. 43, Oct. 23, 1919, pp. 1280-1233, 1 fig. Showing various means for avoiding or utilizing heat losses; suggestions for preventing explosions in Siemens Martin furnaces when connected with boilers.

See also Hoists.

Reverberotory. Balance of Heat and Matter in a Foundry Laboratory Furnace (Stoff und Wärmebilans eines Giesvereiflammofens), R. Gnade. Stalh und Eisen, vol. 39, no. 22, May 29, 1919, pp. 590-595, 3 figs. Giving analysis of charge, of slag, of coal and flue gas; also temperatures of iron slag and furnace. Showing balance of matter of charge and of yield. (To be concluded.)

GAGES

Hole Limits. Limits for Gages for Holes. Machy. (Lond.), vol. 15, no. 370, Oct. 30, 1919, p. 145. Reasons advanced by Newal Eng. Co., Walthamstow, in support of plus and minus hole limits.

Summary of Reasons in Support of Plus and Minus Hole Limits. Engineering, vol. 108, no. 2808, Oct. 24, 1919, pp. 549-550. Presented in substantiation of contention that proposal of British Engineering Standards Assn. to make nominal size low limit for all holes will not be in best interest of all concerned.

Screw. Modern Methods of Screw Gage Production. Machy. (Lond.), vol. 15, no. 369, Oct. 23, 1919, pp. 121-124, 13 figs. Illustrating various specially designed single-purpose machines.

Screw Gage Making at Guildford. Engineer, vol. 128, no. 3329, Oct. 17, 1919, pp. 375-378, 14 figs. Machines and methods of testing.

Serration. The Inspection of Serration Gages and Serrated Components, R. B. Dyer. Machy. (Lond.), vol. 14, no. 359, Aug. 14, 1919, pp. 589-590, 8 figs. Formulae for checking broaches, cutters, tools, gages, etc. Form of serration considered is where spaces between teeth are sufficiently narrow in proportion to their depth to permit of measurement by means of wires.

GAS

Consuming Devices. Lack of Standard Performance Data Tends to Prevent Improvement in Efficiency of Gas Consuming Devices. Am. Gas Eng. Jl., vol. III, no. 18, Nov. 1, 1919, pp. 420-421 and 426. Report of Industrial Fuel Committee of Committee on Standard Performance Specifications for Gas Appliances of Am. Gas Assn.

HEATMETER

A New Compensated Heatmeter, Charles P. Frey. Proc. Steel Treating Research Soc., vol. 2, no. 7, 1919, pp. 27-33 and p. 51, 6 figs. Apparatus is essentially Brown pyrometer in which effect of line and thermocouple resistance has been eliminated.

HEAT TREATMENT

Steel. Notes on Heat Treatment of Steel, D. T. Lynch. Proc. Steel Treating Research Soc., vol. 2, no. 7, 1919, pp. 12-19 and 35-37, 11 figs. Comparison of physical properties of plain carbon steel with test result in 6-in. shell, presented with view to emphasize fact that problem of heat treating plain carbon steel is verification of old processes rather than any new development.

Tractor Parts. Heat Treating at the Holt Plant, J. W. Cook. Metal Trades, vol. 10, no. 11, Nov. 1919, pp. 479-481, 5 figs. Process used for heat treating tractor parts.

See also Alloys, Vanadium; Case Hardening; and Steel, Heat Treatment.

HIGH-POTENTIAL SYSTEMS

Discussion of Code Rules on High-Potential Systems, G. S. Lawler. Elec. Rev. (Chicago), vol. 75, no. 20, Nov. 15, 1919, pp. 822-824. Comments on relation of present rules to developments in field practice, with suggestions for proposed changes in rules given in paper presented to National Assn. of Elec. Inspectors.

Excess Voltage Produced by Means of Sustained Oscillation (Sovratensioni elettriche prodotte dalle oscillazioni persistenti), L. Lombardi. Elettrotecnica, vol. 6, no. 26, Sept. 15, 1919, pp. 556-561. Laboratory experiments performed in high-tension artificial line.

HOISTING MACHINERY

A New Development in Hoisting Machinery, Warren Travell. Freight Handling & Terminal Eng., vol. 5, no. 10, Oct. 1919, pp. 380-382, 3 figs. Apparatus in which single drum is used for both vertical hoisting and horisontal traversing.

HOISTS

Main Hoists for Open Hearth Ladle Cranes, W. W. Garrett, Jr. Assn. Iron & Steel Elec. Engrs., Oct. 1919, pp. 18-22 and (discussion) pp. 22-29. Tests and observations made on overhead electric traveling cranes, and suggestions in regard to their operation.

HOURS OF WORK

Revolutionizing the Wage and Industrial System in France, W. F. Bradley. Automotive Industries, vol. 41, no. 14, Oct. 2, 1919, pp. 670-674, 8 figs. Effect of introducing 48-hour week.

HOUSES

Concrete. Moulding Houses in Steel Forms for War Workers, Milton Dana Morrill. Cement & Eng. News, vol. 31, no. 11, Nov. 1919, pp. 36-38, 10 figs. Concrete houses built of cinder concrete mixed in proportion of one part cement, 2½ parts sand and 5 parts cinders.

Construction. British House Building Methods, Charles T. Ruthen. Building News, vol. 117, nos. 3380 and 3381, Oct. 17 and 24, 1919, pp. 331-332 and 337-338, 3 figs. Oct. 17: Economic aspect of housing problem in Great Britain. Oct. 24: Weatherproof houses that have been erected at Newton in a few weeks and were ready to be tenanted immediately. Also in Surveyor, vol. 56, no. 1449, Oct. 24, 1919, pp. 241-244, 4 figs.

Construction of Small Cottages (Kleine Wohnhäuser), Schweizerische Bauzeitung, vol. 74, no. 17, Oct. 25, 1919, pp. 209-211, 11 figs. Cheap type of workmen's houses constructed of wood and concrete, designed by Swiss architects. (Concluded.)

Residence Design. Large 8-Roomed Residence. Contract Rec., vol. 33, no. 44, Oct. 29, p. 1011, 3 figs. Rooms are designed to provide suites separate from rest of house.

HOUSING

The Work of the Toronto Housing Commission. Contract Rec., vol. 33, no. 46, Nov. 12, 1919, pp. 1041-1042, 2 figs. Types of houses being erected by the commission for use of workingmen. Two styles costing from $3,800 to $4,000.

See also Houses and Salvage Wall.

HYDROELECTRIC PLANTS

Canada. Hydro-Electric Power Development at High Falls. Can. Engr., vol. 37, no. 20, Nov. 13, 1919, pp. 451-454, 15 figs. Net head of 80 ft. utilized at power site on Miss. River by Hydro-Electric Power Commission of Ontario. Details of dam, intake, gate house, pipe line and power house. Surface area method of proportioning materials said to show excellent results in construction of concrete dam.

Niagara Falls. Queenston-Chippewa Development at Niagara Falls, Ontario, Harry Gardiner. Eng. World, vol. 15, no. 9, Nov. 1, 1919, pp. 17-21, 11 figs. Canal project, to cost about $25,000,000, consisting of one of possible group of several parallel canals near Niagara Falls, each intended to develop 300,000 hp.

The Relation of the Chemical Industry of Niagara Falls to the Water Works, John A. Kienle. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 496-513 and (discussion) pp. 514-517, 7 figs. Statistics of power development and of electrically made products, notably manufacture of liquid chlorine and bleaching powder by electrolytic method.

Norway. Hydroelectric Installations in Norway, Chas. H. Tallant. Jl. Electricity, vol. 43, no. 9, Nov. 1, 1919, pp. 417-418, 3 figs. Notably installation of electrolytic furnace plant where seven 4500-hp. Pelton impulse turbine, direct connected to 10,000-amperes, 300-volt direct-current generators.

Hydrolysis. Investigation of Hydrolysis of some Metal Acetates (Untersuchung über die Hydrolyse Metallacetate), N. Löfman. Zeitschrift für einiger anorganische und allgemeine Chemie, vol. 107, no. 4, July 29, 1919, pp. 241-246, 1 fig. Special tests of distribution coefficient and its dependency on temperature and concentration. Acetates examined were ammonia, aluminum, iron, mercury, silver, nickel, cobalt, zinc, lead, magnesium and natrium acetate.

INDUSTRIAL DEMOCRACY

Experiences in Industrial Democracy, F. L. Fluerbach. Contract Rec., vol. 33, nos. 45 and 46, Nov. 5, & 12, 1919, pp. 1032-1034, & 1051-1053. Successful application by William Demuth & Co. of a plan of internal government in its plant, aiming to solve labor difficulties.

Industrial Democracy—a remarkable experience, B. C. Forbes. Brick & Clay Rec., vol. 55, no. 11, Nov. 18, 1919, pp. 957-960. How Packer Piano Co. of Fort Wayne, Ind., established about six years ago "cordial, friendly, co-operative and mutually profitable relation" between employers and workers, which "have continued unruffled ever since."

INDUSTRIAL RELATIONS

Capital and Labor. Competition, Combination and Co-operation, S. P. Robins. Can. Ry. Club, vol. 18, no. 7, Oct. 1919, pp. 17-31. Observes that "Capitalists like workmen are at liberty to pursue their own interests in the way which they think best, provided always that way is not unethical" but "What is certainly wrong is that combinations of capitalists should disregard all considerations of justice, humanity and civilization in order to attain their own ends."

Human Factor. The Human Factor in the Operation of Industry, Henry R. Seager. Mech. Eng., vol. 41, no. 11, Nov. 1919, pp. 886-887. Four ways of handling labor problems that are currently being tried are discussed: (1) Method of just and generous small employer who keeps in touch with needs of his employees and anticipates their needs; (2) method of large corporations, which tries by means of wellfare workers and profit-sharing to content employees and discourage them from going in labor organizations: (3) method of shop committee; and (4) plan of joint industrial councils.

Labor Organizations. How the Employer May Control the Changing Demands of Radical Labor, Harry Tipper. Automotive Industries, vol. 41, no. 16, Oct. 16, 1919, pp. 784-785. Advocates formation of labor organization within each factory which should permit collective bargaining and meet through needs of workers. Labor, writer says, is being influenced by men possessing no constractive ability who are drawing workers away from their old leaders by virtue of irresponsible promises and criticisms of deficiencies of union system.

Magazines for Employees. The Function of the Employees Magazine, E. B. Archley. Elec. Traction, vol. 15, no. 11, Nov. 15, 1919, pp. 759-761. Experience of railway company in securing contentment of employees by publishing in company organ notices warning men against activities of agitators.

Mining Industry. Industrial Relations in the Mining Industry, Chas. F. Willis. Arizona Min. Jl., vol. 3, no. 6, Nov. 1919, pp. 3-5. Their establishment is needed, writer observes, because psychology of miner is no different from that of any other worker, but he points out special conditions in industry which necessitate modification of systems followed in work-shops.

Profit Sharing. *See Profit Sharing.*

Unrest. Industrial Unrest. Mech. Eng., vol. 41, no. 11, Nov. 1919, pp. 884-885. Historical survey of industrial unrest in United States.

INSULATORS

Causes of Breakage in High-Tension Insulators, E. O. Meyer. Elecn., vol. 83, no. 2162, Oct. 24, 1919, pp. 466-467. Examination of breakages occurring frequently in transmission line in Germany claimed to have discovered that cause of cracking lay in cementing process by which parts of insulators were joined together. Translated from Elektrotechnische Zeitschrift, nos. 16, 17, 18 and 24, 1919.

Phenomena Causing Rupture of High-Tension Insulators (Phénomènes provoquant la mise hors service des isolateurs à haute tension), E. O. Mayer. Revue générale de l'Electricité, vol. 6, no. 18, Nov. 1, 1919, pp. 608-609, 3 figs. Factors which influence formation of fissures. Translated from Elektrotechnische Zeitschrift.

Inyoite. Colemanite Pseudomorphous after Inyoite from Death Valley, California, Austin F. Rogers. Am. Mineralogist, vol. 4, no. 11, Nov. 1919, pp. 135-139, 2 figs. Including graphic method for determining geometrical constant of inyoite.

IRON AND STEEL MANUFACTURE

Fuel Economy and Consumption in the Manufacture of Iron and Steel, W. A. Bone, R. Hadfield and A. Hutchinson. Engineer, vol. 128, nos. 3326 and 3327, Sept. 26 and Oct. 3, 1919, pp. 316-317 and 341-343, 1 fig. Abstract of report presented to Iron and Steel Institute Autumns Meeting, on behalf of British Assn. Fuel Economy Committee.

IRON ORE

Developments. Recent Iron Ore Developments in the United Kingdom, F. H. Hatch. Colliery Guardian, vol. 118, no. 3055, July 18, 1919, pp. 157-158, 2 figs. Process of treating jurassic ironstones.

MAGNETIC MATERIALS

[illegible] for Electrical Purposes, Frank P. Fahy. Jl Am Steel [illegible], vol. 2, [illegible] 2, Nov., 1919, pp. 74-87, 4 figs. Points out fields of [illegible] magnetic material and source of common variations in [illegible] quality.

MAGNETOS

British Standard Specification for Magnetos for Aircraft-Purposes. British [illegible] Standards Assn., no. 86, July 1919, 27 pp., 23 figs. Only dimensions which [illegible] magnetos as a whole are dealt with.

MAIZE AS FUEL

Maize as Fuel for Steam Boilers. Ry. Gas, vol. 31, no. 17, Oct. 24, 1919, pp. 525. Use on locomotive engines in Argentine, with notes on calorific value and costs.

MALLEABLE IRON

Strive for Strength in Malleable, H. E. Diller. Foundry, vol. 47, no. 19, Nov. 15, 1919, pp. 803-807, 19 figs. Experience of company which formerly made railroad castings and has recently engaged in automobile work.

MANAGEMENT

See [illegible] Management and Shop Management.

MECHANICS

Solutions of the Problem of Three Bodies When the Lines Joining the Three Bodies Form an Isosceles Triangle (Sur les solutions du problème des trois corps où les trois corps forment un triangle isoscèle), Jean Chazy. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 12, Sept. 22, 1919, pp. 526-529. Five movements pointed out—Lagrange's Euler's, movement admitting axis of symmetry, movement admitting plane of symmetry, and limit of two preceding movements.

MERCURY VAPOR PRESSURES

The Vapor Pressures of Mercury in the Range 120 deg. to 250 deg., Alan W. C. Menzies. Jl. Am. Chem. Soc., vol. 41, no. 11, Nov. 1919, pp. 1783-1787, 1 fig. Measurement by method involving use of two McLeod gages, hot and cold respectively.

METAL CONSTRUCTION

Esthetics of Metal Construction (Consideraciones sobre la estética de las construcciones metalicas), ... vol. 67, no. 2297, Oct. 2, 1919, pp. 488-494. Possibilities of ....as determined by mathematical calculations, to make them comply with accepted standards of artistic beauty.

METEOROLOGY

See Balloons.

METRIC SYSTEM

Standardization With .... Drury. Jl... Electricity, vol. 43, no. 9, Nov. 1, 1919, pp. 409-411, ... dealings with Allies during war "we were not at one" with them because we did not use the metric system while "30 nations fighting Germany were all using the metric units of weights and measures, and were thus capable of complete co-operation and united action."

MICARTA

See Aeroplanes Propellers.

MILLS

AUXILIARIES, DRIVES. Electric Versus Hydraulic Drive for Steel-Mill Auxiliaries, R. B. Gerhardt. Elec. Rev. (Chicago), vol. 75, no. 18, Nov. 1, 1919, pp. 736-738. From standpoint of control, adaptability, efficiency, and cost. Paper read before Iron & Steel Engrs.

POWER PIPING. Power Piping Requirements in Modern Mills, J. Roy Tanner and George J. Stuart. Blast Furnace & Steel Plant, vol. 7, no. 11, Nov. 1919, pp. 566-568. It is claimed that development of power generating machinery has stimulated progress in manufacture and mode of installation of power piping and placed heavier demands on specialists. Paper read before Engrs. Soc. of Western Pa.

SAFETY MOVEMENT IN. Safety Movement in Steel Mills, C. M. Brading and F. A. Wiley. Assn. Iron & Steel Elec. Engrs., Oct. 1919, pp. 3-17. Planning direction and supervision of safeguarding and education as elements in safety movement.

MILLING MACHINES

SPINDLE NOSES. Standard Spindle Noses for Milling Machines. Engineering, vol. 108, no. 2808, Oct. 24, 1919, pp. 548-549, 17 figs. Types in use by various members of Associated British Machine Tool Makers, Ltd., are presented and it is suggested in reference to previous article on subject published in Engineering that whole question of standardization be thrashed out with a view to securing interchangeability of arbors. Also in Engr., vol. 128, no. 3328, Oct. 10, 1919, p. 358, 4 figs.

THREAD MILLING. British Thread Milling Machines—III & IV. Engineer, vol. 128, no. 3326 & 3327, Sept. 26 and Oct. 3, 1919, pp. 302-304 and 324-326, 12 figs. Machine in which cutter and work are always driven at same speed, thread is not milled to full depth until after work has made 30 to 40 revolutions and work and cutter do not move longitudinally relatively to each other.

MINE ACCIDENTS

HAULAGE INCLINES. Accidents on Haulage Inclines—I, V. Eatteyne and L. Lebens. Colliery Guardian, vol. 118, no. 3070, Oct. 31, 1919, p. 1165, 7 figs. Recommendations based on investigation of cases of accidents in Belgium mines during period of 1889 to 1912. Translated from Annales des Mines de Belgioue.

Causes of Accidents on Incline Planes of Mines and Manner of Preventing Them (Les Causes d'Accidents sur les Plans Inclinés des Mines et l'étude des dispositions à prendre pour les prévenir). Génie Civil, vol. 75. no. 17, Oct. 25, 1919, pp. 395-398, 23 figs. Investigation and studies made by Belgium Department of Mines. Abstracted from Annales des Mines de Belgique, vol. 19 and 20.

EFFECT OF COMMON LANGUAGE. English Language and Mine Accidents, Albert H. Fay. Coal Industry, vol. 2, no. 11, Nov. 1919, pp. 489-492. Showing by comparison accidents increase as failure to speak a common language decreases.

FIRES. *See Breathing Apparatus.*

MINE WATER

NEUTRALIZATION. Neutralizing of Acid Mine Water on the Witwatersrand and Settlement and Treatment of Sludge formed thereby, F. Wartensweiler. Jl. South African Instn. Engrs., vol. 18, no. 3, Oct. 1919, pp. 46-53. Based on data obtained as result of experimental investigations.

MINES

PLANS. Isometric Mine Plans: Their Applications, Limitations and Method of Construction, H. Edward Clayton. Proc. Australasian Inst. Min. & Metallurgy, no. 34, June 30, 1919, pp. 9-18, 8 figs. Indicating cases in which method can be used to advantage.

RESCUE. Standardizing Mine Rescue. Salt Lake Min. Rev., vol. 21, no. 15, Nov. 15, 1919, pp. 29-30. Its desirability. Address delivered at Eighth Annual Safety Congress.

MINES

SALTING, DETECTION OF. The Detection of Salting, Morton Webber. Min. & Sci. Press, vol. 119, no. 19, Nov. 8, 1919, pp. 673-676. Suggested for detecting fraud.

STATE CONTROL. A National Mining Scheme, J. M. M. Munro. Iron & Coal Trades Rev., vol. 99, no. 2695, Oct. 24, 1919, p. 541. Underlying idea is that State should buy under compulsory powers controlling interest in industry and reconstruct it on safe lines.

VENTILATION. Ventilation in Shaft Sinking—I & II, H. Joosten. Colliery Guardian, vol. 118, nos. 3054-3055, July 11 & 18, 1919, pp. 91-92 and 159-160, 22 figs. Details of sinking derrick with ventilating appliances. Methods for coupling up lengths of pipe by means of flanges tightened with bo ts or clamps and sleeves. (Concluded.) Translated from Glückauf.

WORKING CAPACITY. The Working Capacity of Mines, A. Delmer. Colliery Guardian, vol. 118, no. 3059, Aug. 15, 1919, pp. 426-427. Study of nature of deposit, method of working and number of workmen as factors affecting productivity of each.

MINING PROFESSION

The Relation between Pure Science and the Mining Profession, J. S. Haldane. Sci. & Art of Min., vol. 30, no. 7, Nov. 1, 1919, pp. 97-100. Paper presented before the Past & Present Mining Students' Assn. at the Wigna Min. & Technical College, Oct. 18, 1919.

MINING INDUSTRY

See Industrial Relations, Mining Industry.

MOLDING SANDS

Molding Sands for Non-Ferrous Foundry Work, P. G. H. Boswell. Engineering, vol. 108, no. 2804, Sept. 26, 1919, pp. 418-420, 1 fig. Results of chemical and mechanical analyses. Paper read before Instn. of Metals. Also in Foundry Trade Jl., vol. 21, no. 214, Oct. 1919, pp. 712-716.

See also Foundries.

MOLDS

Leam Mold for Evaporator Steam Belt. Foundry, vol. 47, no. 19, Nov. 15, 1919, pp. 811-816, 9 figs. Example of loam-molding job recently completed in gray-iron foundry. Casting forms steam belt for evaporator and constitutes part of installation in sugar mill.

MOLYBDENITE

Some Optical and Photoelectric Properties of Molybdenite, W. W. Coblentz and H. Rakler. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 338, pp. 121-162, 22 figs. Data on change in electrical conductivity of molybdenite when exposed to thermal radiations of wave lengths extending from 0.36u in ultra-violet to beyond 9u in infra-red. Also in Jl. Wash. Acad. Sci., vol. 9, no. 18, Nov. 4, 1919, pp. 537-539.

PAINT-OIL SUBSTITUTE

Paint Oil Substitutes, A. H. F. Phillips. Ry. Rev., vol. 65, no. 18, Nov. 1, 1919, pp. 663-664. Linseed oil substitutes being employed in manufacture of paints for railway use

PAPER MILLS

History and Economics of Papermaking, Job Taylor. Paper, vol. 25, no. 4, Oct. 1, 1919, pp. 56 and 60-62. Early origin of the art and rise and development of wood fibers in paper-making.

Hydroelectric Plant and Paper Mill at Ocean Falls, B.C., W. A. Scott. Eng World, vol. 15, no. 10, Nov. 15, 1919, pp. 35-38, 7 figs. Plant has producing capacity of 200 tons of paper per day. Special attention is given to features of motor drive.

PARACHUTES

Airplane Parachutes (Notes sur les Parachutes d'avions), L.-P. Frantzen. Aérophile, vol. 27, nos. 17 and 18, Sept. 1-15, 1919, pp. 279-283, 4 figs. "Robert" type, developed in France, which is said to open entirely in 3 4/5 sec. (Continuation of serial.)

PARAFFIN

See Napthalene.

PATENTS

Patents and Progress, William E. Greenawalt. Min. & Sci. Press, vol. 119, no. 20, Nov. 15, 1919, pp. 708-712. Expressions given in technical press about use and abuse of patents are criticized because they make no attempt to conform with other laws pertaining to property or position. It is remarked that "special legislation is never a success," and "patented inventions are no different from other terms of property, and the general laws that govern one form of property should govern every other form."

PATTERNMAKING

The Segmental Method in Patternmaking, James Edgar. Mech. World, vol. 66, no. 1713, Oct. 31, 1919, pp. 210-211, 7 figs. Believed to be preferable for shapes that are irregular or that have to be recessed in places after work is turned. Examples of application are given.

PAVEMENTS

Permanent Pavements at Railway Stations and Freight Terminals, H. Colin Campbell. Eng. World, vol. 15, no. 10, Nov. 15, 1919, pp. 19-20, 6 figs. Their construction suggested as inviting field for contractors specializing in concrete street and highway paving.

PETROLEUM INDUSTRY

BAKU. The Petroleum Industry of Baku (L'Industria petrolifera di "Baku"), Rivista Marittima, vol. 52, nos. 8 and 9. Aug. and Sept. 1919, pp. 201-228, 2 figs. General statistics of production of region compared with figures indicating total production in Russia.

BORYSLAW. Geological Notes on the Boryslaw Petroleum Field in Galacia (Remarques géologiques sur le profil du champ pétrolifère de Boryslaw en Galicie), Arnold Heim. Archives des Sciences physiques et naturelles, vol. 1, no. 5, July and Aug. 1919, pp. 289-301, 2 figs., on two supp. plates. Stratigraphic study specially of zone which is believed to indicate permanently passage from Eocene and Olgocene in tetiary series.

PHOTOELECTRIC SENSITIVITY

Spectral Photoelectric Sensitivity of Silver Sulphide and Several Other Substances, W. W. Coblentz and H. Kahler. Dept. Commerce. Scientific Papers of Bur. of Standards, no. 344, Sept. 19, 1919, pp. 231-249, 17 figs. Data on change in electrical resistance of sulphides of silver and of bismuth, when exposed to radiations of wave lengths extending from 0.6 u invisible spectrum to about 3 u in infrared; also measurements upon galena cylindrite, pyrites, and jamesonite.

PHOTOMETERS

Suggestion in Regard to Manner of Using Weber Photometer (Contribution à l'emploi du Photomètre de Wéber). Société belge des Electriciens, vol. 33, July-Sept. 1919, pp. 185-187, 2 figs. Connecting in series the two incandescent lamps which are used as standards.

PHOTOPHONE

Bell's "Photophone" made practical. Telephone Engr., vol. 22, no. 5, Nov. 1919, pp. 13-15, 7 figs. Arrangement and action of Rankine's improvement. Apparatus in form given was used for British war signals.

PIEZO-ELECTRIC EFFECT

The Piezo-electric Effect in the Composite Rochelle Salt Crystal, A. McL. Nicolson. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 11, Nov., 1919, pp. 1315-1335, 20 figs., partly on two supp. plates. Exposition of Piezo electricity and related optical and other properties belonging to these crystals. Special reference is made to comparatively large piezo electric effects produced by Rochelle salts crystals, prepared so as to develop natural composite structure.

PILING

Making Interlocking Steel Piling Watertight, W. T. Christine. Eng. World, vol. 15, no. 10, Nov. 15, 1919, pp. 27-28, 1 fig. By driving combination of sheet steel piling and heavy timbers along face of wall about 5 ft. outside the wall and in line with it.

PIPE

FLANGES. Investigation of Question of Flanges for Light Cast Iron Pipe, John Knickerbacker. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 457-472, 12 figs. Sketches showing in full size thickness of pipe and thickness of flanges for Am. Water Works Assn. classes A, B, and C pipe, flanges for these pipes being calculated by formula which established that thickness of flanges equals one and one-half times thickness of pipe plus one-eighth of an inch. Reference is made to report of Committee on Light Flanges of The American Society of Mechanical Engineers presented at annual meeting on Dec. 1919.

JOINTING. Recommend Deeper Bell and Elimination of Lead Groove for Cast Iron Pipe to be Jointed with Cement. Am. Gas Eng. Jl., vol. 111, no. 19, Nov. 8, 1919, pp. 444-446. Object sought is to take advantage of sheer resistance of cement being greater than strength of bond. Report of Cast Iron Pipe Joints Committee of Am. Gas Assn.

PIPE LINES

DESIGN. Factors in Design of Sluices and Pipe Lines for Hydraulicking, F. A. Goodale. Eng. & Contracting, vol. 52, no. 21, Nov. 19, 1919, pp. 590-591, 2 figs. Empirical formula for estimating amounts flume will carry and grade to use. From Colo. School of Mines Magazine.

OIL. Oil Pipe Lines, S. A. Sulentic. Mech. Eng., vol. 41, no. 11, Nov. 1919, pp. 833 and 914. Writer compares cost of pipe-line transportation with that of rail and canal and shows advantages of oil engine and means of economically transporting oil for long distance through pipes. Derives formulae for calculating pressure, net horsepower and brake horsepower necessary for transmission of any quantity of oil per day through pipe of known diameter.

PIPING

See Mills, Power Piping.

PISTONS

The Manufacture of Pistons in a Medium Sized Factory, J. Edward Schipper. Automotive Industry, vol. 41, no. 16, Oct. 16, 1919, pp. 767-771, 6 figs. How it is possible in plant making 50 engines daily to use regular standard tools to advantage of production work.

PITOMETER SURVEY

See Water Waste, Prevention.

POISONING

Industrial Poisoning in British Works. Chem. Age, vol. 1, no. 17, Oct. 11, 1919, pp. 465-467. From annual report of Chief Inspector of Factories and Workshops for 1918.

POLE LINES

Wind and Ice Data, Stanley Rhoads. Telegraph & Telephone Age, vol. 37, no. 21, Nov. 1, 1919, pp. 526-527, 1 fig. For use in calculating class and number of poles required for telegraph and telephone pole lines.

POLES

Means for Increasing Life of Poles for Overhead Cables (Ueber Freileitungsmasten und Mittel zur Erhöhung dhrer Lebensdauer), J. Schmidt. Elektrotechnischer Anzeiger, vol. 36, nos. 63, 64 and 74, June 24 and 28, and July 20, 1919, pp. 289-290, 293-294, and 343-344. Details of Ruping system of impregnating wooden poles with creosote. Method is said to assure greatest safety regarding complete saturation of wood by mechanical means, to allow of easy handling of poles and to increase tensile and compressive strength of fiber by 15 per cent. (To be continued.)

POLYNOMIAL FUNCTIONS

Bernoulli Polynomials (Sur les polynomes de Bernoulli), N. E. Nörlund. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 12, Sept. 22, 1919, pp. 521-524. Their extension by considering analogous polynomials which depend on two variables.

Symmetrical System of Polynomials (Un système symétrique de polynomes), L.-B. Robinson. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 12, Sept. 22, 1919, pp. 524-526. Determination of conditions necessary and sufficient that a system composed of a number of integral equations and their polar equations may have solutions which do not cancel all determinants of matrix.

POLYPHASE CURRENTS

New Application of Polyphase Current (Ueber ein neues Anwendungsgebiet des Drehstroms), Gustav W. Meyer. Elektrotechnischer Anzeiger, vol. 36, nos. 42, 44 and 45, May 6, 11 and 13, 1919, pp. 197-198, 203-204, and 209-210, 10 figs. Short review of former attempts to use a. c. in magnetic dressing of ores. It is claimed that rotating field separator, invented by writer, makes possible a magnetic separation even of diamagnetic parts as long as they possess sufficient electric conductivity.

PORCELAINS

Relation Between the Composition and the Thermal Expansivity of Porcelains, F. H. Riddle. Jl. Am. Ceramic Soc., vol. 2, no. 10, Oct. 1919, pp. 804-811, 1 fig. Experimental. Bodies high in clay substance showed low thermal expansions. Variations in flint content within narrow limits possible in such bodies did not indicate decided lowering of expansivity. As clay content of porcelains was lowered and amount of quartz became larger, its quantitative effect as regards thermal expansion became more marked.

POWER GENERATION

POWER PLANTS

PROFIT SHARING

PULLEYS

QUARTZ CRYSTALS

RADIO CONSTRUCTION

RAILS

Fissures. Examination of Rails Long in Service for Relation Between Internal Stresses and Strains and Transverse Fissures, W. C. Cushing. Bul. Am. Ry. Eng. Assn., vol. 21, no. 218, Aug. 1919, pp. 95-124, 31 figs. Account of mechanical, chemical and microscopical examinations at Altoona Laboratory of Pa. Railroad.

Transverse Fissure Rails on Atchison, Topeka & Santa Fe Railroad—Heat 41177, M. H. Wickhorst. Bul. Am. Ry. Eng., Assn., vol. 21, no. 218, Aug. 1919, pp. 1-19, 16 figs. Investigation made of 52 rails of one heat, one of which failed due to transverse fissures and derailed train. Investigation disclosed that metal in interior of head of several rails was in badly shattered condition, containing numerous cracks, a few of these acting as nuclei from which transverse fissures developed in service.

Pressure. Intensity of Pressure on Rails, J. R. Onderdonk. Bul. Am. Ry. Eng. Assn., vol. 21, no. 218, Aug. 1919, pp. 49-87, 42 figs., partly on three supp. plates. Report of Sub-Committee on Rational Relation between intensity of pressure due to wheel loads and resistance of rail steel to crushing and deformation.

Relaying. Time Tests in Relaying 105-lb. Rail. Eng. & Contracting, vol. 52, no. 21, Nov. 19, 1919, p. 583. Tests were made to determine average amount of time used and lost during a day's work.

Rupture. On One Cause of Rupture of Rails and the Means of Preventing it (Sur une cause de rupture des rails et un moyen de la supprimer), Georges Charpy and Jean Durand. Génie Civil, vol. 75, no. 16, Oct. 18, 1919, pp. 377-379, 7 figs. Fissures developed in rails after certain time of service attributed to weakening of steel. Superficial reheating suggested as remedy. Paper read before Académie des Sciences.

TESTING MACHINES

British Standard Specification for Falling Weight Testing Machines for Rails. British Eng. Standards Assn., no. 103, June 1919, 1 p.

RAILWAYS

Construction. New Railways Planned in Foreign Countries. Ry. Rev., vol. 65, no. 19, Nov. 8, 1919, pp. 679-682. In Africa, Argentina, Australia, Bolivia, Brazil, Chile and China. (To be continued.)

Submergence of Culturable Land by Railway Embankments, R. Egerton Purves. Indian Eng., vol. 66, no. 15, Oct. 11, 1919, pp. 206-207, 1 fig., on supp. plate. Calculations of submergence due to embankment of Mallani-Dudwa Branch, Rohilkund-Kumaon Ry. across Sarda Valley in vicinity of Palia Kalan. Tehsil Nighasan, District Kheri, Oudh, presented typical of this class of works.

Electric. *See Street Railways.*

Freight Handling. Freight Handling on the Scioto Valley Railway. Elec. Traction, vol. 15, no. 11, Nov. 15, 1919, pp. 746-750, 14 figs. Methods employed in order to meet sudden rush of freight business due to establishment of war camp on line.

Operation. Co-operation with Farmers Gets Freight Business. Elec. Traction, vol. 15, no. 11, Nov. 15, 1919, pp. 743-746, 8 figs. How the Chicago, North Shore & Milwaukee Railroad Traffic Dept., gets acquainted with and co-operates with farmers and farmers' associations and gets freight business.

Repair Shops. Railroad Repair Shop Efficiency, Frank McManamy. Ry. Rev., vol. 65, no. 18, Nov. 1, 1919, pp. 638-642. Modernized and increased facilities for maintaining both cars and locomotives are held to be necessary in order to meet changed conditions as to wages that have transpired during period of war.

Signals. Busy Junction Protected by a Low Voltage Plant, A. M. Theiss. Ry. Signal Engr., vol. 12, no. 11, Nov. 1919, pp. 384-387, 10 figs. Train stops are eliminated at diverging point 4000 ft. from station by means of installation.

Spain. The Three Principal Aspects of Railroads (Los tres principales aspectos que presentan los ferrocarriles), Francisco Cambo. Revista de Obras Públicas, vol. 67, no. 2301, Oct. 30, 1919, pp. 534-539. Technical, economical and financial. Article discusses question of extending and improving railway service in Spain.

Spikes. Recent Tests on the Holding Power of Railroad Spikes. Eng. & Contracting, vol. 52, no. 21, Nov. 19, 1919, pp. 593-595, 3 figs. Behavior of various spikes was investigated at laboratory of Columbia University for resistance to direct pull and also resistance to direct pull as affected by redriving.

Track Material. Life, Renewal and Depreciation of Railroad Track Material (Note sur la durée, le renouvellement et la dépréciation du matériel de voie ferrée), A. Perey. Bulletin Technique de la Suisse Romande, vol. 49, nos. 21 and 22, Oct. 18 and Nov. 1, 1919, pp. 219-221 and 235-237. Oct. 18: Statistical figures of service given by ties in branch of Swiss railway. Nov. 1: Empirical formulae for determining depreciation.

See also Canal Construction and Fire Protection Equipment.

Yards. The New Feltham Concentration Yard, London & South Western Railway. Ry. Gaz., vol. 31, no. 16, Oct. 17, 1919, pp. 482-488, 11 figs., partly on supp. plate. Capacity is 3500 freight cars. Tracks circuiting in up and down marshalling sidings is indicated by diagrams.

RAIN GUARDS

Centrifugal Rain and Spray Guard. Eng., vol. 128, no. 3326, Sept. 26, 1919, pp. 319, 3 figs. Device for keeping window or screen free from water, rain or snow.

RANGE FINDER

The Works and Products of Messrs. Barr and Stroud, Limited. Engineering, vol. 108, no. 2808, Oct. 24, 1919, pp. 536-540, 29 figs., partly on two supp plates. Range finders and fire-control gear. (Continuation of serial.)

RECTIFIERS

Electric Current Rectifiers. Post Office Elec. Engrs. Jl., vol. 12, no. 3, Oct. 1919, pp. 137-143, 1 fig. Concerning life and efficiency of glass bulb rectifier, with special reference to electrolytic and vibrating-tongue types.

REFLECTIVITY

Reflecting Power of Stellite and Lacquered Silver, W. W. Coblentz and H. Kabler. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 342, Sept. 11, 1919, pp. 215-217. Data presented show that reflectivity of stellite varies somewhat in visible spectrum, depending upon homogeneity and upon exact composition of alloy. Data on reflecting power of lacquered silver mirrors show that owing to photochemical action in lacquer, silver is turned brown in color, thus reducing its reflecting power.

REFRACTION

Immersion Method for Measuring Indices of Refraction of Solid Bodies (Méthode par immersion pour la mesure des indices de réfraction des corps solides), Ch. Fabry. Jl. de Physique Théorique et Appliquée, vol. 8, Jan. 1919, pp. 11-25. Principle of method consists in immersing solid in liquid the composition of which is varied until its index of refraction for a certain radiation is the same as that of solid, equality of indices being determined by fact that passage of radiation through solid is accomplished without any deviation taking place.

REFRACTORIES

Alumina. Refractory Properties of Alumina Products (Propriétés réfractaires des produits alumineux), H. Le Chatelier and B. Bogitch. Comptes rendus des Séances de l'Académie des Sciences, vol. 169, no. 11, Sept. 15, 1919, pp. 495-499, 1 fig. Comparison of experimental results obtained with bauxite brick, cornidite and products having carborundum base.

Coke Ovens. Investigation into the Properties of Refractory Materials Used in Coke Oven Construction. Gas World, vol. 71, no. 1837, Oct. 4, 1919, pp. 21-24. Results of research at Imperial College of Science and Technology, England. Experiments are claimed to have shown that presence of water favors actual incorporation of alkali into refractory. Investigation also covers action of "salty" coals and experiments of washing.

REFRIGERATING PLANTS

How Can Our Plant Be Improved? Charles H. Herter. Refrig. World, vol. 54, no. 11, Nov. 1919, pp. 29-30. Advises taking advantage of approaching winter to effect improvements in equipment of refrigerating plant.

REFRIGERATOR CARS

Canadian Pacific Railway Steel Underframe Refrigerator Cars. Can. Ry. & Mar. World, no. 261, Nov. 1919, pp. 585-586, 1 fig. Particulars of 41-ft. cars.

REFUSE DISPOSAL

Refuse Disposal, Thomas L. Willes. Proc. Louisiana Eng. Soc., vol. 5, no. 4, Aug. 1919, pp. 253-268 and (discussion), pp. 268-273. Tests conducted for period of one year to determine character and amount of waste in City of New Orleans are said to have shown that this refuse contained enough grease and other valuable materials to insure profitable operation of reduction and utilization plant.

RELATIVITY

Michelson's Experiment and his Interpretation (L'esperienza di Michelson e la sua interpretazione). Il Nuovo Cimento, vol. 18, no. 6, Sept. 1919, pp. 91-106, 3 figs. In the light of modern theory of relativity.

Some Functional Equations in the Theory of Relativity, Arthur C. Lunn. Bul. Am. Math. Soc., vol. 26, no. 1, Oct. 1919, pp. 26-34. Attempt to transcribe more completely by means of functional equations and their solutions without appeal to differentiation of relations connecting space-time co-ordinates in two systems of reference, which Einstein obtains in transcribing process of light signal.

RESCUE APPARATUS

See Breathing Apparatus.

RESEARCH

Industrial Research in Small Establishments. Science, vol. 50, no. 1298, Nov. 14, 1919, pp. 445-448, 1 fig. Opposes making distinction between research and testing laboratory and that industrial research be defined for any given establishment "all that class of work which enlarges the technical horizon of the established beyond what is necessary for routing production and test of its products."

See also Bureau of Mines; Cotton Industry and Shipbuilding, Research.

[illegible]

ROLLER BEARINGS

[illegible]

SEWERS

Building the Augusta Street Concrete Intercepting Sewer, W. T. Christine. Eng. World, vol. 15, no. 9, Nov. 1, 1919, pp. 37-39, 4 figs. Notes on excavation work, which was done in large part by Marion Model 60 shovel equipped with 35-ft. boom and 42-ft. dipper arm with 1¾-yd. bucket.

SHAFTING, LINE

See Bearings.

SHELL-BED GEOLOGY

On a Shell-bed Underlying Volcanic Tuff Near Warrnambool; with Notes on the Age of the Deposit, Fredk. Chapman and Chas. J. Gabriel. Proc. Roy. Soc. Victoria, vol. 30, no. 1, Sept. 1917, pp. 4-14. Bed is believed to belong to same episode as older dune-rock accumulations of that locality.

SHIPBUILDING

AUSTRALIA. Shipbuilding in Australia. Shipbuilder, vol. 21, no. 111, No. 1919, pp. 258-260, 2 figs. Particulars of Dromana, built under scheme of Ship Construction service, are: Length overall, 341 ft. 6 in.; length between perpendicular, 331 ft.; breadth extreme, 48 ft.; depth moulded, 26 ft. 6 in.;load deadweight, 5600 tons. Propelling machinery consists of set of triple-expansion reciprocating engines.

NEW ORLEANS. Great Shipbuilding Plant and Drydock in New Orleans. Manufacturers Rec., vol. 76, no. 19, Nov. 6, 1919, pp. 182-183, 4 figs. Notes on equipment. Plant is able to do any work on the ship and lift vessels up to 11,000 tons. It was constructed at cost of $2,000,000.

RESEARCH. Scientific Research in Connection with Marine Engineering and Shipbuilding, Frank Heath. Trans. North-East Coast Instn. of Engers. & Shipbuilders, vol. 35, no. 2, Mar. 1919, pp. 69-81 and (discussion) 81-85. Possible field for investigation are indicated and reasons are given to prove that organization of research should be in hands of government.

SHIPS

CASTINGS. Castings for Ship Construction, Ben Shaw and James Edgar. Foundry, vol. 47, no. 19, Nov. 15, 1919, pp. 832-835, 15 figs. Method of preparing bearings for pit molding propeller shaft bracket. Also in Foundry Trade Jl., vol. 21, no. 214, Oct. 1919, pp. 717-728, 29 figs.

CONSTRUCTION COSTS. How to Determine Shipyard Costs, Creighton Churchill. Mar. Rev., vol. 49, no. 12, Dec. 1919, pp. 586-589, 10 figs. Study of factors entering into ship construction costs with outline of method for adapting findings to different yards. Paper presented befofe Soc. of Naval Architects & Mar. Engrs.

ELECTRIC PROPULSION. The Electric Propulsion of Ships (La propulsione turboelettrica delle navi), Ing. Filiberto Dondona. Rivista Marittima, vol. 52, nos. 8 and 9, Aug. and Sept. 1919, pp. 167-200, 3 figs. Developments in England and United States, with general statement of characteristics of installation in U. S. S. New Mexico.

FREIGHT. American Standard 8800 Ton D. W. Cargo Steamships. Shipbuilding and Shipping Rev., vol. 14, no. 19, Nov. 6, 1919, pp. 517-521, 7 figs., partly on supp. plate. Built by Newburgh Shipyards, Inc., Newburgh, N. Y., for U. S. Shipping Board. Principal dimensions are: Length overall, 417 ft. 10 in.; breadth moulded, 54 ft.; depth moulded to upper deck, 32 ft. 10 in.; draught, Lloyds summer freeboard, 25 ft 6 in.

The Economic Efficiency of Merchant Ships, Alexander Urwin. Trans. North-East Coast Instn. Engrs. & Shipbuilders, vol. 35, part 3, May 1919, pp. 86-96 and (discussion), pp. 96-108, 2 figs., partly on supp. plate. Proposes scheme whereby efficiency of merchant ship can be measured and contribution to final efficiency of each factor shown in such manner as to give definite figure to its importance and indicate its value relative to other items.

MODELS. Experiments on Full Cargo-Ship Models. Shipbuilding & Shipping Rec., vol. 14, no. 17, Oct. 23, 1919, pp. 465-467, 3 figs. Comparison of various models. (To be continued.)

PAINTING. How Modern Ships Are Painted—I, Fred B. Jacobs. Mar. Rev., vol. 49, no. 12, Dec. 1919, pp. 571-573, 2 figs. Importance of selecting and preparing materials. Reasons why special attention should be given to pigments, solvente and driers.

STABILITY. "Shape Stability" of Ships ("Formstabile Schiffskörper"), Ernst Foerster. Zeitschrift des Vereins Deutscher Ingemeure, vol. 63, no. 29, July 19, 1919, pp. 669-676, 24 figs. Tests were made on ships plying beetween Lissabon and Rio de Janeiro, having speed of 15 knots. Stability losses between points of departure and port of arrival are calculated. Effect of stabilizing additions to body of ship. (To be concluded.)

SHOP EFFICIENCY

Shop Efficiency, Frank McManamy. New England RR. Club, Oct. 14, 1919, pp. 129-146. Warns against overlooking, while making time studies of shop operations, conditions where time is lost greatly in excess of amount that time studies are intended to save.

SHOP MANAGEMENT

Graphic Representation Reduces Travel in Meter Repair Shop Hundreds of Miles with Consequent Saving in Costs, H. M. Riley. Am. Gas Eng. Jl., vol. III, no. 20, Nov. 15, 1919, pp. 461-468, 7 figs. Diagram studies made preliminary to changing layout of shop.

SIGNAL INDICATORS

Visual and Audible Signal Indicator at Blairhall Colliery. Colliery Guardian, vol. 118, no. 3070, Oct. 31, 1919, p. 1163, 5 figs. Instrument is of aluminous type and comprises polished wood case hinged in two parts and so made as to be placed on floor immediately in front of engine keeper when operating engines.

SILK

The Silkworm's Formidable Competitor, R. G. Skerrett. Sci. Am., vol. 121, no. 19, Nov. 8, 1919, pp. 460 and 470, 3 figs. Outline of methods and results.

SILOS

40,000-Ton Grain Silo at the King George Dock, Hull. Eng., vol. 128, no. 3328, Oct. 10, 1919, pp. 360, 364-366, 16 figs., partly on two supp. plates. It is made of reinforced concrete and comprises two blocks each 96 feet wide and 241 feet long, in which are placed elevating, weighing, cleaning and other machinery.

SILVER

The Properties of Standard or Sterling Silver, with Notes on its Manufacture, Ernest A. Smith and Harold Turner. Metal Indus., vol. 15, no. 15, Oct. 10, 1919, pp. 303-316, 24 figs. and (discussion) 316-317. It is concluded from microscopic examinations and tests that alloys of silver and copper from simple series with eutectic containing 72 per cent silver and 28 per cent copper, which is said to be most uniform in composition of alloys of series.

SLUICEWAYS

Removal of Sand from Irrigation Canal by Sluicing. Eng. & Contracting, vol. 52, no. 20, Nov. 12, 1919, pp. 559-560, 1 fig. Sluiceways have been built at intervals of several miles and sand is removed by aid of water. From Sept. Reclamation Rec.

SLUICES

DESIGN. *See Pipe Lines, Design.*

SOIL

PERMEABILITY. *See Irrigation.*

VIBRATION. Vibration of Elastic Soil (Sulle vibrazioni di un suolo elastico), Pietro Alibrandi. Il Nuovo Cimento, vol. 17, nos. 4, 5 and 6, Apr., May June 1919, pp. 159-181. Technical study. Circumstances of perturbation at points at various distances from source of motion.

SOLIDIFICATION OF METALS

Second Report to the Beilby Prize Committee of the Institute of Metals on the Solidification of Metals from the Liquid State, Cecil H. Desch. Metal Indus., vol. 15, no. 16, Oct. 17, 1919, pp. 325-331 and (discussion)pp. 331-332, 9 figs. Deals with form of crystal grains and their relation to foam structures, and solidification of liquids exhibiting cellular convection structure.

SOLUTIONS

CONDUCTIVITY. *See Solutions.*

SOUTH AMERICA

See Latin America.

SPRINGS

Design of Multiple Helical Springs (Calcolo delle molle ad elica eilindrica multiple), Nicola Fabiano. Rivista Tecnica delle Ferrovia Italiane, vol. 16, nos. 1 and 2, July and Aug. 1919, pp. 1-12, 8 figs. Formulae for computing dimensions for types used for locomotive support.

SPECTROPHOTOMETRY

Photoelectric Spectrophotometry by the Null Method, K. S. Gibson. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 349, Oct. 11, 1919, pp. 325-352, 10 figs. It is believed in consequence of experimentation by Null method that between ware lengths 410 and 550 mm. inclusive, on certainty of measurements is not greater than 0.01 for values of transmission between zero and 1, and not greater than 0.003 for values between zero and 0.1; and beyond this range as far as 390 and 600 mm. on certainty is slightly greater, being at these wave lengths about twice as great as throughout better range.

STANDARDIZATION

See Construction Standards; Transformers, Instruments.

STACKS

Why Concrete Stacks Are Successful, A. C. Irwin. Power Plant Eng., vol. 23, no. 22, Nov. 15, 1919, pp. 1012-1013, 1 fig. Properties of concrete which is said to render material capable of withstanding exacting service.

STANDPIPES

The Standpipe in Action, Edward R. Hardy. Quarterly of the Nat. Fire Protection Assn., vol. 13, no. 2, Oct. 1919, pp. 155-159. Records of its use at fires.

MULTIPLEX. The Different Systems of Rapid Telegraphy (Les différent systèmes de télégraphie rapide), E. Montoriol. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 3, Sept. 1919, pp. 324-381, 24 figs. Instrument used and operation of automatic and multiplex systems. Paper read before Société française des Electriciens.

PRINTING SYSTEMS. The Morkrum Printing Telegraph System. Telegraph & Telephone Age, vol. 57, nos. 21 and 22, Nov. 1 and 16, 1919, pp. 528-533 and 557-534, 21 figs. Nov. 1: Description of operation. Nov. 16: Description of automatic transmitter.

The Baudot. Telegraph & Telephone Jl., vol. 5, no. 55, Oct. 1919, pp. 1-3, 7 figs. Description of Baudot multiplex type printing telegraph system. (To be continued.)

TELEPHONY

ITALY. Telephone Industry in Italy (L'industria telefonica in Italia); L. A. Zanni. Elettrotecnica, vol. 6, no. 29, Oct. 15, 1919, pp. 622-626. Statistical figures of existing installations.

ANTI-INDUCTION LINES. Anti-Inductionof Telephonie Circuits (Anti-induction des circuits téléphoniques), M. Cahen. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 3, Sept. 1919, pp. 430-445, 8 figs. Comparative study of systems used in different countries.

INTERFERENCE. European Telephone Practice. Fred. W. Scholz Telephone Engr., vol. 22, no. 5, Nov. 1919, pp. 38-40, 3 figs. Troubles caused to telephone service through interference of railway lines.

REPEATERS. Telephone Repeaters, Hancroft Gherardi and Frank B Jewett. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 11, Nov. 1919, pp. 1255-1313. 48 figs., partly on 8 supp. plates. History of research and development work which has led up to final production of successful telephone repeaters. Various forms of amplifiers are described and their possibilities and limitations pointed out.

The Telephone Repeater. Post Office Elec. Engrs., Jl. vol. 12, no. 3, Oct. 1919, pp. 129-133. 4 figs. Patented repeater circuit, known as "scilesTee," each wire of which is used for telegraph working.

TEMPERATURE MEASUREMENTS

ELECTRIC INDICATOR. Designing an Electric Temperature Indicator, V. H. Todd. Power Plant Eng., vol. 23, no. 22, Nov. 15, 1919, pp. 1018-1019, 4 figs. Principle of operation and method of making required calculatiens.

STEEL FURNACES. Steel Furnace Temperature Measurements, George K. Burgess. Blast Furnace & Steel Plant, vol. 7, no. 11, Nov. 1919, pp. 550-551. Role played by research laboratory in problem .... steel temperatures. Work of Bur. of Standards and National Research Council. Paper read before Am. Iron & Steel Inst.

TEXTILE INDUSTRY

Safety Education in Textile Industry, William S. Ide. Textile World Jl., vol. 56, no. 15, Nov. 15, 1919, pp. 91-92. Records of accomplishments at mills of one company.

THALLIUM AMALGAMS

Concentrated Thallium Amalgams: Their electrochemical and thermochemical Behavior, Densities and Freezing Points. Theodore W. Richard and Farrington Daniels. Jl. Am. Chem. Soc., vol. 41, no. 11, Nov. 1919, pp. 1732-1768, 12 figs. Experimental measurements of electromotive forces between amalgams ranging from 0.33 per cent to saturation (over 40 per cent.) These potentials were found to be greater than those demanded by simple concentration law.

THEATRES

A Community Amusement Building, Donald J. Baker. Coal Age, vol. 16, no. 15, Oct. 9, 1919, pp. 602-604, 2 figs. Built at Pennylvania Mine. Building is of stucco-tile construction with fiber roofing.

Some Features of Danforth Theatre, Toronto. Contract Rec., vol. 33, no. 46, Nov. 12, 1919, pp. 1037-1038, 3 figs. Notably concrete balcony and pre-cast roof.

THERMAL ANALYSIS

A Simplification of the Inverse-Rate Method for Thermal Analysis, P. D. Merica. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 336, June 11, 1919, pp. 101-104, 1 figs. Suggested method of recording successive time intervals without use of chronograph.

THERMIONIC VALVE

See Vacuum Tubes, Thermionic Valves.

THREADS

FORMS. Threads Forms for Worms and Hobs, D. P. Waterman. Mech. Eng., vol. 41, no. 11, Nov. 1919, pp. 872-873, 5 figs. Mechanical problems involved in construction and operation of worm gears. Writer believes it is desirable to establish and follow standard line of procedure in manufacture of worm gears as their use is increasing rapidly and suggests adoption of straight-sided cutters with change in pressure handle at same sided angle of helix and change of axial to normal depth at same point.

STANDARDS. Historical Synopsis of Work Undertaken by the Société d'Encouragement pour l'Industrie Nationale with a view to standardizing Systems of Threads Employed in Mechanical Constructions by Introducing in These Systems the Metric and Decimal Systems (Résumé historique des travaux entrepris par la Société d'Encouragement pour vue d'assurer l'unification des systèmes de filetage employés dans les constructions mécaniques par application à ces filetages du système métrique et du système décimal). Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 5, Sept. and Oct. 1919, pp. 177-216, 6 figs. A bibliographic list of documents on screw threads published by the Société is appended and also a report of the Union des Syndicats de l'Electricité in which a comparison is made of the dimensions of bolt, screws and notes adopted by the Congress of Zurich and Société d'Encouragement, the Schneider works, the French Railways and the Chambre Syndicale des Constructeurs d'Automobiles.

See also Screw Threads.

TIMBER PRODUCTION

Timber Production and Growth Curves in the Mountain Ash. Eucalytus, regnans, R. T. Patton. Proc. Roy. Soc. Victoria, vol. 30, no. 1, Sept. 1917, pp. 1-3, 4 figs., partly on two supp. plates. From study of annual rings, it is concluded that Mountain ash reaches its maturity between fortieth and fiftieth years, but it is not then fit for milling.

TIME STUDY

Research on Rapid Evaluation of Elementary times Needed for Mechanical Operations (Recherches sur l'évolution rapide des temps élémentaires des travaux mécaniques), J. Androuin. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 5, Sept. and Oct. 1919, pp. 145-154, 2 figs. Proposes decimal geometric series for rapid calculation of number of lathes, times of operation, etc.

TINNING

Equipment and Methods of Tinning, E. P. Later. Foundry, vol. 47, no. 19, Nov. 15, 1919. pp. 817-820. Pickling processes with details for handling various classes of work.

TOW BOATS

Tow Boats and Barges for American Inland Waterways. Pac. Mar. Rev., vol. 16, no. 11, Nov. 1919, pp. 93-95, 8 figs. Construction is practically all of steel, assembled in sizes and shapes to meet requirements of Am. Bur. of Shipping.

TOWN PLANNING

See Cities, Planning.

TRACK-CIRCUIT LAYOUTS. A. C. Track-Circuiting Lay-Outs—II, A. E. Tattersall. Ry. Engr., vol. 40, no. 478, Nov. 1919, pp. 239-243, 20 figs. Siemens' system. (Continuation of serial.)

TRACTORS

PERFORMANCE. Calculating Performance of Industrial Tractors. Elec. World, vol. 47, no. 15, Oct. 11, 1919, pp. 795-797, 2 figs. Performance graphs with various motor and battery equipment.

SAMSON. Mechanical Details of the $650 Samson Tractor. Automotive Industries, vol. 41, no. 16, Oct. 16, 1919, pp. 772-773. 1 fig. Tractor is of backbone type, transmission and rear axle housing being in one and bolted and fly wheel housing.

SCHNEIDER. Schneider Automobile Tractors Used for Towing Canal Barges (Tracteur automobile, système Scheneider, pour le galage des bateaux), Génie Civil, vol. 75, no. 18, Nov. 1, 1919, pp. 432-434, 4 figs. Tractor is fitted with 12 hp. engine. Wheels have metallic tires. Machine is said to tow barge of 225 tons with speed of about 2½ miles an hr.

TRAIN LIGHTING

Illumination of Cars is Becoming an Exact Science. Ry. Elec. Engr., vol. 10, no. 10, Oct. 1919, pp. 360-368, 24 figs. Data in regard to efficiency and uniformity of distribution, effect of coloring of head lining, installation, maintenance cost and methods of testing intensity required. Committee report of Assn. Ry. Elec. Engrs.

Specifications for Electric Train Lighting Equipment. Ry. Elec. Engr., vol. 10, no. 10, Oct. 1919, pp. 380-383. Suggesting reductions in present practices, which are believed not to impair qualities of service. Committee report of Assn. Ry. Elec. Engrs.

TRANSFORMERS

DESIGN. Designing Transformers (Het ontwerpen van transformatoren), A. M. A. Wijans. Ingenieur, vol. 34, no. 43, Oct. 25, 1919, pp. 787-795, 8 figs. With special reference to Pohl's and Feldman's method of calculation. Designing core transformers with rectangular or with elliptic core sections. Factors influencing costs. Berry transformers.

EQUATIONS. Alternating Current dynamic Transformer (Un transformatore dinamico per correnti alternate), A. G. Rossi. Il Nuovo Cimento, vol. 17, nos. 4, 5 and 6, Apr., May, June 1919, pp. 95-132, 9 figs. Expressions determining conditions of operations under various system of connections. (Concluded.)

HEATING. The Heating of Transformers, M. Vidmar. Elecn., vol. 83, no. 2164, Nov. 7, 1919, pp. 525-526. Formulae for computing internal temperature fall both in non-impregnated and impregnated copper coils. Translated from Elektrotechnische Zeitschrift.

VOLTAGE REGULATORS

Automatic Voltage Regulators, Terrell Croft. Natl. vol. 23, no. 2, Nov. 1919, pp. 576-580, 12 figs Illustrating principle of automatic voltage regulator as applied to small generators, both of a c and of d c. types.

VOLTAGE SYSTEMS

Constant and Variable Voltage Systems, A. M. Bennett. Am Drop Forger, vol. 5, no. 11, Nov. 1919, pp. 548-550, 2 figs. It is pointed out that any number of workers can operate in multiple from same machine up to its capacity when constant voltage system is used. Paper read before Am. Iron & Steel Elec. Engrs.

WAGES

See Bonus Systems.

WASTE MATERIALS

See Cars, Dump.

WATER HAMMER

Water Hammer in Conduits Consisting of Two or Three Sections of Different Diameters (Calcul du coup de bélier maximum dans les conduites formées de deux de trois tronçons de diamètres différents), Ed. Carey. Revue générale de l'Electricité, vol. 6, no. 17, Oct. 25, 1919, pp. 539-551, 8 figs. Simplification by means of graphs of formulae developed by M. de Sparre. (To be continued.)

WATER POWER

British Columbia. Report on Water Powers of British Columbia. Can. Engr., vol. 37, no. 20, Nov. 13, 1919, pp. 461-465, 3 figs. Concerning water legislation, meteorological and topographical data, surveys and maps, stream flow data, bench marks, power sites, present and proposed developments, electrical inspection and bibliography. From report published under Commission of Conservation. Also in Contract Rec., vol. 33, no. 46, Nov. 12, 1919, pp. 1053-1059.

Plants. Reconstruction of Small Water Power, Plants, Ray K. Holland. Contrac Rec., vol. 33, no. 45, Nov. 5, 1919, pp. 1029-1031. Conditions to be considered by engineer when making improvements to old or insufficient developments.

WATER PURIFICATION

Motor-Truck-Mounted Water Purification Units, Wm. J. Orchard. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 532-571, 7 figs. Arrangement and operation.

WATER RATES

The Control of Water Rates, Edward S. Walsh. Freight Handling & Terminal Eng., vol. 5, no. 10, Oct. 1919, pp. 383-388. Statement of Superintendent of Public Works, State of New York, in opposition to bill empowering Interstate Commerce Commission to control water front.

WATER SUPPLY

Army Camps. Notes on the Water Supplies of Army Camps, Cantonments and Posts in the United States, with Particular Reference to Problems of Quality, Charles Gilman Hyde and Charles A. Haskins. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 532-561. After reviewing circumstances and conditions which were obtained with respect to control of quality of water supplied to army camps, it appears to writers that variability in bacteriological quality observed with respect to considerable number of ground water supplies is shown that frequent examinations should be made of samples collected from different points in water-supply system.

Army of Occupation. Water Supply Service in the Army of Occupation in Germany, Lucius A. Gritze. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 422-426. Scheme of organization.

Catskill Aqueduct. History of Water Supply, J. C. Beardsler. Jl. Cleveland Eng. Soc., vol. 12, no. 1, July 1919, pp. 25-42, 11 figs. Olden works contracted with such modern undertakings as Catskill aqueduct.

Schoharie Development, Catskill Water Supply System for New York City, J. Waldo Smith. Jl. New England Water Works Assn., vol. 33, no. 3, Sept. 1919, pp. 257-272, 4 figs. Project involves impounding water of Schoharie Creek in reservoir of 20 billion gal. capacity to be formed by construction of dam in Schoharie County, flow line of reservoir being at level of 1130 ft. above sea level.

Collecting Galleries. The Gallery Collecting System of the Des Moines Water Company, Des Moines, Iowa, A. T. Luce. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 475-485, 4 figs. Structural details of galleries.

Old Hickory Works. The Water Supply of the Old Hickory Works, Oscar E. Bulkeley. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 427-438. System consists of two intake pumping stations, three large parallel wood-stave pipe lines about 1½ miles long, booster pump house, filtration plant, power house flume and twelve service pumps, and distribution systems. Approximately 1000,000,000 gal. of raw water are required daily, of which 65,000,000 are filtered.

Scouring. Index Numbers and Scoring of Water Supplies, Abel Wolman. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 444-456, 5 figs. Principles of water supply scoring, comparison of these methods with similar ones in index number making discussion of their points of analogy and difference, and development of data as guides in problems of water-supply standardization.

WATER WASTE

Prevention. Philadelphia Fights Water Waste. Fire and Water Eng., vol. 66, nos. 15-18, Oct. 1919, pp. 837-841, 8 figs. Charts showing Pitot records obtained (To be continued.)

Some Details of Water-Waste Prevention Surveys, Paul Lanham. Jl. New England Water Works Assn., vol. 33, no. 3, Sept. 1919, pp. 287-300 and (discussion) pp. 300-305, 7 figs., partly on supp. plate. Concerning proper division of mains into permanent districts, making and studying flow charts taken upon various districts, and organizing properly balanced force for handling water-waste problem.

Reduction of Water Consumption by Means of Pitometer Survey and Constant Inspection, George C. Andrews. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 355-370, 8 figs. Experience of Buffalo Bur. of Water.

WATER WORKS

Practical Checks upon Water-Works Depreciation Estimates, Leonard Metcalf. Jl. Am. Water Works Assn., vol. 6, no. 3, Sept. 1919, pp. 371-393. Records of actual depreciation developed in practical administration of water works in different parts of United States. Necessity for keeping better records of plant abandoned as evidence of actual in contra-distinction to theoretical depreciation.

WATT-HOUR METERS

Calibrating Standard Watt-Hour Meters, F. A. Kartak. Elec. World, vol. 74, no. 14, Oct. 4, 1919, pp. 740-742, 6 figs. Extreme accuracy in testing portable standard watt-hour meters by taking revolutions of meter during a definite time interval fixed by an electric clock; details of electrical apparatus which starts and stops meter.

WATERSHED LEAKAGE

Watershed Leakage in Relation to Gravity Water Supplies, Robert E. Horton. Jl. New England Water Works Assn., vol. 33, no. 3, Sept. 1919, pp. 306-332 and (discussion) pp. 333-336, 11 figs. Based on examination of conditions in various plains in New York State.

WAVE MOTION

Absolute Mechanics of Wave Motion and the Newtonian Relativity of Energie (Mécanique absolue des ondulations et Relativité newtonienne de l'Energie), G. Sagnac. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 15, Oct. 13, 1919, pp. 643-646. Their correlation in view of accepted theories of radiation and movement.

Ether and the Absolute Mechanics of Wave Motion (Æther et mécanique absolue des endulations), G. Sagnac. Comptes rendus des séances de l'Académie des Sciences, vol. 169, nos. 10 and 12, Sept. 8 and 22, 1919, pp. 469-471 and 529-531, Sept. 8: Concerning absolute origin of velocities measured in universal system of reference. Sept. 22: Establishment of relation between internal absolute waves and total Newtonian energy.

WEIGHTS AND MEASURES

Weights and Measures of the Far East Trans-Pacific, vol. 1, no. 3, Nov. 1919, pp. 67-68. Units used in the various countries and their equivalents in English system.

See also Metric Systems.

WEIRS AND DAMS

Ferro-Concrete Weirs and Dams. Ferro-Concrete, vol. 11, no. 3, Sept. 1919, pp. 89-91, 8 figs. Particulars of various structures.

WELDERS

Training Arc Welders—II, O. H. Eschholz. Elec. World, vol. 74, no. 14, Oct. 4, 1919, pp. 750-752. Discussion of principles necessary for production of satisfactory welds. Definition of welding terms and bibliography of articles on welding in technical magazines.

WELDING

Acetylene. Oxy-Acetylene Industry in France, Paul Pleiss and C. V. Price. Welding Eng., vol. 4, no. 11, Nov. 1919, pp. 21-25. Practices of various companies in regard to charging acetylene generators, pressures used, etc. Comparing conditions with industry in United States writer says that outstanding difference is degree of co-operation that exists between manufacturers, users, and the French Welding Soc., who are all "united in their efforts to further the use of the process through the offices of the Welding Soc., and this spirit has been of tremendous import to the growth of the Industry in France."

Oxy-Acetylene Welding Methods, Automotive Manufacturer, vol. 61, no. 6, Sept. 1919, pp. 25-26, 2 figs. Filling blow-holes and other cavities.

Oxy-Acetylene Welding of heavy Sheets, F. H. Sweet. Am. Drop Forger, vol. 5, no. 11, Nov. 1919, pp. 553-554. Material to use and bow to handle it.

Use of Acetylene in Navy Yards during the War, H. G. Know. Acetylene Jl., vol. 21, no. 5, Nov. 1919, pp. 325-334, 17 figs. New York yard used about 110,000 cu. ft. per month; Charleston 15,000 cu. ft.; Norfolk, 60,000 cu. ft.; Boston 75,000 cu. ft. Applications are illustrated. Paper read before International Acetylene Assn.

Technical Engineer's Judgment of the Oxy-Acetylene Process, Alfred S. Kinsey. Acetylene Jl., vol. 21, no. 5, Nov. 1919, pp. 346-350. Fundamental principles involved in oxyacetylene welding, which were not used in shop practice before introduction of this process. Paper read before International Acetylene Assn.

Members of Council for 1919

PRESIDENT
Lieut.-Col. R. W. LEONARD, St. Catharines, Ont.

VICE-PRESIDENTS
‡WALTER J. FRANCIS, Montreal
*R. F. HAYWARD, Vancouver
*Prof. H. E. T. HAULTAIN, Toronto
‡D. O. LEWIS, Victoria

PAST PRESIDENTS
G. H. DUGGAN, Montreal
Col. J. S. DENNIS, Montreal
H. H. VAUGHAN, Montreal

COUNCILLORS
‡W. P. BRERETON, Winnipeg
‡N. E. BROOKS, Sherbrooke
†Prof. ERNEST BROWN, Montreal
*A. R. DECARY, Quebec
‡L. B. ELLIOT, Edmonton
‡G. GORDON GALE, Ottawa
‡J. E. GIBAULT, Quebec
†Prof. PETER GILLESPIE, Toronto
‡ALEX GRAY, St. John, N.B.
*Prof. A. R. GREIG, Saskatoon
*J. H. KENNEDY, Vancouver
*H. LONGLEY, Halifax, N.S.
‡G. D. MACKIE, Moose Jaw
‡R. W. MacINTYRE, Victoria
†M. H. MacLEOD, Toronto
†E. G. MATHESON, Vancouver
*G. A. McCARTHY, Toronto
†D. H. McDOUGALL, New Glasgow, N.S.
‡W. A. McLEAN, Toronto
†JOHN MURPHY, Ottawa
†Wm. PEARCE, Calgary
*F. H. PETERS, Calgary
†J. M. ROBERTSON, Montreal
*R. A. ROSS, Montreal
*JULIAN C. SMITH, Montreal
†J. G. SULLIVAN, Winnipeg, Man.
†L. A. THORNTON, Regina
*JAMES WHITE, Ottawa
‡ARTHUR SURVEYER, Montreal

* For 1919 † For 1919-20 ‡ For 1919-20-21

TREASURER
‡Brig.-Gen. SIR ALEX BERTRAM, Montreal

SECRETARY
FRASER S. KEITH, Montreal

OFFICERS OF BRANCHES

HALIFAX
Chairman, F. A. BOWMAN
Sec.-Treas., FRED. R. FAULKNER
Nova Scotia Technical College, Halifax, N.S.
Executive, L. H. WHEATON

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

[illegible]

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print, up to 11 x 14 in. in size, 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library,

29 West Thirty-ninth Street, New York, N.Y.

ACOUSTICS

[illegible]

AERONAUTICS

[illegible]

[illegible]

1919, pp. 298-300, 8 figs. [illegible]

Metal Construction of Aircraft, A. P. Thurston. Aeronautical Jl., vol. 23, no. 105, Sept. 1919, pp. 473-512, 41 figs. Methods of design, kinds of materials used and method of testing specimens at various works in England.

D. F. W. German. The German D. F. W. Commercial Four Engined Biplane. Aerial Age, vol. 10, no. 9, Dec. 8 and 15, 1919, pp. 326-328, 4 figs. Machine is fitted with four 220-hp. Mercedes engines placed in fuselage and driving airscrews on wings by means of bevel gears and shafts.

Dopes. Aeroplane Dopes and Doping, W. H. Smith. Aerial Age, vol. 10, no. 6, Oct. 27 and Nov. 3, 1919, pp. 208 and 213. Report no. 38 of National Advisory Committee of Aeronautics.

Eagle. The Curtiss Eagle Transport Airplane. Aviation, vol. 7, no. 7, Nov. 1, 1919, p. 309, 1 fig. Tractor fuselage biplane fitted with additional wing engines and propellers.

Hangars. *See Hangars.*

Hild-Marshonet. The Hild-Marshonet Sportplane. Aerial Age, vol. 10, no. 11, Dec. 29, 1919, pp. 400-401, 9 figs. General characteristics are: spread overall 24 ft.; length 19 ft.; weight, loaded with pilot and fuel for three hours 700 lb., speed range 35-65 m.p.h.

Lawson. Air Liner is Designed for Commerce. Automotive Industries, vol. 41, no. 20, Nov. 13, 1919, pp. 964-967, 4 figs. Details of construction of twin-motor Lawson C-2.

The Lawson Airplane C-2. Aviation, vol. 7, no. 7, Nov. 1, 1919, pp. 315-316, 1 fig. Structural characteristics are: overall length, 48 ft.; overall height, 15 ft.; span of upper and lower wings, 91 ft.; total weight, loaded, 13,929 lb.

Limitations. The Large Aeroplane and Its Limitations, A. Ryan. Aeronautical Jl., vol. 23, no. 106, Oct. 1919, pp. 530-537. Effects of increasing size under following conditions: (1) all sizes to have same speed, (2) loss per sq. ft. of surface same for all sizes and (3) density of atmosphere constant.

Linke-Hoffman. The Linke-Hoffman Central Power Plant Giant Biplanes, Eric Hildesheim. Aviation, vol. 7, no. 9, Dec. 1, 1919, pp. 391-393, 10 figs.

Nieuport. The Nieuport "Nighthawk." Flight, vol. 11, no. 48, Nov. 27, 1919, pp. 1524-1532, 21 figs. Single-seater fitted with 320 hp. ABC Dragonfly engine. Main characteristics are: total weight, 2100 lb.; speed at 5000 ft., 150 m.p.h.; climb, 29,000 ft. in 20 min.; ceiling, 29,000 ft.

Performance Estimation. Estimating Performance of an Airplane, V. E. Clark. Aviation, vol. 7, no. 8, Nov. 15, 1919, pp. 349-350, 1 fig. Given engine, flight duration and military or commercial load.

Radiators. Preliminary Report on Resistance due to Nose Radiator. Flight, vol. 11, no. 47, Nov. 20, 1919, pp. 1509-1510, 8 figs. Based on experiments carried out by Am. Bur. of Standards.

Stresses. The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 17, nos. 309, 310, 315, 317 and 318, Sept. 18, 25, Oct. 30, Nov. 13 and 20, 1919, pp. 289-292, 314-315, 406-407, 450-452 and 471-472, 37 figs. Systems of bracing employed in triplanes. Design of spar sections. Examples of investigating mechanical stresses in stiff-jointed frame-works. Mechanical study of stresses produced in various members during steep dives. Calculation of loads in front and rear trusses due to lift reactions. (Continuation of serial.)

Struts. Resistance of Navy No. 1 Struts, A. F. Zahm. Aerial Age, vol. 10, no. 11, Dec. 29, 1919, p.p. 407-408, 4 figs. Aviation, vol. 7, no. 6, Oct. 15, 1919, pp. 256-257, 4 figs. Results of tests. Experimental investigation Bureau of Construction and Repair is said to have established that Navy No. 1 strut has smaller coefficient of resistance than any hitherto reported.

Technical Orders. Eng. Division, Air Service, Dayton, Ohio, no. 7, Apr. 1919, 91 pp., 12 figs. Including non-injurious tests for determining ultimate strength of interplane struts for airplanes.

The Strength of Tubular Struts, Andrew Robertson. Aeronautics, vol. 17, no. 309, Sept. 18, 1919, p. 281. Formula for collapsing load per sq. in.

Turn Indicators. The Static Head Turn Indicator for Aeroplanes, Horace Darwin. Sci. Am. Supp., vol. 88, no. 2288, Nov. 29, 1919, pp. 322-323. See also Aeronautics, vol. 17, no. 315, Oct. 30, 1919, pp. 419-412. Instrument designed to indicate whether under all conditions path of aeroplane is straight line or whether machine is turning to right or left.

Undercarriages. Aircraft Undercarriages, John D. North. Flight, vol. 11, no. 50, Dec. 11, 1919, pp. 1596-1599, 7 figs. Account of development. (To be continued.) Paper read before Royal Aeronautical Soc.

Wing Coverings. Modern Wing Coverings—Materials Used and Their Application, R. G. Dort. Aerial Age, vol. 10, nos. 9 and 11, Dec. 8, 15 and 29, 1919, pp. 329-330 and 335, 403-406 and 418. Types of pigmented protective coverings; application of wing covering materials. (To be concluded.)

Wing Rib. Development of a 15-Foot Airplane Wing Rib, Raymond M. Wirka. Aviation, vol. 7, no. 9, Dec. 1, 1919, pp. 386-388, 12 figs. Load-travel curves, plywood web, twisted veneer strap, and Pratt truss types at Forest Service, Madison, Wis., showed that ribs of these types were not quite so stiff as those of other types, ribs of Warren truss type, design no 11, were superior in strength per unit weight to all oth er ribs tested.

See also Flying Boats; Seaplanes.

AEROPLANE ENGINES

Altitude Operation. Report on Variation of Horse-Power with Temperature. Aeronautics, vol. 17, no. 310, Sept. 25, 1919, pp. 308-313, 11 figs. Tests covering altitudes from 2000 ft. to 30,000, with engine being fitted successively with Clandel, Stromberg and Tice carburetors. U. S. Bur. of Standards Aeronautic Power Plants. Report No. 8.

Fuel. Qualities of Gasoline for Aviation Motors (Les qualités de l'essence pour moteurs d'aviation), A. Grebel. Génie Civil, vol. 75, no. 21, Nov. 22, 1919, pp. 517-519, 3 figs. Characteristics of fuel fixed in September 1917, by Service d'Aeronautique militaire.

Napier. Aircraft Practice in the 1920 Napier, M. W. Bourdon. Automotive Industries, vol. 41, no. 22, Nov. 27, 1919, pp. 1056-1060, 9 figs. Overhead valves are fitted in detachable aluminum cylinder head and are operated by overhead camshaft; cylinder jackets and upper half of crank case are cased as unit in aluminum with pressed in steel liners for pistons.

Napier Lion. Aero Engine with New Arrangement of Cylinders, M. W. Bourdon. Automotive Industries, vol. 41, no. 21, Nov. 20, 1919, pp. 1006-1012 and 1015, 13 figs. Napier Lion 450-hp., 12-cylinder engine designed and built for British air service. Attention is called to short stroke, roller-bearing crankshaft and special details of cylinder and head construction.

Siddeley Puma. The Siddeley Puma Aircraft Engine. Automobile Engr., vol. 9, no. 132, Nov. 1919, pp. 369-376, 26 figs., partly on supp. plate. Engine has six cylinders in line and is of vertical water-cooled type. Valves are actuated by overhead camshaft which operates exhaust valves directly from cams and inlet valves by means of rockers. Cylinders are of aluminum, with steel liners ranged in special manner.

Starting. The Starting of Aeroplane Engines—I, T. L. Sherman. Automobile Engr., vol. 9, no. 132, Nov. 1919, pp. 366-368, 3 figs. Classification of systems of starting and suggestions in regard to effecting improvements. (To be continued.)

Testing. Altitude Laboratory for the Testing of Aero Engines, H. C. Dickinson and H. G. Boutell. Aerial Age, vol. 10, no. 4, Oct. 6, 1919, pp. 122-123 and 134, 3 figs. Description of laboratory constructed at Bur. of Standards for National Advisory Committee for Aeronautics. (Concluded.)

Viking. The Viking Aircraft Motor. Aerial Age, vol. 10, no. 9, Dec. 8 and 15, 1919, p. 325, 1 fig. Sixteen-cylinder, air-cooled, X type, having four rows of cylinders of four cylinders each, set at 90 deg. angle.

See also Internal-Combustion Engines.

AIR ANALYSIS

The Rapid Determination of Carbon Monoxide in Air, Arthur B. Lamb and Alfred T. Larson. Jl. Am. Chem. Soc., vol. 41, no. 12, Dec. 1919, pp. 1908-1921, 5 figs. Two thermometric methods are described.

AIR CONDITIONING

Humidification and Cooling of Work Shops (L'Humidification et le rafraîchissement des ateliers), Emile Masson. Revue Universelle des Mines, vol. 2, no. 2, June 1919, pp. 285-323, 10 figs. Comparative study of value of vaporizers, saturators, atomizers and super-saturators. Regulations adopted at Rouen congress are quoted. These established that hygrometric state of work shop should be maintained between 61 to 70 per cent, that the air of factory should be renewed twice each hour and that the inside temperature should be maintained above 15 deg. cent. in winter and below 25 deg. cent. in summer.

AIRCRAFT

See Aeronautics; Aeroplanes; Airships; Aviation; Baloons; Flying Boats; Seaplanes.

AIR PUMPS

See Pumps, Air ; Blowers ; Compressors.

AIRSHIPS

Airships, T. R. Cave-Browne. Cave. Aeronautics, vol. 17, no. 309, Sept. 18, 1919, pp. 277-280. Table showing strength of various fabrics, method of using steam engine for airship propulsion. Paper read before Eng. Section of "G" British Assn.

The Transverse Frame of the Rigid Airship, E. H. Lewitt. Aeronautics, vol. 17, no. 309, Sept. 18, 1919, pp. 287-288, 3 figs. Calculation of stress developed in frame.

French Practice in Airship Construction, John Jay Ide. Aviation, vol. 7, no. 9, Dec. 1, 1919, pp. 400-402, 3 figs. Specifications for seams of envelopes; precaution taken against explosions when filing dirigibles, and against sparks from atmospheric electricity and radio.

See also Balloons.

ALCOHOL

Symposium on Industrial Alcohols. Chem. & Metallurgical Eng., vol. 21, no. 11, Oct. 29 and Nov. 5, 1919, pp. 557-559, 1 fig. Presented at meeting in N. Y. Section of Am. Chem. Soc. Attention is focussed upon production and industrial uses of more important alcohols. Chart showing several uses of alcohol is given.

Alcohol as Motor Fuel. Times Eng. Supp., no. 537, July 1919, p. 223. Conditions of use.

ALLOYS

Aluminum. Heat Treating of Aluminum Alloys (Traitements thermiques d'alliages d'aluminum), M. Girard. Comptes Rendus des séances de l'Académie des Sciences, vol. 169, no. 13, Sept. 29, 1919, pp. 571-574, 1 fig. Study of variations of mechanical characteristics in terms of heat-treating temperature after rolling and of velocity of cooling after treatment.

Increasing the Scope of Aluminum Alloys, Ferdinand Jehle. Automotive Industries, vol. 41, no. 21, Nov. 20, 1919, pp. 1025-1027, 5 figs. Properties of aluminum alloys developed during war, specially Lynite alloys.

G. N. Air-Cooled. The Air-cooled G. N. Autocar, vol. 43, no. 1260, Dec. 13, 1919, pp. 1122-1123, 4 figs. Principal specifications are: 90 deg. V twin air-cooled engine, 84 x 98 mm bore and stroke; disc clutch; three speed and reverse gear.

Lancia. Lancia Produces a Novel Twelve Cylinder Model. Automotive Industries, vol. 41, no. 18, Oct. 30, 1919, pp. 862-864, 5 figs. Cylinders are block casting with angle of only 22 deg. between two rows, one row being offset in relation to other so that connecting rods are side by side.

Lighting and Starting. British Adaptation of Starting and Lighting Equipment, F. H. Hutton. Automotive Industries, vol. 41, no. 21, Nov. 20, 1919, pp. 1002-1004, 5 figs. Analysis of equipment in 1920 cars exhibited at Olympia show.

Lorraine Dietrich. Lorraine Dietrich Builds Low-priced Six Cylinder. Automotive Industries, vol. 41, no. 18, Oct. 30, 1919, pp. 860-861, 5 figs. Car designed for quantity production.

Military Transport. Military Transport Chassis—XVII. Automobile Engr., vol. 9, no. 132, Nov. 1919, pp. 391-394, 6 figs. Performance of Hallford chassis type E. I. F. 100 under war conditions.

Delage Offers the Only Car Built for Military Service. Automotive Industries, vol. 41, no. 20, Nov. 13, 1919, pp. 960-963, 8 figs. Unit construction with 6-cylinder engine and gear-box. Noted feature is great accessibility there being no obstructions to reaching valve steams.

Radiators. Manufacturers Producing Major Part of Automobile and Aeroplane Radiators Use Gas for Every Operation Requiring Heat, Charles A. Drum. Am. Gas Eng. Jl., vol. 111, no. 22, Nov. 29, 1919, pp. 505-508, 8 figs. Notes on manufacture of radiator.

Rear-Axle Housing. A Rear-Axle Housing That Is Different, Fred. H. Colvin. Am. Mach., vol. 51, no. 21, Nov. 27, and Dec. 4, 1919, pp. 919-921, 5 figs. Jigs and fixtures are so designed that each one checks work of previous operation.

Show. The Motor Car Show at Olympia. Engineering, vol. 108, no. 2811, Nov. 14, 1919, pp. 658-661, 14 figs. Trend of design.

Sigma. The 10 hp. Sigma. Autocar, vol. 43, no. 1260, Dec. 13, 1919, pp. 1117-1119, 6 figs. Principal specifications are : 10 hp., four cylinders, 65 x 120 mm; Hele-Shaw clutch; four-speed gear box; semi-elliptic springs.

Sizaire-Berwick. The New 25-50 hp. Sizaire-Berwick. Autocar, vol. 43, no. 1258, Nov. 29, 1919, pp. 1026-1030, 10 figs. Principal specifications are: 25-50 hp., four-cylinder, 95 by 160 mm. engine; four-speed and reverse gear box; full floating helical bevel-driven rear axle; semi-elliptic springs.

Steam. The Scott-Newcomb Steam System. Automobile Engr., vol. 9, no. 132, Nov. 1919, pp. 381-383, 4 figs. Advantages of this system for automobile use, as compared with internal combustion power plant.

Tires. Pneumatic Tire and Wheel Equipment for Motor Trucks, J. E. Hale. Automotive Industries, vol. 41, no. 19, Nov. 6, 1919, pp. 918-921, 2 figs. Discussion of probable change coming in motor truck equipment.

Turcat-Mery. The 15-25 hp. Turcat-Méry. Autocar, vol. 43, no. 1259, Dec. 6, 1919, pp. 1075-1077, 6 figs. Principal specifications are: 15-25 hp., four cylinders, 80 x 150 mm.; leather cone clutch; four-speed and reverse gear box, unit with engine.

Voisin. The 25-35 hp. Voisin. Autocar, vol. 43, no. 1259, Dec. 6, 1919, pp. 1067-1069, 6 figs. Principal specifications are: 25-35 hp., four cylinders, 95 x 140 mm. bore and stroke; Knight sleeve valves, aluminum pistons; dioc clutch ;semi-elliptic front, cantilever rear springs.

Wolseley. Wolseley Cars at Olympia. Engineering, vol. 108, no. 2810, Nov. 7, 1919, pp. 606-609, 21 figs., partly on supp. plate. Three models: 10-hp. 4-cylinder; 15-hp. 4-cylinder and 20 hp. 6-cylinder.

Motor Car Show at Olympia—I. Engineer, vol. 128, no. 3332, Nov. 7, 1919, pp. 460-462, 8 figs. Particulars of Wolseley cars.

AUTOMOBILE ENGINES

Air Cooling. A Test of Air Cooling, B. H. Davies. Autocar, vol. 43, no. 1259, Dec. 6, 1919, pp. 1064-1065, 3 figs. Road trial of air-cooled engine.

Clayden. The Clayden Engine. Autocar, vol. 43, no. 1259, Dec. 6, 1919, pp. 1073-1074, 4 figs. Principal specifications are: 20 hp. four cylinders, 90 x 135 mm; multi-disk Ferodo-lined clutch; four-speed gear box; three-quarter floating, bevel-driven rear axle.

Farman, Six. Aviation Practice Features Farman Six Cylinder. Automotive Industries, vol. 41, no. 18, Oct. 30, 1919, pp. 866-867 and 870, 4 figs. Engine of aviation type, developing 85 hp., fitted to automobile.

Stroke-Bore Ratio. Analyzing the Question of the Stroke-Bore Ratio, Edward G. Ingram. Automotive Industries, vol. 41, no. 21, Nov. 20, 1919, pp. 1016-1019, 2 figs. Analysis of long- versus short-stroke engines taking into consideration all forces acting on bearings. Writer concludes that bearing loads will be lower in short-stoke type at high speeds.

Temperature Control. Reducing the Cold Engine Troubles, J. Edward Schipper. Automotive Industries, vol. 41, no. 21, Nov. 20, 1919, pp. 1014-1015, 2 figs. Device which puts water circulation under control of driver by means of butterfly valve, controlled by Bowden wire from dash, in one of pipes.

See also Internet Combustion Engines.

AVIATION

Civil. An Analysis of the Need for Civil Aviation, W. F. Durand. Automotive Industries, vol. 41, no. 18, Oct. 30, 1919, pp. 872-875. Report to Executive Committee of Nat. Advisory Committee for Aeronautics.

Civil Aviation. Flight, vol. 11, no. 47, Nov. 20, 1919, pp. 1506-1508. Summary of work carried out during last six months by Department of Civil Aviation of Air Ministry.

Racing Statistics. Aeroplanes Safer Than Automobiles, Glenn L. Martin. Aeronautics, vol. 17, no. 318, Nov. 20, 1919, pp. 476-477. Statistics of recent aeroplane races compared with similar statistics for automobile races. Figure of 4,000 machine-miles per death for automobile contrasted with 17,940 machine-miles per death for aeroplane.

Transportation. Possibilities of Aerial Transport in Peru, G. M. Dyott. Aeronautical Jl., vol. 23, no. 106, Oct. 1919, pp. 521-529, 3 figs. Commercial possibilities offered by reasons of climate, natural resources, geographical position and peculiar topographical configuration.

The Need for Civil Aerial Transport—II, III, W. F. Durand. Automotive Industries, vol. 41, nos. 19 and 20, Nov. 6 and 13, 1919, pp. 922-924 and 968-971. Nov. 6: Estimated cost of transportation of express matter by airplane. Nov. 13: Problems of personnel, production and operation.

BALLOONS

Some Kite-Balloon Experiments, Griffith Brewer. Flight, vol. 11, no. 48, Nov. 27, 1919, pp. 1533-1538, 16 figs. For the purpose of devising method of descending in event of cable breaking. Paper read before Roy. Aeronautical Soc.

BATHING PAVILIONS

Chicago Municipal Improvements—I and II. Am. Architect, vol. 116, nos. 2284 and 2285, Oct. 1 and 8, 1919, pp. 461-465 and 483-490, 17 figs. Constructional details of bathing pavilion at Jackson Park.

BATTLESHIPS

H.M.S. "Hood," the Latest Capital Ship. Engineer, vol. 128, no. 3332, Nov. 7, 1919, pp. 468-470, 3 figs. Outline of salient features, and comparison with powerful units of other navies.

BEAMS

Charts for Designing T Beams, Ernest Owen. Concrete, vol. 15, no. 6, Dec. 1919, pp. 230-233, 5 figs. Developed from design formulæ.

Criticism of the Ordinary Methods of Designing Reinforced Concrete Beams, James W. Pearl. Eng. & Contracting, vol. 52, no. 22, Nov. 26, 1919, pp. 616-617, 1 fig. Following proportionality of table proposed for diameter for reinforced bars in preliminary designing: In straight cantilever beams, 0.010 arm; in straight simple beams, 0.005 span; in straight continuous beams at center, 0.003 span and at support, 0.005 span.

Concrete Arched Beams and Open Girder Carry Roof of Theater. Eng. World, vol. 15, no. 12, Dec. 15, 1919, pp. 27-28, 4 figs. Reinforced concrete roof and balcony designed on Hennebique system.

BEARING METALS

Conservation of Tin in Bearing Metals, Bronzes and Solders, G. K. Burgess and R. W. Woodward. Am. Mach., vol. 51, no. 20, Nov. 13 and 20, 1919, pp. 883-885. Reference is made to experiments carried out to determine whether lowering tin content in alloys by substitution or addition of other metals would render alloy less fit for its intended use. Formulæ are suggested for modification of alloys so as to reduce their tin content.

BEARING

Aluminum. Aluminum Bearings (Coussinets en aluminum), M. Legrand. Industrie des Tramways et Chemins de Fer, vol. 13, nos. 148-149 and 150. Apr.-May-June 1919, pp. 30-34, 4 figs. Tests performed with cargo machine said to have given promising results. It is therefore suggested that tests be made of aluminum bearings in actual work with a view to determine advisability of substituting them for bronze bushings.

Automobile. Putting Quality First in Bearing Production, J. Edward Schipper. Automotive Industries, vol. 41, no. 19, Nov. 6, 1919, pp. 909-913, 13 figs. Method of manufacturing bearing supporting unusually heavy and rigid crank-shaft in Marmon cars.

Kingsbury Thrust. Slow-Speed Tests of Kingsbury Thrust Bearings, H. A. S. Howarth. Mech. Eng., vol. 41, no. 12, Dec. 1919, pp. 915-917 and 968. Operating and experimental data which show wide range of application of Kingsbury thrust bearings are presented, together with particulars of typical installations which have been in successful operation since 1911. Results of tests made on bearing having total area of 76 sq. in. on its four shoes and load of 10,000 lb. are said to have indicated that the lower the speed at which bearing is run continuously, the better are the conditions of the bearing surfaces.

Mitchell. The Mitchell Bearing, Eric W. Walford. Automobile Engr., vol. 9, no. 132, Nov. 1919, p. 384, 3 figs. Patented form of thrust bearing in which place where pressure is smaller than maximum is provided for continuously introducing oil.

BELT CONVEYORS

Elevating and Conveying Equipment—II. Coal Trade Jl., vol. 50, no. 49, Dec. 3, 1919, pp. 1396-1397, 2 figs. Illustrating uses of belt conveyors.

BELTING

Leather Substitutes. The Question of Substitutes for Leather Belting, G. Steinmetz. Eng. & Indus. Management, vol. 2, no. 20, Nov. 13, 1919, pp. 611-613, 6 figs. Substitutes are divided into two classes, (1) manufactured on principle of textile belting from woven flat wedding, strapping or rope of hemp, paper, etc., with or without interwoven wire, and (2) of leather link type manufactured from individual links of wire, wood, compressed paper or sheet metal. Results are given of textile breaking tests. Translated from Der Betreib-

CONCRETE ARCH. Through Concrete Arch Bridge to Give Large Waterway, F. W. Epps. Eng. News-Rec., vol. 82, no. 21, Dec. 11 and 18, 1919, pp. 994-99,5 4 figs. Roadway suspended by light hangers and each floor-beam hinged to allow bending under arch expansion.

DESIGN. The Comparative Economies of Cantilever and Suspension Bridges, J. A. L. Waddell. Jl. Western Soc. Engrs., vol. 24, no. 4, Apr. 1919, pp. 187-214, 11 figs. Concluded that for exclusively railroad bridges economic limit for cantilever type of structure is that length which requires $4\frac{1}{2}$ lb. of metal to carry one lb. of live load. For modern highway structure carrying also incidentally electric railway tracks this limit is set at 1000 ft., and for combined railway and highway structures limit is placed intermediate between limit for railway structures and that for highway structures.

Increasing the Permissible Stresses for Iron Bridge Structures (Ueber die Erhohung der zulassigen Materialinanspruchnahme eiserner Brücken), Friedrich Hartmann. Zeitschrift des oesterr. Ingenieur-u. Architekten-Vereines, vol. 71, no. 37, Sept. 12, 1919, pp. 339-341, 2 figs. Comparison of values obtained by writer with those given by Patton. Calculation of influence of method of load on the secondary stresses of chords. (To be continued.)

Economic Span Lengths for Simple-Truss Bridges on Various Types of Foundation, J. A. L. Waddell. Jl. Western Soc. Engrs., vol. 24, no. 4, Apr. 1919, pp. 215-260, 36 figs. Computations and diagrams. Conclusions are in part, that for all types of bridges ecoonomic span length increases with dept of foundation though not in same proportion; that the leghter the superstructure and the live load it carries, the greater is the economic span length and the greater the variation of the latter with depth of foundation; that using nickel steel instead of carbon steel in the superstructure increases materially economic span length.

Unusual Design and Joint Details of 430-Foot Bridge. Eng. News-Rec., vol. 83, no. 14, Oct. 2, 1919, pp. 656-657, 3 figs. Heat-treated steel eyebars and high-carbon steel built-up members used in Warren-type truss for economy is material.

DRIP FLOOR. Steel-Plate Drip Floor for Niagara Railway Arch Bridge. Can. Ry. & Mar. World, no. 262, Dec. 1919, pp. 645-646, 3 figs. Floor consists of plates of copper-steel 3/16 in. thick resting on maple raising strips bolted to top flanges every 3 ft. by countersunk bolts.

HELL GATE. Hell Gate Bridge, New York, Frank W. Skinner. Engineering, vol. 108, no. 2812, Nov. 21, 1919, pp. 674-678, 28 figs., partly on three supp. plates. Design of viaducts.(Concluded.)

MISSOURI RIVER. An Unusual Design for a Missouri River Bridge. Ry. Age, vol. 67, no. 25, Dec. 19, 1919, pp. 1177-1179, 5 figs. Pile piers are used as supports for 300-foot steel truss span.

OHIO RIVER. The Metropolis Bridge Over the Ohio River at Metropolis, Ill., Ralph Modjeski. Jl. Western Soc. Engrs., vol. 24, no. 2, Feb. 1919, pp. 59-81 and (discussion) pp. 81-87, 36 figs., partly on fourteen supp. plates. Main bridge consists of one 300-ft. through span, four 551-ft. 3-in. thorough spans, one 720-ft. through span, and one 246-ft. deck span. General problems of design and construction are discussed.

BROACHING

Broaching as an Aid to Greater Production, Frank H. Mayo. Can. Machy., vol. 22, nos. 22 and 24, Nov. 27 and Dec. 11, 1919, pp. 518-572, 29 figs. Combinations used in production of broaching work, together with description of various types of broaching machines.

BUILDING LAWS

"The Law of Ancient Lights" and "London Building Act" George R. Mackenzie. Jl. Engrs. Club Philadelphia, vol. 36, no. 181, Dec. 1919, pp. 466-469. Review of early English building laws and London building act of 1894, with particular reference to their value in zoning.

Revision of Toronto's Building By-Law. Contract Rec., vol. 33, no. 47, Nov. 19, 1919, pp. 1063-1066. Regulations for flat slabs.

BUILDINGS

CONCRETE. Factory at Montreal for Crane Co., Ltd. Contract Rec., vol. 33, no. 51, Dec. 17, 1919, pp. 1164-1166, 6 figs. Layout of flat slab reinforced concrete building.

The Protection of Concrete Buildings Against Damp and Water. Concrete & Constructional Eng., vol. 14, no. 10, Oct. 1919, pp. 579-582, 5 figs. Following proportions are suggested where dampness of water is to be combated: (1) for 4 parts of crushed stone ¼ to ½ in diameter, mixture of one part of cement and 2 parts of sand containing rather more fine grade than are needed to obtain concrete of maximum strength: (2) for smaller stones ½ in and less 1: 2: 2 mixture. From La Revue des Matériaux de Construction et de Travaux Publics.

A Reinforced Concrete Canteen. Concrete & Constructional Eng., vol. 14, no. 11, Nov. 1919, pp. 631-637, 7 figs. Building measuring about 242 ft. by 50 ft. wide, wing portion being about 70 ft. by 50 ft. is provided by English works for comfort of workers.

FIRE HAZARDS. Miscellaneous Hazards in Building Operations. Contract Rec., vol. 33, no. 51, Dec. 17, 1919, pp. 1166-1167. Danger of fire during construction due to lack of care in properly storing materials.

HEAT LOSSES. Air Interchange and Heat Loss from Buildings, W. W. Nobbs. Domestic Eng. & Estate Engr., vol. 39, no. 11, Nov. 1919, pp. 155-162. Formulæ. Paper read before Instn. of Heating & Ventilating Engrs.

SPECIFICATIONS. Standard Specification for Cottages. Concrete & Constructional Eng., vol. 14, nos. 10 and 11, Oct. and Nov. 1919, pp. 565-570 and 664-669. Approved by Ministry of Health. (To be continued.)

STANDARDIZATION. Need for Standardization in Construction, Ernest T. Trigg. Contract Rec., vol. 33, no. 47, Nov. 19, 1919, pp. 1073-1076. Necessitated, it is pointed out, by reason of advance in price of all building materials.

STEELWORK. Common Errors in Detailing Steelwork for Buildings, Edward Godfrey. Eng. News-Rec., vol. 83, no. 16, Oct. 16, 1919, pp. 730-733, 8 figs. Specially those occurring in eccentric loads, cantilever beams and curved beams.

BULKHEADS

A Test of Watertight Bulkheads for Ship Subdivision, Archibald Hogg. Engineering, vol. 108, no. 2814, Dec. 5, 1919, pp. 762-763, 3 figs. Committee report presented before Northeast Coast Instn. of Engrs. and Shipbuilders.

An Analysis of Stresses in Bulkhead Stiffeners (Bracketed End Connections). Int. Mar. Eng., vol. 24, no. 11, Nov. 1919, pp. 729-234, 5 figs. Data figured on assumption that brackets fix ends of stiffeners absolutely.

BUSHINGS

Interchangeable Bushings for High Voltage Apparatus, Eugene D. Eby. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 865-875, 20 figs. Standard types manufactured by Gen. Elec. Co. Curves showing variation in flashover point with change in altitude and correction factor for different altitudes, as well as other technical data obtained by Company's High Voltage Bushing Eng. Dept., are given.

BUYING

Specializing in Efficient Buying, Robert N. Ladd. Iron Trade Rev., vol. 65, no. 25, Dec. 18, 1919, pp. 1650-1651. Separate department with trained men in charge considered just as necessary to successful conduct of business as sales, auditing or other departments. Requisites of an able executive.

CANAL LOCKS

Manufacture and Testing of Large Chains for the Fenders in the Panama Canal Locks, Henry Goldmark. Jl. Western Soc. Engrs., vol. 24, no. 2, Feb. 1919, pp. 88-101, 9 figs. Average breaking strength of four test chains was found to be 541, 250 lb. Summary of specification for chains as developed from results obtained in tests is presented.

CAMS

Rational Study of Mechanisms Operated by Cams (Etude rationelle des mécanismes commandés par cames), Octave Lepersonne. Revue Universelle des Mines, vol. 2, no. 2, June 1919, pp. 193-284, 32 figs. Profiles composed of straight lines and arcs of circle.

CAMSHAFTS

The Problems in Designing an Engine Camshaft—I, Don T. Hastings. Automotive Industries, vol. 41, no. 22, Nov. 27, 1919, pp. 1072-1080. Valve timing and operating mechanism; tangential and mushroom cams; constant acceleration cam. (To be continued.)

CARBON MONOXIDE

See Air Analysis.

CARBURETORS

The Beemac Carburetter. Motor Traction, vol. 29, no. 768, Nov. 19, 1919, p. 465. Constructed with throttle barril, jet chamber, and float chamber in one unit. It is governed by sliding valve which is operated by suction of engine.

CARS

AXLES. The Car Axle. Ry. & Locomotive Eng., vol. 32, no. 11, Nov. 1919, pp. 330-332. Its early history and development.

CABOOSES. Approved Standard Design for Caboose Cars. Ry. Age, vol. 67, no. 25, Dec. 19, 1919, pp. 1187-1189, 6 figs. Design is 24-ft. caboose of composite type having steel underframe and super structure with wood outside sheeting and interior finish.

U. S. R. A. Standard Caboose Car. Ry. Mech. Engr., vol. 93, no. 11, Nov. 1919, pp. 654-656, 6 figs. Design recommended by Railroad Administration; strong underframe for heavy pusher service.

CHINESE. General Characteristics of Chinese Bolling Stock, Frank Rhea. Ry. Mech. Engr., vol. 93, no. 10, Oct. 1919, pp. 585-586, 3 figs. From report no. 80 of Bureau of Foreign and Domestic Commerce, Department of Commerce.

DINING. New Steel Dining Cars for the North British Railway. Ry. Gaz., vol. 31, no. 19, Nov. 7, 1919, pp. 592-595, 8 figs. Principal dimensions are: Length over body 66 ft.; width, outside body, 9 ft.; height to top of roof from rail, 12 ft. 4 in.; approximate total weight loaded, 45 tons.

ELECTRIC. Transference of Load in Cars while Braking, T. F. Burke. Elec. Ry. Jl., vol. 54, no. 16, Oct. 18, 1919, pp. 750-752, 3 figs. Methods used in calculating "fly-wheel" of rotating parts of electric car equipment and explanation of how load is transferred throughout train during retardation period.

FREIGHT. Diagonal Frame Bracing of Freight Cars, Ry. & Locomotive Eng., vol. 32, no. 10, Oct. 1919, pp. 306-308, 7 figs. Arguments in behalf of each of two methods—(1) running braces from junction of end and center sills out to end of bolster and (2) running braces from corner of car into junction of center sills with bolster.

Freight Car Utilization, Warren C. Kendall. Official Proc. N. Y. Railroad Club, vol. 29, no. 9, Oct. 17, 1919, pp. 5721-5736 and (discussion) pp. 5736-5750. How railroad, shipper and consignee may co-operate to increase capacity and proper working of a freight car.

CITY PLANNING

INDUSTRIAL DEVELOPMENT. Town Planning in Relation to Industrial Development, C. W. Kirkpatrick. Can. Engr., vol. 37, no. 24, Dec. 11, 1919, pp. 524-525 and 531-532. Because, it is noted, it is not possible to get "the most or the best out of a man unless he be happy and contented."

ONTARIO. Planning and Development of Cities in Ontario. Thomas Adams. Can. Engr., vol. 37, no. 23, Dec. 4, 1919, pp. 509-510. Planning and development act of Ontario, which deals largely with planning as a matter of fixing location and dealing with widening, extnsion and relocation of highways and parkways is not considered satisfactory because it does not deal with town planning, i.e. "with the regulations for the use of land and character of building developed in cities, towns and rural areas."

PRINCIPLES. Principles of City Planning, Noulan Cauchon. Eng. & Contracting vol. 52, no. 23, Dec. 3, 1919, pp. 653-654. From viewpoint of ethics, economics and art. Paper read before Joint Conference of Am. City Planning Inst. and Town Planning Inst. of Can.

WINNETKA, ILL. The Proposed City Plan of Winnetka, Illinois, E. H. Bennett. Am. City, City Edition, vol. 21, no. 4, Oct. 1919, pp. 305-307, 3 figs. Previsions for establishing motor highways.

ZONING. Zoning Cities for To-morrow, W. J. Donald. Can. Engr., vol. 37, no. 23, Dec. 4, 1919, pp. 510-512. Plan projected for Niagara Falls, which provides for six classes of zones or districts for which different conditions for use height and area of buildings are specified.

The Legality of Zoning Regulations, Herbert S. Swan. Am. City, City Edition, vol. 21, no. 5, Nov. 1919, pp. 458-459. Court decisions quoted as having withheld that city's expansion and growth are superior to individual caprice of land owners.

CLAY

The China Clay Industry of The West of England, Henry F. Collins. Min. Mag., vol. 21, no. 5, Nov. 1919, pp. 269-275, 5 figs. Geological occurrence and mineralogical characteristics of china clay, method of mining and preparation for market, and economic questions involved in its disposal. (To be continued.)

CLIMATE CONTROL

Factors of Climatic Control, W. J. Humphreys. Jl. Franklin Inst., vol. 188, no. 6, Dec. 1919, pp. 775-810, 3 figs. Discussion of principal factors and effects of their possible changes, that determine various averages and extremes of weather of any given place. Question is studied from viewpoint of physics and not of geographic distribution. (To be continued.)

COAL

BUNKERS. Cement Clinker and Coal Bunkers at Newmains, N.B. Ferro-Concrete, vol. 11, no. 4, Oct. 1919, pp. 108-110, 2 figs. Bunkers for storage capacity of 1000 tons of clinker and were constructed on Mouchel-Hennebique system of ferro-concrete.

DEPOSITS. Coal in French Indo-China, Min. Mag., vol. 21, no. 5, Nov. 1919, pp. 307-309, 1 fig. Account of coal deposits in Tonkin. Vrom Far Eastern Rev., Shanghai.

HANDLING PLANT. Efficient Handling Plant at Alicia Mines No. 1. Coal Trade Jl., vol. 50, no. 52, Dec. 24, 1919, pp. 1483-1484, 1 fig. Plant has storage capacity of 100,000 tons.

LABOR SAVING MACHINERY. Improving the American Coal Situation, L. W. Alwyn-Schmidt. Power Plant Eng., vol. 23, no. 24, Dec. 15, 1919, pp. 1100-1102, 1 fig. Possible ways to increase the coal production by the introduction of labor-saving machinery, and use of coal at mines.

METERS. The Lea Coal Meter, J. H. Blakey. Power Plant Eng., vol. 23, no. 23, Dec. 1, 1919, pp. 1060-1061, 4 figs. Illustrating application of meter to Babcock & Wilcox boiler and also to boiler fed intermittently.

SULPHUR COMPOUNDS. A Study of the Forms in Which Sulphur Occurs in Coal, A. R. Powell and S. W. Parr. University of Illinois Bul., vol. 16, no. 34, Apr. 21, 1919, 66 pp., 3 figs. Investigation to determine relationship between amounts of various sulphur forms in coal and residual sulphur left in coke and also nature of sulphur retained in coal.

Occurrence and Origin of Finely Disseminated Sulphur Compounds in Coal, Reinhardt Thiessen. Coal Age, vol. 16, no. 17, Oct. 23, 1919, pp. 668-673, 10 figs. Presence of sulphur in coal, either as sulphur balls or lenses or as minute particles scattered throughout mass, attributed to sulphur originally contained in plant matter from which coal has been evolved.

STRUCTURE. Constitution of Coal through a Microscope, Reinhart Thiessen. Coal Indus., vol. 2, no. 12, Dec. 1919, pp. 558-563, 10 figs. Microphotographs of Illinois, Indiana, Pittsburgh and Alabama coals.

WASHING. Modern Practice in the Washing of Coal, Horatio C. Ray. Coal Industry, vol. 2, no. 12, Dec. 1919, pp. 535-543, 9 figs. It is said that coal which contains mechanically mixed impurities can be successfully washed after being crushed sufficiently to free these impurities.

Purification of Coal, B. J. Roberts. Cement, Mill & Quarry, vol. 15, no. 10, Nov. 20, 1919, pp. 11-13. Also Eng. World, vol. 15, no. 12, Dec. 15, 1919, pp. 49-51. Data in regard to uses of concentrating table and accessory equipment, compiled from results of experimental work conducted by corporation of Fort Wayne, Ind.

COAL MINES

No. 1 Plant of the Mather Collieries, Donald J. Baker. Coal Age, vol. 16, no. 20, Nov. 13 and 20, 1919, pp. 783-786, 11 figs. Plant was designed for capacity of 5000 tons in 8 hr.

New Pit at Swanwick Collieries. Iron & Coal Trades Rev., vol. 99 no. 2697, Nov. 7, 1919, pp. 593-594, 8 figs., partly on supp. plate. Concerning coal pit which is 16 ft. in diameter and has been sunk to depth of 400 yd.

COAL MINING

ELECTRICAL APPLIANCES. Electricity Applied to the Mechanical Mining of Coal, C. B. Reed. Popular Engr., vol. 12, no. 6, Dec. 1919, pp. 10-13. Survey of applications of electricity in collieries.

FIRE PREVENTION. Fire Prevention in Anthracite Coal Mines, M. W. Price. Coal Age, vol. 16, no. 16, Oct. 1919, pp. 651-652. Necessary equipment for extinguishment of mine fires. Paper read before National Safety Congress.

GERMAN REGULATION. State Participation in German Coal Mining—I & II, E. Jüngst. Colliery Guardian, vol. 118, no. 3071 and 3072, Nov. 7 and 14, 1919, pp. 1230-1231 and 1297-1298, 3 figs. Tables showing records of yearly mining operations in various districts from 1880 to time of war. Statistics of recovery of by-products in various districts. Translated from "Glückauf."

PROBLEMS. Present Problems of Mining Industry, Van H. Manning. Min. & Sci. Press, vol. 119, no. 23, Dec. 6, 1919, pp. 816-818. Such as frequent periods in which the bituminous mines, especially in spring and summer months, are not worked from cause not under the control of either operator or miner. Address delivered before Am. Min. Congress.

PILLAR DRAWING. Different Methods of Pillar Drawing, A. W. Hesse. Coal Indus., vol. 2, no. 12, Dec. 1919, pp. 543-551, 7 figs. Also Coal Age, vol. 16, no. 21, Nov. 27 and Dec. 4, 1919, pp. 845-849, 7 figs. Fairmount, Keighley, Gay and Block systems; half advance and half retreat, concentrated and two other methods. Factors which affect pillar drawing.

ROOF CONTROL. Roof Control in Coal Mines, James Ashworth. Can. Min. Jl., vol. 40, nos. 48 and 49, Dec. 3 and 10, 1919, pp. 901-904, 933-935, 8 figs. It is concluded from analysis of conditions at various mines that "bumps" are not related to outbursts of explosive gases, but are caused by subsidence of roof under rigidity rocks.

SHAFT SINKING. Colliery Shaft Sinking, Edmund L. Hann. Times Eng. Supp., no. 536, June 1919, p. 188. Novel methods in Kent.

COAL TIPPLES

New Coal Tipple of the Consolidation Coal Company. William Brasack. Coal Age, vol. 16, no. 17, Oct. 23, 1919, pp. 678-682, 9 figs. Prepares coal form three drift mines and ultimate capacity will be 5000 tons per day. Tipple is built of steel and has been designed with a view to secure safety and simplicity of operation.

COALING

See Ships Coaling.

COBALT

Passivity of Cobalt, Horace G. Byers and Curtis W. Thing. Jl. Am. Chem. Soc., vol. 41, no. 12, Dec. 1919, pp. 1902-1908, 1 fig. Series of measurements of anodic potentials of iron, nickel and cobalt are given. Results show that at low current densities cobalt when used as anode readily goes into solution.

COKE

Handling of Coke. Times Eng. Supp., no. 536, June 1919, p. 189; Mechanical Systems.

COKE OVENS

Coking of Illinois Coal in Koppers Type Oven, R. S. McBridge and W. A. Selvig. Dept. Commerce Technical Papers of Bur. Standards, no. 137, Nov. 17, 1919, 51 pp. Operating test at St. Paul plant of Minnesota By-Product Coke Co. conducted jointly by Nat. Bur. Standards and Bur. Mines.

Eighty-Oven By-Product Coke Plant of the Steel Co. of Canada at Hamilton. Contract Rec., vol. 34, no. 48, Nov. 26, 1919, pp. 1085-1090, 6 figs. Details of making coke for blast furnace use.

The Dominion Iron and Steel Company's Koppers By-Product Coke Plant at Sydney, N.S., C. E. Wallin. Iron & Steel Co. of Can., vol. 11, no. 11, Dec. 1919, pp. 291-298, 7 figs. Ovens are of standard regenerative type, 37 ft. 6 in. in length, 15¾ in. in width, and 8 ft. 7 in. in height from floor to top of coal.

COKE-OVEN GAS

Coke Oven Gas Reheater Improvement, George B. Cramp. Blast Furnace & Steel Plant, vol. 7, no. 12, Dec. 1919, pp. 606 and 616, 2 figs. Increasing utility of reheater by application of radiator plates of corrugated sheets.

Heating Furnaces and Annealing Furnaces—XI and XII, W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 12, Dec. 1919, pp. 583-585, 9 figs. Also Am. Drop Forger, vol. 5, no. 12, Dec. 1919, pp. 577-579, 9 figs. Economical use of by-product coke oven gas for heating and annealing furnaces.

Moisture in Blast Furnace Coke, Wm. H. George. Jl. Soc. Chem. Indus., vol. 38, no. 22, Nov. 29, 1919, pp. 394T-396T. Method of determining it.

COLLOIDAL FUEL

A Solid Fuel in Liquid Form, Robert G. Skerrett. Sci. Am., vol. 121, no. 25, Dec. 20, 1919, pp. 604-605, 4 figs. Advantages of combining solid and liquid fuels in colloidal form.

METHODS. Cost Accounting, George L. Bennett. Ice & Refrigeration, vol. 57, no. 5, Nov. 1919, pp. 194-197. Advises systematizing cost data in ice-making industry. Paper read before Natural Ice Assn. of Am.

COTTON MILLS

Electric Service at Naumkeag Cotton Mills. Elec. World, vol. 74, no. 18, Nov. 15 and 22, 1919, pp. 933-936, 8 figs. Methods of inspecting and maintaining installation of 3247 motors.

CRANES

CARGO. Mechanical Method for Handling Cargo, Warren Travell. Shipping, vol. 9, no. 11, Dec. 17, 1919, pp. 23-24 and 68, 2 figs. Illustrating types of cranes. (To be continued.)

INSTALLATION. Consider the Crane, Chester C. Rausch. Wisconsin Engr., vol. 24, no. 2, Nov. 1919, pp. 53-62. Suggestions in regard to installation of cranes with a view to avoid accidents and also locating lights in such a position as never to cause a glaring light confusing vision of crane operator. Paper read before National Safety Congress.

OPEN-HEARTH LADLE. Main Hoists for Open Hearth Ladle Cranes. W.W. Garrett, Jr. Blast Furnace & Steel Plant, vol. 7, no. 12, Dec. 1919, pp. 593-594. Tests and observations made on main hoists of two overhead electric travelling open hearth ladle cranes. Paper read before Assn. of Iron & Steel Elec. Engrs.

SHIPBUILDING. Heavy Double Trestle for Shipbuilding Cranes over Newport News Battle-Cruiser Berths, R. W. Burpee. Eng. News-Rec., vol. 83, no. 10, Oct. 16, 1919, pp. 723-728, 9 figs. Long runway without expansion joints. 75-ton and 15-ton cranes on same rails. Truss loads divided between tower columns. Transverse framing statistically indeterminate.

Modern Lifting Machinery. Steamship, vol. 31, no. 366, Dec. 1919, pp. 131-135, 7 figs. Cranes built by Herbert Morris, Ltd., Loughborough, England.

CRANKSHAFTS

Torsional Oscillations of a Crankshaft, J. Morris. Aeronautics, vol. 17, no. 317, Nov. 13, 1919, pp. 454, 3 figs. Effect on crankshaft of relation between frequencies of torsional oscillations and firing strokes.

CRYSTALLIZATION

Rhythmic Crystallization, Raphael Ed. Liesegang. Sci. Am. Supp., vol. 88, p. no. 2287, Nov. 22, 1919, pp. 299. Examples of intermittent precipitation. Translated from Die Naturwissenchaffen.

CUPOLAS

Ancient and Modern Cupolas (Les cubilots anciens et modernes), T. Levoz. Fonderie Moderne, vol. 12, no. 6, June 1919, pp. 125-132, 10 figs. Practice at Milan plant. (Continuation of serial.)

Ancient and Modern Cupolas (Les cubilots anciens et modernes), T. Levoz. Fonderie Moderne, vol. 12, no. 7, July 1919, pp. 153-160, 6 figs. Significance of positions of tuyere. (Concluded.)

Fuel Economy in Cupola Practice, H. James Yates. Engineering, vol. 108, no. 2803, Sept. 19, 1919, pp. 396. Methods of reducing heat losses due to (1) radiation, (2) sensible heat in waste gases, (3) undeveloped heat in unburned carbonic oxide. Paper read before Iron and Steel Inst.

See also Electric Furnaces, Iron Foundry.

CUTTING METALS

Supplement to Frederick W. Taylor's "On the Art of Cutting Metals"—III, Carl G. Barth. Indus. Management, vol. 58, no. 5, Nov. 1919, pp. 369-374, 11 figs. Formulæ for cutting metals and general formula for plotting slide rules; also method used in laying out machine tool slide rule to embody all of variables in general formula.

See also Abrasive Wheels.

DAMS

CONCRETE. Concrete in Water Works Construction, A. O. Irwin. Mn. & County Eng., vol. 57 no. 5, Nov. 1919, pp. 225-234, 8 figs. Constructional details of dams, reservoirs, pipe lines, tanks, standpipes, power houses, etc., made of concrete.

EARTH. Hydraulic Fill Dams of the Miami Conservancy District, Harry Gardner. Eng. World, vol. 15, no. 12, Dec. 15, 1919, pp. 11-17, 7 figs. Concerning construction of large earth dams.

FLOOD CONTROL. Concerning Procedure on Miami Flood-Control Dams. Eng. News-Rec., vol. 83, no. 14, Oct. 2, 1919, pp. 740-743, 7 figs. How standard products were secured by test control of varying aggregates.

JACKSON LAKE. Jackson Lake Dam the Savior of the Sharpe River Valley. Eng. News-Rec., vol. 83, no. 21, Dec. 11, and 18, 1919, pp. 992-994, 6 figs. How flush method of delivery was discarded for regulated continuous-flow method.

PRESSURE MEASUREMENTS. Study of Pressures in Hydraulic Dam Cores. Eng. News'Rec., vol. 83, no. 22, Dec. 25, 1919, pp. 1040-1044, 7 figs. Methods of Miami conservancy engineers to obtain data on core consistency and action. Ball soundings. Measurements of lateral and vertical pressure. Results to date on Germantown Dam.

DETERIORATION

Specific Depreciation as Applied to Mechanical Deterioration, W. W. Pollack. Am. Mach., vol. 51, no. 17, Oct. 23, 1919, pp. 761-762, 1 fig. Suggested form for recording deterioration factors.

DIES

Details of Shaving Dies, Frank A. Stanley. Am. Mach., vol. 51, no. 21, Nov. 27 and Dec. 4, 1919, pp. 929-931, 10 figs. Advantages of shaving dies is said to make possible to attain desired results with less attention to quality of blanking dies.

DIESEL ENGINES

CONSTRUCTION. Merchant Marine Diesel-Engine Construction in Switzerland. Motorship, vol. 4, no. 11, Nov. 1919, pp. 44-49, 16 figs. Shop tests of new model 1250 shaft hp. Sulzer two-type motor. Preliminary details of 4200 shaft hp. (5550 i.hp.) cargo—and passenger-ship model. 40 ft. engine-room for 3000 hp.

MARINE. Nearly Half-a-Million Horse-Power in Marine Heavy-Oil Engines. Motorship, vol. 4, no. 11, Nov. 1919, pp. 33-44, 13 figs. Notes on constructional features of machines built by Vickers Ltd., with remarks on question of solid-injection of fuel.

WERKSPOOR. The New Werkspoor Engine. Motorship, vol. 4, no. 11, Nov. 1919, pp. 54-60, 8 figs. Details of recent changes, particularly in reversing mechanism.

WINTON. Winton Diesel Oil Engines. Gas Engine, vol. 21, no. 12, Dec. 1919, pp. 387-388, 3 figs. Features of stationary type.

DIFFERENTIAL EQUATIONS

Transformations of Linear Equations with Partial Derivatives Involving Two Independent Variables (Sur les transformations des équations linéaires aux dérivées partiels à deux variables indépendantes), G. Cerf. Comptes Rendus des seances de l'Academie des Sciences, vol. 169, no. 14, Oct. 6, 1919, pp. 613-615.

DIRECTION FINDERS

How Aeroplanes are Navigated by Wireless, R. Keen. Wireless World, vol. 7, no. 79, Oct. 1919, pp. 389-393, 3 figs. Operation of wireless direction-finder.

DRAINAGE

Reclamation by Drainage of Land in the Mississippi Valley, Edmund T. Perkins. Mun. & County Eng., vol. 57, no. 5, Nov. 1919, pp. 215-217, 4 figs. Possibilities of developing natural resources of region.

DRIFTS

Making and Using Drifts, H. F. Pusep. Am. Mach., vol. 51, no. 17, Oct. 23, 1919, pp. 757-760, 10 figs. Illustrating possible applications of drifts.

DRINKING FOUNTAINS

The Relative Sanitary Values of Different Types of Drinking Fountains—1 and 2, Louis V. Dieter. Am. City, City Edition, vol. 21, no. 5 and 6, Nov. and Dec. 1919, pp. 452-457 and 549-554, 4 figs. Results of tests of vertical nozzle types and of sloping stream types.

DRYDOCKS

The Morse Dry Dock and Repair Plant. Int. Mar. Eng., vol. 24, no. 12, Dec. 1919, pp. 781-792, 20 figs. Notes on organization methods, welding equipment used for repair work and employes' association established for looking after welfare of men while at their work in shops.

DRYING

Some Factors Involved in Drying Operations, Eustace A. Elliott. Chem. & Metallurgical Eng., vol. 21, no. 12, Nov. 12 and 19, 1919, pp. 620-623, 8 figs. Graphs showing influence of both initial and final moisture on length of drying and other factors. Constructed from experiments carried out in small jacketed pan 4 ft. in diameter.

See also Kiln Drying.

DUST

Further Studies in Methods of Dust Determination, E. V. Hill and Otto W. Armspach. Trans. Am. Soc. Heating & Ventilating Engrs., vol. 25, no. 4, Oct. 1919, pp. 391-404 and (discussion), pp. 404-406, 7 figs. Experimental. It was found that all dust is not retained in process of sampling in passing air through water or water spray.

Removing Solid and Liquid Particles from Gases by Means of Electricity (Elektrische Ausscheidung von festen und flüssigen Teilchen aus Gasen), R. Dürrer. Stahl und Eisen, vol. 39, no. 46, Nov. 13, 1919, pp. 1377-1385, 8 figs. Historical review and description of various types of apparatus used. (To be continued.)

Electric Precipitation of Solid and Liquid Particles in Gases (Elektrische Ausscheidung von festen und flüssigen Teilchen aus Gasen), D. Durrer. Stahl und Eisen, vol. 39, no. 47, Nov. 20, 1919, pp. 1423-1430, 17 figs. Details of Cottrell and Möller processes. Application of Cottrell system in various plants.

ELECTRIC CABLES

SINGLE-PHASE. Electric B+B+B -Freight Locomotives on Silesian Mountain Railway (Elektrische B+B+B -Lokomotiven fur die Guterzugbeforderung auf den schlesischen Gebirgsbahnen), Winkler, Elektrische Kraftbetriebe u. Bahnen, vol. 17, no. 20, July 14, 1919, pp. 153-156, 3 figs. These single-phase a. c. engines have a wheelbase of 13,660 mm.; their entire length, between buffers, is 17,200 mm.

TESTS. St. Paul Locomotive Tested at Erie. Elec. Ry. Jl., vol. 54, no. 18, Nov. 1, 1919, pp. 827-831, 16 figs. Also Ry. Age, vol. 67, no. 15, Oct. 10, 1919, pp. 749-750, 2 figs. Regenerating tests and "tug-of-war" test of giant 3000-volt, direct-current locomotive built by General Elec. Co. for Chicago. Milwaukee & St. Paul Ry. Locomotive is equipped with bi-polar motors of gearless type with motor armatures mounted directly upon driving axles. Locomotive weighs 265 tons of which 229 tons are on drivers.

THREE-PHASE. New "Baltic" Three-Phase High-Speed Locomotives used in the Italian Railways (Nouvelles locomotives triphasées à grande vitesse type "Baltic" des Chemins de Fer de l'Etat Italien). Industrie Electrique, vol. 28, no. 658, Nov. 25, 1919, pp. 423-436, 15 figs. Principal characteristics are: Two traction motors coupled by rank and connecting rods to three 1630-mm. driving wheels; total weight 92 tons; operated at 330 volts.

ELECTRIC MOTORS

MAINTENANCE. The Care of Shop Motors, C. E. Clewell. Am. Mach., vol. 51, no. 20, Nov. 13 and 20, 1919, pp. 877-880, 6 figs. Notes on general instructions to be followed in setting up motors for first time. together with cautions on manipulation of electric machinery.

INSTALLATION. The Installation of Electric Motors, E. Austin. Eng. & Indus. Management, vol. 2, no. 21, Nov. 20, 1919, pp. 645-647, 6 figs. Special work for which each of types of winding is suitable.

OPERATION. Operation of Shop Motor Brushes and Contract Devices, C. E. Clewell. Am. Mach., vol. 51, no. 21, Nov. 27 and Dec. 4, 1919, pp. 939-941, 6 figs. Notes on common adjustment of brushes and brush holder of motor and on care of commutator and brushes.

ELECTRIC MOTORS, A. C.

COMMUTATORS. Uses of Commutators for Polyphase Currents (Sur certains modes d'emploi du collecteur en courants polyphasés), L. Gratzmüller. Revue Générale de l'Electricité, vol. 6, no. 20, Nov. 15, 1919, pp. 659-665, 7 figs. How to regulate speed of asynchronous ring motor by relative displacement of two sets of brushes upon commutator of transformer field of which rotates in synchronism with rotor.

STARTING. The Starting of Asynchronous Motors with Squirrel-Cage Rotors (Der Anlaufvorgang bei Asynchronomotoren mit Kurschlussanker), Reinhold Rudenberg. Elektrotechnik und Maschinenbau, vol. 37, no. 44, Nov. 2, 1919, pp. 497-504, 13 figs. Calculation of starting activities based on assumption that torsional moment corresponds to curve indicated by writer. (To be concluded.)

Manual Starters for Small Squirrel-Cage Induction Motors, C. K. Applegarth and H. D. James. Elec. Jl., vol. 16, no. 12, Dec. 1919, pp. 532-536, 12 figs. Features of design, together with auxiliograph record of test made in 3-phase, 60-cycle, 750-volt line having 55 per cent power factor.

VENTILATION. Ventilation of Induction Motors, Fraser Jeffrey. Elec. World, vol. 74, no. 19, Nov. 29 and Dec. 6, 1919, pp. 988-990, 10 figs. Diagram showing flow of air through ducts and discussion of effect of various shapes of ventilating passages.

ELECTRIC POTENTIAL MEASUREMENT

Measuring Small Differences of Potential by Means of Lamp-Amplifiers (Emploi des amplificateurs pour la mesure des différences de potentiel faibles), R. Depriester. Revue Générale de l'Electricité, vol. 6, no. 19, Nov. 8, 1919, pp. 619-620, 1 fig. Method of thermionic balance in open circuit and without differential galvanometer.

ELECTRIC POWER PLANTS

DRYING OUT. Putting a Flooded Power Station Back into Commission. Elec. Rec., vol. 26, no. 4, Oct. 1919, pp. 197-199, 6 figs. Methods used in drying out and testing electric equipment of 4000-kw. generating station which was flooded by bursting of hydraulic turbine.

INDUCTION-GENERATOR. Induction Generator Plants, C. M. Ripley. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 963-969, 3 figs. It is said that in few instances and under specially favorable circumstances induction generator plant with little or no attendance has been able to justify its installation. Description of such of these is given and it is pointed out that if prices of coal and labor continue to soar at their present rates small induction generator plants will soon be economically more feasible than they are at present.

JAPAN. On the Power Station of Kyushyu Electric Railway Company, Y. Kusakari (In Japanese.) Denki Gakkwai Zasshi, no. 375, Oct. 10, 1919.

LAYOUT. The Electrical Layout of Large Power Systems, Robert Treat. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 918-926, 6 figs. (Discussion of means for insuring continuity of service, with comments on investment in protective apparatus and spare equipment which may be justified under varying conditions. Typical transmission network is described and application to this system of principles of selective relaying is taken up.

NEW ENGLAND. Development in New Hampshire and Vermont. Elec. World, vol. 74, no. 16, Oct. 18, 1919, pp. 833-835, 1 fig. Locations of electric generating stations, substations and transmission lines. Possible connections with Connecticut systems.

The New England Power Company, E. A. Dillard and H. R. Wilson. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 974-979, 5 figs. Developments of system. Energy is transmitted about 300 miles at 66,000 volts and normal week-day output averages 1,100,000 kw-hr. and normal week-day peak averages 80,000 kw.

Centralization and Conservation in Power Supply of Central Massachusetts, F. L. Hunt. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919. pp. 947-959, 19 figs How by closing down 121 isolated and using central stations supply nearly 400,00 tons of coal were saved in one year.

NITRATE PLANT. Electrical Energy Supply for Nitrate Plant, C. D. Gray and E. Hagenlocher. Elec. World, vol. 74, no. 20, Dec. 13, 1919, pp. 1052-1055, 3 figs. Electrical machines are arranged to facilitate straight copper runs; storage battery is to carry vital loads in case of complete generator shut-down.

PROTECTION. Relay Protection for Large Power Stations, O. C. Traver. Gen. Elec. Rev., vol. 22, no. 11, No. 1919, pp. 885-899, 29 figs. Describes recent developments and importance in design and construction of relays and indicates variety of results which can be accomplished by their combinations.

SHORT-CIRCUITING. Effects of Short-Circuits on Power House Equipment, E. G. Merrick. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 935-941, 9 figs. Attention is called to problems created in properly handling vast amounts of energy which interconnection of power systems has created. In dealing with this class of problems writer analysizes troubles which are likely to occur in power house equipment due to electro-magnetic stresses and abnormal temperatures resulting from short circuit.

Calculating Short Circuits on Power Systems I and II, R. F. Gooding. Elec. World, vol. 74, nos. 16 and 18, Oct. 18 and Nov. 15 and 22, 1919, pp. 827-830 and 938-941, 7 figs. Oct. 18: Scheme for investigating 3-face symmetrical short circuits is worked out. Nov. 15 and 22: Case of three large stations to be operated in parallel.

ELECTRIC POWER TRANSMISSION

GAS VS. ELECTRICITY. Power Transmission by Gas Times Eng. Supp., no. 541, Nov. 1919, pp. 331. Comparison with electricity.

HEATING OF CONDUCTORS. Electrical Characteristics of Transmission Circuits—V. Wm. Nesbit. Elec. Jl., vol. 16, no. 12, Dec. 1919, pp. 515-519. With table indicating heating capacity of 40 deg. rise of bare copper conductors suspended out of doors.

HIGH-VOLTAGE LIMITATIONS. The Limitations of High-Voltage Transmission, T. A. Worcester. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 880-884. Visualizes use of 220,000 volts as next step in transmission of energy. This is concluded from examination of past developments, which have involved a systematic increase in maximum voltage from 11,400 in 1894 to 150,000 in 1912. Difficulties to be met in installing transmission system at 220,000 volts and ways in which they may be solved are discussed.

High Voltage Power Transmission Problems, W. W. Lewis. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 927-934. Examples of application of formulæ developed by Steinmetz (See Gen. Elec. Rev., June 1913). It is visualized that voltages and length of line will soon be reached where it will be necessary to employ rigid hyperbolic formulæ.

INDUSTRIAL DEVELOPMENT. Power Transmission and Industrial Development, Ross J. McClelland. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 825-832, 1 fig. Functions of transmission and power sources sighted from viewpoint of possibility of effecting economies. Writer discusses relationship between power supply and transportation, interconnection of power systems and influence that comprehensive scheme of power supply would have upon national industrial and economic development.

INTERCONNECTION. The Seattle-Spokane Transmission Line, G. E. Guinan. Stone & Webster Jl., vol. 25, no. 5, Nov. 1919, pp. 350-357, 10 figs. on 4 supp. plates. Interconnection in one electrical system of various generating plants having total capacity of 298,100 hp.

National Distribution of Electric Energy (Une distribution nationale d'énergie électrique), F. Scoumanne. Revue Générale de l'Electricité, vol. 6, nos. 19 and 20, Nov. 8 and 15, 1919, pp. 638-643, and 667-675. Study of economy resulting from interconnection of central stations. Suggested method of organizing progressive development of general distribution of energy. Question is considered in general without reference to any nation in particular. (Concluded.)

Power and Transmission, H. H. Dewey. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 876-880. Writer calls attention to fact that while demand for power increased enormously during war, normal supply of generating equipment to meet that need was not immediately forthcoming. To supply this deficiency, tendency already in evidence toward inter-connection of power systems was greatly enhanced. He concludes that co-operation between manufacturers of electrical apparatus and operators who use them is essential to avoid serious difficulties of handling of future power networks.

PHILADELPHIA. Distributing System of Philadelpnia Electric Company (Système distributeur d'énergie de la Philadelphia Electric Company), George P. Roux. Revue Générale de l'Electricité, vol. 6, no. 20, Nov. 15, 1919, pp. 675-681, 6 figs. Insists particularly on duties of load dispatcher and describes apparatus by means of which control is affected.

PROTECTING APPARATUS. Automatic Protecting Apparatus for Alternating Current Net Works (Appareillage automatique de protection pour les réseaux à courants alternatifs), M. Rosebourne. Revue Générale de l'Electricité, vol. 6, no. 22, Nov. 29, 1919, pp. 774-780, 14 figs. Comparative value of apparatus employed.

ELECTRIC OSCILLATIONS

Absolute Value of Periods of High-Frequency Electric Oscillations (Mesure en valeur absolue des périodes des oscillations électriques de haute fréquence), Henri Abraham and Eugene Bloch. Annales de Physique, vol. 12, no. 9, Sept.-Oct. 1919, pp. 237-302, 11 figs. Period is determined by rendering it identical to that of harmonic of electric oscillator, fundamental frequency of which can itself be made identical to that of a standard tuning fork.

EMULSIFICATION

Emulsification by Absorption at an Oil-Water Interface, S. E. Sheppard. Jl. Phys. Chem., vol. 23, no. 9, Dec. 1919, pp. 634-639, 3 figs. Experiments are said to have agreed with Bancroft's general theory of peptization that absorption at a liquid, liquid interface is capable of procuring emulsification.

END STANDARDS

Types of End Standards, R. L. Rankin. Iron Age, vol. 104, no. 26, Dec. 25, 1919, pp. 1331-1332, 5 figs. Relative value of flat, cylindrical, spherical and other end standards.

ENGINES

See Aeroplane Engines; Automobile Engine, Diesel Engines, etc.

EVAPORATORS

Modern Commercial Evaporators, W. L. Badger. Michigan Technic, vol. 32, no. 3, Oct. 1919, pp. 186-200, 7 figs. Design calculations.

Efficiency Determination of Evaporator Heating Surfaces (Ueber Verdämpher und die Bestimmung der Leistung ihrer Heizflächen), H. Claassen. Zeischrift für angewandte Chemie, vol. 32, no. 62, Aug. 5, 1919, pp. 241-246, 3 figs. Purpose of article is to establish basis for determination and calculation of practical coefficient of heat flow and certain rules for carrying our efficiency tests in evaporation systems.

EXCAVATING MACHINERY

Electrically Operated Excavating Machines (Machines d'extraction à commande électrique), G. Hacault. Revue Générale de l'Electricité, vol. 6, no. 19, Nov. 8, 1919, pp. 623-637, 22 figs. Alternating-current controllers: comparison of various systems of controlling. (Concluded.)

The Queenstown-Chippewa Hydro-Electric Power Project, Harry Gardner. Eng. World, vol. 15, no. 11, Dec. 1, 1919, pp. 15-19, 14 figs. Operation of electric shovels used for excavation of canal.

Electrically Operated Excavating Machinery in French Mines (Sur l'avenir des installations d'extraction à commande électrique dans les mines françaises), A. Barjon. Revue Générale de l'Electricité, vol. 6, no. 22, Nov. 29, 1919, pp. 768-773, 6 figs. Comparative study of machinery used in collieries. Operation of Leonard coupling with Koepe pulley is particularly noted and advantages of systems are exposed.

EXHAUST HOODS

See Grinding Machines.

EXPLOSIONS

Apparatus for Preventing Explosions. Acetylene & Welding Jl., vol. 16, no. 191, Aug. 1919, pp. 156-157, 2 figs. Flame in gas conduit is arrested by utilizing heat of flame to melt quantity of fusible material in path of gas flow and thereby seal passage.

The Temperature of Explosion for Endothermic Substances, Rasik Lal Datta and Nihar Ranjan Chatterjee. Jl. Chem. Soc., vols. 115 and 116, no. 683, Sept. 1919, pp. 1006-1010. Results obtained experimentally for nitocompounds, picrates azo-compounds, haloid compounds, and organic perchlorates.

EXPLOSIVES

MANUFACTURE. Filling Containers with TNT and Amatol—I, Chem. Age, vol. 1, no. 14, Sept. 20, 1919, pp. 385-386. Methods of filling.

MILITARY TESTS. Experiments with Blast and Pressure Meters and Tests of Explosives, E. H. Schultz. Professional Memoirs, Corps Engrs, U. S. Army and Engr. Dept. at large, vol. 11, no. 57, May-June 1919, pp. 325-346, 9 figs. Tests made at Aberdeen proving grounds, Maryland.

USES. Report of Tests to Demonstrate the Adaptability of Grade III TNT for Clearing Land or Similar Uses, W. J. Montgomery. Professional Memoirs, Corps Engrs. U. S. Army and Engr. Dept. at large, vol. 11, no. 57, May-June 1919, pp. 260-262 and 270-276, 10 figs. Research of Bureau of Mines.

Safety Factors in the Use of Explosives in Cement Rock Quarrying, Walter O. Snelling. Cement & Eng. News, vol. 31, no. 12, Dec. 1919, pp. 31-34, 1 fig. Recommendations as to manner of loading and unloading, thawing, etc.

Proper Use of Explosives in Mines, H. Y. Russel. Cement, Mill & Quarry, vol. 15, no. 11, Dec. 5, 1919, pp. 37-40. Explosives discussed are those in which explosive base consists of nitroglycerine, nitroglycerine in combinationwith guncotton, or nitroglycerine in combination with ammonium nitrate. Paper read before Can. Min. Inst.

EXPORT MARKETS

The Electrical Market in Italy, O. M. Smart. Elec. World, vol. 74, no. 16, Oct. 18, 1919, pp. 831-833, 1 fig. Writer sees great outlet for exports to Italy, where electrical energy is very generally used in industrial plant. Geographic charts show frequencies and other data is given.

FABRICS

Theory of Elastic Fabrics and Its Application to the Calculation of Elastic Plates (Die Theorie elastischer Gewebe und ihre Anwendung auf die Berechnung elastscher Platten), H. Mercus. Armierter Beton, vol. 12, no. 8, Aug. 1919, pp. 181-190, 11 figs. Discussion of plate having uniform loading. (To be continued.)

FACTORY LAYOUT

New Plant of National Acme Company. Iron Age, vol. 104, no. 23, Dec. 4, 1919, pp. 1111-1119, 16 figs. Details of shop built for large production of screw machine products, noting features designed for convenience of employees.

FEEDWATER

Hot-Water Feeding for Boilers (Kesselspeisung mit heissem Wasser), A. Bruser. Kraft und Betrieb, vol. 3, nos. 9 and 10, Aug. 1 and 15, pp. 114-115 and 121-122, 4 figs. Treatise on principles and application of injectors for feedwater of 30 deg.without addition of cold water and for feedwater of maximum heat of 100 deg. cent. with addition of cold water. Description of "hot-water" injector.

Lime-Barium Softener for Treatment of Boiler Feed Water, C. A. Mehring. Chem. & Metallurgical Eñg., vol. 21, no. 12, Nov. 12 and 19, 1919, pp. 629-632, 2 figs. Operating procedure, specially methods of charging softeners and washing filters, sampling and analyzing, and gaging flow with weir.

FERROALLOYS

Complex Ferro-Alloys (Les ferro-alliages complexes). Journal du Four Electrique, vol. 28, no. 22, Nov. 15, 1919, pp. 149-151. Manufacture, properties and uses of ferro-silico-aluminum, ferro-siloco-manganese; ferro-silico-nickel; ferro-mangano-nickel and ferro-chromos-aluminum.

FERTILIZERS

Tetraphosphate—A Special Italian Fertilizer. Am. Fertilizer, vol. 51, no. 11, Nov. 22, 1919, pp. 58-59. Phosphorite is ground finely and mixed with 6 per cent of powder made up principally of oblomite, sulphate of sodium and carbonate of sodium, and is then heated in furnace to about 700 deg. cent; finally, while still hot, mass is hydrated with fine spray of water so as to add about 8 kg. of water per quintal.

Value of Minnesota Peat, Henry H. Hindwhaw. Jl. Am. Peat Soc., vol. 12, no. 4, Oct. 1919, pp. 194-198. As fertilizer element.

FIELD COILS

A Direct Method of Calculating Shunt Field Coils Having Two Bages of Wire, R. G. Jakeman. Elecn., vol. 83, no. 2166, Nov. 21, 1919, pp. 557-578, 1 fig. Fornulæ expressing ratio between winding depths of two standard gages, both in case larger gage is wound first and one smaller gage is wound first.

FILING SYSTEMS

Some Thoughts on Filing Systems, Donald J. Baker. Coal Age, vol. 16, no. 19, Nov. 6, 1919, pp. 736-740, 7 figs. System employed at Bur. of Mines Station in Pittsburgh.

FIRE PROTECTION

CHEMICAL. Chemical Fire Protection for the Car-Storage Yard. Elec. Ry. Jl., vol. 54, no. 16, Oct. 18, 1919, pp. 753-754. Installation of Chicago Elevated which comprises ten cars with chemical apparatus including two 100-gal. operating tanks and a 500-gal. auxiliary supply tank particularly for use to extinguish fires where water mains are not available.

PRIVATE SERVICE. Report of Committee on Private Fire Protection Service. Jl. Am. Water Works Assn., vol. 6, no. 4, Nov. 1919, pp. 679-770 and (discussion) pp. 770-784, 12 figs. Concerning manner of controlling fire service pipes where they enter buildings of private property, limit to be placed upon size of fire-service connections, means to prevent pollution of public water supply through private fire-protection service, and advisability of making charge for private fire-protection service and manner of determining this charge.

SAFETY. Industrial Safety—V. Sidney J. Williams. Power Plant Eng., vol. 23, no. 23, Dec. 1, 1919, pp. 1070-1071. Fire protection in relation to safety. Paper read before Schools for Safety Engrs.

See also Buildings, Fire Hazards; Coal Mines, Fire Prevention.

FIRE PUMPS

See Pumps, Fire.

FLAME COLORATION

Flame Reaction of Selenium and Tellurium, Harry B. Wieser and Allen Garrison. Chem. News, vol. 100, no. 3108, Nov. 7, 1919, pp. 214-217. Probabel causes of colorations produced in flames. (Concluded.)

FLOODS

Propagation of Floods and Their Forecast (Note sur la Propagation des Crues et leur prévision journalière), M. Pigeaud. Annales des Ponts et Chaussées, vol. 51, no. 4, July-Aug. 1919, pp. 29-57, 6 figs. Determining propagation in water course by Graeff sysstem, which is based on gaging graphs establishing at various points definite relation between amount of water passing per second and level to which it rises.

FLOTATION

OIL ACTION. Mechanical Treatment of Ores (Préparation mécanique des minerais), F. Bronckart. Revue Universelle des Mines, vol. 2, no. 2, June 1919, pp. 325-366, 5 figs. Description of flotation and of Murex method, which also outlines selective action of oil but is not a method of flotation.

OIL. Oil Furnaces in Manufacture of Steel (Emploi des fours à l'huile pour la fusion de l'acier), J. Lambot. Fonderie Moderne, vol. 12, no. 7, July 1919, pp. 146-148. Construction and operation of furnaces.
Safety Rules for Tar-Oil Furnaces (Sicherheitsvorschriften für Teeröfeurrungen). Zeitschrift des Bayerischen Revisions-Vereins, vol. 23, no. 17, Sept. 15, 1919, p. 139. Fourteen rules to avoid explosions.

ROSENHAIN. Use of a Modified Rosenhain Furnace for Thermal Analysis, H. Scott and J. R. Freeman, Jr. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 348, 1919, pp. 317-323, 5 figs. Description is given of thermal analysis furnace constructed on principle of Rosenhain's furnace, chief departures from his design being, (1) use of gravity-drive rate control and (2) introduction of sample through bottom and cold end of furnace. Advantages and faults of these modifications are mentioned.

TEMPERATURE MEASUREMENTS. Measuring Furnace Temperature, George K. Burgess. Iron Trade Rev., vol. 65, no. 19, Nov. 6, 1919, pp. 1248-1249. Solution of pyrometer problems is said to depend upon co-operation of steelmaker scientific man in research laboratory and instrument maker.

WASTE-HEAT UTILIZATION. Using Waste Heat from Industrial Furnaces—I. Metal Worker, Plumber and Steam Fitter, vol. 92, no. 15, Oct. 10, 1919, pp. 427-428, 2 figs. It is said that waste of heat can be stopped, expense of waste saved and increased service enjoyed everywhere if local heating engineer makes non-competitive business for himself by examining plants in his vicinity. (To be continued.)

GAGES

BRASS GOODS. Gauges and Standards for Manufacturing Brass Goods, P. W. Blair. Metal Indus., vol. 17, no. 10, Oct. 1919, pp. 460-462, 7 figs. Comparison of standards proposed by various scientific organizations.

HOLE LIMITS. Limits for Gauges for Holes. Engineer, vol. 128, no. 3331, Oct. 31, 1919, pp. 444-445. Summary of reasons in support of plus and minus hole limits.

INSPECTION. Use of Precision Balls for Accurate Measurements, R. L. Rankin. Machy. (Lond.), vol. 15, no. 374, Nov. 27, 1919, pp. 272-274, 7 figs. Attachments for machines and for taking direct measurements in inspection of gages. Practice of Gauge Section of Bur. of Standards.

MANUFACTURE. Elements of Gage Making—VII, C. A. Macready. Am. Mach., vol. 51, no. 23, Dec. 18, 1919, pp. 1035-1036, 7 figs. Points out errors caused by attaching gages temporarily to auxiliary pieces used to hold them while being machined.

SYSTEMS. The Use of Gauges in the Mechanical Field, E. C. Peck. Can. Machy., vol. 21, no. 23, Dec. 4, 1919, pp. 549-551. Origin of gages and description of principal systems in use.

GARBAGE DISPOSAL

Recovery of Valuable Constituents of Garbage, Samuel A. Greeley. Can. Engr., vol. 37, no. 22, Nov. 27, 1919, pp. 495-498. Summary of various methods of disposal of municipal wastes, including hog-feeding, incineration, sorting, reduction, alcohol production, etc. Paper read before Am. Soc. for Municipal Improvement.
Recent Practice in Garbage Disposal by Feeding to Pigs. Eng. & Contracting, vol. 52, no. 24, Dec. 10, 1919, pp. 672-673. Committee report submitted at convention of Am. Public Health Assn.
Pig Feeding for Disposal of Garbage, F. S. Besson. Mun. Jl. & Public Works, vol. 47, no. 21, Nov. 22, 1919, pp. 306-309, 4 figs. Results obtained at experimental farm operated by District of Columbia, and conclusions therefrom.

GAS ANALYSIS

An Improved Orsat Apparatus for Gas Analysis, G. W. Jones and F. R. Neumeister. Chem. & Metallurgical Eng., vol. 21, no. 14, Dec. 10-17, 1919, pp. 734-736, 4 figs. Apparatus used by Bureau of Mines.

GAS APPLIANCES

Industrial Fuel Committee Report of Sub-Committee on Standard Performance Specifications for Gas Appliances, I. Lundgaard. Am. Gas Assn. Monthly, vol. 1, nos. 11-12, Nov.-Dec. 1919, pp. 627-633, 6 figs. Tentative proposal for standard specifications for oven furnaces and instruments for testing furnaces.

GAS ENGINES

DEVELOPMENT. The Development and Use of High-Power Gas Engines, Walter Crooke and John Lyon Ewan. Iron & Coal Trades Rev., vol. 99 and 100, nos. 2697 2698 and 2899, Nov. 7, 14 and 21, 1919, pp. 590-598, 623-625, and 659-661, 14 figs. Design features of four-stroke, horizontal, double-acting tandem arrangement. Tests with non-recovery producer gas on 2-cycle single-acting engines; curves showing variation of consumption of heat units, mechanical efficiency and overall efficiency load for gas engines running on Mond recovery producer plant.

KNOCKING. Knocking in Gas Engines, Mark Meredith. Gas Engine, vol. 21, no. 12, Dec. 1919, pp. 385-386. Causes which develop knocking. Instances quoted where, after numerous investigations, knocking was found to be due to slackness in flywheel.

HEAT CONSUMPTION. Gas Machines (Gasmaschinen), Rudolph Schick. Kraft und Betrieb, vol. 3, no. 11, Sept. 1, 1919, pp. 129-131. Comparative calculations of heat consumption of steam engine and gas engine. Utilization of furnace and coke oven gases is discussed and gasification of fuels is described.

GAS FLOW

Three-dimensional Flow of Gases (Mehrdimensionale Strömung von Gasen), Gustav Flugel. Zeitschrift für das gesamte Turbinenwesen, vol. 16, no. 18, June 30, 1919, pp. 178-180, 2 figs. Stationary axial flow in a diaphragm and stationary rotating axial flow in a rotor are described. (Concluded.)

GAS MAINS

Regulation for High and Low Pressure Mains, Geo. T. Macbeth. Gas Age, vol. 44, no. 10, Nov. 15, 1919, pp. 443-445, 3 figs. Experience in regulating pressures from transmission or pumping mains into distribution mains.

GAS MANUFACTURE

Determination of the Amounts of Tar and Gas and the Heat Value of Gas in Gasification (Ueber die Ermittlung der Teerund Gasmenge, sowle des Gasheizwertes dei Vergasungen), Deinlein. Zeitschrift des Bayerischen Revisions-Vereins, vol. 23, no. 16, Aug. 31, 1919, pp. 128-130. Discussing amount of tar, composition of coal and tar, amount of gas and heat value.
Inert Products in Coal Gas. Times Eng. Supp., no. 537, July 1919, p. 224. Origin and methods of avoiding.
Rational Use of Coal for Power and Heat, John Blizard. Can. Min. Inst. Bul., no. 92, Dec. 1919, pp. 1214-1221. Possibilities of carbonizing or complete gasifying coal, supplying consumers with gas and coke instead of raw coal.
Process in Coal Carbonization since 1916, J. A. Brown. Gas Age, vol. 44, no. 11, Dec. 1, 1919, pp. 475-477. General report of Carbonization of Am. Gas Assn. and special reports on installations.

GAS PRODUCERS

Home-Made Gas Producers Increase Lime Burned Per Unit of Fuel 50 per cent. Rock Products, vol. 22, no. 23, Nov. 8, 1919, pp. 37-40, 12 figs. Experience of company after replacing coal-fired furnaces with semi-gas producers.
Operation of a Gas Producer, J. S. McClimon. Chem. & Metallurgical Eng., vol. 21, no. 12, Nov. 12 and 19, 1919, pp. 632-635, 1 fig. Suggestions in regard to various details of operation.

GAS RETORTS

Heavy Duty Through Retort Operation in St. Louis, J. L. Eigenbrot. Gas Age, vol. 44, no. 9, Nov. 1, 1919, pp. 395-396, 2 figs. Handling horizontal through retorts with heavy duty Debrouwer chargers and dischargers.
Practical Hints on Retort House Operation, Carl B. Wyckoff. Gas Age, vol. 44, no. 9, Nov. 1, 1919, pp. 389-392, 1 fig. Concerning introduction of primary air into bench, arrangement of secondary air ports, form of steam super-heater, temperature to maintain in retort and making Orsat test. (Concluded.)
Steaming Horizontals, R. J. Rew. Gas World, vol. 71, no. 1834, Sept. 13, 1919, pp. 201-202, 1 fig. Manner of proceeding. Advantages of short period steaming.

GAS WAREFARE

Gas In Defense, Amos A. Fries. Nat. Service & Internat. Millitary Digest, vol. 6, no. 5, Nov. 1919, pp. 273-277, 5 figs. Development of gas mash, specially in America, and comparison of principal types constructed by various belligerants.

GASES

BSORPTION. The Absorption of Gases at Low and Moderate concentrations, I, II & III, A. M. Williams. Proc. Roy. Soc., vol. 96, no. A-677, Nov. 1, 1919, pp. 287-311, 6 figs. Theoretical form of absorption isostere is found to be $\log a/c = B + A/T$ where B and A are functions of a only. Part III—Relationship among constants was found to be in good agreement with theory based on existence of thing surface layer.

HEAT-VALUE INDICATOR. A New Heat Value Indicator for Gasworks Use, Edward J. Brady. Gas World, vol. 71, no. 1844, Nov. 22, 1919, pp. 410-412, 8 figs. Apparatus designed for study of flame characteristics.

IGNITION BY HOT WIRE. The Igition of Gases by Hot Wires, W. M. Thornton. Lond. Edinburgh, and Dublin Phil. Mag., vol. 38, no. 227, Nov. 1919, pp. 613-633, 9 figs. Article deals with problem of ignition by hot wires, such as may occurr in coal mines, battery rooms or in manufacturing processes where combustible gas is set free.

OCCLUDED. The Influence of Hydrogen Sulphide on the Occlusion of Hydrogen by Palladium, Edward Bradford Maxted. Jl. Chem. Soc., vols. 115 and 116, no. 683, Sept. 1919, pp. 1050-1055, 1 fig. Hydrogen-occluding power of oxygen-free palladium-black was measured before and after treatment with hydrogen of sulphide. Data are presented relating to absorption of hydrogen sulphide by palladium and stability of absorption compound.

GEARS

LUBRICATION. The Lubrication of Worm Gear, Motor Traction, vol. 29, no. 770, Dec. 3, 1919, pp. 543-545. Also Autocar, vol. 43, no. 1258, Nov. 29, 1919, pp. 1016-1018, 2 figs. Tests made at National Physical Laboratory for determining lubricating qualities of various classes of oil.

MANUFACTURE. Gear Makers Adopt Standard Contract. Automobile Industries, vol. 41, no. 17, Oct. 23, 1919, pp. 830-831 and 833. Form drawn by Committee of Am. Gear Manufacturers' Assn.
Gear Manufacture—Types and Materials—II, Raw Material, vol. 1, no. 8, Nov. 1919, pp. 377-384, 18 figs. Materials for noiseless operation of gears.

Scandinavia. Heating and Ventilating of Workshops in Scandinavia (Litt om opvarmning av verksteden), O. Gruner Loken and Henrik Ovenberg. Teknisk Ukelblad, vol. 66, no. 44, Oct. 3, 1919, pp. 514-515 and 516, 1 fig. Air heating nd ventilating arrangement of building 690 ft. long by 59 ft. wide, containing four stories each 13 ft. high. It is said that ventilation and heating of workshops by warm air is more effective than heating by radiators or stoves and that it results in increased production from workman.

St. Paul Public Library. St. Paul Public Library Heating and Ventilating, C. S. Tompkins. Power Plant Eng., vol. 23, no. 24, Dec. 15, 1919, pp. 1093-1097, 7 figs. Fans are designed to make six changes of air per hour.

HIGHWAYS

See Roads; Pavements.

HOUSING, INDUSTRIAL

Houses by the Bucketful, Floyd Hamilton Hazard. Sci. Am., vol. 121, no. 23, Dec. 6, 1919, p. 553, 1 fig. One-piece concrete house that is said to be built in ten days.

Industrial Housing at Walkerville, Ont., Norman C. McEachren and Wm. H. Martin. Contract Rec., vol. 33, no. 51, Dec. 17, 1919, pp. 1154-1158, 7 figs. Constructional details of houses built.

Industrial Housing Development, Harold R. Watson. Can. Manufacturer, vol. 39, no. 12, Dec. 1919, pp. 53-57, 7 figs. Illustrating recent work under Housing Act.

Some Sidelights on Construction Work, N. L. Rea. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 913-917, 9 figs. Concerning specially living conditions for men engaged in transportation of materials and questions of assembly and erection as influenced by local conditions.

The Workman's Home—I, Leslie H. Allen. Sci. Am. Supp., vol. 88, no. 2289, Dec. 6, 1919, pp. 330-331. Its influence upon production in the factory and labor turnover. Paper read before Am. Soc. Mech. Engrs.

HYDRAULIC COMPUTATIONS

Another Diagram for Solving the Manning Hydraulic Formula, R. D. Goodrich. Eng. News-Rec., vol. 83, no. 14, Oct. 2, 1919, pp. 648-649, 1 fig. Prepared to facilitate hydraulic computations involved in investigation of river and flood channels preliminary to design of regulation of river system.

HYDRAULIC TURBINES

A New Type of Hydraulic-Turbine Runner, Forrest Nagler. Mech. Eng., vol. 41, no. 12, Dec. 1919, pp. 921-925, 7 figs. Design is based on straight radial blade, which is said to offer abslute minimum of wetted surface and of bending moment on root of blade. From direction of flow it is characterized as pure Jonval type. Writer expects that this water-wheel runner, because of its simplicity and inexpensiveness, will supersede mixed-flow or Francis type.

Features of Design in Large Hydraulic Turbines, F. H. Rogers. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 849-852, 5 figs. Relative importance of losses occurring in penstock runner and draft tube at various heads and specific speeds is discussed and attention is called to conditions under which certain of these losses become sufficiently important to warrant exercising considerable effort to minimize them.

HYDROLYSIS

Diastatic Inversion of Saccharose; Influence of Products of Reaction on Velocity of Hydrolysis (Sur l'inversion diastasique du saccharose; Influence des produits de la réaction sur la vitesse d'hydrolyse), H. Collin and A. Chaudun. Comptes Rendus des séances de l'Académie des Sciences, vol. 169, no. 19, Nov. 10, 1919, pp. 849-852. Experiments are said to have established that velocity of hydrolysis is function of first degree of fluidity of solutions and retardation of diastatic inversion of saccharose, due to presence of glucose, is attributed to increase of viscosity of solution.

HYDRODYNAMICS

Movement of a Solid in an Indefinite Liquid (Sur le mouvement d'un solide dans un liquide indéfini), G. Kolessoff. Comptes rendus des séances de l'Académie des Sciences, vol. 160, no. 16, Oct. 20, 1919, pp. 685-687. Cases of integration of general equations of movement.

HYDROELECTRIC PLANTS

Chile. New Hydroelectric Power Plant at Rio Pangal, Chile, Hugh L. Cooper. Elec. Rev. (Chicago), vol. 75, no. 21, Nov. 22, 1919, pp. 853-856, 6 figs.; also in Eng. World, vol. 15, no. 12, Dec. 15, 1919, pp. 29-32, 6 figs. Construction feature of diversion dam, seven-mile pipe line, penstocks and waterwheels for new plant built by Braden Copper Co. to supply power to its works at Sewell, Chile. Plant capacity will be 20,000 kv. a. available at low-tension busbars of generating station.

Industrial Use. Hydro-Electric Power and Its Use for Industrial Purposes, Eric A. Lof. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 942-946, 4 figs. It is urged that development of our water power resources be encouraged by enactment of just laws governing their use and construction of large economical supplementary steam plants at "strategic" points.

Keokuk. The Hydro-Electric Plant at Keokuk, Ia. Power House, vol. 12, no. 19, Nov. 20, 1919, pp. 509-510, 4 figs. Capacity is 150,000 hp. Dam, power house, lock, dry dock, sea-wall and ice fender are all one concrete monolith, with total linear measurement of 13,185 ft.

Niagara Falls. New Hydroelectric Developments at Niagara—1. Engineer, vol. 128, no. 3331 and 3332, Oct. 31 and Nov. 7, 1919, pp. 427-429 and 454-455, 7 figs. Concerning plant operating under head of 305 ft. and developing 300,000 hp. with provision for eventual increase to nearly 1,000,000 hp.

Construction Progress on Canadian Niagara Power Project. Eng. News-Rec., vol. 83, no. 21, Dec. 11, and 18, 1919, pp. 1010-1012, 7 figs. Excavation under way on Queenston-Chippewa Canal which will develop most of head between two great lakes.

See also Water Power.

HYDROGEN OVERVOLTAGE

Hydrogen Overvoltage, II. Applications of Its Variation with Pressure to Reduction, Metal Solution and Deposition, D. A. McInnes and A. W. Contieri. Jl. Am. Chem. Soc., vol. 41, no. 12, Dec. 1919, pp. 2013-2019, 3 figs. Increase of hydrogen over voltage with a diminished pressure is shown to follow, in nearly quantitative manner, from theory advanced by MacInnes and Adler.

ICE

Plants. Electrically Driven Raw Water Ice Plants, A. M. Jones. Ice and Refrigeration, vol. 57, no. 6, Dec. 1919, pp. 260-261. Reasons for tendency to introduce electric drive.

Low-Pressure Absorption Ice Plant, C. M. Vaden. Ice and Refrigeration, vol. 57, no. 6, Dec. 1919, pp. 290-291. Discussion of conditions which effect economy of plant.

Saving Labor Costs, Van R. H. Greene. Ice and Refrigeration, vol. 57, no. 6, Dec. 1919, pp. 251-252. Examples of labor saving in ice tank room, daily ice storage room and engine and boiler rooms of refrigerating plant.

Storage. Interior Finishes of Ice Storages, Junius H. Stone. Ice and Refrigeration, vol. 57, no. 6, Dec. 1919, pp. 254-256. Relative values of wood, cement and asphalt as storage house finishes.

Transportation. Transportation of Ice, Nat Duke. Ice & Refrigeration, vol. 57, no. 5, Nov. 1919, pp. 200-201. Difficulties encountered last summer by railroad administration in transporting ice for conservation of food particularly into New York City. Paper read before Natural Ice Assn. of Am.

IGNITION

Coil Energization. Energization of the Ignition Coil, Harry F. Geist. Automotive Industries, vol. 41, no. 17, Oct. 23, 1919, pp. 824-828, 5 figs. Calculation of time required for ignition coil to build up to different fractions of its maximum strength. Discussion of energy involved in spark and efficiency of sparking systems under different conditions.

Practice. Recent Ignition Practice in Great Britain, F. H. Hutton. Automotive Industries, vol. 41, no. 22, Nov. 27, 1919, pp. 1052-1055, 8 figs. Development of magneto industry under war necessity.

Spark Plug. The B-G Spark Plug. Aerial Age, vol. 10, no. 7, Nov. 10 and 17, 1919, p. 247, 2 figs. Design possesses self-cleaning feature which is obtained by high pressure air blast directed over sparking points on all four strokes of engine cycle.

Subsidiary Gap. The Subsidiary Gap as a Means for Improving Ignition, W. S. Gorton. Gas Engine, vol. 21, no. 12, Dec. 1919, pp. 400-406, 1 fig. Report prepared at Bureau of Standards for National Advisory Committee for Aeronautics. It is concluded that series gap may be used as remedy for considerable part of trouble due to fouling of blocks which is met with in practice.

Tests. The Relation of Time of Ignition to the Economy of the Gasoline Engine, J. P. Calderwood and A. J. Mack. Gas Engine, vol. 21, no. 12, Dec. 1919, pp. 390-391, 2 figs. Results of tests made at Engineering Experiment Station of Kansas State Agricultural College. It was concluded that (1) with other conditions constant, economical spark advance to be carried depends on fuel mixture and (2) with richer mixture and higher spark advance, maximum delivered hp. will be greater than can be secured with leaner mixtures and smaller spark advance.

IMPACT

Remarks on the Problem of Impact, N. W. Akinoff. Jl. Am. Soc. Naval Engrs., vol. 31, no. 4, Nov. 1919, pp. 849-856, 4 figs. Popular exposition of difference in concepts of force, work and power.

INCLINOMETER

Determination of Inclination by Means of Induction Inclinometer (Ueber die Bestimmung der Inklination mit dem Induktions—Inklinator), W. Uljanin. Terrestrial Magnetism and Atmospheric Electricity, vol. 24, no. 3, Sept. 1919, pp. 113-117, 1 fig. New method for determining angle of inclination said to be superior to Wild's method, which is most frequently used at present.

INDICATOR DIAGRAMS

The Steam Engine Indicator Diagram—II. Power Plant Eng., vol. 23, no. 24, Dec. 15, 1919, pp. 1104-1106, 18 figs. Analysis of expension, release, exhaust and compression lines.

INDUCTANCE COILS

Simplified Inductance Calculations, with Special Reference to Thick Coils, Philip R. Coursey. Wireless World, vol. 7, no. 79. Oct. 1919, pp. 380-385, 3 figs. Plots for determining values of various coefficients and formulæ and thus simplify cal ulations. Abstract of paper read before Phys. Soc. of Lond.

High-Tension Lines. Changing Insulators on Live Lines. Elec. World, vol. 74, no. 19, Nov. 29 and Dec. 6, 1919, pp. 992-994, 12 figs. Insulating frame used to raise and hold high-tension line conductors above top of pole so that insulators and cross arms can be replaced with ease. Lifting tools and other devices aid in tying wires to insulators.

Elimination of Insulator Failures, E. J. Kallevang. Elec. World, vol. 74, no. 20, Dec. 13, 1919, pp. 1063-1064. Results of tests and experience with insulators on transmission lines in Wisconsin.

Testing. Apparatus for Testing Insulation (Insolationsprüfer). Elektrotechnischer Anzeiger, vol. 36, no. 77, July 27, 1919, pp. 357-358, 4 figs. Illustrating various types of testing apparatus.

IRRIGATION

See Tunnels.

JAPANNING

Electric Japanning Gives Extreme Satisfaction. Elec. World, vol. 74, no. 17, Oct. 25, Nov. 1 and 8, 1919, pp. 876-879, 5 figs. Method of operating and comparison with gas kiln for baking japan.

JUTE

The Preparation and Dyeing of Jute. Textile World Jl., vol. 56, no. 18, Dec. 6, 1919, pp. 70, 75 and 107. Treatment of material. Classes of colors employed.

KILN DRYING

Inadequacy of Visual Inspection in Kiln-Drying, H. D. Tiemann. Aviation, vol. 7, no. 8, Nov. 15, 1919, pp. 352-354. Experimental work at Forest Products Laboratory of U. S. Forest Service, Madison, Wis.

See also Drying.

KILNS

How a Ceramic Kiln May be Insulated, P. A. Bocek. Brick and Clay Rec., vol. 55, no. 12, Dec.2, 1919,pp. 1044-1047, 5 figs. Illustrating round down-draft kiln which was insulated by covering crown partly with platting and partly with insulation bricks.

LABOR

Employer's Duty. The Employer's Duty in Dealing with Labor, Harry Tipper. Automotive Industries, vol. 41, no. 17, Oct. 23, 1919, pp. 832-833. Writer points out futility of general settlements of labor difficulties. He observes that employes and employers of individual factories must work, one with the other, to oviate broken contracts and excessive demands from labor and to assure justice from organization head.

Federal Incorporation of Organizations. Industrial Stability by Federal Incorporation of Trade and Labor Associations, John Stephen Sewell. Manufacturers Rec., vol. 76, no. 22, Nov. 27, 1919, pp. 113-117. Suggests plan which involves enactment of legislation to stabilize relations between capital and labor in interest of general good. Representations of capital and labor in consultation with legislators are to establish scale of wages and prices, which having been fixed makes strikes, boycotts, etc., punishable as conspiracies "without depriving the individual workman of his right to quit or change his employment, nor the individual employer of his right to discharge or employ individual workmen."

Hours of Work. Recent Application of the 8-Hour Day and the 44-Hour Week. Monthly Labor Review, vol. 9, no. 5, Nov. 1919, pp. 194-199. Statsitical figures give number of establishments reported as adopting 8-hour day in 1915, 1916, 1917, 1918, and first 6 months of 1919.

See also Industrial Relations; Women Workers.

LADLE HANGERS

The Breaking of Ladle Hangers (Ueber den Bruch von Giesspfannengehängen). Stahl u. Eisen, vol. 39, no. 44, Oct. 30, 1919, pp. 1309-1315 and (discussion), pp. 1315-1318, 8 figs. Discussion of causes and suggested remedies. Writer attributes breaking to variation in temperature and lack of elasticity in hanger material. (Concluded.)

LATHES

Turret Lathe Practice—I, II, and III. Machy. (Lond.), vol. 15, no. 371, 373 and 374, Nov. 6, 20 and 27, 1919, pp. 174-180, 228-231 and 261-269, 60 figs. Illustrating practice at English work shops. Tooling equipment for auto truck wheels. Tractor axle housings, wheel hubs and motor frames.

LEAD MEATLLURGY

Losses in Dry Lead and Zinc Processes, K. Friedrich. Metal Industry, vol. 15, no. 20, Nov. 14, 1919, pp. 405-407. Points out possible fields of scientific investigation. Translated from Metall und Erz.

LIBERTY MOTORS

How Ford Built Liberty Motors, Fred H. Colvin. Am. Mach., vol. 51, no. 23, Dec. 18, 1919, pp. 1037-1041, 24 figs. Notes specially assembling operations.

LIGHT

Absorption. Absorption of Light by Gases (Contribution à l'étude de l'absorption de la lumière par les gaz), G. Ribaud. Annales de Physique, vol. 12, no. 9, Sept.-Oct. 1919, pp. 107-226, 22 figs. Study of continuous absorption of brome vapor in ultraviolet under various conditions of vapor and at temperatures up to 620 deg. C.

Diffusion. Diffusion of Light by Rain, Cloud or Fog, A. Mallock. Proc. Roy. Soc., vol. 96, no. A-677, Nov. 1, 1919, pp. 267-272. Data showing effect of shower or cloud in obscuring direct light of distant source.

Diffused Reflexion and Transmission of Light, A. P. Trotter. Illuminating Engr., vol. 12, no. 9, Sept. 1919, pp. 243-267, 54 figs. It is shown how specular reflexion can be separated from diffused reflexion by drawing internal osculating circle, instead of circumscribing circle of Bouguer and Blondel.

Refraction. The Scattering of Light in the Refractive Media of the Eye, C. V. Raman. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 227, Nov. 1919, pp 568-572. Examination of Helmholtz explanation of luminous streamers observed when small and intensely luminous source of light is viewed directly by eye against dark ground.

On Terrestrial Refraction, A. B. McLeod. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 227, Nov. 1919, pp. 546-568, 7 figs. Refraction of light rays of various length and sinus distances by atmosphere is dealt with and errors in Chauvenet dip range formulæ are considered. Report communicated to Advisory Committee for Aeronautics, England.

LIGHTHOUSES

Repairing a Lighthouse, James H. Deppeler. Jl. Am. Welding Soc., vol. 1, no. 1, Oct. 1919, pp. 15-17, 3 figs. Bulk of ice piling on one side caused cast iron columns, which supported lighthouse superstructure, to bend through an angle of about 20 deg. and break. Column were welded with thermit steel.

LIGHTING

Shops. Good Lighting Aids Production, Ward Morrison. Iron Trade Rev., vol. 65, no. 25, Dec. 18, 1919, pp. 1637-1641, 5 figs. Tests conducted to find relation of lighting and production are said to have shown that substitution of proper lamps and reflectors for antiquated equipment increased output by from 2 to 35 per cent. Paper read before Soc. of Indus. Engrs.

Shop Protective Lighting, C. E. Clewell. Am. Mach., vol. 51, no. 18, Oct. 30,1919, pp. 785-788, 7 figs. Discusses question of lighting yards and building fronts as protective measure, and advantages of night lighting for yard areas, loading platforms and similar places.

Lighting Fixtures for Shop Illumination, C. E. Clewell. Am. Mach., vol. 51, no. 16, Oct. 16, 1919, pp. 727-731, 14 figs. Features for minimizing glare of Mazda gas-filled lamps.

Street. Development of the Chicago Street-Lighting System, William G. Keith. Eng. World, vol. 15, no. 12, Dec. 15, 1919, pp. 39-41. Installation and operation of series group systems. Paper read before Internat. Assn. of Mun. Elecns.

LIGHTNING

Lightning—II. The Effect of Lightning Voltages on Arrester Gaps, Insulators and Bushings on Transmission Lines, F. W. Peek. Jr. Gen Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 900-906, 14 figs. Writer calls attention to necessity to produce lightning arresters of very high speed if steep wave front impulses are to be removed before damage is done to apparatus, bushings and other equipment. He then proceeds with analysis of relative speeds of different forms of gaps and shows variation in discharge value for and gaps under 60-cycle and lightning voltages and under wet and dry conditions.

LIGNITE

See Fuels.

LIME

The Hydrated Lime Plant at Genoa, Ohio, of the U. S. Gypsum Company, Curtis F. Columbia. Rock Products, vol. 22, no. 24, Nov. 22, 1919, pp. 30-32, 5 figs. Capacity of plant is 200 tons. Operation of Schaffer hydrator is illustrated.

LIMESTONE

Limestone for Newcastle Steel Works, Commonwealth Engr., vol. 6, no. 9, Apr. 1, 1919, pp. 274-280, 8 figs. Description of quarrying, crushing, handling and storage in Australian works. Face worked is 300 ft. long with average height of 30 ft. and maximum height of 50 ft.

LIQUID FILMS

See Soap Bubbles.

LOAD DISPATCHING

See Central Stations; Load Dispatching.

LOCKS

The Cylinder Lock—III, Ellsworth Sheldon. Am. Mach., vol. 51, no. 22, Dec. 11, 1919, pp. 979-983, 5 figs. Master keying system.

LOCOMOTIVES

Boilers. Boilers for 2-8-0 Goods Engines, Great Central R. Ry. Engr., vol. 40, no. 479, Dec. 1919, pp. 258-262, 5 figs. Boilers are fitted with superheaters of 28 elements and made for working pressure of 180 lbs. per sq. inch.

DEOXIDIZERS. Magnesium as a Scavenger of Metals, J. T. Rooney. Metal Industry, vol. 17, no. 12, Dec. 1919, p. 511. Advantage of magnesium over other deoxidizers.

EXPANSION. Stretched Wire Apparatus for Measuring Thermal Expansions, Arthur W. Gray. Chem. & Metallurgical Eng., vol. 21, no. 13, Nov. 26-Dec. 3, 1919, pp. 667-671, 6 figs. Equipment used at Bureau of Standards for determining expansivity of material in form of bars.

Influence of Length of Bar on Elongation (Einfluss der Stablänge auf die Dehnung), M. Rudeloff. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 215, 1919, 80 pp., 27 figs. Treatise on proportion between extensions of tensile strength tests having length of 1 = 5d and 1 = 10d, respectively, but otherwise with same dimensions and of same material.

MELTING. Waste in Melting of Alloys, E. H. Schulz and H. Winkler. Metal Industry (Lond.), vol. 15, no. 13, Sept. 26, 1919, pp. 241-242. Also Metal Industry (N. Y.), vol. 7, no. 12, Dec. 1919, pp. 521-522. Experimental meltings carried out (1) with 33 per cent of new metal and 67 per cent of old brass scraps and turnings and (2) 80 per cent scraps and 20 per cent of new copper and zinc. It was concluded that melting in hearth furnace with addition of 60 to 67 per cent of scrap of somewhat poor quality will result in loss of 7.5 per cent of charge. Translated from Metall. und Ers.

MOULDS. The Practical Use of Denseners and Permanent Moulds, E. H. Broughall. Foundry Trade Jl., vol. 21, no. 213, Sept. 1919, pp. 624-629, 7 figs. Concerning use of ordinary denseners for equalizing rate of cooling between thick and thin portion of casting and use of permanent moulds for production of sound castings. Paper read before Birmingham Branch of Inst. of British Foundrymen.

POURING. Pouring Lead, Zinc and White Metal Alloys. Metal Industry, vol. 15, no. 12, Sept. 19, 1919, pp. 221-222, 7 figs. Device in which plug is mounted outside pot but close up against it is considered better arrangement to mounting tapping plug inside pot. Machine for rapid casting metal bars is illustrated.

SEASON CRACKING. Season Cracking. W. H. Hatfield. Engineering, vol. 108, no. 2805, Oct. 3, 1919, pp. 456-460, 20 figs. Results of investigations in which writers endeavored particularly to determine effect of cold work and internal stresses introduced thereby into metals, whether non-ferrous or ferrous. Photomicrographs are presented. Paper read before Inst. of Metals.

SOLIDIFICATION. The Solidification of Metals from the Liquid State, Cecil H. Desch. Engineering, vol. 108, no. 2810, Nov. 7, 1919, pp. 612-615, 9 figs. Concerning form of crystal grains and their relation to form structures and solidification of liquids exhibiting cellular convection and crystal grains.

STRAINS IN ROLLING. Investigation of Strains in Rolling of Metal. Alfred Musso. Mech. Eng., vol. 41, no. 12, Dec. 1919, pp. 937-938, 3 figs. Experimental investigation to determine most convenient length and width of piece of metal to be rolled in order to produce finished article of certain definite dimensions so that waste of material may be reduced to minimum.

METEOROLOGY

The Supply of Meteorological Information, H. G. Lyons. Aviation, vol. 7, no. 8, Nov. 15, 1919, pp. 346-348, 2 figs. Methods of keeping meteorological data at French Meteorological Office.

Normal Temperatures (Daily): Are Irregularities in the Annual March of Temperature Persistent? Charles F. Marvin. Monthly Weather Rev., vol. 47, no. 8, Aug. 1919, pp. 544-555, 5 figs. Based on records from widely scattered weather bureau stations, covering period 1871-1916.

See also Aeronautics, Weather Conditions in Flight.

MICA

On the Colors of the Striæ in Mica, and the Radiation from Laminar Diffracting Boundaries, Phanindra Nath Ghosh. Proc. Roy. Soc., vol. 96, no. A-677, Nov. 1, 1919, pp. 257-266. Striæ are said to have been shown by examination of Haidinger's rings in mica to be boundaries bewteen parts having slightly different thicknesses.

MICRO-ORGANISMS

The Employment of Micro-Organisms in the Service of Industrial Chemistry, A. Chaston Chapman. Chem. News, vol. 119, no. 3109, Nov. 14, 1919, pp. 223-226. Plea for National Institute of Industrial Micro Biology. Paper read before Gen. Meeting of Soc. of Chem. Indus., Lond.

MICROPHONES

Multiple-Contact Microphone (Sur un microphone à alvéoles multiples). A. Soret and R. Conespel. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 9, Sept. 1, 1919, pp. 431-432. Microphone with 21-mm. carbon paste having 220 interstics each contining one granule of carbon is reported to have shown high sensibility and to have transmitted sound with extreme purity.

MICROPHOTOMETERS

Construction and Operation of New Microphotometer (Description et emploi d'un nouveau microphotomètre), Ch. Fabry and H. Buisson. Journal de Physique théorique et appliquée, vol. 9, no. 5, Feb. 1919, pp. 37-46, 3 figs. Designed with a view to securing uniformity of photometric plates.

MILLING CUTTERS

The Milling of Side Relief on Side and Face Milling Cutters. Machy. (Lond.), vol. 15, no. 373, Nov. 20, 1919, pp. 235-236, 6 figs. Describing method of setting and relieving cutter; diagram illustrating construction to obtain correct relieving.

Milling Cutter for Splined Transmission Shaft, W. Richards. Machy. (Lond.), vol. 15, no. 372, Nov. 13, 1919, pp. 218-221, 9 figs. How to make milling cutter to cut within close limits 4 splines in transmission shaft.

MILLING MACHINES

The Cincinnati M-Type Milling Machine, John H. Van Deventer. Am. Mach., vol. 51, no. 17, Oct. 23, 1919, pp. 749-753, 12 figs. Made in two sizes and in three forms—plain. universal and vertical—all of constant-speed type.

Ingersoll Circular Table Continuous Milling Machine. J. V. Hunter. Am. Mach., vol. 51, no. 21, Nov. 27 and Dec. 4, 1919, pp. 915-918, 6 figs. Types of continuous milling machines designed for maximum production with minimum labor.

MINES

ACCIDENTS. Mine Accidents, Albert H. Fay. Eng. & Min. Jl., vol. 108, no. 18, Nov. 1, 1919, pp. 726-729. Statistics of accidents due to employes not understanding English.

Mine Accidents: English Speaking vs. Non-English Speaking Employes, Albert H. Fay. Coal Age. vol. 16, no. 20, Nov. 13 and 20, 1919, pp. 777-782. Statistical figures. Paper presented before Eighth Annual Safety Congress.

EXPLOSIONS. Report of Some of the Most Interesting Explosions in Prussian Anthracite Mines During 1918 (Mittellungen über einige der bemerkenswertesten Explosionen beim preussischen Steinkonlen bergbau im jahre 1918). Zeitschrift fur das Berg- Hütten-u. Salinenwesen im preusischen Staate, vol. 67, no. 2, 1919, pp. 100-131, 18 figs. Report on causes and damages resulting from ten different explosions, based on official figures.

HOISTS. Progress in the Electrification of Mine Hoists, R. S. Sage. Coal Age, vol. 16, no. 20, Nov. 13 and 20, 1919, pp. 770-776, 11 figs. It is noted that electrification of mine hoists proceeded slowly for many years, chiefly because of their intermittent operation and high peak loads to which they were subject. Difficulties have been so successfully overcome, however, that at present over 85 per cent of new installations are electrically driven.

LOCOMOTIVES. *See Locomotives, Storage Battery.*

RESCUE APPARATUS. Effective Means of Using Rescue Apparatus in the Fighting of Mine Fires, J. T. Ryan. Coal Age, vol. 16, no. 19, Nov. 6, 1919, pp. 741-743. Organization and equipment of recue crews. Paper read before Min. Section of National Safety Congress.

See also Breathing Apparatus.

RESCUE TRAINING. Desirability of Standardizing Mine Rescue Training and a Plan Therefor, D. J. Parker. Coal Age, vol. 16, no. 17, Oct. 23, 1919, pp. 686-687. Principally because "thorough and systematic training are essential to insure safe and economic use of apparatus" and "such training can best be secured through standardization of training methods."

SURVEYING. Short Cuts in Mine Surveying—I and II, Douglas Waterman. Min. & Sci. Press, vol. 119, nos. 21 and 22, Nov. 22 and 29, 1919, pp. 749-752 and 773-779, 5 figs. Illustrating use of protractor and parallel-ruler in plotting survey made with Brunton compass, and manner of massing stadia measurements. (To be continued.)

MINERALS

Eighth List of New Mineral Names, L. J. Spencer. Mineralogical Mag., vol. 18, no. 87, Nov. 1919, pp. 373-390. Compiled from reports of scientific publications throughout the world; principal particulars of 106 minerals are given.

A New Mineral, Isomorphous with Trechmannite, from the Binn Valley, Switzerland, R. H. Solly. Mineralogical Mag., vol. 18, no. 87, Nov. 1919, pp. 363-365. Description of specimen in which were three small round-shaped crystals, about the size of small shot, grown upon a prismatic crystal of sartorite.

MINERAL DEPOSITS

Tungsten, Cinnabar, Manganese, Molybdenum, and Tin Deposits of Idaho, D. C. Livingston and Francis A. Thomson. Bul. University of Idaho School of Mines, vol. 14, no. 2, Jan. 1919, 72 pp., 11 figs. With notes on the antimony deposits.

MINIMA SURFACES

Surfaces of Translation and Minima Surfaces in Curved Spaces (Surfaces de translation et surfaces minima dans les espaces courbes), E. Bompiam. Comptes Rendus des Seances de l'Académie des Sciences, vol. 169, no. 19, Nov. 10, 1919, pp. 840-843. Theorem concerning characteristic property of minima surfaces having isothermic network of asymptomic orthogonal lines.

MINING INDUSTRY

The Duty of the Mining Industry, George Otis Smith. Min. & Sci. Press, vol. 119, no. 22, Nov. 29, 1919, pp. 782-784. Emphasizes importance of increasing production of raw materials. Address delivered before Min. Congress.

MOLDING METHODS

Speed Marks Auto Parts Molding, D. M. Avey. Foundry, vol. 47, no. 20, Dec. 1, 1919, pp. 852-857, 13 figs. Methods of molding cylinder and crankcase bleok, transmission housings and cylinder heads, developed by Am. Foundry Co., Indianapolis.

ORE CONCENTRATION

A New Machine for Concentrating Minnesota Wash Ores, Edward W. Davis. Bul. University of Minnesota, vol. 22, no. 56, Dec. 16, 1919, 32 pp., 5 figs. It is concluded from tests that Dorr classifier equipped with submerged trommel will produce practically same results as are secured in standard log-washing plants

ORE DEPOSITS

Ore Deposits of Utah—I, II, B. S. Butler. Eng. & Min. Jl., vol. 108, nos. 15 and 16, Oct. 11 and 18, 1919, pp. 605-611 and 641-645, 11 figs. Oct. 11: Principal mining districts of State are described as being associated with occurrences of intrusive rocks, ore bodies occurring as replacement deposits in fissures. Oct. 18: Evidences presented to show that formation of large ore bodies were influenced by relation existing between interior and surface at period of solidification.

ORE UNLOADERS

Unique Ore Unloader for Lake Steamers. Mar. Eng. and Can. Merchant Service Guild Rev., vol. 9, no. 11, Nov. 1919, pp. 369-371, 4 figs.; also Int. Mar. Eng., vol. 24, no. 11, Nov. 1919, pp. 735-737, 5 figs. W. S. M. automatic ore unloader. It consists of main frame work mounted on trucks which along runway rails. Two operators control unloading, weighing and delivery of ore.

ORGANIC COMPOUNDS

Commercial Possibilities in the Electrochemical Production of Organic Compounds, C. J. Tthatcher. Chem. & Metallurgical Eng., vol. 21, no. 13, Nov. 26-Dec. 3, 1919, pp. 663-666. Particularly study of conditions favoring economy in operation catalytic effect, diaphragms and suggestions in regard to effecting organic electrosyntheses.

OZONE

Electrical Production of Ozone and Its Industrial Applications. Elec. Rec., vol. 26, no. 5, Nov. 1919, pp. 268-270, 9 figs. Description of equipment used in generation of ozone. Uses of ozone.

OXY-ACETYLENE WELDING

Equipment. Autogenous Welding of Metals (La soudure autogène des métaux). Métallurgie, vol. 51, no. 48, Nov. 26, 1919, pp. 3254-3255, 1 fig. Connections of equipment for securing constant flow of acetylene at low pressure. (To be continued.)

Fireboxes. Boiler Repairs by Oxy-Acetylene Welding. Acetylene & Welding Jl., vol. 16, no. 193, Oct. 1919, pp. 190-192, 6 figs. Illustrating welding back and front plates of fireboxes and cracks in side sheets of fireboxes. (Continuation of serial.)

Heavy Forgings. Oxy-Acetylene's Possibilities in Heavy Welding, J. G. Hill. Can. Machy., vol. 21, no. 23, Dec. 4, 1919, pp. 560-561. Cases are cited such as welding section 18 in. by 40 in. of 70-ton frame of bull-dozer for piercing shelf forging. Paper read before Convention International Soc. Assn.

Pumping Station Equipment. Oxy-Acetylene Welding, J. H. Stoliker. Natural Gas & Gasoline Jl., vol. 13, no. 11, Nov. 1919, pp. 389-391. Experience with welding equipment at large pumping station located 25 miles from nearest repair shop.

Ship Construction. Oxy-Acetylene Welding in Hull Construction, Charles C. Phelps. Int. Mar. Eng., vol. 24, no. 11, Nov. 1919, pp. 727-729, 6 figs. Parts of vessel which may be welded with the approval of principal ship classification societies in United States and Great Britain.

Ship Repair. The Use of Acetylene in Navy Yards, H. G. Knox. Int. Mar. Eng., vol. 24, no. 11, Nov. 1919, pp. 720-727, 25 figs. Oxy-acetylene apparatus for welding and cutting is said to have proved indispensable in building and repairing of ships. Uses are illustrated and typical plan of an oxygen, hydrogen and acetylene generating plant for navy yard is given. Paper read before Int. Acetylene Assn.

Training Welders. Value of Oxy-Acetylene Welding Process, Alfred S. Kinsey. Metal Worker, Plumber and Steam Fitter, vol. 92, no. 19, Nov. 7, 1919, pp. 555-557. Points out training necessary to insure wider use and better services. Paper read before Internat. Acetylene Assn.

Tubing. Tube Welding by the Oxy-Acetylene Process, F. W. Smith. Am. Mach., vol. 51, no. 20, Nov. 13 and 20, 1919, pp. 845-848, 6 figs. Writer believes that reasons for rmarkably rapid growth of industry of tube welding are high quality and low cost of welded tubing.

PAPER

Composition. Graphic Analytical Method for Paper, Ignatius L. Gartland. Paper, vol. 25, no. 10, Nov. 12, 1919, pp. 15-19, 5 figs. Chart system of presenting analytical data concerning the composition of paper.

Estimating Percentages of Fibers in Papers, Roger C. Griffin. Paper, vol. 25, no. 9, Nov. 5, 1919, pp. 23-24. Count and estimation methods contrasted to advantage of latter.

The Estimation of Starch in Paper—II, Oliver Kamm and Frank H. Tendick. Paper, vol. 25, no. 9, Nov. 5, 1919, pp. 20-21. Analysis for dextrins in presence of beater starch.

Manufacture. How Paper is Formed on the Fourdrinier Wire. Paper, vol. 25, no. 11, Nov. 19, 1919, pp. 19-21, 2 figs. Influence of certain conditions as degree of upward or downward inclination of wire, height of damming behind slices, etc., on formation of sheet.

Paravane. The Paravane, Robert F. McKay. Engineering, vol. 108, no. 2803, Sept. 19, 1919, pp. 389-392, 8 figs. Paravane installations are illustrated and their utility emphasized.

PARAFFIN

Paraffin Wax and Its Manufacture, A. Campbell and W. J. Wilson. Jl. Inst. Petroleum Technologists, vol. 5, no. 18, Feb. 1919, pp. 106-130 and (discussion) pp. 130-136, 1 fig. Experimental investigation, (1) to observe effect of variation of time and rate of temperature-increase of sweating, and (2) to ascertain advantage or disadvantage of obtaining scales obtained by separate filtrations at different temperatures, as compared with separate sweating of crude products.

PATENTS

Restraint of Trade in Patent Agreements, Chesla C. Sherlock. Am. Mach., vol. 51, no. 17, Oct. 23, 1919, pp. 763-765. Exposition of rights and privileges conferred on patentee or owner of patent by statutes and by judicial influence of courts.

PATTERNS

The Economical Control and Handling of Patterns in a Large Foundry. Walter D. Jones. Am. Mach., vol. 51, no. 23, Dec. 18, 1919, pp. 1043-1044. Describes pattern system adopted by large steel foundry, in which patterns go in turn from pattern storage to sketch and checking room, to active floor, and to foundry, and finally are returned to storage section. Movement of pattern through this cycle is governed by five cards, function of which are explained in article. Paper read before Am. Foundrymen's Assn.

Making Column Patterns, Joseph Horner. Foundry Trade Jl., vol. 21, no. 215, Nov. 1919, pp. 795-800, 16 figs. Illustrating sequence of operations.

Iron Foundry Assists Pattern Shop, H. E. Diller. Foundry, vol. 47, no. 21, Dec. 15, 1919, pp. 887-891, 11 figs. Experience of foundry with gray-iron foundry established as adjunct to pattern department for testing and trying all patterns before delivery to customer.

PAVEMENTS

Asphalt. Hot-Mix Asphalt Pavements—III, Francis P. Smith. Am. City, City Ed., vol. 21, no. 4 and 6, Oct. and Dec. 1919, pp. 341-347; 545-548, 6 figs. Standard sheet asphalt construction.

Bitulithic. Bituminous Pavement Investigations in Certain Texas Cities—Part I, Bitulithic, Roy M. Green. Bul. Agricultural and Mech. College of Texas, bul. 22, vol. 5, no. 9, May 1, 1919, 62 pp., 12 figs. It is concluded that seal coat of appreciable thickness is necessary in order to keep pavement in such a condition that it will be able to withstand action of traffic for long period of years.

Brick Asphaltic Filler for Brick Pavements, Allen D. Dimmick. Mun. & County Eng., vol. 57, no. 5, Nov. 1919, pp. 201-203, 3 figs. Practice of application is reviewed. It is said that maximum results are procured when filler is heated to temperature of from 350 to 400 deg. Fahr.

Vertical Fiber Brick Pavement. Mun. Jl. and Public Works, vol. 47, no. 18, Nov. 1, 1919, pp. 266-267. Advantages of this type of pavement and account of its latest developments.

New Paving Standards. Brick and Clay Rec., vol. 55, no. 12, Dec. 2, 1919, pp. 1041-1042. Recently revised specifications for standard vitrified paving brick of Nat. Paving Brick Manufacturing Assn.

Success of Asphalt Joint-Filler in Vertical Fiber Brick Pavements, Clark R. Mandigo. Mun. & County Eng., vol. 57, no. 5, Nov. 1919, pp. 211-212. As dependent on (1) method of application, (2) shape and texture of brick, (3) quality of filler, and (4) character of traffic.

Concrete. Cement Concrete Pavements in New Zealand and the United States and Canada, Walter E. Bush. Engineering, vol. 108, no. 2813, Nov. 28, 1919, pp. 735-737. Practices of construction and records of service. Paper read before County Councils Assn. at Roads and Transport Congress.

Labor Cost of Paving Alleys with Concrete. Eng. & Contracting, vol. 52, no. 23, Dec. 3, 1919, p. 638. Data obtained in paving four alleys at University City, Mo., in 1917 and 1919.

Wood-Block. New Joint Spacer for Wood-Block Pavements, John Stanley Crandell. Good Roads, vol. 18, no. 22, Nov. 26, 1919, p. 227, 2 figs. Corrugated cardboard spacer placed between each two rows.

See also Roads.

Peat. Evaporation Tests with Peat and Peat Coke (Verdampfungsversuche mit Torf und Torfkoks), H. Winkelman. Kraft und Betrieb, vol. 3, no. 12, Sept. 15, 1919, pp. 138-139. Showing construction of boiler in which tests were made, also measurements taken during tests, analysis of fuel and results of tests.

PETROLEUM

See Oil.

PHOTOGRAPHY

The Photography of Bomb Trajectories, A. Wm. Duff. Jl. Worcester Polytechnic Inst., vol. 23, no. 1, Nov. 1919, pp. 24-33, 3 figs. Procedure in taking photographs.

The Polar, Multi-Exposure, High Speed Camera, J. W. Legg. Elec. Jl., vol. 16, no. 12, Dec. 1919, pp. 509-512, 5 figs. Examples of stereoscopic photographs of arc.

PHOTOMETRY

Heterochromous Photometry Permitting Physical Measurement of Luminous Intensity (Sur une solution de la photométrie hétérochrome permettant une mesure physique de l'intensité lumineuse), A. Blondel. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 19, Nov. 10, 1919, pp. 830-835. Luminous source of bolometer or thermo element received inversely on spectroscope.

PILOT TUBES

POLES

EUROPEAN. European Power Plant Practice—II, Stephen Q. Hayes. Elec. World, vol. 74, no. 18, Nov. 15 and 22, 1919, pp. 924-928, 13 figs. Protective devices, switchboards and transformer practice. It is noted that use of draw-out and sheet-metal- inclosed switchboards has become more general abroad than in U. S., and that in matter of power transformers core type is commonly used to facilitate repairs.

GENERAL ELECTRIC COMPANY. Features of the New Steam Power Plant at the Erie Works of the General Electric Company, A. R. Smith. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 907-913, 4 figs. Coal and ash handling facilities, lighting and ventilation, steam distribution, cable distribution and power distribution.

RECORDS. Daily Records of Plant Costs and Efficiencies, J. N. Strike. Elec. World, vol. 74, no. 17, Oct. 25, Nov. 1, and 8, 1919, pp. 870-874, 4 figs. System of records followed in 20,000 kw. power plant, which is said to reveal operating conditions daily, thereby permitting immediate action to stop losses.

See also Electric Power Plants; Electric Power Transmission.

PROFITS

On What Should Profits Be Based? W. L. Churchill. Indus. Management, vol. 58, no. 5, Nov. 1919, pp. 375-380. Writer lays down general principle that profit charge should be just for quality of service rendered. With this in mind he analyzes common methods of "profiting" and finds that they are inconsistent and even dangerous under certain conditions of labor and material costs.

PROJECTILES

See Photography.

PROPELLERS

STRESSES. Some Notes on Propeller Stresses—I & II, Mech. World, vol. 66, no. 1714 and 1716, Nov. 7 and 21, 1919, pp. 220-221 and 247-248, 10 figs. Formulæ for finding modulus of blade section and for calculating stress in boss of propeller.

TANDEM Note on the Efficiency of Tandem Propellers, J. G. Coffin. Aviation, vol. 7, no. 8, Nov. 15, 1919, p. 350. Formula showing that it is always detrimental to run propeller in slip stream of another unless other attendant gains more than compensate for necessary loss in efficiency thereby incurred.

TESTING. The Propeller Testing Laboratory of the Army Air Service at McCook Field, F. W. Caldwell. Aerical Age, vol. 10, no. 10, Dec. 22, 1919, pp. 365-370, 15 figs. Description of laboratory equipment and of scope of tests that are carried out.

THEORY. A Complete Theory of the Screw Propeller Working in Air, M. A. S. Riach. Engineering, vol. 108, no. 2803 and 2810, Sept. 29 and Nov. 7, 1919, pp. 361-363 and 601-603, 3 figs. Example of application of method for designing air screw outlined in preceding installments. Taking into account both ship and inflow velocity and notation set up in race column. (Continuation of serial.)

THRUST. Thrust and Power of Rotating Blades that are Unevenly Twisted (Poussées et puissances de pales tournantes inégalement tordues), M. Amans. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 18, Nov. 3, 1919, pp. 779-781. Table giving experimentally measured thrust for various incidences of blade to equator plane.

VARIABLE-PITCH. Variable Pitch Propellers (Verstellbare Luftschrauben), C. Eberhardt. Motorwagen, vol. 22, no. 21, July 31, 1919, pp. 365-368, 6 figs. Adaptation of propellers to height of flight. (Concluded.)

PUBLIC WORKS DEPARTMENT

A National Department of Public Works, M. O. Leighton. Jl. Engrs. Club, Philadelphia, vol. 36, no. 181, Dec. 1919, pp. 472-476. Outline of existing conditions and conflicts of authority in Federal management of Public Works which have led National Engineering Societies to undertake movement for co-ordination of all such work under Cabinet officer in charge of Dept. of Public Works. Digest of bill now before Congress designed to accomplish this co-ordination.

PULVERIZED COAL

Pulverized Coal in the Brass Foundry, L. C. Hervey. Metal Industry, vol. 15, no. 12, Sept. 19, pp. 224-227, 4 figs. Suggested type of furnace for powdered coal firing.

Pulverized Coal in Open-Hearth Practice, W. H. Fitch. Iron Age, vol. 104, no. 26, Dec. 25, 1919, pp. 1323-1328. Review of experience of eighteen American steel plants.

Burning Pulverized Coal in a Sheet Mill, Iron Age, vol. 104, no. 24, Dec. 11, 1919, pp. 1167-1172, 14 figs. Details of installation at rolling mills.

PUMPS

AIR. Air Pumps for Condensing Equipment, Frank R. Wheeler. Mech. Eng., vol. 41, no. 12, Dec. 1919, pp. 926-930, 6 figs. After presenting classification of air pumps writer takes up features of each type and makes comparative study of their respective advantages and limitations, giving special attention to steam-jet ejector type of pump, for which extreme simplicity, reliability and flexibility, stability, low-steam consumption and high efficiency are claimed.

CENTRIFUGAL. The Principles of a New Centrifugal Pump, J. H. Moore. Power House, vol. 12, no. 19, Nov. 20, 1919, pp. 513-518, 10 figs. Rees-Ro-Turbo type, which comprises single or series of pressure drums—number depending on nature of work—rotating inside cast-iron casing at moderately high speed. When running water gravitates or is drawn into eye of revolving pressure drum where its speed, being slow relative thereto, water is carried round by revolving partitions.

FIRE. Fire Pumps, Charles L. Hubbard. Power Plant Eng., vol. 23, no. 23, Dec. 1, 1919, pp. 1047-1051, 12 figs. Various types, their construction and methods of driving.

SALVAGE. Turbine-Driven Salvage and Bilge Pump. Shipbuilding & Shipping Rec., vol. 14, no. 20, Nov. 13, 1919, pp. 553-555, 6 figs. Also Steamship, vol. 31, no. 366, Dec. 1919, pp. 143-146, 7 figs. Pump is direct-driven and of centrifugal type. It is mounted on tank top or inner bottom of vessel, drawing direct from bilge through removable strainer and delivering thourgh connection passing through bottom to under side of vessel.

SQUEEGEE ROTARY. The Squeegee Rotary Pump. Engineering, vol. 108, no. 2905, Oct. 3, 1919, pp. 455, 4 figs. Pump consists of six main parts—casing, two covers, shaft and two rotors, which, in standard design, are covered with india rubber.

RADIO-ELEMENTS

The Radio-Elements and Their Classification, P. Curie. Chem. News, vol. 119, no. 3108, Nov. 7, 1919, pp. 211-212. Table showing classification of radio elements in groups of same chemical properties. Translated from Le Radium.

RADIOMETALLOGRAPHY

Radiometallography, T. Thorne Baker. Elecn., vol. 83, no. 2167, Nov. 28, 1919, pp. 611-612, 1 fig. Apparatus used for testing of metals.

X-Ray Applied to Examination of Metals, W. E. Ruder. Blast Furnace & Steel Plant, vol. 7, no. 12, Dec. 1919, pp. 589-593, 15 figs. Technique, possibilities and limitations of examination of physical condition of ordinarily invisible portion of metallurgical products. Paper read before N. Y. meeting of Am. Iron & Steel Inst.

See also Steel, Radiographic Investigation.

RADIOTELEGRAPHY

AERONAUTICAL SETS. Radio Equipment for Commercial Aircraft, Edgar H. Felix. Aerial Age, vol. 10, no. 6, Oct. 27 and Nov. 3, 1919, pp. 205-207, 4 figs. Description of National Wireless Telegraph Transmitter unit, Simon aircraft transmitter and Simon compact receiving equipment.

ANTENNAE. Harmonic Oscillations in Directly Excited Antennas used in Radio Telegraphy, Luigi Lombardi. Proc. Inst. Radio Engrs., vol. 7, no. 6, Dec. 1919, pp. 636-647 and (discussion) pp. 648-651, 3 figs. Using symmetrically excited artificial antenna consisting of two long coils with spark gap between them, writer measures frequencies, decrements, and relative amplitudes of fundemental current and of each of harmonics.

Theoretical Research on Radiation of Antenna Systems (Theoretische Untersuchungen über die Strahlung von Antennensystemen), Max Abraham. Achiv für Elektrotechnik, vol. 8, nos. 2 and 3, July 24, 1919, pp. 92-116, 2 figs. Basic formulæ, radiation of two synchronous antennae, radiation resistances, etc. are discussed.

FIELD SETS. "W/F. T. R. E.," B. F. J. Schoenland. Wireless World, vol. 7, nos. 79 and 80, Oct. and Nov. 1919, pp. 394-397, 452-455, 4 figs. Account of work and development of field wireless sets used by allied armies during war.

NAVAL. The United States Naval Communication Service, S. W. Bryant. Jl. Franklin Inst., vol. 188, no. 6, Dec. 1919, pp. 751-770. Establishment of Navy Radio Service for developing continuous communication with fleets and among various subdivisions of fleets and for co-ordinating all naval communication facilities so as to provide rapid and reliable interchange of information between all naval organizations afloat and ashore.

RECEIVING CIRCUITS. A Non-Radiating Wireless Receiving Circuit for the Reception of Damped and Undamped Waves John Scott-Taggart. Elec. Rev. (Lond.), vol. 85, no. 2190, Nov. 14, 1919, pp. 614-615, 1 fig. Radiations from aerial of steady stream of feeble continuous waves receiving stations with a few miles radius.

An Oscillation Source for Radio Receiver Investigations, Julius Weinberger and Carl Dreher. Proc. Inst. Radio Engrs., vol. 7, no. 6. Dec. 1919, pp. 584-602, 13 figs. By special construction stray fields are reduced and instead of measuring current in dummy receiving antenna e.m.f. of known amplitudes is introduced.

Long Wave Reception and the Elimination of Strays on Ground Wires (Subterranean and Submarine), A. Hoyt Taylor. Proc. Inst. Radio Engrs., vol. 7, no. 6, Dec. 1919, pp. 559-583, 11 figs. Question of Optimum length of ground wires for reception at given wave length is discussed and experimental data are given.

On a New Circuit for the Reception of Electric Waves, G. Leithauser. Wireless World, vol. 7, no. 79, Oct. 1919, pp. 386-388, 3 figs. Oscillatory circuit is symmeterically placed with respect to two high resistances which are wound on bobbins of small diameter; variations of potential across condenser are transferred to grid and filament by means of additional blocking condensers. Translated from Jahrbuch der drahtlosen Telegraphie und Telephonie, July 1919.

SUBMARINE. Submarine Radio-Telegraphy. H. D. Forest Stevers. Armour Engr., vol. 11, no. 1, Nov. 1919, pp. 12-16. Description of single turn loop antenna receiving coils.

TIME RECORDING. Recording of Eiffel Tower Time Signals for Determination of Clock Error, L. B. Turner. Elecn., vol. 83, no. 2165, Nov. 14, 1919, pp. 554-557, 8 figs. Wireless recording apparatus intended for use in determinations of longitude for survey work in East Africa.

RADIOTELEPHONY

Wireless Telephony (Ueber die drahtlose Telephonie), A. Meissner. Tele-Telegraphen-u. Fernsprech-Technik, vol. 8, no. 4, July 1919, pp. 45-48, 11 figs. Review showing how three basic problems of wireless telephony—generation of constant, undamped oscillations, production of strong-current microphone and development of duplex transmission—have been solved.

RAILWAY ARTILLERY

RESERVOIRS

Concrete Fuel Oil Reservoirs, H. B. Andrews. Oil News, vol. 7, no. 23, Nov. 20, 1919, pp. 15-17, 2 figs. Considerations in regard to location, size, shape, proportions and protection. Paper read before Am. Concrete Inst.

RETAINING WALLS

Concrete I-Beams Used to Make Crib Retaining Wall. Eng. News-Rec., vol. 83, no. 14, Oct. 2, 1919, pp. 651-652, 4 figs. Experience of railroad is said to have shown that concrete structure combines flexbility of wood crib with permanence of concrete.

REVETMENTS

See Concrete Blocks.

ROADS

Bituminous Macadam. Asphalt Macadam (Bituminous) Roads, and Their Extended Use, H. T. Wakelam. Engineering, vol. 108, no. 2813, Nov. 28, 1919, pp. 737-738. Experiments to determine wearing qualities of various road metals.
Why Bituminous Macadam Is Successful in Rhode Island, Irving W. Patterson. Eng. News-Rec., vol. 83, no. 21, Dec. 11 and 18, 1919, pp. 976-984, 4 figs. Writer is of opinion that bituminous macadam properly laid is economical pavement under certain conditions. He claims that good results have been obtained in Rhode Island with bituminous concrete of mineral aggregate, consisting of local sand or gravel laid over base of local rock crushed to large sizes.

Brick. The Economy of Brick Street and Road Construction, Will P. Blair. Clay-Worker, vol. 72, no. 5, Nov. 1919, pp. 440-441. Advises against building curve in brick-paved country roads. Paper read before Am. Soc. for Mun. Improvements.

Classification. Classification and Uses of Highways and the Influence of Federal-Aid Acts, Thomas H. MacDonald. Eng. News-Rec., vol. 83, no. 21, Dec. 11 and 18, 1919, pp. 985-988. An address before Louisville Convention of American Association of State Highway Officials, Dec. 10, 1919.
Classification of Highways, H. G. Shirley. Better Roads & Streets, vol. 9, no. 10, Oct. 1919, pp. 339-340. Proposes plan of national, state and county highways at expenditure of seventeen billion dollars during next ten to twenty years.

Concrete. A Reinforced Concrete Highway in Essex. Concrete and Constructional Eng., vol. 14, no. 12, Dec. 1919, pp. 708-710, 1 fig. Road is reinforced with fabric which is pressed 1½ inch from bottom.
Details of Inspection and Construction in Concrete Highway Work, H. Eltinge Breed. Am. City, Town & County Ed., vol. 21, no. 4, Oct. 1919, pp. 305-309, 1 fig. Concerning manner of testing fine aggregate for organic impurities, gradation, mortar strength, and volume of silt or loam.
New Features in Indiana's Concrete Road Specifications, Eng. News-Rec., vol. 83, no. 15, Sept. 25, 1919, pp. 614-615. Specifications of Ind. State Highway Commission include both one and two-course construction, with and without reinforcement, but conditions determining use of these alternative designs are not stated.
Reinforced Concrete Roads, Their Construction, Maintenance and Life, W. Matthews Jones. Engineering, vol. 108, no. 2813, Nov. 28, 1919, pp. 733-735. Recommendations to surveyors. Paper read before County Councils Assn. at Roads and Transport Congress.
Recent Developments in Concrete Highway Construction, A. N. Johnson. Mun. & County Eng., vol. 57, no. 5, Nov. 1919, pp. 204-206. Concerning grading of aggregate, determining amount of water to use, methods of finishing, and uses of machinery and reinforcement.
The Advent of Concrete Roads in the Metropolitan Area. Concrete & Constructional Eng., vol. 14, no. 11, Nov. 1919, pp. 638-643, 4 figs. Account of construction of various concrete roads in London district.

Economic Value. Good Roads Are a Factor in Production, W. A. McLean. Contract Rec., vol. 33, no. 47, Nov. 19, 1919, pp. 1061-1062. Emphasizes service rendered by improved highways. Paper read before Elec. Club of Toronto.

Grades. Capacity Load and Ruling Grade in Highway Transportation, R. C. Barnett. Eng. & Contracting, vol. 52, no. 23, Dec. 3, 1919, pp. 637-638, 3 figs. Graphs indicating effect of grades in reduction of trailer loads.

Gravel. The Construction and Maintenance of Gravel Roads, Frederick H. Colburn Good Roads, vol. 18, no. 20, Nov. 12, 1919, pp. 211-213, 2 figs. Paper presented before New Hampshire Good Roads Assn.

Hard-Surfaced. Hard-Surfaced Roads—II, E. J. Wulff. Good Roads, vol. 18, no. 18, Oct. 29, 1919, pp. 195-196, 2 figs. Discussion of different types of hard-surfaced roads with special reference to conditions in North Carolina. Paper read before North Carolina Good Roads Assn.

Impact Test. Impact Tests on Highway Surfaces, A. T. Goldbeck. Eng. World, vol. 15, no. 11, Dec. 1, 1919, pp. 37-43, 13 figs. Also Eng. & Contracting, vol. 52, no. 23, Dec. 3, 1919, pp. 651-652. Made by Bur. of Public Roads for the purpose of determining (1) amount of impact delivered to road surfaces, and (2) effect of this impact on different types or surfaces.

Installment Construction. Paved Roads Built in Installments From Dirt Roads. Eng. News-Rec., vol. 83, no. 21, Dec. 11 and 18, 1919, pp. 1008-1009. Plan followed at Iowa.

Macadam. Method of Constructing Macadam in Province of Quebec, A. Paradis. Eng. & Contracting, vol. 52, no. 23, Dec. 3, 1919, pp. 648-649. Method necessitated by reason of special conditions found, such as heavy winter frost which penetrate several feet into earth and cause heaving, and nature of local materials. Paper read before Can. Good Roads Assn.
Resurfacing of Old Macadam Streets in Milwaukee, C. J. Van Etta. Mun. & County Eng., vol. 57, no. 5, Nov. 1919, pp. 195-196, 4 figs. Surface of old road after being cleaned, is spiked or scarrified. Road surface is reshaped, made smooth conforming with grade, but 2½ in. below finished grade, and rolled until firm and hard.

Maintenance. Heavy Motor Transport and Road Construction. Engineering, vol. 108, no. 2814, Dec. 5, 1919, pp. 768-772. Symposium of weight, construction and speed of mechanically-propelled vehicles in relation to construction and maintenance of roads at Road and Transport Congress of County Councils Assn.
Maintenance of Indiana Highways, George E. Martin. Purdue University, Pub. Eng. Dept., Highway Bul. no. 1, vol. 1, Apr. 1919, 24 pp., 10 figs. Concerning building and placing of new culverts, reflooring of bridges, cutting down hills and raising fills. It is particularly emphasized that "the public must be educated to the fact that there is no perfect road surface," and that "all of them, no matter how built and of what material, require maintenance."

Patrol Maintenance. Patrol Maintenance on Hard Surface Roads, J. S. Crandell. Can. Eng., vol. 37, no. 25, Dec. 18, 1919, pp. 542-543, 4 figs. Design of patrol house for storing road materials and inexpensive municipal storage tank.
Motor Truck Patrol Maintenance on Gravel Roads, Charles E. Moore. Am. City, Town & Country Ed., vol. 21, no. 5, Nov. 1919, pp. 419-420. Practice in Rock County, Wis.

Reconstruction. Reconstruction of Narrow Trunk Highways. Good Roads, vol. 18, no. 21, Nov. 19, 1919, pp. 219-220. Progress report of Committee of Am. Road Builders' Assn.

Snow Removal. Solving Snow Problem on Highways, A. H. Hinkle. Eng. & Contracting, vol. 52, no. 23, Dec. 3, 1919, pp. 642-644, 3 figs. From bulletin offering suggestions for keeping roads open for motor traffic during winter months; prepared by Dept. Highway Commissioner of Ohio, and shaped snow plow designed by Ohio State Highway Dept. is described.

See also Street Cleaning.

Surfacing. Types of Surfacing for Light and Medium Traffic Roads, C. L. Moth. Eng. & Contracting, vol. 52, no. 23, Dec. 3, 1919, p. 650. Used in Minnesota where subgrade materials are principally either heavy clay or black loam.

See also Pavements.

ROAD MACHINERY

Large Paving Mixer Puts in 180-Yard Slab Every Hour. Eng. News-Rec., vol. 83, no. 14, Oct. 2, 1919, pp. 658-659, 5 figs. Bulk cement is clamshelled from gondola cars to bins; boxes carrying proportioned batches crane-charged into mixer.
Machines Take the Place of Men on 20-Mile Concrete Road. Cement & Eng. News, vol. 31, no. 12, Dec. 1919, pp. 24-26, 4 figs. Also Eng. News-Rec., vol. 83, no. 14, Oct. 2, 1919, pp. 664-666, 4 figs. Methods of grading, subgrading and slab construction in Illinois section of Lincoln Highway.
Recent Developments in Concrete Highway Construction, A. N. Johnson. Eng. & Contracting, vol. 52, no. 23, Dec. 3, 1919, pp. 644-674, 5 figs. Special machinery for finishing concrete roads. Paper read before Am. Soc. for Mun. Improvements.

ROCK CRUSHERS

Design of Large Rock-Crushing Plant—II, Brownell McCraw. Rock Products, vol. 22, no. 23, Nov. 8, 1919, pp. 24-25. Location of rejection crushers and storage bins.

ROCK DRILLS

Development of the Rock Drill in America, Charles Austin Hirschberg. Eng. & Min. Jl., vol. 108, no. 17, Oct. 25, 1919, pp. 677-681, 26 figs. General types of power rock drills and parts.

ROLLING MILLS

New Rolling-Mill Plant at the Works of Messrs. Steel, Peech and Tozer, Ltd. Iron & Coal Trades Rev., vol. 99, no. 2702, Dec. 12, 1919, pp. 763-765. 18 figs., partly on four supp. plates. Details of plant for rolling billets and slabs.
Electrically Driven Reversing Rolling Mills, Wilfred Sykes. Iron Age, vol. 104, no. 26, Dec. 25, 1919, pp. 1332-1333. With notes on comparative values of electric and steam drives. Discussion before Am. Iron & Steel Inst.
Rolls Strip Steel in Long Lengths, G. H. Manlove. Iron Trade Rev., vol. 65, no. 20, Nov. 13, 1919, pp. 1317-1320, 6 figs. Vertical guides near last finishing stand impart oscillating motion to product as it slides on edge to coilers.

RUBBER

Synthetic. An Examination of German Synthetic Rubber, Lothar E. Weber. India Rubber World, vol. 61, no. 2, Nov. 1, 1919, pp. 71-72, 4 figs. Results of chemical analyses of four samples of synthetic rubber obtained from Germany and tests for determining their aging properties cause writer to call this synthetic product an astounding chemical accomplishment.
The Future of Artifical Rubber, E. K. Rideal. Chem. Engr., vol. 27, no. 10, Oct. 1919, pp. 249-251. After reviewing various methods of preparing butadienes writer concludes that possible competition of synthetic process rubber with natural product does not rest entirely with successful economic development of one of these processes because "natural rubber by no means consists entirely of condensed isoprene." From Chem. Age.

SEPARATORS

Centrifugal Machines Recover and Purify Oil. Automotive Industries, vol. 41, no. 20, Nov. 13, 1919, pp. 972-973, 4 figs. De Laval separators.

The Steam Separator, A. J. Dixon. Southern Engr., vol. 32, no. 4, Dec. 1919, pp. 38-41, 13 figs. Explanation of benefits obtained by separating moisture from steam, together with description of mechanical principles of various devices so employed.

SERIES

New Observations on Ultra-Spherical Series (Nouvelles observations sur les séries ultrasphériques), Erwand Kobetliantz. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, nos. 9 and 18, Sept. 1 and Nov. 3, 1919, pp. 423-426 and 769-770. Concerning summation of ultraspherical development of $f(x)$ in interval $(-1,+1)$. Reference is made to theorems given in C. R. vol. 169, 1919 p. 322.

SEWAGE

Army Camps. Sewerage, Sanitation and Reclamation at U. S. Army Camps, Leonard J. Doten. Jl. Western Soc. Engrs., vol. 24, no. 5, May 1919, pp. 263-275 and (discussion), pp. 275-281, 11 figs., partly on three supp. plates. Scheme adopted for cantonments consisted of classification and separation of waste materials in such manner as to secure greatest amount of revenue from sale of material; all wastes were collected by means of duplicate can system. Garbage and other wastes were disposed of by sale to contractors.

Disposal. Sewage-Disposal Difficulties at Madison, Wisconsin. Contract Rec., vol. 33, no. 47, Nov. 19, 1919, pp. 1079-1080. How sludge handling was improved by hoppers and new pipe connections.

Present Status ofthe Sewage Disposal Problem, George G. Nasmith. Can. Engr., vol. 37, no. 24, Dec. 11, 1919, pp. 519-522. It is noted that efforts to recover nitrogenous contents of sewage are made difficult by colloidal nature of activated sludge. In opinion of writer cities may have to dissolve and oxidize as much of organic material as possible, turning out smaller quantity of stable residue and making no attempt at conservation.

The Present Situation in Regard to Sewage Disposal Problems and Methods, George G. Nasmith. Contract Rec., vol. 33, no. 50, Dec. 10, 1919, pp. 1137-1140. Combination of activated sludge or trickling filters with sludge digestion regarded as best solution.

Screens. Results of 1918 Operations of Testing Station of Milwaukee Sewerage Commissions. Eng. & Contracting, vol. 52, no. 24, Dec. 10, 1919, pp. 669-671. 1 fig. Experiments demonstrated that revolving screen with slots 2 in. by ¼ in. working under 2-in. loss of head handled 3,000,000 gal. of sewage upon 27 sq. ft. of wet screen area per day and removed 156 lb. of dry solids per 1,000,000 gal., and that activated sludge tanks 15 ft. deep treated affluent from such screen at rate of 16.5 million gal. per acre per day.

Sludge Handling. Sewage Sludge Economic Value, Raymond Wells. Eng. World, vol. 15, no. 11, Dec. 1, 1919, pp. 27-31. How Cobwell process, which is usually applied to handling of municipal garbage, dead animals, slaughter-house offal and other wet organic waste materials, has been applied to sewage sludge. Paper read before Am. Soc. for Municipal Improvements.

Tanks. "Dortmund" Sewage Tank. Ferro-Concrete, vol. 11, no. 4, Oct. 1919, pp. 104-107, 7 figs. Sewage is discharged from carrier into cast-iron supply pipe serving 24-in. down pipe at center of tank, this pipe terminating 14 ft. below top so that sewage may be deposited within conical portion.

Treatment. Sewage Treatment Plant at Montezuma, Iowa, J. H. Dunlap. Mun. & County Eng., vol. 57, no. 5, Nov. 1919, pp. 218-222, 6 figs. Plant consists of sedimentation tank of Imhoff type, siphon chamber, two intermittent sand filters and sludge bed.

SEWERS

Earth Slips Prove Disastrous to Open-Cut Sewers. Eng. News-Rec., vol. 83, no. 21, Dec. 11 and 18, 1919, pp. 989-991, 5 figs. Experience in conducting Detroit sewers.

Multiple Outlet Provides for Variable Sewage Flow, S. T. Smetters. Eng. News-Rec., vol. 83, no. 16, Oct. 16, 1919, pp. 728-730, 4 figs. Regulation and distribution of sewage discharge through seven outlets into Calumet-Sag Canal.

Sewer Ventilation and Health, William Brown. Soc. Engrs., Jl. and Trans., vol. 10, no. 9, 1919, pp. 247-261 and (discussion), 261-278, 2 figs. Writer contends that "constant, efficient ventilation of each whole system of sewerage is the dominant desideratum in the solution of public health problems" and offers arguments in substantiation of this proposition by studying conditions in London sewers noting how formation of sewer gas is prevented by sewer ventilation.

SHAFTS

High-Speed Shafts (Schnellaufende Wellen), D. Dresden. Zeitschrift für das gesamte Turbinewesen, vol. 16, no. 20, July 20, 1919, pp. 197-202, 9 figs. Critical discussion of de Laval, Stobola, Dunkerley, Chree, Kerr and Leblanc theories. (To be continued.)

Formula of Dunkerley for the Critical Velocity of Rotating Shafts: Demonstrations and Applications (La formule de Dunkerley pour la vitesses critique des arbres tournante; démonstration et applications), M. Goupil. Annales des Ponts et Chaussées, vol. 51, no. 4, July-Aug. 1919, pp. 66-74. Review of applications which have appeared in technical press, notably Phil. Transactions of London, Pro. Roy. Soc. and Zeitschrift des Vereins Deutcher Ingenieure.

SHELLAC

Pure Gum Shellac, Chester H. Jones. Chem. & Metallurgical Eng., vol. 21, no. 14, Dec. 10-17, 1919, pp. 715-721, 11 figs. Account of manufacture and suggested specifications for pure shellac varnishes.

SHIPS

Cargo. Economical Cargo Ships, Alfred J. C. Robertson. Int. Mar. Eng., vol. 24, no. 12, Dec. 1919, pp. 799-805, 3 figs. Cost of operation at four different speeds of four standard vessels of different sizes. Paper read before Soc. Naval Architects and Mar. Engrs.

Coaling. Coaling Ships at Sea, H. Hubert. Coal Trade Jl., vol. 50, no. 49, Dec. 3, 1919, pp. 1393-1395, 3 figs. British floating coal depot used for storing large quantities of coal afloat.

The Michener System of Coaling Vessels, George Frederick Zimmer. Eng. & Indus. Management, vol. 2, no. 23, Dec. 4, 1919, pp. 729-732, 4 figs. Noted feature is that driving and delivery terminals are in permanent position relative to spot where coal is to be delivered into vessel.

Construction. Internal Bossing for Cargo Vessels, E. de Brinja. Int. Mar. Eng., vol. 24, no. 11, Nov. 1919, pp. 752-754, 2 figs. Structural changes proposed where strength and savings in space and cost are of vital importance.

Castings Used in Ship Construction—II and III, Ben Shaw and James Edgar. Foundry Trade Jl., vol. 21, no. 213 and 215, Sept. and Nov. 1919, pp. 635-639 and 815-823, 59 figs. Also Foundry, vol. 47, nos. 20 and 21, Dec. 1 and 15, 1919, pp. 870-873, 902-905, 33 figs. Patternmaking of propeller-shaft bracket moulding propeller brackets.

Electric Propulsion. Electric Propelling Machinery of the U. S. S. Tennessee, William H. Easton. Power Plant Eng., vol. 23, no. 24, Dec. 15, 1919, pp. 1118-1119, 3 figs. Maximum power will be 33,500 hp. and maximum speed is expected to be over 21 knots.

Electric Propulsion of Merchant Ships, W. L. R. Emmett. Int. Mar. Eng., vol. 24, no. 12, Dec. 1919, pp. 814-817, 5 figs. Results obtained with electrically propelled ships; advantages claimed and comparison with geared turbine and reciprocating engine drive.

Ex-German. Electrical Repairs on Ex-German Ships, Joseph Stansbury Jones. Int. Mar. Eng., vol. 24, no. 12. Dec. 1919, pp. 818-822, 11 figs. Nature of damage to electrical equipment by sabotage; alterations and replacements; generators and motors lighting and communication systems.

Freight. Designing Economical Freighters, Alfred J. C. Robertson. Mar. Rev., vol. 50, no. 1, Jan. 1920, pp. 13-15. Data obtained on ship operating costs, compiled from vessels of varying capacities.

Launchings. Observations on Side Launchings, John A. McAleer. Int. Mar. Eng., vol. 24, no. 11, Nov. 1919, pp. 746-749. Arrangement of blocking. Progressive loss of support as vessel goes down the ways. Lifting and tipping pressures.

Machinery. Designing Marine Machinery for Economy, H. C. Dinger. Int. Mar. Eng., vol. 24, no. 11, Nov. 1919, pp. 743-744. Features of machinery design that affect fuel consumption of ship. Reduction and simplification of pipnig. Furnace and condenser losses.

Models. Experiments on Full Cargo-Ship Models. Shipbuilding & Shipping Rec. vol. 14, no. 20, Nov. 13, 1919, pp. 556-558. 2 figs. Curves of propeller characteristics. (Concluded.) Paper read before Instn. of Naval Architects.

Molds. Sequence of Mold Work in the Loft, J. A. Ridley. Int. Mar. Eng., vol. 24 no. 11, Nov. 1919, pp. 754-756. System adopted at McDougall-Duluth Shipyard for getting out material for standard lake type cargo steamers.

Painting. How Modern Vessels Are Painted—II, Fred R. Jacobs. Mar. Rev., vol. 50, no. 1, Jan. 1920, pp. 30-32, 4 figs. Uses of paint gun.

Power Circulation. Power and Speed of Steamers, Arthur R. Liddell. Engineer, vol. 128, no. 3331, Oct. 31, 1919, pp. 430-431. Methods for calculating power required to overcome different resistances experienced by ship.

Propulsion. Development of Geared Turbines for the Propulsion of Ships, R. J. Walker. Engineering, vol. 108, no. 2803, Sept. 19, 1919, pp. 386-387, 1 fig. With table of comparative results obtained with Parsons single-reduction gear turbines and reciprocating engines. Paper read before Engineering Section of British Assn.

The Propulsive Efficiency of Single-Screw Cargo Ships, Wm. McEntee. Int. Mar. Eng., vol. 24, no. 12, Dec. 1919, pp. 796-799, 6 figs. Effect of varying amount of parallel middle body and longitudinal coefficient simultaneously with constant over-all dimensions. Paper read before Soc. Naval Architects and Mar. Engrs.

Reinforced-Concrete. Construction of Reinforced Concrete Barges and Seagoing Ships (La Construction des Chalands et des Navires de Mer en Ciment armé), M. Fourniols. Revue Générale des Sciences, vol. 30, no. 21, Nov. 15, 1919, pp. 617-623, 7 figs. Development of industry, noting constructional features of important recent types.

Sweden's First Wood and Reinforced-Concrete Ship (Das erste Holz-Eisenbetonschiff Schwedens), K. W. Ljungdell. Beton u. Eisen, vol. 18, nos. 12 and 13, Aug. 4, 1919, pp. 132-136, 17 figs. It has displacement of about 1000 tons and carrying capacity of 700 tons. Length over all is 42 m.; draft unloaded, 2.05, loaded in 4 m.; and makes eight knots when loaded.

Ventilation. Employing the Nozzle Effect for the Ventilation of Ships (Die Ausnützung der Düsenwirkung für die Lüftung auf Schiffen), Freudenthal. Schiffbau, vol. 20, no. 20, July 23, 1919, pp. 551-560, 26 figs. Sanitary significance of enlarged nozzle. Increasing nozzle effect by means of suction nozzle. (To be concluded.)

SHOPS

See Factories.

SIDEWALKS

City Sidewalks (Les Trottoirs de ville), Ch. Dubasch. Annales des Travaux Publics de Belgique, vol. 20, no. 3, Sept. 1919, pp. 390-391, 10 figs. Their construction, practices in various countries for determining their width in proportion to the total width of street, their height, etc.

SNOW REMOVAL

RUSSIA. Iron and Steel Resources of Russia, P. Kovaloff. Iron Age, vol. 104, no. 25, Dec. 18, 1919, pp. 1247-1251, 2 figs. Data on estimated large future requirements of Russia for Iron and steel products and country's facilities for supplying demand. Paper read before Assn. of Russian Engrs. for Relief of Russia.

SULPHUR EFFECTS. The Effect of Sulphur on Steel Castings, A. E. White. Blast Burnace & Steel Plant, vol. 7, no. 12, Dec. 1919, pp. 586-587. Minute scrutiny of sulphur held to be not as essential in making steel castings as design, composition, molding, steel-making and annealing practice. It is suggested that basis of accepting steel casting should be broader. Paper read before Am. Foundrymen's Assn.

TOOL. Tool Steel's Influence on Progress and Prosperity. Raw Material, vol. 1, no. 8, Nov. 1919, pp. 368-376, 8 figs. Survey of developments in manufacture of tool steel. (To be continued.)

VISCOSITY. Viscosity of Steels at High Temperatures (Sur la viscosité des aciers aux températures élevées), P. Chevenard. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 17, Oct. 27, 1919, pp. 712-715, 2 figs. Experiments are said to have established that all steels, excepting extra rapid steels, by being exposed for certain hours to temperature between 700 and 600 deg. cent. are relieved of internal stresses developed by any previous heat or mechanical treatments.

STEEL MANUFACTURE

The Use of Spiegeleisen in Steel Manufacture, Henry D. Hibbard. Dept. Interior, Bur. Mines, Monthly Reports of Investigations, Nov. 1919, 8 pp. Possibilities of utilizing greater quantity of spiegel and interimmediate grades of ferro-manganese.

STEEL PLANTS

Welsh Steel Plant Self-Contained, Joseph Horton. Iron Trade Rev., vol. 65, no. 22, Nov. 27, 1919, pp. 1441-1445, 6 figs. How raw materials are controlled by company which makes diversified line of products.

STOCK ROOMS

Caring for the Stock. Jl. Electricity, vol. 43, no. 11, Dec. 1, 1919, pp. 503-505, 4 figs. Stock room devices used by Pac. State Elec. Co.

STONEWARE

Manufacture of Stoneware Used in Chemical Industry (La fabrication des produits en grès pour l'industrie chimique), Paul Razous. Génie Civil, vol. 75, no. 20, Nov. 15, 1919, pp. 481-485, 3 figs. Suggested methods for determining thickness of walls of stoneware apparatus.

STOKERS

A New Overfeed Automatic Stoker. Power Plant Engr., vol. 23, no. 23, Ded. 1, 1919, p. 1088, 2 figs. Machine is of incline moving grate overfeed type. It is claimed that use of overfeed principle results in ash being kept in zone of low temperature.

STORAGE

BUNKERS. Stone Storage Bunkers. Ferro-Concrete, vol. 11, no. 4, Oct. 1919, pp. 112-114, 3 figs. Capacity is 4000 tons. Structure is supported upon three rows of reinforced concrete pillars.

SYSTEMS. The Organization of a Steel Stores, E. A. Allcut. Eng. and Indus. Management, vol. 2, no. 23, Dec. 4, 1919, pp. 707-708, 2 figs. Classification and discussion of systems of steel storage.

A Group Tool Storage System, Peter F. O'Shea. Am. Mach., vol. 51, no. 20, Nov. 13, and 20, 1919, pp. 893-895. Acts enacted in various states.

STORAGE BATTERIES

Cadmium Electrode for Storage-Battery Testing, H. D. Holler and J. M. Braham. Dept. Commerce, Technologic Papers of Bur. of Standards, no. 146, 1919, 15 pp., 3 figs. It is concluded that cadmium electrode is accurate to about 0.02 volt provided proper precautions are taken. It was found to be constant within 0.01 volt during several hours, but from day to day it varied as much as 0.02 volt. Greatest error in use of cadmium electrode was determined to be due to polarization caused by voltmeter of low resistance.

STONES

See Electric Stones.

STREET CLEANING

Street Cleaning, Refuse Disposal and Snow Removal, George H. Norton. Eng. World, vol. 15, no. 11, Dec. 1, 1919, pp. 33-34. Report of Bur. of Eng. of Buffalo. Paper read before Am. Soc. for Municipal Improvements.

See also Roads, Snow Removal.

STREET RAILWAYS

BRAKING. Against the Purely Electric Braking of Street Cars (Gegen die rein elektrische Bremsung der Strassenbahnwagen), H. Sauveur. Elektrische Kraftbetriebe und Bahnen, vol. 17, no. 21, July 24, 1919, pp. 161-164, 1 fig. It is noted that air brake insures greater safety of operation than the electric brake because the energy necessary for braking is actually there ready for use, and its volume noticeable to motorman.

CAR OPERATION. Economies in Car Operation, F. R. Phillips. Elec. Traction, vol. 15, no. 12, Dec. 15, 1919, pp. 815-821 and (discussion), 821-829, 2 figs. Concerning number of stops and slow-downs, density and regulation of traffic, speed of boarding and alighting from cars, etc.

CARS. Construction Features of New Cars Now Building at Detroit. Elec. Ry. Jl., vol. 54, no. 19, Nov. 8, 1919, pp. 863-864. 10 figs. Special members are used in floor and side frame, and there are no bulkheads. Arch roof is in three units without headlining.

Safety Cars for Brooklyn. Elec. Ry. Jl., vol. 54, no. 17, Oct. 25, 1919, pp. 784-789, 16 figs. Overall length is 3 in. greater than standard safety car previously constructed. Other modifications are: Water table is pressed as integral part of letterboard; side posts are extended downover side sill: crown pieces are substituted for dasher angles and furring: and belt rails, ¼ in. by 1¾ in., are used instead of dropper bars.

Italian Car Design Experience. Elec. Ry. Jl., vol. 54, no. 20, Nov. 15, 22, 29 and Dec. 6 and 13, 1919, pp. 909-910, 4 figs. Car with standing room only is said to have proven very unpopular in Rome.

CORPORATE STRUCTURE. Simplification of Corporate Structures, Charles B. Cooke, Jr. Elec. Ry. Jl., vol. 54, no. 19, Nov. 8, 1919, pp. 858-861, 1 fig. Co-operative plan is outlined for relief of large street railway systems through reconstruction of underlying corporate and financial structure. By special increase in fare sinking fund is provided by which underlying securities are retired, equity therefrom being taken by city.

EXPRESS SERVICE. Electric Railway Express Service, C. J. Munton. Elec. Traction, vol. 15, no. 12, Dec. 15, 1919, pp. 808-810 and (discussion) 810-815. Replies to questionnaire sent to various companies in which they were asked to outline method by which they provide express service. Paper read before Central El. Ry. Assn.

FARES. Fares in Chicago, Cleveland and Philadelphia Compared, L. A. Busby. Elec. Ry. Jl., vol. 54, no. 17, Oct. 25, 1919, pp. 795-796. Average fare per passenger, that is, amount determined by dividing total passenger rates by total passengers carried—cash, transfer and free, computed for each of these cities. Although there is 7-cent fare in Chicago and 5-cent fare in other two cities, it developes that average fare per passenger in Chicago is 3.92 cents 3.98 cents in Philadelphia and 3.7 cents in Cleveland.

London's Tubes and Ruses—II, WalterJ ackson. Elec. Ry. Jl., vol. 54, no. 18, Nov. 1, 1919, pp. 816-823, 24 figs. Methods of zone fare auditing; training, welfare work and other features relative to employees.

FREIGHT SERVICE. Heavy Freight Service on a Single-Track, High-Speed Passenger Line, A. B. Cole. Elec. Ry. Jl., vol. 54, no. 19, Nov. 8, 1919, pp. 866-868, 7 figs. Dispatch merchandise and steam road interchange freight service interspersed with frequent multiple-unit passenger trains.

INTERURBAN. Cutting Down Operating Expenses on a Small Interurban Road, C. T. Dehore. Elec. Ry. Jl., vol. 54, no. 20, Nov. 15, 22, 29 and Dec. 6 and 13, 1919, pp. 915-918, 6 figs. Examples of eliminating useless material, reducing labor cost and speeding up cars.

PHILADELPHIA. Philadelphia Conditions Analyzed. Elec. Ry. Jl., vol. 54, no. 21, Dec. 20, 1919, pp. 999-1002, 2 figs. City director of transit Twining criticises recent Phila. Rapid Transit- proposals and discusses five-cent fare situation in that city. Comparative figures are given with previous years and other cities.

PUBLIC REGULATION. Service at Cost Agreements, Harlow C. Clark. Aera, vol. 8, no. 4, Nov. 1919, pp. 504-509. Analysis of various laws and ordinances which are now in effect in American cities.

STANDARDIZATION. Standardization Rules for Tramways and Vignoles Rail Lines (Matériel standard pour voies de tramways et voies vignoles). Industrie des Tramways et Chemins de Fer, vol. 13, nos. 148-149 and 150, Apr.-May-June 1919, pp. 26-30, 19 figs. Types adopted by standardization committees of French Ministry of Public Works and of Commerce.

ZONE PLAN. The Connecticut Company Goes to Zone Plan. Elec. Ry. Jl., vol. 54, no. 19, Nov. 8, 1919, pp. 852-857, 10 figs. One of features is that in business center of each city "neutral" areas are provided to permit passengers to ride beyond geographical center in order to reach stores in central business region without paying extra fare.

See also Cars; Locomotives; Railways.

STREAM-LINE FLOW

Stream-Line Flow from a Disturbed Area, A. R. Richardson. Lond., Edinburgh and Dublin Phil. Mag., vol. 38, no. 226, Oct. 1919, pp. 433-452, 5 figs. Study of vortices caused by viscosity and of effect of alteration in shape on resistance of body moving at given speed.

STUCCO CONSTRUCTION

Successful Building in Stucco—II. Am. Architect, vol. 116, no. 2200, No. 12, 1919, pp. 615-621, 13 figs. Illustrating hollow wall tile construction.

SUBMARINE MINES

Stray Mines in the North Atlantic (Les mines errantes sur l'Atlantique nord), Albert, Prince of Monaco. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 13, Sept. 29, 1919, pp. 562-566, 1 fig. Communications of Weather Bureau and Hydrographic Office at Washington to meteorologic service of Azores, advising of finding of 33 stray mines at various points along course of Gulf Stream are quoted, and possible courses followed by other mines, particularly along coast of U. S. A. are traced.

TEXTILE INDUSTRY

[illegible]

TEXTILE MILLS

[illegible]

Electrical Operation of a Small Textile Mill, H. C. N. Ripley. Elec. World, vol. 74, no. 17, Oct. 25, Nov 1 and 8, 1919, pp. 868-869, 4 figs. Details of motor installations, motor-control equipment and lighting layout, together with cost of lighting and power service.

THERMIT WELDING

Repairs Made with Thermit. Ry. Jl., vol. 25, no. 8, Aug. 1919, pp. 21-23, 6 figs. Welds made on locomotive parts in railway shops.

Safety Practices in Thermit and Electric Welding. Marine News, vol. 6, no. 8, Jan. 1920, pp. 156-160. Recommendations of Nat. Safety Council.

THERMO-ELECTRICITY

Thermo-Electricity of Liquid Mercury Demonstrated by Means of Galvanometer (Thermo-électricité du mercure liquide démontrée au moyen du galvanomètre). Calr Benedicks. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 13, Sept. 29, 1919, pp. 578-581, 1 fig. Negative effect reported to have been obtained by subjecting special glass container of mercury to differences in temperature amounting to 150 deg. Cent.

TIDAL POWER

Tidal Power and Some of Its Aspects, William T. Taylor. Elec. Times, vol. 56, no. 1464, Nov. 6, 1919, pp. 356-358, 3 figs. Comparative study of various schemes proposed.

TILE CONSTRUCTION

See Stucco Construction.

TIMBER PERFORATING

Timber Perforating Patent Released. Ry. Age, vol. 67, no. 25, Dec. 19, 1919, pp. 1203-1204, 2 figs. Method consists of perforating surface of wood to be treated by holes systematically located at uniform distances apart, both transversely and longitudinally.

TIME MEASUREMENTS

Measurement of Absolute Value of Time Based on Newton's Law (Sur la mesure absolue du temps fondée sur les lois de Newton), Gabriel Lippmann. Annales de Physique, vol. 12, no. 9, Sept.-Oct. 1919, pp. 226-237. Suggested concept of absolute unit of time.

TIN

Bibliography of Recent Articles on Tin, R. R. Horner. Dept. Interior, Bur. Mines. Monthly Reports of Investigations, Nov. 1919, 8 pp. Articles indexed have appeared in technical literature of England and United States during years 192 to Nov 1919

The Electrolytic Extraction of Tin from Tinplate Scrap. Metal Industry, vol. 15, no. 18, Oct. 31, 1919, p. 372. Precautions to observe while applying Keihl process of submitting tinplate scrap to electrolytic action in alkaline solution. Translated from Bul. de la société des Ingenieurs Civils.

TITANIUM

Rapid Method for the Estimation of Titanium in Titaniferous Iron Ores, John Waddell. Analyst, vol 44, no. 522, Sept. 1919, pp. 307-309. Method in use at Queens' University, Kingston, Canada.

TOLUENE

The Critical Solution Temperature of a Ternary Mixture as a Criterion of Purity of Toluene, Kennedy Joseph Previte Orton and David Charles Jones. Jl Chem. Soc., vols. 115 and 116, no. 683, Sept. 1919, pp. 1055-1070, 6 figs. Method said to be particularly applicable to detecting and estimating petroleum in toluene.

TOOLS

Heat Treatment of Alternate Contact Tools, John J. Jones. Jl. Am. Steel Treaters Soc., vol. 2, no. 3, Dec. 1919, pp. 171-176. Concerning use of pyrometers, economical management of heat-treating plant and manner of treating such tools as punches, dies and pneumatic hammer pistons.

Reclaiming High Speed Precision Cutting Tools from Scrap Heap, W. H. Lloyd. Iron Trade Rev., vol. 65, no. 21, Nov. 20, 1919, pp. 1379-1383, 12 figs. Practice of large plant.

TOOL ROOMS

Making the Toolroom Efficient, F. B. Jacobs. Iron Trade Rev., vol. 65, no. 20, Nov. 13, 1919, pp. 1326-1327. It is held that economical tool room practice depends on two principal factors; installing up-to-date equipment and routing work so that lower priced workmen perform simle operations.

TOWN PLANNING

See City Planning.

TRACK BONDING

Soldered Bonds for Track Bonding, G. H. McKelway. Elec. Ry Jl., vol. 54, no. 20, Nov. 15, 22, 29 and Dec. 6 and 13, 1919, pp. 899-901, 8 figs. Types of soldered bonds.

TRACTORS

British. Description and Features of the British Tractors, M. W. Bourdon. Automotive Industries, vol. 41, no. 18, Oct. 30, 1919, pp. 852-859, 11 figs. Based on examination of types exhibited at Lincoln trials.

Design. Constructive Comment on Tractor Design, M. W. Bourdon. Automotive Industries, vol. 41, no. 18, Oct. 30, 1919, pp. 849-851. Account of English tractor trials at Lincoln. (Concluded.)

Transformation of Automobile Vehicles into Tractors on Rails by Army in the Orient (La transformation de voitures automobiles en tracteurs sur rails à l'armée d'Orient), Génie Civil, vol. 75, no. 22, Nov. 29, 1919, pp. 529-531, 5 figs. Experience is discussed in light of requirements which must be satisfied by automobile designed for operation on rails.

Fiat Lorry. The Fiat Lorry Tractor. Motor Traction, vol. 29, no. 770, Dec. 3, 1919, pp. 523-524, 3 figs. For hauling loads up to 100 tons.

TRACTOR ENGINES

Accessibility is Featured in Tractor Engine. Automotive Industries, vol. 41, no. 22, Nov. 27, 1919, pp. 1064-1066, 2 figs. Stearns engine designed for tractor work.

TRANSFORMERS

Construction and Application of Potential and Current Transformers. Elec. Rec., vol. 26, no. 4, Oct. 1919, pp. 217-221, 34 figs. Including dry insulated, oil-insulated and busbar pipes built by General Elec. Co., at Schenectady.

Some Recent Developments in Power Transformers, W. S. Moody. Gen. Elec. Rev., vol. 22, no. 11, Nov. 1919, pp. 853-864, 16 figs. Writer observes that importance in self-cooled transformer brought about by development of radiator tank, have made it possible to use self-cooled units in many places where water-cooling would formerly have been considered essential. He describes how special problems involved in design of transformers for electric furnaces were met successively, and reference to use of conservators.

Testing Transformers by the Alternating Potentionmeter, Douglas C. Gall. Elecn., vol. 83, no. 2167, Nov. 28, 1919, pp. 603-604, 4 figs. Description of test made upon current transformer of nominal ratio 1 to 10, secondary full-load 5 amperes.

TRAWLERS

Diesel-Electric Drive for Trawlers. Motorship, vol. 4, no. 12, Dec. 1919, pp. 32-34, 6 figs. Account of trials of 500-ton fishing vessel with heavy-oil engine and electric transmission for propelling and auxiliary power.

TRENCH DIGGING

Steam Shovel Digs Sewer Trench in Narrow Space, George C. D. Lenth. Eng. News-Rec., vol. 83, no. 22, Dec. 25, 1919, pp. 1064-1066, 5 figs. Illustrating method of excavating trench between footings and under floor of bridge over street.

TRUCKS

Use of Electric Industrial Trucks. Textile World Jl., vol. 56, no. 17, Nov. 29, 1919, pp. 111-113, 6 figs. Illustrating uses of tractors provided with safety devices, which permit employment of women workers.

Electric Trucks and Tractors in Printing Plants, Bernard K. Dillon. Elec. Rev., vol. 75, no. 22, Nov. 29, 1919, pp. 895-897, 3 figs. Illustrating methods of applying electric apparatus to handling problems of such plants.

Using Basements and Subways for Factory Trucking, Peter F. O'Shea. Factory, vol. 23, no. 6, Dec. 1919, pp 1285-1289, 6 figs. System of Fisk Rubber Co. for fast trucking between departments and between buildings.

TUNGSTEN

Political and Commercial Geology Series No. I—The Tungsten Resources of the World, Frank L. Hess. Eng. & Min. Jl., vol. 108, no. 18, Nov. 1, 1919, pp. 715-722, 1 fig. Geographical distribution, indicating control exerted by principal nations.

TUNNELS

Cost of Driving 8,700 Ft. of Tunnel by Station Men. Eng. & Contracting, vol. 52, no. 25, Dec. 17, 1919, pp. 689-690. Figures obtained in reconstruction of canal system of irrigation district in Yakima Valley, Wash.

The Scranton Tunnel. Ry. Engr., vol. 40, no. 179, Dec. 1919, pp. 270-273, 7 figs. Total length is 4747 ft. width 17 ft. clear inside and height 20 ft. above and 2 ft. below rail level. Account of construction.

TURBINES

The Possibilities of an Aeronautical Gas Turbine, C. A. Norman. Automotive Industries, vo. 41, no. 19, Nov. 6, 1919, pp. 914-917, 8 figs. Discussing report that German engineers have developed aeronautic gasoline turbine engine, writer concludes that such an engine is a possibility but that is advantages would not be of consequence.

See also Hydraulic Turbines.

TURBO-ALTERNATORS

See Electric Generators, A. C.

UNIVERSAL JOINTS

The Universal Joint. Automobile Engr., vol. 9, no. 132, Nov. 1919, pp. 411-412, 12 figs. Concerning calculations involved in designing of various types.

VACUUM TUBES

VALUATION

VALVE GEARS

VALVES

VAPOR PRESSURES

VENTILATION

VENTURI METERS

VIBRATION MEASUREMENT

VISCOSITY

WATER FLOW MEASUREMENTS

WATER POWER

New Horsepower Formulæ, P. M. Heldt. Automotive Industries, vol. 41, no. 20, Nov. 13, 1919, p. 959. Proposes that for passenger car engines rule be adopted of one houre-power per 10.5 cu. in. piston displacement at 1000 r.p.m. and proportionately more at higher speeds.

Water Power Resources of British Columbia. Elec. News, vol. 28, no. 22, Nov. 15, 1919, pp. 32-36, 5 figs. Abstracts of report issued by Commission of Conservation of Can. Resources are estimated at 3,000,000 hp.

WATERPROOFING

Suggested Improvements in Waterproofing Railroad Structures. Eng. & Contracting, vol. 52, no. 25, Dec. 17, 1919, pp. 701-702. Such as having membrane come in ready-made sheets on work.

WATER PURIFICATION

Chlorination. Field Methods for the Chlorination of Small Amounts of Water, F. R. Georgia. Jl. Am. Water Works Assn., vol. 6, no. 4, Nov. 1919, pp. 654-663, 1 fig. Chlorination was carried out in Lyster bags. Details of system used for effecting continous purification of water as it was pumped.

The Chloramine Process as Applied to the Catskill (Esopus) Water, Frank E. Hale. Jl. Am. Water Works Assn., vol. 6, no. 4, Nov. 1919, pp. 804-817 and (discussion) pp. 818-822, 3 figs. Concerning reported discovery of dead trout and other fish in Esopus Creek after treatment of water was started with with 0.4 p.p.m. chlorine.

The Effect of Chlorine on Periodic Precipitation, A. W. Foster. Jl. Phys. Chem., vol. 23, no. 9, Dec. 1919, pp. 645-655, 9 figs. Results obtained by using chlorinated tap water instead of distilled water in experiments on absorption of ions by colloids.

Filter Nozzles. Testing Discharge of Sprinkling Filter Nozzles, W. Earle Weller. Mun. & County Eng., vol. 57, no. 5, Nov. 1919, pp. 203-204, 3 figs. Tests made by Bur. of Eng. of City of Binghamton, N.Y.

Filter Plant. Water Filtration Plant built on Gravity Supply at Dundas, Ont., built at low Figure. Contract Rec., vol. 34, no. 48, Nov. 26, 1919, pp. 1092-1096, 8 figs. Capacity of plant is 700,000 gallons per day. It is said to have been erected at cost of $30,000.

WATER SUPPLY

Army. Keeping the First Army Supplied with Water, F. W. Scheidenhelm. Jl. Am. Water Works Assn., vol. 6, no. 4, Nov. 1919, pp. 623-638, 8 figs. Work of Water Supply Service. Its responsibility covered water for men, for animals, for railways, both standard and narrow gages, and for hospitals including field and evacuation hospitals.

Aviation Fields. Water Supply and Sewage Disposal at the Military Aviation Fields, Posts, Depots, etc., in the United States, Robert H. Craig. Jl. Am. Water Works Assn., vol. 6, no. 4, Nov. 1919, pp. 664-678. Experiences are quoted, such as for instance that Imhoff tanks with longitudinal flow, one flowing-through compartment over each sludge digestion chamber, settling compartment with steep sloping sides in less than 1:1 and with gas vent area from 20 to 25 per cent of total tank area gave best results.

Catskill. Schobarie Development of the Catskill Water Supply System for New York City, J. Waldo Smith. Jl. Am. Water Works Assn., vol. 6, no. 4, Nov. 1919, pp. 639-653, 5 figs. Project involves extending system 36 miles north from Ashokan dam making overall distance for system of 156 miles from new dam to terminal reservoir on Staten Isd.

Metering. Effect of Metering on Water Consumption, H. P. Matte. Jl. Western Soc. Engrs., vol. 24, no. 3, March 1919, pp. 133-148 and (discussion) pp. 148-152, 9 figs. Based on records taken at various cities both before and after instaling meters.

What Metering of Water has Done for a New England City. Contract Rec., vol. 34, no. 48, Nov. 26, 1919, pp. 1103-1104. By installing meters city of Middletown, Conn., is said to have reduced its water consumption from 133 gal. per capita to 78 gal. per capita.

Waste Prevention. Water Waste Prevention Surveys in Washington, Paul Lanham. Mun. Jl. & Public Works, vol. 47, no. 17, Oct. 25, 1919, pp. 250-254, 11 figs. Plan and organization by which 45,000,000 gal. have been saved daily.

WATER WORKS

The Effect of the War Period 1914-1918, and Public Control Upon the Water of the United States, Leonard Metcalf. Jl. Am. Water Works Assn., vol. 6, no. 4, Nov. 1919, pp. 785-803, 5 figs. Review of 500 decisions, more or less effecting water works, handed down by courts and commissions during four and one-half period from Jan. 1915 to May 1919.

Present Conditions in the Waterworks Field. Eng. & Contracting, vol. 52, no. 24, Dec. 10, 1919, pp. 668-669. Committee report submitted at convention of Am. Soc. Municipal Improvements.

WEIRS

See Water-Flow Measurements Weirs.

WELDING

Burners. Improvements in Spray Burners for Welding and Cutting Metals. Acetylene & Welding Jl., vol. 16, no. 191, Aug. 1919, pp. 157-158, 1 fig. Apparatus is arranged so as to permit soaking and spraying liquid fuel with burner tube by oxygen introduced by pressure.

Disk-Depression Method. Disk-Depression Method of Welding, Chas. H. Kicklighter. Southern Eng., vol. 32, no. 4, Dec. 1919, pp. 66-68, 12 figs. It is claimed for this method that joint effected by it has greater strength than riveted joint and that greater economy in production is secured with it.

Engine Cylinders. The Making and Welding of Engine Cylinders. Practical Engr., vol. 60, no. 1707, Nov. 13, 1919, pp. 233-234, 8 figs. American patent relating to welding elbow-like members of gas passages leading to or from inlet or exhaust ports to cylinder.

Welding Large Mill Engine Cylinders, L. M. Malcher. Foundry, vol. 47, no. 21, Dec. 15, 1919, pp. 908-909, 5 figs. Repairing 70-in. cylinder of Allis-Chalmers twin tandem-compounds engine. Also in Iron Trade Rev., vol. 65, no. 26, Dec. 25, 1919, pp. 1710-1711, 5 figs.

Welding Locomotive Cylinders. Am. Mach., vol. 51, no. 21, Nov. 27 and Dec. 4, 1919, pp. 932-933. Symposium presented at convention of Int. Ry. Gen. Foremen's Assn.

Forgings. Fusion Welding Applied to Drop Forgings, S. W. Miller. Acetylene Jl., vol. 21, no. 6, Dec. 1919, pp. 402-406 and 420-424. Oxy-acetylene and electric welds and their applicability to defective forgings. Effect of high temperatures on physical structure. Paper presented before Am. Drop Forge Assn.

Foundry Work. The Welder in the Iron Foundry, David Baxter. Acetylene Jl., vol. 21, no. 6, Dec. 1919, pp. 410-416, 2 figs. Applications of welding in foundry, with instructions for doing various classes of work.

Steel. Welding of Bessemer and Open Hearth Steel, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 11, Nov. 1919, pp. 406-408, 3 figs. Study of effect of impurities and result of electric arc on various compositions.

Tanks. Welded Water Tank Constructed from Surplus War Material. Acetylene Jl., vol. 21, no. 6, Dec. 1919, pp. 400-401, 4 figs. How iron sheets originally made for shrapnel protection in trenches are being used in construction of 9700-gal. water tanks.

Tests. Tests of Welded Materials Maurice Y. Kapetansky. Michigan Technic, vol. 32, no. 3, Oct. 1919, pp. 201-213, 16 figs. Results of chemical, physical and microscopical tests are presented and their relative importance in determining value of welds is discussed. Use of microscope alone, it is noted, saves a great deal of preparation as cost of preparing specimens of microscopical examination is only one-forth or one-fifth that of preparing samples for physical test.

Training Welders. Training Welders and Cutters. Acetylene & Welding Jl., vol. 16, no. 193, Oct. 1919, pp. 102-103. Ability required by prospective welder. (Concluded.)

Truck Frames. Welding Truck Side Frames, Bolsters Side Bars. Ry. Jl., vol. 25, no. 8, Aug. 1919, pp. 23-26. Committee report presented at joint convention of Master Car Builders and Master Mechanics.

See also Electric Welding, Oxy-Acetylene Welding; Thermit Welding.

WELFARE WORK

Strong Background for Community Work Is Formed by Bathhouses and Laundries, Donald J. Paker. Coal Age, vol. 16, no. 16, Oct. 16, 1919, pp. 634-637, 3 figs. Results obtained by coal and coke company in Pa. which has established installation of bathhouses and laundries in mining camp.

WIND MOTORS

Wind Motors, Faville C. Poulton. Sci. Am. Supp., vol. 88, no. 2268, Nov. 15, 1919, pp. 286-287. Their possibilities and limitations. From Roy. Soc. Arts.

WIRELESS COMMUNICATION

See Radiotelegraphy; Radiotelephony.

WOMEN WORKERS

The Works and Products of Messrs. Barr and Stroud Limited. Engineering, vol. 108, no. 2803. Sept. 19, 1919, pp. 363-365, 4 figs. Employment of female labor at these works is said to have shown that "women, with suitable training could prove as efficient as men in some ordinary instrument making work." (Continuation of serial.)

WOOD

Average Weights of Various Species of Wood. Eng. & Contracting, vol. 52, no. 22, Nov. 26, 1919, p. 610. Table giving figures computed by U. S. Forest Products Laboratory.

WOOD WASTE

The Economy of Using Waste Wood for Heat and Power Generation in Woodworking Establishments (Die Wirtschaftlichkeit der Abfallholzverwendung zu Heiz, und Kraftdampf für Holzbearbeitungsbetriebe), M. A. Nüscheler. Zeitschrift des Bayerischen Revisions-Vereins, vol. 23, nos. 16 and 17, Aug. 31, and Sept. 15, 1919, pp. 125-128 and 135-138, 4 figs. Experience with boilers of Cornwall type of comparatively long construction and having only one large flue in order to provide large heating surface. (To be concluded.)

ZINC BRONZE

Five Foundry Tests of Zinc Bronzes, C. P. Karr. Brass World, vol. 15. no. 10, Oct. 1919, pp. 320-322. Proportional limit, tensile strength, elongation and reduction in area of specimens of two compositions, 88 copper, 10 tin, and 2 zincs, and 88 copper, 8 tin, and 4 zinc.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

In this department will be published from month to month the titles of current engineering papers with [illegible] and source and a brief outline of the most important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostat copies may be obtained of any of the articles listed in this section.

Price of each print [illegible] 25 cents plus postage. A separate print is required for each page of the larger periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N. Y.

AIRSHIPS

[illegible]

AIRCRAFT CONSTRUCTION MATERIALS

AIRPLANE DOPES. Airplane Dopes and Doping. W. H. Smith. Sci. Am. Supp., vol. 88, no 2292 Dec. 27, 1919, pp 387 and 399. Method of shrinking and waterproofing fabric of aeroplane wings. From fourth annual report of Nat. Advisory Committee for Aeronautics.

AIRPLANE WING COVERINGS. Airplane Wing Coverings, Charles J. Cleary Aviation, vol 7, no. 11, Jan 1, 1920, pp. 487-490, 5 figs. Methods of covering aerofoils and methods of testing fabric

Modern Wing Coverings—Materials Used and Their Application, R. G. Dort Aerial Age, vol. 10, no. 12, Jan 5, 1919, pp. 455-457 Manner of applying dope and pigmented protective coverings. (Concluded.)

RUBBERIZED BALLOON CLOTHS. Permeability of Rubberized Balloon Materials (Die Gasdurchlässigkeit von gummierten Ballonstoffen), Walter Frenzel. Chemiker Zeitung, vol 43, no 100, Aug. 19, 1919, pp. 530-532, 6 figs. Account of testing various balloon materials as to their permeability and its dependence of pressure and temperature by means of an interferometer.

AIRSHIPS

COMMERCIAL. Airships for Civilian Purposes, W. T. Blake. Aeronautics, vol. 17, no, 321, Dec. 11, 1919, pp 530-531. Performances of types of 2,000,000-cu. ft. and 70,000-cu. ft. capacities are studied and possibilities of using these types for commercial purposes are deduced.

ALCOHOL

ETHYLENE FROM COKE-OVEN GAS. Ethylene as Alcohol from Coke-Oven Gases, Ernest Bury and O Ollander. Iron and Coal Trades Rev., vol. 99, nos. 2703 and 2704, Dec. 19 and 26, 1919, pp. 801-805 and 831-832. Possibilities of producing absolute alcohol from coke-oven gas are pointed out and chart is given illustrating derivation of alcohol and its derivatives from coke-oven gas. Ethylene is said to be absorbed by coke-oven gas at temperature of 60 to 80 deg. cent. Paper before Cleveland Instn. of Engrs.

FUEL. Three New Sources of Fuel Alcohol. Automotive Industries, vol. 42, no. 2, Jan. 8, 1920, pp. 80-83. Processes for production of alcohol from molasses, wood waste and acetylene described in technical appendices to German war-time law creating an alcohol monopoly. Commercial prospects of processes are discussed.

ALUMINUM

CASTINGS. Casts Large Tonnage of Aluminum. Foundry, vol. 48, no. 1, Jan. 1, 1920, pp. 17-23, 13 figs. Attention is called to system in Detroit foundry, which permits continuous pouring and automatic removing of castings from moulding floor.

ALUMINUM ALLOYS

ALUMINUM-MAGNESIUM-COPPER Mechanical Properties and Resistance to Corrosion of Rolled Light Alloys of Aluminum and Magnesium with Copper with Nickel and with Manganese, F. D. Merica, R G. Waltenberg and A N Finn. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 132, Oct. 25, 1719, 13 pp., 3 figs. Alloys of aluminum-magnesium-copper were found to be superior in all conditions to those of other series in respect to tensile properties.

IRON, NICKEL, MANGANESE AND ANTIMONY. Transformations Experienced by Certain Aluminum Alloys (Sur les transformations subies par certains alliages d'aluminium), Leon Guillet. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 22, Dec. 1, 1719, pp. 1042-1043. Alloys experimented on were: Aluminum-iron with 77.55 per cent iron; aluminum-nickel with 62 52 per cent nickel; aluminum-manganese with 85.4 per cent manganese and aluminum-antimony with 79.86 per cent antimony.

AMMONIA

OXIDATION OF. The Catalyst for the Oxidation of Ammonia, G. A. Perley. Chem. & Metallurgical Eng., vol, 22, no. 3, Jan, 21, 1920, pp. 125-129. Use of suitably preheated air-ammonia mixture is pointed out as most important for production of sufficiently high temperature for rapid reaction velocity of desired reaction. It is believed that use of platinum gauze of 0 0025 in, diameter wire and 120 to 150 mesh is more convenient than one of 80 mesh because it decreases free gas space between wires.

The Commercial Oxidation of Ammonia, George Arthur Perley. Jl. Indus, & Eng. Chem., vol. 12, no. 1, Jan. 1920, pp, 5-16. 2 figs. Survey of work done by various investigators, specially at Bur. of Mines. (To be concluded)

NORMAL VALUE IN. "Normal" Value in Appraisals, Cecil F, Elmes. Eng. & Contracting, vol 53 no. 3, Jan 21, 1920, pp, 65-70, 4 figs. Charts representing average cost of various basic commodities for a number of years are presented and question of determining from them average value of each commodity is discussed. Paper read before Ill. Gas Assn.

APPRENTICES, TRAINING OF

FOUNDRY. Training Men for Foundry Duties, C. C. Schoen. Foundry, vol. 48, no. 2, Jan. 15, 1920, pp 50-51. Claims that existing conditions in foundry labor demand more general use of short time training systems for apprentice labor and unskilled help now available.

ARCHES

DESIGN. Influence Lines Applied to Arch Design, G. R. Magnel. Engineering, vol. 108, no. 2817, Dec. 26, 1919, pp. 843-845, 6 figs. Exemplifies methods of plotting influence lines for designing arch to withstand rolling loads.

REINFORCED-CONCRETE. Study of a Reinforced-Concrete Arch (Estudo de um arco de concreto armado), Machado de Costa. Boletin do Instituto de Engenharia, vol. 2, nos 6 and 7, April and Aug. 1919, pp 355-369 and 391-420, 8 figs. General theory of stresses is first presented and its application is subsequently illustrated by working out design of arch of 150-ft. span.

ASPHALT

SOFTENING POINT. Determination of the Softening Point of Asphaltum and other Plastic Substances, D. F. Twiss and E. A. Murphy. Jl. Soc. Chem. Indus., vol. 38, no. 23, Dec. 15 1919, pp. 405T-406T, 2 figs. Arrangements to simplify introduction of bituminous material into tube in Krämer-Sarrow method.

AUDIONS

See *Radiotelegraphy, Audions.*

AUTOMOBILE ENGINES

CAMERON AIR-COOLED. The Cameron Air Cooled in a "Comeback." Automotive Industries, vol. 41, no 24, Dec. 11, 1919, pp. 1164-1166. 6 figs. Valves are operated by groove cams mounted on crankshaft in bottom of crank case.

CAMSHAFTS. The Problems in Designing an Engine Camshaft—II, Don T. Hastings. Automotive Industries, vol. 41, no. 23, Dec. 4, 1919, pp. 1116-1124, 4 figs. Comparaison of action obtained from tangential and mushroom cams.

CRANKSHAFT VIBRATION. How to Prevent Torsional Vibration in the Camshaft, P. M. Heldt. Automotive Industries, vol. 42, no. 1, Jan. 1, 1920, pp 26-28, 3 figs. Damper with very thick web in which holes were drilled for coiled springs that press together friction plates at both sides of web is said to have proven entirely satisfactory.

CYLINDER MACHINING. Automobile Cylinder Blocks. Automobile Engrs., vol. 9, no. 133. Dec. 1919, pp. 424-425, 5 figs. Notes on special machines for mass production.

FUEL PUMP. An Intersting Invention. Autocar, vol. 43, no. 1261, Dec. 20, 1919, p. 1152, 2 figs. Fuel pump having no loose valves.

IGNITION. A Flexible Closed Circuit Type of Ignition, Automotive Industries, vol 41, no. 25, Dec. 25. 1919, pp 1253-1255, 5 figs. System which may be changed from four-cylinder ignition set to one adapted to six-cylinder machine.

LUBRICATING OILS. Engine Oils, W. R. G. Atkins. Automobile Engr., vol. 9, no. 133, Dec. 1919. pp. 425-429 Outline of chemical and physical tests usually applied to oils, and discussion of serviceableness of each.

PREMIER VALVE MECHANISM. Details of Valve Mechanism on New Premier. Motor Age, vol. 37, no. 2, Jan. 8, 1920, p 30, 2 figs. Rocker arms are lubricated by wick system and end of rocker arm has rolling action.

RECENT PATENTS. Inventions, B. H. Davies. Autocar, vol. 43, no. 1262, Dec. 27, 1919, pp. 1177-1179, 13 figs. Review of and comments upon recent automobile and aero engine patent specifications.

ROTARY VALVE FOR. A Rotary Valve not Moved by Pressure in Cylinder. Automotive Industries, vol. 41, no. 25, Dec. 18, 1919, p. 1217, 4 figs. Valve receives its motion from cam disc and begins to move only after spent gases have been eliminated.

VALVES. Valve Failures and Valve Steels in Internal-Combustion Engines, Leslie Aitchison. Engineering, vol. 108, no. 2816, Dec. 19, 1919, pp 834-836 3 figs. Properties of valve steels, especially hardness after cooling in air from different high temperatures. (Concluded.) Paper read before Instn. Automobile Engrs.

AUTOMOBILES

DESIGN. Current Tendencies in Automobile Design, E. de Normanville. Engineer, vol. 128, no. 3330, Oct. 24, 1919, pp. 406-409, 7 figs. Remarks on designs exhibited at Olympia, England. Tyler and Napier engines are particularly considered as exemplifying recent progress.

HEADLIGHTS. Anti-Dazzle Device. Autocar, vol. 44, no. 1263, Jan. 3, 1920, pp. 16-17, 4 figs. Various devices are illustrated. Preventing any of beams of lamp to shine into person's eyes is mentioned as principle of practically all anti-dazzling devices.

RADIATORS. A New Style Winter Radiator. Automotive Industries, vol 42, no. 1, Jan. 1, 1920, p. 17, 1 fig. Device consists of drawn steel shell fitting over core of radiator and is attached by four bolts which pass through it.

STARTING AND LIGHTING. A Single Unit Starting and Lighting System Developed in France. Automotive Industries, vol. 41, no. 26, Dec. 25, 1919, pp. 1257 and 1259, 4 figs. Essentials of Dynastart which is combined generator and starter having both shunt and series field winding.

TIRE MANUFACTURE. The Mechanical Building of Pneumatic Tyre Casings. India-Rubber Jl., vol. 58, no. 22, Nov. 29. 1919, pp. 9-10, 2 figs. By Thropp patent tire building machine. Distinct feature of machine is two guide plates which are operated through right and left-hand screws geared so that turning of one handle brings guide plates closer together or further apart.

VALVES. Valve Failures and Valve Steels. Leslie Aitchison. Automotive Industries, vol. 41, no. 25. Dec. 25, 1919, pp. 1254-1258, 2 figs. Gives account of experiments that have been made to obtain knowledge of properties which should be possessed by valve and indicates best methods of selecting suitable valve steel. Paper read before Inst. of Automobile Engrs.

FUTURE OF. The Future of Aviation. [illegible] Mech. Eng., vol. [illegible] no. 1, Jan. 1920, pp. [illegible], [illegible] figs. [illegible]

MARKING AIR ROUTES. Marking Overland Lines for Guidance of Airplanes. [illegible] Dec. [illegible] 1919 [illegible] figs. [illegible] suggestions made to this [illegible]

See also Zeppelins.

BALLISTICS

GERMAN LONG-RANGE GUNS. Some Considerations on the Ballistics of a Gun of Seventy-Five Mile Range. Arthur Gordon Webster. [illegible] Nat. Acad. [illegible] vol. [illegible] 1919, pp. [illegible] figs. Technical considerations showing how Germans [illegible] Paris from distance of seventy miles was made possible by taking advantage of decrease in resistance due to decreasing density of air at high altitudes.

BAROMETERS

TYPES. Barometers and Vacuum Measuring Instruments. Power Plant Eng., vol. 24, no. 1, Jan. 1, 1920, pp. [illegible], [illegible] figs. Descriptions of various types, their construction and principles of operation.

BATTERIES, PRIMARY

DRY CELLS AND THEIR TESTING. Electrical Characteristics and Testing of Dry Cells. [illegible] Elec. Rev., vol. [illegible], no. [illegible], Dec. [illegible] 1919, pp. [illegible], [illegible] figs. Describes various kinds of cells that are obtainable, indicates kinds of service for which they are adapted, and outlines methods of testing them. Abstract of Circular 79 of U. S. Bur. of Standards.

BEAMS

CONTINUOUS, BENDING MOMENT IN. Calculation of Bending Moment in Continuous Beams having Three Supports. [illegible] Schweiz. Bauzeitung, vol. [illegible], nos. [illegible] 1919, pp. [illegible], 34 figs. Equations. (Concluded.)

See also Concrete Construction, Reinforced; Vibration, Effect on Beams.

BEARINGS

BALL, SWIVELLING. The Principles and Practice of Swivelling Ball Bearings. W. H. [illegible] Engineering, vol. [illegible], no. [illegible] 1919, pp. [illegible], [illegible] figs. [illegible] bearings which [illegible] should only be used where [illegible] shaft [illegible] as in textile machines found in leather, paper-making and [illegible] and in [illegible]

BALL, NEW TYPE. A New Design of Ball Bearing. L. H. Little. Elec., vol. 83, no. [illegible], Dec. [illegible], 1919, pp. [illegible], [illegible] figs. Special feature is patented cage which is said to give [illegible] advantages of both ball and roller types.

BELTING

COMPARISON OF TYPES. The Economy of Various Types of Power Transmission. [illegible] Zeitschrift des Vereines Deutscher Ingenieure, vol. [illegible], no. [illegible], Sept. [illegible] 1919, pp. [illegible], 1 fig. Discussion of advantages and disadvantages of [illegible] and [illegible] belting, of rope and steel bands and suggestions for improving rope drives.

HAIR. Unusual and Severe Applications of Hair Belting. Belting, vol. 15, no. 12, Dec. [illegible] 1919, pp. [illegible], [illegible] figs. Service in [illegible] foundry, machine shop, power plant and sugar refinery described in detail and illustrated.

BENZOL

MARKETING OF. British Plans for Marketing Benzol. [illegible] vol. [illegible], no. [illegible], Jan. [illegible], 1920, pp. [illegible], [illegible] figs. Organization and work of [illegible] formed in England to advertise and introduce benzol as motor-car fuel.

BLAST-FURNACE GAS

CLEANING. Blast Furnace Plants Install Electrical Precipitation for Cleaning Gas. N. H. Gellert. Blast Furnace & Steel Plant, vol. [illegible], no. 1, Jan. 1920, pp. [illegible], 5 figs. [illegible] for gas cleaning, and [illegible] to wet cleaning [illegible] advantages of electrical precipitation.

Cleaning Blast Furnace Gas by Electrical Precipitation. [illegible] Eng. Jl., vol. 112, no. [illegible], Jan. [illegible], 1920, pp. [illegible] and [illegible] [illegible] measurements are said to have shown that [illegible] gas to less than [illegible] grain of dust per cubic foot of gas at standard conditions.

The Cleaning of Blast Furnace Gases. Iron & Coal Trades Rev., vol. [illegible], no. [illegible], Dec. [illegible], 1919, pp. [illegible], [illegible] figs. [illegible] Halberg-Beth dry plant for cleaning gas [illegible] without [illegible] water.

BOILER OPERATION

COMBUSTION CONTROL. Hagan Combustion-Control Regulator. Power, vol. 50, no. 17, Oct. 21, 1919, pp. [illegible], [illegible] figs. System which regulates fuel and air supply in accordance with flow of steam.

BOILERS

COKE PLANT. See Coke, Coking and Fuels.

CORROSION OF. Pitting and Corrosion in Boilers and Economizers. F. J. [illegible] [illegible] vol. [illegible], no. [illegible], Jan. [illegible], 1920, pp. [illegible] Survey of theories [illegible] and suggested [illegible] of prevention.

EXPLOSIONS OF. Boiler Explosions Reports. [illegible] Eng. & [illegible] vol. [illegible], no. [illegible], Dec. 1919, pp. [illegible], [illegible] figs. [illegible]

FLUE. See Marine Boilers.

PREVENTION OF. [illegible] Boilers. [illegible] Eng., vol. [illegible], no. 1, Jan. 1920, pp. [illegible], [illegible] figs. [illegible]

PERFORMANCE. [illegible] Study of Boiler Performance. Power, vol. 50, no. [illegible], [illegible] 1919, pp. [illegible], [illegible] figs. [illegible]

BONUS SYSTEMS

[illegible] Wages with Bonus Systems. [illegible] Eng. & Indus. Management, vol. [illegible], no. [illegible], Jan. [illegible], 1920, pp. [illegible], [illegible] figs. [illegible]

BRAKES

AUTOMATIC [illegible]. The Automatic [illegible] Brake on [illegible] vol. [illegible], no. [illegible], Dec. [illegible], 1919, p. [illegible], 1 fig. [illegible]

BRASS

[illegible] See Press Work; [illegible]

BRASS FURNACES

[illegible] Furnaces for Brass [illegible] vol. [illegible], no. [illegible], Jan. [illegible], 1920, p. [illegible] Comparative value of [illegible] furnaces with [illegible] fired with [illegible] fuel or gas.

BRIDGES

CONSTRUCTION [illegible]. [illegible] of Good Bridge Construction [illegible] [illegible] vol. [illegible], no. [illegible], 1919, pp. [illegible], 18 figs. [illegible]

SPAN [illegible]. A [illegible] of Recent [illegible] in the Length of Spans of Different Classes of Bridges. [illegible] Civil Eng., vol. [illegible], no. [illegible], 1919, pp. [illegible] [illegible] for different classes of bridges.

BRIDGES, CONCRETE

DIAGRAMS FOR ESTIMATING QUANTITIES. Highway Bridges of Steel and Concrete. [illegible] Eng. & Contracting, vol. [illegible], no. [illegible], Dec. 1919, pp. [illegible], [illegible] figs. Diagrams [illegible] estimating quantities of reinforced concrete highway spans, and [illegible] amounts of steel reinforcement [illegible] spans with [illegible]

BRIDGES, LIFT

STRAUSS BASCULE. Bascule Bridges [illegible] W. [illegible] Eng. World, vol. 16, no. 1, Jan. 1, 1920, pp. [illegible], [illegible] figs. [illegible]

[illegible] Ft. Span [illegible] and Bascule Bridge [illegible] Eng. & Contracting, vol. [illegible], no. [illegible], Dec. [illegible], 1919, pp. [illegible], [illegible] figs. [illegible]

BRIQUETTING

FOR CONCRETE. [illegible] for Concrete [illegible] Frank H. Mayoh. Can. [illegible] vol. [illegible], no. 1, Jan. [illegible], 1920, pp. [illegible], [illegible] figs. [illegible]

BUILDINGS

CONCRETE, [illegible]. The [illegible] of Concrete Buildings [illegible] Eng. & Contracting, vol. [illegible], no. [illegible], Dec. [illegible], 1919, pp. [illegible], [illegible] figs. [illegible]

BUNKERS

CONCRETE. A [illegible] Bunker. [illegible] Eng. & Contracting, vol. [illegible], no. [illegible], Dec. [illegible], 1919, p. [illegible], [illegible] figs. [illegible]

BUREAU OF MINES

[illegible]. The Bureau of Mines. [illegible] Eng., vol. [illegible], no. [illegible], Jan. 1920, pp. [illegible], [illegible] figs. [illegible]

CONICAL, CALCULATION. Study on the Calculation of Conical Bushings (Beitrag zur Berechnung von kegeligen Hülsen), H. Bonte. Zeitschrift des Vereins deutscher Ingenieure, vol. 63, no. 38, Sept. 20, 1919, pp 823-926, 11 figs. Used in connecting piston and piston rod, crosshead and piston rod, etc.

ARMORED, DEFECTS IN. Defects in Armored Cables (Recherche des défauts dans les cables armés), G. Lebaupin. Electricien, vol. 49, no. 1242, Dec. 15, 1919, pp. 250-252. Based on writer's experience with line of 350 km. carrying energy at 15,000 volts.

CALORIMETERS

CONSTRUCTION. Calorimeters. Power Plant Eng., vol. 24, no. 1, Jan. 1, 1920, pp. 95 97, 3 figs. How constructed and used.
Testing Heat Values of Fuels. Power Plant Eng., vol. 24, no. 1, Jan. 1, 1920, pp. 97-99, 3 figs. Calorimeters, their construction and use.

CAMS

DESIGN. Cam Operation of Valves, T. L. Sherman. Automobile Engr., vol. 10, no. 134, Jan. 1920, pp. 2-5, 12, figs. Analytical design of cams of predetermined performance.

CANALS

IRRIGATION, CONCRETE-LINED. Method of Lining-Irrigation Canal with Reinforced Concrete. Eng. & Contracting, vol. 53, no. 2, Jan. 14, 1920, p. 35, 1 fig. concrete lining is 3 in thick, of 1:2:4 mix, and is reinforced with No. 11 electric welded 12 in. by 12 in. mesh wire.

CARS

ADJUSTABLE-GAGE. Design Developed by Swiss Industrial Society of Neuhausen for Adapting Wheels of Railway Cars to Different Track Gages (Dispositif de la Société industrielle suisse de Neuhausen, pour faire varier l'écartement des roues de wagons). Génie Civil, vol. 75, no. 23. Dec. 6, 1919, pp. 578-579, 1 figs. In order to separate wheels or bring them closer together car is run over special length of track rails of which are inclined to direction of travel and in center of which rack engages with small gear operating mechanism separating wheels or bringing them together.

FLEXIBLE AXLES, CURVE RESISTANCE. Behavior of Free Flexible Axles in Railway Cars on Curves (Das Verhalten der freien Lenkachsen bei der Bewegung der Eisenbahnwagen in Gleisbogen), Chr Boedecker. Zentralblatt der Bauverwaltung, vol. 39, no. 62, July 30, 1919, pp. 361-366, 9 figs. Calculation of resistance values.

INSPECTION. Inspecting Cars in Interchange. Ry. Mech. Engr., vol. 93, no. 12, Dec. 1919, pp. 722-724. Suggested manner of procedure.

CARS, FREIGHT

MAINTENANCE. Economics of Freight Car Maintenance and Operation, L. K. Sillcox. Ry. Age, vol. 67, no. 26, Dec. 26, 1919, pp. 1227-1231, 1 fig. Discusses relative saving effected by rebuilding or retirement.

NUMBER NEEDED BEFORE 1923. Production Is Limited by Lack of Freight Cars. Ry. Age, vol. 68, no. 1, Jan. 2, 1920, pp. 27-32, 3 figs. Writer notes that equipment has not kept pace with growth of traffic. He believes that 800,000 cars will be needed in next three years.

CARS, PASSENGER

LONDON SUBWAY. New Passenger Car on the Metropolitan Railway. Ry. Gaz., vol. 32, no. 1, Jan. 2, 1920, pp. 21-24, 5 figs. Provided with five swing doors on each side and accommodation of 58 seats.

NUMBER NEEDED BEFORE 1923. 24,500 Passenger Cars Needed in Next Three Years. Ry. Age, vol. 68, no. 1, Jan. 2, 1920, pp. 37-40, 2 figs. Is based on past record in 10 years up to June 30, 1915 in which time it is said passenger traffic increased 48 per cent and number of passenger cars increased 35 per cent

CARS, REFRIGERATOR

C. P. RY. Refrigerator Cars for the C. P. R. Ry. Mech. Engr., vol. 93, no. 12, Dec. 1919, pp. 713-716, 4 figs. Steel underframe construction, 41 ft. long, fitted with tank bunkers, meat racks and ventilators.

CARS, TANK

MAINTENANCE. Tank Car Maintenance. Ry. & Locomotive Eng., vol. 32, no. 12 Dec. 1919, pp. 361-362. Importance of proper repairs of friction draft gears.

CASE HARDENING

CALCIUM CYANIDE. Heat Treating Methods Improved in 1919, B. F. Weston. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 113-114. Notably by use of calcium cyanamide in case hardening.

STEEL. Case Hardening of Steel, Walter Rosenbain. Automotive Industries, vol. 42, no. 2, Jan. 8, 1920, pp. 74-76, 2 figs. Outline of principles underlying process and discussion of recent improvements in it which overcome tendency for case to crack and fleck off.

CAST IRON. The Casehardening of Steel—II, J. F. Springer. Ry. Mech. Engr., vol. 93, no. 12, Dec. 1919. pp. 731-735, 1 fig. Chart showing relation of time and temperature to depth of impregnation.

CAST IRON

SYNTHETIC. Synthetic Cast Iron, Charles Albert Keller. Chem. & Metallurgical Eng., vol. 22, no. 2, Jan. 14, 1920, pp 83-88. 2 figs. Outlines continuous process of rapid carburization during melting of steel turnings, said to produce cast iron and semi-steel of exceptional purity and exact chemical analysis for manufacture of heavy shells and high-grade castings. From paper presented to Iron & Steel Inst.

CEMENT

EFFECT OF CALCIUM SULPHATE. Effect of Sulphate on Cement, J. C. Witt. Eng. World, vol. 16, no. 2, Jan. 15, 1920, pp. 83-87, 2 figs. Experiments at Chemical Laboratory, Bur. of Sci., Manila. It was found that cement ground in regular way at plant must have sulphuric anhydride content of 1.8 per cent to insure normal set. Effects of exposure to air and of additions of hydrated lime were found to be independent of sulphuric anhydride content.

SOLUBILITY. The Solubility of Portland Cement.—Its Relation to Theories of Hydration, J. C. Witt and F. D. Reyes. Concrete, Cement Mill Section, vol. 16, no 1, Jan. 1920, pp. 13-17, 1 fig. Factors that effect solubility were found to be (1) absence of carbon dioxide, (2) method of agitation, (3) fitness of grain, (4) volume of water and (5) time. Of these, volume of water is said to be most important. Investigations at laboratory of General, Inorganic and Physical Chem., Bur. of Sci., Manila, P. I.

CEMENT MANUFACTURE

ROTARY KILNS. Preheating Air for Rotary Kilns, S. H. Harrison. Concrete, Cement Mill Section, vol. 16, no. 1, Jan. 1920, pp 9-11, 2 figs. Method of calculating theoretical maximum temperature of preheated air under ideal conditions.

WET PROCESS. New Wet Process Plant of the Indiana Portland Cement Co. Concrete, Cement Mill Section, vol. 16, no. 1 Jan 1920, pp. 1-9, 9 figs. Capacity for plant is 1500 bbl. Storage and mixing tanks, slurry and clinker elevators, hoppers, platforms and machinery supports are of reinforced concrete; piers for kilns and heavy machinery are of massive concrete.

CENTRAL STATIONS

ECONOMICAL OPERATION. Central-Station Operation and District Heating Service, I. L. Kentish-Rankin. Elec. Rev., vol. 7, no. 1, Jan. 3, 1920, pp. 19-21. Points out opportunities for increasing revenue and conserving fuel.

RATE MAKING. Central-Station Rates in Theory and Practice, H. E. Eisenmenger. Elec. Rev., Chicago, vol. 75, no. 26, Dec 27, 1919, pp. 1048-1053. Questions involving valuation of physical and intangible property of utility.

CERIUM

CASTINGS FROM. Cerium and Its Alloys, Charles Vickers. Brass World, vol. 5, no. 11, Nov. 1919, pp. 330-332, 3 figs. Specifications contained in United States patent for "process of making castings of rare-earth metals and their alloys."

CHAINS

ROLLER STANDARDIZATION OF. The Standardization of Roller Chains. Automotive Industries, vol. 42, no. 1, Jan. 1, 1920, p. 33, 1 fig. Standard adopted by Assn. of British Chain Manufacturers.

CHEMICAL CONSTANTS

DETERMINATION. Note on the Determination of Chemical Constants, Alfred C. Egerton. Lond., Edinburg & Dublin Phil Mag., ol. 39, no. 229, Jan. 1920, pp. 1-20. Methods of calculating chemical constants and conditions necessary for obtaining accurate results are discussed. It is claimed that the older formula by which most of constants were calculated leads to result without physical significance. Formula which should be used, writer contends, requires knowledge of specific heat of substance.

CHIMNEYS

HEAT LOSSES IN. Reading Chimney Losses Direct from CO_2 Charts, C. C. Phelps. Power Plant Eng., vol. 24, no 2, Jan. 15, 1920, pp. 133-136, 6 figs. Illustrates why average CO_2 does not indicate chimney loss.

CHUCKS

MAGNETIC. Relative Characteristics of Magnetic Chucks, O. A. Kenyon. Mech. World, vol. 66, no. 1719, Dec. 12, 1919, pp 279-280, 5 figs. Outline of principles embodied in construction of magnetic chucks.

CLUTCHES

See Couplings, Flexible-Clutch.

COAL

ASH, FUSIBILITY OF. Fusibility of Coal Ash from Eastern Coals, W. A. Selvig, D. C. Brown and A. C. Fieldner. Chem. & Metallurgical Eng., vol. 22, no. 2, Jan. 14, 1920, pp 80-81. Table giving results of tests of standard mine samples collected by representatives of Bureau of Mines, U. S. Geol. Suevey, or by various State. Geol. Surveys, according to methods used by Bureau of Mines.

COPPER METALLURGY

Production from Secondary Material. Production of Copper from Secondary Material, Lawrence Addicks. Chem. & Metallurgical Eng., vol. 22, no. 3, Jan. 21, 1920, pp. 119-122, 1 fig. Methods of sampling miscellaneous products entering refinery, their treatment in regular or special furnaces with discussion of commercial possibility of recovering some of impurities as metallic by-products.

COST ACCOUNTING

Economic Requirements. Cost Accounting in the "New Industrial Day," G. Charter Harrison. Indus. Management, vol. 58, no. 6, Dec. 1919, pp' 441-444; also vol. 59, no. 1, Jan. 1920, pp. 13-17, 1 fig. Opinion is expressed that accounting profession faces crisis and great responsibility in its relation to industrial production. Also that cost accounting must fulfill its duty in industrial economics and should parallel actual costs and established standards, showing why first varies from latter if such is the case.

Laboratories. The Value of Cost Accounting in Commercial Laboratories, William W. Caswell. Jl. Indus. & Eng. Chem., vol. 12, no. 1, Jan. 1920, pp. 79-81. Economical aspect of installing system of cost accounting.

See also Steam Power Plants.

COSTS

Analysis of. A Graphic Method of Cost Analysis, G. I. Vincent. Am. Gas Assn. Monthly, vol. 1, no. 8, Aug. 1919, pp. 431-434, 2 figs. Suggested graphic method is illustrated with graphic studies of boiler fuel cost and boiler house labor cost.

Factory, Checking. Checking the Factory Costs, Wm. A. Smith. Eng. & Indus. Management, vol. 2, no. 25, Dec. 18, 1919, pp. 786-787. Indicates how cost records can be interlocked and checked with financial books.

Foundry. Production Cost and Profit Control in Non-Ferrous Foundries, Walter Glenn Scott. Metal Indus., vol. 15, no. 21, Nov. 21, 1919, pp. 429-431, 1 fig. Suggested method of keeping in touch with cost of a product at any stage of its manufacture.

COUPLINGS

Flexible-Clutch. Flexible Clutch Couplings, Charles L. Hubbard. Nat. Engr., vol. 24, no. 1, Jan. 1920, pp. 13-16, 13 figs. To compensate for shafting out of alignment and overcome difficulties in installation and operation. Various types and applications

CRANES

Cargo. Mechanical Method for Handling Cargo, Warren Travell. Shipping, vol. 9, no. 12, Dec. 24, 1919, pp. 23-24, 2 figs. General design of cargo cranes of types C and D. (Concluded.)

Safety Practice for. Cranes, Chester C. Rausch. Power Plant Eng., vol. 24, no. 2, Jan. 15, 1920, pp. 150-151. Recommendations in regard to safe practice and safety devices in connection with overhead and locomotive cranes.

Wharf. Cargo Handling at Ports, Brysson Cunningham. Elec., vol. 83 no. 2169, Dec. 12, 1919, pp. 652-657, 3 figs. Early appliances are alluded to, inception of hydraulic crane is described, and features and requirements of electric quay crane are enumerated.

CREOSOTE OIL

See Pavements, Wood-Block.

CUTTING METALS

Barth Slide Rules. Supplement to Frederick W. Taylor's "On the Art of Cutting Metals"—IV and V, Carl G. Barth. Indus. Management, vol. 58, no. 6, Dec. 1919, pp. 483-487, 6 figs., and vol. 59, no. 1, Jan. 1920, pp. 49-53, 7 figs. Describes logarithmic slide rule for formula embodying variables of tool pressure, feed and depth of cut, and modifications of this leading up to construction of compound planer slide rule and lathe slide rule for cutting steel.

Lathe Tools, Cutting Power of. Cutting Power of Lathe Turning Tools—II, George W. Burley. Engineering, vol. 108, no. 2817, Dec. 26, 1919, pp. 867-875, 25 figs. It is concluded from experiments that there is no practical cutting speed in which it is impossible to obtain satisfactory surface on plain carbon steels by means of ordinary lathe finishing tools, whether these be made of plain carbon tool steel, ordinary non-vanadium high-speed steel or vanadium high-speed steel. It is added that there is a maximum limiting speed at or above which satisfactory finish cannot be obtained on account of tendency of tool to plug at and tear surface, this tendency being related to phenomenon of building up on cutting edge of tool. Paper read before Inst. Mech. Engrs.

Rivet Removal. Process for Removing Rivets and Cutting Metals. Acetylene & Welding Jl., vol. 16, no. 194, Nov. 1919, p. 224. Recent invention by Société Anonyme L'Acetylène Dissous. Process consists essentially in fusing head of rivet by electric arc of suitable intensity enabling metal of rivet head to combine with substances adapted to form therewith compounds which are sufficiently fusible and liquid at working temperature to flow readily or be blown away by wind of arc.

See Electric Welding, Arc, Carbon Arc, also Oxy-Acetylene Welding.

CYLINDERS

Engine, Machining Fins on. Machining Fins on Radial Engine Cylinders, S. A. Inscoe. Machy. (Lond.), vol. 15, no. 379, Jan. 1, 1920, pp. 427-428, 5 figs. Methods of cutting grooves over bosses.

Molding Methods. Efficient Rig for Making Cylinders, J. R Anderson. Foundry vol. 48, no. 11, Jan. 1, 1920,pp. 15-16, 4 figs. Suggested design of rig.

DIES

Design of. The Design of Upsetting Machine Dies—I. Mech. World, vol. 67, no. 1722, Jan. 2, 1920, pp. 2-3, 1 fig. Illustrates set of heading tools and dies for production of mild-steel collars.

DIESEL ENGINES

Augsburg. World's Highest-Powered Naval-Type Diesel Engine. Motorship, vol. 5, no. 1, Jan. 1920, pp. 25-28, 6 figs. Augsburg 3000-shaft-horse-power heavy-oil engine for German submarine-cruisers. Engine is of 10-cylinder, 4-cycle, reversable high-speed type and runs at 385 r.p.m.

Cards from. Some Cards from a Diesel Engine, G. Ure-Reid. Engineer, vol. 128, no. 3333, Nov. 14, 1919, p. 497, 9 figs. Attention is called to difference in results obtained from engine when (1) each cylinder had separate pump discharging through accumalator to its spray valve and (2), where separate pumps discharged through their accumulators to common pipe and then to spray valves.

Design. Some Notes on the Design and Construction of Diesel Engines. Motorship, vol. 5, no. 1, Jan. 1920, pp. 40-41, 4 figs. Table giving piston speeds in various makes of 4-stroke engines and diagram showing piston effort curve for 4-stroke engine are studied and conclusions drawn in regard to most suitable stroke-bore ratio. (To be continued.)

German Submarine. German Submarine Diesel Engines, Philip H. Smith. Petroleum World, vol. 17, no. 232, Jan. 1920, pp. 35-38, 4 figs. Discussed their adaptability for industrial purposes.

Testing. Testing High-Powered Marine Oil-Engines. Motorship, vol. 5, no. 1, Jan. 1920, pp. 31-33, 4 figs. Dynamometer commonly sued by engine builders.

Valve Gear. Notes on the Valve-gear of Diesel Engines. Mech. World, vol. 67, no. 1772, Jan. 2, 1920, 6 figs. Study of valve diagrams.

See also Heavy-Oil Engines.

DIRECTION FINDERS

Zero Method, Application of. On the Goniometric Functions Applicable to Directive Aerials, A. Blondel. Radio Rev., vol. 1, nos. 1, 2 and 3, Oct., Nov. and Dec. 1919, pp. 1-10, 8 figs., 58-66, 1 fig., and 100-123, 4 figs. Indicates manner in which phase differences of electromotive forces induced in two vertical parts of measuring aerial necessitate corrections, when dimensions of loop or frame are not very small compared with wave length employed. Application of "zero method" to direction finding; effect of wave decrement; errors due to neglecting damping.

DREDGING

Suction Dredge. A Dredging Pump of Novel Construction, Walter J. White. Mech. Eng., vol. 42, no. 1, Jan. 1920, pp. 1-7 and 80, 13 figs. Modification of dredges employed in construction in canal connecting Mississippi River with Lake Pontchartrain was necessitated by reason of large number of stumps of trees and roots which it was desired to pump through dredge. Accordingly pump casings and impellers of 20-in. dredge were modified by changing shape of throat ring, and fitting new piece of suction pipe and cutting out two-thirds of each alternate vane.

DUST

Explosions. Dust Explosions, Ralph B. Chandler. Can. Engr., vol. 38, no. 1, Jan. 1, 1920, pp. 107-108, 1 fig. Account of accident and suggested theory of dust explosions.

Health Hazards. Health Hazards of Non-Poisonous Dusts. A Résumé of Some Recent Investigations. Emery R. Hayhurst. Am. Jl. of Public Health, vol. 10, no. 1, Jan. 1920, pp. 60-65. Includes also bibliography of articles in current literature on health hazards of dusts in industry.

Notes on the Final Report of the South African Miners' Phthisis-Prevention Committee, E. M. Weston. Eng. & Min. Jl., vol. 108, no. 23, Dec. 27, 1919, pp. 944-947. Comparative study of various methods of testing samples of air and discussion of effects of different types of drills on dust production and diffusion.

DYE INDUSTRY

Hygienic Control. Hygienic Control of the Anilin Dye Industry in Europe, Alice Hamilton. Monthly Labor Rev., vol. 9, no. 6, Dec. 1919, pp. 1-21. Notes complied by writer while sent on special mission to examine conditions in European factories in which anilin dyes and dye intermediates are manufactured, particularly measures taken to protect workers against danger of industrial poisoning.

DYES

Bibliography. General Review and Bibliography of Dyeing—II, P. E. King. Color Trade Jl., vol. 6, no. 1, Jan. 1920, pp 18-23. Articles on substantive dyes, colloid solutions and absorption phenomena, which have appeared in technical press, especially in German periodicals. From British Assn. Reports.

Dangers in Dyestuff Industry. Dangers in the Dyestuff Industry, L. C. Cone. Chem. & Metallurgical Eng., vol. 22, no. 1, Jan. 7, 1920, pp. 33-35. Review of incidental accidents due to inexperience in new industries. Explosion risks of dyes and intermediates of high-pressure apparatus and of inflammable vapor mixtures. Paper read before the Eighth Annual Safety Congress.

ELECTRIC WELDING

RATES FOR. Making Proper Rates for Electric Welding, S. I. Oetreicher. Elec. World, vol. 75, no. 2, Jan. 10, 1920, pp. 70-72, 2 figs. Points out that question of central station rates is of vast importance to welding industry and advises that all factors be considered fairly and far-reaching co-operative policy be adopted.

ELECTRIC WELDING, ARC

APPLICATIONS. Arc Welding Apparatus and Its Applications, A. M. Candy. Welding. Engr., vol. 5, no. 1, Jan. 1920, pp. 28-32 and 36, 23 figs. Suggestions in regard to installation of equipment and selection of electrodes. (To be continued.)

Some Applications of Electric-Arc Welding. Metal Trades, vol. 11, no. 1, Jan. 1920, pp. 38-41, 9 figs. Illustrates filling blow-hole in steel casting by carbon-electro process, welding hatch-cover on steel vessel, repairing of brake fulcrum, and similar operations.

CARBON-ARC. Carbon-Electrode Arc Welding and Cutting, O. H. Eschholz. Elec. World, vol. 74, no. 22, Dec. 27, 1919, pp. 1158-1162, 9 figs. Enumerates advantageous applications of welding and cutting by means of carbon arc.

FACTORS IN. Arc Welding F. A. Anderson. Jl. Electricity, vol. 44, no. 2, Jan. 15, 1920, pp. 70-72, 5 figs. Discusses properties of various metals in their relation to welding, efficiency of welds, and various factors which contribute to successful work.

LOCOMOTIVE BOILER REPAIRS. Locomotive Boiler and Fire Box Arc Welding, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 12, Dec. 1919, pp. 431-439, 33 figs. Illustrates practice followed at repair shops of Rock Island Lines.

PLASTIC-ARC, SHIP WORK. Plastic-Arc Welding Applied to Ship Construction and Repair, J. O. Smith. Int. Mar. Eng., vol. 25, no. 1, Jan. 1920, pp. 47-48. Enumerates reasons for defective rivets and observes that as long as present practice for repairing leaky rivets is to weld defective spots question naturally arises why it would not be advisable to weld plates at first.

SHORT ARC, IMPORTANCE OF. Some First Principles of Arc Welding with Metal Electrodes, J. F. Springer. Ry. & Locomotive Eng., vol. 32, no. 12, Dec. 1919, pp. 373-374, 2 figs. Writer establishes that best safeguard against rupture or dislocation of jet is maintenance of short arc.

ELECTRIC WIRING

ELECTRIC DIAGRAMS FOR. Application of Vectors to Wiring Diagrams, Lewis A. Terven. Elec. World, vol. 75, no. 2, Jan. 10, 1920, pp. 60-63, 11 figs. Illustrates manner of working out relay and metering schemes by means of vector diagrams.

ELECTRICAL INDUSTRY

DEVELOPMENTS IN. A Review of Developments in the Electrical Industry in 1919, Ainslie A. Gray. Elec. Rev., vol. 76, no. 1, Jan. 3, 1920, pp. 1-8. All elements of industry, except electric railways, are described as being busy and prosperous.

ECONOMIC OUTLOOK. The Economic Outlook in Industry, Henry I. Harriman. Elec. World, vol. 75, no. 4, Jan. 24, 1920, pp. 200-201. It is emphasized that increased production and better human relations must be combined to attain lasting success.

ELECTRICAL MACHINERY

FLUX DISPERSION, CALCULATION. Calculation of the Dispersion of Flux in Electrical Machines (Calcolo delle dispersioni di flusio nelle macchine elettriche), E. Morelli. L'Elettrotecnica, vol. 6, no. 35, Dec. 15, 1919, pp. 774-779, 7 figs. Comparative study of various formulæ

SURFACE TEMPERATURES, MEASUREMENT OF. Study on the Measurement of Surface Temperatures in Connection with Electrical Engineering (Zur Frace der Messung von Oberflächentemperaturen in der Elektrotechnik), Max Jakob. Archiv. für Elektrotechnik, vol. 8, no. 4, Aug. 28, 1919, pp. 126-132, 3 figs. Its importance in electrical engineering and methods for measuring.

WINDINGS TEMPERATURE DISTRIBUTION IN. Distribution of Temperature in Electric Winding of Rectangular Cross-Section (Die Temperaturvertailung in einer elektrischen Wicklung von rechteckigem Querschnitt), Max Jakob. Archiv. für Elektrotechnik, vol. 8, no. 4, Aug. 28, 1919, pp. 117-126, 6 figs. Graphs and tables showing distribution in various cross-sections.

ELECTRIFICATION

See Railway Electrification.

ELECTROLYTES

COLLOIDAL. Colloidal Electrolytes: Soap Solutions as a Type, James William McBain, Mary Evelyn Laing and Alan Francis Titley. Jl. Chem. Soc., vols. 115 and 116, no. 685, Nov. 1919, pp. 1279-1300, 3 figs. Theory of colloidal electrolytes is derived from conception that ions may be created to form nucleus of colloidal particle, termed ionic miccelle, while retaining their equivalent electrical charges.

ELECTRONS

RADIUM AND. Radium and the Electron, Ernest Rutherford. Nature, vol. 104, no. 2610, Nov. 6, 1919, pp. 226-320. Survey of progress of atomic physics since 1869.

ELECTROPLATING

COPPER ON IRON. Electro-Plating on Iron in Copper Sulphate Solution, Oliver P. Watts. Metal Industry, (Lond.), vol. 14, no. 21, May 23, 1919, pp. 428-430. It is said that certain lead and antimony may be substituted for arsenic dip, previous to direct-current plating of copper on iron from copper sulphate.

ELEVATORS

BUCKET. Types and Uses of Bucket Elevators—III, Clarence C. Brinley. Coal Trade Jl., vol. 50, no. 53, Dec. 31, 1919, pp. 1507-1508. Uses and advantages of continous discharge elevator.

EMPLOYEES' REPRESENTATION

SHOP COMMITTEES. Industrial Democracy in Practice in England Clarence H. Northcott. Automotive Industries, vol. 41, no. 25, Dec. 18, 1919, pp. 1197-1200. Operation of "joint standing industrial councils."

One Year of Shop Committees, William Leavitt Steddard. Indus. Management, vol. 59, no. 1, Jan. 1920, pp. 31-33. Summary of experimental movement in industry.

Systems for Mutual Control of Industry, William L. Leiserson. Mech. Eng., vol. 42, no. 1, Jan. 1920, pp. 24-25 and 82. Writer discusses various plans of employees' organization and features of collective bargaining which he believes would contribute to its success and also those which he thinks would doom it to failure.

WORKS COUNCILS. Employee Representation in Industrial Plants, Magnus W. Alexander. Elec. World, vol. 75, no. 3, Jan. 17, 1920, pp. 121-122. Opinion is expressed that works council plan offers helpful method of securing better relationship between employer and employee.

EMPLOYEES, TRAINING OF

FOREMEN. Training the Foremen of Industry, Dudley R. Kennedy. Indus. Management, vol. 59, no. 1, Jan. 1920, pp. 67-70. Opinion is advanced that foremen must not only be taught and trained but that their knowledge of economic truth must become a part of themselves, so that they may transmit it to workers under their direction.

MOLDERS. Training Men in the Molding Art, R. R. Clarke. Foundry, vol. 48, no. 1, 1920, pp. 11-13. Suggests instilling in workmen under training desire to look for reason in all operations.

SAFETY AND EFFICIENCY TRAINING. The Management and Training of Men, W. W Gidley. Universal Engr., vol. 30, no. 4, Dec. 1919, pp. 34-36. Importance of establishing departments in safety and efficiency particularly as means of promoting safety.

EMPLOYMENT MANAGEMENT

COMMUNITY POLICY. Permanent Employment Is Assured, Pat Dwyer. Foundry, vol. 48, no. 1, Jan. 1, 1920, pp. 1-5, 7 figs. Labor policy in large steel foundry, patterned on community lines but more free in its interpretation forms.

INSPECTORS, GRADING OF. Materials for Mass Production—IV, E. A. Allcut, Eng. & Indus. Management, vol. 3, no. 1, Jan. 1, 1920, pp. 21-22, 1 fig. Concerning relative grading of inspectors and amount of responsibility to be borne by each grade.

SELECTING EMPLOYEES. Choosing the Worker, B. Muscio. Eng. & Indus. Management, vol. 3, no. 1, Jan. 1, 1920, pp. 5-9. Emphasizes importance of bringing about precise adaption of worker to his work.

ENGINEERS

CLASSIFICATION AND COMPENSATION. Classification and Compensation of Engineers as Proposed by Engineering Council Committee, Eng. & Contracting, vol. 53, no. 2, Jan. 14, 1920, pp. 41-45, 1 fig. Eight grades are defined, five professional and three sub-professional, and necessary qualifications are specified. Investigations of Committee are represented as having shown "lack of any adequate or consistent employment policy with respect to professional engineers."

CO-OPERATION AMONG. Co-operation among Engineers, F. H. Newell. Eng. & Contracting, vol. 52, no. 26, Dec. 24, 1919, pp. 732-733. Points out how engineers may best co-operate and for what reason they should co-operate. From address before Ohio Assn. of Tech. Socs.

FUTURE OPPORTUNITIES AND OBLIGATIONS. Future Opportunities and Obligations of Engineers, George W. Fuller. Jl. Boston Soc Civ. Engrs., vol. 6, no. 10, Dec. 1919, pp. 341-352. Writer praises efforts of National Engineering Societies in furthering proposed Nat. Dept. of Public Works, and further observes that "it is necessary to create and maintain and strengthen a wide appreciation of the opportunities of engineers to play, at this particular period, a full part in a betterment program for the future."

INDUSTRIAL, OPPORTUNITY OF. Industrial Engineers' Opportunity, L. W. Wallace. Indus. Management, vol. 58, no. 6, Dec. 1919, pp. 462-464. Writer places principle of honesty, fairness and justice in forefront of fundamentals that should govern relations of employers and employees. Future of industrial expert is visualized as presenting great opportunities with ever increasing demand for production.

RELATIONS WITH CITIES. Co-operation among Cities Ensures Better Relations with Engineering Profession, Charles A. Mullen. Contract Rec., vol. 33, no. 53, Dec. 31, 1919, pp. 1203-1206. Points out advantages of union in securing a centralizing bureau and a clearing house of information.

ETHYLENE

See Alcohol.

FACTORY MANAGEMENT

FURNACES, HEAT-TREATING

TOOL HARDENING. Drop-stamping. Drop-forgings, etc.—XIV. Joseph Horner. Mech. World, vol. 66, no. 1721, Dec. 26, 1919, pp. 307-308, 2 figs. Design of furnace for hardening milling cutters, dies, etc., of high-speed steel.

See also Refractories.

FURNACES, HEATING

PROGRESS IN 1919. Heating Furnace Fuel Progress During 1919, A. E. Blake. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 121-124, 2 figs. Impetus given by fuel situation to study of more economical combustion methods.

FURNACES, HOT-AIR

RESEARCH. Report of Progress in Warm-Air Furnace Research, A. C. Willard. Univ. of Illinois Bul., vol 16, no. 38, May 19, 1919, 68 pp., 22 figs. Investigation to determine efficiency and capacity of commercial warm-air furnace, satisfactory and simple methods for rating furnace, methods of increasing efficiency and capacity of furnace heating equipment, proper sizes and proportions of leaders, stacks and registers supplying air to various floors, and friction losses in cold air of recirculating ducts and registers.

GAGES

INSPECTION. Standardized Inspection Tools. Pac. Mar. Rev., vol. 17, no. 1, Jan. 1920, pp. 108-111, 8 figs. Inspection tools and gages manufactured by Taft-Peirce Mfg. Co.

GALVANIZING

CONTINUOUS FURNACE FOR. Continuous Sheet Galvanizing Furnace, A. E. Blake. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 124-125 and 128. Description of furnace installed at Apollo Steel Co. which is said to represent considerable fuel saving over previous furnaces.

MODERN PRACTICE. Modern Galvanizing Practice. A. J. Franklin. Metal Industry (Lond.), vol. 16, no. 1, Jan. 2, 1920, pp. 7-9, 2 figs. Classification and description of important processes.
See also Sherardizing.

GAS MANUFACTURE

COAL COSTS FOR VARIOUS SYSTEMS. Net Cost of Coal for Various Systems of Gasification, Gas Jl., vol. 148. no. 2952, Dec. 9, 1919, pp. 541-543. 6 figs. Systems considered are: Continuous vertical, high steaming retorts; horizontal retorts; mixture of 75 per cent coal gas from horizontals and 25 per cent blue water gas; continuous verticals, moderate steaming; and continuous vertical retorts, non-steaming.

EFFECT OF INERTS ON EFFICIENCY. Effects of Inerts on Thermal Efficiency, J. W. Wood. Gas World, vol. 71, no. 1846, Dec. 6, 1919, pp. 451-453. Also Gas Jl., vol. 148, no. 2952, Dec. 9, 1919, pp. 545-548, 1 fig. Admission of inerts to gas is characterized as being commercially advantageous because ingress of definite amount of inerts at retort is said to mean less likelihood of loss of valuable coal gas to settings.

GASES

ABSORPTION IN SPRAY COOLING SYSTEM. The Absorption of Gases in Spray Systems and Towers, Edwin M. Baker. Chem. & Metallurgical Eng., vol. 22, no. 3, Jan. 21, 1920, pp. 122-124, 3 figs. Account of tests made using spray system for liquidd cooling.

ABSORPTION BY CHARCOAL. Studies of the absorption of Gases by Charcoal—II, Harvey B. Lemon and Kathryn Blodgett. Phys. Rev. vol. 14, no. 5, Nov. 1919, pp. 394-402, 5 figs. To determine how equilibrium pressure at constant volume depends upon composition of mixture, ratio of mass of gas to mass of charcoal remaining the same, when activated and previously evacuated specimen of cocoanut shell charcoal is exposed to excess of mixture of oxygen and nitrogen.

IONIZATION OF. Ionization of Gases, J. S. Townsend. Nature, vol. 104, no. 2610, Nov. 6, 1919, pp. 233-234. Discoveries which have led to advances in knowledge of molecular physics.

LOW TEMPERATURES AND CHEMICAL CONSTANT. Note on the Significance of the Chemical Constant and its Relation to the Behaviour of Gases at Low Temperatures, F. A. Lindemann. Lond. Edinburgh. & Dublin Phil. Mag., vol. 39, no. 229, Jan. 1920, pp. 21-25. It is shown that chemical constant has dimensions of logarithm of pressure if atomic heat of monatomic gases becomes zero at absolute zero.

GASOLINE

SPECIFICATIONS. Motor Gasoline Specifications Revised. Automotive Manufacturer, vol. 61, no. 9, Dec. 1919, pp. 18-20. Committee on petroleum specifications reports new end point, higher 90 per cent point, and elimination of all gravity references.

GEAR CUTTING

SHAPING MACHINE FOR. New Gear-Shaping Machine. Machy. (Lond.), vol. 15, no. 379, Jan. 1, 1920, pp. 425-427, 4 figs. Designed for all classes of repetition work on internal and external gears or ratchets. Main frame is single casting bolted to circular cast base which can be mounted on bench or column.

GEARS

CHANGE, DESIGN OF. Designing Change Gears. Machy. (Lond.), vol. 15, no. 378, Dec. 25, 1919, pp. 381-384, 3 figs. Calculations involved in designing change gear mechanisms for machine tools so that speeds will vary in geometrical progression.

REDUCTION. High-Speed Gearing. Times Eng. Supp., no. 542, Dec. 1919, p. 364. Design and construction of high-speed turbine gears. Paper read before Manchester Assn. of Engrs.

GEOLOGY

SULPHATES IN ORE DEPOSITS. Primary (Hupogene) Sulphate Minerals in Ore Deposits. B. S. Butler. Economic Geology, vol. 14, no. 8, Dec. 1919, pp. 581-609, 2 figs. From experimental investigation it is concluded that some of the metals which at high temperature are combined with oxygen as temperature is reduced give up oxygen and both metals and oxygen combine with sulphur producing sulphates of metals and oxides of sulphur.

GEOPHONE

See Coal Mines, Fires, Location of.

GIRDERS

LATTICE, ROLLING LOAD DIAGRAM. Simple Stress Diagram for Rolling Loads, Norman G. Kapp. Engineering, vol. 109, no. 2819, Jan. 9, 1920, p. 35, 5 figs. Calculated for lattice girder of eight panels of 10-ft. each.

GLASS

WIRED, AS FIRE RETARDANT. Wired Glass as a Fire Retardant, M. I. Carr. Fire & Water Eng., vol. 66, no. 26, Dec. 24, 1919, pp. 1217-1218. Experience is said to have shown that wired glass is perfect barrier to flame so long as it remains in position and that it is capable of affording moderate degree of resistance to passage of heat through it.

GOLD MINES

PANEL STOPING IN. Panel System of Stoping at the Herman Mine, S. H. Brockunier. Eng. & Min. Jl., vol. 108, no. 21, Dec. 6, 1919, pp. 856-858, 2 figs. Stopes worked by system of raises within ore-shoot, followed by panel stoping.

GRAIN HANDLING

BRITISH INSTALLATION. An interesting Grain Handling Equipment. Elecn., vol. 83. no. 2169, Dec. 12, 1919, pp. 694-696, 3 figs. Installation comprises one telescopic elevator, external to warehouse, two elevators inside warehouse, two automatic weighing machines, one loading-out shoot from warehouse and one loading-out shoot from elevator head.

GRAVITATION

EINSTEIN'S RELATIVITY THEORY. Einstein's Relativity Theory of Gravitation. Nature, vol. 104, nos. 2614 and 2615, Dec. 4 and 11, 1919, pp. 354-356 and 374-376. Points out how Einstein evolved his theoru by investigating relation between gravitation and energy and apparent consequent necessity for a beam of light to have weight if it has momentum.
Time, Space and Gravitation. Albert Einstein. Science, vol. 51, no 1305, Jan. 2, 1920. pp. 8-10. Exposition of theory of relativity. From the London Times.

HEALTH

DUST HAZARDS. *See Dust.*

HAZARDS IN CHEMICAL INDUSTRY. Health Hazards in the Chemical Industry. Chem. Age, vol. 1, no. 7, Dec 25, 1919, pp. 308-310. Based on survey of conditions affecting labor employed in chemical industries of State of New York, made by Industrial Commission of State Dept. of Labor.
Health Hazards of the Chemical Industry, State of N. Y., Dept. Labor, Special Bulletin no. 96, Nov. 1919, 69 pp., 11 figs. Based on examination of 335 plants.

IMPROVEMENT IN COTTON INDUSTRY. Preventable Death in Cotton Manufacturing Industry, Arthur Reed Perry. U.S. Dept. Labor. Bur. Labor Statistics, no. 251, 1919, 534 pp. Extensive tables are presented showing death hazard by age groups for wage earners under 45 years. Discussion is given of factors which have been specially active in cutting off lives of wage earners during age periods which are normally of greatest productive activity.

INDUSTRIAL HAZARDS. Industrial Health Hazards, Charles A. Lauffer Safety Eng., vol. 38. no. 5, Nov. 1919, pp. 279-282. Classification of hazards of employees and suggested remedies. From Proc. of Eighth Annual Safety Congress.

MEDICAL CARE OF WORKERS. The Medical Care of Industrial Workers.—II, C. D. Selby. Eng. & Indus. Management, vol. 2, no. 24, Dec. 11, 1919, pp. 742-745, 2 figs. Concerning relation of medical departments and industrial organizations, and selection of industrial personnel.

HEAT TREATMENT

See Nichrome; Steel, Heat Treatment of.

HEATING

BUILDINGS, OIL FIRING IN. Heating Buildings by Fuel Oil. Am. Architect, vol. 116, no. 2291, Nov. 19, 1919, pp. 648-650. Relative cost of and relative storage space required for oil and coal.

HEATING, STEAM

HYDRAULIC TURBINES

HYDROELECTRIC PLANTS

INDUSTRIAL MANAGEMENT

INDUSTRIAL RELATIONS

INSULATING MATERIALS

THERMAL CONDUCTIVITY OF. Thermal Conductivity of Insulating Materials, T. S. Taylor. Mech. Eng., vol. 42, no. 1, Jan. 1920, pp. 8-10, 2 figs. Experimental. "Thermal bridge" recommended by Prof. Northrup (Jl. Instn. of E. E., Lond., vol. 48, 1912, p. 674) was found satisfactory for determining thermal conductivity of sheet materials, while "thermal meters," meters," one of circular cross-section and the other of square cross-section, were found entirely reliable for measurement of thermal conductivity of sheet and other materials. Table is included giving results of measurements of thermal conductivity for large number of materials both across and along laminations.

INSULATORS, ELECTRIC

LINE TESTS FOR. Present and Future of Line Insulators, F. W. Peck, Jr. Elec. World, vol. 75, no. 4, Jan. 24, 1920, pp. 209-211, 4 figs. Failure is attributed to expansion of metal parts, cement, etc. It is believed that combined electrical, mechanical and porosity test should be substituted for present tests.

INSULATORS, HEAT

THERMAL CONDUCTIVITY OF. The Thermal Conductivity of Solid Insulators, W. M. Thornton. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 228, Dec. 1919, pp. 705-707. It is concluded from examination of properties of various insulators that "chief practical qualification of a material as a heat insulator is that it should be light and inelastic."

INTERCHANGEABLE MANUFACTURE

DRAWINGS FOR. Component Drawings for Interchangeable Manufacture, Earle Buckingham. Machy. (Lond.), vol. 15, no. 379, Jan. 1, 1920, pp. 417-421, 18 figs. Methods of dimensioning drawings and indicating tolerances.

INTERNAL-COMBUSTION ENGINES

PROGRESS IN 1919. Internal Combustion Engine Progress in 1919. Gas & Oil Power, vol. 15, no. 172, Jan. 1, 1920, pp. 57-58. Progress is seen to have consisted principally in standardization of gas and oil engines.

See also Aeroplane Engines; Automobile Engines; Diesel Engines; Oil Engines; Tractor Engines.

INVENTIONS

See Mechanical Science.

IRON MANUFACTURE

PUDDLED IRON. On Future Development in Puddled Iron Manufacture, J. E. Fletcher. Engineering, vol. 108, no. 2816, Dec. 19, 1919, pp. 836-840, 6 figs. Possibilities of reducing puddling labor and of saving fuel. (Concluded.) Paper read before Staffordshire Iron & Steel Inst.

The Characteristics of Puddled Iron, J. E. Fletcher. Eng. & Indus. Management, vol. 2, no. 24, Dec. 11, 1919, pp. 739-741, 2 figs. Writer states that there is sound scientific reason for belief that mechanical puddling of metal at temperatures below melting point of borderland alloy between cast iron and steel (that containing about 2 per cent carbon) should be practically and economically possible. Paper read before Staffordshire Iron & Steel Inst.

JIGS

LOCOMOTIVE REPAIR SHOPS. Jigs and Special Devices in Locomotive Repair Shops, J. C. Bevelle. Ry. Mech. Engr., vol. 93, no. 12, Dec. 1919, pp. 725-727, 7 figs. Such as special cutter for milling quadrants, flue sheet cutters, etc.

JUTE

See Rope Drive.

LABOR

CONTRACTS. Essentials of a Labor Contract, Edwin Gruhl. Elec. Ry. Jl., vol. 55, no. 2, Jan. 10, 1920, pp. 96-101. Writer first outlines principles underlying proper relation of employer and employee and then sets forth and dicusses section by section suggested labor contract.

HOURS OF WORK, REDUCTION IN. Methods of Reducing Hours of Work in Great Britain. Monthly Labor Rev., vol. 9, no. 6, Dec. 1919, pp. 251-254. Three ways are explained: (1) one-break day system; (2) two day-shift system; (3) five-day week system.

MINIMUM WAGE, CALIFORNIA. Effect of Minimum Wage Orders in California. Monthly Labor Rev., vol. 9, no. 6, Dec. 1919, pp. 261-263. It is said that no establishment was forced out of existence by order and that number of employees was not decreased but increased 10 per cent. Minimum wage is considered in consequence as real remedial measure.

RESPONSIBILITIES OF. Labor ans Its Responsibilities, Charles Piez. Coal Age, vol. 16, no. 22, Dec. 11 and 18, 1919, pp. 882-884. Address delivered before Am. Min. Congress.

LIGHTING

COLOR MATCHING, LIGHT FOR. Artificial Daylight, A. P. Trotter. Times Eng. Supp., no. 542, Dec. 1919, p. 361. Concerning matching of colors.

FARM LIGHTING SYSTEM. Knight Engine Adapted to Two-Unit Farm Lighting System. Automotive Industries, vol. 42, no. 1, Jan. 1, 1920, pp. 14-17, 5 figs. Spherical combustion chamber is notable feature of this air-cooled motor.

INDUSTRIAL SURVEY OF CONDITIONS. Survey of Prevailing Conditions as to Industrial Lighting—I. Elec. Rev. (Chicago), vol. 65, no. 4, Jan. 24, 1920, pp. 139-141. Investigation of actual conditions in 15 States.

INTERIOR SYSTEMS, IMPROVING ILLUMINATION. Maintenance of Interior Lighting Systems, Ward Harrison and J. R. Colville. Elec. World, vol. 75, no. 4, Jan. 24, 1920, pp. 204-208, 7 figs. Case is cited where it is said illumination was raised from 2.7 to 7 foot-candles by cleaning lamps, reflectors, walls and ceiling.

RAILWAY STATIONS. Report of Committee, VI—On Buildings. Bul. Am. Ry. Eng. Assn., vol. 21, no. 220, Oct. 1919, pp. 123-138, 4 figs. Proposes standards of illumination for passenger-station interiors and surroundings and platforms, covered and uncovered.

RESIDENCE. Home-Lighting—How to Make It Comfortable and Effective, A. L. Powell and R. E. Harrington. Trans. Illum. Eng. Soc., vol. 14, no. 8, Nov. 10, 1919, pp. 394-406 and (discussion) pp. 407-414, 8 figs. Concerning avoidance of extreme contrasts and arranging lights so as to derive greatest flexibility of lighting.

STREET. Single Light Compared with Cluster Units for Street Lighting, S. L. E. Rose and H. E. Butler. Gen. Elec. Rev., vol. 22, no. 12, Dec. 1919, pp 1044-1055, 16 figs. Writers point out what they term inefficiency of cluster unit and present data in support of their contention that this type of unit should be discarded.

THEATERS. Artistic and Utilitarian Theater Lighting, Lyman Day Morgan. Elec. World, vol. 75, no. 1, Jan. 3, 1920, pp. 4-6, 7 figs. Scheme of concealed light sources at Milwaukee theater.

LOCOMOTIVES

DESIGNING. Locomotive Designing. Ry. & Locomotive Eng., vol. 32, no. 12, Dec. 1919, pp. 358-361, 3 figs. Features involved in locomotive using coal for fuel.

FEEDWATER HEATING. Locomotive Feed Water Heating. Ry. Gaz., vol. 31, no. 25, Dec. 19, 1919, pp. 818-820, 4 figs. Discusses application of exhaust steam and waste gases to feedwater heating.

FEEDWATER TREATMENT. Treatment of Water for Locomotives, William M. Barr. Ry. Rev., vol. 65, no. 26, Dec. 27, 1919, pp. 953-957. Notes on utility of boiler compounds, wayside treatment, boiler washing, etc., and conditions under which each of these is most useful.

FIREBOXES, STAYBOLT DEFLECTION. Deflection of Staybolts, George L. Fowler. Ry. Rev., vol. 65, no. 26, Dec. 27, 1919, pp. 949-953, 8 figs. Also Ry. Mech. Engr., vol. 93, no. 12, Dec. 1919, pp. 701-707, 13 figs. Account of investigation to determine nature and extent of staybolt movement under influence of temperature and pressure.

NUMBER NEEDED BEFORE 1923. Adequate Motive Power for Railroads a Necessity. Ry. Age, vol. 68, no. 1, Jan. 2, 1920, pp. 33-36. Figures indicating motive power required in next three years and estimated cost.

PULVERIZED-COAL-BURNING. Locomotive Fitted for Burning Pulverized Fuel. Ry. Gaz., vol, 32, no. 2, Jan. 9, 1920, pp 55-59, 7 figs. Scheme invented and patented by J. G. Robinson, chief mechanical engineer of Gt. Central Ry., England.

REDESIGNING. Changing Prairie Type to Mikado. Ry. Mech. Engr., vol. 93, no. 12, Dec. 1919, pp. 694-696, 4 figs. Redesigning of boiler to increase efficiency and provide ample steaming capacity for larger cylinders.

MACHINE TOOLS

FEEDS AND SPEEDS. The Androuin Series of Feeds and Speeds. Engineer, vol. 128, no. 3336, Dec. 5, 1919, pp. 556-559, 1 fig. Summary of studies by J. Androuin (see Bulletin de la Société d'Encouragement pour l'Industrie Nationale. Sept.-Oct., 1919) to discover series of figures for feeds and speeds of machine tools which, while suitable for all practical requirements, would also be such that time required to machine given piece of work could be calculated with great rapidity and care.

MAGNETIC SEPARATORS

TYPES. Electromagnetic Concentration and Separation of Iron Minerals and Metallurgical Waste (La concentration et le triage électromagnétique des minérais de fer et des déchets métallurgiques). Jean Escard. Génie Civil, vol. 75. nos 24, 25 and 26, Dec. 13, 20 and 27, 1919, pp. 603-607, 7 figs, pp. 622-627. 24 figs., and pp. 648-652, 10 figs. Particulars of construction and records of operation of Edison, Rowland, Waterhill, Humboldt, Negreanu, Blake, Steinert-Kertler, Gröndel and Luther magnetic separators.

MARINE BOILERS

SCOTCH, DESIGN OF. Application of Standardization and Graphical Methods to the Design of Cylindrical Return Tubular Boilers, Henry C. E. Meyer Boiler Maker, vol. 19, no. 12, Dec. 1919, pp. 351-355, 11 figs. Suggested rules for designing boilers of Scotch type. Paper read before Soc. of Naval Architects and Marine Engrs.

MARINE STEAM TURBINES

GOVERNOR. Westinghouse Marine Turbine Governor. Power, vol. 50, no. 20, Nov. 25, Dec. 2-9, 1919, pp. 766-767, 4 figs. Governor is of centrifugal type. Has arrangement for automatic control of steam and water supply to glands, which prevents leakage where rotor emerges from casing on both high- and low-pressure turbines.

MELTING POINTS

METALS

MINE RESCUE APPARATUS

MINES

MINING

MINING INDUSTRY

Pipe-Line Transmission. Oil-Pipe Line Transmission, H. W. Crozier. Jl. Electricity, vol. 44, no. 1, Jan. 1, 1920, pp. 24-27, 3 figs. Study of methods of determining viscosity, particularly in general case of pipe lines where oil, initially heated, cools rapidly as it flows along.

Rectified Petroleum Spirit. Composition of Rectified Petroleum Spirit from Toluol-Petroleum Spirit Runnings of Asiatic Petroleum, H. G. Evans. Jl. Soc. Chem. Indus., vol. 38, no. 23, Dec. 15, 1919, pp. 401T-402T, 1 fig. Account of investigations undertaken to determine approximate composition of petroleum spirit in toluol-petroleum spirit runnings from Asiatic petroleum.

Refinery Sludge, Utilization of. Utilization of Asphaltic Base Acid Sludge Obtained in Refining Petroleum and Shale Oils, Charles Baskerville. Jl. Indus. & Eng. Chem. ,vol. 12, no. 1, Jan. 1920, pp. 30-31. Method developed at Dept. of Chem., College of City of N.Y.

World Resources. Political and Commercial Geology Series. The Petroleum Resources of the World—II, John D. Northrop. Eng. & Min. Jl., vol. 109, no. 1, Jan. 3, 1920, pp. 34-38, 1 fig. It states that American British and Dutch interests control most of world's oil; also that U. S. is supreme in western hemisphere but has not aggressive nationalistic policy of foreign governments.

OIL ENGINES

Akroyd Type. Modern Development of Oil Engines, Mark Meredith. Gas Engine, vol. 22, no. 1, Jan. 1920, pp. 32-33. Particularly of type using Akroyd principle.

OIL FIELDS

Mackenzie River Basin. The Mackenzie River Basin, Philip Thompson. Eng. & Min. Jl. ,vol. 108, no. 31, Dec. 6, 1919, pp. 866-868, 1 fig. Geological features of the area and most favorable regions in which to prospect for mineral and oil.

OIL SHALES

Kiln Distillation. The Eventual Retort Plant for the Distribution of Oil Shales, Louis Simpson. Chem. & Metallurgical Eng., vol. 22, no. 2, Jan. 14, 1920, pp. 71-72. Alleges that horizontal revolving kiln, as constructed for burning of cement clinker, is more capable of handling spent shale than Scotch retort.

Nitrogen from. Recovery of the Nitrogen Contained in Oil Shales, Louis Simpson. Chem. & Metallurgical Eng., vol. 22, no. 1, Jan. 7, 1920, pp. 20-22. Writer believes that future of oil shale industry is largely dependent upon construction of "single purpose" retort that can be erected at low cost and which will recover maximum quantity of oil.

OIL WELLS

Mapping. Mapping of Oil Wells, S. S. Langley. Eng. & Min. Jl., vol. 108, no. 22, Dec. 13 and 20, 1919, pp. 908-911, 5 figs. Illustrates charts indicating undergrounds conditions, constructed from drillers' reports.

OPEN-HEARTH FURNACES

Acid, Action of Iron Oxides on. The Action of Iron Oxides Upon the Acid Furnace Structure, J. H. Whiteley and A. F. Hallimond. Engineering, vol 108, no. 2807, Oct. 17, 1919, pp. 528-532, 10 figs. Source of iron oxides carried from furnace by outgoing gases is considered and method is described by which comparative amounts present in gases at various stages of process may be ascertained. Paper read before Iron and Steel Inst.

Electric vs. Electric vs. Open Hearth Furnace Practice. E. H. Ballard. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, p. 62. Comparison of costs.

Large-Unit Practice. Open Hearth Practice with Large Units, N. E. Maccallum. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 52-55, 6 figs. Double ladle practice is upheld. Experience with metalkase brick is illustrated.

Martin-Siemens. Martin-Siemens Furnaces (Les fours Martin-Siemens), A. D. Williams. Revue de Métallurgie, vol. 16, no. 5, Sept.-Oct. 1919, pp. 313-339, 16 figs. Survey of technical and experimental researches of various investigators, undertaken with a view to determine best proportion of dimensions of furnaces, together with exposition of physical phenomena taking lace in furnace. (To be continued.)

ORE DRESSING

Ball Mills. Fine-Grinding in Ball-Mills, Henry Hanson. Min. & Sci. Press, vol. 120, no. 1, Jan. 3, 1920, pp. 17-20. Results of comparative tests.

OXY-ACETYLENE WELDING

Boiler Repairs. Boiler Repairs by Oxy-Acetylene Welding. Acetylene & Welding Jl., vol. 16, no. 194, Nov. 1919, pp. 214-215, 8 figs. Illustrates welding of cracks in tube plates.

Boilers. Autogenous Welding Accepted in Boiler and Pressure Vessel Repairs. Boiler Maker, vol. 20, no. 1, Jan. 1920, pp. 17-18. Committee report of Engineers' Committee of Steam Boiler and Fly-Wheel Service Bur. which was made up for representatives from all companies writing steam boiler insurance.

Blowpipe Manipulation. Blowpipe Manipulation. A New Method of Executing Welds. Acetylene & Welding Jl., vol. 16, no. 194, Nov. 1919, pp. 218-219, 3 figs. Executing welds by method in which welding rod follows blowpipe instead of preceding it.

Drop Forgings. Fusion Welding Applies to Drop Forgings, S. W. Miller. Can. Machy., vol. 23, no. 3, Jan. 15, 1920, pp. 92-93. Writer holds that oxy-acetylene process is more applicable to reclaiming of drop forging than electric, especially where defects are small, because "while the electric process is considerably cheaper . . . yet there is greater liability with the electric process."

Fractures. Metallurgy for Welders, Paul C. Tris. Acetylene Jl., vol. 21, no. 7, Jan. 1920, pp. 480-482. Photomicrographs illustrating various conditions which are likely to be found in fractures.

Iron Foundry Work. The Welder in the Iron Foundry, David Baster. Acetylene Jl., vol. 21, no. 7, Jan. 1920, pp. 469-472, 2 figs. Possibilities of effecting savings in foundry by introduction of welding.

Isolated Plant. Oxy-Acetylene Welding in an Isolated Plant, J. H. Sto.iker. Acetylene Jl., vol. 21, no. 7, Jan. 1920, pp. 475-478. Conditions for successful welding. Paper read before Can. Natural Gas & Petroleum Assn.

Procedure. Oxy-Acetylene Welding and Cutting, Hugh H. Dyar. Boiler Maker, vol. 19, no. 12, Dec. 1919, pp. 362-364. Concerning uniting of gases in torch, heat treatment of cast iron, uses of special jigs for tank welding, and strength of welds.

OXYGEN

Electrolytic Production. *See Hydrogen, Electrolytic Production.*

PAINTS

Rosin in. Use of Rosin in Paint and Varnish, Maximilian Toch. Chem. & Metallurgical Eng., vol. 21, no. 15, Dec. 24 and 31, 1919, pp. 767-768. Experiments are quoted in which it is said that rosin with china wood oil paint left better surface for repainting than linseed oil paint. Paper read before Am. Inst. Chem. Engrs.

PAPER MAKING

Cellulose Formations. Process for Cellulose Formations. Paper, vol. 25, no. 17, Dec. 31, 1919, pp. 23-24. German patent for producing cellulose formations by precipitating ammoniacal copper oxide cellulose solution.

Coloring. The Coloring of Paper, Otto Kress. Paper, vol. 25, no. 19, Jan. 14, 1920, pp. 17-20. Equipment required for testing dyes for strength and shade. (Continuation of serial.)

PAPER MILLS

See Roofs, Paper Mill, Decay Prevention.

PAVEMENTS, ASPHALT

Joining to Car Tracks. Asphalt Paving Laid Without Granite Blocks Alongside Rails, Clifford A. Elliott. Elec. Ry. Jl., vol. 55, no. 3, Jan. 17, 1920, pp. 158-159, 4 figs. It is said that Pacific Elec. Ry. has omitted granite paving blocks from alongside girder and T-rails in paved-street construction.

Mixtures. Asphalt Paving Mixtures, Prevost Hubbard. Better Roads & Streets, vol. 9, no. 11, Nov. 1919, pp. 369-370. Their classification.

PAVEMENTS, BITUMINOUS

Aggregates for. Mineral Aggregates for Bituminous Pavements, Wallace L. Caldwell. Mun & County Eng., vol. 57, no. 6, Dec. 1919, pp. 246-250. Classification of causes of failure of bituminous pavements and suggestions in regard to method of testing aggregates.

Foundations for. Foundations for Warrenite-Bitulithic, George C. Warren. Good Roads, vol. 18, no. 26, Dec. 24, 1919, pp. 261-262 and 264, 2 figs. Discussion of relative merits of resilient and rigid bases for warrenite-bitulithic surfaces and of use of old macadam.

PAVEMENTS, BRICK

Economical Construction. Suggested Economies in Brick Street and Road Construction, Will P. Blair. Mun. & Country Eng., vol. 57, no. 6, Dec. 1919, pp. 262-264. In designing of proper tools and appliances which will lessen actual labor necessary in construction.

Resurfacing with Asphalt. Method of Resurfacing Worn Brick Pavement with Asphalt, Charles E. Murphy. Eng. & Contracting, vol. 53, no. 1, Jan. 7, 1920, p. 7, 3 figs. Illustrates method of applying 2-in. asphaltic concrete.

PAVEMENTS, CONCRETE

Cold-Weather Construction. Precautions for Concrete Pavement Construction in Cold Weather. Concrete Age, vol. 1, no. 3, Dec. 1919, pp. 16-17. Arrangement which is said to have enabled placing of concrete at from 75 to 85 deg. during temperatures from 4 to 43 deg.

Voids in Aggregate. Does It Pay to Determine Void Percentages in Coarse Aggregate for Concrete Pavement? William G. Crandall. Mun. & County Eng., vol. 57, no. 6, Dec. 1919, pp. 264-266, 2 figs. Diagrams for obtaining interpolated values of factors when voids in either of coarse aggregates vary from multiple of 5 per cent.

PAVEMENTS, WOOD-BLOCK

Creosote Oil for Blocks. Proper Grade of Creosote Oil for Wood Paving Blocks, K. M. Waddell. Mun. & County Eng., vol. 52, no. 6, Dec. 1919, pp. 269-272, 3 figs. Characteristics required are said to be, (1) toxicity, (2) waterproofing values, (3) permanence, and (4) penetrance.

PETROLEUM

See Oil.

RECORDS

Filing System. Office Records—Their Filing and Indexing, Irene Warren. Jl. Electricity, vol 44, no. 1, Jan. 1, 1920, pp. 22-23, 3 figs. Advantages of central filing system.

RECTIFIERS

Large-Capacity. Mercury Arc Rectifiers for Large Outputs. Electrician, vol. 84, no. 2172, Jan. 2, 1920, pp. 10-13, 8 figs. Diagrammatic representation of types built by Brown Boveri & Co., Switzerland, for outputs of 150-kw. and 500-kw.

REDUCTION GEARS

See Gears, Reduction.

REFRACTORIES

Furnace Linings. Refractories in Heat-Treating Furnaces, John A. King. Proc. Steel Treating Research Soc., vol. 2, no. 8, 1919, pp. 16-19 and 32. Deals with linings and factors which determine life of linings, and gives general outline of kinds of refractories and various tests applied to them.

Silica Brick. Silica Bricks (Les briques de silice), Pierre Gilard. Revue Universelle des Mines, vol. 2, no. 3, July-Aug. 1919, pp. 559-582, 12 figs. Survey of technical researches concerning influence of nature of silica on properties of brick. (To be continued.)

RELATIVITY THEORY

See Gravitation.

RELAYS

Overload. Induction-Type Overload Relays—Their Operation and Application. Victor H. Todd. Power, vol. 50, no. 16, Nov. 22, 1919, pp. 583-585, 13 figs. Discusses construction and operation of overload relay, in which movement similar to watt-hour meter is used to obtain protective device of high accuracy.

RESEARCH

Industrial. Elements of Industrial Research, Frank B. Jewett. Chem. Age, vol. 1, no. 7, Dec. 25, 1919, pp. 285-286. Suggests co-operation of teacher and employer of technical men.

Industrial Research. Times Eng. Supp., no. 542, Dec. 1919, p. 367. Account of conference convened by Dept. of Sci. and Indus. Research with a view to exchanging views in regard to problems arising out of establishment and working of industrial organizations.

Organization of. The Organization of Research, Henry Prentiss Armsby. Science, vol. 51, no. 1300, Jan. 9, 1920, pp. 33-38. Its significance for advancement of science. Address delivered before Agricultural Section, British Assn. for Advancement of Science.

Workers, Development of. What Is Needed to Develop Good Research Workers, W. R. Whitney. Elec. World, vol. 75, no. 3, Jan. 17, 1920, pp. 151-154, 7 figs. Suggests that students be encouraged to share inspiration of engineering work instead of being instructed in facts only.

ROAD TRACTION

Present Status. The Present Position of Mechanical Road Traction, C. G. Conradi. Jl. Instn. Mech. Engrs., no. 9, Dec. 1919, pp. 661-701 and discussion, pp. 702-706, 53 figs., partly on eight supp. plates. Comparative study of costs of steam, gasoline and electric traction. Problems of goods transportation are classified and economical operation by one of these three systems of traction is determined for each.

ROLLER CHAINS

See Chains, Roller.

ROLLING MILLS

Draft and Peak Load Relations. Plate Mill Draft and Peak Load Relation, J. T. Eaton. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 94-96 3 figs. Discussion of draft and peak load relations as influenced by steel temperature and number of passes.

Friction and Spreading Forces. Friction and Spreading Forces in Rolling Mills, W. B. Skinkle. Mech. Eng., vol. 42, no. 1, Jan. 1920, pp. 11-13, 5 figs. Description of apparatus designed for special series of investigations to be made on experimental rolling mill at Carnegie Inst. of Technology.

Research Bureau Studies Practical Rolling Mill Technical Problems, W. B. Skinkle. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 84-88, 6 figs. Description of equipment to be installed at Rolling Mill Research Bur. for experimental measurement of friction losses and spreading forces on rolls and roll housings.

Hot Rolling, Theories. Theories of Hot Rolling (Les théories du laminage à chaud), P. Maringer. Revue Universelle des Mines, vol. 2, no. 3, July-Aug. 1919, pp. 425-533, 53 figs. Energy required for rolling and determination of efforts exerted by cylinders. (Concluded.)

Rolling Processes. Rolling Processes from Thermal and Mechanical Points of View, Frithiof Holmgren. Jernkontorets Annaler, vol. 103, May 31, 1919, pp. 87-124. Discussion of process of rolling of metals, both historical and technical view of heat application and power consumption.

Sheet Rolling. Development of Modern Sheet Rolling, W. H. Melaney. Blast Furnace & Steel Plant, vol. 8 no. 1, Jan. 1920, pp. 91-93. Outline of operations peculiar to manufacture of sheets.

ROOFS

Paper Mill, Decay Prevention. Paper Mill Roofs, R. J. Blair. Paper, vol. 25, no. 17, Dec. 31, 1919, pp. 15-23, 12 figs. Investigations of Forest Products Laboratories of Canada to determine best method of preventing decay in timber of pulp and paper mill roofs.

ROPE DRIVE

Indian Mills. Jute and Its Manufacture in India. Engineer, vol. 128, no. 3334, Nov. 21, 1919, pp. 505-506, 7 figs., partly on supp. plate. Rope driving from slow-speed horizontal side-by-side compound engines is mentioned as general practice in Indian mills.

RUBBER

Caoutchouc Industry. Caoutchouc Industry (L'industrie du caoutchouc). Génie Civil, vol. 75, no. 26, Dec. 27, 1919, pp. 661-662. Production, methods of testing and classification of caoutchouc.

Expansion During Vulcanization. The Expansion of Rubber Compounds During Vulcanization, C. W. Sanderson. Jl. Indus. & Eng. Chem., vol. 12, no. 1, Jan. 1920, pp. 37-40, 5 figs. Experiments to determine whether or not use could be made of expansion test in distinguishing between stocks which move freely and mold well and those which do if mold well.

Synthetic. Analytical Determination of Synthetic Rubber (Versuche zur analytischen Bestimmung von synthetischen Kautshuk), G. Hübner. Gummi-Zeitung, vol. 33, no. 23, Mar. 7, 1919, pp. 361-362. Results of tests.

Volume Increase Under Strain. Volume Increase of Compounded Rubber Under Strain, H. F. Schippel. Jl. Indus. & Eng. Chem., vol. 12, no. 1, Jan. 1920, pp. 33-37, 11 figs. Account of tests. It is concluded that "the greater the mean diameter of the pigment particles, the greater is the volume increase under strain."

RUST PREVENTION

Phosphatic Coatings for. Phosphatic Coating for Rust Proofing Iron and Steel, L. E. Eckelmann. Chem. & Metallurgical Eng., vol. 21, no. 15, Dec. 24 and 31, 1919, pp. 787-789, 4 figs. After exposing various methods of phosphatizing writer observes that while phosphatic coatings "are not so resistant to wear and abuse as sherardized or galvanized metals," nevertheless "phosphatic rustproofing is considerably cheaper than any other well known rustproofing process in use today."

SCIENTIFIC MANAGEMENT

British Shops. Scientific Management, H. W. Allingham. Eng. & Indus. Management, vol. 2, no. 26, Dec. 25, 1919, pp. 803-808, 5 figs. Its application in British shops.

Mining Industry. Taylorism in the Mine, M. Langrogne. Colliery Guardian, vol. 118, no. 3078, Dec. 27, 1919, pp. 1714-1715. Chief requirements for successful application are seen to be, unity of control, reinforced technical assistance, and precise definition of working program and means of carrying it out. (Concluded.) Paper read before Société de l'Industrie minérale de France.

Result from. Scientific Management: A Solution of the Capital and Labor Problem—II, J. M. Scott Maxwell. Machy. (Lond.), vol. 15, nos. 377 and 378, Dec. 18 and 25, 1919, pp. 366-369, 2 figs., and 354-357. Economical aspect of payment-by-results system. Gives charts showing comparison of efforts extended in manufacturing operations by experienced and inexperienced workers.

See also Factory Management; Industrial Management.

SEAPLANES

See Aeroplane Engines, Design.

SEMI-STEEL

See Cast Iron, Synthetic.

SEWAGE TREATMENT

Brooklyn, N. Y. Some Results of the Brooklyn, N. Y., Sewage Treatment Experiments. Eng. & Contracting, vol. 53, no. 2, Jan. 14, 1920, pp. 39-41. Data pertaining to Imhof tank operation, trickling filters, etc.

Plainfield, N. J., Plant. Plainfield's Sewage Treatment Plant. Mun. Jl. & Public Works, vol. 47, no. 22, Nov. 29, 1919, pp. 318-322, 7 figs. Details of operation of Imhoff tanks and sprinkling filters.

SHAFT SINKING

See Mines, Shaft Sinking; Iron Mines, Shaft Sinking.

SHAFTS

Keyways, Influence of. On the Influence of Keyways on the Stress Distribution in Cylindrical Shafts, T. H. Gronwall. Trans. Am. Math. Soc., vol. 20, no. 3, July 1919, pp 234-244, 1 fig. Mathematical expression of ratio between maximum stresses in keyed and full parts of shaft.

SILICA BRICK

STEAM

Self-Tempering, Critical Points. Critical Points of Self-Tempering Steels (Sur les points critiques d'aciers auto-trempants). P. Dejean. Comptes rendus des Séances de l'Académie des Sciences, vol. 169, no. 22, Dec. 1, 1919, pp. 1043-1045, 1 fig. Examination of cooling curves obtained by differential method of nickel-chrome-copper steel.

STEEL CHROME-NICKEL

Nichroloy Products. The Making of Nickel-Chromium Products W. F. Sutherlan. Can. Machy., vol. 23, no. 2, Jan. 8, 1920, pp. 57-60, 5 figs. Manufacture of "nichroloy" products. "Nichroloy" is composed principally of low-carbon steel, chromium, silicon, manganese, aluminum and nickel.

STEEL, HEAT TREATMENT OF

Alloy Steel. Alloy Steel and Heat Treatment in the Production of Special Forgings. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 106-108, 7 figs. Practice of Am. Forge & Machine Co. in manufacture of high grade chrome-vanadium and steel forgings.

Ball-Bearing Races. Electric Furnace Installation for Heat Treatment of Ball Bearing Races. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 115-117, 7 figs. Treating equipment consists of pusher type furnace, oil quench tank and oil drawing bath arranged in series for continuous flow of material.

Hardening. The Hardening of Steel, H. C. H. Carpenter. Chem. News, vol. 119, no. 3112, Dec. 5, 1919, pp. 261-264. Theories of hardening. (Concluded.)

See also Forgings, Electric Heat Treatment.

STEEL INDUSTRY

Electric Drive. Electricity in Steel Industry, 1919, G. E. Stoltz. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 4-7, 6 figs. Outlines usual methods of operating electric drive and presents charts showing costs and other data.

Metallurgical Progress. Metallurgical Progress in Steel Industry. Blast Furnace & Steel Plant, vol. 8, no. 1, Jan. 1920, pp. 56-58. No radical departures in metallurgical processes are believed to have been developed even during the war, and it is remarked that progress made consisted chiefly in a more intelligent application of processes already known.

STEEL, MANGANESE

Open-Hearth. Making Manganese Steel by the Open-Hearth Process, E. L. Shaner. Foundry, vol. 48, no. 2, Jan. 15, 1920, pp. 63-66, 8 figs. Attention is specially called to method of adding alloy and quenching heat-treated castings.

STEEL, MOLYBDENUM

Properties and Uses. Molybdenum and Molybdenum Steel, W. E. Simpson. Min. & Sci. Press, vol. 119, no. 25, Dec. 20, 1919, pp. 894-896. As example of toughening property imparted to steel by addition of over one per cent molybdenum, it is mentioned that plates of war tanks, which were made of this steel were unafftected by machine-gun fire at ten yards point-blank range. Commercial applications of molybdenum steel, particularly in mining industry, are quoted.

STREET RAILWAYS

Leakage Resistance of Roadbeds. Leakage Resistance of Street Railway Roadbeds and Its Relation to Electrolysis of Underground Structures, E. R. Shepard. Dept. Commerce, Technologic Papers of Bur. of Standards, no. 127, Oct. 6, 1919, 39 pp., 10 figs. Roadbeds constructed with solid concrete ballast, vitrified brick, or other nonporous pavements, were found to have low leakage resistance to earth, and roadbeds constructed with foundation of clean, crushed stone under concrete paving base much higher resistance than roadbeds with solid concrete ballast. Other types were experimented with. Comparative results are given.

Maintenance of Way. Maintenance of Way for Street Railways, W. R. Dunham. Elec. Ry. Jl., vol. 55, no. 2, Jan. 10, 1920, pp. 103-107, 10 figs. Describes organization and methods employed for carrying on work necessary for maintaining tracks of a Connecticut company.

Service-at-Cost Agreements. Service-at-Cost Agreements, Harlow C. Clark. Aera, vol. 8, no. 5, Dec. 1919, pp. 582-593. Analysis of laws and ordinances of city of Montreal.

Valuation. Valuation and Accruing Depreciation, P. J. Kealy. Jl. Western Soc. Engrs., vol. 25, no. 1, Jan. 5, 1920, pp. 11-14. In opinion of writer future of traction companies lies along way to private operation based on cost of service, with sufficient public supervision to insure proper costs and adequate service.

See also Electric Railways.

STRUCTURES

Statically Indeterminate, Analyzing. Advantages of the Slope Deflection Method of Analyzing Statically-Indeterminate Structures, M. Grodsky. Eng. & Contracting, vol. 52, no. 26, Dec. 24, 1919, pp. 720-723, 10 figs. Analysis of two statistically-indeterminate structures of slope-deflection method. Reference is made to computation of same structure by least-work method in Eng. & Contracting, Sept. 24, 1919.

SUBMARINE SIGNALING

Radius of Operation. Effect of Horizontal Temperature Layers of Sea Water on Radius of Sound Signals Under Water (Ueber den Einfluss horizontaler Temperaturschichtung des Seewassers auf die Reichweite von Unterwasserschallsignalen), H. Litche. Physikalische Zeitschrift, vol. 20, no. 17, Sept. 1, 1919, pp. 385-389, 2 figs. Equations and curves showing radius of sound.

SUBMARINES

Influence in Warfare. The Influence of the Submarine in Naval Warfare in the Future, W. S. King-Hall. Jl. Roy. United Service Instn., vol. 64, no. 455, Aug. 1919, pp. 359-381. Summarizing experience of last war, writer concludes that for purpose of tactical attack submarine did not prove its importance, but he notes that strategically, "a flotilla of submarines represent a concentration of armed force, and the fact that this concentration can emerge and disappear from sight is an important point."

SUBSTATIONS

Automatic. Automatic Substations Eliminate Labor Expense, R. J. Wensley. Elec. World, vol. 75, no. 3, Jan. 17, 1920, pp. 137-138. Operating expense of two stations, one used for industrial service and other for three-wire circuits.

SULPHURIC ACID

Recovery from Sodium Bisulphate. Recovery of Sulphuric Acid (La récupération de l'acide sulphurique). Génie Civil, vol. 75, no. 26, Dec. 27, 1919, pp. 655-657. Process of recovering sulphuric acid from sodium bisulphate obtained as residue in manufacture of explosives.

See also Coal, Pyrite, Use of.

TANKS

Concrete. Concrete Tanks for Industrial Purposes. Contract Rec., vol. 33, no. 53, Dec. 31, 1919, pp. 1211-1212. Construction requirements of concrete tanks for storage of mineral oils, brine, molasses, vegetable and animal oils and chemicals.

The Handling of Cocanut Oil, Charles W. Geiger. Power Plant Eng., vol. 24, no. 2, Jan. 15, 1920, pp. 121-126, 8 figs. Description of Philippine Vegetable Oil Co.'s storage plant including constructional features of reinforced-concrete storage tanks.

Oil. *See Concrete.*

Wooden. *See Water Meters, Railway Water Service.*

TAXES

British System of Levying. A Simple Progressive Tax and Its Bearing on the Federal Income Tax and Other Acts, H. S. Carslaw. Jl. & Proc. Roy. Soc. New South Wales for 1918, vol. 52, pp. 203-214, 2 figs. Mathematical analysis of systems of levying taxes in Great Britain and various states in Australia.

TELEGRAPHY

Baudot Quadruplex. The Baudot. Telegraph and Telephone Jl., vol. 6, no. 57, Dec. 1919, pp. 31-33, 6 figs. Electric weight lift attatchment as applied at Indian Government Telegraph Works to both distributor and receiver. (Continuation of serial.)

TELEPHONY

Progress in 1919. Progress in the Art of Communication, Bancroft Gherardi and Frank B. Jewett. Elec. World, vol. 75, no. 4, Jan. 24, 1920, pp. 202-204, 1 fig. Opinion is advanced that development of machine switching of telephone circuits and further application of vacuum tubes marked year of 1919.

TETRYL

See Explosives, Tetryl.

TEXTILE MILLS

Cleaning in. *See Compressed Air, Textile Uses.*

Conveyors for. Conveying Systems in Textile Mills. Textile World Jl., vol. 57, no. 2, Jan. 10, 1920, pp. 101-103, 5 figs. Their development and relation to transport. (To be continued.)

Drawing Rolls, Setting. The Setting of Drawing Rolls. Textile World Jl., vol. 57, no. 3, Jan. 17, 1920, pp. 45-46, 6 figs. Writer asserts that improper setting or neglect of any kind of setting of drawing rolls on moving and spinning frames in cotton mills is responsible for considerable amount of deficient work and waste.

Hot-Water Supply. Hot Water Supply of Textile Mills, W. C. Beekley. Textile World Jl., vol. 57, no. 2, Jan. 10, 1920, pp. 103-105. Need of careful analytical study of conditions in every plant is pointed out.

Use of Steam in. Steam Use in Textile Process, George H. Perkins. Mech. Eng., vol. 42, no. 1, Jan. 1920, pp. 14-16, 2 figs. Tables of comparative figures showing importance of use of steam for manufacturing processes in textile industry. Analyses are given of various uses to which steam is put, and suggestions are made for research and improvement of economy.

THERMOREGULATORS

TIDAL POWER

TIMBER

WAGES

WATER HAMMER

Remedy for. Water Hammer in Conduit Under Pressure (Les coups de bélier dans conduites forcées). Génie Civil, vol. 76, no. 1, Jan. 3, 1920, pp. 9-12, 6 figs. Suggests means of overcoming water hammer in hydroelectric installations. (To be continued.)

METERS

Railway Water Service. Report of Committee XIII—On Water Service. Bul. Am. Ry. Eng. Assn., vol. 21, no. 220, Oct. 1919, pp. 65-97, 6 figs. Report includes recommendations in regard to water meters considered as suitable for railroad water service and methods for testing and reading meters, and specifications for wooden water tank of 50,000-gal. capacity.

WATER PIPES

Laying in Frozen Ground. Laying a Pipe Line in Frozen Ground, William W. Elmer, Eng. & Min. Jl., vol. 108, no. 20, Nov. 22 and 29, 1919, pp. 823-824. Details of method used in British Columbia, where deep snows and 45 per cent grade were encountered.

WATER POWER

British Columbia. The Waterpowers of British Columbia—I and II. Power House, vol. 12, no. 21, and vol. 13, no. 1, Dec. 20, 1919, and Jan. 5, 1920, pp. 553-558 and 1-7, 11 figs. From report of Commission of Conservation on Waterpowers of British Columbia, giving information in regard to actual installations which are developing power for municipal and private use.

WATER PURIFICATION

Ozonizing Plant. Swimming Pool of the West Point Military Academy. Am. Architect, vol. 116, no. 2293, Dec. 3, 1919, pp. 701-705, 5 figs. Layout and features of ozone water purifying plant.

WATER SUPPLY

Winnipeg, Man. *See Conduits, Reinforced-Concrete.*

WELDING

Boilers. Boiler Welding, Ben. K. Smith. Welding Engr., vol. 5, no. 1, Jan. 1920, pp. 49-52 and 57-60, 14 figs. Its advantages over riveting.

Electric. *See Electric Welding.*

Joints, Design of. Design of Welded Joint. Universal Engr., vol. 31, no. 1, Jan. 1920, pp. 36-38, 13 figs. Various types of metallic joints are sketched and method of welding each is indicated.

Oxy-Acetylene. *See Oxy-Acetylene Welding.*

Ship Construction. Welding vs. Riveting in Ship Construction, Letson Balliet. Metal Trades, vol. 11, no. 1, Jan. 1920, pp. 27-28. Welding is decidedly preferred among other reasons because "total cost of welding the seam is but little more than the value of the metal-saved because of no lap being required."

Welding Mild Steel, H. M. Hobart. Welding Engr., vol. 4, no. 12, Dec. 1919, pp. 40-44 and 49-55. Investigations undertaken by Welding Research Sub-Committee of Welding Committee of Emergency Fleet Corporation. General object of investigations was to extend use of welding in construction of merchant ships and to provide definite basis for obtaining best economy and efficiency in employing welding in place of riveting in construction of hulls. (To be continued.)

WELFARE WORK

Factories. Welfare Work in Factories, J. Badcliffe. Jl. Roy. Sanitary Inst., vol. 39, no. 3, Feb. 1919, pp. 93-99. Necessity for promoting it.

Welfare Work in Factories and Workshops, Ethel Brown. Jl. Roy. Sanitary Inst., vol. 39, no. 3, Feb. 1919, pp. 99-106. Experience of textile plant in England quoted as example of successful accomplishment.

Physical Care of Employees. Physical Care of Cement Plant Employees, Charles E. Coleman. Cement Mill and Quarry, vol. 16, no. 1, Jan. 5, 1920, pp. 21-23. Practice of treating injured at two large Illinois mills. From proceedings of Annual Safety Congress.

WELLS

Pollution of. Pollution of Deep Wells at Lansing, Michigan, Edward D. Rich. Mun. & County Eng., vol. 52, no. 6, Dec. 1919, pp. 278-282. Pollution came about, writer says, because sense of security created by clearance of water, depth of wells and absence of epidemics, led to lack of watchfulness "which shouls always be maintained over every water supply."

WINCHES

Electrically Driven. Electrically-Driven Winches and Capstans. Elecn., vol. 83, no. 2169, Dec. 12, 1919, pp. 689-691, 8 figs. Features of design that have to be provided in order to meet special requirements of these plants, such as their being submerged by heavy seas breaking on board and tropical conditions of heat and moisture.

WIRELESS

See Radiotelegraphy.

WOMEN WORKERS

Post-War Employment, England. Post-War Employment of British Women. Monthly Labor Rev., vol. 9, no. 6, Dec. 1919, pp. 292-298. Report of Women's Employment Committee of British Ministry of Reconstruction. Importance is emphasized of giving women "as wide an opportunity of employment as other considerations may permit."

WOOD

Moisture Content. Method for Determining the Moisture Content of Wood. Ry. Mech. Engr., vol. 93, no. 12, Dec. 1919, pp. 717-716, 4 figs. Directions issued by Forest Products Laboratory.
See also Timber.

WOOD PRESERVATION

Building Material. Timber: Its Conversion, Decay and Preservation, William Ransom. Surveyor, vol. 56, no. 1456, Dec. 12, 1919, pp. 379-380. With special reference to characteristics which must be possessed by timber intended to be used in erection of buildings. (To be continued.) Paper read before Instn. of Municipal & County Engrs.

Surface Perforation. Timber Perforating Patent Given to Public. Ry. Maintenance Engr., vol. 16, no. 1, Jan. 1920, pp. 17-18, 2 figs. Goss patent which consist of method of puncturing surface of wood to be treated by holes systematically located at uniform distances apart, both transversely and longitudinally, distances depending on know normal absorption of preservative with and across grain of wood under given time of immersion, pressure and size of perforations.

Treating Methods. Inaccuracy of Treating Methods Due to Moisture in Wood, Ernest Bateman. Chem. & Metallurgical Eng., vol. 22, no. 2, Jan. 14, 1920, pp. 57-59. Account of experimental work to determine reactions taking place in treatment of wood with inorganic salt preservatives. It was concluded that "there is no apparent reason to suppose that a chemical combination results from the treatment of wood with most inorganic salts, such as zinc chloride, zinc sulphate, sodium fluoride, calcium chloride, etc." and that "any system of measuring the absorption of salt by wood during treatment which is based on a measurement of the weight or volume of the solution before or after treatment is liable to a very considerable error."

WORKS COUNCILS

Ore Smelting. *See Electric Furnaces, Zinc-Ore Smelting.*

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print, up to 11 x 14 in. size, 25 cents, plus postage. A separate print is required for each page of the larger size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

AIRSHIPS

Rigid, Construction, Principles of. The Principles of Rigid Airship Construction, A P Cole. Aeronautics, vol. 18, no. 328, Jan. 29, 1920, pp 101-104. Formulæ for determining structural strength of airship members. (To be continued.) Paper read before Roy. Aeronautical Soc.

Ethyl, From Wood. Ethyl Alcohol from Wood, F. W. Kressman. Chem. Age, vol. 2, no. 1, Jan. 10, 1920, pp. 319-321. Successful production of ethyl alcohol from wood is visualized to depend primarily upon steady uniform supply of wood waste available at low price for period of twelve years or more.

ALLOY STEELS

Metallurgy of. Progress in Metallurgy of Alloy Steels, Harold F. Wood. Am. Drop Forger, vol. 6, no. 1, Jan. 1920, pp. 25-27. No material change is seen in basic principles of alloy-steel production during 1919. It is said that lessons learned during war showed clearly that good alloy steel can be made by either electric-furnace, crucible or open-hearth process, and that also by merely specifying process to be used does not insure buyer of high-quality product.

Molybdenum in. Molydenum in Commercial Alloy Steel. Iron Age, vol. 105, no. 6, Feb. 5, 1920, pp. 407-409, 1 fig. Effect on physical properties and heat-treatment temperature range when substituted for portions of nickel or chromium. Graph is included showing relative properties of chrome-molybdenum steel at various temperatures and heat-treatment conditions. From book soon to be published by Climax Molybdenum Co., New York.

ALLOYS

Corrosion-Resisting. Alloys of High Corrosion Resistance (Gegen Korrosion widerstandsfähigere Legierungen), Hugo Rieger. Giesserie-Zeitung, vol. 16, nos. 19 and 20, Oct. 1 and 15, 1919, pp. 289-291 and 316-319. Circumstances to be considered in choice of alloy. Formulæ are given for armature gun-metal alloys employed in manufacture of gages, pump cases, plungers, valves and other parts in distilleries and breweries, sugar factories, canneries, etc.; and also for manufacture of vessels for production of alcoholic beverages and sugar, various chemical products, aniline dyes, etc.

Various Tests of. Alloys (Alliages), Maillard. Fonderie Moderne, vol. 12, no. 8, Aug. 1919, pp. 170-172. Physical tests conducted by various companies with copper-zinc-lead, aluminum-beryllium and zirconium-nickel alloys.

ALTERNATORS

See Electric Generators, A. C.

ALUMINUM

Substitution for Steel. Notes on the Uses of Aluminum (Notes concernant quelques applications de l'aluminium), M. Legrand. Industrie des Tramways et Chemins de Fer, vol. 13, nos. 151-152-153, July-Aug.-Sept. 1919, pp. 77-80. Discusses economy of substituting aluminum for steel in automobile and electrical industries.

ALUMINUM ALLOYS

See Bronzes, Aluminum.

AMMONIA COMPRESSORS

Vilter High-Speed. Two New Vilter High-Speed Ammonia Compressors. Power, vol. 50, no. 21, Dec. 16-23-30, 1919, pp. 804-806, 6 figs. Double trunk piston with piston rings to stop both ammonia and oil is fitted to guard against oil getting past piston and draining crankpit.

ARMATURES

See Electrical Machinery Dipping and Baking Coils.

ARTILLERY

Ammunition. Modern Artillery Ammunition—II, H. M. Brayton. Am. Mach., vol. 52, no. 2, Jan. 8, 1920, pp. 95-101, 4 figs. Study of calculation involved in modern artillery ammunition and description of developments during war at Frankford Arsenal.

Big Guns, Life of. The Death of a Big Gun, Arthur Benington. Sci. Am. Monthly, vol. 1, no. 1, Jan. 1920, pp. 33-35. 4 figs. Theories accounting for hardening and cracking of rifled surface. From book on artillery by Admiral Ettore Bravetta of Italian navy.

German Long-Range Gun. The German Long-Range Gun, H. W. Miller. Mech. Eng., vol. 42, no. 2, Feb. 1920, pp. 89-100, 25 figs. Account of German super-gun bombardment of Paris from Forest of Gobain, 70 miles distant, in spring of 1918, together with authentic details regarding design of gun, carriage, emplacement and projectile.

Railway, Clearances for. Railway Clearances for Railway Artillery, E. D Campbell. Jl. U. S. Artillery, vol. 52, no. 2, Feb. 1920, pp. 147-152, 4 figs. Composite clearance diagrams of various railway systems, prepared by Ordnance Department.

ASH HANDLING

Bucket Carrier System. An Efficient Coal and Ash Handling Plant—II, Henry I. Edsall. Coal Trade Jl., vol. 51, no. 4, Jan. 28, 1920. Installation using Peck overlapping pivoted bucket carrier to distribute fuel and take away ashes.

Vacuum and Steam Systems. Ash-Handling in Power Plants—IV, Robert June. Elec. Rev. (Chicago), vol. 76, no. 8, Feb. 21, 1920, pp. 308-310, 1 fig. Comparative study of vacuum and steam ash-handling systems.

ATMOSPHERE

Transperency, Measurement of. Method of Measuring Transparency of Atmosphere (Sur une méthode pour la mesure de la transparance atmosphérique), André Bloudel. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 2, Jan. 12, 1920, pp. 93-97, 1 fig. Differential method analogous to that employed for measuring absorbing power of a liquid.

AUDIONS

See Radiotelegraphy, Audions.

AUTOMOBILE ENGINES

Air Cooling of. The Air-Cooling of Petrol Engines. Autocar, vol. 44, no. 1267, Jan. 31, 1920, pp. 217-218, 5 figs. Results of experimental work conducted during war in order to determine best shape of fins, most adequate surface of cylinder, etc. Paper read before Instn. Automobile Engrs.

Continental. New Continental Engine an Exceptional Production Job. Automotive Industries, vol. 17, no. 6, Feb. 5, 1920, pp. 400-402, 5 figs. Engine is 3¼ x 4½-in. 6-cylinder-unit power plant type with removable cylinder head and aluminum crankcase.

Cylinder Head, Detachable. The Detachable Cylinder Head, Georges Funck. Autocar, vol. 44, no. 1266, Jan. 24, 1920, pp. 139-142, 14 figs. Various constructions criticized from point of view of designer, manufacturer and user.

Cylinders, Casting. Precautions That Must Be Taken in the Manufacture of Automobile Cylinders (Precautions à prendre pour la fabrication des cylindres d'automobiles), Charles Bichon. Fonderie Moderne, no. 9, pp. 207-211, 2 figs. Suggestions in regard to manner of drying molds, proportioning metal, etc.

Cylinders, Machinery. *See Cylinders, Machining.*

Double-Piston Type. New Crank Motion Embodied in Engine, P. M. Heldt. Automotive Industries, vol. 17, no. 6, Feb. 1920, 5 1920, pp. 405-407, 3 figs. Description of engine of double-piston type, each cylinder containing two pistons between heads of which explosion takes place.

Mixture Requirements. Mixture Requirements of Automobile Engines, O. C. Berry. Gas Engine, vol. 22, no. 2, Feb. 1920, pp. 57-63, 11 figs. It is concluded from tests at Purdue University Engineering Experiment Station that: (1) Mixture giving maximum power does not vary materially with brake load carried, but remains constant at about 0.0775 lb. of gasoline per lb. of dry air; (2) at light loads, engine will not operate well with as wide a range of mixtures as it can use when carrying more nearly its full capacity; and (3) mixture giving maximum thermal efficiency becomes leaner as brake load is increased, specially between no load and half load.

Testing Beds. Torque Reaction Beds for Engine Tests. Aviation, vol. 7, no. 12, Jan. 15, 1920, p. 536. Design which is said to eliminate effect of forces through engine axis. From Zeitschrift des Verenes deutscher Ingenieure.

AUTOMOBILES

Bodies. Body Features at the New York Show, George J. Mercer. Automotive Industries, vol. 42, no. 4, Jan. 22, 1920, pp. 300-305, 11 figs. Points out various refinements and novelties in coach work of models exhibited at Grand Central Palace.

Whirls and Eddies. Autocar, vol. 44, no. 1266, Jan. 24, 1920, pp. 167, 168, 2 figs. Suggests applying principles of aeroplane construction to design of automobile body.

Braking, Four-Wheel. Braking on All Four Wheels, W. F. Bradley. Automotive Industries, vol. 42, no. 7, Feb. 12, 1920, pp. 460-462, 5 figs. Comparison of European and American practices.

Design, Trend of. British Tendencies in Passenger Car Design. Automotive Industries, vol. 42, no. 3, Jan. 15, 1920, pp. 124-129. Lists are included giving specifications of British and Continental passenger cars.

Trend in Passenger Car Design, P. M. Heldt. Automotive Industries, vol. 42, no. 3, Jan. 15, 1920, pp. 114-117, 11 figs. Points out such changes as slight falling off in eight and twelve-cylinder engines decline of T-head type engine, continued decline of gravity fuel feed and almost complete disappearance of dual ignition system.

Dynamotor for. A Flywheel Dynamotor. Autocar, vol. 44, no. 1266, Jan. 24, 1920, pp. 156-157, 2 figs. Bowman-Aspden device combining dynamo, starting motor and fiywheel.

1920 Cars, Data on. 1920 Passenger Automobiles Listed with Their Technical Specifications. Automotive Industries, vol. 42, no. 3, Jan. 15, 1920, pp. 118-123. Over 120 cars are listed, and specifications refer to systems of lubrication, carburation, ignition, electric system transmission nature of running gear, type of bearings, etc.

Parts, Machining on Automatic. Ford Mult-au-matic Practice, Edward K. Hammond. Machy. (N. Y.), vol. 26, no. 4, Dec. 1919, pp. 299-308, 18 figs. In machining automobile parts on Bullard mult-au-matics.

BOILER FIRING

BRIDGES, RAILWAY

NIAGARA, REINFORCEMENT OF. Niagara Railway Arch Reinforced for Heaviest Traffic. Eng News-Record, vol 83, no. 19, Nov. 13-20, 1919, pp. 877-881, 4 figs. Stresses in 550-ft. arch span were redistributed by changing crown shims. Floor was reconstructed for E 70 loading.

PLATTE RIVER, RECONSTRUCTION OF. Platte River Bridge Reconstruction, Rock Island Lines. Eng. News-Rec., vol. 84, no. 6, Feb. 5, 1920, pp. 287-289, 5 figs. Pile-bent piers with concrete caps to carry girder-spans, and sheathed pile bents fitted with pile breakers, are prominent features of design.

BRONZES

ALUMINUM, INGOT-CASTING METHOD. Further Progress in Ingot Production, Charles Meigh. Metal Industry (Lond.), vol. 16, no. 4, Jan. 23, 1920, pp. 61-62, 3 figs. Method of casting alloy aluminum bronzes at low temperature with minimum fall and exposure to air, while molten, and automatic feed.

MANGANESE, METALLURGY OF. Metallurgy of Manganese Bronze, Ernest J. Davis. Foundry, vol. 48, no. 3, Feb. 1, 1920, pp. 109-111, 4 figs. Photomicrographs indicating percentage of alpha and beta solid solutions.

PHOSPHOR BRONZE, TESTING. The Testing of Phosphor Bronze, Leslie Aitchison. Metal Industry (London), vol. 15, no. 26. Dec. 26, 1919, pp. 525-526. Opinion is expressed that Brinell test or scleroscope test should be disregarded for cast phosphor bronze and that metal should be passed upon tensile test.

BUILDINGS

VIBRATION PREVENTION. Means Employed for preventing Transmission of Vibrations to Buildings (Moyens d'empêcher la transmission des vibrations aux bâtiments). Industrie Electrique, vol. 29, no. 661, Jan. 10, 1920, pp. 1-2, 6 figs. Gerb anti-vibrator and other types are described.

BUREAU OF MINES

EXPERIMENT STATIONS. Experiment Stations of the Bureau of Mines Van H. Manning. Bur. of Mines, bul. 175, 1919, 105 pp., 22 figs. Character of work and organization of each of the eleven mining experiment stations es a' .ished since the creation of the Bureau in 1910.

CABLEWAYS

SEMI-PORTABLE. Semi-Portable Aerial Ropeway, Engineering, vol. 109, no. 2820, Jan. 16, 1920, pp. 80-82, 20 figs. Ropeway erected to handle timber on Lond. and South-Western Ry.

CAMS

TANGENTIAL, DESIGN. Cam Design and Construction, Franklin DeR. Furman. Am. Mach., vol. 52, no. 1, Jan. 1, 1920, pp. 21-27, 14 figs. Tangential cams.

CANALS

NEW YORK STATE BARGE. The New York State Barge Canal—I and II, Frank M. Williams. Sci. Am., vol. 122, nos. 1 and 2, Jan. 3 and 10, 1920, pp. 14-15, 40-41 and 51, 13 figs. How some of engineering problems involved in construction were net, particularly that of obtaining sufficient water to provide for minimum depth at all times.(To be continued.)

CAR AXLES

See Car Wheels.

CAR FLOATS

CONCRETE. Concerte Floats Meet hard Test, W. T. Duggan. Mar. Rev., vol. 50, no. 2, Feb. 1920, pp. 88-90, 6 figs. Tests of various floats built for army-transport service and survey of uses of car floats in New York Harbor are said to have demonstrated that working of floats does not set up stresses on steel sufficient to cause fatigue of metal as it would be occasioned on the high seas.

CAR WHEELS

ENGLISH AND AMERICAN. Railway Wheels and Axles, T. H. Sanders. Engineering, vol. 109, no. 2820, Jan. 16, 1920, pp. 99-100. Certification of types used in English and American practice, and discussion of tests to which wheels and axles are submitted before acceptance by railway authorities. Paper read before Sheffield Section of Jl. Instn. of Engrs.

CARBON

ACTIVATION OF. The Activation of Carbon, N. K. Chaney. Chem. Engr., vol. 28, no. 1, Jan. 1920, pp. 19-22. Technical study of method of activation by differential oxidation.

CARBURETORS

PREHEATING AND ATOMIZING IN. Preheating and Atomizing in Carburetors (Etude du réchauffage et de la pulvérisation dans les carburateurs), M. Carbonaro. Génie Civil, vol. 76, no. 4, Jan. 24, 1920, pp. 93-97, 6 figs. Influence of these processes upon the condition of mixture at the moment of admission into cylinder. It is concluded that preheating has no action except in case of very long piping and in case of motors running at very low speeds; in all cases improvement due to preheating is calculated never to exceed 40 per cent. (To be continued.)

CARS, FREIGHT

HARTEND GENERAL SERVICE TYPE. Hartend General Service Car, and Hart Door Gear. Ry. Mech. Eng., vol. 94, no. 1, Jan. 1920, pp. 51-52, 2 figs. Between bolster and end sill at either end floor plates are sloped downwardly and outwardly from center sill, thus forming hopper at each corner of car. Outer sides of these hoppers are closed by swinging doors hinged at top and closed and locked by hand.

INSPECTION OF. The Inspection of Freight Equipment, L. K. Sillcox. Ry. Mech. Engr., vol. 94, no. 2, Feb. 1920, pp. 93-96, 2 figs. Defects that must be avoided in selection of freight cars for certain commodities.

CARS, REFRIGERATOR

COMPARATIVE TESTS. Comparative Tests of Refrigerator Cars, Ry. Mech. Engr., vol. 94, no. 1, Jan. 1920, pp. 28-32, 5 figs. Temperature readings in actual service on cars equipped with overhead and end ice bunkers.

STANDARD TYPE. The Development of a Standard Refrigerator Car, M. E. Pennington. A.S.R.E. Jl., vol. 6, no. 1, July, 1919, pp. 1-12 and (discussion), pp. 12-24, 7 figs. Essentials laid down by railroad administration Mechanical Department Circular No. 7.

CEMENT

HANDLING IN BULK. Handling and Storing Bulk Cement Wallace R. Harris. Jl. Western Soc. Engrs., vol. 24, no. 1, Jan. 1919, pp. 21-26 and (discussion), pp. 26-30, 8 figs. Saving effected by handling cement in bulk are pointed out and various schemes for bulk handling of cement are outlined.

CEMENT MANUFACTURE

WET PROCESS. Latest Development in Wet Process Portland Cement Plants. Rock Products, vol. 23, no. 1, Jan. 3, 1920, pp. 48-56, 29 figs. Plant at Greencastle, Ind., which is laid out to fu nish capacity of 1200 to 1500 bbl. of cement per 24 h.

OPERATING RATIO DECREASE. Central Station Operating Ratio Decreasing, Elec. World, vol. 75, no. 5, Jan. 31, 1920, pp. 260-261, 5 figs. Claims that in spite of increasing costs of labor and materials, manufacturing and distribution costs per kilowatt-hour are now on decline.

See also Electric Plants; Heating, District Heating Service.

CHARTS

WEIGHT OF ROUND BARS. Weight Chart for Bar Stock Articles, Hans Ernest. Am. Mach., vol. 52, no. 7, Feb. 12, 1920, pp. 351, 1 fig. Chart for determining length and weight of round stock.

WEIGHTS OF RODS AND TUBES. Time-Saving Tube and Rod Chart, Melvin D. Casler. Am. Mach., vol. 52, no. 2, Jan. 8, 1920, pp. 67-70, 1 fig. For calculating weights of rods and tubes of different shapes.

CHEMICAL INDUSTRY

JAPAN. The Chemical Industry and Trade of Japan, O. P. Hopkins. Jl. Indus. & Eng Chem., vol. 12, no. 2, Feb. 1920, pp. 110-119. Efforts are said to have so far been directed mainly toward development of coal-tar industry, production of alkalies for paper, glass, textile, and soap industries, progress in metal refining and greatest possible utilization of water power in electrochemical processes.

CHEMISTRY

COLLOIDAL. Colloid Chemistry and Its Application in the Arts, Joseph V. Meigs. Chem. Age, vol. 2, no. 1, Jan. 10, 1920, pp. 325-329. Brings out how colloid chemistry furnishes clearer understanding of many manufacturing processes and their products and consequently makes possible development of former and more effective exploitation of latter.

CLAY

FOUNDRY, TESTS OF. How to Test Clay for Foundry Use, Homer F. Staley. Foundry, vol. 48, no. 3, Feb. 1, 1920, pp. 101-102. Opinion is expressed that time of slaking bonding power, vitrification temperature and softening point rather than chemical analysis are factors which determine adaptability of clays for this prupose. Paper presented before American Foundrymen's Assn.

CLOCKS

ERRORS IN PRECISION TIMEPIECES. Errors in Timepieces of Precision, E. P. Cotton. Surveyor (Sydney), vol. 32, no. 1, Feb. 28, 1919, pp. 10-16, 1 fig. Records of two clocks at Besançon observatory are given to illustrate variations of their daily mean rate.

CLUTCHES

DESIGN. Clutch Design, H. M. Brayton, Machy. (N. Y.), vol. 26, no. 5, Jan. 1920, pp. 415-418, 4 figs. Analysis of forces which must be considered in designing multiple disk, cone, and toother clutches, and application of inclined plane principle to tooth form of solenoid-operated clutch.

COAL

BITUMINOUS, WASHING TESTS OF. Washing Tests of a Bituminous Coal, H. F. Yancey and Thomas Fraser. Coal Industry, vol. 3, no. 1, Jan. 1920, pp. 32-36, 3 figs. Tests made in laboratories of University of Ill. to determine methods for washing clover-run coal from Mahaffy, Pa.

COPPER

Export and Import. *See Iron, Export and Imports.*

COPPER ALLOYS

Copper-Antimony. Expansion of Copper-Antimony Alloys (Sur la dilatation des alliages cuivre-antimoine), Paul Braesco. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 2, Jan. 12, 1920, pp. 103-105, 2 figs. Experimental measurement of coefficient of expansion of tempered and preheated samples of different compositions of copper-antimony alloys at temperatures between 100 and 300 deg. cent.

Copper-Silicon. The Alloys of Copper and Silicon, A. Sanfourche. Foundry Trade Jl., vol. 22, no. 217, Jan. 1920, pp. 52-53, 1 fig. Maximum in liquidus curve is interpreted to have composition $Cu_{13}Si_4$ and Y crystals to be definite compounds of composition $Cu_{19}Si_4$. Translated from Revue de Métallurgie.

CORES

Electrically Heated Ovens for. Tests Conducted of Electrically Heated Core Ovens. Iron Age, vol. 105, no. 3, Jan. 15, 1920, pp. 193-195, 3 figs. Current used and weight of cores baked per kilowatt.

COST ACCOUNTING

See Factory Management, Routing.

COST SYSTEMS

Forms for. A Cost System that Guides Policies, William R. Rassett and S. R. Gordon. Factory, vol. 24, no. 1, Jan. 1920, pp. 43-48, 7 figs. Forms for charge register, expense analysis, distribution, payroll, etc. Their use in knitting mill is explained.

Requirements for Success. Advantages of Uniformity in Costs, C. E. Knoeppel. Foundry, vol. 48, no. 4, Feb. 15, 1920, pp. 133-135. Writer maintains that an accurate cost system based on uniform plan is only successful when it serves with equal fidelity sales, production and financial departments.

CRANKSHAFTS

Diesel-Engine, Machining. Machining Diesel Engine Crankshafts. Motorship, vol. 5, no. 2, Feb. 1920, pp. 122-123, 3 figs. Method patented by John M. Larsen, N.Y.C., in which operations carried out in drilling, planning and slotting machines are eliminated.

Stresses in. Stresses in Crankshafts, Victor M. Summa. Machy. (N.Y.), vol. 26, no. 3, Nov. 1919, pp. 240-241, 3 figs. Calculations involved in design of shaft of uniform strength.

CREDIT

Equating Value of Credit Instruments. Can the Standard Measure of Value be Improved? Jl. Eng. Inst. of Canada, vol. 2, no. 11, Nov. 1919, pp. 720-727. Urges enacting and suggests draft of act "for equating of the value of letters of credit and promises to pay, which change in value on account of the fluctuation of the value of the dollar."

CUPOLAS

Combustion Process in. Combustion Process in a Foundry Cupola and the Predetermination of Gas Composition (Der Verbrennungsvorgang im Giessereischachtofen (Kupolofen) und die Vorausbestimmung des Zusammensetzung der Gichtgase), Bernhard Osann. Giesserei Zeitung, vol. 16, no. 15, Aug. 1, 1919, pp. 225-230, 3 figs. Writer seeks to demonstrate that when gas is composed of a large quantity of carbon monoxide and small quantity of carbon dioxide, absolute amount of carbon burned to carbon dioxide is not diminished.

CUTTING METALS

Barth Slide Rules. Supplement to Frederick W. Taylor's "On the Art of Cutting Metals"—VI, Carl G. Barth. Indus. Management, vol. 59, no. 2, Feb. 1920, pp. 153-155, 2 figs. Construction and operation of lathe slide rule for cutting steel.

Stellite Tools for. How to Use Stellite, G. L. Kronfeld. Am. Mach., vol. 52, no. 6, Feb. 5, 1920, pp. 293-295, 11 figs. Rakes recommended for stellite tools.

CUTTING TOOLS

Formed, Formulae for. Formulas for Formed Tools, W. E. Thompson. Machy. (N.Y.), vol. 26, no. 5, Jan. 1920, pp. 424-428, 8 figs. Also Machy. (Lond.), vol. 15, no. 381, Jan. 15, 1920, pp. 493-495, 8 figs. Angular position of tools used for planing formed tools. Calculations for making circular tools used on automatic screw machines.

CYANIDING

Cheap Processes for. Some Aspects of Cheap Cyanide Processes, Herbert Phillipp. Chem. & Metallurgical Eng., vol. 22, no. 7, 18, 1920, pp. 313-317. Reviews developments made in cyanide synthesis, and improvements made in ferrocyanide process.

New Type of Cyanide. A New Cyanide, W. S. Landis. Chem. & Metallurgical Eng., vol. 22, no. 6, Feb. 11, 1920, pp. 265-268. Development of process at plant of American Cyanamid Co. is illustrated by quoting that while in 1917 there was produced approximately 2,187,000 lb. equivalent of 100 per cent sodium cyanide, in 1918 this grew to 2,350,000. In 1919, during the seven months the plant operated, it produced at rate of 4,000,000 lb. per year. Account is given of experiments conducted and modifications introduced in design of furnace which resulted in so great an increase of production.

CYLINDERS

Automobile, Machining. How We Make Automobile Cylinders, Fred H. Colvin. Am. Mach., vol. 52, no. 3, Jan. 15, 1920, pp. 123-126, 10 figs. Survey of Methods in different shops in United States.

Impeller Pump, Machining. Machining Impeller Pump Cylinders. Machy. (N.Y.), vol. 26, no. 4, Dec. 1919, pp. 330-331, 5 figs. Also Machy. (Lond.), vol. 15, no. 383, Jan. 29, 1920, pp. 552-553, 5 figs. Methods employed for facing flanges, drilling and tapping flange holes, and boring cylinder.

Steel, Stresses During Tempering. Method of Determining Tensions in a Circular Cylinder (Méthode de détermination des tensions existant dans un cylindre circulaire), M. Mesnager. Comptes rendus des Séances de l'Académie des Sciences, vol. 169, no. 26, Dec. 29, 1919, pp 1391-1393. Suggested procedure for determining stresses developed in steel cylinder during tempering.

Tractor, Machining. Machining Cylinders for the Fordson Tractor, Fred. H. Colvin. Am. Mach., vol. 52, no. 6, Feb. 5, 1920, pp. 269-273, 15 figs. Types of continuous milling machines used.

DIE MAKING

Die-Sinking Machine. Becker Die-Sinking Machine. Machy. (N.Y.), vol. 26, no. 3, Nov. 1919, pp. 277-278, 3 figs. Attention is especially called to feature of machine which allows operator, standing in his position at front of machine, to operate all hand and power feeds conveniently.

Swaging-Machine Dies. The Swaging Machine and Toolroom Methods of Making the Dies, W. E. Thompson. Am. Mach., vol. 52, no. 6, Feb. 5, 1920, pp. 275-277, 7 figs. Toolroom method for producing dies used in swaging machine and for reducing and shaping steel and other wires.

DIE STOCKS

Machining. Machining Operations on Die Stocks, J. V. Hunter. Am. Mach., vol. 52, no. 5, Jan. 29, 1920, pp. 231-232, 3 figs. Methods used by Reed Mfg. Co., Erie, Penn., in manufacturing die stocks for pipe dies.

DIES

Trimming and Shaving. Adjustable Trimming and Shaving Dies, Frank A. Stanley. Am. Mach., vol. 52, no. 4, Jan. 22, 1920, pp. 177-180, 9 figs. Method of blanking, trimming and shaving set of nine steel cams for calculating machine, cams varying in length throughout group of nine parts.

Combined Trimming and Shaving Dies, Frank H. Stanley. Am. Mach., vol. 52, no. 6, Feb. 5, 1920, pp. 297-299, 10 figs. Forms of shaving dies combined with piercing tools.

Lubrication of. Approved Methods of Diesel-Engine Lubrication, R. C. DeMary. Elec. Rev. (Chicago), vol. 76, no. 5, Jan. 31, 1920, pp. 188-190. Advocates use of asphalt-base oil with graphite.

DILUTION

Law of, Investigations on. Some Recent Investigations on the Dilution Law J. R. Partington. Trans. Faraday Soc., vol. 15, part 1, Dec. 1919, pp. 98-121. Survey of technical literature on dilution law which has appeared since 1910.

DISSOCIATION

Electrolytic. Some Aspects of the Electrolytic Dissociation Theory, Nil Ratan Dhar. Trans. Faraday Soc., vol. 15, part 1, Dec. 1919, pp. 81-93. Discusses hypothesis on conditions of dissolved electrolytes put forward by Snethlage (Zeit. phys. Chem., 1915, 90, 1, 139).

DRILLS

Tap. Tap Drills, Clearances and Tolerances, Walter J. Rudolph. Am. Mach., vol. 52, no. 2, Jan. 8, 1920, pp. 65-66. Tables of tolerances and clearances.

DRINKING WATER

Sanitary Fountains for. Final Report of the Committee on Sanitary Drinking Fountains of the Iowa Section of the American Water Works Association. Jl. Am. Water Works Assn., vol. 7, no. 1, Jan. 1920, pp. 33-40. It is concluded from experiments that (1) all types of drinking fountains with vertical jets are to be condemned, (2) most types of drinking fountains with slanting jets are to be condamned and (3) to be sanitary, jets should be slanting and orifices of jet s should be perfected in such a manner that they cannot be touched by fingers or lips, or contaminated by droppings from mouth or by splashings from basins beneath orifices.

DRY DOCKS

Caisson Gates for. Lowering a 400-Ton Dock Caisson Gate with Sand Jacks, G. W. Plaisted. Eng. News-Rec., vol. 83, no. 19, Nov. 13-20, 1919, pp. 886-890, 8 figs. Tests on manipulation of sand jacks are said to have led to their use in placing gate to Navy's Puget Sound shipbuilding dock.

Structural Design of Caisson Gates for Dry Docks, Eugene E. Jalmos. Eng. News-Rec., vol. 84, no. 2, Jan. 8, 1920, pp. 89-91, 1 fig. Theoretical design, using method of least work with practical application to actual caisson structure.

Floating. A 50,000-Ton Floating Dock, Shipbuilder, vol. 22, no. 113, Jan. 1920, pp. 16-23, 5 figs., partly on supp. plate. Dock has overall length of 218 m., clear width of 44.5 m. and draft over keel-blocks of 12 m. Pumping machinery designed to lift vessel of 45,000 tons displacement and 9 m. draft in 3 hr.

Floating Dry Docks, G. B. Canaga. Freight Handling & Terminal Eng., vol. 6, no. 1, Jan. 1920, pp 17-22, 2 figs. Considerations which determine dimensions of floating docks, together with remarks in regard to stresses in them. Reference is made to various 10,000-ton docks now building by Emergency Fleet Corp. Paper read before Soc. Terminal Engrs.

TROLLEY FREIGHT IN NEW ENGLAND. Trolley Freight in New England, R. E. Cosgrove. Elec. Ry. Jl., vol. 55, no. 4, Jan. 24, 1920, pp. 197-199. Business is said to be constantly growing in spite of motor-truck competition and to amount now to more than $2,000,000 per year. Writers gives suggestions regarding equipment, schedules and other details.

ELECTRIC TRANSMISSION LINES

1100-MILE LINE, CALIFORNIA. Proposed Transmission Line for California, R. W. Sorenson, H. H. Cox and G. E. Armstrong. Eng. World, vol. 16, no. 3, Feb. 1, 1920, pp. 127-130, 4 figs. Salient features of 220-kw. line to transmit 1,500,000 kw. 1100 miles.

ELECTRIC WELDING, ARC

APPLICATIONS. Application of Electric Arc Welding—I, C. B. Auel. Indus Management, vol. 59, no. 2, Feb. 1920, pp. 107-116, 19 figs. Apparatus used is described and applications of welding to repairing of flywheels, locomotive frames, etc., are illustrated.

CAST IRON. Restoring Cast Iron Cylinder by Electric Welding Process. Mar. News, vol. 6, no. 9, Feb. 1920, p. 97, 3 figs. Work involved operation of arc on working surface of cylinder and was done without removing cylinder from engine.

Welding Cast Iron With the Electric Arc, Otis Allen Kenyon. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 12-16, 17 figs. Typical illustrations of welding methods and suggestions in regard to overcoming brittleness and cracking.

RAILWAY REPAIR WORK. Electric Arc Welding in Railroad Maintenance, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 11, no. 1, Jan. 1920, pp. 21-28, 38 figs. Illustrating repairing and recovery of locomotives, frames members, axles, couplers, knuckles, car bolsters, etc.

ELECTRIC WELDING, RESISTANCE

SPOT WELDERS. The A-1 Electric Spot Welders. Iron and Coal Trades Rev., vol. 100, no. 2707, Jan. 16, 1920, pp. 79-80, 5 figs. Standard type constructed by A-1 Manufacturing Co., which has welding capacities for mild steel from 1-64 in. up to 7-8-in. made-up thickness.

ELECTRICAL INDUSTRY

DEVELOPMENT IN 1919. Some Developments in the Electrical Industry During 1919, John Liston. Gen. Elec. Rev., vol. 23, no. 1, Jan. 1920, pp. 4-56, 118 figs. Among prominent developments recorded are electric propulsion equipment installed on board marine ships, 265-ton gearless passenger locomotive built for Chicago, Milwaukee & St. Paul, 60-cycle, 500-kv-a. automatic hydro-electric generators, and direct current welding which delivers current directly to arc without use of any form of ballast resistance or external regulation device.

ELECTRICAL MACHINERY

DIPPING AND BAKING COILS. An Almost Laborless Dipping and Baking Plant. Elec. Ry. Jl., vol. 55, no. 8, Feb. 21, 1920, pp. 386-387, 5 figs. Equipment of International Ry., Buffalo, for dipping and baking armatures and field coils.

ELECTRICAL MEASUREMENTS

INDUCTANCE AND CAPACITY. A Universal Inductance and Capacity Testing Bridge, C. V. Drysdale. Elecn., vol. 84, nos. 2175 and 2176, Jan. 23 and 30, 1920 pp. 80-82, 12 figs., and 108-109, 9 figs. Consists of plain four-arm Wheatstone bridge, each arm being provided with four coils of 1, 10, 100 and 1000 ohms. Article describes manner of conducting tests and of measuring electrolytic resistance.

ELECTRIFICATION

See Railway Electrification.

ELECTROLYTIC CELLS

RESISTANCE OF. The Resistance of an Electrolytic Cell, E. Newberry. Trans. Faraday Soc., vol. 15, part 1, Dec. 1919, pp. 126-136. Experimental determination of that part of irreversible resistance of electrolytic cell which is concerned in transfer of current from electrode to electrolyte in various types of cells.

ELECTROMAGNETIC WAVES

TRANSMISSION ABOUT EARTH. The Transmission of Electro-Magnetic Waves About the Earth, J. Erskine-Murray. Wireless World, vol. 7, no. 83, Feb. 1920, 651-664, 15 figs. Survey of researches by different experimenters. Paper read before Wireless Soc. of Lond.

ELECTROPLATING

COPPER. Metal Plating, W. G. Knox. Metal Industry (N. Y.), vol. 18, no. 1, Jan. 1920, pp. 14-15, 1 fig. Compilation of tables showing time required to deposit given thickness of copper.

ELECTROTHERAPY

PRINCIPLES AND TECHNIQUE. The Physical Principles and the Technique of Electrotherapy (Die physikalischen Grundlagen und die Technik der Elektrotherapie), K. Bangert, Elektrotechnische Zeitschrift, vol. 40, nos. 41 and 42, Oct. 9 and 16, 1919, pp. 508-511 and 520-523, 7 figs. Suggests co-operation of physicians, physicists and technical engineers and outlines briefly a joint course based on physical principles. Some of the subjects discussed are: The human body as line resistance, qualitive and quantitative measurements, the electrodes, electro-medical apparatus, Röntgen rays, etc. Address delivered before Electrotechnical Society.

EMPLOYEES

SAVINGS SYSTEMS FOR. Systematizing Thrift Among Employees, F. R. Hickman. Iron Age, vol. 105, no. 2, Jan. 8, 1920, pp. 133-134. Saving system operated by Locomobile Co. is said to prove effective.

The Solvay Thrift Plan for Industrial Employees, H. W. Jordan. Iron Age, vol. 105, no. 8, Feb. 19, 1920, pp. 543. Voluntary savings of employees deposited to individual accounts by weekly check from employing company.

EMPLOYEES' REPRESENTATION

COLORADO FUEL & IRON CO. PLAN. Successful Trial of Industrial Representation Plan, E. S. Cowdrick. Indus. Management, vol. 59, no. 2, Feb. 1920, pp. 123-125. Colorado plan approved by employees and directors of Colorado Fuel and Iron Co. in 1915 after the bitter strike of 1913.

PASSAIC METAL WARE CO. SYSTEM. Representative Government in a Manufacturing Plant, J. J. Calahan. Machy. (N. Y.), vol. 26, no. 3, Nov. 1919, pp. 256-258. Experience of Passaic Metal Ware Co. where system of management is modeled after government of United States. Senate, which is composed of foremen, heads of departments, or supervisors, elects whatever committees are needed. Employees throughout plant elect members of House, each class of workers being represented.

EMPLOYEES, TRAINING OF

TEXTBOOKS FOR. Text Books Used to Educate Employees. Iron Age, vol. 105, no. 5, Jan. 29, 1920, pp. 334, 335. Manuals prepared by Am. Inst. Corp.

EMPLOYMENT MANAGEMENT

BIBLIOGRAPHY ON. Progress in Industrial Personnel, Eugene J. Benge. Iron Age, vol. 105, no. 8, Feb. 19, 1920, pp. 541-543, 3 figs. Bibliography including articles in current journals, military publications and books.

FORMS USED. How One Manufacturer Handles Labor, Robert I. Clegg. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 27-31, 25 figs. Forms used by employment department of Graton & Knight Mfg. Co.

WESTINGHOUSE ELEC. & MFG. CO. METHODS. Westinghouse Employment Department, John C. Bower. Machy. (N. Y.), vol. 26, no. 3, Nov. 1919, pp. 243-246, 8 figs. Methods used by Westinghouse Elec. & Mfg. Co., East Pittsburgh, Pa., in hiring men and in retaining working force. Records kept in employment department are illustrated.

ENGINEERS

BUSINESS TRAINING FOR. Commercial Engineering, Glen Levin Swiggett. Department of the Inter. Bur. of Education, bul., 1919, no. 58, 180 pp., 5 figs. Report of conference on business training for engineers and engineering training for students of business.

CLASSIFICATION. Classification and Compensation of Engineers. Mech. Eng., vol. 42, no. 2, Feb. 1920, pp. 138-140. Report of Engineering Council committee proposing classification of engineering positions in federal, state, country, municipal and railroad services.

COMPENSATION OF. Engineering Council's Committee Reports on Compensation of Engineers. Eng. News-Rec., vol. 84, no. 3, Jan. 15, 1920, pp. 117-121, 1 fig. Presents uniform grading plan for "professional" and "sub-professional" services. Standard salary schedule is submitted and duties and titles are defined.

Low Pay of City and State Engineers Disclosed by Answers to Questionnaire. Eng. News-Rec., vol. 84, no. 5, Jan. 29, 1920, pp. 217-221. Report of State, County and Municipal Sections of Engineering Council Committee on Classification and Compensation of Engineers, based on statements from engineers in service of 35 states and 66 cities in United States.

See also Classification.

NEEDS OF, IN GOVERNMENT ADMINISTRATION. The Engineer in National Affairs, Herbert C. Hoover. Chem. & Met. Eng., vol. 22, no. 7, Feb. 25, 1920, pp. 349-352. Writer suggests outline of national policy with regard to railroads, shipping and industrial relations, and points out need of engineering thinking in Government administration. Presidential address at meeting of Am. Inst. Min. & Met. Engrs.

EVAPORATORS

AIR-PUMP CAPACITIES REQUIRED. Air-Pump Capacities and Incondensible-Gas Volumes in Industrial Vacuum-Evaporator Plant, Edward Corner. Engineering, vol. 109, no. 2820, Jan. 16, 1920, pp. 74-75, 3 figs. Theoretical principles implied in derivation of empirical formulæ.

EXPLOSIONS

COAL-DUST, STEEL MILLS. Steel Mill Coal Dust Explosion Hazards, L. D. Tracey. Blast Furnace & Steel Plant, vol. 8, no. 2, Feb. 1920, pp. 147-148. Results of tests and investigations made by U. S. Bur. of Mines in ascertaining liability of coal dust causing explosions.

EXPORT TRADE

PACKING FOR. Packing for Domestic and Export Shipping, Harry N. Knowlton. Am. Mach., vol. 52, no. 7, Feb. 12, 1920, pp. 323-326. Economic aspect of good packing.

See also Machine-Tool Industry, South American Trade; Spanish Trade; Swedish Trade.

FATIGUE

FERRIES

FERROALLOYS

FIREBRICK

FLOW OF WATER

POWER HOUSES. Power House Foundations, E. M. Lurie. Power Plant Eng., vol. 24, no. 3, Feb. 1, 1920, pp. 167-173, 7 figs. Suggestions in regard to testing soils, methods of compacting, column footing, and draining.

FOUNDRIES

ACID-STEEL. New Acid Steel Foundry at Alliance, Ohio. Iron Age, vol. 105, no. 7, Feb. 12, 1920, pp. 457-460, 5 figs. Attention is directed to method employed in conserving water supply and specially designed bearings used on cars for mold drying ovens.

ALUMINUM-CASTINGS. Modern Foundry for Aluminum Castings, F. L. Prentiss. Iron Age, vol. 105, no. 8, Feb. 19, 1920, pp. 535-539, 10 figs. System of conveyors for handling castings as well as sand installed at plant of Aluminum Manufacturers, Inc.

AUTOMOBILE-CYLINDER. Plant for Casting Automobile Cylinders. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 23-26, 6 figs. Attention is directed to arrangement permitting molding machine to travel and equipment for handling sand from bins along side.

INCREASING OUTPUT, METHODS FOR. Foundry Reduces Unit Cost of Manufacture, Gilbert L. Lacher. Iron Age, vol. 105, no. 3, Jan. 15, 1920, pp. 191-193, 1 fig. Piece-work system and improvements in material-handling methods and molding practice are said to have increased output per employee.

SAND-HANDLING EQUIPMENT. Modern Foundry Sand Handling Equipment, H. L. McKinnon. Metal Industry (Lond.), vol. 16, no. 5, Jan. 30, 1920, pp. 83-84, 2 figs. Use of rubber conveyor belt is recommended because it is said to possess smooth operating surface which cannot become impregnated with sand and which resists wear for long period.

FRAMES

RIGID, ECCENTRICALLY LOADED. Eccentric Loading in Rigid Frames, F. L. Richart. Eng. News-Rec., vol. 84, no. 7, Feb. 12, 1920, pp. 331-332, 4 figs. Explains how fundamental frame formulæ may be applied when columns of frame have loads applied eccentrically.

FREIGHT HANDLING

MECHANICAL METHODS. Electric Auto-Mechanical Freight Handling, Zenas W. Carter. Ry. Rev., vol. 66, no. 8, Feb. 21, 1920, pp. 282-284. Gattie system in London and Cincinnati schemes are outlined as typical of installations and possibilities of mechanical freight handling. Paper read before N.Y.R.R. Club.

FUEL OIL

BURDON OIL-GAS FIRING SYSTEM. The Burden Oil-Gas System. Iron & Coal Trades Rev., vol. 100, no. 2708, Jan. 23, 1920, p. 115, 2 figs. In Burdon system of oil firing oil is broken up finely by high-pressure air, or air and steam in combination working through atomizer attached direct to furnace.

COSTS, HEATING VALVES, BURNERS, ETC. Oil Fuel, F. W. Staley. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 26, no. 1, Jan. 1920, pp. 73-83. Data of comparative costs of various fuels, solid and liquid, heat value of different fuel oils, and also classification and outline of types of oil burners.

FUEL OIL VS. STOKER-FIRED COAL. Fuel Oil Versus Coal on Mechanical Stokers, F. H. Daniels. Iron Age, vol. 105, no. 3, Jan. 15, 1920, pp. 203-204, 1 fig. Chart to determine what price of oil of different grades must be to compete with coal of various grades at varying prices.

TEXTILE MILL INSTALLATIONS. Fuel Oil in Textile Mills, J. J. Tyrrell. Textile World Jl., vol. 57, no. 6, Feb 7, 1920, pp. 465-467, 3 figs. Installations in New England.

FUELS

COLLOIDAL. Colloidal Fuel, London W. Bates. Can. Chem. Jl., vol. 41, no. 2, Feb. 1920, pp. 40-47. Nature of colloidal fuel, its development during war, results by trial, with review of its present and future general industrial possibilities.

LIQUID, SPONTANEOUS IGNITION OF. Spontaneous Ignition-Temperatures of Liquid Fuels, Harold Moore. Petroleum Times, vol. 3, nos. 55 and 56, Jan. 24 and 31, 1920, pp. 101-103 and 123-124. Results of experiments (with table) conducted to determine property of oils originating from coal tars, which causes their spontaneous ignition. Paper read before Instn. of Petroleum Technologists

See Pulverized Coal, Fuel Oil.

FURNACES, ELECTRIC

See Electric Furnaces.

FURNACES, HEATING

FORGING WORK. A Review on Designs of Forge Furnaces, H. B. Dempsey. Am. Drop Forger, vol. 6, no. 1, Jan. 1920, pp. 22-24, 7 figs. It is emphasized that accurate temperature control is absolutely necessary to obtain best results in forge work.

GAS-FIRED. Multi-Flame and Rotary-Flame Gas-Fired Furnaces. Iron and Coal Trades Rev., vol. 100, no. 2706, Jan. 9, 1920, pp. 40-41, 4 figs. Chantraine patent. It is built with double roof, space between two arches forming hot air chamber. Furnace is built with athermanous blanket of gas into which jets of hot air are directed.

REHEATING. Recuperative Furnaces for Re-Heating, N. R. Rees. Iron & Coal Trades Rev., vol. 100, no. 2709, Jan. 30, 1920, pp. 139-146, 1 fig. Types used for metallurgical purposes. Paper read before Staffordshire Iron & Steel Inst.

FURNACES, HEAT-TREATING

CARBONIZING. Carbonizing Furnaces, Theodore G. Selleck. Jl. Am. Steel Treaters Soc., vol. 2, no. 4, Jan. 1920, pp. 206-213, 4 figs. Suggested form of construction

FURNACES, INDUSTRIAL

FUEL COSTS. Fuel Consumption and Its Wastes as Affected by the Proper Use of Pyrometers and the Design of Furnaces, Claude S. Gordon. Jl. Am. Steel Treaters Soc., vol. 2, no. 5, Feb. 1920, pp. 241-250. Includes table giving relative and theoretical cost of energy in various fuels. Results of tests on three different nut stamping furnaces.

GAS-FIRED. Improvement in the Construction of Furnaces, Newton Booth and G. H. Roberts. Gas Jl., vol. 149, no. 2959, Jan. 27, 1920, pp. 188-189. Experiments are related and from results obtained rules are formulated as guide for designing gas furnaces to work at high temperatures with "reasonably high thermal efficiencies." Paper read before Instn. Gas Engrs.

GAGES

PRECISION-BALL, INSPECTION OF. Use of Precision Balls for Accurate Measurements, R. L. Rankin. Machy. (N. Y.), vol. 26, no. 3, Nov. 1919, pp. 236-238, 6 figs. Practice of U. S. Bur. of Standards in use of precision balls as attachments for machines and for taking direct measurements in inspection of gages.

SCREW-THREAD. Thread Gage Standards, J. E. Collins. Machy. (N. Y.), vol. 26, no. 5, Jan. 1920, pp. 427-433, 6 figs. System for thread plug and ring gages for U. S. standard threads.

SNAP, PLUG AND RING. Snap, Plug and Ring Gages, J. E. Collins. Machy. (N.Y.). vol. 26, no. 3, Nov. 1919, pp. 212-218, 10 figs. Methods of construction, proportion, tolerances, etc. Article is based upon practice of Gage Division of Ordnance Department during war.

Making Special Snap Gages, John Teckeer. Am. Mach., vol. 52 no. 2. Jan. 8, 1920, pp. 83-85, 5 figs. Fixtures for grinding large and small snap gages so that they will not have to be remade on account of warping. Method of regulating pull of magnetic chuck is also given.

TAPER, MEASUREMENT OF. The Measurement of Taper Gages. Inspector, vol. 2, no. 1, Dec. 15, 1919-Jan. 15, 1920, pp. 5-11, 9 figs. Methods commonly applied by Gage Section, U. S. Bureau of Standards, for measuring simple tapered plug, plug having double taper, plug having triple taper, taper ring gages and profile gages having tapered surfaces.

GARBAGE DISPOSAL

WASTE RECLAMATION AND. Garbage Disposal and the Economic Recovery of Valuable Constituents of Municipal Waste, Samuel A. Greeley. Mun. & County Eng., vol. 58, no. 1, Jan. 1920, pp. 22-26, 2 figs. Writer observes that garbage disposal should be considered with a view to economic recovery of valuable constituents, but he warns that lure of profit should not overshadow development of operation for convenience and comfort of householder and for economy of collection.

See also Refuse Disposal.

GAS MANUFACTURE

BY-PRODUCT RECOVERY. Rochester By-Product Activity, R. E. Krueger. Gas Age, vol. 45, no. 2, Jan. 26, 1920, pp. 59-65, 6 figs. Experience of Rochester Gas and Electrical Corp. in recovery, utilization and marketing of by-products produced in making gas.

COAL COSTS FOR VARIOUS SYSTEMS. Net Cost of Coal for Various Systems of Gasification. Gas Jl., vol. 148, no. 2953, Dec. 16, 1919, pp. 604-605, 5 figs. Charts indicating net cost of coal and cost of B.t.u. delivered to consumer, prepared for prices from $5.00 to $11.00 per ton. (Concluded.)

HEATING VALUE INDICATOR. Heating Value Indicator, Edward J. Brady. Gas Industry, vol. 20, no. 1, 1920, pp. 27-29. Flame is burned with continually increasing ratio of air to gas. When yellow tip disappears heating value is read off from prepared scale.

GAS PIPE

CAST IRON, JOINTS FOR. Cast Iron Pipe Joints. Natural Gas & Gasoline Jl., vol. 14, no. 1, Jan. 1920, pp. 13-16. Recommendations made by Am. Gas Assn. Committee appointed for purpose of preparing satisfactory design for joints for cast-iron mains.

GASES

FLOW RATE, MEASUREMENT OF. The Effect of Pressure and Temperature on a Meter for Measuring the Rate of Flow of a Gas, N. W. McLachlan. Phys. Soc. of London, vol. 32, part 1, Dec. 15, 1919, pp. 1-20, 11 figs. Theory of instrument for measuring rate of flow of gas is outlined, effects of variation of temperature and pressure of gas being taken into consideration. This theory is tested experimentally for pressures varying from 1250 to 250 mm. Hg., and for temperatures from 10 to 100 deg. cent.

FLOW THROUGH ORIFICES. Efflux of Gases Through Small Orifices, Edgar Buckingham and Junius David Edwards. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 359, Jan. 28, 1920, pp. 573-615, 8 figs., partly on 7 supp. plates.

HYDRAULIC TURBINES

HYDROGEN

Electrolytic Production of. Electrolytic Production of Hydrogen, Harry L. Barnitz. Chem. & Met. Eng., vol. 22, no. 5, Feb. 4, 1920, pp. 201-206, 8 figs. Theoretical principles involved in calculation of cell efficiency are outlined and various types of electrolytic cells for commercial production of hydrogen and oxygen are described.

Magnetic Susceptibility of. On the Magnetic Susceptibilities of Hydrogen and Some Other Gases, Také Soné. Sci. Reports Tohoku Imperial Univ., vol. 8, no. 3, Dec. 1919, pp. 115-167, 12 figs., partly on supp. plate. Account of relative measurement of susceptibility of gases in which susceptibility of pure water was taken as 0.720 x 10—6.

Ozone Form of. The Ozone Form of Hydrogen, Gerald L. Wendt. Proc. Nat. Academyjof Sciences, vol. 5, no. 11, Nov. 1919, pp. 518-521. Evidence said to establish existence of form of hydrogen which bears same ralation to ordinary hydrogen that ozone bears to oxygen.

ILLUMINATION

Daylight, Factory. Daylight Illumination in the Shops. Int. Mar. Eng., vol. 25, no. 2, Feb. 1920, pp. 122-126, 6 figs. Illustrates how "daylight factor" can be increased by devoting maximum amount of wall space to galss.

INDUSTRIAL CONDITIONS

France. French Industrial Conditions, A. L. Valentine. Machy. (N.Y.), vol. 26, no. 5, Jan. 1920, pp. 409-410. Writer expects that France will shortly get back to stable basis.

INDUSTRIAL MANAGEMENT

See Factory Management; Scientific Management.

INDUSTRIAL ORGANIZATION

Laws of. Laws of Industrial Organization—V, C. E. Knoeppel. Indus. Management, vol. 59, no. 2, Feb. 1920, pp. 145-148. It is emphasized that competence must not only prevail in industry but likewise in public offices of all kinds.

Power-Plant Employees. Efficient Organization of Power Plant Help—II, H. A. Wilcox. Power Plant Eng., vol. 24, no. 3, Feb. 1, 1920, pp. 174-176. Points out duties and responsibilities of central-station operators.

Whitley Plan for British Industries. Whitley Plan in Fifty British Industries. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 16-18. It is reported that after more than two years of agitation, 50 industries have been organized according to Whitley plan.

INDUSTRIAL RAILWAYS

See Railways, Industrial.

INDUSTRIAL RELATIONS

Collective Bargaining. Collective Bargaining in Practice, Dubley R. Kennedy. Indus. Management, vol. 59, no. 2, Feb. 1920, pp. 149-152. Argues that collective bargaining must be accepted or rejected not on its theory but on its practical application in industry: and that collective bargaining of organized labor is the closed shop with all bargaining done by trade-union officials.

Taft, Hughes and Hoover on Collective Bargaining. Indus. Management, vol. 59, no. 2, Feb. 1920, pp. 93-97. Quotations from their public addresses as reported in press despatches.

Legislation Required. View on Industrial Relations, Daniel Guggenheim. Eng. & Min. Jl., vol. 109, no. 4, Jan. 24, 1920, pp. 252-254. Legislation which affects present-day business, it is pointed out, must be such as will make proper provision for settlement of industrial disputes, compel proper living and working conditions, and eliminate industrial unrest.

Lessons of Labor Crisis. Lasting Lessons of the Labor Crisis. Indus. Management, vol. 59, no. 2, Feb. 1920, pp. 89-93 and 96a-96b. Comments on letter by Franklin K. Lane, Secretary of the Interior, to editor of Indus. Management in which Secretary Lane States that "chief delinquency in this present government" has been "lack of engineering." Efforts of industrial conference called by President are explained.

Progress in Harmonizing. Labor Statistics Give Definite Industrial Facts. Automotive Industries, vol. 42, no. 3, Jan. 15, 1920, pp. 259-267. Optimistic view is presented of labor situation and it is said that latest labor statistics show industrial conflict is not on the increase and that definite progress is being made toward peaceful settlement of industrial disputes.

Public Status in. Capital, Labor and the Public, Robert Julius Andersen. Indus. Management, vol. 59, no. 2, Feb. 1920, pp. 117-119. Points out that "we have had too much one-sidedness on this subject" of bringing capital and labor together and that before better relations can be brought about between these forces pleas of the third party, namely, the public, must be heard.

Social Unrest. Science and Social Unrest. Ernest R. Grove. Sci. Monthly, vol. 10, no. 2, Feb. 1920, pp. 157-162. Situation in the world is attributed to "impossibility of a people socially unscientific living a satisfactory life in a scientific era." The way out is foreseen to be "through popularizing of the spirit of science," that is, "socializing of science and the acceptance on the part of the scientist of his obligation as a public teacher."

See also Works Councils.

INSPECTION

Opical Methods for. Optical Aids for the Engineer, R. J. Whibley. Machy. (Lond.), vol. 15, no. 380, Jan. 8, 1920, pp. 451-459, 18 figs. Optical methods that have been developed at National Physical Laboratory. Teddington, England, for aiding inspection work in metrology department.

INSULATORS

High-Voltage. Researches in High-Voltage Insulation, Harris J. Ryan. Elec. World, vol. 75, no. 5, Jan. 31, 1920, pp. 253-256, 4 figs. Tests of suspension insulators at Leland Stanford Jr. University are said to have shown that temperature changes are most serious causes of failure.

INTERCHANGEABLE MANUFACTURE

Drawings for. Component Drawings for Interchangeable Manufacture, Earle Buckingham. Machy. (N.Y.), vol. 26, nos. 3, 4 and 5, Nov., Dec. 1919 and Jan. 1920, pp. 259-263, 18 figs., 332-336, 14 figs. and 438-442, 7 figs. Methods of dimensioning drawing and indicating tolerances.

INTERNAL COMBUSTION ENGINES

See Aeroplane Engines; Automobile Engines; Diesel Engines; Oil Engines.

IRON

Export and Import of. Iron and Copper, F. T. Eddington and F. E. Wormser. Eng. World, vol. 16, no. 3, Feb. 1, 1920, pp. 135-137. Data on movements of iron ore and pig iron to and from United States and movements of copper to and from the United States.

IRON MINING

Production in U. S. in 1919. Iron Mining in the United States. Eng. & Min. Jl., vol. 109, no. 3, Jan. 17, 1920, pp. 240-241. Production throughout various mining districts is said to have been lower than that of 1918, particularly so in Lake Superior districts where, it is quoted, shipments amounted to only about 80 per cent of that obtaining in either of two years previous.

JIGS

Indexing. A Progressive Indexing Jig. Am. Mach., vol. 52, no. 1, Jan. 1, 1920, pp. 7-9, 4 figs. Tools used in making roller cage for roller bearing of rolling mill.

KILNS

Producer-Gas-Fired. Producer Gas Solves Fuel Problem. Rock Products, vol. 23, no. 1, Jan. 3, 1920, pp. 60-62, 11 figs. Kiln designed for either wood or gas burning without change, or also combination of these two fuels.

LABOR

Periodicals Relating to. Publications Relating to Labor. Monthly Labor Rev., vol. 10, no. 1, Jan. 1920, pp. 284-303. List of official and unofficial periodicals published in U. S. Australia, Canada, France, Germany, Great Britain, India, Italy, New Zealand, Roumania and Switzerland.

Problem of. The Labor Problem, Harry Tipper. Jl. Soc. Automotive Engrs., vol. 5, no. 6, Dec. 1919, pp. 395-398 and (discussion) pp. 398-401. Historial survey of economic and social motives which have brought about present in industrial problems.

LATHES

Turret Practice. Turret Lathe Practice, Erik Oberk. Machy. (N.Y.), vol. 26, nos. 3 and 4, Nov. and Dec. 1919, pp. 227-235, 35 figs., and 344-351, 28 figs. Tooling equipment, order of operations for turret-lathe work and examples of practice. Based upon experience and practice of Gisholt Machine Co., Madison, Wis.

LEAD

Recovery from Lead Sulphate. The Problem of Reducing Lead Sulphate, F. N. Flynn. Eng. & Min. Jl., vol. 109, no. 8, Feb. 21, 1920, pp. 487-489, 1 fig. Present methods of treatment are discussed and process is suggested for recovering lead by electrolytic means.

LEAD PIPE

See Pipe, Lead.

LIGHTING

Diffuse Reflection. An Absolute Method for Determining Coefficients of Diffuse Reflection, F. A. Benford. Gen. Elec. Rev., vol. 23, no. 1, Jan. 1920, pp. 72-76, 6 figs. It is called absolute because no photometric standards are involved, brightness measurements being made with uncalibrated lamps and unknown instrument constants.

Factories. Survey of Prevailing Conditions as to Industrial Lighting—II. Elec. Rev. (Chicago), vol. 76, no. 5, Jan. 31, 1920, pp. 180-183, 7 figs. Technical and commercial data gathered from visit to 450 plants in 57 cities located in 15 of leading industrial states.

METALS

Analysis of. Analysis of Metals by Electrolysis Without Using External Source of Electrical Energy (Sur un procédé de dosage des métaux par dépôt électrolytique sans emploi d'une énergie électrique extérieure), Maurice François. Annales de Chimie, vol. 12, Sept.-Oct. 1919, pp. 178-192, 1 fig. Solution under examination is placed in platinum crucible. Across border of crucible nickel bar is placed which supports zinc element immersed in salt. Analysis is made by measuring deposit collected at bottom of crucible.

Progress in Metal Analysis in 1917 and 1918 (Fortschritte auf dem Gebiete der Metallanalyse in den Jahren 1917 und 1918), Th. Döring. Chemiker-Zeitung, vol. 43, nos. 114, 118, 120 and 122, pp. 626-628, 653-655, 665-668 and 681-684. Analyses of lead and arsenic. Analyses of antimony, bismuth, manganese and iron. Determination of phosphorus in pig iron and steel carried out alkalimetrically; determination of chrome in iron ore and ferrochrome; colorimetric process for determination of wolfram in solution of alkali-wolframate.

Cold Work, Effect of. The Effect of Cold Work on Metals and Alloys—V. O. W. E. Ellis. Metal Industry (London), vol. 15, no. 24, Dec. 12, 1919, pp. 452-455, 5 figs., and vol. 16, nos. 1 and 2, Jan. 2 and 9, 1920, pp. 4-6, 6 figs. and 21-24, 7 figs. Theories which have been propounded to account for continuity of structure and changes in mechanical and physical conditions of cold-worked metal and alloys, are exposed and various views are discussed which have been expressed relative to critical degree of deformation at which slackening in increase of tensile strength, etc., occurs. "Season cracking" of brass is attributed primarily to internal stresses.

Fatigue of. Fatigue of Metals under Repeated Stress, Herbert F. Moore, Jl. Western Soc. Engrs., vol. 24, no. 6, June 1919, pp. 331-336 and (discussion) pp. 336-340, 4 figs. Endurance diagram for various metals tested under repeated stress.

Fusion and Thermal Conductivity. On the Variation of Thermal Conductivity During the Fusion of Metals, Seibei Konno. Sci. Reports Tohoku Imperial Univ., vol. 8, no. 3, Dec. 1919, pp. 169-179, 6 figs., partly on two suppl. plates. Thermal conductivity of tin, lead, zinc and aluminum was found to decrease gradually with rise of temperature up to melting point and abruptly during melting. It is noted that changes of thermal conductivity corresponded to those of electric conductivity for same metals.

Protective Coatings. *See Schoop Spraying Process.*

Sheet, Testing. The Testing of Sheet Metals, A. G. C. Gwyer. Metal Industry (Lond.), vol. 16, no. 3, Jan. 16, 1920, pp. 42-45, 6 figs. Hardness tests are discussed with special reference to scleroscopic, punching, and cupping tests.

METEOROLOGY

Atmospheric Turbulence. Taylor's Theory of Atmospheric Turbulence, Eric E. Miller. Monthly Weather Rev., vol. 47, no. 10, Oct. 1919, pp. 703-706. Turbulence is regarded as made up of eddies and an eddy is considered as air that moves from a stratum where it has the same temperature, humidity, and momentum as its surroundings to another stratum with which it mixes.

Pilot-Balloon Flights. Note on Pilot-Balloon Flights in a Thunderstorm Formation, Ivan R. Tannehill. Monthly Weather Rev., vol. 47, no. 10, Oct. 1919, pp. 725-727, 3 figs. Horizontal projections of balloon paths during storm.

Wind Velocity. Wind Velocity in the Stratosphere (Sur la vitesse du vent dans la stratosphère), Ch. Maurain. Comptes rendus des Séances de l'Académie des Sciences, vol. 169, no. 26, Dec. 29, 1919, pp. 1419-1420. Tabulated results of observation with sounding balloons at altitudes from 11,000 m. to 19,000 m. Mean velocities given vary from 8 to 14 m. per sec.

MICROBALANCE

Simple Arrangement. A Cheap and Simple Micro-Balance, J. H. Shaxby. Phys. Soc. of London, vol. 32, part I, Dec. 15, 1919, pp. 21-25, 5 figs. It consists of long horizontal fiber joining lower ends of two vertical beams each pivoted very little above its center mass so that small weight acting at middle of fiber causes considerable depression. This is read off by arranging slider on vertical millimeter scale about 2-ft. in front.

MILLING

Duplicate Part Work. Production Milling on Automatic Machines, Edward K. Hammond. Machy. (N.Y.), vol. 26, no. 3, Nov. 1919, pp. 247-251, 12 figs. Practice in milling of duplicate parts. Third article.

String Milling Fixtures. String Milling Fixtures, Edward K Hammond. Machy. (N. Y.), vol. 26, nos. 4 and 5, Dec. 1919 and Jan. 1920, pp. 337-341, 9 figs., and 443-447, 11 figs. Discussion of typical examples of design and results obtained in operating fixtures.

MILLING CUTTERS

Cast Alloy Steel. Chrobaltic Cast Milling Cutters, Edward K. Hammond. Machy. (N.Y.), vol. 26, no. 4, Dec. 1919, pp. 354-358, 9 figs. Methods used in casting milling cutters form chromium cobalt alloy steel.

MILLING MACHINES

Rockford. Rockford Number Three Milling Machine, J. V. Hunter. Am. Mach., vol. 52, no. 8, Feb. 19, 1920, pp. 377-379, 5 figs. Features of machine are rectangular overarm saddle support and reinforced base for elevating screw.

Toledo Vertical. Toledo Vertical Milling Machine. Machy. (N.Y.), vol. 26, no. 4, Dec. 1919, pp. 363-364. Attention is called to design and weight of main column of miller. It is machined from casting weighing 1½ tons, metal being so proportioned as to give greater resistance against strain.

MINE SHAFTS

Sinking, Water Problems in. A Water Problem in Shaft Sinking, James E. Harding. Eng. & Min. Jl., vol. 109, no. 4, Jan. 24, 1920, pp. 263-264, 4 figs. How pumping was tried from churn-drill hole at one side of shaft in order to dispose of excessive flow struck in sinking shaft in Atacama Desert, Chile.

MINES

Fire Prevention in. Subterranean Fires (Etude sur les feux souterrains), M. Frantzen. Annales des Mines, vol. 8, no. 3, 1919, pp. 5-140, 28 figs. Survey of systems for protection against fire, employed in various mines of France, Germany and Austria.

MOULDING MACHINES

French. Moulding Machines and the Preparation of Model Patterns (Les machines à mouler et la préparation des plaques modèles). Fonderie Moderne, no. 9, Sept. 1919, pp. 194-198, 9 figs. Patents recently granted to Establissements Glaenzer et Perraud. Paris.

MOLYBDENUM

Molybdenite Deposits. Molybdenite Deposits of Lacorne Township, Abitibi, P. Q. Adhemar Mailhiot. Can. Min. Jl. vol. 41, no. 7, Feb. 18, 1920, pp. 135-138, 4 figs. Outline is given of both general and economic geology and description of work done on veins individually.

Reaction of Water on. Reversible Reaction of Water on Molybdenum (Réaction réversible de l'eau sur le molybdène), Georges Chaudron. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 3, Jan. 19, 1920, pp. 182-185, 2 figs. Study of equilibrium of system: water vapor molybdenum, hydrogen, molydenum bioxide.

MOTOR TRUCKS

British War Models. Mechanical Transport in the war, Richard Twelvetrees. Soc. of Engrs. Jl. & Trans., vol. 10, no. 10, 1919, pp. 279-300 and (discussion) pp. 300-314, 8 figs. Models developed in England during war are analyzed and it is concluded that heavy vehicle will have to undergo much modification of detail, specially to eliminate defects developing as result of war and to avoid complicated designs.

De Dion. 1920 3½-Ton deDion Chassis. Motor Traction, vol. 30, no. 775, Jan. 7, 1920, pp. 11-14, 13 figs. Specifications: engine, 25 h.p., 4 cyl., 100 x 140 mm.; lubrication pump; gears, four and reverse; final drive, internal gear; wheelbase, 13 ft. 5 in.

Design, Trend of. The 1920 Trend in Truck Design, J. Edward Schipper. Automotive Industries, vol. 42, no. 3, Jan. 15, 1920, pp. 135-137, 4 figs. Tendency to build trucks larger than two tons for pneumatic tire equipment is visualized as outstanding feature at beginning of year. Influence of Class B military truck, higher speed engines, influence of good roads, gains for internal gear final drive and propect of increased prices are also pointed out.

German Types. Analysis of German Trucks by the Motor Transport Corps, C. R. Hays. Automotive Industries, vol. 42, no. 4, 5, 6 and 7, Jan. 22, 25, Feb. 5 and 12, 1920, pp. 306-309, 354-355, 403-404 and 454-457. Jan. 22: Specifications of Saurer and Yomag. Jan. 29: Investigations and tests on Opel truck. Feb. 5: Data on Hercules truck. Feb. 12: Characteristics of Hering and Nacke types.

New York Show. New York Truck Show. Commercial Vehicle, vol. 21, no. 12, Jan. 15, 1920, pp. 486-497 and 504-507, 27 figs. Attention is called to greatly increased number of vehicles shown mounting on pneumatic tires. Notable developments of parts and accessory equipment are illustrated.

1920 Trucks, Data on. Detailed Technical Specifications of Gasoline Motor Trucks for 1920. Automotive Industries, vol. 42, no. 3, Jan. 15, 1920, pp. 138-155. Details of 516 gasoline and 22 electric Chassis as produced by 208 American manufacturers. Particulars of types and makes of principal truck parts, parts, including engines, clutches, gear-sets, rear axles, steering gears, governors and also electric and fuel systems.

Operating Costs vs. Road Conditions. Heavy Motor Vehicles in Relation to Roads, W. D. Williamson. Engineer, vol. 128, no. 3338, Dec. 19, 1919, pp. 608-610. Figures are presented which show effect of roads on running cost of vehicles. (Concluded.) Paper read before Roads & Transport Congress.

MOTORSHIPS

Steel Tanker. Another Hudson-Built Steel Motor Tanker. Motorship, vol. 5, no. 2, Feb. 1920, pp. 117-118, 3 figs. Dimensions: Length overall, 216 ft. 7 in.; molded breadth, 35 ft. 6 in.; molded depth, 17 ft. 4 in.; main engine power, 500 shaft hp.; dead weight, 750 tons.

MUNICIPAL IMPROVEMENTS

Risks in Untried Processes. What Risks Should Cities Take in Installing Relatively Untried Processes? Eng. News-Rec., vol. 84, no. 3, Jan. 15, 1920, pp. 132-135. Letters from consulting engineers, municipal engineers and engineers of state departments of health, particularly in reference to drifting sand filters and electrolytic process of sewage treatment.

NITRIC ACID

Manufacture. Manufacture of Nitric Acid from Nitrogen Oxide (Sur la formation de l'acide nitrique à partir de l'oxyde azotique), A. Sanfourche. Bulletin de la Société chimique de France, vol. 25-26, no. 12, Dec. 1919, pp. 633-655, 5 figs. Account of experimental study of conditions of oxidation of NO temperatures from—50 to 500 deg. cent.

OXYACETYLENE WELDING

OXYGEN

PAPER

PAVEMENTS

PILES

PIPE

PIPE LINES

PISTON RINGS

PISTONS

PLATINUM

Bibliography. Bibliography of the Metals of the Platinum Group, Jas. Lewis Howe and H. C. Holtz. Dept. of Interior, U. S. Geological Survey, Bul. 694, 1919, 558 pp. List of articles which have appeared in scientific literature from 1748-1917.

POLES

Cedar, Life of. Natural Life of Cedar Poles, Page Golsan. Elec. World, vol. 75, no. 5, Jan. 31, 1920, pp. 257-258, 4 figs. Quantitative study of butt rot is claimed to have shown that cedar poles should last from 14 to 17 years. It is noted that mechanical strength is determined largely by side pull and it is advised that poles be well guyed.

POLISHING

Methods Used. Polishing Methods, Edward K. Hammond, Machy. (N. Y.), vol. 26, no. 3, Nov. 1919, pp. 203-210, 15 figs. Information concerning wheels, belts, and abrasives used by Royal Typewriter Co.

PORCELAIN

Shrinkage Equivalents. A Table of Porcelain Shrinkage Equivalents, L. M. Case. Am. Mach., vol. 52, no. 7, Feb. 12, 1920, pp. 352-353. Gives equivalent of dimensions from 0.001 in. to 1 in. by thousandths, based on annual shrinkage of 0.1406 in. per inch for porcelain products.

POWER GENERATION

Coal vs. Water, Norway. Coal or Water (Utenlandske Kul eller norsk Vandkraft som Warmekilde i vore Boliger), A. Saxegaards. Teknisk Ukeblad, vol. 67, no. 4, Jan. 23, 1920, pp. 49-52. Discussion of whether imported coal or local water power should be used as a source of power generation. Statistics are given applying to Norwegian conditions.

Cost of Gas Engines and Electric Motors. Hydro-Electric Power Pumping in the Oil Fields, R. A. Hopkins. Min. and Oil Bul., vol. 6, no. 2, Jan. 1920. pp. 83-85 and 108, 4 figs. Comparative cost of gas engines and electric motors.

PRECIPITATION

Cottrell Process. The Cottrell Process in Japan, Ritaro Hirota and Kyoshi Shiga. Min. & Sci. Press, vol. 120, no. 7, Feb. 14, 1920, pp. 223-228, 7 figs. Process said to have made comparatively rapid progress. Article briefly describes electrical precipitators installed in Japan up to present time.

PROBABILITY

Normal Curve. A Derivation of the Equation of the Normal Probability Curve, W. D. Cairns. Bul. Am. Math. Soc., vol. 26, no. 3, Dec. 1919, pp. 105-108. Method consists in controlling what are termed points of inflection of polygon of symmetrical distribution of magnitudes about their mean, so that these points approach predetermined positions on each side of mean.

PRODUCTION

Electricity Supply and, Parallel Increase of. Central Station Power as a Factor in Effecting Economies and in Increasing Production, George H. Jones. Western Soc. Engrs., vol. 25, no. 2, Jan. 20, 1920, pp. 59-65, 4 figs. Diagram is presented showing relative growth in investment and in electricity sold in kw-hr. in years 1900 to 1928, and curve showing increase in number of employees compared with increase in kw-hr. sold.

PROPELLERS, SHIP

Design. The Propeller (L'hélice propulsive), M. le Besnerais. Bulletin technique du Bureau Veritas, vol. 2, no. 1, Jan. 1920, pp. 7-13, 5 figs. Various theories explaining operation of propeller are surveyed and method is developed for ascertaining characteristics which must be possessed by a propeller in order to satisfy a given set of conditions. (To be continued.)

PULVERIZED COAL

Fineness Factor. Status of the Powdered Fuel Problem, Joseph F. Shadgen. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 32-34. Plea for establishing factor of fineness.

Preparation of. Methods of Preparing Pulverized Coal, Joseph F. Shadgen. Iron Age, vol. 105, no. 6, Feb. 5, 1920, pp. 389-392. Descriptions of devices for crushing, pulverizing, drying, handling, cleaning, weighing and ventilating.

Uses. Pulverized Fuel, E. R. Knowles. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 26, no. 1, Jan. 1920, pp. 17-72, 38 figs. Illustrates typical applications of pulverized fuel to heating furnace with waste-heat boiler, to open-hearth furnaces, and arrangement of plant for pulverizing coal. Advantages and disavantages of pulverized coal as fuel are discussed and figures are presented giving costs of coal-pulverizing plants and cost of pulverizing coal per ton.

PUMPING ENGINES

Unaflow. Tests of the Unaflow Pumping Engine, D. A. Decrow. Jl. N. E. Water Works Assn., vol. 33, no. 4, Dec. 1919, pp. 535-543 and (discussion) pp. 543-544, 4 figs. Set of indicator cards from condensing engines are shown and discussed.

PUMPS, CENTRIFUGAL

Motor-Driven, Water-Works. A Remarkable Pumping Performance at the Northeast Pumping Station, Minneapolis, F. W. Cappelen. J.l Am. Water Works Assn., vol. 7, no. 1, Jan. 1920, pp. 88-101. Specifications for electric-motor-driven centrifugal pump designed to deliver 30,000,000 gal. of water in 24 hours against average dynamic head of 250 ft.

Motors for Driving. Synchronous Motors for Driving Centrifugal Pumps, Soren H. Mortensen. Power, vol. 51, no. 3, Jan. 20, 1920, pp. 90-93, 7 figs. Difference between self-starting and plain synchronous motor is explained and cases are discussed where, it is stated, synchronous motor should be used in preference to induction motor.

PUMPS

Electrically Operated. Observations on Electrically Operated Pumps in Indiana, G. C. Blalock. Elec. Rev. (Chicago), vol. 76, no. 5, Jan. 31, 1920, pp. 184-187, 5 figs. Forms and types of cells and methods of pumping water employed. Paper read before Indiana Eng. Society.

Submersible. Submersible Pumps. Engineer, vol. 128, no. 3337, Dec. 12, 1919, p. 595, 3 figs. Motor is enclosed in water-tight cylindrical casting of boiler plate and is directly coupled to centrifugal pump.

QUARRYING

Methods of. Methods of Quarry Operation. Rock Products, vol. 23, no. 2, Jan. 17, 1920, pp. 22-25, 25 figs. Practice and experience of France Stone Co. Toledo, Ohio.

RADIO COMMUNICATION

Progress During War. Wireless Telegraphy and Telephony During the War (La télégraphie et le téléphone sans fil pendant la guerre), Camille Gutton. Société industrielle de l'Est, Bulletin no. 153, Dec. 1919, pp. 5-19, 8 figs. Survey of progress.

See also Radiotelegraphy.

RADIOTELEGRAPHY

Audions as Receivers and Dampers. Graphical Study of the Operation of Resonator Audions as Sensibilized Receivers and as Dampers (Étude graphique du fonctionnement des audions à circuit résonant comme récepteurs sensibilisés ou comme désamortisseurs), M. André Blondel. Comptes rendus des Séances de l'Académie des Sciences, vol. 169, no. 26, Dec. 29, 1919, pp. 1377-1382, 2 figs. Example of dynamic characteristics of audion generator deduced by anamorphosis from static characteristic of audion on hypothesis that saturation current remains invariable.

Detector. The Use of Three-Electrode Lamp-Valves by the French Military Radiotelegraphy (L'emploi des lampes-valves à 3 électrodes par la radiotélégraphie militaire), C. Gutton. Bulletin de la Société d'Encouragement pour l'Industrie nationale, vol. 131, no. 6, Nov.-Dec. 1919, pp. 389-408, 11 figs. Explains operation of three-electrode valve as detector and as generator of electric oscillations.

High-Frequency Current Measurements. Measurement of Electrical Quantities in Circuits Carrying Currents at High Frequencies (Mesures électriques en haute fréquence), Léon Brillouin. Bulletin de la Société Française des Electriciens, vol. 9, no. 83, Aug.-Nov. 1919, pp. 555-572, 11 figs. Apparatus developed by French military radiotelegraphy.

Oscillations, Generation of. *See Detector.*

Vacuum Valves. Structure and Operation of the Vacuum Valve, Robert W. A. Brewer. Jl. Electricity, vol. 44, no. 3, Feb. 1, 1920, pp. 102-105, 5 figs. Features upon which uniformity of operation of vacuum valve depends.

RAILWAY ELECTRIFICATION

Direct-Current Transmission System. The Direct Current Transmission System in Main Line Railway Electrification, Alfred Raworth. Ry. Gas., vol. 32, no. 3, Jan. 16, 1920, pp. 84-85, 1 fig. Proposes arrangement embodying installation along each track of two insulated and conductor rail for direct-current transmission.

French Commission Report. Railway Electrification (L'électrification des chemins de fer). Industrie des tramways et Chemins de Fer, vol. 13, nos. 151-152-153, July-Aug.-Sept. 1919, pp. 84-88, 4 figs. Report submitted by commission sent to America by French Ministry of Public Works.

RAILWAY MANAGEMENT

Suggested Reorganization Plan. The Railway Problem, Charles Whiting Baker. Eng. News-Rec., vol. 83, nos. 17 and 18, Oct. 23 and 30, 1919, pp. 752-758 and 789-796. Suggests organization of railway corporations under Federal charters, all profits above fair return on capital to be invested for public benefit, to supply need for new railway capital and amortize existing capital.

RAILWAY OPERATION

Automatic Train Control. Report of the Automatic Train Control Committee. Ry. Rev., vol. 66, nos. 6 and 7, Feb. 7 and 14, 1920, pp. 204-209 and 248-251. Committee was appointed by U. S. Railroad Administration to study automatic train-control devices undergoing test upon various lines of railroad and to offer recommendations in regard to installation and further practical test of any devices available for that purpose.

ROADS, BRICK

Beam Strength in. Is Beam Strength the Important Item in Brick Roads? Will P. Blair. Eng. News-Rec., vol. 83, no. 15, Oct. 9, 1919, pp. 699-700. It is claimed practice shows beam strength is not essential.

Rapid Laying of. Tamping Templet Expedites Brick Road Construction, F. A. Churchill. Eng. News-Rec., vol. 84, no. 6, Feb. 5, 1920, pp. 282-283, 2 figs. It is said that 12 miles of monolithic brick road were completed in Ohio in 92 working days. Itemized manipulation cost of laying is given.

Types and Records of Service. The Construction of Brick Pavements in and Near Danville, Illinois, Harlan H. Edwards. Mun. & County Eng., vol. 58, no. 1, Jan. 1920, pp. 3-8, 12 figs. Survey of types of pavements in use and records of their service. In particular it is mentioned that monolithic brick 9-ft. wide and 6 miles in length, which was built in 1916, by using 4-in. brick laid on 1-in. bed of fine gravel concrete has given very satisfactory service.

ROADS, CONCRETE

Construction. Concrete Road Contract Has Plant for Rapid Progress. Eng. News-Rec., vol. 84, no. 1, Jan. 1, 1920, pp. 28-31, 5 figs. Plant for building 9-mile stretch of Lincoln Highway in Illinois comprised system for loading batch boxes, revolving crane traveling on concrete mixer of high capacity and large machinery equipment.

Fast Roadbuilding with Concrete Hauled Four Miles. Eng. News-Rec., vol. 84, no. 6, Feb. 5, 1920, pp. 280-281, 5 figs. Sketch plan of central mixing plant and truck system for building 6-mile road.

Reinforcement for. Should "Binding Steel" Be Used in Concrete Highways? W. C. Conger. Concrete, vol. 16, no. 2, Feb. 1920, pp. 77-79. It is claimed the binding steel "will increase the direct tensile property of the concrete," and "will positively prevent the many hair cracks which form in the slab."

The Roads and Public Works Utilities. Concrete & Constructional Eng., vol. 15, no. 1, Jan. 1920, pp. 47-59, 19 figs. Various exhibits are illustrated, particularly those of mesh and bar reinforcement for concrete roads.

Requirements in Contractor for. An Appraisal of Modern Plant Performance in Concrete Road Construction, H. D. Hammond. Eng. News-Rec., vol. 83, no. 18, Oct. 30-Nov. 6, 1919, pp. 784-788, 7 figs. Emphasizes importance of managerial ability and organizing genius on the part of contractor.

State Specifications. Charted Summary of State Concrete Road Specifications, A. N. Johnson. Cement and Eng. News, vol. 32, no. 1, Jan. 1920, pp. 32-33. Chart covers main requirements of various State Highway Departments in regard to fine and coarse aggregate, mixing, consistency, forms, expansion joints, reinforcement, finishing and curing.

Value of. Reinforcement Concrete Roads, J. H. Walker. Surveyor, vol. 57, no. 1459, Jan. 2, 1920, pp. 7-8. Writer sees in reinforced concrete road "the road that, laid now, will not only take present-day traffic, but also the greatly increased traffic of some years hence."

ROLLING MILLS

Electrically Driven, Temple-borough. Electrical Rolling Mills at Templeborough. Engineer, vol. 128, no. 3337, Dec. 12, 1919, pp. 586-588, 9 figs., partly on two supp. plates. Designed for reducing 3-ton ingots of 20-in. by 20-in. section principally into blooms 6 in. by. 6 in., which will then pass to 21-in. and subsequently to an 18-in. Morgan continuous mill.

SAFETY

Standards Available. What Constitutes Good Inspection? Lew R. Palmer. Safety Eng., vol. 38, no. 6, Dec. 1919, pp. 323-326. List of available industrial safety standards which have been formulated by representative national organizations, such as Nat. Safety Council, Am. Soc. M. E., and U. S. Shipping Board Emergency Fleet Corp.

SAFETY DEVICES

Railway Operation. Annual Report of the Bureau of Safety. Ry. Mech. Engr., vol. 94, no. 1, Jan. 1920, pp. 26-28. Account of tests of automatic stops and train pipe connectors. Use of hand brakes on heavy grades condemned.

SAND BLAST

Applications. Application and Growth of Sand Blasting, H. D. Gates. Am. Drop Forger, vol. 6, no. 1, Jan. 1920, pp. 14-16, 5 figs. Types of machines are described and illustrations are presented which show work before and after being sandblasted.

SCALES

Railway Track. Specifications for the Manufacture and Installation of Railroad Track Scales. Circular of Bur. of Standards, no. 83, Jan. 31, 1920, 35 pp. for knife-edge scales of straight and torsion lever types only, not including overheaded suspension scales.

SCHOOP SPRAYING PROCESS

Simplified Apparatus for. A Simplified "Schoop Pistol," M. V. Schoop. Metal Industry (Lond.), vol. 16, no. 3, Jan. 16, 1920, pp. 41-42, 3 figs. New feed of wire-spraying pistol consists mainly in pushing wire to be moved into interior of hollow axle of turbine causing wire to engage with several dies, which are provided with thread-like pressure faces and rotate with axle of turbine.

SCIENTIFIC MANAGEMENT

Layout of Departments and Machinery. Scientific Management, Henry Atkinson. Eng. & Indus. Management, vol. 3, no. 5, Jan. 29, 1920, pp. 131-134, 3 figs. Concerning layout of department in new works and machinery in each department.

See also Time Study.

SCREW THREADS

Hartness Comparator. Hartness Screw Thread Comparator. Machy. (N. Y.), vol. 26, no. 5, Jan. 1920, pp. 467-469, 5 figs. Projection type of apparatus designed to show instantly magnitude and kind of errors in screw threads.

See also Gages, Screw-Thread.

SEWER CONSTRUCTION

Bank Slides in. Earth Slips Prove Disastrous to Open-Cut Sewers. Eng. News-Rec., vol. 83, no. 21, Dec. 11-18, 1919, pp. 989-991, 5 figs. Methods devised to correct trouble arising from bank slides and bottom upheavals in work on Detroit sewers.

SEWAGE PLANTS

Electrolytic. Idle Electrolytic Sewage-Works in Oklahoma. Eng. News-Rec., vol. 84, no. 3, Jan. 15, 1920, pp. 135-136, 1 fig. Official report of engineer of state department of public health is quoted as saying that "average municipality will not give sufficient attention to an electrolytic plant to justify expenditure of an installment."

Screening Plant. Operating Results of Dyckman Street Sewage-Screening Plant, Charles E. Gregory. Eng. News-Rec., vol. 84, no. 4, Jan. 22, 1920, pp. 171-172. Table giving results of tests of Riensch-Wurl screens.

SEWAGE TREATMENT

Doten Tank. Sewering War-time Housing Developments. Mun. Jl. & Public Works, vol. 48, no. 2, Jan. 17-24, 1920, pp. 25-28, 3 figs. Doten tank as modified in Emergency Housing Projects for Construction Division of War Department.

Testing Apparatus. Sewage-Treatment Report Forms and Testing Apparatus, E. J. Tully and James H. Mackin, Eng. News-Rec., vol. 83, no. 18, Oct. 30-Nov. 6, 1919, pp. 825-826, 2 figs. Monthly blank sheet for daily test records and apparatus for finding settleable solids and sludge depths.

SEWERS

Storm-Water Drain Design. A Diagram Adaptation of the Rational Method of Storm-Water Drain Design, Harold G. McGee. Eng. News-Rec., vol. 83, no. 19, Nov. 13-20, 1919, pp. 868-872, 7 figs. Review of maps, population estimates, rainfall intensities, probability charts and various instruments and methods associated with storm-sewer design, and illustration of how diagram is used.

SHIP CONSTRUCTION

Isherwood System. An Analysis of the Isherwood System, John Flodin. Int. Mar. Eng., vol. 25, no. 2, Feb. 1920, pp. 128-131, 4 figs. Experience of shipbuilding company is referred to which changed from transverse to longitudinal system of construction. Design under consideration was: Length between perpendiculars, 380 ft.: length overall, 395 ft.; breadth, molded, 53 ft.; depth, molded, 29 ft. 3 in.; load draft, 23 ft. 6 in.; deadweight cargo capacity, 7500 tons. (To be continued.)

Joining Sections, New Method. New Method of Joining Ship Sections, James Nacy. Int. Mar. Eng., vol. 25, no. 2, Feb. 1920, pp. 115-116, 2 figs. Methods designed with object of eliminating use of dry dock in assembling several sections. Process is to render each section seaworthy unit by closing ends with special watertight bulkheads and to arrange pipe connections in each section so that usual trouble of pipe fitting after assembly is avoided.

Pre-assembly Methods. Pre-assembly in Ship Construction, R. D. Gatewood. Am. Mach., vol. 52, nos. 1 and 4, Jan. 1 and 22, 1920, pp. 1-6, 12 figs., and 171-176, 8 figs. Describes and illustrates pre-assembly methods of building ships in 12-slip yards turning out an 880-ton ship every two weeks.

SHIP DESIGN

Special Form of Keel Structure. Special Form of Ship Keel Structure Providing a Clear Fore-and-Aft Passage, E. F. Spanner. Steamship, vol. 31, no. 368, Feb. 1920, pp. 189-191. Urges arranging leads along compact but accessible duct clear of cargo spaces. Paper read before Inst. Mar. Engrs.

Thrust Block. The Marine Thrust Block. Mech. World, vol. 67, no. 1723, Jan. 9, 1920, pp. 27-28, 6 figs. Formulæ for determining dimensions of various parts.

SHIP PROPULSION

Steam-Turbine. Westinghouse Propelling and Auxiliary Machinery Installed in Fabricated Ships, P. M. Robinson. Int. Mar. Eng., vol. 25, no. 2, Feb. 1920, pp. 83-100, 35 figs. Machinery consisted of Westinghouse turbines of impulse-reaction, cross-compound type, consisting of high-pressure and low-pressure unit, each of which was connected to first reduction opinion through flexible shaft and coupling.

STEEL

PHOSPHORUS AND SULPHUR IN. Phosphorus and Sulphur in Steel. Iron Age, vol. 105, no. 6, Feb. 5, 1920, pp. 397-398. Plans for investigation by joint committee of Am. Soc. for Testing Materials, Railroad Administration and U. S. Bur. of Standards.

WOODY FRACTURES. Woody Structures of Fractures of Transverse, Test-Pieces Taken from Certain Special Steels, J. J. Cohade. Chem. & Metallurgical Eng., vol. 22, no. 6, Feb. 11, 1920, pp. 259-264, 5 figs. Observations are claimed to indicate that acid open-hearth metal is less liable to give woody fractures, while molybdenum and high-carbon nickel steel give poor transverse tests by virtue of their chemical composition.

See also Alloy Steels.

STEEL CASTINGS

HEAT TREATMENT. The Use of the Microscope in Foundry Problems, G. R. Bolsover. Metal Industry (Lond.), vol. 16, no. 5, Jan. 30, 1920, pp. 85-87, 16 figs. Variations in properties of steel effected by suitable heat treatment are pointed out. Paper read before Instn. British Foundrymen.

STEEL, HEAT TREATMENT OF

AUTOMOBILE AND TRUCK GEARS. Development of Commercial Heat Treating, W. H. Phillips. Am. Drop Forger, vol. 6, no. 1, Jan. 1920, pp. 28-30, 4 figs. Refers particularly to developing of processes for heat-treating automotive gears.

BALL-BEARING RACES. Electric Heat-Treatment of Ball Bearing Races, F. T. Cope. Elec. Furnace, vol. 1, no. 1, Jan. 1920, pp. 11-12. Equipment comprises through-type pusher furnace, oil quench tank and oil drawing bath, arranged in series for continuous flows of material.

ELECTRIC FURNACES FOR. Electric Furnaces for Heat Treating, R. E. Talley. Proc. Steel Treating Research Soc., vol. 2, no. 9, 1920, pp. 24-28 and (discussion) 28-29 and 38-40, 11 figs. Surveys development of various types.

FACTORS IN. Factors to be considered in the Heating and Cooling of Steel, C. D. Barnhart. Jl. Am. Steel Treaters Soc., vol. 2, no. 4, Jan. 1920, pp. 201-206. It is emphasized that "it is the uniformity of the final set or adjustment of the structure in cooling that determines the uniformity of the actual heat treatment."

HUMP METHOD. The Hump Method of Heat Treatment, George W. Tall. Jl. Am. Steel Treaters Soc., vol. 2, no. 4, Jan. 1920, pp. 185-195 and (discussion) pp. 195-198, 11 figs. Essential feature of method lies in treating steel from change in rate of heating of neutral body at time transformation in steel occurs.

LOW-CARBON STEEL. The Effect of Heat Treatment and Mechanical Work on the Physical Properties of Mild Steel, Wilfred Hanby. Jl. Am. Steel Treaters Soc., vol. 2, no. 5, Feb. 1920, pp. 226-234, 16 figs. Gives results of tests made on steel containing 0.24 per cent carbon, which are said to show that "information obtained from tensile tests alone is by no means sufficient criterion as to true value of material for all purposes of construction."

RIFLES AND GUNS. The Heat Treatment of Rifles and Guns, Arthur W. F. Green. Am. Drop Forger, vol. 6, no. 1, Jan. 1920, pp. 36-40, 8 figs. Photo-micrographs showing grain growth at a high temperature and sorbitic structure throughout piece of steel. Experience of plant is discussed where it is said that production of heat-treated rifle and machine-gun barrels is accomplished practically without rejection.

SCREW-MACHINE STOCK, WATER-QUENCHING. Results of a Series of Tests of Water-Quenched Free-Cutting Steel, C. P. Miller. Am. Mach., vol. 52, no. 2, Jan. 8, 1920, pp. 87-88, 3 figs. It is concluded from tests that water quenching raises tensile strength of 1 in. screw-machine steel 27 per cent, yield point 28 per cent, reduction of area 8 per cent, while elongation is decreased 22 per cent.

TOOL-ROOM EQUIPMENT AND METHODS. Heat Treatment of Steel in the Tool Room, M. H. Williams. Ry. Mech. Engr., vol. 94, no. 1, Jan. 1920, pp. 39-47, 7 figs. Equipment and methods for tempering carbon and high-speed steel, hardness tests and service records.

STEEL, HIGH-SPEED

MOLYBDENUM-ALLOY. The New High Speed Steel, Leslie Aitchison. Autocar, vol. 44, no. 1264, Jan. 10, 1920, pp. 56-57. Examination of formulæ of cutting steels with special reference to patent by Professor Arnold of Sheffield University. Arnold's discovery consists in substituting in high-speed steel about 6 per cent of molybdenum for 18 per cent tungsten which it normally contains.

STEEL INDUSTRY

ELECTRIC STEEL. The Status of the Electric Steel Industry, Edwin F. Cone. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 75-77 and 98. It is noted that United States still leads in output with 323 furnaces, a gain of 12 per cent in 1919. Number of furnaces in world's steel industry is placed at about 875.
The Electric Furnace and Electric Steel. Blast Furnace & Steel Plant, vol. 8, no. 2, Feb. 1920, pp. 135-137, 2 figs. Data collected by Electric Furnace Assn. relative to quality of electric furnace products. Statistics on electric steel production.

GERMAN OUTLOOK. The German Iron and Steel Trade. Iron Age, vol. 105, no. 8, Feb. 19, 1920, pp. 558-559. Represented as sold months ahead with no bright outlook for expanding production.

GREAT BRITAIN, 1919. British Iron and Steel in 1919. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 63-65. Decreasing production, unsatisfied demand, record profit and still advancing prices are recorded.

INDIA. Development of India's Iron and Steel Industry. Iron and Coal Trades Rev., vol. 100, no. 2707, Jan. 16, 1920, pp. 74-75. From report of British Senior Trade Commissioner in India and Ceylon relating to present conditions and prospects of British trade in Indian Empire as viewed from importer's standpoint.

METALLURGICAL PROGRESS, 1919. The Year in Iron and Steel Metallurgy, Lewis B. Lindemuth. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 61-62. It is considered that while year brought out little that is new, nevertheless general application of metallurgical principles necessitated by economy has raised standard of iron and steel production.

STATUS IN 1919. A Troubled Year in the Steel Trade. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 1-3 and 43-44. Production is said to have been 75 to 80 per cent of average for war years 1916, 1917 and 1918. Little progress is seen to have been made on road to readjustment.

STEEL MANUFACTURE

COOLING RATE OF INGOTS. The Cooling of Highly-Heated Iron Masses and the Distribution of Temperature Within Them (Die Abkhülung hocherhitzer Eisenkörper und die Temperaturverteilung in deren Innerem), F. Riedel. Stahl und Eisen, vol. 40, no. 1, Jan. 1, 1920, pp. 1-9, 12 figs. Curves and formulæ are given for calculating time necessary for cooling off by heat radiation and heat-reduction processes.

DUPLEX PROCESS, PROPOSED. Proposed Duplex Process for making Steel, G. L. Fisk. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 38-41, 2 figs. Cost comparisons with bessemer and straight open-hearth process.

USE OF SPIEGELEISEN IN. Use of Spiegeleisen in Steel Manufacture, Henry D. Hibbard. Chem. & Met. Eng., vol. 22, no. 5, Feb. 4, 1920, pp. 209-210. Data in which estimate of requirements for 1918 was based. From monthly report of investigations, Bureau of Mines.

STEEL, MOLYBDENUM

QUALITIES OF. The Qualities of the Molybdenum Steels. Automotive Industries, vol. 42, no. 5, Jan. 29, 1920, pp. 358-361, 9 figs. Elastic limit, tensile strength, elongation percent and reduction of area are quoted and photomicrographs are presented of alloy containing 0.32 per cent. carbon, 0.49 per cent. manganese 0.10 per cent. silicon, 0.90 per cent. chromium and 0.10 per cent. molybdenum.

STEEL WORKS

AUSTRALIA. The Infant Steel Industry of Australia, Clement F. Poppleton. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 7-11, 1 fig. Features of two existing producing plants and of proposed design for third.

INDIA. New Steel Plant Being Built in India. Iron Age, vol. 105, no. 1, Jan. 1, 1920, pp. 18-19, 2 figs. Blast furnace of 350-ton capacity and 168-oven by-product coke plant.

STEELITE

See Cutting Metals, Steelite Tools for.

STOKERS

CHAIN-GRATE. Developing the Chain-Grate Stoker, H. F. Gauss. Power, vol. 51, no. 4, Jan. 27, 1920, pp. 144-146, 2 figs. Application of forced draft, it is said, has resulted in much higher rates of combustion, reduction of ignition troubles, better air control to various sections of grate and less leakage of air into furnace.

MARINE-BOILER. Mechanical Stokers Aboard Ships, Charles H. Bromley. Power, vol. 51, no. 3, Jan. 20, 1920, pp. 86-89, 8 figs. Illustrates various types which are being installed aboard ships in England and United States.

STRESSES

ENGINEERING MATERIALS, DISTRIBUTION IN. Stress Distribution in Engineering Materials, L. N. G. Filon. Engineering, vol. 109, no. 2819, Jan. 9, 1920, pp. 64-66, 4 figs. Principle of dynamical similarity applied to deformable elastic structures.

SUBMARINES

ELECTRIC STEERING. Electric Rudder Engines on U-Boats, Their Development and Adaptability for Large Warships and Merchant Ships (Die elektrischen Rudermaschinen auf U-Booten, ihre Entwickelung und Anwendung für grösser-Kriegs- und Handelsschiffe). Schiffbau, vol. 21, nos. 5 and 6, Dec. 10 and 24, 1919, pp. 220-228, 36 figs. Studies of advantages and disadvantages, based on several years' experience, of original electric rudder machines and their gradual development. Details of pilot switch and direct automatic steering. (To be continued.)

ENGLISH. English Submarines during the War and the Battle against the German Submarines (Les sous-marins anglais pendant la guerre et la lutte contre les sous-marins allemands), A. Poidloué. Génie Civil, vol. 76, no. 4, Jan. 24, 1920, pp. 85-89, 10 figs. English types. Specifications are: Length, 55.15 m.; breadth, 6.95 m.; depth, 3.85 m.; displacement, 662 tons; power plant, 1600 hp.

SUBWAYS

LONDON, OPERATIONS AND FARES. Operating London's Underground Railways, Walter Jackson. Elec. Ry. Jl., vol. 55, no. 6, Feb. 7, 1920, pp. 276-283, 9 figs. How differential fare works out and why former flat-fare lines changed to graduated fare beginning at lower rate. Intensive utilization of double-track lines and non-stop and skip-stop trains is pointed out as interesting feature of operation.

WATER HAMMER

CALCULATION OF. Calculation of Water Hammer in Conduits Formed of Two or Three Sections of Different Diameters (Calcul du coup de bélier dans les conduites formées de deux ou de trois tronçons de diamètres différents), E. Carey. Bulletin technique de la Suisse romande, vol. 47, no. 1, Jan. 10, 1920, pp. 5-7, 2 figs. Water-hammer curve is constructed for conduit of assumed characteristics, in order to illustrate method outlined in previous installments. (Continuation of serial.)

LAWS OF PRESSURES DROP. Laws of Pressure Drop Resulting in Conduits from the Sudden Shutting of Gates (Les lois de fermeture rapide déduites des abaques de M. Allievi), D. Gaden. Revue générale de l'Electricité, vol. 7, nos. 3 and 4, Jan. 17 and 24, 1920, pp. 75-89 and 115-121, 17 figs. Based on theory of water hammer developed by L. Allievi in Teoria del Colpo d'Ariete, published in Atti del Collegio regli Ingegneri el Architetti, Milan, Italy.

WATER POLLUTION

NIAGARA RIVER. Pollution of Niagara River by Wash Water from Filtration Plant Enjoined. Jl. Am. Water Works Assn., vol. 7, no. 1, Jan. 1920, pp. 52-59. Concerning court action to prevent pollution brought by water company against public water board, pollution in question being due to discharge of waste and wash water from water filtration plant.

TYPHOID FROM INFILTRATED SEWAGE. Water-Supply Typhoid Outbreak at Lansing, Mich., J. R. Daugherty. Eng. News-Rec., vol. 84, no. 2, Jan. 8, 1920, pp. 92-94, 5 figs. Wells with leaky casings were polluted by sewage forced into soil during high water in Grand River, March, 1919.

WATER PURIFICATION

CHLORINE TREATMENT, FRENCH ARMY. The Progress in the Purification of Water by Chlorine (Les progrès de l'épuration des eaux par le chlore), A. Moreau. Bulletin d'Encouragement pour l'Industrie nationale, vol. 131, no. 6, Nov.-Dec. 1919, pp. 416-423, 4 figs. Bunau-Varilla automatic aparatus employed by French army.

OZONE IN. Ozone as a Disinfectant in Water Purification, Joseph W. Ellms. Jl. Am. Water Works Assn., vol. 7, no. 1, Jan. 1920, pp. 60-64. Also Fire & Water Eng., vol. 67, no 3, Jan. 21, 1920, pp. 147-148. It is pointed out that ozone used as disinfecting agent is "no more a cure-all for a polluted water supply than are other disinfecting agents that are at present more widely employed," and that it cannot be denied "that the process needs investigation and scientific development in order to make it economically efficient."

RAPID SAND FILTRATION PLANTS. Twin Falls Water Purification Plant. Mun. Jl. & Public Works, vol. 48, no. 3, Jan. 31, 1920, pp. 41-43, 4 figs. Rapid sand filtration plant with capacity of 6,000,000 gal. per 24 hours.

Rapid Sand Filtration Plant at Hawkesbury, J. O. Meadows. Contract Rec., vol. 34, no. 3, Jan. 21, 1920, pp. 52-54, 5 figs. Plant consists of two Allis-Chalmers low lift centrifugal pumps, each having capacity of 750-gal. per minute against head of 30-ft., coagulation basin, two reinforced-concrete chemical solution tanks, each with capacity of 620-gal. and chemical feeding devices.

TORONTO DRIFTING SAND FILTRATION PLANT. Description, Operation and Purification Effected by Drifting Sand Filtration System in Toronto During 1918, Norman J. Howard. Jl. N. E. Water Works Assn., vol. 33, no. 4, Dec. 1919, pp. 504-520 and (discussion) pp. 521-534, Capacity of plant is 60,000,000 gal. in 24 hr., but maximum rate of 72,000,000 gal. must be maintained for period of ten hours. Rate of filtration is 150,000,000 gal. per acre per day.

The Toronto Drifting Sand Water Purification Plant, William Gore. William Storries. Jl. Eng. Inst. of Canada, vol. 2, no. 11, Nov. 1919, pp, 701-713, 17 figs. Details of construction and characteristic curves of sand-lifting.

WATER SOFTENING

LIME-SODA ASH PROCESS. A Study of the Lime-Soda Ash Water-Softening Process, Max R. Herrle and Francis M. Gleeson. Chem. & Metallurgical Eng., vol. 22, no. 6, Feb. 11, 1920, pp. 269-272, 3 figs. Observations on changes in alkalinity and hardness with addition of lime and soda ash separately and consecutively to hard water. Effects of insufficient, correct and excessive amounts of reagents.

WATER SUPPLY

PURE, LEGAL RESPONSIBILITY FOR. Legal Responsibility for a Pure Water Supply, John Wilson. Jl. Am. Water Works Assn., vol. 7, no. 1, Jan. 1920, pp. 44-51. Discussion of legal proceeding resulting from typhoid epidemic at Mankato in 1908.

SNOW-FIELD, DETERMINATION OF. Determination of Water-Supply from Snow Fields. Eng. News-Rec., vol. 83. no. 17, Oct. 23, 1919, pp. 766-768, 1 fig. Snow sampler measurements and tables based on investigations made in Sierra Nevada Mountains.

STORAGE IN OPEN RESERVOIRS. Sanitary Effect of Water Storage in Open Reservoirs, Abel Wolman and S. T. Powell. Eng. News-Rec., vol. 83, no. 18, Oct. 30-Nov. 6, 1919, pp. 804-805, 2 figs. Studies of chemical and bacterial characteristics of water on entering and leaving two reservoirs in Maryland.

WATERSHED LEAKAGE. Watershed Leakage in Relation to Gravity Water Supplies, Rob. E. Horton, Can. Engr., vol. 38, no. 6, Feb. 5 1920, pp. 195-198, 6 figs. Writer makes suggestions for investigating likelihood of watershed leakage, maintaining that the shallower the soil mantle, and the closer to surface the rock, the steeper the slopes, and the more impervious the soil and lock, the less likelihood of serious watershed leakage.

WATER TANKS

CONCRETE. Concrete Water Tank on the Western Railway of Havana, John P. Risque. Ry. Maintenance Engr , vol. 16, no. 2, Feb. 1920, 3 figs. Five 50,000-gal. tanks said to have been erected at cost of 27½ cents per gal. of capacity and to have given uniformly good service with material reduction in amount of painting required. Details of construction are given.

WATER TOWERS

See Coal Bunkers, Reinforced Concrete.

WATER WORKS

Pumps, see Pumps, Centrifugal.

WATERWAYS, INLAND

TRANSPORTATION, FUTURE OF. What Is the Future of Inland Water Transportation? Charles Whiting Baker. Eng. News-Rec., vol. 84, nos. 1-5, Jan. 1, 8, 15, 22 and 29, 1920, pp. 19-28, 85-89, 137-144, 184-199, 234-242. Economic condition of inland water transportation is studied, field which it should occupy with relation to railway transport is pointed out, and conclusions are drawn in regard to policy which it is believed should be adopted with reference to waterway development.

WEIRS

See Flow of Water, Improved Weir for Measuring.

WELDING

See Oxy-Acetylene Welding; Electric Welding.

WIRE DRAWING

See Dies, Wire-Drawing.

WIRED GLASS

See Fire Protection, Wired Glass.

WIRELESS

See Radio Communication; Radiotelegraphy.

WORKMEN'S COMPENSATION

ACCIDENT FREQUENCY AND SEVERITY RATES. New Basis for Measuring Accident Frequency and Severity Rates. Monthly Labor Rev., vol. 10, no. 1, Jan. 1920, pp. 218-219. Committee on Statistics and Compensation Insurance Cost of Int. Assn. of Indus. Accident Board and Commissions recommends that accident rates, both frequency rates and severity rates, be computed on basis of 1000 hours' exposure instead of 3000 hours' exposure.

DIGEST OF STATE LAWS. A Workman's Compensation Digest, Chesla C. Sherlock. Am. Mach., vol. 52, no. 2, Jan. 8, 1920, pp. 77-80, 1 fig. Digest of practice in States which have compensation acts.

WORKS COUNCILS

INTERNATIONAL HARVESTER CO. PLAN. Some Experiences in Industrial Relations, Arthur H. Young. Factory, vol. 24, no. 2, Feb. 1, 1920, pp. 259-264. Eleven months' test of Harvester Co.'s industrial council plan, principal feature of which consists in establishment of Works Council for considering and shaping plant's policies with relation to matters of mutual interest to employers and employees.

INITED STATES. Works-Councils in the United States. Metal Trades, vol. 11, no. 2, 2 Feb. 1920, pp. 78-81. Summary of Report of Nat. Indus. Conference Board.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

PHOTOSTATED PRINTS

Harrison W. Craver, Director,
Engineering Societies Library

29 West Thirty-ninth Street New York, N.Y.

STRUTS, DESIGN OF. The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 18, nos. 329, 331, 332 and 333, Feb. 5, 19, 26 and March 4, 1920, pp. 123-124, 1 fig., pp. 160-161, 2 figs., pp. 178-179, 4 figs., pp. 196-197, 3 figs. Feb. 5: Results of tests on solid ground steel specimens and on tubular steel struts. Feb. 19. Account of experiments made on 1¼. No. 185 W. G. tubes 3¼ in. long. Theory of composite struts. Feb. 26: Euler failing load of symmetrical strut of any taper. March 4: Design of short tapered strut. (Continuation of serial.)

WING BEAMS, DEFLECTION OF. The Graphical Method for the Deflection of Beams of Non-Uniform Section, B. C. Boulton, H. M. Priest. Aerial Age, vol. 11, no. 1, Mar. 15, 1920, pp. 17-19, 7 figs. Method is developed on principle that deflection curve of wing beams of aeroplane can be obtained from loading curve by four successive integrations or from moment curve by two successive integrations. Integrations are performed graphically.

WING DESIGN. Theories of Wing Design. Aeronautics, vol. 18, no. 332, Feb. 26 1920, p. 185, 3 figs. Measurements taken by means of borings are said to have supported theory that efficiency of wing is due to rarefactions of air and consequent suction action on upper surface of wing.

See also Flying Boats.

AIR COMPRESSORS

TURBO-COMPRESSOR CALCULATIONS. Turbo-Compressor Calculations, Allen H. Blaisdell. Mech. Eng., vol 42, no. 3, March 1920, pp. 151-156, 6 figs. Number of stages to be used in a given case is discussed and method of laying out compression diagram and of subdividing it according to number of stages to be provided for is explained. Expressions are derived for actual and effective impeller radii and axial depth of channel of any radius and graphical method is outlined for calculating theoretical head to be developed by an impeller.

AIR EJECTORS

THEORY AND DESIGN. Air Ejectors; Theory and Design, E. J. Lashinger. Jl. South African Inst. of Engrs., vol. 18, no. 6, Jan. 1920, pp. 89-91 and (discussion) pp. 91-95, 5 figs. Formulæ for determining proportions of nozzles to throat.

AIRCRAFT

DESIGN. Characteristics of Design Affecting Production Operation, and Maintenance of Aircraft, Percy Bishop. Flight, vol. 12, no. 8, Feb. 19, 1920, pp. 216-219. Paper read before Royal Aeronautical Society.

See also Aeroplanes; Airships; Seaplanes.

AIRCRAFT CONSTRUCTION MATERIALS

WOODS. Supplies and Production of Aircraft Woods. Nat. Advisory Committee for Aeronautics, report no. 67, 1919, 62 pp., 23 figs. Summary of available information regarding supplies of kinds of wood that have been used of seem likely to become important in construction of airplanes, and on amount of lumber of each species put on market each year.

AIRCRAFT PRODUCTION

UNDERCARRIAGES. Aircraft Undercarriages, John D. North. Flight, vol. 12, no. 6, Feb. 5, 1920, pp. 161-163, 2 figs. Study of stresses developed in undercarriage during landing with notes on design of undercarriage with a view to diminishing these stresses. (Concluded.)

AIRSHIPS

ENGINES FOR. The Power Plant of a Modern Airship, W. T. Van Orman. Gas Engine, vol. 22, no. 3, March 1920, pp. 69-73, 6 figs. General requirements of airship engine are pointed out and engine of naval airships built by Goodyear Tire & Rubber Co. is described.

RIGID, PRINCIPLES OF CONSTRUCTION. The Principles of Rigid Airship Construction, A. P. Cole. Flight, vol. 12, nos. 6, 7 and 8, Feb. 5, 12 and 19, 1920, pp. 159, 1 fig., 183-186, 5 figs., and 205-209, 6 figs. Feb. 5: Formula for determining structural strength of ship, Feb. 12: Transverse wiring of frames, Feb. 19: Manufacture of gas bags.

The Principles of Rigid Airship Construction, A. P. Cole. Aeronautics, vol. 18, no. 32, Feb. 5, 1920, pp. 126-127 and (discussion) pp. 127-130. Dimensions of German Zeppelin rigid airships. (Concluded). Paper read before Roy. Aeronautical Soc.

RIGID, STRESS DISTRIBUTION IN. The Distribution of Bending Stresses in a Rigid Airship, E. H. Lewitt. Aeronautics, vol. 18, no. 330, Feb. 12, 1920, pp. 140-143, 8 figs. Technical examination of stresses leads to conclusion that built-up tube behaves as heated beam only when (1) cross-section is inscribed in circle, (2) lengths of sides are equal, and (3) there is no variation in size of diagonal wiring in any one bay.

ALCOHOL

COKE-OVEN GAS AS SOURCE OF. Ethyl Alcohol from Coke Oven Gas, Ernest Bury and O. Ollander. Am. Gas. Eng. Jl., vol. 112, no. 10, Mar. 6, 1920, pp. 179-183. Writers expressed their conviction before Cleveland Instn. Engrs. that alcohol extraction from coke-oven gas is commercially practical in Great Britain. Sequence of process for successful recovery of ethylene by means of concentrated sulphuric acid in connection with ordinary by-product recovery plant is defined.

ALLOY STEELS

TOOL STEEL. Tool Steel's Influence on Progress and Prosperity. Raw Material, vol. 2, no. 2, Feb. 1920, pp. 54-59, 10 figs. Alloy steels intermediate between carbon and high-speed steels are described. Ingot improvements by Gathman molds patented by the Gathmann Eng. Co. of Baltimore, are pointed out and illustrated.

ALLOYS

ELECTRICAL MELTING OF. Electrical Melting of Alloys—II, H. W. Gillett. Foundry, vol. 48, no. 6, Mar. 15, 1920, pp. 229-231 and 238. Essential and desirable features of furnaces for melting nonferrous metals are outlined and distinctions are drawn between their relative merits.

HARDNESS OF. Hardness of the Most Important Alloys for Technical Purposes, P. Ludwik. Metal Industry (Lond.) vol. 16, no. 7, Feb. 13, 1920, pp. 125-129, 5 figs. Hardness of most important alloys of copper, tin, lead, zinc and aluminum is examined, both in case of cast specimens which have been suddenly quenched and those which have been annealed by means of chemical pressure in order to establish hardening effect on various individual constituents of alloys. Translated from Zeitschrift des Vereins deutscher Ingenieure.

See also Non-Ferrous Metals.

ALTERNATORS

See Bearings, Thrust; Electric Generators, A. C.

ALUMINUM

ANALYSIS, METHOD OF. The Analysis of Aluminum, Its Compounds and Alloys, J. E. Clennell. Min. Mag., vol. 22, no. 2, Feb. 1920, pp. 88-93. General survey of methods of analysis, methods of separation of aluminum, gravimetric methods for estimation of aluminum in pure substances, and details of separation and estimation of aluminum by gravimetric analysis. (To be continued.)

NAVY SPECIFICATIONS. Aluminum Rolling-Mill Practice—I. Commercial Pig and Scrap, Robert J. Anderson and Marshall B. Anderson. Chem. & Metallurgical Engr., vol. 22, no. 11, Mar. 17, 1920, pp. 489-491. Navy Department specifications for pig aluminum are included.

ALUMINUM ALLOYS

ANALYSES OF. Aluminum Alloys New and Old. Raw Material, vol. 2, no. 2, Feb. 1920, pp. 52-53. Analyses of 26 aluminum alloys and their uses are presented.

DURALUMIN. Heat Treatment of Duralumin, P. D. Merica, R. G. Waltenberg and H. Scott. Sci. Papers of Bur. of Standards, Dept. Commerce, no. 347, Nov. 15, 1919, pp. 271-316, 26 figs. Heat treatment of alloys of duralumin type was investigated and effect observed of variations in heat-treating conditions, such as quenching temperature, temperature of quenching bath, and of aging or tempering, and time of aging upon mechanical properties. Theory of mechanism of hardening of duralumin during aging after quenching from higher temperatures is developed, which is based upon decreasing solubility of compound $CuAl_2$ in solid solution in aluminum with decreasing temperatures from 520 deg. cent. to ordinary temperatures.

AMMETERS

SPLITDORF. Steps in Making an Aluminum Moving Coil for an Ammeter, K. H. Condit. Am. Mach., vol. 51, no. 23, Dec. 18, 1919, pp. 1055-1056, 4 figs. Discussion of moving coil of Splitdorf meter with illustrations of various stages in transformation of an aluminum disk into finished coil.

AMMONIA

SYNTHESIS OF. An Electrically Heated Bomb for Ammonia Synthesis, R. O. E. Davis and Harry Bryan. Jl. Indus. & Eng. Chem., vol. 12, no. 3, Mar. 1920, pp. 287-288, 3 figs. Type used at Bureau of Soils, Department of Agriculture, Washington, D. C.

Purification of Compressed Gases in Testing Catalysts for Ammonia Synthesis, R. O. E. Davis. Jl. Indus. & Eng. Chem., vol. 12, no. 3, Mar. 1920, pp. 289-290, 3 figs. Method used at Arlington, Va., plant, in work on synthesis of ammonia carried on in co-operation with Bureau of Soils, Department of Agriculture and Nitrate Division of War Department.

AMPLIFIERS

MULTIPLE-STAGE. The Design of Multiple-Stage Amplifiers Using Three-Electrode Thermionics Valves, C. L. Fortescue. Jl. Inst. Elec. Engrs., vol. 58, no. 287, Jan. 1920, pp. 65-74 and (discussion) pp. 74-82, 14 figs. Amplifying circuits are illustrated and limitations to effective amplification are discussed.

AQUEDUCTS

SAN FRANCISCO, WATER SUPPLY. Hetch Hetchy Water Supply—I. Public Works, vol. 48, no. 8, Mar. 6, 1920, pp. 165-167, 3 figs. Details of 154-mile aqueduct and auxiliaries for ultimate delivery of 400,000,000 gal. daily to San Francisco at estimated cost of $45,000,000. Description of Hetch Hetchy railroad, 68 miles long, built by city of San Francisco.

ARCHES

PARABOLIC ELASTIC. Rapid Calculation of Deflecting Moments in Parabolic Elastic Arch (Calculo rapido de momentos flectores en el arco elastico parabolico), Cesar Chiodi. Revista del Centro de Estudiantes de Ingenieria, no. 203. May 1919, pp. 532-542, 8 figs. Graphs are given for determination of K and R.

ASH HANDLING

AUTOMATIC PLANTS. Automatic Ash-Removing Plants (Selbsttätige Entaschungsanlagen), A. Rüster. Zeitschrift des Bayerischen Revisions-Verein, vol. 23, no. 20, Oct. 31, 1919, pp. 157-159, 5 figs. Details and illustrations of light ash suction plant, ash retainer, suction nozzle, travelling machine for breaking clinkers, and air-pump suction apparatus for cleaning flue.

BONUS SYSTEMS

Comparison with Efficiency Systems. Wages and Bonus Systems—VI, Herbert C. Armitage. Eng. & Indus. Management, vol. 3, no. 6, Feb. 5, 1920, pp. 163-165. Comparative study of bonus and efficiency systems of wage payment.

Foundry Output Increased by. Efficiency Methods Triple Foundry Output, C. E. Wright. Iron Age, vol. 104, no. 13, Sept. 25, 1919, pp. 849-855, 13 figs. It is stated that Bullard Machine Co., Bridgeport, Conn., greatly increases production by bonus plan. Daily record per man is said to be up from 360 to 1020 lb.

BRAKES

Back-Steam. The Use of Back-Steam as a Brake; Its Power and Its Present Use, A. Herdner. Bul. Int. Ry. Assn., vol. 1, no. 4-5-6, Oct.-Nov.-Dec. 1919, pp. 197-206. Objections against using back steam as brake are examined and separately discussed.

Electromagnetic. Theory of Electromagnetic Brake (La teoria del freno electromagnético), Richard Gans. Contribucion al Estudio de las Ciencias fisicas y matematicas, Universidad nacional de la Plata, vol. 2, no. 43, Sept. 1919, pp. 391-412, 5 figs. Behavior of metallic sphere turning in magnetic field is determined theoretically. Equations for braking couple are derived and stability of motor provided with electromagnetic brake is discussed.

Freight-Train. Continuous Brakes for Heavy Goods Trains. Ry. Gaz., vol. 32, no. 6, Feb. 6, 1920, pp. 189-193, 9 figs. "Loud" brake which provides for augmentation of brake power, when desired, on loaded cars fitted with automatic vacuum brake. Device is being used on Great Indian Peninsula Ry.

Development and Arrangement of Brakes for Through Freight Trains (Die Ausbildung und Einrichtung der durchgehenden Güterzugbremse), G. Oppermann. Annalen für Gewerbe und Bauwesen, vol. 85, no. 2, July 15, 1919, pp. 13-16, 6 figs. Details of Kunze-Knorr and Oppermann compound brakes.

BRASS

Nickel, Effect of Adding. Copper, Zinc and Nickel Alloys (Sur les alliages de cuivre, de zinc et de nickel), Léon Guillet. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 8, Feb. 23, 1920, pp. 460-462. Experiments established that effect of nickel in brass is to raise position of transformation points and to facilitate its forging at high temperatures.

Standardization of. The Standardization of Metals and Metal Alloys. Metal Industry (Lond.), vol. 16, nos. 8 and 9, Feb. 20 and 27, 1920, pp. 141-143 and 161-163. Report submitted to German Committee for Standardization of Metals and Metal Alloys, dealing with standardization o most important brass and bronze alloys.

Management. *See Industrial Management, Brickyards.*

BRIDGES

County, System for Numbering. A Comprehensive System for Numbering County Bridges, Harry F. Harris. Good Roads, vol. 19, no. 6, Feb. 11, 1920, pp. 81-82. Exposition of Dewey decimal system.

BRIDGES, RAILWAY

Raising and Repairing. The Raising and Repair of the Railway Bridge at Houplines, E. M. Sinauer. Bul. Int. Ry. Assn., vol. 1, nos. 4-5-6. Oct.-Nov.-Dec. 1919, pp. 238-244, 2 figs. Bridge consisted of single span, 125 ft. clear, total weight being about 100 tons.

Steel, Specifications for. Report of Committee XV—On Iron and Steel Structures. Bul. Am. Ry. Eng. Assn., vol. 21, no. 223, Jan. 1920, pp. 429-520, 46 figs. General specifications for steel railway bridge, and comparison of column formulæ.

BUILDING CONSTRUCTION

Standardization of Specifications. Practical Economics Secured by Standardization of Construction Specifications, R. C. Marshall, Jr. Am. Architect, vol. 117, no. 2302, Feb. 4, 1920, pp. 165-168. It is pointed out that Department of Public Works, in conference with national technical societies, could establish in most effective manner standard specification for Government work which would insure both safety and economy of design and results would in very few years pay thousand-fold return on investment. Extracts from address before Nat. Department of Public Works Assn.

CAPSTANS

Electric. Electric Capstans for Railway Work. Ry. Gaz., vol. 32, no. 6, Feb. 6, 1920, pp. 195-196, 3 figs. Capstan made by Thomas Broudbent & Sons, Ltd., Hubbersfield, England.

CARBURETORS

Atomization vs. Preheating. Study of Preheating and Atomization in Carburetors (Etude de réchauffage et de la pulvérisation dans les carburateurs). Génie civil, vol. 76, no. 5, Jan. 31, 1920, pp. 119-121, 6 figs. Advantages of atomization over preheating are pointed out. (Concluded.)

CARS, FREIGHT

Equipment, Inspection of. The Inspection of Freight Equipment, L. K. Sillcox. Ry. Mech. Engr., vol. 94, no. 3, Mar. 1920, pp. 149-152. Defects of couplers and related parts are summarized and federal requirements for safety appliances are mentioned.

CARS, TANK

Wrecks and Derailments, Handling. Handling Wrecks and Derailments Involving Loaded Tank Cars, W. S. Topping. Ry. Mech. Engr., vol. 94, no. 3, Mar. 1920, pp 157-158. Rules are formulated for safely handling wrecks while tank cars are leaking gasoline copiously, or gasoline which has already escaped in quantity is still uncared for.

CAST IRON

Silicon, Influence. Investigation of Silicon Reviewed, T. Turner. Foundry, vol. 48, no. 5, March 1, 1920, pp. 184-186. Highest tensile strength of cast iron has been obtained with 1.8 per cent silicon and hardness has been found to decrease until iron contained approximately 2.5 per cent silicon. Paper read before Coventry branch, Instn. of British Foundrymen.

The Influence of Silicon in Cast Iron Foundry Trade Jl. & Pattern Maker, vol. 22, no. 218, Feb. 1920, pp. 101-108, 7 figs. Results of various experimentors are quoted. It is noted that bar of pure washed iron contracts uniformly throughout cooling; immediately on addition of 0.23 per cent silicon marked expansion of units becomes evident after solidification, expansion increasing by 160 units to 240 units on formation of graphite.

CEMENT

Fineness, Effect of. Effect of Fineness of Cement, Duff A. Abrams. Bul. 4, Structural Materials Research Laboratory, Dec. 1919, 81 pp., 36 figs. Report covers compression tests on over six thousand 6-in. by 12-in. concrete cylinders, nine thousand compression and tension tests of mortar and several thousand miscellaneous tests. Strength tests of concrete and mortar were made at ages of seven days to one year. Information was secured on effect of fineness of cement under following conditions: (1) Effect of fineness of cement on strength of concrete; (2) quality of concrete using different cements; (3) effect of quantity of cement used; (4) effect of consistency of concrete; (5) effect of size and grading of aggregate; (6) variation in type of aggregate; (7) effect of age of concrete; (8) elongation and contraction of concrete; (9) effect of fineness of cement on workability of concrete. Reprint from Proc. of Am. Soc. for Testing Materials.

CEMENT, PORTLAND

Raw Materials. Analysis of Portland Cement Raw Mixture, J. C. Witt. Cement, Mill and Quarry, vol. 16, no. 5, Mar. 5, 1920, pp. 23-27, 2 figs. Of two classes of methods for determining calcium carbonate content of portland-cement raw mixture, namely those in which calcium is determined and those in which other constituent is determined, methods of latter class are held to be simpler and more rapid.

Producing Raw Materials for Portland Cement—V and VI, Oliver Bowles. Cement, Mill & Quarry, vol. 16, nos. 4 and 5, Feb. 20 and Mar. 5, 1920, pp. 13-17, 5 figs., and 19-22, Feb. 20: Notes on use of tripod drills where rock contains pockets of clay, use of hammer drills, arrangement of churn-drill holes for multiple shots, difficulties encountered in steeply inclined beds, and "gopher-hole" or "tunnel" method of blasting. Mar. 5: Types of explosives used in quarrying cement rock.

CENTRAL STATIONS

Communication with Substations. Intercommunication of Central Electric Station and Substations Feeding High Tension Net-work (Note sur les liaisons entre une centrale électrique et les sous-stations alimentant un réseau de distribution à haute tension), A. Laucagne. Revue générale de l'Electricité, vol. 7, no. 5, Jan. 31, 1920, pp. 157-162, 5 figs. Discusses introducing system of wireless telegraphy and telephony, similar to that at present used in telephone systems, which centralizes control at office of load-dispatcher.

Economy of Installation. Economy in Fuel Consumption, C. E. Stromyer. Eng. & Indus. Management, vol. 3, no. 7, Feb. 12, 1920, pp. 195-198. Writer suggests that wherever two works are situated not too far apart, one requiring much power and the other much steam for boiling, they could with advantage combine their steam requirements and thus reduce their joint coal bill by one-half.

CHEMICAL INDUSTRIES

Span. The Chemical Industry and Trade of Spain, O. P. Hopkins. Jl. Indus. & Eng. Chem., vol. 12, no. 3, March 1920, pp. 223-227. With tables giving imports and exports of chemicals and allied products.

CHIMNEYS

Earthquake-Resisting. Self-Supporting Chimneys to Withstand Earthquake, C. R. Weymouth. Mech. Eng., vol. 42, no. 3, March 1920, pp. 157-160 and 204-205, 2 figs. Studies of Japanese investigating committee are examined in light of records secured from San Francisco earthquake of 1906. Theory is developed that a chimney should be considered as body oscillating about center of percussion.

Radial Brick. Anaconda Chimney Largest and Tallest in the World. Public Works, vol. 48, no. 9, Mar. 13, 1920, pp. 181-183, 3 figs. Structure is 585 ft. tall weighs 30,000 tons and has 60 ft. inside diameter at top. It is said that 6,000,000 radial bricks were required.

Reinforced-Concrete. *See Water Towers, Reinforced-Concrete.*

CINEMATOGRAPH

See Motion-Picture Photography.

COST ACCOUNTING

Man-Hour Rate Basis. The Philadelphia Electric Company Payroll System for Cost Work on Departmental Man-Hour Rate Basis, G. P. Landwehr. Nat. Elec. Light Assn. Bul., vol. 7, no. 1, Jan. 1920, pp. 47-51, 6 figs. Forms used in connection with determination of costs of constructing operating and maintaining necessary equipment for production of article to be sold.

Scientific Basis for. Scientific Basis for Cost Accounting, G. Charter Harrison. Indus. Management, vol. 59, no. 3, March 1920, pp. 237-242. Formulæ are given for determining cost variations for different classes of expense.

CUTTING METALS

Barth Slide Rules. Supplement to Frederick W. Taylor's "On the Art of Cutting Metals"—VII. Carl G. Barth. Indus. Management, vol. 59, no. 3, March 1920, pp. 222-231, 3 figs. Gives formulæ and shows how to make slide rules for cutting cast iron.

DAMS

Earth Miami Conservancy District. Huffman Dam Outlet. Contrasting, vol. 9, Jan. 1, 1920, pp. 243-244, 2 figs. It is stated that structure in Miami Conservancy District, 70 ft. high through earth dam, was built in seven months, 32,450 yd. concrete having been placed in it by two 95-ft. derrick booins.

Masonry, Up-Stream Treatment of. The Value of Up-Stream Treatment in Dams Founded on Stratified Rock. Indian Eng., vol. 67, no. 3, Jan. 17, 1920, p. 38, 3 figs. on supplement plate. Methods carried out in two masonry dams founded on rock having vertical and horizontal fissures full of argillaceous material in India is explained and rules are suggested for building dams on stratified rock.

DIE CASTING

Advantages of. Modern Die Cast Parts and Metals—II. Raw Materials, vol. 2, no. 2, Feb. 1920, pp. 45-50, 9 figs. Writer points out that late developments of dies now allows casting of brass, both in steel and in plastic dies of high heat resistance, and concludes that process has many advantages from viewpoint of machine-part designer whereby part itself can be strengthened as well as most efficiently and economically produced by die casting. Illustrations of various die cast parts are included.

DIES

Thread-Cutting, Caps for. The Manufacture of Caps for Threading Dies, F. E. Merriam. Am. Mach., vol. 51, no. 19, Nov. 6, 1919, pp. 827-830, 12 figs. It is stated that much of efficiency of die depends upon correct machining of cap.

DIRECTION FINDERS

Method of Using. A Method of Direction Finding of Wireless Waves, and Its Applications to Aerial and Marine Navigation, James Robinson. Radio Rev., vol 1, no. 5, Feb. 1920, pp. 213-219, 3 figs. Methods in which coils can be placed actually on position which indicates bearing, thus avoiding necessity of having to determine two positions where signals are just audible. (To be concluded.)

DREDGING

Electric. Electric Dredging on the Yukon, Allen E. Ransom. Elec. Jl., vol. 17, no. 3, Mar. 1920, pp. 86-90, 13 figs. Dredge and characteristics and operating data.

DRILLING MACHINES

See Machine Tools, Special.

DRILLS

Twist, Manufacture of. The Manufacture of Twist Drills and Taps. Machy. (London). vol. 15, no. 386, Feb. 19, 1920, pp. 641-643, 7 figs. Production methods of Sir W. G. Armstrong, Whitworth & Co., Ltd. Openshaw, Manchester, England.

DROP FORGINGS

Heat Treatment of. The Heat Treatment of Drop Forgings,—1, Leslie Atchison Am. Drop Forger, vol. 6, no. 2, Feb. 1920, pp. 107-109, 2 figs. Effect of alloying elements on general characteristics of steel.(To be continued.) Paper presented before Association of Drop Forgers, England.

DRY DOCKS

Floating, Mobile, Ala. New Floating Dry Dock Built at Mobile. Int. Mar. Eng., vol. 25, no. 3, Mar. 1920, pp. 214-218, 8 figs. Donnelly-Type 10,000-ton wooden deck added to Pinto Island plant of Alabama Dry Dock and Shipbuilding Co.

Wooden, Floating, Durability of. A Sixty-Year-Old Floating Dry Dock, Paul H. Macneil, Int. Mar. Eng., vol. 25, no. 3, Mar. 1920, pp. 178-180, 5 figs. Durability of wooden floating dry dock is said to be proven by Bruce drydock at Pensacola, Fla., which has been in service since before outbreak of Civil War and is still in active operation.

DURALUMIN

See Aluminum Alloys.

DUST

Explosions. *See Explosions, Grain-Dust.*

DYNAMETER

See Testing Machines.

ELECTRIC CONDUCTORS

Parallel, Potential Distribution on. Equal Parallel Cylindrical Conductors in Electrical Problems, F. J. W. Whipple. Proc. Roy. Soc., vol. 96, no. A680, Feb. 3, 1920, pp. 465-475, 4 figs. Distribution of charge and potential determined by method of conjugate functions.

ELECTRIC CURRENTS

Alternating. *See Harmonic Mean.*

Direct, Heavy, Measurement of. A New Method of Measuring Heavy Direct Currents, R. E. Neale. Elec. Rev. (Lond.), vol. 86, no. 2206, Mar. 5, 1920, p. 292, 2 figs. Method depends upon change in choking effect of choking coil fed with alternating current when iron core of coil is magnetized by direct current to be measured as well as by alternating current. Translated from Elektrotechnische Zeitschrift.

ELECTRIC DISCHARGE

Theory of. The Quantum Theory of Electric Discharge, D. N. Mallik and A. B. Das. London, Edinburgh and Dublin Philosophical Mag., vol. 39, no. 230, Feb. 1920, pp. 233-238, 1 fig. Interprets behavior of electric discharge in vacuum-tube in terms of quantum theory.

Ludlum Type. The Ludlum Type of Electric Furnace, W. F. Sutherland. Can. Machy., vol. 23, no. 10, Mar. 4, 1920, pp. 249-251, 3 figs. Description of an electric furnace distinguished by ellipsoidal shape of hearth and by arrangement of 3-phase electrodes in line which is said to insure proper heat distribution.

Uses. Electric Furnace Progress. Metal Industry (N. Y.), vol. 18, no. 2, Feb. 1920, pp. 65-67. Rapid increase in use of electric furnaces for melting and heating metals is pointed out.

ELECTRIC FURNACES

See also Steel Manufacture, Electric Furnace for.

ELECTRIC GENERATORS

Losses, Measurement of. Measurement of Losses and Efficiency by Temperature Rise of Ventilating Air, Wm. F. Dawson. Gen. Elec. Rev., vol. 23, no. 2, Feb. 1920, pp. 153-161, 9 figs. Two methods are discussed: Measuring average inlet and outlet temperatures and volume of ventilating air assuming specific weight and heat of air: and measuring average inlet and outlet temperatures, passing discharged air through electric heater of known capacity and measuring average temperature of air from heater.

ELECTRIC GENERATORS, A. C.

Dissimilar. Oscillating Frequency of Two Dissimilar Synchronous Machines, R. E. Doherty. Gen. Elec. Rev., vol. 23, no. 2, Feb. 1920, pp. 125-129, 2 figs. Avoidance of "hunting" in parallel operation of two dissimilar alternators.

Short-Circuit Tests. Short-Circuit Tests on a 10,000-kv-a. Turbine Alternator, E. S. Henningsen. Gen. Elec. Rev., vol. 23, no. 3, Mar. 1920, pp. 214-221, 11 figs. Tests were conducted under different conditions of short circuit, with various arrangements of reactors in circuit and with no reactors in circuit. Empirical expressions are formulated, from results of tests, for effective symmetrical initial short-circuit current of turbine generator and percentage synchronous reactance. Relation is established that for practical purposes per cent leakage reactance may be considered as varying inversely with voltage.

Sine-Wave Testing Sets. Sine Wave Testing Sets, E. J. Burnham. Gen. Elec. Rev., vol. 23, no. 2, Feb. 1920, pp. 177-180, 10 figs. Generator designed to produce accurate sine wave under different load conditions. Large number of stator and rotor slots is used and also cylindrical rotor on which exciting coils are displaced in phase.

Small. Belted Alternating-Current Generators, A. L. Hadley. Gen. Elec. Rev., vol. 23, no. 2, Feb. 1920, pp. 171-176, 13 figs. Principal features in construction of line of small alternators ranging from 37½ kv-a. to 300 kv-a.

Synchronous. Some Mechanical Features of Synchronous Machines, A. P. Wood. Gen. Elec. Rev., vol. 23, no. 2, Feb. 1920, pp. 130-135, 11 figs. Illustrations are given of improvements which have been made in design and construction by introduction of arc welding and spot welding. Descriptions are included of oil starting system and oil circulating system, coreless and cored box type of stator frame, and rotor spiders of various types and speeds.

Voltage Transformation. Transforming 600-kva Alternator from 500 to 220 Volts (Transformation d'un alternateur de 600 kva de 500 volts à 220 volts), Léon Depierris. Electrician, vol. 50, no. 1246, Feb. 15, 1920, pp. 49-54, 10 figs. Instance is related in which transformation was effected by connecting coils in ten groups of two coils in series on each phase.

EMPLOYEES

PHYSICAL EXAMINATION OF. Making Examinations Universal, T. E. Jennings. Iron Trade Rev., vol. 66, no. 4, Jan. 22, 1920, pp. 284-285. Writer believes that physical examination of all employees will reduce losses from labor turnover, conserve man power and prove advantageous to employer and workmen. Objections of labor are answered.

EMPLOYEES' REPRESENTATION

STATUS IN UNITED STATES. Employees' Representation in Management of Industry, Royal Meeker, U. S. Dept. Labor. Bur. Labor Statistics, vol. 10, no. 2, Feb. 1920, pp. 1-14. Reference is made to establishment of Whitley plan in Great Britain and comparison is made of conditions in that country with those in U. S. Opinion is expressed that of the many systems of industrial democracy introduced in U. S. "very few give promise of accomplishing much in the way of winning enthusiasm and support of the workers, because little, if any, additional authority over or responsibility for methods and results is accorded them."

ENGLISH

FACTORY TRAINING IN. Preparing Industrial English Lessons, George F. Quimby and Charles H. Paull. Indus. Management, vol. 59, no. 3, March 1920, pp. 231-236, 3 figs. Lessons prepared by Industrial Service Department of Associated Industries of Massachusetts and Bureau of Vocational Guidance at Harvard University, which have been working co-operatively on industrial Americanization projects during past year.

EXPLOSIONS

COAL DUST IN STEEL MILLS. Explosion Hazard in Steel Mills From Partly Consumed Coal Dust. Chem. & Met. Eng., vol. 22, no. 9, March 3, 1920, pp. 422-423. Example is quoted of metal plant where there were a number of puddling furnaces some of which used pulverized coal as fuel. Draft of air blew some of coal dust over red-hot iron. Dust immediately ignited and communicated flames to roof trusses.

GRAIN-DUST, PREVENTION OF. Firemen and Prevention of Grain Dust Explosions, David J. Price. Fire & Water Eng., vol. 47, no. 7, Feb. 14, 1920, pp. 379-381 and 400, 4 figs. Examination of reason for dust explosions. It is concluded that special provision should be made in design of mills and elevators to prevent accumulation of dust throughout various parts of plant.

EXPORT TRADE

ENGLISH AS WORLD LANGUAGE. The English Language and International Trade, Alfred E. Hayes. Jl. Royal Soc. of Arts, vol. 68, no. 3508, Feb. 13, 1920, pp. 198-207 and (discussion) pp. 207-209. German and Bulgarian reviews are quoted as suggesting use of English as international trade language, and it is remarked how personal advantages and intellectual interests have prompted establishment of English-speaking associations in Belgium, Russia and other nations. Impracticability of adopting any artificial tongue is concluded from persistent failure of Volapük, Esperanto, Ido, Pëus, and other world languages.

SHIPPING QUOTATIONS, STANDARDIZATION OF. Standardized Practice for American Export Quotations. Automotive Industries, vol. 42, no. 8, Feb. 19, 1920, pp. 520-522. Rules for standardization of shipping quotations adopted at recent conference of trade organizations.

See also Metric System.

EXTENSOMETERS

See Testing Machines, Extensometer.

FACTORY MANAGEMENT

See Industrial Management.

FATIGUE

PREVENTION OF. Prevention of Fatigue in Industry—III, Reynold A. Spaeth. Indus. Management, vol. 59, no. 3, Mar. 1920, pp. 215-217, 1 fig. It is advised to analyze physical, physiological and psychological requirements of various processes and establish standards for each job. For strength testing, spring balance method of Lovett & Martin (Am. Jl. Orthopedic Surgery, 1916, no. 14, p. 415) is recommended.

REDUCTION OF. Unnecessary Fatigue, Frank B. Gilbreth and Lillian M. Gilbreth. Sci. Am. Monthly, vol. 1, no. 2, Feb. 1920, pp. 154-156, 7 figs. Recommends making regular fatigue surveys and points out ways of reducing unnecessary fatigue.

REST-DAY PROVISION. A Rest Day in Continuous Operation Industry, Fred C. Croxton. U. S. Dept. Labor, Bur. Labor Statistics, vol. 10, no. 2, Feb. 1920, pp. 118-127, 3 figs. Three plans are submitted which cover six working positions. The one suggested as simplest provides for full 24-hour rest after six consecutive turns.

FILTERS, SAND

HARTFORD, CONN. Building the Hartford Filter. Public Works, vol. 48, no. 8, Mar. 6, 1920, pp. 159-162, 4 figs. Describes methods and plant used by contractor in building slow-sand filter covering five acres and roofed over. It is related that concrete was distributed entirely by spouting and collapsible roof forms were used eight times.

FILTRATION

COMMERCIAL. Commercial Filtration—IV, J. E. Springer. Color Trade Jl., vol. 6, no. 3, Mar. 1920, pp. 73-76, 3 figs. Notes on disk filter, long-leaf pressure type of filter and method of operating it, and cleaning of filter cloths.

INDUSTRIAL. Industrial Filtration, Henry B. Faber. Jl. Soc. Chem. Industry, vol. 39, no. 3, Feb. 16, 1920, pp. 21T-22T. Process invented by George Moore. Involves use of filter leaves operating in open tank.

FIRECLAYS

COMPOSITION OF. The Use of Fire-Clay in Laying Fire-Clay Bricks, Raymond M. Howe. Gas Jl., vol. 149, no. 2962, Feb. 17, 1920, pp. 366-368, 7 figs. Experiments to determine effect of adding different amounts of water, glass, salt, portland cement, carborundum, asbestos and lime to plastic fireclay.

MORTARS, TESTS OF. Tests of Fire Clay Mortars, Raymond M. Howe. Gas Age, vol. 45, no. 4, Feb. 25, 1920, pp. 174-176, 7 figs. Addition of ground bats was found beneficial.

FLAME PROPAGATION

VELOCITY IN ENGINE CYLINDERS. The Velocity of Flame Propagation in Engine Cylinders, Donald MacKenzie and R. K. Honaman. Jl. Soc. Automotive Engrs., vol. 6, no. 2, Feb. 1920, pp. 119-122, 5 figs. Method is described for measuring rate of flame propagation in gaseous mixtures. Method depends upon fact that bodies at high temperature ionize space about them. Empirical expression for velocity of flame propagation is formulated from results of experiments.

FLIGHT

SOARING. Theory of Soaring Flight (Etude du vol à la voile dans la Haute-Guinée), M. P. Idrac. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 5, Feb. 2, 1920, pp. 269-272. From records of observations of direction and velocity of wind and calculated absolute velocity of bird, forces operating in flight are determined.

FLOOD CONTROL

See Rivers, Scioto, Improvement of.

FLOTATION

BRADFORD PROCESS. Selective Flotation by the Bradford Process. Eng. & Min. Jl., vol. 109, no. 12, Mar. 20, 1920, pp. 700-701. Method as developed at Broken Hill, Australia, is said to be particularly suited to separation of lead-zinc sulphides and to possess advantages over electrolytic, Horwood, magnetic and other treatment.

FLYING BOATS

HULL DIMENSIONS. Flying-Boats: The Form and Dimensions of Their Hull, G. S. Baker. Flight, vol. 12, no. 10, Mar. 4, 1920, pp. 270-272, 1 fig. Diagram showing effect of hull dimension on power required to overcome water resistance. (To be continued.) Paper read before North-East Coast Instn. Engrs. & Shipbuilders.

FOREMEN

QUALIFICATIONS. Qualifications for Foremanship, Charles W. Clark. Indus. Management, vol. 59, no. 3, Mar. 1920, pp. 199-202. Qualifications enumerated are force, idealism, positive personality, common sense, good health and unquestioned loyalty.

FORGING

CANADIAN PLANT. The Dominion Forge Plant at Walkerville. Am. Drop Forger, vol. 6, no. 2, Feb. 1920, pp. 96-101, 10 figs. Plant at present comprises group of 13 buildings on 10-acre tract of ground, 410 ft. wide by average of 800 ft. deep.

FOUNDRIES

BRITISH PRACTICE. Some Aspects of British Foundry Practice. Iron Age, vol. 104, no. 13, Sept. 25, 1929, pp. 873-874. Correspondent claims no notable improvements have apparently result from war activity. Great attention is being paid, it is pointed out, to chill castings with object of reducing subsequent machining operations to minimum.

STEEL, ECONOMIC OPERATION. Steel Foundry Starts Operations—I. Foundry, vol. 48, no. 5, Mar. 1, 1920, pp. 187-191, 9 figs. Efforts made by Vulcan Iron Works, Wilkes-Barre, Pa., to reduce operating expense.

MAGNETIC SEPARATION OF IRON FROM REFUSE. Magnetic Separation of Iron from Foundry Refuse from an Economic Standpoint (Ueber die Wirtschaftlichkeit der magnetischen Aufbereitung von Schutt und Schlacken in der Eisenund Stahlgiesserei), Hubert Hermanns. Giesserei-Zeitung, vol. 16, nos. 16, 17 and 18, Aug. 15, Sept. 1 and Sept. 15, 1919, pp. 244-248, 260-263 and 275-277, 13 figs. Illustrations and operating costs of traveling, portable and stationary separation plants are given. Traveling plants are said to have shown most satisfactory results in average works.

MALLEABLE-IRON. Economies in a Malleable Iron Foundry, A. F. Conant. Iron Age, vol. 104, no. 13, Sept. 25, 1919, pp. 859-861, 5 figs. It is claimed good working conditions have been provided in annealing department of Rhode Island Malleable Iron Works, Hills Grove, R. I., by constructing building with unusually high roof; great economies are said to have been effected by concreting entire yard to depth of 6 or 8 in., except beneath stock piles.

HANDLING MATERIALS

English Docks, System on. Cargo Handling in England, F. T. Chambers. Nautical Gas., vol. 98, no. 10, Mar. 6, 1920, pp. 381-382. Writer, who was sent abroad in 1918 at head of mission to study various features of port management and development, believes American engineers could profitably study system followed in construction of modern British docks.

Gravel. Mechanical Handling of Gravel or Broken Stone, Alan Mair Jackson. Can. Engr., vol. 38, no. 11, Mar. 11, 1920, pp. 273-275, 1 fig. Installation at Brant County, Ontario, combining slot, elevator and bin method. Paper read before County Road Superintendents & Engrs. of Ontario.

HEALTH

Miners' Nystagmus. A Lecture on Miners' Nystagmus, T. Lister Lewellyn. Trans. Instn. Min. Engrs., vol. 58, part 3, Feb. 1920, pp. 167-175 and (discussion) pp. 175-182. Theory that disease is due to deficient illumination is upheld, symptoms are explained and factors determining occurrence of disease are discussed.

HEAT INTERCHANGERS

Double Pipe. Double Pipe Heat Interchangers, George A. Richter. Chem. & Met. Eng., vol. 22, no. 12, March 24, 1920, pp. 551-556, 13 figs. It is concluded from experimental work that double pipe heat interchanger in form of helix gives marked increase in K over same tubular parts put into form of straight pipe lengths, also that conductivity in all cases increases slightly with increase in average temperatures in system. Helical cooler consisting of 2-in. pipe within 4-in. pipe was found to give higher conductivity than corresponding cooler equipped with 1-1.2-in. inner coil. Paper read before Am. Inst. Chem. Engrs.

HEAT TREATMENT

See Steel, Heat Treatment of.

HEATING

Gas vs. Electricity. The Relative Merits of Gas and Electricity for Heating and Power. Gas Jl., vol. 149, no. 2963, Feb. 24, 1920, pp. 434-436. Debate at University of Birmingham (Eng.) on utilization of fuel for generation of power; industrial application of the two agents (furnaces in particular): domestic appliances (other than lighting); transmission or distribution of power.

HEATING, ELECTRIC

Cost of. The Idaho Commission's Decision on Electric Heating of Houses and Building, George E. Erb. Nat. Elec. Light Assn. Bul., vol. 7, no. 1, Jan. 1920, pp. 11-13. Testimony and facts before Commission showed, it is claimed, that on account of cost "it is impossible to furnish electricity for house heating as a commercial proposition in competition with wood or coal", and that "only when an excess of current is generated and may be sold as a by-product can it be used for heating purposes."

Switzerland. The Prospects of House Heating with Electricity in Switzerland (Die Aussichten der elektrischen Raumheizung in der Schweiz), M. Hottinger. Schweizerische Bauzeitung, vol. 75, no. 6, Feb. 7, 1920, pp. 57-60. Question is discussed of how large a part of quantity of electricity obtainable by water power in Switzerland would be available for house-heating purposes in future. Writer refers to this as a problem of great national and economic importance.

HEATING AND VENTILATION

Preliminary Work. Plan and Specification Data Sheets for Heating and Ventilating—II. Heat. & Vent. Mag., vol. 17, no. 2, Feb. 1920, pp. 29-32. Suggests forms suitable for use in preliminary work prior to design of installation itself.

Research. Heating and Ventilating Research Work—I. Masao Kinoshita. Domestic Eng. & Estate Engr., vol. 40, no. 14, Feb. 1920, pp. 20-21. Researches carried out at London University by Research Committee of Institution of Heating and Ventilating Engineers.

HIGHWAYS

Canada, Federal Aid in. Federal Aid, A. W. Campbell. Can. Engr., vol. 38, no. 11, Mar. 11, 1920, pp. 275-276. Act was passed July 7, 1919, by Dominion government appropriating $20,000,000 to be divided among provinces according to their population, this sum to be used in paying 40 per cent of cost of improving roads designated by provincial governments and approved by federal department of highways. Suggestions as to best manner of utilizing this appropriation in provinces are pointed out.

Drainage of. Highway Drainage, U. W. Christie. Can. Engr., vol. 38, no. 10, March 4, 1920, pp. 263-265. Economy in drainage is pointed out. Paper read before Assn. of Ontario Land Surveyors.

Saskatchewan, Canada. Developments of Saskatchewan's Highway System, Charles W. Dill. Can. Engr., vol. 38, no. 8, Feb. 19, 1920, pp. 222-225. Organization and duties of department. Paper read before Association of Dominion Land Surveyors.

Tests of. New Highway Tests Being Made by the Bureau of Public Roads. A. T. Goldbeck. Good Roads, vol. 19, no. 7, Feb. 18, 1920, pp. 97-98 and 102-103. Investigations being undertaken cover (1) study of amount of impact delivered by motor trucks to roads, (2) study of effect of this impact on different types of road surfaces, (3) study of effect of traffic on different types of road surfaces, and (4) study of bearing power of subgrades as affected by moisture.

See also Roads.

HOUSES

Pisé de Terre. Pisé de Terre and Its Possibilities. Clough Williams-Ellis. Surveyor, vol. 57, no. 1466. Feb. 20, 1920, pp. 183-184. Definition of pisé de terre and plant required for pisé building: method of construction end extracts from specifications of house built of pisé.

HOUSES, CONCRETE

Construction. Concrete Cottage Building. Concrete & Constructional Eng., vol. 15, no. 2, Feb. 1920, pp. 84-91, 7 figs. Basis of construction is steel frame encased in expanded metal, which forms reinforcement for concrete outside walls, inside walls being of slabs.

HYDRAULIC TURBINES

Wear of. Wear of Hydraulic Turbines, Its Consequences and the Methods of Reducing It (L'usure des turbines hydrauliques, ses conséquences et les moyens d'y parer), Henri Dufour. Bulletin Technique de la Suisse Romande, vol. 46, nos. 3 and 4, Feb. 7 and 21, 1920, pp. 25-26, 2 figs., and 37-41, 5 figs. Feb. 7: Suggests improvement of Boucher apparatus for precipitating alluvial loams. Feb. 21: Reservoirs near Santiago, Chile, for removal of sand and loams from water. Railings are specially arranged to cause precipitation of matter in suspension without permitting it to form deposits at bottom. (Concluded.)

HYDROELECTRIC PLANTS

Automatic Operation. Development of Automatic Hydro-Electric Generating Stations, T. A. E. Belt. Elec. World, vol. 75, no. 9, Feb. 28, 1920, pp. 477-479, 4 figs. Successful operation of plant installed by Iowa Railway & Light Co. at Cedar Rapids, Iowa, is quoted as establishing practicability of automatically operating hydro-electric generating stations. Wiring schemes for remote control and automatic hydro-electric plant are illustrated.

France. Developing Hydroelectric Steelmaking. Iron Trade Rev., vol. 66, no. 2, Jan. 8, 1920, pp. 151-152, 1 fig. It is stated that hydraulic power of French Alps represents today 6,270,000 tons of coal, of which metallurgical operations absorb 303,000 hp. and chemical industry 255,000.

Pond-Level Control. Pond-Level Control for Hydro Plants, Earl Stafford. Elec. World, vol. 75, no. 12, Mar. 20, 1920, pp. 663-665. Comparative study of devices used to regulate pond levels and provide discharge capacity for floods.

ICE PLANTS

Raw-Water vs. Distilled-Water. Raw Water vs. Distilled Water Ice Plants—Steam to Electricity, A. H. Hutchinson Refrigeration, vol. 26, no. 1, Feb. 1920, pp. 36-38. Writer concludes that, on the whole, the raw-water plant is most surely the plant of the future. Paper prepared for convention of Southern Ice Exchange.

INDUSTRIAL CONDITIONS

England and France. Industrial and labor Conditions abroad, Luther D. Burlingame. Am. Mach., vol. 51, no. 24, Dec. 25, 1919, pp. 1079-1083. Views based on experiences of writer's recent trip to England and France, as member of Nat. Screw Thread Commission, presented with thought that they may serve as guide and warning to both employers and workmen engaged in American industries.

INDUSTRIAL MANAGEMENT

Machine Work. *See Cutting Metals, Barth Slide Rules.*

Planning. Output Planning as a Function of Management, S. Robert Stelling. Eng. & Industrial Management, vol. 3, no. 9, Feb. 26, 1920, pp. 259-261, 2 figs. Suggested forms of cards for use in planning work in shop.

Production Control. A Plea for Better Harmony Between Theory and Practice. Machy. (Lond.), vol. 15, no. 388, Mar. 4, 1920, pp. 705-716, 40 figs. Co-ordination of castings and machining operations for production on large scale. (Continuation of serial.)

Graphic Production Control, E. T. Spidy. Ry. Rev., vol. 66, no. 10, Mar. 6, 1920, pp. 364-368, 6 figs. Account, with illustrations, of methods employed at Angus shops of Can. Pacific Ry., in scheduling work through shops, and in accounting for time, labor and materials. From paper read before Can. Ry. Club.

Visualizing Facts for Control—III, L. V. Estes. Indus. Management, vol. 59, no. 3, March 1920, pp. 209-214, 3 figs. Explains operation of dispatch board for shop control, control board for shipping goods in mail-order house and chart for production control in manufacturing plant, as examples of control mechanisms.

Routing. Stock Parts and Their Routing, L. D. Burlingame. Machy. (Lond.), vol. 15, no. 385, Feb. 12, 1920, pp. 617-621, 12 figs. System of classifying, ordering, routing and storing of stock parts at plant of Brown & Sharpe Co.

Time Study. *See Time Study.*

Tool Room Organization. Tool Room Organization. Eng. & Indus. Management, vol. 3, no. 8, Feb. 19, 1920, pp. 233-235, 4 figs. Suggestions in regard to organization of tool room in factory.

Tool-Storage System. A Group Tool Storage System, Peter F. O'Shea. Am. Mach., vol. 51, no. 20, Nov. 13-20, 1919, pp. 887-889, 4 figs. Tool crib, tool identification card, and belt-storage rack in machine shop of large plant.

LUBRICANTS

ENGINE, DILUTION BY FUEL. Dilution of Engine Lubricants by Fuel, Gustave A. Kramer. Jl. Soc. Automotive Engrs., vol. 6, no. 2, Feb. 1920, pp. 123-128, 13 figs. Experiments to determine effect of dilution by fuels on viscosities of lubricants, fuels being diluted either by average grade of fuel gasoline or by commercial kerosene. Use of oil renovator as part of engine itself is suggested.

The Proper Balancing of Fuel, Lubricant and Motor, William F. Parish. Mech. Eng., vol. 42, no. 3, Mar. 1920, pp. 164-168, 8 figs. Experiments conducted to determine cause of dilution of motor lubricating oil demonstrated, it is claimed, that it is due mainly to leakage past piston rings during compression stroke. It is recommended that selection of motor oil for given motor be based upon scientific grounds and that engines be designed to permit entire consumption of fuel on top of pistons.

LUBRICATION

THEORY OF. Notes on the Theory and Practice of Lubrication, J. P. Hamer. Managing Engr., vol. 6, no. 10, Feb. 1920, pp. 239-243, 4 figs. Mechanics of parallel surface in relative tangential motion is discussed and equations are derived for tangential forces operating and diagrams of pressure are constructed.

MACHINE DESIGN

LABOR-SAVING MACHINERY. Specialization in Design of Labour-Saving Machine, C. H. Smith, Eng. & Industrial Management, vol. 3, no. 9, Feb. 26, 1920, pp. 266-270. Suggestions in regard to designing and installing of labor-saving machines. Paper read before Birmingham Assn. of Mechanical Engrs.

WORKING OUT DETAILS. Designing a Special Machine. Machy. (Lond.), vol. 15, no. 385, Feb. 12, 1920, pp. 609-612, 6 figs. Value of schedules in working out preliminary details is illustrated by working out example of special duplex grinding machine.

MACHINE-TOOL INDUSTRY

CHINESE MARKETS. China as a Machine Tool Market, Julean Arnold. Machy. (N. Y.), vol. 26, no. 7, Mar. 1920, p. 616. Writer, who is American commercial attaché at Pekin, China, gives his views of possibilities of future machine tool trade with China, and points out that Chinese engineering schools provide one of the best means for advertising American machine tools to Chinese.

MACHINE TOOLS

AMERICAN, FRENCH DEMAND FOR. American Machine Tools Needed in France, L. W. Alwyn-Schmidt. Am. Mach., vol. 51, no. 19, Nov. 6, 1919, pp. 825-826. It is pointed out that during first four months of 1919 value of American machine tools shipped to France reached $5.000,000. Factors advised to be taken into consideration in studying present and future machine-tool needs of France are destruction of industrial equipment in northeastern France and likely expansion of French iron industry following acquisition of iron mines of Lorraine.

FEEDS AND SPEEDS. The Androuin Progression Ratio for Speeds and Feeds for Machine Tools, Machy. (Lond.), vol. 15, no. 385, Feb. 12, 1920, pp. 613-616, 1 fig. Proposes progressive ratio of 1.259, that is, 1¼ approximately. It is claimed that this series ratio facilitates calculation of cutting times. Translated from Bulletin de la Société d'Encouragement pour l'Industrie Nationale.

INERTIA EFFECTS. Inertia Effects in the Operation of Shop Machinery, C. E. Clewell. Am. Mach., vol. 51, no. 13, Sept. 25, 1919, pp. 607-609, 6 figs. Discusses problem of inertia in quick acceleration and retardation of machine tools with reference to frequent reversals of planing, shaping and punching machines. Notes are included on reduction of inertia in pulleys by use of aluminum and on ways of reducing inertia in a rapidly revolving motor that is subject to frequent reversals.

MAGAZINE FEEDS FOR. Maganize Feed Mechanisms, Edward K. Hammond. Machy. (N. Y.), vol. 26, no. 7, Mar. 1920, pp. 593-601, 19 figs. Description of mechanisms and mechanical movements used in design of magazine feeding devices for automatic machines employed by Diamond Chain & Mfg. Co. Their advantages are pointed out.

MAGNETS

PERMANENT, LINES OF FORCE IN. Dependence of Temperature Coefficients of Permanent Magnets on Their Form (Über die Abhängigkeit des Temperaturkoeffizienten permanenter Magnete von deren Gestalt), E. Gumlich. Annalen der Physik, vol. 59, no. 7, Sept. 4, 1919, pp. 668-688, 6 figs. Experimental determination of distribution of lines of force in a simple horseshoe magnet, both open and closed. Information from Natl. Physical and Tech. Inst.

MAGNETOS

MAGNETS FOR. *See Steel, Magnet.*

MALLEABLE IRON

RESEARCH. Research Work on Malleable Iron, Enrique Touceda. Can. Foundryman, vol. 11, no. 2, Feb. 1920, pp. 40-41, 6 figs. Results of 4 years of research work for American Malleable Casting Association. (Concluded.)

METALS

NON-FERROUS PRICES IN 1919. Exports Sustain Metal Markets. Iron Trade Rev., vol. 66, no. 1, Jan. 1, 1920, pp. 113-114. It is stated that heavy demands from abroad are partially met, despite exchange rate, while domestic requirements for most non-ferrous metals, except copper and brass, are slack. Table of average monthly non-ferrous prices in 1919 is presented.

PROGRESS IN 1919. The Year's Progress in Metals. Metal Industry (N. Y.), vol. 18, no. 2, Feb. 1920, pp. 85-86. Review of important work conducted in United States and England on metals and alloys. Abstracts are presented of important articles which have appeared in technical papers in both countries. (Concluded.)

See also Ores.

METEOROLOGY

BRIGHTNESS OF SKY. The Brightness of the Sky, A. F. Moore and L. M. Abbot, Smithsonian Misc. Coll., vol. 71, no. 4, Feb. 4, 1920, 36 pp., 2 figs. Account of set of observations made at Hump Mountain, Elk Park, N. C., from July 1917 to April 1918, with pyranometer, an instrument constructed by Smithsonian Instn. for purpose of measuring radiation of various kinds. Measurements were made on intensity of radiation from sky, clear, hazy, cloudy and foggy; radiation under trees, plants, etc.; snow reflection, radiation, etc. Instrument was taken to Calama, Chile, and other sky-radiation measurements were made there.

PRESSURE AND WEIGHT OF AIR VS. ALTITUDE. Experimental Laws of Variation of Barometric Pressures and Specific Weight of Air with altitude (Lois expérimentales des variations de la pression barométrique et du poids spécifique de l'air avec l'altitude), Rodolphe Soreau. Aérophile, vol. 27, no. 21-22, Nov. 1-15, 1919, pp. 335-342, 1 fig. Barometric formulæ derived from fundamental differential equation combining pressure, specific weight and altitude. Records of observations at various places are also given.

TEMPERATURE EQUATION. Determination of Normal Temperatures by Means of the Equation of the Seasonal Temperature Variation and a Modified Thermograph Record, F. L. West, N. E. Edlefsen and S. Ewing. Jl. Agricultural Research, vol. 18, no. 10, Feb. 16, 1920, pp. 499-510, 6 figs. It is illustrated how equation can be derived from observations of Weather Bureau for determining normal temperature at certain place at an assigned hour of day on particular day of year.

METRIC SYSTEM

EXPORT TRADE AND. The Metric System and Our Export Trade. Chem. Engr., vol. 28, no. 2, Feb. 1920, 49-50. Bureau of Standards is quoted as expressing opinion that American exporters are hampered by retention of present system of measurement. It is stated that 34 countries have adopted metric system.

MILLING

FIXTURE FOR. Some Examples of Profile Milling Practice, F. Scriber. Can. Machy., vol. 23, no. 9, Feb. 26, 1920, pp. 215-218, 12 figs. Various fixtures are shown and discussed.

MILLING MACHINES

BRACINGS FOR. Recent Machine Tool Developments—XI, Joseph Horner. Eng., vol. 109, no. 2825, Feb. 20, 1920, pp. 236-239, 32 figs. Details of bracings for pillar and knee machines, Lincoln machine braces, gear-cutter bracings and shapers.

INGERSOLL CIRCULAR-TABLE. Ingersoll Circular-Table Continuous Milling Machines, J. V. Hunter. Am. Mach., vol. 51, no. 21, Nov. 27-Dec. 4, 1919, pp. 915-918, 7 figs. Types of continuous milling machines that have been developed for maximum production with minimum labor.

INGERSOLL DIFFERENTIAL TYPE. The Ingersoll Differential-Type Continuous-Milling Machine, J. V. Hunter. Am. Mach., vol. 51, no. 14, Oct. 2, 1919, pp. 645-650, 7 figs. Outstanding features are said to be; (1) Large capacity on relatively large pieces of work in connection with minimum amount of floor space; (2) small amount of labor required, only one operator being required; and (3) fact that it carries large number of milling cutters, each of which may be arranged for simultaneous operation of different pieces of work.

SPLINE, TWO-SPINDLE. Two-Spindle Spline Milling Machine. Can. Machy., vol. 23, no. 9, Feb. 26, 1920, pp. 228-229, 4 figs. Description and illustrations of machine recently placed on market by Taylor & Fenn Co., Hartford, Conn.

MINE HOISTING

ELECTRIC CONTROLLERS FOR. Electric Controllers for Mine Hoists, W. C. Goodwin. Elec. Jl., vol. 17, no. 3, Mar. 1920, pp. 119-122, 6 figs. Typical installation of high-voltage electric motor mine hoist.

WINDING-ROPE STRESSES. Winding Ropes and Bending Stresses, O. Speer. Colliery Guardian, vol. 119, no. 3085, Feb. 13, 1920, p. 449, 7 figs. Writer holds that spirally twisted wires in rope are more flexible than same wire straightened out. Deductions from winding rope statistics of the Dortmund district. (Translated from Glückauf.)

MINE TIMBERING

FAILURE. Failure of Mine Timbers, George J. Young. Eng. & Min. Jl., vol. 109, no. 10, March 6, 1920, pp. 611-612, 2 figs. Influence of ventilation and high temperatures in reducing strength of timbers.

MINERALS

U. S., SOURCES OF SUPPLY. Our Mineral Supplies, H. D. McCaskey and E. F. Burchard. Dept. of Interior, U. S. Geol. Survey, Bul. 666, 1919, 278 pp. Compilation of reports issued by U. S. Geol. Survey. Each report discusses source of supply of mineral considered, its uses, both in peace and in war, and normal demand, and for some minerals probable demand under war conditions is indicated.

TUBES. Tube Welding by the Oxy-Acetylene Process, F. W. Smith. Am. Mach., vol. 51, no. 20, Nov. 13-20, 1919, pp. 845-848, 6 figs. It is pointed out that as tubes welded by oxy-acetylene process are almost invariably butt-welded, heat, which is applied to seam only, must be of intensity to raise edges under flame immediately to fusing point. Material from which tubing is made is usually low-carbon steel.

See Foundries, Welding, Applications of.

PAPER MILLS

HYDROELECTRIC DRIVE. Electric, Steam and Water Power Drive in a Paper Mill. Elec. Rev., vol. 76, no. 9, Feb. 28, 1920, pp. 345-347, 6 figs. Hydroelectric unit comprises 907-kva. Three-phase alternator operating at 2300 volts, 60 cycles, and driven by 39-in. S. Morgan Smith water turbine having speed of 240 r.p.m. and equipped with Woodward governor.

PATENTS

VALUATION OF INVENTION. Patenting and Promoting Inventions, Mois H. Avram. Chem. Engr., vol. 28, no. 2, Feb. 1920, pp. 37-40. It is pointed out that value of an invention can be estimated only after careful survey of market it is designed to supply. It is held that such survey is as indispensable as investigation of technical character of invention.

PATTERNS

TURNING OF. Notes on Pattern Turning. Model Engr. & Elecn., vol. 42, no. 982, Feb. 19, 1920, pp. 178-183, 34 figs. Details and illustrations of typical examples. (Continuation of serial.)

PAVEMENTS

CONSTRUCTION STATISTICS. Annual Paving Statistics—IV. Public Works, vol. 48, no. 7, Feb. 28, 1920, pp. 150-151. Facts and figures in tabulated form from several hundred cities concerning amount and nature of work done by each during 1918.

PAVEMENTS, ASPHALT

NEW YORK CITY. Resurfacing Asphalt Pavements in New York. Public Works, vol. 48, no. 8, Mar. 6, 1920, pp. 170-172, 2 figs. Describes how city forces removed about half an inch of worn and deteriorated wearing surface without injuring remainder and replaced it with new asphalt thoroughly welded. It is said that 183,000 yd. were resurfaced in 1919 at cost of less than $1 per yd.

PAVEMENTS, CONCRETE

DESIGN. Fundamental Considerations for Concrete Pavement Design, S. T. Morse. Eng. & Contracting, vol. 53, no. 9, Mar. 3, 1920, pp. 245-247. Writer describes effect of roadway width on thickness of pavement and gives formula for design of concrete slabs. Reference is made to Prof. Duff A. Abrams' tests at Lewis Inst., Chicago.

PAVEMENTS, WOOD-BLOCK

ECONOMICAL VALUE. Wood Block Paving, Walter Buehler. Jl. West. Soc. of Engrs., vol. 25, no. 3, Feb. 5, 1920, pp. 73-84 and (discussion) pp. 84-92, 6 figs. Inspection of creosoted-block pavements in loop district of Chicago is said to demonstrate that these pavements have been an economic investment.

PETROLEUM

BIBLIOGRAPHY. Recent Articles on Petroleum and Allied Substances. Monthly Reports of Investigations, Bur. of Mines, Feb. 1920. 33 pp. Covering history, geology and origin, development and production, transportation, storage and distribution, properties and their determination, refining, and utilization.

ORIGIN OF. The Origin of Petroleum, I. A. Stigand. Min. Mag., vol. 22, no. 1, Jan. 1920, pp. 11-22. Author reviews various theories put forward to explain origin and lays particular stress on marine sources of origin, especially small forms of organism, both animal and vegetable and adduces new evidence in favor of this theory. Summary of required conditions or factors for production of deposits of petroleum, originating from organic matter.

UNITED STATES, RESERVES OF. The Petroleum Reserves of the United States, Petroleum Times, vol. 3, no. 59, Feb. 21, 1920, p. 190. It is said that Dr. David White, chief geologist of U. S. Geol. Survey, forecasts exhaustion in twenty years, total available supply being approximately 7,000,000,000 bbl.

See also Oil.

PHOSPHATES

MINING OF. Hydraulic Methods in the Florida Phosphate Fields, Victor J. Milkowski. Rock Products, vol. 23, no. 3, Jan. 31, 1920, pp. 17-19, 5 figs. Sketch showing arrangement of nozzles and sumps.

PHOTOGRAPHY

AERIAL. *See Aerial Photography.*

PHOTOTELEGRAPHY

METHOD. Method for Conversion of Light Rays into Code Characters for Phototelegraphy (Anordnung zur Umwandlung von Lichtstrahlen in Schriftzeichen für Lickttelegraphic), Georg Schmidt. Elektrotechnischer Anzeiger, vol. 36, no. 90, Aug. 26, 1919, pp. 420-422, 1 fig. Details of new method and device for converting rays of light by means of selenium or similar photoelectric cells into mechanical work. Discovery, it is ert forth, is for purpose of establishing by means of differential connection system, electric connection in one or more local circuits under any lighting conditions either by day or night.

PIERS

See Terminals, Marine, Piers.

PIPE

LEAD, EXTRUSION OF. The Extrusion of Lead Pipe, Ellsworth Sheldon. Am. Mach., vol. 51, no. 21, Nov. 27, Dec. 4, 1919, pp. 909-913, 10 figs. Possibility of extruding iron is mentioned and notes are added on lead refining and alloying, and making shrapnel balls.

STANDARD THREADS FOR. Gauging American Standard Pipe Threads, J. H. Rodgers. Can. Machy., vol. 23, no. 8, Feb. 19, 1920, pp. 195-198, 15 figs. Summary or revised formulation of Briggs' standard and gaging system adopted by different manufacturers of pipes, valves and fittings.

PIPE, CAST-IRON

CENTRIFUGALLY CAST. Centrifugally Cast Pipe in South America, Iron Age, vol. 104, no. 13, Sept. 25, 1919, pp. 863-865, 7 figs. Account of new plants in Brazil and Argentine using the DeLavaud process of iron pipe. Notes on method of tapping hot iron from cupolas at plant in Buenos Aires.

JOINTS. Cast Iron Pipe Joints. Gas Industry, vol. 20, no. 2, Feb. 1920, pp. 43-46. Report of Committee appointed by American Gas Association to prepare satisfactory design for joints for cast iron mains. New design of bell for tentative alternating standard is recommended.

PIPE, CONCRETE

PRESSURE, TESTS OF. Reinforced Concrete Pressure Pipe Test Concrete Products, vol. 18, no. 2, Feb. 1920, pp. 13-15, 3 figs. Service tests of Meriwether reinforced-concrete pressure pipe which is designed for use in water conduits, power-house and similar work requiring watertight pipe.

PLATINUM

CANADIAN DEPOSITS. Possibilities for Platinum in Western Canada, W. L. Uglow. Can. Min. Inst. Bul., no. 95, Mar. 1920, pp. 207-220. It is concluded from survey of platinum-bearing deposits that possibilities for future supply of metal are good Rules are formulated for distinguishing rocks and ore bodies which may be possible carrier of platinum.

GERMAN PRODUCTION, 1919. German Potash Production and Prices. Cement, Mill & Quarry, vol. 16, no. 4, Feb. 20, 1920, pp. 19-21. According to Commercial Attache Edwards at The Hague, Netherlands German Potash Syndicate reports total production of actual potash for 1919 at 946,000 tons, of which 264,000 tons were sold abroad, remainder meeting about 41 per cent of home requirements.

POWER GENERATION

EUROPE, PROGRESS IN. Progress of Power Engineering—I, L. W. Alwyn-Schmidt. Power Plant Eng., vol. 24, no. 5, March 1, 1920, pp. 268-270. Analysis of recent developments in Europe based on U. S. consular and commercial reports. Opportunities for American trade are pointed out.

PROGRESS IN. Progress of Power Engineering—II, L. W. Alwyn-Schmidt. Power Plant Eng., vol. 24, no. 6, Mar. 15, 1920, pp. 321-323. Review of power developments in Asia, Australia, and South and Central America during last few years, and possibilities for future expansion.

REPAIR SHOPS. The Power Plant Repair Shop. Power Plant Eng., vol. 24, no. 5, March 1, 1920, pp. 271-274, 5 figs. Suggests outline of equipment, location and arrangement for shop suited to medium-size plant.

PRECIPITATION

ELECTRICAL, BIBLIOGRAPHY OF. Bibliography of Selected Articles on Electrical Precipitation of Suspended Matter. Cement, Mill & Quarry, vol. 16, no. 4, Feb. 20, 1920, p. 18.

See also Gases, Cleaning by Electricity.

PULLEYS

See Machine Tools, Inertia Effects.

PULVERIZED COAL

ADVANTAGES. Pulverized Coal for Fuel Makes Good Saving in Milwaukee, John Anderson. Elec. Ry. Jl., vol. 55, no. 10, March 6, 1920, pp. 473-477, 1 fig. Ease with which fuel feed and draft and controlled, ability to take and drop heavy overloads quickly without waste, thorough combustion and uniformly high efficiency are claimed as advantages of pulverized coal.

BLAST FURNACES, USE IN. Progress in the Use of Pulverized Fuel in Blast Furnaces, W. L. Wotherspoon. Iron & Steel of Canada, vol. 3, no. 1, Feb. 1920, pp. 5-8, 2 figs. Description of Vortex tuyere and its adaptation to form small combustion chamber.

CANADIAN REPORT ON. The General Fuel Situation in Canada. Power House, vol. 13, no. 4, Feb. 20, 1920, pp. 76-77. Abstract of report of Commission of Conservation, Ottawa, on pulverized coal.

CENTRAL STATIONS. Pulverized Coal in Central Stations, John Anderson. Elec. World, vol. 75, no. 11, Mar. 13, 1920, pp. 589-591, 2 figs. In tests conducted by engineers of Milwaukee Elec. Ry. & Light Co. efficiency of 80 per cent is said to have been obtained for pulverized-fuel installation.

RAILWAY TRACK

BALLAST. A Scientific Study of Railway Track Under Load—II Ry. Age, vol. 68, no. 11, Mar. 12, 1920, pp. 775-779. Results of field and laboratory tests are said to have indicated that presence of ballast above level of bottom of tie has little influence on quiescent load which will be carried before ballast will or out from under tie and allow it to settle, but that under repeated applications of load and particularly under jarring and vibratory loads ultimate carrying capacity of ballast is considerably increased by raising level of ballast surface to top of tie.

Report of Committee II—On Ballast. Bul. Am. Ry. Eng. Assn., vol. 21, no. 222, Dec. 1919, pp. 365-409, 15 figs. Standardization of ballast tools is suggested; specifications are recommended for storm ballast, and instructions are formulated to govern ballasting on operated line.

FISHPLATES. Experiments on the Strength and Deflection of Fishplates Made, E. W. Stoney. Indian Eng., vol. 67, no. 4, Jan. 24, 1920, p. 52, 2 figs. Tabular statement showing results obtained in testing strength of Madras Railway fishplates and rail joints is presented and illustration is given of two forms of cast-iron joint sleepers, designed by writer, one for supported joint and one for suspended joint.

FROG ANGLES, MEASURING OF. Model Railway Matters—VI. Model Engr. & Elecn., vol. 42, no. 983, Feb. 26, 1920, pp. 197-199, 4 figs. Details of curves, points and crossings. Method of measuring railway frog angles and of calculating length of cross-overs.

SLIP ROADS, SHORTENING OF. Devices for Shortening Slip Roads, A. Goupil. Bul. Int. Ry. Assn., vol. 1, nos. 4-5-6, Oct.-Nov.-Dec. 1919, pp. 245-249, 7 figs. By lengthening connecting curve of switch by eliminating continuation of nose of frog to mathematical intersection point. Translated from Génie Civil.

STRESSES UNDER LOAD. A Scientific Study of Railway Track Under Load. Ry. Age, vol. 68, no. 10, Mar. 5, 1920, pp. 670-673, 2 figs. Investigations of Special Joint Committee of Am. Soc. Civil Engrs. and Am. Ry. Eng. Assn.

TIE TAMPER, ELECTRIC. The Jackson Electric Tie Tamper. Ry. Rev., vol. 66, no. 3, Jan. 17, 1920, pp. 90-93, 5 figs. Tamper consists of electric motor, the shafts of which carries unbalanced weight which revolving at 3600 r.p.m. causes motor to vibrate.

TIES, CAST-IRON. Experiments made to Determine the Strength of Cast-Iron Bowl Sleepers, E. W. Stoney. India Eng., vol. 67, no. 6, Feb. 7, 1920, pp. 80-81, 13 figs., on two supp. plates. Weight of 479 lb. was allowed to fall from heights from 1 ft. 6 in. increasing by from 3 to 6 in. till failure took place. Results are shown in tabular statement and diagrams are included indicating particulars of ties tested and manner in which each failed.

TIES, DURABILITY OF. Report of Committee III—On Ties. Bul. Am. Ry. Eng. Assn., vol. 21, no. 223, Jan. 1920, pp. 521-560, 11 figs. Account of experimental study undertaken to determine effect of design of tie plates and spikes on durability of cross-ties.

RAILWAYS

FRANCE. The Railways of France, Charles Weiss. Cornell Civ. Engr., vol. 28, no. 4, Jan. 1920, pp. 179-185, 1 fig. Account of war and peacetime operation, station and other facilities, rolling equipment, track, signals, etc.

SAND

HORIZONTAL PRESSURE OF. Experiments on the Horizontal Pressure of Sand, Ponsonby Moory Crosthwaite. Eng., vol. 109, no. 2825, Feb. 20, 1920, pp. 253-254. Results of experiments recently made by author to ascertain angle of internal friction in sand, clay and other materials by loading a plunger of known diameter and measuring penetration caused by known weights. Author presents conclusions drawn from his investigations. Abstract of paper read before Instn. C. E.

SAWS

BAND, HORIZONTAL LOG-CUTTING. Horizontal Log-Cutting Band Saw. Eng., vol. 109, no. 2825, Feb. 20, 1920, pp. 256-257, 9 figs. Description and illustrations of improved tensioning gear applied to horizontal log-cutting band saws, constructed by Thomas Robinson & Son, Ltd., Rochdale, England.

SCIENTIFIC MANAGEMENT

See Industrial Management.

SCREW MACHINES

HAND, PRACTICE FOR. Hand Screw Machine Practice. Machy. (N. Y.), vol. 26, no. 7, Mar. 1920, pp. 620-624, 18 figs. Examples of work finished in hand screw machine, based on practice of Warner & Swasey Co., Cleveland, Ohio.

SCREW THREADS

PIPE THREADS. *See Pipe, Standard Threads.*

PITCH AND ANGLE ERRORS, COMPENSATION OF. British Standard Tables, for Use in Engineering Workshops giving Corrections to Effective Diameter Required to Compensate Pitch and Angle Errors in Screw Threads of Whitworth Form. British Eng. Standards Assn., no. 95, Dec. 1919, 59 pp.

SQUARE, MILLING. Milling Square Threads, Francis W. Shaw. Machy., vol. 15, no. 385, Feb. 12, 1920, pp. 627-630, 5 figs. Attempts to evolve cutter to mill square thread are reviewed and it is concluded that "while the possibility exists of cutting by thread milling an approximately correct square thread, the expense of making special cutters is not warranted in view of the existence of the readily-producible 'acme' thread."

STANDARDS FOR. Standards for Screw Threads, Herbert T. Wade. Sci. Am. Monthly, vol. 1, no. 2, Feb. 1920, pp. 149-153, 8 figs. Discusses possibility of evolving universal and international system.

SEARCHLIGHTS

CARBON-ARC. Carbon Arcs for Searchlights, C. C. Paterson, J. W. T. Walsh, A. K. Taylor and W. Barnett. Jl. Inst. Elec. Engrs., vol. 58, no. 287, Jan. 1920, pp. 83-97 and (discussion) pp. 97-106, 20 figs. Experiments at National Physical Laboratory undertaken at request of British Admiralty, with object (1) to develop the best method of testing carbons in order to prove their value for searchlights, (2) to compare relative qualities of existing carbons, other than flame carbons, for producing high-intensity searchlight beams, (3) to determine what improvement can be made either in the carbons themselves or in the methods of burning them.

PHOTOMETRY OF. Photometry of Searchlights—II (Ueber das Photometrieren von Scheinwerfen), Georg Gerlhoff and Helmuth Schering. Zeitschrift für Beleuchtungswesen Heizungs—u. Lüftungstechnik, no. 17-18, Sept. 1919, pp. 83-89, 13 figs. Explains theoretical and practical fundamental principles of photometry of the maximum and medium intensity of a searchlight with usual light sources.

SELENIUM

APPLICATIONS. Practical Applications of Selenium—II and III, Louis Ancell. Sci. Am. Monthly, vol. 1, nos. 2 and 3, Feb. and Mar. 1920, pp. 157-159, 4 figs., and 253-255, 5 figs. Feb.: Its utilization in biological chemistry and in glass and rubber industries. Mar.: Utilization for controlling draft of factory chimneys and in telemechanics. Translated from Chimie et Industries.

SEMI-DIESEL ENGINES

VICKER-PETTERS. Vickers-Petters Semi-Diesel Marine Oil Engine. Eng., vol. 109, no. 2825, Feb. 20, 1920, pp. 246 and 248, 5 figs., 4 on supp. plate. Described as 2-cycle type with crank-case compression, and made in sizes from 10-b. hp. to 450-b. hp. with from one to six cylinders.

SEWAGE TREATMENT

ACTIVATED SLUDGE. Manchester's Experience with Activated Sludge. Contract Rec., vol. 34, no. 8, Feb. 25, 1920, pp. 180-182. Excerpts of reports of Manchester (Eng.) River Department in which reference is made to activated sludge sewage purification plant in the city. Average of 172,000 gal. per day of sewage, which are screened and passed through detritus tanks, are treated. Tabulated date on typical average analytical returns.

SEWER CONSTRUCTION

BROOKLYN, N.Y. Ralph Avenue Sewer, Brooklyn. Public Works, vol. 48, no. 7, Feb. 28, 1920, pp. 145-146, 3 figs. Details of construction. Account of deep-sheeted trench excavated by steam shovel and clamshell buckets and large invert concrete far in advance of arch. Plant is said to be largely operated by electric power.

CALCULATIONS IN. Expedients for Sewer Calculation (Hilfsmittel fur die Kanalberechnung), H. Kräwinkel. Gesundheits-Ingenieur, vol. 42, no. 41, Oct. 11, 1919, pp. 417-424, 6 figs. Sewer calculations are discussed referring to relations between such variable quantities as water volume and velocity, hydraulic co-efficients, degree of roughness, etc. Graphic and logarithmic tables are included.

REINFORCED CONCRETE. Storm Water Sewer Construction at Hamilton, O. Eng. & Contracting, vol. 53, no. 10, Mar. 10, 1920, pp. 258-261, 6 figs. Reinforced concrete sewers, 4-ft. to 5-ft. 8-in. in size, a total length of 4160 ft.

SEWERS

CONCRETE STORM-WATER. Building Storm Water Sewers in Hamilton, Ohio, Roger B. McWhorter. Mun. & County Eng., vol. 58, no. 2, Feb. 1920, pp. 52-56, 6 figs. Details of concrete storm-water sewers built by Miami Conservancy District as part of local flood-proteetion work.

DESIGN OF SYSTEM. Design of York Township Sewerage System, J. M. M. Greig. Can. Engr., vol. 38, no. 10, Mar. 4, 1920, pp. 255-258, 4 figs. Description of methods adopted in preparing report recently submitted to township council. Paper read before Toronto Branch, Eng. Inst. of Canada.

NARROW-GAGE. The Gage of Narrow-Gage Railways (Die Spurweite der Kleinbahnen), H. Blum. Zeitschrift des Vereines deutscher Ingenieure, vol. 63, no. 39, Sept. 27, 1919, pp. 946-951, 1 fig. Writer states that the 60-cm. gage has been found so uneconomic that not only will its construction be discontinued, but many lines now esisting will probably be rebuilt with wider gage; the 75-cm. gage has given general satisfaction; greatest possible standardization and classification are recommended. (Concluded.)

ROADS, MACADAM

SYNTHETIC. The Employment of Old and Artificial Rubber for the Manufacture of Automobile Tires During the War (Die Verwertung von Altgummi und kunstlichem Kautschuk wahrend des Krieges). H. Memmler. Verhandlungen des Vereins zur Beförderung des Gewerbfleisses, no. 7, Sept. 1919, pp. 83-89. Brief survey of what is described as phenomenal work accomplished by the German Army Administration and rubber industry during war, although it is admitted that inspite of these efforts, the final result aimed at has not been achieved. Writer believes no definite statement can yet be made as to future development of synthetic rubber.

RUSTPROOFING

ELECTRIC PROCESS. Electro Sherardizing. Machy. (N. Y.), vol. 26, no. 7, Mar. 1920, pp. 649-652, 5 figs. Describes application of a rustproof coating to miscellaneous products including sheet metal. Special reference is made to practice of the Wise Electro Sherardizing Co., of Detroit, and the General Electric sherardizing equipment. Limitations of sherardizing process are pointed out.

SHIP CONSTRUCTION

ISHERWOOD SYSTEM. An Analysis of Isherwood System, John Flodin. Int. Mar. Eng., vol. 25, no. 3, Mar. 1920, pp. 205-210. 11 figs. It is concluded that Isherwood system of longitudinal framing offers important advantages and that disadvantages are relatively slight. (Concluded.)

The Effect of the Isherwood System. Shipping, vol. 10, no. 10, Mar. 10, 1920, pp. 18 and 45. States that within twelve years nearly 1300 ships have been constructed or are now under construction on longitudinal system invented by Isherwood and that system has had revolutionizing effect on shipbuilding industry.

STANDARDS FOR. Standards for Ship Construction, Creighton Churchill. Int. Mar. Eng., vol. 25, no. 3, Mar. 1920, pp. 198-205, 3 figs. Chart showing relative costs of 9000-deadweight-ton cargo vessel for different times of building, number of men being the same; also chart showing number of men per way (direct labor) at different man efficiencies and for efficient building programs.

STERN-FRAME CASTINGS. Castings Used in Ship Construction—II, Ben Shaw and James Edgar. Foundry Trade Jl. & Pattern Maker, vol. 22, no. 218, Feb. 1920, pp. 119-125, 29 figs. Type of stern frame used in single-screw ships.

RESISTANCE FORMULAE. Analysis of Resistance of a Ship Based on Experiments with Models (Eine Zerlegung des Schiffswiderstandes auf Grund von Modellversuchen), Wilhelm Schmidt. Schiffbau, vol. 21, no. 5, Dec. 10, 1919, pp. 174-182, 11 figs. Formulæ and equations are presented and compared with former formulæ. Differences between these and the Froude tests are pointed out. (Concluded.)

SHIP PROPULSION

COMPARISON OF SYSTEMS. Sulzer Two-Cycle Engines and the Propulsion of Cargo Boats. Motorship, vol. 5, no. 3, Mar. 1920, pp. 209-212, 11 figs. Comparison with four-cycle Diesel engines, steam-reciprocating engines and steam turbines.

DIESEL-ELECTRIC DRIVE. Converting the Ferris-Type Wooden Hulls Into Diesel-Electric Driven Motorships, Renwick Z. Dickie. Int. Mar. Eng., vol. 25, no. 3, Mar. 1920, pp. 166-169, 5 figs. How Winton Engine Works, Cleveland, Ohio, in collaboration with Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., is manufacturing direct-connected stationary engines for this purpose which are light enough to allow main power plant of vessel to be placed on deck.

INTERNAL-COMBUSTION ENGINE. Internal Combustion Engine Used as Locomotive in English Tests, Henry F. Grady. Bul. Nat. Ga Engine Assn., Feb. 1920, pp. 17-18. It is reported that oil-burning apparatus is being installed in the reconditioning of White Star liner Olympic, and that oil-burning gear is also being introduced in Mauretania and Aquitania, as well as other Cunard and associated vessels under construction.

SHIP SALVAGE

REINFORCED-CONCRETE FLOATS FOR. Christiani-Nleisen Reinforced-Concrete Floats for Salvaging Ships (Flotteurs en béton armé, système Christiani et Nielsen, pour le renflouage des navires). Génie Civil, vol. 76, no. 8. Feb. 21, 1920, pp. 211-212, 8 figs. Each float is a cylinder 68 ft. long and 11 ft. in diameter. It is divided into six compartments and emptying is accomplished by compressed air.

SHIPBUILDING

TECHNICAL PROGRESS. Recent Technical Progress in Shipbuilding. Nautical Gaz., vol. 98, no. 10, Mar. 6, 1920, pp. 376-377. Advance during past year said to be largely confined to improvements in propelling machinery.

SHIPS

CARGO STEAMERS, DESIGNS OF. From Warships to Cargo Steamers. Shipbuilding & Shipping Rec., vol. 15, no. 9, Feb. 26, 1920, pp. 266-270, 5 figs. Designs of 500 tons d.w., 2000 tons d.w. and 4300 tons d.w. being built by John I. Thornycroft & Co., Ltd., Southampton, Eng.

DETACHABLE-POWER-PLANT TYPE. Constan Type of Ship With Detachable Power Plant (Navires a "pousseurs," système Constan). Génie Civil, vol. 76, no. 6, Feb. 7, 1920, pp. 152-154, 13 figs., partly and supplement plate. Power plant is carried on special hull, wedge-shaped in front, which is fastened rigidly at edge of wedge to edge of diehedral angle in stern of cargo hull.

SILOS

LOADS IN. Calculation of Loads in Silos (Métodos de calculo del empuje en los silos), Fernando D. da Silva. Revista del Centro Estudiantes de Ingenieria, no. 201, Mar. 1919, pp. 199-209, 4 figs. Graphs for computing loads produced by wheat and by corn.

SILVER METALLURGY

EXTRACTION AND REFINING. The Extraction and Refining of Silver, Metal Industry (Lond.), vol. 16, no. 10, Mar. 5, 1920, pp. 193-194. Summary of report by Professor H. C. H. Carpenter and Professor C. G. Cullis on World's Production of Silver, which was included among appendices to report of committee appointed by British Secretary of State for India to inquire into Indian exchange and currency.

SPARK GAPS

BREAKDOWN VOLTAGE. The Breakdown Voltage of a Spark Gap, L. B. Loeb and F. B. Silsbee. Sci. Am. Monthly, vol. 1, no. 3, Mar. 1920, pp. 218-220, 5 figs. It was confirmed by experiments that breakdown voltage of spark gap depends only upon density of gas and varies with pressure and temperature only as they affect density. This relation was found to be valid up to 800 deg. cent. and 8 atmospheres pressure. From report 54 of National Advisory Committee for Aeronautics.

Effect of Temperature and Pressure on the Sparking Voltage, L. B. Loeb and F. B. Silsbee. Aerial Age, vol. 10, no. 19, Feb. 23, 1920, pp. 691-693, 6 figs. Experiments at Bureau of Standards are said to have confirmed relation that breakdown voltage of spark gap depends only upon density of gas and varies with pressure and temperature only as they affect density. This relation was found to be valid up to 800 deg. cent. and 8 atmospheres pressure.

SPARK PLUGS

PREIGNITION CAUSED BY. Preignition and Spark-Plugs, Standwood W. Sparrow. Jl. Soc. Automotive Engrs., vol. 6, no. 2, Feb. 1920, pp. 129-132, 14 figs. Experiments were made with various types of spark plugs in some of which porcelain part was cracked and subsequently partially removed. It was found that preignition occurred when procelain was so placed that it became instrumental in heating central electrode to igniting temperature.

SPECTROGRAPH

ULTRA-VIOLET STUDY, WITH. Spectograph for Extreme Ultraviolet Study (Dispositif spectrographique pour l'étude de l'ultraviolet extrême), Léon et Eugène Block. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 4, Jan. 26, 1920, pp. 226-228. Combination of constant deviation Broca-Pellin fluorine prism and fluorine lenses.

STAIRWAYS

REINFORCED-CONCRETE. *See Concrete Construction, Reinforced.*

STEAM ENGINES

COMPOUND. A Method of Combining Cards of a Compound Engine, Julius Wolf. Southern Engr., vol. 33, no. 1, Mar. 1920, p. 49, 1 fig. Suggests using low-pressure spring scale and high-pressure piston displacement scale as common scales for combined diagram.

STEAM POWER PLANTS

CONNECTICUT. Eastern Connecticut Served by New Station, E. T. Phillips. Elec. World, vol. 75, no. 10, Mar. 6, 1920, pp. 533-535, 7 figs. Two horizontal Curtis steam turbines rated at 10,000 kw. (continuous) and 1800 r.p.m. drive 12,500-kva., three-phase, 60-cycle, 11,000-volt generators.

STEAM TURBINES

OPERATING DATA. Operating Features of Steam Turbines, Power House, vol. 13, no. 4, Feb. 20, 1920, pp. 78-81, 2 figs. Data relative to operation of steam turbines, particularly from safety standpoint, published by "Travellers' Standard."

STEEL

CHROME-NICKEL. *See Steel, Chrome-Nickel.*

HIGH-SPEED. *See Steel, High-Speed.*

MAGNET, STANDARD SECTIONS FOR. British Standard Rolled Sections for Magnet Steel. British Eng. Standards Assn., no. 107, Oct. 1919, 6 pp., 2 figs. Table is included giving dimensions of rolled steel sections for permanent magnets for the ignition magnetos.

STEEL CASTINGS

STEEL HEAT TREATMENT

STEEL RAILWAYS

TRACKWORK, STANDARD. Report on British Standard Special Trackwork for Tramways. British Eng. Standards Assn., no. 79, Dec. 1919, 36 pp., 29 figs. Diagram are given illustrating various types of point, crossing and layout used in actual practice and standard title for each is suggested.

STRESSES

DISTRIBUTION AROUND CIRCULAR HOLES. Photo-Elastic and Strain Measurements of the Effects of Circular Holes on the Distribution of Stress in Tension Members, E. G. Coker, K. C. Chakko and Y. Satake. Eng., vol. 109, no. 2825, Feb. 20, pp. 259-264, 19 figs. Account of extension of some experimental work undertaken on transparent plates to find nature of distribution around circular hole. (To be continued.) Paper read before Instn. Engrs. & Shipbuilders.

SUBMARINES

NAVAL WARFARE, USE IN. The Influence of the Submarine in Naval Warfare in the Future, C. M. Faure. Jl. Roy. United States Service Instn., vol. 64, no. 456, Nov. 1919, pp. 563-582. Urges use of submarine by Great Britain to preserve her supremacy of naval power. It is argued that to abolish the submarine would be to compromise, which is "fatal for strategy." If war is to be abolished, it is observed, "idialists should banish all armaments."

SUBWAYS

LONDON, CARS FOR. New Types of Cars on the Metropolitan and District Railways. Tramway & Ry. World, vol. 47, no. 8, Feb. 12, 1920, pp. 69-72, 5 figs. Car used on underground and suburban railways of London. It has five side doors for rapid movement of passengers.

MAINTENANCE. Engineering Maintenance on Underground Railways—I, A. R. Cooper. Ry. Engr., vol. 41, no. 481, Feb. 1920, pp. 57-62, 13 figs. Features of organization and detail work which are necessary in order to give prompt attention to breakdowns or defects that may interfere with train service.

SWAGING MACHINES

See Machine Tools, Special.

TANK STEAMERS

CONVERTED SAILING SHIP. Sailing Ship to Oil Tanker. Shipbuilding & Shipping Rec., vol. 15, no. 8, Feb. 19, 1920, pp. 232-233, 2 figs. Conversion carried out at Glasgow, Scotland, by Alex. Stephen & Sons, Limited. Propelling machinery consists of two Vickers four-stroke: reversing type, eight-cylinder internal-combustion engines adjusted to give 630 b. hp. each at 320 r.p.m.

TANKS

CYLINDRICAL, CONSTRUCTION OF. Tank Construction—XXXVIII, Ernest G. Beck. Mech. World, vol. 67, no. 1729, Feb. 20, 1920, pp. 120-121, 5 figs. Describes floors of cylindrical tanks and recommends, as tending toward facility and economy in manufacture of such floors, that transverse (5 ft.) seams be of single-riveted butt joints, with inside covers, instead of lap joints.

TANKS, MILITARY

CATERPILLARS. Caterpillars and Their Construction—I, K. H. Condit. Am. Mach., vol. 51, no. 13, Sept. 25, 1919, pp. 601-604, 5 figs. Brief history of work of the Holt "caterpillars" for the Allies.

TAPS

MANUFACTURE. *See Drills, Manufacture of.*

TAR

FRACTIONAL CONDENSATION. Fractional Condensation of Tar. Gas Age, vol. 45, no. 5, Mar. 10, 1920, pp. 220-222. Direct recovery of pitch and coal-tar oils from gas in German Tar Works. Translated from Journal fur Gasbeleuchtung.

RECOVERY FROM SHALE. Development of Coking Industry for the Recovery of Tar and Oil from Bituminous Shale and Lignite (Die Entwiekelung der Schwelindustrie zur Gewinnung von Teer and Oel aus bituminösen Schiefern u. Braunkohlen), R. Beyschlag. Zeitschrift für das Berg-Hütten und Salinenwesen, vol. 67, no. 3, 1919, pp. 185-256, 44 figs. Historical review of coke industry in Germany and other countries and modern experiments and investigations in Germany. Recovery of oil from shale; details of preliminary tests near Berlin, the experimental station in Schandelah near Braunschweig, and in Württengerg; recovery of tar from lignite; description of plants at Lützkendorf and Rosits; modern construction of large recovery plants.

TELEGRAPHY

LINE INTERFERENCE. Effects of Heavy-Current Installations on Telegraph and Telephone Lines (Einwirkung von Starkstromanlagen auf Schwachstromleitungen), H. Brauns. Telegraphen- u. Fernsprech-Technik, vol. 8, no. 5, Aug. 1919, pp. 61-75, 7 figs. Survey of nature and extent of above-mentioned effect and measures for combating it.

TELEPHONY

LINES, CALCULATION OF. Calculation of Telephone Lines (Berechnung von Fernsprechleitungen), F. Lüschen. Telegraphen- u. Fernsprech-Technik, vol. 8, no. 6, Sept. 1919, pp. 81-93, 4 figs. Discusses wave resistance and propagation constants of homogeneous lines, and also their efficiency "distortion." Compound lines, or those consisting of two unequal homogeneous sections, are subsequently taken up.

TERMINALS, MARINE

DIMENSIONS FOR. Quay Design for Ocean, Lake, Inland River and Canal Terminal, H. McL. Harding. Int. Mar. Eng., vol. 25, no. 3, Mar. 1920, pp. 182-178, 7 figs. Generalization and codification of dimensions generally adopted in quay terminals.

MECHANICAL HANDLING. Mechanical Handling in Marine Terminal Work. Harwood Frost. Freight Handling & Terminal Eng., vol. 6, no. 2, Feb. 1920, pp. 48-56. Writer divides devices available for handling freight into three general classes— portable, stationary, and so-called "semi-portable," and points out value of portable conveyor, its adaptability and capacity. Writer also points out objections to mechanical equipment. Paper read before Soc. Terminal Engrs.

PIERS. Piers Design for Ocean and Lake Terminals, H. McL. Harding. Pac. Mar. Rev., vol. 17, no. 3, Mar. 1920, pp. 102-104, 2 figs. Opinion is expressed that single unit piers about 700 ft. long should be 140 to 150 ft. wide with slips 280 to 300 ft. wide and that sheds should be equipped with overhead tiering machinery to give large capacity for storage.

SAN FRANCISCO. Pacific Port Terminal, B. F. Cresson, Jr. and C. W. Staniford. Pac. Mar. Rev., vol. 17, no. 3, Mar. 1920, pp. 98-101, 3 figs. Project for increasing shipping facilities of San Francisco.

TESTING MACHINES

IMPACT TYPES. The Impact Testing of Metals, F. C. Thompson. Sci. Am. Monthly, vol. 1, no. 2, Feb. 1920, pp. 138-140. Types of machines designed for conducting tests.

See also Gears, Spur-Gear Testing Machine.

TEXTILE MILLS

ELECTRIC DRIVE FOR. Textile Mill Equipment—Its Advance and Systems, C. S. Ickringill. Elecn., vol. 84, no. 2181, Mar. 5, 1920, pp. 254-259, 6 figs. Advantages of electric drive are explained. Instance is quoted where production was increased 5½ per cent. by introducing electric drive.

The Development of Electric Supply to Textile Mills, W. Browning, Elecn., vol. 84, no. 2181, Mar. 5, 1920, pp. 263-265, 1 fig. Economy of electric drive is discussed.

ELECTRIC POWER SUPPLY. Electric Power Supply of Southern Textile Mills, J. E. Sirrine. Mech. Eng., vol. 42, no. 3, Mar. 1920, pp. 161-163 and 205, 7 figs. Typical examples of generating plants, distribution lines, substatious and motor installations are illustrated.

GAS ENGINES FOR. Gas Engines for Textile Mills, J. G. Walthew. Elecn., vol. 84, no. 2181, Mar. 5, 1920, pp. 266-268, 3 figs. Operating costs of actual installations are quoted.

THERMIONIC VALVES

AMPLIFICATION, MEASUREMENT OF. On the Measurement of Amplification given by Triode Amplifiers at Audible and at Radio Frequencies, F. E. Smith and H. C. Napier. Proc. Physical Soc. of Lond., vol. 32, no. 182, part 2, Feb. 15, 1919, pp. 116-132, 7 figs. Mutual inductance method in which alternating voltage applied between filament and grid of first valve is varied by quickly changing connections to air-core transformer having two secondaries at right ang es, these secondaries to be capable of rotation so as to give any desired ratio of mutual inductances between primary and respective secondaries.

OSCILLATIONS OF. On the Variations of Wave-Length of the Oscillations Generated by Three-electrode Thermionic Tubes due to Changes in Filament Current, Plate Voltage, Grid Voltage, or Coupling, W. H. Eccles, and J. H. Vincent. Proc. Roy. Soc., vol. 96, no. A680, Feb. 3, 1920, pp. 455-465, 7 figs. Experimental investigation conducted to study effects of altering each of chief variables with view to finding conditions most favorable for production of continuous waves of constant frequency.

TESTING. A Comparative Method of Testing Thermionic Valves for Passing no Reverse Current at High Voltages, N. W. McLachlan. Proc. Physical Soc. of Lond., vol. 32, no. 182, part 2, Feb. 15, 1919, pp. 72-77, 4 figs. Anode of standard valve known to pass no reverse current is connected to that of valve under tests and filaments are joined to terminals of high-tension alternating-voltage supply. Low-reading electrostatic voltmeter with parallel condenser is arranged to indicate if valve under examination passes reverse current.

WATER HAMMER

Conduits of Varying Section. Water Hammer in Conduits Formed of Two or Three Sections for Different Diameters (Calcul du coup de bélier dans les conduites formées de deux ou de trois tronçons de diamètres différents), Ed. Carey. Bulletin Technique de la Suisse Romande, vol. 47, no. 2,Jan. 24, 1920, pp. 21-23, 2 figs. Illustrates by numerical examples application of formulæ worked out in previous installments. (Continuation of serial.)

WATER POWER

United States. Water Powers of the United States. Elec-World, vol. 75, no. 12, Mar. 20, 1920, pp. 654-659, 3 figs. Analysis of developed and undeveloped sources. Figures given for total potential warer power is 59,360,000 hp., of which it is said, only 9,823,540 hp. is developed.

Utilization of. Recent Advances in Utilization of Water-Power, Eric B. Bergstrom. Jl. Instn. Mech. Engrs., no. 1, 1920, Feb. 1920, pp. 55-128, 37 figs. Rapid extension of use of Francis turbine is pointed out from manufacturing records of European firm of turbine makers. It is believed that it has now superseded all other known types of low-pressure turbines. Modern tendency of installing fewer units but of larger capacity is also pointed out. Records of operation of Francis turbines at various installations are given and characteristics of this type are discussed at length.

WATER SUPPLY

Industrial Housing Projects. The Water Distribution System of Industrial Housing Projects for Shipbuilders, William H. C. Ramsey. Jl. Am. Water Works Assn., vol. 7, no. 2, Mar. 1920, pp. 239-263, 7 figs. Systems installed in housing projects of Emergency Fleet Corporation.

Newark, N. J., Metering of. Method of Metering the Water Supplied to the Five Distribution Systems of the City of Newark, N. J. George Sanzenbacher. Jl. Am. Water Works Assn., vol. 7, no. 2, Mar. 1920, pp. 163-170, 6 figs. Continuous automatic record of quantity of water supplied to each of five service districts is kept.

See also Pumping, Electric, Califormia.

WATER TOWERS

Reinforced-Concrete. Concrete in Water Works Construction, A. C. Irwin. Jl. Am. Water Works Assn., vol. 7, no. 2, Mar. 1920, pp. 203-211, 1 fig. Examples are illustrated of reinforced-concrete water tower and chimney.

See also Electric Welding; Electric Welding, Arc; Oxy-Acetylene Welding; Thermit Welding; Welds.

WELDS

Strength of. Effects of the Chemical Composition of Welding Electrodes, J. S. Orton: Am. Mach., vol. 51, no. 13, Sept. 25, 1919, pp. 625-626, 2 figs. Results of tests undertaken to determine effects of chemical composition of electrode on strength of weld.

Welding Ships at Tampa. Welding Engr., vol. 5, no. 2, Feb. 1920, pp. 44-48, 5 figs. It is said that welded specimen was bent cold until ends met at 180 deg. and later was hammered that without any defects showing in welding.

WELFARE WORK

Coal Mine. Welfare Work at an Anthracite Colliery Dever C. Ashmead. Coal Age, vol. 17, no. 9, Feb. 26, 1920, pp. 382-385, 6 figs. Welfare endeavours of company include service and advice in connection with maintenance of schools for children of miners.

WELLS

Drilling, Cost of. Electric Well Drilling. Natural Gas & Gasoline Jl., vol. 14, no. 2, Feb. 1920, pp. 61-63, 2 figs. Comparative cost of drilling by electricity and steam.

WIRE ROPE

Stresses in. Winding Ropes and Bending Stresses, C. Speer. Quarry, vol. 25, no. 277, Mar. 1920, pp. 57-59, 6 figs. Experiments are reported which proved that spirally twisted wires in rope are more flexible than when straightned out. Reasons for this phenomenon are advanced. Translated from Gluckauf.

WIRING

Portable Cord. The Wiring Committee's Investigation of Portable Cords. Nat. Elec. Light Assn. Bul., vol. 7, no. 1, Jan. 1920, pp. 65-66. Durability tests conducted by Electrical Testing Laboratorires.

WOOD PRESERVATION

A. R. E. A. Specifications. Report of Committee XVII—Wood Preservation. Bul. Am. Ry. Eng. Assn., vol. 21, no. 222, Dec. 1919, pp. 295-337, 18 figs. Specifications and quoted for preservative treatment of wood, (2) with zinc chloride, (2) with creosote oil, full-cell process, (3) with zinc chloride and creosote oil, (4) with creosote oil, empty-cell process with final vacuum, and (5) with creosote oil, empty-cell process with initial air and final vacuum.

ZINC

Production of. New Method of Zinc Production, Stanley C. Bullock. Meta Industry (Lond.), vol. 16, no. 7, Feb. 13, 1920, pp. 121-123. Possibilities of electrolytic, and electrothermic processes as substitutes for distillation process. Electrolytic process is considered as capable of competing with distillation, but it is pointed out that to do this, plant must be erected with large capacities as economy of process depends upon its mechanical features and these only show to advantage when quantity of raw product to be handled is such that man-handling is impossible under present conditions of labor.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print, up to 11 x 14 in. size, 25 cents, plus postage. A separate print is required for each page of the larger size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library,

29 West Thirty-ninth Street, New York, N. Y.

[illegible]

Load Factors. Schedule of Load Factors for Heavier-than-Air Craft. Eng. & Indus. Management, vol. 3, no. 11, March 11, 1920, pp. 332-333. Report adopted by sub-committee appointed by Advisory Committee for Aeronautics to consider and report as to definite rules which should be adopted to govern load factors required for all classes of civil aircraft, and upon which certificates of airworthiness may be based.

Paris Show. The Paris Aviation Show—II. Engr., vol. 129, no. 3342, Jan. 16, 1920, pp. 63-64, 1 fig. Machines exhibited are believed to have shown that "there is a good, if limited, choice of big aeroplanes suitable for the transport of merchandise and passengers.

Radiators. General Discussion of Test Methods for Radiators. Nat. Advisory Committee for Aeronautics, report no. 60, 1920, 24 pp., 16 figs. Apparatus involved and methods of taking observations and of computing results employed in connection with measurements of (1) core characteristics, (2) heat dissipated, (3) power needed to lift radiator and overcome head resistance, and (4) mass flow of air through core.

General Analysis of Airplane Radiator Problems. Nat. Advisory Committee for Aeronautics, report no. 59, 1920, 9 pp. Basis on which experimental work is conducted at Bureau of Standards is explained and technical terms are defined.

Stability and Balance. Stability and Balance in Airplanes, D. R. Husted. Aviation, vol. 8, no. 5, Apr. 1, 1920, pp. 193-194, 4 figs. Practice of measuring dynamic stability of a machine in laboratories of Curtiss Engineering Corp. at Garden City, L. I. It is assumed that when model test gives pitching moment-angle of incidence curve having negative slope of proper magnitude, actual machine will have sufficient pitching stability.

Stresses on. The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 18, nos. 334 and 335, March 11 and 18, 1920, pp. 218-219, 5 figs. and 235-236, 5 figs. Mar. 11: Load curves of ribs, Mar. 18: Initial stresses in ribs due to fabric. (Continuation of serial.)

Struts. The Use of the Hollow Strut on the New Airplanes, Edward P. Warner. Automotive Industries, vol. 42, no. 12, Mar. 18, 1920, pp. 716-720, 20 figs. Analytical determination of possible saving in weight as compared with solid struts.

See also Flying Boats; Wind Tunnels.

AIR COMPRESSORS

Low-Pressure. Driving Air Compressors by Exhaust Steam. A. Dessemond. Colliery Guardian, vol. 119, no. 3089, March 12, 1920, pp. 745-746, 3 figs. Description of low-pressure compressor at Villiers Colliery. (Concluded.) Translated from Bulletin de la Société de l'Industrie Minérale.

Turbo-Driven. Driven Air Compressors by Exhaust Steam, A. Dessemond. Colliery Guardian, vol. 119, no. 3088, Mar. 5, 1920, pp. 659-660, 3 figs. Rateau system of direct drive from mixed pressure turbine. Translated from Bul. de la Société de l'Industrie Minérale.

AIR FLOW

Venturi-Meter Calculations. Simplification of Venturi-Meter Calculations, Glenn B. Warren. Mech. Eng., vol. 42, no. 4, Apr. 1920, pp. 220-221 and 260, 3 figs. Graphs for facilitating slide-rule calculation of flow of compressed air, also suggested sumplification of venturi-meter formula given by Herbert B. Reynolds in Trans. Am. Soc. M. E., vol. 38, p. 799.

AIRCRAFT CONSTRUCTION MATERIALS

Aeroplane Woods. Supplies and Production of Aircraft Woods. Nat. Advisory Committee for Aeronautics, report no. 67, 1920, 62 pp., 23 figs. Compilation of avialable information regarding supplies of kinds of wood that have been used or seem likely to become important in construction of airplanes and amount of lumber of each species normally put on the market each year: uses to which each kind of wood is or may be put.

Glues. Glues Used in Airplane Parts. Nat. Advisory Committee for Aeronautics, report no. 66, 1920, 28 pp., 3 figs. Glues are divided into five types: Animal glues; liquid glues; vegetable glues; casein glues; and blood albumin glues. Manufacture, preparation and application of each of these types is discussed.

AIRSHIPS

Machinery of. Airship Machinery: Past Experience and Future Requirements, C. F. Abell. Aeronautics, vol. 18, nos. 335 and 336, Mar. 18 and 25, 1920, pp. 244 and 260-261. Mar. 18, Description of engines and installation work which were used in various ships built during war. Paper read before Royal Aeronautical Society, Mar. 25: Mechanical equipment of principal types, particularly R 33 and R 34. (To be continued.)

Performance During War. Dirigible Balloons and Airships During the War (Dirigeables et aérostats pendant la guerre), Charles Dollfus. L'Aérophile, vol. 28, nos. 1-2, Jan. 1-15, 1920, pp. 23-30, 7 figs. Structural details and records of operating performances of principal French, English, Italian and German types. (To be continued.)

Regid Construction. The Principles of Rigid Airship Construction. Aeronautical Jl., vol. 24, no. 111, March 1920, pp. 98-118 and (discussion) pp. 119-131, 12 figs. Glossary of terms is given, mechanical discussion of stresses in the various parts of an airship is taken up and typical designs of German zeppelins and structural characteristics of R34 are illustrated and analyzed.

ALLOY STEELS

Molybdenum, Effect of. The Effect of Molybdenum in Alloy Steels. Ry. Mech. Engr., vol. 94, no. 4, April 1920, pp. 205-207, 7 figs. Data presented are stated to be results of tests of ordinary commercial steels taken from records of users of these alloys. It appears that increased toughness and wide hardening range characterize molybdenum steels. From book recently issued by Climax Molybdenum Co., New York.

Pickling, Effect of. Effect of Pickling on Alloy Steels, H. L. Hess. Iron Age, vol. 105, no. 9, Feb. 26, 1920, pp. 593-594, 6 figs. Tests made by metallurgical department of Hess Steel Corporation, Baltimore, Md., to determine degree of interference with quality and machinability of material. It was concluded that pickling in itself, as well as pickling followed by various treatments does not interfere in any noticeable way with quality or machinability of steel.

ALTERNATORS

See Electric Generators, A. C.

ALUMINUM

Corrosion of. The Action on Aluminum of Hard Industrial Waters. Richard Seligman and Percy Williams. Metal Industry (Lond.); vol. 16, no. 12, March 19, 1920, pp. 233-236.

Rolling-Mill Practice. Aluminum Rolling-Mill Practice—III; Ingot Heating and Mill Calculations, Robert J. Anderson and Marshall B. Anderson. Chem. & Met. Eng., vol. 22, no. 13, March 31, 1920, pp. 599-604. Specifications and some of uses for sheet aluminum are given, together with discussion of furnaces for heating ingots preparatory to slabbing. Tables and examples of calculations are included whereby individual orders may be rolled with minimum allowance for scrap.

Uses in Electrical Industry. Uses of Aluminum in the Electrical Industry (L'aluminium dans l'appareillage électrique). C. Zetter. Revue générale de l'Electricité, vol. 6, no. 26, Dec. 27, 1919, special supplement, pp. 63-78, 2 figs. Steel, aluminum, duralumin, and brass are compared from viewpoints of initial costs, ease of manufacture and adaptability to electrical uses.

ALUMINUM ALLOYS

Aluminum Bronze Casting. The Still Process for Casting Aluminum Bronze. Metal Industry, vol. 18, no. 3, March 1920, pp. 118-120, 6 figs. Method was devised specially for preventing formation of alumina in aluminum bronze.

Reflective Properties of. Preparation and Reflective Properties of Some Alloys of Aluminum with Magnesium and with Zinc. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 363, Feb. 12, 1920, pp. 653-657, 1 fig. Alloys of aluminum with magnesium and with zinc are not considered suitable for mirrors where permanency is of prime importance, but it is said that $Al_3 Mg_4$ deteriorates less rapidly than any other alloy examined and could be used in apparatus where highly reflecting mirror is desired for a short time.

ANTENNAE

Capacity Calculations. Calculation of Antenna Capacity, Louis W. Austin. Proc. Inst. Radio Engrs., vol. 8, no. 2, April 1920, pp. 164-168. Two empirical formulæ—one applying to broad antennæ and the other to elongated antennæ—are given. Results obtained from their use are shown to agree closely with actual experimentally determined values.

APPRENTICES, TRAINING OF

School for Apprentices. The Production and Instruction in an Apprentice School, Peter F. O'Shea. Am. Mach., vol. 52, no. 10, March 4, 1920, pp. 505-508, 3 figs. Apprentice school of Greenfield Tap and Die Corporation.

ARMY SUPPLY BASES

Philadelphia. Planning and Process on a Big Construction Job—II, Charles Penrose. Eng. News-Rec., vol. 84, no. 13, March 25, 1920, pp. 627-633, 6 figs. How charts kept during building of Philadelphia army base showed performance in various details of engineering work.

ARTILLERY

Caterpillar Traction of Heavy Guns. Artillery Motorization as Related to Carterpillar Traction, George W. Dunham. Jl. Soc. Automotive Engrs., vol. 6, no. 3, Mar. 1920, pp. 161-173, 21 figs. Progress in design of caterpillar vehicles by Ordnance Department during war is recorded and lines are indicated along which further improvement may be effected. Opinion is expressed that greater speed ranges for heavy-duty purposes can be obtained by using light track shoes and very small amount of unsprung weight, emdodying use of considerable quantity of rubber or other cushioning medium in connection with rolling members and track.

ARTILLERY FIRE CONTROL

Work of Field Survey Troops. Field Survey Troops: Their Work at the Front, E. W. Berry. Can. Engr., vol. 38, no. 13, March 25, 1920, pp. 317-320, 2 figs. How draftsmen, photographers, lithographers and topographers assisted artillery commanders.

BRASS

INTERNAL STRESS, REMOVAL OF. The Removal of Internal Stress in 70: 30 Brass by Low Temperature Annealing, H Moore and S. Beckinsale. Metal Industry (Lond.), vol 16, no 14, Apr. 2, 1920, pp. 267-269, 4 figs. It was found in experiments that minimum times in which internal stress was completely removed by low-temperature annealing were: at 200 deg. cent, 96 hr; 225 deg. cent, 48 hr; 250 deg. cent, 5 hr.; 275 deg cent., 1 hr; 300 deg cent, 20 min; 325 deg. cent, 5 min Internal stress was not removed and did not appear to be appreciably reduced by annealing at 100 deg. cent for many weeks.

BRASS FOUNDING

ELECTRIC-FURNACE MELTING. Developments in Brass Melting—III, Otis Allen Kenyon. Iron Age, vol. 105, no. 13, March 25, 1920, pp. 880-883, 7 figs. Electric casting shop of Bridgeport Brass Co., Bridgeport, Conn., is described as illustrating broad commercial scale of electric furnace use.

BRIDGE DESIGN

STRESSES, DETERMINATION OF. Primary Stress-Determination in Space Frames, R. V. Southwell. Eng., vol. 109, no. 2823, Feb. 6, 1920, pp. 165-168, 10 figs. Analytical method is exemplified with reference to steel cantilever bridge.

See also Bridges, Railways.

BRIDGES, RAILWAYS

STEEL, DESIGN. Report on Iron and Steel Structures. Ry. Age (Daily Edition), vol. 68, no. 11c. Mar. 18, 1920, pp. 911-915, 3 figs. Curve comparing column formulæ is given and a formula is recommended for use with ordinary structural steel for which basic unit tensile stress is 16,000 lb. per sq. in. and for ratios of l/r not greater than 200. Also specification loading for design of steel railroad bridges. Committee report presented to Am. Ry. Eng. Assn.

WOODEN. Report on Wooden Bridges and Trestles. Ry. Age (Daily Edition), vol. 68, no. 11c, Mar. 18, 1920, pp. 915-917. Specifications for Southern yellow pine and Douglas fir. Committee report presented to Am. Ry. Eng. Assn.

BRIDGES, STEEL

ANCHOR PINS, RENEWAL OF. Anchor Pins of Cornwall Cantilever Bridge Bored Out and Renewed, H. T. Welty. Eng. News-Rec., vol. 84, no. 10, March 4, 1920, pp. 453-456, 8 figs. Repair work of steel bridge involved boring out of worn and weak pins and replacing them with new pins of larger diameter. It is said work was accomplished without use of supporting falsework under bridge and with practically on interruption to traffic.

RECONSTRUCTION. Reconstructing Poughkeepsie Cantilever Bridge for Heavy Traffic, Clement E. Chase. Eng. News-Rec., vol. 84, no. 11, March 11, 1920, pp. 528-534, 11 figs. Double-track deck over three trusses changed to gauntlet-track deck. Structure is 6767 ft. long over all. Main spans over Hudson constitute cantilever system with two fixed spans 525 ft. long, three cantilever spans 546 and 548 ft. long, and two anchor arms 200 ft. 10 in. long.

Strengthening a County Bridge to Carry Motor-Truck Traffic, Morris Goodkind. Eng. New-Rec., vol. 84, no. 13, March 25, 1920, pp. 617-618, 3 figs. Replacement of stringers and reinforcements of floor beams in 52-ft. span steel bridge.

BRONZE

See Brass.

BUILDING CONSTRUCTION

STEEL FRAMING. Steel Framing for Public Hall in Cleveland, Eng. News-Rec., vol. 84, no. 9, Feb. 26, 1920, pp. 414-415, 7 figs. Special arrangement of steel stresses for hip-roof framing designed in order to avoid placing large columns at points where they would encroach upon inclines which take place of stairways between floors, and at the same time meet roof lines chosen by architect.

U. S. ARMY, CONSTRUCTION DIVISION. The Work of the Construction Division of the United States Army from Coast to Coast, 1917-1919, E. B. Morden. Jl. Engrs. Club of Philadelphia, vol. 37-3, no. 184, March 1920, pp. 86-137, 50 figs. Scope, origin and evolution, and general demonstration of Construction Division is first outlined, and account of projects undertaken from 1917 to 1919 is subsequently presented, and article is concluded with general statistics of work of Construction Division.

BUSES

GREAT BRITAIN. The Place of the Bus—II, Walter Jackson. Elec. Ry. Jl., vol. 55, no. 14, April 3, 1920, pp. 683-689, 6 figs. Details are presented of relative costs of car and bus operation in Great Britain, together with some notes on bus design, weight and capacity, operating speeds, legal regulations, and fuel and roadway taxes.

CABLES

HOISTING, FLEXIBILITY OF. Should the Flexibility of Haulage Rope Be Computed? (Sollen Forderseile auf Biegung berechnet werden)?, O. Speer. Glückauff, vol. 55, nos. 44 and 45, Nov. 1 and 8, 1919, pp. 849-853 and 869-878, 13 figs. Gives tables of cable data from which author concludes that the bending stress has no great bearing on the life, strength and efficiency of the main haulage cable, and in calculation of cable, its flexibility need not be taken into account.

HOISTING, INSTALLATION IN MINES. The Installation of a Shaft Cable at Kirkby Colliery, Joseph Bircumshaw. Colliery Guardian, vol. 119, no. 3088, Mar. 5, 1920, pp. 657-658, 9 figs. Cable is three-core cable 0.25 sq. in. in area, paper-insulated, bitumen-sheathed, double-wire armored, and carries 3300 volts. Method of lowering cable into position in shaft by winding engines is explained.

See also Wire Rope.

CABLES, ELECTRIC

BREAKS, LOCALIZATION OF. On the Localization of High-Resistance Breaks in Submarine Cables, A. Poulsen. Elecn., vol. 84, no. 2183, March 19, 1920, pp. 312-315, 3 figs. Corrections are proposed for Siemens method which consists in determining resistance of cable up to break by means of combined resistance and capacity test.

JOINTS. Report of Committee IX—Wires and Cables. Ry. Age (Daily Edition), vol. 68, no. 11b, Mar. 17, 1920, pp. 882-884, 8 figs. Specifications for wire joints and copper bond wires recommended by committee of Am. Ry. Eng. Assn.

CAISSONS

See Foundations, Caissons.

CANALS

SWITZERLAND. The Swiss Rhone-Rhine Navigation Project, A. Wharton Metcalfe. Engr., vol. 129, nos. 3348 and 3350, Feb. 27 and Mar. 12, 1920, pp. 212-214, 3 figs., and 264-265; 1 fig. Discussion of economical aspects of project under consideration by Swiss Government for over ten years, together with maps showing proposed works between Geneva and Seyssel.

CAR WHEELS

CHILLED-IRON, MANUFACTURE. Manufacturing Chilled Iron Car Wheels—I, H. E. Diller. Foundry, vol. 48, no. 7, April 1, 1920, pp. 259-265, 5 figs. History, metallurgy, molding, testing and construction of chilled-iron car wheels.

CARS, FREIGHT

INSPECTION OF. The Inspection of Freight Equipment, L. K. Sillcox. Ry. Mech Engr., vol. 94, no. 4, April 1920, pp. 216-220. Classification of defects to be reported by federal inspectors, also specification covering installation of air-brake equipment of freight cars.

CARS, PASSENGER

CANADIAN NATIONAL RAILWAYS. New Sleeping Cars, Canadian National Rys. Ry. Rev., vol. 66, no. 13, March 27, 1920, pp. 511-512, 4 figs. Cars are specially insulated in consideration of extreme weather conditions under which they will operate.

LONDON UNDERGROUND RAILWAY. New Electric Cars Built for British Line, Frederick C. Coleman. Ry. Mech. Engr., vol. 94, no. 4, April 1920, pp. 211-213, 5 figs. Passenger cars of Metropolitan Railway of London designed with five side doors for reducing stopping time at stations.

CASE-HARDENING

SHIMER PROCESS. A Practical Talk on Some Modern Methods of Heat-Treatment, Hohn E. Halbing and Frank Shepherd. Jl. Am. Steel Treaters Soc., vol. 2, no. 6, March 1920, pp. 257-278, 12 figs. Various suggestions are given, specially method for heat treating tools made from one per cent straight carbon steel. Analysis is also made of Shimer case-hardening process in which calcium chloride and sodium chloride are used as base and when in molten state calcium cyanamid is immersed to add case hardening properties.

CEMENT

STRENGTH OF. Determination of Breaking Strength (Bestimmung der Bruchfestigkeit), R. Grun. Tonindustrie-Zeitung, vol. 43, no. 97, Aug. 19, 1919, pp. 871-872, 2 figs. Writer describes a simple device and process worked out and employed by him for several years before the war, for determining in figures the breaking strength of cement after 24 hours.

CEMENT, PORTLAND

RAW MATERIALS FOR. Producing Raw Materials for Portland Cement—VII, Oliver Bowles. Cement, Mill & Quarry, vol. 16, no. 6, March 20, 1920, pp. 15-20, 4 figs. Arrangement of charges in drill holes.

CHROMIUM

ELECTROLYTIC PRODUCTION. Electrolytic Chromium, George J. Sargent. General Meeting Am. Electrochemical Soc., April 8-10, 1920, paper 18, pp. 275-292. Alludes to history of deposition of chromium, including unpublished work done at Cornell University. Gives details of electrolysis of various mixtures of chromic sulphate and chronic acid, showing that yield of chromium from chromic-acid solutions is greatly increeased by addition of chromic sulphate.

COAL

PURCHASING ON SPECIFICATIONS. Purchase of Coal on Specifications, John Howatt. Jl. Western Soc. Engrs., vol. 24, no. 9, Nov. 1919, pp. 535-552 and (discussion) pp. 553-556. Method is outlined for purchasing coal on B.t.u. basis. System provides definite basis for cancellation of contract.

STORAGE YARDS. Reading's Storage Yards Keep the Mines Running Steadily, Dever C. Ashmead. Coal Age, vol. 17, no. 13, March 25, 1920, pp. 581-586, 6 figs. Experience of Philadelphia & Reading Coal and Iron Co. is quoted as proof that coal storage results in decrease of cost of fuel to consumer by equalizing demand. Capacity of storage yard of this company is 1,000,000 tons.

STRIPED. Striped Coals, H. Winter. Colliery Guardian, vol. 119, no. 3081, Jan. 16, 1920, pp. 172-173. Results of microscopical examination and chemical analysis of various samples.

CONCRETE CONSTRUCTION. REINFORCED

Australian Structures. Typical Examples of Reinforced Concrete Structures in Australia, Æ. G. Stone. Commonwealth Engr., vol. 7, no. 7, Feb. 2, 1920, pp. 204-212, 15 figs. Structures illustrated and described are wheat silos, sewerage pipes, aqueduct, pontoons, etc.

Stresses in Frames. Problems in the Theory of Construction. Regid Reinforced Concrete Frames, Ewart S. Andrews. Concrete and Constructional Eng., vol. 15, no. 3, March 1920, pp. 161-165, 5 figs. Graphical derivation of formulæ. (Concluded.)

CONCRETE, REINFORCED

Specifications. Report of Committee on Masonry. Ry. Age (Daily Edition), vol. 68, no. 11, Mar. 17, 1920, pp. 862-867. Specifications for plain and reinforced concrete and for billet-steel concrete reinforcement bars, recommended by committee of Am. Ry. Eng. Assn.

CONVEYORS

Belt. Methods Used in the Installation of Conveyor Belts. Belting and Transmission, vol. 16, no. 5, March 5, 1920, pp. 27-30, 8 figs. Attention is called to precision required in putting big belt in place in order to secure efficient service and freedom from shut-downs for repairs.

See also Coal Handling, Belt Conveyors.

COPPER

Properties, Determination of. Relationship of Physical and Chemical Properties of Copper, Frank L. Antisell. Min. & Metallurgy, no. 157, section 2, Jan. 1920, 5 pp. Reasons for rejecting refined copper on physical examination are enumerated. Electrical conductivity of copper is considered as most convenient method of determining its general properties.

COPPER ALLOYS

Commercial Compositions. Copper Alloys, Brasses and Bronzes, H. L. Reason. Managing Eng., vol. 6, no. 9, Jan. 1920, pp. 212-218, 18 figs. Specifications for various commercial compositions, specially such patented alloys as delta metal, together with curves giving physical characteristics of copper alloys. (To be continued.)

COPPER MINING

British Columbia. Boundary District, British Columbia, C. M. Campbell. Eng. & Min. Jl., vol. 109, no. 17, April 24, 1920, pp. 968-973, 5 figs. Historic development of mining operations in regious which within 20 years have produced 20,000,000 tons of low-grade copper ores.

Sampling. Mine-Sampling, William Huff Wagner. Min. & Sci. Press, vol. 120, no. 13, March 27, 1920, pp. 451-453, 4 figs. Sampling practice followed in mining copper ore in Butte district.

CORROSION

See Aluminum, Corrosion of.

COST ACCOUNTING

Record Forms. An improved System of Engineering Costing, G. E. Hitchen. Machy. (Lond.), vol. 15, no. 389, March 11, 1920, pp. 751-756, 14 figs. Forms for recording weekly cost of each job, weekly proportion of labor to materials, exact cost of job and of any desired section of job as soon as completed.

Tools in Stock Room. Cadillac Stock-Room Methods. Machy. (N. Y.), vol. 26, no. 6, Feb. 1920, pp. 501-502, 2 figs. System of cost accounting consists of figuring average price of all tools of given type, which are on hand in stock-room at time each new shipment of tools of that type is received.

CRANES

Floating. Load Strain-Gage Test of 150-Ton Floating Crane for the Bureau of Yards and Docks U. S. Navy Department, Louis J. Larson and Richard L. Templing. Technologic Papers Bur. Standards, no. 151, March 18, 1920, 34 pp., 27 figs. Arrangements made to take strain-gage measurements on important members of 150-ton revolving, floating crane built for use in navy yard at Norfolk, Va.

CRIPPLES

Reeduction of. Minnesota Plan for the Reeducation and Placement of Cripples, Oscar M. Sullivan. Monthly Labor Rev., vol. 10, no. 1, Jan. 1920, pp. 184-189. Act follows plan of Mass. act, but authority is placed under State Board for Vocational Education instead of industrial accident commission and scope includes all cripples.

CRUCIBLES

Clays. Properties of American Bond Clays and Their Use in Graphite Crucibles and Glass Pots. Dept. Commerce, Technologic Papers of Bur. of Standards. no. 144, Jan. 28, 1920, 52 pp., 24 figs. Physical properties of three typical German clays formerly imported in large quantities are given on basis of constants which permit comparison and evaluation of American materials. Physical characteristics of 23 American and 2 English bond clays are determined.

DAMS

Concrete-Arch. Concrete Arch Dam Built from Superposed Trestle. Eng. News-Rec., vol. 84, no. 9, Feb. 26, 1920, pp. 421-422, 3 figs. Frame work was erected complete before starting dam. Concrete was elevated to cars on top and dropped through chutes.

Design Details and Field Methods on Thin Arch Dam. Eng. News-Rec., vol. 84, no. 10, March 4, 1920, pp. 474-476, 7 figs. Straddling trestle method of construction used on Warm Springs concrete dam in Oregon.

Failures of. The Record of 100 Dam Failures, Lars Jorgensen. Jl. Electricity, vol. 44, no. 6, March 15, 1920, pp. 274-276, 2 figs. Presented as warning to engineers designing hydroelectric projects involving utilization of natural water powers.

See also Hydroelectric Plants, Quebec; Water Works, Denver.

DIESEL ENGINES

Augsburg. World's Highest-Powered Naval-Type Diesel Engine. Automotive Manufacturer, vol. 61, no. 11, Feb. 1920, pp. 14-19 and p. 34. Details of Augsburg ten-cylinder 3000-hp. heavy-oil unit used in German submarine cruisers. Main dimensions are; Length overall, 37 ft. 5 in.; height, 11 ft. 6 in.; width, 5 ft.; bore and stroke, $20\frac{7}{8}$ x $20\frac{7}{8}$ in.; weight, 75 tons; engine speed, 375 r.p.m.

Cammellaird-Fullagar. Cammellaird-Fullagar Diesel Marine Engine—II. Motorship, vol. 5, no. 4, April 1920, pp. 302-306, 6 figs. Description of 1000-shaft-hp. opposed-piston type heavy-oil marine engine. It weighs 91 long-tons and is 19 ft. 9 in long.

Castings for. Diesel Engine Castings, F. J. Cook. Eng., vol. 109, no. 2823, Feb. 6, 1920, pp. 177-179, 9 figs. Proportions of various chemical elements which were found to give good results for Diesel-engine cylinders, liners and pistons are: Total carbon, 3 per cent to 3.2 per cent; silicon, 1 per cent to 1.2 per cent; phosphorus, not over 1 per cent; sulphur, 0.12 per cent; manganese, not over 0.5 per cent. Paper read before North-East Coast Instn. Engrs. & Shipbuilders.

Solid-Injection Type. Notes on the Care and Maintenance of the Solid Injection Diesel Engine, David P. Peel. Trans. Inst. of Marine Engrs., vol. 31, Feb. 1920, pp. 563-572, 4 figs. Notes, based on writer's experience with the Vickers' solid-injection submarine Diesel engine, on smoking, knocking in the cylinders, bearing lubrication, cylinder lubrication, the governor, water cooling, fuel, setting sprayer valves, and diagram of operations.

Two- vs. Four-Cycle in Marine Service. Comparison Between Marine Diesel-Engines of the Two and Four Cycle Types. Motorship, vol. 5, no. 4, April, 1920, pp. 313-315, 6 figs. Practice of principal motorship builders of the world. Opinion is expressed that four-cycle engines, judging from present tendencies, "will be the marine motor of the future." Paper read before Norwegian Veritas.

DIRECTION FINDERS

Method of Using. A Method of Direction Finding of Wireless Waves and Its Applications to Aerial and Marine Navigation, James Robinson. Radio Rev., vol. 1, no. 6, March, 1920, pp. 265-275, 4 figs. Application of method described in previous installments to Bellini-Tosi system is explained. (Concluded.)

Multiple-Spindle Horizontal Type. Special Types of Drilling Machines. Machy. (Lond.), vol. 15, no. 390, March 18, 1920, pp. 778-780, 5 figs. Multiple-spindle horizontal drilling machine with cam-controlled quickreturn feed.

Special Types. Special Types of Drilling Machines, F. E. Johnson. Machy. (N. Y.), vol. 26, no 6, Feb. 1920, pp. 511-513, 5 figs.

DROP FORGING

Shipbuilding Application. Drop Forging as Applied to Shipbuilding—I, Joseph L. Murphy. Am. Drop Forger, vol. 6, no. 3, March, 1920, pp. 125-128, 6 figs. Examples of work done in various plants.

DURALUMIN

See Aluminum, Uses in Electrical Industry.

ECONOMIZERS

Savings Due to. Savings Due to Economizer, R. G. Bohn. Power Plant Eng., vol. 24, no. 7, April 1, 1920, pp. 367-370, 2 figs. Methods of calculating heat tranfer, final temperatures and net savings.

ELECTRIC CIRCUITS, D. C.

Regulation of. Inherent Regulation of Continuous Current Circuits, A. L. Ellis and B. W. St. Clair. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 2, Feb. 1920, pp. 135-142, 13 figs. Discusses voltage changes inherent in d. c. circuits upon change of load. Means of mitigating their effect is given.

ELECTRIC CURRENTS, ALTERNATING

Multiphase, Measurement of. Measurements of Multiphase Currents (Mehrphasenstrommessungen), H. Michalke. Archiv für Elektrotechnik, vol. 8, nos. 6-7, Oct. 10, 1919, pp. 205-209, 2 figs. Compares Fröhlich and Friese systems of connection and shows how to determine total output of multiphase current system by means of torsion dynamometer.

ELECTRIC GENERATORS, A. C.

ELECTRIC MOTORS, A. C.

ELECTRIC PLANTS

ELECTRIC POWER

ELECTRIC WELDING, ARC

Short Arc, Advantages of. The Groove and Arc in Arc Welding, J. F. Springer. Ry. & Locomotive Eng., vol. 33, no. 1, Jan. 1920, pp. 21-22, 2 figs. Advantages of short arc are indicated and preheating of cast-iron welds is advised.

ELECTRICAL MACHINERY

No-Load Losses. A Method for Separating No-Load Losses in Electrical Machinery, Carl J. Fechheimer. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 2, Feb. 1920, pp. 162-164, 3 figs. Method proposed makes use of idle operation of machine as motor, voltage being varied and speed kept constant. After deducting armature I^2R losses from watts input remaining watts are plotted against voltage. Formula is derived based upon assumption that watts are equal to constant windage and friction loss plus core loss, which latter varies as constant power of voltage.

ELECTRICAL MEASUREMENTS

High Alternating Voltages. Notes on the Synchronous Commutator, J. B. Whitehead and T. Isshiki. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 2, Feb. 1920, pp. 105-116, 19 figs. Magnitude of errors which may arise due to relatively small amounts of capacity in commutator and galvanometer circuits is studied for number of different connections, and methods for eliminating them are pointed out.

ELECTRIFICATION

See Railway Electrification.

ELECTROMETALLURGY

Rare Metals. Progress in Electrometallurgy of Rare Metals (Neuerungen in der Elektrometallurgie der Edelmetalle), Franz Peters. Glückauf, vol. 55, nos. 47 and 49, Nov. 22 and Dec. 6, 1919, pp. 917-923 and 964-965. Notes on recent electrothermal, wet and cyanide processes, electro-amalgamation, electrolytic purification and gold and silver electroplating.

EMPLOYEES' REPRESENTATION

Clark Equipment Co. Stimulating Co-operation Between Employer and Employee. Machy. (N.Y.), vol. 26, no. 6, Feb. 1920, pp. 544-550, 8 figs. Experience of Clark Equipment Co., Buchanan, Mich., where employees' representation plan is said to be successfully operating.

President's Industrial Conference. Employee Representation Indorsed. Iron Age, vol. 105, no. 13, Mar. 25, 1920, pp. 875-879. Final report of President's second industrial conference. Plan makes machinery available for collective bargaining with only incidental and limited arbitration. Conference places emphasis upon proposal for joint organization and management of employees as means of preventing misunderstanding and of securing co-operative effort.

EMPLOYEES, TRAINING OF

Success in. Results of Mastering Power Production, L. P. Alford. Indus. Management, vol. 59, no. 4, Apr. 1920, pp. 273-280, 9 figs. Instances are related which illustrate successful introduction of systematic training of workmen in factories.

ENAMELING

Enamel-Lined Apparatus. The Manufacture of Enamel Lined Apparatus, Emerson P. Poste. Jl. Am. Ceramic Soc., vol. 2, no. 12, Dec. 1919, pp. 944-976, 34 figs. Deals with manufacture of steel and cast-iron apparatus including by way of contrast details relative to other types of enamels.

EXECUTIVES

Training of. Trains Executives in Its Own Plants. Iron Age, vol. 105, no. 13, Mar. 25, 1920, pp. 869-872, 7 figs. It is said that Westinghouse Electric & Mfg. Co., which has conducted its own schools since 1900, finds plan of benefit in development of men.

EXPLOSIONS

See Coal Dust.

EXPLOSIVES

Explosion Temperature. Comparison of Values for Explosion Temperatures Obtained from Specific Heats with Those Calculated from Explosive Pressures (Comparaison des températures d'explosion calculées à partir des chaleurs spécifiques et des températures d'explosion calculées à partir des pressions explosives), Henri Muraour. Annales des Mines, vol. 9, no. 2, 1920, pp. 166-180, 1 fig. Graphs are plotted from figures given in tables calculated by various writers and from values determined in experiments with several explosives.

High, Manufacture of. The Manufacture and Use of High Explosives, R. Blane. Jl. South African Instn. Engrs., vol. 18, no. 8, Mar. 1920, pp. 128-136, 5 figs. Processes followed at Watford Factory, England, in manufacture of T.N.T and other high explosives.

FACTORY MANAGEMENT

See Industrial Management.

FANS

See Coal Mines, Fans.

FATIGUE

Prevention of. Prevention of Fatigue in Industry—IV, Reynold A. Spaeth. Indus. Management, vol. 59, no. 4, Apr. 1920, pp. 311-313. Results of psychological tests made with large number of girls engaged in gaging and inspecting shells for rifle cartridges. Inspectors recommended by these tests worked much longer than those who were not so recommended, but were hired. (To be concluded.)

The Promotion of Industrial Efficiency. South African Jl. Industries, vol. 3, no. 1, Jan. 1920, pp. 56-68. Discusses influence, upon efficiency and output, of hours of labor, rest pauses and holidays. From Bulletin issued by Advisory Council of Science and Industry of Australia.

Unnecessary Fatigue—The Immense Loss It Causes to the State, Frank B. Gilbreth, Lillian M. Gilbreth. Eng. & Indus. Management, vol. 3, no. 2, Jan. 8, 1920, pp. 50-52. Attention is directed to painting factory interiors with a view to diminishing eye strain, providing chairs for permitting workers to sit during periods of unavoidable delay in standing operations, etc.

FERROALLOYS

Electric-Furnace Manufacture. Recent Developments in the Ferro-Alloy Industry, Robert J. Anderson. General Meeting Am. Electrochemical Soc., April 8-10, 1920, paper 13, pp. 177-206. Discussion of conditions in industry, with special reference to relations of industry in the United States to that in foreign countries. It is stated that "the electric furnace has made the growth of the industry possible" and that "further development and use of alloy steels is certain to continue and at the same time increase the normal demand for all kinds of ferroalloys."

The Manufacture of Ferro-Alloys in the Electric Furnace, C. B. Gibson. General Meeting Am. Electrochemical Soc., April 8-10, 1920, paper 17, pp. 265-273. Notes on design of electric furnaces for producing alloys, with data on power consumption and raw materials handled per kw.-year, published by various experimenters.

(*See also Ferrosilicon; Ferrotungsten.*)

FERROSILICON

Fusion Diagram. Contribution to the Study of Ferrosilicon (Contribution à l'étude des ferro-siliciums), M. A. Sanfourche. Revue de Métallurgie, vol. 16, no. 3, May-June, 1919, pp. 217-224, 2 figs. Fusion diagram is constructed from results of experiments. Melting point of iron is lowered from 1515 deg. cent. to 1445 by addition of 1.5 Si; it is raised to 1516 with 3 per cent; it diminishes to 1410 with 6 per cent and again increases to 1427 with 7 per cent; lowering is continuous regularly after this point, it is 1256 with 14.3 per cent, 1392 with 33.3 per cent and 1185 with 53.5 per cent.

FERROTUNGSTEN

Tungsten Content of. The Determination of Tungsten in Ferrotungsten (Zur Wolframbestimmung in Ferrowolfram), Ludwig Lövy. Zeitschrift für angewandte Chemie, vol. 32, no. 100, Dec. 16, 1919, pp. 379-380. Details and results of experiments carried out at the laboratory of the Mannesmann Works in Saarbrücken.

FLIGHT

Transcontinental. Report on First Transcontinental Reliability and Endurance Test Conducted by the Air Service, U.S.A., October 8 to October 31, 1919. Air Service Information Circular, vol. 1, no. 2, Feb. 5, 1920, 35 pp., 1 fig. Experience is discussed principally with regard to influence of organization of personnel in successfully undertaking long-distance flights, and account is given of difficulties encountered in above-cloud flying and other aeronautical problems.

FLOOD CONTROL

Winnipeg. Flood Prevention Projects to Protect Winnipeg, Douglas L. McLean. Can. Engr., vol. 38, no. 14, Apr. 1, 1920, pp. 333-335, 4 figs. It is predicted that unless works are constructed to control flood waters of Red River of the North, next inundation at Winnipeg may cause damage totalling millions of dollars. Reservoirs, dikes and channel improvements are proposed.

FLYING BOATS

Design of. Flying-Boats, G. S. Baker. Flight, vol. 12, no. 11, Mar. 11, 1920, pp. 290-301, 1 fig. Table indicating variation of maximum power with hull beam for machines of 10,000 lb. total displacement. (Continuation of serial.)

FOREMEN

Training of. The foreman and Industrial Democracy, John Calder. Iron Age, vol. 105, no. 14, April 1, 1920, pp. 951-954. Training of foremen to properly handle workmen is urged. Experience of Swift & Co. in this direction is related Paper read before Soc. of Indus. Engrs.

FOUNDRIES

Continuous Operation. Keeping the Foundry in Continuous Operation, John H. Eastham. Can. Foundryman, vol. 11, no. 3, Mar. 1920, pp. 63-65, 4 figs. Survey of practice in various Canadian shops.

Organization. Organization in Non-Ferrous Foundries, O. Bertoya. Metal Industry (Lond.), vol. 16, no. 12, Mar. 19, 1920, pp. 225-229, 10 figs. Order cards, pattern registers and other foundry cards used at various English works, are illustrated.

GOLD MINING

ELECTRICITY IN. Electricity in Gold and Silver Mining, B. B. Beckett. Jl. Electricity, vol 44, no. 6, March 15, 1920, pp. 263-265, 4 figs. Records of power consumption of typical property in Nevada.

GRAB BUCKETS

ELECTRICALLY-DRIVEN. The Modern Development of Electrically-Driven Automatic Grab Buckets. (Die neuzeitliche Entwicklung des elektrisch betriebenen Selbstgreifers), H. Wintermeyer. Elektrotechnische Zeitschrift, vol. 40, nos. 47 and 48, Nov. 20 and 27, 1919, pp. 600-602 and 610-612, 18 figs. Description and illustrations of automatic grab buckets with electric motor attached to frame, with stationary electric drive, with a single stationary driving motor, and with two stationary driving motors.

GRINDING MACHINES

UNIVERSAL. A New Universal Grinding Machine. Machy. (Lond.), vol. 15, no. 389, March 11, 1920, pp. 760-761, 4 figs. Grinder has all-gear drive, weighs 6000 lbs., and is designed for rapidly grinding external, internal and face work. Wheel-slide suspension weight is contained in body of machine and permits slide to be set round to any angle without interference by weight, tension on slide maintained irrespective of its angular position.

HEALTH

BRITISH NATIONAL INSURANCE ACT. The British National Health Insurance System, Henry J. Harris. Monthly Labor Rev., vol. 10, no. 1, Jan. 1920, pp. 45-59. By act of Dec. 16, 1911, which came into operation on July 15, 1912, system of compulsory health and invalidity insurance was introduced into Great Britain. Article summarizes provisions of this act as amended by legislation of 1913, 1918 and 1919.

MINERS' NYSTAGMUS. Miners' Nystagmus, Lister Llewelyn. Colliery Guardian, vol. 119, no. 3081, Jan. 16, 1920, pp. 170-171. Attributes production of this disease principally to insufficient illumination. Paper read before North Staffordshire Inst. Min. Engrs.

SICKNESS REPORTING. A Standard Method of Sickness Reporting. Monthly Labor Rev., vol. 10, no. 1, Jan. 1920, pp. 220-223. Formulated by Special Committee on Industrial Morbidity Statistics, Vital Statistics Section of Am. Public Health Assn., in co-operation with Public Health Service and with advice and assistance of other Government bureaus.

See also Mining Industry, Health of Workers.

HEAT

DISSIPATION BY VARIOUS SURFACES. The Dissipation of Heat by Various Surfaces, T. S. Taylor. Mech. Engr., vol. 42, no. 4, Apr. 1920, pp. 230-232 and 259, 4 figs. Using bare tin as standard of reference, it was found in experiments that tin covered with 0.013 in. of sheet asbestos dissipated about 37 per cent more heat; asbestos-covered tin having layer of dust, 32 per cent more; and tin with layer of dust only, 7 per cent more. Thickness of 0.4 in. of asbestos resulted in saving of 25 per cent over that of bare pipe, and seven layers of 0.013-in. sheet asbestos loosely applied, 75 per cent.

HEAT TREATMENT

See Steel, Heat Treatment of.

HEAT TRANSMISSION

MASH COOKERS AND BREW KETTLES. Transmission of Heat in Mash Cookers and Brew Kettles (Ueber den Wärmedurchgang an Heizkörpern von Dampfphannen), Karl Fehrmann, Zeitschrift des Vereines deutscher Ingenieure, vol. 63, no. 40, Oct. 4, 1919, pp. 973-978, 6 figs. Deals with heat transmission in kettles and cookers employed in breweries for boiling mash and wort. Experiments are said to demonstrate the dependence of coefficient of heat transfer on pressure of superheated steam.

HEAVY-OIL ENGINES

NEW TYPE. A New Crude Oil Engine. Engr., vol. 129, no. 3350, March 12, 1920, pp. 278-280, 9 figs. Four-cylinder hot-bulb heavy-oil engine manufactured by W. H. Allen, Son & Co., Ltd., Bedford, England. Engine is said to be capable of running at no load even when operating on heavy residual oil. Reason for this is ascribed to spherical shape of combustion chamber and the fact that, in regulating injection to suit load, governor not only varies quantity but also time of injection, so that at light load injection may take place as much as 50 deg. before dead centre.

HIGHWAYS

See Road Construction.

HOISTS

MINE, ELECTRIC. Electric Winding Engines and Mine Hoists, H. H. Broughton. Elecn., vol. 84, nos. 2182 and 2186, March 12 and April 9, 1920, pp. 286-289, and 390-392, 3 figs. Mar. 12: Methods of estimating moments of inertia are explained, and tables are given indicating inertia of rotors of 50-cycle induction motors and inertia of cylindrical drums. Apr. 9: Geared three-phase window for shaft of uniform slope. (Continuation of serial.)

HOUSES

WALLS, HEAT PERMEABILITY OF. A Simple and Practical Method for Determining Insulation of Various Forms of Building Construction (Ein einfaches, praktisches Verfahren zur Bestimmung des Wärmeschutzes verschiedener Bauweisen), Karl Hencky. Gesundheits-Ingenieur, vol. 42, no. 46, Nov. 15, 1919, pp. 469-472, 3 figs. Methods for determining heat permeability of walls which, it is claimed, is specially adaptable for examination of walls of completed houses.

HOUSES, CONCRETE

OLYMPIA SHOW. Housing Exhibition at Olympia. Concrete & Constructional Eng., vol. 15, no. 3, March 1920, pp. 193-198, 8 figs. Examples of methods of small construction which have been approved by Ministry of Health as suitable for use in connection with housing schemes.

PLASTERED TYPE. Plastered or Concrete Gun Types of Concrete Houses. Eng. & Contracting, vol. 53, no. 12, March 24, 1920, p. 325. Committee report presented at National Conference on Concrete House Construction.

HYDRAULIC TURBINES

SEEWER GOVERNOR. Seewer's Method of Regulating High-Head Pelton Wheels (Seewers Universalregelung für Hochdruck-Pelton-Turbinen), F. Prasil. Zeitschrift des Vereines deutscher Ingenieure, vol. 63, no. 48, Nov. 29, 1919, pp. 1194-1200, 24 figs. Discusses principle of jet dispersion and its realization by means of movable guide plates in the nozzle. Description of construction and operation based on verbal and written report of Seewer, as well as observations of writer and his assistants during tests. Results of experiments are presented with aid of tables and diagrams.

Seewer Universal Governor for High-Pressure Pelton Turbines (Le régulateur universel système Seewer pour turbines hydrauliques à haute chute (Pelton), L. Joeffre. Revue générale de l'Électricité, vol. 6, no. 26, Dec. 27, 1919, pp. 935-940, 7 figs. Deviation of jet is accomplished by dispersing it by means of guiding elements placed in interior of piping. Successful operation of this governor is said to have been secured in trial at laboratories of Zurich Polytechnic School.

HYDROELECTRIC PLANTS

AUTOMATIC STATIONS. Automatic Hydro-Electric Stations, T. A. E. Belt. Elec. World, vol. 75, no. 15, Apr. 10, 1920, pp. 827-830, 6 figs. Performance of plant of Iowa Railway & Light Co. of Cedar Rapids, Iowa and of plant of Ontario Power Co. of Cal. are said to attest reliability of automatic devices.

OUTDOOR INSTALLATION. The Outdoor Generating Station, H. W. Buck. Gen. Elec. Rev., vol. 23, no. 3, Mar. 1920, pp. 194-197, 2 figs. Drawings are shown of hydro-electric plant which was designed and submitted to War Department for development at Muscle Shoals, Ala. It is argued that a plant of this kind is entirely feasible and offers decided advantages from standpoint of economy and construction.

QUEBEC. Hydro-Electric Development at St. Jerome, Que., L. A. Wright. Can. Engr., vol. 38, no. 12, Mar. 18, 1920, pp. 299-302, 7 figs. Concrete dam, with 190-ft. spillway, carries railway siding. Shaft of hydraulic turbine is direct connected to generator and also drives main power shaft of factory by means of speed-reducing silent chain.

SCANDINAVIAN. Power Developments in Scandinavia, J. W. Beckman. Gen. Meeting Electrochemical Soc., April 8-10, 1920, no. 29, pp. 403-409. Résumé of developments of water power for various purposes in Norway and Sweden, showing chronological rise of this development and its cost and the cost of power in those countries. It is estimated that Norway has potential water power of 7,500,000 hp., or 3020 hp. per 1000 inhabitants; Sweden, 6,200,000 hp. or 1050 hp. per 1000; and United States, 67,000,000 hp. or 540 hp. per 1000.

SWITZERLAND. The Navigation and the Harnessing of the Rhine (Le Rhin aux points de vue de la navigation et des forces hydrauliques). Vie Technique & Industrielle, vol. 1, no. 5, Feb. 1920, pp. 357-363, 14 figs. Hydroelectric power plant under construction at Eglisan where it is expected maximum power of 24,000 hp. will be developed. (Continuation of serial.)

ICE PLANTS

ELECTRIC OPERATION. Operating an Ice Plant, C. E. Rose. Refrigerating World, vol. 55, no. 3, Mar. 1920, pp. 13-16, 2 figs. Substitution of electric motors for oil engines at plant of Arkansas Cold Storage Co., Little Rock, Ark., is said to have resulted in decrease of operating cost.

MANAGEMENT. Men and Machinery in the Ice Plant, Erle S. Ormsby. Am. Soc. Refrigerating Engrs., vol. 6, no. 2, Sept. 1919, pp. 103-107. Instances are related where, it is said, introduction of modern methods and organization by modern methods improved efficiency and increased output of plant.

INDUSTRIAL MANAGEMENT

INDUSTRIAL RELATIONS

INSULATION, ELECTRIC

INTERNAL-COMBUSTION ENGINES

LABOR TURNOVER

MEASUREMENT. The Mathematics of Labor Turnover, Carl G. Barth. Indus. Management, vol. 59, no. 4, Apr. 1920, pp. 315-318, 4 figs. It is concluded from mathematical analysis that labor turnover should be measured by dividing average total payroll into factor of total separations of workers from a force.

LATHES

RELIEVING. The Relieving Lathe, Francis W. Shaw. Machy. (Lond.), vol. 15, no. 387, Feb. 26, 1920, pp. 673-684, 11 figs. Principles and operation of spiral relieving mechanism.

TURRET. Labour Saving Machines of the Capstan Lathe and Combination Turret Lathe Class for Commercial Purposes, G. H. Smith. Managing Eng., vol. 6, no. 9, Jan., 1920, pp. 205-211. Suggestions in regard to design of headstocks, pulley mounting, friction clutches, shafts and positive clutches, gearing, etc. Turret Lathe Practice. Machy, (N. Y.), vol. 26, no. 6, Feb., 1920, pp. 514-520, 28 figs. Practice of Warner & Swasey Co., Cleveland, Ohio.

LIGHTING

DAYLIGHT SAVING. Daylight Saving, Preston S. Millar. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 2, Feb., 1920, pp. 146-158, 13 figs. It is estimated that annual saving in United States of 19,250,000 could be effected by daylight saving, but as economic losses resulting in consequence of interference with agriculture, dairying and truck gardening are valued at over 1,000,000,000, it is concluded that solution of problem lies in diversification of hours of industry.

STREETS. Constant Potential Series Lighting, Chas. P. Steinmetz. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 3, Mar., 1920, pp. 245-248. Comparison of three types of high-voltage street-lighting systems: constant-current series, constant-potential series, and constant-potential multiple systems.

VILLAGE COMMUNITIES. Lighting for Country Homes and Village Communities, Wm. Kunerth. Official Publication Iowa State College Agriculture & Mechanic Arts, vol. 18, no. 19, Oct. 8, 1919, 32 pp., 26 figs. Necessity for better light in village communities is emphasized by statement that New York State Health Department has found that while 21 per cent of country school children have defective vision, only five per cent of city school children are so afflicted. Schemes of illumination for such communities are suggested and their comparative costs indicated.

See also Illumination.

LIGNITE

GERMANY, UTILIZATION IN. The Utilization of Lignite Mines for Alleviation of the Coal Famine (Die Heranziehung des Braunkohlenbergbanes zur Linderung der Kohlennot), H. Kegel. Zeitschrift des Vereines deutscher Ingenieure, vol. 64, no. 6, Feb. 7, 1920, pp. 125-129, 4 figs. States that the German lignite fields contain more than 15 billion tons. The low peat value necessitates production of rich briquets from dry raw lignite; along with recovery of low-temperature tar, lignite coke can be recovered which is said to be a valuable house fuel. (To be continued.)

See Explosives, Liquid Air.

LOCOMOTIVE BOILERS

TUBE COSTS. Locomotive Boiler Tubes. Ry. Gaz., vol. 32, no. 13, Mar. 26, 1920, pp. 495-496. Table showing cost of tubes for each of 604 engines of London, Brighton & South Coast Railway in copper, brass, and steel.

LOCOMOTIVES

COALING STATION FOR. New Coaling Station Speeds up Engine Service. Ry. Age., vol. 68, no. 14, April 2, 1920, pp. 1085-1087, 3 figs. Station of Pittsburgh and Lake Erie with capacity of 750 tons. Locomotives are given coal, sand, ashes and water service during stop of 20 min. with train leaving on estimated spacing of 10 min.

CYLINDERS. The Casting and Machining of Locomotive Cylinders. Ry. Engr., vol. 41, no. 483, April 1920, pp. 175-183, 12 figs. Methods employed in production of cylinder castings with piston-valve steam chests for three-cylinder express freight locomotive of Great Northern Ry.

ELECTRIC. *See Electric Locomotives.*

MINE. *See Mine Locomotives.*

STOKERS ON. Mechanical Stokers on Locomotives. Ry. Jl., vol. 26, no. 2, Feb. 1920, pp. 17-19. Committee report before Traveling Engrs.' Assn.

VALVES, ADJUSTMENT OF. Effect of Lame Engines on Fuel Consumption, J. W. Hardy. Ry. Jl., vol. 26, no. 2, Feb. 1920, pp. 24-26. Tests made on Houston & Galveston divisions of Southern Pacific to determine increase in fuel consumption resulting from operating locomotive engines with valves out of adjustment. Paper read before Int. Ry. Fuel Assn.

See also Railway Repair Shops.

LUBRICATING OILS

ECONOMIC UTILIZATION. The Economic Utilization of Lubricating Oils (Wirtschaftliche Schmieröl-Ausnutzung), H. Winkelmann. Kraft und Betrieb, vol. 3, nos. 14 and 15, Oct. 15 and Nov. 1, 1919, pp. 154-155 and 163-164. Instructions for utilization of lubricating oil and the production and application of substitutes.

LUBRICATION

FATTY OILS AND ACIDS. The Theory and Practice of Lubrication; The "Germ" Process, Henry M. Wells and James E. Southcombe. Jl. Soc. Chem. Industry, vol. 39, no. 5, March 15, 1920, pp. 51T-55T and (discussion) pp. 55T-60T, 5 figs. Writers conclude from physical and physico-chemical study of lubrication, as well as from their experience that fatty compounded oils are unnecessary for many purposes of lubrication and that fatty acids can entirely and completely displace oils for such purposes.

MAGNETOS

HIGH TENSION, CHARACTERISTICS OF. Characteristics of High-Tension Magnetos. Nat. Advisory Committee for Aeronautics, report no. 58, 1920, 23 pp. 22 figs. Analysis of successive operations, showing connection between several phenomena concerned and their relative importance on basis of energy transformed. Method for measuring ratio of turns of high-tension magnetos or induction coils is suggested and result of its application to various magnetos is quoted.

MANGANESE

ORE, ELECTRIC SMELTING OF. Electric Furnace Smelting of Montana Manganese Ores, E. S. Bardwell. Chem. & Metallurgical Eng., vol. 22, no. 15, Apr. 14, 1920, pp. 681-685. Balance sheet of 10-day electric furnace test. Discussion of slag and furnace losses, together with method of calculating charges. Description of electric furnace plant at Great Falls. Paper read before Am. Electrochemical Soc.

MANOMETERS

GAGING OF. Tavel Apparatus for Gaging Metallic Manometers (Appareil, système Tavel, pour l'étalonnage des manomètres métalliques). Génie Civil, vol. 76, no. 2, Jan. 10, 1920, pp. 47-48, 1 fig. Manometric column of apparatus is made up of steel-pipe sections, each of length corresponding to mercury column giving pressure of 1 kg. p. sq. in. Isolated nickel points at each junction of sections are connected in series with battery and lamp. As mercury ascends pressure is read off by number opposite last lamp lighted.

MARINE BOILERS

COMBUSTION-CHAMBER TEMPERATURE, MEASUREMENT. Observing Temperatures in Marine Propelling Installations. Engr., vol. 129, no. 3348, Feb. 27, 1920, pp. 226-228, 10 figs. Diagrams are presented which show results of measuring temperatures in combustion chambers in multi-tubular marine boiler by means of thermo-couples. Paper read before Northeast Coast Instn. Engrs. & Shipbuilders.

MARINE ENGINES

VERTICAL QUADRUPLEX-EXPANSION TYPE. Machining and Erecting Marine Engines, William Wylde and R. M. Sherman. Int. Mar. Eng., vol. 25, no. 4, April 1920, pp. 305-318, 21 figs. Practice at shops of Newport News Shipbuilding and Dry Dock Company, Newport News, Va. Engine, construction of which is described, has cylinders 24 in., 35 in., 51 in., and 75 in. in diameter, by 51-in. stroke. Stephenson link-valve gear and is designed for 2600 i.hp. at 70 r.p.m.

See also Diesel Engines, Cammellaird.Fullagar; Two vs. Four-Cycle; Oil Engines, Bergsund; Neptune.

MARINE STEAM TURBINES

HIGH-SPEED IMPULSE TYPE. High-Speed Impulse Type Marine Turbines. Shipbuilding & Shipping Rec., vol. 15, no. 11, March 11, 1920, pp. 337-340, 7 figs. Units constructed for ship propulsion by Fraser & Chalmers Engineering Works, Erith, England.

METAL ORES

BALKAN STATES, DEPOSITS IN. The Balkan States as a Source of Supply of Raw Material for the German Metal Industry (Der Balkan als neue Rohstoffquelle der Metal-industrie Deutschlands), H. Ed. Kepler. Metall und Erz, vol. 16, nos. 16, 18 and 19, Aug. 22, Sept. 22 and Oct. 8, 1919, pp. 373-375, 415-420 and 444-455, 4 figs. Notes on gold, silver, zinc, lead, copper, chromium, granite, limestone and other ores found in Macedonia, Moravia and Bulgaria. (Continuation of serial.)

MILLING CUTTERS

DROP FORGINGS FOR. High Speed Steel Drop Forgings for Milling Cutters and Special Tools, A. F. MacFarland. Jl. Am. Steel Treaters Soc., vol. 2, no. 6, March 1920, pp. 279-287, 17 figs. Advantages claimed are more homogeneous structure, lower machine cost, lower scrap losses, time saved in making tool, elimination of physical defects, and increased production obtained per tool.

SCREW-THREAD, TESTS OF. Cutting Pressure, Cutting Speeds, Feed and Life of High-Speed Steel Screw Thread Milling Cutters, H. Ederheimer. Eng. & Indus. Management, vol. 3, no. 10, Mar. 4, 1920, pp. 309-311, 5 figs. Results of tests showing influence of cutting feed and speed of high-speed screw thread milling cutters of 38.5, 48 and 53 mm. diameter upon number of cuts possible before first regrinding is necessary and upon total life of cutter, as well as dependence of life upon cutting pressure. Translated from Zeitschrift des Vereines Deutscher Ingenieure.

The Cutting Pressure, Cutting Speed, Feed and Durability of High-Speed-Tool-Steel Thread-Milling Cutters (Schnittdruck, Schnittgeschwindigkeit, Vorschub und Lebensdauer bei Gesindefräsern aus Schnellstahl), Hermann Ederheimer. Zeitschrift des Vereines deutscher Ingenieure, vol. 64, no. 7, Feb. 14, 1920, pp. 149-153, 15 figs. By means of experiments described, writer has determined for thread-milling cutters of 38.5, 48 and 53.5 mm. diam., influence of cutting speed and feed, on number of cuts up to first grinding and on total life of cutters, as well as the dependence of life of cutter on cutting pressure.

OIL FIELDS

Decline Curves. Variation in Decline Curves of Various Oil Pools Roswell H. Johnson. Min. & Metallurgy, no. 157, section 8, Jan. 1920, 5 pp. Based on data given in Manual of the Oil and Gas Industry published by Treasury Department, Washington.

Marine Boilers. Utilization of Liquid Fuel in Marine Boilers (Utilisation des combustibles liquides dans les chaudières marines). Bulletin technique du Bureau Veritas, vol. 2, no. 2, Feb. 1920, pp. 26-28, 7 figs. Description of Koerting, and Wallsend-Howden burners.

Mechanical Atomizers. Burning Oil with Mechanical Atomizers, Robert Sibley and C. H. Delany. Elec. World, vol. 75, no. 13, March 27, 1920, pp. 727-728, 4 figs. Advantages claimed for mechanical atomizing burner are that mixture of air and gases occurred throughout entire furnace and that large quantities of oil can be burned in furnace of given volume. Disadvantages mentioned are tendency for small orifice in burner to choke up and separate adjustment of air supply for each burner required every time there is change in quantity of oil burned.

Safety in Firing. The Installation and Cost of Oil Firing (Einbau und Kosten von Oel-Feuerungen), H. Viesohn. Jl. für Gasbeleuchtung, vol. 62, no. 50, Dec. 13, 1919, pp. 746-752, 10 figs. Notes on safety measures to be observed and experiences in the Hattersheim waterworks. Frankfort. Regulations are formulated for preventing accidents with tar-oil firing and it is concluded that its use should be of great value in bridging over the coal shortage in German public and industrial works. Address read before Central Rhenish Assn. of Gas and Water Engineers.

OIL WELLS

Pumping. Oil Well Pumping Methods and Equipment, Seth S. Langley. Eng. & Min. Jl., vol. 109, no.,13, March 27, 1920, pp. 748-754, 7 figs. Details of equipment necessary and statement of costs in California.

OPEN-HEARTH FURNACES

Design. Design of Open Hearth Furnaces, A. D. Williams. Iron Age, vol. 105, no. 12, March 18, 1920, pp. 805-806, 2 figs. Bearing of time factor on thickness of checker brick is illustrated by graph showing rise in temperature on medium line of fireclay brick in percentage of surface temperature.

OXY-ACETYLENE WELDING

Forge Work. Fusion Welding as Applied to Forge Work, S. W. Miller. Ry. Jl., vol. 26, no. 2, Feb. 1920, pp. 20-22. Oxy-acetylene process is perferred to electric process for fusion welding because "while the electric process is considerably cheaper. There is greater liability with the electric process of not getting through fusion at the beginning of the work. Paper read before Am. Drop Forge Assn.

Steam Boilers. Autogenous Welding and the Steam Boiler, T. H. Fenner. Power House, vol. 13, no. 6, Mar. 20, 1920, pp. 134-136 and 143, 7 figs. Examples of firebox-sheet failures are given, together with rules of Steam Boiler and Fly Wheel Service Bureau, New York, organization which includes engineering staffs of large insurance companies of North American continent.

PAVEMENTS, WOOD BLOCK

Street Railway Tracks. Wood Block Paving Between Street Railway Tracks, Andrew F. Macallum. Am. City (City Edition), vol. 22, no. 3, March 1920, pp. 237-238, 2 figs. Method of tract construction employed on Elgin Street, Ottawa, in 1919. Wood blocks are laid on pitch cushions and sandstone blocks on mortar cushions.

PEAT

Classification of. Quality and Value of Important Types of Peat Material, Alfred P. Dachnowski. U. S. Department of Agriculture, bul. no. 802, Dec. 29, 1919, 40 pp. A classification of peat based upon its botanical composition and physical and chemical characteristics.

PETROLEUM

Geology. Geology Distillation of Petroleum, Bailey Willis. Min. & Metallurgy. no. 157, section 10, Jan. 1920, 7 pp., 1 fig. Peckham's hypothesis is applied to and found to be confirmed in Appalachian field.

Industry, Features of. Methods for More Efficiently Utilizing our Fuel Resources, Chester G. Gilbert and Joseph E. Pogue. Gen. Elec. Rev., vol. 23, no. 3, Mar. 1920, pp. 198-207, 5 figs. Treats of nature and occurrence of petroleum and essential features of petroleum industry, including production, transportation and refining, as well as distribution of products. Chart is included showing relative values of principal petroleum products in United States from 1899 to 1914.

Mapping. The Barometric Method of Geologic Surveying for Petroleum Mapping, Frederic H. Lahee. Economic Geology, vol. 15, no. 2, Mar. 1920, pp. 150-169, 8 figs. Comparison is included of barometric and plane table methods.

PHOTOGRAPHY

See Aerial Photography.

PILES

Greosote Treatment. A Conclusive Record for Creosoted Piles. Ry. Maintennaec Engr., vol. 16, no. 1, Jan. 1920, pp. 23-25, 4 figs. Three-mile approach on Indiana end of Louisville & Nashville bridge over Ohio river at Henderson, Ky., of which 177 bents at south end were built of creosoted, long-leaf, yellow pine piles has had, it is said, a useful life of 35 years.

PLATES

Flat, Strength and Stiffness of. The Strength and Stiffness of Flat Plates. F. H. Hummel. Mech. World, vol. 67, no. 1732, March 12, 1920, pp. 172-173. Table giving maximum deflection at centre, stress at centre and maximum stress in plate for plates of different forms and dimensions.

PLOWS

See Tractors, German.

POWER FACTORS

Measurement for Rates. Measurement of Power Factor for Rates, C. E. Brown. Elec. World, vol. 75, no. 13, March 27, 1920, pp. 721-722, 5 figs. It is indicated how average power factor may be obtained over period of time by using standard watt-hour meters connected to register energy and reactive components of load.

PRODUCTION

Central Consulting Council. The Question of Production, John Holloway. Eng. & Indus. Management, vol. 3, no. 2, Jan. 8, 1920, pp. 40-43. Suggests collaboration and exchange of ideas between different manufacturers as to best plans of increasing production and setting up Central Consulting Council in various districts of county (England) which would constitute an avenue through which ideas and practices for intensified production could be distributed.

PROJECTILES

Velocity Measurement. The Measurement of Projectile Velocities, Paul E. Klopsteg and Alfred L. Loomis. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 2, Feb. 1920, pp. 98-104, 6 figs. Development of "Aberdeen chronograph" adopted as standard by Ordnance Department during war and designed for rapid production. Comparative results as to speed and accuracy of measurement of Aberdeen and Boulangé chronographs are given.

PULVERIZED COAL

Cost of. Powdered Coal Winning Out in Special Fields, Charles Longenecker. Coal Trade Jl., vol. 51, no. 13, March 31, 1920, pp. 353-355, 4 figs. Table is given showing comparative cost of powdered coal with other fuels.

Distribution to Small Plants. Distributing Pulverized Coal to Small Plants, B. J. Cross. Coal Age, vol. 17, no. 14, April 1, 1920, pp. 635-637, 5 figs. It is stated that using pulverized coal from central plant is becoming general practice in West. It is emphasized that pulverized sub-bituminous coal must be kept dry and air so far as possible excluded if fuel is to be handled safely.

Economy of Burning. Forecasting the Fuel of the Future, V. Z. Caracristi. Chem. Age, vol. 2, no. 2, Feb. 1920, pp. 361-365, 2 figs. Economies of burning coal, pulverized and in suspension, are pointed out.

Metallurgical Furnaces. Pulverized Coal in Metallurgical Furnaces at High Altitudes, Otis L. McIntyre. Mech. Eng., vol. 42, no. 4, Apr. 1920, pp. 225-227, 4 figs. Preliminary experiments with pulverized coal which led to installation of apparatus for its use in blast furnaces, reverberatories and sintering machines of Cerro de Pasco Copper Corporation at La Fundiction, Peru, works situated at an elevation of 14,000 ft.

Milwaukee Plant Equipment. Pulverized Coal in a Milwaukee Power Plant. Elec. Rev. (Chicago), vol. 76, no. 12, Mar. 20, 1920, pp. 469-472, 5 figs. Plant layout, methods and special features of Oneida Street station of Milwaukee Elec. Ry. & Light Co. Details of equipment and sizes of motors used. Data on operating experiences.

RAILWAYS

BALTIC STATES. The Railroads of Lithuania and the Baltic States Under Russian Administration and Their Development During the War (Die Eisenbahnen Litauens und des Baltikums zu rushischer Zeit und ihre Entwickelung durch den Krieg), Georg Neumann. Zeitung des Vereins deutscher Eisenbahnverwaultungen, vol. 59, nos. 83 and 84, Nov. 1 and 5, 1919, pp. 879-883 and 893-895, 4 figs. Account of the neglected state of these railroad systems before the war and improvements effected by German railroad engineers which, it is claimed, will prove of future benefit to the countries in question.

BRITISH, SPEEDS IN 1919. Railway Speed in 1919. Engr., vol. 129, no. 33-42, Jan. 16, 1920, pp. 59-60. Tables giving fastest start-to-stop and longest non-stop runs in United Kingsdom.

RECLAMATION

POSSIBILITIES IN U. S. Report on Development of Unused Lands. Eng. News-Rec., vol. 84, no. 8, Feb. 19, 1920, pp. 375-377. Study of possibilities of reclaiming arid, wet and cut-over timber lands, made by U. S. Reclamation Service in latter part of 1919.

REFRACTORIES

CHEMICAL ANALYSIS. Are Images in Chemical Analysis, Wm. Roy Mott. General Meeting Am. Electrochemical Soc., April 8-10, 1920, paper 11, pp. 121-160. Method of chemical analysis is formulated which consists of bringing materials to be tested into or under influence of carbon arc in specified manner. It is claimed that method has unique advantages in analysis of all refractory materials, minerals and compounds, and that major constituent of any mineral alloy, refractory or chemical precipitate, can be easily identified in less than ten minutes.

PHYSICAL PROPERTIES OF. Physical Characteristics of Specialized Refractories, M. L. Hartman and O. A. Hougen. Gen. Meeting Am Electrochemical Soc , April 8-10, nos 22 & 23, pp 349-354, 9 figs., pp. 355-358—1 fig. No. 22: Comparative tests of resistances of 12 different kinds of refractory bricks to rapid cooling by air blast after heating to 1350 deg. cent. Percentage loss of weight varied from 0.3 per cent with bonded carborundum to 100 per cent with chrome, silica and magnesia samples. No. 23: Account of tests of different refractory materials at ordinary temperatures and at 1350 deg. cent., made by carborundum cutting wheel under constant pressure and measuring depth abraded in given time.

INDIA. The Organization of Scientific Work in India. Nature, vol. 104, no. 2625, Feb. 19, 1920, pp. 659-654. Policy contemplated consists in centralizing scientific work in Imperial Department of Industries of Government of India.

INDUSTRIES AND. How Research Helps Rejuvenate Industries, Arthur Van Vlissinger, Jr. Factory, vol. 24, no. 6, Apr. 1, 1920, pp. 947-952, 4 figs. Based on experience of various manufacturers.

NATIONAL RESEARCH COUNCIL. Constructive Scientific Research by Co-operation, Burton E. Livingston. Science, vol. 51, no. 1316, Mar. 19, 1920, pp. 277-283. Slow progress of science is attributed to scientific research problems being attacked by individuals or by small, local groups of workers influenced by a single individual. It is suggested to organize system of co-operative research under auspices of National Research Council.

RETAINING WALLS

LARGE BUILDINGS. Retaining Walls for Large Buildings. Concrete & Constructional Eng., vol. 15, no. 3, Mar. 1920, pp. 155-160, 5 figs. Instead of customary procedure of excavating whole area, trenches were dug against road frontages to accommodate retaining walls, sufficient amount of earth being left against backs of street frontage to render them self-supporting.

ROAD CONSTRUCTION

LIMITING FACTORS. Factors Which Will Limit Highway Construction During the Coming Season, O. P. Chamberlain. Good Roads, vol. 19, no. 9, Mar. 3, 1920, pp. 123-126. Labor difficulties in plants producing road building materials, it is feared, will limit highway construction.

PROGRESS IN 1919. County Highway Data. Public Works, vol. 48, no. 12, Apr. 3, 1920, pp. 276-287. Tabulated data on county highway work done during 1919, practice as to road shoulders, resurfacing county highways and maintenance of water-bound macadam county highways.

TOP SOIL BASE. Value of Top Soil as Base for Modern Highways, D. S. Humphrey. Eng. News-Rec., vol. 84, no. 12, Mar. 18, 1920, pp. 566-567. It is recommended that earth's crust be unmolested and that side ditching be avoided.

ROADS

TESTING WITH CORE DRILLS. Core Drills as a Means of Securing Road Samples for Testing Purposes, F. A. McLean. Contract Rec., vol. 34, no. 11, Mar. 17, 1920, pp. 255-257, 2 figs. Because samples secured by core drills are of uniform size, it is believed that they may be depended upon to give more accurate indication of strength and wearing qualities of road bed than those extracted by hand.

ROADS, CONCRETE

NEW YORK PRACTICE. State Highway Construction in New York, Jas. H. Sturdevant. Public Works, vol. 48, no. 10, Mar. 20, 1920, pp. 207-209. Standard practice for concrete roads.

Utilizing Old Macadam to Increase Width of Concrete Road. Eng. News-Rec., vol. 84, no. 10, Mar. 4, 1920, pp. 461-463, 3 figs. Reconstruction of old macadam roads by building concrete surface in two strips with old surface left in middle. Work done by New York State Highway Department.

ROLLING MILLS

STEEL-CHANNEL, LUXEMBURG. The Rolling of Steel Channels (Le calibrage des fers en U), Norbert Metz. Revue de Métallurgie, vol. 16, no. 3, May-June 1919, pp. 157-174, 50 figs. Technique of manufacturing practice followed at mills of Dudlange, Luxemburg, with tables of dimensions of their standard sections.

RUDDERS

CAST STEEL. Machining Rudders for Troopships, Albert Fisher. Am. Mach., vol. 52, no. 12, Mar. 18, 1920, pp. 610-612, 8 figs. Methods used in making cast-steel rudders for 8000-ton troopships in shop located more than 350 miles from yard where they were built.

KITCHEN TYPE. Manœuvring and Reversing Rudders. Engr., vol. 129, no. 33-35, Feb. 6, 1920, p. 149, 10 figs. Form evolved by J. G. E. Kitchen of Lancaster, England. Essential parts of rudders consist of two curved deflectors formed as parts of circular cylinder, partly enclosing propeller. Both deflectors are pivoted at top and bottom on common centres, and their opening or closing regulates speed of ship.

SAFETY

DEPARTMENTAL MEETINGS. Safety and Welfare Work in Industrial Plants, H. A. Schultz. Proc. Engrs. Soc. Western Pa., vol. 35, no. 8, Nov. 1919, pp. 395-423 and (discussion) pp. 424-426. Recommends holding departmental safety meetings regularly, conducting safety lectures periodically in training and apprenticeship schools and holding safety rallies occasionally for workmen and their families. Practice of U. S. Steel Corp. is quoted as example.

SCIENTIFIC MANAGEMENT

See Industrial Management; Taylor System; Time Study.

SCREW MACHINES

LARGE FOUR-SPINDLE. Four-Spindle Screw Machines for Large Work. Iron Age, vol. 105, no. 14, April 1; 1920, pp. 935-939, 13 figs. Machines are evolution in development of multiple-spindle screw machines to meet requirements of users for machines for larger diameter work than could be produced on 2¼-in. machines. They are built by National Acme Co., Cleveland.

SCREW THREADS

TIGHT-FITTING. Tight-Fitting Threads for Bolts and Nuts, Chester B. Lord. Mech. Eng., vol. 42, no. 4, Apr. 1920, pp. 222-224 and 259, 5 figs. Conclusions drawn from experimental work are in part: Cause of stripped threads is lack of room into which metal can flow; pitch diameter and lead should be the same in both threads; and thread angle should differ by not more than 10 deg.

SEMI-STEEL

MANUFACTURE. Manufacture of Smi-steel for Shells, Frank E. Hall, Min. & Metallurgy, no. 157, section 15, Jan. 1920, 7 pp. Requirements of U. S. Ordnance Department.

STEAM PIPES

SUPERHEATED-STEAM, INSULATION OF. Losses from Long Superheat Steam Pipes Determined by Means of Curves, Thomas G Estep. Blast Furnace & Steel Plant, vol. 8, no. 4, Apr. 1920, pp. 259-261 and 263, 3 figs. Curves showing (1) most economical thickness of pipe covering for various temperature differences and heat costs, (2) total heat loss per 100 lineal feet of pipe in B.t.u. per hr. when covered with most economical thickness of pipe covering and (3) temperature drop per 100 lineal feet of pipe when covered with most economical thickness of pipe covering.

STEAM POWER PLANTS

STATISTICS FOR COMPARISON. Essential Statistics for General Comparison of Steam Power Plant Performance, W. S. Gorsuch. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 2, Feb. 1920, pp. 132-134. Method for comparing efficiencies between different plants without going into detailed study of thermal characteristics of plants or introducing power costs. Essential items of steam-power plant performance that should be recorded and uniform method of expressing them are given in tabulated form, with illustration demonstrating advantage of proposed method.

STEAM TURBINES

PUMPING SETS. High Pressure Turbine Pumping Set. Engr., vol. 129, no. 3348, Feb. 27, 1920, pp. 228-229, 5 figs. Set manufactured by Mather and Platt, Limited, Manchester, England. Overall length of complete set is 31 ft. 3½ in. height 5 ft. 5½ in.; overall width, 6 ft. 7½ in. Motor designed for three-phase 50 periods and pressure of 6600 volts.

60,000-KW. Most Powerful Prime Mover in the World. Ry. & Locomotive Eng., vol. 33, no. 1, Jan. 1920, pp. 1-2, 1 fig. Turbine of 60,000 kw. continuous capacity at 74th Street Station of Interborough Rapid Transit Co., New York.

See also Marine Steam Turbines.

STEEL

ALLOY. *See Alloy Steels.*

CRITICAL POINTS. Practical Determination of the Critical Points of Steels by the Differential Method (Sur la détermination pratique des points critiques des aciers par la méthode différentielle), A. Portevin and V. Bernard. Revue de Métallurgie, vol. 16, no. 3, May-June 1919, pp. 175-192, 15 figs. Experience of writers in application of Roberts Austen's differential method. Substitution of Chevenard differential expansimeter in place of Saladin-Le Chatelier double galvanometer has been found by them to increase considerably accuracy of method.

FORGED VS. ROLLED BARS. Rolled and Forged Steel Bars, J. H. Higgins. Jl. Am. Steel Treaters Soc., vol. 2, no. 6, Mar. 1920, pp. 295-298, 12 figs. Results of investigations conducted at works of Camden Forge Co., in which forged bars were found to give better results in natural, annealed and heat-treated state, both physically and micrographically.

HIGH-SPEED. *See Steel High-Speed.*

MANGANESE. *See Steel Manganese.*

MOLYBDENUM. *See Steel Molybdenum.*

PRODUCTION DURING WAR. The Iron and Steel Trades During the War, M. S. Birkett. Iron & Coal Trades Rev., vol. 100, no. 2716, Mar. 19, 1920, pp. 381-384. Tables showing production and exports of iron and steel of each of chief steel-producing countries for 1913, 1918, and 1919. Paper read before Roy. Statistical Soc.

SULPHUR AND PHOSPHORUS, INFLUENCE OF. Contemporary Foreign Opinion on Sulphur and Phosphorus in Steels, Henry S. Rawdon. Chem. & Met. Eng., vol. 22, no. 13, Mar. 31, 1920, pp. 609-611. Result of canvassing opinions at English and French metallurgical centres as to how moderate increases in sulphur and phosphorus would influence laborarory tests and service performance of steels.

STEEL CASTINGS

OPEN-HEARTH VS. ELECTRIC-FURNACE. Melting Changes Bring Lower Costs, Foundry, vol. 48, no. 7, Apr. 1, 1920, pp. 253-258, 9 figs. Experience of Bayonne Steel Castings Co., Bayonne, N. J. Open-hearth displaced electric furnace in steel foundry when power charges became excessive. It is said that open-hearth furnace produces steel which is satisfactory in quality for all requirements and at less cost than was possible with electric furnace.

STEEL, HEAT TREATMENT OF

CARBONIZING, BOXES FOR. Pots and Boxes Used in Carbonizing, H. H. Harris. Iron Age, vol. 105, no. 10, Mar. 4, 1920, pp. 729-731. Comparative value of cast iron, steel and special alloys for pots and boxes used in heat-treating processes. Each material is found to be best suited for certain specific applications, and it is observed that the only true scale of value is that of comparing their life under service conditions with their initial cost and determining how many units of service each renders per dollar investment.

CARBURIZING. Pre-Heating in Carburizing, Theodore G. Selleck. Jl. Am. Steel Treaters Soc., vol. 2, no. 6, Mar. 1920, pp. 288-295, 6 figs. Advantages claimed for pre-heating method of carburizing are greater uniformity of results, speed of operation, economy and convenience as well as, in most cases, greater cleanliness and more comfort for operator.

HARDENING. Hardening Steel Without Distortion, Fred H. Colvin. Am. Mach.; vol. 52, no. 10, Mar. 4, 1920, pp. 489-493, 7 figs. Electric furnace and equipment designed to take into account discrepancies between true temperature of steel at any instant and indications of thermocouple on record.

HIGH STRENGTH FROM. The Elastic Development of Steel, Sidney Cornell. Chem. & Metallurgical Eng., vol. 22, no. 15, Apr. 14, 1920, pp. 677-680, 9 figs. Account of research undertaken by Remington Arms Union Metallic Cartridge Co. to salvage about one million bayonets rejected by inspectors of English Government. Research consisted principally of testing steel heat-treated at various temperatures. It was brought out that unusually high strengths could be produced in medium-and high-carbon steels by high drawing after quenching.

HUMP METHOD. Heat Treating Steel by New Method Claims Valuable Results. Automotive Industries, vol. 42, no. 14, April 1, 1920, pp. 812-815, 6 figs. Hump method. Material is quenched at definite point in heating when temperature rise shows marked decrease and change from previous uniform rate. Advantages claimed are that it results in higher grade and more uniform output and simplifies handling and cleaning.

TRACTOR PARTS. Heat Treating Cast Steel for Tractors, Fred Grotts. Am. Drop Forger, vol. 6, no. 3, Mar. 1920, pp. 123-124, 4 figs. Survey of developments of present practice.

STEEL, HIGH-SPEED

MELTING UP BROKEN TOOLS. Reclaiming and Using Broken High Speed Tools, John A. Hope. Can. Machy., vol. 33, no. 31, Mar. 25, 1920, pp. 312-313, 1 fig. Construction and operation of high-speed steel melting furnace.

STEEL, MANGANESE

ANALYSIS OF. Generalization of Method of Analyzing Manganese in Special Steels by Persulphate in the Presence of Chromium and Tungsten (Généralisation de la méthode du dosage du manganèse dans les aciers spéciaux par le persulfate en présence du chrome et du tungstène), P. Nicolardot and A. Levi. Revue de Métallurgie, vol. 16, no. 3, May-June 1919, pp. 201-216. Rapidity and accuracy between 0.1 and 3 per cent are claimed for this method.

STEEL MANUFACTURE

CHEMICAL REACTIONS IN. Balanced Reactions in Steel Manufacture, Andrew McCance. Chem. & Metallurgical Eng., vol. 22, no. 14, Apr. 7, 1920, pp. 634-638, 1 fig. Argument is advanced that oxidation of iron during melting is by steam, that iron oxide is soluble in molten iron, and that silicon is reduced from acid slag by carbon. Observations on composition of gas in blow-holes and in solution in solid steel. Paper presented before Faraday Society.

ELECTRIC-FURNACE. The Electric Furnace and the Central Station, H. L. Hess. General Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper 14, pp. 207-220. Economic aspect of securing power from central station for manufacturing electric steel is discussed. World's production in 1918 amounted to 1,155,273 tons, the United States leading with 511,364 tons.

See also Rolling Mills.

STEEL, MOLYBDENUM

COMMERCIAL, DATA ON. Commercial Molybdenum Steel Test Data. Raw Material, vol. 2, no. 3, Mar. 1920, pp. 87-91, 6 figs. Test results obtained by Carbon Steel Co., Pittsburgh, Pa., are tabulated and charts are given which indicate influence of heat treatment upon various physical properties of metal.

DETERMINATION OF MOLYBDENUM. Determination of Character and Quantity of Molybdenum in Steel and Iron (Ueber den Art-und Mengennachweis des Molybdäns im Stahl und Eisen), Seigfried Laurens Malowan. Zeitschrift für anorganische und allegameine Chemie, vol. 108, no. 1, Aug. 13, 1919, pp. 73-80, 1 fig. Deals with a color reaction of molybdenum which, it is claimed, has never been used in elementary analysis. Writer, after investigating action of xanthic acid and its salt on molybdenum compounds, seeks to demonstrate their adaptability for a given amount of molybdenum in steel.

STORAGE BATTERIES

STREET RAILWAYS

STRESSES

TANK STEAMERS

10,000-Ton. 10,000-Ton Oil Tank Steamship. Int. Mar. Eng., vol. 25, no. 4, Apr. 1920, pp. 272-274, 8 figs. Dimensions: Length overall, 439 ft. 7 in.; length between perpendiculars, 424 ft.; beam molded, 58 ft.; draft, 25 ft. 5 in.; deadweight tonnage, 10,000 tons; service speed, 10½ knots. Propulsion is by single screw of four-bladed built-up type driven by vertical inverted triple-expansion surface-condensing engine.

TANKS

Oil, Reinforced-Concrete. Large Concrete Oil Tank Built for Panama Canal, R. C. Hardman. Eng. News-Rec., vol. 84, no. 8, Feb. 19, 1920, pp. 380-381, 2 figs. Tank is 115 ft. in diameter and 30 ft. deep. Concrete was approximately 1 :2 :4 mix, proportions used at start of walls being one cement, 2¼ sand and 3¾ crushed stone. Steel stresses of 16,000 lb. per sq. in. were used. Capacity is 55,000 bbl.

TAYLOR SYSTEM

Advantages of. The Taylor System and Its Applications (Le système Taylor et quelques considérations sur son application), R. de Vallière. Bulletin Technique de la Suisse Romande, vol. 46, nos. 5 and 6, Mar. 6 and 20, 1920, pp. 49-53 and 61-63. It is shown how essence of system consists, not in requiring greater exertion of worker, but in regulating his normal exertion in a manner to increase production. Economical advantages of introducing Taylor system in manufacturing establishments are pointed out. It is visualized that principles upon which Taylor system is based could be profitably applied to financial enterprises and governmental departments as well. (Concluded.)

TELEGRAPHY

Multiplex. High-Frequency Multiplex Telephony and Telegraphy (Hochfrequenz-Mehrfachtelephonie und-Telegraphie Längs Leitungen), H. Fassbender and E. Habann. Jahrbuch der drahtlosen Telegraphie und Telephonie, vol. 14, no. 5, Oct. 1919, pp. 451-478, 17 figs. Discussion of development of a wire system completed before armistice and later enlarged upon to meet demands of German postal and railroad administrations. Both military and civil apparatus are described. The multiplex transmission of news is defined as a recent departure in feeble-current technique suggested by the introduction of vacuum tubes in wireless telegraphy.

See also Electric Arc A. C., Speaking.

TELEPHONY

See Telegraphy, Multiplex.

TERMINALS, FREIGHT

Motorization of. *See Motor-Truck Transportation, Cincinnati Freight Terminals.*

TERMINALS, LOCOMOTIVE

Lehigh Valley Railroad. New Engine Terminal for Lehigh Valley Railroad. News-Rec., vol. 84, no. 11, Mar. 11, 1920, pp. 514-516, 7 figs. Details of engine house, coaling station and ashpit.

Rectangular. A Terminal Built for Special Operating Conditions. Ry. Age, vol. 68, no. 13, Mar. 26, 1920, pp. 1025-1030, 10 figs. Special design of yards necessitated in order to serve coal traffic movement westward from Utah coal field. Among distinctive features is rectangular engine terminal, innovation undertaken because of considerable number of Mallet engines which must be accommodated at that terminal and difficulty encountered in keeping turn-table pit clear for operation.

TERMINALS, MARINE

Philadelphia Army Base. Planning and Progress on a Big Construction Job—I, Charles Penrose. Eng. News-Rec., vol. 84, no. 12, Mar. 18, 1920, pp. 554-561, 7 figs. How records were kept at Philadelphia army base in order to plan and schedule work, to follow progress of construction, and to control future operations.

Transit Sheds. Steel Design and Erection on Transit Sheds at Halifax Ocean Terminals, J. Robertson. Contract Rec., vol. 34, no. 12, Mar. 24, 1920, pp. 268-269, 4 figs. Sheds 1210 ft. long and 87 ft. wide containing 3600 tons of steel are said to have been erected in six weeks with twin derrick traveler.

THERMIT WELDING

Railway Repair Shops, In. Where Thermit Means Economy. Ry. Jl., vol. 26, no. 2, Feb. 1920, pp. 14-16, 10 figs. Examples of welding by thermit process at repair shops of various railways.

THERMOELECTRICITY

Voltage Measurement. A Precision Galvanometric Instrument for Measuring Thermoelectric E. M. Fs., T. R. Harrison and Paul D. Foote. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 2, Feb. 1920, pp. 165-176, 11 figs. Scheme is explained whereby ordinary millivoltmeter may be converted into instrument in which usual errors arising from variable line resistance are eliminated. Instrument measures true e. m. f. in simple circuit or if connected across resistance or net-work through which current flows, it indicates potential drop which would have existed if instrument had not been connected.

TIME STUDY

Applications. Time Study in an Engineering Works, W. Symes. Eng. & Indus. Management, vol. 3, no. 10, Mar. 4, 1920, pp. 296-298, 1 fig. Method of time study is outlined and, by way of illustration, its application to various machinery operations is explained.

Economical Advantages. Time and Job Analysis in Management—I, William O. Lichtner. Indus. Management, vol. 59, no. 4, Apr. 1920, pp. 301-306, 4 figs. Economical advantages of introducing time and job analysis and its relation to low costs and the labor question.

TIN DEPOSITS

Tungsten, Association With. Tin and Tungsten Deposits: The Economic Significance of their Relative Temperatures of Formation, William R. Jones. Bul. Instn. Min. & Metallurgy, no. 186, Mar. 1920, pp. 1-27, 28 figs. partly on 9 supp. plates.

TIN MINING

Australia. The Production of Tin in Australia, J. B. Lewis. Chem. Eng. & Min. Rev., vol. 12, no. 136, Jan. 5, 1920, pp. 137-144, 4 figs. Potentialities of large low-grade deposits.

TITANIUM

Alloys, Electrical Properties. Some Electrical Properties of Titanium Alloys, M. A. Hunter and J. W. Bacon. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, no. 28, pp. 391-401, 2 figs.

TRADE UNIONS

Temperament and. Trade Unionism and Temperament, E. E. Southard. Indus. Management, vol. 59, no. 4, Apr. 1920, pp. 265-270. Suggestion is advanced that studies both by psychiatrists and psychologists will contribute much to our understanding of trade unionism which, it is believed, may be manifestation of mass psychology. Paper read before Nat. Committee for Mental Hygiene.

TRANSFORMERS

Insulation of Windings. Insulation Problems for High-Tension Transformers (Isolierprobleme an Transformatoren für hohe Spannungen), J. Müller. Elektrotechnik und Maschinenbau, vol. 37, nos. 37 and 38, Sept. 14 and 21, 1919, pp. 413-416 and 428-433, 24 figs. Notes on designs and insulation of windings for high tensions. Writer observes that every insulation problem requires careful and thorough examination, because in no other field is failure of rigid application of formulæ so complete.

TRESTLES

See Bridges, Railways, Wooden.

TUBES

Brazing. Brazing Steel Tubes and Sheets. Am. Mach., vol. 52, no. 11, Mar. 11, 1920, pp. 543-544. Results of experimental joints made with different brazing metals. Brazing metal containing 83 per cent copper and 17 per cent zinc gave stronger joints. It was also found that joints made with acetylene torch were distinctly stronger than those made in gas flame and that heat-treatment of joints brazed with acetylene gave marked increase in strength.

WELDING

Gas Torch. Modern Welding and Cutting, Ethan Viall. Am. Mach., vol. 52, no. 12, Mar. 18, 1920, pp. 603-609, 33 figs. Examples illustrating possibilities of gas torch as welding tool.

Iron Wire. Welded Line Joints Prove Their Efficiency, B. J. Schwendt. Ry. Signal Engr., vol. 13, no. 3, Mar. 1920, pp. 97-102, 13 figs. Various types of joints are illustrated and characteristics of each are discussed. Statistical data are presented in which comparative figures, based on tests made by Bureau of Standards, Washington, D. C., indicate electrical and mechanical properties of both welded and soldered galvanized iron line wire.

See also Electric Welding, Electric Welding, Arc; Oxy-Acetylene Welding; Thermit Welding.

WELFARE WORK

Co-operative Stores. The Packard Co-operative Store, D. G. Stanbrough. Indus. Management, vol. 59, no. 4, Apr. 1920, pp. 281-283. How movement for purchasing of groceries started in 1917 by 35 employes has grown so rapidly under company's auspices that yearly sales increased from $25,000 in 1917 to $175,000 in 1919.

Restaurant Plan. A Novel Employees' Restaurant Plan, F. L. Prentiss. Iron Age, vol. 105, no. 9, Feb. 26, 1920, pp. 591-592, 3 figs. Serve-self system of operating restaurant has been discarded and waste is avoided by patrons ordering one day what they will eat the next.

WIND TUNNELS

Recording Instruments. Recording Instruments for Use in Wind Tunnels, Albert A. Merrill. Aviation, vol. 8, no. 5, Apr. 1, 1920, pp. 190-191, 5 figs. Attachment to aerodynamical balance employed for experimental work at Throop College, Pasadena, Cal., for recording graphically variation of force in Tunnel.

See also Aeroplane Propellers.

WIRE

See Welding, Iron Wire.

WOOD PRESERVATION

Treating Plants. The Wood-Impregnating Plant of the Royal Swedish State Railway Administration at Pitea. (Die Holzimprägnieranstalt der Kgl schwedischen Staatseisenbahnverwaltung zu Pitea), Friedrich Moll. Zeitschrift des Vereines deutscher Ingenieure, vol. 63, no. 44, Nov. 1, 1919, pp. 1095-1096, 5 figs. Description of plant in which impregnation with fluorine salt mixtures is carried out according to process widely used in Germany. Plant was designed and constructed by a Berlin company.

Zinc Chloride, Treatment. Report of Committee on Wood Preservation. Ry. Age (Daily Edition), vol. 68, no. 11c, Mar. 18, 1920, pp. 924-928. Specification for preservative treatment of wood with zinc chloride. Recommended by Committee of Am. Ry. Eng. Assn.

ZINC

Electrolytic Production. Methods for Analytical Control of Electrolytic Zinc Production, H. F. Bradley. Chem. & Metallurgical Eng., vol. 22, no. 14, Apr. 7, 1920, pp. 651-654, 1 fig. Methods used at laboratory of Judge Mining & Smelting Co., Park City, Utah, for analysis of leach and electrolyte solutions, concentrates, calcines and leach residues, zinc-dust precipitate and anode scale from cells.

ZINC ALLOYS

Zinc-Aluminum-Copper. Zinc Alloys with Aluminum and Copper, Walter Rosenhain, John L. Haughton and Kathleen E. Bingham. Metal Industry (Lond.), vol. 16, no. 14, Apr. 2, 1920, pp. 271-279, 6 figs. Based on tensile and hardness tests and tests to determine heat treatment on mechanical properties conducted at National Physical Laboratory, Teddington, England. In alloys tested copper content was limited to 10 per cent and aluminum to 15 per cent.

ZINC METALLURGY

Electrolytic Plant. Electrolytic Zinc Plant of the Judge Mining & Smelting Co., L. W. Chapman. Chem. & Met. Eng., vol. 22, no. 12, Mar. 24, 1920, pp. 537-540, 5 figs. Plant is designed to treat concentrates obtained from sulphide ore containing zinc, lead and silver.

The Electrolytic Zinc Plant of the Judge Mining & Smelting Co., at Park City, Utah, L. S. Austin. Min. & Sci. Press, vol. 120, no. 12, Mar. 20, 1920, pp. 409-411, 2 figs.

Muffles. The Effect of Pressure in Zinc Muffles on the Extraction of the Metal (Ueber den Einfluss der in den Zinkmuffein herrschenden Spannung auf das Metallausbringen), O. Mühlhaeuser. Metall und Erz, vol. 18, no. 16, Aug. 22, 1919, pp. 363-373, 7 figs. Results of experiments are summarized and presented in tabular form. It is pointed out that imperviousness of muffles is variable and no two vessels seem to be alike. In all cases it is said to be advisable to keep the zinc furnaces at as high pressure as possible.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

In this department will be published from month to month the titles of current engineering papers, with the authors and sources, and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering. [illegible]

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print [illegible] A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together [illegible]. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

[illegible]

AIR COMPRESSORS

LUBRICATION OF. Lubrication of Air Compressors, H. V. Conrad. Boiler Maker, vol. 20, no. 4, Apr. 1920, pp. 95-97. Satisfactory lubrication of air-compressor cylinders is said to be attained by securing (1) reduction of friction to a minimum, and (2) elimination of carbonization of oil as far as possible.

AIRCRAFT CONSTRUCTION MATERIALS

TIMBER, X-RAY EXAMINATION OF. The Examination of Aircraft Timber by X-Rays, R. Knox and G. W. C. Kaye. Trans. Faraday Soc., vol. 15, part 2, Feb. 1920, pp. 60-65, 17 figs on 6 supp. plates. Method of examining aeroplane timber parts by X-rays developed by Aeronautical Inspection Department of Royal Air Force, England. It is said that no difficulty is experienced in detecting by that method concealed knots, resin pockets and grub holes, as well as excess or deficiency of glue in glued joints. It is added that in almost all instances fluorescent-screen examination suffices.

AIRSHIPS

RIGID CONSTRUCTION. Rigid Airships and Their Development, Alan Anderson. Aeronautical Jl., vol. 24, no. 112, April 1920, pp. 143-171 and discussion pp. 171-184, 20 figs. Details of construction of British types are outlined and problems of mooring, water recovery, and passenger accommodation are discussed, specially in regard to their bearing on structure and performance. Reliability of airship flying is concluded from official reports stating that during ten months of 1918 prior to armistice, proportion of days upon which airships carried out their flights was 97 per cent. a record which was obtained before the problem of mooring rigid airships has been solved.

Rigid Airship Construction, A. E. Rankin. Flight, vol. 12, no. 16, April 15, 1920, pp. 417-418, 6 figs. Type of bracing is suggested in which only five rivets are used instead of 12 rivets used in conventional type.

See also Aeroplanes, Transoceanic Service.

ALCOHOL

BY-PRODUCT OF COAL DISTILLATION. Alcohol — A New By-Product of Coal Distillation (L'alcool, nouveau sous-produit de distillation de la houille), E. de Loisy. Revue de Métallurgie, vol. 17, no. 2, Feb. 1920, pp. 56-62. Process at Skinningrove Works, England. Cold charcoal absorbs ethylene from gases and gives it off when heated.

Alcohol from By-Product Gas. Gas Age, vol. 45, no. 7, Apr. 10, 1920, pp. 294-295. It is reported that motor fuel prospects in England have been brightened by the Skinningrove experiments converting ethylene into alcohol.

MOTOR FUEL. Alcohol As Fuel—I. Automobile Engr., vol. 10, no. 137, April 1920, pp. 157-160, 5 figs. Survey of chemical and physical properties of alcohol which determine its adaptability as motor fuel.

ALLOY STEELS

COEFFICIENT OF EXPANSION. The Coefficient of Expansion of Alloy Steels, John A. Mathews. Min. & Metallurgy, no. 158, section 8, Feb. 1920, 4 pp. Measurements were effected for various alloy steels at temperature range from 25 to 100 deg. cent. Values obtained ranged from 11.37 to 12.76 parts per million per deg. cent.

See also Steel, High-Speed.

ALLOYS

ELECTRIC PRODUCTION OF. The Electrical Production of Alloys, Ralph M. Major. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper no. 33, pp. 441-447, 2 figs. Account of producing alloys in two Héroult furnaces having different electrode regulating equipment, also discussion of general conditions of electric melting as compared with any other process of producing alloys. Manufacture and properties of Nichrome. Kromore, Mangaloy, Climax and Inbar, are included.

ALUMINUM

BRITISH FOUNDRY PRACTICE. British Aluminum Foundry Practice—II. Metal Industry, (N. Y.), vol. 18, no. 5, May 1920, pp. 221-224. From booklet of British Aluminum Co., Ltd., London.

CASTINGS, HARD SPOTS IN. Investigate Hard Spots in Aluminum, Robert J. Anderson and Julian H. Capps. Foundry, vol. 48, no. 9, May 1, 1920, pp. 337-342, 23 figs. Investigations at Bur. of Mines are said to have disclosed that hard spots in aluminum-alloy sand castings are caused by metallic and non-metallic inclusions. Metallic inclusions are said to be due to admixtures of iron, and non-metallic are attributed to carelessness.

ALUMINUM ALLOYS

UNSOUND CASTINGS. Blowholes, Porosity, and Unsoundness in Aluminum-Alloy Castings, Robert J. Anderson. Dept. Interior, Bur. Mines, no. 241, 34 pp., 16 figs. It is concluded from results of experimental work ,survey of experience of various foundries and examination of current literature, that: (1) Number of blowholes present is directly proportional to pouring temperature, (2) undoundness varies with temperature to which charge is heated, the higher the temperature the more unsound being the resultant castings, and (3) unsoundness is function of length of time of melting, the longer any melt is held in furnace the more unsound being the castings, irrespective of temperature of heating and pouring temperature.

USES. Increasing Use of Alloyed Aluminum as an Engineering Material—I, G. M. Rollason. Indus. Management, vol. 59, no. 5, May 1920, pp. 387-390, 9 figs. Properties of aluminum and aluminum alloys are given, and their recent uses are pointed out, particularly in automobile industry. Paper read before New York Section, Am. Soc. M. E.

AMMONIA

SYNTHESIS OF. Direct Synthesis of Ammonia by Catalysis Under Pressure (Contribution à l'étude de la synthèse directe de l'ammoniaque par catalyse sous pression), Marcel Guichard. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 132, no. 1, Jan.-Feb. 1920, pp. 71-102, 22 figs. Over 400 catalyzers were experimentally studied. From data obtained and analytical consideration, gaseous cycle is formulated for determining best conditions of industrial synthesis of ammonia.

AMPLIFIERS

THERMIONIC INTER-VALVE RESISTANCE COUPLINGS. An Amplifier Employing Thermionic Inter-Valve Resistance Couplings, John Scott-Taggart. Elec. Rev. (Lond.), vol. 86, no. 2214, Apr. 30, 1920, pp. 549-550, 1 figs. It is proposed to use in place of ordinary conductors of high impedance a conductive path between cathode and anode. Application of arrangement to reception of wireless signals is explained.

APPRENTICES, TRAINING OF

WILLYS-OVERLAND SYSTEM. Successful Substitute for Apprenticeship. Machy. (N. Y.), vol. 26, no. 8, Apr. 1920, pp. 746-748, 3 figs. System of labor-training developed by Willys-Overland Co., Toledo, Ohio, which keeps the "improvers," as men taking course of training are called, engaged upon regular lines of production work. How system is applied.

ARMY SUPPLY BASES

PHILADELPHIA. Equipment of Army Supply Base at Philadelphia. Elec. Rev. (Chicago), vol. 76, no. 18, May 1, 1920, pp. 715-718, 8 figs. Electrical equipment of piers and warehouses to be used at loading station. Includes electrically operated cranes, electric trucks for moving traffic and electrically operated elevators.

ASPHALT

SOURCES OF. The Lake Asphalt Industry, J. Strother Miller. Chem. & Metallurgical Eng., vol. 22, no. 16 Apr. 21, 1920, pp. 749-754, 8 figs. Description of most important sources of natural asphalt, Trinidad Lake and Bermudez Lake; and refining and fluxing. Ultra-microscope is said to show presence of colloidal clay particles. Review of theory of colloidal state.

AUTOMOBILE ENGINES

CYLINDERS. Accelerating Cylinder Production. Foundry, vol. 48, no. 345, Apr. 15, 1920, pp. 311-318, 15 figs. Details of foundry of the Nash Motor Co. in Kenosha, Wis., which, it is said, produces all its own castings. Attention to minute detail and adoption of every mechanical aid to speed and accuracy have, it is claimed, increased output of automobile cylinders in this plant.

Air-Cooled Cylinders for Franklins. Am. Mach., vol. 52, no. 14, April 1, 1920, pp. 705-718, 58 figs. Method of machining engine cylinders for Franklin, Packard, Cadillac, Chandler and Peerless automobiles.

DESIGN. Modern Tendencies in Engine Design, L. H. Pomeroy. Automotive Manufacturer, vol. 62, no. 1, Apr. 1920, pp. 13-16, 1 fig. Summary of attempts made to employ other fuels than gasoline, and of studies undertaken to determine crankcase lubricant dilution by gasoline and best materials for various engine parts. (Concluded.)

PISTONS, MACHINING. Machining Automobile Engine Pistons, Ralph E. Flanders. Machy. (N. Y.), vol. 26, no. 8, Apr., 1920, pp. 710-713, 7 figs. Description of methods and tooling equipments used in quantity production of automobile engine pistons.

Methods of Making the Winton Piston, Fred H. Colvin. Am. Mach., vol. 52, no. 18, April 29, 1920, pp. 927-934, 27 figs. Practice in Winton, Franklin, White and Packard Shops.

Making 21,000 Pistons a Day, Fred H. Colvin. Am. Mach., vol. 52, no. 16, April 15, 1920, pp. 819-828, 31 figs. Practice in Ford, Cadillac and Autocar shops.

TESTING. Organization and Method in the Testing Laboratory, P. S. Tice. Automotive Industries, vol. 42, no. 19, May 6, 1920, pp. 1061-1063. System is suggested which aims at eliminating haphazard running of tests by keeping complete and adequate records. Reference is made to method employed in dynamometer laboratory of carbureter division of Stewart-Warner Speedometer Corp.

See also spark plugs.

AUTOMOBILES

BODY DESIGN. Automobile Body Design, William Brewster. Jl. Soc. Automotive Engrs., vol. 6, no. 4, April 1920, pp. 215-218, 5 figs. Such considerations are taken up as size of relative positions of seats and doors, position of extra tires, design of windshield and influence of weight upon design.

Fine Coachwork from British Shops in Lanchester. Automotive Manufacturer, vol. 62, no. 1, April 1920, pp. 10-12, 3 figs. Details of vee-fronted sedan called saloon body, on 40-hp. six-cylinder chassis.

DRIVE SHAFTS. Electrically-Heated Tubing for Automobile Drive Shafts. Automotive Manufacturer, vol. 62, no. 1, April 1920, pp. 21-23, 3 figs. Method of heat-treating developed by Snead & Co. Electric current of low voltage and high amperage is employed to heat tubing by its own internal resistance.

CHARACTERISTICS OF. Characteristics of Three-Phase Lines for Harmonics of Third Order (Constantes caractéristiques des lignes triphasées pour les harmoniques 3), R. Swyngedauw. Revue générale de l'Electricité, vol. 7, nos. 15 & 16, April 10 and April 17, 1920, pp. 483-492 and pp. 515-526, 6 figs. Formulæ for electrical characteristics of long armored cables in underground lines. Phenomena in lines not exceeding 20 or 30 km. can well be studied, it is stated, neglecting effective resistance and reactance and taking into consideration only persistance and susceptance. Experimental measurements of reactance, impedance and resistance of cables 4 to 10 km. long.

COMBINED TELEPHONE AND TELEGRAPH. Combined Telephone and Telegraph Cables: Important Trials, A. H. Roberts and W. J. Hilyer. Post Office Elec. Engrs. Jl., vol. 13, part 1, April 1920, pp. 29-48, 13 figs. Tests made on 76-pair 40-lb. balanced telephone cable in order to ascertain practicability of providing combined telephone and telegraph cables between London and Manchester. Over loop circuit 186 miles in length, speed of 150 words per minute duplex was obtained with 40 volts on differential system and 60 volts on bridge system; induction on loaded telephone pairs was less from differential than from bridge Wheatstone working. Other results are mentioned.

CAR WHEELS

CHILLED-IRON, MANUFACTURE. Manufacturing Chilled Iron Car Wheels—II and III, H. E. Diller. Foundry, vol. 48, nos. 345 and 346, April 15 and May 1, 1920, pp. 304-310, 16 figs., and pp. 353-359, 13 figs. Description of cupola practice and methods of core room. Description of molding methods.

CARS, FREIGHT

INSPECTION OF. The Inspection of Freight Equipment, L. K. Sillcox. Ry. Mech. Engr., vol. 94, no. 5, May 1920, pp. 285-288. Air brakes and foundation brake rigging; estimated braking power; defects of arch bars and trucks. Fifth article.

REPAIRING OF. Freight Car Repairs on the E. P. & S. W., A. M. Dow. Ry. Mech. Engr., vol. 94, no. 5, May 1920, pp. 281-284, 11 figs. Outline of policies followed by El Paso & Southwestern Railway.

CAST IRON

IRON CARBIDE IN. The Solubility and Stability of Iron Carbide in Cast Iron, J. A. Holden. Foundry Trade Jl. & Pattern Maker, vol. 22, no. 220, April 1920, pp. 270-271, 3 figs. Experiments are related and it is concluded from them that carbide is stable while it is in solid solution even in presence of considerable percentage of silicon.

CEMENT GUN

APPLICATIONS. Construction Work by Cement Gun Methods, Arthur J. White. Proc. Engrs. Soc. Western Pennsylvania, vol. 36, no. 2, March. 1920, pp. 109-130 and (discussion) pp. 131-144, 13 figs. Examples are presented of structures covered with gunite. Among these are rapid transit bridge, Long Island, N. Y., roof of power plant of Ford Motor Co., Detroit, and tanks of People Gas, Light & Coke Co., Chicago. Advantages of covering steel structures with gunite are enumerated.

CEMENT MANUFACTURE

KILN INSULATION. Cement and Lime Kiln Insulation, K. A. Grogan. Cement, Mill & Quarry, vol. 16, no. 8, April 20 ,1920, pp. 27-32, 16 figs. Advantages of insulating cement and lime kiln are pointed out, and curves are shown comparing amount of heat lost through kiln crown when insulated and uninsulated. Sil-O-Cel insulating brick is recommended as "highly effective for all classes of insulating service.

CENTRAL STATIONS

ELECTRIC-FURNACE LOADS. Electric Furnace Power from the Standpoint of the Central Station, E. A. Wilcox. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper no. 38, pp. 589-609, 2 figs. Questions relative to operation of electric furnaces from central power station are discussed, such as comparison with other kinds of power station loads, methods of charging for power, offpeak service (particularly to steel castings plants), continuous vs. intermittent service, power rate schedules and different systems of furnaces and their demands on power supply.

The Electric-Arc Melting Furnace and the Central Station Electric Company, Augustus C. Smith. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper no. 43, pp. 701-709, 7 figs. Effect electric-arc melting furnace has on power supply, particularly surges on line because of careless handling of furnace during melting-down period. Experience is quoted of abnormal requirements of number of furnaces and it is pointed out how economical operation may be effected by careful working.

LARGE, INDUSTRIAL NEED OF. Urgent Need of Super-Power Developments, C. F. Lacombe. Elec. World, vol. 75, no. 20, May 15, 1920, pp. 1128-1131, 1 fig. It is said that increased industrial production and shortage of power over large manufacturing districts call for immediate development of great power projects and elimination of small steam plants.

CHUCKS

MAGNETIC. The Magnetic Chuck, Its Design and Varied Uses, J. H. Moore. Can. Machy., vol. 23, nos. 16 & 17, April 15 and 22, 1920, pp. 369-372, 10 figs., and pp. 394-399, 12 figs. Fundamental principles of design, together with varied uses of magnetic chuck are discussed.

CIRCUIT BREAKERS

AUTOMATIC. Automatic Circuit-Breakers (Dispositifs automatiques de sectionnement des lignes électriques), P. Charpentier. Revue générale de l'Électricité, vol. 7, no. 15, Apr. 10, 1920, pp. 493-497, 16 figs. Oil three-pole circuit breaker built by Maljournal and Bourron Electric Works.

CITY PLANNING

See Terminals, Railway, Relation to City Plan.

COAL

SPONTANEOUS IGNITION. A Method of Determining the Relative Temperatures of Spontaneous Ignition of Solid Fuels, F. S. Sinnatt and Burrows Moore. Jl. Soc. Chem. Industry, vol. 39, no. 6, March 31, 1920, pp. 72T-78T, 8 figs. Experiments planned (1) to determine relative tendencies to spontaneous ignition in oxygen of certain finely powdered fuels; (2) to examine influence of degree of fineness of particles on temperature recorded; and (3) to examine influence of volatile matter upon temperature recorded. Apparatus consisted of heavy cast-iron vessel in which enclosed nickel crucible could be raised to any desired temperature.

COAL BREAKERS

PENNSYLVANIA. Price-Pancoast Breaker Relies on Gravity to Do Much of the Work, Dever C. Ashmead. Coal Age, vol. 17, no. 18, April 29, 1920, pp. 841-844, 5 figs. Installation of coal company in—Pennsylvania where only two conveyors are installed, one for handling condemned coal and one for handling rock. Coal is conveyed by gravity.

COAL HANDLING

CAR-DUMP COAL PIER. Design and Operation of Modern Car-Dump Coal Pier. Eng. News-Rec., vol. 84, no. 16, April 15, 1920, pp. 759-762, 8 figs. Coal pier of C. R. R. of N. J., at Jersey City terminal, built to handle 400 cars per day, and equipped with two independently operated cardumpers. Reinforced-concrete girder trestles, it is stated, have proved more economical than steel.

LOADING MACHINE. Coal Loader Based on a New Principle. Coal Age, vol. 17, no. 19, May 6, 1920, pp. 900-902, 3 figs. Joy loading machine. Machine is electrically driven and is 29½ ft. long, 5 ft. wide and 5 ft. high. Gathering mechanism consists of pair of gear fingers, the initial movement of which is forward into coal, after which there is raking motion across coal face, then rearward movement toward loading conveyor, then return to starting position.

COAL MINES

EXHAUST-STEAM UTILIZATION IN. Cutting Power Costs at an Anthracite Mine by Utilizing Exhaust Steam, Dever C. Ashmead. Coal Age, vol. 17, no. 20, May 13, 1920, pp. 983-986, 7 figs. Experience of Price-Pancoast Coal Co., Scranton, Pennsylvania, with low-pressure turbines utilizing exhaust steam from several engines.

MANAGEMENT METHODS. Management Methods That Will Secure Results in Mine Construction, Charles Gottschalk. Coal Age, vol. 17, no. 20, May 13, 1920, pp. 987-989. Organization required for simultaneously carrying on various operations involved in constructing surface layout and in developing underground nucleus for coal mine of large capacity.

COAL MINING

COAL-CUTTING EQUIPMENT. Approved Explosion-Proof Coal-Cutting Equipment, L. C. Ilsey and E. J. Gleim. Dept. Interior, Bur. Mines, bulletin 78, 1920, 53 pp., 35 figs. Gives Bureau's schedule and shows its application to testing of commercial apparatus. Describes electrical apparatus that has been tested and approved under this schedule and also tests on which approvals were based.

ELECTRIC POWER IN. Using Electric Power for Mining Coal. Black Diamond, vol. 64, no. 17, April 24, 1920 pp. 462-465, 7 figs. Details of Kentucky and West Virginia Power Company's plant which supplies power to practically all the coal mines in Logan district and to most of those in Mingo County, West Virginia and Pike and Perry Counties, Kentucky.

SHAFT LAYOUT. Mine Layout Arranged for Large Tonnage and Minimum Handling Cost, James R. Elliott. Coal Age, vol. 17, no. 20, May 13, 1920, pp. 978-979, 3 figs. Shaft layout at Mather Collieries, Greene County, Pennsylvania.

COAL STORAGE

ECONOMY AND ADVANTAGES Storage of Coal—An Engineers' Problem. Indus. Management, vol. 59, no. 5, May 1920, pp. 399-408, 3 figs. Symposium by prominent engineers. Economy of coal storage, its use for stabilizing coal industry, and its advantages to the mining industry, are discussed.

DAMS

[illegible]

HYDRAULIC FILL. Hydraulic Fill Dams for Miami Conservancy District. Public Works, vol. 48, no. 17, May 8, 1920, pp. 301-394, 2 figs. Method of constructing earth dams with core embankments built up between side slopes enclosed by parallel levees, all made of materials excavated by dragline machines, hauled in dump cars, pumped to site and deposited by hydraulic operations.

MOVABLE-CREST. Design and Operation of Movable Crest Dams, Wm. G. Fargo. Mun. & County Eng., vol. 58, no. 4, April 1920, pp. 157-159, 8 figs. Gates and movable weirs are classified and various means for operating gates are illustrated.

WANAQUE, NEW JERSEY. The Wanaque Dam. Public Works, vol. 48, no. 14, Apr. 17, 1920, pp. 324-330, 4 figs. North New Jersey water supply is to be provided by impounding run-off from a 94-sq.mi. water shed in a reservoir of eleven billion gallons capacity, to be built in 3½ years. Details of special construction features involved by the requirements of the rigid specifications for imperviousness of embankment and concrete; extreme depth of core-wall trench, and maintenance during first year of construction operations of continuous flow in this river and water supply to large paper mill that will remain located and operating near center of dam site for months while construction is in progress around it.

DIESEL ENGINES

SKANDIA MARINE. First Large Marine Diesel Engines Complete on Pacific Coast, Frederik Van Rossen Hoogendyk. Pacific Marine Rev., vol. 17, no. 4, Apr., 1920, pp. 107-111, 5 figs. Description of 1100-i.p.h. Diesel engines building at Skandia Pacific Oil Engine Co. under license of Dutch Werkspoor Co. for U. S. Shipping Board Emergency Fleet Corporation. Engines are 4-cycle, single-acting marine crosshead type, 20½-in. bore, 35½-in. stroke and 135 r.p.m.; built-up crankshaft is 12½ in. in diameter.

DITCHES

See Drainage.

DRAINAGE

DITCHES, MAINTENANCE OF. Studies of Maintenance Work on Drainage Ditches, H. M. Lynde. Eng. News-Rec., vol. 84, no. 15, April 8, 1920, pp. 713-715, 2 figs. It is concluded from experiments conducted by Bur. Public Roads that channels of drainage ditches need to be cleaned annually to insure proper flow capacity and sanitary conditions, but that banks need to be cleared only at intervals of from 3 to 5 years.

UNDERGROUND SYSTEMS. The Spacing and Depth of Laterals in Iowa Underdrainage Systems and the Rate of Run off from Them with Data from Investigations, W. J. Schlick. Official Publication Iowa State College of Agriculture & Mechanic Arts, vol. 17, no. 20, Oct. 16, 1918, 119 pp. 70 figs. Investigation undertaken to collect information as to operation of typical and special underdrainage systems with a view to suggesting improvements in underdrainage systems in use.

DRAWING

PNEUMATIC DIE CUSHIONS. Pneumatic Cushions in Metal-Drawing Operations, John Nelson. Machy. (N. Y.), vol. 26, no. 8, Apr., 1920, pp. 726-729, 5 figs. Description of various types of pneumatic die cushions used in connection with punch presses, and methods of installing.

DRILLING

CRADLE FORGINGS. Unusual Methods of Securing Extreme Accuracy—II, A. L. DeLeeuw. Am. Mach., vol. 52, no. 18, April 29, 1920, pp. 937-941, 16 figs. Operations of drilling and boring two main holes in cradle forging are taken up in detail. Methods used, types of tools and working limits are discussed.

DROP FORGING

MINNESOTA PLANT. New Drop Forge Shop Built in Northwest. Am. Drop Forger, vol. 6, no. 4, April 1920, pp. 170-174, 7 figs. Attention is called to arrangement which permits of production to travel one way by electric motors, trucks and cranes.

DRYDOCKS

PHILADELPHIA NAVY YARD. Soft Ground Complicates Dry-Dock Construction, Charles A. Lee. Eng. News-Rec., vol. 84, no. 16, April 15, 1920, pp. 748-752. 7 figs. Account of changes made necessary in construction of graving dock being built at Philadelphia Navy Yard by appearances of water-bearing strata which were not indicated in preliminary borings.

DYESTUFFS

PROPERTIES OF. Chemical and Physical Properties of Dye-Stuffs, J. Traube and F. Koehler. Sci. Am. Monthly, vol. 1, no. 5, May 1920, pp. 408-411. Experimental study of diffusion of acid and basic dyes in gelatin substances. Translated from Internationale Zeitschrift fuer Physikalish-Chemische Biologie.

ELECTRIC CIRCUITS

PROTECTION OF. Switching and Protection of Transmission Circuits, S. Q. Hayes. Elec. Jl., vol. 17, no. 5, May 1920, pp. 178-188, 29 figs. Deals principally with oil circuit breakers, relay equipment, lightning arresters, station layouts and system arrangement. A few high-voltage transformers used on some of larger systems are described. (To be continued.)

ELECTRIC DRIVE

See Paper Mills.

ELECTRIC FURNACES

AJAX-NORTHRUP. The Ajax-Northrup Electric Furnace, Dudley Willcox. Metal Industry (N. Y.), vol. 18, no. 5, May 1920, pp. 213-216, 7 figs. It is said that there is no necessity in this type for interlinkage of magnetic circuit with electric circuit.

CARBON ELECTRODES, MANUFACTURE OF. Manufacture of Carbon Electrodes for Electric Furnace Purposes, Walter L. Morrison. Chem. & Metallurgical Eng., vol. 22, no. 16, Apr. 21, 1920, pp. 741-744. Description of raw materials used and their preparation, calcining furnaces and plant operation in the "rammed process" of manufacturing electrodes for electric furnace purposes, with an outline of practical deductions obtained from experimental data.

INDUCTION. Induction Furnaces and Their Application in Iron and Steel Industries (Les fours à induction et leur application dans l'industrie du fer et de l'acier). Houille Blanche, vol. 19, no. 37-38, Jan.-Feb. 1920, pp. 12-16, 16 figs. Electrical and structural details of following types: Colby, Kjellin, Hjorth, Ferranti, Frick, Schneider, Gin, and Röchling-Rodenhauser. (To be continued.)

METALLURGICAL USES. The Electric Furnace as Applied to Metallurgy, Clarence Jay West. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper no. 35, pp. 461-552. List of magazine references on construction and operation of electric furnace as applied to metallurgy of iron and steel and non-ferrous metals.

The position of the Electric Furnace in Iron and Steel Metallurgy. Lewis B. Lindemuth. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper no. 39, pp. 611-627. Comparison is made between physical and chemical characteristics and phenomena of four steel-making processes, namely, bessemer, open-hearth, crucible and electric furnace. Undue praise and claims for electric furnace method and process is deprecated, but it is claimed that when properly installed and operated it is metallurgically the best and economically the cheapest.

OPERATING COSTS. Electric Melting in an Oil Furnace, William J. Reardon. Metal Industry (N. Y.), vol. 18, no. 5, May 1920, pp. 207-212, 4 figs. Comparative cost data of electric, Schwartz and coke pit furnaces are included.

RESISTOR TYPE. High Temperature Electric Heat-Treating Furnace, Geo. H. Holden. Sci. Am. Monthly, vol. 1, no. 5, May 1920, pp. 440-444, 11 figs. Electric furnaces of resistor type built with approval of Navy Department to fill out their contract requiring delivery of 5,000,000 of 3-in. and 4-in. gun forgings.

TRANSFORMERS FOR. Interlacing Furnace Transformer Busbars, C. B. Gibson, Elec. World, vol. 75, no. 18, May 1, 1920, pp. 991-993, 4 figs. Scheme for interlacing bus bars for three-phase transformer.

See also Alloys, Electric Production of; Steel, High-speed, Electric Furnace Manufacture.

ELECTRIC GENERATORS

See Electrical Machinery, Brushes; Design.

ELECTRIC LOCOMOTIVES

BROWN, BOVERI & CO. The Single-Phase Locomotives of the Gothard Railway, Switzerland, Built by Brown, Boveri & Co. (Les locomotives électriques du Chemin de fer du Gothard (Suisse). Locomotives omnophasées de la Société Brown, Boveri et Cie). Génie Civil, vol. 76, no. 11, Mar. 13, 1920, pp. 265-268, 8 figs., partly on supp. plate. Locomotives operate at 15,000 volts, under frequency of 16⅔ periods, and have four motors, each of 550 hp.

CHICAGO, MILWAUKEE & ST. PAUL. New Electric Locomotives for the C. M. & St. P. Ry. Mech. Engr., vol. 94, no. 5, May 1920, pp. 259-264, 9 figs. Comparative study of two types recently designed for passenger service, one of 3,380 hp. built by General Electric Co., and the other of 4,200 hp. built by Westinghouse Electric & Manufacturing Co.

CRITICAL SPEED. The Critical Speed of the Lötschberg Locomotive, Type 1 E 1, Analytically and Graphically Computed (Die kritische Geschwindigkeit der Lötschberg-Lokomotive, Typ 1 E 1, analytisch und graphisch berechnet), Karl E. Müller. Schweizerische Bauzeitung, vol. 75, no. 10, Mar. 6, 1920, pp. 107-110, 5 figs. Calculation said to prove that theory of the shaking vibration of driving gear is now developed to point where it can be practically applied. Reference is made to investigations and calculating methods of Couwenhoven.

ELECTRIC MEASURING INSTRUMENTS

CALIBRATION OF. New Current Balance for Calibration Work, Otto A. Knopp. Elec. World, vol. 75, no. 18, May 1, 1920, pp. 993-996, 6 figs. Testing device developed by writer and used in electrical laboratory of Pacific Gas & Electric Co. in routine calibration of ammeters and watt-meters.

ELECTRIC MOTORS

RATING. The Ffty Degree Rise Method of Motor Rating, J. M. Hipple. Elec. Jl., vol. 17, no. 5, May, 1920, pp. 203-205. Argument is presented for establishing 50 deg. rise as standard for semi-enclosed general-purpose motors and for open and semi-enclosed short-time rated motors.

ENAMELLING

[illegible]

COMPENSATION OF. Compensation for Engineers, O. C. Merrill. Professional Engr., vol. 5, no. 5, May 1920, pp. 14-15. Remark of Prof. Irving Fisher before governors and mayors assembled at White House March 3-5, 1919, that the nation is "on a permanently higher price level," is quoted and it is urged that salary scales be revised along sound principles and "in full recognition of present-day conditions." Activities of Engineering Council in the study of situation in this respect of engineers in federal, state and municipal service, are related.

EDUCATION OF. Some Forces in Engineering Education, Homer A. Watt. Eng. News-Rec., vol. 84, no. 16, April 15, 1920, pp. 771-773. It is emphasized that "engineer cannot play his part by the side of educated professional men without a broader training in history, English and the social sciences," and it is therefore stated that "the engineering college which neglects the cultural elements in its curriculum will find itself in a few years, only an industrial school."

INDUSTRIAL RELATIONS. Industrial Relations of Engineers, H. H. Higbie. Michigan Technic, vol. 33, no. 1, March 1920, pp. 23-28. Because the engineer "is usually the connecting link between capital and labor," and because he "has the trained intelligence and innate respect for verities which are essential to correct and lasting solution of the difficult relation of capital and labor," it is concluded that it is distinctly his duty to formulate a solution of social problems "which shall conform just as closely to psychological and normal laws as his usual plans and specifications conform to physical laws."

EXPORT TRADE

PACKING FOR. Packing for Domestic and Export Shipping—II, Harry N. Knowlton. Am. Mach., vol. 52, no. 16, April 15, 1920, pp. 829-832, 3 figs. Types of packages and methods of handling. Definitions and descriptions of different forms of packages used in shipping goods are given, and method of handling and possibilities of damage to improperly packed commodities are taken up.

FACTORY MANAGEMENT

See Industrial Management.

FANS

See Gas Works, Water-Gas Plant.

FATIGUE

PREVENTION OF. Prevention of Fatigue in Industry—V, Reynold A. Spaeth. Indus. Management, vol. 59, no. 5, May 1920, pp. 409-411, 1 fig. Limitations of methods of scientific management are discussed. Claim is made that loyalty and fairness will get results in production without knowledge or use of elementary times. It is suggested that time-study methods should be standardized by a committee of representative industrialists.

FERROCHROME

See Ferrosilicon, Electric-Furnace Manufacture.

FERROSILICON

ELECTRIC-FURNACE, MANUFACTURE. Builds Electric Ferroalloy Plant. Iron Trade Rev., vol. 66, no. 10, Mar. 4, 1920, pp. 706-707, 4 figs. Plant of United States Ferro Alloys Corp., Niagara Falls, N. Y. Principal products are ferrosilicon and ferrochrome.

PROPERTIES OF. Properties of Ferrosilicon, F. A. Raven. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper no. 37, pp. 577-588, 7 figs. Various grades of commercial ferrosilicon are described and their metallography and physical properties discussed. Their production by reduction by carbon in blast furnace is described and also their production in electric furnace. Writer declares that furnaces with high-frequency current (60 cycles), will work just as efficiently and satisfactorily as low-frequency furnaces (25 cycles), if properly designed and operated.

FERROVANADIUM

METALLURGY OF. Development of Ferro-Vanadium Metallurgy, B. D. Saklatwalla. Gen. Meeting Am. Electro-chemical Soc., Apr. 8-10, 1920, paper no. 42, pp. 689-700. General review is given of occurrence of vanadium in nature, its discovery and its restricted utilization as rare and expensive element. Details are included of its modern introduction into large scale metallurgical practice in armor plate and special steels, and of reduction of its compounds to metal by silicon in electric furnace. Alumino-thermic reduction as practiced on a large scale in the United States is explained.

FILES

MICROSCOPIC STRUCTURE. The Microscopic Structure of Files and Chip-Forming Tools in General (Mikroskopische Struktur der Feile und spanbidende Werkzeuge im allgemeinen), W. Scheffer. Zeitschrift für Dampfkessel u. Maschinenbetrieb, vol. 42, no. 51, Dec. 19, 1919, pp. 393-394, 9 figs. Photomicrographs.

FIRE HOSE

ACTION OF WATER UPON. The Action of Water Upon Hose Linings and the Acid Corrosion of Jackets and Couplings, L. B. Buchanan. Nat. Fire Protection Assn., vol. 13, no. 3, Jan. 1920, pp. 263-268. Tests are said to have demonstrated that practically all hose is liable to generate sulphuric acid if left wet inside for any considerable length of time in a warm room, weak acid so generated being capable of concentration to a strength sufficient to destroy fabric and corrode couplings.

FIRE PROTECTION

SPRINKLERS. Unsatisfactory or Serious Fires in Buildings Equipped with Sprinklers. Nat. Fire Protection Assn., vol. 13, no. 3, Jan. 1920, pp. 293-299. Examples are quoted of fires in buildings equipped with sprinklers and reasons are indicated why sprinklers failed to operate satisfactorily.

FLIGHT

HIGH-ALTIDUDE. Flying at Very High Altitudes (La vie et les voyages aux très hautes altitudes), Docteur Guglielmineti. Génie Civil, vol. 76, no. 12, Mar. 20, 1920, pp. 288-292, 7 figs. Physiological effects of altitudes greater than 12,000 meters (39,360 ft.). It is at such altitudes, it is said, that aerial routes for transoceanic service will have to be established in order to attain maximum practicable speed. Structural details of enclosed cabin for maintaining constant air pressure are given.

RECTILINEAR. The Rectilinear Flight of Aeroplanes. A. Rateau. Mech. Eng., vol. 42, no. 5, May 1920, pp. 268-269 and 316, 1 fig. Principles of analytical theory of rectilinear flight of aeroplanes are formulated. Graph is constructed indicating variation of fuel and oil consumption per distance of flight with variation in distance of plane from its ceiling during flight.

SOARING FLIGHT. Soaring in Horizontal Wind of Invariable Speed and Direction (Le vol à voile par vent horizontal de vitesse et de direction invariables), Jean Viley et A. Volmerange. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 14, Apr. 6, 1920, pp. 838-841, 1 fig. Study of forces acting on bird.

FLOOD PREVENTION

WATER FLOW THROUGH CONTRACTED CHANNEL. Experiments on the Flow of Water Through Contractions in an Open Channel, F. W. Lane. Proc. Am. Soc. Civil Engrs., vol. 45, nos. 8-9-10, Oct.-Nov.-Dec., 1919, pp. 717-774, 20 figs. Studies for design of flood prevention works of Miami Conservancy District. Measurements were made of flow through (1) contraction with rounded edges, (2) sharp-edged contraction, (3) short flume with rounded entrance, (4) short flume with sharp corner entrance, and (5) expanding or venturi flume.

FOREMAN

PLACE IN INDUSTRIAL MANAGEMENT. The Foreman, Sanford E. Thompson. Bul. Taylor Soc., vol. 5, no. 1, Feb. 1920, pp. 43-46 and (discussion) pp. 46-48. Scientific management, it is observed, has given a definite place to foreman in industry and has clearly outlined his position with reference to the workman.

FOUNDATIONS

TESTING SUBSOIL. Foundations, Their Selection, Design and Construction. Am. Architect, vol. 117, no. 2314, April 28, 1920, pp. 533-536, 4 figs. Design of platform is suggested for testing soil bearing.

FREIGHT HANDLING

ENGLAND. Freight Handling in England as Applied to Our Home Problem, F. T. Chambers. Pacific Marine Rev., vol. 17, no. 4, Apr. 1920, pp. 53-56 and 104-106, 7 figs. Address delivered before Material Handling Mach. Manufacturers' Assn., with illustrations from author's report published by U. S. Shipping Board.

FUELS

COLLOIDAL. Colloidal Fuel and Its Use—II, Lindon W. Bates. Chem. Engr., vol. 28, no. 4, April 1920, pp. 125-127. Nature of colloidal fuel, its development during war, results by tests, with review of present and future general industrial possibilities.

RESEARCH, BRITISH. Report of the Fuel Research Board for the Years 1918, 1919. Dept. Sci. Indus. Research, Lond., 1920, 57 pp., 5 figs. Account of survey of coals of Great Britain in particular as to suitability of different types of known origin for conversion into gases, fuel oils and coke, and also account of work undertaken with a view to obtaining thermal and economic data in connection with use of peat as fuel. Use of pulverized fuel in operations of various kinds is taken up and records are given of effects of purely meteorological conditions on natural draft of a chimney.

See also Peat; Pulverized Coal.

FURNACES, BOILER

BAGASSE. Bagasse Furnaces, A. G. Budge. Int. Sugar Jl., vol. 22, no. 256, Apr. 1920, pp. 211-214, 4 figs. Types used in factories in Hawaii.

FRANCE. Navigation and Harnessing of the Rhine (Le Rhin aux points de vue de la navigation et des forces hydrauliques), B. Seitre. Vie Technique & Industrielle, vol. 1, no. 6, Mar. 1920, pp. 457-462, 4 figs. Hydroelectric installation projected near Mulhouse. (Concluded.)

INDUCTION COILS

RESONANCE. Electric Resonance in a Coil with an Iron Core (Résonnance électrique dans un cricuit dont la self-induction contient du fer), P. Boucherot. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 12, March 22, 1920, pp. 725-728, 2 figs. Formula for determining excess voltage resulting from grounding conductor in long cable.

REMOTELY CONTROLLED. Remotely Controlled Hydroelectric Synchronous Generators, Charles H. Tallant. Jl. Electricity, vol. 44, no. 9, May 1, 1920, pp. 432-433, 3 figs. Automatic installation at Ontario Cal., by Ontario power Co. Equipment consists of one single Pelton impulse turbine, overhung from Westinghouse 500-kva., 50-cycle generator. Plant is controlled with double-throw switch from another plant situated three and one-half miles down canyon.

SWITZERLAND. The Water-Power Plant "Gosgen" on the Aare River (Die Wasserkraftanlage "Gosgen" an der Aare der A. G. Electrizitätswerk Olten-Aarburg). Schweizerische Bauzeitung, vol. 75, nos. 9 and 10, Feb. 28 and Mar. 6, 1920, pp. 93-96 and 110-113, 24 figs. Description and illustrations of the headwater canal, entire length of which is 4.80 km., construction involving approximately excavation of 1,100,000 cu. m. of earth and 250,000 cu. m. of rock. (Continuation of serial.)

INDICATORS

STEAM-ENGINE. High-Speed Indicators, Thomas Midgley, Jr. Jl. Soc. Automotive Engrs., vol. 6, no. 4, April 1920, pp. 254-257, 11 figs. Classification and description of various types of steam-engine indicators, particularly type developed at Bur. of Standards.

INDUSTRIAL MANAGEMENT

ANALYSIS OF SHOP METHODS. Improving Shop Methods by Analysis—II, L. V. Estes. Indus. Management, vol. 59, no. 5, May 1920, pp. 367-371. It is shown how analysis provides facts upon which shop man can base improvement of his methods.

PURCHASING DATA, RECORDING. Economic Value of Good Buying, Wilfrid G. Astle. Elec. Traction, vol. 16, no. 5, May 1920, pp. 324-326. Emphasizes economy of introducting efficient system of keeping all buying data.

RECORDS, FILING OF. Purchasing Department Records, G. W. Greenwood. Indus. Management, vol. 59, no. 5, May 1920, pp. 383-386, 4 figs. Method is suggested for filing filled purchase orders so that any particular item can be readily located with no other information than name of part in question.

SHIPYARDS. Industrial Engineering Applied to Shipyard Management, Norman Howard. Indus. Management, vol. 59, no. 5, May 1920, pp. 372-376, 4 figs. Work done by Indsutrial Management Section of Emergency Fleet Corporation. (To be continued.)

STORES SYSTEM. Modern Stores System Proves Successful in Strip Mill, H. R. Simonds. Iron Trade Rev., vol. 66, no. 17, Apr. 22, 1920, pp. 1197-1202, 10 figs. Record forms used in stores system of Am. Tube & Stamping Co., Bridgeport, Conn.

See also Coal Mines, Management Methods; Foremen; Foundries, Organization of; Production; Time Study.

INDUSTRIAL RELATIONS

See Engineers, Industrial Relations.

INSULATION

See Walls, Heat Insulation of.

INSULATORS, HEAT

THICKNESS REQUIRED. Heat Insulation. Power Plant Eng., vol. 24, no. 10, May 15, 1920, pp. 514-516, 1 fig. Diagram for finding correct thickness of various insulating materials.

INTERCHANGEABLE MANUFACTURE

EQUIPMENT FOR. Equipment for Interchangeable Manufacturing, Earle Buckingham. Machy. (N. Y.), vol. 26, nos. 8 and 9, Apr. and May 1920, pp. 754-760 and 828-833, 32 figs. Discussion of principles to be considered in selection of machine tools and in designing jigs, fixtures and cutting tools for interchangeable manufacture. Description of jigs used in machining an automobile transmission case, and other examples.

INTERNAL-COMBUSTION ENGINES

LUBRICANTS FOR. Tests of Lubricants for the Internal Combustion Engine, Fred C. Ziesenheim. Automotive Industries, vol. 42, no. 17, April 22, 1920, pp. 960-962, 1 fig. Outline of method of testing engine with different kinds of oil and manner of determining which is best suited for particular conditions under which engine is intended to operate.

TESTING PLANT. A modern Testing Station. Automobile Engr., vol. 10, no. 137, April 1920, pp. 134-138, 14 figs. Research works of Messrs. Ricardo & Co., Engineers, Ltd., England, for internal-combustion engine investigations.

See also Diesel Engines; Gas Engines; Gasoline Engines; Kerosene Engines; Marine Engines; Heavy Oil.

IRRIGATION

PACIFIC NORTHWEST. The Duty of Water in the Pacific Northwest, J. C. Stevens. Proc. Am. Soc. Civil Engrs., vol. 46, no. 3, Mar. 1920, pp. 461-480, 1 fig. By duty of water is meant average percentage of soil mixture that should be maintained for particular soil and crops. Quantity of irrigation water that, with precipitation and unavoidable losses, will maintain required amount of soil mointure in Pacific Northwest region of United States, is investigated.

LABOR

GREAT BRITAIN. The Course of Labor and the Workers' Tendency in Great Britain, Clarence H. Northcott. Automotive Industries, vol. 42, no. 17, April 22, 1920, pp. 970-973. Attitude of labor in regard to increased production. It is said that in spite of placards and notices emphasizing the necessity for increased production in country, "labor is little interested" and "they do not see either the use or necessity of continued toil."

LATHES

DOUBLE-END CENTRE-DRIVE. Greenlee Double-End Centre-Drive Lathe, J. V. Hunter. Am. Mach., vol. 52, no. 16, April 15, 1920, pp. 815-817, 4 figs. Lathe developed by Greenlee Bros. Co., Rockford, Ill., for turning both ends of automobile axle at the same time, and now being applied to bar and shaft work requiring turning only on ends.

TURRET. Turret Lathe Practice. Machy. (Lond.), vol. 16, no. 394, April 15, 1920, pp. 29-35, 16 figs. Methods employed in machining large gas-engine pistons at works of Alfred Herbert, Ltd., England.

LIGHTING

INDUSTRIAL, COST OF. Notes on Industrial Lighting, Otis L. Johnson. Elec. Jl., vol. 17, no. 5, May 1920, pp. 198-201, 9 figs. Cost of efficient industrial lighting is investigated and it is found that good illumination can be installed and operated for less than 1 per cent of average workman's wages.

STREET. Ornamental Street Lighting, L. A. S. Wood. Elec. Jl., vol. 17, no. 5, May 1920, pp. 195-197, 10 figs. Various designs of posts and lanterns are illustrated.

LOCOMOTIVES

BRITISH. British Locomotive Practice: 1914-1919, J. F. Gairns. Bul. Int. Ry. Assn., vol. 2, nos. 1-2-3, Jan.-Feb.-March 1920, pp. 3-16, 6 figs. In regard to cylinder arrangement, reference is made to experiments with uniflow cylinders, which were followed construction of three-cylinder 4-4-2 express locomotive on this principle. Construction of two 4-6-0 four-cylinder locomotives is also reported.

EFFICIENCY, INCREASING. Increasing Locomotive Efficiency and Capacity, B. B. Milner. Ry. Mech. Engr., vol. 94, no. 5, May 1920, pp. 265-268, 5 figs. Improvements suggested include feedwater heating, trailer booster, lighter rods and cut-off regulation. Paper read before New Railroad Club.

Increasing Locomotive Operating Efficiency, R. S. Mounce. Ry. Age, vol. 68, no. 16, Apr. 16, 1920, pp. 1191-1196, 5 figs. Notes on adapting design to service conditions, modernizing, reassigning and accurate train loading.

ELECTRIC. *See Electric Locomotives.*

ENGLISH SUPERHEATER. New Locomotives for the Great Central Railway. Ry. Gaz., vol. 32, no. 15, April 9, 1920, pp. 556-557, 3 figs. Express locomotives of 4-4-0 type. Particulars are: Cylinders, 28-in. diameter by 26-in. stroke; working pressure, 180 lb. per square inch; heating surface, total, 1752 sq. ft.; superheater, inside, 20 sq. ft.

FEEDWATER HEATING. Locomotive Feedwater Heating, Thomas C. McBride. Mech. Eng., 42, no. 5, May 1920, pp. 283-286 and 316, 5 figs. Pump and open type heater manufactured by Worthington Pump and Machinery Corp. are described and results of tests of their operation are presented.

FRENCH. The Evolution of the High-Speed Locomotive in France, Between 1878 and 1914, and the influence of Alsatian Practice, A. Herdner. Bul. Int. Ry. Assn., vol. 2, nos. 1-2-3, Jan.-Feb.-March, 1920, pp. 17-44, 13 figs. Attention is especially directed to development of Mallet compound type, first constructed in 1878 and introduced into many other countries since that time. Comparative economies of various types of locomotives equipped with turbo heaters are discussed.

LOGGING INDUSTRY

See Electric Railways, Logging Indsutry, Use in.

LUBRICATING OILS

CASTOR OIL, MANUFACTURE OF. Operation of the Gainesville Castor Oil Plant, J. H. Shrader and A. C. Goetz. Chem. & Metallurgical Eng., vol. 22, no. 18. May 5, 1920, pp. 833-838, 5 figs. Details of installation and solvent extraction process of obtaining high recovery of oil from castor beans.

MOTOR-TRUCK TRANSPORTATION

ECONOMIC STATUS OF TRUCKS. The Economic Place of the Motor Truck in the Nation's Transportation. Automotive Industries, vol. 42, no. 20, May 13, 1920, pp. 1122-1123. Survey of uses to which motor trucks have been put and visualization of their future expansion.

MOTOR TRUCKS

PNEUMATIC VS. SOLID TIRES. Relation of Solid and Pneumatic Tires to Motor-Truck Efficiency, S. V. Norton. Jl. Soc. Automotive Engrs., vol. 6, no. 4, April 1920, pp. 208-214. Factors considered are those involved in engineering design and those resulting from practical limitations by reason of requirements of service. Opinion is expressed that in spite of present progress, question of using pneumatic tires on trucks should not overshadow study of other means than tires to develop cushion effects.

SPECIFICATIONS. Motor Truck Specifications. Power Wagon, vol. 24, no. 186, May 1920, pp. 4566. Major specifications of internal-combustion and electric trucks grouped according to load rating and arranged alphabetically according to brand name.

USE IN RAILWAY TERMINALS. Removable Truck Bodies Save Labor, B. F. Fitch. Iron Trade Rev., vol. 66, no. 13, Mar. 25, 1920, pp. 924-925, 3 figs. Experience at Cincinnati Terminal of Big Four railroad.

See also Terminals, Marine, Tractors and Trailers.

MOTORSHIPS

CONVERTED SCHOONER. New Uses for Old Sailing Vessels. Int. Mar. Eng., vol. 25, no. 5, May 1920, pp. 393-394, 1 fig. Former British-built schooner Katherine converted into motor vegetable-oil tanker for American company.

NATURAL GAS

EFFICIENCY IN COOKING. Efficiency of Natural Gas Used in Domestic Service Robert F. Earhart. Mech, Eng., vol. 42, no. 5, May 1920, pp. 287-288 and 316, 4 figs. Results of tests on commercial burners under kitchen conditions, showing effect of gas pressure and distance between burner and vessel on the efficiency.

OIL

FRACTIONATION. Constant-Temperature Still Head for Light-Oil Fractionation, Frederick M. Washburn. Dept. Commerce, Technologic Papers, Bur. Standards, no. 140, Oct. 18, 1919, 12 pp., 4 figs. Types of methods generally in use for fractionation of light oil and determination of benzene, toluene and solvent naphtha are discussed and improvement is suggested of depthlegmator of Wilson and Roberts still.

See also Petroleum.

OIL FIELDS

ALSACE. The Oil Fields of Alsace (Les gisements de pétrole d'Alsace), Paul de Chambrier. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 132, no. 1, Jan.-Feb. 1920, pp. 45-70, 9 figs. Mining and refining operations.

NORTHWEST GERMANY AND ROUMANIA. The Petroleum Fields of Roumania Compared with Those of Northwest Germany (Die Erdöllagerstätten in Runänien verglichen mit denen in Nordwestdeutschland), G. Guüich. Petroleum, vol. 14, no. 13, Apr. 1, 1919, pp. 597-601, 5 figs. Writer points out dissimilar features of the German and Roumanian oil field, but claims, nevertheless, that a great similarity exists. Notes on the stratigraphy of the Roumanian oil territory and a geological sketch of Roumanian petroleum zone presented by Mrazec in 1907, along with report of investigations at the 3rd Petroleum Congress at Bucharest.

OHIO AND INDIANA. Rise and Decline in Production of Petroleum in Ohio and Indiana, J. A. Bownocker. Min. & Metallurgy, No. 158, Section 22, Feb. 1920, 12 pp., 2 figs. Geology of region and records of wells.

PENNSYLVANIA-NEW YORK. A Résumé of the Pennsylvania-New York Oil Field, Roswell H. Johnson and Stirling Huntley, Min. & Metallurgy, No. 158, Section 23 Feb. 1920, 4 pp. Geological and stratigraphical notes.

OIL FUEL

BURNERS FOR. The Utilization of Oil Fuel in Industrial Furnaces (L'emploie des combustibles liquides dans les foyers industriels), F. Scoumanne. Revue générale de l'Electricité, vol. 7, no. 16, Apr. 17, 1920, pp. 527-536, 3 figs. Comparative study of various types of burners. (Concluded.)

The Wallsend-Howden System of Burning Liquid Fuel. Shipbuilding & Shipping Rec., vol. 15, no. 16, April 15, 1920, pp. 519-520, 5 figs. Liquid fuel is injected into furnaces under pressure through burner, where it is atomized. Burner is designed to force oil into furnace in shape of conical spray of fine particles, which burst into flame at distance of from 6 in. to 8 in. from nozzle.

HANDLING. Handling Heavy Oils at Locomotive Fuel Stations, J. L. Starkie. Ry. Age, vol. 68, no. 15, Apr. 9, 1920, pp. 1147-1148, 4 figs. Points out that tanks and pipe lines must be heated to obtain necessary fluidity in service installations. Describes how turns, bends and expansion joints joints are handled when steam pipes are placed inside oil pipes.

OIL TANKS

PROTECTION AGAINST LIGHTNING. Protecting Oil Storage Tanks Against Lightning, Oliver Lodge. Nat. Fire Protection Assn., vol. 13, no. 3, Jan. 1920, pp. 241-244. Opinion is expressed that metal tanks, not over-elevated and not specially earthed, with good joints and free from leaks, "are as safe as anything can well be, provided the roof and other parts are examined from time to time from the point of view of corrosion." From Petroleum World.

OIL WELLS

PERMITS AND LEASES. Regulations Concerning Oil and Gas Permits and Leases (Including Relief Measures) and Rights of Way for Oil and Gas Pipe Lines, Dept. Interior, Gen. Land Office, no. 672, March 11, 1920, 38 pp. Rules and regulations prescribed for administration of provisions of act of Congress approved Feb. 25, 1920, entitled "An act to promote the mining of coal, phosphate, oil, shale, gas and sodium on the public domain."

OPEN-HEARTH FURNACES

DESIGN. Design of Furnaces and Ovens is Factor in Cutting Costs in New Open-Hearth Plant. Iron Trade Rev., vol. 66, no. 13, Mar. 25, 1920, pp. 915-920, 8 figs. Features of furnaces to which attention is particularly directed are cooling of furnace doors with running water and their operation by compressed air, which is controlled by valve centralized at one station near wall in front of furnace, charge being brought from stock yard in charging boxes carried on flat-bottom cars, and complete record being kept of every heat.

WASTE-HEAT UTILIZATION. Using Waste Heat from Furnaces, B. H. Greene. Iron Trade Rev., vol. 66, no. 15, Apr. 8, 1920, pp. 1065-1068, 3 figs. Installation where steam derived from waste heat is supplemented by coal-fired boilers and used for electric power generation. Paper read before Cleveland Section, Assn. Iron and Steel Elec. Engrs.

OSCILLATIONS

DAMPED. Damped Oscillations in Coupled Circuits, G. Bamwell Ehrenborg. Radio Rev., vol. 1, no. 7, April 1920, pp. 329-336, 6 figs. Mathematical study. (Continuation of serial.)

OXY-ACETYLENE WELDING

LOCOMOTIVE CYLINDERS. Welding a High-Pressure Cylinder, Frank H. Frye. Welding Engr., vol. 5, no. 4, April 1920, pp. 28 and 32, 4 figs. Welding of high-pressure cylinder of Mallet Articulated Class AE Locomotive by Oxweld Acetylene process.

PIPE JOINTS. Oxyacetylene Gas Welding, Alfred S. Kinsey, Gas Age, vol. 45, no. 8, Apr. 26, 1920, pp. 331-335, 10 figs. Laying of pipe line near Philadelphia. Line is of standard 12-in. and 16-in. steel pipe, being double-piped for three miles and single-piped for five miles. Pipe joints were welded by oxyacetylene process.

PAINTING

SPRAY METHOD. Spray Painting, H. A. Gardner. Sci. Am. Monthly, vol. 1, no. 4, April 1920, pp. 335-336, 6 figs. Study of practicability of blowing paint on various surfaces.

PAINTS

THINNERS FOR. Notes on the Standardization of Mineral Spirits, Henry A. Gardner. Paint Manufacturers' Assn. of U. S., circular 94, May 1920, 3 pp. Rules are suggested for standardization of turpentine and other mineral oils used for thinning paints and varnishes.

PATTERN-MAKING

CANAL ZONE SHOPS. The Pattern Shop at Balboa, R. D. Gatewood. Am. Mach., vol. 52, no. 14, April 1, 1920, pp. 723-725, 6 figs. Balboa shops of Panama Canal.

PATTERNS

STORAGE OF. Safe Storage of Patterns, J. V. Hunter. Am. Mach., vol. 52, no. 17, April 22, 1920, pp. 901-902, 5 figs. Experience of Minneapolis Threshing Machine Co., which has built fireproof pattern-storage building to house what is estimated to be one million dollars worth of patterns.

PAPER MILLS

ELECTRIC DRIVE. The Electric Drive in Paper Mills, E. Tanner and C. F. Papworth. Elecn., vol. 84, no. 2184, March 26, 1920, pp. 344-348, 5 figs. Description of paper mill in south of England, having average weekly output of 1500 tons of paper.

100-TON MILL. Large Pulp and Paper Mill Development by International Paper Co. at Three Rivers, Romeo Morrissette. Contract Rec., vol. 34, no. 15, Apr. 14, 1920, pp. 338-340, 3 figs. Description of 100-ton-per-day sulphite mill which is nearly completed. Outline of workmen's dwellings to be built in connection with plant.

RAILS

FRACTURE. One of the Causes of Rail Fracture, and a Way of Preventing It, Georges Charpy and Jean Durand. Bul. Int. Ry. Assn., vol. 2, nos. 1-2-3, Jan.-Feb.-March 1920, pp. 45-48, 5 figs. Fine cracks which are formed in course of time on rolling surface of rails are attributed, as result of experimental investigation, to intense crushing to which superficial layer of rail is subjected. This phonomenon is said to be common to other objects, such as chains, bolts, stays, etc. It is said that this effect can be counteracted by annealing treatment applied to surface at suitable intervals. Translated from Comptes rendus des Séances de l'Académie des Sciences.

SPECIFICATIONS. Report of Committee IV—On Rail. Bul. Am. Ry. Eng. Assn., vol. 21, no. 225, March 1920, pp. 225-266, 19 figs. Specifications for carbon-steel rails are formulated. One appendix enumerates results of experiments made to determine nature of defects revealed by deep etching transversely fissured rails, and another discusses brittleness in steel rails.

WEAR. Cause of Undulatory Wear of Rails (Cause de l'usure ondulatoire des rails), Ch. Frémont. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 14, Apr. 6, 1920, pp. 837-838. Explanation given is as follows: When a wheel slides on rail, axle of wheel is strained by resisting torque; when wheel comes to sudden stop energy of torsion in axle is suddenly released and wheel is caused to rotate slightly in opposite direction, thus grinding rail.

RAILWAY OPERATION

AUTOMATIC CONTROL SYSTEMS. Regan Automatic Train Control System C. R. I. & P. Ry. Ry. Rev., vol. 66, no. 18, May 1, 1920, pp. 720-723, 6 figs. System is of intermittent contact type and is designed to carry continuous speed control through caution territory. It embraces both automatic speed control and automatic stop features.

FREIGHT-TRAIN LOADING METHOD. A Practical Freight Train Loading Method, R. S. Mounce. Ry. Mech. Eng., vol. 94, no. 5, May, 1920, pp. 270-274, 5 figs. Method is outlined for finding car factor and equated loading for any given condition. Basis of method is standard loading chart for 10,000-lb. available tractive effort at speeds between 5 and 12 m.p.h. under various weather conditions.

SIGNAL INDICATIONS. Train Operation by Means of Signal Indications, F. H. Bagley. Ry. Signal Engr., vol. 13, no. 5, May, 1920, pp. 208-210, 6 figs. Automatic signals operating an overlap scheme, together with time block and written orders, it is said, have controlled traffic for past eight years over stretch of single track of Louisville & Nashville Railroad.

SINGLE-TRACK. Single Track Operation Without Train Orders, F. H. Bagley. Ry. Age, vol. 68, no. 16, Apr. 16, 1920, pp. 1205-1206, 2 figs. Busy stretch operated by signal indication by installation of traffic locking scheme.

SPEED CONTROL. Rock Island Installs Speed Control and Train Stop. Ry. Signal Engr., vol. 13, no. 5, May, 1920, pp. 204-206, 5 figs. Three-position relay repeats signal indications. Passing of caution signals restricts speed.

See also Snow Plows.

RAILWAY SIGNALING

MELBOURNE. Signaling On Melbourne Electrified Railways, F. M. Calcutt. Ry. Signal Engr., vol. 13, no. 5, May 1920, pp. 184-198, 11 figs. Three-position automatic signaling is used. From Indus. Australian and Min. Standard.

RADIO SIGNALING. Augereau Wireless System of Railway Signaling (Le système Augereau pour la répétition des signaux sur les locomotives), Revue générale de l'Electricité, vol. 7, no. 15, Apr. 10, 1920, pp. 506-507, 3 figs. Apparatus for reproducing in locomotive cab by means of Hertzian waves signals usually indicated along track. This system has been tried successfully, it is said, by French State Railways.

RAILWAY TRACK

CONCRETE ROADBED. Concrete Roadbed for Track, Tunnels and Stations. Eng. News-Rec., vol. 84, no. 17, April 22, 1920, pp. 826-828, 9 figs. Experience of various railways is quoted in securing increased stability and decreased maintenance by using concrete slab base under railway track. From report of Ballast Committee of Am. Ry. Eng. Assn.

MAINTENANCE. Maintenance Cost Reduced by Pneumatic Tie Tampers, W. H. Armstrong. Compressed Air Mag., vol. 25, no. 4, April 1920, pp. 9604-9609, 25 figs. Based on records of performances of tie tamping machines obtained by U. S. Railroad Administration.

STRESSES IN. Second Progress Report of the Special Committee to Report on Stresses in Railroad Track. Proc. Am. Soc. Civil Engrs., vol. 46, no. 2, Feb. 1920, pp. 133-304, 100 figs. Report of joint committee of Am. Soc. of Civil Engrs. with Am. Ry. Eng. Assn. It is concluded from results obtained in numerous tests with different types of engines that action of driving-wheel counterbalance multiplies static load stresses in rail. In some cases excess stress chargeable to unbalance is much more than static rail stress. Nature of service given by tie is defined by measurements of tie bending and distribution of rail load to ballast.

See also Scales, Track.

RAILWAYS, MILITARY

LIGHT RAILWAYS, FRENCH BATTLE FRONT. The "Light Railways" of the Battle Front in France, Frank G. Jonah. Proc. Am. Soc. Civil Engrs., vol. 46, no. 1, Jan. 1920, pp. 81-98, 20 figs. partly on 4 supp. plates. Types of "light railways" built at the front by American, French, English and German troops.

RANGE FINDERS

NAVAL, ACCURACY OF. Range Finders and Range Finding, F. J. Cleary. Jl. Am. Soc. Naval Engrs., vol. 32, no. 1, Feb. 1920, pp. 1-37, 25 figs. Notes on accuracy of range finders employed in naval service and suggestions in regard to care that must be exercised in handling them.

REFRACTORIES

MAGNESITE. Magnesite Refractories, J. Spotts McDowell and Raymond M. Howe. Jl. Am. Ceramic Soc., vol. 3, no. 3, March 1920, pp. 185-246, 5 figs. Survey of development of magnesia refractories in steel making, with notes on crude magnesite and the manufacture of magnesite bricks, as well as enumeration of properties of caustic, dead-burned and fused magnesia. Photomicrographs of magnesia brick are included, and also biography of magnesite and magnesite brick.

RELATIVITY

THEORY OF. Note on the Central Differential Equation in the Relativity Theory of Gravitation, A. R. Forsyth. Proc. Roy. Soc., vol. 97, no. A682, Apr. 1, 1920, pp. 145-151. Equation is integrated, and approximations for solar system are obtained.

RESEARCH

METALLURGICAL, UTAH SCHOOL OF MINES. The Metallurgical Research Department of the Utah State School of Mines, L. W. Chapman. Chem. & Metallurgical Eng., vol. 22, no. 19, May 12, 1920, pp. 877-881, 5 figs. Station is used for general work in ore dressing, and researches of chloride volatilization and oil shales. Equipment is described.

See also Aeronautics, Research; Colloids, Research; Fuels, Research; Radio-Metallography, Research.

ROAD CONSTRUCTION

FEDERAL AID. For What Class of Roads and What Type of Construction Should Federal Aid Funds be Used? Thomas H. MacDonald. Good Roads, vol. 19, no. 15, Apr. 14, 1920, pp. 199-200 and 203. Writer expresses opinion that "federal aid funds should be expended, either for the low-cost types in the building of which machinery is used practically altogether, or for the higher-cost roads, for which machinery, if not already developed, is rapidly being developed."

SPECIFICATIONS FOR ASHOKAN HIGHWAYS. Construction and Maintenance of the Ashokan Highways, George G. Honness. Eng. News-Rec., vol. 84, no. 14, April 1, 1920, pp. 652-657, 4 figs. Specifications for mixed bituminous concrete, vitrified brick on concrete foundation, waterbound macadam, and asphalt block roads within area of Ashokan reservoir, located in foothills of Catskill Mountains, which is principal impounding reservoir for New York's Catskill water supply.

WINCONSIN. Wisconsin Standardizes Highway Cost Estimates. Eng. News-Rec., vol. 84, no. 14, April 1, 1920, pp. 663-664, 1 fig. Standard bidders' estimating form prepared for use of state highway engineers in estimating cost of improvements and for use of contractors in preparing bidding prices for construction.

See also Roads, Macadam, Surfacing.

ROADS

IMPACT TESTS ON. The Present Status of Impact Tests on Roadway Surfaces, A. T. Goldbeck. Public Roads, U. S. Dept. Agriculture, Bur. Public Roads, vol. 2, nos. 18-19, Oct.-Nov. 1919, pp. 19-25, 13 figs. Also Jl. Soc. Automotive Engrs., vol. 6, no. 4, April 1920, pp. 265-269, 11 figs. Account of experiments being conducted by Bureau of Public Roads with a view to determining fundamentals affecting road design. Highest value of impact pressure so far measured is 42,000 lb. when weight on rear wheel causing this pressure was only 7750 lb.

ROADS, CONCRETE

DELAWARE. Concrete Road Construction Methods on Contract No. 8 of the Du Pont Highway, Delaware, George A. Sherron. Eng. & Contracting, vol. 53, no. 14, April 7, 1920, pp. 402-404, 5 figs. Construction of road for distance of six and one-half miles. Road is of 1-course cement concrete, mixed in of proportions of 1 part cement, 2 parts fine aggregate and 4 parts coarse aggregate, to which 10 per cent by volume of hydrated lime is added.

DESIGN AND CONSTRUCTION. The Design and Construction of Different Types of Pavements, A. N. Johnson. Good Roads, vol. 19, no. 14, April 7, 1920, pp. 182-186, 2 figs. Construction details of concrete roads including method of testing sand for organic impurities, Abram's table of proportions and quantities for one cubic yard of concrete and suggested specifications for proportions using Abram's table.

STEAM POWER PLANTS

WESTERN STATES, TENDENCIES IN DESIGN. Steam-Electric Generation in Far West, W. F. Durand and C. H. Delany. Elec. World, vol. 75, no. 20, May 15, 1920, pp. 1123-1127, 10 figs. Survey of present tendency of design. Leaning is said to be toward higher superheat, centrifugal-pump auxiliaries, automatic control and use of recording meters in boiler room.

STEEL

ABSORPTION POWER, TESTING. Testing the Absorption Power of Different Steels Under the X-Rays, Robert Hadfield, S. A. Main, J. Brooksbank. Trans. Faraday Soc., vol. 15, part 2, Feb. 1920, pp. 74-75, 4 figs. on 2 supp. plates. Account of experiments carried out by Hadfield Research Laboratory in Sheffield, England.

COLD-ROLLED STRIP. Cold Rolled Strip Manufacture and Products. Raw Material, vol. 2, no. 4, April 1920, pp. 131, 140, 19 figs. Description of strip steel manufactured into finished products.

ELASTIC STRENGTH. The Relation Between the Elastic Strengths of Steel in Tension, Compression and Shear, Fred B. Seely and William J. Putnam. University of Illinois Bul., vol. 17, no. 11, Nov. 10, 1919, 49 pp., 9 figs. Results of experiments with soft, mild and medium carbon steel, and vanadium, nickel and chrome-nickel alloy steel. It is concluded in part that correct value of elastic shearing strength of steel as measured by proportional limit or useful limit point is from 0.55 to 0.65 of elastic tensile strength, thus disproving maximum shear theory of failure of elastic action of tensile steel, sometimes called Guest's law, which assumes that elastic shearing strength is 0.5 of elastic tensile strength.

EXPORTATION. Exporting Iron and Steel—I and II, V. G. Iden. Iron Trade Rev., vol. 66, nos. 14 and 18, April 1 and April 29, 1920, pp. 987-991 and pp. 1257-1261. World market conditions and problems in foreign trade analyzed. Influence of tariff and quantity production by American industries on foreign trade. Export combinations encouraged.

FERRITE IN. Genesis of Ferrite, Federico Giolitti. Chem. & Metallurgical Eng., vol. 22, no. 16, Apr. 21, 1920, pp. 737-739, 10 figs.

MARKET CONDITIONS, FACTORS AFFECTING. World's Steel Output Below Need, John A. Topping. Iron Trade Rev., vol. 66, no. 19, May 6, 1920, pp. 1321-1322. Underlying factors which offset market and price conditions are pointed out. It is stated that European production is scarcely one-third of pre-war figure. Heavy railroad and agricultural demands are forecast.

MICROSTRUCTURE OF. Microstructure of Iron and Mild Steel at High Temperatures, Henry S. Rawdon. Min. & Metallurgy, No. 158, Section 18, Feb. 1920, 20 pp., 13 figs. Experimental investigation of surface layer during heating in vacuo, and of formation of surface pattern under "heat-relief" etching.

PROPERTIES BELOW CRITICAL RANGE. Physical Changes in Iron and Steel Below the Thermal Critical Range, Zay Jeffries. Min. & Metallurgy, No. 158, Section 20, Feb. 1920, 17 pp. Survey of technical literature and account of experimentation work. Committee report presented to Engineering Division of Nat. Research Council.

SULPHUR IN. Studies Sulphur Problem Abroad, Henry S. Rawdon. Iron Trade Rev., vol. 66, no. 15, Apr. 8, 1920, pp. 1069-1071. Representative of United States Bureau of Standards reports that French and British specifications for steels furnish few data applicable to research on effect of sulphur and phosphorus.

STEEL CASTINGS

FAILURE OF. Using the Microscope to Detect Causes of Failure of Steel Castings, O. A. Knight. Blast Furnace & Steel Plant, vol. 8, no. 5, May 1920, pp. 281-283, 9 figs. It is pointed out how microscope can determine correct heat treatment to give to steel castings. Photomicrographs are presented and interpreted.

MICROSCOPIC EXAMINATION OF. Using the Microscope to Detect Causes of Failure of Steel Castings, O. A. Knight. Am. Drop Forger, vol. 6, no. 4, April 1920, pp. 163-165, 9 figs. Photomicrographs of various specimens are studied and it is pointed out how defects in heat treatment can be determined by means of them.

STEEL, HEAT TREATMENT OF

FURNACES. Furnaces Used in Heat-Treating Steel, S. P. Rockwell. Machy. (N.Y.), vol. 26, no. 8, Apr. 1920, pp. 749-753, 6 figs. Comparison of types of furnaces used in carburizing, hardening and tempering.

REGULATION OF. Important Factors to be Considered in Heating and Cooling Steel, C. B. Barnhardt. Am. Drop Forger, vol. 6, no. 4, April 1920, pp. 189-193, 4 figs. Uniform pyrometer record is said not to be sufficient indication of proper heating or cooling. It is pointed out that temperature, time, surface and mass are the factors which must be considered in heat-treating.

See also Steel Castings, Heat Treatment; Steel, Nickel, Thermal Treatment.

STEEL, HIGH-SPEED

ELECTRIC-FURNACE MANUFACTURE. The Manufacture of High Speed Steel in the Electric Furnace, Roy C. McKenna. Gen. Meeting Am. Electrochemical Soc., Apr. 8-10, 1920, paper no. 31, pp. 417-423. Advantages of electric furnace process over any other way of making high-speed tool steel are pointed out and details of charging, melting, slagging, teeming, forging, heat treatment, etc., are discussed.

TESTS. A Comparative Test Upon High-Speed Steels—I and II, A. J. Langhammer. Chem. & Metallurgical Eng., vol. 22, nos. 18 and 19, May 5 and May 12, 1920, pp. 829-833 and pp. 889-892. Notes on competition of modern high-speed steels conducted for automotive manufacturer. Preliminary observations on current sales practices and general review of various classes, and effect of chemical compositions and heat treatment. Conditions entering into testing of tool for cutting, listed by Taylor, are discussed. Detailed information is given as to method of eliminating most of variables from comparative test for efficiency of several brands of commercial tool steel.

STEEL INDUSTRY

GERMANY. German Steel and Iron in 1920—I, II, III and IV, H. Cole Estep. Iron Trade Rev., vol. 66, nos. 15, 16, 17, 18, April 8, 15, 22, 29, 1920, pp. 1059-1063, 2 figs., pp. 1131-1139, 6 figs., pp. 1189-1193, 4 figs., pp. 1263-1267, 7 figs. Based on writer's personal investigations. Iron and steel industry, it is said, is displaying a certain amount of spirit, energy and valor in its present struggle, but it will be long, if at all, before it can recuperate its former position. Official statistics are quoted which show production has reduced two-thirds since 1913. Labor conditions as affected by food situation. With steel production at low ebb Germany is said to have excess of shop capacity and her shipyards to be nearly idle.

STEEL, MANGANESE

GRINDING. Grinding Manganese Steel, R. M. Johnson. Iron Trade Rev., vol. 66, no. 14, Apr. 1, 1920, pp. 999-1001, 10 figs. Methods employing swing frame grinding machines are illustrated.

STEEL MANUFACTURE

DUPLEXING PROCESS. Develops New Duplexing Process, H. E. Diller. Iron Trade Rev., vol. 66, no. 19, May 6, 1920, pp. 1324-1327, 9 figs. High-carbon steel is melted in electric furnace and trasnferred to converter to be finished. It is said that good grade metal is thus obtained at low cost.

ELECTRIC-FURNACE. Manufacture of Steel in the Electric Furnace (Le four à arc pour la fabrication de l'acier), H. Verdinne. Revue universelle des Mines, vol. 5, no. 1, Apr. 1, 1920, pp. 5-52, 26 figs. Classification and description of principal types of electric furnaces used in steel manufacture. (To be continued.)

ELECTRIC HEATING IN. Electric Heating in Steel Wire Manufacture. Blast Furnace & Steel Plant, vol. 8, no. 5, May 1920, pp. 291-293, 2 figs. Comparative cost statistics taken at plant of Halcomb Steel Co , Syracuse, N. Y., on drying ovens heated electrically and similar ovens using coke and steam. Coke ovens cost $22.289 per net ton, against $12.2926 per net ton for electric.

See also Electric Furnaces, Metallurgical Uses.

STEEL, NICKEL

THERMAL TREATMENT. Critical Ranges of Some Commercial Nickel Steels, Howard Scott. Min. & Metallurgy, No. 158, Section 16, Feb. 1920, 17 pp., 11 figs. Transformation-temperature data secured at Bureau of Standards as basis for standardization and specification of thermal treatments for nickel steels.

STEEL WORKS

ELECTRICITY IN. Electricity in a Large Modern Steel Plant—I, R. B. Gerhardt. Blast Furnace & Steel Plant, vol. 8, no. 5, May 1920, pp. 295-298. Details of electrical apparatus at Maryland plant of Bethlehem Steel Co. Paper read before Philadelphia Section of Assn. of Iron & Steel Elec. Engrs.

Electricity Plays Important Part in Connecticut Steel Foundry. Iron Trade Rev., vol. 66, no. 12, Mar. 18, 1920, pp. 846-849, 5 figs. Electricity is used for melting charge, baking, cores, annealing and heat-treating castings, and in cleaning room.

STOKERS

PERFORMANCE. Exact Data on the Performance of Mechanical Stokers as Applied to "Lancashire" or Other Narrow-Flued Boilers, Favid Brownlie. Jl. Instn. Mech. Engrs., no. 3, Apr. 1920, pp. 263-280. Figures obtained in experimental investigation of 80 typical Lancashire boilers mechanically fired. (To be continued.)

STREET RAILWAYS

CAR MAINTENANCE. Maintenance Practice of the Anglo-Argentine Tramway—II, R. Francisco Apeseche. Elec. Ry. Jl., vol. 55, no. 20, May 15, 1920, pp. 978-982, 7 figs. Classes for inspection and overhauling of cars are described, together with duties of men and types of work performed.

CARS, CONVERTING. Open Trailers Converted into Desirable Closed Cars. Elec. Traction, vol. 16, no. 5, May 1920, pp. 331-332, 3 figs. Old-type open trailers in Memphis converted into closed cars at a cost of about $1500.

CARS, NON-ELECTRIC. Is the Non-Electric Street Railway Car a Serious Possibility? Ferdinand C. Cusani. Elec. Ry. Jl., vol. 55, no. 18, May 1, 1920, pp. 893-895. Writer believes that there is a field for self-propelled safety car, but considers steam power plant to be superior to oil or gas engine for purpose.

TRACTORS

USES OF. Increasing the Utility of the Tractor, Arnold P. Yerkes. Jl. Soc. Automotive Engrs., vol. 6, no. 4, April 1920, pp. 226-230. Efforts of manufacturers to secure adaptability of tractors to other uses than plowing are related and it is pointed out that reason why sales of tractors have not been as extensive as manufacturers had anticipated it because of financial inability of farmerss in small farms to invest in a machine from which they cannot derive service in proportion to their investment.

Use of Heavy Tractors for Hauling Elevating Graders and Wagon Trains from Steam Shovel. Eng. & Contracting, vol. 53, no. 16, April 21, 1920, pp. 451-454, 3 figs. Account of work done with three artillery-type tractors designed by War Department for military use, which were employed by U. S. Reclamation Service in construction of Salmon Lake Dam and Conconully dam enlargement of Okanogan Project, Wash.

TRANSFORMERS

STEEL-CLAD. Steel Clad Distribution Transformers, E. G. Reed. Elec. Jl., vol. 17, no. 5, May 1920, pp. 213-218, 22 figs. Process of manufacture at works of Westinghouse Elec. & Mfg. Co.

TRESTLES

See Bridges, Railway, Wooden.

TUBING

COPPER AND BRASS, MANUFACTURE OF. Making Seamless Copper Tubing. Iron Trade Rev., vol. 66, no. 9, Feb. 26, 1920, pp. 638-641, 7 figs. Plant for producing seamless copper or brass tubing, recently placed in operation by United States Copper Products Corp., Cleveland.

LIGHT STEEL, MANUFACTURE. Light Steel Tubing Manufacture and Markets. Raw Material, vol. 2, no. 4, April 1920, pp. 147-150, 5 figs. Manufacturing details of light steel tubing, and methods of welding steel tubing seams.

TUNNELS

LINING OF. Notes on Tunnel Lining, S. Johannesson and B. H. M. Hewett. Proc. Am. Soc. Civil Engrs., vol. 46, no. 3, Mar. 1920, pp. 426-460, 13 figs. Causes for distortion and displacements of tunnel linings are discussed, and modifications of existing practice are suggested for avoiding them.

VEHICULAR, HUDSON RIVER. The World's Greatest Vehicular Tunnel. Robert G. Skerrett, Sci. Am., vol. 122, no. 19, May 8, 1920, pp. 510-528 and 528-529, 4 figs. Structural features of New York, New Jersey project. From report of chief engineer of New York State Bridge and Tunnel Commission and New Jersey interstate Bridge and Tunnel Commission.

WATER, REPAIRING. Method of Repairing Water Tunnel with Cement Gun. Eng. & Contracting, vol. 53, no. 19, May 12, 1920, pp. 534-536, 2 figs. Repairing 120-ft. section of defective pressure tunnel on main supply line of Water Department of Tacoma, Wash., with steel reinforcement and gunite.

VACUUM TUBES

See Thermionic Valves; Triode Valves.

VAPORS

TENSION, MEASUREMENT OF. An Apparatus for Measuring the Vapour Tensions of Volatile Liquids, A. V. C. Fenby. Chem. Age., vol. 2, no. 45, Apr. 24, 1920, pp. 434-435, 1 fig. Apparatus consists of two similar barometer tubes of special construction fixed to suitable stand and connected at their lower ends by thick-walled rubber tubing to mercury reservoir which can be raised or lowered. One of these tubes is used as barometer and the other as vapor tension tube.

VIADUCTS

FLAT-SLAB CONSTRUCTION. An Interesting Type of Flat Slab Construction. Ry. Age, vol. 68, no. 17, April 23, 1920, pp. 1233-1235, 5 figs. Concrete viaduct of flat-slab type reinforced in four directions, being built by Delaware, Lackawanna & Western to carry roadway over tracks, in separation of grades of Newark Turnpike and tracks of Morris & Essex branch.

WARSHIPS

U. S. S. IDAHO. U. S. S. Idaho, Henderson B. Gregory. Jl. Am. Soc. Naval Engrs., vol. 32, no. 1, Feb. 1920, pp. 99-133. Characteristics: Length between perpendiculars, 600 ft.; breadth, molded, 97 ft.; depth, molded, 46 ft. 3½ in.; draught. mean, 30 ft.; displacement, 32,000 tons; main battery, twelve 14-in. guns arranged in four three-gun turrets along centre line of vessel; secondary battery, fourteen 5-in. rapid-fire guns for torpedo defence; torpedo equipment, four 6.8-meter by 21-in. submerged torpedo tubes; propelling machinery. Parsons turbines driving four lines of shafting; speed, 21 knots.

WASTE PREVENTION

WOODWORKING PLANTS. Controlling Wastes in Woodworking Plants, Carle M. Bigelow. Indus. Management, vol. 59, no. 5, May 1920, pp. 377-383, 7 figs. Methods and practice for utilizing large pieces of scrap, economical burning of chips, shavings and the like, and determining percentages of waste.

WATER HAMMER

CALCULATION OF. Calculation of Water Hammer in Conduits Formed of Two or Three Sections of Different Diameters (Calcul du coup de bélier dans les conduites formées de deux ou de trois tronçons de diamètre différents), Ed. Carey. Bulletin Technique de la Suisse Romande, vol. 46, no. 8, Apr. 17, 1920, pp. 85-88, 2 figs. Formula expressing transmission of pressure in case of sudden shut off of valve. (Continuation of serial.)

WATER SOFTENING

HOT PROCESS. The Hot-Process Water Softener, George H. Gibson. Chem. & Metallurgical Eng., vol. 22, no. 19, May 12, 1920, pp. 899-902, 4 figs. Study of rate of sedimentation of lime and magnesia precipitates during softening at low and high temperatures. Plant equipment: reagent proportioner, tanks and filter.

WATER SUPPLY

SUBMERGED PIPE LINE. Repairs to Twelve-Inch Submerged Pipe Line, Patrick Quilty. Fire & Water Eng., vol. 67, no. 16, April 21, 1920, pp. 831-833 and p. 847, 5 figs. Installation of and subsequent repairs to main supplying North Brother Island, New York City.

WATER TANKS

REINFORCED-CONCRETE. Reinforced Concrete in Chile. Concrete & Constructional Eng., vol. 15, no. 4, April 1920, pp. 227-233, 3 figs. Details of reinforced-concrete water tank of 15,000 metric tons capacity.

WATER WORKS

CHICAGO. Plan of Chicago's Water System—1920-1955, P. S. Combs. Eng. World, vol. 16, no. 7, May 1920, pp. 379-387, 6 figs. Intakes in Lake Michigan.

SEDIMENTATION BASINS. New Intake and Sedimentation Basin at Sarnia, F. W. Thorold. Can. Engr., vol. 38, no. 18, Apr. 29, 1920, pp. 413-416, 8 figs. One of nineteen concrete basins is used for screen house and others for sedimentation. Wooden form for intake structure was sunk to depth of 47 ft. and filled with concrete.

WELDING

JIGS AND FIXTURES FOR. Modern Welding and Cutting—XX, Ethan Viall. Am. Mach., vol. 52, no. 13, Mar. 25, 1920, pp. 665-669, 13 figs. Welding jigs and fixtures used for repetition jobs.

See also Electric Welding, Arc; Electric Welding Resistance; Oxy-Acetylene Welding.

LOCOMOTIVE FIREBOXES. Methods of Welding Locomotive Fireboxes, George L. Walker and R. T. Peabody. Boiler Maker, vol. 20, no. 4, Apr. 1920, pp. 99-103, 37 figs. Discusses methods of restoring firebox edges by welding and offers suggestions for facilitating repairs. (Concluded.)

WELFARE WORK

FACTORY DOCTOR. Why a Factory Doctor's Salary Costs Less than Nothing, G. L. Howe. Factory, vol. 24, no. 4, Mar. 1, 1920, pp. 618-621, 2 figs. Writer claims medical supervision is not philanthropy, but a business proposition, and presents figures and facts to bear out his arguments.

WELLS

RECOVERY OF SAND PUMP. Recovering Lost Sand Pump from a Deep City Well, R. A. Campbell. Eng. World, vol. 16, no. 7, May 1920, pp. 416-418, 6 figs. Special hook was developed after taking impression of existing conditions by means of impression tool.

WOOD

See Aircraft Construction Materials, Timber.

WORKMEN'S COMPENSATION

ATTORNEY'S FEES. Notices and Claims Under Compensation Acts—III, Chesla C. Sherlock. Am. Mach., vol. 52, no. 16, April 15, 1920, pp. 844-846. Concerning costs, particularly attorney's fees, in proceedings under Workmen's Compensation acts.

LAWS ON, REVISION OF. The Cost of Industrial Accidents, Royal Meeker. Monthly Labor Rev., vol. 10, no. 4, Apr. 1920, pp. 1-13. Plea is made for revising the compensation laws which have been enacted in the various states. These laws show, it is claimed, lack of uniformity in coverage and inexplicable inequalities in money and medical compensation. It is also urged that accurate and up-to-date statistics of industrial accidents causing physical injuries be kept in all states and territories.

LAWS ON, SCOPE OF. Scope and Operation of the Workmen's Compensation Laws of the United States, Lindley D. Clark. Monthly Labor Rev., vol. 10, no. 4, Apr. 1920, pp. 14-32, 1 fig. on supp. plate. Comparative study of laws of the various states.

X-RAYS

ACTION UPON PLATES. The Behavior of Photographic Plates to X-Rays, O. Bloch and F. F. Renwick. Trans. Faraday Soc., vol. 15, part 2, Feb. 1920, pp. 40-46, 7 figs. Account of work done in Research Laboratories of Ilfrod, Limited, on action of X-Rays upon gelatine dry plates.

TUBES. A Method of Testing an X-Ray Tube for Definition, J. Brooksbank. Trans. Faraday Soc., vol. 15, part 2, Feb. 1920, pp. 66-71, 5 figs. on 4 supp. plates. Method of determining size of focal spot required is suggested which consists in taking series of radiographs of two uniform parallel wires of given thickness and placed definite distance apart.

See also Radiometallography.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

In this department will be published from month to month the titles of current engineering papers with the author's name, source and a brief extract of the main contents. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

WING BEAMS. The Strength of One-Piece Solid, Built-Up, and Laminated Wood Airplane Wing Beams, John H. Nelson. Nat. Advisory Committee for Aeronautics, no. 35, 1919, 12 pp. 12 figs. It was found in tests that beams of fir can be produced which, weight for weight, will prove as strong as those made of spruce, but will not, however, show quite same stiffness. Cypress was not found satisfactory substitute for spruce. Beams of laminated construction showed themselves as strong as one-piece solid construction.

WING-FABRIC FASTENINGS. Fabric Fastenings, E. D. Whalen and R. T. Fisher. Aerial Age, vol. 11, no. 14, June 14, 1920, pp. 474-475. It is concluded from tests that (1) unwaxed cotton cords are materially better resistors of abrasion fray than unwaxed linen, (2) waxen linen and cotton have practically the same resistance to abrasion fray, and (3) waxed or unwaxed cotton cords are materially better than waxed or unwaxed linin as a resistor of tension fray.

See also Flying Boats; Parachutes; Wind Tunnels.

AIR COMPRESSORS

ELECTRICALLY DRIVEN. Electrically-Driven Geared Air Compressors. Engr., vol. 129, no. 3343, Jan. 23, 1920, p. 98, 2 figs. Models recently placed on market by Broom and Wade, Ltd., High Wycombe.

AIR FILTERS

NON-FABRIC. Construction of Air Filters without Cotton or Other Fabrics (Stofflose Luftfilter), Drnst Preger. Werkstattstechnik, vol. 14, no. 3, Feb. 1, 1920, pp. 71-73, 16 figs. Types operating according to principle of subjecting the air to a repeated change of direction and thereby causing the dust to settle on walls to which it adheres.

AIRCRAFT CONSTRUCTION MATERIALS

See Steel, Heat Treatment of, Brazed Fittings for Aircraft.

AIRSHIPS

R.33 AND R.34. The Machinery of H. M. Airships R.33 and R.34. Eng., vol. 109, nos. 2831 and 2833, Apr. 2 and 16, 1920, pp. 433-434, 7 figs., and 504-505, 10 figs., partly on supp. plate. Structural details of gondolas. Details of Sunbeam-Coatalen "Maori" engines with which both vessels are fitted.

Rigid Airships and Their Development, J. E. M. Pritchard. Flight, vol. 12, nos. 20, 21, 22 and 23, May 13, 20, 27 and June 3, 1920, pp. 525-528, 4 figs., pp. 554-557, 7 figs., pp. 578-581, 4 figs., pp. 597-600, 8 figs. Accepted functions of both military and commercial rigid airships are outlined and divergence between two types indicated. Structural features of hull, fabric and cars are discussed. Keel, fins and planes. Outer cover requirements to prevent superheating. Comparative study of Zeppelin type and British type of car suspensions. Paper read before Roy. Aeronautical Soc.

SEMI-RIGID. The Italian Semi-Rigid Airship Roma. Aerial Age, vol. 11, no. 14, June 14, 1920, p. 478, 2 figs. Characteristics: Volume, 1,200,000 cu. ft.; total weight, 34 gross tons; length, 125 m.; beam, 25 m.; height, 27.5. m.

See also Hangars.

ALLOYS

ELECTRICAL MELTING. Electrical Melting of Alloys—I, II, III, IV, V, VI, VII and VIII, H. W. Gillett. Foundry, vol. 48, nos. 4, 5, 6, 7, 8, 9, 10, 11 and 12, March 1 and 15, April 1 and 15, May 1 and 15, June 1 and 15, 1920, pp. 177-180, 229-231 and p. 238, 275-281, 319-323, 362-366, 400-406, 445-453 and p. 457, 486-491, 67 figs.

TERNARY, MODEL FOR. A Model for Representing the Constitution of Ternary Alloys, Walter Rosenhain. Eng., vol. 109, no. 2833, Apr. 16, 1920, pp. 527-529, 4 figs. Model constructed of wires of various thicknesses and colors at National Physical Laboratory, England.

ALTERNATORS

See Electric Generators, A. C.

ALUMINUM

AUTOMOBILE USES. The Use of Aluminum in the Present and the Future Motor Car, Ferdinand Jehle. Jl. Soc. Automotive Engrs., vol. 6, no. 6, June, 1920, pp. 367-372, 6 figs. Use of aluminum alloys in pistons, crankcases, cylinder blocks, oil pans, inlet manifolds, bodies, etc. is noted, and it is visualized that wheels, rear-axle housings and similar parts will be aluminized in near future.

CORROSION. Rate of Corrosion of Aluminium, G. H. Bailey. Jl. Soc. Chem. Indus., vol. 39, no. 9, May 15, 1920, pp. 118T-120T, 2 figs.

The Action on Aluminum of Hard Industrial Waters, Richard Seligman and Percy Williams. Eng., vol. 109, no. 2828, Mar. 12, 1920, pp. 362-364.

ALUMINUM ALLOYS

DURALUMIN. Increasing Use of Alloyed Aluminum as an Engineering Material—II, G. M. Rollason. Indus. Management, vol. 59, no. 6, June 1920, pp. 456-461, 10 figs. Composition and physical properties of more important aluminum alloys, particularly duralumin.

IMPACT TESTS. Charpy Impact Test as Applied to Aluminum Alloys, E. H. Dix. Min. & Metallurgy, no. 160, April, 1920, p. 31. It is concluded from results of tests at Lynite Laboratories of Aluminum Manufactures, Inc., that Charpy impact resistance of copper-aluminum alloys decreases with increase of copper content.

AMMONIA COMPRESSORS

DIRECT-CONNECTED. Direct Connected Compressors, C. N. Drake. Ice & Refrigeration, vol. 58, no. 5, May 1920, pp. 267-268. Advantages quoted for direct-connected synchronous motor drive for ammonia compressors are: (1) higher motor efficiency, (2) elimination of belts and transmission losses, (3) high power factor with consequent lower power rates, and (4) saving in floor space.

ARCHES

REINFORCED-CONCRETE. Novel Concrete Arches for Garage Roof Supports, G. E. Warren. Concrete, vol. 16, no. 5, May 1920, pp. 210-212, 7 figs. Span width of each of arches is 103 ft. 7½ in. over all.

AUDIONS

See Radiotelegraphy Audion Connections.

AUTOGENOUS WELDING

FRENCH SYSTEM. A New Method of Welding. Sci. Am. Monthly, vol. 1, no. 6, June 1920, p. 522, 3 figs. French system of holding welding rod to rear of torch. Translated from Revue de la Soudure Autogène.

AUTOMOBILE ENGINES

AIR COOLING OF. The Air Cooling of Petrol Engines, A. H. Gibson. Eng., vol. 109, no. 2824, Feb. 13, 1920, pp. 211-213. Records obtained in experiments with aeroplane engines. Results are, however, presented as useful to design of air-cooled gasoline engine for car work. (To be continued). Paper read before Instn. Automobile Engrs.

CARBURETORS. *See Carburetors.*

CONNECTING RODS. Comparative Methods of Machining Automobile Engine Connecting Rods, Fred H. Colvin. Am. Mach., vol. 52, no. 20, May 13, 1920, pp. 1023-1035, 42 figs. Practices in manufacture of connecting rods for Packard, Cadillac, Peerless, Chandler and Franklin cars.

Producing 17,000 Connecting Rods a Day—I, Fred H. Colvin. Am. Mach., vol. 52, no. 23, June 3, 1920, pp. 1199-1203, 13 figs. Methods used by Ford Motor Co. Rod and cap are forged separately up to final boring, facing and broaching operation.

CRANKSHAFTS. Inertia Torque in Crankshafts, F. A. Stepney Acres. Automobile Engr., vol. 10, no. 138, May, 1920, pp. 208-216, 16 figs. Different crank arrangements are compared from view-point of internal stresses in crankshaft set up by inertia torque.

DIE-CAST BEARINGS. The Manufacture and Use of Die-Cast Engine Bearings, H. C. Skinner. Automotive Industries, vol. 42, no. 21, May 20, 1920, pp. 1160-1162, 7 figs. Experience and present practice of Franklin Die-Casting Corp.

AUTOMOBILE FUELS

NATALITE. Fuel for Internal-Combustion Engine. Eng., vol. 109, no. 2822, Jan. 30, 1920, p. 150. Properties of "Natalite," a fuel manufactured at Natal, South Africa, composed of 54 per cent ethyl alcohol, 45 per cent ether, and 1 per cent trimethylamine.

SPONTANEOUS IGNITION TEMPERATURES. Spontaneous-Ignition Temperatures of Liquid Fuels, Harold Moore. Automobile Engr., vol. 10, no. 138, May 1920, pp. 199-204, 14 figs. Results of experimental measurements of temperatures of spontaneous ignition for kerosene-creosote mixtures, petrol-xylol mixtures, ether-xylol, ether-kerosene mixtures, petrol-benzole mixtures, and cannel oil-creosote mixtures.

See Gasoline.

ELECTRICAL EQUIPMENT. The Electrical Equipment of Motor Cars—I. Engr., vol. 129, no. 3354, Apr. 9, 1920, pp. 366-368, 13 figs. Types exhibited at Olympia automobile show.

LIGHTING AND EQUIPMENT. Lighting and Equipment Laws of Various States. Automotive Industries, vol. 42, no. 21, May 20, 1920, pp. 1164-1165. Tables showing general features of State laws relating to headlights, dimmers, spotlight, turn or stop signals and mirrors for motor vehicles.

PRODUCTION INCREASE. Production Expansion Obtained in the Assembly Track Layout, J. Edward Schipper. Automotive Industries, vol. 42, no. 22, May 27, 1920, pp. 1210-1213, 6 figs. It is said that Hudson Co. has increased its production facilities from 160 to 250 cars daily by rearranging assembly track layout.

REAR AXLES, MANUFACTURE OF. Manufacturing Clark Rear Axles—II, Edward K. Hammond. Machy. (N.Y.), vol. 26, no. 9, May 1920, pp. 801-806, 14 figs. Description of methods used by Clark Equipment Co., Buchanan, Mich., in manufacture of automobile rear axles, including machining operations on dead and live axles, axle housings, brake supports, brake drums and gear cases.

TIRES, MOLDS FOR. Machining Molds and Cores for Auto Tires, W. O. Francis. Am. Mach., vol. 52, no. 21, May 20, 1920, pp. 1099-1102, 17 figs. Methods used by some of the large tire manufacturers.

USES IN WAR. Automotive Vehicles in the Great War, Clarence J. West. Jl. Soc. Automotive Engrs., vol. 6, no. 6, June 1920, pp. 409-416. Bibliography of important articles in technical journals of United States and other countries relating to use of automobiles and motor trucks.

See also Aluminum, Automobile Uses; Steel Manufacture, Automobile Steels.

BRIDGES

STRESS RECORDER FOR. The Fereday-Palmer Stress Recorder. Eng., vol. 109, no. 2822, Jan. 30, 1920, pp. 138-139, 19 figs. Patented machine designed for determining stresses on bridge members.

BRIDGES, CONCRETE

ARCH. Longest Concrete Arch Span Being Built at Minneapolis. Cement & Eng. News, vol. 32, no. 5, May 1920, p. 21, 1 fig. Arch will consist of two separate ribs of 400-ft. span between faces of piers, with rise of 88 ft. above springing line, at high-water level. Main arch is flanked at each end by one arch with clear span of 199 ft. and one of 55½ ft., total length of bridge over abutmnts being 1032 ft.

See also Bridges, Highway, Reinforced-Concrete.

BRIDGES, HIGHWAY

FLOOR JOISTS, LOAD CONCENTRATIONS ON. Load Concentrations on Steel Floor Joists of Wood Floor Highway Bridges, T. R. Agg and C. S. Nichols. Official Publication of Iowa State College of Agriculture & Mechanic Arts, vol. 17, no. 48, April 30, 1919, 31 pp., 24 figs. Investigation undertaken to determine manner in which heavy wheel loads, such as those of traction engines, are distributed to various I-beams and channels in highway-bridge floor system. It was found that concentration on single floor joist, equal to 55 per cent of one wheel load, is possible where single thickness of wood floor is laid on steel floor joists. Effects of loosening ends of plank, placing second layer of floor planks, etc., were also investigated.

REINFORCED-CONCRETE. Reinforced Concrete Highway Bridges, Public Works, vol. 48, no. 19, May 22, 1920, pp. 442-444. Details of design specifications and construction which should be studied with view to developing and standardizing practice in this branch of highway work as proposed by chairman of committee of Am. Concrete Inst.

KENOVA. Kenova Bridge, Channel Span Erection, Public Works, vol. 48, no. 19, May 22, 1920, pp. 437-439, 4 figs. Cantilever erection of 518-ft. centre span outside of old span under traffic. Adjacent anchor spans moved longitudinally and heavy girder ties shortened for erection adjustments. Centre panel erection connections adjusted by jacking up ends of connected spans.

BROACHES

TOOTH SIZES. Graphical Method of Designing Broaches, George C. Hanneman. Machy (N. Y.), vol. 26, no. 9, May 1920, pp. 823-824, 5 figs. Method for determining diameter or size of any tooth of a broach after total amount of stock to be removed has been determined.

BRONZE CASTINGS

ELASTIC PROPERTIES. Elastic Properties of Bronze Castings, George F. Comstock. Chemical & Metallurgical Eng., vol. 22, no. 24, June 16, 1920, pp. 1113-1118, 4 figs. Tests are quoted in which definite proportional limit was easily determined for bronzes, and suggestions is made that this test should replace "yield point" determinations.

BRONZES

SPECIFICATIONS. *See Brasses, Specifications.*

BUILDING CONSTRUCTION

CONCRETE, ADVANTAGES OF. Use of Concrete Increasing in All Permanent Construction. Concrete Products, vol. 18, no. 5, May 1920, pp. 15-17, 4 figs. Types of concrete construction used for building are reviewed. Special attention is given to reinforced-concrete flat slab which is said to be highest type of fire-resistive construction and to possess saving story height amounting to about one story in eight without cutting down usable clear headroom.

COST ESTIMATING. Elements That Must Be Considered in Cost Estimating. Eng. & Contracting, vol. 53, no. 20, May 19, 1920, pp. 567-569. Report of Committee on Cost Estimating of Northwestern Assn. of Gen. Contractors.

OLYMPIA EXHIBITION. The Building Exhibition at Olympia. Eng., vol. 109, no. 2833 and 2834, April 16 and 23, 1920, pp. 518-519 and 556-557, 3 figs. Briquetting press, concrete-title machine and concrete road-making machine.

CABLES, ELECTRIC

ENERGY LOSS IN DIELECTRIC. Energy Loss in the Dielectric of Industrial Cables (Sur la perte d'énergie dans le diélectrique des cables industriels), G. Renneson. Revue générale de l'Electricité, vol. 7, no. 18, May 1, 1920, pp. 579-581, 3 figs. Experimental. It was found that (1) at constant temperature and frequency, losses are proportional to square or power 2.5 of voltage and (2) at constant voltage and frequency, losses diminish at first up to 30 deg., where there is a minimum, and increase to 60 deg., limit to which experiments were carried.

OVERVOLTAGES. Overvoltages in Armored Cables and How to Prevent Their Occurrence (Surtensions par câbles armés et les moyens d'y parer), P. Bougherot. Revue générale de l'Electricité, vol. 7, no. 21, May 22, 1920, pp. 675-689, 7 figs. Computation of overvoltage occurring in long armored cable carrying alternating current when cable becomes grounded at or near the end of the line. Attention is directed to overvoltage produced by magnetic saturation of straining straps.

CAMS

DESIGN. Cam Design and Construction—XI and XII, Franklin DeR. Furman. Am. Mach., vol. 52, nos. 19 and 22, May 6 and 27, 1920, pp. 987-999, 13 figs., and 1129-1135, 16 figs. Elliptical arc for rolling cams. Effect of swinging transmitter arm between ordinary radial cam and follower.

CAR WHEELS

CHILLED-IRON. Manufacturing Chilled Iron-Car Wheels VI, H. E. Diller. Foundry, vol. 48, no. 12, June 15, 1920, pp 481-483, 5 figs Procedure for small wheels.

CARBON BLACK

MANUFACTURE FROM NATURAL GAS. Carbon Black, Roy O. Neal. Natural Gas & Gasoline Jl., vol. 14, no. 5, May 1920, pp. 143-145. Its manufacture from natural gas. Results of investigations by Bur. of Mines.

CARBURETORS

CLAUDEL. The Claudel Carburetor. Aviation, vol. 8, no. 8, May 15, 1920, pp. 342-326, 7 figs. Tube automatic compensating carburetor without moving parts.

METERING CHARACTERISTICS. Metering Characteristics of Carburetors, Percival S. Tice and H. C. Dickinson. Nat. Advisory Committee for Aeronautics, no. 49, 1919, 55 pp., 46 figs. Among results found in experimental tests are: Control of range of mixture ratios delivered by carburetor is obtainable by simple selection of ratio of length to diameter for fuel metering passage; coefficient of discharge has almost constant value for throat velocities greater than 145 ft. per second; effect upon carburetor capacity of usual rates and amplitudes is practically negligible; mixture ratio for maximum power is practically constant at all air densities; and ordinarily employed variations in structure and in method of fuel control in carburetors effect inappreciable modifications of altimetric compensation.

CARS

JOURNAL BOXES. Standard Method of Packing Journal Boxes. Ry. Age, Daily Edition, vol. 68, no. 24, June 15, 1920, pp. 1807-1809, 1 fig. Method recommended by Committee of Am. Railroad Assn., Mech. Section.

OSCILLATIONS ON CURVES. Recommendations for the Mitigation of Detrimental Oscillations of Railroad Cars on Curves (Gedanken und Vorschläge zur Milderung der nachteiligen Schwankungen der Eisenbahnfahrzeuge in den Gleiskrummungen), G. Maas. Annalen für Gewerbe u. Bauwesen, vol. 85, no. 12, Dec. 15, 1919, pp. 97-100, 5 figs. Description and illustrations of a car so constructed that when rounding a curve the axles assume position of radii to the curve.

CARS, FREIGHT

DOUBLE BOLSTER. The Double Bolster Wagon. Ry. Gaz., vol. 32, no. 20, May 14, 1920, pp. 721-722. Type which can be used either as 12-ton ordinary freight car or as double olster.

CEMENT GUN

COVERING MINE BUILDINGS. Gunite Forms an Excellent Material for Covering Mine Buildings. Coal Age, vol. 17, no. 24, June 10, 1910, pp. 1185-1188. Frame buildings with gunite covering it is claimed, are cheaper than cement structures covered with sheathing and clapboards and nearly fireproof, only the trim requiring repainting.

CEMENT, PORTLAND

BLAST-FURNACE SLAG. Iron Portland Cement, with Classification of Cements Made from Blast-Furnace Slag, Edwin H. Lewis. Iron & Steel Inst., Paper 6. Annual Meeting, May 6 and 7, 1920, 10 pp. Cements made from blast-furnace slag are divided into five classes: (1) Blast-furnace slag as cement: (2) slag cements; (3) portland cement; (4) improved slag cement; and (5) iron portland cement. How far iron portland cement can comply with tests required in British standard specification for portland cement is indicated.

CENTRAL STATIONS

ANNUAL LOAD FACTOR. Developing the Electrical Possibilities in Arkansas. Elec. World, vol. 75, no. 22, May 29, 1920, pp. 1265-1267, 6 figs. How combination of seasonal loads and ordinary commercial lighting and power loads gives high annual load factor to Arkansas light & Power Co.

CONNECTIONS. Relative Merits of Connections Employed in High-Voltage Generating Stations, Ernest Pragst. Gen. Elec. Rev., vol. 23, no. 5, May, 1920, pp. 386-391, 8 figs. Suggestions for planning system of connections for central station.

POWER FACTOR. The Power Factor of Central Stations (La question du facteur de puissance), Pierre Dumartin. Revue générale de l'Electricité, vol. 7, no. 20, May 15, 1920, pp. 643-656. Methods of improving power factor are discussed. Judicious combination of synchronous motors and phase compensators installed at places where energy is consumd, is preferred.

SUPERPOWER. Design of a Superpower Station, H. Goodwin, Jr. Gen. Elec. Rev., vol. 23, no. 5, May, 1920, pp. 399-418, 15 figs. Method of designing is exemplified by working out case of steam-turbine generating station of 245-000-kw., 300,000-kva. capacity and 66,000-volt distribution.

CONVERTERS

SYNCHRONOUS. 60-Cycle Converting Apparatus, J. L. Burnham. Gen. Elec. Rev., vol. 23, no. 5, May, 1920, pp. 392-398, 12 figs. Devices which have been developed to prevent flashing of commutator when converters used for voltages of 500 and 600 are subjected to short-circuits or quick changes in load.

COPPER ALLOYS

PHOSPHOROUS-COPPER. Fifteen Per Cent. Phosphor-Copper—New Process for Making, P. E. Dummler. Min. & Metallurgy, no. 162, June 1920, pp. 32-33. Uniform product is obtained, it is said, by passing phosphorus vapor over copper heated to temperature of 400 deg. cent.

COPPER DEPOSITS

JEROME ARIZ. Geology and Ore Deposits of Jerome District, Louis E. Reber. Min. & Metallurgy, no. 161, May 1920, pp. 25-27. Notes on copper deposits of Jerome district of north central Arizona, which ranks sixth among copper camps of United States.

COPPER METALLURGY

SMELTER SLAGS. Copper and Magnetite in Copper Smelter Slags—I, Charles G. Maier and G. D. Van Arsdale Chemical & Metallurgical Eng., vol. 22, no. 24, June 16, 1920, pp. 1101-1107, 30 figs. Chemical and microscopic examination of series of representative slags, showing how copper losses occur, relation of magnetite to copper loss, behavior of converter slags in reverberatory furnaces and suggestions for reducing copper slag losses.

CORONA

LOSS TESTS. Some Corona Loss Tests, W. W. Lewis. Gen. Elec. Rev., vol. 23, no. 5, May 1920, pp. 419-426, 12 figs. Results of tests on 150-mile transmission line at potentials up to about 200,000 volts. Comparison is made between measured and calculated losses.

CORROSION

IRON AND LEAD UNDERGROUND PIPE. Corrosive Action of Soils on Iron and Lead, L. A. Stenger. Chem. & Metallurgical Eng., vol. 22, no. 21, May 26, 1920, pp. 965-968, 1 fig. It is concluded from field and laboratory experiments that electrolysis of underground structures may be caused by definite conditions which are determinable by electrical measurements and study of environments. Method is suggested for prolonging life of iron structures in given soils. Long life of cast iron, it is pointed out, is due to its greater wall thickness.

See also Aluminum, Corrosion; Hot water Supply, Piping, Rust Prevention in.

COST ACCOUNTING

OVERHEAD, DISTRIBUTION OF. Handling "Overhead"—A Plan That Avoids Red Tape, S. P. Keator. Factory, vol. 24, no. 8, May 1, 1920, pp. 1343-1346. It is said that distribution of overhead costs can be greatly simplified if a method and forms are devised to secure simple and accurate expense reports from the shop. Practice of one plant is explained.

COST SYSTEMS

FOUNDRY. Standard Foundry Cost System—III. Foundry, vol. 48, no. 12, June 15, 1920, pp. 474-480. Depreciation rates for buildings and equipment.

COSTS

STEAM POWER. *See Steam Power Plants, Costs.*

WOODWORKING. *See Woodworking Industry, Costs.*

CRANES

TRAVELING. Five-Ton Electric Traveling Crane Moving Structural Steel by Means of Lifting Magnets (Pont roulant électrique de 5 tonnes pour le transport de profilés au moyen d'électro-aimants de levage). Génie Civil, vol. 76, no. 13, March 27, 1920, pp. 314-315, 4 figs., partly on supp. plate. Built at Oerlikon Works.

CUTTING METALS

BARTH SLIDE RULES. Supplement to Frederick W. Taylor's "On the Art of Cutting Metals"—IX, Carl G. Barth. Indus. Management, vol. 59, no. 6, June 1920, pp. 483-486, 8 figs. Construction of machine-tool slide rules for shapers and slotters, including rocker drive shaper, shapers and slotters with Whitworth quick-return motion.

DETECTORS.

See Vacuum Tubes, Uses as Detectors.

DIES

AUTOMOBILE PARTS. Dies for Automobile Oil Filler Cup, J. Bingham. Machy. (Lond.), vol. 16, no. 395, Apr. 22, 1920, pp. 78-79, 5 figs. Description of dies used in manufacture of an oil-filler cup or breathing tube for automobile engine, an illustration of each die in the order in which it is used, and a detail of shell as it appears after each operation.

DIESEL ENGINES

CAMMELLAIRD-FULLAGAR. The Cammellaird-Fullagar Marine Diesel Oil Engine. Eng., vol. 109, no. 2822, Jan. 30, 1920, pp. 144-146, 8 figs., partly on supp. plate. Two-cycle opposed-piston type. It is said that small space occupied by this engine permits its replacing steam engine and boilers of existing steamships without altering shafting or propellers.

UBMARINE. German Submarine Diesel Engines. Eng., vol. 109, no. 2836, May 7, 1920, pp. 613-614. It is stated that four-cycle engine was preferred in Germany for use in submarines because it involved fewer difficulties of construction and as it was more developed it was more reliable. Translated from "Schiffbau."

TREND IN MARINE TYPES. The General Trend of Diesel Marine Machinery. Eng., vol. 109, no. 2836, May 7, 1920, pp. 617-618. Survey of types being built in various countries.

DRAINAGE

ASSESSMENTS FOR. The Assessment of Drainage Districts, Lewis E. Ashbaugh. Iowa State College of Agriculture & Mechanic Arts, vol. 5, no. 2, Nov. 1906, 18 pp., 2 figs. Principles are suggested for governing distribution of expenses over various tracts, and also arithmetical method for computing assessments. Principle followed is that "assessment must be proportionate to the benefits received."

FARM. Recommendations for Farm Drainage, W. J. Schlick. Official Publication of Iowa State College of Agriculture & Mechanic Arts, vol. 17, no. 19, Oct. 9, 1918, 24 pp. Graphs are included for computing capacities of tile drains based on calculations by Kutter's formula with $n — 0.015$.

DROP FORGING

HAMMER LUBRICATION. Hammer Lubrication for Drop Forge Plant, R. V. Harty. Am. Drop Forger, vol. 6, no. 5, May 1920, pp. 244-246, 8 figs. Review of common practices of lubrication by hydrostatic and individual forced-feed systems. Advantages of central forced-feed system are enumerated.

DURALUMIN

See Aluminum Alloys.

ECONOMIZERS

ADVANTAGES. Economizers. W. F. Wurster. Jl. Engrs. Club of Philadelphia, vol. 37-6, no. 187, June, 1920, pp. 323-325, 5 figs. Construction features are explained and advantages pointed out.

ELECTRIC CIRCUITS, A.C.

METER CONNECTIONS. Switchboard Meter Connections for Alternating Current Circuits—VI, J. C. Group. Elec. Jl., vol. 17, no. 6, June 1920, pp. 251-253, 6 figs. Six-phase circuits.

OSCILLATORY. On the Period and Decrement of an Oscillatory Electrical Circuit Provided with a Short-Circuited Secondary, Iolo Jones. Lond., Edinburgh & Dublin Phil. Mag. & Jl. of Science, vol. 39, no. 233, May 1920, pp. 553-565, 8 figs. Mathematical study of effect on period and decrement of oscillation of system, of varying resistance of short-circuited coil.

ELECTRIC CONDUCTORS

RESISTANCE. Section-Length-Resistance Relations of Conductors, E. B. Merrill. Elec. News, vol. 29, no. 10, May 15, 1920, pp. 30-31, 1 fig. Chart showing interrelation of resistance, length and cross-section of various conductors. Arranged for determining resistance of various sizes of wire of principal metals for lengths from 0.01 ft. to 1000 miles.

ELECTRIC DRIVE

See Rolling Mills, Electrically Driven.

ELECTRIC FURNACES

ARC, ELECTRODE CONTROL. Automatic Control of Arc Furnace Electrodes, J. A. Seede. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 6, June 1920, pp. 593-597, 7 figs. Methods of electrode regulation.

HEAT-TREATING. Metallic Resistor Electric Furnaces for Heat Treating Operations, E. F. Collins. Gen. Elec. Rev., vol. 23, no. 5, May 1920, pp. 433-441, 16 figs. Types are described in which heat element consists of bare exceptionally heavy metallic ribbon uniformly distributed over interior of furnace.

REACTORS FOR. Reactors for Electric Furnace Circuits, Harry A. Winne. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 6, June 1920, pp. 589-592. 8 figs. Methods of introducing reactance into furnace circuits.

RESISTANCE TYPE. Electric Furnaces of the Resistance Type for Heat Treating, T. F. Baily. Elec. Furnace, vol. 1, no. 45, April-May 1920, pp. 3-5 & pp. 18-19, 6 figs. Survey of types which have been built for heat-treating plants. Paper read before Detroit Chapter of Am. Soc. for Steel Treating.

SELF-BAKING ELECTRODES FOR. The Söderberg Self-Baking Electrode, Joseph W. Richards. Iron Age, vol. 105, no. 17, Apr. 22, 1920, pp. 1171-1173, 4 figs. Norwegian invention insuring continuous electrode supply to furnace. Describes how mixture is made and advantage of Söderberg electrode. From paper presented before Am. Electrochemical Soc. of Boston.

MAGNETIC FLUX. A Direct Recording Method of Measuring Magnetic Flux Distribution, F. S. Dellenbaugh, Jr. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 6, June, 1920, pp. 583-587, 2 figs. Revolving search coil fitted with collecting device and operating at high and constant speed.

ELECTROLYSIS

See Corrosion.

ELEVATORS

MECHANICAL INTERLOCKS. Mechanical Elevator Interlocks, Clayton W. Old. Safety Eng., vol. 39, no. 5, May 1920 pp. 243-251, 3 figs. Study of elevator shaft door accidents, their causes and current means of prevention. From Proc. of Am. Soc. of Safety Engrs.

ROPES. Reserve Strength of Elevator Ropes, W. Voigtlander. Safety Eng., vol. 39, no. 4, Apr. 1920, pp. 194-197, 7 figs. Gives results of tests of 6 × 19 ropes showing reserve strength, and illustrates method of socketing wire rope. From Proc. of Am. Soc. of Safety Engrs.

EMPLOYEES' REPRESENTATION

STANDARD OIL COMPANY. Employee Representation on the Job in Standard Oil, Burton Kline. Indus. Management, vol. 59, no. 6, June 1920, pp. 496-501. Experience of Standard Oil Co. during past two years in which conferences between employee representatives and officers have been held periodically at refineries and oil fields.

TREND OF. Trends in Management, William Leavitt Stoddard. Factory, vol. 24, no. 9, May 15, 1920, pp. 1544-1546, 7 figs. Gives charts from which, it is said, progress in employee representation movement may be studied profitably.

ENGINEHOUSES

STANDARD DESIGNS. A Unit Construction Method for Engine Houses. Ry. Age, vol. 65, no. 24, June 11, 1920, pp. 1663-1667, 6 figs. Standard designs developed by Pennsylvania system.

EXPLOSIVES

TESTS. Theoretical Maximum Pressure Developed in Own Volume by Thirteen Military Explosives, J. E. Crawshaw. Jl. of Franklin Inst., vol. 189, no. 5, May 1920, pp. 607-625. Results of tests performed at Explosives Experiment Station of Bur. of Mines.

TNT. TNT as a Blasting Explosive, Charles E. Munroe and Spencer P. Howell. U. S. Dept. of Agriculture, Dept. Circular no. 94, May 1920, 24 pp., 12 figs. Results of investigations conducted at U. S. Bureau of Mines to discover safest and best ways of utilizing TNT for industrial blasting purposes. Physical and chemical properties of different grades of explosives are given, together with precautions to be observed in handling, packing, preparation of cartridges, and charging, and results of field tests in blasting stumps, rocks and other work are presented and compared with similar results obtained from dynamite.

FACTORY MANAGEMENT

See Industrial Management.

FERROALLOYS

ELECTRIC MANUFACTURE. Electric Practice in Making Ferroalloys, W. A. Darrah. Iron Age, vol. 105, nos. 15 and 17, Apr. 8 and 22, 1920, pp. 1019-1021 and 1170. American electric ferromanganese is compared with the blast furnace product. Notes on losses and power consumption, and commercial conditions. Raw materials and operating practice for ferrosilicon.

Manufacture of Electric Ferroalloys, C. B. Gibson. Iron Age, vol. 105, no. 16, Apr. 15, 1920, pp. 1102-1103. Notes on factors affecting success, design of furnace for various alloys, power consumption, and recent improved devices.

PROPERTIES. Variation of Magnetic Properties, Resistivity and Density of Ferroalloys with Their Chemical Composition and Thermal Treatment (Variations des propriétés magnétiques, de la résistivité et de la densité des alliages de fer avec leur composition chimique et leur traitement thermique), E. Gumlich. Revue générale de l'Électricité, vol. 7, no. 18, May 1, 1920, pp. 581-588, 10 figs.

FILTERS

CLEANING. Scientific Control of the Filter Station—III, Arthur Wright. Chemical & Metallurgical Eng., vol. 22, no. 24, June 16, 1920, pp. 1119-1122, 3 figs. Discussion on washing and drying filter cakes, and blowing with air or steam to displace filtrate, wash liquor and water.

MOORE. Vacuum and Compressed Air for Industrial Filtration (L'emploi du vide et de l'air comprimé pour la filtration), Léonce Fabre. Génie Civil, vol. 76, no. 18, May 1, 1920, pp. 405-409, 15 figs. Moore immersion and suction filters.

FLIGHT

PHYSICS OF. The Physics of Flight, David L. Webster. Jl. of Franklin Inst., vol. 189, no. 5, May 1920, pp. 553-580, 8 figs. Laws of aerodynamics are stated and their application to flight of aeroplanes discussed.

FLOATING DOCKS

DESIGN. The Design of Floating Docks. Public Works of the Navy, Under the Cognizance of the Bureau of Yards and Docks and the Corps of Civil Engineers. U. S. Navy, Bul. no. 31, Apr. 1920, pp. 47-83, 12 figs. Maximum moments are calculated for bulkhead, cross girders and side walls. Structure considered consists of single side walls connected by girders which are in turn connected by continuous main bulkhead. Translation of two articles, one published in Zeitschrift für Bauwesen in 1892, and another in Schiffbau of May 8, 1912, latter being amplification and generalization of method outlined in former article.

FLOORS

REINFORCED-CONCRETE. Charts Giving Thickness and Reinforcement of Reinforced-Concrete Floor Slabs (Diagrammes donnant les épaisseurs et les reforcements des dalles de hourdis en béton armé), Henri Kampmann. Génie Civil, vol. 76, no. 13, March 27, 1920, pp. 312-314, 3 figs. One chart gives thickness for slab of known length required to support known load, and another the reinforcement required for slab.

FLOTATION

ABSORPTION CONDITIONS. Flotation from the Standpoint of Colloidal Chemistry (Die Schwimmaufbereitung vom Standpunkt der Kolloidchemie), P. Vageler. Metall u. Erz, vol. 17, no. 5, Mar. 8, 1920, pp. 113-119. Writer maintains that as a purely qualitative method of investigation the flotation method is the most unsuitable; but recommends as promising genuine success in regard to the whole problem, a quantitative, systematic study of the absorption conditions in three-phase and multi-phase systems of the most important ores in connection with the technical reagents. Address delivered before Soc. of German Met. & Min. Engrs.

MACHINES. A New Flotation Machine, A. W. Fahrenwald. Pahasapa Quarterly, vol. 9, no. 3, April 1920, pp. 125-130. Pneumatic machine designed without porous bottoms.

FLOW OF FLUIDS

LAWS. The Laws of Elastico-Viscous Flow—II. Jl. Geology, vol. 28, no. 1, Jan.-Feb. 1920, pp. 18-24. Concerning combination of laws of Larmor and of Maxwell proposed by Harold Jeffreys (see monthly notices of Royal Astronomical Soc., vol. 77, no. 5). First article appeared in Jl. Geology, vol. 25, 1917, pp. 405-410.

FLOW OF WATER

RESERVOIRS. Equilibrium of Water Flowing Into Reservoir (Sur le régime permanent dans les chambres d'eau), M. C. Camichel. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 17, April 26, 1920, pp. 986-988. General formulæ giving distribution of velocities in liquid mass according to three rectangular axes.

FLYING BOATS

HULLS. Flying Boats—The Form and Dimensions of Their Hull, G. S. Baker. Eng., vol. 109, no. 2827, March 5, 1920, pp. 323-327, 6 figs. Dynamics requirements of hull are considered under the several headings of diving at low speed, seaworthiness, and ability to change trim at high speeds. Comparison is made between results obtained in full-scale tests and of similar results deduced from tank experiments.

Notes on Flying Boat Hulls, Linton Hope. Flight, vol. 12, nos. 21, 22 and 23. May 20, 27, and June 3, 1920, pp. 546-548, 5 figs., 569-573, 9 figs., and 590-593, 5 figs. Also Aeronautics, vol. 18, no. 344, May 20, 1920, pp. 396-399. Paper read before Royal Aeronautical Society. Deals with method of designing flying-boat hulls and with estimation of weights and proportions.

FOREMEN

PLACE IN INDUSTRIAL PROGRESS. The Foreman's Place in Industrial Progress. Eng. & Indus. Management, vol. 3, no. 18, Apr. 29, 1920, pp. 557-559. Deals with importance of foreman's part in industrial progress as "link" between manager and workers.

FORTIFICATIONS

GERMAN, IN BELGIUM. The German Defences on the Coast of Belgium, H. W. Miller. Mech. Eng., vol. 42, no. 6, June 1920, pp. 319-333, 28 figs. Description of system of fortification employed, together with particulars regarding guns, fire-control stations, shelters, etc., and details of mechanism of various batteries.

FOUNDATIONS

FOOTINGS. Flat Foundations—Concrete, Reinforced Concrete, Masonry, etc. [Étude sur les fondations par empattements (Béton, béton-armé, maçonneries, etc.)], Aimé Willame and Henri Chenu. Annales des Travaux publics de Belgique, vol. 21, no. 2, feb. 1920, pp. 7-81, 26 figs. Mathematical study of stresses. Stresses developed at bottom of massive base are computed approximately from theory of flexure.

See also Machinery.

Steam Pipes. Heat Insulation Facts, L. B. McMillan. Jl. Am. Soc. Heat & Vent. Engr., vol. 26, no. 4, May, 1920, pp. 387-402, 7 figs. Curves showing rates of heat losses from uninsulated surfaces, chart indicating heat lost by bare steam pipe and saving which may be secured by using good covering graph of variation of heat transmission for various thicknesses of material on flat surfaces, etc.

HEAT TREATING

Plant Layouts. Heat Treating Plant for Traction Parts, Edmund Blasko. Am. Drop Forger, vol. 6, no. 5, May 1920, pp. 222-227, 4 figs. Notes on layout and management.
Layout of Heat Treating Plant for Tools, John J. Jones. Am. Drop Forger, vol. 6, no. 5, May 1920, pp. 228-229, 2 figs. Suggestions in regard to layout, construction and operation.

Plant . General Industrial Heat Treating Plant, William J. Merton. Am. Drop Forger, vol. 6, no. 5, May 1920, pp. 216-221, 5 figs. Analysis of factors to consider in plant.

See also Electric Furnaces, Heat-Treating.

HEATING AND VENTILATION

Health and Humidity. Symposium on Health and Humidity, E. Vernon Hill and J. J. Aeberly. Jl. Am. Soc., Heat & Vent, Engrs., vol. 26, no. 4, May 1920, pp. 471-488, 9 figs. Subjects discussed were relation of death rate to wet-bulb temperature prevailing, and relation of wet-bulb temperature to health.

HEATING

Central-Station. *See Heat Losses, Pipes Buried in Ground.*

HEATING, ELECTRIC

Drying Ovens. Electric Heating in Steel Wire Manufacture, Am. Drop Forger, vol. 6, no. 5, May 1920, pp. 236-238, 2 figs. Comparative cost statistics taken at plant of Halcomb Steel Company on drying ovens heated electrically and similar ovens using coke and steam.

Industrial. Industrial Electric Heating, Wirt S. Scott. Jl. Am. Soc. Heat & Vent. Engrs., vol. 26, no. 4, May 1920, pp. 431-440, 7 figs. Advantages claimed are cleanliness, absence of objectionable gases and of products of combustion, elimination of fire hazard, ease of operation, economy and automatic maintenance of temperature.

HELIUM

U. S. Plant, Fort Worth, Tex. United States Helium-Production Plant, Fort Worth, Tex., Willard A. Pollard. Public Works of the Navy, Under the Cognizance of the Bureau of Yards and Docks and the Corps of Civil Engineers, U. S. Navy, Bul. no. 31, Apr. 1920, pp. 13-46, 10 figs. Helium is extracted from natural gas by compression of incoming gas to high pressure, removal of heat of compression by circulation of cold water, progressive cooling resulting from expansion of highly compressed gas through expansion value to low pressure, and application of cold waste gases and closed external refrigerating cycles of nitrogen and CO_2 as refrigerating media. Capacity of plant is 40,000 cu. ft. of helium per day.

HOT-WATER SUPPLY

Piping, Rust Prevention in. The Prevention of the Red-Water Plague, Wm. H. Walker. New England Water Works Assn., vol. 34, no. 1, March 1920, pp. 33-38 and (discussion) pp. 38-48, 6 figs. System for deactivation of water which has been installed in large apartment house in New York City.

HOUSES, CONCRETE

Block and Tile. Concrete Block and Tile House Construction. Contract Rec., vol. 34, no. 19, May 12, 1920, pp. 441-443. Code of recommended practices for concrete block and tile house construction reported by special committee ot Nat. Conference on Concrete House Constructon.
Recommended Practice for Block and Tile House Construction. Concrete Products, vol. 18, no. 5, May 1920, pp. 19-21, 1 fig. Report of Sub-Committee A of Nat. Conference on Concrete House Construction.

Rapid Construction. Confortable and Permanent Industrial Homes of Concrete. Compressed Air. Mag., vol. 25, no. 5, May 1920, pp. 9649-9650, 2 figs. Industrial housing project sponsored by Ingersoll-Rand Co. of New York for its factory employees at Phillipsburg, N. J.

HOUSING

Eliminating Slums. Eliminating the Slums, Emile G. Perrot. Jl. Engrs. Club of Philadelphia, vol. 37-6, no. 187, June 1920, pp. 235-241, 15 figs. Danger of unfit housing is pointed out as well as economic advantages resulting from erecting sanitary industrial houses. Typical models in industrial villages in England and United States are illustrated.

Industrial. The Financial Problems of Industrial Housing, Leslie H. Allen. Mech. Eng., vol. 43, no. 6, June 1920, pp. 346-348. Housing shortage is said to be due partly to fear of financial panic and partly to fact that, high as rents are, they are not high enough to show adequate return on present-day construction costs. Relation of rents to capital invested, calculation of proper rents, and methods of financing house construction are discussed. A scheme of co-operative housing is suggested as solution of present housing problems.
Your Housing Problem. Factory, vol. 24, no. 8, May 1, 1920, pp. 1317-1323, 10 figs. Ideas for meeting it, drawn from an investigation among 1,000 industrial concerns.

See also Houses, Concrete, Rapid Construction.

HUMIDITY

See Heating and Ventilation.

HYDRAULIC TURBINES

Wear. Wear of Hydraulic Turbines, Its Consequences and the Means of Reducing It (L'usure des turbines hydrauliques, ses conséquences et les moyens d'y parer), Henry Dufour. Bulletin technique de la Suisse romande, vol. 46, no. 9, May 1, 1920, pp. 97-100, 3 figs. Sandsettling basin in hydroelectric plant at Ackersand (Valais). (Continuation of serial.)

HYDROELECTRIC PLANTS

Ontario, Can. The Central Ontario System of Hydro-Electric Power, G. B. Smith. Jl. Eng. Inst. of Canada, vol. 3, no. 6, June 1920, pp. 289-292, 1 fig. System comprises seven power houses operating in parallel and feeding into a system of 370 miles of 44,000-volt transmission lines.

Semi-Protable Machine Shelters. An Alternative for Outdoor Generators, Henry G. Reist. Gen. Elec. Rev., vol. 23, no. 5, May 1920, pp. 360-361. Reference is made to article on Outdoor Generators published in Gen. Elec. Rev., March 1920. It is suggested that in order to overcome difficulties there envisaged arising from sluggishness developed by lubricating oils in cold weather, standard generators be used and housed under inexpensive semi-portable shelters.

INDUSTRIAL MANAGEMENT

Bibliography. A List of Bibliographies on Industrial Engineering and Management. Soc. Indus. Engrs., vol. 3, no. 6, May 1920, 23 pp. Compiled by Committee on Research of Society of Industrial Engineers.

Counsel. Why Industry Seeks Competent Counsel, L. V. Estes. Indus. Management, vol. 59, no. 6, June 1920, pp. 475-480. Significance of competent counsel in improvement and progress of induseries.

Employees, Contentment of. Making Employees Interested in Their Work, Harry Dexter Kitson. Am. Mach., vol. 52, no. 19, May 6, 1920, pp. 983-985. Psychological principles involved in process of arousing interest of employees.

Group Working. Grouping Workers to Get Best Results, Eugene J. Benge. Factory, vol. 24, no. 8, May 1, 1920, pp. 1332-1333, 3 figs. It is claimed if each workman in a group produces about same as his nieghbor, there is likely to be less dissatisfaction and greater total output. Plan is said to be measure of working force's effectiveness.
The Lincoln Motor Production Plan, I. J. Beatty. Factory, vol. 24, nos. 8 and 9, May 1 and 15, 1920, pp. 1328-1332 and 1547-1549, 2 figs. Notes on working; dispatching assemblies and recording operations.

Machine Records. Keeping Tab on Machines That Loaf, A. B. Burgess Factory, vol. 24, no. 8, May 1, 1920, p. 1339, 2 figs. Method of showing management at all times number of machines in operation.

Planning. Output Planning, A. Robert Stelling. Elecn., vol. 84, no. 2189, Apr. 30, 1920, pp. 487-491, 4 figs. Writer contends that planning is a factor in the elimination of waste and should be considered as much a separate function of management as cost accounting and treated as such. Notes on the principles of planning with illustrations of "route sheets" for assembly and machine work.

Production Methods. Increasing Production Without a Bonus—II, Fred H. Colvin. Am. Mach., vol. 52, no. 20, May 13, 1920, pp. 1041-1044. Part played in plan of management of White Motor Co. by monthly publication, The White Book, in which, it is said, all questions are freely and frankly discussed.
Installing Gantt Production Methods, Wallace Clark. Indus. Management, vol. 59, no. 6, June 1920, pp. 443-448. System which permits foremen to fill his orders as rapidly as possible and in proper sequence, and to operate every machine when there is work for it to do.
"Limits" and Their Relation to Increased Production, W. Groocock. Eng. & Indus. Management, vol. 3, no. 17, Apr. 22, 1920, pp. 515-517. The question of mass production of individual commodities is said to be intimately associated with principle of utilizing labor-saving machines for production of numerous articles which are at present employing large amount of manual labor. Discussion of problems of organization and machinery for production of such labor-saving machines.
Mass Production, H. W. Allingham. Elecn., vol. 84, no. 2189, Apr. 30, 1920, pp. 478-479, 3 figs. Writer points out difficulties of mass production in engineering and discusses mass production in a gas-fittings factory, the motor-car industry, etc.
Moderm Production Methods—III, IV, and V, W. R. Basset. Am. Mach., vol. 52, nos. 19, 21 and 23, May 6 and 20 and June 3, 1920, pp. 1003-1008, 7 figs., 1087-1090, 2 figs., and 1177-1182, 11 figs. Need for systematic stock keeping is pointed out and record forms are illustrated, May 20: Organization of engineering department. June 3: Tool-order forms and follow-up cards.
The Manufacture of Houseshold Appliances, J. V. Hunter. Am. Mach., vol. 52, no. 23, June 3, 1920, pp. 1173-1174, 5 figs. Method employed for quantity production by Hurley Machine Co., Chicago.

See also Group Working.

Routing. Routing Gears and Machine Parts Through the Factory, J. A. Urquhart. Am. Mach., vol. 52, no. 24, June 10, 1920, pp. 1231-1236, 11 figs. Method used at plant of Brown & Sharpe Mfg. Co. Paper read before Am. Gear Manufacturers' Assn.

Shipyards. Industrial Organization Applied to Shipyard Management, Norman Howard. Indus. Management, vol. 59, no. 6, June 1920, pp. 492-495, 6 figs. Work of industrial management section of Emergency Fleet Corporation.

See also Cutting Metals; Ship-Building, Production System; Time Study.

IRON

INDIRECT. Illumination of Artistic Interiors Without the Use of Pendant Ceiling Fixtures, Augustus D. Curtis and J. L. Stair. Trans. of Illuminating Eng. Soc., vol. 15, no. 1, Feb. 10, 1920, pp. 61-73 and (discussion) pp. 73-76, 14 figs. Examples of indirect lighting are illustrated, notably in American Theatre of Chicago, National Bank of Commerce, New York, and Hotel Commodore Lobby, New York.

INDUSTRIAL. A Survey of Industrial Lighting in Fifteen States, R. O. Eastman. Trans. of Illuminating Eng. Soc., vol. 15, no. 1, Feb. 10, 1920, pp. 77-93 and (discussion) pp. 93-96, 17 figs. Based on visits to representative plants.

See also Factory.

STREET. Intensive Street Lighting, W. D'Arcy Ryan. Gen. Elec. Rev., vol. 23, no. 5, May 1920, pp. 362-373, 12 figs. Details of "intensive white way" system of illumination installed in principal streets of various cities.

Recent Developments in Gas Street Lighting, F. V. Westermater, Am. City (Town & County Edition), vol. 22, no. 5, May 1920, pp. 490-492, 3 figs. Fixtures are illustrated and a table is given showing illuminating powers of different lamps used.

The Trend of Modern Practice in Street Lighting, W. E. Underwood. Elec. Rev. (Chic.), vol. 76, no. 24, June 12, 1920, pp. 980-983, 4 figs. Practice in connection with transformers, mounting heights, glassware and series and multiple systems.

LIGHTNING ARRESTERS

ALTERNATING-CURRENT. Alternating-Current Lightning Arresters, V. E. Goodwin. Gen. Elec. Rev., vol. 23, no. 5, May 1920, pp. 429-432, 8 figs. Survey of developments with special reference to aluminum cell and oxide-film arrester.

LIGNITE

MINING. *See Excavating Machines, German.*

LOCOMOTIVE BOILERS

COPPER VS. STEEL TUBES. Locomotive Boiler Tubes: Copper v. Steel, Gerard A. Muntz. Ry. Gaz., vol. 32, no. 18, April 30, 1920, pp. 655-656, 1 fig. First cost of steel tubes is said to be nearer one-half than one-third that of copper. Life of steel tubes is given as 120,000 train-miles, whereas life of copper tubes is put at 360,000 train-miles.

LOCOMOTIVES

BRITISH. A British Ten-Wheel-Coupled Locomotive, W. Parker. Ry. & Locomotive Eng., vol. 33, no. 5, May 1920, p. 131, 1 fig. Description of a 4-cylinder 0-10-0 locomotive for banking trains up an incline with gradient of 1 in 37.7 built at Derby Works for the Midland Railway of England.

CYLINDER VALVES. New Application of Piston Valves to Slide Valve Cylinders, J. Snowden Bell. Ry. & Locomotive Eng., vol. 33, no. 5, May 1920, pp. 142-143, 3 figs. Description and illustrations of what is said to be a new and entirely practical method of converting inside steam-pipe slide-valve locomotive cylinders into outside steam-pipe piston-valve cylinders, devised and patented by Patrick Sheedy, superintendent of motive power of Southern Pacific System at Los Angeles, Cal.

EFFICIENCY, INCREASING. How to Increase the Efficiency and Operating Capacity of Steam Locomotives, B. B. Milner. Official Proc. New York Railroad Club, vol. 30, no. 6, April 16, 1920, pp. 6069-6089 and (discussion) pp. 6089-6095, 4 figs. Suggestions in regard to installing feedwater heater and trailer booster and lightening reciprocating and revolving weights by use of alloy steel.

ELECTRIC. *See Electric Locomotives.*

FUEL FOR. *See Coal, Iowa and Illinois.*

OIL-BURNING. Heavy Oil as Locomotive Fuel (Le chauffage aux huiles lourdes appliqué aux locomotives), L. Pierre-Guédon. Génie Civil, vol. 76, no. 14, April 3, 1920, pp. 329-333, 10 figs. Burner for oil residue used in locomotives of Paris, Lyons and Mediterranean Railway.

REPAIRING. Scheduling and Routing Systems for Locomotive Repairs, Ry. Age Daily Edition), vol. 68, no. 24a, June 11, 1920, pp. 1716-1917, 4 figs. Practices of several railroads. Committee report presented at meeting of Mechanical Section, American Railroad Assn.

SPEED INDICATORS. Speed Indicators and Recorders for Application to Locomotives. Ry. Gaz., vol. 32, no. 22, May 28, 1920, pp. 794-795, 4 figs. Description of "Teloc" locomotive speed indicator and recorder, recently put on the market by Hasler Telegraph Works, London.

STEEL FOR. Report on Specifications and Tests for Materials. Ry. Age, Daily Edition, vol. 68, no. 24, June 15, 1920, pp. 1795-1800, 4 figs. Practice recommended by Committee of Am. Railroad Assn., Mech. Section, in regard to method of manufacture and tests of steel for tires of locomotives and cars, boiler and fire box of locomotives, journal bearings, axles, shafts and other forgings.

SUPERHEATER. Cylinders of 0-8-0 Type Superheater Locomotive; North-Eastern Railway. Eng., vol. 109, no. 2824, Feb. 13, 1920, pp. 208-209, 11 figs. Details of cylinders, and records of trials of locomotive.

0-10-0 Type Superheater Locomotive for the Midland Railway. Eng., vol. 109, no. 2827, Mar. 5, 1920, pp. 311 and 314, 15 figs., partly on 2 supp. plates. Data: Cylinders, four, 16¾-in. diameter by 28-in. stroke; valve motion, Walschaerts; wheels, diameter, 4 ft. 7½-in.; total heating surface, 1718.25 sq. ft.; superheater surface, 445 sq. ft.; working boiler pressure, 180 lb. per sq. in.; tractive force at 85 per cent boiler pressure, 43,312 lb.; weight of engine in working order, 72 tons 13 cwt.

Report of Committee on Superheater Locomotives. Ry. Age (Daily Edition), vol. 68, no. 24a, June 11, 1920, pp. 1720-1721. Installation, operation, care, and maintenance of superheater equipment for locomotives. Committee report presented at meeting of Mechanical Section, American Railroad Assn.

TENDER CONNECTIONS. Safety Connections Between Engine and Tender. Ry. Age, (Daily Edition), vol. 68, no. 24a, June 11, 1920, pp. 1707-1711, 6 figs. It is urged that all new locomotives be built with central safety bar located immediately beneath drawbar, and where construction of locomotive and tender prevents this, that two safety bars be applied, one located on each side of drawbar and as near thereto as possible. Committee report presented at meeting of Mechanical Section, American Railroad Assn.

WHEEL-BALANCING MACHINE. Locomotive Wheel Balancing Machine, Engr., vol. 129, no. 3354, Apr. 2, 1920, pp. 354-355, 7 figs. Axle is placed on bearings which are each supported on four springs so arranged that bearings may "float" and "dither" with axle, should wheels when spun be out of strict balance.

MACHINE SCREWS

See Bolts.

MACHINE TOOLS

ADJUSTING STRIPS, SLIDES, ETC. Recent Machine Tool Developments—XI, Joseph Horner. Eng., vol. 109, no. 2833, Apr. 16, 1920, pp. 505-508, 46 figs. Adjusting strips, and lubrication of slides.

MACHINERY

FOUNDATIONS FOR. Fastening Machines to Concrete Floors and Foundations, Arthur F. Owen. Machy. (N.Y.), vol. 26, no. 9, May, 1920, pp. 820-821, 5 figs. Description and illustrations of common methods of fastening machine tools to concrete floors and types of drills employed to drill holes in concrete floors and foundations.

MANGANESE ORE

INDIA, MINING. Manganese-Ore Mining in India, E. N. T. Slater. Eng. & Min. Jl., vol. 109, no. 21, May 22, 1920, pp. 1155-1159, 7 figs. Rich deposits in jungle were worked by open pits, gravity planes being used for collecting ores at loading points. Condition and propects of industry are noted, together with marketing of ores in England.

MARINE ENGINES

See Diesel Engines, Trend in Marine Types; Oil Engines.

MARINE STEAM TURBINES

REDUCTION GEARS. Reduction Gearing on Steamships. Eng., vol. 109, no. 2836, May 7, 1920, pp. 599-601, 6 figs. Notes on their design.

MATERIALS

DUCTILE, RESISTANCE OF. On the Resistance of Ductile Materials to Combined Stresses in Two or Three Directions Perpendicular to One Another, H. M. Westergaard. Jl. of Franklin Inst., vol. 189, no. 5, May 1920, pp. 627-640, 9 figs. Various theories for determining resistance of materials to combined stresses are discussed. In particular stress-solid resulting from application of maximum shear and maximum strain theory is indicated.

MERCHANT MARINE

LABOR PROBLEM. The Labor Problem and its Influence Upon the Merchant Marine of the Future, Waldon Fawcett. Int. Mar. Eng., vol. 25, no. 6, June, 1920, pp. 513-515. Opinion is expressed that one solution for American labor problem in maritime industries and for high costs of operation is to be found in employment of vessels of maximum size.

METALS

See Chemical Analysis, Metals, X-Ray.

METEOROLOGY

FREE-AIR CONDITIONS. Average Free-Air Conditions as Observed by Means of Kites at Drexel Aerological Station, Nebr., During the Period November, 1915, to December, 1918, inclusive, Willis Ray Gregg. Monthly Weather Rev., vol. 48, no. 1, Jan. 1920, pp. 1-11, 8 figs. Tables and figures are given indicating monthly, seasonal and annual values of different elements at various levels up to 5 km. Data are compared with similar data for Mount Weather, Blue Hill and elsewhere, and separate table contains comparative values of air density as determined by different investigators for various parts of the world.

PREDICTING MINIMUM TEMPERATURES. Predicting Minimum Temperatures from Hygrometric Date, J. Warren Smith. Monthly Weather Rev., Supp. no. 16, 76 pp., 57 figs. Application of mathematical methods to forecast minimum temperatures is exemplified.

METRIC SYSTEM

ARGUMENTS AGAINST ADOPTION IN U. S. Adoption of the Metric System Would Do Untold Damage, Henry R. Towne. Indus. Management, vol. 59, no. 6, June, 1920, pp. 473-477. Abandonment of present basic standards would involve, it is claimed, damage beyond easy comprehension, injury to organized industries, injury to commerce and needless inconvenience to the people.

OIL FIELDS

Geology of. Geologic and Economic Features of Oil Structures, Victor Ziegler. Economic Geology, vol. 15, no. 3, April-May, 1920, pp. 247-258. It is claimed that (1) comparatively recent age of formation, (2) slight folding, very closely following period of deposition, and (3) rock originally rich in organic remains, are features favoring maximum accumulation of oil.

Russia. The Oil Fields of Russia, A. Beeby Thompson. Min. & Metallurgy, no. 161, May 1920, pp. 27-29. Notes on Baku oil fields. Operated area of 250 acres is said to have produced over 500,000 bbl. per acre.

OIL FUEL

See Petroleum.

OIL TANKS

Reinforced-Concrete. Concrete Storage Tanks for Fuel Oil Square and Circular, R. E. Parker. Concrete, vol. 16, no. 5, May 1920, pp. 213-217, 11 figs. Two types, one circular and one rectangular, built by Aberthaw Construction Co., are illustrated and described.

Steel. New Design for Oil Tankage, H. T. Carlton. Eng. & Min. Jl., vol. 109, no. 19, May 8, 1920, pp. 1078-1079, 2 figs. Type developed by D. O'Hara and A. L. Shaw, of San Francisco involving suspended steel "arch," which has recently been patented.

OILS

Blended, Viscosity of. The Saybolt Viscosity of Oil Blends, Winslow H. Herschel. Chemical & Metallurgical Eng., vol. 22, no. 24, June 16, 1920, pp. 1109-1112, 3 figs. Charts for determining oil blends of components of known viscosity, including logarithmic rule and correction factors to be applied in calculations, and tables of viscosities of blends containing 25,50 and 75 per cent of heavier oil

OPEN-HEARTH FURNACES

Waste-Heat Utilization. Steel Plant Power Generation from Waste Heat and Coal, B. H. Greene. Assn. of Iron & Steel Elec. Engrs., Jan. 1920, pp. 25-27, 3 figs. Writer presents some practical problems encountered in utilization of waste heat from open-hearth furnaces for generation of power for steel mill use. Description of an installation, wherein steam derived from waste heat was supplemented by coal-fired boilers and used for electric power generation.

OXY-ACETYLENE CUTTING

Manhole-Cutting Machine. Oxy-Acetylene Manhole Cutting Machine. Eng., vol. 109, no. 2836, May 7, 1920, p. 606, 4 figs. Machine constructed by Davis-Bournonville Co., Jersey City, for repetition cutting of manholes to template.

OXY-ACETYLENE WELDING

See Autogenous Welding.

PACKING

See Boxes.

PAPER MANUFACTURE

Pulp-Grinder Speed Control. Increasing Efficiency by Speed Control of Turbine-Driven Pulp Grinders, Adolph F. Meyer. Paper, vol. 26, no. 11, May 19, 1920, pp. 11-19, 14 figs. Method of controlling speed of hydraulic turbines is explained, and tachometer charts are given showing results secured with governor under average conditions.

PARACHUTES

Static Burns. Recent Data on Parachutes, Floyd Smith. Aviation, vol. 8, no. 9, June 1, 1920, pp. 369-370. Experimental study of friction static burns developed in silk parachutes.

PAVEMENTS

Labor Requirements. Method of Estimating Labor Hour Requirements on Paving Work, D. B. Davis. Eng. & Contracting, vol. 53, no. 18, May 5, 1920, pp. 508-509, 7 figs. Writer points out that in making an estimate of certain work a chart showing various conditions relating to work will help to guarantee against omission of important details. Brief study for determining labor-hour requirements for some divisions of work connected with a brick paving job in a city is included.

PAVEMENTS, ASPHALTIC CONCRETE

Types. Asphaltic Concrete Pavement, W. H. Connell. Can. Engr., vol. 38, no. 24, June 10, 1920, pp. 543-544, 559 and 561. Best asphaltic concrete pavements, writer has found in his experience as road builder, is a patented one which specifies 7½ per cent of asphalt 8 to 10 per cent of limestone or Portland cement dust, 50 to 55 or 60 per cent of stone and 25 to 30 per cent of sand.

PAVEMENTS, STONE

Granite-Block. Granite Block on Old Concrete Base. Public Works, vol. 48, no. 19, May 22, 1920, pp. 441-442, 1 fig. Repaving part of Park Avenue, New York, for heavy traffic,with granite blocks replacing asphalt blocks on original base.

PEAT

Pulverized. Pulverized Peat Firing in Sweden (Die Torfstaubfeuerung in Schweden), P. Wangemann. Feuerungstechnik, vol. 8, no. 7, Jan. 1, 1920, pp. 53-58, 16 figs. It is pointed out that in America the difficulty of pulverized coal firing was overcome by increased drying and finer grinding, whereas in Sweden the opposite method was employed of adapting burner to coarser material with greater water content, both methods proving successful. Advantages and disadvantages of both methods are discussed. Results of experiments are said to show that pulverized peat firing results in higher superheat temperature than anthracite firing.

PETROLEUM

Colombian Law. The Colombian Petroleum Law, J. W. Thompson. Eng. & Min. Jl., vol. 109, no. 21, May 22, 1920, pp. 1170-1172. Regulations concerning development and providing royalties to be paid. Foreign companies required to have local representatives. Development or production tax of 8-6-4 per cent, determined by distance from sea coast.

U. S. Supply. Relief from Oil Shortage, Oswald F. Schuette. Gas Age, vol. 45, no. 9, May 10, 1920, pp. 422-423. Proposals under consideration by United States Congress for obtaining fuel oil for United States vessels.

PETROLEUM INDUSTRY

Progress 1916-18. The Petroleum Industry in the Years 1916-1918 (Die Erdölindustrie in den Jahren 1916-1918), Richard Kissling. Chemiker-Zeitung, vol. 43, nos. 153, 154 and 155, Dec. 20, 23 and 25, 1919, pp 897-899, 905-909, and 913-916. A review of production and of literature, patents, processes, etc., from all parts of the world.

PHASE MODIFIERS

Commutator Type. Commutator Phase Shifters (Ueber Kommutator-Phasenschieber), J. Kozisek. Elektrotechnische Zeitschrift, vol. 41, no. 3, Jan. 15, 1920, pp. 52-55, 15 figs. Notes on effect of saturation and extension of compensating field. Other means of extension, such as three-phase regulation of phase shifters, excess compensation at full load, etc., are discussed.

PHOTOMETERS

Photoelectric. A Photoelectric Photomoter, Arthur H. Compton. Trans. of Illuminating Eng. Soc., vol. 15, no. 1, Feb. 10, 1920, pp. 28-33, 1 fig. Use of thermionic amplifier to increase current readings of photoelectric cells is suggested, also filter to reduce proportion of blue light and render indications proportional to photometric value. With such equipment, lamps are compared by varying their distances to cell, until deflection of galvanameter is the same as that given by standard lamp.

Photometric Integrator. A Universal Photonetric Integrator, Frank A. Benford. Trans. of Illuminating Eng. Soc., vol. 15, no. 1, Feb. 10, 1920, pp. 19-27, 12 figs. Apparatus for testing military searchlights. It consists of photometer track 150 ft. long on which rides hemispherical light-collecting shell with small portable-type photometer attached and system of curtains along track to absorb stray light.

PIERS

Design. Pier Design for Ocean and Lake Terminals, H. McL. Harding. Int. Mar. Eng., vol. 25, no. 6, June 1920, pp. 523-528, 11 figs. It is advanced that single-unit piers about 700 ft. long to be used by freight-carrying ships should be 140 ft. to 150 ft. wide, with slips 280 ft. to 300 ft. wide. Suggestions are made in regard to equipment to install.

PIPE LINES

Fuel-Oil. Crude Oil and Kerosene (La mazout et le pétrole lampant), Auguste Pawlowski. Génie Civil, vol. 76, no. 16, Apr. 17, 1920, pp. 365-370, 3 figs. Notes on importation of fuel oil into France, particularly on projected pipe line from Havre to Paris.

PIPE, WROUGHT-IRON

Manufacture. Manufacture of Wrought Iron Pipe, N. Bowland. Machy. (N.Y.), vol. 26, no. 9, May, 1920, pp. 844-849, 20 figs. Description of various steps in production of wrought-iron pipe, beginning with puddling process and ending with inspection.

PIPING

Calculations for. A Graphic Method for the Calculation of Steam and Air Piping (Eine allegemeine graphische Methode, augewendet bei der Berechnung der Dampf- end Luftleitungen), Alexander Fisher. Zeitschrift für das gesamte Turbinenwesen, vol. 16, no. 36, Dec. 30, 1919, pp. 391-393. Description of a general method by means of which it is said to be possible to make calculations of quantities and in which the functional relationship between quantities is given in the form of a diagram or table of figures. In complicated cases in connection with the logarithmographic method of Mehmke it is said to arrive at results rapidly.

Power-Plant. Design and Construction of Power-Plant Piping, John D. Morgan. Power, vol. 51, no. 20, May 18, 1920, pp. 797-799, 2 figs. Suggestions regarding design and construction of piping including materials used, valves, fittings and types of joints of various pressures and temperatures.

RESEARCH

ENGLAND. Report of First Conference of Research Organizations. Department of Scientific and Industrial Research. C. R. O. no. 1, July 29, 1919, 30 pp. Means of co-operating of various research organizations in British industries discussed.

Report of Second Conference of Research Organizations. Department of Scientific and Industrial Research, C. R. O. no. 2, Dec. 12, 1919, 30 pp., 1 fig. Development of research work in British industries.

POST-WAR, STIMULATION OF. The Stimulation of Research After the War, R. A. Harper. Science, vol. 51, no. 1324, May 14, 1920, pp. 473-478. Scientists, it is said, should set an example of discriminating judgment and careful analysis of evidence against "evolutionary theories promulgated by visionary and ill-trained statesmen and politicians, by properly regulating and co-ordinating research so that each problem shall receive its fit proportion of attendance, and making provision in research for "that free and untrammeled environment where personal inclination and initiative are the major factors."

See also Nitrogen, Fixation of.

RESERVOIRS, WATER

MECHANICS OF. Application of the Principles of Images to a Water Reservoir (Application du principe des images aux chambres d'eau), C. Camichel. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 19, May 10, 1920, pp. 1106-1107. Experimental application of Lord Kelvin's principle to the distribution of velocities in a water reservoir.

See also Flow of Water.

RIVERS

IMPROVEMENT. Construction of Lock D, Cumberland River, Rufus W. Pafford. Military Engr., vol. 12, no. 61, Jan.-Feb. 1920, pp. 13-20 and 77 and (discussion) pp. 77-78. Details of design and construction of one of the six locks comprising project for improvement of that part of river from Nashville, Tenn., to mouth, called Lower Cumberland.

MISSISSIPPI, MOUTH OF. An Open Mouth for the Mississippi River, Allen E. Washburn. Proc. Louisiana Eng. Soc., vol. 6, no. 1, Feb. 1920, pp. 17-32 and (discussion) pp. 32-41. Survey of work done to maintain navigable entrance to New Orleans, and visualization of probable future developments.

RIVETED JOINTS

DESIGN. The Design of Riveted Joints, James Montgomerie. Eng. & Indus. Management, vol. 3, no. 18, Apr. 29, 1920, pp. 547-548, 1 fig. Information based on experiments carried out at instance of Committee of Lloyd's Register of Shipping concerning physical qualities of riveted joints. Paper presented before Instn. Engrs. & Shipbuilders in Scotland.

RIVETING

ELECTRIC MACHINE FOR. The "Remca" Electric Riveting Machine. Eng., vol. 109, no. 2836, May 7, 1920, pp. 625-626, 6 figs. Patented machine manufactured by Mada Eng. Co., Ltd., Liverpool.

ROAD CONSTRUCTION

PERSONNEL FOR. Training the Personnel for Highway Construction and Transport, Clyde Jennings. Automotive Industries, vol. 42, no. 21, May 20, 1920, pp. 1145-1147. Opinions expressed at joint educational conference at Washington, May 14 and 15.

ROADS

DESIGN. Traffic Census as Basis for Road Design, W. A. McLean. Contract Rec., vol. 34, no. 23, June 9, 1920, pp. 544-546. Experiences in Ontario and Massachussetts.

MATERIALS, TESTS FOR. Road Materials. Report of Committee D-4 Annual Meeting. Am. Soc. Testing Matls., June 22-25, 1920, 44 pp., 2 figs. Tests are suggested for specific gravity of road oils, road tars, asphalt cements and soft tar pitches and for quantity of clay and silt in gravel for highway construction; also for proportions for concrete for highway construction.

ROADS, BITUMINOUS

SURFACING. Bituminous Surface Treatment, M. C. Welborn. Good Roads, vol. 19, no. 23. June 5, 1920, pp. 287-290. Practice of Texas State Highway Dept.

WARRENITE-BITULITHIC. History of Warrenite-Bitulithic Roads and Some Discoveries in Pavement Construction, George C. Warren. Contract Rec., vol. 34, no. 20, May 19, 1920, pp. 458-460. Notes on asbestos-bitulithic and double re-flushcoating are included.

ROADS, CONCRETE

CONSTRUCTION. Constructing a Concrete Road in Nebraska, A. S. Mirick. Public Works, vol. 48, no. 21, June 5, 1920, pp. 493-494. Round, water-worn gravel of feldspar and quartz, the only material available in the state, was tested for use as the concrete aggregate and was found to make stronger concrete than Potomac River gravel. It is now being used for six miles of the Lincoln Highway.

The Industrial Railway in Road Work. Good Roads, vol. 19, no. 17, Apr. 28, 1920, pp. 217-218, 2 figs. Equipment used by contractors in Illinois and Michigan in construction of concrete roads.

DEVELOPMENTS. Recent Deve ~ ments in Concrete Road Construction, A. N. Johnson. Eng. & Contracting, vol. 53, no. 18, May 5, 1920, pp. 514-518, 2 figs. Notes on subgrade, coarse aggregate tests and tests of sand for organic impurities, consistency, proportions for mixing concrete, etc. Gives Abrams tables of proportions and quantities for 1 cu.yd. of concrete, and instruction for practical application of table, and example of use of table. Abstract of paper presented before Am. Road Builders' Assn.

ROADS, EARTH

MAINTENANCE. How to Improve and Maintain Earth, Clay and Sand Roads, A. R. Hirst. Can. Engr., vol. 38, no. 24, June 10, 1920, pp. 553-556. Experience of writer as highway engineer of state of Wisconsin.

ROCK DRILLS

CARE OF. Care of Rock Drills, Howard R. Drullard. Min. & Metallurgy, no. 162, June 1920, pp. 28-29, 1 fig. Suggestions in regard to lubrication of drills and method of forming drill shank.

ROLLER CHAIN

TRANSMISSION. Roller-Chain for Tractors and Power Transmission. Am. Mach., vol. 52, no. 24, June 10, 1920, pp. 1223-1226, 12 figs. Manufacturing process of Spaulding Chain Co., Bloomfield, N. J.

ROLLING MILLS

ELECTRICALLY DRIVEN. Electric Mill Drives, J. D. Wright. Assn. of Iron & Steel Elec. Engrs., Jan. 1920, pp. 15-24, 6 figs. Discussion of electric mill drives with particular reference to some of factors which influence selection of electric equipment for driving main rolls of various types of mills. Information which is necessary for calculating proper size of motor required to roll any given product.

Electric Drive for Rolling Mill for Lead Sheets. Eng., vol. 109, no. 2824, Feb. 13, 1920, pp. 215 and 218, 4 figs. Equipment consists of 90-hp. mill motor, 75-kw. motor generator set with 2-ton flywheel and Ward-Leonard control gear.

The Largest Rolling Mill in the World. Elecn., vol. 84, no. 2190, May 7, 1920, pp. 519-521, 5 figs. Description and illustrations of a 20,500 hp. electrically-driven British 42-in. plate mill of reversing type, turning out plates at rate of 60 tons per hr. for two hrs. and at rate of 30 tons per hr. for remainder of shift. (To be concluded.)

POWER DRIVES. Power Drives for Rolling Mills, W. O. Rogers. Power, vol. 51, no. 20, May 18, 1920, pp. 800-803, 6 figs. Various types of engine valves are treated as applying to rolling mill units. Reference is made to two large poppet-valve uniflow engines operating a 9- and 12-in. merchant mill. These engines operate with condensers and have disk-driven governors so designed that engine speed can be regulated while engine is in operation.

SCREW-DOWN MOTOR CONTROLLERS. Control of Blooming Mill Tables and Screw-Downs, Walter C. Kennedy. Jl. Engrs. Club of Philadelphia, vol. 37-6, no. 187, June 1920, pp. 227. Design and characteristics of screw-down motor controllers.

SHIP-PLATE. The Dominion Iron and Steel Company's New Ship-Plate Rolling Mill, H. E. Rice. Iron & Steel of Canada, vol. 3, no. 4, May 1920, pp. 116-119, 3 figs. Latest type of mill erected at cost of $5,000,000 and put into operation Feb. 19, 1920.

ROPE DRIVE

COTTON ROPE. Cotton Rope for Power Transmission, J. Melville Alison. Jl. Eng. Inst. of Canada, vol. 3, no. 6, June 1920, pp. 292-298, 10 figs. Discussing comparative advantages of cotton and Manila rope, it is claimed, that although cotton is dearer than Manilla, "its superior resilience, grip and groove impact add so greatly to driving force that up to one-third more horsepower may be transmitted." It is stated that cotton has entirely supplanted any other material for transmission work in England. Table of horsepowers transmitted by three-strand cotton driving rope of various diameters is included.

RUBBER

VULCANIZATION OF. The Acceleration of Vulcanization, D. F. Twiss and S. A. Brazier. Jl. Soc. Chem. Indus., vol. 39, no. 9, May 15, 1920, pp. 125T-132T, 10 figs. Experimental study of three methods: (1) raising temperature, (2) increasing proportion of sulphur relative to rubber, and (3) introducing accelerator.

RUBBER INDUSTRY

ELECTRICITY, APPLICATIONS OF. Electricity in the Rubber Industry, C. W. Drake. Can. Chem. Jl., vol. 4, no. 5, May 1920, pp. 133-135. Discusses high load and power factors for rubber plants.

RUST PREVENTION

STEAM

ALIGNMENT DIAGRAM. A Steam Alignment Diagram, D. Halton Thomson. Eng., vol. 109, no. 2827, Mar. 5, 1920, pp. 301-305, 10 figs. Based on equations for properties of steam propounded by Prof. H. L. Callendar.

STEAM POWER PLANTS

AUXILIARIES. Electric Drive for Station Auxiliaries, E. E. George. Elec. World, vol. 75, no. 24, June 12, 1920, pp. 1365-1366. Motors operated with steam diverted from intermediate stage of turbines for feedwater heating are said to be more economical than steam-driven auxiliaries.

COSTS. Power Costs During Years 1914 to 1919, Hubert E. Collins. Indus. Management, vol. 59, no. 6, June 1920, pp. 467-472, 1 fig. Summary of records of 14 representative plants. Conditions that prevailed in plants are surveyed, noting changes in power costs that took place during the years of the war. Tables of costs of heating industrial buildings, distribution of power consumption between various departments of industrial plants, and costs of softening boiler feed water using lime and soda ash, are given.

STEAM TURBINES

GEARED, LUBRICATING SYSTEM FOR. Lubricating System for Geared Turbines, J. Emile Schmeltzer and B. G. Fernald. Int. Mar. Eng., vol. 25, no. 6, June, 1920, pp. 508-510, 1 fig. Standard oiling system developed by Emergency Fleet Corporation for adoption on vessels equipped with geared turbines. Paper read before Soc. of Nav. Architects and Mar. Engrs.

STEEL

GALVANIZED, STRENGTH OF. Metallographical Study on Galvanized Steel, Y. Taji. Eng., vol. 109, no. 2827, Mar. 5, 1920, pp. 327-329, 19 figs. Results of experiments. Of special interest were values found for alternating strength of steel bar both before and after galvanization, which were 25.2 and 24 tons per sq. in. respectively. Paper read before Soc. of Naval Architects, Japan.

NITROGEN IN. Nitrogen in Steel, and the Erosion of Guns, H. E. Wheeler. Min. & Metallurgy, no. 160, April 1920, p. 32. Experiments conducted at testing laboratory of Watertown Arsenal.

SULPHUR AND PHOSPHORUS IN. Sulphur and Phosphorus in Steel, E. E. Thun. Jl. Am. Steel Treaters Soc., vol. 2, no. 8, May 1920, pp. 368-391. Survey of technical literature on effect of sulphur and phosphorus on quality of steel. Outline of tests to be conducted by representative committee appointed upon initiative of Am. Soc. for Testing Materials, U. S. Railroad Administration and Bur. of Standards for investigation of problem.

Metallurgical Theories Conflict. Foundry, vol. 48, no. 12, June 15, 1920, pp. 467-468 and p. 495. Bibliography on effect of phosphorus and sulphur in steel compiled by joint committee of several technical societies.

The Distribution of Phosphorus in Steel Between the Points AC1 and AC3, J. H. Whiteley. Iron & Steel Inst., Paper 9, Annual Meeting, May 6 & 7, 1920, 24 pp. 24 figs. Steels in which phosphorus varied from 0.006 to 0.12 per cent were heated to and maintained at temperatures between critical points Ac1 and Ac3. Part of phosphorus contained in Y-iron diffused into adjacent ferrite. At temperatures below 650 deg. cent. phosphorus diffused extremely slowly in ferrite; above this temperature, velocity gradually increased, and above 800 deg. cent. it was rapid. Velocity of diffusion of phosphorus in Y-iron also increased with temperature.

See also Chromium Steel; Chrome-Nickel Steel; Nickel Steel.

STEEL CASTINGS

DESIGN. Practical Notes on the Design and Treatment of Steel Castings, George F. Preston. Iron & Steel Inst., Paper 7, Annual Meeting, May 6 & 7, 1920, 12 pp., 9 figs. Suggestions to designers of castings.

STEEL, HEAT TREATMENT OF

BALL BEARINGS. The Heat Treatment of Ball Bearing Steel, Carl T. Hewitt. Jl. Am. Steel Treaters Soc., vol. 2, no. 8, May 1920, pp. 395-399, 5 figs. Practice at plant of Fafnir Bearing Co.

BRAZED FITTINGS FOR AIRCRAFT. Heat-Treating of Brazed Fittings for Aircraft, Archibald Black. Am. Mach., vol. 52, no. 23, June 3, 1920, pp. 1184-1186, 4 figs. Includes typical list of steels used in aircraft work with their approximate properties.

QUENCHING BATHS. Fuels, Burners and Quenching Mediums for Heat-Treatment, S. P. Rockwell. Machy. (N. Y.), vol. 26, no. 9, May 1920, pp. 837-840, 5 figs. Points out advantages and disadvantages of different kinds of fuel and types of burners, and gives description of results obtained by various quenching baths.

TOOL HARDENING. Some General Principles of Tool Hardening, A. E. Bellis. Jl. Am. Steel Treaters Soc., vol. 2, no. 8, May 1920, pp. 364-367. Emphasizes that practical means of controlling results from foundry, through rolling annealing, forging, and hardening, is to maintain uniformity of composition and uniformity of heat treatment.

STEEL, HIGH-SPEED

HARDENING AND TEMPERING. Note on the Structural Constitution, Hardening, and Tempering of High-Speed Steel Containing Chromium and Tungsten, Kotaro Honda and Takejior Murakami. Iron & Steel Inst., Paper 15, Annual Meeting, May 6 & 7, 1920, 11 pp. It is concluded from experimental analysis that in annealed state, high-speed steel containing about 5 per cent chromium, 18 per cent tungsten and 0.6 per cent carbon consists of iron dissolving tungstide, free tungstide and carbides, Cr_4C and WC, in free state. Tungstein, it is said, lowers maximum temperature at which, during cooling, self-hardening property of steels begins to take place. Abstract from 32nd Report of Iron & Steel Research Inst. of Japan.

TESTING. A Comparative Test of High-Speed Steels, A. J. Langhammer. Am. Mach., vol. 52, nos. 19, 22 and 24, May 6 and 27 and June 10, 1920, pp. 979-982, 1140-1143, 4 figs, and 1227-1230. Method of procedure in testing sixteen different commercial brands of high-speed tool steel, together with data as to performance of each individual tool, its chemical composition, heat treatment, and hardness.

A Comparative Test Upon High-Speed Steels—IV, A. L. Langhammer. Chem. & Metallurgical Eng., vol. 22, no. 21, May 26, 1920, pp. 969-975, 18 figs. It is concluded from tests that chemical analysis of high-speed steel may be used only as indicator of its possible qualities. It is advised that in conducting a test no less than four specimen tools should be used, and in order to get most efficient results from high-speed steel tools they must be operated under heavy duty.

STEEL MANUFACTURE

AUTOMOBILE STEELS. The Essentials of High-Grade Steel Manufacture, W. R. Shimer. Jl. Soc. Automotive Engrs., vol. 6, no. 6, June 1920, pp. 387-393. Selection of raw materials.

ELECTRIC-FURNACE. The Manufacture of Steel in the Electric Arc Furnace (Le four à arc pour la fabrication de l'acier), H. Verdinne. Revue universelle des Mines, vol. 5, no. 2, April 15, 1920, pp. 107-132. Economical advantages. (Conducted.)

OPEN-HEARTH PROCESS. Notes on Slag Conditions in Open-Hearth Basic Steel-Making Practice, Jno. F. Wilson. Iron & Steel Inst., Paper 10, Annual Meeting, May 6 & 7, 1920, 22 pp., 3 figs. Opinion is expressed that in fluid state, slags cannot contain any "free acids" or "free bases," and can be viewed as solution of different chemical compounds in one another. "Free acids" or "free bases," by themselves, it is said, demand higher temperatures to bring them to a molten condition than is usually attained by steel furnace slag.

The Reduction of Silicon from the Slag in the Acid Open-Hearth Process, B. Yaneske and G. A. Wood. Iron & Steel Inst., Paper 12, Annual Meeting, May 6 & 7, 1920, 20 pp., 2 figs. Five examples of finished steels which were found to contain much higher percentage of silicon than was expected from finishing additions, are described.

STEEL WORKS

ELECTRICALLY DRIVEN. Direct Curernt Compared with Three-Phase Current for Driving Steelworks Plant, C. A. Ablett. Iron & Steel Inst., Paper, Annual Meeting, May 6 & 7, 1920, 17 pp. 2 figs. Direct-current motors are preferred because they are capable of speed variation over wide range without loss of power, while three-phase motors are not capable of such variation without considerable loss of power unless they are of complicated and costly type, "and therefore not well suited to many steel works purposes."

LORRAINE, FRANCE. Lorraine Steel Works in French Hands. Machy. (London), vol. 105, no. 15, April 8, 1920, pp. 1023-1024 and 1039. Abstract of report of trade commissioner J. F. Butler sent from Paris to Bureau of Foreign & Domestic Commerce at Washington, giving account of extent of industry in annexed territory, difficulties with labor under new ownership, etc. Output is said to be only one-third of normal.

MACHINERY, FRENCH WORKS. Machinery at the Steel Works of the Société Normande de Métallurgie, Caen, France. Eng., vol. 109, no. 2826, Feb. 27, 1920, pp. 284 and 293-294, 24 figs. partly on 4 supp. plates. Metal mixer, ladle cranes, soaking pits, and billet-handling cranes. (Concluded.)

REPAIR SHOPS. Steel Mill Electrical Repair Shop Practice, A. J. Standing. Assn. of Iron & Steel Elec. Engrs., April 1920, pp. 19-28 and (discussion) pp. 28-45. Writer claims as most plants are rather spread out, it is necessary to decide on one or two definite policies; first, the use of one large central repair shop to which all damaged apparatus is sent for repairs, or second, the use of a somewhat smaller central repair shop, together with several small local repair shops in isolated parts of mill. Recommends electrical storeroom in conjunction with shop, and discusses correlation between construction and maintenance, etc.

STRIKES

LAW GOVERNING. The Law and the Labor Unions, Kenneth M. Spence. Indus. Management, vol. 59, no. 6, June 1920, pp. 433-438. Exposition of law governing coal, railroad and other strikes. Rights and limitations of employees to strike and of employers to close their plants and cease to do business, are explained. It is demonstrated how certain rights that belong to an individual do not belong to a combination of individuals. Theory is advocated that disputes in industry should be determined on a broader basis than mere law, by applying social and economic principles.

STRUCTURAL STEEL

PRESERVATIVE COATINGS FOR. Report of Committee D-1, Annual Meeting, Am. Soc. Testing Matls., June 22-25, 1920, 32 pp., 4 figs. Theory of preservative coatings for structural materials. Tentative specifications for turpentine.

SUBMARINES

GERMAN. German Submarines, A. W. Johns. Eng., vol. 109, no. 2830, March 26, 1920, pp. 428-432, 9 figs. Information as to types, number, cost and other particulars.

SUGAR

ANALYSIS. The Double-Polarization Method for Estimation of Sucrose and the Evaluation of the Clarget Divisor, Richard F. Jackson and Clara L. Gillis. Dept. of Commerce, Sci. Papers, Bur. of Standards, no. 375, March 30, 1920, pp. 125-194, 2 figs. Velocity of inversion of sucrose was measured at temperatures from 20 to 90 deg. cent. and was found to follow exponential law proposed by Arrhenius. Rates of reaction were measured for three different concentrations of hydrochloric acid. Time required under different conditions to produce 99.99 per cent inversion is computed and tabulated.

WAGES

France. Excess Wages Paid to Heads of Families (Le sursalaire familial), Paul Razous. Génie Civil, vol. 76, no. 21, May 22, 1920, pp. 475-477. Practices of French companies. One company, for example, gives excess wages of 240 francs a year to employees having one child, 600 francs a year for two children, and 600 francs a year for each child above two.

German Mechanics. The Cost of Labor in Germany. Am. Mach., vol. 52, no. 23, June 3, 1920, pp. 1197-1198. Tables showing minimum wages paid to mechanics in different parts of Germany according to recent wage agreements.

Gradual Rise of. The Evolution of Wage and Price Levels, H. H. Manchester. Am. Mach., vol. 52, no. 22, May 27, 1920, pp. 1123-1127, 2 figs. Historical study of relation between wages and their producing power.

See also Bonus System.

WARSHIPS

Battle Cruiser H. M. S. Hood. H. M. S. Hood, Eustace D'Eyncourt. Eng., vol. 109, no. 2830, Mar. 26, 1920, pp. 423-426, 3 figs. Principal data: Length between perpendiculars, 810 ft.; length overall, 860 ft.; breadth, extreme, 104 ft.; load draught, mean, 28 ft. 6 in.; displacement at load draught, 41,200 tons; speed at load draught, 31 knots; oil fuel capacity, 4,000 tons.

H. M. Battle Cruiser "Hood." Eng., vol. 109, no. 2830, Mar. 26, 1920, pp. 397-399 and 414, 16 figs, partly on 4 supp. plates. Notable departure from existing types is "blister" surrounding main hull of ship as protection against effective attack by torpedo. Propelling machinery consists of four sets of Brown-Curtis turbines driving propeller shafting through single reduction gearing.

Destroyers. Geared Turbines for Torpedo Boat Destroyers. Int. Mar. Eng., vol. 25, no. 6, June 1920, pp. 479-480, 2 figs. Arrangement of engine room in U. S. S. Clemson. Particulars of destroyer are: Displacement, 1200 tons; horsepower, 28,000; speed, 35 knots.

Reduction Gears. Experience and Practice in Mechanical Reduction Gears in Warships, H. B. Tostevin. Eng., vol. 109, no. 2832, April 9, 1920, pp. 474-480 and p. 482, 16 figs. Changes introduced since 1910 in type then first adopted by British Admiralty. Attention is particularly directed to sprayer used for lubricating reduction gears of British torpedo-boat destroyers. Paper read before Instn. Naval Architects.

WASTE ELIMINATION

Industrial Opportunities for. Fields for Investigating Waste Elimination, A. Thau. Iron Age, vol. 105, no. 17, Apr. 22, 1920, pp. 1155-1157. Writer points out that there are a number of works which without their revenue being supplemented by substantial income from their by-product plants would financially be unable to exist and tells how coke-oven by-product recovery began. He adds notes on heat of discharged coke for steam making, putting incandescent coke into blast furnace, a coke-quenching machine in England, and utilizing carbon dioxide from chimneys in a German iron works.

WASTES

Municipal, Disposal of. Disposal of Municipal Wastes, Joseph Goder. Public Works, vol. 48, no. 19, May 22, 1920, pp. 444-446. Writer discusses several methods of disposal, giving his reasons for concluding that incineration is decidedly preferable for some classes of waste in all cases and for all classes in some cases. Interrelation of collection and local characteristics of several classes of waste material with most desirable method of disposal is pointed out.

WATER FILTRATION

Mechanical. Investigations on the Presence of Alumina Hydrate in Mechanically Filtered Water, Norman J. Howard and Frank Hannan. Contract Rec., vol. 34, no. 20, May 19, 1920, pp. 454-455. Work was done at Toronto filtration plant laboratories. Occurrence of aluminum hydrate was noticed in all waters examined. Its presence in Toronto water, however, is believed to be devoid of any sanitary significance.

WATER GAS

Gas-Oil Situation. Gas Oil Situation Analyzed, J. B. Klumpp. Gas Age, vol. 45, no. 11, June 10, 1920, pp. 503-506, 1 fig. Statement prepared by Gas-Oil Committee of Am. Gas Assn. for emergency committee conference.

Production. Addition of Water Gas to City Illuminating Gas (L'introduction du gaz "à l'eau" dans le gaz "de ville"), A. Grebel. Génie Civil, vol. 76, no. 13, March 27, 1920, pp. 305-312, 12 figs. Economics resulting from adding water gas to city illuminating gas are pointed out, and various processes of manufacturing water gas are described, notably Dellwik-Fleischer and Humphreys-Glasgow.

WATER HAMMER

Calculation of. Calculation of Water Hammer in Conduits Formed of Two or Three Sections of Different Diameters (Calcul de coup de bélier dans les conduites formées de deux ou de trois tronçons de diamètres différents), Ed. Carey. Bulletin Technique de la Suisse Romande, vol. 46, no. 10, May 15, 1920, pp. 111-115, 6 figs. Formulæ for various special cases. (Continuation of serial.)

WATER TREATMENT

Chlorination. Chlorination as a Means of Disinfecting Municipal Water Supplies, G. G. Nasmith. Contract Rev., vol. 34, no. 23, June 9, 1920, pp. 532-537. Advantages of method, with notes on amounts of chlorine required by different waters.

Pumps. Modern Pumps for Small Water Works, Creed W. Fulton. New England Water Works Assn., vol. 34, no. 1, March 1920, pp. 1-22 and (discussion) pp. 23-27, 11 figs. Pumps for plants where daily consumption does not exceed 3,000,000 gal.

WATER WORKS

Motor-Driven Pumps. Motor Driven Centrifugal Pumps at Quincy, Ill., W. R. Gelston. Public Works, vol. 48, no. 22, June 12, 1920, pp. 504-507, 1 fig. Both low-lift and high-lift pumps and booster pumps are driven by electricity. Water Department finds these pumps "economical and very reliable and satisfactory," and it is said that reserve steam equipment is seldom used.

Toronto. Growth of New Toronto Waterworks System from Village Supply to Large Plant, E. M. Proctor. Contract Rec., vol. 34, no. 23, June 9, 1920, pp. 518-522, 12 figs. Present average daily pumpage is 2,500,000 gal.

WATTMETERS

Thermal. The Thermal Storage Demand Wattmeter, Paul M. Lincoln. Elec. Jl., vol. 17, no. 6, June 1920, pp. 253-256, 6 figs. Schematic diagram of operation. Reference is made to article in Trans. Am. Inst. Elec. Engs., vol. 37, p. 189, explaining principle of operation of thermal wattmeter.

WELDING

See Autogenous Welding; Electric Welding, Arc.

WIND TUNNELS

Air-Flow Visualization. Study of Flight Vortices, F. W. Caldwell and E. N. Fales. Eng., vol. 109, nos. 2833 and 2834, April 16 and 23, 1920, pp. 501-504, 9 figs., and 534-537, 15 figs. Method of visualizing air flow in wind tunnel by fog condensation of moisture in air is explained and photographs of flight vortices thus obtained are presented.

Model Experiments. Wind Tunnel Studies in Aerodynamic Phenomena at High Speed, F. W. Caldwell and E. N. Fales. Nat. Advisory Committee for Aeronautics, Report No. 83, 1920, 52 pp., 42 figs. Description of model wind-tunnel experiments, McCook Field wind tunnel and of method there employed of visualing flight vortices by condensation of moisture in air, together with account of model tests on propeller aerofoils.

Static Pressure Gradients. Static Pressure Gradients in Wind Tunnel Work, J. G. Coffin. Aviation, vol. 8, no. 8, May 15, 1920, pp. 317-318, 4 figs. Formula for computing tunnel axis force, and method of computing pressure-gradient corrections.

See also Laboratories, Aeronautic.

WIRE ROPE

See Elevators, Ropes.

WOOD

Drying. Phenomena of Drying Wood, Harry D. Tiemann. Jl. of Franklin Inst., vol. 189, no. 5, May 1920, pp. 645-648, 1 fig. Analogistic ex planation of "casehardening" or the relations of "set" and stresses that occur in drying wood.

WOODWORKING INDUSTRY

Costs. Accumulation of Costs in Woodworking, Carle M. Bigelow. Indus. Management, vol. 59, no. 6, June 1920, pp. 480-482. Interpretation of woodworking factory costs.

WORKMEN'S COMPENSATION

Kentucky Coal Mine. Coal-Mine Compensation in Kentucky, Herbert M. Wilson. Coal Age, vol. 17, no. 25, June 17, 1920, pp. 1259-1262. Inspection reports, safety-engineering service, low cost and checking up of experience records are said to be features of system designed to exceed possibilities of mutual or self-insurance.

See also Ladders.

ZINC INDUSTRY

Oklahoma, Missouri and Kansas. The Zinc Industry of the Tri-State Field, Francis Judson Tietsort. Compressed Air Mag., vol. 25, no. 5, May 1920, pp. 9635-9643, 15 figs. Survey of conditions with notes on future production and marketing problems. Work of Am. Zinc. Inst. in developing zinc industry is noted.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print, up to 11 x 14 in. size, 25 cents plus postage. A separate print is required for each page of the larger size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

AIRCRAFT CONSTRUCTION MATERIALS

Steel. Steel for the Structural Parts of Aircraft, John L. Harkness. Jl., Am Steel Treaters Soc., vol. 2, no. 9, June 1920, pp. 466-469. For light machines, ordinary commercial cold-rolled steel is believed to be most suitable; for medium-sized machines, either 0.2-0.3 or 0.3-0.4 heat-treated carbon steel; and for large machines either chrome-nickel or chrome-vanadium steel. Tables of physical properties of chrome-nickel, chrome-vanadium, carbon and nickel steels are included.

Wood. Properties of Woods at 10 Per Cent Moisture, Air Service Information Circular, vol. 1, no. 53, May 18, 1920, 7 pp., 1 fig. Data available are said to indicate strongly that following species can be substituted for spruce in highly stressed parts; Port Orford cedar, coast-type Douglas fir, Amabilis, Grand, Noble, and white firs, eastern and western white pine, yellow poplar, cucumber, and magnolia.

See also Aeroplane Engines, Maybach; Hangars.

ALLOY STEELS

Tempering, Effect on Hardness. Effect of Tempering on the Hardness of Alloys (Action systématique de la trempe sur la dureté des alliages), L. Grenet. Technique Moderne, vol. 12, no. 3, Mar. 1920, pp. 107-112, 2 figs. Remarks on internal structure of tempered alloys, particularly alloy steels.

See also Steel, High-Speed, Molybdenum Steel, Nickel-Chrome Steel.

ALLOYS

Cadmium-Arsenic. An Alloy Substitute for Tin and Antimony (Legierung als Zinnbzw. Antimonersatz). Metall-Technik. vol. 46, nos. 5-6, Feb. 3, 1920, patented, cadmium is alloyed with arsenic to form substitute for tin.

ALUMINUM

Foundry Losses. Casting Losses in Aluminum-Foundry Practice in the United States, Robert J. Anderson. Monthly Reports of Investigations. Bur. or Mines, Dept. of Interior, April 1920, 3 pp. Average casting loss, including rejections of all kinds on foundry floor, in inspection department and machine-shop returns, is placed at 10 per cent. Variations in losses range, it is said, from 0 to 75 per cent.

See also Non-Ferrous Metals, Specifications.

ALTERNATORS

See Electric Generators, A. C.

ALUMINUM ALLOYS

Lynite Alloys. Developments in Alloyed Aluminum, R. E. Carpenter, Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 86-88, 5 figs. Production of Lynite alloys is recorded, and table of their physical properties is included.

Nickel Plating. Nickel Plating of Aluminum and Its Alloys (Sur le nickelage de l'aluminum et de ses alliages). Léon Guillet and Maxime Gasnier. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 21, May 25, 1920, pp. 1253-1256. Following procedure is reported to have proved successful: Scraping of metal by sand jet under pressure of 1500 gr. per sq. in. nickel-plating for one-half hours under 0.8 amp. per sq. dm.: copper-plating for 2 hours under 1 amp. per sq. dm.: polishing of copper surpace; nickel plating for 1 hour under 0.5 amp. per sq. dm.: and final polishing of surface.

AMMONIA

Synthesis. Industrial Synthesis of Ammonia by Georges Claude Process (La synthese industrielle de l'ammoniaque par le procédé Georges Claude), Jacques Boyer, La Nature, nos. 2397 and 2398, April 10, 1920, pp. 151-156, 7 figs. Method at Montereau Works, France.

ANEMOMETERS

Electrical Oscillation. Anemometer Operating by Electrical Oscillations (Sur un anémomètre à oscillations électriques), M. E. Rothé. Comptres rendus des Séances de l'Académie des Sciences, vol. 170, no. 20, May 17, 1920, pp. 1197-1198. Fan of anemometer operates as interrupter and at each contact sets electrical vibrator in action.

ARCHES

Concrete. Truss Centering Used for 113-ft. Concrete Arch, C. B. McCullough. Eng. News-Rec., vol. 84, no. 18, Apr. 29, 1920, pp. 851-852, 3 figs. Timber Howe truss adopted instead of falsework because of depth of water in channel of Rogue River Bridge, Oregon.

See also Tunnels, Arches in.

AUTOMOBILE ENGINES

Balancing. Balance of V-Engines with Eight Cylinders Set at 90 Degrees (Equilibrage des moteurs à 8 cylindres en V a 90°), J. Petit. Technique Automobile et Aérienne, vol. 11, no. 1, 1920, pp. 6-9, 4 figs. Diagrams of inertia forces, both horizontal and vertical.

Cams for. Cams for Radial and Rotary Engines. Wm. John Walker. Automobile Engr., vol. 10, no. 139, June 1920, p. 241, 1 fig. Design of multil-lobed cam suitable for operating valves of given multi-cylinder engine of four-stroke type, cam being rotated at certain speed in opposite direction to that of crankshaft.

Fuel Consumption, Reducing. Fuel Economy and Engine Design. H. R. Ricardo. Autocar, vol. 44, no. 1287, June 19, 1920, pp. 1135-1140. Possibilities of improving present designs with a special view to economy of fuel. Factors which are mentioned as having great influence on fuel consumption are : (1) Internal friction and (2) design of combustion head. In this connection side-by-side valves are recommended in preference to overhead valves.

Inertia Forces in. Influence of Inertia Forces Upon Torque Variations of an Automobile Engine (Influence des forces d'inertie sur la variation du couple moteur), H. Petit. Technique Automobile et Aérienne, vol. 11, no. 1, 1920, pp. 9-18, 7 figs. Diagrams of inertia forces and torque diagrams, constructed for six-cylinder, eight-cylinder and twelve-cylinder engines.

Vacuum Fuel-Feed System. LePere Vacum Fuel Feed System for Airplanes. Automotive Industries, vol. 42, no. 26, June 24, 1920, pp. 1450-1451, 5 figs. Investigations of this system, made at McCook Field by Eng. Division of Air Service are said to have established its applicability to motor car. Vacuum of gasolines supply system used on LePere biplane is generated by venturi tube placed in air stream above upper wing. Gasoline is drawn from main supply tank in fuselage to gravity distributing tank in upper wing.

See also Aeroplane Engines, Construction Materials; Carburetors.

AUTOMOBILE FUELS

Efficient Utilization. Report on the Utilization of Present Fuel in Present Engines. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 25-29, 6 figs. Committee report presented at semi-annual meeting of Society of Automotive Engineers. Question of mixture giving best distribution and most complete combustion, design of manifolds, condensation of fuel and application of heat are taken up.

Gasoline Mixture. Meeting the Cumbustion Requirements of Present Fuels. Automotive Industries, vol. 42, no. 26, June 24, 1920, pp. 1445-1447 and p. 1449, 6 figs. Preparation of proper combustible mixtures from less volatile gasolines, with notes on vaporization and distribution. Report of Fuel Committee of Automotive Engrs.

See also Benzol; Gasoline.

AUTOMOBILES

Body Suspension. Notes on the Suspension of Automobile Bodies (Quelques remarques sur la suspension des véhicules automobiles). Technique Automobile et Aerienne, vol. 11, no. 1, 1920, pp. 18-22, 5 figs. Technical study, Special attention is given to influence of size of wheelbase on suspension. It is established that, within certain limits and other things being equal, the smaller the wheelbase, the more effective the suspension mechanism.

Shaft Joints. Flexible Shaft-Joints Progress, Carl A. Schell. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 30-32. It is recommended to make total disk thickness about one-eighth of diameter and center hole of disk about 40 per cent of total diameter.

Steels for Automobile Parts. The Most Suitable Steels for Automobile Parts, W. H. Hartfield. Automobile Engr., vol. 10, no. 139, June 1920, pp. 245-261, 11 figs. Tables are given in which are indicated the various stresses coming upon different automobile parts, the steels being used or which have been used in their construction, and the steels recommended by the writer as a result of tests and analyses of materials.

Wheel Hub Standardization. Hub Standardization Is Getting Under Way, J. Edward Schipper. Automotive Industries, vol. 42, no. 25, June 17, 1920, pp. 1391-1393. Diagram of work to be undertaken by committee of Automotive Metal Wheel Assn.

See also Ferries, Automobile; Industrial Management, Production Systems.

AVIATORS

Oxygen Supply. A Note on Oxygen Supply for Aviators, G. B. Obear. Air Service Information Circular, vol. 1, no. 3, March 15, 1920, pp. 44-57, 12 figs. Description of various types of oxygen-supply apparatus.

Physiology. The Aviator's Heart. Roentgen Ray Studies Under Conditions Simulating High Altitudes, Leon T. LeWald, Guy H. Turrell. Air Service Information Circular, vol. 1, no. 3, March 15, 1920, pp. 3-25, 85 figs., partly on 15 supp. plates. Two series of studies were undertaken one with Henderson rebreather and the other in the low-pressure chamber.

BARGES

Oil-Tank. Oil Barges (Chalands Pétroliers). Bulletin Technique du Bureau Veritas, vol. 2, no. 5, May 1920, pp. 94-98, 4 figs. Designs operating in French and German rivers.

Ore. Design of Ore Fleet for Upper Mississippi, William S. Mitchell, Mech. Eng., vol. 42, no. 7, July 1920, pp. 379-382, 4 figs. Writer describes two experimental trips which were conducted during the war to try out possibilities of such transportation on Mississippi river. Results of these trips are said to have warranted construction of fleet of 24 barges and 4 towboats for traffic of ore and fuel. Particulars are given regarding design and construction of vessels, and terminal facilities projected.

CAMS

DESIGN. Study of Mechanisms Operated by Cams (Etude rationnelle des mécanismes commandés par cames). Octabe LePersonne. Revue universelle des Mines, vol. 3, no. 1, Sept.-Oct. 1919, pp. 73-109, 9 figs., partly on 4 supp. plates. With special reference to design of cams for operating valves of internal-combustion engines. (Concluded.)

CANALS

NEW ORLEANS HARBOR. Unwatering the Lock Site of New Orleans Harbor Canal, George R. Goethals. Eng. News-Rec., vol. 84, no. 20, May 13, 1920, pp. 940-943, 2 figs. Sheet-pile cofferdams, driven in successive rows nearer and nearer to lock, cut off porous underlying quicksand strata which are tapped with flowing wells as dams close in.

CAR WHEELS

CHILLED-IRON. Manufacturing Chilled Iron Car Wheels—IV and V. H. E. Diller. Foundry, vol. 48, nos. 10 and 11, May 15 and June 1, 1920, pp. 389-396, 15 figs., and 429-434, 8 figs. May 15; Different types of chillers; details of methods of annealing. June 1: Inspection and testing in order to assure adherence to standard specifications.

GRINDING, RECLAMATION BY. Economies Possible by Car Wheel Grinding. Ry. Mech. Engr., vol. 94, no. 6, June 1920, pp. 355-358, 3 figs. Practice of various railroads in reclaiming car wheels by grinding, with description of machine developed for grinding mounted car wheels. Cast-iron car wheels with flat spots are reclaimed, it is said, up to 3½ in. long, provided wheel has not made too great a mileage.

INGOTS FOR. Individual Ingots for Tires and Wheels. Iron Age, vol. 105, no. 22, May 27, 1920, pp. 1507-1509, 3 figs. Comparative value of multiple and individual ingots. To secure individual pipeless ingots of uniform composition three conditions are said to be essential: Well-made dead-melted steel, correct ingot-mold proportions, and proper carbonaceous material for ingot top.

CARBURETORS

LOW-GRADE FUEL. Carburetion and Distribution of Low-Grade Fuels, O. H. Ensign. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 19-24 and 50, 11 figs. Carburetor is described which is said to produce a mixture which meets theoretical conditions of operation under throttle control with economy and flexibility. Principle involved for metering fuel and air in carburetor is drop in pressure that occurs at center of whirling mass of fluid.

VARIABLE-AIR-PRESSURE TYPE. Controlling and Atomizing Fuel by Variable Engine Pressures, John G. Willet. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 51-55, 5 figs. Carburetor designed by writer, in which fuel is controlled and atomized by variable air pressure supplied by engine-driven compressor of standard tire-pump dimensions capable of giving maximum pressure of 15 lb. per sq. in.

CASE-HARDENING

RULES FOR. Practical Case hardening, Theodore G. Selleck. Jl. Am. Steel Treaters Soc., vol. 2, no. 9, June 1920, pp. 460-465. It is emphasized that, no matter what method of operation is employed, "the man is more than the method.,,

CEMENT

STORAGE, EFFECT OF. Effect of Storage of Cement, Duff A. Abrams. Structural Materials Research Laboratory, Lewis Inst., Chicago, bul. 6, June 1920, 29 pp. 10 figs. Tests of effect of storage of portland cement in different kinds of packages and under different conditions on its concrete and mortar-making properties. Compression tests of about 1000 6 by 12-in. concrete cylinders of 1-3 standard sand mortar, and about 500 miscellaneous tests, are included. Among results found were that after 3-months' storage in shed in yard cement had 80 per cent of its original strength: after 6-months' storage, 71 per cent; after 1-year, 61 per cent; and after 2-years, 40 per cent.

TESTER, AUTOMATIC. A New Type of Automatic Cement Tester, Thorsten Y. Olsen. Twenty-Third Annual Meeting, Am. Soc. for Testing Matls., June 22-25, 1920, 4 pp. 1 fig. Machine resembles ordinary type of automatic shot cement tester, with the one difference that a liquid is used in place of shot.

CENTRAL STATIONS

CANADA. Central Electric Station Industry in Canada. Can. Engr., vol. 38, no. 26, June 24, 1920, pp. 593-596, 3 figs. Statistics giving number of stations, total revenue from sale of power, total operating expenses, salaries and wages, number of persons employed, etc. On January 1, 1919, there were 795 central stations developing a total of 1,841,114 hp.

INTERCONNECTION WITH INDUSTRIAL PLANTS. Interconnecting Industrial and Central-Station Plants, Cornelius G. Weber. Power, vol. 51, no. 26, June 29, 1920, pp. 1049-1052, 5 figs. With data from a number of individual cases writer gives some indication of large savings in coal, labor and transportation that would be possible from electrical interconnection on a give-and-take basis.

REACTORS, USE OF. Stabilizing Large Generating Systems. Elec. World, vol. 76, no. 1, July 3, 1920, pp. 5-8, 5 figs. Value of feeder reactance in keeping alternators in synchronism i sillustrated by relating instance in which serious breakdown was traced to lack of sufficient protective reactances.

CHARCOAL

ACTIVATION OF. Charcoal Activation, H. H. Sheldon. Proc. Nat. Acad. of Sciences, vol. 6, no. 4, April 1920, pp. 178-182, 4 figs. Results of experiments at University of Chicago on variations due to heat treatment in absorption of gases by charcoal.

CHEMISTRY

RESEARCH IN. A Plan for Incentive to Research in Pure and Applied Chemistry, William J. Hale. Jl. Indus. & Eng. Chem., vol. 12, no. 7, July 1920, pp. 690-696. Plan proposed contemplates providing pecuniary facilities whereby technical men will feel justified to engage their activities in research work. Writer emphasizes that "the best men, the live men, the men who have the mental grasp for bigger things, will not tarry too long where life is difficult and honor shallow."

COAL

COKING VALUE. A New Characteristic For Coal: The Agglutinating Power Curve, F. S. Sinnatt, A. Grounds. Jl. Soc. Chem. Industry, vol. 39, no. 7, April 15, 1920, pp. 83T-86T, 1 fig. Experimental study of influence of degree of fineness of powdered inert matter on caking property of coal. It was found that fundamental property of caking, which varies considerably in different coals, is influenced by degree of fineness of inert substance until, when inert material, finer than 1/90 mesh is taken, caking property of coal may be entirely destroyed by less than its own weight of inert matter.

COKING. Researches on Coal—H. S. Roy Illingworth. Jl. Soc. Chem. Industry, vol. 39, no. 10. May 31, 1920, pp. 133T-138T, 6 figs. Investigations of coking coals. Theory of coking is suggested from results obtained in experiments. Special attention is given to qualities of coke obtained from coking at various temperatures and at different coking times.

FUSAIN IN COAL DUST. Coal Dust and Fusain, F. S. Sinnatt. Lancashire & Cheshire Coal Research Assn., bul. 5, 1920, 19 pp. Research work conducted to determine composition of fusain and amount present in dust produced during working of coal at colliery.

LOW-GRADE, DISTILLATION OF. Sub-Bituminous and Lignite Coals, S. M. Darling. Ry. Rev., vol. 66, no. 26, June 26, 1920, pp. 1096-1098. Economic possibilities of applying distillation methods to large quantities of sub-s an lard fuels, deposited in various parts of United States. Paper read before International Railway Fuel Association.

COAL MINES

CABLE INSTALLATION. The Installation of a Shaft-Cable at Kirkby Colliery. Joseph Bircumshaw. Trans. Instn. Min. Engrs., vol. 59, part 2, May 1920, pp. 109-113, 9 figs. on supp. plate. Method of supporting cable through brickwork walling and through cast-iron tubing illustrated.

FERRIC HYDRATE FROM MINE WATER. Six Tons of Ferric Hydrate Secured Daily from Water at a Connellsville Mine, L. D. Tracy, Coal Age, vol. 18, no. 1, July 1, 1920, pp. 13-16, 2 figs. By treating mine water with finely ground lime, ferric hydrate is said to be obtained which is used in desulphurization of gas and as a pigment for paint. Purified water is used for quenching coke.

VENTILATION. Force and Exhaust Systems of Ventilation, R. Z. Virgin. Coal Industry, vol. 3, no. 6, June 1920, pp. 278-280, 1 fig. Features of each, showing advantages and disadvantages. Reference is made to discrepancies in laws of different states.

COAL MINING

BARRIER PILLARS. What Barrier Coal Has Been and Should Be Left to Protect Anthracite Mines—II, W. B. Richards. Coal Age, vol. 17, no. 23, June 3, 1920, pp. 1135-1140, 10 figs. Survey of formulæ and methods that have been developed for determining size of barrier pillars.

COAL-CUTTING MACHINERY. Economy and Safety are Secured by Use of Alternating-Current Coal Cutters, Charles B. Officer. Coal Age, vol. 17, no. 26, June 24, 1920, pp. 1303-1306, 4 figs. Savings in equipment cost, in power expense and maintenance charges, as well as greater safety are said to accrue from use of alternating instead of direct-current for driving undercutters.

MINERS' NYSTAGMUS. The Economic Aspect of Miners' Mystagmus, T. Lister Llewellyn. Colliery Guardian, vol. 119, no. 3101, June 4, 1920, pp. 1565-1567, 5 figs. It is claimed that nystagmus is due to deficiency light in coal mines, and improvement of illumination underground is urged as preventative.

PNEUMATIC PICKS. The Use of Pneumatic Picks in Coal Mining (L'emploi de marteaux à air comprimé pour l'abatage de la houille). M. A. Dessemond, Bul. et Comptes rendus mensuels de la Société de l'Industrie Minérale, vol. 17, no. 2, March-April 1920, pp. 125-143, 2 figs. Records of service at Saint-Etienne collieries, where 70 per cent of coal produced is mined with pneumatic picks.

POWER REQUIREMENTS. Power Requirements for Coal Mining, Robert Anthony. Elec. World, vol. 76, no. 1, July 3, 1920, pp. 14-15, 6 figs. Energy consumption and minimum demand of bituminous coal mines shown under different mining conditions and with varying output of coal. Suggestions made for successfully changing over old mines.

STRIPPING. Where Stripping is Regarded as a Regular Adjuct to Underground Mining —1. Donald J. Baker. Coal Age, vol. 17, no. 23, June 3, 1920, pp. 1143-1146, 8 figs. Coal is stripped by steam shovel from outcrop to contour, where depth of overburden makes open mining prohibitive. From that line, which is set where cover is 45 ft. deep, to boundary line of property underground mining methods are employed.

See also Education, Technical, Coal Mining.

CONCRETE

CONTRACT WORK

DAMS

CONCRETE. Big Eddy Storage Dam—II. Public Works, vol. 48, no. 23, June 19, 1920, pp. 529-534, 9 figs. Monolithic concrete construction 1100 ft. long and 159 ft high, with gravity cross-section about 100 ft. wide at the base. Attention is directed to special methods of construction necessitated by irregularity of rock bottom which it was necessary first to partially level by submerged drilling, blasting and divers' work before commencing main structure.

EARTH. Repairs to Pavement of the Belle Fourche Dam, B. E. Hayden, Eng. World, vol. 17, no. 1, July 1920, pp. 11-13, 4 figs. Dam is earthen structure 6200 ft. long on top and 122 ft. high above cut-off trench at maximum section. Method of repair followed consisted of refilling breaches with gravel, relaying disturbed blocks 6 to 8 in. below grade, and finishing with continuous layer of concrete to grade.

GRAVITY. Dams for Artificial Lakes Recently Built in Italy (Les digues pour lacs artificiels récomment construites en Italie). Luigi Luiggi, Annales des Ponts et Chausseés, vol. 45, no. 1, Jan.-Feb. 1920, pp. 62-95, 12 figs. partly on supp. plate. Gravity dams.

The St. Maurice River Regulation and the Gouin Dam, Olivier Lefebvre. Jl. Eng. Inst. Can., vol. 3, no. 7, July 1920, pp. 342-348, 3 figs. Gravity dam. 1646 ft. long and 20 ft. wide at crest. Highest section is 90 ft., width at base at that point being 72 ft.

HYDRAULIC-FILL. Hydraulic-Fill Dams (Barrages Hydrauliques). Houille Blanche, vol. 19, no. 39-40, March-April 1920, pp. 41-44, 13 figs. Hubert and Lutz improved bear-trap type. (To be continued.)

Hydraulic-Fill Dams for Miami Conservancy District. Public Works, vol. 48, no. 18, May 15, 1920, pp. 419-422, 7 figs. Method of building up levees, beaches and water-tight core by means of steam shovels window pipes and other contrivances. (Concluded.)

Measuring Internal Pressures in Hydraulic-Fill Cores. Public Works, vol. 48, no. 24, June 26, 1920, pp. 553-555, 3 figs. Earth-pressure cells were varied at different depths in semi-fluid core, where relation between horizontal and vertical pressure indicated rate of solidification of material. Diagrams of pressures obtained are given.

MASONRY. Measuring Upward Pressure Under a Masonry Dam, E. W. Lane and E. L. Chandler, Eng. News-Rec., vol. 81, no. 21, May 20, 1920, pp. 1104-1016, 4 figs. Tests made on Island Park Dam at Dayton, Ohio, to determine extent of under pressure through porous foundations.

DIESEL ENGINES

GERMAN SUBMARINE. The Diesel Engine of the German Submarine U-117 Holbrook C. Gibson, Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 15-18, 1 fig. Engine is of 1200 h.p., six-cylinder type and has air compressor on forward end. Bedplate comes right up, instead of being bolted on flange, and forms housing. Both bedplate and housing are thorougly ribbed. Cylinder jackets comes out in a skirt which gives vertical structure and strength.

HIGH-ALTITUDE OPERATION. Diesel Engines Under High Altitude Conditions, Theodore M. Robie. Eng. & Min. Jl., vol. 109, no. 23, June 5, 1920, p. 260, 1 fig. It is shown analytically how pressure in cylinders may be considerably reduced and still obtain same temperature at end of compression as at sea level.

MARINE. Progress in Marine Diesel-Engine Building at Krupp's During the War, Otto Alt. Motorship, vol. 5, no. 7, July 1920, pp. 604-606, 5 figs. For 1250 shaft h.p., four-cycle type is being constructed; for over 4000 shaft h. p., double-acting port-scavenging two-cycle sets; and for 19,000 shaft h.p., four-cycle sets in 12 cylinders with supercompression. (To be continued.)

SUPERCHARGING. Surcharging Diesel Engines, Cl. Ruegg. Power, vol. 51, no. 18, May 4, 1920, pp. 712-714, 9 figs. Surcharging is said to have proven successful with two-cycle Diesel engine for direct connection to air compressor in plant operated at 6000 ft. above sea level.

DISTILLATION

BROWN'S FORMULA FOR. On Brown's Formula for Distillation, Sydney Young. Sci. Proc. Roy, Dublin Soc., vol. 15, no. 47, Jan. 1920, pp. 667-672. Brown's formula was found to be applicable without serious errors to mixtures of benzene and toluene.

DRAINAGE

CHANNEL WALLS, MAINTENANCE OF. Gunite Maintenance of Chicago's Drainage Channel Walls, W. T. Christine. Eng. World, vol. 16, no. 8, June 1920, pp. 459, 461, 6 figs. Treatment of breaches in wall is illustrated.

DREDGING

CENTRIFUGAL-PUMP. Dredging New Orleans' Inner Harbor Navigation Canal, Walter J. White. Proc. Louisiana Eng. Soc., vol. 6, no. 2, April 1920, pp. 80-102. 12 figs. Performance and tests of centrifugal dredging pumps. Paper presented at joint meeting of Louisiana Eng. Soc. and Local Chapter of Am. Soc. of Mech. Engrs.

DROP FORGING

DIE-BLOCK STANDARDIZATION. Physical Requirements of Die Blocks, W. C. Peterson. Am. Drop Forger, vol. 6, no. 6, June 1920, pp. 297-299. Urges that plan be formulated for correct study of use of die blocks and their attendant failures. Paper read before Am. Drop. Forge Assn.

Reasons for Standardizing of Die Blocks, C. R. Porter. Amer. Drop Forger, vol. 6, no. 6, June 1920, pp. 286-287. Urges necessity of standardizing die blocks with respect to their size, the quality of steel used, the method of forging and annealing and the hardening treatments for safe operation. Paper read before Am. Drop Forge Assn.

EDUCATION, ENGINEERING

PROFESSIONAL SPIRIT IN. The Professional Spirit in Engineering Education, C. R. Mann. Eng. News-Rec., vol. 84, no. 26, June 24, 1920, pp. 1242-1244. Current schooling, it is said, is conspicuously designed to inspire individual to make most of himself for the sake of his own success, while required training must inspire individual to make most of himself for the common good.

EDUCATIONAL, TECHNICAL

COAL MINING. The Training of Students in Coal-Mining, with Special Reference to the Scheme of the Engineering Training Organization. F. W. Hardwick. Trans. North England Inst. Min. & Mech. Engrs., vol. 69, part 2, Feb. 1919, pp. 13-20 and (discussion) pp. 20-28. Engineering Training Organization is a British institution formed to serve as central organization for improvement in and better co-ordination of engineering training.

ELECTRIC CIRCUITS, A. C.

PROTECTION. The Protection of Alternating-Current Systems Without the Use of Special Conductors, Kenelm Edgcumbe. Jl. Instn. Elec. Engrs., vol. 58, no. 291, May 1920, pp. 391-407 and discussion(), pp. 407-416, 30 figs. Possible schemes.

THREE PHASE, UNBALANCED. Unbalanced Three-Phase Circuits. Waldo V. Lyon. Elec. World, vol. 75, no. 23, June 5, 1920, pp. 1304-1308, 9 figs. Analytical and graphical methods of treating problems arising from operation of three-phase apparatus on unbalanced voltages. Examples are given to illustrate theory.

ELECTRIC CONDUCTORS

RESISTANCE AND INDUCTANCE FORMULAE. An Integration Method of Deriving the Alternating-Current Resistance and Inductance of Conductors. Harvey L. Curtis. Sci. Papers, Bur. of Standards, no. 374, April 7, 1920, pp. 93-124, 4 figs. Method consists in dividing conductor into infinitesimal filaments by surfaces which coincide with lines of current flow. Magnetic field at any point is sum of magnetic fields of these filaments. Counter e. m. f. in a filament is determined by rate at which magnetic fields of all other filaments cut this filament.

ELECTRIC CURRENTS

COMPARATOR OF. A Dynamometrical Comparator Edy Velander. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 7, July 1920, pp. 680-686, 8 figs. Differential dynamometer for accurate comparison of alternating and direct-current strengths.

ELECTRIC CURRENTS, ALTERNATING

BRIDGE MEASUREMENT. Bridge Methods for Alternating-Current Measurements, D. I. Cone, Jl. Am. Inst. Elec. Engrs., vol. 39, no. 7, July 1920, pp. 640-647, 18 figs. Résumé of simple methods of utilizing "bridge" networks in alternating-current measurements of impedances and their components of effective resistance, self and mutual inductance and capacitance, and in frequency measurement. Bibliography is appended.

ELECTRIC FURNACES

ELECTRODES. Electrodes for Iron and Steel Furnaces, C. G. Vom Baur. Iron Age, vol. 105, no. 24, June 10, 1920, pp. 1653-1654. Comparison of carbon and graphite. Question of metallic electrodes. Cooling collars and carbon consumption.

GREAVES-ETCHELLS. Electric Steel Furnaces and Electric Steel, F. J. Cleary. Jl. Am. Soc. Naval Engrs., vol. 32, no. 2, May 1920, pp. 242-310, 16 figs. Special reference is made to steel castings and Greaves-Etchells type of electric furnace. Compilation of information which has appeared in technical papers in United States and England.

HEAT-TREATING. A Modern Tool Room Heat Treating Plant, Ry. Mech. Engr., vol. 94, no. 6, June 1920, pp. 389-391, 3 figs. Electric furnaces and pyrometers installed at Ft. Wayne shops of Pennsylvania system.

INDUCTION. Induction Furnaces and Their Appliction in the Iron and Steel Industry (Les fours à induction et leur application dans l'industrie du fer et de l'acier). W. Engelhardt, Houille Blanche, vol. 19, no. 39-40, March-April 1920, pp. 58-61, 6 figs. Kjellin German typs. (Continuation of serial.)

ELECTRIC GENERATORS, A. C.

RADIO-FREQUENCY. Radio Frequency Alternators, Marius Latour Proc. Inst. Radio Engrs., vol. 8, no. 3, June 1920, pp. 220-237, 18 figs. Types of radio-frequency alternators, with special reference to those most used in France at present. Translated from Bul. de la Société Française des Electriciens.

WATERWHEEL-DRIVEN. Vertical-Shaft Waterwheel-Driven Alternators—Brakes, Ventilation and Exciters, S. H. Mortensen. Power vol. 51, no. 24, June 15, 1920, pp. 953-954, 3 figs. Brakes operated by hand and compressed air, ventilation of alternators and excitation with direct-connected and independent exciters.

Vertical-Shaft Waterwheel-Driven Alternators—Mechanical Features, S. H. Mortensen. Power, vol. 51, no. 18, May 4, 1920, pp. 698-700. Structural details of several large units, special 32,500 kva. machine, said to be largest hydro-electric unit in the world.

See also Turbo-Alternators.

EMPLOYMENT MANAGEMENT

Industrial Training and. Employment Management and Industrial Training, Roy W. Kelly. Federal Board for Vocational Education, bul. no. 48, Oct. 1919, 106 pp. Economical and social losses resulting to nation from lack of education or faulty education of wage earners in industry are pointed out, together with more important difficulties to be overcome in preventing them, and practical methods are suggested by which industries and educational institutions may co-operate in industrial training.

Records. Visualizing Employment Records, W. S. Wells. Indus. Management, vol. 60, no. 1, July 1920, pp. 67-70, 6 figs. Method of keeping records at Newburgh Shipyards.

ENGINEERING SOCIETIES

Federated American Engineering Societies. Organizing Conference Plans Federation of Engineering Societies. Mech. Eng., vol. 42, no. 7, July 1920, pp. 422-423. Also in Jl. Am. Inst. Elec. Engrs., vol. 39, no. 7, July 1920, pp. 690-692, and Min. and Metallurgy, no. 163, July 1920, pp. 7-13. Account of conference of 71 engineering organizations and allied technical societies, held at Washington on June 3 and 4. A new organization. The Federated American Engineering Societies, was created, which is to represent profession in matters of common concern and in national and state affairs.

Federated American Engineering Societies, L. P. Alford. Indus. Management. vol. 60, no. 1, July 1920, pp. 53-55.

ENGINEERS

National Organization. The Proposed Comprehensive Organization of National, Local, State and Regional Engineering Societies for the Advancement of the Welfare of the Engineers, Edward J. Cattell. Jl. Engrs. Club of Phila., vol. 37-5, no. 186, May 1920, pp. 209-215. Addresses made by President of Am. Soc. of Mech. Engrs., Am. Soc. of Civil Engrs., and Am. Inst. Electrical Engrs. and a Past President of the Am. Inst. of Min. & Metallurgical Engrs.

FACTORY MANAGEMENT

See Industrial Management.

FANS, CENTRIFUGAL

Motors for. Motors for Driving Ventilating Fans, William H. Eastop. Power, vol. 51, no. 19, May 11, 1920, pp. 759-761, 6 figs. Characteristics of motors for fan drives. Comparisons between alternating-current and direct-current motors. Methods of control and formula for calculating horsepower required to drive fans.

FARM MACHINERY

Operating Speeds. The Operating Speeds of Agricultural Implements. Percival White. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 47-50. Opinions of experts are quoted concerning increasing operating speeds of farm machinery, particularly plowing tractor. Majority of them believe that "an acceleration in implement speeds is bound to come, but that its coming will be gradual and slow."

See also Motor Plows.

FATIGUE

Industrial. Studies in Industrial Physiology: Fatigue in Relation to Working Capacity, Joseph Goldmark, Mary D. Hopkins, Philip Sargant Florence and Frederick S. Lee. Treasury Dept., Public Health Bul. no. 106, Feb. 1920, 213 pp., 40 figs. Comparison of an eight-hour plant and a ten-hour plant. Average output per worker, or group of workers, for each hour of day, is given in figures and tables. Conspicuous feature of eight-hour plant is its steady maintenance of output in contrast to fluctuations of output of ten-hour plant.

FILTRATION

Filtrate Classification. Scientific Control of the Filter Station—I, Arthur Wright. Chem. & Metallurgical Eng., vol. 22, no. 22, June 2, 1920, pp. 1015-1017. Discussion on clarification of filtrate. Use of lighter filter cloths made of open woven fabrics advocated. Method of application and use of filter-aids.

Press Operation. Scientific Control of the Filter Station—V, Arthur Wright. Chem. & Metallurgical Eng., vol. 22, no. 26, June 30, 1920. General discussion and summary of features on filter press operation. Types of presses and their application. Materials used in construction of presses, pressure devices, scope of centrifuging, decantation and flotation.

FIREBRICK

Porosity and Volume at Furnace Temperatures. Porosity and Volume Changes of Clay Fire Bricks at Furnace Temperatures, George A. Loomis. Technologic Papers Bur. of Standards, no. 159, April 26, 1920, 29 pp., 3 figs. Experimental investigation. Bricks which were capable of withstanding pressure of 40 lb. per sq. in. at 1350 deg. cent. showed slight changes in volume or porosity when burnt at temperatures up to 1425 deg. cent. Large number of bricks which failed to pass load test showed marked change in volume or in porosity at some temperatures below 1425 deg. cent. Bricks which showed distinct overburning by pronounced expansion at temperatures below 1400 deg. cent. invariably failed in load test.

FLOOD CONTROL

Miami Conservancy District. Effect of Flood on Miami Conservancy Work. Eng. World, vol. 17, no. 1, July 1920, pp. 1-5, 5 figs. Operation and action of hydraulic pump as utilized in outlet works of district dams.

FLOORS

Concrete, Hardeners for. Floor Hardener Tests by Bureau of Standards. Concrete, vol. 16, no. 6, June 1920, pp. 279-280. Service tests of concrete floor hardeners. Types tested were magnesium fluosilicates, varnishes and paints, waxes and various preservatives.

FLYING BOATS

Design. Flying Boats—The Form and Dimensions of Their Hull, G. S. Baker. Shipbuilder, vol. 22, no. 117, May 1920, pp. 345-349, 2 figs. Curves showing effect of hull dimension on power required to overcome water resistance, sketches of typical hulls and efficiency curves for various types.

FORGING

Equipment. Economic Considerations in Regard to the Selection of Forging Equipment (Wirtschaftliche Gesichtspunkte bei der Wahl von Schmiedeaggregaten), H. Schneider. Der praktische Maschinen-Konstrukteur, vol. 53, nos. 2, 4 and 6, Jan. 15, 29 and Feb. 12, 1920, pp. 1-4, 12-15 and 20-24, 11 figs. Description and illustrations of steam hammers, steam hydraulic and pure hydraulic presses, with graphic charts showing kinetic energy stored in a hammer tup, pressure exerted by hammers of different sizes, maximum capacities, and operating costs of presses and hammers. (To be continued.)

FOUNDRIES

Equipment. Many Equipment Features in Hercules Foundry, Gilbert L. Lacher. Iron Age, vol. 106, no. 3, July 15, 1920, pp. 123-130, 15 figs. Plant is equipped with three 96-in. Whiting cupolas with total daily melt of 250 to 300 tons. Buda elevating trucks operated by storage batteries are used to transport cars for pig iron, scrap, coke and facing sand.

Reclaiming Metal from Sand. Reclaiming Metal Parts from Sand, George H. Manlove. Foundry, vol. 48, no. 11, June 1, 1920, pp. 426-428, 2 figs. Thorough screening with suitable magnetic means for removing iron objects from foundry sand is said to have resulted in considerable saving to several large foundries.

See also Cost Accounting, Foundries.

FREIGHT HANDLING

See Terminal, Marine, Freight Handling.

FREQUENCY CHANGERS

Researches. Researches on Frequency Transformers, Tsunetaro Kujirai. Jl. College of Eng., Tokyo Imperial University, vol. 10, no. 5, March 30, 1920, pp. 87-143, 30 figs., partly on 16 supp. plates. Theoretical and experimental investigations of no load cores, and load cores, and of conditions of maximum volt-ampere capacity and maximum efficiency. For a given magnetic induction and current density, volt-ampere capacity is found to be maximum when copper and iron spaces are so proportioned that copper space equals five-fourths of iron space, and under this condition of maximum volt-ampere capacity maximum efficiency is said to occur when iron loss per unit volume equals copper loss per unit volume.

FROZEN-MEAT INDUSTRY

Research in. The Method and Scope of Scientific and Industrial Research, with Special Reference to the Frozen Meat Industry, A. M. Wright. Cold Storage & Ice Assn. Proc., vol. 15, 1918-1919, pp. 147-155 and (discussion) pp. 156-159.

FUELS

Liquid, Ignition Temperatures. Spontaneous Ignition-Temperatures of Liquid Fuels, Harold Moore. Jl. Instn. Petroleum Technologist & Rec. of Trans., vol. 6, no. 22, April 1920, pp. 186-211 and (discussion) pp. 211-223, 28 figs. Fuels measured by different experimenters are compared and results obtained by writer in similar experiments are quoted. Ignition points are listed for different mixtures of hydrocarbons.

FURNACES, ELECTRIC

See Electric Furnaces.

FURNACES, HEAT-TREATING

Rotary Hearth-Type. Rotary Oil-Fired Furnace of New Design. Iron Age, vol. 105, no. 21, May 20, 1920, pp. 1448-1450, 5 figs. Motor-driven hearth-type which makes one revolution for time required for carburizing. Results of trial operations are quoted.

INTERCONNECTION OF. Interconnection in Southern Vermont. Elec. World, vol. 76, no. 1, July 3, 1920, pp. 9-12. Records of savings in fuel and water by interconnection of hydroelectric sources in southern Vermont.

SILT DISPOSAL. Silt Disposal at Tacoma Hydro-Electric Plant, Llewellyn Evans. Power, vol. 51, no. 18, May 4, 1920, pp. 694-697, 6 figs. Development consists of 50-ft. concrete dam diverting water across bend in river with 10-000-ft. tunnel.

See also Reservoirs; Water Power.

ICE PLANTS

CONCRETE FREEZING TANKS. Construction a Concrete Freezing Tank, W. A. Darter. Power Plant Eng., vol. 24, no. 13, July 1, 1920, pp. 665-666, 2 figs. Method of utilizing old steel tanks as forms in making new concrete tanks.

STORAGE CAPACITY. Determining Advantageous Ice Storage Capacity, F. E. Matthews. Am. Soc. Refrig. Engrs. Jl., vol. 6, no. 3, Nov. 1919, pp. 196-200, 2 figs. Construction of graph representing storage and sale for entire year. Paper read before Eastern Ice Manufacturers' Assn.

INDUCTION COILS

AIR-CORE. The Design of Air-Core Inductance Coils of Minimum Weight for a Given Inductance and Resistance, C. O. Gibbon. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 7, July 1920, pp. 660-665, 2 figs. General outline of theory. It is determined that reluctance of total magnetic path is twice that of portion of path through coil, for maximum efficiency coils.

INDUSTRIAL MANAGEMENT

GREAT BRITAIN. Scientific Management in Great Britain, Clarence H. Northcott. Indus. Management, vol. 60, no. 1, July 1920, pp. 57-58. Experience during eight years of firm of Hans Renold, which was one of first to institute works committees in Great Britain.

Scientific Management: A Solution of the Capital and Labour Problem, J. M. Scott-Maxwell. Jl. Instn. Elec. Engrs., vol. 58, no. 291, May 1920, pp. 329-342 and (discussion), pp. 342-376, 2 figs. It is urged that by generalization of industrial management in industry, progress of reconstruction can be accellerated in England.

PRINCIPLES. The Principles of Industrial Management (Les principes de L'Organisation industrielle), Danty-LaFrance. Vie Technique & Industrielle, vol. 1, no. 3, May 1920, pp. 123-127. Industrial management, it is said, is not a science based upon mathematical principles, but rests upon faithful observations of rules and methods of procedure. Necessity of standardizing conditions of work, writing instructions and other practices is concluded.

PRODUCTION CONTROL. Shop Production-Control and Accounting Systems, A. G. Drefs. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July 1920, pp. 33-38, 3 figs. Graphical method is suggested for securing complete factory costs.

PRODUCTION SYSTEMS, BRITISH. Production Methods in the British Automobile Plants, M. W. Bourdon. Automotive Industries, vol. 42, no. 26, June 24, 1920, pp. 1461-1462. Despite schedules for larger outputs English factories, it is said, generally continue pre-war methods of machining and assembling. There is, however, it is noted, greater accuracy in manufacture and greater tolerance where narrow limits are unnecessary, as for instance, in external finish.

ROUTING. Routing Machine Parts Through the Factory, J. A. Urquhart. Iron Age, vol. 105, no. 20, May 13, 1920, pp. 1375-1379, 9 figs. System covering ordering, planning, scheduling and dispatching in use by Brown & Sharpe Mfg. Co.

SHIPYARDS. Industrial Organization Applied to Shipyard Management, Norman Howard. Indus. Management, vol. 60, no. 1, July 1920, pp. 38-42, 7 figs. Elements worked out as standard practice by Industrial Management Section of Emergency Fleet Corporation.

STOREKEEPING. Scientific Management—XIV, Henry Atkinson. Eng. & Indus. Management, vol. 3, no. 25, June 17, 1920, pp. 771-774, 3 figs. Methods of storekeeping.

See also Time Study.

INLAND WATERWAYS

AUTOMOTIVE SHIPMENTS. Water Borne Transportation for Automotive Shipments. George E. Quisenberry. Automotive Industries. vol. 43, no. 1, July 1, 1920, pp. 28-30, 1 fig. Survey of possibilities of such transportation based upon experience of several companies.

TRANSPORTATION RATES. Influence of Capacity of Ships Upon Transportation Rates in Canals (Influence de la capacité des bateaux sur les frais de transports par canaux), M. Galliot. Annales des Ponts et Chaussées, vol. 54, no. 1, Jan.-Feb. 1920, pp. 39-61. Procedure is suggested for calculating most economical tonnage for ships operating in canal in terms of total cost of construction, operation and maintenance of canal, total traffic it carries, etc.

INSULATORS, ELECTRIC

SUSPENSION. Electrical Characteristics of the Suspension Insulator—II, F. W. Peek, Jr. Jl. Am. Inst. Elec. Engrs., vol. 30, no. 7, July 1920, pp. 623-630, 23 figs. Duties of line insulators at voltages above 100 kv. are reviewed and compared with duties imposed by lower voltages.

Unit Voltage Duties in Long Suspension Insulators, Harris J. Ryan and Henry H. Henline, Jl. Am. Inst. Elec. Engrs., vol. 39, no. 7, July 1920, pp. 631-636, 21 figs. Potentiometer measurements were made of maximum and average voltage duties occurring in strings made up of 10-in. cap and pin type units wherein numbers of units were varied from 2 to 20. It is concluded that suspension insulator units in common use can be satisfactorily employed for make-up of insulators for 250-kv. lines, and that static shields in requisite forms will lower maximum unit voltage duties so as to permit satisfactory insulation of lines for use of voltages far above 150 kv.

IRON-CARBON ALLOYS

GRAPHITIZATION. On the Graphitization in Iron-Carbon Alloys, Kuniichi Tawara and Genshichi Asahara. Jl. College of Eng., Tokio Imperial University, vol. 9, no. 6, Nov. 25, 1918, pp. 197-237, 38 figs, partly on 12 supp. plates. Various alloys with carbon content ranging from 2 to 4 per cent were cast under different conditions. Factors, such as casting temperature, temperature of mold, time and mode of cooling, were found to do nothing more than define solidifying velocity of molten metal and cooling velocity of it after solidification. It is concluded that under the same conditions the higher the temperature of a molten is, the more graphitization occurs. Graphite was produced at temperatures of 1100 deg. cent. and 1000 deg. cent., the former being the more favorable while it was not at temperature of 900 deg. cent.

IRON FOUNDING

INGOT MOLD CASTING. Large Ingot Mold Casting. Iron Age, vol. 105, no. 20. May 13, 1920, pp. 1365-1366, 3 figs. Molding and pouring problems in making 114-ton iron mold.

MODERN PRACTICE. How Machine Castings Are Made. Foundry, vol. 48, no. 10, May 15, 1920, pp. 379-383, 8 figs. Practice of modern foundry company. Mechanical equipment makes it possible, it is said, to produce castings conforming to severe specifications with unskilled labor.

POURING DIRECT FROM BLAST FURNACE. Making Ore Pile Part of Automotive Plant, F. L. Prentiss. Iron Age, vol. 105, no. 19, May 6, 1920, pp. 1295-1302, 14 figs. partly on supp. plate. Plan of Henry Ford to pour castings direct from blast furnace.

KILN DRYING

See Aircraft Construction Materials.

LATHES

INCREASING-LEAD SCREW CUTTING. Screws with an Increasing Lead. Machy. (Lond.), vol. 16, no. 398, May 13, 1920, pp. 173-174. Lathe for machining such screws.

LINE-BEARING AND FLANGE-TURNKNG. Wickes Crankshaft Line-Bearing and Flange-Turning Lathe, J. V. Hunter. Am. Mach., vol. 53, no. 3, July 15, 1920, pp. 99-100, 4 figs. Line of lathes specially adapted to turning line bearings and flanges on automotive crankshafts.

LEAD METALLURGY

ROASTING AND SMELTING. Roasting and Lead-Smelting Practice at the Port Pirie (S. A.), Plant of the Broken Hill Association Smelters Proprietary, Ltd., Gilbert Rigg. Bul. of Insts. of Min. & Metallurgy, no. 188, May 1920, 15 pp. Experiments which led to adoption of double Dwight-Lloyd method.

LIGHTING

FACTORY. High Intensity Factory Illumination, M. A. Smilari. Iron Age, vol. 105, no. 21, May 10, 1920, pp. 1428-1431, 5 figs. Economic and social effects. Specifications for artificial sources of light. Range of intensities for various kinds of work.

ILLUMINATION INTENSITY. Predetermining Foot-Candle Illumination, I. W. Gross. Elec. World, vol. 75, no. 25, June 19, 1920, pp. 1423-1425, 2 figs. Chart for determining vertical illumination on horizontal plane at any distance below center of light from 2 ft. up to 100 ft. and along horizontal plane up to distance of 300 ft. on each side of unit.

LIGNITE

SURFACE MINING. Apparatus for Handling Lignite in Surface Mining (Braunkohlenförderbahnen). W. Metz. Fördertechnik u. Frachtverkehr, vol. 13, no. 1, Jan. 9, 1920, pp. 4-7, 10 figs. Describes improvements in excavating and transporting which have reduced costs of operation.

LOCOMOTIVE BOILERS

SUPERHEATER LOCOMOTIVE. Locomotive Boilers. Ry. Engr., vol. 41, no. 485, June 1920, pp. 254-258, 9 figs. Sectional drawings, etc., of large boilers utilized by Lancashire and Yorkshire Ry. Co. on 0-8-0 type superheater locomotives.

LOCOMOTIVES

AUXILIARIES, AIR CONSUMPTION OF. Air Consumption of Locomotive Auxiliaries. Ry. Mech. Engr., vol. 94, no. 6, June 1920, pp. 395-398, 3 figs. Cost of wasted air shown and condemning limits proposed to raise standard of maintenance. Abstract of committee report and discussion. presented at annual convention of Air Brake Assn.

REBUILDING. A Useful Locomotive Rebuild. Ry. Engr., vol. 41, no. 485, June 1920, pp. 259-262, 7 figs. Illustrated description of rebuilding of class "E" express locomotive on South-Eastern & Chatham Ry., special features being small increase in weight and greatly increased efficiency.

REPAIR COSTS. Reducing Cost of Locomotive Repairs, S. W. Mullinix. Ry. Rev., vol. 66, no. 20, May 15, 1920, pp. 795-797. Rearranging and regrouping machines, dividing shops into separate departments and other means of reducing costs. Paper read before West. Ry. Club.

NICKEL

ROLLED SHAPES. Rolled Products of 99 per cent Nickel, Edwin F. Cone. Iron Age, vol. 105, no. 25, June 17, 1920, pp. 1713-1716, 9 figs. Open-hearth treatment which makes possible rolling of same shapes now produced in mild steel.

NICKEL-CHROME STEEL

BRITTLENESS. Brittleness in Nickel-Chrome and Other Steels.—II, F. Rogers. Annual Meeting, Iron & Steel Inst., May 6 & 7, 1920, 5 pp. 2 figs. Heating and cooling curves constructed from data obtained experimentally. First paper was published in Jl. Iron & Steel Inst., no. 2, 1919, pp. 325-328.

NICKEL PLATING

See Aluminum Alloys, Nickel Plating.

NON-FERROUS METALS

SPECIFICATIONS. Report of Committee B-2 on Non-Ferrous Metals and Alloys. Twenty-Third Annual Meeting, Am. Soc. for Testing Matls., June 22-25, 1920, 33 pp. Revised specifications for copper bars for locomotive staybolts, and for aluminum ingots for remelting and rolling; also revised methods for chemical analysis of alloys of lead, tin, antimony and copper.

OFFICE MANAGEMENT

PRINCIPLES. Getting the Office Work Done—I. Wallace Clark. Indus. Management, vol. 60, no. 1, July 1920, pp. 13-16, 3 figs. Application of principles of industrial management to organization and management of offices.

OIL

See Petroleum.

OIL ENGINES

STEINBECKER SOLID-INJECTION. The Steinbecker Solid-Injection Engine. Motorship, vol. 5, no. 7, July 1920, pp. 625-626, 3 figs. Constant-pressure oil engine, built by German Automobile Construction Co., Ltd., Berlin, and Hanover Machine Co. (To be continued.)

See also Diesel Engines, Heavy-Oil Engines.

OIL FIELDS

VALUATION. The Classification of Undeveloped Oil Lands for Purposes of Valuation, Carl H. Beal. Economic Geology, vol. 55, no. 4, June 1920, pp. 315-327, 1 fig. Based on answers to questionnaire sent to geologists and petroleum engineers requesting their views on tentative definitions.

OIL FUEL

BURNING. Recent Developments in the Design of Oil-Burning Furnaces (Les plus récents procédés de chauffage au mazout). G. Lechartier. Technique Moderne, vol. 12, no. 3, March 1920, pp. 116-123, 25 figs. Attention is directed to adaptation to oil-burning of boilers built to burn coal. One installation in Berlin and another in Rotterdam are described. Results of service tests of various classes of oil fuels conducted at works of Smith Dock Co.,North Shields, England, are quoted.

ECONOMY. Economies Obtained in Burning Oil ,Robert Sibley and C. H. Delany. Elec. World, vol. 75, no. 26, June 26, 1920, pp. 1483-1484. Results obtained at three Arizona plants.

INDUSTRIAL DEMAND. Industrial Demand for Oil as a Fuel, George Otis, Smith. Blast Furnace & Steel Plant, vol. 8, no. 6, June 1920, pp. 365-367. It is stated that first three months of 1920 have established rate of domestic production that if unchecked will reach a total of 415,000,000 barrels. Paper read before Am. Iron & Steel Inst.

OPEN-HEARTH FURNACES

FRANCE. The Tilting Open Hearth's Future in France. Iron Age, vol. 105, no. 22, May 27, 1920, pp. 1499-1500. Superiority of basic open-hearth steel over basic bessemer steel is pointed out and increasingly large demand in Europe for former kind of material is noted. Translated from Revue de Métallurgie.

GAS-FIRED. The Heating of Open-Hearth Furnaces with Lignite Producer Gas (Die Beheizung von Martinöfen mit Braunkohlengeneratorgas), Stahl u. Eisen, vol. 40, no. 17, April 29, 1920, pp. 565-567 and (discussion), pp. 567-568. It is pointed out that in gasification of briquets in producers, special attention should be given to clinker, and addition of steam is necessary to insure good quality of gas and to maintain as even, not too high temperature, which is also necessary for production of tar. Report from steelworks committee of Assn. German Foundrymen.

OSCILLATIONS

See Ionic Valves, Oscillations.

OXY-ACETYLENE CUTTING

DEVELOPMENTS. Recent Developments in Oxygen Cutting, Stuart Plumley and F. J. Napolitan. Iron Age, vol. 105, no. 22, May 27, 1920, pp. 1505-1506, 1 fig. Development quoted as most interesting which has occurred recently is successful cutting of cast iron. Theory and principles of oxy-acetylene cutting of cast iron are discussed.

OXY-ACETYLENE WELDING

PIPE MAINS. Oxy-Acetylene Welding of Pipe Mains. Alfred S. Kinsey. Welding Engr., vol. 5, no. 6, June 1920, pp. 30-32, and p. 38, 4 figs. Method of welding joints on top of ditch and turning pipe to meet convenience of welder is said to be most efficient and economical.

PARACHUTES

STABILITY. Stability of the Parachute and Helicopter, H. Bateman. Nat. Advisory Committee for Aeronautics, report no. 80, 1920, 11 p. Mathematical theory.

PAVEMENTS, ASPHALT

ASPHALT-CEMENT SPECIFICATIONS. Asphalt Cement Qualities and Tests Needed in Specifications for Sheet Asphalt and Asphalt Concrete Pavements, J. W. Howard. Mun. & County Eng., vol. 58, no. 6, June 1920, pp. 236-236. Qualities recommended to be specified include ductility, specific gravity, penetration and freedom from volatile oil.

PAVEMENTS, ASPHALTIC CONCRETE

MERITS OF. The Merits of Asphaltic Concrete Pavements, W. H. Connell. Contract Rec., vol. 34, no. 25, June 23, 1920, pp. 603-605. Importance of properly maintaining asphaltic concrete roads in order to get maximum service from them is pointed out. As instance of successful maintenance, Grand Boulevard and concourse of New York City, built in 1910 and still in perfect condition, is indicated.

PAVEMENTS, BITUMINOUS

CONSTRUCTION METHODS. Bituminous Paving Suggestions, Theodor S. Oxholm. Public Works, vol. 48, no. 18, May 15, 1920, pp. 425-426, 1 ffig. Corrugating base to prevent creeping of asphalt surface, use of old macadam as base, softness of asphalt that gives best results, and laying next to rails.

PETROLEUM

CONSUMPTION IN U. S. The Industrial Demand for Oil and the Available Supply, George Otis Smith. Automotive Industries, vol. 42, no. 25. June 17, 1920, pp. 1419-1421. Warning is issued that rate of consumption of oil in United States exceeds rate of production. Total consumption for year at present rate would be 490,000,000 bbl., while production is expected to be 415,000,000 bbl.

RESOURCES OF U. S. Industry's Need of Oil, George Otis Smith. Iron Age, vol. 105, no. 23, June 3, 1920, pp. 1584-1586. Warning is issued that oil demand in United States is now in excess of supply. First three months of 1920, it is said, have established rate of domestic production that if unchecked will mean 415,000,000 bbl. for year, and rate of consumption that will make year's requirements more than 490,000,000 bbl. Paper read before Am. Iron and Steel Inst.

PETROLEUM INDUSTRY

DETAILS OF. The Petroleum Industry (L'industrie du pétrole), H. Pouleur. Revue universelle des Mines, vol. 3, no. 1, Sept.-Oct. 1919, pp. 1-71, Composition of raw oil is taken up, together with its transportation, its storage, and processes of distillation are classified, and properties and uses of each explained.

PIERS

CONCRETE ROOF TRUSSES. Precast Concrete Roof Trusses in Panama Pier Shed, Guy W. True. Eng. News-Rec., vol. 84, no. 26, June 24, 1920, pp. 1232-1238, 9 figs. Discussion of feasibility of concrete roof trusses with comparisons of cost data between two similar sheds, one with reinforced-concrete roof trusses and one of structural steel.

PILES

SHEET, TESTS OF. Tests of Solid and Laminated Wood Sheetpiles. Eng. News-Rec. vol. 84, no. 25, June 17. 1920, pp. 1201-1202. Tests made at Cornell University on quarter-scale models under bending loads.

PIPE, CONCRETE

CENTRIFUGAL PROCESS. The Manufacture of Concrete Pipes by "Hume" Centrifugal Process. W. Wolstenholme. Jl. South African Instn. Engrs., vol. 18, no. 10, May 1920, pp. 175-181 and (discussion), pp. 181-184, 8 figs. Process at factory of Hume Pipe Co., Germiston, South Africa.

POWER FACTOR

VARIATIONS. Variations of Power Factor in Terms of Variations of Active Compo- [illegible]

RAILWAYS

SOUTH AMERICA. Railway Equipment in South America, J. P. Risque. By Mech. Engr., vol. 94, no. 6, June 1920, pp. 364-368, 13 figs. About 65 per cent of roads are owned and controlled by British capital and operated by British nationals. Equipment used is generally of British type.

TRACTION ON HEAVY GRADIENTS. Traction on Heavy Gradients by Means of Auxiliary Adhesion, Ch. Dantin. Bul. Int. Ry. Assn., vol. 2, no. 5, May 1920, pp. 272-284. 11 figs. Use of Hanscotte system for haulage of artillery trains. Translated from Genie Civil.

RECTIFIERS

MECHANICAL. Mechanical Alternating-Current Rectifiers (Le redressement des courants alternatifs par des appareils mécaniques), Alfred Soulier. Revue générale de l'Électricité, vol. 7, no. 19, May 8, 1920, pp. 619-625, 10 figs. Apparatus designed by writer.

REFRACTORIES

RESEARCH COMMITTEE REPORT. Report of Refractory Materials Research Committee, Gas Jl., vol. 150, no. 2978, June 8, 1920, pp. 576-583, 2 figs. Committee report of Instn. of Gas Engrs. Experiments are described which were performed to ascertain conditions required for successful casting of refractory ware containing high percentage of grog. Comparative tests were also reported of machine made and hand-made silica bricks. Measured specific heats of various refractory materials at high temperatures are included.

REFRIGERATING PLANTS

AMMONIA-COMPRESSION. Two Indirect Methods of Finding the Weight of Ammonia in Circulation in Compression Refrigeration, J. W. Gavett. Jr. Power, vol. 51, no. 26, June 29, 1920, pp. 1042-1045, 6 figs. Non-mechanical methods of computing weight of ammonia by means of pressure-volume charts and temperature-entropy charts of ammonia cycle.

AMMONIA LEAKS. Testing for Ammonia Leaks in Refrigerating Plants, B. E. Hill. Power, vol. 51, no. 24, June 15, 1920, pp. 955-956. Directions for testing for ammonia leaks with phenolphthalein and sulphur sticks.

REFRIGERATION

ETHYL CHLORIDE. Properties of Ethyl Chloride, G. C. Hodgson and Albert Henning. Refrig. World, vol. 55, no. 6, June 1920, pp. 16-18 and p. 26. Table giving results of two-ton Clothel refrigerating machine is included.

RESEARCH IN. Education and Research in the Refrigerating Industry, J. Wemyss Anderson. Proc. Cold Storage & Ice Assn., vol. 14, 1917, pp. 5-15 and (discussion), pp. 16-30. Suggests that Cold Storage & Ice Assn. petition Government to subsidize Association Internationale du Froid, foster research and approve formation of Schools of Refrigeration.

RESEARCH

BRIQUETTING PLANT. Experimental Briquetting Plant, Albert L. Stillman. Chem. & Metallurgical Eng., vol. 22, no. 22, June 2, 1920, pp. 1035-1038, 4 figs. Outline of briquetting research work in General Briquetting Co.'s experimental plant.

GOVERNMENTAL CO-OPERATION IN. The Economic Importance of the Scientific Work of the Government, E. B. Rosa. Jl. Washington Acad. of Science, vol. 10, no. 12, June 19, 1920, pp. 341-382, 3 figs. Benefits resulting to the public from governmental co-operation in industrial research are pointed out. Reasonablesness of Government assisting and leading in research work is determined from analysis of present national budget, in which only one per cent of total is dedicated to research, education and development of municipal work. Government, it is concluded, should co-operate with industries in peace as earnestly and as effectively as industries co-operated with it in war.

PHOTOBIBLIOGRAPHIC METHODS. Photobibliographic Research Methods—The Compilation of Technical Data with the Aid of Photography, Arthur Worischek. Jl. Indus. & Eng. Chem., vol. 12, no. 7, July 1920, pp. 679-682, 2 figs. Need for portable and cheaply operated photographic device for copying illustrations and articles on file in reference libraries is pointed out. It is believed that a device combining operating principles of existing bromide paper copying machines and self-illuminated meter-reading cameras would prove to be valuable aid in data compilation and simple enough in operation for use by non-technical clerical assistants.

TABLES, PREPARATION OF. The Rapid Preparation of Tables, J. C. Witt, Jl. Indus. & Eng. Chem., vol. 12, no. 6, June 1920, pp. 591-592. Illustrates simplification of computation of results obtained in laboratory tests by constructing expression indicating progressional value of series.

See also Chemistry, Research in: Electrical Engineering, Research Problems; Frozen-Meat Industry, Research in; Gas, Research; Gas Industry, Coal Research Work; Heating and Ventilation, Research; Hydraulics, Research; Refrigeration, Research in.

RESERVOIRS

NORTH CAROLINA. Master Storage Reservoir for Southern Power Company's System. W. S. Lee and Richard Pfaehler. Elec. World, vol. 75, no. 23, June 5, 1920, pp. 1299-1303, 10 figs. Features of Bridgewater reservoir which provides storage for seven hydroelectric plants of Southern Power Co. and detail of 25,000 kva. Bridgewater Station at this reservoir.

ROADS, CONCRETE

CALIFORNIA. Reinforcing Concrete Pavements on California Highways. Eng. News-Rec., vol. 84, no. 26, June 24, 1920, p. 1255, 1 fig. Transverse bars used to prevent cracks from widening and to maintain surface continuity.

PROPORTIONING AGGREGATES. New Ideas Applied to Cement Concrete Roads, W. P. Near. Contract Rec., vol. 34, no. 25, June 23 1920, pp. 605-608. Abrams' table of proportions and quantities for one cubic yard of concrete, based on laboratory investigations. Suggestions in regard to specification for consistency. Paper read before Canadian Good Roads Congress.

RIVETED JOINTS

TESTS. Experiments on Riveted Joints, James Montgomerie, Shipbuilder, vol. 22, no. 117, May 1920, pp. 335-338. Experiments undertaken at Proving House in Glasgow at instance of Committee of Lloyd's Register of Shipping.

ROAD CONSTRUCTION

GEORGIA CONTRACT FORM. Georgia's New Road Contract, Public Works, vol. 48, no. 23, June 19, 1920, pp. 534-536. Form which State Highway Department is intending to try out, involving estimate by contractor and fee or profit varying inversely as actual cost.

ROAD MATERIALS

OILS, ASPHALT CONTENT OF. The So-Called Asphalt Content of Road Oils, B. A. Anderton and D. G. Taylor. Twenty-Third Annual Meeting, Am. Soc. for Testing Matls., June 22-25, 1920, 7 pp. 1 fig. Investigation of Bur. of Public Roads of value of determining asphalt of 100 penetration in road oils in differentiating between various types and consistencies of oils. As a general conclusion, it is believed that percentage of asphalt gives no information on suitability of a road oil for a given purpose that is not adequately indicated by other well standardized tests.

ROCK

DEVAL ABRASION TEST. The Standard Deval Abrasion Test for Rock, F. H. Jackson. Twenty-Third Annual Meeting, Am. Soc. for Testing Matls., June 22-25, 1920, 14 pp. 6 figs. Results of tests made in laboratory of Bur. of Public Roads in connection with proposed changes in Deval abrasion test for rock. It is concluded that results of standard Deval abrasion test as conducted in usual way are accurate to within one per cent.

ROCK DRILLS

HAMMER, HOSE FITTINGS FOR. Standardization of Hose Fittings for Hammer Rock Drills, George H. Gilman. Eng. & Min. Jl., vol. 109, no. 23, June 5, 1920, pp. 1252-1255, 18 figs. Conical joint, standard pipe threads, and use of beat-treated steel are suggested.

ROLLING MILLS

POWER DRIVES. Power Drives for Rolling Mills, W. O. Rogers. Power ,vol. 51, no. 24, June 15, 1920, pp. 962-966, 5 figs. Several types of mills are described, together with details regarding process in rolling steel into various products, from ingot into slabs, billets., skepl, plates and pipes.

SHEET. Bethlehem's Sheet and Tin Plate Mills. Iron Age, vol. 105, no. 21, May 20, 1920, pp. 1433-1435, 1 fig. Description of arrangement and equipment of sheet mills, together with account of enlarged tin plate department of Maryland plant.

Wider Sheet Bars Advocated. Clement F. Poppleton. Iron Age, vol. 105, no. 20, May 13, 1920, pp. 1359-1363, 4 figs. Matter of balanced rigging in stands. Economics calculated and two layouts shown by way of illustrations.

SHIP-PLATE. The Dominion Iron and Steel Company's New Ship-Plate Rolling Mill. H. E. Rice. Can. Min. Inst. Bul., no. 97, May 1920, pp. 367-377, 5 figs. Mill is a 110-in. x 36-in. three-high plate mill of Lauth type. It consists of one stand of rolls served by tilting tables and is driven by 4000 h.p. 82-r.p.m. motor through set of cut herringbone pinions.

ROOF TRUSSES

See Piers, Concrete Roof Trusses.

RUBBER

ANALYSIS. A Direct Method for the Determination of Rubber Hydrocarbon in Raw and Vulcanized Rubber, W. K. Lewis and W. H. McAdams. Jl. Indus. & Eng. Chem., vol. 12, no. 7, July 1920, pp. 673-676, 1 fig. Working with filtered carbon tetrachloride solution of acetone-extracted plantation pale crêpe, it is said to have been shown by a volumetric method involving a double titration that bromide consumption, corrected for observed substitution, is true measure of pure rubber hydrocarbon present.

STRESS-STRAIN CURVE. Some Aspects of the Rubber Stress-Strain Curve, William B. Wiegand. Can. Chem. Jl., vol. 4, no. 6, June 1920, pp. 160-170, 21 figs. Survey of researches made by various investigators.

SHOP COMMITTEES

STEEL

STEEL, HEAT TREATMENT OF

CONTROL. Relationship Between Dendritic Structure and Ferrite Mesh, Federico Giolitti. Chem. & Metallurgical Eng., vol. 22, no. 20, May 19, 1920, pp. 921-929, 42 figs. It was found in experimental researches in steel metallurgy that fir-tree crystals do not influence directly location of ferrite shells either in ingot structure or after drastic heat treatments, while physical properties of normalized castings depends primarily on an improvement of pearlitic kernels by gradual diffusion of segregates. From studies On the Control of the Preliminary Heat Treatment of Steel in Large Masses, published in Metallurgia Italiana, 1913.

HIGH-CHROMIUM STEEL. The Heat-Treatment of a High-Chromium Steel, H. J. French. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July, 1920, pp. 103-109, 10 figs. Experimental determination of effect of various heat-treatments on tensile properties of steel containing about 11 to 15 per cent of chromium and from 0.20 to 0.40 per cent of carbon (stainless steel). With increasing quenching temperature hardness as measured by Brinell and Shore instruments increased until temperature of about 19.50 deg. fahr. was reached. Quenching from about 1750 deg. fahr. developed best combination of strength and ductility, which was not coincident with range of maximum hardness. Ductility as measured by elongation and reduction in area was very low in samples quenched from 1850 deg. fahr. or above.

LOCOMOTIVE FORGINGS. Notes on the Heat Treatment of Locomotive Forgings and Similar Parts, Lawford H. Fry. Jl. Am. Steel Treaters Soc., vol. 2, no. 9, June 1920, pp. 435-441, 1 fig. Tables of quenching speeds and resulting physical properties.

MICROSCOPIC STUDY. The Microscope and the Heat Treatment of Steel, Albert Sauveur. Iron Age, vol. 105, nos. 23 and 25 (Discussion), June 3 and 17, 1920, pp. 1586-1589, 10 figs. and 1717-1720, 8 figs. Photomicrographs illustrating various transformations in structure and properties under thermal conditions. Paper read before Am. Iron and Steel Inst.

PARTIAL CEMENTATION. Partial Cementation of Steel by Means of Solid Cements, Gordon A. Webb. Jl. Am. Steel Treaters Soc., vol. 2, no. 9, June 1920, pp. 442-450. Properties acquired by steels of different composition by carburization.

PLANT. Heat Treatment for Continuous Operation, L. W. Heiser and J. L. M'Cloud. Am. Drop Forger, vol. 6, no. 6, June 1920, pp. 272-274, 2 figs. Proposed heat-treating plant, designed to treat 100,000 lb. of work, in which the operation is continuous.

STEEL, HIGH-SPEED

TESTS. A Comparative Test Upon High-Speed Steels—III, A. J. Langhammer. Chem. & Metallurgical Eng., vol. 22, no. 20, May 19, 1920, pp. 939-942, 2 figs. Detailed description of method of procedure in testing 16 different commercial brands of high-steel tool steel, together with data as to performance of each individual tool, its chemical composition, heat treatment, and hardness.

STEEL INDUSTRY

OUTLOOK. What the Outlook is for Iron and Steel, John A. Topping. Iron Age, vol. 105, no. 19, May 6, 1920, pp. 1307-1308. Supply is said not to have caught up with demand, but prices are not considered to be relatively high.

STEEL MANUFACTURE

ACID OPEN-HEARTH PROCESS. The Acid Open Hearth Process, B. E. L. DeMaré. Iron Age, vol. 105, no. 23, June 3, 1920, pp. 1589-1593, 1 fig. Practice as carried out in open-hearth department of Nicetown Plant of Midvale Steel and Ordnance Co., Philadelphia. Paper read before Am. Iron and Steel Inst.

BETHLEHEM STEEL CO. Features of a Modern Steel Plant. Iron Age, vol. 105, no. 24, June 10, 1920, pp. 1657-1660. Steps in manufacture of steel products from raw material at Maryland plant of Bethlehem Steel Corporation.

OPEN-HEARTH PROCESS. Notes on the Acid Open Hearth Process, B. De Mare. Blast Furnace & Steel Plant, vol. 8, no. 6, June 1920, pp. 318-324 and p. 385, 3 figs. Discussion of practice as carried out in open hearth department of Nicetown plant of Midvale Steel & Ordnance Co.

See also Rails, Pipeless Electric Furnaces, Induction; Open-Hearth Furnaces, Gas-Fired.

STEEL MILLS

ELECTRIC REPAIR-SHOP PRACTICE. Steel Mill Electric Repair Shop Practice, A. J. Standing. Jl. Engrs. Club of Phila., vol. 37-5, no. 186, May 1920, pp. 215-218. Practice of Bethlehem Steel Co., Bethlehem, Pa.

ELECTRICALLY DRIVEN. Electrically Driven Steel Reversing Mills, Fraser Jeffrey. Power, vol. 51, no. 26, June 29, 1920, pp. 1030-1033, 5 figs. Tonnage output per cost of operation and maintenance rather than first cost, it is said, is basis on which electricity is efficiently replacing steam as a mill drive. An installation is described in which a reversing motor and its necessary complements replaced an engine unit.

See also Signaling, Acoustic.

STOKERS

TESTS. Mechanical Stoker Tests. Jl. Instn. Mech. Engrs., no. 4, May 1920, pp. 281-313 and (discussion) pp. 314-428. Details of performance of 80 typical mechanically fired "Lancashire" steam boiler plants in Great Britain. (Concluded.)

STREET CLEANING

SWEEPING COSTS. Forms for Motor Sweeper Cost Keeping, John Townshend Child. Public Works, vol. 38, no. 18, May 15, 1920, pp. 417-419, 2 figs. Methods and forms devised in Rochester, N.Y., for keeping cost records of street sweepers for aid in controlling work, making budget estimates, comparing and purchasing equipment, and determining special assessments.

STREET RAILWAYS

CAR MATERIALS. Railway Car Materials—Steel II, Norman Litchfield. Elec. Ry. Jl., vol. 55, no. 25, June 19, 1920, pp. 1247-1250, 3 figs. Discussion of physical and chemical properties necessary and their relation to strength and durability.

IMPROVING SERVICE. Merchandising Transportation, F. G. Buffe. Elec. Ry. Jl., vol. 55, no. 25, June 19, 1920, pp. 1251-1254. Various methods of disposing "of street car rights by merchandising methods" are discussed, including means for improving service, publicity of improvements and securing co-operation of trainmen.

SUBMARINES

EUROPEAN TYPES. Submarines (Les sous-marins), A. M. Laubeuf. Revue de l'Ingénieur et Index Technique, vol. 26, no. 5, May 1920, pp. 491-521, 21 figs. Description of French, English and German types. (Continuation of serial.)

GERMAN. German Submarines, A. W. Johns. Shipbuilder, vol. 22, no. 117, May 1920, pp. 298-302, 7 figs. Information as to types, number, cost and other particulars.

SURVEYING

RECTANGULAR CO-ORDINATE. Rectangular-Co-ordinates Used in Surveys and Maps, H. A. Foster. Eng. News-Rec., vol. 84, no. 20, May 13, 1920, pp. 962-963, 1 fig. Grid system based on Lambert projection, employed by armies in France, is recommended for civilian practice.

TAR

See Wood, Tar Distillation.

TELEPHONY

See Phototelephony; Radiotelephony.

TELLURIUM

See Selenium.

TEMPERATURE CONTROL

Automatic Control of High Temperatures. Iron Age, vol. 105, no. 22, May 27, 1920, pp. 1516-1517, 2 figs. Automatic recording controller manufactured by Leeds & Northrup Co., Philadelphia.

TERMINALS, MARINE

FREIGHT HANDLING. Freight Handling at Marine Terminals, A. K. West. Int. Mar. Eng., vol. 25, no. 7, July, 1920, pp. 598-600, 4 figs. Methods at Boston Army Supply Base.

TIDAL POWER

UTILIZATION. Coupling of Electric Plants Utilizing Tidal Power (Couplage d'usines électriques utilisant la force des marées), Georges Mangin. Revue générale de l'Électricité, vol. 7, no. 19, May 8, 1920, pp. 626-631, 6 figs. If plants are built at two different points, so situated that high tide in the one corresponds to low tide in the other, and vice versa, coupling of these two plants, it is observed, will secure continuous supply of power. Construction and coupling of such plants at St. Malo and Brest is studied.

Utilization of Tidal Energy at the Mouth of Rivers (Utilisation de l'énergie de l'embouchure des fleuves), Ch. Andry-Bourgeois. Électricien, vol. 35, no. 1253, June 1, 1920, pp. 217-219, 1 fig. Scheme suggested consists in building canal at estuary of river. Turbines placed at middle of canal are operated continuously by flux and reflux of water.

TIME

MEASUREMENT OF. Representation and Measurement of Time (Représentation et mesure du temps), Édouard Guillaume. Archives des Sciences physiques et naturelles, vol. 2, Mar.-Apr. 1920, pp. 125-146. Kant's axiom, different times cannot be simultaneous, is applied to Lorentz' transformation. Investigation is carried in light of principles of theory of relativity.

TIME STUDY

DETAILS OF. Time and Job Analysis in Management—IV, William O. Litchner. Indus. Management, vol. 60, no. 1, July 1920, pp. 28-34, 7 figs. Details and technique of taking time studies.

TUNNELS

TURBO-ALTERNATORS

VACUUM TUBES

WATER

WATER PURIFICATION

WATER HAMMER

WATER MAINS

WATER POWER

WATER SOFTENING

Hot Process. Development of Hot Process Water Softener, George Gibson. Blast Furnace & Steel Plant, vol. 8, no. 6, June 1920, pp. 325-326, 3 figs. Sorge-Cochrane softener.

WATER SUPPLY

Booster Station. Combined Gas and Motor-Driven Pressure Booster Station, A. E. Walden. Power, vol. 51, no. 24, June 15, 1920, pp. 950-952, 5 figs. Details of two pressure booster stations, consisting of combination gas-engine and motor-driven centrifugal pump units of 75 and 150-h.p. capacity, each with pumping capacity of 2,000,000 gal. of water daily, at 55 ft. to 115 ft. and 231 ft. head respectively.

Montreal. The Municipal Water Supply of Montreal, T. W. Lesage. Can. Engr., vol. 38, no. 26, June 24, 1920, pp. 584-587, 1 fig. Water is sterilized by hypochlorite. Average daily consumption for 1919 was 65,046,000 imp. gal. Paper read before American Water Works Association.

WATER TREATMENT

Clay and Silica Removal. The Removal of Clay and Silica From Water, Otto M. Smith. Jl. Am. Water Works Assn., vol. 7, no. 3, May 1920, pp. 302-314, 10 figs. List of electrolytes is given arranged in the order of their efficiencies as coagulants, and results of tests with these electrolytes are presented in diagrammatic forms.

Rainfall and High Bacterial Count. An Inquiry Into the Effect of Meteorological Conditions Upon the Efficiency of Storage, Filtration and Chlorination, Based Upon a Study of the Hagerstown Water Supply, Abel Wolman. Jl. Am. Water Works Assn., vol. 7, no. 3, May 1920, pp. 352-363. Fundamental cause producing excessive bacteria counts in tap water was found to be excessive rainfall.

WATER WORKS

Centrifugal Pumps in. The Use of Centrifugal Pumps in Municipal Water Plants, Russell A. Murdoch. Mun. & County Eng., vol. 58, no. 6, June 1920, pp. 253-255 and p. 258, 3 figs. Performance curve of centrifugal pump operating against constant head.

Construction. Cost-Plus Contracts for Water Works Construction, George W. Fuller. Can. Engr., vol. 38, no. 26, June 24, 1920, pp. 599-601. Comparative advantages and disadvantages of cost-plus and lump-sum contracts.

Electrically Driven. The Application of Electric Motive Power to Small Waterworks Plants in Indiana, D. D. Ewing, and G. C. Blalock. Purdue University, Publications of Eng. Departments, vol. 3, no. 3, Dec. 1919, 100 p. 47 figs. Survey of plants. Electrically driven pumps, it is said, have proven highly satisfactory. It is added: that no troubles were found which were directly chargeable to mode of operation. It is also mentioned that first cost of an electrically operated pumping plant is from 25,000 of that of a steam pumping plant. Bibliography on electrification of pumping stations is appended.

WATTMETERS

Reactive Volt-Ampere Measurements. Reactive Volt-Ampere Indicators, H. C. Yeaton. Elec. World, vol. 75, no. 26, June 26, 1920, pp. 1476-1479, 10 figs. It is shown how standard indicating wattmeters may be applied to measurement.

Water, Power from. An Experimental Determination and Utilization of Wave Power. College of Eng., Tokyo Imperial University, vol. 10, no. 1, June 30, 1919, pp. 21-36, 6 figs. partly on supp. plate. Describes apparatus for measuring wave power consisting of float board weighted with stones making large pendulum, which is allowed to swing freely under stroke of waves. Amplitude of motion of pendulum measured at each stroke gives amount of available energy. Apparatus is also described for compressing air in container by exposing grated opening of large pipe to alternate action of wave.

WAVES

Force of, Estimating. On a Method of Estimating the Force of Waves, I. Hiroi. Jl. College of Eng., Tokyo Imperial University, vol. 10, no. 1, June 30, 1919, pp. 1-19, 9 figs. partly on supp. plate. It is concluded from study of empirical formulæ and results of experiments that greatest intensity of wave pressure is found near water surface, acting on comparatively small area. It is believed that mean intensity of pressure on large area is hardly capable of direct measurement, and use of reliable formula is considered as only practical method for estimating probable mean wave pressure in any given locality.

WELDING

Automobile Repair Work. Welding and Its Relation to the Repair Industry, Lord Campbell, Jr. Jl. Soc. Automotive Engrs., vol. 7, no. 1, July, 1920, pp. 42-46, 4 figs. Welding is classified into four general headings: Forging, oxy-acetylene or other gas processes, electric arc and thermit methods. Field of each one of these is pointed out with special reference to automobile repair work.

See also Electric Welding; oxy-acetylene welding.

WELFARE WORK

Store Departments. Advantage of a Company Store to a Plant, E. E. Adams. Am. Drop Forger, vol. 6, no. 6, June 1920, pp. 288-290. Experience of forge-plant superintendent who conducted company store in connection with supply department, in which, it is said, he saved his workmen 20 per cent. Paper read before Am. Drop. Forge Assn.

WIND TUNNELS

Design. The Design of Wind Tunnels and Wind Tunnel Propellers, Edward P. Warner, F. H. Norton and C. M. Hebbert. Nat. Advisory Committee for Aeronautics, report no. 73, 1919, 24 pp. 16 figs. Application of Dryewiecki theory.

WIRE ROPE

Care of. Suggestions for Care of Wire Rope, James F. Howe. Eng. World, vol. 17, no. 1, July, 1920, pp. 36-37. Directions for attaching sockets to wire rope are included.

WOOD

Tar Distillation. Tar-Still Operation in Hardwood Distillation Plants, L. F. Hawley and H. N. Calderwood, Jr. Jl. Indus. & Eng. Chem., vol. 12, no. 7, July, 1920, pp. 684-685. Tests made to determine effects of speed and steam pressure. Directions for tar-still operation are suggested.

See also Aircraft Construction Materials, Wood.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print (up to 11 x 14 in. in size), 25 cents plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

ROLLS-ROYCE. The Rolls-Royce Aircraft Engines Described and Illustrated. Automotive Industries, vol. 43, nos. 5, 6 and 7, July 29, and Aug. 5 and 12, 1920, pp. 210-214, 18 figs., 261-265, 12 figs., 316-320, 11 figs. Detailed description of larger size of Eagle type Rolls-Royce engine; 12-cylinder "V" type, with a bore of 114 and a stroke of 165 mm., output 352 hp., and 1,650 to 1,800 r.p.m. Translated from Der Motorwagen.

SUPERCHARGED AND OVER-DIMENSIONED. The Design of Supercharged and Over-Dimensioned Aircraft Motors. Aeronautics, vol. 19, no. 355, Aug. 5, 1920, pp. 118-119, 3 figs. Method of calculating dimensions of an over-dimensioned and supercharged motor. Translated from Technische Berichte.

SUPERCHARGERS. Superchargers for Airplane Engines, Sanford A. Moss. Am. Mach., vol. 53, no. 8, Aug. 19, 1920, pp. 345-348. Treats of aeroplane-engine development showing value of supercharger for high altitude flying.

See also Aeroplanes, International Exhibition.

AEROPLANE PROPELLERS

DESIGN. Approximating Bending Moments in Air Propellers, Edward P. Warner. Aviation, vol. 8, no. 11, July 1, 1920, pp. 430-431, 2 figs. Describes method which, it is claimed, has been found to give results of quite surprising accuracy. In order to permit analytical determination of bending moments, load-grading curve was assumed to be made up of three straight lines and parabola.

PITCH AND CLIMBING CAPACITY. The Aeroplane in Diagram (Das Flugzeug in Diagramm), H. Schuster, Luftfahrt, vol. 24, nos. 3 and 4, March and April 1920, pp. 41-43 and 60-61, 2 figs. Points out influence of propeller pitch on climbing capacity of aeroplane. Shows by diagram that propeller with large pitch is favorable for speed, and one with small pitch for climbing capacity of machine and that choice of pitch must be made accordingly.

THEORY OF. New Theory of the Screw Propeller, M. A. S. Riach. Aeronautics, vol. 19, no. 354, July 29, 1920, pp. 98-100, 1 fig. Theory refers to "static" case of V-O.

AEROPLANES

ALL-METAL. Experiences in the Construction of Metal Aeroplanes (Eigene Arbeiten auf dem Gebiete Metall-Flugzeughaues), H. Junkers. Zeitschrift für Flugtechnik u. Motorluftschiffahrt., vol. 11, no. 3, Feb. 14, 1920, pp. 35-37, 7 figs. Writer explains why metal was employed for construction of the Junkers aeroplanes and gives reasons why it is perhaps advisable to employ metal in place of wood.

BRITISH. The Air Ministry Competition at Martlesham. Flight, vol. 12, no. 32, Aug. 5, 1920, pp. 855-861, 13 figs. Mechanical details of machines entered.

DAYTON-WRIGHT. Report of Static Test on DH-4 (Dayton-Wright) Tail Surfaces. Air Service Information Circular, vol. 1, no. 23, March 31, 1920, 7 pp., 4 figs. Elevator, stabilizer and rudder satisfactory. Fin not tested but held on previous tests and is regarded safe.

Report of Static Test of the Fuselage of the D.H.-4 (Dayton-Wright). Air Service Information Circular, Eng. Div., Air Service, vol. 1, no. 34, May 8, 1920, 1 p., 6 figs. Test showed fuselage to be satisfactory, holding a load factor of 5.

DESIGN. The Structural Analysis and Design of the Aeroplane, B. C. Boulton. Aerial Age, vol. 11, nos. 22 and 23, Aug., 9 and 16, 1920, pp. 742-744, 10 figs., and 775-777, 4 figs. Calculations of internal stresses in members of structure. Formulæ for designing structural members made of wood and steel in combinations. (Continuation of serial.)

DETECTION OF. Seeing in the Dark. Sci. Am., vol. 123, no. 7, Aug. 14, 1920, pp. 154 and 166-168, 5 figs. Thermopiles and holders for detecting aeroplanes in the dark.

GALLAUDET. The Gallaudet C-3 Liberty Tourist Plane. Aerial Age, vol. 11, no. 23, Aug. 16, 1920, p. 771, 3 figs. Dimensions: Length overall, 29 ft. 5 in.; wing span, 44 ft.; height, 10 ft. 3 in.; wing area 48 sq. ft.; weight loaded, 3,800 lb.; cruising radius, 500 miles; ceiling, 18,000 ft.; maximum speed, 125 m.p.h. Built by Gallaudet Aircraft Corporation, East Greenwich, R.I.

INTERNAIONAL EXHIBITION. The International Aero Exhibition. Eng., vol. 110, nos. 2846 and 2848, July 16 and 30, 1920, pp. 74-79 and p. 82, 12 figs., and 137-142, 8 figs. Details of models exhibited and of Clergat and Zeitlin engines.

LINCOLN STANDARD SPEEDSTER. The Lincoln Standard Speedster. Aerial Age, vol. 11, no. 22, Aug. 9, 1920. pp. 740-741, 5 figs. Characteristics; Length overall, 25 ft. 8 in.; height overall, 10 ft.; span, 32 ft.; chord, 6 ft.; weight loaded, 2,150; hp. 150 or 180 Hispano-Suiza; climb loaded, 5,000 ft. in 10 min.; Speed maximum 107 m.p.h.

PROFILE FOR GIVEN LIFT. Theory of the Lift of Supporting Planes (Zur Theorie des Tragflächenauftriebes), R. I. Mises. Zeitschrift (für Flugtechnik u. Motorluftschiffahrt. vol. 11, nos. 5 and 6, March 15 and 31, 1920, pp. 68-73 and 87-89, 14 figs. Writer seeks to find suitable profile forms for given lift conditions. Notes on size and position of lifting force, parameter of profile and the Joukowski form of profile. It is concluded that the reduction of camber as well as increase of thickness and of edge angle have a favorable effect on movement of pressure centre. Examples of profiles with pressure centres are given.

RIB CONSTRUCTION. Tests with a Special Rib Construction (Versuche mit einer besonderen Holmkonstruktion). Karl Balaban. Zeitschrift für Flugtechnik u. Motorluftschiffahrt, vol. 13, no. 6, March 31. 1920, pp. 81-84, 8 figs. Describes a tongued-and-grooved joint used and gives results of experiments with ribs so constructed.

STALLINGOF. The Dangers and Effect of Construction on Stalling (Der uberzogene Flug, seine Gefahren und seine Beeinflussung durch die Konstruktion), H. Hopf. Zeitschrift für Flugtechnik u. Motorluftschiffahrt, vol. 11, no. 4, Feb. 28, 1920, pp. 52-54, 4 figs. Construction of plane is said to affect stalling in two ways: (1) An aeroplane becomes more readily stalled as difference becomes less between its usual speed and speed at which equilibrium of vertical force is no longer possible: (2) aeroplane comes more readily out of stalling as turning in space becomes easier and the more it is possible to check turning of flight path.

STRUTS. Effect of Surface Quality of Struts on Aeroplane Resistance (Der Einfluss der Oberflachenbeschaffenheit auf den Widerstand, untersucht an Streben). C. Wieslsberger. Zeitschrift für Flugtechnik u. Motorluftschiffahrt. vol. 11, no. 4, Feb. 28, 1920, pp. 54-57, 8 figs. Curves are given showing results of tests on thick struts covered with linen and with a single coat of varnish. Third report from the Göttingen Model Experimental Station for Aerodynamics.

The Efficiency of Airplane Struts, Wallace F. Wiley, Aviation, vol. 8, no. 12, July 15, 1920, pp. 477-478, 3 figs. General equation for power absorbed by a strut of any material, section, length and strength at any velocity. Application of equation exemplified.

WINGS. Report of Static Test of D.H. 4 (P. 34) Wing Cellule. Aid Service Information Circular, Eng. Div., Air Service, vol. 1, no. 36, May 8, 1920, 2 pp., 5 figs. Test showed that with proper maintenance and repair of damage, strength of the wing structure will not be materially reduced by long service.

The "Alula" Wing. Flight, vol. 12, no. 32, Aug. 5, 1920, pp. 862-863, 2 figs. Wing is characterized by very high maximum lift with maximum *L/D* of about 22.9. Design with such wing and intended for carrying heavy loads at moderate speeds is suggested.

See also Aeronautics; Aircraft, Undercarriages; Aviation; Flying Boats; Seaplanes.

AIRCRAFT

UNDERCARRIAGES. Aircraft Undercarriages. John D. North. Aeronautical Jl., vol. 24, no. 110, Feb., 1920, pp. 39-73 and (discussion) 73-84, 39 figs. Some of points indicated are: Wheel "strain energy" is negligible: shock absorbing capacity increases with rate of loading; energy dissipated (hysteresis) increases with rate of loading, etc.; solid or cushion tires may be used with advantage to reduce oscillations; even tensioning and consistent quality of material are important, and individual rings seem to give best promise of fulfilling these requirements; shock absorbing capacity remains constant with varying rate of loading, and energy dissipated diminishes with rate of loading.

AIRSHIPS

CHALAIS-MEUDON. The Chalais-Meudon Airship C. M. 5. Automotive Industries, vol. 43, no. 5, July 29, 1920, p. 219, 1 fig. Description of airship built by French Government for U. S. Navy, now purchased by Goodyear Tire and Rubber Co.

R. 80 H. M. Airship "R. 80." Eng., vol. 110, no. 2848, July 30, 1920, pp. 142. 145 and p. 150, 27 figs, partly on 4 supp. plates. Dimensions: Overall length of hull, 529 ft. without mooring attachment; gas capacity, 1,250,000 cu. ft., giving gross displacement of 38.25 tons of which 17.8 tons is disposable lift. Section of hull is uniform polygon having 21 sides. and diameter of circumscribing circle at largest part is 70 ft. 7½ in. Overall height of ship from bottom of bumping bags on cars to top of hull is 86 ft. 5 in. when axis is horizontal. Ship is propelled at maximum speed of 65 m.p.h. by four engines carried in three cars suspended from hull structure and developing 1,000 h.p. at full power. Range at full power is 3,900 miles and at normal power 4,500 miles.

SCHUTTE-LANZ. The Importance of the Schütte-Lanz Dirigibles (Die Bedeutung der Schüfte-Lanz-Luftschiffe). D. Rühl. Luftfahrt, vol. 24, no. 3, March 4, 1920, 38-40, 6 figs. Details of various models and table giving most important data of the characteristics of Schütte-Lanz dirigibles. Attributes present-day high efficiency and degree of perfection of rigid type of dirigible to adoption of form of minimum air resistance, to simple steering gear, elastic suspension of nacelle, etc.

ALLOYS

ELECTRICAL MELTING. Electrical Melting of Alloys—XI and XII. H. W. Gillett. Foundry, vol. 48, nos. 15 and 16, Aug. 1 and 15, 1920, pp. 612-614 and 656-658. Aug. 1. It is observed that essential points which influence efficiency of operations require installation of electric furnaces under expert supervision. Refractories are discussed. Aug. 15. It is pointed out that efficient operation is measured by continuity of output, as more power is needed per ton melted when furnace cools between heats. It is also noted that cost per kilowatt hour is lower in large installations.

IMPACT TESTS. Study of Impact Tests on Alloys, Austin B. Wilson. Foundry, vol. 48, no. 352, Aug. 1, 1920, pp. 616-617 and 622, 3 figs. Tests made on impact-shear machines and on alternating impact testers indicated relative value of various alloys. Machining of bars found to be unnecessary for impact-shear test.

NON-FERROUS, STANDARDS FOR. New Standards for Metals. Metal Industry (N.Y.), vol. 18, no. 8, Aug. 1920, pp. 349-350. Reports on composition and nomenclature of non-ferrous alloys at 1920 meeting of Am. Soc. for Testing Matls.

ALUMINUM

INDUSTRY, GERMANY. The Aluminum Industry in Germany During and After the War (L'industrie de l'aluminium en Allemagne pendant et après la guerre), M. L. Descroix. Revue de Métallurgie, vol. 17, no. 4, April 1920, pp. 275-285. Economical study based on data published in German periodicals.

WELDING OF. Autogenous Welding of Aluminum (Autogene Aluminiumschweissung), H. Pradel. Elektrotechnischer Anzeiger, vol. 37, no. 30, Feb. 21, 1920, p. 139. Describes process developed by the Griesheim-Elektron chemical factory in Frankfurt, according to which aluminum can be welded in any form as casting, plate or wire with the aid of a liquid for dissolving the aluminum oxide layer.

AUTOMOBILE ENGINES

AUTOMOBILE FUELS

AUTOMOBILES

B

BOILER FEEDWATER

TREATMENT. Progress in the Purification of Boiler Feedwaters (Fortschritte in der Reinigung von Kesselspeisewassern). D. B. Preu. Zeitschrift für angewandte Chemie, vol. 33, nos. 2 and 24-25, March 16 and 26, 1920, pp. 61-63 and 70-72, 1 fig. Discusses various purification methods and apparatus and points out their defects, many of which, it is claimed, are eliminated by application of the Neckar water-purification process with use of apparatus constructed by P. Müller Co., Ltd., Stuttgart, consisting of a purification tank with built-in drop pipe, filter and sludge collector with sludge-discharging device, which is connected with a second tank for refiltration provided with similar equipment.

BOILER FIRING

See Oil Firing, White System.

BOILER OPERATION

COMBUSTION CONTROL. Combustion-Control Apparatus for the Boiler Room(Verbrennungs-Kontrollapparate für das Kesselhaus). Der Praktische Maschinen-Konstrukteur, vol. 53, no. 11, Mar. 18, 1920, pp. 91-96, 9 figs. Details of the Ados apparatus which is claimed to so record CO_2 percentage content of combustion gases that with the use of a table it is possible to determine extent of fuel loss; and the Mono combustion-control apparatus, designed by H. Maihak Co., Inc., Hamburg, consisting of an absorption apparatus and recording instrument enclosed in a dust-proof cast-iron case, the door of which has a glass pane at the top through which the record of previous ten hours is visible, and which even in case of 50 analyses per hr. is said to give perfect result.s

EFFICIENCIES AT HIGH AND LOW RATINGS. Developing High Overload Capacities. Power House, vol. 13, no. 15, Aug. 5, 1920, pp. 356-357 and p. 350, 4 figs. Particulars of tests run on water-tube boiler with horizontal baffling to determine efficiencies at high and low ratings.

BOILERS

AIR LEAKAGE THROUGH SETTINGS. CO_2 Exploration to Detect Air Leakage, A. E. Grunert. Power, vol. 52, no. 2, July 13, 1920, pp. 54-56, 3 figs. Method of exploration for detecting air leakage and giving CO_2 conditions throughout boiler setting is presented. Its use in cases cited so reduced air infiltration that final overall efficiencies of 81 to 83 per cent were obtained.

CORROSION. Corrosion in Locomobile Boilers and Its Prevention (Anfressungen an Lokomobilkesseln und ihre Behämpfung). H. Reichelt. Zeitschrift für Dampfkessel u. Maschinenbetrieb, vol. 43, nos. 11 and 12-13, Mar. 12 and 26, 1920, pp. 81-82 and 90-92, 12 figs. Describes typical corrosions occurring in boilers with suspended fireboxes after prolonged operation and careless attendance; and in boilers with cylindrical fireboxes and removable pipe system. A graphite-tar coating is recommended for outside of smokebox tube wall and for firebox base in boilers with suspended firebox.

ELECTRICALLY-HEATED. Electrically Heated Steam Boilers and Heat-Storage Tanks (Ueber elektrisch geheizte Dampfkessel und Wärmespeicher), E. Höhn, Zeitschrift des Bayerischen Revisions-Vereins, vol. 24, nos. 6 and 7, March 31 and April 15, 1920, pp. 44-46 and 50-52, 13 figs. Discussion of electrode boilers and hot-water storage for generation of steam. Description of heat storage by means of oil, by concrete and hot water with heat transmission by oil, and with tube evaporators. Notes on hot-water heating, and economic problems in connection with conversion of electric current into heat. Address before Swiss Soc. of Steam Boiler Masters. (Concluded).)

HORIZONTAL BAFFLING. Boiler Plant Practice. Refrigerating World, vol. 55, no. 7, July 1920, pp. 21-23, 4 figs. Texts conducted on one unit of installation of boiler plant to ascertain whether arrangement of horizontal baffling suitable for attaining high capacities would prejudice efficiencies obtainable at lower ratings.

Tests on Large Horizontally Baffled Boiler. Textile World Jl., vol. 58, no. 6, Aug. 7, 1920, pp. 115-117, 4 figs. Tests conducted on boiler unit to ascertain whether arrangements of horizontal baffling suitable for attaining high capacities would prejudice efficiencies obtainable at lower ratings. High overload capacities were obtained with type of boiler and arrangement of baffles used.

See also Steam Generators.

BOILERS, WATER-TUBE

VERTICAL. Investigations of Vertical Water-Tube Boilers (Untersuchungen an Steilrohrkesseln). Friedrich Münzinger. Zeitschrift des Vereines deustcher Ingenieure, vol. 64, nos. 21-22, 23-24 and 25, May 29, June 12 and 19, 1920, pp. 393-398, 432-433 and 453-457, 24 figs. Based on investigation of the seven types installed at the Golpa central power station, certain ideas for construction of large steam boilers for low-grade lignite are developed, followed by discussion of a mothed for calculation of the water circulation in double-headed and vertical water-tube boilers.

BORING MILLS

VERTICAL. A New Vertical Boring and Turning Mill, Eng. Production, vol. 1, no. 7, July 1920, p. 258, 2 figs. Details of latest Wilkinson 20-in. duplex vertical boring and turning mill with gear-box drive, which is said to permit rapid handling of medium-sized jobs.

BRAKES

PNEUMATIC VS. ELECTRIC. Pneumatic and Electric Brakes (Druckluftbremse und elektrische Bremse), H. Sauveur. Verkehrstechnik, vol. 37, no. 9, March 25, 1920, pp. 126-130, 5 figs. Comparison of their relative merits, from which it is concluded that none of the electric brakes possesses the safety of operation of the air brake. Results of tests to determine operation movements in the handling of brakes are shown in illustrations.

PNEUMATIC VS. SUCTION. Freight Train Brakes (Zur Bremsüng der Güterzüge). E. Cimonetti. Zeitung des Vereins deutscher Eisenhahnverwallungen, vol. 60, no. 5, Jan. 21, 1920, pp. 53-55. Discussion of the relative merits of the pneumatic and suction air brakes.

BRIDGE DESIGN

TRUSSES, RIVETED JOINTS IN. Detail Design of Riveted Joints of Bridge Trusses, W. M. Wilson. Eng. News-Rec., vol. 85, no. 6, Aug. 5, 1920, pp. 259-260, 2 figs. Riveting determined by study of paths of forces connected. Two examples.

BRIDGES, RAILWAY

ARSTA BAY, SWEDEN. International Competitive Designs for a Railroad Bridge over Arsta Bay Near Stockholm (Wettbewerb zu einer Eisenbahnbrücke über die Arsta-Bucht bei Stockholm), Zentralblatt der Bauverwaltung, vol. 40, nos. 20 and 21, March 10 and 13, 1920, pp. 125-127 and 130-136, 35 figs. Plans call for moveable bridge, 600 m. long, opening to width of 24 m. for passage of high-masted ships, with superstructure of iron or concrete, or both. Details and illustrations of the three prize-winning designs and the four designs bought by railroad administration. (Continuation of serial.)

FLOORS FOR. Floor for Railway Under-Bridges. Engr., vol. 129, nos. 3355 and 3356, April 16 and 23, 1920, pp. 391-394, 11 figs., and 416-418, 8 figs. Following types are described: single line, double line, and double line with centre girder, longitudinal and concrete.

BRIDGES, STEEL

DESIGN. Stability of Compression Members of Steel Bridges (La stabilité des membrures comprimées des ponts métalliques), M. Keelhoff. Annales des Ponts et Chaussées, vol. 55, no. 2, March-April 1920, pp. 193-231. 27 figs., partly on supp. plate. Suggestions in regard to design of cross bracings. Cases in which they are indispensable.

RAPID ERECTION. The First Bridge to be Constructed on the Roth Waagner System (Die erstmalige Anwendung der Roth-Waagner-Brücke), R. Feindler. Eisenbau, vol. 11, no. 8, April 23, 1920, pp. 151-156, 8 figs. Details of 470-m. street truss bridge over Save River, Belgrade, Servia, built according to system developed by Roth & Waagner, Vienna-Budapest, which permits of extremely rapid erection.

RECONSTRUCTION. The Reconstruction of the Bridge over the Narew River Near Modlin (Nowo Georgiewsk), Poland (Die Wiederherstellung der Brücke über den Narew bei Modlin). Eissenbau, vol. 11, no. 9, May 4, 1920, pp. 161-185, 36 figs. Three new large superstructures were built in place of old ones with same span of 76.86 m., according to system of parallel beam with alternating rising and falling diagonals and intermediate verticals: height of system, 7.15 m., bay width, 7.32 m.; width of roadway, 5m.with 1.78-m. sidewalks on either side; weight of steel construction, over 2,000 tons. Details of equipment used.

RESTORATION. Restoration of the Cernavoda-Danube Bridge. Eng., vol. 109, no. 2842, June 18, 1920, pp. 837-840, 19 figs. Restoration by Germans of bridge and viaduct destroyed by Rumanians and Russians.

SOLID WEB TRUSSES. The Calculation of the Statically Indeterminate Solid Web Trusses with the Aid of Displacement Diagrams (Zur Berechnung statisch unbestimmter Vollwandbinder mit Hilfe von Verschiebungsplänen), E. Kammer, Eisenbau, vol. 11, no. 5, March 9, 1920, pp. 117-128, 31 figs. Calculation of displacements in bar tensions by determination of vertical and horizontal components. Investigation of frequently occurring special conditions whereby area of influence for statically indeterminate quantity of system is a parabola. Formulae for calculation of horizontal components of displacements given for the case where the equation of the truss of header axis and equation of vertical displacements are known.

BRIDGES, SUSPENSION

DEFLECTION, REDUCTION OF. The Suspension Bridge over the Rio Sapucahy (Brazil) and General Considerations of Suspension Bridge Deflections (Die Hängebrucke brücke uber den Rio Sapucahy nebst einigen allgemeinen Remerkungen über die Durchbiegung von Hangebrücken), A. Müllenhoff. Eisenbau, vol. 11, no. 6, March 23, 1920, pp. 129-137, 9 figs. Account of a statically indeterminate steel cable bridge of 90 m. span with 4.24 m. distance between main girders which are 2.19 m. high. Numerical tables are given for use of designing engineers, as well as general formulæ relating to reduction of deflection.

BUSES

ELECTRIC RAILWAYS, VS. The Place of the Bus—VI. Walter Jackson. Elec. Ry. Jl., vol. 56, no. 5, July 31, 1920, pp. 209.218. Opinion is expressed that at present costs the bus may supplement but cannot, from an economical point of view, supplant the electric railway upon the basis of equal fare and responsibilities.

C

DISTILLATION OF. The Distillation of Coal in Rotating Furnaces (Die Entgasung der Kohle im Drehofen), E. Roser. Stahl u. Eisen, vol. 40, no. 22, June 3, 1920, pp. 741-747, 5 figs. Summarisez results obtained by separation of distillation from gasification in gas-producer operation with recovery of by-products. It is claimed that by extensive recovery of by-products from coal, shales, etc., a great part of heating and lubricating oils used in Germany will, in a few years, be produced from her own coal supplies.

SAMPLING. Shipping American Coals to Switzerland, with Sampling Methods in Use Joseph D. Davis. Coal Age, vol. 18, no. 7, Aug. 12, 1920, pp. 334-338, 10 figs. Methods of sampling here and abroad, with information regarding Swiss requirements. Description of handling of coal by Northern, or German, route to Switzerland. Why American coals have difficulty in finding welcome equal to that given to known European fuels.

SPONTANEOUS-COMBUSTION. The Constitution of Coal in Relation to its Spontaneous Combustion, F. V. Tideswell. Proc. South Wales Inst. of Engr., vol. 36, no. 1. July 16, 1920, pp. 183-258, 4 figs. Survey of experimental results found by various investigators. Bibliography of articles on the subject is appended.

COAL GAS

EFFICIENCIES IN USE OF DIFFERENT GRADES. Efficiencies in Use of Different Grades of Gas. Gas World, vol. 72, no. 1872, June 5, 1920, pp. 488-492. Report of Research Committee of Gas Investigations Committee, Instn. of Gas Engrs. It deals with illuminating power and thermal efficiency attainable with low-pressure upright incandescent burner and different grades of gas.

COAL HANDLING

RETARDING CONVEYORS. Lowering Lump Coal Down a Steep Mountain on a Moving Bed of Slack, Donald J. Baker. Coal Age, vol. 18, no. 2, July 8, 1920, pp. 53-58, 10 figs. Describes what are probably two longest retarding conveyors in the world, at Beard's Fork mine in Fayette County, W. Va.; machines require power to start them, but one, when started, is self-actuating and other approaches that point; save coal from breakage and act as picking tables.

COAL MINING

STRIPPING. Stripping 85-ft. Cover from an Anthracite Bed with a Dragline Excavator. Coal Age, vol. 18, no. 2, July 8, 1920, pp. 63-66, 12 figs. Large tonnage will be mined on surface and passed down battery breasts, which will be driven from mine below; coal is to be hauled underground to a breaker for preparation.

COAL TAR

INDUSTRIAL TECHNOLOGY. Medern Technology of the Coal Tar Industry—XI (La technique moderne de l'industrie des goudrons de houille), M. C. Berthelot, Revue de Métallurgie, vol. 17, no. 4, April 1920, pp. 252-261, 11 figs. Survey of processes for continuous distillation of tar. Processes for the complete transformation of tar into rosin. (Continuation of serial.)

COKE

QUALITY, CRITERIA OF. Carbon Blisters and Carbon Threads are said to be Evidence of Good Coke. Coal Age, vol. 18, no. 4, July 22, 1920, pp. 173-174, 1 fig. Undecomposed hydrocarbons at bottom of oven rise into fierce glow of upper part of charge, where they split, leaving pure carbon on coke faces.

COKE MANUFACTURE

FOUNDRY COKE. Manufacture of Foundry Coke, Edward H. Bauer. Gas Rec., vol. 18, nos. 1 and 2, July 14 and 28, 1920, pp. 15-21. 12 figs., and 21-24 and 46, 10 figs. Method used by Providence Gas Co. in making high-grade fuel, together with details of coke-over plant. Effect of various coal mixtures and quenching upon quality of metallurgical coke produced.

COKE PLANTS

BY-PRODUCT. Condensation in Coke Plants (Sur la condensation dans les cokeries), E. Orè. Technique Moderne, vol. 12, no. 1, Jan. 1920, pp. 7-11, 21 figs. Comparative value of industrial by-product distillation processes.

Making By-product Foundry Coke in New England, H. R. Simonds. Iron Trade Rev., vol. 66, no. 21, May 20, 1920, pp. 1467-1471, 9 figs. Isolated gas and coke-making plant in Rhode Island devotes attention to cupola fuel. By-product coke used more generally in New England because of restrictions on transportation of beehive oven fuel. Relation of low and high-volatile coals in coke-making.

COLUMNS

REINFORCED-CONCRETE. Experiments with Spirally Reinforced Concrete Columns With and Without Stone Cores at the Technical High School of Vienna (Versuche mit umschnürten Betonsäulen mit und ohne Steinkernen an der Technischen Hochschule Wien). Beton u. Eisen, vol. 19, nos. 1 and 4.5- Jan. 8 and March 4, 1920, pp. 10-13 and 44-46, 8 figs. Results of tests with two kinds of concrete, showing that with the richer mixture the utilization of core and influence of reinforcing decrease, in spite of which total strength increases.

COMPRESSED AIR

HYDROELECTRIC PLANTS. San Joaquin Light and Power Corporation's Kerckhoff Power Project, W. C. Collyer. Compressed Air Mag., vol. 25, no. 8, Aug. 1920, pp. 9757-9758, 3 figs. Compressed-air equipment at hydroelectric power development to utilize water of San Joaquin River at Auberry, Cal.

RAILWAY TERMINALS. St. Paul's New Union Depot Serving Ten Railroads, Francis Judson Tietsort. Compressed Air Mag., vol. 25, no. 8, Aug. 1920, pp. 9759-9761, 7 figs. Uses of compressed air in building structure and for testing air brakes for repair tools and for enginehouse requirements.

CONCRETE

COMPRESSIVE STRENGTH. Compressive Strength of Concrete in Flexure, W. A. Slater and R. R. Zipprodt. Can. Engr., vol. 39, no. 2, July 8, 1920, pp. 123-127, 8 figs. Description of special tests conducted at Lehigh University and Lafayette College, from which it is concluded that 45 per cent of the compressive strength of the concrete may be used as a working stress.

CURING OF. Soaking Concrete in $MgSiF_2$ and $Na_2Si_4O_2$, Solutions. Concrete, vol. 17, no. 1, July 1920, pp. 28-29, 6 figs. Tests indicated that the 1 :1 :2 concrete cured in $MgSiF_6$ solutions was improved in strength for three out of four different curing conditions.

ELECTRIC RESISTANCE OF. Concrete in Connection with Electrical Accidents (Beton und elektrischer Unfall), Stefan Jellinek. Beton u. Eisen, vol. 19, nos. 2-3 and 4-5, Feb. 4 and March 4, 1920, pp. 27-29 and 47-49. Results of investigations carried out at different times and places of electrical resistance of concrete and the changes in concrete caused by electricity, based on works by Berndt and his collaborators.

PROPORTIONING. Volume-Moisture Relation in Sand and a Method of Determining Surface Area Based Thereon, R. B. Young, and W. D. Walcott. Eng. and Contracting, vol. 54, no. 4, July 28, 1920, pp. 91-94, 6 figs. It is concluded from tests that surface area must be taken into account in any method of proportioning concrete mixtures.

STRENGTH, INFLUENCE OF JARRING ON. Influence of Jarring on the Strength of Concrete (Der Einfluss von Erschütterungen auf die Festigkeit des Betons), Hans Schäfer. Prometheus, vol. 31, no. 18, Jan. 31, 1920, pp. 140-142. Results of experiments carried out in the Saxon Mech-Technical Experimental Inst., Dresden, are said to show that a slight jarring before setting begins will have a favorable effect on strength of concrete; during setting period its influence varies and precautions should be taken; after cement is hardened no apparent effect is noted.

WATERTIGHT. Watertight Concrete. Nat. Lime Assn., bul. no. 301, 1920, 20 pp., 12 figs. Summary of facts concerning effects of hydrated lime in improving structure of reinforced concrete and rendering it impermeable to water, together with comments and field data concerning beneficial effects resulting from its use.

CONCRETE, REINFORCED

FLAT SLABS, DESIGN OF. New York City Regulations for Design of Reinforced Concrete Flat Slabs. Eng. and Contracting, vol. 54, no. 4, July 28, 1920, pp. 89-91. Rules adopted by Board of Standards and Appeals governing design of reinforced-concrete flat slabs.

CONDENSERS, STEAM

CIRCULATING-WATER STRAINERS. The Straining of Circulating Water. Eng., vol. 109, no. 2388, May 21, 1920, p. 679, 4 figs. Patented scheme in which straining surface is outside of perforated drum built up of gun-metal plates on cast-iron spiders, one end of drum being closed and the other open to outlet for strained water.

CONVERTERS

ROTARY. Phasing-Out Rotary Converters, K. A. Reed. Power, Vol. 52, no. 2, July 13, 1920, pp. 51-53, 6 figs. Method is outlined which required no other equipment than a number of lamps and special brushes.

CONVEYORS

APRON-TYPE. Kinlok Mine of the Valley Camp Coal Co., J. W. Marshall, Coal Industry, vol. 3, no. 7, July 1920, pp. 307-310, 3 figs. Description and operation of apron-type conveyor said to be largest now being used in U. S.

BELT, WOODEN-LINK. The Kaul Wooden Conveyor Belt (Das Holzglieder-Förderband (System Kaul)). Heinz Gante. Fördertechnik u. Frachtverkehr, vol. 13, no. 4, Feb. 20, 1920, pp. 41-42, 1 fig. Describes belt consisting of wooden links, 50x50x 20 mm. jointed together horizontally with Mannesmann tubes, which is said to have been used successfully in anthracite, lignite, cement, food-products and chemical industries as well as for coaling plants.

BELT, WOODEN-SLAT. The Killewald Wooden Conveyor Belt (Das Holzgliedforderhand "System Killewald"), Fördertechnik u. Frachtverkehr, vol. 13, no. 5, March 5, 1920, pp. 56-57, 2 figs. Describes conveyor exhibited at the Leipzig Exposition by the Bernburg Potash Works, consisting of two parallel wire ropes to which narrow wooden slats are clamped to form the conveying surface, original feature of which lies in the arrangement and fastening of the bars on the wire ropes.

COPPER ALLOYS

PHOSPHOR-COPPER. New Process for Making Fifteen Per Cent Phosphor-Copper, P. E. Demmler, Metal Industry (New York), vol. 18, no. 7, July, 1920. pp. 314-315, 1 fig. Gives particulars of experiments of authors showing that a uniform 15 per cent phosphor-copper can be produced by passing phosphorus vapor over heated copper, and that most satisfactory temperature of copper is 400 deg cent. Paper to be presented in Oct. before Inst. Metals Division of Am. Inst. Min. & Met. Engrs.

D

E

ELECTRIC CURRENTS, ALTERNATING

Rectification by Galena. Two Ways of Rectification of Currents by Galena (Sur deux modes de rectification des courants par les galènes), Paule Collet. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 25, June 21, 1920, pp. 1489-1491. Writer claims to have observed in experiments (1) that when a small electric current traverses lead sulphite ore introduced in a metallic circuit, there is a positive flow from ore to metal, and (2) that when current is large there is a negative flow.

ELECTRIC FURNACES

Non-Ferrous Work. Electric Furnaces, J. H. Stansbie. Metal Industry (London), vol. 14, no. 24, June 13, 1919, pp. 483-487, 2 figs. Prominence given to use of electric furnaces for non-ferrous work is noted and information presented as to great possibilities of zirconium as refractory for furnace lining. Report of joint meeting of Birmingham Branch of British Foundrymen's Assn. and Birmingham Metallurgical Soc. and Staffordshire Iron & Steel Ist. (To be concluded.)

ELECTRIC GENERATORS, A. C.

Field Excitation. Connected Load Versus Generator Capacity, Fraser Jeffrey. Power, vol. 52, no. 5, Aug. 3, 1920, pp. 162-164, 5 figs. Limitations to field excitation are discussed, with special reference to starting periods of squirel-cage indution motors.

See also Turbo-Generators.

ELECTRIC LAMPS, INCANDESCENT

Luminous Efficiency. Luminous Efficiency of Incandescent Bodies (Etude du rendement lumineux des corps incandescents), R. Painvin. Revue générale de l'Electricité, vol. 7, no. 24, June 12, 1920, pp. 787-791. Formula is established for calculating, in terms of temperature, luminous efficiency of carbon and tungtsen filaments of incandescent lamps.

ELECTRIC LOCOMOTIVES

Citroen-Geared. Citröen Gear for Electric Locomotives. Eng., vol. 109, no. 2839, May 28, 1920. pp. 712-715, 8 figs. Power transmitted by gearing is 1,000 b.hp. on speeds of 550 r.p.m. and 169 r.p.m., corresponding to traveling speed of 26 m.p.h., with wheels 4 ft. 3½ in. in diameter, maximum speed being 920 r.p.m. at motor and 43.5 m.p.h. on track.

Swiss Railways. Swiss Federal Railways Buy New Electric Locomotives. Elec. Ry. Jl., vol. 56, no. 6, Aug. 7, 1920, pp. 256-260, 10 figs. Single-phase freight locomotives manufactured by Oerlikon Co. Data: height, 12 ft. 5 in.; total length, 63 ft. 6 in.; gage 4 ft. 8½ in.; diameter, 53¼ in.; crankpin stroke, 23⅝ in.; transmission ratio, 43.03; total weight, 256,000 lb.; adhesive weight, 208,000 lb.

ELECTRIC MOTORS, A. C.

Induction. How to Calculate a New Winding for an Inductor-Motor Stator Core. A. M. Dudley. Power, vol. 52, no. 1, July 16, 1920, pp. 13-18, 5 figs. Six factors that require consideration in figuring new winding for induction motor to operate under new conditions of speed, horsepower, voltage, phase or frequency are enumerated, then problem is worked out to show how each is determined.

ELECTRIC PLANTS

Commonwealth Edition Co., Chicago. Service Work for 1919 Below Pre-War Cost, D. W. Roper. Elec. World, vol. 76, no. 6, Aug. 7, 1920, pp. 273-276, 7 figs. Operating records of Commonwealth Edison Co., Chicago. It is said that in spite of increased wages and inroads of war and industry on ranks of trained workers, careful engineeing has succeeded in reducing cost. Factors that have played a part in bringing this about are enumerated.

Parallel Operation. Governor Adjustment for Efficient Parallel Operation. F. Oppenheimer. Elec. World, vol. 76, no. 5, July 31, 1920, pp. 239-240, 9 figs. Principles of operating steam and hydroelectric plants in parallel and methods of changing governor regulations while running.

ELECTRIC RAILWAY SIGNALS

Dual Control. Dual Control Signals on the Pacific Electric, Clifford A. Elliott. Elec. Ry. Jl., vol. 56, no. 7, Aug. 14, 1920, pp. 321-322, 4 figs. Improved type of signal-light circuit adopted for single-track line to minimize hazardous operating conditions.

ELECTRIC RAILWAYS

Supplying Parts to Repair Shops. Supplying Repair Parts to Shops, W. G. Murrin. Elec. Ry. Jl., vol. 56, no. 2, July 10, 1920, pp. 85-86, 1 fig. Canadian company replaces worn-out supply car with auto truck; sends salvage car monthly over interurban division. Advantage of plan is that in enables foreman in each repair shop to accumulate pieces for repair until a man or machine can do the work in quantities and so reduce unit cost.

ELECTRIC RAILWAYS TRACK

Current Losses. Current Losses in Electric Railway Tracks (Sur les pertes de courant qui se produisent le long des voies de tramways), G. Girousse. Revue générale de l'Electricité, vol. 8, no. 1, July 3, 1920, pp. 837-844, 10 figs. Simplifications of usual formula are suggested.

ELECTRIC TRANSMISSION LINES

Construction Costs. Interconnecting Small Cities. Elec. World, vol. 76, no. 7, Aug. 14, 1920, pp. 321-324, 7 figs. Data on costs of present-day line construction, together with methods of emergency operation, collected from Indiana central-station companies serving 21 communities.

Feeder Voltage Regulation. Calculation of Feeder Voltage Regulation, W. C. Chappell. Elec. World, vol. 76, no. 2, July 10, 1920, pp. 73-74, 1 fig. Chart for computing voltage regulation of given feeder for any load and power factor.

Protection. Protection of Transmission Systems—1, Emil Alm. Elec. World, vol. 76, no. 6, Aug. 7, 1920, pp. 277-278, 2 figs. Analysis of abnormal voltages on transmission systems and methods adopted by company in Sweden to protect station apparatus from insulation breakdown.

ELECTRIC UNITS

Data on. Electric Units and Standards. Circular of Bur. of Standards, no. 60 March 12, 1920, 68 pp. Notes on systems of units, including units in general, electrostatic and electromagnetic systems, and international electric units; evolution of present system of concrete standards; units and standards of principal electric quantities—resistance, current, electromotive force, quantity of electricity, capacity, inductance, power and energy, and resistivity; magnetic units. Appendices on conversion factors, legislation on electric units giving laws of various countries, and bibliography.

ELECTRIC WELDING, ARC

Machines. Automatic Electric Arc Welding Machine, H. L. Unland. Welding Engr., vol. 5, no. 7, July 1920, pp. 26-28, and 32, 14 figs. Automatic are welder is a device for automatically feeding metallic electrode wire into welding are at rate required to hold a constant arc length. Article describes investigation to determine controlling feed of electrode to electric arc in a metallic-electrode welding circuit.

Electric Welding Machines—Direct-Current Constant-Potential Types, L. W. Webb. Power, vol. 52, no. 6, Aug. 10, 1920, pp. 210-212, 4 figs. Operation of different makes of welding machines of constant-potential type.

Metal Deposition in. Metal Deposition in Arc Welding—II, O. H. Escholz. Elec. World, vol. 76, no. 3, July 17, 1920, pp. 118-121, 11 figs. Mechanism of metal transfer from electrode to plate is explained by the aid of photography. Evidence indicates that 85 fer cent of the metal is carried across arc in liquid form by molecular forces.

ELECTRICITY

Atmospheric, Utilization of. A New Source of Energy and Its Useful Possibilities (Eine neue Energiequelle und deren Verwendungsmöglichkeiten für die chemische Industrie), Hermann Plauson. Chemiker-Zeitung, vol. 44, no. 34-35, March 23, 1920, pp. 229-231. Notes on recovery and utilization of atmospheric electricity, which, it is claimed, can be utilized in a practical manner and which offers the prospect of a working capacity of 200 hp. in form of electric energy for every sq. km. of soil. Some of its uses in chemical and electrochemical industries are pointed out.

Price per Kw-Hr. Alignment Charts for the Graphical Computation of Rates of Electricity (Abaques à alignement pour le calcul graphique des tarifs d'électricité), R. Courau. Revue générale de l'Electricité, vol. 7, no. 24, June 12, 1920, pp. 801-807, 4 figs. Graphs constructed from formulæ for determining price of kw-hr.

ELECTROLYSIS

Electric Waves, Influence of. The influence of Electric Waves on Electrolysis (Einfluss elektrischer Wellen auf die Elektrolyse), Franz Grünwald. Elektrotechnischer Anzeiger, vol. 37, no. 36, March 3, 1920, p. 170, 1 fig. It is stated that North German Refinery uses for gold refining direct current with superimposed unsymmetrical alternating current of 50 periods per sec., according to Wohlwill process.

ELECTROMAGNETISM

Galvanomagnetic Effects. Analysis of Three Galvanomagnetic Effects. Confirmation of a New Effect (Analyse de trois effets galvanomagnétiques. Confirmation d'un nouvel effet), A. Sellerio. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 26, June 28. 1920, pp. 1570-1573, 2 figs. Experimental study claimed to have confirmed that when a plate is traversed by an electric current perpendicular to a magnetic field, the field causes flow of current along lines of magnetic force.

ELEVATORS

Worm Gears. Electric-Elevator Machinery. Worm Gears and Their Lubrication, M. A. Meyers. Power, vol. 52, no. 4, July 27, 1920, pp. 136-138, 6 figs. How to remove worm gear from elevator reduction gear is explained. Castor oil is recommended as best for lubrication of these gears.

EMPLOYEES' REPRESENTATION

Advantages. Letting Your Employees do the Hiring. Factory, vol. 25, no. 1, July 1, 1920, pp. 41-44, 1 fig. Method of employee representation lowers labor turnover, assures adequate supply of labor and builds up in the minds of the workers feeling that they are part of the institution, writer believes.

ENGRAVING MACHINES

FORGING

Progress Since 1912. Progress in Forging Practice During Recent Years (Ueber die Fortschritte auf dem Gebiet der Eisenhuttenkunde in den letzten Jahren), K. Dornhecker. Zeitschrift fur angewandte Chemie, vol. 33, nos. 32 and 36, Apr. 20 and May 4, 1920, pp. 96-100 and 106-111, 10 figs. Description of the most important foreign and domestic processes and inventions since 1912.

FOUNDATIONS

Underpinning Methods. Underpinning and Foundations of Heavy Buildings—I, Engr., vol. 129, no. 3365, June 25, 1920, pp. 639-642, 12 figs. Methods of underpinning walls used at various New York and Chicago buildings.

Uniform Pressure on Beds. Uniform Pressure on Building Foundation Beds, R. Fleming. Eng. News-Rec., vol. 85, no. 5, July 29, 1920, pp. 219-223. Review of practice and code provisions, with numerical comparisons for typical office buildings, followed by recommended specification.

FOUNDRIES

Continuous. Continuous Shop is Highly Efficient, Pat Dwyer. Foundry, vol. 48, no. 16, Aug. 15, 1920, pp. 625-630, 9 figs. Among advantages claimed to be derived from continuous foundries are increased tonnage from given floor space and limited flask equipment. Operation of continuous foundry of Air Brake Company. Wlimerding, Pa., for last 30 years is quoted as example.

Design. Toledo Company Building New Plant. Iron Age, vol. 106, no. 8, Aug. 19, 1920, pp. 439-442, 6 figs. Particulars of design of foundry intended for castings ranging in weight from a few ounces to 50 tons.

Increasing Output. Innovations Increase Unit Output—I. Foundry, vol. 48, no. 352, Aug. 1, 1920, pp. 599-607, 11 figs. General features of Saginaw Malleable Iron Co., discussed, and some examples of molding and coremaking procedure presented. (To be continued.)

FOUNDRY EQUIPMENT

Flasks, Steel. Fabricating Steel Foundry Flasks, J. D. Knox. Foundry, vol. 48, no. 16, Aug. 15, 1920, pp. 631-634, 15 figs. Rigidity is obtained by forming ribs on 3-inch centers. Bottom half of each rib is made shallow to provide shoulder upon which sand rests. Diversified uses of flasks.

FUELS

Coal, Oil and Sawmill Refuse. Sawmill Refuse, Powdered Coal, and Oil Fuels, Darrah Corbet. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 8, August 1920, pp. 715-732, 2 figs. It is said that "it will be necessary to curtail some of the further development in the use of oil fuel." Advantages of burning pulverized coal and possibilities of using sawmill refuse, are pointed out.

Heating Value. Heating Value of Fuels (Sur la valeur d'usage des combustibles), Emilio Damour. Comptes rendus des Séances de l'Académie des Sciences, vol. 170, no. 26, June 28, 1920, pp. 1578-1581. Heating value is expressed as reciprocal of weights of two fuels which could produce the same thermal effect in a given furnace. A method is outlined for comparing effectiveness of various fuels in any case by means of that definition for heating value.

See also Oil Fuel; Pulverized Coal.

FURNACES, ANNEALING

Chantraine. The chantraine Rotary Flame Pot Annealing Furnace. Eng., vol. 109, no. 2840, June 4, 1920, p. 754, 4 figs. Type of furnace which has been largely taken up in Belgium and is being introduced in several plants in England.

FURNACES, BOILER

Air-Cooled Scraper Grate. Experiments with an Air-Cooled Scraper Grate (Versuche mit einem luftkekühlten Staurost), H. Kreyssig. Feuerungstechnik, vol. 8, no. 8, Jan. 15, 1920, pp. 69-71, 3 figs. Gives results of experiments with device installed at the discharge end of the Week traveling grates under the Stirling boilers of the Municipal Elec. Works of Reichenbach, showing its value when lignite briquets are employed as fuel.

Low-Grade Fuels. Boiler Furnaces for Economical Utilization of Low-Grade Fuels (Feuerungsanlagen für Wärmesparwirtschaft bei Verwendung minderwertiger Brennstoffe). Der praktische Maschinen-Konstrukteur, vol. 53, no. 11, Mar. 18, 1920, pp. 83-90, 13 figs. Details of under-graduate blower arrangement for furnace with automatically stoked internally fired boiler, constructed by Germania Machine Factory, Chemnitz; the Topf self-feeding furnace for burning lignite; and traveling grates developed by the firm of C. H. Week & Co., Dölau for use of low-grade fuels.

FURNACES, HEATING

Revergen. The "Revergen" Forging Furnace. Eng. Production, vol. 1, no. 7, July, 1920, pp. 262, 2 figs. Describes improved regenerative system of gas firing, developed by The Davis Fuel Co., London, Eng., with which, it is claimed, considerable fuel economies are effected. Consists of an outer casing of sheet steel, bound by channels, tie rods, and thrust plates, body of furnace being composed of Scotch firebrick of extra thickness.

G

GAGES

Thread. The Hardening of Screw-Gages with the Least Distortion in Pitch, Wilfrid J. Lineham. Instn. of Mech. Engrs., Jl., no. 5, June 1920, pp. 451-487 and (discussion) 478-529, 40 figs. Paper in two parts, one devoted to water hardening and the other to oil hardening. Object of paper is to prove that quenching, while crossing an arrest or recalescence point, produces the least amount of distortion, and to give the results of the writer's tests. It is also shown that hardening screw gages in oil, after casing in cyanide, can be performed with less distortion than if water is the quenching medium.

Tool-Setting. Precision Type of Planer Tool-Setting Gage, Gustave Youngquist. Machy. (N. Y.), vol. 26, no. 12, Aug. 1920, pp. 1121-1122, 4 figs. Tool-setting gage provided with vernier for obtaining direct readings and with means for securing quick and accurate adjustments.

Whitworth Thread. Making Whitworth Thread Gages, C. Edgar Allen. Machy. (N. Y.), vol. 26, no. 12, Aug. 1920, pp. 1157-1160, 5 figs. Method which utilizes disintegration of grinding wheel during grinding operation to produce final thread form.

See also Interchangeable Manufacture, Gages for.

GAS ENGINES

Korting. Determination of the Degree of Irregularity of a Single-Cylinder Körting Gas Engine and Construction of Curve of Angular Deviations (Ermittlung des Ungleichformigkietsgrades eines einzylindrigen Körtingsten Gasmotors und Aufzeichnung der Kurve der Winkelabweichungen), O. Bauer. Der praktische Maschinen-Konstrukteur, vol. 53, no. 9, Mar. 4, 1920, pp. 66-72, 4 figs. Gives graphical method and results of investigations which are believed should be of influence in the constructive development of the gas engine.

GAS MAINS

Corrosion. Internal Corrosion of Mains, Services and Meters, J. G. Taplay. Gas World, vol. 72, no. 1872, June 5, 1920, pp. 481-485. Report of life of Gas Meters Joint Committee of Instn. of Gas Engers. Findings based on examination of 26 corrosion deposits and liquors contributed by engineers from different parts of England. Preliminary conclusions are given having reference to destructive influence of hydrocyanic acid, salts produced by interaction of ammonia and carbon bi-sulphide, oxygen and carbon dioxide.

GAS MANUFACTURE

Economies of Production. Tests on Carbonization at Uddingston. Gas World, vol. 72, no. 1872, June 5, 1920, pp. 492-504, 2 figs. Report of Research Committee of Instn. of Gas Engrs., giving account of first stage of investigation into comparative economies of production, from thermal and chemical standpoints, of different grades of gas. Appendices give in detail method of calibration and analyses employed in research.

Horizontal Retort Installations. Carbonization. Gas World, vol. 72, no. 1872, June 5, 1920, pp. 505-510. Descriptions of various English horizontal carbonization plants illustrating efforts which have been made to satisfy present-day requirements. Paper presented before Instn. of Gas Engrs.

Retort Discharger. The Resnard Retort Discharger. Gas Jl., vol. 151, no. 2968, Aug. 4, 1920, p. 240, 4 figs. Patented apparatus consisting of rake so mounted on end of a horizontal iron tube that it can be extended in horizontal position or brough down at right angles by its own weight and by operation of carrier tube.

GAS PRODUCERS

Marine. Producer Gas for Marine Power. Gas & Oil Power, vol. 15, no. 179, Aug. 5, 1920, pp. 175-178, 3 figs. Report of trials of gas producers patented by D. J. Smith. Consumption trials were carried out on gasoline at various speeds and then at the same speeds on producer gas. Consumption of gasoline and coal for same work was relatively equal.

GAS TURBINES

Holzwarth. The Holzwarth Gas Turbine. Gas & Oil Power, vol. 15, no. 177, June 3, 1920, pp. 145-147, 5 figs. Account of progress made in Germany since 1914 in development of Holzwarth type of gas turbine, extracted from article in Jl. Assn. German Engrs. Zeitschrift des Vereines deutscher Ingenieure, Feb. 28, 1920).

GAS WORKS

Sulphate Making. The "Direct" Process of Sulphate making in Gas-Works. Gas Jl., vol. 151, no. 2986, Aug. 4, 1920, pp. 234-237. Tables giving comparative cost figures of materials and labor of manufacture of sulphate by ordinary distillation and "direct" processes.

GEAR CUTTING

Gear Shaper. Machining the Gear-Shaper Saddle, Douglas T. Hamilton. Am. Mach., vol. 53, no. 7, Aug. 12, 1920, pp. 293-295, 18 figs. Practice of Fellows Gear Shaper Co., Springfield, Vt.

GEARS

Automobile. Automobile Gear Making Centralized. Iron Age, vol. 106, no. 5, July 29, 1920, pp. 245-250, 10 figs. New works of General Motors Corporation. Well-lighted, single-room machine shop half acre in size and complete heat-treating plant with efficient routing of work.

H

HEAVY-OIL ENGINES

ENGLISH TYPES. Some Lincolnshire Oil Engines, F. H. Livens. Eng., vol. 110, no. 2848, July 30, 1920, pp. 159-162, 13 figs. Description of various types of heavy-oil engines, indicating developments in design from 1891 to 1919. Paper read before Instn. Mech. Engrs.

HOISTING MACHINERY

EFFICIENCY. The Efficiency of Hoisting Machinery When Lowering the Load (Der Wirkungsgrad von Lasthebemaschinen beim Senken der Last). Leopold Feigl. Fördertechnik u. Frachtverkehr, vol. 13, nos. 6 and 7, Mar. 19 and April 2, 1920, pp. 61-62 and 70-72. Points out that in hoisting machinery without warm gears the lowering capacity is not quite 1 per cent under hoisting capacity, or so slight as to be negligible. Account of experiments carried out to confirm calcutaled results. Basic conditions for the derived equations are given.

STANDARDIZATION. Important Considerations in Regard to Standardization (Wichtige Gesichtspunkte bei Normalisierungen), R. P. Schröder. Fördertechnik u. Frachtverkehr, vol. 13, no. 5, March 5, 1920, pp. 50-52. Notes on basic principle of standardization of parts, with examples demonstrating suitable and tested applications; investigation of standards presented by German Engrs.; and suggestions for improvement of method now in use.

HOISTS

ELECTRIC. Modern Electric Hoists (Neuzeilitliche Motorflaschenzüge). Ernst. Blau. Fördertechnik u. Franchtverkehr, vool. 13, no. 5, March 5, 1920, pp. 54-56, 2 figs. States their advantages and describes spur-gear electric hoist of the German Machine Works Corp. (Demag) in Duisburg, built for loads up to 5 tons.

MINE. A New Depth Indicator for Mine Hoists (Ein neuer Teufenzeiger für Fordermaschinen), Wilh. Weber. Fördertechnik u. Frachtverkehr, vol. 13, no. 4, Feb. 20, 1920, pp. 40-41, 1 fig. Device constructed by W. Weber & Co., Wiesbaden, for indicating exact position of cage, etc.

HOSE

FLEXIBLE-METAL. The Manufacture and Uses of Flexible Metal Hose (Der Metallschlauch, seine Herstellung und Verwendung,) Metall-Technik, vol. 46, nos. 11-12, March 18, 1920, pp. 42-43, 10 figs. Usually made in lengths of 4 to 42 m. and up to 50 em. diam. Suggestions for joining sections together, for protection against destruction and repair. Used for conveying coal, grain, ashes, etc.; distributing water, oil, gas, steam, etc.; for fire-extinguishing, suction dust collecting purposes, etc.

HOUSING

BRITISH GOVERNMENT'S SCHEME. The British Government's Huge Housing Scheme, E. J. Mehren. Eng. News-Rec., vol. 85, no. 5, July 29, 1920, pp. 217-218. Means being taken by British Government to promote and subsidize housing enterprises.

INDUSTRIAL. Manufacturers' Housing Problems, Harold R. Watson. Can. Manufacturer, vol. 40, no. 8, Aug. 1920, pp. 47-52, 6 figs. Housing problem developed by Borders Housing Co., Canada.

HYDRAULIC TURBINES

BUCKETS. Increasing the Life of Turbine Buckets (Erhöhung der Lebensdauer von Turbinenschaufein), Hans Schneider, Zeitschrift für das gesamte Turbinenwesen, vol. 17, no. 1, Jan. 10, pp. 8-9, 2 figs. Quotes suggestion of Schoop that metal-spraying process developed by him be applied to turbine buckets to increase their durability.

PELTON TYPE. Pelton Wheel Reconstruction, Percy Pitman. Eng., vol. 109, no. 2843, June 25, 1920, pp. 851-853, 13 figs. Reconstruction carried out at large ammunition works during war period to replace defective and broken buckets and to economize in water by fitting on buckets of more modern and efficient type.

WEAR OF. Wear of Hydraulic Turbines, its Consequences, and the Methods of Reducing It (L'usure des turbines hydrauliques, ses conséquences et les moyens d'y parer), Henri Dufour, Bulletin Technique de la Suisse Romande, vol. 46, no. 12, June 12, 1920, pp. 133-140, 8 figs. Records of operation of sand settling basin in Switzerland. (Concluded.)

HYDROELECTRIC PLANTS

EFFICIENT OPERATION. Effecting Efficient Operating Methods in Hydro-Electric Plants, L. W. Wyss. Power, vol. 52, no. 3, July 20, 1920, pp. 217-219. Based on experience in number of different hydro-electric stations located in various parts of the country.

NIAGARA FALLS. Developing Niagara Falls Without Marring Its Beauty, J. G. Warren. Elec. World, vol. 76, no. 7, Aug. 14, 1920, pp. 329-331. Seven months of utilizing additional diversion of 20,000 sec.-ft., showing comparative costs, 573,000 hp. to 787,000 hp. can be developed under these plans. Submerged weirs are proposed.

REGULATING PRIME MOVERS. Regulating Hydro-Electric Prime Movers, C. F. Mosher. Elec. World, vol. 76, no. 6, Aug. 7, 1920, pp. 280-281. Ability to hold constant speed, inherent regulation and momentary changes of speed are discussed in detail. Conditions upon which speed changes are based. From paper read before System Operators of New England.

RHONE-RHINE POSSIBILITIES. The Swiss Rhone-Rhine Navigation—V. A. Wharton Metcalfe, Engr., vol. 120, no. 3355, April 16, 1920, pp. 389-390, 2 figs. Hydro-electric aspect. Water power and generating stations. (Concluded.)

SWITZERLAND. The Water-Power Plant on the Aar River (Die Wasserkraftanlage "Gösgen" an der Aare der A.-G. (Elektrizitätswerk Olten-Aarburg). Schweizische Bauzeitung, vol. 75, nos. 23 and 24, June 5 and 12, 1920, pp. 249-254 and 263-266, 16 figs. Details of turbine installation, generators and exciters, transformers (including technical data for the two transformer types), and water supply of plant. (Continuation of serial.)

See also Compressed Air, Hydroelectric Plants.

HYDROGEN

ELECTROLYTIC PRODUCTION. Electrolytic Production of Hydrogen and Oxygen by the British Armies (La production de l'hydrogène et de l'oxygène par électrolyse aux armées britanniques); T. A. Ross. Revenue générale de l'Electricité, vol. 7, no. 24, June 12 1920, pp. 795-801, 19 figs. Details of installation near Rouen.

I

ICE PLANTS

ECONOMICAL OPERATION. Economy at the Finney Avenue Ice Plant, St. Louis, C. Wilkie. Power, vol. 51, no. 25, June 22, 1920, pp. 990-994, 12 figs. Plant 14 years old, with mediocre equipment, is said to be operating at 58.6 per cent over its rated capacity and to be delivering average of 8.5 tons of ice per ton of 10,000-B.t.u. coal. Such performance is attributed to ingenuity of management, co-operation of operating force and careful manipulation of equipment.

INDUSTRIAL MANAGEMENT

FARMING. Notes on Power Farming, R. W. Lohman. Jl. Soc. Automotive Engrs., vol. 7, no. 2, Aug. 1920, pp. 160-174 and 185, 36 figs. Paper discusses laying out of a production program, transportation of men and supplies, special implements for raw land preparation, tractor dynamometers, large tractors, special plowing and tilling implements, four-wheel-drive tractors and road haulage.

PRODUCTION CONTROL. Production Control Through a Routing Department, Norman G. Shidle. Automotive Industries, vol. 43, no. 7, Aug. 12, 1920, pp. 322-325, 6 figs. Operation of production control board and pneumatic-tube system by means of which, it is said, large machine-tool concern is keeping all its machines running efficiently.

PRODUCTION SYSTEMS. Modern Production Methods, W. R. Basset. Am. Mach., vol. 53, nos. 1 and 5, July 1 and 29, 1920, pp. 17-20, 5 figs., and 215-219, 9 figs. Take up planning of production so that all necessary parts of machine reach assembly floor at the same time. Discusses control of work in shop and describes "booth" system.

Organizing for Production—I. Eng. Production, vol. 1, no. 8, Aug. 1920, pp. 289-292, 4 figs. Procedure in American works manufacturing automobile carburetors.

Production Board at Marchant Calculating Machine Company. Metal Trades, vol. 11, no. 8, Aug. 1920, pp. 333-336, 6 figs. Production board devised to route work in such a way as to make it possible to determine at any time present status of any job in the factory, and to permit checking of costs at any time.

Production Planning and Tracing System. Iron Age, vol. 106, no. 4, July 22, 1920, pp. 183-185, 4 figs. System installed in Moreland Motor Truck Co.'s plant at Los Angeles, Cal., Following-up record forms are illustrated.

The Lincoln Motor Production Plan—X. Methods of Receiving and Storing Material, I. J. Beatty. Factory, vol. 25, no. 1, July 1, 1920, pp. 38-41, 6 figs. How plant handles receiving and storing raw materials and completed parts so that production shcedule is not held back.

RECORD SHEETS. Piecework System by Which Clerical Work is Done Almost Entirely by Office Machine (Akkordsystem mit fast ausschliesslich durch Büromaschinen verrichtbaren Schreibund Rechenarbeiten), Carl Rüsch. Werkstattstechnik, vol. 14, no. 6, March 15, 1920, pp. 164-170, 12 figs. Gives illustrations of the various record sheets and describes system employed by machine-tool concern with 650 workmen, which manufacturers tools used in all the other work-shops of a large plant.

TOOLROOM ORGANIZATION. Toolroom System, E. E. Hirschhauter. Am. Mach., vol. 53, no. 8, Aug. 19, 1920, pp. 358-360, 9 figs. System said to have been in successful use for last five years in large gas-engine shop.

See also Taylor System, Time Study.

INDUSTRY

SOCIALIZATION OF. A German Industrialist's Views on Socialisation, Felix Deutsch. Eng., vol. 109, nos. 2838 and 2839, May 21 and 28, 1920, pp. 703-704 and 734-735. Facts and figures are presented which, it is claimed, demonstrate "that exaggerated demands by employees and workmen cannot bring them any benefit, but may in a measurable distance of time bring our (German) industry to a standstill, and themselves to unemployment.

INDUSTRIAL ORGANIZATION

ENGLISH WORKS. The Organization of a Modern Engineering Works, with Some Observations Upon the Construction of Special Machinery, the Science of Production, the Training of Pupils and Trade Apprentices, and "Welfare," Richard W. Allen. Proc. South Wales Inst. of Engrs., vol. 36, no. 1, July 16, 1920, pp. 91-118. Based on organization of Messrs. W. H. Allen Sons & Co., Queen's Engineering Works, Bedford, England.

INLAND WATERWAYS

SIZE OF, DETERMINATION. Determination of the Dimensions of Large Ships Intended for Inland Navigation, and of the Size to be given to Inland Waterways (Détermination des dimensions des bateaux de navigation intérieure de fort tonnage, et du gabarit des voies navigables). Annales des Ponts et Chaussées, vol. 55, no. 2, March-April 1920, pp. 169-192. Study of comparative-economy of carrying traffic in large ships and in barges. It is found that larger ships and waterways are more economical when traffic is in excess of 3,000,000 tons per year. Memoir prepared by Committee appointed by French Ministry of Public Works.

K

L

OIL VS. COAL-BURNING. Santa Fe Locomotive Oil Burning Practice and Fuel Performance. Walter Bohnstengel. Ry. Mech. Engr., vol. 94, no. 7, July 1920, pp. 449-450 Santa Fe System has approximately 3160 locomotives, of which two-thirds use coal and one-third use oil as fuel. Tests show evaporate efficiency of oil is about 25 per cent more than coal for hand-fired and 40 per cent more than coal for stoker-fired locomotives. Also showed that installation and maintenance of brick arch cannot be justified in oil-burning locomotives. From paper read before Railway Fuel Association.

STEAM SEPARATORS FOR. Purification of Steam for Locomotives (Reinigung des Dampfes fur Lokomotiven und deren Wirtschaft), Ewald Mees. Organ für die Fortschritte des Eisenbahnwesens, vol. 57, no. 5, March 1, 1920, pp. 68-71, 2 figs. Points out defects in devices such as the Kappe's baffle use on the Prussian and Hessian railroads, and describes centrifugal steam separator patented by author and constructed for locomotives and stationary boilers, consisting of a cylindrical vessel in which steam enters and is conducted through a spiral-shaped conduit until it reaches outlet in the center.

LUBRICANTS

STANDARD. Government Standards for Oils and Greases. Power, vol. 52, no. 3, July 20, 1920, pp. 99-103, 1 fig. Abstract of report of United States Government's committee on Standardization of Lubricants.

LUBRICATING OILS

SPECIFICATIONS. Writing Specifications for Lubricating Oils and Greases, A. A. Potter and A. J. Mack. Elec. World, vol. 76, no. 6, Aug. 7, 1920, pp. 281-282. General properties of oils which have bearing on specifications. Typical specifications for turbine, dynamo and other oils.

VOLTOL. Friction in Journal Bearings When Lubricated by Mineral Oil to which Voltol Has Been Added and under Variation of Speed and Temperature (Die Reibung in Gleitlagern bei Zusatz von Voltol-Oel zu Mineralöl und bei Veränderung der Umlaufzahl und der Temperatur). C. Biel. Zeitschrift des Vereines deutscher Ingenieure, vol. 64, nos. 25 and 26, June 19 and 26, 1920, pp. 449-452 and 483-485, 9 figs. It is demonstrated by a number of tests carried out in 1915 at the Technical High School, Carlsruhe, that a mixture of mineral oil and "voltol" acts differently from pure mineral oil of the same viscosity and reasons therefor are given. Gives some new expressions for dependence of friction on speed, temperature and viscosity, which are said to agree with those of former researches.

LUBRICATION

GERM PROCESS. The Germ Process of Lubrication, Henry M. Wells and James Ed. Southcombe. Ry. Rev., vol. 67, no. 2, July 10, 1920, pp. 45-48. It is demonstrated by laboratory processes that increased value of compounded oils is due to presence in them of fatty acids introduced as impurities with vegetable or animal oils added to mineral oil as per formula or specification. By addition of fatty acids, it is said, authors have been able to duplicate and even improve on results yielded by compounded oils and with a degree of economy measured by cost of vegetable and animal oils formerly employed. From paper read at Nat. Petroleum Assn.

M

MACHINE SHOPS

ENGLISH. The Works of Messrs. Clayton and Shuttleworth, Ltd., at Lincoln. Eng., vol. 109, nos. 2840 and 2841, June 4 and 11, 1920, pp. 741-747, 30 figs., and 778-801, 11 figs. Steam and electric road tractors, railway rolling stock, drop stampings and steel forgings are manufactured in works.

The Works of Messrs. Marshall, Sons and Co., Ltd., Gainsborough. Eng., vol. 109, nos. 2837 and 2838, May 14 and 21, 1920, pp. 635-641 and p. 652, 24 figs., and 670-675 and 686, 20 figs., partly on 3 supp. plates. Historical account of development. Works manufacture portable engines, road rollers, traction engines, locomobiles, fixed engines, etc.

The Works of Messrs. William Foster and Co., Ltd., Lincoln. Eng., vol. 109, no. 2843, June 25, 1920, pp. 847-850, 15 figs. partly on 4 supp. plates. Tractors, road locomotives, threshing machines and other farm machinery are constructed. War tanks were developed in these shops.

MACHINE TOOLS

HERRINGBONE FOR GEARS. Herringbone Gears for Machine Tools, Nikola Trbojevich. Machy, (N.Y.), vol. 26, no. 12, Aug. 1920, pp. 1164-1169, 6 figs. Advantages gained by use of herringbone gears and methods employed in cutting them.

PROVISION FOR REPAIRS. A Plea for Better Harmony Between Theory and Practice—III. Machy. (London), vol. 16, no. 410, Aug. 1920, pp. 546-548, 5 figs. Examples of faulty designs of machine tools lacking accessibility for making repairs.

SPINDLES AND BEARINGS. Recent Machine Tool Developments—XIII. Joseph Horner. Eng., vol. 109, no. 2839, May 28, 1920, pp. 707-710, 19 figs. Spindles and bearings of machine tools.

MAGNESIUM ALLOYS

DOW METAL. The New Alloy of Magnesium, E. J. Jenkins, Iron Age, vol. 106, no. 4, July 22, 1920, pp. 193-194, 3 figs. Dow metal manufactured by Dow Chemical Co., Midland, Mich., said to be lightest metal known which is adapted to commercial uses. Alloy is said to be manufactured electrolytically from magnesium chloride.

MAGNETOS

FRENCH MACHINES. Magneto Industry in France (L'industrie de la magnéto d'allumage en France), H. W. Porret. Technique Moderne, vol. 12, no. 1, Jan. 1920, pp. 25-28, 17 figs. High-tension machines. (Continuation of serial.)

WYCO TYPE. Two Types of Magneto that Employ the Magnetic Bridge Principle. Automotive Industries, vol. 43, no. 6, Aug. 5, 1920, pp. 256-257, 4 figs. Wyco magnetos. One has reciprocating armature and in the other armature is on periphery of flywheel.

MALLEABLE CASTINGS

ANNEALING. Annealing Mallable in Tunnel Kiln, H. E. Diller. Foundry, vol. 48, no. 16, Aug. 15, 1920, pp. 638-644, 11 figs. Kiln of tunnel type used for continuous annealing at plant of Saginaw Malleable Iron Co.

MARINE ENGINES

FORCED LUBRICATION. Forced Lubrication for Marine Engines, W. C. Owen. Int. Marine Eng., vol. 25, no. 8, Aug. 1920, pp. 662-664, 2 figs. Application of forced lubrication to reciprocating engines; arrangement for oiling main bearing, crank pins and crossheads.

STILL VS. SULZER TYPES. "Still" and "Sulzer" Marine Engines, William Denny. Eng., vol. 110, no. 2846, July 16, 1920, pp. 98-100, 8 figs. Comparative trials of Still and Sulzer engines under actual working conditions on board ship. Paper read before Inst. Naval Architects.

See also Diesel Engines, Kerosene Engines.

MARINE FITTINGS

CHARACTERISTICS. Marine Brass Goods and Fittings, Peter W. Blair. Metal Industry (N.Y.), vol. 18, no. 8, Aug. 1920, pp. 351-352, 6 figs. Cahracteristics of marine fixtures as distinguished from standard lines.

MEASURING MACHINES

UNIVERSAL. Universal Measuring Machine. Engr., vol. 129, no. 3358, May 7, 1920, pp. 472-473, and p. 476, 9 figs. partly on 2 supp. plates. Type designed by Société Genevoise d'Instruments Physique of Geneva, which is said to enable absolute measurement to be made with accuracy of 0.00005 in.

METAL SPRAYING

METHODS. Metal-Spraying Methods in Art and Industry (Die Megallspritzverfahren in Kunt und Industrie). Der praktische Maschinen-Konstrukteur, vol. 53, nos. 7 and 9, Feb. 19 and March. 4 1920, pp. 27-30 and 36-38, 3 figs. Deals with Schoop metal-spraying process and the various discoveries of Thurston, Morf, and others.

METALS

TESTING. Mechanical Testing of Mêtals (La pratique des essais méchaniques des métaux), Jean Durand. Génie Civil, vol. 77, no. 1, July 3, 1920, pp. 8-11, 4 figs. Rules defining testing practice, formulated by Commission permanente de Standardization.

X-RAY STUDIES. Some Studies of Metals by Means of X-Rays, S. Nishikawa and G. Asahara. Physical Rev., vol. 15, no. 1, sec. series, Jan. 1920, pp. 38-45, 18 figs. on 3 supp. plates. By passing a narrow beam of heterogeneous rays through a thin sheet of metal, a pattern may be photographically recorded which depends on crystalline structure of metal. Authors have used this phenomenon to study effect of rolling and subsequent annealing on various metals, and results are given in the case of various metals. It was shown that the various metals differ greatly in their response to annealing.

METALLURGY

OXYGEN, USES IN. The Future of Oxygen Enrichment of Air in Metallurgical Operations, F. G. Cottrell. Chem. & Met. Eng., vol. 23, no. 2, July 14, 1920, pp. 53-56. Discusses apparent possibilities of applying cheap oxygen to various standardized metallurgical operations, permitting closer economy of blast-furnace fuel, reducing atmospheres in the open-hearth, and low-silicon iron to converters. Paper presented before Am. Iron & Steel Inst.

METEOROLOGY

AERONAUTICS, RELATION TO. Meteorology and Aeronautics. Air Service Information Circular, vol. 1, no. 77, May 12, 1920, 8 pp., 2 figs. Location and layout of flying fields, exploration of upper air, forecasts, light charts and magnetic charts.

MILLING

POWER CONSUMED IN. Power Consumed in Milling, Fred A. Parsons. Am. March., vol. 53, no. 7, Aug. 12, 1920, pp. 315-316, 1 fig. Investigation of variables affecting power consumed in milling was undertaken for purpose of constructing slide rule which would indicate for various cuts power required, and therefore, machine best adapted for job. Data were obtained in tests made by Kempsmith Manufacturing Co. on various Kempsmith millers.

N

NOZZLES

De Laval. The Determination of Temperature of Rapidly Flowing Gases or Vapors by Expansion in a de Laval Nozzle (Ueber die Ermittlung des Temperaturverlaufes von schnellströmenden Gasen oder Dampfen bei expansion in einer Laval-Düse), Friedrich Maller. Zeitschrift fur das gesamte Turbinenwesen, vol. 17, nos. 6, 7, 8 and 9, Feb. 29, March 10, 20 and 30, 1920, pp. 61-65, 76-80, 87-90 and 100-106, 26 figs. Results of experiments show agreement with Batho that temperatures of wet vapors flowing in a nozzle are properly measured with thermocouples, and accord with Nusselt that in temperature measurement of dry and superheated steam, the use of thermocouples must be avoided, and contrast of the contradictory results explained. It is said that a final solution can probably be achieved only with aid of a more precise testing device.

O

OFFICE MANAGEMENT

Stenographic Department. Getting the Office Work Done—II, Wallace Clark. Indus. Management, vol. 60, no. 2, Aug. 1920, pp. 116-121, 6 figs. How to organize stenographic department.

OIL ENGINES

Ingersoll-Rand. Many New Ideas in Ingersoll-Rand P-R Oil Engine. Automotive Manufacturer, vol. 62, no. 3, June 1920, pp. 7-12, 6 figs. New type of engine said to possess many novel features and to produce high unit power output and low fuel consumption, as well as remarkably slow speed.

Solid-Injection. The Lincoln Works of Messrs Ruston and Hornsby, Limited. Eng., vol. 110, no. 2844, July 2, 1920, pp. 4-10, 24 figs, partly on 2 supp. plates. Among principal products manufactured are solid-injection crude-oil engines which are built of single-cylinder type in 11 sizes ranging from 15 b.hp. to 170 b.hp. and double-cylinder type in 5 sizes from 100 b.hp to 340 b.hp. Engine of latter type developing 260 b.hp. is described and illustrated. (To be continued.)

See also Diesel Engines; Heavy-Oil Engines; Kerosene Engines.

OIL FIELDS

British Empire. The Oil Resources of the British Empire, John Cadman. Jl. Royal Soc. of Arts, vol. 68, no. 3532, July 30, 1920, pp. 584-596 and (discussion) pp. 596-600. Statistics of production with comparative analyses of various kinds of oil.

New Mexico. Probable Oil Resources of New Mexico, John K. Knox. Eng. & Min. Jl., vol. 110, no. 2, July 10, 1920, pp. 69-74. Summary of stratigraphic and structural geology of state, with particular reference to possible sources of petroleum; some oil has been discovered, and a few localities are promising. Paper read in more extended form before Am. Assn. Petroleum Geologists.

Persia and Near East. Petroleum in Persia and the Near East, Edmund M. Spieker. Eng. & Min. Jl., vol. 110, no. 7, Aug. 14,, 1920, pp. 316-323, 1 fig. Area is said to comprise richest and most extensive oil-bearing region of the world. Geological characteristics, commercial possibilities and potentialities of future development are indicated.

Relationship with Gas Fields. Experimental Studies of Subsurface Relationships in Oil and Gas Fields, R. Van. A Mills. Economic Geology, vol. 15, no. 5, July-Aug. 1920, pp. 398-421, 10 figs. Apparatus and methods developed by writer for laboratory study of subsurface relationships of oil and gas fields.

OIL FUEL

White System. The White Oil-Fuel System. Eng., vol. 10, no. 2844, July 2, 1920, pp. 23-24, 16 figs. partly on 2 supp. plates. Oil is forced into burners at pressure of from 60 to 90 lb. per square inch, and sprayed by mechanical action only. This system has been used in oil-fuel installations recently completed on Cunard liner Aquitania and Whie Star liner Olympic.

OVENS

Electrically Heated. Experience with Electric Core Baking, Alan D. Dauch. Elec. World, vol. 76, no. 4, July 24, 1920, pp. 168-170, 4 figs. Reduction of baking time, greater uniformity of product, improved washing conditions and decreased labor cost shown in changing from gas to electric ovens.

OXY-ACETYLENE CUTTING

Iron and Steel. Metallography of Iron and Steel as Related to Cutting with Oxygen, F. J. Mapolitan. Metal Trades, vol. 11, no. 8, Aug. 1920, pp. 325-326. Account of experience in cutting iron and steel of different carbon compositions at Eng. & Research Laboratory of Davis-Bournonville Co.

Under Water. Autogenous Cutting Under Water (Autogenschneiden under Wasser). Autogene Metalbearbeitung, vol. 13, no. 5, Marsh 1, 1920, pp. 54-58, 8 figs. States that the Larsen sheet piling and a described method of cutting under water can be used wherever large cofferdams are required instead of the costly double-wall wooden cofferdams.

OXY-ACETYLENE WELDING

Applications. The Rapid Repair of Machinery Equipment by the Autogenous Cutting and Welding Process (Beschleunigte Ausbesserungen von maschinellen Einrichtungen durch das autogene Schneid und Schweissverfahren). A. Nolte. Stahl u. Eisen, vol. 40, no. 21, May 27, pp. 713-717, 17 figs. Writer gives examples of practical application of this process in works under his superintendence.

Safety Devices. Safety Devices for Use in Autogenous Metalworking (Sicherungen bei der fautogenen Metallbearbeitung). P. Max Grenpe. Der praktische Maschinen-Konstrukteur, vol. 53, nos. 11 and 13, March 8 and April 1, 1920, pp. 45-47 and 52-54, 4 figs. States safety regulations and describes arrangements for prevention of accidents used in the works of German General Elec. Co., including device for preventing standing steel bottles from falling over, carts for transporting them, etc.

P

PAPER MANUFACTURE

Research. Research Problems of the Pulp and Paper Industry, D. C. Everest. Paper, vol. 26, no. 22, Aug. 4, 1920, pp. 11-14 and p. 30, 2 figs. Survey of work of Forest Products Laboratory.

PAVEMENTS, CONCRETE

Construction. Concrete Pavements and Walks. Tyrrell B. Shnertzer. Nat. Lime Assn., no. 3, 7 pp. 1 fig. Directions for putting in sub-base and for proportioning and mixing concrete base and top course.

PIERS

Staten Island. New Steamship Piers on Staten Island are Too Narrow, John Meigs, William S. Wilgus, Frank G. White, Fay, Spofford & Thorndike, Frederick W. Cowie and George F. Nicholson. Eng. News-Rec., vol. 85, no. 4, July 22, 1920, pp. 160-165. Opinions of leading port and terminal engineers.

PIPE, CAST IRON

Cement Joints for. Cement Joints for Cast Iron Water Pipe, George W. Pracy. Jl. of Am. Water Works Assn., vol. 7, no. 4, July 1920, pp. 436-439. It is pointed out that cement joints increase electric resistance of pipe, a feature of particular importance in larger cities where electrolytic action does considerable damage. Other advantages lead writer to believe cement joint has come to stay.

PIPE LINES

Natural Gas Transportation. Pipe Lines for Transporting Natural Gas, Clifford E. Brock. Mech. Engr., vol. 42, no. 8, Aug. 1920, pp. 445-447, 4 figs. Construction, repair and operation of jointed and welded lines, including particulars regarding couplings used, pipe-laying machines, strength of welded pipe, pressure regulation, etc.

PIPE, STEEL

Spirally Ribbed. The Manufacture of Pipes with Spiral Ribs and of Pipes for Exchange of Heat from Rolled Sections (Herstellung von Rohren mit Spiralförmig verlaufenden Rippen und von Wärmeaustauschrohren aus Walzprofilen). Autogene Metallbearbeitung, vol. 13, nos. 3 and 10, Feb. 1 and May 15, 1920, pp. 33-34 and 107-109, 10 figs. Feb. 1. Describes process in which they are made by winding a special T section around a mandrel and welding together the contiguous spirals. May 15. Describes construction of similar pipes patented by Chief Engineer Wiss of the Griesheim-Electron Chem. Factory.

PORTS

Facilities for Handling Traffic. Port Facilities, Charles Evan Fowler. Freight Handling & Terminal Eng., vol. 6, no. 7, July 1920, pp. 265-268. Discussion of types of docks and piers and port equipment best suited for rapid handling of traffic. Paper read before Great Lakes-Tidewater Congress.

PRESS WORK

Stamping Electric-Fan Base. Making a Pressed-Steel Base for Electric Fan, H. Jay. Am. Mech., vol. 53, no. 8, Aug. 19, 1920, pp. 361-362, 9 figs. Stamping process for producing base of an electric fan, method being different from that usually employed for making such parts.

PROFIT SHARING

Co-operation and. Co-operation and Profit Sharing. Monthly Labor Rev., vol. 10, no. 6, June 1920, pp. 117-145. Discussion of aims and possibilities of the Consumers' co-operative movement; Russian co-operative movement; progress of co-operation in various countries, including Denmark, Germany, India, Italy, Netherlands, Norway, Roumania and Sweden; profit sharing and labor copartnership in the United Kingdom.

PROPELLERS, SHIP

Four-Blades vs. Three-Blade. Model Experiments for a Double-Screw Tug Boat of 1,400 Hp. (Modellversuche für einen Doppelschrauben-Schlepper von 1,400 PSi), K. Schaffran. Schiffbau, vol. 21, no. 31, June 23, 1920, pp. 851-856, 8 figs. Results of tests to determine influence of number of blades on towing efficiency showed efficiency of 4-blade propellers tested to be 4 per cent higher than that of the 3-blade propellers.

R

TIME VS. SPACE INTERVALS. The Use of Signals for Better Train Operation—I, Henry M Sperry. Ry Signal Engr, vol 13, no. 7, July 1920, pp. 270-275, 5 figs. Comparison of time-interval and space interval methods leads to the conclusion that delays and hazards are reduced to the minimum by latter and that maximum track capacity is also possible under this method. (To be continued.)

RAILWAY TRACK

CONSTRUCTION. A Short Cut in Estimating Track Materials, H. M. Booth, Jr., Ry. Maintenance Engr., vol. 16, no. 8, Aug. 1920, pp. 314-315, 1 fig. Chart for estimating amount of materials that enter into construction of industrial track and sidings.

SWITCHES. Swtiches with Curved Crossings (Weichen mit gekrummten Herzstücken), H. Schwartz. Zentralblatt der Bauverwaltung, vol. 40, no. 19, Mar. 6, 1920, pp. 119-123, 19 figs. Describes new switches, some of advantages of which are said to be: With 190-m. radius switch, a 1:6 set of points can be obtained without changing the tongue arrangement and the 1:9 radius of switch; the 1:7 switch can be dispensed with; number of required switches and accessory parts is diminished, etc.

TIE-PLATE CORROSION. Copper Reduces Corrosion in Tie Plates. Ry. Maintenance Engr., vol. 16, no. 7, July 1920, pp. 255-256, 2 figs. New York Central experiments showed that introduction of small percentage in steel made marked difference in corrosion of tie plates.

RAILWAYS

CZECHO-SLOVAKIA. The Railways of Czecho-Slovakia. Vladimir A. Geringer. Ry. Rev., vol. 67, no. 2, July 10, 1920, pp. 48-51. Data abstracted from report by U. S. Trade Commissioner at Prague, embodying official statement by Dr. Franke, Minister of Railways of Czecho-Slovak Republic.

REFRIGERATING MACHINES

TESTS. Experiments with a Large Ammonia Refrigerating Machine (Versuche an einer grossen Ammoniak-Kältemaschine), Martin Krause. Zeischrift für die gesamte Kälte-Industrie, vol. 27, no. 4, Apr. 1920, pp. 35-38, 1 fig. Results of various experiments are given in tabular form. (Concluded.)

REFRIGERATING PLANTS

TROUBLES. Trouble-Hunting in Refrigerating Plants, J. C. Moran. Power, vol. 52, nos. 3 and 5, July 20 and Aug. 3, 1920, pp. 87-89, 2 figs., and 168-170, 2 figs., July 20: One installation of two 100-ton single-acting twin-cylinder machines, two double-pipe condensers, and direct-expansion coils was giving one-half of normal capacity only. How plant was brought back to normal production without introducing new machinery is related. Aug. 3: How a faulty gate valve in brine-circulating system caused freeze-up of nearly the entire system.

UNION STOCK YARDS, CHICAGO. Large Freezer Plant at Union Stock Yards, Chicago. Ice and Refrigeration, vol. 59, no. 2, Aug. 1920, pp. 37-40, 5 figs. Ten-story building erected at cost of about $2,000,000 with capacity for freezing approximately 50,000,000 lb. of meat and meat products.

RESEARCH

ALLOYS. Thermo-Electromotive Force and Alloy Research, John L. Haughton. Eug., vol. 109, no. 2841, June 11, 1920, pp. 803-807, 8 figs. Study of thermal electromotive force as aid to investigation on constitution of alloy systems, with appendix on Peltier and other effects. Paper read before Inst. of Metals.

GOVERNMENT-CONDUCTED. The Economic Importance of the Scientific Work of the Government, Edward B. Rosa. Sci. Monthly, vol. 11, no. 1, July 1920. pp. 5-24, 6 figs. Address before Washington Acad. of Sci. (To be concluded.)

OBESRVATIONS, ADJUSTMENT OF. The Adjustment of Observations, R. Meldrum Stewart. London Edinburgh & Dublin Philosophical Mag. & Jl. of Science, vol. 40, nu. 236, Aug. 1920, pp. 217-227. Criticism of method of deduction on observations offered as substitute for method of least squares by Dr. Norman Campbell in Philosophical Mag., Feb. 1920, p. 177.

ORGANIZATION OF. The Organization of Research, James R. Angell. Sci. Monthly, vol. 11, no. 1, July 1920, pp. 25-42. Notes on conception and distribution of research functions, personnel, organization and co-operation and organization of Nat. Research Council for mobilization of the scientific resources of the country to permit their most effective use continously in times of peace as well as war.

PLACE IN INDUSTRY. The Art of Systematic Inquiry (Research), Its Place in Industry, H. E. Armstrong, Eng., vol. 109, no. 2839, May 28, 1920, pp. 735-737. Lecture delivered before Ceramic Soc.

See also Paper Manufacture.

RIVERS

LEVEE CONSTRUCTION, DAYTON, O. High-Speed Block-Laying on Miami River Leeves. Eng. News-Rec., vol. 85, no. 6, Aug. 5, 1920, pp. 248-249, 1 fig. Flexible concrete mattress construction by stringing precast concrete blocks on steel cable being done in improving channel of Miami River at Dayton, Ohio.

REGULATION. Improvement Work on River Murray in South Australia, Robert C. Cutting. Eng. News-Rec., vol. 85, no. 6, Aug. 5, 1920, pp. 244-246, 6 figs. Regulation of longest river on island for navigation by locks and dams.

ROAD CONSTRUCTION

WINTER CONSTRUCTION. Winter Road Work in the Dakotas, Minnesota, and Wisconsin a Success, E. G. Edwards. Public Roads, vol. 3, no. 25, May 1920, pp. 7-10, 5 figs. Advantages claimed for building roads in winter are (1) greater accessibility of pits, (2) larger number of teams available and (3) lengthening of construction period.

ROAD MATERIALS

STANDARD SPECIFICATIONS. Proposed Standard Specifications for Road Building Materials. Rock Products, vol. 23, no. 15, July 17, 1920, pp. 31-33. Proposed methods for testing quantity of clay and silt in sand and gravel; standard sizes of crushed stone, sand and gravel; methods for sampling crushed stone, sand, gravel and slag; and specifications for crusher-run slag for macadam roads. Specifications proposed at convention of the Am. Soc. for Testing Materials.

TESTING. Testing of Roads and Road Materials. Quarry, vol. 25, no. 282, Aug. 1920, pp. 213-215, 4 figs. Procedure in laboratories of Road Testing Dept. at Nat. Physical Laboratory, Teddington, England.

ROADS

SURFACING. Semi-Portable Oil Heating Plant for Surfacing Roads. Eng., News-Rec., vol. 85, no. 6, Aug. 5, 1920, pp. 250-251. Scheme devised by California Highway Commission.

ROADS, GRAVEL

NEW HAMPSHIRE. The Construction of Crushed Gravel Roads in New Hampshire, Frederic E. Everett. Municipal and County Eng., vol. 59, no. 1, July 1920, pp. 5-6. It requires approximately 145 cu. yd. of covering per mile of 16-ft. road to make two applications. There are about 100 miles of crushed gravel road in N. H. some sections of which have been laid as long as 15 yr.

ROADS, MACADAM

BITUMINOUS SURFACED. Bituminous Surface Treated Macadam and Gravel Roads, J. F. Witt. Public Roads, vol. 3, no. 25, May 1920, pp. 3-6, 2 figs. It is claimed that water-bound macadam has been a failure in United States. Practice of writer of treating water-bound macadam with bituminous material is described.

ROCK

DEVAL TEST. A Study of the Standard Deval Test for Rock. Eng. & Contracting, vol. 54, no. 5, Aug. 4, 1920, pp. 113-114, 1 fig. Experiments made to determine how variations in results of tests due to laboratory manipulating might be reduced, and comparative range in values obtained with and without "dust cushion." Paper read before Am. Soc. for Testing Malts.

ROCK CRUSHING

PROGERSS SINCE 1910. Progress in the Fine Crushing of Hard Material (Neuerungen der Hartzerkleinerung), Carl Naske. Zeitschrift des Vereines deutscher Ingenieure, vol. 64, no. 26, June 26, 1920, pp. 469-475, 30 figs. Account of developments during last ten years, with description of simple toggle lever, pendulum roll and gyratory crushers; crushing and grinding in one machine and one operation; machines with separate screening of material to be ground, improvements of Griffin mills; screenless ball mills; combination of ball and tube mills, etc.

ROCK DRILLS

DRILL STEEL. Handling and Treatment of Rock-Drill Steel at Copper Range Mines, H. T. Mercer and A. C. Paulson. Min. & Metallurgy, no. 164, Aug. 1920, pp. 20-21, 1 fig. Reports of each drill machine are made daily by shop and mine, and tables compiled from these reports show footage drilled, steel broken, drills received and sent out of shop, drills sharpened and bits cut off. Dimensions of drill adopted are given and reasons for their adoption explained. (Abstract.)

ROLLING MILLS

DEFORMATION WORK IN ROLLING. The Numerical Determination of the Deformation Work in Rolling, Forging, etc. (Zur rechnerischen Ermittlung der reinen Umformungsarbeit beim Walzen. Schmieden usw.), H. Preussler. Stahl u, Eisen, vol. 40, no. 19, May 13, 1920, pp. 641-649, 7 figs. Derives expression, based on mathematical-mechanical principle for theoretical minimum power required for deformation of a plastic material, which covers every change in form with regard to stretching, expanding and shaping.

DESIGN. Design of Experimental Rolling Mills—II and III, W. B. Skinkle. Blast Furnace and Steel Plant, vol. 8, nos. 7 and 8, July and Aug. 1920, pp. 404-407 and 454-457, 16 figs. Details of design of experimental mill of the Bureau of Rolling Mill Research. General features of different types of mills when they are assembled.

ELECTRICALLY-DRIVEN. Columbia Steel Company's New Plant. Blast Furnace and Steel Plant, vol. 8, no. 7, July 1920, pp. 401-403, 4 figs. Description of electrically driven merchant mills for production of bars and shapes.

Power Drives for Rolling Mills, W. O. Rogers. Power, vol. 52, nos. 1, 3 and 5, July 6, 20 and Aug. 3, 1920, pp. 9-12, 90-93 and 171-176, 28 figs. Several types of shears are illustrated; plate and job mills, structural, sheet and tin-plate mills, also wire-rod mills are briefly described. Experience with induction motors driving plate mill. Direct-current reversible motors of 5000 to 15,000-hp. capacity used to run reversing blooming mills.

S

STEAM ENGINES

ROBEY COMPOUND SUPERHEAETR ENGINE. The Works of Messrs. Robey and Co., Limited, of Lincoln. Eng., vol. 110, no. 2847, July 23, 1920, pp. 104-106, 16 figs., partly on supp. plates. Details of Robey compound superheater engine. (Concluded).

UNIFLOW. The Uniflow Steam Engine, F. B. Perry. Eng., vol. 110, no. 2848, July 30, 1920, pp. 162-164, 6 figs. Principle of operation and details of construction. Paper read before Instn. Mech. Engrs.

See also Locomobiles.

STEAM GENERATORS

ELECTRICALLY OPERATED. Electrically-Operated Steam Generators, F. G. Constam-Gull. Can. Engr., vol. 39, no. 7, Aug. 12, 1920, pp. 231-234, 4 figs. Results obtained in official tests of steam generators electrically operated which are being used in hydroelectric installation in Switzerland. High efficiency attained corresponds to evaporation of 2.9 lb. of so-called standard steam per kilowatt-hour. Steam produced had content of water of only about 3 per cent. compared with steam of 5 to 10 per cent humidity produced by ordinary fired boilers.

STEAM POWER PLANTS

DESIGN. Power Station Design in Relation to Thermal Efficiency, I. V. Robinson. Engr., vol. 129, no. 3365, June 25, 1920, pp. 655-656. Developments in power-station design leading to greater thermal efficiency are classified into (1), increase in range of working temperatures of steam, (2), saving of low-grade heat, and (3) increase in size of generating sets. Paper read before Incorporated Minicipal Elec. Assn. Convention.

RECONSTRUCTION. Reconstruction of a Power Plant Under Operation, Thorleif Fliflet. Power, vol. 52, no. 3, July 20, 1920, pp. 82-84, 3 figs. Power production is said to have maintained at normal in plant of Surpass Leather Co., Philadelphia, Pa., over entire period during which battery of seven old return-tubular boilers was replaced, two at a time, by three water-tube stoker-fired boilers.

STEAM REGENERATORS

REQUIREMENTS OF. Steam Regenerators Reduce Coal Consumption, W. H. Schackt. Min. & Metallurgy, no. 164, Aug. 1920, pp. 32-33. Method for regulating regenerator requirements. (Abstract.)

STEAM TURBINES

CALCULATIONS. The Application of the v^2-Method in the Calculation of Steam Turbines (Ueber die Verwendung der v^2-Methode bei der Berechnung von Dampfturbinen), R. Fichtner. Zeitschrift für das gesamte Turbinenwesen, vol. 17, no. 9, Mar. 20, 1920, pp. 97-100, 6 figs. In the usual v^2-method with charging of the v^2-against the heat content, a change is made by charging against the adiabatic drop and use of velocity coefficients; it is shown by examples that both methods agree fundamentally and differ only in velocity of efflux.

OPERATION AND ADJUSTMENT. Operation and Adjustment of Turbine Machinery—I, II and III, Eustis H. Thompson. Power, vol. 52, nos. 1, 3 and 5, July 6, 20 and Aug. 3, 1920, pp. 2-4, 85-87 and 181-183, 6 figs. Concerning leveling of turbines, assembly of casting, and aligning of bearing pedestals. Inspecting machine before setting it in motion. Examining and starting large turbines after their erection.

STEEL

COLD-ROLLING. Study Stresses in Cold Rolling, Henry M. Howe and E. C. Groesbeck. Iron Trade Rev., vol. 66, no. 26, June 24, 1920, pp. 1824-1825, 6 figs. Investigation indicated that internal stress increases with amont of reduction per pass due to skin friction of rolls, and that elongation is independent of number of passes. Paper read before Am. Soc. Testing Materials.

SURFACE CHANGES WHEN HEATED IN VACUO. Surface Changes of Carbon Steels Heated in Vacuo, E. Heaton Himingway and George R. Ensminger. Min. & Metallurgy, no. 164, Aug. 1920, p. 24. Three types of markings were observed when samples of steel were held at 1000 deg. cent, in vacuo for a few hours: (1) Deeply marked polyhedral structure which represented final gamma boundaries; (2) fine clean-cut structure representing alpha boundaries; and (3) indefinite, and often partly obliterated structure representing boundaries of former gamma crystals that had been absorbed by crystalline growth. (Abstract.)

See also Chrome-Nickel Steel; Nickel Steel: Structural steel.

STEEL MANUFACTURE

CASTING AND MOLDING INGOTS. Casting and Molding Steel Ingots, Emil Gathmann. Min. & Metallurgy, no. 164, Aug. 1920, pp. 29-31. Best results as to freedon from surface blowholes, snakes, etc., in evolution steels are said to be obtained when ingots are bottom cast. Method by which similar results were obtained with other steels is described which consisted of employing special teeming or pouring nozzle whereby pressure and velocity of liquid steel as it entered mold was greatly reduced, without, however reducing quantity or volume per minute of steel teemed. (Abstract.)

TILTING FURNACES. Tilting Furnaces Used for Steel Manufacture (L'emploi des fours oscillants pour la fabrication de l'acier). Génie Civil, vol. 76, no. 25, June 19, 1920, pp. 545-548, 4 figs. Wellman steel works in Staffordshire, England.

STOKERS

See Furnaces Boiler, Air-Cooled Scraper Grate.

STORAGE BATTERIES

NON-LIQUID. Non-Liquid Storage Battery of Durable Construction. Automotive Industries, vol. 42, no. 4, July 22, 1920, pp. 157. Storage battery without a liquid electrolyte and with many of the features of a primary cell.

STORM WATER

RUN-OFF. Storm Water Run-Off Diagram for Rational Method, George C. D. Lenth. Eng. News-Rec., vol. 85, no. 4, July 22, 1920, pp. 151-152, 1 fig. Diagram made to give run-off on given area in second-feet, when time of concentration, area, and ratio of run-off to rainfall has been determined.

STREET CLEANING

METHODS. Report on Investigation and Study of Methods of Street Cleaning, Collecting and Disposal of Municipal Waste in Other Cities—Recommendation and Plan of Procedure for Philadelphia, J. H. Neeson. Jl. Engrs. Club of Phila., vol. 37-8, no. 188, Aug. 1920, pp. 336-340. It is recommended that service of cleaning of streets, collecting ashes, rubbish and garbage should be given to the public at cost by municipal forces.

Report on the Study of the Methods of Street Cleaning and Collection and Disposal of Municipal Wastes, E. B. Morden, J. F. Follin and J. H. Neeson. Jl. Engrs. Club of Phila., vols. 37-8, no. 188. Aug. 1920, pp. 326-336. Data collected in inspection tour of 15 of principal cities of United States.

STREET RAILWAYS

CARS, SAFETY. Battery Cars Changed to Safety Cars, R. H. Parsons. Elec. Ry. Jl., vol. 56, no. 7, Aug. 14, 1920, pp. 311-314, 10 figs. Details of conversion of 50 storage-battery cars to safety cars for one and two-man operation by Third Avenue Railway, New York, for use in outlying districts.

The Safety Car, W. D. Bearce. Gen. Elec. Rev., vol. 23, no. 7, July 1920, pp. 597-6-5, 13 figs. Operating figures from various parts of the country.

FREIGHT CARS FOR. Four-Axled Cars for Freight Transportation on Street Railway Tracks (Vierachsige Wagen für Güterbeförderung auf Strassenbahnen), H. Otto. Verkehrstechnik, vol. 37, no. 5, Feb. 15, 1920, pp. 66.67, 2 figs. Description of 5-ton metergage car constructed by firm of Krupp and now in operation. Dimensions: Maximum length above buffer head, 10,120 mm.; maximum width 2,000 mm.; height, 1,200 mm.

STREETS

DOUBLE DECK. Chicago Double Deck Street for Congested District. Eng. News-Rec., vol. 85, no. 4, July 22, 1920, pp. 173-175, 4 figs. Traffic separation is main purpose. Automobile parking space, wharfage and freight house facilities included.

STRUCTURAL STEEL

STANDARD SHAPES. Proposed Standards for Shapes. Iron Trade Rev., vol. 67, no. 1, July 1, 1920, pp. 43-44, 3 figs. Section Committee of Am. Standards Committee formulates basis for Anglo-American standards for structural shapes. British bulb angle sections and new channel and beam sections are recommended.

WIDE-FLANGE BEAMS. Wide Flange Beams by the Sack Method. Iron Age, vol. 106, no. 8, Aug. 19, 1920, pp. 448-449, 8 figs. Results of German practice in producing shapes like those of Bethlehem mill. Roll design and theory of process. (To be concluded.) Translated from Stahl und Eisen.

SUBMARINE CABLES

TESTS. Induction Disturbances in the Anglo-German Telegraph Cables and Their Elimination. (Induktionsstörungen in den deutsch-englischen Telegraphenkabeln und Ihre Beseitigung.) A. Kunert. Telegraphen u. Fernsprech-Technik, vol. 8, no. 12, March 1920, pp. 202-216, 21 figs. Results of tests with the double-line operation show that the two cable loops by double Baudot ensure an entirely reliable operation, and with adequate improvement of the artificial lines they permit a triple and probably quadruple Baudot. Double-line operation is shown to be the best and simplest means of overcoming induction disturbances.

Measurements on Guttapercha Telegraph Cables with Single Conductors by Means of Alternating Currents of Low Frequency. (Messungen an Guttapercha-Telegraphenkabeln mit Einzeladern mittels Wechselströmen niederer Frequenz), A. Kunert. Telegraphen- u. Fernsprech-Technik, vol. 8, no. 12, March 1920, pp. 189-198, 13 figs. Results of measurements show among other things that a noticeable influence of insulation of adjoining conductors in the case of multi-conductor cables is first apparent at a higher frequency than 100; the so-called conductivity constants are not constants; increase of copper resistance with increasing frequency is much greater than was to be expected from theory, etc. (Concluded.)

SUBMARINE WARFARE

EXPERIMENTS. Model Experiments in Connection with Submarine Warfare, G. S. Baker. Eng., vol. 109, no. 2840, June 4, 1920, pp. 770-773, 5 figs. Work done at the Tank, England. Paper read before Instn. Naval Architects.

T

V

VENTILATION

Synthetic Air Chart. The New Measure of Ventilation, E. Vernon Hill. Heat & Vent. Mag., vol. 17, no. 8, Aug. 1920, pp. 27-29, 2 figs. Instructions for using synthetic air chart recently adopted by Soc. of Heat & Vent. Engrs. Chart is designed as means of accuralety measuring air conditions maintained in any given room.

VACUUM

High. *See Pumps, Vacuum.*

W

WAGES

Extra Pay for Families. Extra Pay for Families. Iron Age, vol. 106, no. 5, July 29, 1920, p. 277. System of allowances in French metal-working industries.

Hours of Labor and. Wages and Hours of Labor. Monthly Labor Rev., vol. 10, no. 6, June 1920, pp. 82-115. Tables presenting a summary report on industries, including manufacture of machinery, machine tools, and typewriters, automobiles, cars, electrical apparatus and foundry industry. Wages and hours of labor in anthracite and bituminous coal mines, rise of wages in British industries, etc.

Minimum. Minimum Quantity Budget Necessary to Maintain a Worker's Family of Five in Health and Decency. Monthly Labor Rev., vol. 10, no. 6, June 1920, pp. 1-18. Prepared by Bur. of Labor Statistics.

Payments, Systems of. Wage Payment Administration and Its Relation to Production Control, Paul Faltin and Leon Blog. Indus. Management, vol. 60, no. 2, Aug. 1920, pp. 139-142, 2 figs. Piece-work method of payment is advocated as more efficient than day-work method. It is urged, however, that in computing rate difference should be recognized between cases where output is primarily controlled by machines and cases where it depends almost wholly upon human element. Example are given.

Production Basis for. The Human Element in Production, A. F. Knobloch. Jl. Soc. Automotive Engrs., vol. 7, no 2, Aug. 1920, pp. 137-139. Writer believes that workman must be paid in the ratio of production secured from him, and that without endangering his future. Describe how one plant has solved the problem.

U. S. Government's Policy. The Government's Wage Policy During the Last Quarter Century, Mary Conyngton. Monthly Labor Rev., vol. 10, no. 6, June 1920, pp. 19-35, 2 figs. Gives tables based on figures furnished to Commission on Reclassification by various bureaus, divisions and groups concerned, and used by Commission as a basis of a series of charts prepared under direction of Bur. of Education.

WASTE HEAT

Utilization of. Waste-Heat Utilization in Steel Works. (Abfallwirtschaft in Eisenhüttenwerken), H. Hermanns. Verhandlungen des Vereins zur Beförderung des Gowerbfleisses, no. 1, Jan. 1920, pp. 6-14 and (discussion) pp. 14-16. Recommends a better utilization of the available fuels by extended use of waste fuels and of gas, which is all the more important because of recovery of low-temperature tar: economic utilization of energy content in exhaust gases, reserving high-grade gases for such heat processes where they can be most advantageously employed: utilizing waste heat from smelting, heating and annealing furnaces for generation of steam, waste heat from steam engines for heating purposes, utilization of natural heat of producer gas, and of clinker heat for generation of steam, etc.

WATER FILTRATION

Testing Station Results. Milwaukee Testing Station Results on Filtration of Water. Eng. News-Rec., vol. 85, no. 6, Aug. 5, 1920, pp. 257-259. Hydraulic pump has been found to make excellent coagulant mixer, slat underdrains are proven effective, but cost of ozone treatment has been found to be too high.

WATER MAINS

Jointing Compounds. The Efficiency of Pipe Jointing Compounds as Compared with Lead, Fred O. Stevens. N. E. Water Works Assn., Jl., vol. 34, no. 2, June 1920, pp. 102-104 and (discussion) 105-113. Eriter urges that water-works managers and engineers try out the value of substitutes. Gives tests to show satisfactory use of several compounds.

WATER POWER

Federal Act. Provisions of the Federal Water-Power Act. Eng. News-Rec., vol. 85, no. 5, July 29, 1920, pp. 204-208. Abstract of law creating federal power commission and permitting long-time use of water on government lands and navigable streams.

Utilization, Recent Advance. Recent Advances in Utilization of Water Power, Eric M. Bergstrom. Jl. Instn. Mech. Engrs., nos. 1 and 2, Féb. and March 1920, pp. 55-128, 129-151, and (discussion) 152-158, 51 figs. Also Eng., vol. 109, no. 2822, no. 2823, no. 2824, Jan. 30, 1920, Feb. 6, 1920, Feb. 13, 1920, pp. 140-143, 191-197 and pp. 227-232, 50 figs. Outstanding developments enumerated are: Exclusive use of Francis reaction turbines for low and medium heads and Pelton impulse wheels for high heads; extension of use of Francis turbines under heads approaching 800 ft., and Pelton wheels in single stage up to 5,500 ft.; exclusive adoption of balanced wicket gates for regulation of Francis turbines and circular nozzle with combined deflector and needle regulation for Pelton wheels; standardization of turbine runners and increased specific speed; increase of output per unit, maximum output at present being 31,200 b.hp.; increase of overall efficiency; exclusive use of oil-pressure governors; efficient regulation by means of differential surge tanks of turbines using long pipe lines; and employment of large diameter pipe lines under high heads.

WATER SUPPLY

Conduit Capacity and Storage. Estimation of Conduit Capacity in Relation to Storage, Frederic H. Hapgood. Eng. News-Rec., vol. 85, no. 4, July 22, 1920, pp. 153-154, 1 fig. Calculations made in connection with studies for new water supply for New Britain, Conn. Problem was finding most economical combination of capacities of retarding reservoir and pipe line to provide sufficiently complete development of drainage area selected.

Pumping by Hydraulic Power. Pumping Croton Water by Hydraulic Power: Water Supply of New York, Winfred D. Hubbard. Jl. of Am. Water Works Assn., vol. 7, no. 4, July 1920, pp. 461-470, 2 figs. Only approximately 50 per cent of Croton has been in use because of low service. It is planned to use centrifugal pumps which would take Croton water from low-service mains and deliver it to intermediate service, which is much more in demand.

Waste Control. Water Waste Control. Jl. of Am. Water Works Assn., vol. 7, no. 4, July 1920, pp. 488-515, 2 figs. Informal discussion by New York Section of Assn. Deals with conditions in New York City and vicinity and in Buffalo, N.Y.

WATER WORKS

Appliances, Standardization of. Standardization of Water Works Appliances. Adolph Mueller. Contract Rec., vol. 34, no. 28, July 14, 1920, pp. 668-669. As an example of unnecessary number of appliances, it is stated that 128 cities use 332 styles of corporation cocks where three patterns in seven sizes would answer.

See also Pumping Stations.

WELDING

Eye Protection. Eye Protection in Welding Operations, R. R. Butler. Eng., vol. 109, no. 2842, June 18, 1920, pp. 823-826, 7 figs. Reasons why protection is needed for the eye and properties of glasses for protecting eyes from injurious radiations. Paper read before British Acetylene & Welding Assn.

High-Pressure Cylinders. Proposed French Regulations for High Pressure Cylinders. Welding Engr., vol. 5, no. 7, July 1920, pp. 34, 36 and 42. Proposed regulations for metallic containers for compressed, liquified and dissolved gases.

See also Aluminum,, Welding of: Electric Welding; Electric Welding, Arc; oxy-acetylene welding.

WELFARE WORK

Mines. Welfare Work at the Homestake Mine, B. C. Yates. Eng. and Min. Jl., vol. 110, no. 5, July 31, 1920, pp. 198-203, 7 figs. Avoidance of paternalism, a lively interest in clean amusement, and development of the community spirit, it is said, have been the guiding Influences in shaping the human engineering plan followed by the Homestake Mining Co., Lead, S. D.

Shop Papers. Human Interest in the Employees' Magazine, John T. Bartlett, Indus. Management, vol. 60, no. 2, Aug. 1920, pp. 112-115. Editorial attitude to assume in shop papers. Examples of articles published in shop papers which have developed interest among employees.

Steel Industry. How Corporation Aids Workers, C. L. Close. Iron Trade Rev., vol. 66, no. 24, June 10, 1920, pp. 1685-1690, 5 figs. Welfare work, accident prevention, stock subscription for employees and pension funds have entailed expenditure of $71,651,731 since 1912. Multiplicity of interests of U. S. Steel Corp., described by department manager. Paper read before Am. Iron and Steel Inst.

WIRE DRAWING

Steel, Theory of. Steel Wire and Wire Drawing, E. A. Atkins, Eng., vol. 109, nos. 2839 and 2840. May 28 and June 4, 1920, pp. 731-734, 19 figs., and 749-752, 15 figs. Theory of wire drawing, with photomicrographs showing deformation of crystals during flow of steel and stress-strain diagrams of various alloy steels. Impurities in steel as they affect wiredrawing. Paper read before Liverpool Eng. Soc.

WOODWORKING INDUSTRY

Need of Engineering Skill in. The Engineer and the Woodworking Industry, Thomas D. Perry. Mech. Eng., vol. 42, no. 8, Aug. 1920, pp. 448-450, 3 figs. Scope of woodworking field is outlined and engineering problems involved are presented. It is said there exists an urgent need of engineering skill in woodworking industry.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the Members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print, up to 11 x 14 in. size, 25 cents plus postage. A separate print is required for each page of the larger size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library

29 West Thirty-ninth Street, New York, N.Y.

A

TORPEDOPLANES. German Torpedoplanes (Deutsche Torpedoflugzeuge), Werner v. Langsdorff. Schiffbau, vol. 21, no 32, June 30, 1920, pp. 873-874. Account of types used successfully during war, designed by K. Roesner of the Gotha car shops, developed from the double-engine giant aeroplane Gotha, which is also constructed as a seaplane. Also used as observation planes and for transportation of troops in rapid occupation of small islands, etc.

WINGS. Preliminary Choice of a Wing Section, W. F. Gerhardt, B. C. Boulton and L. V. Kerber. Aerial Age, vol. 11, no. 25, Aug. 30, 1920, pp. 839-841 and 849. Analytical tests are suggested for preliminary evaluation of aerofoils best adapted for given conditions of aeroplane design.
The Alula High-Lift Wing. Aerial Age, vol. 11, no. 25, Aug. 30, 1920, pp. 836-838, 3 figs. Data on wing recently developed in England.

AIR PUMPS

RADOJET. The Radojet Air Pump, M. C. Stuart and Arthur H. Senner. Jl. Am. Soc. Naval Engrs., vol. 32, no. 3, Aug. 1920, pp. 347-471, 32 figs., partly on 9 supp. plates. Results of tests made at U. S. Naval Eng. Experiment Station, Annapolis, Md. on two Radojet air pumps manufactured by C. H. Wheeler Manufacturing Co.

AIRCRAFT CONSTRUCTION MATERIALS

MCCABE SLEEVE. The McCabe Sleeve, I. E. McCabe. Aviation, vol. 9, no. 2, Aug. 15, 1920, pp. 60-62, 2 figs. McCabe sleeve is a wire-rope fastener applied by use of mechanical means only and has been developed chiefly for use on aircraft. Method of forming it is explaned.

See also Wood, Moisture-Resistant Finishes.

DETERMINATION OF RESISTANCE. Determination of the Resistance of Airship Models, R. H. Smith, Aviation, vol. 9, no. 2, Aug. 15, 1920, pp. 44-47. Comparative value of Eiffel and bell-crank aerodynamic balances.

AIRSHIPS

NON-RIGID. Model Test for Strength and Deformation of Non-Rigid Airship Hulls, J. C. Hunsaker. Aviation, vol. 9, no. 2, Aug. 15, 1920, pp. 53-54, 3 figs. Aircraft Technical Note, Bureau of Construction and Repair, Navy Dept.

ALCOHOL

SYNTHETIC. Synthesis of Alcohol by Loisy Process (L'alcool de synthèse par le procédé de Loisy). Journal des Usines à Gaz, vol. 44, no. 13, July 5, 1920, pp. 193-195. Reaction consists of absorption of ethylene by concentrated sulphuric acid with formation of sulphovinic acid, saponification of this by water, with regeneration of dilute sulphuric acid and production of alcohol.

ALLOY STEELS

HEAT TREATMENTS FOR. Some Commercial Heat Treatments for Alloy Steels, A. H. Miller. Mech. Eng., vol. 42, no. 9, Sept. 1920, pp. 506-508, 11 figs. Deals with heat treatment of alloy steels used for structural purposes, specially of nickel and nickel-chrome steel, and described series of tests which were conducted to determine effect of various heat treatments on samples of same chemical composition, results being illustrated by series of photomicrographs showing effect of different adjustments of temperature, time and rate of cooling of heat treatment.

IMPACT TENSILE TESTS. Impact Tensile Tests with Alloy Steel (Schlagzugversuche mit Sonderstählen), A. Gessner. Stahl u. Eisen, vol. 40, no. 23, June 10, 1920, pp. 781-783, 1 fig, Results of impact tests show that alloy steels of pronounced tenacity, even up to a tensile strength of 100 kg. per sq. mm. and in spite of the extremely short duration of the impact stress—0.003 to 0.005 sec.—give higher values for elongation, construction and resilience than those with steady stress in the static tests.

MANUFACTURE. The Production of Tool Steel, Fred. R. Daniels. Machy. (N.Y.), vol. 27, no. 1, Sept. 1920, pp. 42-46, 8 figs. Processes employed in steel mill of Ludium Steel Co., Watervliet, N.Y., which is engaged exclusively in manufacture of tool and special alloy steels.

ALLOYS

DEVELOPMENTS. Alloys of the Past and Present, Colin G. Fink. Chem. & Metallurgical Eng., vol. 23, no. 10, Sept. 8, 1920, pp. 471-473, 2 figs. Review of recent developments in production of pure metals, ferroalloys, bronzes and brasses and of increasing uses for less common metals and their alloys. Research suggestions for production of special alloys.

ELECTRICAL MELTING. Electrical Melting of Alloys—XIII, H. W. Gillett. Foundry, vol. 48, no. 354, Sept. 1, 1920, pp. 693-695. Future of electric furnace in alloy industry is considered as a whole and in reference to different types of furnaces and possibilities of each class.

ALUMINUM

NICKEL PLATING. Nickel Plating of Aluminum (Nickelage de l'aluminium), Léon Guillet and M. Gasnier. Revue de Métallurgie, vol. 17, no. 5, May 1920, pp. 351-359, 10 figs. Results obtained by first roughening surface of aluminum with sand blast, also with preliminary copper plating before plating with nickel.

WIRE JOINTS. Investigations of the Size and Durability of Wire Joints with Special Regard to Aluminum (Untersuchungen über die Grösse und Beständigkeit von Kontaktverbindungen unter besonderer Berücksichtigung des Aluminums), Rudolf Richter. Elektrotechnische Zeitschrift, vol. 41, nos. 18, 19, 20, 21, 22 and 23, May 6, 13, 20, 27, June 10, 1920, pp. 345-351, 367-370, 386-392, 409-413, 433-435 and 448-452, 19 figs. Results of investigations extending over 3½ years of 421 screwed, riveted, soldered and twisted joints of aluminum and other metallic wires showed that in every respect satisfactory screw and solder joints between aluminum and other metals are possible; twisted and riveted joints with aluminum are unreliable; position of metals to be joined in the electric contact series has no important bearing on size and durability of the joints.

ALUMINUM ALLOYS

ALUMINUM-COPPER. Some Theoretical Principles of Alloying, Robert J. Anderson. Chem. & Metallurgical Eng., vol. 23, no. 9, Aug. 25, 1920, pp. 317-320, 6 figs. Discussion of possible applications of such general concepts as may be drawn from equilibrium diagram, heat of alloy formation, thermit reaction, diffusion and solution to problems connected with production of aluminum-copper alloys in the foundry.

INDUSTRIAL USES. Alloyed Aluminum as an Engineering Material, G. M. Rollason. Mech. Eng., vol. 42, no. 9, Sept. 1920, pp. 495-500, 11 figs. Traces improvement in development of commercial alloys, presenting in connection therewith photomicrographs on alloys commonly used, discusses subject of casting of aluminum as well as methods employed in both cold and hot rolling of metal, and visualizes possible future uses of aluminum and its various alloys.

USES IN AUTOMOTIVE INDUSTRY. Aluminum Alloys, Zay Jeffries. Jl. Soc. of Automotive Engrs., vol. 7, no. 3, Sept. 1920, pp. 295-299 and p. 305, 14 figs. Effect of aluminum alloying on its physical properties, and uses of aluminum alloys in automotive industry.

See also Duralumin.

AMMONIA

SYNTHETIC. The Direct Synthetic Ammonia Process, R. S. Tour. Jl. Indus. & Eng. Chem., vol. 12, no. 9, Sept. 1920, pp. 844-852, 7 figs. General outline of process as developed by Fritz Haber, of Karlsruhe, Germany, and C. Bosch, of Hadische Anilin und Soda Fabrick of Ludwingshafen, Germany.

APPRENTICES, TRAINING OF

FORD MOTOR CO. Training 300 Apprentice Die-Makers with One Instructor, Norman G. Shidle. Automotive Industries, vol. 43, no. 10, Sept. 2, 1920, pp. 472-475, 6 figs. Course given at plant of Ford Motor Co.

AQUEDUCTS

REINFORCED-CONCRETE. The Construction of the Pouilles Aqueduct (L'achèvement de l'aqueduc des Pouilles). Génie Civil, vol. 77, no. 6, Aug. 7, 1920, pp. 105-109, 13 figs. Details of reinforced-concrete siphones. (Concluded.)

AUTOMOBILE ENGINES

ALUMINUM IN. The Status of Aluminum in the Automobile Engine, J. Edward Schipper. Automotive Industries, vol. 43, no. 10, Sept. 2, 1920, pp. 468-470, 6 figs. After five years of development, engineers are unable to agree as to future of lighter metal. Most of those who are using it for pistons are firm believers, but there seems to be limit in size. It is popular for crankcase housings, but has not been adaptable for axle manufacture.

CONNECTING RODS. Seventy-Five Operations Give Accuracy in Connecting Rod Production, J. Edward Schipper. Automotive Industries, vol. 43, no. 11, Sept. 9, 1920, pp. 522-526, 14 figs. Production methods for manufacturing connecting rods used on Marmon cars.

OFF-SET. The Off-Set Motor (Les Moteurs désaxés), H. Petit. Vie Automobile, vol. 16, no. 711, Aug. 10, 1920, pp. 293-295, 9 figs. Graphs showing comparative lateral pressures in cylinder for ordinary type and off-set type. In off-set motor center of crank does not lie in projection of axis of cylinder.

PISTONS. Cast-Iron and Aluminum Piston, Fred H. Colvin. Am. Mach., vol. 53, no. 9, Aug. 26, 1920, pp. 416-421, 18 figs. Methods used by builders of Studebaker and Oakland cars in machining their pistons.
New Type Aluminum Piston in Cole. Motor Age, vol. 38, no. 9, Aug. 26, 1920, pp. 13 and 29. It is said that an aluminum piston that will not "slap" or stick has been developed by Cole engineers. Such piston is claimed to have worked satisfactorily in trials at Indianapolis motor speedway under A. A. A. suction. No details of piston are given.

RADIATORS. Special Methods for Making Radiators, Fred H. Colvin. Am. Mach., vol. 53, no. 4, July 22, 1920, pp. 176-177, 5 figs. Methods of assembling soldering and testing radiators.

SLEEVE-VALVE. A New Sleeve-Valve Motor: The Serex. Auto, vol. 25, no. 35, Aug. 26, 1920, pp. 896-897, 3 figs. Original features are that main inlet and exhaust ports are differently located from either Argyll or Knight, that it possesses separate fuel admission, and that although it is a four-stroke motor, piston co-operates with sleeve to determine opening and closing of inlet, exhaust and fuel admission ports.

STARTER RING GEAR. Flywheel Starter Ring Gears, Fred H. Colvin. Am. Mach., vol. 53, no. 11, Sept. 9, 1920, pp. 513-515, 1 fig. Manufacture by Ford Motor Co. of steel ring gear that bolts to flyweel and which obviates broken teeth as well as undue wear.

See Igniton; Research, Industrial Laboratories.

AUTOMOBILE FUELS

COMBUSTION OF, REGULATION. Combination of Fuels in Internal-Combustion Engines C. F. Kettering. Jl. Soc. of Automotive Engrs., vol. 7, no. 3, Sept. 1920, pp. 224-227. Regulating combustion by addition of chemicals to fuels. It is visualized that if, for example, automotive industry could get chemical industry to increase coal-tar production of country, enabling aniline to be sold at $2 per gal., and automotive industry would use 1 per cent, then compression of automobile engines could be raised to 100 lb. and thus efficiency of normal running almost doubled.

Porous Concrete Slabs. New Material Used in Manufacturing Building at Newark, N. J. Am. Architect, vol. 118, no. 2331, Aug. 25, 1920, pp. 255-260, 15 figs. Poroux-concrete slabs. Mechanically produced pellets of neutral wax-like material are added to concrete. After slab is formed pellets are removed by application of heat.

Statistics of New Construction Throughout United States. Public Rebels Against Closed Shop System. Iron Trade Rev., vol. 67, no. 8, Aug. 19, 1920, pp. 505-508, 1 fig. While building permits in United States show increase in recent months, it is generally estimated that twice as much construction would be undertaken as at present if labor conditions were more stable.

C

CABLES, ELECTRIC

Underground. Underground Electric Cables (Câbles souterrains d'alimentation), L. Sekutowiez. Industrie des Tramways et Chemins de Fer, vol. 14, nos. 161-162, May-June 1920, pp. 85-100, 14 figs. Technical conditions with which armored cables must comply. Aluminum as conductor. Data on direction of underground cables. (Concluded.) Report prepared for presentation to the International Congress which was to be held at Budapest in 1914.

Unipolar. Unipolar Cables with Lead Sheathing (Câbles unipolaires sous enveloppe de plomb), P. Capdeville. Revue générale de l'Électricité, vol. 8, no. 6, Aug. 7, 1920, pp. 177-181, 8 figs. Formulæ for calculating, for a given network, currents and voltages induced in lead and their influence on the characteristics of copper conductor.

CABLEWAYS

Timber Transportation. Ropeways for the Transport of Timber, P. Stephan. Eng. Progress, vol. 1, no. 9, Sept. 1920, pp. 279-281, 10 figs. Transport upon wooden runners and by means of field railways; ropeways for wide spans. Details of construction and economy.

CAMS

Design of. Rational Study of Mechanisms Operated by Cams (Etude rationnelle des méchanismes commandés par cames), Octave Lepersonne. Revue universelle des Mines, vol. 6, no. 2, July 15, 1920, pp. 122-126. Formula for dimensions for cam in terms of those of return springs.

CANALS

Electric Traction on. Electric Traction on Canals (La traction électrique sur les canaux), M. Tumerelle. Bulletin de la Société française des Electriciens, vol. 10, no. 89, May 1920, pp. 187-198, 1 fig. Economical study based on results of operating various canals electrically in France.

Great Lakes-Atlantic Ocean. The St. Lawrence Route and Welland Ship Canal, Alex. J. Grant. Jl. Eng. Inst. of Canada, vol. 3, no. 9, Sept. 1920, pp. 425-434, 11 figs. Origin, development and construction of canals that form navigation system connecting Great Lakes with Atlantic Ocean via St. Lawrence Route.

Locks. The Lock Foundation, Inner Harbor Navigation Canal, New Orleans, La—The Problem and the Solution, Geo. R. Goathals. Proc. La. Eng. Soc., vol. 6, no. 3, June 1920, pp. 134-158, 8 figs. Lock is located 2000 ft. measured along canal channel, from river. Canal prism between river and lock will be 125 ft. wide, with 30 ft. minimum depth; and between lock and lake, bottom width of 150 ft. and minimum depth of 30 ft. will be provided. Unique feature is that high-level pool may be either on river side or on lake side.

Welland Ship. Progress on New Welland Ship Canal. Can. Eng., vol. 39, no. 11, Sept. 9, 1920, pp. 319-330, 24 figs., partly on supp. plate. Estimated quantities of excavation, concrete and embankments. Review of canal's history, purpose, design and construction, with special reference to 1919 and 1920 work. Program for 1921.

CARBURETORS

Kerosene. A New Kerosene Carburetor. Automotive Industries, vol. 43, no. 12, Sept. 16, 1920, p. 561, 1 fig. Kjellberg carburetor. Kerosene is mixed with portion of air required for combustion and mixture heated by exhaust heat. Further on toward inlet valves extra air is added.

CARS

Pipe Connectors, Automatic. The Beahm Automatic Connector for Train Pipes. Ry. Age, vol. 69, no. 11, Sept. 10, 1920, pp. 451-453, 5 figs. Connector differs from other types in gathering arrangement, in method of attachment to coupler and in means employed for coupling to cars not equipped with connectors.

CARS, FREIGHT

Draft Gears. Draft Gear Tests, U. S. R. A.—Design, Nature and Scope. Ry. Rev., vol. 67, nos. 11 and 17, Sept. 11 and 18, 1920, pp. 383-396 and 425-429, 3 figs. Action and comparative merits of various gears from viewpoint of impact and buffing. Discussion of developments noted in rivet shearing and impact tests. (To be continued.)

CARS, REFRIGERATOR

Gas-Eliminating System. Refrigerator Car Gas Eliminating System. Ry. Mech. Engr., vol. 94, no. 8, Aug. 1920, pp. 545-546, 1 fig. Function of system is to remove from atmosphere of refrigerator the gases produced by bacterial action in breaking down of tissues of product under refrigeration, and it is designed for use with any cooling system. System has been developed and is now controlled by Acme Refrigerator Corporation, Chicago.

CASE-HARDENING

Gas Furnace for. City Gas as a Case-hardening Agent, H. M. Crawford. Metal Trades, vol. 11, no. 9, Sept. 1920, pp. 386-388, 3 figs. Results of carburizing low-carbon steel for seven hours in illuminating gas at various temperatures. Sketch of gas-carburizing furnace.

CELLULOSE

Acetate, Manufacture of. Manufacture of Cellulose Acetate, Maurice Deschiens. Chem. & Metallurgical Eng., vol. 23, no. 11, Sept. 15, 1920, pp. 533-536, 1 fig. Generalities on cellulose acetates. Esterification, Operating conditions, Industrial manufacture by acetylation of modified or natural cellulose with or without solution of cellulose in esterifying bath.

CEMENT GUN

Uses. Cement Gun and Its Uses (Le cement-gun et ses applications générales), M. Bousquet. Vie Technique et Industrielle, vol. 1, nos. 10 and 11, July and Aug. 1920, pp. 294-296 and 399-402, 9 figs. Results of experiments made at experimental laboratory of the Conservatoire national des Arts et Métiers, Paris, France.

CEMENT MANUFACTURE

State-Owned Plant. Should the State Own and Operate a Plant for the Manufacture of Portland Cement? J. C. Nagle. Good Roads, vol. 20, no. 8, Aug. 25, 1920, pp. 92 and 94-95. State-owned plant, it is claimed, would stabilize market prices and reduce fluctuations.

CENTRAL STATIONS

California. The Industrial Load in California. Elec. World, vol. 76, no. 9, Aug. 28, 1920, pp. 428-430, 2 figs. Central station figures for first quarter of year indicate large increases in industrial load.

Expansion in 1920. Central-Station Expansion in 1920. Elec. World, vol. 76, no. 11, Sept. 11, 1920, pp. 518-520. Analysis of returns received indicates that about 1,500,000 kw. will be added to generating capacity of central stations in 1920.

U. S. Census of 1917. U. S. Census of Central Stations 1917. Elec. World, vol. 76, no. 10, Sept. 4, 1920, pp. 476-477, 1 fig. Census indicates 6542 central stations, with installed rating of 8,994,407 kw. and total output of 31,044,049,234 kw-hr. Stationary motors served number 555,924, with continued rating of 9,216,330 hp.

CERAMIC MIXTURES

Colors Produced by Nickel Oxide. A Glaze Study Involving Some Interesting Colors Produced by Nickel Oxide, J. D. Whitmer. Jl. Am. Ceramic Soc., vol. 3, no. 8, Aug. 1920, pp. 663-670. Grays were obtained in tests from oxide of nickel in presence of magnesium oxide.

CHIMNEYS

Concrete. New Concrete Chimney System. Concrete, vol. 17, no. 1, July 1920, pp. 33-34, 4 figs. Coniform design in which monolith is strengthened with series of vertical and integral ribs, half round in section, extending from bottom to top and terminating at base of ornamental top.

CHROME STEEL

Welding. Welding Heat-Treated Chrome Alloy Steel, J. Churchward. Iron Age, vol. 106, no. 11, Sept. 9, 1920, pp. 641-642, 7 figs. How controlling welding heat insured minimum of injury to original structure. Special welding machine employed. Saving defective forgings.

CHROME-NICKEL STEEL

Torsion Elasticity. Torsion Elasticity of Nickel Steels with High Chromium Content (Étude de l'élasticité de torsion des aciers au nickel à haute teneur en chrome), P. Chevenard. Comptes rendus des Séances de l'Académie de Sciences, vol. 171, no. 2, July 12, 1920, pp. 93-96, 3 figs. Charts giving experimentally measured moduli of torsion of various nickel steels containing from 10 to 100 per cent chromium.

Uses in Automotive Industry. Some Applications of Alloy Steels in the Automotive Industry, H. J. French. Mech. Eng., vol. 42, no. 9, Sept. 1920, pp. 501-505 and p. 547, 9 figs. Reference is made to uses of steel containing 1 per cent nickel and 1 per cent chromium and also 3 per cent nickel and 3 per cent chromium. Data are given for these two steels showing tensile properties and hardness developed in small-size rounds subjected to varying heat treatments. Mention is made of nickel-chromium steels and treatments used for gears and airplane-engine crankshafts. "Streaks" and "temper-brittleness," both encountered in use of nickel-chromium steels are discussed and curves showing tensile properties and hardness of "strainless steel" under varying oil-quenching and tempering treatments are presented, and also results of cutting tests made with cast high-speed steel milling cutters and comparison is given with high-speed cutters made by present-day ordinary methods.

CHUTES

Design. The Design of Chutes and Ore Bins, John S. Watts. Iron & Steel of Canada, vol. 3, no. 8, Sept. 1920, pp. 244-246. Slope to give for different materials. Advantages of making chute in two sections.

COAL DISTILLATION

COAL MINES

COAL MINING

COKE OVENS

Beams, Diagonal Tension in. Reinforcement for Diagonal Tension in Reinforced Concrete Beams, Edward Godfrey. Concrete, vol. 17, no. 1, July 1920, pp. 15-20, 12 figs. It is claimed that in customary designs of reinforced concrete beams, reinforcement is not placed in a position to take care of diagonal tension. A system of bending reinforcing bars diagonally in direction in which diagonal tension is said to take place is offered.

Flat Slabs. New York City Concrete Flat-Slab Regulations. Eng. News-Rec., vol. 85, no. 7, Aug. 12, 1920, pp. 300-302, 2 figs. Standards adopted by Board of Standards and Appeals for uniform use of all boroughs of city.

CONDENSERS, ELECTRIC

Capacities of. Capacities and Condensers (Capacités et condensateurs), P. Bunet. Revue générale de l'Électricité, vol. 8, no. 8, Aug. 21, 1920, pp. 237-250, 11 figs. Comparative study of capacities of various forms of condensers. Examples are worked out of determination of capacities of electric circuits by means of their self-inductance. Opinion is expressed that it is possible to design high-powered condensers, which would be capable of being branched in derivation on high-tension high-power distribution systems.

CONDUITS

Air Chambers in. Researches on Conduits with Air Chambers (Recherches sur les conduites possédant des réservoirs d'air), C. Camichel. Houille Blanche, vol. 19, nos. 41-42, May-June 1920, pp. 111-113, 6 figs. Experiments at Institut Electrotechnique de Toulouse to study behavior of conduits provided with devices for relief of water hammer.

Concrete. Excavation below Arch Bridge Foundations. Public Works, vol. 49, no. 10, Sept. 4, 1920, pp. 205-208, 4 figs. Concrete conduits 25 ft. wide constructed on opposite sides of railroad bridge pier and carried down 12 ft. below pier footings on gravel retained by steel sheet piles.

Method of Building Concrete Tailrace below Stone Arch Bridge Foundation Level. Eng. and Contracting, vol. 54, no. 7, Aug. 18, 1920, pp. 155-157, 5 figs. To keep gravel under grillages from caving in, line of interlocking steel sheet piling was driven on each side of excavation, and as material was dug out, bracing timbers were introduced between two rows of piling.

Reinforced Concrete Conduit under Pressure at the Rioupéroux Hydro-electric Plant (Conduite forcée en béton armé des usines hydro-électriques de Rioupéroux), A. Waechter, Schweizerische Bauzeitung, vol. 76, no. 6, Aug. 7, 1920, pp. 59-61, 6 figs. Diameter of conduit is 8¼ ft. Length is 2017 ft.

CONNECTING RODS

Machining. Connecting Rods for the Fordson Tractor, Fred H. Colvin. Am. Mach., vol. 53, no. 6, Aug. 5, 1920, pp. 273-277, 17 figs. Attention is directed to three-point suspension method of holding and locating connecting rods during various machining operations.

CONVEYORS

Steel-Belt. The Sandvik Steel Conveyor Belt (Stahlförderband System Sandviken), S. Michelson. Fordertöchnik u. Frachtverkehr, vol. 13, no 11, May 28, 1920, pp. 104-105, 4 figs. Describes a Swedish type of steel belt manufactured entirely in one piece in length up to 90 m., which is pliable, of small weight, russ-proof, is durable and easily connected and repaired.

COPPER

Cold-Rolling. The Influence of Cold Rolling on the Physical Properties of Copper, F. Johnson. Eng., vol. 110, no. 2851, Aug. 20, 1920, pp. 257-260, 9 figs. Experimental studies of critical ranges on deformation. Examination of theories which have been advanced to explain existence of critical ranges in cold-worked metals, that is, allotropic theory and recrystallization theory. Paper read before Inst. of Metals.

Extruded Rods. Extruding Brass and Copper Rods, Edward K. Hammond. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, pp. 1-4, 7 figs. Methods and equipment employed by Rome Brass & Copper Co., Rome, New York, in production of brass and copper rods by extrusion process.

Leaching. Leaching and Concentrating Mixed Copper Ores, Arthur Crowfoot and Kenneth H. Donaldson. Eng. & Min. Jl., vol. 110, no. 10, Sept. 4, 1920, pp. 471-474, 5 figs. Method used at experimental plant of Arizona Copper Co., which consists in regrinding, dissolution of oxidized copper in weak sulphuric acid and flotation of sulphide slimes.

COPPER METALLURGY

Refineries, Power Problems of. The Power Problem in a Copper Refinery, Lawrence Addicks. Chem. & Metallurgical Eng., vol. 23, no. 7, Aug. 18, 1920, pp. 275-278, 4 figs. Outline of steam recovery possible with waste-heat boilers and steam demand for heating electrolyte, with discussion of bearing of these factors upon problem of choice of prime mover.

Smelter Slag. Selecting a Slag and Apportioning Slag Losses, C. A. Grabill. Eng. & Min. Jl., vol. 110, no. 12, Sept. 18, 1920, pp. 569-572, 2 figs. Details method of calculating slag and matte composition from given charge. Various means of charging for copper loss. Advantages of basing it on iron contents of slag. Second of series of three articles.

CORONA

High-Voltage. The High Voltage Corona in Air, J. B. Whitehead. Proc. Am. Phil. Soc., vol. 59, no. 4, 1920, pp. 245-260, 8 figs. Experimental testing of empirical formulæ for computing losses due to corona discharges. Construction and operation of corona voltmeter for measuring high voltage.

COSTS

England. Engineering Costs, Frank Walker. Eng. & Indus. Management, vol. 4, no. 8, Aug. 19, 1920, pp. 227-232, 3 figs. Statement of costs of labor and materials from July 1914 to June 1920, given in official organ of British Elec. & Allied Manufacturers' Assn.

CRANES

Traveling. Overhead Traveling Crane with Telescopic Cage. Engr., vol. 130, no. 3368, July 16, 1920, pp. 66-67, 2 figs. Crane is capable of lifting 120 tons and is fitted with electric turning gear at hook to facilitate manipulation of work at press and with releasing gear to prevent damage by overloads produced by action of press on work.

Traveling Crane with Lifting Magnet for the Transportation of Long Rolled Steel Sections (Laufkran mit Lasthebemagneten für den Transport von langen Walzeisen), W. Druey. Schweizerische Bauzeitung, vol. 76, no. 6, Aug. 7, 1920, pp. 64-65, 3 figs. Described plant constructed by the Oerlikon Machine Works, consisting of a traveling crane of 5000 kg. carrying capacity and 25 m. span; two lifting magnets are suspended from each end of the 10-m. long runway, with which ten or twelve rail section 15 of 20 m. long can be lifted and transported.

Wooden-Jib. 135-Ft. Wooden Derrick Crane Jib. Eng., vol. 110, no. 2850, Aug. 13, 1920, pp. 206-207, 6 figs. Constructed by Imber Court Engineering Works, Thames Ditton, Surrey, for British Admiralty during war. Working conditions to be fulfilled were that crane with post 50 ft. high was to lift 3-ton load up to platform 100 ft. high. Wooden construction was adopted in perference to steel in order to save weight.

CUTTING TOOLS

Barth Slide Rules. Supplement of Frederick W. Taylor's "On the Art of Cutting Metals"—XI, Carl G. Barth. Indus. Management, vol. 60, no. 3, Sept. 1920, pp. 218-225, 6 figs. Presentation of basic formulæ and construction of slide rules for milling and gear cutting.

D

DAMS

Concrete. Light Concretes and the Height of Dams (Les bétons légers et les records de hauteur des barrages), Charles Rabut. Houille Blanche, vol. 19, nos. 41-42, May-June 1920, pp. 85-87, 2 figs. Formulæ for maximum height of dam in terms of specific gravity and ultimate strength of concrete.

Curved. Gravity and Arch Action in Curved Dams, Fred. A. Noetzli. Proc. Am. Soc. of Civil Engrs., vol. 46, no. 6, Aug. 1920, pp. 950-951. Methods for determining for arch dam, proportion of load carried either by gravity, that is, vertical cantilever action, or by horizontal arching. Accuracy of method is believed to compare favorably with that obtained by purely mathematical solution of problem of arched dams. (Abstract.)

Earth. Building the Earth Dams at the Bridge-water Project, Richard Pfaehler. Eng. News-Rec., vol. 85, no. 7, Aug. 12, 1920, pp. 306-309, 5 figs. Three closures of large storage reservoirs built by sluicing earth fill into pool from dumped embankments.

Flood-Check. Flood-Check Dams Formed by Fill behind Wire Frame. Eng. News-Rec., vol. 85, no. 11, Sept. 9, 1920, pp. 506-507, 3 figs. New type of California dam automatically fills with flood debris which causes barrier.

Hydraulic. Hydraulic Dams (Barrages hydrauliques). Houille Blanche, vol. 19, nos. 41-42, May-June 1920, pp. 81-85, 11 figs. Particulars of various structures. (Concluded.)

Hydraulic-Fill. Hydraulic Fill at the Miami Conservancy Dams, C. S. Hill. Eng. News-Rec., vol. 85, nos. 11 and 12, Sept. 9, and 16, 1920, pp. 486-490 and 547-550, 10 figs. Developments which have resulted from study of experiments applied to hydraulic-fill operations of Miami Conservancy District. Among these are included manganese-steel centrifugal pump which, compared with cast iron has doubled output life of pump shells and increased nearly tenfold output life of pump runners, and a new design of pump shell in white iron that has exhibited resistance to wear which indicates output life of 400,000 cu. yd. of heavy gravel and sand fill. Improved sump and pump layout reduces losses of head at suction. Manganese steel doubles and white iron quardruples pump output life.

DIE BLOCKS

Chemical Analyses. Analyses Die Block Requirements, W. C. Peterson. Iron Trade Rev., vol. 67, no. 8, Aug. 19, 1920, pp. 517-519. Standardization of chemical analyses is urged. Squeezing die blocks is considered superior to hammering. Paper read before Am. Drop Forge Assn.

DITCHES

EARTH

EDUCATION, ENGINEERING

ELECTRIC LOCOMOTIVES

British. British Electric Locomotives for Freight Service. Ry. Engr., vol. 41, no. 488, Sept. 1920, pp. 368-378, 12 figs. partly on supp. plate. Dimensions: Total weight, 74 tons 8 cwt.; length over buffers, 39 ft. 4 in.; height from rail to center of buffers, 3 ft. 5 in.; height of cab roof from rail, 11 ft. 6 ¾ in.; width of cab, 7 ft. 6 ¼ in.; total wheelbase, 27 ft.; diameter of wheels, 24 ft.; motor equipment of each locomotive consists of four totally enclosed motors, each driving axle through single-reduction twin gearing.

Italian State Railways. A Powerful Three-Phase Locomotive. Elecn., vol. 85, no. 2205, Aug. 20, 1920, pp. 204-206, 5 figs. Line voltage, 3000 to 3700; frequency, 15 to 17; number of traction motors, 2; number of driving wheels, coupled, 6; number of bogie wheels, 8; diameter of driving wheels, 1630 mm.; diameter of bogie wheel, 960 mm.; tractive effort 9000 kg.; power 1670 hp,; synchronous speed, 50 km.-hr.

ELECTRIC MOTORS, A. C.

Synchronous. Influence of Saturation on the Operation of Synchronous Machines (Influence de la saturation sur le fonctionnement des machines synchrones), G. H. Perrin. Revue générale de l'Électricité, vol. 8, no. 3, July 17, 1920, pp. 67-73, 11 figs. Study based on Potier's diagram.

ELECTRIC RAILWAYS

Federal Commission Report. Federal Commission Report. Elec. Ry. Jl., vol. 56, no. 9, Aug. 28, 1920, pp. 398-411. Full text of report. Scope of inquiry was to ascertain actual financial and service condition of electric railways of United States at present, causes which have contributed to such conditions, what readjustments of relations between electric railways and communities which they serve must be brought about in order to restore confidence of public and to put companies upon such financial basis for future as will enable them to render continuous and efficient service to their respective communities.

ELECTRIC RAILWAYS, TRACK

Rail Joints. Progress in Rail Joint Construction, R. C. Cram. Elec. Ry. Jl., vol. 56, no. 9, Aug. 28, 1920, pp. 415-419. Opposite vs. staggered joints. Strength of electric bar-weld joints. Essentials for success of arc-weld type of joint.

ELECTRIC SWITCHES

Oil. Maljournal-Bourron Compression Chamber Oil Interrupter (Disjoncteur Maljournal et Bourron à chambres de compression), P. Charpentier. Revue générale de l'Électricité, vol. 8, no. 7, Aug. 14, 1920, pp. 211-215, 5 figs. Combination of compression chamber and mechanism providing rapid opening of circuit.

ELECTRIC TRANSMISSION LINES

Accounting. Utility Construction Accounting. Elec. World, vol. 76, no. 12, Sept. 18, 1920, pp. 574-575, 1 fig. Urges using accounting system on construction of transmission and distribution lines and similar undertakings.

Calculation of. Modern Methods of Designing and Operating High-Tension Electric Transmission Lines (Sur les méthodes modernes de calcul et sur le régime de fonctionnement des lignes de transmission d'énergie à haute tension), A. Blondel. Revue générale de l'Électricité, vol. 8, no. 6, Aug. 7, 1920, pp. 163-174, 8 figs. Graphs for simplifying calculations involving hyperbolic functions. (Continuation of serial.)

"Half-Wave" Lines. "Half-Wave" Electric Transmission Lines (Sur les lignes de transport d'énergie demi-onde), M. E. Brylinski. Bulletin de la Société française des Électriciens, vol. 10, no. 89, May 1920, pp. 169-185. Comparative value of "half-wave" and "quarter-wave" lines for transmission of electric power at great distances.

High-Tension. Arcing Grounds on High-Tension Lines. W. D. A. Peaslee. Elec World, vol. 76, no. 9, Aug. 28, 1920, pp. 424-427, 6 figs. Experimental investigation of the voltage stress on insulators and connected apparatus on high-tension transmission lines due to normal-frequency voltage and the high-frequency surges caused by arcing grounds.

ELECTRIC TRANSMISSION LINES

High-Tension. Design and Operation of High-Tension Electric Transmission Lines (Sur les méthodes modernes de calcul et sur le régime de fonctionnement des lignes de transmission d'énergie à haute tension), A. Blondel. Revue générale de l'Électricité, vol. 8, nos. 5, 7 and 8, July 31, Aug. 14 and 21, 1920, pp. 131-141, 195-206 and 227-236, 16 figs. Technical and graphical study. Graphical method of computing characteristics. Suggested generalization of Brown diagram. Maximum power transmissible and maximum efficiency attainable.

Induction Coefficients. Induction Coefficients of Electric Transmission Lines (Coefficients d'induction des lignes électriques), P. Capdeville. Revue générale de l'Électricité, vol. 8, no. 5, July 31, 1920, pp. 152-156, 6 figs. Process for computing coefficients by introducing return conductor necessary to consideration of flux, but limiting its position in finite space.

110,000-Volt. Transportation of Electrical Energy at 110,000 Volts between Gösgen, Switzerland, and Pouxeux, Vosges, France (Transport d'énergie électrique à 110,000 volts entre Gösgen (Suisse) et Pouxeux (Vosges), P. Caufourier. Génie Civil, vol. 77, no. 4, July 24, 1920, pp. 65-69, 13 figs. Total length of line is 115 miles. Power transmitted is 15,000 kw.

Protection of. Current-Balance Relay Protection, E. R. Stauffacher. Elec. World, vol. 76, no. 10, Sept. 4, 1920, pp. 465-467, 3 figs. Necessity for development of new system of relay protection where duplicate parallel lines are operated is met by current-balance relay.

Protection of Transmission Systems—II, Emil Alm. Elec. World, vol. 76, no. 8, Aug. 21, 1920, pp. 377-380, 3 figs. Analysis of abnormal voltages which may occur on transmission systems and methods adopted by company in Sweden to protect station apparatus from insulation breakdown.

Stresses Due to Rupture of a Span. Elastic Equilibrium of an Aerial Line of an Indefinite Number of Spans When One Span Fails (Sur l'équilibre élastique d'une ligne aérienne formée d'un nombre indéfini de travées identiques, quand les fils d'une travée sont rompus), E. Batilce. Revue générale de l'Électricité, vol. 8, no. 4, July 24, 1920, pp. 100-102. It is assumed that the number of supports on either side of failing span is large enough to permit normal tension to exist at certain distances from failure. Equations are derived and applied to numerical case.

Tension and Sag Calculations. Charts Show Tension and Sag for Transmission Lines. Elec. World, vol. 76, no. 11, 1920, pp. 529-530, 3 figs. Charts for finding proper sag and tension when given a line to string, so that allowable stress will not be exceeded in cold or windy weather, and also to determine what sag will correspond to any given tension under present conditions.

ELECTRIC WELDING

Machines. Electric Welding Machines—Factors Influencing Their Operation, L. W. Webb. Power, vol. 52, no. 9, Aug. 31, 1920, pp. 337-338, 2 figs. Curves showing amount of reactance required in welding circuit for different values of current.

ELECTRIC WELDING, ARC

Automatic Machines. Automatic Electric Arc Welding Machine, H. L. Unland. Am. Mach., vol. 53, no. 9, Aug. 26, 1920, pp. 403-406, 8 figs. Types built by General Elec. Co. Paper read before Am. Welding Soc.

Cast Iron. Welding Cast Iron with the Electric Arc, Robert E. Kinkead. Welding Engr., vol. 5, no. 8, Aug. 1920, pp. 23-24. Comparative advantages of oxy-acetylene and electric processes for welding cast iron. Paper read before American Welding Society.

ELECTRICAL APPARATUS

Testing. Polyphase Experimental and Instrument-Testing Table, H. P. Sparkes. Elec. World, vol. 76, no. 8, Aug. 21, 1920, pp. 380-381, 2 figs. Switchboard used in testing laboratory of Westinghouse Electric & Manufacturing Company for polyphase experiment tests.

ELECTROLYTIC CELLS

Cylindrical. The Cylindrical Electrolytic Cell, L. D. Vorce. Chem. Age, vol. 28, no. 8, Aug. 1920, pp. 279-281, 2 figs. Comparison of cylindrical and box-shaped cells. Paper read before Am. Inst. Chem. Engrs.

EMPLOYMENT MANAGEMENT

Automobile Plants. Employment Department Increases Efficiency of Office Personnel, Norman G. Shidle. Automotive Industries, vol. 43, no. 12, Sept. 16, 1920, pp. 576-578, 9 figs. Results obtained by applying effective personnel methods in office work at large automobile plant.

Development of Department. How an Effective Employment Department Is Being Developed, Norman G. Shidle. Automotive Industries, vol. 43, no. 8, Aug. 19, 1920, pp. 370-373, 7 figs. It is said that large expenditures and elaborate equipment are not essential to successful operation of employment department, and that intelligent vision and progressive development are of more importance. System of records in use in employment department of Detroit automobile manufacturer is explained.

Record Forms. Aids for the New Employment Manager, F. Morgan Keyser. Indus. Management, vol. 60, no. 3, Sept. 1920, pp. 245-247, 2 figs. Suggested forms for recording term of service and for showing total separations by periods.

Vocational Tests. Psycho-Technics in Germany, Alfred Gradenwitz. Am. Mach., vol. 53, no. 9, Aug. 26, 1920, pp. 407-408, 6 figs. Apparatus used in German laboratory to pick out right man for job.

ENGINEERING SOCIETIES

Federated Engineering Societies. Federated Engineering Societies of America, Arthur P. Davis. Eng. World, vol. 17, no. 3, Sept. 1920, pp. 198-201. Reasons for establishing Federated Engineering Societies. Work Federation will accomplish. Why this work cannot be accomplished by any other society.

ENGINEERS

Licensing. Legislation Governing Practice of Engineers. Contract Rec., vol. 34, no. 33, Aug. 18, 1920, pp. 784-787. Act recently passed in Nova Scotia.

ETHYLENE

Recovery from Coal. Recovery of Ethylene from Coal. Colliery Guardian, vol. 120, no. 3112, Aug. 20, 1920, p. 533, 1 fig. Process for treatment of gaseous products from coke ovens, patented jointly by Ernest Bury and Skinningrove Iron Co., Ltd.

F

COMPARATIVE COST. Comparative Cost of Fuels, M. Kinoshita. Dom. Eng. (Lond.), vol. 40, no. 20, Aug 1920, pp. 123-124, 1 fig. Alignment chart indicating actual cost of obtaining 100,000 B.t.u. and 1 hp-hr. as mechanical energy from solid, liquid and gaseous fuel, and also electric energy, for given price, calorific value and efficiency.

ECONOMY. Fuel Economy. Engr., vol. 130, no. 3374, Aug 27, 1920, pp. 196 and 198. Report of committee appointed for investigation of fuel economy, utilization of coal and smoke prevention, presented at meeting of Chemistry section, British Assn. for Advancement of Science. Among subjects discussed are future standards of gas supplies and alcohol from coke oven gas.

LIQUID. Calorific Power of Liquid Fuels (Pouvoir calorifique des combustibles liquides), H. Décluy. Journal des Usines à Gaz, vol. 44, no. 13, July 5, 1920, pp. 195-196. Table of equivalents with coal.

See also Coal; Lignite; Pulverized Coal.

FURNACES, ANNEALING

STOKER-FIRED TANDEM. Sheet, Pair and Annealing Furnaces—I, C. F. Poppleton. Iron Age, vol. 106, no. 12, Sept. 16, 1920, pp. 714-717, 2 figs. Typical tandem combination sheet and pair furnaces originally designed for use of producer gas and later changed with specially corrugated tiles. It is arranged with two doors and pairs are charged to back and front of hearth alternately. Stoker is placed centrally on longitudinal center line of sheet and pair furnace with its combustion grates on either side of feeding worm. (To be continued.)

FURNACES, BOILER

TWO-STAGE. Two-Stage Combustion (La combustion en deux temps), Henry Dieterlen. Chaleur et Industrie, no. 4, July 1920, pp. 206-214, 17 figs. Boiler furnace said to have been developed from results obtained in extensive experimental researches of combustion. Furnace consists of four parts: Continuous furnace with mechanism for regulating proportions of fuel and air; first boiler element intended to cool gases to temperature near minimum at which they can be reignited; mechanism for thoroughly mixing cooled gases; second boiler element where exchange of heat takes place. Furnace is said to be capable of application to any type of boiler and for burning any fuel.

FURNACES, HEAT-TREATING

NEW TYPE. New-Heat Treating Furnace. Iron Age, vol. 106, no. 11, Sept. 9, 1920, p. 644, 2 figs. Similar to pusher type. It has no skid rails or other metal in floor, all beams being covered with fire tile. Manufactured by Advance Furnace & Eng. Co., Springfield, Mass.

FURNACES, HEATING

ROLLING MILLS. Experimental Study of Reheating of Metallic Pieces in Forging Furnaces (Études expérimentales sur le réchauffage des pièces métalliques dans les fours de forge), Félix Verdeaux. Revue de Métallurgie, vol. 17, no. 5, May 1920, pp. 312-334, 23 figs. Experiments with continuous and non-continuous furnaces with automatic and non-automatic grates, of type usually employed in rolling-mills.

G

GAGES

INTERCHANGEABLE MANUFACTURE. Gages in Interchangeable Manufacturing—I and II, Earle Buckingham. Machy. (Lond.), vol. 16, nos. 411 and 413, Aug. 12 and 26, pp. 576-582 and 637-642, 39 figs. Types of gages and gaging devices employed in manufacturing interchangeable parts.

LAPPING. Accurate Lapping, L. J. Vorhees. Am. Mach., vol. 53, no. 6, Aug. 5, 1920, pp. 263-265, 3 figs. Instructions for gage lapping and for making laps.

LIMIT PLUG. Quantity Production of Combination Limit Plug Gages. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, pp. 59-61, 4 figs. Description of new system of limit plug gages developed by Taft-Pierce Mfg. Co., and methods employed in their manufacture on quantity production plan. Limit plug gage made to this system consists of (1) gage handle, (2) "go" plug gage unit, (3) "not go" plug gage unit, (4) and (5) screws for holding gage units to handle. Principle advantage is possibility of interchanging gage units according to actual limits required in any one case.

MANUFACTURE. Elements of Gage Making—IX and X, C. A. Macready. Am. Mach., vol. 53, nos. 4 and 6, July 22 and Aug. 5, 1920, pp. 167-169 and 253-255, 11 figs. Fixtures for grinding of radii to points of tangency. Use of sine bar as means to obtain greater degree of accuracy.

PLANER-TOOL-SETTING. Precision Type of Planer-Tool-Setting Gage. Machy. (Lond.), vol. 16, no. 414, Sept. 2, 1920, pp. 681-683, 4 figs. Tool-setting gage provided with Vernier for obtaining direct readings and with means for securing quick and accurate adjustments.

SCREW, HARDENING OF. The Hardening of Screw Gages with the Least Distortion in Pitch, Wilfrid J. Lineham. Am. Mach., vol. 53, no. 12, Sept. 16, 1920, pp. 547-551, 14 figs. Hardening of screw gages at Goldsmith's college to find means of quenching steel after heating so that distortion along pitch line should be reduced to minimum. Paper read before Instn. Mech. Engrs.

TOLERANCES. Chart for Determining Fit Allowances, J. B. Conway. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, p. 17. Chart for determining tolerances and limits to be allowed for various classes of fits.

See also Screw Threads, National Screw Thread Commission.

GAS ENGINES

BLAST-FURNACE-GAS OPERATED. Gas Blowing Engines at Jarrow. Iron & Coal Trades Rev., vol. 101, no. 2739, Aug. 27, 1920, pp. 260-262, 5 figs. Notable feature is casting of cylinder body in two halves, each half being cast with valve portion at bottom and with large head of metal above central flange. Two halves are hydraulically forced over liner. Pistons, built according to Galloways' patent, are water-cooled.

MODERN TYPES. Modern Large Gas Engines, H. Dubbel. Eng. Progress, vol. 1, no. 9, Sept. 1920, pp. 282-286, 12 figs. Details of Nürnberg, Körting and other types.

GAS MANUFACTURE

LIGNITE GAS. Lignite for Gas Making, W. D. Wilcox. Gas Rec., vol. 18, no. 4, Aug. 25, 1920, pp. 11-14. Tests. Gas from sub-bituminous coal had heat value of about 550 B.t.u.: lignite gave gas slightly better than 450 B.t.u. before purification.

See also Water Gas.

GASES

COMPRESSED, CONTAINERS FOR. High-Pressure Seamless Steel Cylinders. Iron Age, vol. 106, no. 7, Aug. 12, 1920, pp. 377-379, 12 figs. How containers for gases are made from tubes by piercing process and from flat plates by cupping process.

GASOLINE

DISTILLATION. Durability of Electric Heaters for Gasoline Distillation, W. A. Jacobs and E. W. Dean. Chem. & Metallurgical Eng., vol. 23, no. 8, Aug. 25, 1920, pp. 343-344. Bureau of Mines electric gasoline distillation heater and commercial device sold for same use were subjected to life tests at maximum current load. Each failed at end of approximately 500 hr. Bureau heater through deterioration of resistance wire, and commercial heater through disintegration of block of insulating material holding resistance wire. From reports of Investigations, U. S. Bureau of Mines.

PRODUCTION FROM HEAVY OIL HYDROCARBONS. Production of Motor Gasoline from Heavy Oil Hydrocarbons, Fred W. Padgett. Chem. & Metallurgical Eng., vol. 23, no. 11, Sept. 15, 1920, pp. 521-525, 3 figs. Study of possible reactions taking place in cracking pehnomena, noting particularly action of catalysts upon heating and composition and refining of pyrolytic distillates.

QUALITY. Motor Gasoline Survey of Bureau of Mines. Automotive Industries, vol. 43, no. 12, Sept. 16, 1920, pp. 575 and 583, 1 fig. Tests of samples taken in various large cities of country during latter part of July compared with similar tests made in January last. Increase in average boiling point regarded as seasonal change.

SUBSTITUTES. Alternatives to Motor Spirit. Petroleum Times, vol. 4, no. 82, July 31, 1920, pp. 131-132. Report of British Fuel Research Board.

SURVEY IN U. S. Internal-Combustion Engine Gasoline Survey, N. A. C. Smith. Jl. Soc. of Automotive Engrs., vol. 7, no. 3, Sept. 1920, pp. 300-301. Curves showing how average distillation of gasoline samples secured from principal cities in U. S. in Bur. of Mines surveys compares with Government specification.

GASOLINE ENGINES

TOLPUTT SLIDE-VALVE. The Tolputt Slide-Valve Engine. Autocar, vol. 45, no. 1297, Aug. 28, 1920, pp. 371-372, 2 figs. Cylinder block with slide valve gear, intended to take place of ordinary poppet-valve cylinders on crankcase of existing engine.

GEAR CUTTING

SHARPENING CUTTERS. Sharpening Hobs and Cutters. Carl G. Olson. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, pp. 11-13, 14 figs. Points to be considered in obtaining good results in cutting of gears.

SPUR-GEAR MACHINE. New Spur Gear Generating Machine. Machy. (Lond.), vol. 16, no. 414, Sept. 2, 1920, pp. 684-685, 4 figs. Massive puncher slotting machines, in which bed and head are cast together to insure rigidity designed and constructed by William Muir & Co., Ltd., Manchester, England.

See also Hobbing Machines.

GEARS

ELLIPTIC. The Manufacture of Elliptic Gears (Construction des engrenages elliptiques), P. Massot. Ouvrier Moderne, vol. 3, no. 1, April 1920, pp. 1-5, 4 figs. Milling method.

HORSEPOWER CHARTS. A Horsepower and Torque Chart, John S. Watts. Am. Mach., vol. 53, no. 4, July 22, 1920, p. 191, 1 fig. Chart for determining sizes of gears or pulleys required to transmit given horsepower at speed given in revolutions per minute.

Horsepower Chart for Gear Teeth, William W. Gaylord. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, pp. 62-63, 1 fig. Chart from which horsepower transmitted by gear can be read when load is known.

INTERMITTENT-MOTION. A Mutilated Gear Feed, William Gumprich. Am. Mach., vol. 53, no. 6, Aug. 5, 1920, pp. 250-252, 3 figs. Modification of Geneva stop.

INVOLUTE. The Involute Gear, Francis W. Shaw. Machy. (Lond.), vol. 16, no. 412, Aug. 19, 1920, pp. 630-632. Argument against contention of A. Fisher (see Machy. pp. 388 and 517) that Fisher gear reduces pressure.

H

HOBBING MACHINES

HOISTING

River-Flow Measurements. Measuring River Flow for Hydro-Electric Plant Operation, R. D. DeWolf. Power, vol. 52, no. 10, Sept. 7, 1920, pp. 361-363, 4 figs. Chart for estimating pond capacity, river flow, and period that given load can be carried with pond at given level.

Queenston-Chippawa Development. Electrical Features—Queenston-Chippawa Development, E. T. J. Brandon. Jl. Eng. Inst. of Canada, vol. 3, no. 9, Sept. 1920, p. 445. Vertical shaft generators of 45,000 kva. capacity operating at 12,000 volts, 25 cycles, 187½ r.p.m., with thrust bearings designed to carry load of about 100,000,000 lb.

Hydraulic Installation of the Queenston-Chippawa Development, M. V. Sauer. Jl. Eng. Inst. of Canada, vol. 3, no. 9, Sept. 1920, pp. 440-444, 5 figs. Features described are canal control gate, ice chutes, screens, removable gates, penstocks, Johnson valves, turbines, governor system, control pedestals and service units.

The Design of the Queenston-Chippawa Power Canal, T. H. Hogg. Jl. Eng. Inst. of Canada, vol. 3, no. 9, Sept. 1920, pp. 435-439, 6 figs. General description of economics and hydraulics of canal, together with details of methods of design.

The General and Economic Features of the Queenston-Chippawa Development, H. G. Acres. Jl. Eng. Inst. of Canada, vol. 3, no. 9, Sept. 1920, pp. 446-452, 9 figs. Development of plant designed with aggregate of 500,000 hp. capacity.

HYSTERESIS

Measurement of. Measurement of Hysteresis Values from High Magnetizing Forces, W. L. Cheney. Scientific Paper of Bur. of Standards, Dept. of Commerce, no. 383, June 19, 1920, pp. 281-289, 3 figs. Apparatus for measuring hysteresis by a modification of "isthmus method." Graphs showing coercive force and residual induction from successively higher maximum magnetizing forces plotted against latter as independent variable up to field of $H = 2500$ gausses.

I

IGNITION

Magneto, Advantages of. Advantages of Magneto Ignition, A. D. T. Libby. Jl. Soc. of Automotive Engrs., vol. 7, no. 3, Sept. 1920, pp. 277-287 and (discussion) pp. 287-290, 15 figs. Advantages claimed are that magneto does not depend upon battery and generator for starting and running, that with it safer starting is assured, that it gives more power with less oil and fuel, cooler and smoother running engines and cleaner spark-plugs and that it does not deteriorate rapidly with age.

INDUSTRIAL MANAGEMENT

Engineering Students, Training in. The Training of Engineering Students in Industrial Management, Bruce W. Benedict. Mech. Eng., vol. 42, no. 9, Sept. 1920, pp. 492-494, 1 fig. How University of Illinois has organized its school shops upon commercial basis. Plan is based upon recognition of fact that "engineering is primarily manager of human enterprises rather than a technician making plans for others to execute."

Fixing Responsibility. Arranging Functions to Fix Responsibility, A. Whitehead. Eng., vol. 110, nos. 2849, 2850 and 2851, Aug. 6, 13 and 20, 1920, pp. 172-174, 204-206 and 236-237. Organization of shop with a view to avoiding repetition of work by various persons and establishing definite relationships between different departments.

German Engineers and. What Engineers Are Doing in Germany, E. J. Mehren. Eng. News-Rec., vol. 85, no. 12, Sept. 16, 1920, pp. 562-565. Work on standardization and progress in industrial management.

Inspection. Inspection: The Control of Quality—I, George S. Radford. Indus. Management, vol. 60, no. 3, Sept. 1920, pp. 169-172. Relation of quality to quantity, cost and marketing.

Production Systems. How Can We Increase Production? Sidney J. Williams. Am. Mach., vol. 53, no. 6, Aug. 5, 1920, pp. 270-272. Address before Eng. Section, Nat. Safety Council.

Interdepartment Production Contest, R. R. Potter. Jl. Soc. of Automotive Engrs., vol. 7, no. 3, Sept. 1920, pp. 258-262, 4 figs. Experience at plant of Fuller & Sons Mfg. Co., Kalamazoo, Mich.

Job Analysis Aid to Production, J. D. Hackett. Iron Trade Rev., vol. 67, no. 11, Sept. 9, 1920, pp. 722-724, 1 fig. Suggested forms of job specification to bring qualifications of worker and requirements of job together.

Shipyards. Results Obtained by Applying Scientific Management in a French Ship Yard, M. Lavallée. Indus. Management, vol. 60, no. 3, Sept. 1920, pp. 240-244, 1 fig. Results obtained in application of principles of industrial management in shipyard employing 3000 men. Translated from paper presented before Société d'Encouragement pour l'Industrie Nationale.

Store Keeping. Company Stores—Do They Pay? E. E. Adams. Iron Trade Rev., vol. 67, no. 6, Aug. 5, 1920, pp. 374-377, 4 figs. Writer believes industrial stores do not aid employers in securing labor, but he adds that as buying agencies they are justified by surprising results. Paper read before Am. Drop Forge Assn.

How Do You Regulate Materials?—III, Henry H. Farquhar. Am. Mach., vol. 53, no. 4, July 22, 1920, pp. 151-152, 1 fig. Considerations in regard to issuing goods from storeroom, and classification of materials. Principles to be kept in mind in arranging inter-relationships between various officials entrusted with maintaining material control.

Putting a Store in Your Factory. Leon I. Thomas. Factory, vol. 25, no. 5, Sept. 1, 1920, pp. 687-690. Replies from 120 plants to inquiry concerning their experience with co-operative stores.

See also Interchangeable Manufacture; Taylor System; Time Study.

INDUSTRIAL RELATIONS

Adjustment of Disputes. Adjustment of Labor Disputes in Packing House Industries. Monthly Labor Rev., vol. 11, no. 1, July 1920, pp. 101-105. From seven pamphlets issued by U. S. Administration for Adjustment of Labor Questions arising in certain packing-house industries.

Australia. Development of the Labor Situation in Australia. Monthly Labor Rev., vol. 11, no. 1, July 1920, pp. 59-66. Two systems are in operation in Australia for regulation of wages, hours and general conditions of labor; "wages board" system general aim of which is prevention of disputes by regulation of wages, hours and by special board appointed for specific industry on application or petition; and "industrial arbitration court" system, under which industry does not ordinarily come under review until dispute had actually arisen. Neither operates satisfactorily.

Employers' Association. Association Lessens Labor Difficulties, Gerard Frazar. Iron Age, vol. 106, no. 11, Sept. 9, 1920, pp. 654-657, 5 figs. Industrial situation stabilized in Hartford County, Conn., by co-operative organization of 160 manufacturers.

Justice in. Industry's One Law "Be Square with Your Men," Ernest E. Bell. Iron Trade Rev., vol. 67, no. 3, July 15, 1920, pp. 169-172 and p. 177. Emphasizes that lasting success is only attained by understanding and utilizing human element in accordance with principles of justice.

Open Shop. Detroit Vindicates Open Shop, A. J. Hain. Iron Trade Rev., vol. 67, no. 9, Aug. 26, 1920, pp. 571-574. Fourth city has attained its greatest growth under policy of freedom in industrial employment relations.

Open Shop Gaining in South, Harold F. Podhaski. Iron Trade Rev., vol. 67, no. 12, Sept. 16, 1920, pp. 787-789, 2 figs. Predicts 90 per cent of industries will soon be operating under this plan. Text of open-shop platform adopted by New Orleans Board of Trade and Association of Commerce is included.

See also Shop Committees.

INFLAMMABLE MATERIALS

Liquids Storing of. A Method for Storing and Handling Inflammable Liquids (Ein neues Lagerund Förderverfahren für feuergefährliche Flüssigkeiten), Georg Urff. Automobil-Rundschau, vol. 19, no. 11-12, June 1920, pp. 113-115, 2 figs. Describes apparatus with motor-drum pump for the continuous supply of a given quantity of liquid. (Concluded.)

INSULATORS, ELECTRIC

Suspension. The Designing and Testing of Suspension Insulators. A New Type of Insulator (Sulle caratteristiche e sulle prove degl isolatori sospesi. Nuovo tipo di isolatore), P. G. Venturini. Elettrotecnica, vol. 7, no. 11, Apr. 15, 1920, pp. 174-178, 10 figs. Porcelain insulator developed by writer from technical study of characteristics of such insulators, and from results of experimental work. Insulator is manufactured by Società Ceramica Richard-Ginori.

INSULATORS, HEAT

Form vs. Heat Transfer. The Effect of Geometrical Form upon the Heat Transfer through Insulation, C. E. Rose. Ice & Refrigeration, vol. 59, no. 3, Sept. 1920, pp. 82-84, 4 figs. Analytical methods for computing insulation in three cases, (1) cork board on plain surface, (2) circular pipe insulated with cylinder of insulation, and (3) circular pipe enclosed in square of insulation.

INTERCHANGEABLE MANUFACTURE

Inspection and Testing. Inspection and Testing in Interchangeable Manufacture, Earle Buckingham. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, pp. 52-54. Principles involved in inspection of interchangeable parts and duties of inspection department.

See also Gages, Interchangeable Manufacture.

INTERNAL-COMBUSTION ENGINES

Combustion Phenomena. Combustion Phenomena in Internal-Combustion Engines (Die Verbrennungsvorgänge im Explosionsmotor), F. Wirth. Automobil-Rundschau, vol. 19, nos. 11-12 and 13-14, June and July 1920, pp. 104-108 and 126-130. Gives formulæ and methods for calculating loss of heat in engine through exhaust gases, sensible heat of exhaust gases, etc. Notes on combustion temperature and speed; suggestions for improvements of combustion engines; bibliography. (Concluded.)

Fan Brakes for Testing. Fan Brakes for Automobile, Boat and Other Small Engines (Bremsflügel für Automobil-, Boots- und andere Kleinmotoren), Fritz Müller. Motorwagen, vol. 23, no. 12, Apr. 30, 1920, pp. 193-195, 5 figs. Describes fan brakes used during war for the quick measurement of capacity of aerial motors, pointing out that smaller brakes of same type can be used advantageously for the brake testing of automobile, boat and other small engines.

Fuel-Consumption Measurement. A New Type of Fuel- and Oil-Consumption Measurement (Eine neuartige Brennstoff- und Oelverbrauchsmessung), K. Fr. Nägele. Oel- u. Gasmaschine, vol. 17, no. 7, July 1920, pp. 99-102, 8 figs. Details of the Seppeler sampling apparatus by use of which it is possible from samples to determine quickly, simply and accurately amount of fuel consumed.

German Submarines. The Motors of the German Submarines (Les moteurs des sous-marins allemands), H. Tastet and F. Bégue. Technique Moderne, vol. 12, no. 5, May 1920, pp. 204-212, 16 figs. Characteristics: Number of cylinders, 6; dimensions of cylinders, 500 mm. stroke by 450 mm. diameter; total power 1650 hp.; total length of machine, 11 meters; width, 1.074 meters; height 2,407 meters. Built by Germania-Krupp Works.

K

L

LOCOMOTIVE BOILERS

Flue-Tube Joints. Tensile Strength of Various Types of Flue-Tube Joints (Essais à la traction de joints de tuyauterie à lentille et à collerette et de joints mandrinés), M. Bonnin. Revue générale des Chemins de Fer, vol. 39, no. 6, June 1920, pp. 389-393, 6 figs. Tests conducted by Northern Ry. of France.

LOCOMOTIVES

Booster for. The Locomotive Booster. Ry. & Locomotive Eng., vol. 33, no. 9, Sept. 1920, pp. 266-267, 11 figs. Simple two-cylinder steam engine applied to tralling wheels at starting and when going up hill.

British. 2-8-9 Type Superheater Locomotive for the Ministry of Munitions. Eng., vol. 110, no. 2849, Aug. 6, 1920, pp. 176-177, 7 figs., partly on supp. plate. Dimensions; cylinder, 21-in.diameter by 25$\frac{1}{16}$ in. stroke; driving wheels, diameter, 4 ft. 6¼ in.; leading wheels, diameter, 3 ft. 1½ in.; total heating surface, 1715 sq. ft.; superheater surface, 308 sq. ft.; working pressure 135 lb. per sq. in.; length of engine, 38 ft. 9⅝ in.; weight of engine in working order, 71.4 tons.

LOCOMOTIVES

Front-End Air Leaks. How Front-End Air Leaks Can Be Prevented. Ry. Mech. Engr., vol. 94, no. 8, Aug. 1920, pp. 515-516, 5 figs. Account of tests made by Fuel Conservation Section of Railroad Administration to determine exact effect of reducing nozzles and disarranging front end to overcome effects of front-end air leaks.

Valve Gears, Young. Actuating Mechanism of the Steam Locomotive, Ry. & Locomotive Eng., vol. 33, no. 9, Sept. 1920, pp. 260-263, 5 figs. Pistontype valve invented by O. W. Young.

Water-Indicating Devices. Improved Water Indicating Devices Necessary. Ry. Age, vol. 69, no. 9, Aug. 27, 1920, pp. 359-362, 4 figs. Account of recent government tests. It was found that gage cocks screwed directly in boiler do not correctly indicate general water level. Water column that is able to afford safest and most practical method for accurately indicating general water level in boiler under all conditions of service is worked out.

Urgent Need of Improved Water Gage Appliance. Ry. & Locomotive Eng., vol. 33, no. 9, Sept. 1920, pp. 272-278, 11 figs. Tests conducted by Bur. of Locomotive Inspection, Interstate Commerce Commission.

Works. Beardmore's Locomotive Works. Engr., vol. 130, no. 3372, Aug. 13, 1920, pp. 149-150, 11 figs., partly on 2 supp. plates. Reconstruction for locomotive manufacture of works building large gun mounting during war.

Worthington Feedwater Heater. Worthington Open Time Locomotive Feedwater (Réchauffeuralimentateur pour locomotives type "Ouvert," système Worthington), Génie Civil, vol. 77, no. 3, July 17, 1920, pp. 51-53, 7 figs. Heater, feeder, automatic regulator of water level and two pumps, one for cold and one hot water, operated by same steam piston, combined in one unit. Record of tests.

See also Electric Locomotives; Mine Locomotives.

M

MAGNETOS

Ignition. A Gaging Fixture for the Relation of the Cams to Keyway. Automotive Industries, vol. 43, no. 10, Sept. 2, 1920, p. 257, 1 fig. Device for measuring angular relation of breaking point on cam and keyway on shaft of ignition magnetos.

MACHINE SHOPS

College. The Loughborough Technical College. Eng., vol. 110, nos. 2850 and 2851, Aug. 13 and 20, 1920, pp. 199-202, 19 figs., partly on 2 supp. plates, and 232-236, 12 figs. Instrutional factory organized throughout as far as possible as commercial firm.

MACHINE-TOOLS INDUSTRY

Automobile Factories. Labour-Saving Devices in a Motor Car Works. Eng., vol. 130, no. 2273, Aug. 20, 1920, pp. 132-133 and p. 136, 9 figs. Machine tools at works of Vulcan Motor and Engineering Co., Ltd., Crossens, Southport, England.

British. The British Machine Tool Industry. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, pp. 23-24. Industry is rapidly reaching more normal conditions although it is not quite up to pre-war standards. New developments are being constantly introduced. Concentration on minimum of varieties is being substituted for pre-war tendencies on part of many firms to undertake any type of tool for which inquiry was received.

German. The German Machine Tool Industry. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, p. 21. Output since 1914 has increased considerably, and export of twist drills and other metal-working tools as well as of precision measuring instruments assumed large proportions during past year.

International Exposition. The Machine Tool and Engineering Exhibition. Eng. Production, vol. 1, no. 9, Sept. 1920, pp. 324-354, 58 figs. Models exhibited.

The Second International Machine Tool and Engineering Exhibition. Machy. (Lond.), vol. 16, nos. 413 and 414, Aug. 26 and Sept. 2, 1920, pp. 655-661 and 687-694, 12 figs. Review of exhibits, including Smith & Coventry spiral-bevel-gear planer; Archdale automatic manufacturing milling machine; Herbert 4-ft. radial drilling machine; Asquith universal portable radial drilling machine.

MACHINERIES

Foundations. New Process of Fixing a Machine on Its Concrete Foundation (Un nouveau procédé de fixation sur les maçonneries), Ouvrier Moderne, vol. 3, no. 1, April, 1920, pp. 18-20, 11 figs. Bolt with cylindrical elements which press against sides of hole in masonry as nut fastening the machine is driven on bolt.

Properties. Variables Bias Malleable Tests, H. A. Schwartz. Iron Trade Rev., vol. 67, no. 6, Aug. 5, 1920, pp. 371-373, 5 figs. Relation between tensile strength and percentage of elongation and diameter of rough and machined specimens is shown in graphically expressed data. Paper read before Am. Soc. for Testing Materials.

MANAGEMENT

Statistics Value of. Commercial Statistics and Their Value to the Executive, G. P. Baldwin. Gen. Elec. Rev., vol. 23, no. 8, Aug. 1920, pp. 648-652, 7 figs. Graphical methods are suggested for preparing statistics for number or orders taken, amount of sales made, and expense incurred by sales office.

MARINE ENGINES

See Diesel Engines.

MARINE STEAM TURBINES

Reproduction-Geared. Geared Turbines with Double Reduction Gear. Eng., vol. 110, no. 2850, Aug. 13, 1920, pp. 211-212 and p. 214, 9 figs., partly on 2 suppl. plates. Turbines are designed to develop aggregate of 3000 hp. Three are ahead turbines arranged in series and two astern turbines fitted, respectively, within low-pressure and intermediate pressure casings. High-pressure and intermediate turbines both gear with one wheel. Low-pressure gears with second wheel on opposite side of propeller shaft. Installation was constructed by the Parsons Marine Steam Turbine Co., Ltd., for S. S. "Corrientes."

Vibration in. Vibration in Ship Turbines (Schwingungen bei Schiffsturbinen), Ingenieure, vol. 64, no. 31, July 31, 1920, pp. 603-605, 4 figs. Frequent turbine disturbances which occurred on a torpedo boat could only be attributed to vibrations of the turbine rotor. Investigation by means of pallographs could not be completed. Opinions of several authorities in regard to case are recorded.

See also Reduction Gears.

MATERIALS

Properties at High Temperatures. The Effect of Temperature on Some of the Properties of Materials, F. C. Lea. Eng., vol. 110, no. 2852, Aug. 27, 1920, pp. 293-298, 31 figs. Results of experiments with aluminum alloys, alloy steels, and concrete cylinders. It was found, for example, for mild steel that maximum strength is passed at 235 deg. cent. At temperatures beyond 300 deg. cent. strength diminished very rapidly and at temperatures from 615 to 640 deg. cent. breaking strength was less than 7 tons per sq. in. Paper read before Eng. Section, British Assn. for Advancement of Science.

Repeated-Stress Safety Factors. Repeated-Stress Safety Factors Quickly Determined, J. B. Kommers. Eng. News-Rec., vol. 85, no. 9, Aug. 26, 1920, pp 393-394. Table of factors based on unit stress and on repetition. Goodman' diagram and recent test date used.

Strength and Suitability. The Strength and Suitability of Engineering Materials C. F. Jenkin. Engr., vol. 130, no. 3374, Aug. 27, 1920, pp. 200-201. Presidential address to Eng. Section, British Assn. for Advancement of Science.

METALLOGRAPHY

Non-Ferrous Castings. Metallography in the Detection of a Substituted Test Coupon, D. J. McAdam, Jr., and Gilbert E. Doan. Jl. Am. Soc. Naval Engrs., vol. 32, no. 3, Aug. 1920, pp. 481-487, 13 figs. Experience in application of matallography to inspection of non-ferrous castings. It was desired to determine history of castings by metallographic analysis.

METRIC SYSTEM

Argument against Adoption in U. S. Report of the Cleveland Chamber of Commerce on the Metric System. Am. Mach., vol. 53, no. 6, Aug. 5, 1920, pp. 283-287, 1 fig. Committee "is not able to believe that the adoption of the metric system will promote....standards and interchangeability."

Why the Westinghouse Company Does Not Use the Metric System. Machy. (N. Y.), vol. 27, no. 1, Sept. 1920, pp. 22. Metric measurements are claimed to complicate shop work because they cannot, as English, be halved and quartered without introducing complicating fractions.

MILLING MACHINES

Crankshaft. Stamets Crankshaft Milling Machine, Ethan Vial. Am. Mach., vol. 53, no. 6, Aug. 5, 1920, pp. 245-248, 7 figs. Construction and operation of machines for quantity milling of odd-shaped crankshaft.

Parkinson. Recent Machine Tool Developments—XV, Joseph Horner. Eng., vol. 110, no. 2852, Aug. 27, 1920, pp. 268-270, 9 figs. Parkinson universal milling machines. (Continuation of serial.)

MINE HAULAGE

Acceleration, Measurement of. Measurement of Acceleration of Haulage Plants (Zur Messung der Beschleunigung auf Förderanlagen), E. Jahnke and C. Keinath. Dingler's polytechnisches Jl., vol. 305, no. 11, May 29, 1920, pp. 119-125, 16 figs. Results of experiments carried out in haulage plants of a number of mines with a described registering acceleration meter constructed by Siemens & Halske.

MINING

NATURAL GAS

Gasoline Content. Factors in Determining the Gasoline Content in Natural Gas by the Absorption Method, D. B. Dow. Reports of Investigations, Bur. of Mines, serial no. 2157, Aug. 1920, 9 pp., 4 figs. Factors which should be considered in making absorption tests using "mineral seal oil" as absorbent.

NAVIGATION

Shoal-Water Warning. The Sperry Ship's Log, R. E. Kortepeter. Sperryscope, vol. 1, no. 12, Apr. 1920, pp. 1-4 and 15, 7 figs. Speed and distance indicating instrument that gives shoal-water warning.

See also Submarine Signals.

NICKEL ALLOYS

Copper-Nickel, Magnetic Properties. The Magnetic Properties of Nickel-Copper Alloys (Die magnetischen Eigenschaften von Nickel-Kupfer-Legierungen), R. Gans and A. Fonseca. Annalen der Physik, vol. 61, no. 8, May 4, 1920, pp. 742-752, 5 figs. In opposition to the Tammann rule, it is concluded that ferromagnetic crystals dissolved in unmagnetic crystals can form ferromagnetic alloys. Results obtained coincide with the behavior of the Co-Cu alloys with single exception that the break in the series of the mixed crystals is considerably greater in these. Report from Physical Inst. of La Plata, Argentine.

NICKEL PLATING

See Aluminum Nickel-Plating.

NON-FERROUS METALS

Researches. A Study of Researches into Metallic Alloys, C. T. Heycock. Chem. Age (Lond.), vol. 3, no. 63, Aug. 28, 1920, pp. 229-232. Also in Nature (Lond.), vol. 106, no. 2654, Sept. 9, 1920, pp. 60-62. Presidential address in Chemical Section British Association for Advancement of Science.

NUTS

Manufacture. Making 30,000 Nuts in 9 Hours on One Machine, J. H. Moore. Can. Machy., vol. 24, no. 11, Sept. 9, 1920, pp. 243-245, 5 figs. Nut and Bolt Dept. of plant of International Harvester Co., Ltd., Hamilton, Canada.

O

OFFICES

Equipment. Getting the Office Work Done—III, Wallace Clark. Indus. Management, vol. 60, no. 3, Sept. 1920, pp. 189-194, 4 figs. Suggestions in regard to furnishing and equipping an office.

OIL ENGINES

Air Injection for. Air-Injection for High-Pressure Oil-Engines—III, J. L. Chaloner. Motorship, vol. 5, no. 9, Sept. 1920, pp. 806-810, 11 figs. Records of ratio of fuel to injection-air obtained in tests on a number of four-stroke engines of varying power.

High-Compression. The High Compression Oil Engine, J. L. Chaloner. Gas & Oil Power, vol. 15, no. 180, Sept. 2, 1920, pp. 193-198, 11 figs. Steinbecker four-stroke type.

OIL FUEL

Burning of. The Science of Burning Liquid Fuel, W. N. Best. Am. Drop Forger, vol. 6, no. 8, Aug. 1920, pp. 368-373, 7 figs. Date obtained from tests covering 33 years experience in burning of different fuels in various types of furnaces.

Kermode's Pressure-Jet System. Self-Contained Pressure-Jet Oil Fuel Plant. Eng., vol. 110, no. 2849, Aug. 6, 1920, pp. 180-181, 5 figs. Kermode's pressure-jet oil fuel system. Oil is atomized in special burner which uses neither steam nor pressure air, but to which oil is supplied under pressure. Various ships have been fitted with this type of plant.

See also Fuels, Coal vs. Oil; Liquid.

OIL INDUSTRY

Conditions in 1920. The Trend of the Oil Industry during First Half of 1920, Joseph E. Pogue. Automotive Industries, vol. 43, no. 10, Sept. 2, 1920, pp. 451-456, 4 figs. Review as to stocks, exports and production compared with conditions in 1919.

OILS

Mineral, Specific Heats. The Determination of the Specific Heat of Heavy Mineral Oils, Herbert S. Bailey and Carlton B. Edwards. Jl. Indus. & Eng. Chem., vol. 12, no. 9, Sept. 1920, pp. 891-894, 1 fig. Method is outlined which is believed to be especially adaptable to plant control work and to laboratory investigations where rapid work and fair degree of accuracy are required.

OPEN-HEARTH FURNACES

Design. Design of Open-Hearth Furnaces, A. D. Williams. Iron Age, vol. 105, no. 18 and vol. 106, no. 6, Apr. 29 and Aug. 5, 1920, pp. 1225-1226 and 319-321, 3 figs. Apr. 29. Heat-capacity curves of producer gas, various air supplies and their products of combustion, together with curves indicating calorific intensity as affected by various degrees of preheating of air, gas, and of both air and gas. Aug. 5. Waste heat boiler installations. Calculations involved and questions of setting and draft. Records of tests.

ORE BINS

See Chutes, Design.

ORE HANDLING

Automatic Unloader. Improvements in Bulk Cargo Handling. Iron Age, vol. 106, no. 7, Aug. 12, 1920, pp. 385-387, 3 figs. Fifteen-ton bucket automatic ore unloader and 100-ton car dumper for Atlantic Coast.

OXY-ACETYLENE WELDING

Accident Prevention. Hazards in Gas Welding and Cutting. Power Plant Eng., vol. 24, no. 18, Sept. 15, 1920, pp. 892-895, 4 figs. Prepared by Eng. Dept. of Nat. Safety Council.

Cast Iron. Gas Welding of Cast Iron, C. K. Bryce. Welding Engr., vol. 5, no. 8, Aug. 1920, pp. 25-27. Precautions to be taken for securing good welds. Paper read before American Welding Society.

P

PAPER

Thread, Manufacture of. Manufacture of Paper Threads, J. G. Varlot. Paper, vol. 26, no. 26, Sept. 1, 1920, pp. 15-18 and p. 29, 5 figs. Machines developed in Europe, principally Germany. Translated from La Papeterie.

PAPER MANUFACTURE

Bleach Consumption. Curtailing Bleach Consumption by Adding Sulphur to Digested Liquor, George K. Spence. Paper, vol. 26, no. 27, Sept. 8, 1920, pp. 19-21. Tables giving results of experiments performed with and without sulphur.

PAVEMENTS

Philadelphia. Street Paving in Philadelphia. Public Works, vol. 49, no. 10, Sept. 4, 1920, pp. 208-210, 2 figs. Nearly $8,000,000 of work being executed this year on 1800 miles of streets and roads, League Island Park and Roosevelt Boulevard. Concrete delivered by auto truck service from central mixing plant.

Specifications. Paving for Cities of the Fourth Class, George M. Shepard. Bul. Affiliated Eng. Soc., Minn., vol. 5, no. 7, July 1920, pp. 17-28, 1 fig. Specifications drawn up for pavements constructed during 1919 by St. Paul, Minn., firm of consulting engineers.

PETROLEUM

Great Britain. Britain and Colonial Petroleum Resources, Henry B. Milner. Can. Min. Jl., vol. 41, no. 35, Sept. 3, 1920, pp. 716-721, 1 fig. Review of oil situation.

Ontario. Future Prospects for Oil and Gas Production in Ontario, M. U. Williams. Can. Chem. Jl., vol. 4, no. 7, Sept. 1920, pp. 246-248. Extent to which various geological formations have been searched for oil and results obtained. Paper read before Can. Min. Inst.

See also Oils, Mineral.

PHOTOGRAPHY

Color. The Prospects for Color Photography (Die Aussichten der Farbenphotographie), Felix Formstecher. Deutsche Optische Wochenschrift, nos. 15-16 and 19-20, Apr. 15 and May 11, 1920, pp. 131-132 and 162-165. Deals with color photographs in which the color values are positively established by the process of production, from the so-called photographs in natural colors.

PIERS

New York City. $50,000,000 Pier Improvement Will Give New York 18 Modern Piers. Mar. News, vol. 7, no. 4, Sept. 1920, pp. 112-114, 2 figs. Plans approved by Sinking Fund Commission. Plans provide for building of 18 piers from 950 to 1025 ft. in length along North River between Vesey and Perry streets, replacing 32 erected in 1871. Work is expected to be started in spring of 1921.

PILE DRIVERS

Steam Hammers. A New Method of Driving Piles. Public Works, vol. 49, no. 6, Aug. 1, 1920, pp. 136-138, 3 figs. Account of driving reinforced-concrete piles 44 ft. long and 16 in. square by doubleacting no. O "Union" steam hammer making 110 strokes per minute and operated by three-drum, three-spool 60-hp. Lidgerwood steam hoisting engine on platform of special steel tower.

R

RAILWAY SHOPS

HYDRAULIC PRESSWORK. Norfolk & Western Railroad Shop Kinks. Ry. & Locomotive Eng., vol. 33, no. 9, Sept. 1920, pp. 256-257, 5 figs. Method of rolling cooper bushing in hydraulic press.

RAILWAY SIGNALING

INTERLOCKING MACHINES. A Unique Crossing Gate Arrangement, Paul F. Bunker. Ry. Signal Engr., vol. 13, no. 9, Sept. 1920, p. 363, 1 fig. Apparatus and circuits for gate control from electro-pneumatic interlocking machine.

Electro-Mechanical Interlocking at Sunbury, Pa., John Moore. Ry. Signal Engr., vol. 13, no. 9, Sept. 1920, pp. 371-373, 3 figs. A. c. power is used for electric functions except signal control relays and locks on machine.

OVERLAP vs. A. P. B. Overlap vs. A. P. B. Signaling Single Track. Ry. Age, vol. 69, no. 11, Sept. 10, 1920, pp. 439-441. Comparative merits from operating standpoint. Opinions expressed by signal engineers at meeting of St. Louis Sectional Committee of Signal Division, Am. R. R. Assn.

SYSTEMS. What Scheme of Signaling Is Most Desirable? Ry. Signal Engr., vol. 13, no. 9, Sept. 1920, pp. 356-359, 3 figs. Comparative value of schemes. Abstracts of papers presented at meeting of St. Louis Sectional Committee of Am. Railroad Assn. Titles discussed were: Absolute Permissive Block Signaling, A. R. Fugina, Straight Automatic Blocking on the U. P. System, A. H. McKeen, and S. P. Single Track Signaling ,E. E. Worthing.

RAILWAY TRACK

TIE PLATES. Principles to Be Followed in Tie Plate Design, Howard H. George. Elec. Ry. Jl., vol. 56, no. 8, Aug. 21, 1920, pp. 359-361, 2 figs. Specifications for steel tie plates. Results of tests carried out by New York Central Railroad.

TRANSITION CURVES. New Transition Curve Based upon the Lemniscate, J. E. Williams. Eng. News-Rec., vol. 85, no. 9, Aug. 26, 1920, pp. 406-407, 3 figs. Method of locating points of curve.

The True Transition Curve for Railway Problems, George Paaswell. Eng. News-Rec., vol. 85, no. 9, Aug. 26, 1920, pp. 407-409, 4 figs. Suggested simplification on mathematical work. Functions of true transition curve, with tables for supplying curve in practice.

RAILWAYS

BAGHDAD. The Baghdad Railway. Eng., vol. 110, no. 2849, Aug. 6, 1920, pp. 174-175 and p. 184, 8 figs. Notes on construction and equipment.

SNOW-FIGHTING EQUIPMENT. Snow Fighting Equipment, W. H. Winterrowd. Can. Ry. & Marine World, no. 271, Sept. 1920, pp. 469-475, 16 figs. Survey of types developed with special reference to those recently operated by Canadian Pacific Railway.

RECTIFIERS

MERCURY-VAPOR. The Mercury Vapor-Arc Rectifier in Its Present Development (Der Quecksiberdampf-Gleichrichter in seiner jetzigen Eutwicklung), H. Wintermeyer. Elektrotechnischer Anzeiger, vol. 37, nos. 98 and 99, June 19 and 23, 1920, pp. 443-444 and 449, 6 figs. Describes theoretical basic principles of these rectifiers and gives constructional details of latest standard models of Brown, Boveri & Co. and Gen. Elec. Co.

REDUCTION GEARS

DESIGN. Reduction Gears for Marine Turbines (Réducteurs de vitesse à engrenages pour turbines marines), M. Vasset. Bulletin technique du Bureau Veritas, vol. 2, nos. 7 and 8, July and Aug., 1920, pp. 134-138 and 161-164, 11 figs. Technical notes on helicoidal gears. Materials employed in construction of gears.

RELFECTORS

PARABOLIC. The Electrolytic Manufacture of Parabolic Reflectors, Samuel Wein. Brass World, vol. 16, no. 8, Aug. 1920, pp. 218-220. Summary of patents and recent improvements in manufacturing process.

REFRACTORIES

PHYSICAL PROPERTIES. Physical Characteristics of Specialized Refractories, M. L. Hartmann, A. P. Sullivan and D. E. Allen. Thirty-eighth General Meeting of Am. Electrochemical Soc., Sept. 30 to Oct. 2, 1920, paper no. 1, pp. 1-15, 10 figs. Tests of electrical resistivities of nine commercially used refractory materials at temperatures up to 1500 deg. cent. Measurements were taken while heating up slowly and while cooling down slowly, thermocouple measuring temperature being outside specimens.

RESERVOIRS

WATER LEVEL, MEASUREMENT OF. The Pneumercator. Elec. Times, vol. 58, no. 1504, Aug. 12, 1920, pp. 128-129, 3 figs. Apparatus for measuring height of water in reservoirs. Also applicable to any other liquid. Device is used in U. S. Navy for oil-tank readings.

RESEARCH

COAL. Research upon the Chemistry of Coal and Combustion, William A. Bone. Combustion, vol. 3, no. 3, Sept. 1920, pp. 24-25. Urges establishment of national policy with regard to research upon chemistry of coal and combustion and points out how such policy could be carried out in best interests both of progress in science and economic development of coal fields.

Researches on Coal and Gases Obtained by Its Distillation (Recherches sur la houille et les gaz provenant de la distillation), Leo Vignon. Annales de Chimie, vol. 13, no. 9, May-June, 1920, pp. 284-301. Studies comprise (1) coal solvent, (2) composition of gases obtained by distillation of coal at different temperatures, (3) influence of composition of coal on proportions of carbon oxide and carbonic acid present in coal gas, and (4) elimination of carbon oxide from coal gas.

CONCRETE. Recent Advances in Concrete Practice. Ry. Maintenance Engr., vol. 16, no. 9, Sept. 1920, pp. 334-336. Summary of work undertaken at Structural Malts. Research Laboratory established in 1914 at Lewis Inst., Chicago.

EXPLOSIVES. The Research Department, Woolwich, Robert Robertson. Nature (Lond.), vol. 105, no. 2649, Aug. 5, 1920, pp. 710-712, 3 figs. Work done with regard to explosives, particularly TNT. (To be continued.)

GLASS INDUSTRY. Putting the Glass Industry on a Scientific Basis, E. Ward Tillotson. Chem. & Metallurgical Eng., vol. 23, no. 10, Sept. 8, 1920, pp. 461-465, 4 figs. Role of modern science in ancient art of glassmaking. Developments due to engineering. Refractories and raw materials. Accomplishments of chemist.

GOVERNMENT-CONDUCTED. The Economic Importance of the Scientific Work of the Government—III, Edward B. Rosa. Sci. Monthly, vol. 11, no. 3, Sept. 1920, pp. 246-253. It is argued that "government should be constructive and helpful to the people and to business wherever possible," that "government would spend less for its purchases if it sent more in standardizing products purchased and in testing deliveries systematically," and principally "that research and development work by the government develop wealth and the burdening of taxations is thereby lightened."

GREAT BRITAIN. The Excess Profits Duty and Scientific Research. Jl. Soc. Chem. Industry, vol. 39, no. 15, Aug. 16, 1920, p. 265R. Comments on clause of British Finance Bill by which contributions made for charitable, educational and scientific (research) objects are to be allowed as deductions in computing excess profits duty.

INDUSTRIAL. The Need of Research in the Industrial Field, P. F. Walker. Mech. Eng., vol. 42, no. 9, Sept. 1920, pp. 487-491. Discussion of problems which await engineer in field of industry. Emphasis is laid upon study of economics upon location of industry, pointing out unfortunate conditions which now exist in Kansas and neighboring states solely because this problem is as yet unsolved. It is said that problem is distinctly an engineering one. An abstract of report prepared by Research Committee of Mid-Continent Section of Am. Soc., Mech. Engre. is included.

INDUSTRIAL LABORATORIES. A Novel Laboratory for Industrial Research. Chem. & Metallurgical Eng., vol. 23, no. 10, Sept. 8, 1920, pp. 496-498, 3 figs. Description of research laboratory organized to study and develop new and economical problems relating to chemical and metallurgical processes and equipment, with enumeration of some problems which are being studied.

Experimental and Research Laboratory of the Hall-Scott Motor Car Company, Richard Vosbrink. Metal Trades, vol. 11, no. 9, Sept. 1920, pp. 370-372, Equipment for testing automobile engines.

LEATHER INDUSTRY. The Leather Industry. John Arthur Wilson. Chem. & Metallurgical Eng., vol. 23, no. 10, Sept. 8, 1920, pp. 457-460, 4 figs. Points out that many problems awaiting solution in such phases of leather manufacture as unhairing, deliming, bating, tanning, suffing and dyeing involve fundamental scientific principles which can best be studied through co-operation between university and tannery chemists.

METALLURGICAL. The Research Department, Woolwich—II, Robert Robertson. Nature (Lond.), vol. 105, no. 2650, Aug. 12, 1920, pp. 743-745, 3 figs. Metallurgical studies.

OIL-SHALE INDUSTRY. The Necessity for Research in the Oil-Shale Industry, Martin J. Gavin. Chem. & Metallurgical Eng., vol 23, no. 10, Sept. 8, 1920, pp. 489-495, 4 figs. Account of shale oil industry as developed in Scotland. Steam-regulated pyrolytic distillation. Quality and quantity of oil yields.

PULP AND PAPER INDUSTRY. The Future of Chemical and Engineering Research in the Pulp and Paper Industry, John Stevens, 3d. Chem. & Metallurgical Eng., vol. 23, no. 10, Sept. 8, 1920, pp. 451-453, 3 figs. Prospectus on pulp and paper research. By-product possibilities and reduction of wastes. Less liquor dilution by more efficient washing. Fuel and power costs reduced by use of vacuum drying and better designed beaters.

REFRACTORIES. Extend Facilities for Refractories Testing. Brick & Clay Rec., vol. 56, no. 12, June 1, 1920, pp. 1100-1101. It is announced that facilities of followship endowed by Refractories Manufacturers' Assn. at Mellon Inst. of Indus. Research of University of Pittsburgh are now open to individual firms and corporations not manufacturers of refractories, according to resolution adopted on April 20 by Assn.

ROLLING MILLS. The Bureau of Rolling-Mill Research, W. B. Skinkle. Proc. Engrs. Soc. Western Pa., vol. 36, no. 5, June 1920, pp. 295-328 and (discussion) pp. 329-344, 42 figs. Plans for research mill which is to be built at Carnegie Inst. of Technology by organization of steel and equipment manufacturers and engineers.

RUBBER. Future Rubber Research, Andrew H. King. Chem. & Metallurgical Eng., vol. 23, no. 10, Sept. 8, 1920, pp. 449-450. Appeal for more and improved methods of testing rubber and its products as guide to compounding. Need for study of fabric and design of products. Continuous vulcanizing and temperature control essential.

See also Colloids, Research.

ROLLING MILLS

S

SHIP DESIGN

Hull Resistance. Note on Resistance of Hull, Influence of Trim of Ship (Note sur les résistances de carène. Influence de l'assiette du navire), C. H. Holst. Bulletin Technique de Bureau Veritas, vol. 2, no. 8, Aug. 1920, pp. 157-161, 7 figs. Technical study. Graphs indicating normal resistances.

SHIP PROPULSION

Efficiency. The Efficiency of Propulsion of Full-Sized Ships, C. Frodsham. Eng., vol. 110, no. 2849, Aug. 6, 1920, pp. 193-196, 10 figs. It is contented that propulsive coefficient derived synthetically from model experiments is not realized in actual ship. Values of propeller efficiency, wake factor, or hull efficiency in model and actual ships are compared. Suggestions in design of ships are formulated from study of test data obtained in trials of various ships. Paper read before Instn. Naval Architects.

SHIPS

Cargo Motorships vs. Steamships. Cargo Motorships vs. Steamships, Charles E. Lucke. Int. Mar. Eng., vol. 25, no. 9 Sept. 1920, pp. 759-763. Comparative calculations of expenses and earnings for operation of steam and motor ships. (To be concluded.)

Ice Breakers. Ice-Breakers, John Flodin. Int. Mar. Eng., vol. 25, no. 9, Sept. 1920, pp. 707-712, 5 figs. Characteristics of vessels designed expressly as ice breakers. American and European practice. Work in pack ice.

SHIPS, CONCRETE

Advantages. The Question of Concrete Ships (La question des navires en béton armé), R. Tardieu. Revue de l'Ingénieur et Index technique, vol. 27, no. 1, July 1920, pp. 25-40, 7 figs. Urges construction of concrete ships in France. Arguments are presented in proof of reliability and advantages of such ships.

Hollow-Tile Construction. New Methods for the Construction of Reinforced-Concrete Ships (Neue Wege beim Bau von Eisenbetonschiffen), Martin Mertes. Beton u. Eisen, vol. 19, nos. 6 and 9-10, Apr. 8 and June 5, 1920, pp. 64-66 and 112-113, 9 figs. Suggests new method which differs from usual one mainly in that the walls and floor of ship are built of hollow tiles made from light concrete about 26 in. long and 13 in. wide.

Oil Tanker. Concrete Tanker Built of Separetely Cast Cylinders. Eng. New-Rec., vol. 85, no. 9, Aug. 26, 1920, pp. 388-393, 17 figs. Sections of two interlocked cylinders poured upright on platform and turned horizontally to be joined together to make 2000-ton oil carrying self-propelled vessel.

SHIPYARDS

Europe. Shipbuilding in Europe, James J. Pearson, Pac. Mar. Rev., vol. 17, no. 9, Sept. 1920, pp. 107-108, 4 figs. Observations on conditions in British and continental shipyards.

Slipway Haulage Machinery. 800-Ton Electric Shipway Machinery at Southampton. Eng., vol. 110, no. 2851, Aug. 20, 1920, pp. 246 and 255, 7 figs. Slipway haulage machinery for raising vessels out of water. Single-drum design driven by reversible continuous-current motor. Cradle which travels up and down slipway is made in four positions coupled together, each portion having an independent sheave block.

SHOP COMMITTEE

Advantages of. Laying the Cards on the Table, Fred H. Colvin. Am. Mach., vol. 53, no. 12, Sept. 16, 1920, pp. 531-532, 2 figs. Advantages of shop-committee system established at plant of White Motor Co., Cleveland, Ohio.

Working in Practice. Serious Labor Problems in Cleveland, George Smart. Iron Age, vol. 106, no. 9, Aug. 26, 1920, pp. 515-517. Practical demonstration of working of shop committees.

SIPHONS

See Aqueducts, Reinforced Concrete.

SPARK PLUGS

Insulators. Methods of Measuring Resistance of Insulators at High Temperatures, F. B. Silsbee and R. K. Honaman. Aerial Age, vol. 11, no. 24, Aug. 23, 1920, pp. 806-809, 11 figs. Report on preliminary experiments made on conductivity of sparkplug insulators in order to develop satisfactory comparative method for testing various materials. Measurements were made at temperatures between 200 deg. and 900 deg. cent. and with both alternating and direct current at voltages as high as 2000 volts. Report No. 53 of Nat. Advisory Committee for Aeronautics.

Visible Ignition. A Visible Ignition Spark Plug, and Another with an Air-Cooled Central Electrode, Auto, vol. 25, no. 36, Sept. 2, 1920, p. 921, 2 figs. Leda ignition plugs. Central electrode is hollow and is fitted at top with cup-shaped terminal and massive cap containing circular window of transparent material.

SPRINGS

Helical. Application of Equations of Elasticity to the Deformations of a Helical Spring (Sur l'application des équations de l'élasticité aux deformations d'un ressort en hélice), M. Galbrun. Comptes rendus des Séances de l'Académie des Sciences, vol. 171, no. 2, July 12, 1920, pp. 91-93.

Testing Machine. Spring Scragging Machine. Eng., vol. 110, no. 2851, Aug. 20, 1920, pp. 242-244, 4 figs. System adopted for applying scragging tests to springs embodying motor-driven variable rotary oil pump on Hele-Shaw principle. Arrangement permits obtaining about 40 complete strokes of tup per minute.

SPROCKET WHEELS

Cast-Steel, Machining of. The Machining of Large Cast Steel Sprocket Wheels, H. Varley. Eng. & Indus. Management, vol. 4, no. 9, Aug. 26, 1920, pp. 260-263, 9 figs. Discusses difficulties in machining of cast steel where large production is undertaken, and explains how big output was gained in connection with important detail of Mark V tanks without employing gear-cutting machine.

STANDARDIZATION

Industrial. Engineering and Industrial Standardization. Mech. Eng., vol. 42, no. 9, Sept. 1920, pp. 544-545. Review of standardization work now in progress, both in this country and abroad, as reported by Am. Eng. Standards Committee and foreign standardizing bodies.

STANDARDS

See Screw Threads, National Screw Thread Commission.

STEAM

Flow in Pipes. Flow of Steam Through Pipes and Fittings, M. C. Stuart and M. H. Russell. Jl. Am. Soc. Naval Engrs., vol. 32, no. 3, Aug. 1920, pp. 472-480, 5 figs. Charts constructed from Carpenter formula.

STEAM HOSE

Construction. Construction of Steam Hose. Ry. Mech. Engr., vol. 94, no. 8, Aug. 1920, pp. 519-520. Experimental comparative study of relative values of seamless and plied tubes, and of simple duck and duck supplemented by braiding. Steam hose made with seamless tubes was found superior in endurance under steam pressure to hose with tubes made up of successive piles of sheeted stock. Hose with plied tubes was found to fail by splitting and separation of seam necessarily formed at surface of tube in its construction. Steam hose with fabric constructed of successive plies of frictioned duck proved superior in endurance to, and practically equal in expansion and contraction of, hose made of fewer number of plies of duck supplemented by plies of braiding.

STEAM POWER PLANTS

Shipyards. Ten-Thousand Horsepower Station for Operating Shipyard, Julius G. Berger. Power, vol. 52, no. 8, Aug. 24, 1920, pp. 284-289, 8 figs. Combined 5000-kva. turbo-alternator and 4500-hp. air-compressor plant. New plant built around old station while latter was kept in operation. Steam header 590 ft. long and main air line 2315 ft. long has butt-welded connections. Acceptance test data and performance are given.

Tests. Steam Power Plant Tests—III, H. L. Doolittle. Jl. Electricity, vol. 45, no. 4, Aug. 15, 1920, pp. 182-183, 1 fig. Charts showing results of simultaneous readings of pressures on steam and oil headers and also pressures of steam and oil at burner.

STEAM TURBINES

Balancing, Testing of. Levelling Micrometer for Testing the Balancing of Turbines. Eng., vol. 110, no. 2850, Aug. 13, 1920, p. 210, 2 figs. Designed and manufactured by Cambridge and Paul Instrument Co., Ltd., of Cambridge, London.

Operation and Adjustment. Operation and Adjustment of Turbine Machinery, Eustis H. Thompson. Power, vol. 52, nos. 8 and 10, Aug. 24 and Sept. 7, 1920, pp. 297-298, 16 figs., and 389-390, 1 fig. Troubles encountered in operation of turbine machinery are discussed, such as accumulation of coat of scale on blades, loss of balance of machine, shaft packing, etc.

See also Marine Steam Turbines.

STEEL

Arsenic in, Effect of. Effect of Arsenic in Steel, P. E. McKinney. Chem. & Metallurgical Eng., vol. 23, no. 7, Aug. 18, 1920, p. 294. Static testing disclosed that 0.3 arsenic is not injurious. It is observed, however, that arsenic is extremely hard to get rid of after it is once present in steel and that if steel used for scrap purposes after its usefulness has ceased, there is a constant automatic augmentation of arsenic content which will in time get beyond limits desired.

Cast, Macrostructure of. Studies of the Macrostructure of Cast Steel, Fred G. Allison and Martin M. Rock. Chem. & Metallurgical Eng., vol. 23, no. 9, Sept. 1, 1920, pp. 383-389, 25 figs. Procedure is outlined for development and record of macrostructure. It is observed that symmetrical arrangement of dendrites is necessary for consistent physical tests, and it is pointed out that pouring cold metal suppresses dendrites.

High-Carbon, Welding. Difficulties in Welding High-Carbon Steel, G. H. Higgens. Am. Drop Forger, vol. 6, no. 8, Aug. 1920, pp. 387-388, 3 figs. It is shown that welding high-carbon steel tends to weaken part welded. Photomicrographs are presented illustrating actual structure of spring steel and patch after operation.

Magnetic Properties. The Variations of Residual Induction and Coercive Force with Magnetizing Force, R. L. Sanford and W. L. Cheney. Scientific Papers of Bur. of Standards, Dept. of Commerce, no. 384, June 23, 1920, pp. 291-298, 6 figs. Graphs and tables giving magnetic properties of steels of various compositions.

Properties at High Temperatures. Properties of Iron and Steel at High Temperatures, A. E. White. Jl. of Am. Steel Treaters Soc., vol. 2, no. 10, Sept. 1920, pp. 521-528, 8 figs. Photomicrographs of steels of different compositions at high temperatures. Graphs of physical characteristics of various steels at high temperatures, constructed from data obtained by various experimenters, notably, H. J. French at United States Bur. of Standards.

SUPERHEATERS

Tests Nickel Plate Power Plant at Conneaut, J. S. Morris. Ry. Mech. Engr., vol. 94, no. 8, Aug 1920, pp. 537-539, 4 figs. Results of tests of superheater installation in stationary boilers.

SWITCHBOARDS

See Electrical Apparatus, Testing.

T

TAYLOR SYSTEM

Mnemonic Classification. The Mnemonic System of Classification, H. K. Hathaway. Indus. Management, vol. 60, no. 3, Sept. 1920, pp. 173-183, 13 figs. Method as used in Taylor system of management. Reason for and advantages of mnemonic classification in industry and examples showing how system is applied and used.

TELEGRAPHY

Earth-Current. Earth-Current Telegraphy, L. C. Carus-Wilson. Bul. Int. Ry. Assn., vol. 2, no. 7, July 1920, pp. 422-431, 9 figs. Methods developed by armies for communication with troops at front. From Ry. Engrs. Jl.

TERMINALS, MARINE

Bulk Cargo Handling. Bulk Cargo Handling on the Atlantic Coast. Int. Mar. Eng., vol. 25, no. 9, Sept. 1920, pp. 740-743, 3 figs. Wellman-Seaver-Morgan unloader. Leg is so mounted in walking beam that it can rotate in circle, allowing bucket to reach out in all directions. Machine can unload 97 per cent of cargo without help of shovelers.

Economical Construction and Equipment. Quays More Economical Than Piers for Comprehensive Port, F. T. Chambers. Eng. News-Rec., vol. 85, no. 12, Sept. 16, 1920, pp. 556-558, 3 figs. Urges economical construction and equipment of marine terminals and their co-ordinate economic management.

Inefficiency, Cost of. The Cost of Inefficiency at Our Terminals, Harwood Frost. Int. Mar. Eng., vol. 25, no. 9, Sept. 1920, pp. 768-769. Writer estimates an annual waste of not less than $400,000,000 at American terminals due to inefficient equipment and methods. He indicates way in which it can be eliminated.

TERMINALS, RAILWAY

Columbus, Ohio. Up-to-Date Engine Terminal Management. Ry. Rev., vol. 67, no. 10, Sept. 4, 1920, pp. 345-356, 33 figs. Description of intensive operations and facilities therefor at Pennsylvania terminal at Columbus, Ohio.

Freight, Municipal. Municipal Freight Terminals, O. W. Stiles. Ry. Rev., vol. 67, no. 7, Aug. 14, 1920, pp. 233-235. Suggestion is offered as means of making present rolling stock adequate to needs of present-day transportation requirements, that each municipality assume financial and operating responsibility for its own terminals, leaving roads with more definite transportation duty and less of business duty to perform.

TERRA COTTA

Grog Grain, Effect of Size. The Effect of the Size of Grog Grain in a Terra Cotta Body, H. E. Davis. Jl. Am. Ceramic Soc., vol. 3, no. 8, Aug. 1920, pp. 641-652, 7 figs. It is concluded from results obtained experimentally that to develop good strength, both burned and dry, grog ingredient should contain rather large amounts of fine material as coarser material cracks and thus weakens body.

TESTING MACHINES

Bending Tests. Dynamic Tests of Metals by the Vibroflectometer (Essais dynamiques des métaux par le vibroflectomètre), H. Lepage. Technique Automobile et Aérienne, vol. 2, no. 109, second quarter 1920, pp. 43-45, 4 figs. Patented machine for quantity testing.

Foundry. Testing Machines as Related to the Foundry, Thorsten Y. Olsen. Am. Mach., vol. 53, no. 12, Sept. 16, 1920, pp. 525-530, 13 figs. Survey of recent types, notably standard level type Brinell hardness-testing machines, hydraulic type Brinell hardness-testing type, automatic and autographic torsion machine, universal efficiency testing machine, Matsumura repeat-impact testing machine, and Norris slip-abrasion testing machine.

Hardness Testing. New Hardness Testing Machine has Wider Range of Action. Automotive Manufacturer, vol. 62, no. 5, Aug. 1920, pp. 20-21, 4 figs. Rockwell machine. Tests is made by forcing alloy steel point under constant pressure into work under test.

Paper Strength. New Tearing Machine Measures Strength of Paper. Paper, vol. 26, no. 26, Sept. 1, 1920, p. 11, 1 fig. Recent development by Forest Products Laboratory makes duplicate tears in several sheets at once. Operations means of a pendulum.

See also Springs, Testing Machine.

TEXTILE INDUSTRY

Machinery. The British and Foreign Textile Machinery Industry. Eng., vol. 110, no. 2850, Aug. 13, 1920, p. 209. Tables of exports of textile machinery from Great Britain from 1913 to 1920.

Electrically Deposited. Electrically Deposited Thermo-Couples. Engr., vol. 130, no. 3373, Aug. 20, 1920, p. 143, 7 figs. Number of turns of constantan wire wound upon ebonite rod and immersed in copper plating bath so that half circumferantial surface of rod was above level of liquid. Wire was then plated, thus forming sheathing of copper on each turn for approximately half its length. When junctions along one side of cylinder were heated above temperature of those on opposite side contrivance behaved as thermopile having large number of junctions in series.

THERMOELECTRICITY

Currents in Mercury. Thermoelectric Currents in Mercury (Ueber thermoelektrische Strome in Quecksilber), H. Haga and F. Zernike. Annalen der Physik, vol. 61, no. 8, May 4, 1920, pp. 753-760, 1 fig. Results of experiments, in authors' opinion, refute existence of effect sought by Benedicks, and it is therefore not necessary to alter present theory of thermoelectricity. Report from Physical Inst. of Groningen University.

TIDAL POWER

Utilization. Economical Utilization of Tidal Power (Un moyen économique d'utiliser la force des marées), G. Bigourdan. Comptes rendus des Séances de l'Académie des Sciences, vol. 171, no. 4, July 26, 1920, pp. 211-212. Idea is suggested of utilizing tidal power by means of bell into which air is compressed during flow and a suction established during ebb.

TIME STUDY

Foundries. Time Study Underlines Bonus System, H. E. Diller. Foundry, vol. 48, no. 354, Sept. 1, 1920, pp. 682-686, 5 figs. Methods used for determining standard time for different foundry operations and forms used for recording amount of each kind of stock on hand and being consumed at foundry of Saginaw Malleable Iron Co.

Power Shovel. Time Studies for a Power Shovel, Daniel J. Hauer. Eng. and Contracting, vol. 54, no. 7, Aug. 18, 1920, pp. 168-170, 2 figs. Forms used.

Rate Setting. Time and Job Analysis in Management—VI, William O. Lichtner. Indus. Management, vol. 60, no. 3, Sept. 1920, pp. 201-207, 2 figs. Possibility is pointed out of employing analyst jointly by employers and employees to secure facts in regard to industrial disputes and reaching a just decision. Reference is made to agreements worked out in garment making industry of New York City in support of this contention.

TIN PLATING

Alkaline Tin Baths. Tin Plating from Alkaline Tin Baths by the Use of Addition Agents, Frank C. Mathers and William H. Bell. Thirty-eighth General Meeting of Am. Electrochmical Soc., Sept. 30 to Oct. 2, 1920, paper no. 6, pp. 41-44. Balsam copaiba, rosin, and to lesser extent, other similar organic fatty acids or acid-containing substances were found to be successful addition agents in producing smooth, adherent deposits of tin from sodium stannite baths.

TIRES, RUBBER

TOOL-GRINDING MACHINES

Automatic. New Automatic Universal Machine for Sharpening Tools of Lathes, Planing Machines, Slotting Machines, etc. (Nouvelle machine automatique et universelle à affuter les outils de tour, raboteuses, mortoiseuses, etc.), Serge Haranger. Ouvrier Moderne, vol. 3, no. 1, April 1920, pp. 24-28, 5 figs. Description of S. H. D. machine. (Concluded.)

TOOLS

Cutting Edges of. Cutting Edges, R. E. Crompton. Eng., vol 110, no. 2852, Aug. 27, 1920, p. 292. Table indicating angles for cutting edges of tools or other cutting appliances. Paper read before Eng. Section, British Assn. for Advancement of Science.

TOWN PLANNING

Transportation and. City Building and Transportation, James Rowland Bibbins. Jl. Western Soc. Engrs., vol. 25, no. 12, Aug. 20, 1920, pp. 441-459 and (discussion), pp. 459-469, 25 figs. Technical relationships involved with reference to conditions in large American cities.

TRACTOR ENGINES

Burt Sleeve-Valve. The Burt Single Sleeve-Valve Petrol Engine. Engr., vol. 130, no. 3372, Aug. 13, 1920, pp. 154-156 and p. 158, 7 figs. Manufactured by Wallace Farm Implements, Ltd., Cardonald, Glasgow, for its "Glasgow" tractor and other agricultural appliances. Sleeve is disposed between piston and walls of cylinder barrel and projects down into interior of crank case where it is formed on one side with pair of flanges. Link engaging between flanges connects sleeve to short-throw crankshaft in such a way that as valve shaft rotates sleeves rotates backwards and forwards through small arc and at same time rises and falls vertically.

V

VENTILATION

W

WATER SOFTENING

Continuous Lime-Soda Type. Data on operation of Continuous Type Lime-Soda Ash Water Softener, R. F. Catherman and H. C. Fisher. Chem. & Metallurgical Eng., vol. 23, no. 11, Sept. 15, 1920, pp. 526-528, 5 figs. Information obtained during operation of Booth continuous water softener for a period of six months, 16 hr. per day.

WELDING

Boiler Repairs. Repairs to Boiler by Welding, Eng. & Indus. Management, vol. 4, no. 8, Aug. 19, 1920, pp. 234-235, 2 figs. Regulations enacted by Nat. Boiler & General Insurance Co., Ltd., Manchester for use and information of its inspectors and of firms insuring their machinery under company's policy. Rules refer to both electrical and gas welding.

See also Electric Welding; Electric Welding Arc; Oxy-Acetylene Welding; Steel, High-Carbon Welding.

WELFARE WORK

Technical Institute for Employees. Ford Technical Institute to Better Education of Employees. Motor Age, vol. 38, no. 10, Sept. 2, 1920, p. 26. University plans to confer degrees in mechanical, electrical and chemical engineering.

See also Hospitals, Shop.

WELLS

Percolation. The Analysis of Yield Tests Made on a Percolation Well. Eng., vol. 110, no. 2852, Aug. 27, 1920, pp. 272-273, 2 figs. Analysis of yield tests made on experimental well sunk into water bearing, decomposed and disintegrated granite soil in order to ascertain if locality was suitable for obtaining supply of water sufficient for water supply of small town in South India.

WINCHES

Electric. Efficiency in Electric-Winch Design, Sv. Fasting. Motorship, vol. 5, no. 9, Sept. 1920, pp. 812-815, 3 figs. Diagrams showing relative values of winch with standard type of dynamic breaking and winch equipped with Shepard automatic mechanical load brake.

WIRES

Elastic Limits of Copper, Bronze and Iron. Elastic Limits of Copper, Bronze and Iron Wires (Sur la limite d'élasticité des fils de cuivre, bronze et fer), Société belge des Electriciens, Bulletin mensuel, vol. 34, no. 3, July 1920, pp. 127-129. Values measured at State research laboratories at Malines, Belgium.

WOOD

Allowable Stresses. Douglas Fir as a Structural Timber. Can. Engr., vol. 39, no. 11, Sept. 9, 1920, pp. 317-318. Table of working stresses adopted by various authorities, such as Department of Railways and Canals, Canada, Am. Ry. Ry. Eng. & Maintenance-of-way Assn., etc.

Cellulose in Determination of. Some Observations on the Determination of Cellulose in Woods, S. A. Mahood. Jl. Indus. & Eng. Chem., vol. 12, no. 9, Sept. 1920, pp. 873-875. Experiments to investigate effect of size of particle on yield of cellulose. Material which passes an 80-mesh standard (Am.Soc.C.E.) sieve but is retained on 100-mesh sieve was found to be most satisfactory from standpoint of both yield and manipulation.

Distillation. Recent Developments in the Hardwood Distillation Industry and Suggestions for the Future, L. F. Hawley. Chem. & Metallurgical Eng., vol. 23, no. 10, Sept. 8, 1920, pp. 466-468, 2 figs. Work on increase and variation of yields of pyroligneous products: acetate of lime, methanol and charcoal. Cord stocks cut into 5-in. blocks. Control of retorting temperatures. Central research organization.

Moisture-Resistant Finishes. Moisture Resistant Finishes for Airplane Woods, M. E. Dunlap. Nat. Advisory Committee for Aeronautics, report no. 85, 1920, 8 pp., 2 figs. Investigations made at Forest Products Laboratory. Types tested were oil, wax, oil varnish, enamel, spirit varnish, cellulose varnish, condensation varnish, rubber coating and metal coating. Graph showing relative effectiveness of different materials and methods of treatment.

Properties. Properties of Woods at 10 Per Cent Moisture, B. C. Boulton. Aerial Age, vol. 12, no. 1, Sept. 13, 1920, pp. 11-13 and p. 30, 1 fig. Table of strength properties of woods reduced to standard moisture of 15 per cent prepared by Forest Products Laboratory for use of aeroplane designers in Navy, is reduced to bases of 10 per cent moisture content. (To be concluded.)

Testing Laboratory, Canada. Wood Testing Laboratory Does Good Work, L. N. Seaman. Contract Rec., vol. 34, no. 36, Sept. 8, 1920, pp. 848-849. 1 fig. Organization and scope of work of Forest Products Laboratories of Canada.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTAT PRINTS

Photostat copies may be obtained of any of the articles noted in this section.

Price of each print, up to 11 x 14 in. in size, 25 cents, plus postage. A separate print is required for each page of the larger size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N. Y.

A

AERIAL PHOTOGRAPHY

STEEL TUBING. Report of Test on Steel Tubing and Wing Beams Taken from the Fokker D-VII. Air Service Information Circular, vol. 2, no. 104, Aug. 10, 1920, 4 pp., 6 figs.

AIRSHIPS

GERMAN. German Airships. Jl. Soc. Automotive Engrs., vol. 7, no. 4, Oct. 1920, pp. 347-348, 2 figs. Data regarding L 70 class dirigible; maximum diameter, 79 ft.; length, 745 ft.; cubic contents, 242,000 cu. ft.; useful load, 57½ tons; maximum speed 83¾ m.p.h.; maximum weight of gasoline carried, 44 tons.

RIGID. The Effect of Distortion on the Bending Stresses in a Rigid Airship, E. H. Lewitt. Aeronautics, vol. 19, no. 360, Sept. 9, 1920, pp. 196-198, 5 figs. Derivation of formulæ, and results of experiments.

Vickers Rigid Airship R. 80. Aeronautics, vol. 19, no. 363, Sept. 30, 1920, pp. 243-245, 2 figs. Designed for use for long patrol cruises over sea and particularly to obtain greatest endurance and speed possible. Capacity is only 1,250,000 cu. ft., but airship is said to give performance in speed and endurance equal to that of R. 33 and R. 34. Dimensions: Overall length, 530 ft.; diameter, 70 ft.; height, 85 ft.; engines, four of Wolseley-Maybach type of 230 b.hp.

SCHUTTE-LANZ. New Schutte-Lanz Construction. Aviation, vol. 9, no. 5, Oct. 1, 1920, p. 165. Airship has capacity of 2,048,360 cu. ft., overall length of 650 ft. 8 in. and maximum diameter of 75 ft. 6 in. It is provided with five 240-hp. Maybach motors which give it maximum speed of 62 m.p.h. Carrying capacity is 37.5 tons.

ALCOHOL

INDUSTRIAL. Industrial Alcohol, Burnell R. Tunison. Jl. Franklin Inst., vol. 190, no. 3, Sept. 1920, pp. 373-420, 24 figs. Notes on manufacture of alcohol for industrial purposes. Nature and scope of alcohol industry and vast number of other industries in which industrial alcohol is a necessity are pointed out, and favorable legislation concerning industrial alcohol and stimulation of those industries which have not yet attained their proper expansion in United States.

RECOVERY FROM COKE OVEN GAS. The Recovery of Industrial Alcohol from Coke Oven Gases. Gas World, vol. 73, no. 1885, Sept. 4, 1920, pp. 13-16, 1 fig. Bury & Ollander process for recovery of ethylene and its homologues from gases of distillation by use of sulphuric acid and subsequently to convert acid sulphates into industrial alcohol. Report of Fuel Economy Committee of British Assn. for Advancement of Science.

See also Automobile Fuels, Alcohol.

ALLOYS

MAGNESIUM. New Magnesium Alloy Shows Much Promise. Automotive Manufacturer, vol. 42, no. 6, Sept. 1920, pp. 33 and 35. Alloy, called Dow metal, brought out by Dow Chemical Co., Midland, Mich. It is said to contain over 90 per cent of metallic magnesium and to have specific garvity of 1.97 and tensile strength of 22,000 to 25,000 lb. per sq. in.

METALLOGRAPHY. Micrographic Similarities Among Carbon Steels, Brasses, Copper, Bronzes and Aluminum Bronzes (Similitudes d'aspect micrographique existant aux divers états, entre les alliages fer-carbone (aciers), cuivre-étain (bronzes d'étain), cuivre-zinc (laitons) et cuivre-aluminium (bronzes d'aluminium), A. Portevin. Comptes rendus des Séances de l'Académie des Sciences, vol. 171, no. 6, Aug. 9, 1920, pp. 350-353, 3 figs. Experimental observations. Photomicrographs.

See also Aluminum Alloys.

PROGRESS DURING WAR. Improvements in Alloys and Metal Treatment (Ueber Fortschritte auf dem Gebiet der Legierungskunde und Metallverarbeitung) E. H. Schulz. Metall u. Erz, vol. 17, nos. 10 and 11, May 22 and June 8, 1920, pp. 229-233 and 251-256. Brief review of progress during war in investigation of constitution and recommendations of new alloys, production smelting and annealing), treatment by swaging and annealing, and investigation of properties.

ALUMINUM ALLOYS

ALUMINUM-COPPER. Foundry Methods for Light Aluminum: Copper Alloys, Robert J. Anderson. Chem. & Metallurgical Eng., vol. 23, no. 15, Oct. 13, 1920, pp. 735-737. Statement of melting and alloying practice in vogue in America for production of no. 12 alloy, and discussion of apparent advantages and disadvantages in use of copper or various copper-rich hardeners.

Manufacture of Rich Copper: Aluminum Alloys or Hardeners, Robert J. Anderson. Chem. & Metallurgical Eng., vol. 23, no. 13, Sept. 29, 1920, pp. 617-621, 5 figs. Describes methods in use in aluminum foundries of United States for manufacturing rich alloys of copper and aluminum, and details of experiments carried out for purpose of comparing different methods.

BRONZES. Self Annealing in Aluminum Bronze, Austin B. Wilson. Foundry, vol. 48, no. 19, Oct. 1, 1920, pp. 776-778, 9 figs. Results of tests of self-annealed aluminum bronze.

HARDNESS OF. Hardness of Certain Aluminum Alloys, R. E. Search. Metal Industry (N. Y.), vol. 18, no. 9, Sept. 1920, pp. 403-405, 6 figs. Compilation of investigations of M. M. Leon Guillet, Jean Durand and Jean Galibourg, from Revue de Metallurgie. (To be concluded.)

AMMONIA COMPRESSORS

ENGLISH. Some Profitable Reflections or the Intending Purchaser of Ammonia Refrigerating Plant, Leuig Chew. Cold Storage & Ice Assn., vol. 16, no. 2, 1920, pp. 35-58 and (discussion), pp. 59-68, 6 figs., on 5 supp. plates. Improvements in design and construction of ammonia compressors which are outcome of reecnt experimental work and comparative tests carried out by H. J. West & Co., England, and other manufacturers.

APPRAISAL

VALUATION and. Appraisal and Valuation of Properties. Mech. Eng., vol. 42, no. 10, Oct. 1920, pp. 549-561 and p. 597. Symposium at St. Louis meeting of Am. Soc. Mech. Engrs. Papers given are: Rational Valuation—A Comparative Study, James Rowland Bibbins; Price Levels in Relation to Value, Cecil F. Elmes; The Cost of Organizing and Financing a Public-Utility Project, F. B. H. Paine; The Construction Period, H. C. Anderson.

SYSTEMS OF INSTRUCTION. Programs of Apprenticeship and Special Training in Representative Corporations, J. V. L. Morris. Am. Mach., vol. 53, nos. 13, 15 and 17, Sept. 23, Oct. 7 and Oct. 21, 1920, pp. 565-568, 657-559 and 765-766, 15 figs. Sept. 23: System in use in Schenectady plant of General Electric Co'y. Oct. 7: System in use in plant of R. Hoe & Co., New York. Oct. 21: System of instruction given to trades apprentices and machine specialists by Mergenthaler Linotype Co., Brooklyn, N.Y.

ALCOHOL. Alcohol Fuel Patents. Motor Traction, vol. 31, no. 813, Sept. 27, 1920, pp. 310-311, 3 figs. Legal considerations affecting their validity.

ALCOHOL-BENZOL MIXTURES. Alcohol-Benzol Fuels are Found Satisfactory Abroad. Power Wagon, no. 191, Oct. 1920, p. 22. Higher efficiency and easier starting is claimed for such fuels by London General Omnibus Co. who have experimented with them under service conditions. Mixtures used have been 50 per cent alcohol and benzol.

AUTOMOBILES

AIR PROPELLER-OPERATED. The Air-Propeller Automobile (Das Luftschrauben-Automobil). Allgemeine Automobile-Zeitung, vol. 21, no. 33, Aug. 14, 1920, p. 23, 1 fig. Discussion of its advantages and disadvantages.

ALUMINUM PARTS. Machining Aluminum Automobile Parts. Machy. (N. Y.), vol. 27, no. 2, Oct. 1920, pp. 115-119, 9 figs. Machining operations performed in construction of Essex car built by Hudson Motor Car Co., Detroit, Mich.

CLUTCHES, MACHINING. Machining Cluth Parts on Turret Lathes. Machy. (N.Y.), vol. 27, no. 2, Oct. 1920, pp. 156-159, 11 figs. Tooling equipment used in plant of Borg & Beck Co., Chicago, Ill., for machining automobile clutches.

ITALIAN TYPES. The 35.8 H. P. 8-Cylindered Isotta-Fraschini. Auto, vol. 25, no. 38, Sept. 16, 1920, pp. 962-965, 10 figs. Italian type. (To be continued.)

SPECIFICATIONS. British Standard Dimensions for Body Spaces and Frame Ends for Chassis for Private Automobiles. British Eng. Standards Assn., no. 100, 1920, 8 pp., 4 figs. Specifications approved in March 1920.

WHEELS. Indestructible Pressed Steel Double Disc Wheels. Automotive Manufacturer, vol. 42, no. 6, Sept. 1920, pp. 30-31, 1 fig. Built on triangle principle and equipped with Firestone demountable rim.

See also Garages; Tires, Rubber.

AVIATORS

PHYSIOLOGY OF. Physiological Effects of Insufficient Oxygen Supply, J. Barcroft. Nature (Lond.), vol. 106, no. 2656, Sept. 23, 1920, pp. 125-129. From presidential address delivered at Physiology Section, British Assn. for Advancement of Science.

B

BALLOON FABRICS

FIREPROOFING. The Fireproofing of Sacking, Tent Linen and Balloon Material (Die Imprägnierung von Sackstoffen, Zeltleinen und Ballonstoffen gegen Feuer), W. Hacker. Feuerwehrtechnische Zeitschrift, vol. 8, nos. 13-14, July 5-20, 1920, pp. 109-112. Of all the media for rendering textiles fireproof, ammonia sulphate and ammonium phosphate are said to be the most expedient. Description of various foreign and domestic patents.

BEAMS

CALCULATION OF SIZE. Short Cut to Accurate Calculations, E. I. Freese. Am. Architect, vol. 118, no. 2336, Sept. 29, 1920, pp. 416-418, 2 figs. Tables for calculating sizes of timber beams and steel firders.

REINFORCED-CONCRETE. Control Cement Content by Field Beam Tests. Marshall G. Findley. Eng. News-Rec., vol. 85, no. 15, Oct. 7, 1920, pp. 703-704, 2 figs. Machine devised on New Orleans inner harbor canal, which measures breaking load of large concrete beams.

BEARINGS

EXPANDING OF. Expanding Bronze Bearings, C. M. Cross. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 452-453, 1 fig. Method for expanding loose armature bearings of electric motors.

SELF-LUBRICATING BUSHINGS. New Bearing Material Announced after 6 Years' Tests, Charles H. Fish. Belting & Transmission, vol. 17, no. 7, Oct. 5, 1920, pp. 37-38. Description of cellugraph, a self-lubricant bushing made of hard wood impregnated by long and carefully followed chemical treatment, which is said to form basis of practically inexhaustible supply of lubricant.

BEARINGS, BALL

LOAD-CARRYING CAPACITY. Load-Carrying Capacity of the Single-Row Groove-Type Ball Bearing, Arvid Palmgren. Jl. Soc. Automotive Engrs., vol. 7, no. 4, Oct. 1920, pp. 335-339, 9 figs. Methods of investigating, both theoretically and experimentally, carrying capacity of ball bearings, followed by SKF Co., Gothenburg, Sweden.

STANDARD ALLOWANCES. Ball Bearing Allowances (Kugellagerpassungen), Friedrich Weidmann. Betrieb, vol. 2, no. 13, July 1920, pp. 325-330, 4 figs. Critical discussion of the allowances heretofore employed for ball bearings and recommendations for the development of a unit system, taking into consideration the work of the German Industry Committee on Standards (NDI).

C

CASTINGS

NON-FERROUS. Heat Control in Non-ferrous Melting, John Arnot. Foundry, vol. 48, no. 19, Oct. 1, 1920, pp. 766-767. Influence exerted by temperature at pouring in quality of non-ferrous castings. British methods of measuring temperature are outlined and instruments described. Paper read before Instn. British Foundrymen.

CEMENT, PORTLAND

SPECIFICATIONS. British Standard Specification for Portland Cement. British Eng. Standards Assn., no. 12, 1920, 18 pp., 6 figs. Specifications approved on Aug. 5, 1920.

TESTS. On Long-Time Tests of Portland Cement, Hydraulic Lime, and Volcanic Ashes, I. Hiroi. Jl. College of Eng., Tokyo Imperial University, vol. 10, no. 7, June 30, 1920, pp. 155-172, 32 figs. on 10 supp. plates.

CHEMICAL INDUSTRY

DEVELOPMENTS. Recent developments in Chemical Plant and Machinery, W. B. Davidson. Chem. Trade Jl. & Chem. Engr., vol. 67, no. 1741, Oct. 2, 1920, pp 435-438. Developments in England in manufacture of sulphuric acid. developments in German chemical plant, and survey of patents and inventions.

NEW YORK EXPOSITION. Sidelights on the Chemical Exposition. Chem. and Metallurgical Eng., vol. 23, no. 14, Oct. 6, 1920, pp. 653-657, 4 figs. Notes on new developments as featured at Sixth National Exposition held in New York, September 20 to 25.

CHRONOMETERS

REGULATING MECHANISM. Regulating Mechanism of Chronometers (Sur les organes réglants des chronomètres), Jules Andrade. Comptes rendus des Séances de l'Académie des Sciences, vol. 171, no. 9, Aug 30, 1920, pp, 458-461. Proposed simplification of present system employing spiral springs.

CENTRAL STATIONS

COAL STORAGE. Effect of Coal Situation. Elec. World, vol. 76, no. 16, Oct. 16, 1920, pp. 772-775. Reports from 54 central stations show storage one-thrid normal. Prices average 176 per cent higher, economy and boiler rating are much impaired and operating difficulties are greatly increased.

FINANCING. Central-Station Financing, H. M. Addinsell. Elec. World, vol. 76, no. 15, Oct. 9, 1920, pp. 725-727. Proper ratio of debt to capitalization and of earnings to interest. From paper read before Assn. of Edison Illuminating Companies.

COAL

DISTILLATION OF. Extraction of Different Products from Distillation of Coal. Process and installations of the Société du Gaz de Paris (L'extraction des différents produits de la distillation de la houille. Procédés et installations de la Société du Gaz de Paris), A. Grebel. Génie Civil, vol. 77, no. 9, Aug. 28, 1920, pp. 165-170, 13 figs. Recuperation of naphthalene and benzol.

ECONOMIC SELECTION OF. Economic Selection of Coal, A. L. Booth. Iron and Steel Inst., Meeting, Sept. 21-22, 1920, paper no 1a, 9 pp., 16 figs. on supp. plate. Photomicrographic studies of coal and conclusions as to their suitability for various kinds of work. Only coals in commercial use in England are considered. It is determined for example, that Humic coals, which contain fair proportion of cuticle or spores, are most suitable for steam raising.

STORAGE. Bituminous Coal Storage Practice, H. H. Stoek, C. W. Hippard, W. D. Langrty. University of Illinois Bul., Eng. Experiment Station, Bul. no. 116, 157 pp., 75 figs. Data obtained from replies received from questionnaire sent to representative individuals and companies, from investigations made by writers of fires in coal piles which have occurred in various parts of the county, and from information furnished by Fuel Conservation Section of U. S. Railroad Administration.

COAL GAS

ADDING WATER GAS TO. Advantages and disadvantages of Adding Water Gas to Illuminating Gas (Avantages et inconvénients de l'adjonction du gaz à l'eau au gaz d'éclairage), H. Pfeiffer. Journal des Usines à Gaz, vol. 44, nos. 16 and 17, Aug. 20, and Sept. 5, 1920, pp. 253-255 and 266-271. Conference delivered before Union of Gas and Water Technicians of Saxony and Thuringia. From Jourrnal für Gasbeleuchtung.

FIREDAMP. Effects of Earth Pressure in Coal Mining ((Quelques effets de pressions de terrains dans les exploitations houillères), L. Morin. Bulletin et comptes rendus mensuels de la Société de l'Industrie minérale, vol. 17, no. 3, May-June 1920, pp. 229-274, 2 figs. Sudden, disengagements of firedamp are explained as resulting from mechanical actions on coal produced by great pressures it has borne in terrestrial movements, as also from pressures to which it might have been subjected in recent times. It is therefore, concluded that study of instantaneous vibrations of firedamp should be linked with examination of pressures that have existed in region. Points to consider in coal mining for preventing sudden escape of firedamp are also formulated.

See also Mine Rescue Work.

COAL MINING

CULM. Removing Boiler Ash Burned Coal and Slate from the Coal in a Culm Bank, Dever C. Ashmead. Coal Age, vol. 18, no. 16, Oct. 14, 1920, pp. 796-798, 3 figs. Problems involved in preparation of anthracite from culm banks.

STRIPPING. A Modern Coal Stripping Installation, Excavating Engr., vol. 14, no. 8, Oct. 1920, pp. 959-961, 2 figs. Description of allied Coal Co.'s installation in Ohio with special reference to operation of coal-stripping and coal-loading shovels.

See also Explosives, Safety Devices.

COAL POCKETS

DESIGN. Coal Pockets—A Construction Opportunity, W. G. Kaiser. Concrete, vol. 17, no. 4, Oct. 1920, pp. 120-122, 5 figs. Coal pockets equipped with power-driven conveyors for unloading coal from cars into bins and with gravity chutes for transferring it from bins to wagons or trucks for delivery.

COAL STORAGE

FIRES. Typical Fires in Stored Coal, W. D. Langtry. Power, vol. 52, no. 14, Oct. 5, 1920, pp. 546-547, 10 figs. From records of fires compiled by U. S. Fuel Administration for Illinois.

COMBUSTION

AIR PREHEATERS. Recuperation of Heat in Products of Combustion with Air Preheaters (Sur la récupération de chaleur sensible dans les produits de la combustion par l'emploi de l'air chaud), G. Bastien. Chaleur et Industrie, no. 5, July-Aug. 1920, pp. 297-301. Results of tests showing economical value of air preheaters.

CONCRETE

AGGREGATES, PROPORTIONING. Surface Area of Sand Determined by Volume-Moisture Relations, R. B. Young and W. D. Walcott. Eng. World, vol. 17, no. 4, Oct. 1920, pp. 243-245, 5 figs. Results of tests carried out in laboratories of Hydro-Electric Power Commission of Ontario as part of extended research being conducted there into problem of concrete proportioning.

AGGREGATES, TESTING. Making sure of the Concrete Batch. Sci. Am. vol. 123, no. 15, Oct. 9, 1920, p. 379, 1 fig. Apparatus for testing aggregates, developed at United States Bur. of Public Roads.

ALKALI SOILS, ACTION OF. Concrete in Alkali Soils and Waters, A. S. Dawson. Jl. Eng. Inst. of Canada, vol. 3, no. 10, Oct. 1920, pp. 476-493. Experimental work by Concrete Committee of Eng. Inst. of Canada. It has so far been found that in concrete of high density, where absorption of alkali ground water is mainly at surface of concrete, action is relatively slow and is largely in the nature of surface action, gradually extending to interior; presence of alkali soil solutions does not retard setting of cement; action is more rapid in weaker mixtures and mixtures of low density.

RESEARCH. Notes on Recent Developments in Concrete, H. C. Boyden. Jl. Am. Water Works Assn., vol. 7, no. 5, Sept. 1920, pp. 672-682. Research work conducted at Structural Materials Research Laboratory at Lewis Institute, Chicago.

CONCRETE BLOCKS

BRICK VS. Comparative Cost of Laying Block and Brick, A. J. R. Curtis. Concrete, vol. 17, no. 4, Oct. 1920, p. 130, 1 fig. Figures obtained in actual cases show greater economy of concrete block.

CONCRETE CONSTRUCTION

PORTABLE TRACK AND CARS FOR. Use of Portable Track and Cars in Concrete Construction, William Wren Hay. Concrete, vol. 17, no. 4, Oct. 1920, pp. 128-130, 1 fig. Table giving costs of loading and unloading materials.

CONCRETE CONSTRUCTION, REINFORCED

OFFICE BUILDDINGS. Reinforced Concrete Office Buildings for New York City. Eng. World, vol. 17, no. 4, Oct. 1920, pp. 233-235, 1 fig. Proportions for concrete used in building under construction for Western Electric Co. are generally 1: 2: 4 but in certain columns richer mixture is used. Specifications require use of 1½ in. stone.

CONCRETE, REINFORCED

FLAT-SLAB. Concrete Flat Slab Regulations. Eng. World, vol. 17, no. 4, Oct. 1920, pp. 239-240. Adopted by New York City as standard.

ROOF TRUSSES. Concrete Trusses and Cantilever Girders in Theatre. Eng. News-Rec., vol. 85, no. 13, Sept. 23, 1920, pp. 604-605, 4 figs. Roof cost reduced by substituting concrete for steel. Balcony has heavy girders and long cantilevers in theatre at Cleveland, O.

CONDENSERS, STEAM

NAVAL. Service Experience with Condensers, G. B. Allen. Shipbuilding & Shipping Rec., vol. 16, no. 14, Sept. 30, 1920, pp. 395-396; also Eng., vol. 110, no. 2856, Sept. 24, 1920, pp. 423-424, 1 fig. Analysis of causes of failure of naval condenser tubes, with suggestions as to their prevention. Paper read before Inst. of Metals.

CORROSION

IRON AND STEEL. The Influence of Copper, Manganese and Chromium and Some of their Combinations on the Corrosion of Iron and Steel, E. A. Richardson and L. T. Richardson. Gen. Meeting of Am. Electrochem, Soc., Sept. 30-Oct. 2, 1920, paper no 13, pp. 123-125, 6 figs.

CRANKCASES

MACHINING OPERATIONS. Machining Operations on a Six-Cylinder and Crankcase Block, P. M. Heldt. Automotive Industries, vol. 43, no. 15, Oct. 7, 1920, pp. 712-716, 12 figs. Practice of casting top half of crankcase integral with cylinder block, first applied in connection with four-cylinder engines, has recently been adopted for six-cylinder construction. Milling and drilling work which has to be done on block in preparation for attachment of other parts is described.

ELECTRIC GENERATORS, A. C.

Design. Factors Determining Generator Design, F. D. Newbury, R. B. Williamson and W. J. Foster. Elec. World, vol. 76, no. 16, Oct. 16, 1920, pp. 779-783, 8 figs. Principal dimensions and weights of 32,500-kwa., 12,000-volt, three-phase, 25-cycle, 150-r.p.m., Westinghouse waterwheel-driven generators installed in new 100,000 hp. extension of Niagara Falls Co.

ELECTRIC LAMPS, INCANDESCENT

Watertight Fittings. British Standard Specification for Watertight Fittings for Incandescent Electric Lamps. British Eng. Standards Assn., no. 97, 1920, 33 pp., 38 figs. Specifications approved on Aug. 5, 1920.

ELECTRIC LOCOMOTIVES

Overloads on Motor Armatures. Effect of Short-Time Overloads on Railway Motor Armatures, J. K. Stotz. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 473-474, 2 figs. Graphs showing comparative temperature rises on field coils of ventilated and non-ventilated motors having same continuous capacity.

Repair Costs. The Logical Unit for Comparing Repair Costs of Electric Locomotives and Cars, Hugh Pattison. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 475-477. Kilowatt-hour input to locomotive or car is thought to be much more correct and convenient unit than locomotive-mile or train-mile units.

See also locomotives Diesel-Electric.

ELECTRIC MOTORS

Installation. Lining up a Motor for Shafting or Machine Drive, K. A. Reed. Power, vol. 52, no. 12, Sept. 21, 1920, pp. 459-461, 4 figs. How to install motor on ceiling, wall or floor and line it up to shafting is explained and methods of handling motor during installation are given.

ELECTRIC MOTORS, A. C.

Induction. Induction Motor Core Losses, P. L. Alger and R. Eksergian. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 10, Oct. 1920, pp. 906-920, 17 figs.

Reconnecting Two-Phase Induction Motors, A. C. Roe. Elec. World, vol. 76, no. 14, Oct. 2, 1920, pp. 683-684, 30 figs., on supp. plate. Tables and winding diagrams giving information necessary for connecting two-pole to twelve-pole motors.

ELECTRIC MOTORS, D. C.

Mine Installations. Treatment of Direct-Current Motorsf or Mining Conditions, T. H. Arnold. Power, vol. 52, no. 15, Oct. 12, 1920, pp. 582-583, 2 figs. Advises dipping and baking armatures in field coils systematically. Dipping and baking process in described.

ELECTRIC PLANTS

Load Factor. The Measurement of Maximum Demand and the Determination of Load Factor, Perry A. Borden. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 10, Oct. 1920, pp. 875-887, 14 figs. Determination of load factor with a view to rate making. Survey of present situation. Comparison of performance of a number of demand-measuring devices.

ELECTRIC RAILWAYS

Braking, Regenerative. Electric Braking of Direct-Current Vehicles, W. M. Hutchinson. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 471-473, 5 figs. Fundamental principles involved.

Multiple-Unit Train Operation, S. B. Schenck. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 457-460, 6 figs. Types of multiple-unit controls.

Operation. The Scientific Arrangement of Schedules, Edward Dana. Elec. Ry. Jl., vol. 56, no. 14, Oct. 2, 1920, pp. 647-651, 7 figs. Close relation of efficient schedules to economical operation. Eight-hour-day problem as worked out on Boston Elevated Railway.

Protection of Electrical Equipments. Methods of Protecting Electrical Equipments, Lynn G. Riley. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 453-456, 12 figs. Methods of protecting electricl equipments on cars and locomotives.

ELECTRIC SWITCHES

Oil. Oil Circuit Breaker Arrangements and Switching Schemes for Steel Mills, G. P. Wilson. Elec. Jl.,, vol. 17, no. 9, Sept. 1920, pp. 402-410, 15 figs. Schematic diagram of power plants and mill equipment located in five separate mills of one large company.

Oil Switches for Large Electrical Supply Systems, Eng., vol. 130, no. 3375, Sept. 3, 1920, pp. 220-222, 9 figs. Critical study of present designs.

The Phenomena of Switching in Oil and the Possibilities of Standardizing the Apparatus, P. Charpentier. Elecn., vol. 84, no. 2196, June 18, 1920, pp. 668-670. Paper read before Union des Syndicats de l'Electricité. This organization is about to draw up standard rules for oil switching apparatus. Lines along which standards are practicable are discussed in article. Translated from Revue Electrique.

ELECTRIC TRANSMISSION

Long-Distance, Power Required. The Power Required for Long Distance Transmission. Radio Rev., vol. 1, no. 12, Sept. 1920, pp. 598-608, 8 figs. Formulæ and graphs. Distances considered are 1000, 2000, 3000, 5000 and 10,000 km.

ELECTRIC TRANSMISSION LINES

Automatic Protective Devices. Automatic Protective Devices for Alternating-Current Systems, A. E. McColl. Jl. Instn. Elec. Engrs., vol. 58, no. 293, July 1920, pp. 525-543 and (discussion) pp. 543-554, 40 figs. Survey of recent developments.

Economics of. Economic Study of Secondary Distribution, P. O. Reyneau and Howard P. Seelye. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 10, Oct. 1920, pp. 861-874, 13 figs. Problems taken up are (1) new lines in thinly populated districts where load will probably build up rapidly, (2) old lines in residence districts well built up where revision is necessary to care for slowly increasing load, (3) old lines in districts with heavy, increasing load such as business districts, and (4) exceptional installations such as for permanent loads with no increase or for a decreasing load. Equations and curves are derived and constructed and their application explained.

High-Tension. Calculation of Electric Transmission Lines by Means of Vectors Representing Real Quantities (Sur le calcul des lignes électriques par l'emploi de fonctions victorielles en notations réelles), André Blondel Comptes rendus des Séances de l'Académie des Sciences, vol 171, no. 11, Sept. 13, 1920, pp. 504-509. Suggests system of computing elements of high tension electric transmission lines without introducing imaginary quantities.

Three-Phase. The Electrical Properties of Three-Phase Transmission Lines, E. Parry. English Elec. Jl., vol. 1, no. 2, April 1920, pp. 54-68, 4 figs. Compilation of tables and data for use of departmental offices in designing transmission lines.

ELECTRIC WELDING, ARC

Strength of Joint. Notes on Electric Welding, Henry S. Rawdon and O. H. Eschholz. Mech. Engr., vol. 42, no. 10, Oct. 1920, pp. 567-574, 21 figs. Electric welding of steel. Data on strength of joint and properties of arc-fused metal. Papers read before Washington Section of Am. Soc. Mech. Engrs.

ELECTRIC WELDING, RESISTANCE

Percussive Welding. Developments in Electro-Percussive Welding. Iron Age, vol. 106, no. 17, Oct. 21, 1920, pp. 1040-1041, 6 figs. Quantity production of duplicate parts. Dissimilar metals joined and cutting tools attached to low grade shanks. Paper read before American Welding Society.

ELECTRODES

See Electric Furnaces, Electrodes for.

ELECTROPLATING

See Brass, Electric Deposition of.

EMPLOYEES

Shop Magazines for. Gaging Employees' Magazine Results, John T. Bartlett. Am. Mach., vol. 53, no. 13, 1920, pp. 589-591. Writer tells of means of estimating results obtained by means of such papers, and also of means of getting results through them.

EMPLOYMENT MANAGEMENT

Interviewing Applicants. The Art of Interviewing, R. T. Fennell. Indus. Management, vol. 60, no. 4, Oct. 1920, pp. 310-311. Requirements of successful interviewing.

The Art of Interviewing Applicants, Russell J. Waldo. Indus. Management, vol. 60, no. 4, Oct. 1920, pp. 273-277, 14 figs. Procedure followed in employment department of representative firms. System of keeping records of applicants.

Methods of Hiring Men. Methods of Hiring and Training Men, Henry S. Day. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 447-451, 6 figs. Methods used by Mechanical Department of Kansas City Railways.

ENGINEERING SCHOOLS

Co-operative Course. A new Co-operative Course in Electrical Engineering, W. H. Timbie. Gen. Elec.-Rev., vol. 23, no. 9, Sept. 1920, pp. 784-790. Co-operative course given by General Electric Co. and Massachusetts Institute of Technology. Practical training is given in six thirteen-week periods during last three years of five-year course.

ENGINEERING SOCIETIES

Federated American Engineering Societies.. Am.-Soc. C. E. Arguments for and Against Federation, Eng. News-Rec., vol. 85, no. 14, Sept. 30, 1920, pp. 663-665. Membership receives presentation of opposing views prior to voting on question of joining the new organization.

ENGINEERS

Civic Activities, Italy. The National Convention of the Italian Engineers at Naples (Il convehno nazionale degli ingegneri italiani a Napoli). Associazione nazionale degli Ingegneri italiani Giornale ufficiale, vol. 1, no. 21, July 30, 1920, pp. 157-161. Summary of proceedings of National Convention of Italian Engineers held at Naples, May 20 to 25, 1920. One of topics discussed was, "Civic Activities of Engineers."

Participation in Civic Affairs. Responsibilities of Technical Men and Obligations of the People, Warren G. Harding. Chem. Eng (N. Y.), vol. 28, no. 9, Sept. 1920, pp. 309-310. Opinion is expressed by writer that "representatives of the engineering professions should sit in our state and national legislative bodies, instead of being merely the administrative agents of the great engineering projects that our intensive civilization now demands shall have greater fruition."

GARAGES

CONCRETE. Concrete Cantilever Construction in Chicago Garage, Eng. News-Rec., vol. 85, no. 13 Sept. 23, 1920, pp. 609-611, 3 figs. Single and double cantilever beams support 11-ft. span of floor and roof slab and carry 50-ft. monitor trusses.

GAS

CALORIFIC VALUE. Advantages of a Reasonable Standard of Calorific Value for City Gas—Experiences in Canada, Arthur Hewitt. Am. Gas Light Assn. Monthly, vol. 2, no. 10, Oct. 1920, pp. 595-598, 1 fig. Minimum calorific standard of 150 B.t.u. was fixed by Canadian government as temporary measure in Nov. 1919, and was to be continued for a period of four months. Results realized are said to have been "most satisfactory to all interests concerned."

GAS ENGINES

GOVERNING. Stabilized Governing, Oscar C. Roos. Sci. Am. Monthly, vol. 2, no. 2, Oct. 1920, pp. 141-144. 9 figs. "Dead beat" governor for auto-truck radio plants.

GAS MAINS

SUBMERGED. Laying Submerged Gas Mains, D. L. Hill. Gas Age, vol 46, no. 6, Sept. 25, 1920, pp. 213-215, 1 fig. Particulars of various submerged mains, notably Astoria 72-in. double line, Toronto 12-in. line, and 36-in. water main across Narrows, New York Harbor.

See also Molding Methods, Large Gas Mains.

GAS PRODUCERS

MECHANICAL. Smith Mechanical Gas Producer, Power, vol. 52, no. 15, Oct. 12, 1920, pp. 572-573, 2 figs. Type of gas producer in which fuel is distributed mechanically over bed and poking done automatically, developed by Smith Gas Engineering Co., Dayton, Ohio.

TAR RECOVERY IN. The Recovery of Fuels at Low Temperatures (Die Entstehung der Brennstoffe bei tiefen Temperaturen), H. Gwodz. Oel- u. Gasmaschine, vol. 17, no. 8, Aug. 1920, pp. 119-125, 7 figs. Details of various patented gas producers provided with tar-recovery apparatus.

GASES

DUST PRECIPITATION IN. A New Electrical Precipitation Treater, Motoji Shibusawa and Yasujiro Niwa. Jl. Am. Inst. Elec. Engrs., vol. 39, no. 10, Oct. 1920, pp. 890-903, 35 figs. Treater, as in case of modern type, consists of metal cylinder as passive electrode and metal wire suspended along center of cylinder as active electrode; only difference being that electrodes in their treater are entirely separated with dielectric substances such as glass, procelain, etc. Treater was developed as result of experience at Electrotechnical Laboratory in Tokyo, Japan, and has been recently applied to treater at Nikko Copper Refining Works. Theory of new treater is given in detail.

GASOLINE

RECOVERY FROM NATURAL GAS. *See Natural Gas, Gasoline Recovry from.*

SITUATION IN U. S. The Gasoline Situation, R. L. Welch. Jl. Soc. Automotive Engrs., vol. 7, no. 4, Oct. 1920, pp. 353-355. Statistics regarding oil production and consumption in U. S.

SUBSTITUTES FOR. New Gasoline Substitute an Alcohol Derivative. Automotive Manufacturer, vol. 42, no. 6, Sept. 1920, pp. 24 and 26. Fermogas, manufactured by Fermogas Corporation, New York. It is described as specially denatured alcohol wherein denaturizing agent is petroleum or coal tar derivative.

GASOLINE ENGINES

CENTRIFUGAL OIL CLEANER. Experimental Centrifugal Oil Cleaner Attached to Liberty Engine. Automotive Industries, vol. 43, no. 13, Sept. 23, 1920, pp. 610-611, 3 figs. Device designed and developed by Installation Branch, Power Plant Section, and constructed in shops at McCook Field.

GEARS

BEVEL. Chordal Thickness of Tooth and Corrected Pitch Depth of Bevel Gears, C. W. Mapes. Machy. (N. Y.), vol. 27, no. 2, Oct. 1920, pp. 169-170, 1 fig. Diagram showing dimensions and angles used in determining chordal thickness and corrected pitch depth of bevel gear teeth.

CALIPERS FOR. The "Sykes" Gear Tooth Caliper. Machy. (Lond.), vol. 16, no. 418, Sept. 30, 1920, pp. 8-4-805, 2 figs. Type of gear caliper that enables gear teeth to be gaged with one setting only.

HELICAL. Calculation of Helical Gears with Axes at Right Angles (Calcul des engrenages hélicoidaux à axes rectangulaires), Jean Bertrand. Vie Technique & Industrielle, vol. 1, no. 12, Sept. 1920, pp. 489-494, 8 figs. Formulæ and graphs for designing such gears.

HOBBING. Formulæ Used in Hobbing Large Prime Numbered Gears, A. Fisher. Machy. (Lond.), vol. 16, no. 415, Sept. 9, 1920, pp. 705-706. Formulæ used in calculations of change wheels for hobbing machines when cutting gears with large prime number of teeth.

INVOLUTE. Interference of Involute Spur-Gear Teeth, A. B. Cox. Am. Mach., vol. 53, no. 16, Oct. 14, 1920, pp. 707-708, 2 figs. Formula expressing relation between gear ratio, number of teeth in pinion and interference.

TESTING, MACHINE FOR. Machines for Testing Gears (Machine à essayer les engrenages). Technique Automobile et Aérienne, vol. 10, no. 110, 1920, pp. 67-69, 7 figs. Mechanism for comparing gears with untoothed discs. (Concluded.)

GRAIN ELEVATORS

PNEUMATIC. Pneumatic Elevators, William Cramp. Eng., vol. 110, no. 2853, Sept. 3, 1920, p. 330. Experiments to determine power required to lift granular material by pneumatic means. Empirical formula for vacuum in centimenters of mercury is developed in treatment of different pressures across conveying pipe and quantity of air per second moved under this pressure difference. (Abstract.) Paper read before Eng. Section, British Assn. for Advancement of Science.

GRINDING

AUTOMOBILE PARTS. Cadillac Grinding Practice, Edward K. Hammond. Machy. (N. Y.), vol. 27, no. 2, Oct. 1920, pp. 103-107, 9 figs. Description of methods employed in grinding department of plant building high-grade automobiles.

GRINDING MACHINES

NORTON. Norton 10-inch "B" Type Grinding Machine. Am. Mach., vol. 53, no. 13, Sept. 23, 1920, pp. 604f-604g, 4 figs. Tables speed has been increased to 36 ft. per minute, which is three times that of fastest speed hitherto attempted.

H

HARBOR IMPROVEMENTS

KINGSTON HARBOR. Proposed Development of Kingston Harbor, A. Langlois. Can. Engr., vol. 39, no. 15, Oct. 7, 1920, p. 408, 1 fig. Movement contemplates making Kingston the Lake Ontario terminal, for proper utilization of Welland Ship Canal.

HEAT TRANSMISSION

THIN WALLS. Heating and Ventilating Research Work—V. Domestic Eng. (Lond.), vol. 40, no. 22, Oct. 1920, pp. 149-150. Heat transmission through thin walls. From report of Building Matls. Research Committee under British Department of Scientific and Industrial Research.

HEATING

BUILDINGS, LOSSES IN. Fundamental Principles of the Calculation of Heat Losses for Buildings (Grundlagen der Wärmeverlusberechnung für Gebäude), B. Biegeleisen. Gesundheits-Ingenieur, vol. 43, no. 31, July 31, 1920, pp. 361-372, 4 figs. Writer points out that, until other and more accurate tests are available, the most expedient way of improving method of calculation is (1) through determination of faults in existing methods, and (2) through utilization of results of tests carried out since the development of Rietschel's calculations. New method is evolved for calculation of heat transmission which, it is claimed, under certain conditions, may be more accurate than the Rietschel values.

SYSTEMS. Short Cuts to Accurate Calculations, Am. Architect, vol. 118, no. 2337, Oct. 6, 1920, pp. 450-452. Chart and table for computing steam radiation.

HEATING, ELECTRIC

COOKING RANGE. British Standard Specification for Electrically Heated Cooking Range (Two Sizes), British Eng. Standards Assn., no. 106, 1920, 15 pp., 6 figs. Specifications approved on July 8, 1920.

DEVELOPMENTS IN. New Heating and Cooking Apparatus. Elecn., vol. 85, no. 2210, Sept. 24, 1920, pp. 365-371, 24 figs. Survey of developments shows that electric heating and cooking continue to progress particularly in connection with large installations for restaurants, canteens, etc. It is also noted that electric heating and cooking is becoming increasingly popular for marine work, both cargo and passenger steamers and in Navy. Equipment survey is principally of British manufacture.

HEAVY-OIL ENGINES

FUEL SELECTION. The Selection of Fuel Oil for Heavy Oil Engines, Allen F. Brewer. Gas Engine, vol. 22, no. 10, Oct. 1920, pp. 295-297. It is advised that customer should approach market in selection of fuel oil from angle of presenting operating conditions and peculiarities of his plant, rather than limiting himself to laboratory specifications.

HELICOPTERS

See Aeroplanes, Helicopters.

HOISTS

MINE. Mine Safety Experts Discuss at Milwaukee Accidents, Health and Warfare—II, R. Dawson Hall. Coal Age, vol.18, no. 16, Oct. 14, 1920. pp. 801-806. Safety devices on hoisting engines. Paper read before Nat. Safety Council.

HOSE

STEAM. Standard Specification for Steam Hose, Power, vol. 52, no. 15, Oct. 12, 1920, p. 601. Specifications adopted by Am. Soc. for Testing Matls.

HOUSES, CONCRETE

CONCRETE BLOCKS. Local Authorities and Housing, Surveyor, vol. 58, no. 1499, Oct. 8, 1920, pp. 235-236, 2 figs. Plan of constructing houses on continuous cavity system at Brighton.

HOUSING

GARDEN CITY SCHEME, LONDON. Unpopulating London, John Irwin Bright. Jl. Am. Inst. of Architects, vol. 8, no. 10, Oct. 1920, pp. 354-356, 2 figs. Housing scheme prepared by Garden Cities and Town Planning Assn., London. Instead of houses being packed together, it is proposed to create separate "Garden Cities" with population from 30,000 to 50,000, at convenient distances apart and ready for communication with center of metropolis.

LADLES

LIFTERS FOR. Fractures in Ladle Lifters (Bruche an Giesspfannengehängen), A. Pomp. Stahl u. Eisen, vol. 40, no. 34, Aug. 26, 1920, pp. 1136-1138, 3 figs. Results of investigations show that fracture of a ladle lifter is due to changes in form of material at blue heat.

LATHES

TURRET. Alfred Herbert No. 5 Automatic Turret Lathe. Am. Mach., vol. 53, no. 13, Sept. 23, 1920, pp. 600-601, 1 fig. General-purpose automatic machines representative of English practice. Comparison with American automatic turret lathes.

See also Automobiles, Clutches, Machining.

LIGHT

TRANSMISSION THROUGH ATMOSPHERE. Relative Spectral Transmission of the Atmosphere, Wnoch Karrar and E. P. T. Tyndall. Dept. of Commerce, Sci. Papers of Bur. of Standards, no. 389, July 21, 1920, pp. 377-408, 20 figs. Transmission of atmosphere was studied with a view to determining data useful for aerial photography and use of light projectors for automobile and locomotive head-lamps, for signaling and as beacons, and for searching on land, water and in the air.

LIGHTING

ARC VS. INCANDESCENT LAMPS. Comparative Cost of Lighting by Arc and by Incandescent Lamps (Coût comparatif de l'éclairage par arc et par incandescence), M. H. Dupont. Bulletin mensuel de la Société belge de l'Electriciens, vol. 34, no. 4, Aug. 1920, pp. 157-172. Total cost, including installation and maintenance, is determined to be smaller for incandescent lamps. Installations considered are principally those in industrial works.

CANDLEPOWER REQUIRED. Relation of Lighting Feeders to Watts per Square Foot, Victor Tousley. Elec. World, vol. 76, no. 14, Oct. 2, 1920, pp. 686-687. Tables showing actual demand factors in units per square foot used in different classes of business and industry.

DESIGN OF SYSTEM. Designing Direct and Indirect Illumination, M. M. Samuels and C. O. von Dannenberg. Elec. World, vol. 76, no. 15, Oct. 9, 1920, pp. 721-724, 9 figs. Practical method of determining illumination in given plane for either direct or indirect fixtures and original scheme of calculating foot-candle in one horizontal plane from values obtained in another.

FACTORY. Shop Lighting, C. W. Price. Bul. Dept. of Labor & Industry, vol. 7, no. 4, 1920, pp. 39-44. Suggested standardization.

THEATRES. Lighting the World's Largest Theatre. Elec. World, vol. 76, no. 16, Oct. 16, 1920, pp. 776-779, 9 figs. Electric fixtures used for lighting Capitol Theatre, New York City, which has seating capacity of 5300.

LOCOMOTIVE BOILERS

COPPER VS. STEEL TUBES. Locomotive Boiler Tubes: Copper vs. Steel, Gerard A. Muntz. Ry. Gaz., vol. 32, no. 26, June 25, 1920, pp. 943-944. Comparative economy in use of copper, brass and steel tubes in locomotive boilers. Further notes on discussion given in issue of June 4, Ry. Gaz.

WATER-LEVEL INDICATORS. Correct Application of Water-Level Indicators in Locomotive Boilers, A. G. Pack. Boiler Maker, vol. 20, no. 9, Sept. 1920, pp. 261-265, 5 figs. Investigations conducted by Bur. of Locomotive Inspection, Interstate Commerce Commission, to determine effect of water circulation on accuracy of indicating devices.

Government Test of Water-Indicating Devices, A. G. Pack. Ry. Mech. engr., vol. 94, nos. 9 and 10, Sept. and Oct. 1920, pp. 575-579 and 630-633, 7 figs. Sept.: Account of tests conducted by Bureau of Locomotive Inspection. Tests demonstrated unreliability of many water-indicating appliances on modern locomotives; Oct.; Report of final tests and recommendations submitted by Bureau of Locomotive Inspection.

LOCOMOTIVES

DEVELOPMENT IN U. S. The Development of the Modern Steam Locomotive in the United States, Fredk. V. Green and John D. Rogers. Jl. South African Instn. Engrs., vol. 19, no. 2, Sept. 1920, pp. 14-22 and (discussion) pp. 22-29, 2 figs.

FEEDWATER HEATERS. Locomotive Feedwater heating in Europe, Robert E. Thayer. Ry. Mech. Engr., vol. 94, no. 9, Sept. 1920, pp. 569-572, 8 figs. There are over 10,000 feedwater heaters in use on railways of Europe. These are distributed among Weir system. Caille-Potonie system and Knorr system, the latter having by far the greater distribution. Weir system is confined almost entirely to Great Britain, Caille-Potonie to France, and Knorr to Germany, Holland and Switzerland.

FREIGHT. New Mountain Type Locomotives for Fast Freight. Ry. Age, vol. 69, no. 15, Oct. 8, 1920, pp. 608-611, 7 figs. Dimensions: Tractive effort, 53,900 tons; weight of engine and tender in working order, 511,000 tons; wheel base, total, 40 ft.; total heating surface, 4121 sq. ft.; super heater heating surface, 1009 sq. ft.; working pressure, 200 lb. per sq. in.

OIL FIRING. Heavy-Oil Firing for Locomotives, L. Pierre-Guedon. Bul. Int. Ry. Assn., vol. 2, no. 8, Aug. 1920, pp. 517-527, 10 figs. Historical summary, with special reference to developments in design of locomotives for burning oil, as worked out by Paris-Lyons-Mediterranean Ry. Translated from Génie Civil.

The Scarab System of Oil Fuel Burning on Locomotives, Eng., vol. 110, no. 2853, Sept. 3, 1920, pp. 324, 3 figs. System as applied in locomotive of London and Northwestern Railway. System was introduced by Scarab Oil Burning Co., Ltd., Haymarket, England.

REBUILDING. Rebuilding Locomotives at Kilmarnock Works, Glasgow & South Western Railway, Ry. Gaz., vol. 33, no. 13, Sept. 24, 1920, pp. 396-399, 7 figs. Reconstruction work involves putting boiler 6 in. larger in diameter, and making steam reversing gear direct instead of being actuated through rocking lever and link, as formerly.

LUBRICATING OILS

CASTOR VS. MINERAL OIL. A Comparison of Qualities of Castor and Mineral Oils, Fred C. Ziesenheim. Automotive Industries, vol. 43, no. 13, Sept. 23, 1920, pp. 612-613, 1 figs. Results of tests. Superiority of castor oil over mineral oils for particular conditions of service is due primarily to its greater capillarity which results from presence of free fatty acids.

SPECIFICATIONS. Development of Oil Specifications, William F. Parish. Jl. Soc. Automotive Engrs., vol. 7, no. 4, Oct. 1920, pp. 313-315. Points to be considered in drawing up specifications, with reference to specifications for lubricating oils used by War Department.

M

MACHINE TOOLS

COUNTERWEIGHTS FOR. Machine Tool Counterweights, Fred. Horner. Machy. (N. Y.), vol 27, no. 2, Oct. 1920, pp. 108-114, 17 figs. Methods of applying counterweights to different types of machine tools for counterbalancing weights of spindles, slides and work-tables.

PARIS EXHIBITION. Machine Tools at the Paris Exhibition (Les machines-outils et l'outillage méchanique à la foire de Paris), Ouvrier Moderne, vol. 3, nos. 3, 4 and 5, June July and Aug. 1920, pp. 111-112, 159-160 and 206-208, 10 figs. Details of principal exhibits shown at Paris exhibition held May 5-20, 1920.

SPECIAL-PURPOSE. Special-Purpose Machines in the LeBlond Plant. Machy. (Lond.), vol. 16, no. 418, Sept. 30, 1920, pp. 797-803, 7 figs. Also Machy. (N. Y.), vol. 27, no. 2, Oct. 1920, pp. 144-150, 7 figs. Vertical sawing machine built for operation customarily performed on radial drilling machines, special keyseater for long shafts, planer adapted for grinding large flat surfaces, etc.

MACHINERY

SHIPMENT OF. Insuring the Safe Shipment of Machinery, Fred H. Colvin. Am. Mach., vol. 53, no. 16, Oct. 14, 1920, pp. 712-718, 17 figs. Methods of development by Brown & Sharpe Mfg. Co., Providence, R. I.

MALLEABLE IRON

ANNEALING OVENS. New Oven Secures Uniform Anneal. Foundry, vol. 48, no. 19, Oct. 1, 1920, pp. 768-771, 11 figs. Two fireboxes at each side are in oven proper. Flues are located in center of floor. Four tons of castings are annealed with one ton of coal.

MANGANESE ORE

SMELTING ELECTRIC. Electric Furnace Smelting of Montana Manganese Ores, E. S. Bardwell. Gen. Meeting of Am. Electrochem, Soc., Sept. 30-Oct. 2, 1920, paper no. 14, pp. 137-152. Account of plant of Onaconda Copper Co. at Great Falls, Mont, for reducing Montana rhodochrosite manganese ores. Detailed description is given of furnace, electrode holders, and operation of furnaces.

MARINE BOILERS

See Boilers, Water-Tube, Houghton's Patent.

MARINE ENGINES

See Oil Engines.

MARINE STEAM TURBINES

EMERGENCY GOVERNOR. Emergency Governor and Gear for Marine Turbine. Eng., vol. 110, no. 2854, Sept. 10, 1920, pp. 344-345, 8 figs. Type being introduced by Messrs. Aspinall's Patent Governor Co., Liverpool.

FLEXIBLE EXPANSION COUPLING. The "Robertson-Fairfield" Flexible Expansion Coupling. Eng., vol. 110, no. 2854, Sept. 10, 1920, p. 357, 5 figs. Coupling consists of casing or shell made in halves which are bolted together when coupling is assembled. "Pivot keys sockets" fitted in slots machined in casing, transmit drive to casing. Any relative axial motion between drivers and driving shaft is provided for by sliding these blocks along their slots in shell.

RATEAU. The Development of the Rateau Geared Turbine for Marine Work, A. V. Jarratt. Elecn., vol. 85, no. 2207, Sept. 3, 1920, pp. 253-257, 6 figs. Rateau turbines as manufactured by Metropolitan-Vickers Electrical Co., Ltd. Turbine is constructed with two cylinders, high and low pressure, mounted side by side, both driving high-speed pinions on reduction gearings.

MATERIALS

TESTING. Compares Fatigue and Recovery, Robert G. Guthrie. Iron Trade Rev., vol. 67, no. 13, Sept. 23, 1920, pp. 843-845, 4 figs. Instruments for determining recoverance, which is capacity of material to return immediately energy that has been imparted to it by any external force. Records of operation of machine.

Recoverance, Robert G. Guthrie. Chem. and Metallurgical Eng., vol. 23, no. 14, Oct. 6, 1920, pp. 671-672. Recoverance is defined as capacity of material to return immediately energy that has been imparted to it by any external forces. Methods of measuring recoverance are explained.

MEASURING INSTRUMENTS

TWO-NEEDLE. New Type of Apparatus for the Direct Measurement of Magnitudes which are Functions of Two Variables (Sur une nouvelle classe d'appareils de mesure pour l'évaluation directe des grandeurs fonctions de deux variables), L. Barbillion and M. Dugit. Comptes rendus des Séances de l'Académie des Sciences, vol. 171, no. 7, Aug. 17, 1920, pp. 389-392. Instruments using two needles, one curvilinear and one rectilinear, or both curvilinear, turning about the same axis. As exampled are quoted an instrument for measuring relative velocity of an aeroplane, and an indicator of carburation in explosion motors.

METALS

METEOROLOGY

METRIC SYSTEM

MOTOR TRUCKS

STEAMSHIPS vs. Cargo Motorships vs. Steamships—II, Charles E. Lucke. Int. Mar. Eng., vol. 25, no. 10, Oct. 1920, pp. 837-841. Fixed annual expenses and service expenses. Cost of cargo transportation, net earnings and investment returns.

Motorships v. Steamships, Charles E. Lucke. Motorship, vol 5, no. 10, Oct. 1920, p. 910. Comparative operating expenses and earnings of cargo vessels. (Continuation of serial.)

N

NATURAL GAS

CONSERVATION OF. Conservation of Gas, L. B. Denning. Natural Gas & Gasoline Jl., vol. 14, no. 9, Sept. 1920, pp. 261-262. Work done by National Committee on National Gas Conservation, which consists of four representatives of public, four representatives of gas-producing companies, and two representatives of Dept. of Interior. Set of rules and regulations drawn up by committee is given.

CURTAILMENT IN INDUSTRY. Chemical Industries Likely to Lose Natural Gas Supply, R. S. McBride. Chem. & Metallurgical Eng., vol. 23, no. 15, Oct. 13, 1920, pp. 743-744, 4 figs. Investigations being conducted by State Public Service Commissions of West Va., Pa., Ohio, Md. and New York, in regard to advisability of restricting use of natural gas to domestic purposes.

UTILIZATION AND CONSERVATION. Mud Process in Saving Gas, A. W. Ambrose. Gas Rec., vol. 18, no. 6, Sept. 22, 1920, pp. 31-33. Method of preventing waste while drilling for gas and oil.

NAVIGATION

SUBMARINES, NAVIGATIONAL OBLIGATIONS. Modern Marine Problems in War and Peace, C. V. Drysdale. Jl. Instn. Elec. Engrs., vol. 58, no. 293, July 1920, pp. 572-597. Account of scientific investigations which have been carried out in marine problems during and after the war under British Admiralty at various experimental stations. Work during war consisted chiefly of devising means for detecting submarines. Eleventh Kelvin Lecture.

See also Radio Communication, Guiding Aerial and Marine Craft.

NICKEL-IRON ALLOYS

CONSTITUTION. The Constitution of the Nickel-Iron Alloys, D. Hanson and Hilda E. Hanson. Iron and Steel Inst., Meeting Sept. 21-22, 1920, paper no. 5.20 pp., 31 figs. Investigation into constitution of nickel-iron alloys. Special attention was given to determination of effect of small quantities of nickel on critical points of pure iron. Osmond's theory of nickel-iron alloys is examined, and attempt is made to construct "stable" diagram of nickel-iron alloys.

NOZZLES

STEAM ACTION IN. Steam Action in Simple Nozzle Forms. A. L. Mellanby and Wm. Kerr. Eng., vol. 110, no. 2853, Sept. 3, 1920, pp. 310-314, 15 figs. Charts giving pressure ratio curves for various types, constructed from results obtained from experiments. Paper read before Eng. Section, British Assn. for Advancement of Science.

OIL ENGINES

FAIRBANKS-MORSE. The Fairbanks-Morse "C-O" Marine Oil Engines. Practical Engr., vol. 62, no. 1752, Sept. 23, 1920, pp. 201-203, 5 figs. Outstanding features are (1) no water injection into cylinders, (2) water jacketing of combustion chamber and exhaust manifold, and (3) special means for quick starting.

MARINE. A High-Compression Marine Oil Engine. Engr., vol. 130, no. 3375, Sept. 3, 1920, pp. 224-226, 5 figs. Built by Plenty & Son, Ltd., Newbury, England. Engines are manufactured with two sizes of cylinders, 270 mm. bore by 300 mm. stroke and 335 mm. by 350 mm., grouped according to power required.

See also Diesel Engines; Semi-Diesel Engines.

OIL FIELDS

ARGENTINE. Petroleum in Commodoro Rivadavia (El petro leo en Commodoro Rivadavia), Walter C. Kretz. Ingenieria Internacional, vol. 4, no. 4, Oct. 1920, pp. 195-201, 7 figs. Description of oil fields and methods of exploitation.

BOLIVIA. Bolivia as a Source of Petroleum Supply. Petroleum Times, vol. 4, no. 90, Sept. 25, 1920, p. 312. Nature of oil deposits. Conditions governing concessions of oil lands.

OIL FUEL

PASSENGER SHIPS. Oil Fuel on Passenger Ships, Shipbuilding and Shipping Rec., vol. 16, no. 13, Sept. 23, 1920, pp. 373-376. Report of Board of Trade Committee on prevention of fire on passenger ships burning oil fuel. Minimum flash point. Precautions proposed.

OIL SHALES

UTILIZATION. The Oil Shale Industry in Scotland and England. Am. Gas Eng. Jl., vol. 113, no. 14, Oct. 2, 1920, pp. 255-260 and p. 265. Analyzes methods employed abroad and bases suggestions on these findings for utilization of American shales.

OIL TANKS

MEASURING LIQUIDS IN. Measuring Liquids in Ships' Tanks. Int. Mar. Eng., vol. 25, no. 10, Oct. 1920, pp. 841-843, 3 figs. Operation of tank gage and draft indicator.

ORE DRESSING

CLASSIFIER EFFICIENCY. Classifier Efficiency, R. T. Hancock. Eng. and Min. Jl., vol. 110, no. 13, Sept. 25, 1920, pp. 622-623. Improvement over former methods of determination suggested. Elutriation preferable to screening tests.

OXY-ACETYLENE WELDING

AUTOMOBILES. Autogenous Welding in the Citroen Automobile Factory (Die autogene Schweissung in der Automobilfabrik Citroen), Autogene Metallbearbeitung, vol. 13, no. 11, June 1, 1920, pp. 118-124, 3 figs. Includes illustrations of auxiliary welding devices and of the numerous welded automobile parts. From report of the Swiss Acetylene Assn.

CHARACTERISTICS OF WELDS. Characteristics Peculiar to Oxy-Acetylene Welds, Alfred S. Kinsey. Welding Engr., vol. 5, no. 9, Sept. 1920, pp. 23-24. One of characteristics noted is its applicability to all kinds of metals. Paper read before Joint Meeting, New York Section Am. Soc. M.E. and Am. Welding Soc.

OXYGEN

LIQUID. *See Explosives, Liquid Oxygen.*

P

PAINTS

EXPOSURE TESTS. Report on Paint Exposure Tests at Atlantic City, New Jersey, Henry A. Gardner. Am. Architect, vol. 118, no. 2337, Oct. 6, 1920, pp. 445-449, 6 figs. Further account of paint exposure test panels consisting of wood and metal, both bare and coated with various types of paint and varnish, exposed on Young's Million Dollar Pier at Atlantic City, N.J., and described in Am. Architect issue of Aug. 27, 1919.

PAVEMENTS

COMPARATIVE VALUES OF. Costs on Four Types of Pavement in Philadelphia Test Road. Eng. News-Rec., vol. 85, no. 13, Sept. 23, 1920, pp. 607-608. Twenty-six sections, comprising bituminous macadam, mixed and penetration methods, concrete and vitrified block compared.

PAVEMENTS, ASPHALT

MAINTENANCE COSTS. Sheet Asphalt Maintenance Costs in District of Columbia, F. S. Besson. Eng. News-Rec., vol. 85, no. 15, Oct. 7, 1920, pp. 705-707. Use of salvaged material makes cost $1.74 square yard, including asphalt cost, haulage, cutting out, working patch.

SPECIFICATIONS. Specifications for Asphalt Pavements. Good Roads, vol. 20, no. 14, Oct. 13, 1920, pp. 186-187. Prepared by technical committee of Asphalt Assn., New York, N.Y.

PAVEMENTS, BRICK

MONOLITHIC. Monolithic Brick Pavement Fails from Expansion, M. W. Watson. Eng. News-Rec., vol. 85, no. 13, Sept. 23, 1920, pp. 595-596, 3 figs. Experience in Kansas highways. Heat caused brick slabs to separate from concrete base and finally to rupture with violence.

PAVEMENTS, CONCRETE

HANDLING CONCRETE MATERIAL. New Method of Handling Concrete Material on Minneapolis Paving Job. Ellis R. Dutton. Mun. and County Eng., vol. 59, no. 3, Sept. 1920, pp. 22-24, 3 figs. Truck tractor having dumping body used in connection with bucket loader.

PAVEMENTS, STONE

GRANITE-BLOCK. Method of Constructing Duras Pavement, W. C. Mallonee. Eng. & Contracting, vol. 54, no. 14, Oct. 6, 1920, pp. 351-352, 2 figs. Granite block pavements laid upon concrete foundation.

PAVEMENTS WOOD-BLOCK

COMPARATIVE VALUE OF WOODS. Utility of Hardwoods for Paving Shown in Comparative Tests, E. E. Butterfield. Eng. News-Rec., vol. 85, no. 14, Sept. 30. 1920, pp. 656-658. Relative insusceptibility to expansion through water absorption, and greater strength are said to recommend oaks and hickory.

TIGHTENING BLOCKS. Jackscrews Tighten Wood Block Pavement in Place, W. W. Horner. Eng. News-Rec., vol. 85, no. 15, Oct. 7, 1920, pp. 686-689, 3 figs. Method developed at St. Louis, Mo. Pavement is cut in two at intervals and blocks on each side of cuts are tightened up with jack-screws.

PETROLEUM

PERU AND BOLIVIA. The Prospects for Petroleum Production in Peru and Bolivia, Charles S. Haley. Eng. & Min. Jl., vol. 110, no. 16, Oct. 16, 1920, pp. 772-774. High cost of development, difficulties of transportation, high royalties asked and objection to long-term concessions are drawbacks to exploitation of oil possibilities in these countries.

RESIDUALS. Characteristics of Steam-Distilled Petroleum Residuals, B. A. Anderton. Can. Engr., vol. 39, no. 15, Oct. 7, 1920, pp. 411-414, 11 figs. Tests of consistency with progress of distillation. Paper presented before Am. Soc. for Testing Matls.

RAILWAYS

SAFETY WORK. The Economic Value of Railway Safety Work, Samuel O. Dunn. Ry. Age, vol. 69, no. 15, Oct. 8, 1920, pp. 605-607. Survey of improvements in railway accident record within last decade. Paper read before Nat. Safety Council.

RECOVERANCE

See materials, Testing.

RESEARCH

AGRICULTURAL. Scientific Research in Relation to Agricultural Problems. Science, vol. 52, no. 1344, Oct. 1, 1920. pp. 301-307. Address delivered at organizing convention of Can. Soc. of Technical Agriculturists, Ottawa, June 3, 1920.

EGYPTIAN GOVERNMENT ANALYTICAL LABORATORY. Egyptian Analytical Laboratory and Assay Office, A. Lucas. Chem. Age (Lond.), vol. 3. no. 64, Sept. 4, 1920, pp. 256-257. Report on work of Government Analytical Laboratory and Assay of Office during period of 1913-1919. Report emphasizes need of industrial research and of thoroughly up-tp-date scientific library for general reference.

INDUSTRIAL. Relations between Science and Industry and the Societies for Industrial Advancement (Les relations entre la science et l'industrie et les sociétés de perfectionnements industriels), R. d'Adhémar. Revue générale des Sciences, vol. 31, nos. 15-16, Aug. 15-30, 1920, pp. 513-519. Advantages of industrial research.

Scientific and Industrial Research. Chem. Age (Lond.), vol. 3, no. 67, Sept. 25, 1920, pp. 332-334. Also Gas World, vol. 73, no. 1888, Sept. 25, 1920, pp. 228-229. Fifth annual progress report of British Committee of Privy Council for Scientific and Industrial Research.

Science and the Industries, John J. Carty. Reprint & Circular Series of Nat. Research Council, no. 8, 16 pp, 2 figs. Address delivered under auspices of Nat. Research Council, Washington, D. S.. Feb. 6, 1920.

The Engineer in Industry, Edward A. Deeds. Jl. Soc. Automotive Engrs., vol. 7, no. 4, Oct. 1920, pp. 331-333. Necessity for research in industry.

INTERNATIONAL RESEARCH COUNCIL. The International Organization of Scientific Research, George Ellery Hale. Int. Concillation, no. 154, Sept. 1920, pp. 431-441. Notes on International Research Council organized at International meeting held in Brussels, July 18-28, 1919.

NATIONAL RESEARCH COUNCIL. Fourth Annual Report of the National Research Council. Washington Government Printing Office, 1920, 68 pp. Council was established in 1916 at request of President of United States under charter of Nalt. Academy of Sciences.

REDUCTION OF OBSERVATIONS. Adjustment of Parabolic and Linear Curves to Observations Taken at Equal Intervals of the Independent Variable, Harry M. Roeser. Dept. of Commerce, Sci. Papers of Bur. of Standards, no. 388, July 21, 1920, pp. 363-375. Ordinary least-square formulæ are subjected to mathematical treatment and rigorous solutions are evolved which require ultimate minimum of arithmetical work. Table is furnished from which large portion of solutions can be written down from mere inspection of observations. Application of solutions is made to typical problems and absolute check with ordinary least-square aolutions is shown.

UNITED STATES. The Development of Research in the United States. James Rowland Angell. Reprint & Circular Series of Nat. Research Council, no. 6, 19 pp. Address delivered before Assn. of Land-Grant Colleges at Chicago, Nov. 13, 1919. Reprinted from Proceedings of Thirty-third Annual Convention of Assn. of Am. Agricultural Colleges & Experiment Stations.

See also Concrete, Research; Flotation, Research.

RHEOSTATS

LIQUID. The New Liquid Rheostats for the Norfolk & Western Railway, D. C. West. Elec. Jl., vol. 17, no. 10, Oct. 1920, pp. 483-484. Rheostat for each truck consists of two electrode assemblies, of three electrodes each, mounted side by side in rectangular tank, which is provided with set of weirs for raising and lowering height of electrolyte around electrodes.

RIPARIAN RIGHTS

RETENTION BY STATE. Riparian Rights, J. Spencer Smith. Freight Handling & Terminal Eng., vol. 6, no. 9, Sept. 1920, p. 334. Contrast is made between developments at Montreal and New Orleans, where riparian rights have been retained by state, and Jersey City, N. J., where riparian rights have not been so retained. More scientific developments on former ports is attributed to retention of such rights. Paper read before Am. Port Authorities, Chicago, Sept. 1920.

RIVER VESSELS

COAL BARGES. Material for Construction of Coal Barges (Note sur le matériel de la batellerie). Bulletin technique du Bureau Veritas, vol. 2, no. 9, Sept. 1920, pp. 179-182, 3 figs. Coal barges employed for canal transportation of coal from Sarre district. Dimensions are: Length between perpendiculars, 38.35 m.; breadth, 5 m.; mean depth, 2.7 m.

RIVERS

See Riparian Rights.

RIVETING

ELECTRIC RIVET HEATERS. An Electric Rivet Heater Eng., vol. 110, no. 2856, Sept. 24, 1920, p. 408, 1 fig. Apparatus consists of simple framework on wheels for carrying transformer. It is constructed by A.1 Manufacturing Co., Bradford, England.

ROAD CONSTRUCTION

ILLINOIS. Highway Work in Illinois. Good Roads, vol. 20, no. 14, Oct. 13, 1920, pp. 179-180. 49 miles were completed during September on Federal Aid System which involves construction of 225 miles. $2,881,504 bridge and grading contracts were let.

MACHINERY. Novel Construction Methods Employed on Morris-Ottawa, Illinois Concrete Road, J. E. Huber. 1920, pp. 83-85, 11 figs. Specially constructed excavator which operates like elevating grader and is equipped with caterpillar traction, its power being furnished by large gas engine.

ROAD ROLLERS

STEAM VS. ELECTRIC. Power Road Rollers (Motor-Strassenwalzen), H. Jacoby. Allgemeine Automobil-Zeitung, vol. 21, no. 33, Aug. 13, 1920, pp. 24-26, 4 figs. Describes various new types and gives data of comparative costs of 12-ton steam roller and 6 to 8-ton electric roller.

ROADS

FEDERAL-AID TYPES. The Selection and Comparison of Federal-Aid Road Types, E. W. James. Eng. & Contracting, vol. 54, no. 14, Oct. 6, 1920, pp. 348-351. Paper presented before conference of District Engrs. of U. S. Bur. of Public Roads.

ROADS, CONCRETE

CONSTRUCTION. Central Mixing and Proportioning Plants in National Old Trails Road Construction in Illinois. Eng. & Contracting, vol. 54, no. 14, Oct. 6, 1920, pp. 339-342, 13 figs. Comparison of two methods of handling concreting, in central mixing plant or in central proportioning plant, based on experience of contractors who have used these two methods in road construction work in Illinois.

ROLLING MILLS

ALLOY-STEEL SHEETS. Carbon Steel Company Jobbing Mill, J. F. Burt. Blast Furnace & Steel Plant, vol. 8, no. 10, Oct. 1920, pp. 545-547, 5 figs. New mill used for rolling high-carbon and alloy-steel sheets and plates at Pittsburgh plant of Carbon Steel Co.

ELECTRIC. Electric Reversing Mill Considered from the Standpoint of Tonnage, K. A. Pauly. Blast Furnace & Steel Plant, vol. 8, no. 10, Oct. 1920, pp. 541-544, 2 figs. Discussion of influence of control on rolling time, particularly to effect of limiting maximum power delivered to direct current motor driving rolls. (Abstract.) Paper read before Assn. Iron & Steel Elec. Engrs.

See also Electric Drive, Rolling Mills.

RUBBER

PERMEABILITY TO GASES. Permeability of Rubber to Gases, Junius David Edwards and S. F. Pickering. Dept. Commerce, Sci. Papers of Bur. of Standards, no. 387, July 12, 1920, pp. 327-363, 9 figs. Certain of factors which determine permeability of rubber to gases were investigated and relative rates of penetration of number of gases determined. It was found for example, that permeability to hydrogen is inversely proportional to thickness of rubber and that permeability to any gas is found to be directly proportional to its partial pressure, provided total pressure is constant.

S

SAFETY

See Railways, Safety Work.

SAND, MOLDING

STANDARDIZATION. Standardization of Molding Sands, C. Powell Karr Iron Age, vol. 106, no. 14, Sept. 30, 1920, pp. 845-849, 2 figs. Suggestions for classifying and establishing relative values. Apparatus and methods for testing. Characteristics of typical sands.

SANITATION

WORKS. The New Sanitation Works of Codigoro (La nouvelle installation d'assainissement de Codigoro), G. Muller. Bulletion technique de la Suisse romande, vol. 46, no. 17, Aug. 21, 1920, pp. 193-197, 9 figs. Details of pumping installation. (Continuation of serial.)

SCIENTIFIC MANAGEMENT

See Industrial Management.

SCREW THREADS

CONICAL. Device for Cutting Conical Screw Threads (Vorrichtung zum Schneiden von konischem Aussenund Innengewinde), Metall-Technik, vol. 46, nos. 25-26, June 28, 1920, p. 97, 2 figs. Describes patented device for cutting internal and external threads which can be attached to any lathe, and is especially adapted to the machining of workpieces of large diameter, such as pipe sleeves, nipples, etc.

NATIONAL SCREW THREAD COMMISSION. Tentative Report of the National Screw Thread Commission. Jl. Soc. Automotive Engrs., vol. 7, no. 4, Oct. 1920. pp. 317-320. Tables giving proposed series of coarse-thread and fine-thread screws.

SEAPLANES

AIR MINISTRY COMPETITION. The Air Ministry Seaplane (Amphibian) Competition. Flight, vol. 12, no. 39, Sept. 23, 1920, pp. 1013-1021, 22 figs. Description of machines entered in British air ministry competion for amphibian machines.

Electric, Manufacture of. Electric Steels, C. G. Carlisle. Iron and Steel Inst., Meeting, Sept. 21-22, 1920, paper no. 2, 23, pp., 1 fig. Tension, compression and torsion tests of steel manufacture in electric furnace, also tests of endurance. Study of suitability for die making, etc.

Macrostructure. Revealing Macrostructure of Iron and Steel, Henry S. Rawdon. Iron Age, vol. 106, no. 16, Oct. 14, 1920, pp. 965-968, 7 figs. Method of etching with ammonium persulphate as agent.

Non-Magnetic. Non-Magnetic, Flame, Acid, and Rust Resisting Steel, C. M. Johnson. Am. Drop Forger, vol. 6, no. 9, Sept. 1920, pp. 423-424. Properties of steel developed in Research Dept., Crucible Steel Co. of America.

Physical and Chemical Properties, Relation of. Notes as to Rates of Reaction in Certain Steels at 930 deg. cent., E. D. Campbell and B. A. Soule. Iron and Steel Inst., Meeting, Sept. 21-22, 1920, paper no. 1, 6 pp. It was desired to determine whether when bar of steel 6 mm. square by 15 cm. long was hardened by quickly plunging it into ice water there would be detectable difference in chemical constitution between two ends of bar. It was found that difference in rate of cooling of two ends of bar produces changes in chemical constitution which result in differences in thermo-electromotive potential much in excess of anything attributable to experimental error. Differences in potential at opposite ends indicated difference in chemical constitution.

Production in U. S. Statistics of Rolled Steel Products—Smaller Tonnages in 1919 than in Preceding Year. Iron Age, vol. 106, no. 16, Oct. 14, 1920, pp. 985-987. Statistics compiled by Am. Iron & Steel Inst. showing production of steel ingots and castings and other products.

STEEL, HEAT TREATMENT OF

Electric Furnaces. Heat Treating Steel Electrically, E. F. Collins. Iron Trade Rev., vol.67, no. 15, Oct. 7, 1920, pp. 990-994, 12 figs. Factors affecting uniformity and quality of castings. Advantages of electric furnaces for heat treating. Automatic control is recommended. Paper read before Am. Foundrymen's Assn.

Gas Heating. Heat Treatment Using High Pressure Gas, A. C. Roessler. Am. Drop Forger, vol. 6, no. 9, Sept. 1920, pp. 450-452, 2 figs. "Romec" system of high pressure gas heating.

Hump Method. Hump Method of Heat Treatment of Steel in Electrical Furnaces, Mr. Tall. Proc. Steel Treating Research Soc. & Jl. Am. Steel Treaters Soc., vol. 2, no. 13, pp. 18-22, 11 figs. Equipment manufactured by Leeds-Northrup Co.

STEEL, HIGH-SPEED

Forging Temperatures, Effect of. Some Effects of Forging Temperatures on Drill Steel, B. Franklin Shepherd. Compressed Air Mag., vol. 25, no. 10, Oct. 1920, p. 9833, 2 figs. Results of tests.

STEEL MANUFACTURE

Ingot Molds. Influence of Manganese Content on Duration of Molds for Steel Ingots (Influence d'une augmentation notable de la teneur en manganèse des fontes de lingotières d'acierie), M. Groschaude. Génie Civil, vol. 77, no. 10, Sept. 4, 1920, pp. 198-199, 1 fig. Molds containing from 1.75 to 2.25 per cent manganese are said to have resisted 250 casts. Diagram showing ralation between manganese content and duration of mold is constructed from results of experimence in steel foundry.

STEEL MILLS

Electrical Equipment, Standardization of. Standardization of Electrical Equipment and its Relation to Accident Hazard, Walter Greenwood. Blast Furnace & Steel Plant, vol. 8, no. 10, Oct. 1920, pp. 548-549. Standardization demanded on account of economy in construction and operation and equally so on account of lowering of accident hazard. (Abstract.) Paper read before Assn. Iron & Steel Elec. Engrs.

Power Plants. Current Limiting Reactances, R. H. Kiel. Blast Furnace & Steel Plant, vol. 8, no. 10, Oct. 1920, pp. 554-556. Disadvantages of centralizing generating equipment. Means for aiding power house in maintaining a continuous supply of electric power on its lines. (Abstract). Paper read before Assn. Iron & Steel Elec. Engrs.

Some Economic Consideration in Design of Power Plants for Steel Mills, T. E. Keating. Blast Furnace & Steel Plant, vol. 8, no. 10, Oct. 1920, pp. 570-574. Deals with economic centralization of power generation for various units of steel industry. How to design power plants for greatest economy. (Abstract.) Paper read before Assn. Iron & Steel Elec. Engrs.

See also Electric Drive, Rolling Mills.

STEEL WORKS

Ebbw Vale. The Electrification of the Works and Collieries of the Ebbw Vale Steel, Iron and Coal Company, Limited, Walter Dixon. Eng., vol. 110, no. 2856, Sept. 24, 1920, pp. 419-421, 5 figs. Also Engr., vol. 130, no. 3378, Sept. 24, 1920, pp. 299-300, 5 figs. Works are expected to provide after completion of improvements, annual output of 5,500,000 tons of coal, 575,000 tons of coke, and 450,000 tons pig iron. Allied industries embrace manufacture of steel rails and sleepers, galvanized steel sheets, weldless steel tubes and couplings, coke-oven and blast-furnace by-products, iron and steel castings and engineering work. Paper read before Iron & Steel Inst.

Waste-Heat Operated. Steel Plant Operated with Waste Heat. Iron Age, vol. 106, no. 13, Sept. 23, 1920, pp. 765-769, 7 figs. New Works of Electric Steel & Forge Co., Cleveland, for manufacture of alloy steels. Ingots broken down under hammer.

STREET RAILWAYS

Cars, Safety. New Standard Type of Safety Car Suggested, Wray T. Thorn. Elec. Ry. Jl., vol. 56, no. 12, Sept. 18, 1920, pp. 549-550, 1 figs. Separate entrance and exit, longitudinal seats at the ends and other changes recommended to make small one-man car better adapted to fairly heavy traffic lines.

Results of Safety Car Operation, J. C. Thirlwall. Elec. Ry. Jl., vol. 56, no. 14, Oct. 2, 1920, pp. 642-646, 8 figs. Experience of 38 companies. It is said that safety cars reduce injuries to passengers, provide safer, better paid and more interesting work for employees, and are popular with public.

Snow and Ice Loads on Trolley Wires. Formulæ for Ice-Covered Trolley Lines (Aneisungsformeln), Robert Edler. Schweiz. elektrotchnischer Verein Bul., vol. 11, no. 8, Aug. 1920, pp. 207-214, 3 figs. Results of calculation of additional load caused by snow and ice. (To be concluded.)

Switchboard Connections. Scheme for Investigating the Electrical Condition of one of the Lines in a Street Railway Network (Installation permettant de vérifier rapidement l'isolement des différentes lignes d'un réseau de tramways), E. Favreau. Revue générale de l'Electricité, vol. 7, no. 25, June 19, pp. 827-828, 2 figs. Suggests arrangement whereby voltmeter becomes connected to circuit when automatic circuit breaker opens.

STREETS

Cleaning. Contract Work vs. Municipal Forces in Street Cleaning, Eng. & contracting, vol. 54, no. 14, Oct. 6, 1920, pp. 346-347. Study of method employed by various municipalities in street cleaning and in collection and disposal of municipal waste.

See also Snow Removal.

STRUCTURAL STEEL

Specifications. Specifications for Carbon Steel Bars, Blooms and Billets for other Purposes than Machine Tools (Cahier des charges pour la fourniture de barres, blooms, billettes et largets en aciers au carbone autres que les Aciers à outils). Revue de Métallurgie, vol. 17, no. 7, July 1920, pp. 478-483. Specifications prepared by Commission Permanente de Standardisation.

Specifications for Non-Tempering Carbon Steel Bars, Blooms and Billets (Cahier des charges pour la fourniture des barres, blooms, billettes et largets en aciers au carbone non trempants). Revue de Métallurgie, vol. 17, no. 7, July 1920, pp. 469-473, 1 fig. Specifications prepared by Commission Permanente de Standardisation.

Standard Sections. Lists of British Standard Rolled Steel Sections for Structural purposes. British Eng. Standards Assn., no. 1, 1920, 19 pp., 6 figs. Standards adopted in July 1920.

SUBMARINE WARFARE

Detection of Submarines. Detection of Submarines Harvey C. Hayes. Proc. Am. Philosophical Soc., vol. 59, no. 1, 1920, pp. 1-47, 18 figs. Research and development work carried out by two groups of scientists, one group backed by private companies, the other by the U. S. Navy. Types of submarine detectors developed by England, France and United States.

SUBMARINES

Uses in Peace. Small Submarine for Oceanographic Work (Sur un petit sous-marin destiné aux travaux océanographiques, Maxime Laubeuf. Comptes rendus des Séances de l'Académie des Sciences, vol. 171, no. 10, Sept. 6, 1920, pp. 485-489. Suggests design.

See also Navigation, Submarine, Navigational Obligations.

SUPERHEATERS

Steam Velocities in. Steam Velocities and Pressure Drop in Superheaters, H. B. Oatley. Int. Mar. Eng., vol. 25, no. 10. Oct. 1920, pp. 824-825. Advantages resulting from use of high steam velocities.

SWITCHBOARDS

See Street Railways, Switchboard Connections.

T

TELEGRAPHY

Duplexing Submarine Cables. The Semi-Bridge System of Duplexing Submarine Telegraph Cables (Kajiura's System), J. Kajiura. Telegraphs & Telephone Age, vol. 38, no. 19, Oct. 1, 1920, pp. 510-512, 2 figs. Japanese invention said to have proven successful in application to a number of submarine telegraph cables.

Rapid. Rapid Telegraphy (La télégraphie rapide), J. B. Pomey. Electricien, vol. 51, no. 1258, Aug. 15, 1920, pp. 342-349, 7 figs. Comparison of Buckingham and Baudot apparatus.

TRACTORS

VALUATION

W

WATER HAMMER

METALLIC CONDUITS UNDER PRESSURE. Study of Water Hammer in Metal Conduits under Pressure (L'étude des coups de bélier dans les canalisations métalliques sous pression), C. Camichel and D. Eydoux. Houille Blanche, vol. 19, nos. 43-44, July-Aug. 1920, pp. 127-131, 3 figs. Formulæ for determining velocity of transmission, pressure exerted, etc., and graphs indicating transmission of water hammer. (Continuation of serial.)

SOUTH AMERICA. Electrical Possibilities in South America, Verne Leroy Havens. Elec. World, vol. 76, no. 15, Oct. 9, 1920, pp. 729-730. Opportunities for water power development. Operating difficulties and how they are overcome.

WATER PURIFICATION

ASPIRATORS, DESIGN OF. The Design of Aspirators of Sterilizing Water. A. E. Walden. Mech. Eng., vol. 42, no. 10, Oct. 1920, pp. 562-564, 7 figs. Type developed from results of numerous tests with different forms of aspirators, ejectors, siphons, jets and nozzles.

WATER WORKS

COST-PLUS CONTRACTS. Cost-Plus Contracts for Water Works Construction, George W. Fuller. Jl. Am. Water Works Assn., vol. 7, no. 5, Sept. 1920, pp. 683-692. It is held that cost plus contracts, with proper provision for accounting and supervision, may be satisfactory where conditions are not definitely known and in case of private corporations where well qualified contractors may be selected to work under adequate supervision. Under war conditions, it is said cost-plus contracts were necessary and even now have many advantages.

WATERWAYS, INLAND

RECONSTRUCTION. The Reconstruction of French Inland Waterways (Pour la reconstruction de notre réseau navigable), J. Boudet. Vie Technique & Industrielle, vol. 1, no. 12, Sept. 1920, pp. 463-472, 7 figs. Method of "isolated sections" for reconstructing waterway without interrupting traffic, Special portable dams are firmly placed about 600 ft. apart; water is pumped out from section thus isolated and work required performed over night. Method was invented by Enterprise Fougerolle and is said to have been applied successfully by them in various enterprises.

WELDING

See Electric Welding, Arc; Electric Welding, Resistance; Oxy-Acetylene welding.

WELFARE WORK

INDUSTRIAL HYGIENE. Economic Aspect of Industrial Hygiene, Bernard J. Newman. Indus. Management, vol. 60, no. 4, Oct. 1920, pp. 271-272. Relation between health and general welfare of employees and their working efficiency.

WELFARE DEPARTMENT. Is "Welfare Work" Accomplishing Constructive Results? Norman G. Shidle. Automotive Industries, vol. 43, no. 13, Sept. 23, 1920, pp. 619-621. Suggests auditing "welfare" department and making it justify its existence just as definitely as in production department.

See also Mining Industry, Welfare Work.

WOMEN WORKERS

See Executives, Women as.

WOOD

TREATMENT OF. Treatment, Seasoning and Fire-proofing of Industrial Wood (Imprégnation, sénilisation et ignifugation des bois d'industrie), J. Escard. Houille Blanche, vol. 19, nos. 43-44, July-Aug. 1920, pp. 148-151. Chemical compounds used for treating. (Continuation of serial.)
