The Future of Applied Science

C. H. Mitchell, C.B., C.M.G., D.S.O., M.E.I.C.

A Survey of the Effect of the War on Engineering Training, the Qualities Desirable in an Engineer, and Proposed Changes in the Curriculum of Applied Science.

The future of Applied Science rests with all of us who are concerned with the development of this great country. This concern lies not only in the actual processes of development but equally as well in the education of our young men who are going to participate in its development.

It is not for me to point out on this occasion the greatness of this young Canada in its potentialities or to enlarge on the methods by which those potentialities will be developed in the next decade. But it is opportune for us to look about and to ascertain what the country expects —what it demands—of us, who, in a large measure are responsible for the leadership in those methods. It is opportune for us also to examine into our own capabilities and our own preparations so far as education is concerned, for undertaking that work of leadership and for influencing the younger generation in those directions in which the development of the country can be followed best.

It is not sufficient for us who are going to be responsible for the education of the young men who twenty years hence are to be the leaders in this country simply to "wait and see" or to accept the trend of events as they arrive in the inevitable development of the country. It is for us to anticipate the requirements and how those demands may be made, so that when they are put forward we are standing ready to meet them or, better still, can say that they are already met, the highly educated and trained men are already here or in the field ready to take their appointed places.

Herein, it seems to me, is the highest function of a great University leading the country in thought and action, anticipating its needs not by a few months but by years, so that the necessary influence has already gone out by which the reaction comes about in real results. And nowhere more than in Applied Science does this principle stand in need of adoption, of careful leading and of persistent pursuit.

It is now opportune for us to examine ourselves and our surroundings, to orient ourselves in this great year of Nineteen Hundred and Nineteen, on the one hand to the tragic years that are past and on the other to the hopeful years that are to come.

Who can say what this great war has been to us in influencing our lives and our ideals for the future? Those of us who through a Good Providence came through its fire, realize that the gallant men who have come back to us come back full of new ideas and new ideals, full of energy and the consciousness of the value of real hard work, full of hope in the reconstruction of the homeland that will

Inaugural address of Brigadier-General C. H. Mitchell C.B., C.M.G., D.S.O., as Dean of the Faculty of Applied Science and Engineering at the University of Toronto, 8th of October, 1919.

make and keep it the best place in the world in which to live and to work. And of those men in the war who engaged in the engineering and scientific achievements what can we say? We can never say enough and all will not be told for years to come. That great man of the Empire, Mr. Lloyd George, has said—and he recognized and said it early in the war—"It is an engineer's war"—and no one knew better than he, for among those who closely surrounded him were many of the greatest engineers and scientists of the Empire.

Technical Knowledge and the War

We are all aware that early in the struggle an Inventions Board was constituted through which all manner of new devices and suggestions were brought to notice— and very democratic, patient and sympathetic it was too. During the past months we have been reading with interest of the decisions of this now famous Board with respect to the apportionment of the credit (and remuneration) for the numberless devices, which have now become historic in the years of battle.

On the field of battle, evolving through the months and years from the early days, as many of us remember the stories of the failures and successes of individual offensive and defensive weapons, trench ordnance, wire cutting devices, defensive trench structures and emplacements, mining and tunnelling operations, the tremendous and rapid development of artillery of both light and heavy guns and, in the end, the remarkable evolution of the "tank" with its unique place in the battles of the latter months.

In the air, what can be said in a few words to indicate the effort, the triumphs and the disappointments of the engineer and the long months of anxieties and trials through which he has finally emerged with the aircraft of to-day? When we remember that as the war started, the mechanics and the principles of the science of the aeroplane as we now know it, were but in their very infancy, we realize how in the few short years, concerted, diligent, almost feverish effort in the application of science has brought us so far in the actuality of aerial navigation, a study by the way, in which I had myself become intensely interested as far back as 1894, twenty years before the war.

On and under the sea too there is yet to be told the story of the struggle and the patient careful months of work in the evolution of the mighty British fleet and in the effort to meet the insidious unseen menace of the enemy's submarine warfare.

Who can say when and how we may apply our knowledge gained of aerial navigation, aeroplane reconnaissances and aeroplane photographs; of wireless communication—even wireless interceptions—as well as of those elusive principles of the electric telephone and detector devices used so successfully in the front line; of the principles of acoustics and electricity so curiously developed in the methods of sound ranging practice and so successfully applied in co-operating with our artillery.

What of the application of rapidly constructed portable steel bridges; of the principles of building railways in impossible places and roadways over impassable marshes or of concrete emplacements and steel reinforced concrete dugouts to withstand the enormous impact of a bursting shell? And under the ground what more have our engineers learned of soft earth mining, of continuous contests with water and ventilation and of live saving apparatus? What have we learned of steam, electric and petrol motor traction and the principles above all of keeping the traffic going, despite everything that the frailties of man deprive it, the vagaries to which the elements subject it, and the fiendishness of a relentless enemy? How far are we on the way to ensure stability in the air or in the development of air propellers and engines? What have we learned that will be useful in the inevitable further development of our shipbuilding in Canada for the sea coasts and great lakes?

And in the great basic industries, in steel and the economic metals, in textiles, in ceramics, and even in the graphic arts, how much more do our soldiers and war workers know for their five years of diligent labour? In the fields of the manufacturing industries of electrical and mechanical character, the producers of the great volume of munitions and of the multitudinous articles of equipment and apparatus of warfare by their new devices and new applications and by their new methods of manufacture and organization of labour have brought about a new epoch in the whole of our industrial structure; what have we learned and what are we going to do about it?

And perhaps greater than all, in the value of chemical industry, do we look for the lead which the war has given. The initiative in this which was undoubtedly held by the enemy at the commencement of the war, went through a long period of trial and competition between the two great armies of scientific workers until, when the war ended even the enemy will agree that the domination of the scientific field lay with the Allies of the Entente. In the constituents of explosives, in fuels, in gases for offensive warfare—in the components of manufacture of that same numberless lot of articles used in warfare and in the normal (or should we say abnormal) commercial and industrial development arising from the seizure of the enemy's foreign trade denied them by their war, in all of these the applied sciences in the chemical industries contributed a share in the war which is even yet but little known to the public of the great nations for whom it has all been done.

And one should not forget another feature, a feature which stands apart, in which the soldier returning to his homeland from the great battle regions of France, Flanders, and Italy, but little realizes the influence. The subtle unconscious effect of a life however uncomfortable, unpleasant and lacking in the refinement of home, set amidst the great historic places of Europe and daily face to face with many of the architectural and artistic gems of the old world, could not but have an influence with will follow him through life. So with all his materialism, with the horrors of war, and with his daily life in contact with the varied applications of science to the great business of war, he had, withal, ever about him, the object lessons of the aesthetic whereby, by contract he must at least have somewhat learned to love the beautiful in nature and to be inspired by the charming things made by the great masters of the centuries.

Now with all this inventory of what has been brought back from the war and after this process of looking about us to find and orient ourselves, we quickly realize that even yet we are but standing on the threshold of the new era of reconstruction. There is a new world ahead in Applied Science and it is for us to apply and to reapply the principles and discoveries which have brought us thus far.

The War and Canadian Engineering Activities

Let us now turn to the field toward which we look and in which we are now called to work after this war period. Canada is quite as much what she was before the war but she has found herself in a manner that few of us could even have hoped. And she has found herself in no more definite way and in no more important way than in the realization of her great resources and her ability to apply them to her own life and the life of the Empire.

If we are to study for a few moments the trend of the great engineering activities of the country as they appeared firstly, before the war, compared with the period of the war; and secondly, during the war as compared with the future and its prospects of reconstruction activities, we find divergent differences. The activities have passed through various stages. It will be remembered that the prominent features of these activities before the war were connected mainly with the huge railway construction and extensions. Further activities included other features of transportation, of canals and terminals, then of hydro-electric power developments and a definite trend just previous to the war to comprehensive programmes of large building construction connected with the expansion of manufacturing and commerce. This period too claimed a lengthy activity in mining and its allied industries.

The war changed all that; through the same sudden transition by which we passed from peace to war we almost as suddenly passed from the stages just described to the stages consequent upon the national mobilization of all our resources, and with that came an entirely different character of engineering activity. It resolved itself into the transformation of most of our great manufactories into munition works or works solely engaged upon war material, whilst the remainder and many new ones had perforce to continue in the work of carrying on the normal industries for the life of the country carried on with redoubled energy. Thus all the great public works of state or municipality were either hurriedly completed or abandoned for the time being.

In the same manner the sudden termination of the war from its greatest intensity to an unexpected armistice, brought about a similar transition in the opposite direction. With the difference, however, that the great public works have not been resumed and if one may be bold to forecast, it is unlikely that they will be for some time to come in so far as railway construction is concerned.

But what does appear on the horizon, as the future of these great activities of the country indicates is a large resumption of manufacturing and industrial work through the return to peaceful pursuits and the consequent readjustment of all that pertains to the life of a newly developed manufacturing country in which, as always, the agricultural industry is, and will be, the mainstay. But there is more than that; all those smaller public works and those smaller private enterprises which were arrested or dislocated during the war and which are not yet ready to be prosecuted or financed are still to be revived and within a few years will doubtless absorb the attention and services of many engineers, as well as the interest of the financiers of the country. This is all without any reference to the entirely new enterprises consequent upon the normal growth and development of the country such as was steadily proceeding previous to the war. Already there are signs of the resumption of this growth and it remains still to be seen whether this will take on the same form as previously in national or municipal public works, in mining and metallurgical progress, and in all those scattered activities where the services of the applied scientist and the engineer are called into use.

Trend of Engineering Training

Translating these considerations into terms of the needful scientific education to meet the requirements, and analysing these requirements in view of the necessary leadership which, as has already been said, the University must exercise, it is reasonably certain that a reversal of the requirements has taken place and should be provided for. In short where before the war the various branches of Civil Engineering stood pre-eminently first in the requirements, its relative demand in Canada, for the immediate future at any rate, has apparently fallen to second or perhaps third place in the grouping. The Industrial group of engineering has come to the front and hence we find Electrical, Mechanical and Chemical Engineering high up in the group. In fact it is a curious feature that of the present first year in this Faculty numbering about four hundred in all of the eight departments, practically one quarter are proceeding in Chemical Engineering; this is undoubtedly a direct outcome and influence of the war. The Mining group, including metallurgy, appears likely to follow a normal expansion for some years to come although the actual increase in activity in mining not only in Ontario but throughout Canada has been somewhat arrested by the war, except in those directions actually influenced by munition production. In the more aesthetic side of Applied Science—that of Architecture, Town Planning, and the like—who can say what the future may bring? It is difficult to foretell and to foresee what course the educational requirements of the country may take, although after all much depends on the extent to which the University offers attractions in this much discussed branch of scientific and artistic education—in other words it is for the University to offer influence and make the demand for architectural education and thus indirectly have an influence on the architecture of the country.

Having thus examined the course of the various branches of engineering and analysed the tendencies and probabilites for the immediate future, it is necessary to see wherein the Applied Science and Engineering education, as it has been and is now constituted in this country, is designed to meet the requirements of the times.

History of Engineering Instruction

To appreciate properly the relation of the demand and supply of scientific education, if we may use such terms, it is necessary to first go back and consider the historic evolution of Applied Science and Engineering in this and some of the other older universities on this continent. In doing so it is curious to find how, within limits, the university or college education has endeavoured to meet the requirements of the particular period in the country's development. Forty years ago—and engineering in this University of Toronto under the Old School of Practical Science dates back to that period—it was wholly Civil Engineering and was designed to meet a demand mainly for those public works which were necessary to the growth of the country at that time. Thirty years ago, a critical period in the development, a departure had been made, increasing or varying the courses to include Mechanical and Electrical Engineering, Architecture and Chemistry—as an instance, when I myself graduated in Civil Engineering twenty-seven years ago, there were, out of a total class of nineteen, fourteen in Civil, three in Mechanical and Electrical, one in Architecture and one in Chemistry.

In the intervening years a steady increase of the departments other than Civil has taken place, and we now find that after various cycles of influences the industrial groups have come rapidly to the front and even dominate the whole Faculty. This is but a reflection of the normal development of the country, and is after all, what was to be expected. As for the phases through which the general process of the teaching of Applied Science has passed through these years, it is equally interesting to observe that the great principles which were laid down in those early days—those of the splendid founder of this great Faculty, the late Dean Galbraith—have been and still are adhered to—and let me now say that so far as I myself can influence them, will still be adhered to, modified only in so far as may be necessary to meet the changed situation of the times. These great principles are comprised in the teaching, first the necessary theoretical science, and then the methods of application, in other words the placing of mathematics, physics, chemistry, and descriptive geometry, with the inevitable drawing, before the work of the applied science itself.

In the cycles of change in the methods and in what may be termed the fashion, in Applied Science education, a curious period of transition is just now coming about, irrespective of the influence of the war. It is easily recognized that dating from say ten years ago, a wave of specialization swept over this continent and before and even during the war was running riot amongst the younger graduates of Engineering schools in an alarming fashion. It is obviously necessary to point out that a young gentleman scarcely out of his teens, however brilliant he may be, can hardly be said to be a subject for intensive specialization in such difficult branches of professional work as present themselves in these fields of learning and practice. Despite all efforts and contriving it seemed to have taken the fancy of the young generation so that they were the more drawn to those institutions where attractive special intensive courses were offered for their choice. I am glad to say, however, that this criticism is but slightly directed toward Canadian universities. That was all very well up to a certain point, but the process got somewhat out of hand, the pendulum swung—and has swung—too far, and now we are confronted with the inevitable readjustment by which a means is sought to counteract this tendency.

Requirements in Technical Education

Reverting to the great fundamental principles of Applied Science education it must be accepted that the first requisite is, without question, a sound general education as a foundation. This principle has already been put into practical application in this University by the establishment of more comprehensive and more stringent requirements at matriculation, whereby not only a very high standard is required in mathematics, (senior matriculation), but high standing is also necessary in English and languages. But that is only the start and does not by any means ensure all those fundamentals which form the foundation for the proper education of the applied scientist or engineer.

Following this further and considering the entire education of the young engineer, there seems only one conclusion as to the necessity of to-day in this young country at its critical stages of development. For now-a-days we require not only technologists in the form of applied scientists or engineers but we want men who are more, much more than that, we require to produce men who by their college education will be:

First—Broadly educated, cultured gentlemen.

Second—Good citizens of Canada and leaders of influence within the community in which they may be placed.

Third—Thoroughly educated technologists in whatever branch of applied science they may choose to enter.

How best to produce this type of rounded out graduate in the four short years in which he is under the influence of his professors and instructors is open to much discussion and time does not permit to follow it through. It is obvious, however, that if a University education does nothing else, it ought to produce a broadly educated, well informed citizen, capable of thinking for himself on all public questions and taking his part in leadership and genuine public service—all this apart entirely from the necessary special education and the application of it to his gaining a livelihood in the practice of his chosen profession. If then in coming up to the University to obtain his education, he must devote himself to his professional course in Applied Science, that course and that Faculty must provide him with his education in its entirety and must, therefore, not limit itself solely to the technological side of it.

At the other end of the scale of his education the young engineer of to-day who is not to be over specialized must learn to think in terms of subjects and educational values which may prove of the most use to him on going down from the University and entering his professional life. True, it has been said he must have been grounded in the fundamentals and in the practical application of these to the varied problems in the many sided phases of Applied Science as it is to-day known and practised. But there is a further distance he must go, especially in these days of materialism and of what is known in the workaday world as "practical results." He must learn to orient his technical education with the economics of the world into which he is about to enter, so that he may the more readily become the thinker, the leader, and the actor in the great effort of development and service in which he engages. Herein lies what, in a few years, will be found to be one of the governing factors in the more detailed and special education of the young engineer, his place in the economics of the community. It can easily be said that in the four years of a college course but little time can be given to this phase of education, that is agreed, but it is possible to instruct and to combine the types of work in such manner as to keep these principles of engineering economics clearly before the student in his later years.

The Returned Soldier and Applied Science

Just here it seems opportune to revert to the returned soldier and to try to look at Applied Science and its changed conditions through his eyes. He has seen as no one else has seen the truest application of science to the most practical of problems that have ever been put on in the world drama, and he has seen as no one else has seen the results of that application. He expects on coming back here to his University that we too have an appreciation of how better to apply these great principles of science to the world's problems not of war but of peace, and his eyes are on his University as never before.

Doubtless the type of student will be found to have changed during the past years in so far as the war has left its imprint. I speak of this because the returned soldier types and the normal types of recent years, were influenced by war conditions, are of a peculiarly high order, and in making this statement I am speaking from an experience which has included visits to many universities including those in Great Britain. As I stood before the first year in Applied Science a week ago to-day, over half of them returned soldiers, I could not help but be struck by the particularly strong features, the intelligent types and general appearance of men who can and will energetically accomplish things, an especially valuable characteristic in the engineer. Then I thought of that splendid tribute which I heard General Sir Arthur Currie pay to the Canadian soldier in his memorable speech to the Canada Club in London on the 20th of May last, in which he said "All Canadians are pioneers themselves or are immediate descendants of pioneers. Most of them have gained or inherited those indelible signs with which Nature graced the bodies and souls of those who have pitted their will, their strength, and their determination against elemental forces and have earned for themselves a portion of her riches."

The war itself produced new characteristics in those who remained in Canada and those who went abroad. The spirit of irresponsibility, so deplorably manifesting itself before the war, was arrested, and gave place to a greater sense of responsibility in all ranks in and out of the army. The logic here is that this new sense in the young generation has returned from the battle to our teaching to carry at least for the years of reconstruction. I shall always remember an inspiring address to staff officers which used to be made during the war by that good leader among staff officers, General Sir Charles Harington, in which he held up three words as a test: Trust, Training and Thoroughness. What more could we have wanted in leaders and followers alike?

Proposed Changes in Curriculum

All this leads up to the consideration of the curriculum and the manner and extent of instruction which is best suited for the country for the period in which we find ourselves and for the general type of student who comes to this University for his education. The curriculum throughout all engineering colleges, especially on this continent, is in the process of change for the reasons already referred to and a study of the tendencies in these changes reveals a degree of uniformity which in a measure applies to the particular requirements of this country and this University. During my visit the past spring to some of the leading universities in Great Britain where Applied Science is prominent, I was struck by the efforts that were being made to transform and reconstruct the curriculum in accordance with the newer demands, efforts which were due to the same causes and tendencies in the national life with which we ourselves are now confronted.

If the signs and the tendencies can be correctly interpreted—and this appears to be a universal opinion today among not only those engaged in engineering education but in practice as well—there are several radical changes in the curriculum which are now opportune, indeed are demanded. Amongst these are proposed: First—a rearrangement of subjects and economy of time by avoiding crowding the curriculum with less essential subjects and by judicious sequence to limit the number of subjects simultaneously studied to less than is now usual although not decreasing the number of student hours per week. Second—The introduction of broader humanistic subjects in the first two years which may be termed the general educational portion of the course, including, in addition to all the mathematics and science, a further study of English with special reference to Applied Science, and the introduction of studies in Economics, Sociology, and possibly Logic and Psychology in a form applicable to this work. This is without reference to the continuation of the study of modern languages which are so essential in the technical world of today. Third—The inclusion in the last two years of some of the higher forms of these broad subjects but with special application to the work and the relationship of the graduate after he enters his professional life; these subjects must be such as Finance, Engineering Law and Jurisprudence, Commercial Engineering, Industrial Management, and Engineering Economics, and it may be of interest to note here that some of this work in its simpler form has been included in the curriculum of this Faculty for some time past.

In addition to the foregoing there seem to be various other considerations. For instance, the student has great difficulty in his early years in orienting himself to the objects and processes of study in Applied Science, in discovering the relative value of the various subjects he is put to study and in realizing the application of these subjects to the real business of engineering practice.

Much stress is laid by British and American Universities on the inclusion of what they call practical engineering work side by side with the theoretical work in the earlier years. This was clearly recognized in this University in the early curriculum of the School of Practical Science and has been a feature ever since—for instance the laboratory work helps out the lectures in electricity and mechanics and surveying helps out the mathematics. In addition to this our curriculum here has always made it an essential that the student engage in some actual practical employment in the field and in engineering works during the summer holiday, lengthened specially for this purpose, and a new departure is now made by the establishment of a large rural camp or school about thirty miles north of Toronto for the purpose of carrying on instruction in surveying independent of that experience to be gained in the ordinary manner. The general tendency now, and one to be encouraged in connection with the education of the electrical, mechanical, or chemical engineer, is to participate in real industrial work, not only through the summer holiday period, but in some form of continuous co-operation with industries. Such work should be supervised to some extent by the College, and used as a source of problems and projects for scientific analysis and study and can be made mutually useful to the industry and the student. I appeal to the manufacturers of Toronto and the vicinity to meet the University in this regard, and I can assure them that in most cases whatever inconvenience they may be put to by such an arrangement will be reciprocated in some form to the advantage of their work in connection with study and research which may arise from it.

Expansion in Applied Science Education

While it is doubtless expected of me on assuming this post to indicate along what lines the course of expansion in Applied Science education will proceed, it is almost too early to go into further detail as to the curriculum than has already been outlined. As, however, a certain well defined policy is already in progress it may be sufficient to add to the foregoing that it is considered desirable amongst other things to reconstitute the Department of Civil Engineering to embrace general sections which will deal more specifically with those subjects of Municipal and Sanitary Engineering which are and will be more demanded by our municipalities whether civic or rural. In this department too it is thought that even in the face of changing tendencies already referred to, Transportation Engineering, (by Railway and Canal), as well as Highway Engineering should be further expanded in the senior years.

Irrigation and Reclamation Engineering too, so requisite in the development of our Western Provinces especially, should be given more attention, and even the work in Water Power, already highly developed in our curriculum, should be broadened.

The inclusion of a course of lectures and laboratory work in Ærodynamics so much in demand arising out of the war, is already provided for, and much assistance will be obtained by the elaborate air channel and other experimental apparatus which already has been installed in the Thermodynamics Building during the past year.

The subjects of Ship-building and Naval Architecture, which appear to be now in some demand especially with the revival of Canadian shipping on the Great Lakes and the development of the harbour works at Toronto and elsewhere, are being kept in view.

In Architecture very considerable extensions and changes are under way, and it is proposed to strengthen the Department by increased personnel including an additional associate professor; it is proposed too, to broaden and alter the character of the instruction materially by a closer co-operation with the architectural profession, whereby better opportunities may be secured for the student during his course.

Not the least of the additions to the programme is the inclusion of a course of lectures in Civic Town Planning by an eminent authority which will, it is hoped, broaden before long, in co-operation between the Engineering and the Architectural Departments, to a highly useful branch of instruction destined to become a real factor in the utilities and aesthetics of our municipal and industrial life.

In order to provide the student with a viewpoint somewhat in anticipation of his future career, the principle already established of arranging courses of lectures from prominent members of the profession will be further developed as this has been highly recomended by graduates and is recognized as of great value to the senior students.

In the programme particular reference must be made to engineering Research for which there is now separate provision to carry on, independently of the regular courses of instruction in the Faculty, by the employment of specially selected personnel under the heads of the various departments, utilizing the laboratory and other equipment at hand. Too much cannot be said of this work or of its inevitable effect on the industries and the application of science throughout the community. In electrical and chemical work much has already been accomplished and the full programme for the coming year in these and other branches is, it is hoped, only the commencement of a great work in the service of the country.

It may be said that such an extensive programme is beyond the compass of a four years college course. This is fully recognized but it is realized that a way must be found to introduce at least a portion of the fuller curriculum either by curtailing the present in the less essentials or by the introduction of a fifth year which is the alternative. This is for serious future consideration.

To summarize the foregoing considerations of the curriculum it will be observed that there are three main divisions all of which are common to the various courses and department of Civil, Mechanical, Electrical Mining and Chemical Engineering, and Architecture. First—the sciences, mathematics, physics, chemistry and mechanics; Second—the graphic and mechanical arts, drawing, design and practical field or shop work; Third—the humanities, English, economics, languages, and possibly philosophy.

Value of the Broad Curriculum

It is not radical to make these and their subsidiary subjects common to all departments for it is obvious that, for instance, the civil engineer must know something of electrical, steam, gas and other mechanical work; the electrical engineer of to-day must know something of hydraulics, masonry construction, railways, bridge building and even tunnelling, while the municipal and sanitary engineer must know considerable about electrical railways and pumps, steam engines and hydraulics in connection with the broad subjects of civics.

To pass further to these considerations and view them on a still broader horizon, the three main factors in the actual practice in which the graduate will engage may be resolved into scientific theory, the methods and practice in this application and the economic considerations. It has been said by some, with respect to the latter, that it is time enough when the graduate walks out into his professional life. Not so; if, when he is at the University, he has not been able to co-ordinate sicence and practice and obtain a sense of the economy of their application, he is going out into the world ill fitted to take his place alongside the men who are already there; much less to attain to be a leader amongst them. More than this, the complex industrial conditions of to-day are understandable only by long, careful study by thinking men living in close contact with industry; how much better it is to give the student while at college his first acquaintance with these complexities and his basic principles of industrial management. The philosophy of values and costs, the psychology of labour and industrial problems and skill in expression in writing and speech are all subjects worthy of attention whilst the student is still at college. The practical academic process by which these can all be combined into one course of study in senior years seems reasonable when one considers how for instance a complete project from its inception may be followed through to its conclusion by a series of problems for class discussion, outside study in operating concerns, broad reading and an ultimate report of a comprehensive character.

In considering the problems of values and costs, of labour and industrial conditions and their relation to production which is now paramount in this country, it must be born in mind that "the control of engineering lies in the hands of those who judge most accurately what enterprises men value sufficiently to be willing to assume the cost." Because engineering education has heretofore been confined mainly to technology the engineer has seldom been placed on executive governmental commissions or other public boards—boards and commissions that must decide on how public funds shall be extended on enterprises that are essentially engineering in character. Why has it happened too frequently in the past that the engineer has been called in to do the technical work of design and construction only after a board comprised of lawyers, bankers, doctors, clergymen, merchants or politicians had made a decision as to whether, from a standpoint of values and costs and other economic considerations the project under discussion shall in whole or in part go forward to construction." It is encouraging to know, however, that the idea is now developing that the public interest would be better served if the engineer had a greater voice in making such decisions.

Now to meet this new value which the public is beginning to place on the engineer what are we going to do about his education? This is a distinct demand if there ever was one, and the Universities should be the first to hasten to meet it. If the engineer and the applied scientist are to be prepared to take their proper places in the community they must be trained to appraise correctly what men consider to be worth while.

Qualities of the Engineer

And here let us consider for a moment what attributes and values the public will place on the engineer when he goes out into life. If he is going to be something more than a technologist what more must he be? This is a question which has been asked for some years in the searching that has been going on in the engineering profession on this continent not only with a view of training the young generation but in consideration of the whole relation of the engineer to the public. An inquiry was instituted two years ago by the Carnegie Foundation and in connection with that admirable study of the whole situation by Professor Mann, *A Study of Engineering Education*, the following question was put to the engineering profession at large from whom fifteen hundred replies were received, "What are the most important factors in determining probable success or failure in engineering?" It may not be a surprise to you to learn that for the first requisite, personal qualities were placed above everything, and these attributes were given seven times as frequently as were the knowledge of engineering science and the technique of practice. A second circular letter stating this result was then sent to the members of the great national engineering societies, each being asked to place in sequence of value six groups of those qualities head respectively, Character, Judgment, Efficiency, Understanding of Men, Knowledge and Technique. Over seven thousand replies were received and their votes placed Character at the head by 95 per cent., while Technique was voted to the bottom by an equally decisive majority.

Therefore, as Engineering and Applied Science expand into the new fields opening before them, the conception that character, judgment, efficiency, and understanding of men, are no less necessary than technical knowledge and skill will become more and more impelling, and it will become more and more essential that engineering colleges pay greater attention to the effect of their work on the development of the students."

An Instrument for Measurement of Rail Wear

Alexander D. Ferguson, A.M.E.I.C., Winnipeg, Man.

Many instruments and mechanical devices have been used from time to time in endeavours accurately to measure the "wear" on rails. Most of these have been of a "caliper" variety and have, I believe, not given great satisfaction for two reasons, viz.:—the uncertainty, firstly, that each measurement is taken in the same relative position with regard to the perpendicular axis of the rail and secondly, that, as usually only one measurement is taken at each point, such reading may not represent accurately the rail wear at that point. The instrument herein described does away with both of these primary objections and readily lends itself for use with any rail section with great speed and accuracy.

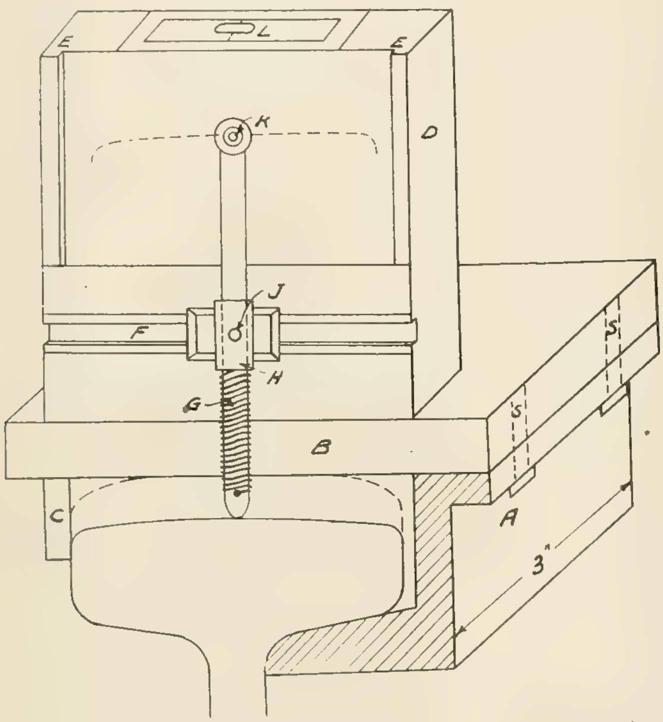

Fig. 1

The device consists essentially of :—(See Fig. 1.)

a. A casting of hard babbitt, cast against a new rail of the same section as the one to be measured, so as to give good contact with the under side of the rail head and also to fit tight into the curve where the rail head meets the web. As in the figure there is a little clearance between the side of the rail head and the edge of the casting to allow for a fit even if the rail head is battered over. A different casting is used for each different rail section. The castings are fastened to the recorder by screws S, S.

b. A mahogany plate about ⅜" thick with a clamp C, which moves in a slot and can be pushed hard against the outer edge of rail and screwed tight by a thumb screw, thus giving the instrument great stability when sitting on the rail. Behind is a single screw reaching down to the rail head which is used to level the instrument—using small level on the top as an indicator.

d. An upright mahogany plate with two slots E for the reception of cards, which are kept in position by a screw at the back of D.

f. A horizontal slot in which G has a free sliding movement.

g. Is of steel (hardened at the lower end but not sharpened to a point), G also has free vertical motion in sleeve H, which is fitted with a small screw J to clamp G when not in use. At the upper end of G there is K an attachment containing a pencil which by means of a spring can be kept pressed against a card inserted in E, E.

Method of Taking a Reading

The under side of the rail head is cleared of all debris. (When the setts are of wood this is easily accomplished, but when of stone it is necessary to cut these out with a stone chisel—the time taken in this operation is small as it is only necessary to cut out an opening 3" x ½" in to the web of the rail). The requisite casting is screwed on and is pushed under the flange side of the rail until good contact has been established; C is then pushed hard against the outer edge of the rail, screwed up tight and the instrument levelled up.

A card is inserted in E. E, and G is released so that the lower end rests on the rail head; K is then released so that the pencil presses hard against the card. G is then drawn across the face of the instrument and K makes an exact tracing of the rail head on the card, which is then taken out and the location, weight of section, etc., written on the back. By repeating this process at convenient intervals a graphic representation of the rail head over a certain route or routes is obtained.

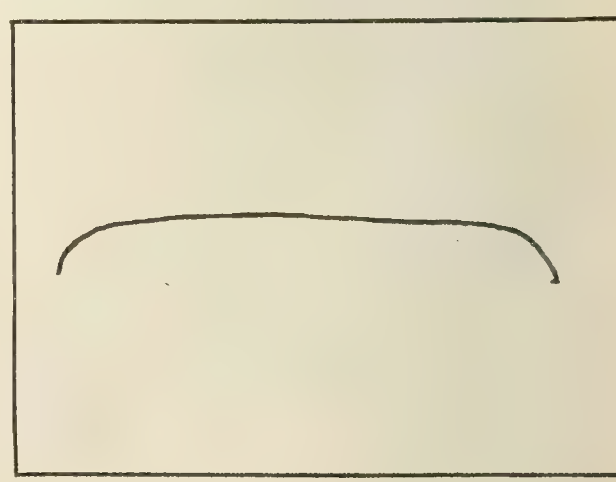

Fig. 2

Fig. II shows a representative set of cards. The instrument is set up on a new rail of the same section and the graph of this superimposed on the cards as in Fig. III.

This is the final card, and the shaded area represents accurately the portion of the rail head worn off at that point. By means of a planimeter this area is readily taken off; say, area is A.

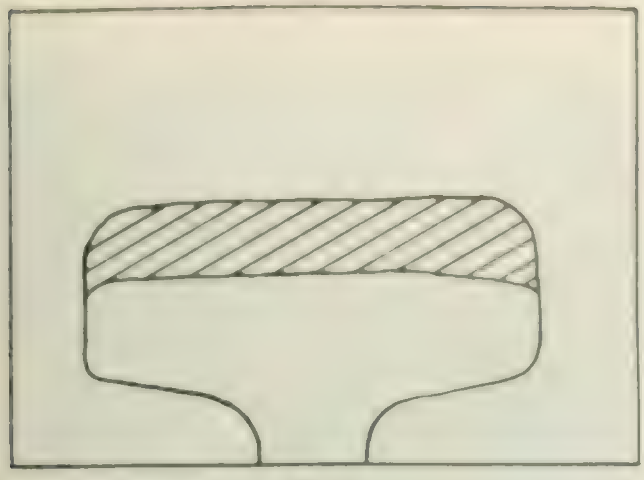

Fig. 3

If for any purpose it is desired to express the area worn off as a percentage of total allowable wear, the allowable wear must first be definitely ascertained. Suppose that when a rail has worn to a depth "w" on the central perpendicular axis it should be discarded, i.e., it has depreciated 100%. This distance is measured on a carefully drawn plan of the rail, the area of total allowable wear (B) deducted (by planimeter). Then A/B is the percentage of wear or represents the percentage of depreciation.

Below are some sketches of actual graphs of rail heads taken by the writer while conducting a series of measurements over the whole tracks of the Winnipeg Electric Railway during the Appraisal by the Manitoba Public Utilities Commission, (over 1200 readings were taken covering approximately 172 miles of track.)

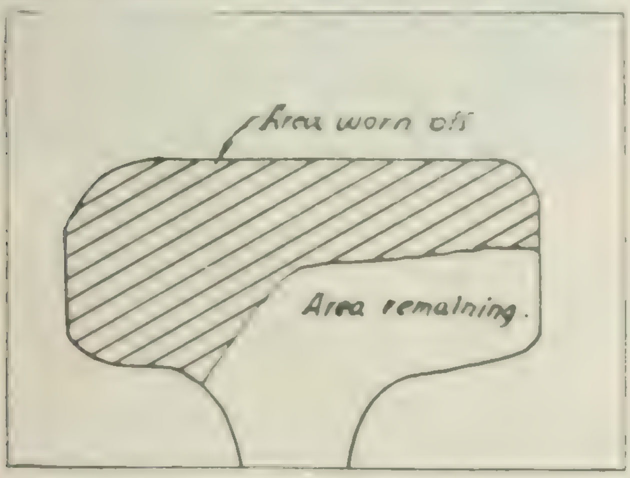

Fig. 4

Fig. IV.—70 lb. A.S.C.E. rail, more than 60% of the total head area of the rail was worn away.

Fig. 5

Fig. V.—60 lb. A.S.C.E. rail—an example of rolling or flow of metal.

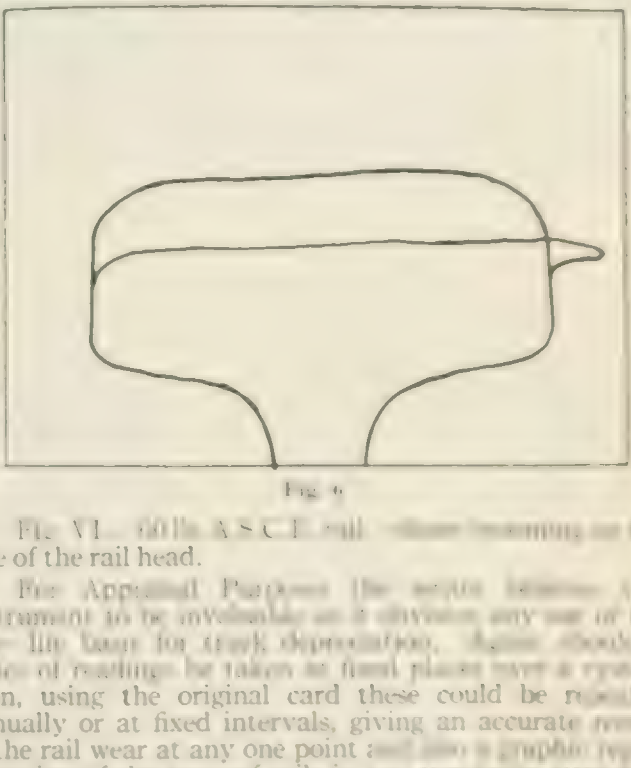

Fig. 6

Fig. VI.—60 lb. A.S.C.E. rail—shows becoming on the side of the rail head.

For Appraisal Purposes the writer believes this instrument to be invaluable as it obviates any use of the age-life basis for track depreciation. Again, should a series of readings be taken at fixed places over a system, then, using the original card these could be repeated annually or at fixed intervals, giving an accurate record of the rail wear at any one point and also a graphic representation of the state of rails in any particular stretch of track.

The writer is much indebted to Mr. Hypes of Winnipeg for his great interest and care in making the first instrument from very rough sketches, and for working out some important details.

To W. M. Scott, Esq., M.E.I.C., under whose direct supervision the Appraisal of the W. E. R. properties has been carried out, the writer's thanks are also due for his great interest and permission to develop and thoroughly test this new departure for the accurate measurement of wear of rail heads.

"Recent Experiments with Straw Gas"

By Professor A. R. Greig, A.M.E.I.C.

About three years ago, Mr. Harrison of Moose Jaw discovered that he could obtain a combustible gas from straw. He experimented with it for a time and took out some patents on the process.

The Agricultural Engineering Department of the University of Saskatchewan, through Doctor McLaurin, obtained Mr. Harrison's apparatus. It, however, had been through the fire at his foundry, and had to be completely rebuilt.

Experiments have been conducted for two winters, and in order that it may be known what has been done, the results, as far as we have gone, are set forth in what follows.

About 12 or 13 years ago, the city of Brandon experimented with straw in a gas plant, but it did not prove a success. The superintendent of the Winnipeg Gas Works at that time was of the opinion that it would not prove satisfactory.

The following is a description of Mr. Harrison's plant, and other apparatus used.

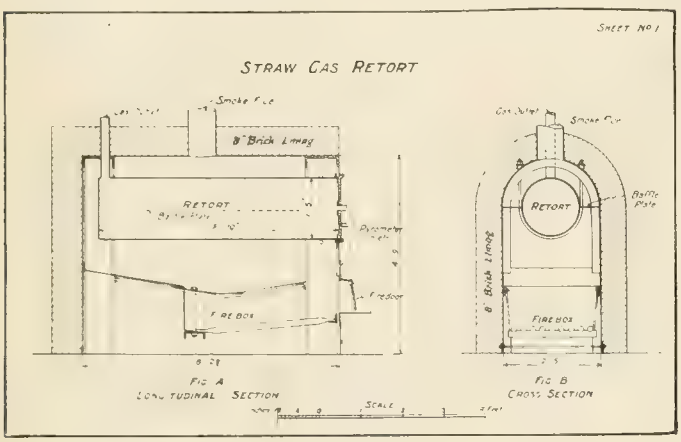

Fig. No. 1

Plate 2—Retort and Pyrometer Equipment

Plate No. 1 diagram A shows a vertical longitudinal section, and fig. B a vertical cross section through the retort and fire-box. This retort held a bale and a half of 100 lbs. of straw when compressed. The means taken for compressing the straw in the retort is shown on plate No. 3, fig. C. It consists of a large screw-press, the screw of which is 1½ inches in diameter and has four threads per inch. The plunger is of wood with an iron plate to take the thrust of the screw. The retort was filled with straw which was then compressed several times before 100 lbs. of baled straw could be put into it.

The removal of the char from the last days burning and the filling of the retort usually took 2½ hours of one man's time. The char when removed, on coming in contact with the air, often started to burn. It was practically all carbon and weighed 38 lbs. on the average. A great deal of the heat value of the straw is contained in this char.

The furnace was fired with straw and it took from 425 to 450 lbs. of good wheat-straw to distill one retort full of straw. The temperature in the fire box was kept at about 1500°F., which meant that the retort was a cherry red colour. A number of holes in it were burned in the retort, which were welded with the oxy-acetylene process. The last time a hole was burned it was found necessary to cut out a considerable portion of the bottom of the retort and weld in a new piece of steel.

Read before Saskatchewan Branch, September 11th, 1919.

The distillation usually took from 6 to 7 hours. Any attempt to shorten this time resulted in a higher temperature of the retort, and partial gas leaks and consequent burning of the retort.

Last winter pyrometers were kept, one in the fire box, one in the centre, and one three and one-half inches in from the side of the retort. Readings were taken at five minute intervals. It was found that the temperature in the fire box rose very quickly. The temperature as shown by the pyrometer three and one-half inches inside the retort would go up in a short time to slightly over 200° and stay there for nearly two hours.

The temperature would then rise once more at a nearly uniform rate of 200 to 225°F. per hour. The pyrometer in the centre would follow very slowly, until a final temperature of 1000 to 1100°F. was reached, after which the flow of gas ceased.

The gas was taken off through the gas outlet pipe shown on the top near the back end of the retort (Plate 1, fig. A). It started to move the meter about 30 minutes after operations were begun and came off at a nearly uniform rate of about 2 cubic feet per minute for from 2 to 3 hours, gradually diminishing after that period. An average of 500 cubic feet of gas was obtained from 100 lbs. of wheat straw. It is doubtful if the last 50 cubic feet were worth the extra fuel and firing.

Date 1919	Straw in Retort	Time Firing	Fuel Used	Gas Cu. ft.	Char Lbs.	Fluid Lbs.
April						
8	100 lbs.	7 hrs.		450		37
9	100 "	7-5	435	450	39	38
10	105 "	7	440	450		38
11	105 "	6-20	455	500		39
14	105 "	7-25	450	525	38	38
15	100 "	6	Wood	525		

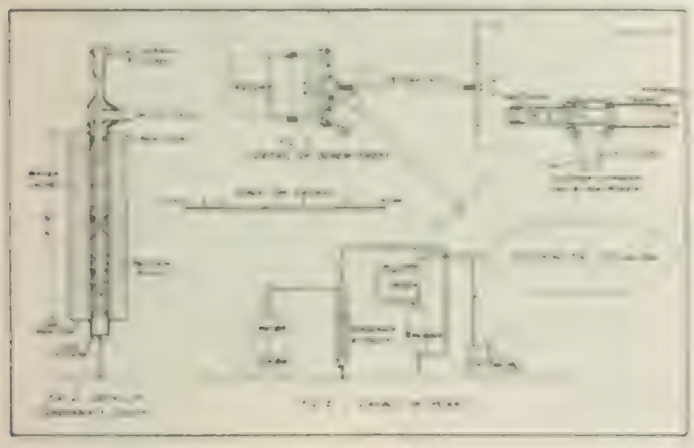

Fig. No. 5

D-45 McLaughlin car fitted for straw gas

The gas was taken from the retort to the cooler and condenser shown on Plate No. 2, Fig. D. Here the gas was taken down the centre pipe to near the bottom, returning up between the inner and outer pipes, the whole apparatus being enclosed in a jacket of running water. The inner pipe was fitted on the outside with a number of galvanized iron aprons filled with small holes to aid in the throwing down of the fluids condensed. About 38 lbs. of a heavy tarry liquid was obtained from the 100 lbs. of wheat straw, a considerable portion of which was evidently water.

The gas left the cooler at a temperature of 80 to 100°F. It was then piped to the scrubber shown on sheet No. 1, fig. E. This consisted of a steel tank, 15" dia. x 3/4" high filled with iron cuttings and charcoal, and having a spray of water on top. From the scrubber the gas was taken through the meter to the retaining bag or engine as desired.

This gas has a heat value of nearly 400 B.T.U. per cubic feet, while coal gas has a heat value of 650 B.T.U. per cu. ft.

Engine trials: It was found that the straw-gas was considerably different gas to deal with than gasoline vapor. After a good many trials we settled on a compression ratio of 5:2. Some fairly good brake horse power trials were obtained when a number of indicator cards were taken. These show an explosive pressure of 260 to 280 lbs.—much less than that obtained with gasoline. The trials were run on a 4 horse power International Harvester Co. engine. The bore of the cylinder is 4½", the stroke 7½", rated revolutions per minute 400. 5 brake horse power were obtained at 500 R.P.M. on a fuel consumption of 37.5 cubic feet per horse-power-hour. The 500 cubic feet ran the 5 horse power engine for 2 hours and 40 minutes.

Assuming the heat value as given above, this gave us practically the same thermal efficiency as was obtained on the same engine using gasoline. The mixing device is very simple. It is shown on Plate No. 2, fig. F. The gas inlet pipe is 1″ diam., the air inlet 1½″ diam., the tee 1½″ diam., reduced to take the one inch gas pipe as shown.Both air and gas pipes were throttled. It was found much easier to start on a gasoline priming than on the gas.

A D-45 McLaughlin car loaned by the Saskatoon branch of the McLaughlin Carriage Co., was fitted up with a 300 cu. ft. gas bag as shown in the photograph. The gas and air were mixed in the same way as for the small stationary engine, only the fittings were larger. The mixture was piped to the carburetor inlet so that by closing off the gas the car could be run on gasoline. The engine was started in this way, the gas valve was then opened, and the needle valve of the carburettor closed. The car was run only a short distance on straw gas before it stalled.

The 300 cu. ft. bag of gas has less heat value than one gallon of gasoline, so that it will readily be seen that it does not give promise of being a substitute for gasoline.

Summary:—By one man working 8 to 9 hours cleaning, filling the retort, and firing, 500 cubic feet of gas can be obtained from 100 lbs. straw and 450 lbs. of straw used as fuel, the total heat value of which is nearly 200,000 B.T.U., or an amount equal to what could be obtained from a scoop shovel full of good coal (16 to 18 lbs.)

To heat an ordinary 7 room house in Saskatchewan with straw gas, a gas holder of 4000 cu. ft. capacity would be necessary for 24 hours heating on the cold days. To fill this holder, 800 pounds of straw gas would have to be distilled and about 3600 pounds of straw would be used as fuel. Less fuel could be used if a battery of retorts were used.

Regulations of the Governor in Council as Required by Section Five of the Canada Highways Act.—A. W. Campbell, M.E.I.C., Highways Commission.

Sec. 5—The Governor in Council may make such regulations to be published in the "Canada Gazette" as are deemed advisable for giving effect to the objects and purposes of this Act.

Section 1—Work to be Aided

The highways to be aided under the Act shall comprise such main and market roads as have been designated by the Province as hereinafter provided with a view to encouraging production and stimulating trade and commerce, and as shall be approved by the Minister.

Section 2 Customary Highway Expenditure to be Supplemented

It is understood that the expenditures called for under the Canada Highways Act are intended to supplement the usual amounts granted and devoted to the construction and improvement of its highways by the Province itself.

Section 3—Method and Form of Making Application, Preliminary Procedure

Before an agreement is made with respect to any road or roads, there shall be furnished to the Minister by the Provincial Government a statement setting forth a programme for construction or improvement of a system of highways in the Provinces from which projects shall be selected. Such statement shall be accompanied by a general map of the proposed programme, bearing the approval of the Provincial Government and the endorsement of the Highways Department thereof. Each Provincial programme shall include, first, roads having greatest local agricultural and commercial importance, and second, roads having both local and general importance, and these programmes shall be so adjusted and arranged that the whole shall be correlated and form, as far as possible, a general system of Inter-provincial highways. This programme and amendments thereto shall be satisfactory to the Minister, and applications relating to the construction of specific portions thereof shall be made from time to time as provided for in the following section.

Section 4—Method and Form of Making Application, Project Statement, Plans, Specifications, Estimates, Etc.

Each application for aid shall be embodied in a project statement, on forms which may be had on application to the Commissioner of highways of the Department of Railways and Canals, which shall contain the following information and exhibits:—

(*a*) The purposes the undertaking will serve, and why it is in the public interest;

(*b*) The character and extent of traffic, present and prospective on the road;

(*c*) How the undertaking relates to the Provincial programme;

(*d*) A statement of the type of construction or improvement it is proposed to make, together with a report of the Engineer of the Provincial Highways Department endorsing the adoption of the proposed type and the design thereof as being the most economical and practicable in the public interest, his reasons therefore, and a full explanation of any special or unusual features thereof;

(*e*) The administrative control of and responsibility for the undertaking ;

(f) The source and method of procuring the necessary money for the undertaking and the extent to which interested municipalities contributed thereto;

(g) Plans in standard form to be prescribed by the Minister and in detail following accepted engineering practice, together with a sketch map showing the position of the proposed project on the general programme map of the Province;

(h) Specifications in standard form to be prescribed by the Minister setting forth the proposed type and method of construction, materials to be used, and other essentials, in such detail as to afford complete knowledge of all steps to be taken in carrying out the project;

(i) Copies of the form of contract to be used, together with all documents referred to therein or made a part thereof; and

(j) Estimated cost of the project, giving a schedule of quantities and the estimated cost of each item in detail.

All project statements, plans, specifications, estimates and other papers required in connection with any application of a Province for aid under the Act shall be forwarded to the Commissioner.

Section 5—The Agreement

When a project statement has been approved by the Minister an Agreement as provided for in the Act between the Province and the Minister shall be executed in triplicate by the Province on a form furnished by the Commissioner.

No payment under the Act shall be made until such agreement has been executed by the Minister nor shall payment be made for work done prior to such execution unless with the express approval of the Governor in Council which approval shall not be given in connection with work done prior to the coming into force of the Canada Highways Act or not done in accordance with these regulations.

Section 6—Tenders and Contracts

All expenditures shall be made pursuant to tender and contract, except as provided by the act, and shall be on the basis of unit prices. Tenders shall be called for at least three weeks before the work is to be let and notice of the calling for tenders shall appear in a contractors' or engineering journal as well as in such local newspapers as the Province deems necessary.

Section 7—Payments

In determining the actual necessary and reasonable cost of any highway for the purpose of fixing the amount to be paid under the Act, the cost of the following shall not be considered as a part thereof.

The cost of right of way and incidental damages, bridges, viaducts, subways, exceptional grade separations, provincial overhead and administrative expenses, the making of surveys, plans, specifications and estimates, or any engineering expenses incident to the project prior to the beginning of actual construction. The cost of culverts having a clear width of opening of not more than twenty (20) feet may be included.

Certified vouchers showing the amounts expended on each section of completed road, also showing the amounts, if any, expended on any uncompleted sections up to subgrade at the termination of each fiscal year during the five year period commencing April 1, 1919, shall be submitted to the Commissioner, and when he has certified that the terms and conditions of the agreement, in respect of the plans and specifications attached thereto, have been carried out as far as relates to such sections, forty (40) per cent of the cost thereof as defined by these regulations and expressly subject to section five thereof, will, upon authority of the Minister be paid to the Provincial Treasurer, or other person named in the agreement to receive the same.

Section 8—Records

Such records of the tenders submitted, of the cost of the work, of the inspections made, and tests of materials shall be kept by the province as shall enable the Commissioner at any time to determine the cost to the province and the status of the construction work done on any project. These accounts and records together with all supporting documents, shall be open at all times to the inspection of the Commissioner or his representatives, and certified copies thereof shall be furnished at his request.

Section 9—Inspection

The supervision of each project by the Provisional Highway Department shall include adequate inspection of work and material by competent engineers throughout the course of construction. To this end, any recommendation of the Minister to the Provincial Government with respect to the necessary technical qualifications and experience of the members of the highway organization will be enforced by such Government.

Section 10—Maintenance

Each Province shall agree that when the roads or highways constructed or improved with Federal aid shall have been accepted as completed, the Province shall maintain or cause the same to be maintained, with all necessary repairs and renewals, so as to preserve the standard of construction of each particular class of completed road or highway.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. January 1920 No. 1

New Year Wishes

The Executive Committee of The Journal extends to all members of The Institute heartiest greetings of good will and best wishes for a happy and prosperous nineteen hundred and twenty.

Annual General and Professional Meeting

The Annual General Meeting of The Institute will be held at Headquarters on Tuesday, January the twenty-seventh at ten A.M.

Following the Annual Meeting will be a General Professional Meeting Wednesday and Thursday, January twenty-eighth and twenty-ninth, under the auspices of the Montreal Branch of The Institute. The Montreal Branch executive and membership has been engaged for several months past in arranging the programme and details of this meeting, which they have planned to make the greatest and most enjoyable gathering of engineers yet held in Canada.

A large attendance of ladies is anticipated, for whose entertainment special arrangements are being made, in addition to most of the regular functions at which they will be welcome.

Kindly keep these dates in mind, plan to be present and get the benefit of the inspiration that such a meeting presents with the added opportunity of a closer contact with your fellow engineers from all parts of Canada.

Town Planning in Canada

Of one Canadian city, interested in town planning, it was recently remarked that to bring a town planning scheme into effect two things were necessary—a topographical map and legislation. Granted that there exists an urge for a development that will be healthful, pleasing and yet economic and with due regard for commerce as the general *raison d'être* of large centres, then the degree of excellence of a topographical map and the scope of town planning legislation may be accepted as some measure of the success of town planning.

Judged by such standards, Canada is greatly handicapped by the fact that there exist no accurate topographical maps of a scale sufficient to exhibit in detail, features that must be considered in planning. We are indebted to various Federal Government Departments for topographical maps of various parts of Canada. The scale is generally one to sixty-three thousand, three hundred and sixty, or thereabouts, (one inch to one mile), and the maps which cover but a small part of the Dominion, are, therefore, as a rule, of value for regional planning only.

The need for accurate and detailed topographical maps and their usefulness for all engineering purposes have of course long been recognized. Of recent years, Major D. H. Nelles, M.E.I.C., has given particular thought and study to the matter as viewed in the light of experience in Europe and in the United States. He has specially urged the preparation of topographical maps for our Canadian cities. The scales he advises are 1 to 1,000 (one inch to eighty feet, approximately) for detailed city topography with reduction to one to ten thousand (one inch to eight

Members having copies of the October number of The Journal, which they do not wish to keep for reference, would confer a great favor by mailing them to the Secretary. About twenty copies are required.

hundred feet, approximately), where studies of the city as a whole are to be made, and also the latter scale for topographical maps for rural or regional areas. It is with difficulty that the average citizen can be made to grasp the necessity for a detailed topographical map when he knows there already exist compilations of subdivision plans. Such compilations are, of course, practically worthless for purposes of planning or development. Town planning schemes being carried out in Canada have had to contend with the handicap of poor maps.

In May, 1919, there was compiled by the South Australian Town Planning and Housing Association, information in regard to town planning legislation (existing and proposed), in various parts of the world. With but one or two amendments or additions this information is submitted as follows:—

Europe:

Italian Municipal Town Planning Act (since amended and extended), 1865.

Swedish Town Planning Law (1867).

Prussian Town Planning Act (1875), since extended and supplemented by other legislation applicable to all German States.

Town Planning legislation is also applied by councils and state Authorities in Holland, Belgium, France, Austria and other European Countries.

Britain:

Housing and Town Planning Act, 1909, amended by Housing and Town Planning Bill, 1919, assented to 31st July, 1919.

Canada:

Town Planning Acts have been passed in the following Provinces:—Prince Edward Island, 1918; Nova Scotia, 1912 and 1915; New Brunswick, 1912; Ontario, 1918; Manitoba, 1916; Saskatchewan, 1917; Alberta, 1913.

India:

Bombay Town Planning Act, 1916; Madras Town Planning Bill, 1918.

South Africa:

Transvaal Town Planning Bill (in draft).

Ceylon:

Housing and Town Improvement Ordinance, 1915.

Japan:

The Town Planning Committee of the Imperial Japanese Government is now at work.

United States:

City Planning Acts have existed for some time in the following States:—California, Massachusetts, New Jersey, Ohio and New York.

The following State Legislatures this year have passed or are about to pass similar Acts, namely:—Michigan, North Carolina, Texas, Utah and Indiana.

City Planning Commissions.—In the United States during 1918 there were 34 city or town planning Commissions at work, preparing for the planning and development of their cities and towns.

During 1917 the number of cities and towns with planning and development schemes of similar kinds in hand had increased to 230, many of which have considerably less population than Adelaide and suburbs (about 200,000).

Australia:

South Australia.—Town Planning and Development Bill, 1918, following Town Planning and Housing Bill, 1916.

New South Wales.—Town Planning Bill (in draft); Greater Sydney Bill (1918) (with town planning chapter), passed House of Assembly.

Queensland.—Greater Brisbane Bill (as above) in draft.

Western Australia and Tasmania.—Town Planning Bills (in draft).

Victoria.—Town Planning Bill promised since 1915.

New Zealand:

Town Planning Bill, 1918, introduced in Parliament and now under consideration in accordance with the recommendations of the New Zealand Town Planning Conference and Exhibition, 1919.

Canada's progress in legislation as compared with other countries can be gathered from the above. It might be of interest to returned men from France to know, as some of them probably do know, that in that country which affords such a splendid example in planning as Paris, town planning is now compulsory. Under the amended British Housing and Town Planning Act, 1919, town planning there is now also compulsory. By a certain date every town or area with a population of 20,000 must prepare a town planning scheme.

Similar in this respect to most countries, town planning legislation in Canada comes under provincial and not federal jurisdiction. The result is that in this Dominion some provinces have acts more advanced than those in other provinces, while two provinces have as yet passed no town planning legislation. The passing of advanced provincial legislation has been due largely to the efforts and with the advice of the Federal Commission of Conservation.

No town planning act can be fully effective if it fails to control building development as well as the mere planning of streets or parks. Town Planning in its broad sense includes "Housing" as a special form of building development. Effective housing, consequently, should be a part of or correlated to town planning. To avail themselves of the federal loan of $25,000,000 for the provision of homes for workingmen, and particularly returned soldiers, most of the Provinces have passed special housing legislation. In a number of instances the housing schemes have been, and in other cases are proposed to be, of such a size as to permit of town planning treatment, which is encouraged by most of the Housing Acts or regulations, and in one Province (Quebec) such is to be the only housing carried out.

To round out a trinity of requirements for effective town planning, to a topographical map and legislation, there can be added education. To a number engaged or interested in town planning in Canada this latter need became a pressing one. The immediate urge came from the Association of Dominion Land Surveyors and resulted in the formation of the Town Planning Institute of Canada. The first annual meeting of the Institute was held on the 31st May, 1919, and there are now some ninety members, architects, engineers, surveyors, associates, and up to the present one legal member. The membership of the American City Planning Institute, with whom a joint conference was held in October last, numbers, it is understood, only about sixty.

The objects of the Town Planning Institute of Canada are largely to promote university courses in town planning, and by local branch meetings to aid in the education of the members along the various architectural, engineering and surveying activities connected with town planning.

All the provinces in Canada suffer from the lack of real city topographical maps, some provinces from the lack of advanced town planning legislation, and some from the lack of taking full advantage of existing legislation. Endeavours are being made to have these deficiencies made good. And through education the spirit of town planning is spreading. The primary appeal of town planning is undoubtedly a moral or ethical one, and is to those who love their fellowmen. But its aim is economy, not only ultimate economy as regards human life but immediate economy in the carrying out of engineering projects. Possessed of a real desire for human betterment it opens up to the engineer unlimited possiblities for development in his profession.

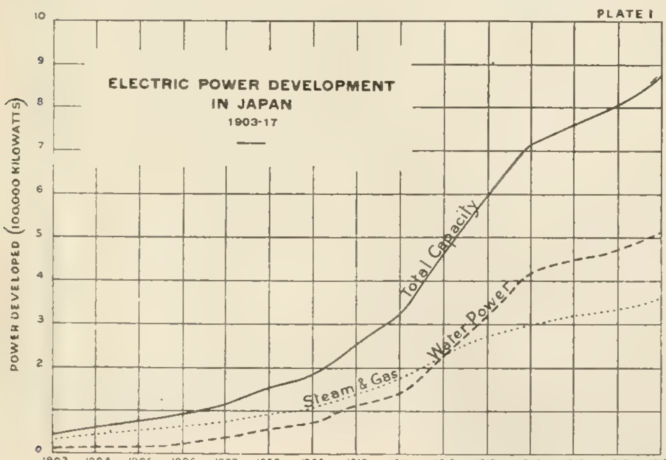
H. L. SEYMOUR, A.M.E.I.C.

Japanese Hydro-Electric Enterprise

For some years we have been aware that the electric industry in Japan was making remarkable progress, but anything like a complete record of the industry was not available.

In June last the Japanese Department of Communications issued a "Statistical Report of Electric Undertakings in Japan," from which the following information is compiled.

PLATE I



Attention is first called to Plate I which shews graphically the progress of electric power development in Japan from 1903 to 1917. The total kilowatt capacity (including reserves), increased from 44,252 k.w. in 1903 to 875,563, in 1917. During this period the capacity of electric plants using steam or gas as their primary source of power increased from 31,128 k.w. to 364,473 k.w. while water power made the enormous stride of from 13,124 k.w. to 511,090 k.w.

The most rapid progress was made during the five pre-war years (1910-1914), during which period the water power development nearly quadrupled while the steam or gas development only doubled.

PLATE 2

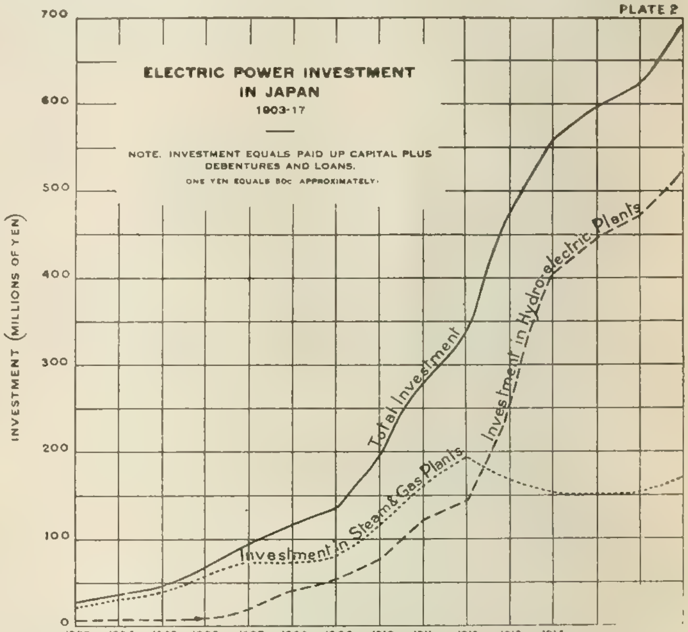


Plate II shows the growth of the actual capital invested (paid up capital plus loans or debentures), in electrical undertakings in Japan during the 1903-1917 period and indicates that since 1912 water power investment had nearly quadrupled whereas the investment in electrical undertakings using steam or gas has actually diminished. The total investment in electric power undertakings has grown in fifteen years from about 26 million yen to 693 million or roughly 13 million dollars to 346 million.

The foregoing shows in no uncertain manner that the central electric station industry is growing very rapidly in Japan and further that water power has overtaken other sources of power and is lengthening its lead steadily.

That water power would normally attain first place as the principal prime mover in Japan is evident, but the war-changed conditions demand that this source of power shall bear an immensely increased share of the burden, and both the government and private companies are taking active measures for further large scale water power developments.

A special committee of the Osaka Chamber of Commerce submitted a report to the government pointing out that coal—one of staple commodities of modern civilization—was both scarce and expensive, and that, therefore, it was vitally necessary to develope the hydro-electric industry to minimize coal consumption. This committee suggests that the government publish as far as possible the results of its hydro-electric investigations, that it afford every facility for private hydro-electric investigations, that it simplify proceedings and expedite development as far as possible.

Water Power activity in Japan is by no means confined to Chamber of Commerce resolutions. The Japanese Government has recently issued a bulletin outlining the extent and scope of the Water Power Survey. The intention is to expend 800,000 yen ($415,000 approximately) on the work between 1918 and 1922. Twenty-two survey parties will investigate 635 power sites on 200 rivers, establish 570 gauging stations and 116 new meteorological observatories. The approximate total power available is estimated at over two and one-half million continuous horse power or upwards of five million under average flow.

Yet another indication of Japanese enterprise in hydro-electric matters is the recent formation of the Japan Hydro-electric Company the capital stock of which is said to have been heavily over-subscribed. The increase of coal costs from 30 yen to 150 or 160 yen per ton, was seriously militating against Japanese industrial progress, consequently the several interests controlling the Electric Light Companies of Osaka and Kyoto, the Hokuroku Electro-Chemical Company supported by their friends in Tokyo, Osaka, and Kyoto, and elsewhere pooled their interests and organized the Japan Hydro Electric Company with a capital of fifty million yen ($25,000,000). This Company proposes to develope, within two years, 105,000 k.w., from the most convenient water powers, the rights of which are held by the above mentioned three companies.

The completion of these works will, according to estimates, enable the Japan Hydro-Electric Company, since it becomes possessed of the steam power stations of the Osaka and Kyoto companies (125,000 k.w. and 8,000 k.w. respectively), to dispose of 300,000 k.w. and further, by virtue of its amalgamation with the Hokuroku Electro-Chemical Company, to secure a large and profitable market for its surplus and off-peak power.

LIBRARY NOTES

Books Received

The following books have been received, and are to be found in the Library of *The Institute*.

British Engineering Standards Association Reports:—

No. 7, 1919	Dimensions of Insulated Annealed Copper Conductors for Electric Power and Light.
No. 47, 1919.	Specification and Sections of Steel Fishplates for Bull Head and Flat Bottom Railway Rails.
No. 81, 1919.	British Standard Specification for Instrument Transformers.
No. 86, 1919.	Report on Dimensions of Magnetos for Aircraft Purposes.
No. 89, 1919.	Specification for Indicating Ammeters, Voltmeters, Wattmeters, Frequency and Power Factor Meters.
No. 90, 1919.	Specification for Recording (Graphic) Ammeters, Voltmeters, and Wattmeters.
No. 100, 1919.	Specification for Falling Weight Testing Machines for Rails.
No. 101, 1919.	Sections of Light Flat-bottom Railway Rails and Fishplates.
No. C.L., 7270.	Interim Report on British Standard Whitworth Screw Thread and their Tolerances.
No. C.L., 7271.	Interim Report on British Association Screw Threads with Tolerances for Sizes Nos. 0 to 12 B.A.

CORRESPONDENCE

Editor, Journal: Jasper, Alta.

Dear Sir,

I send you herewith as a contribution to *The Journal of The Engineering Institute of Canada*, what I believe to be a new method of employing the prismoidal correction in calculating earthwork quantities.

During the war I have been somewhat out of touch with the proceedings of the various engineering societies, and it may be presumption on my part to say that the method is new. At any rate I cannot find any reference to it in the text books at my command, nor in the instructions to resident engineers on railways or highways. In this way this article may be of interest to members of *The Institute* engaged on works of this nature. I believe that one reason for many engineers labeling the prismoidal formula as an "unnecessary refinement" is the difficulty in applying it to all forms of earthwork prismoids.

Yours faithfully,

J. GRANT MACGREGOR, A.M.E.I.C.
Resident Engineer, Edith Cavell Highway

A New and Rapid Method of applying the Prismoidal Correction in Computing Earthwork Volumes

The usual method of computing earthwork is by taking the quantities from a table giving cubic yards for the sum of the end areas, and basing the correction for the prismoidal formula on the difference in width and depth of the two cross sections, representing the form of the prismoid. In order that the prismoidal correction can be applied in this manner, there must also be a similarity of form between the cross sections.

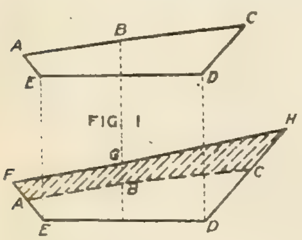
To compute earthwork accurately the cross sections must at least represent the average contour of the ground lying between them, and it is sometimes difficult to do this by what is known as a three or five level cross section in order that the prismoidal formula may apply.

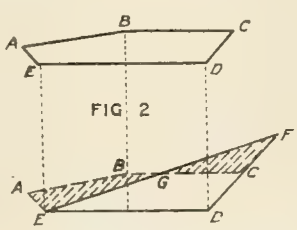
It may not have occurred to many engineers that the prismoidal correction may be based, not only on the general dimensions and form of the prismoids, but also on the ratio which the two end areas bear to one another. The assumption is that a prismoid of unequal end areas is composed of a number of small prismoids, the unit being a square foot at the base for the larger area, and terminating at the smaller end with an area proportional to the area of the smaller cross section. By dividing the larger area of one cross section by the smaller area of the other this ratio is obtained that is applied in the following table, giving the prismoidal correction for a prismoid 100 feet long and 100 square feet at the base.

TABLE

Ratio of End Areas	Prismoidal Correction Base 100 sq. ft.	.1	.2	.3	.4	.5	.6	.7	.8	.9
1–1	.00	0.05	0.21	0.47	0.55	1.33	1.91	2.61	4.26	4.31
1–2	5.33	0.06	0.23	0.53	0.90	1.49	2.14	2.92	3.81	4.82
1–3	11.29	0.04	0.16	0.37	0.66	1.03	1.49	2.03	2.65	3.36
1–4	15.44	0.03	0.13	0.30	0.54	0.85	1.23	1.68	2.19	2.78
1–5	18.87	0.02	0.11	0.25	0.44	0.69	1.00	1.37	1.78	2.26
1–6	21.66	0.02	0.08	0.18	0.33	0.51	0.73	1.00	1.31	1.66
1–7	23.73	0.02	0.08	0.20	0.34	0.53	0.77	1.05	1.37	1.74
1–8	25.88	0.01	0.06	0.15	0.27	0.42	0.60	0.82	1.08	1.38
1–9	27.57	0.01	0.05	0.11	0.20	0.31	0.45	0.62	0.81	1.03
1–10	28.84	....	....	....	....	....	....	....	....	....

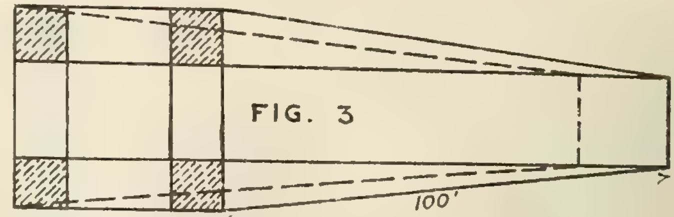
The same result is obtained by computing the volume of a prismoid of uniform cross section corresponding to the smaller cross section and adding to this the remaining wedge having an area at the base equal to the difference of the areas of the two cross sections.





The assumption in the case of a wedge is the same as for a prismoid, i.e., the mass would be composed of a number of small wedges having a base area of one square foot and vanishing at the upper perimeter of the smaller cross section. It is evident, therefore, that if the volume of the prismoid requires no correction, being uniform throughout, the remaining wedge is responsible for the entire correction to be made. In this way the table is made applicable to wedges as well as prismoids, the ratio for the correction in the case of a wedge, being the square root of the length of the thin edge for 100 square feet of base, or in the above case the square root of the width at the upper perimeter of the smaller cross section.

The foregoing appears to be true regardless of the dissimilarity of the cross sections and will apply in a case where the usual prismoid terminates in a triangle with a warped surface, providing that straight lines drawn from any point on the upper perimeter of one cross section to a corresponding point on the other will coincide with the warped surface of the prismoid. In the case of the prismoid terminating in a triangle as in Fig. 2, two wedges are formed, one being positive and the other negative. The vanishing point as before being at the upper perimeter of the cross section A. B. C. D. E.



Prismoidal Correction for End Areas

The same table of quantities for the sum of the end areas may also be used for the correction to be applied. It was found that if the smaller end area was computed throughout as a uniform prismoid requiring no correction the error was confined to the remaining wedge. It may also be shown in the following figure that the correction required may be confined to the four quarter pyramids at the corners of the prismoid. The remaining four wedges along with the uniform prismoid contained within the four wedges, are applicable to the table without any correction for the prismoidal formulas. The four quarter pyramids at the corners form a perfect pyramid, and in taking the quantity from the table of end areas corresponding to the base of the pyramid an error equal to one-third the true volume of the pyramid is made. This error is equal to the difference of the square roots of the end areas squared and divided by three, and is applied to the table as a negative quantity. The square roots of the end areas are readily obtainable from any table of squares and square roots and the operation is simpler and takes less time than by taking the correction from the table.

End Areas, a, a′ in sq. ft.

Prismoidal Correction

$$\frac{(\sqrt{a}-\sqrt{a_1})^2 \times 100}{81} = \text{Cu. Yds.}$$

REPORT OF COUNCIL MEETING

The regular monthly meeting of the Council was held at the rooms of *The Institute,* 176 Mansfield Street, on Tuesday, December 16th, at 8.15 P.M.

Montreal Branch Suggestions. The suggestions from the Executive of the Montreal Branch relating to improving the meeting hall, *Journal* and the meetings of the Branch, were noted. Mr. Francis agreed to report back to the Executive that the matters mentioned were under consideration.

Highway Development in Canada. The situation regarding highway development in Canada was discussed, it being resolved that *The Institute* favour the principle that this work be done under competent engineering supervision. The Secretary was instructed to write to the Provincial Divisions intimating that in view of the large road programme to be entered into by the

Provincial and Dominion Governments, and, inasmuch as this matter would be discussed at the Annual Meeting, it is desired to know from the Divisions or Branches what is the policy of the local Governments regarding this, so that representatives from the various provinces may reflect provincial opinion at the annual meeting.

Secretary's Visit to New York. The Secretary reported a satisfactory trip to New York, at which time he attended the Convention of the American Society of Mechanical Engineers and held conferences with the various engineering secretaries. He found the attitude was one of great friendliness towards *The Institute* and that the general feeling was towards closer unity and cooperation on the part of the entire engineering profession.

Legislation. Various correspondence relating to the legislation situation in Ontario was noted and the subject discussed at some length.

Approval of Branch By-Laws. Branch By-Laws were approved for Winnipeg; Saskatchewan; Niagara Peninsula; Hamilton; and, subject to slight modifications, St. John; Sault Ste. Marie; and Border Cities.

Changes in By-Laws. The report of the By-Laws Committee signed by Messrs. Ernest Brown and Walter J. Francis and approved by H. E. T. Haultain, was adopted as follows:

Montreal, December 15th, 1919.

The Council of

The Engineering Institute of Canada.

Gentlemen:—

We beg to submit herewith the report of the By-Laws Committee for the present year as follows:—

(1) That Section 57 be amended by the deletion of the words "except the Montreal Branch," after the twelfth word "Branch." The Section would then read:

Revenue

Section 57: The Secretary of the Institute shall each year remit to each Branch, twenty-five per cent. of the annual fees, current or arrears, received from the members of that Branch during that year, payments being made quarterly. A statement showing the individual amounts, and from whom collected, shall accompany each quarterly remittance.

For the purpose of this By-Law, the Branch Membership list shall be revised on the first day of January and the first day of July in each year, but the change shall not be retroactive, except in the case of new admissions to the Institute.

(2) That Section 61 be amended to provide for the election of a Vice-Chairman of a Provincial Division, by the addition of the words "a Vice-Chairman" after the tenth word "Chairman." The Section would then read:

Officers

Section 61: The Officers of a Provincial Division shall be a Chairman, a Vice-Chairman, and a Secretary-Treasurer, or a Secretary and a Treasurer, who shall be elected by the Executive Committee of the Division.

(3) That Section 65 be amended to provide for an additional District in Ontario. This proposal involves changes of boundaries and re-numbering of Districts. The Section as amended would then read:

Nomination and Election of Officers
Electoral Districts

Section 65: For the purpose of the nomination and election of officers the membership of the Institute shall be divided into Electoral Districts as follows:—

District No. 1, shall include all corporate members within twenty-five miles of the Headquarters of the Institute and all members residing outside of Canada.

District No. 2, all members outside of District No. 1 resident in the Province of Quebec.

District No. 3, all members resident in the Provinces of Nova Scotia, New Brunswick and Prince Edward Island.

District No. 4, all members resident in the Province of Ontario east of longitude 77° 30'.

District No. 5, all members resident in the Province of Ontario between longitude 77° 30' and a line starting at Lake Ontario and running as follows: along the [illegible] to longitude 80° 30', thence northerly to latitude 47° N, thence westerly to longitude 85° W, and thence northerly to the boundary of the Province.

District No. 6, all members resident in the Province of Ontario west of District No. 5.

District No. 7, all members resident in the Province of Manitoba.

District No. 8, all members resident in the Province of Saskatchewan.

District No. 9, all members resident in the Province of Alberta.

District No. 10, all members resident in the Province of British Columbia and in the Yukon Territory.

No other proposals for changes in the By-Laws have been considered.

We beg to remain,
Yours faithfully,
E. BROWN,
Chairman of Committee.
WALTER J. FRANCIS,
H. E. T. HAULTAIN, Members of Committee.

The Secretary was instructed to send the proposals of Council relating to the changes in the By-Laws to the entire membership at the earliest possible moment.

Ontario Provincial Division: The minutes of the Ontario Provincial Division Executive Committee meeting, held in Toronto on November 22nd, as forwarded by the Secretary, were noted.

The By-Laws of the Division were approved as submitted.

A request for an additional $25.00 for the Ontario Provincial Division was granted.

Calgary Branch Resolution: The resolution of the Calgary Branch regarding legislation was presented, and the Secretary instructed to write a letter outlining what Council was doing in this connection.

Peterborough Electrical Engineers: A copy of a petition forwarded by the electrical engineers of Peterborough, opposing a proposal to form a separate electrical engineering society in Canada, was noted. The Secretary was instructed to write expressing the appreciation of Council of their stand, illustrating their loyalty to the profession.

Ontario Professional Meeting: Hearty approval was given to the proposal to hold a General Professional Meeting of *The Institute* in Ontario either in June or September under the auspices of the Niagara Peninsula Branch, supported by the Ontario Provincial Division. Approval was also given to the proposal that this meeting be held in co-operation with a meeting of the American Institute of Chemical Engineers, provided satisfactory arrangements could be made regarding the date and programme.

Engineering Appointments: Letters from the Niagara Peninsula Branch and Ontario Provincial Division regarding certain engineering appointments were presented, and the proposal that such a position as Chairman of the Toronto and Northern Ontario Railway Board should be filled by an engineer was approved, also that a competent engineer should be on the proposed Administrative Board of the Government in connection with the Grand Trunk Railway. The Secretary was instructed to write to the Minister of Lands and Mines stating that *The Institute* supported the proposal that an engineer should be chairman of the T. & N.O. Railway Board.

Architects and Big Bridges: A report of the Montreal Branch on this subject was received and the suggestion of the Montreal Branch Executive that this be considered by the Legislation Committee of *The Institute* for report to the Council and the Montreal Branch was approved.

Registration of Civil Engineers: A circular sent by the Institution of Civil Engineers relating to the registration of Civil Engineers and showing the legislation situation in Great Britain was noted.

Municipal Standards: The memorandum submitted by R. A. Ross in response to a request for advice from the Secretary of the Canadian Engineering Standards Association, was approved, and the Secretary instructed to forward a copy to Captain Durley.

Ottawa Branch Classifications: A sub-committee consisting of G. Gordon Gale and the local members of the Council was appointed to examine the records of all the men whose names had been mentioned in the correspondence with the Ottawa Branch regarding classification, to report at a later meeting of the Council.

War Memorial: A proposed letter from the President to Lieut. Col. Doughty relating to a war memorial was approved.

Forms C and D: The Secretary requested advice regarding Forms C and D as a new supply was being ordered. It was resolved that the last paragraph of Form C be deleted and the words "and 'E' " be inserted after "Form D" in the third line of the second paragraph.

Quebec Bridge Transactions: On motion by Mr. Francis it was resolved that a letter of appreciation and thanks for their kindness in connection with assisting in the production of the Quebec Bridge Transactions be sent to the St. Lawrence Bridge Company, and also a similar letter to Messrs. Duggan and Johnson.

A letter from Dr. Craver, complimenting *The Institute* on the Quebec Bridge Transactions was noted and the Secretary instructed to forward copy of same with the above mentioned letters.

It was resolved that a charge of $10.00 be made for additional copies of these Transactions.

Announcement Annual Meeting: It was resolved that the announcement regarding the Annual Meeting be forwarded to the membership at the same time as the suggested changes in By-Laws. The Secretary was instructed to send cordial invitations to be present to the Presidents and Secretaries of the founder engineering societies, Canadian Mining Institute, His Grace the Duke of Devonshire and to the Presidents of the Canadian railways.

Reorganization of the Kingston Branch: It was noted that the Kingston Branch had re-organized with Col. Macphail as Chairman and W. H. Slinn as Secretary. The invitation to the Secretary to attend their postponed meeting on Tuesday, January 20th was considered, it being decided that owing to its nearness to the Annual Meeting it would be impossible for the Secretary to attend until a month later.

Journal: Consideration was given to the publication of papers in *The Journal* and elsewhere together with a request for a Montreal Branch paper, the entire matter being referred to the recently appointed Editorial Committee.

The late Stephen P. Brown : It was resolved that the Council record with sincere regret the death of Stephen P. Brown, a former member of Council. The Secretary was instructed to convey the sympathy of the Council to Mrs. Brown and family.

I.C.E. Transactions Available: A letter from Dr. Adams pointing out that a set of transactions of the Institution of Civil Engineers from the earliest volumes was available, was noted. The Secretary was instructed to thank Dr. Adams for his kindness in bringing this matter to the attention of Council.

Miscellaneous: A list of members whose dues had been unpaid for several years was presented. It was resolved that the various men whose names were mentioned be personally interviewed.

Personal: A number of applications were brought up for reconsideration, all of which were dealt with.

Owing to the lateness of the hour it was impossible to deal with the regular applications.

The following students were admitted.

L. H. Armstrong, G. H. Desbarats, R. N. Drummond, E. F. Emmons, W. A. Gale, A. R. Garrett, G. W. Hudson, H. L. Humes, E. S. Kelsey, L. S. McLennan, H. A. Pearse, W. S. Peck, I. Perzner, A. M. Reid, J. M. White, H. B. Wilder, W. H. Woods.

The meeting adjourned to Tuesday evening, December 30th.

BRANCH NEWS

Halifax Branch

F. R. Faulkner, M.E.I.C., Secretary-Treasurer

The regular monthly meeting of the Halifax Branch was held at the Green Lantern, Wednesday, Dec. 17th. Following the custom inaugurated last spring, this was a supper meeting. A pleasing feature was the presence of a number of guests which included a number of engineering students, the majority of whom have already filed applications for admission.

The Chairman first introduced new members or members who have just taken up their residence in Halifax. K. H. Smith, A.M.E.I.C., formerly Secretary-Treasurer of the branch, was then asked to come forward and the Chairman on behalf of the Branch presented Mr. Smith with a gold mounted fountain pen as a token of appreciation of his services in assisting to organize the branch and of his work as Secretary.

The Chairman explained why the paper to be presented at this meeting was not available, as the author was called to Montreal by the early train that morning. He then outlined the papers proposed for the January and February meetings, and strongly urged the members to work up papers for presentation before the branch.

Under the Branch By-Laws as originally adopted, the January meeting would be the annual meeting of the Branch. The attention of the members had been directed to the proposed Standard Branch By-Laws and on behalf of the Executive committee the Chairman submitted two resolutions:—one to the effect that the Branch adopt the proposed Standard Branch By-Laws and the other to the effect that the present executive remain in office until the proposed annual meeting in May. The Secretary was instructed to send out a letter ballot on these resolutions to be returned in time for the meeting in January.

The meeting was then thrown open for general discussion on subjects of Engineering interest. J. L. Allan brought up the question of the proposed bridge across the narrows to connect Halifax and Dartmouth and told of the work already done by various bodies in connection with this idea. The attention of the members was directed to the engineering features of the bridge and the discussion was along that line. A number took part in the discussion and as a result a committee composed of Messrs L. H. Wheaton, A. F. Dyer and H. W. L. Doane were appointed to submit a report at the January meeting.

After some further discussion on various subjects the meeting adjourned.

St. John Branch

A. R. Crookshank, M.E.I.C., Secretary

A joint meeting of the St. John Branch of *The Engineering Institute of Canada*, the Board of Trade Housing Committee, and the Commercial Club of St. John was held in the Board of Trade rooms on the evening of December 10th, with C. C. Kirby, A.M.E.I.C., in the chair. A report from Messrs. Ross & Macdonald, architects of Montreal, was read by the Chairman in which the abandonment of the old shell of the court house was advocated and the erection in its stead of a building, which, besides containing all the accommodation which might be required by the county and city authorities, would also serve as a civic centre. Attached to this report were sketches of two schemes, one taking in the whole block bounded by King, Carmarthen, Leinster and Sydney streets, and the other for the use of the present site. The first plan according to G. G. Hare, city engineer, would involve an expenditure of $1,400,000.00 and the second would necessitate an outlay of $600,000.00. These plans, which were submitted to the meeting only as an indication of what might be done, caused a lengthy discussion on the matter.

Various opinions were expressed regarding the two general areas, special features of the building, and the desirable features to be incorporated in design and construction. The matter was of such interest, however, that the subject was postponed for discussion until the following Thursday night, when other speakers would be invited, and an endeavour made to get the opinion of the public on the matter.

Montreal Branch

Frederick B. Brown, M.E.I.C., Secretary-Treasurer

On November 27th, W. E. L. Dyer presented a paper on "Railway Track Design and Manufacture," in which he referred to the recent practice in track construction for steam and electric railways. The author made special reference to the use of manganese and other alloy steels in heavy duty track work. The paper was followed by an interesting discussion in which a number of members and visitors took part. The Chair was occupied by Mr. Newell.

Following the lecture on "Engineering Features of a Sugar Refinery" given by J. J. York, A.E.I.C., on November 6th, the members of the Montreal Branch accepted the invitation of the St. Lawrence Sugar Refinery to visit their plant. About 75 members were present on Friday evening, November 28th, and about 60 on Saturday afternoon, November 29th. The parties were divided up into small groups, each being under the guidance of a member of Mr. York's staff, Mr. York taking charge of one of the groups. The visitors were taken through the plant in such a way that they could follow the whole process of sugar refining from the moment the raw sugar arrived at the receiving sheds to the packing of the finished product.

An interesting feature of the plant was the main boiler house and the pumping machinery, the latter having a capacity of two million gallons of water a day. The receiving sheds are modern steel and concrete structures, equipped with a number of travelling cranes and automatic weigh-bridges so that the sugar can be unloaded from ships lying at the wharf and delivered to any part of the receiving shed, which has a capacity of one-month's supply of raw sugar, equivalent to about forty million pounds. The raw sugar is taken from the shed to the top of the main building where preparatory to filtration it is passed through centrifugals, mixed with syrup and melted. Mr. York pointed out that the change from gravity to pressure filtration cost $20,000, but the daily saving amounted to $250, which soon made up for the capital spent.

The charcoal filtration formed an interesting part of the process. Liquid sugar having come through the first pressure filtration is passed through the charcoal filters, the filtrate at first being absolutely colorless. After a time it becomes darker and is developed to be used as lower grade syrups.

After filtration the syrups are ready for crystalization, which is obtained by boiling the syrup in large vacuum pans for periods depending on the quality of the syrup. The size and uniformity of the grain of the sugar is controlled by the degree of vacuum and the rate of feed of the syrup. The crystalized sugar is then passed through centrifugals where all the liquid is drained off and the crystalized sugar is passed through large drum dryers and is then ready for packing.

The thanks of the members of the Montreal Branch who visited the refinery are due to Mr. York, not only for his very thorough and interesting explanation of the various processes, but also for the arrangements which he made for the reception of the visitors.

On December 4th a very important address on the present Railway Situation in Canada was given by W. F. Tye, M.E.I.C. In dealing with the present railway mileage in Canada the author drew comparisons with other countries showing that Canada had a very much larger per capita mileage than any other country in the world, pointing out that in this country there are only 200 people to support each mile of railway. He referred to the earlier policies of the various Governments supporting first one road and then the other, and the fact that the rapid construction of trans-continental systems caused their ultimate bankruptcies. Mr. Tye was strongly opposed to Government ownership of the railways, and expressed his opinion that the only satisfactory solution of the present problem was to give an immediate decided increase in freight rates and for the Government to put the roads in such a condition that they will again become attractive to private owners.

A number of members entered into the discussion after the address, and the author replied to a number of questions. Mr. Hunter of the Papers and Meetings Committee occupied the Chair.

On December 11th, John Grieve, A.M.E.I.C., read his paper on "Paint for the Protection of Steel Work," Mr. Lefebvre acted as Chairman.

On December 18th, John T. Farmer, M.E.I.C., presented, on behalf of the Combusion Engineering Corporation, an illustrated lecture on "Mechanical Stokers," describing the advancement in this field and explaining the relative advantages of various types. Mr. Duchastel was Chairman for this meeting.

The Council having authorized the Montreal Branch to hold a Professional Meeting in conjunction with the Annual Meeting, the Executive Committee of the Branch has held a number of meetings for the purpose of drawing up a programme and making preliminary arrangements for this meeting. The subject was also discussed at the meeting of the Branch on December 18th. The Executive has appointed Messrs. Surveyer, H. G. Hunter, Thornton, Busfield and J. H. Hunter as Chairmen of the Programme, Entertainment, Publicity, Reception and Subscription Committees, respectively.

Ottawa Branch

J. M. Cochrane, A.M.E.I.C., Sec'y-Treas.

The Ottawa Branch of *The Engineering Institute of Canada* gave a luncheon on December 4th to Major-General Sir Edward Morrison, K.C.M.G., C.B., D.S.O., Deputy Inspector of Artillery for Canada. Over 175 were present and R. de B. Corriveau, M.E.I.C., presided. The theme of Sir Edward's address was, "The Invasion of Germany," with emphasis on the part played by engineers in connection with the war. Sir Edward paid a high tribute to the engineering profession, which he said had been closely allied to the artillery branch of the service; no profession had contributed more to ultimate victory in the war; he went on to say, jokingly, that he was one of that low class of people whose business was to kill rather than to save and mend life. In the engineering profession when the country was at war is found the men best able to do this. Sir Edward made a passing reference to universal training, which he considered of great importance. He then went on to go into more details of the engineers in war;—they supplied telephones, telephone service, railway engineering, railway service, tunnelling, bridging, making gun emplacements, etc., etc. In connection with building railways the Canadians stood pre-eminent.

Sir Edward described the various net-works, standard gauge lines, narrow gauge lines, and finally the 30-centimetre lines, the narrowest of all, used right at the front. At Vimy Ridge there was the finest system of this 30-centimeter railway that had ever existed in war, and this was due to the ability and perseverance of "a little red-headed engineer from Cobalt." There were sixty-five miles of these tiny roads at this point, which led to every heavy battery. When it was considered that some of the shells weighed two hundred pounds the saving in man power by those roads was enormous. Sir Edward described an experience of his own at Valcartier; the engineers built a bridge across the river, the first bridge of the kind that these engineers had built. After the bridge was built Sir Edward took his battery across, a few nights later a log boom burst up the river, and thousands of logs came tumbling down the high water, but the bridge stood; a few nights later 2000 horses broke loose and came tearing across the bridge—and the bridge stood. At Ypres it was a Canadian engineer who built a railway through and around houses and obstacles up to the front, and thereafter Canadians were in great demand for this work.

General Morrison told a story of a bridge that had been mined by the Germans; if this had been blown up it would have meant the lives of a thousand or more Canadians. Just as the Germans were blowing up the bridge a young Canadian officer darted forward, crossed the bridge, killed four of the Germans, took the fifth prisoner and stamped out the fuse. For this action he was awarded the Victoria Cross.

At the conclusion of the speech Mr. de Carteret thanked Major-General Morrison for his presence and for his very interesting speech. The gathering concluded with the singing of the National Anthem.

The second luncheon of the Ottawa Branch was held on December 19th, when Commander Ramsay, Flag Commander to Admiral of the Fleet Viscount Jellicoe, described the work of the Dover Patrol.

This address was of exceptional interest as Commander Ramsay was able to give an account of some of the methods used and operations proposed, which have not previously been made public. Commander Ramsay, who was for a considerable time in command of H.M.S. Broke, flotilla leader, which along with the Swift took part in the celebrated engagement with five German destroyers, was exceptionally well qualified to deal with his subject.

His Excellency the Governor-General, one of the Honorary Members of *The Institute*, was present at the luncheon, and tendered the thanks of *The Institute* to Commander Ramsay for his address, at the same time drawing attention to the importance of the present visit of Admiral Jellicoe and his staff. The officers of Lord Jellicoe's staff and the headquarters staff of the Canadian Naval Service were guests of the Branch at this luncheon, which was the most largely attended of any held this winter.

The programme of the second half of the winter session is now being arranged, and will contain several papers and addresses of unusual interest.

Ontario Provincial Division

Geo. Hogarth, M.E.I.C., Secretary-Treasurer

The following extract which gives a more detailed account of the result of this meeting than appeared in the December Journal is from the minutes of the meeting of the Ontario Provincial Division Executive held in Toronto, Saturday, November 22nd:—

"By request, Willis Chipman, M.E.I.C., of the Toronto Branch, explained the sequence of events which led up to the submission by Council to the Provincial Division of the general question of appropriate action, so far as the Province of Ontario is concerned, with reference to legislation to define the status of the engineer. Mr. Chipman further explained the action of the Special Committee of the Toronto Branch in further consideration of the draft bill prepared by the Special General Committee of *The Institute* which met in Montreal on April 5th, 1919.

The Chairman of the Toronto Branch, Mr. Harkness, then explained the action of his Branch in arranging for an informal gathering at the Engineers' Club at 6.30 on Monday evening, November 24th, for the purpose of explaining the point of view of *The Engineering Institute* in the matter of legislation, and further, to make it distinctly understood that *The Engineering Institute* so far as the Province of Ontario is concerned, proposed to co-operate with other professional engineering societies in taking any definite steps towards the introduction of legislation.

The meeting voiced its hearty approval of the constructive action of the Toronto Branch in considering the legislation proposals of the Special Committee of *The Institute* as explained by Mr. Chipman, and of the action of the Toronto Branch in convening an informal meeting, as explained by Mr. Harkness, of representatives of the Toronto organizations of the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the Society of Chemical Industry, the Canadian Mining Institute and the Ontario Association of Architects."

It was unanimously resolved that the following organizations be invited to act with the Ontario Provincial Division of *The Engineering Institute* as an Advisory Conference Committee:

The Canadian Mining Institute.
The Canadian Society of Chemical Industry.
The American Society of Mechanical Engineers.
The American Institute of Electrical Engineers.
The Ontario Association of Architects.

Toronto Branch

H. S. Goldman, A.M.E.I.C., Acting Secretary.

An Open Meeting of the Branch was held at the Engineers' Club at 8 p.m. on Thursday, Dec. 4th, 1919.

Mr. Harkness, Presiding Chairman, announced the resignation of W. S. Harvey from the office of Secretary-Treasurer, and stated that if the present election should decide again in favor of Mr. Harvey new nominations will have to be called for and another election for the office of Secretary-Treasurer will have to take place. In the meantime he suggested that H. S. Goldman act as Secretary until one be properly elected.

The minutes of the previous meeting were then read and adopted.

The following members were then appointed as scrutineers to canvass the ballots for the election of officers for the coming year:—E. T. Wilkie, [illegible] and George Hogarth.

The scrutineers reported that the following members were elected to office :—

Chairman—R. O. Wynne-Roberts.

Secretary—W. S. Harvey.

Committee—Geo. T. Clark, C. R. Young and T. Taylor.

These Committee-men are elected for two years. As J. C. Krumm received the next highest number of votes, the Chairman declared him also elected in the place of W. A. Bucke whose resignation had been received recently. Mr. Krumm is only elected for one year, since by the end of that time the term of Mr. Bucke would have expired.

After the report of the scrutineers was received and confirmed, the Chairman called upon Professor J. Roy Cockburn who delivered an excellent lecture on the scientific application of locating guns by sound ranging.

The lecture was illustrated by numerous lantern slides and was much enjoyed by the members present.

The meeting adjourned at 11 p.m.

At a meeting of the Executive of the Toronto Branch held on Monday, December 15th, it was decided to refer the J. C. T. O. Report on "Status of Engineers" to the Provincial Division.

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary-Treasurer

A general business meeting of the Branch was held on November 25th at the Engineer's Club, Thorold.

The business on the agenda was as follows:—

1. Report of the Branch Salary Committee.
2. Report of the Branch representative at the first meeting of the Ontario Provincial Division Executive.
3. Report of committee on Branch By-laws.

Report of Salary Committee:

F. S. Lazier, Chairman of the Committee, read the report which was adopted by the Branch after a short discussion.

The report follows:—

Report of Salaries Committee

To the Chairman and Members,
Niagara Peninsula Branch,
Engineering Institute of Canada.

At a general meeting of the Branch held at Thorold on May 9th, you appointed us to study the question of engineering salaries, and instructed that we report at an early date our views as to what might be considered a fair schedule of salaries for the usual positions in all branches of the profession.

The ground to be covered by such a study and in compiling the required schedule is much greater than might be immediately apparent. It involves at the outset a professional classification, detailed and general enough to include all engineers who are employed in salaried positions.

Fortunately, we had at our disposal and available for study, a classification made by the American Association of Engineers, to which was also appended the salaries they considered to be the fair minimum and maximum for each position.

At an early date we learned that the Toronto Branch of *The Institute* had, in February, appointed a large and representative Committee to consider the salary question and that they had made considerable progress in a general classification of the profession.

The reclassification of the Civil Service of Canada, including the engineering positions therein, was also about ready for publication at the time your Salaries Committee was appointed.

With these several classifications of positions available, or to be ready in the near future, your Committee considered it would be an unwarranted duplication of effort to attempt the compiling of another, but thought that in view of the comprehensive personnel of, and the amount of this work already done by the Salaries Committee of the Toronto Branch their labors would probably produce a general engineering classification, which would, with such amendments as other Branches might suggest, be particularly applicable to the profession in Canada.

Your Committee held several meetings at which the general status of the profession was discussed, past and present salaries paid for engineering services reviewed, and possible means both of bettering the future status of the engineer and his financial position considered. The classification and salaries proposed by the American Association of Engineers, the Civil Service of Canada and the Toronto Branch of *The Institute* were studied and discussed and the whole matter given careful consideration.

From this study of the status of the engineering profession in Canada and the compensations accruing to the members thereof we beg to submit the following:—

1. We consider that in view of the increase in the cost of living and the training necessary to qualify for this work, the engineer, particularly in the junior positions of the profession is underpaid.

2. We feel that the adoption of a scale of minimum salaries and a standard classification of positions would be beneficial to the profession and to the general public.

3. We believe that the classification and scale of minimum salaries as compiled and adopted by the Toronto Branch, a copy of which is hereto attached, should be endorsed by the Niagara Peninsula Branch with the following exceptions:—

(*a*) In the case of engineers employed on Public Works, five instead of two years' practical experience should be required in place of graduation from a technical school of recognized standing.

(*b*) As the classification purports to deal with the profession of engineering, in which both education and training are necessary; and that inasmuch as the salaries mentioned for ... men, specifically described as having had no previous experience, appear to your Committee excessive, we would therefore recommend that the words "no previous experience necessary" be struck out wherever found and the clause "with fair education and previous experience" be substituted.

As there are no purely mining operations being carried on in the territory of this Branch it has not been considered advisable or necessary to attempt to formulate a schedule for this branch of the profession.

In conclusion your Committee desires to emphasize that the salaries set forth in the attached schedule are minimum salaries and that no attempt has been or should be made to fix the maximum which may be paid for any position in any of the various classes.

Respectfully submitted,

(Sgd.) F. S. Lazier,
S. R. Frost,
L. L. Gisborne.

The report of A. C. D. Blanchard, Chairman of the Branch and representative at the first meeting of the Ontario Provincial Division was next received. The following action was taken by the Branch on matters growing out of the report.

1. Representation on the Council from the Province of Ontario.

A motion was unanimously carried endorsing the decision of the Provincial Division to ask Council to permit the forming of another District in Ontario, the dividing line running approximately from Oakville to Owen Sound, the present line between districts No.'s 4 and 5 being moved so as to put Peterboro in the same district as Toronto, leaving Kingston in District No. 4.

2. General Professional Meeting in 1920.

In view of the fact that the Provincial Division Executive has decided upon holding a general professional meeting in 1920, a motion was unanimously passed setting forth that this Branch is desirous of holding this meeting at Niagara Falls under the auspices of the Niagara Peninsula Branch and that September would be the most preferable month. It was also decided to extend an invitation to the American Institute of Chemical Engineers to co-operate in holding a joint meeting. It was decided to appoint a nominating committee for the purpose of nominating sub-committees to arrange for the meeting. Those appointed follow:—F. W. Clark, S. R. Frost, the chairman and secretary of the Branch, A. W. L. Butler J. C. Moyer, H. M. Belfour, R. W. Powell and W. P. Near

The instructions given to the nominating committee are as follows:—

1. To apply through the Branch Secretary to the Ontario Provincial Division Executive for permission to hold a general professional meeting at Niagara Falls in 1920.

2. In the event of permission being granted to hold a professional meeting at Niagara Falls, to ascertain whether the American Institute of Chemical Engineers will co-operate in holding a joint meeting.

3. To fix upon a date for the meeting.

4. To determine the necessary sub-committees required to arrange plans for the meeting and to appoint these committees and give instructions to each.

5. To report on all the above matters to the next general business meeting of the Branch.

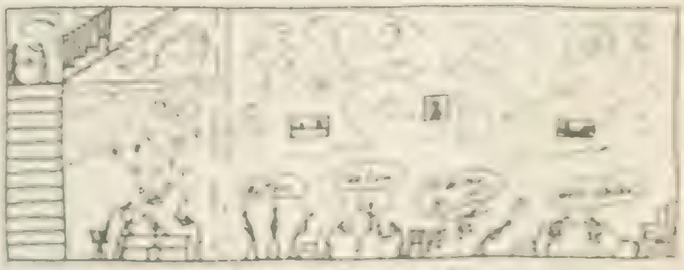
6. To remain in office till the professional meeting has been concluded and to see that each sub-committee is doing its work with proper dispatch.

Branch By-Laws.

The committee on Branch By-Laws made its report which was adopted by the meeting. The By-laws were framed along the lines of the proposed Standard Branch By-Laws recommended by Council. The Branch By-laws as adopted are subject to approval of Council.

Report of Salary Committee

Vote on the Salary Schedule



at close of Meeting

Niagara Peninsula Branch Meeting

Border Cities Branch

J. E. Porter, A.M.E.I.C., Secretary-Treasurer

At the adjourned annual meeting of the Border Cities Branch, held on December 1919, the discussion of Branch By-laws was continued from last meeting and these were revised in accordance with suggestions from the Council.

M. E. Brian then made a report in detail of the meeting of the Ontario Provincial Division, held at Toronto on November 22nd and considerable discussion ensued. The discussion was mainly on the proposed legislation and will be continued at our next meeting.

The reports for the closing year were received and the following officers for 1920 were elected.

Chairman	H. B. R. Craig, M.E.I.C.
Sec.-Treas	J. E. Porter, A.M.E.I.C.
Executive Committee	J. J. Newman, O.L.S., A.M.E.I.C.
	H. Thorne, M.E.I.C.
	M. E. Brian, O.L.S., A.M.E.I.C.

The meeting expressed its regret at the departure for Hamilton of our first Chairman, J. A. W. Brown, wishing him every success in his new work.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary

At a meeting of the Peterborough Branch held on Saturday, December 6th, 1919, the following were elected officers of the Branch:—

Hon. Chairman	R. B. Rogers,
Chairman	G. Reid Munro,
Vice-Chairman	R. H. Parsons,
Secretary	R. L. Dobbin,
Treasurer	D. L. McLaren,
Executive Committee	E. R. Shirley, A. L. Killaly, G. R. Langley, C. E. Sisson, P. L. Allison.

The officers were appointed a committee to draft the By-Laws for the Branch, and report at an early meeting.

G. Reid Munro and R. L. Dobbin were appointed representatives on the Executive Committee of the Ontario Provincial Division.

The Secretary was instructed to write and convey to Walter J. Francis of Montreal, the thanks of the Branch for the very artistic and clever manner in which he had written up the minutes of the inaugural meeting on November 6th.

A letter was received from the General Secretary at Montreal enclosing a cheque for $25.00 as an advance to the Branch. The Secretary was instructed to acknowledge this with thanks.

The paper of the evening was read by G. B. Smith, of Belleville, on the Central Ontario System of the Hydro-Electric Power Commission of Ontario of which Mr. Smith is Superintendent. Maps and diagrams were used to illustrate Mr. Smith's remarks, and at the conclusion of the paper, as an added attraction a large number of slides were shown of the Chippewa Development of the Commission.

Walter R. Blackwell, the architect of the new Memorial School, gave a short talk on the plans of the building.

The meeting was held in the Empress Hotel, and about fifty sat down to supper. The membership of the Branch is as follows:—11 Members, 17 Associate Members, 5 Juniors, 33 Affiliates.

Kingston Branch

W. H. Slinn, Jr. E.I.C., Sec'y.-Treas.

At a reorganization meeting of the Kingston Branch, Alexander Macphail, M.E.I.C., was appointed chairman, and W. H. Slinn, Jr.E.I.C., Secretary-Treasurer. It was agreed that the next meeting be held on December 16th at which J. M. Campbell, M.E.I.C., would read a paper on "The Electrical Power Plant at Kingston Mills, Ont." and the Secretary was instructed to extend an invitation to the General Secretary of *The Engineering Institute* to be present at the meeting and give a talk on the aims and organization, etc., of *The Institute.*

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Sec'y.-Treas.

On Thursday, December 4th, a paper was presented to the Branch by C. D. How, on the "Economics of Elevator Construction and Operation." Mr. How, who is Engineer for the Dominion Grain Commission, gave an interesting address which was listened to with appreciation by a large attendance.

On December 9th, at the Fort Garry Hotel, a complimentary banquet, was given by the Branch to returned members, during which banquet Capt. C. N. Mitchell, V.C., M.C., A.M.E.I.C., was presented with an illuminated address as a mark of esteem and appreciation from his fellow members. An Associate Membership Badge was also presented on behalf of the Council of *The Institute.* The presentation of the Address was made by General H. N. Ruttan, and *The Institute* Badge by J. G. Sullivan. The address presented to Capt. Mitchell is as follows:—

"Your fellow-members of the Manitoba branch of *The Engineering Institute of Canada,* desire to express in some tangible form their great appreciation of the distinguished services you have rendered to the empire during the recent war, and especially for the courageous deeds by which you won the Victoria Cross and the Military Cross.

"The call of the empire came to you, and inspired by the precepts and example of your loyal father, you at once responded and placed your services at the disposal of the military authorities of Canada.

"We remember that you asked no preferment, but were content to go forth as a humble private, asking no favors and making no conditions; that by dint of unfailing devotion to duty and efficient service, you rose step by step until you attained the rank of captain in the Canadian Engineers.

"Your record at Messines, Menin Road, Amiens, Arras and Cambrai, and in the final advance on Mons, will ever be a source of pride to your professional brethren. We rejoice in the honor you have brought to yourself, your family and your profession by your gallant conduct in the field.

"We trust that you may live long to wear the decorations conferred upon you by his gracious majesty King George the Fifth, and that every blessing may attend your return to civil life."

The Chairman, W. P. Brereton, read many letters from other branches, "Wishing the returned men success, and that they may live long and enjoy the benefits of peace, for which they fought so nobly." Many prominent citizens were present, among them being Mayor C. F. Gray; Hon. G. Grierson, Minister of Public Works; and Isaac Campbell, K.C., all of whom addressed the meeting.

On December 17th, F. H. Martin gave a very interesting address on "Niagara Hydro-Electric Power Developments." Mr. Martin's address was of unusual interest, as he traced the history of the Falls from the time it was first discovered; and by means of a large number o. Lantern Slides showed the conditions existing previous to present developments. Mr. Martin dealt with the engineering problems which had to be overcome by the pioneer developers, and by means of lantern slides explained the more prominent engineering features of the work, which has been done during the last fifteen or twenty years.

Local Notes

J. G. Sullivan, M.E.I.C., member of the executive, Manitoba Branch, was elected Alderman to the City of Winnipeg Council in the recent election.

Mr. Sullivan's election is looked upon by all to be a compliment to the local branch and it is felt by many that his expert engineering knowledge and experience will be of incalculable benefit to the city in the forthcoming year, when many problems, which require engineering knowledge, will be brought before the council. He is assured of the best wishes of his associates in the profession with the assurance of their hearty co-operation during his term of office.

A. G. Dalzell, Secretary of the Vancouver Branch of *The Engineering Institute of Canada*, was recently in Winnipeg and attended the December 4th meeting of the Manitoba Branch, where he received a hearty welcome.

Calgary Branch

[illegible], *M.E.I.C.*, Secretary-Treasurer

The Annual General Meeting was held in the Board of Trade rooms on Saturday, Dec. [illegible]

The meeting was preceded by a luncheon, at which about [illegible] members and guests were present.

The meeting came to order at 2.30 P.M., and the retiring Chairman, Mr. Craig made a short address on the [illegible] members present and welcomed those who had recently returned from service overseas with the Allied forces. He gave a brief outline of the work that had been done during that time and drew attention to the many important matters to come up during the coming year, which would require their co-operation and support.

Ballots for Officers for the year [illegible] were called in, and Messrs. Chapman and [illegible] were asked to act as scrutineers and report the result of the Election.

The Secretary then read the minutes of the last annual meeting and of all subsequent meetings.

Arising out of the minutes, Mr. Craig stated that he had acted as delegate to the Municipalities Convention at Medicine Hat and had written a reply to the paper presented by a Mr. Godfrey criticising the Engineering profession. This reply had been published as part of the minutes and given full publicity, so that the members of the profession would not suffer from this unjust criticism, especially as the author had not seen fit to defend his action.

Mr. Pearce gave a brief account of the work done by the Provincial Natural Resources Committee to which he had been appointed a member through the efforts of the Branch.

Upon the motion of Mr. Peters seconded by J. I. Fish, the minutes of the previous meetings were adopted as read.

The Secretary read his report of the work of the Branch and a financial statement which had been audited, both of which are appended as part of these minutes.

Mr. Peters gave a brief account of the work done in an endeavour to secure legislation for the Engineering profession and answered questions of Messrs. [illegible] and [illegible] upon the subject. He felt that the Council of The Institute had not pushed this matter as they should have done in view of the mandate given it at the Annual Meeting in Ottawa last winter.

He therefore, submitted the following resolution for the consideration of the meeting:

> "That the attention of Council be strongly directed to the fact that in accordance with the last paragraph of the resolution concerning legislation passed at the last annual meeting held at Ottawa, they are required immediately to take the necessary measures in co-operation with the branches to have

legislation enacted. And, further, that it is the opinion of the Calgary Branch that it is the duty of the Council to take the initiative in this matter."

"That a copy of this resolution be sent to all the Branches."

The last paragraph of the resolution passed at Ottawa is as follows:—

"That the Council of *The Institute* shall report the result of the ballot to the branches, and if the vote is favorable to legislation the Council of *The Institute* shall immediately take the necessary measures, in co-operation with the Branches, to have legislation enacted."

The resolution was put to the meeting after being seconded by Mr. Pearce and carried unanimously.

Mr. Pearce moved that the Secretary be instructed to urge a speedy reply by the Council of *The Institute* to the resolution forwarded to them regarding Legislation, and that as soon as this reply was received the Secretary circularize the members, leaving it to the Chairman to call a special meeting if thought necessary. Seconded by P. J. Jennings, and Carried.

The scrutineers reported the result of the ballot for Officers to the Chairman, who declared the following elected, to act during the year 1920.

Chairman	P. Turner Bone.
Secretary-Treasurer	C. M. Arnold.
Executive Committee	H. B. Muckleston.
	F. W. Alexander.
	G. N. Houston.
Members of Executive without election	Wm. Pearce.
	G. W. Craig.
Auditors	F. K. Beach.
	W. J. Gale.

Mr. Craig expressed his appreciation of the assistance given him while Chairman of the Branch and said he felt it a great honor to have acted in that capacity.

Mr. Turner Bone was invited to take the Chair and met with a hearty reception.

He thanked the members for electing him to such an important office and stated that he was eager to do anything in his power to forward the work of the branch.

The meeting adjourned at 4.45 P.M.

Saskatchewan Branch

J. N. deStein, M.E.I.C., Sec'y.-Treasurer

The winter activities of the Branch began with the October meeting, at which H. G. Phillips, A.M.E.I.C., read a valuable paper on "Drainage Assessments." We had the pleasure at that meeting of having H. W. B. Swabey, A.M.E.I.C., of the Ottawa Branch with us.

The November meeting took the form of a "Welcome to the Returned Members," a detailed report of which appeared in the December number of *The Journal.*

At the December meeting (December 11th). A. J. McPherson, A.M.E.I.C., gave a very interesting resume of the preliminary work done in connection with the "Saskatchewan River Water supply." This is one of the most important questions, with which the engineers in Saskatchewan will have to deal in the next few years. The cities of Moose Jaw and Regina will have to look for an additional water supply and the whole district from the Elbow (on the Saskatchewan River) to Regina and some piece south of it, will have to depend on this future supply.

Mr. McPherson mentioned, that as early as 1894, already J. S. Dennis looked upon the Saskatchewan River as a supply for Irrigation purposes. After some preliminary surveys the Irrigation Department appropriated 200 cubic ft./second from the Saskatchewan River for the use of the District, which water, however, has never yet been utilized. There were a number of projects made, which Mr. McPherson enumerated in detail, but the difficulty seems to be to find out the minimum quantity of water necessary at present, and to build up a system, which is capable of future extensions. The amount of water necessary at present will hardly pay the cost of construction.

A further paper on this subject will be given before the Branch at an early date by G. D. Mackie, M.E.I.C., City Commissioner, Moose Jaw.

A number of Branch Committees have also begun their activities. The Paper and Library Committee (Chairman: D. A. R. McCannell, A.M.E.I.C.) has drawn up a program for the season's meetings, which are held every second Thursday of the month at the Kitchener Hotel, Regina, in conjunction with a dinner. The Concrete Committee (Chairman: H. McIver Weir, M.E.I.C., Saskatoon) has done some very valuable work in the investigation of the influence of Alkali upon concrete. The University of Saskatchewan appropriated considerable money for the purpose of research work in this connection and is proceeding in conjunction with the Branch. Professor C. J. Mackenzie, A.M.E.I.C., will read a paper at the Annual Meeting of the Branch, January 8th, giving a résumé of the work done by the Committee.

The Committee to assist the Canadian Engineering Standard Association (Chairman: A. P. Linton, A.M.E.I.C.) has invited contributions and suggestions from all members of the Branch.

The Branch as such is gaining rapidly in membership and there are very few engineers in Saskatchewan, who have not joined our ranks. We are also carrying on an active campaign to increase the number of Affiliates of the Branch and bespeak the assistance of all members.

The Secretary was favored with a visit from A. G. Dalzell, M.E.I.C., from Vancouver, who made a very short stop-over on his way from Ottawa, to his home.

C. P. Richards, A.M.E.I.C., the energetic Chairman of the Legislation Committee of the Branch had to go to British Columbia for the winter on account of his health.

Messrs. R. C. F. Chown, A.M.E.I.C., and J. M. Mackay, A.M.E.I.C., who spent several months in England and Scotland respectively, returned and resumed their respective duties.

O. W. Smith, M.E.I.C., has again gone to Victoria for the winter.

R. N. Coke, A.M.E.I.C., returned to his home in Jamaica.

Vancouver Branch

J. N. Anderson, A.M.E.I.C., Secretary

A general meeting of the Branch was held in the Board of Trade Auditorium on Monday, December 1st. The Branch Chairman, F. G. Matheson, presided over an attendance of thirty members, while the invitation extended to the members of the British Columbia Technical Association to attend our meetings was largely accepted. The subject of proposed legislation was fully discussed, and amongst those taking part were Messrs. Hill, Kennedy, Brakenridge, L. L. Brown, Powell, Mills, Philip and Parlan, also Messrs. Foreman and Bigwood, from the Victoria Branch. Professor Turnbull, member of the Mining Institute of Canada also spoke in favor of the proposal. Mr. Matheson vacated the chair to bring forward motion to pledge the Branch to favor the proposed bill to be presented to the British Columbia Legislature at the coming session, and also to further it by giving the Joint Committee all the financial help necessary to ensure its becoming an Act of Parliament. This was carried unanimously. The following Finance Committee was appointed to obtain funds for the furtherance of the desired legislation:—L. L. Brown, Chairman, R. Snodgrass, Secretary; J. H. Anderson, Treasurer; W. T. Johnston, F. O. Mills, and P. Philip.

A. E. Foreman, B.Sc., M.E.I.C., Public Works Engineer for the Province of British Columbia delivered a lecture on the "Organization and work of the Provincial Public Works Department." This proved to be most interesting and instructive and many valuable statistics were presented showing Departmental methods and the large savings in expenditures resulting from the methods now being adopted. Standard plans for all classes of road work were shown, and their application to this large and mountainous province explained. The Chairman presented the thanks of the meeting to Mr. Foreman for his excellent address.

Proposed Legislation for Engineers

A Legislative Committee of Engineers representing *The Engineering Institute of Canada*, the Mining Institute of Canada, the B. C. Technical Association, and other Societies, is now undertaking the work of drafting a Bill to incorporate Engineers on the lines of the draft Bill published by *The Engineering Institute of Canada* and the Canadian Mining Institute.

Joint Mainland Committee

F. G. Matheson, B.A.Sc., M.E.I.C., Chairman.
W. Anderson, M.E.I.C.
C. Brakenridge, M.E.I.C.
W. B. [illegible], M.E.I.C.
A. G. Dalzell, M.E.I.C.
N. J. Ker, M.E.I.C.
A. E. [illegible], M.C.I.
J. Muirhead, B.Sc., A.M.E.I.C.
W. H. Powell, B.Sc., D.L.S., M.E.I.C.
H. L. Robertson.
R. Snodgrass, A.M.E.I.C., Secretary.
J. M. Turnbull, B.A.Sc.
W. F. Anderson, B.Sc., A.M.E.I.C., M.L.A.
J. N. Anderson, A.M.E.I.C., Treasurer

Joint Island Committee

A. E. Foreman, B.Sc., M.E.I.C., Chairman.
H. C. Bailey.
P. W. W. Bell, M.E.I.C.
H. S. Browne.
W. M. Brewer.
E. C. Hayward.
E. N. Horsey, A.M.E.I.C.
J. B. Lambert.
D. O. Lewis, M.E.I.C.
T. K. Loach.
G. P. Napier, M.E.I.C.
W. Sleet Robertson.
S. N. Preston, A.M.E.I.C.
R. H. Woods.

The following has been sent to all engineers in the Province:—

Advertising of this Bill must be commenced by December 12th, and it is estimated that about $2000 will be required to get the Bill through the House at the next session of the B.C. Legislature.

A sum sufficient to cover the advertising and immediate expenses is required in the next few days by this Committee, in order that action may be initiated. The action of the Committee will depend on the support immediately received. Five dollars per head by 400 engineers is required, and as some will probably not come through, it is advisable to subscribe a larger sum if possible. Excess over sum required will be returned to subscriber pro rata. In order to be effective your subscription should be sent in immediately on receipt of this notice.

At the time of writing the Joint Committee has drafted a Bill which will be ready for [illegible] by the middle of December. Lt.-Col. H. S. Tobin, of the firm of Pattullo & Tobin, Barristers & Solicitors has been retained by the Committee to act as solicitor and to see the Bill presented to the House. The necessary advertisements are now appearing in the press of the Province and the progress of the Bill will be keenly watched by all members of the profession in Canada.

Copy of advertisement:—

NOTICE

Notice is hereby given that an application will be made to the Legislative Assembly of the Province of British Columbia at the next session, on behalf of the Association of Professional Engineers of British Columbia, for a Private Bill to incorporate the said Association, the said Bill to be known as THE BRITISH COLUMBIA ENGINEERING PROFESSION ACT, for the purposes of governing and regulating the practice of Civil, Mining, Metallurgical, Mechanical, Electrical and Chemical Engineering in the Province of British Columbia, and the qualification, examination and registration of intending practitioners, the discipline of its members, and for the acquiring of real and personal property and the disposal of the same, and for the general management of the Association.

Dated at the City of Vancouver, B. C., this 5th day of December, A. D. 1919.

H. S. TOBIN,
of the firm of Pattullo & Tobin,
Solicitors for the Applicants.

As soon as received a copy of the Bill will be forwarded to Headquarters and all Branches. The Finance Committee appointed by *The Engineering Institute of Canada* is acting for the Joint Committee on legislation.

Victoria Branch

Horace M. Bigwood, A.M.E.I.C., Secretary

The branch held the first of a series of informal receptions on the 24th of Nov. last, which was attended by about 65 members and friends.

The Chairman, Capt. W. M. Everall with Mrs. Everall, received the guests and fulfilled their duties in a very pleasing manner.

Dancing formed the basis for a very enjoyable evening, and several songs rendered by members and ladies, between dances, were much appreciated.

The committee are so satisfied with the result of their efforts that they feel sure that the succeeding events of a similar nature, which are to be held monthly on the fourth Monday, will be equally successful.

It is hoped by such means to bring the members into closer touch and to interest those of the profession who do not belong, and be the means of inducing them to join.

The Annual Meeting of the branch will be held on Dec. 17th, when officers for the ensuing year will be elected.

Algonquin Park

A good place to spend a winter vacation is Algonquin Park where winter sports usch as skating, tobogganing, ski-ing and snow-shoeing may be enjoyed to the full. Situated about 200 miles north of Toronto, and 170 miles east of Ottawa, Algonquin Park is easily accessible. The "Highland Inn," the largest of the Park hotels is open throughout the year so that visitors may be sure of first class hotel accommodation at any time. A copy of the new publication, "Enjoy winter in Ontario Highlands" may be obtained on request from Grand Trunk agents.

Presented to the Peterborough Branch E.I.C. by Ottawa Branch.

OBITUARIES

J. Eustache Sirois, A.M.E.I.C.

The death of Joseph Eustache Sirois, A.M.E.I.C., occurred on October 10th, 1919, at Ste. Anne de la Pocatière, P.Q.

Mr. Sirois was born on September 19th, 1858, at Ste. Anne de la Pocatière, P.Q., and was educated at the St. Anne's College, St. Anne de la Pocatière. He was admitted to practice as a Quebec Land Surveyor in April 1882, and as a Dominion Land Surveyor in December 1882. In 1883 and 1884, he surveyed different lands in the west of Canada for the Government of the Dominion. From 1884 till the time of his death he was doing engineering work in different capacities, being with the Riviere Ouelle Pulp & Lumber Company; Brown Corporation; Transcontinental Railway and the Great Northern Railway. Mr. Sirois was a member of the Board of Directors, of the Quebec Land Surveyors since 1886, and was appointed President of this corporation in 1912, which charge he occupied until the time of his death. He was an Associate Member of *The Institute*.

Flight Lieut. J. R. Middleton, Jr.E.I.C.

The Institute has learned with deep regret of the death of Flight Lieut. J. R. Middleton, Jr.E.I.C.

Flight Lieut. Middleton was the eldest son of the late Mr. G. H. Middleton and Mrs. Middleton, 38 Iverleith Place, Edinburgh, Scotland, was born at Toronto in 1888, and educated in Natal and at Edinburgh Academy and University.

In 1906 he joined the Canadian Pacific Railway engineering staff, and at the outbreak of the war was engaged on bridge work in British Columbia. He at once joined Lord Strathcona's Horse and served in France with that regiment, later being attached to the 7th Cameron Highlanders. In 1916 he served as a pilot with the Royal Flying Corps, and on March 24th when his squadron was heavily attacked, his machine was forced down in the German lines. As a wounded prisoner Lt. Middleton was sent to Mulbum Rubr Hospital, where he died on June 21, 1917.

A younger brother, Lieut. A. S. Middleton, who was on the Canadian Northern Railway Engineering Staff, died in France of wounds received at the battle of Lens. Another brother, Lt. G. H. Middleton, [illegible], was killed in North Russia.

Stephen Pearson Brown, M.E.I.C.

Stephen Pearson Brown, M.E.I.C.

It is with great regret that *The Institute* has learned of the sad fatality which occurred at [illegible] Lake, Me., on Dec. 7th, when S. P. Brown, M.E.I.C., was drowned. Mr. Brown was dragging his son on a sled when the ice gave way beneath him, and he was drowned before assistance arrived. Mr. Brown was born at Dover, Me., in 1877, was educated at the Massachusetts Institute of Technology, Boston, Mass., and graduated with the degree of S. B., in 1900. From 1900 to 1901, he was a junior partner of the firm of Collier & Brown, Consulting Engineers, Atlanta, Ga. In 1902-05, he was successively consulting engineer with the [illegible] Company, New York, engineer on construction, New York, New Haven & Hartford R.R., Bridgeport, Conn., and designer in reinforced concrete with the [illegible] Fireproofing Co., New York. From 1905 to 19[illegible] Mr. Brown was principal assistant engineer, United Engineering & Contracting Co., New York. During this period Mr. Brown was engaged on the following important undertakings:—depression of track of New York Central Ry. on Port Morris Branch, New York, the design of plant structures, concrete work and general construction on

Penn. R.R. cross-town tunnels in New York; with general superintendence of all work west of Fifth Avenue in 1908.

Mr. Brown came to Montreal in 1912 as engineer in charge of the construction of the Mount Royal Tunnel. He superintended the drawing up of the plans of the tunnel and took charge of this work from start to finish, and was chiefly responsible for its successful accomplishment. This was a remarkable achievement, since the construction of the tunnel under Mount Royal established a world's record in the matter of time and the successful working out of the details.

The tunnel proper was completed before Mr. Brown left Montreal. Immediately after the United States declared war in 1917, he left for the United States and offered his services to the Government in any capacity. He was not accepted for active service overseas, but was retained in the engineering department of the war service at home. At the conclusion of hostilities Mr. Brown became Vice-President and General Manager of Ford, Bacon & Davis, a large contracting firm of New York, which post he held until his death. He was an American citizen and came to Montreal almost a complete stranger. He resided here for about five years during which period he made himself almost a home citizen of Montreal and took a prominent part in much of the war work here. He brought his family to Montreal with him and they lived for a time on University Street, just above Burnside Place, and during the summer lived in Westmount on the Heights. Mr. Brown was active in supporting the Patriotic Fund, and numerous other enterprises of a similar nature for the benefit of Canadian soldiers and families in which work he was joined by Mrs. Brown. He was elected a member of the Council of *The Engineering Institute of Canada* in which he took an active part, addressing *The Institute* several times on the work of constructing the Mount Royal Tunnel. He was also a member of the Rotary Club, and the University Club. He was exceedingly popular in McGill circles, lecturing several times to the students on his work, and conducting parties of professors and students through the tunnel whenever they wished. Mr. Brown kept in touch with the Montreal engineers after his return to the United States, especially in matters connected with the tunnel.

During his stay in Montreal Mr. Brown won the respect and admiration of the members of the engineering profession not only by his high abilities, but by his excellent qualities as a citizen, and his death will be deeply regretted by every member of *The Institute*.

Mr. Brown is survived by his wife, who was Miss Edith Luce, of Boston, and two sons, his mother and two sisters, Mrs. J. Arnold Norcross, of New Haven, Conn., and Mrs. Clarence F. Doore, of Melrose, Mass.

The funeral was held in the Congregational Church, on the afternoon of December 8th, under the direction of Francis C. Peaks, and there was a large attendance. Beautiful flowers had been sent by the relatives and friends. The burial was in the family lot in Foxcroft cemetery.

PERSONALS

Frank Lee, M.E.I.C., has been appointed Engineer, Maintenance of Way, Eastern Lines, C.P.R., Winnipeg, Man.

*

William Smail, B.A.Sc., M.E.I.C., has been appointed chief engineer of the Northern Construction Co., in Vancouver, B.C.

*

C. B. Kingston, M.E.I.C., formerly of Pearce, Kingston & Brown, London, England, has moved to Johannesburg where he is with the African & European Investment Co.

*

C. H. Attwood, A.M.E.I.C., has been transferred from Ottawa to the Manitoba Hydrometric Survey of the Dominion Water Power Branch, Dept. of the Interior, Winnipeg.

*

Wimund Huber, A.M.E.I.C., has recently severed his connection with the Ontario Department of Public Highways and is now engaged in business as a contractor in Toronto.

*

S. J. Fisher, M.E.I.C., has been appointed superintendent of the James Smart plant of the Canada Foundry and Forgings Company at Brockville. Mr. Fisher took over the responsibilities of this position on December 1st.

*

Wm. P. Parker, M.E.I.C., formerly with the Keystone State Construction Co., has accepted a position with Ballinger & Perrot, architects, engineers and constructors, Philadelphia, in the capacity of production engineer.

*

J. E. Milne, Jr.E.I.C., has been appointed municipal engineer of Saanich, B.C. Lieut. Milne resigned the position of municipal engineer of Burnaby to accept the position at Saanich.

*

James McGregor, M.E.I.C., Superintending Engineer, Halifax Ocean Terminals, Canadian National Railways, has left Canada for a visit to Scotland and expects to be absent from this country for some time.

*

H. A. Paquette, A.M.E.I.C., of Levis, P.Q., formerly general manager of the Lauzon Engineering Works has resigned his position and has organized the Levis File Company at Levis, P.Q., of which he will be the directing head.

C. Brakenridge, M.E.I.C., is leaving for England, and his temporary address will be, c/o D. Brakenridge, 12 Selwyn View, Whitehaven, England. Mr. Brakenridge has been Acting Secretary of the Vancouver Branch and did much good work in this connection.

•

W. G. Milne, A.M.E.I.C., has been appointed mechanical superintendent for Dominion Foundries & Steel Co., of Hamilton, Ont., the appointment having taken place on September 1st, 1919. Mr. Milne was formerly with the Hamilton Bridge Works Co., of Hamilton, Ont., where he occupied the position of Plant Engineer.

•

G. C. Williams, M.E.I.C., has accepted the position of contracting engineer, with the Whitehead and Kales Iron Works, Detroit, Mich. Mr. Williams was with the Canadian Bridge Company, Walkerville, Ont., for fifteen years, starting with them as a draftsman in 1904. At the time of his resignation he was sales engineer in charge of local structural sales.

•

Baron Gustave de Coriolis, A.M.E.I.C., has returned to Canada after being absent from this country for twelve years in France. His present address is 170 de l'Epee Ave., Outremont. Baron de Coriolis was in Paris during the later stages of the war and is interested in the reconstruction problem now facing France, particularly the development of hydro-electric power.

•

Lieut. B. A. Johnston, Jr.E.I.C., enlisted in Jan. 1916, with the 46th Battalion, going to England in November 1916. He went to France in December 1916, and in May 1917 was wounded in the left forearm. He spent ten months in the hospital in England. Lieut. Johnston returned to Canada in 1918, and spent fourteen months in the Tuxedo Military Hospital, Winnipeg before final discharge.

•

J. M. Begg, A.M.E.I.C., enlisted in October 1914, with the Highland Field Company, Royal Engineers, attached to the 51st Highland Division and served with that division in France from May 1915, till September 1916. From September 1916, till the Armistice was signed he was Staff Sergeant, foreman of works on construction of ammunition depots and aeroplanes in France. He returned to Canada in 1919 and is now residing at 256 MacKay St., Montreal.

•

J. J. McArthur, M.E.I.C., H.B.M. Boundary Commissioner and the Commission Engineers, Messrs. Craig and Fawcett, have been in conference during the past month at Ottawa with E. C. Barnard, U. S. Boundary Commissioner and R. N. Ashmun, of the Washington staff, and have dealt with a number of questions relating to the International Boundary.

The two Washington engineers were guests at the Ottawa Branch luncheon held in honour of Major-General Sir Edward Morrison.

Albert S. Miller, B.A.Sc., S.E.I.C., enlisted in Toronto in June 1917, with the Canadian Forestry & Railway Construction Depot. He went overseas immediately, was with the Canadian Railway Troops Depot in England, and was sent with reinforcements to the 1st Battalion, Canadian Railway Troops engaged in the construction of standard-gauge railways and bridges in Belgium and France. He returned to Canada in April 1919, and is now in charge of the Engineering Depot., of the Factories in Eastern Division, Dominion Canners, Ltd., Brighton, Ont.

•

Lieut. Thos. C. Main, A.M.E.I.C., enlisted in Winnipeg as a sapper in December 1914. He went overseas with the 44th Battalion, serving in all ranks up to Sergeant. In April 1916 he was transferred back to the Canadian Engineers and was wounded in June 1916 at Sanctuary Woods. In October 1916 he was sent to Salonika where he served with the 139th Army Troop Company; he was then sent to Italy with the 4th Heavy Bridging Train. Lieut. Main was awarded the Italian Croix de Guerre in connection with pontoon work on the River Piave in October 1918. He returned to Canada on June 13th, 1919.

•

Capt. E. R. B. Pike, A.M.E.I.C., enlisted as Lieut. O.C. Machine Gun Section, 2nd Australian Light Horse in August 1914, served in Gallipoli, was promoted to Captain, and returned to Australia owing to illness in August 1916. He was discharged as unfit for service, and was employed on camp work until December 1916, when he was appointed to A.I.F. transport service, and sent to England. Capt. Pike returned to Australia in July 1917, when his appointment in the A.I.F. terminated, and he was then employed on recruiting work. In October 1917 he was appointed Secretary, State Recruiting Committee in Queensland, which position he occupied until the close of hostilities.

•

Herbert P. Heywood, Jr.E.I.C., enlisted on July 4th, 1916, and left for England in December 1916. He was quarantined for some time at Bramshott and Purfleet Camps, leaving for France in March 1917 with the 3rd Canadian Railway Troops on railway construction, light railways, battery positions, etc., and later on the construction of fifteen miles of light railway from St. Aubain to Lestrem. Towards the close of the war the 3rd C.R.T. were sent to the Lens front to build a railway over No-Man's Land and later to Donai on standard gauge line to Valenciennes. Mr. Heywood was demobilized in Canada in October 1919 and is at present representing the Lock Joint Pipe Co., in Eastern Canada, with headquarters at 259 Davenport Road, Toronto, Ont.

•

Lt.-Col. R. B. Harkness, D.S.O., Croix de Guerre, M.E.I.C., enlisted with the Canadian Engineers in January 1915, going overseas the same month with that unit. He accepted a commission with the 19th Battalion Welsh Regiment, 38th Imperial Division, going to France in November 1915 with this Division, and serving with them until the signing of the Armistice. He was wounded in March 1918, was awarded the D.S.O., (which was presented to him by H.R.H. the Prince of Wales on the occasion of his recent visit to Montreal), the Croix de Guerre, and was three times mentioned in despatches. He returned to Canada and was demobilized in March 1919. Lt.-Col. Harkness is now District Vocational Officer in the Soldiers' Civil Re-Establishment, St. Catharines, Ont.

*

Captain L. W. Gill, M.E.I.C., formerly, Professor of Electrical Engineering at the Kingston School of Mining, has been appointed Director of Technical Education for Canada, and has come to Ottawa to take up his new position.

Captain Gill will have charge of the administration of technical education throughout the Dominion, as provided for in the Technical Education Act passed at the last regular session of Parliament.

An expenditure of $700,000.00 in the various provinces is proposed, and it is expected that Captain Gill will at once confer with representatives of the various provinces in regard to the detail of the organization work.

Captain Gill is well known to members of *The Institute* in connection with his brilliant services overseas as officer of the 46th Field Battery, C.E.F.

*

W. S. Harvey, A.M.E.I.C., has resigned his position with the Toronto Harbor Commission to take up work in association with Mr. Alexander Potter, M.E.I.C., Consulting Engineer, New York; he expects to be for some time at Warren, Ohio, on investigation of sources of water supply in preparation of design and plans. Mr. Harvey received his early engineering training in Wales, was later associated with the British Insulated & Helsby Cables, Ltd., in charge of track work and street paving for the Chesterfield Electric Tramways, and was also in charge of contract work at Weston-super-Mare and Hull. Mr. Harvey came to Canada in 1910, and with the exception of six months at Lethbridge, has been associated with the city of Toronto in design of drainage systems, etc. Mr. Harvey has been a very energetic Secretary-Treasurer of the Toronto Branch and his loss will be felt by all the members of the Branch.

*

Hugh A. Lumsden, A.M.E.I.C., Assistant District Vocational Officer at Orillia, Ont., enlisted in April 1915, with the 35th Battalion, as Lieutenant; was transferred to the 19th, went overseas in May 1915, and in England he was transferred to the Overseas Railway Construction Corps, went to France in March 1916, joining the C.O.R.C.C. on railway construction work. The Corps consisted almost entirely of Canadian railway men, and out of a total strength of five hundred and ten men over one hundred commissions were eventually obtained. In October 1916, Colonel C. W. P. Ramsey, M.E.I.C., was appointed Railway Construction Engineer for the Fifth Army, and Lieut. Lumsden was appointed Adjutant under him. He was given command of "C" Company, in the Canadian Railway Troops, under Lieut.-Col. (now Brig.-General) Hervey, M.E.I.C., and was promoted to the rank of Major. A bad attack of influenza put a sudden end to active work and Major Lumsden was in hospital for four months. Since returning to Canada in April 1919, Major Lumsden has been with the Dept. of Soldiers' Civil Re-establishment, and expects to return to engineering work early next year. In July 1919, Major Lumsden was elected an Associate Member of the Institute of Civil Engineers in Great Britain.

*

Paul Emile Mercier, consulting engineer to the Administrative Commission of the city of Montreal, who was recently appointed as a professor on the staff of L'Ecole Polytechnique, Montreal, and who will hereafter devote a considerable portion of his time to educational work, was born March 15, 1877, at St. Hyacinthe, P.Q. He was educated at St. Mary's College, Montreal, and received his technical training at L'Ecole Polytechnique. He became chainman of the Montreal on the Montreal Park & Island Railway in 1895. Entering the service of the C.P.R., in 1896, as a rodman on the Quebec Division, he became a leveller in 1897. In 1898, he joined the staff of the Public Works Dept. of Canada as an assistant engineer and from 1899 to 1904 was a district engineer in that department. In 1905 his services were requested by the National Transcontinental Railway and for the following two years he was engineer in charge of that project. In 1908, Mr. Mercier engaged in private practice in Montreal, under the firm name of Baulne & Mercier, which connection was retained until 1914, when he was appointed deputy chief engineer of the city of Montreal. When George Janin, chief engineer of the city, was given leave of absence to go overseas in December 1914, Mr. Mercier became acting chief engineer, and upon Mr. Janin's death, in 1915, Mr. Mercier was appointed chief engineer. In May 1918, he became the City's Director of Public Works, from which position he retired in November 1918, to act as consulting engineer to the newly-appointed Administrative Commission. Mr. Mercier is a member of *The Engineering Institute of Canada,* the American Society of Civil Engineers and the Society of Civil Engineers in France.

*

Colonel Francis F. Longley, D.S.M., O.B.E., graduated ln 1902 from the United States Military Academy at West Point, and was commissioned in the Corps of Engineers, United States Army. He resigned his commission soon thereafter to engage in the practice of Civil and Sanitary Engineering and took a special course in the Massachusetts Institute of Technology in Sanitary Engineering Lines, his work being largely in the United States, but he has also done work in Canada and New Foundland. During the past seven years he has been a member of the firm of Hazen, Whipple and Fuller, Consulting Engineers of New York City, whose acquaintance with and experience in various phases of Sanitary Engineering work is world-wide.

In August 1917, Colonel Longley was commissioned as Major of Engineers, United States Army and sent to France to organize a service of water supply for the American Expeditionary forces. In November 1917 he was promoted to Lieutenant-Colonel and assigned to the 26th Engineers, the army water supply regiment. In October 1918 he was promoted to Colonel, 26th Engineers. During the first few months of American activities abroad, the water supply work was confined mainly to the line of communications. He also spent much time during the fall of 1917 with the British and French armies, studying their methods of handling water supply and other closely related problems. In the spring of 1918 he was engaged in the organization of the water supply service of the army, and for this work he was awarded the Distinguished Service Medal for his participation in this work. After the Armistice Colonel Langley was sent to England in charge of the army educational program in the United Kingdom, under which some two thousand officers and soldiers of the American Army attended British Universities for a period of about four months in the spring of 1919. On November 22nd, 1919, on board H.M.S. "Renown" Colonel Langley was invested by H.R.H. The Prince of Wales as Honorary Commander of the Order of the British Empire. He is a member of the American Society of Civil Engineers, *The Engineering Institute of Canada*, The American Public Health Association, The American Water Works Association, and the New England Water Works Association.

Norman M. Campbell, A.M.E.I.C., has resigned his position as General Sales Manager of Canadian Ingersoll Rand Co. Limited, and as a director of that company, having been appointed Managing Director of General Combustion Co. of Canada, Limited, with headquarters in New Birks Building, Montreal. He will assume his new duties on the first day of January 1920.

Norman M. Campbell, B.Sc., A.M.E.I.C.

Mr. Campbell was born in Montreal in 1878, the son of Rev. Dr. Robert Campbell of that City. He was educated at Montreal High School, Abingdon School and McGill University, from which he graduated in 1899 with the degree of Bachelor of Science.

On graduation he was appointed assistant engineer in the Waterworks Department of the Dominion Iron and Steel Co. at Sydney, during the construction of that company's plant.

He joined the staff of the Canadian Ingersoll Rand Co. Ltd., in [illegible], as manager of their Toronto branch and moved to Montreal to take a similar position there three years later.

In 1910 he was appointed general sales manager of the company, and during his tenure of that position he has had the satisfaction of seeing the company grow from a very modest concern to its present status as one of the largest manufacturing plants in the iron and steel industry of Canada.

The General Combustion Company was recently formed to exploit in Canada and Great Britain, industrial furnaces for annealing, forging, heat treating, etc., under the [illegible] patents with the trade name of "[illegible]" furnaces.

In connection with the retirement of Mr. Campbell from the Canadian Ingersoll Rand Co., a dinner was given in his honor in the Blue Room of the Windsor Hotel, Montreal, on Thursday, December 11th, at which a large number of the engineering and sales staff of the company was present. The following speech was read by E. W. Gilman, General Manager of the Company:—

Norman Campbell, B.Sc.: This gathering and these few expressions and this little remembrance that we give you from our hearts, evidence, in a simple way, the great good-will which your friends and co-workers in the Canadian Ingersoll-Rand Co., Limited, entertain for you. In retiring from this Company which you have served so faithfully for so many years, the sentiment is general that we are losing a capable, conscientious and faithful officer of the Company.

The desire to show recognition of the signal services you have performed in the upbuilding of the Company does not constitute the only motive for admiration and respect. Consistency of character, and a uniform regard for the welfare of your fellow workers, coupled ever with evidence of fairness, courtesy and high minded principles, have commanded a confidence and esteem which promoted the pleasantest relations and insures for you always the kindliest recollections.

In the success of all engagements and the achievement of every ambition, you have the earnest and cordial following of a host of well-wishers, who appreciate you as an executive, admire you as a citizen and honor you as a man.

EMPLOYMENT BUREAU

Situations Vacant

Electrical Draftsmen

Two electrical draftsmen experienced in transmission line and switchboard detail desired. Apply Box No. 71.

Junior Draughtsman

Junior draughtsman for designing small structures such as dams, etc., mapping and general draughting work, a graduate in applied science desired. Salary $100 to $110. per month. Apply Box No. 70.

Railway Draftsmen

Two good railway draftsmen wanted for an Ontario Public Utility. Box 69.

Two Steamship Inspectors for Vancouver and Quebec, Department of Marine. Salaries $2,700 per Annum.

Two Steamship Inspectors, one for the port of Vancouver and the other for the port of Quebec, to act in the dual capacity of inspector of boilers and machinery and of hulls and equipment, at an initial salary of $2,700 per annum, which will be increased on recommendation for efficient service at the rate of $180 per annum until a maximum of $3,240 has been reached.

Candidates must have education equivalent to graduation in engineering from a technical school of recognized standing; at least twelve years of experience in the design, construction, maintenance or operation of ships, marine engines and boilers; thorough knowledge of the theory and the practice of marine engineering and ship construction; ability to make clear and concise reports on inspections and to make working drawings, specifications, and estimates for proposed work; tact and good judgment.

The successful candidate will be required to perform the following duties: To inspect the boilers and machinery and hulls and equipment of steamships during construction, and, as required by law, to determine whether they are sufficient for the service intended and in good condition; to examine plans of ships and their equipment, marine machinery and boilers submitted for the purpose of determining by calculations of the strength of the various parts whether they can receive approval; to advise builders, owners, and others concerned in the matter of construction of ships and their machinery and the repairs required to keep the same in efficient condition; when satisfied as regards the sufficiency of ships, their boilers and machinery, and that the law as regards certificated officers, etc., has been complied with, to issue a statutory certificate of inspection, to examine candidates for marine engineer certificates; to act as a member of a Board of Steamship Inspection occasionally as required; to investigate and report on accidents and breakdowns happening to ships, their boilers and machinery; to supervise and report on repairs to Government ships, their boilers and machinery, and to perform other related work as required. Candidates should be not more than 40 years of age.

An examination will be held in connection with the filling of the position, and candidates will be notified later of the date and place of examination. *Preference will be given to residents in the provinces of British Columbia and Quebec respectively.*

The position of Steamship Inspector at Vancouver was advertised September 4 and is now readvertised.

Situations Wanted

Plant Engineer

Plant Engineer.—Engineer at present in charge of design and construction, of tools, fixtures, dies, etc., and all mechanical equipment of manufacturing plant, employed at present in New England wishes to return to Canada is fully qualified for the position of factory executive or plant engineer. Apply Box 12-P.

Oregon Provides for the Registration of all Professional Engineers

Act Recently Passed Affects Municipal and County Engineers as Well as Those in Consulting Practice

The Oregon State Legislature has provided in Chapter 381 of the General Laws of 1919 for the registration of all professional engineers, including civil, mechanical, electrical, chemical and mining. After January 1, 1920, no engineer can practice his profession in Oregon without being registered by the State Board of Examiners. This means that after the date given no county or municipal engineer can perform the duties of his office without being registered, as every map or official plan must be prepared or approved by a duly registered professional engineer.

Up to January 1, 1920, any engineer who files an application or registration and can show under oath that he had had at least six years' experience in professional engineering can be registered without examination. After that date, however, an engineer can be registered and receive a certificate only after passing an examination prepared by the Board.

The effect of this act will be to raise the standard of the engineering profession by safeguarding the public from the practice of incompetent and untrustworthy engineers. It will undoubtedly raise the standard of municipal and county engineers, particularly in the smaller places, and its results will probably be similar to those of the act recently passed by the state of California regarding the competence of county engineers; it will limit the practice of the profession of engineering to men duly qualified by experience and training or both. More than 400 engineers have already applied for registration, so that it is anticipated that all who are able to qualify will have registered before January 1, 1920.
"American City," November, 1919.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Published Monthly at 176 Mansfield Street, Montreal

— By —

THE ENGINEERING INSTITUTE OF CANADA

Incorporated in 1887 as

THE CANADIAN SOCIETY OF CIVIL ENGINEERS

Entered at the Post Office, Montreal, as Second Class Matter

Volume III MONTREAL, FEBRUARY 1920 Number 2

Report of Council for the Year Nineteen Hundred and Nineteen

Service to the individual member, to the Branches and to the Engineering Profession, has been the constant aim of the Council during the past year. This spirit of service has been one of evolution spreading over a number of years until it is now fully recognized and firmly established as a basic principle underlining the policy of *The Engineering Institute of Canada*. It has been exemplified in many ways in connection with the work of *The Institute* during 1919, which as far as real progress in co-ordinating the engineering profession and developing a professional spirit is concerned, is believed to be one of the most progressive in the history of the profession in this country. A material result of this spirit is evidenced by the unprecedented number of applications for admission by engineers of a high standing. The stimulation to personal effort which the new policy has evolved on the part of the individual member, and the growing feeling in the minds of non-member engineers that the influence of *The Institute* warrants their becoming part and parcel of its fabric, is undoubtedly having its effect.

While the financial statement dealt with in the Report of the Finance Committee shows that operating expenses have exceeded the revenue, *The Institute* has profited materially in the matter of good will and interest of the individual members, and this represents a capital investment.

In carrying out the policy of the Council, a considerable part of the Secretary's time has been spent in visits to the Branches and personal consideration on behalf of the individual members.

During the year new Branches were established at Sault Ste. Marie, Niagara Peninsula, Border Cities and Peterborough, and the Kingston Branch has renewed its activities. Every one of the eighteen Branches of *The Institute* is in a flourishing condition so that the great strength of the national organization to day is its local societies or branches, each one of which is becoming more and more a force and a factor in the community in which it is located.

In connection with the Branches, the rebates have been increased. Standard stationery has been adopted, and is supplied without charge from headquarters. There has also developed a strengthening of the bonds between the various Branches, resulting in a considerable interchange of branch ideas and courtesies.

The new membership certificate of *The Institute* has been produced and issued to several hundred of the new members, and it is confidently hoped that the balance of those delayed will be sent out without undue delay. The new certificate, together with the new badge, which is already worn by a large number of the members, have met with general approval and much complimentary comment.

The Journal of *The Institute* has grown in favour from month to month, and it is strongly urged that every member give it his personal support, because of its value to the profession and because it has done much to strengthen the bond of union between the members.

The past year has seen the return of our men from the Front. After the wonderful record which they made they are gladly welcomed back. Every effort was made to assist the returned men to secure suitable positions and with considerable success, in spite of the fact that engineering during the past year has been far below normal with a consequent lessened demand for engineering services.

In addition to *The Journal*, two outstanding publications have been issued: "The Manufacture of Munitions in Canada," by Past President H. H. Vaughan, the most complete record of the production of munitions in this country that has been published. "The Quebec Bridge" Transactions which have been described as the outstanding engineering publication of the year in America reflect great credit on the authors, and the thanks of *The Institute* are due the St. Lawrence Bridge Company and Past Presidents Johnson and Duggan for their unstinted interest and assistance in their production.

Beginning with a discussion at the Professional Meeting in Saskatoon during the summer of 1918, the question of legislation has occupied a prominent place in the activities of *The Institute* during the past twelve months. A special Committee representing every Branch formed in accordance with a resolution of the last Annual Meeting, has drawn up a Proposed Act, the principle of which has been approved by Council, and which at the present moment is under active consideration in every Province. In some instances, application for the registration of engineers has already been presented to the local Legislatures, while in other Provinces Acts are in the course of preparation. *The Institute*, although initiating the movement, has made no attempt to make this an Institute proceeding, but has left the matter in the hands of the engineers in each province.

Engineering classification and remuneration have been sponsored by *The Institute* during the past year, and a movement was taken up by *The Institute* on behalf of the individual engineer. These efforts, although falling somewhat short of the results hoped for, have paved the way for a greater recognition of the value of engineering services.

Generally speaking the past year has been a notable one for the profession, the results of which, if the present policy be continued, will have a far-reaching effect on the profession in the years to come.

R. W. LEONARD,
President.

FRASER S. KEITH,
Secretary.

ROLL OF THE INSTITUTE

Elections during the year resulted in the following additions to the Roll:—fifty-two Members; two hundred and fifty-one Associate Members; fifty-eight Juniors; one hundred and thirty-seven Students, and five Associates.

The following transfers were made:—sixty-five associate Members to the class of Member; seventy-seven Juniors and thirty-two Students to the class of Associate Member; thirty Students to the class of Junior, and one Junior to the class of Associate.

There have been removed from the rolls by resignation or on account of non-payment of dues:—four Members; eleven Associate Members; one Junior; three Students and one Associate. A detailed list of resignations accepted is as follows:—

Members............... Binnie, A. T.
Owens, R. B.
Roehm, G. E.

Associate Members...... Boyce, C. F.
Brandeis, C.
Clark, F.
Kennedy, J.
Kennedy, W. A.
Moodie, W. H.
Sedziack, F.

Junior.................. Vallee, J. I.

Students............... Begras, A.
Jodoin, T.
Panneton, F.

The following deaths, thirty-eight in number, have been reported, of which number thirteen were killed in action:

Members.............. Brown, Stephen P.
Browne, William L.
Campbell, Duncan McD.
Garden, G. H.
Hillman, Thomas E.
Marceau, Ernest
Newman, R. L.
O'Donnell, John P.
Thornton, N. M.
Vallee, Louis A.

Associate Members...... Baird, George H.
Doyle, David
Fraser, Alan T.
Sirois, J. Eustache
Smith, Harry G.
Tourigny, Honore B.

Juniors................. Goodstone, Arthur S.
Grenier, Hector
Mortimer, Frank R.
Price, Charles B.
Ross, George W.

Students............... Gooderham, G. A.
McRostie, George M.

Associate............... Weddell, Robert

Killed in Action or Died while on Active Service

Member	Brunlees, H.
Associate Members	Lawledge, F. M., Lieut. Mullon, J. M. L. G. Stirling, Robert A.
Juniors	Ewart, D. M., Lieut., M.C. Munkman, G. H. N., Lieut. Tingley, Frank H.
Students	Binns, P. V. Lennox, Victor S. Marchbank, O. J., Lieut. Perry, C. V. Scott, Wm. Douglas. Wallace, Hugh.

At present the membership stands as follows:

Honorary Members	10
Members	836
Associate Members	1,825
Juniors	334
Students	518
Associates	32
	3,555
Elected—acceptances pending	102
	3,657

ELECTIONS AND TRANSFERS

The following is a detailed statement of elections and transfers which have taken place during the year. These are not included in the official membership roll until acceptances have been received.

January 21st, 1919

Members:

Barnes, A. J. — Misener, J. S.
MacNab, I. P.

Associate Members:

Griffith, J. — MacKay, W. B.
Harris, R. C. — Nixon, R. L.
Houghton, J. W. — Scott, W. K.
Jones, W. G. — Stephens, G. L.
Macdonald, A. T.

Transferred from the Class of Associate Member to that of Member:

Crysdale, C. R. — Darling, E. H.

Transferred from the Class of Junior to that of Associate Member:

Hobbs, W. E. — Whittaker, D.

February 25th, 1919

Members:

Campbell, T. B. — Marrs, C. H.
Gaby, F. A. — Reid, F. B.
Glassco, J. G.

Associate Members:

Battershill, J. W. H. — Perkins, H. W.
Brunskill, H. C. D. — Peters, J. D.
Cameron, C. F. — Preston, J. E.
Orton, C. J. S. — Ryan, E. A.
Patterson, E. B. — Schachere, B.

Associate:

Pinder-Moss, J. F. S.

Transferred from the Class of Associate Member to that of Member:

Burbidge, G. H. — Duff, W. Alex.
Cagnat, G. H. — Rogers, C. H.

Transferred from the Class of Junior to that of Associate Member:

Eardley-Wilmot, T. — Morrissette, J. N. E. H.
Manning, J. M.

Transferred from the Class of Student to that of Associate Member:

Rocher, B.

Transferred from the Class of Student to that of Junior:

Cresser, J. A. — Way, W. R.

March 25th, 1919

Members:

Denis, L. G. — Palmer, R. K.
Gaines, E. C. — Reid, J. A.
Hobson, R. — Tobey, W. M.
Hungerford, S. J. — Wardwell, W. H.
Larson, C. H. — Weekes, M. B.

Associate Members:

Bellows, W. S. — Morley, J. H.
Brown, G. J. — Munroe, St. J.
Buchanan, C. A. — Neville, E. A.
Duperron, A. — Robinson, R. C.
Eager, A. H. — Sandover-Sly, R. J.
Howarth, C. — Sedgwick, A.
Hubbard, F. W. — Smail, F. H.
Huether, A. D. — Timm, C. H.
MacPherson, A. R. — Vaughan, F. P.
Milne, W. G. — Viens, E.
Mills, G. A.

Junior:

MacTavish, W. I. — Owens, J. E.
Nesham, L. C.

Transferred from the Class of Associate Member to that of Member:

Armstrong, J. — Leamy, J. M.
Bond, F. L. C.

April 24th, 1919

Member:

Newman, W.

Associate Members:

Balls, M. — Newman, J. J.
Bene, M. E. — Templeman, G. E.
Boese, G. P. F.

Junior:

Childerhose, E. A.

Transferred from the Class of Associate Member to that of Member:

Cole, F. T. — McFarlane, J. A.
Derrom, D. L. — McKenzie, B. S.
Emra, F. H. — Montgomery, E. G. W.
McArthur, F. — Swabey, H. W. B.

Transferred from the Class of Junior to that of Associate Member :

Askwith, F. C. Porter, J. E.
Calvert, D. G. Rutledge, M. J.
Dixon, A. Stairs, G. S.
Hunt, W. H. Valiquette, J. H.
McCully, R. C. Watson, M. B.

Transferred from the Class of Student to that of Associate Member:

Dalton, G. F. Hornsby, L. H.

Transferred from the Class of Student to that of Junior:

Hadley, W. F. Hunt, W. G.

June 3rd, 1919

Members:

Baldwin, R. A. Phillips, H.
Haycock, R. L. Smith, W. N.
Morris, W. R. C. Tyrell, J. W.

Associate Members:

Barnes, H. E. R. MacDonald, P. J.
Claxton, G. Mylrea, T. D.
Cuthbert, A. D. W. Nichol, F. T.
Davidson, J. M. Porter, J. H.
Joslyn, C. E. Randleson, H. G.
Kearney, T. Ricketts, S. F.
Kirby, T. H. Tait, E. L.
Landry, J. H. Venney, L. T.
MacDermot, S. G. Wheatley, J. H.

Juniors:

Creighton, C. S. Patterson, H. W.
James, A.

Transferred from the Class of Associate Member to that of Member:

Craig, J. D. Moore, E. V.
Dobbin, R. L. Wallberg, E. A.
Drysdale, W. F.

Transferred from the Class of Junior to that of Associate Member:

Dalziel, W. Milne, J. E.
Devereux, L. J. Oliver, S. E.
MacIsaac, D. F. Strachan, J., Jr.
McLaren, W. C. Turner, S. R.

Transferred from the Class of Student to that of Associate Member:

Boisseau, L. J. G. Thorn, G. O.

Transferred from the Class of Student to that of Junior:

Boulton, C. A. Scott, E. H.
Leclair, W. J. Williams, J. N.
McCrudden, H. E.

June 24th, 1919

Members:

Bishop, W. L. Fawcett, T.

Associate Members:

Arcand, C. L. Richards, E. G.
Campbell, J. G. Shaw, J. W., Jr.
Fraser, D. J. Sherrin, P.
Macleod, J. W. Wilson, B.
Purser, R. C.

Associate:

Christie, G. M.

Juniors:

Freeman, H. J. Walcot, J. B.
Freeman, P. W.

Transferred from the Class of Associate Member to that of Member:

Loudon, T. R. Thomson, L. R.
McCubbin, G. A. Thorne, H.

Transferred from the Class of Junior to that of Associate Member:

Cimon, J. M. H. Inness, R. D.

July 22nd, 1919

Members:

Buck, H. W. Cole, G. P.
Chambers, A. R. White, F. O.

Associate Members:

Black, J. R. McFaul, W. L.
Charles, J. L. Pickings, H. B.
Clark, F. W. Richardson, F. L.
Colhoun, G. A. Ross, K. G.
Dean, C. D. Skolfield, H. N.
Jacobs, L. L. Stidwill, F.
Loudon, A. C. Stokes, C. W.
Macaulay, H. D. Tripp, G. M.
Marchand, J. A. H. Walcott, W. D.
Martindale, E. S. Whitney, C. S.
McClymont, H. R. Wickwire, D. S.
McColl, C. R.

Juniors:

Buckley, P. B. Simpson, B. N.
McCort, C. R. Vogan, G. O.
Richardson, W. H. S. Whitman, C. O.
Roberts, S. O.

Transferred from the Class of Associate Member to that of Member:

Caddy, A. E. Johnson, S. B.
Decew, J. A. McLean, N. B.
Elliot, L. B. Murdoch, G. G.
Hill, B. M. Redmond, A. V.

Transferred from the Class of Junior to that of Associate Member:

Dupuis, L. C. McLerie, A. G.
Keefer, J. A. Stinson, J. N.
Kirkpatrick, A. M. Wynne-Roberts, L. W.

Transferred from the Class of Student to that of Associate Member:

Avery, C. R. Lindsay, C. C.
Drolet, J. H. A. E. Ratz, J. E.
Heroux, J. E. Stephens, W. E.
Johnson, R. P. Wright, A. C.
Kirkpatrick, P. C.

Transferred from the Class of Student to that of Junior:

Galbraith, R. D. Redman, W. B.

August 19th, 1919

Members:

Locke, T. J. Svenningson, S.
Reid, F. C.

Associate Members:

Anderson, J. N. Lowry, G. H.
Archibald, C. L. MacKenzie, W. J.
Beresford, G. W. MacLaurin, J. G.
Bigwood, H. M. Malloch, E. S.
Buckley, R. E. Malloch, N.
Burbank, M. A. McAndrew, J. B.

Report of Finance Committee

The Finance Committee submits a similar table to those prepared during the past few years, showing the receipts and expenditures for the last ten years, on which they comment as follows:—

1. In 1918 the receipts from *The Journal* are shown in Miscellaneous Earnings and the Expenses of *The Journal* in Printing and Stationery.

In 1919 the sum of $2,003.00, received as voluntary subscriptions to *The Journal* are shown in Miscellaneous Earnings, and the difference of $3,019.00 between the amount received from advertising and the expense of publishing *The Journal* is shown as a charge against Printing and Stationery.

2. For both years the difference between the cost of Printing and Stationery and the receipts from Miscellaneous Earnings is approximately the same so that these amounts may be ignored in making a comparison.

3. Excluding miscellaneous earnings, in 1919, there is an increase of approximately $[illegible] in the gross receipts. Both subscriptions and entrance fees show a large increase due to the extension that has taken place in the activities of *The Institute*. This increase is most satisfactory and, although most of our men have returned from the front, the subscriptions this year have not benefited to the full extent from their re-entry into civil life.

4. Excluding printing and stationery, in 1919, there is an increase of $12,278.00 in the expenses. This increase is accounted for as follows:—

Salaries and Wages	$6,265 00
General Expenses	1,848 00
Branch Operations	2,287 00
Legislation Committee	1,727 00
Other Amounts	151 00

The increase in Salary and Wages account is partly chargeable to *The Journal*, which would account for about $4,000.00 of the increase, partly to the large increase of work on account of the expansion in the membership and activities of *The Institute*, and partly due to the increases it has been necessary to make in the salaries of the Staff. The increase in general expense is not unreasonable and that in the expenses of Branches is caused by the increased number of Branches and the expense of the professional meetings.

5. A portion of the increased expenditure might be considered as extraordinary, but these extraordinary expenses will recur from time to time and your Committee feels that steps must be taken to obtain sufficient revenue to wipe out our present deficit. The publication of *The Journal* has cost *The Institute* approximately $[illegible] during the past year. This is largely caused by the inclusion in it of the Engineering Index, but this Index is of great service to our membership and *The Institute* may certainly feel greatly favoured by the generous arrangement by which this information is furnished us by the American Society of Mechanical Engineers. Your Committee considers it would be a great mistake to discontinue this publication, but that, in view of the benefit the membership receive from *The Journal*, a reasonable subscription for it is justified.

6. Your Committee, therefore, recommend that the by-laws be amended to restore the subscription fees to *The Institute* to the amount at which they stood before the subscription was deducted from them and that the present by-law charging $[illegible] per annum for a subscription to *The Journal* be retained. This would increase the revenue of *The Institute* about $[illegible] per annum and, with the larger receipts we may confidently expect from the current fees, should place it in a sound financial condition. In view of the length of time necessary to make a change in the by-law, your Committee would suggest that the Annual Meeting recommend the Council to request our membership to voluntarily agree to this proposition for the ensuing year.

ALEX. BERTRAM,
Treasurer.

MONTREAL, JANUARY [illegible], 1920.

Report of the Library & House Committee

During the past year your Committee has investigated conditions in connection with the Library and has come to the conclusion that the Library can be made much more useful than it is at present. It was understood that money was not available for the Library during the past year and consequently no specific recommendations were made. We would point out, however, that in order to keep a technical library up to date, there must be added each year a reasonable percentage of new books on a number of subjects which are not at present properly covered. We recommend therefore, that an appropriation be set aside for the Library and that the incoming Library Committee be authorized to make a judicious selection of needed technical books. As a further means of making the Library more useful particularly to outside members, we would recommend the preparation of a Library Catalogue to be placed in the hands of all members of *The Institute.*

The staff quarters of the building are not sufficient for the headquarters' staff and a re-allocation should be made.

The Council has approved of the suggestion of the Library and House Committee that the expensive ventilating equipment in the basement of the building be sold. The amount realized from this should provide a reasonable fund for books for 1920.

Your Committee recommends that in future two separate committees be appointed, one to deal with the Library, the other the House.

Publications Received

The following publications were presented to *The Institute* during the current year:—

By Geo. A. Mountain, M.E.I.C.—Report of Board of Railway Commissioners of Canada, 1916.

By F. A. Combe, A.M.E.I.C.—Principles of Combustion in the Steam Boiler Furnace, by Arthur D. Pratt.

By W. Bell Dawson, M.E.I.C.—Reports of Tidal and Current Survey, 1894-1918.

By R. De L. French, M.E.I.C.—Handbook of Street Railroad Location, by John P. Brooks, Surveying Manual, by Pense & Ketchum, Manual of Field Engineering, by Ives & Hilts, The Building Law of the City of Boston, Acts of 1907-Chapter 550. Rural Sanitation in the Tropics, by Malcolm Watson, The Railroad Spiral, by Searles.

By F. C. C. Lynch, A.M.E.I.—Index Map, 1919, corrected.

By H. W. B. Swabey, M.E.I.C. Standard Instructions for Chief Examiners to Govern Inspection of Steel, Shell and Forgings.

By The Canadian Engineer.—Bound Volume XXXV, The Canadian Engineer, July-Dec. 1918. Bound Volume XXXVI, The Canadian Engineer, January-June 20, 1919.

By The Trautwine Company.—The Civil Engineer's Pocket Book.

By The American Institute of Consulting Engineers, Inc.—Constitution and By-Laws and List of Members.

By R. E. Horton.—The Measurement of Rainfall and Snow, by Robert E. Horton, Consulting Engineer, Albany, N.Y.

By The Canadian Ingersoll-Rand Company.—Compressed Air Data.

By C. F. Herington.—Powdered Coal as a Fuel.

By The Public Works Department of the City of Boston.—Annual Report for 1917.

By The Hydro Electric Power Commission of Ontario, Toronto.—Annual Reports for 1909; 1911, 1912, 1914, 1915, 3 volumes for 1916, 3 volumes for 1917, 1918.

By The Sturtevant Engineering Company.—Mechanical Draft.

By The Association of Dominion Land Surveyor.—Annual Report of Twelfth Annual Meeting.

By The Department of the Interior.—Topographical Surveys Branch Bulletin No. 42, The Testing of Aneroid Barometers at the Laboratory of the Dominion Land Surveys.

By The National Xray Reflector Company.—Lighting from Concealed Sources.

By The Altantic Loading Company, New York.—Construction and Operation of a Shell Loading Plant and the Town of Amatol, New Jersey, prepared by Victor F. Hammel, M. Am.Soc.C.E.

By The United States Housing Corporation, Washington, D.C.—Report of the United States Housing Corporation—Houses, Site-planning, Utilities.

By Octave Doin & Fils, Publishers, Paris France.—Mines, Grisou, Poussières.

By The D. Van Nostrand Company, Publisher, New York.—Motor Vehicles and Their Engines, by Fraser & Jones, The Location, Construction and Maintenance of Roads, by John M. Goodell, Asphalts and Allied Substances, by Herbert Abraham.

By Doran & Company, Publishers.—Gas and Flame, Aircraft in War and Commerce, Practical Flying.

By The Société Générale d'Etude et de Travaux Topographiques, d'Etudes et Travaux Géodésiques et Topographiques.

By Masson & Company, Publishers, Paris, France.—Les Applications de la Physique pendant la Guerre.

By McGraw-Hill Book Company, New York.—Concrete Engineers' Handbook, by Hool & Johnson.

The following additions were made in exchange of *The Journal* or the Transactions:

Technical Supplement to the Review of the Foreign Press, The Associated General Contractors of America Publications, Experiment Station Record, U.S. Department of Agriculture Revista Del Centro Estudiantes De Ingenieria, Professional Memoirs, Corps of Engineers, U.S. Army, Geological Survey Publications, U.S. Geological Survey Department, Publications of the Société Industrielle du Nord de la France, Journal of the U.S. Artillery, Publications of the University of Illinois Library, Shipbuilding and Harbour Construction Magazine, Oil News.

Respectfully submitted,

ALEX. BERTRAM,
Chairman.

Montreal, January 14th, 1920.

Report of Publications Committee

On behalf of the Publications Committee I beg to submit the following report for the year 1919:—

We recommend that the papers named below, and discussion thereon shall be printed in Transactions.

Manufacture of Munitions in Canada	H. H. Vaughan.
The Mount Royal Tunnel from an Economic Point of View	H. K. Wicksteed
The Mount Royal Tunnel	J. L. Busfield.
Mean Sea Level as a General Datum for Canada	W. Bell Dawson.
The Mining and Metallurgy of Cobalt Silver Ores	President Leonard.
The Design and Construction of Reinforced Concrete Viaducts. North Toronto. C.P.R.	B. O. Eriksen and H. S. Deubelbeiss.
Notes on the Test of a Girderless Floor	P. Gillespie. and T. D. Mylrea.
Suggested Harbour Improvements For Greater Montreal	E. S. M. Lovelace.
The Design of Hydro-Electric Power Plants for Combatting Ice Troubles	R. M. Wilson.
Railway Electrification	John Murphy.
Economics of Electric Operation of Railways	W. G. Gordon.
Railroad Electrification	F. H. Shepard.
Sooke Lake Water Supply. Victoria, B.C.	C. H. Rust.
The Bloor Street Viaduct. Toronto	Thomas Taylor.
The Operation of Railways as an Engineering Problem	V. I. Smart.
The Design and Construction of Reinforced Concrete Covered Reservoirs	R. deL. French.
Proposed Tidal Hydro-Electric Power Development of the Petitcodiac and Memramcook Rivers	W. R Turnbull.
The Toronto Drifting Sand Water Purification Plant	William Gore and William Storrie.

It is understood that discussion shall be revised where necessary before publication, and that in the case of papers, any general remarks pertinent only to the occasion of presentation of the paper, shall be deleted from Transactions. Members concerned will be expected to co-operate in making such revisions as are necessary.

Owing to the shortness of time available it was found impossible to give adequate consideration to the papers appearing in the December issue of *The Journal.* It is therefore recommended that these papers be considered by the Publications Committee for 1920, and that a similar procedure be followed in future.

According to By-laws the Transactions will also contain reports of the General Professional Meetings to which extended reference has been made in *The Journal* from time to time.

It is also recommended that a list of all papers appearing in *The Journal* be printed in Transactions, with corresponding reference, so that there may be available in one volume a complete statement of all publications in the form of papers by members of *The Institute.*

The report of the committee is unanimous.

On behalf of the committee I beg to remain,

Yours faithfully,

E. BROWN,
Chairman.

Montreal, December 29th, 1919.

Report of Honour Roll Committee

Since the report of your Committee last year considerable additional data has been received showing that the members of *The Institute* made even a greater and more creditable record at the Front than our previous report indicated.

This Committee is compiling all available information regarding the records of our men at the Front and it is hoped that within another year this work can be completed so that a final report may be made and published for the benefit of the membership.

Respectfully submitted,

C. N. MONSARRAT,
Chairman.

Montreal, January 14th, 1920.

Report of Board of Examiners and Education

The principal work of the Board during the year has been the consideration of such applications for admission and transfer as have been referred to the

Board by Council with a view to appraising the educational qualifications of the candidates. Although examinations have been specified for many applicants, very few offer themselves for examination, as the great majority of candidates, for Associate Membership particularly, prefer to wait until their experience enables them to attain that grade without examination.

The following table shown the number of candidates who presented themselves for examination and the general results:—

Schedule B	Passed	Failed	Total
Physics and Mechanics	2	3	5
Strength of Materials	4	1	5
Schedule C			
Railway Engineering	1	1	2
Electrical Engineering	1	0	1
Hydraulic Engineering	1	0	1
Total	9	5	14

H. M. MacKay,
Chairman.

Report of the Committee on Steel Railway Bridges

Your Committee desires to report as follows:—

It has during the year followed developments in the art of bridge design and construction, especially with regard to physical and chemical properties of material, the question of impact, standard engine loadings, standard clearances, column formulae etc., and a number of written communications have been discussed on these and other details of the subject.

During the year co-operation has been effected with Committee XV of the American Railway Engineering Association, which is doing similar work as this Committee, by submitting copies of our specification to that body and discussing various phases of our work with it. Members of their Committee were complimentary regarding the general makeup and sequence of our specification, and it is understood that their new specification will be modelled along similar lines. As a matter of information may be mentioned the fact that they have decided to recommend, as standard practice, a clearance diagram practically the same as ours, viz. 16 ft. wide x 22′6″ high from base of rail with small differences in the lower corners, and in addition they are adopting the Specifications on Materials put forth by the American Society for Testing Materials.

A rather full discussion has also been going on regarding assumed loadings for bridges. The concensus of opinion seems to be that Cooper's system of loading should be maintained, while there is a growing feeling that this system no longer gives the best results in view of the advent of the Mallet, Decapod and the Electric Locomotive, which are entirely different from the Consolidation Engine used in the Cooper system.

In addition to the foregoing some discussions have been sent in by various members of the Committee with respect to moveable bridges, which have been considered and are held for later action.

Your Committee thinks, therefore, in view of the still unsettled state of opinion in the various bodies studying these questions, it is not justified in making a definite report involving revisions at the present time in connection with the current specifications.

Respectfully submitted,
On behalf of the Committee,

P. B. Motley,
Chairman.

Montreal, Dec. 20, 1919.

Committee on International Affiliation

Your Committee on International Affiliation report that, while nothing of an official nature has transpired during the past year, the relations of our *Institute* with the great United States Engineering Societies have been of the most agreeable nature.

At our Annual Meeting in Ottawa last year, we were honored by the attendance of Dr. Ira C. Hollis, representing the American Society of Mechanical Engineers, Professor Comfort A. Adams, representing the American Institute of Electrical Engineers, and Mr. Flynn, representing the United Engineering Societies, who each delivered an address conveying the friendly and co-operative feeling of these Societies to our own.

Invitations have been received by many of our members to attend meetings of the various United States Engineering Societies and our Secretary was cordially welcomed by the American Society of Mechanical Engineers at their recent Annual Meeting in New York. We have enjoyed the friendly co-operation of the American Societies throughout the year and they have frequently expressed their willingness in every possible way to assist us in our Society work and in building up a strong engineering organization in Canada.

A concrete example of the splendid assistance rendered by the American Society of Mechanical Engineers is furnished by the arrangement they have made permitting *The Engineering Institute of Canada* to publish in its *Journal* the Engineering Index, which is compiled by that Society at great expense, for a nominal sum per annum. This Index is of great value to our membership, who receive it every month in our *Journal* and thus obtain a survey of all important articles relating to every branch of the Engineering profession.

H. H. Vaughan,
Chairman.

Report of the Engineering Standards Committee

Your Committee desires to present the following Report to *The Institute* as to the activities of the Canadian Engineering Standards Association for the year 1919:—

The Canadian Engineering Standards Committee was incorporated under Federal Charter on January 31st, 1919, as the Canadian Engineering Standards Association with the object of carrying out in Canada for the benefit of Canadian industries work similar to that done in England by the British Engineering Standards Association which has proved of such great industrial value.

The original members of the Canadian Engineering Standards Committee, before incorporation, are as follows:

Chairman—Sir John Kennedy, Consulting Engineer, Montreal, Harbor Commissioners & Chairman Advisory Cons. of Council, Institution of Civil Eng.

Vice-Chairman—Capt. R. J. Durley, O.B.E., Engineer, i/c Div. of Gauges & Standards I.M.B.

H. H. Vaughan, General Manager, Dominion Bridge Company, Montreal.

Hon. Sec'y.—Professor J. B. Porter, D.Sc. McGill University.

Lt.-Col. W. P. Anderson, C.M.G.—Chief Engineer, Dept. Marine, Ottawa.

M. J. Butler, C.M.G.—G. M. Armstrong-Whitworth Co., Montreal.

K. M. Cameron—Supervisory Engineer, Dept. Public Works, Ottawa.

E. Deville, L.L.D.—Surveyor General, Dept. of Interior, Ottawa.

G. H. Duggan—President, Dominion Bridge Co., Montreal.

J. M. R. Fairbairn—Chief Engineer, Canadian Pacific Railway Co., Montreal.

L. A. Herdt, D.Sc.—Chairman, Can. Electro Technical Commission, Montreal.

R. Hobson—President, Steel Co. of Canada, Hamilton.

Wm. Inglis—President, John Inglis Co., Toronto.

Major W. J. Keighthly—Chief Inspector, Military Stores, Ottawa.

A. B. Macallum, D.Sc. F.R.S.—Chairman, Hon. Advisory Council, Ottawa.

D. H. McDougall—President, Nova Scotia Steel Co., New Glasgow.

J. C. McLennan, D.Sc. F.R.S.—Professor of Physics, University of Toronto, Toronto.

P. L. Miller—G. M. Canadian Vickers Co., Montreal.

Lt.-Col. C. N. Monsarrat—Cons. Eng. Dept. Rys. & Canals, Ottawa.

R. A. Ross—Cons. Eng. & Member Hon. Advisory Council, Montreal.

R. F. Ruttan, M.D.—Prof. Chemistry, McGill University & Member Hon. Advisory Council, Montreal.

A. Surveyer—Cons. Eng. & Member Hon. Advisory Council, Montreal.

A. Stansfield, D.Sc.—Prof. Metallurgy, McGill University, Montreal.

W. F. Tye—Con.s Engineer, Montreal.

E. O. Way—Chief Inspector, Weights & Measures, Ottawa.

Officers of the Canadian Engineering Standards Association as of December 1st, 1919.

Chairman	Sir John Kennedy
Vice-Chairmen	H. H. Vaughan T. A. Russell
Hon. Secretary	J. B. Porter, D.Sc.
Secretary.....	R. J. Durley, O.B.E., Room 112, Western Block, Ottawa, Canada.

The Nominated Members of the Main Committee of the Association as of November 1st, 1919, Are:

	Nominated by
Robert Hobson, Steel Co. of Canada Hamilton............ R. E. Jamieson, President, Dominion Rubber Co., Montreal. A. R. Goldie, Goldie & McCulloch Co., Galt, Ont.	Canadian Manufacturers Ass'n.
D. H. McDougall, Nova Scotia Steel & Coal Co., New Glasgow A. Stansfield, D.Sc., Prof. Metallurgy, McGill Univ., Montreal.	Canadian Mining Institute
W. J. Francis, Cons. Engineer, Montreal.................... W. F. Tye, Cons. Engineer, Montreal.................... H. H. Vaughan, Dom. Bridge Co., Montreal..	Engineering Institute of Canada
A. B. Macallum, F.R.S., Chairman, Research Council, Ottawa. J. C. McLennan, F.R.S., Prof. Physics, Toronto University R. A. Ross, Consulting Eng., Montreal.	Advisory Council for Scientific and Research

G. H. Duggan, Dominion Bridge Co., Montreal................ Sir John Kennedy, Consulting Engineer, Montreal. J. B. Porter, D.Sc., Prof. Mining Engineering, McGill University, Montreal.	Institution of Civil Engineers
P. Gillespie, Prof., Applied Mechanics, University of Toronto. T. A. Russell, Willys-Overland of of Canada, Toronto. J. Watson Bain, Chemical Engineer, University of Toronto.	University of Toronto
A. S. Eve, F.R.S., Prof. Physics, McGill University, Montreal. L. A. Herdt, D.Sc., Prof. Electrical Engineering, McGill University, Montreal. H. M. Mackay, Prof. Civil Engineering, McGill University, Montreal.	McGill University
Aurelien Boyer, Ecole Polytechnique, Montreal. Sir J. Geo. Garneau, Nat. Battlefields Commission, Quebec. A. Surveyer, Consulting Engineer, Montreal.	Laval University

Ex-Officio Members Are:

Lt.-Col. W. P. Anderson, C.M.C., Ottawa......................	Dept. of Marine.
K. M. Cameron, Assistant Chief Engineer....................	Dept. Public Wks.
E. Deville, LLD. Surveyer General	Dept. Interior.
A. D. Dion, Ottawa Electric Co.	Canadian Electrical Ass'n.
J. M. R. Fairbairn, Chief Engineer, C. P. R., Montreal.....	Canadian Pacific Ry.
F. A. Gaby, Chief Eng., Hydro-Electric Commission of Ontario, Toronto.....................	Hydro-Electric Comm. of Ontario
J. H. Grisdale, Deputy Minister..	Dept. Agriculture
H. G. Kelley, Pres. G.T.R., Montreal.....................	Grand Trunk Ry.
Mjr. W. J. Keighthley, Chief Inspector of Artillery Stores, Ottawa......................	Department of Militia and Defence
W. S. Locky, Acting-Sec'y., War Purchasing Commission, Ottawa......................	War purchasing Commission
Lt.-Col. C. N. Monsarrat, Consulting Eng..................	Dept. Railways and Canals
Lt.-Col. G. Ogilvie, C.M.G. Chief Inspector of Explosives........	Dept. of Mines
Eng-Commander T. C. Phillips, Consulting Naval Engineer....	Dept. of Naval Service
J. Stadler, President, Belgo-Canadian Pulp & Paper Co., Shawinigan Falls.............	Canadian Pulp & Paper Association
A. F. Stewart, Chief Engineer, Canadian National Railways..	Canadian National Railways

Co-Opted Members Are:—

Prof. L. W. Gill................	Queen's University
J. G. Morrow — Inspecting Engineer, Steel Co. of Canada......................	Hamilton

Sectional and Sub-Committees

Eight sectional committees, four sub-committees and one special committee have now been formed, as per following list, but none of these committees has yet had time to complete its report.

Name	*Authorized*	*Chairman*
Sectional Committee on Aircraft Parts	In 1918 by the then existing Engineering Committee. Confirmed by Main Committee, June 4, 1919.	Prof. P. Gillespie, University of Toronto.
Sectional Committee on Steel Bridges and Construction	June 4, 1919	G. H. Duggan, Dominion Bridge Co.
Sub-Committee on Steel Railway Bridges	June 4, 1919	R. B. Motley, Engineer of Bridges C.P.R.
Electrical Sectional Committee	June 4, 1919	Dr. L. A. Herdt, McGill University.
Sub-Committee on Incandescent Lamps	June 4, 1919	John Murphy Dept. of Railways & Canals.
Sub-Committee on Telegraph & Telephone Wire	June 4, 1919	W. J. Duckworth, G. N. W. Tel. Co.

Sub-Committee on Transformers	June 4, 1919	A. A. Dion, Ottawa Electric Co.
Sectional Committee on Wire Rope	June 4, 1919	Prof. H. M. Mackay, McGill University
Sectional Committee on Rails & Track	June 4, 1919	J. M. R. Fairbairn, Chief Engineer, C.P.R.
Sectional Committee on Screw Threads	Sept. 8, 1919	H. H. Vaughan, Dominion Bridge Co.
Sectional Committee on Steel	Sept. 8, 1919	J. G. Morrow, Steel Co. of Canada, Hamilton
Sectional Committee on Machine Parts	Sept. 6, 1919	A. R. Goldie, Goldie & McCulloch Galt, Ont.
Special Committee to confer with British Delegates regarding Electrical Fittings	Sept. 8, 1919	E. G. Burr, Consulting Engineer, Montreal

Work in Progress

Aircraft Parts

The Sectional Committee on Aircraft Parts, which was the first to be formed at the request of the British Engineering Standards Association, has acted as the Canadian Committee of the *International Aircraft Standards Commission* and has sent delegates to England to take part in the work of that body. Its advisory sub-committees act as the Canadian members of the Advisory Committees of the I.A.S.C. and have furnished reports on the following subjects for submission at the next plenary meeting of the I.A.S.C. which is expected to be held in Paris in the early part of 1920.

Reports by Canadian Members of Advisory Committees of the International Aircraft Standard Commission

(1) Mechanical Tests,
(2) Chemical Analysis of Steel,
(3) Tolerance on drawn bars,
(4) Magnetos and Sparking Plugs, Electrical Work,
(5) Propeller Hubs, Ball Bearings, Wheel Axles, Hubs, Rims and Tires,
(6) Steel Tubes,
(7) Tests on Wood,
(8) Fabric.

Communications have been addressed to the Air Board, Canada, with the view of obtaining for the Sectional Committee on Aircraft Parts proper governmental recognition as the Canadian section of the International Aircraft Standards Commission. If this approval is given, the C.E.S.A. Committee will have the same recognition from the Canadian Government as the British Government has given to the corresponding Committee of the B.E.S.A.

Incandescent Lamps

In accordance with a suggestion forwarded by *The Engineering Institute of Canada* a sub-committee has been formed with instructions to draft a Canadian specification for tungsten and gas-filled lamps which will be acceptable to makers, importers and users in this country. The opinions and suggestions of the various members are being obtained in writing and will be submitted as a basis of discussion at the first meeting which is shortly to be held.

Transformers

At the suggestion of some of the engineers of the Ontario Hydro-Electric Commission, a sub-committee has been formed and is engaged in drafting a Canadian specification for the external characteristics of pole and service type transformers. As complete information as possible has been collected regarding American and British practice and is being forwarded to the members for consideration.

Galvanized Telegraph and Telephone Wire

At the request of one of the large steel companies a sub-committee has been formed with a view of drafting uniform specifications for two or three grades of iron telegraph and telephone wire which will be acceptable to all telegraph and telephone authorities in Canada. The idea has the interest and support of all concerned and information regarding present practice is being collected and placed before the members for consideration.

British Electrical Fittings

At the request of the B.E.S.A., a Committee has been appointed to receive the views of the Institution of Electrical Engineers of Great Britain and the British Electrical and Allied Manufacturers' Association regarding the difficulties experienced by British electrical manufacturers in obtaining the same recognition in Canada for their fittings as is accorded to equipment of American or Canadian manufacture. A delegation from the above-named bodies is expected to visit Canada in the near future for the purpose of placing its views before the committee in question. The results of this conference will afford much necessary information for another special committee which is in course of organization with the purpose of formulating the electrical portion of a Canadian Underwriters Code.

Rails and Track

A sectional committee has been appointed to endeavour to obtain uniform practice in regard to the requirements for rails and track fastenings on behalf of the various railroad administrations in Canada. The necessary preliminary information is being collected, the views of the engineering departments of the railroads are being obtained. The committee will consult with the manufacturers regarding any commercial difficulties that may occur in furnishing the desired material and will then formulate their specifications.

Wire Rope

In response to a desire expressed in several quarters for authoritative Canadian specifications for wire rope in accordance with which tenders could be asked for, a sectional committee has been appointed to investigate the question and report whether it is possible to draw up such specifications for wire rope for mining, dredging and similar purposes as will obtain general acceptance in Canada. The opinions so far expressed indicate the desirability of preparing such specifications, and this Committee will shortly be in a position to report.

Steel Railway Bridges

A committee of *The Engineering Institute of Canada* has for the past two years been engaged in the preparation of a Canadian specification for steel railway bridges, which is now in draft form. It has been handed over by the E.I.C. to the C.E.S.A. in order that the specification as finally issued may have the widest possible acceptance and may agree in all essential points with the corresponding specifications of authoritative bodies in the United States. Co-operation with the corresponding committee of the American Railway Engineering Association is being arranged for, and it is hoped will result in substantial agreement and an early issue of the specification.

Work About to Commerce

Committees on the following are being formed but have not yet commenced work:—

Screw Threads

A Sectional Committee on Screw Threads is being formed for the purpose of co-ordinating any work in connection with screw threads which may be carried out by any of the other committees. It will also report to the main committee regarding certain measures looking to the International standardization of screw threads and will co-operate with similar committees in Great Britain and the United States.

Steel

A sectional committee on steel is in process of formation, its duty being to co-ordinate the work in connection with the quality of steel carried out by any other committees of the Association and also to consider such questions regarding steel specifications as may be submitted to it. One of its first tasks will be the drafting of a Canadian specification for steel billets for forging purposes.

Machine Parts

A sectional committee on Machine Parts has been authorized for the purpose of dealing with a number of questions which have been raised, such as standard forms for rivet heads, standard proportions for bolt heads and nuts, etc., on which agreement between various Canadian manufacturers seems very desirable.

Work Under Consideration

The following subjects are being considered by the Main Committee with a view to further action. Enquiries are being made in each case as to the possibility and desirability of successful work:—

Canadian Electrical Code,
Standard sizes for mining drill steel & drill chucks,
Railroad frogs and switches,
Uniform grading rules for lumber,
Tooth, sprocket and bevel gearing,
Automobile details & components, and Coil Chains.

Respectfully submitted,

L. A. Herdt,
Chairman.

Engineering Standards Committee.

Report of the Committee on Uniform Boiler Specifications for the Dominion of Canada

Members of Committee

R. J. Durley, W. G. Chace, F. G. Clark, D. M. Robb, Logan Waterous, H. H. Vaughan; L. M. Arkley, *Chairman.*

In our report of last year it was intimated that the Chief Boiler Inspectors of Ontario and the Western Provences were working along the same lines as your Committee and that they had agreed to submit their proposed Uniform Boiler Rules to us for constructive criticism before sending them to the respective Provincial Legislatures for adoption.

In accordance with the above agreement R. N. Blackburn, Secretary, Chief Inspector of Boilers for Sask. forwarded a copy of the proposed rules to your Committee for consideration. The rules are divided into three sections.

First, those covering high pressure steam boiler installations, second, those covering low pressure or heating installations, and third, rules for the construction of tanks and receptacles for compressed air and other gases.

The rules follow closely in many respects those of the Boiler Code Committee of the American Society of Mechanical Engineers, differing from them only in certain points where the changes were considered to afford a greater element of safety.

Some of the good features of the Board of Trade Rules are also included. The Toronto Sub-Committee of your Committee considered these very carefully and drew up a list of changes, (mostly of minor importance), which were submitted to Mr. Blackburn, and most of them were accepted by him as improvements.

Your Committee is of the opinion that the adoption of these rules by all Provinces of the Dominion would be an excellent thing for Canada, and that the E.I.C. should lend its influence to this end.

J. M. Arkley,
Chairman.

Report of Electro-Technical Committee

This Committee takes pleasure in being able to report that during the year 1919 the activities of the Commission have considerably increased, this condition being rendered possible by the cessation of hostilities.

Meetings of the Special Committee on Rating were held in Paris, France, during the month of May, Canada being represented by Col. L. W. Gill, a member of the Canadian Committee.

The Canadian Committee met in Ottawa in September, C. Le Maistre, the General Secretary of London, Eng., being present.

A plenary Commission Congress was held in London in October, Canada being represented by A. P. Trotter, of London, Eng. At that meeting decisions were reached on a number of important questions, particularly on the rating of electrical machinery, a full report thereon being now on the press. It was arranged to hold the next congress on this side of the Atlantic.

Respectfully submitted on behalf of the Canadian Committee.

A. B. Lambe, *Secretary.* L. A. Herdt, *Chairman.*

Meetings

Professional meetings were held as follows:—

Ottawa Professional Meeting, held at Ottawa, February 11th, 12th and 13th, at which the following papers were read:—

Standards in Engineering, by Capt. [illegible], M.E.I.C.

The Development and Future of Aviation in Canada, by M. R. Riddell.

Soldiers' Civil Re-Establishment, by Major [illegible].

National Highways and Good Roads, by Capt. J. Duchastel, M.E.I.C.

Design of Hydro-Electric Plants for Combatting Ice Troubles, by R. M. Wilson, M.E.I.C.

Railway Electrification, by John Murphy, M.E.I.C.

Montreal Tunnel, by J. L. Busfield, A.M.E.I.C.

Mean Seal Level Datum for Canada, by Dr. W. Bell Dawson, M.E.I.C.

Mining and Metallurgy of Cobalt Silver-Ores, by Lt.-Col. R. W. Leonard, M.E.I.C.

Maritime Provinces Professional Meeting, held at St. John, September 10th, 11th and 12th, at which the following papers were read:—

The Usefulness of Vegetation in Maritime Engineering, by E. T. P. Shewen, M.E.I.C.

Forestry in New Brunswick, by G. H. Prince.

Water Powers of New Brunswick, by C. O. Foss, M.E.I.C.

Proposed Tidal Hydro-Electric Power Development of the Petitcodiac and Memramcook Rivers, by W. Rupert Turnbull, F.R.Ae.S.

The Construction of the Bear River Bridge, by A. T. Macdonald, A.M.E.I.C.

High Potential, High Frequency Apparatus and Experiments, by F. P. Vaughan, A.M.E.I.C.

Engineering Problems Involved in the Use of Telephone Cables, by F. A. Bowman, M.E.I.C.

Heating Problems Produced by Some of the Modern Methods of Building Construction, by W. F. MacKay, A.M.E.I.C.

Problems of the Canadian Engineers in France, 1918, by R. F. Armstrong, A.M.E.I.C.

Western Professional Meeting, scheduled for Edmonton, Alta., July 11th, 12th and 13th, was postponed until next year.

ANNUAL REPORT OF BRANCHES

Victoria Branch

The list of Branch Members contains 81 names, 27 Members, 47 Associate Members, 4 Juniors and 3 Students. There are 59 *Institute* members of all grades still resident in Victoria, 10 have left or retired and 12 are still not back from war service. Of the 59 resident in the city only about 28 are active, and one has to give the word all the latitude possible to include so many. 6 of these 59 have either been elected or transferred this year.

It appears that 59 is not a large percentage of the total number of Engineers who are eligible to be elected as members of *The Institute* in one or other of the grades, and 11 seems a small number to show as members on the Island outside the radius of the jurisdiction of the branch.

Officers for 1920

Chairman	A. E. Foreman.
Vice-Chairman	A. W. R. Wilby.
Treasurer	E. Davis.
Secretary	H. M. Bigwood.
Executive	R. A. Bainbridge, W. M. Stokes.

Report of Legislation Committee

In accordance with instructions, the Legislation Committee forwarded a letter on June 5th to members of each of the following bodies:—

B.C. Technical Association.
British Institute of Civil Engineers.
Electrical Engineers.
Engineering Institute of Canada.
Engineering and Technical Institute of B.C.
Mechanical Engineers.
Mining Institute of Canada.

After the different Associations had met and appointed their representatives, the Joint Committee was called together on August 14th—the following officers were elected:

A. E. Foreman	Chairman.
G. P. Napier	Secretary.

A meeting was again called on Oct. 6th, and business arising out of resolutions passed at previous meetings discussed, and the draft bill was considered clause by clause.

A Sub-committee, consisting of A. E. Foreman, D. O. Lewis, E. N. Horsey was appointed to submit a revised draft of the proposed bill. This Sub-committee reported to the Joint Committee on Nov. 17th, and the suggested changes were approved. A. E. Foreman and D. O. Lewis were appointed a Sub-committee to meet the representatives from the Vancouver Sub-committee.

The Chairman met the members of the Vancouver Branch of *The Engineering Institute* and placed before them the amendments suggested by the Victoria committee.

The Joint committee met on Tuesday, Dec. 16th, and considered a draft Bill as prepared by the Vancouver committee, and this bill, as amended, is being mailed to engineers throughout the Province, with a questionaire requesting their opinion upon the principle of asking for legislation restricting the practice of engineering, or legislation restricting the use of the term "Professional Engineer."

Respectfully submitted,

A. E. Foreman,
E. N. Horsey.

Papers Committee

The Papers Committee submitted the following programme:—

Dec. 17th.—Address by A. E. Foreman:
"Organization and Work of the Provincial Public Works Department."

Jan. 21st.—Paper by D. O. Lewis:
"Development of Railways."
Feb. 18th.—Paper by W. F. Best:
"Geology of Coal Mines."

Mar. 18th.—Illustrated address by Prof. E. G. Matheson:

"Sub-aqueous Foundations."

Apr. 15th.—Illustrated Paper by E. P. Girdwood:
"River Protection, Roads and Bridges."

Balance Sheet 1st December, 1918, to 1st December, 1919

Balance in Bank, 1st December, 1918	$181.61	
Cash in hand	8.98	
		$190.59
Receipts:		
Fees due prior to 31st December, 1918	66.50	
Fees due for 1919	119.02	
Rebates from Engineering Inst., Montreal	102.12	
Interest on War Bond	5.50	
		$293.14

Disbursements:

Rent of Club Room, 1st December, 1918, to 30th November, 1919	$180.00		
Telephone	4.80		
Telegrams	[illegible]		
Postage Stamps, etc	13.74		
Stationery	.50		
Binding Books	5.00		
Technical Papers	12.20		
Lecture by A. S. Wheeler	13.00		
Tobacco Fund for Soldiers	25.15		
Typewriter	60.00		
Frame for Roll of Honour	7.00		
		$331.17	
Excess of Disbursements over Receipts			$ 38.03
			$152.56

Liquid Assets:

Victory Bond	$ 99.11
Bank Balance	139.10
Cash	13.46
	$251.67

HORACE H. BIGWOOD,
Secretary.

Calgary Branch

During the year 1919 there have been held four general meetings and two special meetings with addresses and ten Executive Committee meetings.

The following were the speakers at the general and special meetings:

January 15th, Eugene Coste, Member British Institute of Mining and Metallurgy, Member Canadian Mining Institute, "Petroleums and Coals."

January 29th, Dr. T. H. Blow, M.L.A., "Technical and Scientific Education."

February 18th, Arthur O. Wheeler, D.T.S., "Surveying the Great Divide of the Rocky Mountains."

This lecture, to which the public was invited, was given in the auditorium of the Public Library and was well illustrated by lantern slides of the Mountains.

February 24th, Mr. Dalzell, Secretary of the Vancouver Branch and the representative of the Cement Gun Company both addressed the meeting.

Mr. Dalzell spoke on the "Protective League for Technical Men" just organized in Vancouver and the Cement Gun Company's representative gave an informal talk on the many remarkable uses of the Cement Gun, both subjects proving very interesting.

March 21st, Brig.-Gen. Harold F. McDonald, Junior Member E.I.C., "The Work of Engineers in the War."

As viewed by the speaker from his standpoint of "Fighting Man", who was himself an Engineer by training before the war.

The meeting was in the nature of a welcome to the General by the Branch, and a renewal of old friendships. At the same meeting Major Muckleston, M.E.I.C., former Chairman and one of the organizers of the Branch was given a hearty welcome on his return from overseas.

May 1st, G. W. Craig, M.E.I.C., Chairman; Mr. A. S. Chapman, A.M.E.I.C., "Sewage Treatment."

It had been anticipated that the Western Professional Meeting for the Western Provinces would be held in Edmonton in July but Fraser S. Keith who was here in June reported that prospects for any attendance from Manitoba and Saskatchewan were not good on account of strike conditions.

It was therefore decided to suggest to the Edmonton Branch that it be postponed. This was done and eventually this meeting was definitely cancelled for this year on account of lack of support which made this course seem advisable.

During the year thirteen have joined *The Institute* and Branch or obtained transfer to higher grade as follows:

1 Member
6 Associate Members
2 Junior Members
1 Student Member
2 Affiliates of the Branch

and in addition one Transfer from Junior to Associate Member.

The following applications have been received and are being dealt with:—

1 Member
5 Associate Members
1 Transfer Associate Member to Member
1 Transfer Student to Associate Member.

While the Branch has lost some of its members quite a few of our former active and valued ones have returned from overseas notably. Messrs. Muckleston, Jennings, Duke, Meek, Montague, Beach and Hanna.

The present Membership of the Branch totalling 87 is divided as follows:—

Members	[illegible]
Associate Members	[illegible]
Junior Members	[illegible]
Student Members	[illegible]
Associate Member	[illegible]
Affiliates of the Branch	[illegible]
Total	87
With 8 applications pending	8
Making a Total	[illegible]

against 76 a year ago.

This includes but four men who as far as our present information goes are still considered as with the Allied Armies.

Legislation

During the year good progress has been made on the subject of Legislation.

The Membership of the Alberta Branches prepared a draft Act which met with the approval of the Alberta membership, and it was decided to introduce it at the 1919 session of the Provincial Legislature.

Late in December 1918 opposition to the proposed effort to secure the passage of this act was encountered from the Northern Alberta Branch of the Candian Mining Institute and a Committee headed by Mr. Peters was sent to Edmonton to meet them.

This Committee with several members of the Edmonton Branch were successful in securing at that time an interview with the Premier.

The joint Rocky Mountain and Northern Alberta Branches of the Mining Institute were again addressed on the subject at their meetng in Calgary in January.

As they were still opposed to any effort we might make toward the passage of the bill until they had more time to consider the matter, it was decided to drop it for the time being.

Later on, the subject was discussed at the annual meeting at Ottawa and as a result a Committee of delegates from the Branches met at Montreal in April and framed a Model Act which was submitted to the whole membership of *The Institute*, the plebiscite showing a strong sentiment in favor of legislation along the lines of the Model Act.

It is expected that an effort will be made this coming winter to get an Act passed in this Province.

A financial statement for the year is attached hereto.

Calgary, Alberta,
November 26th, 1919.

Dec. 2nd, 1919.

Financial Statement for the Year ending Nov. 30th, 1919

Receipts

Balance in Bank, Dec. 1st, 1918	$200.63
Fees from Members	19.35
Rebates from Parent Institute	119.95
Interest on Bank Account	2.38
Interest on Victory Bond	16.50
	$358.81

Expenditures

Stationery, Printing and General Expense	$ 91.00
Books and Magazines	25.30
Miscellaneous	101.80
Balance in Bank Nov. 30th, 1919	140.71
	$358.81

Assets of Branch

Bank Balance	$140.71
3—$100.00 Victory Bonds	300.00
	$440.71

Respectfully, submitted,

C. M. Arnold,
Sec.-Treas.

Saskatchewan Branch

The third annual report of the Saskatchewan Branch, *Engineering Institute of Canada*, is herewith respectfully submitted:—

The outstanding feature of the past season was the fact that our Branch was able to extend a hearty welcome to all of its members, except two, who had been overseas. One of our members, Major A. de C. Meade, A.M.E.I.C., met an accidental death in Ireland, while another member, Lt.-Colonel K. M. Perry, A.M.E.I.C., has been detained in England in connection with special duties. The Branch is very thankful for the fact that it has not lost a single member in action, while nearly all of them were decorated; the last one being Lt. W. E. Longworthy, who received the Military Medal from the hands of the Prince of Wales during his recent visit here.

A gratifying sign of the interest which engineers throughout the Province are taking in *The Institute* is the fact, that the membership of our Branch has increased during the past year by 21 members, while there are still about 12 applications from engineers in this Province in the hands of Council. We lost one Affiliate through resignation, on account of his transfer to the United States and five Members, through their having moved to another Province. Though the membership in the Branch is voluntary for any member of *The Institute* living more than twenty-five miles from Regina, yet there is not a single member who does not belong to the Branch. We have at present a membership of 108, including Affiliates.

The Branch can look back upon a very active year, as far as the participation of the membership at large and the Committee work is concerned. Special mention has to be made of the work of our Concrete Committee (Chairman, H. McIvor Weir, M.E.I.C.), with headquarters at Saskatoon, and of our Legislation Committee (Chairman, C. P. Richards, A.M.E.I.C.). The former is conducting a series of experiments as to the influence of Alkali Soils on Concrete. The University of Saskatchewan very generously put their laboratories and a special assistant at the disposition of this research work and Prof. C. J. Mackenzie, A.M.E.I.C., is in charge of all work in this connection.

Our Legislation Committee had a very busy year, considering the proposed Legislation and the new Branch By-Laws. The bill as proposed by the Montreal Committee of *The Engineering Institute of Canada* was submitted to the Government of the Province for enactment at the present session. The Government has approached our representatives recently, suggesting certain changes in our Act, before they would submit it to the house, and the negotiations in this respect are still pending at the time of making this report.

There were ten meetings of the Executive Committee of the Branch, seven regular and three special meetings of the Branch during the past season and some of the papers read are as follows:—

"Can Earth Roads be made Satisfactory," by H. S. Carpenter, A.M.E.I.C.

"Rural Paved Roads for Saskatchewan," by D. A. R. McCannell, A.M.E.I.C.

"Economical Road Building," by W. M. Stewart, A.M.E.I.C.

"Recent Experiments with Gas Engines," by Prof. A. R. Greig, M.E.I.C.

"Drainage Assessments," by H. G. Phillips, A.M.E.I.C.

"Remarks on Saskatchewan River Water Supply," by A. J. McPherson, A.M.E.I.C.

We again had the privilege of welcoming Fraser S. Keith, the General Secretary at our Annual Summer Meeting, which was held at Regina, and hope that his visit will be a regular annual event. We were very sorry that General Sir Alexander Bertram was prevented at the last minute from making his proposed Western trip, and we regretted that circumstances made it advisable to cancel the proposed Western Professional Meeting.

We were favored by a paper on "Briquetting of Lignites," by R. deL. French, Engineer of the Lignite Board, and also by a vist of A. J. Dalzell, M.E.I.C., the past Secretary of the Vancouver Branch.

The financial statement is very satisfactory, but our Branch was obliged to levy a Special Assessment of five dollars for 1919 from their members, owing to the reduced rebates from Montreal.

Total Income	$555.40
" Expenditure	374.29
Balance on hand	$179.11

Of the total Income, $34.70 was carried forward from last year, and $145.70 represent rebates received from Montreal. A grant of $50 was made by the Branch towards the work of the Concrete Committee, to which the University of Saskatchewan was good enough to contribute considerable funds.

Assets and Liabilities

Assets:

Cash Balance in Bank	$179.11
" " in hands of Concrete Committee	34.00
Outstanding Branch Assessments and Fees of Affiliates	107.00
Outstanding Rebates	59.00
Total Assets	$379.11

Liabilities:

Outstanding Accounts	$ 17.82
Excess of Assets over Liabilities	$361.29

All of which is respectfully submitted.

H. S. Carpenter,
Chairman.

J. S. De Speir,
Sec'y.-Treasurer.

Regina, January 5th, 1920.

Sault Ste. Marie Branch

On December 16th, 1918, a meeting of Corporate Members of *The Engineering Institute of Canada* resident in Sault Ste. Marie, Ont., was called with a view to forming a local Branch. It was the unanimous opinion of those present that permission should be sought from Council to form such a Branch. On December 27th petition was forwarded to Council, permission granted and inaugural meeting held January 9th, 1919, with Fraser S. Keith present. At this meeting the permanent officers were elected, including a representative on the Provincial Division.

Preliminary Branch By-Laws were drawn up at an executive meeting on January 21st, in which the regular meetings of the Branch were to be held monthly on the last Thursday, except in the months of July and August.

During the year of 1919, the meetings have been well attended, papers, generally of local interest, read and freely discussed and some action taken in matters pertaining to the affairs of *The Institute* and the engineering profession as a whole.

Due to the very diversified interests of local engineers, it has been found practically impossible to touch deeply professional matters, and for this reason, the aim has been to keep the papers and discussions to topics of general and local interest. It has been impossible to divide the different branches of engineering, i.e., civil, mechanical, etc., and to hold meetings of particular interest to the separate branches, due to lack of members rather than enthusiasm.

The membership of the Branch is gradually increasing. We have lost a few members and have added to our numbers one Member, eight Associate Members, one Junior and one Student, making a total membership of:—

3 Members.
15 Associate Members.
2 Juniors.
1 Student.
[illegible] Branch Affiliates.

At the time of formation of the Branch, an advance of fifty dollars was made by Headquarters. Present Bank balance is forty-four dollars and sixty-two cents. The deficit is due to the expense of starting the Branch being rather heavy in proportion to the Membership. The balance, however, will return to the correct side of the ledger on the next rebate of dues.

On the whole, the past and first year of the Branch has been successful. It is the hope of the Executive to make the year 1920 more successful and to bring a number of new members into *The Institute.*

Respectfully submitted,

NEWTON L. SOMERS,
Sec.-Treas.

Border Cities Branch

The Border Cities Branch wish to submit the following report of their activities for the year 1919.

The early months of the passed year were taken up chiefly with matters of organization. On January 17th an informal dinner and meeting was held to which were invited all those interested in the proposed Branch. At this meeting Mr. Keith, who managed to be with us for a few hours, spoke on the aims and objects of *The Engineering Institute of Canada*, the necessity of such an organization, and the benefits of membership.

The first regular meeting for definite organization was held on March 21st. At this meeting the following officers were elected for the year 1919:—

Chairman	J. A. W. Brown.
Secretary	G. C. Williams.
Executive Committee	A. J. Stevens,
	M. E. Brian,
	H. Thorne.

Following this, five regular meetings were held. At these meetings time was taken up chiefly with discussions on general subjects of membership, finances, by-laws, legislation, etc.

At the meeting held on October 17th, W. E. Janny gave us a talk on Blast Furnace and Coke Oven construction, which was followed by interesting questions and discussion. At this meeting Mr. Williams' resignation as Secretary was accepted, owing to his having moved to Detroit and being unable to be in regular attendance. J. E. Porter was elected to fill the vacancy.

At our November meeting held on 21st, it was necessary to elect a Vice-Chairman owing to the moving to Hamilton of our Chairman, J. A. W. Brown. Mr. H. Thorne was elected Vice-Chairman. At this meeting also M. E. Brian was elected representative on Provincial Division Committee. The proposed Professional Act was discussed and Mr. Brian instructed to carry our sentiment to the Provincial Council meeting on November 22nd.

The Annual Meeting of the Branch was called for December 5th. The regular business of the meeting was held up by discussion on the standing of Junior Members. It was decided to postpone election of officers, etc., until the Secretary had taken up with Mr. Keith the matter of Junior Membership.

The adjourned Annual Meeting was held on December 19th. The Branch By-laws were altered in accordance with suggestions from Mr. Keith. Reports were received from Executive Committee, Treasurer, and Special Committees. The following officers were elected for 1920:—

Chairman	H. B. R. Craig.
Sec'y.-Treas	J. E. Porter.
Executive Committee	J. J. Newman,
	H. Thorne.
	M. E. Brian.

Mr. Brian presented his report of the November meeting of the Provincial Council. Owing to the late hour a proper discussion on the matter of Legislation was held over for another meeting.

The Branch has suffered a real loss in the moving to Hamilton of our first Chairman, J. A. W. Brown. Mr. Brown was wide awake in all matters of interest to the Branch and *The Institute* in general. He carries with him our best wishes for every success in his new work.

A copy of the Treasurer's Report is attached.

Yours respectfully,

H. THORNE,
Vice-Cairman.

J. E. PORTER,
Secretary.

Copy of Treasurer's Report, Border Cities Branch, Year 1919.

Receipts:

Mar. 21—Collection for use Chamber of Commerce dining room, Mar. 14th. 12 Members — 50c	$6.00
Apl. 12.—Advance from Headquarters	50.00
Oct. 22.—Twenty per cent remittance from fees	31.40
Total	$87.40

Expenditures:

Mar. 24.—To Chamber of Commerce for use of room	$5.00
Apl. 12—Book for Secretary	5.00
Apl. 25.—Post cards, $1.00; Telegram, 30c; Exchange, 15c	1.45
Oct. and Nov.—Postage Telegrams and Telephones	1.97
Dec. 11.—Expenses Representative to Provincial Council Meeting	19.40
Dec. 19.—Balance in Bank	54.58
Total	$87.40

Dated Windsor, Ont., Dec. 19th, 1919.

F. J. BRIDGES,
Treasurer.

Niagara Penninsula Branch

During the month of February, following a proposal made last year, some of the members of *The Engineering Institute*, resident at Niagara Falls proposed that a branch of *The Institute* be formed in the Niagara District.

A meeting was called to discuss the proposal and it was unanimously agreed that steps should be taken to form a "Niagara Peninsula Branch," provided that members living in St. Catherines would express themselves similarly. It was, therefore, decided that St. Catherines should be visited and an expression of opinion obtained from members resident there.

On March 3rd. members motored from Niagara Falls to St. Catherines to lay the proposition before the members in that city. The matter was discussed and it was decided immediately to proceed towards the formation of a "Niagara Peninsula Branch."

A general meeting and supper of all the engineers in the district was called for March 11th. at Niagara Falls for the purpose of organizing the Branch. The general secretary was present and the Branch was launched with an attendance of sixty-four engineers at the meeting and with an initial membership of twenty-eight.

Since organization the Branch has held five general meetings, six executive meetings and three trips and has made its influence felt in connection with the Civil Service reclassification, the salary question, legislation and has initiated steps in connection with the appointment of engineers to public positions. The 1920 Ontario professional meeting is to be held at Niagara Falls under the auspices of the Branch, and already there has been substantial progress towards preparing for this meeting.

All the meetings of the Branch have been devoted to either business or social affairs and as yet there has not been a meeting at which a paper or technical subject has been discussed.

On April 1st. a well attended "Smoker" was held at Niagara Falls at which the President of *The Institute* was present.

On May 9th. a business meeting was held at the Engineers' Club, Thorold, at which the question of Engineers' salaries and status was considered. A Branch salary committee was appointed at this time and has since made its report which has been adopted by the Branch.

On June 12th. a legislation meeting was held when the draft legislation bill was taken up in detail with E. R. Gray, A.M.E.I.C., of Hamilton explaining the many points.

On September 20th. a social function in the way of a dinner and dance was held at the Clifton Hotel, Niagara Falls. This proved to be a very enjoyable affair for those present.

Early in the fall a trip of inspection was made to the Lackawanna Steel plant in Buffalo. This was very well attended and proved extremely interesting and instructive.

On October 4th, a trip over the Welland Ship Canal work was enjoyed by a large number of the members. The canal engineers and contractors arranged splendid facilities for seeing the work.

Another trip was run over the construction work of the Hydro Electric Power Commission near Niagara Falls. Members were shown over this great power development by the Commission's engineering staff and transportation was supplied by the Commission in the form of motor buses.

On November 26th. a general business meeting was held in Thorold, at which the salary committee made its report and the report of the Branch representative on the Executive of the Ontario Provincial Division was received. Business growing out of this latter report resulted in a decision to ask the Division and Council for permission to hold the 1920 professional meeting at Niagara Falls under the auspices of the Branch. A professional meeting committee was appointed and this committee has already appointed sub-committees and outlined the work of each for preparing for this meeting. The Branch is desirous of co-operating with the American Institute of Chemical Engineers in holding a joint professional meeting and steps are now being taken towards arranging this if possible.

The Branch has no definite quarters but a tentative arrangement has been made with the Thorold Engineers' Club for the use of their building for holding meetings. This is a central point for the various towns within the the Branch radius.

The Branch has had a phenomenal growth since organization. A large number of members have returned from the war and many have joined *The Institute* through the activities of the Branch and the field in this region still has many prospects, particularly among the electrical engineers connected with the power plants at Niagara Falls.

The Branch membership to date is shown as follows:—

Members	9
Associate Members	[illegible]
Students	2
Juniors	8
Affiliates	5
	72

Rex Johnson,
Branch Sec.-Treas.

Financial Statement

Rex Johnson,
Branch Sec.-Treas.

Ontario Provincial Division

As 1919 witnessed the inauguration of the Ontario Provincial Division, too much must not be expected from its first report. Nevertheless substantial progress has been achieved of permanent advantage to the profession and *The Institute.* An appropriate Constitution has been formally adopted; constructive collaboration betwen the Division and the Branches has been accomplished; intra-branch co-operation has been definitely encouraged; the non-resident membership in the province—208 strong—has achieved a direct and definite voice in *Institute* affairs; co-operation with other professional engineering bodies within the province has been encouraged; action has been initiated to secure a more equitable representation upon Council for the members resident in Ontario; preparations have been perfected for a vigorous but conservative membership drive.

There has been an increase in membership of within the province of Ontario. Three new branches have been established; the Niagara Peninsula Branch at Niagara Falls, the Border Cities at Windsor, and the Peterborough Branch. The Kingston Branch has recently renewed its activities after temporary suspension during the war.

Definite arrangements have been made for a General Professional Meeting in Ontario under the auspices of the Niagara Peninsula Branch. The meeting will be held in September at the Clifton House, Niagara Falls, and opportunity will be afforded for visits of inspection to the Chippewa-Queenston Power Development of the Hydro-Electric Commission, the Welland Canal Construction, and to the existing power developments at Niagara.

It is confidently felt that the developments thus generally outlined not only indicate a considerable and commendable degree of accomplishment for those in authority in *Institute* matters, especially Branch officers and the General Secretary, but it portends much for the permanent utility and advantage of the Ontario Provincial Division. If such progress is to be maintained in Ontario *The Institute* must evolve promptly and pursue vigorously a positive policy and progressive programme, not only in professional matters but in cognate public affairs. Certain technical and semi-professional bodies in the Province are by their activities in professional and public endeavour, and by well directed publicity propaganda, rapidly increasing their membership among engineers who should and would join *The Institute* if its various Branches exerted equal effort. One thing only can maintain the present outstanding position of *The Institute*—progressive positive service for the engineer, individually and collectively, as well as for the national weal.

The officers of the Ontario Division are convinced of the urgent necessity for closer solidarity among the constituted parts of *The Institute,* not to combat and compete with regional or local engineering organizations, but primarily to prevent the engineering fraternity from splitting into many parts working at cross purposes, with the inevitable result of becoming a mere collection of isolated and ineffective units. Much of the present activity of regional engineering bodies within the Province of Ontario is largely based upon diverse objectives, impossible of attainment with the present divisive methods. As all are labouring for the advance and advantage of the profession, it should be possible to compose both objective and methods in order that harmonious and homogeneous action can prevail. Consolidation of effort and co-operation of forces are essential.

In the greater vision resulting from the stressful efforts of the many engineering societies of Great Britain, of Australia and of the United States to secure in their respective countries, through effective and economical means, conjoint action by engineers generally in the interests of national, municipal and professional matters, it must be realized that, in *The Institute,* the engineering profession in Canada has an immediately available organization, national in scope, constituted, prepared and willing to realize with least expenditure of effort and with a minimum of delay, the goal of the profession in all English-speaking countries, which goal has been ably expressed by the Joint Conference Committee of the four founder societies of the United States in the following inclusive terms:—

1.—To render the maximum of service to the nation through unity of action.

2.—To give the engineers of the country a more potent voice in public affairs.

3.—To secure greater recognition of the services of the engineer, and to provide for his advancement.

4.—To promote esprit de corps among the members of the profession.

5.—To provide the machinery for prompt and united action on matters affecting the profession, among which are:—

Licensing and registration of engineers;
Scientific and Industrial Research;
Conservation of Natural Resources;
Publicity;
Classification and compensation of engineers;
General employment bureau;
Engineering education;
Industrial relations.

It must be further realized that not only does *The Institute* as now constituted offer an efficient, economical, adaptable and immediately available means for consolidating the engineering profession in Canada into one outspoken, homogeneous body, but in practically every province, except Ontario, it does in practice as well as in theory achieve this proud position. Unfortunately, while Ontario engineers may enthusiastically agree in their concepts of a desirable goal for the profession, they vigorously disagree respecting both the methods and the means of achieving it. A small but active engineering group resident in Toronto favour for the present at any rate the setting up of a new over-all Joint Provincial Committee which can in purely provincial matters, represent and speak for all their technical and semi-professional engineering organizations. Although the Ontario membership strength of *The Institute* is much greater than the combined resident engineering membership of all regional organizations, it is not considered that mere preponderance would warrant the Provincial Division in refusing to confer with and where considered advisable to collaborate with such Committees. This proposal, however, involves a new alignment, and if agreed to by the majority of the professional engineering bodies already interested, most of which are but regional in scope and influence, must be seriously reckoned with by the Ontario Division. This proposal is and will be given serious and sympathetic consideration, but care must and will be taken to avoid the abrogation of the responsibilities and the freedom of action of *The Institute*.

It is the confirmed conviction of the undersigned officers that the necessity for dealing in an adequate way with such problems in Ontario, precipitates the consideration of questions of policy which are of such import to *The Institute* that the undersigned respectfully submit, for the consideration of Council, the advisability of taking early and appropriate action to have such matters considered in the most careful and comprehensive manner possible. As they not only affect Ontario but are of equal import to other provinces, we suggest that they be referred to a special Committee on Development, instructed to consider and report respecting (a) the technical activities, (b) the internal relations and local associations, (c) the relation with other national societies and related organizations, and (d) the relation to public affairs of *The Engineering Institute of Canada*. If such a Committee is properly constituted, its conclusions should not only compose many of the difficulties now confronting *The Institute* in Ontario, but it should result in a declaration of policy that will place *The Institute* in a proper light with the profession and the interested general public throughout the Dominion. *The Institute* must expand to new and greater duties.

Respectfully submitted,

J. B. CHALLIES,
Chairman.

E. R. GRAY,
Vice-Chairman.

GEO. HOGARTH,
Secretary-Treasurer.

The President and Council of
The Engineering Institute of Canada.

Ottawa Branch

On behalf of the Executive Committee of the Ottawa Branch, we beg to submit the following report for calendar year, 1919:—

The outstanding activity of the past year has been the Annual General and Professional Meeting of *The Institute* held at Ottawa last February. Over four hundred registered at this meeting, and it has been a source of great pleasure to the local members that they have been able to show their hospitality to so many members of *The Institute*.

The success of this meeting was largely due to the efforts of the Special Committee in charge, under the chairmanship of Colonel C. N. Monsarrat, with G. B. Dodge as secretary.

The subject of Legislation has received much attention at the hands of the Executive Committee, which, through the branch representative Mr. [illegible], has been in close touch with the work of the Special Committee appointed at the last annual meeting, and the work which is now being done by the Ontario Provincial Division, which is energetically following up the subject in this province.

The Civil Service Classification has, also, been a very live question during the past year, and close co-operation has been maintained with all the branches, in order to secure their advice and assistance from time to time.

The Special Committee of Council, appointed to interview the Civil Service Commission and to deal with the Minister in charge of the Civil Service Bill, came to Ottawa on several occasions, at personal inconvenience and expense, and we have to thank them for pressing the claims of the engineering profession for more adequate pay and improved status.

The branch representative on this committee, C. Gordon [illegible], rendered very valuable services, and was ever ready to assist members of the Ottawa Branch in presenting the case of the government engineer.

Doctor Alfred Thompson, M.P., having kindly volunteered to interest himself on behalf of the technical men of the service, a committee, including representatives of the Ottawa Branch, was formed by O. S. Finnie. This committee met Doctor Thompson and prepared a memorandum making a strong case for the engineers and other technical officers, for submission to members of parliament in connection with the reclassification of the technical service of the Dominion Government.

Through the co-operation of the other branches, a large number of members of parliament were interviewed, and their views obtained with respect to this question. To all those who expressed themselves as being favorable to the improvement of the status of the technical service, copies of this memorandum were distributed from the headquarters of *The Institute* so as to be available during the discussion of the bill.

Proceedings.

No branch meetings were held prior to the Annual General and Professional Meeting. Continuing the regular meetings from March 20th, a good programme was arranged and the meetings and luncheons were well attended.

The following is a list:—

Evening Meetings

Mch. 20—Paper on Radio-Telegraphic Reception, by Lieut.-Commander C. P. Edwards.

Mch. 27—Discussion on the Draft Legislation Bill, led by Messrs. R. F. Uniacke, A. G. Dalzell, and John Murphy.

Aprl 17—Paper on "Mean Sea Level as a General Datum for Canada," by Doctor W. Bell Dawson.

May 8—Paper on "The Production and Inspection of Steel for Munitions in Canada," by Captain H. W. B. Swabey.

May 15—Description of "The Hydro-Electric System of the Aluminum Company of America," by James White.

Nov. 20—Motion picture "Coal is King" (R. E. Cleaton and Company), distributed by the Ford Company.

Luncheons

Apr. 5—Address by Lt.-Col. C. Peck, V.C., D.S.O., M.P., on "Some Phases of the Great War."

Nov. 4—Address by J. Grove Smith, Dominion Fire Commissioner, on "Fire Protection."

Dec. 4—Address by Major-General Sir Edward Morrison, K.C.M.G., C.B., D.S.O., Deputy-Inspector-General of Artillery, on "Some Reminiscences of the Great War."

Dec. 18—Address by Flag Commander B. H. Ramsay, M.V.O., R.N., on "The Dover Patrol."

Membership

During the early spring, the Committee on Membership compiled a list of some seventy-six men in this district who were considered eligible for membership in *The Engineering Institute of Canada*, and, where possible, they were canvassed personally by members of the committee; in other cases they were communicated with in writing.

The results of this canvas have been highly gratifying, as they show a net increase of thirty-seven, or thirteen per cent over that for 1918, against five per cent for the previous year.

The Branch Year Book has been found very useful in keeping in touch with the members, and a careful revision is made each year to take account of the many changes which are constantly occuring.

The following are comparative figures of the Branch Membership for 1917, 1918 and 1919.

	1917	1918	1919
Honorary Members....	1	—	1
Members.............	60	68	81
Associate Members....	113	123	148
Associates...........	2	2	2
Juniors..............	38	33	31
Students.............	25	24	28
Branch Affiliates......	27	28	24
	266	278	315

The Executive Committee, with the assistance of the Committee on Membership, has carefully considered all applications for admission to *The Institute* and transfer from a lower to a higher grade coming within the territory covered by the branch, and have endeavoured to give Council every assistance in their work of dealing with these applications.

Publicity.

Special mention should be made of the work of the Publicity Committee, under the chairmanship of H. L. Seymour.

Their work consists principally in providing material for *The Journal* of *The Institute* and arranging for reports and editorials in the local papers in connection with branch meetings.

The recent addresses, given by Major-General Morrison, Commander Ramsay and His Excellency The Governor General, were fully reported in a satisfactory manner.

Finances.

The financial position of the branch continues to be highly satisfactory, as may be seen by reference to the attached financial statements of assets and liabilities and of receipts and expenditures.

The principal assets of the branch consist of eight hundred dollars ($800.00) in Victory Bonds and about one hundred and seventy-nine dollars ($179.00) in cash. The net income shows a slight increase over that for 1918, while the net expenditure for purely branch purposes has been slightly reduced.

Officers for 1920.

The Annual Meeting of the branch was held on January 8th, at which the following officers and members of the Executive Committee were elected for the coming year:—

Chairman..............G. B. Dodge.
Secretary...............M. F. Cochrane,
Managing Committee....A. F. Macallum,
Lt.-Col. C. N. Monsarrat,
John Blizard,
K. M. Cameron,
Lt.-Com. C. P. Edwards.

The activities of the branch will be fully maintained during the present year, and there is already a prospect of a considerable increase in the branch membership.

R. de B. Corriveau, *Chairman.*
M. F. Cochrane, *Secretary.*

Statement of Assets and Liabilities Year Ending December 31st, 1919

Montreal Branch

The Montreal Branch has been very active during the year just passed. The main items of activity of the Branch as a whole have been recorded from time to time in *The Journal*, and your Executive feels that it is unnecessary to repeat in detail in this report what has been already published and distributed to the members. For those sufficiently interested, therefore, reference may be made to the following numbers of *The Journal*:—

January, 1919,	pages	26 and 27.
February, "	page	132.
March, "	"	236.
June, "	"	472.
July, "	"	524 to 526.
August, "	"	572.
November, "	"	740 and 741.
December, "	"	791 and 792.
January, 1920,	"	21 and 22.

The regular weekly meetings of the Branch have been a marked success. "Every Thursday Evening at 8.15" is now well established. The quality of addresses and papers given at the twenty-five or more of these meetings has been high and the subjects have proved of great interest to the members. The attendance at the various meetings has been very large and on several occasions additional chairs have had to be used to accommodate those present. Light refreshments were served on two or three occasions and were much appreciated.

The membership of the Branch is as follows:—

Honorary Members	3
Members	126
Associate Members	260
Juniors	42
Students	138
Associates	8
Affiliates	3

The question of legislation has occupied the attention of the Branch and several meetings were held to discuss it. A number of the above-mentioned articles in *The Journal* deal with this phase of the Branch's activities. Probably the outstanding single event of the year's operations was the banquet to General Mitchell on June 12th, which is described in the July *Journal*.

The Executive Committee has met regularly and has devoted a great deal of time to Brarch work in the interests of the members. A large number of individual members have throughout shown a real interest in the affairs of the Branch and of *The Institute*, and have unstintingly given of their time and work on behalf of the members, and the Committee wishes to take this opportunity of thanking them.

Financially our Branch has had no standing heretofore, being dependent on the generosity of Council for the necessary funds to carry on the work. It is hoped that the amendment to the by-laws to be submitted at the annual meeting will result in this state of affairs being done away with and the Branch placed on an independent financial footing like any other branch.

It is evident that great interest is being aroused in the Branch activities and a number of members who formerly evinced very little interest are now taking an active part in its affairs. There still remains much to be done and, like a savings bank, the various members will only get returns in proportion to the amount deposited in the institution. There is an opportunity for every Member, Associate Member, Junior, Student, Associate and Affiliate to give service to the profession and receive large returns. The Executive sincerely hopes that the ensuing year may show a continuation of the splendid interest aroused and that each member will do his part to not only keep up the good work, but increase the interest and efficiency by giving his best to the *Institute* and the *Branch.*

A number of important problems are now before the Executive for consideration, action upon which will be taken in due course and the members notified from time to time.

The whole respectfully submitted on behalf of the Executive Committee of the Montreal Branch.

WALTER J. FRANCIS,
Chairman.
FREDERICK B. BROWN,
Secretary.

Montreal, January 16th, 1920.

Vancouver Branch

Public affairs, legislation, and engineering classifications, have been prominent features of the activities of the Vancouver Branch during the past year.

A memorandum was presented to the local members of Parliament regarding the rating of engineers by the Civil Service Commission and the members of Parliament interviewed in that connection. In co-operation with the Victoria Branch, this Branch has endeavoured to keep the engineering profession before the public.

Legislation has taken up considerable of the time and thought of Vancouver engineers and in conjunction with other engineers in the Province, a Bill has been drawn up which is coming before the Provincial Legislature during the month of January.

Ten meetings of the Branch were held during the year.

The membership of the Branch is as follows:—

Members	48
Associate Members	58
Juniors	4
Associates	2
	112

The financial statement of the Branch shows a balance of ninety-seven dollars in the bank.

Respectfully submitted,
J. N. ANDERSON,
Secretary-Treasurer.

Executive

D. J. Carter H. W. Jones
A. Cunningham D. Donaldson
H. P. Graves

Approved Yours truly,
E. J. Glass H. P. Graves
Chairman Secretary-Treasurer

Edmonton Branch

We beg to submit the 1919 Annual Report of the Edmonton Branch.

The Branch membership is as follows:

Members	10
Associate Members	20
Junior Members	6
Student Members	19
Associates	1
Total	56

Twenty-seven of the above members were on Active Service and as they have gradually returned active interest in the Society is increasing. It is hoped that the year 1920 will bring the Branch to normal and that other than papers dealing with local affairs will be added to the programme of the general meetings.

Four general meetings and eleven executive meeting were held during the year these dealing general with City topics and proposed legislation in respect to Professional Engineers. The close of the year finds the various Engineering Societies almost unanimous in favour of legislation and preparation almost complete for submission of a bill to the Legislature which sits in February 1920. The prospects look very favourable that the bill, which is based on that drawn by the parent Society, will be passed.

The Branch had a cash balance on hand of $11.35 on December 31st with all accounts paid.

The Officers for the year were:

Chairman..........J. L. Cote
Vice-Chairman......A. W. Haddow
Secretary-Treasurer..R. J. Gibb.

Manitoba Branch

On behalf of the Winnipeg Branch we submit the following Report for the year 1919.

We are pleased to state that forty-one of our Members who so valiantly fought for the high principles of democracy and civilization as exemplified by Great Britain, have safely returned to us. Nine of these have received special honors for heroic and valuable service in the field. One, Capt. C. N. Mitchell, V.C., M.C., has been honored with the coveted Victoria Cross.

Our Membership as at the end of 1919 totalled [illegible], being distributed into the various classifications as follows:

Members	53
Associate Members	121
Juniors..	[illegible]
Students	31
Associate	1
Affiliates of the Branch	31
	[illegible]

It is with deep regret we have to record the death of one of our esteemed Members, A. T. Fraser.

Nineteen meetings have been held during the year as follows:

Date 1919		Subject	Speaker	Attendance	Remarks
Jan.	2	Reconstruction................	W. J. Dick, M.E.I.C.	26.	Regular
Jan.	8	Consideration of Proposed By-Laws.......		19	Special
Jan.	11	Reconstruction...........................	Alderman A. W. Puttee	40.	Special Luncheon
Jan.	15	Relation of Engineering to Agriculture.........	Theo. Kipp, M.E.IC	49	Regular
Feb.	5	Can the Standard Measure of Value be Improved?..........................	J. G. Sullivan......	48	Regular
Feb.	15	Wealth of the West.......................	H. A. Lovett, K.C..	52	Luncheon
Feb.	19	Consideration of Development of Manitoba's Natural Resources......................		23	Business
Mar.	6	Construction of Greater Winnipeg Water District Tunnel under the Red River.........	John Armstrong, M.E.I.C.	36	Regular
Mar.	19	Civic Management.........................	Theo. A. Hunt, K.C.....	29	Regular
Apl.	3	Manufacturing Overhead Costs..............	T. R. Deacon, M.E.I.C	35	Regular
Apl.	17	Natural Resources of Western Canada.........	Dr. R. C. Wallace........	39	Regular
May	1	Problems of Western Manufacturers...........	Hugh Mackay, A.M.E.I.C.	24	Regular
May	14	Hydraulic Governors for Low Head Hydro-Electric Units..........................	J. W. Sanger.	[illegible]	Regular
Oct.	2	Pressing Problems of the Day.	J. W. Dafoe..............	46	
		Some Experiences Overseas	[illegible], A.M.E.I.C.		Regular
Oct.	6	Outline of Work done by the Lignite Utilization Board..............................	R. A. Ross, M.E.I.C......	32	Special Luncheon
Nov.	6	Military Engineering.....................	Prof. E. P. Featherstonhaugh, A.M.E.I.C.	9	Regular
Nov.	26	Legislation, By-Laws and Banquet...........		[illegible]	Business
Dec.	4	Design and Operation of Terminal Grain Elevators	C. D. Howe	[illegible]	Regular
Dec.	17	History and Development of Niagara Power..	F. H. Martin	[illegible]	Regular

The average attendance during the year was 38, being an increase of five over the year previous.

Through the generosity of R. deL. French, Engineer of the Lignite Utilization Board, the number of books in our library has been increased by the addition of bound volumes of the "Engineering News and News Record" from 1908 to 1917 inclusive, and also "Transactions of the American Society of Civil Engineers" from 1906 to date.

The By-laws of the Branch have been revised, approved by Council and adopted by the Branch as from May 1st, 1919. Our local organization is now the Winnipeg Branch instead of the Manitoba Branch. The adoption of the revised by-laws contemplates the organization of a Manitoba Division. The latter becomes more essential if the proposed legislation is obtained at the coming Session of Provincial Parliament.

The Bank Balance as at December 31st was $396.72. The Branch also holds five $100.00—1937—Victory Bonds, par value—$500.00. As against the Bank Balance shown the Branch has an outstnding obligation to the Royal Bank for $250.00.

As our new By-laws call for our Annual Meeting to be held in May, at which officers are elected for the ensuing year, the present staff of officers are continuing services to that date.

Respectfully submitted,

W. P. Brereton,
Chairman.

George L. Guy,
Secretary-Treasurer.

Toronto Branch

During the year just completed, the Toronto Branch held fifteen General Open meetings, devoted to the following purposes:—

Four meetings were devoted chiefly to lectures and discussions on various technical subjects as follows:—

On February 7th a lecture by Mr. Cleaton on the subject "Coal is King," in which the Lecturer dealt with good and bad methods of coal mining, transportation, firing, etc.

On March 6th a lecture by Frank Barber on "Reinforced Concrete Bridges in Canada."

On December 4th a lecture by Professor J. Roy Cockburn on the "Scientific Application of Locating Guns by Sound Ranging."

On January 8th a lecture by F. G. Engholm on "Reinforced Concrete Construction."

All above lectures were illustrated by numerous lantern slides.

Two meetings were devoted to the discussion of the economic and social position of the Engineering profession and suggested remedies for improving same.

On February 28th, the younger members of the Branch were given an opportunity to present their views and express their opinion as to what steps *The Institute* could take to improve the status of the Engineering profession in Canada.

Four papers by different members of the Branch were read at that meeting and a number of valuable suggestions were brought forward. But the outstanding features of the evening's discussion were the facts brought forward with regard to the relatively small salaries paid for engineering services, a condition which not only affects the individual members, but also the prestige of the entire profession.

Accordingly a Salaries Committee was appointed to study the question and prepare a schedule of minimum salaries to be paid for Engineering services.

This Committee, which at one time consisted of fourteen members, spent the greater part of eight months in carrying out this work. Altogether fourteen general meetings were held by the Committee, with Sub-committees working all the time on the preparation of the details.

On October 16th the Salaries Committee, through its Chairman, submitted the final report and Salary Schedules to the Branch, which received and endorsed it with only a few minor alterations and modifications. Copies of the adopted schedules were sent to all Branches and to the Council of *The Institute.* These Branches and Council having been kept constantly in touch with the work of the Committee as it was progressing.

Before the end of the year the Executive Committee sent a copy of the adopted Schedule to every employer of engineers in the district of Toronto, the Schedule being accompanied by a letter of transmittal requesting the various employers to adopt the salary schedule for their respective engineering staffs.

Five meetings of the Branch were devoted to the much discussed subject of "Legislation for engineers."

On March 13th a meeting was called for the purpose of discussing Legislation, in order to give Mr. Chipman, the Toronto Branch representative on the Legislation Committee at Montreal, an idea as to the attitude of the members on this subject. At this meeting were also represented members of their technical organizations in Toronto, who expressed their opinion as to the probabilities of securing Legislation in this Province.

At a meeting on March 28th Arthur Surveyor of the Montreal Branch read a paper on "Legislation for Engineers." His paper embraced the principal points affecting all branches of the profession. At that meeting Walter Francis and Frederick B. Brown were also visitors of the Toronto Branch and addressed the meeting, telling of the activities carried on in Montreal.

On May 19th a meeting was called for the purpose of discussing the draft Bill on Legislation for Engineers as prepared by the Legislation Committee at Montreal. A very extensive discussion developed, in which many members of the Branch took part. Several clauses of the original Bill did not seem quite satisfactory to many of the members. It was decided, therefore, to endorse the general principles of the proposed Act and suggest that the details be carefully revised before submitting the Bill to the Legislature.

Another meeting to discuss the same subject was called for June 12th on request from several of the younger members of the Branch. The meeting occupied itself chiefly with the consideration of those contentious clauses which have been the cause of considerable criticism of the Bill in the Canadian Technical papers. At the end of the meeting a Legislation Committee was appointed to study the entire Bill and prepare such amendments and modifications as will make it more satisfactory to the great number of engineers.

For nearly six months the Legislation Committee worked on the Bill. Such clauses as 21 have been revised in a way so as to remove the objections raised by salaried engineers. Several new sub-clauses have been added and the whole Bill has been rearranged, the position of various clauses being changed so as to bring them to a more logical and satisfactory order.

On November 20th the Legislation Committee presented its report. This final report, with only very slight modifications, was adopted by the Branch. Copies of this amended Bill are being sent to all Branches, to the Provincial Division, and to the Council of *The Institute*, in order to get an expression of their opinion.

Two meetings were devoted chiefly to a smoking concert and musical programme. One was held on April 24th at which meeting Mr. Chipman also reported on the work done by the Legislation Committee at Montreal. The other meeting was held on October 30th, at which meeting were also received the report and suggested amendments to the Branch By-laws as prepared by the By-laws Committee of the Toronto Branch.

The Annual Meeting of the Toronto Branch was held on January 22nd and the Annual Dinner on December 16th. At the Annual Dinner, Brigadier General C. H. Mitchell addressed the members on the subject "The Future of Applied Science."

The Executive Committee held nineteen meetings during the last year at which all matters in connection with the business of the Branch were transacted.

In addition to the Salaries Committee and the Legislation Committee, which are described above, the following Committees were also active during the year: City of Toronto Building By-laws Committee, Toronto Branch By-laws Committee, Employment Committee, Fees Committee and a Committee to collect back dues.

With all those activities carried on it is quite natural that the expenses of the Branch should have been heavy during the year. The work of some of those Committees involved a considerable amount of typewriting and printing. But after having paid all expenses incurred during the past year, the Branch starts off the new year with a cash balance in the bank of one hundred and eighty dollars and fifty two cents.

A. H. Harkness,
Chairman.

H. A. Goldman,
Acting Secretary.

Hamilton Branch

January 22.—A resolution passed by the Hamilton Branch on the question of legislation for the Incorporation of Engineers. This covered and supplemented action taken by Montreal Branch on December 12th, 1918.

January 30.—An illustrated lecture by E. L. Cousins, Chief Engineer of Toronto Harbor Commission, on improvements which have been made to Toronto Harbor during the past four years. Much information of interest was obtained, especially with regard to the possible future developments of the Hamilton Harbor.

Mr. Cousins recently returned to Hamilton and addressed a large public gathering of citizens on Hamilton Harbor development plans in January 1920.

February 10.—A lecture by F. B. Jewett, Ph.D., Chief Engineer of the Western Electric Company of New York City, on research work and recent developments in Wireless Telephony.

Dr. Jewett who has charge of one of the largest Research Laboratories in the United States spoke on the great need for trained investigators and the many interesting experiments which were carried on during the War, leading up to the rapid perfection of the Wireless Telephone.

February 17. — An illustrated lecture by N. Couchon, Consulting Engineer, on Town Planning and Development, who dealt particularly with a review of the various projects which have been planned for the City of Hamilton, including harbor developments, changes in railwas, public utilities, amusements, etc.

March 14.—By-Laws of Hamilton Branch were prepared and forwarded to Headquarters for consideration and approval, and a notice was received of the adoption of these By-Laws on December 16th.

March 28.—Illustrated lecture on building of Quebec Bridge by G. F. Porter, M.E.I.C., Construction Engineer for the St. Lawrence Bridge Company. This was one of the most successful lectures of the year, the lantern slides being particularly impressive.

March 31.—A committee of three was appointed for the purpose of reporting on the question of Club Rooms for the engineering and professional men of Hamilton. At a subsequent date it was reported by the Committee that suitable rooms could not be obtained within the financial reach of the Branch Members.

April 11. — An address by [illegible] of the Westinghouse Electrical and Manufacturing Company of Pittsburgh on "The Electrification of Steel Mills."

The speaker described, with the help of lantern slides, the advantages of electric motors over steam engines in every application of power to the manufacture of steel, special reference being made to Electric Driven Reversing Mills.

May 1.—Ballots were issued for the election of Officers of the Executive Committee of the Hamilton Branch. The ballot was completed and the Officers notified on the date of the Annual Meeting, May 8th.

May 30.—*Annual Meeting.* At this meeting the Scrutineers appointed announced the result of the election of Branch Officers.

The reports of the retiring Chairman and Secretary-Treasurer were received and adopted.

The report of the Legislation Committee was also presented by E. R. Gray, Representative of the Hamilton Branch.

A resolution was passed recommending the establishment by the Government of Canada of a National Research Institute to carry on and direct research in such industrial, agricultural, commercial and medical problems as will best promote the conservation of Canada's resources.

Nov. 13.—The first meeting of the Fall and Winter Season was held on this date at the Royal Connaught Hotel, where a large number of members enjoyed dinner and a musical and entertainment programme, followed by the address of the Chairman, dealing with matters of business and plans for future meetings.

Owing to the approach of the Christmas Season it was found impossible to arrange anymore open meetings or addresses before the first of the year. A number are in contemplation, but some difficulty has been experienced in getting speakers who will come at their own expense to address the Branch on new or original topics.

Legislation.

During the year considerable interest has been taken by the Executive and Members of Hamilton Branch in the proposed Legislation concerning the Engineering Profession, which has been the subject of much thought and fruitful endeavor on the part of various Branches and bodies of the Engineering Profession, and particularly the Members and Organization of *The Engineering Institute of Canada.*

The local Branch has given its support in the matter through the Local Members of Parliament and by co-operation with the various Branches of *The Institute.*

Financial.

The present financial standing of Hamilton Branch is as follows:—

Balance on Hand January, 1919, as per last Annual Report	$ 78.26
Total receipts during year from Membership, Affiliate Fees, Etc.	108.00
Total	$186.26
Total expenses to December 31, 1919, including sundry unpaid items	150.73
Balance on Hand	$ 35.53

R. K. Palmer,
Chairman.

Corbett F. Whitton,
Secretary-Treasurer.

Peterborough Branch

The Peterborough Branch of *The Engineering Institute of Canada* was formed on Nov. 6th, 1919, at a banquet in the Empress Hotel, at which the following prominent engineers and members of Council were present, Col. R. W. Leonard, Walter J. Francis, Prof. H. E. T. Haultain, R. A. Ross, Prof. Peter Gillespie, James White, J. B. Challies, Fraser S. Keith, A. H. Harkness, Frank Barber. The City Council, and the Chairmen of all the local Municipal bodies were present, as well as the heads of all the local manufacturing concerns employing engineers, and there is no doubt that the prestige of engineers in Peterborough has been measurably increased as a result of that function.

Previous to the inauguration of the Branch, there had been in existence in the City an Engineers' Club, which had been carrying on successfully for over two years. While the results were excellent, it was felt that much better work could be done if a connection were formed with *The Engineering Institute of Canada.* After a visit from Fraser S. Keith, the General Secretary, who explained the Aims and objects of *The Institute* to those who were not already members, it was decided to form a Branch. A petition was presented to the Council and on its being granted the inauguration was proceeded with.

The following are the officers of the Branch for the Season of 1919-20.

Honorary Chairman	Richard B. Rogers, M.E.I.C.
Chairman	G. Reid Munro, M.E.I.C.
Vice-Chairman	Roy H. Parsons, M.E.I.C.
Secretary	R. L. Dobbin, M.E.I.C.
Treasurer	D. L. McLaren, A.M.E.I.C.
Executive Committee	P. L. Allison, M.E.I.C.
	A. L. Killaly, A.M.E.I.C.
	G. R. Langley, M.E.I.C.
	E. R. Shirley, M.E.I.C.
	C. E. Sisson, M.E.I.C.
	P. P. Westby, M.E.I.C.

At present the membership of the Branch is as follows:—

11 Members
17 Associate Members
5 Juniors
23 Affiliates.

56

Since the Inauguaration one meeting was held in December, at which a paper was presented by G. B. Smith of Belleville on the Central Ontario System of the Hydro-Electric Power Commission of Ontario.

All of which is respectfully submitted,

G. R. Munro,
Chairman.

R. L. Dobbin,
Secretary.

Quebec Branch

The Quebec Branch has the pleasure to send the following report displaying its activities during the year 1919.

Eight general meetings were held and honored with an average presence which not being very large still showed the continued interest taken by some of our members in the professional welfare and solidarity.

The momentous question of a provincial legislation adequately protective of the engineering profession— which legislation has been extensively studied by the different branches of *The Institute*—has received from the Quebec Branch one of the effective impulses that brought it to the desired end. The correspondence at the Headquarters, the records of all the Branches include a resolution sent from Quebec in January 1919. The same could be retraced in the proceedings of the General Convention at Ottawa and of the Special Committee originating there. The work of the Quebec delegates was then duly recognized.

To this Branch and especially to one of its members must be credited the elaboration of a legislation project extensively utilized by the Special Committee in the drawing of a uniform legislation bill for all provinces.

When the Branches were urged by the Council to meet the Members of the House of Commons and obtain their approval of a Classification Bill duly protecting the engineers employed by the Federal Government, our members repeatedly corresponded with several representatives of the Quebec District and sent reports claiming the justice of the previous Bill.

Through our Branch, the action inaugurated by *The Institute* was extended to the Provincial field. A list of salaries paid to the engineers employed by the Quebec Government has been prepared and suggestions proposed.

Sharing in the work carried by other branches towards fixing schedules of salaries that should be paid to engineers employed by public service companies, municipalities, industrial companies, and to consulting engineers practising their profession, this branch has through several committees made enquiries, compiled facts and made suggestions helpful to the Council when determining the proper salaries the engineers of this district should receive. Our Branch pays due tribute of thanks to the Ottawa and Toronto Branches, also to the Association of American Engineers for their sending precious reports on salaries.

The establishment of a provincial Division of *The Institute* has received an extensive part of the attention of this branch having a committee to that aim since February 1918. After much study and canvassing with a similar committee of the Montreal Branch, a referendum was carried that showed the strong assent of the engineers of this province.

Answering the desire of the Council and of the Montreal Branch, our Branch called for Committees to help returning soldiers seeking positions.

This Branch also deserves to mention the work of a "Comité de surveillance" which has reported about all the applications [illegible] to it, has investigated several bills of our Legislature in order to prevent the passing of clauses infringing upon the rights of the profession. The Committee has also conducted an active propaganda for the right use of the terms "engineer" and "ingénieur."

To the president of this Branch must be credited the warning given to the engineers of this country about the possible infringement of Architects in the Engineering field, following a recent practice of the kind at [illegible].

It is hoped that within a near future the efforts of this Branch will obtain at the Parliament Library the creation of a technical and scientific section in which the most up to date books and reviews will be at the disposition of the engineers of this district.

The Quebec Branch deeply regrets the death of one of its founder members, Louis A. Vallée, Engineer of the provincial Public Works and Inspector of Railways in the province. We also with the Council and all the Branches of *The Institute* [illegible] regret the grave of the late Ernest Marceau, whose high training and [illegible] have added much to the standing of our Institute.

Our membership at the end of 1919 was the following:

Members........	15
Associate Members	[illegible]
Juniors	[illegible]
Students	16
Associates	[illegible]
	[illegible]

The expenses our Branch has undergone for [illegible] tion purposes were the largest in all past years, but the results obtained may be considered as perfectly [illegible] [illegible] such expenses. To face future needs, this Branch has the pleasure to hold assets amounting to [illegible] on January the [illegible], 1920.

Respectfully submitted,

[illegible],
Chairman.

[illegible],
Secretary.

St. John Branch

We beg to submit herewith our second annual report of the St. John Branch of *The Engineering Institute of Canada*, covering the year ending December 31st, 1919.

The Executive Committee met 14 times during the year and transacted a large amount of business. There were 10 meetings of the Branch, besides the General Professional Meeting held September 10th, 11th and 12th. The following papers were read at the regular meetings:—

"A Contractor in a Clyde Shipyard," by G. S. Baxter, A.M.E.I.C.

"Reminiscenses of the Early Days of Railway Location," by C. O. Foss, M.E.I.C.

"The Reconstruction of the Bridges on the Dominion Atlantic Railway," by G. G. Hare, A.M.E.I.C.

"Aids to Navigation in New Brunswick Waters," by G. S. Macdonald, A.M.E.I.C.

"Experiments with High Potential High Frequency Electric Currents," by F. P. Vaughan, A.M.E.I.C., M.A.I.E.E.

"Cape Bald Breakwater," by Geoffrey Stead, A.M.E.I.C.

"New Brunswick Highways," by B. M. Hill, M.E.I.C.

"The Dominion Housing Act and how it applies to types of Houses suitable to St. John under local building conditions," by Chas. L. Archibald, A.M.E.I.C.

The programme of the second Maritime General Professional Meeting and the report of the proceedings have been published in "*The Journal.*"

Two of the Branch meetings were held in conjunction with the St. John Board of Trade, when reports were submitted on building a Community Centre with court House and City Hall instead of rebuilding the Old Court House, destroyed by fire. The information furnished and the discussion will undoubtedly have a beneficial effect on public opinion.

During the year a new set of By-laws, patterned after the E.I.C. standard set, were drawn up, adopted, and have been approved by the Council.

The matter of obtaining legislation for New Brunswick engineers has taken up a large amount of time and effort, culminating in the formation of the "Association of Professional Engineers of the Province of New Brunswick" at a public meeting called by our Chairman and held September 12th, in St. John. An executive council was elected, with C. C. Kirby as chairman, and this has revised the E.I.C. draft of Act to suit New Brunswick conditions, and will bring it before the next Section of the Legislature.

Effective work has been done by the several committees. The Employment Committee actively co-operated with the Provincial Soldiers Civil Re-establishment Committee and the Government Labor Bureau. The passing of the Civil Service Act and the Re-classification of the Government employees was urged. Data has been gathered re the salaries paid engineers in N.B. and considerable work has been done by the committee appointed to investigate the subject of concrete in sea water and of the concrete structures in local waters. A very complete bibliography has been prepared for the use of the committee, etc. A Halifax Branch committee is co-operating in this work.

Delegates of the Branch are on the local Vocational Training Committee, which has been able, after much difficulty, to get the City to take action and established Vocational Training schools, which are already proving a popular success.

The statement of Membership at the end of the year is as follows:—

Grade	Resident	Non-Resident	Total	Application Pending
Members	11	3	14	..
Associate Members	25	3	28	3
Juniors	9	..	9	1
Honorary Associate	1	..	1	..
Associate	1	..	1	..
Affiliates	10	..	10	..
	57	6	63	4

Membership end of 1918	43
Net gain for year	20

Four members have moved away during the year.

The financial statement for the year 1919 is as follows:—

Receipts.

Balance from 1918	$ 12.77
Rebates on dues by Headquarters	107.35
Dues from Affiliates	8.00
General Professional Meeting subscriptions	124.50
General Professional Meeting sale of tickets	69.00
General Professional Meeting expenses chargeable to any paid by Headquarters	49.70
	$371.32

Expenditure

Postage	$ 23.14
Stationery and printing	24.85
Telegrams	4.92
Stenographic work	15.00
Advertising	[illegible]
Sundries	[illegible]
General Professional Meeting Expenses	[illegible]
Balance in Royal Bank of Canada	60.11
	[illegible]

Respectfully submitted,

C. C. KIRBY,
Chairman

A. R. CROOKSHANK,
Secretary-Treasurer.

Halifax Branch

During the year 1919, the Halifax Branch held eight meeting as follows:—

January 15th, Annual meeting, at which the report of the Secretary-Treasurer was presented and the following officers elected for the coming year:—

Chairman	F. A. Bowman
Secretary-Treasurer	K. H. Smith
Executive	J. L. Allen
	L. H. Wheaton
	A. G. Robb
	W. P. Morrison
	A. F. Dyer

February 20th, which marked the beginning of the supper meetings which have proved so popular. A paper was read by Capt. T. S. Scott, M.E.I.C. on roads.

March 20th, This was an open meeting to which were invited members of the Board of Trade, Commercial Club and other commercial bodies. W. G. Gordon, Transportation Engineer, Canadian General Electric Co., read a paper on "Main Line Railway Electrification in Canada."

April 3rd, Special meeting at which the question of Legislation was dealt with and recommendations made to the representative of the Branch on the Committee for *The Institute.*

April 25th, at which the results of the meeting of the Legislative Committee held in Montreal were discussed.

June 4th, which was devoted to making preliminary arrangements for the proposed Professional Meeting to be held in St. John in September, and to a discussion of the proposed Legislation for Engineers.

October 22nd, at which a paper was read by A. C. Brown, A.M.E.I.C. on "The results of experiments of the effects of freezing on Cement and Lime Mortars."

December 17th, which was chiefly devoted to a discussion of the proposed Halifax-Dartmouth bridge.

The meetings this year have been marked by an increasing attendance. It is especially gratifying to note the number of young members of the profession who have been accepted for membership and their interest in the meetings and in the affairs of the branch.

During the last two months of the year, the Branch has particularly interested itself in the technical side of the proposed bridge between Halifax and Dartmouth. A bridge committee under the able leadership of L. H. Wheaton, A.M.E.I.C., has been appointed to carry on investigations. The various commercial organizations of the city and Dartmouth have joined in forming a committee to further the project vigorously and the Halifax Branch has a representative on this committee to advise on technical points. The Branch has accepted a tentative offer to conduct the preliminary investigations at the proposed site and have offered to conduct these investigations at cost. In this way the Branch will be able to perform a distinct service to the community and to demonstrate to the general public the value of such an organization as ours.

The membership of the Branch has shown a gratifying increase. At the beginning of the year the Secretary's report showed a membership as follows:—

Members	24
Associate Members	29
Juniors	6
Branch Affiliates	2
Total	61

The present membership is as follows:—

Members	31
Associate Members	[illegible]
Juniors	10
Students	6
Branch Affiliates	2
Total	[illegible]

an increase of:—

Members	7
Associate Members	19
Juniors	4
Students	6
Total	36 or 60%

Summary for 1918

Receipts:

July	6	Cheque from Head Office	$50.00	
Oct.	17	Cheque from N.S. Society	100.00	
Nov.	18	Fees from Branch Affiliate	.70	
		St. John Branch, share of Professional Meeting	12.50	$163.20

Disbursed:

Advertising	20.97	
Expense in connection with meetings	28.00	
Entertainment of Guests	23.75	
Postage	6.29	
Printing	2.20	
Incidental office expenses	2.35	
Telegrams	.31	
Expenditures 1918		$110.66
Balance January 1st, 1919		52.54

Summary for 1919

Receipts:

Jan.	13	Rebate on Advertising from Head Office	$20.97	
		Rebate on dues from Head Office	68.20	
Feb.	22	Cheque from N.S. Society	44.02	
May	14	Rebate on dues from Head Office	34.50	
Oct.	27	Rebate on dues from Head Office	71.60	
		Receipts for 1919		$239.29
		Balance January 1st, 1919		52.54
				$291.83

Disbursed:

Clerical help	60.00	
Rebate to N.S. Society Members	78.00	
Postage	21.49	
Advertising	9.75	
Telegrams	2.55	
Entertainment of guests	2.50	
Part's Picture Store	3.80	
Wreath for D. McD. Campbell	5.00	
Expenses in connection with meetings	5.00	
Stationery	1.88	
Incidental office expenses	2.90	$192.87
Balance January 1st, 1920		98.96

Respectfully submitted,

F. R. FAULKNER,
Secretary-Treasurer.

Approved,

F. A. BOWMAN,
Chairman.

Annual and Professional Meeting, Montreal

January 27th, 28th and 29th, 1920

PROGRAMME

[illegible]

Tuesday, January 27th, 1920

9.00 A.M. Opening of Registration at Headquarters.

10.00 A.M. Calling to Order, Annual Meeting—Appointment of Scrutineers, Reception of Reports.

12.50 P.M. **Adjournment until 2.45 P.M.**

1.15 P.M. Luncheon at Windsor Hotel for Members and Ladies, and invited Guests.

1.50 P.M. **Formal Welcome and Greeting.**

2.00 P.M. Address—"Modern Highway Problems," by Mr. E. W. James, Assistant Chief Engineer, Bureau of Public Roads, Washington, D.C.

2.45 P.M. **Resuming of Business Session,** Annual Meeting.

4.10 P.M. **Reception of Report of Scrutineers.**

4.20 P.M. **Address of Retiring President.**

5.00 P.M. **Inauguration of Incoming President.**

5.30 P.M. **Closing of Annual Meeting.**

8.30 P.M. **Reception and Dance,** Rose Room, Windsor Hotel.

Wednesday, January 28th, 1920

10.00 A.M. **Calling to Order,** Professional Meeting, at Windsor Hotel.

"THE GATEWAY OF THE PROFESSION"

"The Training of the Chemical Engineer," by R. F. Ruttan, M.A., M.D., Sc.D., F.R.S., Professor of Chemistry and Director of the Chemical Laboratories, McGill University.

"The Importance of Physics in Engineering Education," by A. S. Eve, D.Sc., C.B.E., F.R.S., Macdonald Professor of Physics, McGill University.

Discussion, by four authorities on technical education—Brig.-Gen. C. H. Mitchell, C.B., C.M.G., D.S.O., M.E.I.C., Dean of the Faculty of Science and Engineering, University of Toronto; Frank D. Adams, Ph.D., D.Sc., F.G.S.A., F.R.S., Hon. M.E.I.C., Dean of the Faculty of Applied Science and Acting Principal, McGill University; Arthur Surveyer, B.A., B.A. Sc., C.E., M.E.I.C., Member of the Board of Governors, University of Montreal; Prof. Chas. F. Scott, Past President, A.I.E.E., Professor of Electrical Engineering, Yale University, New Haven, Conn.

12.50 P.M. Adjournment.

1.10 P.M. Leave Windsor Hotel on special cars for Northern Electric Company's works.

1.30 P.M. Luncheon, as guests of the President and the Directors of the Northern Electric Company, Limited. At the conclusion of the luncheon the members will be escorted in parties over the works, and will be at liberty to depart any time before the closing hour.

7.30 for 8 P.M. Annual Banquet of the Institute, Rose Room, Windsor Hotel.

Thursday, January 29th, 1920

10.00 A.M. **Continuation, Professional Meeting** at Windsor Hotel.—

"ENGINEERING ACTIVITIES OF THE PROVINCE OF QUEBEC"

"Quebec's Water Power Policy and the Work of the Quebec Streams Commission," by Olivier Lefèbvre, B.A.Sc., C.E., M.E.I.C., Chief Engineer, Quebec Streams Commission.

"The Operation of the Quebec Public Health Act," by Theo. J. Lafrenière, B.A.Sc., C.E., M.Sc., Chief Sanitary Engineer to the Superior Board of Health of the Province of Quebec.

"The Evolution of the Public Roads **Problem in the Province,"** by Alex. Fraser, B.A.Sc., C.E., A.M.E.I.C., Assistant Chief Engineer, Quebec Department of Roads.

12.45 P.M. **Adjournment.**

2.30 P.M. Resuming of Session, Professional Meeting.—

"AVIATION"

"The Policy of the Air Board of **Canada,"** by Lieutenant-Colonel O. M. Biggar, B.A., K.C., Vice-Chairman of the Air Board of Canada.

"PULP AND PAPER,"

"The Pulp and Paper Industry," by Ferd. van Bruyssel, C.E., D.P.S.

"QUEBEC FORESTS"

"The Forests of Quebec," by G. C. Piché, A.M.E.I.C., Chief of Forest Service, Quebec Lands and Forests Department.

5.00 P.M. Adjournment.

8.30 P.M. **Smoker,** Ladies' Ordinary, Windsor Hotel.

Retiring President's Address

The very high honour which you conferred upon me a year ago in electing me President of this *Institute* for the year 1919, is a distinction which I value most highly. The office has entailed much responsibility and many onerous duties, in connection with which I take this opportunity of acknowledging, with sincere appreciation, the enthusiastic energy of our Secretary, Mr. Keith, and the hearty co-operation and most valuable assistance rendered by the Vice-Presidents and the Council.

The constant and untiring attention devoted by the members of Council to the large problems and the many details involved in the management of this *Institute,* with its rapid growth in membership and functions—necessitating the "burning of the midnight oil" on frequent occasions at Headquarters, and the carrying on of a great deal of correspondence and telephonic communication daily—has amply demonstrated the keen interest which is being taken in the present work and ensures the future success and prosperity of our new *Institute*

The last, but not the least duty, which custom has required of your President has been the delivery of a Retiring Address, and when I look back upon the high standard and importance of the Addresses of some of my worthy predecessors, and the enormous field now covered by the profession, I feel that this is a duty not to be taken lightly and one which can be looked forward to only with trepidation. The greatest difficulty is to determine what subjects to select and where to stop.

In the wonderful and rapidly-changing age in which we live ("Reconstruction" being the generally accepted term for the immediate changes which are taking place), I feel that it would not be amiss at this time to review briefly some of the more important changes or developments in the various departments of engineering—especially as our *Institute* now embraces all branches of the profession—and consider how they affect the members of it, individually and collectively.

The necessity, created by the War for rapid and unprecedented improvements in many arts and sciences has wrought changes which will prove of great benefit in the arts of peace, and if the war has had any redeeming features, the improved relations between the various classes of the community and the great strides in advance which it has impelled in scientific and industrial pursuits, are results which cannot be overlooked.

It is said by some that the engineers won the war; but, as there are many claimants to that distinction, the members of our modest profession will be content if they are accorded credit for the part they have taken in the trenches, the laboratories and the workshops. That aid has not been restricted to any one branch of warfare, but has been as diversified as are the many branches of the engineering profession, extending from aeronautics to submarine navigation, and including the design, manufacture and operation of all manner of munitions and vehicles of transport by air, land and sea. Nor should we overlook the equally essential work of sanitation and water supply over the great area of the war zone.

Mention should also be made of the splendid service of your Vice-President, Mr. Haultain, in connection with the work of Soldiers' Civil Re-Establishment.

During the year we have welcomed home, with thankful hearts, the large number of our Members who have rendered such notable service in the great War, and last year we sadly unveiled an Honour Roll in the entrance of our Head Office to the memory of those Members who gave up their lives for the cause.

Well, if this is the period of "Reconstruction," let us start at the beginning. Sir Oliver Lodge is quoted as saying: "The Universe has been in labour for a hundred million years, and has produced—us! We are a remarkable product and we are behaving at the present moment in a remarkable manner." Of course, he speaks of only what we can comprehend. The ant is so blind that he cannot see the man who observes his diminutive habitation.

We are behaving in a remarkable manner partly because our education has been of a remarkable character and partly because we have recently allowed ourselves to be unduly influenced by a few noisy and peculiar people who have been very badly educated. The recent Educational Conference at Winnipeg is a remarkable indication of the recognition by many thinking people of the great needs of our times. We have left untaught much fundamental knowledge which should have been taught and we have taught much that should have been left untaught, and there is an apparent lack of national sanity in us.

A few years ago it would have been unnecessary to deal with the fundamentals of our civilization; they were so imbued in our beings that it was almost silly to formulate them into words. We rested securely in the belief that "Truth is might and will prevail." Of late, however, so much false teaching and distortion of fundamental truths has been disseminated, and accepted by so many, that downtrodden Truth would appear to need the assistance of some Minister of Propaganda if she is to hold her place and prevail before the structure of our civilization is badly shaken. Sound economic doctrine is just as much the foundation of the engineer's professional education as mathematics and physics.

We have the much-taught doctrine that "all men are born "equal," which is an obvious fallacy. It is a self-evident fact that there is as great natural inequality-physically and mentally—in the different branches of the human race as in any other species of the animal kingdom. This difference greatly increased by the moral and spiritual inequalities of the human race—is influenced again and emphasized by environment and education from the cradle to the grave. The very men who ignorantly preach that one man is as able as another and as well qualified to rule or hold office—that race and family count for naught—will spare no pains, in breeding his live stock to select parents having certain desired characteristics of disposition and physique.

G. F. Swain, late President of the American Society of Civil Engineers, in his Address at their Ottawa Convention in 1913, made the following remarks:—

"Equality of condition means stagnation or savagery; the inequality of man means the division of labor, progress and civilization.

"In the second place we should encourage the recognition and admiration of superiority.

"In the third place, we should preach the gospel of content instead of discontent. 'Do violence to no man, neither exact anything wrongfully; and be content with your wages', said John the Baptist. There are two kinds of discontent, one praiseworthy, one ignoble. The former springs from a laudable ambition, and a desire to perfect oneself so far as natural endowment will permit. The other springs from envy and the desire to reap the rewards of the industry of others. The former kind of discontent is to be encouraged; every man should be given an opportunity to develop himself and to be confirmed in the possession of the prizes which he may gain; but the discontent which springs from envy, which leads men to depend on Government help instead of self-help, which sanctions form of unjust taxation which may be nothing less than legalized robbery, should in every possible way, be repressed. The attention of men, instead of being concentrated on what they want, should be directed to a realization of what they have. In contrast with the conditions which existed one or two centuries ago, even the conditions of the poorest classes at the present time are immensely improved. Yet with all the reduction in working hours that has taken place in the last fifty years, and the other improvements in conditions, I doubt if there is any more real happiness and content among the poorer classes. Nor have I any doubt that the excessive talk about bettering the condition of the working classes blinds them to the opportunites for their own thrift and industry."

When I begin to quote Mr. Swain's very notable Address I scarcely know where to stop. I commend it all to you as a splendid example of a well-reasoned statement of social conditions which does justice to the disciplined and trained mind of the educated engineer.

The value of such expedients as Old Age Pensions, Unemployment Insurance, etc., may be overestimated, as they must tend to increase a spirit of irresponsibility and extravagance, to lessen the incentive to thrift, to encourage carelessness in quality of work performed, and to reduce the sense of filial responsibility. Such results do not tend to advance our civilization.

"The hand of the diligent shall bear rule, but the slothful shall be under tribute."—Proverbs XIII, 24.

A popular cry of the ignorant, uneducated "socialist" is: "Why should the many support the few." All thinking men know that it is the few who have the energy, intelligence, courage and enterprise to overcome the great natural obstacles that frequently lie in the road to success—to explore the unknown wastes of the earth and make them accessible to man, and to delve into the hidden resources of nature, geographical, geological, physical and chemical, and force her to yield up her undiscovered secrets, and who, through their natural and acquired ability to develop and harness nature's great resources to serve the needs of man, are creating industry and the benefits of industry for the great masses of the people. We realize now in greater measure than ever before that the labour of the explorer, the inventor, the engineer, the manager and the skilled and unskilled workmen is none equally required to restore the world's wealth, wasted in war, and to build up again a well balanced economic and social structure. Achievement along such lines is deserving of honour and distinction, and of the wealth which properly accrues from such accomplishments, for these rewards constitute the foundation stones of the arch of civilization, just as industry, integrity and thrift form the arch stones. It was the tearing out of these arch stones that was largely responsible for the fall of the ancient civilizations of Greece and Rome; it is the tearing away of the foundation stones that has caused the utter collapse of Russia, as we see her to day.

On our own Continent we have to-day attempts by the ignorant and misguided to destroy both the foundation and arch stones of our industry and civilization, and at times it would appear that some temporary progress were attending their efforts. Therefore, it behooves the educated, who realize the dire consequences which must follow any such success—and especially the engineers who have, perhaps, a keener and deeper realization of the physical and economic consequences—to fortify themselves with a thorough knowledge of the subject and prepare to resist such dangerous tendencies as threaten the present arch of civilization as we have it to day.

The foundation stones may be popularly (though loosely and incorrectly) described as "Capital" and the arch stones as "Labour." Each is dependent on the other. I say "may be popularly described," because every man who possesses a constructive mind or owns one dollar's worth of any useful commodity or one dollar in money, is a capitalist; and every man who works, mentally or physically, is a labourer. But the man upon whose work of eight or ten hours per day depends the well-being of himself and those dependent upon him only, cannot be counted of the same value to society as the one upon whose enterprise, ability and industry depends the well-being of a factory full of employees and their families by maintaining the factory in continuous operation on a profitable basis.

In the Bulletin of the A. I. M. & M. E. for May 1919, Calvert Townley, President, is quoted as follows:

"We emerge from war time into a political arena where the voice of reason is drowned between the clamor of labour and the sentimental appeals of the soft-hearted reformer. Never has the clear reasoning of the engineer been more in demand; never was it [illegible] when the trained brain which thinks things through, back from the eternal principles to the inevitable consequences, so much needed as at present.

"We need the engineer's clear thought, always working from cause to effect, constantly exposed in the open, to help neutralize the power of these soft-hearted reformers, who face not facts as they are, but think them as they wish them to be. We need the engineer's clear reasoning to call not only their own minds, but the world, back to some elementary truths."

"That the hand deserves not the same reward as the brains; that there is no justice in a demand to share profits unless losses be divided; that there is no partnership where gains and not risks are shared; that no wages are earned or can endure that are not fully reproduced in product; that there is no great limitless body of wealth that can continue to pay labour which does not reproduce its wage plus a profit to be added to accumulated capital; that all products are the result of joint effort of brains and labour, plus capital and opportunity, and that all of these, save the last, must share the output or the industry shortly ceases.

"We need fearless men who, in the market-place and from the house-top, will force back to the knowledge of the world: that since the beginning of history brains have ruled brawn; that the brain deserves and in the ultimate will inevitably receive greater reward than the hand; that any proposed condition that puts brawn over brains plans the pyramid on its apex and necessarily is one of unstable equilibrium."

"Labour Unrest" is largely the result of failure or refusal to recognize such facts and conditions as fundamentally right. The workers are led, by observation of occasional large returns upon capital (always featured in our newspapers with sensational head-lines) to ignore the risk and more frequent losses incident to industry—(hidden in very small print, if mentioned at all). The taxation of excess profits has incited the worker to seek a share in these profits, while overlooking the logical conclusion that they would necessarily require also to share in the losses, as it is difficult to understand how partnership in industry can long exist without joint distribution of the risks as well as the rewards.

Occasionally one hears of apparent success in some scheme of profit-sharing, joint industrial councils or suggestion of "sweating the machinery instead of the men," and doubtless there are some industries to which such schemes can be adapted so long as the results of operation are profitable. In the event of losses, however (if only over a short period of time), I fear that the system would not long survive such treatment. I defy any engineer to tell me how to "sweat" a pick and shovel without some measure of perspiration on the part of the wielder thereof.

Under many of the proposed schemes it would be difficult to obtain the labour necessary to start a new enterprise or to continue an established one during a time of temporary business depression.

A great part of what is termed "common labour" in this country does not understand our language, our laws or our business methods, beyond the signing of a name or marking of a cross on the pay-roll at regular intervals; and the meaning of a stock certificate would be utterly beyond their comprehension.

As ability to understand what, to him, are the intricacies of business as applied to profit-sharing, etc., is absolutely essential to the success of such schemes, and as practically the only education these men receive in this direction is such as is instilled into them by agitators who find fomenting industrial strife a much pleasanter occupation than working for a living, the prospects for the general successful adoption of these innovations is not bright.

If solutions are possible whereby the lot of the working man can be improved, the engineer—whose training and life-work are devoted to the solution of practical problems —is most capable of finding them.

Engineers know, as well as the intelligent workmen, how fictitious are most of the alleged grievances in many of the recent strikes. These workmen, perhaps, are not to be too severely criticised if they are content to accept any immediate advantage that may be secured by means of some temporary trouble. The frequent argument that "If all vote for a strike there won't be any" is very seductive.

All mankind tends to crystallize into tribes or factions under a leader. Sometimes the employer, by his strength of character or fair dealings, commends himself to the employees as a leader, and in such cases there is seldom serious labour troubles. Lacking this condition the men select their own leaders and—as frequently in democracies—the selection is not always of the wisest or most moderate man. This leader in order to justify himself works day and night and Sundays to find trouble, in the solution of which he can demonstrate his fitness for the job.

Until the wise heads in the Unions get together, take control and educate the others along lines of duty and honest service to their fellow men, there can be no industrial peace.

The present tendency appears to be toward the obtaining of special legislation and privileges for highly organized bodies of labour beyond its proportional value, which, if continued, must result in the eventual extinction of the particular Union, Trade or Business involved, just as the Trade Guilds of the Middle Ages perished, and as the stone-cutter's trade dwindled when concrete took the place of cut stone. A striking example is the headway that the use of concrete is making for house-building in England as a result of the "ca-canny" of the Bricklayers' Unions, which is largely responsible for the increased cost, and, therefore, the rent, of the labourer's cottage.

W. R. Ingalls, in an admirable Address before the Canadian Mining Institute in May last, cites the case very clearly, as follows:—

"It was the theory of Karl Marx, from whose teachings are drived so many of the fallacies of the present time, that labour, in its narrowest sense, produces everything, and, therefore that labour should have all that it produces. That idea is frequently expressed now, all over the world. We have already seen that labour gets almost all as it is, and what remains it would not get, for if profits for example are the reward of intelligence, the removal of intelligence would remove profits also. So long as the world was dependent upon mere man-power there was no very great advance in the wealth of nations beyond what was due to increase in population. There is no good reason to believe that an Englishman in the reign of George IV could carry any more weight per hour or for any more hours, or could exhibit any other superiority of physical power than an Englishman in the time of William the Conqueror. The great increase in production has happened during the last century and a quarter, and has not been because men have grown any stronger, but because mind has taught labour how to become more effective and has provided it with machines and with organization. It is the minds of the capitalists that have produced the great increase in wealth and to these capitalists might reasonably have accrued all that they earned but the economic principle that labour is the residual claimant prevented any such result, even if it were desired. The income of England in 1801 was about £180,000,000. The income of the United Kingdom, at the same rate but allowing for the increase in population, in 1907, would have been about £800,000,000. Actually it was about £1,800,000,000, excluding the income from foreign investments. In the words of Mallock 'the mind of the larger employers was the primary producer of an income of some £1,000,000,000 added to an income that would have otherwise have been £800,000,000 only.' Then he shows conclusively that of this increment the representatives of Mind got only about £250,000,000 for themselves, including both profits and the interest on industrial capital.

"I have shown I hope that there cannot be anything essentially wrong in the existing system of the distribution of the produce of industry as between labour and capital. Labour cannot divide among itself any more than there is to divide, i.e., the total of what is produced. That is self-evident. It may attempt to seize the modest share of capital, but if it succeeds in doing so, that share dries up. If it confiscates capital itself it does not gain anything, for capital, without the directing minds to use it productively, ceases to be of advantage to anybody. The experiences in Mexico and Russia have shown what happens. The Bolshevists of other countries will lead to the same end if they have their way. Why is it that while socialists are shouting from soap-boxes, inflaming the populace with irritant poisons, while doctrinaires who hold professorial chairs are issuing fallacies, while a motley crowd in Russia is performing the most cruel and disastrous experiment every known, we cannot drive into the heads of people that even as things are under the capitalistic system they get all they can, that they can get no more than they produce, and that it is not the power of the mass but rather the minds of the few that have uplifted them to the stage of comfort that they enjoy to day, which is vastly superior to what it was a century ago. If the Marxian doctrine has been true labour would be paid now what it was 100 years ago, no more."

"It is of profound importance to make the millions of workers see things correctly, for they are blindly approaching a time when adverse economic conditions are going to drive them, and no socialistic rantings or paternalistic policies by the Government are going to help them. The world has become so much poorer by the squandering of wealth and manpower during the war that no advance in the scale of living is to be expected from it. The pressure is [illegible] the sooner. The farmer may not lose his cattle but [illegible] for his future because of the loss. The people in a city do not become [illegible] [illegible] has turned away their houses. No more do national incomes [illegible] because war has consumed their substance. Instead of labour holding what it has gained during the war it is probable that it will suffer a relapse to a condition inferior to what it held just before the war, although the unions will struggle bitterly against it. Fortunately, we shall not see a loss of consumer improvements, such as safety measures in industry, the provision of proper working quarters and conditions, because they are necessary, but labour is in danger of losing the eight-hour day for the simple reason that it will have to work nine to ten hours in order to produce enough on which to live.

During the progress of the War, in order to differentiate in a popular way the aims of the belligerents, the word "Democracy" became almost a war-cry, like "Remember the Maine" in the Spanish-American War. Both have served their purpose. "Democracy" is defined as "The form of Government in which sovereignty of the State is vested in the people, or indirectly, by means of representative institutions."

It is the ideal form of Government where "the people" are intelligent and educated on sound principles. If, on the other hand, the majority of the voters—the ruling class—are ignorant, badly led or imbued with false political doctrines, it means the downfall of that State. Lenine is credited with stating that, of every one hundred of his followers, one is a Bolshevik, 39 are criminals and sixty are fools. We see the result in Russia to-day—the most terrible famine and misery that a white nation has probably ever experienced, certainly since the Thirty Years' War.

We must be very jealous about extending the franchise to alien immigrants who become the ready and fanatical followers of irresponsible, self-seeking agitators.

The combination of various classes of workmen into Trades Unions has undoubtedly been the means of bettering the living conditions and wages of the members, by bringing to the attention of the public the defects in those conditions. These successes have naturally led ambitious members to aspire to greater things, until the public who are neither employers or employees in the union sense feel that the limit has been passed, and that, in many cases, the power of the unions is being exercised unwisely and selfishly.

The hope for further progress in trade unions appears to depend on the ability of their leaders to recognize the necessity of instilling sound knowledge into their memberships, with a sense of their duties and responsibilities to the public as well as their rights. These duties include increasing efficiency with increasing pay and decreasing hours of labour. Otherwise, there is no limit to the high cost of living which, in the last analysis, depends largely on the high cost of loafing. Co-operation among all classes and nations there must be if we are to escape the downfall of civilization.

The result of the feeling mentioned, on the part of the public, is the tendency to form unions in other walks of life for self-protection, such as the "Middle Classes Union" in London; or to secure proper recognition of the professions by the public and the Government through legislation.

Doctors, lawyers, dentists and land surveyors have long enjoyed legislative protection, doubtless to the great benefit of the whole community.

The engineering profession is so all-embracing that much difficulty has been found in framing suitable legislation in the past to meet the manifest requirements of the profession.

Last April, however, in obedience to the Resolution passed at the last Annual Meeting, a Committee from the whole Dominion met in Ottawa and drafted an Act for submission to the several Provincial Legislatures. We are advised that much progress has been made looking toward the enactment of this legislation and that our individual members in each Province are co-operating with the members of the Mining Institute and other members of the profession who are not enrolled on our list.

This is not a new movement. I think I remember it as quite a lively subject of debate in the old Society meetings thirty years ago, and I read that it was seriously under discussion by the Institution of Civil Engineers about the same time.

In the United States ten individual States have enacted laws licensing or registering engineers. Eighteen States require the licensing or registering or architects, and six States require the licensing or registering of land surveyors. These laws overlap in a confusing manner, are not all uniform and are likely to prove very embarrassing and annoying to engineers whose activities extend beyond the limits of a single State. Consequently, the Engineering Council has made a report, dated December, 1919, recommending a uniform registration law. In this they have followed the precedent of *The Engineering Institute of Canada* and the great engineering societies in England.

The Institution of Civil Engineers is endeavoring to have passed legislation to make it illegal for local Government authorities to expend public funds upon works unless under the supervision of a properly qualified engineer; also to obtain statutory powers to prescribe the qualifications and to conduct examinations for admission to the profession of Civil Engineers; to keep a register of civil engineers, and to prevent persons who are not duly qualified from holding themselves out as members of that profession.

In this connection, we must consider the difficulty caused by the confusion in the popular mind between the professional engineer and the skilled artisan (often a member of a trades union) who, in England, is defined as an "engineer." A possible solution in Canada is a more distinctive name for our *Institute*.

During his recent visit to Canada, His Royal Highness, the Prince of Wales, graciously honoured our *Institute* by consenting to become an Honorary Member. This distinction I am sure is a subject of much pleasure to all our Membership, and especially to those who had the honour of serving with His Royal Highness in the late War.

Your Council has taken an active and, we believe, a useful part in endeavoring to obtain reasonable salaries for members of the engineering profession employed in the Government service.

A Committee of your Council waited several times upon the Civil Service Commission and the Minister to present the case of our members,—we believe with very good success. The Act when passed will, of course, not be perfect nor meet the views of all our members, but in the Act is provision for further consideration of individual cases of injustice, so that they may be dealt with from time to time.

Your monthly "*Journal*" is now well established and is commending itself very favorably to all the membership. Let us all help to increase its circulation among the profession and its usefulness to the utmost.

The financial statement shews a deficit for the year, due largely to extraordinary expense of legislation committee meetings and the starting of *The "Journal"*; but it is fully expected that this deficit will be speedily wiped off.

Government official recognition of *The Institute* was accorded by the Minister of Labour in granting representation to *The Institute* at the Industrial Conference at Ottawa in September, at which conference our delegates took part as representatives of the majority of the population who are neither employers nor labour unionists, but none the less are suffering on account of the disputes between these two classes.

The membership of *The Institute* during the past year has increased greatly in excess of previous years. It should be the aim of each member to get every qualified engineer of good character into our *Institute*. Those who cannot qualify for full membership, may be very useful as Affiliates, who will find their association with our *Institute* of great service to them.

We now have Provincial Divisions of *The Institute* actively working, including eighteen very energetic Branches which are enthusiastically vieing with each other in a friendly contest for the best results in increase in membership and the contribution of valuable papers.

Our endeavour should be to make this *Institute* more than ever a national society, and thus increase our prestige and usefulness to our country and to one another.

It should be our policy, even our duty, to do all we can to the end that engineers employed by Governments—Federal, Provincial and Municipal, and even industries as far as practicable,—shall be efficient and shall be Canadians; to insist on all machinery and supplies, the purchase of which we may individually control, being of Canadian manufacture.

Some years ago I was asked by a very prominent and capable engineer from the United States to take charge of the development of some important mines in a foreign country, which development would necessitate the installation of a large amount of machinery. The capital invested in that enterprise was largely English and American, with some interest from the country itself. I was given clearly to understand by this engineer that, in case I was appointed to the position, every dollar's worth of machinery required must be purchased in the United States. One reason then dawned upon me why this gentleman was frequently featured in U. S. technical journals as the most highly paid and prominent Mining Engineer in the world. Through unforeseen circumstances the project was deferred indefinitely, but I have often wished that Canadians generally—and particularly engineers—and those in control of the purchase of machinery and supplies for Canadian developments, were imbued with some of this spirit, even if it were not carried to such an extreme.

If you can afford a motor car, (few professional engineers can) see that it is made in Canada, and that the fruit on your table is grown in Canada. If your requirements cannot be purchased in Canada, get them from the Mother country, in preference to foreign countries.

Take an active interest in Municipal and Government measures of an engineering nature. Do not be backward in assisting the public to understand the engineering and economic features of any project that may be under consideration by Municipal, Provincial or Dominion Governments. Your opinions will gain attention and respect if you are a disinterested critic.

The newspapers need your help. Their life blood is advertising, and that depends on circulation, and I am afraid circulation depends to a great extent on sensational head-lines and reading matter rather than on truth and sanity. The easiest and cheapest matter a newspaper can publish to increase its circulation is that which caters to sectional or personal prejudices, and the "Freedom of the Press" makes this form of attack difficult to correct. Undue prominence in head-lines and photographs is given to any radical or extreme utterance of even the most ignorant. Naturally, when any situation points to the possibility of a spicy article, merited or unmerited, at the expense of an industry, it is not neglected. A home industry is selected rather than a foreign corporation doing business in this country, and this tends to discourage our home enterprises to the advantage of foreign concerns. You can do much to correct this by advertising in papers that show a regard for truth and justice rather than in "The Morning Headliner," "The Evening Spasm" or "The Weekly Hysteria," even if the circulation be not so great.

If newspapers were obliged to attach the name of the writer to each article they publish the reader would be in a much better position to know what importance should be attached to the article, than under the present system. Such a practice would tend to produce a saner class of writers and greatly lessen social unrest. One shudders to think of the verdict of posterity on the sanity, wastefulness and sense of humour of our age if it is to be judged by some examples of our daily and weekly newspapers stored in museums 100 years hence.

Railroad construction all over the world was seriously affected by the war. In some cases it was completely suspended, in others retarded, and in a few exceptional cases it was actually hastened by the war. Probably the most complete suspension occurred in Brazil, but with the return of normal conditions steps are being taken to resume operations. In China work was greatly retarded, but nevertheless about 500 miles of new construction was completed, the principal sections being a 150-mile section which will constitute a link in the line by which it is proposed to unite South China and Peking, and a 150-mile branch feeder of the Trans-Siberian Railway in Manchuria. Financial arrangements were also made for a line across Southern Manchuria. In Siberia construction was carried on rapidly and the lines built have given practically a double-track railway from European Russia to Vladivostock. A number of feeders have also been constructed, opening up rich agricultural sections and important coal and iron fields.

In Africa remarkable progress was made in the construction of the Southern section of the Cape-to-Cairo route, the completed mileage now standing at 2000 miles from Capetown to Bukama on the Congo. To complete this transcontinental line now requires but the construction of 600 miles from the Congo to Lake Albert. The extension of the railway in East Africa to Lake Tanganyika, which was practically completed at the outbreak of war, affords a rail and water route across the centre of the Continent. A second East and West transcontinental line passes through Katanga, a rich mineral region in the Belgian Congo, and reaches the Indian Ocean at Beira. The British Expeditionary Forces laid a permanent, standard gauge railway from Egypt into Palestine.

In Australia the work of construction on her east and west transcontinental line was carried on during the war. This line was begun in 1912 and was completed in 1917. 3500 miles of road were built in the Commonwealth during the years 1915-17, and over one-third of the mileage of her north and south transcontinental line is now in operation. All this in spite of the wonderful contribution of Australia to the Allied cause in the War.

In Canada the construction of our second and third transcontinental lines was nearing completion at the outbreak of war. Some work has been done in the building of feeders, and work on the Hudson Bay Railway, which was suspended during the war, will doubtless be resumed at an early date.

It is unfortunate that there are at this time a number of our members, especially returned soldiers, previously engaged on railroad construction, who are out of employment, and they are naturally looking forward rather anxiously to the future.

With the exception of necessary branch feeders and connections to complete and co-ordinate existing systems, Canada has built more railways than she immediately requires. Canada, on the other hand, is very deficient in good roads, and there is no class of men so fitted to undertake the construction of highways as engineers trained on railway construction when they have added to their qualifications a knowledge of the different kinds of materials required for road making on different soils, the most desirable surfaces to meet varying conditions of traffic; and have studied the best form of organization to carry along such work with the greatest economy.

As an indication of the future of highway construction, it is interesting to note to day the development of motor-truck haulage in the conveyance of freight, particularly household goods, from a home, say, in Hamilton or Toronto to another home in New York, returning with freight of a similar nature, in competition with the railroads. Such traffic between cities and towns in southern Ontario is reaching considerable proportions, and the time is not far distant when the Railway Commission will find it necessary to take this traffic under its control. At present it is profitable and promises to expand in much greater proportion than the mileage of good roads. Interurban electric railways do not serve requirements as do the motor trucks, and can not replace them (given good roads) even at the cost of a great extension of unprofitable investment therein.

In electric railway work, advance will be made in electrifying busy terminals, and the high cost of fuel will encourage the electrifying of some main line sections where dense traffic and convenient water power indicate.

The load on hydro-electric stations is generally very irregular, and where the flow of water is abundant it is possible that the spare power (during slack hours or days) might be used to heat reservoirs of water or oil for heating buildings. I have read of such surplus power being used to heat boilers in Swecen to supplement the heat from very expensive coal.

The Scientific and Industrial Research Commission is carrying on a great deal of most valuable work of an engineering nature, such as the preparation of peat and the lignites of the Western Provinces to warrant their more extended use. This is a very promising field for the engineer.

Associated with this problem is the similar one of the coking of U.S. bituminous coals at well-selected centres, to produce coke for domestic and metallurgical purposes, gas for domestic lighting and heating and power transmission, and the saving of the valuable liquid by-products.

The transmission of power by gas made under these conditions may well supplement the transmission by electricity where comparative costs are favorable.

In metallurgy great strides have been made in the past few years, particularly in the flotation of minerals from the finely-ground ore by the aid of a small amount of oil and the formation of a froth. Wasted sand tailings in the Cobalt district, containing as low as 3½ ounces of silver to the tons, are being re-ground and "floated" economically with an extraction of about 66% and a loss in tailings of under 1½ ounces.

Canada has of late increased the range of her metallurgical manufactured products to include many alloys of iron with manganese, chrome, molybdenum, etc.

The refining of nickel, which has been carried on for some years in Canada in connection with the refining of silver, cobalt and arsenic, has recently been greatly increased by the operations of the International Nickel Corporation at Port Colborne. The British American Nickel Company is opening up its extensive refinery near Aylmer, P.Q.

Such industries have created a demand for Canadian-made soda ash, bleach, liquid chlorine, etc., which are now to be obtained in needed quantities.

The fixation of atmospheric nitrogen has been carried on at Niagara Falls, Ont., for some years as cyanimid, and this same plant is now manufacturing sodium cyanide for the extraction of silver and gold from their ores and for insecticide purposes.

In all these technical industries may be found scope for the young engineer who is adaptable and ambitious.

In the industrial world, paper-making, iron and steel making, machine-shop work, etc., there are great opportunities for the energetic, resourceful engineer.

In conclusion, help the other fellow and you won't need help. Maintain, as you have always done, the dignity of the profession, even if the disproportion is at present very marked between your salaries and the pay of the unskilled labourer. Such conditions cannot be permanent.

Let us all help to make *The Engineering Institute of Canada* an institution of national pride. Do not discourage members from joining other Engineering Societies which they believe will be of service to them, but impress upon all professional engineers the duty of helping this *Institute* to be of service to Canada, to the Empire, and to their professional brethern.

We should increase the number of our Branches from eighteen to fifty and our membership from nearly 4000 to 10,000 and put the Engineering Profession where it properly belongs by virtue of the wonderful importance of its work in almost all branches of human endeavor.

Canadian Mining Institute

The Twenty-Second Annual General Meeting of the Institute will be held in the King Edward Hotel, Toronto, on Monday, Tuesday and Wednesday, *March 8th, 9th and 10th, 1920.*

C. W. Knight, Bureau of Mines, Toronto, is secretary of the Local Committee and members wishing to make hotel reservations should notify him at an early date.

"Who's Who"

Annual and Professional Meeting, — Engineering Institute of Canada, Montreal

January, 27, 28, 29, 1920.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Vol. III.   February 1920   No. 2

Thirty-Fourth Annual Meeting

Combined Annual and General Professional Meetings inaugurated at Ottawa last year with such success and repeated with the meeting just closed by the combination of the Thirty-fourth Annual and Sixth General Professional Meeting, at Montreal January twenty-seventh, twenty-eight and twenty-ninth, nineteen hundred and twenty, and having the assets of the experience gained and the enthusiasm aroused a year ago, establishing a record in attendance and interest, have doubtless become a permanent fixture of the features of *The Engineering Institute of Canada.* While comparisons with previous meetings do not detract from any of them, the application of the word "greatest" to the meeting just held in universally conceded. The unusually large attendance is a direct reflection of the greater part that engineers are taking in connection with the affairs of their own profession and are an evidence that we have taken a considerable step in imbuing the profession with a sense of its own importance.

Original plans included holding all sessions at the headquarters of *The Institute,* but before the first session of the Annual Meeting on the morning of January twenty-seventh had well advanced, it was apparent that larger quarters were needed, against which contingency arrangements had been made for the Ladies Ordinary at the Windsor Hotel where the sessions of Tuesday afternoon and Wednesday morning were held. This in turn proved inadequate to accommodate the members attending, as nearly one hundred were unable to be seated at the Wednesday session, and adjournment for Thursday's sessions were made to the Windsor Hall.

President Leonard who occupied the chair for the Thirday-fourth Annual General Meeting, showed himself an adept at having the various items of business on the long agenda put through on scheduled time and with such success that the entire business proceedings were concluded as arranged. The official report of this meeting will appear in the next issue of *The Journal.* the admirable address of the President being printed in this issue.

The Committee reports were all adopted and a number of constructive suggestions made by the various Committees were referred to Council for action, as was the question of the re-appointment of *The Institute* committees. The suggestion of the Finance Committee regarding *The Journal* will be brought more prominently to the members at an early date. Branch reports from sixteen of the Branches and one Provincial Division spoke more eloquently than any general statement possibly could of the remarkable development that has taken place in Canada regarding the interest of engineers in matters concerning their own and the profession's welfare. Every Branch of *The Institute* showed a prosperous financial condition and a substantial numerical increase of membership which shows clearly that they are all live energetic societies. In most of the Branch reports the question of legislation and compensation of engineers was referred to and the fact brought out that in many of the provinces legislation is an active issue of the present moment.

The report of the Scrutineers showed the following elected:—

President	R. A. Ross
Vice-Presidents	Brig.-Gen. C. H. Mitchell
	W. G. Chace
Councillors	
District No. 1	Frederick B. Brown
	Julian C. Smith
District No. 2	A. R. Decary
District No. 3	F. A. Bowman
District No. 4	J. B. Challies
District No. 5	E. R. Gray
District No. 6	Guy C. Dunn—(For Three Years)
	B. S. McKenzie—(For One Year)
District No. 7	J. R. C. Macredie
District No. 8	G. W. Craig
District No. 9	H. M. Burwell

Hearty congratulations were tendered by the visiting members to the Montreal Branch, whose Executive and various committees have had, for weeks, to work with untiring zeal to complete arrangements for the social and professional features that made such a strong appeal to the personal and professional instincts of all who attended. The arrangements for the registration of delegates and all the details were carried out by the committees of the Branch in a manner that did credit to all concerned.

Courtesy Appreciated

Every member of *The Institute* will appreciate the courtesy received from the President and Executive of the Association of Canadian Building and Construction Industries. When the matter was brought to their attention that the dates fixed for the Annual Meeting of their Association corresponded with those arranged for the Annual and Professional Meetings of *The Institute*.

Although President Anglin was good enough to say that in making this change they were only reciprocating the kindness received from members and officers of *The Institute* when the Association was being formed, nevertheless it necessitated trouble and expense, and involved the upsetting of plans carefully completed, so that the spirit shown exemplifies not only a cordial feeling of good followship, but a desire to work together to mutual advantage and to co-operate in the many points where the interests of the Association and *The Institute* are in common. The following correspondence between Secretary J. C. Reilly, of the Association of Canadian Building and Construction Industries and the Secretary of *The Institute* will explain the situation more fully:—

Association of Canadian Building and Construction Industries

Executive Committee

J. P. Anglin, President, Montreal.
J. C. Reilly, Acting General Secretary.
65, Victoria St., Montreal.

Fraser S. Keith, Esq.
Secretary, *The Engineering Institute of Canada*,
176 Mansfield Street,
Montreal, P.Q.

Dear Mr. Keith:—

Following our conversation of a few days ago, and your previous talk with President Anglin, I should say that we have arranged to change the dates of our coming General Conference, in order to avoid conflicting with your Annual Convention.

Our new days are, Monday, Tuesday and Wednesday, the second, third and forth of February. Sessions will be held in the Chateau Laurier, Ottawa, commencing at 10 a.m., on Monday, February 2nd.

I would ask that if possible you make some announcement of our Conference during the progress of your Convention, as there will probably be a good number of contracting engineers present.

With best wishes for a most successful meeting of your organization, I remain,

Yours very truly,
(Sgd.) J. C. REILLY,
Secretary.

ROBERT A. ROSS, M.E.I.C., President, 1920
The Engineering Institute of Canada.

LIBRARY NOTES

The following has been received and is to be found in the Library:—

American Society of Civil Engineers.—Final Report of the Special Committee to formulate principles and methods for the valuation of railroad properties and other public utilities.

Mines, Grisou Poussière

[illegible]

This text-book on Fire-damp and Dust in Coal Mines forms one of a series of practical text-books known as the Encyclopédie Scientifique which corresponds to a certain extent to the Reference Libraries of the Correspondence Schools in this country.

Professor Grussard first takes up the question of the factors controlling the ignition and combustion of Fire-damp and Coal Dust; temperature of combustion, delay factor, etc. The second section deals with actual "flaming" in mines, and discusses thoroughly the Davy and other safety lamps with a simple explanation of the principle of the Davy screen lamp. The question of explosives is next taken up; the various explosives used in coal-mine practice with their characteristics in connection with explosions of fire-damp and coal-dust are discussed, and the rules adopted in France for use of explosives in coal-mines are given. In the last two sections of the text-book Professor Grussard discusses prevention and localisation of explosions, with a chapter on problems in mine ventilation.

The style of the book is conversational throughout, and in few places are figures quoted in detail. From the purely scientific standpoint the text-book is not intended to present results of research work, but would undoubtedly be of value to the mine superintendent, particularly in regard to ventilation and explosives.

Catalogue of the Watt Centenary Exhibition (Science Museum, South Kensington).

Catalogue of the Mechanical Engineering Collection (Science Museum, South Kensington).

Copies of Acts concerning registration of engineers have been received from the following States:—Florida, Illinois, Oregon, Michigan, Iowa, Idaho, Colorado, and copies of the Acts are at present in the Library.

A recent addition to the journals received by the Library is the weekly bulletin of the Department of Trade and Commerce Intelligence Branch. This bulletin gives a useful weekly summary of Canada's export trade in reference to Great Britain and others countries. The publication is free, and can be obtained by any member by writing to the Department of Trade and Commerce.

Practical Flying

By Flight Commander W. G. McMinnier, R.N., G. H. Domico., New York. $1.50.

This book is the outcome of the author's experience in the training of service air pilots. It is very clearly written and the illustrations are excellent. After a brief discussion of the principles of flight, the details of machines and engines and the use of instruments are considered and the course of training in elementary flying, cross-country flying and stunting are freely dealt with. There is a short introduction by General W. S. Brincher, R.A.F. and a chapter on the Medical aspects of aviation by Dr. Graens Anderson.

The glossary of aeronautical terms given as a appendix is rather out of date and should be revised for later editors in the light of the standard glossary recently published by the Royal Aeronautical Society of Great Britain.

The book can be confidently recommended, not only to those wishing to learn to fly, but to all general readers, posesssing the rudiments of engineering training, who are interested in aeronautics.

Gas and Flame in Modern Warfare

By Major S. M. Auld, M.C., Geo. H. Doran, Company, New York.

This book is not a comprehensive study of gas and liquid-fire, but is an interesting narrative of their use by the Germans against the British Forces in France and Belgium until the end of 1917.

The author explains both the gas-cloud attacks first employed, and the gas shell bombardments which superseded them.

He shows how gas-cloud attacks were made, and how the anti-gas measures became so effective that gas-cloud attacks were abandoned in August 1916.

With regards to the gas shell bombardments, the different gases, their characteristics, and their tactical use are all clearly set forth.

The anti-gas measures are fully described, such as the evolution of the respirator, the Vermorel sprayer, the Ayrton fan and the gas-proof dug-out.

The last chapter explains the construction, use and limitations of the "Flammenwerfer", or flame-projector.

No mention is made of the gas and other forms of frightfulness used by the British.

Y. LAMONTAGNE.

CORRESPONDENCE

O'Brien Mine, Cobalt, Ont.

Dec. 14, 1919.

Editor, *Journal*,

Dear Sir:

In the matter of the Engineering Profession Act (in the success of which I personally feel keenly interested), if it may be permitted me to offer a constructive criticism, it is that a little propaganda work would greatly aid in getting the Act favourably considered by those members of the profession who are not connected with *The Institute*, and with that end in view, I would suggest that a small pamphlet or brochure be prepared explaining the intentions of *The Institute* along those lines, also giving the history of previous attempts in that direction, what success they attained, and the nature of the opposition they encountered.

The pamphlet could furthermore enlarge on the superior remuneration obtained by members of the legalized professions compared with that received by engineers and on their higher standing in the community; for it is the humiliating truth that while the engineering profession forms the basis of the structure of present day industrial civilization, the bulk of its members do not enjoy the same consideration as those belonging to the older professions.

I do not mean that a pamphlet or brochure of this nature be scattered broadcast, but that it be distributed privately to members of *The Institute* who are interested in furthering the matter of legislation, by them to be used as a fund of information in gaining converts and combatting the arguments of their opponents. It may be objected to this proposal, that such work can better be done by the various branches; that is, no doubt, true in the large centres of population where they exist, but a great many engineers do not live in these centres; this is especially so with respect to the mining profession among the members of which, propaganda has to be carried on by isolated individuals, many of whom, like myself, have not been long enough connected with *The Institute* to be thoroughly conversant with its history, and hence are sometimes at a loss for facts to support our arguments. I may say that in my opinion a large proportion of mining engineers are thoroughly disgusted with the conditions at present existing in that branch of the profession, and if a vigorous effort be made by those in favour of legislation to shew that it would result in an amelioration of these evils it would have the support of the greater part of the younger generation at any rate. The time is certainly ripe for something to be done along these lines. Regarding the Act itself, there is one clause, which in the interest of the mining industry, could stand some modification, to wit: (1) "Any person who is not a resident of Canada, but is a member of an engineering or technical organization, or society of standing recognized by the Council, may obtain a license to act in an advisory or consultative capacity to a registered member of the Association." Now, in the case of foreign corporations investing in mining property in Canada, they not unnaturally have more confidence in their own advisers than in any native engineer, and it seems to me that the above clause could be construed to prevent any foreign engineer from making mine examinations or doing similar work in the Dominion, if such is the case it is likely to prove a hindrance to foreign capital entering the country, so I would suggest that the said clause be modified so as to permit a foreign (mining) engineer of approved standing to obtain a temporary license to practise.

Yours truly,

J. A. Reid, M.E.I.C.

Re Draughtsmen and Engineers

I wish to draw your attention to a great injustice, for which skill in draughting is responsible, in the Government service.

The majority of engineers are not finished draughtsmen, and when one of the departments here gets hold of a graduate engineer who shows skill in draughting, it keeps him at it to the neglect of his proper work, and to serious detriment of his career and remuneration.

We have had ample opportunity to observe cases amongst the permanent men, and cases such as the following amongst the temporaries.

The Civil Service Commission sends a couple of temporary men out who say they are draughtsmen. The department finds them useless for draughting and promotes them to higher duties. If they are graduates sending them in the field etc., but leaving the original engineer at draughting all the time drawing a draughtsman's pay without even a chance of being classified as an engineer, instead of an engineer who is a good draughtsman doing better in his profession. This is a great drawback in the civil service. In many cases in these branches the chief engineer is a member of *The Engineering Institute of Canada*. Can *The Institute* do nothing in such cases to better the situation?

Two Engineers of Dept. of Interior.

Class and Clash Legislation

The Editor, *Journal*:

Dear Sir,

The subject of legislation has been a live one in Ontario during the past year and few remarks on the subject may not be out of place at the present time.

The proposals of the Special Committee on Legislation of *The Engineering Institute of Canada* contemplate legislative action that will be all-embracing, and which will not give *The Engineering Institute* control of the operation of the Act. In general, the Bill advanced by this Special Committee of *The Institute* contemplates compulsory and consolidated registration for all practising professional engineers, which will place them in a position comparable to the position now enjoyed by lawyers and doctors. Neither the lawyers nor the doctors have found it advisable or necessary to secure separate registration for each branch of their profession. There may be many specialists in each profession, but in all cases they are either lawyers or doctors. If a Bill substantially similar to *The Engineering Institute* Committee Bill is obtained for the Province of Ontario, all engineers, mining, civil, electrical, chemical, etc., will become registered under its provisions. The engineering profession will be one consolidated entity.

On the other hand, the proposals of the Sub-Committee of the Joint Committee of Technical Organizations contemplate a general Bill, which by expressed intent and by means of ancillary Bills may be made all-embracing, including even lawyers, doctors, dentists, veterinary surgeons, etc., and if their recommendations and conclusions are carried out consistently, and a Bill similar to the Illinois Act (upon which they state their proposals are modelled), is passed, the registration may include nurses, movie operators and practically every special endeavour which may be considered to be technical. The Joint Committee proposals, therefore, involve, directly or indirectly, either now or sometime in the future, the possibility of the inclusion of other established professions and sundry technologists. Surely it is manifest that it would be impossible for purely professional engineers to make any headway to secure registration for themselves if their proposals contemplate affecting the status quo of such firmly established and powerfully entrenched professional organizations like those controlling the professions of law, medicine and dentistry. We would only invite their concentrated opposition and even the U.T.C. could not save us.

It is, therefore, submitted that whatever is advisable for the engineering profession must stand on its own merits and not, directly or indirectly, involve, now or in the future, the established rights and privileges of the other professions mentioned. Further, it is surely quite unnecessary for the engineering profession deliberately and seriously to propose a scheme of legislative effort which can be made to include technical or semi-technical organizations which are not, in their essence, engineering. By so doing, engineers will simply carry an unnecessary burden, and the more comprehensive the inclusion of the semi-technical bodies, the more complex and the less powerful will our position as a profession become.

The Ontario Bar Association does not include the technically trained assistants employed regularly by its members. The Ontario Medical Council does not include in its purview the nurses and hospital assistants which are integral parts of its professional activities. The Dental Association does not affect the mechanical and other technical assistants used by the dentists.

Even if the Bill proposed by the J.C.T.O. is maintained as a purely engineering registration scheme, and is confined to purely engineering branches, it portends an ultimate result which is fundamentally antagonistic to the aims and objects of *The Engineering Institute of Canada*, which are to, by every manner and means, coordinate and consolidate all professional engineering endeavour.

The aims and objects of *The Engineering Institute of Canada* do not involve, as a few engineers wrongly claim, the co-ordination and consolidation of the engineering profession in Canada under its aegis in a manner which may result in *The Engineering Institute of Canada* controlling matters. *The Engineering Institute of Canada* is quite prepared to efface itself wherever necessary for the general advantage of the profession. No better examples of this can be cited than the work of the Special Committee of *The Engineering Institute of Canada* on Legislation, the activities of *The Engineering Institute of Canada* in British Columbia in connection with the efforts there to obtain legislation, or than the support of *The Engineering Institute of Canada* to the Town-Planning Institute, a co-operative organization involving conjoint action in the interests of the engineer, the architect, and the town-planner, for a specific purpose.

The J.C.T.O. legislative proposals provide for ancillary Acts, one for each branch of the engineering profession,—structural, chemical, electrical, mining, architectural, etc., and must inevitably produce an ultimate grouping of the engineers into many distinct registration organizations. This simply spells devolution and disintegration. It is *clash* legislation in effect, and *class* legislation carried to its absolute limit.

Most engineers in private practice can only carry on successfully if they act from time to time as civil, electrical, mining, mechanical and even chemical engineers. Surely it is a fallacious and ridiculous proposition to put forth that such an engineer must be registered under the provisions of three or four different ancillary Acts and in each case satisfy a group of theoretical specialists, jealous of their prerogatives and anxious to confine, by limited registration, their numbers to the absolute minimum. Take for instance a mining engineer who is in charge of a large mine in the Cobalt country, he is suddenly called upon in the ordinary course of his work to act as a mechanical engineer and design some piece of mechanism, complex or otherwise, which must be produced immediately and can be worked out in his own shops. Next he has to straighten out and probably even design and superintend the construction of a more or less elaborate electrical equipment. Again he has to act in a hydraulic capacity and possibly construct a dam across a stream for control purposes, along with the necessary pipes, water works system, etc. Over all, he is the director of the mining operations of the property. There are many mining engineers of this type, and such would have to secure registration under each ancillary Act. What chance would such a man have with a group of electrical men controlling the registration of electrical engineers, jealous of their prerogatives and keenly anxious to preserve their membership limited to those who are practicing as electrical specialists? Even if all the registration bodies provided by these proposed ancillary Acts might be willing to strain a point and admit prominent engineers who have to carry on in various phases of special engineering effort, there will always be circumlocution and red tape with the accompanying delay and expense necessary to secure registration under every ancillary Act.

The engineering profession has no greater divisions by way of specialties than have the legal and the medical professions, but both of these professions have but one registration. Surely no better example could be obtained of the paramount practicable advantages of uniform registration than the position now enjoyed by members of the legal and the medical professions. Their prerogatives, prestige and powers are precisely what most engineers desire.

It must further be remembered that the age of specialization in education in the engineering profession is past, the pendulum is undoubtedly swinging back to general courses so that the engineering curricula of our colleges and universities will correspond to the general curricula of the medical and the legal courses. The time of specializing will come, as in those professions, after the graduate gets into actual practice, or by means of post-graduate work. The influence upon the profession generally in the years to come by this tendency for generalization in engineering courses, will make uniform registration of the profession absolutely necessary. Why not adopt the principle now?

While detrimental to the consulting or general practitioner, it will be a tremendous handicap on the young engineer on the threshold of his professional career. If he must go to the expense and the trouble of registering under three or four different groups, he will be up against a handicap in the most critical and difficult period of his professional lifetime, which it will be very difficult for him to overcome. He may be forced to adopt one specialty and carry on for some time in it, whether he desires to or no.

Briefly and in conclusion, the legislative proposals of *The Engineering Institute* contemplate action which will consolidate into a constructive, co-operative entity, all branches of the engineering profession. On the other hand, the proposals of the J.C.T.O. Sub-Committee involve action which means ultimate dispersion of engineering organizations, and disintegration of professional engineering activities so far as the Province of Ontario is concerned.

The Engineering Institute of Canada's legislation proposals follow several years' persistent continuous action with resultant concentrated consultations by representative committees in different parts of the Dominion, all of which culminated in a final conference at Montreal of prominent engineers who have for years given the subject great attention, as a result of which they are recognized as authorities on the subject, and who after a whole week's deliberation, produced what is herein referred to as *The Engineering Institute of Canada's* Bill. This Bill is, therefore, the culmination of years of research and pioneering of many groups of engineers from Halifax to Victoria. It has been by no means confined to one class of engineers, every specialty has been represented, and the Bill may, therefore, be safely stated to represent the considered judgment of the vast majority of the mining, civil, mechanical, electrical and chemical engineers throughout the Dominion. The J.C.T.O. proposal is understood to be the product of a very small group of Toronto engineers after a few weeks' study, and the small group was not unanimous in its conclusions.

The report of the J.C.T.O. Sub-Committee has been given wide publicity by the "Canadian Engineer," it being published in full in the issue of December 4th. In view of this publicity and of the fact that it really does offer a means to an end with the same objective substantially different from the means suggested by *The Engineering Institute of Canada*, it should be given adequate and serious attention by those members of *The Institute* responsible for the moulding of its policy and for advising respecting appropriate action in the premises by *The Institute*. The J.C.T.O. enthusiasts have produced proposals which must be considered on their merits.

It is hoped that the recently constituted Provincial Division is actively functioning in this fundamentally important matter.

Yours truly,
An Ontario Member.

REPORT OF COUNCIL MEETING

A special meeting of the Council was held at headquarters, on Monday, December 29th, at 5 P.M.

The meeting was called for the purpose of considering applications. Classifications were made for a ballot returnable in January.

The adjourned meeting of the Council from December 16th was held at headquarters on Tuesday, December 30th at 8 P.M.

Finances: Following the reading of the final report of the Finance Committee a lengthy discussion took place bearing on the finances of *The Institute*. The Secretary was instructed to go into the question of lowering the cost of reproducing the Engineering Index. Action in this connection was left in the hands of the Executive Committee and the Secretary. It was considered advisable that the [illegible] be [illegible] at the earliest possible moment to enable the Finance Committee to meet at an early date and present the yearly report.

Municipal Standards: The suggestion of the Canadian Engineering Standards Association for a Committee in connection with engineering standards was referred to R. A. Ross for a reply.

War Souvenir: A letter from Dr. Doughty to President Leonard [illegible] consideration when [illegible] were made, was read. Lt.-Col. C. N. Monsarrat was appointed a Committee to keep in touch with Dr. Doughty on this question.

Legislation: The request from the British Columbia Technical Association and Vancouver Branch that their Bill be endorsed by the Council was [illegible] and the Secretary instructed to prepare a letter to be forwarded after having the endorsation of the Legislation Committee. The request for advice from the Saskatchewan Branch was referred to the Legislation Committee with power to act. The circular of the Nova Scotia engineers re engineering legislation was noted.

Classification and Compensation of Engineers: The resolution of the Winnipeg Branch regarding classification and compensation of engineers in connection with the Civil Service was referred to a Committee for report at next meeting.

Registration of Engineers: The report of the Committee of Engineering Council on Licensing Engineers of Engineering Council was noted.

Engineering Appointments: A letter from F. J. Niven, Secretary to the Hon. Mr. Bowman, Minister of Lands and Mines, re appointing an engineer as Chairman of the Toronto and Northern Ontario Railway was noted.

Editing Committee, Journal: A letter from H. H. Vaughan, Chairman, was received, giving the names of Sir Alex. Bertram and J. M. Robertson to complete his committee, which was adopted.

Reports of Committees and letters from Chairmen: The following reports of Committees were submitted and received:

Electro-Technical, L. A. Herdt, Chairman; Steel Railway Bridges, P. B. Motley, Chairman; Roads and Pavements, W. A. McLean, Chairman; International Affiliation, H. H. Vaughan, Chairman; Honour Roll, C. N. Monsarrat, Chairman; Leonard Medal, R. W. Leonard, Chairman; Plummer Medal, A. Surveyer, Chairman; Engineering Standards, L. A. Herdt, Chairman; Board of Examiners & Education H. M. MacKay, Chairman; Publications and Report of Calgary Branch, E. Brown, Chairman.

The Secretary was instructed to have the reports printed as a section of *The Journal* in time for the Annual Meeting.

Mr. Vaughan was appointed Chairman of the Leonard Medal Committee on nomination of President Leonard.

In connection with the Plummer Medal the Secretary was instructed to bring to the attention of the Chairman of this Committee suggestions in addition to his own that might be considered.

A. S. M. E. Correspondence: The Secretary was instructed to forward this to the Mechanical Section of the Montreal Branch for suggestions, with the request that they deal with the matter.

Ballot: A ballot was canvassed and the following admissions and transfers effected:

Members

George Walter Winckler, C. E. (Calcutta Univ.), of Toronto, Ont., in private practice as consult. engr.

Associate Members

Frederick Thomas Ames, of Bentley, Alta., supt. i/c of constrn. and operation, Lacombe and N. W. Ry.; John Marshall Anderson, of Vancouver, B.C., previous to enlistment in 1917 with the C. P. R. as transitman, since 1917 with Canadian Overseas Ry. Constrn. Corps; Percy Halcro Buchan, B.A.Sc., Lieut. (Univ. of Tor.), of Vancouver, B.C., asst. ch. engr., Way Dept., B. C. Electric Rly. Co.; Richard Drummond, of Lindsay, Ont., i/c of drafting dept., Boving Hydraulic and Engineering Co., Ltd.; Leo Gleeson, B.Sc., (Queen's Univ.), of Ottawa, Ont., with Reclamation Service; Harold Chester James, of Vancouver, B.C., Vice-Pres. and Mgr., Pacific Coast Pipe Co., Ltd.; Frederick Simeon Jones, B.Sc. (C.E.) (Univ. of N.B.), Capt., M.C., of Cambridge, N.B., asst. engr., River St. Lawrence Ship Channel, Sorel, P.Q.; Joseph Edouard Lionais, B.Sc. (McGill Univ.), of Montreal, P.Q., Elec. Distribution Dept., Montreal Light, Heat & Power Co.; James Freeman Lumsden, B.Sc. (E.E.) (N. S. Tech. Coll.), of Halifax, N.S., professor of electrical engineering, N.S. Technical College; Marvin Wilbur Maxwell, B.Sc. (C. E.) (Univ. of N. B.), Major, M.C., of Montreal, P.Q., engr. i/c of timber tests, Forest Products Laboratory; Charles Herbert McDougal, of Niagara Falls, Ont., res. engr., Niagara Power Development, H. E. P. C.; Rowland Chapman Moore, B.Sc. (N. S. Tech. Coll.), of Halifax, N.S., asst. engr., Foley Bros., Welch, Stewart & Fauquier; Neil Lyman Morgan, B.Sc., (McGill Univ.), of Montreal, P.Q., research engr., i/c of research laboratory, Northern Electric Co.; James Marshall Morton, B.Sc. (Glasgow Univ.), of Winnipeg, Man., engr., J. & J. J. Allen, on new theatres in western Canada; Hugh Campbell Boyd Nourse, B.Sc. (M.E.) (Queen's Univ.), of Sherbrooke, P.Q., engr., Canadian Ingersoll-Rand Co. Ltd.; Forest Millen Pratt, B.A.Sc. (Univ. of Tor.), of Ottawa, Ont., engr., E. B. Eddy Co.; Alexander M. Ross, of Winnipeg, Man., instrumentman, G. T. P.; Joseph Ernest Roy, of Quebec, P.Q., draftsman, Dept. of Colonization, Mines and Fisheries; Joseph Warren Smith, of Toronto, Ont., ch. draftsman, Dominion Bridge Co., Toronto, also manager, Robb Engineering Works, Toronto; Neil Macmillan Waddell, of Winnipeg, Man., res. engr., C. N. R., Brandon, Man.; George Herbert Whyte, Major, M.C., of Calgary, Alta., div. hydrometric engr., Reclamation Service; William Brand Young, of Vancouver, B.C., ch. draftsman, City Engineer's office; Alexander Claude Roy Yuill, of Vancouver, B.C., conslt. engr.

Juniors

Harold Montgomery Campbell, B.A.Sc., (M.E.) (Univ. of Tor.), Major, of St. Catharines, Ont., mechanical draftsman, Welland Ship Canal; John Murray McCordick Lamb, of St. John, N.B., since 1917, works officer for N.B. under the Canadian Engineers; Henry Petit Lancaster, of St. Catharines, Ont., draftsman, Hydro Electric Power Commn.; Riginald James Maxwell, Lieut., of St. Stephen, N.B., since 1915 on active service as Lieut., 104th Batt., at present convalescing from gas wounds; Frank Stuart Merry, of Toronto, Ont., previous to enlistment with National Tube Works, Pittsburgh, 4¼ yrs. in C.E.F.; John Brooke Molesworth, (Lord Congleton), of Montreal, P.Q., 1909-19 in Royal Navy, at present 3rd yr. mechanical engineering, McGill University; Lewis Alan Perry, of Firdale, Man., instrumentman G. T. P., James Morrison Watson, of Toronto, Ont., recently demobilized; Harold Oswald Day Wilkins, of Norwood, Ont., 1914-Oct. 1919, officer in Imperial regiment, at present, 3rd year mechanical engineering, McGill University, Montreal; John Samuel Wilson, Lieut. M. C., of Toronto, Ont., 4 yrs. overseas, at present attending University of Toronto.

Associate

Robert Hunter Fraser, of Ottawa, Ont., right of way and lease agent, Dept. of Railways and Canals.

Transferred from the Class of Associate Member to that of Member

John Goodall Dickenson, B.A., B.Sc. (Mining) (McGill Univ.,) of Cobalt, Ont., manager of the O'Brien Mine, The Cobalt Foundry, The Miller Lake O'Brien Mine, Gowganda Power Co., Ltd. and President of The Northern Lumber Mills, Ltd.; Halfdan Fenton Harbo Hertzberg, (Grad. S. P. S.), Col. C. M. G., D. S. O., M. C., of Halifax, N. S., C. R. C. E., Military Dist., No. 6; Edgar Murray MacCheyne Hill, (Grad. S. P. S.), Captain, of Winnipeg, Man., exploration and reconnaisance engr., C. N. R.; George Reid Munro, (Grad. S. P. S.), B.A.Sc. (Univ. of Tor.), of Peterboro, Ont., second vice pres. and ch. engr., Wm. Hamilton Co., Ltd.

Transferred from the Class of Junior to that of Associate Member

James Forsyth, of Winnipeg, Man., supt. of constrn., Carter, Halls, Aldinger Co., Ltd.; Oscar Gesner Gallaher, B.Sc., Queen's Univ.), Captain, of Kamloops, B.C., asst. to div. engr., constrn. dept., C.N.R.; Samuel Willis Shackell, Lieut., of Lachine, P.Q., at present, short engagements on engineering work.

Transferred from the Class of Student to that of Associate Member

Albert Ernest Humphrey, (Grad. R.M.C.), of Chilliwack, B.C., Major, D.S.O., in private practice; Charles Beverley Robinson Macdonald, (Grad. R.M.C.), Captain, of London, Eng., with the Hydro Electric Power Commission, Niagara Falls, Ont.

Transferred from the Class of Student to that of Junior

Rowland Edgar Weeks, B.C.E., (Univ. of Man.), of Souris, Man., municipal engr., Municipality of Glenwood, Man.

BRANCH NEWS

Victoria Branch

Horace M. Bigwood, M.E.I.C., Secretary

The annual meeting of the Branch was held on December 17th, when 23 members were present with Capt. W. M. Everall, M.E.I.C., in the chair. After the names of five Affiliates had been presented and accepted by the meeting, the reports of the Committees on Legislation, Papers, and Entertainment were presented by Messrs. A. E. Foreman and E. F. Cooke, and accepted; that of the Entertainment Committee, verbally.

The Secretary, Horace M. Bigwood, then read his report. In this he referred to the membership of the Branch and the possibilities of increased membership. The formation of three new committees was suggested, in connection with Education and Publicity, Branch By-Laws, and Finance, and it was suggested that the Library Committee be given power to arrange for space for books and papers.

The Balance Sheet of the Branch was then presented by the Treasurer and accepted, after which the notice of a motion to be brought before the next meeting of the Branch was posted.

C. P. Richards, M.E.I.C., Chairman of the legislative committee of the Saskatchewan Branch then spoke for a few minutes on the question as they had found it in his district, and the steps being taken by the government of his province who were introducing a bill as a government measure. A resolution was then passed in connection with legislation situation.

The scrutineers appointed by the Chairman, Messrs. E. F. Cooke and J. B. [illegible], announced the result of the ballot for the election of officers to be as follows:

Chairman	A. E. Foreman
Vice-Chairman	A. W. R. Wilby
Treasurer	[illegible]
Secretary	Horace M. Bigwood
Executive	R. A. Bainbridge
	W. M. [illegible]

After the announcement of the new officers of the Branch, the retiring Chairman, Capt. W. M. Everall, spoke for a few minutes on the work of the Branch generally during his term as Chairman, to which position he succeeded after the resignation of Mr. Young, who had gone to live in Vancouver. He expressed the hope that the work of the Branch would proceed actively now that the war was over and more normal conditions would prevail, and that all the members would help in this work. He thanked the officers and committee who had so ably assisted him and hoped that the new Chairman would be as well served.

A vote of thanks to Capt Everall was carried unanimously.

Mr. Foreman thanked the members of the Branch for the honour done him in electing him Chairman for the coming year. He hoped that something would be accomplished to help engineers generally, and appealed to every one to do everything in their power to assist.

Capt. Everall was called to the chair while A. E. Foreman delivered his address on "The Organization and Work of the Provincial Public Works Department," which proved to be most interesting, and at the conclusion of which a hearty vote of thanks was tendered to the author.

The meeting adjourned at 11.30 P.M.

Resolution

Victoria, Dec. 17th, 1919.

Moved by R. A. Bainbridge, seconded by Lt. A. W. R. Wilby: "That Whereas the need for some action to improve the status of the Engineer in B.C. is generally recognized,

"And Whereas the Victoria Branch of *The Engineering Institute of Canada* has previously shown its sympathy with the proposal to introduce a Bill into the Legislature, to, at least, make registration necessary.

"Therefore be it Resolved, that this meeting of the Branch unanimously endorses the action of its Executive and its Representatives on the Joint Legislative Committee, and recommends all members actively to support the movement, by donations and influence.

Further, that the Secretary be authorized to receive from members and other persons wishing to assist, such sums as they wish to donate, and to give receipts for same, such sums to be used for the purpose of obtaining such legislation."

The Annual Meeting of the Victoria Branch was held in the Belmont Building on the evening of December 17th, Capt. Everall, presiding. The following officers were elected for the year:—Chairman, A. E. Foreman, M.E.I.C.; Vice-Chairman, Lt.-Col. A. W. R. Wilby, A.M.E.I.C.; Executive Committee:—R. A. Bainbridge, M.E.I.C., and W. M. Stokes, A.M.E.I.C.; Treasurer; E. Davis, M.E.I.C.; Secretary, Horace M. Bigwood, A.M.E.I.C.

A. E. Foreman, M.E.I.C., Public Works Engineer for the Provincial Government gave a short address on "Organization and Work of Public Works Department." He referred to some of the results obtained by efficient organization of the department, and stated that the Province had been divided into eight districts with a qualified engineer in charge of each district, and that good results were forthcoming. It meant better graded roads with reduced haulage for settlers in the districts concerned.

The following resolution was adopted by the meeting:

"That whereas the need for some action to improve the status of the engineer in British Columbia is generally recognized, and,

"Whereas the Victoria Branch of *The Engineering Institute of Canada* has previously shown its sympathy with the proposal to introduce a bill into the Legislature to at least make registration necessary;

"Therefore, be it resolved, that this meeting of the Branch unanimously endorses the action of its executive and its representatives on the joint legislation committee, and recommends all members to actively support the movement by donations and influence.

"Further, that the Secretary be authorized to receive from members and other persons wishing to assist, such sums as they wish to donate, and to give receipts for same, such moneys to be used for the purpose of obtaining such legislation."

The following programme of lectures has been arranged for the winter season:—

January 21st—D. O. Lewis, "Development of Railways" (second edition of paper).

February 18th—W. F. Best, "Geology of Coal Mines."

March 18th. Prof. R. G. Matheson, "Sub-aqueous Foundations" (illustrated.)

April 15th—E. P. Girdwood, "River Protection; Roads and Bridges" (illustrated).

The second dance of the season under the auspices of *The Engineering Institute of Canada*, Victoria Branch, was held in the Knights of Columbus Hall, Fort Street, last evening. About seventy members and friends were present. Pianoforte music for the dance was provided by Miss Thain and vocal items were rendered by Mrs. J. B. Shaw and Mr. A. E. Foreman. The Committee responsible for the arrangements were Messrs E. F. Cooke, *Chairman*, J. B. Shaw, E. N. Horsey and H. M. Bigwood, *Secretary*.

Sasketchewan Branch

J. N. deStein, M.E.I.C., Sec'y.-Treas.

The Third Annual Meeting of the Saskatchewan Branch was held on January 8th at the Kitchener Hotel, Regina, with the splendid attendance of over forty members. Amongst the outside members of the Branch were noticed: G. D. Mackie, A.M.E.I.C., from Moose Jaw, also J. B. C. Keith, A.M.E.I.C., and Malcolm Sinclair, A.M.E.I.C., from the same city. Professor A. R. Greig, M.E.I.C., and Professor C. J. Mackenzie, A.M.E.I.C., of the University of Saskatchewan, as well as C. H. Fox, A.M.E.I.C., represented Saskatoon, while Swift Current has sent two members, namely P. J. Macdonal, A.M.E.I.C., and J. R. Reid, A.M.E.I.C. Members from other Branches were W. W. B. Swabey, A.M.E.I.C. (Ottawa) and P. M. Sander, M.E.I.C. (Calgary).

The first function of the day was a luncheon tendered by the local members to the outside members of the Branch, at the conclusion of which, the retiring Chairman, H. S. Carpenter gave an address dwelling on the functions of the Branch and its achievements during the past year.

The luncheon was followed by the business session, the greatest part of which was devoted to the subject of Legislation. The Government of the Province had suggested several changes of the proposed Act, such as giving the University exclusive control of the examinations, waiving the right to hold court and collect fees, etc., all of which changes the members present were willing to cede, provided however, that no further concessions would be made, which would eliminate entirely the purpose of the Act. It was, therefore, resolved, following the suggestions communicated to the Branch by Arthur Surveyer, Chairman of the Legislation Committee of *The Institute*, to withdraw the Act for the present, in case the opposition of the Government to the most important clauses could not be overcome.

After reading the report of the Auditors and Standing Committees, the scrutineers announced the result of the ballot for the election of Branch officers for 1920:—Chairman: Professor A. R. Greig, M.E.I.C. (Saskatoon); Vice-Chairman: W. R. Warren, A.M.E.I.C. (Regina); Sec'y.-Treasurer : J. N. de Stein, M.E.I.C. (Regina); and an Executive Committee of five, composed of A. J. MacPherson, A.M.E.I.C. (Regina), D. A. R. McCannell, A.M.E.I.C. (Regina); J. R. C. Macredie, M.E.I.C. (Moose Jaw), W. M. Stewart, A.M.E.I.C. (Saskatoon) and H. McIvor Weir, M.E.I.C. (Saskatoon).

Following the business session a paper was read by Professor, C. J. Mackenzie, A.M.E.I.C., on "Concrete Mixtures in Alkali Soils," being the result of one year's investigations carried on by the University of Saskatchewan in conjunction with the Concrete Committee of the Branch. The discussion of the paper was postponed until it had appeared in print. As there is considerable further research work necessary in this connection, it was decided that the Branch should memorialize the Provincial, Dominion Government and the various cities in the Province with a view of securing contributions and grants for this work.

In the meantime the time set for the Annual Banquet had arrived. Nearly sixty members and guests of the Branch had gathered for this function and every one present admitted that it was one of the best ever attended. During the dinner and in the intervals between the speeches following the dinner, an orchestra rendered an excellent program. After the toast to the King, Professor A. R. Greig, the new Chairman, gave his inaugural address, followed by a splendid toast to "Our Province," proposed by H. R. MacKenzie, A.M.E.I.C., and responded to by Dr. W. D. Cowan, M.P. (an affiliate of our Branch) and George Spence, M.L.A. Mr. Mackenzie gave a brief historical sketch on the Province, enlarging on the important role played by the engineers in its development. Dr. Cowan, in his eloquent way, urged our profession to take the lead in the industrial development of our Province. Numerous questions were only awaiting their solution by the trained brains of the engineer, such as the development of the natural resources, study of power schemes, irrigation of the Southwest parts of the Province, establishment of technical schools, water supply for our Cities, etc. Those questions should all be solved and the necessary plans, etc., be made before the coming influx of new settlers would render the immediate attention to those questions imperative.

Mr. Spence reminded the assembled Engineers, that he somewhat belonged to our profession. He enumerated the natural resources of the Province, especially its mineral wealth. A splendid dramatic recitation, rendered by R. S. Salmond. followed the speech, after which P. J. Macdonal, A.M.E.I.C., toasted the City of Regina, to which Mayor Grassick responded. M. . L. Wade, A.M.E.I.C., proposed the toast on the "Sister Professions," to which Lt. Colonel A. C. Garner responded on behalf of the Saskatchewan Land Surveyors.

A short, but very interesting address on "Sanitation during the War" was given by Capt. R. H. Murray, A.M.E.I.C. The improvement in the sanitary conditions could best be judged by the fact, that in former wars as many as 83% of the total men lost had died of disease, while in this war that number amounted only to 5.14%.

The speeches were then interrupted by a "Muscial Recitation," rendered by *The Engineering Institute of Canada Minstrels*, Conductor R. W. E. Loucks, A.M.E.I.C., followed by a toast on "The Engineering Profession—Ourselves," by G. D. Mackie, M.E.I.C. Going from east to west four of the greatest engineering works place the Canadian engineer amongst the foremost Engineers in the world: The Quebec Bridge, Winnipeg Water supply, C.P.Ry. Irrigation and the Connaught Tunnel. Mr. Mackie dwelt at length upon the objections of the Saskatchewan Government to our proposed Act, which was hard to understand as we were trying to save the Province from faulty Engineers. Any man without any qualification whatever, could build a bridge, water supply, etc., thereby endangering the lives of scores of people.

The last one on the list of speakers was given by Professor C. J. Mackenzie, A.M.E.I.C., who very [illegible] explained the proposed development of the Engineering faculty of the Provincial University.

"Auld Lang Syne" led by the orchestra and sung by the whole assembly, concluded the day.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary.

The first meeting of the Branch for 1920 was held in the Empress Hotel parlors, on Thursday, Jan. 8th, at 8.00 P.M.

A good attendance heard Jas. Macdonell, A.M.E.I.C., give a digest of the proposed legislation for engineers in Ontario. He discussed the progress that had been made up to date, and analyzed the various bills that have been brought forward. The members present took part in the discussion, and it was finally decided to postpone any decision until the next meeting on Jan. 22nd, when the matter will be gone into further.

The Chairman was authorized to appoint a Legislation Committee, to prepare for this meeting, and it was suggested that it take the form of a debate, with members of the Committee on each side.

The question of Branch By-laws was reported on by the Chairman, G. Reid Munro, M.E.I.C., and after discussion was laid over until the meeting on the 22nd.

A resolution along the lines asked for by the Manitoba Branch was passed, calling upon Council to make the strongest effort to secure the representation of the Engineering Profession on the Civil Service Commission.

Congratulations were extended to C. E. Sisson, M.E.I.C., one of the Branch members, on his being elected at the recent municipal elections, as one of the Utilities Commission of the City.

Toronto Branch

H. A. Robinson, A.M.E.I.C., Acting Secretary.

An Open Meeting of the Branch was held at the Engineers' Club at 8 p.m. on Thursday, January 8th, 1920.

The Chairman, A. H. Harkness, presided.

The minutes of the previous meeting were read and approved.

A formal resignation was read from W. S. Harvey, resigning from the office of Secretary-Treasurer to which he was recently elected.

The Secretary read a resolution which was adopted by the Manitoba Branch, whereby the Manitoba Branch requests the Council of *The Institute* to make the strongest effort possible to secure due recognition of the Engineering profession, by either having the engineering profession represented on the Civil Service Commission, or by having a special committee within the Commission composed of technically trained men and members of the engineering profession to pass upon classification, qualification and remuneration as now set forth in the Classification of the Civil Service Commission, and to pass upon applications of candidates for positions in the future.

Moved by Mr. Wynne-Roberts, seconded by Mr. Milne: "that the Toronto Branch endorse the resolution adopted by the Manitoba Branch, and that the Toronto Branch also request the Council of *The Institute* to make the strongest effort possible to secure due recognition of the engineering profession as outlined above." *Carried.*

The Chairman then called upon F. G. Engholm, who delivered a lecture on "Reinforced Concrete Construction." The lecture was illustrated by numerous lantern slides which made it very interesting. The lecturer dwelt considerably on tests made by the Emergency Fleet Corporation, which would indicate that our unit stresses commonly employed in reinforced concrete design are very low. This being particularly true in the case of shear, where the lecturer claimed that if properly designed very much higher stresses should be permitted than the ordinary maximum stresses allowed by our building by-laws. The lecturer maintained that the tying down of the engineer to the given unit stresses is a hindrance to the development of reinforced concrete construction in this country.

Mr. Mylrea, who opened the discussion, agreed fully with the lecturer that the unit stresses commonly employed particularly in the case of shear were too low. He suggested that *The Institute* appoint a committee to study the data supplied by the tests of the Emergency Fleet Corporation. He further suggested that as the stresses must be left to the judgment of the designer, the profession should become a closed profession to protect the public from incompetent designers.

Mr. Oxley believed that the real uncertainty about concrete is in the construction, since a good deal depends on how the concrete is made, and, therefore, proper inspection must be made to insure the safety of the structure. He was afraid that if the unit stresses are raised to conform with the results of the tests, there is the danger that large factories built in small towns, where there are no by-laws and no proper supervision, the structure may be unsafe since we cannot be sure of the material.

Mr. Harkness emphasised the fact that while it may be good economy to get a first class concrete for the building of ships, it may not be quite as economical in the case of an ordinary building, and this point should be considered.

Others who took part in the discussion were Messrs. Scott, Crossley, McLeod and Krumm.

Suggested by Mr. Oxley that Mr. Engholm be added to the Committee on the Building By-laws.

Meeting adjourned at 11.15 p.m.

Ottawa Branch

M. E. Cochrane, A.M.E.I.C., Secretary

The address by His Excellency, the Duke of Devonshire, at the luncheon, Dec. 18th, of the Ottawa branch of *The Engineering Institute of Canada,* and the intensely interesting reminiscences of Commander B. M. Ramsey, M.V.O., of the Royal Navy on the work of the Dover Patrol in the great war, was an occasion that will not soon be forgotten by those fortunate enough to be present.

Commander Ramsay with a modesty characteristic of the best traditions of the navy, told in a most delightful way and with much humor of the great naval force that worked from Dover keeping the enemies' forces from the channel, and protecting the troopships between Britain and France.

Commander Ramsay was flag commander to Admiral of the Fleet, Viscount Jellicoe. For three and a half years of the war he was attached to the Dover Patrol, during which time he was in command of H.M.S., M.-25, engaged on the Belgian coast, and of H.M.S. "Broke," flotilla leader.

Over a hundred and thirty members of *The Institute* sat down to lunch in the ladies' room of the Chateau, in addition to the members of Viscount Jellicoe's staff then in Ottawa, and the headquarters staff of the Naval Service Branch of Canada.

The chairman, R. de B. Corriveau, had with him at the head table the following: At his right, His Excellency the Governor-General, Col. Leonard, G. J. Desbarats, A. Sladen, G. A. Mountain, Commander Sawbridge, R.N., Commander Hemstead, R.N., Gordon G. Gale; on his left, Commander Ramsey, Col. Anderson, Admiral Kingsmill, Col. MacPherson, Commander Stephens, John Murphy, Wing Commander Robertson, Commander Edwards, Lieut. Morgan, and Flag-Lieut. Nelles.

Mr. Corriveau stated *The Institute* was honored in the presence of His Excellency. The visit of Admiral Jellicoe and his staff had been a valuable thing for Canada. Moreover, England too was naturally interested in the development of Canada's national marine fleet with the necessary harbors, docks and dry docks. Many Canadians had taken part in the work of the British fleet during the war in the R.N.A.S. and in the naval patrols. The Dover Patrol had shown a dash and efficiency that had contributed not a little to the safety of Canada's thousands of troops in the passage between Britain and France.

Commander Ramsay, on rising, expressed the honor done to the navy and the Dover Patrol, by the presence of His Excellency. At first he had refused to speak and only consented when he was told the occasion would be informal and that he could talk the same as he would in his own mess.

He had chosen as his theme, the subjects that so far had been least written about and spoken of. The Dover Patrol extended from North Foreland to the mouth of the Scheldt river and from Brighton to the French coast. Its functions were fourfold:—

1. To deny the passing of the straits to the enemy.

2. To protect troops and supplies running between Britain and France.

3. To protect the shipping entering and leaving the Thames.

4. To make offensive against German bases on the Belgian coast.

A most illuminating story of the difficulties of equipment met with in 1914 was told of. Old mines, the only ones available were furnished the patrol.

"Several thousand of these were dropped," said Commander Ramsay, in his witty way, "and while they frequently went off as soon as they were dropped overboard, or when our ships approached near them, they never seemed to operate as long as a German ship was around! Nevertheless they had, I hope, a certain moral effect."

Then when the big ships were found useless for the bombardment of the Belgian coast the monitors started to come and these were a big help.

There was also a ship known as the "bulged ship" which was a great success. This was built with an outer protecting hull, then an area of water between this and the real hull of the ship. When a torpedo from a submarine struck this outer hull the water between it and the real hull took up the shock. "Not one of these ships, hit by a torpedo, was materially injured," stated the speaker amid hearty cheers.

Commander Ramsay told how the patrol started out in a small way but grew in strength and importance as its need was realized. In 1918 it consisted of 14 monitors, 30 destroyers, 12 patrol boats with rams, 20 coastal patrol boats with a speed of 22 knots, 50 trawlers, 200 drifters, 40 motor launches and some other vessels.

It was important to keep submarines out. When they got through the barrage they could operate for three or four days longer than if they had to go around the other way. At first they used to slip through the straits in the dark with the conning towers just out of the water. In 1915 there was only a timber barrage—a sort of boom across the straits, and this was always breaking, owing to its length and to the strong tides and currents.

Next the net barrages were invented and in 1915 fifty miles of these were laid. There was one up and down the Belgian coast and twelve miles from shore, another across the channel. These were large wire mest nets attached to which were contact mines. A submarine would go against the net and push it ahead till the net closed in and the mines would then hit against the stern of the submarine and explode.

Each day the drifters would go out and repair the damage done to the nets. And the German destroyers would come out and try to sink the drifters and there were frequent fights.

"The drifters didn't like this particularly," said the speaker, "but we did."

Then came the contact mines. There were twenty thousand miles of these laid twenty feet apart, and no surface craft could sail safely over them, but no submarine could penetrate them.

In front of these contact mines in the straits were two rows of lighted vessels under which the night-running submarine had to dive. And when it dived it ran into the mines and was accounted for. It took the Germans a long time to realize the nature of the trap. They kept sending submarines which never returned. They then started sending their submarines around close to the shore line, and another device had to be invented.

Control mines were put in near the shore, and the submarines were located by detectors which measured a range of from one to three miles. When the sub got over the mine a button was pressed and that was the end of it.

And in 1916 for a considerable time this stopped the passage of all submarines down the channel.

But again the Germans learned and they made their bearings noiseless and ran at their silent speed, and could not be detected by sound. But another device was invented much better—a device the speaker was not at liberty to explain.

Commander Ramsay also told of the famous great concrete towers it was proposed to build at a weight of 20,000 tons and launch in the channel and then build up so as they would be forts against which torpedoes would dash in vain. Two of these only had been built and finished when the armistice was signed and it was the speaker's opinion that these two would be launched at some suitable spot and the original plan carried out.

The speaker's description of sound ranging was most interesting. On the darkest night and behind a smoke screen the British guns could bombard the Belgian coast. But again the Germans soon discovered this method and could answer back.

Why the large naval guns did not shoot oftener was explained. When a gun had shot 400 rounds it had to be sent to be re-lined which took eight months. Each gun had a spare one, thus the actual number of shots that could be fired in eight months was the four hundred. And the guns always had to be kept in shape to repel any big German attach. Thus shots were not wasted, but most carefully conserved.

In conclusion Commander Ramsay told of a proposed landing on the Belgian coast by the British—a landing that never came off. The landing depended on the British land forces reaching Roulers by a certain time which they were unable to do.

However, the naval patrol had two great monitors lashed together and ahead of them, but shoved by them, was a great pontoon six hundred feet long, thirty feet wide with two feet draft at the bow and eight feet at the stern. There were three of these and it was proposed to land 13,500 men on the Belgian coast between Ostend and Nieuport, in three sections two miles apart.

On the pontoons were first the tanks, which would get off first and destroy the barbed wire entanglements, then the guns, then the other army supplies, and the 4,500 men on each. Elaborate practices and tests were made and it was believed the attempted landing would be successful, especially as there was to be a great British attack on land at the same time. But the British did not make the land advance expected at this time and the attempt was abandoned.

Commander Ramsay recalled that in the first coastal motor patrol boats out from Dover was an Ottawa man, R. E. Sproule, who was present at the luncheon he was addressing. Also the first four men in this service to be decorated were four Canadians, two Ottawa men, and two Montreal men. This evoked hearty cheers.

Mr. Corriveau then announced that His Excellency the Duke of Devonshire had consented to say a few words.

The Governor-General spoke with great eloquence and with evident sincere conviction. He congratulated Commander Ramsay on the modest character of his speech which was in line with the best traditions of the navy. For all time the deeds of the Dover Patrol would be known and they had added another fine tradition to the many surrounding the British navy.

The navy had carried out the great expectations Britishers had of it and kept up the credit of its great name.

After the chairman offered the thanks of the Engineers to Commander Ramsay the luncheon adjourned with the National Anthem.

The Annual Meeting of the Branch was held on January 8th, at the rooms of the Commission of Conservation, through the kindness of Mr. James White.

The attendance was larger than that at any previous annual meeting.

Besides the formal reading of the reports of the Secretary-Treasurer and the Chairmen of the various sub-committees, a summary of which will be found on another page, in the annual report of the Ottawa Branch, there was an interesting discussion on the future activities of the branch.

After the meeting refreshments were served, and the members were glad to have this opportunity for informal discussions and the formation of plans for the future.

On January 15, the branch held a meeting jointly with the Ottawa branch of the Town-Planning Institute and the Ottawa chapter of the Ontario Association of Architects. The meeting was held in the Carnegie Library, and Mr. Frank Barber, of Toronto, A.M.E.I.C., give an interesting address on "Bridges."

The Speaker gave a summary of the historic development of bridges up to the present time, and, as is natural, dwelt strongly on the aesthetic features of bridge design and their relation to architecture and town planning.

There was a large attendance, and it was felt that the policy of holding joint meetings, so as to establish closer union between engineers and the professions most closely allied to them, should be encouraged as much as possible.

Quebec Branch

J. A. Buteau, A.M.E.I.C., Secretary.

At a general meeting held on December 15th, the following committees were appointed to investigate the salaries paid to engineers employed in different fields of activity, to make suggestions as to equitable salaries which should be given to such professional engineers:—

Government Public Service Committee: Messrs. B. Normandin, A. Amos, A. Fraser.

Industrial Companies Committee: Messrs. F. T. Cole, H. J. Simon, L. S. de Carteret, L. Larivière.

Railway Committee: Messrs. J. E. Gibault, C. H. Connell, L. C. Dupuis.

City Committee: Messrs. E. A. Hamel, A. Tremblay.

The Branch also expressed its views as to the importance of continued efforts towards obtaining from the Federal Government equitable salaries for engineers in the Government service. It was resolved that the committee formed to urge such interests at Ottawa should be urged to continue the efficient work done to the fullest extent authorized, by the putting into force of the proposed classification.

Quebec, Que., Jany. 7th, 1920.

J. A. Buteau, Esq.,
Sec.-Treas., *Eng. Inst. of Canada,*
Quebec Branch,
Que.

Dear Sir:—

Referring to your letter addressed to the undersigned, of Dec. the 17th, advising that we have been solicited as a committee to prepare and submit to you a schedule of salaries actually paid to the engineers employed by the Canadian National Railways. I herewith attach your statement showing actual salaries and proposed salaries; also another statement showing the salaries received by employees of other Railway departments.

From the above you will be able to judge that the engineers are very much underpaid, considering the responsibility and technical requirements required to fill the positions. If you figure capital invested for technical education you will at first sight see that the situation needs immediate attention.

Employees of other departments have received salaries during thier education.

Yours very truly,

C. H. N. Connell,
L. G. Dupuis,
J. E. Gibault.

STATEMENT OF SALARIES

		Actual	Proposed
Chief Engineer		$10,000.00	
Asst. Chief Engineer....		7,200.00	
Engineer of Construction		6,600.00	
Bridge Engineer		6,600.00	
Engineer of Maintenance		6,600.00	
Principal Asst. Engineer		6,600.00	
District Engineer	3,600.00	5,400.00 to	$6,000.00
Signal Engineer		3,900.00 to	5,000.00
Architect or Engr. of Building		3,900.00 to	5,000.00
First Asst. Engineer		3,300.00 to	4,500.00
Asst. Bridge Engineer		3,900.00 to	5,000.00
Division Engineer	$2,400 to 2,700.00	3,900.00 to	5,000.00
Chief Draughtsman or Off. Engr.	2,880.00	2,700.00 to	3,000.00
Senior Transitman	1,800.00	2,400.00 to	2,700.00
Instrumentman	1,620.00	1,800.00 to	2,100.00
Draughtsman	1,500.00	1,800.00 to	2,100.00
Rodman	1,050.00		1,500.00
Chainman	900.00		1,200.00

STATEMENT OF SALARIES PAID
OPERATING DEPT.

Engine Drivers	$3,000.00 to	$4,800.00
Firemen	1,800.00 to	3,000.00
Conductors	2,100.00 to	3,600.00
Brakemen	1,500.00 to	2,700.00
Division Superintendents........	4,500.00	
Assistant Superintendents.......	3,300.00	
Master Mechanic...............	4,500.00	
Asst. Master Mechanic..........	3,000.00	
Roadmasters..................	2,472.00	
B. & B. Masters	2,472.00	
Extra Gang Foreman	2,280.00	
Section Foreman	1,404.00	
Brick Layers	2,496.00	
Station Agents (Terminal).......	2,100.00 to	3,600.00
	(5,000 with Commission-Terminal)	
Station Agents (General)........	1,500.00 to	2,400.00
Operators	1,224.00 to	1,440.00

General Supt.'s Staff

Chief Clerk......	2,100.00
General Clerk	1,440.00
File Clerk	1,200.00
Secretary	1,620.00
Other	1,200.00

Supt. Division

Chief Clerk	1,800.00
Staff Clerk	1,320.00
Secretary	1,380.00
File Clerk	1,080.00
Stenographers	1,050.00
Accountant	1,740.00
Timekeeper	1,380.00
Main. of W. Clerk	1,440.00
Stor. & Clerk	1,080.00

Dispatchers

Chief	3,300.00
Dispatchers	2,880.00

St. John Branch

A. R. Crookshank, M.E.I.C., Secretary.

At an adjourned meeting of the St. John Branch held on December 18th, a resolution was unanimously adopted favoring the tearing down of the old Court House, and the erection of a modern civic and community centre in the block bounded by King Street East, Sydney, Carmarthen and Leinster Streets. A most interesting paper on the federal Housing Act and the houses being built by the St. John Housing Commission was read by Charles Archibald, A.M.E.I.C.

In the absence of R. H. Emerson, A.M.E.I.C., the chair was taken by C. C. Kirby, A.M.E.I.C., who read the report of Messrs. Rose & McDonald, the architects who made a survey of the site. The report pointed out the possibilities for the erection of a community centre and suitable municipal building. Two schemes were submitted, one taking in the entire block from Sydney to Carmarthen between Leinster and King Street, East, and the other the erection of a building with large tower in the centre on the present Court House site.

F. A. Dykeman, moved and M. E. Agar seconded the following resolution:—

"That whereas the immediate construction or reconstruction of the St. John County Court House is necessary:

That this meeting declares itself in favour of a scheme of building which shall eventually include the Court House, Registry Office, City Hall and a Community Hall within the same block, and that such buildings be in architectural symmetry with each other; and it is deemed advisable to have the city acquire all property in the block bounded by Sydney, Leinster and Carmarthen;

That the buildings be located on Sydney Street, occupying the whole frontage between King and Leinster Streets;

That copies of this resolution be forwarded to the Council of the Municipality of the City and County of St. John and to the Board of Commissioners of the City of St. John. This passed unanimously.

A plan prepared by Mr. Kirby, showing how the work might be proceeded with a portion at a time was considered. This provided for the building of the Court House on the site of the present building, the City Hall on the corner of Leinster Street, and a community hall in the centre.

It was suggested that the St. John Branch of The Engineering Institute appoint a committee of five to co-operate with other committees in preparing plans for the proposed buildings.

Mr. Kirby then called on Charles Archibald, A.M.E.I.C., to read his paper on the "Housing Act" and the work of the St. John Housing Commission. After pointing out the limitations of the Act he drew attention to some of the requirements. It called for a lot with 1800 square feet for each house in cities, and 4500 square feet in villages and rural communities. The Buildings were not to occupy more than fifty percent of the space. Where buildings were built in groups, if the houses were of frame there must be sixteen feet between each side wall; if built of fireproof material, nine feet.

Dealing with the operations of the St. John Housing Commission Mr. Archibald showed a number of slides of the houses being built on the west side. The type A were costing $4,400, including the land and required between $25. and $30. per month to meet the fixed charges. The double houses would cost the purchaser about $8,000. or $8,500.

Halifax Branch

F. R. Faulkner, M.E.I.C., Secretary

A meeting was held on January 8th in Halifax in connection with Legislation, at which nearly fifty engineers were present, chiefly from Halifax, but a few from outside. Favorable letters were also received from about forty engineers from other parts of the Province. The Committee appointed last October was re-elected and instructed to proceed with the campaign in regard to Legislation, and to take steps to introduce the Bill which had been prepared to the Legislature of Nova Scotia.

PERSONALS

E. A. Carl, A.M.E.I.C., has been appointed Assistant Engineer, on the construction of the Tafo-Kumasi Railway.

*

Marcel Pequegnat, A.M.E.I.C., has been appointed Supt. of Water Commission to succeed Henry Hymmen, who resigned recently.

*

R. L. Nixon, A.M.E.I.C., has accepted the Chair of Engineering at King's College, Windsor, N.S., and is entering on his new duties at once.

*

John H. Ryckman, A.M.E.I.C., has recently changed his position and is now c/o the Bureau of Engineering, Dept. of Public Works, Chicago, Ill.

*

George L. Stephens, A.M.E.I.C., is at present Engineer Lieutenant, R.C.N. of H.M.S. "Ramillies," and can be reached c/o G.P.O. London, England.

Adrian A. St. Laurent, Jr. E.I.C., returned to Canada on July 12th, 1919, and is now employed in the District Engineer's Office, Public Works Dept. Ottawa.

*

G. Gordon Gale, M.E.I.C., vice-president and general manager of the Hull Electric Railway has been elected vice-president of the Canadian Electric Railways Association.

*

A. L. Morgan, A.M.E.I.C., Chief Engineer of the Mapleleaf Mfg. Co., Limited, has moved from Windsor, Ont., to Montreal, as the Mapleleaf Company has transferred its headquarters to Montreal.

*

J. A. W. Brown, A.M.E.I.C., has severed his connection with the Trussed Concrete Steel Company of Canada, Limited, and is now chief engineer of the W. H. Yates Construction Co., Limited, Hamilton, Ont.

*

H. A. Paquette, A.M.E.I.C., of Levis, P.Q., formerly general manager of the Lauzon Engineering Works has resigned his position and has organized the Levis File Company at Levis, P.Q., of which he will be the directing head.

*

E. L. Cousins, A.M.E.I.C., is leaving for England shortly in connection with the business interests of the Toronto Harbor Commissioners coupled with industrial matters relative to the development of waterfront properties.

*

G. B. Smith, now suprintendent of the Central Ontario Division of the Hydro-Electric Power Commission of Ontario recently lectured before the Peterborough Branch of *The Institute* on the growth and operation of the system under his direction.

*

The marriage took place in Stanley Presbyterian Church, Westmount, on December 11th, 1919, of Mary Beatrice (Mame), daughter of Mrs. William Macdonald to Douglas Bremner, A.M.E.I.C., son of Mr. and Mrs. R. H. M. Bremner.

*

Pierre Charton, A.M.E.I.C., has been awarded the Croix de Guerre, and has been mentioned for his gallantry at the front. Mr. Charton was with the French Army, and distinguished himself while commander of the 6th Regiment of Engineers, and as liaison officer between the Railway Sappers and British Army.

*

H. Victor Brayley, A.M.E.I.C., who has been for some time in private practice as Industrial Counsellor and Engineer has formed an association with Kenneth F. Dewar, and Sherwood W. Stevenson, forming the firm of Brayley, Dewar & Stevenson, Industrial Counsellors at 99 St. James Street, Montreal.

*

William Young, M.E.I.C., for six years controller of Water Rights for the Province of British Columbia has resigned and is now practising as a consulting engineer in Vancouver. At the time Mr. Young resigned he was Chairman of the Victoria Branch of *The Engineering Institute*, in the welfare of which he took an active interest.

At the Annual Convention of the Canadian Electric Railways Association held on December 3rd and 4th, 1919, at the Windsor Hotel, Montreal, Acton Burrows, A.E.I.C., Managing Director of The Canadian Railway & Marine World, was elected Honorary Vice-President, and C. Gordon Cale, M.E.I.C., was elected Vice-President and General Manager.

Lieut. J. W. McCammon, Jr., E.I.C., has been recently demobilized after service with the artillery since 1915. Lieut. McCammon enlisted with the 6th Siege Battery in April 1915 at Montreal, was commissioned with the Royal Garrison Artillery in June 1917, transferred to the Canadian Garrison Artillery with the rank of Lieutenant in October 1918. Lieut. McCammon was demobilized in Canada in January 1919.

The Nova Scotia Power Commission has been authorized to proceed with the development of what are known locally as the Margarets Bay water powers, about 20 miles from Halifax. The Commission is undertaking immediately and will carry forward as rapidly as possible an initial development of about 8,000 horse-power. It is probable that at a comparatively early date work will be undertaken at another site in the province with an ultimate capacity of approximately 10,000 horse-power. K. H. Smith, A.M.E.I.C., Chief Engineer.

C. E. Sisson, M.E.I.C., Peterborough, was elected on January 1st to the one vacancy on the Peterborough Utilities Commission by a large plurality over three other candidates, two of whom were ex-mayors. Mr. Sisson's nomination to the office has inspired the enthusiastic gathering of engineers held in Peterborough on November 6th, and his election is due to his high qualifications for the position. The claim of his friends was that an engineer was the best qualified of any class of citizen for position such as this and the work was done on his behalf by a relatively small number of enthusiastic fellow members of the Peterborough Branch.

Lieut. G. J. Dodd, Jr. E.I.C., enlisted with the Canadian Engineers in November, 1914, as a sapper. He was transferred to Ottawa in December, 1914, and promoted to Corporal in the 2nd Signal Co., with which he went to England in May, 1915. He went to France in Sept., 1916, and entered action as Brigade Signal Officer to the 3rd Brigade, New Zealand Division. He was on the Signal Staff of the 15th Corps Signal Company, from September to November, 1916, of which the New Zealand Division formed a part. He was sent to the 3rd Heavy Artillery Brigade in November, 1916, and stayed with this unit through the remainder of the Somme battle, the battle of Arras in April and May, 1917, and the battle of Ypres, starting in July 1917. In Sept., 1917, he was invalided to England with an injured knee and was in hospital till May, 1918. In January, 1919, he helped to organize the Khaki University of Canada at Ryson, Yorkshire, where he was given charge of the Faculty of Applied Science. The University was closed in July 1919, and he was discharged in Canada on Sept. 17th, 1919.

Captain L. W. Klinger, M.C., A.M.E.I.C., has returned from overseas. Captain Klinger was commissioned as Lieutenant, 2nd Field Company of the Canadian Engineers on instruction and training of infantry in field work and military engineering at Toronto, construction work at Niagara, and was later O.C. of the Depot Company, at the Engineers Training Depot, Ottawa, from September, 1915 till March, 1916. From March, 1916 till July, 1916, he was Lieutenant in the 9th, 11th and 12th Field Companies, Canadian Engineers in England. He went to France in August, 1916, and from that date till the signing of the Armistice, Captain Klinger was in the following battles:—Ypres Salient, Somme, Vimy Ridge, Hill 70, Passchendaele, Amiens, Valenciennes. After the signing of the Armistice Captain Klinger was in the Canadian Army of Occupation on the Rhine, and was later stationed in Belgium until May 1919. He was finally demobilized in Canada on July 6th, 1919. Casualties nil. Captain Klinger was awarded the Military Cross on November 16th, 1916, at the Somme Battle.

Capt. Yves Lamontagne has returned to Canada from India after an absence from this country of four years. Captain Lamontagne joined the C.O.R.C.C. (Railway Corps) in April, 1915, and with this unit sailed for England in June, 1915. Two months later the Railway Corps was transferred to France and worked with the Belgian engineers in the trenches for some months. Later they were recalled to England and returned to France a few weeks after on construction of standard gauge track. Lieut. Lamontagne was given a commission in the Royal Engineers, was gazetted 2nd Lieut. in Feb., 1916, and was later posted to the 91st Field Company, 15th Division, remaining with them in the Somme until January, 1917, when he was invalided to England. While in England he supervised the training of sappers and was Adjutant of the training company. In September, 1918, he embarked for India, and arrived at Bombay a few days before the Armistice. Riots and the war with Afghanistan prevented his return to England until October 1919, at which time Capt. Lamontagne was working on erection of aeroplane hangars at Ambala.

Herbert Graham Starr, A.M.E.I.C., graduated from the Royal Military College, Kingston, in 1905. He was transferred from Reserve of Officers to C.E.F. in July, 1915, and posted to the 84th Overseas Battalion as lieutenant. He was promoted to Captain and appointed Adjutant in November, and promoted to field rank and third in command in January, 1916. The 84th Battalion proceeded overseas in June 1916, and was disbanded on arrival for reinforcements. After two weeks in England Major Starr was ordered to France and posted to the 29th Battalion (Vancouver), joining this unit in the Ypres Salient. This unit was moved to Picardy for the advance of September 15th with Battalion Headquarters in Pozieres. Major Starr was wounded while with a working party digging a jumping-off trench on the night of September 12th, and was invalided to England, being in hospital almost continuously till invalided home in March 1918. In August 1918, he was posted to Corps Military Police as Assistant Provost Marshal while remaining

Military Service Act, serving in St. John, Toronto, and Kingston, in that capacity until he was demobilized in January, 1920.

*

Lieut. T. E. A. Hall, A.M.E.I.C., enlisted with the C.A.S.C. in March, 1915, proceeded overseas in June, 1915, was stationed at Shorncliffe, and in July was appointed to Staff of D.A.A.G. In November he was posted with the Canadian Cavalry Brigade Supply Column, and left for France in January, 1916, where this unit joined the Canadian Cavalry Brigade which had then been mounted ater serving as infantry with the 1st Division. After serving at the Somme from July to November, 1916, Lieut. Hall was posted to headquarters of the Division for several months and afterwards was attached to Umbala Brigade Headquarters as Brigade Transport Officer in March, 1917, and took an active part in pursuit of the Boche in his retirement to the Hindenburg line. The Division then took over trenches near St. Quentin where they remained until moving to Passchendaele at the beginning of November. On Nov. 20th they took part in the attack on Cambrai, and after a rest of one day in billets they were sent back to the Cambrai front to help repulse the Boche counter-attack. The 5th Cavalry Division was disbanded, the Umbala and Secunderaba Brigades going to Palestine. They became a part of the 3rd Cavalry Division and were attached to the 5th Army, coming in for a full share of the Boche attack in March, 1918. During this retreat they covered a front extending from St. Quentin to points south of Compeigne. In July they were again near Amiens holding forward positions for two weeks at a time and one week in billets. About this time Lieut. Hall went to hospital at Rouen and on his return in July was transferred to the 2nd Canadian Division, remaining with them until they reached the Canal du Nord near Cagmicourt. In October, 1918, Lieut. Hall left France for an appointment at Witley, where he remained until July 1919, when he returned to Canada and was demobilized at Toronto on July 26th, 1919.

*

The Harbour Commissioners of Vancouver, B.C., have appointed W. G. Swan to the position of chief engineer. Mr. Swan is a Member of *The Engineering Institute of Canada* and holds the degrees of B. A. Sc. and C. E. of the University of Toronto, where he acted for two years as demonstrator and lecturer on mechanics of building materials. In the practice of his profession Mr. Swan has had a varied experience that specially fits him for the class of work that will engage his attention in the services of the commissioners.

In 1903 Mr. Swan acted as assistant hydrographic engineer for the Dominion Government and in the following year transferred to the Canadian Northern Railway, in which service he filled the various capacities of residence,bridge, divisional, terminal and district engineer, with headquarters at New Westminster.

In addition to his general railway constructional experience Mr. Swan was in charge of the Pacific Coast mainland terminals for three years previous to the war, during which time he designed and superintended the construction of the Port Mann wharves. He also had charge of the reclamation of False Creek mud flats for railway terminals.

W. G. SWAN, A.M.E.I.C.

Mr. Swan has to his credit three and one-half years' military service, two years and three months of which he spent in France.

He was an officer in the 10th Westminster Fusiliers Regiment when war broke out and took an active part in the formation of the 131st Battalion, with which unit he served with distinction overseas. He holds the D. S. O. and the French Croix de Guerre and is one of the most popular officers of the famous Fraser Valley unit.

R. G. Swan, chief of the hydrographic survey for British Columbia, is a brother, but A. D. Swan, consulting engineer for the Harbor Commissioners, is in no way related.

The commissioners have also under consideration applications for the position of chief accountant and the appointment will be made within the next few days.

The Annual Meeting of the Association of Canadian Building and Construction Industries has been postponed, and will be held at Ottawa on Monday, Tuesday and Wednesday, the 2nd, 3rd, 4th of February at the Chateau Laurier.

EMPLOYMENT BUREAU

The demand for trained men continues to exceed the supply, we have more requests for young graduate engineers of two or three years standing than we can at present fill. The demand for draughtsmen is also very brisk. The usefulness of the employment bureau is being extended by increasing co-operation with the Branches. When applications are received early in any month, copies will be mailed to the Branch Secretaries who are most likely to be interested. When positions are filled, it is desired that this information be supplied to headquarters so that the cards may be duly cancelled.

Situations Vacant

Engineer wanted for electric interurban railway in Ontario. Should have knowledge of high tension work in order to be able to supervise sub-stations and electrical work in general. Experience in civil railway engineering desirable. Apply Box No. 72.

Assistant engineer wanted in connection with construction of water power plant, in Quebec, should be technical graduate with experience in surveying or construction. Work will last for a year and a half or more. Salary $150.00 per month up according to qualifications. Apply Box No. 73.

Two graduates in electrical engineering wanted for motor department of large electrical manufacturing firm in Toronto. Graduates of two or three years preferred. Good opportunities. Apply Box No. 74.

Two salesmen wanted for electrical firm in Montreal graduates preferred. Excellent opportunities for the right men. Apply Box No. 75.

Resident civil engineer required to supervise construction in Northern Ontario of a Hydro Electric Power Development including dam, power station and transmission line, previous experience on similar work essential. Apply Box No. 76.

Recent graduate or railway man with experience wanted by railway company. Work for four or five months and probably permanent. Address Box No. 77.

Reinforced Concrete Engineer

Montreal firm of contracting engineers requires the services of an expert in reinforced concrete. Liberal salary to the right man. Box 78.

Steel Company requires experienced mechanical engineer to install special equipment. This will lead to a permanent position if services satisfactory. Salary $2,000 to start. Box 79.

The Crown Agents for the Colonies, London desire to obtain the nomination of a candidate for the appointment of Logging Engineering Assistant to the Timber Superintendent in the Railway Department of the Federated Malay States. The salary is six hundred dollars (Straits Settlement), the value of the dollar being fixed at two shillings and six pence. Full particulars can be obtained from the Department of the Secretary of State in Canada, Ottawa.

A Shipyard Superintendent, Sorel, P.Q. Salary, [illegible] per annum.

A Shipyard Superintendent for the Government Shipyard at Sorel, P.Q., Department of Marine, at an initial salary of [illegible] per annum, which will be increased on recommendation for efficient service at the rate of $180 per annum until a maximum of $3,240 has been reached.

Candidates must have education equivalent to graduation in engineering from a school of applied science of recognized standing; at least five years of experience in ship design and construction, two years of which must have been in responsible charge of such work; thorough knowledge of various types of ships and ship machinery and the construction and repair thereof; initiative, tact, good judgment, and ability to manage men; preferably a knowledge of both French and English. No special age limit is fixed for this position, but the appointee must be of such an age as to ensure a reasonable period of satisfactory service after appointment.

The successful candidate will be required to perform the following duties: Under direction to have charge of the Sorel Shipyard; to be responsible for the design, estimate, construction, and repair of ships; to supervise the buying and safekeeping of stores and stock and the work of all employees, and to perform other related work as required.

An examination will be held in Education and Experience along the lines indicated above. An oral examination of the best qualified candidates will be held, if necessary in the opinion of the Commission.

Junior Engineers. Initial Salary $1,080 per Annum.

Junior Engineers, at an initial salary of $1,080 per annum, which will be increased, on recommendation for efficient service, at the rate of $120 per annum until a maximum of $2,040 has been reached. This initial salary is supplemented during the present fiscal year by the following bonus: If head of a household (irrespective of age), $400 per annum; if not the head of a household, $42 per annum, if over 21 years of age; no bonus if below 21.

Candidates must possess the following qualifications: Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing, with two years of engineering experience or four years of engineering experience in design, estimate, construction, and maintenance work; good physical condition. Candidates must not be more than 35 years of age.

Candidates must be able to perform the following work: To lay out and supervise construction work, to plot survey notes and draw plans, to make soundings for dredging purposes and supervise dredging operations; to run a transit, level or other surveying instruments, to calculate quantities and prepare estimates of cost of proposed works, to lay out work for draughting or office staff.

Candidates will be examined in the following subjects which have the relative weights indicated: Education, Training and Experience, 300; Oral Interview, if necessary in the opinion of the Commission, 100.

A list of eligibles will be established for vacancies in the above class throughout the Dominion, but the only vacancy required to be filled at present is that of Junior Engineer, Fisheries Branch, Department of the Naval Service, at Vancouver, B.C. This particular appointee will be required under direction to perform the following duties: To supervise the removal of obstructions in rivers and streams which hinder the free passage of fish up stream; to assist in the design, construction, and maintenance of fish hatcheries, fish ways, and other engineering work in connection with the Fisheries Branch in British Columbia.

So far as this position is concerned, preference will be given to the residents of the province of British Columbia, but persons from other parts of the Dominion are urged to qualify through this competition for other positions of Junior Engineer, vacancies of this nature being of frequent occurrence

Application forms properly filled in, must be filled in the office of the Civil Service Commission. Application forms may be obtained from the offices of the Employment Service of Canada, or from the Secretary of the Civil Service Commission. Ottawa.

Air Station Superintendent, Initial Salary $3,360 per Annum.

832. An Air Station Superintendent for the Air Board at an initial of $3,360 per annum, which will be increased on recommendation for efficient service at the rate of $180 per annum until a maximum of $3,900 has been reached.

Note.—If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation.

Qualifications—Education equivalent to university graduation; at least two years of flying experience; must hold or obtain commercial pilot's and navigator's flying machine certificates or airship pilot's and navigator's certificates; thorough knowledge of the theory of flight and the principles and practice of air navigation; wide acquaintance with all types of aircraft accessories and equipment and their use; administrative and organizing ability; good physical condition.

Duties.—Under the direction of the Director of Flying Operations of the Air Board, to have charge of an air station and to direct the work at flying sub-stations; to direct or personally undertake flying operations; to supervise the staff and be responsible for the maintenance and repair of aircraft and equipment at a flying station; to supervise the care and issue of stores, and to perform other related work as required.

General Directions

Candidates for these positions will be examined in the following subjects, which have the relative weights indicated: Education, Training and Experience, 300; Oral Interview, if necessary in the opinion of the Commission, 100.

According to law preference is given to persons who have been on active service overseas on the military or naval forces of His Majesty, or any of the Allies of His Majesty, during the late war. Returned soldiers must furnish a certified copy of their discharge certificates, or in case of commissioned officers a certified statement of their military service.

Applicants for positions under the Air Board, advertised in July, 1919, who wish to be reconsidered in connection with the positions now advertised must advise the Commission to this effect.

The positions advertised herewith are grouped in the following classes:—

(*a*) Flying.
(*b*) Technical.
(*c*) Mechanical.
(*d*) Other appointments.

Applicants for more than one class of positions must file a separate application for each class for which they are making application. Application forms must be filed in the office of the Civil Service Commission not later than February 19. Such forms may be obtained from the Secretary of the Civil Service Commission, Ottawa, the Secretary of the Air Board, Ottawa, or the offices of the Employment Service of Canada.

By order of the Commission,
W. FORAN,
Secretary.

Ottawa, January 22, 1920.

Situations Wanted

Change wanted — Graduate Engineer, A.M.E.I.C., desires change, six years Civil and Mechanical experience, four of which spent on general steel plant construction and maintenance. Can produce results. No objection to going abroad. Box 12 P.

1920 Executive Committee of the Ontario Provincial Division

Ex-Officio. — Lt.-Col. R. W. Leonard, St. Catharines, Past President, 1920-21-22; Major-General C. H. Mitchell, Toronto, Vice-President, 1920-21; Geo. Hogarth, Toronto, Immediate Past Sec. Treas. Ont. Prov. Div.; John Murphy, Ottawa, Councillor, Dist. No. 4, 1918-19-20; G. G. Gale, Ottawa, Councillor, Dist. No. 4, 1919-20-21; J. B. Challies, Ottawa, Councillor, Dist. No. 4, 1920-21-22; P. Gillespie, Toronto, Councillor, Dist. No. 5, 1918-19-20; W. A. McLean, Toronto, Councillor, Dist. No. 5, 1919-20-21; E. R. Gray, Hamilton, Councillor, Dist. No. 5, 1920-21-22.

Appointed by Branches. — A. C. D. Blanchard, Niagara Peninsula Branch; H. B. R. Craig, Border Cities Branch, Hamilton Branch, Toronto Branch; A. B. Lambe, Ottawa Branch; Lt.-Col. A. MacPhail, Kingston Branch; G. R. Munro, Peterboro Branch; F. M. Perry, Sault Ste. Marie Branch.

Elected by Non Resident Members.—J. A. Bell. St. Thomas; H. A. Brazier, London; G. H. Bryson, Brockville, S. B. Clement, North Bay; T. H. Jones, Brantford; Major W. H. Magwood, Cornwall; F. D. Reid, Cobalt.

At a meeting of the above Committee held in Montreal on January 29, Mr. Craig was elected Chairman, Mr. Jones Vice-Chairman, and Mr. Lambe, Secretary-Treasurer.

Preliminary Notice

of Applications for Admission and for Transfer

[illegible] January, 19[illegible]

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher. [illegible]

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references. [illegible]

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in February, 1920.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:— [illegible]

[illegible]

Every candidate who is not a graduate of some school of engineering recognized by the Council, [illegible]

[illegible]

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Published Monthly at 176 Mansfield Street, Montreal

— BY —

THE ENGINEERING INSTITUTE OF CANADA

INCORPORATED IN 1887 AS

THE CANADIAN SOCIETY OF CIVIL ENGINEERS

Entered at the Post Office, Montreal, as Second Class Matter

Volume III | MONTREAL, MARCH 1920 | Number 3

Report of Thirty-Fourth Annual Meeting

The Meeting was called to order at ten a.m. at the headquarters of *The Institute*, 176 Mansfield Street; President, Lieut.-Col. R. W. Leonard in the chair.

Reading of Minutes: On motion by Wm. McNab, seconded by H. H. Vaughan, and carried, the minutes of the Thirty-Third Annual Meeting as published in *The Journal* of February, Nineteen Hundred and Nineteen, were taken as read and approved.

Appointment of Scrutineers: On motion by R. A. Ross, seconded by Chase Thomson, and carried, Messrs. McNab and Van Scoyoc were appointed Scrutineers.

Appointment of Auditors: On motion by John Murphy, seconded by Walter J. Francis, and carried, Messrs. Riddell, Stead, Graham and Hutchison were appointed Auditors for the year Nineteen Hundred and Twenty.

Report of Council for Nineteen Hundred and Nineteen

On motion by the President, seconded by Walter J. Francis, the Report of Council as printed in the advance proof of *The Journal* (February, page forty-one) and distributed at the meeting, was adopted.

Presentation of Committee Reports

Finance Committee: It was moved by H. H. Vaughan, seconded by R. A. Ross, that the report of the Finance Committee as published in *The Journal* (February, page forty-six), be adopted. It was further moved by Mr. Vaughan, seconded by Frederick B. Brown, that recommendation number six of the Committee's report should be acted upon by the meeting. This recommendation is as follows:

6. Your Committee, therefore, recommend that the by-laws be amended to restore the subscription fees to *The Institute* to the amount at which they stood before the subscription was deducted from them and that the present by-law charging $2.00 per annum for a subscription to *The Journal* be retained. This would increase the revenue of *The Institute* about $[illegible] per annum and with the larger receipts we may confidently expect from the current fees, should place it in a sound financial condition. In view of the length of time necessary to make a change in the by-law your Committee would suggest that the Annual Meeting recommend the Council to request our membership to voluntarily agree to this proposition for the ensuing year.

The motion was carried.

Library and House Committee: It was moved by Mr. Surveyer and seconded by Mr. Francis, that the report of the Library and House Committee, *The Journal* (February, page fifty), be adopted. Carried.

Publications Committee: The report of the Publications Committee, *The Journal* (February, page fifty-[illegible]) was taken as read and the supplementary report read to the meeting. It was moved by Chase Thomson, seconded by J. G. Legrand that the report be adopted. Carried.

Honor Roll Committee: In the absence of the Chairman of this Committee, Mr. Walter J. Francis, moved the adoption of the Report, published in *The Journal* (February, page fifty-one) seconded by Col. Lamb. Carried.

Board of Examiners and Education Committee: Moved by Arthur Surveyer, seconded by Professor Haultain, that the report, published in *The Journal* (February, page fifty-one) be adopte. Carried.

Committee of Steel Railway Bridges: It was moved by Chase Thomson, seconded by Walter J. Francis, that the report published in *The Journal*, (February, page fifty-two) be adopted. Carried.

Engineering Standards Committee: It was moved by Prof. L. A. Herdt, seconded by Arthur Surveyer, that the report published in *The Journal*, (February, page fifty-three) be adopted. Carried.

Committee on Uniform Boiler Specifications: Moved by H. H. Vaughan, seconded by Mr. Gray, that the report published in *The Journal* (February, page fifty-six) be adopted. Carried.

Electro Technical Committee: This report published in *The Journal* (February, page fifty-seven) was read by Dr. Herdt, who moved its adoption, which was seconded by John Murphy and carried.

Legislation Committee: Mr. Surveyer read the report as follows:

Report of Legislation Committee

Dear Sir:—

Notwithstanding the renewed activities within *The Institute* on the subject of Legislation for Engineers, your Legislation Committee has had less to do this year than during previous years. This report is therefore a synopsis of events rather than a resumé of the work performed by your Committee.

The Annual Meeting appointed a Legislation Committee of its own independent of the Legislation Committee of the Council. This special Committee of the annual meeting met in Montreal and prepared a model act for the registration of all professional engineers, which was submitted to the members of *The Institute* and approved by a very large majority, seventy seven per cent of the votes cast being in favour of Legislation.

Since the publishing of this model act in *The Journal* of *The Institute*, New Brunswick and British Columbia have submitted bills to their respective legislature and it is expected that Saskatchewan and Alberta will do the same in the very near future.

Respectfully submitted.

ARTHUR SURVEYER,
Chairman of the Legislation Committee.

Mr. Surveyer moved the adoption of this report, which was seconded by Mr. Francis and carried.

International Affiliation Committee: This report published in *The Journal* (February, page fifty-two) was adopted on motion by Mr. Vaughan, seconded by Professor H. E. T. Haultain.

Gzowski Medal Committee: Mr Vaughan read the report of this Committee as follows:

Dear Sir:—

The Committee on the Gzowski Medal and prizes for students' papers have decided to award the Gzowski Medal for 1920 to Messrs. Phelps Johnson, M.E.I.C., G. H. Duggan, M.E.I.C. and George F. Porter, M.E.I.C. for their paper on "The Design, Manufacture and Erection of the Superstructure of the Quebec Bridge."

Your Committee does not consider it desirable to make any award for a student's paper.

Yours truly,

H. H. VAUGHAN,
Chairman of Committee.

and moved its adoption, seconded by Mr. Francis. Carried.

Leonard Medal Committee: The Chairman of the Committee on the Award of the Leonard Medal reported that no decision had been reached regarding the award of the Medal and that the announcement concerning same would be made at a later date.

McGill University, Montreal.
January 20th, 1920.

The President and Council,
The Engineering Institute of Canada.

Gentlemen,

On behalf of the Publications Committee I beg to make the following recommendations with reference to papers published in *The Journal* from May to December 1918, on which no report has been made in regard to the question of publication in Transactions.

We recommend that the following papers be published in Transactions together with all discussion and reports relating to them:—

The Fuels of Canada	B. F. Haanel
Low Temperature Carbonization of Fuels	E. Stansfield
Canada's Water Powers and their Relation to The Fuel Situation	J. B. Challies
Deterioration of Concrete	B. S. McKenzie
Concrete in Alkali Soil at Saskatoon.	H. McI. Weir
Causes of the Disintegration of Concrete	A. G. Blackie
Fuels of Western Canada	J. White
The Use of Reinforced Concrete Construction in Harbour Work	A. F. Dyer
The Diving Bell in Use at Halifax Ocean Terminals	J. J. Macdonald
St. John Harbour	Alex. Gray
Heat Transfer Tests for Building Materials	L. M. Arkley

The Committee recommend also that an index of all papers appearing in *The Journal* be printed in Transactions so that there may be a suitable reference to all papers which have been read during the year.

On behalf of the Committee I beg to remain,

Yours faithfully,

E. BROWN,
Chairman, Publications Committee.

Reports of Branches

On motion by Mr. Francis, seconded by Mr. Brown, the reports of the Branches as published in the February Journal, Victoria Branch, page fifty-eight; Saskatchewan Branch page fifty-nine; Sault Ste. Marie, page sixty; Border Cities Branch, page sixty; Ottawa Branch, page sixty-three; Montreal Branch, page sixty-five be taken as read and adopted. Carried.

Ontario Provincial Division: In moving the adoption of the report of the Ontario Provincial Division, Mr. Challies read the final paragraph of the report, February Journal page sixty-two, and referred to the fact that although the Division was constituted only last year, at an enthusiastic meeting that was held in Toronto in November a number of questions of import to *The Institute* were discussed which included the interest of *The Institute* in public affairs, legislation and other questions. The officers of the Division had felt that *The Institute's* policy had not been voiced as it should be, and therefore the matter was being brought up at the Annual Meeting with the suggestion that the Council be requested to appoint a committee on development as suggested. The motion to adopt the report included referring to Council the recommendations made therein. On seconding the motion Professor Haultain stated that this recommendation of the Provincial Division was a very wise one and should be acted upon. The motion was carried.

Quebec Branch: The report of the Quebec Branch was read by Mr Fraser, (February Journal, page seventy-three), who move its adoption, seconded by Mr. Evans. Carried.

Calgary Branch: The Secretary stated that this report had been printed but was not yet distributed, (February Journal, page fifty-nine) which he read and moved its adoption, seconded by Col. McPherson. Carried.

Niagara Peninsula Branch. The Secretary read the report of the Niagara Peninsula Branch stating that while it had been organized only in February, Nineteen Hundred and Nineteen, it had made great progress. He moved the adoption of the report which was seconded by Lt.-Col. H. J. Lamb. Carried.

Toronto Branch: The Secretary-Treasurer of the Toronto Branch Mr. H. A. Goldman, read the report of the Branch (February Journal, page seventy) and moved its adoption, seconded by Professor Gillespie. Commenting on the report, Professor Haultain stated that the Toronto Branch had had a good year, and has made an excellent start for the following year, so that Toronto would have a still better report for next year. The older men in the Branch were doing things and the Branch had awakened to great activity. Motion carried

Halifax Branch: The report of the Halifax Branch was read by the Secretary (February Journal, page seventy-five), and its adoption was moved by Mr. Francis and seconded by W. P. Morrison. Carried.

St. John Branch: Chairman, C. C. Kirby, read the report of the St. John Branch, (February Journal page seventy-four), and moved its adoption. This was seconded by G. G. Murdoch and carried.

Edmonton Branch: The report of the Edmonton Branch (February Journal, page sixty-one) was read by the Secretary, who, seconded by Mr. Cassels moved its adoption. Carried.

Vancouver Branch: The Secretary read the report of the Vancouver Branch, (February Journal, page sixty-eight), and moved its adoption, seconded by Mr. Lefebvre. Carried.

Hamilton Branch.

Winnipeg Branch: The report of the Hamilton Branch (February Journal, page seventy-one), and the report of the Winnipeg Branch (February Journal, page sixty-nine), on motion by Mr. Vaughan, seconded by Mr. Davies were taken as read and adopted.

Communications: At the suggestion of President, a number of communications were read by the Secretary, mainly from invited guests and their contents noted.

Announcements: Frederick B. Brown, Secretary-Treasurer of the Montreal Branch, made a number of announcements, two of which referred to McGill University. He pointed out that in Nineteen Hundred and Twenty-one there will be a great re-union of all the graduates of McGill University, which would be of great interest to the graduates, particularly to those in engineering. Brig. Gen. Eric McCuaig, A.M.E.I.C., is the Chairman on the Committee. Further, a special invitation had been received from Dr. Frank D. Adams, Hon. M.E.I.C., Acting Principal of McGill, to all members of *The Institute* to visit McGill University during the Convention. Another announcement was the dinner being held by the Engineering Graduates of the University of Toronto, at the Windsor Hotel at noon on Thursday. Mr. Brown read a letter from the Secretary of the Canadian Forestry Association regarding validating certificates. The courtesy of the Association of Canadian Building and Construction Industries in changing the dates of their Convention was acknowledged and a letter from the Presdient of the Association, Mr. Anglin, was read. The final announcement was included in a letter from Mr. Bowman, Chairman of the Halifax Branch, inviting *The Institute* to hold the Annual Meeting in Halifax in 1924, which was the year of Old Home Celebration and Olympic Games.

Discussion: The items of the agenda having been disposed of and a few minutes left before having to adjourn to luncheon at the Windsor Hotel, the President opened the meeting for discussion.

A brief discussion on the financial statement took place when Messrs. Challies, Vaughan, Ross and Francis referred to the situation, Mr. Francis taking advantage of the occasion to refer particularly to the splendid service rendered *The Institute* during the past year by President Leonard and also by Past Presidents Vaughan and Duggan.

Luncheon at the Windsor Hotel.

The members and their lady friends with a number of invited guests were tendered a luncheon in the Rose Room of the Windsor Hotel, the hosts being the Montreal Branch. Walter J. Francis, Chairman of the Montreal Branch occupied the chair and extended a hearty welcome to all present on behalf of the Montreal Branch. He introduced Mr. Calvin W. Rice, Secretary of the American Society of Mechanical Engineers who had kindly come from New York to be with us on this occasion.

Mr. Rice who was warmly welcomed on rising to speak, conveyed the greetings of the President and Council of the American Society of Mechanical Engineers and expressed the hope that he would have an opportunity of meeting the Committee on International Affiliation of which Mr. Vaughan is the Chairman. With the opinion of the Chairman of the Committee on Sections of the American Institute of Electrical Engineers confirming his own emphatic views he was firmly convinced that respecting membership in *The Engineering Institute of Canada* every qualified technical man in Canada should be a member of *The Institute* as a first duty to his profession. Then as he progressed he might very properly become a member of other societies which would best serve his particular specialty. He repeated that every man domiciled in Canada, whether a citizen or not, owned his professional allegiance to the national society of this country.

Continuing, Mr. Rice paid a compliment to the Ontario Provincial Division report which showed an unusual breadth of vision. He believed that the relative part that sections would take was of minor importance when all joined together to render maximum service to the nation.—Cheers.

The Chairman then introduced Mr. E. W. James of Washington, D.C., Assistant Chief Engineer of the Bureau of Roads of the United States, who gave a splendid address on the requirements of highway development based on the experience of the Federal Government in that connection. Following Mr. James' address, hearty votes of thanks were tendered to Mr. Rice and to Mr. James for their addresses.

Afternoon Session, Tuesday, January 27th

The afternoon session convened in the ladies ordinary of the Windsor Hotel, President Leonard in the chair.

The first order of business was receiving the nominations to the Nominating Committee for the year Nineteen Hundred and Twenty, of the various Branches. The personnel of the Committee was noted as follows:

H. M. MacKay, Chairman	W. Lefebvre
A. E. Doucet	G. W. MacLeod
P. Gillespie	J. G. Legrand
D. A. R. McCannell	A. J. Riddell
H. E. C. Carry	H. U. Hart
A. A. Dion	G. G. Murdoch
W. M. Everall	H. L. Bucke
G. N. Houston	B. E. Barnhill
J. Lorn Allan	P. P. Westbye

Changes in By-laws: The recommendations of the Council regarding changes in the By-Laws, on motion by Lt.-Col. Lamb, seconded by Lt.-Col. McPherson, were adopted as follows; after some discussion regarding the rebates of the Montreal Branch:

(1) That Section 57 be amended by the deletion of the words "except the Montreal Branch," after the twelfth word "Branch." The Section would then read:

Revenue

Section 57: The Secretary of *The Institute* shall each year remit to each Branch, twenty-five per cent. of the annual fees, current of arrears, received from the members of the Branch during that year, payments being made quarterly. A statement showing the individual amounts, and from whom collected, shall accompany each quarterly remittance.

For the purpose of this By-Law, the Branch Membership list shall be revised on the first day of January and the first day of July in each year, but the change shall not be retroactive, except in the case of new admissions to *The Institute.*

(2) That Section 61 be amended to provide for the election of a Vice-Chairman of a Provincial Division, by the addition of the words "a Vice-Chairman" after the tenth word "Chairman." The Section would then read:

Officers

Section 61: The Officers of a Provincial Division shall be a Chairman, a Vice-Chairman, and a Secretary-Treasurer, or a Secretary and a Treasurer, who shall be elected by the Executive Committee of the Division.

(3) That Section 65 be amended to provide for an additional District in Ontario. This proposal involves changes of boundaries and re-numbering of Districts. The Section as amended would then read:

Nomination and Election of Officers
Electoral Districts

Section 65: For the purpose of the nomination and election of officers the membership of *The Institute* shall be divided into ten Electoral Districts as follows:—

District No. 1, shall include all members resident within twenty-five miles of the headquarters of *The Institute* and all members resident outside of Canada.

District No. 2, all members, outside of District No. 1, resident in the Province of Quebec.

District No. 3, all members resident in the Province of Nova Scotia, New Brunswick and Prince Edward Island.

District No. 4, all members resident in the Province of Ontario east of longitude 77° 30.'

District No. 5, all members resident in the Province of Ontario between longitude 77° 30′ and a line starting at Lake Ontario and running as follows:—along the centre line of Halton Country in a north-westerly direction to longitude 80° 30′, thence northerly to latitude 47° 0′, thence westerly to longitude 82° 0′, and thence northerly to the boundary of the Province.

District No. 6, all members resident in the Province of Ontario west of District No. 5.

District No. 7, all members resident in the Province of Manitoba.

District No. 8, all members resident in the Province of Saskatchewan.

District No. 9, all members resident in the Province of Alberta.

District No. 10, all members resident in the Province of British Columbia and in the Yukon Territory.

Report of Scrutineers.—The report of the Scrutineers was read by Mr. McNab showing the following newly-elected officers and members of Council:—President, R. A. Ross; Vice-Presidents, Walter J. Francis, D. O. Lewis, C. H. Mitchell, W. G. Chace; Past Presidents, J. S. Dennis, H. H. Vaughan, R. W. Leonard; Councillors, Frederick B. Brown, Julian C. Smith, Alex. Bertram, J. M. Robertson, Arthur Surveyer, A. R. Decary, N. E. Brooks, J. E. Gibault, F. A. Bowman, Alex. Gray, D. H. McDougall, J. B. Challies, G. Gordon Gale, John Murphy, F. R. Gray, W. A. McLean, P. Gillespie, Guy C. Dunn, W. P. Brereton, B. S. McKenzie, J. R. C. Macredie, G. D. Mackie, L. A. Thornton, G. W. Craig, L. B. Elliot, Wm. Pearce, H. M. Burwell, R. W. MacIntyre, E. G. Matheson.

New Business.—Under the item of new business a cordial invitation was received from Lt.-Col. H. J. Lamb to hold the Annual Convention in Toronto next year, where it was felt by the engineering profession that the honour of holding an Annual Meeting there was unanimously desired. This proposal was endorsed by Prof. Haultain who expressed the regrets of Chairman Wynne-Roberts of the Toronto Branch at his inability to be present. He felt that Toronto would be in good shape next year to undertake and make a success of the Annual Meeting. On behalf of the Winnipeg Branch an invitation was extended by M. A. Lyons that the next Annual Meeting be held in Winnipeg. This was endorsed by R. J. Lecky of Regina. Both proposals were referred to Council for consideration.

Discussion on Legislation.

By special request Mr. Challies, the retiring Chairman of the Ontario Provincial Division gave a resume of the legislation situation in Ontario as follows:

Mr. President—As very lively interest has been evidenced among the members of *The Institute* in the present status of legislation in the province of Ontario, a brief resume of the sequence of events with regard to legislation since the Ontario Provincial Division was constituted, may be appropriate upon this occasion.

Early in October the Provincial Division received an official communication from the General Secretary intimating, "That the Council would further in every "way the desire of the members regarding legislation, "and inasmuch as the actual application of such legisla-"tion is in the hands of the engineers in each province, "it is desirable that the Branches and Provincial Divis-"ions in co-operation with other engineering organiz-"ations in each province take the initiative, in "which they are assured of the moral support of *The "Institute*."

Accordingly, a special meeting of the Provincial Division Committee was held in the Engineers' Club in Toronto on the 22nd of November, when representatives were present from every Ontario Branch, as well as from the non-resident membership. At this meeting the whole question was thoroughly traversed, and after several hours' discussion it was unanimously agreed that satisfactory progress with regard to legislation in the Province of Ontario could only be obtained by the co-operative efforts of the various technical organizations of the province, the majority of whose members are professional engineers. It was decided to suggest to these organizations that an Advisory Conference Committee, consisting of two representatives from each organization be set up for the express purpose of considering ways and means for securing desirable legislation in the interest of the engineering profession in the Province of Ontario.

At this meeting in Toronto on November 22nd certain advance information was available respecting a legislative scheme advocated by a group of engineers resident in Toronto, known as the J.C.T.O. Although full information regarding this legislation was not available, it was apparent that the J.C.T.O. scheme differed radically from the legislation scheme advanced by the Special Legislation Committee of the E.I.C. Owing to the radical differences between these two legislative schemes, the Provincial Division Committee considered that the Advisory Conference Committee referred to would be a particularly appropriate medium for compromising all differences, and would be the proper body to evolve some constructive scheme and method for realizing it which would be most generally acceptable to all professional engineers in the Province, whether members of the various professional bodies or not.

The proposals for the Advisory Conference Committee referred to have been agreed to by the various members organizations invited by the Provincial Division to participate, and its personnel now comprises:—R. W. Angus, Professor of Mechanical Engineering, Toronto University, and Chester Hamilton,—President and Secretary of the Ontario Section of the American Society of Mechanical Engineers; J. Watson Bain, Professor of Applied Chemistry, Toronto University, and E. G. R. Ardagh, Assistant Professor of Applied Chemistry, Toronto University,—President and Secretary of the Canadian Institute of Chemical Engineers; Messrs. A. B. Cooper and F. R. Ewart, representing the Toronto Section of the American Institute of Electrical Engineers; C. E. Smith of Toronto and E. T. Corkill of Coppercliff,—representing the Canadian Mining Institute; J. P. Hynes, representing the Ontario Association of Architects; Willis Chipman, Consulting Engineer, Toronto, and the speaker, representing *The Engineering Institute of Canada.*

At the time of the setting up of the Committee it was considered that as the land surveyors of the Province had satisfactory legislation, the Ontario Association of Land Surveyors would not be interested. However, it has since been decided to invite this Association to appoint two representatives.

As considerable publicity has been given to the legislative proposals advanced by the J.C.T.O., it might be pertinent for me to briefly explain the main differences between the J.C.T.O. scheme and that of the E.I.C. The E.I.C. Bill contemplates the setting up of a Registration Board by an association of professional engineers which will be given legislative authority and control over the practice of professional engineering. There will be but one registration of engineers. Every engineer whether he is mechanical, electrical, civil, hydraulic or mining, will, if entitled to registration, use the title of "professional engineer." The J.C.T.O. proposal contemplates control of the engineering profession by several registration boards, which will be set up upon the initiative and under the control of a Provincial Minister. There will be one Registration Board of five or six members for electrical engineers, another for civil, another for mining, etc. Furthermore, the J.C.T.O. proposal provide for a scheme of general professional registration which may, upon the initiative of the Government be made applicable to all professions, including law, medicine, dentistry, etc. It is modelled after the Illinois legislation scheme, which has recently been roundly criticized by a special committee on Legislation of the Engineering Council, representing the five Founder professional engineering societies in the United States. The originators of the J.C.T.O. Bill claim that the E.I.C. Bill is class legislation, that it will simply result in the control of the engineering profession in Ontario by an association of Provincial engineers, which will merely be another name for the E.I.C.

Such an assumption is ridiculous because *The Engineering Institute* has given many practical evidences of its desire to have appropriate legislation secured without in any way directly or indirectly, desiring to control the legislative machinery. The action of Council in referring the E.I.C. Bill to the Provincial Division with a specific request that other professional engineering bodies be consulted before any action is taken, and the subsequent decision of the Provincial Division Committee that an Advisory Conference Committee should be set up for the purpose of advising as to appropriate means for securing legislation in Ontario, is sufficient answer to the charges that the E.I.C. is desirous of controlling the engineering profession so far as the Province of Ontario is concerned. It must be remembered that although the numerical strength of the corporate members of *The Engineering Institute* resident in Ontario is greater than the professional membership of all other engineering bodies combined, the Provincial Division officers took the initiative to have an Advisory Conference Committee constituted, upon which the E.I.C. would have but two representatives within a total of fourteen.

The E.I.C. Bill contemplates the consolidation of all engineers into one homogeneous and harmonious body; whether they are miners, electricals, mechanicals, chemicals or "what not" engineers they will all be registered as "professional engineers." The J.T.C.O. Bill on the other hand, contemplating as it does special registration for each group, electrical, mining, mechanical, chemical, etc., must inevitably cause the separation of the profession into a number of groups whose tendencies will be to guard jealously their own collective membership, with the ultimate result of a divided and antagonistic profession.

It is confidently expected that when the Advisory Conference Committee referred to makes its report, the differences of opinion among various groups of engineers in the Province of Ontario with regard to legislative schemes, will be satisfactorily composed, and that they may eventuate some legislative proposal and programme which will be acceptable to the vast majority of the professional engineers of the Province of Ontario.

In my opinion it is fortunate that such radically different legislative schemes are being advanced because such action not only indicates a lively constructive interest in the general question, but furnishes something tangible to use as a basis for further consideration. Furthermore, I can say from my knowledge, that the most enthusiastic supporters of both the E.I.C. and J.C.T.O. schemes freely admit that there are advantages and disadvantages in both proposals, and are all quite content to leave the matter in the hands of the Advisory Conference committee. This Committee will be convened in Toronto very shortly, and should reach a satisfactory conclusion and make definite recommendations for appropriate action without undue delay".

Continuing the discussion Mr. Kirby stated that legislation should assist in creating an engineering profession not an engineering trade. Referring to the Bill drawn up in Toronto regarding the engineering profession in addition to the one recommended by the Legislation Committee of the Toronto Branch, Professor Haultain stated that it was being taken too seriously. A committee was appointed some time ago to consider the status of the engineer and as a result a very worthy document concerning the status of the engineer was produced. After the completion of this, one active, restless, energetic member of that committee who is also a member of the E.I.C., and a member of the Executive of the Toronto Branch of the E.I.C. sat up until four o'clock one morning and produced the Bill referred to by Mr. Challies doing it in one sitting. This Bill was printed before it was approved by the committee.

President's Address: As there was no further discussion Lieut.-Col. R. W. Leonard, President of *The Institute,* then gave his excellent retiring-presidential address, published in the February issue of *The Journal.* Before introducing the incoming President, Sir John Kennedy expressing his gratefulness for the President's paper moved a very warm vote of thanks for the research, labor and clear exposition of the important questions embodied in the address. This motion was seconded by Past President, Lt.-Col. Anderson and received by the meeting with applause.

New President: President Ross was then invited to take the chair, and on doing so was enthusiastically received, following a eulogistic reference to his work on behalf of *The Institute.* Mr. Ross expressed his appreciation of the honour received in being made President of *The Engineering Institute of Canada.* He hoped to be able to fill the chair as worthily as his predecessor. *The Institute* had now a surplus of, so-called, intangible assets which do not show in the financial report but which would greatly assist in enabling a good report to be made for the coming year.

As there was no other business on hand, President Ross declared the Thirty-Fourth Annual Meeting closed, the sessions to resume in the morning at ten o'clock of the Sixth Professional Meeting of *The Institute.*

Reception and Dance

The Rose Room of the Windsor Hotel was the scene of a happy social function on Tuesday evening, when, as guests of the Montreal Branch, at a reception and dance over four hundred of the members and their lady friends were present.

An interesting programme of eighteen dances and four extras, comprising one steps, fox trots and waltzes, was provided and the popular selections rendered by the Great War Veterans' Orchestra were particularly pleasing to the dancers. Dancing commenced shortly after nine p.m. and at eleven thirty p.m. a buffet supper was served in the Rose Room, one end of which was arranged with long trestle tables elaborately decorated with red roses and fern. Bridge tables were arranged in the farther end of Peacock Alley, where those who did not join in the dance could play cards. The ladies' reception committee comprised the following: Mrs. H. G. Hunter, convener of the reception committee, Mrs. Frederick B. Brown, Mrs. S. J. Armstrong, Mrs. E. V. Moore, Miss Roche and Mrs. Beaubien. The gentlemen's reception committee was as follows: Messrs. [illegible], Chairman, Hanbury A. Budden, C. M. McKergow, H. [illegible] Mahaffy, [illegible] Roche and de G. Beaubien.

* * *

General Professional Meeting

Morning Session, January 28th.

This session was convened at ten o'clock with President Ross in the chair, being the initial session of the sixth General Professional Meeting, the subject under discussion being, "The Gateway of the Profession," the entire proceedings being of intense interest from start to finish. In calling the meeting to order President Ross announced that this session would be most informative inasmuch as the subject of education in relation to the training of the engineer was being considered by a number of distinguished experts on the subject including Professor R. F. Ruttan, who was scheduled to give the first paper on the subject of "The Training of the Chemical Engineer", followed by that of Professor A. S. Eve on "The Importance of Physics in Engineering Education", the whole subject of technical education to be afterwards discussed by Brig.-Gen. C. H. Mitchell, C.B., C.M.G., D.S.O., M.E.I.C., Dean of the Faculty of Science and Engineering, University of Toronto; Frank D. Adams, Ph. D., D.Sc., F.G.S.A. F.R.S., Hon. M.E.I.C., Dean of the Faculty of Applied Science and Acting Principal, McGill University; Arthur Surveyer, B.A., B.A.Sc., C.E., M.E.I.C., Member of the Board of Governors, University of Montreal; Prof. Chas. F. Scott, Past President, A.I.E.E., Professor of Electrical Engineering, Yale University, New Haven, Conn.

Continuing Mr. Ross stated that this group of talented men would have much to say of fundamental interest which would be of great importance than the mere details of some technical study. This illustrated the policy of The Institute in broadening its scope and discussing the subject such as this of the broadest possible interest and importance. He then called upon Professor R. F. Ruttan, M.A., M.D., Sc.D., F.R.S., Professor of Chemistry and Director of Chemical Laboratories, McGill University, who read [illegible] subject, which showed his high qualifications for [illegible] such a subject, which was, so to speak, very near his own heart.

At the conclusion of Professor Ruttan's paper, Professor A. S. Eve, D.Sc., C.B.E., F.R.S., Macdonald Professor of Physics, McGill University, addressed the meeting. [illegible] these papers are published in this issue [illegible] considerable [illegible]. He considered it of great [illegible] for the future progress of The Institute that the question of education should be placed in the forefront of the programme. He emphasized the point that the art of engineering is the application of [illegible] physics.

Following the discussion by Professor Ruttan and Professor Eve came the discussion by Brig.-Gen. C. H. Mitchell, M.E.I.C., Frank D. Adams, D.Sc., Hon. M.E.I.C., Arthur Surveyer, M.E.I.C., and Professor Chas. F. Scott, Past President, A.I.E.E. These papers will be printed in the April number of the Journal.

Visit to Northern Electric Company's Works

At the conclusion of the morning session the members found special cars awaiting them to convey the party to the plant of the Northern Electric Company on Shearer Street. Over two hundred and fifty members availed themselves of this opportunity to accept the kindness of the President, Paul F. Sise, and the directors of the Company, as guests at luncheon at the works, followed by a visit through this modern plant. During the course of the luncheon, President Sise extended a cordial welcome to the members of The Engineering Institute of Canada, trusting that the visit would be enjoyed and be found interesting. Those who were favoured in being present at this occasion were loud in the praises of the courtesy extended and spoke in the highest terms of what President Ross stated was one of the finest manufacturing plants in Canada.

Annual Banquet, Windsor Hotel

Humanizing the engineer was to a large extent the key-note struck at the Annual Banquet held at the Rose Room in the Windsor Hotel on Wednesday evening with an attendance of over two hundred. [illegible] that there was abundant evidence of the social and humanitarian [illegible] [illegible] are not becoming [illegible] with one another and with those whose phases of life is of a different nature.

In the absence of [illegible] Chairman of the Montreal Branch, who the President [illegible] to act as toastmaster, the chair was presented by President Ross, who expressed the regret of Sir Lomer Gouin, Premier of the Province and of the Hon. L. A. David, Provincial Secretary, who were expected but were unfortunately unable to attend.

The toast list was as follows: The Province of Quebec, proposed by Brig.-Gen. Mitchell, responded to by the

Hon. Chas. Marcil, M.P., Commissioner of the City of Montreal; The Engineering Profession, proposed by Lt.-Col. Leonard, responded to by Prof. Chas. Scott; Sister Professions, proposed by President Ross, coupled with the names of Mr. Justice Surveyer and D. K. Sandwell. God Save the King.

Brig.-Gen. Mitchell : After felicitating *The Institute* on the fact that the Annual Meeting was being held in the Province of Quebec, General Mitchell reminded those present that the Province of Quebec was unique in this unique Canadian Confederation and in this unique British League of Nations — Quebec, the oldest Province, the Province which is the gateway of Canada, and the Province which with its long years of early struggles did all the pioneering work of this magnificent Canada of ours. The first power plant on the western hemisphere was built on the shores of the St. Lawrence by one of the early settlers about fifteen hundred and fifty. To the pioneers of Quebec belong the honour of laying the foundation of the country's first and greatest heritage—the heritage of brains. The sons of Quebec are remaining in Quebec and are doing their share in that great spirit of co-operation which will enable us to work out our own destiny. General Mitchell paid a splendid tribute, as one of the First Contingent who saw them in action at Courcellette, to the gallantry of the Twenty-second Battalion which was one of which the Province of Quebec and all Canada should be proud. In the war of peace which is bringing many problems, the sons of Quebec by their steadfastness are solving the great industrial question. It is this spirit and the spirit of co-operation among the provinces which will enable us to succeed in working out the destiny of this Canada of ours and in the great development which is our future.

Hon. Chas. Marcil : In an eloquent address and with that splendid oratory for which he is noted, Hon. Mr. Marcil responded to the toast to The Province of Quebec. He reviewed the early history of the Province showing the place it has occupied in the history of Canada. He felt that if the people in Ontario would mingle more with the people of Quebec and vice versa there would never be any friction. He believed that no body of men could do more effective work in bringing the people of Canada closer together, in making a homogeneous nation than the engineers. The future of Canada lies largely with the engineering profession which is being realized more and more every day. Every session of Parliament is taken up with that great problem, the development of our natural resources and that lies pre-eminently in the hands of our engineers. He congratulated *The Institute* on having elected as its new President, Mr. Ross, with whom he was associated on the Administrative Commission and who was performing great public work for the citizens of Montreal. Quebec was striving in a modest way to make Canada what it is destined to be ultimately, the keystone of the British Empire of the foremost part of the North American continent.

Lieut.-Col. R. W. Leonard proposed a toast to The Engineering Profession coupled with *The Institute,* to which Professor Chas. Scott replied. Col. Leonard compared the limited amount of engineering thirty years ago which consisted of opening up new country by means of railway surveys and canal construction and some harbour work, with the tremendous engineering undertakings of the present day following the development of electrical power, which included not only construction but the development of the mining industry, electro-chemical, electro-metallurgical, pulp and paper and other industries which at that time did not exist or were negligible. So has the engineering profession in this country grown. And as Canada has grown, as Canada has brought in Provinces, which at that time were not in the Confederation, and has become not only a great country but is now recognized as a nation, so *The Engineering Institute* has grown apace. *The Engineering Institute* as a national institute embracing every branch of the profession had made advances throughout the country in the past few years in numbers and in corresponding influence that are almost unbelievable, and the good work still continues. These advances have been the result of the individual work of a great number of men in forming the branches of which there are now eighteen. In the Provincial Divisions, and at headquarters at Montreal, the men sitting around the Council Board, he predicted greater strides in the future of *The Institute* with much larger membership and a corresponding increased influence.

Professor Chas. F. Scott, who was introduced as a grandfather to the profession, a distinguished engineer and one whose word carries weight, illustrating the rapid development in engineering, stated that only a few years ago a great man who had taken such a constructive part in the building up of Canada, had left one hundred thousand pounds to Yale University to be devoted to the development of transportation by land and water. The third element and one which is today playing a wonderful part in transportation—the air, was left out entirely. The human race has been condemned to labour in its earliest days, and except for the use of domesticated animals this was the case until a hundred years ago. The engineer with his magic took away the burden of mankind by the invention of the steam engine, which has created a miracle for mankind making this world small. Professor Scott showed the wonderful development in industry through the use of power whereby human labour was almost entirely eliminated. Today the electric motor is doing wonders and further lightening the burden. The application of power has changed our methods of living and everything we have in our daily business and social life. He made the startling statement that during the last twenty years engineering enterprises in the world had doubled, that is, all the things which in civilization depend upon engineering and are the outcome of it have increased as much in the last score of years as they had in all time before that. "Electric power has been practically doubling every five years for the thirty or forty years and now electrical engineers are predicting an increase in the next five years equal to all that had taken place in the marvellous electrical growth of the last thirty years. If engineering which transforms the life of the world, which has transformed the whole trend of civilization during the nineteenth century, means anything it means that the engineers who have been responsible for these changes must re-adjust themselves to the new conditions in industry and be able to make the human adjustment to correspond with the changes which the engineer has brought about by his work. The engineering society is guilty of allowing many of the difficulties and problems of the present time to exist, financially, socially and industrially. If this work is to go on, if our engineering is to increase at the rapid rate of acceleration, which it has had in the past, it is placed beyond our imagination. Engineers as we are, see what is coming but other people hardly realize it. We have proved what we can do. Canada has shown clearly the great part she can take when she has a great work to perform. Are the requirements of war really greater than those of peace? Ought we not to put in our best engineering effort to bring the same kind of force which brought results in war time to bear on peace times? Gentlemen, one of my friends made the remark a few moments ago that geographically North America is one. Engineers have done more than anyone else to wipe out national boundaries, to make the whole world a unit. Let us in our professions and in our professional societies, keep that world wide intercourse which the work of the engineer has prepared. Let us be loyal to our countries and protect them; let professional engineers be one for the progress of the world and for civilization. Let us meet the challenge and go forward to do our best."

President, R. A. Ross on rising to propose the toast to the Sister Professions, stated that there were times when one should be very humble and modest but that this was not one of them. He stated that we had had an unprecedented night, an unprecedented ending to our year and an unprecedented meeting, such as we had never had before and he was proud of the men who had made it possible, the committees who had worked to organize the meeting and to bring it to its successful conclusion. Engineers were altogether too modest regarding their accomplishments and any judicious blowing that had been done tonight was nothing to what should have been done. He mentioned that during the strike in Montreal, one enterprising member of *The Engineering Institute*, the morning after the strike, collected fifty engineers of the biggest firms in Canada at *The Institute* rooms and these men supplied the city with engine-men, firemen, boiler-makers in the plant and saved the situation. This was an illustration of what engineers could do and the kind of public service that the engineer can accomplish. He was proud to be at the head of an organization of such men. He urged the engineer to adopt as his finishing course closer contact with humanity. As a result of dealing entirely with inert materials the engineer was inclined to be rigid and dogmatic. Association with members of the human profession, such as law and journalism, would be greatly to the engineers' benefit.

Judge Surveyer stated that there was much kinship between all the professions, that all worship at the altar of the same goddess and that goddess is law, the humblest of whose worshippers are those who call themselves lawyers. The engineer is not only a lawyer but also a judge. A judge between the proposition that his client places before him and the eternal laws of nature; a judge between his own interests and his client's interests; a judge between the various incidents that may happen throughout the execution of his contract; a judge between the workmen and the client; a judge between the contractor and the client for him the job is undertaken and he also undertakes to be a judge when he acts on arbitration tribunals. Thus, the legal profession was honoured to have been called a kindred profession to the earlier and exalted advantages which soldiers, statesmen, ... and sometimes those to get away from the laws of the country.

R. S. ..., representing journalism, and as he termed it a number of other professions, concluded the toast list of the evening with a witty speech, which was followed by the singing of "Auld Lang Syne" and "God Save the King."

* * *

Thursday Morning, January 29th.

The Chairman, President Ross, called the meeting to order at ten a.m. He stated that there were three papers on the programme for the morning on the Engineering Activities of the Province of Quebec, namely, "Quebec Water Power Policy and the Work of the Quebec Streams Commission," by O. Lefebvre, B.A.Sc., A.M.E.I.C., Chief Engineer, Quebec Streams Commission; "The Operation of the Quebec Public Health Act," by Theo. J. Lafreniere, B.A.Sc., C.E., M.Sc., Chief Sanitary Engineer to the Superior Board of Health of the Province of Quebec; "The Evolution of the Public Roads Problem in the Province," by Alex. Fraser, B.A.Sc., C.E., A.M.E.I.C., Assistant Chief Engineer, Quebec Department of Roads. The Chairman suggested that the three papers should be read in order, and that any discussion could be taken up later. The three papers were then read by their respective authors. During the reading of the papers, the chair was taken by Vice President, Brig. Gen. Mitchell.

Discussion: Discussion on the various papers was given by W. A. McLean, M.E.I.C., Deputy Minister of Highways, Province of Ontario; (will be printed in April number of the Journal), Willis Chipman, M.E.I.C., Consulting Engineer, Toronto; Professor Peter Gillespie, M.E.I.C., J. B. Challies, M.E.I.C., after which the meeting adjourned till two thirty, p.m.

Mr. Willis Chipman, M.E.I.C., Toronto: It is quite proper I suppose that I should make some excuse for any remarks that I may make on this excellent paper by Mr. Lafrenière, covering as it does the history of the public Health Act in the Province of Quebec, from the early history of the Province to the present time. It will be a valuable addition to the proceedings of *The Institute*, for further reference and for guidance, and I hope that something of the kind may be prepared for each of the Provinces by the officials of the several Health Departments.

My only justification for speaking on this paper is that I have probably had as lengthy an experience with Public Health Acts in Canada as anyone present, not only in the Province of Ontario, but in some of the other Provinces, in respect to water supply and sewerage.

When I began practising there was not one Municipal sewerage disposal works or water purification plant in Canada. I have seen many types of sewage purification works promoted or experimented with, some being constructed and many abandoned. The list included the B. B.C. process which was the first, introduced here after broad irrigation. Then followed chemical precipitation, after which came the polarite process. Within recent years, the septic tank was proposed as the last word in sewage purification, then bacteria beds, then percolating filters, then the activated sludge process. There are also several electrical and chemical processes that are now being experimented with, also combination of various processes.

The problem of water purification is a much more simple one than that of sewage disposal. Important improvements have been made in filtration plants during the last twenty years, and sterilization by bleach or chlorine is a discovery of the last ten years. It is probable that the competition of the private companies interested in the sale of water filtration equipment contributed materially to the advance of water purification, and at the same time there were many extravagant claims made, and municipal authorities were led to believe that the proper operation of filter plants was a simple matter and that very little attention was required.

Extravagant claims of promoters and salesmen were in many instances based upon laboratory experiments, and too frequently to day the most important factors in the proper maintenance and operation of water purification plants and sewage disposal works are overlooked by the municipal authorities.

Many of the promoters interested in the sale of patents or royalties have made a comfortable incomes in the past from their propaganda at the expense of the rate payers. I will not however say anything respecting the merits or demerits of any of the processes above mentioned.

We have heard valuable papers read at this meeting and interesting discussions on good roads, which have been given the attention of engineers for thousands of years, but yet it is only recently in this country that the public has learned that the solution of the good roads problem is in proper maintenance.

The profession of sanitary engineering is a new one, very little having been known about sanitary matters at the beginning of the last century. The success or failure of a sewage disposal works or of a water purification plants depends largely on the attention given to operation and maintenance, and from my experience I can say that so long as the maintenance of these important engineering works, which are probably contributing more to our health and comfort than works in any other branch of engineering, — so long as they are under the control of politicians, satisfactory results cannot be expected. To day works may be constructed and put into operation which will prove quite satisfactory for a few years. They then may be neglected by the political managers, who would prefer to mortgage the future for new works rather than raise the present rate of taxation. There are now abandoned works that are perfectly good, that would be satisfactory if properly cared for, and there are other works that would give satisfactory results if sufficient sums were expended in intelligent operation. If, however, an active promoter approaches a municipal body with a new scheme, the old neglected works may be condemned as not being up-to-date, and the rate-payers invited to supply funds for new works?

Now, in my opinion the only effectual method of improving the situation in sanitary engineering as to increase the number of engineers on the Provincial Boards. Mr. Lafrenière has informed us that there is but one engineer on the Provincial Board in the Province of Quebec, and this is one more than there is on the Board in the Province of Ontario. As long as the present condition exist we can never expect efficient service, and it rests with the engineers themselves largely as to when conditions will improve.

The suggestion that municipal sewage purification works should be taken out of the hands of municipal politicians and the management transferred to an independent board, preferably of engineers, brings up a question that has hardly been touched upon by engineers, particularly at this convention. I refer to the nationalization of all public works and utilities.

A century ago, our canals and the toll roads, that is good roads, were in the hands of private companies. Not more than sixty years ago there was a boom in the construction of toll roads, which was then an attractive vocations for engineers, and a fertile field for politicians. The road building era was followed by the construction of our canals, and it should not be overlooked that some of our most important canals were constructed by private companies.

The construction of our original canals was followed by the construction of our steam railways, all built by private capital. In the larger cities and towns gas works, water works and electric light systems were as a general rule constructed by a private capital.

Immediately after Confederation the Canadian Government embarked on the construction of a national railway for connecting the Maritime Provinces with Montreal, and shortly afterward the Canadian Pacific Railway was projected as a public enterprise. About 1878 the C.P.R. proposition was handed over to a private company.

Of all our public works the canals were the first to be nationalized. Municipalities followed by acquiring their water works systems, electric light plants and gas works that were installed by private companies, until there are to day few private systems or plants remaining in Canada.

In recent years the nationalization of all steam railways has been urged and within the last year the Government has acquired the C.N.R., and it is proposed to also acquire the G.T.R. system. In our Province the Provincial Government has provided the necessary legislation by means of which municipalities may obtain electric energy through the Hydro Electric Commission, and it will not be many years before practically all of the Province will be supplied through the Provincial Commission. It is also now proposed that radial railways be constructed throughout the Province and be operated as a Provincial concern, the electric power to be provided by the Hydro Electric Commission.

To my mind the engineers should give this question of nationalization closer study, and decide how far it is wise to go on this course. The public is looking to us as engineers to a certain extent for guidance and we should by careful study prepare ourselves in such a way that we may give the technical guidance that the country requires and demands, and expects from us.

Now, Mr. Chairman and Gentlemen, I think that in the last few days we have been living in a Garden of Eden. We heard some remarks about it yesterday. We are having a pleasant time, we are having bouquets [illegible] to us which have been gratefully received.

It must, however, be obvious to all that we as engineers have not as high a standing in the community as the members of the other professions and the question for us to consider is, how are we to remedy the existing state of affairs and how are we to obtain the recognition to which we should be entitled.

At the present time we should, in my opinion, endorse and support the proposed Legislation in the different Provinces. Our next step should be to endeavor to give the students in Engineering a better training in English. Personally, I regret that I did not take an Arts course as a foundation for Engineering. One reason why engineers do not hold their own with other men in the community is due to the fact that they cannot express themselves in good English. This must be patent to all of you who have attended this Convention.

I am referring to this matter from my own personal experience which I am sure is the experience of the majority of the older men present because there are at this meeting so many young engineers. The Engineering student does not see the necessity of study of English and of other subjects that would give him an equal standing in the community with other professional men, he is too busy with his technical duties and is too anxious to get after the almighty dollar. He does not take the necessary time to provide himself with the education that will enable him to compete in the world with those in the other professions.

In my opinion it is this important omission in our education as engineers that detracts from our usefulness on boards of health, commissions dealing with public works, etc.

The nationalization of our natural resources, transportation facilities and other public works are closely connected with engineering, and I hope the members of the profession will give their careful consideration to education and legislation, and prepare the next generation of engineers for taking a more active part in public affairs.

* * *

Professor Gillespie, M.E.I.C., (University of Toronto) I have had much pleasure, as apparently other have had, in listening to this comprehensive paper on the administrative side of public health problems in the Province of Quebec.

Some two years ago a report on sanitation was prepared by the Toronto Branch of the Canadian Society of Civil Engineers in which, among other things, it was suggested that certain of our provincial legislative enactments should be modified so that provincial boards of health should include engineers as well as physicians in their membership. The Committee that prepared the report felt that it would mean something in the way of status to engineers and would result in an improved service if the proposed change could be made. The provincial government of Ontario, to which the resolution was afterwards presented, has changed since then, and doubtless the policy of the administrative department especially concerned. At any rate no change has been made and the anomaly to which Mr. [illegible] has just referred still continues.

We heard a good deal yesterday about co-operation especially between the physician and chemist on the one hand and the engineer on the other. It would be interesting if we could have the personal views of the Institute members on ways and means of securing such co-operation between the physician and the engineer as the [illegible] report contemplated.

* * *

Afternoon Session, Thursday, January 29th.

Vice-President Mitchell, who occupied the chair, called the meeting to order and asked Lieut.-Col. O. M. Biggar, Vice Chairman of the Air Board of Canada to address the meeting on the subject of aviation, "The Policy of the Air Board of Canada". Col. Biggar's address is published in full in this issue of *The Journal*.

Colonel R. W. Leonard opened the discussion stating that there were two gentlemen present who had made a special study of the subject, and who were in a position to do so from the viewpoint of expert knowledge. He suggested that we hear from Gen. Mitchell, who had been studying the matter for twenty odd years and from Prof. McKergow, one of whose subjects at McGill University was aeronautics.

Brig.-Gen. Mitchell traced briefly the development of aerial navigation from the time of the Chicago Exhibition when he had begun to study it, at which time he knew nothing about the problem of aerodynamics or about the scientific principles underlying the aeroplane as we now have it. The stabilizing of the aeroplane had been developed in the early days of the war; a very important feature of the aeroplane service was due to the fact that it was possible to keep in constant communication with headquarters. Such was the development of the aeroplane and so important was this wireless feature, that it would soon be necessary to consider a new section of The Institute's activities in which the aeronautical engineer would find a place. The Institute should also consider to what extent it would take part in this new development.

Major C. M. McKergow, Professor Mechanical Engineering, McGill University, complimented Col. Biggar on the excellence of his address and stated that he was interested in the aeroplane rather than in aerial navigation. His work had been concerned with making the aeroplane more efficient, the engine and the materials which go to make the plane itself. As an engineer he considered there were two functions of the aeroplane which were most important, namely, for forest protection and surveying. This was now being done in Quebec with remarkable success. For exploration work, plotting out new territory and forest ranging the difficulties incidental to the use of the aeroplane for these purposes had been overcome. It is possible that the Federal Government may adopt these methods. He trusted that the Air Board would in their study of their problems realize that the aeroplane must be more perfect in the engine and in the parts, that an impetus should be given to research in metallurgy to develope stronger materials, to improving carburetion and ignition, or possibly eliminating them entirely in an engine, whereby the engine will be one hundred per cent efficient as regards economy and shall give one hundred percent of service, using materials that will not corrode. He believed it was within the limits of metallurgical research to develope materials of strength exceeding those we have at present and if sufficient opportunity were given to the skilled, engineer who was fond of that type of work that an engine might be developed which would eliminate the carburettor and the sparking device, which he understood gave about sixty-eight percent of all troubles in the air. It spoke well of the mechanical part of the construction that the materials, bearings, etc. gave very little trouble. He felt that this wonderful romantic thing capable of flying through the air was worthy of every engineer's earnest consideration.

Col. Biggar replied that during the past three months the Air Board had been in communication with the Research Council of Canada on the subject of aeronautical research and that arrangements had been completed for the appointed for an Air Research Council in connection with the Research Council of Canada which body was holding its organization meeting next week. The Air Board would welcome suggestions with regard to directions in which research might usefully be undertaken.

The reading of his paper "The Pulp and Paper Industry" by Ferd. van Bruyssel, followed by the "Forests of Quebec" by G. C. Piche, A.M.E.I.C., Chief of Forests Service, Quebec Lands and Forests Department, concluded the afternoon session.

* * *

The Final Session

"Although I have attended many engineering conventions," stated an eminent visitor from the United States at the conclusion of the smoker, which wound up the Convention proceedings, "I have never yet attended one where the interest has been more sustained and which has finished with so much pep as has been witnessed tonight." While this in brief summarizes the situation, it fails to give an adequate impression of the friendly atmosphere and the keen enjoyment of those who were able to be present at the rose room at the Windsor Hotel on Thursday evening. Someone remarked, noting the freedom from restraint and the good-natured fellowship, "Surely the spirit of the engineer has changed. He has come out of his shell and has become as human as anyone" —which he has always been, but for a characteristic shyness and reserve.

During the early part of the evening's proceedings, the retiring President was entertaining the President and Council at dinner at the Mount Royal Club and which was made the occasion for the initial meeting of the new Council. Owing to the fact that the afternoon session was concluded rather hurriedly due to the length of some of the papers, resolutions of thanks were passed at this meeting as follows: to the authors of the excellent papers presented during the professional session; to the visitors from the United States who had added greatly to the interest of the meeting and whose messages were appreciated; to President Sise and the directors of the Northern Electric Company for their kindness in entertaining the members at luncheon and providing an opportunity of visiting their splendid plant; to the Chairman, Executive and various committees of the Montreal Branch for the excellent manner in which they had arranged all the social and professional details connected with the Convention. The party from this function joined the festivities at the rose room about eleven o'clock, where they found a joyous crowd entertaining and being entertained.

The college yells were a considerable feature of the programme, the Canadian universities being well-represented, and in this connection no shyness was exhibited in calling attention to the claims of the various colleges. During the evening an excellent programme was given, a number of artists from the various theatres taking part, some of them volunteering their services. The programme, included songs by Bert Mason, vaudeville entertainment by the Wilson sisters, recitations of Dr. Drummond's poems by Mr. Chas. Godwin, cello solos by Mr. J. Beauchamp, and songs by Miss Eleanor Cochrane, Sandy McGregor, Wilkie Bard and Mr. Fisher. The proceedings were concluded by singing God Save the King and Auld Lange Syne.

A prominent member of the Toronto Branch summarized the situation by saying "This has been a great Convention, every one has had a good time. The Montreal Branch has established a record in every direction and I only hope that we can do as well in Toronto if Council decides to have the Convention there next year."

* * *

Convention Notes

"What's the matter with old McGill?", remarked a Varsity enthusiast. The President of *The Institute*, every one of the four Vice Presidents and the two newly elected Councillors from Ontario are all graduates of the University of Toronto.

* * *

There was universal regret during the Convention that Chairman Walter J. Francis of the Montreal Branch, to whose creative capacity tireless energy and unbounded enthusiasm so much of the success of the Convention was due, was confined to his home after the first day's proceedings suffering from severe throat trouble.

* * *

Secretary Calvin W. Rice met many old friends and made many new ones during his three days sojourn at the Convention. His clear-cut statement of the policy of the founder American engineering societies that the first duty of an engineer residing in Canada was to join the national engineering body of this country was greatly appreciated.

* * *

Prof. McKergow's story of the incident when the members were being milled into place for the taking of the photograph at the Northern Electric Company's works, which photo unfortunately was a failure, illustrates what a keen observer he is. The drivers of two grocery sleighs stopped nearby to see what was going on, whereupon one said to the other, "Say Bill, what the hell is the matter?" to which the other replied, "I don't know, but I suppose those blankety-blank fools have gone on strike again."

* * *

The enthusiastic and efficient manner in which the students of *The Institute* and younger members took hold of committee work allotted to them, and particularly in looking after the registration of members and guests, as well as in other ways of activity, including the social side, is such that it is apparent that never again will we hold an Annual and Professional Meeting of *The Institute* in which the young men, will not be given an active and prominent part. It augurs well for the future of *The Institute* to find such an increasing interest being taken on the part of the younger men, and it is evident to those who [illegible] this interest a place in the general activities of *The Institute* should continue to be allocated to them and [illegible].

* * *

Taking advantage of the occasion presented by the Annual Meeting the engineering graduates of the University of Toronto held a "get together" luncheon at the Windsor Hotel at noon on Thursday with over 100 graduates present. This occasion will long be remembered by the graduates and was historic inasmuch as it saw the formation of the Engineering Alumni Association of the University of Toronto with the following officers:—President, Walter J. Francis, M.E.I.C.; Vice-President, Dr. [illegible], M.E.I.C.; Secretary, C. R. Macdonald; Council, [illegible], M.E.I.C., J. B. Challies, M.E.I.C., E. R. Gray, A.M.E.I.C., J. L. Morris, M.E.I.C., G. Reid Munro, A.M.E.I.C., W. G. Chace, M.E.I.C., and W. A. Bucke, A.M.E.I.C. It was decided to hold a general reunion of the Engineering Alumni Association at Toronto next October. Addresses were given by President R. A. Ross, Past President G. H. Duggan and Vice-President Brig.-Gen. C. H. Mitchell.

The Training of the Chemical Engineer

By Dr. R. F. Ruttan, Director of Department of Chemistry, McGill University

The Need for Trained Men

The great field for development of stable chemical industries in Canada is the utilization of those natural resources, both in material and in forces, which we possess in greater quantity or more conveniently situated than in other countries. To develope these available resources, we require trained men. This need not call for a high capacity of original research at first, but rather the adaptation to our conditions of methods, principles and processes already known and well tried elsewhere. This is obviously the function of what we recognize as the chemical engineer, a well trained chemical engineer, a man with sound training in fundamental principles on which is grafted a practical acquaintance with the methods and processes of industrial practice. When, however, the industry becomes more highly developed, a research laboratory becomes essential.

Specialization in Great Britain

The scientific army of Great Britain before the war consisted of a brilliant group of staff officers, perhaps the finest in the world, but England had not learned how to make the most of mediocre ability. She did not recognize that without the scientific rank and file, she could not staff her industrial research laboratories so as to compete with the more elaborate scientific organizations of Germany and America. In England the proportion of university trained men to other operatives in industries was in the proportion of one to five hundred, while in Germany the proportion of university men to other operatives, was in the proportion of one to forty.

The English idea was that the professions of engineering and of chemistry should be kept separate, each specially trained for his field of work, and that a chemical job should be done by a chemist and an engineering task performed by an engineer. This is a point of view still held by many Canadian engineers and chemists, both in universities and in practice. In a discussion on this subject in London a few years ago, Colonel Smithells, a chemist, summarizes this point of view by asking: If they were to produce a chemical engineer, were they going to superimpose engineering on the chemist or chemistry on the engineer? Those who were primarily chemists would oppose the possibility of superimposing any adequate training to make a man worthy of being called an engineer within the time that was practicable, and the converse equally applied. He held that the two should not be combined because the two subjects were too big for one man, save in a few exceptional cases.

This attitude of mind is thoroughly English. It illustrates at the same time the strength and the weakness of the Englishman's character. His thoroughness is shown in that he stands for the mastery of one profession, for the best of its kind and no compromise. His weakness is his reluctance to recognize, because it is not English, the important rôle played in the chemical industries of America and Germany by a class of scientific men who are not highly trained engineers, nor

Read at the General Professional Meeting, Montreal, Jan. 28, 1920.

highly trained chemists, but who are recognized as a class, many of whom have a great deal more in them than a knowledge of chemistry and a knowledge of engineering. They have the right point of view. What is bringing about a change of ideas on this question in England and elsewhere is the difficulty of obtaining co-operation and collaboration between the two scientific forces in the industries.

Specialization versus a Broad Training

They found in England that as the engineer and the chemist become more highly trained and specialized, their paths become more divergent, their point of view more irreconcilable, in short the experience of many heads of works is that the two types are largely incompatible, conflict of authority and absence of co-operation become the rule rather than the exception. A works chemist once defined the average engineer as "an empyric who has been trained on cotton waste and engine oil," while a works chemist has been described by an engineer as "an organic body more liable than any other of similar nature to spontaneous explosions".

Dr. Charles Carpenter in a recent address while referring to inefficiency which results from having the engineer working in a water tight compartment of his own, and the chemist doing likewise, advocated organizing two distinct staffs, under the headship of a chemist on the one hand and an engineer on the other, who would consult with each other and work together.

To illustrate his point of view, he said he looked upon chemists and engineers as the physicians and surgeons of industry, with their respective parts to play in building up and maintaining in increasing strerght the well being of industrial science and extending its usefulness in the service of man. Dr. Carpenter is most unfortunate in his analogy. For every specialized surgeon or physician, the world utilizes at least 100 general practitioners. He forgets that every physician and every surgeon, almost the world over, receives exactly the same university and clinical training for his qualifications. Even in England where separate qualifications are granted, both are trained to be general practitioners, and only after such a training, may one man specialize and become Mr. So-and-so, Surgeon, and the other Dr. So-and-so, Physician; the vast majority of graduates practise as physicians and surgeons.

The chemical engineer is the well qualified general practitioner of the chemical industries; like the physician, his chemical knowledge enables him to see below the surface, to diagnose from physical signs unseen changes and conditions, and from his experience find a remedy for any abnormal reaction. Just as there is a limited number of unseen organs in the human body to be studied and observed, so in a chemical works there is a limited number of more or less invisible operations in chemical units going on, each with its clinical thermometer, pressure indicator, etc., attached, to give early symptoms of any departure from the normal. The engineer in charge, like the surgeon, has to do with the adjustment, repair and alterations of the anatomical units, the works, the accessible outward portions.

Just as minor surgery constitutes a large part of the activities of the general practitioner, so frequent minor adjustments, alterations, improvements and repairs, skilfully carried out, form the larger part of the duties of the chemical engineer. Like the general practitioner, the chemical engineer should know his limitations and when to consult the specialist, the electrical or hydraulic engineer or the synthetic chemist.

No analogy should be carried too far, but I might recall the well recognized fact in the medical profession, that the best specialists in any field of medicine or surgery are those who have spent some years as general practitioners, so the knowledge of the general practice of chemistry and engineering in works is a very sound experience on which to build the expert knowledge of the specialist in either branch of science.

This English prejudice against chemical engineering would seem to be rapidly disappearing, if one may judge from the recent establishment in London of a special Institute of Chemical Engineering, well endowed and under the auspices of the University of London.

The scientific, well informed, young chemical engineer is the crude material from which we may look for the kind of industrial research which the country needs at present, and who, as circumstances or personal capacity will direct, may ultimately become a works manager or research chemist in his special field.

Training the Chemical Engineer

How can the country develope and retain men of this type, is an important question.

During recent years there has been a very prolific discussion regarding the best course of training for the members of this comparatively new profession. It has become generally recognized that progress in industrial chemistry is based upon both engineering and chemistry. It has been further recognized that universities have failed in giving just the right type of education to the chemical engineer. This is due to the fact that the universities are unable to give instruction regarding the control of chemical reactions and the handling of materials in a large way, and perhaps the regular courses in chemistry and engineering have not been adjusted to meet the requirements of men to be trained in both. Some universities in England and in the United States have introduced a certain number of units to illustrate some of the more common processes, such as filtration, distillation, evaporation, etc., on a comparatively large scale, and operations carried on with such apparatus have formed part of the regular courses. This has been found unsatisfactory in the universities for the most part, and the men so trained have been disappointing when actually engaged in chemical works. The universities found that a great part of the time which should be spent in acquiring a knowledge of the fundamental principles of chemistry and engineering was greatly curtailed by attempting to teach, on a small scale, chemical reactions as they are carried out in factory practice. The works manager found that the products of this type of instruction had gained little or no insight regarding operations in the chemical industry by the study of a few miniature units in the university. In most schools of science, both in America and in England, it is obligatory on the part of the students to spend a portion, at least, of their vacation in some chemical or engineering establishment, where they are supposed to see the application of the principles which the university has given them. This is undoubtedly beneficial and of greater practical use than any attempt which has been made to bring the factory to the university by the introduction of plants on a small scale. It results, however, in a very incomplete and one-sided training, one class of work only is obtained during the vacation. The student undoubtedly acquires a more definite knowledge regarding the character of operations on a large scale in this way, but it is confined to one particular type of work, which may be of very little value as a training for his profession. The student is a mere operative, very rarely receiving any attention from the head chemist or manager, who naturally employs him to the best advantage of the firm rather than with a view of training.

The best that can possibly be expected of the university in a course of four years is to give a foundation, broad and scientific, on which the graduate may build his profession, which is really acquired in the industry to which he subsequently devotes himself.

During his undergraduate career, the chemical side of his training should include, besides the ordinary full courses in general chemistry, organic chemistry, qualitative and quantitative analysis, some advanced work in either organic or inorganic, a well illustrated course in industrial chemistry, and above all, he should be thoroughly trained in physical chemistry, for which he should possess a good knowledge of physics. His thermo-chemistry should be linked up with his thermo-dynamics, in connection with his studies of boilers, gas-producers, steam and gas engines, etc. In this way he would acquire ideas of calculation and efficiency. Industrial chemical engineering is essentially applied physical chemistry. In his organic preparations, as well as in his inorganic analyses, the yield should in every case be carefully determined, the efficiency of different methods compared, or, as it has been concisely stated, he should learn to put the dollar mark in his chemical equations.

Essentials in Curriculum

His engineering training, as pointed out by Professor Donnan, could with advantage be specialized and adapted to his proper sphere of work and should include a good knowledge of—

"(a) Physical and chemical properties of materials of construction (wood, metals, alloys, refractories, glazes, enamels).

(b) Methods of testing materials of construction; strength of materials.

(c) Motion of liquids and gases; hydraulics; valves, pumps, etc.

(d) Thermophysics, including heat transfer.

(e) Principles of design and working of all the chief known types of chemical plant and machinery, and a good knowledge of the chief chemical technological processes.

(f) Generation and transmission of power; fuel economy.

(g) Construction of new plant; calculation of costs and design and lay-out of factories.

(h) The use of engineering tools."

But after all, those of us who have had experience as teachers know that the product we turn out from our laboratories depends not so much on the special curriculum studied, as upon the quality of the student. It has been truly said that higher education (and this applies perhaps in a less degree to a technical education) is the only commodity for which people are prepared to pay a large sum and then refuse to take delivery. To make a good chemical engineer, the qualities of industry and accuracy should be supplemented by certain essential qualities of temperament, such as have been described as "sound horse sense, cool quick judgment, power to control workmen, and courage in the face of danger." Without these qualities of character and temperament, no academic or technical knowledge, in my opinion, makes a successful engineer.

The average student is indifferent to his studies. He is impatient of attainment along lines of self-improvement and broad culture. He regards the institution from which he graduates merely as an influence to enable him to obtain a foot-hold in an industry and is satisfied with the minimum requirements essential for his degree.

Many of the larger industries, such as The General Electric in the United States, offer a special training in their works with a view of determining the fitness of the graduate for the engineering profession or for research or the commercial side of the industry. This can only apply to a limited number of men who are turned out each year from the universities, but it is certainly a very effective method of directing the young man, who is on the threshold of life, to the line of work for which he is specially fitted by nature.

The Boston Plan

The average graduate in chemical engineering, who is turned immediately into the industries, has not received, we all recognize, the ideal education and training for a chemical engineer. An additional year of graduate study, in which he could devote some time at least to special research to enable him to acquire more of the scientific habit of mind, would be an enormous advantage to a large class, who would be able to profit by more advanced study. This type would form the material from which to develope the research chemist and the research engineer. After having once entered upon the work of his profession, it is only in very exceptional cases that a man returns to the university for further training in research. Admitting the unsatisfactory and incomplete training which is now being given to the class of men to whom we must look for the development of industrial chemistry in Canada, the time seems ripe for the consideration of some plan which will provide more adequately trained engineers. The plan which in my opinion gives promise of meeting these requirements is an adaptation to Canadian conditions of one which has been developed and is now being tried by the Massachusetts Institute of Technology of Boston. This plan was evolved by a committee of engineers, appointed in 1913 by The Institute, of which A. D. Little was chairman and with whom were associated E. W. Bowditch, Henry Howard and Jasper Whiting. (The description of the character and objects of this course which follows is largely taken from a circular of information issued by the above committee.) It was tried for part of one year and then dropped during the war. This scheme of education is unique and has, up to the present time, so completely realized the expectations of those who brought it about, that I propose directing your attention to it somewhat in detail. "We recognize that the chemical processes we use on the laboratory or factory scale consist of a series of collected "unit" actions, such as pluverizing, mixing, heating, roasting, absorbing, precipitating, condensing, crystallizing, filtering, electrolizing, etc. The number of these basic unit operations is not very large and only a few of them are to be seen in any practical works. The task of the chemical engineer is to determine the conditions of temperature, pressure, etc., under which these actions must be carried out in different processes, together with the construction and design of the apparatus called for by the physical and chemical character of the reacting substances. There is a real demand and necessity for men trained along these lines."

Industry Stations for the Students

To afford an insight into the real problems requiring industrial chemical research, *The Institute* of Technology has extended the course to five years, one of which is spent in study at a number of industries. It has established five or six chemical engineering and research stations in direct contact with important industries. These were selected with a view of bringing to the attention of the engineering student the largest possible number of the unit operations of which chemical processes are generally composed. These stations have a threefold function; first, for the practical instruction of the students in chemical engineering; secondly for the instruction of ambitious foremen and others in the works in the fundamental principles governing their operations; and thirdly, the advancement of industrial research in special industries. The equipment of each station now connected with The Institute, consists of a small building of one storey, which contains a small reference library on matters connected with the particular industry, and a very complete collection of photographs and drawings of apparatus and machinery utilized by that industry, but not installed in that locality; a conference and lecture room to accommodate 15 or 20; a small laboratory with benches for the same number; an office for the station director and a laboratory for specialized industrial research, with space and equipment for one or two graduate research assistants. The cost of such an equipment would reach from $10,000.00 to $15,000.00 in different industries. The total cost of the five stations is not far from $100,000.00.

The industries, with their stations, are located as follows:—

Station A. Bangor, Maine. At the plant of the Eastern Manufacturing Company, makers of electrolytic caustic soda and calcium hypochlorite, cellulose from wood, bond and ledger paper.

Station B. Everett, Mass. At the plant of the New England Gas & Coke Company, makers of gas, coke, ammonia, and tar by-rpoducts.

Station C. Niagara Falls, N.Y. At the plant of the Carborundum Company, makers of carborundum, silicon, and other electric furnace products.

Station D. Stamford, Conn. At the plant of American Synthetic Color Company, makers of phenol, picric acid, dye-stuffs, and coal tar intermediates.

Station E. Northampton, Pa. At the plant of Atlas Portland Cement Company, makers of Portland Cement.

According to the arrangements at the Boston Institute, the students remain at each of these stations for a period of six weeks. They leave the university about the middle of their fourth year and spend the period from January to September in moving from station to station, giving each station a period of six weeks. An instructor is in charge of each station and maintains the same strict discipline among the students as is found at the university. Each day's work is carefully planned and daily lectures on different stages and different units of the process form a part of the system. It is a great advantage to have one accustomed to teaching in charge of the station. From a prospectus issued by the Massachusetts Institute of Technology in connection with their five years course in chemical engineering, the following synopsis of the work to be accomplished has been taken:—

(1) To acquire a first hand knowledge of the processes of the plant and the machines with which it is equipped; the same to be considered as types of the respective classes of operations, and as representative of the application of the principles of science, already studied, to industry.

(2) To study the chemical control of industrial processes through the laboratory, and to acquire ability in the interpretation of laboratory data in terms of factory practice. All of the stations offer splendid opportunities for this most valuable experience.

(3) To obtain a general knowledge of modern methods of factory management and control, together with methods of apportioning cost of manufacture. Instruction in these subjects will be largely by conference, in which officers of the companies at which the stations are located will at times render valuable assistance.

(4) To obtain the wider viewpoint which comes from contact with those who are employed to superintend or carry on the factory operations, and to acquire the degree of confidence in handling industrial processes and large sized apparatus which comes from actual participation in the active work of the plant.

(5) To acquire that inspiration for further work in science and research which intimate contract with large progressive industries inevitably affords.

In Massachusetts the student will return to The Institute to complete his fifth year by following a course of advanced lectures and doing laboratory work, the value of which he will appreciate as the result of his experience in the works. This, in outline, is the object and method of this new plan of educating chemical engineers.

Adaptations to Canadian Conditions

It seems to me quite feasible to apply it in a modified form to our conditions in Canada, where the students will be drawn from all the universities. It will require co-operation among the engineering faculties in Canadian universities on the one hand, and a successful appeal to the captains of Canadian industry. The universities must agree upon the necessity for a five years' course in chemical engineering, and be convinced that one year chiefly spent in training in works is the best way of employing the students' time. Many of the large schools in the United States are already requiring five years for the degree in chemical engineering. It is certain, however, that the success or failure of such a plan will depend very largely on the manufacturers. Without their cordial co-operation and assistance, the plan is obviously doomed to failure. The difficulty of obtaining the permission of the manufacturers and heads of industries to have stations in their works was one which was appreciated by the Massachusetts Institute. They recognized that the keen competition among industries of the same kind has developed a policy of industrial secrecy, a policy which has long dominated the chemical industry and which, up to a recent time, has so greatly hampered the development of industrial research. But it was found that there were really more applications for stations, from industries willing to assume the cost of laboratories, etc., than could be utilized. Only one institution in the United States objected on the grounds of the necessity of keeping their process a secret one. The tendency to-day is in favor of co-operation among similar industries and of pooling information, as well as financial returns. In Canada two industries have already privately signified to me their willingness to participate in this plan. The Honorary Advisory Council for Scientific and Industrial Research has appointed a committee to look into this question, and,—if the general principles are acceptable to the Canadian universities and to the manufacturers,—to formulate a plan for putting in into effect in the very near future. It is well within the duties of this Council to give substantial financial aid, as it seems to me it is a very obvious and effective method of bringing into closer relationship the universities and the industries of Canada, enabling the former to ascertain the important industrial problems of the country, and giving the industries an opportunity of utilizing in part the teaching and research powers of the universities. Not only would this scheme give our students in chemical engineering a range of experience impossible to obtain otherwise, but the stations could offer special courses in the technology of their industry to superintendents, foremen, etc., thus forming a sort of university extension in chemical industry. An added advantage, so far as training is concerned, is that continuous and intimate intercourse would be maintained between teacher and student. The instruction would become a veritable bedside clinic, where an industrial unit would be the patient whose physiology and anatomy is being studied in every detail. The plan lends itself with peculiar effectiveness to the development of industrial research at each station. The director in charge of the station would obviously be a well trained chemist or chemical engineer, who has specialized or intends to specialize along the lines of the particular industry or industries with which he is connected.

Dr. H. C. [illegible] says, in referring to the plan of the Institute of Technology, "the action and reaction thus has brought about between The Institute and the industries cannot be otherwise than highly beneficial to both, and would possess educational advantages not elsewhere to be had, anywhere in the world."

To apply this scheme of training to Canadian conditions will not be as easy when the details are to be worked out. Many difficulties present themselves. In the first place, the total number of graduates in chemical engineering and chemistry in Canada is much less than is annually turned out by the Institute of Technology, hence the field from which we can select is smaller. The average American student is financially better able to spend the extra year, with its additional tuition fees and travelling expenses, than is our Canadian student. Again, few of our industries are on a scale comparable with many in the United States; in other words, the clinical field for instruction is more limited, but these and other suggested difficulties are more apparent than real.

There is little doubt but that industrial chemistry is offering such a future to our technically trained graduates, that chemical engineering is rapidly becoming the most attractive career for the engineering student, and the required number will soon be available. The universities might give the Bachelor degree at the end of four years, and the men leave in May for the works laboratories, remain until the following Christmas, return to their universities, continue their work and receive a Master's degree in Science after the five years. The fees should be made as low as possible and substantial government assistance be given to these training centres. I feel sure that, as at Boston, the obvious value of the practical training would soon create a competition among the students for the privilege of being admitted to the course.

Again, instead of selecting four or five large industries for stations, one or two of the greater industries such as sugar, paper and pulp, cement or starch might be utilized, and the remaining stations placed near a group of kindred industries, each of which would contribute its quota towards the establishment of the station and receive its benefits; such as the groups at Niagara Falls and Shawinigan.

These stations would to a degree act as local scientific bureaus in these centres, while breeding for the country the very class of chemical researchers which Canada needs most, viz. university men whose point of view has been directed to broad problems of industry. The greatest element in the value of a chemical engineer is the element of experience, and this suggested plan gives it.

These stations will, in each of these centres in turn, become the scientific bureau of information and research for the neighbouring industries, and will go far in stimulating an atmosphere of science in those industries in which chemistry plays a part.

Finally, I feel strongly that the chemical engineer so trained is just the type of man to develop our industries. He would be a university man familiar with the engineering problems presented by Canadian chemical industries, whose capacity for initiative and for attacking scientifically an industrial problem, would be many times that of the present science graduate, however adequate his university training may have been.

The Importance of Physics in Engineering Education

A. S. Eve, D.Sc., F. R. S. Macdonald Professor of Physics, McGill University

It is a happy omen of future progress than in the very forefront of your programme you should find time for a discussion on the most important of all problems—the training of future engineers. The real assets of Canada are not so much mines and waterpowers, farms and forests, as the young men and women, boys and girls, who will in a comparatively short time form the next generation, and carry forward the work and duties which we are endeavouring efficiently to bequeath them.

In the first place I wish to emphasize that the art of the engineer is the exalted application of practical physics.

The term "Physics" is still indifferently understood by the public. To some it suggests merely drugs, and the word is wrongly linked with "physician". To others there is some odd connection with "psychics" or "spooks," to which recent utterances of Sir Oliver Lodge may perhaps give some vague colour!

It is a pity that the old name of "natural philosophy" was not retained to indicate the laws and phenomena of mechanics, light, heat, sound and electricity, which have been somewhat artificially separated from the wider realms of science to constitute what is now commonly termed physics.

You find chemists all over the world in every walk of life. The word chemist calls to mind great pioners like Rayleigh, Rutherford and Ramsay, who are also physicists, great industrialists like Solvay, college professors, and so on, down to the vendors of drugs, of alcohols for medical purposes, of cigars and of ice-cream sodas. There are organic and inorganic chemists, industrial chemists, chemical engineers, biological chemists, physical chemists and so forth.

But physicists are rare birds! They flock to universities. They are all professors. To some the name will call to mind the amusing skit of Stephen Leacock, where the physicist not only pays a pushing journalist for the privilege of being interviewed, but actually makes a further payment for the insertion of a distorted effigy in the pages of the journal.

There is however no boundary line to-day between pure and applied science. The physicist and engineer are mutually dependent for ideas, for materials, for appliances.

Doctors, architects, engineers, naval officers, chemists and inventors all recognize that physics is fundamental to their work and training.

In radio work and telephony, in the vast process of electric generation and supply, in the building, maintenance and control of ships, air-craft and submarines, no less in the matter of bridges, highways and railways, we have complicated and involved applications of relatively few fundamental laws of physics, a clear understanding of which is essential to success.

Read at the General Professional Meeting, Montreal, January 28, 1920.

I appeal to my audience, is there anyone here having a sound practical knowledge who does not wish that his theoretical training had been more thorough and complete? And is there present a single man with a wide theoretical knowledge who does not wish that his practical training had been more wide and efficient?

A few examples of the interaction of pure and applied science may suffice:—

Dewar makes a glass vacuum flask to hold his liquid air, and shortly the public find the thermos bottle on the market.

Richardson explores the emission of electrons from hot wires, and soon we derive from Langmuir and others tungsten filaments, nitrogen-filled lamps, Coolidge tubes, and thermionic valves or electron tubes. The whole still in their infancy!

Nor can I refrain from pointing out that in the recent war, men with sound scientific training, blended with common sense, mainly made good. Two examples will be sufficient,—Sir Auckland Geddes; and Brig. Gen. McNaughton, an electrical engineer who became the best counter-battery commander in France.

Those who claim that you can learn physics without previous sound training in elementary mathematics, are throwing dust in the eyes of the public.

A general education, to the age of sixteen or seventeen at least, is of great importance whenever it can be obtained, but this general education should include a most thorough and careful instruction in arithmetic, algebra and geometry given by very capable teachers to our boys between the ages of eleven to fifteen. Are we getting it? Notoriously, no! We want more enthusiasm for education, primarily among parents, so that it may spread to the children. Nor is the social or financial status of our schoolmasters and mistresses at all commensurable with their responsibilities. The Scottish dominie and the bible made Scotland, and it made Scotsmen successful leaders throughout the world. Indeed Scottish education is still the best, and we should study it.

Go where you will, and you will find young representatives of Japan studying and acquiring the be stand most recent developments in Science. Again consider China. Is it for nothing that they sent an order for a quarter of a million of dollars worth of elementary physics apparatus for their schools, to a single firm in Boston?

In Canada, the teaching of Mathematics and of Physics in our schools is very far below the standard necessary to secure the proper developments of our natural resources and to hold for Canada a place, equal to her rights, among the nations.

Also may I venture to point out, that while the literary achievements of the French-Canadian rank high, their scientific training and output are far from standard. France shows the vast scientific possibilities of the race. Would they not do well to import, or train, the ablest possible scientific teachers for their schools and for their universities? After all, education consists mainly in the creation of enthusiasm. Where enthusiasm exists, progress follows, and the driving power in time of difficulty and disappointment becomes so persistent and intensified that obstacles are overcome, and the goal is reached. Hence in a well ordered state the very ablest brains should be devoted to the teaching of the young, and as the youth of a country is the only real potentiality for the future, no pains should be spared for securing the right men as teachers.

Hence we must view with dismay, and take pains to prevent, the danger of large institutions luring with comparatively princely salaries the professors from our Universities. It used to be said that "those who can, do; the rest teach." To which the war has given the lie Direct.

I have spoken of the importance of elementary mathematics, but if time permitted, it would be desirable to emphasize the fact that sound higher mathematics and physics are the keys to the gateway of your profession. It is not sufficient to carry on, but it is necessary to improve, to invent and to develop. We should not be dependent on Great Britain or the United States for such developments or for expert advice, as we are still to a certain extent.

For the ablest students an honours course in mathematics and physics should precede their engineering training, so that men of the highest mental powers, linked with sound practical knowledge, may be available in various branches of engineering. The existing courses are admirable for average students, but our universities and schools are too apt to proceed on the basis, wholly false, that all men are born equal in intellectual powers. In addition to a good general education, we should strive to develop those rarer gifted intelligences to which so much of the real advance of the human race is due.

I cannot refrain however from a tribute to those men, who, returned from the war, having lost in many cases precious years of early manhood most valuable for education, have with the greatest zeal and perseverance resumed their studies and proved themselves excellent students in face of grave difficulties and disadvantages. It will take some years, however, to replace the losses, both of men and of time, so as to replenish adequately the junior ranks of instructors both of our universities and schools.

In conclusion let us consider the desirability of a closer alliance between engineers and physicists, each working in their own spheres, which do however overlap.

The physicist should endeavour to become a better engineer, and the engineer a better physicist. Water tight compartments lead to narrowness of view, and to delay in progress.

The best fire factory in Great Britain was started, organized, and developed by two college professors, the one of engineering, the other of physics. It is a good blend.

Again in the anti-submarine campaign the Admiralty in 1917 found it necessary in various departments to combine together a naval officer, and engineer and a physicist, so that the seaman could determine what was or was not, possible at sea; the physicist could face the essential scientific problem, while the engineer could create and assemble and develop the ultimate solution.

Hence, gentlemen, I trust that the future may find in your institution great engineers who are sound physicists, and great physicists who are sound engineers.

The Water Power Policy of the Province of Quebec, and the Work of the Quebec Streams Commission

By Olivier Lefebvre, A.M.E.I.C., Chief Engineer, Quebec Streams Commission.

Water power policy has been very much discussed in countries well provided with water-falls and rapids during the last twenty years. While only one of the factors to be considered in a water power development scheme, it may be such that the scheme cannot be financed, and under this condition water power development is stopped altogether.

Before stating the law of Quebec and the rules the province has adopted in connection with the water powers within its territory, it is advisable to explain the legal status of the rivers in this province.

Who Owns the Rivers

Article 400 of the Civil Code declares that navigable and floatable rivers and streams and their banks are considered as being dependencies of the crown domain. It follows that there are two classes of rivers, those that are navigable and floatable, and those that are not navigable and not floatable. The bed of the rivers in the first class is the property of the Crown and consequently, the water powers thereon located are public domain.

The bed of the rivers of the second class is the property of the owners of their banks as far as the middle of the stream, provided the ownership of the bank was acquired before June 1st 1884. Since the latter date, the sales and free grants of Crown Lands are and have been subjected to the reserve of a strip three chains wide in favour of the Crown. Therefore the river bed is owned by the Crown, except in that part of the province where shore lots have been sold before 1884.

It may be of interest to note here that in the valley of the St. Lawrence, the king of France has made certain

Read at the General Professional Meeting, Montreal, January 28th, 1920.

land grants, known as "Seignieuries," and few of these grants include the bed of the rivers. On the other hand, in 1898, the Privy Council decided that in the public harbours the river bed is the property of the Federal Government.

There is no definition of the expression "navigable" and "floatable," and the interpretation of the law has given rise to serious litigation.

The questions naturally arise:

Must the river be navigable and floatable?
During all of the open season?
On its whole course, or part only?
At high water, or at low water?
For large or small boats, for loose logs or rafts?
What shape of boats and what drafts?

In order to avoid litigation, the party acquiring a water power site must, when the shore has been sold before 1884, buy the Crown rights and the rights of the riparian owner.

Water Power Policy of Quebec

Power sites in this province have been disposed of in various ways. From 1867 to 1897, no water powers have been sold as such, but mill sites were sold outright for a nominal sum. At that period, the transformation of water power into electricity was in its infancy, and no great importance was attached to the falls and rapids on our rivers.

From 1897 to 1907, when notable progress was made in the design of generators and the transmission of current, the sale of water powers was largely increased. They were sold outright for what was then considered high prices, and somewhat more severe conditions were imposed, such as the obligation of spending a large amount of capital within a few years. The Shawinigan Falls were sold under these conditions.

This policy was later the subject for much criticism. It was argued that such valuable resources as those represented by water powers should be kept for the people and not vested in private interests. However, in the opinion of the writer this policy was completely justified. The development of water power was to a certain extent an experiment, the water wheel was far from having the efficiency which it has to-day, and the capitalists willing to invest money in such development deserved full encouragement. It is doubtful if they could have financed their power schemes had they not been assured that the improvements carried out would be on a property for which they had a clear title.

One danger of this policy was that as the value of the water powers increased, certain sites might be acquired without any development being proposed, but for the sake of holding the property for speculation purposes. This could be remedied, and was, to a large extent, by stipulating that a certain amount had to be spent for development within a certain time.

From 1907 to the middle of 1910, some water powers were sold and others were leased. A sale took place in the case of small powers only. From the middle of 1910 to date, water powers have been leased for periods of seventy-five and ninety-nine years,—in one case only the lease extending over a period of sixty-two years.

However, in the case of small powers not exceeding two hundred horse-power, the Government sells for a definite sum the bed of the river with the shore rights, and the water powers included. Prior to Law 7 George V chapter 22, article 1636, it was not possible for the Government to sell public land which was included in a territory licensed for timber cutting. Now, this power is vested in the Lieutenant-Governor in Council when such land is necessary to the development of the leased water power. Since March 16th 1916, all concessions of river beds may be made only with the authorization of the Lieutenant-Governor in Council, (article 1524a, 6 George V chapter 17.)

The administration of the water powers of the province is under the Department of Lands and Forests, more particularly through its Hydraulic Service Branch, of which Arthur Amos, member of this Institute, is the Chief Engineer.

The policy which prevails is the following:—

1. Water powers are leased for a period of 25 to 99 years, according to the importance of the power and the capital required for development.

2. The payment for the land granted of a fixed annual rental covering the term of the lease.

3. A supplementary annual rental which may vary from ten to thirty-five cents per horse-power developed, according to the facilities or difficulties of development. This supplementary rental may be revised every twenty-one years.

4. A delay of two years to start development, and two more-years to begin the production of power.

5. A deposit guarantee.

6. The lessee must submit plans of the proposed works and report to the Department of Lands and Forests as to the amount of power developed in the plant.

In the case of rivers which are navigable and floatable, the lessee must submit his plans to the Federal Government which has to protect the interests of navigation.

All water powers which, at mean low water have a capacity of two hundred horse-power and over have been declared of public interest, and the owner of such water powers may proceed to the expropriation of adjacent lands required for the proper development of its property, but this expropriation cannot be exercised against an industry previously established, or waterworks supplying the whole of part of a municipality. (Articles 7287, 7288, 7289, Revised Statues of Quebec, 1909.)

A law was passed in 1918, chapter 66, amending articles 7295a of the Revised Statutes of Quebec, which stipulates that the plans and specifications for works proposed in streams of the province must be submitted to the Lieutenant-Governor in Council for approval. Before 1918 it was not possible to build dams for storage purposes unless authorized to this effect by a bill of the Legislature, but in 1918 a law was passed, article 7300a, by which such works may now be carried out, provided the plans and specifications have been submitted to the Lieutenant-Governor in Council and approved.

Such is to-day the water power policy of the Province, and it is claimed that it affords safety for capital invested. It assures the public of a share in the value of these natural resources, and it prevents any speculation in that development being imposed within a definite period under penalty of the lease being cancelled and the deposit confiscated.

The writer believes that water power development should be encouraged as much as possible. Among our natural resources, it stands in a class by itself. In his work, "Conservation of Water by Storage," George Filmore Swain divides natural resources into three classes, as follows:—

1. Those resources which are not renewable, and in which utilization, even though without any waste, necessarily destroys the store available for future generations. Such are coal, oil, gas, phosphates, and other mineral deposits. Every particle of these resources which is utilized diminishes by so much what is left for our successors.

2. Those resources which are self-renewing, though at a comparatively slow rate, requiring considerable time for a complete renewal. In this class are included the forests, which may be entirely cut down, but which will ordinarily reproduce themse lves in time.

3. Water power falls in a different class from either of the above, and seems to occupy a place by itself, having several peculiar characteristics. In the first place, while resources of the first two kinds, if not utilized, are in general store and preserved for the use of future generations, water power if not utilized is constantly wasting, with no good results to anybody.

While, as stated before, the conditions under which water powers may be acquired from the Crown are only one of the factors which make their development desirable or not, this factor may help that development or it may retard it to a large extent.

Capital will not invest where the conditions are drastic or arbitrary, and it is not assured of proper protection by definite conditions covering a long number of years. It is claimed that the policy followed by the Province offers capital every guarantee of safety.

The amount of power there is available in Quebec has been estimated by Mr. Amos, Chief of the Hydraulic Service, as being five million horse-power, not including any territory above the fiftieth degree of latitude. As to the amount of power in the latter territory, no reliable estimate has been made.

Amount of Power Developed

A census of water powers developed in the Province of Quebec in 1918 was made by the Hydraulic Service. It was found that the amount of power installed was 822,274 horse-power. (See Statistics of the Province of Quebec for 1918, page 421.) And this total does not include any station generating less than one thousand horse-power. It is estimated that, should the smaller developments be included, the amount of hydro-power installed in the Province must be 875,000 horse-power. Statistics prepared by the Dominion Bureau of Statistics, in collaboration with the Dominion Water Power Branch and the Hydraulic Service of Quebec, published recently, state that on the first of January 1918, the primary power generated by water in this province was 579,532 horse-power, or 257 horse-power per thousand of population. The statistics compiled by the Province mention the capacity installed, while the Dominion Statistics mention primary power. The capital invested in the central electric stations in Quebec was at that time $130,000,000. The total revenue from the sale of power at these stations was $14,350,000, and new installations contemplated were estimated at about 200,000 HP.

Work of the Quebec Streams Commission

The writer now comes to a field with which he is much more familiar than the subject dealt with above.

The Quebec Streams Commission has done a large amount of work which has made very important power sites considerably more valuable, both in the case of developed and undeveloped water powers. This Commission was appointed in the latter part of the year 1911. Its powers were defined by Law 1 George V, chapter V, 1910, and among the duties it was called upon to perform, there are the following:—

1. To devise just and practical rules respecting the flow, the drawing off, the disposal, the distribution, the storage and generally respecting the preservation and management of running waters in the Province of Quebec.

2. To consider whether it is expedient to have the rivers of the Province classified as navigable and floatable rivers, and rivers which are not navigable nor floatable, classified by an administrative commission or otherwise, according to uniform rules, and to submit such rules, if it be advisable.

The Commission is formed of three members, the chairman and two commissioners. The chairman is the Honourable S. N. Parent, former Prime Minister of this Province. The two commissioners were, at first, Messrs. Wm. I. Bishop, Civil Engineer, and Ernest

Belanger, Civil Engineer, both Members of this Institute. Since the death of Mr. Bélanger, Arthur Amos, Chief Engineer of the Hydraulic Service at Quebec, Associate Member of this Institute, has been appointed Commissioner.

The first work which The Quebec Streams Commission was called upon to make was an investigation of the characteristics of the rivers of this Province and, in 1913, it submitted a report recommending that the said rivers be classed as being public or private property,—according to the area of their watershed. It recommended that the expressions "navigable" and "floatable" be eliminated, that all rivers having a drainage area of three hundred square miles or over should be public property, and that all rivers with an area less than three hundred square miles should be private property.

The most important work which the Commission has performed to date is the regulation of the flow of the St. Maurice river and that of the St. François river. In the case of the former river, a complete control of the water supplied by a drainage basin of three thousand six hundred fifty square miles has been established near the head waters of the river. A few details regarding these works and the results obtained therefrom should prove interesting.

The St. Maurice River Flow Regulation

The St. Maurice River flows into the St. Lawrence at Three Rivers, about half-way between Montreal and Quebec. Its drainage area is 17,000 square miles and the river is about 365 miles long. The difference in level between its head waters and its mouth is approximately 1300 feet. This grade is distributed in a large number of rapids and some high falls,—the most important of which are

The Grès	44 feet
Shawinigan	135 feet
Grand'Mère	40 feet
La Tuque	90 feet
Rapid Blanc	210 feet
Rapid des Cœurs	93 feet
Rapid Allard	55 feet

Of these powers, full developments have been carried out at Shawinigan under a head of 150 feet, and at Grand'-Mère under a head of 75 feet. At the latter point, the natural fall is forty feet, but by building a high dam the water is backed up about 25 miles and small falls and rapids are flooded.

Under natural conditions, the minimum flow of the St. Maurice river at Shawinigan was six thousand cubic feet per second. It reached the absolute minimum of five thousand two hundred second-feet, but for a few days only during the period 1900-1912. Daily records of the flow of this river at Shawinigan have been kept by the Shawinigan Water & Power Company from 1900 to date. As the demand for power was increasing largely, the need of increasing the minimum flow was felt, and the St. Maurice Hydraulic Company, in 1910, built three small storage dams on the Manouane river,—a tributary to the St. Maurice river into which it flows near the Indian post at Weymontachingue, about 188 miles above Shawinigan. These small reservoirs paved the way of the regulation on a larger scale as carried out by the Commission, for they had proved that the water which was let out from these small dams in winter reached Shawinigan with comparatively little loss. This possibility had been doubted somewhat.

In 1912, the St. Maurice Hydraulic Company Limited applied to the Legislature for authorization to carry out a storage scheme in the upper St. Maurice. The Government did not deem it advisable to grant the power demanded, but it decided the The Quebec Streams Commission was the proper party to look into the question and carry out the scheme if it was thought desirable. After a thorough examination of the whole question, it was decided to build a dam at the foot of a large series of lakes at a point two miles above the falls called "La Loutre." The construction of the dam was started in 1915 and it was completed in the month of December 1917. The cost of the total scheme, including the acquisition by the Commission of the three storage dams on the Manouane river, amounts to $2,500,000.

As a result of the control of the waters by this dam, which is now called "the Gouin Dam," the minimum flow of the river is kept at twelve thousand second-feet at Shawinigan. Thus the primary power capacity of the plants at Shawinigan and Grand-Mère has been doubled.

For the benefits derived from the storage, the power companies are paying to the Government an annual sum amounting now to $191,000. This annual revenue will be largely increased when other water powers are developed'

The capacity of the reservoir created by the Gouin Dam is estimated to be one hundred and sixty billion cubic feet, and it is the largest power reservoir in the world,—having about twice the capacity of the Assuan reservoir in Egypt. It is, however, exceeded by the Gatun reservoir built in connection with the Panama Canal,—the capacity of which is one hundred and eighty three billion cubic feet, but it is only fair to say that part only of this water can be used for supplying part of the Panama Canal. The capacity of some of the largest reservoirs in the world are:

Gatun	183,000,000,000 cubic feet
La Loutre, St. Maurice	160,000,000,000 cubic feet
Assuan, Nile	78,000,000,000 cubic feet
Roosevelt, Salt Lake	52,000,000,000 cubic feet
Pathfinder North Platte	45,000,000,000 cubic feet
Shoeshone, Shoeshone	20,000,000,000 cubic feet

The area of the lakes and the rivers affected by the Gouin Dam is two hundred and nine square miles, and with the reservoir full the area of the lake will exceed three hundred square miles. The water is backed up a distance of one hundred and thirty-five miles above the dam.

The amount of power due to the storage has been calculated by using the flow curve of the lowest year during the period 1900-1912—that is the year 1906, and the figures arrived at were 22,000 horse-power years in the case of Shawinigan, and 16,000 horse-power years in the case of Grand'Mère. It is estimated that the low water power possibility of the St. Maurice river has been increased by about four hundred thousand horse-power.

The control of the head waters of the St. Maurice river is also beneficial to the lumbering trade in this valley. The flood waters in the spring are not so high and the minimum flow is very much increased. Therefore, the driving of logs down the river may be carried out under better conditions. Water may be supplied for the log drive at a time when it is not required by the power companies and when it is needed to destroy log jams which are formed at certain rapids. For example, this year, (1919), early in July, about one million and a half logs were jammed and aground in the rapid Blanc, about thirty-five miles upstream from La Tuque. The Commission was asked to help the Association out of this difficulty by giving a shot of water. The Gouin Dam was opened to discharge thirteen thousand six hundred second-feet during twelve days, raising the water to nearly flood conditions. All of the jammed timber was brought out of the rapid and floated down to La Tuque in about two weeks.

River St. François

The next storage scheme which the Commission was called upon to study was the partial regulation of the discharge of the St. François river, by a control of water supplied to lake St. François and to lake Aylmer, both near the head of the river.

Lake St. François is located six miles east from the town of Disraeli and about ten miles south-west from the town of Thetford Mines. River St. François has a drainage area of four thousand one hundred square miles and drains the largest part of the Eastern Townships. It flows into the St. Lawrence at the head of lake St. Peter and runs through the towns of Disraeli, East Angus, Sherbrooke, Windsor Mills, Richmond and Drummondville. The distance between Lake St. François and Lake St. Pierre is about one hundred and twenty miles, and the slope is practically nine hundred feet. This slope is distributed through numerous falls and rapids, making the river very desirable for the development of power. In facts, power plants are located as follows:—

At Disraeli, St. François Water Power Co. . 40′ head
Disraeli, The Champoux Company . . . . . 30′ "
Weedon, City of Sherbrooke . . . . 30′ "
East Angus, Brompton Pulp & Paper Co. Ltd. . . . . 30′ "
Bromptonville, Brompton Pulp & Paper Co. Ltd . . . . 30′ "
Windsor Mills, Canada Paper Company, Ltd . . . . 16′ "
Drummondville, Southern Canada Power Co. Ltd . . . . 30′ "

By the construction of a dam at the outlet of lake St. François, a complete control of the water running from a basin of 172 square miles has been secured, and this water is being evenly distributed throughout the year at the rate of six hundred cubic feet per second. The minimum flow from this lake, under natural conditions, has been measured at one hundred second-feet. The minimum flow from that source has therefore been increased by five hundred second-feet.

Lake Aylmer is located immediately below the town of Disraeli at an altitude of practically one hundred feet below that of lake St. François. Its drainage area is one hundred and thirty-five square miles, and its run-off is controlled by a dam at the outlet of the lake near the village of St. Gérard. It has been calculated that this lake will supply one hundred and fifty second-feet above its natural minimum flow.

The dam at Lake St. François can raise the water twenty-seven feet above natural low water, and the dam at St.Gérard can raise the water twelve feet above natural low water.

The storage capacity of the reservoir created by lake St. François dam is four hundred and thirty-eight square miles, or 12.2 billion cubic feet. The reservoir is filled up in the spring.

The cost of the storage scheme on river St. François amount to $700,000. Of this capital cost, the power owners who reap benefits from the storage have been called upon to pay a yearly rental which covers the interest charges, the sinking fund within a period of thirty years, the cost of maintenance and repairs and a reasonable profit. The amount necessary to cover the above mentioned items is $59,000. The benefits to be derived by each company using the storage water could not be ascertained as no records of the flow of the river were available, and any figures as to additional power due to the storage could only be approximate. In the case of the St. Maurice river, it was different, our calculations were made from complete data. But in this case, to avoid any discussion or litigation as to the benefits derived, it was decided to divide the charges according to the head under which the water was used multiplied by the increase in the minimum discharge. This is called the "second-foot-head method." It is used by the Wisconsin Valley Improvement Company to distribute the storage charges between the various power companies on the Wisconsin river. For example, the storage reservoir of lake St. François supplies five hundred second-feet above the natural minimum flow. This water is used by the St. François Hydraulic Company under a head of forty feet. The charge of this company would be calculated as being 500 x 40 = 20,000 second-foot-head. The companies which have their power plants located below lake Aylmer receive an additional 150 second-feet and, in the case of the Brompton Pulp & Paper Company Limited which uses that water over a head of 85 feet, the proportion would be 650 x 85 = 55,250 second-foot-head. The rate was therefore fixed at fifty cents per second-foot-head. Some of the plant owners have signed contracts and others have accepted the tariff just mentioned.

River St. Anne de Beaupré

A smaller storage scheme has also been carried out in the watershed of the river St. Anne de Beaupré, to increase the minimum flow at St. Ferréol, Seven Falls, where the Laurentian Power Company operates a plant under a head of four hundred and ten feet. The minimum natural flow of the river at that point was one hundred and sixty-five second-feet, and it is hoped to raise that minimum to two hundred and over.

This storage is provided by a dam at the outlet of Lake Brulé and gives a control of the run-off from a watershed of twelve square miles only.

The Commission is contemplating additional storage on this river.

Other Activities of the Quebec Streams Commission

The other activities of The Quebec Streams Commission have been a complete study of the valley of the Chaudière river, in the Beauce district, where disastrous floods occur occasionally. On the 31st of July 1917, after very heavy rains, the water rose thirty-two feet in less than twenty-four hours. The Commission has been called upon to make a full report on the possible prevention of such disasters, and this report is now being prepared.

The Commission has also made a complete study of the possibilities of Lake St. John as a storage reservoir. It was found that by a suitable control at the outlet of this lake, it was possible to keep the minimum flow of the Saguenay river at twenty-two thousand second-feet without causing any damage to lands, wharves, etc., around the lake. Such a storage would make possible the development of six hundred thousand horse-power on the river Saguenay, above the town of Joncquières. Lake St. John has an area of three hundred and fifty square miles, and drains a watershed of thirty-thousand square miles.

The Commission has also made a complete study of the possibilities of creating a storage reservoir in lake Kenogami, west of the towns of Chicoutimi and Kenogami. This lake has an area of twelve square miles, and there is at present partial regulation under the control of the Chicoutimi Pulp Company. Lake Kenogami has two outlets; one into the river Chicoutimi which flows into the Saguenay river at Chicoutimi about ten miles from Kenogami; the other outlet is through the river Aux Sables which flows into the Saguenay at Kenogami. Lake Kenogami is about four hundred and seventy-five feet above the level of the Saguenay river; its two outlets are well provided with falls and rapids. On the Chicoutimi river, water powers have been developed and are being used by the Chicoutimi Pulp Company to operate their large pulp mills. On the river Aux Sables, Price Brothers Limited have developed water powers for the operation of their pulp and paper mills at Kenogami. The cost of storage in Lake Kenogami was estimated at $1,800,000 in 1916 but, under present conditions, it is believed that its cost would be nearly $3,000,000. The question as to whether this work should be carried out or not is now under consideration.

Among the other activities of The Quebec Streams Commission, there is the study of a certain number of undeveloped water-powers, namely on the St. Maurice River on St. François River, on Bell and Harricana Rivers in the Abitibi district, and on the Manicouagan, Aux Outardes and Natashquan rivers on the north shore of the St. Lawrence.

The Commission has also started systematic gaugings of a certain number of rivers in the province. This field of investigation is being enlarged every year, and it is the aim of the Commission to extend it over the whole of the Province.

Results of Work Done

Beneficial results have been already obtained through the water conservation policy inaugurated by the Government. Very important industries have located in the St. Maurice valley, namely: at Shawinigan and Three Rivers, owing to the large increase in the power possibilities of this valley. On the river St. François, plants are now being constructed at Drummondville, Richmond and Sherbrooke, in which several million dollars must be invested and where two or three thousand hands will be given employment.

As mentioned above, the money invested by the province in the conservation of water is a very profitable investment, not only through the charges which are made to the power companies using the water, but through the industrial prosperity which the said policy will contribute largely to bring here.

The Evolution of the Public Roads Problem in the Province of Quebec

[illegible], B.A.Sc., A.M.E.I.C.

—I—

Historical development of the roads administration

1—The Grand Voyer

From the early days of the colony, up to the year 1841, the roads were under the control of an officer called "Grand Voyer," appointed to this duty by the intendants under the French rule and by the different governments under the British rule. It was but a continuation of a policy existing in France at the beginning of the Colony. (1)

This officer had a complete jurisdiction over all the roads of the Province. He had under him, the "députés grands voyers" also appointed by the same authority as the Grand Voyer. (2)

The duties of those officers consisted in looking after all the matters pertaining to roads:

1.—The location of the new roads, their alignments and construction, and also the construction of culverts and bridges. (3)

2.—Their maintenance and the maintenance of bridges and culverts. (4).

3.—The regulation of the traffic. (5).

4.—The ferries and the fares to be collected on same. (6).

5.—The maintenance and the location of the winter roads. (7).

When a settlement wanted a new road, a bridge or a culvert to be built, or when a complaint arose as to the bad condition of the road, etc., an inquiry was held at once by the "Grand Voyer" or one of his "députés." He got into touch with the interested parties, discussed with them, gave the alignment of the new road, determined the settlers who had to contribute to their construction or maintenance as well as the share of each of them. That share consisted generally in statute labor and material in the case of a construction or reconstruction and in assigning to each one a certain portion of road to maintain when a question of maintenance arose.

The officer then made to his intendant or government a written report in accordance with the provisions of which the latter issued its regulations. The enforcement of those regulations was generally entrusted to an officer of the militia. Did anybody refuse to comply with them, another person was engaged to do the work and the expense incurred paid by the defaulter (8).

The same policy existed in France in the seventeenth century and at the beginning of the eighteenth, when it was replaced by statute labor. (9).

A—Bill of 1796

In 1796 a bill entitled "Bill for the construction, repairs and relocation of roads and bridges in the province" was passed by the Legislative Assembly of the Lower Canada. This bill confirmed the state of things that had been existing since the early days of the colony. It stated among other things that all the king's roads and the public bridges were to be built and repaired under the supervision of the Grand Voyer or his assistants in each district of the province.

That law received but a few modifications of little importance, and remained in force until 1841.

B—Special Committee of 1827 and first government contributions

In 1827, a special committee of the Legislative Assembly was instituted to investigate the conditions of trunk roads and other internal communications, and advise as to the best means of building and repairing same. The committee made reports in 1828 and 1829. In one of its reports it was suggested that the control of the roads should be transferred from the "Grand Voyer" to the inhabitants, but not before the formation of the new counties. (11).

Among the reasons set forth in this report for this change was that the system then existing did not favor the opening of new roads often badly needed, on account of the settlers having to defray the expenses of the Grand Voyer which they could not afford to do. (11).

It was also suggested that financial aid be granted by the government for the construction and repairs of the most needed main roads in order to provide easier intercourse between the most important settlements, which up to that time had remained more or less isolated. Contribution by the Government was also suggested towards the betterment of the market roads leading to the city of Quebec, Montreal and Three-Rivers.

The year 1832 was the first in which a certain substantial financial aid was given from the public treasury as an aid to the improvement of the roads in our province. The work done was of a rather general character, widening, grading, improvement of the drain-

age, paving with corduroy of the soft spots, a little of gravelling and macadamizing (12). The total amount of money so contributed from 1833 to 1867 in the Province of Quebec was about $1,433,220.98 on the main roads and $1,353,713.88 on the toll roads. The total mileage improved was as follows: 1168.64 miles of general improvement of which 1141.86 miles on the main roads and 26.78 on the toll roads; 182.96 miles were macadamized of which 30.75 miles on the main roads and 152.21 miles on the toll roads, 38.5 miles were covered with corduroy of which 37.50 miles on the main roads and 1.00 on the toll roads. (13).

2—*Creation of the municipal councils:*

In 1840 were created the municipal authorities. (14) The transfer of the authority from the Grand Voyer to the municipal councils was about the only change of any importance that this new organization brought about with regard to the roads administration.

3—*Comparative study of the different systems of road administration:*

The old system prevailing under the direction of the Grand Voyer continued to be practically the same under the direction of the municipal authorities. It consisted generally with regard to the front roads (les chemins de front) in assigning to each property owner the maintenance of that piece of road running between the limits of his property, and with regard to the by-roads (les routes) the maintenance of a length in proportion to the area of the property of all of those most interested in said road. This system is still in force in about five hundred municipalities of the province, the others having adopted the money tax system.

There was an exception to this general system of road maintenance by individual portion in the English settlements. The settlers of English descent brought with them a system that was in favor in their mother country, the Statute Labor System. It was maintained under the Grand Voyer and under the municipal authority and it is still in force in a few municipalities of our Province, those which have not yet adopted the money tax system.

A.—*Maintenance by individual portions:*

1.—*Advantages:* It permits to each farmer, by his personal attention and work on his portion, to gain his share of the cost of the maintenance.

2.—*Disadvantages:*

a) Lack of maintenance of many sections through the negligence of many farmers or through their being too far away from their own portions.

b) Lack of proper maintenance through the ignorance of the best means and of the best time to do it.

c) Lack of uniformity, as a result of work being done by too many individuals without proper supervision and direction.

d) Lack of equity. As a matter of fact, through this system it often happens that a farmer has a portion of road of a natural good gravelly and solid soil, which requires almost no maintenance to be kept in very good condition, when another may have his portions in a heavy clay soil which requires a great deal of work to be properly maintained.

B.—*The statute labor system:*

1.—*Advantages:*

As in the previous system it permits to each farmer to be able to gain his share of the cost of the maintenance.

2.—*Disadvantages:*

a).—The difficulty of having the roads properly maintained at the right time specially during those periods of the season when the work on the farm requires all the farmer's activity.

b).—Difficulty in having good men at work, the superintendent not having the liberty to choose the best, apart from that not having the proper authority over them, the work cannot progress in a satisfactory manner.

C.—*The money tax system:*

1.—*Advantages:*

a).—More facility for carrying out the work on a business basis.

b).—Better workmanship.

c).—More uniform and better maintenance.

d).—More complete equity to every one concerned.

2.—*Disadvantages:* It has none.

The only complaint that we hear is from the municipalities that have tried it for a short time only. The rate-payers complain about the excessive cost to them. They then accuse the system, when the real cause is a lack of organization, or the great amount of work necessary at the start to put all the roads in proper shape after they have been more or less neglected under the old system.

– II –

Quebec Government Roads Policy and Progress of its Public Roads Improvement during the last Fifteen Years

The individual section and the statute labor systems of maintaining and improving roads were the only two in force in the Province up to the year 1907. For the reasons given above, neither system could bring about any real good results and as a consequence the roads were generally bad. The situation was accepted as an unavoidable fact on account of the lack of financial means to do the necessary improvements, and apart from that the ideas and conditions then existing, good roads were not so much needed as they are at the present time. But the progress and the present needs of agriculture, commerce and industry, the rapid growth of luxury among all classes of society have changed the conditions of our social and economic life. The necessity for the farmers to go every day to the butter or cheese factory, the necessity for him to go on the roads with his heavy and varied agricultural implements, the neces-

ity for him to draw his produce to the market or the railroad station at the most convenient time when he can obtain the best price for it, the progress of education with a better understanding of the need of better schools and of a more regular attendance, the growing necessity of bettering our rural life to stem the move of the rural populations towards the cities, the advent and the rapid development of the automobile, truck and bus traffic and of auto tourism, in short the rapid advance and change of all the economic and social activities during the last part of the nineteenth and the beginning of the twentieth century, have brought to the forefront at the Government most the necessity of the improvement of the rural roads.

1.—*The Act of 1907.*—

The Quebec Provincial Government, well aware of these facts, passed its first road Act which was given the Royal assent on March 14th 1907.

The Government in passing this act, as well as all the following acts and amendments had two main objects in view:

a).—To grant substantial financial aid towards the maintenance and improvements of roads.

b).—To induce the different municipalities to do away with the old individual portion system and the old statute labor system of maintaining the roads and to adopt the money tax system.

The Act of 1907 provided for a grant of $400.00 to each municipality for the improvement and maintenance of their roads on the conditions that said municipality spent an equal amount and provided that the municipal council "passed a by-law ordering that all the municipal roads at the charge of the rate-payers of the said municipality shall be made, improved and maintained at its expense, with moneys levied by direct taxation upon all taxable property of the municipality".

Only two municipalities in each county could benefit by the subsidy in any one year.

2.—*The amendments of 1908.*—

The two main provisions in these amendments of the act of 1907 assented to April 25th 1908 provide that:

a.—The $800.00 allotted to each county could be distributed amongst all the municipalities of the county on the following basis: Three eighths of the total amount were to be distributed among all the municipalities of the county which had spent at least $200.00 in maintenance and construction, and the rest divided in proportion of the amount spent by each of them.

b.—If one municipality had done improvements on its roads for an amount in excess of $800.00 with the money tax system, besides the subsidy mentioned above, it could profit by a grant of half the excess, but this subsidy could never be more than $500.00.

3.—*The amendments of 1909.*—

These amendments brought no change in the amounts of the subsidies.

4.—*The amendments of 1911.*—

Summarized they are as follows:

a).—For the improvement and maintenance with the money tax system: half the expenses, but the subsidy cannot exceed $[illegible]. The two first municipalities in a county that pass a by-law ordering the money tax system, are entitled to a subsidy of three quarters of the expenses incurred instead of the half, but the subsidy for the first municipality cannot exceed $[illegible] and for the second one $[illegible].

b).—*For the macadamizing and gravelling of [illegible] roads.*—

If a municipality has done work for an amount exceeding $[illegible] with the money tax system and has done some macadamizing or gravelling, it is entitled to a subsidy equal to half the amount spent in excess, but that subsidy cannot exceed $1000.00 for a macadam road and $[illegible] for a gravel road.

c).—*For the macadamizing and gravelling of main roads.*—

A rural municipality that has done work for an amount exceeding $800.00 for maintenance and improvement under the money tax system and has done some macadamizing or gravelling on its main road, "may receive from the Minister of Roads out of the appropriation placed at his disposal, a special subsidy in addition to that mentioned above".

This Act which is commonly known in our Province as the Act of 1911 or the 50% Act is still in force.

5.—*The good roads Act of 1912 and amendments.*—

1.—*Local roads.*—The act that has the most contributed towards the advancement of the roads improvement in our Province is the Good Roads Act of 1912.

According to this Act and its amendments, a municipality to benefit by it shall:

"a).—Pass a by-law which shall come into force on the date mentioned ordering the macadamizing, stoning or gravelling of the roads therein described;

b).—Thereafter apply to the Government, by resolution, after a previous understanding with the Roads Department as to the amount thereof, for the sums necessary for the making or improvement of the roads described in the by-law passed in virtue of paragraph *a* of this section.

Such resolution shall authorize the mayor and the secretary treasurer or clerk to sign in favor of the Provincial Treasurer, as soon as the Government is ready to supply the necessary money, forty one coupons containing a promise on the part of the municipality to pay annually, at the time fixed by the Provincial treasurer and mentioned on each coupon, three per cent interest on the sum mentioned in the resolution.

The resolution shall also provide by means of a special tax or otherwise for the payment of the three per cent interest on the sum which may be supplied by the Government."

The Lieutenant Governor in Council may authorize the Provincial Treasurer to contract, from time to time, such loans as may be thought necessary to carry out this act, but the said loans shall not exceed in the aggregate either under this act or under the act George V, chapter 23, section 1, the sum of twenty million dollars.

B.—*Provincial Roads:*—

"19.—The Lieutenant-Governor in Council may also authorize the Minister of Roads to cause to be made or reconstructed, with such material as may be thought proper, new roads or roads already existing in the Province, to connect central points of importance.

The payments required for this work shall be made by the Provincial Treasurer upon a certificate of the Minister of Roads or of the Deputy Minister of Roads.

20.— 1.—When the Lieutenant-Governor in Council decides to make a new road or to restore an old one, he may:—

a).—Fix the place thereof and do all the preliminary work therefor;

b).—Take possession of any road whether subject or not to municipal authority;

c).—Acquire any land that may be necessary in accordance with the law of the Province of Quebec relating to railways and, in default of an understanding with the proprietors or their representatives, expropriate the same in accordance with the provisions of the said law, mutatis mutandis, at the instance of the Minister of Roads, but the judge of the district where the land is situated may always, on such conditions as he thinks just, grant immediate possession;

d).—Fix for each municipality crossed by the said road its share for each mile or part of mile, built or restored within its limits and payable after the completion of the work, provided such share has been determined by resolution of the municipality, and such resolution shall not thereafter be changed, except with the consent of the Lieutenant-Governor in Council;

e).—Settle what the work of building or restoration shall be, and what ought to be classified as part of the cost of such building or restoration;

f).—Determine and change the direction, width, outline and level of such road, the site, dimensions, materials and manner of construction of the roadway, embankments, bridges, drains, guard rails and other road work forming part thereof; deviate and alter water-courses and ditches crossing or paralleling such road; for the drainage of such road, direct and dig water-courses and ditches, lay drains and sewage canals across and along such road and across all lands; remove all posts and conduits;

g).—Approve any agreement that may be made, by way of resolution, by the council of any municipality, with the Minister of Roads, for the construction of the section of the road running through such municipality.

2.—When the resolution mentioned in sub-paragraph *d* or *g* of paragraph 1 or in paragraph 3 of this section has been passed by the municipality and approved by the Lieutenant-Governor in Council, the secretary-treasurer or clerk of the municipality shall provide, at the time of the preparation of the general tax collection roll, if such roll is made within the three months following the approval of the resolution by the Lieutenant-Governor in Council, and otherwise by a special collection roll, for the collection of the moneys necessary to meet, in whole or in part as mentioned in the resolution the payments of the contributions or of the loans occasioned by such contributions.

3.—All resolutions passed before the coming into force of this act, providing for a contribution by municipalities for their share in the improvement of their roads shall be valid, as soon as approved by the Lieutenant-Governor in Council, and cannot thereafter be changed without his consent.

6.—*The Maintenance Act of 1916:*—

The work of maintenance of our improved roads, whether gravel, stone or built in any manner considered permanent is becoming more and more important in our Department. The Provincial government in deciding to spend great sums of money for the improvement of roads in the province, not only took the necessary step in view of the work being done with wisdom and economy but had also in its mind that the money so spent should be considered as a good investment, and as a consequence foresaw the necessity of aiding the municipality in taking proper care of the work done with the sums invested.

As a consequence, in order that the improved roads shall be properly taken care of it passed the Maintenance Act of 1916.

There are two main provisions in the Act.

A.—*The provincial roads:*—

It provides that "out of the sums put at his disposal, each year, by the Legislature, for the improvement and maintenance of roads, the Minister of Roads may, at any time, in the manner he deems suitable, have the work done that is necessary for the improvement and maintenance of the provincial roads.

He may also fix the amount of the contribution that may be exacted from the municipalities traversed by such roads for the work so done, provided that such contribution shall not, for any municipality, be more than fifty per cent of the cost of the work done within its boundaries. Such contribution may be recovered by the Provincial Treasurer, by action in his name, as soon as the Minister of Roads has fixed the amount. The certificate of the Minister shall be final and shall establish beyond dispute that such debt is exigible from the municipality in question.

B.—*Local Roads:*—

"Out of the sums put at his disposal, each year, by the Legislature, for the improvement and maintenance of roads, the Minister of Roads may, each year, grant to any rural, local, village or county municipality, a subsidy of not more than fifty per cent of the expenses incurred by such municipality for the improvement, repair and maintenance of its roads, whether gravel, stone or built in any manner considered permanent; provided that such subsidy shall not exceed, in any year, the sum of four hundred dollars.

After having made an advance estimate of the cost of the work of improvement, repair and maintenance, the Minister of Roads shall communicate such estimated cost to the municipality interested, by notice, by registered letter, addressed to the mayor of such corporation. He shall at the same time indicate the method to follow in the performance of the work, as well as the delay within which it must be commenced, and that within which it must be finished.

Upon receipt of the notice above mentioned, it shall be the duty of the mayor to summon immediately, for the earliest possible date, a special sitting of the council of the municipal corporation, to take into consideration the communication of the Minister, unless a general sitting of the council is to be held at an earlier date.

In the seven days following the special or general sitting, as the case may be, it shall be the duty of the secretary-treasurer of the municipal corporation to forward to the Minister of Roads, by registered letter, a certified copy of the resolution passed by its council at the said sitting. If the municipality decides to itself perform the work directed by the Minister, its resolution must mention the date at which the work will be begun; the said resolution shall be the only formality necessary to order the performance of the said work.

If such date is deemed by the Minister to be too far distant, or if the resolution is not forwarded within the delay fixed in the notice, or if the municipality, having decided to do the prescribed work itself, neglects to commence at the date decided upon, or, having commenced, does not proceed therewith with satisfactory diligence, or again if, by the resolution, the Minister of Roads is requested to have the work done himself, he may, without further notice, take the necessary steps to have the same done at the expense of the corporation interested.

In the case mentioned in paragraph *c*, the cost of the work may be recovered by the Provincial Treasurer, by an ordinary action taken in his name, as soon as the Minister of Roads informs him of the amount.

The certificate of the Minister of Roads shall be final, and shall establish beyond dispute that such debt is exigible from the municipality in question.

As soon as the Provincial Treasurer has informed him of the amount due by a municipality for work done by the Minister of Roads under paragraph *c* of this section, the secretary-treasurer of such municipality must immediately, in accordance with the provisions of the Municipal Code, prepare a special collection roll, and collect the amount claimed, either from the whole municipality, or only from the properties liable for the maintenance of the road where the work was done, according as the road by-laws in force in the municipality provide."

The Act of 1907 with its amendments of 1908, 1909 and 1911, commonly known as the Act of 1911 or the 50% Act; the Act of 1912 known also under the name of the Act of 3%, and the Maintenance Act of 1916 are the three now in force in the Province.

What is given above is only a summary of the main provisions.

7.—*How these Acts were received by the public.*—

It is generally recognised that all peaceful reactions, even the most commendable, leading to the destruction of very ancient practices have always had to proceed at the beginning with a respectful wisdom and a smooth slowness on account of the obstacles of all kinds met. This truth had to apply more specially to the Province of Quebec, to the French Canadian race, one of the most estimable qualities of which is to be an extremely respectful of its traditions.

As stated above, at the date of the passing of the first act to come into aid to the municipalities towards the betterment of their roads, there still existed in the Province the two old systems of road administration: the individual portion system (ou porte de route) and the statute labor system, the latter existing only in a few municipalities of the Eastern Townships. The difference between the individual portion system and the money tax system was evidently greater than between the latter and the statute labor. Besides that, the individual portion having always been in use since the beginning of the Colony, not a few farmers firmly believed their road sections were their own private properties. However, in 1911, when the government decided to vigorously carry on its good roads policy, it started an education campaign to get the people perfectly acquainted with the Good Roads Acts by sending a few lecturers all over the province. This campaign lasted only one year. The people very quickly understood the advantages offered by the government and the necessity of changing their mind. Suffice to say that the progress has been so satisfactory that for many years, instead of the government going to the municipalities to offer its proposition as in 1911, it is the municipalities that come to the Government.

8.—*Financial aids granted by the Provincial Government towards the improvement of Roads.*

A.—*Earth roads.*—

In conformity with the Act of 1907 and the amendments of 1908, 1909 and 1911, the Government has given in aid towards the ordinary improvement and maintenance of earth roads from 1908 to 1919 inclusive the total sum of $743,352.02.

The earth roads still constitute over 90 per cent of all the roads of the Province and will for many years to come remain a large proportion of the total mileage. It is for this reason that the government has given to this question its serious consideration.

As the municipalities, to profit by the government aid, has to spend at least an equal amount, I can state that at least one million and a half dollars have been spent for the improvement and maintenance of our earth roads from 1908 to 1919, or an average of about $1[illegible].00 per year. To profit by the grant the earth roads must be properly graded, well drained and perfectly maintained. Besides that the expense incurred by the municipality has to be paid out of moneys levied by direct taxation. There are now 589 municipalities or a little over half of the total that have done away with the old system of maintenance and construction to adopt the money tax. There was a total of [illegible] rural municipalities in the Province in 1919.

In the course of the season of [illegible], [illegible] miles of earth roads have been permanently improved as such. In 1918, $[illegible] have been contributed by the government as an aid to the municipalities towards this work.

B.—*Gravel and other permanent roads:*—

In accordance with the Act of 1907, and its amendments of 1908, 1909 and 1911, the government has contributed the total sum of over \$262,949.57 for the gravel roads built from 1910 to date and over \$187,132.72 for macadam roads or a total of over \$450.082.23. As the municipalities have paid at least an equal amount, I can say that at least \$1,000,000 has been spent on the roads built under this Act. I did not have time to compile the exact figures, but I know that they are close enough.

In accordance with the Act of 1912 a total of \$19,378,770.14 has been spent for the construction of gravel, waterbound, bituminous macadam, asphaltic and cement concrete roads to date. So a total amount of about \$20,378,770.14 has been spent for the construction of these so called permanent roads in the Province from 1910 to date. As we have at the present time, 3008.38 miles of road so improved, the average cost per mile is about \$6774.00.

Roads built during the last season of 1919:—

Gravel roads	341.77	miles
Waterbound macadam	93.94	"
Bituminous macadam (penetration)	5.87	"
" concrete	3.07	"
Cement "	6.75	"
Total	451.40	miles

Besides the sums mentioned above for the improvement of the so called permanent roads, substantial aids have been granted by the government for permanent improvement on earth roads, the construction of concrete bridges, retaining walls, rip-rap, concrete culverts, maintenance of trunk roads, the purchase and repairs of road machinery, etc.

From the first of July 1912 to the 27th of November 1919 a total of \$23,694,681.39 has been spent for the general improvement of roads in the Province.

We have now a total mileage of trunk roads built of over 350 miles, and besides that the government has now under consideration for the future an approximate total mileage of 1700 miles.

The total mileage of all the rural roads of the Province under the municipal control and outside of the cities is about 40,000 miles. As we have 3008.38 miles of road improved with either gravel, waterbound bituminous bound macadam, asphaltic or cement concrete, about 8% of all our roads are then so improved.

It is generally admitted that about 80% of the whole traffic uses but 20% of the total mileage.

In our province, as the mileage of the roads improved which generally are the most important and the most travelled, constitute 8% of the total, we can easily state without fear of being far from the truth that 40% of over whole traffic goes over our improved roads.

9.—*Work done in conformity with the maintenance Act of 1916 on the improved roads.*

A.—*Maintenance of trunk roads:*—

The trunk roads finished to date are:—

The King Edward Highway, from Montreal to the Boundary at Rouse's Point.

The Montreal-Quebec Highway, from Montreal to Quebec on the North shore of the St-Lawrence River.

The Levis-Jackman Highway, from Levis to the Boundary of Maine, near Jackman, through the Chaudière and the Rivière-du-Loup Valley.

The Sherbrooke-Derby Line Highway, from Sherbrooke to Derby Line at the Boundary.

Montreal-Chambly Highway.

Part of Fraserville-Edmonston Highway, from Rivière-du-Loup to the Boundary of New-Brunswick.

All these trunk roads are maintained by section men under the control of a Superintendent appointed by the Department of Roads. This organization has given very satisfactory results.

B.—*Maintenance of the Macadamised or Gravelled Roads by Municipalities:*—

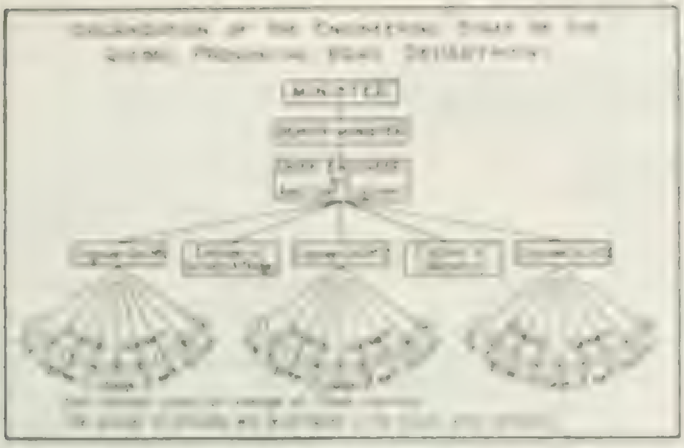
"As a rule, the corporation coming under the law followed the engineer's recommendations with good grace. I must state that if, in certain places, the necessity of maintenance was not realized at once, in others our hopes have been exceeded and our intervention has even been forestalled. We are convinced that such good dispositions will spread throughout the Province. Moreover, we are fully resolved to be firm in enforcing this law which is so necessary for the preservation of the work done in the past five or six years." (Extract from the Minister's report of 1917).

The following summary of the work done in this direction will be sufficient to show that the Minister has kept his word:

During the year 1917, the first of the putting into application of the law, instructions were given for maintaining or repairing macadamized or gravelled roads to 183 municipalities, 94 of which, or about 51% have been able to do work.

During the year 1918, instructions were given to 118 municipalities, 67 of which, or about 57% have been able to do work.

During the year 1919, instructions were given to 336 municipalities, 204 of which, or about 61% have done work on a total length of 535.57 miles of macadamized or gravelled roads. I think that those figures are sufficient to show that the increase has been satisfactory, and that the people is getting more and more convinced every year of the necessity and the economy of taking proper care of what has been done.



– III –

Present Organization of the Engineering Staff of our Provincial Roads Department and Summary of its Work

1.—*The Chief Engineer and Assistant Chief Engineer:*—

They have to prepare all the necessary standards, to look after all the plans, estimates, specifications and approve them, make personal inspections of important works going on, etc.

2.—*Three District Engineers:*—

The Province is divided into three districts with an Engineer in charge of each of them. They have charge of all work going on in their respective district, construction, maintenance and repairs with the aid of their Division Engineers. Besides that they have to prepare, with the aid of their assistants and clerks, all the estimates and specifications in conformity with the reports of the preliminary inspections done in the municipalities by their Division Engineers. Upon the receipt of the necessary information from the Division Engineers on the conditions of the improved roads in different municipalities they have to prepare the necessary specifications or instructions for the proper maintenance or repair of these macadamized or gravelled roads; they have to direct and follow the work of their Division Engineer and inspectors; make frequent inspections, etc.

3.—*The Division Engineers:*—

Each district is divided into eight or nine Divisions with an engineer in charge of each. These Division Engineers have charge of all the road construction, maintenance and repairs in their respective division each under the direction of their respective District Engineer. They have to be familiar with all the road work that is going on in their respective division, construction and maintenance by means of frequent personal inspections. They have to keep themselves perfectly informed as to the conditions of the old gravelled and macadamized roads and make the necessary reports to the respective District Engineers, they have to make the preliminary inspections of the work to be done in every municipality that wishes to profit by the government financial aid and submit a complete report to the District Engineer who has to look after the work of improvement of the earth roads and the maintenance of these earth roads in the municipalities that have adopted the money tax system and wishes to profit by the financial aid of the government, etc.

4.—*The Engineer of Bridges:*—

The Engineer of Bridges has to make all the standard plans, plans of culverts and bridges, retaining walls, etc.

5.—*The Laboratory Engineer:*—

Our Department has its own laboratory in charge of an Engineer.

In our laboratory are made the tests of nearly all the materials that are used on our roads construction.

Suffice to say in order to give an idea of the activities of the laboratory that during the year 1919 the following tests have been made on:

248	samples	of stone
73	"	of sand for concrete
837	"	of gravel for gravel roads
52	"	of gravel for concrete
16	"	of cement
2	"	of culvert concrete
10	"	of bituminous materials

As it is, the organization of our engineering staff, it may be possible to improve but so far it has given very satisfactory results, and all the road work done with government financial aid adequately controlled.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. March 1920 No. 3

As Others See Us.

Adherence to the strict traditions of the profession in Canada would prevent repeating any comments of a favorable nature made regarding the work of *The Institute.* But, inasmuch as modesty of an extreme variety has been a curse to the profession, it seems high time that we should, as President Ross stated at the annual banquet, do a little blowing on our own account. At the moment, however, this seems unnecessary, since we have received at the hands of one whose official position, expert knowledge and intimate contact with the entire range of engineering society activity, place him in a unique position to pass judgment, a high measure of favourable comment. We refer to E. J. Mehren, Editor of the Engineering News Record, who was kind enough to come to Montreal and who attended every session of the annual and general professional meetings.

In the issue of the Engineering News Record, February twelfth, page three hundred and eighteen, under the caption "Impressions Here and There," Mr. Mehren comments on the meeting held in Montreal, and in a manner calculated to give every member of this organization a greater pride in *The Institute,* although every active member from Sydney to Victoria knows that there is still much to be done. In a comparison between the advancement made by *The Institute* as a result of the changed conditions of the past three years, Mr. Mehren advocates the adoption of similar measures by the American Society of Civil Engineers since the tangible and evident results of the changes made by *The Institute* have in every way justified such action.

He remarks favorably on the part that the young men are taking in the affairs of *The Institute,* and expresses satisfaction with the nature of the meeting being a combination of business and professional.

Continuing, Mr. Mehren says, "As to the conduct of the meeting as a whole we can well take a leaf from our Canadian friends' book. From the convening of the business meeting on Tuesday morning, to the singing of "God Save the King" at the close of the concert-smoker Thursday night, the proceedings went with a snap that left nothing to be desired. The serious parts of the programme were relieved by entertainment, both frequent and varied, resulting in a sustained interest and spirit that are difficult to describe without suspicion of exaggeration. There were luncheons Tuesday and Wednesday noon, a reception and dance Tuesday night, a banquet Wednesday night and the concert-smoker Thursday night.

The last event, the concert-smoker, we might particularly copy. The room was amply large, and, mercy of mercies, chairs were provided, gathered suggestively around tables. By contrast, we are still suffering from flat-foot from standing all evening at the Am.Soc.C.E. smoker. And on the tables were bottled goods that cheered—now banished from these arid states. The entertainers were first-class—both professionals and amateurs—led by Wilkie Bard, the famous English comedian, who was playing in the city at the time. Added to it all was a spirit of fellowship that made the company one—from the contingent of men of French descent who sang the praises of Laval, to the last son of McGill or the University of Toronto or Queen's who added his voice in the deafening volume of his university yell. We are sure that everyone went away with the feeling that *The Institute* was a very real thing—something that helped him to come close to his brother engineer and to work with him for common objects.

Before we left we fished an invitation to come next year. We do not see how Toronto, where the next annual meeting is likely to be held, can possible excel the hospitality and enthusiasm of Montreal, but the Toronto men somehow, we well wager, will do it as well. But whatever the programme, if the good Lord spares us, we mean to be there."

Biographies of Engineers

Is it not possible for *The Engineering Institute of Canada*, now that its future and prosperity are quite well assured, to do something to encourage the preparation and publication of memoirs of those engineers who have been prominently identified with Canada's major engineering undertakings? In Canadian biographical history so far as the writer has observed, the work of engineers whose vision and industry have had something to do with Canada's present day status, is for the most part only indirectly recorded. When one considers that the publication of the thirty-two volume historical series, "Chronicles of Canada" was undertaken as a commercial enterprise without endowment of any kind and has proved itself a profitable venture, the present proposal does not seem to be beset with insurmountable difficulties.

In the first place such biographies would be a distinct contribution to Canadian History. In this country where distances are immense, physical features formidable and climate rigorous, the problems of exploration, transportation and development were beset with special difficulties. The men of both nationalities who have overcome these difficulties were in a very real sense makers of Canada, much of the history of whose achievements is the essence of romance. Much of the required information can be obtained from government and other reports, much of it from private correspondence, some of it from personal recollection.

In the second place there would be in a series of well-written memoirs a real inspiration for young Canadians. Who can read the charming biographies of British engineers by the late Samuel Smiles without being touched by the faithful portrayal of human strength and weakness? Who can read without a thrill the story of the optimism, the disappointment, the final success and withal the uncompromising integrity of the late William Hamilton Merritt in the promotion and construction of the first Welland Canal; or the finished diction of the gifted Fleming as found even in his reports on the location and construction of the Canadian Pacific Railway, without admiring the genius, the versatility and the humanity of the man? Then there are Keefer, Robinson, Ross, Dawson, Robb, to mention only a few. They are the men who explored the wilderness, bored the mountains, harnessed the cataracts, developed the national waterways. They are the men, who, disregarding precedent, attempted the impossible. As such they are worthy prototypes for young Canadians, especially those who are more concerned with the character of the service they render than with the immediate reward that service may bring. The recital of their contribution to the nation's development will have served its purpose if, in the words of the biographer of the late George Westinghouse, "it conveys to the young man of today a sense that his career will depend for success less on the splendor of its start than on the spirit in which he pursues it; far less on capital than on courage, on worry than on watchfulness, on 'pull' than on persistence."

In the third place, *The Institute*, by making available these narratives would be vindicating that fine sentiment appearing monthly on the cover page of this *Journal* wherein its policy is declared to be "to enhance the usefulness of the Profession to the public."

Such biographical work should preferably be undertaken by sympathetic workers of the same craft, that is by engineers. The writer believes that there are men in the Profession in Canada who possess enough of the historian's patience and the biographer's artistry and sufficient of the discriminating faculty to qualify them for undertaking what to many would seem a doubtful though rewarding work.

Peter Gillespie, M.E.I.C.

Engineers and Engineering

The matter of professional status is just now seriously engaging the attention of engineers, not only throughout Canada, but in Great Britain and the United States.

In the former, the Institution of Civil Engineers, the leading, largest and most conservative organization of engineers in the world, has at last awakened to the extraordinary fact that even at the end of the second decade of the Twentieth Century *Engineering* has not been recognized as a *Profession*, and at the insistence of a large majority of members the Council of the Institution will introduce a Bill at the next session of the Imperial Parliament to correct this peculiar condition of affairs.

In the United States, within the past couple of years, Acts have been passed in the legislatures of nearly a quarter of the total number of States of the Union compelling engineers to submit to examination of their qualification or their credentials and to register before having a legal right to practice.

In many other States the movement in the same direction has reached various stages and it is anticipated by the American Society of Civil Engineers, which is watching the campaign with the greatest interest, that within a very short time engineering throughout the whole Union will be placed on the same footing, as to status and responsibilities, with other professions.

Some twenty-six years ago the question came up before the Canadian Society of Civil Engineers (now *The Engineering Institute of Canada*, with a membership of over 3,500, in every branch of the profession and every Province of the Dominion), and it was thoroughly discussed in all its bearings.

It was felt that though an engineer was just as useful a member of society as a doctor or a lawyer or a member of any other profession; while he had to go through just as thorough and severe a training, it was a "sad" and an anomaly that he had no recognized legal status. While a man who had no medical training could not lawfully call himself a doctor, nor a man without legal knowledge advertise himself as a barrister, any man was free to call himself an engineer without let or hindrance. There was no authority to question his right to the title or to demand evidence as to his training, experience and capability. His profession had no place or recognition in the laws and statutes of this or any other country.

Every member of the Society was consulted by circular letter and expressions of opinion sought from men whose opinions were valuable. While some members thought that the time was inopportune and while it was realized that the difficulties in the way of legislation were very great, the Society was practically unanimous as to the desirability of some statutory recognition of the profession with the ultimate objects, not only of protecting the individual engineer, but of raising the standard of qualification and of protecting the public from unqualified men and quacks.

The net result of all that discussion and deliberation was a Bill drafted under the advice of the best legal and Parliamentary talent in the country, for presentation in the different Provincial Legislatures of the Dominion. This was necessary because, under the *British North America Act*, Federal Legislation on these lines would be ultra vires in the Provinces.

The measure became law in Manitoba and Quebec and there is little doubt that it will be embodied in the Statutes of every other Province in the near future.

The Bill was introduced in the Legislature of Nova Scotia in February, 1897. It was pretty thoroughly discussed in the Committee of the House of Assembly and it passed that House without a dissentient vote, but for some unknown reason it was "deferred" by the Legislative Council.

For various reasons no further attempt to secure Legislation in Nova Scotia has been made since 1897.

The whole question is now again very much to the fore.

In April, 1919, a Committee of fourteen engineers, representing all branches of the profession, and all Provinces of the Dominion, met in Montreal under the auspices, and at the expense of, *The Engineering Institute of Canada*, and after a week's strenuous labours, and with the best legal advice, they drafted a new Bill.

Its most conspicuous and important feature, which differentiates it from the Bill of 1897, is that Engineers are to be recognized, licensed, registered and given legal status by the several Provincial Legislatures by and through the agency of an Association of Engineers to be created in each Province quite independently of all existing Societies and Organizations of Engineers.

This Association of Engineers will be framed on parallel lines to those of the several Provincial Medical and Bar Societies and clothed with corresponding powers and functions in the admission, and examination of candidates for admission to the Profession. The principle of an entirely independent regulating body was adopted as a basis of the Bill, with the object of eliminating or forestalling opposition that might develop in individual Societies or Organized Bodies of Engineers, of which there are several in the different branches of the Profession throughout the Dominion.

Engineers in all Provinces are now lining up for a vigorous and concerted campaign to introduce the Bill as nearly simultaneously as possible into their respective Legislatures.

To one who gives the matter any consideration it seems strange—even an anomaly—that engineering the world over is not legally, or by legislative enactment and statute, recognized and established as a profession.

To the question "Is engineering a profession or not?" there can surely be none other than an affirmative answer. If, therefore, it be a profession a further question suggests itself. "Why is it not on all fours with other learned professions, e. g., Law and Medicine?" And to this question the answer is not so easy to find. In the first place it must probably be sought in, or associated with, the fact that it is not only the newest of the professions, but its scope is very much wider than that of others and it is more difficult to discriminate between an enginer and a layman than between a doctor or a lawyer and a layman. This difficulty, however, is almost wholly due to the main fact that the engineer is not recognized as a professional man.

The newness of the profession, however, does not consist in the novelty or unprecedented character of the works designed and constructed by engineers, for the pyramids of Egypt were built several thousand years ago; the wonderful aqueducts found in those parts of Europe that were once the Roman Empire—some of them indeed still in use—were built many centuries ago. All these great works, involving prodigious expenditure of time, labour and cleverness, bear eloquent testimony to the fact that engineering skill is no modern or recently discovered faculty. The men who designed and built the pyramids and the aqueducts may not have been called engineers and they may not have belonged to any guild or association of arts and crafts, but they certainly were possessed of some, at least, of the highest qualities and attributes of the most eminent, up-to-date practitioners. Especially will this be apparent when we further consider that in those ancient days neither steam nor electricity had been discovered—at least we believe not—and the builders of those mighty works had not—so far as we know—the advantages of the methods, arts, tools and appliances now regarded as indispensable to the construction of great Engineering works.

Engineers consider theirs to be not merely the noblest, but, so far as utility and modern material development are concerned, the most important Profession. They claim that the qualities that go to make the skilful and successful engineer are of a higher order than those possessed by the successful representative of other professions; that the education, training and general ability indispensable to a successful career as an engineer are at least equal to those demanded by success in other professions. And these claims cannot be called either arrogant or baseless. The civilized world ha ever been and is to day more than ever and still ever increasingly dependent, to an utterly unrealized extent, on the work of the engineer. He is the creator of our roads, railways, canals, docks, harbours, bridges, water works and drainage systems, power developments, engines and machinery of endless variety; the getter and converter to useful purposes of the riches of the mine and the quarry; the designer and builder of ships and aeroplanes. Without the engineer the world would stand still, figuratively and literally.

There is more justice than is generally admitted in his claim to have been largely instrumental in bringing about a triumphant issue to the war. In this great job the function of the military engineer and the civil engineer over-lapped and merged. In a narrow sense the works of the military engineer are confined to the design, construction and destruction of fortifications, guns and other things of a strictly warlike character, but in the recent Armageddon he added his talents and energies to those of his unmilitary colleague in the construction of roads, railways, bridges and other essentials to transportation.

It may here be remarked that the adjective "Civil" as applied to engineers was adopted, or applied, about a century ago to differentiate the nonmilitary from the military engineer, and while it has lost its original distinctive meaning it is still in common use or misuse. The term civil engineer is nowadays very generally and quite inappropriately applied to the men engaged in the design and construction of roads, railways, bridges, harbours, water and drainage works, etc. The builder of works, machinery and appliances for electrical development is called an electrical engineer. He who as a trained and scientific expert conducts mining operations is called a mining engineer. The man who designs engines and machinery a mechanical engineer, and so on, but all these men are civil engineers, because they are not military engineers and the modern tendency is to delete the word civil and substitute for it the word professional, to distinguish the man of high scientific training and knowledge, capable of designing and supervising the construction of engineering works of all kinds, from the mechanic, mechanicien, or skilled artificer whose function is primarily or mainly the *operation* of engines and other machinery. In common parlance the man that drives a locomotive or operates an engine of any size, from a two or three horse power motor for actuating a gasoline boat, to the engine of many thousands of horse power that drives an "Olympic" at thirty knots, is an engineer, and many men in the higher grades of these activities are engineers or professional engineers, beacuse they have undergone long and thorough scientific training and are capable, and often engaged in the design and construction of costly hgh-powered machinery. On the other hand the majority of them are not, properly speaking, engineers, or at least they are not professional engineers and the general public has yet to be educated to discriminate and draw the line between the mere mechanic and the super mechanic or the engineer *par excellence*.

The specializing of engineering is strikingly paralleled in the other leading profession . There are lawyers who devote their talents and energies exclusively to parliamentary and constitutional matters, others to corporation affairs, others to criminal procedure, others to conveyancing and so on. Similarly in medicine, a medical man who makes obstetrics a specialy would not undertake to remove a cataract from an eye, nor would an oculist undertake a midwifery case, and a specialist who devoted his attention to the ear and nose would not amputate a limb, nor could a dentist pretend to advise in a case of cancer or tuberculosis—if they were honest men.

In engineering the specializing is carried to an even greater degree. An engineer making railway building his specialy would not undertake to design and install an electric plant. An engineer who designs and superintends mines and mining machinery would not undertake to design or construct a dry dock. One that made the design of engines a specialty would not advise on a scheme of harbour or river improvements. The electrical engineer would not be consulted in a case of water supply or sewage disposal and the bridge expert would not be called in to advise on a piece of difficult tunnel work. But all these specialists are engineers, unvisersally recognized as such, because they all "direct the great sources of power in nature for the use and convenience of man" (from the charter of the Institute of Civil Engineers of Great Britain founded a century ago and today having a membership of about 10,000, representing every branch of the profession and every country in the civilized world.)

In furtherance of the movement for increased status a general meeting of nearly fifty engineers was held in the Rooms of the Board of Trade, Halifax, on Wednesday evening, the 7th inst.

After an earnest and thorough discussion of the matter it was unanimously and enthusiastically decided to proceed with the campaign as energetically as possible and the Committee that was appointed last October was re-elected and empowered to take the necessary steps to introduce their Bill at the next session of the Provincial Legislature. The decision of the meeting was fortified by the receipt of letters from about forty engineers in various parts of the Province outside Halifax cordially endorsing the movement.

In view of the tenor and objects of the Bill, which are not merely to raise the standard and qualifications of engineers and to elevate engineering to the proper status as a legal, recognized and properly constituted profession, but to protect governments, corporations, capitalists and all other employers of engineers from ignorant and unqualified practitioners and to place upon the shoulders of individual engineers a due and proper responsibility for their acts and works, it seems to be, to the ordinary layman, at any rate, difficult to adduce valid reasons why their efforts should not be crowned by success.

C. E. W. DODWELL, M.E.I.C.

Engineering Legislation in Quebec

The Quebec Act which has been operative under the Canadian Society of Civil Engineers has been transferred to the Association of Professional Engineers of Quebec formed recently of the corporate members of *The Institute*.

Inasmuch as the Quebec Act as such is a provincial measure giving powers to an organization operating under federal charter it has been considered by eminent legal authority that the federal body could not carry out the provisions of the Act. Following the formation of the Association of Professional Engineers in Quebec the approval of the Council was given for the transfer of the operation of this act to the new body. On Saturday, February fourteenth, the Legislative Assembly of the province of Quebec sanctioned Bill number one hundred and sixty seven being "An act to amend the Revised Statutes, nineteen hundred and nine, respecting civil engineers" as follows:—

"His Majesty, with the advice and consent of the Legislative Council and of the Legislative Assembly of Quebec, enacts as follows:

1. Article [illegible] of the Revised Statutes, 1909, is amended:

a. By replacing paragraph [illegible] thereof by the following:

"a. The expression "the Corporation" means the corporation of professional engineers of Quebec.""

b. by replacing the word " society," in the second line of paragraph *b* thereof, by the word " corporation;"

c. by replacing the word " society," in the second line of paragraph *c* thereof, by the word " corporation."

2. The following articles are inserted in the Revised Statutes, 1909, after article 5116 thereof:

5116*a*. The present members of *The Engineering Institute of Canada* formerly " The Canadian Society of Civil Engineers," domiciled and practising in the Province of Quebec, and all other persons whom they may in the future, join to them according to the provisions of this section, shall form a corporation under the name of " The Corporation of Professional Engineers of Quebec " with all the rights and privileges granted by law to ordinary corporations.

5116*b*. 1. Its affairs shall be administered by a council composed of eight members elected in the manner provided by the by-laws of the corporation.

2. It shall have the right to adopt by-laws for the proper administartion of its affairs; to fix the annual contribution of its members; for the election of the members of the Council; for the guidance, the honour and the dignity of its members ; for the admission to study and practice of the profession, in conformity with the provisions of articles 5119, 5120 and 5121; for establishing fees for professional services; for the admission to practice of persons who are members of *The Engineering Institute of Canada,* domiciled outside of the Province of Quebec; for its affiliation to *The Engineering Institute of Canada,* and for all other objects necessary for the proper working of the corporation.

The tariffs of fees hereinabove mentioned shall not come into force until approved by the Lieutenant-Governor in Council and published in the *Quebec Official Gazette.*

" **5116*c*.** The seat of the Corporation shall be in Montreal.

" **5116*d*.** The members of the Executive Committee of the Provincial Division of Quebec of *The Engineering Institute of Canada,* shall form the provisional council of the corporation; they shall, before the first day of June 1920, by a notice signed by the secretary, and addressed, by registered letter, fifteen days in advance, to each of the members, call the first general meeting of the corporation for the purposes of adopting the by-laws thereof, and also to provide for the regular election of the council of the corporation."

3. Article 5117 of the Revised Statutes, 1909, is amended:

a. by replacing the word: " society " in the fourth line thereof, by the word: " corporation;"

b. by replacing the word " society " in the third line of paragraph *c* thereof by the word " corporation;"

4. Article 5118 of the Revised Statutes, 1909, is amended:

a. by replacing the word " society " at the end of paragraph *a* thereof, by the word " corporation;"

b. by replacing the word " society " in the fourth line of paragraph *b* thereof, by the word " corporation;"

c. by replacing the word " society " in the third line of paragraph *c* thereof by the word " corporation;"

d. by replacing the word " society " in the sixth and in the twelfth line of paragraph *d* thereof, by the word " corporation;"

5. Article 5120 of the Revised Statutes, 1920, is amended by replacing the word " society " in the first line of paragraph *a* thereof, by the word " corporation."

6. Article 5121 of the Revised Statutes, 1909, is amended:

a. by replacing the word " sociétě " in the second line of subparagraph *a* of paragraph 1 of the French version thereof, by the word " corporation;"

b. by replacing the word " society " in the third line of paragraph 2 thereof by the word " corporation."

7. Article 5123 of the Revised Statutes, 1909, is amended by replacing the word " society," in the second line thereof, by the word " corporation."

8. This act shall come into force on the day of its sanction.

Completing Honour Roll.

A glance at the Honour Roll published in the List of Members 1919, commencing on page two hundred and nineteen, will reveal the fact that there are many instances where more complete record is required.

The Council of *The Institute* has decided that the List shall include the names of all who served with the allied armies and whose membership or application for membership antedates Armistice Day, that is the eleventh of November, nineteen hundred and eighteen. It is hoped that we may be able to complete the Honour Roll list this year and be enabled to have a permanent Roll of Honour for the hall of the headquarters building.

Status of Engineers

Provisional Council Appointed in Nova Scotia

At a meeting of the Nova Scotia Society of Civil Engineers, C. E. W. Dodwell, M.E.I.C., presiding, a provisional council, with president and vice-president, were selected to take office, after the passage by the Nova Scotia Legislature of the uniform bill fixing the status of the engineering profession in the province, the council to carry on for not more than six months. This bill was drafted at a conference of fourteen engineers, representing all the provinces of the Dominion, held in Montreal, and is already in force in provinces of the West.

The provincial officers and council elected are:—

President, C. E. W. Dodwell, M.E.I.C., Halifax; vice-president, D. H. McDougall, M.E.I.C., New Glasgow; Council, J. L. Allan, M.E.I.C., Dartmouth; T. J. Brown, M.E.I.C., Sydney Mines; F. A. Bowman, M.E.I.C., Halifax; F. W. Doane, M.E.I.C., Halifax; A. F. Dyer, A.M.E.I.C., Halifax; F. R. Faulkner, M.E.I.C., Halifax; I. P. MacNab, M.E.I.C., Halifax; W. G. Matheson, M.E.I.C., New Glasgow; W. P. Morrison, M.E.I.C., Halifax; C. M. Odell, M.E.I.C., Glace Bay; A. G. Robb, M.E.I.C., Amherst; J. W. Roland, M.E.I.C., Halifax; P. P. Buxton, Halifax; K. H. Smith, A.M.E.I.C., Halifax; L. H. Wheaton, A.M.E.I.C.

Halifax. If the bill is passed a new and permanent Council will be appointed within six months.

ROBERT ALEXANDER ROSS, M.E.I.C.

PRESIDENT

The Engineering Institute of Canada

Robert Alexander Ross, the newly-elected President of *The Engineering Institute of Canada*, has for many years occupied a leading position in the ranks of engineering particularly in the electrical field of Canada. Two years ago at the earnest solicitation of his friends and as evidence of a public-spirited sense [illegible], he gave up his active engineering practice to become a member of the Administrative Commission of Montreal, a body formed by the Provincial Government to save the City from financial chaos. As the one practical man on that Commission of five his work has been of immense value.

When the Honorary Advisory Council for Scientific and Industrial Research was established about four years ago by the Dominion Government to promote and encourage research in connection with the development of the natural resources of Canada and to assist manufacturers with their problems, Mr. Ross was made a member of that body.

As an evidence of the position he occupies on the Research Council, the active management of its most important undertaking, the establishment of the Lignite Utilization Board, was placed with Mr. Ross, who as the Chairman of that Board has carried on investigations and has arrived at the point where commercial plants will be established in western Canada, during the coming year whereby tremendous lignite deposits of that part of Canada will be made available for the citizens of the north-west.

Mr. Ross is a Canadian of Scotch Presbyterian ancestry, having been born at Woodstock, Ont., on August 26th, 1865 and was educated in the public and high schools of his native town and in 1893 graduated from the School of Practical Science of the University of Toronto. Before going to the University he served his full time as apprentice as machinist with Robert Whitelaw, engine builder, Woodstock, Ont. Following graduation for three years he was engineer in charge of the engineering department of the Canadian General Electric Company at Sherbrooke. In 1893 he was appointed chief electrical and mechanical engineer of the Royal Electric Company of Montreal in charge of all engineering [illegible]. Since 1903 Mr. Ross has been engaged in consulting engineering practice and has been responsible for the design of many important electrical and power installations including the West Kootenay Power and Light plant at Bonnington Falls, B.C.; the [illegible] Company's plant and Dock of the [illegible] Copper Company of [illegible]; Canadian Pacific Railway Angus Shops; [illegible]; West India Electric Company, Jamaica; [illegible] Power plant, [illegible]; Convocation Hall, University of Toronto; Toronto [illegible] Light and [illegible] Company, Montreal [illegible] water supply and electrical distribution and many others.

At various times he has acted as consultant on the following bodies: the Hydro Electric Power Commission of Ontario, The Canadian Pacific Railway, the Hydro Electric Power Commission of Toronto and the great majority of the large cities and municipalities throughout the Dominion. His engineering work in addition to his engagements in Canada has been carried on in China, India, Straits Settlements, Russia, Finland, Scotland, Australia, Jamaica and the United States.

A few years ago when the City of Montreal became involved in what is known as the "[illegible]" Mr. Ross took a leading part in [illegible] of the City, [illegible] saving the City several million dollars.

Mr. Ross for a number of years was lecturer at McGill University and is author of "Engineering Economics". He is a Fellow of the American Institute of Electrical Engineers, a Member of the American Water Works Association, and for many years an active officer of *The Engineering Institute of Canada* as Councillor and Vice-President. He is a member of the University Club of Montreal and Montreal Clubs and for years has been commodore of the Royal St. Lawrence Yacht Club. He has been one of the leading spirits in sailing in which he is a well known expert and which is his chief recreation.

CORRESPONDENCE

An Appreciation

Editor, *Journal:*

I have received with much pleasure the two volumes of transactions on the Quebec Bridge.

To know that membership in the E.I.C. makes available for one, information on works of such magnitude in the detail with which these volumes are presented, makes one feel that the E.I.C. is second to none among the engineering societies the world over.

Yours very truly,
R. LAURENCE WELDON.

Ontario Legislation

Ottawa, January 22, 1920.

Editor, *Journal.*

In response to your suggestion for a statement from the Ontario Provincial Division respecting an open letter to *The Journal* signed by "an Ontario member", I beg to submit the following:—

At a meeting of the Ontario Provincial Division Committee in Toronto in November last, the question of legislation to define the status of the engineer in the Province of Ontario was given very careful and lengthy consideration. At that time the legislative proposals of the J.C.T.O. referred to were not fully known, but sufficient information was available to indicate in a general way the trend of their proposals. It was unanimously agreed that the recent efforts of the J.C.T.O. should be given full and sympathetic consideration, and it was felt that inasmuch as the J.C.T.O. scheme was radically different from that proposed by *The Engineering Institute,* it would very profitably form the basis of consideration along with the E.I.C. Bill, by some general committee which could go into the whole question thoroughly and report as to what would be the best scheme of legislation and the most desirable method of achieving it so far as the Province of Ontario is concerned.

The Provincial Division decided that the most practicable, generally acceptable means of securing the considered judgment of all the professional engineers in Ontario would be through the medium of an Advisory Conference Committee, which would consist of two representatives from those existing organized technical bodies in Ontario, the majority of whose members were professional engineers.

It was accordingly agreed that the Provincial Division should suggest immediately to the following proposed constituent bodies that they appoint two representatives each to such an Advisory Conference Committee:—American Society of Mechanical Engineers; American Institute of Electrical Engineers; Canadian Mining Institute; Canadian Institute of Chemical Engineers; Ontario Association of Architects; *Engineering Institute of Canada.*

Early in December an appropriate letter was forwarded to each of the bodies mentioned above, and satisfactory replies have been received from all of them. While there has been unavoidable delay in securing the official and formal appointment of two representatives from each of these bodies, it is confidently expected that it will be possible to convene the Advisory Conference Committee in Toronto, immediately after the Annual Meeting of *The Engineering Institute,* which will be held the last week in January.

Yours faithfully,
J. B. CHALLIES,
Chairman, Ontario Provincial Division.

REPORT OF COUNCIL MEETING

Since the last issue of *The Journal* three meetings of Council have been held: one on January 26th, one on January 29th and one on February 17th, at all of which a considerable amount of business was transacted.

Approving the reports of committees and branch reports, the agenda of the Annual Meeting and the programme of the Professional Meeting, together with the opening of a ballot, were the main features of the meeting on January 26th.

On January 29th the meeting was held at the Mount Royal Club, Montreal, at which were present: President R. A. Ross, in the chair; Past Presidents Leonard and H. H. Vaughan; Vice-President, H. E. T. Haultain; Councillors, Messrs. W. A. McLean, Alex. Gray, G. Gordon Gale, John Murphy, Julian C. Smith, J. B. Challies, J. E. Gibault, J. M. Robertson, Arthur Surveyer, Frederick B. Brown, Peter Gillespie, Ernest Brown. There were also present Past Presidents Phelps Johnson, Sir John Kennedy, G. H. Duggan, Col. W. P. Anderson and retiring Councillor James White. At this meeting the auditors, the treasurer and secretary, were all re-appointed. Resolutions of thanks were passed to those who had provided papers and entertained the members during the Professional Meeting. The suggestion of the Finance Committee was adopted and it was decided that all members would be asked for a voluntary contribution of two dollars to *The Journal.*

The meeting of February 17th, discussed and transacted a large amount of routine business. The chairmen of the standing committees of Council were nominated, as was a representative to the Canadian Engineering Standards Association, and the Editorial Committee was re-appointed. The question of the appointment of regular committees was left in abeyance pending a decision regarding the status of the committees of the Engineering Standards Ass'n in relation to *The Institute.* A committee consisting of Councillors Gale, Murphy, and Challies, was appointed to consider and report on the classification of applicants mentioned in correspondence with the Ottawa Branch. It was decided that the final date for the addition of names to the Honour Roll would be November 11th, 1918. That is, those who were members on that date or whose applications were of a previous date. A committee was appointed to consider the entire matter of publicity in connection with Institute affairs, papers and addresses presented at branch and other meetings and recommend regulations to the Council for adoption by The Institute in this connection. Routine business consisting of a large amount of correspondence to be noted and giving consideration to all other matters on the agenda completed the business of the evening.

On January 20th the following admissions and transfers were effected:

Members.

Nathaniel Child Mills, B.Sc., C.E., E.E., (Tufts Coll.), of Montreal, P.Q., vice-president and general manager, Montreal Armature Works, Limited; Albert Irving Payne, C. E. (Princeton Univ.), of Calgary, Alta., designing and supervising engr., P. Burns & Co., Ltd.; Wilfred Arthur Winfield, of Halifax, N.S., general superintendent of plant, Maritime Telephone & Telegraph Co., Ltd.; Archibald Edward Wright, of Copper Mountain, B.C., i/c of Canadian Copper Corpn.

Associate Members.

Cecil Henry Biddell, Lieut., D.L.S., of Regina, Sask., draftsman & plan-checker, Surveys Branch, Dept. of Highways; James Andrew Coombs, B.A.Sc. (Univ. of Tor.), of Toronto, Ont., i/c surveys, Nipigon project, Hydro Electric Power Commission; Cecil McGregor Crooks, of Bedford, N.S., i/c office engineering work, Telephone Company of Prince Edward Island; William Oswald Cudworth, of North Bay, Ont., draftsman, Dist. Engr's. Office, C.P.R.; William Andrew Gilmour, M.A.B.Sc., (Edinburgh Univ.), of Montreal, P.Q., assistant engr., Montreal Water & Power Co.; Kenneth Gordon, of Moncton, N.B., signal inspector, C.N.R.; William Arthur Grafftey, B.Sc. (McGill Univ.), of Westmount, P.Q., engr., wood dept., Riordon Pulp & Paper Co., Ltd.; Philip Stancliffe Gregory, B.A., (Bishops Coll.), B.Sc. (McGill Univ.), of Montreal, P.Q., elec. engr., subsidiary distribution companies, Shawinigan Water & Power Co.; Harold Wilson Harkness, B.A., B.Sc., (Queen's Univ.), of Tsinanfu, China, teacher of physics and res. engr. for Shantung Christian University; Henry Francis Hebert, of Toronto, Ont., Hydro Electric Power Commission; Charles Edward Herd, of Montreal, P. Q., design & estimate dept., Dominion Bridge Co., Ltd.; Henry Buell Hicks, Major, of Cranbrook, B.C., dist. engr., Water Rights Branch, Dept. of Lands; Ernest Hodgson Jupp, Lieut., B.A.Sc. (Univ. of Tor.), of Orillia, Ont., asst. engr., McIntyre Gold Mines; Ralph Evans MacVicar, Capt., B. Sc. (McGill Univ.), of Montreal, P.Q., sales engr., Babcock & Wilcocks, Ltd.; C. K. S. Macdonell, Capt., of Barrie, Ont., town engr.; Leslie Briggs McCurdy, Capt., C.E. (N.S. Tech. Coll.), of Truro, N.S., industrial surveyer, D.S.C.R., Halifax; William Gordon McGhie, Major, B.A.Sc. (Univ. of Tor.), of St. Catharines, Ont., sales engr., Canadian Crocker-Wheeler Co. Ltd.; Joseph Starr Mills, of New Glasgow, N.S., asst. engr. on maintenance, C.N.R.; George Charles Perkins, of Lachine, P.Q., 3 yrs. W.A.A., recently demobilized, at present on contract work; Ernest Leslie Pettingill, B.Sc. (Queen's Univ.), of Copper Cliff, Ont., representative on erection of [illegible] dam, International Nickel Comp.; Wesley [illegible] Redfern, B.A.Sc. (Univ. of Tor.), of Toronto, Ont., with F. A. James Co., Ltd.; Arthur Smith, of Hamilton, Ont., private practice, consult. engr.; John James Traill, B.A.Sc., C.E., (Univ. of Tor.), of Toronto, Ont., asst. prof. of hydraulics, Univ. of Toronto; Lewis S. Tuck, B.Sc. (Univ. of Maine), of Kenogami, P.Q., engr., Price Bros. & Co., Ltd.; John Edwin Archibald Wigmore, B.Sc. (McGill Univ.), of Cape Madeleine, P.Q., asst. engr. i/c plant design, St. Maurice Paper Co., Ltd.; Edmund Sprague Winslow, B.Sc., (M.I.T.) (McGill Univ.), of Westmount, P.Q., asst. to gen. mgr., Canadian Ingersoll-Rand and Jenckes Machine Co.; Sylvester Geoffrey Wales, B.S. (Mass. Inst. of Tech.), of Montreal, P.Q., engr. i/c design, Lockwood, Greene & Co. of Canada, Ltd.

Juniors.

Clyde F. Camber, of Minto, N.B., engr. i/c mining operation, Grand Lake Coal Co., Ltd.; George Vibert Douglas, Capt., of Montreal, P.Q., attending McGill University; Bruce Henry Johnston, Lieut., of Toronto, Ont., at present attending University of Toronto; Merle Franklin Ker, B.Sc. (Queen's Univ.), of Niagara Falls, Ont., field draftsman, Hydro Electric Power Commission; Ewen MacEwen, of Montreal, P.Q., 3½ yrs. W.A.A., at present in fourth year, civil engr., McGill University; Donald Henry Macfarlane, Capt., M.C., of Montreal, P.Q., 4 yrs. W.A.A., at present third year Mechanical engr., McGill University; James Harold McFarlane, of St. John, N.B., asst. engr. on construction, Courtenay Bay Drydock and breakwater; Robert Melrose, of St. John, N.B., deputy land surveyor, Prov. of N.B.; Edgar Penney, of Montreal, P.Q., 3 yrs. W.A.A., at present attending McGill University; William Douglas Proctor, Lieut., of Toronto, Ont., 3 yrs. W.A.A., at present attending University of Toronto; Gordon Hamilton Rochester, Capt., of Montreal, P.Q., 4 yrs. W.A.A., at present third year chemical engr., McGill University; George Henry Thurber, of Chatham, N.B., asst. engr., Department of Public Works.

Transferred from the Class of Associate Member to that of Member.

Joseph Aimé Godefroy Coulis, M.E. (McGill Univ. & Ecole Poly.), of Peterboro, Ont., mech. engr., Canadian General Electric Co.; George Grant Hare, B.A.Sc. (C.E.) (McGill Univ.), city engr.; Charles Conyers Kirby, of St. John, N.B., dist. engr., N.B. district, C.P.R.; Francis Fielding Longley, Col., D.S.M., O.B.E., of New York, N.Y., member of firm Hazen, Whipple & Fuller, consult. engrs.; William Lindsay Malcolm, Lt.-Col., M.A., B.Sc. (Queen's Univ.), O.L.S., D.L.S., professor, municipal engineering, Queen's University, Kingston, Ont.

Transferred from the Class of Junior to that of Associate Member.

Timothy Dwight Ruggles, Captain, B.Sc. (Univ. of N.B.), of Kenora, Ont., div. engr., C.P.R.; Harold Sprenger, of Winnipeg, Man., Carter-Halls-Aldinger Co.

Transferred from the Class of Student to that of Associate Member.

James Archibald Knight, Capt., M.C., B.A.Sc. (Univ. of Tor.), of Toronto, Ont., hydraulic design, Hydro Electric Power Commission.

Transferred from the Class of Student to that of Junior.

Frank Douglas Austin, B.A.Sc., (Univ. of Tor.), of Sault Ste. Marie, Ont., asst. to city engr.; William Earle Longworthy, Lieut., M.C., B.A.Sc. (Univ. of Tor.), of Regina, Sask., asst. engr. on sewage; Donald Stuart McPhail, Capt., of Montreal, 4 yrs., civil engineering, McGill University; Harold Morton Roscoe, B.Sc. (McGill Univ.), of Anyox, B.C., asst. mining engr., Hidden Creek Mine, Granby Consolid. Mining, Smelting and Power Co.; Eugene Levering Schellens, B.Sc. (McGill Univ.), of Montreal, P.Q., mechanical representative, Franklin Railway Supply Co. of Canada, Ltd.

* * *

The following Students were admitted, February 17th:—

R. W. Beckett, G. W. Beecroft, P. G. A. Brault, W. R. Bunting, F. C. Carley, J. D. Conover, R. H. B. Cook, A. L. Dobson, P. R. Drummond, M. G. Evans, T. E. J. Flynn, R. B. Glave, J. H. Hickey, J. G. Johnston, H. L. Kennedy, G. E. Kerr, H. T. Kirkpatrick, J. A. Macdonald, T. M. MacIntyre, W. A. Messenger, L. J. Murtha, W. M. Pfeiffer, J. T. Quinlan, W. M. Reynolds, F. H. Schultz, D. J. Shrimpton, J. M. Smith, H. J. Stevenson, L. F. Stokes, L. D. Tatley.

BRANCH NEWS

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Sec.-Treas.

At the meeting of the Victoria Branch of *The Engineering Institute of Canada* held on Wednesday evening, Jan. 14th, in the Provincial Library, a paper was read by D. O. Lewis M.E.I.C. on "The Development of Railways".

To illustrate his address the reader had a large number of excellent photographs showing all types of Railway Locomotives and Carriages from the earliest horse-drawn style which ran on a prepared track, to the Rocket, the famous engine with which George Stephenson won the prize of 500 pounds offered by the Liverpool and Manchester Railway in 1829.

The paper, which is to be followed by a review of the period from the time of the Rocket to the 460 ton locomotive, at some future date, was enjoyed by those present, and a hearty vote of thanks was tendered the lecturer.

The question of vital importance which is occupying the minds of all members at the present time is the probable fate of the Professional Engineers Bill, which goes to the Private Bills Committee for its first consideration, at 10 a.m. on Thursday the 19th inst.

The social activities of the branch are to be curtailed on account of the prevalence of influenza, and the committee has cancelled the reception which should have been held on the 23rd of the month.

On Wednesday, the 11th, a lecture by W. F. Best on the Geology of Mines was attended by a small but very interested audience. Mr. Best had some very interesting sketches and diagrams to illustrate his remarks. The paper was much appreciated by those able to attend, and considerable interest was evinced. Col. A. W. R. Wilby, the vice-chairman of the branch, presided.

WINTER PROGRAMME 1920

Jan. 14—Regular Meeting in Provincial Library.
Paper by D. O. LEWIS, M.E.I.C., "Development of Railways" part II

Jan. 26—Informal Reception in K. of C. Hall.
Fort Street.

Feb. 11—Regular Meeting in Provincial Library.
Paper by W. F. BEST, "Geology of Coal Mines."

Feb. 23—Informal Reception in K. of C. Hall.

Mar. 10—Regular Meeting in Provincial Library.
Paper by Prof. E.G. MATHESON, M.E.I.C. "Sub-Aqueous Foundations."

Mar. 22—Informal Reception in K. of C. Hall.

Apr. 14—Regular Meeting in Provincial Library.
Paper by E. P. GIRDWOOD, M.E.I.C. River Protection, Roads and Bridges.

Apr. 26—Informal Reception in K. of C. Hall.

Vancouver Branch

J. N. Anderson, A.M.E.I.C., Sec.-Treas.

A general meeting of the Vancouver Branch was held on Monday, January 5th, at the Board of Trade Building, at which a very interesting paper entitled "Sunlight Engineering in Relation to Housing and Town Planning" was read by H. L. Seymour, A.M.E.I.C. Mr. Seymour is an authority on Town Planning, and the paper was heard with great interest by all present. Following Mr. Seymour's paper, A. C. Dalzell, M.E.I.C. gave a short talk on "Town Planning Legislation." A general meeting of the Vancouver Branch was held on Tuesday February 3rd, at which a very interesting and thorough paper was read by H. M. Burwell, M.E.I.C., on "The Reclamation of the Northerly Part of Pitt Meadows, B.C.".

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Sec.-Treas.

Regular meetings of the Winnipeg Branch have been held on January 2nd, 21st, and February 5th. At the meeting held on January 2nd, Col. R. H. Mulock, A.M.E.I.C., read a very interesting paper on the "History of Aviation," illustrated by lantern slides, at that on January 21st, Thos. R. Deacon, M.E.I.C., addressed the members on the subject, "Some Considerations in the Use of Powdered Fuels," and on February 5th, Frank H. Martin, chief engineer of the Winnipeg River Power Company presented a paper on the "Economics of Water Wheel Design." Mr. Martin discussed the characteristics which determine their economics with reference to various conditions of head. This address was also well illustrated by lantern slides. At the same meeting the report of the delegates to the Annual Meeting of *The Institute* was received, and a nominating committee was appointed to draft a slate of officers for the ensuing year.

Sault Ste. Marie Branch

Newton L. Somers, A.M.E.I.C., Sec.-Treas.

After an existence of twelve months, the Sault Ste Marie Branch begins its second year, that of 1920, with renewed energy and a resolve on the part of the Executive and the members themselves to increase the use of the Branch to its members, to *The Institute* and to Engineering. As a beginning a Committee consisting of Messrs L. R. Brown, A.M.E.I.C. and Geo. Kohl, A.M.E.I.C. was chosen to act with the Secretary to this end. The first endeavour is to make the meetings of the utmost value to the resident members due to the diversified interests of individual members, it has been decided to keep as far as possible away from highly technical subjects. These, while of great value in themselves and of considerable interest in larger Branches are, in our case, of interest to probably only two or three causing thereby, a gradual falling off of attendance at the meetings. To offset this, talks and papers on subjects of general interest as economic subjects, local problems, engineering history etc. will be given. Our hope is, in this way to interest all the members and at the same time give that class of information in our meetings which we all, as ordinary practising engineers, so woefully lack ie. and appreciation of the broad principles of economics and finance.

Our new policy was launched at the regular monthly meeting on the evening of January 29 by a talk on the "Economics of Mechanical Engineering" given by A. W. Sinnamon, Assistant Chief Engineer of the Algoma Steel Corporation. During the course of the talk, Mr. Sinnamon cited instances of failures of projects due solely to the lack of the necessary knowledge of economics on the part of the engineer in charge; also on the other hand were instances of brilliant success brought about by broad gauge engineers, as efficient in the use of the implements of the financier as of the Engineer. The speaker drew attention to the lack of this particular branch of instruction in our Schools of Engineering and to the efforts and success of Mr. Bond with a course on this sort at McGill. In concluding, the advice of the speaker to the Engineering Profession as a whole was to pay more attention to this important phase of our mental equipment.

The address was very enthusiastically received by those present and as a tribute to the speaker and the popularity of his subject, the Executive was asked to try and induce Mr. Sinnamon to go further into the subject at a future meeting.

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary.

A meeting of the Branch was held on Feb. 6th, at the Thorold Engineers Club for the purpose of listening to an address on "Recent Theories in Proportioning Concrete" by R. B. Young, A.M.E.I.C., asst. laboratory engineer, Hydro Electric Power Commission of Ontario.

The speaker dealt with theories and practical discoveries which have been made by investigators in the United States and Canada and with his own research work and results in the Hydro laboratories, and showed by means of lantern slide charts and diagrams the great importance of the water content of concrete. The method of obtaining constant strength concrete of different degrees of consistency or workableness by working to a definite ratio of water to cement was described in full.

The speaker described how he had developed Edwards' surface area theory as applied to sand to the course aggregate and the analogy between Abram's fineneness modulus and the surface area principle.

The results of the application of new principles developed in the Hydro laboratories to actual concrete construction work were shown to be of a very satisfactory nature.

The Branch Executive Committee held a meeting on Feb. 3rd and transacted a large amount of business of which the following items are of interest to the membership generally:—

The Chairman has appointed H. L. Bucke, M.E.I.C., as Branch representative on The Institute Nominating Committee for 1920. This appointment has been ratified by the Executive Committee.

The Branch By-Laws as approved by a general meeting of the Branch on Nov. 25th, 1919, have been approved by Council.

In view of the fact that there are, from time to time, appointments to public positions and commissions made by the Provincial Government and that, in the best interests of the public these positions frequently call for the appointment of an engineer:—

Be it resolved:—

That the Executive Committee of the Niagara Peninsula Branch strongly urge upon the Executive Committee of the Ontario Provincial Division the necessity of setting up machinery for bringing these matters promptly to the attention of the Provincial premier at the time they come up for consideraton. It is the opinion of the Niagara Peninsula Branch Executive that a committee of members resident in Toronto should be formed whose duty it would be to interview the government as occasion arises and to follow this up with publicity in the form of write-ups for the Associated Press.

Moved by R. P. Johnson,
Seconded by W. P. Near.

The resolution carried and copies have been sent to the Ontario Provincial Division and to Headquarters for further action.

The question was introduced as to whether the Executive would take any further action in making use of the salary schedule adopted by the Branch on Nov. 25th last. The action of the Toronto Branch in having their schedule printed and distributed was noted. The secretary was instructed to communicate with the Ontario Provincial Division and advise that this Branch Executive is of the opinion that the Provincial Division should take steps to prepare a salary schedule along the lines of those of the Toronto and Niagara Peninsula Branches and that this schedule should be printed and copies sent, to each Branch in the Province with instructions to distribute them to all employers of engineers within the respective Branch radii.

The matter of appointing a Branch Legislation Committee was discussed. On account of the special nature of this subject and the large amount of printed matter requiring perusal and study, it was thought that particular care should be taken in appointing this committee. The Officers were instructed to suggest names for such a committee to the Executive.

The Council and Executive of the Ontario Provincial Division have approved the request of the Branch to hold the 1920 Professional Meeting at Niagara Falls under the auspices of the Branch. The Professional Meeting Committee have held two meetings up to Feb. 3rd and appointed convenors of sub-committees for attending to finance, entertainment, papers and publicity. The convenors of the sub-committees have received instructions to appoint their own committees but suggestions as to personnel in each case have been, made by the general Committee.

The Secretary of the Professional Meeting Committee has been in direct correspondence with the Secretary of the American Institute of Chemical Engineers in connection with holding a joint professional meetings and has ascertained that this will not be feasible as the A.I.C.E. wish to hold their meeting at Montreal.

The dates for the Professional Meeting have been set for September 16th, 17th and 18th.

The attention of members is called to an oversight in the Branch Salary Schedule as published in *The Journal* of December. The signatures of Messrs. N. R. Gibson and D. T. Black should have been shown along with those of the other members of the Salary Committee, Messrs. Lazier, Gisborne and Frost. Mr. Gibson and Mr. Black approved the Salary Committee report but were not present at the meeting at which it was signed and submitted to the Branch.

Border Cities Branch

J. E. Porter, A.M.E.I.C., Sec.-Treas.

The first meeting of the Branch for the New Year was held Monday evening, January 19th, in the Auditorium of the Chamber of Commerce. There were present fifteen members and several friends of the speaker for the evening.

The Branch business at meeting was made very brief, first the election of A. T. Riddell as representative on *The Institute* Nominating Committee, second the matter of the delegate to the Annual Convention at Montreal. This matter was left in the hands of the executive, who later appointed our Chairman, Mr. Craig.

The main feature of the evening was an address by Col. H. J. Lamb, D.S.O., M.E.I.C., who served with distinction with the Canadian Overseas Forces from the outbreak of war in 1914 until 1917 when he was seconded to the Imperials, where, until the spring of 1919, he acted as Assistant Director of Field Works and Fortifications. Col. Lamb had been District Engineer for Department of Public Works in this district, and his remarks were very interesting to all, especially his former business and personal friends present.

The speaker selected for his talk the Second Battle of Ypres and the preparations on the attack on Vimy Ridge. In spite of the fact that Col. Lamb had not prepared a formal paper, his address was listened to with particular interest and pleasure.

A hearty vote of tanks was tendered Col. Lamb and several of the guests of the evening spoke appreciation of his remarks and of his record both overseas and with the Department of Public Works.

The meeting was adjourned at 10.10 p.m.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary.

The regular January meeting of the Peterborough Branch was held on Thursday the 8th, when Mr. Jas. Mackintosh gave a digest of recent proposed legislation in the interests of engineers in Ontario. Mr. Mackintosh gave the history of the various attempts that have been made along this line, and considerable discussion took place among the members present. The merits of the different types of legislation which have been proposed by various bodies were investigated, but no decision was arrived at. The meeting was adjourned until Saturday evening Jan. 24th, when the discussion will be continued.

The Committee appointed to draft a set of By-Laws for the Branch, brought in a report, and after considerable discussion the matter was left over for further consideration.

A special meeting of the Branch was held on Saturday, January 24th, in the Board of Trade Rooms, at 8.00 P.M. The draft of proposed Branch By-Laws were adopted as read, after discussion, were ordered to be sent to the Council for its approval.

P. P. Westbye was appointed to represent the Branch on the Nominating Committee at the Annual Meeting at Montreal.

The discussion on the Proposed Legislation for Engineers was resumed from last meeting, and the discussion was led by Jas. Mackintosh, the chairman of the Special Legislation Committee. The different points of the two drafts now before the Ontario engineers were clarified. The following resolution was passed, "That the Peterborough Branch is in favor of some form of legislation in the interests of the Engineers of the Province."

On Thursday, February 19th, 1920, the Branch entertained J. Grove Smith, Dominion Fire Commissioner, of the Department of Insurance at Ottawa. Mr. Smith spoke to a combined meeting of the Board of Trade and the Branch, on the Economical Significance of Canada's Fire Waste. Mr. Smith used three reels of moving pictures to illustrate his subject.

During the afternoon Mr. Smith was taken around the City and inspected the fire fighting facilities, and the Waterworks Department.

Toronto Branch

H. A. Goldman, A.M.E.I.C., Secretary.

A regular meeting of the Branch was held at the Mining Building of the University of Toronto on Thursday, February 12th, 1920 at 8.15 P.M.

The Chairman (R. O. Wynne-Roberts) presided.

The minutes of the previous meeting were read and approved.

The Chairman read several notices of open engineering positions in Ontario for which applicants were sought.

The Chairman then called upon the first speaker of the evening, Capt. F. A. Dallyn, to speak on conditions in Siberia.

Capt. Dallyn opened his remarks with the statement that "Unhappily very little favorable could be said about the efficiency or ability of the Kolchak Government." He then proceeded to tell a tale of unhappiness, misery, disease and filth that existed there. He told of hospitals where the patients numbered double the capacity of the rooms, and therefore, half of them had no beds and had to lie on the floor. He told of large camps where the majority of the inmates were suffering from typhoid fever, and in such condition were lying in cold damp places, no covering, no heat and not a single doctor to attend to them. There was not the least possible chance, Capt. Dallyn said, for any one of them to recover because no human organism could resist such conditions. He further told of refugees being packed in box cars and sent forth back and from station to station, thus increasing considerably the time required in reaching a certain destination. Sometimes these cars were not opened for several days in succession when no provisions were available. Many of these unfortunate ones were afflicted with sickness and disease, many of them died on the road and were thrown out of the cars. Looking through one of the windows of these box cars, Capt. Dallyn said, those inside did not at all appear to resemble human beings any more, they looked more like animals of the lower type.

Such and similar pictures of conditions in Siberia were described by Capt. Dallyn.

Major Hertzberg, who spoke after Capt. Dallyn, confined himself chiefly to his military experiences and duties that he had to perform in Siberia. These duties consisted in building, fitting out and constructing barracks for the troops which arrived at Vladivostock.

Major Adams, who followed Major Hertzberg, spoke on the lack of proper law and order under the Siberian Government. "Why," he said, "the people there thought less of killing a man than we do of killing a rat. The idea prevailing that if you won't kill the other fellow he will kill you."

He said that when the Government had suspicion of certain individuals who were not quite in sympathy with the Omsk Government, these individuals would be arrested as political offenders, would be sent away from the city and on the journey would be shot on the pretense that they attempted to escape. This practice was carried on to such an extent that the Allied representatives became really alarmed, fearing that the thing was going too far. Reports came in of the execution of such offenders on the excuse of attempting to escape when the evidences were such that there could not be even any possibility of intention to escape. Pressure was therefore brought on the Government to have such offenders brought back and tried by a proper court. There were eight such offenders at that time, and the result was that every one of them was released.

A number of slides were shown on the screen throughout the evening, illustrating the talks and making them so much more impressive and instructive.

List of Subject for Discussion

Every Thursday, at 8.15 p.m., at Engineers' Club.

Feb. 5—Romance of Heat.
By E. METCALF-SHAW.

Feb. 12—Siberia.
Captain F. A. DALLYN and Major C. S. L. HERTZBERG.

Feb. 19—Experimental Roads.
By BRUCE ALDRICH.

Feb. 26—York Township Sewerage Scheme.
By J. M. M. GREIG.

Mar. 4—Debate on "Should Engineers Unionize?"
Positive side By W. SNAITH. Negative side by Prof. P. GILLESPIE.

Mar. 11—Toronto Harbor Works.
By GEO. T. CLARK.

Mar. 18—Automatic Telephones.
By F. A. BANKS. At Physics Building, University.

Mar. 25—Concerning Bridges.
By FRANK BARBER.

Apr. 1—Town Planning and the Canadian Engineer.
By A. V. HALL.

Apr. 8—Chemistry and Engineering.
By T. LINSAY CROSSLEY.

Apr. 15—Sarnia Intake.
By F. W. THOROLD.
Reinforced Concrete Pipes.
By H. W. HEYWOOD.

Apr. 22—Application of the Venturi Principles.
By E. DEAN WILKES.

Apr. 29—Dredging.
By W. E. M. BONN.

May 6—Ontario Highway Policy.
By W. A. McLEAN.

Partial List of Papers Promised for the Autumn Session

Chippewa Hydro Electric Power Scheme.
By H. G. ACRES.

Geology in Relation to Engineering.
By C. W. KNIGHT.

Hydro Radials.
By F. A. GABY.

General Refining Practice.
By C. E. DEAN.

Progress and Development in Design of Centrifugal Pumps.
By T. M. JONES and A. T. CLARK.

New Toronto Union Station.

By A. HEWITT.

Hydro Electric Power.
By T. H. HOGG.

Concrete.
By R. B. YOUNG.

Kingston Branch

W. P. Wilgar, A.M.E.I.C., Sec.-Treas.

An open meeting of the Branch was held in Fleming Hall, Queen's University at 8.00 p.m. Tuesday January 20th 1920.

The minutes of the previous meeting were read and approved.

J. M. Campbell read a very interesting and instructive paper on the Electrical Power Plant at Kingston Mills.

The paper was discussed by Prof. Alexander Macphail, C.M.G. and Prof. W. P. Wilgar.

A hearty vote of thanks was tendered by the chairman to the speaker.

The meeting adjourned at 10 p.m.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec.-Treas.

The first Branch Luncheon for the year was held on February 12th, when J. A. Wilson, A.M.E.I.C., Assistant Deputy Minister of the Naval Service, addressed a large gathering of the members on "Progress in Aviation."

Mr. Wilson has recently visited England in his capacity as Member of the Canadian Air Board, and, while there, inspected many of the air stations under the control of the Air Ministry and the factories of the principal aricraft manufacturers.

Mr. Wilson gave a very able and interesting address covering a wide field. His address will be published in a later number of *The Journal.*

The members of the branch executive have felt for some time that it would be a great advantage to have closer working arrangements with the other technical and scientific associations in Ottawa, so as to avoid overlapping of meetings, to arrange for joint meetings, and to co-operate in securing speakers, etc.

The success of the recent joint meeting with the Architects and Town Planners led to an arrangement by which three members of the branch should meet with an equal number of representatives from each of the ten other principal technical associations in Ottawa, to discuss means of co-operation. This meeting was held on February 6th, but it was soon evident that the delegates from the other associations wished to make use of this opportunity to discuss more ambitious aims, and, after receiving the views of the members of the Ottawa Branch, it was decided that advantage should be taken of this representative meeting to decide what steps would be most effective in protecting the interest of all the scientific and technical officiers in the Federal Civil Service. Since that time other meetings have been held, and an Institute of Professional Civil Servants has been organized. This, of course, has no connection with *The Engineering Institute* except that it will probably contain many members in common with *The Institute.*

At the recent Annual Convention of the Dominion Land Surveyors two papers were read by members of the branch. One by Major Nelles, on Standard Topographical Maps, showing how the standard rules laid down by the International Map Committee which met in London in 1909 could be most usefully applied in Canada, the other was by Mr. Lambart, on the latest developments in Aerial Photography as applied to surveying.

Montreal Branch

Frederick B. Brown, M.E.I.C., Sec.-Treas.

"Thursday evening at 8.15" is once more the slogan, and the regular meetings of the spring programme well under way.

The first regular meeting of the new session was held on Thursday evening February 12th, Mr. Walter J. Francis, in the chair, when John Murphy, M.E.I.C., delivered an address on the formation of frazil and anchor ice. The lecture was illustrated with moving picture films and the attendance was one of the largest of the present winter season, the hall at Headquarters being crowded to capacity.

The pictures were the result of a series of experiments carried out in the Chateau Laurier, Ottawa. They were taken by the photographers and staff of the Canadian Department of Trade and Commerce under the direction of Mr. Murphy. The apparatus used included a number of large water bottles, distilled water, and a moving picture camera with microscopic lens. The pictures showed in detail the formation of the ice in the bottles, in shadowy flakes, which gradually became clearer, until they formed in groups and massed into a coalescent body, either at the top or bottom of the container. It was the first time that these pictures have been displayed, but it was stated that a number of films had been made, and that these would be available for the use of other branches of *The Institute*.

In the course of his lecture Mr. Murphy explained that the motive of the pictures was to show on graphic form the manner of the formation of frazil and anchor ice, and the way in which it interfered with water power machinery. As a result of twenty years' study, much of it with Prof. Barnes of McGill, it had been established that a difference of 1-1000 degree in temperature made all the difference between clogging of machinery by frazil ice, or clear working of the machinery. If the metal parts were a thousandth of a degree above the freezing point they would have no trouble; if a thousandth part of a degree below they would attract the frazil, and in an incredibly short time become clogged.

To avert this expensive danger to water power machinery, Mr. Murphy argued that easy and cheap methods could be used to raise the temperature of the machinery or water to a point where danger from frazil or anchor ice would be avoided. In the films a bottle was shown where frazil was forming with two steel rods immersed. One was just above freezing point, the other just below, the former remained clear as the frazil formed, but within a few moments the latter was covered with growing masses of ice.

Mr. Murphy showed some slides of a river near Dixon, Illinois, and read some correspondence with the companies concerned, in connection with a famous lawsuit brought by an ice harvesting company against an industrial plant upstream. It was shown that the plant upstream discharged eight cubic feet per second of warm exhaust water (at about 50° F.) into the stream flowing about 1000 C. F. S. This amount, [illegible] of the stream flow at 32° (about freezing), was sufficient to prevent the formation of ice for nearly two miles downstream, keeping the river actually open all winter and causing the lawsuit, which ran for five years through a dozen courts. In other words, if the whole volume of a river could be warmed a small fraction of one degree there would be no formation of ice for long distances downstream. Mr. Murphy put forward the suggestion seriously that many rivers, possibly including the St. Lawrence, could be so treated by a method of scientifically applying a small quantity of heat, that ice troubles and consequent flooding damages might be entirely eliminated.

A regular meeting of the Branch was held on the evening of February 19th, Chairman J. H. Hunter, at which Lieut. C. C. Brooks, M.C., gave an illustrated lecture on "Aerial Photography in the War." Lieut. Brooks traced the remarkable development of aerial photography during the war and showed a number of interesting slides made from actual aeroplane photographs taken at the front, the majority of these showing Vimy Ridge and vicinity. Lieut. Brooks pointed out in the course of his lecture that one of the most striking developments had been that of stereoscopic photography, which was found to be of great value in showing up special features in a landscape, such as gun emplacements, etc. He pointed out the value of aeroplane photographs in topographic survey, and indicated the possibilities in this direction.

During the intermission an opportunity was given to members present to examine a number of aeroplane photographies taken on the Canadian front. A short discussion followed, during which Brig. Gen. C. J. Armstrong spoke briefly on the value of aerial photography in war time and testified to the accuracy of Lieut. Brooks' work. A number of members contributed to the discussion.

PROGRAMME OF MEETINGS

February to April 1920

Always at 8.15 p.m. sharp.
Always on Thursday evening.

Feb. 12—Ice Formation.
Illustrated by Moving Pictures. By JOHN MURPHY, M.E.I.C.
Chairman: Mr. Francis.

Feb. 19—Aerial Photography in War.
By Lieut. C. C. BROOKS, M.C.
Chairman—Mr. Hunter.

Feb. 26—Electro Metallurgical Demonstration.
By ALFRED STANSFIELD, D.Sc., F.R.S.C., M.E.I.C., & CLARENCE V. CHRISTIE, B.Sc., M.A., M.E.I.C.
Chairman: [illegible]
(Postponed.)

Mar. 4—Industrial Relations.
By J. S. CAMERON, A.M.E.I.C.
Chairman—Mr. Rutherford.

Mar. 11—Steam Turbines; Manufacture & Testing.
By G. E. NEWELL.
Chairman—Mr. G. K. McDougall.

Mar. 18—The Utilization of Lignite.
By R. de L. FRENCH, M.E.I.C.
Chairman—Mr. MacLeod.
Moving Pictures will be shown Illustrating the Peat Industry.
By E. V. Moore, M.E.I.C.

Mar. 25—Replanning Montreal & District.
By JAMES EWING, M.E.I.C.
Chairman—Mr. Lefebvre.

Apr. 1—No meeting—Easter vacation.

Apr. 8—St. Maurice River Regulation: the Gouin Dam.
By O. LEFEBVRE, M.E.I.C.
Chairman—Mr. Surveyer.

Apr. 15—Naval Gunnery.
By LORD CONGLETON, J.E.I.C.
Chairman—Mr. Farmer.

Apr. 22—Cotton Rope for Power Transmission.
By J. MELVILLE ALLISON.
Chairman—Mr. Newell.

Apr. 29—The Engineering Features of Tramway Operation.
By D. E. BLAIR, A.M.E.I.C.
Chairman—Mr. Burnett.

St. John Branch

A. R. Crookshank, M.E.I.C., Secretary.

How best to protect St. John harbor from heavy seas, great tides and undertow, formed a live topic of discussion at a meeting of the St. John branch of the Canadian Engineering Institute in the old post office building on January 22. F. W. Holt, C.E., read an interesting paper on the subject. He also proposed the development of the outer section of the west side from Sheldon's Point to Negro Point, the reclaimed land to be used for manufacturing purposes and for docks and terminals. Instead of a continuation of the Negro Point breakwater to Partridge Island, he proposed the construction of a breakwater 2500 eventually 10,200 feet long to the westward of the island and extending towords Sheldon's Point, leaving the passage between the island and the mainland open. He believed in building a breakwater side-on to the seas and not bow-on. He admitted that the development of the locality he mentioned and the construction of a long breakwater would cost a very large sum, but thought it would be financially possible and profitable as well. He mentioned the fact the $25,000,000 had been spent in developing Halifax harbor.

City and town planning and engineering problems were considered at a joint public meeting ofthe St. John branch of *The Engineering Institute of Canada*, the housing committees of the Commercial Club and Board of Trade, held at the Board of Trade rooms. C. C. Kirby, C.E., presided, and A. R. Crookshank flashed numerous views on the screen. Among those present were Mayor Hayes, R. W. Wigmore, M.P., commissioners Thornton and Fisher.

W. F. Burditt, chairman of the St. John town planning and city expansion committee, read a very interesting paper on "Town Planning and Engineering Problems," and H. L. Syemour, A.M.E.I.C., engineer assistant to the dominion housing and town planning adviser at Ottawa, spoke of "Some of the General Principles of city Planning with Application to St. John."

Mr. Burditt called attention to the fact that town planning was essentially an engineering problem and suggested two leading principles, adaptation to purpose and adaptation to site. These were the main ideas to be kept in mind. It was obvious that the streets of a city could not be planned without considering the purposes they are to serve. In laying out streets in the past, future plans had been largely disregarded, as many of them were laid out merely to sell land. When a man plans a home he usually provide, for every convenience he can afford.

Cities should be planned as is the modern factory. Streets should not be laid out without due provision for traffic, as they have been in the past. In some American cities it has been estimated that ten per cent of the people's time is lost by the poorly laid out streets. Views of cities having the radial system of street planning were showed on the screen. The rectangular plan, Mr. Burditt said, was the least advantageous from an architectural standpoint.

Mr. Burditt also spoke of other developments comtemplated, including the erection of a new Union Station. He suggested a viaduct for the relief of traffic, and that a new street be built from the corner of Charlotte and Union Streets to the General Public Hospital, with the widening of Charlotte and Union Streets.

Mr. Burditt spoke of the excellent opportunities for a system of parks and scenic drives in the wild, rock country which lies to the northward of the city. He thought that now was the time to reserve land while it was cheap. Proper roads would open up part of that district. By way of illustration, views of parks in Boston and elsewhere were shown. Mr. Burditt said that the beauties of the wilds of St. John were not excelled by eastern parks anywhere. He also said that St. John had thirty miles of waterfront which could be improved and beautified as had been done by cities elsewhere, some no larger than St. John.

Mr. Seymour spoke of visiting the wilds of St. John with which he was duly impressed. He said that legislation was an important matter as it was necessary to make town planning effective. In the absence of legislation the best laid out town might become a poorly managed lace. The zone system, backed by law, prevented the building of stables and other objectionable buildings. All but two provinces had town planning legislation and many countries had either adopted it or were considering it. Accurate topographical maps were also necessary.

A union depot, said Mr. Seymour, should be as near to the business centre as possible. Regarding bridge building he said architects were as necessary as engineers. Factories should be located on the side of a city from which the wind does not blow generally. From figures furnished by D. L. Hutchinson of the St. John Observatory, he learned that the prevailing directions from which the wind blew here were northwest, west and south. Sunshine was an important factor when considering the height of buildings in relation to the width of streets. He was surprised to find that St. John had 1,800 hours of sunlight in 1918, or 40 per cent of the possible. Fredericton had only eighty-two hours more. Toronto had twenty-six hours less sunlight than St. John in winter, but 310 more in summer. When high buildings are too close the light is shut out of offices and the buildings become less profitable. Tall buildings were not profitable. Buildings in St. John should be, on Prince William and parallel streets, eighty-nine feet, and on the south of King and Broad streets, forty-one feet high. On the south side of Princess street they should only be twenty and one-half feet high.

Halifax Branch

F. R. Faulkner, M.E.I.C., Sec.-Treas.

The activities of the Halifax Branch during the month of January were largely confined to committee work. At the regular meeting held in December, as the result of an open discussion on the proposed bridge between Halifax and Dartmouth, a committee was appointed to investigate this question with special reference to the technical points involved. The commercial organizations of Halifax and Dartmouth have organized a general committee, consisting of one member each from these various bodies, and the chairman of our bridge committee, L. H. Wheaton, A.M.E.I.C., was appointed as our representative on this general committee to deal particularly with the Technical questions.

The Branch has also received a tentative offer from some business men of Halifax and Dartmouth to finance the preliminary investigations necessary, and the Branch has offered to carry on such work at cost. Such an investigation would demonstrate to the general public, most forcibly, the value of our organization to them.

The question of Legislation has been engaging the attention of the Engineers of the Province. In October a meeting in the city elected a temporary committee to take this matter in hand. That committee compiled a list of Engineers in the Province to whom notices were sent calling for a general meeting early in January. At that meeting the above committee was continued in office with power to add to the number and the meeting unanimously approved of the idea of securing legislation and resolved to devote their best efforts to secure it.

A copy of the proposed bill was sent to all engineers in the Province who were not already familiar with it, with a request for carefully considered criticisms of its clauses. Accompanying this was a ballot to be used for the election of the provisional council. Another meeting was held on Feb. 12th at which the provisional council were elected.

The Engineers of Nova Scotia are particularly fortunate in having as chairman of this committee, C. E. W. Dodwell, M.E.I.C., who may be said to be the father of legislation in this Province. About twenty years ago Mr. Dodwell was one of the leaders in a movement to obtain legal recognition and protection for the Engineering Profession in Nova Scotia and such legislation was defeated at the time. Mr. Dodwell was again on the firing line when the question was revived about a year ago. He was our representative on the general committee in Montreal last April and was elected chairman of that body. At the meeting held on February 12th he was elected President of the Provisional Council. The secretary of the local committee is W. P. Morrison, M.E.I.C., who can be reached at the Customs Building, Halifax.

A special meeting of the Branch was held in the Assembly Hall of the Nova Scotia Technical College on Monday, February 16th. This meeting was an open meeting to which we invited students of the Engineering Society of Dalhousie, the students of the Nova Scotia Technical College, and a number of others in the city who were interested in the subject of this meeting.

Professor Spencer, A.M.E.I.C., of Dalhousie had procured a two reel film from the Kopper's Manufacturing Company, showing a modern By-product Coke Plant.

Running off the film occupied nearly half an hour and was watched with interest by every one present, every seat in the Assembly Hall being filled. The film showed the various stages in the production of coke from the time the coal was fed into the oven until it was withdrawn, quenched, screened and loaded for shipment. The various appliances used in the collection and treatment of the by-products were also shown.

After the film was finished, the chairman, F. A. Bowman, took charge of the meeting and called for a discussion. Mr. Hamilton of the Nova Scotia Tramways and Power Company spoke for some minutes, drawing the attention of the meeting to various points in the pictures and particularly to the large amount of mechanical appliances that were used. Professor Spencer, in explaining the film in general, noted particularly the growth of plants of this type during a comparatively short period.

C. E. W. Dodwell, M.E.I.C., read some extracts from articles of his own on the Natural Resources of Canada, dealing particularly with the production of Coke and its by-products. He particularly emphasized the wastefulness of the Bee Hive type of oven and predicted that before long no ovens of that type would be allowed to operate. He urged the increasing use of by-product ovens, not only to conserve our coal resources, but to enable us to compete successfully with other countries in manufacturing articles into which these by-products enter.

PERSONALS

C. A. Joulton, Jr., E.I.C., is now with E. G. M. Cape Company, Limited, Montreal, and is at present stationed in Sherbrooke, P.Q.

*

Baron Gustave de Coriolis, A.M.E.I.C., is once more leaving Canada for Paris, where he expects to remain for several years.

*

Arthur Fournier, A.M.E.I.C., has joined the firm of Primeau and Co. Ltd., Builders Supplies, Quebec city, as Vice-President and Sales Manager.

*

T. W. Lesage, M.E.I.C., superintendent of the waterworks of the city, is retiring from the service of Montreal after his long service.

*

H. M. Campbell, J.E.I.C., has resigned from the Welland Ship Canal staff and is now Production Engineer at the works of Whitman-Barnes, St. Catharines.

*

R. R. Knight, M.E.I.C., has recently accepted a position as Toronto engineer and manager of Francis Hankin & Co., Limited, with headquarters at 609 Temple Building, Toronto.

*

W. B. MacDonald, M.E.I.C., has resigned as Mechanical Engineer of the Welland Ship Canal and is now Superintendent of the Electric Steel and Metal Companies' plant at Welland.

*

Lieut. Col. George W. MacLeod, D.S.O., A.M.E.I.C. of Edmonton, Alta was elected president of the Alberta Land Surveyer's Asso. at a meeting of that body held in Edmonton on January 20th.

*

J. N. Aggiman, A.M.E.I.C., has just left on a four month's tour to Eastern Europe to investigate and report on engineering prospects for Anerican interests. His present address is Helvig Han, No. 28 Pera, Constantinople, Turkey.

*

Frank O'B. Nehin, A.M.E.I.C., formerly assistant engineer for the Mount Royal Tunnel and Terminal Company has transferred his business connections and is now field engineer for the Beaver Board Company, Buffalo, N.Y.

*

G. M. Hamilton, M.C., A.M.E.I.C., has resigned from the Welland Ship Canal staff and started in business for himself at Niagara Falls as agent for the Willard Battery Service. His place of business is in the Clifton Hotel building.

*

Capt. N. J. Wallis, A.M.E.I.C., who was overseas with the Canadian Engineers, returned to Canada in November last, and is at present District Engineer, Reclamation Branch, Public Works of Manitoba, Winnipeg, Man.

Stanley A. Neilson, B.Sc., J.E.I.C., was married on January 28th, 1920 to Hazel Jean, daughter of Mrs. John John Allan. Mr. Neilson is a son of the late Matthew Neilson, C.E. who was one of the old time members of the E.I.C., when it was known as the Canadian Society of Civil Engineers.

*

Major A. S. Dawes, A.M.E.I.C., enlisted with the 21st Battery, C.F.A. in February 1915. He arrived in France in May 1915 and was posted to the 2nd Brigade C.F.A. He was twice wounded and in October 1917 was awarded the Military Cross. He returned to Canada and was demobilized in April 1919.

*

H. H. Charles, Esq., A.M.E.I.C. enlisted as a sapper in the C.O.R.C.C. in March 1915, and went to France in August 1915. He rose to the rank of Acting Major, and on becoming a casualty reverted to Captain which rank he retained. He returned to Canada in April 1919, and was demobilized in September 1919.

*

M. L. D. McFarlane, S.E.I.C., enlisted in 1914 with the Middlesex Regiment, going to France the same year, where he was transferred to the R.F.C. and subsequently served with that unit. He is now about to be invalided on account of wounds received while on active service.

*

G. P. Morse, A.M.E.I.C., since returning from overseas is located in Winnipeg as Assistant Engineer, Public Works of Canada. Besides service with the 10th Battalion, C.E. during the 1918 campaign, he was specially employed by the War Office in Ireland and elsewhere, in charge of aerodrome construction.

*

E. E. Down, Jr., E.I.C., has joined the field engineering staff of the Hydro-Electric Power Commission on Niagara Power Development at Niagara Falls, and has identified himself actively with the Niagara Peninsula Branch of *The Institute*. Mr. Down was demobilized in May 1919 from "A" Company, 2nd Battallon, Canadian Engineers.

*

Howard Kelley, M.E.I.C., President of the Grand Trunk Railway has been nominated as the Chairman of the Dominion Railway Board which will manage the Grand Trunk Railway and the Grand Trunk Pacific Railway, pending their absorption in the Canadian National System. S. J. Hungerford, M.E.I.C., has been mentioned as a probable addition to this Board.

*

K. H. Smith, A.M.E.I.C., Chief Engineer of the Nova Scotia Power Commission addressed the Commercial Club of St. John, N.B. on February 13th, his subject being; "Liquid Assets of the Maritime Provinces." Mr. Smith dealt with the proposed hydro-electric developments with particular reference to those under actual construction and those contemplated for the immediate future.

*

E. J. Owens, Jr. E.I.C., office engineer of the St. John & Quebec Ry. has been appointed office engineer of the Dept. of Public Works, Highway Division, reporting directly to Barton M. Hill, M.E.I.C., the Provincial Road Engineer. Mr. Owen is still acting as office engineer of the railway under the control of C. O. Foss, M.E.I.C., chief engineer, whose services have been retained by the Government in a consulting capacity.

A. W. Haddow, B.A.Sc., A.M.E.I.C., City Engineer, Edmonton, Alta. has just been appointed City Commissioner of Public Works. The Commission Board now consists of the Mayor and two permanent appointees. Mr. Haddow took his degree at Queen's University and entered the City Engineering Dept. in 1909, was appointed Acting City Engineer in 1916, and City Engineer in 1919. He will still continue his duties as City Engineer.

E. C. Gaines, M.E.I.C., who for the last three years has been engineer in charge of the crane and conveying machinery departments for the Dominion Bridge Company has severed his connection with the above firm, and will return to the United States. He has accepted a position with the Mead Morrison Mfg. Company and will be located at their Chicago office. The latter Company specializes on coal handling and hoisting machinery equipment.

Capt. C. S. Walley, M.C., Jr., E.I.C., enlisted as a trooper in the 2nd Field Company Canadian Engineers in April 1915. He was transferred to the 44th Battalion, C.E.F. as a private, and received his commission as Lieutenant in October 1915. He was awarded the Military Cross in January 1918, and in May 1918 was gazetted Captain to the 9th Battalion, Canadian Engineers. He returned to Canada and was demobilized in April 1919.

H. E. M. Kensit, M.E.I.C., enlisted in September 1915 with the Canadian Engineers, and served in France as a sapper with the 2nd Field Company. He was severely wounded at Vimy Ridge in April 1917, and on leaving hospital was transferred to the Ministry of Munitions of War, England as Dilution officer. He was engaged in the inspection and organization of munitions works and national factories till January 1919.

Lieut. H. Sprenger, Jr., E.I.C., enlisted in the 100th Regiment Winnipeg Grenadiers in December 1915, went overseas in November 1916 and was transferred to the Canadian Engineers in February 1917. In May 1918 he was appointed engineering officer to Canadian Corps Heavy Artillery and was in charge of all engineering work in connection with heavy artillery positions, bridges, camouflage, etc. He left France in March 1919 and was demobilized in Canada in August 1919.

Lieut. Arthur C. Oxley, D.C.M., M.C., A.M.E.I.C., enlisted in September 1914 as a sapper with the 2nd Field Company, Canadian Engineers. In November 1916 he was appointed to commissioned rank in C.E.T.D. and served in Canada, England and France with the 2nd F.C.C.E., 124 Pioneer Battalion, and the 10th Battalion, Canadian Engineers. He was awarded the D.C.M., and M.C., and was mentioned in Sir. Douglas Haig's despatches. Lieut. Oxley was demobilized in June 1919.

J. A. Symes, A.M.E.I.C., received his commission in April 1915 in the 38th Ottawa Battalion. He left for overseas in March 1916, was musketry and bombing officer with the 6th Reserve Brigade during the early part of 1917, and was later with the Canadian Corps Troops in France engaged in tramway construction, tunnelling and surveying, and construction of trench systems etc. He was invalided to England in August 1918 and is now resident in Ottawa.

Capt. Wilfred E. Hobbs, A.M.E.I.C., enlisted in February 1916, with the Canadian Engineers, was camp engineer at Camp Hughes from June to November 1916, when he was transferred to the Canadian Forestry Corps, and was adjutant of the 116th Company C.F.C. He was promoted to 2nd in command of the 13th Aerodrome Company, C.F.C., B.E.F. He was later promoted to O.C. of the 10th Aerodrome Company, and returned to Canada in July 1919.

James White, M.E.I.C., Deputy Head of the Commission of Conservation, addressed the National Conference on the Fur Industry and Wild Life Protection at the Windsor Hotel, Montreal, on Thursday, February 19th, the subject being "What the Fur Industry Convention may accomplish." This Convention which was held under the joint auspices of the Commission of Conservation and the Advisory Board on Wild Life Protection, and which was the first of its kind to be held Canada, was a great success.

R. S. Lea, M.E.I.C., & W. S. Lea, M.E.I.C., Consulting Engineers have prepared a report for the City of Montreal on the aqueduct project for a larger water supply. Three schemes have been presented, the first to use the aqueduct as a water supply only, the other two to use the aqueduct partly for power and partly for water. It is recommended that the aqueduct be completed for water supply purposes only at a cost of $[illegible], that a new motor driven power plant be provided, and that the capacity of the filtration plant be increased.

Lieut. F. Alport, M.C., A.M.E.I.C., enlisted in November 1914, going to England in April 1915 as sergeant No. 6 Field Company, 2nd Canadian Division, and to France in September 1915. He was wounded in October 1915, getting his commission in December 1916. In April 1918 he was adjutant 4th Canadian Division Engineers, and in May 1918 he was staff captain of the 4th Bde. C.E. Lieut. Alport was awarded the Military Cross in October 1918. He returned to Canada in July 1919, and now resides in Orillia, Ont.

About 50 officials and employees of Morris Knowles, Inc. of Pittsburg, Pa., were entertained recently at the University Club, on the occasion of the annual dinner of the company. At the dinner, Morris Knowles, M.E.I.C. made the announcement that the organization had been consolidated with that of the late Wallace Pratt of Cleveland, and that the Cleveland office would continue to be operated. The work of the combined organizations would continue along the lines already developed in connection with hydraulic engineering, town planning, industrial housing, etc.

Howard W. Tye, M.C., A.M.E.I.C., enlisted as Lieutenant with the 195th Battalion in January 1916, going overseas in November 1916. On arrival in England the 195th Battalion was broken up and Lieutenant Tye was transferred to the 78th Battalion, serving with that unit in France from December 1916 till May 1918, taking part in the actions at Vimy Ridge, Courcellette, Avion, and Passchendaele. In May 1918 he was invalided to England with trench fever and influenza. Lieut Tye was awarded the Military Cross for services at Passchendaele. He returned to Canada in the early part of 1919.

*

Lieut. W. H. Richardson, M.C., S.E.I.C., enlisted with the Canadian Engineers in November 1914, and was transferred to the 2nd Division Signal Company on the formation of the 2nd Division. He went to France in September 1915 and was commissioned in November 1915 in the 8th Battalion of the London Regiment. In June 1917 he was awarded the Military Cross and in September 1917 was given a Bar to the M.C. He was wounded in action on September 20, 1917 and was transferred to the Territorial Reserve Force in November 1918.

*

Major A. P. Linton, A.M.E.I.C., was commissioned a Lieut. with the 68th Battalion in July 1916. After arrival in England he was transferred to the 1st Battalion, Canadian Pioneers, and served with them in France and Belgium. From June 1917 till September 1918, Lieut. Linton was with the 9th Battalion, Canadian Railway Troops, and was later commanding officer of the 1st Bridging Company, Canadian Railway Troops, serving in Palestine and Syria with the Egyptian Expeditionary Force. He was granted the O.B.E. in 1919. In 1916 he was promoted to Captain, and in 1917 promoted to Major.

*

Capt. Henry C. McMordie, Jr., E.I.C., enlisted in Winnipeg in October 1914 with the Cameron Highlanders of Canada, and arrived in England in May 1915. From October 1915 till September 1916 he was assistant instructer in engineering at Canadian Military School, Shorncliffe. He served in France with the 42nd Field Co., Canadian Engineers (later 42nd Battalion, C.E.) from September 1916 till November 1918, when he was invalided to England. He was for five months at Canadian Headquarters, Rhyl. Wales as railway transport officer, and was demobilized from the C.E.F. in July 1919.

*

Major C. Flint, A.M.E.I.C., enlisted in April 1915 with the Canadian Overseas Railway Construction Corps, serving as lieutenant in Belgium and France until February 1917, when he was transferred as major to the 4th Battalion C.R.T. He was seconded to Royal Naval Seige Guns (on Flanders Coast, Nieuport) from April 1917 till January 1919 when he was engaged in mounting and transportation of heavy naval guns and construction of concrete emplacements. He was awarded the D.S.O. in June 1918, the Croix de Guerre (France) in Dec. 1918, and was mentioned in despatches in Dec. 1918.

Lt. Col. Ibbotson Leonard, D.S.O., A.M.E.I.C., enlisted in the 24th Battalion in October 1914 and was given command of the 7th Canadian Mounted Rifles in January 1915. He went to France in September 1915 as O.C. Mounted Troops 2nd Canadian Division until all Canadian Divisional Cavalry was formed into Canadian Light Horse in the Field in May 1916. He commanded the C.L.H. from March 1917 until the armistice was signed, serving continuously in France and participating in all the engagements of the Canadian Corps from the time of its formation. Lt.-Col. Leonard was twice mentioned in despatches, and was awarded the D.S.O. for distinguished services in the field.

*

H. C. Kennedy, A.M.E.I.C., enlisted with the 24th Battalion, V.R. in May 1915, and was with that Battalion from May to November 1915 in both England and France. In November 1915 he was invalided to England, and in January 1916 was attached to the 39th Battalion and promoted to Captain. In July 1916 he was transferred to the Canadian Army Corps, and in August 1917 was seconded to the War Office and was resident engineer on Aerodrome Construction from August 1917 to May 1918. In May 1918 he reverted to the rank of lieutenant to transfer to the Canadian Engineers and served with the 3rd Battalion C.E. in France until February 1919, returning to Canada in May 1919.

*

Dr. Frank D. Adams, Acting Principal of McGill University, and Honorary Member of *The Institute* delivered an address at a meeting of the Commission of Conservation in Montreal on February 18th, regarding the output of mines in Canada. In the course of his address Dr. Adams stated that there had been a marked decrease in the coal output, the production having been 2,000,000 tons lower than that of 1918. As regards metal production, the total value of the mine output for Canada in 1919 had declined from $211,301,897. in 1918 to $167,000,000. This falling off was chiefly in coal, steel, silver, copper, and nickel, while there was a gain in the output of gold.

*

Capt. E. Victor Deverall, S.E.I.C., was commissioned in the 10th Regiment, Royal Grenadiers, Toronto on March 28th, 1916, and after qualifying as lieutenant at Camp Borden was appointed to the 204th Battalion, C.E.F. in September 1916. He qualified as captain in November 1916 and was transferred to the Royal Engineers, and trained at Newark, England, being gazetted as 2nd lieut. in April 1917. Captain Deverall was wounded at Sanctuary Wood in October 1917, and was later awarded the Military Cross for a trench raid at Itencourt. For building a bridge across River Lys to enable the infantry to attack enemy entrenched on the east bank, he was awarded a bar to the Military Cross in October 1918. Captain Deverall was demobilized in July 1919 and granted the permanent rank of captain in the Royal Engineers.

Lieut.-Col. A. C. Garner, D.S.O., M.E.I.C.

Lieut.-Col. A. C. Garner, D.S.O., M.E.I.C., was appointed capt. and adjutant with the 32nd Battalion C.E.F. in November 1914, was later promoted to major and appointed Assistant Director of supply and transport Overseas Canadians. In England further promotion was granted to rank of lieut.-col. and in 1916 he was appointed to recruit and organize the 195th Battalion, and was later appointed to organize the 2nd Canadian Labour Battalion. In October 1916, Col. Garner was placed in command of the 12th Battalion, Canadian Railway Troops. Lieut. Col. Garner was placed on the Active List, Reserve of Officers, in 1919, with the rank of Lieut.-Col. In January 1919, he was awarded the D.S.O.

OBITUARIES

George Herbert Baird, A.M.E.I.C.

Through the publication of the missing membership list, word has been received of the death at Winnipeg, Man., on July [illegible] 1919, of George H. Baird, A.M.E.I.C. Mr. Baird was born in Brucefield, Ont., February 21st, 1897. His father, George Baird, was a school teacher. His mother's maiden name was Catherine McKenzie. Mr. Baird started his railroad carreer as clerk for the G.N.R. in 18[illegible] at St. Paul, Minn. He returned to Canada about 19[illegible] and started surveying and engineering with C.P.R. in northern Ontario and then went West to work on the G.T.P.R. about 1906 and was resident engineer on construction from 1907 to 1911 From 1911 to 1914 Mr. Baird was in private business in Winnipeg. He started with the Provincial Department of Public Works, Winnipeg, in 1914 and was chief draftsman at the time of his death. Mr. Baird leaves a widow and one young son. Mr. Walter S. Baird of Collingwood, [illegible], is a brother.

The late Mr. Baird had a number of friends, not only in Winnipeg but all over the West and was well and popularly known to [illegible]. He was a great lover of all sport, and followed the game, was a keen enthusiast over hockey, lacrosse and baseball. Mr. Baird was of an inventive turn and at the time of his death he had several patents pending.

Colonel Henry W. Hodge, M.E.I.C.

From his partner, Howard C. Baird, word has been received of the death of Col. Henry W. Hodge on December 21st, 1919, concerning which reported particulars have not been received. The late Col. Hodge was born at Washington, D.C., April 10th, 18[illegible] and was graduated from the Rensselaer Polytechnic Institute in 18[illegible], with the degree of C.E. Following graduation, his first years were spent as assistant engineer with the Phoenix Bridge Company, transferring to the Union Iron Works of New York as chief engineer. In 18[illegible] Col. Hodge engaged in private practice and acted as consulting engineer on various important bridge undertakings throughout the country, including consulting to the original Board of Engineers of the Quebec Bridge. At the time of his death Col. Hodge was a member of the firm, Hodge and Baird, consulting engineers, 115 Broadway, New York.

Captain David Kyle, M.C., M.E.I.C.

The death occurred at Sault Ste. Marie on Saturday, February 7th, of Capt. David Kyle, M.C., M.E.I.C., from pneumonia. The late Capt. Kyle joined *The Institute* as a member only last year following the establistment of the Sault Ste. Marie Branch in which he was a prominent member. He was born at [illegible], Scotland, on January [illegible], 18[illegible] and was an associate in mechanical engineering of the Royal Technical College, Glasgow, Scotland, 1906. In 1907 he qualified for associate membership in the Institution of Civil Engineers, London, coming to Canada in 1910 when he had charge of construction of part of the plant of the Algoma Steel Corporation and later was placed in charge of maintenance, following which he became general superintendent. In the early days of the war he went overseas, where he served with distinction winning the Military Cross, returning to Canada in 1917 on account of the requirements of the steel industry in this country. On his return he was made vice president of the Company and placed in charge of operations, which position he occupied at the time of his death.

John Patrick O'Donnell, M.E.I.C.

John Patrick O'Donnell, M.E.I.C., of Walter Lodge, [illegible], Surrey, and 11 New [illegible] Street, London, W.1, [illegible] of Palace Chambers, Bridge Street, Westminster, S.W., whose sudden death we briefly recorded last month, was born in Dublin, Ireland, in 18[illegible]. He was articled with Saxby and Farmer, railway signalling engineers, London and Glasgow, 18[illegible], and served with them until 18[illegible], when he was appointed assistant signal superintendent, Lanchashire and Yorkshire Railway. From 1885 to 1901, Mr. O'Donnell followed his profession as a signalling engineer in which he was particularly successful. In 1901 he formed the British Pneumatic Railway Signal Company of which he was chairman and managing director until his death. Mr. O'Donnell started the first works for the manufacture of pneumatic tools on a large scale in England and was a pioneer in power signalling. At the time of his death, Mr. O'Donnell held the following positions: managing director of the Superheater Corporation, Ltd.; managing director of the British Power Railway Signal Company Ltd.; managing director of the Economical Boiler Washing Co., Ltd. He was a member of the Institution of Civil Engineers, the American Society of Civil Engineers, Institution of Mechanical Engineers, Railway Signal Association, Institution of Railway Signal Engineers, a Fellow of the Chartered Institute of Patent Agents, as well as *The Engineering Institute of Canada*, which he joined in February 8th, 1895.

Hugh Cossart Baker, B.Sc. (McGill) A.M.E.I.C.

On Christmas day, Hugh C. Baker, who had gone to Arizona owing to poor health, died at the St. Luke's Home in Phœnix. The late Mr. Baker graduated in 1895 with the degree of B.Sc., from McGill having taken his course in mechanical engineering. For ten years following his graduation he was engaged in various capacities with a number of mines in Ontario and British Columbia. Later he became engaged in railway engineering followed by building and construction.

The late Mr. Baker was born at Morrisburg, Ontario, in June 4th, 1865. In 1895 he became a Student Member and in 1909 was transferred to Associate Member. He leaves to mourn his loss a wife and three small children.

EMPLOYMENT BUREAU

Situations Vacant

Instrument Man

Instrument man who can lay out construction work with pulp and paper company in Ontario, Salary $200. per month. Board supplied by the company at $40. per month. Apply Box No. 81.

Engineer for Construction

Experienced engineer in construction work, with experience in estimating for pulp and paper company in Ontario. Salary $250. per month. Board $40. per month, or quarters for a married man can be secured. Apply Box 82.

Structural Draftsman

Wanted a structural draftsman on bridge work. Box No. 83.

Railway Engineers

Railway corporation desires three railway engineers who have had experience in maintenance, capable of holding responsible positions. Box No. 84.

Civil Engineer for Pulp and Paper Company

Civil engineer with general pulp and paper mill experience wanted for paper company in Quebec. Experience in drafting, maintenance and construction work desirable. Salary $150. to $200. per month. Apply Box No. 85.

Town Engineer

Town engineer wanted for a town in Nova Scotia. Applicants to state qualifications, experience and salary wanted. Apply Box No. 86.

Town Engineer

Town engineer wanted for a town in Nova Scotia. Applicants to state qualifications, experience and salary wanted. Apply Box No. 87.

Electrical Engineer

Technical graduate in electrical engineering, with one or two years practical experience, for position in engineering department of large electrical manufacturing concern. First class opportunities for advancement. Apply Box No. 88..

Instrument Men and Rodmen

Large paper company requires for the end of March several Instrument men and Rodmen. Good opportunities for Student members. Box 92.

A Highway Engineer

852. A Highway Engineer for the Highways Branch of the Department of Railways and Canals, at an initial salary of $4,000 per annum and up, dependent upon an appraisal of the successful applicant's value in the position.

Applicants must have education equivalent to graduation from a university of recognized standing and have had much experience in and thorough knowledge of all phases of highway engineering work.

The successful applicant will be required to perform the following duties: To engage in the inspection and investigation of road building materials, the inspection and review of specifications and plans for the construction and improvement of various types of roads; to superintend the construction and improvement of such roads, and to perform other related work as provided in the Canada Highways Act.

Applicants should preferably be not more than 45 years of age.

Applicants are to understand that they may be called upon to undergo an oral examination or interview and shall submit in addition to the application, stating their education, experience and engineering training, a brief sketch suggesting a practical method for standardizing the qualifications of men actually engaged in all classes of highway work throughout Canada and for encouraging the maintenance of uniformly high standards of efficiency.

Aeronautical Intelligence Officer

[illegible]. An Aeronautical Intelligence Officer for the Air Board, at an initial salary of $2,400 per annum, which will be increased on recommendation for efficient service at the rate of $[illegible] per annum until a maximum of $[illegible] has been reached. This initial salary is supplemented by whatever bonus may be provided by law.

NOTE.—If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation.

Qualifications.—Education equivalent to graduation from a university of recognized standing; at least two years of experience in the collection and distribution of publicity material or experience of equivalent character and standard, and a high degree of specialized knowledge of aeronautical subjects, administrative ability, tact and good judgment.

Duties.—Under direction, to gather and distribute information relative to aviation, aeronautical science, aeroplane production, and all related subjects; to supervise the preparation and editing of the Aeronautical Year Book; to assist the Secretary, Air Board, in the administration of the office, as assigned, and to act for him in his absence, and to perform other related work as required.

Candidates for this position will be examined in the following subjects, which have the relative weights indicated: Education, Training and Experience, 300; Oral Interview, if necessary in the opinion of the Commission, 100.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from the applications for these positions.

According to law preference is given to persons who have been on active service overseas on the military or naval forces of His Majecty, or any of the Allies of His Majecty, during the late war. The age limit does not apply to persons who have seen active service overseas, but returned soldiers must furnish a certified copy of their discharge certificates, or in the case of commissioned officiers, a certified statement of their military service.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later than March 4. Application forms may be obtained from the office of the Employment Service of Canada, or from the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission.

W. FORAN,
Secretary.

Young Graduate for Photographic Work

Large paper company wants young graduate to be employed on large hydro-electric construction work. Work will be photographing, checking levels etc. Excellent opportunities for working up to good permanent position. Apply Box [illegible].

Draughtsmen

Three technical graduates for draughting and estimating. One of the largest industrial organizations in Montreal offers good prospects for three young men with technical training and some draughting experience. Apply Box [illegible].

Engineer for Dry Dock Design

Wanted at an early date engineer qualified to design work in connection with building of dry docks. An immediate opening for the right man. Apply Box [illegible].

* * *

Situations Wanted

Civil Engineer

A.M.E.I.C., 37 years of age, seventeen years experience on design and construction sewerage, waterworks, etc. Competent to take full charge of office. Available middle of February, Box No. 13-P.

Civil Engineer

Graduate engineer, S.E.I.C. desires change five years experience civil engineering, good experience in reinforced concrete construction, surveying. Can produce best references. Apply Box No. 14-P.

Mechanical Engineer

Mechanical engineer at present with large pulp and paper company wishes to make a change. Four years experience in general plant engineering, maintenance and construction, heating and ventilating, special experimental work etc. B.Sc. McGill. Salary $3000. Address Box No. 15-P.

Civil Engineer

Jr. E.I.C., recently demobilized civil engineering experience on construction survey work, hydrographic survey, speaks French fluently. Full particulars of experience on request. Apply Box 16-P.

Municipal Engineer

Engineer, A.M.E.I.C., now employed in West, wants change to Toronto or vicinity. Accustomed to river flow control, design and construction of municipal and hydro-electric projects. Prefer industrial or contracting opening. Box 17-P

Air Compressor and Boiler for Sale

The City of Saint-Boniface, Man., offers for sale.

1 only Ingersoll-Rand Cross Compound Motor-driven Air Compressor complete with 100 HP. Fairbanks Motor 550 V. 3 ph. 60 cycle 720 RPM slip ring type with switch board. Piston displacement per minute at normal speed 534 cubic feet.

1 only Robb Mumford Boiler 70 HP.

All in first class condition. Good as new.

For further particulars apply: J. A. Meindl, City Engineer.

Good Roads in Ontario

W. A. McLean, M.E.I.C., Deputy Minister of Highways, Province of Ontario

The more I know of the highway problems of other countries, states and provinces the more I am impressed with the general similarity which pertains to all. We have heard of the influence of the Quebec farmer through the labor tax levied upon him; of the growth of highway improvement through municipal organization; and later, the influence of the central government upon the work. That is the story of practically every country in the world that has attained good roads.

Attending conferences in Canada at which roads are a chief topic, when the roads of Ontario are compared with those of other provinces, one is led to believe from the trend of discussion that money is not the root of all evil, but rather that the roads of Ontario are the routes of all evil.

That, however, is not quite a true estimate of the situation in Ontario. Ontario has developed an excellent municipal organization, through which large annual expenditures have been going on and are increasing. We have about 55,000 miles of highway, of which about 42,000 miles are well graded and in use, and 22,000 miles, or over half, are superior to earth roads. While they are not always of marked excellence they are surfaced with gravel, broken stone, concrete, bituminous macadam, and many miles are oiled annually. They are superior to earth roads. That is a record which is rarely equalled on this continent.

Read at General Professional Meeting, Montreal, Jan. [illegible], 1920.

In certain states we find excellent systems of state highways. New York has a splendid system of state highways and we are apt to compare Canadian road conditions with those of New York. That State has had a source of income, the City of New York, through which they are practically able to take toll for highway construction, from the whole of the United States.

These state and county highways are constructed through direct levy on assessment, so that cities pay uniformly with the country districts for main highway construction. When we in Ontario have such a system of distributing the cost, it is quite evident that our expenditures can be much increased. But unfortunately at the present time, cities do not contribute so substantially.

However, present plans contemplate a policy of [illegible]. We estimate that this year, on the country roads of Ontario, we will spend [illegible] millions of dollars, which will be continued annually for at least a period of five years, and I expect that thereafter the annual expenditure will be increased.

An expenditure of [illegible] millions in five years, if properly applied, should make an improvement in Ontario highways, but we do not expect to wait until the end of that period to be able to see these roads with a good deal of satisfaction.

The Value of Good Foundations

The engineer and the layman regard roads from different standpoints. The user of the road considers surface conditions only. The builder must first think of many other factors such as location, alignment, grading, foundation, bridges, drainages and a multitude of preliminary details. Our efforts in Ontario at the present time are largely with respect to foundations and primary construction, with a surface merely to meet immediate needs. When we get the traffic going over roads so built, we know that the high-class surface will take care of itself in accordance with the demands of traffic.

It is useless to put a high-class surface on a poor, inadequate and insufficient foundation. The truth was emphasized by Mr. James in his address at the opening of this annual meeting. It has cost the United States enormous sums of money to re-discover this old and elemental fact. It is to be hoped that Canada will benefit by the experience that has been so expensively acquired in the United States.

I have said that we have 55,000 miles of highway in Ontario, with about 42,000 miles in use, over half of which has some class of surface. These surfaces are under improvement, the foundations are being improved and they are each year receiving more systematic upkeep and repair, which is so much needed.

Work for 1920

That sixteen or eighteen hundred miles we hope to get into passable shape quickly by an average expenditure of over ten thousand dollars a mile. This construction will involve some cement-concrete, asphaltic-concrete and bituminous macadam; and a considerable extent, as in every other country, will have to be gravel construction and broken stone; or these surfaces treated with tar and asphaltic oil.

We expect, if our plans can be put into execution, by the end of the current year, to have between the Quebec boundary and Windsor a highway 500 miles in length that is reasonably passable at every point, and at least superior to an earth road, a road which can be used throughout in spite of any weather conditions, and as fast as a car can travel. Many portions will be of a finished and high-class type.

When that main highway is in good condition, you will find as you come through Ontario that our past substantial expenditures have constructed branch roads from this main artery into all parts of the province.

You will find an excellent system of market roads, macadam, gravel, concrete and other forms, all attainable by means of this one main artery which, to the present time, we have not been able to construct owing to the scattered nature of the population of Ontario.

Some years ago, speaking in this city, I said that perhaps French should be declared by us the "official language" of good roads. I spoke of that because I had a short time before gone over the roads of England, France, Scotland, Switzerland and Belgium, and in no country did I find construction, primary construction, equal to the roads of France.

Other countries have perhaps maintained their roads by higher expenditure, but in primary construction I have not seen roads equal to those of France. In laying out the system in Ontario, I have had before me the general design of the French highway, and we have applied in Ontario a considerable part of the elements of French organization to our administration. In that way, I hope that sometime in the future Ontario will stand in the forefront of those portions of this continent which have good roads.

Concrete Mixtures in Alkali Soils

By C. J. Mackenzie, A.M.E.I.C., Prof. Civil Engineering, University of Sask.

Known Facts Regarding Effect of Alkali Waters on Concrete.

Briefly, the known facts concerning the effect of alkali waters' on cement and concrete mixtures, are as follows:—

1. By laboratory experiment it has been conclusively proved that magnesium and sodium sulphates, which are the predominating salts in our so-called alkali waters, will attack cement chemically and under certain conditions of intimate mixture completely disintegrate the same, (see Montana Agricultural College Bulletin No. 81.)

2. In laboratories it has also been proved that if a porous concrete be saturated and dried alternately, using a solution of soluble salts found in our alkali soils, that the process of crystallization will exert a force which will cause a splitting of the concrete. (Bureau of Standards Paper No. 12.)

3. In practice many cases have been observed where structures of concrete as well as those of chemically inert and porous materials, such as brick, sandstone, etc., where exposed to alkali waters, have been disintegrated, suggesting that the mechanical force of crystallization is the action obtained.

4. Also numerous cases have been observed where the concrete exposed has became soft, pasty and bulged, with the total loss of its cementing value, suggesting a chemical action on the binding material.

Read before the Annual Meeting, Sask. Branch, Jan. 8th, 1920.

3. In practice also we find structures of apparently the same grade of concrete exposed to the same conditions, one of which may be badly attacked with pitting and disintegration, while another appears unaffected.

Two Theories—Mechanical and Chemical

According, therefore, to their personal experiences there are those who hold that the action is entirely mechanical, due to the crystallization of the salts of the alkali water and that, therefore, all required is a dense concrete. There are engineers and chemists who are attacking the problem from the purely chemical side. (See Feret and Montreal Bulletin.) There are also a few engineers who hold that there is no effect from the alkali waters at all; that the trouble is entirely due to poor concrete and the disintegration found in our Western areas of alkali waters would have occurred similarly in the East, and been accredited there to the action of the weather, etc., on a poorly fabricated concrete.

It follows then, that accepting the facts above stated, we may say that while cement can be disintegrated by intimate action of alkali solutions, in laboratories, and also that concrete of porous character can be disintegrated by the mechanical forces of crystallization under ideal laboratory conditions of saturating and drying, these ideal conditions will seldom, if ever, be found in practice and consequently deductions from laboratory experiments must be interpreted with a great deal of caution.

In practice the alkali water is not permitted the intimate contact with cement; nor do we find the rapid saturating and drying, and in addition we have the extremely important problem of what effect the surface coating may have.

It would seem then that the most feasible method of attacking this problem is by actual field tests of concrete in the form of and under conditions found in practice. It is my opinion, and we have outlined our own experiments on this basis, that the proper way to approach the problem for the present is to subject, not a few mixtures to numerous varieties of water, but a number of widely different mixtures to conditions where disintegration is known to have taken place, and in this way we may hope to get some idea as to which mixtures will stand the action of alkali waters and which will not. If we could establish even a danger zone, we would have accomplished something practical, and later the determination of just what chemical or mechanical action takes place when concrete fails, could be undertaken.

Field Tests by the Bureau of Standard

The only published records of field tests of this nature being conducted at present, with which I am familiar, are those of the Bureau of Standards, Washington. Their experiments were initiated in an endeavour to determine the action of sea water on concrete, which we now know is of a similar nature to that of alkali action. Their first published report in 1912 covered an account of experiments conducted in the laboratory and a few field tests in the sea.

This report proved only the theory of mechanical action by crystallization under laboratory conditions.

The second report published in 1917 is devoted to an account of the field tests made on various reclamation projects in the American West, to determine the effect of alkali waters on concrete. The major part of the work covered by this report deals with cement pipe, but there are also the results of a year's experiments on block concrete. The results show pending conclusions. The tile pipes were taken up and crushed, and from their installation in 1913 till 1916 it may be stated generally that all pipes showed increase in strength in alkali waters. Although there were some cases of total failure of individual tiles, and even some of the tiles showing increase in strength were slightly pitted and attacked. It is very possible, however, that the future may yet show the effect of the alkali action.

The only conclusions drawn are that richness of mixture alone will not prevent disintegration and that poor tamping in several rich mixtures showed up much worse than lean mixtures in a well made concrete.

The blocks were only in one year before inspection and, with the exception of two cases, there was no effect noticed other than a slight pitting. The failure of two of the projects indicates that material and proper workmanship are of the greatest importance, but no conclusions of far reaching effect are drawn at the present.

In 1916 I investigated this problem for Chief Engineer, C. D. Howe of the Grain Commissioners of Canada, and the above conclusions were reached at that time. These conclusions, I think, are sound and have been shared for several years by most engineers interested in this problem, and at the same time there was the feeling that we really knew very little about the matter and that there were no very great indications of immediate light ahead.

The only difference in the outlook today, to my mind, is not due to any of the results of direct experiments along this line, but to the great steps in the understanding aand interpretation of concrete mixtures, which have taken place within the past year and a half.

The question that concerns us chiefly as engineers today is, let me repeat, "which mixtures, if any, will successfully withstand the action of the alkali waters as found in our Western Provinces?" The answer demands that we must first have an intimate and complete knowledge of mixtures, and then investigate the action of alkali on a wide range of mixtures and determine, if possible, which are suitable and which are unsuitable for our conditions.

The Science of Mixing Concrete.

I firmly believe that the principal reason we have obtained no clear conclusions up to the present is due to the fact that for the past years we have known practically nothing about the science of the design of concrete mixtures. How could we expect to obtain any definite information as to which mixtures would be suitable and which would not, when we know nothing more about the results of our mixtures, than that they were mixed in the proportions of 1.2.4 or 1.3.5 as the case might be, without any definite knowledge as to the final results of the concrete made?

A mix of, say 1-6, as is common with us, tells absolutely nothing about the finished concrete. The strength and character may vary several hundred per cent on the same job, to say nothing of the variation in mixtures on different jobs using different materials and mixed by different men and different methods. (I make this statement advisedly as the result of actual tests made from concrete poured on various jobs).

For years we have simply mixing concrete with our technical eyes shut. Certainly some engineers and some firms have been making concrete of the very best quality, while others working to the same specifications and with the same materials, have been making concrete of an altogether different character. The thing that has troubled most of us is, I think, the fact that if we were given the ingredients in any case including cement, sand, gravel and water, we could not calculate the strength of the finished product with any degree of assurance, although many men of mature judgment and wide experience could form a very good opinion.

Personally I have done what was called sand and gravel analyses for several years, I have plotted the results on properly ruled paper along with Fuller's Ideal Crow, handed the results to clients and even charged good money for it, but I tell you truthfully, the analysis never meant anything vital to me, and I am absolutely sure that it meant nothing to most of those to whom I sent it. All the time I prayed that someone would do something to clear up the meaning of gravel analyses.

Concrete Mixing Research, by Professor Abrams and Captain Edwards

During the years 1918-1919 two independent experimentors accomplished what I consider to be the biggest step towards placing the mixing of concrete on a scientific basis, that has been made for years. The names of the experimentors, Professor Abrams of the Lewis Institute of Chicago and Captain Edwards, until recently of the Department of Works of the City of Toronto, are familiar no doubt to all of you, and I understand that Professor Abrams attended the meeting held in Saskatoon in 1918, and is known personally as well to many members.

At the risk of covering ground familiar to you, I wish to mention these methods, as we have mixed all our concrete for experimental purposes on these theories, and we have tested their value out on various jobs in Saskatoon during the year and have found them very satisfactory and enlightening.

Professor Abrams proved from the results of about 50,000 tests that the strength of concrete depends only on the ratio of water to cement for all ordinary workable mixtures. The aggregate functions only in determining how much water must be used to make the mix workable. He worked out a method of stating this property of aggregate in terms of a concrete number which he calls "the fineness modulus" and which is readily obtained from a screen analysis. Thus, if we observe the amount of water being used per bag of cement on any job, it is always a simple matter to calculate the strength of the resulting concrete. Or if we are given an aggregate and we obtain its fineness modulus, we can calculate how much water will be necessary for any mix and what the strength will be, or if we wish to make concrete of a certain strength out of a certain aggregate, we can easily calculate the amount of cement required and the necessary water. By this method we have a means of comparing in actual figures of strength and also dollars and cents, the value of different aggregates.

Captain Edwards, on the other hand, attacked the problem from an altogether different viewpoint and concluded that, always providing the concrete mixture is of normal consistency or workability, the strength of concrete depends on the ratio of cement to the surface area of the aggregate. He worked out tables which when applied to the mechanical analysis of any aggregate, will give the surface area per pound of the aggregate. And by this method also mixtures may be analysed and designed as above.

While these two methods on the surface seem quite different and even contradictory they are identical in practical results and have both been found to give satisfaction on practical work.

The scope of this paper does not permit of a thorough discussion of these methods but if there are any members here today who are not familiar with these theories I would strongly urge a serious study of them.

Experiments in Saskatchewan

In outlining the experiments carried out in conjunction with the Committee on Concrete of the Saskatchewan Branch of *The Engineering Institute of Canada*, it would be well to state that we recognized that the problem was a very large one and that with the funds and facilities available at present it would be better to confine our work to one particular district, and if results of any value are obtained, further grants might be secured for a complete survey of the province, and test blocks placed in all the different localities where conditions of ground water, soil and available concrete aggregate differ.

We started with the premises as set forth in the opening paragraphs of this paper and accordingly decided to undertake our work under three divisions:—

(a) Field Tests.

(b) Observation of buildings under construction in areas known to be troublesome.

(c) Laboratory tests both chemical and physical.

(a) *Field Tests.*

For the present we are devoting the major part of our time to the Field Tests and to date we have placed in the ground specimens representing about 39 different concrete mixtures.

It was decided, in view of the fact that the pressing problem, in Saskatoon at least, is in connection with foundations and walls and not with tile, to make up our test blocks in cubes with sides of twelve (12) inches, thus approximating the conditions of walls. Each block is moulded in our laboratories and a wrought iron rod with anchor plate is inserted, the portion protruding forms a loop for handling and has enclosing it a brass identification disc.

The site for placing the test blocks was selected after a thorough investigation of the City and is in the centre of the most troublesome area being surrounded by buildings which have been affected.

Contiguous buildings were inspected to ascertain at what depth the most serious disintegration occurs, and we found that this was at a depth of six feet where a small gravel seam, about two inches in thickness runs through the clay. This depth was used for our blocks.

The test blocks made to date are in six series as follows:—

Plate "A"

Series A.

This series consists of thirteen blocks, ranging from a very strong, well graded, dense concrete to a very weak mixture, of poor pit run gravel, so weak that it was impossible to even handle without knocking the corners off as shown in Photo "A."

Blocks No. 1—No. 5, were made with an aggregate of washed gravel and crushed stone. This aggregate is a good approximation of Fuller's Curve. Its fineness Modulus (according to Abram's method) is 5.5 and the surface area per gr. (calculated by Capt. Edward's Tables) is 2.44.

Mixtures by volume of 1:2.5;—1:3.7—1:5.0—1:6.2. and 1:7.5 were used.

The ratio vol. water/ vol. cement runs from: .62 to 1.31, while the grs. of cement per sq. in. of surface area of aggregate varies from 7.3 to 22.

Blocks No. 6—No. 10 were mixed with a pit run gravel as aggregate, the fineness modulus of which was 3.8 and the surface area per gr. 3.9 sq. in.

The same mixes were used as in blocks No. 1—No. 5 but the ratio vol. water/ cement varied from .82 to 2.4 and the grs. of cement to surface area from 11.7 to 35.1.

Blocks No. 28—No. 30 were mixed with a pit run gravel of a better grade, the fineness modulus being 4.8. The surface area 2.51 sq. in. per gr.

The water/cement ratio varies from [illegible] to [illegible]. The grs. of cement per sq. in. surface area from [illegible]—[illegible].

Thus we have in this series concrete from the best to the worst practicable. A well graded aggregate and a poorly graded aggregate of average quality. A range in water ratio from .62 to 2.4. And a variation from 1 gr. of cement to 7.3 square inches of surface area to 1 gr. to 35.1 sq. inches, which gives a range in crushing strength from [illegible] lbs. sq. in. to 300 lbs. sq. in.

Complete records of the analyses of the cement, aggregate, mixing water have been kept, while from a test hole at the site, a log of the ground water level with the corresponding chemical analyses of the water is being recorded. The weights of the various ingredients as well as the moisture content of the gravel were, of course, kept, and it might be interesting to note that the best Block, No. 1, weighed 147 lbs. per cubic foot while No. [illegible] the poorest, only weighed 131 lbs. per cubic foot.

Before placing in the ground, a photograph was taken of the blocks, and it is proposed that each time the blocks are dug up for inspection, photographs will be taken for comparison and record.

It is believed that from this preliminary series we shall be able to obtain at least the danger zone of mixtures for this particular locality and thus cut down the range for future experiments and indicate the value of the different factors in combating disintegration in this locality.

Plate "B"

Blocks No. 11.—No. 19; No. [illegible]—No. [illegible]; No. [illegible]—No. [illegible] (15 blocks in all).

This series was designed for the purpose of testing a few commercial waterproofing and alkali proof products. Each compound was applied according to the manufacturer's specifications to each of the three blocks corresponding exactly to either blocks Nos. 11-12-13 or Nos. 28-29-30, in constituents, mix and consistency.

Four general types were used; an integral powder mixed with the cement; a compound mixed with the water; an alkali proof paint applied on the surface and tar applied to surface.

Blocks Nos. 20-22.

These blocks were made of the same aggregate and mix as No.11—No.12—No.13 but the consistency was made as wet as possible in order to see if the excess water decreases the resistance of a concrete to alkali just as decreases its strength.

Series D.

The purpose of this series is to check our assumption that the maximum disintegration takes place at a depth of 6 feet. These specimens were made 6″ x 6″ x 6′ and are placed upright so that one end is exposed to the air while the other is well under the ground water level.

If we find that the six ft. level is not the woost we shall be able to change the position of the other blocks and make all future tests accordingly.

Plate "C"

Series E. Blocks No. 34—No. 36.

In this series the pit run gravel was first screened and divided at the No. 4 screen and then re-mixed. The mixtures by volume corresponding to No. 28, No. 29, No. 30. This series was designed to ascertain the economy if any, of screening and remixing the Gravels for concrete aggregate.

Series F. Blocks No. 37, No. 39.

The blocks in this series are of the same mix as No. 28, No. 29 and No. 30, but the mixing water was the alkali water taken from the ground where blocks are placed.

At the time of making up all blocks of the series, small blocks for compression tests were made up for testing after twenty-eight days in water in order to check, if possible, the alkali resisting properties of concrete against its strength.

With blocks No. 25—No. 39, nine compression blocks at each mixture were also buried to be tested three per year.

(b) *Observations of Buildings.*

This phase of the work consisted of an inspection of all known cases of disintegration in the city for the main purpose of defining the troublesome areas, and gathering all the information and evidence possible. Added to that we have outlined a scheme for inspecting all buildings being erected in these areas and personally observing the concrete being put in, the mix, consistency and aggregate, etc.

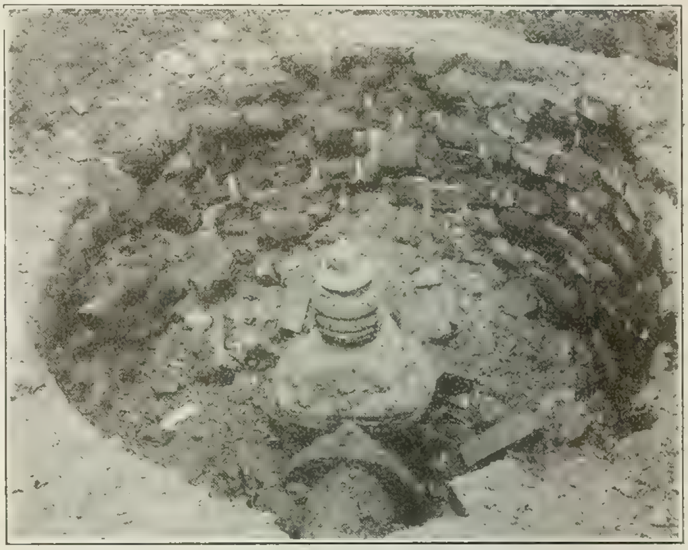

Plate "D"

Our inspection shows that the down town section of about ten city blocks contains the greatest amount of affected concrete, and information gathered from a reliable source indicates that before the city was built this area was what is known as an "alkali slough." Accordingly this section was selected for our tests and observations.

Plate "E"

On new buildings we take records of the conditions of the excavation, including an analysis of the ground water, a mechanical analysis of the aggregate and data as to the mix and water used. On several buildings we got permission to put in a section of the wall of a very much stronger mix than was used for the rest of the work and it is our desire to get a wall poured with about six different mixes, but up to the present time we have not succeeded.

On one old wall which was uncovered when extensions were being made a very interesting thing was observed. Two distinct layers of disintegration were noted, the ordinary one at the six foot level and the other at the ground level, suggesting that perhaps we have here disintegration by crystallization at the surface and direct chemical action at the six foot level.

(c) *Laboratory Tests.*

The laboratory tests are being conducted as an aid to, and for the purpose of throwing light on the results of the field tests, and not as primary tests themselves, as it is felt that conclusions drawn from laboratory tests are not always correct when applied to field conditions.

For the present the chemical work consists of a survey of ground waters, analyses of the mixing waters, aggregate, etc. As we get results from our field tests, the need for laboratory tests to clear up certain points will no doubt be necessary.

Conclusion.

The above is a summary of the work done during the past summer and while a great deal of actual labor has been done, we are, of course, unable to present any conclusions at present, although we hope that even by next summer's meeting we may be able to report at least some indications.

We intend extending the field of the survey next summer and adding [illegible] from time to time [illegible] at 6 ft. level, application of gases to surface, etc.

Effect of Vibration, Jigging and Pressure on Fresh Concrete

By Duff A. Abrams

Presented in part before General Professional Meeting at Rochester.

Introduction

An experimental study of the effect of vibration and pressure on fresh concrete on its strength and other properties is of interest in view of the frequent use of such devices as hand-hammering of forms, or air-hammering, jigging or vibration as an aid in placing concrete. Such methods are particularly applicable to the construction of reinforced-concrete ships and houses, where thin sections and a multiplicity of reinforcing members are of common occurrence. Jigging or vibrating machines are frequently used in concrete products plants. The effect of pressure on fresh concrete is of interest in certain problems of concrete design.

The tests included in this report were made as a part of the experimental studies of concrete and concrete materials being carried out through the co-operation of Lewis Institute and the Portland Cement Association.

Outline of Tests

The tests included in this report cover the following topics:

1. Different methods of hand-moulding of test cylinders.
   - (a) Puddling with 5/8-in. round steel bar (varying number of strokes).
   - (b) Tamping (tampers of different size).
   - (c) Tapping metal forms after puddling.
2. Effect of vibrating fresh concrete (small electric motor, Fig. 1.).
   - (a) Time of vibration varied up to 1 min.
3. Effect of jigging fresh concrete (using machine shown in Fig. 2).
   - (a) Concrete of different mixes (1:7 to 1:2).
   - (b) Concrete of different consistencies (0.90 to 1.20).
   - (c) Using aggregate of different grading (fineness modulus 4.00 to 6.50).
   - (d) Using aggregate of different sizes (0-28 sand to 0-1½-in. concrete aggregate).
   - (e) Using coarse aggregate of different shape (pebbles and crushed stone).
   - (f) Effect of rate of jigging (0 to 150 r. p. m.).
   - (g) Effect of height of drop (0 to 0.50 in.).
   - (h) Effect of length of time jigged (up to 4 min.).
   - (i) Effect of age of concrete before jigging (up to 6 hr.).
   - (j) Jigged with 30-lb. weight on top of fresh concrete.
   - (k) Hand puddling on jigging machine while in operation.
4. Effect of pressure on fresh concrete (method of applying the higher pressures shown in Fig. 3).
   - (a) Using different pressures (0 to 300 lb. per sq. in.).
   - (b) Effect of duration of pressure ([illegible]).
   - (c) Effect of removal of water by pressure.

This series included [illegible] compression tests of 6 by 12-in. concrete cylinders at the age of 28 days. All specimens were made from the same materials at the same time, consequently direct comparisons may be made between any two sets of tests.

Test Pieces

All test pieces consisted of 6 x 12-in. cylinders which were stored in damp sand for 28 days. The concrete for each specimen was proportioned separately and mixed by hand with a bricklayer's trowel in a shallow metal pan. The forms consisted of 12-in. lengths of cold-drawn steel tubing, split along one element. Each form stood on a machined cast-iron base plate. A smooth top was formed by means of neat cement and plate glass.

Unless otherwise noted, the specimens were moulded by the "standard" hand-puddling method before subjecting them to vibration, jigging or pressure. This method consists of puddling the fresh concrete in the metal form in 4-in. layers by means of 25 strokes with a 5/8-in. round steel bar and leveling off with a trowel. This method has been in use for several years in our research work and has been found to give uniform results for different operators. The strength of the concrete produced by this method of moulding is used as a basis for comparison (100 per cent.) for all other methods of treatment included in this investigation.

The mixture is expressed as one volume of cement to a given number of volumes of mixed aggregate. A 1:5 mix expressed in this manner is about the same as the ordinary 1:2:4 mix. The exact equivalent of the latter will vary with the size and grading of the aggregates.

The water content of the concrete is expressed in terms of the relative consistency and the "water-ratio." A relative consistency of 1.00 (normal consistency) is of such plasticity that the concrete of usual mixes will slump ½ to 1 in. if the metal form is withdrawn by a steady upward pull immediately after moulding the cylinder by the standard method. A relative consistency of 1.10 contains 10 per cent more water than normal consistency. The water-ratio is the ratio of volume of water to volume of cement in the batch. The weight of cement was assumed as 94 lb. per cu. ft. For one mix and given concrete materials the relative consistency and water-ratio may be used interchangeably.

In the hand-moulded specimens the method of placing the concrete was varied by changing the number of strokes of the puddling bar, using layers of different thickness, etc. Hand-tampers 2 in. and 5 in. in diameter were also used. In one set of tests the form was struck with a steel bar after moulding by the standard puddling method.

In the vibration tests the cylinder mould was bolted to a light timber table and the concrete specimen moulded by the standard hand-puddling method described above.

Violent vibration was produced by holding an electric motor frame against the side of the steel form as shown in Fig. 1. The motor carried an eccentric flywheel, weighed 12 lb. and ran about 1000 r. p. m. The time of vibration varied from 5 sec. to 1 min.

Fig. 1.—Electric Vibrator.

Shows set-up for vibration tests given in Table 3. Motor weighed 12 lb., ran about 1000 r. p. m.

The jigging tests were made on the machine shown in Fig. 2. The machine consisted of a framework carrying a metal table about 4 ft. wide and 8 ft. long weighing about 700 lb. The table was raised by means of belt-driven cams on two longitudinal shafts. The rate and height of drop could be varied over a wide range. In most of the tests the machine was run for 20 sec. at 100 drops per min., 0.1-in. drop; however, each of these factors were varied with the other two constant.

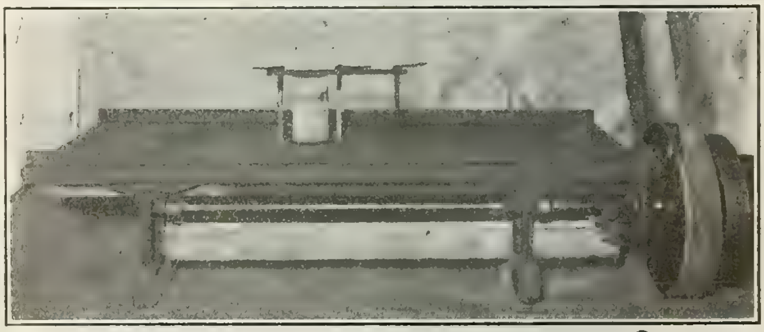

Fig. 2.—Jigging Machine.

Steel table 4 x 8 ft.; weight 700 lb. Table raised by means of cams; rate and height of drop can be varied over wide rangs.

All specimens were moulded by the standard hand-puddling method before pressure was applied. Pressures up to 30 lb. per sq. in. were applied by piling weights on top of a loose-fitting cover plate. Pressures of 75 and 50 lb. per sq. in. were applied by weighted levers. Pressures of 100 to 500 lb. per sq. in. were obtained by placing the freshly moulded specimen in a testing machine, as shown in Fig. 3. The spring facilitated maintaining a constant pressure. For all pressures the times of application varied from 15 min. to 16 hr.

Test Data and Discussion

The diagrams in Figs. 4 to 16 give the data in graphical form.

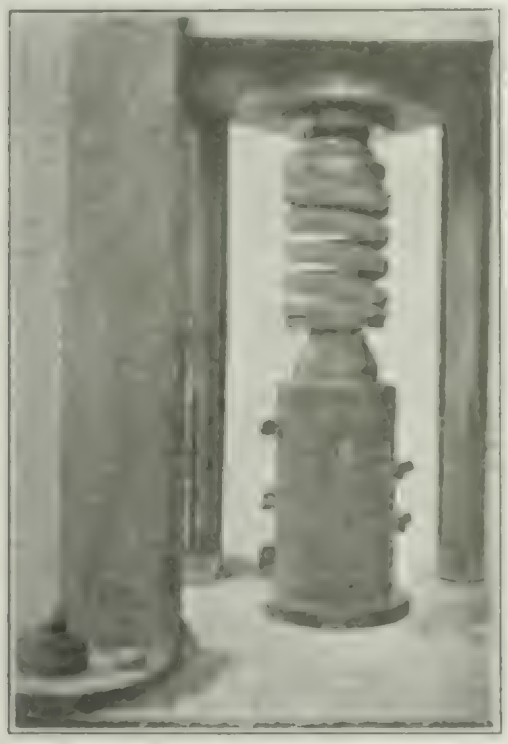

Fig. 3.—Method of Applying Pressure to Fresh Concrete.

The higher pressures were applied by means of a testing machine. The spring facilitated maintaining a constant pressure. The plate in contact with fresh concrete was loose fitting. The water expelled from concrete was collected by means of sponges and weighed.

The effect of vibration with electric vibrator is shown in Fig. 4. Vibrating for about 30 seconds caused no appreciable effect on the strength of concrete which had been puddled in place by hand. The tests indicate that hand-puddling (if thoroughly done) is just as effective as vibration in placing concrete. In other words, concrete which completely fills the form is not improved by vibration. This should not be construed as meaning that vibration is not effective in causing concrete to finds its way into intricate form work and around the reinforcing bars.

The effect of jigging is shown in Figs. 5 to 11. The jigging method used was one which would be applicable in concrete products plants. The tests show that in general jigging of concrete which has been placed by puddling is injurious to the strength. The improvement for the small-sized aggregates is probably due to the fact that the puddling method is not so satisfactory for this condition.

The tests of concrete setting under pressure are of interest in that they reveal the reason for increased strength due to this treatment. The concrete strength is increased due to the fact that some of the original mixing water is forced out. The higher the pressure, the more water is removed, hence the higher the strength.

Attention is called to the unusual uniformity of the results of the tests in this series, as illustrated by the fact that in the diagrams the points fall on smooth curves. There are only a few instances in which there is any appreciable deviation from this rule.

Summary and Conclusions

The tests give conclusive results on many phases of the effect of vibration, jigging and pressure. In some instances the effect is entirely different from what accepted opinion would suggest. Following is a brief summary of the tests:

Effect of Vibration with Electric Motor

Method of vibrating shown in Fig. 1.
Compression tests of 6 x 12-in. cylinders.
Results of tests are platted in Fig. 4.
Age at test 28 days; stored in damp sand; tested damp.
Aggregate—Sand and pebbles from Elgin, Ill., graded 0-1½ in.
Each value is the average of 5 tests made on different days.

Fig. 4.—Effect of Vibration on the Strength of Concrete.

Vibration produced by electric motor shown in Fig. 1. Compression tests of 6 x 12-in. cylinders. Age 28 days. Data from Table [illegible].

TABLE 1.—EFFECT OF METHOD OF MOULDING CONCRETE SPECIMENS.

Compression tests of 6 x 12-in. cylinders.
Age at test 28 days; stored in damp sand; tested damp.
Aggregate—Sand and pebbles from Elgin, Ill., graded 0-1½ in.
Each value is the average of 5 tests made on different days.

Ref. No.	Mix by Volume.	F. M. of Aggregate.	Relative Consistency.	Water-Ratio to Volume of Cement.	Compressive Strength		Treatment of Concrete
					lb. per sq. in.	Per cent of Standard	
1	1:5	5.75	1.00	0.875	2680	96	12 strokes around perimeter of form for each 4-in. layer of concrete using 5/8-in. steel bar.
31	....	....	....	....	2800	100	25 strokes distributed over section for each 4-in. layer using 5/8-in. steel bar. (Standard method).
51	....	....	....	....	2710		
84	....	....	....	....	2840		
					2780*		
2	....	....	....	....	2810	101	50 strokes distributed over section for each 4-in. layer using 5/8-in. bar.
147	....	....	....	....	2690	97	12 strokes on each 3-in. layer using 2-lb. tamper 2 in. in diameter.
148	....	....	....	....	2420	87	12 strokes on each 6-in. layer, using 2-lb. 2-in. tamper.
149	....	....	....	....	2430	87	12 strokes on first 3-in. layer using 2-lb. 2-in. tamper, forms then filled before tamping again with 12 strokes.
150	....	....	....	....	2500	90	12 strokes on first 3-in. layer, using 2-lb. 2-in. tamper, remaining concrete settled by tapping form lightly.
3	....	....	....	....	2800	101	25 strokes distributed over section for each 4-in. layer with 2-lb. 2-in. tamper.
4	....	....	....	....	2570	92	25 strokes distributed over section for each 4-in. layer with 2-lb. 5-in. tamper.
5	....	....	....	....	2740	98	Standard method of moulding, except form struck 3 light blows with steel bar after puddling each 4-in. layer.

*Average of 15 tests made on different days. This value is used as a basis for comparison in Tables.

Effect of Jigging on the Strength of Concrete.

(Using aggregates of different size and grading.)

Values from tests plotted in Figs. 7 and 8.

All cylinders were moulded by the standard method before placing on machine shown in Fig. 2. (100 r.p.m.; 0.1-in. drop; jigged 20 sec.)

Compression tests of 6 x 12-in. cylinders.

Actual tests (28 days; stored in damp sand; tested damp).

Aggregates—Sand and pebbles from Elgin, Ill., except where otherwise noted.

Each value is the average of 3 tests made on different days.

Variation in grading in last two groups was produced by mixing different percentages of sand and coarse aggregate.

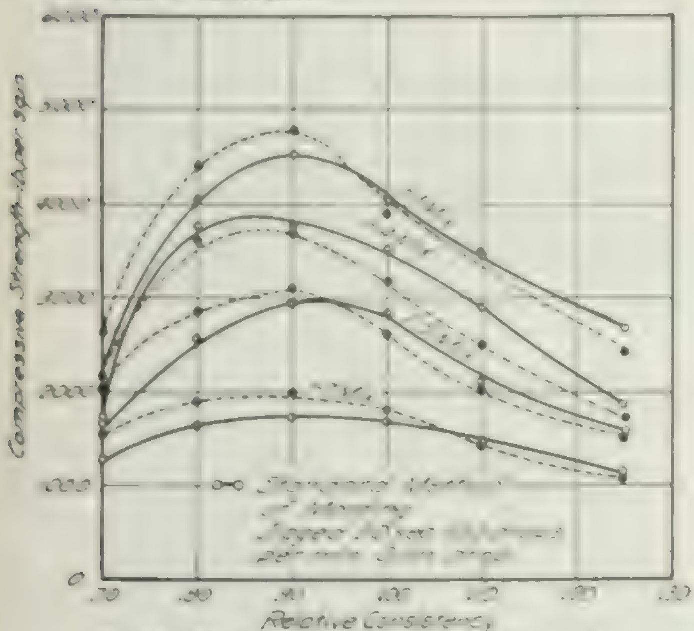

Fig. 5—Effect of Consistency on the Strength of Jigged Concrete.

Specimens moulded by standard method and parallel sets jigged on machine shown in Fig. 2. Compression tests of 6 x 12-in. cylinders. Age 28 days. Data from Table 4.

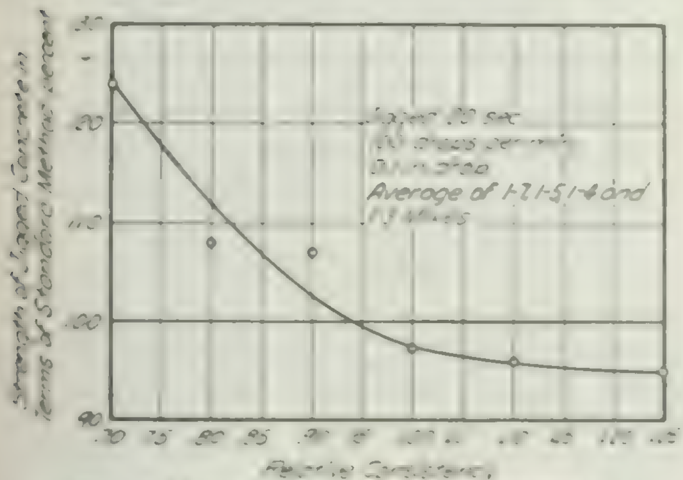

Fig. 6—Effect of Consistency on the Strength of Jigged Concrete.

Each value is the average of 20 tests; 5 each from 4 different mixes.

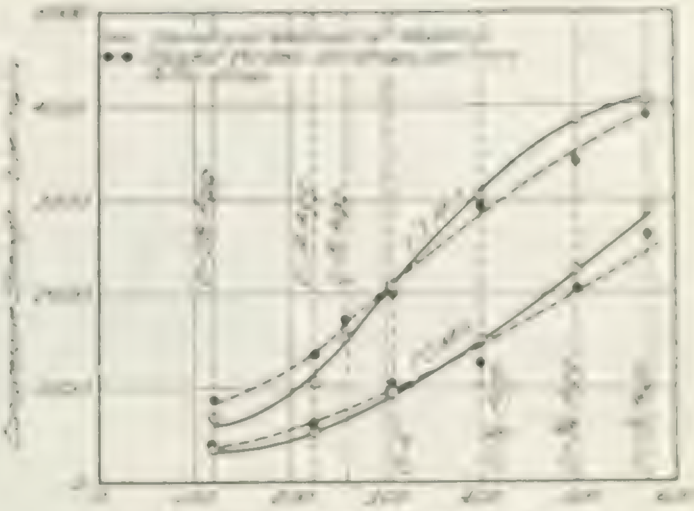

Fig. 7—Effect of Size of Aggregate on the Strength of Jigged Concrete.

Compression tests of 6 x 12-in. cylinders. Age 28 days.

Effect of Puddling and Tamping (Table 1)

1. Varying the number of strokes from 12 to 50 on each 4-in. layer in the standard method of puddling cylinders with a 5/8-in. bar had little influence on the compressive strength of ordinary plastic concrete.

2. In general, the tamping methods used gave lower strengths than hand puddling.

3. A tamper of large diameter for a given weight was less effective than one of small diameter.

4. Increasing the thickness of the layer from 4 to 8 in. caused a falling-off in strength of about [illegible] per cent for tamped concrete.

5. Tamping or puddling the first 4-in. layer only caused a falling off in strength of 10 to 12 per cent.

6. Striking the metal form with a steel bar after the completion of moulding by standard method had no effect on the strength of concrete.

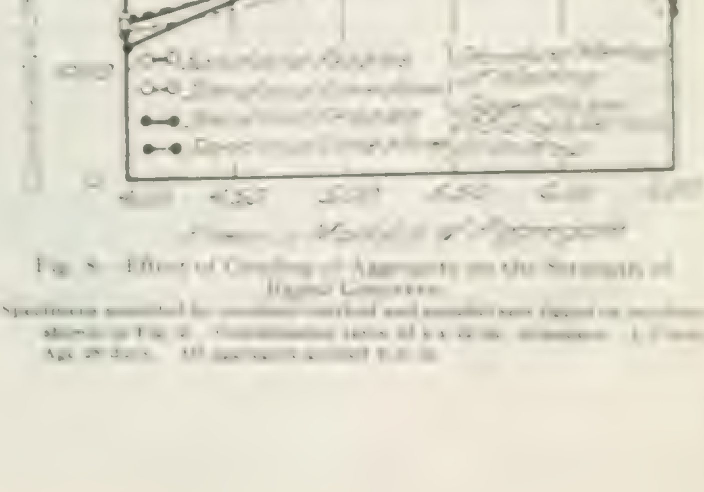

Fig. 8—Effect of Grading of Aggregate on the Strength of Jigged Concrete.

Specimens moulded by standard method and parallel sets jigged on machine shown in Fig. 2. Compression tests of 6 x 12-in. cylinders. Age 28 days. [illegible]

7. The "standard" method of hand-puddling using 25 strokes with a 5/8-in. steel bar for each 4-in. layer of concrete in a 6 x 12-in. cylinder is recommended for laboratory tests of concrete.

Effect of Vibration with Electric Hammer.

8. Vibration of the specimen after moulding by means of an electric hammer running at 1000 r.p.m. had little influence on the strength of the puddled concrete up to a period of about 30 seconds. If continued, there was a steading falling off in strength; after 45 to 60 seconds the strength was only 90 per cent. of that produced by the standard method of puddling. (Fig. 4.)

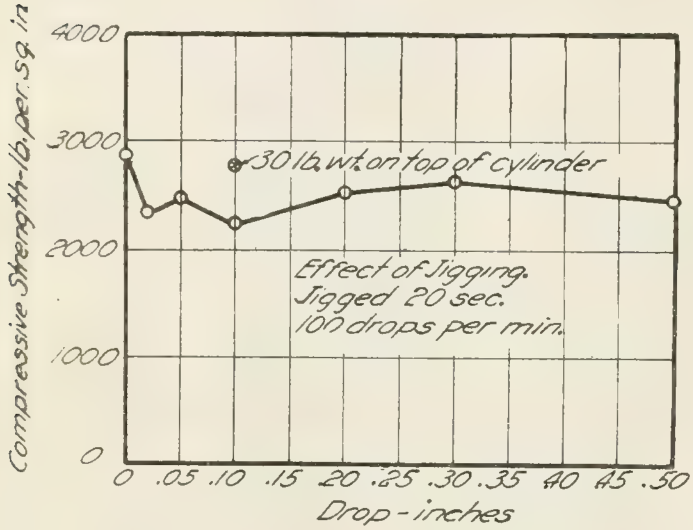

Fig. 9.—Effect of Height of Drop in Jigging Tests.

Compression Tests of 6 x 12-in. cylinders. Age 28 days.

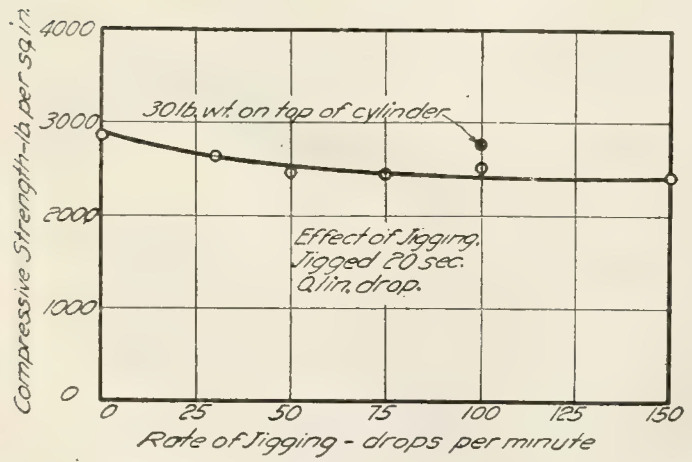

Fig 10. — Effect of Rate of Jigging on the Strength of Concrete.

Compression tests of 6 x 12-in. cylinders. 1: 5 mix. Age 28 days.

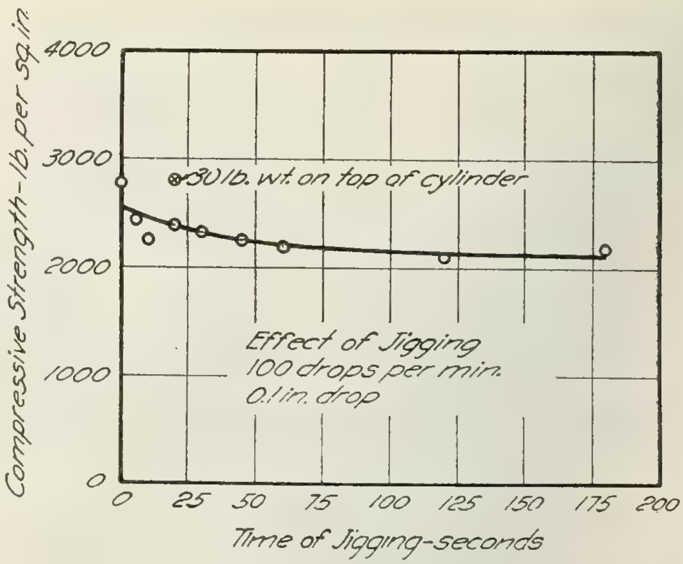

Fig. 11.—Effect of Duration of Jigging on the Strength of Concrete.

Compression tests of 6 x 12-in. cylinders. 1:5 mix. Age 28 days.

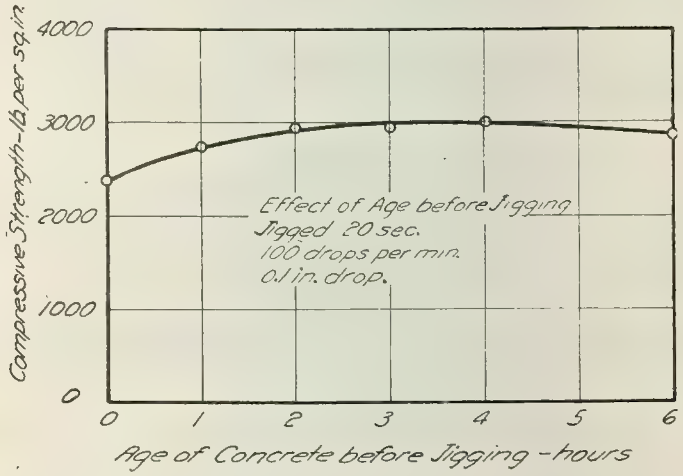

Fig. 12.—Effect of Age of Concrete before Jigging.

Compression tests of 6 x 12-in. cylinders. 1:5 mix. Age 28 days.

Effect of Jigging.

9. In general, jigging in any manner with the apparatus used reduced the compressive strength of the concrete regardless of the height of drop, rate of duration of treatment. Exceptions were found in the dry mixes and those made of aggregates of the smaller sizes. (Figs. 5 to 12.)

10. There was little difference in the effect of jigging due to the quantity of cement used. (Fig. 5.)

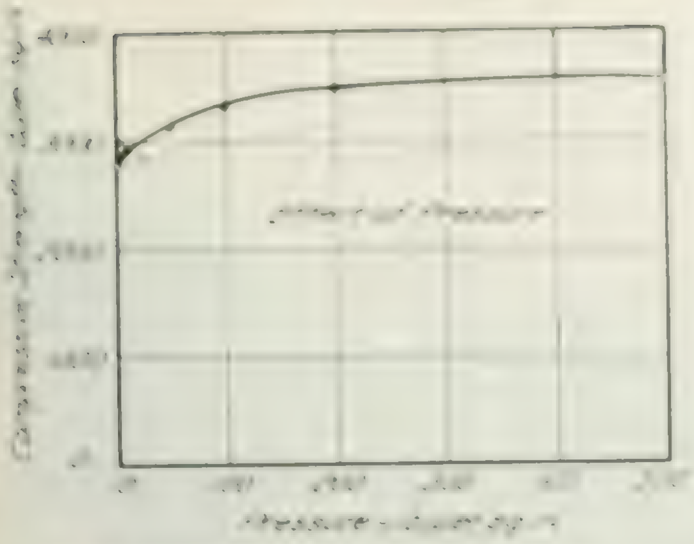

Fig. 13. Effect of Pressure on the Strength of Concrete.

Compression tests of 6 x 12-in. cylinders. 1:5 mix. Age 28 days. Pressure applied immediately after moulding. Each point represents the average of 20 tests, 5 each from 4 different times of application of pressure ranging from 15 min. to 16 hr. Data from Table 7.

11. In the very dry mixes the strength, due to jigging for 20 seconds, was increased about 25 per cent. (Figs. 5 and 6.)

12. The wetter mixes (relative consistency 1.10 to 1.25) were reduced in strength 3 to 6 per cent by jigging. (Figs. 5 and 6.)

13. Pebbles and crushed limestone as coarse aggregate gave essentially the same results in the jigging tests. (Fig. 8.)

14. The concretes from the finer aggregates showed a material increase in strength with jigging in both 1:5 and 1:3 mixes. (Fig. 7.)

15. For aggregate coarser than about 3/8 in., jigging reduced the strength from 3 to 10 per cent. (Fig. 7.)

16. The grading of the aggregates (for a given maximum size) had little influence on the effect of jigging. (Fig. 8.)

17. The greater the drop the greater the reduction in strength for 1:5 concrete. For a drop of ½ in. the strength was reduced 12 per cent. (Fig. 9.)

18. The faster the rate of jigging the lower the strength of 1:5 concrete. Using 1½-in. aggregate at 150 r. p. m. the strength was reduced about 13 per cent. (Fig. 10.)

19. The strength of 1:5 concrete fell off rapidly with the duration of jigging. After 2 to 3 minutes jigging the strength was reduced about 20 per cent. as compared with standard method of hand-puddling. (Fig. 11.)

20. Allowing the concrete to stand for a period of time before jigging, increased the strength to a light extent. The maximum increase was found at 2 to 4 hr. (Fig. 12.)

21. The application of a pressure of 2 lb. per sq. in. during the jigging process (equivalent to a head of 1 ft. of fresh concrete) gave the same strength as standard hand-puddling. (Figs. 9, 10 and 11.)

22. Moulding the cylinders by the standard method on the jigging table while it was in motion, gave the same strength as standard hand-puddling without jigging.

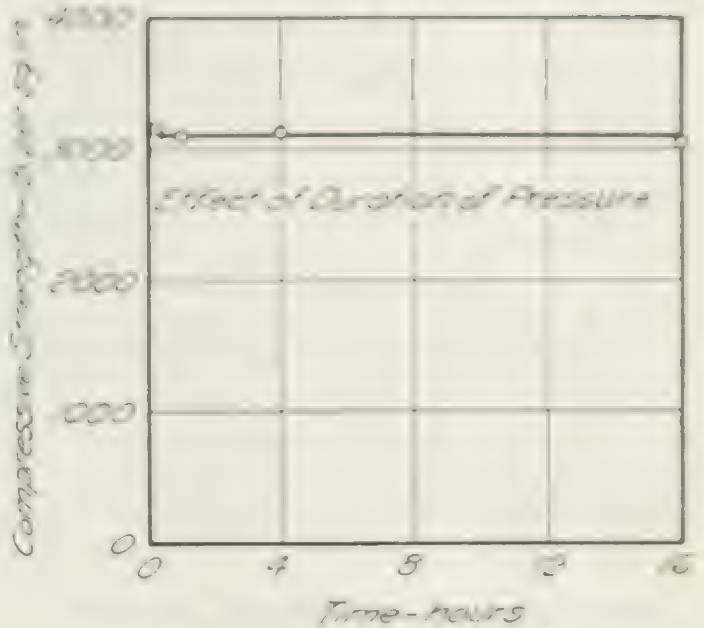

Fig. 14. Effect of Duration of Pressure on the Strength of Concrete.

Compression tests of 6 x 12-in. cylinders. 1:5 mix. Age 28 days. Pressure applied immediately after moulding specimens. Each point represents the average of 45 tests, 5 each from 9 different pressures ranging from 2 to 500 lb. per sq. in. Data from Table 8.

Effect of Pressure

23. The compressive strength of concrete was increased by pressure applied immediately after moulding. For pressure of 300 to 500 lb. per sq. in. the increase was 20 to 35 per cent. (Fig. 13.)

24. The duration of pressure of between 15 min. and 16 hr. produced no difference in strength. (Fig. 14.)

25. There was a steady reduction in the water-ratio of the concrete with the application of pressure. (Fig. 16.)

26. The application of pressure increased the strength of concrete in accordance with the quantity of mixing water expelled. (Fig. 16.)

27. The tests of concrete subjected to pressure showed the usual relation between compressive strength and water-ratio. The strength is increased because the water is expelled. In other words, pressure produces a drier concrete, and consequently gives higher strength.* This makes it clear why the duration of pressure has no influence on the result.

*[illegible] Proceedings, American Concrete Institute, 1918.

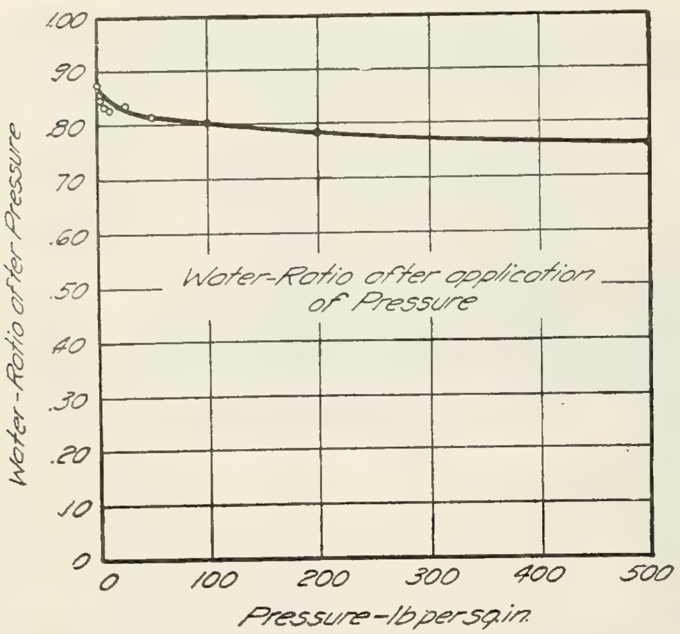

Fig. 15.—Water-Ratio of Concrete after Pressure.

Each point represents the average of 20 tests, 5 each from 4 different times of application of pressure. Data from grand average values in Table 7.

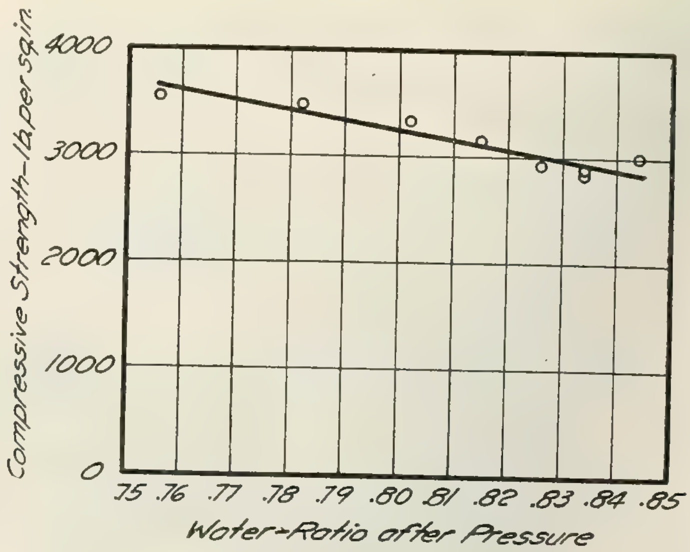

Fig. 16.—Effect of Quantity of Mixing Water on the Strength of Concrete.

Compression tests of 6 x 12-in. cylinders. Age 28 days. Water-ratio determined after application of pressure. Each point represents the average of 45 tests, 5 each from 9 different pressures. Data from grand average values in Table 7. The narrow range in water-ratio gives a straight line relation for these tests. The water-strength relation is represented by a curved line as shown in Bulletin 1, Structural Materials Research Laboratory.

Further Discussion of Vibration, Jigging and Pressure Tests

The indications of the vibrations and jigging tests should not be misinterpreted. The tests show that *after the concrete is properly placed* these methods of treatment do no good and may be harmful if too severe or too long continued. However, there can be no doubt of the value of such methods *for getting concrete into place* in intricate forms and around reinforcing bars. The tests are of value in showing that this is the only desirable function of such treatments. The tests under Ref. No. 149 (Table 1) show the ill effects of lack of compactness in the concrete. Here the strength was reduced 13 per cent due to failure to tamp or puddle the top 9 in. of the cylinder. It is impracticable to duplicate in a compression test piece the performance of air hammers and other similar methods of vibrating when used on reinforced concrete work.

The tests show that with jigging high strength may be secured with drier mixes than would be feasible otherwise. It is a matter of common experience that concrete of drier consistency (and consequently higher strength) can be placed by means of jigging or vibration than would be possible by the usual methods.

The roller method of finishing concrete roads, walks and floors is an interesting example of a combination of slight vibration and pressure accompanied by the removal of excess water. Transverse tests on concrete made in this laboratory showed a marked increase in strength of the rolled slabs as compared with similar slabs without rolling.*

It is clear from these tests that if tamping, vibration or pressure on fresh concrete are to be effective in increasing the strength three factors must be kept in mind:

(1) We must take advantage of the fact that with these methods the concrete can be placed and finished dryer than with ordinary methods.

(2) Excess water which is brought to the surface must be removed.

(3) We must take advantage of the fact that aggregate of a coarser grading may be used when such methods are employed than would be practicable otherwise.

The advantages to be gained under (3) are due to the fact that up to a certain point a plastic mix can be secured with a smaller quantity of water if the aggregate is as coarse as practicable. Unless these precautions are taken, tamping and vibration are of doubtful value.

The Policy of the Air Board in Canada

Colonel O. M. Biggar, [illegible] K.C., Vice-Chairman of the Air Board of Canada

Development of Aviation

The development of air transportation proceeded extraordinarily slowly for a good many centuries and has proceeded with extraordinary rapidity during the last century or thereabouts. The development of the internal combustion engine has really made possible the development of air navigation during a comparatively short time. In 1914 we turned our whole attention, so far as air navigation was concerned, to the development not of a machine for developing the civil social life of the world but a machine of destruction, and these last five years have given an extraordinary impetus and at the same time an extraordinary change in direction to the development of air navigation.

Effect of the War

During these five years war urgency really had two favourable effects. In the first place the money available for air navigation became practically unlimited. Whatever it seemed well to do the money was available to carry out. No considerations of finance intervened to prevent the undertaking of any experiment which promised useful results, and no money lacked for the actual construction of machines which looked as though they had a military value. The situation also had this result, that so far as advertising went the public became completely familiar with the possibility of transport by air. It probably became more familiar in those five years with that possibility than it would have done in a quarter of a century of peace. These two results of the intervention of the war at the time that it did intervene in the development of air navigation had probably a greater effect in the two directions of supplying money and of advertisement than could have been obtained in five times five years of peace. But the war also had another result which was not quite so favourable, although this by no means balanced the advantages to which I have referred. It had this effect, that the Government having been during the war the only employer of air personnel, the only purchaser of aircraft, the public at large after the war was left under the impression that the whole matter of air navigation was a subject for action by the Government and the Government alone. The expenses have now, however, in peace time become a matter of very much more considerable importance and the probability is — I might almost say the certainty is, — that hereafter we shall find that it is much more profitable from the point of view of society generally that the Government's relation to the development of air navigation should be rather that of generating a little current only to serve to throw the proper switches of the local generating stations, which must be supplied with power by individuals and by groups of individuals acting independently altogether of the Government activities.

There is another thing that the war has had its bearing upon air navigation during the war and that is the air navigation being a matter of purely military importance. There grew up in every belligerent country a tremendous military interest in air navigation, and curiously enough, having regard to the extent to which aviation had developed before the war, there was after the war in existence in every country a military air organization but no civil air organization. If you just think a moment you will remember that the Air Ministry in England came into existence only through the war and, at the time of its inception, only for the purposes of the war. In France the whole question of aviation was under the direction of the War Department. In the United States even to-day the whole interest in aviation, the main interest in aviation, is centered in the Departments of War and the Navy. There is not any civil air organization. In England, on the other hand there came into existence after the war a civil air organization, but it came into existence as a sort of an excrescence on the Military Air Ministry. In France I think the situation is still that the air administration is under the War Department.

Generally speaking, the situation common to all the belligerent countries was that the military organization which came into existence for the purpose of the war continued to deal with aviation after the war either directly or through some small auxiliary organization.

Civil Aviation after the War

Canada was in a completely different position from any other belligerent in that respect. Canada came out of the war without any air organization in Canada at all. The only air organization that there was that was Canadian in character consisted of two squadrons which formed part of the Canadian Expeditionary Force. These squadrons were in England; they were administered by the Department of Overseas Military Forces of Canada, and they had no counterpart as far as organization went in Canada. I am speaking about that because there was a widespread misunderstanding to the effect that these squadrons were not Canadian organizations at all, but were two squadrons of the Royal Air Force that were formed from Canadian personnel. That is not the case. The fact was that these two squadrons were exclusively Canadian in character, were organized by the Canadian Overseas Department, paid for by Canada and had an exclusively Canadian character. Then in May last year it was proposed to bring these squadrons back to Canada to form the nucleus of an air organization here. The Government decided against that, and the result was that these squadrons were demobilized in England just as the rest of the Canadian Expeditionary Force was demobilized. None of the squadrons came back as formed organizations. Instead of bringing them back

Read at the General Professional Meeting, Montreal, Jan. [illegible], 1920.

the Government decided to create a new civil organization. to set up a completely new body which would deal with all air matters.

Formation of the Air Board in Canada

The result was the formation of the Air Board, which in effect constitutes a new department of Government, at the head of which is one of the Ministers of the Crown. The personnel of the Air Board was selected from among men who were already in the public service in various departments for the purpose of getting something done, of getting an air administration which could carry on and do the preliminary work of organization. It is probable that the re-organization of the Air Board on a permanent footing will take place before very long.

The work that has been done is of an important character and it is of three different kinds. Different from every other air organization, the air organization thus formed was given control of the air in all its aspects. There is no other department of the Government that is interested in anything above the earth; the whole atmosphere comes under the direction, so far as it can be directed, of the Air Board. The Board has exclusive jurisdiction to form a military air force; it has exclusive jurisdiction over the administration and regulation of civil flying of all kinds; it has exclusive jurisdiction to operate such air services as are necessary to be operated for any government purposes, and in this respect has to some extent the character of a taxicab company.

Work of the Air Board

Now, something has been done by the Air Board along each of these three lines. In the first place, it has put forward a scheme for the organization of a military air force. This scheme is still under consideration. It is not known yet whether it will be found possible to adopt it. The question of finance, of course, enters very largely into any decision that is now arrived at, and these questions and other connected questions are under consideration by the Government. It will depend on the decision that will be arrived at on these questions what form the military air organization will ultimately take.

In the second place plans have been made for quite wide spread flying operations. For these it is proposed to use British machines no longer needed for war. The British Air Ministry on the demobilization of the British Air Forces has treated Canada with extraordinary generosity, and arrangements have been made to send to Canada one hundred heavier than air flying machines as a straight gift. In addition there are sixteen or eighteen flying machines which were presented to the Canadian forces from time to time during the war and are being replaced by the Air Ministry, so that there are about one hundred and twenty heavier than air machines that are coming from England. In addition the Air Ministry is presenting to us some eighteen airships (lighter than air craft), of different types, and a considerable amount of specialized motor transport, the whole running into very large figures, probably some five or six millions dollars. So that we shall be extraordinarily well equipped in the circumstances, not only to train military airmen when authority is given for that purpose but also to carry on our taxicab service for other departments of the Government as soon as the plans for this have been sufficiently developed.

The Work Ahead

I think perhaps I might diverge for a moment here to tell you some results that we have arrived at in connection with the cost of those operations, and which may be interesting to you as engineers. We have made very careful calculations of the probable expense of flying and the results that we have arrived at are somewhat remarkable. The aircraft — I am speaking particularly of the heavier than air craft, because it is those to which we have been directing our attention — the aircraft of to day is a machine with a somewhat uncertain engine in it, not as certain at all events as we would like to have it, and is built up of wood and wire and cloth, with the result that the chance of breakdown and depreciation is very high. The best figures that we have been able to arrive at indicate that, out of the total expense of a given series of air operations, somewhat between sixty and eighty per cent is to be put down to depreciation and insurance against accident. An enormous proportion, as you will agree. It is true that the experience we have to guide us is almost exclusively a war experience, but every allowance has been made for that, and, making those allowances, we have come to the conclusion that the probable rate of depreciation for obsolescence alone is three per cent per month, and that so far as flying is concerned the rate of insurance against accident for which we must allow is pretty nearly one-quarter, perhaps one-fifth, but probably nearer one-quarter per cent for every hour of flying; so if you take a ten thousand dollar machine, you have somewhat about twenty to twenty-five dollars an hour to set aside to meet the chance of that machine breaking down either wholly or partly. Finally we have come to the conclusion that the allowance that must be made for actual deterioration due to flying, not from accident but from ordinary use, runs from one-quarter down to one-sixth of one per cent for every hour of flying, so that you see it is not difficult to get up to between sixty and eighty per cent of the total expense of given operations to cover those extremely heavy charges.

It follows very clearly that the development of flying at the moment depends almost wholly upon the engineer; at all events it depends to a proportion of sixty to eighty per cent on the engineer if the figures I have given are correct, and I have every reason to believe they are. We must develope an engine to show a factor of safety so high that we can reduce that enormous charge for insurance against accidents. We must also develope a machine which is not subject to that very high deterioration in flying. Those are both purely engineering problems, and upon their proper solution I think there is no doubt the future of flying almost wholly depends, I mean, flying for civil purposes.

There is just this further to be said in fairness. All the machines that have been developed up to the present time have been machines that were to be exposed to war risks. Consequently a construction which resisted a deterioration was not of the first importance and as war risks were to be undertaken by the personnel, the construction which gave a high factor of security against accidents was not of the first importance. Now these two things have become of the first importance, and the solution of the problems of the increase of safety, and the extended life of the craft are of very great moment indeed.

Regulation of Civil Aviation

The third thing to which the Air Board has directed its attention, and at which it has been working for some time, is the performance of its third duty, that of regulating flying of all kinds, or regulating civil flying. There was published recently in the Canada Gazette what are known as "Air Regulations, 1920," which are published in book form with the Air Board Act, with all the forms which it is proposed to use under the regulations, and with the provisions of the Convention relating the International Air Navigation, which were discussed and settled in Paris at the same time as, though not as part of, the Peace Treaty. The Commission which drafted the Convention was part of the Peace Conference organization, although the Convention itself was not a necessary part of the peace negotiations.

To give you an outline of the character of the provisions of the Regulations, arrangements are made for registering every aircraft that goes into the air except for the purpose of test or experiment. Only aircraft registered, either in Canada, or in some country with which Canada has a convention, or in some other of His Majesty's Dominions have the right to fly over any part of Canada.

The Air Board has laid down certain fixed specifications for airharbours of all kinds and it is hoped airharbours will be established widely, and that they will be very numerous because upon their number really depends the future of flying. The airharbours used for any commercial purposes are required to be registered, although those that are only used by private persons for their private aircraft do not require registration. Then provision is made for the licensing of all the personnel that goes into the air, not only pilots of all kinds, pilots of flying machines and pilots of airships and balloons, but also navigators and engineers. Then there are provisions for the enforcement of customs laws. There are provisions with regard to the rules of the roads, both in the air and on the ground, and with regard to lights and signals, these being taken from the International Convention, and being therefore likely to be the same throughout the world. There are also certain general provisions for returns and so on, but the result of the whole is that a complete record will be kept under the regulations of all the aircraft and flying personnel in Canada. Speaking generally the regulations follow the International Convention, which is presumably to be world-wide although it has not yet been ratified by Canada.

Aerodromes

With regard to the aerodromes, two possible policies have been suggested. One is the policy of dealing with airharbours in exactly the same way as harbours for watercraft; that is by the provision of these throughout Canada by the Government. The possibility of adopting that policy has been rejected. There are comparatively few places situated on water that require the development of harbours, I mean proportionately to the total number of such places, and it is not altogether unreasonable for the Dominion Government to assume the duty with regard to water harbours. To assume this duty, however, with regard to airharbours would create a situation that would be absolutely impossible. Every city, every town, possibly every village is a possible terminal or way station for aircraft and if the Dominion Government was to undertake to provide each of these places with an airharbour, the result would be that the development would be very very slow, money would be lacking, and favouritism would have to be shown, or more probably nothing would be done either by the localities concerned or by the Government. So that it has been definitely decided that municipalities will not be provided with airharbours, and that the intervention of the Government in the direction of providing airharbours will be confined to the provision of emergency landing grounds between municipalities on recognized air routes where the municipalities themselves have provided airharbours but are too far apart to make the route safe without the provision of emergency landing grounds. I am quite ready to give as much publicity as possible to that decision, because I think that only if this is definitely understood can we look forward to that absolutely necessary development without which we shall not have any considerable amount of flying.

The Problems of Engineering Education

Frank D. Adams, Hon. M.E., LL.D.,
Acting Principal McGill University.

It gives me much pleasure to take part in this discussion and I would first like to make a reference to the allusion, which was made by one of the speakers who has preceded me, to the association of Professor Eve and myself. In one respect this is correct, for this meeting, while a most charming and successful one, could scarcely be said to re-produce even remotely the environment of the Gardens in which our original parents started life. We must, however, allow that the Council and the Committee have been quite up to date in that, if Adam and Eve had to come upon the scene, they should put Eve first. In these days the "ladies" always come first. I remember a little incident which was a matter of gossip about London last winter, which illustrates the same point, and which has reference to a certain modern English poet who was engaged in writing a poem and was finding some difficulties in expression. He woke up one night and shook his wife and said: "Jane, get up and light the light. I have thought of a good word." She said: "John, get up and light it yourself. I have thought of a bad one."

Read at the General Professional Meeting, January 28th, 1920.

In taking part in this discussion, as I have been asked to do, it would seem that a more useful purpose could be subserved if I cover a somewhat wider ground than the other speakers and consider the general question of Engineering Education and the problems which are presented by it in our Engineering Schools in Canada, and which for that matter, are essentially indentical with those in the Engineering Schools of the great Republic to the south. I would like to set before you some of the difficulties which present themselves both to the staff of instructors and to the students, and will hope that we may obtain the benefit of your wisdom and experience in making this educational work more efficient.

Our Raw Material

Let us consider the material we have to work on in the education of engineers. We have one hundred, two hundred, three hundred, four hundred it may be, young men coming to us in the Faculty of Applied Science of each university from the schools each year. These young men are of excellent material. I think there is very little human material which is better than that which comes to the Faculties of Applied Science from the schools in Canada. Now, when they enter these young men find themselves with but the rudiments of an education. I agree with Prof. Eve. We have all agreed with him that with us the great thing to do is to get the schools to carry on their curriculum further than they do at present. There is only one difficulty and that is we cannot get them to do it.

School Education in Canada

Now, if *The Engineering Institute* can do anything to galvanize Canadians into a sense of the necessity of raising the school grade of education it will help the universities along immensely. At McGill we have been continually endeavouring to get the schools to do this by putting on higher mathematics for our matriculation and in many cases men have not been able to come to the university from the country schools because they could not get the education which they required to enter. If we raise our demands to the standard of the second year there are not two schools in the Province of Quebec that could train students for the university. We are continually endeavouring to bring the schools up, but the process is a very slow one. President Falconer, speaking the other day of the difficult position in which the universities find themselves on account of the rise in the cost of living, said that one source of relief would be to unload some of this burden on to the schools and make them do the first year of university work, and whenever that is accomplished no one will be more grateful than the universities.

The Problems of the Student

The young man comes with this comparatively low grade of educational attainment to the university. He passes the matriculation examination, and then he finds himself in the first year. It is a situation which is trying to most young men and no one appreciates that more than the professors in the Faculty of Applied Science. These young men have to enter upon a very stiff course. The shadow of the school-master has been removed. They have to set to work on their own initiative; they also have to learn that it is necessary for them when they work to work, and work hard, and when they play to play hard. In the university there is no time for dawdlers. We have to encourage that idea by the university atmosphere which we throw around them, and many young men fail under those requirements, although I may state that at McGill University we have been endeavouring to inculcate this doctrine for years and now the young men when they go into the first year I think recognize they have come to work and not to idle away their time.

They then, having entered upon their course, must in the first two years acquire a body of information which is quite fundamentally elementary to the proper practice of their profession. Another lion in the path is that these students do not fully recognize the fact that it is necessary for them to learn many things which do not seem to have a very direct bearing upon professional life. We have to instill into them that these are just as important as the actual engineering subjects which come later in the course and which are built upon them.

Essentials of Training

The men must thus in the first place get a good thorough knowledge of mathematics up to calculus. They must not only "see" these subjects as they say in French, but they must get such command of them that they may be able to use and apply to engineering problems. They have in addition to gain a good substantial knowledge of physics and chemistry. They must also acquire a facility in certain arts, such as freehand drawing and mechanical drawing. If they are civil engineers they have to learn the elements of surveying; if metallurgical engineers, the art of assaying. This requires a good deal of time. Having laid in the first two years the foundation stones of engineering knowledge, they proceed in the third year to acquire a broad general knowledge of engineering in its widest terms and here we find there is a diversity of usage in different universities. The question is as to whether you shall endeavour to give every engineer a good sound knowledge of engineering without endeavouring to specialize, or whether you shall start specialization earlier and turn out a man who knows more about, (say), civil engineering and nothing about other branches of the engineering profession.

At McGill our feeling has been that the right thing is to give a man a good broad knowledge of general engineering, and leave the finer specialization to him to acquire when he gets out in practice. The detail of practice in any branch of engineering advances so rapidly from year to year that much which a man might learn in college, two or three or four or five years later would be obsolete. The man must learn the higher specialties of his own profession after graduation.

At the end of three years the student will have acquired a general knowledge of mechanical and electrical engineering and their accessory sciences. In the fourth year he proceeds to branch out into one or other of eight or ten divisions of engineering and endeavour to get a closer acquaintance with some special branch of his profession. All that has to be accomplished in four academic years. How long is an academic year? In the universities which have the longest academic year it consists of eight months; in others of seven months. Take the universities with the longest course: four times eight is thirty-two months. That is, in about two and one-half years of actual study the man is to be transformed from a schoolboy into a young engineer. He certainly is not a thoroughly qualified engineer as yet, but nevertheless he is an engineer in embryo, in the [illegible] one who is able to take his position on the lower rungs of the ladder and work up to any height to which his innate capacity may lead him.

Vacation Work

For a number of years past in my own university we have obtained returns from the students when they come back after the vacation with reference to their work, whether they worked at all, if so how many months they worked and the character of the work upon which they were engaged. We find from these returns for several years before the war, that eighty-six per cent of our men worked all summer. The men having completed the work of the first academic year went out and got work in some line of engineering. They came back to the university and at the end of the session went out again and worked all summer. When the men graduate they had had four academic years of study in the principles, and to a certain extent in the practice of their profession, and four summers of experience of actual manufacturing processes or engineering work, which they see being carried out under conditions of actual practice which gives then an additional grasp of engineering work.

Subjects for the Curriculum

We find in the universities that the tendency is for our courses to become crowded. Some years ago we sent out a questionnaire to a number of engineers in Canada asking in their opinion whether certain subjects should be entered in the course of engineering or whether they should not, and found there was a great diversity of opinion. About fifty per cent of those distinguished engineers were of one mind and the other fifty per cent were of a directly opposite mind. It becomes difficult to decide what should be done under those conditions. Many of them said they were scarcely qualified to judge because it was not possible to put everything in the course, and they were in doubt as to which were the more important subjects to include. This is the problem which faces all those who are called upon to plan out the courses of instruction, in engineering schools. How can the student occupy the limited time he has at his disposal to the best advantage? We find as a result of the greater demands continually made upon engineers, the tendency in all professional faculties is to lengthen out the course. The course of law has been lengthened from three to four years, and the course of medicine is now six years or even more. So the proposal is continually before us as to whether it would not be well in order to provide the young engineer with a knowledge of the greater number of subjects which are required at the present time, to extend the course from four to five years. It is certain that if the student could give more time to his work, [illegible] He may continue to study for four years but give a greater number of months each year, the academic year being lengthened to nine or ten months or he may study for five instead of for four years.

Reasons For and Against the Five-Year Course

Under the conditions which obtain in Canada most of our young men can get summer work which is of advantage to them both educationally and in that they thus earn a certain amount of money which helps to put them through college. We find that most of the young men coming to the universities are in need of this assistance, and it seems a pity to cut it off and to lengthen the course unless we feel that some substantial corresponding benefit can be secured.

It would seem that for the next few years and as long as men can get the summer work in various industries it would be disadvantageous to cut them off from it; but nevertheless it looks quite likely that within the next few years a fifth year will have to be added to the course, and that fifth year might be taken up in part by work in factories, as has already been outlined by Dr. [illegible], although we must remember that the Massachusetts Institute of Technology plan has not been thoroughly tested as yet. These are problems before us. The universities have been gradually feeling their way forward and adopting such methods as are consistent with changing conditions and adapting their courses to those conditions as time goes on. When I think of the course as it existed when I graduated and as it now is the change is immense.

[illegible] to give a course on engineering economics, or the business side of engineering, at my university. It was an excellent series of lectures and is now being given by Mr. Frederick B. Brown. It has proved of great value in introducing the young engineer to the commercial side of his profession. Also we have introduced a similar course on engineering law, and other courses will undoubtedly have to be added as time goes on.

What are the Conditions which will Face the Engineer in the Future?

It is difficult for us to look forward and know this in advance. We did so when Dr. [illegible] was asked to establish a course in chemical engineering several years ago, but for some time there was relatively little work for the men who graduated in this branch. Now the demand has arisen, the [illegible] of such a course is shown to have been a wise one. Probably there are other lines which will open out and for which the engineering colleges will be called upon to train men.

If any members of The [illegible] Institute as a body can help the universities by their advice, this I can assure you will be cordially welcomed by all those who are engaged in training engineers in Canada at the present time.

The Work of the Ecole Polytechnique, Montreal

Arthur Surveyer, M.E.I.C.,
Member of the Board of Directors, Ecole Polytechnique, Montreal.

First I wish to explain that I am not, as gloriously announced on our programme, a member of the Board of Governors of Montreal University, but merely a member of the Board of Directors of Polytechnique, which is affiliated to what used to be Laval University but is now being transformed, at Quebec, into the Montreal University.

History of the Ecole Polytechnique

In order to get a good perspective of our problems it is necessary to briefly outline the history of the Ecole Polytechnique. This institution has the honour of being the only engineering school in North America where tuition is given in French. It was founded in 1874 by the combined efforts of a French general, veteran of 1870, an Alsatian chemist and a French-Canadian architect.

From the first our institution had a very hard road to travel: it was beset with difficulties both of an intellectual and of a financial order. The barrier which the conquest had raised between France and this province had only been partly lowered as the result of the cooperation of the two mother countries during the Crimean war. French engineering text books were at a premium, professors were scarce and the new school depended solely upon the pupils' fees. We did not receive donations and it is only in the last twenty years or so that financial help has come to us in the form of one gift and a yearly subsidy from the province. The professorial staff of Polytechnique is still recruited, I am pleased to say, throughout the French-speaking world, in France, in Belgium and in Quebec. The French-Canadian professors are, of course, all graduates of Polytechnique but the majority of them have taken postgraduate courses either in France or in the United States.

The founders of the "Ecole Polytechnique de Montréal" did not attempt to copy the "Ecole Polytechnique de Paris", which is a pure science faculty rather than an applied science school, but they had taken as model, the "Ecole Centrale des Arts et Manufactures", de Paris, which was even then noted for its encyclopedian teaching. Now that we have advanced far enough to look back and examine the products which we have turned out from Polytechnique, we find that they do not quite correspond to the ideal of the founders of the School. The lack of funds has paralyzed the development of our laboratories and we have unwittingly been led to give more importance to the branches of engineering which do not require expensive laboratories and which lend themselves better to the abstract of theoretical method of teaching.

Type of Training given

Engineers can be divided into two great classes according to the relative importance of the part played by Art and Science in the exercise of their profession. The building engineers and administrators of certain classes of utilities constitute the first group. This class includes the architectural engineer, the structural engineer, the public works engineer and the engineer builder or operator of canals, harbours, railways and tramways. These technicians apply, in their practice, some of the principles of science, but they also, and this probably to a greater extent, apply empirical rules based upon the experience of others and constituting the art of the preceding generations.

The second group is composed of the industrial or manufacturing engineers. Their field of action is very wide; it includes the fabrication of all engines and machinery, all the application of chemistry, such as metallurgy, electro-chemistry, electro-metallurgy and the series of industries dealing with the transformation of materials such as dyeworks, pulp and paper manufactures, tanneries, sugar refineries, glass works, potteries, gas plants, etc. It also embraces all the applications of physics to the compressed gas, cold and liquid air industries and the ever increasing number of applications of electricity to the construction of electrical machinery and wireless telegraphy. This group of engineers utilize science to a greater extent than art and their formation requires more laboratory work and less *ex cathedra* teaching.

The financial handicap with which we are laboring has led Polytechnique to develop chiefly engineers of the first group. Very few of our graduates can be classed as industrial engineers and this has had a marked effect on their average income. The building industry is probably the most sensitive industry to the fluctuations of the money market. Public works, new plants or extensions to existing plants can always be delayed and the building engineer is sure to be an intermittent producer. The periods of intensive activity do not come often enough to compensate for the long periods of stoppage. The industrial engineer also suffers from these variations but his opportunities to rise are greater and, besides, the manufacturing industries never come to a standstill comparable to the inactivity which we have experienced in Canada, since the beginning of the war, both in public works and in railway construction.

During the last three years, the Ecole Polytechnique has inaugurated a course in industrial chemistry and, in my opinion, we should try to develop our teaching so as to cover a larger proportion of the industrial field.

The Importance of Teaching the best Methods of Study

There is one particular subject, however, which I believe should be taught to all students of all faculties and it is a question upon which I am rapidly becoming somewhat of a crank, I refer to the importance of teaching to the students the best methods of intellectual work. It seems illogical to me to take the trouble to initiate the

Read at the General Professional Meeting, Montreal Jan. 28th, 1920.

students in the principles of the different sciences with an abundant use of language and a great display of apparatus, to compel them afterwards to pass severe examinations in these various sciences, and, yet, not to consider it worth while to instruct them in the art of cerebral work. We seem to take for granted that the students know, by intuition, the best methods of study while it has been demonstrated that they invariably adopt the worst ones because they are less painful and do not make the same demands upon their powers of attention or concentration. Students unconsciously drift into bad intellectual habits, and only realize their mistakes when it is very difficult to adopt new methods. "You cannot teach an old dog new tricks" is an old saying and William James considers that men fall into the "old dog" class at twenty five. The eminent psychologist declares that few men change their habits of thought and action to any marked extent after they have passed the middle twenties. It is easy to imagine that professor James either married in his early twenties or died a bachelor. Those of us who married after we had passed thirty can vouch for the fact that habits can be modified after that age, but we will probably also admit that our road to perfection would have been made easier if the way had been pointed out to us when we were in our early twenties. Psychologists also tell us that relatively few people acquire new habits of their own volition. Habits are for the most part inherited or imposed upon us by external authority and it seems to me that in order to spare to the student that reversal of intellectual method long after his graduation, correct habits of the right kinds should be imposed upon him, at the very beginning of his college career, through the institution of a course on "How to use the mind."

Breadth of View in Engineering Training

Prof. Chas. F. Scott, Professor of Electrical Engineering, Yale University.

A few years ago, before I got into my present relations to engineering teaching, when I was a mere engineer, I was invited to a little round table conference at the Massachusetts Institute of Technology Professor D. C. Jackson had been there a year or so, and he called in some of their graduates and others for a conference.

Just as we were about to begin somebody asked Prof. Jackson this question: "Before you tell us how you are going to do it wouldn't it be well to ask what it is you are trying to do? What kind of a man are you trying to turn out?" And he replied "That is a good question," and turning to Mr. Fish and asked: "When you get a graduate what kind of a man do you want?" Mr. Fish, then president of the American Telephone and Telegraph Company, a director of the General Electric Company, one of the overseers of Harvard and I think one of the Trustees of The Institute, leaned back and thought for a moment. "Well, I would like to have a young man who can take up anything and put it through."

We have had this morning two papers. The first on chemical engineering treated of the very much needed important factor, the specialist, and even the super-specialist in chemical engineering. The next presented the relation of the engineer to physics, suggesting possibly that the art of engineering is the application of physics. But here you are, gentlemen, *The Engineering Institute of Canada*. How many of you are super-specialists in any way corresponding to these chemical engineers? How many of you are dealing directly in the application of physics? With how many of you is engineering merely applied physics? Are not the engineers of the world doing something else and something more? Important as is this technical specialization, the great bulk of men who consider themselves engineers are doing something else, another kind of something. We got used to thinking in a certain way about engineers a generation or so ago. Engineering then was largely technical. The problems in electrical and mechanical engineering were pretty largely to get an engine that would run and get a dynamo or motor that would work and keep working. It was a problem of technical design, but in the last generation we passed away beyond that, but when we come to think about education and work of engineers as a class we are apt to think of them along the old lines.

Read at the General Professional Meeting, Montreal, Jan. 28th, 1925.

Variety of Engineering Work.

There are many kinds of engineers! I have a friend who is chief engineer of one of the large power companies at Niagara. He finds it necessary to cross the border frequently and has the regular questionnaire put to him: "Occupation?" "Engineer." "Stationary or marine?"

Engineering has been described as really a method of thinking. It is a way of dealing with problems, many of which are the new problems that come up in the development which has followed in the wake of the pioneer engineer. It is a method of thinking, of dealing with things constructively, a scientific method of getting data, analyzing it, of drawing conclusions and then of applying these conclusions and carrying them through to a useful end. It has been emphasized and well emphasized by some of the former speakers that a sound work in mathematics and physics is essential to engineering but mathematical teaching and physical teaching do not necessarily lead to the engineering point of view. It is the application of mathematics and its use in solving problems, it is the application of physics to the solution of problems which makes them of advantage to the engineer.

I hardly need say to you that the engineer is getting into many fields, and is managing and directing things in a much larger way than formerly. What kind of education and training is best going to develope the broad engineer? It is hard to say. We have young men coming to us, usually of fine quality, with all types of education and training and natural ability. We expect to find them ten years later in a very great variety of fields, doing many kinds of engineering and related work and yet we have a sort of a fixed and rigid course of training by which all kinds of boys are to be developed into all kinds of men.

How the Extended Engineering Course at Yale was Arranged.

A rather interesting point in our engineering educational work at Yale: we have had in the Sheffield Scientific School in the past a three year course. It has recently been changed to a four year course. The first thought was that there was going to be a splendid opportunity increasing our purely engineering work. But our faculty in going over the matter decided on general principles to give our students a little more time for extra-curriculum work,—for athletics, and for entering into the student activities which have a very excellent broadening influence on the students and are one of the valuable things of college life.

We made a careful study of our fundamental subjects by having men from each of our engineering departments, Civil, Mechanical, Mining and Electrical confer with the Physics, Chemistry, Mathematics and English departments and go over in details just what should be included in the several courses. We added more English; we added economics and allied subjects and when we took what was left for engineering we did not have very much beyond what we had before, but we concluded we were doing better for the general group of men by giving a broader training than by increasing the more specialized subjects. If we can give our men the principles and the intellectual power they can acquire the other things afterwards.

We have had some experience such as was spoken of in which the student who spends the first two years in learning mathematics and other fundamental subjects, as a basis of engineering has mighty little engineering atmosphere about him. He gets rather disconsolate; the things which he does not see how to apply do not interest him; it is a pretty hard road to hoe. Many never get to the end of it.

Giving the Engineering Viewpoint to the Freshman.

This year we have introduced something new, new to us: it is a Freshman engineering course. Our Freshmen spend one afternoon a week in this work. They have had considerable variety. Each one of the heads of the engineering departments and a few other have given addresses or talks, explaining in a broad way the particular field. Prof. Breckenridge spoke on mechanical engineering. Other speakers indicated the fields of the different classes of engineering, so that the student can select his particular engineering course intelligently. On other days he has gone into the different departments. For example, one day he went to the electrical department. On another afternoon we gave him a course in illumination, starting right in at the beginning, so that the engineer will know what is good lighting and what is not. On another day he had a little description of the telephone, and went down to the telephone exchange. They have also gone to the mechanical laboratory, to the mining laboratory and to the civil engineering department and in the same way have been given a view of these different kinds of engineering. We have made it a special point to show that there was a necessity for a knowledge of mathematics and physics in order that they could handle the engineering subjects later on alone.

The Engineer as a Factor in Public Life

One other point. I have been making a little investigation into Yale's statistics and find that up to 1916, in the previous dozen years the undergraduate departments of Yale the academic and scientific school had turned out a certain number of graduates. This does not include the professional schools and the graduate schools. Of these ordinary graduates twenty-five per cent came from the engineering courses. Examination of the alumni record of the occupations of all the men who graduated during the same period shows that twenty-two per cent were engaged in engineering, eighteen per cent were in manufacturing, closely allied, making a total of forty per cent for whom an engineering training would have been specially advantageous. Added to that were fourteen per cent engaged in finance and a like number in mercantile pursuits, and these are professions which are wanting more and more technical graduates, because their fundamental operations are based on natural laws. They are connected with industry or transportation or other industries which involve engineering matters.

Hence an examination of the occupations into which our graduates have gone in a dozen years shows that about half of the graduates are in occupations for which engineering would have been a direct and valuable training. And that means that the call for technically trained men in the activities of the world to-day is for many positions beside the specialist and the super-specialist.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. April 1920 No. 4

Remuneration of Engineers

Engineering remuneration formed the subject of a lengthy discussion at the meeting of Council held on March 23rd, with a view to arriving at conclusions that would tend to ameliorate conditions and advance the material interests of the members of the profession. It was resolved that a committee of the Council, called the committee on the remuneration of engineers be appointed consisting of John Murphy, M.E.I.C., Chairman, E. R. Gray, M.E.I.C., Frederick B. Brown, M.E.I.C., and A. R. Decary, M.E.I.C., with power to add thereto, to consider the whole question of the remuneration of all engineers and matters relating thereto, to co-ordinate efforts of the Branches in this connection, to make recommendations and report the recommendations to the Council for action. The committee has important duties to perform and it is obvious that it will have the support of the Branches and the membership at large in fulfilling the function for which it has been appointed. The salary report of the Toronto Branch was noted by Council and referred to this committee.

At the same meeting of Council the committee of Civil Service Classification consisting of Lt.-Col. R. W. Leonard, M.E.I.C., J. M. R. Fairbairn, M.E.I.C., H. H. Vaughan, M.E.I.C., W. F. Tye, M.E.I.C., G. Gordon Gale, M.E.I.C., and President Ross was continued. The work which this committee did last year in the interests of the engineers employed in the Federal Civil Service is not fully appreciated, and had the recommendations of this committee to the experts of the commission been adopted, as they were given to understand would be the case, the salaries of many of the engineers employed by the Dominion Government would be appreciably greater. The Council supported the present Civil Service Classification because it was understood from the commission that should the Bill not pass there was every evidence that the commission might be done away with and the patronage system adopted again. In fact an attempt to bring this about was made by a number of members of parliament. At the present time this committee is ready to take up the case of the civil service engineers of Ottawa and is awaiting a brief from the special committee of the Ottawa Branch giving full information in order that the members may intelligently present the claims of the various engineers where better conditions are desirable. A letter suggesting that *The Institute* Committee cite cases to the Civil Service Commission where Government engineers are receiving less than engineers carrying similar responsibilities employed by private corporations and municipal bodies was presented to Council and referred to the Civil Service Classifications Committee with the suggestion that the recommendation contained in this letter be acted upon.

Good Roads in Canada

The Engineering Institute of Canada has reason to be proud of the part being played by its members in the development of good roads in the Dominion. At the recent meetings of the Ontario Good Roads Association and the Road Superintendents and Engineers of Ontario *The Institute* was well represented. A. W. Campbell, M.E.I.C., Dominion Highway Commissioner, and W. A. McLean, M.E.I.C., Deputy Minister of Highways, both of whom delivered notable addresses on the future of good roads in the Province. Geo. Hogarth, M.E.I.C., is chief engineer of the Department of Highways, Ontario, and was responsible for the carrying out of the ambitious programme announced at these meetings.

The meeting of the Good Roads Association was the largest ever held, and one of the most enthusiastic. A comprehensive programme of construction and maintenance was announced for the Province of Ontario which will provide in five years a network of provincial highways of 1800 miles fed by county and township improved roads in all parts of the province. Important features of the addresses at these meetings were the insistence on the importance of proper maintenance, and the importance of providing adequate funds by equitable distribution of the cost of the improved roads. The tendency both in this country and the United States has been towards the building of magnificent trunk highways with a certain neglect of the minor but none the less important county and township highways, and up to the present the distribution of the taxation for improved roads has not always been according to the best principles. The policy announced for Ontario in these particulars reflects the general trend of opinion throughout the Dominion, and is a healthy sign.

International Engineering Congress

At the annual meeting of *The Institute* held in Ottawa last year an international congress of engineers was proposed by Dr. Ira N. Hollis, President of the Worcester Polytechnic Institute. The Secretary was instructed to take the matter up with the Institution of Civil Engineers and other technical associations in Europe, and the matter is now under way as shown in the following letter from Dr. Hollis. There is little doubt that such an International Congress would be of great benefit, only to the engineering profession of the world.

Worcester, Mass., Feb. 18th, 1920.

Fraser S. Keith, Esq.,
Secretary,
The Engineering Institute of Canada,
176 Mansfield Street,
Montreal, P.Q.

My dear Mr. Keith:—

I have your letter of the 13th, enclosing a communication from Mr. Tadsbery. At the first opportunity I shall take up this whole matter of a great meeting of engineers with our Engineering Council.

It seems to me that the time is ripe for a better understanding amongst all engineering societies, and it would be more than interesting to have a large meeting within easy reach of the battlefields of France. I will write you if anything comes out of it.

Good luck to you.

Yours very truly,

Signed: IRA N. HOLLIS

Scientific Management

At the end of the war the popular theory was that prices would immediately drop, and that a period of depression and low prices would inevitably set in. Whatever the reason may be—the increase in currency and means of exchange, the general restlessness of labor, the continued lack of supplied from Europe—prices have shown no tendency to fall, demand in most lines continues to exceed supply, ever-mounting labor costs continue to prevent any drop in commodity prices, and the problem of keeping manufacturing costs within bounds is more difficult that ever. The obvious lesson is, then, that any method which tends to lower production costs is worthy of attention, and "Scientific Management" should not be lightly dismissed.

"Scientific Management" of the Taylor-Gantt-Emerson School has been developed so quickly, and the knowledge gained is in the hands of so few men, that it has not yet reached the position of being recognized in any University as a separate course, although it plays a highly important part in modern engineering of all kinds. Unfortunately scientific management has become associated in the minds of many with "experts" who produce an array of charts, figures, demand a large clerical staff, and who in produce their personnel only add complications to an already good system, and merely add expense. To others scientific management suggests "immaturity", specialization of functions to machine-shops, and a general soullessness and grinding down of the workman.

As a matter of fact, however, both of these conceptions are misleading. In the earlier days of scientific management, for instance at the time of Taylor's "The Art of Cutting Metals" great emphasis was laid on the time-study part of the scheme, and the earlier and rigid Taylor system is open to the objection of being rather impersonal in its treatment of the machine-operator. However in the past few years scientific management has developed largely along other lines, the reduction of production costs by improving co-operation of departments, simplified cost methods, centralizing control of manufacture, and the supplying of accurate and up-to-the-minute information to the heads of departments.

Modern production, as a matter of fact, is not so revolutionary as many suppose, few entirely new things are done; there are records of time-study, for instance, over forty years ago; the main difference between the improved methods of supervision are in the centralizing of control, and certain detail improvements in methods of obtaining and using production information.

The whole edifice of modern production management is built around the "schedule". The idea of "scheduling is not new; every foreman must have a plan of work even if it is only carried in the mind; the whole force of the modern scheduling is that one system is in force for a whole plant, and the planning for the whole output is done in one office, much in the same way as the "fire-control" station of a battleship controls the firing of a broadside in action. Scheduling of output can be based on records of previous performance, estimates, or accurate study of individual operations; and in the majority of plants all three methods are in use. The whole function of the modern production department is to maintain these schedules in operation, to see that they are correct, and that they are kept up. It is often suggested that scientific management is complicated and the appearance of a busy production department office would seem to confirm this, but the fact is that the production department is now doing a great deal of work which the foreman in the shop formerly had to do to the detriment of their ordinary supervision work, such as "chasing" material, checking up tool requisitions, making requisitions for repairs, etc. Without accurate knowledge such as is readily available to the modern production department delays are bound to occur through material or information being held up at some point. It was well said at a recent meeting of the Canadian Railway Club in Montreal that piece work reduces time on the job, while scheduling reduces delays between jobs.

Enough has been said to indicate the advantages of a carefully worked schedule that is really maintained. Branching out from this central fact there are, however, many other important features, of modern scientific management. It used to be thought that scientific management was in such a hurry to secure "production" that quality was secondary. This, like many other hasty impressions, is entirely untrue. What the production engineer desires is not so much quantity production as low production costs. The customer is the final arbiter of the quality; very few manufacturers depend mainly on first sales, and it is literally true that honesty is the best policy and that it pays to give quality. An inspection system is thus rendered necessary, and it will generally be worth while in cold cash to have a fairly elaborate inspection system with special attention to the use of "limits" for various operations, so that the operator has definite instructions, and does not need to waste his time on accuracy where it is not needed. A good system of inspection will frequently save money by detecting flaws in castings, etc. before many machining operations have been performed. While, of course, thorough inspection is not claimed to be a discovery of scientific management, the "limit" system has been largely developed by modern production management.

A valuable feature of modern methods in shop control in connection with the determination of costs is the pinning down of that elusive term "overhead expense". The difference between successful operation and failure quite frequently depends on whether the overhead expense has been accurately determined. The writer was once asked to secure the labor costs of the parts of a new machine with a view to setting a price list. Having secured the labor figures costs from the cost sheets, the writer asked for instructions with regard to the overhead, "Oh, add 200% to the labor costs", when this was done the powers-that-were gave instructions to change the overhead percentage on labor cost to 300%, and later to 400%—and this incident occurred in a modern plant with an organized cost system. There can be no doubt that scientific management whatever else it may or may not do, supplies much more accurate cost figures, both direct labor costs, and "overhead". The up-to-date shop system has information as to the percentage of time machines lie idle; (very few shops succeed in improving on the figure of 25% idle time)—and the gathering of the information regarding the actual working time of machine-tool equipment can be done with very little extra clerical work. If a machine-shop production system has no other effect than the reduction of the time machines stand idle in the shop from delays in arrival of material, or poor planning, then the system is justified.

"Machine-rate" is a much debated method of arriving at the "overhead"; undoubtedly the putting into force of machine-rate involves a considerable amount of clerical work, and the cost of this additional office expense may more than counterbalance the saving due to better knowledge. However, it is not always necessary to put into force machine-rate for individual machines; with a good production department staff and an efficient cost department it is, however, generally possible to subdivide a shop into cost groups, heavy planers, heavy milling machines, turret lathes, engine lathes, etc. and apply the machine-rate method of arriving at the overhead cost to the machine groups without a great deal of labor.

The work of the production manager is distinctly that of the engineer; all the great leaders in scientific management: Taylor, Barth, Gantt, etc., have been engineers. But costs rule the production world, and the production engineer is concerned with engineering in reference to costs. Where scientific management is in force there is a production manager and his little office staff. A good many cost departments supply a great deal of information, but this information does not trickle through the numerous forms until some time after the product is manufactured, shipped and paid for. With a little ingenuity, and with real co-operation between cost and production departments it is usually possible, if not to obtain current costs, at least to have accurate figures within two days after any operation has taken place in the shop, and here is another place where a good production department can easily pay its way by checking at the source extra expenses and any sudden increases which may take place.

Scientific management is an immense subject, and there exists a large selection of excellent and very practical text-books a large number of which have been issued within the past five years. No attempt has been made here to give any details as to the working out of any particular phase of scientific management. There are, for instance, a number of bulky volumes on the cost-keeping phase alone, but it should be realized that scientific management is by no means a theorist's dream, the number of large and successful corporations using various schemes: Canadian Pacific Railway at the Angus Shops, Northern Electric, etc. is a sufficient proof of this fact. Neither is scientific management a cold-blooded inhuman process of grinding the maximum possible out of the workman; where a sound scheme is put into force the co-operation of the foreman and workmen is not as a rule difficult to secure.

To sum up,—scientific management supplies accurate information with reference to work ahead, the quantity of work, when it will be finished, and the best means of doing the work. It also gives information regarding the probable cost, in reference to work on hand, exactly how far the work has progressed the causes for delays, if any, the best means of doing the work, and the current cost. With scientific management control is centrallized and the planning is not left to the tender mercies of the individual foreman.

S.

Special Conference Called

In view of the approaching professional meeting at Niagara Falls and in order to give an opportunity of discussing other matters of intimate interest to the members of the profession in Ontario, it has been decided to call a special conference of all members of Council from Ontario, the Chairman of the Toronto Branch, the Chairman and Secretary of the Ontario Provincial Division, together with the other members of Council, to be held in Montreal at a date most satisfactory to the Ontario members.

Additional Division Created

The vote to amend the By-laws to permit an additional division of The Institute in Ontario was almost unanimously in favor of the creation of such a division. The report of the scrutineers was presented at the last meeting of Council. As a result Ontario now comprises three divisions instead of two as formerly. Inasmuch as the By-laws allow three councillors for each division, the creation of the new division left three vacancies in Council. The By-laws further provide for the appointment by Council to fill such vacancies. For the vacancy in the central Ontario district, A. H. Harkness, M.E.I.C., of Toronto was appointed, and for the two in western Ontario district H. B. R. Craig, M.E.I.C., of Windsor and A. C. D. Blanchard, M.E.I.C., Niagara Falls.

The Development of the St. Lawrence

For many years past a waterway clear up the St. Lawrence to the head of the Lakes, and of such dimensions as would carry ocean-going boats of at least [illegible] ft. draught, has been the dream of many and the special hope of those deeply interested in certain enterprises which it is expected would be particularly benefited by such a development. As opposed to this however there are those who confidently claim that the general principle that no ocean-going boat can economically navigate any interior water way applies to this proposition also, notwithstanding the fact that in many ways it is inherently different from, and serves a much larger and more diversified territory and population than the usual canal or canalized river.

However, the question is now to be authoritatively investigated, as the Canadian and United States Governments have asked the International Joint Commission to go into the matter and report as to both the cost of navigational improvement and power development, and the economic results and financial returns that may reasonably be expected therefrom. This reference comes partly from a short clause which Senator Lenroot of Wisconsin succeeded in getting into the U.S. Rivers and Harbors Appropriation Bill of 1918, but more largely from the growing realization that the fuel power situation both in the States and Canada is not such as can be allowed to go on as it is very much longer. Moreover, the recent tremendous demands on both the Canadian and United States railways, the peaks of which they have not been able to satisfactorily meet any more than any other individual or community enterprise meets extraordinary crests, has made the transportation question a live one, particularly to the central Western States.

The Commission held its first public meeting on the question in Buffalo on March 1st, the proceedings being of course preliminary only, and consequently more or less informal. It was evident from the start that fairly serious opposition is going to be offered to the scheme, or at least the navigational part of it, by those authorities of New York State who are interested in the New York State Barge Canal. This Canal by the way has cost about one hundred and fifty million dollars, besides which according to the most recent and reliable estimates over twenty-five millions more are needed to provide transportation and loading facilities at the two main terminals, Buffalo and New York. Even then, so the New York State authorities seem to say, the enterprise is never going to be of any substantial use due to the fact that railroads have now developed to such a point that they are able to quote rates which, combined with the superior service inherent to a railroad, keep canal traffic down to an insignificant amount, and will always do so. In other words, their argument is that even if the terminal requirements be provided, together with a great many boats or barges and power boats for towing the same, none of which are yet available, the history of artificial waterway transportation the world over shows that the Canal can never develop a traffic that will amount to any appreciable total. The Canal people, when confronted with the question as to whether or no they were opposed to the power developments that would of course be contingent with the navigational improvements, stated that they were not prepared to give an offhand answer, as they had not considered that side of the question.

It had been stated that certain of the railroads, particularly those specially interested in coal and its transportation, would also offer objections to the scheme, as would various other United States interests, on the plea that that country would be spending its money for the benefit of another state, but neither of these features developed at the hearing. It has also been said that the lake navigation associations would also strongly object, but to the surprise of many, they did not, in fact one supported the proposition. Perhaps they see that their territory and industry are securely guarded by natural and economic laws, notwithstanding what facilities may be provided for the entrance of a competing vessel of the ocean going type.

Whether or no the proposed navigational improvements are gone on with in the near future, undoubtedly the hydro-electric power of the river will very shortly be developed, at least to a very much greater extent than it is at present. This is due of course to the great demand for power from both Ontario and New York State, the former needing it particularly on account of her fuel situation, and the latter desiring to bring it down to her large industrial centres in the eastern and central parts of the State, and the neighboring territory, for which purpose a [illegible] volt transmission line has been suggested, and in fact designed in more or less detail. In round figures there is 2,000,000 h.p., available on the river, of which roughly speaking half is international, divisible equally between the province of Ontario and the state of New York, and half lies wholly within the province of Quebec.

The Commission expects to start a more formal series of hearings shortly after the 1st of May, sitting perhaps first at Detroit and from there going through the central and western states as far as [illegible], then up to Saskatoon, from which latter point they will go eastward through the various Canadian points interested, the last hearings being held later on in the year at the larger Canadian and U.S. eastern cities more particularly concerned. There were [illegible] or more delegates at the Buffalo meeting, of whom quite a proportion were Canadians, the main cities from Ottawa to Windsor all being represented.

LIBRARY NOTES

Since the publication of the last Library Notes the following have been added to Headquarters Library:—

Quebec Bridge Government Report

2 vols. Published by the Department of Railways and Canals. $6.00 pet set of two volumes

A most valuable addition of the library has been presented by the Department of Railways and Canals in the final report on the Quebec Bridge. Volume 1 includes description of the bridge, stress calculations, etc., and the smaller plates; volume 2 includes the larger plates. Both volumes are printed on heavy coated paper, and are cloth bound.

Concrete Engineers' Handbook

By Hool and Johnson. Published by McGraw-Hill Company, New York.

This handbook was first published in 1918, and has now reached its third edition. It contains the latest information available on reinforced construction and is an excellent addition to the concrete construction section of the library. The handbook contains 870 pages and is arranged in the following general sections: Materials, General Methods of Construction, Construction Plant, Concrete Floors and Floor Surface, Sidewalks and Roadways, Properties of Mortar and Plain Concrete, General Properties of Reinforced Concrete. Beams and Slabs, Columns, Bending and Direct Stress, Buildings, Retaining Walls, Slab and Girder Bridges, Concrete Floors and Abutments for Steel Bridges, Arches, Hydraulic Structures, Miscellaneous Structures, Estimating, Standard specifications and tests for Portland Cement, Working Stresses, Rulings pertaining to Flat-slab construction, Concrete barges and ships.

Proportioning Concrete by the Method of Surface Area of Aggregates

By R. B. Young, A.M.E.I.C., reprinted from the Proceeding of the American Society of Testing Materials

Research along the lines indicated in the papers by C. J. Mackenzie and Duff. A. Abrams, printed in this issue of *The Journal.*

The Coal Consumption of Power Plants

By Robert H. Parsons, M.E.I.C., reprinted from The Electrical Review, London, England

24 pages booklet; gives standard charts of coal consumption per working shift for different classes coal, and outlines a system of bonus for coal saving.

Estimating Concrete Buildings

By Clayton W. Mayers. Published by the Aberthaw Construction Company

This is a useful little book on "scaling" concrete buildings, but is not intended to be a complete exposition. 52 pages. Will be supplied free to members of *The Institute.*

The Joint Committee on Standard Specifications for Concrete and Reinforced Concrete

The Joint Committee on Standard Specifications for Concrete and Reinforced Concrete has just been organized. The Committee consists of five representatives from each of the following organizations:

American Society of Civil Engineers
American Society for Testing Materials
American Railway Engineering Association
Portland Cement Association
American Concrete Institute

The purpose of the Committee is to make a thorough study of all available data on the subject of concrete, concrete materials and reinforced concrete, and to incorporate the most modern information and experience into a general specification which may serve as a pattern for detailed specifications covering specific types of concrete construction.

The new "Joint Committee" may be considered as the successor of the "Joint Committee on Concrete and Reinforced Concrete" which was organized in 1904, through the cooperation of the same engineering and technical societies. The original Joint Committee presented its final report to the parent organizations in 1916.

The organization meeting of the Committee was held at the Engineers' Club, Philadelphia on February 11, 1920. The following officers were elected:

R. L. Humphrey, Chairman, Philadelphia,
J. J. Yates, Vice-Chairman, New York City,
D. A. Abrams, Secretary-Treasurer, Chicago.

The following committees, consisting of five to seven members each, have been organized:

Committee 1—Concrete Materials,
" 2—Metal Reinforcing,
" 3—Proportioning and Mixing,
" 4—Forms and Placing,
" 5—Design,
" 6—Details of Construction,
" 7—Waterproofing and Protective Treatment.
" 8—Surface Finish,
" 9—Form of Specification.

A number of the Committees have organized and are actively engaged in the preparation of their preliminary reports. The next meeting of the Committee will probably be held at Asbury Park, N. J., about June 22, during the annual convention of the American Society for Testing Materials.

CORRESPONDENCE

Trades Unionism and Engineers

Montreal, March 19th, 1920

Editor, *Journal*:

Dear Sir:

The subject of whether or not an engineer should join a trades union is so widely discussed in the profession at this time that it seems to me it would be well if our Council gave the subject some special attention in the near future, possibly appointing a committee to investigate and report with recommendations for relieving the causes for the present "unrest" among engineers and other technical men.

We are a Trades Union: I suppose all of our members are agreed that an engineer should join a trades union, for otherwise we would not be members of *The Engineering Institute of Canada.* I see no difference in principle between our organization and that of the bricklayers and plumbers, though there are at present decided differences in tactics. Many of the practices of the bricklayers and plumbers may be objectionable, while some of ours are very unbecoming to engineers for the reason that they are inefficient. A craft, a trade or a profession; they are all the same general thing, subject to the same general natural and economic laws.

A Question of Tactics: The main question seems to be as regards the practices: whether or not engineers should do some of those things which the bricklayers, plumbers and others claim that necessity has justified their doing, or whether we should be satisfied to continue as at present despite the rapidly declining rate of exchange for "professional" engineering services with those of the sometimes less dignified but now relatively better paid "trade" or "craft" services of the bricklayers and plumbers.

Revaluation Necessary: For my part, I think we can learn much from our friends, the bricklayers and plumbers, whom necessity has driven as hard in past years as it now drives some of the engineering rank and file. Whether or not we should affiliate with such an organization as The American Federation of Labor is an open question; but I feel certain that as a class we need to make a revaluation of our position in industrial society, squeeze out some of the water and bring down to par the stock that too many of us were taking in ourselves. We should at least hold out the hand of common interest, in rocognition of working class equality, to those whose labor happens to contain more of the physical and less of the intellectual element than does ours.

Responsibilities Ahead: Our organization should be put in the best possible order and strengthened at this time for two reasons: first, our members and their families are not all securing the necessary amount of food, clothing and shelter required to maintain an engineer in good working order; and second, in the crisis that is now upon the world—though Canada has not yet been seriously affected as compared to other parts—we must be organized and prepared to cooperate with the other branches of labor in carrying on the industrial processes necessary to sustain life and to protect civilization from the chaos into which it is now, or has already had to pass through in some parts of Europe. The first reason is primarily personal; the second, primarily social. We have heavy responsibilities directly ahead of us, and should prepare to shoulder them as becomes men trained to correct thinking and acting.

Fraternally yours,

CHARLES A. [illegible], A.M.E.I.C.

* * *

Thomas A. Edison's 73rd Birthday

The Laboratory of Thomas A. Edison

Orange, N.J., March 22, 1920

Engineering Institute of Canada,
Montreal, Canada.

Dear Sirs:

Owing to a regrettable oversight, no previous acknowledgement has been made of the felicitations you so kindly sent to Mr. Edison on his 73d birthday. The numerous letters and telegrams were sent up to his house so that he and Mrs. Edison might read them leisurely.

This will explain the delayed expression of Mr. Edison's sincere appreciation of your cordial brithday message and of his thanks to you for the good wishes so kindly extended to him.

Yours very truly,

WM. H. MEADOWCROFT,
Assistant to Mr. Edison.

Bill Passes B.C. Legislature

Victoria, B.C., March [illegible], 1920

Professional Engineers Bill of British Columbia passed third reading this afternoon.

D. O. LEWIS, M.E.I.C.,
Vice-President, E.I.C.

REPORT OF COUNCIL MEETING

The Engineering Institute of Canada

The regular meeting of the Council was held at the rooms of *The Institute*, 176 Mansfield Street, on Tuesday, March 23rd, at 8 P.M.

Institute Committees: Committees of *The Institute* were appointed as follows:—

Finance Committee: H. H. Vaughan, Chairman, R. A. Ross, Sir Alex. Bertram, Geo. K. McDougall, Geo. E. Bell.

Library and House Committee: Sir Alex. Bertram, Chairman, R. DeL. French, S. F. Rutherford, Colin Kemp, P. L. Pratley.

Publications Committee: Prof. Ernest Brown, Chairman, A. W. Swan, Secretary, J. A. Duchastel, E. Stansfield, J. S. Cameron, F. P. Shearwood.

By-Laws Committee: Arthur Surveyer, Chairman.

Papers Committee: Frederick B. Brown, Chairman; Chairman of each Branch.

International Co-operation Committee: H. H. Vaughan, Chairman, John Murphy, W. F. Tye.

Roads and Pavements Committee: W. A. McLean, Chairman, W. P. Brereton, F. W. W. Doane, E. A. James, J. Duchastel, J. E. Griffith, G. Henry, A. F. Macallum, A. J. McPherson, W. P. Near, P. E. Mercier, G. G. Powell, C. H. Rust, H. S. Carpenter, A. E. Foreman.

Electro-Technical Committee: L. A. Herdt, Chairman, L. W. Gill, O. Higman, J. Kynoch, T. R. Rosebrugh, John Murphy, A. B. Lambe.

Gzowski Medal and Students' Prizes: Lt.-Col. R. W. Leonard, Chairman, H. E. T. Haultain, J. M. R. Fairbairn, Julian C. Smith, F. H. Peters.

Steam Boilers Committee: L. M. Arkley, Chairman, W. G. Chace, F. G. Clark, R. J. Durley, D. W. Robb, H. H. Vaughan, Logan M. Waterous.
The recommendation of this Committee at the Annual Meeting was adopted.

Board of Examiners and Education Committee: H. M. MacKay, Chairman, Arthur Surveyer, Secretary, Ernest Brown, J. M. Robertson, R. DeL. French, R. S. Lea, A. R. Roberts.

Canadian Engineering Standards Committee: H. H. Vaughan, (three years), Walter J. Francis, (one to retire end of 1920), W. F. Tye, (one to retire end of 1920).

Leonard Medal Committee: H. H. Vaughan, Chairman, Dr. J. B. Porter, H. E. T. Haultain, D. H. McDougall, J. C. Gwillim.

Plummer Medal Committee: H. H. Vaughan, Chairman, Dr. J. B. Porter, H. E. T. Haultain, D. H. McDougall, J. C. Gwillim.

Deterioration of Concrete in Alkali Soils: B. S. McKenzie, W. P. Brereton, J. R. C. Macredie, H. McI. Weir, A. R. Greig, W. G. Chace, J. C. Holden, E. A. Markham, R. J. Lecky, F. W. Alexander, A. S. Dawson, Prof. C. J. Mackenzie.

Legislation Committee: Arthur Surveyer, Chairman, Walter J. Francis, J. M. Robertson.

Committee on Civil Service Classification: R. A. Ross, Chairman, R. W. Leonard, W. F. Tye, J. M. R. Fairbairn, H. H. Vaughan, G. Gordon Gale.

Honour Roll Committee: Brig. Gen. C. J. Armstrong, C.M.G., C.B., Chairman, Col. A. E. Dubuc, Fraser S. Keith.

Legislation Committee of Branches: The Secretary was instructed to ask each Branch at Provincial or Dominion capital to have a committee appointed to report to Council regarding any proposed legislation affecting engineers.

Annual Meeting, 1921: It was resolved that the invitation from the Toronto Branch to hold the Annual Meeting in Toronto, be accepted and that the Toronto Branch be requested to fix the date as soon as possible.

Special Council Meeting: It was resolved that a special meeting of the Council be held at Montreal at an early date for the purpose of discussing with the Ontario Councillors, the Chairman and Secretary of the Ontario Provincial Division and the Chairman of the Toronto Branch, matters affecting that Province, the date to be one most suitable to the men from Ontario.

Report of Publicity Committee: (Committee, Frederick B. Brown, Chairman, H. H. Vaughan, J. B. Challies, P. Gillespie) Mr. Brown reported that the Committee had drawn up regulations which they were still discussing among themselves and would report at the next meeting.

It was resolved that the Canadian Engineering Standards Association be requested to adopt the standards of *The Engineering Institute of Canada* for concrete and reinforced concrete and for cast iron pipe and further that the Standards Association be requested to assume the other standards of *The Institute* for modification where necessary, including, steel highway bridge specification, steel railway bridge specification, portland cement and road ballasting. It is desired by *The Institute* that in adopting theses standards credit be given to *The Institute* by a foot-note to the effect that they are either adopted from the specification of *The Engineering Institute* or modified from the specification of *The Engineering Institute*, as the case may be. The steel bridge specification committee of *The Institute* was not reappointed.

Civil Service Classification: The resolutions of the Winnipeg, Toronto, Border Cities, Peterborough, Ontario Provincial Division, were received, the suggestions contained in the resolutions were adopted and referred to the Civil Service Classifications Committee of *The Institute* for appropriate action.

Committee on Remuneration of Engineers: The resolution of the Toronto branch regarding action in connection with engineering remuneration was presented and discussed at length. It was resolved that a committee of the Council called the Committee on the Remuneration of Engineers be appointed consisting of John Murphy, Chairman, E. R. Gray, Frederick B. Brown and A. R. Decary, with power to add to their number, to consider the whole question of the remuneration of all engineers and all matters relating thereto to coordinate the efforts of the Branches in this connection to make recommendations and report their recommendations to the Council for action.

Salaries Report of the Toronto Branch: The salaries report of the Toronto Branch was noted and referred to the Committee on the Remuneration of Engineers.

A letter suggesting that The [illegible] Committee cite cases to the Civil Service Commission where Government engineers are receiving less than engineers carrying similar responsibilities employed by private corporations and municipal bodies was referred to the Civil Service Classification Committee with the suggestion that the recommendation contained in the letter be acted upon.

Maritime Professional Meeting: The suggestion of the Halifax Branch that the Maritime Professional Meeting be held in Halifax October 13th, 14th and 15th, 1920, was approved.

Peterborough Branch By-Laws: The By-Laws of the Peterborough Branch were noted and approved.

Arrangement Regarding Transactions: A letter making definite suggestions regarding arranging with other engineering bodies to secure Transactions for our members at reduced prices by mutual arrangement, which had already been discussed, was referred to the Committee on International Co-operation, Mr. H. H. Vaughan, Chairman.

Death of G. Reid Munro: The death of G. Reid Munro, M.E.I.C., was noted, and a resolution of sympathy to the family of the late Chairman of the Peterborough Branch was passed. The Secretary was instructed to write a letter of sympathy to the deceased member's family.

Amendments to the By-Laws: The report of the Scrutineer, Professor Brown, was presented as follows showing the result of the Ballot:—

In this Ballot, total of 722 ballots were received, of which 24 were invalid for various reasons, leaving 728 valid ballots. Of these 706 voted "Aye" for all changes, leaving 22 scattered ballots. The Amendments were declared adopted.

Inasmuch as the change in the By-Laws makes an additional district and increases the number of Councillors by three, the Secretary was instructed to make the changes in the wording of the By-Laws which the amendment involved.

New Councillors: The Amendment to the [illegible] [illegible] [illegible] for one Councillor for District No. [illegible] and two Councillors for District No. [illegible]. The Council appointed for District No. [illegible], [illegible], Toronto; District No. [illegible], H. [illegible], [illegible], A. [illegible] Blanchard, Niagara Falls, [illegible] for one year.

American Institute of Chemical Engineers: The fact that the Annual Meeting of the American Institute of Chemical Engineers will be held in Montreal in June, 1920, was noted and the Secretary instructed to write the Secretary of the American Institute of Chemical Engineers offering the headquarters of The Institute for the meetings of the Convention and assuring the A.I.C.E. that we were ready to cooperate in every way to make their Convention a success.

The Ballot was canvassed and the following elections and transfers effected:—

Members

L. H. Cole, B.Sc., (McGill Univ.), of Ottawa, Ont., mining engr., [illegible] Mines Branch; [illegible], [illegible] of Calgary, Alta., [illegible] and [illegible] Alberta Flour Mills; [illegible], B.A.Sc., [illegible], M.Sc. [illegible], of Montreal, sanitary engr., Board of Health, Prov. of Quebec, [illegible] sanitary engr. [illegible] consult. engr., Housing Comm. of the Province; W. L. Mitchell, B.Sc., M.Sc., (McGill Univ.), of Montreal, investigating conditions of pulp and paper industry in foreign countries for Canada [illegible] Paper Co., Ltd.; J. Muirhead, B.Sc. [illegible] (Glasgow Univ.), of Vancouver, B.C., [illegible] Govt. of B.C.; J. L. R. Parsons, B.A. [illegible] (Univ. of Toronto), Fellow in Surveying, [illegible], president, Parsons Construction and Engineering Co., Ltd.; A. W. [illegible], of Sault Ste. Marie, Ont., asst. chief engr., Algoma Steel Corpn.; G. P. Vollmer, Capt. M.Sc. (Victoria Univ., Manchester), of St. Catharines, Ont., 4½ yrs. military service, at present, draftsman, Welland Ship Canal; A. W. Wetmore, first class diploma [illegible] in civil engr. (R.M.C.), of Fredericton, N.B., provincial engr., New Brunswick.

Associate Members

[illegible], of Toronto, Ont., [illegible] engr., [illegible] office, Asphalt Association of New York; H. M. Armstrong, Lieut., of [illegible], N.B., 4 yrs. military service, at present, div. engr., St. John and Quebec Ry.; J. H. Bond, Capt., of [illegible], B.C., [illegible] military service, at present, engr., Queen Victoria Niagara Falls Park; V. J. Borland, of Vernon, B.C., asst. to [illegible] engr., [illegible] Okanagan Branch; A. J. M. [illegible], of Montreal, [illegible] engr., [illegible]; [illegible], Lieut., B.A.Sc. (Univ. of Tor.), of Winnipeg, Man., [illegible] yrs. military service, at present, engineer, [illegible] Service [illegible]; C. [illegible], of Winnipeg, Man., [illegible] yrs. military service, at present, [illegible] supt., light and power dept., [illegible] and underground lines and cables; H. D. Dawson, B.A.Sc. (Univ. of Tor.), of Welland, Ont., [illegible] engr., British

American Shipbuilding Co., Ltd.; L. S. Daynes, capt., D.C.M., of Benyon, Alta., 5 yrs. military service, at present, res. engr. C.M.R.; H. S. Dick, B.Sc. (Queen's Univ.), of Kingston, Ont., 2 yrs. military service, at present, asst. to city engr., Kingston; R. D. Fry, of Winnipeg, Man., reconnaissance engr., Sask. & Hudson Bay Ry.; G. Harrison, of Winnipeg, Man., asst. engr., under bridge engr., C.N.R.; H. A. Ingraham, of Calgary, Alta., reinforced concrete designer, A. Ingraham; W. J. Johnston, B.Sc. (E.E.) (Univ. of N.B.), of St. John, N.B., 2 yrs. military service, at present, asst. engr., P.W.D.; Junius Jonsson, of Saskatoon, Sask., asst. city engr., Saskatoon; G. N. Ledger, of Winnipeg, Man., 2 yrs. military service, at present, chief of field party, Manitoba Drainage Commn.; Harold Lloyd, of Winnipeg, Man., bridge engr., Good Roads Board, Manitoba Govt.; G. H. McCallum, major, M.C., B.Sc. (McGill Univ.), D. & B.C.L.S., of Ottawa, Ont., 4 yrs. military service, at present, geodetic engr., Geodetic Survey of Canada; H. W. Meech, of Lethbridge, Alta., commn'r. of Public Works and city engr., also charge of bldg. inspection; R. K. Northey, B.A.Sc. (Univ. of Tor.), of Regina, Sask., 4 yrs. military service, at present, sec.-treas. Dominion Line and Coal Co., Ltd.; D. E. O'Brien, of Halifax, N.S., ch. engr., Halifax Shipyards Ltd.; P. E. Palmer, lieut., D.L.S., of Ottawa, Ont., preparation of final returns and plans, Topographical Surveys; R. E. Roe, of Edmonton, Alta., 4 yrs. military service, at present, instrumentman on maintenance of way, G.T.P.; L. N. Seaman, major, B.Sc., M.A. (Acadia Univ.), of Montreal, 5 yrs. military service, at present ch., div. of timber tests, Forest Products Laboratories; H. B. Stuart, major, B.A.Sc. (Univ. of Tor.), of Hamilton, Ont., 4 yrs. military service, at present, field engr., Hamilton Bridge Works Co.; R. M. Taylor, of Vernon, B.C., 3 yrs. military service, at present, asst. dist. engr., Upper Okanagan dist., B.C. Provincial Govt.; F. H. Whittaker, of South Vancouver, B.C., municipal engr., South Vancouver; A. G. Willson, of Calgary, Alta., res. supt. for Alta. of eng. branch, D.S.C.R.; S. F. Workman, of Kelowna, B.C., 3 yrs. military service, at present, res. engr. Okanagan Branch, C.N.R.

Juniors

C. T. Barnes, of Winnipeg, Man., engr. i/c appraisal of Wpg. Electric Ry. Co's. properties, W. M. Scott; George Clark, of Winnipeg, Man., draftsman, C.N.R.; W. H. Collins, of Kingston, Ont., 3 yrs. military service, at present, at Queen's University, final year, civil engineering; I. M. Fraser, B.Sc., (M.E.) (McGill Univ.), of Montreal, demonstrator, mechanical dept., McGill University; G. A. Goddard, B.Sc. (M.E.) (McGill Univ.), of Outremont, P.Q., organizing, Crescent Motors Limited; J. R. MacDonald, of Regina, Sask., chief clerk, Surveys Branch, Dept. of Highways Sask.; H. J. McLean, of Calgary, Alta., hydrometric engr., irrigation branch, Dept. of the Interior; R. M. Robertson, of Lachine, P.Q., 3 yrs. military service, at present, final year, civil engineering, McGill University; A. J. Sutherland, of Winnipeg, Man., draftsman, G.T.P.R.; C. F. Wilkins, of Chamberlain, Sask., 5 yrs. military service, at present, leveller on location, C.N.R.

Associate

A. H. Hill, of St. Lambert, P.Q., manager, Francks Hankin & Co., Ltd.

Transferred from Associate Member to Member

J. B. Gilliatt, B.Eng. (Dalhousie Univ.), of Wabana, Nfld., in chg. submarine surveys and surface constrn., N.S. Steel and Coal Co., Ltd.; P.J. Jennings, major, of Calgary, Alta., 3 yrs. military service, office engr., irrigation branch, Reclamation Service; D. W. McLachlan, B.Sc. (McGill Univ.), of Ottawa, Ont., engr. in chg. of harbour works, H.B.Ry.; W. P. Near, B.A., B.Sc., (Univ. of Tor.), of St. Catharines, Ont., city engr., St. Catharines; K. H. Smith, B.A. (Univ. of Tor.), of Halifax, N.S., dist. engr., Dom. Water Powers Branch, Dept. of the Int.; G. A. Walkem, major, B.Sc. (McGill Univ.), of Vancouver, B.C., managing director, Vancouver Machinery Depot, Ltd.

Transferred from Junior to Associate Member

H. F. Bennett, B.Sc. (C.E.) (Univ. of N.B.), of St. John, N.B., 3 yrs. military service, at present, asst. engr., Public Works of Canada; H. L. Bunting, lieut., M.C., of Norwood, Man., B.Sc. (Birmingham Univ.), 3 yrs. military service, at present, instructor in engr. drafting, Re-training Schools, S.C.R.; K. G. Cameron, B.Sc. (Edinburgh Univ.), of Sydney, N.S., ch. draftsman, Dominion Iron and Steel Co.; C. G. Child, major, O.M. F.C., B.Sc. (C.E.) (McGill Univ.), of Banff, Alta., ass. tres. engr., Rocky Mountains Park of Canada; J. H. Hooper, B.Sc. (McGill Univ.), of Port Arthur, Ont., asst. engr. on reconstrn. of Port Colborne grain elevator; F. A. McGiverin, of Montreal, 5 yrs. military service, in charge of track work, Canada Steel Foundries; D. R. Smith, lieut., B.A., B.Sc. (Univ. of N.B.), of River Glade, N.B., bldg. supt., D.S.C.R., St. John; C. J. Swift, major, diploma graduation, R.M.C., of St. Catharines, Ont., 4½ yrs. military service, at present, asst. res. engr., Section No. 1, Welland Ship Canal; J. P. Watson, lieut., B.A.Sc. (Univ. of Toronto), of Montreal, 1 yr. military service, at present, eng. dept., Imperial Tobacco Co., Ltd.

Transferred from Student to Associate Member

D. G. Anglin, B.Sc. (mining eng. & metallurgy), B.Sc. (C.E.), (Queen's Univ.), of Kingston, Ont., asst. engr., P.W.D.; A. H. Munro, lieut., B.A.Sc. (Univ. of Tor.), of Severn Falls, Ont., 5 yrs. military service, at present, instrumentman on Severn. Div., Trent Canal; R. L. Seaborne, B.A.Sc. (S.P.S.), of Quebec, P.Q., mgr., Laurentian Forest Protective Association; L. B. Tillson, lieut., M.C., B.A.Sc. (Univ. of Tor.), of Windsor, Ont., 4 yrs. military service, at present, instrumentman, Can. Steel Corpn.; F. L. West, lieut., B.A., M.A., (Mt. Allison Univ.), B.Sc., (C.E.) (McGill Univ.), of Sackville, N.B., 2 yrs. military service, at present, prof. of civil engr., Mt. Allison Univ.; Russell Yuill, B.Sc. (McGill Univ.), lieut., of Truro, N.S., 1 yr. military service, asst. engr., Dept. Rlys. and Canals.

Transferred from Student to Junior

H. C. Bates, B.Sc. (Queen's Univ.), of Toronto, Ont., instrumentman, Toronto to Niagara Falls location, [illegible] dept., Hydro Electric Power Comm.; R. I. Harvey, B.Sc. (C.E.) (Sask. Univ.), of Regina, Sask., with C. S. Cameron, asst. in charge of municipal engr. work; E. E. H. Hugh, B.A.Sc. (Univ. of Tor.), of Toronto, Ont., structural engr., Thos. W. Lamb; W. C. Miller, B.Sc. (Gold. in C.E.), Queen's Univ.), of St. Thomas, Ont., city engr., St. Thomas; J. T. Rose, B.A.Sc. (Univ. of Tor.), of Winnipeg, Man., junior power development engr., Hydrometric Survey of Manitoba; C. A. Wallace, B.Sc. (McGill Univ.), of Montreal, lecturer in electrical engineering, McGill University.

The meeting adjourned to the call of the President.

OBITUARIES

George Reid Munro, B.Sc., M.E.I.C.

Sudden and untimely was the death of George Reid Munro, 2nd Vice-President of the William Hamilton Company, Ltd., Peterboro', Ont. which took place Monday, March 1st at his residence in that city, after a short illness of influenza. Mr. Munro was apparently recovering from his illness when he was seized with a sudden attack of heart failure and the shock proved fatal.

The late Mr. Munro who was second son of the late George Munro, a grandson of the late Wm. Hamilton founder of the William Hamilton Co. of Peterboro', was born in that city, March 13th, 1887. He received his early education at the Peterboro Public Schools and the Collegiate Institute and later graduated from the School of Practical Science, Toronto. After graduation, he was engineer on the preliminary survey of the Hudson Bay Railway, then on the staff of Messrs. Kerry and Chase, Consulting Engineers, Toronto, and was also connected for a short time with R. S. Lea, M.E.I.C., of Montreal. In July, 1911, he returned to his native city to take the position of engineer with The William Hamilton Company, which position as well as the vice-presidency of the company he held at the time of his death. He was a member of *The Engineering Institute of Canada* and first President of the Peterboro' Branch of that Society and took an especial interest in its organization. He was also a member of the Peterboro Board of Trade and always took a deep interest in anything that pertained to the city's development and welfare.

Mr. Munro was a young man highly esteemed by all for his genial disposition, his true friendship and his upright qualities, which won for him a host of friends in all walks of life, and his death will be more than a loss, not only to the company he so well and faithfully served, but to his native city where he was always regarded with the greatest esteem by all who knew him.

As Chairman of the Peterboro Branch of The Engineering Institute of Canada and having been one of the men most instrumental in the formation of the Branch, the work of Mr. Munro on behalf of the profession has been of considerable importance and the place left vacant, will be hard to fill.

Alden Ferris Bookhout, B.E., A.M.E.I.C.

Alden Ferris Bookhout, B.E., A.M.E.I.C., died at his home in Peterboro on Saturday Feb. 14th. For the last eighteen years Mr. Bookhout was a familiar figure in Peterboro's engineering fraternity, and was one of the pioneer members of the Peterboro Engineering Club that has now become a branch of The Institute.

Mr. Bookhout was born at Walton, N.Y. in 1871 and received his engineering education at Union University, from which he graduated in 1898 with the degree of B.E. After four years experience on testing, drafting and electrical construction work, Mr. Bookhout joined the staff of the Canadian General Electric Co., Peterboro, in the capacity of chief draughtsman. For the last ten years he ably filled the position of assistant engineer in the Switchboard Eng. Dept.

Mr. Bookhout was a member of the Delta Upsilon fraternity, a prominent mason and a trustee of Trinity Methodist Church, Peterboro. He is survived by his wife and one son. His death is deeply mourned by a wide circle of friends and especially by his co-workers.

PERSONALS

H. T. Ortiz, A.M.E.I.C., has been made city manager of Grand Mere, P.Q.

L. L. Theriault, A.M.E.I.C., has been appointed Town Manager for Edmundston, N.B.

A. J. MacPherson, A.M.E.I.C., has been appointed Chairman of the [illegible] River Water Commission.

F. Howard Grose, M.E.I.C., has been appointed Superintending Civil Engineer of H. M. Dockyard, Malta.

Major John R. Cosgrove, M.C., M.E.I.C., has been appointed District Engineer, North Vancouver, B.C.

C. H. Fox, A.M.E.I.C., formerly Division Engineer C. P. Ry. in Saskatoon, has been transferred to the Chief Engineer's office at Winnipeg.

H. Spencer, Jr. E.I.C., has been appointed municipal engineer of the municipality of Dauphin, Man., under the Manitoba Good Roads Act.

F. A. Earl, A.M.E.I.C., sailed for Africa on the R. M. S. "Abinsi." He has been engaged as assistant engineer on construction of Talo Kumasi Railway.

James McGregor, A.M.E.I.C., of Glasgow, Scotland, is at present on a business trip to the Gold Coast, West Africa. He expects to be back in Scotland by May.

*

H. K. Morrison, Jr. E.I.C., has been appointed divisional engineer, Montreal Division, of the Canadian National Railways, with headquarters at Montreal.

*

E. L. Tait, Esq., A.M.E.I.C., has been promoted from acting engineer of way, of the British Columbia Electric Railway Co., Limited, to principal assistant Engineer.

*

Colonel Geo. A. Johnson, M.E.I.C., is resigning his commission in the U. S. Army on March 1st, and will once more take up his regular occupation as an engineer in civil life.

*

J. Roy Underhill, S.E.I.C., has taken a position as instrumentman with the Algoma Steel Corporation on the construction of their new combined rail and structural mill.

*

G. C. P. Montizambert, A.M.E.I.C., has accepted an appointment as officer in charge of building and repairs with the Royal Canadian Mounted Police, at Regina, Sask.

*

Arthur Fournier, A.M.E.I.C., has accepted a position as vice-president and sales manager of Primeau & Company, Limited, with headquarters at 142 St. Peter Street, Quebec.

*

G. M. Hamilton, M.C., A.M.E.I.C., formerly of the Dept. of Railways and Canals, St. Catharines, Ont. is now with the Willard Service Station, The Clifton, Niagara Falls, Ont.

*

H. B. Muckleston, M.E.I.C., formerly with the Dept. of Natural Resources, C. P. R. Calgary, is now chief engineer of the Lethbridge Northern Irrigation District, Lethbridge, Alta.

*

John Blizard, A.M.E.I.C., formerly of the Department of Mines, Ottawa, is now engaged as a fuel engineer, by the U. S. Bureau of Mines, Dept. of the Interior, with headquarters at Pittsburgh, Pa.

*

Francis F. Longley, A.M.E.I.C., is at present in Geneva, Switzerland, where he is assisting in the organization and operation of the Division of Sanitation of the League of Red Cross Societies. Mr. Longley will probably remain abroad for several years.

George Newill, whose application for membership in *The Institute* is now pending, has recently been appointed general manager of the Robb Engineering Works as a subsidiary company of the Dominion Bridge Company, Limited, with headquarters at Amherst, N.S. He will take up his new duties immediately.

*

Coleman Weriwether, A.M.E.I.C., who was the patentee of the lock joint pipe used for a portion of the Winnipeg aqueduct has recently patented a new pipe with an expansion and contraction joint in each pipe, and plans to manufacture this pipe on a large scale from twelve to ninety-six inch size.

*

W. H. Slinn, Jr., E.I.C., who was employed as assistant city engineer of Kingston, Ont., on roads and pavements, has accepted a position with the E. G. M. Cape and Company, engineers and contractors of Montreal, as assistant engineer on the construction of the Canadian Connecticut Cotton Mill at Sherbrooke, Que.

*

J. Clark Keith, B.A.Sc., A.M.E.I.C., who has for a number of years past been in the engineering department of the City of Moose Jaw as assistant engineer and road and building inspector, has accepted a position as manager of the Canadian branch of Morris Knowles, Limited, with headquarters at Windsor, Ont.

*

Frank A. Combe, A.M.E.I.C., has severed his connection as chief engineer for Canada to Babcock & Wilcox, Limited, and will practise in consulting engineering, specializing in boiler plant design and operation, generalization and utilization of steam, combustion of fuels, etc., with offices at The Southam Building, Montreal.

*

W. G. Milne, A.M.E.I.C., has recently taken charge of the factory and production work of Slater & Barnard, Limited who control the Acme Stamping & Tool Works and the Allith Manufacturing Company of Hamilton, Ont. Mr. Milne previous to accepting this position was mechanical superintendent of the Dominion Foundries & Steel Company of Hamilton.

*

C. A. Boulton, J.E.I.C., has accepted a position with the E. G. M. Cape and Company, Engineers and Contractors of Montreal, and is now at Sherbrooke, Que. as assistant engineer on the construction of Mill No. 2 for the Canadian Connecticut Cotton Mill Company. Mr. Boulton has recently returned from Saskatoon, Sask. where he was employed by Murphy and Underwood, consulting engineers.

*

D. J. Emray, S.E.I.C., enlisted with the 5th Field Co., C. E. in October 1914, sailing for England in April 1915, and to France in September 1915. In February 1916 he was transferred to the 3rd Divisional Engineers, and was awarded the Military Medal in October 1916. He was commissioned July 1917 to 6th Field Co., C.E. and in May 1918 was awarded the Military Cross. Mr. Emry returned to Canada and was demobilized in May 1919, and is now completing his second year in Queen's University.

Capt. Chas. E. Brown, S.E.I.C., enlisted with the 100th Infantry in February 1916, and on arrival in England in February 1917 he was transferred to the 8th Canadian Railway Troops. He went to France in 1917, and was awarded the Military Cross and mentioned in Despatches. He returned to Canada May 1919 when he was admitted into Hospital with a fractured ankle sustained in France. Capt. Brown received his discharge in October 1919, and is now employed as Instructor in the Dept. Soldiers Civil Re-establishment, Winnipeg, Man.

•

J. B. Wilkinson, A.M.E.I.C., enlisted for overseas service in May 1916 after taking a course at the Royal School of Artillery in Kingston, and received a commission as lieutenant in the Queen's 72nd Battery. He spent the summer of 1916 in Petawawa, took a draft of the 72nd Battery overseas in March 1917, and went to France in October 1917, when he joined the First Canadian Pioneers 9th C. R. T. Battalion. While repairing the broad gauge railroad east of Cambrai in October 1918, he received a gunshot wound in the leg, and was sent to hospital in England. In July 1919 he was invalided back to Canada, and in October 1919 was demobilized.

•

Capt. Newton J. Wallis, A.M.E.I.C., enlisted with the 2nd Field Troops in December 1914, recruiting and preparing drafts for overseas. In March 1916 he left Winnipeg with the 53rd Battalion for overseas, and in October 1916 he was posted to the 3rd Field Company and proceeded to France. In October 1917 he reported to the Canadian Engineer's Depot, Seaford, England for duty, and in March 1918 he was seconded to the War Office, Air Ministry for duty. Capt. Wallis, was demobilized in England in August 1919, but remained with the Air Ministry till October 1919, in order to complete the work under his charge. He is now District Engineer, Reclamation Branch, Public Works of Manitoba, Winnipeg, Man.

•

Lieut.-Col. E. V. Collier, D.S.O., A.M.E.I.C., went overseas in 1915 with the 23rd Battalion, and on arrival in England attended course of instruction at the Royal Staff College, Camberley. He served in France with the 52nd Infantry Batalion at Vimy, Avion, and Lens, and was wounded at Lens during a raid, awarded the D.S.O. and mentioned in despatches. He returned to France early in 1918, and in July was transferred to the Canadian Engineers, taking part in the Amiens, Arras and Cambrai fighting. In January 1919 he was appointed to command M.D. 6 at Kimnel Park, N. Wales, and in May 1919 was transferred to Witley, Surrey. In September 1919 he joined the firm of Collier & Co., Limited, Lighthouse and Buoy Engineers, successors to the International Marine Signal Co., Ltd. Ottawa. Before going overseas Lieut.-Col. Collier was on the engineering staff of the River St. Lawrence Ship Channel.

•

Capt. K. R. MacKinnon, M.C., Jr. E.I.C. enlisted with the C.E. in 1914 as a sapper, became a sergeant in the 2nd Canadian Divisional Signal Co., and went to France in September 1915. He was given a commission in June 1916 with the same unit and acted as signal officer 4th Canadian Inf. Brigade till December 1917. From December 1917 till April 1918 he was instructor at the Engineers Training Depot in England. He returned to France and rejoined the 2nd Divisional Signal Co. In June 1918 he was appointed signal officer of the 2nd Canadian Divisional Artillery, and held that appointment until demobilization. In April 1917 Capt. MacKinnon was awarded the Military Cross, and in September 1918 was given a bar to the Military Cross. Capt. MacKinnon is now with the Efficiency Dept. of the Nebraska Power Co., at Omaha, Neb.

•

A. S. Fraser, electrical engineer, whose application for admission to *The Institute* is pending, has been appointed manager of the city of Kamloops. The powers and duties of the manager are as follows: To have charge of the hydro-electric, electric lighting and power plant, waterworks system, fire hall, streets, and all other departments of which the Council has or may hereafter have control, or such of the property of the corporation connected therewith and all officers, clerks, servants and employees of the corporation in the departments over which he shall be given charge. To employ and appoint all officers, clerks, servants and employees of the corporation in the departments over which he is given charge, and at his discretion to remove or suspend them. To invest such officers, clerks, servants and employees of the corporation with such powers, authorities, and discretions as he may think expedient, and to fix their salaries or emoluments.

•

E. R. Gray, A.M.E.I.C., City Engineer of Hamilton and Member of Council, has been actively engaged lately in connection with the preparation of a report to the City of Hamilton on the [illegible] gas question. A report has been submitted by a special committee, with the aid of Mr. Gray and other gas experts, on the present situation regarding the supply of natural and manufactured gas. The gist of their recommendations is that the city should at once undertake the construction of an artificial gas plant, preferably of the vertical retort type, of sufficient capacity to furnish the entire present requirements of the city, with an additional water gas plant for increasing the total capacity, which would be about 5,000,000 Ft. per day. It was decided that the by-product coke oven type of plant was not economical as a producer of gas for municipal consumption, owing to the increased amount of coal required to produce the same quantity of gas.

•

J. A. H. O'Reilly, A.M., E.I.C. has been appointed secretary of the research committee of the Winnipeg Board of Trade. Mr. O'Reilly's experience eminently qualifies him for this important position. He has lately been statistical engineer for the Winnipeg Electric Railway Company and before this was Associate Professor of Civil Engineering at Manitoba University. He takes with him the heartiest wishes of the branch for his success in his new position.

In spite of extreme severe climatic conditions the transmission line between Winnipeg and Portage la Prairie is now practically completed and it is expected that the power will be delivered over this line at the end of the month. Considerable extensions of transmission lines throughout the Province are expected to be made in the forthcoming year. All of this work is under the supervision of J. M. Leamy, M.E.I.C., Power Commissioner for Manitoba.

*

Bruce Aldrich, district engineer, Canadian district office of the Asphalt Association located at 95 King Street, East, Toronto, who has just been elected an Associate Member of *The Institute*, advises that the home office of the Asphalt Association, representing the producers and users of asphalt for paving purposes, has removed the head office to new quarters in the new National Association Building, 25 West 43rd Street, New York City. The Asphalt Association will continue its educational and research work along the most effective engineering and economic lines. A feature of the Association's activities is a brochure series explaining the approved methods of constructing asphalt pavements including asphalt macadam, asphaltic concrete and sheet asphalt pavements and presenting information as to asphalt specifications, the use of asphalt fillers for brick and block pavements. Lectures in universities and colleges have been given, or arranged for, in about twenty-five of the leading educational institutions of the United States and Canada.

*

The appointment of Frank S. Rutherford, B.A.Sc., A.M.E.I.C., at a salary of $3,500 a year, to the position of organizer for the industrial and technical education branch of the Department of Education, was announced by Hon. R. H. Grant, Minister of Education. He succeeds K. S. Maclachlan, who resigned.

The position was advertised and Mr. Rutherford chosen from the list of applicants who had active service during the war. Mr. Rutherford is a graduate of the School of Practical Science of the University of Toronto, and an associate member of *The Engineering Institute of Canada*. He has been a public school teacher and has had much experience as an engineer.

He enlisted in 1914 as a sapper in the Second Field Company, Canadian Engineers, and went over with the First Contingent. He returned to England as a casualty, and later to Canada, where he was given a commission on construction work for the School of Trench Warfare. In February 1919, he was discharged from the army to take up work with the Department of Soldiers' Civil Re-establishment.

*

Albert George Hill, A.M.E.I.C., sales manager of the Bawden Machine Company, Limited, Toronto, returned to Canada a few weeks ago after spending the greater part of a year in England where he made arrangements for the Canadian selling rights for Alley and MacLellan, Limited, Glasgow, Scotland, manufacturers of air compressors, valves and water works supplies, and the sole license right to manufacture and sell in Canada the products of the following English and Scotish firms: Robey and Company, Limited Lincoln, England, manufacturers of semi-Diesel oil engines, steam engines, air compressors and mining machinery; John Thompson, Limited, Wolverhampton, England, manufacturers of corrugated furnaces and water tube boilers; David Bridge and Company, Limited, Castleton, Manchester, England, friction clutch rubber and textile-working machinery, E. S. Hindley and Company, Limited, Bourton, Dorsetshire, England, makers of high-speed steam engines, Brown Bros. and Bow, MacLachlan, Limited, manufacturers of steering gears and steam-boat auxiliary machinery. The Bawden Machine Company will manufacture all parts of the English machinery and will supply repair parts.

*

Harold S. Johnston, A.M.E.I.C., late of Calgary, has recently come to Halifax to accept an appointment as hydraulic engineer of the Nova Scotia Power Commission. Mr. Johnston is a graduate of McGill University and has had extensive experience in hydro-electric work both in Ontario and in the Province of Alberta. He was engineer to the Calgary Power Co. for a period of four years covering the construction of two hydro-electric plants of 30,000 horse-power capacity as well as storage dams incidental thereto. He was also engineer for the Dominion Parks Branch, Interior Department, in connection with water supply for Banff and the Rocky Mountain National Park.

For the past eighteen months and up to the time of his appointment to the Nova Scotia Power Commission, Mr. Johnston was assistant Western District Superintendent of the Engineering Branch of the Department of Soldiers' Civil Re-establishment with jurisdiction from Winnipeg to Victoria, and covering the construction and maintenance of hospitals, vocational schools, etc. and particularly a $500,000 tuberculosis sanitarium.

While Mr. Johnston will generally assist in all the projects of the Power Commission, his immediate duties will be the preparation of designs and estimates for the Sheet Harbour project to supply the Pictou County industrial district.

*

Major General Garnet B. Hughes, C.B., D.S.O., M.E.I.C., who has been overseas continuously since September 1914, recently paid his first visit to Canada, the principal objects of his visit being to see his father, Sir Sam Hughes, and to visit his home town of Lindsay, Ont. On the occasion of his visit to Lindsay on March 11th a civic welcome was tendered to General Hughes, a large procession was formed at the C. P. R. station, headed by the citizens' band, veterans, etc., and General Hughes was escorted to the home of Sir Sam and Lady Hughes, where he was welcomed by John Carew, ex-M.P.P. and other prominent citizens.

In an interview with a representative of the Toronto Globe General Hughes spoke optimistically of conditions in Great Britain, and stated that in his opinion prospects were bright. General Hughes is returning to England ere the publication of this number of *The Journal*, and will resume his work as a partner of the firm of Sir Robert McAlpine & Sons, builders and contractors.

*

Col. J. C. Brown, who was elected a Junior Member in 1911 and whose application for transfer to a higher grade is now pending, is at present engaged as Chief of the Anatolian Railways in Asia Minor. This line is at present under British military control and forms the western section of the Bagdad Railway. Col. Brown has had an interesting career during the war. He joined the Canadian Army in 1914, was transferred to the Corps of Royal Engineers, Imperial Army after arrival in

England and went to France as 2nd in command of a Railway Construction Co., R.E. After about three months he was recalled to England and sent to Salonika in command of a similar company, where he served for about three years and attained the rank of Lieutenant Colonel with the title of Railway Construction Engineer, No. 1 British Salonika Force, at the time he had four construction companies under his command.

Since leaving Salonika in March 1919 Colonel Brown has been on construction work in Transcaucasia, and during part of the summer of 1919 was also with the British Military Mission in South Russia as Railway adviser. His present address is c/o Director of Railways, Constantinople, Army of the Black Sea, via G.P.O. London.

A. C. D. Blanchard, M.E.I.C.
Chairman Niagara Peninsula Branch

A. C. D. Blanchard, M.E.I.C., was born in Windsor, N.S. He was educated at Kings College University, and later at McGill University, graduating from McGill in 1901. After graduation Mr. Blanchard was for some time with the American Bridge Co., in Trenton, N.J., and later joined the engineering staff of the Canadian Niagara Power Company under the late C. B. Smith, M.E.I.C. Five years later he was engaged by Messrs. Ross & Holgate, Montreal as assistant to the resident engineer Walter J. Francis, M.E.I.C., on the construction of the 32,000 H.P. Hydro-Electric Plant of the West Kootenay Power & Light at Bonnington Falls, B.C. Upon Mr. Francis' return to Montreal he was promoted to resident engineer. The following year he joined the engineering staff of the City of Toronto, and was placed by C. H. Rust, M.E.I.C., city engineer in charge of a newly created department of special surveys and the design and construction of the main drainage system. In 1911 Mr. Blanchard accepted the position of city engineer of Lethbridge, Alta., remaining there until 1913 when he joined the engineering staff of the Greater Winnipeg Water District under W. G. Chace, M.E.I.C., and in 1911 he returned to Niagara Falls, and has from that time held the position of chief field engineer of the Niagara Development of the Hydro Electric Power Commission. Mr. Blanchard has graduated in The Engineering Institute from Student to full Member. He joined The Institute in 1901 as Student Member, was elected Associate Member in 1904, full Member in 1911 and is now the energetic chairman of the Niagara Peninsula Branch.

Important Appointment

H. R. Safford, M.E.I.C., formerly chief engineer of the Grand Trunk Railway, who has many friends in Canada, has been appointed assistant to President Hale Holden of the Chicago, Burlington and Quincy Railroad Company, the Colorado and Southern Railway Company, Fort Worth and Denver City Railway Company, The Wichita Valley Railway Company.

H. R. Safford, M.E.I.C.

Mr. Safford's elevation to this position is a further recognition of his ability and of the success which attended him in his former position. Mr. Safford has been one of the most earnest promoters of good-will between the United States and Canada. In a recent letter to the Secretary, he writes in part:

"I am sorry, of course, that this [illegible] my business association with my good Canadian friends. [illegible] characterized my connection with the Grand Trunk. However, I [illegible]"

"I hope [illegible]"

BRANCH NEWS

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary

The following resolutions were passed at a recent meeting of the Branch.

"Daylight Saving"

That the time is approaching when a decision upon the question of the continuance of the Daylight Saving principle must be made.

That the practice as carried out in the past years has been beneficial in its operation.

That the Victoria Branch of *The Engineering Institute of Canada* therefore endorses the principle of Daylight Saving, and suggests to the Council that steps be taken to support the movement having for its object the continuance of the practice.

"Re Purchasing Commission"

Whereas the purchase of government supplies during the war as carried out by the War Purchasing Commission, for these departments concerned under the War Measures Act, has, as stated publicly by the Premier, saved the country many millions of dollars by abolishing patronage so far as these departments are concerned, and

Whereas the purchase of all supplies by competitive tender would further increase the saving to the country, and

Whereas any system which prevents possible discrimination in favor of political friends or persons, wishing to become purveyers to the Government, is much preferred by all technical men;

Therefore the Victoria Branch of *The Engineering Institute of Canada* is unanimously in favour of legislation to attain this end, and would place itself on record as endorsing the action of the Government insofar as the proposal to present a bill to create a permanent Purchasing Organization is concerned.

Further agreed that the Council be asked to take the necessary steps and all Branches to support them.

Vancouver Branch

By J. N. Anderson, A.M.E.I.C., Sec.-Treas.

At the March meeting of the Executive of the Vancouver Branch, it was resolved:—

That this Branch goes on record as being unalterably opposed to such amendments of the Civil Service Act as it is understood Sir Sam Hughes proposes to introduce to the present Session of Federal Parliament, tending to eliminate competitive examinations for Civil Service position, and to introduce the old evil system of patronage.

Further that the Council of *The Engineering Institute of Canada* be requested to place this resolution before the proper authorities.

Further that a copy of this resolution be sent to the various Branches of *The Engineering Institute of Canada* for their endorsation.

Saskatchewan Branch

J. N. de Stein, M.E.I.C., Sec.-Treas.

Our Branch stand in the middle of its winter activities. Unfortunately action on our proposed bill had to be deferred until the next session of the Provincial house, but we see with great satisfaction from our correspondence, that this question is being taken up in other Provinces and we certainly wish its success! As far as our Branch is concerned the matter is now in the hands of our Legislation Committee for suggestions as to the best method of ensuring the passing of a satisfactory Act.

The question of technical High School education is also engaging our attention and a special Committee has been appointed to look into this matter.

The Paper and Library Committee has prepared a detail programme for papers to be read at the monthly meetings of the Branch. For the Summer-meeting, which will likely take place at Saskatoon, a paper on the natural resources of the Province is being prepared by R. W. E. Loucks, A.M.E.I.C. Other subjects of interest, which will be dealt with the ensuing season are the Saskatchewan River Water Supply, Concrete, Fuels etc.

At the February meeting of the Branch, W. A. Begg, A.M.E.I.C., Townplanning Engineer of the Saskatchewan Government, gave an interesting address on the procedure under the new Townplanning Act, outlining in detail the methods to be adopted in the field and office in this connection. He dealt also at some length with the larger schemes in other parts of our Dominion and touched upon the subject of the devastated areas in Europe.

After the conclusion of his address, W. T. Thompson, M.E.I.C., the oldest practising engineer and surveyor in our Province, made a few remarks concerning the Hudson Bay Route. He referred to the importance of completing that route to Port Nelson, stating that grading had been finished and the steel laid to within about of ninety miles of the terminal some time ago—that the completion of the road would render the fine fisheries of the Bay available, open up some very fair agricultural land and promote the development of the great mineral resources of the north. He mentioned that large sums of money were being spent in other parts of Canada on the Welland Canal and other works, and he thought it only fair to the West that there should be no further delay in laying the remaining steel and completing the terminal at Port Nelson, especially in view of the resolutions had been passed by our Provincial Legislature urging the construction of the road.

At the March meeting it was decided to grant an annual scholarship of one hundred dollars to the Engineering faculty of the University of Saskatchewan to the most deserving student upon graduation. This to be known as "The Saskatchewan Branch E.I.C. Scholarship."

There was also a special committee appointed to deal with the question of salaries for Engineers and to draw up tentative schedules applicable to our conditions, somewhat along similar lines of the work the Committee of the Toronto Branch has so splendidly accomplished. The Chairman of this Committee to be C. W. Dill, M.E.I.C.

A paper was read by Capt. D. A. Smith, A.M.E.I.C., on "Mapping in War," which was followed by a discussion lead by R. W. E. Loucks, A.M.E.I.C.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Sec.-Treas.

February 5th, Mr. F. H. Martin gave an address on the "Economics of Water Wheel design." Mr. Martin traced the history of water wheel design from its commencement up to the present day and forecasted possible future developments. He illustrated his paper with an extremely interesting series of slides. Particular interest was taken in the graphical method of designing the runners of water wheels. He dealt at considerable length upon the necessity of giving the efficiency of the wheel its proper consideration as part of the whole installation; pointing out and illustrating by actual results in practice that the efficiency may be unduly emphasized and considerable monetary saving may be made by a slight decrease in efficiency. A very good discussion took place, particularly on the latter subject.

A report was heard from the delegates of the branch who attended the annual meeting in Montreal.

A committee was appointed to bring in nominations for officers for the ensuing season.

On February 18th, B. S. McKenzie, M.I.E.E. read a paper by Prof. J. McKenzie of the Saskatchewan Branch, on "Concrete Mixtures in Alkali Soils".

The Committee appointed to nominate officers for the ensuing season reported the names of those nominated for balloting.

Border Cities Branch

J. E. Porter, A.M.E.I.C., Secretary.

The Second Meeting of the Branch for the year was held on Friday night, Feb. 20th, in the Auditorium of the Chamber of Commerce with nine members and several friends of the Speaker for the evening present.

The main feature of the evening was an address by Major W. J. Forbes-Mitchell, D.S.O., on the different types of bombs and their respective mechanisms, on the different gases used at the Front and the methods of combatting their deadly effect, followed by some Lantern slides of interest.

A hearty vote of thanks was tendered Major Forbes-Mitchell.

Due to the unavoidable absence of the Chairman, his report on the Annual Convention was read and adopted as read.

It was decided that the appointment of the Town-planning and Membership Committees be left to the Chairman, Mr. Craig, who later appointed on the Town-planning Committee:

J. J. Newman, A. J. Riddell, C. R. McColl.

And on Membership Committee:

H. Thorne, W. J. Forbes-Mitchell, E. S. Nelles.

The Meeting adjourned at 10.45 P.M.

* * *

A Special Meeting of the Border Cities Branch was held in the Auditorium of the Chamber of Commerce March 1st, with 10 members and several visitors present.

The subject of the evening was an illustrated address to the Panama Canal while under construction and the San Francisco celebration of its completion by Mr. John Murphy, M.E.I.C.

* * *

The regular monthly meeting of the Border Cities Branch was held in the Chamber of Commerce Rooms, on the 5th instant with Fraser S. Keith, General Secretary of *The Institute*, Mr. Proctor of the Toronto Branch and sixteen members present.

Following the reading of the minutes of previous meetings Mr. Craig, in calling upon Mr. Keith for an address, traced the growth of the Canadian Society of Civil Engineers and the present *Engineering Institute of Canada*.

Mr. Keith then gave the members a very instructive and interesting address on Institute matters, dealing with Membership grades, *The Journal*, Legislation and salaries, which was closely followed and appreciated by all.

Major W. J. Forbes-Mitchell moved a hearty vote of thanks to Mr. Keith which was in like manner seconded by A. J. Riddell and heartily endorsed by all.

Mr. Proctor brought greetings from the Toronto Branch and gave the members a short account of the work of the Toronto Branch and of the inaugurated General Engineering Meeting at Toronto held week.

The meeting was then opened for discussion. Considerable discussion followed on Legislation, The *Journal* and Salaries.

The following resolution was passed, viz.

That the attention of the Council be drawn to the advisability, in the smaller branches, of permitting the Junior members of the Branch to vote on all Branch matters and to hold office, and that Council, therefore, put into effect the necessary regulation to permit all Branches, having a total membership of members, associate members, juniors and students, of less than sixty, to add a clause to their By-laws permitting of this action.

The Branch also placed itself on record in unanimously approving the resolution—Re Federal Civil Service Classification—of the Winnipeg Branch of February the 18th.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary.

On Thursday February 19th, the Branch was addressed by R. L. Dobbin, M.E.I.C., Waterworks Superintendent, who spoke on Water Filtration, with special reference to Peterborough's local problems. As the City has in view in the near future a 6,000,000 gallons per day filtration plant, the meeting was well attended by the citizens generally as well as the members of the Branch.

During the month the Branch was asked by the City Council to make a report on the sufficiency of the foundation for the East river pier of the new Hunter Street Bridge. As the river span of this bridge is to be the longest in Canada and one of the longest in America, much of its stability depends on the foundations.

The Branch appointed a Committee from among its members, which after making investigations reported to the Council that the foundations were suitable. This helped to set at rest many rumors that were current in the City as to the poor class of soil in the foundations, and the Branch received the thanks of the City Council for their report.

On February 29th the Branch suffered an irreparable loss in the death of the Chairman, G. Reid Munro, M.E.I.C. An account of Mr. Munro's life and achievments appears elsewhere in this issue, but it may be said here that *The Engineering Institute* in general and Peterborough Branch in particular has been robbed of one its brightest lights.

John Murphy, M.E.I.C., Electrical Engineer of the Department of Railways and Canals was to have addressed the Branch on Thursday March 4th, on the Formation of Ice, but on account of the death of the Chairman, this meeting was put off until a later date.

At the recent elections for the Council of the Local Board of Trade, three out of fifteen elected were members of the Peterboro Branch, which speaks well for the interest of engineers in the City in affairs outside their own line of work.

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary.

A general open meeting of the Branch was held at the Welland Hotel, St. Catharines, on the evening of Feb. 27th.

Nearly an hour was spent in partaking of an excellent dinner to which 93 members and friends sat down.

The speaker of the evening was John Murphy, M.E.I.C., of Ottawa whose subject was entitled "A Trip to the Panama Canal while the Canal was being Built and San Francisco's Celebration of the Opening of the Canal."

The speaker showed a large number of lantern slides and explained each in a very interesting manner. The slides of the Panama-Pacific Exposition were hand colored and showed vividly the beautiful lighting effects of the Exposition. The speaker was much disappointed in not having the slides which he had originally intended to bring. These had been delayed in transit from New York.

Munro Grier K.C. of Toronto was a guest of the Branch at the special request of Mr. Murphy. Some of the slides shown were loaned by the National Electric Light Association and Mr. Grier is a vice-president of this Association.

Mr. Grier spoke in an eloquent and humerous strain for a few moments at the close of Mr. Murphy's talk.

The St. Catharines Canadian Club had been invited to come after the dinner to hear the address and see the pictures, and a number availed themselves of this opportunity as well as a number of guests from the Hotel.

At 10.30 the meeting adjourned to the Grand Theatre to see some motion pictures on Ice Formation which Mr. Murphy had brought with him. These showed in a very striking manner the way in which frazil ice forms in running water and on submerged iron and steel. The speaker explained how this great difficulty in hydro-electric power plant operation may be comparatively easily overcome by the use of relatively small quantities of steam applied to headworks, penstocks and turbines, and closed with a plea for greater recognition of this fact.

* * *

A general meeting of the Branch was held Friday, March 12, at the Engineers' Club, Thorold.

The following members were elected to the Branch Nominating Committee:—

E. P. Johnson, D. T. Black, R. P. Johnson, G. H. Lowry and W. P. Near.

This meeting was the occasion of Mr. Keith's annual official visit to the Branch.

Mr. Keith complimented the Branch upon its accomplishments and record for the first year of its existence and proceeded to a brief outline of the progress and present status of legislation in the various provinces of the Dominion.

The Chairman asked Lieut.-Col. Leonard, past-president of *The Institute*, to speak to the meeting.

Col. Leonard told in an interesting way of some of the early engineering projects in the Niagara Peninsula with which he had been connected. These related to early water power developments and some of the limitations and difficulties of transmitting electrical energy over even short distances.

The Chairman explained that the speaker of the evening had been unable to come but that he himself would endeavor to show the slides and describe the building of the Winnipeg Aqueduct on account of his familiarity with this undertaking.

Mr. Blanchard explained the conditions of the water supply in Winnipeg and showed how necessary it became to secure a large supply of soft water. A board of consulting engineers had reported in 1900 upon securing a supply from the Red River at a point some 60 miles distant from the City and later, another report in 1913 provided for the supply to come from Shoal Lake, 90 miles distant. This last scheme was the one adopted and which the speaker explained, with the aid of lantern slides, in a very interesting manner. A large number of questions from those present indicated considerable interest in the subject.

The attendance at the meeting was thirty-five.

Hamilton Branch

C. F. Whitton, A.M.E.I.C., Sec.-Treas.

The first meeting of the Hamilton Branch for the 1920 season took the form of a visit to the Coke Oven Plant of the Steel Company of Canada. A summary of the equipment and operation of the plant was furnished to each visiting member, and as it has a general interest is given herewith:

By-Product Plant of the Steel Company of Canada, Limited, Hamilton Works

Coal Handling: The normal daily consumption of coal is about 1500 tons. This is unloaded into four receiving hoppers, and lifted by belt conveyor to the Breaker Building where the coal is crushed and delivered to bins, the high volatile coal to one bin, the low volatile coal to the other. From the bins the coal is delivered in certain proportions, usually 85 per cent high volatile, 5 per cent low volatile, to the Hammer Mill, where the two grades are thoroughly mixed and pulverized fine enough for 80% to pass through a 1/8" mesh screen. From the bottom of the Breaker Building the coal is conveyed by belt to the "Larry Bin"—capacity 1400 tons.

Coke Ovens. There are two batteries of ovens, consisting of 40 separate ovens, each of brick construction with iron doors. Between pairs of ovens are the combustion chambers, the ovens being heated by conduction through the intervening brick walls. Each oven is charged from above from a larry car, filled from the larry Bin. Each charge is about 13 net tons. The charge is coked for about 16 hours, the doors at the end of the oven are then opened and the oven-full of coke pushed out by a ram into the quenching car. (The coking process reduces 13 tons of coal to 9½ tons of coke.) At the quenching station the coke is deluged for about a minute by six streams of water and is then dumped out on to "coke wharf." The coke is taken by conveyor to the screening station where it is screened into—foundry sized coke, over 4", furnace sized coke, between 4" and 1½", and Breeze, under 1½". Furnace and foundry coke are shipped, part of the Breeze is kept for blast furnace consumption.

By-Products. During the coking process, large quantities of gas are given off, which accounts for the decrease in weight from coal to coke. This is collected and drawn to the "by-product" building by three "exhausters," being cooled, on the way, in the "primary coolers." During this cooling, from the ovens to the primary coolers, a mixture of tar and ammonia liquor is precipitated from the gas. This is piped to the "separating tank." From the exhausters, gas passes through "tar extractors" in which last traces of tar are removed. From here, gas passes into the "saturators," where it bubbles up through dilute sulphuric acid. The ammonia vapour in the gas combines with the sulphuric acid precipitating "ammonium sulphate." This is dried in centrifugal dryers, and wheeled into the "sulphate storage" room. Here it is bagged [illegible] and shipped as a fertilizer material. Shipped principally to Japan, South America, West Indies and Spain. The mixture of tar and ammonia liquor which went to the "separating tank" separates in that tank by gravity, the tar being pumped to the "tar storage" tank, and the ammonia liquor to the "ammonia liquor" tank. The tar is pumped to the open hearth furnaces and used as fuel. The ammonia liquor is pumped to the ammonia stills, where, by the addition of lime, the free and fixed ammonia are liberated as ammonia vapour. This goes into the saturators along with the gas from the tar extractors. About 75% of the ammonia vapour is extracted from the gas, and about 25% through the ammonia stills.

The gas, after leaving the saturators is finally scrubbed in the "final cooler." Here a certain amount of naphthalene is deposited in the "naphthalene settling basin." This is dried and barreled for sale. The gas then passes into the gas holder, which has a capacity of 20,000 cu. ft. This has a collapsible top, which provides the pressure necessary to force enough gas back to the ovens to continue the coking process. Forty per cent of the total gas produced is returned to the ovens as "fuel gas." The other sixty per cent is pumped by the "booster engine" to the open hearth furnaces, where it is used as fuel with the exception of that sent to the Boiler House and a little used in the lunchroom and the laboratory, etc.

Yields.—From 1500 tons of coal, there is obtained:

- 1100 tons of coke
  - 1000 tons foundry & furnace coke, shipped, used in blast.
  - [illegible] tons chestnut coke, shipped
  - 60 tons coke dust, shipped, used in plant
- 16000 U.S. gallons of tar—used in open hearth furnaces.
- [illegible] pounds of ammonium sulphate, shipped.
- 16,000,000 cubic feet gas
  - 6,400,000 cu. ft. returned to ovens as fuel.
  - 9,600,000 cu. ft. piped to open hearth, boiler house, etc.

This makes the yield of one ton of coal—

- ¾ ton of coke
- 11 U.S. gallons of tar
- [illegible] pounds of ammonium sulphate
- 10,[illegible] cubic feet of gas

Boiler House. Boiler equipment consists of 3 Erie City double-drum water tube boilers — each of 250 Horse Power. Steam pressure carried at 150 pounds. steam superheated 100°. Fuel used is a mixture of coke dust and by-product Gas — about 20 tons of the former and about 250,000 cu. ft. of the latter per 24 hours.

The second meeting of the Branch was held on February 10th. At this meeting Henry Harvie, A.M.E.I.C., of the Hydraulic Engineering Department of the Hydro Power Commission of Ontario read a paper on "The Extent and Value of Canadian Water Powers" in which he gave interesting statistics and information regarding the principal Hydro Electric developments in each province and district as compiled from official sources of information. Interesting lantern slides were also shown.

The next meeting was held on March 2nd at which John Murphy, M.E.I.C., Consulting Electrical Engineer of the Dept. of Railways and Canals, Ottawa, exhibited his remarkable moving pictures on Needle and Anchor Ice Formation, details of which have appeared in the press and Branch News where his lecture has been delivered. A large audience assembled in the lecture theatre of the Canadian Westinghouse Company, for the use of which the local Branch were much indebted to the company. An interesting discussion of the various phases of ice formation in connection with the Hydro Electric Power Plants followed, in which Mr. Murphy; W. G. Angus, Chief Engineer of the Dominion Power & Transmission Company, H. U. Hart, General Manager of the Canadian Westinghouse Company, and several others took part.

The enjoyment of the evening was further enhanced by the showing of a series of beautiful lantern slides of the Panama Canal and Panama Pacific Exposition, which Mr. Murphy very kindly exhibited at the request of those present.

To Mr. Murphy's kindness in affording the Hamilton Branch an opportunity of seeing these pictures and hearing of how they were taken, the local Branch are greatly indebted for one of the most enjoyable and profitable meetings that have been held this year.

The local members of *The Institute* held a well attended meeting, March 11th, at the Royal Connaught Hotel. Several out of town Members and invited guests were also present, including Fraser S. Keith, General Secretarry from Montreal, Alexander J. Grant, engineer in charge of Welland Ship Canal, Messrs. Jewett, Sternes, Plumer, and Powell, also of the engineering staff of the Welland Ship Canal, Alderman John Tope, Chairman of Civic Board of Works Committee, and also several representatives of local contracting firms.

R. K. Palmer, M.E.I.C., occupied the Chair.

Dinner was served to those present, numbering about 55, and an enjoyable musical programme was also furnished by Messrs. Collins, Presser and Carrett.

After an opening address from the Chairman dealing with general matters of business, Mr. Keith spoke on the current activities of *The Engineering Institute* and its Branches. Particular mention was made of the benefits which engineers were beginning to derive from the organization and co-operative action on behalf of their joint interests, such as in the matter of legislation, public recognition and standard of remuneration. *The Institute* has greatly increased since the War, both in numbers, activity and reputation throughout the Dominion. It is considered by American technical societies to be unique, in as much as it combines in one body all the various branches of technical and engineering professions, which are in other countries divided into separate organizations.

A paper was then read by E. H. Darling, M.E.I.C., on the subject of the necessity of an adequate building code. His paper dealt with various phases of this question, such as the regulation of building design and construction for the purpose of fire prevention and public safety. He referred to a report issued by the Commission of Conservation of Fire Waste in Canada which makes a rather startling estimate that of approximately two million buildings throughout the Dominion, less than one tenth of one percent have been built with proper consideration of fire safety.

Several recommendations were made by the speaker in connection with the adoption of standard building regulations, inspection and fire prevention. He emphasized the necessity of engineers of all branches identifying themselves with a movement for improvement along these lines. Their expert opinion and valuable experience should be freely offered for the benefit of the public at large, and especially for the framing of proper Building By-laws for their own City.

It was suggested that a committee of the Local Branch be formed to offer the co-operation of the local engineers to the Civic Committee dealing at present with the revision of the Hamilton Building By-Laws.

Toronto Branch

H. A. Goldman, A.M.E.I.C., Secretary.

A regular meeting of the Toronto Branch was held at the Engineers' Club on Thursday, February 19th, 1920, at 8.15 P. M.

The main speaker of the evening was Captain Bruce Aldrich, who delivered a lecture on "Bituminous Roads."

The lecture was well received and a very unusual, broad and lively discussion followed, which lasted about an hour and in which the following members took part: Messrs. Jupp, Hogarth, Rust, Clark, Professors Young and Gillespie and Mr. Phelps.

A regular general meeting of the Branch was held at the Engineers' Club on Thursday, February 26th, 1920 at 8 P. M.

The minutes of the previous two meetings were read and approved.

E. T. Wilkie, Chairman of the Nominating Committee, presented a report in connection with the nominations for a Secretary-Treasurer of the Branch. Geo. Phelps and H. A. Goldman have been nominated, and both have given their consent to the nomination.

As there was no other business to be considered the Chairman called upon J. M. M. Greig, A.M.E.I.C., who read a paper on "The York Township Sewerage Scheme." Mr. Greig had his paper illustrated with a number of slides, showing maps of the district in question and diagrams and tables in connection with the calculations.

A very interesting discussion followed the reading of the paper, in which the following members participated:—Messrs. Proctor, Powell, Winckler, Meadows, Phelps, Clark, Rust, Storrie, Latornell and Wynne-Roberts.

* * *

A general meeting of the Branch was held at the Engineers' Club on Thursday, March 4th, 1920 at 8.15 P. M.

The meeting was called for the purpose of having a debate on "Should Engineers Unionize."

W. Smith was the first speaker, taking the affirmative side. He pointed out that the unionizing of engineers was advisable, practical and necessary. He called attention to the fact that many engineers in the United States are already organized in unions and it has proven to be practical.

Professor Peter Gillespie, M.E.I.C., spoke against unionizing. He pointed out the position that engineers would be brought to if, for instance, engineers were called out on a sympathetic strike.

Mr. Connor who opened the discussion believed that the whole thing hinges on legislation, and that legislation would improve the condition of engineers.

Mr. Heywood pointed out that in union there is strength. There should, therefore, be some kind of a Union. He preferred an organization that could use the machinery of *The Institute* to promote its interest.

Mr. Storrie also believed that it was legislation that we should try to get.

Mr. Ambrose stated that he was in sympathy with unionism. He referred to his own organization, stating that letters are being received from the Unions asking for a certain increase from a certain date, and the request is immediately complied with, without any discussion, while an individual not belonging to a union cannot receive any increase.

Mr. Harland believed that what was necessary was legislation and publicity.

Mr. Merrick admitted that in unity is strength, but stated that the engineer has to hold up to a high position. He here pointed out that Quebec already has legislation passed.

Mr. Chipman related the history of Legislation and the progress that has been made by *The Institute.*

Mr. Winckler called attention to the necessity of having engineers represented in Parliament.

Mr. [illegible] claimed that if engineers unionize they would not have to be called out on sympathetic strikes, and that no strikes at all would be necessary. He also claimed that other unions have a code of ethics, and if engineers would unionize they would give ethics to the profession.

Professor Haultain stated that Unionism is a hard, divisive and divergent thing. He did not think legislation would help the engineer, as it does not help the teachers. He believed that it will be necessary to unionize after legislation is secured.

Mr. Powell pointed out that in case of labor, as soon as man becomes an employer he cannot belong to the union any more, while in engineering most of the engineers hope to become employers themselves one way or another.

Mr. McCarthy believed there would have to be a distinction between employer and employee.

Mr. Proctor compared engineering with other professions, pointing out that in case of doctors, for instance, the output of graduates is controlled and no over supply of doctors is allowed, while in engineering the rule seems to be the more the better.

Professor Young stated that in the case of the unions the object seems to be the least production, while engineers do not agree with that. He therefore moved the following resolution:

"That whereas by reason of inadequate compensation, salaried engineers are now working under exceptionally trying economic conditions, which in some cases amount to hardship;

"And whereas many engineers in the Toronto district are convinced that these conditions can be ameliorated only by direct organized effort and that immediate remedial measures are imperative.

"And whereas *The Engineering Institute* must either promptly face the issue and grapple with it or stand aside and permit newer and perhaps hostile associations to press the claims of the engineers of this country for economic consideration.

"Therefore be it resolved that this Branch urge Headquarters of *The Institute* forthwith to request all Branches to appoint Committees of not less than five members with power to add to their numbers to thoroughly investigate and report through the various branches to Headquarters upon the structure and constitution of an organization designed to bring into operation direct and concerted effort toward the improvement of the economic status of engineers; and that if practicable Headquarters defray the expenses of these Committees in the matter of holding hearings and obtaining stenographic reports of evidence."

Mr. Taylor seconded the resolution.

Mr. Goldman believed that the matter of holding hearings and obtaining stenographic reports was waste of time since no one denies that conditions are not satisfactory. He also pointed out that the Council, judging from the past, does not seem enthusiastic to take up the Salary question, and therefore, suggested local action.

Mr. Clark stated that the concensus of opinion seems to be that we want legislation. "Why not start now," then he asked.

Mr. Chipman explained that the matter of legislation is now in the hands of the Provincial Division.

Mr. McMaster believed that the junior engineer should have something to compare with, in order to determine what he is worth.

Professor Gillespie and Mr. Snaith then spoke, completing the debate.

Professor Young's motion was then taken to a vote and was carried unanimously.

A hearty vote of thanks to the speakers was then moved and carried.

* * *

A general meeting of the Branch was held at the Engineers' Club on Thursday, March 11th, 1920 a 8.15 p.m.

The minutes of the previous meeting were read and approved.

The Secretary read a resolution which had been adopted by the Manitoba Branch, whereby the Special Committee of the Council of *The Institute* are requested to bring their influence and acquired knowledge to bear with the Civil Service Commission to have the minimum salaries of the responsible officers of the engineering staffs made commensurate with those received by responsible officers in equivalent positions in private corporations.

Moved by Professor Gillespie, seconded by Mr. Clark: "that the Toronto Branch E.I.C., endorse the "resolution adopted by the Manitoba Branch, and the "Council of *The Institute* be notified accordingly."

Carried.

The Chairman then called upon George T. Clark, A.M.E.I.C., who delivered a most interesting lecture on the "Toronto Harbor Development."

Beginning with the history of the appointment of the Toronto Harbor Commissioners and the powers bestowed upon them, the Speaker followed through the various stages of development of the Toronto waterfront. The lecture was illustrated by a number of lantern slides, some of which showed the general plans of the proposed scheme of development, some showed pictures of the various districts taken before and after development, while others showed engineering works under construction.

At the conclusion the Speaker paid a tribute to E. L. Cousins, Chief Engineer and Manager of the Toronto Harbor Commission, to whose initiative and ability is due a good deal of the success of the Harbor development. On behalf of Mr. Cousins, Mr. Clark invited the members of the Toronto Branch to visit the Harbor works some day in the spring or summer to see in actual construction what he showed on the pictures.

The Chairman in reply expressed the appreciation of the Branch and hoped that the Branch will take advantage of the invitation.

In the discussion which followed, the following members took part:—Professor Gillespie, Messrs. Crelock, Merrick, Winckler, Gore, Baldwin Powell, Cockburn, Oxley and Harkness.

The Chairman announced the results of the ballots, that H. A. Goldman was elected Secretary-Treasurer of the Toronto Branch.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec.-Treas.

Two meetings have recently been held. The first was on February 26th, when B. E. Norrish, A.M.E.I.C., Superintendent of Exhibits and Publicity Bureau of the Department of Trade and Commerce, gave a lecture on "The Development of the Motion Picture Industry."

Mr. Norrish traced the development of the projector from its early stages to the present day practice, showing how the pictures have been improved and modified to meet changing conditions, and giving illustrations of the wonderful work of which the camera is capable.

The lecturer has had much to do with the development of this industry from the Government standpoint, and pictures taken under his direction are now shown all over this Continent and in many parts of Europe as well. They have been found to be of great assistance in spreading information with regard to the Dominion Government and its many activities.

The second meeting was held on March 18th, when S. C. Ells, A.M.E.I.C. the Mining Engineer of the Department of Mines, described the Bituminous Sands of Northern Alberta.

These well known tar sands represent the largest known deposits of solid asphaltic material, and will be of immense importance in the making of good roads in Western Canada.

Mr. Ells has had charge of the exploration and the preliminary development of all these deposits. He is very sanguine of the commercial possibilities which await their development.

The lecture gave rise to an interesting discussion, in which A. W. Campbell, the Dominion Highway Commissioner and General Griesbach, M. P. for Edmonton, took part.

The second Luncheon Meeting of the Branch was held on March 4th, the speaker being Alex. Johnston, Deputy Minister of the Department of Marine, and his subject, "The Development of Canada's Mercantile Marine."

The policy of the Dominion Government with regard to shipbuilding has been much critized, and Mr. Johnston's address was looked forward to with very general interest as being the first official pronouncement on this important subject. The speaker was able to make out a very good case for the policy of his department.

His address was of great interest, and has been widely reported in the press.

Montreal Branch

Frederick B. Brown, M.E.I.C., Secretary

An interesting series of meetings has been held at Headquarters during March, the programme being unusually varied. The first meeting of the month was held on March 5th with Mr. Rutherford in the chair, at this meeting J. S. Cameron, A.M.E.I.C., spoke on "Industrial Relations." The paper, which was fully illustrated with lantern slides, dealt with the management system of a modern industrial plant—that of the Northern Electric Company, Ltd., Montreal, and discussed in detail the various aspects of the relations between employer and employee. After a preliminary sketch of the growth of Scientific Management Mr. Cameron described how the system was applied in different ways in his own company—building layout, time-study, first aid and medical service to employees, scientific examination, etc. Mr. Cameron's paper will be printed in an early number of *The Journal*.

In the course of his remarks Mr. Cameron alluded to the Department of Soldiers' Civil Re-establishment, and following his address Capt. Shanley and Capt. Morphy of the D.S.C.R. gave a brief sketch of the remarkable work being done by the Department for the disabled soldier. In the Montreal district alone some 3000 returned men who are unfitted for their former work are being trained to take up civil life, and the statistics of the Department show that these men are a success when the training is completed.

*

With G. K. McDougall in the chair the regular meeting was held on March 12th, when G. L. Shanks, A.M.E.I.C., gave his paper on "Inundation Work with the B.E.F. In the course of his lecture Mr. Shanks showed how inundation had been used as an important part of defensive warfare in the low-lying parts of the Western Front, in France and Belgium, both by the Allies and the German. The slides which illustrated the lecture showed the important part played by the Canadian Engineers in this work, demolishing canal locks, embankments, etc. Several of the slides shown were aeroplane photographs, and illustrated several of the points brought out in the interesting lecture on aeroplane photography delivered to the Branch in February by Lieut. C. C. Brooks.

*

The meeting held on March 19th, was one of the best attended this season, being a double event. Under the chairmanship of Mr. MacLeod, R. de L. French, M.E.I.C., gave an interesting address on the Utilization of Lignite. In this connection the Lignite Utilization Board, of which R. A. Ross, President of *The Engineering Institute*, is Chairman, has done a large amount of investigation. In the course of his lecture Mr. French alluded to the fact that the bulk of Canadian coal is in the form of lignite, the largest fields in Manitoba and Saskatchewan being estimated to contain nearly three billion tons. The Lignite Utilization Board has been working on the problem of making these vast stores available, making experiments on briquetting processes, etc.

Following Mr. French's paper, moving pictures of the peat industry were shown by E. V. Moore, M.E.I.C. The problem in connection with the utilization of peat is similar to that in connection with lignite, the present tendency being in the direction of briquetting processes. In this connection members are referred to the interesting paper on this subject by F. A. J. Sauer, M.E.I.C., which appeared in *The Journal*, December, 1919.

At the regular meeting of the Branch held on Thursday, March 26th, James Ewing, M.E.I.C., read a vigorous paper on "Re-planning Montreal and District." In the course of the lecture Mr. Ewing gave figures showing the enormous waste due to faulty planning, or rather lack of planning in the city of Montreal, and indicated some of the troubles in store should this policy not be righted. Among the principal defects mentioned were, lack of co-ordination in planning suburban, resulting in large expropriations for improvements, the disadvantage of having a large number of through streets instead of having main thoroughfares paved for heavy traffic and minor streets lightly paved, intended for light traffic only, lack of access to Mount Royal, etc. Mr. Ewing described the problems before the city in connection with planning as essentially for engineers, and appealed to the members of *The Institute* to help in any movement for betterment.

Following Mr. Ewing's address, Noulan Cauchon showed a number of interesting slides illustrating the progress of town-planning in other cities of the Dominion.

An interesting discussion followed. R. A. Ross, M.E.I.C., gave his hearty support to the principles outlined in Mr. Ewing's paper, but showed some of the practical difficulties in the way of putting these into effect. Mr. Ross added that the Administrative Commission of Montreal is doing its best in the face of difficulties and joined in Mr. Ewing's request to the members of *The Institute* to get to work and help."

St. John Branch

A. R. Crookshank, M.E.I.C., Secretary

The St. John Branch of *The Engineering Institute of Canada* at the regular monthly meeting, heard a very interesting paper on "The methods adopted in our location surveys in wooded country," read by Moses Burpee, M.E.I.C., Chief Engineer of the Bangor & Aroostook Railroad, of Houlton, Maine.

The paper was illustrated by lantern slides, showing the types of country in the wilds of Maine through which surveys had been made, the various apparatus used, the encampments, and the several means of transportation of outfit and supplies, etc.

Mr. Burpee described how the reconnaissance surveys were made and how on one trip [illegible] or more parties were working one after the other along the line, making the "preliminary," the "topographical" and the "location" surveys. So close was the survey timed that the crews finished work and got their boats and canoes out to civilization the day before the rivers and lake froze up for the season.

One survey paralleled rivers for most of its eighty odd miles of line, and the crews were housed in two bateaux of the type used in that country of lakes and shallow rapid rivers. These were about seventy feet long, ten feet wide, flat bottomed, scow-like boats, with fifteen or more feet of their bottom at bow and stern sloping gently upward. This allows them to ride up over obstacles and to turn readily. The bottom was strongly built and sheathed with birch boards to take the wear of the dragging over the rocks and gravel bars in the shallow places. Twelve to fifteen feet from the bow was a mast, securely guyed to the bateau, and the tow rope was led through a block at the top of this to a small winch on deck. This allowed the lifting of the tow line over any rocks or other obstructions. As there were no tow paths, the team of horses, the driver riding on the back of one of them, travelled on the most convenient bank of the stream or even in the stream itself. Where deep water occurred, when it was necessary to change from towing on one side to the other, or where quicksands were encountered, the horses were taken on board the bateau ahead of the mast and were safely carried across. Astern on the mast was the house, with the last few feet of the roof sloping downward to allow of the use of a long sweep rudder, the tiller of which came up over the stern and this slanting roof, and was operated by the steersman from that vantage point. Another man was necessary to keep the bateau from being pulled on to any rocks by the tow rope, and to see that the rope did not get foul of obstructions.

As these boats only draw from one to one and a half feet of water, they can be taken almost anywhere along the large streams.

Mr. Burpee described the Northern Maine district as rivalling New Brunswick as the sportsman's paradise, and described a splendid canoe trip taken along the Allegash River, he being one of over one thousand persons who had taken the trip during that year.

After a hearty vote of thanks to Mr. Burpee, the meeting adjourned.

G. N. Hatfield, A.M.E.I.C., Chairman of our Employment Bureau, (St. John), from time to time receives from Headquarters and from the Civil Service Commission notices of positions open in various parts of Canada. These, and others, can be seen on application.

The services of the Bureau is free to members, returned soldiers and students. The Secretary has on file, for use of members, a fairly complete set of catalogues of Engineering Government Publication, a bibliography of concrete in sea water, complete set of Canadian Ingersol-Rand Co. Catalogues, salary schedules of the other branches, etc., etc.

Halifax Branch

F. R. Faulkner, M.E.I.C., Sec.-Treas.

The regular monthly meeting of the Halifax Branch was held in the Physics Lecture Room, Science Building, Studley of Friday evening, February 27th. Fifty-one members and guests were present, the chairman of the Branch, F. A. Bowman in the chair. After the minutes of the previous meeting had been read and adopted the chairman explained that the bridge committee had been unable to collect enough data to have the meeting in January. Since that time the question had grown, and the committee was still working of plan, and profiles of several crossings (Halifax Dartmouth.)

After the appointment of Messrs. C. S. Cox and G. B. Stairs as scrutineers of the ballots on the proposed changes in By-laws the Chairman gave for the benefit of the guests present a brief synopsis of the objects of *The Engineering Institute jof Canada*, and the qualifications necessary for admission as Student Members, and as Branch Affiliates. Before the result of the ballot was announced a list was read of positions vacant and wanted which had not appeared in *The Journal*. The result of the ballot was in favor of the proposed change in the By-laws, and the proposal that the present officers of the Branch remain in office till May 1920 was carried.

The Chairman then called on K. H. Smith, A.M.E.I.C., to give a paper on the Water Powers of Nova Scotia.

Mr. Smith first gave a brief history leading up to the present organization in which the Provinces of Nova Scotia, New Brunswick and Prince Edward Island were co-operating with the department of the Interior at Ottawa, so that the one staff could do all the work required in each Province and thus gain the benefits of co-operation.

The speaker then explained the two factors entering into Water Power estimates,—the head and the quantity of water available,—the last in a constantly varying quantity and only to be obtained satisfactorily by means of observations, extending over a period of years. The methods used in gauging streams were referred to. The speaker noted particularly the unsatisfactory results that had been obtained by attempting to utilize existing rainfall records in one locality to obtain an idea of the run off in another place and cited several examples.

He then dealt with the economic side of a water power development, showing that the commercial feasibility of a site must be taken into account, and that unless the power that could be developed can find a market either immediately or in the near future, a Niagara at a man's door would be useless. He emphasized the value of small sites, particularly as they can now be interconnected and their full value utilized.

Mr. Smith then gave a list of the water power developments recently completed or under construction. He tentatively suggested 300,000 h.p. as the commercial capacity of the larger water power sites in the province A brief description of particular sites was given, including

St. Margaret's Bay, Sheet Harbor, Bear River and St. Croix in Nova Scotia and the North shore, the Fredericton district, St. John and vicinity in New Brunswick.

The question of costs was dealt with cautiously, in view of the fluctuations in material and labor, but the speaker felt that we might expect to secure Hydro-Electric Power at considerably less than the present rates. Mr. Smith emphasized repeatedly the fact that water power was not always cheaper than steam power.

Following the paper, a large number of interesting and instructive slides were shown, many of them being from photographs taken at points at which development is contemplated or now under way. Among the slides were maps showing the location of several of the more advanced projects and the proposed method of linking them up. The slides were accompanied by a detailed explanation as they were shown.

Following the slides the chairman called for a discussion. Mr. McColl and P. A. Freeman, in the course of remarks on the subject, complimented Mr. Smith on the excellence of the paper both in substance and in the manner of presentation. A vote of thanks was tendered Mr. Smith by the Chairman. In reply to a question about tidal powers, Mr. Smith read extracts from a letter he had recently written on this subject in which he started that while there was an enormous amount of tidal power, particularly around the Bay of Fundy, and that while tidal power projects should not be discouraged, he felt that any project should be handled with extreme caution.

The chairman drew the attention of the members to the proposed Annual Professional meeting in October, explaining the reasons for holding it in that month.

EMPLOYMENT BUREAU

Situations Vacant

Chief Draughtsman for Pulp & Paper Company

Chief draughtsman for power and paper company, with knowledge of paper mill work, capable of supervising all work in chief engineer's office, experience in mechanical and civil engineering desirable, should be capable of of supervising the making of drawings for installation of new equipment, and re-arranging of old equipment, and be familiar with the usual practice of design of piping system, pumps, foundations, etc. Box No. 93.

Civil Engineer for Ontario City

Civil engineers with experience in design of sewers for a large city in Ontario. Box No. 94.

Junior Engineer for Pulp & Paper Company

Large pulp and paper company requires Junior engineer with experience in instrument work. Box No. 95.

Instrument Man

Railway Company requires an instrument man. Box No. 96.

Foundry Manager

Steel Company has a vacancy for technical graduate as manager of foundry. Box No. 97.

Salesman for Steel Company

Steel Company has a vacancy for a salesman. Box 98.

Hydro Mechanical Engineer for Design

Hydro mechanical engineer having good experience in turbine and heavy power transmission machinery designing. Box 99.

Municipal Engineer

A member of The Institute, resident in Manitoba, engaged in municipal work is anxious to secure similar opening in Ontario or the East. Has had extensive experience and well qualified. Box [illegible]-P.

Structural Mechanical Engineer

Young structural mechanical engineer, age [illegible], graduate Queen's, wants work on a live Engineering Project. Good on organization and detail with all round engineering training. Hard conscientious worker. Detailed record of experience, education and references on application, available May 10th. Box [illegible]-P.

Instructor for Technical School

Science graduate wanted for technical school in large city, Province of Quebec to teach industrial drawing, mechanics and technology, twenty hours of classes per week, salary $1[illegible] per annum with an increase of $120. per annum up to a present maximum of $[illegible]. Besides the regular day classes opportunity will be given for taking night classes with additional salary. Session from September till June 20th with two weeks vacation at Christmas. Box 100.

Situations Wanted

Summer Work Wanted

A student completing his second year in engineering at the University of Manitoba desires a position on engineering work for the summer. Will be able to commence May 1st. Box No. 19-P.

Civil Engineers

Graduate in civil engineering desires position where draughting, estimating and supervising is necessary. Experience in municipal planning, etc., speaks French and English. Box 20-P.

Graduate engineer twenty-seven years old, three and half years experience on construction, surveys etc. at present with pulp and paper company desires to make a change. Salary $[illegible] per month. Box 21-P.

Graduate in civil engineering desires position with a firm doing construction work, experience in bridge work and house construction. Box [illegible]-P.

Experienced public works and harbour engineer now employed wishes to make a change. Willing to go to any part of the world. Would prefer harbour construction work. Box 23-P.

Civil engineer, experience in charge of construction, roads, bridges, dock and harbour, extensive administration and organization experience in Canada, Africa, Australia and India. Full references on request. Records on file at Institute headquarters. Box 24-P.

The Forests of Quebec

G. C. Piché, A.M.E.I.C., Chief of Forests Service, Quebec Lands and Forests Dept.

Area :

The total area of the Province of Quebec is now 450,337,761 acres, 703,653 squares miles or 1,822,461 square kilometres. The annexation of the Ungava territory in 1912 has practically doubled its former surface. The lakes and other water surfaces are estimated to cover 15,969 square miles. (1)

According to the Census of 1911, (2) the properties belonging to private individuals or companies or communities covered then 15,613,267 acres; so that the Crown would still control in Old Quebec, 209,585,294 acres, while New Quebec or Ungava, covering 225,139,200 acres, is intact, making a grand total of 434,724,494 acres. Of this last amount, and in Old Quebec, licenses to cut timber upon Crown Lands, subject to special conditions as detailed further on, have been granted over territories aggregating 44,500,000 acres.

Classification of the Forests of Quebec

Omitting New Quebec and a portion of the Labrador upland, which we are led to consider as not containing any appreciable area of commercial timber, we figure that the forests of this province capable of producing saw logs, pulpwood, etc., cover 130,000,000 acres. We have divided them into five classes according to their tenure:

(a)	Private forest..................	6,000,000 acres
(b)	Forests on lots under location..	[illegible] "
(c)	Forests leased or timber Limits	44,500,000 "
(d)	Township forest reserves.	[illegible] "
(e)	Vacant lands	78,000,000 "
	Total	130,000,000 acres

A description of each class follows. None of the private wood lands are managed according to the principles of Forestry. The same may be said of the forests belonging to settlers.

It is only upon the Crown Lands, (timber limits and township reserves), that the Forest Service of the Province exercises some influence in the direction and supervision of the cutting of trees and their utilization.

1.—Private Forests

[illegible]

These 6,000,000 acres come from the old seigniories and lands either sold to settlers by the Government or granted to railways in aid of their construction.

The largest portion of this class of forests lies in the central valley of the St. Lawrence and is divided up into small properties seldom exceeding 50 acres on an average, with the exception of certain seigniorial domains, such as those of Lotbinière and Beaupré, and the extensive territories granted as subsidies to railways.

Read at the General Professional Meeting, Montreal, Jan. [illegible], 1920.

The stands vary greatly. In fact they include high forests or coppices and pure stands of spruce, pine, or maple. Elsewhere the forests are of a mixed character, consisting of yellow birch, beech, maple, ash, mingled with spruce, balsam fir or white and red pine. (3).

The total value of these stands is about $30,000,000. It is rather difficult to estimate the revenue derived from them owing to the lack of information. But it is a well known fact that our maple groves produce yearly over $700,000.00 worth of sugar and syrup; that our farmers sell annually about 900,000 cords of pulpwood worth, on an average, $3.00 standing; so the total revenue from the private forests, including also the value of the firewood cut, is at least $7,000,000 per annum.

So far no restriction has been imposed upon these operations nor upon the disposal of the pulpwood, which is exported in great quantities to the United States.

2.—Forests on Lots Under Location Tickets

Every year the Government sells to settlers lots of land, containing 100 acres on an average, and usually well timbered. This sale is effected by means of a special contract, called a "Location Ticket," imposing several obligations, in reference to residence, clearings, etc. (4).

When the settler has complied with the various conditions enumerated in this contract, he is entitled to receive his letters patent, giving him full and free possession of his lot.

Owing to the low prices of lots and their comparative richness in timber, they have been the subject of vast speculations, especially since 1900, when spruce and balsam fir became very valuable, owing to the progress made by the pulp and paper industry in the Province. But the creation of the Forest Service and the energetic action taken have put a stop to such waste of the public domain.

The forests of this class are destined through force of circumstances, either to become part of those of the first class—when the settler obtains his letters patents—or to revert to the second class, (timber limits), from which they had been taken out to be granted to so-called settlers who have not fulfilled the conditions of their location tickets. Thus the area of these forests extends or shrinks from year to year.

There are at present about 15,000 lots under location ticket; one third of these could be patented if the owners would take the trouble to take the necessary steps to obtain a definite title.

The penalties collected from speculators from 1907 to 1919 for illegal cuttings amount to $300,000.00, but the annual amount of such fines is now diminishing greatly, as offences of this nature are becoming fewer.

According to the statistics kept by the Forest Service, the total volume of the cut of saw logs in 1918-1919 was, on private lands, 930,574,000 feet board measure, compared with 980,700,000 feet board measure, upon the Crown Lands.

3.—Crown Land Forests

Timber Limits.

This class comprises all forests usually called "timber limits," leased to various license-holders at different periods. The limits are exclusively leased by auction after a notice of at least thirty days, but we have always exceeded that delay. This auction bears upon a special amount called "bonus," which constitutes the fee for obtaining the permit or license to cut exclusively on a specific area. In 1868, there were already 19,000 square miles under lincense; from 1868 to 1919, 55,200 square miles were successively leased as timber limits. But owing to the sale of lots to settlers the area of the limits is now reduced to 69,897 square miles.

All these forests are situated beyond the villages, in the upper basin of the St. Lawrence. They contain a fairly large variety of merchantable timber, such as: white pine, red pine, grey or banksian pine, spruce, balsam fir, cedar, hemlock, tamarack, birch and maple.

The permit granted to the license-holder is valid for twelve months from the first of May. It may be renewed every year, provided the license-holder has complied with all the existing obligations, and with such others as may be determined by the Lieutenant-Governor-in-Council. The license is considered as a negotiable security, but it can be transferred only with the consent of the Minister of Lands & Forests, and after the payment of a fee of $4.00 per square mile. This system has enabled extensive limits to be concentrated and strong companies to be formed for manufacturing pulp and paper. (5).

The principal conditions imposed upon the license-holder are:

1. To pay the *bonus* as set at the auction.

2. To pay a *ground-rent* of $6.50 per square mile, before the 1st September of every year. (This amount will be raised to $8.00 per mile after 1923, for the following five years.)

3. To send, before December 1st, a statement of the quantities of timber it is proposed to cut, giving the places where they are to be cut, and the persons who are to do the lumbering:

4. Not to fell any white or red pine under 13 inches in diameter, nor any spruce, cedar, maple, etc., under 12 inches, except swamp spruce, paper birch, balsam fir, poplar, ash, elem, which can be cut at a minimum diameter of 7 inches measured on the stump, 2 feet from the ground;

5. To have all the timber cut, measured by a culler holding a certificate from the board of examiners appointed by the Government;

6. To allow all the operations to be inspected by the provincial forest rangers, to keep a shanty book in each camp for the recording of the trees cut every day, their measurements, etc.;

7. To practice as great economy as possible in the lumbering operations;

8. To produce a sworn report, before the 20th June, stating all the year's operations both upon limits and upon private lands.

9. To pay royalties or stumpage dues on all timber cut upon the limits according to the log rule and the rates adopted by the Department. (See appendix No. 5).

10. To protect the limits against fire, trespassers, etc.;

11. To export no timber that is not manufactured in Canada, i.e., converted into pulp and paper, deals or boards, or into any other articles of trade or merchandise of which such timber is only the raw material (Art. 13 of Regulations).

From 1867 to 1919, the forests under license have brought in the following amounts to the Province:—

(a)	Ground rents	$8,048,444.22
(b)	Bonuses	3,066,312.06
(c)	Transfer fees	343,529.07
(d)	Royalties or dues on timber cut	31,812,403.59
(e)	Interest on suspense accounts, penalties for illegal cutting, fire taxes	1,072,768.68
	Making a total of	$45,543,764.02

The total revenue of the Department now exceeds $2,500,000.00 per annum.

The cut on the timber limits during the fiscal year of 1918-19, amounted to 800,923,286 feet board measure of spruce, balsam, jack pine, hemlock, birch, poplar, sawlogs.

124,809,129 feet board measure of white pine.
48,083,487 feet board measure of red pine and hardwood.
168,851 railway ties.
12,973 cubic feet of square timber and minor quantities of other wood goods, such as poles, firewood, so that the total cut was practically equal to one billion feet board measure per annum. (In sealing round timber, one cubic foot equals 8 board feet, in average.)

4.—Township Forest Reserves

Since 1911, the Forest Service has devoted much attention to setting apart the uncultivable vacant lands in certain Townships to form forest reserves, which are destined to supply timber to the inhabitants of the neighbouring villages, under special regulations. (See appendix No. 6).

Seventeen township forest reserves, covering a total area of 265,000 acres, have this been created.

The quantity of timber cut on these reserves, in 1919, amounted to 111,784 cubic feet of building timber and 2680 loads of firewood, which brought a revenue to the Crown of $1,018.85 as stumpage dues.

5.—Forests Not Leased: or Virgin Forests

These forests, which are free from any incumbrance extend beyond those under license, lie either in the basin of the St. Lawrence, or that of Hudson Bay and Ungava. No cutting has yet been done on any of these Northern territories, but fire, storms, insects and fungi cause therein considerable damage every year; moreover, the growth in volume of the trees is very slow, as in all Northern forests. Therefore the annual increment in volume is rather low. To the Forest Service has been assigned the duty of making an inventory of these so they may gradually be utilized as the country's needs require.

The timber in these forests consists chiefly of spruce, balsam fir, poplar and Banksian pine; the quantity per acre varies between 6 and 15 cords, mostly of pulpwood. This reserve can furnish millions of cords of pulpwood, and as there are considerable water powers on each of the streams, it can easily be foreseen that, before long, many pulp and paper mills will be erected in the Northland, which will contribute to develop the country and advance the progress of civilization.

The Forest Wealth of Quebec

Our primœval forests were very rich. They extended to the very shores of the St. Lawrence, as we are given to understand by the relations of the first explorers of Canada. (See Champlain, Charlevoix, etc.) They consisted chiefly of white pine (Pinus Strobus), red pine (Pinus Resinosa), balsam fir (Abies Balsamea), white spruce (Picea Canadensis), black spruce (Picea Mariana), hemlock (Tsuga Canadensis), white cedar (Thuya Occidentalis), tamarac (Laryx Americana), white and red oak (Quercus Alba and Quercus Rubra), elm (Ulnus Americana and Ulnus Fulva), maple (Acer Saccharum and Acer Saccharinum and Acer Rubrum), birch (Betula Alba and Betula Paperifefa), etc. etc., All these trees were of a large size, giving a wood of first class quality. But settlement and fires soon caused the removal of the forest, first along the river fronts and finally far into the interior.

Until the beginning of the 19th century, our export trade was insignificant, limited to the demands of the colony; the shipping industry was also in its infancy. After 1830 the European market began to create a large demand upon our forests, which has continued to increase in volume, even after the wooden shipbuilding industry had disappeared in Quebec.

The first licenses to cut timber on the Crown Lands were granted in 1826, and the system has been continued until the present day with variations in the conditions of the lease. (6) (See the Annual Report of the Department of Lands and Forests for 1910, pp. 79-120).

Notwithstanding the difficulties of access to the virgin forests, the first operators did not hesitate to send their axemen very far into the interior, and they soon covered the whole section where white pine was king. A little red pine was than cut into square timber and rafted down the Ottawa, the Gatineau and the Lièvre rivers, and so to Quebec, while from the Montreal and Richelieu districts, oak and elm logs were also brought on the rafts. The methods of cutting in those early days were rudimentary: all the cutting and squaring being done with the axe. The culling of the forest was also very bad, as only the best trees were selected; moreover, only logs of the best quality were taken out. How much timber was thus wasted, no one can tell; but, even now, we come across some of these old-culled logs from which excellent timber is yet made. As a matter of fact, we have become less exigent, because the white pine is now rare and because settlements and too often the fires, have compelled the forests to fall back on the upper slopes of the river basins, into regions remote and more difficult of access. Until 1900 the white pine led the list of the trees lumbered; but spruce, which had gradually gained favor, owing to its qualities and its lower price came into great demand, not only for building purposes, but also for pulp and paper manufacturing. Hence the cut of these species has increased wonderfully, as has that of balsam fir, which wood is somewhat similar but less valuable. The other species gained ground later and the volume of their cut is now quite large. In fact, all the resinous trees of our forests are now utilized, and it remains only to dispose profitably of the hard woods, which, owing to their greater density, cannot be easily floated to the mills. Efforts have been made and are yet made, to solve this problem. Therefore the stumpage value of the hardwoods is rather low, while that of white pine and spruce is comparatively higher.

The Province of Quebec is well justified in spending enough money to protect her forests from fires, and to develope adequate means to utilize this immense fortune. Naturally, it is impossible to do this all at once, but we are satisfied with the results already obtained and we shall continue to ameliorate our conditions as the economical movement of the country warrants us to do so.

Our Lumber Industries

The value of all forest products in Canada for 1917 is estimated at $190,000,000 (See Canada Yearbook of 1918, p. 49), the share of the products of this province being about 30%. Though a quantity of logs exceeding 200,000,000 feet board measure is shipped annually outside of the Province to be converted in the mills of New-Brunswick and Ontario, yet the lumber production of Quebec exceeds all the others, and we find that for several years, Quebec has ranked first for its forest production. There are, in Quebec, over 2,600 establishments in which wood is the main raw material of which there are:

2,200	Sawmills
369	Sash and door factories
281	Planing mills factories
34	Furniture & chair factories
30	Pulp & paper mill plants
30	Box & crate factories
23	Farming implements factories
22	Vehicle & carriage
14	Butter tub & box factories
12	Broom & brush factories
10	Boat & ship building plants
8	Casket & coffin factories
8	Flooring mills

Besides sundry establishments producing railway cars, daily implemeuts, store fixtures, matches, elevators, barrels, bobbins, and spools, cigar boxes, corks and cork goods, frames, charcoal, gun handles, clothes pins, stairways, woodfiber or excelsior, patterns, beds, sewing machines, musical instruments, pianos, organs, veneer, sporting goods, trunks and valises, etc., etc.

Needless to say, several firms produce at the same time quite a number of the articles mentioned above.

With a few exceptions, all our large mills depend mostly upon the leased timber limits for their annual supply while the remainder receive their lumber from the private forest owners.

We may say that heretofore, the lumber industry in this province has been conducted solely according to the demands for particular products according to the facilities of transportation. Water courses had to be used in the past and are still used, as being the cheapest carriers, and often the only one possible. A very small portion of the timber trade in this province is now moved by the railways; but this system is gaining ground and it will develop more rapidly now the hardwoods can be sold profitably. Owing to the rather low altitude of our mountains, lumbering is not confronted here with all the engineering difficulties of the Pacific Coast, but, other problems are sufficient to give the operators plenty to think about. In the past, the main trouble was with the forest speculators, now it is the scarcity of labour.

Owing to our excellent system of rivers, their exceptional size and the normal rate of precipitation, the logs cut can be driven to the mill sites at a moderate cost. Our railways, if not as numerous as elsewhere in Canada, yet are devised in such a manner as to feed a large part of our territory. In particular, the Transcontinental has opened, in the Northwest of this Province, the Abitibi region, which is an excellent agricultural section, as good as any of the Clay Belt; this district, which will soon become a very good farming country is now producing over 90,000,000 feet b.m. yearly. Excepting the years of the Great War, our lumbermen had little difficulty in obtaining labour, at moderate prices, but now this problem is vexing, and in certain sections many are afraid, and with reason, that the lumber-jacks will not be available in the future as they formerly were.

Another drawback is the excellence of our men for this class of work, as they can handle the axe very well, are good drivers and are in fact experts in every line of this trade, hence the great demand for French-Canadian bushmen from every Province and also from many of the States of the American republic. In 1918-19 some 22,265 men were employed on our timber limits, and at least 10,000 others upon the private forests, making a total of 32,000 men employed in the cutting of woodlands.

In latter years, some efforts have been made to employ steam and gasoline tractors to diminish the expense of haulage. We must improve our methods of lumbering as the increase in the cost price of logs is constant; machinery as well as engineering skill will be called on to replace human labor, which is becoming rare, more expensive. However it is certain that, as long as the colonization continues to expand, and it must gradually extend over part of the new forested areas, the lumber companies will always find amongst the settlers a good number of daring, resolute and strong men needed for their operations. At all events, it would be wise for them to imitate Swedish methods, i.e. by establishing at several points of their timber holdings, groups of farms to be leased to their men.

An other great advantage to this industry is the great facility for shipping the finished products, either to Europe or to any point of the Eastern American markets. Over [illegible]% of the cut of sawlogs is now shipped to Europe and half of the cut of pulpwood is now converted into pulp or paper in this province, the rest being exported to the United States. The St. Lawrence, below Montreal, permits, at almost every point, the loading directly into ocean steamers, many new wharves are being constructed to increase this advantage, and the harbours of Montreal, Quebec and Trois-Rivières, are being equipped to compete with any in the world.

With the rapid exhaustion of the timber supply of Europe and of the United States, the position of the Province of Quebec is unique; located close to these two excellent markets, it will always find a chance of selling profitably all its forests products, and this should be a sufficient reason for each lumberman to organize his business permanently. The pulp & paper companies have already begun to do so, but the other forest owners have not done much in this line. We hope that they will do their share as the government is endeavouring to do all what it can.

Little attention has yet been given to foreign markets. The Forest-Service has been studying this question for two years, and numerous enquiries received direct or through the channel of the Department of Trade and Commerce of Ottawa have been communicated immediately to forest companies; we know that some of them have been succesful in obtaining a contract in this manner. Even if they had not, this would be sufficient to show our people the immense possibilities that lie abroad, and the obligation to prepare ourselves to meet the demands of the world in this trade, especially now that the European lumber markets have undergone radical transformations since the war.

Forest Administration

From the beginning of Confederation until 1873, the supervision of the cutting of timber upon Crown lands was left entirely to the local agents under the direction of two superior officers. License-holders were bound then, as now, to send in detailed reports of their lumbering operations, but the Crown agent could only effectively check by his cullers the reported quantities of square timber; consequently, only of a portion of the timber then cut was been fully reported by the license-holders.

In 1873, a body of forest-rangers was established. The duties of these forest-rangers (numbering 28 at first, and 78 in 1889) who acted under the direction of special officers called superintendents, consisted in finding out offences made against the forest laws and regulations by limit holders or by settlers, and also in ascertaining the farming value of Crown lands most advantageously situated for settlement. The new system had a good effect as we find that, with the increased additions to the supervising staff, the amounts collected for penalties and for stumpage dues have increased accordingly.

In 1905, the Provincial Government sent two students to the Yale Forestry School who were charged afterwards with the organization of The Forest Service in 1910. A forestry school was established at Laval University where forest engineers are now trained for the supervision of lumbering operations and the management of the forests belonging to the state or to private individuals.

The Forest service of the Province of Quebec, as at present constituted, has charge of the exploration of the unsurveyed territory of the Province of Quebec, classification of soils, supervision of the lumbering operations on Crown lands, reforestation, and of any other technical work of the Department in connection with forests.

The present staff consists of:

The Chief of the Forest Service.
The Assistant Chief of the Forest Service.
32 Forest Engineers, acting as District Inspectors, Assistant Inspectors, etc.
78 Forest-rangers, expert scalers.
25 Student Assistants.
2 Accountants.

Reforestation

It is only recently that efforts have been made to reclaim our waste lands; the first experiment was done at Oka, in 1889, under the direction of Father Lefebvre, a Sulpician priest, who succeeded in reclaiming [illegible] acres of shifting sands. This plantation consisted mainly of white pine and spruce wildstock, but it has grown so well that many of the trees have now a diameter of 9 to 12 inches and a height of some 40 to 70 feet. These dimensions would be greater had a judicious thinning been made now and then. Several persons have tried the acclimatization of some important foreign trees, and we have to-day at Le Platon—the seigniorial residence of the Joly de Lotbinière family—a beautiful grove of black walnut, besides various plantations of other forest trees.

In 1908, a Provincial Nursery of forest trees was established at Berthierville, with the object of raising not only indigenous trees for the reforestation of waste lands and plantations in the forested areas, so as to increase their productivity; but foreign species were also considered and a systematic study is being conducted there of all the trees growing under this latitude. At present the nursery has a stock of four million plants, and already it has shipped more than [illegible] trees. At Lachute a tract of 500 acres of drifting sands has been reclaimed partly by planting and partly by the sowing of beach grass; near Berthier Junction the same work is in progress. Planting stock has been shipped to our various colleges with the idea of educating our coming generation on this important question. The demand for plants from private owners is now very large, the limit holders are also beginning to plant, and it is a pleasure to mention the good work done by the Laurentide Company in this connection.

We are led to believe that this movement will increase very much in magnitude, and it is the intention of the government to keep pace with the demand which it has created.

We must also mention that the students of the Quebec forest school go to Berthierville every Spring in order to assist in the shipping of the material and in all the work of seeding, transplanting, etc.

The projects of the Forest Service in this line are:—

1. The establishment of forest school nurseries and the creation of scholastic societies, to do the plantation, in each village, not only of forest trees but also of shade trees, such as is done in Europe.

2. The creation of communal forests or city forests; a few projects are already under consideration.

3. The plantation of roadways, in co-operation with the Department of Public Roads.

4. The plantation of all the waste lands, which cover over three million acres in the Province. The Government has already led the movement by purchasing a tract at Lachute, but, we expect the private owners to do their share, and will furnish them the material at a very moderate price.

5. The plantation of timber limits, in order to reforest the burned areas to increase the wealth of green tracts and the introduction of better species. We estimate that there are at least 3,000,000 acres that now require such treatment. All these projects are under study; we expect to come soon to an agreement with the limit-holders as to the conditions under which this work should be done.

6. The introduction of foreign stock. (We have introduced European Larch, Norway Spruce and Scotch Pine, owing to the great facilities for obtaining good and fresh seed, and the good growth made by these trees.) But we prefer to limit the use of the foreign trees for the creation of parks and arboretums until they show they are thoroughly acclimated. Some fifty foreign species are under observation at Berthierville, such as Bull Pine (Pinus Ponderosa), Common Alder (Alnus communis), Austrian Pine (Pinus austriaca), Black Walnut (Juglans Nigra), European Walnut (Juglans Regia), etc.

Encouragement to the Forestry Movement

The Province was the first to take a decided interest in forestry questions. The first forest congress in America was held in Montreal in 1889, and ever since the creation of the Canadian Forestry Association, the Quebec people have always welcomed its meetings, following them in great numbers, and still form a very large part of its members. We must recall here the good work done by the late Mgr. Laflamme of Laval University, by the late Sir Henri and Sir Edmond Joly de Lotbinière, and also by the Venerable Mr. Little, who devoted themselves to the advancement of this great question. For a time, the Provincial Government had left to the initiative of these good citizens the bringing the attention of public on this question; but, in 1905, Sir Lomer Gouin, in publishing his programme, as Prime Minister, announced his intention to establish soon a forest school, and two young men were sent to the Yale Forest School, to study forestry. After their graduation, they were given leave to visit the European forests and study to what extent their methods could be adapted to our conditions. This led to the organization of the Forest Service, which took place in 1909, followed next year by the opening of the Forest School, just a few months before the death of Mgr. Laflamme, who had lived just long enough to see the realization of the doctrine that he had not preached in vain.

As mentioned elsewhere, a Forest Nursery was established at Berthierville, and a definite policy adopted for the reclamation and plantation of the shifting sands and waste lands in the Province.

Further to enlighten the public, lectures are given throughout the province by some of the members of the Forest Service, and a few publications are edited in the same spirit. Owing to the great task ahead this part of the programme has been somewhat neglected, but, with the increase of the technical staff, we expect to issue numerous publications, and start a vigorous campaign to educate the farmer upon the management of his woodlot and the necessity of planting his poorest lands.

Exhibits are also prepared for the various fairs or exhibitions, and collections of the woods of the various Canadian timber trees are furnished to educational institutions.

An intimate connection is maintained with the Canadian Forestry Association and it is even proposed to start a Provincial Quebec branch, to achieve more complete results.

The Administration of the Crown Lands

We deem it necessary to give now some details of the system followed for the extension of colonization in our Province as there are yet many misunderstandings on this subject.

The first settlements were established along the shores of the St. Lawrence, and the King of France granted to his military officers large tracts of lands, known as seignieuries. The seignieurial system was continued until 1793, when it was replaced by the present system of townships and lots, by which the settler can purchase a lot without the incumbrance attached to the former deed of sales. (See the study of Mtre Bouffard, advocate, in Quebec. Yearbook for 1915, pp. 255-270). At the suggestion of Governor Carleton, a return was temporarily made to the seignieurial system, but only eight seignieuries were granted by the English King, as the public insisted and obtained the re-establishment of the township, which has ever since given full satisfaction, notwithstanding the errors made. At the present time we proceed as follows: a systematic reconnaissance is made of all the unsurveyed lands adjoining the settlements by officers of the Forest Service, and, according to the reports of these experts, the township is classified into agricultural and uncultivable or forest land.

Following the spirit of the programme outlined in the Royal instructions to Governor Murray, in 1763, a village site is reserved, in each township, and whenever possible the location of the church is also made in advance, so as to give its natural nucleus to the new establishment, to the new parish. Lots are sold in progression, in order to avoid the scattering of the settlers and to lessen the expenses of roadmaking, etc.

The lots sold to settlers are inspected regularly so as to prevent speculators from transgressing the law. For each quantity of timber sold, the settler must furnish a declaration which is verified by the forest ranger; if the cutting is found illegal, a "fine" is imposed, which is sometimes followed by the cancellation of the location ticket. This control has given excellent results; seeing that they cannot elude the law, the settlers are less tempted to dispose foolishly of their lot and they work their property correspondingly. They also acquire the habit of residing on their property, and we find every year that our rural population increases, that a large area is cleared on fairly good soils, which is profitable both for the homeseeker and for the province. In fact new parishes are opened up while the old settlements are gradually filling up all the territory assigned to them.

In a semi-mountainous country like Quebec, which has suffered so much from the effect of glaciation, the percentage of good farmlands is naturally small and we do not think it exceeds 15% of the area of Old Quebec. It is much higher on the central plain of the St. Lawrence, but in the Laurentian and in the Appalachian mountains, where the colonization movement now extends, the percentage is naturally smaller; therefore it is always necessary to make a thorough classification of the township, in order to avoid the selling of poor lands. The best example of what the Government does in this regard is in the Abitibi region, which forms part of the famous Clay Belt of Ontario and Quebec; a few years ago there was only the virgin forest in this Northern and cold plateau, which lies at an altitude of nearly 1,000 feet, but to-day we see that 4200 farm lots have been sold, and a population of about 10,000 inhabitants has established itself to begin the clearing and cultivation of these good lands. On some lots, from 30 to 60 acres have been completely cleared and sown; crops are already obtained and the Abitibi will soon become the granary of our Province.

This example shows vividly that, where the soil is good, the Government will do everything possible to encourage and stimulate colonization, but, where the soil is poor, it is the policy of the administration to protect the settler against himself, as his efforts would be spent unprofitably and the land after it is cleared would be worth much less than before.

The control of the Government tends to restrain the settler from wasting his energies on poor lands, to prevent him from cutting his trees too soon, to make him burn his clearings without causing any damage to his own wood lot and naturally to the adjoining properties; in a word, to do good and real settlement by clearing each year enough land, so that he will soon be able to live on his own lot. When he has established his good faith by fulfilling his obligations, according to the spirit of the law, he obtains his letters patent, which give him an indisputable title to his homestead.

We must add that the Government spends annually about $150,000.00 to survey into lots as much land as, if not more than was sold to settlers in the year previous, so there always remain available to settlers different areas representing altogether 2,000,000 acres, and these areas are distributed in several counties so that we may safely say that the settler who wishes to remain within sight of his village spire and also the most daring settler who wishes to try his fortune elsewhere. Explorations and reconnaissances are conducted every summer to complete our knowledge of our natural resources of our virgin lands.

The Forest Future of Quebec

The reforms made during the last decade and the rigid control of the operations of settlers and limit holders have modified completely the aspect of the problem. Where in the past the lumberman and the settler were antagonistic, harmony now exists. The members of the Forest Service who were then accused of being only the agents of the lumbermen are now respected and well considered by everyone, thanks to the employment of professional men of the forest engineers. The lumbering operations are controlled more closely, not only upon the settlers' lots, but also upon the timber limits. Our system of fire protection gives us the hope that within a few more years we shall have the situation well in hand, as our people are becoming more careful and all those interested take more pains to prevent accidents.

We must also admit that with a larger technical personnel, as we have now, we can turn our attention to other problems, which we have hitherto been obliged to neglect.

We must frankly admit that the old-time methods of lumbering were not conducted according to the principles of sylviculture, but it is still the best system that could be devised under our forest conditions and, in many cases no one could have done better. It must not be forgotten, that if we were to apply faithfully the European methods of exploiting forests, lumbering would cost so much that it would discourage and possibly ruin almost anyone taking the work in hand. The danger of fire, the lack of railway facilities, the absence of market for each class of products, compel us to adopt more elastic methods, as the expenditures in lumbering must be made in direct proportion to the benefit of the enterprise. The additional value of the timber limit after its lumbering should limit the extra cost of lumbering involved by the introduction of the forestry methods.

As stated before, the actual consumption of timber upon the forests under license is practically one billion feet board measure, which gives an average cut for these 45 million acres of about 20 superficial feet. This is very small, and certainly below the annual growth. In fact, it is admitted that the annual growth of trees in volume will vary from 50 to 600 feet per acre and sometimes more according to the conditions of the locality: therefore we feel pretty sure in stating that we can largely increase our operations if we take the necessary means of handling our forests according to scientific principles. In fact, if the forests under license were handled properly, they could produce ten times as much wood as they do now and this without the least danger of exhausting them, each operation leaving them in a better producing state. Let us not forget that there are in addition some 75,000,000 acres of virgin forest lands, containing on an average at least 3 cords per acre, or 225,000,000 cords of pulpwood, which we consider as a reserve for future developments.

One of the present drawbacks is that the lumbering operations are concentrated over too small areas; in order to reduce the cost of logging, the limit-holders have a tendency to cut too much material per acre, leaving behind only a small forest capital to reduced the future stand. As the average rate of annual growth in volume is about 2% we could afford to come back every 40 years to the same place by removing only half of the actual stand, but if more than that is taken out, it means that the tract cannot be lumbered before a longer period. The larger you leave the trees or the more timber you leave behind, the sooner you are in position to log again at the same place. We fully agree with Mr. Chahoon (See Montreal Gazette commercial and financial review for 1919, p. 42) when he says that hereafter we shall have to regulate the volume of the cut, reducing it where it is needed; this will mean an increase in logging expenses, but our lumbermen and papermen are certainly in a position to stand this additional expenditure, they will certainly willingly make this little sacrifice, knowing that their woodlands, instead of losing value are becoming richer and that the propects are they will be able in the near future to cut much more timber than before. Of course, the limit holders will have to seek elsewhere the quantities of timber they cannot find now on their limits, but they are still immense areas under license that are not operated, and which should be lumbered before the timber dies of over maturity or disease, such as it is the case with balsam fir. They could also buy part of the 900,000 cords of pulpwood offered for sale every year by the private forest owners. Is it not a pity to see each year so much timber leaving this Province to feed the foreign mills whereas it could be used here with profit, and would lessen by so much the drain upon our forests? I cannot understand the indifference of some of our paper companies in this regard; it would prolong the life of their woodlands if they entered into competition for this wood, which they are in position to buy at a higher price than their competitors. A few years ago I tried in vain to interest some papermen in the pulpwood of the Abitibi district; but they would not consider my proposal on account of the freight, yet the same pulpwood from Abitibi is shipped every year to numerous points of the United States......at distances twice as great as that to their mills. In concluding, the measures to be adopted for the welfare of our forest are the following:

1. An inventory of all the forest lands; we ignore all of the North Shore forests, the Ungava is still an unknown factor. There are in these Northern lands immense tracts of forests that could supply numerous large paper plants. We should know of them as soon as possible. These explorations will require many years, but with modern conveniences, with the use of airplanes, the work can be shortened very considerably.

2. The next point is to devote much attention to the classification of lands. The agricultural soils should be mapped and organized for the establishment of settlers under the best conditions. The experiment of the Abitibi is a direct proof that it is yet possible to colonize with success in our Province, and the same methods should be repeated wherever there is a group of suitable lands that can form several parishes. The separation of forest lands from cultivable tracts is progressing rapidly, but the work could be yet accelerated for the greater good of the settler and the lumbermen.

3. Technical studies of the growth of our forest trees, of their reproduction, of the best methods of handling our woodlands should be continued, so as to enable us to organize solidly the management of our forests, in order to insure their perpetuity, and to increase their possible annual yield.

4. Economical methods have already been introduced in lumbering, but there is still a great amount of waste in the woods and in the driving of logs owing to the great distance between the mills and the forest. New method of transportation may have to be devised to avoid this loss, and particularly to allow the removal of the hardwood which, in many cutover sections, is crowding out the resinous trees that have been left. I do not doubt that the birch and the maple will be utilized before long for making pulp, their value for lumber is now very high, therefore it will not take long before it may pay to operate railways to lumber such tracts: but this will depend upon the demand and the selling price of lumber and of paper, and also upon the volume of the stand per acre.

5. The protective systems and organizations elaborated recently should be rapidly extended all over the province, so as to safeguard the remaining forests against fires. If we can protect the actual reproduction against fires, we need not be afraid of the future, because our forests trees will seed over the cutover lands and the brulés, and a new forest will soon spring up. We have, (and this is often forgotten by many), extensive areas of young forests, forming the reserves of the future; these must be protected as well as the large trees so as to insure perpetuity in our forests.

6. Now that our forests are becoming effectively protected against fire, we can devote our attention to reforestation, but it will be necessary to do this work in a business way. First, all the available waste lands belonging to private owners should be planted so as to furnish the necessary supply to our villages, to our markets, and to bring these lands into a revenue producing state. The government will certainly encourage this enterprise; we have established a nursery at Berthierville for this very purpose, and we have already made several demonstrations of the feasibility of this work, notably at Lachute and Berthier Junction. The reforestation of the timber limits is also included in our programme. The government owning the land, not the limitholder, is the first interested in this work. We shall do this work

where we are confident that there is no immediate danger of fire, and where we can protect the plantation against this enemy. The government has no intention of saddling the cost of this work upon the lumbermen, but, in cases where the lumberman is directly responsible for the deterioration of the forest, either through neglect or through wasteful lumbering, he should be compelled to repair the damages he has caused by planting. Plans are under procedure to set millions of trees yearly, and we may before long be planting each year twice as many trees as there will be cut in the province.

We should have the greatest faith in the future of our forests, as we have the material to work with, as we have a progressive class of lumbermen, perhaps better than anywhere else on the continent, on account of the fact that the population wishes to see this province advance and show the lead to the others. We shall soon have the largest paper mills of the world as we have extensive resources in our forests and in our water powers; the location of Quebec is such that we can bid for the markets of the world with all our competitors. We shall achieve all this by working together, by making the necessary expenditure and by supporting the measures of the government which has done so much already, and which is interested in encouraging the steady development of our province.

Appendix

Note.—No. 1.—Statistical year book of Quebec, 1915, p. 131.

Note.—No. 2.—Vol. V, pp. 9 & 95 of Dominion of Canada Census for 1911.

Note.—No. 3.—The following complete inventory, of 45 acres of a private forest made by the students of the Forestry School in the vicinity of the city of Quebec, is an instance of this variety of species:

190 white pine trees containing		41,864	F.B.M.	(1)
47 red pine	"	"	6,740	"
[illegible] spruce	"	"	54,161	"
967 hemlock	"	"	40,547	"
100 cedar	"	"	1,967	"
2001 balsam fir	"	"	57,084	"
470 red oak	"	"	16,068	"
41 yellow birch	"	"	1,065	"
195 ash	"	"	6,360	"
[illegible] elm	"	"	[illegible]	"
[illegible] butternut	"	"	1,549	"
1358 sugar, soft and silver maple	"	"	70,120	"
[illegible] American beech	"	"	3,100	"
620 white birch	"	"	7,000	"
30 iron wood	"	"	[illegible]	"
45 cottonwood	"	"	1,290	"
Total			341,675	"

Or about 7,000 f.b.m. per acre. It should, however, be observed that this stand is much richer than is usually found in most of the other private forests. This tract has, in fact, been properly managed while, in the others, there are no rules regarding cutting, beyond the necessary requirements of the owner or the spasmodic needs of the market.

No. 4.—(1) The purchaser must pay cash one-fifth of the purchase price and the balance in four equal annual instalments with interest from the date of sale at six per cent, but at least one instalment must be paid every year.

(2) The purchaser shall, within eighteen months from the date of the sale, build a habitable house of the dimensions of at least sixteen by twenty feet and shall occupy and reside in it continuously from that moment until the issue of the letters patent.

(3) Within five years, he shall clear and have under good cultivation (with a view to having a profitable crop), an area thereof equal to at least fifteen acres in a single block, but he must every year clear at least three acres; at the expiration of the five years, he must have on the lot a barn of the dimensions of at least 20 x 26 feet and a stable of at least 15 x 20 feet; both of these, however, may be in one and the same building. Three acres at least of the portion under cultivation must be fit for ploughing.

(4) He shall every year cultivate the land so cleared by him as aforesaid.

(5) No timber shall be cut before the issuing of the letters patent except for clearing, fuel, buildings and fences, and all timber cut contrary to this condition shall be considered as having been cut without permission on public lands.

(5a) All timber that a settler is allowed to cut on his lot of land before the issue of the letters patent and which he intends to dispose of for commercial purposes must be manufactured in Canada, and all the provisions of article 13 of the Timber Regulations now in force apply thereto.

(6) No transfer of the purchaser's rights shall be made during five years from the date of the sale except by gift inter-vivos or by will in direct line, ascending and descending, or by intestate succession, and, in such case, the donee or heir shall be subject to the same prohibition as the original owner.

(7) Letters patent shall not be issued, in any case, before the expiration of five years from the date of the sale nor before the fulfilment of all the conditions thereof.

(8) The purchaser binds himself to pay the value of the useful improvements existing on the land and belonging to others than himself or to the Crown.

Note. No. 5. Here is a table giving the classification in 1913 of timber limits in the Province of Quebec, according to their extent.

Classification of Limits According to Area in 1913

Area of limits	Number of license-holders	Total area in sq. miles	Average area per holder in sq. miles
0 to 50 square miles......	94	1,790	19
51 to 100 " "	33	2,265	68
101 to 500 " "	73	19,798	271
501 to 1000 " "	13	9,853	758
over 1000 " "	18	35,102	1,950
Totals.................	231	68,808	298

Note. No. 6.

Stumpage Tariff

All wood cut in virtue of a license during the lumbering seasons 1918-1919 to 1922-23, both inclusive, and 1923-24 to 1927-1928, both inclusive, is subject to the following charge:

		Years 1918-19 to 1922-1923	1923-1924 to 1927-28
1.—	Square, waney or flat timber, per cubic foot:		
a)	White pine, oak, hickory and walnut....................	0.08	0.10
b)	Red pine, elm, ash, cedar, basswood, birch, maple, tamarac.	0.08	0.08
c)	Spruce, balsam. grey pine or banksian pine, hemlock, white birch, aspen, poplar.........	0.04	0.06
II.	Saw logs and boom and dimension timber in the raw state, per thousand feet board measure		
a)	White pine, oak, hickory, walnut	2.60	3.00
b)	Red pine, elm, ash, basswood, birch maple, tamarac........	2.00	2.00
c)	Spruce, balsam, grey pine banksian, pine, hemlock, white aspen poplar................	1.60	1.80
d)	Cedar.......................	1.40	1.40
III.	Poles more than 18 feet in length, not exceeding 10 inches in diameter at the small end, each:		
a)	30 feet and less in length.......	0.25	0.40
b)	31 to 40 feet in length........	0.50	0.75
c)	41 to 50 feet in length.........	1.00	1.50
d)	51 feet and over in length......	2.00	3.00
IV.	Railway ties or sleepers not exceeding 9 feet in length, each.......................	0.10	0.10
V.	All other wood goods, ad valorem....................	15%	15%

Note.—No. 7

1. No one is allowed in the township reserves without a written permit from the warden;

2. Permits to cut timber may be given to any householder within a radius of twenty miles for a certain quantity of timber not to exceed 10,000 feet board measure, or 20 cords of fire wood or 300 ties.

3. The permits are subject to existing regulations of the Department, consistent with the present ones.

4. Permits must be applied for by registered letter, addressed to the warden of the reserve, between the 1st September and 1st December.

5. The permit-holder must cut only the trees marked or indicated to him by the forest agent. He must, within a delay of two years, remove all the timber mentioned in the permit; after such delay, the Minister of Lands & Forests may dispose of all the timber not removed. All the timber cut must be piled so as to be measured, in the forest, by the forest guardian whose measurement is binding. One half of the stumpage dues payable for the timber requested must be paid cash when the permit is issued, and the balance before the timber is removed. Stumpage dues will also be levied on all timber wasted such as stumps over 18 inches high, tops larger than 5 inches in diameter at the thicker end, skids not carted away, trees marked that have not been logged, etc. All remnants of the cutting must be lopped so that the branches and other debris may lay flat on the ground.

6. All timber cut contrary to these regulations will be considered as cut illegally and dealt with accordingly; the permit may be cancelled for any infraction of the regulations.

7. The permit cannot be transferred.

Recent Progress in Wireless Telegraphy

By [illegible], M.I.R.E., Assoc. A.I.E.E.
Chief Engineer, Marconi Wireless Telegraph Co. of Canada Ltd.

Historical

1867—James Clerk Maxwell read a paper before the Royal Society in which he laid down the theory of Electro-magnetism, which he developed more fully in 1873 in his great treatise on electricity and magnetism. He predicted the existence of the electric waves now used in wireless telegraphy.

1879—David E. Hughes discovered the phenomena on which depends the action of what was subsequently known as the coherer, which many years later were used in early electric wave signalling.

1883—Heinrich Rudolph Hertz at Kiel, commenced his studies of Maxwell's electromagnetic theory.

1885—Thomas A. Edison with assistants worked out a system of communication between stations and moving trains, by means of induction and without the use of conducting wires.

1886—A. E. Dolbear of Tufts College, Boston, patented a plan for establishing wireless communication by means of two insulated elevated plates, but there is no evidence that the method proposed by him, did, or could, effect the transmission of signals between stations separated any distance.

1887—Heinrich Rudolph Hertz discovered the progressive propagation of electro-magnetic action through space, and was able to measure the length and velocity of electro-magnetic waves, and to show that in the transverse nature of their vibration, and their susceptibility to refraction and polarisation, they are in complete accordance with the waves of light and heat. Hertz used as a detector of the electric waves, a simple nearly closed circuit of wire, called the "Hertz Resonator" but it was subsequently discovered that the metallic microphone of Hughes was a far more sensitive detector.

1892—Edward Branly devised an appliance for detecting electro-magnetic waves, known as a "coherer." He discovered that these waves had the power of affecting the electric conductivity of materials when in the state of a powder.

1895—G. Marconi's investigations led him to the conclusion that Hertzian waves could be used for telegraphing without wires and he made important experiments at his father's home in Italy.

1896—Mr. Marconi came to England in February and on June 2nd, lodged his application for the first British patent for wireless telegraphy No. 12039, of 1896.

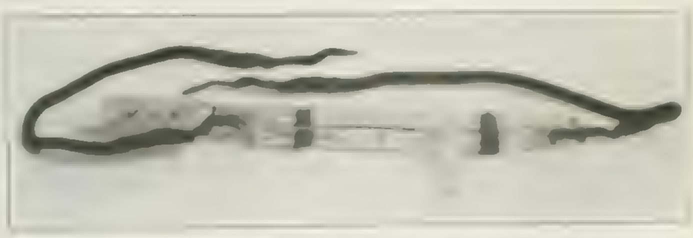
Progress was extremely rapid from 1896 on, as while the apparatus first demonstrated had a range of a few thousand yards, the range was increased to over 2000 miles four years later.

The value of wireless telegraphy was immediately apparent, and was installed on ships of the Royal Navy and Mercantile Marine at an early date. It was successfully used in the South African War in 1900 by both the army and navy. Marconi met with a great deal of opposition in the early days, and several eminent scientists scoffed at the invention, but he continued quietly with his work, receiving very valuable support from Sir William H. Preece, chief electrical engineer of the Post Office, who on December 11th, 1896, lectured on telegraphy without wires, Mr. Marconi conducting the experiments.

In 1900 Marconi was granted the famous "Four sevens" patent which covers the resonant tuning of the primary circuit to the secondary circuit of the transmitter and receiver. This invention, at once made possible the efficient use of high power for long distance working, and was followed in 1905, with his patent for the horizontal directional aerial, marking a further step of great importance in the progress of long distance work.

In 1907 the Transatlantic stations between Glace Bay, Nova Scotia, and Clifden, Ireland were opened for public service. It may be said here, that infringements of Marconi's patents were made as rapidly as they were granted, but in all cases were upheld in the courts and defendants restrained in all instances.

The Germans were rank offenders in this way, the late Professor Slaby who was present, as he said in the interests of science, during experiments conducted by Mr Marconi in May 1897, returned to Germany and lectured on wireless telegraphy, before the German Emperor and Empress at Potsdam in August 1897, and later was instrumental in the formation of the Slaby Arco Co., latterly Telefunken Wireless Co. The German had a very lively appreciation of the value of wireless, and their colonial possessions were all linked up with the headquarters in Berlin.



Marconi Coherer—Early Form of Oscillation Detector.
[illegible]

Read before Montreal Branch, Nov. 13, 1919.

Systems

There are several methods in use to-day for generating electrical oscillations, all of which may be said to have radiated from the original basic patent granted Marconi in 1896. These may be classified as follows:

(*a*) Spark,
(*b*) Poulsen Arc,
(*c*) Dynamic (Alternator),
(*d*) Valve (Thermionic).

Spark System

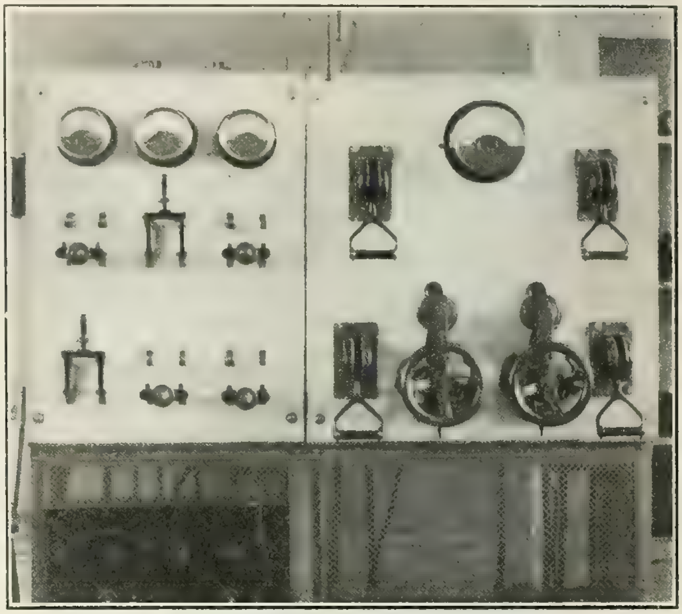
The Marconi spark system is that in general use throughout the world. It depends on the charging, or more usually discharging of a condenser, through an inductance coil. A condenser and inductance coil with a discharge gap forms the high frequency primary circuit of the oscillation transformer. This circuit is connected with a current source, which is in turn controlled by means of a signalling key. The high frequency primary circuit is coupled to the secondary circuit, consisting of an inductance coil and the aerial wires. One end of this circuit is usually grounded. The primary and secondary circuit of the oscillation transformer, are so arranged, that the natural electrical period of each is made equal. When this condition obtains, the two circuits are in resonance, or tune, with each other, at which adjustment the maximum amount of energy is radiated. When the signalling key is depressed the condenser is charged to a pre-arranged valve, which is controlled by the setting of the discharge gap. When this point is reached, the gap discharges the condenser, and oscillatory currents are set up in the inductance, which are in turn induced into the aerial system, and radiated as electro-magnetic waves. The electrical oscillations thus produced, are said to be "damped" for the reason that the train of waves dies down in amplitude due to radiation from, and the resistance of the circuit. An analogy to this is the action of the pendulum being gradually brought to rest, by the damping, due to friction etc. The discharge gap, in general use takes the form of a toothed wheel rotated by a small motor or directly on the alternator shaft. Two electrodes are arranged to coincide with particular teeth on the wheel which results in a musical note being produced in the signals which can be easily read through static interference.

Undamped electric oscillations, or continuous wave, by spark discharge can be produced, and is the method in use at the Marconi Station, Carnarvon Wales, where two transmitters of 300 K.W. each are in operation.

The generation of undamped waves by the spark method is effected by using several of these rotary dischargers in as many oscillating circuits. The dischargers are mounted on the same shaft, insulated from each other, and fixed so that the condensers discharge and recharge in succession, and so that at a given velocity the interval between the beginning of the discharge of one condenser, is equal to the period of oscillation of the aerial or intermediate circuit, or perhaps an exact multiple of the period of oscillation. The resultant of the damped oscillations thus produced, in rotation, gives rise to continuous undamped oscillations.

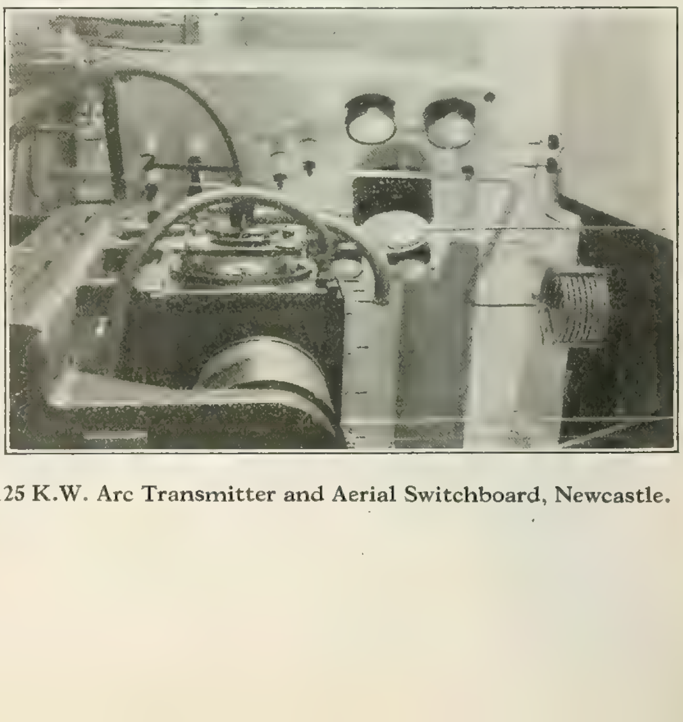
Arc System

The Arc transmitter generates oscillations practically undamped. It was discovered by the late William Duddell that if capacity and inductance was shunted across an arc, electric oscillations were generated, giving a musical note. The action is briefly as follows:

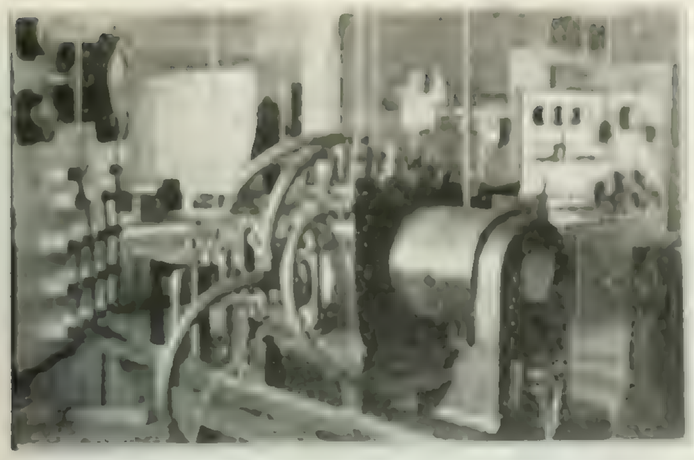


Arc Transmitter Control Switchboard.

Suppose the condenser inductance circuit applied suddenly as shunt to an arc supplied with constant current. The condenser begins to charge, robs the arc of current, the arc voltage therefore rises, and the condenser charges still further. A limit to the voltage is reached when the condenser current stops increasing, for then the steady current through the arc starts increasing, the voltage falls, the current begins to discharge more or less in the time of oscillation determined by the inductance



125 K.W. Arc Transmitter and Aerial Switchboard, Newcastle.



120 K.W. Arc Transmitter, Newcastle

and capacity. The condenser discharge now adds to the steady current through the arc, makes the arc terminal voltage lower than the normal and encourages the motion of the electricity, which goes on till the condenser is fully charged in sign opposite to the last occasion. This action plainly goes indefinitely. It is impossible in the time at my disposal to go into the construction of the arc, but I may say that its operation is extremely simple. At our Newcastle Station, we have two 120 K.W. arcs which are supplied with direct current at from 600-1100 volts. The aerial is connected to one side of the arc, and the ground system to the other. The arc is started on low voltage by striking the electrodes together, separating them and raising the voltage until the maximum current is indicated by the aerial ammeter.

Signalling is effected by short circuiting part of the aerial tuning inductance, usually part of a turn. Tuning is very sharp as the making wave and spacing wave have a difference of 100 metres only. This means that with the signalling key open, the wavelength being radiated is 100 metres longer than the signalling wave with the key closed.

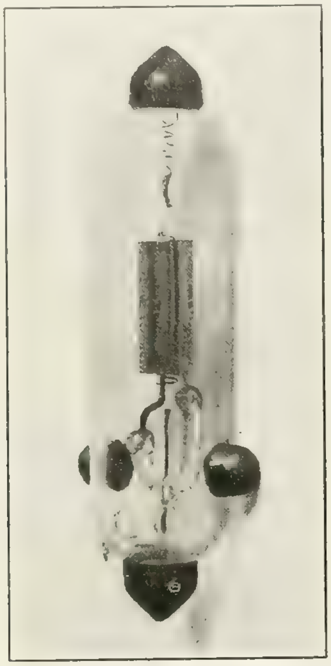
Dynamic Method

This system makes use of a high frequency alternator. Several of these machines have been built. The most successful recently for high power, are those of Alexanderson and Latour. Machines have been built and are in operation, up to 200 K.W. in size. The frequency of these machines is of the order of 20,000 cycles per second corresponding to a wavelength of 15,000 metres. The oscillations are continuous, thus giving undamped waves of constant amplitude. The high frequency machines are connected to the aerial system through an oscillation transformer, and signalling in the case of the Alexanderson Machine is effected by means of a magnetic amplifier, controlling many hundreds of amperes in the aerial circuit, by a comparatively weak current of a few amperes. The Latour alternator is similar in design to the Alexanderson Machine, and signalling is effected by short circuiting the alternator.

Marconi Two Electrode Valve used as [illegible]

Thermionic Vacuum Valve Method

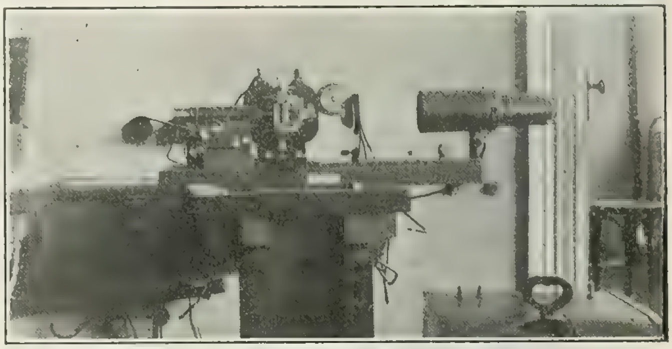
The Thermionic Valve was invented by J. A. Fleming. It consists of a small filament lamp with an additional electrode connected to a metal plate or cylinder, near, or surrounding the filament. When the filament is heated, an E.M.F. applied between the metal plate and either terminal of the filament produces in general, a much larger current from plate to filament through the rarefied gas in the bulb, than in the opposite direction. This phenomenon was noted by Edison many years ago, and was referred to as the Edison effect. It can be seen in an ordinary carbon lamp which has been in service for a considerable time, by the blackening of the inside of the bulb, which is due to electronic emission from the filament. Since the electronic discharge is unidirectional, the thermionic valve is well adapted for use as a rectifier of oscillating currents, and in its original form was used extensively by the Marconi Co. as a detector. An improvement of great value was made by DeForest by the addition of another electrode in the form of a grid, or perforated plate, fixed between the filament and the plate. The result of this improvement was to make the valve an amplifier, as well as a detector. It also functions as a generator of sustained oscillations particularly well adapted for the wireless transmission of speech. I have covered the four methods of generating electrical oscillation in a very brief manner, and may say that the last two, viz. the High Frequency Alternator and the Thermionic Vacuum Valve are the two systems which are to-day being investigated very fully by radio men generally. The High Frequency Alternator is particularly well adapted for long distance wireless telegraph and telephone transmission, and will be followed by the Thermionic Valve Transmitter very soon. The valve receiver has been brought to a high stage of development and efficiency, which may be gathered from the fact that signals from Carnarvon, in Wales, are regularly copied at Sydney, Australia, a distance of 12,000 miles. The receiver uses three valves and the signals are picked up on an aerial 100 feet in length, erected only a few feet above the ground. Wireless sets for aeroplanes are available which permit of telephonic speech or telegraphy at will between plane and plane ground. These sets will be part of the regular equipment of aeroplanes and complete equipment and organization for aeroplane routes is now available. Thermionic Valve Transmitters with a range of 1,000 miles, are also available, and equipment up to 25 K.W. will be ready shortly. Wireless telephones will occupy a field of their own, a particular application being for communication between ships, and possibly rural communities.



Marconi Three Electrode Valve, latest form of Oscillator Detector. (Full size).

Direction Finding

During the War, Direction Finding by Wireless was used extensively, and was directly responsible for many Zeppelin raids being made abortive. A large number of D.F. Stations were erected for the Admiralty by the Marconi Co. in the United Kingdom and Ireland. A constant watch was maintained at these stations, and an enemy submarine sending signals to Headquarters could be accurately located and information given to the destroyer patrol which effected uniformly successful results by depth bombs, etc. Zeppelins depended on land control stations to advise them of their position when on raiding flights, and the D.F. Stations were directly responsible for their defeat by advising the Royal Air Force of their location. Three of these stations were erected in Canada, at Canso, Chebucto Head and Cape Race. These are now used as aids to navigation, and are particularly valuable to ships during fog, the captain being given his position in the majority of cases with absolute accuracy. D.F. equipment for transatlantic flying will enable a true course to be steered day or night, or through fog.



Photographic Recorder at Newcastle.

Static Elimination

The greatest enemy of Wireless is "Static" and its elimination has been the goal sought for by many. Until recently it was impossible, at certain times, to work at all, while certain forms of static obtained. R. A. Weagant, Chief Engineer, of the American Marconi Co. who has been working on the matter for a considerable time, discovered that the most troublesome form of static referred to by those versed in the art as "Grinders" had a vertical component, and it was immediately apparent to him that with a proper arrangement of aerials, these could be cancelled out, which has been accomplished. It has also been discovered that "Static" with a horizontal component has a directional effect with regard to a particular receiving zone. This prevailing direction can be located by means of a loop aerial and the maximum noted, which will be when the plane of the loop is in the plane of direction. The minimum effect will be at right

Wireless Receiving Room, Newcastle.

angles, hence the aerials can be arranged to cancel out such static. Working along somewhat similar lines, we have erected an aerial system at our Transatlantic Receiving Station at Louisburg, N.S. The system in addition to controlling static interference, also eliminates interference from other transmitting stations, both on this Continent and in Europe. The old receiving aerial at this station consisted of a single wire about a half mile in length, supported on six steel masts, 200 feet high, which is now dispensed with. The system now installed permits of Duplex Working, which means simultaneous transmission and reception on both sides of the Atlantic.

High Speed Transmission

Modern conditions make it imperative that traffic be handled rapidly. The average speed of good hand sending is 20 words per minute, which is too slow, and automatic sending is resorted to. This is accomplished over our Transatlantic Circuit as follows: Traffic is punched on tape by means of perforators. The tape is then passed through a Wheatstone Transmitter over connecting lines to the transmitting station, 25 miles away, where it operates the relay and signalling switches. The signals are sent at a rate up to 150 words per minute. These signals are received at Clifden, in Ireland, are amplified by means of Thermionic Valves, and recorded on dictaphones. As the wax cylinders are filled they are removed to a transcribing machine and the signals copied on message blanks by ear. Even this method is found too slow, and special apparatus is now under development which will permit of speeds up to 200 words per minute, but instead of recording on dictaphones, the signals will be translated direct from the wireless circuit to the landline circuit, and from there, taken off on a printing telegraph.

Industrial Relations

By J. S. Cameron, A.M.E.I.C.,

Assistant General Superintendent, Northern Electric Co. Limited, Montreal.

"Industrial Relations" is the term used to describe the relations which exist between employer and employee, other than those directly concerned in carrying out the routine of issuing and fulfilling instructions for productive work.

This is a modern definition, concerning all the human relations which are becoming more and more complex with the growth of industry, and which require special features of organization for handling them.

All of our large industries have grown up from small beginnings, and the success of the business represented by the growth, generally reflects back to the personal supervision of the owner. In most cases the owner dealt directly with each employee and gained a personal knowledge of his problems. On the other hand, the employee could often grasp problems which confronted the business, the solution of which spelled success for himself as well as for his employer.

With the growth of business, however, it becomes increasingly more difficult for the employer to maintain his direct personal contact with his employees. The business situation to-day is such that the men who direct large establishments cannot grow up with the business, and the successful business man will see that his organization, as it expands, is planned so as to maintain the good working relations which he himself created when the business was small.

We therefore find that in large organizations the problems of industrial relations are under the supervision of a distinct branch or department, and it is therefore interesting to trace the growth of an organization to see why this is necessary.

Read before Montreal Branch, March 4, 192[illegible].

The small factory has an internal economy evolved from very small beginnings, and as it grows it is likely to become more thoroughly efficient in some details than in others. It is necessary in building up an executive staff, to delegate certain functions to each of the various officials, the tendency being for the more progressive members to exercise general supervision and become overtaxed by voluntarily assuming new responsibilities when clearly seen. The factory manager has, in addition to the advancement of his product and the improvement of the labor hour efficiency, the task of adjusting the shop routine so as to avoid delay, friction between these officials, and thus maintain the output of his plant.

While the business is small, the manager depends largely on finding suitable men to act as his subordinates, each of whom must perform more than one function and must have some latitude of development, and who is often expected to, and does judge for himself, what he shall do and when he shall do it.

In laying out an organization it is essential that each subordinate should have specific duties within the scope of his ability, and that these duties should be clearly and readily defined. Two types of organizations are generally found — the first being to divide the shop into a number of departments, each of which performs all the operations necessary in the manufacture and assembly of a complete piece of apparatus, the foreman taking care of the hiring and dismissing of their help, setting the wage rates and piece work rates, and often acting as their own inspectors.

The factory organized on this basis will likely have a lack of uniformity in the quality of the product of the various departments, which is difficult to eliminate, and furthermore, a lack of uniformity in the supervision and wages of the employees and their working relations with the foremen.

The second type of organization is based on dividing the work into departments with reference to the class of operations performed. In the manufacturing end the work is divided into departments with reference to the class of mechanical operations performed. In other words, all the drilling is done by one department; all of the milling by a second; all of the woodwork by a third department and so on. In the office end, all of the clerical work is done by one branch, all of the purchasing by a second branch, all of the technical by a third branch and so on. It will therefore be seen that this is a functional type of organization. Each branch has its functions clearly defined, and by this means, dual or overlapping control of one or more departments is avoided. It is to be noted that while this type of organization is far more complex than the first type described, on the other hand it is a logical development to meet the requirements due to growth. It secures uniformity in results, since all of the work belonging to one class is always done by the same department. We therefore find a manufacturing organization divided somewhat along the following lines:

Clerical Branch,
Production Branch,
Manufacturing Branch,
Inspection Branch,
Service and Maintenance Branch,
Industrial Relations Branch.

The functions of the Industrial Relations Branch are:

1. Employment,
2. Training Employees,
3. Wage Systems,
4. Welfare.

Employment Department

The Employment Department is the medium through which the foreman of a department can get the help he requires. The applicant is examined as to his ability, habits, and fitness, and is advised of the rates of pay and conditions under which he is to be employed. Here, the applicant, if otherwise suitable for the position, may be given a physical examination by the Medical Department. This examination is a safeguard to the worker himself and those with whom he has to work. It eliminates undesirables and very often brings to the applicant's attention some physical defects which he can easily have corrected. It is a protection for the employer, where, under Compensation Laws, fraudulent means have been attempted to obtain damages. Lacking a physical examination, the employer has no proof to offer that the defect existed when the man was hired.

Regarding production, it is to the advantage of both that the employee be placed at work for which he is physically suited. The workman may, unknowingly, take jobs which he should really shun.

Candidates who are suffering from contagious diseases or who are manifestly unfit are rejected at once.

A combination of job analysis with medical examination opens the way to placing employees to better advantage, and makes it easier to transfer to other departments those whose health unfits them for the work they are doing.

Indigestion, headaches, neuralgia and other complaints resulting from defective teeth, are reduced in number, thereby reducing tardiness and absence.

Accidents, due to defective hearing and vision are lessened. Claims for injuries received in some previous place of employment can be readily disproved.

Raising the health standards is sure to result in a more efficient, more contended working force. The employee benefits as well as the employer in knowing beforehand whether the applicant is able to do the work without menace to his health.

When an employee satisfies the Employment Department that he can meet the requirements, and after he has passed the physical examination, he is then introduced to the foreman whose acceptance is necessary before the applicant becomes an employee. The foreman therefore becomes the final employer, but he is relieved of the tedious routine of intervewing applicants and can therefore concentrate his attention on the operation of his own department.

Another advantage of centralising employment work in one department is that it is easier to control the requirements, insure equity, and maintain uniform treatment and consideration for applicants, which could not otherwise be obtained. From the contract standpoint, the moral obligation of the employer is greater than the moral obligation of the employee, for, moral responsibility increases in proportion to the opportunity for influence by control. It can generally be said that the employer keeps the employment agreement better than the employee, one reason being that he is financially responsible; another reason is that he appreciates the value of establishing his credit and the value of moral, legal and financial responsibility.

In many plants it is customary for the Employment Department to interview employees who, for any reason, are leaving, and by collecting information in this manner, study the problems so that action can be taken wherever possible to reduce the labor turn-over. Arrangements are made whereby the foreman of any department who is running out of work, can notify the Employment Department in advance that he will have to lay off some of his employees. This means that the Employment Department can often transfer the employees to other departments.

In order to insure fairness to the foreman and the employee in the case of discharging, the employee is very often interviewed by the Employment Department. If, upon investigation, it is simply a matter of personal difference between the foreman and the employee, the employee may be transferred to another department to the satisfaction of all concerned.

Training Employees

The two fundamental elements of production are—materials and men. Engineers with a sound knowledge of science and its application have made great progress in the selection and treatment of materials to meet the developments and requirements for special work, and to-day we find that industries are turning their attention more and more to the training of the men who are going to use the materials.

The introduction of special manufacturing operations requiring the definite planning of manual and machine layouts has necessitated the training of employees who will become adept in such operations, performing it with a minimum loss motion and attaining a high degree of accuracy, quality and economy in manufacture.

This condition is largely due to the increased quantity of manufacture, where large numbers of employees can be kept at work on the same operation continuously. This brings us to the first class of training, namely— that of teaching an employee a specific task—as for example, a machine or bench operation.

We have to-day as formerly, a number of employees who are taught particular trades, such as machinists, toolmakers, etc. In teaching a trade, one of two methods may be employed, the first in having a journeyman or workman teach a boy while at his regular work—the usual practice being to take the boy for three or four hours every week into a class room where he is taught to read drawings, layout work, and solve elementary problems in physics and mechanics. For the most part, these classes are held on company's time, the apprentice being paid his regular wage. The other method which applies to the larger industries, is to have a separate instruction shop which is fully equipped with machinery similar to that used in regular manufacture. For example, the boy is taught how to operate a milling machine, being under the supervision of a man whose sole idea is to teach that boy his trade—not to get a certain amount of work out of him. When he learns to run the milling machine, he is sent out into the shop where he uses his knowledge under the conditions that he will meet when he has finished his apprenticeship; and so on, until at the end of his four years he is thoroughly skilled.

There is a further training or education due to the division of a large industrial organization into separate classes of business. As for example, the commercial branch, which includes the buying, selling, warehousing, transportation, and usually financing. The engineering branch, which controls the design and specifications of the company's products; the manufacturing branch, which covers the handling of raw materials and the production in such quantities as are authorized by the commercial branch and will meet the engineering requirements.

It has been found that the best way to do this is, to teach the business as a whole, the nature and uses of the company's products, the facilities for manufacture and distribution, a knowledge of the machinery required, and a knowledge of organization and personnel. Men trained to meet these requirements may be divided into two general classes; one consists of men who have graduated from schools or universities providing technical and scientific training, the other class consisting of younger men who come from technical or high schools and who desire eventually to become engineers or specialists in some particular branch.

An illustration of this is found in one case where technical graduates who have completed four years of college work, are given a course of intensive training for 26 weeks planned so as to give them an insight into those branches of the company's activities with which they must be familiar before they can intelligently study the problems to which they will be finally assigned. More and more emphasis is being placed on furnishing these men with a broader knowledge of the business than can be gained from experience in a single department, or even a group of departments. It is interesting to note that experience has proven that it is much better to teach and give experience in assembly departments before assigning to work in process departments where the work is done on isolated parts. Considerably less time is required when the employee is given the general knowledge first, than when he is trained by following the complete process through from the raw material to the finish product. Along this line of reasoning, the student is steered to the branch of the business in which he will likely be located.

The work is carried out under the supervision of the educational director, and assignments are made covering the different features of the work, which are laid out in a logical sequence. The student may spend a period of one, two or even four to five weeks on one assignment, depending upon its importance in relation to the course he is taking. He is required to give the educational director a weekly report of the work on which he is engaged, and by means of observation trips and discussions he is able to see how his work fits in with that of other departments. For example, a student taking the engineering course, starts out in the engineering department, working on specifications and drafting. He is then given assignments in the manufacturing departments, following which he is finally assigned to the installation of the apparatus for the customer. In this way he becomes thoroughly conversant with the problems of manufacture and the service expected of the apparatus, so that he will be able to study intelligently his future engineering problems.

The practising engineer of to-day must be more or less of a specialist, and schools of engineering have under consideration specific courses and combined business and technical education. These problems have been outlined in Dean Mitchell's paper "The Future of Applied Science" as printed in The Journal for January of this year. The concensus of opinion seems to indicate that the practising engineer, even though he be a specialist, must have a broad fundamental education, and that by using his college course as a basis, he can build up a knowledge of his speciality. On this basis there will remain ample scope for intensive training by each special branch of industry to meet its own requirements.

Wage Systems

In these times of varying prices and industrial unrest, the factor bearing most directly on the maintenance of satisfactory industrial relations is undoubtedly the question of wage-payment. Each day the newspapers furnish us with fresh details of strikes and lockouts, and the loss in production through these disturbances has, since the signing of the armistice, been colossal. In practically every instance, the chief issue has been one of wages, other demands on the part of organized labor being subordinate to this one. The question as to how labor can be best rewarded has received a great deal of attention during the past thirty years and it is now, more than ever, occupying the time of some of the world's ablest engineers and economists.

Wage systems can be broadly subdivided into three classes as follows:

First — The day work or hourly rate system.
Second—The piece work system.
Third — Bonus systems.

The first of these three systems, the day work or hourly rate system involves the payment of a flat rate per hour, irrespective of the amount of work actually performed. This is the earliest and simplest method of remuneration and is in general use to-day, although modern developments in scientific management are tending to throw it more and more into the background. The disadvantages incidental to the use of day work are obvious. The system is a vague one which rewards all degrees of service alike, neglecting entirely the factor of individual performance and supplying no incentive to workmen to put forth their best effort. The day work system has the general effect of reducing the percentage efficiency of a shop to that of the most inefficient of the workmen.

In the year 1882, the late Dr. Frederick W. Taylor, at that time a machine-shop foreman in the employ of the Midvale Steel Company, entered the arena of industrial management. Dr. Taylor starting as a machinist, and passing successively through the grades of gang boss and shop foreman, had been given abundant opportunity to see at first hand, the evils of both the day work and the existent piece work systems and with that genius which later gave us high speed steel and our modern system of scientific management, he invented a remedy. He had early recognized the fact that piece work rates were not equitable owing first to an absolute lack of standardized working conditions and secondly to a similar absence of any reliable information on the output possibilities of manufacturing operations;—also that no attempt was made to instruct or train workmen in the performance of their individual tasks. So he adopted the expedient of analyzing operations into their component sub-operations, and by means of a decimally graduated stop watch, establishing the shortest possible time in which these sub-operations could be performed consistently with the turning out of good work. When sufficient time-observations had been taken to satisfactorily establish a standard time for the performance of the operation, an instruction-card was prepared which set forth in a clear and concise manner, not only the sub-operations, which the workman would be called upon to perform together with their corresponding standard times, but also any additional information relative to the mechanical or physical conditions surrounding their performance. This instruction card was then used for the purpose of training the workman to do his work in the best and fastest way. With the operations thus standardized and after a suitable allowance had been made to cover fatigue, differential piece work rates were estimated in such a way that if the workman followed the instructions set forth and accomplished his task in the stipulated time, he received an increase of from twenty to one hundred percent over his normal hourly rating, this percentage depending on the nature and difficulty of the job. If he did not quite accomplish his task in the standard time he received a somewhat lower piece work rate, and if he failed by a large margin, he incurred a penalty. By this invention of the time-study, Dr. Taylor created a new field of industrial investigation which has greatly benefited both the employer and employee, through largely increased output on one hand and largely increased earnings on the other.

The third and last method of wage-payment is the bonus plan which is usually used in combination with and in addition to the day work system. It might be well at this point, to establish clearly the difference between the terms "piece work rates" and "bonus", as the significance of these terms is sometimes confused. A piece work rate is a fixed amount paid per unit of output, under which circumstance the workman either gains or loses, depending on the efficiency of his performance. A bonus implies the payment to an efficient workman, of something in addition to his normal day work rate, the latter being assured to him irrespective of the amount of his output. A bonus system is therefore somewhat milder than the piece work system, which, when rigidly enforced, contains elements of severity.

The most successful application of the bonus plan of wage payment will probably be found in the "Task and Bonus System" invented by the late H. L. Gantt while assisting Dr. Taylor in the re-organization of the Bethlehem Steel Company. In principle, this system seems identical with the Taylor System of differential piece work, but in application, the assured day work rate places it in an entirely different category. In a manner similar to the Taylor system, task work with bonus is only applied after careful time study, and the preparation of standard instruction cards. When the best method of performing the operation has been thus determined and standardized, a bonus is paid to the workman for accomplishing his task in the stipulated time.

One company, in formulating wage systems throughout the factory, has endeavoured to adopt whatever seemed best in both the Taylor and Gantt plans. The day work system is used only where for some reason Piece Work cannot be applied as in the case of intermittent operations which are not of the "repeat" type. All operations before being placed on the piece work basis are made the subject of a careful time study and are thoroughly standardized, the rest factor being provided for by means of a fatigue allowance. A Piece Work Rate is then estimated in such a way that the workman can, if efficient, earn a substantial increase over his nominal day work rate. These details, as will be noted, are all features of the Taylor system. If, however, the workman's piece work earnings fall below what he could earn if working on the day work basis, he is given his day work rate, the system at this point assuming the character of Mr. Gantt's task and bonus plan. Operators trained under this system have rarely failed to accomplish their tasks in the time allowed. The piece work rates are so estimated that the operator receives his additional reward for the efficient performance of a reasonable day's work without excessive or hurtful exertion on his part. If, after a fair trial, a workman proves that he is incapable of performing an operation, he is transferred to more suitable work.

Plate 1
Time Study Form—front

The accompanying time study sheet illustrates the manner in which operations are analyzed and stop watch readings noted. The operation in question consists of the braiding of glazed cotton insulation about the outer surface of commutator cords by a girl running two braiding machines. The component sub-operations are shown with corresponding stop watch readings, the latter being taken in cycle, that is, with the stop watch running. When sufficient readings have been taken these are averaged, all unnecessary or waste time substracted, and the operation finally reconstructed on the basis of how long its performance should take. In this instance it has been found that a girl can give from two braiders, an output of 66 cords per hour. The application of an

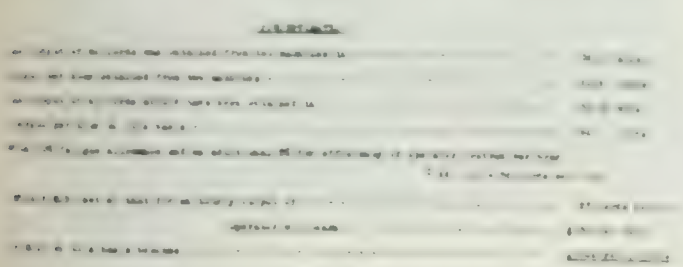


Plate 2
Time Study Form—back

allowance of ten percent to cover fatigue, and an addition of five percent to cover the fact that the girl under observation was above the average in efficiency, reduces this figure to 57 cords per hour for which the operator is paid at the rate of 4.230 Per C-Cords. If the same output at this rate, her earnings will be 19.1% more than if she were working on the day work basis.

The plan described has been found applicable to almost any type of factory work. It presupposes, however, the fact that there is a sufficient volume of standardized work to keep workmen employed steadily.

Plate 3
Instruction Card for window washing

The accompanying duplicate of an instruction card will make clear the manner in wheih the details of operations are set forth for the instruction and guidance of workman. The operation in question is of the simpler type, consisting of washing a certain standard size of factory window, these windows being found in all parts of the factory. The equipment and materials which the workman will use are first listed. Following are all the steps in the operation, these arranged in the order of their performance. The length of time allowed and the piece work rate are finally included. These instruction cards are prepared wherever their application is considered desirable and are then given to the department foreman who uses them for the purpose of training the workman to perform his task in the shortest time and in the most efficient way.

Welfare Work

Welfare work may be defined as anything pertaining to the comfort and improvement, intellectual or social, of the employees, separate and apart from the wages paid, in excess of the necessities of the industry and the requirements by law.

It is difficult to trace the development of welfare work, in as much as the very nature of certain industries necessitated first aid cabinets being located throughout the plant, or even emergency hospitals for treatment in cases of accident. This in turn led to work on prevention of accidents, the success of which turned the attention of industries to the conservation of health. Within the last ten or twelve years, the development has been rapid, and to-day we find that sanitation, good lighting, ventilation, elimination of injurious dust and gases, rest rooms for female employees, lunch rooms, drinking water systems, locker facilities, etc. are all considered as problem of welfare work.

The healthy worker is the contented worker, and the employer realizes that it is necessary to maintain the health of the employee in order to avoid lost time and inefficiency. As a matter of fact, it is difficult to estimate the exact saving to the employer through the resulting decrease in labor turn over, but we have the general experiences of industries in the United States where reductions of 10% to 15% are common in cases of employees of more than two years service. Furthermore, large reductions have been made in time lost in all cases where welfare work has been carried on consistently.

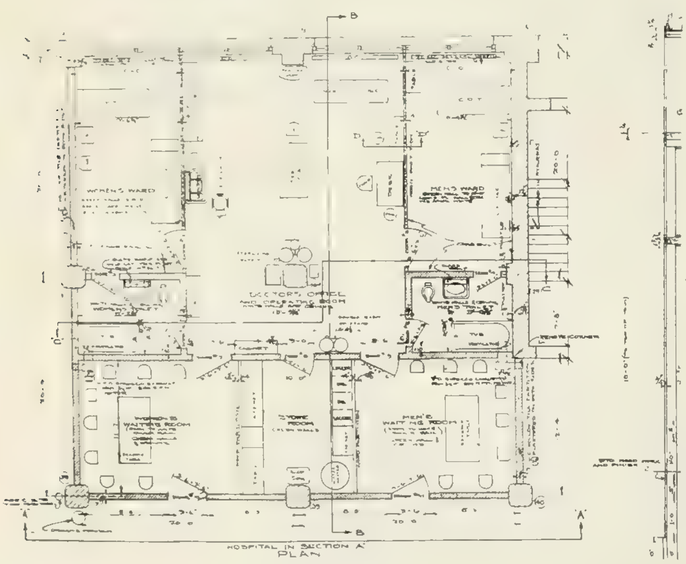

Plate 4
Plan of hospital for industrial establishment, with separate waiting room, ward and toilet rooms for men and women, and a general store room, doctor's office and operating room.

Welfare work has often times failed because the earlier efforts were paternalistic. Recent advancement is largely due to the fact that the work has been promoted by industrial men themselves; men who have risen from the ranks and who therefore understand the requirements and the solutions of the various problems encountered. In practically every industry where large reductions have been made in accidents, the results have been made possible by an organized effort which has included the active participation and co-operation of the worker. Intelligent co-operation in this manner brings the foremen and officials into closer relationship and strengthens the organization as a whole.

In view of the Workmen's Compensation Acts which are now being enforced, it is becoming more and more essential that employers promote any work which has for its object, the prevention of accidents. The employer pays in the long run for accidents, whether the claim is settled directly or indirectly through Employers' Liability Insurance.

Plate 5
View of office and operating room as shown on plan No. 4.

Red Cross work, rest rooms, lunch rooms, etc. are generally under the immediate direction of the employer. On the other hand, athletic and other features of recreation which receive financial support from the Company, are generally under the direction of the employees. As the extent of welfare activities increases, employees can, by experience, take more and more active part in its administration.

The work has not as yet become standardized, and the extent to which it is carried on depends largely on the location and nature of the industry. Many of our large paper industries, in order to get and maintain a desirable class of employees, have promoted facilities for outdoor recreation, housing and town planning.

Two of the most common and often the most difficult problems in industrial welfare are the installation and maintenance of satisfactory lighting systems, both natural and artificial, and proper ventilation which includes the removal of dust and fumes.

Poor lighting impairs the vision, and it unfortunately does so in a gradual way that it may take several years before the affected person becomes aware of it. Dim illumination, flickering light, sharp shadows and glare from bright lamps or highly polished surface within the range of vision are harmful. Experience has proven that accidents occur more frequently in plants with poor lighting than in similar plants well illuminated. Futhermore, better lighting increases production.

The standardization of illumination necessary for satisfactory results in production calls for knowledge based not only on the physical limitations of vision, but also on the character of work handled, and the speed of production involved.

The three essentials of lighting are :—

1. Efficiency.
2. Continuity.
3. Diffusion.

In the case of daylight illumination, these essentials are dependent upon:

(a) Adequate window area.
(b) Means of reducing the intensity of direct sunlight.
(c) Supplementary lighting equipment for especially dark days and towards the close of winter days.
(d) Interior wall and ceiling colouring as light as is practicable, and of a dull finish.

The problem of artificial illumination is not so much the design of lighting apparatus as it is the selection and location of lighting units in order to eliminate discomfort to the worker. Good general illumination tends to insure cleanliness and neatness throughout the plant. Walls and ceilings when painted in light flat colors are preferable to dark glossy finishes; the former diffuse the light, while the latter by reflection cause a glare. This glare may create the impression that the source of light is too powerful, whereas it may be too weak.

Plate 6
Single lighting units with diffusing reflectors above range of vision for machine lighting layout and four-light clusters for general illumination.

Where systems of individual machine lighting and bench lighting are used, the lamps should be of low intensity, shaded in such manner that the light is directed on the work. For this purpose low voltage lamps, such as used in standard train lighting equipment, of 24 watts have been found very satisfactory, especially as the filament of the low voltage lamp is heavier and therefore able to withstand vibration better than the standard 100 volt lamps.

Air cooled transformers of 300 watt capacity are mounted on a column close to the machines. These transformers can be moved as readily as the wiring of the lighting system and therefore form very compact units.

High ceilings permit the use of large and highly intensive lights spaced widely apart. When ceilings are low, small units closely spaced are required in order to obtain proper diffusion and to avoid intense glare.

Plate 7
Semi-indirect illumination for drafting room and office work.

The requirements for different classes of work have been found to be one-half to two ft. candles for aisles, passageways, etc., four to ten ft. candles for general office work, etc., eight to ten ft. candles on drafting tables.

It is preferable wherever possible to make trial installations, and if possible, use a portable photometer. When by moving the lights a certain arrangement is found satisfactory, plans can then be made for the permanent installation, and any future extensions can be checked on the power consumption in watts per square foot for the particular class required.

Emergency lights should be distributed in the main aisles, stairways, passageways and exits. These lights to be arranged so as to insure their reliable operation when, through accident or other cause, the regular lighting is extinguished. Pilot or night lights have been found essential for the use of watchmen in large plants, in which case the switching arrangement is arranged so that lights may be turned on and off at points of entrance.

Additional precautions are sometimes taken in power plants to provide coal oil lanterns ready for use, mounted on brackets so as to be accessible in case of interrupted service.

Ventilation of Workrooms

Regarding ventilation, fresh air is the prime requisite for conservation of physical energy. Whether the functions of the body during the normal working period shall be permitted to replace the broken down tissue, caused by the steady draining of reversed vital force, depends upon the quality and quantity of the pure air that prevents the poisons of fatigue from accumulating.

In an 8 hour day the worker breathes from 250 to 350 cubic feet, according to the degree of his muscular exertion. The air should never be allowed to stagnate, however ample the dimensions of the workroom, and it is generally agreed that the amount of fresh air to be supplied per hour should be in the neighbourhood of 1800 cubic feet per employee.

The ordinary plant does not require a costly ventilating installation. The great essential is to maintain in any workroom, a satisfactory balance between the air drawn from the room and the fresh air admitted to take its place. One solution of this problem is to have the inlet openings about three times the area of the outlet openings, in which case they should be uniformly distributed and air admitted over warm steam coils in order to avoid objectionable drafts.

Dangers of Dust and Fumes

Regarding the dangers from dust and fumes to the health of employees, the relative importance of clean air can be shown by the division of occupational diseases into the following classes:—

1. Diseases due to gases, vapors and high temperature.
2. Diseases due to increased or decreased atmospheric pressure.
3. Diseases due to metallic poisons, dust or fumes.
4. Diseases due to organic or inorganic dust and heated atmosphere.
5. Diseases due to fatigue.

The presence of animal, vegetable, metallic or mineral dusts in the air of the workroom is a menace to the vitality of the worker. A dusty workroom inevitably lowers the standards of shop discipline and of output, and induces chronic intemperance, due to thirst engendered by congestion of the mucous membrane of the throat.

It is therefore essential in such cases to instal exhaust systems, the general practice being to use exhaust fans directly connected to electric motors. Recently some very ingenious installations in this connection have been made, whereby the exhaust fan is by-passed in such a way that it creates a draft of air across the source of the fumes or vapors to direct these into the mouth of the inlet.

Summary

Summing up, the object is to establish definite relations of employment, and by means of training, to produce a better class of workmen; by education of the foreman, to raise his ideals to the level of the ideal of the general management. If the manager can win the confidence of the foreman, the foreman will usually win the confidence of the worker.

Attention to these points, with adequate compensation for services rendered and provision for cheerful and healthy places to work, will go a long way to maintain the management of human relations in industrial plants.

CHANGES OF ADDRESS

Owing to the fact that the firm which has been handling our stencils has removed its agency from Montreal, there may be delay in recording changes of address in connection with this number of the journal.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. May 1920 No. 5

Notable Engineering Conference

Although embodied in the changes which took place in The Institute three years ago whereby the name and many phases of the Constitution were changed, and it is specifically mentioned in the broadened objects that The Institute declares to promote the professional interests of the members, there has been considerable uncertainty as to what this might or might not mean. To some it was believed to be dependent upon personal interpretation. By others it was declared that it was just so many words with no direct effort behind them. Despite the fact that last year's Council declared that service to individuals was an outstanding feature of The Institute's work a large number of members feel that more might have been accomplished for the individual, not knowing or realizing the difficulties encountered.

When the Council of The Institute appointed a Committee on Civil Service Classification to assist the engineers employed by the Federal Government in securing more adequate remuneration and status a clear trail was blazed on behalf of the individual, the purport of which should not be misunderstood. It meant that for the first time in the history of a purely professional organization an active concerted effort had been made to advance the material welfare of a section of its membership, and established a definite policy by The Institute from which it was never intended to recede.

During last year salary schedules and salary considerations have been considered before the various Branches, and have been discussed by the Council of The Institute. In spite of this it has been maintained by some that The Institute has no declared policy in respect to advancing the material welfare of its members.

In order that there should be no further misunderstanding on this subject, and in order that as full an expression of opinion as possible should be received from the members of Council who do not always find it possible to attend the meetings, a special Conference was called and was held in Montreal on Tuesday, April 13th, which lasted all day. At this Conference were present: President R. A. Ross in the chair; the Executive Committee of the Council, Vice-President Walter J. Francis, Councillors Brig.-Gen. Sir Alex. Bertram, Professor Ernest Brown, Arthur Surveyer, Frederick B. Brown, and H. H. Vaughan; Vice President Brig.-Gen. C. H. Mitchell; Councillors A. H. Harkness and Professor Peter Gillespie, Toronto, E. R. Gray, Hamilton, H. B. R. Craig, Windsor, (also Chairman of the Ontario Provincial Division), A. C. D. Blanchard, Niagara Falls, J. B. Challies, Ottawa, and the Chairman of the Toronto Branch R. O. Wynne-Roberts, and A. B. Lambe, Secretary of the Ontario Provincial Division. Councillor A. R. Decary also attended part of the sessions.

While there were many items on the agenda for this meeting the most important was a discussion of the existing situation whereby it is necessary for The Institute to be of greater assistance to its members, and a discussion of ways and means as to how this can best be accomplished. Every member present took part in the discussion and there was unanimity of opinion to the effect that The Institute declare its policy and plan a definite programme along the line of membership welfare promotion. On motion by H. H. Vaughan, seconded by Brig.-Gen. Mitchell the following resolution was carried unanimously:

> "That whereas this Conference of members of Council residing in Montreal and members and others of the Province of Ontario has been called by the request of Council for the purpose of offering an opportunity for the discussion of the policy to be pursued by The Institute.

Be it therefore resolved:—

That in addition to the Committee on Remuneration of Engineers already appointed by Council, a further Committee on Policy should be appointed to prepare for the consideration of Council a statement of the policies and objects of The Institute.

Further that the Council authorize this Committee on Policy to include in its statement the Council's approval of establishing by The Institute of rates of remuneration for its members both by fee and by salary, which rates The Institute will endeavour to uphold.

This resolution will come before Council for ratification at the end of the month of April.

It was further resolved at this Conference that Junior engineers should be included in the personnel on the Committee on Remuneration of Engineers. It was also decided to recommend that the constitution be amended so that Juniors should vote at Branch meetings and hold office except that of Chairman. The policy of The Institute in regard to organized labor was discussed and referred to the Committee on Policy for consideration. The part The Institute should play in developing engineers for highway construction was also brought up. It was felt that The Institute should play an important part in this matter, and the Secretary was instructed to receive suggestions to bring before Council.

A number of other matters were discussed. When the meeting was brought to a close it was felt that the Conference marked a notable step in the history of the affairs of the engineering profession in Canada.

The decision to include as a stated policy of The Institute the establishment by The Institute of rates of remuneration for its members both by fee and by salary with the influence of The Institute behind such schedules, is an open declaration that the profession as represented by The Engineering Institute of Canada pledges itself to a definite plan of promoting the material welfare of its members.

The regular meeting of Council held on April 27th, endorsed in full the resolutions of the special conference. A Committee on Policy was appointed as follows: J. B. Challies M.E.I.C., Ottawa, Chairman; A. R. Decary M.E.I.C., Quebec; Brig-Gen. C. H. Mitchell M.E.I.C., Toronto; Walter J. Francis M.E.I.C., Montreal; K. H. Smith M.E.I.C., Halifax; J. G. Sullivan M.E.I.C., Winnipeg; A. E. Foreman M.E.I.C., Victoria—with power to add thereto, having regard to geographical location.

A. H. Harkness, M.E.I.C., was appointed Chairman of the Committee on Remuneration, it being intended that this committee should include younger members of The Institute.

The Journal's Second Anniversary

With this issue *The Journal of The Engineering Institute* starts the third year of its history. While *The Journal* was inaugurated with misgivings in the minds of some, it has demonstrated in the short period of its existence that it fills a place in the professional life of the members of *The Institute* that not only justifies its establishment and its continuation, but which makes it an intimate personal entity with every member of *The Institute* interested in the welfare of the profession.

Today, no active member of *The Institute* would agree to or tolerate a proposal to discontinue its publication. In its two years it has become the centre around which the activities of the whole *Institute* from coast to coast have revolved, and during that time, backed up as it is by the Council of *The Institute*, by every Branch and Provincial Division, and by every individual member, it has reached a position that under ordinary circumstances would have required a period of a generation or more to attain. The proof of the position it occupies is evidenced by the enthusiastic interest that the members everywhere are taking in its welfare.

The Journal, reflecting as it does the welfare of the engineering profession and being the property of the members thereof, occupies a remarkable position in respect to promoting the profession's welfare, and its objects as published on the front cover are the objects of *The Institute*. It has taken some time for a few of the members, although it was early established in the minds of most, to realize just how great an advantage the profession in this country possesses in its monthly publication.

It is an asset of no small amount, the value of which is shared by every member. Every member can assist in increasing its value both to himself and to the profession by emphasizing to others the high place it occupies in the life of the engineering profession in this country. A year ago the advertising revenue of *The Journal* was practically equal to the printing cost. During the year the cost of production increased very largely both from the viewpoint of overhead expense and printing. The diversity of the activities of *The Institute* last year made it difficult to give *The Journal* the attention it deserved and consequently there was no increase in revenue. Although printing costs have increased again this year, it is a pleasure to announce to the members that *The Journal* is in a much better financial position than it was a year ago. With the strong loyal sentiment growing up on behalf of *The Journal* everywhere, which is strengthening it in no small degree, it is anticipated that before the end of the year *The Journal* will be in a highly flourishing condition. The influence of every member however is needed in this connection.

Commencing with this issue every Branch will receive an allowance for Branch News, which will assist in the Branch finances. It is anticipated that a further arrangement may be made later which will be of still greater benefit to the financial affairs of all the Branches of *The Institute*.

Let no member lose sight of the fact that he is a shareholder in *The Journal of The Engineering Institute of Canada*, and that all the support and influence he gives in its behalf will react directly to his own benefit.

Professional Engineering Acts

Elsewhere in this issue are being published the professional engineering acts of British Columbia and Manitoba both of which have become law. In New Brunswick and Nova Scotia it is expected that during the present sessions of the Legislative Assembly, other professional engineering acts will have been passed, and the Alberta Act has been passed recently. In Quebec as has already been announced, there has been established the corporation of professional engineers. In Ontario the matter of arriving at an acceptable Bill is in the hands of an Advisory Conference Committee established by the suggestion of the Ontario Provincial Division. In Saskatchewan changes were suggested by the Premier which caused the Bill to be withdrawn. The success attending the Bill in British Columbia and Manitoba will no doubt have a beneficial effect on Saskatchewan legislation.

Meeting of the Canadian Engineering Standards Association

A meeting of the Main Committee of this Association was held at Ottawa on April 12th, Sir John Kennedy, Hon. M.E.I.C., in the Chair, when a number of items of interest were dealt with.

The General Specification for Steel Railway Bridges submitted to the Main Committee by the Sectional Committee on Steel Bridges and Construction, was approved for publication. This specification, the essential provisions of which are fortunately in general agreement with the practice of the American Railway Engineering Association, is not drawn up with any intention of limiting the choice of the engineer as to type of bridge, but is so framed as to indicate definite methods of work for the designer, detailer, and manufacturer, with a view of thus obtaining uniform results as regards strength and utility.

The Specification, as now approved, is based on that published in draft form in 1918 by *The Engineering Institute of Canada*, and drawn up by a Committee of that Institute under the chairmanship of P. B. Motley, M.E.I.C., Engineer of Bridges, Canadian Pacific Railway Company. The work of the C.E.S.A. upon it was undertaken at the request of *The Engineering Institute of Canada*.

It is announced that Sub-Committees have been appointed for the purpose of drafting general specifications for guidance in the purchase of Wire Rope, both for Mining purposes, and for dredging and steam shovel work. The former Sub-Committee is under the Chairmanship of F. H. Sutherland, Inspector of Mines of Ontario, and the Chairman of the latter is K. M. Cameron, A.M.E.I.C., Department of Public Works, Ottawa.

A report from the Chairman of the Sub-Committee on Telegraph and Telephone Wire, W. J. Duckworth, of the Great North Western Telegraph Co., Toronto, stated that a specification for two standard grades of this material had been drafted and was now being considered and amended by the Sub-Committee.

J. G. Morrow, Steel Company of Canada, Hamilton, Chairman of the Sectional Committee on Steel, reported that a Special Committee had commenced work with a view of coordinating the numberous specifications for material for carbon steel forgings now being worked to in Canada, and if possible establishing the characteristics of a comparatively small number of grades of steel which could be used to fill those specifications.

It was decided to instruct a Special Committee, under the Chairmanship of E. G. Burr, A.M.E.I.C., Consulting Engineer, Montreal, to proceed with an enquiry into the desirability and possibility of framing a Canadian National Electrical Code. It was pointed out that such a document, so far as hazard to life is conserned, has been drawn up in the United States under the auspices of the Bureau of Standards, while fire hazard has been dealt with the rules of the National Board of Fire Underwriters. The Sub-Committee is to consider the measures to be taken should it be thought advisable to draft a Canadian Code for covering these subjects for wide acceptance in the Dominion.

A communication was read from the Council of *The Engineering Institute of Canada* requesting the Association to deal with a number of the specifications of *The Institute*, considering and revising them if thought necessary, as has already been done in the case of the Specification for Steel Railway Bridges. It was decided to take up first *The Engineering Institute of Canada* Specifications for Steel Highway Bridges and for Cement, and to organize suitable committees to report upon them.

It was announced that the Air Board had approved of the Canadian Engineering Standards Association, through its Sectional Committee on Aircraft Parts, as the body through which Canada is to be represented on the International Aircraft Standards Commission. This action was welcomed by the Committee and it was pointed out that the approval of the Air Board gave official recognition to the work which has already been accomplished by Canadian representatives at meetings of the Commission.

The International Aircraft Standards Commission was organized in 1917, primarily as a war measure, with the object of obtaining, as far as may be, international agreement regarding materials for aircraft as well as details of aircraft construction and equipment. It is, for example, obviously desirable that aero engine magnetos made in different countries should be built within certain limits of overall dimensions and should conform to general specifications which would enable a French magneto to be used in an emergency on a British machine finding itself in difficulties in France. The Commission has already made gratifying progress, although it is unfortunate that the United States has so far been unable to appoint a committee to take part in its work. The countries now active on the Commission are Great Britain, France, Italy and Canada.

A grant of £200 towards the funds of the Association was announced from the British Engineering Standards Association and the Secretary reported that he now had in stock a supply of almost all of the publications of the B.E.S.A., which are available for distribution at a nominal charge.

A communication was read from the American Engineering Standards Committee, advising that in the opinion of the A.E.S.C. co-operation between that body and the C.E.S.A. should be provided for by the interchange of Minutes of the Meetings of the respective Main Committees, so that joint action could be arranged for, wherever necessary. The Committee heartily concurred in this suggestion, which will be adopted in future, and the hope was expressed that many opportunities for co-operation would present themselves.

AN ACT TO INCORPORATE THE ASSOCIATION OF PROFESSIONAL ENGINEERS OF THE PROVINCE OF BRITISH COLUMBIA

BRITISH COLUMBIA

The Association of Professional Engineers of the Province of British Columbia.

3. (a) All persons registered as Professional Engineers under the provisions of this Act are hereby constituted "The Association of Professional Engineers of the Province of British Columbia," and shall be a body politic and corporate, with perpetual succession and a common seal;

(b) The head office of the Association shall be at Vancouver, British Columbia.

4. The Association shall have power to acquire and hold real property not producing at any time an annual income in excess of ten thousand dollars, and personal property, and to alienate. mortgage, lease or otherwise charge or dispose of the same of any part thereof as occasion may require, and to sue and be sued.

5. The Association may pass by-laws not inconsistent with the provisions of this Act, regarding:

(a) The election of the Executive Council of the Association;

(b) The government, discipline and honour of the Members;

(c) The maintenance of the Association and the management of its property;

(d) The fixing of an annual fee not in excess of fifteen dollars, and other fees;

(e) The levying, remission and collecting of annual and other fees;

(f) The examination and admission of candidates to the study and practice of Professional Engineering;

(g) The calling and conduct of meetings, voting, quorum and general business, banking, borrowing and credits;

(h) All other purposes reasonably necessary for the management of the Association.

6. (a) All by-laws or amendments thereto shall become effective only after ratification by two-thirds majority of the votes received from the Members of the Association in good standing at a meeting duly convened. The Registrar shall file with the Lieutenant-Governor in Council a copy of each by-law or any amendment thereto, immediately the same is ratified, certified under the seal of the Association as a true copy;

(b) Notwithstanding anything in this Act contained, any by-law may be disallowed by the Lieutenant-Governor in Council.

Who May Practice.

7. (a) Only such persons who are Members of the Association and registered as such under the provisions of this Act, or who have received a License from the Council of the Association as hereinafter provided. shall be entitled within the Province of British Columbia to take and use the title of "Professional Engineer," or any abbreviation thereof, or to engage in the Practice of "Professional Engineering";

(b) Any person residing in the Province of British Columbia at the date of the passing of this Act, who is at that date, and has been for five years previously practising Professional Engineering as defined in Sub-section (b) of Section 2, shall be entitled to be duly registered as a Member of the Association without examination; provided that such person shall produce to the Council, on or before the first day of April, 1921, satisfactory credentials of his qualifications;

(c) Engineers who were practising previous to the late war and who were accepted for services in the forces of the British Empire, or any of its Allies, shall be entitled to all the rights and privileges confered under Sub-section (b) of this Section;

(d) Any person who may hereafter come to the Province of British Columbia, and who shall produce to the Council a satisfactory certificate signed by the proper officers evidencing the fact that he is a duly registered member in good standing of an Association of Engineers in another Province in the Dominion of Canada, having equivalent standards of qualification for membership to this Association, together with an application for registration in this Association endorsed by the Registrar of such other Association, may become a duly Registered Member of the Association without the payment of the annual fee for the year in which he joins, but shall pay a fee of five dollars for such registration;

MANITOBA

(d) The examination and admission of candidates to the study and practice of the profession;

(e) All other purposes reasonably necessary for the management of the association.

6. Ratification of By-laws

All by-laws or amendments thereto shall become effective only after ratification by two-thirds majority of the votes cast by the members of the association in good standing.

7. Who May Practise

(1) Only such persons who are members of the association hereby incorporated and registered as such under the provisions of this Act, or who have received a license from the council of the association as hereinafter provided, shall be entitled, within the Province of Manitoba, to take and use the title of "professional engineer" or any abbreviation thereof, or to practise as a "professional engineer" or act as engineer in laying, advising on, constructing or superintending the construction of any railway or public work or any work upon which public money is expended, the cost of which is in excess of one thousand dollars.

(2) Any person residing in the Province of Manitoba at the date of the passing of this Act, who is at that date and has been for one year previously practising as a professional engineer, shall be entitled to be duly registered as a member of the association without examination, provided that such person shall produce to the Council satisfactory proof of having so practised.

(3) Any person who may come to reside in the Province of Manitoba. and who at that time is a duly registered member of an association of engineers similarly constituted of any other province of the Dominion of Canada, may become a duly registered member of the association without payment of fee for that year, if he shall produce to the council a certificate of membership in good standing in such province, and an application for transfer of registry endorsed by the registrar of the province in which he lately resided.

(4) Any person not otherwise qualified as hereinbefore mentioned, and who may desire to become a registered member of the association, shall make application to the council, and shall submit to an examination, or shall submit credentials in lieu of examination, whichever the council may decide, and shall be admitted to registry as a member of the association on payment of prescribed fees after the council shall have certified in writing that such examination or credentials have been found satisfactory to it.

(5) Any person not residing in the Province of Manitoba who is a registered member of an association of engineers similarly constituted of any other province of the Dominion of Canada, may obtain from the registrar a license to practise as a professional engineer in the Province of Manitoba, upon production of evidence of his registry in such other province, and upon payment of a fee of one dollar. In the event of such person being unable by reason of emergency or neglect on the part of the registrar, or for any good and sufficient reason, to obtain such license within three months of his making application therefor, he shall be entitled to practise as a professional engineer in the province for such period of three months without holding such license.

(6) Any person who is not a resident of Canada, but who is a member of any engineering or technical organization or society of standing, recognized by the council, may obtain a license to practise his profession in an advisory or consultative capacity.

(7) Any person who is employed as a professional engineer by a public service corporation, a private corporation, public utility or government department, whose business is normally carried on in two or more of the provinces of Canada, and who is by reason of his employment required to practise as a professional engineer in other provinces other than that of his residence, may so practise in the Province of Manitoba, without holding a non-resident license, or payment of fee, if on demand of council, he produces credentials satisfactory to the council showing that he is a registered member of an association of engineers similarly constituted by some other province of Canada.

BRITISH COLUMBIA

(h) The Secretary of the Association shall, on his assumption of office, lodge in the hands of the President of the Council a bond for one thousand dollars in some bonding company satisfactory to the Council. All the expenses arising from the furnishing of such bond shall be borne by the Association;

(i) In case of the resignation or death of any member or members of the Council, the other members of the Council shall have power to fill all vacancies so caused until the time of the holding of the next annual meeting; provided the said annual meeting is not to be held within a period of three months after the occurrence of such vacancy or vacancies.

Examinations.

10. (a) The Council shall appoint annually a Board of Examiners for each branch of Engineering as set out in Section 2, Sub-section (b), and shall fill the vacancies in the same as they occur;

(b) The duties of the Board shall be to examine all candidates for admission to membership by examination. As soon as possible, and not later than 21 days after the close of each examination, the members of the Board who shall have conducted such examination, shall make and file with the Secretary a certificate showing the results of such examination, whereupon the Council shall notify each candidate of the result of the examination and of their decision upon his application. The members of the Board shall also file with the Secretary the examination papers submitted to each and every candidate, together with the answers of the respective candidates thereto, and shall attach thereto a certified copy of their report, with the marks awarded to each candidate in each subject of such examination, and such documents shall remain on file in the office of the Registrar, and shall be open to inspection by any of the said candidates, or by any person duly authorized in writing on their behalf, during regular office hours for a period of at least six months following the examination.

11. (a) Regular examinations of candidates for registration or license shall be held at Vancouver, or such other place or places as the Council may direct, beginning on the last Monday in the months of February and November in every year, unless such Monday be a holiday, in which case they shall begin on the next ensuing day not being a holiday;

(b) Special examinations may be granted, provided the candidate or candidates for such special examination deposit in advance with the Registrar a sum sufficient to defray the expenses of such examination and the prescribed examination fees. Any balance remaining over shall be returned to such candidate or candidates;

(c) The scope of the examinations and the methods of procedure shall be prescribed by the Council, with special reference to the applicant's ability to design and supervise works which shall ensure the safety of life and property;

(d) The candidate shall submit to examination before the Board in one or more of the recognized branches of engineering, such branch or branches to be selected by the candidate;

(e) Every candidate for examination shall give at least one month's notice in writing to the Secretary of his intention to present himself for examination, and with such notice shall forward a fee of five dollars, and before undergoing examination shall pay to the Association twenty-five dollars as a fee, and before receiving his certificate of registration shall pay the annual fee set out in the By-laws and a sum of not more than five dollars for the publication of his name in the British Columbia Gazette;

(f) In case the candidate should fail in his examination, he may present himself at any subsequent regular examination by paying a fee of ten dollars.

Registration Without Examination.

12. (a) The Council shall consider an application for registration from any person who submits proof of qualifications possessed by such person by virtue of experience, training or examination by another examining body of recognized standing, and if found satisfactory shall grant a certificate of registration;

(b) Any person who, without examination, is registered as a Professional Engineer, shall pay to the Association before being so registered the sum of fifteen dollars for examination of credentials, and the annual fee set out in the By-laws, and a sum of not more than five dollars for the publication of his name in the British Columbia Gazette;

MANITOBA

13. Annual Fees

(1) Each person who is registered or licensed to practise under this Act shall pay in advance to the secretary-treasurer, or any person deputed by the council to receive it, such annual fee as may be determined by by-laws of the association, which shall be deemed to be a debt due by the practioner and to be recoverable with costs in the name of the council in any court of competent jurisdiction.

(2) If any registered practioner omit to pay the prescribed annual fee within six months of the date upon which it becomes due, the registrar shall cause the name of such practitioner to be erased from the register, and such practitioner shall thereupon cease to be deemed to be a registered practitioner; but such practitioner shall at any time thereafter, upon paying such fee, be entitled to all his rights and privileges as a registered practitioner from he time of such payment.

(3) The registrar shall not be required to issue a license to practise to any non-resident practitioner otherwise entitled to such license unless the fee provided for by the by-laws of the association shall have been previously paid.

14. Necessity of Registration

Any person entitled to be registered under this Act who shall neglect or omit to be registered shall not be entitled to any of the rights and privileges conferred by the provisions of this Act so long as such neglect or omission shall continue.

15. Right of Appeal

In the case of any refusal by the council to register the name of any person as a member of the association, or of refusal to issue a license to practise, the person aggrieved shall have the right to apply to a judge of the court of King's Bench, who, upon due cause shown, may issue an order to the council to register the name of such person, or to grant him a license to practise or make such other order upon such appeal as may be warranted by the facts, and the council shall forthwith comply with such order. Such order when so made shall be final.

16. Default of Registrar

If the registrar makes or causes to be made any wilful falsification in any matter relating to the register, he shall forfeit a sum not less than one hundred dollars.

17. False Registration

If any person shall wilfully procure or attempt to procure himself to be registered or licensed under this Act, by making or producing, or causing to be made or produced any false or fraudulent representations or declarations, whether verbally or in writing, every such person so doing, and every person knowingly aiding and assisting him therein, shall forfeit and pay a sum of not less than one hundred dollars.

18. Evidence

The certificate of the registrar under the seal of the association shall be **prima facie** evidence of registration or license, or non-registration, as the case may be.

19. Suspension for Misconduct

(1) The council may in its discretion, reprimand, censure or suspend or expel from the association any engineer guilty of unprofessional conduct, negligence, or misconduct in the execution of the duties of his office, or convicted of a criminal offence by any court of competent jurisdiction, but shall not take any such action until a complaint under oath has been filed with the registrar and a copy thereof forwarded to the party accused. The council shall not suspend or expel an engineer without having previously summoned him to appear to be heard in his defence, nor without having heard evidence under oath offered in support of the complaint on or behalf of the engineer. The council shall have the same powers as a justice of the peace to compel witnesses to appear and to answer under oath in the manner and under the penalties prescribed by law. The president of the council or person acting as such in his absence, or the secretary, is hereby authorized to administer oaths in such cases. All evidence shall be taken in writing or by a duly qualified stenographer.

BRITISH COLUMBIA

21. If any person shall wilfully procure or attempt to procure himself to be registered or licensed under this Act, by making or producing, or causing to be made or produced, any false or fraudulent representation or declaration, either verbally or in writing, every such person so doing, and every person knowingly aiding and assisting him therein, shall incur a penalty of not less than twenty dollars nor more than five hundred dollars.

22. Any information for the recovery of any such penalty or forfeiture may be laid by any Member of the Association, or by any person appointed by the Council.

23. No prosecution shall be commenced for any offence against this Act after two years from the date of committing the offence.

24. The Council may, and upon application of any three Members shall, cause inquiry to be made into matters respecting any fraudulent or incorrect entry in the Register, or the unprofessional conduct, negligence or misconduct in the execution of the duties of his office, or the conviction on a criminal offence of any Registered Member, and may in its discretion order the erasure or correction of any entry in the Register, or may reprimand, censure, suspend or expel from the Association any Member found guilty as aforesaid; provided that the name of a Member shall not be erased from the Register on account of a conviction for a political offence outside His Majesty's Dominions, nor on account of a conviction for an offence which, though within the provisions of this Act, ought not, in the opinion of the Council, either from the trivial nature of the offence or from the circumstances in which it was committed, to disqualify a person from practising Professional Engineering.

25. The Council may, for the purpose of the execution of the duties of the Council under this Act, employ at the expense of the Association such legal or other assessor or assistant as the Council may think necessary or proper; and any person whose status or conduct is the subject of inquiry shall also have the right to be represented by counsel.

26. At least one week before the first meeting of the Council to be held for taking evidence or otherwise ascertaining facts, a notice shall be served upon the person whose status or conduct is the subject of inquiry, and such notice shall embody a copy of the charges made against him, or a statement of the subject-matter of the inquiry, and shall also specify the time and place of such meeting. The testimony of witnesses shall be taken under oath, which the Presiding Officer is hereby authorized to administer, and there shall be full right to cross-examine all witnesses called, and to call evidence in defence and reply. In the event of the non-attendance of the person whose status or conduct is the subject of such inquiry, the Council may, upon proof of the personal service of the notice aforesaid in accordance with the provisions of this Section, which proof of service may be by statutory declaration, proceed with the subject-matter of the inquiry in his absence, and make their report of the facts without further notice to such person.

27. The Council, or any person interested in the proceedings on any such inquiry, may make application to the Registrar or any District Registrar of the Supreme Court to seal a writ or writs of subpœna for the attendance of any witness or witnesses, and for the production of books, papers and documents by such witness or witnesses at such inquiry in form similar to that prescribed by the Supreme Court Rules, and such writ or writs of subpœna shall have the same force and effect as though issued out of the Supreme Court, and the fees therefor and the rules governing the same shall be such as are in force in the Supreme Court.

28. Any person who has failed to pass an examination, or whose name has been ordered to be erased from the Register, or who feels himself aggrieved, or is affected by any order of the Council, or any decision of the Board of Examiners, may appeal from such order, finding, action, or decision, to any Judge of the Supreme Court at any time within six months from the date of such order, finding, action or decision, or the publication thereof; the said Judge thereof, upon the hearing of such appeal, which may be analogous to appeal to the County Court under the "Summary Convictions Act," may make such order confirming or reversing in whole or in part, or varying the order, finding, action or decision appealed from, or directing further inquiries by the Council into the facts of the case, and as to costs, as to the said Judge thereof shall seem right in the premises Such order, when so made, shall be final.

29. In all cases where proof of registration under this Act is required to be made, the production of the last annual list published in the Gazette as herein provided, or of a certificate bearing a date

MANITOBA

27. Operation Postponed

No provisions of this Act restricting the practice of the profession or imposing penalties shall take effect until one year after the passing of this Act.

28. Individual Seal

Every person registered under this Act shall have a seal, the impression of which shall contain the name of the engineer and the words "Registered Engineer, Province of Manitoba," with which he shall stamp all official documents and plans.

29. Former Act Repealed

Chapter 32 of the Revised Statutes of Manitoba, 1913, being "The Manitoba Civil Engineers' Act," is hereby repealed.

30. When Act in Force

This Act shall come into force on the day it is assented to.

BRITISH COLUMBIA

subsequent to the issue of the said Gazette containing said annual list, showing that the person or persons therein named is or are duly registered, certified under the hand of the Registrar for the time being and the seal of the Association, shall be sufficient evidence of such registration in lieu of the production of the original Register; and any such certificate purporting to be signed by any person in the capacity of Registrar shall be *prima facie* evidence that such person is such Registrar, without any proof of his signature or of his being in fact such Registrar; provided, always, that the evidence herein aforesaid may be displaced by any certificate of the Registrar under seal of the Association, showing the fact of erasure of any name or suspension or revocation of any licence to practise.

30. Any penalty recoverable under this Act may be recovered in the same manner as penalties are recovered under the "Summary Convictions Act," before any Justice of the Peace having jurisdiction in the locality in which the offence was committed, and every such penalty may, together with the costs of conviction, be levied by distress and sale of the goods and chattels of the offender.

31. Within one month after this Act comes into force, the Lieutenant-Governor in Council shall appoint a provisional Council consisting of eleven members, who shall elect their own officers.

At least one member shall be chosen from practitioners in each of the branches of Engineering named in Section 2, Sub-section (b) hereof.

32. The duties of the Provisional Council shall be to provide the Register called for by this Act, to enter therein the names of those and those only who are entitled to registration under the provisions of Section 7, Sub-section (b), and who apply in writing to be registered and pay the prescribed fees, and to call within six months from the coming into force of this Act the first general meeting of the Association, for the purpose of electing the regular Council and any other organization purposes of the Association; and shall have the powers conferred in this Act on the Council of the Association. Their powers shall cease on the election of the regular Council of the Association.

33. Every person registered under this Act shall have a seal, the impression of which shall contain the name of the Engineering, the branch of Engineering in which he has been accepted, and the words "Professional Engineer, Province of British Columbia," with which he shall stamp all official estimates, specifications, reports, documents and plans.

34. No provisions of this Act restricting the practice of the profession or imposing penalties shall take effect until the first day of April, 1921.

35. Nothing in this Act contained shall be construed as altering or affecting any provisions of the Coal-mines Regulation Act, Metalliferous Mines Inspection Act, or the Pharmaceutical Act.

36. Nothing in this Act contained shall be construed as preventing the carrying on by any person on his own property of any work for the sole use of himself and his domestic establishment; nor the designing, construction or installing by any person of appliances, works or plants of a value not exceeding five thousand dollars; provided, however, that such work shall not involve the safety of the general public.

CORRESPONDENCE

Employment Bureau

Editor, *Journal*,

Dear Sir:—

Having heard of several criticisms re advertisements for "Positions Vacant" in your magazine would like to call your attention to and make the following recommendation:—

That all individuals or firms advertising for engineers in your journal be requested to state more details of position, the salary the position is worth, also where advisable give their name.

I verily believe that this will be a great benefit to the employer as he should only receive replies from men who could "fill the bill". The applicant also would have some idea of the position he was applying for.

I might cite a case as example. In the March issue the following advertisement appeared:—"Town engineer wanted for a town in Nova Scotia. Applicants to state qualifications, experience and salary wanted. Apply Box No. ——"

This leaves the applicant much in the dark and might be changed to something like the following:—"Required engineer for Nova Scotia town, population.... (state population) waterworks installed, sewage system and road program to be extended. Only engineers with experience in similar position, capable of taking full charge and worth $300.00 per month need apply. Signed Mayor or Town Clerk."

Hoping you will give this your serious consideration for the benefit of the engineers in particular and the country in general, I remain,

Sincerely yours,

C. E. Hogarth, A.M.E.I.C.

Berthierville, P. Q.
April 1st, 1920.

A Correction

Editor, *Journal*,

Sir,

I sympathize with the member reporting the proceedings of the Toronto Branch in his efforts to condense into a sentence or two the substance of the various speeches at the debate on "Should Engineers Unionize" but he leaves me in an unfortunate position. He says that I do "not think legislation would help the engineer since it does not help the teachers." What I said was to the effect that legislation by itself would not save the day for the engineer, and cited on the one hand the case of the teachers in the schools of Ontario. Their profession is rigourously closed by legislation but they are very poorly paid; on the other hand I mentioned the case of the doctors who in addition to their legislation have a highly developed organization which is really a system of unionization.

I think the right kind of legislation will very materially help the engineer, but legislation alone will not [illegible] [illegible] to [illegible] [illegible].

Yours truly,

H. E. T. Haultain, M.E.I.C.

Toronto, April 7th, 1920.

A Tribute to the Institute

Editor, *Journal*,

Dear Sir:

At a Meeting of the Provincial Council of the Association representing all branches of the Technical Professions in the Province of British Columbia and the four hundred and fifty Members the following resolution dated the 31st day of March 1920, was unanimously passed:

"That the Secretary be instructed to send a letter expressing the thanks and appreciation of this Association for the pioneer work done by *The Engineering Institute of Canada* in the drafting of a Bill for Professional Engineers which had been the ground work for the Bill just passed by the British Columbia Legislative Assembly."

It is a very great pleasure to me personally to have the opportunity of forwarding this resolution and to tell you it would have been quite impossible for us to have drawn up the act in the time at our disposal without the Model Bill.

I must congratulate you upon the good results of your past labour obtained throughout the Dominion.

Yours very faithfully,

[illegible], A.M.E.I.C.,
Hon. Sec.

British Columbia Technical Association.
Vancouver, B.C.
19th, April, 1920.

B. C. Engineers Joint Legislation Committee

Secretary Engineering Institute of Canada,
176 Mansfield St.,
Montreal, Que.

Bill respecting Professional Engineers passed Legislature and Lieut. governor. Note for Journal.

A. R. Crookshank, M.E.I.C.

EMPLOYMENT BUREAU

Situations Vacant

Chief Draftsman

Chief draftsman wanted for pulp and paper company, should be familiar with plant lay-out and equipment, knowledge of architectural drafting also desirable Box 110.

Inspectors for Fire Underwriters

Several men with engineering experience wanted as inspectors for Fire Underwriters. Men recently graduated can apply. Box 107.

Designer in Reinforced Concrete

Designer in reinforced concrete work wanted for large company in province of Quebec. Immediate applications wanted. Box 105.

Mechanical Engineer

Wanted at once mechanical man for general engineering office work on rolling mill construction. Recent graduate would do. Applications to state experience, salary wanted etc. Box 106.

Mechanical Draughtsman for Paper Mill

Mechanical draughtsman wanted, experienced in machine design and detail, preferably in connection with paper making machinery or crane and conveying machinery. Must be first class man capable of handling work through the office with despatch, permanent work for the right man. Apply stating age, nationality, detail experience and salary required. Box 102.

Junior Mechanical Draughtsman

Junior mechanical draughtsman or designer wanted, prefer man with technical training and some experience in draughting and on outside work. Preference given to man whose experience was secured with a smelting or mining company. Salary $125. per month. Box 101.

Draughtsmen and Designers

Large mining company in Northern Ontario requires several draughtmen and designers, preferably single men. $250. per month. Box 103.

Summer Work for Student Member

Wanted by a manufacturer of a well established product, selling to contractors and municipalities the services of an undergraduate for five or six months from May 1st, to collect data and to further the use of said product by public lectures and moving picture exhibit which we will furnish. Salary and expenses. Territory principal towns and cities from Winnipeg to Halifax. Apply by letter stating salary, experience if any and references. Box 109.

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

Hydraulic Engineers.

962. Hydraulic Engineers at an initial salary $2,700 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $3,180 has been reached. This initial salary will be supplemented by whatever bonus may be provided by law.

Duties.—Under direction, to have charge in a district or division of survey parties engaged in power development, hydrometric, reclamation, river regulation, and other hydraulic engineering works or engaged in the construction of such works; and to perform other related work as required.

Qualifications.—Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with three years of experience in hydraulic engineering survey, design, estimate, and construction work, two years of which shall have been in responsible charge of such work, or five years of experience in hydraulic engineering survey, design, estimate, and construction work, two years of which shall have been in responsible charge of such work; ability to manage men and to complete and make ready for publication the results of drainage investigations and surveys, or other pertinent data; tact; good judgment; administrative ability. While a definite age limit has not been fixed for this competition, age may be a determining factor when making a selection.

Examination.—Subjects and weights as follows:—Education and Experience, 200; Oral Interview, if necessary in the opinion of the Commission, 100.

A list of eligibles will be established for vacancies in the above class throughout the Dominion, but the only vacancies required to be filled at present are in the Department of the Interior, for Alberta and Saskatchewan. Persons qualified are urged to take part in this competition, in order to become eligible.

Assistant Hydraulic Engineers.

963. Assistant Hydraulic Engineers at an initial salary of $2,100 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,580 has been reached. This initial salary will be supplemented by whatever bonus may be provided by law.

Duties.—Under direction, to have charge of survey parties engaged in power development, hydrometric, reclamation, river regulation, or other hydraulic engineering survey work, or to supervise the construction of power development, reclamation, or other hydraulic engineering works; and to perform other related work as required.

Qualifications.—Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with three years of hydraulic engineering experience, one year of which shall have been in responsible charge of such work, or five years of experience in hydraulic engineering work, one year of which shall have been in responsible charge of such work; ability to prepare reports on surveys or investigations, [illegible], tact; ability to manage men. While a definite age limit has not been fixed for this competition, age may be a determining factor when making a selection.

Examination.—Subjects and weights as follows:—Education and Experience, 200; Oral Interview, if necessary in the opinion of the Commission, 100.

A list of eligibles will be established for vacancies in the above class throughout the Dominion, but the only vacancies required to be filled at present are Six Assistant Hydraulic Engineers, Department of the Interior, for Alberta and Saskatchewan. For these particular positions, preference will be given to candidates who have had experience in drainage engineering and surveys. Persons qualified are urged to take part in this competition, in order to become eligible.

Junior Engineers

964. Junior Engineers at an initial salary of $1,[illegible] per annum, which will be increased upon recommendation for efficient service at the rate of $1[illegible] per annum, until a maximum of $2,040 has been reached. This initial salary will be supplemented by whatever bonus may be provided by law.

Duties.—Under direction, to make surveys, supervise engineering construction and repairs, and make computations in connection with engineering work; and to perform other related work as required.

Qualifications.—Education equivalent to high school graduation, either graduation in engineering from a school of applied science of recognized standing with two years of engineering experience, or four years of engineering experience in design, estimate, construction, and maintenance work. While a definite age limit has not been fixed for this competition, age may be a determining factor when making a selection.

Examination.—Subjects and weights as follows:—Education and Experience, 200; Oral Interview, if necessary in the opinion of the Commission, 100.

A list of eligibles will be established for vacancies in the above class throughout the Dominion, but the only vacancies required to be filled at present are Three Junior Engineers, Department of the Interior, for Alberta and Saskatchewan. For these positions preference will be given to candidates who have had experience in drainage engineering and surveys. Persons qualified are urged to take part in this competition, in order to become eligible.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later than May 6, 1920. Application forms may be obtained from the office of the Employment Service of Canada, or from the Secretary of the Civil Service Commission, Ottawa.

Situations Wanted

Highway Engineer

A.M.E.I.C. [illegible] on all classes of road work, with highway, municipal, [illegible] organization and town planning experience, [illegible] position in Ontario or Western provinces. Box [illegible].

Mechanical Engineer

Mechanical engineer, B.Sc., A.M.E.I.C., open for engagement. McGill graduate, several years experience in manufacturing, design, [illegible], production, maintenance, sales engineering, very useful training in machine shop and tool room. Accustomed to handling both skilled and unskilled labour in large numbers. Box [illegible]-P.

Summer Work for Student Member

Wanted by Student member for the summer vacation. Has just completed first year civil engineering, field work preferred. Apply Box No. 29-P.

For Sale.

5" Transit Theodolite, make T. Cook & Sons, [illegible] made 1[illegible]. A cross hairs, reading to 20" with complete vertical circle and compass attached to telescope, stand and case complete. Price $[illegible]. Box No. [illegible].

OBITUARY

A. L. HERTZBERG, M.E.I.C.

A. L. Hertzberg, M.E.I.C., died at his home in Toronto on January 21st, 1920. Mr. Hertzberg was born at Horten, Norway, was educated at Horten, and at Gothenburg University, Sweden, coming to Canada in 18[illegible], when he joined the Credit Valley Railroad as asssistant engineer. After that railroad was taken over by the C.P.R. Mr. Hertzberg became division engineer at Toronto, and later district engineer. In 1882 Mr. Hertzberg married Helen E. McMaster and leaves three sons, Colonel H. F. H. Hertzberg, C.M.G., D.S.O., M.C., M.E.I.C., C. L. Hertzberg, M.E.I.C., consulting engineer, Toronto, and O. P. Hertzberg, resident engineer, C.P.R. From 1894 to 1905, Mr. Hertzberg represented Norway and Sweden in Toronto then as Vice Consul. Mr. Hertzberg has been a member of *The Institute* since 1888. During the many years he has been engaged as division engineer for the C.P.R., He occupied that position with credit to himself and to the profession. He had a kindly disposition and was a man of the highest integrity and his taking is a distinct loss to *The Institute* and to the profession.

PERSONALS

G. B. Mitchell, M.E.I.C., is now with the Foundation Co., at Lima, Peru, address Calle Rifa No. 332.

*

Onesiphore H. Cote, A.M.E.I.C., has been appointed Industrial Commissioner of the Board of Trade for Quebec.

*

A. T. Le Fevre, M.E.I.C., who joined *The Institute* in January last is at present located at Casilla, Antofa gasta, Chile.

*

Allan K. Hay, A.M.E.I.C., has been appointed engineer and secretary to the Ottawa Suburban Roads Commission.

*

J. C. Ball, A.M.E.I.C., is accorded the congratulations of the Niagara Peninsula Branch upon the arrival of a son.

*

F. N. Smail, A.M.E.I.C., formerly in the Provincial Highway Department, Regina, has accepted a position in the City Engineer's office, Moose Jaw.

*

Capt. G. H. Workman Jr. E.I.C. reported as having died on active service is alive and well. He is at present in Winnipeg, address 530 Langside St.

*

Alexander Peden, A.M.E.I.C., has been appointed structural engineer for the Dominion Bridge Company, Lachine, Que. with charge of the structural drawing office.

*

Walter K. Scott, A.M.E.I.C., has joined the firm of McGregor & McIntyre, Limited, Toronto and is transferring his membership from the Montreal to the Toronto Branch.

*

Brig.-Gen. C. J. Armstrong, M.E.I.C., was elected president of the Royal Military College Graduates Club at a general meeting of the club held on April 6th in Montreal.

C. H. Biddel, A.M.E.I.C., one of the Provincial Land Surveyors in the Government service has accepted a position as district surveyor with the Parsons Engineering Company, of Regina.

*

E. L. Miles, M.E.I.C., has recently been appointed assistant engineer to the Toronto and New York Roads Commission in connection with work which is to be carried on this summer.

*

J. E. Pringle, J.E.I.C., of Hamilton, has accepted a position as assistant engineer with the Kipawa Company on construction work in connection with the extension of the Company's sulphite mill.

*

John F. Cassidy, Jr., E.I.C., has resigned from the Department of Provincial Highways, Ottawa, and is now a member of the general contracting firm of Messrs. J. O. Giroux & Co., Limited, of Toronto.

*

C. B. Bate, A.M.E.I.C., formerly on the staff of the Department of Soldier's Civil Re-setablishment at Ottawa has been appointed to the engineering staff of the Riordon Pulp and Paper Co. at Hawkesbury, Ont.

*

D. C. Tennant, M.E.I.C., has been appointed designing engineer at the plant of the Dominion Bridge Company, Lachine, Que. He will assist F. P. Shearwood in all the erection schemes which the company may carry out.

*

G. S. MacDonald, A.M.E.I.C., has resigned his position as resident engineer of the Marine and Fisheries Department at St. John, N.B., and is planning to take over the insurance business of his father, Chas. A. Macdonald, of that city, who died recently.

*

Allan Waters, M.E.I.C., formerly city engineer of Nanaimo, following which he was provincial architect for the province of B.C. and later overseas doing war work has been appointed a resident engineer on the Lethbridge Northern Irrigation District, Lethbridge, Alta.

*

The Saskatchewan River Water Commission, Chairman A. J. MacPherson, A.M.E.I.C., is holding a series of meetings in urban and rural centres of southern Saskatchewan, in order to procure evidence as to the requirements for a water supply from the Saskatchewan River.

*

P. L. Pratley, M.E.I.C., formerly designing engineer of the Dominion Bridge Company has accepted the position of chief of staff on valuation under Lt.-Col. C. N. Monsarrat, M.E.I.C., in connection with the Department of Railways and Canals Valuation Board of the Grand Trunk Railway.

*

J. N. deStein, M.E.I.C., Secretary Treasurer of the Saskatchewan Branch of *The Institute* has been manager of the Parsons Engineering Company in association with Colonel J. L. R. Parsons, M.E.I.C., and W. R. W. Parsons, M.E.I.C. and has formed the Western Draughting & Blue Printing Company, the company has installed a large blue printing machine for this purpose.

C. Brakenridge, M.E.I.C., has returned to Vancouver after spending several months in England, where he was engaged in a study of the methods and materials employed in road building and highway construction. Mr. Brakenridge who was for some time Secretary-Treasurer of the Vancouver Branch, was welcomed at a meeting of the Montreal Branch of *The Institute* on the evening of April 8th.

The Greek Government has conferred the insignia of the Golden Cross of the Saviour to Colonel George Eedson Burns and the insignia of the Silver Cross of the Saviour to Jules A. Duchastel de Montrouge for the eminent and excellent services they rendered to the Greek residents in Canada during the Great War.

The official award of the decorations will take place on the Greek Independence Day, April 4 at 12.30 p.m. in the Oak and Blue rooms of the Hotel Windsor.

T. G. Randolph, A.M.E.I.C., served overseas with the new armies from March 25th, 1915 till April 15th, 1919 attaining the rank of Major R. E. Major Randolph was awarded the Military Cross and had the good fortune not to be wounded during his long period of service. In addition to being an Associate Member of *The Engineering Institute of Canada*, Major Randolph is an Associate Member of the Institution of Civil Engineers. He is at present with Messrs Alfred Booth & Co. Ltd., 11 Adelphi Terrace, Strand, W. C. 2., England.

C.M.Arnold, M.E.I.C., office engineer of the Reclamation Branch of the Department of the Interior has been appointed a division engineer of the Lethbridge Northern Irrigation District under Major H. B. Muckleston, M.E.I.C. Mr. Arnold has taken a leading part in the activities of *The Institute* in the province of Alberta, having acted both as Secretary-Treasurer of the Calgary Branch and Secretary of the Alberta Provincial Division. He has taken an active part in all of the affairs of the profession in that province and has placed the profession under a debt of gratitude for the excellent service he has so unselfishly rendered.

Lt.-Col. H. C. Lott, M.C., A.M.E.I.C., is at present Asst. Director Works, (E. & M. Section) Baghdad, Mesopotamian Exp. Force. Lt.-Col. Lott's responsibilities extend over the whole of Northern Mesopotamia including the cities of Mosul and Baghdad. His department also maintains all the stone crushers and rollers working on the 500 mile road between Railhead in Mesopotamia (close to the Eastern frontier) through Persia, over the Push-to-ka mountains to Enzeli on the Caspain Sea. All his skilled personnel with the exception of officers and a few British upper subordinates come from India and a few locally from the Arab population.

Lieut. Floyd K. Beach returned to Canada in April 1919 after serving for nearly two years in Flanders with the Canadian Railway Troops. Up until nearly the time of the armistice his duties were in construction and maintenance of light railways in the 2nd Army Area, and just prior to and after the armistice in rebuilding the demolished standard gauge lines in the vicinity of Cambrai. He had entire charge of the rebuilding of [illegible] [illegible] yards and engine [illegible] tracks. Since his return he has resumed his duties with the Hydrometric Surveys in Alberta and Saskatchewan and is at present Divisional Hydrometric Engineer with headquarters at Calgary.

Guy L. Tooker, [illegible] E.I.C., enlisted as a private with the 67th Battalion Western Scots on September 1st 1915. He proceeded to England on March 14th 1916 and then to France on August 13th of same year. The Battalion being broken up in March 1917, he was transferred to the 54th Battalion, and after the Vimy battle was recommended for a commission, which was subsequently obtained. In November 1917, he again proceeded to France joining the 47th Battalion. In January 1918, Lt. Tooker was attached to the 10th Canadian Light Trench Mortar Battery, rejoining the 47th Battalion after the armistice. Recommended for the M.C. after the Cambrai battle. Demobilized in Canada on July 8th, 1919.

Edwin J. Beugler, M.E.I.C., has recently been elected vice president in charge of engineering of the Foundation Company, New York. He was previously consulting engineer of Westinghouse, Church, Kerr & Co., Inc., engaged in developing plans for various engineering works and giving general supervision to construction operations. Before that he was chief engineer of Canadian work, following service as managing engineer and earlier as civil engineer of that company.

From 1902 to 1905 he was resident engineer of the Boston Terminal Company in charge of engineering and maintenance departments of the south terminal Station, Boston; 1893-1902, with the construction department of the New York, New Haven & Hartford R.R., and from 1890 to 1893 with the Philadelphia & Reading R.R.

He is also a member of the American Society of Civil Engineer, American Railway Engineering Association, and the Boston Society of Civil Engineers.

J. W. B. Blackman has recently been appointed City Engineer of North Vancouver, B.C. and is at present supervising the paving of the highway at Chilliwack.

Mr. Blackman went overseas with the first Railway Construction Troops company formed in B.C., with the rank of Lieutenant and Second in Command. On arrival in England early in 1917, Lieutenant Blackman was seconded to the War Office for engineering duty and was resident engineer and director of works in connection with the building of a large aerodrome in Norfolk. This was a large undertaking, there being some sixty different buildings and the work included water supply and fire protection, sewage disposal works, power station, roads, railways, etc. On the completion of this work Lieutenant Blackman was promoted to the rank of Captain and appointed to the staff as Chief Water Engineer, and was placed in consulting charge of forty different water supplies both in France and Great Britain. Captain Blackman returned to Canada in April 1919, and has been in North Vancouver since that date.

*

Major W. T. Wilson, D.S.O., M.C., A.M.E.I.C., who previous to the war was with the Montreal Light Heat & Power Company, returned to Canada on the C.P.O.S. "Minnedosa" from Liverpool on March 11th, having been on active duty from the beginning of the war until June 22nd, 1919. After the Armistice Major Wilson was retained for the purpose of demobilizing all Tunnelling Companies of the 3rd and 4th Armies, he being the last man out from the Tunnelling Companies. He went overseas with the C.Y.C. and was loaned to the Imperials as an officer in the Tunnelling Company, R.E., being the only Canadian officer commanding a British Tunnelling Company, seeing active service from June 1915 until the end of the war, and was engaged over the entire Western front from St. Quentin to Nieuport. Besides receiving the Distinguished Service Order and the Military Cross, Major Wilson has the distinction of being in every large engagement of the Western front with one exception. He has promised for the benefit of his fellow members, at some future date, an article on some experience of a tunnelling officer at the front. A number of unique war souvenirs are being presented to *The Institute* by Major Wilson.

*

E. A. Jamieson, A.M.E.I.C., has opened an office in the London Building, Vancouver, B.C. under the firm name of The Jamieson Engineering Company, which was formerly known as The MacAndrew Jamieson Engineering Company, and is conducting a general engineering practice combined with sales agencies of equipment for all kinds of plants. The Company is the Western representatives of the Hydraulic Machinery Company, Limited, Montreal; The Lytle Engineering Company Limited, of Montreal; The Strauss Bascule Bridge Company, Limited of Chicago; The Federal Engineering Company, Limited, Toronto; The Spray Engineering Company of Boston; The Asbestos Mfg. Co., of Montreal; Ruston Hornsby, Engineers, Lincoln, England; The Volta Mfg. Company, Welland; The Hiram Walker Metal Products Company of Walkerville, and The Waterex Waterproofing Co., of San Francisco. This firm has recently, acting as agents for the Strauss Bascule Bridge Co., been successful in closing a contract with the Corporation of the City of Victoria for the design and supervision of the Johnson Street Bridge in that city. Mr. Jamieson held the position of inspector of guns and steel, Canadian Forces after being transferred from the infantry in which he enlisted in 1915.

*

F. Harcourt Emra has established a company, F. H. Emra and Partners, Civil and Mechanical Engineers, at the Hope Chambers, Ottawa. This company will do consulting work and represent several large English manufacturing firms.

Major Emra has had an interesting career in connection with the war. He went to England early in 1915 and worked with the South Eastern Railway as assistant district engineer till July 1915 when he returned to Canada to take a commission with the 1st Canadian Pioneer Battalion. This battalion left Canada in November and landed in France early in March 1916. Major Emra was O.C. of the "C" Company of the 1st Pioneer Battalion from June to September 1916, was wounded at Courcellette in October 1916 and on return to duty was transferred to the 2nd. Battalion Railway Troops in January 1917. Major Emra was again invalided to England in September 1917 in consequence of an old wound from gas burns and on return to duty was seconded to the Admiralty in connection with the department of Auxiliary Shipbuilding. Major Emra was resident engineer of the London and South Eastern Districts and in charge of the Engineering Section at Headquarters. Major Emra resigned this important position in January 1920 and has recently returned to Canada.

*

H. B. R. Craig, recently appointed Chairman of the Border Cities Branch graduated from R.M.C. in 1899, and from Queen's University (B.Sc.) in 1903. For a year after graduation Mr. Craig was resident engineer on construction of the Bay of Quinte Railway, and in 1904 he was resident engineer on construction of the Toronto-Sudbury Branch, Wahnapitae River to Sheppard Lake. For the two years following Mr. Craig was city engineer of Kingston, Ont., but returned to railway work on construction of the Grand Trunk Pacific Railway, being resident engineer on the Lake Superior Division and on the Prairie West Division. From 1908 to 1911 Mr. Craig again took up the duties of city engineer of Kingston, and after a year of consulting work for Prescott and the counties of Lennox and Addington he was appointed senior assistant engineer, Public Works, Canada at Windsor, Ont., in 1911. In 1914 Mr. Craig was transferred to Fort William by the Department of Public Works in the capacity of district engineer after having been acting district engineer for the Windsor district for the previous year; in July 1919 Mr. Craig returned to Windsor as district engineer. In October 1902 he was elected a Student member of *The Institute*, being transferred in March 1905 to Associate Member, and was elected Member in December 1910.

*

Brig.-Gen. Harold French McDonald, D.S.O., C.M.G., Jr. E.I.C., has been appointed general manager of the Industrial Alberta Development Association with headquarters at Calgary. Before going overseas he was employed with the C.P.R., Land Department and Department of Natural Resources from 1908 till 1912, and from 1912 till 1914 was consulting engineer and surveyor, Winnipeg. He enlisted in the first month of the war and was given a commission as Lieutenant with the 16th Canadian Battalion being promoted to Captain on the Staff of 3rd Canadian Infantry Brigade September 1914. He was severely wounded at the 2nd battle of Ypres in April 1915, and later the same year was appointed General Staff Officer, 3rd Grade on the Headquarters of the 2nd Canadian Division. In January 1916 he was promoted to Major, and in May 1916 was appointed Brigade Major 1st Canadian Infantry Brigade. In September 1916 he was severely wounded at the Somme, suffering amputation of the left arm, at which time he was awarded the Distinguished Service Order for gallantry in the field. In December 1916 General (then Lt.-Col.) McDonald took charge of the Canadian troops in training in England. In 1917 he was given the C.M.G. and in December 1917 was promoted to the rank of Brig.-General. Other decorations received by Brigadier General McDonald are the Order of St. Anne of Russia, 2nd Class with Swords, and special mention to H. M. Secretary of State for War for valuable services, January 1918. In May 1917 he visited the Italian Front as a member of the Canadian Mission. In February 1919 Brig.-Gen. McDonald was appointed General Officer Commanding Military District No. 13, Calgary, and in December 1919 he retired from the Canadian Forces.

W. J. Stewart, M.E.I.C., Consulting Engineer, Department of External Affairs, has been appointed by the Canadian Government to act as a representative on behalf of the British Empire on an International Committee of Inquiry which has been set up in Paris to consider draft general conventions on Freedom of Transit, International Ports, and International Railways, and to prepare the way for the work of the League

W. J. STEWART, M.E.I.C.

of Nations on the transportation question. This appointment was made by the Canadian Government at the request of the Imperial Government.

The British Empire will have two representatives on this committee which has a very wide field of inquiry. Mr. Stewart is now in Paris and has already begun reviewing the great quantity of information which will be considered.

Hon. J. L. Cote, A.M.E.I.C., Provincial Secretary for the Province of Alberta, is at present laying the foundation for a department of research in the Province of Alberta. He was born at Les Eboulements and was educated at Montmagny and Ottawa University and graduated in 1890. Following graduation Mr. Cote worked for the Dominion Land Surveys. The years 1892-4 Mr. Cote spent in Alaska on photo-topographical survey of the eastern part of the Alaska International Boundary. After a short time spent in the East, Mr. Cote returned to Manitoba

Hon. J. L. COTE, A.M.E.I.C.

and subsequently to the Yukon where he spent a year on survey work; in 1903 he opened an office as land surveyor and engineer in Edmonton being connected with the Jasper Park Collieries. In 1909 Mr. Cote was returned a Member of Parliament for the district of Athabasca, and 1913 and 1917 was elected for Grouard after the district had been subdivided. On Sept. 25th, 1918 Mr. Cote was appointed Provincial Secretary which position he has since held.

Hon. J. D. Reid, Minister of Railways and Canals, has announced that W. A. Bowden, B.A.Sc., M.E.I.C., chief engineer of that department, has been selected by the Government of Canada to act as Canadian consulting engineer in the reference to the International Joint Commission on the question of the further improvement of the St. Lawrence river between Montreal and Lake Ontario.

The Government of the United States is also a party to this reference, and each Government undertook to appoint from its official engineering personnel an engineer to confer with a similar officer of the other Government in the acquiring of engineering data, the making of necessary surveys, and the completion of outline plans and estimates of the cost of the proposed improvement. In conformity with this arrangement the U. S. Government has appointed Lt.-Col. Wooten, a member of its permanent Government service as the corresponding person on the American side.

The reference to the commission is in the form of a series of questions, the chief of which is:—

What further improvement in the St. Lawrence River between Montreal and Lake Ontario is necessary to make the same navigable for deep-draught vessels of either lake or ocean-going type; what draught of water recommended, and what the estimated cost?

In answering this question, the commission is requested to consider:

(a) Navigation interests alone, whether by the construction of locks and dams in the river, by side canals with the necessary locks, or by a combination of the two.

(b) The combination of navigation and power interests to obtain the greatest beneficial use of the waters of the river.

W. A. BOWDEN, B.A.Sc., M.E.I.C.

Other questions deal with the apportionment of capital cost to each country, as well as cost of operation and maintenance and method of control. The possible effect on the St. Lawrence Ship Canal below Montreal is to be studied, as well as ice conditions; also what improvement may be expected of the resources, commerce and industry of each country, as well as of traffic.

The commission intends to conduct public hearings in both countries to bring out information bearing on the physical, commercial and economic aspects of the project. Hearings will probably commence about May 1st. Engineering plans and estimates are to be submitted to the commission as soon as practicable, but not later than one year from date of appointment of the engineers. And the commission is requested to forward to the two Governments its final report not later than three months thereafter.

No delay is anticipated from the Canadian standpoint. As a matter of fact, it is understood that Mr. Bowden already has tentative plans well advanced. His appointment is regarded as eminently suitable.

BRANCH NEWS

Victoria Branch

Horace M. Bigwood, A.M.E.I.C. Secretary.

At the meeting of the Victoria Branch, *Engineering Institute of Canada*, at the Provincial Library on April 14th, E. P. Girdwood, M.E.I.C., gave a paper on River Protection, Roads, Bridges and General Engineering Construction, chiefly in British Columbia. The lecture was illustrated with about 120 photographs, showing methods of protecting river banks from the erosion of fast flowing rivers, and the construction of roads and railways alongside water courses, which necessitated difficult side-hill cuttings. Bridges of various types and sizes were shown, and described regarding construction methods and results. As illustrating the difficulties engineers experience in designing and carrying out work in country about which little is known, the speaker gave details and views along the G.T.P. Railway, where owing to the river, alongside which they were located, backing up for over four miles, it was necessary to raise the grade, and the bridges fifteen feet above the height originally intended.

The views along some provincial highways not only showed good roads of moderate grades, but also beautiful views and scenery unsurpassed anywhere.

It is unfortunate that the work of the local branch of *The Institute* seems so little known or receives so little support. The attendance was too small considering the amount of labor entailed, and expense incurred to prepare the paper.

The Branch will close the season with a reception on April 26 at the Knights of Columbus Hall.

* * *

Vancouver Branch

J. N. Anderson, A.M.E.I.C., Sec.-Treas.

At a meeting of the Executive Committee of the Vancouver Branch held on April 12th, the following matters were dealt with.

The resolution of the Toronto Branch March 18th re Status and Remuneration of Engineers was endorsed. In this connection, however, it is felt that the British Columbia Technical Association has done much, and is still actively engaged in trying to right just the points covered in the resolution, so that in this Province a live organization is in existence. The work of the B.C.T.A. together with Act of Parliament recently passed regulating Professional Engineers are considered by the Executive here to be of very material benefit in amending the conditions stated in the Resolution.

The Resolution re Purchasing Commission passed by the Victoria Branch on the 16th of March was endorsed.

Edmonton Branch

[illegible], A.M.E.I.C., Sec.-Treas.

At a general meeting of the Edmonton Branch held on April 14th, it was decided to abandon the idea of holding the Western Professional Meeting in Edmonton this year owing to the work necessary in organizing the proposed Association of Professional Engineers as per bill passed by the Legislature of Alberta at their last session. They will however, give their support to any other Branch that may wish to hold the meeting.

Saskatchewan Branch

J. N. de Stein, M.E.I.C., Sec.-Treas.

The April meeting of the Branch concluded the activities of the season, as during the summer months no regular meetings are held except the summer meeting, which according to the By-laws of the Branch has to be held alternately in the various centres of the Province. It was decided to hold it as Saskatoon this year, but the date has to be left open, in order to make it fit the Western Professional meeting, which it is hoped will materialize this year.

The members of our Branch were very gratified to hear that legislation in some of the Provinces of our Dominion has been enacted successfully. It was felt that energetic steps must be introduced in our Province, and the preliminary work started immediately, in order to insure the passing of a satisfactory Act at the next session of the legislature. The question is just being decided — at the moment of the writing of this report — whether our effort should be renewed to bring it up as a Government measure, or whether a proposed "Professional Act" would have a better chance of passing, if submitted in the form of a Private Bill.

The matter has been handed to a joint Committee consisting of the Legislation Committee and the Executive Committee of our Branch with full power to act and to levy such funds as are necessary. To engineers in other Provinces, the fact that all the work in connection with legislation is carried on by this Branch needs a little explanation. Saskatchewan occupies a somewhat unique position in that respect, inasmuch as practically every professional man who is affected by a future "Engineering Profession Act" is a member of our branch.

It was also felt with a great deal of satisfaction that in view of the fact that all western branches have secured legislation we may look forward to considerable assistance from the Western members of *The Institute* in our efforts to procure legislation.

R. J. Lecky, A.M.E.I.C., the official representative of our branch at the annual meeting of *The Institute* at Montreal gave a report of the meeting. A very important resolution was passed by the Branch regarding future annual meetings of *The Institute* which resolution follows:

Whereas: We believe the annual meeting of *The Engineering Institute of Canada* appears to be largely for the transaction of *The Institute* business, and its present form does not warrant the expense necessary for attendance of the majority of its members;

Whereas: There is not at present an opportunity for some classes of Engineers of the Dominion to meet to discuss matters pertaining to their class of work;

Whereas: Certain classes of engineers hold regular annual Dominion-wide meetings to discuss matters pertaining to their particular class of work, which meetings we believe could be arranged to advantage to conform with the time and place of the annual meeting of *The Engineering Institute of Canada*;

Whereas: The Professional meetings held in connection with the Annual meetings and at other times, though of considerable benefit to those attending, and to the membership at large, have been more Provincial than Dominion-wide;

Therefore Be it resolved, that in the opinion of this branch, there is, at present an opportunity for the annual meeting of *The Engineering Institute of Canada* to gradually expand into a Dominion-wide Professional meeting in addition to a business meeting, the Professional meeting to be divided into sessional sections which would embrace all classes of the Profession, each section to be devoted to one or more branches of the Profession, so that it would be of such importance to the Profession as to warrant the attendance of a larger proportion of its members than now attend;

Resolved further, that this Branch request the parent executive to give this matter their early consideration, that the above may be considered in the preparation of the next Annual meeting;

Be it further resolved, that the Secretary of this Branch be instructed to forward a copy of this resolution to the Secretary of the parent Institute and to all the Branches.

If this suggestion is adopted it will mean that the future General Professional Meetings of *The Institute* held in conjunction with the Annual Meeting will mean — in its various sessions — an Annual Meeting for Highway, City, Waterworks, Railroad, Electrical Engineers, etc., etc, and will certainly tend to considerably improve the attendance and also increase the interest in *The Institute*, especially if standing Committees will be formed in the various branches of our great profession.

It was also decided to support the invitation extended by the Manitoba branch to the parent Institute to hold the annual meeting 1921 in Winnipeg and the advisability of suggesting to hold the annual meetings alternately in the east and west will be taken up by the Branch Executive.

A number of correspondents, members of the branch, for *The Journal* were appointed at the various centres of the Province.

H. B. Sherman, A.M.E.I.C., Engineer in charge of operation of the Sask. Government Telephones read a very interesting paper on Rural Automatic Telephones in Saskatchewan, dwelling on the method of simplex dialing, an invention of the Vice Chairman of our branch, W. R. Warren, A.M.E.I.C., and explained the fact that the Saskatchewan system of rural automatic telephones as gradually introduced in the Province was the most advanced system on the continent.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Sec.-Treas.

At a meeting of the branch held at the Engineering Buildings, March 3rd, an address was given by Captain J. W. Wilton, M.L.A. on plans for dealing with the natural resources of the Province.

Captain Wilton who is a member of the Provincial Legislature and supported the measure on the above subject in the present legislature gave an extremely interesting paper, which was listened to by a large attendance. Discussion took place in which a large number of members took part.

The attitude of the meeting was most emphatic on the necessity for bringing to the notice of the public the need of a complete scientific study of the resources of the Province, together with a well thought out scheme for their development. A motion was passed that the Branch concur in the recent action of the Government and the Government be requested to take this matter up, further and take prompt action to prevent the resources being exploited and to ensure the utmost benefit to the public in their ultimate development.

On March 17th, a paper was read by G. R. Pratt, on "A New Type of Combustion Engine". Mr. Pratt's paper described a new development in the use of fuel for power, which he has been working on, and by means of diagrams and drawings showed how large economics could be affected by his system. With his arrangements the thermal cycle approached nearer the ideal conditions than any present heat engine.

A good discussion took place, members showing great interest in the invention. Mr. Pratt was given a very hearty vote of thanks from the branch, it being pointed out that this was one of the most original papers which had been presented to the branch and it was felt that after the development difficulties were overcome the invention would undoubtedly have a great bearing on the economic use of fuel in the future.

A motion of condolence was passed by the Branch on the death of their late Chairman, W. A. Duff.

Considerable interest has been taken by local engineers in the disintegration of concrete in alkali soils which has been brought to their notice by the recent trouble occurring on local concrete structures, most of which are undoubtedly due to this action.

Several members of the local branch have been appointed on the committee to investigate and report on this with reference to the Greater Winnipeg Water District project.

The Winnipeg branch of *The Engineering Institute of Canada* held its annual dance in the Fort Garry hotel on Wednesday, April 7. The students of the engineering department of Manitoba university, a large number of whom are student members of the branch, decided to hold their annual dance in conjunction with the *Engineering Institute*. There was therefore be a very representative gathering of engineers from this province. The patrons and patronesses were as follows: Brig.-Gen. H. N. Ruttan, C.M.G., and Mrs. Ruttan, Mr. and Mrs. J. C. Sullivan, Mr. and Mrs. T. R. Deacon, Mr. and Mrs. W. G. Chace, Mr. H. A. Bowman and Major E. P. Featherstonhaugh. The reception committee was composed of Mr. and Mrs. W. P. Brereton, Mr. and Mrs. W. M. Scott, Mr. and Mrs. Guy C. Dunn, Prof. and Mrs. J. N. Finlayson, Mr. and Mrs. W. J. Dick. The Rotary club quartette contributed numbers; there were also other interesting entertainment.

On April 1st a meeting was held in the University Building. Mr. McNamara of the Provincial Bureau of Labor gave a paper on "Safety Engineering". The paper was illustrated by moving pictures. Mr. McNamara gave a number of interesting statistics showing the economic loss in Canada due to accidents, many of which were preventable. He described the various means undertaken by large manufacturing and public bodies in Canada and the States to educate the public, and particularly the working man, to the necessity of taking precautions to prevent accidents. An interesting discussion took place, a large number of the members taking part.

Prof. Dorsey moved a motion that a small committee be appointed to consider the desirability of an effort being made to organize a wireless network in Manitoba.

That in view of the nature of radial communications being able to reach the frontier of the Province, under any emergency and in times of commercial stress and storm it should be under the Provincial Government control.

That the committee be authorized to fully consider the question and to report to the branch on what steps they think desirable with regard to the development of a wireless system of communication throughout the Province.

The Bill entitled "An Act Respecting Engineering Profession" has passed the legislature. Very few alterations were made to the original draft, such alterations being of a minor character. The Act is in line with the recently considered legislature at the special meeting which was held in Montreal.

A Provisional Council to administer the Act was appointed, and consisted of:

J. G. Sullivan, M.E.I.C., Consulting Engineer, Manitoba Drainage Commission.

W. M. Scott, M.E.I.C., Consulting Engineer.

J. M. Leamy, M.E.I.C., Power Commissioner Manitoba.

W. J. Dick, M.E.I.C., Mining Engineer.

W. P. Brereton, M.E.I.C., City Engineer, Winnipeg.

The Act calls for the council to provide a register and to register applicants.

Within six months of the coming into force of this Act a general meeting of the Association for organizing purposes will be held, when a permanent council will be elected.

The old Manitoba Civil Engineers Act, Chapter [illegible] of revised Statutes of Manitoba, 1913, is repealed.

The Act came into force the day it was assented to.

R. A. Ross, [illegible] of Montreal was visiting Winnipeg during the month.

The annual meeting of the Branch will be held on Thursday, May 6th, 1920.

Sault Ste. Marie Branch

Geo. H. Kohl, A.M.E.I.C., Acting Sec.-Treas.

Newton L. Somers, A.M.E.I.C., having resigned the Secretaryship of the Sault Ste Marie Branch on account of removal from the city, the Branch has unanimously chosen Geo. H. Kohl, A.M.E.I.C., as next year's Secretary-Treasurer. This appointment does not take effect officially until the end of the current year, but Mr. Kohl will carry on the duties of Secretary-Treasurer for the balance of the present year.

Border Cities Branch

J. E. Porter, A.M.E.I.C., Sec.-Treas.

At a meeting of the Border Cities Branch held in Windsor on Friday April 16th., D. A. Molitor, M.E.I.C. of Detroit, gave an address on the advantages of the metric system. Mr. Molitor enumerated four main advantages: simplicity, its international character, its single table of mensuration and the fact that it is based on the decimal system. Mr. Molitor gave the arguments against adopting the metric system, the chief of these being the expense and inconvenience of the change, but in view of the very great advantages inherent in the metric system these objections should not be held as too serious. The meeting, over which H. Thorne, A.M.E.I.C., Vice-Chairman of the Branch presided, was well attended, and gave Mr. Molitor an enthusiastic reception and an attentive hearing.

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary.

The Branch Executive Committee held a meeting at Niagara Falls on April 10th, and transacted a large amount of business, of which the following items are of interest to the membership generally:

Note was made in the Branch News of the March *Journal* of a resolution calling upon the Ontario Provincial Division to set up machinery for bringing to the attention of the Ontario Government the appointment of engineers to public positions and commissions where it was apparent that only a technical man possessed the necessary qualifications. A letter has been received from the Secretary of the Ontario Provincial Division acknowledging receipt of the resolution, and advising that it would come before the Executive of the Division for further action at its next meeting.

Another resolution of the Branch Executive is noted in the March *Journal* which has to do with the preparation of a salary schedule by the Ontario Provincial Division. A letter from the Secretary of the Provincial Division acknowledging receipt of this resolution was read and noted by the Branch Executive. Another letter from the Toronto Branch, giving approval of the resolution, was noted. The Chairman, as Branch representative on the Ontario Provincial Division, reported to the Executive the action which had been taken on the resolution. He showed that the members of the Provincial Division Executive had been circularized to obtain their opinions as to the best method of preparing such a schedule. The result of a ballot provided that the matter would come before the Division Executive at its next meeting in April.

The Executive Committee has had under consideration for some time the appointment of a Branch Legislative Committee and at the last meeting appointed F. E. Sterns A.M.E.I.C., as convener of this committee. The remainder of the committee is to be appointed later after consultation with Mr. Sterns.

The Chairman reported the recent visit of the Secretary of the Ontario Provincial Division to Niagara Falls and the meeting between him and the Chairman and Secretary of the Branch and the Chairman and Secretary of the Professional Meeting Committee. This meeting had to do principally with the 1920 Professional Meeting.

Messrs. K. C. Fellows, A.M.E.I.C. and S. D. Heuther A.M.E.I.C. were appointed auditors to audit the books of the Branch and report to the Annual meeting.

A resolution from the Toronto Branch calling upon Council to immediately take up the salary question was read and fully endorsed.

Trip to the Coniagas Smelter

The Branch held a trip of inspection to the works of the Coniagas Reduction Co. at Thorold, on Saturday afternoon, March 27th.

D. A. S. Mutch A.M.E.I.C., superintendent of the plant, gave a short talk before the trip through the works was started, and explained the process of reducing cobalt ore to its several refined constituents, and exhibited samples of the product from the natural ore state through all stages of refinement. These included metallic cobalt, nickel, silver, cobalt oxide in three forms, copper sulphate and arsenic.

The members were then conducted through the works in two parties, one in charge of Mr. Mutch, and the other under the leadership of Mr. Knittell, works chemist.

The first point visited was the blast furnace in which the ore is partially refined, most of the worthless content removed as slag, and the valuable metallic elements collected in a molten condition as bullion. The furnace was tapped for the benefit of the party, and the process of opening the cinder notch allowing the white hot [illegible] to flow into the ladles, and again closing the notch, was watched with great interest. As the mass cooled, the metals settled out in distinct layers according to their relative weight. When the cold mass was turned out of the ladle it was seen that the silver occupied the bottom portion with the nickel and cobalt above. The silver bottom was removed with a blow from a hammer, and sent on its course for complete refinement by chemical means.

The smoke from the blast furnace contains the iron content of the ore, and this is recovered by precipitation and filtration of the fine arsenic dust.

After the blast furnace treatment the process of obtaining each by-product is a chemical one supplemented by heat treatment at certain stages.

The chemical process consists in obtaining all the metals in solution as salts, neutralizing these to the point of precipitation of one by-product, filtering this out in filter presses and repeating the process with the remaining liquid till all the metallic salts are precipitated. These salts are washed, dehydrated and heated to a molten state and the refined metal obtained. The copper sulphate is crystallized out from the liquid in lead lined tanks, dried in a centrifuge, screened to size and packed for shipment. It is necessary to use lead pipes and pumps throughout the chemical process with special, acid resisting valves.

The final stage of the silver refinement is done in electrolytic baths. The cobalt remains in the oxide state and is shipped in this form. The party was interested in seeing this material being packed for shipment to the Orient.

The members are indebted to Mr. Mutch and Mr. Knittell for their clear explanations of each stage of the process and to Lt.-Col. R. W. Leonard, M.E.I.C.; President of the Coniagas Reduction Co., and Past President of *The Institute*, for the opportunity afforded of seeing the plant.

About thirty-five members participated in the trip.

Toronto Branch

H. A. Goldman, A.M.E.I.C., Secretary.

A general meeting of the Branch was held in the Engineers' Club on Thursday, March 25th, 1920 at 8.15 p.m.

The Chairman (R. O. Wynne-Roberts) presided.

It was moved by Mr. Cross, seconded by Mr. McMaster: "that the Spring Session of the Branch be extended one week to include May 13th, and that Mr. Slater from Washington be invited to come to Toronto to give a lecture, on that night, on the tests performed by the Emergency Fleet Corporation." *Carried.*

The Chairman then called upon the Speaker of the evening, Frank Barber, A.M.E.I.C.

Mr. Barber at first compared Canadian bridges with those built in Europe, pointing out that many bridges in Canada were built too light for the traffic, and the result frequently was disaster. Many bridges are built of wood, and therefore, are short lived, while the European bridges are built to last longer. But, said Mr. Barber, the time for wooden bridges has gone by. Steel largely replaces wood in tall buildings and also in bridges, and in a few years concrete will have replaced steel in bridges, except in special cases. The two characteristics usually attributed to steel, whereby it excels wood, are durability and fireproofing, but, said Mr. Barber, steel is neither durable nor fireproof. The average life of a steel superstructure is probably fifty years.

Mr. Barber then discussed the relation between the architect and the engineer. In the past, he said, the engineer has arrogated to himself the function of both the engineer and architect, this he claimed was a mistake. The practice often has been to call in the architect after all the design and planning of the structure was complete, and the architect was merely expected to add something for ornamentation. This, Mr. Barber thought, was not sufficient. He believed the architect should be consulted while the structure is being passed because he said "No great progress can be made until there is a greater co-operation between the engineer and the architect.

In the discussion which followed, the following members took part: Professors Young and Gillespie, Messrs. Oxley, McCarthy, Connor, Mylrea, Taylor, Hogarth and Engholm.

*

A meeting of the Branch was held at the Physics Building of the University of Toronto on Thursday, March 18th, 1920 at 8.15 P.M.

E. L. Grauel, Field Engineer of the Automatic Telephone Co., delivered a lecture and demonstration on the many different features of the Automatic Telephone.

As the subject under discussion was one of general interest to the public, the meeting was thrown open to the general public.

After the lecture and demonstration a moving picture film, taken at the Annual Meeting of *The Institute* at Montreal, was thrown on the screen.

A regular meeting of the Branch was held at the Engineers' Club on Thursday, April 1st, 1920 at 8.15 p.m.

Two letters, which were received from Mr. Keith were read by the Secretary; one letter announcing the fact that the Council had appointed a Committee on Engineering Remunerations to deal with Engineering salaries and the other letter stating that the invitation by the Toronto Branch to hold the next Annual Meeting of *The Institute* at Toronto was accepted by the Council.

The following resolutions, which were previously passed by the Executive Committee, were also approved at this General Meeting:

"Whereas the Federal Government of Canada has decided to create a new department of Public Health, and

"Whereas in the opinion of the Toronto Branch, E.I.C., it is important that engineers should be represented on the Board;

"Be It Therefore Resolved that the Council should be requested to appoint a committee of members resident in Ottawa to urge upon the Government the importance and desirability of having at least one engineer on the Federal Board of Health."

"Whereas the Toronto Branch of *The Engineering Institute of Canada* at an open meeting held on March 4th, 1920 passed a Resolution urging the Council forthwith to request each Branch to appoint a Committee to investigate and report upon the structure and constitution of an organization designed to bring into operation direct and concerted efforts toward the improvement of the economic status of engineers, a copy of which was forwarded to the Headquarters on March 9th, 1920; and

"Whereas the members of the Toronto Branch desire to know what steps have been taken by Headquarters to give effect to their request, and

"Whereas the Council has invited a conference with the Ontario Councillors, the Chairman and Secretary of the Provincial Division and the Chairman of this Branch to discuss any and all Ontario matters which it is thought require special attention, and

"Whereas it is important that the question concerning the economical status of all engineers should receive the earliest possible attention,

"Be It Therefore Resolved that the Councillors, who are *ex-officio* members of the Executive Committee, and the Chairman of the Toronto Branch of *The Engineering Institute of Canada*, who are invited to Montreal on April 13th next, be requested to explain at the conference the urgency of the appointment of Committees to carry out the requirements named in the Resolution above referred to, and that a copy of this Resolution be sent to Montreal and to the delegates to the Convention."

The Chairman then called upon A. V. Hall, who read an excellent paper on "Town Planning and the Canadian Engineer." The Speaker outlined the elements which must be considered in the planning of a town.

An extensive discussion followed in which the following members took part: Messrs. Oxley, Bonnel, Powell, Hynes, Phelps and Storrie.

Kingston Branch

W. P. Wilgar, M.E.I.C., Sec.-Treas.

The Kingston Branch has been particularly fortunate since its organization, in the co-operation of its members in the matter of interesting technical papers and the courtesy of outside members in supplementing the local contributions.

The first paper, presented by J. M. Campbell, M.E.I.C., dealt with the details of construction and operation of the Kingston Mills Power plant.

Large scale plans and blue prints were used in illustration, and the methods of overcoming the early difficulties of operation were presented in a most interesting manner.

On the 2nd of February the Branch Secretary gave an address on the pioneer days of the National Transcontinental Railway in Northern Ontario and by means of lantern slides illustrated transport and supply arrangements incidental to the isolated portion of that district.

On the first of March the General Secretary, Fraser S. Keith, visited the Branch and delighted a very large attendance with his exposition of the aims and activities of The Engineering Institute.

He spoke particularly of the attitude of The Institute concerning its members, and pointed out its unique position along these lines in the field of technical societies.

On the 5th of March Professor Peter Gillespie of the Toronto Branch drew an audience of three hundred to listen with interest to his address, "Aesthetics of Bridge design as applied to Reinforced Concrete."

Errors of judgment and conventional conceptions in the reinforcing of structural details in design were illustrated by lantern slides.

On the 19th of March Captain F. M. Dawson, M.C., read a paper on "The Microscopic Examination of Cement and Concrete."

Capt. Dawson pointed out the enormous discrepancy between the cement used in proportioning and that which was effective as cementing material. He spoke of the results recently obtained in research along these lines by the addition of a catalytic agent, and illustrated his statements by remarkable photomicrographs of cement and cement mortars.

These, reproduced on the screen, showed clearly the unhydrated cement and the voids of ordinary portland cement mortars, and brought out in contrast the effects of certain catalytics, in reduction of the unhydrated percentage, and the consequent increased density of the mixture.

The members of the Engineering Society of Queen's University, the Undergraduate Engineering organization, were invited to attend all branch meetings, and demonstrated by a large and regular attendance a very keen interest in Branch affairs.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary.

On Thursday evening, March 18th, the Branch was addressed by A. B. Lambe, of Ottawa, Secretary of the Ontario Provincial Division on the subject of "Institute Affairs". Among other things Mr. Lambe described the progress of Legislation in the various provinces and what the Ontario Division proposed to do in this respect.

John Murphy, Electrical Engineer for the Department of Railways and Canals, was the speaker on Thursday, April the 8th, when he gave his celebrated lecture on "Ice, Frazil and Anchor Ice." Both moving pictures and lantern slides were used to illustrate the lecture which resulted in one of the best meetings the Branch has yet had.

The Nominating Committee appointed at the last meeting made the following nominations for the elections which will take place in May:

Honorary Chairman, R. B. Rogers,

Chairman, R. H. Parsons,

Vice Chairman: E. R. Shirley, P. L. Allison,

Secretary: R. L. Dobbin, W. G. Montgomery, B. L. Barns;

Treasurer: D. L. MacLaren, A. B. Gates;

Executive Committee: P. P. Westbye, A. L. Killaly, Jas. Mackintosh, J. A. Goulet, G. R. Langley, C. E. Sisson, C. H. Rogers, A. P. Miller, J. D. W. Magie, W. A. Logan, T. E. Gilchrist, N. D. Seaton.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec.-Treas.

The Branch has held three meetings during the past month. On April 1st, at the regular monthly luncheon at the Chateau Laurier the principal guest and speaker was Mr. Storker Storkersen, who was first officer of the Anglo-American Arctic Expedition in 1906-07, and second in command of the Northern section of the Canadian Arctic Expedition 1913-19. Mr. Storkersen gave a graphic description of his experiences whilst in command of the last ice exploring party of the Canadian Expedition in 1918, when for eight months he and his companions lived and travelled on the ice floes, relying for their food almost entirely on hunting.

On April 8th, the Branch held a joint meeting with the local branches of the Town Planning Institute, and the Ontario Association of Architects, to hear J. Noulan Cauchon, A.M.E.I.C., explain the proposed removal of the Grand Trunk Cross Town Tracks. The subject was fully discussed by representatives of the various local organizations and the members of the Branch present expressed their general approval of the proposition for the removal of the Grand Trunk Cross Town Tracks, and for the transfer of the handling of all through traffic in Ottawa to a line and yards to be established outside the existing city limits.

The Executive Committee have considered that it would be in the interests of the Branch to have each year a popular lecture on some engineering subject of general interest. John Murphy, M.E.I.C., Chief Electrical Engineer, Department of Railways and Canals, and Railway Commission, was selected as the speaker for this year and delivered the first lecture of these annual series on April 21st, his subject being " Canada's Ice Problems and their Solution." Mr. Murphy's work in this connection is very widely known and drew a large and appreciative audience to the Collegiate Institute Hall where the meeting was held. He spoke more particularly in connection with ice jams and floods, hydraulic power plants, and the possibility of earlier navigation. The moving pictures showing frazil and anchor ice in process of formation, which have previously been seen by several of the Branches, were followed with great attention.

Montreal Branch

Frederick B. Brown, M.E.I.C., Secretary.

With John T. Farmer in the Chair, the first meeting of April was held on Thursday, April 2nd, when Lord Congleton, Jr. E.I.C. gave a most interesting address on naval gunnery, with particular reference to recent developments in fire control and direction. Lord Congleton has served for twelve years as a gunnery lieutenant in the Royal Navy and is thoroughly familiar with his subject. The lecture was fully illustrated with lantern slides showing the latest forms of naval gun sights, the director system, etc. An interesting point brought out in the course of the lecture was that with the perfection of the director system — developed largely through the initiative of Admiral Sir Percy Scott — one man controls the fire of not merely the guns of his own ship but those of the next in line. Another unique feature of the director system is that the rolling of the ship is taken advantage of to such an extent that frequently better firing is done in heavy weather than in smooth water. The discussion which followed the reading of the paper was lively.

On Thursday April 9th Capt. F. M. Dawson A.M. E.I.C., gave an illustrated lecture on "The Microscopic Examination of the Hydration of Portland Cement and Super Cement". This paper was highly technical and the result of much careful research work; it will be printed in a later number of *The Journal.* The lecture was illustrated with a number of lantern slides. Following the reading of the paper a number of members interested in this line of work joined in the discussion.

The third meeting of the month was held on the 16th, Arthur Surveyer, Chairman. The lecturer of the evening, Olivier Lefebvre, illustrated his splendid paper on "The Regulation of the St. Maurice River and the Gouin Dam" both with lantern slides and moving picture films showing the progress of construction work on the dam. Among the members who complimented Mr. Lefebvre, was Sir John Kennedy, Hon. M.E.I.C.

On April 23rd, J. Melville Allison gave a lecture on coton rope drive, the address being illustrated by a series of lantern slides specially sent from England, showing various types of cotton rope used for power transmission, and the methods of using it.

Mr. Allison said that in England they had paid much more attention to rope drive for power transmission than on this continent. Cotton, he said, had superseded manila and any other material for rope drive in this connection. Manila rope, he said, was cheaper than cotton, but the latter would carry a third more power, with a lifetime in the ratio of five to one, while the cotton rope was much less affected by atmospheric conditions.

St. John Branch

A. R. Crookshank, M.E.I.C., Sec.-Treas.

Good progress has been made this month with the Bill that the Association of Professional Engineers of the Province of New Brunswick have brought before the. Provincial Legislature, as it has received its first and second reading, and passed the committee stage on April 20th.

The Bill, as approved by the Provisional Council, was distributed to all engineers in the Province, and was filed with the Legislature on March [illegible]. The Bill was accompanied by a petition signed by 104 engineers.

Several of the Moncton engineers did not approve of some of the sections and called a meeting, which was held in Moncton on March [illegible]th, and was well attended, and several amendments were adopted.

On March 31st, a delegation from that meeting met the St. John Councillors and the other engineers and spent the day in thoroughly discussing the amendments. The majority of the amendments were approved, and the rest modified, and they were recommended to the Provisional Council.

The Council met that evening at Fredericton, with Moncton and other engineers, and the Association's legal adviser, and completed work on the revision of the amendments so that the Act, as amended, would be agreeable to all. The Act as amended was formally approved at a meeting of the Council the next morning, April 1st, after which a large delegation of engineers waited on the Law Committee of the Legislature and pleaded their case. The Committee had to adjourn before they had completed their study of the Bill.

The Law Committee completed their study of the the Bill the following week, and it was taken up in the Committee of the House on the [illegible].

The Committee had no objection to the principle of the Bill, but did not approve of the definition of "Professional Engineer," as they considered it might unintentionally infringe on the liberties of other classes of workmen, so sent it back to the Law Committee to be amended.

Some opposition was raised by the Association of Domestic Sanitary and Heating Engineers of New Brunswick, who objected on account of their not being included in the working of the Act.

The Law Committee amended the definition by changing the first three lines of Section 2, subsection (b) from "The practice of a Professional Engineer within the meaning of this Act embraces advising on, valuating, designing, laying out, and supervising the construction, enlargement," etc. to "'Practice as a Professional Engineer" shall mean and include the designing, laying out, and supervising in a professional capacity the construction, enlargement,' etc. The first clause of this refers to the penalty clause, section 11 (a).

It is expected that the third reading will take place before this goes to press.

The St. John Branch held its regular monthly meeting on April 22nd with G. G. Murdoch, M.E.I.C., in the Chair.

The Committees on the "Old Court House" rebuilding proposition, and on City planning reported progress.

The speaker of the evening was Capt. C. McN. Steeves, M.E.I.C., late Adjutant 9th. Battalion Canadian Engineers, who took as his subject "Organization of Military Bridging Operations."

Mr. Steeves dealt very exhaustively with all the detail steps and operations followed by the Engineering Corps in France in preparation for and the building of temporary or semi-permanent bridges for army purposes.

On first entering upon an area information was gathered from all possible sources of the location, dimensions, etc., of existing bridges in the country that was or might be occupied. Also information was obtained regarding possible bridge sites, railroad, highway and other transportation facilities, resources of the country in building material, etc.

Large depots were established at the rail-head, where complete supplies of standardized bridging materials, tools and equipment were kept. This included fabricated steel and wooden spans from 10 to [illegible] feet long all ready to be put together at the bridge site, trestle bents of varying heights, standard lengths of boat sections, etc. Smaller depots were opened up at transportation centres farther inland.

When a bridge was found to be necessary the Engineers of the field party would obtain information as to the requirements of the case and would report to Headquarters the size and type of span required, the stock of material at hand, transportation difficulties, and would make arrangements for the rationing and the taking care of the men composing the working parties. Detail methods of handling the material and transporting it to the site worked out so as to have the material arrive when wanted and to avoid congestion or other interference to rail or highway traffic. Highways had to be improved to take the heavy steam or petrol lorries, and yards at the site prepared for storing the material as delivered and from where it was taken and erected into the structure as required.

Materials would start arriving from the depots in from twenty-four to thirty-six hours after the requisition had been sent in so little time was given in getting ready to receive it. Piers and abutments were made of pier supports or built up of three foot cribs of angle iron, bolted together by light timbers. These coming already built would be put together quickly.

A novel departure from civilian practice was the placing of the spans without any falsework. The span was built inshore on rollers and ropes were attached to its river end and led to derricks on the opposite bank of the river. When it was completed it was pulled across until it rested on the bridge-seat on the farther side. Preventer tackle attached to dead men and the inshore end of span controlled the movement.

After an interesting discussion on Mr. Steeves' paper considerable business was transacted which included a resolution approving of the stand taken by the Manitoba Branch re the Federal Civil Service classification.

Halifax Branch

[illegible], M.E.I.C., Sec.-Treas.

A meeting was held in the [illegible] Banquet Room on Friday, March 26, at 1 P.M. ([illegible]). The attendance was [illegible] including Messrs. H. S. [illegible], representing the Dartmouth Board of Trade, H. L. Hart, representing the [illegible], [illegible], representing the Halifax Board of Trade, Geo. L. [illegible], representing the Rotary Club, and C. P. Wood, representing the Commercial Club, these gentlemen being guests of the Branch.

The following letters were read:

Halifax, March 20th, 1920.

F. A. Bowman, Esq.,
Chairman Halifax Branch,
Engineering Institute of Canada.

Dear Sir:—

Your committee appointed to investigate a proposed Bridge across Halifax Harbor at a suitable point nearer the center of population (than that suggested at the "Narrows") and as brought up at the Citizens Joint Committee, beg to report as follows:—

The type of bridge to be considered is one to carry street railway vehicular and pedestrian traffic. From available information it is quite certain that the Admiralty will not permit piers or obstructions of any kind outside of pier-head lines. As a result this puts a low level bridge, with draw or lift spans out of the question.

A high level bridge was then investigated and as a height of at least 150 feet was necessary for the entire width of Harbor, nothing else seems feasible except a Suspension type, which would be cheaper than a cantilever to give the full necessary clearance. The site suggested was that between the vicinity of the Dockyard on the Halifax side and Black Rock point on the Dartmouth side. A sketch plan is herewith submitted showing soundings, elevations, and profile of approaches, the soundings being obtained from Admiralty chart of 1918, and profile from measurements and levels on the ground. It will be seen from this sketch that the height of Main piers is approximately 200 feet to base of Towers. Approches on the Halifax side can be obtained as shown with a fairly easy grade from Lorne Terrace, and on the Dartmouth side the long approach seems the best.

Under these conditions we estimate the cost of Bridge at not less than $10,000,000.00 arrived at as follows:

Two main piers	$ 2,400,000.00
Anchorage	600,000.00
Suspension Span	3,000,000.00
Approaches	2,000,000.00
Right of Way & Engineering	2,000,000.00
	$10,000,000.00

The annual cost of such a Structure would be in our opinion about $1,300,000.00 arrived at as follows;

Upkeep	3%	300,000.00
Depreciation	3%	300,000.00
Interest	7%	700,000.00
		$1,300,000.00

Further we do not believe, from enquiry made during the short time at our disposal, that more than 25% of the annual cost could be raised by any system of reasonable tools and rentals. We therefore beg to report that we do not consider this proposition could be justified by the traffic which it would serve.

For the Committee,

(Sgd.) L. H. WHEATON,
Chairman.

F. A. Bowman, Esq.,
Chairman,
Halifax Branch, Eng. Assoc. of Canada.

Dear Sir:—

As a delegate from this Branch to the Joint Committee on the proposed Dartmouth Bridge, I wish to deal further with this question beyond my instructions as Chairman of our own Society's Committee, which dealt solely with the Bridge at the Dockyard site. Any one can see from the sketch that, assuming the permission of the Admiralty were granted for a Low Level Bridge, there are some complications connected with this which require attention.

If this bridge were built to enable railway connections; and this is quite feasible, either the grade problem, due to over head crossing of tracks on each side of the Harbor, would compel broken grade approaches, and result in an unaesthetic structure; or a double deck bridge with traffic floor above the railway level would have to be built, thus, adding materially to the cost.

Again, if you eliminate railway connections, the traffic bridge could be built at same level as floor of over-head bridges-giving us higher piers, but not increasing cost, as this would be off-set by the elimination of the railway connections.

In my opinion, the bridge at the narrows, while lengthening the distance to and from Dartmouth, seems the most feasible, and the most likely to be financed—since there is the hope of Government aid in all or the greater part of the cost, which is less than any other structure, better located for railway traffic, and more in keeping with the amount of other traffic to be served.

Yours very truly,

(Sgd.) L. H. WHEATON,
Consulting Engineer.

The Chairman gave a brief outline of the reasons for the appointment of the Bridge committee and of their work in getting up the report. The report of the committee was then read by the Chairman and ordered incorporated in the minutes as heretofore given.

Mr. Wheaton then explained how the figures in the report were arrived at. Relative cost data were given for a bridge at the Narrows and a low level bridge at the Dockyard in comparison with the estimates for a suspension bridge at the latter point.

A lively discussion followed; in this several visitors took part and many interesting facts were brought out.

The Chairman extended the thanks of the branch to the guests for the part they had taken in the discussion and also extended the thanks of the branch to Mr. Wheaton and his associates for the excellent work done.

Mr. Allen, on behalf of the general bridge committee extended the thanks of that committee to Mr. Wheaton and his associates, and stated that the report would be laid before this committee at an early date. Mr. Hart, in seconding this vote of thanks on behalf the Progressive Club expressed his personal pleasure in being present.

Preliminary Notice

of Applications for Admission and for Transfer

[illegible] April, 1920.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in May 1920.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at the option of the candidate: Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: Geography, History (Govt. of Canada in particular), Arithmetic, Geometry (Euclid Books I-IV and VI), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements or practical experience is qualified to cooperate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

THE ENGINEERING INSTITUTE OF CANADA

[illegible]

THE CANADIAN SOCIETY OF CIVIL ENGINEERS

[illegible]

VOLUME III — MONTREAL, JUNE 1920 — Number [illegible]

Replanning Montreal and District

[illegible], M.E.I.C.

Montreal spent fourteen and a half millions of dollars in expropriations for street widenings, extensions, etc., during the six years ending [illegible]. In addition to this the actual operations of carrying out these schemes must have amounted to several millions more.

This may be described as Montreal's medicine bill, taken on account of some of the troubles affecting her as the result of bad planning.

The disease itself, however, continues to run its course unarrested, and every year is taking a deeper and firmer hold.

The Cost of Faulty Planning

What the ravages of this disease has cost the City of Montreal in cold cash during the last quarter of a century is not easy to estimate. That is not like the fourteen and a half millions or more entered in the ledger, it cannot be expressed in figures, but it is none the less real and substantial. It is the unseen and unrelenting daily drain which week by week, month by month, and year by year piles up to an astonishing aggregate, beside which the fourteen and a half millions appear paltry and insignificant.

When one thinks for instance of the tremendous cost of street cartage every day in a city like Montreal and realizes that by reason of congestion and delays, indirect routes, short loading on account of steep grades and so forth, there must be a loss of something approaching one third on the cost of that cartage, we might profitably inquire into a question like that, but we are not very inquisitive.

When one considers the needless waste of land, of grading and of paving in our streets, because it is our wont to accept them exactly as laid down for us by the land owner or the real estate man, every new subdivision thickly seeded with an [illegible] crop of future expropriations, this might well afford us food for deliberation, but we do not deliberate.

And when we see, as we can hardly help seeing, the most prodigal, almost incalculable, needless expenditure on the laying and maintenance of our streets, and the maintaining of water, sewerage, power and other services, because we indiscriminately scatter our factories and industrial establishments all over the place, regardless of their harmful effects on nearby business and residential properties, surely all this might teach us wisdom. But it doesn't.

Read before Montreal Branch, [illegible], 1920.

And when we observe everywhere around us the chaotic conditions, the general state of instability and makeshift, the putting up and pulling down, building and rebuilding, all of this the result of hap-hazard and indiscriminate development, and through the want of planning with a purpose, we might well if we had not become callous and inured to it all determine to find a better way.

Of course we know in our hearts that some day or other the reckoning must be paid, some day we must face the inevitable and tackle the question with grim resolution, in the meantime the most we care about doing is to — temporize.

Benefits of Good Planning in Dollars and Cents

During the last few years the great metropolitan city of New York has been wrestling with the problem and has evolved a scheme by which, it is authoritatively stated, that from plans and estimates prepared and beginning to be carried out, they figure on saving within the next twenty years the vast sum of a thousand million dollars. We may argue from that something of how many thousand million dollars New York must have lost in the past through not having commenced sooner, and we may at the same time take the lesson home to ourselves, and further argue that Montreal, with conditions essentially similar, must have a tremendous leakage, and could by endeavouring as much as possible to put a stop to that leakage save in proportion to its relative size and population well over a hundred millions within the next twenty years.

Chicago too, after years of laborious groundwork by its engineers, followed by an active propaganda of public enlightenment, has succeeded in evolving a scheme that bids fair to transform one of the ugliest and dingiest of cities into a veritable Paris of the West.

The Growth of Montreal

It seems indeed that Montreal is asleep and relatively a back number amongst its compeers, since it was recently stated here by Thomas Adams that it was the only one of all the cities approaching its size and importance on the North American Continent that is still without a general and comprehensive scheme of civic betterment. This, moreover, in face of the fact that by reason of its unique and strategic situation as an ocean port in the heart of a continent its destiny is so plainly manifest. For Montreal in spite of all its disabilities has progressed in a most marvellous way, if mere increase in bulk can be called progress.

Its growth has been coincident with that of the Dominion of Canada, and while during the last thirty years the population of the Dominion has barely doubled, that of its largest city has more than quadrupled.

It does not seem therefore that there is very much of a gamble about the future of Montreal, and it could hardly be called too optimistic to surmise that within the next ten or twelve years we should reach a population of a million and a half.

Mere bulk however is not everything, and one hesitates to think of what kind of a city it will be by that time if such development should take place along existing lines and not on more sane and rational ones. What will our central streets then be like since they are crowded and congested now? Will our railroad crossings continue to block our street traffic in still more accentuated form? Will there be four times the number of killings at these crossings since there will be twice the number of people and twice the number of trains? Will our factories all have moved away indiscriminately to the outskirts, there to create a new plethora of slums in addition to the old ones left behind? Will our present provision of parks and playgrounds then be sufficient, and how many incline elevators will be necessary to take the "rabble" up to the top of Mount Royal, or will they still congretate thick as flies on the plain below? Where shall we then park our automobiles since they will have multiplied ten times over, and it is doubtful if all the public squares and breathing places will be able to contain them?

These are questions suggested in rather a light vein it is true, but still requiring serious reflection, and careful and laborious working out.

If we look at the map of Montreal and begin with that section skirting the river, we observe first a number of somewhat irregular and rather narrow streets, which constituted the old town of Ville Marie. As a matter of fact that is the only portion of the city which has really been planned or shows any clear evidence of design; the rest is only a patchwork of subdivisions, hitched together, which is a very different thing.

Over a century ago Town Planning as an art was held in higher esteem than it is in these days, for history tells us that the French King commissioned his engineers to prepare this plan, and it must be conceded they succeeded better than we have ever been able to do at a later date, excepting perhaps for the narrowness of the streets, surely excusable when we consider that those pioneers had not the faintest motion of the mighty city that would eventuate from the nucleus they were then laying down.

Above Craig Street the character of the layout changes and becomes practically rectangular with what may be called the uptown streets predominating over the crosstown ones in the proportion of about three to one, which is just the reverse of what it should be considering that the city is spreading along the river and is about twice as long as it is broad.

This is where we got away from the town planning, and into the subdivision business, and we have been getting worse and worse ever since. For it is simply a case of laying out the streets according to the farm lots, without relation to the shaping of the town itself or the trend of traffic within, and very little correlation of adjoining subdivisions one with the other.

The King of France has long since passed away, and his engineers and their methods have alike been forgotten. We have become democratic now and imagine we are free, but are really the slaves of a more merciless tyrant of our own creation. For the Real Estate Monarch holds undisputed sway, and the divine right of private ownership upheld by legislative authority exacts its tribute and dictates and determines for us the form and the manner in which the land shall be used, leaving on the shoulders of the always and longsuffering taxpayer the burden of paving, and all the inconveniences and troubles besides.

The difference between the absolutism of an older day and that of the more modern and up-to-date autocracy is one mainly of motive. For whereas the former was benignant and concerned throughout in the development of the land for the well-being of the inhabitants, the latter is interested only to the extent of getting all of it for the largest and quickest returns it can get.

Street Widths

But we are not altogether at the mercy of the real estate dictator, there is at least one reservation our laws have laid down in the Province of Quebec, and that is that within an incorporated town the minimum width of street shall be 66 feet. On the other hand it is doubtful if they could have made a worse selection, for this is too wide for any purely residential street, and much too narrow for a main traffic thoroughfare, especially with double track tramways. And the effect has been that we have practically no main thoroughfares except those that have been widened at tremendous cost, while all our streets have become more or less through traffic streets, necessitating wasteful and expensive paving and maintenance.

Of course outside of an incorporated town this stipulated minimum is of no effect. There they can be anything the proprietor pleases, and our real estate friends are enterprising enough to see that nearly all our subdivisions are made long in advance, and become part of some minor municipality which by Act of Parliament is annexed holus-bolus to the city.

The extent to which this sort of thing aggregates may be gathered from a glance at a tabulation of total street mileage of the city since 1907, in which year we observe the total was 40 miles. In 1910 it was 70; in 1914, 117; in 1916, 222; and in 1919 had reached the astonishing total of 584; or in twelve years in which the population had about doubled, the street mileage had multiplied itself fourteen times over. At first sight this may appear something to boast about, but it really should give us the gravest concern; for it is evident that the hitherto fairly compact nature of the city's growth is giving place to thin and scattered development, with its attendant obligations but without corresponding resources.

The great outstanding shame, for it is doubtful if any other word can express it, is that the City itself should have so little to say regarding the nature and disposition of its own streets, until they are practically past remedy. Yet it should be remembered that the main reason is not that Montreal is without the power, but because she does not exercise it.

The Importance of the General Plan

Unless we are much mistaken, Montreal is really exceptional and very fortunate in having the power and authority to require that all new subdivisions shall conform to the general plan. The unfortunate thing about it is that she has not got the PLAN. And further more we are told that Montreal is too poor and has no money to pay for it; so we are forced to the conclusion that Canada's metropolis is in the sad and somewhat paradoxical predicament of not having enough money to pay for a plan, and never will have enough money until she gets one.

Senator L. O. David the late veteran City Clerk, in citing the principal causes which have contributed to bring the city into financial straits, among others mentioned the following:—

"Absence of a general plan showing the manner of laying out the streets and the width thereof, not only in the city but also in the adjoining municipalities, which will, sooner or later, form part of the city. Owing to the lack of such plan, the streets have been laid out according to the caprice of the interested proprietors and, as a result, there have been effected costly expropriations which have increased our debt by several millions of dollars.

Acceptance by the city of streets which only existed on plans and, therefore, obligation of performing all municipal works in such streets at the expense of the citizens generally. In all the large cities of Canada and the United States those who desire to divide an immovable into building lots have to make their divisions according to the general plan of the city and they must, moreover, perform, at their own expense, all municipal works, to wit: sewers, levellings, pavings, sidewalks, etc., and such work must be done according to the plans and specifications prepared by the city engineers. Needless to say that our debt would not be so high if this system had been adopted.

Absence of a uniform legislation, which would have placed the city and the municipalities which are bound to form part of Montreal, in the same conditions as to the manner of laying out the streets, of carrying out municipal works and of paying the cost thereof, which would have prevented the city from bearing the responsibility for and paying the cost of expensive works, which are often useless and do not agree with our general system."

Looking broadly at the situation, it seems evident that whatever troubles we are now afflicted with by the central portion of the city are in a fair way to be repeated in the outlying districts, only in more intensified form and on a greatly enlarged scale. Indeed signs are not wanting to show that in the method of laying out some of these new subdivisions the practice of preying on the city has developed into a kind of science.

However distressing and ominous such features may be for the future, they are relatively of minor importance for the present compared with the great central fact that the layout or rather conglomeration of layouts that compose the City of Montreal is not on the lines of economical development. It is hardly necessary to point out amongst engineers that its general rectangular character is a wasteful one, or to do more than mention as regards grades that the practice of going plumb up the face of a hill instead of taking it on the bias is devoid of ordinary common sense.

Traffic Thoroughfares and Residential Streets

Regarding the streets of Montreal the commonest criticism we hear is that the streets are too narrow. But a better understanding of the subject would declare that on the contrary most of them are too wide, only a few of them, and these the most important main throughfares are too narrow. The great trouble is that we turn all our streets into through traffic streets, and pave them or endeavour to pave them as such, and the work is never done; it is entirely too big a job. The reason that we have so many holes in St. Catherine St. is because of our outlying residential streets of 60 and 80 feet width that we are striving to pave in concrete and asphalt, when 36 feet streets with the building line set back, and 24 ft. roadways paved with a good tar macadam should suffice. Is it not strange that we engineers should by patient research and careful design and supervision be straining every nerve to save the fraction of a cent off the cost of a yard of asphalt or concrete, and then go unquestioningly and plaster all over these streets anywhere from fifteen to forty per cent more than there is any necessity for, just because it is not our business to inquire?

Is it not forcibly clear that the width nature and disposition of streets in a city are primarily engineering questions of the utmost importance and concern, requiring serious and earnest study, and not to be settled lightly by a wave of the hand from the self interested landowner or his docile surveyor doing his bidding?

It is the main traffic thoroughfares that claim most earnest attention, and these with due and proper study and consideration of the volume and trend to traffic present and prospective, should be of ample capacity, of most direct route, and paved in the strongest and most enduring manner possible.

They should facilitate and invite traffic, whereas subsidiary streets should discourage everything but local traffic, and can quite well be narrow and tortuous, and be ever so lightly paved. The money saved on the one hand could be much more advantageously spent on the other, and still leave a handsome margin of profit.

It is doubtful if it can be said that Montreal has any typical main thoroughfares. We have some which for want of a better medium are used as such, and these are always congested, and in a condition of constant transition and upheaval.

The practice of widening them as necessity compels, especially under existing expropriation laws, experience has abundantly proven to be extravagant and prodigal, and the results in no sense commensurate with the cost. In many cases equivalent advantages could have been attained by the simple expedient of rounding off some of the principal corners, for as the strength of a chain is the strength of its weakest link so is the capacity of a street to be measured by its ability to digest the traffic at its busiest crossings. It may be noted that at many of the more congested corners on central St. Catherine Street such improvement as this would have been of the greatest advantage, and it is to be lamented that in recent years at several of these corners old buildings have been replaced by new and valuable ones, and such golden opportunities have been allowed to pass idly by.

Improving Traffic Facilities

Generally speaking, the widening of principal streets is anything but a paying proposition, not only as regards actual expenditure, but the attendant dislocation of traffic and business is by no means to be lightly estimated. It is usually cheaper and more satisfactory to open up new parallel streets through less valuable property, at the same time as much as possible to weed out buildings of an objectionable nature.

Still more promising is the new diagonal main thoroughfare with its double effect of at once reducing distance and grades, and at the same time relieving both uptown and crosstown streets of their overburden of traffic. It may be objected, of course, that the new diagonal superimposed on an existing rectangular layout is not an economical one as regards land, leaving as it does a number of odd shaped cuttings at the crossings, This is true, but even that has the advantage of providing open spaces that break up the dull and deadly monotony in the regimental regularity of the gridiron pattern. After all, notwitstanding its tawdriness, it is Broadway that is the outstanding feature of New York, and not Fifth Avenue with its never ending repetition of complacency and smugness

These open spaces, too, offer a fine solution of the automobile parking problem which is irritating enough already, and bids fair ultimately to become a vexation of the first magnitude.

The cost of constructing wide diagonal boulevards would naturally be tremendous, and could not be attempted under existing expropriation laws, but, on the basis of a fixed percentage over assessment, and with powers of excess condemnation, there can be little doubt that by thorough and careful study and planning and economical execution the expense would be amply justified by the results.

The improved land values on such wide boulevards would naturally involve less rigidity in our by-laws regarding the height of buildings. Without attempting for a moment to criticise the propriety of the decision recently given on this question, the wisdom of setting a fixed arbitrary limit for all over the city is surely open to criticism. This is surely a question which should be settled in relation to site, surroundings and locality, for it is not difficult to see how a ten story building on St. James or Notre Dame Streets may easily be more of an iniquity than a sixteen or twenty story one on a public square or a wide boulevard, while a ten story apartment house on a narrow street in an uptown residential district is a greater evil than either.

Indeed the carrying out of any great improvements in a city like Montreal can hardly be made feasible without counting on a considerable increase in land values involving the erection of higher and better buildings, and it is the public square and the wide boulevard which should have them and not the narrow side street. Such views as these may be deemed somewhat heretical from the orthodox town planning standpoint. Common sense would indicate however that a great metropolitan city should be proportionately and uniformly great, and the concentration and condensation of business can be of greater import to the public at large than the conservation of a few rays of direct sunlight.

What Town Planning Does

Town Planning has never been more aptly or comprehensively described than by the expression of "Everything in its place and a place for everything." It is the essence of orderliness in city development, but our usual practice is almost the antithesis of this. The ill considered intermingling of industrial business and residential premises has precipitated a condition in which each element is detrimental to the advantageous development of the other. As a natural consequence whichever is most injured and least able to hold its ground has to get out of the way of the offender.

The home gives place to the shop, the shop to the office building, the office to the industrial flat, and in the rear of the procession comes the big heavy factory driving everything before it.

Now it could have been arranged, that certain areas contiguous to main transportation lines should have been reserved for factory purposes, with room for extension, where they might have every facility for carrying on their work, an economic concentration of water, sewerage, light, heat and power, services, special fire protection, and the elimination to a large extent of ruinous cartage on other than main thoroughfares suitably paved. Certain other areas appropriate for residential development could have been selected, and these suitably laid out with streets winding or otherwise, and of no larger capacity than would be necessary for local requirements, with the exception of a few main boulevards on which our public, semi-public, amusement, and tall apartment buildings could be placed, and all of these steadily improved and embellished.

Adequate provision could also have been made for shipping and financial operations located in a way that would be mutually helpful and advantageous each with the other, and planned altogether with a view to the ultimate and highest development of each component part, and to the stability and embellishment of the whole. Such a consummation would be an incalculable and universal benefit to the whole community.

Such ideas as these are by no means so fanciful as they may at first sight appear. On the contrary they are intensely practical and practicable, and to a greater or less extent are actually being carried out in other places today with most beneficent results. And the more study that is given to the question the more it compels the wonder that New York and other large cities should be able to get such result and save such fabulous sums of money, and replaces that wonder by amazement that they did not [illegible].

Railways and the City

The question of the railway situation in any city is one which lies at the very foundation of the civic structure, and to understand it we would do well to remember in the words of one of the railway people themselves that "Railways are not built to carry passengers or freight, but to earn dividends." The convenience and accommodation of the public is therefore not of such paramount importance to them as the securing of business, especially under competitive conditions. In the original locations of these railroads, as in most other things, the lines of least resistance are usually followed, and the most direct route, the easiest grades and the cheapest right of way and construction are the governing factors, always with a keen eye to getting the inside track of a rival road. And so it is not to be wondered at if these railways, the great originators of traffic should themselves be least considerate of those kinds of traffic other than their own, or as mindful of public welfare or feeling as we may think they might be. But that is no reason why the public should neglect to hold up its end in the best way that it can.

It may be said that it takes railways to make a city, and there is nothing like railways to break one. Most of the great towns of the North West which before the advent of the railways were nothing but prairie, and since then have been called into being and sprung up into busy flourishing centres, are now groaning in travail with the iron grip on their vitals, enmeshed as they are in network of rival railways. And this is equally true if less obvious in the greater cities of the East. The trouble is that the questions between the railways and the towns, and in particular the level crossing problem, is not usually settled on the ground of paramount interest or importance, but on the basis of precedence, the simple matter of having got there first, and the railways usually have it, and their motto is "J'y suis, j'y reste." The City of Montreal has a big enough problem on hand in the question of railways already existing, yet notwithstanding all the bitter experience of the past and of the present, it is doubtful if it is fully alive to what may be in store for it in the future, since there are many miles of such lines projected and even approved by the Board of Railway Commissioners involving scores of level crossings with their perilous and paralyzing effects.

The railway question on the Island of Montreal is one that should not be left entirely to the railways even as regards the initiative, but should be a matter of the most careful study either by the city officials or by independent railroad experts conversant with town planning principles and acting on behalf of the city and in the public interest.

Parks and Playgrounds

There is still one question that calls for remark and that is recreation, and especially parks and playgrounds. It is all outlay of course, there is no visible income, but it is doubtful if any money the city can spend can bring in a richer return. Coming out of the Windsor Hotel one day last summer a gentleman of considerable standing from the West remarked looking over on Dominion Square;— "Montreal has many valuable pieces of land, but I doubt if it has anything of such intrinsic value as that," and the force of this remark is brought home to us when we consider that judging from the value of adjoining property this square must be worth anywhere from $10 to $25 a foot. And the question rises in our minds " Would the City be willing to pay anything like that price for it now in order to turn it into a public park, or again, if it had not been for such a park would the bordering property have been anything like so valuable?".

And above all have we failed to understand that there are such things in life as are actually above and beyond all monetary consideration?

Montreal is at present not so badly off for parks and playgrounds so far as actual area is concerned, these are however not so well distributed as they might be, and the fear must be expressed that inadequate provision is being made for the future with a denser population. It is also to be regretted that no part of the magnificent river front has been conserved for this purpose, and that too in face of the fact that other large cities have shown us the commendable example of actually turning over areas used for commercial and wharfage purposes into recreation grounds for the people. It may be said we have the Back River to fall back upon, but real estate enterprise is carefully reserving that for private and individual exploitation and preserve.

Access to Mount Royal

Without Mount Royal which is the crowning glory of the city to which it gives its name we would be poor indeed; and with it under existing conditions we are not much better off, since it is practically inaccessible excepting to a few of the privileged ones who are rich enough to own or hire a conveyance or strong and healthy enough to be able to walk there, and by them their mountain is highly appreciated and very jealously guarded from intrusion. There is however a less fortunate class which consists of the great majority hailing from the densely packed tenement districts and even from the slums. These people have nowhere else that they can go, and since the mountain is the heritage of the entire populace their equal rights and greater necessity should entitle them to whatever special privilege is to be had. From time to time there has been renewed agitation to provide adequate, easy and cheap means of communication with the top of the mountain for all classes without discrimination, and it has always been met with a curtain barrage of protest from the well entrenched batteries of the privileged ones with their high explosives in the press. In default of more solid arguments all sorts of suppositious ones are used, as for instance that if the Tramways Company once get a foothold on the mountain they will be running lines everywhere around; that it will be nothing but another Coney Island debauch, that the mountain will be entirely disfigured with deep cuttings and ugly gashes in its side; and that all the little children within erach or sight will be killed.

There are at least two propositions under consideration at present that have the inherent elements of really satisfying results, and in the absence of more reliable data which a careful survey alone can supply it is impossible to determine their relative constructional advantages. The one is to carry a tramway line behind the mountain and the other to come round in front. At present the only debatable point between them is whether such a line should be kept as much as possible in obscurity, something to be ashamed of and hidden out of sight or else something to be proud of and brought right out into the open and made a special feature.

It should be remembered that there is nothing inherently ugly in the construction of a road, a tramway line or even a steam railroad; it all depends on how it is done as to whether it will prove a disfigurement or even a positive enhancement to the surroundings. And it seems also evident that of the two propositions the latter is more accommodating for the different sections of the mountain, besides affording an unrivalled scenic route, with the possibility of developing at the top a Promenade Terrace overlooking the whole city that would favourably compare with the world-famed Dufferin Terrace at Quebec. A terrace like this could be embellished with artistics shelters, fountains, monuments, band-stand and flower plots, and could be railed off and illuminated at night, becoming a wonderful and attractive resort.

The Role of the Engineer in replanning Montreal

In conclusion, let it be said it can readily be seen that the task of replanning and improving a city like Montreal is clearly no one man's job, even with a lifetime's work. It involves the compilation of a vast amount of sociological and economic data, and with this data the best that can be expected will be merely an approximation of the desired result. This approximation can only be arrived at by a series of compromises requiring immense study and the application of the best brains that can be mobilized. The problem is essentially for the engineers, requiring at the same time the collaboration of the best architects and landscape men. And of one thing we can be very sure, that whatever obtacles and difficulties are in the way, while the compelling force may, and undoubtedly will become stronger as the years roll by, the solution of the problem itself will never be easier than it is to-day.

The Central Ontario System of Hydro-Electric Power

[illegible]

The Hydro-Electric Power Commission's Central Ontario System serves the territory approximately included between Whitby and Kingston, including Prince Edward County on the South, and Fenelon Falls and Tweed on the North. In order to supply this district with power, the Commission in 1916, took over the power developments and transmission system of the Electric Power Company.

The Electric Power Co. was started by Messrs. Smith, Kerry and Chase in 1908 and 1909, when they built what is now called No. 11 Power House at Campbellford, and a short transmission line of about 24 miles from thence north-easterly to Deloro to feed the Deloro Mining & Reduction Company. In 1910 a branch was started from this line to Madoc and also to Sulphide to feed the Nichols Chemical Company. Before the latter line was finished, a branch was also started to feed Belleville. Shortly afterwards, the line was extended east and west to feed the Canada Cement Co. about six miles east of Belleville and westerly to Trenton.

The system developed very rapidly in 1911 and 1912, taking in the Peterboro Light & Power Co. with the old Auburn Power House and its contract with the Quaker Oats Co., also the Trenton Electric & Water Co. at Trenton, and transmission lines were built from Trenton to Oshawa and to Peterboro and Lindsay, taking in the towns en route. The power house at Fenelon Falls and the Distributing System were also taken over from the Lindsay Light, Heat & Power Co., By the end of 1913 there were seven power houses operating in parallel and feeding into a system of 250 miles of 44,000 volt transmission line.

Since the Hydro took over the system, various extensions have been made. Transmission lines have been built from near Trenton to Picton, from Napanee to Kingston, from Healey Falls to Trenton, and a line will shortly be in service connecting Peterboro directly with Healey Falls. A number of low tension feeders have also been added to increase the territory covered by the substations already in operation. To keep up with the increasing demand for power, additional generating equipment has been installed at Healey Falls, and other new developments are contemplated.

The generating stations are all Hydro-Electric, developed along the Trent Valley Canal, the greater number being on the Trent River. This river drains an area of approximately 4350 sq. miles. The discharge varies considerably at different seasons, reaching as high as 6000 to 7000 f.s. during the Spring freshets, and decreasing during dry seasons to as low as 1000-1200 f.s. during the latter part of summer. The stations are designed to fully utilize the average minimum summer flow.

The power houses are numbered to correspond with the numbering of the dams along the canal. The plants at No. 2 near Trenton and No. 5 near Frankford, rated at 3000 K.W. and 250 K.W. respectively, generate at 6600 volts and feed into Sidney terminal station at dam No. 2, where the voltage is stepped up to 44,000 and fed on to lines O, P, & M., feeding west to Port Hope, north to Healey Falls and also to Belleville. The substation at dam No. 1 which supplies Trenton is also fed from Sidney terminal station and supplies feeders 6600 V. The switching arrangements at Sidney terminal are such as to permit practically any combination to be made between the power houses and lines. By the use of double buses on both the low and high tension sides, the station can be operated in two independent sections. Synchronizing apparatus is provided for paralleling with any of the power houses or lines. This station is also intended to receive the power generated at future developments on this section of the canal.

A 6600 volt feeder from Dam No. 6 supplies the Commission's customers at Frankford.

The power house at dam No. 11 at Campbellford of 2000 K.W. capacity, generates at 2400 volts, which is stepped up in the station to 44,000 volts, and feeds on lines A to Deloro, Madoc and Sulphide and G. to Belleville. A 6600 volt feeder supplies the rural district between Campbellford and Hoard's, and a 2400 volt feeder supplies the Commission's Power customers at Campbellford. A 2400 volt tie line also connects with dam No. 12, from which the Commission receives 1100 K.W. by contract with the town of Campbellford.

The Healey Falls Plant at dam No. 14, of 9000 K.W. capacity, generates at 6600 volts, which is stepped up in the station to 44,000 volts and feeds on lines O. to Belleville and R. to Trenton, and will also feed the new tie line between this point and Peterboro. Special switching equipment is provided for operating the station in three separate sections if necessary.

The generating station at dam No. 18, at Peterboro, of 1500 K.W. capacity, generates at 2400 and 6600 volts, which is stepped up to 44,000 volts in a transformer station near the power house, and connects with line K. to Port Hope and Lindsay. The new tie line will also connect here. Three 6600 volt and one 2400 volt feeders from No. 18 to the Peterboro sub-station supply the Peterboro Utilities Commission and the Peterboro Radial Ry.

The station at dam No. 30 at Fenelon Falls generates about 700 K.W. at 2400 volts. This is stepped up to 11,000 and is transmitted to the sub-station at Lindsay, where it is stepped down to 4400 volts. Power from line L from Peterboro is also stepped down to 4400, No. 30 being operated in parallel with this line.

The K.W. ratings given above are on a basis of 80% power factor. The plants Nos. 2, 11 and 14 are equipped with Tirrill regulators for maintaining constant voltages. A synchronous condenser of 1500 K.V.A. capacity is installed at Oshawa for regulating voltage and correcting power factor at this end of the line.

Read before Peterborough Branch, Dec. [illegible], 1919.

Switching stations are located at Port Hope and Belleville. The Port Hope switching station forms the junction of lines H.K. and C. The lines are controlled by oil circuit breakers, that on line C. only, being automatic at present. The switching station at Belleville forms the junction of lines M. B. E. F. and Belleville tap. There are two buses each of which may be cut into two sections. Selector switches allow any line to be connected to either bus, and all lines are controlled by oil breakers, those on E. F. and Belleville Tap being automatic at present.

The transmission lines are carried on wooden poles and total about 370 miles in length. They operate at 44,000 volts, the neutral being ungrounded. As the system becomes more extensive, it appears advisable that the neutral should be grounded, in order to localize line troubles to the sections on which they occur.

Line R. connects the Healey Falls Power House with Sidney terminal station. This line serves only as a feeder between the Plants in the vicinity of Campbellford and the lines along the Lake front, there being no substation fed from it. It is designed to transmit 7000 K.W. Sectionalizing switches are located at Myersburg and Wooler. This line was built to carry a second circuit.

The Western section includes lines H. C. K. & L. It is connected to generating station at Sidney Terminal, Peterboro and Lindsay, through automatic oil circuit breakers, and with the tie line from Peterborough to Healey Falls in service, it will be also fed from the latter point. It will be noted that lines R. H. K. and Y. will form a closed loop. This gives duplicate service to Peterboro and to all other sub-stations on the loop. In case of a line breakdown, the faulty section can be cut out and service restored on the entire section.

Similarly, on the Eastern section, lines O. G. B. M. & R. from a loop, so that any section of these lines that may be in trouble can be cut out, and service quickly restored. This, with the duplicate lines from Belleville to Lehigh, gives the greater part of the load on this section two possible points of supply.

The Northern section consists of lines A. Q. Madoc tap and Delora Tap. Line Q. forms a loop with line G. and the section of line A between No. 11, Power House and Harold. As there is no automatic circuit breaker on line Q., one set of switches is normally left open on one side of Stirling tap tower, to prevent trouble on either the eastern or northern sections from causing interruptions on both.

The fact that the system is supplied from generating stations at widely separated points is a further protection against interruptions. For instance lines M. R. and K. might all be out at the same time, and the service on lines H. and C. maintained through Sidney terminal station from power house No. 2 and No. 5.

All power houses and transmission lines are normally operated in parallel. The transmission system may therefore be considered as a bus into which all power houses feed, the power being distributed to sub-stations located as required. This arrangement is very flexible from an operating standpoint. The total load can be divided between the various power houses in any proportion desired, or can be transferred from one station to another in such cases as a break-down of generating equipment, sudden reductions in stream flow etc. During the low water season it is possible by properly distributing the load, to obtain the greatest use of the water at all plants. Also, in the winter months, the turbines and racks may become blocked with frazil ice, but as this seldom occurs simultanenously at all stations, the load from the plants shut down can be transferred to those not affected. Parallel operation is also a great assistance in maintaining proper regulation, as variations in load are divided between all power houses, instead of falling on one.

There are occasions however, when it is advisable to operate the system in two or more separate sections, such as when storms are passing over the lines, or when trying out the lines to locate trouble. Special switching arrangements are provided for this purpose. As previously stated, the power house at Healey Falls may be arranged to operate in three distinct sections, each feeding a separate line. It is possible at Sidney terminal station to make practically any combination necessary between No. 2 and No. 5, power houses and the outgoing lines. The switching station at Belleville has two separate buses, each of which may be cut in two parts, so that practically any combination of lines may be made.

The operation of the system is under the direction of the load despatcher at Belleville. A private telephone system following the transmission lines connects with all stations and patrolmen. It is the despatcher's duty to see that there are sufficient generators in service to carry the load, and to maintain the proper distribution of load and excitation between the various power houses. In cases of trouble he orders the necessary switching for sectionalizing and testing, and gives all clearances for work on the lines. For this work, an operating diagram is used, which shows the electrical lay-outs at all stations, with indicators to show whether the various switches are open or closed.

A regular system of patrols covers the entire transmission system weekly, the object of which is to inspect the physical condition of the lines, and note all defects that may later lead to breakdown. The patrolmen are available at all times for further inspection and repairs in times of trouble. Any defects found are repaired in such a way and at such times as to reduce interruptions to service to a minimum.

The automatic protection to service, lines and apparatus on such a system, is a fairly complicated problem. In addition to the relays, (devices that automatically open switches under predetermined conditions) at all points of distribution, the lines are equipped with relays at the sources of power and at the switching stations. These relays all have a definite adjustable time setting, and this setting is adjusted, having regard to the position of the line and the sources of power, so that a minimum amount of line is isolated when trouble developes. This localizes disturbances and ensures service to the parts of the net work not affected.

Two factors of importance in the loading of such a system are the load factor and the diversity factor.

Electric Generating and Transmission Systems of the Hydro-Electric Power Commission of Ontario

LEGEND

The characteristics of different loads, that is, the time of maximum and minimum demand, vary considerably, so that a resultant of these characteristics governs directly the generating capacity that must be available for service at any time and the number of hours a given capacity is utilized.

This condition is observed by taking the ratio between the maximum load and the average load over a given period and is known as the load factor. On the Central Ontario system this factor runs around 55% taken over an average year.

Due also to the fact that the peak load of a number of consumers do not occur simultaneously, it is possible to serve a load, whose component peaks are in excess of the actual rating of the apparatus in service. This is called the diversity factor and is the ratio between the sum of the various peak load and the actual maximum load a recorded on the station meters for a given time. On the system described, it varies between 1.05% and 1.15%.

The population served by this system runs well over 100,000 and the industries served include plants for the manufacture of chemicals, automobiles, portland cement, rubber goods, ore reduction, wood pulp, crushed stone, and the many varied industries found in the different towns. In view of the present coal situation and its prospects for the future, it is apparent that Central Ontario is fortunate in the progress made toward independence of this commodity for industrial purposes.

The Commission's engineers are at present investigating new relays and if considered advisable, these will be installed, replacing earlier types of relays. With the closing in of the loops referred to, reverse power relays will also be installed at certain points on the loop, so that sections in trouble can be isolated without interfering with service to any of the towns.

New power houses for the Trent River system are under consideration and a good deal of engineering has been done. It is hoped that construction will commence in the very near future.

The Commission is installing a very large plant at Queenston, consisting of 4 - 48,000 K.V.A. units. In this connection an investigation is being conducted into the engineering and economic possibilities of building a transmission line from Toronto to Oshawa, tying in the Central Ontario System with the Niagara system.

This would mean frequency changers in Toronto, and probably 44,000 volt transmission line from that point to Oshawa, the frequency changers serving the double purpose of changing the frequency from 25 to 60 cycles or vice versa, and they could also be used as condensors to help out the power factor on the Toronto end of the Niagara System and also for the western end of the Central Ontario System.

This would give double service to points west of Port Hope and also makes available any quantity of power that may be required in the Central Ontario District.

Cotton Rope for Power Transmission

J. Melville Alison

The subject of ropes for power transmission is given close attention and consideration by engineers engaged in this class of work in England in fact it is fair to say that in Great Britain this subject is given closer technical and practical consideration than it has hitherto been given on this side, particularly from the rope-makers' standpoint.

Features of English Practice

The outstanding features of English practice may be briefly stated as follows:

1. Cotton has entirely supplanted any other material for transmission work in England — manila is of the dim and distant past.

2. The ropemaker is consulted as to plant layouts, speeds, sheave diameters, centres, grooving, etc., and his opinion is deferred to.

3. Guarantees of maintenance are required and given in almost all installations.

4. The manila and steel rope manufacturers employ cotton ropes for transmitting their power.

5. The efficiency and longevity of cotton ropes have commanded the employment of this material in the manufacture of transmission ropes.

It is necessary at the outset to state why cotton should dominate other materials. Longevity and a higher factor of efficiency are the factors in the case. The longest life we have is of ropes installed in October 1879 (in 24-hr day work), and still doing service, but it is common to find cotton ropes doing night and day duty for periods of twenty years and over. A higher initial cost is readily overlooked. In rolling mill practice we get up to ten or more years for hot roll work, and fifteen or more in cold roll tin plate mills.

In England possibly the rope drive is utilized much more freely than in Canada or United States, but on the other hand, the installations here, are, in many instances, much larger than in England.

Cotton vs. Manila

In discussing the question of cotton or manila for transmission ropes, one must not lay too much stress

Read before Montreal Branch, April 22nd, 1920.

upon initial cost, for although cotton is dearer than manila, its superior coefficient [illegible] and greater elasticity add so greatly to driving force that up to one-third more horse-power may be transmitted. Further, its prolonged life, being reckoned at approximately five to one, will reduce appreciably excessive first charges to an insignificant item.

The loss of production due to frequent stoppages for replacement or take-up of manila ropes must however be figured as the greatest argument in favor of cotton ropes which seldom require further attention, particularly on English System Drives, after they have been properly fixed by a skilled splicing mechanic.

Tensile Strains

The tensile strain of a driving rope does not enter largely into the problem, else manila would undoubtedly hold the field, but its fibres are of so harsh and wiry a nature, that they do not take kindly to the successive twisting and bending operations, nor do they cling to the sheaves with the tenacity of the softer material. Having little natural resilience, the strands scrub one upon the other, setting up internal abrasion, which not only proves an inconstant quantity, but also invariably leads to repeated tightenings.

Three vs. Four (or More) Strand Ropes

Rope of three, four or even seven strands is sometimes employed, but since the contest lies mainly between the three and four strand, it will suffice to demonstrate the advantage held by the three strand over the four or any other construction.

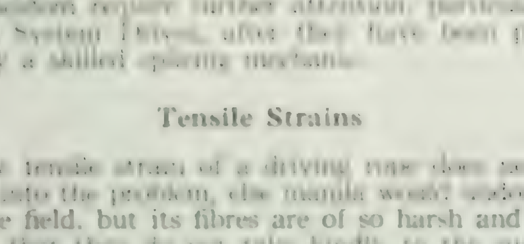

Fig. 1. Section of Three and Four-Strand Ropes

Examining the section of a three strand rope, (fig. 1), we obtain an equilateral triangle by connecting the centres of each strand, demonstrating the triangulation of the strains, a principle adopted by all engineers in erecting angular constructions, such as bridges, etc. In a rope of this construction we have a trinity of elastic spirals, so supple that they will bend to and fro without disturbing their formation. With the four strand rope, adopting the same method of connecting the strand centres, we obtain a square and an illustration of the parallelogram of forces from the four centres. Again, the four strand rope cannot be constructed without a supporting core, and since this is indispensable to its construction, its collapse must mean the dislocation of the whole structure, and as the core represents only about one fortieth of the area, it may be reasonably assumed that the [illegible] force exerted by the alternate contraction and extension of the strands as the rope passes over the sheaves, must tend toward the crushing out of this core, the period of endurance being limited by its tenacity and the tension at which it is held. This is what actually takes place.

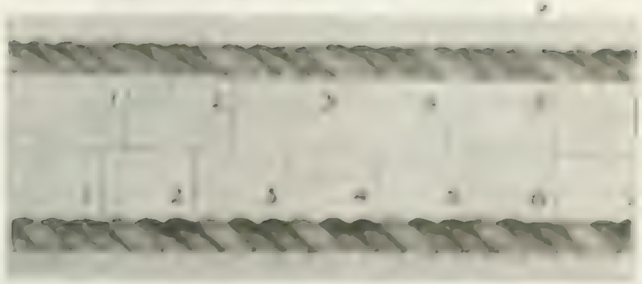

Fig. 2. Relative Elongation of Three and Four Strand Ropes

Spiral Elongation

This will probably be the more readily grasped by referring to Fig. 2 which shows a three and four strand rope in parallel, with the turns of each strand indicated by the figured lines. Thus the turns of the three strand gradually gain upon the four in the proportion of one in five or in other words, six turns of the three strand occupy the space of five turns on the four strand, say, in ropes of the same thickness. The strand spiral of a seven strand rope is nearer the straight line, being almost double the length of a three strand rope.

It will, therefore, be acceptable that the medium engaging the greatest number of turns should prove to be the most resilient and more capable of dispersing all the shocks and stresses set up for instance in rolling mill work than any other. Again, as affecting the bending capacity of the rope, another important difference is observable — only two strands appear between every turn of a three strand, while three occupy the spaces between every turn of a four strand.

Grooving

In laying out a groove it should always be borne in mind that a rope is to all intents and purposes an elastic wedge and reaches its highest driving capacity when it is pressed to the shape of the groove itself. This compression ought, therefore, to be anticipated, for if the sides of the groove are merely shown as tangent to the circle representing a given size of rope, and this is so with all American illustrations I have seen, then there is present the danger of making the groove too shallow so that when the compression takes place, and possibly after a short term of running, the rope is liable to find its way to the bottom of the groove, when gripping is considerably weakened and slipping takes place, the true indication of which is heated sheave rims. Grooves with curved sides have proved not only hindrances to driving force, but also a stimulus to that destructive rolling action which is the very antithesis of good practice, and should, therefore, always be discouraged.

Hence, curves being disallowed, permit only the angular groove, and we contend that the rope should divide the angle of the groove and not the groove the rope.

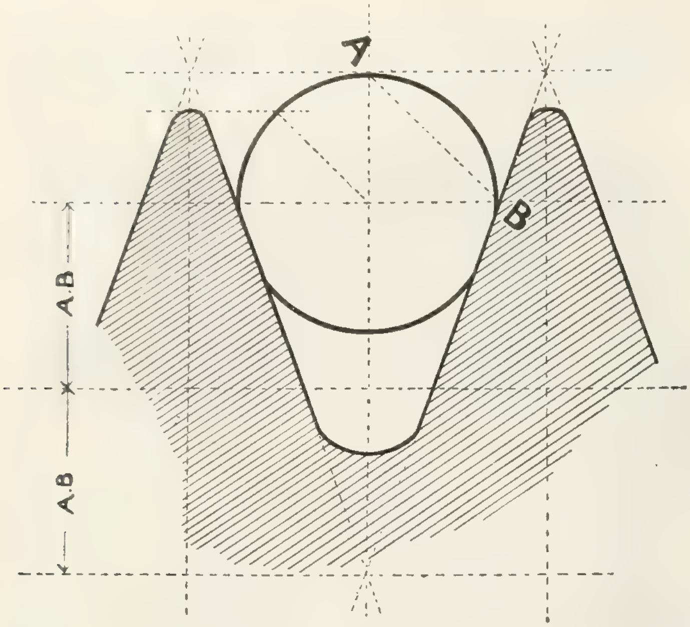

Fig. 3.

Without use of the protractor, the groove demanded by a given size of rope, may be set out as shown in Fig. 3.

First set a circle of equal diameter to the rope, draw the vertical and horizontal centre lines. The chord of the arc AB is then marked off. This becomes the unit measurement and when laid off downward along the vertical line from the centre of the circle, indicates the centre of the curve of the bottom ot the groove. Laid off a second time from this centre, the apex of the inverted angle of the groove is determined. This angle always comes out at about 40 deg. whatever the size of the rope may be. Extend the lines of the angle through BB, cutting off segment of the circle on the way, until they intersect the upper horizontal line at CC, which points fix the radii of the mid-flanges. This groove may be taken as a standard for ropes over 1-inch diameter and also shows the approximate actual compression which takes place in a rope at work.

The value of good grooving cannot be too strongly advanced. A further great benefit to be obtained in successful transmission is by polishing the grooves. It is difficult to understand why the engineer has not seen to this being done here, since it must be a grievous fact to him to know that his second set of ropes will do better than his first, pointing to the fact that the first set are expected to polish the tool marks from the grooves.

Fixed or Revolving Ropes

It has been a matter of education in England to get the engineer to agree as to whether the fixed-wedged or revolving rope is the better driving medium. The wedged rope with its angular formation gains in groove contact over the revolving rope, and contact means power. Further, the wedged rope cannot have the tendency to slip which the revolving ropes would have, and also the life of the revolving rope is considerably reduced. The cause of ropes revolving is difficult to ascertain, but it is computed that the life of a rope is reduced by at least one-third when it revolves.

Ropes which are underworked will very often tend to revolve, a golden rule in rope transmission being that ropes like work to do.

Perhaps the most apt illustration of a wedge-shaped medium is the drive on a motorcycle, where a V-shaped belt is fitted to a V-groove, without, however, the belt reaching bottom, yet obtaining the greatest possible groove contact and impact.

Longevity of Cotton Ropes

As to the life of cotton ropes much, of course, depends upon their size and the conditions under which they have to work. All things being equal, durability may be gauged by sectional area, and the most economical diameters range from $1\frac{1}{2}$ in. to $1\frac{3}{4}$ in., more of the latter being used in England than any other size. For rolling mill work, however, it so often becomes a matter of sheave widths, that 2 in. ropes are generally used. A remarkable case of longevity may be mentioned of 24 cotton ropes $1\frac{3}{4}$ in., diameter employed to transmit 820 h. p. at a velocity of 4396 ft. direct from the engine fly wheel 28 ft. in diameter, in a Lancashire cotton mill. These were fixed in October, 1879, and are still running in 24-hour a day service, a period of over 40 years. Another set has been working 28 years, on an average of 20 hours per day, and appear little the worse for wear.

Such cases of longevity lead to the conclusion that fatigue of material due to constant activity does not readily manifest itself in well-made cotton ropes. Their quick recovery from driving strain is suggested as the cause, since they pull down on the working side and bulge out to their normal diameter, immediately upon passing to the idle or slack side of the drive.

English vs. American Systems

There are advocates of both systems on this side of the Atlantic. We in England, are almost exclusively roped under the English multiple system, — and have little experience of the American continuous method. Our education however in this latter has been considerably advanced during the last six to ten years on this side, and it has been amply demonstrated that good cotton rope on the continuous system will pay for itself dollar-for-dollar, and give a handsome return on the investment.

In England we are satisfied that the multiple rope system is the better in all-round practice. Immunity from stoppage is the most important factor, since it is seldom that more than one rope gives way at a time. The offender may be laid aside to await a favorable opportunity for replacement. An admission made to me by one of the leading authorities of the American system was that while all his experiments had been made with manila rope he had the impression he could get still better results with a good cotton rope.

Short Centres

For evidence of the fact that by adding sufficient rope to make up any deficiency in contact, driving may be successfully accomplished when sheaves are almost touching, we need only refer to the case of an engine in Scotland, (Fig. 4), where spur gearing was removed and rope sheaves fixed on the same centres, permitting only a distance of 8" between sheave rims. A load of [illegible] h.p. is comfortably transmitted with 16 ropes 1½ in. diameter. At a mill in the north of France the sheaves are so close that a finger would scarcely pass between them.

Fig. 4 Short Centre Rope Drive

A drive has been erected for the Armstrong-Whitworth Company of Canada Limited, at Longueuil, Que., in which the sheaves are 108 in. and 72 in. in a rolling mill plant, with only 15 ft. centres and grooves for 12 – 1¾ in. ropes, which allows for only 7′ 6 between rims. This drive was fitted under guarantee of maintenance from the ropemakers, who originally were consulted on the scheme.

Over Roping

Over roping certainly retards efficiency. The fault sometimes manifests itself by the slack changing with the pulling side, and at other times by the ropes travelling across the grooves or even leaving the pulleys altogether. When such troubles arise it is best to remove one or several ropes if need be, without interfering with the splicing. Pass them over both pulleys and tie them well back to avoid revolving shafts. They can then be readily put back to work as the others give out. We have known instances where half the original number were taken off before satisfactory driving was obtained. This state of things frequently arises, even under [illegible] regular loads, when actual requirements come below the calculated power.

Over or Under Driving

While it is, and has been, generally accepted that the slack side of the drive should come on top, this position is not always obtainable, nor is it under all circumstances desirable. With an erratic or fluctuating load, such as obtains in rolling mill practice, we recommend the slack to come on the bottom. The variable load of the mill tends to set up considerable oscillation in the ropes and if the slack is above, may cause the ropes to ride or even jump off the sheaves. On the other hand, if the slack is below, any tendency of the rope to wander from its appointed track is held very largely in check by the pull on the tight side, also gravity and the weight of rope will control the oscillation.

Rope Guards

If, however, ropes persist in wandering from their appointed track, we recommend the erection of a rope guard in comb fashion, which should be placed approximately [illegible] percent of the centres away from the driven sheave. In rolling mill practice in England this is very freely adopted.

Sheave Diameters

Sheave diameters have a very important bearing upon the question and while in England the minimum standard is taken as approximately [illegible] times the diameter of rope, in America [illegible] times is accepted.

This however is largely a question of speeds to sheave size, as for instance a ½" rope will run comfortably over a [illegible] sheave at 1000 R.P.M., a 1" rope over a [illegible] sheave at 3000 R.P.M., and it is only when the speed rises to 5000 feet P.M. that we meet the [illegible] times rule for 1" rope.

Here again cotton scores over manila, since its softness readily admits of superior bending properties while the native harshness of manila and almost entire absence of resilience compel a higher minimum sheave diameter to which ropes of this material can be bent over. The power table is calculated upon an average contact arc of 170 deg.

Centrifugal Force

Groove impact also acts in opposition to centrifugal force, which has proved so potent a factor in belt drives, that whatever is done by way of compensating with narrower belts, adhesive dressings, or squeezing out the inevitable air-cushion, it will assert its retarding influence at a velocity fixed roughly at about [illegible] feet per minute, when the power calculated on the basis of width must be discounted in proportion to the increase in speed.

As affecting the rope drive, however, many tables are compiled whereby a steady decrease of transmitted power over 4800 feet per minute is shown, until we find ropes at 7000 feet capable of transmitting only half the load of the same rope at 4800 feet.

Diameter of Ropes

Velocity in feet per minute	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
1000	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2000	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3000	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
4000			[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
5000				[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
6000					[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
7000							[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

While few cases of rope transmission exceed a velocity of 5000 feet, possibly because of the necessity for specially constructed sheaves, those of higher speeds totally disprove the theory of centrifugal detraction at the higher velocities, but rather reveal a larger ratio of increase than the advancing figures of Table No. 1 indicate. We have drives in England and France running at over 7000 feet per minute, and transmitting the higher calculated horsepower, but I think all are outdone by a drive which I encountered in Cleveland where the ropes are running at 7800 feet per minute. The driving sheave is 14 ft. 4 in. diam., making 168 rev. per min. with driven sheave 4 ft. 7 in. diam., and fitted with 19 2-in. ropes to transmit approximately 1400 h. p. The driven sheave only shows a 27½ times diameter of rope but is giving comparatively good service. This will prove a unique illustration to friends in England, but seems to leave us farther in the dark as to centrifugal force.

Effect of Moisture

Cotton ropes are also less susceptible to atmospheric changes than manila for the reason that moisture more readily evaporates through the fibres, thus rendering them practically immune from internal mildew which so often is apparent in a discarded manila rope.

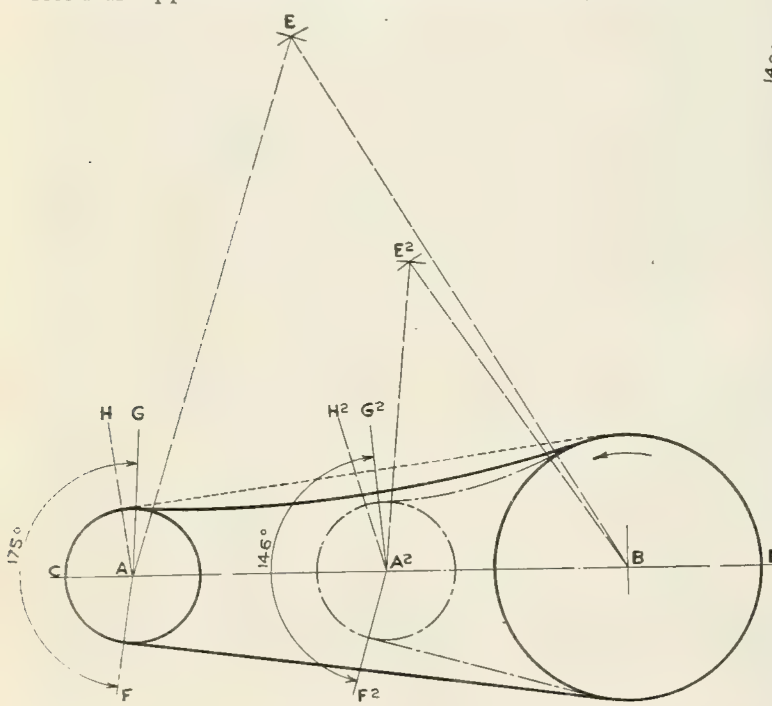

Fig. 5.

Arc of Contact with Slack Above

Before dismissing the consideration of sheave diameters, it will be well to notice another phase of the same question, viz., that which deals with the arc of contact.

It needs but little reasoning to prove that rope contact reaches its maximum when both pulleys are equal in size, but when unequal the utmost quantity realizable is that carried by the smallest pulley whether it be driver or driven. The full value of this assessment, however, also depends upon the centre distances, as may be readily inferred by reference to the geometrical formula, Fig. 5.

First, measure the length of the two radii crossing at E from A to D off point B, and from B to C off point A. A line carried through the centre at A gives FE. The line AH is gained by taking the vertical of the top pulley line, while equally dividing the angle AHE by C produces the angle FAG, which represents an arc 175 deg. By bringing the small circle to the second position and repeating the same formula the arc FAG, is constructed and gives only 146 degrees.

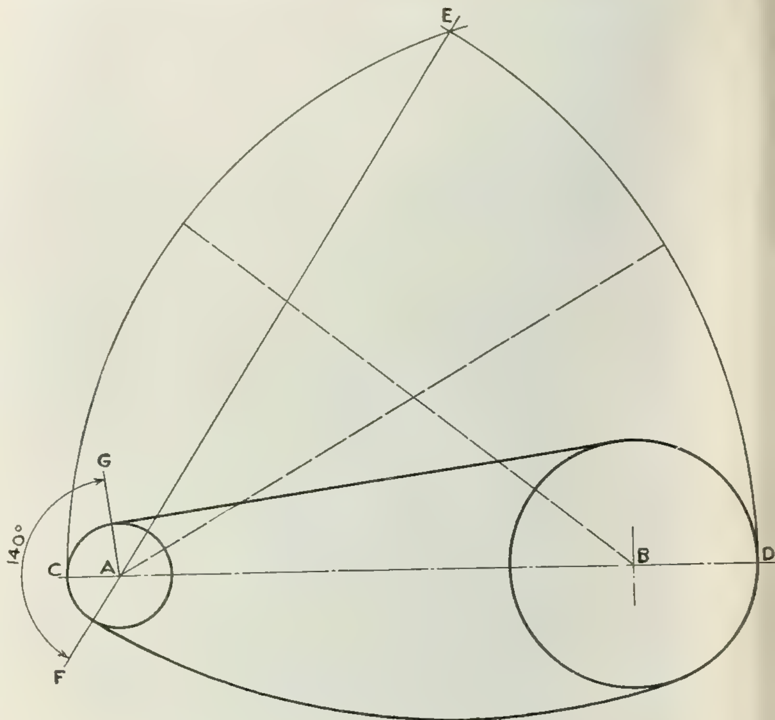

Fig. 6.

Arc of Contact with Slack Below

The formula is somewhat altered in order to ascertain the arc of contact for any distance of centres with slack below. Therefore, mark the distance from A to D and B to C at E, which gives the curve radius for the under slack and constructs FAG by the lines EF and AG, the latter vertical with the upper line over top of circle, thus declaring an angle of 140 degrees. (See Fig. 6.)

This formula will be found useful for ascertaining the depths of rope pits, by what may be termed the ultimate slack.

Generally speaking, it is advisable to discount the transmitting value of the ropes by the amount of difference between the actual arc of contact and 170 degrees, but when the sheaves are comparatively large, these difference may be neglected.

While an effective working tension of about 200 lb. per sq. in. of rope section may be calculated upon, this figure may, in some cases, be profitably exceeded. To quote an instance, a large sheet rolling mill, when first installed, was driven by 26 ropes 2 in. diameter by electric motors and to provide against a peak load of 1500 h. p. was helped by the momentum of two heavy fly wheels making 35 r. p. m. or a peripheral velocity of 3516 ft. Tests conducted under working conditions revealed a high rate of resistance, which diminished as the load rapidly advanced from 150 to 900 h. p. This was considered due to over roping at the lower power. Six of the ropes were accordingly removed. Running with only 20 ropes lowered their average friction from (say) 5.8 to less than 3 percent, brought about steadier transmission, and materially improved the output.

Inter Stranded Cotton Driving Rope

Allowing the claims in favour of the three-strand rope, without further advocacy of the general principles involved, it may be logically contended that if such a rope possesses constant roundness throughout, if the yarns are equal in tension, resiliency, tensile strength and lustre, each one following its appointed track without deviation, and are all of the best procurable quality, then we have arrived at a point bordering on perfection in the making of driving ropes, and their manufacture and application has been a close study for over 20 years.

is maintained in the [illegible]. [illegible] construction means that with the rope in work each thread takes its relative proportion of duty, and again in wearing only the external layer will show [illegible], leaving the next layer intact. This feature is of [illegible] value since there are many instances where say a [illegible] in. rope, after years of work is reduced in diameter, but has still sufficient life left in it [illegible] where ropes of about [illegible] in. diameter [illegible].

There is no limit in length in manufacturing this rope other than may be restricted by convenience in transportation.

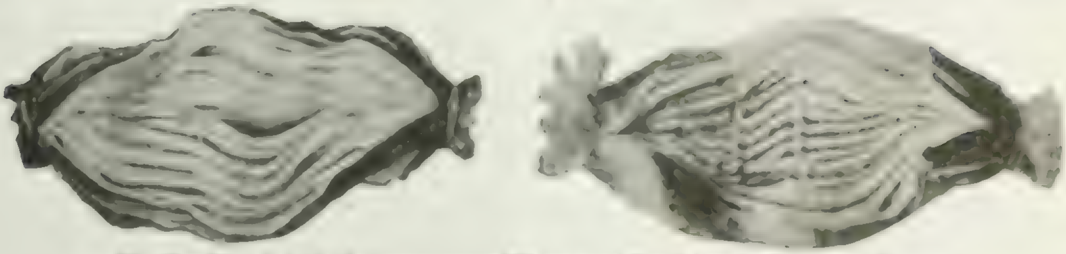

Fig. 7. Even Lay in Inter-stranded Rope and Crinkling in Ordinary Rope.

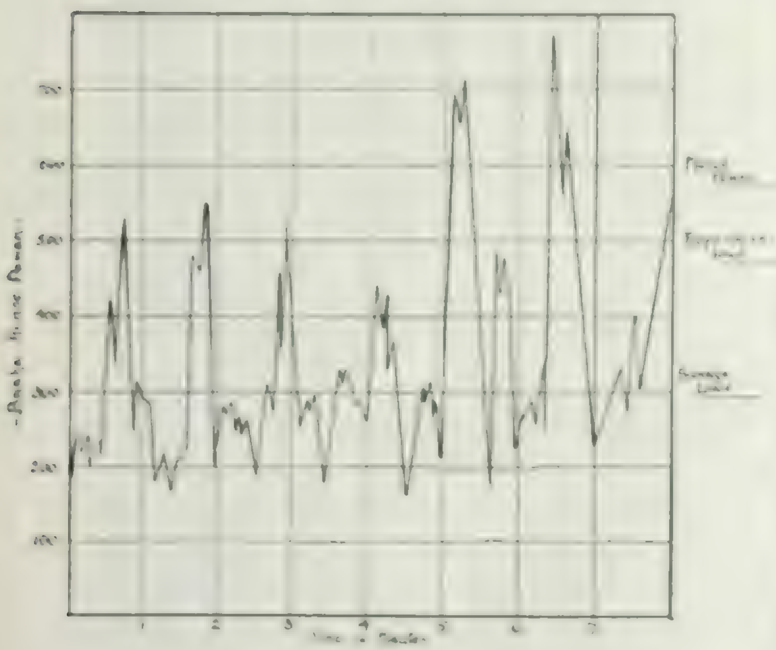

Fig. 8

Fig. 10. Vertical Drive.

This rope is made expressly for power transmission from the finest selected American yarns. Each of the three strands is made up of a succession of sheaths or layers of yarns, which may be peeled off until the centre thread is reached. The rope is machine built, under hydraulic tension, so that a perfect and continued tension is secured to each thread, from the moment these threads are fed to the machine. The crinkling effect to be found more or less in all rope made by the ordinary method is thereby eliminated.

As previously mentioned, the triangulation of strains is secured in three strand ropes and in this particular rope

Splicing

All that has been said relative to the making of power driving ropes and their application to transmission of power would be of little value without some reference to the question of splicing.

This is so important to the well-being of the system in general that rather than have installations spoiled by indifferent workmanship expert splicing mechanics, properly trained to this duty, are sent out from England to all parts of the world.

We have experimented with different devices of metal and other couplings, with a view to dispensing with splicing, but nothing has yet been found, which, in England, would be considered against the long splice. This is usually calculated at about 82 times the diameter of the rope.

Operation of the Quebec Public Health Act

Theo J. Lafrenière, M.E.I.C., Chief Sanitary Engineer to the Superior Board of Health of the Province of Quebec.

The first Public Health Act in this province was passed in 1849, during the cholera epidemic of that year, but the act was temporary, to be used at times of epidemics only. The permanent act was passed in 1886, creating the Board of Health. Before going into the details of the present law, a brief review of the first health measures promulgated in this country, may be of interest.

The first measure dates back to 1667, during the French régime; the members of the clergy were requested to keep a record of all births, deaths and marriages occurring during the year, and to transmit a copy of the same to the civil authority. This order is still in force to-day in this province; since 1893, a copy of the record is also transmitted to the recorder of vital statistics.

In 1676, a law was passed ordering every householder to have a privy pit, and putrescible refuse had to be disposed of without creating a nuisance. The inspection of bread and meat was established in 1706.

After the cession of Canada to England, in 1763, health matters remained stationary, the orders issued under the French régime being maintained. During that period, the first measure of importance was passed in 1795, after the separation of Quebec from Ontario. The typhus epidemic in Ireland was threatening the

Read at the General Professional Meeting, Montreal, Jan. 29th, 1920.

colony, in order to guard against its invasion, the quarantine of all incoming ships was decreed, and the captain of the ship had to give all information required by the inspector under the penalty of death "without benefit of Clergy."

From that date, the government concerned itself with Public Health at times of epidemics only. A campaign against smallpox was made during 1815 to 1821 and vaccination was much recommended. The cholera epidemic of 1832 caused the Government to appoint a Health Commission composed of sixteen members, for the time of the epidemic only. With the appearance of cholera in 1849, the legislature passed an Act creating the Central Board of Health, with extensive powers, and the act could be applied whenever the health of the public was threatened. The act was used in 1854, 1866, 1885 and in 1919 during the influenza epidemic and can still be declared in force by proclamation.

Three years after the confederation, in 1870, the municipal code was passed, giving to every municipality, the power to make regulations concerning health matters, such as inspection of buildings, abatement of nuisances, construction of water and sewerage works, and control of infectious diseases. Few municipalities used the powers granted by this act which contained the health laws in existence from 1870 to 1885, and when the smallpox epidemic occurred in 1885, the government had to resort to the special act of 1849. It was then decided to have a permanent board of health for the whole province and in 1877 a commission composed of six members was appointed. The powers granted were limited, being rather advisory in their nature, but amendments passed in 1888, 1890 and 1893 made them a real public health act, with enough powers to promote public health in the province.

At first, the organization of the Board consisted of a president, a secretary and one inspector, but in 1893 and 1894, a statistician, a chemist and a bacteriologist were appointed; in 1899, consulting sanitary engineers were nominated, and in 1909 a division of sanitary engineering was created. In 1911, the province was divided into ten districts, with a medical inspector in charge of each district under the direction of a chief inspector.

The members on the Board have been increased from six to ten, and to-day the Board is composed of eight doctors, one dentist, and one engineer whose commission has expired several months ago, but the vacancy has not yet been filled.

The Quebec Health Act, after numerous amendments, is quite complete. Powers are given to municipalities by the municipal code or the statutes of the province, and the Board of Health has the authority to force the municipalities to use such powers granted to them. The general duties of the Board consist in the study of vital statistics, the investigation of the causes of contagious diseases, the sanitary control of water-supplies and water courses, the surveillance of the local boards of health, and in making regulations respecting industrial establishments.

The section of the Public Health which is of special interest to the engineer is the one relating to water supply and sewerage. The clauses 3978 and 3906 are similar; they require that plans and specifications of water and sewerage works and of treatment works be submitted to the Board for approval before their execution. Proposed extensions to old installations come under these two articles. The plans to be submitted must be prepared by a graduate engineer, licensed or engineer authorized to practise in the province.

No by-law providing for such work can be submitted to the approval of the ratepayers, before the plans are approved by the Board of Health. The demand for approval is made by the municipality, corporation or person for whom the work is to be done, and infringement of these clauses renders the party liable to a fine of one hundred dollars, and the works may be demolished when injurious to public health.

In accordance with article 3900, the Board has made regulations determining the information that must be contained in the plans submitted. General and detailed plans are required, and must be accompanied by a report prepared by the engineer, the said report giving the necessary data for the comprehension of the project.

When the water supply is derived from surface waters, the Board will approve of such plans only that provide for adequate purification works, unless the supply is otherwise protected against all sources of contamination. If the supply is of underground source, a map of the district within 1,000 feet of the proposed source showing houses, barns, privies, etc., shall be submitted. When for extra fire protection, there are by-passes by which partly treated or raw water can be used, the circumstances under which they are to be used shall be described, and their frequency indicated. The valves controlling the by-passes, when approved, shall be sealed by a representative of the Board of Health, and opened only under the provisions governing their approval.

The plans for sewerage works shall show the entire area of the municipality and the proposed sewers on all streets, even if the construction of some of the sewers is to be deferred. Where grades causing a velocity of less than $1\frac{1}{2}$ feet per second, with sewer flowing full, are used, an explanation for the use of such grades shall be mentioned in the engineers' report. Under ordinary circumstances, the Board will approve such plans only that are designed on the separate system. When the combined system is used, all supplementary data necessary to calculate the run off, etc., shall be furnished. The project shall provide for sewage treatment of such a nature as not to cause undue pollution of the stream or body of water into which the sewage or the effluent is to be discharged.

When the plans submitted are for the extension of an existing system, only such information as is necessary for the comprehension of the plans need be furnished.

A preliminary report of the project may be submitted to the Board of Health, prior to the submission of final plans.

Article 3910a is of a special character, and usually does not appear in similar acts. Whenever the Board finds that on account of the geographical situation of two or more municipalities and for the sake of their future development, it is necessary or advantageous for such municipalites to perform jointly certain sewerage works, for reason of health or economy, the question may be referred to the Public Utilities' Commission which determines the nature of the work to be executed, and apportion the cost of such works. The object of this article, is to prevent, in the case of contiguous towns, water intakes and sewer outlets in close proximity. Any municipality may borrow the necessary moneys to comply with the order of the Commission without affecting its ordinary borrowing powers. One such case is now before the Public Utilities' Commission.

Extensive powers are conferred on the Board by articles 3911a, b, c, d and e, which are an adaptation of the Bense Act of Ohio. They permit the sanitary control of rivers and the improvement of existing water supplies. The method of procedure is as follows:—The Board investigates the polluted body of water or the source of water supply, as the case may be. The results of its findings are transmitted to the interested parties, and a conference is held at which the parties discuss the results of the investagation; then the Board gives its order. Any municipality, corporation or person who is not satisfied with the decision of the Board, may appeal within a delay of fifteen days, and the question is then submitted to a board of arbitrators composed of two sanitary engineers, one appointed by the party who seeks revision and the other by the Provincial Secretary. If necessary, the two engineers may appoint a third arbitrator or have him appointed by the Superior Court. The decision of the majority of the arbitrators is final, and is executory as if it were an order of the Board of Health.

Any municipality, to comply with the order of the Board, is authorized to borrow the necessary amount without having to observe the required formalities regarding loans.

Any person or corporation operating waterworks, ordered to improve the quality of the supply, may apply to the Quebec Public Utilities Commission, who shall establish the apportionment of the cost of the improvement between the owner of the waterworks and the municipality using the supply. This provision is made in order to protect the waterworks owner, in the instances where the supply has become polluted, due to causes beyond his control.

A heavy fine is provided to enforce this section of the act, and moreover, the Board has the right to have the improvements done at the expense of the municipality, corporation or person in default.

Most of these powers have been granted by the legislature since 1915, and consequently their application has been somewhat difficult, due to the conditions created by the war. Eight filtration plants have been installed and six more plants have been ordered; one town has changed the source of its supply and another one is resisting the order of the Board; the case is now before the court. Two sewerage systems have been ordered, and four municipalities have been required to join in a common sewerage project.

Several water purification plants have been installed upon the recommendation of the Board, and to-day, 860,000 people are supplied with filtered water, and 170,000 with chlorinated water. Sewage disposal works are seldom needed on account of the high degree of dilution obtainable in most cases, and it has been the policy of the Board to insure a safe water supply by water purification rather than by sewage treatment.

The study of the water-supplies in the province shows that there are 440 waterworks; half of them are very small, but 192 serve minicipalities with a population of over 500 inhabitants. The combined population served by these latter is 1,383,700.

Sources of water supplies in town of more than 500 population.

Source of supply	Number of works	Population	Per cent of total population
Rivers	97	1,192,512	86.2
Lakes	20	52,879	3.8
Springs or wells	75	138,338	10.0
Total	192	1,383,700	100.0

It appears from the table, that 86.2% of the population is supplied with river water; 3.8%, with lake water; 10% with underground water.

The water obtained from lakes or springs is generally good; the water derived from the rivers requires purification. The supply of 86% of the population using river water is filtered or chlorinated, but the supply of the remaining 14%, representing 60 towns, will be difficult to improve, because the towns are small. The cost of filtration works is almost prohibitive for a small municipality; and chlorination, without expert supervision, does not afford much protection.

A new method of controlling the operation of water purification plants has been tried for a year. The method consists in the examination, for the presence of B. Coli, of daily water samples, sent by mail. By this means, any decrease in the efficiency of the plant may be quickly detected and remedied before harm is done. Better results have been obtained from chlorination plants, by this continuous control, and it is to be hoped that in the near future, all water supplies in this province derived from rivers exposed to contamination, shall be either filtered or disinfected.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. June 1920 No. 6

The Seventh Western Professional Meeting will be held in Niagara Falls, September 16th, 17th and 18th, and the Eighth Professional Meeting will be held in Halifax, October 13th, 14th and 15th.

Annual Meeting 1921

At a meeting of the general committee of the Toronto Branch of *The Institute* formed to arrange the details of the annual meeting at Toronto next year active steps were taken, ensuring the greatest possible success for this gathering. The energy with which the members of the Toronto Branch have taken up the matter of the annual professional meeting next year at Toronto combined with the excellent choice that has been made of the chairmen of the various committees indicates that there will be held next year in Toronto a meeting which will equal or surpass any other in the annals of the engineering profession in Canada. This year has already seen the profession making notable strides in its advancement, and it is intended by the members of the Toronto Branch that next year will see the engineering profession in a position of strength and influence much greater than at any previous time. The entire membership of *The Institute* is behind the Toronto members in their efforts in this connection, and it is expected that in attendance, interest and achievement the annual meeting in Toronto next year will break all previous records.

The following have been selected as chairmen of the various committees:—General Committee: Col. H. J. Lamb, D.S.O., M.E.I.C.; Finance Committee: W. A. Bucke, A.M.E.I.C.; Entertainment Committee: Prof. T. R. Loudon, M.E.I.C.; Technical Papers Committee: C. A. McCarthy, M.E.I.C.; Publicity Committee: J. R. W. Ambrose, M.E.I.C.; Accommodation Committee: J. B. Carswell, A.M.E.I.C.; Service Committee: Prof. H. E. T. Haultain, M.E.I.C.; Joint Secretaries: L. W. Wynne-Roberts, A.M.E.I.C., and J. R. Montague, A.M. E.I.C.

The dates suggested for the meeting are Tuesday, Wednesday and Thursday February the first, second and third.

Improving the Highway Improvement Act

W. A. McLean, M.E.I.C., Deputy Minister of Highways, Ontario is responsible for a change in the Highway Improvement Act of Ontario, which gives a striking illustration of the recognition that the building of highways involves technical knowledge and skill, and that as far as Ontario is concerned it is intended to have competent direction on the construction and maintenance of the highways of Ontario. The Council of *The Institute* expressed its appreciation to Mr. McLean in recognizing the standing of the membership of *The Engineering Institute of Canada*, and the sentiments of Council will be endorsed by the membership of *The Institute* in this connection.

The wording of the Act mentioned is as follows:—

His Majesty, by and with the advice and consent of the Legislative Assembly of the Province of Ontario enacts as follows:—

1. Section 7 of *The Highway Improvement Act* is amended by striking out the words "or some other competent person" in the third line, and by adding thereto the following subsection:

(2) Every engineer hereafter appointed by the council of a county, in pursuance of this section, shall be a graduate in civil engineering of a university of recognized standing, or a member of *The Engineering Institute of Canada*, or an Ontario land surveyor.

A Notable Tribute

Canadian engineers have recently received probably the highest tribute that has yet been paid them, and directly as a result of their magnificent work during the war, in getting preference by the British Government for engineering positions available in Mesopotamia. In the employment bureau department this month will be found an announcement calling for engineers, the remuneration being, generally speaking on a much higher scale than is being received in Canada. The above incident will be received with satisfaction by the engineering profession in this country, placing as it does the official seal of merit on the Canadian engineer and singling him out as having no superior in the world.

Employment Service Bureau

The employment bureau is an important service to the members of *The Engineering Institute*, and the gradual but sure growth of the utility of this service during the past year has been encouraging. Originally the Bureau was confined largely to headquarters between issues of *The Journal*, but a recent extension of the work has increased its scope. It is now the policy to forward to the branch secretaries the information regarding applications for engineers whenever practicable, in order that the informations may be given the widest possible publicity in the shortest time. Thus the branch secretaries have information of value, not only to the members, but also to those not members of the branch, who if desirous of making a change may get in touch with the nearest branch secretary inquiring if recent application have been received for engineers. It may not be generally known, but a member living outside a Branch centre may become a member of any branch upon written request and receive the notices of Branch meetings. In some cases the branch secretaries have adopted the idea of giving a list of the latest vacancies on the post cards announcing the meetings, which applies particularly to the winter months. The federal and provincial government, municipalities, railroads and industrial companies, including not only the metal working industries, pulp and paper, contracting, and other corporations employing engineers, but also companies not heretofore in the habit of engaging technical men are making use of the possibilities which *The Institute* present as a clearing house for engineers. More and more will this be the case as it becomes better known what a distinct advantage it is to any one requiring the services of an engineer to be able to take advantage of the facilities offered by *The Institute* and of having the fact known to such a wide body of highly trained men as are constituted in this organization.

The employment Service Bureau now being well established will attain great efficiency as the more employing members of *The Institute* realize the usefulness to be gained through using this service.

Engineering employment is fairly satisfactory at the present time, there being still a dearth of junior engineers, and the students from the universities are getting more responsible work than was offered them a few years ago. The present graduating class has been absorbed and many of the younger engineers on leaving college have the choice of several positions.

Message to Good Roads Congress

Embodying good-will towards the Canadian Good Roads Association and a constructive suggestion regarding making greater use of technical men in the construction of highways, the following message was presented to the Congress by W. A. McLean, M.E.I.C., on behalf of the Council of *The Institute*:

"The Council of *The Engineering Institute of Canada*, recognizing the important place which highway construction and maintenance must of necessity play in the social, industrial, agricultural and commercial development of Canada desires to extend to the Canadian Good Roads Association best wishes for a successful convention in Winnipeg and to assure the Association of the interest with which *The Institute*, representing the Engineering profession as a body, will follow the proceedings of this Congress.

The Engineering Institute may be permitted to refer with some degree of satisfaction to the services which the engineering profession has performed in creating the magnificent network of steam railways which to-day traverses all occupied portions of Canada; and with some pride may refer to the distinguished services in the great war which the various Railway Construction Battalions of Canada were able to achieve in competition with the best engineering skill of all nations, achievements as was made possible only by reason of the ability, energy and experience gained under conditions of peace.

It is to be recognized that the improvement of common roads has been a matter of comparatively recent and that such improvement on a substantial scale is now the most important public work remaining to be carried out in order that Canada may be enabled to take advantage of her wonderful resources and the opportunities which have been created by railway and canal construction and other works of development.

Provincial and municipal highway and street departments in the recent expansion of their work, it is stated, have found difficulty in obtaining experienced highway engineers to place in charge of this construction. Such a shortage of highway engineers, if it exists, is probably due in part to the failure of rural and urban Councils to utilize services of engineers on minor works of road improvement through which experience would have been gained to qualify them for the present under demand.

When steam railway construction was initiated, a similar scarity of railway engineers existed; but experience (said to be a costly teacher) rapidly produced a corps of railway engineers of ability adequate to the wonderful results which have been reached.

Highway engineers of finished calibre and qualifications as the railway and other branches of construction can only be produced through the medium of experience. But this *Institute* would submit for the consideration of the Road Congress, that technically trained men will usually respond most effectively to experience, and that the most valuable supervision can be produced only by providing the necessary experience for technically trained men.

The tendency of some highway authorities has been to employ practical men and men of local influence in positions which might readily be opened to young engineers. The Provinces are annually turning out from their Universities, groups of young men who have spent several years of labour at expense and without remuneration in procuring a technical education. As a practical suggestion, *The Engineering Institute* would offer the recommendation that the experience which is largely lost by bestowing it upon laymen might with benefit be conserved by preferring for these minor positions, young technical graduates—a practical method of conservation which would ultimately mean much as a matter of public economy and efficiency.

In submitting this view the Council of *The Engineering Institute* is aware that narrow motives might be imputed; but rather, the Council is disposed to believe that the national advantage of well qualified and experienced engineering services in the great work of highway development will be accepted by the Good Roads Congress, as common ground for co-operative effort, and the sincere interest which the Council has already expressed in the proceeding of the Congress."

Convention of the American Waterworks Association

The Fortieth Annual Convention of the American Water Works Association will be held in Montreal June 21-24, the Windsor Hotel being the headquarters. A large number of members of the Association are expected to be present at this Convention from the Dominion and from the United States and a very interesting programme has been arranged. It will be noted from the programme that members of *The Engineering Institute of Canada* are taking an active part in presenting papers. The address of welcome will be read by Commissioner R. A. Ross, M.E.I.C., President of the Institute.

The Council of the Institute has issued a cordial invitation to the Waterworks Association and convention delegates to make use of the Headquarters Building for any purpose they may require.

* * *

Tentative Programme

Monday, June 21.

Registration, meetings of Executive and other Committees and informal get aquainted meetings in lobies and exhibit room.

Monday Evening.

Informal reception at the Windsor Hotel.

Tuesday, June 22.

Opening of Convention, reading of following papers: The Municipal Water Supply of Montreal, by Thomas W. Lesage, M.E.I.C.; The Works of the Montreal Water & Power Company, by F. H. Pitcher, M.E.I.C.; The Experience in Montreal in the Manufacture of Alum, by James O. Meadows, A.M.E.I.C.

Afternoon

The Water Works of the City of Quebec, by Arthur Surveyer, M.E.I.C.; Water Supply Problems in the Province of Quebec, by T. J. Lafreniere, M.E.I.C.; The Water Works of St. John, N.B., by Frank A. Barbour, M.E.I.C.

Evening

Water Works Experiences, by Beekman C. Little; Economic Features of Pumping Station Operation, by Leonard C. Day; Difficulties in Building the Louisville Pumping Station, by James B. Wilson.

Wednesday, June 23.

The New Water Supply of Winnipeg, by James H. Fuertes, M.E.I.C., and Wm. G. Chace, M.E.I.C.; President's Address, by President Carleton E. Davis; Reports from Sections; Report of the Association's Representatives on the American Electrolysis Committee; Report of the Committee on Private Fire Protection Services, Nicholas S. Hill, Chairman; Report of the Committee on Official Standards for Water Analysis, Jack J. Hinman, Jr. Chairman; Report of the Committee on Standard Specifications for Cast Iron Pipe and Specials, Frank A. Barbour, M.E.I.C., Chairman; Report of the Committee on Cold Weather Troubles, Charles R. Bettes, Chairman.

Afternoon

Entertainment by the Water Works Manufacturers Association, possibly a trip through the rapids of the St. Lawrence River.

Evening

A smoker for the men, given by the Water Works Manufacturers' Association, and for the ladies a theatre or card party.

Thursday, June 24.

Discussion of Water Meters. This will be opened by several papers by members of the Association. All members of the Association with any information of interest on this subject are requested to communicate with John M. Goodell, 106 Loraine Ave., Upper Montclair, N.J.

A separate meeting will be held by the Chemical and Bacteriological Section at which a paper will be read by Colonel Geo. A. Johnson on quality of water.

Afternoon

A general discussion of the legitimate uses of water, water waste, etc.

Evening

Passage of Deep Water to Sea Water, by Dr. Wm. P. Mason; Cost-Plus Contracts in Water Works Construction, by Geo. W. Fuller, M.E.I.C.; Standard Forms for Contracts, by C. W. Hubbell; The Trend of Prices, by Leonard Metcalf.

Arrangements have been made for trips about the city of Montreal, inspection of water works, etc. A special trip may be arranged to the Saguenay River.

REPORT OF COUNCIL MEETING

The main features of the regular meeting of Council held on April 27th were reported in the first editorial of the May issue of *The Journal*.

At the adjourned meeting of Council held at headquarters on Monday, May 3rd, Branch resolutions were noted and approved.

The compendium on engineering legislation compiled for the use of the Advisory Conference Committee of Ontario was presented and received with thanks. The action of W. A. McLean, M.E.I.C., Deputy Minister of Highways, Ontario, in amending the Highway Improvement Act to give recognition to the engineering qualifications of members of *The Institute* was noted and the thanks of *The Institute* expressed to Mr. McLean for his action in this connection. The suggestion of Dr. Herdt that the name of the Electro Technical Committee of *The Institute* be changed and known as the Canadian International Electrotechnical Commission was approved and the name of H. A. Dupré, A.M.E.I.C., was added to the Committee. Items ninety-five to one hundred and two of the proceedings of the Main Committee of the Canadian Engineering Standards Association meeting of April 15th relating to *The Engineering Institute of Canada* were noted to the effect that the Canadian Engineering Standards Association proposed taking over the standards of *The Institute* as suggested and that credit would be given to *The Institute* for all work done thereon by *The Institute*. The name of J. B. Challies, M.E.I.C., was added to *The Institute* Committee on Remuneration of Engineers. Letter from the Edmonton Branch advising that they were unable to undertake the responsibility of having a Professional meeting this year was noted. The suggestion that the present maximum limit of twenty-five years for students be increased, and the present minimum of thirty-five years for members be decreased was referred to the By-laws Committee with a request that this committee confer with the Board of Examiners and Education and report to Council. The recommendation regarding changes in the By-laws to enable juniors to vote and hold office in Branches [illegible] of chairman, approved at the last meeting of Council, was referred to the By-laws Committee with a request that a draft be made of the changes to include this suggestion. The question of publishing transactions as recommended by the Publication Committee was considered. It was decided to make a note in the agenda of the next meeting and that all councillors be advised that the question of publication of papers and transactions be discussed at the next meeting of Council, and later submitted to the membership for decision.

Resignations were accepted as follows:—

H. R. Crossley, G. H. G. Conrwick, F. C. Albert.

Classifications were made for a ballot returnable at the next regular meeting of Council.

In April the following elections and transfers were effected:—

Members

R. N. Blackburn of Regina, Sask., chief boiler inspector, Prov. Gov't of Sask.; J. G. Berning of London, Eng., Stockholm Tech. Univ., Managing Director of Berning & Co. Ltd.; W. L. Dennault of Coniston, Ont., Chief Engineer, Mond Nickel Co.; W. P. Dobson, B.A.Sc., M.A.Sc. (Univ. of Tor.), Laboratory engr. Hydro-Elec. Power Comm. Toronto; E. T. Croll of Niagara Falls, Ont., Plant engr. on Chippawa-Queenston Power Dev., Hydro-Elec. Power Comm.; H. V. Haight, B.A.Sc. (Univ. of Tor.) of Sherbrooke, Que., Chief engr., Canadian Ingersoll-rand Co.; J. D. Hathaway, of Westmount, Que., Pres. British Manganese Co. Ltd.; G. P. Hawley of Cedars, Que., resident engr. Cedars Rapids Mfg. & Power Co.; W. G. Hewson, B.A.Sc. (Univ. of Tor.) of Toronto, rly. engr. H.E.P.C.; E. D. LeMay of Toronto, city surveyor, Toronto; W. B. Lindsay, C.M.G., D.S.O., of Strathroy, Ont., G.O.C. Can. Engrs. and chief engr. Can. Corps.; W. MacLachlan, B.A.Sc. (Univ. of Tor.) of Toronto, consultant, Industrial relations, H.E.P.C.; L. D. Magee of Peterboro, Ont., works engr. Can. Gen. Elec. Co.; J. McEvoy, B.A.Sc. (McGill Univ.) of Toronto, consulting mining engr. and geologist; G. L. Sneath of Amherst, N.S., gen. mgr. Robb Engineering Wks.; D. W. Roper, of Toronto, C.E. Univ. of Tor. '00, vice-pres. and mgr. Ontario Rock Co. Ltd., engr. and mgr. Electro Metals Quarries, Ltd., Welland, Ont.; H. M. Scott, of Montreal, mgr. mech'l. dept. P. Lyall & Sons, constrn. Co.; P. T. Sise, B.Sc. (McGill Univ. '01) of Montreal, president, Nor. Elec. Co.

Associate Members

N. T. Binks, B.Sc. (McGill Univ. '[illegible]) of Montreal, sec.-treas. John MacGregor Ltd., engrs. and contractors; W. M. Cruthers, B.A.Sc. (Univ. of Tor. '[illegible]) of Peterboro, engr. Can. Gen. Elec. Co. [illegible]; F. E. Darrell, B.Sc. (C.E., Univ. of Maine '[illegible]) of [illegible], and of res. engr. Price Bros. & Co. Ltd.; A. L. Dickinson, B.Sc., M.Sc. (McGill Univ.) of Peterboro, induction motor designer, Can. Gen. Elec. Co.; D. A. Duffy, of St. John, N.B., asst. to road engr. St. John; K. A. Dunphy, B.Sc. (Univ. of N.B.) of [illegible], Man., dir. engr. bridge and bldg. [illegible]; R. H. Findlay, Assoc. Royal Tech. Coll. of Westmount, Que., chief draft'g dept. [illegible], Dom. Bridge Co.; V. S. Foster, B.Sc. (Univ. of Kansas) M.Sc. (Penn's State Coll.) of Peterboro, engr. in chge. D.C. machine design. Can. Gen. Elec. Co.; L. F. Fyles, B.Sc. (McGill Univ.) of Calgary, Alta., deputy district vocational officer for Alta. D.S.C.R.; A. M. Grant, B.Sc. (Queen's Univ.) of Ottawa, in chge of triangulation, Montreal and district, Geodetic Survey of Canada; R. L. Hearn, B.A.Sc., (Univ. of Tor.) of Toronto, chief asst. to hydraulic engr., chge of designing and drafting staff, Queenston-Chippawa development; V. J. Hvidt, (Poly. Tech. Copenhagen '09) of Princeton, res. engr., Copper Mountain Branch, Kettle Valley Rly.; C. J. Jeffery, of Armstrong, B.C., res. engr. on constrn. C.N.R., Okanagan Branch; F. B. James, of Walkerton, Ont., private practice; B. F. Lamson, B.Sc., (Queen's Univ.) of St. Catharines, asst. city engr.; C. J. LeBlanc, B.A.Sc. (C.E.) (Ecole Poly. '10) of Montreal, engr. in chge. contract works road dept. Montreal; W. S. Lockhart, B.Sc. (E.E.) (McGill Univ.) of Montreal, elec. engr. Engineering Co. of Canada; W. M. MacAndrew, B.A.Sc., (Univ. of Tor.) of Vancouver, B.C., member of firm MacAndrew-Jamieson Eng. Co.; J. P. Mackenzie, (Glasgow Univ.) of Vancouver, in chge of eng. work, Loomis, McFee, Henry & McDonald, contractors; M. S. Madden, B.S., B.Sc., of Keewatin, Res. engr. at Keewatin for Man. Hydrometric Survey; W. F. McKnight, B.Sc. (McGill Univ.) of Montreal, educ. director, Nor. Elec. Co.; R. Morham, of Toronto, draftsman Hydro-Elec. Power Comm.; R. R. Murray, B.Sc. (N.S. Tech. Coll.) of Halifax, re-educ. principal, D.S.C.R.; B. T. O'Grady, of Nelson, B.C., locating engr. for P.W.D. for West Kootenay; F. E. Orr, (Queen's Univ.) of Alfred, Ont., supt. in chge of erection of plant, Alfred; G. H. Patterson, B.Sc. (Univ. of N.B.) of Quebec, transitman in chge of foundation work, St. Malo Shops, C.N.R.; H. C. F. Poste, of Cornwall, Ont., mgr. St. Lawrence Power Co. Ltd., mgr. Cedars Rapids Transmission Co.; W. Ramsay, (Dundee Univ.) of Nelson, B.C., dist. engr. West. Kootenay; J. J. Richardson, of Quebec, Que., asst. dist. engr. C.N.R.; G. L. Ridout, (R.M.C. '07) of Toronto, engr., Norman McLeod, Ltd.; H. S. Rimmington, B.C.E. (Univ. of Man.) of Winnipeg, designing engr. and asst. to bridge engr. C.N.R.; F. A. Ritchie, of Sault Ste. Marie, drawing and engr. on constrn., Algoma Steel Corp.; A. R. Robertson, B.A.Sc., (Univ. of Tor.) of Toronto, sales engr. McGregor, McGregor and McIntyre, Ltd.; S. G. Smith, of Toronto, asst. to chief land surveyor, C.N.R.; R. D. Sutherland, B.Sc. (McGill Univ.) (R.M.C.) of Montreal, on eng. staff, Electrics Ltd.; F. E. Umphrey, of Winnipeg, in chge of drainage dists., prov. of Man.; J. Veitch, (Heriot Watt Coll.) of Winnipeg, engr. in chge. mech. dept. Man. Power Comm.; W. C. Way, M.Sc. (Queen's Univ.) of Ottawa, director of surveys lab., Dept. of Inter.; H. M. White, (Univ. of Tor.) (Hons.) of Winnipeg, designing engr. Winnipeg Branch, Dom. Bridge Co.; J. M. F. Wilson, B.Sc. (London) of Winnipeg, head of dept. of elec. eng., Kelvin Tech. High School; J. Young, (Univ. of Tor.) of Winnipeg, chief inspector, Western Canada Fire Underwriters Ass'n.

Juniors

P. Danais, B.Sc. (C.E.) (Queen's Univ.) of Baie St. Paul, installation of water plant with R. Fortin; N. H. Daniel, B.A.Sc. (Univ. of Tor.) of Toronto, drfts'man, Toronto harbour Comm.; D. C. M. Davies, of Regina, inspector of P. W., Prov. of Sask.; R. C. Eastman, of Capreol, Ont., res. engr. m't'ce of way, C.N.R.; J. W. D. Farrell, B.A., B.Sc. (Queen's Univ.) of Regina, draftsman, irrigation div., Dept. of Inter.; H. E. Miller, of Charlottetown, P.E.I., in chge of North Lake Boat Harbour, layout and constrn.; V. C. Moulton, B.Arch. (McGill Univ.) of Westmount, Que., estimating and drafting, Douglas Bremner & Co.; A. Pirie, of Vancouver, asst. engr. B.C. hydrometric Survey, Water Power Branch; J. R. Ross, (Univ. of Man.) of Winnipeg asst. to municipal engr., Rockwood, Man.; J. H. Russell, of Peterboro, Ont., with Russell-Townsend Co., Contractors; W. J. Rutherford, of Westmount, Que., attending McGill Univ.; A. B. Rutherford, of Westmount, Que., attending McGill Univ.; W. B. Scott, of Montreal, attending McGill Univ.; N. H. F. Smith, of Ottawa, Ont., in chge of subdiv. of adjusting div., Geodetic Survey of Canada; A. R. Whittier, B.Sc. (Queen's Univ.) of Ottawa, final year Queen's Univ.; E. P. Wilson, of Montreal, attending McGill Univ.; J. K. Wilson, of Montreal, attending McGill Univ.

Associate

F. Hankin, of Montreal, president, Francis Hankin & Co. Ltd.

Transferred from the class of Associate Member to Member

W. E. Davis, B.A. (Ohio State Univ.) of Winnipeg, office engr. G.T.P.; E. P. Fetherstonhaugh, B.Sc. (E.E.) (McGill Univ.) of Winnipeg; J. D. McBeath, B.A.I. (Univ. of N.B.) of Moncton, asst. city engr.; P. H. Mitchell, (Univ. of Tor.) of Toronto, partner C.H. & P.H. Mitchell, conslt. engrs.; W. H. Munro, (S.P.S.) of London, Eng., senior hydraulic engr., Vickers, Ltd.; J. J. Newman, (S.P.S.) of Windsor, Ont., private practice; J. Rocchetti, (Liege Univ.) (E.E.) of Winnipeg, chief engr. Man. Power Comm.; J. S. Tempest, of Ottawa, Ont., supervising hydraulic engr. Reclamation Service.

Transferred from the class of Junior to Member

J. C. Brown, (Univ. of N.B.) of Constantinople, chief engr., Anatolian Rlys., in Asia Minor.

Transferred from the class of Junior to Associate Member

G. Affleck, of Winnipeg, dist. engr. Reclamation Branch, P.W.D.; W. W. Dynes, B.C.E. (Univ. of Man.) of Winnipeg, asst. engr. City of Winnipeg; E. Duncan, (Glasgow Tech. Coll.) of Galt, Ont., locating engr., Hydro. Elec. Power Comm.; L. I. Easton, B.C.E. (Univ. of Man.) of Winnipeg, designing, bridge dept., C.N.R.; H. F. J. Estrup, (Polytech. Coll. Copenhagen) of Welland, Ont., director and president, British-American Shipbldg. Co. Ltd.; H. P. Heywood, of Toronto, asst. engr., Toronto Harbour Comm.; K. R. MacKinnon, B.Sc. (McGill Univ.) of Omaha, Neb.; K. W. Morton, of New Westminster, B.C., asst. engr. on design and supt. of constrn. P.W.D.; W. H. Norrish, B.Sc. (Queen's Univ.) of Ottawa, in chge of D.L.S. party; G. R. Turner, of Fredericton, N.B., asst. res. supt. eng. branch K unit. D.S.C.R.; C. S. Walley, B. Eng. (Liverpool Univ.) of Winnipeg, supt'g. engr., Lount Eng. Co. Ltd.

Transferred from the class of Student to Associate Member

Y. Lamontagne, B.Sc. (C.E.) (McGill Univ.) of Montreal; H. R. Urie, B.C.E. (Univ. of Man.) of Winnipeg, dist. engr., Good Roads Board.

Transferred from the class of Student to Junior

A. M. Alberga, B.Sc. (C.E.) (McGill Univ.) of Montreal; L. F. Barron, B.A.Sc. (Univ. of Tor.) of Hamilton, Ont.; W. S. Collins, B.C.E., (Man. Univ.) of Winnipeg, draftsman, bridge eng. dept., C.N.R.; W. W. Crouch, B.C.E., (Man. Univ.) of Selkirk, Man., inst'man on constrn. C.N.R.; J. A. Dufresne, B.A.Sc., C.E., (Laval Univ.) of St. Placide, Que., engr. hydraulic service, dept. of Lands and Forests, Quebec; J. C. Irving, B.C.E. (Univ. of Man.) of Winnipeg, asst. engr., Good Roads Board; H. MacNeil, of Montreal, inst'man on m't'ce., C.N.R.; F. G. Rounthwaite, B.Sc., (C.E.) (McGill Univ.) of Montreal, asst. to constrn engr., Atlas Constrn. Co. Ltd.

The following Students were elected

H. R. Burton, W. L. Campkin, I. B. Cassidy, C. M. Cassin, J. P. Devenny, A. L. Doucette, H. A. Gauthier, W. C. Gilman, A. W. Isaac, C. M. Johnston, D. Massey, L. W. May, H. H. Niles, J. B. Parker, F. C. Richardson, M. G. Stewart, J. A. Wright.

CORRESPONDENCE

Re Draftsmen and Engineers

Editor, *Journal:—*

Dear Sir,

In the February issue, a letter appeared on this subject.

I desire to deal with a different phase and show that it is allied with absorbing outside engineers and draftsmen into Canada, principally from the Old-Country.

In railways, few engineers were skilled draftsmen. It was the custom for field men to be brought into the drafting room during winter. The few who developed real skill had great difficulty in getting sent out again as engineers. Often an engineer took the place of the chief draftsman. Recent practice is the reverse. Those who do not acquire great skill, even though their work is very good, are let out of drafting anyway. This is very hard on a railway engineer in a slack time. Especially so because the same old countryman stays in the drafting room and in the minor field positions, preventing the engineer in winter, and the Varsity man in the holidays, from getting experience and the money to re-attend the fall session. At the head office of one of Canada's great systems this spring, there were six Old Countrymen and one lone Canadian at the engineering drafting tables, to say nothing of the other departments. The international character of The Institute is all very well, but it is time for some Canadian authorities to wake up.

W. C. McLean, A.M.E.I.C.

781 Shaw St., Toronto.

An Enquiry

Editor, *Journal:—*

Dear Sir,

It is the opinion of the writer that the usefulness of *The Journal* would be much enhanced if there was a section in which Members could make enquiries relating to problems which arise in their daily work; for instance the writer would like information on the following subjects:

1. What is the strength of Mild Steel, Cast Steel and Cast Iron at Temperatures above the normal?

2. What is the power ratio between a worm and a gear, also the strength of the teeth?

3. What are the physical properties of Antimonial lead?

Yours truly,

C. D. [illegible], A.M.E.I.C.

British America Nickel Corporation Ltd.,
Deschenes, P.Q.
May 5, 1920.

* * *

1. The best information on this subject is to be found in the standard text-books on heat-treatment. Among these are: "Hardening and Tempering Steel," by Bernard E. Jones, published by Cassell and Company, (in the library); "The Crystallization of Iron and Steel," by J. W. Mellor, published by Longmans and Green (in the library); "The Composition and Heat Treatment of Steel" by Lake, published by McGraw-Hill.

2. There are several excellent text-books on machine design which give full information in answer to the question; "Machine Design" by F. R. Jones, published by Wiley and Sons (in the library); "Machine Design" by Smith and Marx, published by Wiley and Sons.

3. Very little on the subject of antimonial lead is to be found in current mining literature. Bibliographies are given in "Mining Engineers' Handbook" by Peele; there are also references in "Prospector's Field-book and Guide" by Osborne and Von Bernewitz.

In connection with all of these questions reference is recommended to the annual volumes of the Engineering Index, the files of the Transactions of the American Society of Mechanical Engineers, American Society of Testing Materials, Canadian Mining Institute, American Institute of Mining Engineers; also to the files of the technical journals such as "Canadian Machinery", "Machinery", "Canadian Mining Journal", and "Engineering and Mining Journal". The principal technical publishers are Wiley and Sons and McGraw Hill, both of New York.

EMPLOYMENT BUREAU

A letter has been received from Col. Houliston with information regarding appointment of eight irrigation engineers for service in Mesopotamia. Further particulars with regard to this appointment may be obtained from headquarters, any of the Branch Secretaries, or Col. J. Houliston, A.M.E.I.C., Dept. of Militia & Defense, Ottawa, Ont.

Situations Vacant

Boxes 83, 90, 87, 88, 89, 94, and 93 are filled.
Boxes still available 92, 96, 99, 100, 101, 102, 103, 104, 105, 106, 107, 109, 110.

The Paper Company referred to in Box 92 in the April *Journal* still requires instrumentmen, draughtsmen and rodman, but does not wish applications from inexperienced men.

Civil Engineer

Experienced civil engineer wanted for pulp and paper company in the province of Quebec. Box 114.

Investigation of Water Power

Civil Engineer; field work—charge of party on investigation of a water power. Box 116.

Hydraulic Engineer

Hydraulic Engineer; office work, designs and estimates on hydro-elec. power house work, etc. Box 118.

Electrical and Mechanical Engineer

Electrical and Mechanical Engineer; office work, designs and estimates on hydro-elec. power house work, transmission lines, etc. Box 117.

Assistant Draughtsman

Assistant draughtsman for new development in wireless apparatus in connection with experimental and development work, good opportunity for entering the field of wireless engineering. Box No. 111.

Engineer for Consulting Engineering Work

Engineer to take charge of office work in leading consulting engineer's office, preferably with structural designing experience. Work will include office management and design principally structural work on buildings and bridges; layout of waterworks and sewerage systems. This is a permanent position with good prospects. State experience, references and salary required. Box 115.

Junior Assistant Roadway Division

Wanted, a young graduate for Junior Assistant in Roadway Division. A permanent position for the right man. Box No. 119.

Situations Wanted

Quebec Land Surveyer S.E.I.C. Young man seeking employment preferably of a permanent character. Box No. 33-P.

Civil Engineer

Civil engineer, A.M.E.I.C., sixteen years experience construction work as chief of party, squadman and assistant chief draughtsman, chemical works smelter and railway, present salary $250.00, rural situation desired. Box 30-P.

Civil Engineer

Civil Engineer, B.A.Sc., S.P.S., Toronto, four years engineering experience, at present with Pulp Company, returned soldier, wishes position as Assistant Town Engineer, or Assistant on construction work, salary $200 per month.

Structural Engineer

Structural engineer with varied experience including responsible charge of important works both in Canada and India, would like to become associated with a construction company in Ontario, Quebec or Eastern Canada. Has had responsible experience in connection with drains and sewers, reservoirs and dams, land reclamation, irrigation river control works, open caisson foundations, paved and earth roads etc. also experience in reinforced concrete steel and brick construction. Box No. 31P.

UNIVERSITY OF MANITOBA APPOINTMENT IN CIVIL ENGINEERING

The Board of Governors will proceed shortly to appoint an Assistant Professor of Civil Engineering, having regard especially to his qualifications in Municipal Engineering and Hydraulics. Initial salary, $2,500. The successful applicant will be expected to enter upon his duties on or about September 1st, 1920. Five printed or typewritten copies of letter of application and testimonials should be in the hands of the Board of Governors on or before June 20th, 1920.

THE SECRETARY,
BOARD OF GOVERNORS,
University of Manitoba,
Winnipeg, Canada.

Member's Exchange

Transit for Sale

Buff and Buff Transit. 5" Horizontal and 4" Vertical Circle. In excellent condition. Price $175.00. Box No. 1A.

OBITUARIES

Cameron A. Buck, Jr., E.I.C.

Cameron A. Buck, E.I.C., died from pneumonia at Black Lake, Que., on March 20th. At the time of his death Mr. Buck was civil engineer with the Black Lake Asbestos and Chrome company of Black Lake, Que. He obtained his high school education in Edmonton, and attended the University of Alberta from 1911 to 1916 when he received the degree of B.Sc. During his university course he took a keen interest in student societies and activities as well as obtaining a high academic standing winning the Applied Science Scholarship in his sophomore year. In 1915 he was manager of the International Championship Rugby team. After graduation Mr. Buck was engaged in munitions work in Toronto, later joining in the Canadian Engineers with the rank of Lieutenant. He was overseas one year being discharged in June 1919.

Lieut. Clarence Thorne Evans, Jr., E.I.C.

The Border Cities Branch of *The Engineering Institute of Canada* suffered the loss of another of its members in the death on the 9th, instant, of Lieut. Clarence T. Evans, Jr. E.I.C., after an illness of only one week. Since his return from overseas in 1918 the late Mr. Evans had been draughtsman for the Canadian Steel Corporation, Ojibway, until a few months ago when he joined the General Motors Corporation, Walkerville in a similar position.

The late Lieut. Evans spent two and a half years in the University of Michigan on mechanical engineering, having entered as an honor matriculant. He started his engineering career with the Packard Motor Company in 1906, in 1911 he was designer with the General Motors Co., in the experimental department. He entered *The Institute* as Junior on Nov., 27th, 1919.

Gerald C. Williams, M.E.I.C.

The death occurred in Detroit of G. C. Williams, A.M.E.I.C., who a few months ago was Secretary-Treasurer of the Border Cities Branch.

Mr. Williams was born at St. Thomas, Ont. on April 23rd, 1880, and was educated at the public and high schools of his native town. Mr. Williams was from March 1901 to September 1902 a pupil in railroad engineering with the Grand Trunk Western Railway, and was later draughtsman with the Pennsylvania Salt Company, Wyandotte, Mich., draughtsman with the American Bridge Company, Detroit, Mich. with the Canadian Bridge Co., $2\frac{1}{2}$ years as draughtsman and two years as assistant to principal in charge of work. For the past fifteen years he had charge of structural sales with the Canadian Bridge Co., Walkerville, until last August when he joined the firm of Whiteside & Kales, Detroit, Mich., in a similar capacity.

The late Mr. Williams was sick for some weeks with influenza which was followed with complications resulting in his death.

Peter Scott, A.M.E.I.C.

Intimation has been received of the death at Glasgow, Scotland in April last, of Peter Scott, A.M.E.I.C. He was a native of Greenock, Scotland, and having graduated from the Glasgow & West of Scotland Technical College in 1901, he served a pupilage under the late [illegible] Caldwell, A.M.I.C.E., on the Greenock Waterworks systems, and in the construction of reservoirs and [illegible] works for various towns in the West of Scotland. Coming to Canada in 1908, he was employed as draughtsman in the Construction Department of the Canadian Pacific Railway at Montreal, and from 1912 to 1914 was engaged as assistant engineer on Water Survey for the Com. [illegible] [illegible] Eastern Lines. In 1915 he returned to Scotland and was appointed senior assistant engineer of [illegible] Glasgow area, with supervision of [illegible] work all over Scotland. He devoted himself assiduously and unsparingly to this work to an extent that undermined his health which was never very robust. It was always his intention to return to Canada as soon as circumstances were favourable. But at the early age of thirty seven years, and leaving a widow and one child to mourn his loss, a very promising career has been cut short. A loyal and lovable nature, and a kind and cheerful companion, has passed away.

Major Thomas Henry Jones, B.A.Sc., M.E.I.C.

After thirty-seven years continuous service as city engineer of the city of Brantford, Ont., Major Thomas Henry Jones, B.A.Sc., M.E.I.C., passed away suddenly on the afternoon of Sunday, April 25th following an attack of pneumonia. The late Major Jones was born at Brantford, Ont., on April [illegible], [illegible], and graduated from McGill University in civil and mechanical engineering with the degree of B.A.Sc., in [illegible], and two years later commenced a general practice as engineer and surveyor in the city of Brantford having passed his final examinations as Provincial and Dominion Land Surveyor the year previous. In 1883 he was appointed acting city engineer for the city of Brantford as well as for the surrounding townships. During the intervening years he has had charge of all public improvements for that city and during that time has been a faithful employee endearing himself to the citizens in a way that makes his passing taking a severe loss to the city of Brantford.

Familiarly known as T. Harry Jones he occupied a prominent place in the civic activities of the community. He was an ardent chess player, an [illegible] of [illegible], a keen lover of sports and an able [illegible]. In religious and civic matters he took a prominent part, conducting a young men's bible class in the [illegible] Methodist Church. He is survived by Mrs. Jones, two sons, Gordon R. Jones, a missionary in China, who served in the late war, Duncan Jones and three daughters, Misses Wilma, Marjorie and [illegible] and two brothers, Colonel C. S. Jones, Crown Lands Department, Toronto, and S. Alfred Jones, [illegible] in the city of Brantford. In 1890 the late Major Jones became an associate member of *The Institute* transferring to full membership in 1897. He took an active part in the affairs of *The Institute* having been present at the last annual meeting and as vice-president of the Ontario Provincial Division attended the meetings of the Executive and gave valuable assistance. His sterling character and fine manly qualities will always be remembered by those who were privileged to be associated with him.

BRANCH NEWS

Victoria Branch

Horace M. Bigwood, A.M.E.I.C., Secretary.

Engineers End Season—The winter social season of the Victoria branch of *The Engineering Institute of Canada* ended on the evening of Monday April 26th, with the final monthly reception. These functions have been held throughout the winter in the K. of C. Hall and have proved popular with *The Institute* members and their friends. They have assisted in keeping up interest in the local branch. It is planned to hold luncheons or meetings of some form during the Summer.

Calgary Branch

Arthur L. Ford, M.E.I.C., Secretary-Treasurer

C. M. Arnold, M.E.I.C. having accepted a position on construction on the Lethbridge Northern Irrigation Project, has resigned as Secretary-Treasurer of the Calgary Branch, and the Executive Board has appointed Arthur L. Ford, M.E.I.C., as Secretary-Treasurer in his place.

*

At an informal meeting on May 4th in Calgary, a committee was appointed to consider and report on the question of the Western Professional Meeting which it is proposed to hold this Autumn. The committee is composed of F. H. Peters, M.E.I.C., G. W. Craig, M.E.I.C., Alex. S. Dawson, M.E.I.C., G. N. Houston, M.E.I.C., A. I. Payne, M.E.I.C., F. Beach, A.M.E.I.C.

*

The Legislation Situation in Alberta

Arthur L. Ford, M.E.I.C.

Back in the nineties the professional engineers in Eastern Canada were active in the matter of gaining legislation for engineers. Two Acts were put through, one in Manitoba and one in Quebec. After this the whole matter was dropped and nothing further was done until about three years ago, when, through the activities of F. H. Peters, M.E.I.C., the Calgary Branch of the E.I.C. started in to work on the idea again. It is a matter of very great interest to all members, not only of the Calgary Branch but of the Alberta Division to know that Professional Engineer's Acts have been passed in British Columbia and Manitoba, are before legislatures in New Brunswick and Nova Scotia, and particularly that the Engineering Professional Act was passed by the legislature of Alberta on or about April 10th last.

Printed copies of the Alberta Act are not yet available. However, the joint Committee of engineers, who were interested in gaining the legislation supplied copies of the proposed Act to a large number of engineers. The Act as passed is, generally speaking, the same as the proposed Act except that registration is not a necessary antecedent to practice. Registration is voluntary, and the control as regards admission and registration is placed with a Board appointed by the Senate of the University of Alberta.

The Act names nine professional engineers, representative of all the branches of the profession, as corporate members and constituting an interim council. These members are given the necessary powers, and their duty is to enlarge the association, by providing for the admission of new members, and their duties and interim offices cease when the first general meeting is held.

The personnel of the Interim Council is as follows: O. E. S. Whiteside, Pres. of Can. Mining Institute, International Coal and Coke, Coleman, Alta.; L. E. Drummond, Tagler Block, Edmonton, Alta., Consulting Mining Engineer; F. H. Peters, M.E.I.C., Commissioner of Irrigation, Calgary; R. J. Gibb, M.E.I.C., Asst. City Engineer, Edmonton; J. F. McCall, Chief Engineer, Power Dept., City of Calgary; F. W. Hobson, Chief Inspector of Boilers, Alberta Government, Edmonton, Alta.; W. R. Pearce, Supt. of Alberta Government Telephones, Edmonton; R. A. Brown, City Electrical Engineer, Calgary; R. L. S. Wilson, Prof. of Civil Engineering, University of Alberta, Edmonton.

This Interim Council held an organization meeting at Calgary on May 6th and laid plans and made as many arrangements to carry out the work devolving on them under the Act as possibly could be made at that time. Such interim by-laws were passed as are necessary to provide a procedure to carry on the business of the Association until the general meeting is held. The interim entrance fee of $10.00 was fixed with a view to making the dee as low as possible and at the same time producing sufficient revenue to carry on the business. The interim by-laws also provide that the first election of officers shall be by letter ballot so prepared as to produce equal representation in the Council of the four main branches of the profession, viz:—civil, electrical, mechanical and mining.

R. L. S. Wilson has been appointed Interim Registrar of the Association and under the supervision of the Board appointed by the Senate of the University he will now proceed to admit new members to the Association.

Applications may now be submitted for admission to the Association of Professional Engineers of Alberta and to become registered as a Professional Engineer in Alberta.

Applications should be made in accordance with a form decided upon by the Interim Council, and blank copies of this form may be obtained from any member of the Interim Council or from the Secretary of the Calgary Branch of *The Institute*. The forms when filled in should be sent to R. L. S. Wilson, Interim Registrar and Secretary, Association of Professional Engineers, University of Alberta, Edmonton. It is suggested that there be included with the application a concise but complete statement of the applicants professional career, giving details of work done with dates.

All applications should be accompanied by a remittance of $10.00 payable at par at Edmonton to R. L. S. Wilson. It is hoped that applications will be submitted at an early date because the Act is mandatory as the calling of a general meeting of the then members of the Association on or before July 10th, next, and the general meeting will elect the first regular officers and consider the adoption of By-laws of the Association.

While the Act as passed is not all that was desired by professional engineers because it is voluntary instead of obligatory, the voluntary Association (pending the time of getting something better) can be made to serve the same purpose as an obligatory one if it is backed up by all the qualified professional engineers in Alberta. The consensus of opinion seems to be that the Act makes possible a well-foundationed organization which will not only give a proper protection to the public but also give a proper material recognition to the professional engineer.

It would seem that the feeling towards this new Association is very favourable throughout the province not only by members of *The Institute*, but by all professional engineers.

The joint committees which were formed for the purpose of bringing the Act before the legislature were very successful in getting team play amongst all branches of the engineering profession and it is expected that this feeling is going to be maintained by all the engineers in the province getting behind the Act and making it a success.

On May 4th an informal meeting of engineers was held at the Board of Trade Rooms, Calgary, to discuss the question of the formation of an Association of Professional Engineers. Mr. Peters was chosen to act as chairman and after he had reviewed the work that had been done to secure legislation in this province as well as in other provinces of Canada, he called for a full discussion. This discussion developed that the engineers present were in favour of the forming of the Association which was afterwards proved by the passing of a motion to that effect by a unanimous vote.

About forty to fifty engineers representative of various branches of the profession were present, and interest in the question was fully sustained until the hour of adjournment was reached.

Immediately after the meeting on May 4th those members of the Calgary Branch who were present discussed informally another very important question. As the Edmonton Branch had found it impossible, on account of their activity in connection with the Professional Engineers' Act, to go ahead with the Western Professional Meeting, they had thrown open the field to any other Western Branch which would like to undertake the holding of this meeting. Mr. Craig, the acting Chairman, dwelt on the excellent meeting which had been put on by the Saskatchewan Branch at Saskatoon in 1918 and expressed himself as in favour of the Calgary Branch going ahead with it provided suitable arrangements could be made and a success ensured.

After considerable discussion as to ways and means the meeting unanimously expressed itself in favour of holding the Western Professional Meeting under the auspices of the Calgary Branch this summer and appointed Messrs. Craig, Peters, Hanson, Dawson, Pierce and Bosch, as a committee to study the question in detail and to report to a general meeting of the Branch.

This committee has held two meetings and are now in a position to report to the Branch at a general meeting called for Saturday night, May 22nd. They will report in favour of holding the meeting at Banff, Alta., during the last week in July or first week in August. The proposal also is to have the engineers and their guests live under canvas during the meeting. Tentative arrangements for securing tents have been made with the Park Branch of the Dominion Government. The feature together with the natural attractions at Banff should make the gathering one to be remembered by all attending it and it is to be hoped that the general meeting will approve the committee's suggestion so that we may all look forward to a happy and jolly three days at Banff under canvas.

At a meeting of the executive committee held in the Dominion Government Irrigation Offices in April, Arthur L. Ford was appointed Secretary-Treasurer to succeed C. M. Arnold who had accepted a position out of town. Although unable to continue his secretarial duties, Mr. Arnold is remaining a member of the Branch.

Saskatchewan Branch

J. N. deStein, M.E.I.C., Secretary-Treasurer.

The summer meeting of the Saskatchewan Branch will be held on Thursday, July 15.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.

On April 21st at the regular meeting of the branch held in the University of Manitoba, a paper was read by C. A. Clendening, A.M.E.I.C., entitled "Some Observations on Electrical Distribution".

The paper dealt with the economics of city distribution very fully. An interesting discussion took place in which a large number of the members present took part.

On Thursday, May 6th, the annual meeting of the Branch was held in the University Buildings.

Reports of Committees were received and approved. The report of the Secretary showed that a very successful season had just been closed.

Total enrollment to date showed.

Members........	[illegible]
Associate Members.	[illegible]
Juniors	[illegible]
Students	[illegible]
Local Affiliates.	[illegible]
Total membership.	24[illegible]

An increase of 44 over the previous year.

The average attendance per meeting during the session was 46.

Some important questions were discussed thoroughly during the session among which were the Legislation for Engineers, Research into the "Disintegration of Concrete in Alkali Soils" and the "Drafting of New By-laws".

The retiring chairman, Mr. W. P. Brereton thanked the members and committees for their co-operation during his term of office, and congratulated the branch on its progress during the recent year.

The scrutineers reported the following elections:

Chairman:	W. M. Scott.
Sec.-Treas.:	Geo. L. Guy.
Executive Com:	E. P. Featherstonhaugh, J. Brydon Jack, A. W. Smith, J. G. LeGrand, J. M. Leamy, J. G. Glassco.
Auditors:	W. Aldrich, R. H. O'Reilly.
Nomination Com:	E. V. Caton, A. W. Smith, J. H. Douglas, F. H. Farmer, B. Gaffrey.
Research Com:	D. S. McKenzie, J. W. Dorsey, J. Finlayson, W. J. Melstead, T. Kipp.
Programme Com:	W. M. Scott, D. McLean, J. G. LeGrand, D. R. Deacon, J. M. Leamy.
Library & Publication Committee:	Geo. L. Guy, G. B. McColl, G. H. Brown, D. F. Gorie, G. P. Morse, E. P. Patterson.
Legislation and Public Affairs:	W. J. Dick, J. M. Leamy, M. H. Lyons, S. E. McColl, A. J. Taunton.
Advisory Com:	J. G. Sullivan, H. M. Ruttan, J. G. LeGrand, Frank Lee, D. H. Ross.
Councillors:	W. M. Scott, T. R. Deacon.

Among other business transacted W. G. Chase, M.E.I.C. reported that certain Engineersi nterested in the disintegration of concrete would be visiting the City in the near future. The committee was authorized to make the necessary arrangements for their entertainment and if necessary to arrange for meetings, at which an interchange of view and discussion can be arranged.

Notice of motion was given to amend the by-laws and to allow juniors being allowed to vote on branch matters, and to hold office, except that of Chairman.

A letter was received stating that Calvert Townley, President of the American Institute of Electrical Engineers, would be passing through Winnipeg on his way west early in June. The secretary was instructed to write and invite Mr. Townley to stop off on his way through and meet the local engineers. The committee was instructed to make the necessary arrangements for his entertainment if he accepted the invitation.

Border Cities Branch

J. E. Porter, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting was held on May 7th. in the auditorium of the Chamber of Commerce, with H. B. R. Craig, Chairman, presiding.

The first item of business taken up was the amendment of the Branch By-laws allowing Juniors of *The Institute* to have the same rights as Corporate Members with the exception that a Junior Member shall not be eligible for election as Chairman.

A very interesting feature of the evening was the presentation of the Gzowski Medal, awarded to Geo. F. Porter Esq. M.E.I.C. by the Gzowski Medal Committee of 1919, for the part taken by him in the preparation of the paper entitled "The Design Manufacture and Construction of the Superstructure of the Quebec Bridge". The joint authors of this paper, Messrs Phelps Johnston M.E.I.C. and G. H. Duggan M.E.I.C. were each to be presented with the Gzowski Medal in Montreal. On presenting the Medal, the Chairman pointed out that this Medal is awarded yearly for "The Premier Engineering Paper in Canada", and he took occasion to congratulate the Branch on their having as a member one of such pre-eminent ability and importance in the Engineering and Industrial world as Mr. Porter.

This paper has been distributed to the members of *The Institute* and has created a great deal of favorable comment. It has been acknowledged by experts to be in its year, the outstanding engineering publication in engineering circles throughout the world. Mr. Porter and his two associates have good reason to be proud as winners of this Medal. Mr. Porter, in reply, gave the members considerable encouragement in the work of *The Institute.*

The present financial status of the Branch was discussed at some length and the possible sources of income were considered. As the Branch was somewhat in arrears the motion was carried unanimously that a circular letter be sent to the members requesting a voluntary subscription of from two to five dollars for the maintenance of the Branch.

Mr. Craig reported the recent Conference of Ontario Representatives and Council at Montreal, dealing with the questions of Legislation and Salary Schedules, and the action taken at this Conference appeared to meet with the approval of those present.

In the absence of M. E. Brian, Branch Representative on Provincial Council, the Chairman gave a brief report of the Proceedings of Provincial Council Meeting held recently in Toronto.

The meeting adjourned at 10 P. M.

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary.

A. C. D. Blanchard, M.E.I.C., chairman of the Branch, attended the conference between the Montreal and Ontario Councillors and the Executive Committee of the Ontario Provincial Division which was held in Montreal on April 13th. Mr. Blanchard attended the conference in a dual capacity, that of Councillor and also as a member of the Ontario Division Executive. The chairman also attended the meeting of the Provincial Division Executive held in Toronto on April 24th.

A general meeting of the Branch was held at the Engineer's Club, Thorold, on April 23rd, at which Dr. R. C. Snowdon of the Hooker Electrochemical Company, Niagara Falls, N.Y. spoke on "The Purification of Public Water Supplies."

The speaker dealt with the subject in a general way, with particular reference to the natural waters of the Niagara District. The physical features of water were first dealt with; hardness due to mineral salts in solution and methods and devices for softening water for industrial and laundry purposes. The sanitary aspect of the subject dealt with the removal of micro-organisms by means of various filters and chemicals.

A good discussion took place at the close of Dr. Snowdon's address in which A. Milne, A.M.E.I.C., of the St. Catharines Water Works, took the leading part. Mr. Milne outlined the early history of water purification and showed how steady improvements had brought the science up to its present efficient state. N. R. Gibson, A.M.E.I.C., proposed that the Branch should study the proposed metropolitan water supply scheme for the cities and towns of the Niagara District. Mr. Gibson advised that it was too early yet to take any definite action as no specific proposition had been put forward by its originator up to the present time and closed his remarks by proposing a vote of thanks to Dr. Snowdon for his paper. The motion was seconded by W. P. Near, M.E.I.C., and carried unanimously.

A few items of business took up a short amount of the meeting's time. Among these was the question as to the form of gathering the coming annual meeting of the Branch should take. The discussion on this brought out the feeling of the members and gave the committee in charge of the arrangements data with which to proceed.

The attendance of the meeting was about thirty.

F. E. Sterns, A.M.E.I.C., of the Niagara Peninsula Branch, has been chosen by the Executive as convenor of the recently appointed Branch Legislation Committee.

A. C. D. Blanchard, M.E.I.C., chairman of the Niagara Peninsula Branch, has the congratulations of the Branch in having recently been elected a Councillor as one of the additional Councillors to represent the new district in Ontario.

One of the most successful Annual Meetings of the Niagara Peninsula Branch was held on May 19th. The meeting took the form of a dinner and smoker and a very lively entertainment was furnished by a representative group of [illegible]. A number of [illegible] were made up from [illegible] and songs and everyone joined heartily in singing as the songs were thrown on the screen. The Professional Meeting to be held in [illegible] was discussed and $250.00 was pledged from those present as a guarantee subscription. The Secretary, Rex P. Johnson, A.M.E.I.C., was presented with a silver cigarette case with the crest of The Institute engraved upon it. The new officers and Branch Executive are:

Chairman,	W. P. Near.
Vice Chairman,	N. R. Gibson.
Sec.-Treas.,	Rex P. Johnson, Box 205, Niagara Falls, Ont.
Executive,	H. L. Bucke. W. H. Sullivan. F. S. Lazier. A. J. Grant.
(Ex. officio),	A. C. D. Blanchard, Lt.-Col. R. W. Leonard.

Toronto Branch

[illegible], A.M.E.I.C., Secretary-Treasurer.

A special General Meeting of the Toronto Branch was held at the Mining Building of the University of Toronto on Thursday, May 13th, 1920 at [illegible] P.M.

At the request of the Council of *The Engineering Institute of Canada* arrangements were made for the presentation at this meeting of a gold badge of honorary membership in *The Engineering Institute of Canada* to Dr. W. H. Ellis, late Dean of the Faculty of Science and Engineering of the University of Toronto.

Professor H. E. T. Haultain, M.E.I.C., in a brief speech of introduction pointed out the varied qualities possessed by Dr. Ellis. They were, he said, of an academic, scientific and business nature, and he was eminent in all three. He was a poet of no mean ability, a skilled raconteur and a fisherman. He was the outstanding man of culture in the University, many-sided, well-rounded. Many men had come under his beneficent influence in the character of a teacher. But he was not of a soft, gentle, academic type. He had borne arms in his country's service. Lately during the clash resulting from the rivalries of the Dominion and Provincial Governments on the subject of the training of returned men, in which work Dr. Ellis had taken a responsible post, he had stood firm and the storm had passed. Through his influence, the School of Engineering Research had been established, and in this respect he was specially worthy of welcome by *The Engineering Institute*.

C. H. Rust, M.E.I.C., followed, speaking of the admiration and love of his students for Dr. Ellis. R. O. Wynne-Roberts, Chairman of the Branch, then presented the gold badge to Dr. Ellis amid hearty applause.

In replying, Dr. Ellis stated that while he was not an engineer, he had long worked and associated wit engineers, and had, perhaps, gained some of their atmosphere. He appreciated the honor greatly.

After the presentation of the badge, Professor W. A. Slater, B.S. C.E. M.S., Engineer Physicist, United States Bureau of Standards, proceeded with a lecture on the tests of Reinforced concrete beams and ship frames for the United States Emergency Fleet Corporation. "There is a general impression that the concrete ship has failed," said Professor Slater. "I wish to correct that impression. I am not ready to say that it has been an unqualified success, but structurally, so far as we know anything about it in use, it has been a success."

A concrete ship would suffer the same damage as other types of ship in collision, said Professor Slater. The salvation of the ship was the ease of repair and the smallness of the hole resulting from impacts. Extensive tests had been carried out to prove the strength of reinforced concrete for ship purposes. The failure of the concrete in these tests had been a tension failure. They showed that it was necessary to inspect the steel used as carefully as the concrete.

Professor Slater had a number of slides showing the members that were tested and also the diagram and tables that were prepared after the tests giving the results obtained and the conclusions arrived at. He also had a complete moving picture outfit showing the testing work in actual performance.

A very interesting discussion followed in which many members took active part.

The meeting adjourned at 11.45 P.M.

Peterborough Branch

R. L. Dobbin, M.E.I.C., Secretary

A regular meeting of the Branch was held on Thursday April 22nd, 1920, when a paper was read by P. P. Westbye, gen. mgr. of the Wm. Hamilton Mfg. Co. of Peterborough. His subject was the History and Development of the Pulp and Paper Industry. Many lantern slides, made from Mr. Westbye's own collection of photographs, were used, and also a film loaned by the Ontario Government Motion Picture Bureau.

The Annual Meeting of the Branch was held on May 6th, in the Board of Trade Rooms. The Vice-Chairman, R. H. Parsons, being called out of the City, appointed C. E. Sisson to act as Chairman of the meeting.

The first item of business was the appointment of two scrutineers to act with R. B. Rogers in counting the Ballot for the election of officers. R. E. Stavert and J. H. Reid were elected for this work, and retired with Mr. Rogers.

While the ballots were being counted, Mr. Sisson gave a short report on the activities of the past season, and referred to the change from the Engineer's Club to the Branch of *The Institute.*

E. R. Shirley, Chairman of the Meetings and Papers Committee read the report of that Committee, as follows:

"The year just coming to a close marks the inauguration of a new era in Peterborough Engineering Circles. During the year we have been somewhat disorganized owing to the passing of the old Engineers Club, and the establishment of the new Branch, the delay consequent upon the election of the new officers, adoption of new By-Laws, and appointing of new Committees. Finally we have been most seriously handicapped by the lamentable death of our Chairman, G. Reid Munro, and another of our fellow-members, A. F. Bookhout.

In spite of these difficulties, we are able to review our year's work, and report a most successful season. The meetings held were as follows:

September, 18, 1919: "Construction Methods on the Hunter Street Bridge." *Speaker*, Chas. Townsend, of the Russell-Townsend Co.

November, 6, 1919: Inaugural Banquet of Peterborough Branch.

December, 8, 1919: "Central Ontario System of the H. E. P. C. *Speaker*, G. B. Smith, Belelville, Superintendent.

January, 8, 1920: "Digest of Proposed Legislation for Engineers." *Speaker*, Jas. Mackintosh, Peterborough.

January, 24, 1920: Continuation of same subject.

February, 12, 1920: "The Economic Significance of Canada's Fire Waste." *Speaker*, J. Grove Smith, Dominion Fire Commissioner. Illustrated with lantern slides and moving pictures.

February, 19, 1920: "Water Filtration." *Speaker*, R. L. Dobbin, Waterworks Superintendent. Illustrated with Lantern Slides.

March, 18, 1920: "Institute Affairs." *Speaker*, A. B. Lambe, Sec. Provincial Division.

April, 8, 1920: "Frazil and Anchor Ice." *Speaker*, John Murphy of Ottawa. Illustrated with moving pictures and lantern slides.

April, 22, 1920: "History and Development of Pulp and Paper Industry." *Speaker*, P. P. Westbye, Gen. Mgr. Wm. Hamilton Co. Illustrated with lantern slides and moving pictures.

The inaugural banquet marking our entrance into *The Institute* was probably the most successful affair of its kind ever held in Peterborough. It was graced by the attendance of the President, Vice-Presidents, and members of the Council, and also many of the most prominent engineers of the Dominion. This banquet is still referred to by our guests, as well as ourselves, as the one big event of the year. We hope to duplicate the performance next Fall.

You will note from the outline of the meetings given above that we have increased the number from one to two per month. We were of the opinion that this would increase the interest in the Branch, and due to the added opportunity of mingling together and becoming better acquainted, be of mutual advantage to all the members. It is our recommendation that this practice be followed by our successors.

P. L. Allison, Chairman of the Membership Committee reported as follows:

"When the Branch was organized last year, there was a membership of 25 corporate and 4 juniors. In spite of the fact of the death of our late Chairman, G. R. Munro, and of A. F. Hockland, it is gratifying to note that the branch has had a very satisfactory growth. At the present time there are 33 corporate and 8 junior members, and 17 affiliates.

The qualifications for the various classes of members may be found in the Charter of *The Institute*, and it is to be noted that only corporate members, that is Members and Associate members, may vote and hold office. We have discussed the matter of allowing the Juniors to vote and hold office, and it is pleasing to the Executive Committee to announce that recently a letter has been received from Mr. Keith, saying that Council has given permission for Branches to amend their By-Laws to allow of this. It is proposed to take this step at an early date."

The Scrutineers then made their report and declared the following elected to direct the affairs of the Branch for the coming season:

Honorary Chairman, R. B. Rogers, M.E.I.C.

Chairman, R. H. Parsons, M.E.I.C., City Engineer.

Vice Chairman, P. L. Allsop, M.E.I.C., Industrial Control Engineer, Canadian General Electric Co.

Secretary, R. L. Dobbin, M.E.I.C., City Waterworks Superintendent.

Treasurer, D. L. McLaren, A.M.E.I.C., Assistant Engineer, Can. Gen. Elec. Co.

Executive Committee:

C. E. Sisson, M.E.I.C., Transformer Engineer, Can. Gen. Elec. Co.

P. P. Westbye, M.E.I.C., Gen. Mgr. Wm. Hamilton Co.

Jas. Mackintosh, M.E.I.C., Hydraulic Engineer, Hydro. Elec. Power Comm.

D. L. W. Magie, M.E.I.C., Works Engineer, Can. Gen. Elec. Co.

A. L. Killaly, A.M.E.I.C., Superintendent, Trent Canal.

C. H. Rogers, M.E.I.C., Manager Peterborough Canoe Co.

R. L. Dobbin was elected to represent the Branch on the Executive of the Ontario Provincial Division.

After the announcement of the result of the elections, an informal entertainment took place. Moving pictures and refreshments in the shape of coffee and "hot dogs", formed the main items.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Secretary-Treasurer.

On May 8, A. P. Davis, President of the American Society of Civil Engineers and Director of the United States Reclamation Service, who at that time was visiting Ottawa in connection with the sittings of the International Joint Commission, was tendered a luncheon at the Chateau Laurier by the Executive Committee of the Ottawa Branch, in conjunction with the Past Councillors, Vice-Presidents and Presidents residing in Ottawa. Mr. Davis was attended by Mr. Hobbs, State Engineer of Montana and B. E. Jones of the United States Geological Survey.

In his speech, Mr. Davis referred to the difficulties which now confront the American Society of Civil Engineers, and strongly emphasized the importance of maintaining the high professional standard of that society, and for the necessity of broadening and democratizing its work.

He congratulated Canada on its Engineering Institute, which embraces all classes of engineers.

On May 19th, the new badge was presented to His Excellency, The Governor General, as an Honorary Member, by Colonel W. P. Anderson, as the Senior Past President, in Ottawa.

Colonel Anderson, who was accompanied by the Chairman and Secretary of the Branch, explained the enlarged plans of *The Institute* and its increasing success. His Excellency, after most cordially thanking the delegation for presenting him with the badge, asked to be kept informed as to the meetings of *The Institute* and of the Ottawa Branch, and stated that it was his desire to attend those meetings whenever it was possible for him to do so.

Montreal Branch

Frederick B. Brown, M.E.I.C., Secretary.

Several events occurred at the final meeting for the season of the Montreal Branch of *The Engineering Institute of Canada* held on April 29th that marked an important epoch in the annals of *The Institute*. Lord Shaughnessy, chairman of the C.P.R., and Sir John Kennedy, dean of the engineering profession in Canada, were both present, and were presented with gold badges, as honorary members of *The Institute*, the badges being exact replicas of that struck for the Prince of Wales, when, during his visit here last year, he consented to become an honorary member of *The Institute*. The presentations were made by R. A. Ross, M.E.I.C., as president of *The Engineering Institute*, and were carried out with full ceremonial, both recipients making brief speeches of appreciation.

An interesting paper was read by D. E. Blair, of the Montreal Tramways Co., on "The Engineering Features of Tramway Operation." There was a large attendance, and the various events were greeted with much applause, refreshments being served at the close.

An interesting discussion followed, taking part in by Commissioner Ross and Prof. L. A. Herdt, of the Tramways Commission, both of whom showed sympathy with the ideas promulgated by Mr. Blair.

At the conclusion of the engineering paper, Walter J. Francis, as chairman of the branch, took the chair, and called upon Commissioner R. A. Ross to present the Gzowski Medal for the most meritorious contribution to engineering literature during the year. This year, he said, the medal had been presented to the three authors of the paper on the construction of the Quebec bridge, which was universally recognized as the most important contribution to the world's engineering literature during the past year.

Commissioner Ross then presented the medals to Messrs. Phelps Johnson and G. H. Duggan with a brief speech in which he complimented them on producing a piece of engineering literature which had been approved by the profession throughout the world. Both recipients made short speeches of thanks.

Chairman Francis then said that the occasion had arrived when they could present the gold badges as honorary members of *The Institute* to two of their most honored members, Lord Shaughnessy, head of the greatest transportation company in the world, and Sir John Kennedy, whose long and useful life was synonymous with the progress of engineering in Canada.

Amidst prolonged applause, Commissioner Ross, as president of *The Engineering Institute of Canada,* then pinned the gold badges on the lapels of Sir John Kennedy and Lord Shaughnessy.

Sir John Kennedy, who was received with three cheers, said that he had assisted at the birth of *The Canadian Engineering Institute;* its first meetings having been held at his house, and later at his office. Since then the original society had grown to become a national institution, with branches all over the Dominion, with great good to the profession and to the country, helping to do and build better things.

Sir John recalled the time sixty years ago when the then Prince of Wales had visited Hamilton, Ont., and officially started the first turbine pump ever made in Canada, when he himself had had the honor of starting the other one of the twin turbines. Looking back over that long history of engineering development and all that had been accomplished by *The Engineering Institute,* he felt very grateful for the honor now conferred upon him. (Applause.)

In presenting the badge to Lord Shaughnessy, Commissioner Ross said it was peculiarly fitting, since the C.P.R. was the greatest institution in Canada, and one which had made the Dominion known throughout the whole world, the time probably not being far distant when its transportation enterprises would encircle the globe. As head of the C.P.R. during much of its growing period, Lord Shaughnessy had had much to do with engineers, and knew how much the company owed to the engineers, while the latter knew how much they owed the C.P.R.

In expressing his thanks, Lord Shaughnessy said that during a great part of his career he had been actively associated with engineers, and had lived in an engineering atmosphere.

"During the past 25 years," said Lord Shaughnessy, "I have been associated with many enormous engineering enterprises of every description. I have consulted with and taken the advice of civil, hydraulic, mining, marine and mechanical engineers of every description. During all those years they were my guides, philosophers and friends, and, while I have not had the training of an engineer, I have learned very much from the profession.

"Jointly, through this friendly co-operation we have carried out during the last quarter of a century many great engineering works involving the expenditure of many hundred millions of dollars. Generally the work was satisfactorily done. Sometimes there may have been a miss, but we were jointly responsible, and did not blame each other.

"I appreciate very much the honor you have done me in making me an honorary member of your society, and, while I cannot hope to enjoy this membership for many years to come, I hope that your society will continue to grow and prosper, for the good of Canada's development."

The retiring chairman, Walter J. Francis, M.E.I.C., then made his valedictory address, thanking the members of the branch for the interest they had shown in its work during the past two years, which had resulted in unprecedented growth in its work, to such an extent that the meetings had been changed from fortnightly to weekly, with greatly increased membership and attendance.

Votes of thanks were passed to the retiring chairman, and the various committees which had acted during the year.

St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

A meeting was held on April 22nd in the old Post Office Building. After reports from Harry F. Bennett and G. G. Murdoch in connection with the Old Court House Reconstruction and the City Planning Committees has been presented, the Chairman called upon the speaker of the evening, Capt. C. McN. Steeves, M.E.I.C., late Adjutant 9th Battalion, Canadian Engineers, who read a very comprehensive and interesting paper on "Organization of Military Bridging Operations".

The Secretary read correspondence with other Branches. On motion of Mr. Steeves, seconded by Mr. Goodspeed, it was decided that the St. John Branch endorse the action of the Vancouver Branch in passing the following resolution at their March Meeting. "That this Branch goes on record as being unalterably opposed to such amendments of the Civil Service Act as (etc.) tending to eliminate competitive examinations for Civil Service positions and to introduce the old evil system of patronage, etc. etc.

Moved by H. Bennett, seconded by Mr. Goodspeed that the resolution of the Toronto Branch of March 4th re requesting Headquarters to appoint a Salaries Committee, etc., be laid on the table until after passing of our Act, etc. Carried.

Moved by G. Macdonald, seconded by Mr. Steeves and carried, 'That we approve of the resolution of the Manitoba Branch of February 18th re Civil Service Classification and that the Secretary advise the Council to that effect."

* * *

The second Annual Meeting of the St. John Branch was held in the old Post Office Building, May 6th, 1920, with past president A. Gray in the chair. After the minutes of the last Annual Meeting and the meeting of April 22nd had been read and adopted the Secretary read the report of the Secretary-Treasurer and Executive which was adopted. The following reports were then read, Committee on Concrete in Sea Water, Civic Centre Committee, City Planning Committee, Salaries Committee and Legislation Committee.

On account of the absence of the Chairman, Mr. C. C. Kirby, from the City, A. Gray read the Chairman's retiring address and on Mr. Waring, seconded by Mr. Goodspeed, a hearty vote of thanks was tendered Mr. Kirby for his untiring efforts in behalf of the Branch and the profession in general.

On motion of Mr. Cushing, seconded by Mr. Goodspeed, a vote of thanks was tendered Mr. Crookshank for his effective work as Secretary-Treasurer.

Mr. Hatfield reported for the Employment Committee and on motion the report was adopted and the Committee continued in office.

Mr. Crookshank reported for the By-Laws committee, which report was adopted.

The scrutineers then announced the new executive as follows:

Chairman: G. G. Murdoch, M.E.I.C.,
Secretary-Treasurer: H. F. Bennett, A.M.E.I.C.
By ballot, F. P. Vaughan, A.M.E.I.C.

The new officers took their places and F. G. Goodspeed read a most interesting paper on the "Improvement of navigation in river estuaries, with particular reference to the Mississippi River."

At the conclusion of the paper a hearty vote of thanks was tendered Mr. Goodspeed on motion of Mr. Gray and seconded by Mr. Hatfield.

Mr. Crookshank read the report of the Harbour Commission Committee which was adopted and the executive asked to appoint a similar Committee to carry on the work.

On motion of Mr. Crookshank the incoming officers were authorized to transact the financial business of the branch.

On motion of Mr. Gray the resolution adopted by the Toronto Branch re compensation was left to the executive.

On motion of Mr. Huestis the matter re Juniors voting and holding office was left to the executive.

Combined Annual Report of the Executive Committee and of the Sec.-Treasurer

We beg to herewith submit our report for the Second Branch Year of the St. John Branch of *The Engineering Institute of Canada*, covering the period between the Annual Meetings of January 1919 and May 1920.

The Executive Committee met nineteen times during their term of office, and transacted a large amount of business.

There were fourteen meetings of the Branch, ten in 1919, and four in 1920, besides the second Maritime General Professional Meeting, held on September 10th, 11th and 12th.

Papers were read, addresses given, and important business transacted at the meetings, as follows:—

Jan. 14th, 1919. Annual meeting. "A Contractor in a Clyde Shipyard" by G. S. Baxter, A.M.E.I.C. Election of officers as stated below. Committees appointed. Legislation and By-laws discussed.

Feb. 20th, 1919. "Reminiscences of the Early Days of Railway Location" by C. O. Foss, M.E.I.C. By-laws amended by Executive Committee, adopted by letter ballot.

March 27th, 1919. "The Reconstruction of the Bridges on the Dominion Atlantic Railway" by O. K. Hare, A.M.E.I.C. Committees appointed. Legislation discussed. Chairman submitted his proposed draft of act.

Apr. 17th, 1919. Chairman's report re Montreal inter-branch legislation conference. Calgary salary paper discussed. Salaries & Employment Bureau Committees appointed.

May 8th, 1919. "Aids to Navigation in New Brunswick Waters" by G. S. MacDonald, A.M.E.I.C. Concrete in sea water and General Professional Meeting committees appointed.

May 29th, 1919. "Experiments with High Potential High Frequency Electric Currents" by F. P. Vaughan, A.M.E.I.C., M.A.I.E.E.

July 2nd, 1919. Discussion re legislation, based on E.I.C. printed Draft of Act, preparatory to E.I.C. ballot on it.

Sept. 10th, 11th, and 12th, 1919. General Professional Meeting—Details published in *Journal*.

Nov. 13th, 1919. "Cape Breton Breakwater" by Geoffrey Stead, A.M.E.I.C. "New Brunswick Highways" by B. M. Hill, M.E.I.C.

Dec. 10th, 1919. Public meeting in Board of Trade Rooms, held in conjunction with Housing Committee of the Board of Trade and Commercial Club. Report of Architects Ross & McDonald on rebuilding Old Court House, read and discussed.

Dec. 18th, 1919. Discussion continued from adjourned meeting of Dec. 10th. "The Dominion Housing Act and how it applies to types of houses suitable to St. John under local building conditions" by Chas. L. Archibald, A.M.E.I.C.

Jan. 22nd, 1920. "St. John and its Harbour, with particular reference to its protection" by F. W. Holt. Commission Acts discussed. Committee appointed.

Feb. 10th, 1920. Public meeting in Board of Trade Rooms. "Town Planning and Engineering Problems" by W. F. Burditt, Chairman St. John Town Planning Commission, "General Principles of Town Planning" by H. L. Seymour, A.M.E.I.C.

Mar. 11th, 1920. "The methods adopted in our location surveys in wooded country" by Moses Burpee, M.E.I.C. Civic Buildings and City Planning Committees appointed.

Apr. 22nd, 1920. "Organization of Military Bridging Operations" by Capt. C. McN. Steeves, M.E.I.C.

May 6th, 1920. This an Annual Meeting, when election of officers will take place, and paper of F. G. Goodspeed, M.E.I.C. on "Improvements of Navigation in River Estuaries, with particular reference to the Mississippi River" will be read.

The three public meetings, at which the building of a Community Centre, with Court House and City Hall, with plan to utilize the whole block here for civic buildings, instead of rebuilding the "Old Court House," (destroyed by fire) and the study of City planning were taken up, have disseminated considerable information, and the publicity of the discussions will undoubtedly have a beneficial effect on public opinion, both as regards these subjects and the Branch itself.

During the year, a new set of By-laws, patterned after the E.I.C. Standard Set, were drawn up, adopted, and have been approved by the Council.

The matter of obtaining legislation for New Brunswick engineers has taken up a large amount of time and effort, culminating in the formation of the "Association of Professional Engineers of the Province of New Brunswick" at a public meeting called by our Chairman, and held September 12th, in St. John. An executive council was elected, with him as chairman, and they revised the E.I.C. draft of Act to suit New Brunswick conditions, submitted it to the engineers of the Province, for their approval, and presented it to the Legislature, who passed it after it had been amended, and it has now become law.

Effective work has been done by the several committees. The Employment Committee actively co-operated with the Provincial Soldiers Civil Re-establishment Committee and the Government Labour Bureau. The passing of the Civil Service Act and the Reclassification of the Government employees was urged. Data has been gather re the salaries paid engineers in New Brunswick. The committee on Concrete in sea water has prepared a very complete bibliography on this subject. A committee of the Halifax Branch is co-operating in the work of investigating this important matter.

Two delegates of the Branch are on the Vocational Training Committee, which brought about the inauguration of this system in the city, and which assists the official committee where necessary.

The Branch, during its two years of life, has accomplished much for its local members, and for the engineers of the Province as a whole. The membership is better acquainted with each other and with the subjects of vital interest to them. Their interest in civic matters has been concretely shown, and the public is beginning to appreciate having engineers among them to assist in investigating problems and by their technical advice. This is concretely shown by our Chairman being officially requested, as chairman of the Branch, to be present at the recent conference which took up the matter of the Union of the Maritime Provinces of New Brunswick, Nova Scotia and Prince Edward Island.

It has been the policy of the executive to give as much publicity as possible to the doings of the Branch in "*The Journal*" and in the press, and they recommend that this be continued, as they consider it effective in stimulating public interest in the engineer and his work and so enhancing his status in the community.

The executive recommend that, in future, the Secretary be authorized to engage clerical assistance from time to time, in handling the work of his office. This will, no doubt, mean a levy on the Branch members to meet the increased expenditure. This has been done by other Branches this year.

Officers elected at Annual Meeting held January 14th, 1919:—

Chairman, C. C. Kirby; Secretary-Treasurer, A. R. Crookshank; Executive Committee-men, Past Chairman, A. Gray, C. O. Foss, G. G. Hare, G. G. Murdoch.

The following committees were appointed during the Branch year:—

Membership, Executive as a whole, Publication, C. C. Kirby, A. R. Crookshank; Proceedings, C. O. Foss, G. G. Hare; By-laws, Executive Committee. Delegate to Ottawa Legislative Meeting, C. C. Kirby; Delegate to Montreal inter-Branch Meeting, C. C. Kirby; Soldiers Civil Re-establishment, C. O. Foss; Civil Service, G. G. Hare, G. G. Murdoch, A. R. Dufresne, J. A. Grant; Salaries, C. C. Kirby, G. G. Murdoch, A. R. Crookshank; Vocational Training, F. P. Vaughan, A. R. Crookshank; Employment Bureau, G. N. Hatfield, F. G. Goodspeed, J. A. W. Waring; Concrete in sea water, A. Gray, G. S. Macdonald, F. G. Goodspeed, G. G. Hare, G. S. Baxter; General Professional Meeting; Executive with G. S. Macdonald, A. R. Dufresne, G. N. Hartfield; New Civic Buildings (Old Court House), H. Bennett, C. McN. Steeves, J. A. Grant; Harbour Commission, etc., C. C. Kirby, A. R. Dufresne, G. G. Hare; City Planning, E. M. Archibald, G. G. Murdoch; Auditors, J. A. W. Waring, C. O. Foss.

The statement of Membership of the Branch on May 1st, 1920, is as follows:—

Grade	Resident	Non-Resident	Total	Election Pending
Members..........	13	4	17	..
Associate Members..	26	4	30	..
Juniors.............	6	..	6	2
Honorary Associates.	1	..	1	..
Associates..........	1	..	1	..
Affiliates...........	10	..	10	..
	57	8	65	2

Membership at end of 1918.......	43
Net gain..................	22
Moved away during period.......	13
Gross gain.................	35

The financial statement is herewith attached.

Respectfully submitted,

C. C. KIRBY,
Chairman.

A. R. CROOKSHANK,
Secretary-Treasurer.

A summary of the financial report is given herewith: total receipts 1919, $386.99; expenditures, $345.42, leaving a net balance in the bank of $41.45, assets on hand valued at $81.35 as against liabilities of $50.00.

Report of Committee on Harbour Commission

This committee finds that the matter of Harbour Commission, Government for the Port of Nationalization, is one in which the matter of public policy is most chiefly concerned and that the full amount of information necessary for a recommendation is either not available or has to be treated confidentially by the Members of the Committee.

This Committee begs to be dissolved and suggests that if the meeting so desires a new Committee be appointed with a different personnel.

C. C. Kirby,
Chairman.

Report of Publicity Committee

We beg to call the attention of the members of the Branch to the amount of advertising that the Engineers have received in the newspapers since the formation of the Branch two years ago.

We wish to express our appreciation of the generous manner in which our local newspapers have given space to the report of our doings.

The following approximate list shows the amount of material printed in the newspapers, column width:—

Year	Reg. Reports	Gen. Prof. Meeting	Total	Columns
1918	114 inches	237 in (Halifax Papers; 107 in (St. John only)	468"	23
1919	245 "	597 in (St. John only).	842"	40
1920	125 "		130"	5½
(To May 1st)			1440"	68.5

Nearly ten complete pages of newspaper reports of the doings of engineers.

The Journal published the following St. John news and articles in columns of 9", two columns per page:—

Year	Reports	Papers	Total	Gen. Prof. Meeting	Cols.
1918	11	16	27	79 Halifax papers.....	106
1919	17	88	105	12	117
1920	8	—	8		8
(To May 1st)...			140 cols.		231

A total of 70 pages of St. John material.

Respectfully submitted,
A. R. Crookshank.

Report on Legislation

On April 24th, the "Engineering Profession Act" was passed by the Legislature of New Brunswick and received the Royal assent. This act was submitted as a Bill by the Council of the Association of Professional Engineers of New Brunswick. The only amendment by the Legislature, except as proposed by the Council, was the alteration of the term "principal assistant" to that of "an assistant" in the paragraph dealing with initial registration.

Some opposition was encountered in the Committee stage towards the definition clause, it being the feeling of the Members that the definition should be reworded so as to prevent a possible misuse of the Act by having the definition so broad that some persons might be unduly interfered with who should be properly allowed to proceed with their business without being required to become registered Professional Engineers. This difficulty was overcome by the insertion of the words "in a professional capacity" in that part of the definition setting forth the kind of work which, when undertaken, constitutes the practice of a Professional Engineer.

The Act was amended by the Council rather considerably from the original draft bill of the E.I.C. These changes were chiefly those of expression rather than of principle in order to get the meaning more clearly expressed, on the recommendation of the Council's legal adviser.

Differences of principle were made from the E.I.C. Model Bill in the clause by which foreign engineers may now be admitted to practise on license instead of being limited to consultation work only. Consultation work was made permissible to foreign engineers without the formality of license. This latter change was made to conform with the expressed wishes of the Law Committee of the Legislature. British Columbia has also included this feature in its act.

The following is the present situation regarding Legislation in the other Provinces:—

British Columbia, Alberta and Manitoba have passed similar acts.

Saskatchewan and Ontario have not yet applied for Legislation.

Nova Scotia has had its bill passed by the Lower House and the bill is at present before the Legislative Council.

Quebec has passed an amendment to the existing Quebec act placing its administration in the hands of the "Corporation of Professional Engineers of Quebec."

(Sdg.) C. C. Kirby,
Chairman.

Halifax Branch

[illegible], M.E.I.C., Secretary-Treasurer.

The Annual Meeting of the Halifax Branch was held at the Green Lantern at 6.30 p.m., Thursday, May 13th, 1920, attendance [illegible], including General C. H. Mitchell of Toronto and Dr. F. H. Sexton of Halifax, as guests of the Branch.

After the [illegible] of the [illegible], the Chairman called for the report of the Secretary-Treasurer which was given as follows:—

Report of the Secretary-Treasurer

The report of the present Secretary-Treasurer covers the period from January 1st, 1919 to May 13th, 1920. As the members will remember, the officers for 1919 were held in office until this meeting.

During the period [illegible] meetings were held as follows:—

January 15th, 1919; The Annual meeting at which the following officers were elected:—

Chairman	F. A. Bowman, M.E.I.C.
Secy-Treas.	K. H. Smith, M.E.I.C.
Executive:	J. L. Allen, M.E.I.C.
	A. E. Dyer, A.M.E.I.C.
	W. P. Morrison, M.E.I.C.
	A. G. Robb, M.E.I.C.
	L. H. Wheaton, A.M.E.I.C.

February 20th, Paper by Capt. T. S. Scott on Roads.

March 20th, Paper by W. G. Gordon, transportation engineer, Canadian General Electric Co. on "Main Line Railway Electrification in Canada."

April 3rd, A special meeting dealing with Engineering Legislation.

April 25th, Report on the results of the meeting of the Legislative Committee held in Montreal. At this meeting K. H. Smith the Secretary-Treasurer tendered his resignation and on May 1st, the Executive Committee appointed F. R. Faulkner to fill the vacancy for the remainder of the year.

June 4th, Devoted to making preliminary arrangements for the proposed Professional Meeting in St. John, in September and to a discussion of the proposed Legislation for Engineers.

October 22nd, Paper by A. C. Brown on "The Results of Experiments of the effects of Ironstone on Cement and Lime mortars."

December 17th, Devoted to a discussion of the proposed Halifax-Dartmouth bridge.

February 16th, 1920, a special meeting at which was shown a film from the Kopper's Manufacturing Co., illustrating a modern By-Product Coke plant.

February 27th, At this meeting the standard branch by-laws were adopted and the officers for 1919 were continued in office until the annual meeting in May. K. H. Smith read a paper on "The Water Powers of Nova Scotia."

March 26th, At this meeting the report of the bridge Committee was presented. This report dealt with some of the projects for the proposed Halifax-Dartmouth bridge.

Membership

On January 1st, 1919; the Secretary's report showed a membership as follows:—

Member	24
Associate Members	29
Juniors	6
Branch Affiliates	2
Total	61

The membership at present, including those recently accepted by the Council is as follows:—

Members	34
Associate Members	55
Juniors	10
Students	17
Branch Affiliates	4
Total	120

The increase in membership is then as follows:

Members	10
Associate Members	26
Juniors	4
Students	17
Branch Affiliates	2
Total	59 or 97%.

The above numbers include all those who were on the list from the Head Office in January but some of these may have moved from the city and now be attached to other branches. Thirty two of the membership are resident outside the twenty five mile limit. It is interesting to note that of the 17 Student members, 9 are at present at the Technical College.

It is distinctly encouraging to note that applications are pending from 22, including 8 students at Dalhousie and the Technical College.

There are still a number of engineers in this City and vicinity who are eligible for admission and every member of the branch is earnestly requested to constitute himself a canvasser. This work cannot all be done by the officers. There are also a number in the city who, while not engineers, are interested in engineering works and who would be eligible for Branch Affiliate membership. A determined canvass among these would no doubt yield satisfactory results.

The financial report divided into two parts—for 1919 and 1920, was read.

The financial report as read shows a satisfactory balance on hand, the balance January 1st, 1920 being $98.96, this being an increase of $46.44 over the balance on hand in 1919, the current balance being $45.37.

After the adoption of this report the Chairman of the Branch then presented his report which will be given in full in the July *Journal.*

I. P. MacNab then presented the report of the scrutineers which showed the following officers elected for the ensuing year.

Chairman: C. E. W. Dodwell
Sec.-Treas.: F. R. Faulkner
Executive Committee:

K. H. Smith	for two years
W. P. Morrison	
L. H. Wheaton	
H. W. L. Doane	for one year
J. L. Allen	
A. S. Robb	

F. A. Bowman, the retiring chairman, is also a member of the Executive as the immediate past chairman and also as a member of the Council resident within the jurisdiction of the branch.

In installing the new chairman, Mr. Bowman thought the Branch had honored itself by electing Mr. Dodwell to that position, he was one of the charter members of the Canadian Society of Civil Engineers, Secretary of that organization for the first year, Vice-President three times and Councillor eleven times. In accepting the chair, Mr. Dodwell expressed his thanks for the honor that the branch had conferred on him and felt that the coming year was full of promise for the engineering profession in general and the Halifax Branch particularly. He gave a brief report on the progress of the Professional Engineers' bill. It had already passed the lower house and was now before the upper chamber. He felt that if the bill became a law, *The Engineering Institute of Canada* would be greatly benefited. He then called on Dr. F. H. Sexton who as a member of the Committee on Legislation, and as a member of the Professional Council, had rendered signal service to the profession.

Dr. Sexton, after congratulating Mr. Dodwell on the election and the Branch on their choice of Chairman, dealt with the progress of Legislation. He felt that the future of the Engineering profession was assured. Even though some may think that the large number now entering the Engineering Colleges might cause a surplus in the profession, he felt that an engineering training was a splendid foundation for any line of work. The Chairman then introduced General C. H. Mitchell.

General Mitchell, after expressing his pleasure in being able to be present, gave the members of the Branch a hearty invitation to attend the professional meeting in Niagara Falls next September, and the annual meeting of *The Institute* in Toronto next January. He then gave an account of the progress of Engineering Legislation in Ontario and spoke of the difficulties that had been encountered in that Province. He spoke of the work of the Toronto Branch had done in preparing a schedule of fees and salaries. This Schedule had been considered at a conference in Montreal recently and it is possible that *The Institute* may now take up the problem of raising the fees and salaries of Professional Engineers, providing the body as a whole is agreeable. He urged the fullest co-operation and requested suggestions from the Halifax Branch.

General Mitchell felt that the engineering profession had not received due recognition in the past, partly owing to the disinclination of engineers to play a stronger part in public affairs. There were many public questions on which the branches could give invaluable advice and thus aid their community and the profession as well. He spoke of the great demand at the present time for men with engineering training and felt that an increasingly larger number of engineers would, within a few years after graduation, find themselves in business. He agreed with Dr. Sexton that the engineer's training was the best foundation for a business career.

After the Chairman had conveyed the thanks of the Branch to both General Mitchell and Dr. Sexton, the meeting adjourned.

PERSONALS

S. C. Brown, Jr.E.I.C., has been appointed chief engineer, J. P. Porter & Co., contractors.

D. O. Wing, A.M.E.I.C., has been placed in charge of the St. Johns, Que. office of Anglin-Norcross, Ltd., contracting engineers and builders.

H. M. Scott, A.M.E.I.C., has changed business connections and is now with F. Lyall & Sons Construction Co. Ltd., Wellington Ave., Montreal.

F. H. Small, A.M.E.I.C., has resigned his position with the department of highways, Regina, and has accepted a position on the engineering staff, City of Moose Jaw.

Meyer Goodman, A.M.E.I.C., formerly assistant engineer, Dept. of Public Works, Montreal, has recently opened an office at Room 14, McLean Building, 10 St. John St., Montreal.

C. H. Jette, A.M.E.I.C., has tendered his resignation as assistant engineer, Public Works of Canada, and accepted a position in the engineering department of the St. Maurice Paper Co., Three Rivers, Que.

H. R. Safford, M.E.I.C., President of the American Railway Engineering Association has been appointed to represent the Association upon Engineering Council which the Association has recently joined.

E. P. Muntz, A.M.E.I.C., of the Niagara Peninsula Branch, has recently resigned from the staff of the Welland Ship Canal and is engaged as contractor's engineer on reconstruction work on the Grand Valley Railway, with headquarters at Galt.

F. Harcourt Emra, M.E.I.C., has been honoured by the King as being awarded the order of O.B.E. In 1918 Mr. Emra was appointed assistant director to the Admiralty for engineering work and was acting as director of shipyard extensions for the whole of that year.

C. M. Arnold, M.E.I.C., having accepted a position on construction on the Lethbridge Northern Irrigation Project, has resigned as Secretary-Treasurer of the Calgary Branch and Arthur L. Ford, M.E.I.C., has been appointed by the Executive of the Branch as Secretary-Treasurer.

James Macdonald, A.M.E.I.C., member of the Executive Committee of the Peterborough Branch is at present engineer in charge of the hydraulic surveys being carried out in the Nipissing District of the Hydro-Electric Power Commission of Ontario, with headquarters at North Bay.

J. A. Burnett, A.M.E.I.C., of Smart & Burnett, consulting engineers, Montreal, has been appointed by the Grand Trunk Railway interests to assist in the government appraisal of the electrical equipment of St. Clair Tunnel Co., Oshawa Railway and Montreal and Southern Counties Railway Co.

*

R. H. Parsons, M.E.I.C., city engineer of Peterborough, has just returned from a trip to New Orleans, La. and Houston, Texas, where he has been looking into the activated sludge sewage disposal plants located there, and also new types of sewage pumps. Mr. Parsons has recently been elected Chairman of the Peterborough Branch.

*

L. D. W. Magie, M.E.I.C., works engineer of the Peterborough Plant of the Canadian General Electric Company, and P. L. Allison M.E.I.C., industrial control engineer for the same Company, have recently returned from an inspection trip through the General Electric Company's plants at Pittsfield, Erie, Bloomfield and Schenectady.

*

N. A. Pearson, A.M.E.I.C., resigned from the Irrigation Office, Dept. of the Interior at Calgary in March of this year, having held the position of Chief Draughtsman for the past six years. He has accepted an appointment with the American Smelting and Refining Company at Santiago, Chili in connection with the design and erection of the company's large copper reduction works.

*

Gordon Grant, M.E.I.C., formerly chief engineer of the Transcontinental Railway and of the Quebec and Saguenay Railway, has been appointed chief engineer of highways, with headquarters at Ottawa. This appointment is in addition to Mr. Grant's duties as consulting engineer to the Department of Railways & Canals.

*

Walter E. Joyce, A.M.E.I.C., who has been chief engineer of the Montreal Tunnel since the death of S. P. Brown, M.E.I.C., has resigned this position to take charge of the Ridout Suspension Bridge, Kingston, New York. In taking up this new work Mr. Joyce is returning to the scene of his former labour as he was actively connected with the building of the Manhattan Suspension Bridge.

*

R. J. Lecky, A.M.E.I.C., Regina, President of Provincial and also of Regina Association of Canadian Building Construction Industries represented the province of Saskatchewan on the employers side of the Industried conference held at Ottawa, which completed its session on May 1st on uniformity of labour laws. Mr. Lecky is also a member of the committee on legislation of the Saskatchewan Branch.

P. M. Sauder, M.E.I.C., who organized the Hydrometric Surveys in Alberta and Saskatchewan and since their inception has been chief engineer, has resigned from the Government Service and has accepted a more lucrative position with the Lethbridge Northern Irrigation District. Mr. Sauder has taken an active interest in the work of *The Institute* and for three years was Secretary of the Calgary Branch.

*

L. M. Arkley, M.E.I.C., professor of mechanical engineering, University of Toronto, was elected President of the Graduates Society of McGill University of Toronto organized on May 1st at a dinner held at Hart House, University of Toronto, at which seventy graduates of McGill were present. Doctor Frank D. Adams, Hon. M.E.I.C., acting principal of McGill University and dean of the Faculty of Applied Science, Dr. W. H. Ellis, Hon. M.E.I.C., and Sir Robert Falconer of the University of Toronto, addressed the gathering.

*

Arthur L. Ford, M.E.I.C., was appointed chief hydrometric engineer on Mr. Sauder's resignation. Mr. Ford has had a long and widely varied engineering experience. He was actively connected with the construction of the Grand Trunk Pacific Railway as inspecting engineer for the Dept. of Railways and Canals. After the completion of this railway he transferred to the interior department and his recent appointment as chief hydrometric engineer is a recognition of his valued services in the latter department.

*

H. L. Seymour, A.M.E.I.C., assistant to Thomas Adams, housing and town planning adviser to the Dominion Government, will soon sever his connection with the government in order to accept an offer of partnership with Frank Barber and R. O. Wynne-Roberts, consulting engineers, Toronto. Mr. Seymour has been very prominent for several years past in town planning activities, and played a leading part in the formation of the Town Planning Institute of Canada. In his new connections Mr. Seymour intends to link town planning with the firm's other activities.

*

Edward A. Ryan, B.Sc., A.M.E.I.C., has resigned from the engineering staff of the Laurentide Co. Ltd., Grandmere, Que., and has opened an office in the Southam Building, Montreal, where he will carry on a general consulting engineering practice specializing in mechanical and electrical equipment of buildings. Mr. Ryan has acquired the use of the office records, drawings, files, data, etc. of R. J. Durley, M.E.I.C., of whose office in Montreal he was formerly in charge. Mr. Ryan has been engaged in the last few years on work in connection with mechanical, electrical and ventilating plants for the Fort Garry Hotel, Winnipeg; Toronto Union Station; Sun Life Building, Montreal; British Chemical Co., Trenton, Ont.; and The Laurentide's Company's plant, Grandmere, Que.

Lt.-Com. C. P. Edwards.

Appointed Officer of the Order of the British Empire.

Lt.-Com. C. P. Edwards, R.N.C.V.R., A.M.E.I.C., Director of Radiotelegraph Service, Naval Department, Ottawa, has been appointed as an Officer of the Order of the British Empire, Military Division, for services rendered during the War. Commander Edwards has had direction of all the Radio activities of the Dominion Government, both naval and commercial, since [illegible]. He is one of the most active members of the Executive Committee of the Ottawa Branch, and Chairman of the Committee on Proceedings. He is a Fellow of The Institute of Radio Engineers.

LT.-COM. C. P. EDWARDS, R.N.C.V.R., A.M.E.I.C.

Commander Edwards' Branch performed most useful work during the War, and he was singled out for special mention in Lord Jellicoe's report, recently laid before Parliament, for the "eminently satisfactory and efficient manner" in which the radio war work of the Canadian Naval Service had been organized and carried out.

Appointment to International Conference on Seamen's Employment.

G. J. Desbarats, C.M.G., M.E.I.C., has been appointed Canadian delegate to the International Conference on Seamen's Employment, which is to be held in Genoa on [illegible] June next.

This Conference is in connection with the League of Nations and is the outcome of the International Labour Conference recently held at Washington. It will deal more particularly with the application of the Washington Convention to seamen, the limitation of working hours to 48 per week, the supervision of articles of agreement, establishment of facilities for securing employment for seamen, and the possibility of drawing up an international seamen's code.

G. J. DESBARATS, C.M.G., M.E.I.C.

Canada is closely interested in this matter in that there are at present [illegible] vessels on the Canadian register employing a total of [illegible] men and boys.

This is not the first time Mr. Desbarats has represented Canada at important conferences, having attended several Imperial Conferences and also acted as plenipotentiary for Canada at the International Radiotelegraph Conference of 1912; this latter appointment has considerable interest, the same being the first time a representative ever acted for Canada as a nation instead of going as a member of a British delegation.

Appointments of a diplomatic nature such as this usually go to the legal profession, but all who know Mr. Desbarats are assured that he will conduct his mission to the satisfaction of the Canadian Government and to the honour of himself and the Engineering profession.

Engineers, as a body, are pleased that one of their members should be selected for so important a mission, and the Government is to be congratulated on the appointment.

Victoria Branch Chairman

[illegible] Ernest Foreman, B.Sc., M.E.I.C., who presides over the destinies of the Victoria Branch as Chairman, is chief engineer of Public Works of the Province of British Columbia and has under his control the entire engineering work of the province embracing over [illegible] hundred thousand square miles of territory. During his course at McGill University he was leader in his class and graduated with honours, winning the British Association prize and medal. After graduation in [illegible] he resided for a number of years in Toronto going to Vancouver in [illegible] where he was engaged in engineering construction and later in consulting practice. From 1910 to 1912 he was supervising engineer on the Dallas Road sea wall for the city and provincial governments, Victoria, B.C. In 1912 he was appointed engineer-in-charge of reconstruction of Smith's Hill reservoir and from 1912 to 1916 was

ALVAH ERNEST FOREMAN, B.Sc., M.E.I.C.

Chairman, Victoria Branch

assistant city engineer of Victoria receiving the appointment in 1917 of public works' engineer in the provincial government. Mr. Foreman takes a keen interest in civic as well as engineering matters and is doing much for the welfare of the engineering profession. He was successful in securing substantial increases to the remuneration of engineers employed in his department; which he has brought up to a state of efficiency, which members of the provincial government refer to with pride.

*

Rotary President, Lethbridge, Alta.

Sam. G. Porter, M.E.I.C., Superintendent of Operation and Maintenance of the Department of National Resources, Canadian Pacific Railway Co., at Lethbridge, Alta., was elected President of the Rotary Club at the Annual Meeting held recently.

Mr. Porter's work on behalf of the engineering profession is well known by members of *The Institute.*

Speaking of his appointment as President of the Rotary Club, the Lethbridge Daily Herald says: "President-elect Sam Porter is one of the most enthusiastic members of the Lethbridge Rotary Club and while he has been a resident of Lethbridge for only a little more than a year he has entered into all the interests of the community with zest. He was one of the members of the club who had much to do with making the visit of the Lethbridge Rotarians to the district convention at Calgary such a success.

Sam Porter lived on a farm in Texas for 20 years and that is where he acquired his broad breezy outlook

SAM. G. PORTER, M.E.I.C.

on life. From the Lone Star he went to the Massachusetts Institute of Technology, graduating in civil engineering. He is also a Master of Arts from the Baylor University, Waco, Texas, member of *The Engineering Institute of Canada,* and member of American Society of Civil Engineers.

During his career as a practicing engineer he has been three years with the U. S. Reclamation Service, six years as Chief engineer of Arkansas Valley Sugar Beet and Irrigated Land Co., Colorado, five years with the irrigation branch of the Dominion Government, Reclamation as special inspecting engineer and assistant chief, during which time he had charge of many of the surveys upon which irrigation districts in Southern Alberta are now being formed. A little over a year ago he came to Lethbridge to take charge of the Lethbridge project of the Canadian Pacific Railway irrigation department in which position he has had district success. Under his guidance the Lethbridge Rotary Club foresees a year of activity in all its ramifications.

*

John W. Le B. Ross, M.E.I.C., Superintending Engineer, Sault Ste Marie Canal, who has been the active head of the Sault Ste Marie Branch of *The Institute* since its inauguration, continues as Chairman of the Branch for the ensuing year. Mr. Ross has an enviable record of thirty-two years in the service of the Canadian Government in connection with the construction and maintenance of the canals and river channels of Canada.

JOHN W. Le B. ROSS, M.E.I.C.

Chairman Sault Ste Marie Branch; Superintending Engineer Sault Ste Marie Canal.

Twenty years of this period were spent on the St. Louis between Cornwall and Prescott and for the past twelve years in charge of Sault Ste Marie Canal.

Mr. Ross joined *The Institute* as Associate Member in [illegible] and was promoted full Member in 1901.

Border Cities Branch Chairman

H. B. R. Craig, M.E.I.C., recently appointed Chairman of the Border Cities Branch, graduated from R.M.C. in 1899, and from Queen's University (B.Sc.) in 1901. For a year after graduation Mr. Craig was resident engineer on construction of the Bay of Quinte Railway, and in 1904 he was resident engineer on construction of the Toronto-Sudbury Branch, Wahnapitae River to Sheppard Lake. For the two years following Mr. Craig was city engineer of Kingston, Ont., but returned to railway work on construction of the Grand Trunk Pacific Railway, being resident engineer on the Lake Superior Division and on the Prairie West Division. From 1908 to 1911 Mr. Craig again took up the duties of city engineer of Kingston, and after a year of consulting work for Prescott and the counties of Lennox and Addington he was appointed senior assistant engineer, Public Works, Canada at Windsor, Ont., in 1911. In 1914 Mr. Craig was transferred to Fort William by the Department of Public Works in the capacity of District Engineer after having been acting district engineer for the Windsor district for the previous year; in July 1919 Mr. Craig returned to Windsor as District engineer. In October 1902 he was elected a Student member of *The Institute*, being transferred in March 1905 to Associate Member, and was elected Member in December 1910.

Howard G. Kelley, M.E.I.C., who has been president of the Grand Trunk System since 1917, gained his early experience of railway work in the wild west, going straight from the University to railway construction work to share the hardships of the pioneers of railway building. After a brief interlude of mining he returned to the railway, and soon began to take over positions of responsibility.

HOWARD G. KELLEY, M.E.I.C.

President of the Grand Trunk Pacific Railway, has been appointed Chairman of the Committee of Management for the amalgamation of the Grand Trunk Railway with the Canadian National System.

In 1907 he was appointed chief engineer of the Grand Trunk Railway System, and [illegible] years later became vice-president in charge of operation, maintenance and construction, which office he relinquished on appointment as president of the Grand Trunk and Grand Trunk Pacific Railways.

Montreal Water Board

At a recent meeting of the Administrative Commission of Montreal a very important step was taken in connection with the water supply of the city. An advisory board of engineers, to be known briefly as "The Water Board of Montreal", was appointed to study in all its details the water supply problem of Montreal, including the generation or purchase of power of any kind, the enlargement of the filtration plant, the provision of reservoirs, the construction of pumping stations, canals, conduits, and so forth. The duties of the Board are to consist further in the supervision of the preparation of plans, specifications and estimates, and of the construction of the works.

A. E. DOUCET, M.E.I.C.

The Board is composed of three of our well known members, A. E. Doucet, M.E.I.C., Walter J. Francis, M.E.I.C., and R. S. Lea, M.E.I.C. Mr. Doucet is the Director of Public Works of the City of Montreal and is Chairman of the Board; Mr. Francis, one of our Vice-Presidents, is a member of the firm of consulting engineers of Walter J. Francis & Company; Mr. Lea is a member of the firm of consulting engineers of R. S. & W. S. Lea.

In order to facilitate the functioning of the Board the other members of the above named firms will act on the Board, Frederick B. Brown, M.E.I.C., representing Mr. Francis, and W. S. Lea, M.E.I.C., representing Mr. Lea. By this excellent arrangement the Corporation has practically engaged two established Consulting

R. S. LEA. M.E.I.C.

Engineering firms to act in an advisory capacity in conjunction with the Chairman of the Public Works Department. The fee for the advisory services of each of the members of the Board is said to be $10,000.00 per annum.

The Board has already entered upon its duties and has organized its staff and placed a number of orders for plant and equipment. Charles Desbaillets, A.M.E.I.C., formerly manager of the Gas & Light Department of the City of Sherbrooke, has been engaged as engineer in charge.

WALTER J. FRANCIS, M.E.I.C.

Retirement of H. J. Cambie, M.E.I.C.

H. J. Cambie, M.E.I.C., who has recently retired from active service with the Canadian Pacific Railway has just completed a professional career of sixty-seven and a half years.

As a boy of sixteen, fresh from school in England, Mr. Cambie entered the office of W. Walter Shanly in September 1852, who was then making surveys for the proposed Toronto and Guelph Railway, which was absorbed the following year by the Grand Trunk Railway when the latter obtained a charter.

H. J. CAMBIE, M.E.I.C.

He occupied various junior positions with C. S. Gzowski & Co. contractors for the Grand Trunk Railway, West of Toronto, from 1853 to 1859, and after the completion of the Grand Trunk Railway, there not being any railway engineering work in Ontario, served his time to Col. J. S. Dennis, passed as a land surveyor and under him, made explorations and surveys for the Province of Ontario in the Muskoka and Parry Sound districts during 1860 to 1862.

From 1863 to 1866 Mr. Cambie was employed by Sir Sanford Fleming on explorations and surveys for the Intercolonial Railway in the Province of Quebec and in Nova Scotia.

During 1867 to 1869, as engineer for Punchard Clarke & Co., contractors for the Windsor and Annapolis Railway in Nova Scotia, he located and constructed the Western half of that line forty-four miles.

During 1870 to 1873, Mr. Cambie had charge of construction under Sir Sanford Fleming as chief engineer of the Intercolonial Railway from Rimouski to near Lake Metapedia and resided at Metis.

During 1874 to 1875, under Marcus Smith, he was employed on surveys for the Canadian Pacific Railway in British Columbia.

In 1876 Marcus Smith, having been appointed acting chief engineer, took charge of all the surveys in British Columbia during that and the following years until in 1879 it was decided by the Government, on the advice of Sir Sanford Fleming, to adopt the Fraser River route, with terminal on Burrard Inlet.

During 1880 to 1883 Mr. Cambie had charge of construction of Government Contract 60, through the canyons of the Fraser River. The most difficult and costly work which had been attempted in Canada up to that time.

In 1884 he entered the service of the Canadian Pacific Railway Company and during that and the following year, had charge of the construction of their main line from Savona (the end of the Government Work in British Columbia) to Kamloops and Shuswap Lake, about sixty miles.

From 1886 to 1903, he was in charge of the Maintenance, of the Pacific Division of the Canadian Pacific Railway, embracing the main line and all its branches in British Columbia.

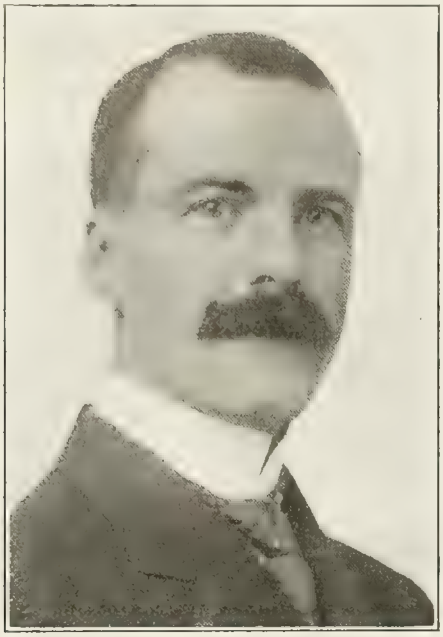
In 1904 Mr. Cambie was appointed special Assistant engineer for the Canadian Pacific Railway, with office in Vancouver, and during 1905 to 1907 had charge of the construction of the Nicola Valley Railway and from 1908 to March 1920, was chief engineer of the Esquimalt and Nanaimo Railway.

S. J. HUNGERFORD, M.E.I.C.

S. J. Hungerford, M.E.I.C., has been appointed to represent the Government on the Commission for the amalgamation of the Grand Trunk Railway with the Canadian National Railways.

City Planning Conference

The twelfth Annual Conference on City Planning was held this year, 19 to 22 April, at Cincinnati. While already a member of the Board of Directors of the American City Planning Institute, I greatly appreciated the privilege of being designated as the special representative there of *The Engineering Institute of Canada,* and a like honour which was extended to me by the Town Planning Institute of Canada to represent them also.



NOULAN CAUCHON, A.M.E.I.C.,

This meeting showed the ever increasing membership and attendance which has become characteristic of the movement. The Institute which comprises the technical men meets jointly with the Conference which comprises the representatives of municipalities and other bodies interested in city betterment—physical and sociological. A notable feature was the increasing number of engineers who are taking an interest in and contributing papers and taking part in the discussions. City Planning is fundamentally economic engineering and, the carrying out of plans at least, must in the nature of things rest largely in the hands of City Engineers. The more the engineer studies the science of economics the more ready and better able will he be to enjoy and profit by the collaboration of the Architect and the Landscape Artist.

The most notable paper from our angle delivered at the Conference was the one by the presidential address, Nelson P. Lewis, chief engineer of New York City, on Transportation Problems in Cities.

The dominating discussion of this Conference was zoning in the regulating of the use and development of land in cities involving width of streets and the relation of buildings thereto as to height cubage and air space etc.

The annual dinner at Hotel Sinton, where the Conference was held, was presided over by Alfred Bettman, a prominent lawyer of Cincinnati and an indefatigable friend of Sound City Planning who paid a glowing and generous tribute to the part which Great Britain and her Dominions had played in the great War.

A stimulating incident of the dinner was an address by a Chicago representative who depicted such progress being made in their City Planning that he led us to believe that Chicago would soon become a more attractive home than Heaven—and he was a lawyer at that! So you see what fascinating possibilities await the enthusiastic mind.

Altogether City Planning has taken a good stride in progressive advancement as a result of this most successful Conference.

NOULAN CAUCHON, A.M.E.I.C.

Preliminary Notice

of Applications for Admission and for Transfer

[illegible] May, 1920

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in June, 1920.

FRASER S. KEITH, Secretary.

---

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option: Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I-IV and VI), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

MACNAMARA—ARTHUR, of Winnipeg, Man. Born at Toronto, Ont., March 4th, 1885; Educ: Public School, night School & private study; Machinist apprentice, railway shops Montreal & Toronto; 7 yrs. with G.T.P. Ry. as Asst. to Master Mechanic on constrn, and later Asst. Supt. of Motive Power, built & organized all Repair Stns. for locomotives & cars from Ft. William to Prince Rupert; 2½ yrs. Technical Stores officer R.A.F.; 1915 to date, Chief Inspector Manitoba Bureau of labor.

References: D. Main, G. L. Guy, J. M. Leamy, J. G. LeGrand, H. A. Bowman, J. Rocchetti.

MADGETT—GEORGE HENRY, of Hamilton, Ont. Born at Hamilton, Ont., Feb. 14th, 1891; Educ: Collegiate Institute Hamilton, Ont.; 1908-18, tracing detailing & checking Structural Steel at Hamilton Bridge Works; 1918-19, in charge of designing & estimating, and 6 mos. designing engr. with Standard Steel Constrn. Co.; 3 mos. with E. H. Darling, Hamilton, Ont.; At present Designing Engr. with W. J. Westaway, Hamilton, Ont.

References: R. K. Palmer, C. H. Marrs, J. A. McFarlane, E. H. Darling, J. Erskine, P. M. Smith, G. Jack.

MANSBRIDGE—ALFRED SWATTON, of Walkerville, Ont. Born at Manchester, England, Dec. 17th, 1886; Educ: Public & Night School; 5 yrs. apprentice to machine shop (Scotland); 2½ yrs. rodman Vancouver, B.C.; 1909-13, dftsman & engr. B.C. Elec. Ry.; 1913-15, Asst. to Chief Dftsman Pacific Eastern Ry.; 1915-19, with C.F.A.; 1919, 2 mos. dftsman & 2 wks. Hydrographic Survey Vancouver Hbr. Comm.; At present dftsman, Trussed Concrete Steel Co., of Canada Ltd., Walkerville, Ont.

References: E. G. Matheson, H. W. Frith, A. E. B. Hill, A. J. Riddell, R. Snodgrass.

MARRYAT—GERALD, of Montreal (temporarily). Born at Redhill, Surrey, England, March 5th, 1876; Educ: Marlborough College, England; Acted as French Interpreter in France during late War; 1903-04, topog'r. and dftsman G.T.P. original surveys; 1905-06, transitman T.C. Ry.; 1907; Temiskaming & Nor. Ont. Rly. on location 100 miles from Sudbury to Port Arthur, all estimates etc.; 1909, in partnership with Arthur Cotton, O.L.S. in Elk Lake, as Surveyors, Engineers etc., and afterwards in business for self as Contractor for Mining Work; 1914-20, with C.E.F. in Can. Engrs. on Survey and Map work in France and Belgium; Wounded Jan. 1916; Later Res. Engr. for War Office for big Aerodrome Bldg., and afterwards with Can. Forestry Corps on grading work; Discharged from Ste. Agathe Military Hospital two months ago.

Progress in Aviation

J. A. Wilson, A.M.E.I.C., Member of the Air Board of Canada.

Before dealing with developments in Canada, it will be as well to consider for a few minutes what has been achieved elsewhere.

The rate of progress of heavier than air machines has been that of the development of suitable engines. It is not too much to say that flying waited fifty years before accomplishment, for the development of a light enough engine to make it possible to fly. The principles of flight were fully known long before Langley and Wright made their first flights. Further progress is dependent on the same factor. Though the Wrights flew in 1903, yet it was 1908 before any progress was made. Earlier machines had to be launched, they could not get off unaided. In that year the Antoinette and Anzani engines were produced and real progress commenced. In July, 1909, Bleriot flew the Channel and in August the Gnome rotary engine was produced in France. This halved the weight per H.P. of any existing engine and though not very reliable at first and extremely wasteful of fuel and oil, it enabled anything in the shape of an aeroplane to fly as long as it kept running. Once the engine problem was solved progress became rapid and continuous. Engine weights of ten or even fifteen pounds per H.P. have been quickly reduced to 1.5 pounds or less and today a small fast machine will not weigh more all told with fuel and pilot up than did the pre-war engine alone, i.e., about five or six pounds per H.P.

"Rotary" Type Aero Engine Le Rhone 110 H.P.

Read before Ottawa Branch, The Engineering Institute of Canada, Feb. 12th, 19[illegible]

The Present-Day Aero Engine

Aero engines today generally are of two main types. The rotary in which the cylinders themselves revolve round a fixed crank and carry the air screw with them. This type is only suitable for small powers up to 150 H.P. at the most up to the present, is fairly reliable, very light, but not very efficient as regards fuel consumption or lubricants. The Gnome, Le Rhone and Clerget are the best known types. They are all air-cooled and were used in scout machines where lightness was the great object to be obtained. The weight per H.P. obtained from these engines today is: Gnome 2.7 pounds, Le Rhone 3 pounds, Clerget 3 pounds.

In the other group the cylinders are stationary, the pistons drive, through a connecting rod, a revolving crank shaft to which is fixed, either direct or through gearing, the air screw. The original stationary engine was the ordinary vertical automobile engine. In the endeavour to gain power per crank the "VEE" engine has been evolved with 2 cylinders working on the same crank, and the "Broad Arrow" having 3 cylinders acting on the same crank. Certain other types having 4 cylinders in the same vertical plane and, finally, the Radial Engine in which many stationary cylinders are arranged round a common crank. With the exception of the Radial which is air cooled, (though there is now a water cooled radial made by the Fiat Company on the market,) the others are water cooled. The best known types are Vertical, Beardmore, Siddely; "Vee" Rolls-Royce, Sunbeam, Liberty; "Broad Arrow", — Napier "Lion": Radial,—Cosmos, & A.B.C.

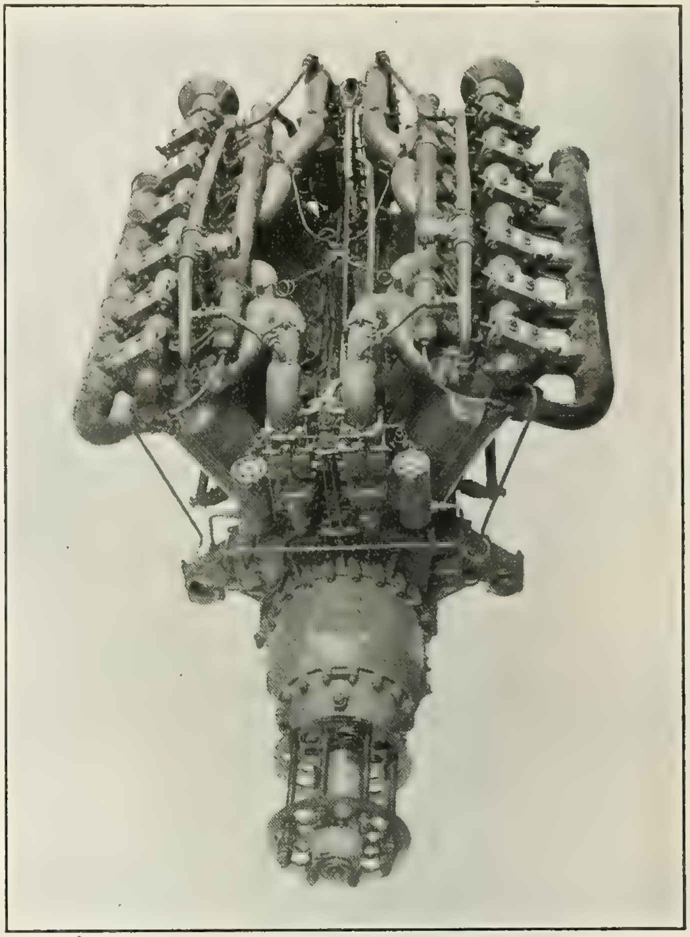
The water cooled engines weigh about an average of from 3-3½ lbs. per H.P.; the Radials are as light as 1.7 lbs. for the 300 H.P. "Cosmos", 1.4 lbs. for the 500 H.P. type. Another advantage of the Radial is its short shaft length as compared with the Vertical or "V" types. Air cooled engines save of course, not only the weight of the water, but of the radiator and somewhat complicated circulation system and have the advantage of simplicity and fewer "gadgets" to get out of order. Full economy varies a good deal, a really first class engine in good order uses about 1 gallon for every 15 or 16 H.P. per hour running at normal speed.

Factors in Design

Perhaps the heaviest loading per H.P. with which a modern machine could fly is about 40 pounds per H.P. This would leave no margin, however, for climbing and is extreme. About 25 pounds per H.P. would be the most which could be used in actual practice and that only with a large slow weight—carrying machine of considerable wing area.

The complementary factor to weight per H.P. is weight per square foot of flying surface. This also varies considerably, from as little as five pounds per square foot to as much as fifteen. Under present designs the maximum loading possible is about twenty pounds per square foot.

The third factor in design is the form and size of the wing area and the angle of incidence; all design is a compromise between these factors and resolves itself into how to design your machine so that you can carry the greatest weight the farthest distance at the best speed for the least H.P. That success has attended the solution of these problems in all directions will be seen from consideration of the following flights:—



"Vee Type Aero Engine
"Rolls-Royce" Eagle VIII 360 H.P.

Record Flights

Speed: Nieuport Biplane, 300 H.P. Hispano Suiza engine, 190 miles per hour. This speed was actually made, but the conditions are unknown. Speeds of 150 miles per hour in an enclosed circuit were officially recorded by an "Airco" Machine.

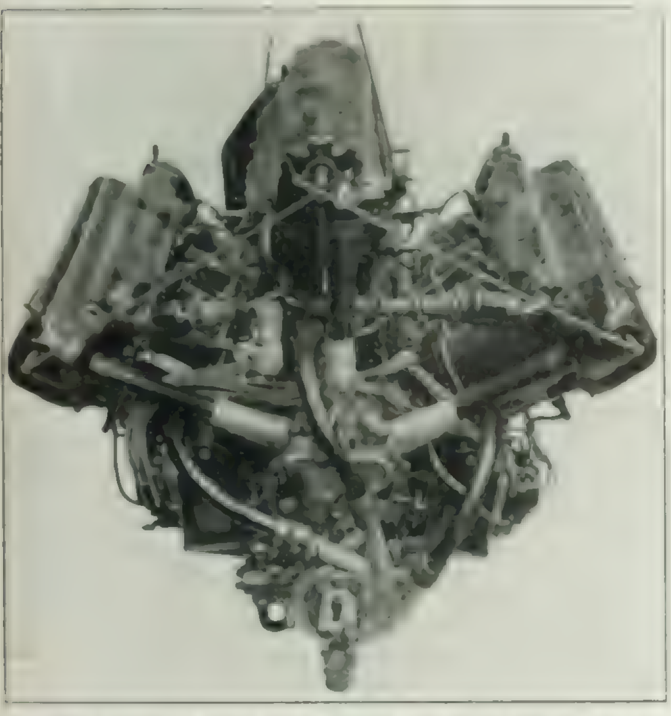
Height: "Airco" Machine, 450 H.P. Napier-"Lion" engine, 30,500 ft. A height of 34,600 has lately been reported by an American machine—Curtiss "Wasp"—but has not been officially authenticated so far.

Longest continuous flight: England to Australia, distance 11,500 miles.

Trans-Atlantic flight: Vickers' "Vimy", time 16 hours, distance 1,890 miles, non-stop, Rolls-Royce engines. It is understood that in this case enough fuel was left after that accomplishment to make another 600 or 700 miles. (This is not the greatest duration flight, the record for which was made by a Hun machine in pre-war days of over 21 hours. This performance has never to my knowledge been beaten.)

The Trans-Atlantic flight though proving the reliability of the engines and the skill of the navigator and pilot, was useless as regards showing commercial possibilities as the whole useful load was taken by fuel.

The Australian flight, taken by short stages, was a much more useful test as it showed the reliability of the machine to fly, day after day, moderate distances under varying conditions.



"Broad Arrow" Type Aero Engine Napier "Lion" 450 H.P.

Long Distance Flights in the Future

The long distance routes of the future will be covered in moderate sections of from 200 to 400 miles, each machine doing its own section, just as in railway locomotive practice today.

The pilots will also be confined to sections with which they will become thoroughly familiar under all weather conditions and the passengers and freight will be transferred from machine to machine at each stopping place. The endurance of the crews and machines will not, therefore, be put to any extraordinary strain and the service will be capable of being run at much greater speed and without lengthy stops. The time taken for the Australian flight was 28 days, but the actual flying time was, it is understood, about 6 days only.

With a proper ground organization and relays of machines available the flight could be made normally in that time.

The Vickers' "Vimy" weighs empty 7,100 pounds, fully loaded 12,500 and has a normal capacity for cargo or passengers of 2,100 pounds, the balance being fuel, oil, etc.

These records are the highest achievements which have so far been attained, but that they are by no means exceptional or that similar machines could not make equal records at any time is certain. What is holding back aviation is solely the lack of ground organization which takes time and money to provide. Once air routes are laid out and equipped, records such as these will become everyday performances. Where the ground organization is in existence regular services run with surprising regularity and safety.

London-Paris — London-Brussels Services

The London-Paris and Brussels mail and passenger services have been running for some months now. They have proved their ability to operate this service under most adverse weather conditions, and have made the cross channel flight several times when no steamers could cross. So far they have had one serious accident only with the loss of one life. The "Airco's" mileage is now over 60,000 miles, flown at an average speed of 100 miles per hour. The time taken is usually about 2¼ hours. This is by no means the record, however, as during the Peace Conference a Martinsyde machine crossed in 75 minutes with despatches. The time by train and boat service is about eight hours.

The Handley Page Services have carried during October, November and December 900 passengers, 45,000 lbs. of freight, and have a mileage of 62,000 miles. No accident has occurred during these flights. During the first six months of civil flying, in over 100,000 flying hours there were only thirteen accidents and two fatalities in Great Britain. Considering the lack of experience and imperfect organization this shows the comparative safety of modern flying. Accidents are known in other forms of transportation too. Even Canadian railways have been known to kill their passengers, and motor cars also.

These services were carried on at first by converted war machines, but special types designed for the service are now on all routes.

The new Handley-Page machine "W.8" with two 450 "Lion" engines on her trial trip made the passage in one hour and fifty minutes, flying to Paris to be exhibited in the Aero Exhibition there.

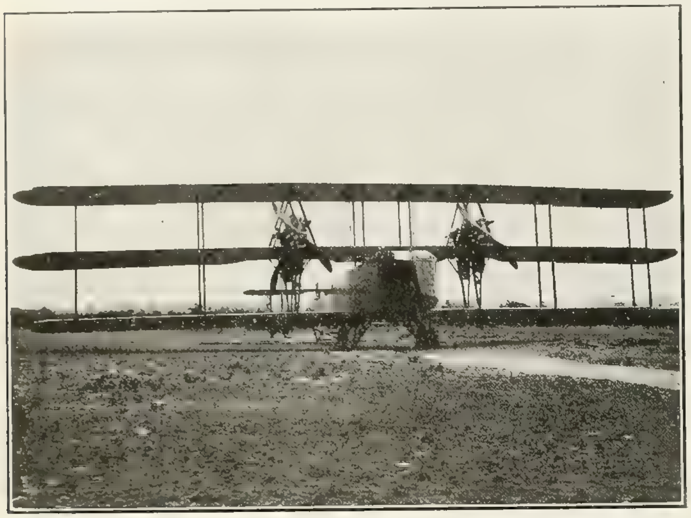
Other commercial machines are coming into use rapidly. One other excellent record might be cited, that of the Alliance "P.3", eleven seater, which made the London-Madrid non-stop flight recently, 900 miles in 7½ hours. This machine can carry eleven passengers or one ton of mail or express matter. The cost of fuel during this flight was 15 cents per mile.

The successful operation of the mail services in the United States show also what can be done in the way of regularity of service, freedom from accident and cheapness of operation.

Mr. Holt Thomas of the "Airco" is prepared to carry mails at one penny an ounce if guaranteed 400 lbs.

each trip, London-Paris, 250 miles in two hours; one halfpenny an ounce if guaranteed 800 lbs. per trip and Express matter at one shilling and four pence per lb. if guaranteed 2000 lbs. per trip. The present "grande vitesse" rate by train and boat is one shilling and six pence per lb. and takes 24 hours in delivery. This will give some idea of the commercial feasibility of air mails.

The progress up to date appears to show that with sound ground organization commercial flight has already a future. When one considers that flight itself is only really about fifteen years old and it has had only one year of real development, and that year one of re-organization, it is astonishing what has been done in the way of commercial progress.



"Bristol" Triplane Bomber, Four "Liberty" Engines.

Engine Improvement

Though progress has been rapid, yet there is no doubt that even greater progress will be made in the near future. Along what lines is progress most required? First, there is the question of engine reliability, efficiency and economy. With heavier than air machines which depend solely on their engines to keep them in flight, this is of course the first essential. There is no doubt but that progress is being made in this direction and that the aero engine will soon have attained the reliability of its parent the automobile engine. Further improvements are being sought along the lines of the use of a cheaper fuel, and in other directions. The development will be gradual and may be in a totally new direction. That it will come is undoubted.

Landing Speed

The next great drawback to be overcome is the high landing speed of present day machines. The average landing speed is perhaps from forty to fifty miles per hour, and faster machines require greater speeds. This means necessarily a large space for an aerodrome and also a perfect surface. The solution of this problem is urgent. Large prizes are already offered, for instance, M. Michilin has offered $100,000. for a machine with a flying speed range of from 6 to 125 miles per hour. The Imperial Government in their $350,000 prize competition make a feature of low landing speeds. This is largely a problem of varying the size or shape of the wings and angle of incidence.

The All-Metal Aeroplane

Another improvement which will be of great benefit to the progress of the aeroplane will be the substitution of metal for wood and fabric. Wood, though possessing so many excellent qualities is much affected by climate, and machines made of wood require constant re-rigging and adjustment.

The development of the all-metal plane is coming fast. A machine with a metal framework of rolled steel of suitable sections was shown by Messrs. Boulton and Paul at the recent show, which is 25% lighter than a similar wooden machine, and has a greater strength. The frame-work is filled in with a special fibre sheet which is water and fire proof. A great deal of work has been done by this firm and others, and there is no doubt that the present rapid rate of depreciation of machines could be greatly lessened by the adoption of metal and fibre structures.

Then too, there is the very old question of the Helicopter. The idea of rising vertically in the air by means of the lift of an air screw revolving horizontally is a very old one and is the subject of constant experiment. It does not seem very vital today, however, as it would appear that it is being solved naturally by the increased ability to climb of the modern machines. I think the official climb record stands at 10,000 ft. in six minutes 19 seconds, made by the Bristol-Rolls machine over a year ago. This must have been beaten many times by now, however, and I read the other day of a new machine doing 10,000 ft. in two minutes. If this is correct the helicopter has already arrived by natural evolution. My source in this case is not very trustworthy, I am sorry to say. I read it in an American flying paper!

The aeroplane of today beats the bird at its own game. It can climb and travel far faster and over much greater distances. It can loop, spin, roll and dive as no bird can. The best of our pilots have the flying instinct. Where the bird has the advantage is its power to fold and spread its wings and flex them at will. This power would give us what we still require, greater range of speed and manoeuvrability.

Until these problems are satisfactorily solved, it does not appear that much further development can be expected in the way of larger land machines. These were, of course, very highly developed during the war and the progress since made has been more in the line of the adoption of present designs to commercial work. Passenger bodies are now most comfortable, just as much so as a limousine body, and having in the larger types much more room.

The Flying Boat

The development of the flying boat had not reached so high a point in 1918, when the war stopped. Its development is of great interest to Canada, as in a great

"Phœnix Cork" Flying Boat, two Rolls-Royce Eagle Engines
The English Electric Co.

part of our country its use is most suitable because of our great inland waterways and many lakes. Its use for communication in the West Indies and South Pacific Islands would be of great benefit to these scattered communities. Three machines, larger than any existing heavier than air machines, are now under construction for the Air Ministry in Great Britain, of 160 ft. span with 60 ft. hulls and 2,400 H.P. engines. They are biplanes of wooden construction. A still larger all metal machine is being built. Its dimensions are: span 220 ft., length of hull, 100 ft., toal weight, 50 tons, useful load, 23 tons. H.P. 5,200, eight 650 Rolls-Royce engines, each pair driving an 21 ft. air screw. Its maximum speed will be 100 miles per hour and cruising speed 80, at which speed it will have a radius of 24 hours. This, of course, is very much the largest heavier-than-air machine ever attempted and its success will be watched with great interest. There is no doubt that a great future lies before the flying boat and with machines of this size and power under construction you will easily understand that it has passed its infancy and is no longer a toy or a fad, but a fact which has to be reckoned with in the transportation world so far as passenger and express matter is concerned.

The Airship

We will now consider for a moment lighter-than-air craft. The proportion of useful lift, that is lift available for fuel, cargo and crew, to the gross lift is much higher in Airships than in Aeroplanes. In the former about 60 per cent, in the latter 33 per cent. The unfortunate property of structures that their strength varies inversely as their length is true of both airships and aeroplanes. The latter, however, are dependent on their lift for an area, that is a square quantity, whereas the former is dependent for its lift on cubic capacity. For instance, a 10 million cubic foot dirigible would have five times the total lift of a 2 million foot airship, but the length of the structure would only be 1.7 times as great. The gross lift of a 10 million cubic foot airship would be in the neighborhood of 300 tons of which 200 would be disposable lift and at a cruising speed of 40 miles an hour would have an endurance of approximately three weeks. Its ceiling could be some 20,000 feet and range 20,000 miles. Great endurance and range can be achieved in a large type because, contrary to heavier than air machines, the characteristics of lighter than air machines are governed by two factors: (1) the lift is in proportion to its cubic capacity, (2) all fuel is used for propulsion and not as in the case of a heavier than air craft for maintaining the structure in the air.

It would appear to follow that the advantage of the heavier than air machine will remain in the future as at present, high speed, rendering it independent of all weather conditions except the very worst, moderate capacity and range and handiness, and that the characteristics of the lighter than air machine of the future will be moderate speed, great endurance and large lifting capacity.

R. 33 and R. 34 are the best known types of this class, as one of them made the Trans-Atlantic voyage last August. They are 640 ft. long, 79 ft. in diameter, and have a capacity of two million c. ft. They have five 275 H.P. engines. The net weight of the ship is 26.5 tons and the disposable lift for crew, fuel, cargo and ballast 29 tons. The maximum speed is 62 miles per hour and cruising speed 45 miles per hour.

These machines are no larger or more efficient than the German "Zeps", and credit must be given to the Huns to whom the progress made is largely due.

The cost of construction and operation of such machine is, of course, heavy, and this has led the Imperial Government to enter into negotiations for the continuance of the development of the type, which under present financial circumstances it does not wish to assume, to commercial firms, and for commercial purposes. That such services are not practical cannot be maintained. In Germany between 1910-1912 a German company ran a lighter-than-air ship service. In 800 trips lasting 1,600 hours and making a mileage of 102,000 they carried over 17,000 passengers. The capacity of these ships was 20 passengers and the fittings were most luxurious. The trips were of about three hours' duration and the fare was 100 marks, or about $20.00 a trip, including lunch served on board. They made a profit and the trips were booked days ahead, so popular was the service. The Hun has not been idle since the armistice and a new Zep. the "Boden See" was running passenger services last fall. Eight years have seen a tremendous development and modern machines are much more efficient.

Costs of Air Services

The estimated cost of a big rigid airship service with four 3½ million c. ft. ships has been worked out on the following basis:

Capital required £2,600,000. Taking 200 trips per year between London and New York the cost per passenger mile would be 4 pence, and mail rate 3 pence per ounce. Of the total cost 25% would be operating and 75% overhead. Overhead is a very big factor in all flying costs.

The expense of maintaining rigid airship stations is, of course, very considerable. Not only do they require very large landing grounds, but the hangars required for their building and housing are very large and costly structures. The operation of taking a machine from its shed, taking off, landing and rehousing requires at present a very large personnel. Experiments have been under way for many months with a view to lessening the numbers required and the difficulties and risks involved in handling machines from the ground. With this in view a mooring mast with a swivel top to which machines may be moored in the open has been designed by Vickers Limited. A series of experiments extending over many months have been made with these mooring masts with different types of machines, rigid and non-rigid. The results are extremely satisfactory and that both types of machines have remained out for months moored to such masts in all weather without accident and with remarkably little deterioration in the fabric of the machines. The process of mooring is accomplished by throwing out from the airship a cable which is connected with another leading from the top of the mast, the slack is then taken in and the airship drawn to her mooring at the swivel top, by means of a winch, where she is made fast. The bow only is made fast and the body swings with the wind, the swivel mast head allowing the ship movement in any horizontal direction. The trimming of the machine, of course, requires careful attention. This is accomplished by filling or emptying her ballast tanks. The problem of landing and taking off appears to have been satisfactorily solved by this device and the experience obtained to show that airships need not be taken to their hangars except for general overhaul just as at present ships are taken to drydock periodically.

Illustrating method of mooring to steel mast in open.

Airships and Canada

The development of these large machines with a view to the establishment of a regular trans-Atlantic service is of course of very great importance to Canada. Owing to her northerly position the shortest routes across the Atlantic and Pacific Oceans are both via Canada. Very strong westerly winds prevail on the North Atlantic, amounting, it is said, to as much as an average all the year round of from 15 to 17 miles per hour. Westward flight from Europe to Canada will be handicapped to this extent and it may therefore pay to take a more southerly route and thus obtain more favourable winds, which will help rather than retard the progress of the airship and thus shorten the passage materially. Preliminary examination of the possibilities of the trans-Atlantic Service, it is understood, lead to the conclusion that southerly route from London towards the Portugese Coast, then westwards towards the Azores and striking the American continent in the neighbourhood of Florida or Virginia would prove the most feasible route for the westward journey, making it 600 miles further, i.e. equal to a contrary wind of 10 miles per hour on the direct route. Going eastward, of course, from New York, Montreal or any northern point the full benefit of the westerly winds would be obtained.

If, when the service is established, these proposals are carried out, no efforts should be spared to obtain the northern terminus for eastward passage for a Canadian Station; it follows, therefore, that it will be most desirable for Canada to follow very closely the development of lighter-than-air craft and to keep in close touch with the proposed commercial organization, with a view to taking the necessary action when the time comes to obtain the northern terminus of the service for Canada.

Turning now to Canada and conditions in this country; there has been up to date practically no civil flying in this country. Though a good deal of work was done in the early days by Mr. Graham Bell at Baddeck, N.S., and Messrs. Baldwin and McCurdy, there has been no continuous development. This was due to the war and the stoppage of all private effort while it lasted.

The year which has elapsed "since this devastating peace broke out" as a well known airman termed it, has not been an idle one.

The Air Board of Canada

Legislation was passed in June, 1919, creating an Air Board for the regulation of aeronautics in Canada. The Board was given undivided jurisdiction over the subject. This, undoubtedly, was the wisest solution in Canada of a rather vexed problem, discussion over which is raging at present in the United States and over which there has been in the past and still is much controversy in the Old Country. The alternative meant the creation of at least three bodies to deal with the military, naval and civil operations. The composition of the Air Board is as follows:—

A Chairman, who must be a Minister of the Crown, a Vice-Chairman, who will be the chief executive officer of the Department, a military and a naval representative, and from one to three other members.

The Vice-Chairman, Colonel Biggar, was a member of the Canadian delegation to the Peace Conference and represented Canada on the committee which drew up the International Air Convention and had a unique opportunity while on that Board of studying the legislation required for the proper regulation of flying.

The Board was instituted in July last, and since then has been active in all directions. The Air Regulations for Canada were promulgated last month, and I think I am correct in saying that the only other country in the world to adopt a formal Air Code is Great Britain.

Civil flying divides itself naturally into two branches: (1) the traffic end, including the carriage of passengers, mails, express matter and communications generally; (2) co-operation with existing Government services, forests patrols, auxiliary work in connection with surveys, North West Mounted Police, fishery protection, explorations, and so on.

It is felt that the first group, the traffic end, is already performed by agencies in the commercial world and should be left in the beginning at any rate to commercial companies which we desire to encourage in every possible way, and that the second group of operations, which are now almost wholly performed by the Government, would provide more than sufficient scope for a government flying service on civilian lines and in co-operation with existing government services. A preliminary survey of the whole of Canada has been made with a view to determining the most necessary and practical operations in which the Government was interested, in order that a start in operations might be made this spring. The result of this survey has already been the subject of a preliminary conference with the officers of other interested departments. The following extract from the agenda of the Interdepartmental Conference shows scheme of development considered by the Board most likely to give the best results:—

The Field for Air Service

"The immediate field for air service seems to lie rather in the direction of securing access by air to districts not easily reached by ground transport facilities, and of obtaining information not readily obtainable by investigations on the ground. It is therefore thought that the less well settled and less thoroughly explored parts of Canada offer the most favourable areas for the immediate development of air services. In most of these areas the number of bodies of water makes the provision of aerodromes unnecessary, except between seasons, and, where the water is not present, the surface of the ground is often of such a character that the landing of flying machines presents no difficulty.

In almost no part of Canada will winter conditions prevent flying. They will not even seriously interfere with it when operations are carried out from properly equipped stations. From the slender information now available it is thought that the number of non-flying days is not likely to exceed five in any month, but experiments have to be carried out to determine whether or not this estimate is too optimistic.

The range from a given air station will generally be somewhat in excess of 150 miles, but work this range will sometimes involve the establishment of sub-stations with re-fuelling facilities.

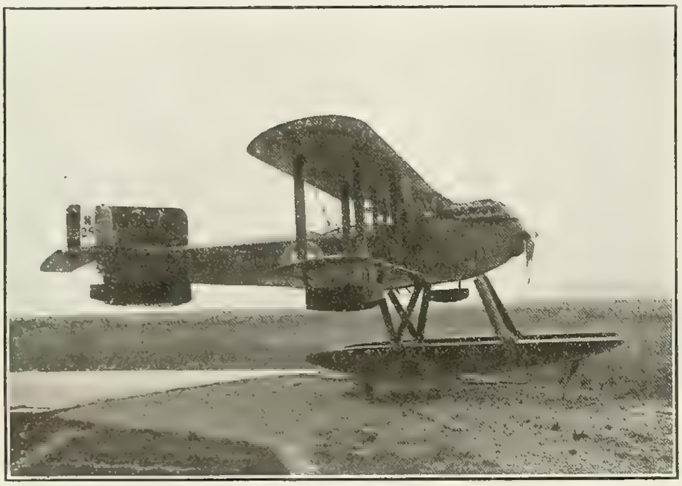
The question whether stations can usefully be opened and economically operated depends upon the combination of duties which can be carried on from them and the extent to which Departments of the Government can, in combination, provide the appropriations necessary for their establishment and maintenance."

The cost of flying is given by [illegible] at from $1.00 to $1.50 per mile; this covers the ground organization necessary, and overhead and depreciation as well. Discussions as to costs of operation and feasibility of the various proposals put before us are now under way and it is hoped that a beginning may be made at several of the stations during the coming season. Flying, of course, is at present expensive and the extent of the operations to be undertaken are limited by the amount of money which can be spared. This is, under present circumstances, probably a strictly limited amount. The opening of three or four stations for useful work this summer would enable the Board to gain experience in what, after all, is still an untried field and to ascertain definitely the cost of operating and the possibilities of successful operation. If the stations are found to operate to advantage, the service could be extended in later years as funds permit. Very many interesting proposals have been suggested by different branches of the Government Service for the consideration of our officers. Perhaps the most feasible is the work which might be done in co-operation with the present forestry services, Provincial and Dominion.

Forest Protective Service

An experiment in this work was carried out last year by the St. Maurice Forest Protective Association, thanks to the initiative of Mr. Elwood Wilson, and owing to the interest in the scheme of Mr. Ballantyne and Mr. Desbarats, Minister and Deputy Minister of the Naval Service, machines were lent free of charge for the purpose. They were not available until July, when the season of greatest fire hazard was already past, yet the experience gained there showed conclusively that with proper co-operation with existing ground patrols an air patrol could be of the greatest benefit in forestry work. Flying was carried out until well on in October, when operations were no longer required. The type of machine used was the H.S.2L Single Engine "Liberty" 400 H.P. Curtiss Flying Boat with a capacity of 1000 pounds useful load. Over 6000 miles were flown without accident and with only one forced landing during the season, and that, I think, on the first or second flight attempted. A range of vision of at least forty miles is easily obtainable on a clear day and as the machine can make seventy miles an hour, a flight out and home of 150 miles each way covers an immense area. A fire pump and 1200 feet of hose can be carried in the machine and landed near the seat of any fire. This type of machine is, of course, only suitable for use where there are lakes scattered throughout the territory to be patrolled. This condition of affairs exists practically throughout the whole of eastern and northern Canada and until landing grounds are provided there is no doubt that the flying boat and seaplane provide an immediate solution without waiting for the provision of aerodromes which is bound to be a slower business.

To show what can be done in cross country flying one only needs to instance the route taken by these machines from Halifax to Grand-Mere, across Nova Scotia from Halifax to Windsor, down the Bay of Fundy to St. John, up the St. John River and across the height of land to Fraserville on the St. Lawrence, then up the St. Lawrence to Three Rivers and up the St. Maurice River to Grand-Mere. The pilot informed me that he was never out of reach of a safe landing, the whole time at 5000 feet altitude. These two flights are perhaps the best cross country flights that have ever been made in water machines and show the possibilities of this type of machine for use in a country such as Canada very clearly.



"Fairey 3C" Seaplane (Rolls-Royce Engine "Eagle".)

Lumber Companies and the Aeroplane

I am glad to say that the lumber companies are taking an active interest in this experiment and that steps are being taken by several of the largest firms to obtain their own machines, not so much, I understand from the view of protection against fire, but for better transportation within their limits. Trips which took their superintendents, foremen and workmen days or even weeks to cover, can be performed by air in an hour or two. The companies are quick to realize the possibilities of increased control and better transportation facilities. Fire patrols will undoubtedly be carried on throughout all forest country within the next few years. It is not expected that they will entirely supersede the existing ground organization, but will supplement it. Patrolling huge areas of forest country from the ground is a difficult problem and lumberman are the first to admit that the present system is expensive and in the remoter parts of the country inefficient. A very well known lumberman told me the other day that last spring more than ten square miles of the finest timber in Eastern Canada was destroyed and that their company did not learn of its destruction for many weeks. The loss is estimated at many millions of dollars. That such a condition of affairs could exist with an efficient air patrol is inconceivable. The fire loss exceeds the growth in many forest reserves, and there is no doubt that the conservation of the forest resources, which are today one of the chief assets of Canada can be immensely strengthened by the installation of air patrols during the fire season.

There has been a lot of talk about aerial surveys. The problem has been dealt with by men more capable of judging its possibilities than I am. It appears to me, however, that aerial photography can never supersede the ground survey, but that it can, once ground control is established be of very great assistance in filling in the detail. It will undoubtedly come into use as has phototopography. In exploratory work it will be undoubtedly of great value in showing the nature of a country, the shape of its main physical features, even though it may be possible to fix them with absolute accuracy.

In opening up our north country, which is a task for the present and coming generation, the air will undoubtedly play an important part. No part of Continental Canada is more than one day's flight from present communications.

Gift from Imperial Government

That the Air Board can contemplate such operations is largely due to the generosity of the Imperial Air Ministry. They have made a gift to Canada of very great value indeed. Of their generosity, offers of assistance and sympathy in our endeavours, it is impossible to speak too highly. We have now being shipped from England machines and equipment, the value of which is not less than $7,000,000.

The possibilities of rapid inter-communication between our cities opens up a tremendous field for aviation. There is no doubt that in a few years' time when people become more accustomed to the idea of travelling by air, this will be a quite common mode of travel and will reduce very materially long tedious journeys. For instance, instead of taking the thirty hours required at present for the journey from Montreal to Halifax, a business man will save a day by taking the 500 mile direct trip by air in six hours, and as the Governor-General remarked the other day, one soon will be able to breakfast in Montreal, arrive in Winnipeg in time for supper, and go on to Vancouver next day if he does not care for night travelling by air. Safe, regular and efficient travel by air depends as much on a good ground organization as on a good flying machine and pilot. The necessity of providing Air Harbours and landing grounds throughout the country is obvious. Before regular services can be run, this is essential. It is hoped that once the public becomes educated to air travel just as it has become educated to motor travel "Good aerodromes" will be the slogan in ten years just as "good roads" is at present.

It is hoped that all municipalities will take steps to assist in the provision of air harbours. Their provision by the Dominion Government cannot be contemplated for a moment because of the cost.

Future Development

Air travel will always be more expensive than travel by land or sea, and the carriage of bulky and heavy freight and ordinary passenger traffic cannot be contemplated. That there is room for another though more expensive and quicker form of travel is undoubted and it will come in a very few years if present progress is maintained. A vast and undeveloped country provides an opportunity for useful and profitable experiment and there is every reason to hope that in a few years Canada will lead the world in flying. Certainly no other country presents such opportunities for aviation. We have a suitable climate, a suitable country; our pilots have shown themselves to be second to none and it is up to our engineers to take their part in the great development of aerial transport. The British Empire today leads the world in aerial work, in design, manufacture and operation. We must be first in the air, as we are at sea. Owing to the small extent and bad climate of Great Britain, her operations cannot be confined to the Old Country, but must spread over the world. The Dominions offer an unsurpassed field for air work. Canada's name is first in air war work. She has shown vision and boldness in her railway and canal development. She is now creating a mercantile marine and becoming a sea power. In the air she will also take that rightful place in time of peace her pilots earned in war.

Legislation in New Brunswick

(Retiring Address)

C. C. Kirby, M.E.I.C., Chairman, St. John Branch, 1919-20.

I wish to express my regret at being unable to be present at the Second Annual Meeting of the St. John Branch of *The Engineering Institute of Canada* and in doing so I also desire to acknowledge the honour which has fallen upon me during the past year of acting as Chairman of the Branch. The onerous duties of this office have been greatly lightened by the enthusiastic energy of the Secretary, Mr. Crookshank, and the members of the Executive Committee. The success of the Maritime Professionial Meeting in September last was in no small measure due to the activities of the Executive Committee and those other members who were called upon to act on the Special Committee. The support of the members of this Branch for the Maritime Meeting to be held in Halifax in October next is strongly urged, and any member who is willing to contribute to the programme of papers to be read at that meeting should advise the Executive Committee to that effect at the earliest possible date.

The formation of a Branch of *The Institute* at Moncton is to be urged by the General Secretary in the near future. All members of this Branch who come in contact with Moncton Members should support this idea by urging its fulfillment so that the activities of the Members in the Province may be more wide spread.

Since our last annual meeting, one of the main objects of recent years has been attained by the passing of Legislation in the Province creating the Association of Professional Engineers of New Brunswick vested with powers to regulate the practice of the engineering profession. The main objects of this Legislature are to improve the status of the engineer in the community and thereby obtain greater recognition and consequent better remuneration for services rendered, and to afford protection to the public by defining what a Professional Engineer is and who shall be entitled to act as such. It is of course, encumbent upon all engineers in this Province, as loyal citizens, to become registered members of this Association and to assist in every way in accomplishing the results aimed at. The Members of *The Engineering Institute* throughout the province will be looked to, to take the lead in this matter as it is a development of the spirit of loyalty to the profession which they have already displayed in the past by their membership in and active support of *The Institute.*

Just what effect the existence of the new Association, with its compulsory membership and annual dues, will have upon the future success of *The Engineering Institute of Canada* is problematical at the present time. A considerable number of Members, among whom are some of the leaders of the E.I.C., have expressed grave fears of the effect upon the fortunes of the E.I.C., which may result from the disposition of a large number of men to allow their membership to lapse with the idea that membership in the Provincial Association will be all that is required to give them a status as engineers. That this will be the case with some men is undoubtedly true but it should be borne in mind that the functions of the two bodies are quite different and do not conflict with one another. In my opinion the success of the E.I.C. has been in spite of its inability to confer status, as it has been in this last capacity that it has been most lacking. This is due to the fact that non-membership has never been recognized by the Public as in any way a reflection upon the merits or worth of any person. The chief function which the E.I.C. has played and will continue to play is that of—

> "Facilitating the acquirement and interchange of Professional knowledge among its members, the encouragement of its original research, the development and maintenance of high standards in the profession and the enhancement of the usefulness of the profession to the public."

Retiring address at the annual meeting of the St. John Branch, The Engineering Institute of Canada, May 6th, 1920.

That the development of the E.I.C. along the lines of Branch organization closely in touch with other branches throughout the Dominion and with the Head Office in Montreal, will be the means of its continued success is most likely, as it thus presents opportunities of great value for real service to its members in technical, social and financial ways.

The Provincial Association under the new legislation conveys the legal recognition of the Profession which is the backbone of the proper relationship with the public, whereas the E.I.C. provides for the desirable and necessary recognition among men of our own profession.

Both of these organizations deserve the support of all engineers. The great majority of engineers rely for their advancement upon engineers in the same service who are their superior officers. Membership in the Provincial Association is the minimum requirement which all must possess except in the junior positions; membership in the E.I.C. and advancement through its different grades will continue to be the standard of merit within the profession which will be looked for.

In conclusion I wish to thank the members of the Branch for their support during the past year and appeal for their continued support to the Branch even to a greater extent in the future.

The St. Maurice River Regulation and the Gouin Dam

Olivier Lefebvre, A.M.E.I.C., Chief Engineer of The Quebec Streams Commission.

The rivers of the Province of Quebec are generally subject to large fluctuations in the volumes of their daily discharge. The ratio between maximum and minimum discharges varies for each river. It is sometimes fifty to one, and has reached three hundred to one on the Chaudière river. On the river St. Francis, it is about thirty to one at Richmond. On the St. Lawrence river, owing to the natural reservoirs formed by the Great Lakes, the ratio between maximum and minimum is nearly two to one. On the St. Maurice river, at Shawinigan, it is about thirty-five to one under natural conditions.

The purpose of flow regulation is to decrease the maximum flow and increase the minimum. Perfect regulation, that is uniform flow throughout the year, is not obtainable, but is the aim of storage reservoirs.

This policy has been advocated in this province, both by the Government and by companies interested in the generation of hydro-power. The advantages to be derived from this policy were so plain that no opposition was shown towards it.

St. Maurice River

The St. Maurice River is one of the tributaries of the St. Lawrence river, into which it flows at Three Rivers. It runs from north-west to south-east, across the Laurentides, and takes its rise in a series of lakes located at an altitute of about 1,300 feet above mean sea level. The river is approximately 367 miles long. Its drainage area is 17,000 square miles,—most of it being under forest cover. Farming is carried out on a large scale in the lower part of the river valley, between Grand'Mère and the St. Lawrence. The country through which it runs is very mountainous, and it is cut up by numerous tributary streams and deep gullies.

Timber is the principal resource along this river, the cut this year will amount to 600,000 cords. When one mentions the fact that the average yield of an acre is six to ten cords, an idea may be had of the area over which such a large cut was made.

Read before Montreal Branch, The Engineering Institute of Canada, April 15th, 1920.

The river runs through the towns of Shawinigan, Grand'Mère and La Tuque. It is broken by numerous falls and rapids, the principal being—going up the river:

Les Forges	12 feet.
La Gabelle	10 "
Les Grès	44 "
Shawinigan	150 "
Grand'Mère	78 "
La Tuque	88 "
Rapid Blanc	212 "
Rapid des Coeurs	93 "
Rapid Allard	45 "

Two of the above mentioned falls are fully developed, namely: at Shawinigan, Grand'Mère, and a third at La Tuque is partially utilized. It is expected that Les Grès and La Gabelle will be developed in the very near future. All the other falls above La Tuque are still the property of the Crown.

Natural Flow of the River

The flow of the river has been measured at Shawinigan, by the Shawinigan Water & Power Company, and complete daily discharge records are available from the year 1900 to date. They show that the average low water discharge was 6,000 second-feet. The lowest discharge recorded was 5,200 second-feet for about one week in March 1901; the highest water recorded was 166,000 second-feet on the 6th of May 1904.

Duration curves plotted for the years 1900 to 1912 show that the flow was for—

	Highest year	*Lowest year*	*Average*
Seven months	24,500 s.-ft.	9,000 s.-ft.	13,200 s.-ft.
Eight months	16,700 "	7,800 "	11,300 "
Nine months	14,300 "	7,400 "	9,800 "

The average yearly run-off from the watershed at that point for the period 1900-1912 was 21.3 inches,—the maximum being supplied in 1907-08 when the depth was 26.9 inches, and the minimum was recorded in the year 1906 at 15.33 inches.

Manouan Reservoirs

As the demand for power increased, it was plain that additional power could be obtained in the cheapest way by attempting to regulate the flow of the river. The companies generating hydro-power were not alone to suffer from the water shortage. The lumber companies were also affected during the log drive, the driving season being extended later in the summer as the yearly cut was increasing and the wood taken from farther up the river. These interests combined in 1909 and formed The St. Maurice Hydraulic Company which was authorized by the Government to carry out certain storage schemes on the Manouan river. Three dams were constructed from 1909 to 1911, and the three reservoirs thus created have a total capacity of 890 square-mile-feet. Henri Desaulniers, Civil Engineer, was in charge of the building of these dams and he deserves great commendation for the energy and ability he displayed in face of great difficulties.

The water from these reservoirs was used during summer low water and during winter. The minimum flow at Shawinigan was thereby raised to nearly 8,000 second-feet, instead of 6,000 second-feet.

The Manouan reservoirs had proved the feasibility of getting water supplied from reservoirs located two hundred miles from the generating plant, even under most severe winter conditions. In 1912, the St. Maurice Hydraulic Company applied to the Legislature for authorization to carry out storage on a much larger scale in the series of lakes which form the upper reaches of the St. Maurice river. After due consideration of the matter, the Quebec Government decided that it would be a better policy to have the scheme carried out by the Province. There was fear that the different interests in the river might not agree in the future, and the Crown being still the owner of very important falls on the river, felt that the storage rights should be kept. So the Quebec Streams Commission was authorized to investigate and report upon the possibilities of storage in the upper lakes, and here begins the story of the Gouin Dam. The field work was carried out in the summer of 1912 and was in charge of Engineer J. V. Perrin. Two alternate schemes were considered: five small dams each controlling a series of lakes and giving partial control, or one big dam giving complete control. The latter scheme was favoured and recommended by Commissioner Wm. I. Bishop, after an inspection of the district. The Commission decided to control the water with one big dam.

Preliminary Work for the Gouin Dam

Contours were located in the watershed, special care being given to the lowest passes where it would be possible for the raised water to escape into adjoining basins. When this work was complete, it was found that by raising the water 47 feet above natural low water, by a dam near the head of La Loutre falls, the capacity of the reservoir would be 5,722 square-mile-feet. The watershed area, measured on the best available maps, was found to be 3,650 square miles. The proposed reservoir had a capacity to hold a run-off equal to nineteen inches on the basin. The location of the dam is at a point fifty miles from the National Transcontinental Railway at Parent, or forty miles from the Transcontinental Railway at Parent. The site may be reached from Manouan by canoeing on the St. Maurice river, and from Parent by trails and canoe across country. The Parent route was followed in the spring of 1913 when supplies and boring outfit were taken in for the boring. When the dam site had been fully surveyed and investigated, borings made on the bed of the river and plans were prepared.

Design

Several types of dams were considered, namely: the hollow concrete, gravity section, earthen dam. The gravity section type was recommended by Edward Wegmann, Consulting Engineer of New York. In recommending the gravity section dam as the proper type to build, Mr. Wegmann submitted what, in his opinion, was a suitable cross-section. In calculating this section, he made the following assumptions:

Weight of water $61\frac{1}{2}$ lbs. per cubic foot

Weight of concrete $150\frac{1}{2}$ lbs. per cubic foot

This was calculated after the weight of the rock to be used in the concrete had been ascertained.

Uplift pressure None

Ice pressure 50,000 lbs. per lineal foot and acting at the height of the spillway.

As is well known and generally accepted, the condition of safety of a gravity section dam is that the resultant of all the external forces must cross the base of the structure within the middle third of the section, either when the dam is under pressure or when the reservoir is empty. When the resultant force is thus within the middle third, there is no danger of overturning and the weight of the structure must be such that the coefficient of safety against sliding, the relation between the vertical forces and the horizontal forces, must be one and over in the case of concrete on rock, and two and a half to three and three and a half in the case of concrete on clay. At the Gouin dam, the coefficient of friction of concrete on the rock was taken as 0.6, and the weight of a section multiplied by 0.6 divided by the horizontal force is 1.20 as factor against sliding.

Ice Pressure

The question of ice pressure on dams is one upon which engineers do not agree, and upon which there is a lack of reliable data. What is certain is that the ice contracts with a lowering temperature and this results in cracks throughout the ice cover. These cracks fill with water from below. This water freezes and renews the continuous ice sheet. The whole mass expands when the temperature rises. This expansion creates pressure on the shore lines and structures across the ice field, the limit of pressure would be the crushing strength of the ice.

When a dam is built across a narrow stream, and the ice cover is confined between the structure and vertical shores, there is a heavy thrust acting horizontally against the dam; an example of failure in this way was at Minneapolis in 1899. Details of this failure were given in "Engineering News" of May 11th 1899 and in "Engineering Record" of May 13th 1899). However, where the body of water is large and the shore lines slope gradually, the ice expands along the shore lines and the structure is barely affected.

Another condition which a dam may be called upon to resist is the thrust due to an ice field at the time of the spring break-up. In large lakes, where the water rises, the area of the lake increases and the ice sheet becomes detached from the shores. The ice cover, under the action of a heavy wind, may be shifted bodily and damages do result. The ice pressures assumed in the design of some important dams are as follows:—

	Lbs. per lineal foot at the highest ice line.	
Wochusett Dam	47,000	
Croton Falls Dam	30,000	(Croton reservoir, New York Water Supply.)
Cross River Dam	24,000	
Olive Bridge	47,000	
Kensico Dam	47,000	

Since the building of the Gouin Dam, no ice has formed opposite the gate section for a distance of over fifty feet from the face of the dam. And it is very doubtful that any appreciable ice thrust has been exerted against the structure.

Uplift Pressure

When water penetrates between a structure and the foundation supporting it, there results a pressure which tends to lift the structure. This is uplift pressure. The water may reach the foundation of a dam through cracks in the rock, or through faulty joints, or through impervious soil.

The foundation of the Gouin Dam is upon a solid Laurentian Gneiss rock. It was considered by Mr. Wegmann that the water would not percolate and reach the foundation of the dam and he, therefore, assumed that no uplift pressure would take place.

Stress Diagram

An examination of the stress diagram shows that when water pressure on the upstream face is the only outside force taken into consideration, the line of resulting pressure is well within the middle third. When an ice thrust of 50,000 lbs. per lineal foot is assumed to act at the top of the dam in addition to the water pressure, the resultant force comes out of the middle third between elevation 1280 and 1320. When the water pressure is considered with an uplift pressure of 100% at the heel or upstream and gradually decreasing to zero at the toe, the resultant force still acts within the middle third. When the resultant comes out of the middle third on the downstream side, it means that the masonry of the upstream face is subject to tension. To take care of this tension, steel reinforcements located 9 inches from the face have been provided between the points where the resultant was outside of this middle third. The amount of steel was calculated for the maximum stress, supposing the steel to work at 16,000 lbs. per square inch.

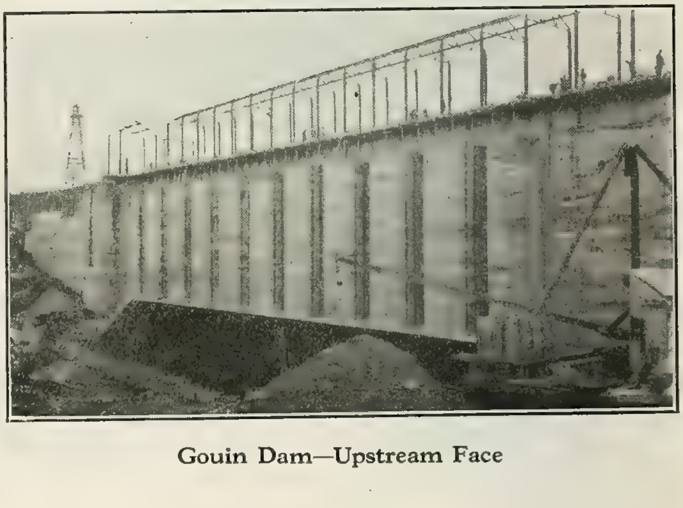
Dimensions

The plans for the Gouin Dam were prepared in the office of the Commission by J. W. Thurso and, when completed, submitted to A. St-Laurent, of Ottawa and J. M. McCarthy, of Quebec, for approval. The dam was built in a broken line of four parts,— the total deflection being 28 degrees,— to take advantage of the topography of the site and the island dividing the river into two channels. The dam is 1,646 feet long, 20 feet wide at the crest; the upstream face is vertical and the downstream face vertical at the upper part and, then, slopes 9 inches horizontal to 12 inches vertical. The width at any point is not less than seventy-five per cent of the height. The highest section of the dam is 90 feet, the width of the base at that point being 72 feet.

The contract was awarded to The St. Maurice Construction Company Limited, in July 1915. The firm of Fraser, Brace & Company, Limited, was connected with the contracting company and was in charge of the construction of the dam. Preparatory work was started in 1915 by improving the river to make it navigable between Sanmaur and Chaudière,—a distance of thirty miles,—making terminals at these points, locating a railroad between Chaudière and the dam site,—a distance of some twenty miles — and beginning its construction, building camps at the dam and at suitable points down the river.

After investigation, the company decided to develop hydro-electric power for the operation of the construction plant, sawmill, air compressor, stone crusher, etc. This development is located about two miles from the dam at the La Loutre Falls, where advantage was taken of a head of 15 to 25 feet, and two generators were installed having each a capacity of 550 KW. The power was transmitted to the dam by a pole line. Electricity was used in the lighting of all the camps and for the operation of the whole of the construction plant.

The railroad was operated with Dunkey engines which were outfitted to burn oil during the summer season and to burn wood in the early spring and fall. The railroad is of standard gauge, 4 feet 8½ inches, 56



Gouin Dam—Upstream Face

the rails laid on standard ties. The grades were as high as 3.75%, and the maximum curves about [illegible] degrees. A Lindsay engine could haul two standard carloads over the twenty miles in about two hours.

Start of Construction

The construction of the dam was actually started early in September 1916 when the east channel was unwatered. This part of the dam was brought to elevation 1300. Five temporary sluices were left in this section to take care of the river flow at the time the west channel would be closed by a cofferdam. These openings were controlled by stop logs. Their full capacity was about 11,000 second-feet.

The structure was made of concrete mixed in the proportion of [illegible] into which was embedded an average of a little over 15% of displacers or plums. The bed of the river was completely unwatered by means of a large cofferdam.

The construction of the dam was completed early in December 1917. The work was carried out in sections about forty feet long,—the vertical joints between the sections being continuous from the bottom to the top. The sections were made to interlock by means of bond boxes, (generally three inches deep and three feet wide) being provided inside the form of the first section erected.

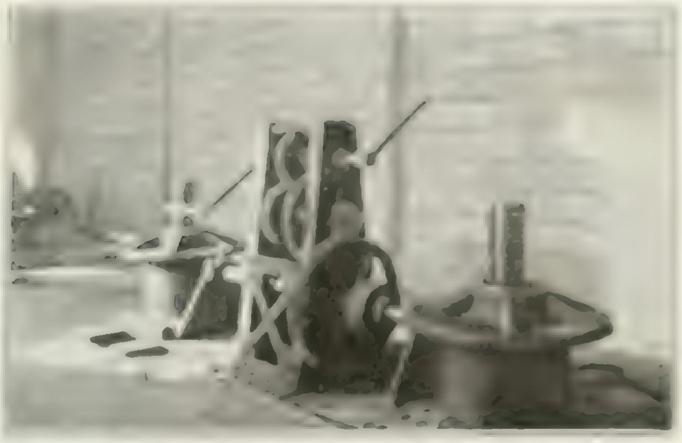
The rock required for the concrete was taken from a quarry on the west side of the dam, and the sand from a pit six miles from the dam alongside the railroad.

There is nothing extraordinary about the Gouin Dam, except that its location is very far away from any transportation facilities, and the big problem was to find the best way to reach the site and take the plant and materials to it. This problem was solved in a most economical manner by the contractors,—the transportation being done partly by water and partly by railroad. Navigation was very good during the whole season of 1917 when the river flow was maintained at a high level, by taking advantage of the partial storage which the upstream cofferdam provided. Although the natural low water level was 1278, the upstream cofferdam was built to elevation 1300 and a large body of water provided a regular flow through temporary sluices.

The top of the bulkhead section is at elevation 1335 above mean sea level and the top of the spillway is ten feet lower.

Spillway

The dam is provided with a spillway 840 feet long capable of discharging 15,000 second-feet under a head of three feet. This was calculated by using Francis formula: $Q = 3.33\, L\, H^{3/2}$. Its cross-section was designed so that the spilling water shall not leave the masonry, eliminating the possibility of a vacuum between the sheet of falling water and the masonry. The bulkhead section is provided with ten openings each 12 feet high and 7½ feet wide. The total area of the opening is 900 square feet. Each opening is closed with a steel gate 13 feet by about 9 feet. These gates slide on a brass metal frame and they are operated from the top



Gate Operating Mechanism

of the dam. The openings may be closed by stop logs both on the upstream and on the downstream face of the dam. The pressure on each gate, when the reservoir is full, figuring 100% friction, is about [illegible] lbs. The weight of the gate and lifting arm is about 10,000 lbs.

The machinery supplied for the operation of the dam may be operated by hand,—two men lifting any gate but, of course the operation is very slow as it requires 81 revolutions of the commanding shaft to make one revolution of the lifting screw,—that is 81 revolutions of the commanding shaft will open or close the gate one inch. The gates and the lifting machinery were designed by the Dominion Bridge Company.

The machinery for operating the gates had to be well anchored into the masonry to prevent its being lifted when a gate was being closed. This is provided by two vertical I beams, one on each side of the gate continuous from the bottom of the gate pit to the top of the dam. Although this machinery could be operated by hand, it is being operated by a pulley connected to a small electric portable motor arranged so that it may be adjusted to operate any of the gates.

Log Sluices

The plans of the dam provided originally for a log sluice opening 7½ feet wide and closed by a double leaf steel gate, 33 feet high, and a smaller log chute to pass the logs from the reservoir to the downstream reach. This sluice is rectangular at the upstream part and is gradually decreased until it has the form of a triangle at the outlet. The reduction in the cross section is provided to compensate for the increase in the velocity of the water, the depth of the water in the sluice being nearly constant. This sluice has not been operated as yet, no timber having been cut above the dam before this winter. The lumber companies interested in the timber limits above the dam thought that the log sluice provided in the dam would not be sufficient for their requirements, and an additional opening [illegible] feet wide was left at the west side of the gate section. This opening is closed with stop logs. No sluiceway has been built on the downstream side of this opening but, should it be necessary to sluice logs by that opening, works to take care of the logs downstream will have to be provided.

What the Gouin Dam Has Accomplished

The dam has now been in operation for over two years, comprising three winters and, during that time, the flow of the river has been maintained so that at no time the minimum at Shawinigan was below 12,000 second-feet. The water level in the reservoir is today forty-one feet above natural low water,—that is to say six feet below the crest of the spillway. Last summer, the water level reached 1322.25, or 2 feet 9 inches below the top of the spillway.

The benefits to be derived from regulation were calculated from the flow curve of the year 1906, which was the lowest year for the period 1900 to 1912. From the records of that year, a duration curve was made and the amount of water necessary to make up the deficit for a minimum flow of 12,000 second-feet was easily arrived at. This water being used at Shawinigan over a head of 150 feet, the number of horse-power figured at 80% efficiency on the wheels, was deducted at low water. This number was close to 81,000 horse-power for a short time, and the benefits were as the water required decreased. Distributed uniformly over the whole year, the benefits total 32,250 HP.

At Grand'Mère where the water is being used under a head of 75 feet, the benefits will be exactly half of those of Shawinigan.

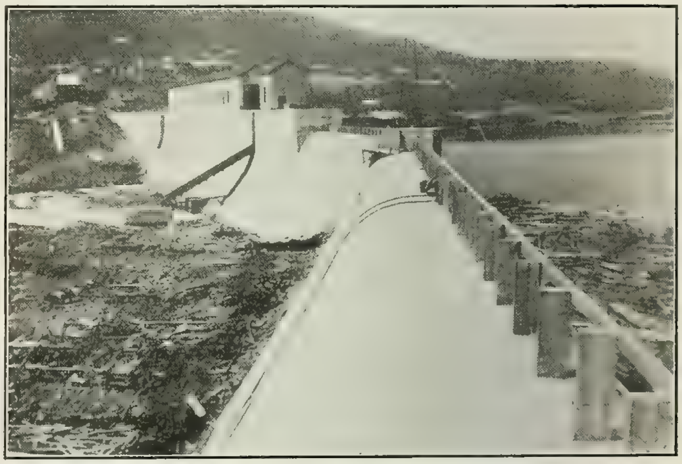
In order to ascertain that the amount of water available in the Gouin Reservoir would be sufficient for a regulation to 12,000 second-feet at Shawinigan, calculations were made since the latter part of April 1913, when flow records were kept at the Gouin Dam. The amount of water measured at the dam site was taken as being the supply from the watershed. The amount of water required at Shawinigan to bring the flow up to 12,000 second-feet was taken as being the demand and, accordingly, a diagram was made showing two curves: one being the supply curve and the other the demand curve. The supply curve is made up of the amount of water which was measured at the dam; the demand curve is made up with the amount of water required at Shawinigan to maintain the minimum flow at 12,000 second-feet, after deducting the natural flow from the proposed reservoir, that is to say—supposing, for example, that the discharge at Shawinigan was 15,000 second-feet and that, on the same day, the discharge at the Gouin Dam station was 5,000 second-feet, it meant that the discharge of the St. Maurice river, outside of the reservoir was 10,000 second-feet in that particular case, and that the demand was 2,000 second-feet and the supply 5,000 second-feet. The daily discharge is easily computed into square-mile-feet by multiplying by 0.0031.

The Gouin Dam is located about 220 miles from Shawinigan, which is the point of regulation. The water let out from the dam does not reach Shawinigan until ten to twelve days later,—that is, its full effect is not felt until after ten days in summertime and twelve days in wintertime. There must be a certain amount of loss by evaporation in this distance, and calculations were made entailing a loss of 25% in the amount of water let out from the dam. Similar calculations were made for a regulation to 14,000 second-feet. The curves show that a regulation to 14,000 second-feet is possible, but should there be a loss of 25% in the amount of water let out, the reservoir would not be sufficient.

Discharge Control

The discharge of the river is controlled at three different points, namely: at Weymontachingue, fifty miles below the dam where a gauging station was established by the Shawinigan Water & Power Company in 1915, and a flow curve determined for that point. A similar station was established by the same company at La Tuque, immediately below the falls, and a third station is that at Shawinigan. The water level at Weymontachingue and La Tuque is recorded daily and the information wired to the office of the Commission. Similar information is obtained from the Shawinigan Water & Power Company regarding the conditions at Shawinigan and Grand'Mère. The points of control are also provided with rain gauges and we are also informed of the amount of rainfall recorded. In this way, a pretty good idea may be had as to the period when it will be necessary to draw upon the storage.

Last winter, the run-off in the rivers of this Province was exceedingly low. In order to maintain a discharge of 12,000 second-feet at Shawinigan, it was necessary to supply from the Gouin reservoir 10,000 second-feet during the month of March. In the past winter, the reservoir level was lowered 4.2 feet, that is from 1322.2 to 1318: during the winter of 1919, the flow was maintained at the regulated figure of 12,000 second-feet by lowering the reservoir level three feet, from 1314 to 1311.



General View of Gouin Dam

The discharge from the gate is calculated by the usual formula $Q = AC\sqrt{2gh}$, in which

Q = volume of water in second-feet,

A = area of the opening,

H = difference between the level of the water upstream and the level downstream.

C = coefficient which varies according to size of the openings. It varies from 0.65 for small openings to 0.95 for full gate opening. This was determined by metering the river near the dam.

Reservoir

It is claimed that the Gouin Storage Reservoir is the second largest in the world, being exceeded only by the Gatun reservoir. It is the largest one used for flow regulation. The capacity of the most important reservoirs is as follows:—

	Height of dam	*Capacity in cubic feet*
Gatun, (Gatun river)	115	183,000,000,000
Gouin, (St. Maurice river)	90	160,000,000,000
Assouan, (Nile River)	111	78,000,000,000
Roosevelt, (Salt Lake)	276	53,000,000,000
Pathfinder, (North Platte)	215	45,000,000,000
Shoshone, (Shoshone river)	328	20,000,000,000

The reservoir is made up by a series of large lakes which have the following area:

	Square miles.
Kikendatch	2.6
Coutchiwastin	13.4
Traverse	14.
Aux Sables	21.5
Obidjuan	17.8
Onigamis	16.3
Perchaude	10.
Bureau	41.5
Du Mâle Matawa Sarana	55.

The total water area under natural conditions was 209 square miles.

Ground Storage

By raising the water forty feet above natural high water at La Loutre, the different lakes form one large body of water, the area of which is 304 square miles,—the flooded lands being therefore 95 square miles, more or less. Much of the land covered is pervious to water and a large amount of ground storage must take place. The natural run-off, as a rule, is a minimum in the month of March. Before the water was raised, the average for the winter months of three years was:—

January	291 square-mile-feet
February	246 "
March	215 "

Since the reservoir is being operated, the run-off or supply is much larger in March and February than it was under natural conditions:—

	1919	*1920*	*compared with*
March	450 sq.-mi.-ft.	785	215
February	284 "	751	219

We cannot explain this otherwise than by ground storage. At the beginning of the winter, the reservoir level is at the maximum height for the season, and the demand upon it increasing; the level is lowered when the demand is larger than the supply. When the lake level has been lowered a couple of feet, the ground which is saturated gives back some of its storage water and this ground flow increases as the lake level gets farther from the maximum.

Land Clearing

The area flooded by the reservoir has been estimated at roughly 100 square miles, the larger proportion of which is covered by forest. This flooded area was not cleared on account of the large expenditure which it would involve. Even at present prices of $50.00 per acre and, assuming that only 50% of the flooded area would have to be cleared, the cost would have been $16,000 per square mile, or nearly $1,000,000 for fifty square miles. It is not expected, however, that a large amount of the floating dead wood will reach the dam. We believe that most of it will drift to the shore of the numerous and large bays of the reservoir. It is certain that some of the débris from the flooded area in the vicinity of the dam will reach the latter. In fact, some trash of all sorts has already floated to it. Much of this material has been pulled to the shore and burned.

The question has been asked as to what proportion of the water discharged at the dam reaches the plant. It is almost impossible to get during the open season because weather conditions make the observations in that respect unreliable. A heavy rain, for example, defeats all measurements. But, in winter time, it is believed that nearly all the water discharged does reach the plant. Such a large volume is hardly affected by small losses over the ice or the covering snow. What may prove to be a serious loss in the case of a small reservoir is not felt when the water let out reaches as high as 5,000 to 10,000 second-feet.

Manouan Dams

Mention was made of the three dams on the Manouan river. These have been acquired by the Commission and are being operated together with the Gouin Dam for the regulation of the river St Maurice. These three dams are of the ordinary wooden crib type, filled with stone. Their sluice openings are controlled by stop logs. The combined capacity of the reservoir formed is nearly 590 square-mile-feet, or 16 billion cubic feet of water, or about 10% of that of the Gouin reservoir. The combined drainage area is 1250 square miles. The supply of water from the basin is therefore much larger than the capacities of the three reservoirs. These are overflowing in the spring and are generally emptied during the dry summer months. They usually fill up again in the fall.

Demand

Calculation made of the amount of water required at Shawinigan to maintain a minimum flow of 12,000 second-feet and the supply available in the Gouin reservoir watershed had disclosed the fact that the reservoir should not be full until the third year after completion. We hope that, this year, our calculation will be fully verified, as the water level in the reservoir is now within six feet from the crest of the spillway, and the spring waters from the whole basin will be completely held.

Revenue and Cost

The capital cost of the whole scheme has been $2,500,000, or $430 per square-mile-foot of water. The yearly revenue from same is at present $191,000. This revenue will be largely increased when any new water power development is carried out. It will also be increased from another source. The lumbering companies will be called upon to pay for the benefits which they derive in connection with the driving of their logs down the river. Negotiations are now under way and no figure can be mentioned.

This regulation work has been a great success and owing to it the amount of power now generated on the St. Maurice river is nearly 400,000 HP., and nearly 500,000 additional HP could be developed. We believe that these works will eventually make the St. Maurice one of the most important sources of hydro-power on this continent.

The Quebec Streams Commission does not claim all the credit for this achievement. A large share of it is due to the officers and engineers of the Shawinigan Water and Power Company. Their initiative for the collection of hydrometric data on the St. Maurice river and the pioneer storage works of the Manouan river have been very important factors to the success of the enterprise.

Mention must also be made of the good work performed by J. B. D'Aeth, who acted as engineer in charge during the construction of the dam and by his senior assistant H. Massue.

Engineering Progress in Nova Scotia

(Retiring Address)

F. A. Bowman, M.E.I.C., Chairman, Halifax Branch, 1919-20.

In December, 1913, at the close of my term of office as President of the Nova Scotia Society of Engineers, I made some remarks about the growth of the work of the engineering profession in this Province during the course of my own experience. I now propose to give some facts and figures which will show the growth that has taken place since 1913, especially in and about Halifax.

The Nova Scotia Society of Engineers carried on the work until the end of 1917. The transfer of its activities to *The Engineering Institute of Canada* in the early months of 1918 has been fully justified by the results. The most conspicuous of these are the very successful General Professional meetings held here and in St. John, and the preparation of Legislation for the protection of the members of the profession, which is now working its way through the Legislatures of most of the Provinces in the Dominion, and which has already passed into law in some of them.

The Secretary-Treasurer's report shows that this Branch now has a membership of 119.

At the time of the meeting in 1913, to which I have referred, No. 2 Pier was about half completed, and work had been begun in the previous June on the Ocean Terminals. The new Acadia Sugar Refinery at Woodside was well under way.

A real estate boom started with the work on the terminals, and some very rosy pictures were drawn of the future of Halifax. The outbreak of the war pricked the bubble, and our attention has been so concentrated on the war and the problems of reconstruction that have followed it, that we do not realize how much has actually been accomplished. The amount of work that has been carried on in and around Halifax during those years is so great that it is well to gather it together in a few short statements.

No. 2 Pier has been completed, and has made for itself a place in the history of the world which will always be known to those who follow the details of the history of the Great War. Not to repeat all that has been said about it, I will merely state that the records show that 569,000 troops sailed from, or were landed at that pier. The total cost of this pier was $1,250,000.

The Ocean Terminals have been carried to a point where they are in regular commercial use, although the permanent station and some of the other permanent buildings have not yet been erected. The total cost of the work to date has been about $15,000,000.

The Acadia Sugar Refinery at Woodside has been completed at a cost of about $3,000,000.

Following on the example set by the concrete pile construction of No. 2 Pier, a modification of this type was used in building the Furness-Withy Pier, at a cost of $250,000.

The Imperial Oil Company has erected works at Imperoyal, which have cost to date about $6,000,000, and it is understood that they propose to make very material extensions to them.

The city itself has carried out extensive work in the last few years, including an intercepting sewer built to prevent the sewerage from the western slope of the city from being carried into the North West Arm. This has cost $225,000.

Last summer a really substantial scheme of street paving was undertaken, at a cost of about $1,200,000, and the work on this is now being pushed forward rapidly.

This paving work involved other heavy expenditures by the city for replacing water mains on the streets about to be paved, and also work of new track laying by the street railway, and underground conduit work by the Telephone Company.

Retiring address at the annual meeting of Halifax Branch, The Engineering Institute of Canada, 13th May, 1920.

The Halifax shipyard has been under construction for about two years, and is now nearing completion. The cost of this work to date has been about $10,000,000. Five ships are now being constructed there, of which two are 10,000 tons and three 7,500 tons each.

The Maritime Telegraph & Telephone Company has spent in Halifax, in the last six years, about $700,000 on new construction work.

The Nova Scotia Tramways & Power Company have erected their gasworks, and have done other new work, and have extensive track work in hand. The amount already expended is about $1,700,000.

The Western Union Cable Company has erected a large wharf and cable storage plant, which cost approximately $100,000.

Building permits for the city, for the years 1913 to 1919 inclusive, has amounted to the sum of $12,952,[illegible].

I have omitted from the above any estimate of expenditures for direct military purposes made during the war. The exact figures are not available, but it is well known that they would represent a very large amount of money.

In connection with the terrible explosion of December, 1917: we have had an enormous amount of reconstruction work done. Much of this, of course, was simply the repairing of existing structures; but the construction of the hydrostone area represents a permanent improvement to the city.

The total expenditures under the above mentioned items amount to $22,000,000, and a great part of these works was done or contracted for in such a way as to not include the present inflation of prices.

Very conflicting statements are made regarding the present population of the City of Halifax and Dartmouth, but I think there are figures enough available from various sources, from which the population may be estimated, to make it a perfectly safe statement that the population of the two sides of the Harbour must today be very close to 90,000.

Turning now to the rest of the Province, we find that steady growth has gone on all over it. The Dominion Atlantic Railway has rebuilt all its bridges, and the work of laying heavier rails was begun, but stopped by the war. The Canadian National Railways has also done a good deal. The big steel and coal companies have made extensions and additions to their plants in Cape Breton and Pictou County.

But perhaps the most important event has been the work of the Water Powers Commission, which has resulted in convincing us that instead of being, as we thought we were, a Province almost devoid of water powers, we have at least 300,000 horse power available. Also a definite policy has been mapped out for developing these powers into what will probably be one day an interlocking system of tremendous importance to the industrial development of the Province.

All this means that the outlook for our own profession is most encouraging.

A Brief Account of the Seismological Work at the Dominion Observatory

with

Some of its Practical Applications.

G. W. F. Johnston, Jr.E.I.C.

The scientific study of seismic disturbance is of such recent date that seismology may be said to be among our newest sciences. We find mention of earthquakes in historical notes dating back to the almost mythical days of the great Chinese dynasties, but without exception the historians seem to accept the convulsions of the earth as a divine punishment for human frailties. It was not till about 1850 that attempts were made even to collect and tabulate these records; and actual scientific investigation was not directed to the subject till 1880, in which year the Seismological Society of Japan was founded.

The first step of these pioneers was to devise instruments which would not only record the fact that an earthquake had occurred, but would give a measure of the movements of the earth in amplitudes and periods. The history of the development of the seismograph from the first crude machine to the present delicate instrument which will record the slightest movement, is extremely interesting, but beyond the limits of this article. Suffice it to say that as the instruments became more sensitive, and especially more accurate in time determination, so the deductions from the facts of their records became more sure, until now, given a good record, we can definitely place the distance of a station from the source of the disturbance, or epicentre, within 40 or 50 kilometres.

Bosch 200 gramme horizontal Seismograph.
M— [illegible]
P— Pendulum.

It was in 1906 that the two Bosch 200 gramme horizontal seismographs at present in use in the Dominion Observatory were installed, and these were supplemented by a Spindler and Hoyer vertical seismograph in 1913. The principle of the modern seismograph, roughly speaking, is that of the pendulum, — its action being the exact reverse of its usual swinging motion. In other words, it is the heavy mass of the pendulum which remains still, and the earth which swings. These two Bosch horizontal instruments are identical and are placed on the same pier, — one in a N.S. direction and the other in an E.W., thus resolving any horizontal motion into its two components in an E.W. and N.S. direction respectively. Divested of all its delicate appliances for reducing friction, providing magnification and modifying the amplitudes, our apparatus is a simple horizontal pendulum to which is attached, in the axis of rotation, a small concave mirror. At the other end of the room is the recording drum and lamp. The record is photographic, the light being projected from a slit in the lamp to the mirror of the seismograph which reflects the ray into a horizontal slit in the box covering the drum. Behind this slit is a cylindrical lens which converges the ray to a point of light. On the drum, which revolves on a threaded axis and consequently moves laterally to the left, is a sheet of photographic paper on which the point of light traces out a line,—the result being a helix. It is at once apparent that any motion of the pendulum, or rather of its supporting pivots, will cause a corresponding movement of the spot of light from the mirror, and thus we have a very accurate method of registering the movements of the earth. The vertical seismograph depends on the inertia of a heavy mass supported by a spring, to record the vertical movements of the earth. This movement is changed to a horizontal one and magnified by a series of levers,—the record being traced out by an aluminium stylus on a sheet of smoked paper mounted on a revolving drum. It has been the experience at the Observatory that the horizontal movements are much more pronounced than the vertical, which is what one would naturally expect at a point distant from the 'quake. This condition happens to apply to Ottawa in almost every instance. If we were near the epicentre the reverse would be the case.

By reading these three records together,—N.S., E.W., and vertical, it is possible with sharp tracing to compute not only how distant is the source of the earthquake, but also its direction. For example:

The N.S. record being thus,—*See Fig. 1*——————
and the E.W. thus,—*See Fig. 2*——————————
we have an indication that there was a "thrust" or "pull" toward the S.W. at the first impulse. If we glance at the vertical and find,— *See Fig. 3* ——————

Fig. 1.

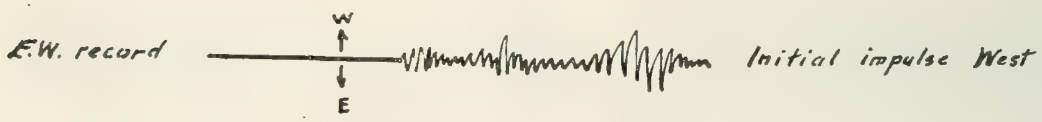


Fig. 2

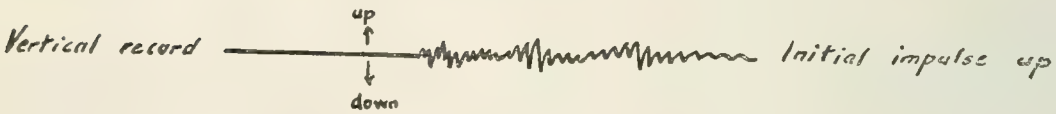

Fig. 3.

A Typical Seismogram, showing P, S, and L.

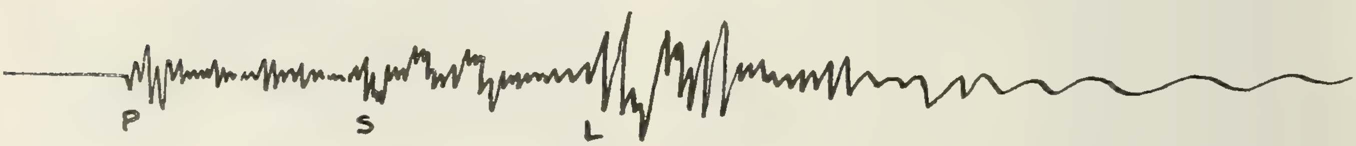

Fig. 4

we know that the first impulse was a thrust and consequently the source must lie to the N.E.

Before giving the method of computation of distances, it would perhaps be as well to describe briefly the characteristics of a seismic record. There are three main types of waves produced by an earthquake,—longitudinal waves travelling through the earth, (these are waves of compression or rarefaction like sound waves), transverse waves also travelling through the earth, (these are waves of distortion like light waves), and long waves travelling along the surface. Owing to the increased density and elasticity of the interior of the earth, the first two types have greater velocity and hence the waves arrive in the order named, being called for the sake of clarity, Preliminary and Secondary tremors and Long waves, or P, S, and L. A good seismograph shows these three types in this manner:— See Fig. 2.

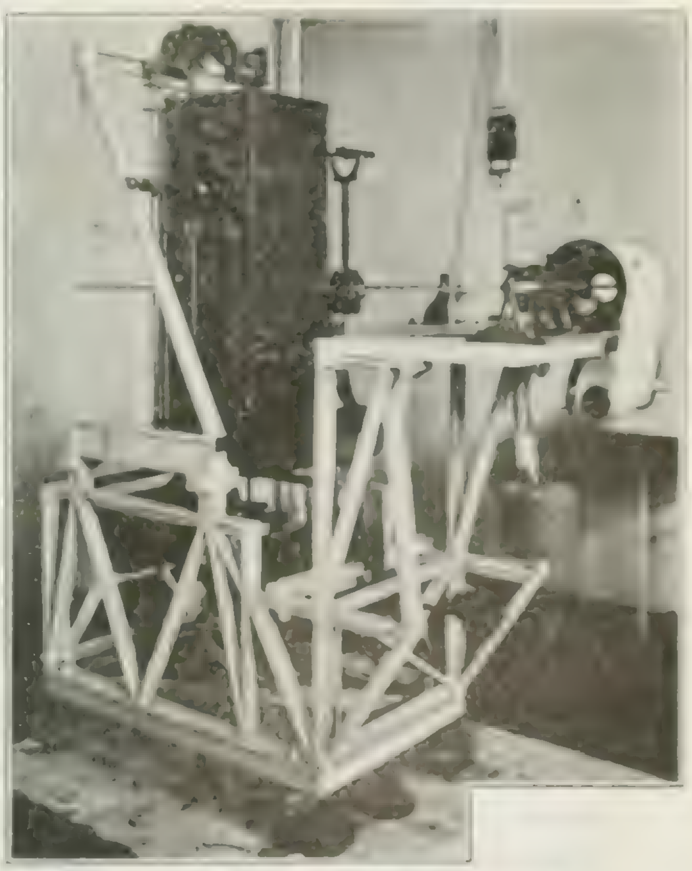
Now it has been found from observation that these waves have definite velocities and therefore the difference between the time of arrival of the preliminary and secondary tremors, or S-P, has a definite relation to the distance from the origin and also the time of occurrence at the epicentre. Tables have been computed by various seismologists, and under the direction of Dr. Klotz, Director of the Dominion Observatory, these have been collected and additions made, so that it is now a very simple matter to make the actual computation of the distance of station from epicentre, and the time of occurrence at the epicentre,— in symbols, Δ and O.

Bulletins are received by the Seismological branch of the Observatory from earthquake stations all over the world, and these are entered on comparison sheets so that, for example, for an earthquake in South America on a certain date, the reports from as many as fifty different stations are all together; and as all stations record in Greenwich Mean Time, the comparison of these records is rendered very simple. The O's and Δ's are computed for each, and it will be at once apparent that though the Δ's differ for each station the O's should be the same. In one particularly good instance in the 1917 computations, the O's of thirty stations ranging from Java to Scotland, agreed within ten seconds. When these computations are complete they are plotted in stereographic projection, with reference to the latitude and longitude of the stations and the Δ's, and the position of the epicentre graphically determined. Tables giving the stereographic co-ordinates for varying distances from every station have been issued by the Dominion Observatory, thus simplifying the work still further.

It is impossible of course, due to poor records, to accurately fix the epicentral position of every earthquake, but at least 90 per cent of the world shaking' quakes may be located with a very fair degree of accuracy, and as from 100 to 150 earthquakes are recorded every year, it will be seen that if only by supplying such information, seismology steps at once from the realm of pure science into that of practical life. The study and analysis of seismic disturbances has a greater significance to modern engineering than may be generally known. The classic example of earthquake disturbance on this continent in recent years is of course the San Francisco earthquake of 1906, which occupied the attention of engineers and builders as well as seismologists. In its preliminary report the State Earthquake Investigation Commission says: "A complete study of the phenomena will undoubtedly contribute greatly not only to our knowledge of the evolution of the earth's crust but also our knowledge of means of minimizing the calamities which arise from the destruction of buildings, water pipes and other structures when such shocks occur in the future," and such indeed has proved the case. A number of interesting and instructive reports were made by government commissions and others, which are well worth reading,— notably "The San Francisco Earthquake and Fire of April 18, 1906, and Their Effects on Structures and Structural Material", (Bull. 324 U. S. Geol. Survey 1907) and "The Effects of the San Francisco Earthquake of April 18, 1906, on Engineering Construction", (Trans. Am. Soc. C. E., Vol. LIX, Dec. 1907.)

The surveyor, too, will find earthquakes and their effects rather interesting in view of the movements of triangulation points and the consequent breaking of triangulation lines. In the earthquake mentioned above there were "relative displacements of the earth's surface of from 7 to 21 feet at points near the fault," extending for a distance of 185 miles. This necessitated a new triangulation to reestablish a control for subsequent surveys.

We have seen that epicentres may be plotted with a very fair degree of accuracy, and hence, by marking on a world map the epicentres for a certain year, we get what might be called a chart of seismic disturbances for that year. If it is desired the period may be extended to five, ten, or twenty years. Such a map shows at once the centres of seismic action, and may be used by the geologist as an aid in locating ancient fault lines. These fault lines, being old cracks in the earth's crust due to redistribution of loading, are still points of weakness and as such their location is of great practical importance. In a recent article Sidney D. Townley says: "There are two



Spindler & Hoyer Vertical Seismograph
W—Weight
S—Spring
A—[illegible]
P—Pointer carried Drum

methods of protection against earthquakes. The first method is to study the geology of the country and to locate the origin of the shocks and to find the fault lines along which shocks are likely to occur. Some of these active fault lines are readily known, and building construction of various kinds should be kept away from these active faults. This phase of the subject is of particular interest to engineers engaged in the location of reservoirs, dams, and pipe lines. If it is necessary that a pipe line should cross a known fault, then some means should be taken to guard against the possibility of its breaking. The Los Angeles aqueduct crosses a number of known faults, and has already been broken once by an earthquake. The method adopted in these cases is to place a valve in the line above the place where it crosses the fault so that the water may be shut off when the break occurs. Materials are also kept at these various places so that immediate repairs in the pipe line can be made......... Engineers are becoming more and more interested in this subject, and the Seismological Society of America has had many inquiries from engineers engaged in the construction of irrigation systems and power plants asking for information concerning the location of fault lines and the possibility of their works being damaged by earthquake." (Bull. Seis. Soc. of Am., Sept. 1919). The San Francisco earthquake was caused by a fault along an old line which has been traced for a distance of 400 miles to the point where it disappeared in the Pacific.

But the seismic chart shows that the greatest disturbances have their origin beneath the ocean, and here the geologist cannot follow them. Very recently, however, what was probably the first attempt at locating submarine faults by seismograms was made at this Observatory. Dr. Klotz had for some time been of the opinion that "with high class seismographs and expert readings of their records we could not only be able to obtain the average position of the epicentre but also the position and direction of the fault line itself." In 1917, by combining records of the same 'quake, from Perth, Australia; Zi-ka-wei, China; and Honolulu, he obtained an epicentre off the Island of Urup, while the Ottawa and other western stations gave the epicentre off the southern extremity of the peninsula of Kamtchatka, near Onekotan Island. Re-reading and plotting the various distances of other stations giving good records, to the nearest point along the line joining these two epicentres, he found that "better accordances were secured than if we attempted to join them all to one point, — to one epicentre. The conclusion was forced upon one that we have here to deal with a breakdown along a fault line 500 km. long running in a N.E.-S.W. direction, the trend of the well known Kurile Deep, and the seat of much seismic action." ("Locating Submarine Faults." O. Klotz, Journ. R. A. S. C., Feb. 1918.)

In time, as the science of seismology grows, there is no doubt that submarine faults will be definitely located throughout the world. When we consider the annoyance caused by the breaking of cables this knowledge has a very practical bearing. As far back as 1897, in his seismological report before the British Association, Prof. Milne stated that "there was an average of one dislocation per year for every 434 miles of cable" and that the majority of these breaks were due to earthquakes changing the surface of the ocean bed, and putting heavy strains on the cables. A knowledge of the fault lines would be valuable in determining the position of breaks and more especially in showing the lines of danger to be avoided when laying new cables.

Here in Canada we seem to be fairly immune from earthquakes, and for that reason the interest of the canadian engineer in matters seismological may not be as strong as that of his brother to the south. Though not generally known, however, it is a fact of at least academic interest that one of the fault lines referred to above runs right along the channel of the St. Lawrence, beginning at Lake Champlain, reaching the St. Lawrence at Quebec, and then following the channel to the Gulf; that in 1663 an earthquake occurring in this region did considerable damage according to the Jesuit historians. The possibilities of the recurrence of this disturbance are very remote, but in the light of the disastrous effects of the California and other earthquakes on bridges, one cannot help wondering how our famous Quebec bridge would fare, should the south of the river slip from 7 to 20 feet past the north one.

Some years ago an interesting application of seismometry was made in investigations into vibrations of locomotive engines travelling along a railway track. "By means of a not very delicate form of seismometer placed on the engine, tracings were obtained which varied in magnitude according to the position of the track, indicating at once where the less perfect parts were. The work has been continued by Omori (of Japan) with improved apparatus; and valuable results have been obtained bearing upon various questions, such as the relation between the vibration of carriages and the speed of propulsion, the comparison of the vibrations of the carriage as it passes across a bridge or travels on the ground, etc." ("Earthquake Phenomena", Knott.) The seismograph is also capable of being used to record the effects of wind on high towers and chimneys; to obtain accurate data for the study of the vibrations in bridges caused by moving loads, and to detect the subsidence to an unequal degree of the walls of a building whose foundations are suspected of slipping.

The continued study of earthquake phenomena is likely to result in the prediction of earthquakes for special localities in which they are more or less frequent, which will probably at least as accurate (if not more so) as the present day prediction of weather conditions. By the comparison of wave velocities and the systematic investigations of the distribution and geological effect of earthquakes, the seismologist is collecting a mass of facts which have an important bearing on the speculations about the interior of the earth. So far, the results have proved definitely that the interior of the earth is not liquid as formerly believed, but absolutely solid and fully of the rigidity of steel; and, as time goes on, and the new science develops, it is not unlikely that the trained student of seismology with more delicate and sure instruments, and a much larger and more accurate collection of data than he has at present, will wrest from the interior of our earth secrets which will prove of great value to practical geology and through it to mankind in general.

In concluding this article, the writer wishes to express his indebtedness to Dr. Klotz, Director of the Dominion Observatory, and E. A. Hodgson, Senior Seismologist for their valuable suggestions.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. III. July 1920 No. 7

Dates of Professional Meetings

The Seventh General Professional Meeting will be held in Niagara Falls, September 16th, 17th, and 18th, and the Eighth General Professional Meeting will be held in Halifax, October 13th, 14th and 15th.

The Annual and Annual General Professional Meeting will be held in Toronto on February 1st, 2nd and 3rd, 1921.

Ontario General Professional Meeting

The Niagara Peninsula Branch is making great preparations for the Professional Meeting to be held at Niagara Falls in September.

Members on their arrival will register at the Clifton Hotel, and the proceedings will start with a luncheon at noon on Thursday, September 16th.

The morning of Friday will be taken up with professional papers and business of the Ontario Executive, having special reference to the younger members.

Excursions over the great engineering works now going on in the district are arranged for Thursday and Friday afternoons.

Thursday evening will be taken up with entertainment and there is to be a dance on Friday evening. Visitors will be the guests of the Branch at this dance.

Arrangements are being made for a variety of entertainments for Saturday morning. Golfers will discover their affinity at one of the various courses in the neighborhood, and those who desire to visit one of the power plants at Niagara Falls will have the opportunity to do so. A few motor cars will be available for drives on the Boulevard of the Queen Victoria Niagara Falls' Park Commission.

No special programme will be arranged for Saturday afternoon — opportunity being given for all to visit the various points of interest in the neighborhood and the shops on both sides of the river.

Those who stay over the week-end will have a chance of taking part in the informal dance at the Clifton on Saturday evening, although the formal programme will end with the luncheon on Saturday.

The programme has been arranged in such a way so that it will be interesting and entertaining to ladies accompanying the members, and it is hoped that there will be a large delegation of the fair sex at the meeting.

Western Professional Meeting

Following the decision of the Edmonton Branch that they were unable to take the responsibility of a General Western Professional Meeting, the zealous members of the Calgary Branch decided to take up the responsibility. Unfortunately there was not sufficient time to arrange for a General Western Professional Meeting of *The Institute,* consequently a Western Professional Meeting under the auspices of the Calgary Branch will be held at Banff, August 14th, to 18th. A novel feature of this gathering is that it will start on Saturday, arrangements having been made for the visitors to live in tents over the week end and during the meeting, the Professional Meeting commencing on Monday 16th. Sleeping accommodations will be available on August 13th, for any arriving on that date. Another interesting feature of this gathering is that an invitation is being extended to all professional engineers regardless of their membership in *The Institute,* the Association of Architects and Land Surveyers in Alberta, Saskatchewan, Manitoba and British Columbia.

The following committee has been appointed to make all arrangements:—

G. W. Craig, M.E.I.C., Chairman, city engineer of Calgary.

F. H. Peters, M.E.I.C., commissioner of Irrigation, Calgary.

J. M. Wardle, A.M.E.I.C., supt. Rocky Mountain Park, Banff.

A. S. Dawson, M.E.I.C., chief engineer Dept. Nat. Resources, C.P.R., Calgary.

A. I. Payne, M.E.I.C., engineer P. Burns Co.

G. N. Houston, M.E.I.C., asst. commissioner of Irrigation.

F. K. Beach, A.M.E.I.C., div. hydrometric engineer.

Wm. Pearce, M.E.I.C., statistician C.P.R. Dept. of Colonization and Development.

A. L. Ford, M.E.I.C., chief hydrometric engineer, Calgary.

R. C. Harris, A.M.E.I.C., div. engineer C.P.R.

F. E. Emery, A.M.E.I.C., Secy. Western Professional Meeting.

J. M. Wardle, A.M.E.I.C., Supt. of Rocky Mountain Parks at Banff, has kindly arranged with the Government for the use of military bell tents and clean blankets; cots and mattresses will also be supplied under arrangements of Calgary Branch.

Arrangements are being made to serve meals in camp, and therefore cost will be much less than at the hotels. Any who wish to make reservation at hotels are at liberty to do so. Camp is located on a beautiful spot about 500 yards east of the C.P.R. Banff Springs Hotel, on the bank of the Bow River and less than five minutes' walk from the golf course.

The tentative program provides for professional meetings mornings and possibly evenings, with afternoons devoted to pleasure and sight seeing.

The camp will be open on Saturday morning, August 14th, for any who wish to spend the week-end in Banff, but sleeping accommodation will be available Friday night, August 13th, for any arriving that date. Professional meetings will begin Monday morning, August 16th, and conclude Wednesday night, August 18th; camp will be broken up Thursday night, August 19th.

The members of *The Engineering Institute of Canada* and members of the Association of Professional Engineers, Mining Institute, Association of Architects and Land Surveyors of Alberta, British Columbia, Saskatchewan and Manitoba, with their families, are cordially invited to attend, providing the secretary is notified not later than July 25th in order that accommodation may be arranged for all.

Railway Fares—Regular summer rate on C.P.R. from following points to Banff and return are:—

Winnipeg – – –	$56.15	including War Tax
Regina – – – –	36.20	" " "
Saskatoon – – –	31.15	" " "
Edmonton, 14 days	14.55	" " "

Vancouver and Victoria through Banff to Calgary and return through the Crow's Nest Pass, good for stop-over in Banff, is $55.55.

Meals and accommodation at the camp will be provided at actual cost, which is expected not to exceed $[illegible] per day per person, and if at all possible will be kept lower.

Visitors are requested to bring their own bed linen and towels.

Golfers bring your golf clubs. Charges on Government Golf Course are [illegible] per round, $1.00 per day or $[illegible] per week.

Excursions will be arranged [illegible] walk. Boat trips for small parties can also be arranged and visitors may avail themselves of hot sulphur baths at the C.P.R. hotel, cave and basin or sanitarium baths. Charges are [illegible] at the C.P.R. Hotel, and [illegible] at Cave and Basin Baths, which includes bathing suit, towel and dressing room.

Rowboats, canoes and motor boats are available at the Boat House.

Bring warm clothing, as nights are usually chilly at Banff.

The Calgary Branch extends to you a cordial invitation to come and enjoy a delightful holiday and professional meeting combined.

Replying to Sponsor Forms

For the most part members of *The Institute* have a laudable pride in promptly acceding to the request for information regarding applications for admission and transfer and returning the forms provided for that purpose. It very often happens, however, that an applicant provides only five names, in which case, before the application can come before Council for consideration every sponsor must have replied and failure to do so on the part of one sponsor may delay an application for many months. The duties of the application clerk at headquarters are enumerated in the following instructions from the Secretary:—

Application Clerk, Responsible to Chief Clerk.

Shall receive all applications for admission and transfer [illegible] **The Journal** to be completed not later than the [illegible] of the month. [illegible]

The sponsor forms which have been going out from headquarters were forwarded under one cent postage but the Post Office department has declared this to be first class matter and consequently in the future full postage will be required adding considerably to the expenses of operating the application department and members are earnestly requested to co-operate in every way in connection with the return of sponsor forms.

Headquarters Property Valuation

The Valuation Committee of *The Institute,* appointed by the president, to place a re-valuation on the headquarters property of *The Institute,* consisting of James S. Costigan, M.E.I.C., A. F. Byers, M.E.I.C., and A. Sydney Dawes, A.M.E.I.C., presented the result of their investigations, in a report to Council, which was required in connection with a consideration of re-insurance. The report presented to the president and Council of *The Institute* is as follows:—

> Your Committee appointed to consider the valuation of *The Institute*'s buildings at 176 Mansfield Street, having met and considered the matter beg to report that in our opinion the replacement value of the buildings, exclusive of contents, is ninety-five thousand dollars ($95,000).
>
> Our valuation for insurances purposes exclusive of foundations is seventy-seven thousand dollars ($77,000), being twenty-four thousand, five hundred dollars ($24,500) for the front building, and fifty-two thousand, five hundred dollars ($52,500) for the reinforced concrete building.
>
> If insuring with an 80% co-insurance clause the buildings should carry an insurance of sixty-two thousand dollars ($62,000).

The question of re-insurance was referred to the Finance Committee together with the Valuation Committee's report.

Important Concrete Investigation

The value of the work being done by the Committee of *The Institute* appointed to investigate the action of alkali salts on concrete and the amount of labour that has been put into the investigation is not generally known nor thoroughly appreciated by the membership at large. Following the general professional meeting at Saskatoon in nineteen hundred and eighteen realizing that a serious situation obtained in respect to concrete when exposed to the action of alkali waters, the Council approved of the appointment of the committee to investigate and report on the situation.

The Winnipeg members together with Prof. C. J. MacKenzie of Saskatoon held an informal meeting at the Royal Alexandra Hotel, on June 4th with Prof. Duff Abrams, Lewis Institute, Chicago; G. M. Williams, Bureau of Standards, Washington, and Messrs. Van Scoyoc and Fleming, Canada Cement Company, Montreal. The chair was taken by B. Stuart McKenzie, Chairman of the Committee of *The Institute.* While informal, this meeting originated valuable suggestions which have been approved by Council and suggested that the scope of the work inaugurated by *The Institute* be broadened and more representative including, besides *The Institute,* the Honorary Advisory Council for Scientific and Industrial Research, The Society of Chemical Industry, The Association of Canadian Building and Contracting Industries, The Bureau of Standards at Washington, The Technical Bureau of the Portland Cement Association and others. The consensus opinion of this meeting was contained in the following:—

> The matter of alkali action was most important. Field and Laboratory experiments under efficient direction was essential.
>
> Arrangements should be made at once for the formation of an Advisory Council to superintend operations, this council to have representatives from all interested organizations.
>
> That formal request be made to the Research Council for the sum of $15,000, or if Canada Cement Company desire to contribute, this sum be divided between the two.
>
> That a field man be selected at once and that field experiments be undertaken without delay.
>
> That advisory council meet once a year at any convenient centre.
>
> That when funds are on hand a central laboratory be established with competent chemist in charge to devote his entire time to laboratory work in connection with the alkali problem.

It is proposed to call a general meeting of the Committee at an early date to discuss the proposals, and having already been approved by Council it is expected that the proposed investigation will be undertaken shortly and it is hoped that it will result in a solution of the difficulty.

Employing Canadian Architects

In the House of Commons on June 8th, the Honourable W. L. MacKenzie King asked whether the proposed new war memorial building was to be designed and built under the direction of British architects. Sir Robert Borden had no information on the subject. For a building of this type which will stand as a monument to future generations and serve as a repository of the glorious record of Canadian achievement in the war, an opportunity is offered for architectural genius of a high order. To secure this it is not necessary for the Government of Canada to go outside the borders of the Dominion. As in engineering so in architecture, any requirements demanded of the profession can be adequately met by the men who compose the profession in this country.

Following the precedent established in connection with the new Parliament Buildings it is hoped that the Federal Government will maintain this procedure as a definite policy. The architects of Canada given the opportunity, and during the war this profession was called upon for heavy sacrifices, will without doubt rise to the highest eminence that the occasion demands. Should any negotiations have been made to employ other than Canadian architects for this important undertaking, it is hoped that a re-consideration will be made in favour of the men of excellent professional character and standing who comprise the profession of Canadian architects.

The architects will have the sympathetic support of the engineering profession in any efforts they may make towards the recognition and adoption of this procedure by the Canadian Government.

Maintaining a High Standard

The Quebec Branch of *The Institute* has consistently advocated the maintenance of a high standard in the engineering profession and has been one of the foremost of the branches in adhering to the highest qualifications for admission to *The Institute*, both as to education and experience.

At a meeting of Council held on June 22nd a resolution of this branch was presented pointing out that in connection with appointments made by one of the Government railway boards, cases had come to its attention where it appeared that appointments had been made of men who did not possess the necessary qualifications and requested that the influence of *The Institute* be used in the case of admission to the engineering staff of the government railways of corporate members of *The Engineering Institute of Canada* or graduates of recognized engineering universities. This principle was approved and steps taken to lay the situation before those in authority in order that the public may be protected from the possibility of men receiving appointments where influence is a factor and the necessary standard apparently lacking.

President Canadian Good Roads Association

As is fitting in view of the most important position which the engineers of Canada occupy in the development of good roads, the President of the Canadian Good Roads Association is an engineer, A. E. Foreman, B.Sc., M.E.I.C., chairman of the Victoria Branch of *The Institute* and chief engineer of Public Works of British Columbia. In the last issue of *The Journal* personal reference was made to Mr. Foreman in his position as chairman of the Branch. The prominent part Mr. Foreman has taken in the past in public activities and the success which has attended his efforts previously are an ample guarantee that under his direction for the coming year the affairs of the Canadian Good Roads Association will be well presided. Mr. Foreman was a member of the class of naught three of McGill which has a proud significance for the naught three members of his own and other universities.

Co-Operation for Mutual Benefit

During the past two years, an almost complete revolution has taken place in the mind of the average professional engineer in Canada in his relation to his responsibility to himself and to the profession. The former situation whereby the interest was not universal was due largely to the fact there was not an intimate contact as between the members of branches and between the individual nor a knowledge of what was taking place throughout the country, by the average member, such as has been made possible through the circulation of *The Journal*.

Loyalty to the profession is a dominant feature of the lives of Canadian engineers today, which, coupled with a desire on the part of nearly every engineer to share in advancing his status and standard is bound to result in an entire changed condition of affairs, and now that engineers are appreciating themselves the public will inevitably be educated to the important place the engineer holds in the industrial, social and economic life of the nation.

A striking illustration of changed sentiment, both on the part of engineers and of the public is afforded in one Canadian county where a branch was established during the past three years. Before the establishment of the branch the engineers had not realized their common interests and their combined influence was almost negligible in the municipality. Following the establishment of the branch the majority of the members of which became enthusiastic as to the possibilities and their enthusiasm at their meetings made an impression upon the mind of the average citizen. The municipal engineer was, generally speaking, on the defensive before every interfering rate-payer and ordinary seeking local politician. With the assistance of the local papers and by co-operating as a unit the engineering society stands as one of the most influential bodies and the municipal engineer's position is one of prestige and influence such as was not dreamed of a short time ago.

It is only by such loyalty and of co-operation that the profession in Canada is going to achieve its desired end. When it was brought to the attention of Council at the May meeting that there was a prospect of chapters being started in Canada of the A.A.E. with the avowed object of carrying on the same work for the profession as has been undertaken by *The Institute* it was felt by Council that such would result in a duplication of effort and would not achieve the results possible under the influence of the combined membership of *The Institute*. A letter embodying this sentiment was sent to the Executive of all the Branches. Following the receipt of this letter came the decision of the Toronto Branch which reflects in general the feeling of the engineers throughout Canada. This resolution which follows, and has been approved by the Council, was forwarded by the Toronto Branch to the Executives of all the branches.

> "We concur with the suggestions of the Council of The Institute as forwarded in the General Secretary's letter. We emphasize the fact that The Institute, with its organization and resources, has now become definitely committed to the policy of promoting, as the second of its papers, the welfare of its members, as evidenced by the formation of Committees on "Policy" and "Remuneration" as shown by The Journal for May 1921.
>
> We call attention to the [illegible] years' history showing on the members of [illegible] such [illegible] as [illegible] into Canada as this [illegible] of the American Association of Engineers, or any other [illegible] organization, however commendable its aims and ambitions.
>
> We emphasize the privilege and duty of the members of The Institute [illegible] [illegible] the work of the Committees on Policy and Remuneration [illegible].
>
> We [illegible] that the membership may [illegible] an attitude of undivided loyalty to The Institute and co-operating [illegible] in the work of the above two Committees [illegible] and [illegible] not [illegible] to [illegible]."

There is no question as to the result: the committee on Remuneration and the committee on Policy have a most important work to do as well as a great responsibility to the profession. It is hoped that the Branches may lose no time in tabulating all possible data and information bearing upon these subjects so that their findings may be considered as soon as possible and put into effect for the benefit and added prestige of the profession in this country.

ELECTIONS AND TRANSFERS

Elections and Transfers.

At the meeting of Council on June 22nd, a ballot was canvassed and the following were declared elected:—

Members.

Willie Harry Baltzell, of Windsor, Ont. chief engineer, Can. Steel Corpn. Ltd., Ojibway, Ont.

Associate Members.

S. W. Bruce Black of Toronto, Ont. B.A.Sc., (Univ. of Tor. 1913) with Hydro Elec. Power Comm. on details of design and layout; Jacob Edward Buerk, of Winnipeg, Man. acting engr. for Carter Halls Aldinger Co., Frederick Josef Conradi, of St. Catharines, Ont. (C.E.) plant engr. Brit. Am. Shipbldg. Co., Welland, Ont.; Herbert James DeSavigny of Weyburn, Sask. Res. engr. C.P.Ry.; Alexander Syme Fraser, of Kamloops, B.C. city manager, Kamloops, B.C.; Samuel Wilson Gray of Halifax, N.S. B.Sc., (C.E.) industrial surveyer with Dept. of S.C.R. Halifax, N.S.; B. Henderson, of Brandon, Man. instr'man, Maintenance of Way, C.N.Ry. Brandon, Man.; John Bain Lambert, of Victoria, B.C. senior asst. engr. in District Engr's office, Victoria, B.C.; Robert Spencer Lawrence, of Lethbridge, Alta. asst. engr. C.P.Ry. Dept. of Nat. Resources, Lethbridge, Alta.; Jeffrey Burland Macphail, B.A., (McGill Univ. 1914) at present bdge major, civil engineers training centre, Seaford, Eng.; Richard Alexander Malloy, of Devon, N.B. asst. engr. in D.P.W. (Bridge Dept.) New Brunswick; Kenneth Duncan McDonald of Toronto, Ont. B.A.Sc. highway engr. Imperial Oil Co. Toronto, Ont.; Patrick Joseph McGarry, of Merritton, Ont. D. & O.L.S., at present D.L.S. with Dom. Govt.; Earl John McIntire, of Sandwich, Ont. constr, engr. Canadian Steel Corp. Ltd. Ojibway, Ont.; John O'Neil of Fredericton, N.B. B.Sc., (C.E. Univ. of N.B.) at present instructor and demonstrator Univ. of N.B.; Gordon McGregor Pearston, of Winnipeg, Man. res. engr. with C.N.Ry.; Leandre Pierard, of Winnipeg, Man. B.Sc., designing dftsman, chief engr's dftg office, C.P.R. Winnipeg, Man.; William Hoyt Snelson of Calgary, Alta. at present ch. agric. engr. Irrig. Branch, Dept. of Interior, Calgary, Alta.; Hugh Wakefield Tooker, of Prince Rupert, B.C., in charge of constr. of Car Ferry Slip, and responsible for all instrument and other engr. work at G.T.P. yds. Prince Rupert, B.C.; Earle Oliver Turner, of Fredericton, N.B., B.Sc., Professor of C.E. Univ. of N.B.; Hugh Stanley Van Patter, of Kingston, Ont., M.A., (Math. Queens Univ. 1912), B.Sc., (Queens Univ. 1915), lecturer in maths., Faculty of Applied Science, Queens Univ.; Thomas Lee Watt, of Brantford, Ont., asst. engr. Port Weller Hbr. Constrn. Welland Ship Canal.

Juniors.

Wilmot Bright Browett, of Peterboro, Ont., foreman draughtsman in chge. of Industrial Control Apparatus, etc. with Can. Genl. Elec. Co. Ltd.; Murray Frederick Cossitt, of Halifax, N.S., in charge of survey wk. and gen'l. engr'g. for Pickings & Rolland, Civil & Mining Engrs., Halifax, N.S.; Horace McNaughton Fraser, of Vancouver, B.C., at present asst. to E. A. Jamieson, A.M.E.I.C., on hydro elec. power surveys; William Evans Jefferson, of Halifax, N.S., asst. instructor E.E. Dept. of S.C.R. Halifax, N.S.; Malcolm James MacMillan, of Halifax, N.S., at present 3rd yr. N.S. Tech. College; Samuel George Newland, of Sandwich, Ont. engr. in charge of constrn. work Great Lakes Dredging Co., Ojibway, Ont.; William Ewart Ross, of Peterboro, Ont., dftsman. Can. Gen. Elec. Peterboro, Ont.; George Winston Templeton, of Vancouver, B.C., at present asst. to E. A. Jamieson on hydro. elec. power surveys.

Associate.

Charles Henry Taggart, of Kamloops, B.C., at present in charge of party making re-survey and investigations to soils etc. in Manitoba under the direction of surveyer general.

Transferred from Associate Member to Member.

Frank Goldie Haven, of Winnipeg, Man., Div. Engr. with C.N.R. Winnipeg, Man.; Jeremiah James MacDonald, of London, Eng., B.Sc., (McGill Univ. 1911) ch. engr. of design for W. Alban Richards, engrs. and contractors, London & Paris; Ellis Waymough, Reed-Lewis, of Toronto, Ont., at present on engr. staff of Super Cement (America) Ltd. Mt. Dennis, Ont.; William John Duane Reed-Lewis, of Orillia, Ont., Dist. Vocational Officer, Voc. Br. Dept. S.C.R. Orillia, Ont.

Transferred from Junior to Associate Member.

Maxfield Lea Boswell, of Halifax, N.S., B.Sc., (C.E. McGill Univ. 1914), at present engr. with Halifax Ocean Terminals; John Francis Cassidy, of Toronto, Ont., at present asst. engr. Dept. Public Highways, Ontario; John Arthur Dickinson, of East Angus, Quebec, ch. draughtsman, Brompton Pulp & Paper Co., on mill maintenance and new constr.; John Raymond Hamilton, of Sault Ste. Marie, Ont., B.A.Sc., field engr. Algoma Steel Corpn. Sault Ste. Marie, Ont.; Roy Alexander McLellan, of Saskatoon, Sask., B.A.Sc., engineer and surveyer for Murphy & Underwood, Saskatoon, Sask.; Robert Wynyard Powell, of Thorold, Ont., at present asst. engr. Welland Ship Canal; James Harold Ramsay, of Cameron Falls, Ont., in charge of surveys, Cameron Falls Development, H.E.P.C.; Arthur William Sullivan, of Valleyfield, Que., Q.L.S. (Laval 1908,) private practice and ch. engr. for Valleyfield.

Transferred from the class of student to that of Associate Member.

Joseph Charles Day, of Montreal, B.Sc., (civil) (McGill Univ. 1914), at present in charge of structural dept. including all designing, plans and specifications, Lockwood, Greene & Co., of Canada, Ltd.

Transferred from Student to Junior.

Robert Scott Eadie, of Montreal, Que., at present taking fourth year in civil engineering at McGill Univ.

NEW BRUNSWICK

(f) All other purposes pertaining to the management of the Association.

6. All by-laws and amendments thereto shall become effective only after ratification by two-thirds of the votes received from members of the Association in good standing.

Who May Practise

7. (a) Only those persons who are members of the Association hereby incorporated and registered as such under the provisions of this Act, or who have received a license from the Council of the Association as hereinafter provided, shall be entitled to take and use the title of "Professional Engineer," or any abbreviation thereof, or to practise as a professional engineer within the Province of New Brunswick;

(b) Any person residing in the Province of New Brunswick at the time of the passing of this Act, who has practised engineering for at least six, (6), years preceding the date of his application, and who during that period has had charge of engineering work, or has been employed as an assistant on engineering work for at least two, (2), years shall be entitled to be registered as a member of the Association without examination, provided that such person shall produce to the Council within one year from the passing of this Act satisfactory proof of having so practised. In case of a graduate in engineering from a University or College recognized by the Council, the period of engagement in engineering work required by this section shall include his prescribed term of instruction in such college;

(c) Any person who shall come hereafter to reside in the Province of New Brunswick, and who at the time of his so coming to reside in this Province is a duly registered member of an Association of engineers of some other Province in the Dominion of Canada, with a constitution similar to the Association hereby incorporated may upon application be registered as a member of this Association without payment of fee for the then current year; provided that he produce to or file with the Council a certificate of membership in good standing in said other Association and an application for transfer of registry endorsed by the registrar or other proper officer of said other Association;

(d) Any person residing in the Province of New Brunswick not qualified as hereinbefore mentioned, and who may desire to become registered as a member of the Association, may make application to the Council, and shall submit to such examination as the Council may require, or shall submit such other proof of qualification in lieu of an examination as the Council may decide, and such person shall be registered as a member of the Association on payment of the prescribed fees after the Council shall have certified in writing that such examination has been satisfactorily passed, or that such other proof has been found satisfactory. If the applicant be a graduate in engineering of the University of New Brunswick or other college of standing recognized by the Council, he will not be required to submit to a written examination, but the applicant will be required to give the necessary proof as to his other qualifications as required by this act;

(e) Any non-resident of the Province of New Brunswick who is a registered member of an Association of Engineers in any other Province of the Dominion of Canada, having a constitution similar to the Association hereby incorporated, may obtain from the registrar a licence to practise as a professional engineer in the Province of New Brunswick upon application to the registrar for that purpose, and upon production of satisfactory evidence of his being a registered member in any such other Association, and on payment of a fee of one dollar Such license when so issued shall entitle said person to practise as a professional engineer in New Brunswick during the then current year.

Upon submitting the evidence required by this sub-section, and upon payment of the said fee, said person shall be entitled to practise as a professional engineer in New Brunswick pending the disposal of said application;

(f) Any person who is not a resident of Canada, but who is a member of any engineering or technical organization or society of standing recognized by the Council, may obtain a license to practice subject to the like qualifications as are required for registration under section 17 of this Act, and any person who is not a resident of New

ALBERTA

(a) The election of the council;

(b) The government and discipline of the members;

(c) The management of its property;

(d) The appointment of such officers as may be necessary for carrying out the purposes of the association;

(e) The maintenance of the association and the fixing and collecting of annual and other fees;

(f) The admission of candidates to the practice and profession of a professional engineer;

(g) The time and place for, and method of conducting, the annual and other meetings of the association;

(h) All such other purposes as may be deemed necessary or convenient for the management of the association and the promotion of its welfare or the conduct of its business.

(2) No by-law or amendment thereto framed by the council shall become effective until it has been ratified by two-thirds of the members of the association in good standing and voting thereon:

Provided that no such by-laws or amendments thereto shall be valid or take effect until approved by the Lieutenant Governor in Council.

5. (a) There shall be an interim council consisting of the members hereinbefore mentioned.

(b) The interim council shall appoint an interim registrar why shall for not more than three months have all the powers of an ordinaro registrar.

(c) The interim council shall assist the interim registrar in his work by approving or disapproving of the credentials submitted to him by persons applying for registration.

(d) Within three months after the passing of this Act the interim council shall call a general meeting of the then members of the association and shall upon the appointment of an ordinary council by such meeting cease to have any powers.

(e) The interim council shall have such powers as are necessary to carry on the interim business of the association.

(f) A quorum shall consist of five councillors but no application for registration of any person in any branch of engineering shall be considered unless a representative of that branch is present at the council meeting.

6. Professional engineering shall for the purpose of examination and representation upon the council only, be subdivided into the following branches: civil engineering, electrical engineering, mechanical engineering and mining engineering. New branches shall be formed on petition of members and ratification by the association at a general meeting thereof.

7. Only a member of the association or a person who has received a license from the council so to do, shall be entitled to take and use the designation of "registered professional engineer" or any abbreviation thereof or to hold himself out or to advertise himself as a "registered professional engineer."

8. The following persons shall be entitled, subject to the conditions in this section set out, to be registered as members of the association:

(a) Any person domiciled in Alberta at the date of the passing of this Act, if he has for five years previously practised as a professional engineer, and produces to the board on or before January 1, 1921, satisfactory credentials.

(b) Any person domiciled in Alberta, if he is a registered member of an association of engineers having the same or similar powers in any other province of the Dominion of Canada and produces to the board a certificate of membership in good standing in such other association, and an application for transfer of registry endorsed by the proper officer of the first mentioned association.

NEW BRUNSWICK

Partnership

Administration

ALBERTA

NEW BRUNSWICK

(e) The registrar and the secretary shall be appointed by the Council. The same person may be appointed to the office of both registrar and secretary;

(f) The secretary of the Association shall also be the secretary of the Council.

10. (a) The Council may on a two-third vote of all the members of the Council reprimand, suspend or expel from the Association any member guilty of unprofessional conduct, negligence or misconduct in the execution of the duties of his office, or convicted of a criminal offence by any Court of competent jurisdiction.

The Council shall not take any such action until a complaint under oath has been filed with the registrar and a copy thereof forwarded to the person accused. The Council shall not suspend or expel a member without having previously summoned him to appear to be heard in his defence, nor without having heard evidence under oath in support of the complaint and on behalf of the member charged if offered. The Council shall have the power to summon witnesses to attend and to answer under oath concerning the matter of the said enquiry. The president of the Council or any person acting in his behalf on the hearing of the said charge, or the secretary, is hereby authorized to administer oaths in such case. All evidence given shall be taken down in writing or by a stenographer duly qualified and sworn for the purpose;

(b) Any member so expelled or suspended may within thirty days after the making of the order of expulsion or suspension, appeal to a judge of the Supreme Court from such order, giving seven days' notice of appeal to the secretary of the Council, who shall thereupon file the evidence so taken with the registrar of the Supreme Court, whereupon such judge shall decide the matter of appeal upon the evidence so filed, or may in his discretion hear additional evidence, and shall confirm or set aside such order of expulsion or suspension, and the order of the said judge shall be final. The costs of such appeal shall be in the discretion of the said judge;

(c) Unless the order of expulsion or suspension is set aside on such appeal, or the said judge or the Council otherwise order, the member so expelled or suspended shall not practise thereafter except in case of suspension upon expiry of the period of suspension. Pending an appeal, the members so expelled or suspended may practise.

Penalties

11. Any person who not being a registered or licensed professional engineer in New Brunswick, or who is suspended or has been expelled under the proceedings of the next preceding section:

(a) Practises as a professional engineer, or

(b) Uses the title of professional engineer or makes use of any abbreviation of any such title, or of any name, title or designation which may lead to the belief that he is a professional engineer or a member of the Association, or

(c) Advertises himself as such in any way or by any means, or

(d) Acts in such manner as to lead to the belief that he is authorized to fill the office of or to act as a professional engineer,

shall be liable upon summary conviction to a fine of not less than $100.00 nor more than $200.00 and costs, and on failure to pay the same, to imprisonment for not more than three months for the first offence, and for any subsequent offence to a fine of not less than $200.00 and not more than $500.00 and costs, and on failure to pay the same to imprisonment for not more than six months.

Registration

12. It shall be the duty of the registrar to enter in the register the name of each person entitled to practise as a professional engineer. He shall keep his register correct in accordance with the provisions of this Act and of the rules, orders and regulations of the Council. The certificate of the registrar under the seal of the Association shall be prima facie evidence of registration or license as the case may be.

ALBERTA

(2) If any member omits to pay the prescribed annual fee within six months of the date upon which it became due, the registrar shall cause the name of such member to be erased from the register, and such member shall thereupon cease to be entitled to practise as a registered professional engineer, but shall, at any time thereafter, upon paying such fee as may be prescribed by the council, be entitled to all his rights and privileges as a member from the time of such payment.

14. A registrar shall be elected by ballot by the council as soon as possible after the first annual election of the council, and biennially thereafter.

(2) The registrar shall be the executive officer of the association under the direction of the council and shall have such powers as are necessary for the proper administration and enforcement of the provisions of this Act and the by-laws made thereunder.

15. A register of all registered professional engineers showing the dates of their certificates shall be kept and a list of registered professional engineers in good standing shall be published in the first issue of The Alberta Gazette on or before February 15, of each year.

(2) Every certificate of registration or license shall be signed by the president and the registrar, and shall bear the seal of the association and shall specify the branch or branches of professional engineering in which the professional engineer has been registered or licensed.

(3) Every person registered under this Act shall have a seal, supplied by the council at his expense with which he shall stamp all official documents and plans. The seal shall state upon its face the branch or branches of professional engineering in which he has been examined or otherwise admitted.

16. The certificate of the registrar under the seal of the association shall be **prima facie** evidence of membership of the association or licence, or non-registration or non-possession of license, as the case may be.

17. The board shall inspect all diplomas, certificates, and credentials presented or given in evidence for the purpose of obtaining admission to examination, and may require the holder of such credentials to attest to them by oath or affidavit in any matter involved in his application. If such evidence is not satisfactory to the board, the board shall refuse to admit such candidate to examination for registration.

18. From and after January first, 1921, every applicant for membership not qualified under subsections (b) and (c) of section 8 of this Act, shall, in addition to complying with the requirements of that section, pass such examinations as may be approved by the Senate and the said Senate shall appoint a board of examiners for the purpose of conducting such.

20. Regular examinations of candidates for registration shall be held at Edmonton or such other place or places as the Senate may direct.

(2) The scope of the examinations and the methods of procedure shall be prescribed by the Senate with special reference to the applicant's ability to carry on the particular branch or branches of professional engineering which he desires to practise in the province.

(3) Every candidate for examination shall give at least one month's notice in writing to the registrar of his intention to present himself for examination and with such notice shall forward the fee prescribed by the by-laws of the association and before receiving his certificate of registration the prescribed entrance fee, the prescribed annual fee and a sum of not more than five dollars for the publication of his name in The Alberta Gazette.

(4) In case the candidate should fail in his examination he may present himself at any subsequent regular examination by paying the prescribed examination fee.

21. Notwithstanding any other provision of this Act, no person shall be registered or licensed unless at least twenty-five years of age, and unless he has been engaged for eight years in some branch of professional engineering, except in the case of a graduate from an engineering college or university approved by the Senate in which

ALBERTA

NEW BRUNSWICK

such person to be erased from the register, and such person shall thereupon cease to be deemed to be a professional engineer, but such person shall at any time thereafter upon payment of all fees in arrear be entitled to all his rights and privileges, as a professional engineer from the time of such payment;

(c) Any person registered under this Act may resign from membership in the Association upon giving notice in writing to the secretary, whereupon the name of the said member shall be erased from the register, and such member shall be relieved of the liability for further annual fees.

21. In case the Council neglect or refuse to register the name of any person as a member of the Association, or to issue a license to practise, the person aggrieved shall have the right to apply to a judge of the Supreme Court, who, upon due cause shown, may make an order directing the Council to register the name of such person or to grant to such person a license to practice, or make such other order as may be warranted by the facts, and the Council shall forthwith comply with such order. Such order when so made shall be final.

22. If the registrar makes or causes to be made any willful falsification in any matters relating to the register, he shall forfeit the sum of $100.00.

23. If any person shall willfully procure or attempt to procure himself to be registered or licensed under this Act by making or producing or causing to be made or produced any false or fraudulent representation or declaration, either verbally or in writing, every such person so doing, and each person knowingly aiding and assisting him therein, shall forfeit and pay the sum of $100.00.

24. Any and all penalties imposed under this Act and any and all sums of money forfeited shall be recoverable with costs under the provisions of the law respecting Summary Convictions.

25. Any information for the recovering of any such penalty or forfeiture may be laid by any member of the Association appointed by the Council.

26. Any sum recovered as a penalty or forfeit under this Act shall upon being recovered belong to the Association for the use thereof.

27. No proceeding shall be commenced for any violation of the provisions of this Act but within one year from the date of such violation.

28. No person practising as a professional engineer shall be entitled to recover any charge in any court of law for any service included within the practice of a professional engineer as defined in section 2, sub-section (b) of this Act unless he shall be registered under this Act.

29. The following persons are hereby constituted a Provisional Council of the Association: President—Charles C. Kirby, of the city of St. John; vice-president—Geoffrey Stead, of the town of Chatham; councillors—R. Fraser Armstrong, of the town of Woodstock; Collingwood B. Brown, of the city of Moncton; Burton M. Hill, of the city of Fredericton; David F. Maxwell, of the town of St. Stephen; R. J. Sandover-Sly, of the town of Campbellton; Alexander R. Dufresne, of the city of St. John; Charles O. Foss, of the city of St. John; Joseph A. Grant, of the city of St. John; Gilbert G. Murdoch, of the city of St. John.

30. The duties of the Provisional Council shall be to provide the register called for by this Act, to enter therein the names of those who are entitled to registration, and who apply therefor under the provisions of section 7, sub-section (b), and to call within six months from the coming into force of this Act the first general meeting of the Association for the said purposes; and for the purposes of organization of the Association they shall have the powers conferred by this Act on the Council of the Association. The powers of the said Provisional Council shall cease on the election of the first regular Council of the Association.

31. No provision of this Act restricting the practice of the profession or imposing penalties therefor shall take effect until one year after the passing of this Act.

32. Every person registered under this Act may have a seal, the impression of which shall contain the name of the engineer and the words "Registered Engineer, Province of New Brunswick," with which he may stamp all official documents and plans.

33. The activities of the Association are hereby restricted to the functions necessary to the administration of this Act.

ALBERTA

26. Where any person, after conviction under this Act or who, not being a registered professional engineer, uses, or purports to use the designation or title of "Registered Professional Engineer," or who holds himself out as such, the association may apply to a judge of the Supreme Court for an injunction restraining such person from using, attempting or purporting to use such designation or title, and such judge or court shall, on being satisfied that such person has so been convicted, or has used, or attempted or purported to use designation or title, in the province grant the said injunction.

27. If any person shall wilfully procure or attempt to procure himself to be registered or licensed under this Act, by making or producing, or causing to be made or produced, any false or fraudulent representations or declarations, either verbal or in writing, he, and every person knowingly aiding or assisting him therein, shall be liable on summary conviction thereof to a fine of one hundred dollars.

29. The activities of the association are hereby restricted to the functions necessary to the administration of this Act.

SCHEDULE A.

Transportation work, roads, railways, waterways, and all detail works connected therewith, such as bridges, tunnels, yards, docks, lighthouses, rolling-stock and vessels, also aeroplanes and airships.

Public utility works, such as telegraph systems, telephone systems, electric light systems, waterworks, gasworks, irrigation works, drainage works, sewerage works and incinerators.

Steel, concrete, reinforced concrete structures.

Mechanical works, such as steam boilers, engines, turbines, condensers, pumps, internal combustion engines, and other motive power machinery and accessories.

Electrical machinery and apparatus and works for the development, transmission, and application of all forms of electrical energy.

Mining and metallurgical works, such as mining properties, mine and concentrator machinery and apparatus, oil and gas wells, smelters, cyanide plants, acid plants, metallurgical machinery, equipment and apparatus, and works necessary for the economical winning or preparation of metals, minerals or rocks.

All buildings and structures necessary for the proper housing of operation of the above mentioned works.

The mechanical, electrical, chemical, electro-chemical mining, or metallurgical treatment of the inorganic elements and combinations thereof for all industrial purposes.

Investigations relating to the examination, exploration and development of rocks and minerals, mineral deposits, rock structures and the application of geology to the industries of arts, or to engineering.

EMPLOYMENT BUREAU

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Vacant

General Foreman for Municipal Work

General foreman for municipal work. Applicant must be able to secure results and have had previous experience. Salary approximately $150.00 a month to start. Apply stating salary desired and give references. Box No. 120.

Mechanical Foreman

Young graduate mechanical engineer with shop experience wanted for machinery company. Box No. 121.

Graduate for Railway Engineering

Young graduate wanted for railway engineering, Montreal, Box 123.

Engineer for Railway

Engineer wanted for unit prices and construction work etc. Railway engineering. Box 124.

Field Draughtsman

Field draughtsman for St. Lawrence Ship Canal Survey, $100 and $110 and expenses per month. Box 125.

Mechanical Engineer

First class mechanical engineer, familiar with machine and pipe layout and general maintenance work; pulp and paper mill experience desirable; speed and accuracy essential; salary $150.00 to $200.00 a month. Box 127.

Town Engineer

Town engineer wanted for small municipality in northern Quebec, to have charge of the various town departments. Salary $200 to $250 a month. Box 128.

Rodman-Chainman.

Young engineer experienced in instrument work wanted as rodman-chainman for lumber company in New Brunswick to work on surveys for large hydro-electric development; $75.00 to $100.00 a month and board for rodman-chairman or $100.00 to $150.00 a month and board for instrument-man depending upon qualifications. Box 129.

Draughtsmen

Two draughtsmen wanted for general plant layout work, etc., for Montreal. Salary $160.00 per month. Box 130.

Electrical Engineer

Electrical engineer for electric light and water works systems, Ontario municipality. Box 131.

Mechanical Engineer

Engineer with mechanical experience for appraisal of machinery and equipment. Salary about $[illegible] per month with expenses, depending on qualifications. Box [illegible].

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

Shipyard Superintendent, Sorel, P.Q.

1164. A Shipyard Superintendent for the Government Shipyard at Sorel, P.Q., at an initial salary of $3,000 per annum, which will be increased upon recommendation for efficient service at the rate of $180 per annum until a maximum of $3,540 has been reached. This initial salary will be supplemented for the present fiscal year by the bonus provided by law.

Duties.—Under executive direction, to have charge of the Sorel shipyard; to be responsible for the design, estimates for construction, and repair of ships; to supervise safekeeping of stores and stock and the work of all employees; and to perform other related work as required.

Examination.—Subjects and weights as follows: Education, training and experience, [illegible]; Oral Interview, if necessary in the opinion of the Commission, [illegible].

Hydraulic Engineer.

1165. An Hydraulic Engineer, at an initial salary of $2,700, which will be increased upon recommendation for efficient service at the rate of $120 per annum until a maximum of $3,180 has been reached. This initial salary will be supplemented for the present fiscal year by the bonus provided by law.

Duties.—Under direction, to have charge in a district or division of survey parties engaged in power development, hydrometric, reclamation, river regulation and other hydraulic engineering works; to prepare plans, specifications and estimates for, and supervise construction of various hydraulic engineering works; and to perform other related work as required.

Examination.—Subjects and weights as follows: Education, training and experience, [illegible]; Oral Interview, if necessary in the opinion of the Commission, [illegible].

A list of eligibles will be established in this class, but the only vacancy at present is in the Chief Engineer's Branch of the Department of Railways and Canals, Ottawa.

Situations Wanted

Civil Engineer

Graduate Civil Eng'r. Jr.E.I.C., with good experience in construction, surveys, etc. is open for position with contracting firm or manufacturing company. Box 33-P.

Civil Engineer

Situation wanted by graduate civil engineer. A.M.E.I.C., experienced in coal tar products, especially benzol recovery; also good construction man. Box 37-P.

OBITUARY

Past President Kennet William Blackwell

The fourteenth President of *The Institute* Kennet William Blackwell, M.E.I.C., vice president of the Canadian Steel Foundries, Limited, died at his home at 103 Crescent Street, Montreal, on Friday, June 11th, after a brief illness.

KENNET WILLIAM BLACKWELL, M.E.I.C.

In addition to occupying a prominent place in engineering circles Mr. Blackwell's name will be remembered in connection with the prominent place he occupied in building up the steel casting industry in Canada. A son of the late Thomas E. Blackwell, he was born in Wiltshire, England in 1850, and came to Canada as a youth with his father who was the first general manager of the Grand Trunk Railway. He was educated at Bishops' College School, Lennoxville, and was apprenticed as a mechanical engineer in the G.T.R. shops, Point St. Charles. He was later appointed mechanical superintendent of the G.T.R. for the division between Montreal and Toronto with headquarters at Belleville. Subsequently he became mechanical superintendent of the Chicago and Grand Trunk Railway and later joined the Canadian Pacific Railway as mechanical superintendent. In 1882 he went into the manufacturing business under the name of K. W. Blackwell, manufacturing railway car springs, etc. This business later became a joint stock company of which Mr. Blackwell was president, the firm subsequently becoming Montreal Steel Works, Limited, of which Mr. Blackwell was president and managing director. The company was absorbed by the Canadian Car & Foundry Co. under the name of Canadian Steel Foundries, Limited, Mr. Blackwell being vice president up till the time of his death. Mr. Blackwell was vice president of the Merchants' Bank of Canada, and a director of several prominent business concerns.

He is survived by Mrs. Blackwell, two sons and one daughter, E. G. Blackwell, Vancouver, K. G. Blackwell of Martintown, Ont. and Mrs. A. E. Blake of Somersetshire, England.

PERSONALS

Edward Hughes, Jr.E.I.C., has accepted a position as mine surveyor for the C.M.P.C. Co. Fernie, B.C.

*

George G. Anderson, M.E.I.C., consulting civil engineer has moved his office to 533 Consolidated Realty Building, Los Angeles, California.

*

John S. Brisbane, A.M.E.I.C., has resigned his position with the Imperial Oil, Ltd., to accept a position with T. Pringle & Sons of Montreal.

*

J. Howard Wheatley, A.M.E.I.C., has accepted a position as sales engineer with the Blashill Wire Machinery Company Ltd., 307 St. James St. Montreal.

*

Harry L. Bunting, A.M.E.I.C., since March 1st, 1920 has held the position of municipal engineer in the district of Ste. Anne, Manitoba, under the Manitoba Good Roads Board.

*

Albert Holland, A.M.E.I.C., has sailed for Africa on the R.M.S. "Abinsi". He has been appointed an executive engineer in the Public Works Department, Gold Coast Colony.

*

W. D. Proctor, Jr.E.I.C., has accepted a position as resident engineer on waterworks construction in Scarboro Township with the E. A. James Co. Ltd., 36 Toronto St., Toronto.

*

D. L. Derrom, M.E.I.C., sailed for Brazil on the 26th of June and his present address is C/o Trading Engineer, Inc., Rua da Assemblea, 8, Rio de Janeiro, Brazil.

Axel Rath, M.E.I.C., late of Copenhagen is at present engaged in municipal work in Java and his present address is Ingenieur Burgerlyke Openbare Werken Dept., Batavia, Java.

•

W. P. Near, M.E.I.C., the newly elected chairman of the Niagara Peninsula Branch, read a paper before the Canadian Good Roads Congress at its meeting in Winnipeg early in June. The title of Mr. Near's paper was "The Cement Concrete Road."

•

Charles E. Henderson, M.E.I.C., has accepted an appointment with Morris Knowles, Ltd., engineers, of Windsor, Ont., as manager. Mr. Henderson was formerly principal assistant engineer with the United States Housing Corporation, Washington, D.C.

•

Romeo Morrissette, A.M.E.I.C., has resigned his position as principal assistant district engineer for the Department of Public Works, Canada, and has accepted a position on the staff of the National Shipbuilding Company, Three Rivers.

•

John H. Ryckman, A.M.E.I.C., has recently passed examinations for registered structural engineer under the law of the State of Illinois and now holds a license to practice structural engineering in that state. Mr. Byckman is at present designing engineer, Department of Public Works, Chicago.

•

The marriage took place early in June of R. G. Bangs, A.M.E.I.C., to Miss U. E. Plant of Westmount, at St. George's church, Montreal. After the honeymoon Mr. Bangs expects to reside in St. Catharines where he will continue in the government service in connection with the Welland Ship Canal.

•

A. A. Dion, M.E.I.C., general manager of the Ottawa Electric Company and the Ottawa Gas Company has been raised to the grade of full membership in the Illuminating Engineering Society of the United States. He has also been elected member of the Engineering Section of the National Safety Council of the United States.

•

Frank Peden, B.Sc., A.M.E.I.C., formerly of the architectural firm of Peden and McLaren, Montreal, who has for several years past been connected with the engineering staff of The Steel Company of Canada in the capacity of engineer, has opened an office at 65 McGill College Avenue, Montreal. He will resume his practice as architect and constructional engineer.

Colonel J. L. R. Parsons, D.S.O., B.A., M.E.I.C., who has recently been elected to membership in The Institute is president of the Parsons Engineering Co., engineers and surveyors of Regina. With him are associated in business, W. R. W. Parsons, M.E.I.C., vice-president, J. N. deStein, M.E.I.C., sec.-treas. and manager, [illegible], A.M.E.I.C., R. S. Cowdery, A.M.E.I.C., and C. H. Iuddell, A.M.E.I.C.

•

F. E. Emery, A.M.E.I.C., secretary of the special committee to make arrangements for the Western Professional Meeting at Banff, August 16 to 18th, made a trip to Banff on June 10th to make preliminary arrangements and look over the site of the camp which will be used on that occasion. Mr. Emery brings back a very favourable report on the camp site and camping facilities provided by the Dominion Government, near the mouth of the Spray river, immediately adjacent to the town and railway station at Banff.

•

S. J. Chapleau, M.E.I.C., resident engineer of the Department of Public Works, has been appointed to act as representative for Canada on the board of control, the formation of which was recommended by the International Joint Commission, for the construction of compensating works in St. Mary's river by the Michigan Northern Power Corporation and the Algoma Steel Corporation. Mr. Chapleau will act on the board of control during the absence in Europe of W. J. Stewart, M.E.I.C., who was formally appointed in June 1914 as Canadian representative.

•

G. H. Duggan, M.E.I.C., President of the Dominion Bridge Company of Montreal, who graduated with the class of '83 from the University of Toronto, was given the honorary degree of D.Sc. at the convocation held in Toronto on Thursday, June 3rd. Dr. Duggan has not only played a prominent part in engineering development in Canada, as, for example, in the design and construction of the Quebec Bridge, but he has for some time taken an increasingly important part in financial undertakings. He is a director of the Royal Bank and a member of other well-known institutions.

•

J. L. Busfield, A.M.E.I.C., the newly elected Secretary-Treasurer of the Montreal Branch, is a graduate of London (Eng.) University, and has been an active member of The Institute for a number of years. He has presented several papers on engineering subjects to the members, and during the past year was Chairman of the Reception Committee of the Montreal Branch. Mr. Busfield was for some time connected with the construction of the Mount Royal Tunnel, but for some years has been principal assistant to Walter J. Francis & Company, consulting engineers.

H. S. Philips, A.M.E.I.C., who has recently been appointed to the staff of H. A. Brazer, A.M.E.I.C., city engineer, London, Ont., in connection with special drainage work including pumping stations and sewage treatment works, enlisted in the Canadian Engineers in February 1917 and served in Canada until he was appointed assistant to the District Vocational Officer, Montreal with the Dept. of Soldiers Civil Re-Establishment. Mr. Philips entered the Dept. of Works, Toronto, in August 1911 and was appointed engineer-in-charge of sewer design. From July to December 1915 he was assistant district engineer, Buffalo District in connection with the Pollution of Boundary Waters Reference for the International Joint Commission when complete studies were made for sewerage treatment works for all the towns and cities on the Niagara River. During the early part of the war Mr. Philips was with the Canada Nitro-Products Ltd., Toronto on munition plant design.

*

Brig.-Gen. H. T. Hughes, C.M.G.,D.S.O.,A.M.E.I.C., chief engineer of the Battlefield Exploit Memorial Commission, sailed on June 16th on the Empress of France for France and Belgium where he expects to remain for the years, perfecting plans and carrying on the work in next there connection with the Battlefields Memorials. He was accompanied by three Canadian officers, all returned men, namely, a finance officer, an assistant engineer and a landscape architect. The sites have been definitely fixed as follows: St. Julien, Passchendael, Hill 62, in front of Sanctuary Wood, Vimy, Dury Cross Road, Bourlon Wood, Courcelette Hospital Wood, and a site just north of Lequesnal. Brig.-Gen. Hughes, upon his arrival, will take steps to secure the right of way from the main roads up o each of these sites, and will build roads leading to them. Then in the fall or early winter, plans will be prepared for the memorials themselves, and the honorary commission in Canada will call for competitive designs from the architects and sculptors in Canada.

*

Tyrrell Ferrier, Jr.E.I.C., who returned to Canada in June 1919, sailed from Canada to join the Imperial Forces on February 27th 1915 and was gazetted as an inspector of ordnance machinery, third class and Hon. Lieut. A.O.D. on March 15th 1915, taking thereafter a three months' course on field and fortress armament etc., with another three months at Stirling, Scotland. Lieut. Ferrier left for France on September 20th, 1915 and spent the next three years with the B.E.F. with a light ordnance mobile work shop, superintending repair and maintenance of guns, carriages, optical instruments and all manner of war-like stores. Lieut. Ferrier returned to England in July 1918 and was stationed at Harwich, Sheerness and Chatham looking after fortress and anti-aircraft armament and was demobilized as Captain and I.O.M. 2nd class, from the Royal Army Ordnance Corps when he reached Canada in June 1919 and was demobilized. Finally Captain Ferrier retu ned to work or the Hydro-Electric Power Commission of Ontario on July 2nd, 1919 with whom he is at present engaged.

Colonel W. H. Magwood, M.E.I.C., who has recently been elected vice-chairman of the Ontario Provincial Division, was born in the township of Mornington, Ont. in 1870 and was educated in public schools and Collegiate Institute with matriculation. From 1891 to 1897 he devoted his time to chain and compass survey and attended lectures on topography, fortification, explosives, etc. Later he studied under T. H. Wiggins, and F. D. McNaughton, municipal engineering. In 1902 Colonel Magwood formed a private business which in 1905 was extended to Magwood and Walker and in 1912 the name of the firm was changed to Magwood and Stidwill.

Colonel Magwood was engaged in municipal engineering in eastern Ontario in the design and construction of reinforced concrete bridges and buildings etc.; during this period he was acting resident engineer, Ottawa Division, New York Central R.R. In August 1915 to June 1917 Colonel Magwood was in the Canadian Expeditionary Forces in Canada, England and France (77th, 154th and 28th Brit. Inf.) returning in 1917 to his former occupation of professional engineer. At present Colonel Magwood is town engineer for Cornwall, Alexandria, Maxville, and several rural municipalities in charge of the survey and construction of five miles of railway in the Adirondack Mountains, drainage of extension swamp lands in Caledonia and Alfred townships, and general municipal work.

*

Chief Whip of British Columbia Government

F. W. Anderson, B.Sc., A.M.E.I.C., son of the late Wm. Anderson, a well-known lumberman of the Ottawa Valley and late manager for J. R. Booth Co., Ottawa, is

F. W. Anderson, B.Sc., M.L.A., A.M.E.I.C., Chief Government Whip, British Columbia.

responsible more than any other member of the profession for the successful passing of the act to incorporate the Association of Professional Engineers of the province of British Columbia. In his capacity as a member of the Legislative Assembly and as an ardent advocate of the status of the engineering profession, he protected the cause of engineers through the stress of heated debate and succeeded against considerable opposition in having the act made law.

Mr. Anderson was born in 1883 at Ottawa, Ont., educated at Ottawa Collegiate Institute and McGill University, Montreal (Bachelor of Science in Civil Engineering) and started as instrumentman with the Temiskaming & Northern Ontario Railway in 1903. In 1905 he was in charge of hydrographic work, stream gauging etc. of the Georgian Bay Ship Canal Survey and in 1906 he was inspector on plants for T. Pringle & Sons of Montreal. In 1907 he was engineer for the Eastern Construction Company on a fifty-two mile contract on the National Transcontinental Railway. In 1908 Mr. Anderson was resident engineer for the Grand Falls Power Company, Ltd., of Grand Falls, N.B. After spending some time on construction and other work he went to Kamloops and is now largely interested in live stock, farming and irrigation developments. He holds the commission of Lieutenant, Canadian Engineers, C.E.F. Mr. Anderson was first elected to the Legislative Assembly of B.C. for Kamloops in 1916 and he was elected first deputy government whip in 1917 and chief whip in 1918.

Enthusiastic Champion of Profession

C. E. W. Dodwell, B.A., M.E.I.C., President of the Association of Professional Engineers of the Province of Nova Scotia, and Chairman of the Halifax Branch of *The Institute* occupies a premier position in the development of the affairs of professional engineers in the Dominion. For over twenty years he has worked assiduously in order that engineers might occupy a higher place in national affairs and enjoy greater prestige individually and professionally. When the application was forwarded to Council for permission to establish a Branch of *The Institute* in Halifax his was the first signature. In all the efforts to secure legislation for engineers at Ottawa Mr. Dodwell has been a leader, and the zealous interest he has taken from the time that many of the present members of *The Institute* were in their boyhood has never waned.

When the committee was appointed by Council to prepare a model act for engineers it was natural that Mr. Dodwell should be a member of this committee, of which as Chairman he was the guiding spirit. On this occasion his fellow committee members presented him with a suitably engraved silver cigarette holder.

Writing of the Legislation situation present and past in a recent communication Mr. Dodwell says:—

> "In our Act, as finally passed, there are, as was to have been expected, several amendments which, while they certainly do not improve it, cannot be regarded as seriously detrimental or poisonous to its spirit and intent. There will be interest in a comparison between the draft as prepared by the general committee in Montreal in April 1919 and the final Act.
>
> Our local Legislation committee early decided to [illegible] in accepting the best of less objectionable amendments, feeling that any Act, so long as it was not emasculated beyond recognition, was better than none, because if in local [illegible] it proves inadequate or insufficient to the realization of the legitimate aspirations of the Profession, it would not be a difficult matter to have further and favorable amendments made as conditions may arise in the future.

C. E. W. DODWELL, B.A., M.E.I.C.

> The history and progress of our Legislation campaign for the past two or three years, or since the Annual Meeting of the E.I.C. in Ottawa in February 1919 have been set forth very fully in the columns of *The Journal*, but a few words regarding its conception may not be out of place here because the account of our early struggles and strivings for the establishment and recognition of our profession by Legislative enactment may not be lacking in historic interest for future generations of engineers throughout Canada.
>
> The general subject of improved status was pretty fully discussed in the ranks of the C.S.C.E. and in the Council in [illegible] and [illegible]. At the Annual Meeting of the Society in Montreal in the latter year a resolution was passed providing for the appointment by the Council of a central committee of five in Montreal and sub-committees of three each in Ottawa and Toronto. The members of the central committee of five were Alan MacDougall, chairman,

W. T. Jennings, Walter Shanly, G. H. Webster, A. J. Hill and C. E. W. Dodwell, and of these I am the sole survivor. The sub-committee for Nova Scotia, appointed in February 1896, comprised Dr. Murphy, M.E.I.C., convenor, W. R. Butler, M.E.I.C., W. G. Matheson, M.E.I.C., and C. E. W. Dodwell, M.E.I.C. all of whom are still in the land of the living.

A Bill drafted conjointly with the Central Committee in Montreal and the Nova Scotia Committee was presented to the Legislature in Halifax in February 1887. It was passed by the House of Assembly, but "deferred" by the Legislative Council, and the whole matter lay dormant in this province from that date until the present year.

A few words now about the conception and birth of the E.I.C.

R. O. Wynne-Roberts, M.E.I.C., chairman of the Toronto Branch of the E.I.C. in his excellent inaugural address on January 22nd, 1920, "A Generation of Engineering in Canada" said:—"The late Alan Macdougall of Toronto appears to have been one of its active organizers....". Here I rise with due diffidence and respect to prefer my claim to be associated with the late Mr. Macdougall in the credit for the joint fatherhood of the Society for in 1884 and 1885 he and I earnestly debated the matter in Toronto, when I was there (1882 to 1885) in charge as division engineer of the construction office of the Ontario and Quebec Railway, from Toronto to Smiths Falls, (C.P.Ry.). Subsequently committees were formed in Toronto, Ottawa and Montreal to discuss details and design the framework of the proposed organization.

The Montreal delegates, John Kennedy, M.E.I.C., P. W. St. George, M.E.I.C., and H. G. Bovey,—to meet those from Ottawa and Toronto—were elected at a meeting at Mr. Kennedy's house on Thursday, November 11th, 1886. Later a larger central committee virtually forming the nucleus of the C.S.C.E. was set up in Montreal, the members being, John Kennedy, M.E.I.C., E. P. Hannaford, G. H. Henshaw, H. Wallis, M.E.I.C., P.W. St. George, M.E.I.C., H. T. Bovey, K. Blackwell, P. A. Peterson and C. E. W. Dodwell, M.E.I.C. The final meeting of this committee at which the C.S.C.E. was born, took place in the Board Rooms of the Harbour Commissioners in Montreal on the 20th of January 1887. It was a notable and successful achievement in obstetrics. The infant that first saw the light on that memorable occasion throve from the first, and now, in its thirty-fourth year has reached a healthful and useful maturity.

The Society was duly incorporated by Royal Charter on the 23rd, of June 1887, and the first section of that historic document gives the names of nineteen engineers as constituting the Society with others. In this list my name should have been included, though I was of mature age (33) and an Associate Member of the Institution of Civil Engineers, and I was thus robbed of an honor to which I felt that I was entitled. At that time I was division engineer in charge of the construction of the C.P.Ry. from Windsor Street, Montreal to Vaudreuil, the late Mr. Peterson being my immediate chief."

That Mr. Dodwell may be spared many years of useful effort, and that he may live to see his untiring efforts in the interests of the engineering profession bear fruit in a greater measure is the sincere wish of his host of friends in the profession which includes not only Canada but the United States and Great Britain.

BRANCH NEWS

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

The Annual Meeting of the Montreal Branch was held on Thursday, May 27th, and was attended by about 100 members of the Branch. The Chairman of the Branch, Walter J. Francis, M.E.I.C., presided.

The report of the scrutineers, Messrs. Beique and Hannaford, was read and the result of the elections was as follows:—

Chairman,	Arthur Surveyer, M.E.I.C.
Vice-Chairman,	J. H. Hunter, A.M.E.I.C.
Secretary-Treasurer,	J. L. Busfield, A.M.E.I.C

all by acclamation. Messrs. John T. Farmer, M.E.I.C., O. O. Lefebvre, A.M.E.I.C., and G. R. MacLeod, M.E.I.C., were elected to the vacancies on the Executive Committee.

The Secretary read the Annual Report of the Branch which, he explained, was really "a bringing-up-to-date" of the Annual Report to *The Institute* covering the previous calendar year. The accounts of the activities of the Branch since January are to be found in *The Journal* as follows:—

March, 1920,	page 155,
April, "	" 19,
May, "	" 274.

The report deals at some length with the financial standing of the Branch and particular reference is made to the fact that the Branch will be placed on its own financial footing similar to all the other branches.

The retiring Chairman in a brief valedictory expressed appreciation on behalf of himself and of the retiring officers and Executive Committee for the hearty co-operation of all committees and members of the Branch, and also expressed his personal pleasure at having been chairman of the Branch since its formation. Continuing, he proceeded to introduce briefly each of the elected officers and committeemen to the meeting, giving their university degrees, affiliations, and so forth.

The Chair was then taken by Mr. Surveyer as the new Chairman of the Branch, who, in a few well-chosen words thanked the Branch for the honour conferred on him and promised the faithful services of himself and the Executive Committee during the coming year.

Votes of thanks were passed to the members of the Executive and of the committees, special reference being made to the work of the Chairman and Secretary-Treasurer.

At the first meeting of the new Executive Committee a quantity of routine business was transacted and in addition the following appointments were made for the year 1920-21:—

ARTHUR SURVEYER, M.C.E., M.E.I.C.
Chairman Montreal Branch.

Chairman, Papers and Meetings Committee, J. A. Burnett, A.M.E.I.C,

Vice-Chairman, Papers and Meetings Committee, V. I. Smart, M.E.I.C.

Chairman,	Civil Section,	O.O.Lefebvre,A.M.E.I.C.
"	Mechanical Section,	John T.Farmer,M.E.I.C.
"	Electrical Section,	G.K.MacDougall,M.E.I.C.
"	Industrial Section,	S.F.Rutherford,A.M.E.I.C.

In addition to the above it is confidently expected that a Chemists' and a Physicists' Section will be formed and be in operation before the commencement of the winter sessions.

Arthur Surveyer, M.C.E., M.E.I.C., the newly elected Chairman of the Montreal Branch, is one of the best known consulting engineers in Montreal. He is a graduate of Ecole Polytechnique (now the Applied Science Faculty of the Université de Montréal) of twenty years standing, and has been associated with many important works throughout the eastern part of Canada. He has been very active in hydraulic engineering particularly, and his services are in great demand in connection with arbitrations, expert evidence and other matters in this branch of engineering. He has been a member of *The Engineering Institute of Canada* for over twenty years and has been one of its most whole-hearted supporters. His work in connection with the Legislation Committee and other committees of *The Institute* has been of great value. Mr. Surveyer is a member of the Society of Consulting Engineers of France, and is also a member of the Honorary Advisory Council for Industrial and Scientific Research in Canada, in which capacity he has given unsparingly of his time and effort to the furtherance of this most important branch of Canadian development. He is also one of the governors of the Université de Montréal and a valued member of the Faculty.

James H. Hunter, M.E.I.C., the newly elected Vice-Chairman of the Montreal Branch, is a civil and mechanical engineer of high standing who has been actively associated with *The Engineering Institute of Canada* for many years. He is chief engineer of the Canada Starch Company and has under his charge plants in different parts of the country. He is a strong supporter of the high ideals of the engineering profession and of what is best in its practice.

John T. Farmer, M.E.I.C., who has been elected to the Executive Committee of the Montreal Branch is engaged in mechanical engineering in private practice in Montreal. During the past year, as Chairman of the Papers and Meetings Committee, he provided a splendid programme of meetings for the Branch.

O.O. Lefebvre, A.M.E.I.C., recently elected to the Executive Committee of the Montreal Branch, is Chief Engineer of the Quebec Streams Commission and one of the best known French engineers in Montreal. He is a frequent contributor to the literature of *The Institute.*

George R. MacLeod, M.E.I.C., who has recently been elected to the Executive Committee of the Montreal Branch, is a graduate of McGill University and engineer of lines and levels for the City of Montreal. He is well known to the members of *The Institute* through holding the position of Assistant Secretary for some years in conjunction with the late Professor McLeod.

Peterborough Branch

E. E. Dobbin, M.E.I.C., Secretary.

At a meeting of the Executive Committee of the Branch the following Standing Committees were appointed:

Membership—P. L. Allison, (Chairman), A. L. Killaly, P. P. Westby, G. R. Langley.

Meetings and Papers—E. R. Shirley, (Chairman), W. G. Montgomery, J. A. G. Goulet, L. D. W. Magie

Entertainment—C. H. Rogers, (Chairman), A. B. Gates, G. O. Cameron, Geo. Perks.

Legislation—Jas. Mackintosh, (Chairman), B. L. Barnes, A. P. Millar.

Junior — C. E. Sisson, (Chairman), W. M. Cruthers, R. C. Flitton, R. E. Stavert.

The activities of the Branch will be suspended for the Summer months, except for the annual picnic in July.

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary-Treasurer.

The last meeting of the season was held at the Thorold Engineer's Club, May 28th, when a very interesting talk and pictures were presented on "Modern Concrete Road Construction,—Machinery and Methods," by G. A. Sherron, eastern manager of the Koehring Machine Co. of Philadelphia.

The speaker discussed the machinery used for all conditions of concrete road building and followed this with an extremely interesting series of lantern slides and two reels of moving pictures. The last reel consisted of an animated blue print of the operation of various plants and was the result of fifteen thousand drawings. The drawings showed how construction plant works and operates, each unit in step with the others, and the spasmodic and ludicrous actions of cranes and locomotives gave the audience several good laughs.

W. P. Near, M.E.I.C., the new Branch Chairman, presided at this meeting and was received with applause by the members. The attendance was thirty.

At the first meeting of the new Excutive Committee all Branch committees were re-appointed with the exception of the Publicity Committee. This Committee will be appointed after the General Professional Meeting in September when the Executive will have discovered those members who prove most efficient on the Professional Meeting Sub-committee on Publicity.

The whole energies of the Branch are now centered upon preparations for the General Professional Meeting in September. Each week sees several meetings of Committees and Sub-committees and a large proportion of the Branch membership is actively at work making many arrangements and deciding what seem to be almost endless details. However, all this is going to be a very fine thing because the Branch is going to find itself by drawing many members intimately together. Also we are going to discover a lot of prospective chairmen and secretaries and committee men and thus develop our big store of latent ability and enthusiasm.

Members will help along if they will make use of every opportunity to tell the members of other Branches about the General Professional Meeting so that everybody will be keen to come. The great success of the Annual Meeting of the Branch augures well for what is to come.

Calgary Branch

Arthur L. Ford, M.E.I.C. Secretary.

At a meeting of the Branch held on May 22nd to consider the question of holding the Western Professional Meeting under the auspices of the Calgary Branch this summer, the special committee reported in favour of holding this meeting at Banff, in July or August.

After the reading of messages from the western Branches promising support, the meeting instructed the committee to go ahead with the arrangements and indicated the middle of August as the date most acceptable.

However, as the committee found that the parent Society would be unable to assist in a Western Professional Meeting this year as two professional meetings had already been arranged for in the east, it was decided to refer the matter back to the Branch before making final arrangements.

The meeting of the Branch held on June 5th was unanimously in favour of putting on the meeting at Banff about August 15th with the Calgary Branch assuming full responsibility but counting on the other western Branches for their hearty support. Communications were received from the several western Branches favouring the idea and promising attendance and assistance in the program.

The committee has since been hard at work making the preliminary arrangements and getting out an invitation which it intends to distribute to western members through the Branch secretaries. For the engineering readers of *The Journal* whom it is impossible to reach otherwise the invitation to attend this meeting as issued by the Committee is appended.

Vancouver Branch

J. N. Anderson, A.M.E.I.C., Secretary-Treasurer.

L. L. Brown, B.Sc., A.M.E.I.C., late lieut. C.E.F., superintendent of the Vancouver Laboratory, Forest Products Laboratories of Canada (Dominion Government), has been appointed lumber commissioner, representing the Province of British Columbia in the Eastern Provinces, with Headquarters in Toronto.

On the eve of his departure to take up his new duties, Mr. Brown was the guest of honour at a dinner tendered by his engineering friends in Vancouver, and he was the recipient of a silver cigarette case, suitably engraved, in appreciation of his services in connection with the finances for the British Columbia Professional Engineers' Act.

E. P. Labelle, Jr. E.I.C., has been promoted from the position of chief engineer of the British Columbia Telephone Co., to that of general superintendent of Plant.

The Association of Professional Engineers of the Province of British Columbia

In accordance with the provisions of the British Columbia Engineering Profession Act the Lieut.-Governor in Council has appointed the following gentlemen to act as a Provisional Council.

E. G. Matheson, M.E.I.C., Prof. of Civil Engineering, University of B.C., Representing University of B.C.

D. O. Lewis, M.E.I.C., Division Engineer C.N.R., Victoria, B.C.; A. E. Foreman, M.E.I.C., Chief Engineer, Dept. of Public Works, Province of B.C., Victoria, B.C.; W. H. Powell, M.E.I.C., City Surveyor, Vancouver, Civil Engineers.

S. S. Fowler, General Manager, The New Canadian Metal Co., Ltd., Riondel, B.C.; J. M. Turnbull, Professor of Mining, University of B.C., and consulting mining engineer; Angus Davis, consulting mining engineer, Vancouver, Mining Engineers.

J. Peck, chief inspector of machinery for B.C. New Westminster, Mechanical Engineers.

W. R. Bonnycastle, M.E.I.C., consulting engineer, Vancouver, Electrical Engineers.

J. A. M. Dawson, Chief of Dominion Trades and Commerce Laboratory, Vancouver, Chemical Engineers.

H. L. Robertson, consulting engineer, Vancouver, Structural Engineers.

At the first meeting of this Provisional Council held at Vancouver on 2nd June, Professor Matheson was elected President; D. O. Lewis, Vice-President; H. L. Robertson, 502-3 Yorkshire Building, Vancouver, B.C., was appointed Registrar and Secretary-Treasurer.

At this meeting a form of Application was drawn up, and it was decided to circularise all interested persons, at the same time sending them the necessary form and a copy of the Act.

* * *

Canadian Good Roads Association

At the successful meeting of the Canadian Good Roads Convention, held in Winnipeg on June 4th, the following members were elected as the executive for the coming year.

A. E. Foreman, M.E.I.C., chief engineer, Public Works Dept., B.C. as president; Dr. E. M. Desaulniers, M.L.A., of Montreal, first vice-president; Hon. Sam. J. Latta, Minister of Highways, Saskatchewan, second vice-president; George A. McNamee, Montreal, secretary-treasurer. The advisory committee consists of: J. H. Dandurand, Montreal; W. A. McLean, M.E.I.C., Deputy Minister of Highways, Ontario; B. Michaud, Deputy Minister of Highways, Quebec; J. E. Duhamel, Outremont; S. L. Squire, Toronto, past president; A. F. MacCallum, M.E.I.C., Ottawa, past vice-president. The following directors were elected: J. R. Douglas, president Automobile Club of Canada, Montreal; L. J. Tarte, Montreal; Hon. Frank Carrel, Quebec; Mayor Gale of Vancouver; S. R. Henderson, president Manitoba Good Roads Association, Winnipeg; Capt. Lamar Allen, president Ontario Good Roads Association, Belleville; G. F. Pearson, Nova Scotia; W. Findlay, Toronto; C. R. Wheelock, Orangeville, Ont.; Russell T. Kelley, president Hamilton Board of Trade; H. S. Carpenter, Deputy Minister of Highways, Saskatchewan; A. M. Rankin, M.P.P. Ontario; T. P. Regan, president New Brunswick Auto Association, St. John, N.B.; H. H. Shaw, A.M.E.I.C., chief engineer Public Works Department, Charlottetown, P.E.I.; L. C. Charlesworth, M.E.I.C., Deputy Minister of Public Works, Edmonton, Alta. To this Board of Directors will be added the presidents of the provincial motor leagues and automobile associations of the Dominion.

The Governor-General is to be asked to be the honorary patron of the association, with the provincial Lieut. Governors as honorary vice-patrons, and Sir John Eaton as the patron of the association.

Extract from the minutes of the annual general meeting of the Canadian Good Roads Association, held in the Royal Alexandra Hotel, on Thursday evening, June 3rd, 1920.

> UNANIMOUSLY RESOLVED: "That the
> "Canadian Good Roads Association in annual Con-
> "gress at Winnipeg, Acknowledges with pleasure
> "the message of the Council of *The Engineering Insti-*
> "*tute of Canada*, and desires to endorse the view
> "expressed by the Council that the supervision and
> "inspection of highway work of all descriptions
> "should as far as practicable be entrusted by
> "municipal and provincial authorities to qualified
> "engineers, and young men with technical qualifi-
> "cations in order that the experience thereby
> "obtained may be usefully conserved and expanded
> "to the future national advantage in this important
> "public undertaking."

Corporation of Professional Engineers of the Province of Quebec

The first meeting of the Corporation of Professional Engineers of the Province of Quebec was held at the headquarters of *The Engineering Institute of Canada*, 176 Mansfield St., Montreal on Thursday, May 27th, 1920. The meeting was a lively one with considerable discussion. The majority of members wished to elect the provisional council, which had undertaken all the work of preparing the legislation authorizing the incorporation of the association and compiling the by-laws as the first formal council of the corporation. A small minority objected to this and this objection led to several amendments being suggested and a proposition that the nominations be thrown open to a vote by ballot. The amendments were voted down one by one and eventually the provisional council was elected by a very large majority for the ensuing term as the first council of the new Corporation of Professional Engineers.

It was decided to elect a council of eight members, five from the district west of Three Rivers, and three from that east of the same city, chiefly from Quebec City. The following members were elected:—West of Three Rivers:—Arthur Surveyer, M.E.I.C., W. F. Tye, M.E.I.C., Walter J. Francis, M.E.I.C., K. B. Thornton, A.M.E.I.C. and Frederick B. Brown, M.E.I.C., of Montreal. East of Three Rivers:—A. R. Decary, M.E.I.C., A. B. Normandin, A.M.E.I.C. and J. Gibeau, A.M.E.I.C., of Quebec City. A. R. Decary of Quebec City who had presided over the deliberations of the provisional council, presided at the meeting with Frederick B. Brown as Secretary. Mr. Decary recounted the work done during the past year for the organizing of the Corporation of Professional Engineers of the province, affiliated with *The Engineering Institute of Canada*, with headquarters at Montreal. The Act, he said, was simply transferred from *The Engineering Institute of Canada* to the new Corporation of Professional Engineers, making the usual provisions for membership and by laws. Annual meetings will be held at the headquarters of the Corporation in Montreal. Continuing, Mr. Decary said that this movement had been started by the Quebec engineers, after the formation of *The Engineering Institute of Canada*, and every province of Canada, with the exception of Ontario and Saskatchewan, had followed suit. Following the election of the council, of whom half are to remain in office for two years and half for one year, the meeting settled down to the work of adopting the by-laws of the corporation which were read and adopted with some minor amendments.

At a subsequent meeting of the council the following officers were elected:—President, A. R. Decary, Quebec; Vice-President, Walter J. Francis; Honorary Secretary-Treasurer, Frederick B. Brown.

EMPLOYMENT BUREAU

Supplement to Situations Vacant

Designers, etc.

Four designers for reinforced concrete work, two instrument men, two electrical engineers. Box 133.

Chemical Engineer

Chemical engineer. Montreal industrial company requires services of a young chemical engineer aquainted with fuel and steam problems. Salary $3,000 to $3,500. Box 134.

Municipal Engineer

Engineer wanted for Ontario city with municipal experience. Must be thoroughly qualified and in possession of P.L.S. certificate. Population of city 33,000. Box 135.

Preliminary Notice

of Applications for Admission and for Transfer

[illegible]

The By-laws now provide that the Council of the Institute shall [illegible] from one grade of membership to another.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a [illegible] statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, [illegible].

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in July, 1920.

FRASER S. KEITH, Secretary.

---

* The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially [illegible] Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized **by the Council, or has not passed the examinations of the first year in such a course,** shall be required to pass an examination in the following subjects: Geography, History [illegible] Arithmetic, Geometry [illegible] Books I-IV and VI, Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits [illegible] or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

[illegible]

[illegible]

FREEMAN—GEORGE LEONARD, of Mattawa, Ont. Born at Gray, U.S.A., Sept 6th, 1881; Educ., B.S in C.E., Maine Univ., 1903; June 1903-Apr. 1906, dftsman, designer & fieldman for I.W. Jones, Milton, N. H., hydro. elect. & steam power plants, paper-pulp, leather board & fibre mills; Apr. 1906-Oct. 1909, designer & asst. engr. for Elk Tanning Co., Ridgway, Pa.; Oct. 1909-1918, with Moulton Engr'g. Corpor., Portland, Maine, as chf. engr., also engaged at different times with Winchester Repeating Arms Co., New Haven, Conn., Rundlitt & Verrill, Co., & Shipbuilding Co., Portland, Maine, in constrn. work; 1918-1919, with The Foundation Co., New York as asst. engr. i.c of all design & est. in Eng. office; 1919 to date, with Kipawa Co., Ltd., Mattawa, Ont., as mgr. of engr'g.

Naval Gunnery

Lord Congleton, Jr.E.I.C.

The sailor branch of the Royal Navy is split into two rival classes—The Gunnery men and the Torpedo men. The former are positive that the war was won by gunnery and the latter will point out that the war if not won, was very nearly lost owing to torpedoes and mines.

However both gunnery and torpedo are branches of engineering, and it is the gunnery case which I wish to advance here.

The term naval gunnery is an exceedingly broad one and so in the short space available I must confine my attention to one or two features of particular interest.

The material side of naval gunnery may be divided roughly under five headings:—

1 — Gun construction,

2 — Hydraulic, electric and hand worked gun mountings,

3 — Gun sights and gun directors,

4 — Fire control,

5 — Ammunition.

The Influence of the Director on Naval Gunnery.

It is the gun director system that I shall attempt to describe in this paper, as this is one of the most interesting recent developments of naval gunnery. The director was only just in its infancy on the outbreak of war and at the armistice its perfection was only just complete.

Our Greatest Warship, H.M.S. "Hood."

Read before Montreal Branch of The Engineering Institute of Canada, April [illegible], 1920.

Much of the gun director work is necessarily still confidential and on this account I was unable to obtain any photographs of it from the Gunnery School at Portsmouth.

Before dealing with the director however, a short description of gun sights and fire control must be given as all three are intimately connected.

It is obvious that naval gunnery is distinguished from field gunnery by several complicating factors, the chief of which are:—

1. The enemy and your own ship are both moving rapidly. Both are free to alter course and speed, and so the relative course and speed is continually changing.

2. The enemy and your own ship are moving irrespective of their speed due to the motion of the sea:

This second factor requires no further comment. Now in consequence of these two factors, conditions are never constant but vary rapidly from minute to minute. Thus the human factor which is slow and liable to error must be eliminated as far as possible and fool-proof machinery substituted instead.

All the movements of the gun platform and the enemy can be resolved into horizontal and vertical movements at the gun and in modern practice it is usual to have a gunlayer to deal with movements in the vertical and a trainer to deal with movements in the horizontal plane. These movements are continuous; and consequently all firing at sea must be "direct"; i. e. the gunlayer and trainer in order to keep their telescope cross wires on the target must be able to see the target.

Ashore the gun can be laid by angles; indirect fire can be used and the same can be done when bombarding a fixed object from the sea, but at sea firing must be "direct", if the target is moving.

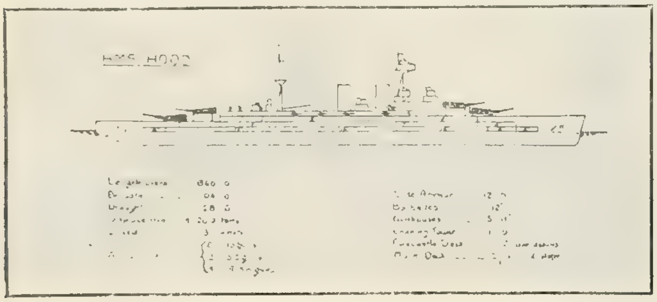
As long as the telescopes are on the enemy, the line of sight from telescope to enemy is horizontal.

The gunlayer is the senior rating and fires the gun when his horizontal cross wire is on. The trainer has to keep his vertical wire on.

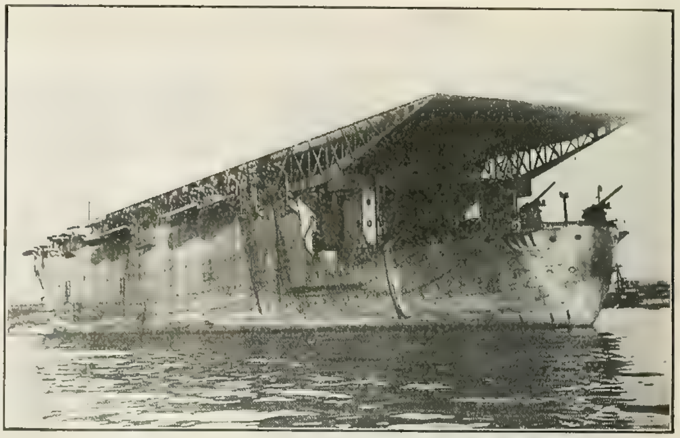
The Sight

Now the piece of machinery that carries the telescopes is the sight.

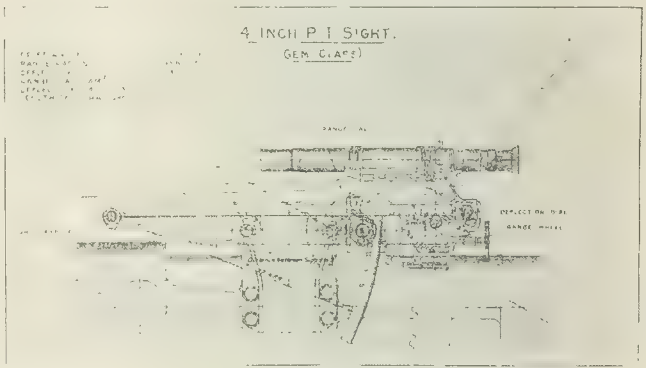
The theory of sighting affords a fascinating study of ballistics and trajectories into which we have no time to



go. It is sufficient to say that owing to the resistance of the air to the passage of the projectile there is an appreciable interval, called the Time of Flight, between the moment when the gun is fired and the moment when the projectile reaches the target. With heavier guns it may be anything up to a minute or more. It is during this interval that all sorts of bad influences have time to act on the projectile and drag it from the straight and narrow path leading to the target.



The Royal Navy and Aviation, H.M.S. "Argus"



Errors in Sighting

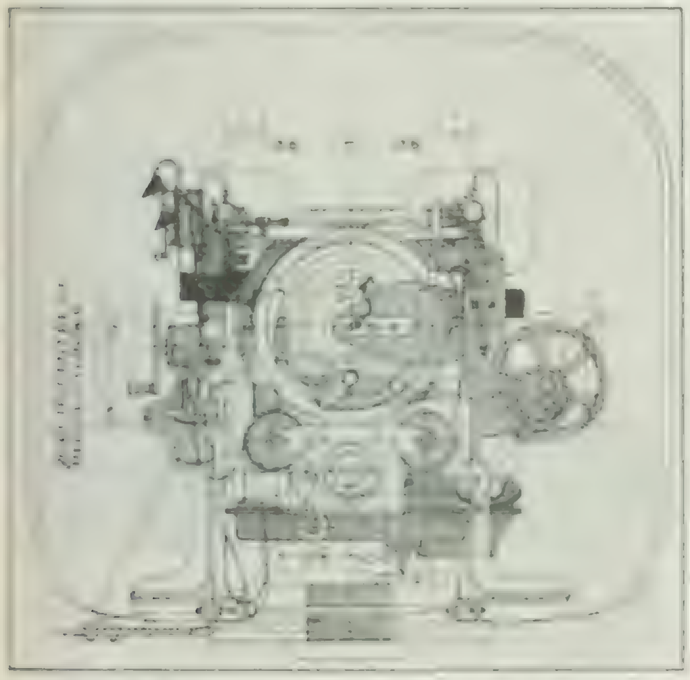
There are two sorts of errors, those in the vertica plane which make the projectile fall "over" or "short," and those in the horizontal plane which make the projectile wander to the "right" or to the "left".

In the former we class gravity, the worst offender; as every one knows, a certain angle of elevation must be given to the gun to counteract the effect of gravity on the projectile. This angle depends primarily on the range of the enemy and the muzzle velocity of the gun, but also to a certain extent on the shape and weight of the projectile, the density of the atmosphere and the wind.

The errors that make the projectile miss to the "right" or "left" are caused by the wind across the range, the sideways motion due to the fact that the ship is moving as the projectile leaves the gun, and the drift of the projectile due to its spin. All these are classed under the heading of deflection.

Now coming back to the question of the sight. It can be seen that there are two functions which an efficient type of gun-sight must perform. Firstly it must give the gun the correct elevation in the vertical plane and secondly it must give the gun the correct deflection in the horizontal plane to counteract all these errors. At the same time it must be borne in mind that there is a rapid relative movement between the enemy and your own ship and a prediction of the elevation and deflection must be made. It is these predicted values which must be on the sight at the moment of firing, so that fifteen or twenty seconds later, or whatever the time of flight may be, when the projectile is about to score a bull's eye, it will not find that the target has moved out of the way.

Of all the causes just enumerated which affect the elevation and deflection none are constant, and so the sights are continually being reset and the gun is continually moving.



All modern gun sights are bolted to the cradle of the gun, so as to be unaffected by the recoil. They consist of:

Sight bracket;
Sight carrier;
Telescope holder
Telescope or periscope.

The trainer has a duplicate sight so that one sight-setter sets both layer's and trainer's sight.

In order that range in yards may be passed to the sight setter the angles of elevation for a standard set of conditions are worked out and the corresponding ranges are scribed on the sight dial, which is then geared to the carrier. Any abnormal alteration of conditions from the standard is corrected for by an automatic sight corrector fixed to the sight, which, depending on its setting, adds or subtracts the correct amount for each range.

Originally, as in this sight, the carrier was raised by pinion gearing, but a cam has now been substituted, as it was found that the cam could be cut and the range dial marked so as to do away with the complicated sight corrector.

A further improvement was the introduction of the "follow the pointer" sight. In this type pointers worked by small step by step electric motors inside the range and deflection dials, indicate the correct setting and all the sight setter has to do is to keep his pointers in line with fixed marks on the body of the sight. These small motors are worked from down below in the transmitting station.

Fire Control

And now a word must be said on Fire Control to indicate how the range and deflection which finally arrive on the sight are obtained.

Up aloft in the control top is the controlling officer, there are generally two others in different spots, but he is the primary control officer. He is in direct communication with the transmitting station, which is situated well below the water line and behind armour, and he gives all orders to the guns via the T.S. (Transmitting Station), and "spots" the fall of shot.

The range is obtained from the range finders. These number up to eight or ten in some and there is talk of more. They are coincidence range finders and are now built with a forty foot base. They pass down a constant stream of ranges and bearings of the enemy to the transmitting station.

Finally there is the transmitting station which is the hub of the whole system. Down here a staff of thirty officers and men are at work, working out and correcting the range and deflection, and passing them on by electric transmitters, telephones and voicepipes to the sight setters at the guns.

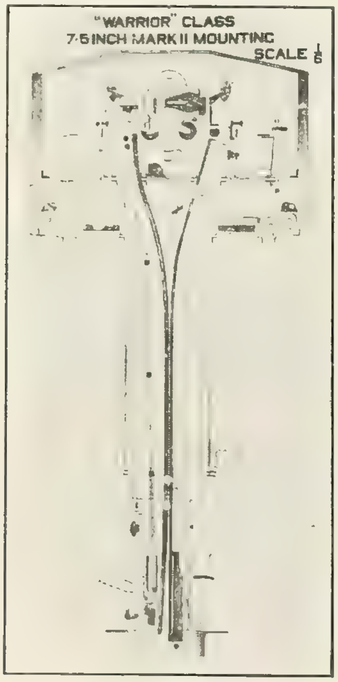
Control Top—Transmitting Station—Gun positions. This constitutes the primary control system. In the event of a break-down in the control top, there are at least two other positions ready to take on the job at once; and finally if all communications are shot away and the guns isolated, each turret is a self contained unit and can "carry on" in local control with its own complete set of instruments and its own control party.

The Director

Such very roughly is the control system at present in use. It will be seen that except for the control officer at one end and the gunlayers and trainers at the other, nobody in the system has much excuse for making a mistake, their duties are purely mechanical. By the introduction of the gun director, the gunlayers and trainers are turned into machines and another human factor is eliminated.

The director can be considered as a dummy gun, i.e. A mounting without any gun in it, but fitted with ordinary elevating training and sighting mechanism, and placed aloft in or near the control top.

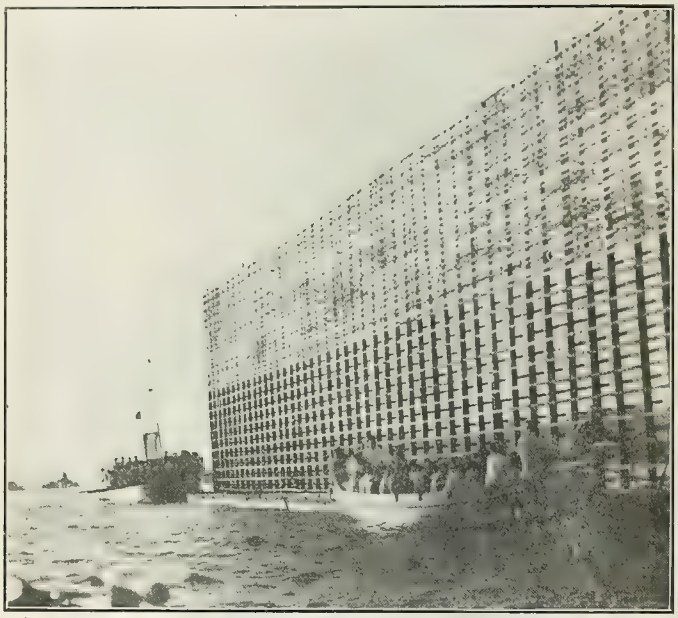
This dummy gun is layed and trained in the usual way and its movements are transmitted to all the guns in the ship by electric transmitters.



The idea is not a new one; as far back as 1900, Admiral, then Captain Percy Scott, was experimenting with such an arrangement of his own, with home-made and very rough materials. After a great deal of opposition it was decided in 1914 to fit all ships with the gun director. By Aug. '14 six ships only had been fitted, but by May '16 all the big ships were fitted, and the destroyers were just completed when the armistice was declared. The chief factor which influenced the Admiralty was the introduction of the long range torpedo which enormously increased the fighting gun range and it came to the point that some type of director firing must be used or the gun would go under before the torpedo. The first successful director was fitted in H.M.S. Orion in the early part of 1914, and one of the many remarkable results obtained from her gun trials was that the director was very much better in rough than in fine weather.

The system is simply an application of the "follow the pointer" principle.

On receiving the order to "fire" from the control officer who is usually just above the director, the director layer brings his telescope cross wires slightly above the target and waits a pause until the roll of the ship brings him on. This pause of about five seconds enables every gunlayer and trainer to bring his two pointers accurately into line. As soon as his crosswire rolls onto the target the director layer presses the firing key and every gun in the ship goes off instantaneously.



A Naval Floating Target.

Results with the Director

Remarkable results have been obtained with director firing. Firing at 15,000 yards salve spreads of 100 yards and under are usually obtained and the shot fall so closely in line with one another that the salvos have to be spread out by throwing the guns slightly out of adjustment with the director. The director is in fact too accurate.

With good visibility, not often obtainable in the North Sea, hits can be registered at 25,000 yards, as compared with an outside range of 12,000 before the war using individual firing.

This has been achieved only as the result of an enormous amount of calculation and practical experiment. To mention two firms outside the Naval Service, Vickers on the mechanical and Elliot Brothers on the electrical side, are largely responsible.

The system appears simple enough but when one realises that fifteen or twenty degrees is the limit of elevation and ranges of from 0 to 22,000 yards have to be accounted for between these limits, it will be seen that the instruments have to be extremely accurate and no backlash can be allowed to creep in.

Night action has been revolutionized by the introduction of the director.

German Control and Gun Director

The Germans had some type of gun director but no details have ever been published. When the German fleet came into the Firth of Forth and they were inspected it was found that the whole of the director system had been stripped even to the wiring.

General Design of a Lock and Approaches

J. B. [illegible], M.E.I.C., Chairman Sault Ste. Marie Branch.

In considering the general design of a lock and its approaches the first consideration is the safety of the lock and the vessels passing through, but where the traffic is great and is liable to become congested the consideration of the ease with which vessels may move, and the speed with which they may be passed through, is an important one.

The traffic through the Canadian canal at Sault Ste. Marie, (of which the writer has had charge for over twelve years,) has always been heavy, but reached its maximum in the year 1913, when 42,696,143 tons of freight or 55% of the total traffic of the St. Mary's River, passed through in 8,[illegible] vessels. During the years 1909-1914 the traffic was so heavy that congestion occurred about once a week, when anywhere from ten to forty vessels were at anchor waiting for the lock, and these delays proved costly to the vessels.

A record was kept, during the season of 1912, of delayed down bound vessels, as practically all of the delays took place above the canal, and of 4,358 vessels, 3,216 were delayed on an average of three hours and thirteen minutes each, or a total delay for the season of 10,345 hours. This delay at $21.00 per hour, the earning capacity of an average sized vessel, represented a total loss for the season of $217,245.

In addition to the regular congestion mentioned above there have been several much more serious periods of congestion caused by one of the locks being put out of operation by an accident, or from some other cause.

On one of these occasions when the Poe lock, of the United States Canal, was put out of operation by an accident, in November, 1909, the Canadian lock was in continuous operation for 264 hours, passing 460 vessels with a total registered tonnage of 1,372,145 tons.

On this occasion the blockade was so serious that at one time there were 87 vessels at anchor above the canal; and the delay to each vessel was from sixty to one hundred hours. The total financial loss to the vessels through the delay amounting to $250,000.

In the following Spring the opening of the Poe lock was delayed, by some construction work, until May 5th, (or for twenty-three days after the Canadian lock was opened) and a very heavy congestion occurred, there being at one time 140 vessels at anchor, about equally divided between the upper and lower river.

On this occasion the Canadian canal was in continuous operation for [illegible] hours, passing 1,140 vessels with a total registered tonnage of 2,871,[illegible] tons.

The above cases are cited to show how immensely important it is to vessels, in times of traffic congestion, that there be as little delay as possible in locking.

Records were kept which show the time taken by vessels in making a lockage, as follows:—

DOWN BOUND VESSELS

AVERAGE TIME IN MAKING A LOCKAGE

Time from Stop Post to Lock	Moving into Lock	Lowering Vessel	Moving out of Lock	Clearing Lower Stop Post or Waiting Vessel	Total Time
7 min.	8 min.	11 min.	7 min.	4 min.	37 min.

UP BOUND VESSELS

AVERAGE TIME IN MAKING A LOCKAGE

Time from Stop Post to Lock	Moving into Lock	Raising Vessel	Moving out of Lock	Clearing Upper Stop Post or Waiting Vessel	Total Time
7 min.	10 min.	10 min.	7 min.	2 min.	[illegible]

SPECIAL CASE

UP BOUND VESSEL.

Time from Stop Post to Lock	Moving into Lock	Raising Vessel	Moving out of Lock	Clearing Upper Stop Post or Waiting Vessel	Total Time
7 min.	50 min.	15 min.	8 min.	7 min.	87 min.

The up bound vessel which took fifty minutes to move a little more than her own length in getting into the lock was four feet narrower than the lock and her draft was six inches less than the depth of the water in the lock. She was unable to use her own power as the action of her propellor would draw the water from under

Read at the annual meeting of the Sault Ste. Marie Branch of The Engineering Institute of Canada, June [illegible].

her and she would settle on the bottom of the lock. She was, therefore, heaved into the lock by her bow lines, and could only move very slowly owing to the difficulty of getting the water in the lock past the vessel.

While the lock can be filled or emptied in six minutes it is to be noticed that in actual practice it usually takes ten minutes or more. This is necessitated by the surging ahead of the vessel or vessels in the lock, with a chance of a collision or danger to the vessels when the water is let in or out too rapidly. It would only be possible to use the valves to their full capacity by making the flow of water uniform at all parts of the lock, when filling or emptying.

Factors in Design

In considering the design of a lock and its approaches it is necessary to note certain conditions which occur in the operation of the lock and in the handling of the vessels.

Figs. 1, 2, 3 and 4 show curves which indicate the movement of the water in and above the lock when making a lockage. The two quadrilateral figures in each diagram represent the valve action. The oblique lines represent the opening of the valves, the horizontal lines represent the percentage of opening, and the vertical lines represent the moment when the valve action ceases by the opening of the lock gates. Fig. 1 represents the filling of the lock by throwing the valves wide open. The water in the lock immediately commences to rise and the water above falls 1.8 feet, then commences to rise slowly at first, then more rapidly, passing and rising

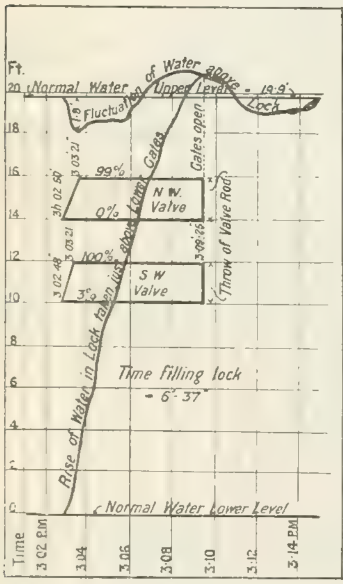


Fig. 1. — Showing filling of lock by throwing valves wide open.

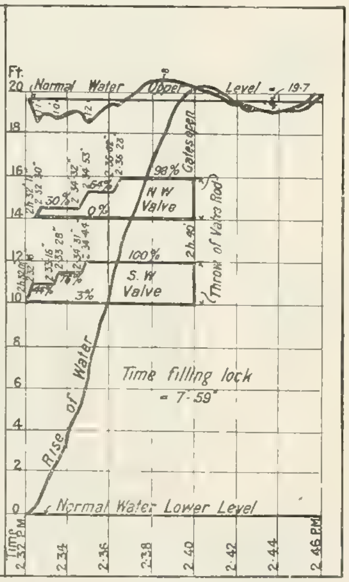

Fig. 2. — Showing filling of lock by operating valves gradually.

1.2 feet above the normal upper level. The water in and above the lock come together at a point one foot above normal, and the lock gates are opened. The water continues to surge up and down until the motion gradually dies away. It is to be noticed that it is necessary to put a foot more water in the lock than is indicated by the difference in the normal levels; and that had there been no surge above the lock the gates might have been opened one minute sooner.

Fig. 2, represents the filling of the lock by operating the valves more slowly, taking longer to fill the lock, but with less surge in the upper level. The effect of each valve movement may be noticed in the fluctuation of the upper level.

When the water suddenly drops in the upper level, as shown in Fig. 1, it may be imagined what effect this would have on a vessel lying moored above awaiting her turn to lock down. The vessel is caused to surge violently ahead and then back, and if the linemen are not standing by the mooring cables they will break, allowing the vessel to get out of control.

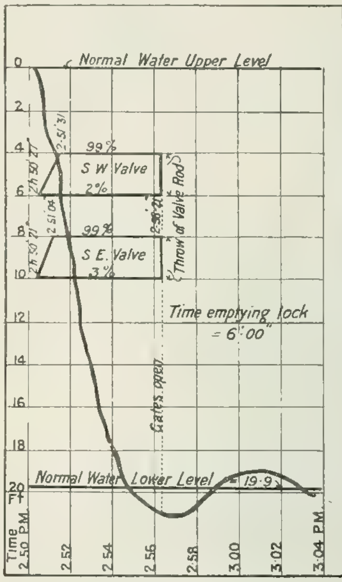

Fig. 3. — Emptying of lock with valves wide open.

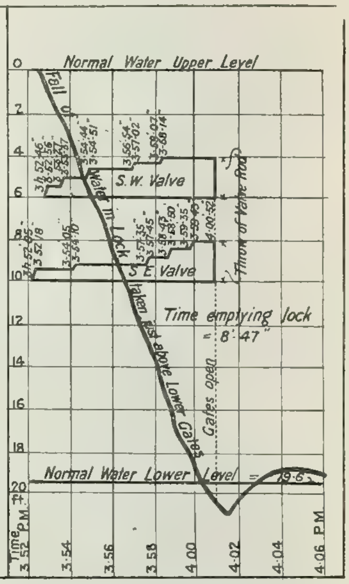

Fig. 4 — Emptying of lock by gradual operation of valves.

Figs. 3 and 4, represent the emptying of the lock, Fig. 3, with the valves wide open, and Fig. 4, by a gradual operation of the valves. The curves for the lower levels were not obtained, owing to the agitated condition of the water, but it is to be noticed that the water in the lock fell 1.1 feet below the normal level of the lower entrance before the gates could be opened, indicating the surge that was caused in the lower level by the rush of water from the lock.

It is also to be noticed that it was necessary to empty 1.1 feet of water out of the lock, more than is indicated by the difference between the normal levels, and had the surge not occurred, the lock gates might have been opened one minute and thirty-three seconds sooner.

If the draft of a vessel being locked down was equal to the full draft of the lock, she would rest on the bottom of the lock when the gates were opened, until her water marks were one foot out of water, and she could not move out of the lock on her own steam until the return surge lifted her off, or about three minutes later. It will be seen, then, that the depth of the water in the lock should be a foot or more greater than the allowed draft of the vessels.

The surge in the entrances could only be got rid of by taking the water supply from some other source than the upper entrance, and discharging in some other place than the lower entrance, a condition that rarely occurs. It might however be greatly reduced by widening the entrances, and where a large quantity of water is required to fill a lock as in the New Welland Ship Canal, a large pond must be provided to furnish the water without unduly drawing down the level. A pond seventy acres in area would be lowered one foot in filling one of these locks.

Fig. 5.—Action of vessel moving ahead engines suddenly reversed.

Fig. 6.—Vessel effecting landing on port side.

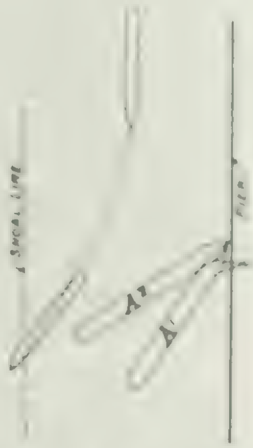

Fig. 7.—Vessel attempting landing on starboard side, causing accident.

Fig. 5, represents the action of a vessel when moving ahead and her engines are suddenly reversed to stop her, the rudder remaining amidships. The action of the vessel's propeller causes the bow to swing to startboard and her stern to port. This is an important point when designing the approaches, as it is evident that it would be easier for a vessel to land on her port side than on her starboard side. Fig. 6 represents a vessel making a landing on her port side; she approaches the pier in an oblique direction and reverses her engines so that she will come to a stop before striking the pier. When her bow comes close to the pier a bow line is put out and her engines continuing to reverse her stern is thrown towards the pier making it easy to get out a stern line. Fig. 7, represents an actual case of a 600 foot vessel 'A' attempting to land on her starboard side. The reversing of her engines caused her stern to swing away from the pier 'A2' so that they failed to get a stern line out in time and the vessel swung across the canal. An upbound vessel, which was moving at a fairly rapid speed, was unable to stop and attempted to pass around the stern of the other vessel, but was forced ashore on the other side of the canal.

Fig. 8, represents an accident which actually occurred on the Sault Ste. Marie Canal. A and B are waiting vessels moored to the piers. C is an outgoing vessel moving six or seven miles an hour. C was forced to hold close to the side of the canal to avoid A and when her bow passed the angle in the pier, D, the suction on the bow of the vessel was released, allowing the vessel to swing to starboard, C2, her helm was put over the moment this motion and a few moments later when her stern cleared the angle in the pier, C3, the combined action of the helm and the letting go of the suction on the stern of the vessel caused her bow to swing violently to port, C4, and collide with B before her direction could be corrected. This accident caused a vertical hole to be cut in the bow of B, about twelve feet long.

Fig. 8.—Sketch showing accident on S. S. Marie Canal.

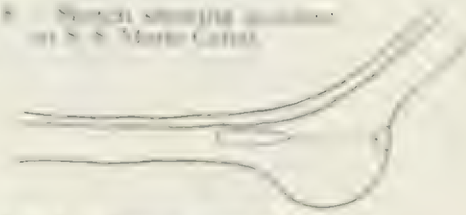

Fig. 9.—Sketch showing accident at Morrisburg.

Fig. 10.—Sketch showing accident narrowly averted, S. S. Marie Canal.

Fig. 9 illustrates an accident which occurred on the canal at Morrisburg, some years ago. The vessel was moving up the canal, which had a sudden turn to the left at this point. A construction scow was moored, for safety, in the bay on the opposite side of the canal. The vessel held too close to the canal bank on her port side and when she attempted to turn to port her bow refused to come round as the suction held her stern to the bank, with the result that the vessel went straight ahead and cut the scow in two.

This accident suggests the danger of two vessels attempting to pass one another on a curve of a canal. The vessel on the inside of a curve should hold back, allowing the vessel on the outside to have the right of way. This point should be covered by the canal regulations.

What was nearly another accident of this kind is illustrated in Fig. 10, which shows the lower entrance to the Sault Ste. Marie Canal. The vessel leaving the lock, when her bow cleared the end of the lock wall, began to swing to starboard and threatened to collide with the waiting vessel. The captain realized that if he reversed the engines the vessel would not be stopped in time to avoid a collision and that the bow would surely be thrown further to starboard, making a collision certain, he therefore signalled full speed ahead, put the helm hard over to hold the bow to port, and succeeded in clearing the waiting vessel by a very narrow margin. These three cases are given to illustrate the important influence that suction has on the movement of vessels in confined waters.

Fig. 11. — Upper entrance S. S. Marie Canal showing difficulty of large vessel passing another waiting vessel.

Fig. 12. — Suggested improved entrance.

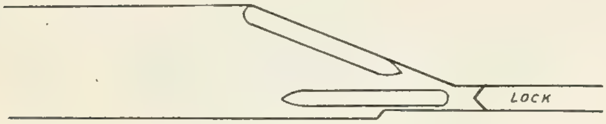

Fig. 13. — Suggested wider entrance.

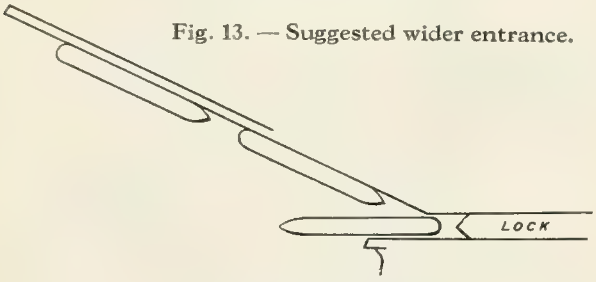

Fig. 14. — Suggested entrance opening on wide expanse of water.

When the Canadian Lock at Sault Ste. Marie was designed it was thought that the dimensions, 60 feet by 900 feet, were ample for many years to come. When the canal was opened in 1895 there were very few vessels over 400 feet long and their greatest beam about 50 feet. Ten years later there were 23 vessels over 500 feet long and the greatest beam was not much less than the width of the lock. To-day there are 121 vessels between 500 and 600 feet long and 42 over 600 feet long while their beam has increased to 64 feet or four feet wider than the Canadian Lock.

The special case given above of the time of an up-bound vessel to enter the lock, (50 minutes), shows the difficulty experienced in not having sufficient space for the water in the lock to pass the vessel. It would have been almost impossible to lock the larger vessels, (58 x 600 Feet), that have been passing through for many years, without opening the valves behind down bound vessels and allowing water in to fill the space behind the vessel as she moved out. The average time mentioned above, 7 minutes, taken by down bound vessels to move out of the lock, would have been increased by ten times.

It is, therefore, evident that a lock should be designed as to width and depth so that the largest vessel likely to use it for many years to come could move in and out of the lock freely on her own steam. That is to say that the lock should be at least ten feet wider and a foot deeper than the largest loaded vessel. The additional foot in depth is required on account of the surge in the lower entrance when emptying the lock, (See Figs. 3 & 4).

Fig. 11, shows the upper entrance to the Sault Ste. Marie Canal and indicates the difficulty that the large six hundred foot vessel has in passing a waiting vessel of the same size; and it can be imagined how much delay occurs, as the outgoing vessel has to move so slowly so as to avoid a collision.

Fig. 12, shows an improved entrance. The incoming vessel is moored on her port side, which is the side easiest for her to land on; and she is lying outside the line of the lock so as to be as far as possible removed from danger of collision with the outgoing vessel. The lock wall on the port side of the outgoing vessel is carried straight ahead to a point about opposite the middle of the waiting vessel so that that the outgoing vessel may move rapidly without danger of swinging towards the waiting vessel. If this wall were not carried so far ahead the outgoing vessel would have to move slower so as not to swing towards the waiting vessel when the suction released her bow.

Fig. 13 shows a wider entrance in which the waiting vessel lies in an oblique line. The lock wall on the port side of the outgoing vessel would not be carried so far ahead. The incoming vessel when about to enter the lock moves ahead until her bow comes to the end of the lock wall, then snubs with her bow line while her propellor still works ahead, causing her stern to swing out so that the axis of the vessel becomes parallel with the axis of the lock, when she lets go her bow line and moves into the lock.

The incoming vessel in figure 12, takes longer to move into the lock, as she has first to snub with her stern line and back her propellor to throw her bow out, then to go ahead and when her bow comes to the end of the lock wall, snub with the bow line, and still moving ahead throw her stern out. This vessel has two movements to make before entering the lock, whereas the vessel in Figure 13, only has one movement to make.

Figure 14, shows an entrance which opens on a wide expanse of water. This entrance would allow vessels to move with the greatest ease and would give the best dispatch. It must however, be remembered that local conditions would have to be considered in adapting any one of these entrances.

The depth of the water in the approaches should be at least two feet deeper at low water than the draft of a vessel, as records have been obtained where vessels have settled as much as one foot when running at full speed.

In the above paper the writer has endeavoured to show how costly it is to vessels to be delayed, to show the causes of delay insofar as canals are concerned, and to show how these delays may be overcome to some extent in the design of a lock and approaches.

A Study of Definitions of "Professional Engineer" and "Engineering"

By Alfred D. Flinn, Secretary Engineering Council

With the Collaboration of Alfred W. Kiddle and Harrison W. Craver

Introduction

When Engineering Council's Committee on Licensing of Engineers early in 1920 began the task of framing a model bill for the registration of engineers, it seemed desirable to include in this bill a definition of "engineer" and "engineering". Many attempts at such definition were made by the Committee and by the Secretary of Engineering Council, aided by several other persons, the chief contributors being Alfred W. Kiddle, Esq., of Kiddle and Margeson, New York, patent attorneys, Associate of the American Institute of Electrical Engineers, and Director Harrison W. Craver, of Engineering Societies Library. The results of these labors are worth recording for the convenience of future inquirers.

Many definitions of "engineer" and "engineering" were found in dictionaries, encyclopedias and engineering literature. Others were drafted. None proved adequate for the purposes of a statute, for none was found sufficiently comprehensive for the modern profession of engineering which did not also include architecture and possibly other professions of the applied sciences. The Committee on Licensing of Engineers concluded that it was impracticable to write a definition suited to its purposes. Furthermore, a definition did not seem essential to a law providing for the registration of engineers. It was deemed sufficient to assume that courts, commissions, and juries would know what an engineer was for the purposes of any case just as they would know what a doctor or a carpenter was. Therefore the recommended bill was drafted without a definition of "engineer" or of "engineering".

For the purposes of legislation a suitable definition should be so worded as to stand the test of trial in court; should include all branches of the engineering profession, to be regulated by the law, but not other professions, and should exclude those men who, by an unfortunate duality in the English vocabulary, are also called engineers, although engaged in a different vocation. In other words, the legal definition should include all the varieties of professional engineers to be governed by the given law, and comprise all the functions constituting their professional practice; but should exclude the men who run engines, an equally worthy but different vocation. Definitions of "engineer" and "engineering" have been essayed by many persons. In framing them it should be remembered that definitions written for the purpose of a statute must be somewhat different from those to be placed upon tablets or included in laudatory statements about the profession. Both kinds of definitions should be stated in such terms that they would not soon become obsolete.

Both Mr. Kiddle and Mr. Craver made many helpful suggestions and aided in this compilation in more ways than one. Mr. Kiddle compiled from numerous dictionaries and encyclopedias a most interesting "Bibliography on Definition 'Engineer' and 'Engineering'" and drafted tentative definitions as bases for discussion. He suggested, also stating in detail, as fully as possible, all the functions included in all branches of modern professional engineering, exclusive of military engineering, so that this statement could be used in testing and revising the drafts of definitions. Director Craver made a search of engineering literature and selected a number of definitions which it seemed worth while to place in one collection. Others have been added from reports of committees and from laws for licensing of engineers. During the past few years the expression "Engineer" has attained great currency and breadth with corresponding indefiniteness. It is frequently used in the popular press to mean any or all of the applications of science to industry and commerce. Many adjectives are now often used with "engineer" which only a few years ago would not have been granted the privilege of such company.

This study is not exhaustive of the subject. It is simply a product of the available time and facilities.

Tentative and Miscellaneous Definitions

1. *Engineer.*—One who is engaged in practicing the art or science relating to the discovery, investigation and utilization of the principles, forces, properties and substances of Nature and to the methods, means, devices, machines, apparatus and structures for employing the same.

NOTE: This is concise in its expression but comprehensive in its meaning and application.

Alfred W. Kiddle.

2. *Engineer.*—One who is engaged in utilizing or in directing or instructing others in the utilization of the principles, forces, properties and substances of nature in the production, manufacture, construction, operation and use of things; or who utilizes or directs or instructs others in the utilization, production, manufacture, construction and operation of means, methods, machines, devices and structures for utilizing or employing the principles, forces, properties and substances of nature.—Alfred W. Kiddle.

3. *Engineering.*—Is the art or science of utilizing, directing or instructing others in the utilization of the principles, forces, properties and substances of nature in the production, manufacture, construction, operation and use of things; or of utilizing or directing or instructing others in the utilization, production, manufacture, construction and operation of means, methods, machines, devices and structures for utilizing or employing the principles, forces, properties and substances of nature.—Alfred W. Kiddle.

4. *Engineer* — He who practices the art or science of engineering.

Engineering — The art or science governing the application of the forces and materials of nature to the use of man. — J. V. Davies.

5. *A Professional Engineer* is a man informed in the principles of engineering, and professionally engaged in the practice of engineering, as hereinafter defined.

Engineering is the art which applies science and scientific methods to develop and control resources of Nature for the use of Man; it involves measuring, directing of forces, inventing of processes, instructing and directing of men, and organizing of human efforts, for the fabrication of machines, the erection of structures, the production and transportation of articles of commerce, and the maintenance, operation or demolition of machines and structures; its purpose is the advancement of the welfare of Mankind. — Alfred D. Flinn.

6. *Engineering* — Definition in large letters on the wall of Engineering Societies Library, New York; "Engineering, the art of organizing and directing men and controlling forces and materials of nature, for the benefit of the human race." — Henry Gordon Stott, Presidential address 1908, to American Institute of Electrical Engineers.

7. *Engineering* — S. E. Lindsay, engineer for the Puget Sound Traction, Light and Power Co., Seattle, has recently proposed the following:

"Engineering is the practice of safe and economic application of the scientific laws governing the forces and materials of nature by means of organization, design and construction, for the general benefit of mankind."

"An Engineer is one who is properly qualified to engage in the practice of engineering."

8. "If the phrase, 'for the general benefit of mankind' is eliminated, Mr. Lindsay's definition is similar to the one first given in Gillette's Handbook of Cost Data ten years ago, namely, 'Engineering is the conscious application of science to the problems of economic production.' Mr. Gillette pointed out that since management had become a science it was unnecessary specifically to mention the management of men in defining engineering. In the new Handbook of Mechanical and Electrical Engineering, by Gillette and Dana, Mr. Gillette's original definition is slightly changed, and it reads: 'Engineering is the systematic application of science to the problems of economic production.' "

9. "A definition is a brief specification. A definition of engineering specifies what human activities are of an engineering nature. Most of the older engineers at first refused to revise the Tredgold definition so as to admit 'management engineers', 'industrial engineers,' 'efficiency engineers,' 'cost analysis engineers,' and the like, to the brotherhood of technical engineers. Even yet the requirements for membership in many of the great engineering societies are so worded that, if taken literally, a management engineer could not become a full member without qualifying as a designing or constructing engineer. Thus the old, narrow conception of engineering still survives in the by-laws of engineering societies, even though a modern definition 'is written in large letters on the wall of the engineers' library in New York' " — "Engineering and Contracting," October 8, 1919.

10. *Definitions of Engineering: Committee of Development American Society of Civil Engineers, October 1919.*

(a) Engineering is the science and art of directing the great sources of power in Nature to the use and convenience of man.

(b) Engineering is an art and science. It is a science in so far as physical laws are its basis, and an art in so far as in the application of these laws the things designed and constructed develop the spirit of progress, the creation of wealth, and the well-being of all peoples.

Engineering is generally divided into four major divisions, viz., civil, mechanical, electrical and mining.

The practice of engineering requires knowledge of physical laws, forces, and the materials of Nature.

The professional engineer is one who by reason of special training, education, and experience is qualified to design and direct the construction of engineering work in one or more of the major divisions of engineering.

(c) Engineering is the creative science and art of applying economically the materials and forces of Nature to the use and convenience of man.

(d) Engineering is the science of industrial effort, and the science and art of applying this effort for the welfare of the public.

An engineer is one versed in the science and art of industrial effort made for the purpose of public welfare.

11. *Definition of Engineering, from a Typical Law for Registration of Professional Engineers, Drafted by a Joint Committee of* American Society of Civil Engineers, American Society of Mechanical Engineers, American Institute of Electrical Engineers, American Institute of Mining Engineers, Society of Naval Architects and Marine Engineers, American Institute of Consulting Engineers, *February, 1915.*

"A person practises professional engineering within the meaning of this act who practises any branch of the profession of engineering other than military engineering. The practice of said profession embraces the design and the supervision of the construction of public and private utilities, such as railroads, bridges, highways, roads, canals, harbors, river improvements, lighthouses, wet docks, dry docks, ships, barges, dredges, cranes, floating docks and other floating property, the design and the supervision of the construction of steam engines, turbines, internal combustion engines and other mechanical structures, electrical machinery and apparatus, and of works for the development, transmission or application of powers, the design and the supervision of mining operations and of processes and apparatus for carrying out such operations, and the design and the supervision of the construction of municipal works, irrigation works, water supply works, sewerage works, drainage works, industrial works, sanitary works, hydraulic works and structural works and other public or private utilities or works which require for their design or the supervision of their construction such experience and technical knowledge as are required in Section 8 of this act for admission to examination. The enumeration of any public or private utilities or works in this section shall not be construed as excluding any other public or private utilities or works which require such experience and technical knowledge for their design or the supervision of their construction. The execution as a contractor of work designed by a professional engineer or the supervision of the construction of such work as a foreman or superintendent for such a contractor shall not be deemed to be the practice of professional engineering within the meaning of this act.

"Professional engineer" means any person who practises professional engineering.

12. *Engineer*.—"By the engineer I mean the man who can apply imagination to facts — the planner, the one who sees his way through, the one who deals with realities in the light of possibilities. The men who drafted the constitution of the United States were engineers. They did not attempt to do the impossible, they tried to do the best possible with the facts as they knew them. Our great pieces of legislation, such as the Federal Reserve Act, are matters of engineering just as definitely as an irrigation project on which we gather into one great reservoir the waters of a score of streams and then distribute these waters again over the thirsty lands by tunnel, canal and ditch. ——— More and more we will find use for the man who thinks ahead with the sure background of facts. This is statesmanship; this is engineering." — Extract from letter of Hon. Franklin K. Lane, Secretary of the Interior, January 31, 1920, to John R. Dunlap, Editor and Proprietor, "Industrial Management", published in February, 1920, issue of that paper.

Definitions of "Art", "Science", "Profession"

13. "*Art*.— In the most extended and popular sense of the word, means everything which we distinguish from Nature. Art and Nature are the two most comprehensive genera of which the human mind has formed the conception. Under the genus Nature, or the genus Art, we include all the phenomena of the universe. ——— We designate familiarly as Nature all which exists independently of our study, forethought, and exertion—in other words, those phenomena in ourselves or the world which we do not originate but find; and we designate familiarly as Art, all which we do not find but originate — or in other words, the phenomena which we do add by study, forethought and exertion to those existing independently of us.———If, though, we were called upon to frame a general definition of Art leaving room for every accepted usage of the word, it would run thus:—Every regulated operation or dexterity by which organized beings pursue ends which they know beforehand, together with the rules and the result of every such operation or dexterity."—

14. "*Science* — consists in knowing. Art consists in doing. What I must do in order to know, is Art subordinate to or concerned in Science. What I must know in order to do, is Science subordinate to or concerned in Art." — Encyclopædia Britannica, 9th Edition.

15. *Profession*.—"A learned profession may be defined as a vocation in which scholarly accomplishments are used in the service of society, or of other individuals, for a valuable consideration. Under such a definition every new vocation in which a very considerable amount of scholarship is required for its successful prosecution, and which is placed in the service of others, must be held as a learned profession, and as engineering now demands fully as great an amount of learning or scholarship as any other, it has already taken a high rank among these professions, although as a learned profession it is scarcely half a century old. Engineering differs from all other learned professions, however, in this that its learning has to do only with the inanimate world, the world of dead matter and force. The materials, the laws and the forces of Nature, and warranty to any extent to life, are the peculiar field of the engineer. I am here using the term engineer as including the large class of modern industrial workers, who make the new applications of science to the needs of modern life their peculiar business and profession. A man of this class may also be called an applied scientist."
— Extracts from "Two Kinds of Education for Engineers", Prof. J. B. Johnson.

16. A *Profession* is defined as being "a vocation founded upon specialized educational training, the purpose of which is to supply disinterested counsel and service to others, for a direct and definite compensation, wholly apart from the expectation of other business gain".

17. *Art* — Practice as guided by the correct principles in the use of means for the attainment of a certain end. (1) Skill in applying knowledge or ability to the accomplishment of a concrete purpose. (2) A system of rules devised for procuring some scientific, aesthetic or practical result; also, the mastery of such rules. By extension, a branch of learning to be studied in order to be applied, as the art of arithmetic, the seven liberal arts of the Schoolmen. (3) Facility resulting from practice; dexterity; knack; power. New Standard Dictionary, 1919 edition.

18. *Science* — (1) Knowledge gained and verified by exact observation and correct thinking, especially as methodically formulated and arranged in a rational system; also, the sum of universal knowledge.

Science in the wide sense includes (1) science proper embracing (a) exact knowledge of facts (historical or empirical science), (b) exact knowledge of laws obtained by correlating facts (comparative science), and (c) exact knowledge of proximate causes (rational science); and (2) philosophy. In the narrow sense of positive science, the word is used as including only the first two divisions of science proper.

(2) Any department of knowledge in which the results of investigation have been worked out and systematized; an exact and systematic statement of knowledge concerning some subject or group of subjects, especially a system of ascertained facts and principles covering and attempting to give adequate expression to a great natural group or division of knowledge; as, the sciences of astronomy, botany, chemistry and medicine.

The sciences are divisible into (1) the mathematical, treating of quantity; (2) the physical, treating of matter and its properties; (3) biological, treating of the phenomena of life; (4) the anthropological, treating of man; (5) the theological, treating of the Deity.

In the progress of human knowledge a science, in its earliest and simplest form, is usually a mere collection of observed facts, like the knowledge of the movement of the heavenly bodies possessed by the ancient Egyptians. The next step is to correlate or generalize these facts, forming a system like that of Ptolomy, or Copernicus; the next, to formulate these generalizations as laws, as was done by Kepler; the final step, to proceed to some principle or force accounting for these laws, usually by the aid of mathematical analysis, as was done by Newton in his theory of universal gravitation. The tendency of modern physical science is toward this more complete generalization, its goal being the discovery of a principle that shall connect all physical phenomena. New Standard Dictionary, 1916 edition.

19. *Profession* — 1. An occupation that properly involves a liberal education or its equivalent, and mental rather than manual labor; especially, one of the three so-called learned profession.

2. Hence, any calling or occupation involving special mental and other attainments or special discipline, as editing, acting, engineering, authorship, etc., also, the collective body of those following such vocation. New Standard Dictionary, 1916 edition.

A Test of the Adequacy of Tentative Definitions

NOTE: Additions should be made to the columns below, if they do not cover all branches of modern professional engineering, exclusive of military engineering.

20. *Engineer:* One who is engaged in:

discovering investigating developing controlling measuring conserving adapting utilizing and/or instructing others concerning	the principles forces powers properties substances elements and/or resources OF NATURE:

And/or one who is engaged in:

Inventing discovering devising investigating developing designing constructing erecting producing making operating employing practising and/or instructing others concerning	means methods processes machines apparatus devices and/or structures	for utilizing employing controlling directing rendering available adapting transforming generating distributing and/or transmitting	the principles forces powers properties substances elements and/or resources OF NATURE.

Alfred W. Kiddle

Detailed Description of Professional, Civilian* Engineering to Include Members of all Branches of the Profession

(*Exclusive of Military Engineering.*)

NOTE: Emendations may be made, if the following statement is not sufficient. It is intended to be used as an aid in framing definitions of "engineer" and "engineering".

21. *A professional, civilian engineer* is one who, being informed in the natural, mathematical and sociological sciences and the industrial arts, is engaged in:

1. discovering and developing forces, materials and other resources of Nature;
2. measuring forces and the properties of materials (substances);
3. utilizing resources of Nature for the benefit and convenience of Man;
4. inventing machines, structures, processes and devices;
5. organizing men, equipment and facilities for construction or production or demolition;
6. designing, constructing and/or maintaining or demolishing structures;
7. designing, constructing and/or maintaining or demolishing machines of all kinds, and/or directing their operation;
8. designing, constructing and/or maintaining or demolishing ways and means of communication, transportation, illumination, heating and ventilation, and/or facilities therefor, and/or directing their operation;
9. designing and constructing vehicles, vessels and other means for transporting persons and/or goods on, in, through, over, under land, water, air;
10. investigating properties, projects, prospects and routes;
11. investigating methods, efficiency and economy of construction, production and/or operation;
12. surveying land, bodies of water, mines, structures, and quantities of materials, incidentally to other functions of professional practice;
13. excavating, embanking, grading, tunneling;
14. inspecting and testing materials, methods, processes, machines and structures;
15. generating and/or transmitting power, light, heat and intelligence;
16. regulating, surveying, conserving and utilizing water and other natural resources;
17. regulating streams for prevention of floods or improvement of navigation;

**Used with the early broad meaning of "civil", as the opposite of "military".*

18. designing, constructing, maintaining and/or operating harbors, harbor works, dry docks, canals, lighthouses and other aids to navigation;

19. reclaiming waste lands by drainage, irrigation and other methods of improvement;

20. supplying communities and industries with water;

21. draining or sewering cities, towns or other areas;

22. disposing of sewage and other wastes;

23. demolishing structures and machines;

24. developing and improving forests, parks, and public and private grounds;

25. preparing plans, specifications, contracts, drawings, and other documents for purposes of construction, production or demolition;

26. and or directing, instructing, supervising others in any of the above functions;

27. and or giving advice in regard to any of said functions;

28. and/or directing, instructing, supervising, or superintending those performing the skilled or unskilled labor involved in engineering operations.

29. In the foregoing paragraphs, "construction" is meant to include assembling, erection, re-construction, alteration, improvement and repair.

30. With all the machines and structures mentioned above are included their appurtenances.

31. In all the functions of the professional engineer the mental elements predominate, including the ability to originate, adapt, analyze and apply; in contradistinction to the functions of the mechanician, technician, constructor, computer, craftsman, or operative, in which predominate physical or mental skill gained by instruction and repetition.

Chemical Engineering
Civil Engineering
Commercial Engineering
Consulting Engineering
Drainage Engineering
Efficiency Engineering
Electrical Engineering
Electric Railway Engineer'g
Electrochemical Engineering
Experimental Engineering
Fire Prevention Engineering
Forestry Engineering

Irrigation Engineering
Landscape Engineering
Management Engineering
Marine Engineering
Materials Engineering
Mechanical Engineering
Metallurgical Engineering
Military Engineering
Mill Engineering
Mining Engineering
Municipal Engineering
Nautical Engineering
Naval Architecture or Engineering
Ordnance Engineering
Petroleum Engineering
Power Engineering
Radio Engineering
Railroad Engineering

Gas Engineering
Harbor Engineering
Heating and Ventilating Engineering
Highway Engineering
Human Engineering
Hydraulic Engineering
Hydrographic and Geodetic Engineering

Valuation Engineering
Water Supply Engineering

Historical Notes on "Engineer" and "Architect"

23. Historically the builder of fortifications, the military engineer, and the builder of dwellings and temples, the architect, were [illegible] on the ground. The distinction was then between military and civilian, and between engineer and architect. All of us who have translated him, remember that Julius Caesar built a bridge — and we know of the military Roman roads of England. In his illuminating lecture on "The Romance of Engineering", Professor C. J. Tilden, of Yale, states that Vitruvius, in his treatise written about the beginning of the Christian Era, divides the field of architecture into three main divisions as follows:

1. The Art of Building.
   a. The construction of fortified towns and of works for general use in public places —
      I. For defensive purposes — the planning of walls, towers and gates, permanent devices for resistance against hostile attacks.
      II. For religious purposes — the erection of fanes and temples to the immortal gods.
      III. For utilitarian purposes — the provision of meeting places for public use, such as harbors, markets, colonnades, baths, theatres, promenades, and all similar arrangements.
   b. The putting up of structures for private individuals.
2. The Making of Time-pieces. (Sundials, water clocks, etc.)
3. The Construction of Machinery —
   a. Civil — water wheels, screw pumps, hydraulics, etc.
   b. Military—balistae, catapults, rams, siege machines, etc."

The very considerable Avignon bridge across the Rhone River (about 1200 A.D.), with eighteen clear arch spans of from sixty-five to eighty feet each, in a swift-flowing river subject to ice jams, was regarded as a work of architecture. The term Architect of Bridges is authentic. Michel Angelo (1475-1564) was not only the architect of St. Peters, but he designed the fortifications of Rome.

Leonardo da Vinci (1452-1519) not only made plans for Milan Cathedral, and painted the "Last Supper" and "Mona Lisa", but he was a chief military engineer, and a hydraulic engineer dealing with irrigation, river control and harbor works, and designed a flight of six vessel-locks. He styled himself engineer as well as architect.

The term Architect in its etymology means "Master Builder".

In the evolution of construction, two classes of builders have by some vagary of word-growth been verbally torn apart in their kinship sometimes questioned. It is odd that in this juggling of old terms and the emergence of new terms, one class of engineers, — and a class whose work is of the highly-specialized, technical kind which deals with the direction of great mechanical forces, — has kept the old family name, the Naval Architects. An accident of name-evolution has tended to segregate one class of master-builders, from the other classes of master-builders. It may be thought that initiative and imagination are the qualities of architects, while engineers deal with the prose of construction. Analysis will, however, reveal the fact that eighty per cent of the architectural structures of our cities are commonplace, with no peculiar beauty or originality. Now and again a Woolworth building springs sky-ward, worthy of the phrase "frozen music", and we recognize again the master-builder of the sixteenth century. But the same quality of mind went into the wireless telegraph, the airplane, the Panama canal and hydro-electric developments and transmission at Niagara. Engineers without creative imagination are as mediocre as architects without this same vital and indispensable attribute of the master-builder. Architects must recognize that scientific imagination is on the same high plane as their own best creative brought; and engineers must concede the esthetic contribution of architects in adding to the durable satisfactions of life. Both are creative workers. — Francis C. Shenehen, M. Am. Soc. C. E.

Definitions of "Engineer" and "Engineering" as Written into State License Laws

Note: Eleven States have laws regulating the practice of engineering.

24. A person shall be regarded as practising *structural engineering* within the meaning of this act who is engaged in the designing or supervising of the construction, enlargement, or alteration of structures, or any part thereof, for others, to be constructed by persons other than himself. Structures within the meaning of this act are all structures, having as essential features, foundations, columns, girders, trusses, arches and beams, with or without other parts, and in which safe design and construction require that loads and stresses must be computed and the size and strength of parts determined by mathematical calculations based upon scientific principles and engineering data. A person shall also be regarded as practising structural engineering with the meaning of this act who is engaged as a principal in the designing and supervision of the construction of structures or of the structural part of edifices designed solely for the generation of electricity; or for the hoisting, cleaning, sizing or storing of coal, cement, sand, grain, gravel or similar materials; elevators; manufacturing plants; docks; bridges; blast furnaces; rolling mills; gas producers and reservoirs; smelters; dams; reservoirs; waterworks; sanitary works as applied to the purification of water; plants for waste and sewage disposal; round houses for locomotives; railroad shops; pumping or power stations for drainage districts; or power houses, even though such structures may come within the definition of "buildings" as defined in any act in force in this state relating to the regulation of the practice of architecture.— *Illinois Law, 1920.*

25. *Civil engineering,* within the meaning of this act, is the practice of any branch of the profession of engineering other than mining, metallurgical and military. Said profession embraces the design and supervision of the construction of all public or private utilities except those in connection with mining operations exclusively, and other works which require experience, and the same technical knowledge as engineering schools of recognized reputation prescribe for graduation.— *Idaho Law, 1919.*

26. *An Engineer,* within the meaning of this act, is a person who is engaged in the practice of the profession of engineering in any of its branches, except military engineering.— *Colorado Law, 1919.*

27. *Joint Committee Definition* of 1915* was written into *Florida Law, 1917, Oregon Law, 1919,* and *Iowa Law 1919. Florida Law* omits sentence, "The enumeration of any public or private utilities or works in this section shall not be construed as excluding any other public or private utilities or works which require such experience and technical knowledge for their design or the supervision of their construction." *Iowa Law* omits the same sentence and inserts after the words "such a contractor,"—"or the construction, improving, or extending of private drains or drainage works, private irrigation works, private water supply works, or other works of a private nature shall not be deemed to be the practice of professional engineering within the meaning of this act."

Louisiana, Michigan, New York, Virginia and Wyoming license laws contain no definition.

NOTE.—Mr. Flinn follows with definitions taken from a number of catalogues of American universities and engineering schools which are omitted here.

Inundation Work with the British Expeditionary Force in France

[illegible], A.M.E.I.C., Lieutenant, Inundation Section R. E., G.H.Q., B. E. F.

War, on a large scale in a civilized country between two forces about evenly matched, requires a vast amount of scientific effort on the part of the victor to overcome an intelligent, energetic and ever alert enemy. Medicine, of course, assumes a very important role and pure science again demonstrates its usefulness in blazing new trails in the forest of learning, but unquestionably the most important work is performed by the applied scientist or engineer. It seems to be axiomatic that the larger the war the more the engineer has to do with it. Indeed the late war, the Great War, the greatest of all wars in history, has been publicly called the engineer's war, by no less a personage than Lloyd George, than whom there is no person better qualified to speak with authority.

Take the chief weapons of modern warfare, battleships of all sizes (especially submarines), airships, aeroplanes, tanks, heavy artillery (and explosives in general), and what are they but children of an engineer's brain? Poison gas stands in a class apart as a product of pure science but in its actual use it is ineffective and in fact dangerous without the engineer's skill.

The above named weapons are all agencies of destruction but it must not be assumed that the engineer in warfare is of value only when devising and operating destructive forces. Practically all of his peace time activities are duplicated in warfare with this fundamental and all important difference — in peace time the engineer is called upon to produce results as economically as possible, in war he must produce results at any cost, if necessary.

The civil engineer, though perhaps less directly concerned than his mechanical and electrical brethren, nevertheless played an important part in the Great War. In the forward areas bridging and water supply remained his peculiar work, while at the bases harbor and dock work were looked upon as his specialty.

No Army in the recent war, except probably the German Army, developed its engineer service to anything like the proportions or to include anything like the variety of work that the British Army did. As an illustration of this; it should be mentioned that the War Office in London is preparing official records on "The Work of the Royal Engineers in the European War 1914-1919", under the following synopsis.

Part 1. General. Development of the Corps. Causes that led to the formation of new branches and units. Charts to show organization and strength of the Corps in August 1914, and November 1918, etc.

Part 2. Work under the Director of Fortifications and Works. (This includes harbor and defence work around the coast of the British Isles and at interior posts).

Part 3. Work in the Field under the Commander-in-Chief, B.E.F. (France).

Section 1—General.
2—Engineer Intelligence.
3—Defences.
4—Bridging.
5—Water supply.
6—Machinery, workshops, electricity.
7—Mining, [illegible] and tunnelling.
8—Geology.
9—Inundations.
10—Camouflage.
11—Anti-aircraft searchlights.
12—[illegible]
13—[illegible]
14—Experimental section.
15—Hutting and Encampments.
16—Schools.

Part 4. Work in the Field under other branches of the Staff (France).

Section 1—Maps.
2—Gas services.
3—Forestry.
4—Postal services.
5—Meteorological.

Part 5. Work in the Field in other theatres of War.

Section 1—Egypt.
2—Gallipoli.
3—Mesopotamia.
4—Salonika.
5—West Africa.
6—East Africa.
7—Miscellaneous.

Part 6. Work under the Director of Works — France.

Part 7. Work under the Director General of Transportation.

Part 8. Supply of Engineer Stores and Materials.

To the above should be added other sections on the work of the Railway and of the Inland Water Transport services. It can thus be seen what a great field was covered by engineering activity.

The subject of Inundations will now be dealt with and it is hoped will prove of interest to members of the Institute. This is one of a small group of subjects ([illegible]) included in the above list which developed during the Great War from nothing to quite respectable proportions. [illegible]

Read before Montreal Branch of The Engineering Institute of Canada, March [illegible].

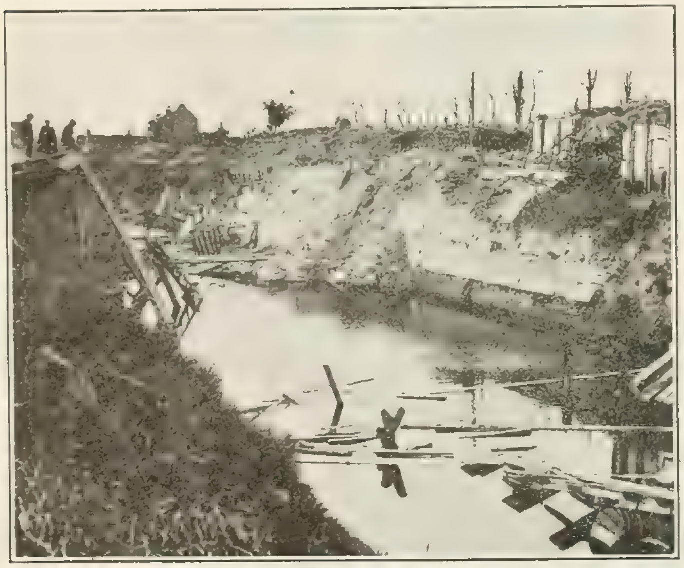
Inundation work with the British Armies in France may be divided into four distinct phases or periods:—

I Preliminary — 1914-1917
II 1918 — Defensive
III 1918 — Offensive
IV Reconstruction

I.—Preliminary — 1914-1917

The first (preliminary) period covers the trench warfare period from roughly the First Battle of Ypres (in the Winter of 1914-1915) to the Winter of 1917-18. Looking back in the light of present knowledge it was a very disappointing period from the inundation standpoint, — so much remained undone or was never even thought of, that could easily have been done. The very first stand of the British force to come under fire (General Smith-Dorrien's II Corps along the Mons-Condé canal) was made at the place of all places in Northern France, (the Condé-Quievrain-Valenciennes marsh) where inundation work on the part of the Germans some time afterwards proved so effective, yet nothing was ever attempted. A few hours work at certain critical points along the bank of the Mons-Condé canal, which is mostly above the level of the surrounding country, would have released a large volume of water, and seriously impeded the advance of the Germans at a time when a day's time was invaluable. The blame for this lack of foresight must rest with the British General Staff at the War Office, since the French General Staff and Staff College, years before, (as will be shown later) had prepared detailed defence plans covering all features of this work in case of a German invasion.

Detailed hydraulic studies did not start until the retirement of the Allies in 1914 and the race to the sea had ended in the trench warfare deadlock, and both sides settled down to more or less permanent residence. Naturally, the first district to be critically examined was the low-lying Flanders coast from Ypres to Nieuport. German attempts by shelling to destroy the water gates at Nieuport and hence British control over the canal water-levels, first drew (it is believed) attention to the seriousness of the problem and its possibilities for defence. All available Belgian records were obtained and carefully studied and in addition precise check levels were run and canal and stream discharge measurements were taken wherever possible. This work was put in charge of Capt. A. P. McDermid R.E., afterwards Inundation Officer to the Engineer in Chief at General Headquarters, and credit must be given to him for the first scientific attempt to develop inundation work in a tactical sense. The chief difficulty in effecting any decisive result along these lines in this area during the early years of the war lay in the fact that the important canal control points were fairly evenly divided between the British and Germans, due to the complicated nature of the canal system in this part of Belgium and France, and neither side could do anything important of an offensive nature without imperilling its own defences. So both Armies remained fixed in position but watching each other for the first signs of weakness. During the summers of 1916 and 1917 the British brought from England into this area a large pumping plant on a shallow draft barge and this was used at a critical point to pump canal water from one low level behind the British line to another low level behind the German line over a high level stretch (which both armies controlled) and so keep flooded an area of country which the Germans especially wanted dry.



A typical canal view in the area subject to inundations as the Germans left it. To regain control on such stretches was often a difficult matter.

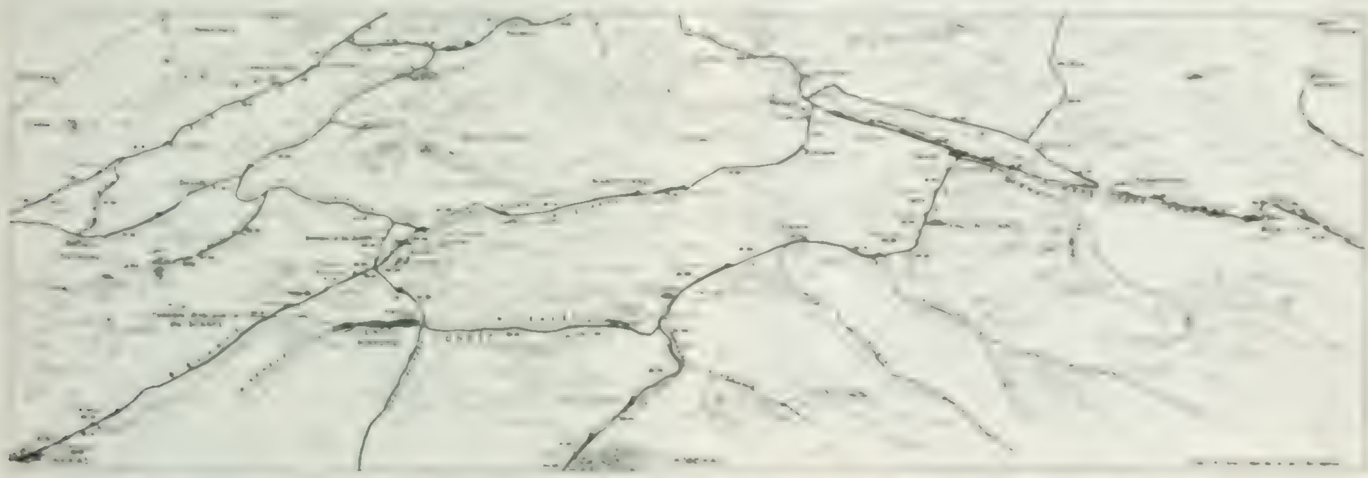
On the balance of the British front during this period, the situation was considerably different and there is nothing of special interest to report. Any inundation problems that arose were small and local and easily handled by local units and personnel without reference to more than Corps or sometimes Army Headquarters. During this period, however, the British Expeditionary Force grew from the original "Contemptibles", some 160,000 strong, to five British Armies. Over the five Chief Engineers of the Armies was appointed an Engineer-in-Chief who gradually collected about him a staff of specialists and serious attention was devoted to such technical and tactical problems as inundations, and canal and river control. It was in this period that Brig. General Liddell, Deputy Engineer-in-Chief, made a memorable trip to the French War Office in Paris and obtained invaluable information as to the possible defence value of inundating the low-lying parts of the chief river valleys in North-East France. The most interesting and valuable document, a copy of which was obtained, was the proceedings of a conference held in 1897 at the instigation of the French Staff College, in conjunction with Engineers from the Department des Ponts et Chaussées, the Department of Navigable Waterways, and Engineers from the Belgian General Staff, for the purpose of considering all possible defence measures in case of a German invasion over the Belgian frontier. The inundation part of this report contained practically all the hydraulic and topographical data necessary to develop schemes for flooding low-lying areas at the most feasible points, with estimates of time, volume of water needed, etc., and a full list of control points. This report became the basis for all the future work done by the Inundation Section R.E. One copy was known to have been lost at Lille at the time of the German advance in 1914 and, it is feared, fell into the enemy's hands as all the future work seemed to show a great resemblance to the schemes and principles laid down in that report. Inundation warfare in the latter stages of the war (September-November 1918) thus became a game of chess, as it were, between two opponents who each knew fully the rules of the game and what the other could do. The advantage lay with the Germans, however, as they had the actual ground and stream control points to work with.

As evidence that the Germans early grasped the tactical value of inundations in defence operations may be mentioned the fact that aerial photographs in 1916 of the lower Scarpe River Valley (North-West of Valenciennes) showed large tracts of flooded country around St. Amand which were not understood until a prisoner confessed that the German engineers had been practising an inundation stunt, and had obtained valuable information as to proper size of water openings, run-off time, evaporation, etc.

The four chief rivers behind the British line during the period, were: First, The Somme, running through Amiens, Abbeville, etc.; Second, the Authie, running through Auxi-le-Chateau; Third, The Canche, running through Hesdin to Etaples past General Headquarters at Montreuil; and Fourth, The Aa, running through St. Omer to Gravelines on the Channel coast, East of Calais.

The topographical and hydraulic features of these river valleys were not known sufficiently accurately to plan or lay out any areas to be flooded as it became necessary to make hurried surveys. With Canadian-built British theodolites, these were eventually made all the way back to the coast, on each of the above mentioned rivers. After several unsatisfactory attempts to work with detached personnel it was decided to organize a new unit (Inundation Section R.E.) directly attached to the staff of the Engineer-in-Chief, General Headquarters.

The writer joined the Section on June 7, 1918 as Senior Subaltern, and was immediately assigned to the Somme Valley work between Amiens and Abbeville. It may be of interest to describe the work on this stretch



Birds eye view of the intricate canalized river system of Northern France, showing the inundated areas mentioned in this article.

II.—Defence Period — March to August 1918.

This period covers the time from the great German offensive on March 21, 1918 until August 8, 1918 when the great British offensive was launched at Amiens and the final decisive stage of the war entered into. The initial success of the German attack made it absolutely imperative to develop every means of defence to the utmost, and inundation work began to assume considerable importance, especially in the Somme River valley behind Amiens. Control of the work, along with other special defence schemes, was assumed direct by General Headquarters and the Deputy Engineer-in-Chief, Brigadier General McInnes, C.M.G., D.S.O., R.E., a Canadian in the regular British Army, was put in charge. Unfortunately he died shortly after. Capt. A. P. McDermid R.E., was then given control, under the Engineer-in-Chief, and he remained in charge until the end of the war.

in some detail, as the field methods first worked out here were used subsequently, on all the work on the other three rivers.

The Somme is a canalized river flowing in an old, well-eroded valley about a mile wide with fairly high ground (50-100 ft.) on both sides of the valley. The average water slope is two feet per mile, and single locks are spaced approximately six miles apart. Barge traffic is fairly heavy in peace time and the size of the barges is governed by the size of the lock chambers, which are all a standard size, 17' x 125'. During the war the Inland Water Transport Section R.E. operated the barges on all these canals in Northern France and at each lock the old French regular lock-keeper (éclusier) was retained to operate the by-pass control gates, and so regulate the water level in the upstream and downstream reaches. The minimum depth of water was about eight feet, the average width at water level was approximately fifty feet, the sides were sloped one and one-half to one, and there was always a six foot tow-path for horse locomotion.

At this stage of the war the Germans were within six miles of Amiens, so the first work done in the Somme Valley was to develop hastily what control points in and around the City of Amiens were obviously seen to be available for flooding large areas of low-lying land above the city towards the German line. All culverts, control gates, by-passes and small openings were blocked by sand bags (or stop-logs) or otherwise prepared for immediate closure. This naturally increased the flow in the two main channels of the Somme flowing through the city. At the upstream end of two of the largest bridges stop-log control dams were built and hung by tackle so that at a minute's notice they could be dropped into place. Everything was ready for immediate and effective action should the Germans advance further, but fortunately the scheme was not needed.

Next a hurried reconnaissance survey was made of all the existing water-pools and marshes (old peat cutting grounds) in the Somme Valley all the way back to Abbeville, a distance of twenty miles. These were sketched in by eye, together with all small streams emptying into them. Then a more detailed and thorough instrument survey was started on the "spot-level" method over the same area, starting from Amiens and working downstream. Taking the best and largest scale French map of the valley that could be obtained (r.f. 1/80000) as a basis, level readings were taken on *such* points from side to side of the valley and on as *many* points as were considered necessary to give sufficient topographical data. Great accuracy of lineal measurement was not essential so distances were paced, or more often, estimated by eye. Accuracy of elevation was, however, essential and all rod readings were read to the nearest tenth of a foot except those on Bench-Marks and Turning Points which were read to the nearest hundredth of a foot. The level bubble of a five inch English transit was used for the work and all work was based on Bench-Marks of the French Nivellement General. Each and every lock, by-pass control, sluice, bridge, culvert, etc., in the area was measured and indexed, and the inundation scheme for the valley, when completed, contained detailed instructions for handling each of these control points.

The Aa River, like the Somme, is a canalized river, but the Authie and the Canche are not. Numerous mills along the banks of these streams, however, furnish control points by means of their barrages (dams) and weirs. Wherever possible, the stream discharge was measured at these weirs, otherwise the cross-section and surface-float-velocity method was used.

In all cases, the underlying idea was to so obtain control that a large volume of water might be quickly applied over as large an area of land as possible but *not* to a great depth. Experience proved that a shallow pond or marsh is desired for inundation purposes rather than a lake. A lake is navigable by rafts or other craft but a marsh furnishes just as valuable an obstacle and is in addition, absolutely impassable to all arms except aircraft.

Canadians making emergency repairs to lock-gates in an effort to regain control of water level.

III.—Offensive Period—September to November 1918.

This period, in its variety and difficulty of work is of far greater interest than any of the other three periods. The Hun, by this time in retreat, had learned his inundation lessons, and was proceeding, as far as he could, to put into effect the different schemes that had been so carefully worked out by the French Staff College back in 1897. It therefore became the function of the Inundation Section at General Headquarters to advise the Enginer-in-Chief in advance, (and through him the Chief of the General Staff) what to expect as the British Armies advanced and to act in a consulting capacity regarding any and all river and canal technical problems as they arose. A typical case in point is as follows: — One morning an aerial photograph was brought in which showed the Germans starting a dam across an important canal far behind their front line. On examination it was soon apparent that when the stream was dammed and a cut made through the canal bank a short distance above the dam a large area of country would be flooded. The Chief of the General Staff was immediately advised, through the Engineer-in-Chief, of the seriousness of the work. Next morning another aerial photograph of the same spot was brought in which showed how effectively the British bombing planes had spoilt the German's little scheme.

Of the four main rivers, the Sambre, The Escaut (Scheldt in Belgium) the Scarpe and the Lys, followed by the British Armies in the final advance, the Escaut and the Scarpe with their lateral connecting canals (Sensée and Haute Deule) were by far the most susceptible of being developed as serious tactical obstacles by means of inundations, and it is an interesting point to notice that the Canadian Corps (as the centre Corps of the First Army) happened to be on the part of the Front opposite these obstacles and was the direct means of overcoming same.

The writer was posted for duty as Inundation Officer to the Chief Engineer of the 1st Army on October

15, 1918 and immediately attached to the Staff of Maj. General W. B. Lindsay, Chief Engineer of the Canadian Corps as General Headquarters Inundation Officer, remaining there until Mons was captured on November 11th.

The only three districts in which it was possible for the Germans to develop any large inundation areas and cause any serious tactical obstacles were: First, the lower reaches of the French Escaut River (especially around Condé). Second, the lower reaches of the Scarpe River from Lallaing to St. Amand. Third, Part of the Haute Deule Canal from Lille upstream to Wavrin.

The Escaut, a canalized river from Cambrai down to the sea has three important tributaries (La Selle River, L'Ecaillon River, and la Rhonelle River) below its junction with the Sensée canal at Estrun (or Bassin Rond) and a large flow, which the Germans used to the utmost in developing their Conde marsh inundation scheme.

The Scarpe River, starting at Arras, is joined at Corbehen by the Sensée canal, and, under dual control, flows through Douai, from where it splits, part of the flow going down the Scarpe River (canalized) to join the Escaut at Mortagne and the rest going down the Haute Deule canal through Lille. The only possible source of water for the Lille inundation scheme is from this supply.

The Sensée canal, joining the Scarpe and the Escaut, is fed by the famous Arleux-Palluel marsh, at Palluel, the junction of the Sensée and the new canal du Nord. This marsh is six feet above the water level in the Sensée canal and furnishes a constant supply of water, but was fairly low in the autumn of 1918. There is no lock in the Sensée canal between Goeulzin and Iwuy, (on the Escaut), and the water level at both these locks falls away towards the Scarpe and Escaut Rivers respectively so it is self evident that this high level Sensée Canal is really a feeder to either the Scarpe or the Escaut, depending on the lock manipulation. It was thus very important in the inundation problem.

Below Corbehen, the Scarpe flow, (or the Scarpe and Sensée) could be sent down either by the diversion canal to the west of Douai or down the old river channel through the city itself. The two locks (one on the Scarpe proper and one on the Haute Deule at its junction with the Scarpe) at Fort de Scarpe below Douai, were probably the two most important locks dealt with on this work. By proper manipulation, the whole flow of the Scarpe (or Scarpe and Sensée) can be choked off from going on down towards St. Amand and can all be diverted down the Haute Deule canal. This was actually done by the Canadians immediately after Douai was captured (by the VIII Corps on October 17th) and was undoubtedly the means of preventing any serious floods along the lower Scarpe, where they might have been expected. Lille, by this time, was in British hands.

But the first serious problem confronting the Canadians, before Douai was captured, was to choke off the Scarpe River flow and prevent any water from reaching Douai to form local inundations there. This was solved partly by ponding in the headwaters around Arras, but chiefly by reviving an old trick of the Duke of Marlborough, when defending Douai in 1670. The lock and by-pass at Vitry were blocked as much as possible and a cut made upstream in the river bank of the Canal at Biache with the result that the Scarpe water found its way down a small valley into the Arleux-Palluel marsh, which was low and could absorb a large quantity. As soon as Douai was captured the break was repaired and the Scarpe resumed its natural course.

By means of blocking the lock on the Escaut at Pont Malin (below Bassin Rond) and opening the lock at Goeulzin on the Sensée, the whole flow of the Escaut above Pont Malin can be diverted down the Scarpe and Haute Deule canals through Lille and this was also done by the Canadians, in due course, to prevent all water possible from reaching the already large inundation obstacle between Valenciennes and Condé. This marsh had already been completed, however, in a tactical sense

Aerial view of La Folie Lock No. 11 below Valenciennes in the Condé Marsh inundated area along the Escaut River.

and functioned perfectly in that it forced the Canadians to stand and capture the city of Valenciennes by a direct attack instead of by their previously successful method of flanking envelopment. It was the outstanding example in the War of the value of inundation, scientifically carried out, as a means of defence.

IV.—Reconstruction Period—After the Armistice.

As the result of a conference held at Roubaix on November 12, 1918, between representatives from the Belgian Army, French Army, the First, Second and Fifth British Armies, and British General Headquarters, the control of all canals and rivers on the first, fifth and second British army fronts from Cambrai to Oudenarde (on the Scheldt above Ghent) was put in the hands of Brigadier General C. J. Armstrong, C.B., C.M.G., Chief Engineer VII (British) Corps, formerly Chief Engineer Canadian Corps and a Member of this Institute. The writer was attached to his staff as Inundation Officer.

The chief problems were: — First, to devise ways and means of regaining control of the Escaut and Scarpe rivers since practically all the locks and control points had been destroyed by the Germans and the two streams were in effect free-running rivers. Second, to drain the inundated areas. Third, to clear away all channel obstructions. Fourth, to rebuild as many of the locks and by-passes as the available labor and material would permit and in so far as this rebuilding scheme was agreeable to the French and Belgian Governments.

Practically no rebuilding was done, but a serious attempt was made to regain control of the streams at critical points by means of stop-logs, etc. A detailed survey was made, on foot, of the Scarpe, the Sensée, the Haute Deule, the Escaut from Cambrai to Oudenarde, the Mons-Condé, the Pommeroeul-Antoing, and the Blaton-Ath canals, to obtain some idea of the work to be done, and the report on the Mons-Condé canal is quite typical of conditions as the Germans left them in this part of France.

The attached appendices, are self explanatory. They explain in greater detail some of the more important points and problems mentioned in the preceding summary. The VIII Corps being situated on the left of the Canadians, or downstream on the Escaut, the inundation situation as developed on its front is almost of equal interest with that on the Canadian Front.

The War Diary Extract, is of special interest as it shows the great amount of important work that was done in two critical weeks in October during the final advance of the Canadian Corps.

(COPY)

First Army No. G.S. 1406/4

VIII Corps.
Adv. XXII Corps.
Adv. Canadian Corps.

The Army Commander, (Genl. Sir Henry Horne,) directs that the following principles be followed in dealing with the inundation in the Scarpe and Sensée Valleys:—

Canal scene in French town, showing bridge demolished by the Germans. Control of the water level is very important in such stretches as these.

(a) Regain control of the flow of all canal water —
1. by immediately regulating water to normal flow at all locks captured.
11. by replacing damaged locks and dams with temporarily built adjustable barrages.

(b) Drainage of the valley of the Trinquis brook as far as l'Ecluse and allowing water to impound in the reservoirs in the vicinity of Palluel as far as possible.

(c) Prevention of any abnormal flow of water being sent down the Haute Deule Canal or the lower Scarpe Canal, or any inundations being formed in the valley of the Sensée between Arleux and Estrun.

2. Corps will be responsible for the immediate regulation, when possible, of captured lock gates. The Canadian Corps will be responsible for all work on the Scarpe and Sensée Canals up to Corbenham inclusive.

3. To carry out the principles enumerated above the following courses are suggested:—

(a) The breaks in the banks of the Scarpe Canal should be repaired and locks at Biache, Vitry and Corbenham should be controlled.

(b) All dams and obstacles to drainage in the valley of the Trinquis River should be removed, and an adjustable dam built at the entrance to the Malderez Canal at Palluel and any other openings from the Palluel lagoons.

(c) If the lock at Goeulzin has been destroyed, the lock at Estrun should be regulated so that no abnormal amount of water flows from the Escaut into the canals north of Douai.

Later a regulator may be possible at the disused lock at Pont de la Redoute (L.31.a.3.3.)

4. A precis of information re inundations is attached for information.

5. A special inundation officer from General Headquarters is being attached to the Canadian Corps to give technical advice, and to see that General Headquarters are kept in close touch with all action taken by the First Army and co-ordinate it with the rest of the British front.

First Army, (sd) S. H. J. NICHOLSON,
13th October 1918 Lt.-Col. for Major-General,
General Staff, First Army.

(COPY)

Precis of Information re Inundations

(Checked with General Headquarters Inundation Officer, 7th October, 1918)

1. Canal du Scarpe.

The lock at Vitry has been closed, and the south canal bank cut at 1.18.a.7.8. All the Scarpe water has inundated the low ground down to Palluel and filled up the reservoirs and lakes known as Sequestre, l'Ecluse, Palluel, and Arleux. The flow of these marshes is controlled—

(i) West of l'Ecluse at Mill L.36.b. (destroyed by us)

(ii) Road bridge L.36.d. (destroyed)

(iii) Palluel Q.11.a.9.8. where Sensée River runs into Mallebrux Canal. This barrage was destroyed by the enemy and the water is reported, on 6th October, to be flowing through a 10 feet span, 4 feet drop, into the Marbayn Canal, which leads to the Canal du Nord.

(iv) Lock and barrage at Pont de Pronnon — Q.5.a.8.2. — which is under close machine gun fire of enemy.

(v) Possibly sluices on the Rivière de Moulins at Arleux — K.35.d.2.1. — but this is said to be unimportant.

All the water enters the Canal du Nord at Q.6.c.1.3. Where it is going is unknown, but is discussed in para. 4.

2. Canal du Sensee.

This Canal flows from the Escaut at Estrun to the Scarpe Canal at Corbenham. One lock exists at Goeuzin with a fall of 16 feet. The locks at Fressies and Pont de Redoute (L.31.2.3.3.) are reported as having been done away with, but, from the air photo, the latter can be blocked.

By blocking this point, or closing the Goeulzin lock, water from the Palluel marshes can be sent down the Sensée Canal to Estrun, and thence into the Canal de l'Escaut.

If the lock at Estrun is closed and dammed, the Valley from Palluel to Estrun could eventually be inundated. If the lock on the l'Escaut Canal at Bouchain were dammed, and the lock at Estrun open, more formidable inundations could be made, as the waters of the Canal de l'Escaut would be available.

At present, it seems as if a dam might exist at Pont Rade — M.18.b. — as air photos show signs of flood on the south side of the Canal.

It may further be noted that the River Sensée ceases as such West of the Canal du Nord at Palluel — there is no through connection. It commences again east of the Canal du Nord in two branches:—

(a) Flows from the vicinity of Palluel in the marshes east of the Canal.

(b) Leaves the Canal at Le Moulinet — K.17. central — through sluices in the Canal bank, and flows into the Scarpe Canal at Lambres.

3. If we could now open the dam at Vitry, stop the cut in the bank, allow the Scarpe water to flow down the Scarpe Canal, and keep the dam at Palluel open, it is probable that the marshes would be drained from Biache to l'Ecluse in a few months. These marshes would then act as an empty reservoir, and if we again reconnected the dams on the Scarpe and Sensée and the Sensée River at [illegible], no water would go into the enemy's canals at the Lower Scarpe or Haute Deule, south for a month or two, while these [illegible] were filling the marshes. This should prevent [illegible] in the [illegible] possibly stop navigation and possibly embarrass the enemy.

4. The main control we could have at present is at Palluel — Q.11.a.9.8. Arrangements have been made to dam this if required.

(a) The water entering may be going down the Canal towards the Haute Deule Canal, if the lock at Courchelettes has been opened, but it seems that if the enemy was to [illegible] most of the Scarpe water, he would open the dam at Vitry and close the cut he made at L.18 b. the inundations necessary to guard his flank along the Trinquis Brook having been made; but it is also possible that if the flow from the Scarpe Canal is stopped, the inundations as far east as Sailly will drain away in 3 or 4 days.

(b) If he has closed the Goeulzin lock, or made a dam at Pont de la Redoute to send water down towards Estrun, there are little signs of inundations at present. The photographs show he had a control at Q.[illegible], and the water is now flowing through a [illegible] at the end of the control. If he had intended this control to send the water from the Palluel marshes towards the l'Escaut he would have put it at Q.6.b.3.9.

By closing the dam at Q.11.a.9.8., we will further fill up the inundations on the defensive flank from Biache to Palluel, but will not, probably, do much additional flooding. We will insure the enemy cannot use the water for flooding in the Haute Deule Canal or Lower Scarpe Canal, or Sensée Canal, but the area of the Sensée Canal from Arleux to Estrun could be flooded by the enemy from the l'Escaut.

Canadian Corps War Diary

Field Engineer, Inundations
October, 1918

Oct. 11th. Took over Inundation work in Scarpe and Sensée Valleys from XXII Corps.

Oct. 12th. Engineer Instructions No. [illegible] issued regarding control of water in Canal System near Douai.

1st Bde C.E. advises lock in Scarpe at Biache blocked by enemy with concrete; also canal banks cut on S. side above and below same lock.

1st Bde C.E. advises lock on Scarpe at Vitry destroyed but stop-logs holding 3ft head.

Oct. 13th. 1st Bde C.E. instructed not to open Vitry dams until waterways further down is under control.

Oct. 14th. First Army Order No. G.S.1406/4 received regarding control of water in Scarpe and Sensée Valleys. Canadian Corps to be responsible for all work down to Corbenham, inclusive. Precis of information re inundation possibilities on First Army front attached to above order. Precis made by Maj. Genl. Atkinson and checked by Capt. MacDermid, G.H.Q.

Oct. 15th. Received Order No. G.435/21-1 from Canadian General Staff to direct Scarpe River into Sensée marshes; also to prevent Escaut from flowing West into Sensée Canal.

Oct. 16th. 4th Bde. C.E. take over reading of water gauges in Sensée marshes near Palluel from 56th Division.

C.R.E. 56th Division reports that damming of Arleux–Palluel crossing floods the road and his G.O.C. ordered dams lowered to leave road crossing dry.

Reconnaissance made of storage capacity on Scarpe Valley at Arras with view to impounding upper Scarpe water there to prevent enemy using same for defensive inundations above Douai.

Oct. 17th. 8th Division closed gaps in Canal bank below Biache lock. This had effect of increasing flood over roads in Sensée Valley down to Arleux–Palluel, so 1st Bde C.E. were ordered to open same immediately, thus keeping greater part of Scarpe flow down Scarpe Valley.

1st. Bde C.E. report W.L. in Sensée Canal N. of Goeulzin lock dropped 8 ft.

Oct. 18th. Reconnaissance made on Scarpe, Scarpe deviation, and Sensée Canals near and through Douai by Major Goldie, Major Fetherston haugh, and 2nd Lieut. Shanks, R.E. showed that the Germans, before retiring on the 17th, had with two exceptions demolished all locks and control points. The two exceptions were the two locks (Sud and Nord) on the Scarpe Deviation W. of Douai, which were blocked with earth, stones, etc. The effect of all this demolition was to pull the Scarpe and Sensée water with the retiring Germans for possible use in inundations in the Lower Scarpe Valley. First Army orders VIII Corps to put in stop-log dam at Fort de Scarpe lock on the Scarpe to prevent more water escaping into Lower Scarpe.

Oct. 19th. First Army Orders (1) Canadian Corps to put in stop-log dam at Courcelettes in Middle Scarpe and to clear out obstruction at Sud lock on Scarpe Deviation.

(2) VIII Corps to clear out obstruction at Nord Lock on Scarpe Deviation and to close breach in west bank of Scarpe Deviation between Sud and Nord Locks. 2nd Bde. C.E. ordered to put in Stop-log dam at Pont Malin Lock on Escaut and to close breach in East Canal bank above same lock.

Dams at Arras closed and "G" and "Q" Branches notified.

First Army advise that Fifth Army want water in Haute Deule Canal and order Canadian Corps to pass as much water down as possible.

G.H.Q. policy at this stage in the operations was to prevent any water flowing down lower Scarpe or Escaut Rivers and to divert Escaut, Sensée, and Scarpe flow into Le Haute Deule Canal via the Scarpe Deviation West of Douai.

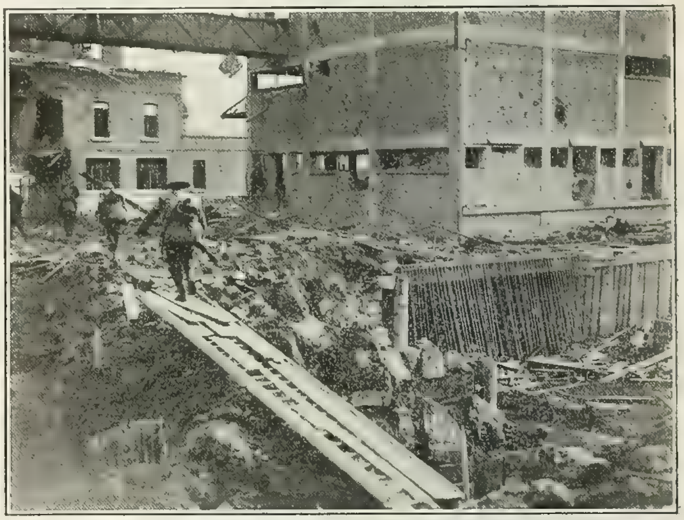
Oct. 21st. 1st Bde. C.E. ordered to lower stop-log dam 3 ft. in by-pass at Biache Lock.

Oct. 22nd. 2nd Bde. C.E. finished at 10.00 hours putting in stop-log dam at Pont Malin Lock and closing breach in Canal bank.

Capt. Curry, I.W.T., arrived to take over control of work in back area up to Fort de Scarpe and Pont Malin Locks inclusive.

Oct. 23rd. 4th Bde. C.E. report dam put in at Neuville sur l'Escaut where lock was destroyed by enemy on retiring.

2nd Army Troops Coy. C.E. takes over control of water levels at Goeulzin, Sud, and Courcelettes Locks.



Canadians crossing one of the control gates at Notre Dame lock No. 11 in Valenciennes. This was wrecked in order to develop inundations above the city.

4th Bde. C.E. reports condition of Escaut locks at Neuville, Denain, Haulchin, and Trith St. Leger after enemy retirement.

Oct. 24th. Engineer-in-Chief advises that rising water in Haute Deule in danger of overflowing and orders diversion into lower Scarpe.

First Army orders closing of sluices at Arleux-Palluel crossing.

Oct. 25th. C.E. VIII Corps advises floods in Haute Deule endangering bridges and requests diversion of Scarpe water into Sensée marshes.

Discharge of Ecaillon River at Thiant measured by Major Fetherstonhaugh and 2nd Lieut. Shanks as 25 cub. ft. per. sec.

Oct. 26th. Discharge of Selle River at Denain measured by 2nd Lieut. Shanks as 70 cub. ft. per sec.

2nd Army Troops Coy. C.E. take over gates and dams at Lecluse and Palluel from 1st Bde. C.E.

3rd Bde. C.E. report reconnaissance of flooded area in Escaut Valley near Lock No. 14 at Fresnes.

2nd A.T. Coy. C.E. put in dams at Blache and Arleux Palluel crossing.

Oct. 27th. First Army orders flow down Haute Deule to be kept down to a minimum as Fifth Army not ready yet to receive any more. E-in-C and First Army advised that Canadian Corps holding back all water possible.

Reconnaissance made of lock at Trith St. Leger and flooded area near there by Major Goldie and 2nd Lieut. Shanks. Canal W.L. North of Valenciennes reported falling rapidly. 2nd A.T. Coy. C.E. put in dams at Arras.

Oct. 28th. Engineer in Chief orders no more water sent down Haute Deule and to impound in Sensée Marshes.

Received circular order from Chief Engineer First Army No. 3465 8 14 of 27-10-18 re control of waterways.

First Army orders lock opened at Fort de Scarpe to allow flow down lower Scarpe and so relieve flow down lower Haute Deule. Also orders upper gap at Blache opened again and Scarpe Canal dammed to divert all Scarpe water to Sensée marshes, even if road crossings flooded.

Oct. 29th. Engineer Instructions No. 42, 42a, 42b, 44, 44a, 44b, issued re action to take in order to gain control of Escaut Canal waterway in Valenciennes-Condé Area during and after pending corps operations to take Valenciennes and high ground east of same.

Issued detailed instructions to 4th Bde. C.E. to lower inundations at Trith St. Leger in order that a road crossing may be established there.

Issued instructions to 3rd BDE. C.E. to clear as soon as possible Locks 13 and 14 on Escaut and all obstructions between them, and if possible drain flooded area near them back into canal.

Oct. 30th. Engineer in Chief advises Escaut water being shut off above Cambrai for 30 hours.

(Sgd) E. C. GOLDIE, Major
F.E. Inundations, for
C.E., Canadian Corps.

(COPY)

Canadian Corps Inundation Situation
(Nov. 8, 1918.)

1. Normal flow of Escaut diverted into Sensée Canal by means of dam at Pont Malin lock.

2. The Sensée River, however, contributes its normal flow into the Escaut Canal below Pont Malin lock, and the Selle River also has free entry into the Canal at Denain. The Rhonelle River, which had been diverted by the Germans into the flood between Maing and Trith St. Leger has been blocked and now resumes its normal course into the Escaut below Thiant.

3. At the following locks which are demolished there is no control over the Canal flow:

Lock No. 7 at Neuville sur l'Escaut.

Lock No. 8 at Denain.

Lock No. 9 at Haulchin.

4. The following locks (and accompanying barrages) are intact but blocked by masses of earth and road metal.

Lock No. 10 at Trith St. Leger

Lock No. 11 at Valenciennes

Lock No. 12 at Anzin

Lock No. 13 at Bruay.

5. Lock No. 14 at Fresnes, now in VIII Corps area, is believed to be intact and blocked also.
